Babington, CHURCHILL: classical philologist; b. in Leicestershire, England, in 1821; graduated at St. John's College, Cambridge; held the chapelry of Horningsea, Cambridgeshire, 1848-61; was Disney professor of archæology 1865-80; became rector of Cockfield in 1866; edited from MSS. discovered, 1847 and 1856, orations of Hyperides; wrote largely on botany, ornithology, archæology, and numismatics for various works and *Transactions*, and was a contributor to Smith's *Dictionary of Christian Antiquities*. D. Jan. 13, 1889.

Babingtonite: a silicate of iron and calcium.

Babirussa: See BABYROUSSA.

Bab'ists [Pers. *bābī*, babism, deriv. of *bāb*, gate, the name assumed by the founder, Ali Mohammed ibn Redha]: a Mohammedan sect which originated in Persia in the second quarter of the present century, and in a short time attained to a widespread cult. Its political agitation led the present shah to oppose it. The Babists defended themselves, and civil war ensued. The Bab was shot at Tabriz, 1850. His successor was Yahya Hazrat-i-Ezel. In 1852, in consequence of a Babist attempt on the shah's life, the sect was suppressed. Many were put to death, many more were forced to recant, but the sect still lives; indeed, it is said that its adherents at present amount to several millions. In 1867 a split occurred, headed by Behá (Huseyn Ali), who claims to be inspired. The Babists profess to be reformers, assert the absolute unity of God, and claim that the Bab is as much superior to Mohammed as the latter is to Christ. They consider the Bab to be an incarnation of God. Their religious ideas are a mixture of various elements—mysticism, gnosticism, and fanaticism—well-nigh impossible of definition. Their principal social reforms are in the way of elevating the position of women by rendering divorce less easy and remarriage of the divorced women allowable. They also forbid traffic in slaves, and smoking. See E. G. Browne, *The Babists of Persia*, in the *Journal of the Royal Asiatic Society*, new series, vol. xxi. (July and Oct., 1889); cf. his translation *The Episode of the Bab* (London and New York, 1892); also Clement Huart, *La Religion de Bab* (Paris, 1889).

SAMUEL MACAULEY JACKSON.

Bab'lah: the fruit of several species of acacia. It contains tannic acid and a red coloring-matter. It is used in dyeing and calico-printing for fawn colors.

Ba'boo [Bengali and Hindi, *bābū*]: a Hindu title equivalent to the English "Mr.," usually given to gentlemen who are educated and wealthy. The Baboos are noted for generosity and public spirit, and are liberal in religion. Many of them are bankers and merchants.

Baboon' [from Old Fr. *babuin*, *baboin*, *babion*; of unknown origin]: one of a group of monkeys belonging to the family *Simiida*, distinguished by long truncated muzzles and cheek-pouches. The face resembles that of a dog, and the ridges over the eyes are very distinct. Baboons have large callosities on the buttocks, and a repulsive physiognomy. They walk or run easily on the ground, and climb trees with agility. They are exceedingly strong, cunning, and mischievous. Troops of these animals sometimes enter a plantation for plunder, and destroy much besides what they eat and carry away in their cheek-pouches. They are chiefly found on the continent of Africa, and feed mostly on fruits

and vegetables. The group is divisible into two genera—the baboons proper (*Cynocephalus*), which have long tails, and the mandrills (*Mormon*), which have very short tails. As examples of baboons of the first genus may be mentioned

The baboon mother and her infant.

the chacma, or pig-faced baboon (*Cynocephalus porcarius*), a native of South Africa, one of the largest of the baboons, and about the size of a mastiff; and the dog-faced baboon (*Cynocephalus hamadryas*), which is a native of Arabia and Abyssinia. The latter species is often sculptured on the ancient monuments of Egypt, and it is supposed to have been the "Thoth" baboon to which divine honors were paid. It was frequently embalmed, and the mummies are still found. The mandrill, or rib-nosed baboon (*C. mormon*), a native of Guinea, is the largest, ugliest, and fiercest of the whole group. Its muzzle is marked with blue and scarlet ribs. Numerous other species are known, the most familiar being *Cynocephalus babuin* of Northeastern Africa.

Revised by D. S. JORDAN.

Babrius (in Gr. *Βάβριος*): a famous Greek fabulist; a Syrian by birth; of uncertain period. The estimates are no less than five hundred years apart; but it is safer to put him in the early centuries A. D. Babrius drew his material mainly from the old stock of fables, and his great charm lies in his careful handling of the choliambic meter in which his fables are composed and in the popular character of his style. The poems of Babrius lay hidden for ages under a prose paraphrase. The poetic form was detected by Tyrwhitt in 1776; 123 of the poems were discovered at Mt. Athos by Minoïdes Minas in 1843, and first edited by Boissonade in 1844. A valuable edition, with notes by W. G. Rutherford (London, 1883). There is an English translation by James Davies (London, 1860). B. L. GILDERSLEEVE.

Babur, MOHAMMED: See **BABER**.

Babuyan', or Five Islands: the northern end of the Philippine Archipelago, forming a kind of circular chain fronting the north coast of Luzon, consisting of Fuga, Dalupiri, Calayan, Babuyan Claro, and Camiguin. They are volcanic, and furnish a supply of sulphur. Babuyan Claro (i. e. bright Babuyan) has been all but abandoned on account of volcanic eruptions. While under Spanish rule they formed the department of Cayan. Area of the group, 175 sq. miles. Pop. about 7,000.

Baby, LOUIS FRANÇOIS GEORGES: Canadian jurist; b. in Montreal, Aug. 26, 1834; educated at St. Sulpice College, Montreal, and at the College of Joliette; admitted to the bar of Lower Canada in 1857; represented Joliette in the Dominion Parliament 1872-80; became Minister of Inland Revenue Oct. 26, 1878; judge of the Superior Court of the

Province of Quebec 1880, and a judge of the Court of Queen's Bench April, 1881. He was a founder of the Historical Society of Montreal; has been several times mayor of Joliette; and was appointed an advocate of the papal see in 1888. Pope Leo XIII. conferred on him the title of Knight Grand Cross of the Order of St. Gregory the Great.

NEIL MACDONALD.

Bab'ylas, SAINT: Bishop of Antioch from 237 to 250 A. D., when he suffered martyrdom. He is noted for his holy courage in compelling the Emperor Philip to undergo public penance at Antioch for his part in the murder of his predecessor, the Emperor Gordianus. The body of the saint was buried first in Antioch; transferred in 351 to Daphne, a suburb, by Gallus Cæsar, who built a church over his relics, with the object of checking the licentiousness for which the groves of Daphne were notorious. There was a temple of Apollo hard by, but the oracle of the heathen god was silenced by the relics of the Christian saint. In 362 the pagan Emperor Julian visited Antioch. He learned of the troubles of Apollo from the god himself, and therefore ordered the relics to be removed, which was done amid a great outburst of Christian zeal. They were transferred to a church in Antioch. But that very night the temple of Apollo was struck by lightning, the roof was burnt, and the famous image of Apollo himself destroyed. Julian, in rage, punished the pagan priests, and shut up the great Christian church of Antioch. Shortly after the relics were removed to the church built to receive them on the other side of the Orontes. See the *Homily on S. Babylas* by Chrysostom, delivered in 387. (Eng. trans. in *Nicene and Post-Nicene Fathers*, New York, Christian Literature Company, vol. ix., 141-43.) During the crusades the relics were taken to Cremona, Italy. His day in the Latin Church is Jan. 24; in the Greek Church Sept. 4. See Butler, *Lives of the Saints*, sub Jan. 24.

SAMUEL MACAULEY JACKSON.

Bab'ylon: an ancient powerful city situated on the Euphrates river, about 60 miles south of the present Bagdad. It was for many centuries the most important center of civilization in Western Asia. The native Semitic form of the name *Bābīlu*, i. e. gate of God, is the translation of an older non-Semitic name, *Ka-dingir*, *Ka* meaning gate and *dingir* God. There were various other names, one of which, *Tintir*, means grove of life. Such names arise from the sacred character of the city as the home of the gods. Regarding the earliest history of the city we are not informed. It is likely that many other cities in the valley are older, and it seems that they attained to importance before Babylon. It was about 2300 B. C. that Babylon became the chief city, through the successful wars waged by its king, Hammurabi, against his neighbors. The political supremacy thus attained by Babylon resulted also in religious supremacy, and Marduk, the god of the city, became the national god. After Hammurabi's time we are instructed regarding the successive dynasties ruling at Babylon, but of many of the kings we have little more than the names and the length of the reigns. In the sixteenth century B. C. fall the wars with Assyria and the correspondence with Egypt, already mentioned in the article on ASSYRIAN EXPLORATION. Several of these letters were from Burnaburiash, King of Babylon, about 1550 B. C. After this time Babylonian political history is largely involved in that of Assyria, and much of what we know on the subject comes from Assyrian sources. The state archives of Babylon have not yet been found, and though we have numerous records from the later kings, these are mainly devoted to architecture and religion.

The early records of the city have doubtless perished in war. When Sennacherib, about 690 B. C., sacked and demolished it, he states that he cast even the débris into canals and pits, and made the very site unrecognizable. There is likewise a tradition that Nabonassar, King of Babylon, 747-733 B. C., destroyed all the records he could find of former kings, in order that subsequent history might date from his reign, but such an act is highly improbable.

The Babylonians were much less given to wars of conquest than their northern neighbors. During the time of the Assyrian foreign wars Babylon was often subject to Assyria. The brutal policy of Sennacherib, involving the city in the catastrophe just mentioned, was reversed by his son, Esarhaddon, who early in his reign rebuilt Babylon. During the reign of Assurbanipal at Nineveh, a brother of this monarch was for twenty years on the Babylonian throne, 668-648, after which the city was again made more directly subject to Assyria. In the declining years of Nine-

veh, Babylon was regaining something of her former greatness. Nabopolassar, 624-604, began those great restorations and new buildings for which the city became famous. With the fall of Nineveh, about 606, Babylon again acquired political significance. Nabopolassar's great son Nebuchadnezzar, 604-562, was both warrior and architect. His inscriptions have been found in large numbers, but, while he applies to himself military titles, we have not yet the native records of his wars. From the biblical books of Kings and Chronicles, and from the contemporary prophets Jeremiah and Ezekiel, we have accounts of his Syrian wars, resulting in a capture of Jerusalem in 597 B. C., and of a second capture and demolition in 586, both of which captures were attended with deportation of Hebrews to Babylon. The writings of Nebuchadnezzar give numerous details regarding his buildings, especially of the palace at Babylon, and of the temple of Marduk in that city, and of the temple of Nabu in Borsippa. The succeeding native kings are of little consequence till we come to Nabonidus, 555-538 B. C. This monarch likewise was a great builder and antiquarian, but not a warrior. For some reason he became distasteful to his subjects. His son Belshazzar, though not king, was active in public affairs, and took a leading part in defending Babylon against the invasions of the Persians. But in 538 B. C. the city fell into the hands of Cyrus, and thus lost forever its independence. Its subsequent political history is Persian and Greek, and our information regarding it comes from foreign sources. Cyrus and his successors resided at Babylon during a part of the year, and the city was one of the capitals of the Persian empire. Both Persian and Greek kings continued to care for its temples, and the old culture lived on as before. But the loss of independence, the presence of foreign rulers, the rise of other cities in the vicinity, built in part from the materials removed from Babylon, led to the gradual decay of the city until it became a place of utter desolation. In the time of Nebuchadnezzar the city was surrounded by a double wall and moats. Herodotus and other Greek and Roman writers give accounts of its great extent and magnificence, its principal temple and its hanging gardens being two of the seven wonders of the world. See C. J. Rich's *Memoir on the Ruins of Babylon* (London, 1818); Sir R. K. Porter's *Travels* (2 vols., 1821-22); Friedrich Delitzsch's *Wo lag das Paradies?* (Leipzig, 1881); George Rawlinson's *Herodotus*; and the works referred to under ASSYRIA.

D. G. LYON.

Babylon: town and popular watering-place; Suffolk co., Long Island, N. Y. (for location of county, see map of New York, ref. 8-K); on the Great South Bay, and the Long Island Railroad; 33 miles E. of Brooklyn. It is connected with Fire island by steam ferry, and is famed for the salubrity of its climate, and much frequented as a summer resort. The township of Babylon was formed in 1872 from the south part of Huntington township. Pop. (1880) 4,739; (1890) 6,035; (1900) village, 2,157.

Babylonia: the territory through which the Tigris and Euphrates rivers flow, extending from about Bagdad to the Persian Gulf. This district has been won from the sea by the deposits of the two rivers. It is accordingly an alluvial plain, much of which is covered by water at the time of the annual overflow of the rivers (Tigris, March-June; Euphrates, March-September). The rate of encroachment on the sea is estimated to be about a mile in seventy years, but is believed to have been much more rapid in ancient times. Prof. George Rawlinson reckons the gain in the past 4,000 years to be a region 130 miles long by 60 or 70 miles broad. This great gain is explained by the lowness of the plain, the swiftness of the rivers, and the shallowness of the gulf. The Babylonia of history was perhaps not much larger than the State of South Carolina. This plain is bounded on the E. by the mountains of Elam, and on the W. by the Arabian desert. Owing to lack of irrigation it is being gradually invaded by the desert, and the sand moves at times in storms of great intensity. Formerly there was an extensive system of canals, the old beds of which intersect the plain in all directions. These canals were both for commerce and for irrigation, and on their banks stood some of the largest cities. Changes of government and of population, misrule and extortion, have led to neglect of these waterways, so that the region, which was once a paradise of productiveness, is now, during a portion of the year, covered with marshes and lakes, and during the remainder is a desolate waste. The heat of the summer is intense, while the exhalations from the marshes in summer and autumn fill the air with pestilence and fever.

The inhospitality of the climate, together with the lack of money and the difficulty of obtaining firmans from the Turkish Government, has allowed but little exhaustive digging in the artificial mounds which are so numerous in the plain, and which mark the sites of the ancient cities.

Babylonia is one of the first centers at which men reached a high state of culture. Whether the beginnings of this culture antedate that of Egypt is impossible to decide. It is also unknown whence the first occupants of the land came, but there are strong grounds for believing that the first settlements were at or near the upper end of the Persian Gulf. These first settlers were perhaps the inventors of the cuneiform system of writing, a system destined to have such a long history in Western Asia, and to which we now owe most of our information regarding Babylonia. To judge from the language and the physiognomy (discoveries by E. de Sarzec at Telloh), the first-comers were of non-Semitic stock. As early as 4000 B. C., or earlier, the land was invaded by Semites. These may have been rude inhabitants of the Arabian peninsula who were attracted by the easier life in Babylonia. For many generations the two populations lived together, the newer borrowing much of its culture from the older, but also robbing it by degrees of its political significance. This early occupation of Babylonia by Semites is only one wave of a succession of invasions by the people of this race. Similar invasions are the one by the Aramæans, the one by the Mohammedan conquerors, and the one by the Bedouin tribes of to-day. In ancient times the population had still other elements. There were the *Kaldi*, or Chaldæans, who may likewise have been Semites, the *Kasshi*, or Kassites, the Elamites, and in the period of foreign wars hosts of captives brought in as well by Kings of Assyria as by those of Babylon.

The history of Babylonia after the time of Hammurabi, about 2300 B. C., is intimately connected with that of the city of Babylon. Of the centuries preceding this time our information is scant, and comes mainly from the very brief inscriptions of certain of the earlier kings, and from references in the writings of kings of later date. Successively or contemporaneously small kingdoms arose, with capitals at Ur, Nisin, Nipur (Niffer), Uruk (Erech, Warka), Larsa, and other points. At times several of these smaller kingdoms were united under a single scepter.

The oldest definite date takes us to North Babylonia, to the time of Sargon I. and his son Naram-Sin. On the authority of Nabu-na'id, the last native King of Babylon (B. C. 555-538), these two rulers belong to the first half of the thirty-eighth century B. C. Nabu-na'id relates that, while he was restoring the temple of the sun-god at Sippar, he found a record deposited in the foundation by Naram-Sin 3200 years before the discovery. Inscriptions have reached us from both of these ancient kings. Sargon is called the King of Agade (which is the twin city of Sippar), and it seems certain that he erected buildings at Agade, Babylon, and Nipur. A late Assyrian scribe has preserved a record in which Sargon speaks in the first person, telling how he was born in secret, exposed as an infant in a basket of rushes on the river, rescued and reared by a shepherd, chosen leader of a band in the mountains, and afterward crowned as king. Another inscription records that his conquests reached the Mediterranean. The British Museum owns an egg-shaped marble object with an inscription of Sargon written in nine lines of very archaic script and reading: "Sargon the king, King of Agade. To the Sun-god in Sippar I have dedicated." One of the finest carved seals ever found bears the name of Sargon, and has eight lines of archaic writing. From the son, Naram-Sin, there is likewise an inscription in eight archaic lines. The diggings by the party from Philadelphia (1888-90), led by Dr. J. P. Peters, in the ruins of Niffer, brought to light various objects from Sargon and Naram-Sin. These rulers seem to have been Semites.

Not much later perhaps were the rulers who resided at the city represented by the modern ruins called Telloh (Shirpurla, in the inscriptions), in Southern Babylonia, where De Sarzec found (1878-82) a large quantity of the most archaic material, including about a dozen statues. According to the researches of M. Amiaud, four or five of these rulers call themselves king, while the remaining nine style themselves by the lower title *patesi*. The inscriptions of the kings have a more archaic appearance, and one may hence place them earlier than those of the *patesis*. If this be correct, the explanation is probably that, after a period of independence, the city had become tributary to some other power, as that of Ur. We know that one of the *patesis* was contemporary

and apparently subject to the great King Dungi of Ur, and that this Dungi also erected temples for the gods of Shirpurla. At the same time, one of the *patesis*, Gudea by name, if tributary, was still a ruler of great power and magnificence. From him come eight of the remarkable statues from Telloh, two large clay cylinders covered with writing, and hundreds of smaller tablets and fragments. Gudea waged successful war with Elam, and had commercial relations with distant regions, as the Persian Gulf, the Sinaitic peninsula, and apparently Egypt. The inscriptions of these rulers are chiefly accounts of the erection of temples.

The next strong government in Babylonia seems to have had its center at Ur, the biblical Ur of the Chaldees, the modern ruins Mugheir. Inscriptions from the kings of this dynasty have been found at Mugheir, Warka, Senkereh, Niffer, Telloh, and Abu-Shahreim. Such wide dispersion indicates that the rule extended over a considerable part of Babylonia. The two chief rulers were Dungi and his father, whose name is read variously as Urbagas, Urbau, Urgur, etc. These kings style themselves not only "King of Ur," but also King of Sumer and Akkad. These terms are commonly held to be synonyms of South Babylonia and North Babylonia, but Dr. H. Winckler has shown that at this early time they designated two portions of South Babylonia, the union of which under one rule makes the first important kingdom in Babylonia. Dungi seems also to have held rule over a portion of North Babylonia. In Cutha, near Babylon, he built a temple to the god Nergal. He likewise calls himself king of the four regions. This term is commonly supposed to mean king of all the world, but Dr. Winckler sees in it a designation for North Babylonia, corresponding to Sumer and Akkad for South Babylonia.

Unknown conditions led to a shifting of the seat of power to other Babylonian cities, followed, however, by a second period of supremacy at Ur. The rulers of the new dynasty call themselves not only kings of Ur, but also kings of the four regions. This dynasty was displaced by an invasion from Elam, led by Rim-Sin, son of Kudur-Mabuk. Rim-Sin was devoted to the worship of the Babylonian gods, and has left records of temple constructions. The invader, however, was not to found a dynasty. A power was rising at Babylon which was to put an end to the existing order and to make that city ever after the first in the land. Its ruler, Hammurabi, repulsed Rim-Sin, and united all of Babylonia under himself. Henceforth the great cities of the south were to have religious significance, but their political power passed over to Babylon. From this time the history of Babylonia and that of Babylon are inseparably connected.

For the Babylonian chronology after this time we have most valuable information in the so-called *Dynastic Tablets*. (See translation in the *Records of the Past*, new series, vol. i.) These tablets give us the succession of dynasties ruling at Babylon, beginning with the one to which Hammurabi belonged and extending to the death of Asshurbanipal, 626 B. C. There are, unfortunately, some serious lacunæ. In their unbroken condition the tablets gave the names of the successive dynasties, the length of their continuance, and the names of the respective kings. Hammurabi is the sixth king of the "Dynasty of Babylon." He began his rule about 2300 B. C., and reigned for fifty-five years. The dynasty, embracing eleven kings, began about 2400 B. C., and continued for 305 years. From the second king of the dynasty to the eleventh, the succession passed regularly from father to son, and the average length of the reigns was twenty-eight years—facts which indicate tranquility or executive ability. From Hammurabi we have many inscriptions recording his victories, his buildings, and his digging of canals. There are also many commercial records from his time, as well as from the reign of his son Samsu-iluna and other kings of the dynasty. Some of these documents contain in their dates valuable historical allusions.

The summary of these dynasties is as follows:

NAME.	No. of years.	No. of kings.	Approximate dates, B. C.
1. Babylonian	305	11	2422-2117
2. Uru-azagga	368	11	2117-1749
3. Kassite	576½	36	1749-1172
4. Pashe	72½	11	1172-1100
5. Seacoast	21½	3	1100-1078
6. Bit-[Bazi]	20½	3	1078-1058
7.	6	1	1058-1052
8.	290	17 (?)	1052-762
9. Babylonian	31	5 (?)	762-731
10.	105½	16 +	731-626

Dynasty nine really includes various dynasties of brief duration. The first name in this dynasty is Ukin-zir, who was defeated and succeeded, in 729 B. C., by Pul, the biblical Pul or Tiglathpileser (King of Assyria 745-727 B. C.). On the dynastic tablets the names, or portions of the names, of seventy-seven of the kings of Babylon are preserved. Before the tablets were injured they must have contained at least one hundred names.

The *Kasshi*, or Kassites, who furnished many of the kings of the third of these dynasties, were a warlike people, living to the east of Babylon, in the mountainous borders of Elam. Having once gained possession of the Babylonian territory, they played an important rôle for nearly six centuries. Our information concerning the character of this period comes from Assyria and Egypt. The fragments of the so-called synchronous history of Assyria and Babylon give brief accounts of the quarrels between the two countries at this time. There were frequent invasions and counter invasions, the differences being at times settled by intermarriage of the two royal houses. Some of these Kassite Kings of Babylon lived also on friendly terms with the kings of Egypt, and were among those who, in the sixteenth century B. C., sent presents and letters to the Pharaohs.

Of the succeeding dynasties at Babylon we know but little. The history becomes intimately involved with that of Assyria. The armies from Nineveh frequently overrun the country, and most of the rulers named in the tenth dynasty are either kings of Assyria or their appointees. During this time, however, there were two other powers contending for the throne of Babylon, the Elamites and the Chaldeans. The Elamites had been from time immemorial enemies both of Babylon and of Assyria. But in the times when their own country was overrun by Assyrians, they joined their forces to those of Babylon or to those of Chaldæa in order to resist the power from Nineveh. The so-called *Babylonian Chronicle* gives the account of the relations of the three countries, Babylon, Assyria, and Elam, from 745 to 668 B. C.

For the correct understanding of the later history of Babylonia it is important to know who the *Chaldæans* were. The confusion of the name Babylonian and Chaldæan has led to much obscurity. The credit of having cleared up this obscurity by a close study of the data in the cuneiform inscriptions belongs to A. Delattre and H. Winckler. Chaldæa proper was a district in South Babylonia on the Persian Gulf, and its inhabitants were the Chaldæans. Whence and when they came is unknown, but they were perhaps of Semitic stock. The fifth of the Babylonian dynasties, called the dynasty from the seacoast, was probably Chaldæan. Even as early as the time of the Kassite dynasty the Chaldæan kingdom may have existed as a tributary power. However this may be, when the period of Assyrian conquest begins, after 900 B. C., we find that the invaders march past Babylon to the subjection of the Chaldæans. There were even times when the Chaldæans disputed with Assyria the possession of Babylon. Such was the case when the Chaldæan Mero-dachbaladan contended with varying fortune against Sargon and Sennacherib. Some of the fiercest fighting about Babylon was with these Chaldæans, who spread themselves over the country, dispossessing the people of Babylon of their lands, and even carrying the people into captivity to Chaldæa. When Sargon overran Chaldæa he released these captives from prison, and his grandson Esarhaddon restored to the people of Babylon and Borsippa the lands of which they had been robbed by the Chaldæans. The people of Chaldæa were more warlike than the natives of Babylon. When the Assyrian power began to wane toward the end of the seventh century B. C., the Chaldæans again became masters. Nabopolassar may have recognized in a manner the superiority of Assyria. His son Nebuchadrezzar succeeded him, and Chaldæa now became supreme. This great prince so identified his interests with those of Babylon that he raised the city to a degree of splendor and power which it had never known before. It is the Babylon of this great builder which is pictured in glowing language by Daniel and Herodotus. The name Chaldæa now came to be applied to all of Babylonia, and Babylonian and Chaldæan became synonymous terms. There were extensive foreign wars, the real Chaldæans doubtless forming the more important portion of the army. This is the army to which the powers of Judah submitted, and by which they were led into exile. (For further details of the political history, see article BABYLON.) In still later times, when the government of Babylon had passed away from the Semites, the Chaldæans became

famous for their wisdom. They were no longer regarded as a people, but as a class or caste.

See G. Rawlinson's *Ancient Monarchies* (London, 1862-67); Fr. Delitzsch's *Wo lag das Paradies?* (Leipzig, 1881); Layard's *Nineveh and Babylon*; E. De Sarzec's *Découvertes en Chaldée*; H. Winckler's *Untersuchungen zur Altorientalischen Geschichte* (Leipzig, 1889); A. Delattre's *Les Chaldéens* (Louvain, 1889); C. P. Tiele's *Babylonisch-Assyrische Geschichte* (Gotha, 1886-88); *Records of the Past* (new series, vols i. and ii.).

D. G. LYON.

Babyrous'sa, or **Babirussa**: an animal (*Babyroussa alfurus*) allied to the hog; found only in the islands of Celebes and Buru. It is remarkable for the long tusks of the upper jaw, which are curved backward and resemble horns. Its legs are more slender than those of the hog.

Babyroussa.

Baccarat, bāk'ka-raa' [Fr.]: game of cards, of French or Italian origin, played with one or more packs of cards, any number of betters, and a banker. Each better plays a

stake which the banker duplicates, after which two cards are dealt by the latter to each player, including himself. The face cards count ten and the others according to the spots. The aim is to make the value of the player's card foot up the total of 9, 19, 29, or as nearly so as possible. The player may call for more cards at the risk of exceeding 29, in which case his stake is forfeited. If a player has 9, 19, or 29 he declares it, and the banker pays all hands superior to his own their bets and takes the stakes of the inferior hands. In America face cards and tens do not count. C. H. T.

Bacchana'lia (called by the Greeks *Dionysia*): the feasts and orgies of the votaries of Bacchus among the ancient Greeks and Romans. On account of the licentious practices and drunkenness which prevailed on these occasions, they were prohibited by the Roman Senate in 186 B. C. In modern language the term is applied to wild revels and intemperate feasts. Theatrical representations originated in Greece from these feasts. See DIONYSIA.

Bacchan'tes [from pres. partic. of Lat. *baccha'ri*, celebrate with frenzy, based on Gr. *βάκχην*, a Bacchant]: those, whether male or female, who joined in the orgies of Bacchus among the ancient Greeks and Romans. Their conduct was very disorderly. They danced, swung the thyrsus about, and made a great noise. According to an ancient poetical legend, Orpheus was torn to pieces by some female Bacchantes.

Bac'chus [Lat., from Gr. *Βάκχος*]: the god of wine (called also *Dionysus* by the Greeks, and sometimes *Liber* by the Romans). He was said to be the son of Jupiter and Semele, or, according to one tradition, of Ammon, King of Libya, and Amalthea. He taught men the culture of the vine, and first produced from grapes an intoxicating drink. His worship was spread over many countries of the world, and the myth of Bacchus was variously modified by different peoples. Bacchus is usually represented as an effeminate young man, crowned with vine or ivy leaves, with a *thyrsus* (a stick with a pine cone at the end) in his hand. His votaries carried sticks or staves called *thyrsi* (sing. *thyrsus*), which were bound with leaves of the ivy and vine. He is said to have performed a successful expedition to India. The Greek festivals in honor of Bacchus were called *Dionysia*. See BACCHANALIA and BACCHANTES.

Bacchyl'ides (in Gr. *Βακχυλίδης*): one of the nine canonical Greek lyric poets, about 470 B. C.; was a nephew of Simonides of Ceos, and, according to tradition, joint rival with him of Pindar. The peer of his uncle in elegance of composition and softness of tone, he was not his equal in range or power. Of the few fragments that remain famous is the one on *Peace*. See Bergk's *Poetae Lyrici Graeci*.

B. L. G.

Bach, baach: the name of a celebrated German family which for upward of two centuries was noted for great musical talent and produced more than fifty distinguished artists.—VEIT BACH, the founder of the family, was a native of Presburg in Hungary, and emigrated to Thuringia about 1600. Besides the great JOHANN SEBASTIAN (1685-1750), other eminent members of the family were JOHANN CHRISTIAN, called the "Milanese Bach" (1735-82); JOHANN CHRISTOPH (1642-1703), with his sons JOHANN CHRISTOPH and Jo-

HANN NIKOLAUS; also KARL PHILIPP EMANUEL (1714-88), and WILHELM FRIEDEMANN (1710-84).

Bach, JOHANN SEBASTIAN: youngest son of Johann Ambrosius, court-musician of Eisenach; b. there Mar. 21, 1685; the most distinguished of the remarkable family of BACH, and one of the great musicians of the world. A North German and a Protestant, he was a patriarch and founder of German music, and has been not inaptly termed the Albert Dürer of his art. An extraordinary talent, united with enthusiasm and tireless industry, made his whole long life, from childhood on, a career of acquisition and greatness. Early throwing aside the traditions of the Italian school, he penetrated by severe study the secrets of musical science, sought the boldest masters, and pursued the most rigorous methods. Music in every style interested him—instruments of all kinds, but the organ was his great delight. He walked miles, as a boy, to hear a master's performance on that instrument. Such ability and enthusiasm were recognized from the first. Bach was spared the struggle with poverty, and rapidly, by his own efforts, rose to eminence. He had, till his voice became manly, sung treble in a choir at Lüneburg; at eighteen he was a violinist at the court of Weimar; at twenty he filled the place of organist at Arnstadt; at twenty-one he was at Mühlhausen; at twenty-two he was at Weimar again as court-organist; seven years later he resigned that most honorable position for that of concert-master to the duke, an office demanding high capacity, imposing varied responsibilities, and offering rich opportunity for study and practice in composition. His industry at this period was marvelous. Here, however, his stay was short. In 1723—in the meantime he had passed six years as chapel-master to the court at Köthen, capital of the duchy of Anhalt-Köthen—the city authorities of Leipzig chose him to the place of musical director of the St. Thomas School; he was thirty-eight years old. Here for the rest of his life, twenty-seven years, he lived, honored and happy, in the bosom of a large family, for he had ten sons, all musicians—beloved by numerous pupils, and occupied with the art he had done so much to create. D. at Leipzig, July 28, 1750.

Bach's compositions were numerous, original, and in many styles. He wrote for voice and instrument—for orchestra, organ, pianoforte, instruments of wood and metal, himself being a performer on them all. He wrote for sacred occasions masses, oratorios, concerted pieces of every kind; his preludes, fugues, cantatas are famous; but his stately genius unbent at festive occasions, births, and weddings; and even comedy was not out of his range. In nearly every field of his art he was a discoverer—in some he was a prophet of future discoveries. The fame of Bach has been increasing since his death. For generations to come they who would study the difficult science of music will go to him, as students of literature or painting go to the grand masters. There are statues of him at Leipzig (1842) and Eisenach (1884). See his biography by Spitta (Leipzig, 1873-80, 2 vols).

Bache, bayeh, ALEXANDER DALLAS, LL. D.: a distinguished educator and scientist; b. in Philadelphia, July 19, 1806; great-grandson of Benjamin Franklin; received his higher education at the U. S. Military Academy, where he graduated in 1825 at the head of his class. After serving there as assistant professor for one year, and on military engineering duty for two more, he was called to the chair of Natural Philosophy and Chemistry in the University of Pennsylvania, which position he filled with great success for eight years, during which he was also constantly engaged upon scientific researches in physics and chemistry, and as member of the Franklin Institute conducted important experiments on steam-boiler explosions and kindred matters. In 1836 he was appointed president of Girard College, then about to be organized, and went to Europe to study the systems of education and methods of instruction and discipline adopted there. His report on education in Europe (1839), embodying the results of his studies, has done very much to improve the theory and art of education in America. The Girard College not being ready to go into operation, Bache undertook the organization of the school-system of Philadelphia; after accomplishing which he resumed his old chair at the university. He established at Girard College, and during five years directed, a magnetical and meteorological observatory, supported by the American Philosophical Society, of which he was a member. The results of these observations, which were made in correspondence with other observations in different countries, have

largely added to our knowledge of terrestrial magnetism. In 1843 he was appointed superintendent of the U. S. Coast Survey, which important position he filled to the end of his life, displaying the highest administrative ability, combined with all the scientific knowledge requisite for the successful prosecution of that important work. By the confidence with which he inspired the Government he was enabled largely to increase the scale of expenditure for the survey, resulting in a still greater ratio of progress. He omitted no opportunity of securing for science the collateral results that could be gathered during the prosecution of the work; he organized a systematic exploration of the Gulf Stream, an extended series of tidal observations, of the magnetism of the earth, of the direction of the winds; and instituted researches in regard to the bottom of the ocean within soundings, and to the forms of animal life existing there. His annual reports to Congress are a monument, not only of his administration, but also of his personal investigations in regard to the subjects named, and many others connected with the improvement of methods of geodesy. In addition to the direction of the coast survey, Prof. Bache had, *ex officio*, charge of the construction of standard weights and measures for the U. S., and was a member of the lighthouse board. As a regent of the Smithsonian Institution from 1846 to the end of his life, he had a large share in shaping its operations. During the civil war he was active as a member of the Sanitary Commission, and in directing the resources of the coast survey to the assistance of the naval and military forces. When, in 1863, the National Academy of Sciences was organized by Congress, Prof. Bache, as the acknowledged leader of science in the country, was elected its president; nor were his distinguished services to science less acknowledged abroad, as was evinced by his election to membership of the most prominent scientific bodies of Europe. Prof. Bache married Miss Naney Clarke Fowler, of Newport, but had no issue. He left his property in trust to the National Academy of Sciences, the income to be devoted to researches in physical science. D. at Newport, R. I., after a lingering illness, Feb. 17, 1867.

Bache, FRANKLIN, M. D.: son of Benjamin Franklin Bache; b. in Philadelphia, Oct. 25, 1792. He graduated at the University of Pennsylvania in 1810. He published a *System of Chemistry for the Use of Students of Medicine* (1819); became Professor of Chemistry in the Philadelphia College of Pharmacy in 1831, and obtained the same chair at the Jefferson Medical College in 1841. He was one of the authors of Wood and Bache's *Dispensatory of the United States*, an acknowledged standard of authority. D. in Philadelphia, Mar. 19, 1864.

Bache, GEORGE M.: commander, U. S. N.; b. in the District of Columbia, Nov. 12, 1840; graduated at the Naval Academy in 1860; became a lieutenant in 1862. He commanded the ironclad *Cincinnati* during her various engagements on the Mississippi river, and until she was sunk by the Vicksburg batteries, May 27, 1863. His conduct in this last affair elicited the admiration of Admiral Porter and Gen. Sherman; and the Secretary of the Navy, Gideon Welles, in his "letter of thanks to Lieut.-Commander Bache," says: "Amidst an incessant fire of shot and shell, even when the fate of the vessel had been sealed, and destruction both from the elements and the enemy was threatened, the officers and men appear to have stood bravely at their posts; and it is a proud record of the *Cincinnati* that when her last moments came she went down with the colors nailed to the mast. It is with no ordinary pleasure that I express to you, and to the surviving officers and crew of the *Cincinnati*, the department's appreciation of your brave conduct." He was in command of a little squadron of three vessels, the *Tyler*, the *Naumkeag*, and *Fawn*, in the very spirited action of June 24, 1864, at Clarendon, Ark., where in forty-five minutes he drove the enemy from their battery of seven guns, capturing guns, ammunition, and stores. He was in both attacks on Fort Fisher, and led the men of the *Powhatan* in the naval assault on the fort Jan. 15, 1865, where he was wounded in the right shoulder. Referring to this assault, Rear-Admiral Porter, in his dispatch of Jan. 28, 1865, says: "Nowhere in the annals of war have officers and sailors undertaken so desperate a service. The names of some of these officers will be found on record on the files of the department, among which that of Lieut. George M. Bache will be found most conspicuous." Retired Apr. 5, 1875.

Bache, HARTMAN: soldier; great-grandson of Dr. Franklin; b. in Philadelphia, Pa., Sept. 3, 1798; graduated at West Point in 1818; colonel of engineers Mar. 3, 1863; served chiefly as topographical engineer on surveys for coast defense, naval depôts, harbor and river improvements, roads, and canals, and for lighthouse sites 1818-47, in constructing Brandywine screw-pile lighthouse and ice harbor, Del., 1848-51, on engineer boards 1852-55, as lighthouse engineer 1852-70, in charge of military roads on Pacific coast 1855-58, in topographical bureau, Washington, D. C., 1861-62, in charge 1861, and member of lighthouse board 1862-70. Became brevet brigadier-general U. S. A. Mar. 13, 1865, for long, faithful, and meritorious services, and retired from active service May 7, 1867. D. in Philadelphia, Pa., Oct. 8, 1872.

Bache, WALTER: a pianist of extraordinary merit, and devoted to the compositions of Liszt; b. in Birmingham, England, June 19, 1842; studied first at home, but in 1858 went to Leipzig and studied under Plaidy, Moscheles, Hauptmann, and Richter; then he went to Rome and for three years received lessons from Liszt, returning to London in 1865. From that time till his death on Mar. 26, 1888, he was an unflinching advocate of Liszt's music, bringing it forward on all occasions. He gave many concerts of Liszt's compositions at a personal pecuniary loss, but before he died had the satisfaction of seeing a change in the public appreciation of his beloved master, and he was instrumental in establishing a Liszt scholarship at the Royal Academy of Music, where he was one of the piano teachers. He composed little or nothing, his fame resting entirely upon his piano playing and his teaching. D. E. HERVEY.

Bachelor's-but'tons: the double-flowered forms of one of the buttercups (*Ranunculus acris*).

Bachelor of Music: See DOCTOR OF MUSIC.

Bachkirtsev, MARIE: See BASHKIRTSEFF, MARIE.

Bachman, bāk'man, JOHN, D. D., LL. D.: naturalist; b. in Dutchess co., N. Y., Feb. 4, 1790. He was pastor of a Lutheran church at Charleston, S. C. (1815 to death). He contributed to Audubon's great work on ornithology, and wrote the principal part of the work on the quadrupeds of North America, which was illustrated by Audubon and his sons. Among his other works is *Characteristics of Genera and Species as Applicable to the Doctrine of the Unity of the Human Race* (1854). D. in Charleston, S. C., Feb. 25, 1874.

Bacillaria'ceæ: See DIATOMS.

Bacil'lus: See BACTERIA.

Backergunge, baa-ker-gūnj', or Bakarganj': a district of the Dacca division, Bengal, India. Area, 3,649 sq. miles. Pop. about 2,000,000. It lies in the delta formation at the apex of the Bay of Bengal, to the W. of the Bramaputra, here called the Megna, river. It is a flat, even country, without a hillock, intersected by a perfect network of dark-colored, sluggish streams, and dotted with clusters of bamboos and betel-nut trees. It is always green and fresh; aquatic plants grow in the greatest luxuriance and profusion. Travel is almost impossible except by boat. Toward the N. W. the country is so marshy as to be still for the most part unreclaimed. Along the sea-face lie the forest tracts of Sundarbans, the home of tigers, leopards, and other wild beasts. The streams are all subject to tidal action. A very strong bore runs up the Megna at spring tides, giving rise to a singular sound like thunder, known as the "Barisal guns," often heard far out to sea. Two-thirds of the inhabitants are Mohammedans, here of a very low type. A gipsy-like tribe, called the Bebjias, are rather numerous. They live in boats, travel from place to place, profess Mohammedanism, and make a living by wood-cutting, fishing, fortune-telling, and trading in trinkets. The towns are all small. Barisal, the largest, containing about 8,000 inhabitants. Rice is the great crop, and three harvests are obtained annually. Other crops are mustard, rape, linseed, jute, sugar-cane, and betel-nut. The rainfall is heavy and the water bad, but the district is one of the healthiest of Eastern Bengal, because fully exposed to the strong S. W. monsoon. The thermometer ranges from 62° to 98°, with a mean annual temperature of 78° to 85°. Cholera is always present, and smallpox is occasionally epidemic.

MARK W. HARRINGTON.

Back'gammon [-gammon is from M. Eng. *gamen*, game; the element *back-* is of doubtful origin]: a game of com-

bined skill and chance, played upon a peculiar board or table with men and with dice. The men are of two colors, and the table is divided into two compartments, each with two sets of points, of which there are twenty-four in all. Upon these points the men are placed in playing, and their movements are determined by throws of the dice alternately made by each player; but the rules of the game are such that much skill may be exercised in executing the movements of the men as indicated by the dice. The object of the game is for the player to bring his own men into his own inner table, and to prevent his adversary from doing the same. There are several games of backgammon, for which the rules are given in *Hoyle's Games*. Backgammon is a very ancient recreation, and is by many authorities said to have originated in England, or perhaps in ancient Britain.

Backhuysen: See BAKHUYSEN.

Back'us, AZEL, D. D.: nephew of Charles Backus; b. at Norwich, Conn., Oct. 13, 1765; graduated at Yale 1787; in 1791 succeeded Dr. Bellamy as pastor of the Congregational church in Bethlehem, Conn.; in 1812 was chosen first president of Hamilton College, Clinton, N. Y., and died in that place Dec. 9, 1817. He took great interest in political questions, was an eloquent preacher, and a successful teacher and disciplinarian. He published only a few sermons.

Backus, CHARLES, D. D.: b. at Norwich, Conn., Nov. 5, 1749; graduated at Yale 1769; was settled over the Congregational church in Somers, Conn., in 1774, and died there Dec. 30, 1803. For many years he was accustomed to receive theological students into his family. Nearly fifty were trained by him, among whom were Dr. Woods, of Andover, President Moore, of Amherst College, President Davis, of Hamilton College, and several other distinguished men. He published many sermons.

Backus, ISAAC: b. at Norwich, Conn., Jan. 9, 1724; ordained pastor of a Separatist church in Titicut (a parish of Bridgewater and Middleboro), Mass., Apr. 13, 1748; preached in Titicut till his death, which occurred Nov. 20, 1806. In 1751 Mr. Backus espoused Baptist principles, and soon became one of the most active and influential ministers of that denomination. He was for thirty-four years a trustee of Rhode Island College (now Brown University); was in 1774 agent of the Warren (R. I.) Association to advocate before Congress equal privileges for all religious denominations, and in 1788 delegate from Middleboro to the Massachusetts convention which ratified the Federal Constitution. In 1777-96 Mr. Backus published *A History of New England, with Especial Reference to the Baptists* (3 vols.), a work which is still of value to the general student of the history of New England. A new edition, in two octavo volumes (carefully edited by Prof. David Weston, of Madison University), was published by the Backus Historical Society, Newton Centre, Mass., in 1871. See his *Life* by A. Hovey, Boston, 1858.

Ba'con, BENJAMIN WISNER: Congregationalist; son of Rev. Leonard W. Bacon; b. at Litchfield, Jan. 15, 1860; graduated at Yale 1881, and at the Yale Divinity School 1884; pastor at Lyme, Conn., 1884-89; at Oswego, N. Y., since 1889. He is the author of an able and scholarly work, *The Genesis of Genesis* (1892), which has been reprinted in Germany.

GEORGE P. FISHER.

Bacon, DELIA: author; sister of Dr. Leonard Bacon; b. at Tallmadge, O., Feb. 2, 1811; wrote, besides *Tales of the Puritans* and a drama entitled *The Bride of Fort Edward*, *The Philosophy of Shakspeare's Plays* (1857), in which she first threw out the startling hypothesis that these plays were really written by Francis Bacon, who simply used Shakspeare as a shield against the prejudices of the time. In support of this hypothesis, which became an infatuation, she visited England, met much repression, and her troubles impaired her health. D. at Hartford, Conn., Sept. 2, 1859. See *Delia Bacon: a Biographical Sketch*, by Theodore Bacon (1888); and *Recollections of a Gifted Woman*, in Hawthorne's *Our Old Home*.

Revised by HENRY A. BEERS.

Bacon, EZEKIEL, LL. D.: b. in Stockbridge, Mass., Sept. 1, 1776; graduated at Yale in 1794; was one of the chief justices of the Massachusetts court of common pleas in 1813, first comptroller of the U. S. treasury (1813-15), and a member of Congress from Massachusetts (1807-13). He afterward removed to Utica, N. Y., and was a delegate to the State constitutional convention of 1821. He published in 1843 *Recollections of Fifty Years Since*. D. Oct. 18, 1870.

Bacon, FRANCIS (in Latin *Francis'cus Baco'nus*), BARON VER'ULAM, VISCOUNT SAINT ALBANS: one of the most illustrious of modern philosophers; b. in London, England, Jan. 22, 1561. His father, Sir Nicholas Bacon, was Lord-Keeper of the Great Seal under Elizabeth. His mother, a lady of fine talents, whose maiden name was Anne Cooke, was a sister of Mildred, the second wife of Lord Burleigh. Bacon, soon after he had completed his twelfth year, was sent to Cambridge, where he is said to have distinguished himself by diligence and by rapid progress in his studies. While at the university he conceived, it is said, a decided dislike to the philosophy of Aristotle as it was then taught in the schools. Soon after leaving Cambridge he visited France, in order to acquire the French language and to continue his studies on the Continent, but his father's death, in 1579, obliged him to return to England. In 1582 he was admitted to the bar, and became in 1584 member of Parliament, and in 1590 counselor-extraordinary to the queen—a distinction almost without example for one so young. Ben Jonson speaks in the highest terms of his gifts as an orator; he tells us that Bacon "commanded when he spoke, and had his judges angry or pleased at his devotion. No man had their affections more in his power. The fear of every man that heard him was that he should make an end." Lord Burleigh, though Bacon's uncle by marriage, appears rather to have retarded than aided the promotion of his nephew. The latter, left wholly to his own exertions, applied himself diligently to his profession, and at length acquired a lucrative practice. He became in 1594 a candidate for the office of solicitor-general, but was unsuccessful. The Earl of Essex, who appears to have conceived a warm and sincere friendship for Bacon, in order to console him under his disappointment made him a present of an estate near Twickenham worth £1,800 sterling, which in real value was, in all probability, nearly if not quite equal to five times that number of pounds at the present day.

It appears to have been Bacon's aim for many years to acquire a fortune by a wealthy marriage. He paid court (1597) to the rich young widow, Lady Hatton, but, though aided by the intercession of Essex, who was then in great favor at court, he was not successful; which, according to Ma-caulay, was a very fortunate circumstance for Bacon. The lady afterward married Bacon's rival and enemy, Sir Edward Coke, and "did her best to make him as miserable as he deserved to be." When Essex, seduced by a wild and reckless ambition, embarked on those schemes which afterward led to his death on the block (see ESSEX), Bacon appears to have used whatever influence he had in order to mitigate the resentment of the queen against her misguided kinsman. Unhappily for his reputation, he was induced by the desire to advance his interest at court—for we can scarcely suppose he was influenced by a sense of duty—to abandon the office of intercessor, and to take an active and prominent part in the prosecution of his former friend. And worse still, after the death of Essex, in order to vindicate the conduct of the queen, he employed his talents and eloquence to blacken the character of his benefactor. After the accession of James I., Bacon appears to have enjoyed the highest favor at court. He was knighted (1603) before the king's coronation. His law practice had now become, if not very extensive, at least very lucrative. In 1606 he married Alice Barnham, the daughter of a rich London merchant. He had previously been appointed king's counsel, and in 1607 he was made solicitor-general. He became in 1613 attorney-general and a member of the privy council. He was selected by the king as his agent to conduct the prosecution against Peacham, in which affair Bacon is accused of having sought, against law and justice, to obtain the opinions of the judges before the case came up for trial. Bacon was appointed in 1617 Keeper of the Great Seal, and in January of the ensuing year he was made Lord High Chancellor of England, the highest civil office to which any subject could then attain. In the following July he was created Baron Verulam, and admitted to a seat in the House of Peers. In 1621 he became Viscount Saint Albans, and in 1620 published his greatest work, the *NOVUM ORGANUM (q. v.)*. The cup of his prosperity and fame appeared to be full to overflowing, but a great reverse was near. It seemed as if Fate had raised him to the highest pinnacle of greatness that his fall might be the more tragic and more conspicuous. He was accused of accepting bribes by a man named Waynham, against whom Bacon had decided a suit in chancery. A committee of the House of Commons was appointed to inquire into the case, which was

referred to the House of Lords as the only legitimate tribunal for trying it. At the beginning of the trial Bacon strongly asserted his innocence, but he subsequently abandoned his defense and confessed his guilt. He was sentenced (May 3, 1621) to pay a fine of £40,000 and to be imprisoned at the king's pleasure. James was disposed to show him every indulgence. As a mere form he was sent to the Tower, but two days afterward he was set at liberty. His fine was also remitted, and he was allowed an income of £1,200, a sum which may safely be pronounced fully equal to £6,000 at the present day. He died at Highgate, London, Apr. 9, 1626, and left no children. Bacon's celebrated *Novum Organum* and his *De Augmentis* are but parts of a more extensive work entitled *Instauratio Magna*, or Great Restoration, so called because through its means he hoped to recall Philosophy from what he considered the vain and idle speculations of the Aristotelian school, and restore her to her true and legitimate office of interpreter of nature. Among his other works should be mentioned his *Essays* (first published in 1597), doubtless the most popular and widely read of all his writings, and his *De Sapientia Veterum* (On the Wisdom of the Ancients, 1609), of which a good translation by Sir A. Gorges was published in 1619. Although Bacon's celebrity as an author may be said to rest exclusively on his philosophical writings and his *Essays*, he left some very able legal treatises; among others his *History of the Alienation Office*. In person Bacon was well formed, but not robust, of a middling stature, with a high and broad forehead, his countenance conveying the impression both of intellectual power and benevolence of disposition. In society he is said to have been "a most delightful companion, adapting himself to company of every degree, calling, and humor, . . . bringing out with great effect his unexhausted stores of jests new and old." His complete works were edited by Spedding, Ellis, and Heath (London, 1857-59, 7 vols.); for general use see his *Works* (selected, New York, 1877, 2 vols.); his biography by Spedding (London, 1862-74, 7 vols.); R. W. Church (1884), E. A. Abbott (1885). Best edition of the *Essays* is by W. Aldis Wright (new ed. London, 1883). J. THOMAS.

Revised by S. M. JACKSON.

Bacon, GEORGE BLAGDEN: son of Rev. Dr. Leonard Bacon, Sr.; b. at New Haven, Conn., May 23, 1836; studied theology at Yale Divinity School; minister at Orange Valley, N. J., from 1861; d. there Sept. 16, 1876. He wrote *Six Sermons on the Sabbath Question* (1st and 2d ed. New York, 1882). GEORGE P. FISHER.

Bacon, HENRY: genre-painter; b. at Haverhill, Mass., in 1839; pupil of Cabanel in Paris, and at Écouen, France, of Edouard Frère. Among his most popular works are pictures of life on the transatlantic steamships, and he has also painted a number of pictures of peasant life in France, which are notable for good qualities of color and drawing.

Bacon, JOEL S., D. D.: b. in Cayuga co., N. Y., Sept. 3, 1802; graduated at Hamilton College, Clinton, N. Y., in 1826; studied theology at Newton, Mass., 1829-30; was successively president of Georgetown College, Kentucky, pastor of a Baptist church in Lynn, Mass., professor in the institution at Hamilton, N. Y. (1834-37), president of Columbian College, D. C. (1843-54), and subsequently was a teacher in Alabama and in Virginia. D. at Richmond, Va., Nov. 9, 1869.

Bacon, JOHN: See BACONTHORPE.

Bacon, JOHN: sculptor; b. in Southwark, Nov. 24, 1740; in 1769 received the first gold medal for sculpture awarded by the Royal Academy. Principal works are monuments to Lord Chatham in Westminster Abbey and the Guildhall; to Howard and Johnson in St. Paul's; to Blackstone in All Souls' College, Oxford. D. in London, Aug. 4, 1799.

Bacon, JOHN EDMUND: See the Appendix.

Bacon, LEONARD, D. D., LL. D.: the son of a Connecticut missionary to the Indians; b. at Detroit, Mich., Feb. 19, 1802; graduated at Yale 1820, and at Andover 1824. From 1825 to 1866 he was pastor of the First church (Congregational), New Haven, Conn.; from 1866 to 1871 he was acting Professor of Systematic Theology, and after 1871 was lecturer on church polity and American church history in the Divinity School of Yale College. He contributed largely to the *Christian Spectator* and the *New Englander*, and was for several years one of the editors of the *Independent*. Besides numerous occasional sermons and addresses, he published *Select Practical Writings of Richard Baxter* (1830), *Thir-*

teen Discourses on the Two Hundredth Anniversary of the First Church in New Haven (1839); *Slavery Discussed* (1846); *Genesis of the New England Churches* (New York, 1874). D. in New Haven, Conn., Dec. 24, 1881. He was a prolific writer, and among Congregationalists a leader of great ability and influence. Revised by GEORGE P. FISHER.

Bacon, LEONARD WOOLSEY, M. D., D. D.: Congregationalist; b. at New Haven, Conn., Jan. 1, 1830; graduated at Yale College 1850, and at Yale Divinity School 1854; minister at Litchfield, Conn., 1857-60. He spent several years in Europe (1872-77), principally at Geneva. He has been pastor in several other places, including Norwich, Conn. (1878-82), Brooklyn, N. Y., and Philadelphia, Pa. His contributions to the public press are numerous. He has published a number of volumes of hymns and tunes. Among his other writings are *Church Papers, etc.* (1876), and a volume of *Sermons*, marked by freshness and vigor (1886). GEORGE P. FISHER.

Bacon, NATHANIEL: a young English lawyer; b. in Suffolk, Jan. 2, 1647, and migrated to Virginia, where he died Oct. 29, 1676. See Sparks's *American Biography*, vol. iii. of new series, and BACON'S REBELLION.

Bacon, Sir NICHOLAS: an English statesman; b. at Chislehurst, in Kent, in 1509; was the father of Sir Francis Bacon, Baron Verulam. He was educated at Cambridge, studied law, and was appointed solicitor to the court of augmentations in 1537. In 1546 he obtained the office of attorney to the court of wards and liveries, which he kept under Queen Mary, although he was a Protestant. He was appointed Lord-Keeper of the Great Seal by Elizabeth in 1558. He was distinguished for his moderation, sagacity, and discretion, and rendered important services to the Protestant cause. Among the English statesmen of that age he was ranked next to Lord Burleigh, who was his friend and brother-in-law. Having held the office of lord-keeper about twenty years, he died in London, Feb. 20, 1579. See G. Whetstone, *Memoir of Sir N. Bacon*; Lord Campbell, *Lives of the Lord Chancellors*.

Bacon, ROGER: an eminent English philosopher and monk, called THE ADMIRABLE DOCTOR; b. near Ilchester, in Somersetshire, about 1214. He studied at Oxford and at Paris, where he took the degree of doctor of laws. Having entered the order of Franciscan monks, he settled at Oxford and devoted much time to experimental philosophy. He was far in advance of his age, and made discoveries in several sciences. He wrote in Latin a number of works on chemistry, optics, physics, etc. By denouncing the immorality and ignorance of the clergy and monks, he made many enemies. His mechanical skill and his insight into the secrets of nature were such that he was suspected of dealing in magic. Thus he became in the popular imagination the necromancer, Friar Bacon, who figures largely in legends. His writings having been condemned by a council of Franciscan monks, he was thrown into prison about 1278, and confined at least ten years. Indeed, it is not certain that he ever came out of prison. Nor is it certain in what year he died, but probably at Oxford, June 11, 1294. His capital work, which treats of several sciences, is entitled *Opus Majus*, and was written about 1266. It was first printed in 1733. Several of his works, such as the *Opus Tertium*, *Opus Minus*, and *Compendium Philosophiæ*, were published for the first time in 1859. It appears that he was acquainted with the composition and explosive power of gunpowder. "The mind of Roger Bacon," says Hallam, "was strangely compounded of almost prophetic gleams of the future course of science and the best principles of the inductive philosophy, with a more than usual credulity in the superstitions of his own time." Recent investigations have proved how much in advance of his times he was, and that he really anticipated later discoveries. See his *Opera*, ed. J. S. Brewer (London, 1859); best biography (in French) by E. Charles (Paris, 1861). Revised by S. M. JACKSON.

Bacon, THOMAS SCOTT, D. D.: controversial and theological writer of the Protestant Episcopal Church; b. in Saratoga, N. Y., Feb. 1, 1825; graduated at Williams College; originally a lawyer and member of the Suffolk bar, Boston, 1847; ordained deacon 1853, priest 1854. The civil war found him at his parish in the old French town of Natchitoches, La. Though an ardent sympathizer with the North he was able to remain and, to a certain extent, exercise his ministry under most romantic and trying circumstances. Removing to Maryland at the close of the war he has lived the life of a student and divine in a secluded par-

ish. Author of *Both Sides of the Controversy between the Roman and the Reformed Churches* (1858); *Christian Children: How the Church Regards and Addresses them* (1868); *The Reign of God, not the Reign of Law* (1879); *The Beginnings of Religion* (London, 1887); *Primitive Man in Christian Thought* (1890); *It is Written* (1891); *The Primitive and Catholic Doctrine as to Holy Scripture* (1892); sermons, reviews, addresses, etc. W. S. PERRY.

Bacon's Rebellion: the civil conflict which, under the leadership of Nathaniel Bacon, took place in Virginia during the rule of Sir William Berkeley, one hundred years before the American Revolution. About the details and the real significance of the conflict there has been, until recently, much obscurity; but careful studies of the original sources by John W. Johnston and G. Brown Goode in Virginia, and Edward Eggleston in the British Record Office, have tended to clear up many obscurities and relieve Bacon of much of the opprobrium which formerly attached to his name. That the colonists had great reason for complaint against the oppressive tyranny of Berkeley can no longer admit of any doubt. The causes of dissatisfaction were aggravated by the attitude of the British Government. An act of Parliament declared that all goods, from whatever country or place they came, if intended for Virginia, should be shipped first to England, and then be reshipped in British vessels to the colony. The practical effect of this measure was, on the one hand, to limit the market for tobacco to England, and thus greatly reduce the only source of revenue to the colony, and, on the other, greatly to increase the price of all articles furnished by foreign countries. It was for the purpose of enforcing this obnoxious law that the Government erected a series of forts, against which the most strenuous objections were made by the colonists. Popular opinion became still more hostile when the edict was promulgated that no tobacco or other produce could be sold at any point except where there was a fort. Not less obnoxious were the duties imposed on trade between the colonies themselves, especially when it was found that no part of the duties collected went into the colonial treasury. Of all the moneys thus paid in the collector received one-half, the comptroller one-fourth, and the other fourth went to the minor officials. A similar spirit was shown in the law requiring that fish from the other colonies should pay duties, while fish imported by people living in England should be admitted free. Still further to shake the faith of the colonies in the beneficent disposition of the mother country was the fact that about the year 1673 the crown assigned the whole province of Virginia for thirty-one years to the royal favorites, Lords Arlington and Culpepper, with power to collect for their own uses all quit rents, escheats, and duties; to name sheriffs, surveyors, and other officers; to make new counties, and, in general, to exercise in their own name all the essential authority of absolute rulers. The Governor of the province, Sir William Berkeley, was an ardent royalist, who seemed to think that the function of a governor was to obtain as much as possible from the colonists for himself and for his masters at the least possible cost. But the most flagrant offense of Berkeley was his total neglect and refusal to provide for the safety and defense of the colonists against the Indians. Murderous assaults were made again and again upon the inhabitants along the James river; but no remonstrance or petition that the Governor would organize a defensive army was of any avail.

Such was the general state of affairs when Nathaniel Bacon arrived in the colony in 1673. B. Jan. 2, 1647, he had been admitted to St. Catherine's College, Cambridge, in 1660, where he took the degree of M. A. at the age of twenty, in the year 1667. After studying law at the Inns of Court, he determined to go to Virginia. When he arrived in the colony he was only twenty-six. Descended from a patrician family, he brought with him a fortune sufficient to give him immediate prominence. He purchased one estate at a point now occupied by the city of Richmond, and another some miles lower down on the James river. Bacon had scarcely taken up his abode in the new province when his qualities as a leader began to make themselves manifest. Though he professed unswerving loyalty to the crown, he saw plainly the abuses to which the colonists were subjected, and did not hesitate to denounce the course taken by Berkeley. His ability and energy soon gave him unbounded popularity. Though there were many causes of discontent, the most extreme dissatisfaction was

felt with the refusals of the Governor to take any measures to protect the colonists against the Indians. Bacon's first important movement was in this direction at the moment when it was ascertained that the Indian tribes were collecting all their forces with the evident intent of exterminating the whites. Bacon had never seen a hostile Indian, and he knew absolutely nothing from personal experience of the most successful manner of fighting them. The knowledge came to him as by instinct. He first applied to the Governor for authority to organize the people. Berkeley neither granted nor refused the petition; he simply did nothing. Bacon then declared that if another white person lost his life at the hands of the hostile Indians he would not wait for formal authority, but would act without it. He had not long to wait. One of Bacon's own men was killed at his lower plantation, whereupon the news spread rapidly, and the people flocked together, demanding that Bacon should put himself at their head and take the field against the savages. With a force of 500 men, but without authority or even permission from the Governor, he assumed the offensive against the savage foes. As soon as Berkeley heard of what had taken place he issued a proclamation, depriving Bacon of his seat in the House of Burgesses and ordering his followers to disband and disperse to their homes. Many of the men, fearing the confiscation of their property, deserted, and Bacon was left with only fifty-seven men. With this force, however, he did not hesitate to sally forth into the wilderness. In his first conflict with the enemy he set fire to the palisades erected by the Indians and, it is said, killed 150 of the enemy, with a loss of only three of his own men. After the capture of the Indian fort he determined to go to Jamestown and demand of Berkeley not only the restoration of his seat in the assembly, but a commission as major-general. This was an audacious move, but Bacon was conscious of having the support of the entire province. Forty men insisted on accompanying him. On approaching Jamestown he was arrested and brought before Berkeley, who addressed him as "the greatest rebel that ever was in Virginia." The news of his arrest, however, set the country ablaze with excitement, and Berkeley thought it not prudent to punish or retain him. Though Bacon escaped, it was immediately evident that matters could not be settled without a formal trial of strength. Berkeley at once called his forces together, but Bacon determined to avoid the defensive by making an immediate attack on Jamestown. Everybody at the capital, excepting the Governor, appears to have been panic-stricken. Berkeley, however, never lost his courage, for on the appearance of Bacon he drew his sword and offered to decide the matter in a hand-to-hand contest. Bacon answered that he came not to hurt a hair of the Governor's head, but simply to get a commission against the heathen who were spilling so much good blood. But these courtly speeches were not successful. It was necessary that he try a new device. Drawing up his troops, he ordered them to present arms, and then declared that, if the commission were not forthcoming, he would kill the Governor and the Council and then sheathe his sword in his own heart's blood. His energetic declaration was effective, for one of the burgesses called out that, if he would hold his hand, he should have what he pleased. He demanded a commission as major-general for himself, and thirty commissions in blank for his subordinate officers. More than this, he extorted a letter signed by the Governor and directed to the king, exculpating himself and his followers. The Governor even assented to a large number of laws, some of them repealing the most obnoxious statutes, and some of them providing for meeting the present needs of the colonies. But while this legislation was going on, Bacon heard of a desperate attack by the Indians only a few miles away, and determined to advance to the invaded region. No sooner had he gone, however, than Berkeley set himself to undo all that had been accomplished. He summoned troops from York and elsewhere; but when they learned that it was against Bacon that they were to march they refused to move. It is said that the Governor fainted with chagrin. Bacon, on the other hand, as soon as he learned of the attempts of Berkeley, made a ringing speech to his troops and turned to go back to Jamestown. Berkeley fled at his approach, and Bacon found the government of the province practically in his hands. The Indians, however, had taken advantage of his absence, and had again made an attack upon the inhabitants up the river. Bacon not only learned of this fact, but he knew that if he should leave Jamestown Berkeley would at once return and attempt to

re-establish himself in power. Bacon determined to attack the savages with great vigor. The battle, which completely broke their power, was fought on the ground now occupied by the eastern part of the city of Richmond. The name "Bloody Run" has from that day to this clung to the stream which is said to have been reddened by Indian blood. But no sooner had Bacon turned against the Indians than Berkeley turned against Jamestown. The capital could make no resistance. Bacon, however, decided to return, and marched with such extraordinary speed that he was ready for an attack before Berkeley knew of his approach. A siege was begun and carried on with such vigor that Berkeley, though he had superior numbers, soon decided to evacuate. The Governor's fleet, however, anchored near the town with the evident purpose of returning to the attack. Bacon, knowing that he had a greatly inferior force, acted with characteristic promptness and set fire to all the buildings of the town, including the church and the State-house. But this was practically the end of his career. He had enacted and caused to be promulgated a number of laws so favorable to the people that, long after his death and when all his acts had been reversed, there was a popular clamor for the re-enactment of "Bacon's laws." But, in the course of his latest expedition in the swamps, Bacon was attacked with a fatal dysentery, and he died Oct. 29, 1676. Until very recently the date of his death was unknown, and the place of his burial has remained in persistent obscurity. Friends disposed of his body in such a way that it was impossible for Berkeley to display it upon the gibbet. Bacon left no leader to take his place; and hence it has been customary to attach to his name the obloquy which usually accompanies the name of an unsuccessful rebel. But recent studies have revealed the fact that he was actuated by lofty motives, that he did much to protect the colonies, and that his laws were of a most beneficent nature. The reasons for his rebellion, though local in their scope, were not less flagrant than the reasons for the American Revolution just a hundred years later. The accounts in the standard histories have been made inadequate by recent investigations. See *Magazine of American History*, vols. xvii. and xviii., and the *Century Magazine* for 1890. C. K. ADAMS.

Baconthorpe, Bacon, or Bacho, JOHN: an English Carmelite, surnamed THE RESOLUTE DOCTOR; b. at Baconthorpe, in Norfolk, about the beginning of the fourteenth century. He was said to be the grand-nephew of Roger Bacon, and he advocated the philosophy of Averroës, and had great reputation for learning. Among his works is a commentary on the *Master of Sentences* (Peter Lombard). D. in London, 1346.

Bacs, baach: a county of Hungary; bounded N. by the county of Pesth, E. by Torontal, S. by Slavonia, and W. by Baranya. Area, 4,260 sq. miles. The Danube flows along the western boundary, and the Theiss along the eastern, while the two are connected by the canal of Bacs, which is about 60 miles long. The county is entirely level, and, with the exception of the swamps along the rivers, is very fertile. Pop. (1890) 716,325. Chief town, Zombor.

Bacte'ria [plur. of Gr. *βακτήριον*; dimin. of *βακτηρία* or *βάκτρον*, staff, stick]: minute, chlorophyll-less plants, belonging to the lowest class (*Schizophyceæ*) in the vegetable kingdom. They are allied to the minute aquatic green plants, water-slimes, so common in pools of water, and belonging to the genera *Nostoc*, *Oscillaria*, *Leptothrix*, *Spirulina*, etc., from which they may have been derived by degeneration due to their parasitic and saprophytic habits. "Bacteria appear in the form of round or cylindrical rod-shaped, rarely fusiform, cells of very minute size. The diameter or the transverse section of the cylindrical cells is in most cases about one micromillimeter ($\frac{1}{25000}$ inch), or even less; the length of the cylindrical cell is two to four times the transverse section, rarely more. There are only a few forms with distinctly large dimensions" (*De Bary*).

On account of their minute size their study is surrounded by many difficulties. Thus while they are unquestionably cells, and chains of cells, according to De Bary, "cell-nuclei have not yet been observed in them." They multiply by simple fission of the ordinary cells as in other simple plants, and by spore formation. Of the latter there are two kinds, distinguished as endosporous and arthrosporous, which seem to divide the Bacteria into two groups. In the development of an endospore, it begins as "a comparatively very minute, point-like granule in the protoplasm of a hitherto vegetative cell. This granule increases in volume, and soon pre-

sents the appearance of an elongated or round, highly refringent, sharply defined body, attains its ultimate size rapidly, sometimes in a few hours, and is then the mature spore. The spore always remains smaller than its mother-cell, the protoplasm and other contents of which disappear with the growth of the spore, being doubtless consumed for its benefit, until at length the spore is seen suspended in a pellucid substance inside the delicate membrane of the mother-cell" (*De Bary*).

In the arthrosporous Bacteria the spores are produced by the breaking asunder of the cells which constitute the filament, each cell thus becoming a spore.

The classification of Bacteria is as yet largely artificial, being based to a great extent upon form. The arrangement by De Toni and Trevisan is as follows:

Sub-family I.—Plants in mature state filamentous; arthrosporous. The principal genera are *Crenothrix*, *Cladothrix*, *Nocardia*, *Rasmussenia*, *Leptorhchia*, and *Beggiatoa*.

Nocardia actinomycetes is the cause of the disease in cattle known as "Actinomycosis." *Rasmussenia buccalis* occurs in decayed teeth.

Bacteria: I. A species of bacillus, some of the plants forming spores, magnified 600 times. II. A species of micrococcus (*M. ureæ*), magnified 1,100 times. III. The bacillus of anthrax (*B. anthracis*), two plants forming spores, magnified 600 times.

Sub-family II.—Plants in mature state short rods (bacilli); mostly endosporous. The principal genera are *Bacillus* (of which 227 species have been described), *Pasteurella*, *Cornilia*, *Clostridium*, *Vibrio*, *Spirillum*, *Pacinia*, *Bacterium*, and *Klebsiella*.

Bacillus tuberculosis produces tuberculosis in animals (and man); *B. anthracis* is the cause of anthrax in animals; *B. subtilis* is common in fermenting and decaying substances; *B. amylovorus* is the cause of apple blight. Species of *Pasteurella* produce, or are associated with, diseases in domestic animals; e. g. *P. billingsii*, Texas fever; *P. suilla*, swine plague; *P. cholerae-gallinarum*, chicken cholera. *Cornilia alvei* produces a serious disease in bees. *Pacinia laeffleri* is associated with diphtheria, and *P. cholerae-asiaticæ* with Asiatic cholera in man, the latter being the so-called "Comma Bacillus" of Koch. *Bacterium aceti* is the "mother of vinegar," producing acetous fermentation.

Sub-family III.—Plants minute spheres (cocci). The principal genera are *Sarcina*, *Streptococcus*, *Neisseria*, *Staphylococcus*, and *Micrococcus*. *Sarcina ventriculi* occurs in the intestinal canal of animals (and man); *Streptococcus variolæ* occurs in smallpox pustules; *S. insectarum* produce a disease in chinch-bugs; *S. alvearis* is the cause of "foul brood" in bees.

On account of their importance Bacteria have been much studied in recent years, and the literature of the subject is already large. Very high powers of the microscope are necessary, and special cultures must be resorted to in order to isolate the species from one another.

The following works may be profitably consulted; they contain a full account of the voluminous literature: De Bary, *Comparative Morphology and Biology of the Fungi, Mycetozoa, and Bacteria* (1887); De Toni and Trevisan, *Schizomycetaceæ*, in Saccardo's *Sylloge Fungorum* (vol. viii., 1889); Dolley, *The Technology of Bacteria Investigation* (1885); Grove, *A Synopsis of the Bacteria and Yeast Fungi* (1884); Hueppe, *The Methods of Bacteriological Investigation* (1886); Prudden, *The Story of the Bacteria, and their Relations to Health and Disease* (1889). See also BACTERIOLOGY. CHARLES E. BESSEY.

Bacteria'ceæ [from *bacterium* + *-aceæ*, a botanical suffix used in forming ordinal and family names]: bacteria considered as a group in systematic botany. See BACTERIA.

Bacteriol'ogy [from *bacterium* + *λέγειν*, to discuss]: scientific study of bacteria. The general term "Bacteria" denotes a group of minute miscellaneous vegetable organisms

1. Primary forms of bacteria:
Spheroidal, rod-like, and spiral.

2. *Bacillus tetani* from a culture.

3. *Gonococcus* in pus cells.

4. *Bacillus typhosus* from a culture.

6. Spiral bacteria with cilia from
a putrefying vegetable infusion.

7. Yeast - *Saccharomyces*.

5. Mould - *Penicillium*.

8. Cocci in groups of eight (*Sarcina*)

9. Spheroidal bacteria (cocci)
in pairs (*Diplococcus*)

10. Cocci in chains (*Streptococcus*)

11. *Diplococcus pneumoniae* in blood.

15. *Bacillus anthracis* from a culture.

16. *Spirillum cholerae* in segments
(Comma bacillus from a culture)

17. Rod-like bacteria (bacilli) with spores.

18. *Bacillus tuberculosis* in sputum.

BACTERIA.

closely allied to, and now usually classed with, the fungi. They multiply by the simple process of transverse division, and are therefore known as *Schizomycetes*, or fission fungi. The simplest forms appear under the microscope as spherical bodies varying in size from minute points just visible under the high powers to $\frac{1}{100000}$ of an inch in diameter. These are called *Micrococci*. Others are rod-shaped—from $\frac{1}{12000}$ to $\frac{1}{5000}$ of an inch in length, and usually much less than half that in breadth. To these the name *Bacillus* is given. Others appear as undulating threads or rods twisted like a corkscrew. To these the name *Spirillum* is given.

These morphological peculiarities of the different bacteria are constant—that is to say, an organism that is normally spherical in shape always remains spherical and can never be caused to become rod-like in outline, and a rod-shaped organism remains rod-shaped, never becoming either a sphere or a spiral form. For this reason a number of classifications for the bacteria, based entirely upon morphological peculiarities, have been suggested; but as they are in the main the classifications of the older authors, many details have been introduced that are now known to be unnecessary. The tendency of the day is to simplify the grouping, and recognize the three grand morphological groups already mentioned—viz., *Micrococci*, *Bacilli*, and *Spirilla*. In the course of development, however, the members of these three divisions are seen to group themselves in a more or less constant and characteristic manner, and undergo certain peculiar alterations in their life cycle, and for this reason many of them have received names indicative of these conditions.

For example, in the group *Micrococci* there are those which, when growing, divide in such a way as to form clusters somewhat resembling bunches of grapes; to these the name *Staphylococci* is given. Others when growing are always seen in chains somewhat resembling strands of beads. These are therefore known as *Streptococci*; while again others divide commonly into twos, and are consequently seen in pairs—*Diplococci*. The *Tetrads* are those that develop by dividing in length and breadth, forming groups of fours. Another group, the *Sarcine*, include those forms that divide regularly in length, breadth, and thickness, the resulting cluster having somewhat the appearance of a bale of cotton. The *Bacilli* comprise all straight bacteria, whether long or short, that are not spherical in outline. Among the bacilli some forms possess the interesting property of passing into a stage in which they are much more resistant to detrimental influences than when growing normally. This stage of development is known as the spore, or permanent stage. The property of forming spores is not possessed by all bacilli. Some of them under all conditions appear as nothing else than simple rods that elongate and divide into two, and repeat this process until conditions unfavorable to their life processes arise, when development ceases and they die. Others also, when growing under the most favorable conditions, appear only as rods longer or shorter in size, but with the advent of surroundings not favorable to this regular and normal vegetation there appears a change in the individual rods that indicates the formation within the body of the rod of a structure quite different in size, outline, and color from the bacillus in which it is forming. This body when formed is round or oval in outline, very highly refractive to light, and markedly glistening. It is the spore of the bacillus, and is usually situated about the center of the rod in which it appears. When in this condition the organisms are said to be in the resting stage, and many of them by virtue of this peculiarity retain their vitality for years under conditions that would be destructive to the vitality of organisms in the stage of active growth and development.

The spore-stage is strictly a resting or inactive stage of these organisms. That is to say, spores can not divide into two and form other spores in the same way that the vegetative forms multiply, but they lie dormant until conditions favorable to their growth appear; they then germinate, not into spores, but into rods in every way identical, not only morphologically but physiologically, with the rods from which they were formed.

Spores are much more resistant to chemical and thermal influences than the vegetative forms from which they arose, and it is this that makes disinfection of those substances containing spores a matter of some difficulty. The spiral forms appear as those having the turns of the spiral long and quite obtuse, *Spirilla*, and those in which the angles are acute, *Spirochaete*. Owing to the difficulty, and in many

instances the impossibility, of obtaining the spiral bacteria in artificial cultures, our knowledge of them is quite limited. They apparently multiply by simple fission, and, so far as is known, do not form spores. Another property possessed by many bacteria is motility—they possess the power of independent motion, and, by the lashing movements of delicate hair-like appendages (flagella), move themselves about from one place to another in the fluid in which they float. Other forms are without the locomotive apparatus, and in consequence do not possess the property of independent motion.

In their nutritive processes bacteria differ markedly from the more highly organized members of the vegetable kingdom. They are devoid of chlorophyll, the green coloring-matter by virtue of which the higher plants decompose, and obtain their nutrition from, such bodies as carbonic acid and ammonia, and must therefore obtain the nitrogenous compounds necessary to the building up of their tissues from previously formed organic matter. They can not exist upon inorganic compounds alone. Because of the absence of chlorophyll from their tissues, they exist as saprophytes, obtaining their nutrition from dead organic matter, or as parasites, which exist at the expense of either a living animal or vegetable.

Owing to the rapidity of their life processes, they produce the most profound decomposition and fermentative changes in the materials to which they have gained access. Decomposition and fermentation are the results of the growth of saprophytic bacteria, whereas the parasitic forms produce changes in the tissues of their hosts, which may result in disease, and frequently in death.

To those unfamiliar with the part played in nature by these minute organisms, the word bacteria is frequently associated exclusively with disease. This is erroneous, for the number of species of bacteria capable of causing disease is relatively small. The great majority of them are concerned in processes that are not only in no way related to disease, but are directly beneficial to all living members of both the animal and vegetable kingdoms; in fact, they are essential to life upon the surface of the earth. Through their action the highly complicated tissues of dead animals and vegetables are resolved into simple compounds—carbonic acid, ammonia, and water—in which form they serve as nutrition for the more highly organized growing plants. It is to the ultimate production of carbonic acid and ammonia by bacteria, as end products in the process of decomposition, that the demands of growing vegetation for these compounds can be supplied. Without the carbon and nitrogen compounds resulting from the activities of saprophytic bacteria, the growth of higher vegetation would cease. Deprive the animal kingdom of the foodstuffs supplied to it by the vegetable world and life is no longer possible. The parasites, on the other hand, play a part which is usually in no way beneficial to the higher kingdoms. Their host must always be either a living animal or vegetable, in which are present conditions favorable to the development of the parasite. With this development substances are appropriated as nutrition that are essential to the health and life of the tissues in which the parasite is located. At the same time the materials formed as a result of the nutrition of the parasites are direct poisons for the surrounding tissues.

It is plain, therefore, that the positions occupied by the saprophytic and parasitic bacteria in nature are, in their relation to mankind, diametrically opposite, the saprophytes standing in the relation of benefactors, while the result of the growth of the parasites is almost always a more or less serious loss to their hosts.

For the growth of bacteria organic matter, moisture and a suitable temperature are necessary, the latter varying from about 70° F. to that of the human body. Living bacteria are almost omnipresent in nature; they are found in the water, soil, air, on the surface of moist and dry bodies exposed to the air, and in the intestinal canal of all animals. They are never present in the tissues of the healthy organs of the living animal.

As found in nature, many species of bacteria are usually present as a heterogeneous mixture, and in order that the characteristics of the individuals comprising the group can be studied, separation of the individual species by artificial means in what are called "pure cultures" is necessary. The process commonly employed for this purpose is in principle similar to the means that would be taken for separating the different granules from a handful of mixed seeds. As the grains lie in the hollow of the hand it is difficult if not impossible to pick out each separate granule having a distinct

size and shape, but if one throws them upon the surface of a table, or some large flat object, the task then becomes very simple. So it is with the bacteria: if they can be diffused in some medium that has the property of at one time being fluid and at another solid, they can be scattered so that each drop of the fluid will contain a few of these microscopic bodies. If now, while fluid, this diluted culture medium is poured out upon a large glass surface, the individual bacteria are more widely separated the one from the other, and if the medium possesses the property of solidifying when brought in contact with the cool surface of the glass plate, the bacteria are not only separated, but, as solidification occurs, are fixed in this separated condition. The media that are employed for this purpose are composed primarily of beef tea to which enough ordinary bone gelatin or vegetable gelatin (agar-agar of the Japanese) is added to permit of their being at one temperature fluid, and at a lower temperature solid. These media afford conditions favorable to the growth of bacteria, so that in the course of from twenty-four to forty-eight hours the organisms, separated by the process described above, begin to grow, and very quickly give rise to what are known as colonies of bacteria that can easily be seen with the unaided eye. Each colony represents the offspring from a single bacterium that was fixed at the point at which it appears. They are therefore each a pure culture of the organism from which they sprang. As colonies from different species of bacteria commonly present peculiar characteristics, it is usually possible to determine the number of particular species that were present in the original mixture by the appearance of the colonies developing from them. In some instances the resulting colonies will have a characteristic shape, being regularly round or oval in outline; again they will be irregular and ragged at their borders; in some instances they will be dense and non-transparent; and again very thin, delicate, and translucent. Some of them grow as dry lusterless patches, others as moist glistening islands that stand up above the surrounding medium. Many species of bacteria—the chromogenic varieties—possess the interesting property of producing brilliant pigments, by which they can readily be recognized. Just as some roses grow red, others white, and others yellow, so will the colonies resulting from certain of the chromogenic species be in one case red, in another yellow, and in still others violet in color, so that a plate that is made for the purpose of separating the individuals of a mixture containing, with other organisms, certain of these color-producers, will often present a most attractive array of these various pigmented colonies.

If now a portion from each representative colony is introduced into a tube or flask containing a sterile, nutrient medium, the growth that results will be a pure culture of the organism forming the colony from which the bit was taken. By this means it is a comparatively simple matter to separate from a mixture of bacteria the individuals that composed it. The process, as just described, represents the well-known method of Koch for the isolation and cultivation of bacteria on solid media.

Another means for distinguishing them is by their relation to bone gelatin. Some of them by their powers of peptonization cause the gelatin to become fluid, and in doing this so alter the chemical constitution of the medium that it can not again be rendered solid. Others never under any circumstances bring about this change.

Again, certain of them are characterized by their relation to oxygen. Most species—the aerobic forms—require this gas for their development, while others—the anaerobic forms—not only do not grow where it is present, but are directly destroyed through its influence.

Still another means of identification is by the nature of their chemical products, and finally, and most important to mankind, by the absence or presence of the power to produce disease.

With certain mixtures of bacteria, particularly those suspected of containing pathogenic (disease-producing) organisms, another method of separation is often resorted to: the inoculation of susceptible animals with the suspicious mixtures. The innocent saprophytes are quickly destroyed by the tissues of the animal, while the disease-producers will perform their specific function, and can often be obtained from the blood or organs in pure culture.

The life history of the parasites when outside of the body of their host is not only an interesting one, but to mankind a matter of great practical importance. When disease-producing bacteria are thrown off from the body of the affected animal or man, either with the intestinal evacuations, the

sputum, or from the skin, the conditions which they meet, though not sufficiently unfavorable in most cases to prevent the development of the ordinary saprophytes, are by no means favorable to the growth of the more delicate parasites, so that in the main they quickly lose their vitality. Where conditions of a more favorable character do exist, they are likewise those under which the saprophytic forms grow most luxuriantly, so that again the delicate disease-producers meet another element not favorable to their growth—the antagonism that is offered to them by the common organisms found upon the surface of the earth, in the water, etc. Were it otherwise, the causes of some diseases, such as typhoid fever, would be much more persistent and widespread than they seem to be at present.

By the methods described, with certain modifications, the details of which can hardly be given in an article of this character, a very large number of different species of bacteria have been isolated, and their peculiarities in cultures and their relation to changes going on about us and to diseases have been established.

At different places upon the earth's surface bacteriological analyses of waters have been made, and comparisons of the results reveal the interesting fact that there is a definite flora of bacteria from open watercourses over the entire earth. These water bacteria, as they are commonly called, are saprophytes, and do not possess the property of inducing disease. By their presence in water complex nitrogenous matter is converted into simpler forms, in which it is either taken up as food by the higher inhabitants of the water, or is precipitated to the bottom of the stream by chemical processes, or remains in solution in the water in the form of innocent inorganic salts.

No less interesting and instructive are the results of studies upon the soil. Here are found countless numbers of bacteria, the majority of which are those concerned in the great process of decomposition and disintegration constantly in progress. Of these certain species are, however, directly instrumental in a more or less specific feature of decomposition—nitrification, i. e. the production of soluble salts of nitric acid from the more complex forms of nitrogenous organic matter. It is through the agency of these organisms, most probably in combination with other organisms that are concerned in the primary process of decomposing the nitrogenous organic matter as such, that the purification of sewage by filtration through soil is mainly accomplished. It is also due to the activities of the same organisms that ammonia, nitrous and nitric acid are found in water polluted by nitrogenous wastes, and it is these microscopic creatures that are instrumental in perpetuating the niter or saltpeter beds of Chili and Peru, that are of such importance in commerce. It is interesting to note that, though the organisms of nitrification produce these characteristic end products from nitrogenous organic matter, they are still incapable of development in the nitrogenous nutritive media employed in general bacteriological studies. They can not be isolated by the ordinary methods from water or soil in which they are present, but require for their isolation media quite different from those utilized in the cultivation of any other known bacteria. Those who have worked with greatest success upon this organism have cultivated it only through the use of solutions of inorganic salts in distilled water, from which organic matter is absent. It is isolated from waters in which nitrification is in progress by a process of dilution. As other organisms that were originally present with the nitrifying bacillus do not retain their life properties in solutions favorable to the growth of this organism, it is a comparatively simple matter to exclude them after a few generations.

The nitrifying bacillus, when examined microscopically, is a short rod of a slightly oval shape. It varies in size from 1.1μ to 1.7μ in length, and from 0.8μ to 0.9μ in breadth. It stains with difficulty with the ordinary aniline staining reagents, and is, when examined fresh, seen to be without the power of independent movement. As found in cultures they are grouped very characteristically in irregular clumps, and are held together by a jelly-like material. These clumps are found usually at the bottom of the fluid. It is not improbable that there may be several closely allied, though not identical, organisms included in this term "nitrifying bacillus." The most remarkable feature of the organism, and that which distinguishes it from all other bacteria thus far studied, is its peculiar source of nutrition. The absence of chlorophyll from its tissues precludes the possibility of its obtaining the necessary carbon and nitrogen from such

simple substances as gaseous ammonia and carbonic acid, as do the more highly organized green plants; and its failure to grow in artificial cultures or media containing nitrogenous organic matter renders it somewhat enigmatical as to how its processes of nutrition are conducted. It is to be hoped that further studies upon this interesting and important organism will clear away some of these obscure points.

The disease-producing organisms are not very rarely found in the soil, and are for the most part those possessing the property of forming spores, by which they are enabled to resist those detrimental influences that result in the death of the less resistant, non-spore-forming organisms. Of these forms the most conspicuous are the bacillus of tetanus (lockjaw) and the bacillus of malignant œdema.

The bacillus of tetanus is a delicate rod of about 1.0μ to 1.3μ in length, and of about 0.1 to 0.2μ in thickness. It possesses the property of forming spores, and when in this stage has somewhat the appearance of a miniature drumstick, owing to the tendency of the spore to form at one end of the rod, at which point the rod becomes slightly enlarged. It is feebly motile. It is anaërobie, and will therefore not grow in the presence of oxygen. When this gas is rigidly excluded from the cultures, the organism grows well on the ordinary culture media after they have been rendered a little more alkaline than is necessary for the majority of other organisms. It grows best in those media to which a little (about 1 to 2 per cent.) of grape sugar has been added. It is not a rapidly growing organism, and thrives best at the temperature of the human body. It liquefies gelatin, and gives off a peculiar, unpleasant odor. It can be stained with the ordinary aniline dyes. It is most readily obtained in pure cultures from the soil or other materials in which it is present, after subjecting them for two or three successive days to a temperature of 80°C . (176°F .) for one-half to one hour, a temperature that destroys the other organisms present but is not harmful to the spores of the tetanus bacillus. When subjected to the temperature of steam (100°C . or 212°F .) for five minutes the organism and its spores are killed. When in the dried condition the spores of this organism have been known to retain their virulence for as long as sixteen months.

The animals that are susceptible to its pathogenic activities are horses, sheep, dogs, mice, rats, guinea-pigs, rabbits, and also man. As seen experimentally, the clinical manifestations and pathological alterations in this disease are due entirely to the absorption of the poisonous products of growth of the organisms located at the point at which they gained access to the tissues. In animals dead of this disease neither the bacilli nor their spores are ever found in the internal organs, and in many cases they are even absent from the seat of inoculation. The presence of this organism in the soil serves to explain the frequent appearance of tetanus as an accompaniment of wounds to which dirt and dust have had access—those wounds, for example, of individuals engaged in agricultural labors, street workmen, and crushed wounds from the wheels of engines and railroad cars.

The bacillus of malignant œdema (French, *Vibrion septique*), another pathogenic organism found in the soil, is a rod-shaped organism of 3 to 4μ long and 1.0 to 1.1μ thick. It is sometimes straight and sometimes slightly curved in shape, and not infrequently grows as long threads. In the vegetative stage it is motile, but becomes motionless as the spores form within it. It is, strictly speaking, an anaërobie organism, and grows best in an atmosphere of hydrogen. It is not a gas-producer, and gives off when growing an unpleasant acid odor. On bone gelatin it produces liquefaction. It stains with the ordinary aniline dyes. It grows most luxuriantly at the temperature of the human body.

The animals that are susceptible to the action of this bacillus are guinea-pigs, mice, cattle, sheep, goats, pigs, chickens, and rabbits, though the intensity of the disease varies considerably with the animal affected. Guinea-pigs that have died as a result of subcutaneous inoculation with this organism present the condition of intense œdema of the subcutaneous and muscular tissues at and about the point of inoculation. The bacilli can easily be found in this œdematous fluid, and have been detected in the tissues of the mesentery. Horses, asses, and white rats when inoculated present only a very limited local swelling that quickly disappears without proving fatal, while hogs, dogs, cats, rabbits, ducks, chickens, and pigeons are practically susceptible to the disease. Aside from the importance of the relation of this organism to the lower animals, it is principally of interest historically as being the organism that was, prior to

the more exact methods of work of to-day, most frequently confounded with the bacillus of ANTHRAX (*q. v.*).

Bacteriological study of the air has shown that the number of organisms present are in proportion to the amount of floating matters, i. e. the amount of dust; and microscopic examination of these dust particles shows them to be covered in most cases with a group of adherent organisms. Individual bacteria alone are probably not present in the air, but, as stated, are deposited upon dust particles. The bacteria found in the air are most commonly the ordinary saprophytes, though under certain conditions disease-producing bacteria may be detected not in the open air, but in that of closed apartments occupied by persons or animals suffering from infectious diseases. In badly managed surgical wards of hospitals the bacteria concerned in ordinary suppurative processes have been detected; also the *Streptococcus* of erysipelas has in a few instances been found in the dust of these rooms. Though it has not been found floating in the air, still the bacillus of tuberculosis (consumption) has been found in quite a number of instances in the dust of apartments occupied by individuals suffering from this malady. This is particularly the case in those instances in which cleanliness is not rigidly observed—where the expectoration finds its way to the floor and is ground into dry dust by the feet of those walking about the room. As this expectoration contains the tubercle bacilli, frequently in very large numbers, it is easy to conceive of the danger of breathing the dust-laden atmosphere of such rooms. This source of infection can easily be eliminated by having the sputum from these patients collected in vessels containing water. The vessels, with their contents, should be boiled every morning. Bacteria can only be swept into the air from dry surfaces, and can not by ordinary means find their way into the air from moist surfaces. The characteristics of the pathogenic organisms named, that may under exceptional instances be present in the air of closed spaces, are as follows:

The ordinary organisms of suppuration, the pyogenic cocci, as they are called, comprise a group of micrococci that are distinguished from one another by the fact that they are of different degrees of virulence, produce different colors in the course of their artificial cultivation, and in the course of their growth are grouped differently. There are four different kinds of micrococci to which the term pyogenic is applied: The *Staphylococcus pyogenes aureus*, so called because of the golden color of its colonies; the *Staphylococcus pyogenes albus*, the colonies of which are white; the *Staphylococcus pyogenes citreus*, which grows in lemon-colored colonies; and the *Streptococcus pyogenes*, so called because it grows in chains consisting of several individual organisms joined together. The staphylococci of pus are very closely allied in their cultural peculiarities, and biologically are distinguished the one from the other only by the color of the pigments produced. They are all micrococci of about 0.87μ in diameter, grouped together like clusters of grapes. They are non-motile, and being of the micrococcus group do not form spores. They grow readily at the ordinary temperature of a room, about 68° to 70°F ., but most luxuriantly at the temperature of the body. They grow on all the ordinary culture-media—agar-agar, gelatin, potato, blood-serum, and bouillon. They liquefy gelatin, and can readily be stained with the ordinary aniline dyes. They may be found both microscopically and by culture methods in the pus from acute, circumscribed, suppurative processes, though the *Staphylococcus pyogenes aureus* is much more frequently present than either of the others. Suppurative processes similar to those from which these organisms are obtained can be reproduced in susceptible lower animals by the introduction of the organisms into the tissues; and, by the intravenous injection of the *Staphylococcus aureus* into rabbits, multiple abscess formations, most conspicuous in the muscles, the heart, and kidneys, can be produced.

The *Streptococcus pyogenes* is most commonly found in those suppurative processes which partake of the nature of erysipelas, i. e. those of a spreading tendency. As stated, this organism is grouped in the form of chains somewhat resembling strands of beads. In cultures it grows less luxuriantly than do the other pyogenic cocci, and is throughout a much less hardy organism, though the disease processes produced by it are usually of a more serious character than those resulting from the activities of the *Staphylococci*. It does not liquefy gelatin. It is not motile, and under artificial conditions not very tenacious of life. On the other hand, it appears to be of high vitality when once having gained

access to the tissues of susceptible animals, and particularly man. It stains readily with the ordinary staining reagents. This organism is so like the *Streptococcus* concerned in the production of erysipelas as in all probability to be identical with it. Inoculations of lower animals with this organism do sometimes, though not constantly, result in the appearance of a condition analogous to that from which the organisms were obtained.

The *Bacillus tuberculosis*, the other pathogenic organism that may possibly be present in the air of an inclosed space, is a rod-shaped bacillus of about 2 to 5 μ long and very slender. It is usually beaded in appearance and slightly curved or bent on its long axis. It forms spores. Under artificial conditions it grows very slowly, and either very slightly or not at all at a temperature lower than that of the animal body. It grows best on solidified blood-serum or nutritive agar-agar to which about 6 per cent. of glycerin has been added. Its growth on those media is characteristic, being very dry and coarsely granular, so that the point at which it is developing has somewhat the appearance of having been spread with dry meal. It grows also on glycerin-bouillon, forming a dry pellicle that floats upon the surface of the fluid. It does not develop upon gelatin, because of the low temperature at which this medium must be used. It does not stain by the ordinary methods, but requires a special process, so that it can be identified by this means. It is very difficult to stain, but when once stained is equally tenacious of its color.

These organisms are present in the sputum of all persons suffering from pulmonary tuberculosis, in the intestinal evacuations of all patients with tubercular enteritis, in serofulous glands, and in tuberculous bone troubles. They stand in direct causal relation to these processes. Tubercular infection can occur through the air-passages, the alimentary tract, and through wounds of the skin. The animals, including man, that are susceptible to the action of this organism are cattle, hogs, cats, rabbits, guinea-pigs, and field mice. White mice, rats, and dogs possess natural immunity.

In addition to the organisms mentioned, the bacillus of anthrax, that of typhoid fever, and that of Asiatic cholera are now and then found outside the body in either the soil or water. Besides these there are other pathogenic organisms whose relation to disease is established, but which have not been found outside of the diseased conditions with which they are associated. Of these may be mentioned the *Bacillus diphtheriae* and the *Diplococcus lanceolatus* of pneumonia, an organism that, according to Sternberg, is found in the mouth cavity of about 20 per cent. of all healthy persons.

The *Bacillus diphtheriae* is a rod-shaped organism of about the size of the tubercle bacillus, but very irregular in its morphology, which may be curved, straight, spindle or club shaped. It is always present in the false membranes in the pharynx of diphtheric patients, and rarely in the internal organs of individuals that have died of the disease. It can be isolated and cultivated upon artificial media, and when introduced into the tissues of guinea-pigs and kittens gives rise to alterations quite identical with those of diphtheria in the human being. Like tetanus, the symptoms and pathological lesions of diphtheria are due not to the dissemination of the bacteria through the body, but rather to the absorption of their poisonous products from the seat of activity in the throat.

The *Diplococcus lanceolatus* of pneumonia, though not fulfilling all the postulates necessary to prove absolutely its relation to acute fibrinous pneumonia, is nevertheless in all probability the etiological factor in the production of this disease. As its name implies, it is a coccus commonly found in pairs. It is an extremely delicate organism, so that it is with much difficulty that it can be cultivated for any length of time upon artificial media. It is possible to isolate it from pneumonic processes, however, and cultivate it artificially. When introduced into the tissues of susceptible animals, particularly mice and rabbits, the resulting process is not pneumonia, but a very acute and fatal form of septicaemia. This organism is present in the saliva of about 20 per cent. of all normal, healthy individuals.

The results of studies upon the *modus operandi* of infection lead us to believe that bacteria invade and destroy the vitality of tissues in which they are located, principally by the production of poisonous products that are of an albuminous nature. These products are the weapons, so to speak, of the invading foe and the result of the contest depends mainly upon the power of the tissues to resist the action of these agents: this they do through substances which

are chemically of a somewhat similar nature to the products of the bacteria, but which act as antidotes in neutralizing the poisons as fast as formed.

The study of bacteria in disease is by no means the only direction in which bacteriological research is being directed. The employment of bacteria in the industries is a very important problem. It is to the activities of peculiar species of bacteria that certain cheeses owe their flavor that gives to them their value as an article of food. It is by bacteria and closely allied forms that many of the organic acids are produced, and the part played by the yeast fungus, which, though not a bacterium, is usually considered with them, in the manufacture of beer, ale, and alcohol, is a very important one.

A. C. ABBOTT and J. S. BILLINGS.

Bact'erium, plural BACTERIA: See BACTERIA and BACTERIOLOGY.

Bac'tria, or **Bactria'na**: an ancient country of Central Asia, bounded N. by the river Oxus (Amoo or Gihon) and S. by the Hindu Koosh Mountains (anc. *Paropamisus*). Its boundaries are not perfectly known, but it is considered to be identical with the modern province of Balkh. This is supposed by some to have been the native country of the Aryan race. Bactria was the center of a powerful kingdom which flourished before the historical period. Its capital, Bactra, or Zariaspa, which stood on the site of the modern Balkh, was the headquarters of the Magi. In the time of Cyrus the Great, Bactria became a Persian province, and was conquered, with the rest of the Persian empire, by Alexander the Great. In the third century B. C., by the revolt of the satrap Diodotus, it gained independence, and was ruled by a dynasty of Greek origin, whose coins have not yet elucidated their succession. In the early Christian centuries it became a powerful seat of Buddhism. With Bokhara, to which it was subject, it passed under Russian control about 1868. This history of Bactria has recently been elucidated by numerous Græco-Bactrian coins and other antiquities found in the *topes* or burial-places of Afghanistan. Some of these coins present Greek letters, and also letters of a dialect of Sanskrit. See Wilson, *Ariana Antiqua* (1841); Lassen, *Indische Alterthumskunde* (1849); E. Thomas, *Bactrian Coins*, in *Journal of Royal Asiatic Society* (London, 1873).

Revised by D. O. KELLOGG.

Bac'tris [from Gr. *βάκτρον*, a stick]: a genus of palms, comprising about fifty known species, all natives of America. They are generally small trees, with slender stems and pinnate leaves. Some of them are spiny, and form thickets which are almost impenetrable. The *Bactris maraja*, or the maraja palm, bears clusters of fruit resembling small grapes, with a pulp of an agreeable flavor. The stems are used as walking-sticks.

Bactri'tes [from Gr. *βάκτρον*, a stick]: a genus of fossil *Nautiloidea*, with a straight shell, sutures simply curved, and siphon marginal. Classed with the *Orthoceratidae* by Zittel, but by Sandberger it was placed among the *Goniatites*. Several species from the Devonian and Silurian rocks are described.

H. S. WILLIAMS.

Baculi'tes [from Lat. *ba'culum*, stick]: a genus of fossil AMMONOIDEA (*q. v.*), with a straight shell with finely foliated sutures and marginal siphon. Characteristic of the Cretaceous. Though presenting some resemblance to the Palæozoic *Bactrites*, this genus is readily distinguished from it by the foliated sutures.

H. S. WILLIAMS.

Bac'up: a flourishing town of Lancashire, England; 22 miles by rail N. of Manchester (see map of England, ref. 7-G). It is situated in a beautiful valley, and is a terminus of a branch of the Lancashire and Yorkshire Railway. It has many churches and chapels, a fine market-house, and a literary institute. Here are extensive cotton-factories and several brass and iron foundries and dye-works. Coal mines are worked in the vicinity. Pop. (1891) 23,498.

Badag'ry: a seaport-town in the southwest angle of the British Niger Territory, Africa; 50 miles E. N. E. of Whydah (see map of Africa, ref. 5-C). The Portuguese once had several factories at this place, which was a market for slaves. Pop. about 10,000.

Badajoz, *va-da-khoth'*, or **Badajos'**: a province of Spain; formerly known as Lower Estremadura; bounded N. by Caceres, E. by Ciudad Real and Cordova, S. by Seville and Huelva, and W. by Portugal. Area, 8,687 sq. miles. It is for the greater part a poor and uncultivated region, and is chiefly used as pasture-grounds for immense herds of sheep and swine. Pop. (1887) 480,418.

Badajoz, or **Badajos** (anc. *Pax Augusti*): a fortified town of Spain; capital of province of same name; situated on the left bank of the Guadiana; 132 miles by rail E. of Lisbon (see map of Spain, ref. 17-C). The river is here crossed by a good granite bridge of twenty-eight arches. The town contains an old cathedral, an arsenal, and a cannon-foundry. It has manufactures of soap, coarse woolen stuffs, and leather, and a brisk contraband trade. Badajoz was the native place of the painter Morales. It has been the scene of several important military events. It was besieged and taken by the French Marshal Soult in Mar., 1811. Wellington attempted to retake it in April, but he failed. Having renewed the siege in Mar., 1812, he took it by storm on Apr. 6 ensuing, after a desperate contest, in which the British lost 4,824 men, killed and wounded. Pop. (1877) 22,965; (1887) 27,279.

Badakhshan, baa-daa'k'h-shaan': a portion of Eastern Afghanistan, lying between Bokhara and Kafiristan, W. of the Pamirs and N. of the Hindu Kush Mountains. It includes several valleys of the head-streams of the Oxus. The surface is mountainous, and a great mountain-range extends along the eastern border. Here are ruby mines and massive cliffs or quarries of lapis-lazuli. Iron, salt, and sulphur are also obtained here. The inhabitants are Mohammedans. Capital, Faizabad.

Baddeck' (originally *Bedique*): a watering-place and shire-town of Victoria co., Cape Breton island, N. S.; 40 miles W. of Sydney. Pop. 1,900.

Badeau, ADAM: soldier; b. in New York city, Dec. 29, 1831. He received an excellent education, and devoted himself to literary pursuits. He was one of the first volunteers in defense of the Union, and became a captain in 1862. He served on Gen. Sherman's staff, and was wounded at Port Hudson (May 27, 1863). In 1864 he was appointed military secretary to Gen. Grant, with the rank of colonel. This position he held until Mar., 1869. After the close of the war he received a brevet as brigadier-general in recognition of "faithful and meritorious services." He published a *Military History of General Grant* (1867-81, 3 vols.; n. e. 1885), and became in 1869 secretary of legation, and afterward U. S. consul-general in London, and U. S. consul-general at Havana 1882-84. Author of *Conspiracy* (1885); *Aristocracy in England* (1886); and *Grant in Peace* (1886). D. at Ridgewood, N. J., Mar. 19, 1895.

Baden, baa'den (literally, baths; anc. called *Ther'mæ Helvet'icæ*, i. e. Helvetian baths): a town and watering-place of Switzerland; canton of Aargau; on the Limmat; 14 miles by rail N. W. of Zurich (see map of Switzerland, ref. 2-F.). Tacitus mentions it (c. 67, *Histories*); the Goths despoiled it; the Hapsburgs held it until it became Swiss in 1415. The dispute of Zwingli and Œcolampadius with Eck was held here (1526), and the treaty which ended the Spanish Succession war was made here (1714). In Jan., 1834, the "conference of Baden" was held here, in which the representatives of Lucerne, Aargau, Thurgau, Soleure, Berne, Basel city, and St. Gall met to settle the relations of the Catholic Church with these cantons. The temperature of the baths is about 117° F. Pop. (1888) 3,887.

Baden, Grand Duchy of: a state of Germany; bordering on Alsace and Switzerland; bounded N. by Hesse-Darmstadt, E. by Würtemberg, and S. and W. by the Rhine. It has an area of 5,822 sq. miles. Pop. (1895) 1,725,464. The surface is mountainous. A long mountain-range called the Black Forest (Schwarzwald) extends along the eastern border. The highest point is the Feldberg, 4,886 feet high. The western part of Baden is a long plain extending along the Rhine from Basel to Mannheim. The chief rivers, besides the Rhine, are the Danube, which rises in Baden, and the Neckar. The valley of the Rhine has a mild climate and a very fertile soil, which is well cultivated. The grape and other fruits flourish here in abundance. Among the staple products are wheat, barley, rye, oats, pulse, potatoes, and tobacco. Good pine timber abounds in the Black Forest. The average quantity of wine produced annually is about 14,000,000 gal. The mineral produce consists almost solely of salt and building-stone. Baden is rich in mineral springs, which are much frequented as watering-places, as Baden-Baden, Badenweiler, etc. The principal manufactures are silk ribbons, hats, brushes, leather, paper, clocks, musical instruments, and machinery. The chief articles of export are wine and timber. The chief

towns are Mannheim, Carlsruhe (the capital), Freiburg, Heidelberg, Pforzheim, and Constance.

Religion and Government.—Two-thirds of the people are Roman Catholics and one-third Protestants. Baden has two universities (Heidelberg and Freiburg); an excellent system of public instruction, and the children are compelled to attend school. This state is governed by a hereditary grand duke, who in relation to foreign and military affairs is dependent upon the Emperor of Germany. He governs according to a constitution, which is among the most liberal in Germany. The parliament of Baden consists of a chamber of peers and one of sixty-three deputies. The public debt consists almost entirely of the railway debt, which at the beginning of 1891 amounted to 328,733,363 marks. The state then owned 836 of the total 907 miles of railway in the duchy. For 1891 the revenue was estimated at 65,952,000 marks, and the expenditure at 68,120,000. Hermann II., who died in 1130, was the first to assume the title of Margrave of Baden. The grand ducal family now reigning in Baden are his lineal descendants. In 1746 Charles Frederick became Margrave of Baden, which under his reign increased in extent and importance. He acquired the dignity of elector in 1803, and the title of grand duke in 1806. Having joined the Confederation of the Rhine, he gained a large accession of territory. His grandson, Charles Louis, granted in 1818 a charter which forms the basis of the present constitution. Under the impulse of the revolutionary movement which began in France in Feb., 1848, the popular party of Baden took arms to found a republic. The grand duke fled, and a constituent assembly was convened in May, 1849. By the aid of a Prussian army he was restored in July of that year. In Aug., 1866, Baden formed with Prussia a secret alliance, which was made public about Apr., 1867. Baden became in 1870 a state of the new German empire, in the federal council of which she has three votes, the whole number of votes being fifty-eight. The Grand Duke Friedrich I., born Sept. 9, 1826, came to the throne Sept. 5, 1856.

Revised by C. K. ADAMS.

Baden-Baden (anc. *Civitas Aurelia Aquen'sis*): a town and a celebrated watering-place in the grand duchy of Baden; is beautifully situated in the Oos valley at the foot of the Schwarzwald (Black Forest) Mountains; 23 miles by rail S. S. W. of Carlsruhe and 6 miles from the Rhine. It is on a branch of the Mannheim and Basel Railway. Here are warm saline springs, the temperature of which ranges from 117° to 154° F., which were much resorted to in the time of the Roman emperors. They are efficacious in cases of gout and chronic cutaneous diseases. Baden-Baden is frequented in summer by visitors from all parts of Europe and America, to the number of about 30,000 annually. In former years its gambling-hall was a great attraction, but upon the restoration of the German empire gambling here, as in the other watering-places, was suppressed. Relics of Roman sculpture and architecture have been found here. From the fourteenth century the margraves dwelt here; first in the old castle whose ruins crown the hill above the town. They removed (1479) to the new castle near the town, rebuilt in 1697, which still remains with its dungeons. The parish church was the sepulchre of the old margraves. Pop. (1890) 13,889; (1895) 14,862.

Baden-bei-Wien, baa'den-bi-veen (anc. *Ther'mæ Cætiæ* or *Panno'niæ*): a town and bathing-place of Lower Austria; on the river Schwachat; 12 miles by rail S. of Vienna. Here are warm mineral springs, which are frequented by the citizens of Vienna. Many of the Austrian nobility have mansions here, among them the imperial castle of Weilberg. Small steel tools are the principal manufacture. About 8,000 patients visit the waters annually. Pop. (1890) 11,262.

Baden-Powell, bay'den-pow'el, Sir GEORGE SMYTH, M. P., K. C. M. G., F. R. S.: British diplomat and author; b. in Oxford, Dec. 24, 1847; educated at St. Paul's School, Marlborough, and Balliol College, Oxford. Between leaving Marlborough and entering Balliol he traveled extensively in the colonial possessions of Great Britain, and published during the first year of his university career *New Homes for the Old Country: a Personal Experience of the Political and Domestic Life, the Industries, and the Natural History of Australia and New Zealand*, which has been called a cyclopædia of Australian knowledge. Commissioner to investigate West Indian affairs 1882-84; joined Sir Charles Warren in Bechuanaland 1884, and made a tour of investigation in Basutoland, Zululand, and other places in South Africa; and in 1886-87 came to Canada and the United

States to prepare a statement of the fishery dispute. Some of his other works are *Protection and Bad Times* (1879); *State Aid and State Interference* (1882); *The Truth about Home Rule* (1888); *The Political and Social Results of the Absorption of Small States by Large* (1876); *The Land Systems of India* (1892). He was knighted in 1887. D. in London, Nov. 20, 1898. C. H. THURBER.

Badge [O. Fr. *bage*; possibly of Ger. origin]: anything worn as a distinguishing mark, to show that the wearer belongs to a certain body of men, society, rank, or the like; thus a white cockade was a badge of Jacobites in England, a cockade of red, white, and blue was the badge of the Revolutionists in Paris in 1789 and after. The badge has sometimes been a part of the heraldic bearings of the wearer, but more usually it was wholly separate. The same thing is seen in national badges; thus the rose, which is the badge of England, and the thistle, which is the badge of Scotland, do not appear in the royal arms of Great Britain. R. S.

Badger [probably from *badge*, in allusion to the stripes on its head]: a carnivorous animal of the family *Mustelidae*, belonging to the genus *Meles*, *Mydaus*, *Arctonyx*, or *Taxidea*. They attain the size of a cat or medium-sized dog, are plantigrades, have a pointed skull, and feet adapted for burrowing. They have anal glands, as in the closely related skunks, the secretion of which has a disagreeable odor. They live in deep burrows, going out at evenings in search of roots, fruits, insects, frogs, etc. The common badger of Europe (*Meles taxus*) is about the size of the common fox.

The European badger.

It was formerly, and is even now, kept for "badger-drawing." The animal is put into a barrel and assailed by numerous dogs, which are trained to pull the badger out. The animal resists obstinately until overpowered, when he is allowed a short rest and is then ready for another struggle with his enemies. The animal is quite harmless if not abused. Allied species are found in Asia. The East Indian badger (*Arctonyx collaris*) is a more formidable animal. The fur of the American badger (*Taxidea americana*) is fine and soft, and is used for muffs and rugs. The species is more carnivorous than the European badger, and is remarkable for its short ears, long hair, and the rapidity with which it burrows in the earth. Revised by D. S. JORDAN.

Badger, GEORGE EDMUND, LL. D.: statesman; b. in Newbern, N. C., on Apr. 13, 1795. He graduated at Yale in 1813, practiced law at Raleigh with distinction, and in Mar., 1841, was appointed Secretary of the Navy by President Harrison. He resigned in September of that year, because Tyler vetoed the bill to recharter the U. S. Bank. He was a Senator of the U. S. for about seven years (1846-53). He opposed secession. D. at Raleigh, N. C., May 11, 1866.

Badger, OSCAR C.: commodore U. S. N.; b. in Windham, Conn., Aug. 12, 1823; entered the navy as a midshipman on Sept. 19, 1841. In 1861-62 he commanded the steamer *Anacostia* of the Potomac flotilla, was engaged at various times with the batteries on the Potomac river, and the "precision" of the fire of his vessel is more than once referred to by the commanding officer of the flotilla, Lieut.-commanding Wyman, in his reports to the Navy Department. Badger was in command of the ironclads *Patapsco* and *Montauk* in their many engagements with the forts and batteries of Charleston harbor in the summer of 1863; as

fleet-captain was with Rear-Admiral Dahlgren on board the ironclad *Weehawken* in a night attack upon Fort Sumter, Sept. 1, 1863, when he received a severe wound in the right leg. His services, character, etc., are thus mentioned by Rear-Admiral Dahlgren, in his report to the Secretary of the Navy of Sept. 2, 1863: "I shall feel greatly the loss of Commander Badger's services at this time. He has been with me for more than eight years, and his sterling qualities have rendered him one of the very best ordnance officers in the navy." In 1872 he was made captain and in 1881 commodore. Retired 1885. D. in Concord, Mass., June 20, 1899.

Badham, CHARLES: Greek scholar; b. in Glasgow, Scotland, 1813; was in his early years a pupil of Pestalozzi in Yverdon. He was graduated at Oxford in 1837. After traveling in Germany, France, and Italy for seven years, he took holy orders in 1847. In 1867 he went to Sydney (New South Wales) as Professor of Classical Philology and Logic, where he remained till his death, Feb. 27, 1884. His work was chiefly confined to editions of Plato, notably the *Philebus*, *Laws*, *Euthydemus*, *Laches* and *Symposium*. In his critical methods Badham was strongly influenced by Porson and Cobet, for whom he professed an almost idolatrous admiration. ALFRED GUDEMAN.

Badia y Lablich, baä-dee'a-ee-laab'leek, DOMINGO: traveler; b. in Barcelona, 1766; disguised as a Mussulman, and aided by a perfect knowledge of Arabic, he crossed to Africa, 1801, and after two years' residence in Morocco made a tour to Mecca, traveling through Barbary, Greece, Syria, and Egypt; first Christian to visit Mecca since the institution of Islam; returning to Spain, was appointed prefect of Cordova 1812; published *Voyage d'Ali-Bei en Afrique et en Asie* (Paris, 1814). D. in Syria on his way to Damascus, Aug. 30, 1818. C. H. T.

Badlam, STEPHEN: b. in Milton, Mass., Mar. 25, 1748; entered the army in 1775; commanded the artillery in department of Canada; became a Revolutionary officer, and was made brigadier-general of militia in 1779. D. at Dorchester, Mass., Aug. 24, 1815.

Bad-Lands (originally called *Mauvaises terres pour traverser* by the French explorers, from the extreme irregularity of the surface): Bad-lands are common in the arid Western regions of the U. S., where the absence of vegetation enables the scanty rains to wash away the fine unconsolidated sediments, often old lake-beds, and carve them into innumerable hills and ravines of ever-varying yet systematic form. They are generally best developed near the line of some relatively large stream, whose valley has been deepened on account of a general uplift of the land in recent geological time, thus enabling the small wet-weather branches to dissect the weak strata for several miles on either side in an effective manner. Many remarkable fossils of extinct mammals have been preserved in the sediments of extinct Western lakes; the discovery of the fossils is greatly aided in the bad-lands from the thorough dissection of the mass by ravines and by the barrenness of the surface. W. M. DAVIS.

Bad-Lands: as a specific geographical name, refers to an extensive region lying partly in South Dakota and partly in Nebraska, between the North Fork of the Platte and the South Fork of the Cheyenne rivers. It affords the refuge of a natural fortress to the great family of Sioux Indians in their wars with the U. S., but is more famous for the paleontological work done there by O. C. Marsh, D. D. Owen, E. D. Cope, and other geologists.

Badminton: seat of the Duke of Beaufort in the south of Gloucestershire, England, from which have been named a kind of claret-cup and a game somewhat resembling lawn-tennis, played with a shuttlecock instead of a ball.

Baedeker, bay'de-ker, KARL: German publisher; b. in Essen, Nov. 3, 1801; began publishing in 1827 at Coblenz, where he died Oct. 4, 1859. As the originator of a celebrated series of guide-books, his name is favorably known to all travelers. The first guide-book published by Karl Baedeker was a small book on the Rhine, 1839; the series now comprises admirable guides to every country much visited by travelers, and is published in all the principal languages. The business was removed to Leipzig in 1872. C. H. T.

Baehrens, bay'rens, PAUL HEINRICH EMIL, Ph. D.: classical scholar; b. at Bayenthal, near Cologne, Sept. 24, 1848; took his degree (Ph. D.) at Bonn in 1870; became Professor of Latin in Groningen 1877; d. there Sept. 26, 1888. He

was a man of wide erndition, astounding diligence, and great literary productivity. The permanent character of much of his work is, however, partially invalidated by the extreme recklessness of his critical method, and by the passionate invective against opponents which too often defaces his writings. His most valuable contributions to Latin philology, for he was but an indifferent Greek scholar, are *Poete Latini minores* (5 vols.); *Catullus*, with commentary (2 vols.); *Fragmenta poetarum Romanorum*. ALFRED GUEDEMAN.

Baena, baā-ay'nāā: a town of Spain; province of Cordova; sitnated on the Marbella; 32 miles S. E. of Cordova (see map of Spain, ref. 18-E). It occupies the site of an ancient Roman town. Grain and oil are exported from this place. Pop. (1887) 12,036.

Baer, baa'er, KARL ERNST, von: a Russian naturalist of German extraction: b. in Piep, Esthonia, Feb. 17 (28), 1792. He became in 1819 Professor of Zoölogy at Königsberg. He wrote, besides other works in German, a *History of the Development of Animals* (2 vols., 1828-37). In 1834 he removed to St. Petersburg, and was appointed librarian of the Academy of Sciences. He made several discoveries in physiology and zoölogy. D. in Dorpat, Nov. 28, 1876.

Baeyer, bi-er, ADOLPH, von: chemist; b. in Berlin, Oct. 31, 1835. He was Professor of Chemistry in the Gewerbe Akademie at Berlin (1866), but afterward became professor in the University of Strassburg (1872), and, after Liebig's death, was called to Munich (1875). He has carried on many important investigations, particularly in the field of organic chemistry. Among the subjects to the development of which his work has largely contributed are indigo, the phthaleins, benzene. He discovered a method for the artificial preparation of indigo.

Baeza, baā-ay'tha (anc. *Beatia*): an old town of Spain; province of Jaen: 22 miles N. E. of the city of Jaen. It contains a cathedral and several monasteries in the Gothic style, which, with other buildings, present an imposing appearance. The university, established in 1533, has ceased to exist in recent times. Under the Moors the city was the capital of the kingdom of Bajasat, and is said to have had 150,000 inhabitants. Cloth, leather, and soap are made here. Pop. (1887) 13,911.

Baffa, baaff'a (anc. *Pa'phos*): a seaport-town on the southwest coast of the island of Cyprus. It was once an important place, but is now ruined or decayed and nearly deserted. In ancient times Paphos was a beautiful city, having several temples, and was a famous place for the worship of Venus. Lat. 34° 47' N., lon. 32° 26' E.

Baffin, WILLIAM: English navigator; b. probably in London in 1584; accompanied James Hall in an Arctic expedition in 1612, and on a subsequent expedition discovered Baffin's Bay in 1616. He wrote two narratives of these voyages, and gave in the first a new method of ascertaining the longitude at sea by observation of the heavenly bodies. He was killed at the siege of Ormuz, May 23, 1622. See Clements R. Markham, *Voyages of William Baffin, 1612-22* (London, 1881, for the Hakluyt Society).

Baffin's Bay: a large gulf or inland sea of North America; communicates with the North Atlantic by Davis's Strait, and with the Arctic Ocean by Smith's Sound. It is about 950 miles long, and has an average width of about 300 miles. The greatest depth is about 1,050 fathoms. The shores are generally high and rocky, backed by ranges of snow-covered mountains. It was first explored by William Baffin in 1616. Whales abound here.

Bagatelle [Fr., from Ital. *bagatella*, trifle]: a game somewhat resembling billiards. A bagatelle-table is usually about 7 feet long and 21 inches wide, and is lined with cloth. The other apparatus of the game consists of small ivory balls and a mace or cue.

Bag'dad: a pashalic forming the S. E. portion of Asiatic Turkey, bordering on Arabia and Persia. It extends from the Persian Gulf northwestward about 600 miles, and is intersected by the Euphrates and the Tigris. It includes the ancient Chaldaea, Susiana, and Mesopotamia. The part which lies between the Euphrates and Arabia is a barren, sandy plain. The soil of some other parts is fertile. The population is a mixture of Turks, Arabs, Kurds, Armenians, etc. Area, 54,503 sq. miles. Pop. (1885) 850,000.

Bagdad: a celebrated city of Asiatic Turkey; formerly the capital of the empire of the caliphs, and now the capital of the pashalic of Bagdad; situated on both banks of the

Tigris; about 60 miles N. of Babylon; lat. 33° 20' N., lon. 44° 22' 38" E. The river is here about 700 feet wide, and is crossed by a bridge of boats. The appearance of the city at a distance is rendered picturesque by groves of palm-trees and numerous minarets, but the streets are narrow, crooked, and dirty. The dwelling-houses, having no windows on the side next to the street, present an unpleasing exterior, but the interiors are often richly decorated. Bagdad contains about 100 mosques, some of which have beautiful domes and lofty minarets. Here are large bazaars filled with the products of European and Turkish markets. It was formerly a very magnificent city, and was for many ages the great emporium of commerce of the surrounding countries, but its trade has declined. It has manufactures of silk and cotton stuffs and red and yellow leather. In 1831 an inundation destroyed a large part of the city. Bagdad was founded by the Caliph Almansur about 763 A. D., and built out of the ruins of Ctesiphon. In the ninth century it was enlarged by Haroun-al-Raschid, who built here a fine palace. In the tenth and eleventh centuries it is said to have had 2,000,000 inhabitants. It was sacked by Hulaku about 1258, and after several changes of masters was conquered by the Turks in 1638. Pop. (1885) 180,000.

Bagdad, or Boea del Rio, bō'kaā-del-ree'ō: a town on the Rio Grande, near its mouth, in the Mexican state of Tamaulipas; was during the civil war in the U. S. a place of great importance to blockade-runners, who carried on from this point a heavy trade with Western Texas (see map of Mexico, ref. 4-I).

Bagehot, bāj'ot, WALTER: an English publicist, whose writings went far to restrict the scope of deductive and enlarge that of historical economics. He was born in Langport, Somersetshire, Feb. 3, 1826; educated at Bristol and University College, Oxford, where he was graduated in 1848. Four years later he was called to the bar, but he entered then his father's banking-house, and made that his lifelong business. A witness in Paris of the *coup d'état* of Dec., 1851, he wrote a series of letters to a London paper defending the conduct of Louis Napoleon as advantageous to France. In 1858 he married a daughter of James Wilson, founder of *The London Economist*, and soon became editor of that periodical, continuing this duty until he died. His books are *The English Constitution* (London, 1867), a comparative treatment of its tendencies and utilities; *Physies and Politics* (London, 1872); *Lombard Street* (London, 1873; 8th ed. 1878), a treatise on money and its functions of great vogue; and *The Depreciation of Silver* (1877). Posthumously, under the editorship of R. H. Hutton, appeared *Literary Studies* (1879); *Economic Studies* (1880); and *Biographical Studies* (1881), a book of critical literary ability. A complete edition of his works was published about 1888 by an insurance company of Hartford, Conn. D. in Langport, Mar. 24, 1877. Bagehot in early life was a disciple of Ricardo, but an independent investigator, who gave a kindly reception to the historic school when it arose. He did much to clear the field for it. To him the "abstract economic man" of the English school was a good working hypothesis for highly organized industrial conditions, where competition effects prompt transfers of capital and labor from one employment to another. Such conditions he considered to be substantially realized for Great Britain. But the theory was limited, and did not apply to other countries and times; it was insular, and convenient for use in Lombard Street or in the great markets of the world. Outside of the abstractions of the orthodox school lay the concrete world, where quite other methods were requisite, which give rise to a general science of sociology. His influence was marked in showing the restrictions which rest upon the *a priori* method, and the necessity of the historical investigation of wealth as an instrument for the moral and material development of human societies. For this sort of research he displayed great ability, though he wrought in it only in a fragmentary way. His treatment of the "middleman," or the function of superintendence, was the amplest and clearest then extant, and throws light on practical industrial co-operation.

Baggesen, baag'ge-sen, JENS: Danish poet; b. at Korsör, in the island of Seeland, Feb. 15, 1764. He was highly gifted, but of a weak character; with a fine fancy, but of a restless spirit; excitable, but without passion; fantastic, but without imagination. Born between two periods, he could neither stay with the old nor march with the new. He was enthusiastically received by the educated, but he never

reached the great public. Born a Dane, and married first to a German, then to a French lady, he fluttered from one country and language and literature to another—made a noise in all, and became great in none. Of his Danish writings, his *Komiske Fortællinger*, in verse (1785), and his *Labyrinthen*, in prose (1792-93, 2 vols.), are entertaining. Of his German writings, his *Haideblumen* are not without merit. His letters, of which he wrote thousands in different languages, are very interesting. D. in Hamburg, Oct. 3, 1826.

Baginsky, baā-khin'skĕe, ADOLF: German specialist in children's diseases; b. at Ratibor, May 22, 1843; M. D., University of Berlin, 1866; became Lecturer on Diseases of Children, University of Berlin, 1882; author of *Handbuch der Schulhygiene* (Stuttgart, 1883); *Lehrbuch der Kinderkrankheiten* (Berlin, 1884; 3d ed. 1889); *Praktische Beiträge für Kinderheilkunde* (Tübingen, 1884); editor of *Archiv für Kinderheilkunde* (Stuttgart).

Bagirmi, baā-geer'mĕe, or **Baghirmi**: a sultanate of Central Africa; southeast of Lake Chad; on the lower Shari river, between Bornu and Wadai. Area, 56,600 sq. miles. The greatest length is about 250 miles. Capital, Massenya. The surface is for the most part nearly level; the soil is the most fertile and the best watered of the Sudan. It was founded by a heathen chief about 300 years ago, but Mohammedanism soon became the ruling religion. It is tributary to both Bornu and Wadai. The natives are physically well-formed and warlike. Bagirmi was visited by Dr. Barth in 1852. Pop. about 1,500,000. See Barth's *Travels in Central Africa*.

Baglivi, baā-glee'vĕe, GIORGIO, F. R. S.: an Italian medical writer; b. at Ragusa, Sept., 1669. He became in 1692 the pupil of Malpighi at Rome, and subsequently Professor of Anatomy at the College Della Sapienza in that city. He gained distinction as the author of the system of *Solidism*—i. e. the theory that diseases originate in the solids. He published *Opera Omnia Medico-practica* (1704). D. in Rome, Mar., 1707.

Bagnacavallo, BARTOLOMEO RAMENGI: See RAMENGI.

Bagnères de Bigorre, baān'yār'de bĕe'gōr' (anc. *Vicus Aquen'sis*): a town and fashionable watering-place in the S. of France; department of Hautes-Pyrénées; on the river Adour; 14 miles by rail S. S. E. of Tarbes (see map of France, ref. 9-D). It is situated in the romantic valley of Campan, and is among the most frequented watering-places in France. It has a college, a public library, a theater, a museum, and good hotels. The springs, of which there are thirty-two, and whose temperature ranges from 72° to 124° F., are visited by about 25,000 persons annually. Barèges and woolen stuffs are made here. Pop. (1891) 8,638.

Bagnères de Luchon, baān'yār'de lū'shōn' (anc. *A'qua Convena'rum*): a town of France; department of Upper Garonne, and in the Pyrenees; 42 miles by rail from Bagnères de Bigorre (see map of France, ref. 9-E). It has sulphurous thermal springs, and is a place of summer resort. Pop. (1891) 3,528. About 10,000 patients visit the town annually.

Bagnes: a French word signifying "galleys"; is now the name of the convict prisons of France in which criminals were confined and employed at hard labor, since the galleys were abolished in 1748. Large numbers of convicts were thus confined at Brest and Toulon, and were employed in mechanical and other work. Various trades or mechanical arts were taught to the convicts. In the reign of Napoleon III. the bagnés were gradually abolished, and the penal colonies substituted in their place.

Bagnes-le-Chable: a parish and village of Switzerland; in Valais, on the Dranse; 12 miles E. S. E. of Martigny. Pop. of the parish, which is coextensive with the Val-de-Bagnes, 4,256. This valley was inundated in 1818 by a *débâcle* which carried away 400 cottages.

Bago'as: a Persian eunuch and soldier in the service of Artaxerxes Ochus. In 338 B. C. he poisoned that king and several of his sons. He raised to the throne of Persia Darius Codomannus, who put Bagoas to death about 336 B. C.

Bag'ot, Sir CHARLES: an English diplomatist; b. in Blithfield, Staffordshire, Sept. 23, 1781. He was minister plenipotentiary at Washington 1816-19; ambassador to St. Petersburg 1820-24; to Holland 1824-34; to Austria 1834-42. He in 1842 became Governor-General of Canada, where he died May 18, 1843.

Bagot, LEWIS: b. in London, Jan. 1, 1740; was educated at Westminster School and Christ Church, Oxford, England. In 1777 he became dean of Christ Church, and was made Bishop of Bristol in 1782. He was transferred to Norwich in 1783, and to St. Asaph in 1790. D. in London, June 4, 1802.

Bagpipe: a wind instrument supposed to be of great antiquity. It consists of a leathern bag which the player inflates by blowing with his mouth through a tube, or, in some cases, by a bellows worked by the elbow. The music proceeds from three or four pipes, whose mouthpieces are inserted into the bag, the wind being forced out by pressing the bag under the arm. One of the pipes, called the "chanter," is pierced with eight holes, while the others, or "drones," sound each only one continuous low note. Though generally fallen into disuse, the bagpipe is still a popular instrument in the Highlands of Scotland and the west of Ireland, and the Highland regiments are always accompanied by their pipers, dressed in proper costume. The bagpipe is still used in Southern Italy, as formerly in Spain.

Bagradites: the name of a royal family of Georgia and Armenia; of Jewish extraction. In Armenia from a very early period it had the privilege of crowning the Armenian monarchs. In 748 it came to regal authority, and maintained it till 1079. In Georgia the Bagradites ruled the country from 574 till 994 in direct line, and in collateral branches till 1424.

Bagra'tion, PETER IVANOVITCH: a Russian general; b. in 1765; was descended from the noble Georgian family of Bagradites. He served with distinction under Suwarow in Italy in 1799. In Nov., 1805, he kept in check for six hours a superior force of French under Murat. He led the vanguard at Austerlitz, Dec., 1805, and rendered important services at Eylau and Friedland (1807). He was mortally wounded at Borodino, Sept. 7, and d. Oct. 7, 1812.

Bagshot Beds [named from Bagshot Heath, Surrey]: a British geologic formation of Eocene age. The Eocene rocks of England occupy two synclinal basins in the southeastern part of the island. The Bagshot beds constitute the upper part of the series in the London basin, where they rest on the London clay. They range in thickness from 200 to 700 feet, and consist chiefly of sand. In the lower part are clays and marls containing marine shells and the remains of sharks and turtles. They are ordinarily classified in three subdivisions, of which upper is referred to the newer Eocene, and the middle and lower to the Middle Eocene. The sandy beds are in the main unconsolidated or feebly coherent, but at a few horizons are cemented into firm sandstones. In districts where much of the formation has been eroded away, scattered blocks of the sandstone remain, and the distribution of these "Druid stones" is popularly ascribed to prehistoric races. See STONEHENGE.

Bahama, ba-haa'ma, **Grand**: the most western island of the Bahama group, 57 miles E. of Florida. It is 74 miles long and 9 miles wide. Area, 428 sq. miles. The soil is moderately fertile. Pop. 1,020.

Bahama Islands, or **Lucayos**, loō-kī'ōs: a group of islands in the Atlantic Ocean; lying N. E. of Cuba, from which they are separated by the old Bahama Channel. They belong to Great Britain. They consist of 26 islands, 647 keys, and 2,387 reefs and cliffs, together 3,060 islands and islets, 25 of which are inhabited. They extend like a chain from lat. 21° to 27° 31' N., in a northwestern direction for a distance of about 700 miles. They are generally long and narrow, and have little elevation above the sea. The climate in winter is very mild and salubrious. The soil is thin, but produces maize, cotton, oranges, pineapples, etc. The area is 5,450 sq. miles. Capital, Nassau, in New Providence. In 1890 the receipts amounted to £54,826, and the expenses to £48,688. The value of the imports was £222,512, and of the exports £168,121. The names of the larger islands are Grand Bahama, Abaco, Eleuthera, New Providence, Andros, San Salvador (or Cat island), Exuma, Long island, Crooked island, Inagua, and Caicos. These are mostly covered with forests of the madeira tree, the mastie, *lignum vitæ*, etc. San Salvador (or perhaps Watling's island) was the first land discovered by Columbus in 1492. The Bahamas were then inhabited by a gentle race of aborigines, who were soon exterminated by the Spaniards. The English obtained possession of them in 1629. The chief island politically is New Providence (area, 85 sq. miles), on which is the capital, Nassau (pop. 12,000), a handsome city, and a winter health-re-

sort for Americans and West Indians. Among the exports are canella, arrowroot, sponges, salt, conch-shells, eleuthera bark, fresh and canned pineapples, etc. Pop. (1888) 48,000.

Revised by M. W. HARRINGTON.

Bahia, bãă-ce'ãã (i. e. bay): a state of Brazil; bounded N. by Pernambuco, E. by Sergipe and the Atlantic Ocean, S. by Minas Geraes and Espírito Santo, and W. by Goyaz. Area, 164,649 sq. miles. The large river São Francisco flows along or near the northwestern border of the province, which is traversed by a high mountain-range about 200 miles from the seacoast. The soil of the lowlands is fertile. The chief products are sugar, tobacco, cotton, rice, manioc, and coffee. Diamonds and gold are found in this province. Pop. (1888) 1,821,089.

Bahia, or **São Salvador**, sowni'-saül-vãã-dör': an important maritime city of Brazil; capital of province of same name; situated about 740 miles N. N. E. of Rio Janeiro; lat. 13° S., lon. 38° 32' W. The name is derived from Bahia de Todos-os-Santos (All Saints' Bay), at the entrance to which it is pleasantly situated. The upper part of the city is several hundred feet higher than the lower, and presents a very fine appearance from the sea. The upper town is the most populous, most beautiful, and contains the important public buildings, among which are the governor's palace, the cathedral, the theater, the mint, and many fine churches and convents. It is the seat of the Archbishop of São Salvador. A public library was founded here in 1811. The harbor of Bahia is one of the best in America, and admits vessels of the largest size. It is defended by several forts, and has a lighthouse at the entrance. The chief exports of Bahia are sugar, cotton, coffee, tobacco, rum, dye-stuffs, hides, and horns. Bahia is the oldest city of Brazil, having been founded in 1549, and was until 1763 the capital. It is, next to Rio de Janeiro, the largest commercial city of Brazil. The Bahia Steam Navigation Company, organized in 1861, has a large number of steamers in use here. Pop. estimated (1890) 80,000.

Bahia Honda: a port of north Cuba, W. of Havana; has one of the finest harbors in Cuba. Pop. 1,900.

Bähr, bayr', or **Baehr**, JOHANN CHRISTIAN FELIX: an eminent German philologist; b. in Darmstadt, June 13, 1798, and educated at Heidelberg, where in 1826 he became Professor of Classical Literature. He published a *History of Roman Literature* (Karlsruhe, 2 vols., 1828; 4th ed. 1868-73; with supplement of Christian Latin literature, 3 parts, 1836-40), and edited several of Plutarch's *Lives*. He also published a Latin translation of Herodotus, with valuable notes (1856-61). D. in Heidelberg, Nov. 28, 1872.

Bahraich, bãă-rîch': city and district of Faizabad, Oudh, India. The district is in lat. 27° to 28° N., lon. 81° to 82° E. Area, 2,741 sq. miles; pop. 900,000. It is at the foot of the Himalayas, on the Goggra river. The city is 62 miles N. E. of Lucknow. It is a city of great activity, and has manufactures of fireworks and native cloth. Pop. 19,439.

Bahrđt, baart, KARL FRIEDRICH: German theologian; b. in Bischofswerda, Aug. 25, 1741. A representative of extreme rationalism in religion, he occupied various positions as professor of theology and preacher. Died as an innkeeper near Halle, Apr. 23, 1792. See J. Leyser, *Karl Friedr. Bahrđt* (Neustadt, 1867; 2d ed. 1870). JULIUS GOEBEL.

Bahrein, bãă-rayn', **Islands** (anc. *Ty'los* or *Ty'ros*): a group of British islands in the Persian Gulf; near the Arabian coast; about 200 miles S. of Bushire. The chief island is 27 miles long and 10 wide, and is surrounded by several small islands. Manama, the capital, on the northern extremity, has a good harbor. These islands derive their importance from their pearl-fisheries, the annual product of which is estimated at \$1,000,000. Area, 270 sq. miles. Pop. about 25,000.

Bahr-el-Abiad, baar'-el-ãã-beë-aad' [Arab., white stream]: the old Arabic name of the White Nile, which is the main branch of the Nile after it receives the Bahr-el-Ghazal, and until it unites with the Blue Nile at Khartum. The river is said to be navigable 1,000 miles above Khartum. The upper divisions of the Nile above the confluence of the Bahr-el-Ghazal going south are Bahr-el-Jebel (river of the mountains), or the Kir, a name applied below the outlet of Albert Nyanza; and the Victoria Nile, which unites the Victoria and Albert Lakes. The White Nile also receives the eastern tributary, Sobat, about 90 miles below Bahr-el-Ghazal. See NILE.

Bahr-el-Azrek, baar'-el-ããz-rek' [Arab., blue river]: one of the two great branches of the Nile. It unites with the other branch, the Bahr-el-Abiad ("white river") in lat. 15° 37' N. Its sources are in lat. about 13° N. at the center of Tana Lake, and 37° 30' E. long., but its course, traced through all its windings, will probably exceed 1,000 miles. In this distance it descends with immense impetuosity from an elevation of 9,000 feet to one of 1,500 feet. The Blue river is navigable up to Fazogl, under the twelfth parallel, 1,500 miles from Rosetta. Its upper waters before it breaks through the mountains and reaches its confluence with Yabus river are known as the Abai, a rapid mountainous stream which makes an enormous fish-hook bend from Lake Tana to the Yabus, extending over three degrees of latitude and five of longitude, encircling the southern end of the Abyssinian mountains.

Bahr-el-Ghazal, baar-el-gaã-zaal' (i. e. Gazelle river): a name applied to two distinct African rivers, and sometimes to the area of their basins, both in the Sudan. One in the Eastern Sudan joins the Bahr-el-Jebel to form the Bahr-el-Abiad, or White Nile. Its basin is very extensive, reaching from 5° to 15° N. lat. and 23° to 30° E. lon. It is very rich in river courses, some of which, however, come from the desert and do not bring down much water. The principal river contains much water, but has often no perceptible current, and is much obstructed by vegetable growths. The southern watershed of its valley forms the northeastern boundary of the Congo Free State. The basin includes the northwest of British East Africa, a large part of Dar-Fur, Dar-Fertil, and some unnamed territory. The second is a desert watercourse on the east side of Lake Chad. It lies in the district between Wadai and Borku, east of Kanem and northwest of Dar-Fur, between the parallels 13° and 18° N. and the meridians 16° and 22° E. It is a desert area, inhabited by Arabs, and is very little known. M. W. H.

Bahrens: See BAEHRENS.

Baiæ (mod. *Baja*, baa'yaã): an ancient town of Italy; beautifully situated on the bay of same name, in Campania, 10 miles W. of Naples. It was the favorite watering-place of the ancient Romans, who were attracted by the beauty of its position and adjacent scenery, the amenity of the climate, and the virtues of its warm mineral springs. Julius Cæsar and Pompey had country-houses at Baiæ, and Horace preferred it to all other places. The society of Baiæ was proverbially voluptuous and dissolute. Ruins of ancient temples and villas are visible in this vicinity. These include temples of Mercury, of Venus, and of Diana, all of which are in reality only parts of Roman baths.

Baier, bi'er, JOHANN WILHELM: German Lutheran theologian; b. in Nuremberg, Nov. 11, 1647; d. as court-preacher in Weimar, Oct. 19, 1695. His *Compendium theologicæ positivæ* (Jena, 1686; last ed. Berlin, 1864) was for long years a standard manual.

Baïf, bãă'eef', JEAN ANTOINE, dc: French poet; member of the PLÉIADE (*q. v.*); b. in Venice, Feb., 1532; d. in Paris, 1589. The son of Lazare Antoine de Baïf, prothonotary of Francis I. and ambassador to Venice, the young man had the best education possible in the Greek and Latin classics. He was a fellow-student of Ronsard, and helped the latter much in his Greek studies. In 1551 he published a French version of the Latin distiches written for the tomb of Marguerite de Valois. In 1552 appeared his *Ravissement d'Europe* and his *Amours de Meline*; in 1555 his *Amours de Francine*. After a sojourn in Italy he translated the *Antigone* of Sophocles and the *Eunuchus* of Terence (1565). In 1567 he wrote *Le Brave*, a comedy in the manner of Plautus. In his later years he attempted to introduce ancient meters into French and to simplify French orthography. To this end he devised an academy of music and poetry, which was authorized by Charles IX. and endured twenty years (from Nov., 1570). In 1574 he published his *Étrennes de poésie française*, in which he used the orthographic system of Ramus. In 1576 he brought out two books of *Mimes*. See *Choix des poésies de Baïf*, with introduction, by Becq de Fouquières (Paris, 1874); *Les Mimes, etc., de Baïf*, ed. by Blanchemain (2 vols., Paris, 1880). A. R. MARSH.

Baikal, bi'kaal [Tartar, the rich lake], called also the HOLY SEA: a large lake in the southern part of Siberia, between Irkutsk and Transbaikal; an expansion of the river Angara. It is situated between lat. 51° 28' and 55° 41' N., and lon. 103° and 110° E. It is about 400 miles long, and has an average width of nearly 45 miles. Area, estimated at

13,200 sq. miles. It is in some places 300 fathoms deep, and lies in a depression or crevice, with the Baikal Mountains on the west and the Bargasinsk on the east, which approach the lake so as to divide it into the great and little parts. It receives the Selenga, Barguzin, and other rivers, and discharges its waters by the Angara, an affluent of the Yenisei. In summer steamboats navigate this lake, which is frozen from November to April. Here are valuable seal and sturgeon fisheries. The waters of this lake are said to have a curious ground swell called *zyb*, the nature of which has never been explained. One basis, among many, for the legend of Prester John, the mythical Christian king of the twelfth century in Farther India, has been found in Gur Khan of Kara-Khitai, whose dominions lay from Baikal Lake to the great Chinese wall.

Baikie, WILLIAM BALFOUR: traveler; b. at Kirkwall, Orkney, Aug. 27, 1825; assistant surgeon Royal Navy, 1848; surgeon and naturalist to the Niger expedition (1854), in which, after the death of the captain, he succeeded to the command of the *Pleiad*, which was wrecked on the second expedition in 1857. He founded a settlement, built roads, opened the Niger to navigation, and collected a native vocabulary. D. at Sierra Leone, Dec. 12, 1864. Author of *List of Books and Manuscripts Relating to Orkney; Observations on the Haussa and Fulfulde Languages* (1861); and of works on natural history. C. H. T.

Bail [Old Fr. *bail*, power, eustody; *bailler*, control, deliver]: The original signification of this word is to "deliver." It is used both as a noun and a verb, and refers to property, as well as to a person, in the custody of the law. It implies safe-keeping or delivery for a special purpose. It may signify the delivery of a person arrested, either on civil or criminal process, from the eustody of the sheriff or some other officer of the law, into the safe-keeping of persons who bind themselves for his appearance in court or obedience to its processes. Again, it denotes the persons into whose keeping the party discharged from actual arrest is delivered, and sometimes the amount of security given or required for the defendant's appearance.

In all civil actions the defendant may give bail as a matter of right, and generally in criminal proceedings, unless he is charged with a capital offense. The amount of bail is in the discretion of the court, controlled by the somewhat vague constitutional provision that excessive bail shall not be required.

Bail below, or *bail to the sheriff*, is bail given to the sheriff to secure the appearance of the defendant in the action, or his putting in special bail on a required day. **Bail to the action**, or *bail above*, is given either to satisfy the judgment if one should be recovered, or to deliver up the defendant to custody. In some of the States the defendant when arrested gives bail to render himself at all times amenable to the process of the court, which takes the place of bail below and bail above.

Common bail is the formal entry of fictitious security with the clerk of the court. It is given for the appearance of the defendant and his future obedience in cases where he has not actually been arrested. **Special bail** is responsible bail, given when the defendant has actually been arrested. Bailors must in general possess certain prescribed qualifications. They must be *freeholders* or *householders*; must be within reach of the process of the court, and must not be privileged from arrest; must be competent to make a contract, and of sufficient means to pay the amount for which they become responsible. They can be compelled, on suitable application in the action, to justify; this means, to show by satisfactory evidence that they possess the qualifications required by law.

While the prisoner, when released on bail, is in fact generally allowed to go at large, he is regarded by the law as in custody of his bail. They can take possession of his person at any time or in any place, even though it is necessary to break into his house. By delivering him to the sheriff and complying with legal forms of surrender, they can discharge themselves from liability.

It should be remarked that when a prisoner is held under final process—that is, process to enforce a judgment of the court—he can not be released on bail. However, by statute law he is sometimes allowed in civil cases, on giving security of the nature of bail, to be released from strict confinement in jail, at the same time being partially restrained of his liberty by the action of rules defining territorial limits beyond which he can not lawfully go. T. W. DWIGHT.

Bailey, GAMALIEL, M. D.: b. at Mt. Holly, N. J., Dec. 3, 1807. In conjunction with J. G. Birney he founded in 1836 the *Cincinnati Philanthropist*, an anti-slavery journal. Although his press was destroyed by a mob, he continued the publication till 1847, when he issued the first number of the *National Era* at Washington. The celebrated novel *Uncle Tom's Cabin* first appeared in this journal. Died at sea, on his way to Europe, June 5, 1859.

Bailey, GILBERT STEPHENS, D. D.: b. at Dalton, Pa., Oct. 17, 1822; educated at Oberlin College, O.; pastor of a Baptist church in Cornwall, N. Y., 1845–46; pastor in Illinois 1846–63; superintendent of missions for the Baptist General Association of Illinois 1863–67; and from 1867 to 1875 secretary of the Baptist Theological Union at Chicago. He is the author of several works, mostly denominational. Dr. Bailey originated the system of "ministers' institutes" now prevalent in the Baptist denomination, holding the first at Chicago in 1864.

Bailey, JACOB WHITMAN: soldier and naturalist; b. at Ward (now Auburn), Mass., Apr. 29, 1811; graduated at West Point 1832; served as lieutenant of artillery in Charleston harbor (1832–33) during threatened nullification of South Carolina; at Bellona arsenal, Va., 1834–35; as assistant professor at Military Academy 1834–35, and acting Professor of Chemistry, Mineralogy, and Geology 1835–38, becoming, upon resigning his lieutenantcy, July 8, 1838, full professor, which position he held, to the great benefit of the academy and advantage to cadets, till his death. He was the inventor of *Bailey's Indicator*, and of many improvements in the microscope, in the use of which he achieved the highest distinction, particularly in the examination of infusoria, algæ, and the products of the deep-sea soundings of the coast survey, U. S. exploring expeditions, and the Atlantic telegraph plateau, of which he made valuable collections and numerous delineations, bequeathing them to the Boston Society of Natural History. He was president of the American Association for the Advancement of Science 1857, and member of various societies of savants at home and abroad, and author of over fifty able papers in various scientific journals. His health, always delicate, was completely shattered by exposure in the Hudson river while attempting to rescue his wife and daughter, lost in the burning of the steamer *Henry Clay*. D. at West Point, Feb. 26, 1857.

Bailey, JAMES MONTGOMERY: editor of *The Danbury News*; a well-known humorist; b. in Albany, N. Y., Sept. 25, 1841; commenced journalism on the *Danbury Times* (afterwards *News*) in 1865, which paper soon acquired a celebrity throughout the U. S. from an incessant flow of humor which the pen of its editor imparted to its columns. He published *The Danbury News Man* (1872) and *Life in Danbury* (Boston, 1873). D. in Danbury, Mar. 4, 1894.

Bailey, JOSEPH: soldier; b. in Salem, O., Apr. 28, 1827; served on the Federal side in the civil war, and distinguished himself by his successful attempt in 1864 to save thirteen gunboats, etc., of the Mississippi flotilla. The water of the Red river, La., having fallen so low that Admiral Porter's squadron was unable to pass the rapids, Col. Bailey in the course of eleven days constructed dams which, by raising the water, enabled the boats to descend safely, for which he received the thanks of Congress and was made a brigadier-general. D. near Nevada, Vernon co., Mo., Mar. 21, 1867.

Bailey, LIBERTY HYDE: horticulturist; an associate editor of this cyclopædia and editor of *American Gardening*; b. in South Haven, Mich., Mar. 15, 1858; graduated at the Michigan Agricultural College in 1882; two years assistant to the late Dr. Asa Gray at Harvard University; Professor of Horticulture and Landscape Gardening at the Michigan Agricultural College 1885–88; then Professor of General and Experimental Horticulture at Cornell University; employed in 1886 on the geological and natural history survey of Minnesota; has given particular attention to the genus *Carex*, upon which he has published a number of papers and two preliminary monographs; author of *Annals of Horticulture*, a yearly *résumé* of progress in horticulture, which has now reached four volumes; also *Talks Afield, about Plants and the Science of Plants; Horticulturists' Rule-book; Nursery-book, or Handbook of Plant Propagation and Pollination; Field Notes on Apple Culture; Cross-breeding and Hybridizing; American Grape Training*; also many special reports and monographs.

Bailey, LORING WOART: See the Appendix.

Bailey, NATHAN: an English lexicographer and classical scholar, who kept a school at Stepney, where he died June 27, 1742. In 1721 he published his *Universal Etymological English Dictionary*, the first English dictionary which aimed at completeness, and which was the basis of Dr. Johnson's more celebrated work (1755). He wrote also a *Domestic Dictionary* (1766), and other books on education. He was a Seventh-day Baptist.

Bailey, PHILIP JAMES: poet; b. in Nottingham, England, Apr. 22, 1816. He studied law, and was called to the bar in 1840. In 1839 he published *Festus* (8th ed. 1868), a poem which treats of the highest themes of philosophy and religion. It excited much admiration, and had a wide temporary success, to which its extravagance and defects contributed. He wrote other poems, entitled *The Angel World*, afterward incorporated with *Festus* (1850); *The Mystic* (1855); *The Age*, a satire (1858); and *The Universal Hymn* (1867).

Bailey, THEODORUS: b. in Dutchess co., N. Y., Oct. 12, 1758; member of Congress from New York 1793-97 and 1799-1803; U. S. Senator 1803-04, when he resigned, and was appointed postmaster of New York. D. in New York city, Sept. 6, 1828.

Bailey, THEODORUS: rear-admiral U. S. N.; b. at Chateaugay, N. Y., Apr. 12, 1805; entered the navy as a midshipman, Jan. 1, 1818. He did good service on the west coast of Mexico in the Mexican war, and during a part of 1861-62 commanded the frigate Colorado, western Gulf blockading squadron. On Apr. 24, 1862, he commanded the right column of Farragut's fleet in the passage of Forts St. Philip and Jackson, and at the capture of the Chalmette batteries and the city of New Orleans, where he led the fleet, and was conspicuous for his great gallantry and self-possession. From 1862 to 1865 he was in command of the eastern Gulf blockading squadron. D. in Washington, D. C., Feb. 10, 1877.

Bailey, WILLIAM WHITMAN, B. P.: b. at West Point, Orange co., N. Y., Feb. 22, 1843; was educated at Brown University, Providence, R. I., whence he graduated in 1864; was botanist of the U. S. geological survey of the fortieth parallel in 1867; deputy secretary of State of Rhode Island in 1868; assistant librarian of Providence Athenæum 1869-71; then instructor (1877), but since Professor of Botany at Brown University. He published *Botanical Collector's Handbook* (Boston, 1881), and many contributions to periodical literature in prose and verse.

Baillie: a Scottish law-term having several applications. The most common and popular is to a superior officer or magistrate of a municipal corporation, with judicial authority within the city or burgh. In royal burghs the office is in some respects analogous to that of alderman in England.

Bailiff [O. Fr. *baillif* < Late Lat. *bajuli'vus*, adjec. from Lat. *ba'jul'us*, carrier, manager]: in Great Britain a deputy of a sheriff or of a local magistrate; also a magistrate of certain towns and a keeper of a castle. Bailiff may be defined as the keeper or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs arrest culprits, summon juries, and collect fines. There is a class of men employed by the sheriff on account of their adroitness and dexterity who are called bound bailiffs, because the sheriff being responsible for their official misdemeanors, they are annually bound in an obligation with surties for the due performance of their service. The sheriff himself is the queen's bailiff. The term bailiff is seldom used in the U. S.

Baillie, JOANNA: poetess; b. in the manse of Bothwell, Lanarkshire, Scotland, Sept. 11, 1762. In early life she went to reside in London with her brother, Matthew Baillie, the celebrated physician. She published in 1798 the first volume of *Plays on the Passions*, which had great success. Several other volumes of the same appeared in 1802, 1812, etc. Among the most popular of her other works are *De Montfort*, a tragedy, and *Basil*, a drama. She wrote several ballads and songs which were much admired. She was an intimate friend of Sir Walter Scott, and her house was the resort of many other British and foreign literary celebrities. Her *Dramatic and Poetical Works Complete in one Volume* (London, 1851). D. in London, Feb. 23, 1851.

Baillie, MATTHEW, M. D.: a brother of the preceding, was born at Shots, in Lanarkshire, Scotland, Oct. 27, 1761. His mother was a sister of the great anatomists, John and William Hunter. He studied anatomy under his uncle, and

entered Oxford, where he graduated as M. D. In 1783 he succeeded Dr. Hunter as Lecturer on Anatomy in London. He acquired a high reputation as a teacher and expositor of that science. He published in 1795 an excellent work on *The Morbid Anatomy of Some of the Most Important Parts of the Human Body*, which had a remarkable influence on the study of medicine. He practiced medicine in London with great success, and was appointed physician to the king in 1810. D. at Duntisbourne, Gloucestershire, Sept. 23, 1823. See his *Life* by Wardrop prefixed to his *Works* (London, 1825, 2 vols.).

Baillie, ROBERT: an eminent Scottish Presbyterian theologian: b. in Glasgow in 1599. He was distinguished for his learning and moderation. He was one of the commissioners sent to London in 1640 to prepare charges against Laud; became Professor of Divinity at Glasgow in 1642; and was principal of the University of Glasgow after the Restoration. He wrote various works and letters. D. in Glasgow in July, 1662.

Baillie of Jerviswood, ROBERT: a Scottish patriot of excellent abilities and character. He opposed the tyrannical measures of the Duke of Lauderdale, and about 1676 was fined and imprisoned for four months. Having entered into a correspondence with Russell and Sidney, he was arrested and charged with complicity in the Rye House Plot. He was condemned on insufficient evidence, and executed, in Edinburgh, Dec. 24, 1684.

Bailly, JEAN SYLVAIN: French astronomer and statesman; b. in Paris, Sept. 15, 1736. He was admitted into the Academy of Sciences in 1763, and published in 1771 a remarkable *Treatise on the Light of the Satellites of Jupiter*. In 1775 he produced the first volume of his *History of Astronomy, Ancient and Modern* (4 vols., 1775-83), which by its eloquent diction and ingenious ideas obtained great popularity. He became a member of the French Academy in 1784, and of the Academy of Inscriptions in 1785. Fontenelle was the only Frenchman who before that time had had the honor to be a member of the three great academies of Paris. He was the first president of the States-General or National Assembly in 1789, and was elected mayor of Paris in July of that year. His influence was exerted to promote order and moderation. He offended the Jacobins by commanding the national guard to fire on a riotous crowd in July, 1791, and resigned his office soon after that date. During the Reign of Terror he was proscribed by the Jacobins, and after insulting treatment was guillotined, Nov. 12, 1793. Among his works is *Memoirs of the Revolution by an Eye-witness* (3 vols., 1804). See his *Life* by F. Arago (Paris, 1852; Eng. trans. in *Biographies of Distinguished Scientific Men*, Boston, 1859); J. F. Nourrisson (Paris, 1885).

Bailly, JOSEPH A.: a French sculptor; b. in Paris in 1825; emigrated to Philadelphia in 1850. Among his best works are *Adam and Eve*, a group of *Eve and her Two Children*, and a marble monument of *Washington* (1869), placed in front of the State-house in Philadelphia. D. June 15, 1883.

Bailment [O. Fr. *bailement*, deriv. of *bailler*, deliver]: a delivery of goods for some particular purpose, or on mere deposit, upon contract, express or implied, that after the purpose has been performed the identical goods shall be redelivered to the bailor, or otherwise dealt with according to his direction. If the contract permits the return of an equivalent instead of the goods bailed, there is no bailment, but the transaction constitutes a debt or some cognate engagement. Also a delivery of a thing in trust for some special object, and upon contract, express or implied, to conform to the object of the trust.

Bailment includes the borrowing, lending, hiring, or keeping of chattels, and the carrying or working upon them for another. The party making the delivery or *bailing* the property is termed the *bailor*; the party to whom it is delivered, the *bailee*.

Bailments have been classified as follows: 1. *Depositum*, or deposit; a delivery of goods to be kept by the bailee, and returned on demand, without recompense. 2. *Mandatium*, or mandate; where the bailee agrees to do something with or about the thing bailed, without recompense. 3. *Commodatum* (see *LOAN*); where the thing bailed is lent for use, without recompense. 4. *Pignus*, or pledge; where the thing bailed is security for a debt or other engagement. 5. *Locatio*, or hiring; where the use of something is to be

given, or labor performed about it, for a compensation. *Locatio* is subdivided as follows: *Locatio rei* (hiring of a thing) where the bailee by hire gains the temporary use of a thing; *Locatio operis faciendi* (hiring work to be done), where the bailee agrees to perform labor and services, or bestow care and attention upon the thing bailed, for a recompense; *Locatio operis mercium vehendarum* (hiring the work of carrying goods) where goods are delivered to a bailee to be transported to another place, for a recompense.

The question which most frequently arises and presents the greatest difficulty in the law of bailment relates to the responsibility which attaches to a bailee if the property is lost or injured, and the degree of care which he is bound to bestow upon it. With reference to this question, bailments have been divided into three groups: 1. Where the bailment is for the benefit of the bailor alone. This class includes deposits and mandates. Here, as the bailee receives nothing for his services, he is held only to the care which prudent men are supposed to give to their own affairs, and he is responsible only for such loss or injury as results from the absence of such care. The degree of care depends much upon the circumstances of each case; for example, upon the bulk of the article, its fragility, or its exposure to thieves from the dense population of a city as compared with the scanty population of a country district. In each case it is a question of fact whether the proper care was used. 2. Where the bailment is for the benefit of the bailee only. This class includes *commodatum*. Here the greatest care is required of the bailee, and he is responsible for the slightest negligence. It is also a rule that he must keep strictly within the privilege conferred on him with respect to the thing bailed, or he will be liable for any loss or injury to it, even though he is guilty of no negligence. 3. Where the bailment is for the benefit of both bailor and bailee. This is the case in *pignus* and *locatio*. Here the bailee is held to the exercise of the care and attention which prudent men under the circumstances would reasonably be expected to take.

There is a class of bailments of an exceptional nature, embraced under the head of *locatio*, where the policy of the law imposes upon the bailee responsibilities for loss or injury to the property delivered to his charge, entirely irrespective of the question of his care or negligence; this class includes innkeepers and common carriers, the liabilities of whom will be considered in another place. In these cases the bailees are often called insurers. See CARRIERS, HIRING, and INN-KEEPERS.

The relation of bailor and bailee is largely one of trust, and the law requires good faith of each party. As a rule, the bailee will not be allowed to dispute the title of his bailor. He has a right to the possession of the thing bailed during the bailment, and in some instances a special property in it. In other cases he has a bare custody. This would enable him to maintain an action against any one who should unlawfully interfere with the chattel or deprive him of its possession. In such an action he would hold the proceeds beyond what was sufficient to indemnify him for his special interest as a trustee for the bailor.

T. W. DWIGHT.

Bai'ly, EDWARD HODGES: an English sculptor; b. in Bristol, Mar. 10, 1788; was a pupil of Flaxman. He gained the gold and silver medals of the Royal Academy 1809, and became a royal academician in 1821. Among his masterpieces are *Eve at the Fountain*, which is exquisitely graceful; *Apollo Discharging his Arrows*; *The Graces Seated*; *Eve Listening to the Voice*; and a statue of Lord Nelson. D. in Holloway, May 22, 1867.

Baily, FRANCIS, D. C. L.: English astronomer; b. in Newbury, Berkshire, Apr. 28, 1744; became a stock-broker in London 1799. He retired from business in 1825, and thenceforth devoted himself to science. He was one of the founders of the Astronomical Society (1820), and rendered important services to astronomy by the improvement of the *Nautical Almanac* and the production of the *Astronomical Society's Catalogue of Stars*. He wrote several standard works on life annuities, and a *Life of Flamsteed* (1835). D. in London, Aug. 30, 1844.

Bain, ALEXANDER, LL. D.: b. in Aberdeen, Scotland, in 1818; graduated as M. A. at Marischal College in 1840. In 1845 he was appointed Professor of Natural Philosophy in the Andersonian University at Glasgow; in 1857 Examiner in Logic and Moral Philosophy in the London University; in 1860 Professor of Logic in the University of Aber-

deen, of which he was elected lord rector in 1881. He has published *The Senses and the Intellect* (1855), *The Emotions and the Will* (1859), forming together a complete course of mental philosophy; *Study of Character, including an Estimate of Phrenology* (1861); *English Composition and Rhetoric* (1866); *Mental and Moral Science* (1868); *Logic, Deductive and Inductive* (2 vols., 1870); *Mind and Body: Theories of their Relation* (1873); *Education as a Science* (1879); *James Mill and John Stuart Mill* (1882); *Practical Essays* (1884); *Manual of Rhetoric* (part i, 1887; part ii, 1888). He belongs to the Spencerian or experimental school, and his psychology is physiological.

Bain'bridge: town and railroad junction; capital of Decatur co., Ga. (for location of county, see map of Georgia, ref. 7-G); on Flint river, 50 miles from its mouth and at the head of navigation; 236 miles W. S. W. of Savannah; has public and private schools, a cotton manufactory, and is a shipping-point for cotton and tobacco. Pop. (1880) 1,436; (1890) 1,668; (1900) 2,641.

Bainbridge: on Susquehanna river and A. and S. R. R., Chenango co., N. Y. (for location of county, see map of New York, ref. 5-G); 32 miles E. of Binghamton. It has five churches and a beautiful park. It has various industries, including the manufacture of patent food-preparations, children's sleds and wagons, cigars, furniture, lumber, butter, cheese, etc. Pop. (1870) 681; (1880) 781; (1890) 1,049; (1900) 1,092. EDITOR OF "REPUBLICAN."

Bainbridge, WILLIAM: commodore; b. in Princeton, N. J., May 7, 1774. He obtained the rank of captain in 1800, and commanded the frigate Philadelphia in the war against Tripoli. This vessel, having run aground, was captured by the enemy Nov. 1, 1804. He remained a prisoner until peace was concluded, June, 1805, and was afterward raised to the rank of commodore. In Sept., 1812, he obtained command of a squadron consisting of the Constitution, of forty-four guns, the Essex, and the Hornet. In Dec., 1812, he captured the British frigate Java, mounting forty-nine guns. D. in Philadelphia, Pa., July 28, 1833. See his *Life* by Thomas Harris (Phila., 1837).

Baini, bān-ee'nēē, GIUSEPPE: Italian musician; b. in Rome, Oct. 21, 1775; became director of the Papal Orchestra, 1814. D. May 21, 1844. Author of *The Biography of Palestrina*, numerous sacred compositions, and *History of the Papal Orchestra*. He is chiefly famous for his work in the history of music.

Bains, bān (i. e. baths): the name of several watering-places in France. The most important of these is Bains-les-Bains, in the department of Vosges, 14 miles S. W. of Épinal, situated about 1,000 feet above the sea. The place has thirteen springs. Among these "La grosse source" has a temperature of about 120° F.

Bai'ram: a feast of the Mohammedans; begins at the end of the fast of Ramadan. It is inaugurated with great public rejoicings and illuminations. Its observance is commanded by the Koran. "Little Bairam" occurs seventy days later.

Baird, ABSALOM: soldier; b. in Washington, Pa., Aug. 20, 1824; graduated at West Point 1849 in artillery; captain and assistant adjutant-general Aug. 3, 1861; major and inspector-general Nov. 12, 1861; lieutenant-colonel June 13, 1865; brigadier-general U. S. vols. 1862-66. He served at various posts 1849-61; in Florida hostilities 1851-53; as assistant professor at military academy 1856-59; assistant adjutant-general at Washington, D. C., 1861; in Manassas campaign 1861; engaged at Blackburn's Ford and Bull Run; in the adjutant-general's office 1861; in the Virginia Peninsula campaign 1862; engaged at Yorktown and Williamsburg; in command of a brigade in the army of the Ohio, 1862; engaged in the capture of Franklin in Rosecrans' Tennessee campaign 1863; engaged at Tullahoma, Shelbyville, Dug Gap, Chickamauga (brevet lieutenant-colonel), and occupation of Chattanooga; in command of a division in the Fourteenth corps in the operations about Chattanooga (brevet colonel) 1863-64; engaged at Missionary Ridge and skirmished in pursuit of the enemy in the invasion of Georgia 1864; engaged at Resaca, Pine Mountain, Kenesaw, Vining's Station, Peach Tree Creek, Atlanta (brevet brigadier-general), Jonesboro; pursuit of Hood's army; in the "march to the sea" and surrender of Savannah; in the invasion of the Carolinas 1865; engaged at Bentonville, Raleigh, and surrender of Johnston's army at Durham Station. He was breveted major-general U. S. army

Mar. 13, 1865, for gallant and meritorious services in the field, and major-general U. S. vols., Sept. 1, 1864, for distinguished conduct in Atlanta campaign and at Savannah. Became inspector-general of army 1885. Retired Aug. 20, 1888.

Baird, Lieut.-Col. ANDREW WILSON, F. R. S.: b. in Aberdeen, Apr. 28, 1842; educated at Marischal College, Aberdeen University; obtained a commission in the corps of Royal Engineers 1861; entered the service of the Bombay Government 1864; was employed as field engineer in the Abyssinian expedition; employed on the great trigonometrical survey of India 1868; selected to superintend the results of the harmonic analysis of tidal observations in India, where, beginning at the Gulf of Cutch, he established over thirty tidal observatories from Aden to Burma; lieutenant-colonel 1888; mint master of Calcutta 1889; is especially noted for his collaboration with G. H. Darwin in producing *The Harmonic Analysis of Tidal Observations* (1885), presented to the Royal Society of London, for his account of the *Spirit-leveling Operations of the Great Survey of India*, and for his official reports upon these and kindred subjects. He is a fellow of the Royal Geographical Society.

Baird, HENRY MARTYN, Ph. D., D. D., LL. D.: son of the Rev. Robert Baird, D. D.; b. in Philadelphia, Jan. 17, 1832; graduated at the University of the City of New York 1850; attended lectures in the National University (then University of Otho), Athens, Greece, 1851-52; studied theology in the Union Theological Seminary, New York, 1853-55, and Princeton, N. J., 1855-56. He was tutor of Greek in the College of New Jersey 1855-59, and in 1859 became Professor of the Greek Language and Literature in the University of the City of New York. In 1866 he was ordained as an evangelist. He has published *Modern Greece* (1856); *The Life of the Rev. Robert Baird, D. D.* (1866); *History of the Rise of the Huguenots of France* (1879); *The Huguenots and Henry of Navarre* (1886); *The Edict of Nantes and its Recall* (1886); and many articles in the quarterlies.

Baird, ROBERT, D. D.: theologian and writer; b. near Uniontown, Fayette co., Pa., Oct. 6, 1798. He graduated at Jefferson College, Washington, Pa., in 1818, and at Princeton Theological Seminary in 1822. He spent several years (1835 to 1843) in Europe, where he did much to promote Protestant Christianity and the temperance cause. He was corresponding secretary of the American and Foreign Christian Union 1849-55, 1861-63. Among his works are *History of the Waldenses, Albigenses, and Vaudois*; *History of the Temperance Societies* (French orig. Paris, 1836); *Religion in America* (Glasgow and New York, 1844). D. at Yonkers, N. Y., Mar. 15, 1863. See his *Life* by his son, Henry M. Baird (New York, 1866).

Baird, SPENCER FULLERTON, LL. D.: naturalist; b. in Reading, Pa., Feb. 3, 1823; entered Dickinson College in 1836, and graduated in 1840. He got his first love for natural history from his father, who was fond of out-of-door studies of nature, and he was greatly stimulated in this direction by an early acquaintance with Audubon, which he formed as early as 1838. From 1846 to 1850 he was Professor of Natural History in Dickinson College, and just before resigning this position he began his first important literary work—that of translating and editing the *Iconographic Encyclopædia*. In 1850 he was appointed assistant secretary of Smithsonian Institution, which position he held until the death of Prof. Henry, in May, 1878, when he succeeded to the position of secretary, and held it till his death. His most elaborate original memoirs are the catalogue of North American serpents (1853); *Mammals of North America* (1858); the *Review of North American Birds* (1864-66); and a *History of North American Birds* in connection with Mr. Brewer and Mr. Ridgway. From 1870 to 1878 he was scientific editor of the periodicals published by Harper & Brothers. In his writings Prof. Baird covered nearly every branch of natural history. In 1871 he was placed at the head of the newly created U. S. commission of fish and fisheries—an unsalaried office. Mainly through his exertions this commission was raised to its present important position. Not only was he honored by being made an honorary member of nearly every American scientific society, but he was also either a foreign or corresponding member of most of the important scientific societies in England, France, Germany, Austria, and Spain, and was a member of the council of the American National Academy of Sciences. In 1879 he was awarded the gold medal of the Société d'Acclimatation of France, and in 1880 the "erster

Ehrenpreis" of the Internationale Fischerei Ausstellung, at Berlin—the gift of the Emperor of Germany. In 1875 he received from the King of Norway and Sweden the decoration of "knight of the royal Norwegian order of St. Olaf." Other honors and medals were received by him. He was director of the National Museum. D. in Wood's Hole, Mass., Aug. 19, 1887.

Baireuth, or **Bayreuth**, bī'roit: a city of Bavaria; capital of the circle of Upper Franconia; on the Red Main; 126 miles by rail N. of Munich (see map of German Empire, ref. 6-F). It is pleasantly situated and well built, and has gardens and public fountains. The principal buildings are the new palace, the mint, opera-house, town-hall, and the theater built for Wagner, who is buried near here. Here are manufactures of cotton, woolen, porcelain, and leather. Pop. (1890) 24,364.

Bairut: See BEYROUT.

Bai'us (*Bajus*), the Latinized name of MICHAEL DE BAY: a Flemish theologian; b. in Melin, Hainault, in 1513. He became Professor of Divinity at Louvain in 1550, and in 1578 chancellor of that university. He adopted the doctrines of St. Augustine, and wrote works on free will and grace, which were condemned by Pope Pius V. in 1567. Baius retracted or submitted, but his doctrines were propagated in the Netherlands and afterward maintained by the Jansenists. He condemned the Jesuits as Pelagians. His works (Cologne, 1696, 2 vols.) were put in the *Index*. D. in Louvain, Dec. 16, 1589.

Baja: See BALÆ.

Baja, bō'yō: an important market-town of Hungary; in the county of Bács; on the Danube; 90 miles S. of Pesth (see map of Austria-Hungary, ref. 7-H). Here is an important market or annual fair for swine. Large quantities of grain and wine are produced in the vicinity. Pop. about 20,000.

Baja California: the Mexican territory comprising Lower California.

Bajada de Parana: See PARANA.

Bajazet: See BAYAZID.

Ba'ker, ABIJAH RICHARDSON, D. D.: b. in Franklin, Mass., Aug. 30, 1805; graduated at Amherst in 1830; became a teacher in Medway, Dorchester, and Andover, Mass.; ordained pastor of a Congregational church in Medford, Mass.; and was subsequently settled in Lynn, Wellesley, and Boston. D. in Boston, April 30, 1876. He published a *School History of the United States*; *The Catechism Tested by the Bible*; an *Exposition of the Sermon on the Mount*, etc.—His wife, HARRIETTE NEWELL WOODS, a daughter of Rev. Dr. Leonard Woods, was born at Andover in 1815. She has published over 160 volumes, mostly for children, written under the pseudonym of "Madeline Leslie."

Baker, Sir BENJAMIN, F. R. S., Hon. LL. D., Hon. Master of Engineering, V.-P. Inst. C. E.: civil engineer; b. near Bath, England, in 1840. His professional training began with hammer and chisel in one of the oldest workshops in Wales. Thence he was articled to Mr. H. H. Preece, in whose office and shops he obtained experience in foundry, forge, and manufacturing processes, and the designing of machinery. Three years later he obtained some experience in works of masonry. Going to London, he entered the office of Sir John Fowler, and took an active part in the many important engineering works then being carried out, including the Metropolitan Railway (underground) of London. It has fallen to him to repair and strengthen the three historical bridges of Telford, the Menai suspension bridge, the Buildwas cast-iron arched bridge, and the masonry bridge over the Severn, near Gloucester. In 1877 Mr. Baker designed the cylindrical ship in which Cleopatra's Needle was transported. He superintended the loading of the obelisk in Egypt and its re-erection in London. His great work is the Forth bridge, of which Sir John Fowler and himself were the engineers. He is consulting engineer to the Cape of Good Hope Government, the Chinese Government, and one of the consulting engineers of the Bristol Railway Company, of the Chignecto Ship-railway, and the Hudson River Tunnel, representing together a capital of \$750,000,000. Among his writings are *Long Span Iron Bridges*; *The Metropolitan Railway*; *The River Nile*; *Transportation and Re-erection of Cleopatra's Needle*; *The Strength of Beams*; *The Pressure of Earthwork*; *On Timber and Metal Arches*; *Rivets in Girder-flanges*; *Lattice*

versus Box Girders; Pin Connections versus Rivets; Victoria Bridge; Suspension versus Cantilever Bridges; Manufacture and Wear of Rails; Steel for Tires and Axles, etc.

WILLIAM R. HUTTON.

Baker, DANIEL, D. D.: Presbyterian minister; b. in Midway, Liberty co., Ga., Aug. 17, 1791; graduated at Princeton in 1815; was ordained to the Presbyterian ministry in 1818; was pastor at Washington, D. C., Savannah, Ga., Frankfort, Ky., Tuscaloosa, Ala., and Holly Springs, Miss.; was for a time president of Austin College, Huntsville, Tenn.; was a popular and successful preacher; and the author of several practical and polemical religious works. D. in Austin, Tex., Dec. 10, 1857.

Baker, WILLIAM MUMFORD: clergyman and author; son of Daniel Baker; b. in Washington, D. C., June 5, 1825; graduated at Princeton in 1846; is the author of a *Life of his father* (1858), and of several other popular works, such as *Inside, a Chronicle of Secession* (1866); *The New Timothy* (1870); and *His Majesty Myself* (1879). He was a Presbyterian minister in Galveston (1850) and Austin, Tex. (1850-65); at Zanesville, O. (1866-72); Newburyport, Mass. (1872-74); South Boston, Mass. (1874-81); Philadelphia, Pa. (1881); resigned shortly before his death in South Boston, Mass., Aug. 20, 1883.

Baker, Col. EDWARD DICKINSON: a lawyer; b. in London, England, Feb. 24, 1811; emigrated to the U. S. in his youth. He was M. C. from Springfield, Ill., 1844-46, 1849-51; removed to California in 1852, and became a popular orator of the Republican party. In 1860 he was elected U. S. Senator for Oregon. Having obtained command of a brigade of the Union army, he was killed at Ball's Bluff, Va., on the Potomac, Oct. 21, 1861.

Baker, GEORGE AUGUSTUS: portrait-painter; b. in New York in 1821, and died there Apr. 2, 1880. He was a student in the schools of the National Academy of Design, New York, and visited Europe in 1844, where he remained two years. He was elected a National Academician in 1851.

Baker, IRA OSBORN, B. S., C. E.: b. in Linton, Ind., Sept. 23, 1853; graduated at University of Illinois 1874; was Assistant Professor of Civil Engineering in that institution 1874 to 1880, and Professor of Civil Engineering since 1880. Author of *Engineers' Surveying Instruments* (1886); *Treatise on Masonry Construction* (1889); and *Brick Pavements* (1891).

Baker, JAMES HUTCHINS: See the Appendix.

Baker, JOHN GILBERT, F. R. S., F. L. S.: botanist; b. in Guisborough, England, Jan. 13, 1834; educated at the Friends' schools at Ackworth and York. He is keeper of the herbarium and library of the Kew Gardens, and has published a new edition of Hooker's *Synopsis Filicum* (1883); a *Handbook of the Fern Allies* (1887); *Handbook of the Amaryllidæ* (1888); *Handbook of the Bromeliaceæ* (1889); besides many papers on botanical subjects.

Baker, OSMON CLEANDER, D. D.: Methodist; b. in Marlow, N. H., July 30, 1812; studied at Wesleyan University, Connecticut; became teacher in the Newbury Wesleyan Seminary (Vermont) 1834, and its principal 1839-44. He was one of the founders of the Methodist theological schools, and professor in the Biblical Institute at Concord, N. H., 1847-52. In 1852 he was elected bishop. D. at Concord, N. H., Dec. 20, 1871. *Baker on the Discipline of the Methodist Episcopal Church* (New York, 1855) is a standard work.

Baker, Sir RICHARD: author of *The Chronicle of the Kings of England*; b. in Sisinghurst, near Cranbrook, Kent, 1568; educated at Oxford; put into the Fleet Prison, London, for debt in 1635, where he wrote his *Chronicle*. D. a prisoner and in poverty, Feb. 18, 1644-5.

Baker, Sir SAMUEL WHITE: explorer; b. in London, June 8, 1821; organized an extensive agricultural colony at Nerverra Ellia, in Ceylon, 1847, which afterward became a place of considerable importance. In 1861 he went to Africa, with the design of visiting the sources of the Nile. He fell in with Speke and Grant, and afterward explored the western arm of the Nile, and discovered the Albert Nyanza Lake. In 1869 he set out, under the direction of the Khedive of Egypt, with 1,000 picked men, with the design of suppressing the slave-trade and spreading the cultivation of cotton. In 1873 he returned from this expedition, reporting complete success. He has published *The Rifle and Hound in Ceylon* (1854, 1874); *Eight Years' Wanderings in Ceylon* (1855); *The Albert Nyanza* (1866, 2 vols.); *The Nile Tribu-*

aries of Abyssinia (1867); *Ismaila* (1874, 2 vols.); *Cyprus, as I Saw It* (1879); *Wild Beasts and their Ways* (1891). D. Dec. 30, 1893.

Baker, WILLIAM, D. D.: head-master Merchant Taylors' School, London; b. at Reigate, Dec., 1841; educated at St. John's College, Oxford; prebendary of St. Paul's Cathedral, London, 1880; fellow of St. John's, Oxford (1860-70); author of *Historical and Dogmatical Position of the Church of England* (1882); *A Plain Exposition of the XXXIX. Articles* (1883); *Daily Prayers for Younger Boys* (1886).

Baker, WILLIAM BLISS: landscape-painter; b. in New York in 1859; pupil of Albert Bierstadt, M. F. de Haas, and of the National Academy, New York. His landscapes are notable for almost photographic exactness, but are painted with breadth and much truth of observation. One of his best works, *Silence*, is in the collection of Thomas B. Clarke, New York. D. in Ballston, N. Y., in 1889. W. A. C.

Baker, WILLIAM HENRY, M. D.: gynæcologist; b. in Medford, Mass., Mar. 11, 1845; graduated at Harvard Medical School; Professor of Gynæcology in Harvard Medical School; visiting physician of gynæcological department of Boston Dispensary; author of *The Treatment of Cancer of the Uterus*; *Diseases of the Urethra and Bladder*, etc.

Baker, WILLIAM SPOHN: See the Appendix.

Baker City: capital of Baker co., Or. (for location of county, see map of Oregon, ref. 3-I); situated on the east fork of Powder river, in a farming, stock-raising, and gold-mining region. Pop. (1880) 1,258; (1890) 2,604; (1900) 6,663.

Baker's Creek, Battle of: See CHAMPION HILLS.

Baker's Falls: a cascade of the Hudson river, in Kingsbury township, Washington co., N. Y. The stream falls 56 feet in 60 rods, and the scene is one of remarkable beauty. The falls furnish a great water-power. Here are two machine-shops and some paper-mills.

Baker Island, or New Nantucket: a low coral island in the North Pacific. It is in lat. 0° 13' N., lon. 176° 29' E., E. of the Gilbert Archipelago and N. of the Phoenix islands. It is a low coral island (20 feet high), and had a large deposit of guano, which was worked by the American Guano Company. Its surface is very nearly level, and it is devoid of vegetation except for a few patches of grass. The outline is quadrilateral, a mile long E. and W., three-quarters of a mile wide N. and S. Fresh water is not found, but must be obtained by distilling. The guano was worked out in 1872. The island is now uninhabited, though the wooden houses remain. M. W. H.

Baker Lake (Keewatin, Canada): an extension of Chesterfield inlet of Hudson Bay, with which it is connected by two channels; lat. 63° 50' N., lon. 98° W. It is 50 miles long E. and W., by 30 miles broad. It receives the drainage of many lakes, including the Doobaunt on the W. and the Yathkyed on the S. There is said to be a fine waterfall in the river coming in from the west. It is within the sterile Arctic plains, beyond the timber line, which are destitute of agricultural possibilities. M. W. H.

Baker, Mount: volcano in the Cascade Range, N. W. part of the State of Washington; height, 11,100 feet; frequently in eruption; very active in 1880.

Bakersfield: town; capital of Kern co., Cal. (for location of county, see map of California, ref. 10-E); is situated on Kern river, about 60 miles from Visalia. It is the center of a considerable cotton trade. Fruit-growing is a thriving industry. Pop. (1880) 801; (1890) 2,626; (1900) 4,836.

Bake'well: an old market-town of Derbyshire, England; on the river Wye, near its confluence with the Derwent; 25 miles by rail N. W. of Derby. It has an ancient Gothic church, and chalybeate springs with warm baths, which are visited by many persons. Quarries of black marble and mines of coal and lead are worked in the vicinity. Chatsworth House, the splendid mansion of the Duke of Devonshire, is 3 miles from this town, which is surrounded by beautiful scenery. Pop. (1891) 2,748.

Bakewell, ROBERT: an English agriculturist; b. in Dishley, Leicestershire, in 1725. He gained distinction by his improvement of domestic animals, especially sheep and horned cattle. He originated a breed of sheep formerly called by his name, but now known as the Leicester breed. D. in Dishley, Oct. 1, 1795.

Bakhmut, baakh-moot': a Russian town, province of Ekaterinoslav; 127 miles S. E. of Kharkov. In the vicinity

are large coal mines. It manufactures much tallow, and is a market for meat and grain. Pop. (1882) 17,999.

Bakhchisarai, *baakh-shēe-sā-rī'* (Turkish, The Garden Palace): a Tartar town of Russia; government of Taurida (Crimea); 15 miles S. W. of Simferopol. It was formerly the capital of the Tartar khans, whose palace is a remarkable Oriental edifice and in good repair, with spacious galleries, brilliant paintings, and pavilions of light and airy form. Pop. 13,500.

Bakhtegan, *baakh-tā-gaan'*, **Lake**: in Persia; is 50 miles E. of Shiraz. It is 60 miles long, with an average breadth of 8 miles, and receives at its western extremity the river Bundemir (anc. *Araxes*). The lake yields large quantities of salt.

Bakhuysen, *baak-hoi'-zen*, or **Baekhuysen**, LUDOLF: a celebrated Dutch marine-painter; b. at Emden, Dec. 18, 1631. He was a close student of nature, and often ventured out to sea during storms. His paintings are said to express the poetry of the sea. Among his works is a marine view which the magistrates of Amsterdam presented to Louis XIV. of France. D. in 1709. Several of his best works are in the gallery of the Louvre at Paris.

Baking is the mode of cooking food in an oven usually nearly or quite air-tight. The term is also employed in the manufacture of bricks, porcelain, etc. (The baking of bread will be treated under BREAD.) In baking, strictly so called, the oven is so closed that the steam and aroma arising from the substances within are confined; but by opening ventilators a current of air may be produced, and then these ovens may be used for oven-roasting. The offensive taste that often characterizes baked dishes is thus avoided. Baking, although a convenient mode of cooking, is not so good a process for cooking meats as roasting. See COOKERY (*Roasting*).

Baking-powders: mixtures of substances prepared for use in bread-making (see BREAD) in place of yeast. In the fermentation caused by the yeast, carbon dioxide, or carbonic acid gas, is given off, and this makes the bread rise. Baking-powders are made of substances that give off carbon dioxide when they are brought together, and the effect thus produced upon the dough is the same as that produced by the carbon dioxide resulting from the action of the yeast. At the same time other slight changes are caused by the yeast that may be of importance in determining the quality of the bread. Most baking-powders are made of tartaric acid and bicarbonate of soda mixed with starch. When the tartaric acid acts upon the bicarbonate of soda, three products are formed, viz., water, sodium tartrate, and carbon dioxide. Cream of tartar, or acid potassium tartrate, is frequently used instead of tartaric acid. When this acts upon bicarbonate of soda, the products are water, carbon dioxide, and Rochelle salts. Instead of bicarbonate of soda, bicarbonate of ammonia is sometimes used. There is no good objection to the use of the latter substance, though the effort is sometimes made to convince the public that anything related to ammonia is highly objectionable, because ammonia is formed by the decomposition of animal matter. Such reasoning is absolutely worthless. It is only necessary to call attention to the fact that both water and carbon dioxide also are produced by the decomposition of animal matter. As substitutes for the somewhat expensive tartaric acid other substances are often used. Among these alum is perhaps the most prominent. When ordinary alum acts upon bicarbonate of soda the products are sulphate of soda, sulphate of potash, and hydrate of alumina, or aluminium hydroxide. It appears, however, that ammonia alum is used practically to the exclusion of potash alum, and therefore sulphate of ammonia instead of sulphate of potash is formed when the baking-powder is used. Again, most baking-powders contain acid phosphate of calcium ("superphosphate"), and this acting with the other ingredients gives some products in addition to those mentioned. There is no objection to the use of phosphoric acid or of acid phosphate calcium, but objection has frequently been made to the use of alum. Whether or not the use of alum in baking-powders is objectionable on sanitary grounds is difficult to decide positively. From investigations carried out by Prof. J. W. Mallet, of the University of Virginia, among other conclusions the following is drawn: "From the general nature of the results obtained the conclusion may fairly be deduced that not only alum itself, but the residues which its use in baking-powder leaves in bread, can not be viewed as harm-

less, but must be ranked as objectionable, and should be avoided when the object aimed at is the production of wholesome bread."

IRA REMSEN.

Bako'ny-Wald (forest of Bakony): a densely wooded mountain-range of Hungary; extends between the river Raab, the Danube, and Lake Balaton. It is a spur of the Styrian Alps, projecting into the largest plain of Europe, and is 56 miles long and 23 miles wide. The average height is 2,000 feet. Large herds of swine are annually driven hither to feed on mast (acorns). Quarries of good marble are worked in these mountains.

Baku, *baā-koo'*, or **Badku**: a seaport of Asiatic Russia; capital of a province or government of the same name; on the west shore of the Caspian Sea, and on the south side of the peninsula of APSHERON (*q. v.*); 550 miles from Batoum on the Black Sea, with which it is connected by rail viâ Tiflis (see map of Russia, ref. 12-H). In the immediate neighborhood are many naphtha springs, some of which ignite spontaneously, and this circumstance has caused Baku to be regarded as a holy city by the Parsis, who have built several temples here. In 1893 458 oil-wells were operated some part of the year, with a yield of 33,104,126 barrels (of 42 gal.) of crude oil, an increase over 1880 of over 31,000,000 barrels. The oil refineries here give employment to nearly 5,000 persons. In 1806 Baku became a Russian possession. For three hundred years before that it had been, with brief exceptions, under Persian control. The harbor, which is spacious and well sheltered, is strongly fortified. Pop. (1897) 112,253.

Bakunin, *baā-koo'nēen*, MICHAEL: Russian agitator and earliest advocate of Nihilism; b. in Torschok, in the government of Tver, 1814, of a rich family of high rank. He graduated at the Military School of St. Petersburg, and was appointed ensign in the artillery, but resigned and devoted himself to science with great success. In 1841 he left Russia and went to Berlin, where he occupied himself with philosophy, especially Hegelianism; to Dresden, where he studied with Arnold Ruge; and finally (1843) to Paris, where he lived with the Polish emigrants. In Switzerland he became acquainted with the communistic and socialistic societies, and often attended their meetings. In 1847, in a speech at Paris, he advocated a Russian republic and a Russo-Polish fraternity, aiming to revolutionize Russia. On demand of Russia he was expelled from France, Jan., 1848. From this time he took part in all the revolutions of Europe, was put into prison in Saxony, sentenced to death in Austria, delivered up to Russia, and finally exiled to Siberia (1855). In 1860 he escaped to Japan, whence through the U. S. he returned to London. Here he took up again his revolutionary work, and advocated with fervor and boldness the overthrow of the contemporary government in Russia and the foundation of a great Slavonic federal republic. In a speech at Geneva in 1868 he announced himself the bearer of a new gospel. The next year he organized the Social Democratic Alliance, which was speedily absorbed in the International, and in turn he was expelled from the latter organization by the Marx faction in 1872 at The Hague Congress. He attempted to lead a revolt in Lyons (1870), and his views have perceptibly toned the socialism of Mediterranean Europe. His teachings involve a pure materialistic naturalism. Men free from every artificial or historical restraint will act in accordance with natural law, and nothing else is needed. His aim was to destroy the *Lie*; but the beginning of the *Lie* was God, the belief in whom we therefore were to get rid of. Having got rid of it, the next lie to be destroyed was *Right*; for *Right* was but a fiction invented by *Might*, simply in order to insure and strengthen her reign, and *Might* formed the sole groundwork of society, making and unmaking laws. "Therefore our first work," he said, "must be destruction and annihilation—destruction of everything as it now exists, the good with the bad; for if but an atom of this old world remains, the new will never be created." By these means he would secure perfect equality for all persons; the control of the natural sources of subsistence and of industry by the workers, and a solution of the social problem by ultimate solidarity of labor associations of all countries. Views like these form the very platform of the Russian conspiracy known as Nihilism. While Bakunin detested communism, he advocated the abolition of marriage and inheritance, and taught that conscience is a mere matter of education. D. in Bern, July 1, 1876. See his *Dieu et l'État* (God and the State).

Balaam [Heb. *Bileam*, devourer]: son of Beor, the prophet of Pethor, in Aram, by the river Euphrates, who was hired by Balak, King of Moab, to curse Israel, but who instead blessed them, and foretold a great future for them in words of wonderful eloquence. He later advised the Moabites to invite the Israelites to the licentious worship of their god Baal Peor. In punishment of their transgression God sent a plague which slew 24,000 Israelites. When the plague was stayed Israel fought Moab, and in the general overthrow Balaam fell. The narrative is found in Num. xxii-xxv., xxxi.; cf. Josh. xiii. 22; and its historicity is assumed in Deut. xxiii. 4, 5; Josh. xxiv. 9, 10; Neh. xiii. 2; Micah vi. 5. It is alluded to in the New Testament, wherein Balaam is a synonym for avarice, impurity, and impiety (2 Pet. ii. 15, 16; Jude 11; Rev. ii. 14). It is probable that he was a heathen prophet and necromancer of great celebrity, who was hired by Balak like any other diviner. He mistook the real divine possession for the "possession" with which his arts had made him cognizant, and thought not that he was but a tool in the hand of God. The story must have come from some Moabite captive.

The above interpretation is on the theory that the narrative is truthful and a unit. Many biblical critics of standing affirm that it is made up of different and contradictory elements, and contains at most only a modicum of truth. But to those who accept the testimony of the New Testament writers upon historical matters, their confirmation of the narrative will be entirely satisfactory, especially since Peter expressly states his belief in the only portion of the narrative—the speaking ass—which is antecedently improbable.

Josephus and Philo tell the story of Balaam, and the former (*Antiq.* iv. 6) considers him a prophet of the true God, but the latter as a necromancer. In the Talmud he is spoken of as a godless prophet. In the Fathers he is mentioned, of course, for the story is one of the most striking in the Bible. Origen (*Contra Celsum*, i. 59) applies Balaam's prophecy of the star out of Jacob (Num. xxiv. 17) to the star which the Magi saw. Tertullian, Augustine, Ambrose, Jerome judge him variously. He is alluded to in the Koran (Sale's trans., chap. vii., Al'Araf), and the Mohammedans tell various tales about him, as that he was of the Anakim, the giants of Palestine, and that he learned the mystical name Jehovah from the books of Abraham, and by the use of it worked miracles.

SAMUEL MACAULEY JACKSON.

Balænicep'idæ: See SHOE-BILL.

Balaghât, baā-laā-gawt' [Pers.-Hind. *Bālāghāt*, lit., upper plateaus]: a name applied to several sub-Alpine districts in India; but specifically to a district in Nagpur, Central Provinces, between parallels 21° and 23° N., and meridians 80° and 81° E. It is the eastern portion of the central plateau which divides Nagpur E. and W. These highlands remained desolate and neglected until 1866, when the Balaghât district was formed and immigration encouraged. It contains extensive forests, which, however, do not produce timber of value, and much of the area is covered by jungle and is incapable of cultivation. Rice, wheat, and other cereals, oil-seeds, sugar, and tobacco are raised. Iron ore exists and is smelted by the natives. There are no roads, and the towns are small. Although but lately an impenetrable waste, there are some evidences that this district once enjoyed a high civilization. Of such a character is a handsome Bûddhist temple of cut stone belonging to a period of which no historical traces remain. Area, 3,146 sq. miles. Pop. about 350,000. M. W. H.

Balaguer, baā-laā-gār', VICTOR: Spanish poet and historian; b. in Barcelona, Dec. 11, 1824; known principally for his investigations of the early literature and history of Catalonia. In 1854 he was appointed archivist of Barcelona, and soon after Professor of History in the university there. He was also in 1886 made Ministro de Ultramar in Sagasta's cabinet. Among his historical essays and works are *Estudios históricos y políticos* (1876); *Historia de Cataluña* (1878); *Historia política y literaria de los trovadores* (6 vols., 1878-80). As poet he has treated mainly subjects drawn from his native province. His *Tragedias* were published in 1879, and his *Poesías completas* in 1884. A. R. MARSH.

Balakireff, MILY ALEXEJEVITCH: See the Appendix.

Balaklava, baā-laā-klā'va, or **Balaclava**: a small port and town of Russia, in the Crimea, and on the Black Sea, about 7 miles S. from Sevastopol; is separated from the harbor of Sevastopol by a rocky peninsula (see map of Russia, ref. 11-C). It has a good landlocked harbor, supposed to be the

port of the Læstrigonians at which Ulysses landed. The ruins of churches and mosques attest the ancient magnificence of this town. Pop. in 1882, 695. A few days after the battle of Alma, which occurred in Sept., 1854, Balaklava was occupied by the British army, and the harbor became the headquarters of the fleet. The British army suffered here great privations in consequence of the inefficiency of the War Office and the mismanagement of the commissariat. Soldiers perished with hunger and cold, while ample stores of food and clothing were in the holds of ships in the harbor. Here occurred the battle of Balaklava between the British and Russians, Oct. 25, 1854. The charge of the British cavalry in this action was a famous but unsuccessful exploit.

Balance [viâ Fr. from vulg. Lat. **bilancia*; cf. Lat. *bilanx*, adjec. (sc. *libra*); *bi-*, two + *lanx*, pan]: a lever of the first kind, the fulcrum being between the power and the weight; used to ascertain the weight of bodies in standard units. The ordinary balance consists essentially of a metallic bar or lever, called the beam, either delicately suspended or supported on a stand by the intervention of a wedge-shaped prism, technically termed a knife-edge, exactly at its middle point. An index is fixed at right angles to the beam, and made to travel over a graduated arc, so as to show when the beam is horizontal. A scale-pan is suspended from each end of the lever. Since the arms of the balance are equal, it is plain that there can not be equilibrium unless the weights placed in each scale are also equal. When this is the case, the beam is perfectly horizontal and the index vertical. The balance is then said to be true. When the beam is horizontal with unequal weights, the balance is false. Thus it is easy to test the truth of a balance by first placing in the scales weights which apparently are equal, and then transferring each into the other scale. If the weights are not really equal, one of them will appear heavier than the other after the transfer. There are, however, two methods of finding the exact weight of a body by means of a false balance. The body may be weighed with standard weights in each scale successively, and the true weight is the mean proportional between the two apparent weights. Or the body (placed in one scale) may be balanced by a sufficient quantity of any convenient substance—sand, for instance—so that the beam is horizontal, and then replaced by standard weights until the sand is balanced; the weight thus obtained is the true one. A good balance must have its beam in stable equilibrium, for which purpose the center of gravity of the beam and its appendages must fall a little below the knife-edge. The points of suspension of the scale-pans and the fulcrum of the beam should be in the same straight line. Both when the scales are empty and when equal weights are placed in them the beam should be horizontal and the index vertical, the arms, of course, being exactly equal to one another. It is often of importance that the balance should be very sensitive and indicate very slight inequalities in the weights. The sensibility of a balance becomes greater, first, as the length of the arms is increased, which renders the movement about the fulcrum more obvious; and secondly, as the weight of the beam is diminished, for when the beam is displaced by the inequality of the weights, its own weight gives it a tendency to return to its first position. But this displacement is less for a given inequality in the weights as the weight of the beam is increased; so that the less the beam weight, the more sensitive the balance becomes. The sensitiveness of the balance also depends on the distance between the point of suspension and the center of gravity, the sensitiveness increasing as the distance diminishes.

The balance of a watch is a wheel nicely poised on its axis, the pivot-holes in which it turns being frequently formed in rubies or other jewels. The natural effect of an impulse given this wheel would be complete rotation, but this is arrested by the balance-spring, so that it recoils, and a vibratory motion results. The balance-spring is a coil of steel wire so fine and delicate that 4,000 springs weigh only about 1 oz. One of the extremities of the spring is fastened to a point independent of the balance, and the other end is attached near its axis. When the impulse is given to the balance, it moves round just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse, the balance is driven back by the elastic recoil of the spring. In marine chronometers a cylindrical helical spring is used. See the articles TORSION BALANCE and WEIGHING-MACHINES.

Revised by E. L. NICHOLS.

Balance of Power [Fr. *équilibre politique*, i. e. political equilibrium or equilibrium of states]: a phrase used in modern European diplomacy to express a state of political equilibrium among neighboring powers, or a political system so arranged and counterpoised that no nation or monarch may be so powerful as to endanger the independence of other states. Such a balance was aimed at in the political combinations in behalf of Greece; in those of Italy just before the Reformation; in the policy of Europe under the lead of France against Austria and Spain; in the alliances against Louis XIV., against Napoleon I., and more recently against Russia in order to preserve the independence of Turkey. It was the characteristic justification of the foreign policy of William III. of Great Britain, who shaped it into a European principle. Its object is to prevent *political aggrandizement* only. There were in Europe, after the overthrow of Napoleon in 1815, five monarchies recognized as the great powers—namely: France, Austria, Great Britain, Russia, and Prussia, to which, in 1859, the kingdom of Italy was added. The victories of the Prussians in 1866 and 1870 established the German empire, and for a time prostrated the armies of France and Austria. But now the military and political re-establishment of these two powers has given rise to a fresh application of the balance of power principle. This is seen in the Tripartite alliance—a defensive treaty of alliance whereby Germany, Austria, and Italy on the one hand are balanced against France and Russia on the other. See INTERNATIONAL LAW. Revised by THEODORE S. WOOLSEY.

Balance of Trade: the difference in value between the exports and imports of a country. If the country's exports exceed the imports in value, the balance of trade is said to be in its favor, and it is assumed that such a country is growing rich, just as a man grows rich when he produces more than he consumes. In point of fact, a fall in imports does not denote prosperity, or at least not to the extent which is often assumed. In one important sense the true advantage of foreign trade to a country is found in the imports. By its means people obtain those things which they can not themselves produce, except at great sacrifice. The custom-house statistics are fallacious at this point, because they represent the value of the goods in the exporting country, not their value to the importing country. If we import British goods which cost \$100,000,000, and which sell for \$110,000,000, the advantage to us is measured by the latter figure, not by the former. In this sense both nations may gain, and generally do gain, by international trade.

The balance of trade does not consist of the simple difference between exports and imports. Many other elements enter into a nation's accounts. Some of the chief items are as follows:

INCOME.	EXPENSE.
Exports.	Imports.
Payments by foreigners to home ship-owners.	Payments to foreign ship-owners.
Interest from foreign investments.	Interest on securities owned abroad.
Receipts from foreign travelers and immigrants.	The expenses of travelers abroad.

The difference between these two is the balance of trade, properly speaking; but as this balance may be settled either in cash or by securities, another important factor is brought in. It will quite generally be found that the years when our balance of trade appears most favorable are those when Europe is sending our securities home to us in large numbers; and that the apparent favorable result means a loss, rather than a gain, in the productive resources of the country, because of the unwillingness of foreign investors to continue to aid us with their capital. See EXCHANGE.

A. T. HADLEY.

Balanoglossus [Mod. Latin, from Gr. *βάλανος*, acorn + *γλῶσσα*, tongue]: a genus of worm-like forms belonging to the group of *Enteropneusta* (*q. v.*), the position of which is very uncertain. The larva presents many resemblances to those of echinoderms, and the adult has characteristics which elsewhere are found only in vertebrates. The animals live in the sand of the sea, are usually brightly colored, and in size might be compared to an earthworm.

Balanus [Gr. *βάλανος*, acorn]: a genus of barnacles, distinguished by the absence of a flexible stalk and the possession of a symmetrical shell. The name is derived from the Greek word for *acorn*, and the animals are commonly known as the "acorn-barnacles." The base is usually formed

of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. This genus comprises many species, which are found in nearly all seas, attached to stones, shells, and other objects. It is remarkable that in the early stage of their existence they are capable of active locomotion, and have large eyes which disappear, along with the organs of locomotion, when they become stationary. Some of the large species were esteemed a delicacy by the ancient Romans. The Chinese collect and eat the *Balanus tintinnabulum*, which is said to resemble lobster in taste; and *Balanus psittacus*, a South American species, is also eaten. This species is sometimes 4 inches in diameter and 8 or 9 inches in height. There are several species found in the U. S.

Revised by D. S. JORDAN.

Balasore, *baā-laā-sōr'*: a district and city of the Orissa division, Bengal Province, British India. The district is a strip of alluvial coast-land, near the head of the Bay of Bengal, W. of the Gangetic delta, between the parallels 20° and 21° N. and the meridians 86° and 87° E. It runs to the hills behind the coast and varies from 9 to 34 miles in breadth. The coast strip proper is incapable of cultivation, but is used for the production of salt. Behind this comes the arable land, a characteristic feature of which is the numerous cup-shaped depressions which bear the finest crops. This is destitute of natural forests and passes gradually into the foothills, which are rocky and sterile. The district has several streams of considerable size, but they are subject to destructive floods. Area, 2,066 sq. miles. Pop. about 950,000.

The town of Balasore, capital of the district, is 8 miles from the seacoast, on the river Burabalang (see map of S. India, ref. 2-II). The English settlement here was made in 1642, and soon became a large trading-post, protected by a fortification. It was one of the seats from which the British Indian empire took its rise. The importance of the city rapidly declined in the eighteenth century, because of a bar which formed across the mouth of the river and which still remains. Pop. 20,000.

M. W. H.

Balas-ruby: See SPINEL.

Balatka, HANS: See the Appendix.

Bal'aton, Lake [Ger. *Platten-see*; Hun. *Balatony*; anc. *Pelso*]: the largest lake in Hungary; 55 miles S. W. of Pesth; is 51 miles long and 7 miles wide. The area is estimated at 450 sq. miles. It receives numerous streams, the largest of which is the Szala, and discharges its water through the Sio and Sarvitz into the Danube. This lake is often celebrated in the old romantic ballads of the Magyars.

Balbi, *baal'bēc*, ADRIANO: an eminent Italian geographer; b. at Venice, Apr. 25, 1782. He became a resident of Paris, where he passed many years. He published in 1826 an *Ethnographical Atlas of the Globe*, which is highly esteemed. His other chief work is a *Compendium of Geography* (*Abrégé de Géographie*, 1 vol. 8vo), which was considered one of the best treatises on that science that had then appeared. His works are mostly written in French. He removed from Paris to Italy in 1832. D. at Padua, Mar. 14, 1848.

Balbi, GASPARO: Venetian merchant of the sixteenth century; in pursuit of his business he visited Aleppo; made a trip to India lasting several years, the published account of which (1590) was the first description of India beyond the Ganges.

Balbo, CESARE: Italian statesman and author; b. at Turin, Nov. 21, 1789. He was in government service 1807-21. He advocated the independence of Italy in a work called *Speranze d'Italia* (*Hopes of Italy*, 1843), which widely extended his reputation. As a moderate and liberal patriot he took a prominent part in the revolutionary movements of 1848. Among his works is a *History of Italy from the Beginning to 1814* (1849), which is highly esteemed. D. at Turin, June 3, 1853. See his life by H. Reuchlin (Nördlingen, 1861).

Balbo'a, VASCO NUÑEZ, de: a famous Spanish navigator and explorer; b. at Xeres de los Caballeros in Estremadura in 1475. He emigrated to Hayti about 1500, and in 1510 accompanied Enciso in an expedition to Darien. Having quarreled with Enciso, Balboa obtained the chief command of the party, and Sept. 25, 1513, discovered the Pacific Ocean from the top of a mountain. He descended to the shore and took possession of the ocean in the name of his sovereign. In 1514 Pedrarias Dávila was sent from Spain to supersede Balboa, who was punished by a fine for his insubordination. He served as a deputy under Pedrarias, who,

actuated by cruelty and jealousy, accused Balboa of treasonable designs, and put him to death at Castilla de Oro, Darien, in 1517. See Irving, *Voyages and Discoveries of the Companions of Columbus*; M. J. Quintana, *Vidas de Españoles Cebres*; and Justin Winsor, *Narrative and Critical History of America*.

Balbuena, baal-bway'na, BERNARDO, de: Spanish poet; b. at Val-de-Peñas in 1568. He became Bishop of Porto Rico in 1620. Of his works only three have been preserved: *La grandeza Mejicana* (Mexico, 1609; Madrid, 1829); *El Siglo de Oro* (1608); and *El Bernardo*, an epic poem (1624 and 1808). D. at Porto Rico in 1627.

Balbus, L. CORNELIUS, surnamed MAJOR: a Roman officer; b. at Gades (Cadiz); became an intimate friend of Cæsar, whom he accompanied to Spain in 61 B. C. In 40 B. C. he was chosen consul, being the first adopted citizen who received that honor. He wrote a diary of the events of his own and Cæsar's life.

Baleh, GEORGE B.: rear-admiral U. S. N.; b. in Tennessee, Jan. 3, 1821; entered the navy as a midshipman in 1837. From 1862 to 1865 commanded first the steamer Pocahontas and afterward the steamer Pawnee, South Atlantic blockading squadron, during which period, in co-operation with the army, he was almost constantly engaged with the enemy's batteries and forts on the Stone and Black rivers, S. C. He was superintendent of the Naval Academy at Annapolis (1879-81). Retired Jan. 3, 1883.

Bal'dachin [from Ital. *baldacchi'no*, deriv. of *Baldacco*, Ital. name of *Bagdad*, whence came the rich material of which the baldachins were made]: a canopy in the form of a crown or umbrella, made of costly materials, richly adorned, and raised over a throne, couch, pulpit, or altar. In the Church of St. Peter in Rome there is a magnificent baldachin cast in bronze, by Bernini, and supported by four twisted columns. The baldachin is used in processions of the Roman Catholic Church, one of silk or stuff supported on four poles being carried over the pope.

Bald Eagle: the *Halia'ëtus leucoceph'alus*; so called on account of the snowy-white color of the head and neck of the adult bird; a native of North America, where it is widely

Bald eagle.

distributed. The length of this bird is about 40 inches, the stretch of wing from 7 to 8 feet. The white feathers of the neck and tail are not acquired until the third year. The nest of the bald eagle is generally made upon some lofty tree, and sometimes becomes of great size, as the bird is in the habit of using the same nest year after year and making additions to it every season. The female bird generally lays her eggs in January, two or three in number and of a dull white color, and they are hatched by the middle of February. It is strongly attached to its young and will not forsake them, even if the tree on which they rest be enveloped in flames. The bald eagle will eat almost anything, even car-

rion, but it is especially fond of fish, which it steals from the osprey when practicable, but also takes them from the water with much skill. Young lambs, pigs, also ducks, geese, and gulls, are seized by the eagle with avidity. For an interesting description of the manner in which it takes its prey the reader is referred to the account given by Audubon. E. Coues speaks of it as a "piratical parasite of the osprey, otherwise notorious as the emblem of the republic."

Revised by D. S. JORDAN.

Balder: See BALDR.

Bal'deric, or **Baudry**, bō'dree': a French chronicler, Bishop of Dol; b. about the middle of the eleventh century. He took part in all the Church councils of the time, and made active efforts to restore the rigor of monastic discipline. He visited England and left an account of his travels. He wrote a chronicle of the first crusade, entitled *Historie Hierosolomytanæ*.

Baldi d'Urbino, baal'dēe-dōor-bee'nō, BERNARDINO: mathematician and man of letters; b. at Urbino, June 6, 1553; accomplished as a writer and in science as well; under the tutelage of Commandino developed a remarkable zeal for the study of mathematics. He learned the Hebrew and Chaldean tongues the better to understand the Bible. He is said to have been acquainted with twelve languages. His multitudinous writings deal with almost every branch of science. Chief among his works are *Cronica de' Matematici* (Chronology of Mathematicians); *Nautica*, a didactic poem on navigation; an Arabic grammar and dictionary; and a translation of the *Targum* of Onkelos. He began the preparation of a geographic dictionary, but got no farther than the letter C. D. at Urbino, Oct. 10, 1617.

Baldness: same as ALOPECIA; the loss or absence of the hair of the scalp. There are some few cases on record in which the hair has never been developed. This is termed congenital baldness. Accidental baldness is caused by an atrophy of the hair-follicles. Baldness in the comparatively young may occur from wearing waterproof caps or unventilated hats, which, by preventing evaporation from the head, occasion an unhealthy state of skin. It may be complete or partial, occurring in patches. Senile baldness (*calvities*) arises, like the preceding variety, from an atrophy of those parts on which the hairs depend for nutrition. It generally commences on the crown of the head. Women are not so frequently bald as men. The causes of baldness are defective supply of nutrition, a hereditary tendency, dissipation, but especially old age. The hair falls off after severe illnesses or after other causes of general debility. Alopecia is sometimes the result of syphilis. The treatment consists in cleanliness, and in exciting the circulation of the scalp by using a hairbrush and the application of stimulants, as the Spanish-fly ointment, two drachms to an ounce of lard, mixed with the same quantity of pomatum, or some equivalent preparation. Any constitutional debility should be remedied. Shaving the head is sometimes resorted to and is often useful. FAVUS (*q. v.*) permanently destroys the hair.

Bald'pate, or **American Wid'geon** (*Mareca americana*): a duck found throughout North America, breeding

The baldpate, or American widgeon.

to the southward, and prized for the delicacy of its flesh. It takes its name from its white crown. It is variously marked

with reddish brown, gray, white, and chestnut. The male has a green band running from the eyes to the nape.

Baldr, Balder, or Baldur: often called BALDR THE GOOD; the second son of Odin, in the Northern mythology. He was supposed to make all things bright and cheerful, and is identified by some scholars with the bright summer sun; hence he has been termed the "Apollo of the North." His abode was Breiðablik ("widely shining"), where nothing impure could enter. The account of his death, as given in the *Prose Edda*, is as follows: He dreamed one night that his life was in the utmost danger; and when he related this dream the gods were so distressed that his mother, Frigg, exacted an oath from all things, animate and inanimate, that they would not injure Baldr. She did not, however, exact any oath from the mistletoe, because it seemed so harmless and insignificant. Now the gods were accustomed to amuse themselves by shooting arrows and throwing stones at Baldr, to all of which he proved invulnerable. When Loki, the god of evil, found that the mistletoe had not taken the oath, he obtained the plant and went to the assembly of gods, where he found Baldr's brother Höðr, standing apart from the others. He asked him why he also did not throw something at Baldr. "Because I am blind," answered Höðr, "and have nothing to throw." "Come," said Loki, "do like the rest; show honor to Baldr by casting this trifle at him, and I will direct your hand." Höðr did as the tempter bade him, and Baldr, pierced through by the mistletoe, fell dead. So great was the grief of the gods that Hermóðr visited the realms of death, and besought Hel to release her prey and allow Baldr to return to the dwelling of the gods. Hel answered that if everything mourned him, then he should return; but if anything whatever failed to weep, then Baldr must remain in the world of shades. All things animate and inanimate were requested by the gods to weep for Baldr, and all did so except a giant hag named Þökk, or Þökt (afterward found to be Loki himself, who had assumed this form in order to prevent Baldr from returning to life). She answered the request by jeers, and Baldr was accordingly forced to remain in the abode of the dead. It is possible that this story has been influenced by Christian teaching and Christian legend. In any case there is no certain evidence that a god Baldr was known to any Teutonic tribe outside of Scandinavia.

Revised by G. L. KITTRIDGE.

Baldung, baal'doong, HANS: German painter and engraver; b. in Gmünd about 1475; d. in Strassburg, 1545. His best work is his engraving on copper, although this is marked by exaggeration and fantastic ornament. A number of his paintings remain, but are not of great value.

Baldur: See BALDR.

Baldwin: on railroad, Douglas co., Kan. (for location of county, see map of Kansas, ref. 5-J); 15 miles S. of Lawrence; has Baker University. The surrounding region is agricultural. Pop. (1880) 325; (1890) 935; (1900) 1,017.

Baldwin I.: King of Jerusalem; b. in 1058; was a brother of Godfrey of Bouillon. He joined the first crusade in 1096, and fought bravely against the infidels. He was chosen Count of Edessa by the Christian inhabitants of that city. On the death of Godfrey, in 1100, he succeeded him as King of Jerusalem. He defeated the Saracens in several battles, and captured Acre, Cæsarea, and Sidon. He was more ambitious and worldly than his brother Godfrey. D. in Egypt in Mar., 1118. See Gibbon, *Decline and Fall of the Roman Empire*.

Baldwin II. (BALDWIN DU BOURG): King of Jerusalem; was a cousin of Baldwin I., whom he succeeded in 1118. He waged war against the Saracens. During his reign the military order of Templars was instituted for the defense of the Holy Land. D. in Jerusalem, Aug. 21, 1131, and left the throne to his son-in-law, Foulques of Anjou.

Baldwin III.: the son of Foulques of Anjou; was born in 1129, and became King of Jerusalem in 1143. He defeated Noor-ed-Deen, the Sultan of Aleppo, at Jerusalem, in 1152 and 1157. He acquired much renown and influence, and was respected even by the Saracens. His wife was Theodora, a daughter of the Greek Emperor Manuel. D. at Tripolis, Syria, Feb. 10, 1162, and was succeeded by his brother, Amalric or Amaury.

Baldwin IV.: King of Jerusalem; surnamed THE LEPER; was born in 1160. He succeeded his father Amalric in 1174. He defeated the famous Saladin near Tiberias in 1182, but

was afterward defeated by that prince. D. in Jerusalem, 1186, and was succeeded by his nephew, Baldwin V., who died in childhood.

Baldwin I.: the first Latin Emperor of Constantinople; was born at Valenciennes in 1171. He was Baldwin IX., Count of Flanders, having inherited that title from his father, Baldwin VIII. He joined the fourth crusade in 1200, and co-operated with the Venetians in an enterprise against Constantinople, the throne of which was occupied by Alexis, an usurper. The crusaders defeated Alexis, captured the city, and elected Baldwin emperor in 1204. He was defeated and taken prisoner by the Bulgarians in 1205, and died in captivity, 1206, leaving the throne to his brother Henry. See A. Cahour, *Baudouin de Constantinople* (1850).

Baldwin II.: Emperor of Constantinople; b. in 1217; was a son of Peter de Courtenay, and a nephew of Baldwin I. He succeeded to the throne in 1228, and was placed under the guardianship of John de Brienne. He began to reign in 1237, and encountered much opposition from the Greeks and Bulgarians. In 1261 his capital was taken by Michael Palæologus, and Baldwin fled to Italy, where he died 1273. The English family of Courtenay claims to be descended from the stock of this emperor.

Baldwin, CHARLES H.: rear-admiral U. S. N.; b. in the city of New York Sept. 3, 1822; entered the navy as a midshipman Apr. 24, 1839. He served on west coast of Mexico during Mexican war, and was in several sharp engagements with the enemy on shore near Mazatlan. He commanded steamer Clifton of mortar flotilla at passage of Forts St. Philip and Jackson by Farragut's fleet, Apr. 24, 1862, and at attack on Vicksburg, June 28, 1862. In command of Mediterranean squadron from Mar. 10, 1883, to date of his retirement, Sept. 3, 1884. D. in New York city, Nov. 17, 1888. Revised by S. B. LUCE.

Baldwin, HENRY PORTER: b. at Coventry, R. I., Feb. 22, 1814; emigrated to Detroit in his youth; was Governor of Michigan (1869-73), and U. S. Senator (1879) for unexpired term of Senator Chandler, ending Mar. 4, 1881. He was for years a leading member and office-bearer of the diocese of Michigan, and repeatedly represented the diocese in the general convention, the Board of Missions, and other organized bodies of the Protestant Episcopal Church. D. at Detroit, Mich., Dec. 31, 1892.

Baldwin, JAMES MARK, Ph. D.: psychologist and sociologist; b. in Columbia, S. C., Jan. 12, 1861; educated at Princeton, Leipzig, and Berlin Universities; instructor in French at Princeton 1886-87; Professor of Philosophy in Lake Forest University 1887-89, and in Toronto University 1889-93; Professor of Psychology at Princeton since 1893. He is coeditor of *The Psychological Review*, and author of *Handbook of Psychology* (2 vols., 2d ed. 1889-91); *Elements of Psychology* (1893); *Mental Development in the Child and the Race* (4th ed. 1898); *Social and Ethical Interpretations in Mental Development* (2d ed. 1898), a work awarded the gold medal of the Danish Academy of Sciences. He is a member of the Institut International de Sociologie and other learned societies, president of the American Psychological Association (1898), etc.

Baldwin, JOHN DENISON: b. at North Stonington, Conn., Sept. 28, 1810; and was long the editor and proprietor of the *Worcester Spy* (Mass.); member of Congress 1863-69; published *Raymond Hill and Other Poems* (1847); *Prehistoric Nations* (1869); *Ancient America* (1872). D. July 8, 1883.

Baldwin, JOSEPH G.: of Sumter, Ala.; was a native of Virginia. He was a lawyer and politician; author of *Flush Times in Alabama and Mississippi* and of *Party Leaders* (1840); judge of the Superior Court of California in 1857-63, and chief justice of California in 1863. D. Sept. 30, 1864.

Baldwin, ROBERT: Canadian statesman; b. in Toronto, May 12, 1804. He began the practice of law in 1825; was elected to the Upper Canada Assembly in 1829; and visited London in 1836 in the interest of responsible government for Canada, but failed in his mission. He became an executive councillor in 1836, solicitor-general in 1840, and in 1842 premier and attorney-general of Upper Canada, which offices he held till 1843. In 1848 he resumed office in the Baldwin-Lafontaine government; retired from official life in 1851. He is regarded as the father of the Reform party of Canada. D. in Toronto, Dec. 9, 1858. NEIL MACDONALD.

Baldwin, STEPHEN LIVINGSTON, D. D.: secretary of the Missionary Society of M. E. Church; b. at Somerville, N. J.,

Jan. 11, 1835; educated at Newark Wesleyan Institute and Concord Biblical Institute; has been pastor in Newark and New England conferences, and superintendent of the Foochow (China) Mission. Author of a translation of *Judges* and *Daniel* into Foochow colloquial; article on *Confucianism* in Reid's *Doomed Religions*; editor of *Chinese Recorder*.

Baldwinsville: village forming part of Lysander and Van Buren towns, Onondaga co., N. Y. (for location of county, see map of New York, ref. 4-F); on Delaware, Lackawana and Western R. R., 12 miles N. W. of Syracuse, and on Seneca river, which furnishes excellent water-power; has graded schools and an academy and five churches. Baldwinsville is a manufacturing town, in a rich agricultural district; is center of the tobacco-raising industry of the Onondaga region. First settled in 1807, and named Columbia, then (1815) Baldwin's Bridge, and soon after Baldwinsville. Pop. (1880) 2,121; (1890) 3,040; (1900) 2,992.

EDITOR OF "GAZETTE AND FARMERS' JOURNAL."

Bâle, or Basle, French form of BASEL (*q. v.*).

Bale, bayl, JOHN: English theologian and dramatist; b. at Cove, Suffolk, in Nov., 1495; became a Carmelite; was educated at Jesus College, Oxford; turned Protestant; and, after eight years of exile in Flanders, was made Bishop of Ossory, Ireland, in 1552. During the reign of Queen Mary he took refuge in Switzerland. On the accession of Elizabeth he was appointed a prebend in Canterbury Cathedral, and died in Nov., 1563. Besides numerous controversial writings, he published in Latin the first literary history of England, *Scriptorum Illustrum Majoris Britanniae Catalogus* (1548-59), and wrote a number of interludes and morality plays in the Protestant interest, the most important of which was the historical play of *King John*. See his *Select Works* (Parker Society, Cambridge, 1849).

HENRY A. BEERS.

Balear'ic Crane (*Balearica pavonina*): a beautiful crane found in Northern and Western Africa, conspicuous for its crown of golden plumes and its scarlet cheeks. It is readily tamed, often indulging in fantastic dances, running about

Balearic crane.

with great speed, and screaming with a harsh and ringing voice. It is of a bluish-slate color, and is 4 feet high. It is exceedingly gentle, and, unlike some other cranes, is quite harmless.

Balearic Isles (anc. *Baleares* or *Baleares In'sulæ*): a group of five islands in the Mediterranean, forming a Spanish province, the area of which is 1,860 sq. miles. Pop. (in 1887) 312,646. Capital, Palma. Their names are Majorca, Minorca, Iviça, Formentera, and Cabrera. The soil is mostly fertile, though badly cultivated. The climate is very fine. Vegetation has a tropical aspect. The chief exports are olive oil, figs, oranges, wool, mules, wine, hats, brooms, brandy, capers, saffron, cheese, salt, woodenware, baskets, etc. The ancient natives of these islands were very expert slingers, and served in the Carthaginian army. The name is supposed to refer to their expertness through the Greek word βαλλειν, to sling. The Balears were made an independent kingdom in 1256, but soon became feudal to Aragon, to which kingdom they were annexed in 1344. The Moors were long masters here, but were expelled in 1285.

The Kings of Spain long retained the title of "King of the Balearic Islands" as one of their secondary honors. The language is made up of various dialects (Mallorquin, Minorquin, etc.) of the Catalan, mingled with Arabic (and perhaps Punic) elements. The Archduke Ludwig Salvator is publishing (1893) an elaborate work on these islands. Vol. iv., *Minorca*, appeared in 1891. The work is not in the trade. See MAJORCA and MINORCA.

Baléchou, baä'lā'shoo', JEAN JOSEPH NICOLAS: a very eminent French engraver; b. at Arles in 1715. He was the first burinist of his time. His works are remarkably neat, and his style brilliant, vigorous, and bold; but his drawing is often defective, and he paid too little attention to detail. His *Women Bathing*, *Storm*, and *Calm* (after C. J. Vernet), *Saint Genéviève* (after Charles Vanloo), and his full-length portrait of Augustus, King of Poland, are his most famous works. The last mentioned is one of the great triumphs of the engraver's art. D. in Avignon, Aug. 18, 1764.

Baleen' [O. Fr. *baleine*, whale, whalebone < Lat. *balaena*, whale]: a substance commercially known as whale-fin and whalebone; procured from the mouth of the right whale, and various other species. It grows from the roof of the mouth of all the *Balanidæ* or true whales, though in some it is too small to be of commercial importance. It is never found in the sperm whales or the dolphins. From single whales as much as 2 tons of baleen has been taken. It consists of horny plates of albuminous matter charged with phosphate of lime. Baleen takes the place of teeth, and serves as a strainer for separating from the water the little animals which serve as food for the whale. See WHALEBONE.

Balen, baal'en, or **Ballen,** baal'en, HENDRIK, van: a Flemish painter; b. in Antwerp in 1560; studied with Adam van Oort and in Italy, and was the first instructor of Vandyck. In spite of a certain coldness and mannerism, his harmonious coloring, correct taste, and skillful composition have given him a more than respectable rank among painters. Of his numerous works, the best known are scriptural and ecclesiastical pieces. His nude figures are well executed. D. in Antwerp, July 17, 1632.

Balestier, bäl'es-teer, WOLCOTT: novelist; b. at Rochester, N. Y., Dec. 13, 1861. After a short course in Cornell University, and a trip to Colorado and Mexico, he went to New York and connected himself with the publishing-house of Lovell & Co. As London agent of that house he went to England in 1888. D. in Dresden, Saxony, Dec. 6, 1891. Balestier's fictions deal largely with frontier life in Colorado. They include, besides a number of short stories in the magazines and three early novels of inferior merit, *The Naulahka*, written in co-operation with his brother-in-law, Rudyard Kipling, and *Benefits Forgot*, written in 1885 and published serially in *The Century* (1892).

HENRY A. BEERS.

Bales'tra, ANTONIO: an Italian painter; b. at Verona in 1666. After his father's death he followed commercial pursuits until he came of age, when he went to Venice and became a pupil of Belucci (an able colorist), and afterward studied at Rome with Carlo Maratti. His *Defeat of the Giants* gained the prize at the Academy of St. Luke in 1694. Among his other famous pictures are a *Saint Theresa* at Bergamo, a *Virgin* at Mantua, a *Life of Saints Cosmas and Damian* at Padua, and his own portrait at Florence. He was one of the last able artists of the Venetian school, though not a slavish follower of any school. He was a skillful designer, a good colorist, a laborious and faithful student of his art, and was possessed of a vigorous hand and spirit. The works of Giovanni Balestra, a skillful engraver, are often incorrectly assigned to the subject of this notice. D. in Verona, Apr. 21, 1740.

Balfe, MICHAEL WILLIAM: opera-composer; b. in Dublin, Ireland, May 15, 1808, and d. at Rowney Abbey, Hertfordshire, England, Oct. 20, 1870. His first studies in music were as a violinist, and he appeared as a solo performer when a boy. He also studied the piano, but specially devoted himself to singing and dramatic composition, and became, while still young, one of the most popular stage composers of the period. From the beginning to the end of his career he had uninterrupted success. His operas were sung everywhere. The list is a long one, but the following include not only the best known but also the best works: *The Siege of Rochelle* (1835); *The Bohemian Girl* (1843); *The Daughter of St. Mark* (1844); *The Enchantress* (1845); *The Rose of Castile* (1857); *Satanella* (1858); *The Armorer of Nantes*

(1863); *Blanche de Nevers* (1863); *The Knight of the Leopard*, produced in Italian as *Il Talismano* (1874); and *Pittore e Duca*, produced in English as *Moro, the Painter of Antwerp* (1881). Several of these attained wide popularity. *The Bohemian Girl* was performed in German as *Die Zigeunerin*, and in French as *La Zingarella*. This was in a special five-act version made by Balfe for the Paris Grand Opéra. Many of his songs have also become favorites. *Come into the Garden, Maud*, is a famous tenor show song. He also composed several cantatas and concert choruses. A polacca which he composed for full orchestra, scoring it himself, was played in Dublin when he was seven years old. He was sometimes called the "English Rossini," and for fertility in genial melody he deserved the title, but his work lacked seriousness of purpose.

D. E. HERVEY.

Balfour, balf'foor, The Right Hon. ARTHUR JAMES, P. C., LL. D., F. R. S.: British statesman; b. July 25, 1848; educated at Eton and at Trinity College, Cambridge; private secretary to his uncle, the Marquis of Salisbury (1878-80), as such attending the Berlin Congress; member of Parliament for Hertford 1879, and for East Division of Manchester 1885; president of Local Government Board, without seat in the cabinet, 1885; Secretary for Scotland, Aug. 3, 1886; admitted to the Cabinet, Nov. 19, 1886; Chief Secretary for Ireland, Mar. 5, 1887; leader of the House of Commons and First Lord of the Treasury, Nov., 1891, retiring on the accession of the Gladstone ministry in the summer of 1892, when he became leader of the Conservative opposition. On the return of the Unionist Party into power, June, 1895, he again became First Lord of the Treasury and leader of the House. Author of *Defense of Philosophic Doubt* (London, 1879) and various magazine articles. Up to 1878 Mr. Balfour was known only as a brilliant young scholar. His development of rare political capabilities has since been very rapid.

C. K. ADAMS.

Balfour, FRANCIS MAITLAND: embryologist; brother of Arthur J. Balfour; b. at Edinburgh, 1851; educated at Harrow and at Trinity College, Cambridge; became Professor of Morphology at Cambridge after declining offers from Oxford and Edinburgh; published (1880-81) *Comparative Embryology*, on which his fame rests; lost his life July 19, 1882, in attempting to climb one of the spurs of Mont Blanc.

Balfour, ISAAC BAYLEY, M. A., M. D., D. Sc., F. R. S.: botanist; b. in Edinburgh, Mar. 31, 1853; educated in the universities of Edinburgh, Strassburg, and Würzburg; botanist to the transit of Venus expedition to Rodriguez 1874; leader of natural history exploration of Socotra 1879; Professor of Botany in University of Glasgow 1879-84; Professor of Botany in University of Oxford 1884-88; since then Professor of Botany in University of Edinburgh, keeper of Royal Botanic Gardens, and Queen's Botanist of Scotland. His principal publications are *Botany of Rodriguez* (Phil. Trans., 1879) and *Botany of Socotra* (Trans. Roy. Soc. Edin., 1888), and he was editor of the English translations of Goebel's *Outlines of the Classification and Special Morphology of Plants*; De Bary's *Comparative Morphology and Biology of Fungi, Mycetozoa, and Bacteria*; De Bary's *Bacteria*; and Solms-Laubach's *Fossil Botany*. Since 1887 he has been one of the editors of the *Annals of Botany*.

CHARLES E. BESSEY.

Balfour, JOHN BLAIR, Q. C., LL. D., P. C.: Scottish lawyer; b. at Clackmannan, 1837; educated at Edinburgh Academy and at University of Edinburgh; called to the Scottish bar 1861; Solicitor-General for Scotland 1880; privy counselor 1883; Lord Advocate for Scotland 1881-85, 1886, and again in Mr. Gladstone's cabinet of 1892.

Balfour, JOHN HUTTON, M. D., F. R. S.: botanist and physician; b. in Edinburgh, Sept. 15, 1808; nephew of Hutton, the geologist. In 1845 he became Professor of Botany at Edinburgh. He published a *Manual of Botany* (1849) and a *Class-book of Botany* (1852), and contributed the articles on botany to the eighth and ninth editions of the *Encyclopædia Britannica*. D. in Edinburgh, Feb. 11, 1884.

Balfour, THOMAS GRAHAM, M. D., F. R. S.: physician; b. in Edinburgh, Mar. 18, 1813; M. D., University of Edinburgh 1834; gazetted to the medical staff of the army 1836; promoted to be head of the newly formed statistical branch on the reorganization of the Army Medical Service in 1859; became surgeon-general in 1873; retired in 1876; represented the Army Medical Department in the International Medical Congress at London in 1880; member of numerous learned societies; author of five volumes of statis-

tical reports *On the Health of the Army* (with Sir A. Tulloch); of thirteen Annual Reports of the statistical branch, and of numerous articles. D. in Wimbledon, Jan. 17, 1891.

C. H. THURBER.

Bali, baa'lēe, or **Bally**, baal'lēe: an island of the Malay Archipelago; about 3 miles E. of Java; area, 1,999 sq. miles. It is nearly 70 miles long and 35 miles wide. The chief exports are rice, cotton, coffee, tobacco, hides, etc. The island is divided into several small states, of which Badong is the chief. The Balinese mostly profess Brahmanism. They are said to be superior to the Javanese in mind and other respects. Their language resembles that of Java. Bali is a Dutch dependency. Pop. about 500,000.

Baliol, or **Balliol**, EDWARD: a son of King John Baliol; invaded Scotland in 1332 at the head of discontented barons. Having gained several victories over the Scottish army, he was crowned king at Scone in September of that year. About three months later he was surprised in his camp at Annan by Archibald Douglas, and lost his crown. His subsequent career was unfortunate. The last of his house, he died near Doncaster, 1367.

Baliol, or **Balliol**, JOHN: Lord of Galloway and King of Scotland; b. about 1259. He became the rival of Robert Bruce, and claimed the crown as a grandson of David, who was a brother of King William the Lion. The dispute was referred to Edward I. of England, as arbiter, who decided that Baliol was the rightful heir, and imposed the condition that he should do homage to the King of England. He was crowned in 1292, and swore fealty to Edward, but soon renounced his allegiance. Edward invaded Scotland, defeated Baliol's army, and compelled him to resign the crown July 7, 1296. After thirteen years' residence in Normandy he died in 1315.

Baliol College: See OXFORD, UNIVERSITY OF.

Balis'tidæ: the trigger-fishes; a family of plectognath fishes with the pelvic bone well developed and movable, without ventral spines, and with the spinous dorsal represented by at most three spines. They are mostly found in tropical or subtropical seas, and are divisible into two sub-families. The typical species (*Balistine*) have brilliant colors and a curious provision for fixing the first dorsal spine in an erect position or lowering it at will. For this reason they are sometimes called trigger-fishes. The fool-fishes (*Monacanthinæ*) are generally dull in color, and have one spine, supplemented by a second small one behind.

Trigger-fish: balistes.

Revised by D. S. JORDAN.

Balkan, baal-kaan' (anc. *Hæmus*): an important mountain-chain of Europe; extends from Sofia eastward to Cape Emineh on the Black Sea, and forms the southern boundary of the basin of the Danube. Some peaks of this range are over 5,000 feet high. The Balkan is connected with the mountains of Middle Europe by the ranges of Montenegro and Herzegovina. It is an important natural barrier, sloping abruptly to the S.

Balkan Peninsula: the easternmost of the southern peninsulas of Europe, so named from the Balkan Mountains within it. It lies between the Black and Aegean Seas on the E., and the Adriatic and Ionian on the W. The northern boundary is not well defined, but may conveniently be taken as the Danube river and its tributaries, the Save and the Una. Thus defined it is almost entirely surrounded by water, and includes Bosnia, Herzegovina, Montenegro, Servia, Bulgaria, Rumelia, Turkey in Europe, and Greece. The peninsula is very mountainous, culminating in an elevated triangular plateau of which the angles are Sarajevo (capital of Bosnia), Sofia (in Eastern Bulgaria), and Metsovan (on the Grecian frontier). The climate is varied. It is rigorous in the Danubian plain of Bulgaria, but rapidly grows mild toward the south. Constantinople is celebrated for the mildness of the climate and serenity of its sky. The summers of Thrace and the lower plains of Macedonia are cooled and refreshed by sea-breezes. The winters are very severe in the north and over the central plateau. The population is turbulent, and very diverse as to race and religion. In Macedonia the races are confused, but elsewhere they are

more distinct. Bosnia, Serbia, Herzegovina, and Montenegro are chiefly occupied by a branch of the Slavs called the Servo-Croats. In Bulgaria and Eastern Rumelia the dominant people is the Bulgarian, another branch of the Slavs. Albania is largely occupied by an aboriginal race, the Arnauts or Skiptars. Greece and a littoral band several leagues wide, extending from Salonica to Constantinople, are occupied by Greeks, the latter part being more distinctly Byzantine than the former, and there is a large population of Greeks in Constantinople, Adrianople, and other large cities of Thrace and Macedonia. The Turks are generally disseminated through the proper Turkish part of the peninsula, but are in the majority only in Stamboul (a quarter of Constantinople) and in Adrianople. In Salonica Jews of Spanish origin make up nearly two-thirds of the population. There are three principal religions: the Greek Orthodox, professed by the Greeks, Servians, Bulgarians, and Southern Albanians; the Roman Catholic, professed by the Bosnians and Northern Albanians; and Mohammedanism, professed by the Turks and some Bosnians and Albanians.

The Balkan Peninsula has played an important part in history. The Greeks, the Macedonians, the Byzantines, and the Turks have alternately advanced or retarded civilization within its borders. The Turks formerly controlled the whole peninsula. Successive revolts and invasions, especially during the nineteenth century, have generally given a more or less complete autonomy to the various races mentioned above. Serbia, Montenegro, and Greece are independent; Bosnia and Herzegovina are controlled by Austria-Hungary; Bulgaria is nominally tributary to the Sultan of Turkey; the remainder of the peninsula is Turkish, but the Albanians are practically independent. MARK W. HARRINGTON.

Balkash, baäl-kaash' (Kalmuck, great lake; called by the Khirgiz *Ak Tenghiz*, i. e. white sea, or simply *Tenghiz Sea*): a large lake of Asiatic Russia having no visible outlet; is between the provinces of Semipalatinsk and Semiryetshensk, in lat. 45° N., lon. 79° E. Its length from N. E. to S. W. is 390 miles, and its greatest breadth 50 miles. Area, 7,120 sq. miles; elevation above sea-level, 781 feet.

Balkh, baalkh (anc. *Bactria*): a province of Afghan Turkestan between the Hindu Kush and Oxus. It is the best-watered and most fertile part of the country. The population is variously estimated, but probably does not surpass 500,000. Area about 3,000 sq. miles. Capital, Masar-i-Sherif.

Balkh [Turkish *balik*, city]: former capital (anc. *Zarias'pa* and *Bactra*) of the province of Balkh; about 22 miles S. of the Oxus river, and 150 miles N. N. W. of Cabul. The ancient Bactra was an important city, the remains of which cover a space about 20 miles in circuit, and comprise eighteen aqueducts now in ruins. It was destroyed by Jengis Khan. The modern town is insignificant. Pop. about 2,000.

Ball, GAME OF: This was a favorite gymnastic exercise among the ancient Greeks and Romans, the latter of whom called it *pita*. At Rome it was played by persons of all ages and by men of high rank. The Greeks prized the game as the means of giving grace and elasticity to their figures and motions. In the sixteenth century this game was fashionable in the courts of French and Italian princes. The French *jeu de paume* and English *tennis* were modifications of the game of ball. The ball was struck with a mallet (Fr. *mail* or *maille*; Eng. *mallet*), sometimes called pall-mallet or pell-mell, from the Italian *palla*, a ball. A form of this game, called *cricket*, is much played by the English. The popular game of the U. S. is *base-ball*. See BASE-BALL, CRICKET, and TENNIS.

Ball, GEORGE H., D. D.: b. at Oxford, Sherbrook co., East Canada, Dec. 7, 1818; studied at the Theological Seminary of New York, whence he graduated in 1847; was pastor of the Niagara Square Baptist church, Buffalo, N. Y., for about twenty years; pastor of Roger Williams church, Providence, R. I., for two years; editor of the *Baptist Union*, and published *Guide to the Lord's Supper*, *Christian Baptism*, etc.

Ball, SIR ROBERT STAWELL, LL. D., F. R. S.: astronomer; b. in Dublin, July 1, 1840; educated at Trinity College; Professor of Astronomy at Dublin and Astronomer Royal for Ireland 1874; Professor of Astronomy, Cambridge, and Director of the Observatory 1892; President Royal Astronomical Society in 1897; knighted 1886. Author of *Experimental Mechanics* (London, 1871; 2d ed. 1888); *Elements of Astronomy* (1880); *The Story of the Heavens* (1885; 3d ed. 1890), etc., as well as numerous magazine articles.

Ball, THOMAS: sculptor; b. in Charlestown, Mass., June 3, 1819. Employed in the Boston Museum, he cleaned and imitated the pictures, and gradually passed on to miniature and then to portrait painting. During this period he sang in oratorios, his voice passing from soprano to a rich deep bass, effective in *Elijah*. His first published plastic work was a small bust of Jenny Lind during her visit to America, which was pirated by Italians and sold in vast numbers. His life-size bust of Webster, just after that statesman's death, led to a commission for a full statue, and launched him on his especial career. He went to Florence, opened a studio, and commissions flowed in upon him. For many years his time was passed in Italy, interrupted by visits to America. In 1865 he made an equestrian statue of Washington, cast in bronze and now in the Boston Public Garden. An heroic bronze statue of Webster by Ball stands in Central Park, New York. Boston has decorated her public buildings with busts or statues of Rufus Choate, Edward Everett, Gov. John Andrews, and other portrait work by the same artist. In idealization he produced a *Coriolanus*, with Edwin Forrest for a model, an *Eve*, and, besides many other pieces, a colossal group representing *Emancipation*, which is in Washington, D. C., and is the culmination of his art. His later years were passed in Boston. His *Three Score Years and Ten* (Boston, 1891), an autobiography, is a genial and rather garrulous collection of reminiscences of a life rich in acquaintance with artists and noted men.

Ballad Poetry: The word *ballad* in English signifies a narrative song, a short tale in lyric verse, which sense it has come to have, probably through the English, in some other languages. It means, by derivation, a dance-song, but though dancing was formerly, and in some places still is, performed to song instead of instrumental music, the application of the word in English is quite accidental. The *popular* ballad, for which our language has no unequivocal name, is a distinct and very important species of poetry. Its historical and natural place is anterior to the appearance of the poetry of art, to which it has formed a step, and by which it has been regularly displaced, and, in some cases, all but extinguished. Whenever a people in the course of its development reaches a certain intellectual and moral stage, it will feel an impulse to express itself, and the form of expression to which it is first impelled is, as is well known, not prose, but verse, and in fact narrative verse. The condition of society in which a truly national or popular poetry appears explains the character of such poetry. It is a condition in which the people are not divided by political organization and book-culture into markedly distinct classes, in which consequently there is such community of ideas and feelings that the whole people form an individual. Such poetry, accordingly, while it is in its essence an expression of our common human nature, and so of universal and indestructible interest, will in each case be differenced by circumstances and idiosyncrasy. On the other hand, it will always be an expression of the mind and heart of the people as an individual, and never of the personality of individual men. The fundamental characteristic of popular ballads is therefore the absence of subjectivity and of self-consciousness. Though they do not "write themselves," as William Grimm has said, though a man and not a people has composed them, still the author counts for nothing, and it is not by mere accident, but with the best reason, that they have come down to us anonymous. Hence, too, they are extremely difficult to imitate by the highly civilized modern man, and most of the attempts to reproduce this kind of poetry have been ridiculous failures.

The primitive ballad, then, is popular, not in the sense of something arising from and suited to the lower orders of a people. As yet, no sharp distinction of high and low exists, in respect to knowledge, desires, and tastes. An increased civilization, and especially the introduction of book-culture, gradually gives rise to such a division; the poetry of art appears; the popular poetry is no longer relished by a portion of the people, and is abandoned to an uncultivated or not over-cultivated class—a constantly diminishing number. But whatever may be the estimation in which it may be held by particular classes or at particular epochs, it can not lose its value. Being founded on what is permanent and universal in the heart of man, and now by printing put beyond the danger of perishing, it will survive the fluctuations of taste, and may from time to time serve, as it notoriously did in England and Germany a hundred years

ago, to recall a literature from false and artificial courses to nature and truth.

Of the European nations the Spaniards and those of Scandinavian-German stock have best preserved their early popular poetry. We have early notices of the poetry of the Germans. Their ballads, mythical or historical, are several times spoken of by Tacitus, who says that these were their only annals. The earth-born Tuiseo and his son Mannus were celebrated in the one, and the hero Arminius in the other. The historian of the Goths, Jornandes, writing in the sixth century, says that these people were accustomed to sing the exploits of their fathers to the harp, and seems to have taken not a little of his history from such songs. The like is true of Paulus Diaconus, the Lombard historian, who wrote in the eighth century, and mentions songs about Alboin (who died in 563) as existing among all the nations of German speech. Charlemagne had the old traditional songs of his people collected and committed to writing, and even made them one of the subjects of school instruction. Side by side with heroic ballads, social, 'convivial, and funeral songs (which may, to be sure, have been pretty much the same thing) seem to have been in use from the earliest recorded times. To all this popular poetry, by reason of its heathen derivation and character, the Christian clergy opposed themselves with the most determined hostility. Not succeeding in extirpating it by the use of the spiritual and legal means at their command, the German churchmen of the ninth century conceived the idea of crowding it out by substituting poetry of a Christian subject and tone—an expedient which has been tried more than once since then. Though popular song lived on in obscure places, the foreground of history is filled for 600 years with religious and courtly poetry, and with the chivalrous and native epic. Nothing is left of the old heroic songs but a fragment of the *Hildebrandslied*, from the eighth century (best known in a modernized form of the fifteenth century); and of the Christianized song we have also but a single specimen, the *Ludwigslied*, of the year 881. The former is in the ancient alliterative meter, the latter in the then newly introduced rhymed stanza. During the fifteenth and the early part of the sixteenth century a second growth of the genuine popular song appears, some of it springing, doubtless, out of shoots from the old stock which had lived through this long interval, some of it a fresh product of the age. These ballads were popular in the large and strict sense; that is, they were the creation and the manifestation of the whole people, great and humble, who were still one in all essentials, having the same belief, the same ignorance, and the same tastes, and living in much closer relations than now. The diffusion of knowledge and the stimulation of thought through the art of printing, the religious and intellectual consequences of the Reformation, the intrusion of cold reflection into a world of sense and fancy, broke up the national unity. The educated classes took a direction of their own, and left what had been a common treasure to the people in the lower sense, the ignorant or unschooled mass. German ballads have been collected in considerable numbers. The sources have been "flying leaves," manuscripts, printed song-books (mostly of the sixteenth century), and oral tradition. In interest they are decidedly inferior to the Scandinavian and English.

Christianity and foreign culture, which in different ways have been equally destructive in their effects upon ancient national poetry, were introduced into the Scandinavian countries much later than into Germany and England. In the Scandinavian countries, too, the peasantry long maintained a much higher position. They were not an oppressed and ignorant class, but free men, who shared fully in the indigenous culture, and so were well fitted to keep and transmit their poetical heritage. While, therefore, the heroic ballads of Germany and England have been lost—those of England utterly, those of Germany being preserved only in epic conglomerates like the *Nibelungenlied*—and while the mythical cycle in both countries is but feebly, if at all, represented, Scandinavia has kept a great deal of both. The story of Thor's Hammer forms the subject of a ballad still known in all the Scandinavian countries; a volume of ballads concerning Sigurd has been gathered from tradition in the Faroe isles within this century, and several ballads of this cycle and of that of Dietrich of Bern are found in Danish manuscript ballad-books. Svend Grundtvig, the editor of the still unfinished but truly magnificent collection of the old Danish ballads, has arranged them in four classes:

first, the Heroic; second, the Trylleviser, or ballads of giants, dwarfs, nixes, elves, mountain-spirits, enchantment, spells, and ghosts; third, the Historic; and fourth, ballads of Chivalry. The historic ballads (intending their original, not their actual, form) mostly fall within the period from 1150 to 1300; the chivalrous are later, and the two other classes belong to a still earlier term, which may extend over the first half of the twelfth century, and into, or perhaps through, the eleventh—that is, to the epoch of the introduction of Christianity. Ballads are best preserved by oral tradition in Norway and the Faroe isles, but not at all, there, in old manuscripts; Sweden has a few manuscripts, and Denmark a great number, written mostly by noble ladies living on their estates, and giving the ballads as they were sung three or four hundred years ago, as well in the lord's castle as in the peasant's hut. The Danish ballads were collected in a printed form earlier than any others except the Spanish. Vedel published a hundred in 1591; another collection, called *Tragica*, or old Danish historic love-ballads, appeared at Copenhagen in 1657; and in 1695 Syv republished Vedel's ballads, with the addition of another hundred.

The English have preserved but a moderate number of very early ballads, and the date of many of these it is impossible to fix. There are some narrative poems in Anglo-Saxon which, without stretch of language, might be called ballads. The Norman Conquest, and the predominance of the French language for more than two hundred years, had of course momentous literary consequences, but there is no reason why the production of the native ballad should have stopped. The story of the Saxon outlaw Hereward, which begins with the second year after the Conquest, and has been handed down to us in Latin prose of the twelfth century, is full of such adventures as form the themes of ballads, and very likely was made up from popular songs. Such ballads, if they existed, are lost, but ballads concerning outlaws are among the earliest and best ones of the English. In place of Hereward of the Conqueror's time, and Fulk Fitz-Warin of John's time (whose history was also extremely popular), we have Robin Hood of uncertain time. Songs of Robin Hood and of Randolph, Earl of Chester (probably the third earl, who died in 1232), we know, from Piers Ploughman, were current among the lower orders at the middle of the fourteenth century, and one Robin Hood ballad exists in a manuscript which may be as old as the first quarter of the next century. Another occurs in a manuscript dated at about 1500, others in the Percy manuscript. The *Little Gest* of Robin Hood, which is a miniature epic made up of half a dozen ballads, was printed by Wynken de Worde, "probably," says Ritson, "in 1489." We may reasonably place the origin of the Robin Hood ballads as early as the thirteenth century. To the thirteenth century may belong Hugh of Lincoln, which is founded on an incident that occurred in 1255. An Anglo-Norman ballad on the same subject twice refers to a King Henry, and is therefore put within the reign of Henry III., which ended 1276. After this there are only one or two ballads with dates till we come to the Battle of Otterbourn, 1388, from which time we have a succession of ballads founded on ascertained events, down to the middle of the eighteenth century. Ballads like those of Grundtvig's second class exist in a small number; one of them in a manuscript of the middle of the fifteenth century. The little that we have of ballads of the Arthur cycle, and many of the best of all kinds, we owe to the Percy manuscript, written just before 1650. A few ballads besides those named have been gleaned from manuscripts and early prints, but a large part of our whole stock has been recovered within the last 130 years from the oral tradition of Scotland. The first impulse to the collecting of this poetry was given by the publication of Percy's *Reliques* in 1765. The *Reliques* inspired Bürger and Herder, through whom, and especially through Herder's *Volklieder* (1778-79), that interest in the literature of the people was awakened in Germany which has spread over the whole of Europe, and has led to the collecting and study of the traditional songs and tales of all the European, and some of the Asiatic, African, and American races.

The Spanish alone of the Latin nations can boast a ballad poetry of great compass and antiquity. Following the law of analogy where documents are wanting, the origin of these ballads would be put between the years 1000 and 1200, the period when the Spanish nationality and language had been developed to that degree which invariably

incites and leads to expression in epic song. Some sort of popular poetry about the Cid (whose time is 1040-99) is known to have been sung as early as 1147; the poem of the Cid itself is placed about 1200. During the century that follows we find occasional mention of ballad-singers, but no ballads. As in Germany, the popular poetry, after the first bloom of the national genius, was supplanted by art-poetry, among the higher classes, and it passed out of notice for two or three hundred years. A reaction set in in the sixteenth century. This was the glorious period of Spanish history, and the return to the national poetry was a natural consequence of the powerful stirring of the national mind. Omitting "flying leaves" or broadsides, and a few ballads in the *Cancionero General* of 1511, the earliest collection of Spanish ballads is an undated *Cancionero de Romances*, printed at Antwerp about 1546; and this, it must be observed, is the first ballad-book printed in any language, and was gathered in part from the memory of the people. Other similar collections followed, from which was made in 1600 the great *Romancero General*. Toward the end of the seventeenth century the national ballads declined in favor, with a decline of national spirit, but since the beginning of the present century they have been restored to a high estimation at home, and have gained the admiration of the world. The oldest ballads are those which relate to the history and traditions of Spain, and recount the exploits of Bernardo del Carpio, Fernan Gonzalez, the Seven Lords of Lara, and the Cid. Then comes a variety of romantic and chivalrous ballads, and then ballads of the Carolingian cycle. These oldest and most characteristic of the Spanish ballads have been excellently edited by Wolf and Hofmann, and the entire body of this literature, amounting to more than 1,900 pieces, is included in the *Romancero General*, edited by Duran in 1849-51. The collections of ballads in the other Latin languages will be found below.

The ballads of other European nations are scarcely less interesting than those which have been noticed, and those of races which possess little or no other literature are peculiarly instructive, by reason of the light which they throw on the history of national poetry; for instance, the songs of the Slavic races. The Slavic songs as a class are distinguished from the Teutonic by the absence of the sentiment of *romantic* love and of *chivalrous* heroism. In their form, too, they are much less dramatic, and even the division of epic from lyric songs is not easy. Many songs begin with a few narrative verses, and then become entirely lyric, and the narrative part is almost always descriptive. The Servians—especially those of Turkish Servia, Bosnia, and Montenegro, who have not been much affected by civilization—afford a capital example of a race that has not outlived the ballad era. Vuk has collected many hundreds of their songs, one-third of them epic, and every one of them from the mouths of the people. A few of these are, in their actual form, as old as the fifteenth century, some belong to a remoter time, and indeed many retain marks of an ante-Christian origin. So far the Servians are like the German nations: the distinction is that the fountain of popular poetry still flows, and that heroic poems have been produced among the Servians in this century which are essentially similar to the older ones, and not at all inferior. We find the national poetry there in a condition closely resembling that in which it was among the races of Northern and Eastern Europe many hundred years ago. New songs appear with new occasions, but do not supersede the ancient ones. The heroic ballads are chanted at taverns, in the public squares, in the halls of chiefs, to the accompaniment of a simple instrument. Sometimes they are only recited, and in this way are taught by the old to the young. All classes know them: the peasant, the merchant, the hayduk (the klepht of the modern Greek, a sort of Robin Hood), as well as the professional bard. No class scorns to sing them—not even the clergy or the chiefs.

One or two general remarks are required to prevent misconceptions and to supply omissions. From what has been said, it may be seen or inferred that the popular ballad is not originally the product or the property of the lower orders of the people. Nothing, in fact, is more obvious than that many of the ballads of the now most refined nations had their origin in that class whose acts and fortunes they depict—the upper class—though the growth of civilization has driven them from the memory of the highly polished and instructed, and has left them as an exclusive possession to the uneducated. The genuine popular ballad had its rise in a time when the distinctions since brought about by ed-

ucation and other circumstances had practically no existence. The vulgar ballads of our day, the "broadsides" which were printed in such huge numbers in England and elsewhere in the sixteenth century or later, belong to a different genus; they are products of a low kind of *art*, and most of them are, from a literary point of view, thoroughly despicable and worthless.

Next it must be observed that ballads which have been handed down by long-repeated tradition have always departed considerably from their original form. If the transmission has been purely through the mouths of unlearned people, there is less probability of willful change, but once in the hands of professional singers there is no amount of change which they may not undergo. Last of all comes the modern editor, whose so-called improvements are more to be feared than the mischances of a thousand years. A very old ballad will often be found to have resolved itself in the course of what may be called its propagation into several distinct shapes, and each of these again to have received distinct modifications. When the fashion of verse has altered, we shall find a change of form as great as that in the *Hildebrandslied*, from alliteration without stanza to stanza with rhyme. In all cases the language drifts insensibly from ancient forms, though not at the same rate with the language of every-day life. The professional ballad-singer or minstrel, whose sole object is to please the audience before him, will alter, omit, or add, without scruple, and nothing is more common than to find different ballads blended together.

There remains the very curious question of the origin of the resemblances which are found in the ballads of different nations, the recurrence of the same incidents or even of the same story, among races distinct in blood and history, and geographically far separated. The Scottish ballad of May Colvin, for instance—the German Ulinger—is also found in Danish, Norwegian, Swedish, Icelandic, Dutch, Low German, Spanish, Portuguese, Italian, French, Polish, Servian, Bohemian, Wendish, Magyar, and there are traces of it in other languages. Some have thought that to explain this phenomenon we must go back almost to the cradle of mankind, to a primeval common ancestry of all or most of the nations among whom it appears. But so stupendous an hypothesis is scarcely necessary. The incidents of many ballads are such as might occur anywhere and at any time; and with regard to agreements that can not be explained in this way we have only to remember that tales and songs were the chief social amusement of all classes of people in all the nations of Europe during the Middle Ages, and that new stories would be eagerly sought for by those whose business it was to furnish this amusement, and be rapidly spread among the fraternity. A great effect was undoubtedly produced by the crusades, which both brought the chief European nations into closer intercourse and made them acquainted with the East, thus facilitating the interchange of stories and greatly enlarging the stock.

Some of the more important collections of popular ballads are:

English.—*Reliques of Ancient English Poetry*, by Thomas Percy, 1st ed. 1765, 4th improved ed. London, 1794, and often since then; *Ancient and Modern Scottish Songs*, by David Herd, 2d ed. 2 vols., Edinburgh, 1776; *Minstrelsy of the Scottish Border*, by Sir Walter Scott, 3 vols., Edinburgh, 1802-03, and often since then; *Popular Ballads and Songs*, by Robert Jamieson, 2 vols., Edinburgh, 1806; *Ancient Scottish Ballads*, by George R. Kinloch, Edinburgh, 1827; *Minstrelsy, Ancient and Modern*, by William Motherwell, Glasgow, 1827; *Ancient Ballads and Songs of the North of Scotland*, by Peter Buchan, 2 vols., Edinburgh, 1828; *The English and Scottish Popular Ballads*, by F. J. Child, Boston, 1882-92, 8 parts, and one to follow, which will contain a full bibliography.

Scandinavian.—*Danmarks Gamle Folkeviser* (The Ancient Ballads of Denmark), by Svend Grundtvig, 5 vols., the last half of the 5th, by Axel Olrik, unfinished, Copenhagen, 1853-90; *Jyske Folkeviser*, in *Jyske Folkeminder*, by E. T. Kristensen, vols. i., ii., x., Copenhagen, 1871-89; *Ancient Danish Ballads*, translated from the originals by R. C. Alex. Prior, 3 vols., London, 1860; *Norske Folkeviser* (Norwegian Ballads), by M. B. Landstad, Christiania, 1853; *Gamle Norske Folkeviser* (Ancient Norwegian Ballads), by Sophus Bugge, Christiania, 1858; *Svenska Folkvisor* (Swedish Ballads), by Geijer and Afzelius, 3 vols., Stockholm, 1814-16, improved ed. by Bergström and Höijer, 3 vols., Stockholm, 1880; *Svenska Fornsånger*, by A. I. Ar-

widsson, 3 vols., Stockholm, 1834-42; *Færøiske Kvæder* (Ballads of the Faroe Isles), by V. U. Hammershamb, Copenhagen, 1851-55; *Færøsk Anthologi*, by the same, Copenhagen, 1886, 1891; *Islensk Fornkvæði*, by Grundtvig and Sigurðsson, Copenhagen, 1854-85.

High German.—*Des Knaben Wunderhorn*, Arnim and Brentano, 3 vols., Heidelberg, 1806-08, 4 vols., Berlin, 1853-54; *Alle teutsche Volkslieder in der Mundart des Kuhländchens*, J. G. Meinert, Vienna and Hamburg, 1817; *Oesterreichische Volkslieder*, Ziska and Schottky, Pesth, 1819; *Die Volkslieder der Deutschen*, F. K. von Erlach, 5 vols., Mannheim, 1834-36; *Deutsche Volkslieder*, A. Kretzschmer and A. W. v. Zuccaliniaglio, 2 vols., Berlin, 1840; *Schlesische Volkslieder*, Hoffmann von Fallersleben and Riecher, Leipzig, 1842; *Alle hoch- und niederdeutsche Volkslieder*, L. Uhland, 2 vols., Stuttgart, 1844-45; *Die deutschen Volkslieder*, K. Simrock, Frankfurt-am-Main, 1851; *Deutsche Volkslieder*, F. L. Mittler, Marburg and Leipzig, 1855; *Fränkische Volkslieder*, F. M. von Dittfurth, 2 parts, Leipzig, 1855; *Schwäbische Volkslieder*, E. Meier, Berlin, 1855; *Weltliche u. geistliche Volkslieder*, H. Pröhle, Asehersleben, 1855; *Deutscher Liederhort*, L. Erk, Berlin, 1856; *Die historischen Volkslieder der Deutschen*, R. von Lilieneron, 4 vols., Leipzig, 1865-69; *Altdeutsches Liederbuch*, F. M. Böhme, Leipzig, 1877; *Westfälische Volkslieder*, A. Reifferscheid, Heilbronn, 1879.

Low German, Netherlandish.—Uhland, as above; *Oude Vlaemsche Liederen*, J. F. Willems, Ghent, 1848; *Niederländische Volkslieder*, Hoffmann von Fallersleben, 2d ed. Hanover, 1856; *Chants Populaires des Flamands de France*, E. de Coussemaker, Ghent, 1856; *Oude en nieuwe Liedjes*, F. A. Snellaert, 2d ed. Ghent, 1864; *Chants Populaires Flamands*, A. Lootens and J. M. E. Feys, Bruges, 1879.

Spanish and Portuguese.—*Romanceero General* (vols. x. and xvi. of *Biblioteca de autores Españoles*), Agustín Durán, Madrid, 1849, 1851; *Primavera y Flor de Romances*, F. J. Wolf and C. Hoffmann, 2 vols., Berlin, 1856; *Romanzen Asturiens*, u. s. w., José Amador de los Rios, in *Jahrbuch für romanische- u. englische Literatur*, iii. 268, 1861; *Colección de los viejos romances que se cantan por los Asturianos*, J. M. Pidal, Madrid, 1885; *Cansons de la Terra, Cants populars Catalans*, F. Pelay Briz, 5 vols. (i, y Candi Candi, ii, y J. Saltó), Barcelona, 1866-75; *Romance-rillo Catalan*, M. Milá y Fontanals, Barcelona, 1882; *Romanceiro*, Almeida-Garrett, 3 vols., Lisbon, 1863; Th. Braga, *Cancioneiro Popular*, Coimbra, 1867, *Romanceiro Geral*, Coimbra, 1867, *Cantos Populares do Archipelago Açoriano*, Porto, 1869; *Romanceiro Portuguez*, V. E. Hardung, 2 vols., Leipzig, 1877; *Romanceiro do Archipelago da Madeira*, A. Rodrigues de Azevedo, Funchal, 1880; *Cantos pop. do Brazil*, S. Roméro, 2 vols., Lisbon, 1883.

Italian.—*Canti popolari Toscani, Corsi, Illirici, Greci*, N. Tommaso, 4 vols., Venice, 1841-42, 2d ed. of vol. i., 1848; *Canti pop. inediti Umbri, etc.*, O. Marcoaldi, Genoa, 1856; *Saggio di canti pop. Veronesi*, E. S. Righi, Verona, 1863; *Volkslieder aus Venetien, gesammelt von G. Widter*, ed. A. Wolf, Vienna, 1864; *Canzoni pop. Comasche*, G. B. Bolza, Vienna Academy, 1867; *Canti pop. Veneziani*, G. Bernoni, Venice, 1872; *Canti e Racconti del Popolo Italiano*, D. Comparetti and A. d'Ancona, Turin and Florence, vols. i.-v., viii., ix., 1870-91; *Archivio per lo Studio delle Tradizioni pop.*, Pitre and Imbriani, i.-xi., 1882-92; *Canti pop. Umbri*, G. Mazzatinti, Bologna, 1883; *Canti pop. del Piemonte*, C. Nigra, Turin, 1888; *Canti pop. Siciliani*, G. Pitre, 2d ed. 2 vols., Palermo, 1891.

French.—*Instructions relatives aux Poésies populaires de la France*, J. J. Ampère, Paris, 1853; *Étude sur la poésie populaire en Normandie*, Eug. de Beaurepaire, Avranches, 1856; *Chansons pop. des Provinces de France* (Jules Fleury), Paris, 1860; *Chants populaires du pays castrais*, A. Combes, Castres, 1862; *Noëls et Chants pop. de la Franche-Comté*, M. Buehon, Salins, 1863; *Chants pop. de la Provence*, Damase Arbaud, 2 vols., Aix, 1862-64; *Romanceero de Champagne*, P. Tarbé, 5 vols., Reims, 1863-64; *Chants pop. recueillis dans le pays messin*, Comte de Puymaigre, Metz, 1865, 2d ed. 2 vols., 1881; *Chants et chansons pop. des provinces de l'ouest, Poitou, etc.*, J. Bujeaud, 2 vols., Niort, 1866; *Chansons pop. du Canada*, E. Gagnon, Quebec, 2d ed. 1880; *Chants pop. du Languedoc*, A. Montel et L. Lambert, Paris, 1880; *Chants pop. du Velay et du Forez* (Victor Smith), in *Romania*, Paris, 1872-81; *Poésies pop. de la Gascogne*, J. F. Bladé, 3 vols., Paris, 1881-82; *Chansons pop. de l'Ain*, C. Guillon, Paris, 1883; *Chansons pop. d'Ille-et-Vilaine*, L.

Decombe, Rennes, 1884; *Chansons et Ballades pop. du Valois*, Gérard de Nerval, Paris, 1885; *Vieux Chants pop. recueillis en Quercy*, J. Daynard, Cahors, 1889; *Chants pop. du Bas-Quercy*, E. Soleville, Paris, 1889; *Recueil de Chansons pop.*, 6 vols., E. Rolland, Paris, 1883-90; *Traditions, etc., des Ardennes*, A. Meyrac, Charleville, 1890.

Roumanian.—*Balade*, B. Alexandri, 2 vols., Jassy, 1853-54, and *Poesii Populare ale Românilor*, Bucharest, 1866; *Ballades et Chants pop. de la Roumanie, recueillis et traduits par V. Alexandri*, Paris, 1855; *Rouman Anthology, National Ballads of Moldavia, etc.*, H. Stanley, Hertford, 1856; *Poesia Popurala, Balade*, Marienescu, Pesth, 1859; *Balade populare române*, M. Pompiliu, Jassy, 1870.

Romaic.—*Chants populaires de la Grèce moderne*, C. Fauriel, 2 vols., Paris, 1824-25; the same in German, by W. Müller, Leipzig, 1825; *Canti popolari Toscani, Corsi, Illirici, Greci*, N. Tommaso, 4 vols., Venice, 1841-42; *Neugriechische Volks- u. Freiheitslieder*, D. H. Sanders, Leipzig, 1842; *Das Volksleben der Neugriechen, etc.*, D. H. Sanders, Mannheim, 1844; *Τραγούδια ἔθνικὰ*, 2 parts, A. Manousos, Coreyra, 1850; *Chants du Peuple en Grèce*, Comte de Marcellus, 2 vols., Paris, 1851; *Ἀισματα δημοτικὰ τῆς Ἑλλάδος* (Popular Songs of Greece), Spyr. Zampelios, Coreyra, 1852; *Carmina popularia Graeciae recentioris*, A. Passow, Leipzig, 1860; *Anthologie neugriechischer Volkslieder*, Th. Kind, Leipzig, 1861; *Συλλογὴ τῶν κατὰ τὴν Ἠπειρον δημοτικῶν ᾠμάτων*, G. Chr. Chasiotes, Athens, 1866; *Neugriechische Volks-gesänge*, J. M. Firmenich-Riehartz, 2 parts, Berlin, 1840, 1867; *Δημοτικὴ Ἀθολογία*, M. S. Lelekos, Athens, 1868; *τὰ Κυπριακά*, 3d vol., A. A. Sakellarios, Athens, 1868; *Νεοελληνικὰ Ἀνάλεκτα*, Athens, 1871-81; *Recueil de chansons populaires Grecques*, É. Legrand, Paris, 1874; *Kretas Volkslieder*, A. Jeannarakis, Leipzig, 1876; *Griechische Märchen, Sagen, und Volkslieder*, A. Schmidt, Leipzig, 1877; *Συλλογὴ δημοῶδων ᾠμάτων τῆς Ἠπειροῦ*, P. Arabantinos, Athens, 1880; *Τραγούδια τοῦ Ὀλύμπου*, A. K. Oikonomides, Athens, 1881; *Δελτίον τῆς ἱστορικῆς καὶ ἐθνολογικῆς ἐταιρίας τῆς Ἑλλάδος*, Athens, 1883 ff.; K. N. Kanellakes, *Χιακὰ Ἀνάλεκτα*, Athens, 1890; *Ζωγραφεῖος Ἀγών*, vol. i., Constantinople, 1891.

Russian.—Bylinas, Popular Epics, Heroic Ballads: the collections of Kirsha Danilof and Kalaidovitch, Moscow, 1818, 3d ed. 1878; of P. N. Rybnikof, vols. i., ii., Moscow, 1861-62, vol. iii. Petrozavodsk, 1863, vol. iv., St. Petersburg, 1867; of P. V. Kirveevsky, ed. Bezsonof, 10 parts, 2d ed., Moscow, 1868-75; of A. F. Hilferding, St. Petersburg, 1873; *Untersuchungen über die Volksepik der Grossrussen*, W. Wollner, Leipzig, 1879; *The Epic Songs of Russia*, Isabel Florence Hapgood, New York, 1886. *Piesni russkago naroda* (Songs of the Russian People), 5 vols., J. P. Sakharof, St. Petersburg, 1838-39, and his *Skazaniya r. n.*, 3d ed. vol. i., St. Petersburg, 1841; *Kalyeki Perekhozhie* (Wandering Psalm-singers), 2 vols., P. Bezsonof, Moscow, 1861-62; *Russkiya narodnyya piesni*, P. V. Shein, Moscow, 1870.

South Russian (Little Russian, Ruthenian, White Russian).—*Piesni ludu ruskiego w Galieyi*, Z. Pauli, Lemberg, 1839-40; *Prósni wieśniacze z nad Niemna i Dzwiny*, J. Czeezot, Wilna, 1844, 1846; *Sbornik ukrainskikh piesen*, M. A. Maksimović, Kiev, 1849; *Narodnyya yuzhnorusskiya piesni*, A. Metlinsky, Kiev, 1854; *Belorusskiya piesni*, P. A. Bezsonof, Moscow, 1871; *Belorusskiya narodnyya piesni*, P. V. Shein, St. Petersburg, 1874; *Tchumatzkiya narodnyya piesni*, I. Ya. Rudtchenko, Kiev, 1874; "Trudy" of the Russian Geographical Society, southwest division, vol. v., St. Petersburg, 1874; *Istoricheskiya piesni malorusskago naroda*, V. L. Antonovitch and M. Dragomanof, vols. i. and ii. 1, Kiev, 1874-75; *Narodnyya piesni galitzkoi i ugarskoj Rusi*, J. F. Golovatsky, 4 vols., Moscow, 1879. See also Polish, below.

South Slavic (Serbian, Croat, Illyrian, Slovenian).—*Narodne srpske pjesme* (Songs of the Serbian People), Vuk St. Karadžić, 3d ed. 5 vols., Vienna, 1841-65; *Volkslieder der Serben*, Talvj (Mrs. Robinson), 2d ed. 2 vols., Leipzig, 1853; *Die Gesänge der Serben*, S. Kapper, 2 parts, Leipzig, 1852; *Poésies pop. Serbes*, A. Dozon, Paris, 1859; *Pievaniya tzer-nogorska i hertzevatehka*, S. Milutinović, Vienna, 1833, Leipzig, 1837; *Srpske narodne pjesme iz Bozne i Hertze-govine*, B. Petranović, Belgrad, 1867; *Srpske narodne pjesme*, K. X. Ristić, Belgrad, 1873; *Pjesme: s dodatkom narodnih pjesamah puka hrvatskoga*, I. Kukuljević, Agram, 1847; *Narodne pjesme* (Croat, Dalmatian, Bosnian, Servian), L. Polish.—*Pieśni polskie i ruskie ludu galicyjskiego* (Polish and Russian people in Galicia), W. z Oleska, Lemberg, 1833; *Pieśni ludu bialo-chrobotów, mazurów, i rusi z nad Bugu* (White Chrobatians, Massovians, and Russianians on the Bug), K. W. Wojciecki, Warsaw, 1836; *Piosnki wieśniacze z nad Niemna*, J. Czeczot, Wilna, 1837; *Pieśni ludu polskiego w Galicyi*, Z. Pauli, Lemberg, 1838; *Piosnki ludu wielkopolskiego*, J. J. Lipiński, Posen, 1842; *Pieśni ludu podhalan*, L. Zeiszner, Warsaw, 1845; *Pieśni ludu polskiego*, Oskar Kolberg, Warsaw, 1859, and in many of twenty subsequent volumes of his *Lud*, 1867-88, as also in his *Mazowsze*, 4 vols., Cracow, 1885-88, and his *Pokucie*, 4 vols., Cracow, 1882-89; *Pieśni ludu polskiego w Górnym Szląsku* (Silesia), J. Roger, Wrocław, 1863; *Lud, Pieśni, etc.*, K. Kozłowski, Warsaw, 1869; *O Mazurach*, W. Kętrzyński, Posen, 1872; *Lud okolic Zarek*, M. Fedorowski, Warsaw, 1888-89; *Z. Powreści i Pieśni górali beskidowych*, R. Zawiliński, Warsaw, 1889; *Jagodne*, Z. Wasilewski, Warsaw, 1889.

Bohemian, Moravian, Slovakian.—*Slowanské národní písně* (Bohemian, Moravian, Slovakian, and other), F. L. Čelakowský, 3 parts, Prague, 1822-27 and 1839-44; *Národní zpěvanky čili písně světské slováků v Uhrách* (Popular Songs of the Slovaks in Hungary), J. Kollár, 2 vols., Buda, 1834-35; *Prostonárodní české písně, etc.*, K. J. Erben, 3d ed. Prague, 1862-64; *Böhmische Granaten, Czechische Volkslieder*, M. Waldau, 2 vols., Prague, 1858-60; *Moravské národní písně*, F. Sušil, 2d ed. Brünn, 1860; *Sborník slovenských národních písní, etc.*, Matica Slovenská, Turc St. Martin, i. 1870, ii. 1, 1874; *Národní pohádky písně, etc.*, by the society "Slavia," Prague, 1873-75 (Národní písně, pohádky, etc.), 1877-78; *Nové národní písně moravské*, F. Bartoš, Brünn, 1882.

Wendish.—*Volkslieder der Wenden in der Ober- u. Nieder-Lausitz*, L. Haupt and J. E. Schmalzer, Grimma, 1841-43; *Dehjoluziske pjesnje*, E. Muka, Bautzen, 1877; *Dodawki k ludowym pjesnjam*, E. Muka, Bautzen, 1883.

General Works.—*Geschichte der slavischen Literaturen*, von A. V. Pypin und V. D. Spasović, übertragen von T. Pech, 2 vols., Leipzig, 1880-84; *Historical View of the Languages and Literature of the Slavic Nations, etc.*, Talvj (Mrs. Robinson), New York, 1850; *Slawische Volkslieder* (Russian, Bohemian, Slovak, Bulgarian), J. Wenzig, Halle, 1830; *Slawische Balalaika* (Russian, Little Russian, Carniolan, Polish), W. v. Waldbrühl, Leipzig, 1843.

Breton.—*Barzuz-Breiz, Chants populaires de la Bretagne*, Th. Hersart de la Villemarqué, Paris, 1867; *Chants populaires de la Basse-Bretagne*, F. M. Luzel: Gwerziou Breiz-Izel, 2 vols., Lorient, 1868, 1874, *Soniou Breiz-Izel*, 2 vols., Paris, 1890; *Chansons et Danses des Bretons*, N. Quellien, Paris, 1889.

Of non-Indo-European races the more important collections are:

Finnish.—*Finnische Runen* (Finnish and German), by H. R. von Schröter, Stuttgart, 1834, Upsala, 1819, Stuttgart, 1875; *Kanteletar*, E. Lönnrot, 2 vols., Helsingfors, 1840, in one vol., 1864; *Kalevala*, ed. E. Lönnrot, Helsingfors, 1849, 1866 (compounded from popular epic songs); *Les Variantes du Kalevala*, J. Krohn (1st part), Helsingfors, 1888. **Esthonian.**—*Ehstnische Volkslieder*, original and translation, H. Neus, Reval, 1850-52; *Vana kannel, Vollständige Sammlung alter estnischer Volkslieder*, 2 vols., J. Hurt, Dorpat, 1884-86. **Magyar.**—*Népdalok és Mondák* (Songs and Tales), J. Erdélyi, 3 vols., Pesth, 1846-48; *Ausgewählte ungarische Volkslieder*, translated and edited by K. M. Kertbeny, Darmstadt, 1851; *Vadrózsák* (Wild Roses, a collection of Szekler Popular Poetry), J. Kríza, Klausenburg, 1863; *Magyar Népköltési Gyűjtemény* (Collection of Magyar Popular Poetry), L. Arany and P. Gyulai, 3 vols., Pest, 1872, 1882; *Koszorúk* (Garlands from Alföld), L. Kálmány, Arad, 1877. **Turkish.**—*Proben der Volkshitteratur*

der türkischen Stämme Süd-Siberiens, W. Radlof, 6 vols. of text and 6 of translation, St. Petersburg, 1866-86.

Of comprehensive works and collections the most noticeable are: *Stimmen der Völker in Liedern*, J. G. v. Herder, 1778, ed. by J. v. Müller, Tübingen, 1807; Talvj (Mrs. Robinson), *Versuch einer geschichtlichen Charakteristik der Volkslieder germanischen Nationen, etc.*, Leipzig, 1840; *Hausschatz der Volkspoesie*, O. L. B. Wolff, Leipzig, 1853; *Volksdichtungen nord- u. südeuropäischer Völker alter u. neuer Zeit*, J. M. Firmenich, 1867. F. J. CHILD.

Ballanche, baäl'lääñsh', PIERRE SIMON: a French social theorist; b. at Lyons, Aug. 4, 1776; was at first a simple printer, but soon gave signs of a certain strange literary power. In 1812 Mme. Récamier made his acquaintance, and a deep, as well as lasting, friendship began between the two, which led Ballanche to sell his printing business and remove to Paris. Here he at once attracted attention because of his mystical speculations upon the course of human history, and his predictions of the speedy coming of a new order of things in society and government. Taking up Bonnet's theory of individual palingenesis, he transferred it to states, and brought it into the form of a system, which he developed in the following works: *Antigone* (1815); *Essai sur les Institutions Sociales* (1818); *Vieillard et jeune homme* (1819); *L'Homme sans nom* (1820); *Essais de palingénésie sociale* (never completed). His system bears the name of "Ballanchisme." See *Œuvres de Ballanche* (4 vols., Paris, 1830; *ibid.*, 5 vols., 1833); L. de Loménie, *M. Ballanche, par un homme de rien* (1841); Albert Aubert, *P. S. Ballanche* (1847). See his *Life* by J. J. Ampère, Paris, 1848. D. in Paris, June 19, 1847. A. R. MARSH.

Bal'lantine, WILLIAM: English lawyer; b. in London, Jan. 3, 1812; called to the bar 1834; created sergeant 1856; assisted in the famous Müller murder trial, the Tichborne case, and the defense of the Gaikwar of Baroda; said to have received a fee of 20,000 guineas for the latter case to induce him to visit India. Author of *Experiences of a Barrister's Life*, London (1882); *Old World and the New* (1884). D. in Margate, Jan. 9, 1887.

Ballantine, WILLIAM GAY: Congregationalist; b. at Washington, D. C., Dec. 7, 1848; graduated at Marietta College, Ohio, 1868, and at Union Theological Seminary, New York, 1872. He was professor at Ripon College (1874-76), at Indiana University (1876-78), and in Oberlin Theological Seminary (1878-91), president of Oberlin College (1891-96). He is one of the editors of the *Bibliotheca Sacra*. GEORGE P. FISHER.

Ballantyne, JAMES: b. at Kelso, Scotland, 1772; d. in Edinburgh, Jan. 17, 1833; and JOHN, b. at Kelso, 1774; d. at Edinburgh, June 16, 1821: Sir Walter Scott's printers. See *The History of the Ballantyne Press* (Edinburgh, 1871); and SCOTT, SIR WALTER.

Bal'larat: an Australian city and gold-field in Victoria; 75 miles W. N. W. of Melbourne (see map of Australia, ref. 8-II). The gold mines of this place, which were opened in 1851, are among the richest in the colony of Victoria. Surface digging is a thing of the past; many of the mines are hundreds of feet deep. Quartz reefs are also worked, and there is extensive crushing machinery for extracting the gold. Ballarat is unrivaled in the fineness of its gold, which averages 23½ carats, the pure metal being 24 carats. Pop. (1895) 45,326 (estimated).

Bal'last [nautical term common to most European languages. Perhaps from Scand. *bar*, bare, mere + *last*, load]: material carried by a ship or other vessel to increase its stability. Hence, in railroad engineering, material placed below and around the cross-ties of a railroad track, such as gravel, cinders, furnace slag, or broken stone. Its office is to make a solid roadway over which trains may pass smoothly, to secure quick and thorough drainage, and to prevent the formation of dust. On the best roads the depth of the ballast below the bottom of the ties is 12 inches, and, as the spaces around the cross-ties are filled in level with their tops, its total depth is 16 or 17 inches. Gravel and cinders, often used on light roads, make a ballast cheaper than broken stone, but it is liable to become dusty and also to heave under the action of frost. Furnace slag, in localities where it can be had, is extensively used, and makes a very smooth riding track. But broken stone best answers the requirements of a perfect ballast. It should be uniform in size, angular, and each piece should be able to pass in any way through a 1½-inch ring. By its use an even and

solid track is secured, together with perfect drainage, thus insuring long life to the cross-ties; it does not heave in winter, can be worked in both wet and dry weather, and is free from dust. Trap and hard sandstone rocks make good ballast, and also some limestones. MANSFIELD MERRIMAN.

Ballenstedt, baal'len-stet: town in the duchy of Anhalt; S. E. part of Harz Mountains. Pop. (1890) 4,779. The castle was, until 1863, the residence of the Dukes of Anhalt-Bernburg.

Ballet, baal'lay' [Fr., dimin. of *bal*, dance]: a dramatic or theatrical exhibition of dancing and pantomime, with music; a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. The ballet has some resemblance to the pantomimic sacrificial dances of the ancient Greeks, among whom were dancers who expressed actions and passions by rhythm applied to gesture. The ballet was introduced into France under the auspices of Catherine de' Médié about 1580. Noverre about 1770 made improvements in it, to which he gave an independent dramatic form. The Vestris family were celebrated as performers in ballets. In recent times the public favor is almost exclusively bestowed on female dancers. The ballet has degenerated in many respects of late years.

Ballia: a district of Benares division, Northwestern Provinces, British India. It is at the eastern extremity of these provinces, between the Ganges and Goggra. Area, 1,145 sq. miles. Pop. about 1,000,000.

Ballina': a market-town and seaport of Ireland, partly in Mayo and partly in Sligo counties; on the river Moy; 7 miles from its entrance into Killala Bay, and 18 miles N. N. E. of Castlebar (see map of Ireland, ref. 6-D). The part of the town on the east bank of the Moy is called Ardnaree. Ballina has manufactures of coarse linens and snuff; also an active trade in fish, provisions, etc. Pop. 6,000.

Balliol: See BALIOL.

Ballis'ta, or **Balis'ta** [Lat.]: a military engine used before the invention of gunpowder to propel large stones or other heavy missiles. It probably originated with the ancient Romans, who used it in the siege and defense of fortified places. The construction of the ballista is not well understood. It appears that the elastic force with which a twisted rope uncoils itself was commonly used as the propelling power, with which other forces were perhaps combined. For a vivid picture of the effects of the ballista, see Lucan's *Pharsalia*, lib. iii. l. 465 *et seq.*

Ballis'tic Galvanom'eter: a galvanometer which measures electrical quantity by means of its first oscillation, instead of measuring electric current by its permanent deflection. The term refers rather to the method of using a galvanometer than to the type of instrument employed, although the qualities sought for, viz., a long period of oscillation and an undamped movement of the needle, differ from those essential to the ordinary galvanometer. See ELECTRICITY and GALVANOMETER. E. L. NICHOLS.

Ballistic Pen'dulum: an instrument used to ascertain the velocity of projectiles and to prove the quality of gunpowder. In its simplest form it consists of a large block of wood suspended as a pendulum bob at that point in the path of the projectile for which the velocity is desired. When the angle through which the pendulum swings after impact with the shot, which lodges in the wooden bob, is known, together with the centers of suspension and oscillation of the mass, the velocity of the shot can be determined by calculation. The gun itself is also sometimes made a ballistic pendulum, being suspended, and its recoil observed. But these contrivances are both long since superseded by various electrical devices for determining the velocity of projectiles. E. L. NICHOLS.

Ballistics [from *ballista*, *q. v.*]: that branch of dynamics which treats of the circumstances of motion of projectiles from the instant of ignition of the powder charge to that at which the projectile comes to rest.

It is divided into "interior" and "exterior" ballistics.

Interior ballistics attempts to determine the intensity of the pressure of the powder gases in the bore of the gun, and the law of variation in this arising from differences in the quantity, composition, density, size of grain and density of loading of the powder, and the weight and frictional resistances of the projectile.

Also it attempts to determine the law of variation in the motion of the projectile and its velocity at any point of the

bore of the gun, under the varying pressure of the powder gas, the friction of the projectile, and the resistances of inertia arising from its acceleration in motion of translation and rotation.

Exterior ballistics deals with the circumstances of the motion of the projectile between the instants at which it leaves the muzzle of the gun and that at which it comes to rest. It seeks to determine the amount of and law of variation in the resistance of the atmosphere, and its effect in retarding projectiles of different weight and form, moving with different velocities; as well as in producing "drift" or lateral deviation in rifled projectiles; and from these elements to construct the actual trajectories described by projectiles fired from small arms and cannon of all kinds. The physical and mathematical discussion of this subject is very complicated. See GUNNERY and GUNPOWDER.

BOOKS OF REFERENCE.—Ingall's *Interior Ballistics*; Ingall's *Exterior Ballistics*; Noble and Abel's *Experiments on Fired Gunpowder*; Sarrau's *Researches on the Effect of Powder*. JAMES MERCUR.

Balloons: See AERONAUTICS.

Balloon-fish: a name of various fishes of the families *Tetraodontidæ*, *Diodontidæ*, and *Triodontidæ*. They are so named from the power which they possess of inflating their stomachs with air, and thus floating, belly upward, on the surface of the water for the purpose of evading pursuit. Many species are known, of which several are American. They are not used for food. Revised by D. S. JORDAN.

Ballot Reform [*ballot* is from Ital. *ballotta*, dimin. of *balla*, ball]: such changes in the voting system as will best secure the secrecy of the ballot, and prevent fraud at the polls and in the count. The earliest and simplest form of election in all parts of the world has doubtless been *viva voce*, or by a showing of hands, as is now common in ordinary public meetings upon matters of lesser importance. It soon becomes evident, however, everywhere, that many persons have not the moral courage to express their opinions independently in the presence of others holding hostile opinions. Consequently, as in ancient Greece, in the case of ostracism, and in modern times in nearly all civilized countries in elections, the method of voting by ballot has been introduced in order to secure secrecy, and thereby independence. The form of the ballot at times has been a ball, a shell, colored beans, etc., but the most common form has doubtless been by written or printed ticket.

In all of the elections in the U. S., and in many foreign countries, it has been the custom for the candidate, or his party managers, to provide printed slips of paper containing the names of the candidates to be presented to the voters. The voter then, after making his selection among these tickets, could fold his ballot and present it to the election officers, or himself place it in the ballot-box without revealing its purport. The importance of the interests at stake, however, and the consequent influence that was brought to bear upon the voters, led in very many cases to intimidation and fraud, so that of late years, especially among the English-speaking races, some method of reform has been found necessary.

METHODS OF FRAUD.—The expense involved in the printing of tickets by political parties and by candidates led to the practice of raising large sums of money, ostensibly for the purpose of paying these legitimate expenses. The money, however, in the hands of campaign committees was frequently used for the purpose of renting unnecessary rooms, of hiring voters at enormous pay, for erecting campaign poles for banners, etc., for paying voters for guarding these poles, and for other methods more or less indirect and of purchasing votes. Perhaps the most common form in the U. S. has been that of hiring *ticket-peddlers*, that is, men whose business it is to stand at the polls and provide voters with tickets of the various candidates. The work seems a legitimate one under the old method of voting, but it was easy to hire an unnecessarily large number of men to do this work, and thus secure their votes. Another form of fraud at times practiced was the voting of *tissue ballots*. The ballots were printed on light but stiff tissue paper, so that a large number of ballots might be folded inside of one printed upon ordinary paper without detection. If they were not folded too closely the shaking of the box or a twisting of the ballots as they were dropped into the box would separate them, so that it was impossible to tell whether they were properly cast or not. When, at the close of the polls, it was found that more ballots had been cast than there

were voters in the district, the drawing out of the surplus ballots at random would still leave the advantage very largely with the fraudulent voter. The fact that it was possible to put a ticket into a voter's hand and keep him in view until it was safely deposited in the ballot-box made possible also the *direct purchase* of votes. In many cases voters have been corrupted by the dozen; tickets have been placed in their hands which were to be held in such position that a watcher could see them, and the men then marched in file to the ballot-box under careful supervision until each ticket was deposited, when they could be taken to a place free from observation and paid the reward of their infamy. In densely populated cities, where the number of voters at any polling-place was large, and where, consequently, it was practically impossible for all the voters in any one precinct to be personally known by any one man, "*repeating*" has been common. A man might vote readily in his own home district in the morning, then pass from voting precinct to voting precinct in the same city, casting a vote in every place with little danger of detection. So, too, it was possible for political managers to bring into the voting district men from elsewhere, not legitimate voters, and have them cast votes on election day.

REFORM MEASURES.—To check these methods of fraud the following methods of reform have been introduced in various places, with a large degree of success.

1. *Registration.*—To guard against "*repeating*" and the "*importation*" of voters, no method has been found so efficient as that of a previous registration. Under this system each voter is required to register his name with the election officers at certain fixed times, varying from ten days to four weeks before the election. These registration lists, when completely made up, are then opened to the inspection of the public; and agents of the various candidates, or other citizens, looking them through carefully with ample leisure for investigation, have full opportunity of detecting and exposing any illegal registration. On election day these registration lists are in the hands of the election officers, and no person whose name does not appear upon the list is permitted to vote. In country districts, where voters have frequently to go long distances in order to register, and where also, on account of the more intimate acquaintance of the voters one with the other, "*repeating*" or "*importation*" of voters is less likely to be successful, the system of registration seems at times to work hardship. A modification of this system, introduced in Indiana in 1889, has many commendable features. In that State the law does not require repeated registration of citizens who reside continuously in the same county; but registration is required of every person who moves into any county within six months preceding an election, and also of every person who, having once been a citizen of that State, shall have voted in another State, or shall have been absent from the State for a period long enough to lose his domicile, unless upon leaving the State he has declared his intention of still holding his citizenship and of returning within a specified period. The registration also is required to be made at a period (fifty-nine days) longer than usual before an election. This modification of the system seems to guard against fraud as well as the other, and to work much less hardship in ordinary cases.

2. The most efficient safeguard that has yet been attempted against the other methods of fraud mentioned seems to be the *Australian ballot system*.

The essential features of this system are the arrangement and control of the polling-places, the inclosed polling-booth, and the official ballot.

a. While usage in different places varies somewhat, it is customary for no electioneering to be permitted within 50 feet of the polls, and for each voter to approach the *polling-place* through a chute 50 feet long, formed of ropes or a light railing. In the voting-room only the officers of election and from one to three voters are permitted at a time. In this way the voter is protected from the importunities of electioneering agents while preparing his ballot.

b. The *booths* are small stalls arranged in some part of the voting-room, so that the voter, while preparing his ballot in

the booth, shall be entirely screened from observation. Each booth is provided with a shelf or counter at the proper height, and with all of the materials necessary for marking or otherwise preparing the ballot.

c. The expenses of preparing, printing, and distributing the *official ballots* are all borne by the state or the local government, thus removing from political parties in good part the necessity for the raising of large sums of money to be used as campaign funds. The system at its best permits the use of no ballots except the official ones; and these, prepared and printed under the direction of election officers, are given out only within the polling-place, one to each voter as needed. It is a crime in some States, punishable by fine and imprisonment, for any person to have an official ballot in his possession outside of the polling-place.

The original and perhaps the most common form of this ticket in the U. S. is that used in Massachusetts. There the names and addresses of all the candidates for each office are arranged in a column alphabetically, with a small blank space opposite each name. All the names for all the offices are thus grouped together upon one "*blanket ballot*."

In the United Kingdom and Canada, where usually very few officers are voted for at the same time, often only one, besides the name and residence of the candidate appears also his business. The voter designates the candidate for whom he wishes to vote by placing in the square opposite his name a small cross with a lead-pencil or a rubber stamp. In Missouri the names of those not voted for are to be erased, leaving untouched the name of the preferred candidate.

A second form of ballot that meets with more favor where party feeling is strong, and there is a large number of officers to be voted for at the same election, is that used in Indiana and other States. On this the names of all the candidates representing one political party are grouped together in one column, with the name of the political party which they represent at its head, and in the small square in line with that name the voting-mark is to be placed. Usually also at the head of the column will be placed some device, readily recognized by the illiterate voter, such as a domestic fowl, an eagle, or the like, as in the accompanying diagram. In order to prevent more effectively the use of any but official ballots, it is customary to place upon the back of the ballot some official designation, either a printed device or the name and number of the polling-district, or, more commonly, the written initials of the poll-clerks; and when voted the ballot must be so folded that, while the names of the candidates are all concealed, these initials or other devices shall be on the outside and visible to the inspector of elections.

In order to favor the illiterate voter still more, as well as to avoid the constitutional objections in the States providing for manhood suffrage, some of the States, notably New York, have provided that "*paster ballots*" may also be employed. These paster ballots may contain the names of any candidates for whom the voter may desire to cast his ballot, and may be prepared outside by any person and brought by the voter into the polling-place, and cast by pasting them upon

the face of the official ballot. It is claimed by many, with some justice, that without the use of the "*paster ballot*" many illiterate voters would be practically disfranchised. In most States, however, provision is made that any voter, by declaring his inability to read, or such physical disability that he can not prepare his ballot, may be accompanied to the booth by the election officers, who will give him needed assistance.

For the success of this system, as well as of a careful registration system, it is desirable that the election precincts be made small, so that the number of voters in each shall not be more than two or three hundred, in order that they may be readily known, and may all vote in one day without

undue haste. The accompanying diagram A will make clear the method of voting under the Australian election system.

The voter enters the chute E, E. Challengers, representing the leading political parties, standing outside of the polling-place by the window C, may challenge his vote if there is question as to his being a legal voter. A judge of election, from the inside, at the window, may administer the proper oath to test this question. Passing the challengers, he enters the door D, and receives from one of the poll-clerks at the table A his official ballot and whatever explanations he desires with reference to the

DIAGRAM A.—A. Table for election board. B, B, B. Booths where ballots are marked. C. Challenge window. D. Door. E, E. Chute through which the voter must enter. F. Railing separating the election board from the voters. W, W. Windows.

method of voting. Entering then one of the booths, he prepares his ballot, screened from observation, and, folding it so that no one of the names on the ballot can be seen, he goes out of the booth, hands the ballot to the inspector, who places it, in his presence, in the ballot-box. He then withdraws immediately from the room, and gives place to another voter.

The Myers American ballot-machine offers, probably, the most effective way of insuring absolute secrecy of the ballot, with the additional advantage (no slight one) of readiness of counting. This ballot-machine consists of a cabinet some 7 feet high and 5 feet in width and depth. It is simply a light iron frame covered with heavy sheet iron, divided by a steel partition into a voter's compartment, 4 feet by 5 feet in size, and a counter compartment, 1 foot by 5 feet, in which are lever mechanical counters. The voter enters his compartment, and a door is closed after him, leaving him entirely alone. In the compartment are vertical rows or columns, 6 inches apart, of "ballot-pushers," nickel-plated knobs standing out 3 inches from the partition. To the left of each column of knobs are the permanent ballots of each particular party, containing in large print the name of the candidates and the name of the office for which each is intended to be chosen, and nothing else but a large index hand pointing to the proper knob. These ballots are arranged in the most convenient manner, with the most important office at the top. A man votes for any candidate whom he prefers by pushing inward for 2 inches the knob opposite his name. This act counts one for this candidate upon the hidden dial in the counter compartment, and at the same time locks out all other push-knobs of the other candidates for the same office. By pushing in these ballot knobs, in a few seconds a man may vote either a straight or a split ticket without possibility of mistake, and his votes are at the same time counted upon the unseen dials. After voting he goes out through the exit door, the closing of which returns the knobs ready for the next voter.

As there are models of the keyboard of the machine placed in different situations about the polling-place, that may be studied before one enters the cabinet, an illiterate voter by counting the knobs, and even a blind voter by a sense of touch, may vote, it is claimed, with perfect accuracy without assistance. Immediately after the close of the election the counter compartment is unlocked by the inspectors of election, and they find the totals already recorded upon the dial opposite each candidate's name, so that within three minutes after the polls close the entire result is known, and there can be no error in the count. The machine is durable, cheap, may be used more rapidly than the present system, seems to be absolutely secret, and does its own counting. It has been tested in many places and seems to meet all the requirements for voting. The accompanying diagrams (B and C) show a section of the keyboard and of the concealed counter compartment. See VOTING MACHINES.

These ballot-reform laws already described have doubtless done much to prevent corruption of the voters, but none of

them have proved entirely efficient. For the man who lacks the moral courage to vote as he wills in the presence of others, or who is likely to be terrorized by an employer or other person to whom he is under obligations, the Australian

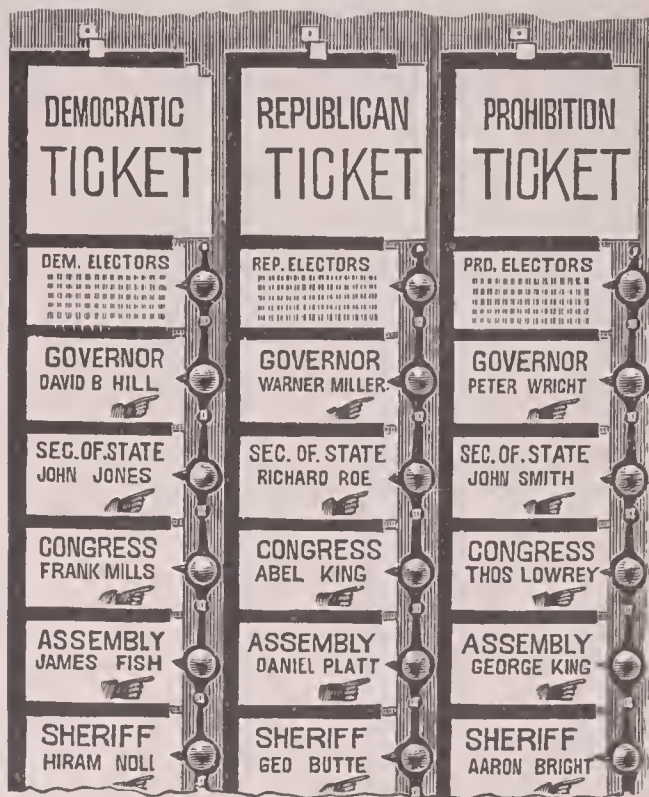

DIAGRAM B.

ballot or the Myers machine gives perfect security. But many voters who are willing to sell their votes, even though they can not be followed to the polls by the briber, have

DIAGRAM C.

still honor enough left to cast their vote as they have agreed. So, too, at times, when election inspectors are not unwilling to tolerate corruption, the laws are in good part practically set aside by their lax enforcement by the election officers. Various devices to cheat the election officers have also been discovered in different places; but, on the whole, the Australian system has been very efficient, and has doubtless reduced vote-buying to a very great extent. The system is in use in all Australasia, where it was first used. Canada and all the States of the U. S. but fifteen have adopted some modification of the system, while in Europe Belgium, Italy, Greece, Norway, Great Britain, and Luxembourg have similar systems.

No ballot reform, however, is complete that deals only with the casting of the ballot. The method of making nominations (see PRIMARY ELECTIONS) must also be controlled, and efficient laws must be provided for inflicting severe penalties upon those violating election laws. The most efficient form of a Corrupt Practices Act is perhaps found in Great Britain.

Corrupt Practices Acts.—The first act for the prevention of corrupt practices in elections in the United Kingdom was passed in 1854, and this has since then been supplemented by others in 1858, 1863, 1882, and 1883. These acts give in the first place a very complete and thorough definition of bribery, both for the giver and the receiver, of treating, and of undue influence over voters. The law limits strictly the amount of money that may be expended at any election by any candidate, or by an agent in his behalf. It forbids the expenditure of money for many purposes that are common in other places; such as for the conveyance of electors to or from the polls by the hiring of horses or carriages, or pay-

ment of railway fares or otherwise, or for the use of committee-rooms or other buildings or premises beyond a certain fixed number, or for any entertainment (beyond a certain fixed amount for speakers and others), or for bands of music, torches, flags, badges, ribbons, etc., or for the employment of more than a designated number of agents and sub-agents for electioneering purposes. After the election an itemized statement of all the expenditures incurred on his account is to be made by the candidate and his agent under oath, and the further declaration that no expenses have been made contrary to the law or for purposes of bribery, direct or indirect. These reports must be public. "If it is found that a corrupt practice has been permitted with the knowledge and consent of the candidate, he is forever disqualified from holding office and is deprived of his franchise as an elector. If such corrupt practice is found to have occurred by the act of the agent, with or without the candidate's knowledge and consent, the candidate himself is disqualified from serving during the time for which he was elected, and can neither hold office nor act as an elector for seven years. Similar penalties are imposed on agents and sub-agents found guilty. These penalties are all in addition to penalties of fines and imprisonment for conviction on an indictment of bribery, undue influence, treating, illegal payments, or other corrupt practices."

Any unsuccessful candidate, if he has reason to believe that his successful opponent has employed corrupt practices of any kind, may by petition have a scrutiny, and, if he can prove his charge, may unseat his opponent and take the seat himself, unless it can be proved that he also has been guilty of corrupt practices, in which case a new election must be held. These acts in connection with the secret ballot have resulted in almost entirely suppressing corruption in elections in many parts of Great Britain and Canada, and have greatly decreased it wherever introduced. Similar acts, more or less complete, some covering only the expenses of the candidate, which may be evaded by giving a large sum to an irresponsible committee, others covering also the work of committees, have been passed in Massachusetts, New York, Minnesota, and other States. It is too soon yet to see the full effect here, but it will doubtless be good.

AUTHORITIES.—John H. Wigmore, *The Australian Ballot System* (Boston, 1889), and the statutes of the States mentioned above.

JEREMIAH W. JENKS.

Ballou, HOSEA: one of the fathers of the Universalist denomination in the U. S.; b. at Richmond, N. H., Apr. 30, 1771. His early education was acquired by his own efforts, though he had to contend with unusual obstacles. He began to preach when about twenty-one years of age, and labored in various places in New England. In 1807 he settled in Portsmouth, N. H., in 1815 in Salem, Mass., and in 1817 in Boston. In 1819 he became editor of the *Universalist Magazine*, and in 1831–32 was connected with the *Expositor*. He was a radical reformer of the Universalist theology, which, as shaped by Murray, the founder of Universalism in America, had been Calvinistic in its doctrines, with the exception that all were, as he thought, elect and consequently all saved. Ballou rejected Calvinism entirely, and the orthodox doctrines of the Trinity and Atonement by the vicarious sacrifice of Christ. He did this several years before it was done, at least openly, by the New England Unitarians. D. in Boston, June 7, 1852. Among his works are *Notes on the Parables* (1804), and an *Examination of the Doctrine of a Future Retribution* (1846); also, with a friend, a book of Universalist hymns, now very rare, remarkable for its lack of poetic merit. See his *Life*, by M. M. Ballou; another by T. Whittemore (1854), and one by O. F. Safford (1889). Revised by JOHN W. CHADWICK.

Ballou, HOSEA, D. D.: b. at Halifax, Vt., Oct. 18, 1796. He was a nephew of the foregoing. He entered the Universalist ministry in his youth, and preached at Stafford, Conn., and Roxbury and Medford, Mass. In 1822 became an editor of the *Universalist Magazine*, and was long connected with various journals of his denomination. He displayed much ability as editor of the *Universalist Quarterly*. He was (1854–61) the first president of Tufts College. He published *Ancient History of Universalism* (1829) and a hymn-book (1837). D. at Somerville, Mass., May 27, 1861.

Revised by JOHN W. CHADWICK.

Ballou, MATURIN MURRAY: journalist; son of Rev. Hosea Ballou; b. in Boston, Mass., Apr. 14, 1820; has edited *Ballou's Pictorial*, *The Flag of our Union*, *Ballou's Monthly*, and other periodicals; and has published a *History of Cuba*

(1854), *Biography of Hosea Ballou*, *Life-work of Hosea Ballou*, and a valuable compilation of quotations from a great number of writers. He became in 1872 one of the founders and the editor-in-chief of the *Boston Globe*. D. in Cairo, Egypt, Mar. 27, 1895. Author of *Due South; or, Cuba, Past and Present* (1885); *Due North* (1887), etc.

Ball's Bluff: Loudon co., Va.; on the right bank of the Potomac, about 33 miles N. W. of Washington. The bank here rises about 150 feet above the level of the river. It was the scene of a disastrous defeat of the U. S. forces under Col. E. D. Baker, Oct. 21, 1861. The hostile forces of the North and South had for several months confronted each other on opposite banks of the Potomac. On Oct. 19 and 20 reconnoissances were made in the direction of Dranesville and Leesburg by the Federal forces under Gen. McCall, without encountering any opposition. Gen. McClellan being anxious to ascertain the strength of the Confederates in these positions, on Oct. 20 (10:30 P. M.) instructions were sent to Gen. Stone at Poolesville, Md., directing him to keep a good lookout on Leesburg, to note the effect of this movement, and adding that "perhaps a slight demonstration on your (Stone's) part might have the effect to move them." Accordingly, Gen. Stone ordered the Fifteenth Massachusetts, Col. Devens, to be moved to Harrison's island in the Potomac, opposite the bluff, and about 100 yards distant from the Virginia shore; which was promptly effected in flatboats. At dark Devens sent a detachment of fifteen men under Capt. Philbrick to the Virginia shore to ascertain the whereabouts of the Confederates. After ascending the bluff they had proceeded but a short distance when they discovered what was supposed to be a camp, apparently but poorly guarded, which situation Philbrick reported to Col. Devens on his return. Devens forwarded this report to Gen. Stone, who immediately issued an order directing Col. Devens to land with five companies of his regiment and proceed to surprise the discovered camp at daybreak, and, after having accomplished this, to pursue as far as he deemed prudent, destroy the camp, and return to his position on the island, unless he saw a favorable position on the Virginia side which he could hold until re-enforced. At the same time Col. Lee (Twentieth Massachusetts) was ordered to occupy Harrison's island with his regiment, and to throw one company across to the heights on the Virginia shore to cover Col. Devens's return. These orders were carried into effect, and at daylight Devens advanced only to find the reported camp to be, in fact, no camp, the detachment of the night before having been deceived in the moonlight, and mistaken the openings between the trees for tents. Col. Devens, however, advanced to within a mile of Leesburg, where he halted and, concealing his force in the woods, reported to Gen. Stone that he had met with no opposition, and asked for further orders. About 7 A. M. a body of Confederates appeared, but retired when approached, and cavalry were also seen on the Leesburg road; whereupon Col. Devens fell back to the bluff without interference, and reported to Gen. Stone, who directed him to remain, and that he would be re-enforced. At this time his force of officers and men was about 650. The position he had taken up was surrounded on three sides by woods, and here about noon he was attacked and fell back to a more secure position; being again attacked, he retired still farther, to the edge of the bluff, where he was re-enforced by Col. Baker with his regiment of First California Volunteers, and who by seniority of rank took command. Col. Baker's instructions were discretionary whether to remain or withdraw, but on finding an attack already commenced he decided to remain. The force at his command amounted to about 1,900 men; the Confederate force in the woods was reported at 1,700, not including, however, a regiment of Mississippi volunteers so stationed as to prevent succor to Col. Baker from Edwards's Ferry. Col. Baker had no more than disposed his men in line when he received a vigorous attack on his right, extending soon to his left and center. For two hours a desperate conflict was maintained, the Federals from their exposed position suffering by far the heaviest loss. Col. Baker, who displayed the greatest bravery, was killed about five o'clock, and the command devolved upon Col. Cogswell (New York Tammany Regiment). The severe fire to which the Federal troops had been subjected, and the fearful loss they had sustained, caused them to waver, and the only hope that appeared to be left was to endeavor to join Gen. Stone, who was known to have a strong force at Edwards's Ferry, about 2 miles away; but this

movement was met by a body of fresh Mississippi infantry, and under their attack the disheartened and reduced troops were routed, and, flying in great disorder down the bluff, were subjected to a galling fire from all directions. The boats to which they fled were upset or sunk by the Confederates' fire, and the few that escaped either swam out into the stream or concealed themselves along the banks of the river, reaching the Federal lines under cover of the darkness. In the meantime, Gen. Stone had ordered an advance across Edwards's Ferry, but his troops arrived on the field too late to furnish any material assistance. The Federal loss in killed, drowned, and wounded exceeded, probably, 1,000 men; Gen. Evans, in command of the Confederate forces, reported his loss at 155. Much blame was attached to Col. Baker for recklessness, and Gen. Stone was subsequently arrested and confined in Fort La Fayette in New York harbor, but was afterward discharged, and at a later period again given a command.

Ballston Spa, sometimes called simply **Ballston**: a village on Del. and H. Canal Co. R. R., capital of Saratoga co., N. Y. (for location of county, see map of New York, ref. 4-J); 6 miles S. W. of Saratoga Springs. Here are mineral springs, which rise from the lower part of the Hudson river (Silurian) shales, and rank among the best acidulous chalybeate springs in the U. S. The village has several manufactories, including axe and scythe works, immense pulp and paper mills, and one of the largest tanneries in the world; five churches, and graded school-system with high school. Pop. (1870) 2,970; (1880) 3,011; (1890) 3,527; (1900) 3,923.

EDITOR "DAILY NEWS."

Bally: See **BALI**.

Bally [from Gael. *baile*, Manx, *balley*, town]: a prefix signifying "town," entering into the composition of the names of a great number of places in Ireland and Scotland.

Ballyme'na: a market-town of Ireland; in the county of Antrim; on the river Braid, 2 miles above its junction with the Maine and 33 miles by rail N. N. W. of Belfast (see map of Ireland, ref. 4-I). It has large public schools, a cotton-spinning mill, and extensive bleaching-grounds, and is one of the greatest linen and flax markets in Ireland. Pop. 9,000.

Ballyshan'non: a seaport-town of Ireland; in the county of Donegal; on the river Erne at its entrance into Donegal Bay; 120 miles N. W. of Dublin (see map of Ireland, ref. 4-F). A bridge of fourteen arches here crosses the Erne. It has six churches and chapels. Here is a valuable salmon-fishery in the Erne. Pop. 3,000.

Balm (*Melis'sa officinalis*): a perennial herbaceous plant of the family *Labiatae*; a native of the south of Europe; is cultivated in American gardens, and prized for its lemon-scented leaves. The leaves, which are ovate and crenate, and the stem are occasionally used in medicine as a gentle aromatic, stimulant, and tonic. Its properties depend on an essential oil called oil of balm. An infusion of balm is an excellent beverage in febrile diseases.

Balmaceda, baäl-maä-thay'da, JOSÉ MANUEL: president of Chili; b. in Santiago, 1840; committed suicide in the Argentine legation house there, Sept. 19, 1891. Educated for the priesthood; founded Reform Club (1868); deputy and senator in Chilian Congress; minister to Buenos Ayres; Minister of Interior (1882); president (1886) for five years. In 1890 he began intrigues to place one of his creatures in office as his successor; appointed an unpopular cabinet, prorogued Congress, and set on foot fictitious revolts in Valparaiso, which broke out in June. A junta was formed in Congress and the navy, which denounced Balmaceda, seized the best-armed vessels and the nitrate provinces, and marched south, beating the presidential forces as they advanced, until they appeared before Santiago, Aug. 27, 1891. The president fled, but returned to refuge with the Argentine minister. He was succeeded by Admiral Jorge Montt, provisionally at first, by election Nov. 6, 1891.

Balmés, JAYME LUCIO: a Spanish Catholic priest; b. at Vich, in Catalonia, Aug. 28, 1810. He was a remarkably precocious scholar. He wrote in reply to Guizot an able work entitled *Protestantism Compared with Catholicism in its Relations to European Civilization* (3 vols., 1848), which was translated into English, French, Italian, and German. Among his other works is *Filosofia Fundamental*, which was translated into English by H. F. Brownson (New York, 1857). D. at Vich, July 9, 1848. See Antonio Soler, *Biografía de D. J. Balmés* (1850); Garcia de los Santos, *Vida*

de Balmés (1848); A. de Blanche-Raffin, *J. Balmés, sa Vie et ses Ouvrages* (1849).

Balm of Gilead: either of several quite distinct plants. In Great Britain it is a small shrub (*Cedronella triphylla*) of the mint family, and native of Canary islands. In the U. S. it is a species of poplar (*Populus balsamifera*, var. *candicans*). In Arabia the balm of gilead is *Commiphora opobalsamum*, var. *gileadensis*, a small tree of the family *Burseraceae*.

CHARLES E. BESSEY.

Balmor'al Castle: the autumnal residence of Queen Victoria; is in a beautiful valley in Aberdeenshire, Scotland, on the river Dee, 48 miles W. S. W. of Aberdeen. It commands a magnificent prospect, and comprises 40,000 acres of beautiful grounds. Prince Albert purchased this estate in 1852 for £32,000, and erected a granite castle in the Scottish baronial style. It consists of two blocks of buildings united by wings, and a massive tower 35 feet square, rising to the height of 80 feet, and surmounted by a turret 20 feet high.

Balnav'es, HENRY, of Halhill: an eminent Scottish reformer and writer; b. at Kirkcaldy in Fifeshire about 1520. He studied law, and became Secretary of State in 1540. In 1546 he, with other Protestants, took refuge in the castle of St. Andrews, and was declared a traitor. The castle was captured by the French, who took him, with Knox, to Rouen as prisoners. While in prison he wrote a *Confession of Faith*. He returned to Scotland in 1556. D. in Edinburgh, 1579.

Balsam (*Impatiens balsamina*) [Lat. *bal'samum*, from Gr. *βάλσαμον*; of Semitic origin]: a well-known herbaceous annual belonging to the geranium family, and closely related to the touch-me-not. It is a native of India, and has been cultivated in European gardens for 300 years. It has developed many varieties.

CHARLES E. BESSEY.

Balsam, Canada: the thick, terebinthine sap of *Abies balsamea*, which collects in blisters beneath the epidermis of the trunks of young trees. These blisters are punctured, and the balsam gathered as an article of commerce. It is used in medicines, for varnishes, for mounting microscopic objects, etc. *Abies grandis* of the west coast of North America furnishes a similar fluid.

Balsam Fir: See **ABIES**.

Balta, baal'ta: a well-built town of Russian Poland; in Podolia; on the Kodema river; 132 miles E. S. E. of Kamieniec (see map of Russia, ref. 9-C). It has over twenty factories of candles, soap, etc., and has an extensive trade in cattle, horses, hides, wool, and grain. Pop. (1888) 32,983.

Balti, baal'tée, **Baltistan**, baäl-tée-staan', or **Little Tibet**: the upper end of the Indus valley, subject to Kashmir; having Chinese Tartary on the N., Afghanistan on the W., and Kashmir on the S., between lat. 34° 30' and 36° N., and lon. 74° 40' and 76° 30' E. The inhabitants are Shiite Mohammedans of Tibetan origin. The climate has greater extremes than that of Kashmir; the soil produces grains and fruits in abundance. Chief town, Iskardi. Area, 19,000 sq. miles.

Baltic, or **Baltic Sea** (in Germ. *Ostsee*; New Lat. *Mare Balticum* and *Sinus Codanus*): an inland sea or gulf of Northern Europe; situated between Russia, Sweden, Germany, and Denmark, and connecting with the German Ocean and the Cattegat by the Sound and the Great and Little Belts. It is 830 miles long. Its greatest width is 420 miles, and the area 154,570 sq. miles. On account of the small proportion of salt it contains (not over 2 per cent.), the Baltic freezes much more easily and early than the ocean. It is not affected by the tide. The numerous sandbanks and islands, and the violent storms with sudden changes of wind, render the navigation of the Baltic dangerous. It receives several large rivers—namely, the Oder, Vistula, Niemen, Düna, Narva, Neva, Torneå, Dal, etc. No sea has in proportion to its size so great an influx of fresh water. The chief ports are St. Petersburg, Riga, Dantzic, Stralsund, Königsberg, Stockholm, and Copenhagen. A remarkable phenomenon connected with this sea is the slow and gradual rising of its shore in Sweden. A ship-canal connecting the Baltic Sea and the North Sea through the river Elbe was begun in 1891; opened for traffic June 20, 1895. It begins at Holtenau on Kiel Bay and reaches the Elbe 15 miles from the mouth of the latter. It is 61.31 miles long and needs no locks.

By some the word "Baltic" is derived from Lith. *baltas*, white, *balti*, be white; by others from the same source as

Lat. *balticus*, Eng. *belt*. According to an ancient tradition which has come down to us through Pliny, Baltia was the name of a great island situated at a distance of three days' sail from the coast of Scythia. This term is not found either in German or in any of the Scandinavian languages; the Baltic is there invariably called the "East Sea." It is an aid to the understanding of ancient geography to know that both terms were used in early days.

Baltic Languages: See LITHUANIAN, LETTISH, and OLD PRUSSIAN.

Baltimore: the chief city of Maryland; an important railroad and commercial center (for location, see map of Maryland, ref. 2-F); is in 39° 17' N. lat. and 0° 26' E. lon. (76° 37' 30" W. from Greenwich), at head of tide-water and navigation on Patapsco river, about 14 miles from Chesapeake Bay, and nearly 200 from the ocean by ship-channel. The Patapsco to this point is a broad estuary; above, a small and swift stream, furnishing water-power to many mills and manufactories. The harbor is spacious and secure, and its original depth of about 20 feet has been increased to the requirements of the ocean steamships by extensive dredging prosecuted at the expense of the U. S., the State, and the city governments. The city covers about 20,000 acres of land, and the surface of its site was originally very hilly.

The first steps for "erecting a town" on the Patapsco, to be called Baltimore Town, were taken by a legislative act in 1729, and it was laid out in half-acre lots in 1730. In 1752 it contained 25 houses and 200 persons; in 1765 the number had increased to 50 houses. After this the growth was more rapid, and in 1775 there were 564 houses and 5,934 persons. In Dec., 1776, the Continental Congress transferred its sittings from Philadelphia to Baltimore, and met here for about two months. In 1797 it was incorporated as a city. Pop. (1790) 13,503; (1870) 267,354; (1880) 332,313; (1890) 434,439; (1900) 508,957.

The city is laid out, for the most part, at right angles, the streets having generally a width of about 60 feet, and the buildings are mostly built of red brick, made from immense clay-beds adjacent to the city. White marble, of excellent quality, is procured from inexhaustible quarries about 10 miles N. of the city; granite from quarries about 15 miles W. Ship-building has always been one of the leading industries of the city, and the repairs of ships are greatly facilitated by an excellent dry-dock capable of receiving the largest ships that can enter the harbor.

Manufactures.—The principal industries are clothing, tobacco, foundries and machine-shops, meat packing, breweries, and distilleries. There are forty establishments for packing oysters and fruits. This is a very important industry, and gives employment to 8,990 hands, consumes from 7,000,000 to 8,000,000 bushels of oysters, gathered from the Chesapeake Bay, in a year, and during the season—Sept. 1 to Apr. 1—often sends inland, packed raw, or cooked and hermetically sealed, from 40 to 60 car loads a day. These industries find their outlet both by land and water communication. There are lines of steamships to Liverpool, Bremen, Boston, Providence, Wilmington (N. C.), Charleston, Savannah, Havana, New Orleans, etc., and steamboat lines to Norfolk, Richmond, Fredericksburg, Washington, and all points on the Chesapeake Bay and its many estuaries. A ship-canal across the State of Delaware gives the city a direct outlet for trade with Philadelphia. The city is a terminus of the Maryland and Pennsylvania R. R. which runs to York, of the Western Md. R. R. which runs to Cherry Run, and of the Annapolis and Baltimore Short Line R. R. The Baltimore and Ohio R. R. passes through the center of the city in the long Belt Line Tunnel. Indeed, it is noteworthy that the most important roads pass through the city in tunnels, thus avoiding grade crossings. The Baltimore and Ohio R. R. main line to Frederick (66 miles) was the first railroad operated in the U. S. The Baltimore and Potomac R. R. (to Washington) passes by a tunnel 7,400 feet in length under the northwest part of the city; and the Northern Central R. R. (to Harrisburg) reaches tide-water by a similar tunnel 3,500 feet long, under the northeast section. Besides floating elevators for the transfer of grain, reaching the market by water, the railroads have at their termini six substantial elevators, with a storage capacity of 5,000,000 bushels, and others are projected.

Its sobriquet "Monumental City" was derived from the Washington Monument and Battle Monument, erected by the gratitude and patriotism of its citizens. The former, located at Mt. Vernon Place, North Charles Street, is a

Doric shaft of white marble 180 feet high, surmounted by a statue of Washington 16 feet high, erected 1816–30. Access to the top is had by 220 winding stairs within the column. Battle Monument, commemorating the defeat of the British at the battle of North Point, near Baltimore, on Sept. 12, 1814, is in Monument Square, North Calvert Street. It is also of white marble, 52½ feet high. Wilkey Monument on Broadway, of white marble, 52 feet high, was erected to Thomas Wilkey, a citizen of Baltimore, who died in 1861, and was the founder of Odd Fellowship in America. There is also in Greenmount Cemetery a monument and statue to John McDonogh, who bequeathed to the city a large sum (amounting now to about \$1,000,000) to establish the McDonogh Institute, an industrial institution for the education of poor boys, about 15 miles N. W. of the city. A monument in Harlem Park to James L. Ridgely, secretary of the Sovereign Grand Lodge of Odd Fellows, was unveiled Sept. 22, 1885. In the grounds of the Samuel Ready School for girls is a brick obelisk erected as a monument to Christopher Columbus by the Chevalier d'Anmour in 1792, and believed to be the first such monument in the world. Greenmount and London Park are two beautiful cemeteries, and there are several other minor ones. The city has about 480 churches and 22 Jewish synagogues. The oldest church in the city is St. Paul's (Episcopal). This church antedates the founding of the city, the parish having been erected in the end of the seventeenth century. The first Presbyterian church was established in 1761; the first Roman Catholic, in 1770; the first Wesleyan Methodist, in 1773; the first Baptist, in 1780; the first Friends' meeting about 1680, long before the town was laid out. The Reformed and Lutheran churches were first established about 1750. Several of the churches are imposing and beautiful structures. Among the most noticeable are the cathedral, St. Alphonsus, Corpus Christi (Jenkins Memorial), and St. Ignatius (Roman Catholic); Grace, St. Peter's, and Christ (Episcopal); the Mount Vernon, Madison Avenue, and First (Methodist); Westminster, Brown Memorial, and First (Presbyterian); Eutaw Place (Baptist); and the Unitarian. The finest synagogues are those of the Baltimore Hebrew Congregation (the oldest Jewish organization in the city), Oheb Shalom, Chizook Emunah, and Har Sinai (Reformed).

The water-supply of the city until 1881 was taken from Jones's Falls, about 7 miles above the city, and was of good quality and ordinarily abundant. In that year a further supply was brought, at an expense of \$4,000,000, from the Gunpowder river by natural flow through a tunnel of 12 feet interior diameter, 7 miles in length, with capacity for daily delivery of 170,000,000 gal. The reservoirs upon the two systems have a storage capacity of 2,241,000,000 gal.; the average daily flow of the streams that supply them is 165,000,000 gal., and the aqueducts leading from the storage reservoirs have a capacity for delivering in the city 200,000,000 gal. a day. This is distributed everywhere in abundance, and there are about 1,000 fire-plugs for use in case of fire. The fire department is well organized, directed by a police and fire-alarm telegraph, and notably efficient. It has 23 steam fire-engines and 9 hook-and-ladder companies.

Numerous public squares add to the beauty and healthfulness of the city. Patterson Park, in the southeast section of the city, contains 200 acres. Druid Hill Park, in the northwest section, contains 704 acres of ground, with fine forests, lakes, and lawns, and about 20 miles of good carriage-drives. In this park are fine statues in marble of Christopher Columbus erected by the Italian residents in 1892 and in bronze of William Wallace given by W. W. Spence. Clifton Park, the former residence of Johns Hopkins, in the northeastern part of the city, and Carroll Park, with the residence of Charles Carroll, barrister, in the southwest, are also beautiful pleasure grounds.

Public Buildings.—First among the public buildings should be named the city-hall, built of white marble, occupying an entire square, and costing \$3,000,000. The new court-house occupies another square, and is a white marble building erected at a cost of \$2,000,000. A third square is occupied by the fine Federal building, erected about 1885, for the post-office and U. S. courts. A new custom house was begun in 1901. The Maryland Institute is of brick, is 355 feet long, and is occupied by a successful school of art. It was formerly the scene of a number of national political conventions. The Odd Fellows' Hall, of brick, the Masonic Temple, of white marble, the jail and the new Penitentiary, of granite, are all remarkable structures. Outside of the city limits, but a part of its institutions, should be noted

INDEX.

Bay View Asylum (city almshouse), 714 feet in length; the House of Refuge, maintaining about 400 juvenile delinquents; Spring Grove Asylum, a State institution for the insane, of granite, with capacity for 600 patients. The Maryland Institution for the Blind possesses two beautiful white marble buildings, and instructs the blind children of Maryland and the District of Columbia. The Sheppard and Enoch Pratt Hospital for the insane, near the city, was founded by a bequest of about \$1,000,000 from Moses Sheppard and further endowed by Enoch Pratt with about \$1,750,000. The Peabody Institute of Baltimore was the recipient of over \$1,000,000 from the late George Peabody. It has, in its fine white marble building by the side of the Washington Monument, a free library of 135,000 books and pamphlets, an art-gallery, music conservatory, rooms for lectures, concerts, etc. The Johns Hopkins Hospital has no superior in its appointments in this country—probably none anywhere. In Mar., 1873, Johns Hopkins, a merchant of the city, placed in the hands of trustees selected by him 13 acres of land in the eastern part of the city, with directions to establish thereon a free hospital for the "indigent sick of the city and its environs, without regard to sex, age, or color." He left it half of his estate, giving it an endowment of over \$3,000,000. The buildings were erected from the income of the endowment, and the hospital was opened in 1889.

Education, etc.—Johns Hopkins also established the university bearing his name, over which Daniel C. Gilman, LL.D., was president from its opening until 1901. It was opened in 1876, and offered especial opportunities for graduate students from the first. By its system of fellowship it has always given great encouragement to original work. A college department, largely patronized by students from Maryland, has been carried on from the first, and a medical department, operated in connection with the Johns Hopkins Hospital, was opened in 1893. From 1898 to 1902 the university received an annual appropriation from the State. The Johns Hopkins was the first institution in the U. S. to establish a university press to publish the results of the work of its professors and students. The university has in all departments 120 instructors and about 600 students. Its buildings and equipments are valued at over \$1,000,000, and its productive funds at \$3,000,000. There are 90,000 volumes and 60,000 pamphlets in its library. Its medical school received an endowment from Miss Mary Garrett of nearly \$400,000 on condition that its courses of instruction should be open to women. The general education of the city is provided for in 125 graded public schools. Loyola College, a Catholic institution under the supervision of the Jesuits, and the seminary of St. Sulpice (St. Mary's College), a Catholic theological institution, are both in a flourishing condition. The University of Maryland (established in 1812) has prosperous departments of medicine, law, and dentistry. The Baltimore Dental College (established in 1839) is the oldest institution of the sort in the world. Other professional schools are the College of Physicians and Surgeons, Baltimore Medical College, Woman's Medical College, Southern Homœopathic College, Maryland Medical School, Maryland College of Pharmacy, and Baltimore Law School. The Baltimore University conducts departments of medicine and law. The Woman's College of Baltimore, established in 1884, is one of the most important institutions of the kind in the U. S. It has some 500 students, and is well equipped. It is under the control of the Methodist Episcopal Church. The city has 20 national banks, 25 State and savings banks, and 12 trust companies, 9 daily and 43 weekly newspapers, and 22 monthly and semi-monthly magazines.

In 1882 Enoch Pratt, a successful merchant of the city, offered the city a free circulating library for the use of the citizens, which the city accepted and named the "Enoch Pratt Free Library." It has a central building on Mulberry Street and seven branches in the different quarters of the city. The endowment consisted of these buildings and the sum of \$833,333.33, given the city in return for the creation by the city of a perpetual annuity of \$50,000 payable to trustees originally selected by the donor and having the right of coöptation. The Central Library contains 130,000 volumes, and the branches from 5,000 to 15,000 each. The total collection is some 210,000 volumes. Other libraries of the city are Mercantile Library Association, about 60,000; Maryland Institute, 20,000; Baltimore Bar Association, about 12,000; Odd Fellows', about 25,000; Maryland Historical Society, about 30,000; Loyola College, 22,000; Maryland Diocesan Library (Whittingham Memorial), about

25,000; Library of the State Medical and Chirurgical Faculty, about 13,000. Revised by BERNARD C. STEINER.

Baltimore, Lord: a title of the Calvert family in the Irish peerage; created in 1625 by James I., who marked his confidence in Sir George Calvert by making him, though a Roman Catholic, Baron of Baltimore (Ireland). Calvert was born at Kipling, Yorkshire, England, in 1582. He graduated at Oxford; held several important public trusts; was knighted in 1617; became principal Secretary of State in 1619; member of Parliament 1620-21; and first Lord Baltimore 1625. By grant of James I. he became proprietary of Avalon in Newfoundland, endeavored to plant a colony there, and went thither himself in 1625. Owing chiefly to the unfavorable soil and climate, the colony was a failure. He then (1628) visited Virginia, met an ungracious reception, and returned to England. He seems then to have petitioned Charles I. for a charter for founding a new colony, and to have met with favor; but before the charter was issued he died in London, Apr. 15, 1632. The charter which he had secured was re-issued in June, 1632, to his son Cecil, who became the second Lord Baltimore, and real founder of the colony of Maryland. The territory granted by the charter included the whole of the present State of Maryland. Cecil never visited it, but sent out an expedition in Nov., 1633, under the charge of his brother, Leonard Calvert, as governor. The Calverts have been much praised for their liberal and tolerant spirit, and their wise and equitable legislation in the colony. The successive Lords Baltimore were Charles (the third), Benedict-Leonard (fourth), Charles (fifth), and Frederick (sixth). Frederick died in 1771, leaving no legitimate children, and with him the title Lord Baltimore became extinct. See Fuller's *Worthies of England*; Bancroft's and Hildreth's *Histories of the United States*; J. P. Kennedy, *Character of George Calvert: Proceedings of Maryland Historical Society*; Sparks's *American Biography*, vol. ix. S. S.

Baltimore Oriole, also called **Golden Robin**: a well-known and conspicuously beautiful bird (*Icterus galbula*) of the New-World family *Icteridae*. This family, closely allied in structure and habits with the weaving-birds (*Ploceidae*) of Africa and Asia, displays an equally wonderful skill in the construction of its nest, which is a pendulous, cylindrical pouch suspended from the extremity of a hanging branch. Both are also distinguished by the brilliant contrast in the colors of their plumage. Black and yellow, the two colors of the coat-of-arms of Lord Baltimore, suggested the name of this species, which is the best known of the group. In the summer months the Baltimore oriole is found from Florida to New Brunswick on the coast, westward, as far as the great plains, from the valley of the Saskatchewan on the N. to Louisiana and Texas. It is a winter resident of the West Indies and Central America as far S. as Panama. As a vocalist it is a bird of rare power, combining beauty and variety in its notes. The eggs are from four to six in number; they hatch in 14 days. The oriole feeds chiefly on insects, many of them highly injurious to vegetation, and is thus of immense service to the farmer, destroying the worst pests of the orchard. The parents feed their young chiefly with caterpillars, which they swallow and disgorge for this purpose. Besides the Baltimore oriole there are four other orioles common in the U. S.—Bullock's oriole of the Pacific coast, the orchard oriole of the Eastern States, and the hooded and Scott's orioles of Texas and Arizona.

Baluchi, bã-loo'chěe, or **Balūcī**, bã-loo'chěe (also **Beloochee**, **Biluchi**): the language spoken in BALUCHISTAN (*q. v.*), a branch of the Iranian division of languages, which closely resembles modern Persian. Two dialectic groups are distinctly recognized: first, the northeastern or North Baluchi; second, the southwestern, the Makrānī or South Baluchi. The dialectic division is made by the interposed wedge of the Brāhūī tribes, a people of Dravidian stock and speech. The separation thus made is so marked that Southern Baluchi speech is sometimes almost unintelligible in the north. The South Baluchi dialect is more ancient in its character; the North Baluchi is marked especially by the use of spirants and aspirates.

Baluchi, like modern Persian, may be regarded as an analytic language. The noun-inflection consists chiefly in adding *a* to form the oblique case in the singular, and *ān*, or, in the oblique cases *āna*, in the plural. The verb is comparatively meager in forms, and somewhat irregular.

Baluchi hardly possessed a written literature until recent

times, when the Persian script began to be used in recording it. There exists quite a rich store of popular songs and stories, on legendary, historical, religious, heroic, and amatory subjects. A number of these have already been collected, and some of them bear the name of Jām Durrak, a celebrated Baluchi poet of the eighteenth century. Riddles seem to have been an especially popular style of composition among the Baluchis.

Consult Picree's *Mekranee Beloochee Dialect* (*Journ. Bombay Branch Roy. As. Society*, Bombay, 1876); Dames's *Northern Balochi Language, Grammar, Vocabulary, Specimens* (*Journ. Roy. As. Society of Bengal*, Calcutta, 1881); and especially the contributions of Wilhelm Geiger, *Dialektspaltung in Balūči, Etymologie des Balūči, Lautlehre des Balūči* (Bayer. Akademie der Wiss., 1889-91, *seq.*). See also IRANIAN LANGUAGES. A. V. WILLIAMS JACKSON.

Baluchistan, baā-loo-ehis-taan', or **Beluchistan**, be-loo-ehis-taan' (from *Baluchi*, one of the races occupying the country): a maritime country of Asia; with Afghanistan on the N., British India on the E., the Arabian Sea on the S., and Persia on the W. It is an irregular rectangle in form, with a projection at the northeast angle which extends to lat. 32° N. The seacoast runs E. and W. for about 600 miles, but has no good harbor. Area about 130,000 sq. miles.

Topography.—The surface is rugged and elevated, generally barren, and deficient in water. The Herbie or Hala Mountains run N. and S., separating the country from India, and there are several parallel ranges in Eastern Baluchistan. The northeastern extension is very mountainous. The coast is bordered by a lower range at some distance inland, with parallel ranges farther in the interior. The northwestern quarter is a dry, elevated plateau, with many independent drainage basins, and includes a part of the great Sarhadd plateau of Persia, and a part of the periodically dry and overflowed territory, the most of which lies in Afghanistan and Persia. The drainage of the country is for the most part into this area, but a few short streams find their way into the gulf.

Inhabitants.—The total population is (1901) 810,811. There are two distinct races occupying the country, the Baluch or Baluchi and the Brahūi. They are clearly distinguished from each other in language and appearance, and each is divided into an infinity of tribes. The Baluchis have a language allied to Persia, are handsome, active, tall, strong, with long visages and raised features, pastoral, predatory, and hospitable, warlike, but lazy. Their chief articles of food are milk and flesh, the latter, by preference, only half cooked. They keep many slaves, and usually the men have several wives. The Brahūis have a language strongly resembling the Hindu dialect spoken in the Punjab, are short and thick, with round faces and flat features. They are the dominant race, though the Baluchis were the earlier occupants of the country.

Productions.—The climate is various, but usually dry, and the soil generally unfertile, though there are regions where the most of the crops of India can be produced. The chief pursuit is that of camel-raising; the other domestic animals are the horse, mule, ass, buffalo, black cattle, sheep, goats, fowls, and pigeons. Especial attention is given to the culture of dates in Mekran, in the southwest. A great variety of ores have been found. Iron and lead are mined near Nal, 150 miles S. of Khelat. Coal has been found in several places. At Khost, on the Sind-Pishin Railway, it has been successfully worked for some years.

History.—The power of the Brahūi Khans of Khelat was founded toward the end of the seventeenth century. The previous dynasty was a Hindu one. Nasir Khan II. of the Brahūi dynasty was recognized by the British in 1841, and in 1854 a treaty was made with him, under the terms of which he received an annual subsidy of \$17,000. He was succeeded in 1857 by his brother Khudadad, who is the present khan. With him a fresh treaty was made in 1876, and the subsidy paid him was doubled. He turned over the district of Quetta to the British, for which he receives an annual quit-rent of \$8,000, besides \$10,000 per annum in lieu of his right to levy duty on merchandise in the Bolan Pass—making \$50,000 paid to him by the British annually. In 1888-89 the district of Khethran, between Quetta and India, was brought under British control, and the territory has since been extended.

Government.—Baluchistan, as it now (1893) stands, may be divided into three parts: (1) The districts to the northeast, for the most part formerly included in Afghanistan, now

under British rule, and forming British Baluchistan. (2) The districts of Quetta and Bolan, now administered by British officials on the khan's behalf. (3) The greater part of Baluchistan, composed of a confederation of chiefs under the suzerainty of the Khan of Khelat, and in a general way under British protection. The capital of this part of Baluchistan is Khelat. The British administrative center is Quetta. From Quetta, which is strongly fortified, a railway runs through the Kwaja Amran range toward CANDAHAR (*q. v.*).

LITERATURE.—Hughes, *The Country of Baluchistan* (1877); Floyer, *Unexplored Baluchistan* (1882); MacGregor, *Wanderings in Baluchistan* (1882); Oliver, *Across the Border, or Pathan and Biloch* (1891). MARK W. HARRINGTON.

Baluze, baā'lüz', ÉTIENNE: a French historian; b. at Tulle, Dec. 24, 1630; became in 1668 Professor of Canon Law in Paris, and in 1707 director of the Royal College under Louis XIV. Among his works are *Lives of the Popes of Avignon* (Paris, 1693), and *History of the House of Auvergne* (1708, 2 vols.), in which he endeavored to show that the House of Bouillon was descended from the ancient Dukes of Guienne, and therefore owed no allegiance to the King of France. The king suppressed this work, exiled the author, and confiscated his estates, but he was recalled in 1713. He published forty-five works, among which were *Capitularia Regum Francorum* (1677, 2 vols.); *Conciliarum Nova Collectio* (1685), etc. D. in Paris, July 28, 1718.

Balzac, baāl'zaak', HONORÉ, de: the most famous French novelist of the nineteenth century; b. at Tours, May 20, 1799; of plebeian origin, notwithstanding the *de* which he placed before his name. Coming early to Paris, he lived on to the age of nearly thirty with his head full of ambitions, but without achieving a success. In 1829 he published his *Dernier Chouan* (written, however, in 1827), the first of his novels to show real power. In 1829 (dated 1830) appeared his *Physiologie du mariage*, witty, acute, often gross—and his fortune was almost made. In 1831 it was quite made by his *Peau de Chagrin*, full of wise and just things, mingled with much that was the opposite. From this time till his death Balzac produced enormously—the list of his books from 1827-48 including ninety-seven titles. He early began to elaborate a new theory of novel-writing—that it should consist in giving documents from the life of the society in which the writer lives; and his enormous production purported to be the carrying into practice of this theory. In it he has been followed also by later novelists; and has thus become perhaps the most important influence upon the imaginative literature of the end of the nineteenth century. His total work he called the *Comédie humaine*, in contrast to the Dantesque *Divina Commedia*. Furthermore, he divided his stories into lesser groups—*Contes philosophiques*, *Scènes de la vie privée*, *Scènes de la vie de province*, *Contes drolatiques*, etc. Of single novels, besides those named above, the most famous are perhaps *Eugénie Grandet* (1833); *Seraphita* (1834); *Le Père Goriot* (1834); *La Recherche de l'absolu* (1834); *Le Lys dans la Vallée* (1835); *César Birotteau* (1837); *Béatrix* (1844); *Modeste Mignon* (1844). In conclusion, it may be said that most of the prevailing French theories about novel-writing—so-called "realism," "naturalism," etc.—go back to Balzac. His novels have been translated into English by Miss K. P. Wormley, and an edition by various translators has been edited by Prof. Geo. Saintsbury. D. in Paris, Aug. 18, 1850.

See George Sand, *Notice biographique de H. de Balzac* (1853); Vieohte de Spoelbergh de Lovenjoul, *Histoire des Œuvres de H. de Balzac* (1886); A. Cerfbeer et J. Christophe, *Répertoire de la Comédie humaine de H. de Balzac* (1887); M. Barrière, *L'Œuvre de H. de Balzac* (1890); E. E. Saltus, *Balzac*, with full bibliography of his works (Boston, 1888).

A. R. MARSH.

Balzac, JEAN LOUIS GUEZ, de, Seigneur: French writer; b. at Angoulême in 1597. He was patronized by Cardinal Richelieu, and was admitted into the French Academy in 1634. He did for French prose what Malherbe did for verse, i. e. purified it from the pedantries of the sixteenth century and the obscurities of a still earlier time. Almost all the great writers of the age of Louis XIV. show his influence. As Sainte-Beuve said: "He gave the French tongue a stiff course in rhetoric." Personally he was vain, uncertain, and vacillating. His youth was spent in dissipations, his age in devotions; but he had observed much, and reflected deeply upon the course of human life, and his works contain so much of human experience that they must long remain famous. His reputation mainly rests upon his *Letters*, the

first collection of which, after they had passed through many private hands, appeared in 1624. Besides these, he published several works avowedly written for the public at large—as his *Prince* (1631); *Socrate Chrétien* (1652); *Entretiens* (1657); *Aristippe* (1658). His collected works appeared 1665, 2 t. fol., and 1854. Many separate editions of his *Letters* have appeared, e. g. by P. T. de Larroque, Paris, 1874. D. at Angoulême, Feb. 15, 1654. Revised by A. R. MARSH.

Bambar'ra: a large district in the Western Sudan, on both sides of the Upper Niger or Joliba, which flows in a N. E. direction through the middle of this state. Its boundaries are uncertain, but it lies entirely in the area claimed by the French. The soil is well watered and fertile. The rainy season lasts from June to November. Two crops of maize, cotton, and yams are raised annually. The baobab, butter-tree, and date-palm are found here. The wild animals are lions, elephants, leopards, panthers, etc. The population is composed mostly of Mandingoes. Area about 20,000 sq. miles.

Bam'berg: a city of Bavaria, in Upper Franconia; is beautifully situated on the river Regnitz, 30 miles N. of Nuremberg and 3 miles from the river Main (see map of German Empire, ref. 6-E). It is connected by railway with Nuremberg and other towns. It is well built, and has spacious, well-lighted streets, which are lined with handsome houses. Among the remarkable public buildings are the magnificent cathedral (Domkirche) in the Byzantine style, founded in 1004 by the Emperor Henry II.; the old palace of the bishops of Bamberg; and the Jesuit church of St. Martin's. Bamberg contains a theater, a lyceum, a museum of natural history, and a royal library of 135,000 volumes. Here are manufactures of porcelain, jewelry, musical instruments, gloves, etc.; also numerous breweries, which produce beer of superior quality. It has numerous literary and charitable institutions. Pop. (1895) 38,949.

Bam'boo' (Fr. *bambou*): the common name of the arborescent grasses of the genus *Bambusa*, numbering forty-six species; natives of the tropical and warm parts of Asia and America, and grow to a large size. Some of the species are a foot in diameter and 120 feet in height. The bamboo is a plant of great utility and importance. It has a jointed and hollow stem, which is very hard and light, and is externally coated with silex. It has been called the national plant of China, the natives of which make from it a great variety of articles, furniture, weapons, etc. It is sometimes used for building houses and bridges and for water-pipes. The smaller stems are converted into walking-sticks, and are employed in wickerwork and the seats of chairs. Some species of *Bambusa* secrete a silicious, phosphorescent substance called tabasheer, to which remarkable properties have been attributed. See TABASHEER.

Revised by CHARLES E. BESSEY.

Bam'borough (or **Bambrongh**) **Castle**: one of the oldest castles in Great Britain; is on the coast of Northumberland, 16 miles S. E. of Berwick. It stands on a basaltic rock 150 feet high, and accessible only on the southeast side. It was founded in 1070. Connected with this castle is an extensive public library, a dispensary, life-boats to save the crews of shipwrecked vessels, and other charitable institutions. Near the castle is a village of the same name.

Bambuk, baām-book': a district in the French Senegal Territory, West Africa; on the Upper Senegal river, between it and its tributary, the Faleme. The surface is hilly, and the soil of the valleys fertile. It is inhabited by Mandingoes, who are said to be very ferocious. The baobab and other trees here attain an enormous size. Bambuk has long been celebrated for its rich gold mines. Pop. about 800,000.

Bamian, baā-mcē-aan': a valley and pass of Afghanistan; on the route from Cabul to Turkestan, and between the central and western ranges of the Hindu Kush Mountains; is at an elevation of 8,496 feet, and is important as the only known pass over the Hindu Kush Mountains that is practicable for artillery. The valley is covered with ruins of the city of Gulgula, which was destroyed by Jengis Khan about 1220. Bamian was one of the chief centers of the Būddhist worship, and presents numerous caves with gigantic idols cut out of the rock. One of these is 160 feet high.

Bamo: same as BHAMO.

Bamp'ton Lec'tures: so called after the name of their founder, the Rev. John Bampton (1689-1751), of Trinity College, Oxford, Canon of Salisbury, who in 1751 left his "lands

and estates" to the University of Oxford for "the endowment of eight divinity lecture sermons," to be preached annually at "St. Mary's in Oxford." The subjects specified were: (1) "To confirm and establish the Christian faith, and to confute all heretics and schismatics; (2) upon the divine authority of the Holy Scriptures; (3) upon the authority of the writings of the primitive Fathers as to the faith and practice of the primitive Church; (4) upon the divinity of our Lord and Saviour Jesus Christ; (5) upon the divinity of the Holy Ghost; (6) upon the articles of the Christian faith as comprehended in the Apostles' and Nicene creeds." When the lectures commenced, in 1780, the income of the estate was £120 a year. Ever since then (except in the years 1834, 1835, and 1841) these lectures have been delivered. Some of the more noted of the earlier lecturers were Dr. White, in 1784, on *Christianity and Mohammedanism*; Dr. Nott, in 1802, on *Religious Enthusiasm*; Bishop Heber, in 1815; and Archbishop Whately, in 1822. Mansel, in 1858, on *The Limits of Religious Thought*, opened a new era in the history of the lectures. Since then we have had, among others, George Rawlinson in 1859, Farrar in 1863, Bernard in 1864, Mozly in 1865, Liddon in 1866, Irons in 1870, Jackson in 1875, Row in 1877, Wace in 1879, Hatch in 1880, John Wordsworth in 1881, Temple in 1884. Hurst's *Bibliotheca Theologica*, rev. ed., gives a complete list down to 1892.

Ban [a Teutonic word signifying proclamation, edict, prohibition, the verb of which, *bannan*, exists in O. Eng., but which actually came into Eng. viâ Fr. Cf. root of Gr. *φάναι*, Lat. *fari*, assert]: a word which occurs in many modern languages, signifying an edict; a public order or prohibition; an interdiction; a notice of marriage; a curse or excommunication. In the former German empire to put a prince under the ban of the empire was to divest him of his dignities, and pronounce on him a sentence of outlawry.

Ban and Arrière Ban: military terms used in France under the feudal system. When the feudal barons were summoned to the service of the king in time of war, they were called the *ban*. Their tenants or inferior vassals formed the second levy, or *arrière ban*. The *ban* and *arrière ban* constituted the entire military force of France in feudal times.

Ban, or Ba'nus [Pers. *bān*, lord]: the title formerly given to military governors of certain districts, called *banats*, in the eastern part of Hungary. The ban was appointed by the king, with the consent of the Diet, and had formerly very extensive powers. In political, judicial, and military affairs his authority was supreme. In time of war he commanded the troops of his banat. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, and Makovia (or Machow), but their boundaries often changed, and they were at length united into the double banat of Dalmatia and Croatia.

Ban, baan, MATIJA: Servian poet and writer; b. at Ragusa in Dalmatia, Dec. 18, 1818. He went to Constantinople in 1839, and was married there to a Greek lady in 1840. He studied at Greek and French colleges, and learned many languages and literatures. In 1845 he went to Belgrade in Servia, and settled there. From 1845 to 1849 he was tutor of the daughters of the Prince Regent of Servia. In 1848 he took vehement part in the revolution that broke out in Servia, as elsewhere in Europe, striving to unite Croats, Servians, and Dalmatians against the Hungarians. During these years he wrote the most famous of his tragedies—*Mejrima, or the Liberation of Bosnia* (1851). After the revolution he taught foreign literatures in the lyceum and the college in Belgrade. In 1860 he became Minister of Foreign Affairs for Servia; in 1868 he was given a national pension; in 1885 there was a magnificent celebration of the fiftieth year of his literary career.

Among his works may be mentioned: Dramas, *Miljenko*, *Dobriča*, *Dabroslavili*, *Jean Hus*, *Maroječa Kaboga*; poems, *Raslisne pezmé* (1853). He has written also many books and articles upon various aspects of the Eastern question. See Siméon Pjerotic, *Sulla vita e sulle opere di Mattia Ban* (Zara, 1881). A. R. MARSH.

Bana'na (*Mu'sa sapien'tium*): a tropical fruit-tree (and fruit) of great importance in both hemispheres. It is an herbaceous plant with a strong rhizome, from which sprouts or suckers arise and propagate the species, for the fruit is nearly always seedless. The plant grows to a height of 10 to 20 feet, bearing enormous entire ascending leaves, and clusters containing from 50 to 150 fruits. A year or two after

a banana-plant becomes established it begins to flower, the fruit maturing in from 90 to 120 days thereafter. After the fruit is ripe, the plant dies to the ground and the younger shoots take its place. Two or three suckers are allowed to grow from a plant, the others being destroyed or transplanted. The suckers are transplanted when 2 or 3 feet high, and are set deep, as low as 2 feet in many cases. It is thought that the transplanted plants do not produce so well as the suckers which are undisturbed. Bananas are planted in rows about 8 feet apart, and the plants in adjoining rows alternate at a distance apart of about 9 or 10 feet. This method affords shade to the ground, while it does not keep the sun from the plants. The banana is now grown in Southern Florida with success. The varieties are numerous and various. Bananas are constantly gaining in popularity in this country as a common article of food. This is due in part to the better transportation facilities of recent years between the tropics and northern markets. The first bananas brought to this country are said to have come from Cuba in 1804, and the first full cargo (1,500 bunches) arrived in 1830. The annual importation is now (1893) not far from 10,000,000 bunches. See PLANTAIN. L. H. BAILEY.

Bananal, bã-naã-naal' [said to be from *banana*]: an island of Brazil; in the river Araguay, and in the province of Goyaz. Its length from N. to S. is 290 miles, and its width about 35 miles. The soil is fertile and covered with a dense forest. There is a large lake near the middle of the island.

Banana-quit': one of a group of very small birds of the honey-creeper family (*Cærebidæ*), found in tropical America. One species (*Certhiola bahamensis*) is found in Florida.

Banat: district or territory under a BAN (*q. v.*); especially the name of a territory of Hungary (distinctively pronounced bã-naat'), embracing the counties of Temesvár, Torontál, and Krasso; principal town, Temesvár; originally a part of Hungary; belonged to the Turks 1652-1716; became united with Hungary 1779.

Ban'bury: small town of Oxfordshire: 78 miles N. W. of London (see map of England, ref. 11-H); returned a member to Parliament until 1885. Pop. (1891) 12,767; famous in Ben Jonson's day and at present for its cakes and ale.

Banc: in law, a term used in the phrases trial in banc, sitting in banc, meaning a trial or sitting at which the full number of judges are present, as distinguished from a trial or sitting *nisi prius* presided over by a single judge. See NISI PRIUS. F. STURGES ALLEN.

Banca, baang'kaã, or **Bangka**: an island in the Malay Archipelago; belonging to Holland; about 10 miles E. of Sumatra, from which it is separated by the Strait of Banca (see map of East Indies, ref. 7-C). It is about 100 miles long, and has an area of 4,977 sq. miles. The surface is hilly, the soil mostly dry and stony, and the island to a great extent covered with forests. It is celebrated for its tin mines, which are very productive, about 4,700 tons having been produced in a single year. Copper, iron, and lead are also found here. Pop. (1890) 79,648.

Ban'co: the standard money in which a bank keeps its accounts, as distinguished from current money. The term is chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not coined money. The Hamburg mark banco (= 1s. 5½d. sterling) is to the current mark (= 1s. 2½d. sterling) as 20 to 17.

Ban'croft, AARON, D. D.: Unitarian minister; b. at Reading, Mass., Nov. 10, 1755. He graduated at Harvard in 1778, and became in 1785 pastor at Worcester, where he remained upward of fifty years. Among his works, beside a great number of sermons, is a life of George Washington (1807), which was very popular. He was the father of George Bancroft, the historian. D. at Worcester, Mass., Aug. 19, 1839.

Bancroft, EDWARD, M. D., F. R. S.: b. at Westfield, Mass., Jan. 9, 1744; ran away from his native country in his youth; practiced medicine in Guiana, and resided long in England. He was a friend of Dr. Franklin, and professed to labor in behalf of America, but is believed to have been a spy of the British Government. He published several political works, a *Natural History of Guiana* (London, 1769), and *Researches Concerning the Philosophy of Permanent Colors* (2 vols., 1794-1813). D. in London, Sept. 8, 1820.

Bancroft, GEORGE, Ph. D., LL. D., L. H. D., D. C. L.: historian; a son of Aaron, noticed above; b. at Worcester, Mass., Oct. 3, 1800; graduated at Harvard College in 1817, and entered in 1818 the University of Göttingen, where he

studied history and philology under Heeren, Bunsen, and others. In 1820 he took the degree of Doctor of Philosophy at Göttingen. Having returned home in 1822, he published a volume of poems (1823) and a translation of Heeren's *Reflections on the Politics of Ancient Greece* (1824). In 1834 he produced the first volume of his *History of the United States*. He was appointed Secretary of the Navy by President Polk in Mar., 1845, in which year he founded the U. S. Naval Academy; resigned office in 1846, and was sent as minister plenipotentiary to England in the same year. He returned home in 1849, retired from the public service, and for several years resided in Washington, D. C. Appointed minister to the court of Berlin in 1867, he negotiated a treaty by which Germans emigrating to the U. S. are released from their allegiance to the Government of their native country. In 1871-74 he was minister plenipotentiary to the German empire, and rendered important services in settling the San Juan boundary question. His capital work is a *History of the United States*. The tenth volume, to the end of the Revolutionary war, appeared in 1874. The eleventh and twelfth volumes, giving the history of the Constitution, appeared in 1882. In the same year he began to issue his final revised edition of the whole work. This edition (last volume published in 1885) is completed in 6 vols. 8vo. The work is the most elaborate and carefully prepared history of the Colonial and Revolutionary periods yet published. It is the result of fifty years of labor on all available European and American sources. The style is stately and somewhat discursive. D. in Washington, D. C., Jan. 17, 1891. Revised by C. K. ADAMS.

Bancroft, HUBERT HOWE: historical writer; b. at Granville, O., May 5, 1832; first went to California in 1852; established a book-store in San Francisco 1856, which developed into one of the largest book-stores and publishing-houses in the country; began (1859) collecting books in Europe and America concerning the Pacific coast, and gradually formed the Bancroft library (50,000 vols.), which occupies a substantial building erected by Mr. Bancroft on Valencia Street; resolved about 1871 to devote himself to the writing of the history of the Pacific slope. On account of the magnitude of the task he organized a large staff of literary assistants. His published works in thirty-nine volumes are: *Native Races of the Pacific States* (5 vols., 1875-76); histories of *Central America* (3 vols., 1882-83); *Mexico* (6 vols., 1883-85); *North Mexican States* (2 vols., 1887); *California* (7 vols., 1886-90); *Oregon* (2 vols., 1886-87); *Northwest Coast* (2 vols., 1884); *British Columbia*; *Alaska*; *Utah*; *Nevada and Colorado*; *New Mexico*; *Popular Tribunals*; *California Pastoral*; *California inter Pocula*; *Essays and Miscellany*; *Literary Industries*. The last named contains an interesting account of his methods of work. His avowed purpose was less to write history than to make accessible to students the vast accumulations of documents and information which he had gathered. C. H. THURBER.

Bancroft, RICHARD: Archbishop of Canterbury; b. at Farnworth, Sept., 1544; educated at Cambridge; chaplain to Archbishop Whitgift; consecrated Bishop of London 1597; attended Queen Elizabeth during her last illness; became Archbishop of Canterbury 1604; Chancellor of the University of Oxford 1608; bitterly opposed the Puritans; proclaimed the divine origin and prerogative of bishops; enforced conformity with a high hand; deprived forty-nine ministers of their livings for disobedience; was "chief overseer" of the commission which produced the King James version of the Bible. He was a resolute ruler and an eloquent preacher, and the High Church party of the Anglican Church dates from him. D. in London, Nov. 2, 1610.

Banda, baan'daã: a district and city of the Allahabad division, Northwestern Provinces, British India. It lies between the parallels 25° and 26° N., and meridians 80° and 82° E.; on the Jamna river. Area, 3,061 sq. miles. Pop. 700,000, nearly all of whom are Hindus. The surface is variegated and somewhat rocky, the Vindhya Hills forming the boundary on the S. E. The most important crop is cotton, and the district is so well known for this that its product is distinguished in commerce as Banda cotton. Millet, wheat, corn, barley, and rice are also raised extensively. Iron and building-stone are the only mineral products. Coarse cotton-cloth, sackcloth, and stone handles for knives are manufactured. The climate is cold in winter, but very hot in summer. Hot winds are a not unusual cause of death to natives exposed to them. The annual rainfall is about 50 inches. A branch of the East Indian Railway passes through the

district. Banda city (lat. 25° 28' N., lon. 80° 23' E.) (see map of N. India, ref. 6-F), on the river Ken, has a population of 29,000. The other towns are small. M. W. H.

Bandages [from Fr. *bandage*, a bandage, deriv. of *bande*, Eng. *band*; of Teutonic origin]: the bands used by surgeons to bind wounds or injured parts, or to retain dressings. The most common form of bandage is made of strips of muslin, linen, or the like, of varying width, and rolled longitudinally into a cylinder. The bandage is applied to a limb in a spiral manner, each turn overlapping one-third of the last, and where the limb is conical the bandage is folded back or *reversed* so as to exercise pressure equably. Pressure must be carefully regulated lest the circulation be obstructed, and, as has frequently happened, gangrene result. Special forms of bandages are used for different parts of the body. A large handkerchief may sometimes be used with advantage. Sometimes bandages are made to become immovable by first being soaked in starch or plaster-of-Paris. One of the most useful of bandages for emergencies is the "Spanish windlass," to check serious bleeding from any part of either extremity. It is merely a strip of muslin or a pocket handkerchief passed around the upper part of the limb, tied in a knot, and then twisted firmly by a stick or bayonet passed under it, so as to press with sufficient force to arrest the arterial circulation. It must not be left on many hours, but its temporary application has often saved life. In like manner, free bleeding from a wound of the scalp may be controlled by a compress and bandage tightly applied around the head. Revised by WILLIAM PEPPER.

Bandai-San, *bān'-dī-sān'*: a volcano of Japan; about 140 miles N. of Tokio. The summit includes several peaks, of which the highest rises 6,035 feet above the ocean and about 4,000 feet above the adjacent plain. On the morning of July 15, 1888, a tremendous explosion of steam occurred by which a side of the mountain was blown out, producing a crater more than a mile wide, with precipitous walls on three sides. The rock was broken into fragments and partly reduced to dust, and the *débris* rushed down the slope and over the adjacent plain, covering a district 27 sq. miles in area, burying a number of villages and killing 461 persons. The volume of the ejected material was about two-sevenths of a cubic mile. The eruption is described by S. Sekiya and Y. Kikuchi in vol. xiii. of the *Transactions of the Seismological Society of Japan*. G. K. GILBERT.

Ban'da Isles: a group of islands, about 50 miles S. of Ceram, forming part of the Molucca Archipelago; belonging to the Dutch (see map of East Indies, ref. 8-I); discovered in 1511 by a Portuguese, Antonio Abreis. Portugal took possession of the islands in 1524, and in 1599 they passed under the dominion of the Dutch, and as a Dutch province they now form the presidency of Banda, with an area of 7,150 sq. miles and a population of 111,000, of whom 6,000 are in Neira, the seat of government. They are lofty and volcanic; one of them, named Gunong Api, rises 7,880 feet above the sea, and is an active volcano. In the larger islands nutmegs and mace are grown exclusively. The name is sometimes, but improperly, applied to all the islands N. of the Banda Sea.

Banda'na, or **Bandan'na**: a silk or cotton handkerchief of East Indian origin, though now extensively manufactured in Great Britain. The cloth is dyed Turkey-red, and then the pattern is made by discharging the color with bleaching-liquor in a hydraulic press. The patterns of the real bandana are spots and diamond prints.

Banda (*baan'dān*) **Oriental**, i. e. the Eastern Shore, a name often employed for URUGUAY (*q. v.*).

Bandel, *bān'del*, JOSEPH ERNST, von: b. at Anspach, May 17, 1800; received his artistic education at the academy of Munich; studied for several years in Rome, and settled in 1827 at Munich. In 1834 he moved to Hanover. His principal work is the Hermann monument in the Teutoburger-Wald, near Detmold. It was begun in 1838, but not finished until nearly forty years later, and consists of a figure representing Hermann, 90 feet high, of copper, and raised on a foundation of granite 93½ feet high. In 1846 the foundation was ready to receive the statue, but the reaction which in 1850 set in and swept through the whole of Germany made it impossible to carry out a plan like that of the Hermann monument. In 1862 an association was formed in Hanover for the purpose, but only an insignificant sum was raised; in 1869 the King of Prussia gave 2,000 thalers; but after the Franco-German war the Hermann monument became a na-

tional affair and was soon completed. D. at Neudegg, near Donauwörth, Sept. 25, 1876.

Ban-de-la-Roche: See OBERLIN, JEAN FRÉDÉRIC.

Bandelkhand: another spelling of BUNDELKHAND (*q. v.*).

Bandello, *bān-del'lō*, MATTEO: Italian story-writer; b. at Castelnuovo, Piedmont, in 1480; became a Dominican, and was teacher to Lucrezia Gonzaga. After the battle of Pavia he had to flee to France, and finally Henry II. made him Bishop of Agen (1550). He was living in 1561. His *Novelle* were famous over all Europe, and like the similar collection, the *Decameron*, served as a quarry for many succeeding writers, among them Shakspeare. There are 214 of these *Novelle* divided into four parts. The best edition is that of Sylvestri (Milan, 1813-14, 9 vols.). Some of them were translated by T. Roscoe in his *Italian Novelists* (vol. iii., London, 1825). Revised by A. R. MARSH.

Bandettini, *bān-det-tee'nē*, TERESA: Italian poet and improvisatrice; b. at Lucca, Aug. 12, 1755; d. Apr. 5, 1837. She began life as a *danseuse*, and only by chance discovered her talent for poetical improvisation. Her success in the latter field was extraordinary; and the *Amarilli Etrusca*, as she was called, received distinguished honors in many parts of Italy. Of her verse we have in permanent form: *La Morte di Adonide*, a poem in four chants; *Il Polidoro*, a tragedy; *La Rosmunda*, a drama; besides many shorter pieces. A. R. MARSH.

Bandfish: the *Cep'ola rubes'cens* or any allied fish having the body much elongated and compressed. The name

Red bandfish.

has also been given sometimes to other elongated and much compressed fishes. The red bandfish (*Cep'ola rubescens*) is about 15 inches long, and is found in the Mediterranean.

Ban'dicoot: a species of *Peramelidae*, a family of marsupial quadrupeds, natives of Australia and Tasmania, having a long head and a pointed muzzle. They devour grain in

Long-nosed bandicoot.

granaries and potatoes in the field. The *Perameles nasuta* is about 18 inches long. The name is popularly extended to several kindred genera of marsupials.

Bandiera, *bān-dē-ā'ra*, AILIO and EMILIO: two brothers and Italian patriots; born respectively in 1817 and 1819; were sons of a vice-admiral in the Austrian service. In the year 1842 they opened a correspondence with Mazzini, and formed a design to liberate Italy by a conspiracy. They failed, and escaped to Corfu about Mar., 1844, but hearing a false or exaggerated rumor of a revolt in Naples, they returned with a few friends and landed in Calabria in June. They were executed in the public square of Cosenza, July

25, 1844, their letters to Mazzini having been opened by the British postmaster-general, and the contents communicated to the Austrian Government.

Bandinelli, bān-deē-nel'lee, Baccio: sculptor and painter; b. 1493; d. at Florence, 1560. He was one of the more celebrated artists of the sixteenth century, but rather from the large amount of his generally skillful and popular work than by any lofty character or unusual excellence given to it. The *Hercules and Cacus* in the Loggia dei Lanzi at Florence, the tombs of the Popes Clement VII. and Leo X. in the Church of Santa Maria sopra Minerva at Rome, and the *Archangel Michael* on the top of the Castle of St. Angelo, also at Rome, are perhaps his best-known works.

RUSSELL STURGIS.

Bandini, bān-dec'nēe, ANGIOLO MARIA (1726-1803): classical philologist and librarian of the Laurentiana in Florence; made famous by his *Catalogue of the Laurentiana*, a monumental work of erudition and accuracy.

Bandit'ti [from Ital. *bandito*, proclaimed, outlawed, deriv. of *bandire* = Med. Lat. *banni're*, from Teutonic *ban*; cf. Eng. *ban*]: bands of robbers in the mountainous parts of Italy and Greece, who fall upon travelers and hold them captive for a ransom. In former times there existed in the larger towns of Italy organized associations of bandits, whose stilettoes were ready for hire to accomplish any deadly scheme. They were called euphemistically *bravi* ("brave men"), and were not exterminated until the modern improvements in police organization. Hired assassination (*homicidium conductum, assassinatus*) was a worse crime than ordinary murder, and punished by the wheel.

Band of Hope: See LOYAL TEMPERANCE LEGION.

Ban'don, or **Bandonbridge**: a town of Ireland; on the river Bandon; 20 miles S. W. of Cork (see map of Ireland, ref. 14-E). It is situated on both sides of the river, which enters the harbor of Kinsale. Bandon was formerly a prosperous manufacturing town, but its prosperity has considerably declined. Pop. 6,000.

Banér, bā-nār', written also **Bannier**, or **Bannér**, JOHAN: a famous Swedish general; b. at Djursholm, near Stockholm, June 23, 1596. He commanded the right wing under Gustavus Adolphus at the battle of Leipzig in Sept., 1631. His conduct in this action was highly applauded. On the death of Gustavus Adolphus (Nov., 1632) he became the commander-in-chief of the Swedish army. He gained a brilliant victory near Wittstock, Oct. 4, 1636, and again defeated the imperial army near Chemnitz, Apr. 14, 1639, after which he overran a large part of Germany. D. at Halberstadt, June 20, 1641. Schiller represents him as great in adversity, and formidable even after defeat. See Schiller, *History of the Thirty Years War*; Carl Manderfeldt, *Éloge de J. Banér*, Copenhagen, 1787.

Banff, bāmf: an ancient seaport-town of Scotland; capital of Banffshire; at the mouth of the river Deveron; on Moray Frith; about 40 miles N. N. W. of Aberdeen (see map of Scotland, ref. 6-I). A bridge over the river connects it with Macduff. Here is Duff House, the seat of the Earl of Fife, with a park 14 miles in circumference. Banff has manufactures of leather, soap, iron castings, linen, sails, and cordage, and has important fisheries of salmon, cod, and herring, which, with agricultural products, are exported from this town by sea. Banff has a lighthouse in lat. 57° 40' N., lon. 2° 31' W. The harbor is shallow and poor. The town has numerous and excellent schools and charitable institutions. The river is liable to floods, which have sometimes been destructive. Pop. 8,000.

Banff'shire: a county of Scotland; bounded N. by Moray Frith, E. and S. by Aberdeenshire, and W. by Elgin and Inverness-shire, and partly by the river Spey, a very rapid stream. Area, 614 sq. miles. The surface is greatly diversified by mountains and valleys. Among its highest peaks is Cairngorm, 4,090 feet high. Granite, slate, old red sandstone, limestone, and serpentine occur here. The soil of the valleys is fertile. The breeding of cattle is the chief occupation of the farmers. Capital, Banff. Pop. (1881) 62,736; (1891) 64,167; (1901) 61,439.

Bang, bāng, ANTON CHRISTIAN: a Norwegian author of a series of valuable works on church history; b. Sept. 18, 1840. His chief works are: *Hans Nielsen Hauge og hans Samtid* (2d ed. 1875); *Kirken og Romerstolen indtil Constantin den Store* (1879); *Julian den Frafaldne* (1881); and

Udsigt over den norske Kirkes Historie efter Reformationen (1883). In recent years he has written some valuable pamphlets on Norse mythology.

R. B. ANDERSON.

Bang, HERMAN; Danish novelist and poet; b. on the island of Alsen, Apr. 20, 1857. His masterpiece is perhaps *Ved Veien* (By the Roadside). Of his other works the following may be mentioned: *Haabløse Slægter* (Hopeless Generations); *Fædra*; *Excentriske Noveller* (Eccentric Tales); *Stuk*; *Digte* (Poems); *Under Aaget* (Under the Yoke); *Ti Aar* (Ten Years)—all published since 1879.

G. L. KITTREDGE.

Bangalore, bāng-ga-lōr': a strongly fortified town of India; the capital of Mysore; on a high table-land; 71 miles N. E. of Seringapatam; lat. 12° 58' N., lon. 77° 38' E. (see map of S. India, ref. 6-E). It is the chief British military station in Mysore, and is much frequented by Europeans, attracted by the salubrity of the air. The temperature seldom exceeds 90° F. Here are important manufactures of cotton and silk. It was taken by storm by Lord Cornwallis in 1791. Pop. (1891) 179,670.

Bang-ka, baang'ka, or **Mang-ka**, maang'ka, the largest city of Northern Formosa (*q. v.*), on the Tamsui river, and about 13 miles from its mouth. A railway connects it with KILUNG (*q. v.*). Near Bang-ka is Twa-tu-tia, the great center of the tea-trade of Formosa, and the capital of the province of Taiwan (i. e. Formosa) from 1885 to 1896. Pop. variously estimated from 50,000 to 100,000.

Bang'kok', or **Bankok**: a large commercial city; capital of Siam; situated on the river Meinam, about 20 miles from its entrance into the Gulf of Siam; lat. 13° 38' N., lon. 100° 34' E. (see map of East Indies, ref. 3-B). It is mostly built of wood, but has some brick and stone houses. Many of the houses are built on movable bamboo rafts on the river. The Chinese constitute a large part of the population, which is estimated at 600,000 to 1,000,000. Bangkok contains a large royal palace and numerous Buddhist temples, which are decorated in a gorgeous style. The stationary dwelling-houses are raised on piles 6 or 8 feet from the ground, in order to protect them from inundations. The river is navigable for vessels of 250 tons from its mouth to Bangkok, which has an extensive trade. The chief articles of export are sugar, pepper, rice, ivory, cardamoms, hides, tin, etc. Iron mines and forests of teak occur in the vicinity. It is the seat of Roman Catholic and of American Baptist and Presbyterian missions. It has some native Christians of Portuguese descent. See Sir John Bowring's *Siam*.

Bau'gor: an episcopal city and seaport of North Wales; county of Caernarvon; on the S. E. shore of Menai Strait; 2½ miles from the Britannia bridge, and 9 miles N. E. of Caernarvon (see map of England, ref. 8-D). It is on the railway which connects Chester and Holyhead, and is situated in a narrow, romantic valley. The grandeur and beauty of the scenery render it a favorite place of summer resort. Six miles from Bangor are slate-quarries which employ about 2,000 men. This city is very ancient. The famous monastery of Bangor was founded by Comgall. The cathedral, originally founded in 525, has been twice destroyed (in 1071 and in 1402). Bangor has eight annual fairs, four of which are for cattle. They are visited by great throngs of buyers and sellers. The trade by sea is not important, the harbor not being accessible to large vessels. The diocese includes the island of Anglesea. Pop. (1891) 9,892.

Bangor: a city, port of entry, and important railroad and commercial center; capital of Penobscot co., Me. (for location, see map of Maine, ref. 6-E); on the right bank of the Penobscot river, about 60 miles from its mouth, and at the head of navigation. The Kenduskeag stream, navigable to the center of the city, runs directly through it, dividing the city into two nearly equal parts. The stream is spanned by a number of bridges, and on it are located several important manufacturing industries. The city is surrounded by an excellent agricultural country, which sends to Bangor large quantities of farming produce for export. There is a large business in insurance done here. Water is carried from the river by the Holly system to every portion of the city, supplying residences and stores, furnishing power for small industries, and an abundant supply for extinguishing fires. The dam, built at an expense of \$500,000, crosses the river at the water-works, and affords excellent power for manufacturing industries. Bangor has a fine granite custom-house, an elegant opera-house, and several first-class hotels. The streets are broad, well shaded, and lighted by elec-

tricity. There are 5 national, 2 savings, and several private banks.

Manufactures, etc.—The manufacturing industries of Bangor are diversified, including several large iron foundries, planing-mills, furniture, carriage, and trunk manufactories, and a number of boot and shoe manufactories. The city offers special inducements to manufacturers on account of the low cost of suitable locations and the cheapness of most of the necessaries of life. The most magnificent water-power in New England is located a few miles above the city, and here extensive woolen mills are situated. Several pulp-mills are located along the river above the city, and in time this section is certain to be one of the most important manufacturing localities in New England. The lumber business is the principal industry, the amount sawed here being 175,000,000 feet annually. The ice-business of Bangor is now under the management of the American Ice Company. About 425,000 tons are cut annually.

Commerce, etc.—There is considerable commerce, coastwise and foreign; the average yearly arrivals are about 2,000. The foreign exports amount to about \$150,000 annually, of which spool-wood, shooks, and lumber form the principal part. The city has railroad and steamboat communication with all points east, west, and south. The completion of the Canadian Pacific Railway, connecting with the Bangor and Piscataquis R. R. at Brownsville, adds greatly to the advantages of Bangor as a commercial center. Bangor is the distributing point for travel to the summer-resorts of Eastern Maine, among the principal of which are Bar Harbor, which is within two hours' ride of the city, and Mt. Kineo, Moosehead Lake. A new railroad, the Bangor and Aroostook, is now in operation from Bangor to Northern Aroostook, a distance of 200 miles. The Bangor and Piscataquis has been bought, and the Bangor and Katahdin Iron Works Railway leased, by this company—making their total mileage operated 360 miles.

Salmon-fishing.—In 1886 it was discovered that salmon could be taken with a fly in the river below the dam, and now salmon-fishing, at the famous salmon pool, is very popular. A fine club-house for sportsmen has been built.

Churches, Education, etc.—The city has 18 churches, and 2 daily papers with weekly editions. The city schools are among the best in the State, and the theological seminary has a high reputation. The fine public library has 48,500 volumes. It is mainly supported by the income of a fund, amounting to \$112,000, established by citizens of Bangor, the greater portion of which (\$100,000) was given by the late Samuel F. Hersey.

History.—The French erected a fort on the present site of Bangor in 1656, and named it Norombega. The place was settled in 1769, and was then called Kenduskeag. Its name was changed to Bangor by Rev. Seth Noble, in honor of a well-known psalm-tune of that name. In 1791 the village was incorporated as a town, and in 1834 it became a city. Its rapid growth since that time has been the result of its position, which combines the advantages of a noble and navigable tidal river with a large and constant water-power. It has in the upper waters of the Penobscot the means of very cheap transportation of logs from the magnificent forests of Northern Maine. These advantages made it for a long time the greatest lumber-market in the world, and even now but few places excel it in the amount and value of lumber sawed and shipped. Pop. (1870) 18,289; (1880) 16,856; (1890) 19,103; (1900) 21,850. Bangor, with its suburb, Brewer, with which it is connected by bridge and a steam-ferry, had in 1900 a population of 26,685 and a valuation of over \$16,000,000. EDITOR "DAILY COMMERCIAL."

Bangor: borough; Northampton co., Pa. (for location of county, see map of Pennsylvania, ref. 4-J); on N. J. Cent. and Bangor and Port. R. R's., 15 miles N. of Easton. It has slate-quarries and manufactories. Pop. (1880) 1,328; (1890) 2,509; (1900) 4,106.

Bangor Theological Seminary: chartered by the Legislature of Massachusetts in 1814; opened at Hampden in 1816, and removed to Bangor, Me., in 1819, where its first class graduated the next year. It is a Congregational institution, but its rooms and tuition are free to Christian young men. The regular course consists of three years' work. The library contains over 17,000 volumes, and the property of the institution is valued at \$275,000. In 1899 there were 23 students, and 20,600 volumes in the library.

Bangs, HEMAN: Methodist preacher; b. at Fairfield, Conn., Apr., 1790; joined the New York Annual Conference

in 1815. He labored effectively in the pulpits of his denomination in New York and Connecticut. He was one of the principal founders of the Wesleyan University at Middletown, Conn., and one of the most powerful preachers of Methodism. D. at New Haven, Conn., Nov. 2, 1869.

Bangs, NATHAN, D. D.: Methodist minister; b. at Stratford, Conn., May 2, 1778. He became editor of the *Christian Advocate and Journal* (1828), and president of the Wesleyan University at Middletown, Conn. (1841), but resigned the next year. He wrote, among other works, a *History of the Methodist Episcopal Church* (4 vols., New York, 1839-42). D. in New York city, May 3, 1862. See his *Life*, by Abel Stevens, New York, 1863.

Bangwe'lo, or Bem'ba: a large lake in South Africa; lat. 10° to 13° S., lon. 30° E.; about 150 miles long from N. to S., and half as broad; elevation above the sea about 4,000 feet. It was discovered by Livingstone in 1868. It is fed by several large streams, the principal being the Chambezi from the northeast. It is of very irregular outline and shallow. It empties at its southwestern extremity into the Luapula, and this, probably, through Lake Moero, into the Congo river. M. W. H.

Baniäluka, bã-nëe-ää-loo'ka: a fortified town of Bosnia; on the river Verbas, 94 miles N. W. of Bosna-Serai (see map of Austria-Hungary, ref. 9-F). It has numerous mosques, many bazaars, a manufactory of gunpowder, hot springs, and Roman antiquities. Pop. (1885) 11,357.

Ba'nim, JOHN: Irish novelist; b. at Kilkenny, Apr. 3, 1798; excelled in the delineation of the life and character of the Irish peasantry. He published, with his brother, in 1825 *Tales of the O'Hara Family*, which was very popular. Among his other works are *The Battle of the Boyne* (1828); *The Denounced* (1830); *The Smuggler* (1831); and *The Mayor of Wind-gap*. D. at Wind-gap, near Kilkenny, Aug. 1, 1842. He has been called the "Scott of Ireland," but is deficient in humor, which is not to be wondered at, seeing he was a lifelong invalid. He wrote several successful plays, the most notable being *Damon and Pythias*, played at Covent Garden Theatre by Macready and Kemble in 1822. See his *Life*, by P. J. Murray (London, 1857). A new edition of the *O'Hara Tales* appeared in 1865.

Ban'ister, HENRY CHARLES: See the Appendix.

Banister, JOHN: b. in England; came from the West Indies to Virginia, and settled in the neighborhood of Jamestown, devoting himself to botanical investigations. He contributed in 1680 a catalogue of Virginia plants to Ray's *History of Plants*. He published, among other works, *Observations on the Natural Productions of Jamaica*, *The Insects of Virginia*, and *Curiosities in Virginia*. The genus *Banisteria* was named in his honor. He was killed in Virginia, in 1692, in one of his botanical excursions, by a fall.

Banister, JOHN: son of preceding; b. in Virginia; was educated in England, and studied law there. He was colonel in the Virginia line; was prominent in the patriotic conventions of the Revolution; member of the Virginia Assembly; delegate from Virginia to the Continental Congress in 1778-79, and signed the Articles of Confederation. He was lieutenant-colonel of cavalry in 1781. D. in 1787.

Baniwas: a tribe of South American Indians living on the Amazon and the Rio Negro. A vocabulary of their language is given by Alfred Wallace in *A Narrative of Travels on the Amazon and the Rio Negro* (1853, pp. 521-441).

Baniya: See BANYAN.

Banjarmassin, bãan-jar-maas'sin, or Benjar-Massen (i. e. the river of plenty): a town on the river Banjar, 15 miles from its mouth, on the south coast of Borneo (see map of East Indies, ref. 7-F). Owing to the inundations of the river, the town is mostly built on piles. It has a considerable trade in gold-dust, precious stones, birds' nests, wax, resin, rubber, rattan, pepper, and steel of native manufacture and excellent quality. Many of the inhabitants are Chinese, and most of the trade is with China. The name is also given to the former sultanate, which comprises about 6,000 sq. miles, with 300,000 inhabitants, mostly Mohammedans. It has been tributary to the Dutch since 1787, and was annexed by them in 1857. Pop. of town, 30,000.

Bank [viâ Fr. *banque* and Ital. *banca*, loan from Teutonic; cf. O. H. Germ. *banch*, Eng. *bench*. The special connection of signification with money is an Italian development]: a credit institution or a dealer in credits. This credit is of various kinds. A SAVINGS-BANK (q. v.) receives

deposits, and loans them to investors for long terms, chiefly on real-estate mortgages. A loan and trust company advances money on pledges of stocks, bonds, or other securities. A banker deals chiefly with commercial papers, secured not by real estate or stocks, but by the business transactions of his customers. Some bankers make a specialty of foreign exchange business; but the great majority of the loans are made on ordinary commercial paper; i. e. on accepted bills. If A sells B a hundred dollars' worth of goods, B may not and generally will not pay for it in cash, but in an acceptance, which is virtually a promise to pay 30, 60, or 90 days afterward. But a business man wants the cash to use immediately. He therefore takes this bill to his bank, and has it discounted. The bank considers that a hundred dollars two months hence is worth ninety-nine dollars to-day, and offers that amount for it. If the bank (or broker) pays in specie, it has to charge an extra rate of interest to make a profit on the transaction. But it may make a profit at the ordinary rate of interest, either by paying in its own notes as a bank of issue or by simply crediting its customers with the ninety-nine dollars, and allowing him to draw checks on this credit from time to time, as he may have occasion—acting as a *bank of deposit*. The more advanced the commerce of a country, the more important does the last-named function become. Large payments are universally made by check; metallic money and its representative, the circulating note, are together only the small change of trade, employed in the settlement of balances and in the smaller purchases and payments. The operations of the New York Clearing-house are a good illustration of the small amount of money required in the transaction of business, the balances paid in money being only about 4 per cent. of the amount of the settlements.

The earliest banking institution in Europe was the Bank of Venice, founded A. D. 1171. It was based upon a forced loan of the republic. Funds deposited in it could not be withdrawn, but were transferable on the books at the pleasure of the owner—in this respect not unlike the perpetual annuities of the British debt. These inscriptions of credit were usually at a premium over current coins, which were worn and clipped and were of various countries and values. Except in so far as the transfers of credit on the books were concerned, the bank was only a fiscal agent of the government. It continued in operation until 1797, when it was overthrown by the Revolutionary army of France.

The Bank of Genoa went into operation in 1407. For centuries it was one of the principal banks of Europe. It was the first to issue circulating notes, which were negotiated or passed only by indorsement, not made payable to bearer. It is not known whether or not they were issued in small denominations. They were probably made for considerable amounts, and employed only, or chiefly, in large transactions. This was a large step in advance of the earlier system of deposit transfers, which was also employed by this bank. In 1800, when its circulating notes were at a large premium, it was pillaged by the French army, and thenceforth ceased to perform the functions of a bank.

The Bank of Amsterdam, established in the year 1607, was the earliest considerable institution of the kind which looked to the promotion of commerce. Its predecessors of Venice and Genoa were chiefly devoted to the management of state finances. It was plundered by the French army in 1794, when it was found that, with the reputation of fifty millions of dollars in its vaults, it had nothing, its capital having been loaned to the States-General, the East India Company, and to the city of Amsterdam. In this condition of its affairs it had done an immense business during the preceding fifty years.

The Bank of Hamburg, established in 1619, was a bank of deposit and circulation based upon fine silver bars. The deposits were confined to silver. This institution, like nearly all those of the time, had, as a principal object, the protection of the people from worn, sweated, clipped, and plugged coins, and from coins of the German empire secretly reduced in standard value. The remedy was that previously adopted by the Bank of Amsterdam—to lock up the debased and depreciated coins, and circulate the credit granted for them.

The Bank of England was established in the year 1694. Nearly all the paper money of England and Wales is issued by this bank, £15,000,000 being based on securities, the rest upon actual deposits of coin, like U. S. gold certificates. During the period of the Napoleonic wars and immediately afterward (1797–1822) specie payments were suspended, but at present such a contingency is wholly out of the question.

Its charter has been frequently renewed, and, although considered as perpetual, is subject to amendment.

Previous to the passage of the bank-charter act of 1844 any bank or private person could issue bank-notes, subject to the condition that they must be paid in coin on demand. By that act such issue, with but slight exceptions, was confined to the Bank of England. This was divided into two departments—the bank and the issue department. The bank department is as private as any bank corporation; the issue department is an office of the state. The bank receives from the state office 15 millions of pounds in currency, which amount is loaned or issued to the Government, on which the bank receives 3 per cent. interest. The bank, however, pays to the Government about £200,000 annually for this privilege, and the profit to the bank from this source, after deducting the expense of management, is estimated at only about £100,000 annually. The notes are a legal tender everywhere except in payments by the bank. Bank-notes in excess of 15 million pounds are furnished by the issue department upon the gold coin and bullion held by it, which amount is not included in the reserves and is not under the control of the bank. In 1847, 1857, and 1866 the act was suspended, and the bank issued notes without holding gold; but the amount issued has only once exceeded the amount allowed by the bank charter, and then the excess was but £800,000.

The bank rate of interest since 1865 has varied from 10 to 2 per cent. The average rate for 1866 was 7 per cent.; for 1875, 3½ per cent.; for 1880, 2.76 per cent. The rate was reduced in Mar., 1887, from 4 to 3½ per cent. Its usual dividends are 10 per cent. per annum. The total issues of the United Kingdom on Feb. 5, 1887, were: Bank of England, £23,682,138; 148 private and joint-stock banks, £2,652,765; Scotland, £5,686,201; Ireland, £6,132,129; total for the United Kingdom, £38,153,970.

There is a large number of joint-stock banks which are not banks of issue. The usual dividends of the London and Westminster, London and Joint Stock, London and County, and the Union, which are leading joint-stock banks, are 20 per cent. per annum, and their average deposits are about twelve times the amount of their capital. In 1887 11 joint-stock banks in England, with a capital of £11,305,000, had 426 branches. The total deposits of the joint-stock banks of the United Kingdom in 1891 amounted to £539,000,000.

The number of banks in the Dominion of Canada in 1890 was 39; capital, 59 millions of dollars; circulation, 32 millions; deposits, 136 millions.

The Bank of France was authorized in 1800. Since 1803 it has had the exclusive privilege in Paris, and since 1857 in France, of issuing notes payable on demand. The bank in Mar., 1876, had 74 branches in the departments, and 14 others were in course of organization. Its present charter extends to the year 1897. During the revolution of 1848 it was authorized to suspend specie payments and its notes were made a legal tender. The Bank of France is not a fiscal agent of the Government, as is that of England. It does not collect or disburse the revenues of the exchequer, but lends to it largely in its exigencies, while its credits, in the form of circulating notes and other acceptances, have borne the government safely through extraordinary needs. During the war with Prussia, which continued for ten months and terminated on May 10, 1871, it rendered unexampled service. According to the report of the Minister of Finance for 1873, the total expenditures arising out of the war to that date were 9,288 millions of francs, or (at 20 cents to the franc) about 1,857 millions of dollars—an amount equal to about two-thirds of the war-debt of the U. S. When the war began the circulation of the bank was 251 millions of dollars, and its specie 229 millions, or 90 per cent. of its circulation. In June, 1871, the capital of the bank was 36½ million dollars, its circulation 442 millions, and its specie 110 millions, or about 25 per cent. of its circulation. In Nov., 1873, the circulation reached its maximum, and was 614 millions, while its specie had increased to 146 millions, or 24 per cent. of its circulation. In Dec., 1874, the ratio of specie to circulation was 52 per cent., and in Sept., 1875, 70 per cent. Since that date the amount of the circulation has fluctuated, standing on Nov. 2, 1876, at 515 millions, and on Feb. 8, 1877, at 533 millions. The stock of specie has risen rapidly since Dec., 1874. On Mar. 30, 1876, the bank held 350 millions of specie (of which 250 millions was in gold), being 76½ per cent. of its circulation and 63 per cent. of its deposits and circulation. In 1877, Feb. 22, it held 446 millions of specie, being 84½ per cent. of its circulation, which

was 528 millions. The increase of the circulation from July, 1870, to Nov., 1873, was 351 millions, and the decrease in specie 83 millions. The decrease in circulation from Nov., 1873, to Sept., 1875, when it reached its lowest point, was 135 millions, and the increase in specie in the same period was 179 millions. In Aug., 1870, the bank was again authorized to suspend specie payments and its notes were made a legal tender, but it has since paid out a large amount of coin. In 1875 it paid out 126 millions in gold and 96 millions in silver, and yet its stock of coin increased over 67 millions. Since the declaration of war in 1870 the bank loaned to the Government about \$600,000,000, and since the suspension of specie payments in 1870 the notes of the bank have, except during a brief period, remained at par. It resumed specie payments Jan. 1, 1878. In 1890 its circulation was \$572,000,000; its metallic reserve, \$474,000,000—not quite half of its silver.

The first organized bank in the U. S. had its origin in the formation of a banking company without charter, which was proposed in a resolution passed June 17, 1780, by citizens of Philadelphia. The first action in the Congress of the U. S. looking to the establishment of a bank was taken June 21, 1780, in reference to this proposed association. In the spring of 1781, Robert Morris, then superintendent of finance, submitted to Congress a plan for the establishment of the Bank of North America at Philadelphia, which plan was approved, and on Dec. 31 following a perpetual charter was granted to that institution. The bank opened for business on Jan. 2, 1782, and on Apr. 1 following the Legislature of Pennsylvania granted to the company a perpetual charter, which, though repealed in 1785, was subsequently renewed from time to time to the date of its last charter, on Dec. 3, 1854. On Feb. 7, 1784, the State of Massachusetts incorporated the Massachusetts Bank. The Bank of New York was chartered on Mar. 21, 1791, although it had since 1784 been doing business under "articles of association" drawn by Alexander Hamilton, who was a member of its first board of directors. All of the above-named institutions are still in a prosperous condition, and all have been converted into national banks.

The plan of establishing a Bank of the U. S. originated with Alexander Hamilton, then Secretary of the Treasury, and was first embodied in his report to Congress on Dec. 13, 1790. The capital of the proposed bank was fixed at \$10,000,000, one-fourth of the private and corporate subscriptions to be paid in gold and silver, and three-fourths in U. S. stocks bearing 6 per cent. interest. Two millions, to be subscribed by the U. S., were to be paid in ten equal annual installments by loans from the bank, or, as Mr. Hamilton describes the operation, "by borrowing with one hand what is lent with the other." This plan was adopted without material alteration by Congress, and approved by Washington, Feb. 25, 1791. During the years 1796–1802 the Government disposed of its stock in the bank at a considerable profit, 2,200 shares having been sold in the last-mentioned year at a premium of 45 per cent.

On Jan. 20, 1815, in accordance with the recommendation of Secretary Dallas, a bill was passed reorganizing the bank, many prominent members of both houses who had previously voted against a renewal of the charter now voting in its favor. President Madison ten days later returned the bill with his objections, but on Apr. 10, 1816, he approved a bill of substantially the same import; and this was the second and last charter of the bank granted by the general Government. The plan proposed by Mr. Dallas was modeled upon the charter of the first U. S. bank, and the act of incorporation, as finally passed, did not differ materially from the plan proposed by him. The charter was limited to twenty years, expiring on Mar. 3, 1836. The capital was fixed at \$35,000,000, seven millions of which was to be subscribed by the Government, payable in coin or in stock of the U. S. bearing interest at 5 per cent., and redeemable at the pleasure of the Government.

During the following year the currency was greatly depreciated; very many failures of State banks, corporations, and individuals had occurred, and the country had not yet recovered from the exhausting effects of its late war. In this emergency the bank attempted, by the importation of more than seven millions of dollars from Europe, at a cost of half a million, to restore soundness to the currency; but it became itself embarrassed, largely through the mismanagement of the branch at Baltimore, and was in danger of absolute failure. Its losses were reported to exceed three millions of dollars; but the bank, as well as the business of the country, eventually recovered. The industries of the

people and the finances of the Government prospered from 1820 to 1835. In this interval the national debt was paid, and the stock of the bank rose in the market until it commanded a premium of 20 per cent.

Congress having refused to recharter the bank, a bill was introduced in the Legislature of Pennsylvania to charter a State bank, to be called the U. S. Bank, which bill became a law just thirteen days before the expiration of the original charter. The circulating notes and the deposits of the Bank of the U. S. were eventually paid in full, and the accounts of the assignees were finally settled in 1856. The shares of the bank were quoted in 1837 at 125, in 1839 at 111, and in 1843, after its failure, at 1 $\frac{7}{8}$ per cent. The shareholders received no returns on their stock in the final settlement, the whole twenty-eight millions invested by them having been a total loss. The treasury records show that the Government realized a profit of \$6,093,167 upon its investment in the stock of the bank.

State banks were organized in most of the States of the Union under special charters obtained from their several Legislatures. Many of the States, chiefly Southern and Western, authorized banking corporations, with the State as part or sole stockholder. The amount of currency issued by them was frequently twice, and in many instances three times, the amount of their nominal capital. These charters were valuable, and the State Legislatures were besieged by applicants for such special privileges. In 1814 a bill was passed, by a two-thirds vote over the second veto of Gov. Snyder, of Pennsylvania, authorizing forty-one banks, with an aggregate capital of \$17,000,000, of which only one-fifth part was required to be paid in. Charters of banks authorized by the New England and the Southern States in some instances were disposed of to non-residents, who organized banks of circulation with little or no capital, and the citizens of other remote States suffered great loss from the worthlessness of such bank issues. The charters of these banks were in the interest of individuals, and generally of the friends of the dominant political party in the Legislature which granted them. In many instances they were corruptly obtained. Gov. Tompkins, of New York, in the year 1813, under authority of a clause in the constitution of 1777, prorogued the Legislature of that State, assigning as one of the reasons for such action that bank applicants had used or attempted to use corrupt means to secure a charter; and a clause was inserted in the constitution of 1821 which required the assent of two-thirds of the Legislature to the incorporation of a moneyed institution. In 1804 and in 1818 restraining acts were passed by the Legislature of that State, the latter of which provided that no person or association, unless authorized by law, should open an office for the purpose of receiving deposits, discounting promissory notes, or issuing circulation. This act was not repealed until the year 1837. Specie payments were generally suspended in 1814, in 1837, and in 1857, but many of the banks, particularly in the Western and Southern States, which were authorized to issue currency without security, and without such judicious restrictions as should always accompany legislation of this kind, were in a continual state of suspension. The rates of exchange between the Eastern, Southern, and Western States were oppressive, and the losses to the bill-holders from this cause were estimated to be not less than 5 per cent. annually upon the circulation, and to equal in 20 years the entire amount of circulation outstanding.

In 1813 a movement toward a reform in bank currency began in Massachusetts. This system was more fully developed in 1825, when five Boston banks undertook its management. Its exclusive control was finally assumed by the Suffolk Bank, which association compelled the redemption at par in Boston of the notes of the New England banks by a system of assorting and returning the notes to the place of issue; and its operations were continued down to the establishment of the national bank system.

In 1829 Mr. Van Buren, then Governor of New York, recommended a "safety-fund" system as affording greater security to the creditors and bill-holders of chartered banks; and during that year a bill which embodied his recommendation passed the Legislature and became a law. The system continued in operation for nine years, and its chief features were subsequently copied by Ohio and other States of the Union.

Suggestions regarding the expediency of requiring security to be given for bank issues were made by financial writers as early as 1815, and by Mr. Gallatin in 1831. The latter proposed that existing bank-notes be taxed out of ex-

istence, and suggested a system of currency which should be secured by stocks and real estate. The system of authorizing banks by special charter, with its attending evils, continued, however, in all the States down to the passage by the New York Legislature of the Free Bank act on Apr. 18, 1838. Under the provisions of this act any number of persons were authorized to form banking associations, upon the conditions and subject to the liabilities specified in the act. The law originally provided for the deposit of the stocks of the different States and bonds and mortgages as security for circulating notes. Previous to the year 1843 twenty-nine of these banks, with an aggregate circulation of \$1,233,374, had failed, and their securities were sufficient to pay but 74 per cent. of the circulation alone. Losses to bill-holders occurred only in the cases of those banks which had deposited State stocks other than those of New York. The law was so amended in 1849 as to require that at least one-half of the securities so deposited should consist of New York State stocks, and that not more than one-half should be in the stocks of the United States, the securities in all cases to be, or to be made, equal to a stock producing an interest of 6 per cent. per annum, and to be taken at a rate not above their par value, and at not more than their market value. The banks were under the supervision of a commissioner appointed under the Safety Fund act until the year 1843, in which year they were required to report to the State Comptroller; but in 1851 the present office of bank superintendent was established. In 1840 a law was passed requiring the banks of New York to redeem their notes at an agency of the bank, either in New York city, Albany, or Troy, at one-half of 1 per cent. discount. This discount was reduced in 1851 to one-fourth of 1 per cent. After the passage of this act two of the principal banks in the city of New York inaugurated a plan of redemption similar to the Suffolk system. The notes of such associations as kept a deposit with them were returned to the banks of issue, and the discount of one-fourth of 1 per cent. was divided between the redemption agent and the associations whose notes were redeemed. Those banks which did not provide the means for redemption were forced to close up their affairs.

Some of the States adopted banking laws based on the New York system, but most of them were careless in this matter, and "wildcat banking" was a prominent cause of the crisis of 1857. The just dissatisfaction of the public with State banks in general and the financial exigencies of the Government in the course of the war combined to pave the way for the establishment of a national banking system, modeled on the general lines of the New York act. Such a system was recommended by Secretary Chase in 1861 and 1862. An act to this effect was passed Feb. 25, 1863, but proved inoperative, and was superseded by the act of June 3, 1864, which forms the basis of the existing system.

It provided for the establishment of a national bank bureau in the Treasury Department, the chief officer of which is the comptroller of the currency. Under this act national banks may be organized by any number of persons, not less than five, the capital in any instance to be not less than \$100,000, except that in cities containing a population not exceeding 6,000 banks may be established with a capital of not less than \$50,000. The capital stock in cities having a population of 50,000 must not be less than \$200,000. Not less than one-third of the capital was required to be invested in U. S. bonds, upon which circulating notes may be issued equal in amount to 90 per cent. of the current market value, but not exceeding 90 per cent. of the par value of the bonds deposited; the notes are receivable at par in the U. S. in all payments to and from the Government, except for duties on imports, interest on the public debt, and in redemption of the national currency. On Mar. 3, 1865, an act was passed providing that every banking association should pay a tax of 10 per cent. on the notes of any person or State bank used for circulation and paid out by them; which act had the effect of taxing State-bank circulation out of existence.

The national bank act authorized the issue of \$300,000,000 of circulation, which amount was increased to \$354,000,000 by the act of May 12, 1870. The act of June 20, 1874, provided for the deposit by any association of lawful money with the treasurer in sums of not less than \$9,000, and the withdrawal of a proportionate amount of the bonds on deposit as security for its circulating notes. The act of Jan. 14, 1875, authorized the unlimited issue of circulating notes, subject to the restrictions of then existing law, but made it the duty of the Secretary of the Treasury to retire legal-

der notes to the extent of 80 per cent. of the additional national bank-notes issued, and to continue such retirement until the legal-tender notes should be reduced to \$300,000,000. The greatest amount of national bank circulation outstanding at any one time was on Oct. 13, 1882, when it reached \$363,407,474. Since that time it has steadily and of late years rapidly decreased, while the deposits have at the same time been increasing.

DATE.	Circulation.	Individual deposits.	DATE.	Circulation.	Individual deposits.
	Millions.	Millions.		Millions.	Millions.
Oct., 1880....	317·3	887·9	Oct., 1888...	155·4	1,350·7
" 1882....	315·0	1,134·9	" 1889....	128·5	1,522·0
" 1884....	289·8	993·0	" 1890....	123·0	1,594·2
" 1886....	228·8	1,189·5	" 1900....	283·9	2,508·2
" 1887....	167·3	1,274·7			

This difference is due, on the one hand, to the increased use of checks as a means of payment instead of notes; and on the other hand to the high price of U. S. bonds, which has reduced the net interest to about 2½ per cent., and made it very unprofitable to hold them as a reserve to secure circulation. So great has been the contraction of the bank-note currency from this latter cause that many efforts have been made to allow the banks to base their circulation on securities other than U. S. bonds, but these efforts have been thus far without effect.

The national banks in twenty-three of the larger cities are required to keep a reserve amounting to 25 per cent. of their deposits. In New York, Chicago, and St. Louis such reserves must be actually on hand; in the other cities, one-half of such reserve may be kept in the form of bank deposits in any of the cities above named. Outside of these larger cities the required reserve is only 15 per cent., and three-fifths of this reserve may be in the form of balances in the hands of banking associations in larger cities. The reserve has been habitually kept much higher than the legal requirement, in the neighborhood of 30 per cent.

The following table shows the resources and liabilities of the national banks, in millions of dollars, at different periods:

RESOURCES, ETC.	Oct., 1870.	Oct., 1880.	Oct., 1890.	Sept., 1900.

Fuller figures are given in the reports of the comptroller of the currency for successive years. See also CLEARING-HOUSE, CURRENCY, SAVINGS-BANKS.

Revised by A. T. HADLEY.

Bank Ban: ban of Hungary; flourished in the first half of the thirteenth century, and acquired a kind of romantic fame from the prompt revenge he took upon Queen Gertrude, the spouse of Andreas II., King of Hungary. The queen's brother, Eckart, seduced the wife of the ban, and the queen aided him in carrying out his evil design. But as soon as Bank discovered the queen's participation in the conspiracy he gathered a mob, stormed the palace, and killed the queen, though he knew that it would cost him his life. And so it did. When King Andreas II., who was absent on a campaign in Poland, returned, he immediately put Bank to death. The story has several times been made the subject of dramatic treatment. Katona's drama *Bank-bán* (Klausenburg, 1827) is considered one of the best dramas the Hungarian literature has produced; it was translated into German by Dux (1858), and the genuine pathos of the characters and the scenic strength of the story made a great impression.

Bankes, HENRY: b. in London, 1757; was educated at Westminster School and at Trinity College, Cambridge, and entered Parliament in 1780 for Corfe Castle, which place—the family borough—he continued to represent till 1826. He wrote *The Civil and Constitutional History of Rome from the Foundation to the Age of Augustus* (1818, 2 vols.). D. at Tregothnan, Cornwall, Dec. 17, 1834.

Bank'head, JOHN PINE: captain U. S. N.; son of Gen. James Bankhead, U. S. A.; b. in South Carolina, Aug. 3, 1821; entered the navy as a midshipman Aug. 6, 1838. He commanded the gunboat Pembina at the battle of Port Royal, Nov. 7, 1861, and during the subsequent operations on the coast of South Carolina; commanded the Monitor when she foundered off Hatteras on the night of Dec. 31, 1862, and displayed admirable coolness on that trying occasion. He was made captain in 1866. D. near Aden, Arabia, Apr. 27, 1869.

Bankrupt [orig. *banke rota*, from Ital. *banca rotta*, bank broken, but changed to *bankrupt* under influence of Lat. *ruptus*]: originally a merchant whose bench or counter had been broken by reason of inability to pay his debts. In its popular sense the word is now nearly synonymous with *insolvent*, and denotes any person unable to meet his liabilities. In England its legal signification is well defined. It embraces only traders, or persons whose business it is to buy and sell for gain, and the various statutes which have been enacted there since the reign of Henry VIII. in relation to bankrupts have been applicable to that class alone. By the English laws a bankrupt is a trader who has committed an act of bankruptcy, as defined by statute. A trader may have committed an act of bankruptcy, and have been formally adjudged a bankrupt, and yet be entirely solvent—that is, eventually able to pay his debts in full; and he may be wholly unable to pay his debts, and yet have committed no act of bankruptcy. A bankrupt was at first regarded as an offender against the law, and bankrupt laws were intended for the benefit of creditors. But at present they are founded on the interests of trade, and intended to be beneficial to both debtor and creditor. If the conduct of the bankrupt has been such as to entitle him to the consideration of the court, he is discharged forever from all debts owing by him at the time he became a bankrupt. The law is confined to traders, because they are regarded as possessing peculiar facilities for delaying and defrauding creditors; and, on the other hand, they are considered, generally speaking, the only class subject to heavy accidental losses, and to an inability to pay their debts without any fault on their part. The above statements must be qualified by the results of the statute 46 and 47 Vict., c. 52 of 1883, and 53 and 54 Vict., c. 71 of 1890. For other details, see *INSOLVENCY*.

In the U. S., Congress possesses the power, under the Constitution, to establish uniform laws on the subject of bankruptcies. Pursuant to this power, in the year 1800, Congress passed a bankrupt law, which by its own terms was limited to five years, but it was repealed in 1803. This law preserved the leading features of the English laws relating to bankruptcy. It could be enforced only on the application of creditors, and embraced only the mercantile class.

In the year 1841 the second bankrupt act was enacted by Congress. It could be taken advantage of by all persons whomsoever residing in the U. S. owing debts not con-

tracted in a fiduciary capacity, although it could be enforced at the instance of creditors only against merchants, bankers, brokers, factors, and underwriters. This extended exercise of the power over the subject of bankruptcy was violently opposed as unconstitutional, on the ground that Congress was confined to the well-recognized meaning of the term bankruptcies as understood in the English courts when the Constitution was formed. The law was repealed in Mar., 1843.

But by act approved Mar. 2, 1867, Congress passed a third bankrupt law, even more general in its scope than the preceding. Under it any person residing in the U. S. and owing debts to the amount of \$300 could, on his own application showing his inability to pay his debts in full, and his desire to surrender his property for the benefit of his creditors, take advantage of the act and be declared a bankrupt. So a debtor owing a specified amount could be forced to become a bankrupt upon the application of creditors if he has committed any of certain offenses or acts specified in the statute. The bankrupt, after the distribution of his property amounting to a fixed percentage of his debts, obtained a discharge from all his indebtedness existing at the time the petition was filed, except in certain instances specified in the act. This act has been in its turn repealed (chap. 160, laws of 1878).

The distinguishing feature of a bankrupt act is the summary seizure of all the debtor's property, and its division among his creditors in proportion to their claims. The race of diligence among creditors is entirely at an end, and all legal proceedings, except such as are in conformity to the statute, are stayed. It is against the policy of the bankrupt law to allow the debtor, in contemplation of bankruptcy, to give preference to one creditor over another. All such preferences are void, and an attempt to make them is of itself an act of bankruptcy.

The various States also possess the power to pass bankrupt laws, but no State bankrupt or insolvent law can impair the obligations of contracts. Hence they can not release a debtor from obligations incurred before the passage of such law, nor act upon the rights of citizens of other States. And when Congress sees fit to exercise the power over the subject of bankruptcies granted it by the Constitution, the State laws on the same subject are suspended. On the repeal of the Congressional law the State laws would revive. The power of Congress over the subject is plenary, and its law may affect existing debts as well as those which are contracted after its enactment.

The judicial business in bankruptcy is in the main transacted by the district court of the U. S., with officers called registers to conduct the administrative or non-contested business. The estate is managed by an assignee, who acts as a trustee, and is accountable to the court referred to. See *BANKRUPTCY*, in the Appendix.

Banks (named after Sir JOSEPH BANKS, *q. v.*): name of four single islands or groups: (1) An island off the coast of British Columbia, on the east side of Hecate Straits, in lat. 53° 30' N., lon. 130° 10' W.; 41 miles long by 5 to 10 broad; high, rocky, and wooded. (2) A large island in the Arctic Sea, north of British America, in about lon. 120° W. (3) A small island in Torres Straits, between New Guinea and Australia. (4) A group of islands in the South Seas, consisting of two larger and five smaller islands, the northern part of the New Hebrides cluster. M. W. H.

Banks, Mrs. ISABELLA VARLEY: See the Appendix.

Banks, Sir JOSEPH, LL. D., F. R. S.: naturalist; b. in London, Feb. 13, 1743. He was educated at Oxford. He sailed with Capt. Cook in his voyage round the world in 1768, returning in 1771 with rich collections of plants, animals, etc. In 1778 he was chosen president of the Royal Society, over which he presided forty-two years. He contributed memoirs to the *Philosophical Transactions* and other publications. D. June 19, 1820.

Banks, NATHANIEL PRENTISS, LL. D.: a statesman and general; b. at Waltham, Mass., Jan. 30, 1816. He learned the trade of a machinist, studied law, was elected to the Legislature as a Democrat in 1849, and was chosen Speaker of the House of Representatives of Massachusetts in 1851. Having been elected a member of the national Congress in 1852, he was separated from the Democratic party by his opposition to the extension of slavery, and in 1854 was returned to Congress by the Republicans and Knownothings. In Feb., 1856, after an exciting contest which occupied two months, he was chosen Speaker of the House on the one

hundred and thirty-third ballot. He was elected Governor of Massachusetts in Nov., 1857, for one year, and was re-elected in 1858 and 1859. In May, 1861, he was appointed a major-general of volunteers, and soon obtained the command of an army on the Potomac. Having gained some advantage at Winchester, in Mar., 1862, he pursued the enemy to Harrisonburg. On May 24 he was attacked by Stonewall Jackson, and retreated rapidly to the Potomac. In Dec., 1862, he succeeded Gen. Butler as commander of the department of the Gulf. About the end of May, 1863, he invested Port Hudson, which was taken with about 6,000 prisoners July 9. In the spring of 1864 he conducted an expedition up the Red river, in which Rear-Admiral Porter co-operated with the gunboats. He ascended above Grand Ecore. After several battles at Pleasant Hill (April 9) and other places, being pressed by superior numbers, he retreated toward New Orleans, and was relieved from the command in May, 1864. He was chosen M. C. by the Republicans of Massachusetts in 1864, 1866, 1868, and 1870. He served as chairman of the Committee of Foreign Relations in the Fortieth and Forty-first Congresses. He advocated the election of Horace Greeley as President, and was defeated for Congress in 1872, but was re-elected in 1874 and 1876. He was U. S. marshal at Boston, Mass., 1879-88; re-elected to Congress Nov. 6, 1888. D. in Waltham, Mass., Sept. 1, 1894.

Banks, THOMAS: the first great English sculptor; b. at Lambeth, Dec. 29, 1735. He gained the gold medal of the Royal Academy in 1770, and went to Rome in 1772. He remained for several years in Rome, and produced there *Caractacus Pleading before Claudius*, and an admirable statue of *Psyche and the Butterfly*, which was purchased by Catherine II. of Russia, at whose invitation he visited St. Petersburg in 1784. Among his masterpieces is the *Mourning Achilles*. He excelled in imaginative works. He became a member of the Royal Academy. D. in London, Feb. 2, 1805.

Banks, Savings: See SAVINGS-BANKS.

Bank Safes and Vaults: See SAFES, BURGLAR-PROOF.

Bank'sia: a genus of Australian shrubs and trees of the family *Proteaceae*, named in honor of Sir Joseph Banks; have hard, dry leaves, and an umbellate arrangement of branches bearing near the extremities oblong heads of numerous flowers, which secrete much honey. They are called honeysuckle trees, and abound in all parts of Australia. One species (*Banksia grandis*), found at Swan river, grows to a height of 50 feet.

Banks Land: island in western part of Arctic America; discovered by Parry 1819; separated by Banks Strait from Melville island on the N. W. and by Prince of Wales Strait from Prince Albert Land on the S. See map of North America, ref. 2-D.

Bankura: a district and town of Burdwan division, Bengal, British India; between the parallels 22° and 23° N. and the meridians 86° and 87° E.; N. W. from Calcutta, and between the Gangetic delta and the highlands. The fat paddy lands along the eastern margin gradually pass into the undulating forest tracts of the west. The district is noted for the fine colored silk cloths manufactured within it. The climate is fairly healthy. The winters are cool and bracing, but the summers are hot and oppressive. The rainfall is about 60 inches. The district suffered greatly from the famine of 1865-66. Area, 2,621 sq. miles. Pop., 1,000,000. Bankura city (see map of N. India, ref. 8-1) is the capital (lat. 23° 14' N., lon. 87° 7' E.); has a population of 19,000. Bishnupur is about as large. M. W. H.

Bann: either of two rivers in N. E. of Ireland—the Upper Bann, 25 miles long, flowing into, and the Lower Bann, 40 miles long, flowing out of, Lough Neagh. The Lower Bann has important salmon and eel fisheries.

Ban'natyne Club: a literary club deriving its name from George Bannatyne (1545-1608), who was born in Scotland. He compiled a collection of manuscripts called *Corpus Poeticum Scotorum*. This club was founded at Edinburgh in 1823 by Sir Walter Scott, its design being to promote the knowledge of Scottish history and antiquities, and to print rare works which tend to illustrate those subjects. The club originally consisted of thirty-one members, and gradually increased to one hundred, to which number it was finally limited.

Ban'neker, BENJAMIN: a Negro mathematician; b. at Ellicott's Mills, Md., Nov. 9, 1731. He was the author of an almanac (1792, *sqq.*), of which a copy was sent by Thomas

Jefferson to the secretary of the Academy of Sciences at Paris. Banneker assisted in laying out Washington city and running the boundary-lines of the District of Columbia. D. at Baltimore in Oct., 1806. See his *Life* by J. H. B. Latrobe (Phila., 1845), and by J. S. Norris (1854).

Ban'ner [O. Fr. *banere*, formed with Lat. suffix *-aria* from a Teutonic loan-word; cf. Goth. *bandwô*, emblem, of same root with Eng. *bind*]: a flag; that is to say, a piece of cloth attached to a spear or staff, and serving to denote the nationality of a company of soldiers, the character and purpose of a society, or the rank of a prince or chief. The modern use of the term for a flag which hangs from a cross-bar is not the original or proper meaning. In the Middle Ages the term denoted the square flag carried before a knight-banneret. In literature the term is used as synonymous with flag, but in a somewhat lofty or poetical sense.

Banner, MICHAEL: See the Appendix.

Ban'neret: See KNIGHT.

Ban'nister, HENRY, D. D.: b. at Conway, Mass., Oct. 5, 1812; graduated at the Wesleyan University, Conn. in 1836; studied at Anburn Theological Seminary; was teacher and principal of the Methodist Academy at Cazenovia 1838-56; and in 1856 was appointed Professor of Exegetical Theology in the Garrett Biblical Institute, which is now the Theological Department of the Northwestern University at Evanston, Ill. He was author of several able published sermons, addresses, and reviews scattered in various periodicals. He was also a highly esteemed professor, teacher, and lecturer. D. at Evanston, Ill., Apr. 15, 1883.

Ban'nockburn: a village of Scotland; in the county of Stirling, on the Bannock rivulet, 3 miles S. of Stirling (see map of Scotland, ref. 11-G). It was the scene of a famous and complete victory gained by Robert Bruce over the English army, led by the king, Edward II., on June 24, 1314. The English lost about 30,000 men. Here are important manufactures of woolens, especially tartans and carpets. Pop. about 2,600.

Banns (or Bans) of Marriage [for etymology see BAN]: a public notice of an intended marriage, given in a church or other place prescribed by law. The law of England requires that all banns of matrimony shall be published in an audible manner, according to the rubric prefixed to the marriage service in the Book of Common Prayer, after the second lesson at matins or evensong, upon three Sundays preceding the ceremony. This rubric is in the following terms: "I publish the banns of marriage between A, of —, and B, of —. If any of you know cause or just impediment why these persons should not be joined together in holy matrimony, ye are to declare it." The English law, however, dispenses with this preliminary publication if the parties obtain a license from the court of the bishop of the diocese or any of his surrogates, or from the Archbishop of Canterbury. A republication of the banns is necessary if the marriage is not solemnized within three months. The "bidding" of banns has fallen into disuse in the U. S., though it is still occasionally heard. The practice was first directed in the times of the Fathers, was enacted afterward by Odo, Bishop of Paris, about 1176, placed in the canon law in 1200 by the Synod of Westminster, and prescribed for the whole Latin Church by the Lateran Council in 1215. It is still required by the canon law of England and of the Roman Catholic Church. Revised by W. S. PERRY.

Bannu: See BANU.

Banswara, baän-swaa'ra (i. e. the forest country): a feudatory state in Rajputana, British India; lat. 23° 30' N., lon. 74° 30' E.; area, 1,500 sq. miles. Pop. 105,000, of whom 48,000 are Bhils, a brave and warlike hill tribe of India, not disposed to agriculture. The country is arid.

Bantam, baän-taam': an old town of Java, on the north coast, 44 miles W. of Batavia (see map of East Indies, ref. 8-C). It was formerly a large city and great entrepôt of trade, but on account of the unhealthy climate is at present almost deserted. In the fifteenth century it was the chief town of a powerful Mohammedan empire of the same name, which at one time even comprised the southern part of Sumatra and the west coast of Borneo. In 1683 the Sultan of Bantam became a vassal of the Netherlands, and in the beginning of the present century the Dutch took possession of the sultanate. The town is in lat. 6° 2' S., lon. 106° 50' E.

Bantam: a name applied to the numerous dwarf breeds of the domestic fowl, many of which are of very recent

origin. Originally given to a small breed supposed to have been brought from Bantam, Java. Bantam fowls are remarkable for their courage and for consequential fussiness.

Ban'teng (*Bibos sondaicus*): a species of ox (*Bovidae*); a native of Java and Borneo, which in color, shape, horns, and want of dewlap bears some resemblance to the gaur of India. It has short and sleek hair, slender limbs, and a sharp muzzle. Though extremely wild, it is often domesticated by the natives, and becomes a very serviceable animal.

Ban'tingism: a regimen for the reduction of corpulence; so called after a London undertaker named William Banting (1797–Mar. 16, 1878), who introduced it (1863) as the result of his own experience. The regimen was suggested to him by Mr. William Harvey. In several weeks he reduced his weight from 202 lb. to 156 lb., and with marked gain to his health. The regimen consists essentially in the avoidance of food containing fatty matter, and of materials which may make fat in the body, as starch and sugar. Lean meat predominates in this diet; vegetables are almost excluded; butter, milk, sugar, and malt liquors are prohibited. With active exercise this method is often successful in reducing excessive weight.

Bantry Bay: a deep inlet in the south of Ireland, in Cork County; is 25 miles long and from 3 to 5 miles wide. It is one of the finest harbors in Europe, affording safe and commodious anchorage for ships of all sizes. The coast of the bay is high and rocky, consisting of Devonian strata, and exhibits some of the finest scenery in the island. Near the entrance of this bay occurred a naval action between the English and French in 1689.

Ban'tu: See AFRICAN LANGUAGES.

Banu, *baa'noo*, or **Bannu**: a district of the Darajat division of the Punjab, British India; situated between the parallels 32° and 33° N. and the meridians 70° and 72° E. Area, 3,868 sq. miles. Pop. 333,000, 90 per cent. of whom are Mohammedans. The Indus flows through the district, but its course is very capricious and it has a tendency to move eastward. During inundations it is a vast body of water, many miles across. The principal crops are the ordinary cereals, millet, sugar-cane, cotton, and oil seeds. The principal towns are Trakhet, pop. 7,500, and Kalabagh, 6,500.

M. W. H.

Banville, *bañ'veel'*, THÉODORE FAULLAIN, de: French poet; b. at Moulins, Mar. 14, 1823; has obtained the admiration of a clique (*soi-disant* decadent) of French and other writers. In 1842 he published *Les Cariatides*, and *Les Stalactites* in 1846; but he first attracted general attention by his *Odes funambulesques* (1857). Afterward he published many verses and wrote several plays. His poetic works have been published together in 3 volumes (1878–79); also his plays (except the opera-ballet *Les Nations*), under the title *Comédies*. A volume of recollections, *Mes Souvenirs*, appeared in 1882. D. in Paris, Mar. 13, 1891.

A. R. MARSH.

Banx'ring: an insectivorous quadruped, of the genus *Tupaia*; native of Sumatra, India, Borneo, etc. It climbs trees with agility, like the lemur and squirrels, and has an elongated muzzle and a long bushy tail.

Tupaia, or banxring.

Ban'yan, **Banian**, or, in Bengalese form, **Baniya** [from Skr. *vaniy*, a merchant]: a Hindu shop-keeper or merchant; especially one of the wholesale dealers and importers of Bombay, Surat, Cambay, etc., who carry on a trade with the interior of Asia by caravans and with Africa by ships. They usually belong to the caste called Vaisayas, and strictly abstain from animal food.

Banyan, or **Banian** [so called because frequently used as market-places by the banyans or merchants]: an East

Banyan-tree.

Indian tree (*Ficus indica*), remarkable for its mode of propagation by means of aerial roots, which, on descending to the ground and penetrating it, become stems or trunks. These roots at first hang like loose cords, but after they take hold they are gradually tightened, till they become almost as firm as a rod of iron. In this manner a single tree spreads over a large extent of ground, and endures for many centuries. One of these trees has been described as having 350 large stems, and occupying so large a space that many thousand persons might stand under its shade. It is a species of fig, and produces a fruit about as large as a cherry, and of a rich scarlet color. An abundance of gum-lac is procured from this tree, the bark of which is esteemed as a tonic by Hindu physicians. The above illustration may serve to give one an idea of a vigorous and comparatively young banyan-tree. In very old trees many of the stems often become almost or quite as large as the original trunk. Its wood is light, porous, and of little value.

Banz, baans: the name of one of the finest Benedictine abbeys known in history; situated in Bavaria in the midst of a beautiful landscape. The monks of this abbey were noted for their learning and humane spirit. It was founded in 1058. The convent was abolished in 1802, and is now the summer residence of the princes of Bavaria. Here is a museum which is especially rich in petrifications.

Ba'obab: See ADANSONIA.

Baour-Lormian, *baä'oör' lör'mi-ään'*, PIERRE MARIE FRANÇOIS LOUIS: French poet of the first empire; b. at Toulouse, Mar. 24, 1770; translator of Tasso (1795) and Ossian (1801), and author of many tragedies in the severely classic style, which were greatly admired in their time; but before his death he saw himself one of the most despised of poets, the butt of numberless epigrams, and the especial detestation of the Romanticists. He had been made a member of the French Academy (1815), however, and when he died this body, still a stronghold of the classicists, manifested their respect for him by unusual signs. Nisard, whose own classical sympathies were in the main with him, pronounced the funeral oration. D. in Paris, Dec. 10, 1854.

Revised by A. R. MARSH.

Baph'omet: a mysterious symbol of the Knight Templars, was a small human figure cut out of stone, having two heads, male and female. It was environed with serpents and astrological attributes, and marked with inscriptions, mostly in Arabic. The word is supposed to be a corruption of Mohammed or Mahomet (called by the Portuguese, Bafoma), to whose religion the Templars were suspected of leaning. Others derive it from Βαφή Μήτρεως, the "bath of wisdom," a reputed name of the Gnostic baptism, often called in old writings "baphometric baptism." Some explain it as a cabalistic term formed by writing backward, *tem. o. h. p. ab*, i. e. *templi omnium hominum pacis abbas*. Quite a number of baphomets are preserved in European archaeological collections.

Baptism [from Gr. βαπτισμός, subst. to βαπτίζω, baptize]: a sacrament and initiatory rite of the Christian Church. By whatever other ceremonies one may be advanced to the privileges of full membership, it has been universally held in Christendom, except among sects repudiating sacraments altogether, that a baptized person was by that rite incorporated into the Church which Christ and the apostles founded, or into the mystical "body of Christ." The authority for this rite rests upon the New Testament. (See Matt. xxviii. 18-20; Mark xvi. 16; Acts ii. 38, x. 44; Rom. vi. 4; Col. ii. 12, etc.) From these and similar texts a doctrine of baptism has been developed, as a common Christian heritage, although it has been variously modified by differing religious bodies.

It has been customary to find the antecedents of baptism in the rites with which it was alleged that the Jews received proselytes into their number, and also in the rite practiced by John the Baptist; but both of these subjects are very obscure. It is thought by some that the Jewish baptism of proselytes came into use after the final dispersion of the nation, and in imitation of Christian practice. As for John's rite, it is not known what formula he used, nor into what body he regarded it as an initiation, if any at all, nor what the inward benefits were which he attached to the ceremony, except that it was a symbol of repentance. For all purpose of argument or use, baptism must stand upon New Testament texts and the usages of the Christian Church.

Rites.—The practice of the early Christians as given in the New Testament was very simple. There is no evidence that Christ ever baptized, but he seems to have adopted the rite of his forerunner and to have lifted it into a higher significance. It was no longer a symbol merely of repentance, but also of a new life, a *palingenesis* wrought by the Holy Ghost, an assurance of forgiveness, and a badge of entrance into the "Kingdom of God." It is clear that the apostles (Acts ii. 38-41; viii. 16) and the evangelists (Acts viii. 37, 38; xix. 3-5) baptized, and in these two passages there is an intimation of the verbal formula at first used. Soon, however, it began to be held that the two outward essentials of baptism were the use of water and of the words of Christ as given in Matt. xxviii. 19. It is probable that the primitive rite was ordinarily performed by immersion, which became a trine immersion in respect to the three persons of the Trinity, but later the trine immersion ceased, as affording ground for questioning the unity of the Godhead. The Council of Ravenna, 1311, legalized the baptism of sprinkling, by leaving to the officiating minister the choice of the two modes of applying water; but the practice of "clinical" or bedside baptism had long been in use, and had spread from the sick-room to the churches. This practice received an impulse from the desire of catechumens to postpone their baptism, as was the case with Constantine, until the end of life drew nigh, that the recipient might receive the spiritual benefits involved at the latest moment, and when the danger was least of forfeiting baptismal grace by subsequent misconduct. By reason of this postponement Christians now and then died unbaptized, but if they departed this life as martyrs they were held to have received the "baptism of blood." St. Augustine speaks also of a "baptism of tears" as possible for the deeply penitent. Baptism of the dead was a rite received often by proxy, but was regarded as heretical. Lay baptism was long recognized as valid in the early and mediæval Church, as it still is by the Roman Catholics, although with the development of high views of the clerical function this practice was discouraged. In emergencies nurses and midwives and even unbaptized laymen, if their intent was right, could administer the sacrament. Among Protestants, however, lay baptism is scarcely recognized at all.

The early Church developed elaborate ceremonies in connection with baptism. Candidates for the rite were termed catechumens, and received by laying on of hands to a long course of instruction. At first they were not allowed to witness the mysteries (hence the term "mass" or *missa* for the Eucharist, which was celebrated after the dismissal of the general congregation). They were permitted to attend church, worship as witnesses at first, and then to take part in the responses and genuflections. From these the *electi* were taken, and baptism was administered at the great church festivals, especially Whitsunday. The catechumen was received; given a Christian name; turning to the west he renounced the "devil and all his works"; then he was exorcised, the priest laying his hands on him, breathing in

his face, and commanding the evil spirit to come out of him. The ceremony of opening the candidate's ears and nose followed, indicating that he was to receive the Word and Holy Spirit. He was then anointed with oil; sometimes an anointing followed the baptism itself. Then came an instruction, which ended with the rehearsal of the Lord's Prayer and Apostle's Creed by the catechumens. Often a whole day was passed in these preliminaries. In baptism the water was first consecrated. The rite was performed at the entrance of the church, and quite commonly after it the baptized received a white garment in token of his cleansing from sin. These garments were often laid up in the churches as witnesses, lest the baptized forget their vows.

Water is still variously applied: in immersion the person is submerged backward in the water; in pouring or affusion, water is poured from a vessel or a shell over the head; in aspersion or sprinkling the water is dropped from the hand upon the head. In primitive immersions the catechumen was submerged face downward. In the Church of England infant immersion, or dipping, was practiced until after the Reformation. In the Greek churches a form of immersion is still observed. In these two and in the Anglican communions the application of water is followed by the minister's making a sign of the cross upon the forehead of the baptized.

The practice of infant baptism gave rise to SPONSORS (*q. v.*), or god-parents, who promised in the child's behalf faith and obedience, and on their own the child's Christian nurture.

Divergencies of views concerning baptism have arisen, extending from the *ex opere operato* theory found in St. Augustine, and the High-Church expansion of his views, to the Quaker contention that the inward witness of the Holy Ghost suffices without other ceremony. They arise over the mode of applying water and over the qualifications for it, from the baptism of infants to that of adults only, and then on a profession of repentance and faith. These characteristic views will be found stated in this work in the article BAPTISTS (*q. v.*) and under the titles of the various Christian denominations. S. M. J.

Baptism from the Roman Catholic standpoint "is the sacrament of regeneration by water in the word." (*Catechism of the Council of Trent.*) 1. The matter of baptism is natural water poured on the head of the person to be baptized. But baptism by immersion or by sprinkling would be equally valid.

2. The form of words to be pronounced by the minister in the very act of pouring on the water is: "I baptize thee in the name of the Father, and of the Son, and of the Holy Ghost."

3. The ordinary minister of baptism is the priest; but any man or woman, heretic, Jew, or pagan can validly baptize, provided he applies properly the matter and form, and has the intention to do what Christ ordains.

4. The effects of baptism are in general regeneration, and in particular the infusion of sanctifying grace, the gifts of the Holy Ghost, faith, hope, and charity, etc., and the remission of all sin, original and actual, and of all penalties due to sin, both temporal and eternal. Baptism also imprints an indelible character, and makes the recipient a member of the Church of Christ.

5. Unless already validly baptized, any human being (even infants and idiots) is a *subject* capable of receiving baptism. Adults should have the proper dispositions.

6. Baptism is *necessary* to salvation. But in case of necessity the baptism of desire, or of blood, can, in the case of adults, supply the place of baptism by water.

JOHN J. KEANE.

Baptistery [from Gr. βαπτιστήριον, bathing-place, baptistry]: the building or chamber set apart for the administration of the sacrament of baptism. These buildings are either octagonal, polygonal, or circular. They are usually placed at the west end of the church or at the entrance, baptism symbolizing the entrance into the Church of Christ. They began to be erected probably in the time of Constantine. The baptistry of the Lateran in Rome (about 62 feet in diameter) is said to have been built by him. The baptistry of Florence, among the most celebrated, is an octagonal structure about 100 feet in diameter, standing in close proximity to the cathedral. It is built of black and white marble. The most remarkable features of this baptistry are the magnificent bronze doors, adorned with bas-reliefs by Ghiberti and others. In the center of each of these build-

ings erected for baptismal purposes is a font, which is often of considerable proportions—that at Ravenna being about 9 feet square, and that of the Lateran, at Rome, 37 inches or more in depth.

Baptists: a body of evangelical Christians numbering about 5,000,000 of communicants, who insist that believers are the only proper subjects, and that immersion is the only proper mode of baptism. They insist also on the Bible as the sole and sufficient rule of faith and practice, on the independence of the local church, the separation of the Church from the state, and the widest liberty of conscience. In America the large majority adhere to strict communion at the Lord's table. There are several divisions among them, but the largest division is Calvinistic in its type of doctrine. They are most numerous in Great Britain and North America, but are also represented in many other countries.

So far as present researches go, the name "*Baptist*," as applied to this body of Christian people, first appears in literature in the year 1644 in a volume entitled *The Anabaptists' Groundwork for Reformation*, page 23. Prior to that date they were without a name, and commonly designated themselves as "those who are unjustly called Anabaptists." (See ANABAPTISTS.) The new name gave offense: it was charged that "they arrogate to themselves the title of Baptists, as if none were baptized but themselves." Much speculation has been bestowed to determine why this more aggressive attitude should have been assumed about the year 1644. Some have fancied that the new title was claimed and maintained because of the change in the form of administering baptism, which is alleged to have occurred about the year 1641, when immersion was restored in the place of sprinkling and pouring. If these had been retained it would have been as impossible for them to shake off the name Anabaptist as it was in the case of the Anabaptists of Germany. After the restoration of immersion, it was easy to insist that those who practiced it were alone "baptized people," emphasis being laid not only upon the subjects as formerly, but also upon the mode of baptism. This latter emphasis was clearly indicated by the name Baptist.

In the year 1609 or 1610 a body of English Anabaptists was organized in Holland, which subsequently developed into the Arminian Anabaptist movement in England. After 1641, when believers' immersion was restored in England, this body of Arminian Anabaptists became known as General Baptists. No traces of believers' immersion have yet been discovered in England between 1509 and 1641. The Puritan movement was in progress: Ainsworth, Johnson, Clifton, and their adherents were already settled in Amsterdam, where they found refuge from their English persecutors. Possibly in 1606 John Smyth made his way to Amsterdam from Lincolnshire for the same purpose, with another party composed of about forty adults. Arrived in Amsterdam, Mr. Smyth shortly fell in with the Mennonites, and fell out with Ainsworth and the friends with whom he had hitherto co-operated. The Mennonites, who opposed infant baptism, persuaded Smyth that he had never been baptized. All of Smyth's company apparently joined him in this conviction, and decided to have themselves rebaptized. Smyth took the lead, and, after performing the ceremony in his own case, proceeded to baptize the others. The mode of this baptism, it is believed, was by sprinkling, since that had now become the general mode in England, and the Brownists do not appear to have used any other. Certainly there was no other mode among the Mennonites, and sprinkling had by this time become almost universal in every section of Holland and Germany.

Instead of welcoming this change the Mennonites criticised the action of Smyth and his people, asserting that they had no right to baptize themselves, for the reason that they had no succession in respect to baptism or the ordination of elders. Smyth was impressed by that reasoning, and shortly became assured that his new position was untenable. According to de Hoop Scheffer, it was in the year 1609 that he applied to be admitted to the Mennonite Church in Amsterdam, where he fancied was true succession both as regards ordinances and officers. Thirty-one of his followers united with him in that request. They were not immediately admitted, but remained on the threshold till the year 1615 before they were finally received. Smyth had passed away meanwhile, in 1612.

Four persons of the party of Smyth were unwilling to join him in seeking admission to the Mennonite Church, as-

serting that succession is a mark of the beast, and intimating that the Mennonites could not demonstrate their own succession. Their names were Thomas Helwys, William Piggott, Thomas Seamer and John Murton. Their protest was uttered on Mar. 12, 1609. Some time afterward, possibly before the close of the year, they concluded to organize themselves into a church, a step in which they may have been joined by their wives or other members of their families. De Hoop Scheffer suggests that as many as ten persons participated in founding this English Anabaptist Church. In the year 1611 appeared their earliest confession of faith, entitled *A Declaration of Faith of English People Remaining at Amsterdam, in Holland*. They shortly returned to England, and established their church at Newgate, in London. In the year 1626 there were five of these English Anabaptist churches in England, which comprised about 150 communicants. By the year 1644 the number of churches had increased to something over forty.

Though the company of Helwys and Morton had refused to enter the Mennonite communion, they had not escaped the influence of the Mennonites. They lost in Holland the assured faith which they had carried thither in the doctrines of the Calvinistic system, and became Arminians. The denomination which they founded later became known as General Baptists, owing to the fact that they believed in a general atonement. They also surrendered the Brownist ecclesiastical constitution, and borrowed from the Mennonites the constitution with elders and deacons which has now become almost universal among Baptists. They stoutly refused to accept the Mennonite opinion regarding oaths and the magistracy, but were disposed to favor the idea that it of churches is sinful for a Christian man to bear arms.

The other branch which, after 1641, became known as English *Particular Baptists*, had a different history. At the outset, all Brownists who could conveniently escape took refuge from persecution in Holland. By the year 1616, however, it was considered possible for them to remain at home, and in that year the oldest Independent church on English soil was established at London under Mr. Henry Jacob. In the course of time it was perceived that a portion of the members of Mr. Jacob's church denied the truth of the parish churches, while others conceded that point. This led to a peaceful separation, the seceding party organizing a new church on Sept. 12, 1633. A large portion of this seceding party also scrupled the baptism which they had received in infancy, and these submitted to adult baptism, apparently by sprinkling. Having had no kind of connection with Holland or the Mennonites, their Calvinism remained intact. Their church constitution was likewise at the beginning unaffected by the Mennonite scheme; they were in favor of the four grades of officers—pastors, teachers, elders, and deacons—which at that period prevailed among the Independents. In fact, so intimate and fraternal were the subsequent relations between the Particular or Calvinistic Baptists and the Independents, that the custom was shortly established of organizing mixed churches, composed in part of Independents and in part of Baptists, with a pastor selected indifferently from either denomination. The church over which Mr. Bunyan presided was of that sort, and there were many others. The lines between the two denominations are now more strictly drawn, but there are still numbers of these mixed churches in England. The Particular Baptists, having received no education in Mennonite views, did not, as the General Baptists are known to have done, feel any scruples touching the lawfulness of military service. That a Christian might become a magistrate, or incur the responsibilities of a judicial oath, was also never questioned among them.

Soon after the organization of this first Calvinistic Anabaptist Church a discussion was raised concerning the proper mode of administering baptism, and the conviction was at length established that immersion was the only scriptural mode. Much embarrassment resulted when they began to consult as to the wisest course of procedure. Mr. Spillsbury, the pastor, and most of the members, held the opinion that, since the circumstances were extraordinary, it was admissible for any minister to administer immersion even though he had not himself received the rite, arguing that neither John the Baptist nor the twelve apostles had been baptized before they commenced to baptize others. That position was approved by the larger number, and those who were accounted most judicious. Others were discontented, and insisted upon obtaining succession. Some of these were members of Mr. Spillsbury's flock, but it is supposed

that the majority still belonged to the Independent Church from which Spillsbury's church had separated. No succession could be obtained in England; they were aware of the existence of the Arminian Anabaptists, but as these were still in the practice of sprinkling they could afford no relief. Mr. Richard Blunt, who took an active part in favor of succession, was master of the Dutch language, and well acquainted with the condition of affairs in Holland. He cited attention to the Collegiants, who in the year 1620 had established the practice of immersion at Rhynsburg, and proposed to send thither and obtain succession from them. He was deputed to go abroad for that purpose, and, arriving at Rhynsburg, was courteously received by Mr. John Batten, successor of the brothers Van der Codde in the pastoral office there. In due time Batten consented to immerse him, and returning to England he administered the rite to the rest of his company. Thus the people now known as Particular Baptists became divided into two separate tendencies; the followers of Spillsbury laid no stress upon succession, his opponents regarded it as indispensable. The same division prevails at the present time.

If the Rhynsburgers introduced immersion only in the year 1620, it might be claimed that their succession was a mere myth, and that Blunt did not obtain what he went so far to seek. That question has been investigated in a special treatise by de Hoop Scheffer, entitled *Overzicht der Geschiedenis van den Doop bij Onderdompeling* (Amsterdam, 1882), in which he suggests that immersion had been brought out of Poland to Rhynsburg by Joannes Geesteranus. From the Polish Anabaptists it might also be traced back to Switzerland and the Reformation. Hence the friends of succession are not so hardly bested as might at first appear. Their case is stronger than some are aware of who oppose their claims.

As soon as they perceived this change, the English Arminian Anabaptists almost immediately accepted it, and so became English General Baptists. Mr. Edward Barber has the honor to have written the initial treatise in the long controversy in favor of the immersion of believers, entitled *A Treatise of Baptism or Dipping* (1641). The Particular Baptists, who had now increased to seven congregations, published their earliest confession of faith in 1644, and took pains to provide for immersion. This confession was to a degree dependent upon the confession of the Brownist churches, which had been issued in various editions in Holland. The confession of 1644 retains the Independent form of church constitution, providing for pastors, teachers, elders, and deacons; but when the edition of 1646 was issued they adopted the scheme derived by the General Baptists from the Mennonites. As already intimated, that scheme has become prevalent; but some of the older churches, as that of Mr. Spurgeon, still retain some features of the Independent scheme.

First Period of English Baptist History (1644-1750).—Having described above the beginnings of Baptist history in England, at least in so far as any organized churches are concerned, it is now in order to give a brief account of their early progress. Almost immediately after the two parties, General and Particular Baptists, had established themselves in the doctrines and usages which they were destined to maintain, the upheavals of the Revolution began to be observed. This movement was of special advantage to the Baptists, who flourished amazingly as long as it continued. Freedom of speech, freedom of the press, and freedom of many other kinds were enjoyed and improved. The Particular Baptists, however, reaped the highest benefits. They stood nearest to the Independents, who became the victorious party. Mr. Kiffin, their most prominent preacher and leader, was a person of wealth, energy, and experience in affairs, whose influence was felt in many quarters. When the Protector was distributing favors, a due share would go to his firm friends and allies of the Particular Baptists. A portion of their ministers were granted positions in the established church; others accompanied the army in the character of chaplains. Thousands of their adherents were in the ranks, and some few attained to prominence in official station. Indeed, when Richard Cromwell displayed his incompetency to succeed his father, it was for a season apprehended that the Baptists might come to the helm of state.

The General Baptists, on the contrary, were handicapped by the principle of opposition to the bearing of arms by Christian men which they had inherited from the Mennonites. That principle, however, was not universally accepted

by the General Baptists, since Gen. Desborough, one of their leaders, attained to prominence and influence in the army. It is also possible that not a few members of his communion may have served in the ranks. Yet the fact remains that the great body of the General Baptists abstained as far as possible from taking part in the triumphs of the military. This attitude toward Cromwell and the cause of the people condemned them to insignificance. During these convulsions was established the marked sympathy between the General Baptists and the Quakers that has been so frequently a matter of observation and remark. Both these parties alike were composed of men of peace, and they would naturally comfort and encourage each other by denouncing the men of the sword. It is suspected that this close contact with the Quakers might have been injurious to the General Baptists, who were commonly more enthusiastic and less safely poised than the Particular Baptists.

The numbers of the Particular Baptists at the Restoration in 1660 can not be definitely ascertained, but it is estimated that there may have been something like 100,000 of them; the General Baptists claimed "more than 20,000." Following the return of the king there was a season of repression and decay. The Particular Baptists are believed to have experienced the heaviest losses, due in part to the fact that multitudes had become attached to them during the Commonwealth period in the expectation that they would one day attain to supreme control in the government. When that hope was thwarted, there was no further incentive to profess their creed, and the floating element retired from their churches. The General Baptists issued a confession of faith in March, 1660, composed of twenty-five articles, in which that denomination as a whole committed themselves to the practice of immersion. After the overthrow of the Stuarts the Particular Baptists held a general assembly at London in Sept., 1689, in which they set forth a new confession for that party. It was based on the Westminster Confession. There were more than 100 churches in the General Assembly of 1689, and it is likely that they represented nearly all the Particular Baptists then in England. It is believed that 15,000 would be a fair estimate of the entire number of communicants. One of the leading items of the platform upon which this assembly stood is given in the following words: "That in those things wherein one church differs from another church in their principles or practices, in point of communion, that we can not, shall not impose upon any particular church therein, but leave every church to their own liberty to walk together as they have received from the Lord." This provision was indispensable for the accommodation of the mixed churches, as well as for the accommodation of such as did not receive a mixed membership and yet granted open communion at the Lord's table. Mr. Bunyan, as the leader of the mixed church contingent, was also the leader of the open communion party. Mr. Kiffin seems to have opposed mixed churches, and was the leader of the strict communion party. These two leaders had recently engaged in a controversy that was still unsettled, and the assembly found it impossible to take any decided position, either in its platform of organization or in the confession of faith which it indorsed. This open communion, however, was hardly intended to apply to any others than members of the Independent body; it did not embrace the General Baptists, who, having no mixed churches, were in their turn strict communionists at the Lord's table.

There was still further decay among the Baptists of England from 1689 to 1750. The seeds of Socinianism, which the General Baptists had brought over with them from Holland, came to ripeness during this period, and the denomination was almost desolated. The Particular Baptists drifted into Hyper-Calvinism; a portion of them likewise were infected by the Socinian leaven. A pretty reliable census of the Particular Baptists in 1750 showed 10,000 communicants. It is likely that the General Baptists did not then number more than 5,000.

Second Period of English Baptist History (1750-1897).—The denomination was at a low ebb at the beginning of this period, but the influences of the Great Awakening were already beginning to be felt among them. The ascendancy of Dr. Gill and of men yet more extreme was still acknowledged, but their views were beginning to be called in question. Finally Andrew Fuller appeared upon the scene with a modified and evangelical form of Calvinism which in the course of time broke the sway of Gill and the Hyper-Calvinists, bringing Baptists into cordial sympathy with the re-

vived religious life of the times. In 1792 was formed the Baptist Missionary Society, and the next year Carey and Thomas were sent as missionaries to India. During the long period of decay it is suspected that the strict communion element had gained some ground among Particular Baptists; but Robert Hall in 1815 took up the cause of Bunyan and secured the triumph of open communion. After that period the strict communion party retired from the fellowship of their brethren and maintained a separate existence. Much attention has been given to the interests of education, and there are several flourishing institutions of learning. Mr. Spurgeon and Robert Hall have been the most prominent ministers. The General Baptists took little part in the revival of religion. At length, however, Mr. Dan Taylor, of Yorkshire, who had been for some years connected with the Methodists, becoming persuaded that immersion was the proper mode of baptism, was immersed by a General Baptist minister in 1763. He continued in alliance with the General Baptists till 1770, but a deal of friction was occasioned by their Socinian tendencies. Finding it impossible longer to endure their heretical sentiments, he withdrew in 1770, and formed a new denomination called the General Baptists of the New Connection, who were somewhat decidedly Methodist in their doctrine and usages. The original denomination continued to exist, but it is believed that they are now nearly extinct. The General Baptists of the New Connection, on the contrary, are in a flourishing condition, numbering at present 203 churches, 134 pastors and missionaries, and 27,256 members. They are open communion in their practice. The Baptists of England, according to the latest statistics, embrace 360,112 communicants. They have been laborious and successful in the cause of missions in India, Ceylon, Burma, and the West Indies.

BAPTISTS OF AMERICA.—In 1636 Roger Williams, who had been banished from the colony of Massachusetts Bay, established a community at Providence, and set up a church. He preached with zeal and regularity until Mar., 1639, when it was decided to make a new departure. Williams, having become convinced of the error of infant baptism, concluded to obtain rebaptism. Eleven others joined him in this step. Ezekiel Holliman baptized Williams, and then Williams baptized the rest of the company, and so they became an Anabaptist church. The ceremony was most likely performed by sprinkling; the immersion of believers had not yet been restored in England; and there is no reason which renders it probable that Williams was in that regard in advance of the people with whom he now allied himself. John Clarke, who had likewise been driven from Massachusetts Bay, arrived at Newport in 1638. Like Williams, he was a zealous preacher and kept regular worship among his fellow-colonists. When Williams caused himself to be rebaptized in 1639, it is likely that Clarke and his people approved the change. In 1640 Gov. Winthrop announces that Clarke and divers of his associates had become Anabaptists. Possibly they were rebaptized by Williams or some of the men from Providence.

Restoration of Believers' Immersion.—In 1644 Williams returned from England with a charter for the colony. It is possible that Mr. Mark Lucar came over with him. Lucar had been a member of the church organized in England on Sept. 12, 1633. In the year 1641, when Mr. Blunt returned from Holland, Mr. Lucar is mentioned as one of the persons who received immersion. Upon his arrival in America he would be swift to advertise the brethren touching the change that had been enacted in England. His representations appear to have met with decided favor; for in the year 1644 the church in Newport was reorganized, with him as one of the most important members. This is believed to signify that they then received immersion at the hands of Lucar, and became for the first time a regular Baptist church in the sense now accepted. Probably the immersion of the Providence men followed in a short while. Mr. Lucar, who is understood to be the founder of believers' immersion in America, brought with him the ideas of succession that were so much valued in England, and many American Baptists have become committed to them. The relations between the Independents and the Baptists in America were very different from those that prevailed in England; by consequence there has never been anything like mixed churches here, and the tendency toward open communion has been very slight.

First Period of American Baptist History (1644-1750).—The earliest churches of Providence and Newport were both of the Particular Baptist persuasion, but the General Bap-

tists shortly appeared upon the scene. In 1652 a General Baptist church was formed at Providence by Chad Brown, Gregory Dexter, and William Wickenden, and in 1656 a similar church was established at Newport, making two rival and more or less hostile Baptist churches in each place. Throughout the period before us the General Baptists were in the ascendant. About the year 1718 the first church in Providence, of which Williams was the founder, became extinct, and the General Baptist church of the Browns triumphed over it. After that casualty only three Particular Baptist churches remained in New England, while the General Baptist churches were quite numerous, having a large and aggressive Yearly Meeting. In the Middle Colonies the forces seem to have been more evenly divided, there being many General Baptists in the Philadelphia Association, and also many Particular Baptists. The two parties appear to have watched each other narrowly and to have manoeuvred for the advantage, which in the end remained with the Particular Baptists. Philadelphia Association is suspected to have begun its history in the character of a Yearly Meeting, but in the year 1707 the other element rallied and gave it the title of Association, a Particular Baptist designation. Nevertheless, some of the churches appear to have been honeycombed by Arminian sentiments, so that it was impossible for the body to adopt a Calvinistic confession of faith before the year 1742. In the Southern Colonies the General Baptists prevailed almost exclusively, there being only a single Particular Baptist church. The Arminians, however, combined against this church in Charleston, S. C., and had well-nigh destroyed it before deliverance came. In North Carolina the General Baptist Yearly Meeting was perhaps the most prosperous, though not the most powerful, body of Baptist people then in existence.

Second Period of American Baptists (1750-1897).—The Particular Baptists were on the point of defeat in 1750; if succor had not been bestowed it is more than likely that the General Baptists would have controlled the destinies of the Baptists of America. But at an early stage of its progress the Great Awakening in America fell under Calvinistic auspices. Jonathan Edwards and George Whitefield took the lead, and, without intending to accomplish such a result, rescued the falling fortunes of the Particular interest. In 1742, shortly after Mr. Whitefield appeared upon the scene, the Philadelphia Association adopted the Philadelphia Confession of Faith, which was the banner of the Particular party in England, and prepared herself for action. In a few years this association acquired the hegemony of American Baptists, and has ever since maintained that dignity. It sent representatives to Maryland and Northern Virginia, where they speedily captured the Arminian churches that existed in that region. It also dispatched agents, men of admirable gifts and zeal, to North Carolina, where in 1755 they captured nearly the whole of the flourishing Yearly Meeting that had been cultivated with so much care by Rev. Paul Palmer. A few of Palmer's followers resisted, and still stand to their colors in that portion of the country, whence they sent forth colonies to the Cumberland country, which have grown to be a somewhat numerous people in Kentucky and Indiana. A Philadelphia minister went to Charleston in 1749, and, taking charge of the first church, soon succeeded in driving away the General Baptist opponent. In 1751 it was given to the exertions of Oliver Hart to lay the foundations of Charleston Association on the Philadelphia model and with the Philadelphia creed. The men of Philadelphia even ventured as far as Nova Scotia to preach the Word. Two of its most gifted young ministers also had the temerity to invade the General Baptist stronghold in New England, and to carry a college to Rhode Island, which at first scarcely anybody was prepared to receive. James Manning and Hezekiah Smith, however, persevered in their task, and at last earned for themselves a welcome. It is amazing the amount of work that was accomplished in the interest of Philadelphia within a period of twenty years. In 1751 Charleston Association was established. In 1765 Kehukee Association was built on the ruins of the General Baptist interest in North Carolina; in 1766 Kettocton was founded by a like process on the borders of Maryland and Virginia; in 1767 Manning and Smith, assisted by John Gano, Abel Griffith, and Noah Hammond, who had made a special journey from Philadelphia for the purpose, established Warren Association in Rhode Island. By this means the entire country was occupied by the Philadelphia Association and its allies. The General Baptists were driven back at every point; their cause was now lost. Their Yearly Meet-

ing in New England has perpetuated itself in a feeble way to the present time, reporting in 1896 only 10 churches and 741 members. They still retain the ancient designation of *Six-principle Baptists*.

The Gibraltar of the General Baptists, however, still held out; the church in Providence had not yet been directly assailed. In 1770 the labor of taking this stronghold was begun. Manning succeeded to admiration; in due time Samuel Winsor retired to Johnston with the original church, and the present First Baptist church of Providence was founded in 1771. Long years of patient education were required before the last vestiges of the old Arminian leaven could be eliminated; it was not until the year 1782 that Manning could induce the new church to attach itself to Warren Association; the Second church of Newport declined to take that step until the year 1801.

Separate Baptists.—Through the influence of Whitefield and Edwards Calvinism gained the victory among American Baptists, and Arminianism was defeated. While the conflict between these parties was going forward a dangerous rival to the Calvinistic interest appeared upon the scene. As a direct result of Whitefield's preaching, a new denomination of Christians had arisen in New England called Separates, from the circumstance that they had separated from the churches of the Standing Order. About the year 1750 numbers of these Separates became convinced of the correctness of Baptist principles, and had themselves immersed. By that means churches of Separate Baptists were constituted in many sections of the country. More than half the Baptists of New England are supposed to be of Separate Baptist extraction. Manning and Smith succeeded in conciliating Isaac Backus, the leader of the Separate Baptists in New England, at an early date, and their forces were thus united with those of Philadelphia. Owing to the intimacy of that union there has not been much friction between the two tendencies in the New England States. A handful of these Separate Baptists, under the lead of Shubael Stearns and Daniel Marshall, got abroad in North Carolina in 1755 and started a movement of gigantic proportions. In the year 1758 they established the first Separate Baptist Association at Sandy Creek, in North Carolina. Before the advent of the American Revolution they had captured nearly the whole of North Carolina, South Carolina, and Georgia for their party. They had also invaded Virginia and occupied nearly the whole of that State; the battle for religious liberty in Virginia was fought and won almost exclusively by Separate Baptists. It is estimated that about seven-tenths of the Baptist people of the Southern States are of Separate Baptist extraction. The power of the Separate Baptists was so marked in the South that the friends of Philadelphia were driven to assume a special designation, and so they called themselves Regular Baptists. But at length, after the Separate Baptists had achieved the triumph of religious liberty in Virginia, it became plain that they could not be despised, even though they might not be quite Regular. Both parties were Calvinistic, but the Separates were Calvinists of the Whitefield and not of the Philadelphia type. Nevertheless, a union was proposed by the friends of Philadelphia in Virginia, and it was happily accomplished in the year 1787. By that means the party who of late seemed destined to become formidable rivals of Philadelphia were brought into close alliance. Thenceforward the Baptists of the Southern States were known as United Baptists, a designation that is still often heard. A small faction of Separate Baptists declined to enter this union, and these have maintained an independent existence, mainly in Kentucky and Indiana, down to the present time. They embrace about seven thousand communicants.

Free-will Baptists.—Since the Separate Baptists had no creed like the Regular Baptists, there were many shades and grades of Calvinism among them, and in some instances they veered round toward Arminianism. A community of Separate Baptists existed in New Hampshire who were so moderate in their Calvinism as to be almost Arminians. Benjamin Randall, who perhaps in some way had come under the influence of the Arminian Baptists of New England, succeeded in organizing these into a party, after the year 1780, who repudiated Calvinism. They have been quite successful in divers directions. In the year 1900 they reported 1,684 churches and 97,242 communicants. It is important to remember that they are of Separate and not of General Baptist extraction.

Primitive Baptists.—For a number of years after 1787

the United Baptists advanced with much harmony and success. But at length, in the year 1812, through the agency of Adoniram Judson and Luther Rice, the denomination was committed to the enterprise of promoting missionary work in foreign lands. From the outset persons were found who objected to that course, and the disaffection continued to spread until about the year 1835, when a schism was begun in which the opponents of missions withdrew and founded another denomination which they called Primitive Baptists, but which is more commonly known by the name of Anti-Mission Baptists. They have been in a declining condition, and at present an active discussion is in progress among them which seems likely to result in a fresh schism. One of the parties, which advocates missions, Sunday-schools, and other agencies, is known as the party of Means; the Anti-Means party stand upon the platform which the denomination originally assumed. The Primitive Baptists in 1900 reported 3,530 churches, and 126,000 communicants.

Seventh-day Baptists.—These are distinguished by the fact that they keep the seventh day of the week as the Sabbath. Their first church in America arose in 1671 by means of a schism from Mr. Clarke's church in Newport, R. I. They have taken little part in the historical development of American Baptists. For the year 1900 they reported 114 churches and 9,161 communicants. Rev. A. H. Lewis, D. D., of Plainfield, N. J., is the leading figure among them.

Great progress has been made by the Baptists of America during the nineteenth century. In the year 1700 there were 6 Calvinistic Baptist churches, 6 Arminian Baptist churches, and in the limits of Philadelphia Association 4 that are supposed to have been doubtful. In addition to these there were 1 church of Seventh-day Baptists, 1 of so-called Rogerenc Baptists, and 2 Indian churches. Reckoning all these as Baptists, there were 20 churches in the year 1700, with perhaps as many as 800 members. In 1784 there were 471 churches, 424 ministers, and 35,101 members. In 1900 there are reported in the U. S. 43,427 Baptist churches and 4,181,686 communicants. In Canada and Mexico there are 1,176 churches and 141,631 communicants. The press is represented in every State and Territory, and is prosperous and powerful. Their missionaries are found in nearly all heathen countries, and also in many regions where the Roman Catholic religion is predominant.

LITERATURE.—Thomas Armitage, *A History of the Baptists* (New York, 1887); Henry C. Vedder, *A Short History of the Baptists* (Phila., no date, but appeared in 1892), the first effort made by a Baptist writer to introduce historical criticism into Baptist history; J. M. Cramp, *Baptist History* (Phila., no date); Thomas Crosby, *The History of the English Baptists from the Reformation to the Beginning of the Reign of George I.* (4 vols., Lond., 1738-40); Joseph Ivimey, *A History of the English Baptists* (4 vols., Lond., 1811-30); H. M. Dexter, *True Story of John Smyth, the Se-Baptist* (Boston, 1881); H. M. Dexter, *Congregationalism as Seen in its Literature* (New York, 1880); Robert Barclay, *The Inner Life of the Religious Societies of the Commonwealth* (Lond., 1876); Isaac Backus, *A History of New England, with Particular Reference to the Denomination of Christians Called Baptists* (3 vols., Boston, 1777-96); David Benedict, *A General History of the Baptist Denomination in America* (2 vols., Boston, 1813); D. WILLIAM H. WHITSITT.

Baptist Young People's Union: See the Appendix.

Bar: a long and narrow piece of wood, metal, or other solid substance, generally round, quadrangular, and other uniform section. BAR, in hydrography, is an accumulation of mud or sand in any navigable channel by which navigation is obstructed, but more particularly a similar formation almost universally found across and exterior to the mouths of rivers and harbors, rendering entrance difficult except to vessels of light draught. In music, the word BAR denotes a straight line drawn across the staff to divide the music into small portions of equal duration, and also comprises the musical notes written or played between such lines. BAR, in heraldry, is one of the important charges known as ordinaries. The bar is formed by two horizontal lines passing over the shield; it differs from the fess in size, the bar occupying only one-fifth of the shield. BAR SINISTER is a term misused for "baton sinister" to denote illegitimacy. In law BAR denotes: 1. A partition or railing intended to inclose that part of the court-room in which prisoners are arraigned or sentenced, and in which the members of the legal profession usually sit; hence this space itself. In Great Britain there are admitted within the bar only solicitors, queen's counsel, and some others having precedence, all others, including the great body of barristers (called *utter* or *outer barristers*), being obliged to stand behind it. Hence the word often collectively signifies lawyers, or persons admitted to practice in the courts; and in some cases it refers to or implies the presence of the court itself. A trial at bar is a trial before a full bench of judges, as distinguished from a *nisi prius* trial—that is, a trial before a single judge. Trials at bar in civil causes were abolished in Great Britain by the Judicature Act of 1875. 2. A complete defense to an action in law. A plea in bar is a plea which, if true, completely defeats the plaintiff's action. Revised by F. STURGES ALLEN.

Bar: a town of Russia; government of Podolia. In 1768 the Confederation of Bar was formed here by the nobility of Poland, to counteract the influence of Russia on King Stanislas Augustus. Bar was taken by the Russians in the same year, and the confederates were compelled to go to Wallachia. Here they declared the king dethroned, had him carried off from Warsaw in 1771, and were only suppressed by Russia after four years' hard fighting. Eleven fairs are held here every year (see map of Russia, ref. 9-B). Pop. 13,000.

Bär, K. E., von: naturalist. See BAER.

Bar'aba': a vast steppe of West Siberia, lying between the rivers Ob and Irtysh on the W., and the Altai Mountains on the S. E. Area about 55,000 sq. miles. It is very level, covered by recent deposits, fertile, with large forests separated by marshes and salt-lakes. It was colonized by the Russians in 1730. Pop. about 250,000; only 4,000 aborigines, the rest Russians.

Bara Banki, baa'ra-baan'keē: a district of Lucknow division, Oudh, British India; between parallels 26° and 28° N. lat., and meridians 81° and 82° E. lon. Area, 1,768 sq. miles. It is a level plain interspersed with marshes. The Gogra river forms the northern boundary. This is navigable, and a railway passes through the district. The population is about 1,000,000; about 85 per cent. Hindus. The largest town is Rudauli, with 12,000 inhabitants.

Bar'aboo: city; on C. and N. W. R. R., capital of Sauk co., Wis. (for location of county, see map of Wisconsin, ref. 6-D); situated in Baraboo valley, on the Baraboo river; is noted for its beauty of situation and magnificent scenery, and is 3 miles from the famous Devil's Lake. It is in the center of a prolific fruit-growing district, has excellent water-power, paved streets, a fine city hall, 4 large and handsome school-houses, 3 magnificent iron bridges, water-works, electric lights, and gas-works. Pop. (1880) 3,266; (1890) 4,605; (1900) 5,751.

EDITOR OF "REPUBLIC."

Barab'ra, or Berab'era: a name applied by the Egyptians to the inhabitants of a small district in Upper Nubia. They are not the same as the Berbers, the latter having derived their name from the Arabians. They trade with the

Egyptians in cattle, which they pasture among the mountains beyond the Atbara and near the Red Sea. They are Mohammedans.

Baracoa, baa-ra-kō'a: a seaport on the northeast coast of Cuba (see map of West Indies, ref. 4-F). See BARACOA in the Appendix.

Barada, baa-rah'da: a river of Syria; probably the Abana of the Old Testament. Its remotest, though not its largest, source is a lake, some 300 yards by 50, in the plain of Zebdany (8 miles by 3), 3,349 feet above the level of the sea, in the heart of Anti-Lebanon. The stream flows south-eastward, passing the ruins of the ancient city of Abila, breaking through three ridges of the mountain, and reaching Damascus (23 miles from its source) after a descent of 1,149 feet. Then it flows on eastward some 17 or 18 miles farther, emptying itself into two marshy lakes, each about 20 miles in circumference. In going through the city and gardens of Damascus it is parted into at least seven streams, which afterward reunite. See Porter's *Damascus*.

Bar'adla Cave: a celebrated cave near AGTELEK (*q. v.*).

Baraga, baa-rah'ga, FRIEDRIC, D. D.: a Roman Catholic missionary; b. at Treffen, in Carniola, Austria, June 29, 1797. He was ordained 1823, came to America in 1830, devoted himself to missionary labor among the Indians of the Lake Superior region, and was made Bishop of Sault St. Marie 1857, of Sault St. Marie and Marquette 1865. He published numerous works in the Ojibway (or Chippewa) dialect; a *Grammar of the Otchipwe Language* (1851); and a *Dictionary of the Otchipwe Language* (1853). D. at Marquette, Mich., Jan. 19, 1868.

Baraguey d'Hilliers, baa'ra-gā' dčēl'yā, ACHILLE, Count: a French general; b. in Paris, Sept. 6, 1795. Having served with distinction in Algeria, he obtained the rank of general of division in 1843. In the autumn of 1849 he became commander of the army that occupied Rome. He returned to France in 1850, and in the Crimean war commanded a corps which co-operated with the British fleet in the Baltic. He was made a marshal of France in 1854. D. at Amélie-les-Bains, France, June 6, 1878.

Baraguey d'Hilliers, LOUIS: a French general; the father of the preceding; was born in Paris, Aug. 13, 1764. He served in the Italian campaigns of 1796-97, soon after which he became a general of division. He commanded the dragoons of the grand army in Austria in 1805, and was appointed Governor of Venice in 1808. In the Russian campaign of 1812 he was taken prisoner, with all his division. D. in Berlin, Jan. 13, 1812.

Baranoff, baa-rah'nōf, ALEXANDER ANDREYEVITCH: first Governor of Russia in America; b. 1746; established a colony on Bering Strait 1796; took possession of Baranoff island 1799. D. at sea, near Java, Apr. 28, 1819.

Barante, baa'raant', PIERRE AIMABLE PROSPER BRUGIÈRE, de: a French statesman and historian; b. at Riom, June 10, 1782. He came of a literary stock, his father and his great-grandfather having distinguished themselves as writers. He was appointed collector-in-chief of customs in 1818, and became a peer of France in 1819. His chief works are a *History of the Dukes of Burgundy* (13 vols., 1826), and a *History of the National Convention* (6 vols., 1853). D. at Puy-de-Dôme, Nov. 21, 1866. See sketches by Guizot in *Revue des deux Mondes* (July, 1867), and E. de Mirecourt (Paris, 1867).

Baran'ya: one of the most populous counties of Hungary; bounded N. by Tolna, E. by Bacs, S. by Slavonia, W. by Somogy; area, 1,966 sq. miles. It is partly mountainous, but is very fertile. The Danube forms part of the western boundary. Capital, Fünfkirchen. Pop. (1890) 321,435.

Barataria Bay: Louisiana; an inlet of the Gulf of Mexico, lying between the Mississippi and the Bayou la Fourche; about 12 miles long from N. to S., and 5 or 6 miles broad, communicating with bayous and lakes of the interior. Its shores are marshes little elevated above the tides, which extend to the cypress swamps. Grande Terre island, a ridge of sand which lies across the mouth, was the headquarters of the brothers Lafitte, the so-called "pirates." (See LAFFITE.) The entrance to the bay was fortified by the U. S. in 1840-50 by the construction of Fort Livingston on the west end of Grande Terre island. The bar has 7 feet of water. Barataria lighthouse, on Grande Terre island, is in lat. 29° 16' 47" N., lon. 89° 54' 33" W. It is of brick and 60 feet high.

Baratier, baŕ'a-ti-ay', JOHANN PHILIPP: b. of French ancestry at Swabach, near Nuremberg, Jan. 19, 1721; when five years old spoke French, German, and Latin; when seven could repeat the Psalms in Hebrew; and when nine composed a Hebrew dictionary; when thirteen years old translated the *Itinerary* of Benjamin of Tudela. He wrote a reply to Crellius's *Artemonius*, called *Antiartemonius* (1735), and a *Disquisition on the Succession of the Roman Pontiffs in very Ancient Times* (1749). He was a Protestant, studied theology and law. D. in Halle, Oct. 5, 1740.

Baratynski, baŕ-ra-tĕen'skĕe, JEWGENIZ ABRAMOVITCII: Russian poet; b. in the government of Tambov, Russia, Mar. 2, 1800; d. in Naples, Italy, July 11, 1844. He was educated in St. Petersburg, and became an ordinary soldier in the guard. As early as the age of twenty, however, he had written interesting verse. In 1826, having become an officer, he resigned from the service. His last years were spent in Paris and Naples. He is chiefly known as a lyric poet, having issued various collections of his lyric verse, as: *The Banquets* (1826); *The Ball* (1828); *The Death of Goethe* (1832); *Twilight* (1842). His complete works were published (Moscow, 1868) by his son.
A. R. MARSIL.

Barb [Fr. *barbe*, deriv. of *Barbarie*, Barbary]: name of a breed of horses which originated among the Moors of Barbary, who introduced it into Spain. Barbs are remarkable for their endurance, docility, and gentleness. The Carthaginian cavalry, which decided several victories over the Romans, are said to have been mounted on horses of this breed, which is a variety of the Arabian horse. The celebrated "Godolphin Arabian" was a barb, as were most of the progenitors of the thoroughbred horse of the present day.—Barb is also the name given in New Jersey to the kingfish (*Menticirrus saxatilis*).

Barbacena, baŕ-baŕ-thay'naŕ, FESBERTO CALDEIRA BRANT, Marquis of: a Brazilian soldier and diplomatist; b. at Sabora in 1772. He was appointed by the Emperor of Brazil to negotiate concerning the independence of that country with Portugal, and for his success was created a marquis. He was afterward twice Minister of Finance. He introduced steam-engines, steamboats, and the printing-press into Brazil. D. in Rio Janeiro, June 13, 1841.

Barbados, baŕ-bay'dŕs (perhaps from Span. *barbado*, bearded, but it was early called St. Bernardo): the most eastern of the Caribbean islands (see map of West Indies, ref. 8-M); is a British colony. Its capital, Bridgetown, is situated in lat. 13° 4' N., and lon. 59° 37' W. The island is 21 miles long, 14 miles wide, and has an area of 166 sq. miles. It is nearly encircled by coral reefs, which are dangerous to navigation. The highest point of the island has an altitude of 1,104 feet. Destructive hurricanes often occur here. The soil is fertile, and produces sugar, cotton, arrowroot, etc. The population and prosperity of Barbados have increased since the abolition of slavery, Aug. 1, 1834. In 1890 the imports were \$6,000,000 and the exports \$5,900,000, and 85,261 hhd. of sugar were raised. There are 24 miles of railway and 58 miles of telephonic communication. In 1891 the public debt was \$150,000. Pop. (1891) 182,322—the most densely populated island in the world. The diocese of Barbados includes the Windward islands from St. Lucia to Granada, of which the see is Bridgetown, the capital; and it enjoys a legislative appropriation of \$50,000 annually. The public schools of Barbados are under Government control. It is headquarters for the British troops in the West Indies.
M. W. H.

Barbados Cherry: the edible fruit of a small West Indian tree (*Malpighia glabra*). Each fruit contains three seeds. The leaves of *Malpighia urens*, which also has edible fruit, have stinging hairs on the lower side.

Barbados Gooseberry: the edible fruit of *Pereskia aculeata*, a shrubby plant of the family *Cactaceae*, having a round stem, thick, alternate leaves, and large spines. The fruit has expectorant properties. The plant grows in the West Indies.

Barbados Leg: See ELEPHANTIASIS.

Barbados Tar, or **Petroleum**: a black, opaque, inflammable liquid of the consistence of molasses. By distillation it yields naphtha and a residuum of asphaltum.

Barbara, SAINT: a virgin martyr of the ancient Church in regard to whom traditions clash. Baronius accepts the story of her martyrdom at Nicomedia in the reign of Maximinus (235-238), and says that she had been a pupil of Origen. Assemani thinks she suffered martyrdom under

Galerius, about 306, at Heliopolis in Cœle-Syria. She is the patron saint of artillery, and the protectress against lightning and fire. The powder-magazine on French men-of-war is still called "Sainte Barbe." She is commemorated Dec. 4.

Barbarian [from Fr. *barbarien*, deriv. of *barbarie*, land of barbarians; from Lat. *barbarus*, Gr. *βάρβαρος*]: a term applied by the ancient Greeks to all foreigners and all who could not speak the Greek language. Plato divided the human family into two great classes—*Hellenes* (Greeks) and *Barbaroi* (barbarians). After the Persian invasion the Greeks used the word as a term of reproach, implying hostility to their own freedom and civilization. After the Romans had conquered Greece, and had become in some measure Hellenized, the word barbarian was applied to all nations except Greeks and Romans. St. Paul uses the word in this sense in Romans i. 14; see also Acts xxviii. 4.

Barbaros'sa: the name of two brothers, renegade Greeks and natives of Mitylene, who became Turkish corsairs, and were the scourge of Christendom for many years (1510-46). The elder, Aruch (Horuk or Ouradjh), made himself master of Algiers, but was defeated by Charles V., captured and beheaded (1518). He was succeeded in 1518 as ruler of Algiers by his brother, Hayraddin, a Christian corruption for Khair-ed-Deen. He obtained Tunis by conquest in 1532, and became the chief admiral of Sultan Solyman in his war with the Emperor Charles V. D. in Constantinople, July 4, 1546.

Barbarossa, EMPEROR: See FREDERICK I.

Barbaroux, baŕ'-ba-roo', CHARLES JEAN MARIE: French Girondist and eloquent advocate; b. at Marseilles, Mar. 6, 1767. He was chosen a deputy to the Legislative Assembly in 1791, and a member of the National Convention in 1792. He denounced Robespierre, and on the trial of the king voted for an appeal to the people. He was distinguished for his energy and personal beauty. Having been proscribed by the Jacobins in May, 1793, he fled from Paris. He was guillotined at Bordeaux, June 25, 1794. See his *Mémoires* (1822).

Bar'bary [of Arab. origin]: an extensive region of Northern Africa, comprising the modern Barca, Tripoli, Tunis, Fezzan, Algeria, and Morocco; extending from Egypt to the Atlantic Ocean. It is included between lat. 25° and 37° N., and lon. 10° W. and 25° E. It included the ancient *Mauritania*, *Numidia*, *Africa propria*, and *Cyrenaica*. Barbary is divided by the Atlas Mountains. The north side comprises Tunis, Tripoli, Morocco, and Algeria. The south is called Beled-el-Jereed (i. e. the country of dates). The soil is generally fertile. It was very rich and populous under the rule of the Carthaginians and of the ancient Romans, who became masters of this region about 146 B. C. It was conquered about 430 A. D. by the Vandals, who misgoverned it for a hundred years, and it fell under the domination of the Arabs in 647 A. D. The inhabitants are mostly Mohammedans.

Barbary Ape, **Pigmy Ape**, or **Magot**: one of a small species of tailless monkey (*Inuus caudatus*); found in but

The magot, or Barbary ape.

one place in Europe—the Rock of Gibraltar. It also abounds in Northern Africa, especially among rocky mountains and forests. It is gregarious, displays great agility in

passing from tree to tree, and usually walks on four feet. It is of a greenish-gray color, and rather larger than a large cat. Bands of these apes often plunder gardens. This species of monkey is occasionally seen in captivity, and is capable of being trained to many tricks.

Barbauld, ANNA LETITIA: English authoress; b. in Kibworth, Leicestershire, June 20, 1743; was a daughter of Rev. John Aikin. She published a volume of poems in 1773, and was married in 1774 to Rochemont Barbauld, a Dissenting minister, with whom she taught a boarding-school for ten years at Palgrave, Suffolk. She published, besides other works, *Devotional Pieces* (1775) and *Early Lessons for Children*, and assisted her brother, Dr. John Aikin, in the composition of a popular work called *Evenings at Home*. D. at Stoke Newington, Mar. 9, 1825. She wrote also *A Legacy for Young Ladies*, published after her death. See a *Life of Mrs. Barbauld*, by Lucy Aikin, prefixed to her works (2 vols., 1825).

Bar'becue [ultimately from Haytian *barbacoda*, a framework of sticks set upon posts, generally for use in drying or smoking meat]: term originally applied, especially in the Southern States, to the practice of roasting an ox or other large animal whole; since applied in the U. S. to a social entertainment on a large scale, generally in the open air, where animals are roasted whole and provisions and drink provided in generous quantities. A barbecue was formerly a favorite means of celebrating political victories.

Barbed Wire: See WIRE AND WIRE-DRAWING.

Bar'bee, WILLIAM J., M. D.: b. in Winchester, Ky., in 1816; educated at Miami University, O.; practiced medicine ten years in Cincinnati, O., and became widely known as a teacher, author, and preacher among the Disciples of Christ. He has published *Physical and Moral Aspects of Geology*, *The Cotton Question*, and various religious and scientific and other works. He died at the residence of his eldest son in Kentucky, Oct. 27, 1892.

Bar'bel: a fish of the genus *Barbus*; of the carp family, or *Cyprinidae*. It resembles the American sucker, but is furnished with four soft barbels, pendent from the snout

Barbel (*Barbus barbus*).

and upper jaw, and suggesting the name; derived from the Latin *barba*, beard. The numerous species of barbel are all inhabitants of fresh water, and seek their food by inserting their snouts into the mud like swine. The common barbel is abundant in England, and affords sport to anglers, but is not much esteemed for food. It sometimes measures 3 feet long, and weighs about 16 lb. Another species called binny or barbel is abundant in the Nile and the Jordan, and is esteemed for food. It sometimes weighs 70 lb. D. S. J.

Barbé-Marbois, bāār-bay' māār-bwaā', FRANÇOIS, Marquis de: French statesman; b. at Metz, Jan. 31, 1745; consul-general to the U. S., and intendant of San Domingo (1785-90), where he introduced many reforms; returned to France, and in 1795 became a member of the council of elders, but was accused of various offenses and exiled; recalled in 1801, he became director of the treasury under Napoleon; negotiated the sale of Louisiana to the U. S.; was made a Senator in 1813, and Minister of Justice in 1816. He wrote *Complot d'Arnold* (1816); *Histoire de la Louisiane* (1828), etc. D. Jan. 14, 1837.

Barber [earlier *barbour*, from O. Fr. *barbeor*, as if from Lat. **barba'tor*, deriv. of Lat. *barba*, beard]: a person who shaves others and cuts their hair. This trade or profession is very ancient, and is mentioned by the prophet Ezekiel (chap. v. 1). In China and other Oriental countries barbers shave the whole or part of the head. The practice of shaving the beard was common among the ancient Egyptians, Greeks, and Romans. Among the ancient Israelites the re-

moval of the beard by shaving or plucking it out was a sign of mourning. In former times barbers served the public in the capacity of surgeons, and performed the operation of bleeding. The spiral red stripe seen on the barber's pole is said to symbolize the winding of a ribbon round the arm previous to letting blood. In London the barber-surgeons formed a corporation with certain privileges. They were incorporated in England in 1461, and were united with the surgeons in the reign of Henry VIII. The connection was dissolved in the reign of George II. by an act, the preamble of which affirms that the trade of a barber is "foreign to and independent of the practice of surgery." Quite recently the surgeons of the Swedish navy were also barbers for the crews. The barber's art was practiced in Greece about 420 B. C., and is said to have been brought from Sicily to Rome in 299 B. C.

Barber, FRANCIS: soldier and teacher; b. at Princeton, N. J., in 1751; graduated at Princeton in 1767. He entered the army in 1776 with the rank of major, and took part in the battles of Trenton, Princeton, Brandywine, Germantown, and Monmouth. He was afterward raised to the rank of colonel, and in 1781 was selected by Gen. Washington for the delicate duty of suppressing a mutiny of the troops, which he performed with success. He was killed accidentally by the fall of a tree at Newburg, Jan. 11, 1783.

Barber, JOHN WARNER: b. at Windsor, Conn., in 1798. He published a *History of New Haven* (1831); *Historical Collections of Connecticut* (1836), Massachusetts (1839), New Jersey (1844), Virginia (1844), Ohio (1847); *Incidents of American History* (1847); *Elements of General History* (1844); *Our Whole Country* (1861), and several other works. D. at New Haven, Conn., June, 1885.

Barberini, bāār-be-ree'nee, FRANCESCO: an Italian cardinal; nephew of Pope Urban VIII.; b. in Florence in 1597. He became librarian of the Vatican, and translated the twelve books of Marcus Aurelius from Greek into Italian. He was the founder of the great Barberini Library. D. in Rome in 1679.

Bar'berry: a plant of the genus *Berberis* and family *Berberidaceae*; comprises many species, which are all shrubs and natives of temperate climates in both hemispheres. They have six stamens, which, when touched at the base, exhibit irritability. The fruit is a berry with two or three seeds. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the *Berberis*, and those with pinnate leaves the sub-genus *Mahonia*. The barberries of Asia are numerous and important for their fruits. Those of our Pacific slope are *Mahonias*. The common barberry (*Berberis vulgaris*) is a native of Europe, sparingly naturalized in the U. S., a shrub armed with spines, and produces small oval red berries in pendulous clusters, which contain free malic acid, and are valuable for preserves and jelly. The bark is astringent, and is used in medicine, and the inner bark and root furnish a good yellow dye. On account of its yellow color the inner bark was formerly in much repute as a remedy for jaundice. Several fine species of *Berberis* grow in the central and western portions of North America. *B. aquifolium*, with spiny leaves and yellow flowers, is generally cultivated as an ornamental shrub. *B. pinnata* of Oregon bears blue, acid berries, and is sometimes called the *Oregon grape*. *B. canadensis* is a native of the Alleghanies. Parts of South America abound in native species of the barberry.

Barberry Family (*Berberidaceae*): herbaceous or shrubby dicotyledons, with the parts of the flower all free from one another, and one or few simple pistils. Therefore related to buttercups, magnolias, and moonseeds. There are about 100 species, widely distributed, especially in temperate regions. The barberry and May-apple are well-known members of this family. CHARLES E. BESSEY.

Barber's Itch: a term applied somewhat indiscriminately by the public and many physicians to two distinct diseases. 1. A majority of cases are instances of *sycosis non-parasitica*, or pustular eruption on the face, from the irritation of too frequent and close shaving. The face is inflamed, red, tender, and nodular, with numerous pustules of various size, discharging pus, which mats in the stumps of the beard and forms scabs. 2. The second form is the true barber's itch, or *Tinea sycosis*, contracted by contact of person or the soiled and contaminated razors and brushes of the barber. It is really "ringworm in the beard." Each hair of the infected beard is covered with a whitish powder of parasitic

scales or sporules. The parasitic vegetation is the *Trichophyton tonsurans*. In either the *syccosis non-parasitica* or the true *syccosis* the inflammation is to be removed by frequent applications of cold water, perfect cleanliness, and soothing lotions, as of glycerine, opium, and acetate of lead. With the first form such methods will suffice. In the second or parasitic form all the infected hairs should be pulled out with the depilation-forceps, and the parasites destroyed in the hair-follicles by parasiticide lotions or unguents. Chief of these are sulphurous acid, either pure or diluted, carbolic acid in glycerine, weak solutions of corrosive sublimate, and ointments of sulphur, nitrate of mercury, and white precipitate.

Revised by WILLIAM PEPPER.

Bar'bet [Fr. and O. Fr. *barbet*, from Lat. *barbatus*, bearded, deriv. of *barba*, beard]: a bird of the genus *Laimodon*; related to the *Picidae*, or woodpeckers. The barbets have a large conical beak surrounded with tufts of bristles; hence the name. They inhabit warm countries, particularly tropical Africa, and feed on insects.

BARBET is also the name given to birds of various genera, chiefly South American and Asiatic, allied to the kingfishers and the trogons.

Revised by D. S. JORDAN.

Barbet: a small variety of the poodle-dog, remarkable for its activity, intelligence, and fidelity to its master; but equally distinguished for its ill-temper and its dislike of all strangers. It is also very liable to disease, and hence is not a general favorite.

Barbey d'Aureville, bãr-bay'dō-re-věe-lee', JULES ANÉDÉE: French novelist; b. at St. Sauveur-le-Vicomte, Nov. 2, 1808; wrote a great number of volumes of a character, on the whole, very brutal and perverse. He, however, attracted the attention of a certain noisy set of writers and readers. The most lauded of his productions are *Une vieille maîtresse* (1851, 5th ed. 1886); *L'Ensorcellée* (1854); *Les Œuvres et les Hommes, XIX^e Siècle* (7 parties, 1861-87); *Le Chevalier Destouches* (1864); *Memoranda* (1885). D. in Paris, Apr. 23, 1889.

A. R. MARSH.

Barbier, bãr'bi-ay', PAUL JULES: French dramatist of remarkable fecundity; b. in Paris, Mar. 8, 1825. His first work was *l'Ombre de Molière*, played at the Théâtre Français (Jan. 15, 1847). Since then he has written almost innumerable plays, besides librettos for both grand and comic opera. He has had many *collaborateurs*, among them Carré, Barrière, Decourcelle. His librettos have been set to music by Meyerbeer, Gounod, Thomas, Reyer, Saint-Saëns, and others.

A. R. MARSH.

Barbou, bãr'boo': name of a celebrated French family of printers, the descendants of John Barbou, of Lyons, who lived in the sixteenth century. His press published in 1539 a beautiful edition of the works of Clement Marot.—His son, HUGH BARBOU, having removed to Limoges, published his celebrated edition of Cicero's *Letters to Atticus*, 1580.—JOSEPH GÉRARD BARBOU, of the same family, settled in Paris, and continued in 1755 a series of Latin classics in duodecimo, begun in 1743 by Coustelier. The series rivals the Elzevirs of earlier date, and is much prized for its elegance and correctness.

C. H. THURBER.

Bar'bour, JAMES: statesman; b. in Orange co., Va., June 10, 1775. He was Governor of Virginia 1812-14; author of Virginia anti-dueling law, and a Senator of the U. S. 1815-25. He voted to recharter the U. S. bank, and became president of the Senate *pro tem*. He was Secretary of War in the cabinet of John Quincy Adams (1825-27); was sent as minister to England in 1828, but was recalled in 1829. In 1839 he was president of the Whig national convention. D. in Orange co., Va., June 8, 1842.

Barbour, or **Barber**, JOHN: Scottish poet; a contemporary of Chaucer; b. about 1320. He became Archdeacon of Aberdeen in 1356, and went to Oxford in 1357 to complete his education. About 1374 he was appointed one of the auditors of the exchequer. His chief work is a natural epic called *The Bruce*, a history of Robert Bruce, which, in addition to its poetical merit, has much historical value. D. Mar. 13, 1396.

Barbour, JOHN HUMPHREY: divine, educator, and writer of the Protestant Episcopal Church; b. at Torrington, Conn., May 29, 1854; educated at Trinity College, Hartford, and at the Berkeley Divinity School, Middletown, Conn.; ordained priest in 1878. Rector of Grace Chapel, Hartford, Conn., 1876-89; librarian of Trinity College 1882-89; Professor of the Literature and Interpretation of the New Testament in the Berkeley Divinity School, and

librarian, since 1889. His *Beginnings of the Historic Episcopate* (New York, 1887) has reached a second edition.

WILLIAM STEVENS PERRY.

Barbour, JOHN S.: U. S. Senator; b. in Culpeper co., Va., Dec. 29, 1820; bore the name of his father (1790-1855), who served five terms in Congress (1823-33), and was a States-rights advocate; studied law at University of Virginia; served in the Virginia Legislature; president of the Orange and Alexandria R. R.; in Congress from 1881-87; chairman of the committee which overthrew the Mahone hold upon Virginia; U. S. Senator in 1889. D. in Washington, D. C., May 14, 1892.

Barbour, OLIVER LORENZO: lawyer; b. at Cambridge, Washington co., N. Y., July 12, 1811. He was reporter of the New York Court of Chancery from 1847-49; of the New York Supreme Court from 1849-76. Hamilton College made him LL. D. in 1859. D. at Saratoga, N. Y., Dec. 17, 1889.

Barbour, PHILIP PENDLETON: a jurist; b. in Orange co., Va., May 25, 1783; was a brother of James, noticed above. He gained distinction as a criminal lawyer; became a member of Congress in 1814; was chosen Speaker of the House (1821), resigned 1825; re-elected to Congress 1827, resigned again 1830. He was appointed an associate judge of the Supreme Court of the U. S. in 1836. D. at Washington, D. C., Feb. 24, 1841.

Barbour, WILLIAM McLEOD, D. D.: Congregationalist; b. at Fochabers, Scotland, May 29, 1827; graduated at Oberlin College 1859, and at Andover Theological Seminary 1861. He was pastor at South Danvers (now Peabody), Mass., 1861-68, professor in Bangor Theological Seminary 1868-77, and Professor of Divinity in Yale College from 1877 until 1887, and principal and Professor of Theology in the Congregational College in Montreal, Canada, 1887-96.

GEORGE P. FISHER.

Bar'bourville: capital of Knox co., Ky. (for location of county, see map of Kentucky, ref. 5-I); on L. and N. R. R., and on the Cumberland river, 116 miles S. E. of Frankfort. It is situated in a farming, mining, and lumbering region. Pop. (1880) 250; (1890) 1,162; (1900) 1,010.

Barboursville, or **Cab'ell Court-house**: the capital of Cabell co., West Va. (for location, see map of West Virginia, ref. 8-D); on railroad and the Guyandotte river, 154 miles S. W. of Wheeling. It became the seat of a State normal school. July 13, 1861, it was the scene of a brilliant action in which the Federal troops were successful. Pop. (1880) 361; (1890) district, 1,838; (1900) district, 2,118; town, 429.

Barboza: Brazilian poet. See CALDAS BARBOZA, DOMINGOS.

Barbuda, bãr-boo'da (Fr. *La Barboude*): one of the British West India islands; 22 miles N. of Antigua (see map of West Indies, ref. 6-M). Its area is 60 sq. miles. It is of coral formation, has no harbor, and is partly covered with forests. It is a dependency of Antigua, in the colony of the Leeward islands. It belongs to the Codrington family, and has a local proprietary government.

Bar'ca (anc. *Cyrena'ica*): a maritime district of Northern Africa; bounded N. by the Mediterranean, E. by Egypt, S. by the Libyan desert, and W. by Tripoli and the Gulf of Sidra; area about 60,700 sq. miles. It is deficient in permanent streams, and the southern part is a desert, but the soil near the sea is fertile. On the mountain-sides are pines, date-palms, and olive trees. The inhabitants are Arabs and Berbers, who are Mohammedans. Formerly it belonged to Tripoli, but since 1869 has been immediately dependent upon Turkey. Pop. estimated at 302,000. Capital, Benghazi.

Barcelona, bãr-se-lō'na, or bãr-thăy-lō'na: a province of Spain; comprising the southeastern part of Catalonia, and sloping toward the Mediterranean. It has an area of 2,985 sq. miles. It is one of the most fertile and best-cultivated provinces of Spain. Pop. (1887) 899,264.

Barcelona [Lat. *Bar'cino*; Gr. Βαρκελών; name said to be from *Barca*, the surname of the Carthaginian general Hamilcar]: the most important manufacturing city of Spain; capital of the province of the same name; in Catalonia, beautifully situated on the Mediterranean; 113 miles E. of Lerida; lat. 41° 23' N., lon. 2° 11' E. (see map of Spain, ref. 14-K). Next to Cadiz, it is the most important seaport of Spain. Pop. (1887) 272,481. It is surrounded by a wall, and defended by a citadel and the strong fort of Montjoi. The city is divided into the old and the new town by a beautiful prome-

nade called La Rambla. The streets of the new town are more spacious and regular than those of the old. Many of the houses are built of hewn stone, and have an imposing appearance. The most remarkable public edifices are the Gothic cathedral, which is about 600 years old, and the Audiencia, or Palacio de la Deputación, which is now occupied by the courts of law. Barcelona has a university, several public libraries, a fine theater, an academy of arts and sciences, and two museums. Here are extensive manufactures of silks, woolen stuffs, calicoes or figured cotton stuffs, lace, shoes, and firearms, which, with copper, wine, and brandy, constitute the principal exports of the city. The harbor is commodious, but is obstructed by a bar which excludes vessels drawing more than 12 feet of water. This is the most populous city of Spain except Madrid. Barcelona is supposed to have been founded by Hamilear Barca. The Romans became masters of it at the end of the third Punic war (146 B. C.). It was taken by the Saracens or Moors about 714 A. D., and became an independent state in 878. In the twelfth century it was annexed to Aragon. In 1714 it was taken by the Duke of Berwick after a long and heroic defense.

Barcelona: a town and seaport of Venezuela; capital of the state of Bermudez; on the Caribbean Sea; at the mouth of the river Neveri; lat. 10° 10' N., lon. 64° 48' W. (see map of South America, ref. 1-D). The houses are built of mud, and the climate is unhealthful. Pop. 13,000.

Bar'clay, or Barklay, ALEXANDER: British writer and translator; supposed to have been born in Scotland about 1475. He studied in one of the English universities, traveled on the Continent, and was made a priest in the College of Ottery St. Mary in Devonshire. He afterward entered the Benedictine monastery of Ely, probably in 1511, and on the dissolution of the monasteries, in 1546, he became Vicar of Much Badew, and in March Vicar of Wokey. The first named he held till his death; the second he resigned in 1552 to accept the rectory of All Hallows, Lombard Street, London. He wrote the lives of several saints, translated Sallust's *Jugurthine War* and a French poem called *The Castle of Labor* (1506). His most popular work is his *Ship of Fools* (1509), a free translation from the German of Sebastian Brandt. D. at Croydon; buried there June 10, 1552. See Jamieson's edition of the *Ship of Fools* (Edinburgh, 1874). Revised by HENRY A. BEERS.

Barclay, JOHN: English satirist; b. at Pont-à-Mousson, Lorraine, Jan. 28, 1582; d. in Rome, Aug. 15, 1621. His celebrated work *Argenis* appeared in the same year. Cowper called it the best romance that ever was written. It has been translated into numerous languages. It is a political allegory, containing several allusions to the state of Europe.

Barclay, JOHN, M. D.: b. on a farm in Perthshire, Scotland, Dec. 10, 1758; was educated at the United College of St. Andrews, where he afterward studied divinity. He was licensed as a preacher by the Dunkeld Presbytery; he became tutor at Edinburgh in 1789 to the family of Sir James Campbell, and commenced the study of medicine; took the degree of M. D. in 1796. He became a noted lecturer on anatomy, commencing his lectures at Edinburgh in 1797, and continuing them until a short time before his death. D. in Edinburgh, Aug. 21, 1826, and left to the Royal College of Surgeons his anatomical collection, afterward called the Barclayan Museum.

Barclay, ROBERT: reformer, and apologist for the Society of Friends: b. at Gordonstown, in Morayshire, Scotland, Dec. 23, 1648. He was educated in Paris at the Scottish College, of which his uncle was rector, and learned to write and speak Latin correctly and fluently. He returned to Scotland in 1664, and became a member and minister of the Society of Friends in 1667. In 1670 he married Christian Mollison, and in the same year published a defense of his fellow-religionists, entitled *Truth Cleared of Calumnies*. He afterward published a *Catechism and Confession of Faith* (1673), and the *Anarchy of the Ranters* (1676). In 1677 he visited Germany on a religious mission in company with George Fox and William Penn. In addition to superior talents, he had moral courage, which qualified him for the part of a reformer. His principal work is *An Apology for the True Christian Divinity, as the same is held forth and preached by the People called in scorn Quakers* (1676), written and published in Latin at Amsterdam, and afterward (1678) translated by the author into English, and published in London (a standard book; many later editions and re-

prints). This work exhibits great logical acumen, and has been commended by eminent persons of different creeds. In 1679 he published a *Vindication* of his *Apology*, which had been criticised by several writers. He was appointed governor of the province of East Jersey—which had been set apart for a Quaker settlement wherein their doctrine of toleration could have free scope, and the persecuted for religion's sake might find an asylum—in 1682, but he never went to America. D. at Ury, Oct. 3, 1690. His *Catechism, Treatise on Church Government*, formerly called *Anarchy of the Ranters*, and *Apology* are reprinted by the Friends' Book Store, Philadelphia. See his *Life* by Joseph G. Bevan (London, 1802), and by Wilson Armistead (Manchester, 1850); cf. *The Histories of the Quakers*, by W. Sewell (London, 1722, repr. Philadelphia, 1844), and by F. S. Turner (London, 1889). Revised by S. M. JACKSON.

Barclay de Tolly, baar'klay'de-tōl-lay', MICHAEL ANDREAS, Prince: a celebrated Russian general of Scottish extraction; was b. at Luhde-Grosshoff, Livonia, Dec. 16 (27) 1761. He fought against the Swedes in 1790, and against the Poles in 1792 and 1794. With the rank of major-general he led Benningsen's advanced guard in 1806. In 1809, at the head of 10,000 men, he crossed the frozen Gulf of Bothnia, and advanced as far as Stockholm. In 1810 he was appointed Minister of War. He became in 1812 commander-in-chief of the Army of the West, but, having been defeated by the French at Smolensko in August of that year, in obedience to popular clamor the emperor reluctantly supplanted him by Kutuzof, but after his death (1813) he again obtained the chief command of the army, which he directed at Bautzen, Culm, and Leipzig. He was raised to the rank of field-marshal in Paris in 1814. D. at Insterburg, East Prussia, May 14 (26), 1818.

Barcokh'eba, or Barkochba (i. e. son of a star), SIMON: a famous Jewish impostor, claiming to be the Messiah. The name by which he is known was given to him by Rabbi Akiba, the most noteworthy of his converts, who believed his Messianic claims and applied to him the prophecies Num. xxiv. 17; Hag. ii. 6, 7. In the reign of Hadrian (A. D. 132) he excited an insurrection among the Jews, and seized Jerusalem and many fortified places. After a long and bloody contest the city was retaken by the Roman General Julius Severus, and Barcokheba was killed in the fortress of Bethar, tradition says, on the 9th of Ab (August), 135. His disappointed countrymen afterward changed his name to Bar-coziba (son of a lie). See J. H. Schwarz, *Der Bar-Coehbaische Aufstand*, Brünn, 1885.

Revised by S. M. JACKSON.

Bard, SAMUEL, M. D., LL. D.: physician; b. in Philadelphia, Apr. 1, 1742; educated at Edinburgh, where he was an inmate in the family of Dr. Robertson, the historian. He practiced in New York city, and was the family physician of Gen. Washington. He published several medical works, and became president of the College of Physicians and Surgeons of New York. He was an active promotor of benevolent enterprises. D. at Hyde Park, N. Y., May 24, 1821. See his *Life* by Rev. John McViekar (New York, 1822).

Bardeleben, baar-de-lay'ben, KARL: German anatomist; b. at Giessen, Mar. 7, 1849; studied in Greifswald, Heidelberg, Berlin, and Leipzig, taking the degree of M. D. at Berlin in 1871; appointed prosecutor and professor in the University of Jena 1873; author of *Beiträge zur Anatomie der Wirbelsäule* (1874); *Die Gesetzmässigkeit des Knochenbaues und seine allgemeine Bedeutung*; the anatomical part of his father's *Lehrbuch der Chirurgie*, etc.

Bardesa'nes of Edes'sa, properly Bar-Daisan (i. e. son of the river Daisan, because he was born on its banks): b. at Edessa, July 11, 155 A. D.; lived at the royal court in great favor; went as missionary to Armenia after the fall of his patron (217); d. perhaps at Edessa, 223. He is commonly but not quite justly called a Gnostic. He was an astrologer, and, although in the main an orthodox Christian, had peculiarities due to Valentinian Gnostic or pagan influences. The treatise attributed to him, *The Dialogue on Fate* or *Book of the Laws of Countries*, was written by some early follower. It was known only from the fragment of the Greek translation preserved in Eusebius's *Preparatio Evangelica*, vi. 9, 10, but the complete original Syriac text was brought by Archdeacon Tattam from the Syrian convent in the Nitrian desert in 1843; recognized by W. Cureton and published by him in 1855, with an English translation; republished in the *Ante-Nicene Fathers*, vol. viii., 723-734

(New York, 1886). Ephraem Syrus, who flourished about two centuries later, says Bardesanes wrote also 150 hymns, which appear to have been more dualistic than the treatise just spoken of. The best compendious notice of Bardesanes is by Hort in Smith and Wace's *Dictionary of Christian Biography*.
Revised by S. M. JACKSON.

Bard'ings, or **Bard**, or **Barding**: a bard is any piece of armor for a horse; hence, bardings are the protective trappings of a horse, whether housings made defensive by stuffing and quilting, or chain-mail or forged pieces of steel. Such defenses were not used in antiquity; they reached their greatest development at the end of the fifteenth century. A horse thus protected is said to be barded.

RUSSELL STURGIS.

Bardsley, CHARLES WAREING: b. at Keighley, Yorkshire, England, 1834; educated at Oxford 1868; ordained deacon 1870; Vicar of Ulverston with Osmotherley, diocese of Carlisle. Author of *English Surnames, their Sources and Significations* (3d ed. 1875); *John Lexley's Troubles* (3 vols., 1876); *Memorials of St. Anne's, Manchester* (1876); *Romance of the London Directory* (2d ed. 1879); *Curiosities of Puritan Nomenclature* (2d ed. 1880); *Chronicles of the Town and Parish of Ulverston* (1884); *Her Grandfather's Bible, a Tale of Furner's Fells* (2d ed. 1886).

Bardsley, JOHN WAREING, D. D.: Bishop of Carlisle; b. at Keighley, Yorkshire, England, 1835; educated at Trinity College, Dublin; ordained in 1860, and became Bishop of Sodor and Man in 1887, whence he was transferred to Carlisle in 1892. He has published *Counsels to Candidates for Confirmation* (1882), and *The Origin of Man* (1883).

Bardstown: town (founded in 1785); capital of Nelson co., Ky. (for location of county, see map of Kentucky, ref. 3-G); on branch of L. and N. R. R.; 39 miles S. E. of Louisville; has public schools (white and colored), several academies, and six churches. Its industries are distilling, milling, and coopering. Pop. (1880) 1,803; (1890) 1,524; (1900) 1,711. EDITOR OF "NELSON COUNTY RECORD."

Barebones, **Barebone**, or **Barbon**, PRAISEGOD: b. in London in 1596; was a leather-seller; became a Baptist and preacher. He defended paedobaptism. He preached in his own large house and was very popular. He was also wealthy. On July 4, 1633, he was summoned to Parliament by Cromwell, and his enemies called the Parliament "Barebones's" or the "Little Parliament." It was dissolved the same year, and Barebones did not sit again. When Gen. Monk came to London, Barebones headed a procession of the people, and presented a remonstrance to Parliament against the restoration of Charles II. (1659). He was in the Tower during 1662. D. in London, Dec., 1679.

Revised by S. M. JACKSON.

Bare-footed Fri'ars [in Lat. *Discalceati fratres*]: an appellation of certain Roman Catholic monks who either wear sandals or go entirely barefoot. They are connected with various congregations of the strict observance in nearly all the orders. There are also barefooted nuns. In some places they wear shoes in severe weather.

Baregine, bār-ay'zhin: a mucous-like substance produced by the algæ which grow in mineral springs. It abounds in the hot springs of Barrèges in France; hence the name. It is a substance resembling, to some extent, the white of an egg, imparts a flesh-broth flavor and odor to the water, and is prized for that reason.

Bareilly, baā-ray'lēē: a city of British India: in the Northwest Provinces; on the river Jua; 151 miles E. of Delhi; principal city of a district of the same name (see map of N. India, ref. 5-E). It contains a number of mosques, a college, and many Hindu schools. Here are manufactures of cutlery, carpets, brazen water-pots, tables, and ornamental chairs. Bareilly was a scene of outrage and rapine during the mutiny of 1857, when the Sepoys murdered a number of Europeans. Pop. (1891) 121,870.

Barentz, baa'rents, WILLEM: Dutch navigator; made repeated attempts to reach China through the Arctic Ocean; reached lat. 78° N. on his third expedition; d. near Nova Zembla on June 20, 1597. In 1871 Captain Carlsen found Barentz's winter quarters undisturbed after a lapse of 274 years. A part of his journals were recovered 1875. See Van Campen's *Barentz's Relics* (London, 1877).

Barère de Vienzac, baā-rār'de-vi-ō-zaak', BERTRAND: a French demagogue and lawyer; b. at Tarbes, Sept. 10, 1755. He was elected in 1792 to the Convention, in which he voted

for the death of the king. In Apr., 1793, he was chosen a member of the Committee of Public Safety. He supported the Jacobins in their contest with the Girondists, and became the reporter of the committee which usurped supreme power in July, 1793. He was the first who proposed that "terror should be the order of the day," and he dressed the atrocious decrees of the committee in such flowery language that he was called the "Anacron of the guillotine." On the 9th Thermidor, 1794, he acted with the enemies of Robespierre. He was banished as a regicide in 1816, but was permitted to return in 1830. He has been called one of the most graceful and accomplished liars in history. D. in Paris, Jan. 13, 1841. See *Mémoires de Barère* (2 vols., Paris, 1834; 2d ed. 4 vols., 1843) and the notice of Barère in Macaulay's *Essays*.

Baretti, baā-ret'tēē, GIUSEPPE: Italian writer; b. at Turin, Apr. 25, 1719; removed to London in 1751, and became a teacher of Italian and a friend of Dr. Johnson. He published the *Italian Library* (1757); *Italian and English Dictionary* (1760); and *Travels through Spain, Portugal, and France* (1770), which is highly commended by Dr. Johnson; *Spanish and English Dictionary*; and many other works. D. in London, May 5, 1789. See G. Franchi's *Notizie intorno alla Vita di G. Baretti* (1790).

Barfod, baar'fōd, PAUL FREDERIK: a Danish historian; b. at Lyngby, Jutland, Apr. 7, 1811; became assistant in the royal library in Copenhagen 1866. His *Fortællinger af Fædrelandets Historie* appeared in 1853 (4th ed. in 1874).

R. B. ANDERSON.

Barfurush, baār-foo-roosh' (i. e. the mart of burdens): important commercial town of Persia; province of Mazanderan; on the river Bahbul; 14 miles from its entrance into the Caspian Sea, and about 110 miles N. E. of Teheran (see map of Persia and Arabia, ref. 2-H). It has an extensive trade, and contains numerous colleges and caravanserais. The bazaars are large, and filled with a great variety of goods. A good road extends from this town to its port, Meshedi-Ser, on the Caspian. Pop. 50,000.

Bargain and Sale: the act of conveying and transferring real or personal property for a valuable consideration. The term is also employed to indicate the instrument by which the transfer is made. In the law of real estate this form of conveyance is in extensive use. The original mode of conveying corporeal real estate was by means of a ceremony termed *LIVERY OF SEISIN* (*q. v.*), in which the seller delivered to the purchaser some visible symbol, such as a clod of earth or twig of a tree, in the name of the property to be conveyed. This method of conveyance came to be regarded as cumbersome and inconvenient. It was governed by strict and technical rules, and the estates that could be created by it were inelastic—not readily molded to the demands of a growing civilization. The attention of conveyancers was attracted to other methods more suited to modern necessities. These methods were found in the doctrine of uses. (See *USES*.) A use in land was a notion derived from the Roman law, by means of which the formal title remained in one person, while the beneficial estate or enjoyment of the profits appertained to another. It corresponded in the main to the idea of trusts in modern law. (See *TRUST*.) A use could be created by a pecuniary or other legal consideration. For example, if an owner of land for a pecuniary consideration purported by present words to sell it, he would be at once converted into a formal owner, and the person advancing the money would be the beneficial owner, or, in technical language, would have "a use" in the land. He could become formal or legal owner by the action of a court of equity, which would, on application, direct that a conveyance should be made. While the law was in this condition an important statute was passed, 27 Hen. VIII., c. 10, called the *Statute of Uses*, the effect of which, in substance, was to declare that one who had acquired a use under certain prescribed conditions in an estate in land should be the legal or formal, as well as the beneficial, owner. One great consequence of this statute was to introduce new conveyances. The principal one was "bargain and sale." The sale of land for a consideration, as already explained, created a use, and the statute gave the owner of the use the title. A subsequent statute (known as the *Statute of Frauds*) requires conveyances to be in writing. This is the foundation of the modern system of conveyancing, both in England and the U. S. Other conveyances, proceeding either wholly or in part on the same theory, are "covenant to stand seised" and "lease and release." In the first of these the

consideration is the affection between near relatives, technically called a "good" consideration, as distinguished from "valuable." In the second, the doctrine of uses is resorted to to put the purchaser in constructive possession of an estate for years in the land, whereupon he may receive a release, and thus become complete owner.

T. W. DWIGHT.

Bargue, baarg, CHARLES: genre-painter; b. in Paris, and died there in 1883 in poverty when about twenty-five years of age. He was a pupil of Gérôme, painted only a few pictures, and never exhibited at the Salon. His works are highly prized by collectors for their minute finish and depth of color, and for their extreme rarity. *Playing Chess on the Terrace*, his last work, is in the collection of Mrs. William H. Vanderbilt, New York.

W. A. C.

Barham, baar'am, RICHARD HARRIS (whose pen-name was *Thomas Ingoldsby*): English clergyman and humorist; b. at Canterbury, Dec. 6, 1788. He was educated at Brasenose College, Oxford; held various church livings, and in 1842 was appointed divinity lecturer at St. Paul's. His most noteworthy work is the *Ingoldsby Legends* (1840 and 1847), a series of comic tales in grotesque, irregular meters, frequently reprinted. D. in London, June 17, 1845. See his *Life* by his son (London, 2 vols., 1870; 3d ed. 1880).

HENRY A. BEERS.

Bar Harbor: a noted summer resort of Hancock co., Me. (for location of county, see map of Maine, ref. 8-F); situated on Frenchman's Bay and on east side of Mt. Desert island. Pop. of Mt. Desert town (1890) 1,355; (1900) 1,600.

Bari, baa'rēe (anc. *Barium*): a fortified city and seaport of Italy; capital of the province of Bari; situated on the Adriatic Sea, 58 miles by rail N. W. of Brindisi (see map of Italy, ref. 6-G). It is defended by a massive old castle of Norman origin. The harbor admits only small vessels. Bari is the see of an archbishop, and has some fine ecclesiastical buildings, among which is the priory of St. Nicholas, founded in 1087. It contains a cathedral, also manufactures of silk, cotton, linen, and glass. *Barium* was a very ancient city, and was flourishing as early as 200 B. C. Pop. of commune, 64,000.

Bari, or **Bari delle Puglie**, baa'rēe-dē-le-pool'ye: a province of Apulia, Italy; bounded N. E. by the Adriatic Sea, S. by Lecce and Potenza, W. by Potenza, and N. W. by Foggia; area, 2,293 sq. miles. The soil is very fertile, producing wheat, fruits, and wine. The climate is very hot in summer. Pop. (1891) 756,071. Capital, Bari.

Baril'la: a crude, impure carbonate of soda, which is a considerable article of commerce, and is used in the manufacture of soap and glass. It is procured by burning plants of the genus *Salsola* or other plants which grow near the sea. Large quantities of it are exported from Spain and the Balearic isles. The *Salsola sativa* is cultivated on ground adjacent to the sea, by which it is occasionally submerged, the sea being admitted by flood-gates through an embankment. The *Salsola* is cut in September, is dried, and burned in a hole in the ground.

Barinas, vaa-ree'naās, or **San Carlos**: a town in the state of Zamora, Venezuela; near the river Santo Domingo (see map of South America, ref. 1-C); founded in the sixteenth century; has suffered devastation twice within a century. It is noted for the exportation of the tobacco which bears its name. Pop. 4,000.

Baring, bay'ring, Sir FRANCIS: an English financier; b. at Larkbear, near Exeter, Apr. 18, 1740; was the father of Lord Ashburton, and the principal founder of the great banking-house of Baring Brothers & Co. of London. He was made a baronet in 1793. D. in London, Sept. 10, 1810.—His eldest son, THOMAS, b. June 12, 1772, was a member of the House of Commons 1830-32. D. Apr. 3, 1848. For his second son, Alexander, see ASHBURTON.

Baring-Gould, SABINE: clergyman and author; b. at Exeter, England, Jan. 28, 1834; was educated at Clare College, Cambridge; visited Iceland in 1862; took orders in 1865; was appointed curate of Horbury, subsequently of Dalton; rector of East Mersca 1871, of Lew Trenchard 1881; and published *Myths of the Middle Ages* (1868); *The Origin and Development of Religious Belief* (1870); *Legends of the Patriarchs and Prophets* (1871); *Lost and Hostile Gospels* (1874); *Lives of the Saints* (15 vols., 1872-77); *Tragedy of the Cæsars* (2 vols., 1892); and other works to the number of about fifty, chiefly on religious subjects or

relating to folk-lore, legend, and popular superstitions. He also in later years became noted for his novels, as *Mehalah*; *Richard Cable*; *John Herring*; *Gaverocks*.

Revised by HENRY A. BEERS.

Barit'ah: a large Australian bird belonging to the *Corvidæ* (crow family). The bill is large and conical, the base

Baritah, or piping crow.

of it extending far backward on the forehead. The *Gymnorhina tibicen* (piping crow or piping grackle) has a melodious voice, is easily tamed, and learns to whistle tunes. There are several genera of these birds.

Baritone: See BARYTONE.

Ba'rium [name devised by Davy from *baryta* (Gr. *Bapty*, heavy), after the analogy of *rhodium*, *strontium*]: one of the alkaline earthy metals; chem. symbol, *Ba*; atomic weight, 137. It occurs in nature chiefly in the forms of sulphate, barite, barytes, or heavy spar, of carbonate, witherite, and of silicate, harmotome. It is very rarely prepared in the metallic state. Barium salts are prepared either from the native carbonate by the action of acids, or from the native sulphate by first reducing it to sulphide by treating with sawdust or some other reducing agent, then treating this with the proper acids. The most important salts are the chloride and nitrate; both are used as tests for sulphuric acid and soluble sulphates. The chloride is used as a preventive of boiler incrustations, owing to its action on the sulphate of lime of the feed-water. It is also extensively used for the preparation of an artificial sulphate known as *blanc fixe*, which is used in enameling paper. Barium forms a protoxide, BaO , called baryta, and a dioxide, BaO_2 . The latter is employed in the preparation of hydrogen dioxide, H_2O_2 . Baric hydrate, BaH_2O_2 , is the most soluble of the alkaline earthy hydrates; it is used in the laboratory as a test for carbonic acid, with which it forms a white precipitate. Baric sulphate is one of the most insoluble salts known. In its native form, barytes or heavy spar, it is extensively mined and used to adulterate white lead, an application for which it is specially adapted by its high specific gravity. The soluble barium salts are all poisonous. Any soluble sulphate, as sodic, Glauber's salt, or magnesia sulphate, Epsom salt, is an antidote.

C. F. CHANDLER.

Bark: the outer parts of the stem of plants, especially of trees. It is best developed on trees of cool climates, such as conifers, oaks, cottonwoods, maples, etc., but the name is also applied to the outer part of the stem in many herbaceous plants. The cortical part of the stem in a hemp plant includes all the tissues outside of the woody cylinder. Here the inner bark consists largely of fibrous cells intermingled with sieve cells and soft tissue; next to this externally is a mass of soft tissue containing more or less chlorophyll, and external to this is the epidermis. This is essentially the structure of the cortex of the young stems of our trees, but as the stems become older the epidermis splits off, and soon the green parenchyma cells disappear also. The bark is henceforth composed of the aggregated annual layers of fibrous, sieve and soft tissue, intermingled with a greater or

less development of cork, i. e. modified soft tissue. (See HISTOLOGY, VEGETABLE.) The annual layers can not long be distinctly recognized in the bark, and in the older portions of trees the outer layers of bark, becoming dry and lifeless, are gradually shed or thrown off. The peculiar juices and characteristic properties of a plant are often most abundant in the true bark, which is the most important part of many medicinal plants, especially of CINCHONA (*q. v.*). In making leather, tanners prefer those kinds of bark which contain most tannic acid. Oak bark is chiefly used in the tanneries of Europe. In the U. S. the bark of several species of oak, and also that of the hemlock, is used. The Spaniards employ the inner layer of the bark of the cork-tree (*Quercus suber*), and the Australians that of the eucalyptus.

Revised by CHARLES E. BESSEY.

Bark-beetle, or Bark-beetle: any one of several coleopterous insects, belonging to the family *Scolytidae*. They bore holes in bark, deposit their eggs in the inner bark, and often kill the tree. One species (*Tomicus typographus*, or the typographic beetle) infests the forests of Germany in great numbers. In 1783 it caused the death of a million pines or more in the Hartz Forest. It receives its name from the circumstance that the burrows formed by it in feeding upon the soft wood immediately within the bark often present a rude resemblance to printed characters. The U. S. have several destructive species.

Barker, A. S.: commander U. S. N.; b. in Massachusetts, Mar. 13, 1843; graduated at the Naval Academy in 1861. He served in the steamer Mississippi at the passage of Forts Jackson and St. Philip and capture of New Orleans, Apr. 24, 1862, and in the attack on Port Hudson, Mar. 14, 1863, where the Mississippi grounded and was destroyed; and afterward in the Monongahela at the siege of Port Hudson, and was in various engagements in her with batteries on the Mississippi river; was promoted to a captaincy May 5, 1892; rear admiral 1899.

Barker, EDMUND HENRY: English philologist; b. at Hollym, Dec. 22, 1788; studied at Cambridge; edited numerous classical works, including the *Revision of Stephen's Thesaurus Linguae Graecae* (12 vols. folio); lost all he had in a lawsuit. D. in London, Mar. 21, 1839.

Barker, FORDYCE, M. D., LL. D.: b. at Wilton, Me., May 2, 1818; educated at Bowdoin College 1837, and studied medicine in Boston and Paris. He became in 1845 Professor of Midwifery in the Medical School at Brunswick, Me.; held the same position in the New York Medical College (1850-57), and in 1860 became Obstetric Physician and Professor of Midwifery at Bellevue Hospital Medical College, New York; published many papers on obstetrical and other kindred subjects, a treatise on *Seasickness*, and one on *Puerperal Diseases*. His private practice was large and lucrative. He was a model man in all the relations of life. He was president of the New York Academy of Medicine, and a leading man in his profession. D. in New York city, May 30, 1891.

Barker, GEORGE FREDERIC, M. D.: chemist and physicist; b. at Charlestown, Mass., July 14, 1835. He became an apprentice in 1851 in a philosophical instrument manufactory in Boston, where he remained until 1856, in which year he entered the Yale Scientific School, and graduated as Bachelor of Philosophy in 1858. He was chemical assistant for two winters (1858-61) in the Harvard Medical School. In 1861 he was appointed Professor of Chemistry and Geology in Wheaton College, Illinois, and was acting Professor of Chemistry in 1862-63 in the Albany Medical College, where he graduated as M. D. in 1863. Early in 1864 he became Professor of Natural Sciences in the Western University of Pennsylvania at Pittsburg, was instructor (1865) in the Yale Medical College, and was appointed Professor of Physiological Chemistry and Toxicology at Yale in 1867. In 1878 he was chosen president of the American Association for the Advancement of Science. In 1873 he became Professor of Physics in the University of Pennsylvania. In 1876 he was elected a member of the National Academy of Sciences. In 1881 he received the decoration of commander of the Legion of Honor from the French Government. He was one of the U. S. commissioners to the Paris Int. Elec. Exhibition in 1881, a delegate to the Int. Congress of Electricians, and a vice-president of the jury. He was appointed by President Arthur a member of the U. S. Electrical Commission in 1884. Among his various productions may be named a *Lecture on the Force of*

Nature, delivered (1863) before the Chemical Society of Union College, by whom it was published; and one on the *Correlation of Vital and Physical Forces*, delivered (Dec. 31, 1869) before the American Institute in New York; republished in France. He is the author of a *Text-book of Elementary Chemistry* (New York, 1870), which has already passed through twenty editions.

Barker's Mill, or Segner's Wheel: a hydraulic machine invented by Dr. Barker toward the end of the seventeenth century. It is a device in which the reaction due to two water jets, *c c* (see cut), is utilized to produce rotary motion. The tube from which the jets issue tends to revolve in the direction opposed to that of the water emitted. The machine is sometimes called the *centrifugal mill*.

E. L. N.

Barking-bird (*Hylactes tarsi*): a small bird of the family *Pteroptochidae*, found in Chili; remarkable for its cry like the yelping of a small dog.

Barker's mill.

Barks'dale, WILLIAM: a brigadier-general in the Confederate service; b. in Rutherford co., Tenn., Aug. 21, 1821; killed at Gettysburg, Pa., July 2, 1863. He was educated at Nashville University, removed to Mississippi, studied law, and was admitted to the bar. He served in the Mexican war. In 1853 he was elected to Congress from Mississippi, and resigned his congressional seat and became a brigadier-general in the Confederate army; and it was at the head of his brigade that he was killed on the second day of the battle of Gettysburg.

Bar'laam: b. at Seminara in Calabria, Southern Italy, near the end of the thirteenth century; was of Greek descent. He became a monk in a Roman Catholic monastery of the order of St. Basil; continued his studies afterward at Thessalonica, becoming proficient in theology, philosophy, and mathematics; went to Constantinople in 1327, where he joined the Greek Church, and was made Abbot of St. Salvador (1331). In 1339 he was sent by the emperor to Avignon to try to bring about a union between the Greek and Latin Churches, but the scheme failed. Being condemned for heresy, he returned to Italy and the Roman Church in 1341, and was made Bishop of Gerace in Calabria in 1342. He is chiefly known, however, as the person from whom Petrarch unsuccessfully endeavored to learn Greek. D. there in 1348.

Barlaam and Jos'aphat (or Joasaph): a Greek religious romance or legend, often erroneously attributed to Johannes Damascenus, a Byzantine theologian of the eighth century. According to the legend, Josaphat is the son of a heathen King of India. In consequence of an astrologer's prediction, he is shut up in a palace by his father, and surrounded with young and beautiful attendants, in order that he may learn nothing of misery, disease, or death. Later the prince is allowed to make excursions from his retreat, but the streets are carefully cleared of the sick and unfortunate. By accident, however, he sees on one occasion a blind man and a leper, and on another he meets a man broken down by age. These sights, and the explanation of them given him by his tutors, make him very thoughtful. Barlaam, an ascetic, gets admitted to the prince, and converts him to Christianity and the monastic ideal. The prayers and threats of the king and the temptations devised by the magician Theudas can not shake Josaphat's faith, and both the king and Theudas become converts. Forty days after his father's death Josaphat abdicates. After long and perilous wanderings he finds Barlaam, and joins in his ascetic devotions, remaining with him till the old monk dies, and continuing the same austerities till his own happy end. The narrative contains a number of parables (such as *The Trumpet of Death*, *The Caskets*, *The Fowler and the Bird*, *The Man in the Pit*), which became a part of the anecdotic literature of the later Middle Ages (see Benfey, *Pantschatantra*, i. 80; Braunholtz, in the bibliography at the end of this article; T. F. Crane, *Exempla from the Sermones Vulgares of Jacques de Vitry*, London, 1890; Oesterley, *Gesta Romanorum*, pp. 736, 739, 745, etc.). It also contains an elaborate exposition

of Christian theology (with a marked tendency to polemic against the Monotheistic heresy) and of Christian ethics. The author is enthusiastic in his praise of the monastic life. His style is rhetorical, and shows the influence of John Chrysostom and Gregory Nazianzen.

Barlaam and Josaphat is really a Christian *rifacimento* of a lost Sanskrit or Pāli legendary biography of the Būddha, and most of the parables it contains are Būddhistic (see Liebrecht, who compares the *Lalitavistara*). The name *Josaphat* has even been identified with *Bodhissatva*, a title of the Būddha (*Zeitschrift der Deutschen Morgenländ. Gesellschaft*, xxiv. 480; Zotenberg, p. 68; Hommel, p. 178). Yet both Barlaam and Josaphat stand as saints in the Roman Martyrologium (Nov. 27) and the Greek Menæa (Aug. 26). The history of the passage of this Būddhist legend into Christian hagiology is obscure. The author of the Greek romance professes to have heard the story from certain pious (εὐλαβεῖς) men of India, who had translated it from trustworthy records or memorials. Zotenberg, combining this statement with another embodied in the title as given in most of the older MSS., thinks it likely that this Greek romance was written by John, a monk of the convent of St. Saba in Jerusalem, about 634, on the basis of communications from Nestorians from India. But one of the oldest MSS. (eleventh century) asserts that the book was translated from Iberian (i. e. Georgian, Grusinian) by Euthymius Iberus (d. 1026); and the discovery in 1887 of a Grusinian version has persuaded Rosen of the truth of this note. He supposes the monk John, who can not in any case be Johannes Damascenus, to have written the romance (probably in Syriac) in the first part of the seventh century, deriving his materials from Nestorian pilgrims. John's text, he conjectures, was turned into Grusinian by monks of the same convent, and this Grusinian translation was the source of the Greek romance, which he takes to be the work of Euthymius. The extant Grusinian version bears the name of Sophron Palæstinus, whom Hommel wishes to identify with Sophron, the friend of St. Jerome (fourth century). Hommel derives this text from a lost Syriac version of a Pehlevi translation (also lost) of the original Būddhist legend, and compares the literary history of the *Kalilah wa-Dimnah* (see PILPAY). He postulates a similar derivation for three non-Christian versions of the *Barlaam* that have come down to us: (1) Arabic, thought to be by the celebrated physician Rhazes (ar-Rāzī, ninth to tenth century), and preserved in an unpublished work of al-Kummī (d. 991) on the Mahdī and in an unpublished Persian translation; (2) Arabic, an anonymous abstract in a Halle MS., edited by Hommel, *Abhandlungen des VII. internat. Orientalisten-Congresses zu Wien*, 1887; (3) Hebrew, by Ibn Chisdai, a Spanish Jew (d. 1240), based on a lost Arabic translation. From these three versions, the relations of which have not been fully cleared up, it is possible partly to reconstruct the Būddhist form of the legend.

The Greek *Barlaam and Josaphat* was very popular. It was translated into Arabic (earliest MS. thirteenth century), and thence into Ethiopic (1553). A Slavonic rendering made it known to Servia, Bulgaria, Roumania, and Russia. Fragments of a French version have been discovered. A Latin translation was made in the twelfth century, and this was inserted by Vincent of Beauvais (d. 1264) in his *Speculum Historiale* (bk. xv., ch. 1-63), was condensed by Jacobus a Voragine (1230-98) for his *Legenda Aurea* (see JACOBUS A VORAGINE), and has given rise, mediately or immediately, to prose or verse translations in almost all the tongues of Western Europe. Thus there are versions in French (poem of Gui de Cambrai, thirteenth century; poem of the Anglo-Norman Chardry, thirteenth century; prose, twelfth century; mystery, about 1400), Provençal (prose, MS. of 1343), Spanish, Italian (various prose texts; mystery), Rhæto-Romanic (prose, seventeenth century or earlier), Czech (MSS. of fifteenth century), Middle High German (poem of Rudolf von Ems, thirteenth century; other fragments), Norse (*Barlaam og Josaphats Soga*, about 1200), Swedish (prose, fifteenth century), Icelandic (fifteenth century), Middle English (prose and verse), etc. A complete catalogue would take much space.

G. L. KITREDGE.

Bar-le-Duc, baar'le-dük', or **Bar-sur-Ornain**, baar'sür-ōr-nāin': a town of France; capital of the department of Meuse; is on the river Ornain, and on the railway which connects Paris with Nancy, 159 miles by rail E. of Paris (see map of France, ref. 3-H). It has a communal college, a normal school, and a public library; also manufactures of cotton stuffs, hosiery, and calicoes. Its trade is facilitated by a canal which connects the Marne with the Rhine. Pop. (1896) 18,249.

Barlet'ta (anc. *Bardulum*): a fortified seaport of Italy; in the province of Bari; on the Adriatic, and on a rocky island 34 miles by rail W. N. W. of Bari; lat. 41° 20' N., lon. 16° 19' E. (see map of Italy, ref. 5-F). It is well built, has handsome stone houses, and wide, well-paved streets. It contains a fine cathedral, a college, a strong citadel or castle, and a colossal statue of the Emperor Heraclius, said to have been found in the sea. Grain, wine, oil, and fruits are exported from this town. Pop. 35,000.

Barley (in Lat. *hor'deum*): a valuable cereal of the family *Gramineæ*; said to be more widely distributed than any other grain. It was cultivated by the ancient Hebrews, Greeks, and Romans, and was an important article of food in remote antiquity; mentioned in Exodus ix. 31. It is adapted to both cold and warm climates. Three species are known to agriculture, the common (*Hor'deum vulgare*) two-rowed (*H. distichon*) and the six-rowed (*H. hexastichon*). Late writers regard these as forms of one species. Barley meal is used for bread in Northern Europe, but in many parts of the world this grain is mostly malted (*germinated*) for the manufacture of beer. It is also valuable as food for horses. When the pellicle of the grain is removed and the grain is rounded, it is called pearl-barley, which is used as food for invalids. The sprat or battledore barley (sometimes called German rice) is much esteemed in Germany. It has only two rows, and has widely spreading awns. The Nepal or Himalaya barley is well adapted for cold and mountainous regions, as it produces good crops at the height of 14,000 feet above the level of the sea. Barley is sown in the spring, and is cultivated in the same manner as spring wheat. Nearly all the American barley is used for malt.

Revised by L. H. BAILEY.

Barleycorn, JOHN: a personification of the spirit of barley or malt liquor; used in humorous poetical composition and in jocular parlance. There is an old whimsical English tract entitled *The Arraigning and Indicting of Sir John Barleycorn*, printed for Timothy Tossopot, in which Barleycorn is described as of "noble blood, well beloved in England," etc.; but John Barleycorn is best known from Burns's humorous poem of that name.

Barlow, FRANCIS CHANNING: major-general; b. at Brooklyn, N. Y., Oct. 19, 1834; graduated first in his class at Harvard College in 1855; served in the Union army 1862-65. He was at Fair Oaks and in almost every subsequent battle of the Army of the Potomac, and won a distinguished reputation as a brave and able officer. He was Secretary of State

for New York in 1866-68, and was elected Attorney-General of New York in 1871. From 1873 he practiced law in New York city, where he died Jan. 11, 1896.

Barlow, JOEL: poet; b. at Redding, Conn., Mar. 24, 1754; graduated at Yale College in 1778. He served as chaplain in the army in the Revolutionary war, after which he studied law. He produced in 1787 *The Vision of Columbus*, a poem which was very popular, and which he expanded into an epic, *The Columbiad* (1807). Having visited Europe on business in 1788, he passed some years in Paris during the French Revolution, and amassed a competence by trade or speculation. He returned to the U. S. in 1805. He was sent as ambassador to France in 1811, and died near Cracow, Dec. 24, 1812, while on his way to Wilna, whither he had been invited to meet Napoleon. His best poem is *Hasty Pudding* (1793), a mock heroic. See *Life and Letters of Joel Barlow*, by Charles Burr Todd (New York, 1886). Revised by HENRY A. BEERS.

Barlow, WILLIAM HENRY, F. R. S.: civil engineer; past president of the Institution of Civil Engineers; hon. mem. Société des Ingénieurs Civils; son of Prof. Barlow. B. at Woolwich, England, 1812; educated at Woolwich; pupil of H. B. Palmer, M. I. C. E. In 1832 erected buildings and plant at Constantinople for reconstruction of Turkish ordnance for Messrs. Maudsley & Field; reported on lighthouse at entrance of Bosphorus; received the decoration of "Nishan." In 1833 was assistant engineer of the Birmingham and Manchester Railway, then resident engineer of the Midland Counties; became engineer of the Midland Railway when formed. In 1857 he took offices in London and became consulting engineer of the Midland Company. He made many of the new lines of the Midland Railway, including its London end and the St. Pancras station. He was joint engineer with Sir John Hawkshaw for the completion of Clifton bridge, a description of which he contributed to the Institution of Civil Engineers. He was associated with Sir John Fowler and Mr. T. Harrison to decide the general-plan of the Forth bridge, and himself designed and constructed the new Tay bridge. He was one of the judges of the Centennial Exposition (Philadelphia, 1876), and vice-president of the Royal Society in 1881. He did much to facilitate the use of steel in constructions, and was a member of three Government commissions: 1. To decide the coefficient for steel to be used in engineering structures; 2. To ascertain the cause of the fall of the first Tay bridge; 3. To report on the provision against wind-pressures in engineering structures.

He was a member of the Ordnance Committee in 1881, which he resigned from ill health in 1888. He became a member of the Institution of Civil Engineers in 1845, and its president in 1880. His wife was Selina Crawford, daughter of W. Coffin, of the Royal arsenal. He has written several papers for the Philosophical Society, and taken part in numerous papers and discussions in the Institution of Civil Engineers upon almost every department of engineering.

WM. R. HUTTON.

Bar'mecides (sing. **Barmecide**): the name of a distinguished and powerful Persian family, which was derived from Barmak or Barmek. His son, Khâled-ben-Barmak, became the Prime Minister of the Caliph Al-Mansoor, and also of Al-Mahdi, who appointed him tutor to Haroun-al-Raschid. Yahya, the son of Khâled, was vizier under Haroun-al-Raschid, to whom he rendered important services. Yahya had four sons, named Fadhl, Mohammed, Musa, and Jaafar, who enjoyed the favor of the sovereign. Fadhl was vizier for some time. Haroun-al-Raschid, who was jealous of their power and popularity, ordered them to be put to death about 802 A. D. (See JAAFAR.) The virtues and misfortunes of the Barmecides have been celebrated by many Oriental poets and historians.

Barmecide's Feast: the name of a celebrated tale from the *Arabian Nights*; often applied to an ostentatious display of worthless bounty. The tale is as follows: Schacabac being reduced to great poverty, and having eaten nothing for two days together, made a visit to a noble Barmecide in Persia, who was very hospitable, but withal a great humorist. The Barmecide was sitting at his table, that seemed ready covered for an entertainment. Upon hearing Schacabac's complaint, he desired him to sit down and fall to. He then gave him an empty plate, and asked him how he liked his rice-soup. Schacabac, who was a man of wit, and resolved to comply with the Barmecide in all his humors, told him it was admirable, and at the same time lifted up the empty spoon to

his mouth [apparently] with great pleasure. The Barmecide then asked him if he ever saw whiter bread. Schacabac, who saw neither bread nor meat, answered, "If I did not like it, you may be sure I should not eat so heartily of it." Several other fine dishes were served up in idea, which both of them commended and feasted on after the same manner. This was followed by an invisible dessert; and Schacabac, at length being tired of moving his jaws up and down to no purpose, desired to be excused, for that really he was so full he could not eat a bit more. "Come, then," said the Barmecide, "you shall taste of my wines, which, I may say without vanity, are the best in Persia." He then filled their glasses out of an empty decanter. Schacabac would have excused himself from drinking so much at once, because he said he was a little quarrelsome in his liquor; however, being pressed to it, he pretended to take it off, having beforehand praised the color and afterward the flavor. Being plied with other imaginary bumpers of different wines, he pretended to grow flustered, and gave the Barmecide a box on the ear; but immediately recovering himself, "Sir," said he, "I beg ten thousand pardons, but I told you before that it was my misfortune to be quarrelsome in my drink." The Barmecide, who was pleased with the complaisance of his guest, then ordered a good substantial dinner to be served up.

Bar'men: a town and valley of Rhenish Prussia; on river Wipper; 17 miles by rail E. N. E. of Düsseldorf. The town is 3 miles E. of Elberfeld, or, according to one statement, is a continuation of Elberfeld, with which it forms one uninterrupted street 6 miles long (see map of German Empire, ref. 4-C). Barmen is the principal seat of the ribbon manufacture on the Continent, and its fabrics are distributed to all parts of the world. Here are also manufactures of cotton and linen goods, velvet, lace, hardware, and chemical products. The district which contains Barmen and Elberfeld is the most populous, industrious, and thriving in Germany. Barmen has a handsome church, an asylum for the deaf and dumb, an exchange, etc. Pop. (1885) 103,066; (1895) 126,992.

Bar'nabas [Gr. Βαρνάβας, from a Heb. word meaning son of consolation], SAINT: an early Christian and apostle; originally named JOSEPH; was born in the island of Cyprus. He was a companion and fellow-laborer of the apostle Paul on his first missionary journey, and appears to have been the principal founder of the church of Antioch, to which he was sent by the church of Jerusalem. "He was a good man, and full of the Holy Ghost and of faith" (Acts xi. 24). His falling out with Paul prevented his going with the latter on his second missionary journey (Acts xv. 39). He returned to Cyprus, and was still active in A. D. 57 (cf. 1 Cor. ix. 6). According to one tradition, he was the first Bishop of Milan.

Barnabas, Epistle of: an epistle of twenty-one chapters, which is supposed to have been written between 107-120 A. D. After having been lost sight of for several centuries, this epistle was first published in 1645, but the first four chapters and a part of the fifth were only in Latin. In 1859 Tischendorf discovered the whole in Greek MS. of the fourth century at Mt. Sinai, and it was published in 1862. Another MS. (dated 1056) was discovered at Constantinople by Bryennios in 1875. It was formerly ascribed to the apostle Barnabas, but it is evidently the work of another and later hand. It is frequently cited by the Fathers, and was by many regarded as being of authority in the Church, some even claiming for it a place in the sacred canon. It is chiefly directed against the Judaizing Christians, and its principal value now is in the light it throws upon the customs and doctrines of the Christians of that time. Several English translations have been published. The best recent editions of Barnabas are by Funk (1878) and Gebhardt and Harnack (1878), and that contributed by Rev. J. R. Harmer, Fellow of Christ Church College, Cambridge, to the edition of *The Apostolic Fathers*, issued by the trustees of the Lightfoot Fund (1891). This text and translation, prepared by the personal friend and collaborateur of the late Bishop of Durham, leaves nothing wanting for the critical study of this epistle.

Revised by W. S. PERRY.

Bar'nabites: an order of monks which was founded by Zaccaria at Milan in 1530, and were so called because they preached in the church of St. Barnabas. Their designation properly is "Regular Clerks of the Congregation of St. Paul." Their duties were to attend the sick, to preach, to instruct the young, etc. They became numerous, and established monasteries or colleges in Italy, France, Austria, and Spain.

Bar'naby, Sir NATHANIEL, K. C. B.: chief naval architect and director of naval construction of the British navy; b. in Chatham in 1829, of a family which has produced many generations of shipwrights in the royal dockyards. Apprenticed to the trade of shipwright at Sheerness in 1843, in 1848 he won by competition an Admiralty scholarship in the school of naval architecture at Portsmouth. In 1854 he superintended the construction of two gun-vessels built for the royal navy. In 1855 he entered the designing-office at the Admiralty, and during the thirty years he served there he was concerned in the design and construction of all but three of the entire list of British sea-going fighting ships, armored and unarmored, in existence, or building at the time of his retirement in 1885. From 1863 to 1870 this office was under the control of Sir Edward J. Reed, who also is credited with the design of some 35,000 tons of ironclads during the first three years of his service. Mr. Barnaby was appointed chief naval constructor in 1872, after the retirement of Sir E. J. Reed. He aided in the substitution of steel for iron in ship-building. He initiated the Admiralty list of subsidized merchant ships, constructed with appreciable fighting or transportation value in time of war. One of the four founders of the Institute of Naval Architects in 1860, he has contributed many papers to its Transactions, and wrote the articles on the *Navy and Ship-building* for the *Encyclopædia Britannica*. He was made a Companion of the Bath in 1876, on the recommendation of Mr. Disraeli, and a Knight Commander of the Bath in 1885, on the recommendation of Mr. Gladstone.

W. M. R. HUTTON.

Barnacle: See CIRRIPIEDIA and BALANUS.

Bar'nacle Goose, or **Brant Goose** (*Branta ber'nicle*): a bird which frequents the coasts of Britain in winter, and migrates northward in spring. It is smaller than the common wild goose, and is esteemed for food. The plumage of the upper part of its body is ash-gray and black, and that of the lower part white. The name of barnacle is sometimes applied to other species of wild geese. All of them are remarkable for powerful flight and distant migrations, and prized for the table. The barnacle goose is a winter bird of passage in the U. S. It takes its name from the old belief that barnacles were often transmuted into geese—a superstition which was once shared by learned and unlearned alike.

Revised by D. S. JORDAN.

Bar'nard, F. E.: astronomer; b. in Nashville, Tenn., Dec. 16, 1857. In his youth he learned the art of photography, and it was with the slender means gained by its practice that he was enabled to purchase his first telescope. About 1878 he began to search for comets, but it was not until September, 1881, that his efforts were rewarded with success. From this time until 1891 he found one, two, or three comets almost every year. In 1883 he entered the Vanderbilt University as Fellow in Astronomy, taking charge of their small observatory, and at the same time taking a course of instruction in the subjects most necessary to astronomical pursuits. Graduating in 1887, he resigned the position of instructor in astronomy to accept that of astronomer at the Liek Observatory. Here he showed himself one of the most zealous and enthusiastic of observers. In 1892 he was allowed to search the heavens with the great 36-inch telescope, and on Sept. 9 he found a new satellite of Jupiter, thus adding a fifth to the four which had been discovered by Galileo. In 1889 he received the degree of A. M. from the University of the Pacific, and in 1892 the Lalande medal of the French Academy was awarded him for the discovery of the new satellite of Jupiter.

S. NEWCOMB.

Barnard, DANIEL DEWEY, LL. D.: a lawyer and Whig politician; b. at Sheffield, Mass., July 16, 1797; graduated at Williams College in 1818, was admitted to the bar at Rochester, N. Y., in 1821; was county attorney in 1826, and a member of Congress from New York (1828-30 and 1839-45). He traveled in Europe in 1830-31, corresponding with a Rochester newspaper; removed to Albany in 1832; became noted in the Whig party, and as a member of the New York Assembly; and was U. S. minister to Prussia (1849-53). He was the author of many published reviews, speeches, etc., including *An Historical Sketch of the Colony of Rensselaerwick*. D. at Albany, N. Y., Apr. 24, 1861.

Barnard, FREDERICK AUGUSTUS PORTER, S. T. D., LL. D., L. H. D., D. C. L.: mathematician, physicist, educator, and divine; b. at Sheffield, Mass., May 5, 1809; graduated at Yale College in 1828; tutor there 1830; Professor of Mathematics and Natural Philosophy in the University of Ala-

bama 1837-48; Professor of Chemistry and Natural History in the same 1848-54; Professor of Mathematics, Natural Philosophy, and Civil Engineering in the University of Mississippi 1854-61; president of the University of Mississippi 1856-58; and chancellor of the same 1858-61. In 1854 he took orders in the Protestant Episcopal Church; resigned his chancellorship and his chair in the university in 1861 on account of the civil war; moved to Washington, D. C., and in 1863-64 was connected with the U. S. coast survey, in charge of chart-printing and lithography. In May, 1864, he was elected president of Columbia College, New York city, which he resigned in 1888 on account of failing health. He received the honorary degree of LL. D. from Jefferson College, Mississippi, in 1855, and from Yale in 1859; also degree of S. T. D. from the University of Mississippi in 1861, and that of L. H. D. from the regents of the University of the State of New York in 1872. In 1860 he was a member of the eclipse expedition sent to Labrador (Cape Chudleigh) by the U. S. Coast Survey; and during his absence was elected president of the American Association for the Advancement of Science. In the act of Congress establishing the National Academy of Sciences (1863) he was named as one of the original corporators, and was chairman of the physical section, 1870-72; in 1867 he was one of the U. S. commissioners to the Paris Exposition. He was also a member of the American Philosophical Society, an associate member of the American Academy of Arts and Sciences, corresponding member of the Royal Society of Liège, and member of many other scientific and literary associations. During his long residence in the South, Dr. Barnard was actively engaged in promoting public education, both primary and higher, encouraging and assisting in all departments of scientific research and literary culture. He was a persistent advocate of the higher education of women in the old colleges, and the Barnard annex for girls to Columbia College, New York, is named for him in recognition of his labors for its creation. His publications have related chiefly to scientific and educational subjects. Among these may be mentioned *Letters on College Government* (1854); *Report on Collegiate Education* (1854); *Art Culture* (1854); *History of the American Coast Survey* (an extended Report to the American Association for the Advancement of Science, 1857); *University Education* (1858); *Undulatory Theory of Light* (1862); *Machinery and Processes of the Industrial Arts, and Apparatus of the Exact Sciences* (1868); *Metric System of Weights and Measures* (1871). D. in New York city, Apr. 27, 1889. See his *Memoirs*, by John Fulton (New York, 1896).

Barnard, HENRY, LL. D., L. H. D.: an eminent educator; b. at Hartford, Conn., Jan. 24, 1811; graduated at Yale in 1830; called to the bar in 1835; while in the Legislature of Connecticut (1837-40) he reorganized the public schools. He was secretary of the board of school commissioners (1838-42); school commissioner of Rhode Island (1843-49); superintendent of schools in Connecticut (1850-54); president State University of Wisconsin (1856-59), and of St. John's College, Annapolis, Md. (1865-66). The normal-school system found in him one of its earliest and most efficient promoters. He published, besides other works, *The Connecticut Common School Journal*, which had reached several volumes in 1855; *Normal Schools in the United States and Europe* (1851); *Education in Factories* (1842); *School Libraries* (1854); *Hints and Methods for the Use of Teachers* (1857); and *National Education in Europe* (1851), when he commenced the publication of the *American Journal of Education*. He was U. S. commissioner of education 1867-70. In 1886 he began the publication of *The American Library of Schools and Education*, which was to comprise 800 of his reports, treatises, etc. D. in Hartford, Conn., July 5, 1900.

Barnard, JOHN: a famous minister of Marblehead, Mass.; b. in Boston, Nov. 6, 1681, and graduated at Harvard in 1700. He was a chaplain in the Port Royal expedition of 1707, of which he wrote an unpublished account. Visiting England, he was offered a chaplaincy to Lord Wharton, but refused to conform. He was ordained colleague minister of Marblehead in 1716, and there remained for life. He took great pains in establishing the fisheries and commerce of his people. He published *A History of the Strange Adventures of Philip Ashton* (1725); a version of the Psalms; sermons, etc. D. at Marblehead, Mass., Jan. 24, 1770.

Barnard, JOHN GROSS, LL. D.: military engineer; b. in Sheffield, Mass., May 19, 1815; was a brother of the president of Columbia College, New York; graduated at U. S. Military Academy 1833; commissioned as brevet second lieutenant in

the corps of engineers. In 1835 was sent to the Gulf coast, where he served seventeen years as an assistant or principal engineer for the fortifications of Pensacola and New Orleans, and on works of harbor improvement. During the war with Mexico he was twice called to the field, and received the brevet of major "for meritorious services while serving in the enemy's country." In 1850 he was named by the President (Taylor) as chief of a scientific commission for the survey of the Isthmus of Tehuantepec, with the view of establishing a route of commerce and travel to our newly acquired Pacific possessions. The report drawn up by J. J. Williams (1852) gives the first full account of that isthmus ever published. In 1854 Barnard was in charge of the construction of the new fortifications of San Francisco, Cal.; in 1855-56 superintendent of the U. S. Military Academy. Subsequently, till 1861, he was in charge of the fortifications of New York harbor. Serving as chief engineer under Gen. McDowell in the first Bull Run campaign, he was present on the field of that battle, as also at the earlier combat at Blackburn's Ford, the very first of the inchoate "Army of the Potomac." As chief engineer (with the rank of brigadier-general) of the Army of the Potomac in the Virginia Peninsula campaign of 1862, he directed the siege operations at Yorktown and before Richmond; and subsequently, as "chief engineer of the defenses of Washington," the extensive works for the defense of the national capital. In the campaign of 1864-65 he served on the staff of Lieut.-Gen. Grant as "chief engineer of the armies in the field," until the surrender of Lee's army at Appomattox Court-house, at which he was present. He was breveted through several grades, and finally received the brevet of major-general U. S. army "for gallant and meritorious services in the field"; also breveted July 4, 1864, major-general U. S. volunteers "for meritorious and distinguished services." From the close of the civil war he served as senior member of the board of engineers for permanent fortifications, and as a member of the U. S. lighthouse board. He was a member and original incorporator of the National Academy of Sciences. The degree of A. M. was conferred upon him by the University of Alabama in 1838, and of LL. D. by Yale College 1864. He was a member of the American Institute of Architects, and an honorary member of the American Society of Civil Engineers. His principal publications are *The Phenomena of the Gyroscope Analytically Examined* (1858); *Notes on Sea-coast Defense* (1861); *Reports of the Engineer and Artillery Operations of the Army of the Potomac* (1863); in conjunction with Gen. W. F. Barry, chief of artillery, *Report on the Defenses of Washington* (1871); *Report on the Fabrication of Iron for Defensive Purposes*, etc. (1871), made in conjunction with Gen. H. G. Wright and Col. P. S. Michie; *The North Sea Canal of Holland, and Improvement of Navigation from Rotterdam to the Sea; Problems of Rotary Motion Presented by the Gyroscope, the Precession of the Equinoxes, and the Pendulum*. In May, 1864, he was nominated brigadier-general and chief of engineers. The nomination was withdrawn at his own request. Retired with rank of colonel of engineers Jan. 2, 1881. D. at Detroit, Mich., May 14, 1882.

Barnaul, baär-nowl': a town of Siberia; government of Tomsk; at the junction of the Barnaul with the river Ob; 230 miles S. S. W. of Tomsk (see map of Asia, ref. 3-F). It has a mining-school, four churches, and several hospitals. All the gold of the Altai Mountains is brought here to be smelted. A magnetic and meteorological observatory was established here about 1841. Pop. (1897) 29,408.

Barnave, baär'naav, ANTOINE PIERRE JOSEPH MARIE: a French revolutionist and advocate; b. at Grenoble, Oct. 22, 1761. He was elected in 1789 to the States-General, and became a leader of the popular party. As a member of the National Assembly he opposed the absolute veto, and advocated the confiscation of church lands and the abolition of convents. He was a member of the committee appointed to attend the king on his return from Varennes to Paris in 1791, after which he became a more moderate reformer, and even defended the royal cause. This change of course rendered him unpopular. He retired to private life in Sept., 1791, and was guillotined in Paris, Nov. 29, 1793. According to Macaulay, he was "the best debater in the National Assembly, but he flinched before the energy of Mirabeau." He left several political treatises, among which is *Réflexions politiques*. See *Life of Barnave*, by M. de Salvandy, and *History of the Girondists*, by Lamartine.

Barnburners: a nickname given to that portion of the Democratic party of the State of New York which opposed the extension of slavery and supported Van Buren against Cass for President in 1848. They were esteemed too radical by their adversaries, one of whom illustrated his meaning by a story of a farmer who was so greatly annoyed by an owl that he shot the bird, and in doing so set fire to his barn, which was destroyed. The barnburners, led by Col. Samuel Young, Hon. Silas Wright, Michael Hoffman, etc., opposed further borrowing for the improvement or extension of their State canals, and were hostile generally to public debts, corporate privileges, etc.

Barnby, Sir JOSEPH: musician; b. at York, England, Aug. 12, 1838; studied at the Royal Academy of Music, London. In 1875 he was appointed successor and director of musical instruction at Eton, which position he held till appointed head of the Guildhall School of Music in London in 1892. He was conductor of the oratorio concerts in London established by Messrs. Novello, Ewer & Co., and has been the conductor of the Royal Albert Hall Choral Society since its establishment. His compositions have been chiefly of a sacred character, and include many church services, anthems, hymn tunes and chants. He edited *The Hymnary: a Book of Church Song*, published in 1872, which contains sixty-three tunes of his composition. Sullivan's *Church Hymns with Tunes* contains fourteen of Barnby's composition, and *Hymns Ancient and Modern* fourteen. His cantatas *Rebekah* and *The Lord is King*, the latter composed for the Leeds festival of 1883, are two examples of larger form. Barnby's music is immensely popular both in England and the U. S., many of his songs and part songs, as well as his church music, being as well known here as there. He was knighted in Aug. 1892. D. in London, Jan. 28, 1896. D. E. HERVEY.

Barnegat Bay: Ocean co., N. J.; connects with the Atlantic by an inlet over a mile wide. The bay extends 23 miles N. to the mouth of the Meteteunk river. There is a lighthouse 150 feet high on the south side of the inlet, with a flashing white light; lat. 39° 45' 48" N., lon. 74° 6' 3" W. Barnegat Bay is separated from the ocean by Squan Beach and Island Beach.

Barnes, ALBERT: Presbyterian divine; b. at Rome, N. Y., Dec. 1, 1798. He graduated at Hamilton College in 1820; became in 1830 pastor of the First Presbyterian church at Philadelphia, where he remained until 1867. He declined the degree of D. D. and was much opposed to its use. As a commentator on the Scriptures, Mr. Barnes was popular with the religious community on both sides of the Atlantic. The circulation of his *Notes on the New Testament* (in eleven volumes) is said to have reached more than a million volumes. He commented also on *Isaiah* (1840), *Job* (1844), *Daniel* (1853), and the *Psalms* (1871). Among his other works may be named *The Church and Slavery* (Phila., 1857); *The Atonement in its Relations to Law and Moral Government* (1859); *Lectures on the Evidences of Christianity* (1868); *Life at Threescore and Ten* (1869). He was tried for heresy because he maintained an unlimited atonement; was acquitted, but the tension produced resulted in the dismemberment of the Presbyterian Church (1837), and he became one of the most prominent advocates of the New School doctrines. He did not love controversies, however, and so rejoiced in the union of the Old and New School branches in 1870. D. in Philadelphia, Dec. 24, 1870.

Barnes, CHARLES RIED, M. A., Ph. D.: botanist; b. in Madison, Ind., Sept. 7, 1858; educated in Hanover College and Harvard University; Professor of Botany and Geology in Purdue University 1879-87; Professor of Botany in University of Wisconsin 1887 to present. He is one of the editors of the *Botanical Gazette*, and in conjunction with Dr. Coulter and Dr. Arthur published a *Handbook of Plant Dissection* (1886). He has written papers upon North American mosses, including *Keys to Genera and Species of North American Mosses* (1890). CHARLES E. BESSEY.

Barnes, EARL, M. S.: See the Appendix.

Barnes, JAMES: soldier and engineer; b. at Boston, Mass., in 1806; graduated at West Point in 1829; was a lieutenant of artillery till he resigned from the army July 31, 1836; served at Military Academy as assistant instructor 1829-30, and 1833-36; at Fort McHenry, Md., 1830-32; in Black Hawk expedition 1832; and at Charleston harbor 1832-33, during the threatened nullification of South Carolina. He was a prominent civil engineer (1836-57), and constructed

many important railroads. At the beginning of the civil war he resumed the military profession as colonel of Eighteenth Massachusetts volunteers; was appointed Nov. 29, 1862, brigadier-general U. S. volunteers, and served in the Virginia peninsula 1862, Northern Virginia campaign 1862, in Maryland campaign 1862, and at Antietam; in Rappahannock campaign 1862-63, at Fredericksburg and Chancellorsville, in Pennsylvania campaign, in several skirmishes, and at the battle of Gettysburg (wounded); was in command of the defenses of Norfolk and Portsmouth, Va., 1863-64, of St. Mary's district 1864-65, and Point Lookout camp for prisoners of war 1864-65. Brevet major-general U. S. volunteers Mar. 13, 1865, for meritorious services, and mustered out of service Jan. 15, 1866. With health destroyed he remained at his home in Springfield, Mass., where he died Feb. 12, 1869.

Barnes, JOSEPH K.: brigadier-general and surgeon-general U. S. army; b. in Philadelphia, July 21, 1817; educated in Philadelphia, receiving his degree of M. D. from the medical department of the University of Pennsylvania, class of 1838. He followed the practice of his profession in the hospitals and as physician to the outdoor poor of Philadelphia till June 15, 1840, when he was appointed an assistant surgeon in the army, and a surgeon Aug. 29, 1856. In 1863 (Feb. 9) he was appointed medical inspector, and Aug. 10 medical inspector-general, with the rank of colonel. On Aug. 25 he was placed in charge of the surgeon-general's office, and Aug. 22, 1864, received the appointment of surgeon-general until retired, June 30, 1883, having administered the responsible duties of his department with marked ability. D. in Washington, D. C., Apr. 5, 1883.

Barnes, JOSHUA: b. in London, Jan. 10, 1654; studied at Cambridge, England; became professor of Greek there 1695. He was highly esteemed as a scholarly editor of *Euripides* (Cambridge, 1694), *Anacreon* (1705), and *Homer* (1710); but his scholarship was inexact, and so his works have little permanent value. D. in Cambridge, Aug. 3, 1712.

Barnes, THOMAS: b. about 1785; educated at Christ's Hospital, London, and at Pembroke College, Cambridge. He became chief editor of the *London Times* 1817, and finally one of the proprietors. He placed it beyond reach of competition. D. in London, May 7, 1841.

Barnes, WILLIAM: philologist, clergyman, and poet; b. in Dorsetshire, England, Feb. 22, 1800; published a number of works, among which were *English Speechcraft* and *Poems of Rural Life in the Dorset Dialect*. D. as rector of Winterbourne Came, Oct. 7, 1886.

Barnesville: town; Pike co., Ga. (for location of county, see map of Georgia, ref. 4-G); on Ga. Cent. R. R., 60 miles S. by E. of Atlanta; has two large buggy-factories and a cotton-factory. Appropriations have been made (1892) for water-works and electric lights. Barnesville is the seat of Gordon Institute. Pop. (1880) 1,962; (1890) 1,839; (1900) with suburbs, 3,036. EDITOR OF "GAZETTE."

Barnesville: city; Clay co., Minn. (for location, see map of Minnesota, ref. 5-A); 218 miles from St. Paul, on Gt. Northern R. R., the division headquarters and shops of which are located here. Pop. (1890) 1,069; (1900) 1,326.

Barnesville: village; Belmont co., O. (for location of county, see map of Ohio, ref. 5-I); 32 miles W. of Wheeling, on B. and O. R. R. It has a variety of manufactures, is the commercial center of a large and wealthy agricultural district, and is noted for its superior strawberries and tobacco. Pop. (1880) 2,435; (1890) 3,207; (1900) 3,721.

Barnet, or Chipping Barnet: market-town of Hertfordshire, England; 11 miles N. N. W. of London. Great cattle fairs are held here. The famous battle of Barnet was fought near here in 1471 between the Yorkists and Lancastrians, in which the latter were routed. The Earl of Warwick, "the king-maker," their leader, was killed. The result of this battle was to firmly establish Edward IV. Pop. 4,500.

Barnett, JOHN: musician; b. near Bedford, England, July 15, 1802, of German parentage. When ten years old, having a remarkable contralto voice, he was articulated to Samuel James Arnold, manager of Drury Lane theater, London, where he sang in many English operas. Studied first under C. E. Horn and Price, and later under Perez, Ferdinand Ries, Schneider and Kalkbrenner. His first musical dramatic work, a musical farce, was produced in 1825; his oratorio *The Omnipresence of the Deity* in 1829; the

Mountain Sylph, his most famous work, in 1834; *Fair Rosamond* in 1836; and *Farinelli* in 1838. In 1841 he retired from public life, and lived at Cheltenham till his death, Apr. 17, 1890. He wrote much miscellaneous music, including upward of 2,000 songs, and several operas and other works were left in manuscript. D. E. HERVEY.

Barnett, JOHN FRANCIS: musician; son of Joseph Alfred Barnett; professor of music, and nephew of John Barnett, the composer of *The Mountain Sylph*; b. in England in 1837; studied first under his parents, both being excellent musicians; then under Dr. Henry Wylde; next at the Royal Academy of Music, London, where he won the Queen's scholarship; and finally at the Leipzig Conservatory under Hauptmann, Rietz, Plaidy, and Moscheles. He returned to London in 1861, and has since pursued a successful career as composer. His chief works are *The Raising of Lazarus* (1873), which was originally sketched out during his student career; *The Ancient Mariner*, for the Birmingham festival (1867); *Paradise and the Peri*, Birmingham festival (1870); *Lay of the Last Minstrel*, Liverpool festival (1874); *Good Shepherd*, Brighton festival; *Building of the Ship*, Leeds festival (1880); *Harvest Festival*, Norwich festival of 1881. He has also composed many smaller works both for voices and instruments, together with a symphony, and overture for full orchestra, and trios, quartets, and quintets for pianoforte and string instruments. He also completed the orchestration of Schubert's unfinished symphony. D. E. HERVEY.

Barnett, JOSEPH ALFRED: See the Appendix.

Barneveldt, JOHN VAN OLDEN: an eminent Dutch statesman; b. at Ameersfoort in Utrecht, Sept. 14, 1547. He was a member of an important embassy sent to England in 1585, and after his return was appointed advocate-general of Holland. He was an adversary of the Earl of Leicester, and became the head of the republican party, while Maurice of Nassau was the chief of its opponents. Barneveldt opposed the ambitious designs and warlike policy of Maurice, and in 1609 concluded a truce with Spain for twelve years. He was for many years grand-pensionary of Holland. The animosity between the two parties was aggravated by religious dissension. Barneveldt favored the Arminians or Remonstrants, while Maurice patronized the intolerant Gomarists, who were also supported by the majority of the army, the clergy, and the populace. The Synod of Dort having condemned the Arminians in 1618, Barneveldt was accused of treason, unjustly convicted and beheaded at The Hague, May 13, 1619. See Motley's *Life of Barneveldt*.

Barn-owl: one of certain species of owls, in which the facial disk is long and subtriangular in form, constituting the genus *Strix*. *S. flammea* is the common European species. The closely related American species is *Strix pratensis*. This solemn-looking and fierce little owl is more abundant southward and westward than along the Atlantic States. See OWL. D. S. J.

Barnsley: a market-town of England; in the West Riding of Yorkshire, on the river Dearne, 11 miles N. of Sheffield, on the North Midland Railway (see map of England, ref. 7-H). It is situated on a hill, has coal and iron mines, and manufactures of linen, glass, etc. The damasks and drills of Barnsley were considered to be unrivaled. Here are also bleaching and dye works and iron foundries. Pop. (1891) 35,427.

Barnstable: port of entry and capital of Barnstable co., Mass. (for location of county, see map of Massachusetts, ref. 5-K); on Old Colony R. R. and Barnstable Bay, 72 miles S. S. E. of Boston. The inhabitants are principally engaged in maritime pursuits and cranberry culture. The southerly portion of the township, on Vineyard Sound, is a noted place of summer resort, and contains Hyannis, Hyannis Port, Cotuit, Wianno, Craigville, Osterville, and Centerville. Pop. of township (1880) 4,242, including 780 in village; of township (1890) 4,023; (1900) 4,364. EDITOR OF "PATRIOT."

Barnstaple: a town and seaport of Devonshire, England; on the river Taw; 6 miles from its mouth, and 40 miles by rail N. W. of Exeter (see map of England, ref. 13-D). The Taw is here crossed by an old bridge of sixteen arches. Barnstaple is pleasantly situated and well built, and has manufactures of pottery, lace, etc. The harbor has been filled with sand, so that it will not admit large vessels. Pop. (1891) 13,058.

Bar'num, PHINEAS TAYLOR: showman; b. in Bethel, Conn., July 5, 1810; d. in Bridgeport, Conn., Apr. 7, 1891.

His father kept an inn and a country-store, and died poor in 1825. Barnum wandered about, and was in business in Brooklyn, New York, and other places. Having saved a little money, he returned to Bethel, opened a small store, took the agency of a State lottery for building the Groton Monument, moved into a larger store and failed. He married in 1829, and soon after started a weekly newspaper called *The Herald of Freedom*; was prosecuted for libel, and imprisoned for sixty days. He went to New York and Philadelphia in 1834. In the latter city he bought for \$1,000 a colored slave woman, Joyee Heth, represented to be the nurse of George Washington and 161 years old; from her exhibition his receipts soon reached \$1,500 a week. She died a year after, but her venerable age was more than doubtful. In 1841, without any funds, he bought Scudder's American Museum in New York, which he called Barnum's Museum; and with his profits paid his indebtedness the first year. In 1842 he introduced the dwarf, Charles S. Stratton (Gen. Tom Thumb), whom he exhibited in the U. S., France, and England. In 1849 Barnum engaged JENNY LIND (*g. v.*) to sing in America for 150 nights, at \$1,000 a night. The gross receipts in 1850-51 in nine months were over \$712,000. In 1856-57 he indorsed notes for nearly \$1,000,000, which went to protest, and wiped out all of his estate except a fortune settled on his wife. He again visited England in 1857 with Tom Thumb, and gave lectures. His museum in New York was burnt July 13, 1865. Another one was also destroyed by fire Mar. 3, 1868. Afterward, in the spring of 1871, he established his "Greatest Show on Earth," the firm being Barnum, Bailey & Hutehinson. He was four times a member of the Connecticut Legislature, and was mayor of Bridgeport. His benefactions were large and numerous. He wrote *Humbugs of the World* (New York, 1865); *Lion Jack, a Story* (1876); and an autobiography (1855, n. e. 1869 and later).

B. B. VALLENTINE.

Barnwell, ROBERT WOODWARD, LL. D.: statesman; b. at Beaufort, S. C., Aug. 10, 1801; graduated at Harvard in 1821. He studied law; was a member of Congress from South Carolina (1829-33); U. S. Senator in 1850; and member of the Confederate Congress. He was president of South Carolina College (now University of South Carolina) (1835-41); and after the civil war held the same position until 1873. D. at Columbia, S. C., Nov. 25, 1882.

Baroach': See BROACH.

Barocchio, or **Barozzi**, GIACOMO DA VIGNOLA: See BAROZZO.

Barocci, bã-rot'chêe, or **Baroccio**, bã-rot'chi-ô (FIORI FEDERICO D'URBINO): a famous Italian painter; b. at Urbino in 1528. Among his best works are a *Descent from the Cross*, at Perugia, and a *Holy Family*, in the Museum at Naples. He also engraved in excellent style a number of his pictures. D. in Urbino, Sept. 30, 1612.

Baroche, bã-rôsh', PIERRE JULES: a French advocate and minister of state; b. in Paris, Nov. 18, 1802. He became a member of the Constituent Assembly 1848-49, and was Minister of the Interior in 1850; Minister of Foreign Affairs in 1851 from April to October. He was appointed president of the council of state immediately after the *coup d'état* of Dec., 1851, and became Minister of Justice and Keeper of the Seals in 1863. Senator in 1864. D. in St. Helier's, Jersey, Oct. 29, 1870.

Baroda, bã-rô'da: a tributary state in Northern Bombay, British India. It is in several distinct irregular patches, the largest of which is between Ahmadabad and Palanpur, and includes the towns of Patan, Sidhpur, Barnagarh, and Maisana; a second is about the city of Baroda, and a third in the S. of the peninsula of Kathiawar. Total area, 8,569 sq. miles. Pop. (1901) 1,950,927. These districts are under a Mahratta prince called the Guicowar, or Gaikwar, of Baroda. It came into dependence on Great Britain in 1802. In 1874 the ruling Gaikwar, Malhar Rao, was tried for attempting to poison the British resident, and, though not convicted, was deposed. The districts of Baroda are very fertile, producing cotton, grain, tobacco, flax, and indigo. Baroda city is the capital.

M. W. H.

Baroda: a city of Hindustan; in Guzerat; situated about 90 miles by rail N. N. E. of Surat; lat. 22° 16' N., lon. 73° 14' E. (see map of N. India, ref. 8-C). It is the residence of the gaikwar, a Mahratta prince, and has an extensive trade, for which its position is advantageous. A railroad extends from Baroda viâ Surat to Bombay, 231 miles. It is a rich city in proportion to its size. Pop. (1891) 116,460.

Barom'eter [from Gr. βάρος, weight + μέτρον, measure]: an instrument for measuring the weight or pressure of the atmosphere. If a tube of uniform bore be bent into the form of the letter U, and partially filled with a liquid, the height of the liquid column, as measured above the bend, will be found to be the same in both branches. This will continue to be true though the air be withdrawn from above the liquid on both sides—a thing which may easily be effected by suitably connecting the two extremities of the tube with an air-pump. But if, while things are in this condition, the air be gradually readmitted to one of the branches and not to the other, the column in that branch will steadily sink, and that in the other will correspondingly rise. Arresting this process at any moment, we may say that the difference of height of the two liquid columns is a measure of the pressure of the air on the surface of the lower; or that the *weight* of a column of the liquid having a height equal to this difference is just equal to the pressure on that surface. In this experiment it would be easy to expel the liquid entirely from one branch of the tube, without establishing an equilibrium with the column in the other, unless the apparatus should be of inconveniently large dimensions, or the liquid employed should be one having great specific gravity. Mercury, in fact, which is nearly fourteen times (13.6) heavier than water, is the only liquid convenient for the purpose of the experiment; and if this be used, the difference of height of the columns in the two branches will be found to be about 30 inches when the full pressure of the atmosphere is admitted to one branch, while it is wholly withdrawn from the other. The weight of a vertical column of mercury, therefore, of uniform horizontal section, 30 inches in height, is equal to the mean pressure of the atmosphere at the surface of the earth on an area equal to the base of the column. The same fact is demonstrated more expeditiously by simply taking a straight tube 32 or 33 inches in length (Fig. 1), closed at one extremity and open at the other, filling it entirely full of mercury, placing the thumb firmly on the open end, inverting it and plunging this extremity beneath the surface of mercury in a basin, and finally removing the thumb. The column will fall, and stand as before at about 30 inches above the level of the mercury in the basin. This is the original experiment of Torricelli, made early in the seventeenth century, by which he furnished the first satisfactory explanation of the phenomena which the old philosophers vaguely ascribed to nature's abhorrence of a vacuum.

If the pressure of the atmosphere were invariable, the barometer would be an instrument of no practical use, and would simply serve to illustrate an interesting physical truth. But this pressure is constantly fluctuating, and its fluctuations are measured by the varying heights of the Torricellian column. All that is necessary to form a barometer, therefore, is to connect with the tube and basin of Torricelli some kind of scale suitable to measure these variations. In the barometers commonly used in Great Britain and the U. S. this scale is divided into inches and decimals; in France, and in continental Europe generally, into millimeters. If the instrument is to be stationary, the scale need only have a range of 3 or 4 inches, since even in localities where the fluctuations are largest they never transcend these limits. The divisions directly marked on the scale are made sufficiently large to be read by the unassisted eye. For smaller divisions a vernier must be employed. (See VERNIER.) In the best instruments the height of the column may be read by means of the vernier to the $\frac{1}{1000}$ th of an inch. Some little practice is required in order to learn to read with accuracy. The vernier carries a horizontal index which moves close to the glass tube containing the mercurial column; but the top of the column is rounded, so that the highest point is distant from the index by half the exterior diameter of the tube. Ordinarily the bore of the tube is small, not exceeding three-sixteenths to three-eighths of an inch; but in large standards a tube an entire inch in bore is often employed, and in such instru-

FIG. 1.

ments the index is a ring or thimble surrounding the tube entirely.

The height of the column must be measured from the surface of the mercury in the basin; but the level of this surface itself varies with the rising and falling of the column in the tube. To provide against error from this cause, the whole scale is in some barometers made movable, and is raised or depressed, as may be necessary, by means of a thumb-screw, before observation. An ivory point directed downward from a short projecting arm carried by the scale is brought so as exactly to meet its image reflected in the mercury of the basin, and this indicates that the zero of the scale is in its true position. In other instruments, and generally in those in common use, the adjustment is made by raising or depressing the level of the mercury itself while the scale remains fixed. Instead of the ivory point, an ivory float is sometimes used, carrying an upright stem on which is a fiducial mark designed to be brought, in the adjustment, into coincidence with a similar fixed mark.

In tubes of small bore the mercurial column does not reach the full height due to the pressure, owing to the effect of CAPILLARY ACTION (*q. v.*). A small correction is therefore necessary on this account, which depends on the diameter of the tube. With tubes of large dimensions this effect is insensible; and it may in any case be completely eliminated by giving to the barometer the form shown in Fig. 2, called a siphon barometer, in which the basin is dispensed with, and the tube is bent upward at the bottom, the recurved part serving as a substitute for the basin. In this form of the instrument, if the bore be uniform throughout, every fluctuation of pressure occasions equal and opposite movements of the two surfaces of mercury; and the reading on a fixed scale will change only half as much as in the common instrument. The whole scale should therefore be movable; or if a fixed scale only be used, the divisions should be made of only half their nominal magnitude. Barometric indications of fluctuating atmospheric pressure are sometimes magnified by transforming the vertical movements of the mercurial column into rotary movements of a long index upon a dial. The siphon barometer presents a convenient means of doing this. A float introduced into the open short arm of the siphon, and connected by a silk thread with a small pulley on the axis of the index, will render conspicuous even a very minute change in the altitude of the column. The uncertain action of this apparatus, however, owing to friction and other causes, is such as to deprive it of any scientific value.

The form of barometer now most generally approved, constructed originally by Fortin, of Paris, and since adopted by Casella, Beck, and others of London, and by James Green, of New York, who has made in it important improvements, is shown in Fig. 3. In this the glass tube is entirely surrounded by a protecting tube of brass, somewhat

enlarged at the top, for convenience in applying a scale and vernier, and having a vertical opening at the same part to allow the summit of the mercurial column to be seen. The cistern at the bottom, which is of boxwood except the upper portion, which is a short glass cylinder, is similarly protected—the glass portion, however, being uncovered, in order to allow the surfaces of the mercury in the cistern to be visible. The cistern has a bottom of flexible leather, which rests on a broad disk of metal supported by a vertical screw, of which the milled head is represented in the figure below the instrument. By turning this screw the level of the mercury in the cistern is brought to the true zero of the scale, indicated by a fixed fiducial point of steel or ivory seen within the cistern.

Since the barometer measures the pressure of the atmosphere, and since this pressure is simply the weight of a vertical column of the aerial ocean above the level of the place of observation, it follows that, if we carry the instrument from a lower to a higher level, the barometric column will fall. One of the most important uses of the barometer, therefore, is as a means of determining heights. (See *HYPSOMETRY.*) But a barometer intended for this purpose, or a so-called "mountain barometer," must have a construction in a number of respects differing from the barometer in common use. It must have, of course, a much larger range of scale, and especial care must be taken to guard it against the danger of fracture in transportation. If it is a cistern barometer, the cistern should be air-tight, and should have no communication with the atmosphere, except through an aperture which may be stopped by a closely fitting screw or cock; and the adjusting screw at the bottom should have so large a range of movement as to allow all the air of the cistern to be expelled by raising the leather bottom, so that the cistern and tube may be both entirely filled with the mercury. The danger of fracture from the oscillations of this dense liquid may thus be avoided. The best mercurial mountain barometer, however, is the siphon barometer of Gay-Lussac, shown in Fig. 4, *a*, without its scale or mounting. In this instrument a tube bent in the manner shown, and closed at both ends, has two straight portions, of small but equal bore, connected by an intermediate portion so much smaller that when, after being filled with mercury, it is reversed, as shown in Fig. 4, *b*, the mercury will be held in the bend by capillarity. The only communication with the air is by the aperture *o*, which is so small that any drops of mercury which may fall into the short arm from the bend, when the instrument is reversed, can not escape. The design, however, is to have no excess of mercury beyond what will be held by capillarity in the position *b*. This tube is suitably supported throughout its whole length, and protected by a surrounding tube of brass. The zero of its scale is at the middle of the length, and it reads from this zero both upward and downward. The readings are taken at both surfaces of the mercury, and their sum gives the true barometric height. The scale is usually inscribed on the tube itself. In transporting the instrument it is carried in the inverted position, where the mercury, filling the whole tube, is necessarily prevented from oscillating. It is usually carried by the mountaineer in a leather case swung over his back, and when set up for observation is suspended in gimbals, supported by a tripod.

FIG. 4.

FIG. 2.

FIG. 3.

When a barometer of this kind is carried from place to place, subject to occasional jars and concussions, sometimes perhaps in a horizontal position, there is a possibility that

minute portions of air may now and then intrude into the tube, between the mercury and the glass. An effectual contrivance for preventing these from making their way into the Torricellian vacuum was devised by M. Buntzen, which is represented in Fig. 4, *c*. The capillary part of the tube is divided; the extremity of the upper portion is drawn out to a minute orifice; that of the lower is widened, so as to form a globular or cylindrical chamber contracted at the mouth; and then the two are united again by fusion in the manner shown in the figure. Any air which may make its way into the tube from below is caught in this chamber, and afterward, when the instrument is inverted for transportation, it escapes by the way it entered. The invention evinces a high degree of ingenuity.

When scientific accuracy is necessary in barometric observations, all mercurial barometers require that their readings should be corrected for temperature. According to Regnault, the absolute dilatation of mercury between 0° and 100° C. = 32° and 212° F., is 0.01813, or about $\frac{1}{55}$ th of its bulk. This corresponds to $\frac{1}{9916}$ th of the bulk for each degree of Fahrenheit's thermometer, which would be equal, for the mean column of 30 inches, to an increase of altitude of about $\frac{1}{330}$ ths, or $\frac{1}{330}$ th per degree. Assuming the height at 32° F., therefore, to be the normal height, the reading at 54° F. will be $\frac{2}{330}$ ths, or $\frac{1}{165}$ th inch too great; at 76° F., or so-called "summer-heat," $\frac{4}{330}$ ths, or $\frac{1}{82}$ th inch too great; and at 98° F., $\frac{6}{330}$ ths, or 0.2 inch too great. The correction for any temperature may be made by calculation from the data here given; but it is more convenient to be provided with a table which has been calculated in advance for all the temperatures to which the observation is likely to extend.

The process of filling the mercurial barometer is one which requires great care. In pouring mercury into a long and narrow tube it is almost impossible to avoid introducing along with it some bubbles of air, which adhere with tenacity to the sides of the tube, but which, after the tube is inverted, gradually find their way into the space above the column and vitiate the vacuum. These may be expelled by boiling the mercury in the tube before inversion, when they will be carried off with the vapor. The operation is attended with some danger to the tube, the boiling-point of mercury being about 360° C., and the concussions of the heavy column in ebullition violent. It is expedient, therefore, to introduce at first only a small quantity, and after boiling that to add more, and so proceed till the tube is filled, always applying the heat at a point but a few inches below the top of the column. Mr. Green, however, recommends filling the tube completely before beginning the operation, then boiling downward from the top, and finally upward from the bottom.

It is of the highest importance that the mercury used in barometers should be quite pure. To be entirely safe on this score, the metal should be distilled before using. The effect of the presence of impurities is to diminish the specific gravity of the fluid, and therefore to make its indications uncertain; but it is also to tarnish the tube, and to render observation after a time difficult or impossible.

Other fluids besides mercury may, of course, be employed in the construction of barometers, but the height of the column will in every case be greater in proportion as the specific gravity of the liquid is less. Water, for example, requires a column of 34 feet, mean height. Very few water barometers have ever been constructed. The first of the kind was erected by Otto Guericke, the inventor of the air-pump, in his house at Magdeburg. The upper portion of the tube only, to an extent of about 6 feet, was of glass, and this was but partially exposed to view, the rest being concealed behind the woodwork of the apartment. Floating on the top of the liquid the inventor had introduced a diminutive figure of a man, which, with the rising of the column in fair weather, presented itself to view, but with the approach of foul weather retreated out of sight. On the other hand, the fluctuations of height of the water column are proportionally large, and serve to render conspicuous slight changes of pressure, which, in the mercurial barometer, are nearly or quite imperceptible. It is an objection, however, to the water barometer that its indications are largely affected by the vapor from the liquid which occupies the space above the column, and that the error thus arising varies with the temperature. Thus at 70° F. the column is depressed by this cause 10 inches; at 80° F., 14 inches; and at 90° F., nearly 20 inches; while even at 32° F., the freezing-point, below which the water barometer is unavailable, the depres-

sion from the same cause is no less than $2\frac{1}{2}$ inches. There are water barometers in the rooms of the Royal Society of London, and in the theater of the natural philosophy class in the University of Edinburgh. About the middle of the nineteenth century a barometer of large dimensions, in which the fluid used was sulphuric acid, was set up at the Smithsonian Institution in Washington by James Green, of New York, under the direction of Prof. Henry. This liquid is free from the objection of forming vapor in the Torricellian void; and owing to its large specific gravity a column of it less than 20 feet high suffices to balance the mean atmospheric pressure. Such, however, is the avidity with which this acid absorbs watery vapor that its exposed surface must be in some manner protected from direct contact with the atmosphere. The protection used in this case was a balloon of india-rubber firmly secured to the short arm of the siphon barometric tube. But, though moisture was thus excluded, air was found to make its way gradually into the void above the column, and the instrument was finally disused and taken down.

A description of barometer known as the aneroid barometer, employing no liquid, has come extensively into use. It is the invention of M. Vidi, a physicist of France.

The instrument itself consists essentially of a flat cylindrical box formed of thin corrugated metal, from the interior of which the air has been nearly exhausted; the immediate effect being to bring the top and bottom into contact with each other by atmospheric pressure. The touching surfaces are then separated by means of a strong spring at-

tached to the center of the upper surface, while the lower is held down, the whole being placed within a larger box properly adapted to receive it. With the varying pressure of the atmosphere the separation of the surfaces is greater or less, or the spring is more or less bent, and the movements thus occasioned are transmitted by proper multiplying-apparatus to an index which traverses a

dial like that of a watch (Fig. 5). Aneroid barometers often perform very well, and perform well for long periods; but in time the spring is liable to lose its elasticity, so as to render the indications untrustworthy. These instruments should therefore be occasionally compared with standard mercurial barometers. They are very convenient for transportation, being constructed of various dimensions, from 8 or 10 inches in external diameter down to 2, and are often graduated to serve as mountain barometers for heights as great as 12,000 or 16,000 feet.

Another form of barometer without liquid, and in external appearance resembling the aneroid, is Bourdon's metallic barometer, improved by M. Richard, of Paris. In this, a broad and nearly flat tube of thin metal, bent into the form of a horseshoe, having been exhausted of

FIG. 5.—Aneroid mountain barometer.

FIG. 6.

air, is secured by the middle part of the box inclosing it, while the ends left free are connected by delicate chains or wires with the apparatus controlling the index (Fig. 6). The effect of increased atmospheric pressure upon an exhausted tube of this form is to bring the extremities nearer together, and that of diminished pressure to cause them to recede; and these changes are shown by the index on the dial.

Long-continued observations of the barometer have demonstrated that there are certain fluctuations of atmospheric pressure which are periodical and regular, though not large; while such as are noticeable for their magnitude are subject to no obvious law. Of periodical fluctuations there is a semi-diurnal inequality having its maximum at about ten o'clock morning and afternoon, and its minimum at four, afternoon and morning. Its magnitude varies with the latitude, being greatest (0.104 inch) at the equator. In lat. 40° it is 0.05 inch, and in lat. 70° only 0.003 inch. There is also an inequality dependent on the seasons, which in some parts of the earth is large, and in others almost or quite imperceptible. Where it is noticed, the highest reading occurs in January, and the lowest in July, or a little later. At Peking, in China, the mean pressure for the first of these months is three-fourths of an inch greater than that for the second. A large part of Asia is similarly affected. At Havana the fluctuation is hardly a quarter of an inch, the minimum seems not to be reached before the month of August, and the decline of the monthly means is not regular. At Boston and at London the monthly means throughout the year scarcely differ from each other by the tenth of an inch, and an annual inequality can hardly be said to exist. The position of the moon seems to have a slight influence on atmospheric pressure, but this, even where most observable, is little more than half a hundredth of an inch.

The non-periodic fluctuations of pressure are very much greater than the periodic. If we call the difference between the greatest and least readings of the barometer within any month the *monthly oscillation*, and combine the observations of many years for the same month, we shall obtain the mean monthly oscillation. This is least near the equator, and increases toward the poles. At the equator it hardly exceeds 0.1 inch; in lat. 30° it is 0.4 inch; in lat. 45°, over the Atlantic, it is 1 inch; in lat. 65° it is 1½ inches. During the three winter months the mean is about one-third greater. On the continents bordering the Atlantic the means are usually less than over the intervening ocean. The *extreme* fluctuations of the barometer, however, very much exceed these means. In Boston the greatest height observed in thirty-seven years is 31.125 inches, and the least, 28.47 inches—difference, 2.655 inches. The greatest observed range at London is 3 inches; at St. Petersburg, 3.5 inches. Within the tropics the range is small. At Christiansborg, near the equator, the greatest range observed in five years was 0.47. Loomis's *Meteorology*.

The barometer is often spoken of as a weather-glass; and the scale of the instrument is often inscribed with words indicative of the weather which may be expected when the head of the column stands opposite them. This is, however, apt to convey very erroneous notions; for neither the actual nor the approaching weather can be correctly inferred from a knowledge of only a single one of the conditions which determine meteorological phenomena. The indications of the thermometer, the anemometer, and the hygrometer, and the progressive changes denoted by those instruments, are quite as important to the prediction of the weather as those of the barometer. Moreover, the prognostications derived from these instruments which would be justified in one part of the world would not be at all so in another where the physical conditions are different. One remark, however, is true generally. Inasmuch as there can be no considerable change in the condition of the atmosphere as to heat or moisture or movement which is not accompanied or immediately preceded or followed by a change of pressure, therefore when the barometer continues steady, whether it be high or low, the actual state of the weather, whatever it may be, is likely to last. It may be added that a rapid movement of the barometer upward or downward, say three-fourths of an inch in twenty-four hours, is of unfavorable augury. Also that a very rapid fall will probably be followed by a violent wind. A slow movement upward gives assurance generally of fair weather.

While observation enables us thus, in some manner, to connect the fluctuations of the barometer with the varying conditions or aspects of the weather, it is not easy in all cases to assign satisfactory causes for the fluctuations them-

selves. The low state of the column which is commonly observed to accompany the formation of heavy clouds and the fall of rain or snow shows that the popular language, which speaks of the atmosphere at such times as "heavy," is scientifically incorrect. Many hypotheses, among them some which, in the present state of science, would be pronounced absurd on the face of them, have been proposed to account for the phenomena; but the true reason of at least the more conspicuous variations of atmospheric pressure must be looked for in rarefaction by heat, of which the ultimate source is the sun. Different portions of the earth's surface become unequally heated by the solar radiation. The heat thus acquired is imparted by the earth to the atmosphere above it, of which the portions most heated are also most dilated, and, in consequence of their diminished specific gravity, tend to rise. In rising they are further dilated by diminished pressure, and their temperature consequently falls until their contained vapor is condensed to cloud, with evolution of its latent heat. The heat evolved increases the rarefaction, and the upward movement continues. The rarefied column is not changed in weight by the mere fact of its rarefaction; but as its altitude is increased it necessarily overflows at top upon the surrounding air, of which the pressure is thus augmented, while its own is correspondingly diminished. As a necessary consequence, the barometer below it falls; and as rain naturally follows the precipitation of vapor, the rain-area will usually be found to correspond with the area of low barometer. Of periodical oscillations, the diurnal are in like manner traceable to heat. Those of longer period depend on causes less easy to ascertain.

For fuller information as to the barometer and its uses, see *Smithsonian Miscellaneous Collections*, vol. i., p. 693, by Prof. Guyot and J. W. C. Coffin (1862); also *Manual of the Barometer*, by J. W. Belville (London, 1849); also the *Smithsonian Annual Reports* of the years 1855, 1856, 1859, and 1867. The report of 1856 has a detailed description of the construction of Green's standard barometer; that of 1867 contains an important memoir by Marshal Vaillant on the horary variations. Loomis's *Meteorology* and Reid's *Law of Storms* may also be consulted with advantage. See also **GAS**.

Revised by E. L. NICHOLS.

Barometric Light: See **ELECTRIC DISCHARGE**.

Bar'ometz, sometimes called **Tartarian** (or **Scythian**) **Lamb**: the prostrate stem (rhizome) of a fern (*Aspidium barometz*) which grows in salt plains near the Caspian Sea. It is covered with a shaggy, silky down, and has some resemblance to an animal. It was anciently believed to be half plant, half animal. It was also known as **baranetz**.

Baron: the title of the lowest degree of hereditary peers in Great Britain and Ireland; is the next below that of viscount. The word was formerly used to include the whole English nobility, because all noblemen were barons. The distinction between the greater and lesser barons seems to have been made at an early period in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, of the crown; while the lesser held of the greater by the tenure of military service. The greater barons had a perpetual summons to attend the parliament or great councils of the nation. The practice of conferring the rank of baron by letters-patent, and as a mere title of honor apart from the possession of land, originated in 1387. Barons are sometimes created by writ, but this mode is nearly obsolete, and creation by patent is the surest way of insuring the hereditary character of the peerage. On great occasions a baron wears a coronet adorned with six pearls set at equal distances on the chaplet. He is addressed as "my lord" or "your lordship," and is styled "right honorable." In France and Germany and in many other countries a baron is a nobleman next in rank to a count. Formerly in Scotland a baron was not necessarily a nobleman, but was a holder of land in what was called baronial right. There are at present several classes of barons: (1) barons of England; (2) barons of Great Britain; (3) barons of the United Kingdom (all the members of these classes have seats in the House of Lords); (4) barons of Scotland; and (5) barons of Ireland; the members of the two latter classes have no seat in the House of Lords unless chosen as representative peers. The life peerage, rarely conferred, does not entitle to a seat in the House of Lords. Certain judges of the exchequer courts of England and Ireland are called barons of the exchequer.

Baron, baä'rōn', originally **Boyron**. **MICHAEL**: French actor; b. in Paris, Oct. 8, 1653. His father, a leather-mer-

chant, having fallen in love with a very beautiful traveling actress, left his business and entered the same troupe. The actress became the mother of Michael Baron. Going to Paris in after years, Michael, a very handsome young man, attracted the attention of the great Molière, who became his friend and instructor. Baron rose rapidly to the first rank of his profession, and was as eminent in tragedy as in comedy. He was with justice called "the honor and the marvel of the French stage." As a writer of plays he was very prolific. His beauty and talents caused his name to be mixed up with much of the gross scandal of the time. His personal vanity was very great. He used to say, "Every century might produce a Caesar, but it took ten thousand years to produce one Baron." It is commonly reported that he died upon the stage, but in reality, though stricken with apoplexy on the stage, he lived after that event more than two months. D. in Paris, Dec. 3, 1729. Revised by B. B. VALLENTINE.

Baron, PIERRE, called **Peter Baro**: b. in Étampes, France, Dec., 1534; became a Protestant, and escaped to England in Queen Elizabeth's time. In 1574 he was appointed Lady Margaret Professor of Divinity at Cambridge, an office which he held till 1596, notwithstanding the strong opposition which his doctrinal teachings encountered. He was an opponent of Calvinism, then strongly maintained at the university and by the Archbishop of Canterbury—Dr. John Whitgift. Baron was therefore subject to many vexatious annoyances, and was openly accused of heresy and of endeavoring to carry the university back to Romanism. He held to his course with great persistency, and even had the courage to preach against the famous Lambeth Articles, which had been drawn up to oppose him and his party. He was consequently forbidden to engage in polemics, and was made so uncomfortable that he was obliged to resign his position (1596) and retire to London, where he died, April, 1599, leaving a number of Latin treatises, since published in English.

Baronet [dimin. of baron]: a title of honor which is hereditary. A baronet is next lower than a baron, compared with whom, however, he is very inferior in rank. Baronets were first created in 1611 by James I., whose object was to raise money especially for the reduction of Ulster, but the money went mostly into the king's purse. The creation of baronets is limited only by the will of the sovereign, who confers the rank either by patent or by writ. A baronet is entitled to the prefix *Sir* to his name, and has precedence of all knights except bannerets, knights of the Garter, and privy councilors. Baronets are of four classes—those of Ulster, England, Nova Scotia (or Scotland), and the United Kingdom. James, having promised not to create more than 200 baronets in England, extended the title to Nova Scotia to raise money for its reduction, and this is the origin of the Scotch baronets. Sir William Alexander (Earl of Stirling) was the first American baronet. This process in Nova Scotia stopped in 1629, when the province was sold to France. No baronets of Scotland have been created since 1799.

Baro'nus, CESAR: Roman Catholic Church historian; b. in Sora, near Naples, Oct. 30, 1538; was a disciple of St. Philip of Neri. He became cardinal (1596), and librarian of the Vatican (1597). His celebrated *Ecclesiastical Annals* from the birth of Christ to 1198 A. D. (Rome, 1588-93, 12 vols. fol.; Antwerp, 1589-1603; Mayence, 1601-05, rev. ed.) was the result of twenty-seven years' labor. The annals of Baronius are continued by Reynolds to 1565, by Caderchi to 1571, and by Theiner to 1584 (in 1856). In 1864 Theiner began a new edition of the annals, but died suddenly in 1874. Baronius was a brilliant dialectician and stylist, but has been charged with many blunders, owing to his ignorance of Greek. Notwithstanding these errors and his strong partisan spirit, his *Annals* are conceded to possess very great learning and value. They were written in reply to the *Magdeburg Centuries*. He published a number of other works, characterized by the same faults and the same great learning as marked his *Annals*. D. in Rome, June 30, 1607.

Barony: the rank, title, or dignity of a baron; the territory or jurisdiction within which a baron exercises his lordship; specifically, the territory over which a court baron has jurisdiction, the court baron originally being a court in which the free tenants, or the freeholders, of a manor were the judges, and the steward of the manor the registrar. It anciently had jurisdiction in suits concerning lands held in the manor, and some other matters; but such courts are now rarely held, except with regard to certain fines, heriots, etc.

Barozzo, bāā-rod'zō, or **Barocchio**, bāā-rot'chi-ō, JACOPO: an illustrious Italian architect; b. at Vignola, near Modena, Oct. 1, 1507, from which fact he is often called VIGNOLA. He studied painting at Bologna, but was so fascinated by the study of perspective that he abandoned painting for architecture, in which art he attained a great reputation. He was employed by an association of antiquaries in Rome to take measurements and execute models of the remains of the ancient statuary of Rome. These models were afterward cast in bronze. In 1541 he went to Paris to superintend the casting of his copies, and while there was engaged in architectural pursuits. In 1550 he became architect to Pope Julius III. He designed the splendid palace of Cardinal Farnese (Caprarola), in which were placed some of his own pictures. He was engaged upon this work from 1555 to 1573. Meanwhile, upon the death of Michael Angelo in 1564, he succeeded the latter as architect of St. Peter's church. He published several valuable works on architecture, among which the best known is *Regole de' cinque ordini d'architettura* (1563), illustrated by engravings. This was long the standard authority in classic architecture. He was one of the designers of the Escorial Palace in Spain. D. in Rome, July 7, 1573.

Barquisimeto, bāā-keē-sē-may'tō: a city of Venezuela; capital of the state of Lara; on a branch of the river Portuguesa, a part of the Orinoco system (see map of South America, ref. 1-C). It is the fourth city in size in the republic. It was almost destroyed by an earthquake in 1812, previous to which it had about 15,000 inhabitants. It has a college, and is situated in a fertile and well-cultivated district. Pop. 32,000.

Barr: a town of Lower Alsace, Germany; 23½ miles by rail S. W. of Strassburg; situated on the east slope of the Vosges, at the mouth of the Uhlrichthal (see map of German Empire, ref. 7-D); has numerous vineyards, distilleries, manufactures of leather, arms, etc., and three annual fairs. Pop. (1890) 5,674.

Barr, AMELIA EDITH (Huddleston): Anglo-American novelist; b. at Ulverstone, Lancashire, England, Mar. 29, 1831; married Robert Barr in 1850, and has resided in the U. S. since 1854, first in Texas and afterward (1869) in New York State. Her husband died in 1867. Among her novels, which are largely historical, are *Romance and Reality* (New York, 1872); *Young People of Shakespeare's Time* (1882); *The Hallam Succession* (1884); *Jan Vedder's Wife* (1885); *A Daughter of Fife* (1886); *A Bow of Orange Ribbon* (1886); *Friend Olivia* (1891); *Beads of Tasmer* (1891); *Sister to Esau* and *A Rose of a Hundred Leaves* (1892). Scotch, north of England, and Dutch New York tales, with a plot of religious persecution, are her finest fields of invention.

HENRY A. BEERS.

Barrackpur, bār-rak-poor': a town and military cantonment of British India; on the left (or east) bank of the Hugli; about 15 miles above Calcutta (see map of N. India, ref. 8-I). It contains the country residence of the Governor-General of India, and many elegant mansions of the European citizens of Calcutta, who are attracted by the salubrity of the place. The adjacent country is covered with beautiful forests and a luxuriant tropical vegetation. Here is a noble park of 250 acres, which exhibits an admirable specimen of landscape-gardening. Barrackpur was called the cradle of the Sepoy mutiny (*q. v.*) of 1857. Several regiments of native troops were stationed here. They objected to biting off the ends of the cartridges for the Enfield rifle, believing the paper to be polluted with animal fat. A Sepoy named Mungal Pandey wounded an officer in Feb., 1857, whose blood was the first that was shed by the mutineers. Pop. (1891) 57,330.

Barracks: buildings for the habitation of troops. The word is sometimes applied to any collection of buildings densely occupied by human beings.

The experience of the civil war in the U. S. has demonstrated that ventilation, abundance of pure air, is more important to the health of man than complete protection from extremes of cold and heat. While soldiers camped in small and crowded tents, kept closed to exclude the cold, suffered from typhoid fever, the sick and wounded in hospital tents and in the light and open wooden barracks established as general hospitals, recovered more rapidly and certainly than those in what are called better buildings, closer and more substantial.

There are few large masonry barracks in the U. S., such

as are found on the continent of Europe in almost every large town. Most of the military posts are beyond the frontier which separates the country of civilization and cultivation from the region occupied, or rather traversed, by the nomadic Indian tribes, and the scarcely less nomadic white miner and hunter. A very few of these posts built on the open prairies, where timber is scarce and costly, have been constructed of stone or brick; some are of sun-dried bricks, called *adobes* by the Mexicans, and within recent years a few have been reconstructed in a more permanent manner. But the greater part of them are of wood—log houses in the timbered country, light frames covered with boards in the prairies. The open joints of the board wall-coverings and roofs and floors make it impossible to exclude fresh air, and they insure a circulation of air, notwithstanding the efforts of the occupants of the building to close all ventilating openings.

The principal and more permanent barracks of the U. S. are Madison barracks, Sackett's Harbor, N. Y.; Jackson barracks, New Orleans, La.; Jefferson barracks, St. Louis, Mo.; and Columbus barracks, Ohio, now used as recruiting dépôts; Fort Sheridan, Ill.; Mt. Vernon barracks, Mississippi; Benicia barracks, California; Vancouver barracks, Washington; Omaha barracks, Omaha; Fort Leavenworth, Kansas; Newport barracks, Kentucky; Presidio of San Francisco, Cal.; Ringgold barracks and Fort Brown, on the Rio Grande, Tex.; and Plattsburg barracks, Lake Champlain. In the official list published in the *Army Register* there are 140 military posts, including 19 arsenals, ordnance, and powder dépôts, 3 recruiting dépôts, and 1 engineer dépôt, at all of which there are barracks either owned or rented by the U. S.

At most of the U. S. navy-yards there are barracks for the marines, generally of masonry. Among them are the marine barracks of Washington, Charlestown, Brooklyn, Pensacola, and Benicia.

Since the Revolution, Paris has been enriched with very fine buildings as barracks. Those of the Prince Engène, the Napoleon barracks, and the new barracks on the Île de la Cité, are noble and beautiful buildings. But it seems impossible to so arrange these great buildings as to secure thorough and satisfactory ventilation. Without fresh air, and disturbed by the movement which must take place night and day among large bodies of men occupying large rooms, these palaces are not believed to have as low rate of mortality as the temporary cheap structures in which the U. S. army lives on the frontier.

There are large barracks in all the great European capitals. Stuttgart, St. Petersburg, Paris, Naples, Rome, are noted for the beauty and extent of their barracks. The Museo Borbonico at Naples was built for a cavalry barrack; in it are now collected the many remains of Roman and Greek art unearthed at Pompeii and Herculaneum.

The Romans, who conquered the known world and held it by military occupation, built strong barracks wherever they established a permanent post. They had no firearms, and a small garrison depended upon the strength of their walls to resist the attacks of barbarians. The remains of such barracks, nearly perfect, have been found of late years at ancient Roman stations in the wilderness of Syria and Palestine. While the Roman legionary was trained and practiced at hard work, he did not hesitate to use in all such constructions the forced labor of his captives of whatever rank or station. Our troops were obliged generally to build their own barracks, but, armed with rifles of long range, they depended upon their superior knowledge and discipline, and seldom fought the savages from behind their barrack-walls.

There are two uses to which barracks are put: one is protection during a siege and bombardment from the missiles of the enemy; the other, and far more constant use, is protection mainly from the weather.

Many of the seacoast forts of the U. S. make ample provision in vaulted casemates for the garrison during a siege, but such barracks in the climate of the coasts of the U. S. should never be occupied in time of peace. They are dark, damp, ill-ventilated, and unhealthy, and provision should be made for shelter outside the ramparts for the peace garrison in all cases. In the climate of Spain and Italy, of the West Indies, and of Mexico, it is probable that the custom of the tropics of living in rooms roofed with earth or masonry has not such disadvantages as farther north.

European practice allows from 420 to 1,200 cubic feet of space per man in barracks and hospitals; and the latter is

better than the former; but in practice the air-space is limited by the appropriations which the government grants. Thorough drainage of the buildings and of the sites is essential to health. Temporary cantonments should never remain long in one place. The troops should remove to fresh ground, and the old site should not be reoccupied until time and frost have thoroughly destroyed the effete animal and vegetable matter which collects about any large body of men.

All barracks are liable, on any temporary increase of the garrison, to overcrowding. In well-built houses each man should have at least 800 cubic feet of air-space, and in hospitals at least 2,000. In a room intended to be occupied by thirty men, at least 60,000 cubic feet of fresh air per hour should be admitted from the outside, and as much more as can be borne without inconvenience, a safe rule being that each man should have one cubic foot of fresh air per second. But all ventilating arrangements are liable to be obstructed by those for whose benefit they are intended, unless made on the most extensive and elaborate scale, and placed entirely beyond their control. A man feels the cold sensation from a draught more distinctly than the headache or oppression resulting from a close and impure atmosphere. He knows that if he stops the ventilating inlet near him he will get rid of the draught. He does not realize that at a future time his health may break down as a consequence of this interference. Practically, therefore, the most efficient barrack ventilation, except in the palaces of masonry built in Europe and ventilated by steam-power, is that inseparable from the imperfect construction of the building itself. These defects, beyond the skill and power of the soldier to remedy, save his health by supplying him continually with fresh air against his will.

The War Department has of late years adopted an iron barrack-bunk to be occupied by a single man, which gives space for circulation of air, and has abolished the use of the two-story double wooden bunks in which soldiers formerly slept.

BOOKS OF REFERENCE.—*Reports of the British Barrack Commission* (London, 1861); *Circulars Nos. 3 and 4 of the Surgeon-General of the United States; Reports on Barracks and Hospitals; Outline Description of Military Posts and Stations*, published in 1871 by the quartermaster's department. Revised by JAS. MERCUR.

Barraenda, bār-ra-koo'da, or **Barracouta** [native name]: a fish of the family *Sphyrænidæ*, notably *Sphyræna picuda*, *S. sphyræna*, and *S. argentea*, which are long, slender, very voracious fishes of the West Indian and other warm seas, highly valued as food.

Barrande, bār'raānd', JOAQUIM: eminent French palæontologist; b. at Sangués, Haute-Loire, France, Aug. 11, 1799. D. near Vienna, Austria, Oct. 5, 1883. His great work, *Système silurien du centre de la Bohême*, occupying nearly 6,000 quarto pages, is one of the most important single treatises on Palæozoic fossils. His *Theory of Colonies*, devised to explain the sporadic occurrence of fossil species or groups of species in formations older or younger than that of which they are characteristic, was an important contribution to the philosophy of geologic correlation. See PALEONTOLOGY. G. K. G.

Barrantes y Moreno, bār-raan'tāy-sē-mō-ray'nō, VICENTE: a Spanish poet and publicist; b. at Badajoz in Extremadura, Mar. 24, 1829. In 1848 he went to Madrid, and in 1850 he became a writer for the journals *La Ilustración* and *Las Novedades*. In 1851 appeared his novel *Siempre tarde*, which attracted general attention. His *début* as poet was soon after made with his *Baladas Españolas*. From 1851 he engaged also in politics, and his satiric articles entitled *Píldoras* brought a heavy fine upon him for their audacity. In 1859 he abandoned the Liberals and joined the New Catholic Conservatives—a change already prefigured in his novel *Juan de Padilla* (1855), in which he attempted to rehabilitate the old Spanish ideals of life and government. In 1866 he was made secretary to the Government for the Philippine islands, and in 1872 he became a member of the Spanish Academy. Among his works are: *La Joven España* (1854); *Narraciones extremeñas* (1872-73); *Viaje á los infiernos del sufragio universal*, etc. (1873); *Diccionario biográfico de hombres célebres extremeños*.

A. R. MARSII.

Barras, bār'raa', PAUL FRANÇOIS JEAN NICOLAS, Count de: a French Jacobin and regicide; b. at Fox-Amphoux, in Provence, June 30, 1755. He was chosen a deputy to the

States-General in 1789, and a member of the National Convention in 1792. He acted with the party called the Mountain, voted for the death of the king, and joined the enemies of Robespierre on the 9th Thermidor, 1794, in which crisis he was commander of the national guard. On the 13th Vendémiaire (Oct. 5, 1795) he was again appointed commander of the troops by the Convention. With the aid of Bonaparte he defeated the royalist insurgents of Paris on that day. He was one of the first five members of the Directory appointed in Nov., 1795, and acted a prominent part in the conflict of the 18th Fructidor (Sept. 4, 1797), after which he was perhaps the most powerful of the Directors. He was venal and dissolute, and abused his power. His political career was ended by the ascendancy of Bonaparte in 1799. D. in Paris, Jan. 29, 1829. See Thiers, *History of the French Revolution*; C. Doris, *Amours et Aventures du Vicomte de Barras* (4 vols., 1816).

Bar'ratry [from O. Fr. deriv. of *barat*, fraud; etym. obscure]: any distinct, unlawful, or dishonest act committed by the master or mariners of a vessel, tending to their own benefit and to the injury of the owner of the vessel. A mutiny of the crew, and forcible dispossession by them of the officers from the ship, would be a form of barratry.

HENRY WADE ROGERS.

Bar're: a village (and township); on B. and M. R. R. and on Ware river, Worcester co., Mass. (for location of county, see map of Massachusetts, ref. 3-F); 21 miles N. W. of Worcester; has an institute for feeble-minded children, and cotton, woolen, and straw factories. It was named in honor of Col. Isaac Barré. Pop. of township (1880) 2,419; (1890) 2,239; (1900) 2,059.

Barre: city (chartered 1894); Washington co., Vt. (for location of county, see map of Vermont, ref. 4-C); on railroad, 6 miles S. E. of Montpelier. It is the seat of Goddard Seminary, and has four churches; is the center of a large granite industry, and has manufactures of agricultural tools and castings. Pop. of village (1890) 4,146; (1900) 8,448.

EDITOR OF "ENTERPRISE."

Barre, baar, ANTOINE JOSEPH LE FÈVRE, de la: French naval officer; b. about 1625; Governor of Guiana in 1663; retook Cayenne from the Dutch in 1667; was made lieutenant-general in 1667, and was Governor of Canada 1682-85. D. in France, May 4, 1688.

Barré, baar-ray', Col. ISAAC: b. in Dublin, Ireland, in 1726, of French parents; entered the British army, where he served with great distinction, receiving a wound at Wolfe's victory at Quebec (1759), in consequence of which he ultimately became blind. He entered the British Parliament in 1761, where for years he nobly defended the rights of the American colonists. D. in London, July 20, 1802.

Barred-owl: a species of owl (*Syrnium nebulosum*) found in Eastern North America. The noisiest of our owls, but rather mild in temper.

Barrèges, baar'rezh', or **Barèges**: a celebrated watering-place of France; department of Hautes-Pyrénées, 23 miles S. of Tarbes (see map of France, ref. 9-D); 3,240 feet above the level of the sea. Here are warm sulphurous springs having a temperature of about 104° to 122° F., which are esteemed efficacious in cases of scrofula, gout, etc.

Barrel: a large wooden vessel for holding liquids or solids; bound with hoops, and formed of staves, which are wider in the middle than at the ends, and have beveled edges, which render the joints tight. Each end of the barrel is closed by a circular head. The arched arrangement of the staves enables it to resist pressure from without. The term is also applied to the quantity contained by a barrel, which varies for different substances. A barrel of flour in the U. S. is equal to 196 lb., and a barrel of pork or beef contains 200 lb. In wine measure, 31½ gal. make a barrel. A barrel of beer in England is equal to 36½ imperial gal.

Barrett, BENJAMIN FISK: Swedenborgian theologian; b. in Dresden, Me., June 24, 1808; educated at Bowdoin College (1832) and Harvard Divinity School (1838); adopted Swedenborgian views and held pastorates of the "New Church" in New York city (1840-48); in Cincinnati till 1850; worked at a trade four years in Chicago to recover his health; settled as a pastor in Philadelphia in 1855, and editor of the *New Church Monthly*; founded the Swedenborgian Publication Society (Philadelphia) in 1885, and presided over it until his death in Germantown, Aug. 6, 1892. Besides many pamphlets and periodical articles, he pub-

lished a *Life of Swedenborg*; *Doctrines of the New Jerusalem Church* (New York, 1842); *New Dispensation and Letters on the Divine Trinity*; *The Golden Reed* (New York, 1855); *Catholicity of the New Church* and *The Visible Church* (1856); *On Future Life* (1872); *The New Church: its Nature and Whereabout*; *Swedenborg and Channing*; and a *New View of Hell* (1872). He edited the *Swedenborg Library* (12 vols., 1876). See his collected works (Philadelphia, 1876).

Barrett, LAWRENCE: actor; b. in Paterson, N. J., Apr. 4, 1838. He first appeared in Detroit in 1853 in *The French Spy*. He played leading parts at the Boston Museum in 1858. At the Winter Garden in New York he acted Othello to Edwin Booth's Iago, and it was considered a most striking performance. He was a captain in a Massachusetts regiment during the civil war. In 1872 he played Cassius to Booth's Brutus. As Lanciotto in *Francesca di Rimini* he made a great success. In 1884 he played in London and was favorably received. Wrote a *Life of Edwin Forrest* (Boston, 1881). D. in New York, Mar. 20, 1891.

Barrett, WILLIAM ALEXANDER: See the Appendix.

Barrhead: a manufacturing town of Renfrewshire, Scotland; 7 miles S. W. of Glasgow (see map of Scotland, ref. 12-F). It has cotton-mills, a machine-shop, print-works, bleaching-works, etc. Pop. 8,000.

Barrias, baar'ree-aas', FÉLIX JOSEPH: historical painter; b. in Paris, Sept. 13, 1822. He was a pupil of Léon Cogniet, and was awarded the Grand Prix de Rome in 1844; Legion of Honor 1859; first class medal, Paris Exposition, 1889. Painted frescoes in the churches of St. Eustace and La Trinité, Paris. One of his compositions, *Landing of the French Troops in the Crimea*, is in the museum at Versailles. His work is academic and conventional, but sound in method.

W. A. C.

Barricade: a military barrier or defensive work, employed to obstruct the passage of an enemy through a road or a street of a city, or to protect troops against the fire of the enemy. Such works are formed of trees, wagons, paving-stones, chains, palisades, etc. They have been often used in popular revolts and street-fights, especially by insurgents in Paris. In 1588 the Roman Catholic faction raised barricades in Paris against Henry III., who was compelled to save himself by flight. A great number of barricades were erected in Paris by the popular party in the revolution of July, 1830, when Charles X. was dethroned. In June, 1848, the streets of Paris were again obstructed by barricades, and a bloody battle was fought between the government of Cavaignac and the Socialists or Communists, who were defeated. In order to counteract such operations, Napoleon III. widened and macadamized the principal streets of his capital, but barricades were again employed by the Communist insurgents in the spring of 1871.

Barrie: capital of Simcoe co., Ontario (Canada); at the western extremity of Lake Simcoe, and on the Northern and Northwestern Division of the Grand Trunk Railway; 65 miles N. N. W. of Toronto (see map of Ontario, ref. 3-D); has excellent schools, including a collegiate institute, 9 churches, a large trade, manufactures of woolen goods, and 3 weekly papers. Steamboats ply on the lake. The town was founded in 1832, and was incorporated as a town in 1871. Pop. (1881) 4,854; (1891) 5,550.

EDITOR OF "EXAMINER."

Barrie, JAMES MATTHEW: novelist; b. in Kirriemuir, Forfarshire, Scotland, May 9, 1860; educated in Dumfries and at Edinburgh University (1882); was journalist in Nottingham and London. His first tale was *Better Dead* (1887), a satire on London life. Next followed *Auld Licht Idylls* and *When a Man's Single* (1888); then *A Window in Thrums* (1889); *My Lady Nicotine* (1890); *The Little Minister* (1891); and a comedy (1892), written for J. L. Toole. *Sentimental Tommy* and *Margaret Ogilvie* (1896); *Tommy and Grizel* (1900). Barrie's delineations of Scotch life are vivid and pathetic.

Barrier Act: the common name of an act passed by the General Assembly of the Church of Scotland, Jan. 8, 1697, intended as a barrier against innovations and an obstruction to precipitate legislation.

Barrière, baar'ri-är', JEAN FRANÇOIS: French writer; b. in Paris, May 12, 1786; edited (with Berville) *Mémoires relatifs à la Révolution Française* (47 vols., 1822 et seq.) and (alone) *Mémoires relatifs à XVIIIème Siècle* (29 vols., 1846-64). D. in Paris, Aug., 1868.

Barrière, Théodore: French dramatist and satirist; b. in Paris, 1823; author of *Filles de marbre* (1853) in opposition to Dumas's *Dame aux Camélias*; *L'ange de minuit* (1861); *Malheur aux vaincus* (1872), etc. D. in Paris, Oct. 16, 1877.

Barrier-reef, The Great: a vast coral-reef situated off the northeast coast of Australia, and extending from lat. 24° 30' S., lon. 158° 20' E., to Bristow island, on the coast of the island of Papua, lat. 9° 15' S., lon. 143° 20' E., nearly 1,300 miles. It is at a distance varying from 10 miles to over 100 miles from the coast, and rises, generally precipitously, from a great depth. It has a number of breaks or passages.

Barrier Treaties: the name given to several treaties between Great Britain and foreign powers; the first between Great Britain and the Netherlands, negotiated by Lord Townsend in 1709. The Dutch pledged themselves to maintain the Queen of England's title and the Protestant succession, while the British engaged to assist the Dutch in preserving their barrier-towns. The second was concluded between the same powers at Utrecht in 1713. The third was signed at Antwerp in 1715, between Great Britain, the Netherlands, and the Emperor Charles VII.

Barringer, Daniel Moreau: politician; b. in Cabarras co., N. C., in 1807; graduated at the State University in 1826, and became a lawyer. He was several years in the State Legislature; represented the State in Congress for six years (1843-49); was U. S. minister to Spain from 1849 to 1853; a delegate to the Peace Congress of 1861, and to the national union convention at Philadelphia in 1866. D. at White Sulphur Springs, Va., Sept. 1, 1873.

Barrington: a post-village of Barrington township, Shelburne co., Nova Scotia; on the Atlantic coast (see map of Quebec, ref. 3-A); has thriving fisheries, ship-building, and coasting trade.—**BARRINGTON PASSAGE,** another village of the same township, has extensive fisheries, and is connected with Cape Sable island by ferry. Pop. of Barrington, 1,000.

Barrington: township; Bristol co., R. I. (for location of county, see map of Rhode Island, ref. 8-O); on Old Col. R. R., 8 miles from Providence. Brick-making is the chief industry. Pop. (1880) 1,359; (1890) 1,461; (1900) 1,135.

Barrington, Hon. Daines: an English jurist and naturalist; brother of Shute Barrington (1734-1826); for thirty-five years Bishop of Durham; b. in 1727. He published *Observations upon the Statutes, chiefly the More Ancient, from Magna Charta to the 21 Jac. I. c. 27* (1766), a standard work; wrote a *Dissertation on the Linnæan System*, and other works. D. in London, Mar. 14, 1800.

Barris, Willis Hervey, D. D.: theologian and scientist; b. at Barrisville (formerly Zilienople), Beaver co., Pa., July 9, 1821; educated at Allegheny College and General Theological Seminary, New York; ordained deacon 1850; leading clergyman in Iowa; for twenty years president standing committee of diocese, and for a quarter of a century Ely Professor Ecclesiastical History in the theological department of Griswold College, Davenport, Ia.; acting Professor of Hebrew and Biblical Exegesis, and dean of the faculty; interested in the study of geology and palæontology. His chief publications, other than sermons, essays, and reviews, are a series of articles on local geology contributed to the *Proceedings of the Davenport Academy of Natural Science*. His work on the *Blastoidea of the Hamilton Group* was republished in vol. viii. *Illinois State Geological Survey*. Dr. Barris's collection of crinoids was secured by Prof. Agassiz for the Peabody Museum of Harvard College. W. S. PERRY.

Barrister: in England, a lawyer who has been called to the bar, and who conducts the trial and argument of causes in court, as distinguished from an attorney, whose duty it is to draw the pleadings and prepare the case for trial. See ATTORNEY. H. W. R.

Barrois, baăr'wăă', Charles, Dr. Sc.: geologist; b. at Lille, France, Apr. 21, 1851; educated at the University of Lille, and afterward Professor of Natural Sciences in the same institution. In the organization of the official geological corps of France he has charge of the work in Brittany. His publications on the geology of France are both numerous and voluminous, and are at once distinguished by their ability and by their wide range of topics, which include stratigraphy, mountain structure, metamorphism, petrography, and several branches of palæontology. He is Bigsby

medalist and foreign member of the Geological Society of London, and was a vice-president of the International Congress of Geologists at the Washington meeting (1891). Among his greater memoirs are *Le Terrain crétacé supérieur de l'Angleterre et de l'Irlande* (1876); *Les Terrains anciens des Asturies et de la Galice* (1882); and *Faune du calcaire d'Erbray* (1889). G. K. G.

Barron, James: naval officer; b. in Virginia in 1769; served in the navy under his father, who was a "commodore of all the armed vessels of the Commonwealth of Virginia"; was commissioned lieutenant in the U. S. navy in 1798, and in 1799 was promoted to be a captain. He was employed on sea-service in the Mediterranean and other waters until 1807, and had acquired a high reputation for seamanship and discipline when the affair of the Chesapeake cast a shadow over his life. On June 22, 1807, the Chesapeake, bearing the pennant of Commodore Barron, sailed from Hampton Roads for the Mediterranean. The British war-vessel Leopard, about three o'clock in the afternoon, bore down upon and hailed the Chesapeake, informing Commodore Barron she had a dispatch for him. A boat being sent alongside, the message proved to be the instructions of Admiral Berkeley of the British navy to search the Chesapeake for deserters. This Commodore Barron refused to permit, and he wrote to Captain Humphreys, commanding the Leopard, that he knew of no deserters on the Chesapeake, and that his orders would not permit his men to be mustered by any other than their own officers. The lieutenant who had brought this dispatch to Commodore Barron returned to the Leopard, and shortly after this vessel opened fire on the Chesapeake, which proved to be entirely unprepared for battle. But one gun was discharged from the Chesapeake before she struck her colors. Three deserters were found on board, and taken to the Leopard, Commodore Barron being permitted to retain his ship, with which he at once returned to Norfolk. Barron was court-martialed for neglect of duty, found guilty, and suspended from the service for five years. Although restored to his rank and placed in responsible positions ashore, he never again did sea-service. A long correspondence with Commodore Decatur on the Chesapeake affair terminated in a duel between them at Bladensburg, Md., in 1820, in which both were severely wounded, Decatur mortally. Barron lived to be the senior officer in the U. S. navy. D. in Norfolk, Va., Apr. 21, 1851.

Barros, baar'rôs, João, de: one of the most eminent of Portuguese historians; b. at Viseu in 1496. He was appointed governor of the Portuguese possessions in Guinea in 1522. His greatest work is entitled *Asia, or the History of the Discoveries and Conquests of the Portuguese in the East Indies* (1552-62). He wrote only three decades of this work, which was continued by Diego de Couto to the twelfth decade. This history is admired for elegance of style and other merits. D. in Pombal, Oct. 20, 1570. See Manoel Severim de Faria, *Vida de João de Barros* (1624).

Barrow: a river of Ireland; rises in Queen's County, on the northeast slope of the Slieve Bloom Mountain. It flows in a general southward direction, passes by Carlow and New Ross, divides the counties of Kildare, Carlow, and Wexford from the counties of Queen's and Kilkenny, and, after uniting with the Suir, enters the sea through Waterford harbor. It is about 100 miles long, and is next in importance to the Shannon among Irish rivers. It is navigable for ships of 300 tons to New Ross, 25 miles from its mouth.

Barrow [O. Eng. *beorg*, mound; Germ., Dutch *berg*, hill]: a name of artificial mounds which are found in many countries, and were erected in ancient times in honor of eminent persons or for monumental purposes. They are formed of earth or stones, and contain in some cases human bones, with armor and utensils. In Great Britain there are numerous barrows, which are supposed to have been raised before the island was conquered by the Romans. One of the largest barrows in Europe is Silbury Hill, in Wiltshire, which has a vertical height of 170 feet and covers 5 acres. Many artificial mounds occur in the U. S., as at Grave Creek, West Va., and near Marietta, O.; also in Central America. See MOUND-BUILDERS.

Barrow, Isaac, D. D., F. R. S.: English pulpit orator and mathematician; b. in London, Oct., 1630. He graduated at Cambridge as M. A. in 1652, and became Professor of Greek in that place in 1660. He was appointed Lucasian Professor of Mathematics in 1663, but resigned that chair in favor of his pupil, the illustrious Newton, in 1669. In 1672 he was

appointed master of Trinity College, Cambridge. He published, besides other able works, *Lectiones Opticæ* (1669) and *Lectiones Geometricæ* (1670). His reputation as a theologian rests chiefly on his sermons, which were edited by Dr. Tillotson (3 vols., 1685). They are very remarkable specimens of clear and exhaustive argument. "The sermons of Barrow," says Hallam, "display a strength of mind, a comprehensiveness, and fertility which have rarely been equaled." Frequently reprinted is his *Treatise on the Pope's Supremacy* (London, 1680); e. g. 1851. D. in London, May 4, 1677. His personal character was noble. See Arthur Hill, *Life of Barrow*, prefixed to his collected works (1685); Ward, *Lives of the Professors of Gresham College*; biography by W. Whewell in vol. ix. of Napier's edition; Barrow's *Theological Works* (Cambridge, 1859, 9 vols.).

Barrow, Sir JOHN, Bart., F. R. S.: traveler; b. in Lancashire, England, June 19, 1764. As secretary to Lord Macartney he went to China in 1792, and to the Cape of Good Hope in 1797. He was secretary to the Admiralty for nearly forty years, and rendered many services to geographical science by promoting scientific expeditions. He was the chief founder of the Royal Geographical Society. Among his works are *Travels in South Africa* (2 vols., 1801-04); *An Account of the Mutiny of the Bounty* (1831); and *Voyages of Discovery and Research within the Arctic Regions* (1846). D. in London, Nov. 23, 1848. See his *Autobiographical Memoir* (1847).

Barrow, WASHINGTON: b. in Davidson co., Tenn., Oct. 5, 1817; became a lawyer; was for several years editor of the *Nashville Banner*, and a leader of the Whig party; State Senator in 1861. In 1841 he was appointed *chargé d'affaires* to Portugal, and was a Representative from Tennessee in Congress 1847-49. During the civil war he was arrested for alleged disloyalty, but was released soon after by order of President Lincoln. D. in St. Louis, Oct. 19, 1866.

Barrowe, HENRY: English Nonconformist; called to the bar in 1576. After a licentious youth he was converted, and abandoned the law. Being attracted to John Greenwood, he became interested in Church reform. Robert Brown influenced them in favor of independency, and Barrowe was illegally arrested Nov. 19, 1586. He was charged with publishing seditious books against the queen and Government, and spent the rest of his life in Fleet Prison. He was condemned with John Greenwood, and they were hanged Apr. 6, 1593. Barrowe wrote *A Brief Discovery of the False Churches*.

Barrow-in-Furness: a seaport and important town of Lancashire, England; on the Irish Sea, 18 miles W. N. W. of Lancaster (see map of England, ref. 6-E). It is on the peninsula of Furness, and is the western terminus of a railway which extends to Dalton, and connects Barrow with the whole railway-system of England. It is separated by a narrow channel from Barrow island, and has a good harbor, formed by the island of Walney, which is 8 miles long. This place, which in 1845 was only a small fishing-village, derives its prosperity from rich mines of iron ore (red hematite) and manufactures of iron and steel, and it has increased with great rapidity. The Barrow Hematite Steel Company has twelve blast furnaces in operation, and the quantity of ore taken from the mines is 500,000 tons annually. This ore yields about 57 per cent. of iron. The steel-works of Barrow are said to be the largest Bessemer steel-works in Britain. About 20,000 tons of slate are annually quarried in the vicinity. Barrow has a town-hall, a public library, and numerous churches. Large sums of money have been expended in converting the channel between the town and Barrow island into docks. Pop. (1891) 51,712; (1901) 57,589.

Barrows, ELIJAH PORTER, D. D.: b. at Mansfield, Conn., Jan. 5, 1805; graduated at Yale in 1826; taught school in Hartford 1826-31; was ordained in 1832; pastor of the first Free Presbyterian church, New York city, 1835-37; Professor of Sacred Literature in Western Reserve College 1837-52, and of Hebrew Language and Literature at Andover Theological Seminary 1853-66. In 1872 he entered the same professorship in Oberlin Theological Seminary. He published a *Memoir of Evertson Judson* (Boston, 1852); *Companion to the Bible* (New York, 1869); *Sacred Geography and Antiquities* (1872). He was one of the authors and editors of the *Bible with Notes* (American Tract Society), and published many articles in the *Bibliotheca Sacra*. D. in Oberlin, Ohio, Sept. 14, 1888.

Barrows, JOHN HENRY, D. D.: Presbyterian minister; chairman of the General Committee on Religious Congresses in connection with the Columbian Exposition of 1893; b. in Medina, Mich., July 11, 1847; was educated at Olivet College, Mich., and at Yale, Union, and Andover Theological Seminaries; pastor of the First Presbyterian church in Chicago 1881-96, and in 1883 published a history of that church, which he left to lecture in India, China, and Japan. He has also published *The Gospels are True Histories* (1891); *I Believe in God the Father Almighty* (1892); and *Henry Ward Beecher, the Pulpit Jupiter* (New York, 1893). W. J. BEECHER.

Barrows, SAMUEL JUNE: Unitarian minister and editor; b. in New York, May 26, 1845; educated at Harvard Divinity School and Leipzig University; became a Baptist minister, but soon exchanged that connection for Unitarianism; secretary to William H. Seward 1867-69; pastor of First Parish, Dorchester, Mass., 1876-80; editor *Christian Register* 1881; author of *The Doom of the Majority* (Boston, 1883); *A Baptist Meeting-house* (1885); *The Slaybacks in Camp* (1888); editor of various volumes of essays and sermons; noted as an earnest worker in educational and penal reforms, and for his linguistic attainments. His wife, BELLA C. BARROWS, has assisted him in his literary work.

Barrnudia, baăr-roon'dĕĕ-ăă, JOSÉ FRANCISCO: a statesman; b. in Honduras in 1779; raised the standard of revolt against the Spanish Government, and was chosen in 1829 president of the republic. As a member of the first Republican assembly, in 1824, he introduced and carried a decree for the abolition of slavery. In 1854 he was minister to the U. S., and d. Aug. 4, 1854, in New York city.

Barry: city (founded in 1836); Pike co., Ill. (for location of county, see map of Illinois, ref. 7-B); on Wabash R. R., 18 miles E. of Hannibal, Mo., 30 miles S. E. of Quincy, Ill. Barry has a high school, three churches, woolen-mill, flour-mill, and pork-packing establishments. The surrounding country is agricultural. Pop. (1880) 1,392; (1890) 1,354; (1900) 1,643. PUBLISHER OF "ADAGE."

Barry, ALFRED, D. D.: late Bishop of Sydney; b. in London in 1826; educated at Trinity College, Cambridge; ordained in 1850, and became Bishop of Sydney, Metropolitan of New South Wales, and Primate of Australia in 1884; Principal of King's College, London, 1868-83; Canon of Worcester 1871-81; Canon of Westminster 1881-83; but resigned in 1889, and in 1891 was appointed Canon of Windsor. Besides sermons and commentaries, he has published a *Life of Sir C. Barry*, his father; *What is Natural Theology?* (1876); *The Teacher's Prayer-book* (numerous editions); *The Parables of the Old Testament* (1889); *Christianity and Socialism* (1891). W. S. PERRY.

Barry, Sir CHARLES: English architect; b. at Westminster, May 23, 1795. He visited Italy, Greece, and Egypt about 1818. He designed the Manchester Athenæum and the grammar school of Edward VI. at Birmingham. In 1841 he became a royal academician. His design for the new Houses of Parliament was preferred to those of his competitors, and the work was commenced in 1840. D. in Clapham, London, May 12, 1860; buried in Westminster Abbey. See *Memoir of Sir Charles Barry*, by his son, the Rev. Alfred Barry (1867).

Barry, EDWARD MIDDLETON: b. in London, 1830; son of Sir Charles Barry, whom he succeeded as architect of the Houses of Parliament; also architect of the National Gallery and other prominent buildings. D. in London, Jan. 29, 1880.

Barry, JAMES: historical painter; b. in Cork, Ireland, Oct. 11, 1741; was patronized by Edmund Burke. He passed about five years at Rome, and became a member of the Royal Academy of London, but he was expelled from the same in 1797 on account of differences of opinion on methods of art-teaching. His masterpiece is *The Victors at Otympia*. D. in London, Feb. 6, 1806. See Cunningham, *Lives of Painters and Sculptors* (*Edinburgh Review* for Aug., 1810).

Barry, JOHN: naval officer; b. in Tacumshane, County Wexford, Ireland, in 1745; emigrated to America about 1760. He became commander of a U. S. frigate in 1776, and captured the British vessel *Atlanta* in May, 1781. After the reorganization of the U. S. navy he was appointed senior officer, and selected to command the frigate *United States*. D. in Philadelphia, Sept. 13, 1803.

Barry, JOHN WOLFE, M. Inst. C. E.: civil engineer; engineer of the extension of the Metropolitan District and Inner Circle (underground) Railways of London; youngest

son of the late Sir Charles Barry, R. A.: b. in 1836; educated at Trinity College, Glenside, Perthshire, and at King's College, London; studied first with Lucas Brothers, afterward articulated to Sir John Hawkshaw. While with the latter he was resident engineer on the Thames bridges and the Charing Cross and Cannon Street stations. Leaving Sir John Hawkshaw in 1867, he commenced work on his own account. He built the Lewes and East Grinstead Railway, the Faling and Fulham extensions of the Metropolitan District Railway, the Inner Circle Railway (these being extensions of the Underground Railway of London), the new Blackfriars bridge over the Thames, the Barry dock near Cardiff, and the railways to connect it with South Wales; engaged in the construction of the new Tower bridge for the corporation of London. In 1872 he visited the Argentine Republic, and laid out a railway from Buenos Ayres to Rosario. In 1886 he was appointed by the Government on the Royal Commission on Irish Public Works: in 1889 on a commission to settle important matters in connection with the river Ribble; and again in the same year on the Western Highlands Commission, having duties similar to those of the Irish Commission. Mr. Barry is member of the Council of the Institution of Civil Engineers, member of the Institution of Mechanical Engineers, Fellow of the Royal Institute, author of *Railway Appliances*, and of a course of lectures with Sir F. J. Bramwell on *Railway and Locomotive* (1882).

WM. R. HUTTON.

Barry, PATRICK: horticulturist; b. near Belfast, Ireland, in May, 1816. At the age of twenty he removed to the U. S., and in 1840 moved to Rochester, where he died June 23, 1890. In his earlier life he was editor of the *Horticulturist* and also of the *Genesee Farmer*. His book called the *Fruit Garden* has long been an authority upon pomological matters. He was well known from his connection with the nursery firm of Ellwanger & Barry.

Barry, WILLIAM FARQUHAR: soldier; colonel of the Second Artillery and brevet brigadier-general U. S. army; b. in New York city, Aug. 18, 1818; graduated at West Point in 1838. His first active services were in the war against the Indians in Florida 1852-53, when he was advanced to a captaincy. In the Mexican war he acted as aide-de-camp to Maj.-Gen. Worth. He served in the difficulties with the Indians in Dakota in 1856, and took part in the Utah expedition 1858. When the civil war broke out he was appointed chief of artillery of the army of the Potomac, with the rank of major and brigadier-general of volunteers. His gallant and meritorious conduct in the capture of Atlanta won him the brevet titles of colonel U. S. army and major-general of volunteers, Sept. 1, 1864. Mar. 13, 1865, he was breveted brigadier-general U. S. A. for gallant services in the campaign terminating in the surrender of the army under Gen. J. E. Johnston, and was made brevet major-general U. S. A. in 1865. Gen. Barry organized the entire artillery of the Army of the Potomac, and served in the field with that army as chief of artillery from Mar., 1862, to Sept., 1862, participating in the siege of Yorktown and the Seven Days' battles ending with Malvern Hill. He subsequently commanded the artillery serving in the defenses of Washington 1861-63, and served as chief of artillery in the armies commanded by Gen. Sherman. He was a member of various boards, and after the war was assigned to the command of the northern (lake) frontier for the preservation of the national neutrality; in 1867 appointed to command the U. S. Artillery School at Fortress Monroe. Gen. Barry was the author of *Engineer and Artillery Operations of the Army of the Potomac, A. D. 1861-62*, in conjunction with the writer, and *A System of Tactics for the Field Artillery of the United States*, in conjunction with Maj.-Gens. W. H. French and H. J. Hunt. D. near Baltimore, July 18, 1879.

Barry, WILLIAM TAYLOR: b. in Lunenburg, Va., Feb. 5, 1784; graduated at William and Mary College in 1803; became a lawyer; was member of Congress from Kentucky (1810-11); served in the war of 1812; was U. S. Senator (1814-16); was in turn a judge, lieutenant-governor, State secretary, and chief justice of Kentucky; Postmaster-General under Jackson (1828-35); and d. in Liverpool, Aug. 30, 1835, while on his way to Spain as U. S. minister.

Barry, COUNTESS DU: See DU BARRY.

Barry Cornwall: See PROCTER, BRYAN WALTER.

Bars, bôrsh: a county of Northern Hungary; area, 1,032 sq. miles. With the exception of a small part in the S., the country is mountainous, and is traversed by the Gran and

the Zsitva. The soil of the plain in the southern part is very fertile, and produces chiefly grain. Pop. (1890) 153,053. Chief town, Krennitz.

Barse, GEORGE R., Jr.: figure-painter; b. in Detroit, Mich., July 31, 1861. Pupil of Cabanel, Boulanger, and Lefebvre, Paris; member of the Society of American Artists 1889. His pictures latterly have been painted from motives found in Capri, Italy, where he went to reside in 1890, and his work is generally decorative in character.

W. A. C.

Bar-sur-Aube, baâr'sür-ôb' (Lat. *Bar'rum ad Al'bulam*): an ancient town of France; department of Aube; on the river Aube; 33 miles by rail E. S. E. of Troyes (see map of France, ref. 4-G). It has a trade in wine, hemp, grain, and wool. The allied sovereigns held a council here Feb., 1814, and here, in the same year, occurred two battles between the allies and the French. Pop. (1891) 4,342.

Bar-sur-Seine, baâr'sür-sayn' (Lat. *Bar'rum ad Seg'uanum*): a town of France; department of Aube; on the river Seine; 17 miles S. E. of Troyes (see map of France, ref. 4-G); was important in the Middle Ages. The allies defeated the French here in 1814. Pop. (1891) 3,237.

Barter: the exchange of one commodity for another, as distinguished from the exchange of a commodity for money. This is a primitive method of trading commonly practiced by barbarous peoples, but inadequate to the needs of the commerce of civilized nations, which demands a standard of value or money. (See MONEY.) Ships sailing to uncivilized countries often carry weapons, tools, or ornaments to be used in barter with savages. Farmers in the U. S. also often barter their produce for goods at the stores.

Revised by F. STURGES ALLEN.

Bartfeld, baart'felt, or Bartfa: an old town of North Hungary, in the county of Saros, on the river Tepla, 20 miles N. of Eperies (see map of Austria-Hungary, ref. 4-J). It has mineral baths, which are much frequented, and a considerable commerce in wine, brandy, linen, etc. Pop. 5,403.

Barth, baart, or Bardt: a seaport-town of Prussia, in the province of Pomerania, on the Binnensee, 15 miles W. N. W. of Stralsund (see map of German Empire, ref. 2-F). It has ship-building docks, and a trade in grain and wool. Pop. (1890) 5,578.

Barth, CASPAR, von (1587-1658): classical philologist; spent his life as a scholarly man of leisure in Halle and Leipzig. A prolific author, and much admired in his own day for his erudition and critical acumen; now chiefly remembered as an unscrupulous fabricator of text readings which he pretended to have discovered in neglected MSS.

ALFRED GUDEMAN.

Barth, HEINRICH: an enterprising German explorer; b. in Hamburg, Feb. 16, 1821. He traveled in Northern Africa in 1845, after which he extended his explorations to Palestine, Arabia, and Asia Minor, and published *Wanderings along the Shores of the Mediterranean* (1849). He joined Richardson and Overweg in an expedition to Central Africa, but they died in 1851, and he explored that country alone for about five years. In 1863 he became Professor of Geography in Berlin. He published *Travels and Discoveries in Central Africa* (5 vols., 1858), which is a very valuable work. D. in Berlin, Nov. 25, 1866.

Barthélemy, baâr'täyl'mee', JEAN JACQUES: French antiquary; b. near Aubagne, in Provence, July 20, 1716. He learned the Greek, Hebrew, Arabic, and Chaldean languages, and became keeper of the royal cabinet of medals in 1753, after which he traveled in Italy and collected many medals. He wrote several treatises on numismatics and ancient inscriptions. His principal and most popular work is *Travels of Anacharsis the Younger in Greece* (*Voyage du jeune Anacharsis en Grèce*, 4 vols., 1788), in which a young Scythian describes his observations in Greece in the fourth century B. C. It has been translated into many languages. He was admitted into the French Academy in 1789. D. April 30, 1795. See Mancini-Nivernais, *Essai sur la vie de J. J. Barthélemy* (1795); Villenave, *Notice sur les ouvrages de J. J. Barthélemy* (1821), in connection with a complete edition of his works in four volumes.

Barthélemy Saint-Hilaire, baâr'täyl'mee' säñ'téc'-lär', JULES: French scholar and journalist; b. in Paris, Aug. 19, 1805. He was an editor of the *National* and other liberal journals. In 1838 he became Professor of Greek and Latin Philosophy in the College of France; translated the works of Aristotle (4 vols., 1839-44), and wrote several works, among

which is *Du Bouddhisme* (1855). He was elected a member of the National Assembly in 1848. He was secretary to President Thiers in 1872-73. D. in Paris, Nov. 25, 1895.

Barthez, baär'tes', or **Barthès**, PAUL JOSEPH, M. D., LL. D.: French physician and writer; b. in Montpellier, Dec. 11, 1734. He became Professor of Medicine in that city in 1759, and removed to Paris in 1780, after which he was consulting physician to the king and a member of the council of state. He wrote, besides other works, *New Elements of the Science of Man* (1778). D. in Paris, Oct. 15, 1806. See Lordat, *Mémoires sur la vie de P. J. Barthez* (1818).

Bartholdi, baär'töl-dee', FRÉDÉRIC AUGUSTE: sculptor; b. at Colmar, in Alsace-Lorraine, Apr. 2, 1834; first studied painting under Ary Scheffer in Paris, but afterward devoted himself exclusively to sculpture, and began to exhibit in 1847. Among his best-known works are the busts of Eckmann and Chatrian, the statues *La Malédiction d'Alsace*; *Lafayette Arriving in America*; and *Liberty Enlightening the World*, the colossal figure of the goddess of Liberty (a complete lighthouse, see NEW YORK CITY) which the people of France presented to the U. S. Bartholdi is author of a description of this statue, published in 1885, was present at its unveiling, Oct. 28, 1886, and has been promoted to the rank of commander of the Legion of Honor.

Bartholin, baär'tō-lin, CASPER: b. in Malmö, Sweden, in 1585. He was famous for his precocity and learning; entered the University of Copenhagen when about eighteen, and afterward studied at Rostock and Wittemberg; was Professor of Medicine in the University of Copenhagen 1613 to 1624. He afterward became Professor of Divinity; wrote about fifty works, mostly on medical subjects. D. in Sorö, July 13, 1630.

Bartholin, THOMAS, M. D.: physician; son of Casper above; b. in Copenhagen, Oct. 20, 1619. He became in 1647 Professor of Mathematics, and next year of Anatomy, at Copenhagen, and wrote, among other works in Latin, one on the lymphatic vessels (the discovery of which he claimed); a treatise on the functions of the liver; and *Anatomia* (1641), which passed through many editions and obtained a high reputation as a text-book. His house, library, and MSS. were burned in 1670. Thereupon he was made physician to the king and librarian of the university. Grand councilor of Denmark in 1675. The Bartholin family produced many eminent physicians. D. Dec. 4, 1680.

Bartholin, THOMAS: b. April 8, 1659; d. Nov. 15, 1690. One of the founders of the study of northern antiquities. His chief work, *Antiquitatum Danicarum de Causis contemptæ a Danis adhuc Gentilibus Mortis Libri Tres*, was published at Copenhagen (where he was professor) in 1689. G. L. KITTREDGE.

Bartholomew: a bayou in Arkansas and Louisiana; rises in Jefferson County in the former State, flows nearly southward into Louisiana, and enters the Washita river at Washita city. It is navigable for steamboats for 250 miles.

Bartholomew [in Gr. Βαρθολομαῖος; in Lat. *Bartholomæus*]: saint, one of the twelve apostles; supposed to be the same as the Nathanael mentioned in John i. 45-49. We have no authentic information respecting his labors or his death. According to tradition, he preached the gospel in India.

Bartholomew, EDWARD SHEFFIELD: sculptor; b. in Colchester, Conn., in 1822. He practiced dentistry for a time, and then learned painting, but afterward became distinguished as a sculptor. From 1845 to 1848 he was in Hartford, and after two years spent in New York he went to Italy, where he died at Naples, May 2, 1858. Some of his works are greatly admired. Among them are *The Shepherd Boy*; *Youth and Age*, a monument to Charles Carroll; *Ganymede and the Eagle*, etc.

Bartholomew Fair: a great English market held annually in West Smithfield, London, on the festival of St. Bartholomew (Aug. 24, old style). The charter of this fair was granted by Henry I. in 1133. It was originally connected with the Church, under whose auspices miracle-plays, mysteries, and moralities were represented at the fair. In the first centuries of its existence this was the chief cloth-fair of the kingdom. Leather, pewter, and live cattle were also sold here. Crowds of people were attracted to it by a variety of popular amusements and the exhibitions of acrobats, tumblers, mountebanks, mummers, and merry-andrews. Having

ceased to be a place of traffic and become a nuisance, it was abolished in 1855. See Henry Morley, *Memoirs of Bartholomew Fair* (1859).

Bartholomew's Hospital, London: founded in 1102 by Rahere, the king's minstrel; was at first connected with a priory established by the same person. It was made a sanctuary by Edward II., but hospital and priory were both dissolved by Henry VIII., who founded the hospital anew, giving 500 marks yearly for its maintenance, on condition the city should give the like sum. There is a medical school attached to it, and the hospital relieves about 70,000 patients annually.

Bartholomew. St.: an island of the West Indies. See ST. BARTHOLOMEW.

Bartholomew, St., Massacre of: the massacre of French Protestants which commenced at Paris in the night of the 23d and 24th of Aug., 1572. During the minority of Charles IX. and the regency of his mother, Catherine de Médicis, a long civil war raged in France between the Catholics and Huguenots, whose leaders were the Prince of Condé and Admiral Coligny. In 1570 the court made to the Huguenots overtures which resulted in a treaty of peace. Charles invited Coligny and other leaders of that party to court, and received them with warm demonstrations of friendship, which were probably perfidious. The false security of the Huguenots was increased by a marriage between Henry of Navarre and Margaret, who was a sister of Charles IX. Many Huguenots went to Paris to attend the wedding in Aug., 1572. Probably the principal instigator of the massacre was Catherine de Médicis. Admiral Coligny was wounded by a shot from a window of the royal palace on the 22d. The general massacre commenced at two o'clock on Sunday morning, Aug. 24, and continued for several days. The provinces followed the example of the capital, with some exceptions. In regard to the number of victims there is no certainty. Estimates have varied from 1,000 to 10,000 for Paris, and from 2,000 to 100,000 for the whole of France. Naturally, in that age when the idea prevailed that religious dissidents were properly to be put to death as foes of God, and persecution was justified on all hands, the news of the massacre occasioned joy in Rome. A medal struck at the time is monumental proof of this. See Sismondi, *History of France*; H. Martin, *History of France*; De Thou, *Historia sui Temporis*; *The Massacre of St. Bartholomew*, by Henry White (London, 1868); especially H. M. Baird, *The Rise of the Huguenots* (New York, 1879, 2 vols., vol. ii.)

Bar'tizan: a term in architecture, first used by Sir Walter Scott, and employed by him to mean sometimes a balcony (as in *Waverley*); sometimes a fortified turret or flanking projection (as in *The Lay of the Last Minstrel* and in *The Eve of St. John*). Scott uses the participle "bartizaned" in the sense of embattled, or furnished with battlements (as in *The Heart of Midlothian*). In this sense it has been used by other writers, but the word has no authority and no positive signification.

Bart'lett, EDWARD TOTTERSON, D. D.: Professor of Ecclesiastical History, and dean of the Episcopal Divinity School, Philadelphia; b. in Philadelphia, July 25, 1843; was graduated at University of Pennsylvania 1865; received D. D. from his *alma mater* 1887; studied theology at Andover 1865-68; ordained 1869-70; professor and dean 1884. Chief literary work, other than occasional sermons, reviews, etc., is the third volume of *The Scriptures, Hebrew and Christian*, 1892; published in connection with the Orientalist, Rev. Prof. John Punnett Peters, Ph. D., formerly Professor of Hebrew in the Philadelphia Divinity School. Bartlett's contribution to this work was the New Testament volume.

Bartlett, ELISHA, M. D.: physician; b. in Smithfield, R. I., Oct. 6, 1804. He was the first mayor of Lowell, Mass.; delivered many medical lectures; became Professor of Medicine in the University of Maryland in 1844, and took the same position in the University of New York in 1850, which he left in 1852 to become Professor of Materia Medica and Medical Jurisprudence in the College of Physicians and Surgeons of the same city. Among other medical works, he wrote an *Essay on the Philosophy of Medical Science*. D. in Smithfield, July 18, 1855.

Bartlett, JOHN R.: U. S. naval officer; b. in Providence, R. I., Sept. 26, 1843; entered the naval academy Nov. 25, 1859; a commander in 1877; chief hydrographer to Bureau of Navigation, Washington, D. C., June 22, 1883, and was promoted to the rank of captain July 1, 1892.

He served in the steamer Mississippi at the passage of Forts Jackson and St. Philip and capture of New Orleans, Apr. 24, 1862. While attached to the steam-sloop Susquehanna he took part in both attacks on Fort Fisher, and was one of the assaulting party of Jan. 15, 1865, and was specially mentioned in the reports of Com. Godon and Lieut.-Com. Blake.

Bartlett, JOHN RUSSELL: writer; b. in Providence, R. I., Oct. 23, 1805; was one of the founders of the American Ethnological Society. He was appointed in 1850 commissioner to determine the boundary between Mexico and the U. S. He published, besides other works, a *Narrative of Explorations and Incidents in Texas and New Mexico* (2 vols., 1854); *Progress of Ethnology* (1847); *Dictionary of Americanisms* (1848); *Bibliotheca Americana* (4 vols., 1865-70); many records of Rhode Island from original documents; historian of the State's part in the civil war; local genealogies, and *Primeval Man* (1868). Secretary of State for Rhode Island 1855-72. D. in Providence, May 28, 1886.

Bartlett, JOSIAH, M. D.: physician and chief justice of New Hampshire; b. in Amesbury, Mass., Nov. 21, 1729. He signed the Declaration of Independence, and was a member of the Continental Congress in 1776-78. He became president of New Hampshire in 1790, and Governor of that State under the new constitution in 1793. D. in New Hampshire, May 19, 1795.

Bartlett, SAMUEL COLCORD, D. D., LL. D.: b. in Salisbury, N. H., Nov. 25, 1817; graduated in 1836 at Dartmouth College, where he was afterward tutor, and at the Andover Theological Seminary in 1842. In 1843 he was settled over the Congregational church in Monson, Mass.; in 1846 became Professor of Intellectual and Moral Philosophy in Western Reserve College; in 1852 took charge of the Franklin Street church, Manchester, N. H.; in 1857 became pastor of the New England church, Chicago, Ill.; and in 1858 was made Professor of Biblical Literature in the Chicago (Congregational) Theological Seminary. In 1873 he had leave of absence for a year to travel in the East. In 1877 he was made president of Dartmouth College, which office he resigned in 1892. He published *Life and Death Eternal*; *Sketches of Missions of the American Board*; *Future Punishment*; besides a large number of sermons, orations, addresses, and articles in the leading reviews. He contributed to the American edition of Smith's *Dictionary of the Bible*. D. in Hanover, N. H., Nov. 16, 1898.

Bartlett, WILLIAM ALVIN, D. D.: Presbyterian minister; b. in Binghamton, N. Y., Dec. 4, 1834; educated at Hamilton College, Union Theological Seminary, and the universities of Halle and Berlin, Germany. Before entering upon his present charge as pastor of the New York Avenue Presbyterian church, Washington, D. C., he was successively pastor of Congregational churches in Owego and Brooklyn, N. Y., and Chicago, Ill., and of the Second Presbyterian church in Indianapolis, Ind. He has published a serial story, *The Lost Image*, and contributed largely to periodical literature.

WILLIS J. BEECHER.

Bartlett, WILLIAM FRANCIS: volunteer soldier; b. in Haverhill, Mass., June 6, 1840; graduated at Harvard University in 1861. On the outbreak of the civil war he entered the service as a private soldier, and was appointed captain in the Twentieth Massachusetts July, 1861; at the siege of Yorktown, Apr., 1862, he lost a leg; was commissioned colonel of the Forty-ninth Massachusetts Infantry, which regiment he led in the assault on Port Hudson, La., May 27, 1863, where he was wounded in the leg and arm. On this occasion he displayed such daring, and was so conspicuous a mark, being mounted, that the Confederate officers gave orders not to shoot at him. Colonel of the Fifty-seventh Massachusetts Veteran Regiment, Aug., 1863; wounded in the battle of the Wilderness; brigadier-general of volunteers June 22, 1864, for conspicuous gallantry. He led the assaulting column at the explosion of the mine near Petersburg, July 30, 1864, and was wounded and taken prisoner. Brevetted major-general U. S. volunteers. D. in Pittsfield, Mass., Dec. 17, 1876.

Bartlett, WILLIAM HENRY: artist and writer; b. in London, England, Mar. 26, 1809. He traveled in many parts of Europe and America, and visited Egypt and Palestine. He published numerous popular works, illustrated with engravings designed by himself. Among his works are *Walks in and about Jerusalem* (1844), and *The Nile-boat, or Glimpses of the Land of Egypt* (1849). D. at sea, between Malta and Marseilles, Sept. 13, 1854.

Bartlett, WILLIAM HENRY: contemporary landscape-painter of the English school; b. in London; pupil of Bouguereau and of Tony Robert Fleury. Received a second-class medal at the Paris Exposition, 1889, for his picture *Return from the Fair*. Has exhibited at the Royal Academy and at the Grosvenor Gallery, London. Studio in London.

W. A. C.

Bartlett, WILLIAM HOLMS CHAMBERS, LL. D.: soldier and scientist; b. in Lancaster co., Pa., 1809; graduated at West Point in 1826. He served, while lieutenant of engineers, as assistant professor at the Military Academy 1827-29; in the construction of Fort Monroe, Va., and Fort Adams, R. I., 1828-32; as assistant to the chief engineer at Washington, D. C., 1832-34; and as acting Professor of Natural and Experimental Philosophy at the Military Academy 1834-36. On resigning his lieutenantcy, Apr. 20, 1836, he was appointed full Professor of Philosophy, continuing as such till retired from active service, Feb. 14, 1871. He is author of a *Treatise on Optics* (1839); of *Synthetical Mechanics* (1850-58); of *Acoustics and Optics* (1852-59); of *Analytical Mechanics* (1853-59); and of *Spherical Astronomy* (1855-58). He was a member of several scientific associations, incorporator of the National Academy of Sciences from its formation, and became in 1871 actuary of the Mutual Life Insurance Company of New York city. D. at Yonkers, N. Y., Feb. 11, 1893.

Bar'tol, CYRUS AUGUSTUS, D. D.: Unitarian preacher and author; b. in Freeport, Me., Apr. 30, 1813. He graduated in Bowdoin College in 1832, at the Cambridge Divinity School in 1835; settled as colleague pastor of West church, Boston, in 1837. A member of the famous Transcendental Club. His principal writings are *Discourses on the Christian Spirit and Life* (1850); *Discourses on the Christian Body and Form* (1854); *Pictures of Europe* (1855); *Radical Problems* (1872); and *The Rising Faith* (1873). His contributions to periodical literature are numerous and valuable, being characterized by a style at once homely and unique, and deep religious feeling. Retired from the ministry after a pastorate of fifty years. D. in Boston, Dec. 17, 1900.

Revised by JOHN W. CHADWICK.

Bartoli, baar'tō-lēē, ADOLFO: philologist and historian of Italian literature; b. in Fivizzano, Nov. 19, 1833; since 1874 Professor of Italian Literature in the Istituto di Studi Superiori in Florence. His first important work was *I primi due secoli della letteratura italiana* (Milan, 1875-80), of great influence upon the study of early Italian literature. Since this he has published *I precursori del Boccaccio* (1876); *I precursori del Rinascimento* (1876); and, chief among his works, *La storia della letteratura italiana* (7 vols., 1878-89).

A. R. MARSH.

Bartoli, TADDEO: Italian painter of the Siennese school; b. 1362; d. 1422; chief work, *Life of the Virgin*, in the Palazzo at Sienna.—**DANIELLO:** Jesuit scholar; b. in Ferrara, Nov. 12, 1608; d. Jan. 13, 1685, as rector of the Jesuit College in Rome; chief work, *History of the Society of Jesus*.—**PIETRO SANTI:** called Perugino; painter and etcher; pupil of Nicholas Poussin; b. in Baratola, Perugia, 1635; d. in Rome, Nov. 7, 1700.

Bartolini, baär-tō-lee'neē, LORENZO: an Italian sculptor; b. in Vernio, Tuscany, Jan. 7, 1777. He studied and worked in Paris, and was patronized by Napoleon, who in 1808 directed him to found a school of sculpture at Carrara. In 1815 he removed to Florence, where he worked for many years. Among his masterpieces are a colossal bust of Napoleon I., the group of *Hercules and Lichas*; *Faith in God*; and a group called *Charity*. His works are characterized by a classic repose and simplicity. He is ranked by the Italians as second only to Canova. D. in Florence, Jan. 20, 1850.

Bartolommeo, baär-tō-lom-may'ō, Fra (whose true name was BACCIO DELLE PORTA): b. in Savignano in 1475; studied under Cosimo Rosselli and Leonardo da Vinci, and had already acquired a great reputation as a painter when the condemnation and execution of his friend Savonarola caused him to give up his art and retire to a Dominican convent in 1500. In 1506, however, he again took up painting, and he subsequently visited Rome in order to study the works of Michael Angelo. Most of his life he spent in Florence, where he died Aug. 3, 1517, and here are his most celebrated pictures, the *Nativity*; *Circumcision*; *Virgin on the Throne*, in the public gallery; the *St. Mark* and the *Descent from the Cross*, in Palazzo Pitti; and *Last Judgment*,

in chapel of Santa Maria Nuova. His *St. Mark* and *St. Sebastian* were painted to prove that he did not lack power, and are his best works.

Bartolozzi, baăr-tō-lot'sēē, FRANCESCO: an Italian engraver; b. in Florence, Sept. 21, 1728; was a scholar of Ferreti and Joseph Wagner. He lived many years in London, and exerted a bad influence by spreading the stippled manner. His works are very numerous. D. in Lisbon, Portugal, about 1816.

Bar'ton: village, on railroad, Orleans co., Vt. (for location of county, see map of Vermont, ref. 2-D). The fertile soil and abundant water-power of the township make agricultural and manufacturing business profitable. The chief article of manufacture is lumber; a large factory for making underwear was built in 1892. It has graded schools, an academy, and a library. Pop. of township (1880) 2,364. Pop. of village (1880) 742; (1890) 778; (1900) 1,050.

EDITOR OF "ORLEANS COUNTY MONITOR."

Barton, BENJAMIN SMITH: physician and botanist; son of Thomas (1730-80), an Episcopal clergyman, and of a sister of David Rittenhouse; b. in Lancaster, Pa., Dec. 19, 1766; educated at York, Pa., and at what now is the University of Pennsylvania; studied medicine at Edinburgh and Göttingen; and became a practitioner in Philadelphia. He was Professor of Natural History and Botany in the college where he graduated 1789, of *Materia Medica* 1795, and succeeded Dr. Benjamin Rush in its medical school 1813. President of the Philadelphia Medical Society; promoter and officer of the American Philosophical Society, contributing to its *Transactions*. He wrote treatises on natural history, aboriginal American ethnology, and on *materia medica*. His most memorable book was *Elements of Botany* (Philadelphia, 1803), which was reprinted and for many years a standard text-book. D. in Philadelphia, Dec. 19, 1815. See *Biography*, by his nephew, W. P. C. Barton (Philadelphia, 1815).

Barton, BERNARD: known as the "Quaker poet"; b. in London, England, Jan. 31, 1784; was a member of the Society of Friends. He became a clerk in a bank at Woodbridge. He published *Poems* (1820); *Napoleon, and other Poems* (1822); *Devotional Verses* (1826); *The Reliquary* (1836); *Household Verses* (1845); and other works. Sir Robert Peel procured for him a pension of £100. D. at Woodbridge, Feb. 19, 1849. See *Memoirs and Letters of Bernard Barton*, edited by his daughter.

Barton, CLARA: b. about 1830 on a farm at Oxford, Mass.; a daughter of Capt. Stephen Barton, and educated at Clinton, N. Y. Early in life she engaged in teaching, and founded a free school at Bordentown, the first in New Jersey, which she opened with six pupils, but which numbered nearly 600 when, in 1854, she went to Washington. Here she was appointed clerk in the department of patents, but on the outbreak of the civil war she resigned her clerkship and devoted herself to the alleviation of the sufferings of the soldiers, serving not in the hospitals, but on the battle-field. She was present at several battles, and after the close of the war originated, and for some time carried on at her own expense, the search for missing soldiers. Having lectured (1866-67) on *Incidents of the War*, she went to Europe for her health, and settled in Switzerland, but on the outbreak of the Franco-German war she accepted the invitation of the Grand Duchess of Baden to aid her in the establishment of her hospitals; and she afterward followed the German army, and was decorated with the Golden Cross by the Grand Duke of Baden, and with the Iron Cross by the Emperor of Germany. In 1881 she organized the American Red Cross Society, and, becoming its president, succeeded in procuring an international treaty granting it protection. In 1883 she was appointed superintendent of the Reformatory Prison for Women at Sherborn, Mass., and in 1884 was chosen delegate to the International Peace Convention at Geneva. In 1883, at the request of a committee of Congress, she prepared a *History of the Red Cross*, which was published by the Government at Washington. In 1898 she was active in relief work in Cuba.

Barton, DAVID: b. about 1785; one of the earliest emigrants to Missouri Territory; president of the convention in 1820 to form a State constitution; Senator in Congress from Missouri 1821-31; and chairman of the committee on public lands. D. at Booneville, Mo., Sept. 28, 1837.

Barton, ELIZABETH: See MAID OF KENT.

Barton, WILLIAM: a Revolutionary general; b. in Warren, Bristol co., R. I., May 26, 1748. As lieutenant-colonel of the Rhode Island militia he captured Gen. Prescott July 10, 1777. He was wounded and disabled in 1778 at Bristol Ferry. Congress gave him a colonel's commission and a sword, and he received a grant of land in Vermont. He was many years imprisoned in Vermont for debt, but was liberated in 1825 by La Fayette, who paid the demand against him. D. at Providence, Oct. 22, 1831.

Barton, WILLIAM PAUL CRILLON, M. D.: a botanist; nephew of Dr. B. S. Barton; b. in Philadelphia, Pa., Nov. 17, 1786; graduated at Princeton in 1805; received his degree of M. D. at the University of Pennsylvania in 1808; surgeon in U. S. navy, and organizer of its bureau of medicine and surgery; Professor of Botany in University of Pennsylvania 1815, and in Jefferson Medical College. He published *Floræ Philadelphicæ* (1815-25); *Flora of North America* (3 vols., 1821-23); *Materia Medica*; *Medical Botany*; *Plan for Marine Hospitals* (1817); *Biography* of his uncle (1815); and several other works. D. in Philadelphia, Pa., Feb. 29, 1856.

Barton-on-Humber: a market-town of North Lincolnshire, England; situated on the south side of the Humber river, 6 miles S. W. of Hull, with which it has steam-communication (see map of England, ref. 7-J). It is a very ancient place, and was one of the principal ports of the Humber river before Hull was settled. It was once surrounded by a rampart and ditch to protect it against the attacks of the Danes and Saxons, and has manufactures of ropes, sacking, bricks, pottery, and whiting; also quarries of chalk and oolite. St. Mary's church is a fine building, erected in the fourteenth century. The ruins of Thornton Abbey, founded in 1139, are about 3 miles to the southeast. Pop. 5,300.

Barton's Buttons (called also **Iris Ornaments**): by means of a dividing-engine, Mr. John Barton succeeded in engraving lines on steel and other surfaces not more than from the $\frac{1}{1000}$ th to the $\frac{1}{10000}$ th of an inch apart. These, owing to the action of grooved surfaces on light, shine in the light of candles or lamps with all the colors of the spectrum. From steel dies thus prepared impressions were stamped upon buttons and other articles, forming ornaments rivaling in colors the brilliant flashes of the diamond.

Bartow, baar'tō: capital of Polk co., Fla. (for location of county, see map of Florida, ref. 6-J); in the phosphate belt, on Southern Florida and Florida Southern R. Rs., 76 miles N. E. of Punta Gorda. It has manufactories and orange groves. Pop. (1880) 77; (1890) 1,386; (1900) 1,983.

Bartow, FRANCIS STEBBINS: b. in Savannah, Ga., Sept. 6, 1816; graduated at Franklin College, Georgia, 1835; studied law at the law school, New Haven, Conn.; became a prominent member of the Savannah bar; was a member of the Georgia Legislature, of the Senate, and of the Confederate Congress. During the civil war he entered the army as captain of the Oglethorpe Light Infantry, was appointed colonel of Eighth Georgia Infantry, and brigadier-general C. S. A. Killed at Manassas, July 21, 1861.

Bartram, WILLIAM: an American botanist, who may also be classed among the earlier ornithologists; b. Feb. 9, 1739. He spent five years in the Southern States drawing and collecting specimens of natural history, and published the results of his observations in a work entitled *Travels through North and South Carolina, Georgia, etc.* (Phila., 1791). This book, which passed through several editions and was translated into French and German, is called by D. Coues "the starting-point of a distinctively American school of ornithology." It contained a catalogue of the birds of the Eastern U. S., in which many species are named as new which later on were fully described by Wilson, who was aided by Bartram in the earlier portion of his book. D. July 22, 1823.

F. A. LUCAS.

Bartsch, KARL FRIEDRICH ADOLF KONRAD: philologist; b. in Sprottau, Prussian Silesia, Feb. 25, 1832; educated at the gymnasiums of Gleiwitz and Breslau, and at the Universities of Breslau and Berlin. In 1853 he went to Paris to study the manuscripts of Provençal poetry, and also visited libraries at London and Oxford in the same year. In 1855 he received an appointment at the library of the Germanic Museum at Nuremberg; was professor at Rostock from 1858-71, and at Heidelberg from 1871-88. His untiring industry combined with natural talents obtained for him a high rank among specialists in the mediæval languages and

literatures of both Germany and France, and he displayed an astonishing activity in publishing editions of texts, and in producing investigations on metrical and literary subjects connected with them. His most important work in the Germanic field was his *Untersuchungen über das Nibelungenlied* (1865), followed by his edition of the poem *Der Nibelunge Nôt*, with the readings of all the manuscripts and a lexicon (1870-80). As a Romance scholar he is most widely known through his books for beginners in the study of Old French and Provençal, the *Chrestomathie de l'ancien français* (1st. ed. 1866) and *Chrestomathie provençale* (1st ed. 1868), both of which, however, even in the latest editions, still contain errors due to a lack of thoroughness in some details. In 1887 he published with A. Horning a work for the study of Old French on a similar plan, *La langue et la littérature française* (ninth to fourteenth centuries). He contributed many articles on various subjects to philological periodicals, and was since 1869 the editor of one of the most important, the *Germania*. Among his other publications may be mentioned: *Karl der Grosse von dem Stricker* (1857); *Albrecht von Halberstadt und Ovid im Mittelalter* (1861); *Ueber Karlmeinet* (1861); *Deutsche Liederdichter des XII. bis XIV. Jahrhunderts* (1864; 2d ed. 1879); *Kudrun* (1865); *Das Nibelungenlied* (1866); *Das Nibelungenlied* (a translation into modern German, 1867); *Herzog Ernst* (1869); *Altfranzösische Romanzen und Pastorellen* (1870); *Wolframs von Eschenbach Parzival und Titivel* (1870-71); *Grundriss zur Geschichte der provenzalischen Literatur* (1872); *Das Rolandslied* (1874); a translation of Dante's *Divina Commedia* (1877); a second edition of Diez's *Leben und Werke der Troubadours* (1882); and of Diez's *Die Poesie der Troubadours* (1883); *Die Altdeutschen Handschriften der Universitäts-Bibliothek in Heidelberg* (1886). D. in Heidelberg, Feb. 19, 1888. E. S. SHELDON.

Baruch, bay'rook: a Hebrew scribe; friend and companion of the prophet Jeremiah, whom he served as amanuensis. Shortly after 586 B. C. he accompanied Jeremiah to Egypt, Jer. xliii. 6, 7. His subsequent history is unknown. The *Book of Baruch*, which the Roman Catholics admit into the canon of the Holy Scripture, is considered apocryphal by Protestants and Jews, as it forms no part of the Hebrew canon. It was written originally in Hebrew, and was probably the joint composition of several persons. Baruch had nothing to do with it. As a whole, it dates from the third century B. C. The so-called *Epistle of Jeremiah*, of later date, appears sometimes as its sixth chapter. The *Apocalypse of Baruch* was published in a Latin translation from the Syriac by Ceriani in 1866, and the Syriac itself (by Ceriani) in 1871. Kneucker's edition appeared in 1879. The original writing was in Greek. There is a pseudepigraphic *Epistle of Baruch* in the Syriac language, probably a monastic forgery, and certainly worthless. See PSEUDEPIGRAPHIA.

Barus, CARL: See the Appendix.

Barwood, or **Camwood**: a red dyewood from the western coast of Africa. It is the wood of *Baphia nitida*, a leguminous tree. Its coloring principle is slightly soluble in boiling water, freely in alcohol and alkaline solutions.

Bary, baa'reë, HEINRICH ANTON, de: German botanist; b. in Frankfurt-on-the-Main, Jan. 26, 1831; educated in the gymnasium of his native city and in the universities of Heidelberg, Marburg, and Berlin. He was Professor of Botany successively in the universities of Freiburg, Halle, and Strassburg. His more important works are: *Die Mycetozoen* (1859); *Beiträge zur Morphologie und Physiologie der Pilze* (1864-81); *Die Morphologie und Physiologie der Pilze, Flechten und Myxomyceeten* (1866); *Vergleichende Anatomie der Vegetationsorgane der Phanerogamen und Farne* (1877); *Vergleichende Morphologie und Biologie der Pilze, Mycetozoen und Bacterien* (1884); *Vorlesungen über Bacterien* (1885). The last three have been translated into English. D. Jan. 19, 1888. CHARLES E. BESSEY.

Barycen'tric Cal'culus: an application to geometry of the mechanical theory of the center of gravity, executed in two distinct ways, according as metrical or descriptive geometrical properties are to be investigated. It was developed almost completely by Möbius in his *Der barycentrische Calcul* (1827).

Barye, baä'ree', ANTOINE LOUIS: sculptor; b. in Paris, Sept. 24, 1795; apprenticed to an engraver; served in the army 1812-14; studied drawing and modeling under Bosio and Baron Gros; began to exhibit his sculptures in 1827; achieved a great reputation, especially by his statuettes, and

groups of beasts, reptiles, etc., in vigorous action—a deer stepping high through the grass, an elephant in full charge, a jaguar devouring a gazelle, the lion and the serpent; became a member of the Academy of Fine Arts in 1868. D. in Paris, June 25, 1875. Copious collections of his works may be seen in Baltimore, in New York, and in the Corcoran Art Gallery in Washington.

Bary'ta, or **Bary'tes** [mod. from Gr. βαρύς, heavy]: the oxide of barium; an alkaline earth and a virulent poison (BaO, sp. gravity 4.5). It is an ingredient in sulphate of baryta, or heavy spar, from which it is obtained, but it is not useful for any purpose except chemical analysis. A solution of baric hydrate is used by the chemist as the best test of the presence of carbonic acid. Barium sulphate, or heavy spar, is a common crystallized mineral which is mixed with white lead and used as a pigment under the name of *permanent white*. Several mixtures of this sulphate and white lead are manufactured and known in commerce. *Venice white* contains 1 part of the sulphate and 1 part white lead. *Hamburg white* contains 2 parts of the sulphate and 1 part white lead. *Dutch white* contains 3 parts of the sulphate and 1 part white lead. The native sulphate was employed by the celebrated potter Wedgwood in the manufacture of jasper-ware and for the formation of white figures, etc., on colored jars and vessels. It is extensively used for adulterating white lead and for giving weight to paper. Baryta is produced, according to the census of 1890, as follows: Illinois, 200 tons; Missouri, 7,558 tons; North Carolina, 3,000 tons; Virginia, 10,702 tons; aggregate value, \$106,313.

Bar'ytone, written also **Baritone** [from Gr. βαρύτονος, deep-sounding; βαρύς, heavy + τόμος, tone. The spelling *baritone* represents introduction viâ Ital. *baritono*, and is the older]: the tone of a man's voice, about half-way between the bass and tenor. It generally extends in compass from low A of the bass clef to high F' above the staff, and occupies the same position as the *mezzo soprano* of the female voice. In Greek grammar, words with an unaccented final syllable are called barytones.

Basalt' [from Lat. *basaltis*]: an ancient term used by Pliny and said to be of African origin. In common usage it includes part of the fine-grained, dark-colored igneous rocks which are common in all geological horizons. In this sense it is nearly synonymous with trap (Swed. *trappa*, stairs), a term first used in Scandinavia in allusion to the step-like appearance produced by intrusive sheets of this rock in softer strata. A common feature of basalt or trap is its tendency to divide, by contraction due to cooling, into polygonal columns, whose position is in the main normal to the cooling surface. These may therefore be vertical, radiating, or, in dykes, horizontal. This columnar parting sometimes occurs in other igneous rocks, but is so characteristic of basalt that it is often called "basaltic structure." Basalt is usually compact and heavy, but it may be vesicular or amygdaloidal.

In a more restricted and scientific sense basalt is used to denote an igneous rock composed essentially of a triclinic feldspar (labradorite), augite, olivine, and magnetite, with more or less glassy base. Its silica percentage is low (45-53). Basalt was formerly applied only to rocks of tertiary age, its coarser varieties being called *dolerite*. The corresponding pretertiary rocks were known as *melaphyre* and *olivine-dabase*. Now, however, it is preferable to use the term basalt without reference to age for all the finer and partly glassy varieties, reserving the terms diabase and dolerite for those that are coarser and holocrystalline.

Basalt occurs in surface flows, intrusive sheets, and dykes. When molten it is very fluid, and often spreads over large areas in thin sheets. According to Von Riechthofen's law (see ANDESITE), basalt, in virtue of its basic character, is one of the youngest products of volcanic activity. By virtue of their durability, basalt flows protect softer rocks beneath them from erosion, and in regions undergoing rapid surface waste they frequently constitute the caps of mesas and plateaus. See GIANT'S CAUSEWAY and ROCKS.

GEORGE H. WILLIAMS.

Bas'anite: See JASPER.

Bas'com, HENRY BIDLEMAN, D. D., LL. D.: bishop of the Methodist Episcopal Church South; b. at Hancock, Delaware co., N. Y., May 27, 1796. He was licensed to preach in 1813, and in 1823 was chosen chaplain to Congress; was president of Madison College, Pa., 1827-29; Professor of Morals, Augusta College, Ky., in 1832, and in 1842 president of Transylvania University, Ky. From 1846 to 1850 he was

editor of the *Quarterly Review* of his Church. In 1850 he was made a bishop. D. in Louisville, Ky., Sept. 8, 1850. In one of his earlier years he preached 400 times, and received a salary of \$12.10. Bishop Bascom was an extremely popular speaker. His complete writings were published in 1856.

Bascom, JOHN, LL. D.: author and scholar; b. at Genoa, N. Y., May 1, 1827; graduated at Williams College in 1849; studied law and theology, the latter at Andover Theological Seminary. In 1855 he became Professor of Rhetoric in Williams College; president of the University of Wisconsin 1874-87. He has published *Political Economy for Colleges* (1859); *Æsthetics* (1862); *Elements of Psychology* (1869); *The Philosophy of English Literature* (1874); *Problems in Philosophy* (1886); *Sociology* (1887); and other works.

Base [viâ Fr. from Lat. *ba'sis*, from Gr. *βᾶσις*, step, base, pedestal, from same root as *βαλνειν*, to go]: a term having important applications in architecture, chemistry, geometry, heraldry, and music (It. *basso*). Base in general signifies the bottom of anything considered as its support, as the base of a mountain. In architecture it denotes the lower part of an architectural composition, as of a pier, column, or pilaster; and also of a complete structure, as of a whole building or one face of it. In these different senses it is often used loosely; thus a base of a wall may be understood as a bottom of the foundation or as the lowest part of the decorative structure above ground. The base of a column is the member which interposes between the shaft and that upon which the column rests as the pedestal or stylobate. In classical architecture the true Doric column of Greece had no base; the Ionic and Corinthian orders had bases of convex and concave moldings, sometimes enriched with sculpture. In European mediæval architecture the columns and piers usually had bases, and these are of endless variety.

RUSSELL STURGIS.

In chemistry it signifies a substance that has the power to neutralize acids and form salts with them. The terms *acid* and *basic* are complementary. The common bases are compounds consisting of a metal in combination with hydrogen and oxygen. Thus the base potassium hydroxide, or hydrate, or caustic potassa, or caustic potash, consists of the metal potassium in combination with hydrogen and oxygen, as expressed in the formula, KOH. So, too, sodium hydroxide, NaOH, ammonium hydroxide, NH₄OH, calcium hydroxide, Ca(OH)₂, barium hydroxide, Ba(OH)₂, cupric hydroxide, Cu(OH)₂, ferric hydroxide, Fe(OH)₃, aluminium hydroxide, Al(OH)₃, etc., are bases. In general terms, whenever a base acts upon an acid a salt is formed. Thus when potassium hydroxide acts upon nitric acid, the salt potassium nitrate or saltpeter, KNO₃, is formed. Similarly sodium hydroxide and sulphuric acid form the salt sodium sulphate.

The above refers to oxygen bases. But there are similar substances containing sulphur, and when these act upon corresponding sulphur acids, salts containing sulphur instead of oxygen, but analogous to the oxygen salts, are formed. It appears also that chlorine, bromine, iodine, and fluorine take the place of oxygen in acids, bases, and salts, and form the well-known compounds commonly called double chlorides, double iodides, double fluorides, etc.

By the expression *organic base* is meant a compound like aniline, which is related to ammonia. There are many of these substances known to chemists. See ALKALOIDS.

IRA REMSEN.

The military term *base of operations* denotes, in contradistinction to *line of operations*, the (usually) contiguous and well-guarded (by our own or allied forces) region upon which an army depends for its supplies, re-enforcements, etc., to which it sends back its sick and wounded, and upon which it (generally) would fall back in case of reverse and retreat. Much pedantry is expended upon these phrases in what were recognized as standard military treatises. The *essential* thing is that an army have a base, though it may temporarily abandon one to acquire another; or in rare cases it may so thoroughly control the hostile region in which it operates as to use it for most of the purposes of a base.

JAMES MERCUR.

Base, in music: See BASS.

Base-ball: the national out-door game of the U. S.; reputed to be a development of the English game of "rounders," but it has little about it now to suggest a kinship, except it is played with bat and ball. The game has developed from the crudest of games in 1845, when little skill was required to play it and only the simplest rules governed the

play, into one of the most scientific and exciting of the world's sports. It has brought into its development the in-born craving of youth to strike hard blows; the playing at catching ball, a pastime of primitive nations; running, in which swiftness is at a premium; throwing for distance, speed, and accuracy; individual chances for brilliant progress in making scores; and the whole combined in such a way that individual skill and judgment are closely joined with team-play.

The first real step toward progress in the development of base-ball was made by the Knickerbocker Club of New York city, which organized in 1845, and soon after prepared a code of playing rules. Up to 1858 the clubs were wholly amateur, but after that date professional clubs were formed, and the game took on new development, which culminated in its present perfected state. There are now hundreds of amateur and professional clubs throughout the U. S., separated into different leagues. First and greatest among these is the National and American Association League, which pays its players salaries varying from one to several thousand dollars for the season.

The game was introduced into Great Britain by players from the U. S. in 1874, and, although it failed at first to excite much interest, it increases steadily in favor, while the same is true of Australia, into which it was introduced in 1888.

The playing-rules regulate the size of balls and bats, as well as define the way the ground shall be laid out. A level plot of land 450 feet square will be sufficient for the best games. The bases are placed on the four corners of a square with sides 90 feet long, and are called respectively going from right to left from home base, first, second, and third base. White chalk lines running through home and first base and home and third base mark the foul lines. A back-stop for stopping pitched balls is placed 90 feet back of home base.

White chalk lines running through home and first base and home and third base mark the foul lines. A back-stop for stopping pitched balls is placed 90 feet back of home base.

Nine players occupy positions in this field. The catcher plays anywhere back of home base to suit his particular duty. The pitcher delivers

the ball to the batter from a defined "box" distant 60 feet from home base. The first, second, and third basemen attend to their respective bases. The short-stop plays anywhere between second and third bases. The left, center, and right fielders take positions outside the diamond and usually in the direction which their name indicates.

The players are divided into three distinct groups, the pitcher and catcher forming the "battery"; the first, second, and third basemen and short-stop composing the "infield"; and the left, center, and right fielder completing the "outfield."

These three groups have specialized duties, the players being selected and placed according to their skill in performing these. The battery attends to the work of trying to keep the batter from reaching first base, through the pitcher using every art and strategy he possesses in delivering the ball to him, and the catcher receiving and holding the ball when not struck. The pitcher is helped in his work by being allowed perfect freedom in throwing underhand or overhand, being the gradual development from a simple pitch or toss through restricted underhand throwing to the present freedom; by the discovery that a ball can be made to curve when given a revolving motion on its own axis as

A A, ground reserved for batsman, umpire, and catcher; B B, for captain and assistant; C C, players' benches; D, bat-rack for visiting players; E, for home players.

it is thrown from the hand, the direction of the curve depending on the direction and velocity of the axis twist; and by acquired muscular co-ordination and control, whereby he deceives the eyes of the batter by varying the speed of the ball without an apparent change of delivery.

The infield attends mostly to fielding balls hit along the ground and throwing the runner out at first base, but frequently at other bases. One-half to two-thirds of the twenty-seven or more put-outs in a game are made by the infield.

The outfield has mostly to do with fielding balls hit into the air. From one-fifth to one-third of the batters are caught out by the outfield.

Eighteen players in all take part in a game. A recent rule allows a change battery to exchange places with the one already playing. By toss of a coin, or by previous arrangement, one captain has the right to decide for his team to "take the bat" or "the field." Then each player takes his turn in striking at the ball until three batters are "out," when the nines exchange places. The order of strikers is previously arranged by the captain. When the other side has had a turn at the bat and been put out, one inning has been played. Nine innings constitute a game, unless at the end of that time the two nines are tied in number of runs or in failure to score any, when the game continues until one side exceeds the score of its opponents on even innings.

The batter takes a position at the home base ready to hit the ball which the pitcher throws. His limitations are that while standing within a defined position he must strike at every ball coming over the home plate between his shoulders and knees or lay himself open to having a "strike" "called" by the umpire. Three strikes put the batter out, except when there is no runner on base, or when one is on second or third base, or when two are out, the catcher has to hold the third strike or throw him out at first base. If, however, four "balls"—i. e. pitched balls not coming under the rule of a strike—have been called by the umpire while the batter is striking, the latter is given his base by forfeit. Should the batter strike the ball so that it touches the ground and remains within bounds until it passes first or third base, the ball is fair and he becomes a "base-runner." Batted ground balls outside the foul lines are "foul," and no base can be run until the base which the runner occupied when the ball was hit is touched after the ball is held by the pitcher in his box. If the ball is struck into the air and falls inside the foul lines again, the batter becomes a base-runner, unless the ball is caught by some fielder. The batter also becomes a base-runner when his person—excepting his hands and forearm, which makes the ball a "dead ball," when no bases can be run—is struck by a pitched ball, unless the umpire decides that the batter intentionally permitted himself to be hit.

The aim of a runner on base is to score a run, which is done when he touches first, second, third, and home base in their order without being put out. He is helped in this by the time given him during the delivery of a ball to the batter to make an attempt to reach the next base; by the ball sometimes being pitched wildly or passing the catcher; by being forced on to give room for some one who has been given first base by a base on balls; or by being struck by a pitched ball; by a pitcher's balk, which is a feint with all the appearances of an intention to pitch the ball, allowing a base-runner an additional base; and by safe hits between the fielders or by batted balls not fielded. All balls batted into the air and caught allow the base-runner to take a base at his risk, provided he leaves his base after the ball is caught.

Base-runners must return to their bases after a foul ball, and remain there until the pitcher receives the ball in his position (in case of a foul or fair fly ball they need remain there only until the ball is caught by the fielder); when the ball becomes dead by hitting the batter's bat or person or the umpire, or when the batter strikes when outside his position, called a foul strike; or when another runner is hit with a batted ball.

The aim of the nine in the field is to put out the batsman and base-runners. The batter is out when he has had three strikes as explained above; when he is discovered having batted out of order; when he makes a foul strike; when attempting to interfere with a catcher in fielding or throwing; when he makes an intentional foul hit after he has had two strikes.

Base-runners are declared out when hit with a batted ball while at the bat and about to run; when they attempt to hinder the catcher from fielding a muffed third strike; when

hit by a batted ball while running for a base; when a ball batted into the air is momentarily held by a fielder before touching the ground or any object other than a fielder; when after three strikes or a fair hit he be touched with the ball in the hands of a fielder, or when the ball is securely held by a fielder while touching first base before the runner reaches the base; when he runs more than 3 feet out of line to dodge a fielder trying to touch him out; when intentionally obstructing a fielder in fielding a ball; when touched by the ball in the hands of a fielder unless his person is touching a base he is entitled to occupy, except he may overrun first base if he turns to the right in returning to the base when on fair ground; when a fair or foul ball is caught and then held by a fielder on the base occupied by the runner when the ball was struck, or if the runner be touched by the ball in the hands of a fielder before he returns to the base; when a fielder holds the ball while touching a base before a runner, who is forced on by another runner, reaches the base, except in the case of a base on balls, or when a batter is hit by a pitched ball; when he fails to touch a base in regular order in running or on the return, except in the case of foul balls, provided he be touched by the ball in the hands of a fielder, or the ball be held at the base he failed to touch.

A. ALONZO STAGG.

Basedow, JOHANN BERNHARD: educational reformer; head of the so-called Philanthropin; b. Sept. 11, 1723, in Hamburg; educated at Leipzig; professor in the academy at Soroe, Denmark, 1753; transferred by the Government, on account of the opposition raised against his unorthodox writings, to the Gymnasium of Altona 1761. Inspired by Rousseau's *Émile*, he turned his attention about this time to educational reform, and soon published the *Address to Philanthropists and Men of Property on Schools and Studies, and their Influence on the Public Weal*, in which he called upon all who loved their fellow-men to contribute to aid him in publishing his book. Among those who responded were the Emperor Joseph II., the Empress Catherine II., King Christian VII. of Denmark, and numerous other celebrities. With the \$10,000 thus received he published in 1774 his *Elementary (Elementarwerk)*, in four volumes, with 100 copper-plate illustrations. In the same year he was called to Dessau by Prince Leopold to take charge of the famous Philanthropin, founded as an ideal school, to be conducted entirely upon his improved principles. While never largely attended, the school excited the greatest interest throughout Germany. Kant prophesied that quite another race of men would grow up now that the Philanthropin had introduced a new system of education. Basedow soon retired (1776) from its management, and, after an irregular life, died in 1790 at Magdeburg. The keynote of Basedow's system was *everything according to nature*. Language he would teach by the conversational method; object lessons and pictures were to be largely employed. His famous *Elementary* contains a large amount of information about various topics arranged as a dialogue, interspersed with tales and poetry, and illustrated by a set of engravings. The natural desires and inclinations of children were to be educated and directed aright, but never suppressed. The accounts of those who visited the Philanthropin are mostly favorable. The teachers used originality in their teaching, and the brightness and animation of the children were noticeable. "Children love motion and noise; here is a hint from nature," said Basedow. The development of the body was specially cared for; gymnastics were for the first time introduced into modern schools, as well as the practice of taking long excursions on foot, now so general in Germany. Kant's expectations, noted above, were generally shared by the friends of humanity throughout Europe. The Philanthropin disappointed these expectations, but it unquestionably introduced valuable new ideas and methods, and, through the teachers who had been connected with it, disseminated new doctrines which had great influence in calling attention to the neglected field of education, and stimulating thought in that direction. Basedow was a bold and fearless innovator, who lacked the personal qualities to embody successfully the ideas he struck out. His character was in many respects unlovely. (See sketch by Goethe in *Wahrheit und Dichtung*.) He had no tact, and was anything but a suitable person for the head of a model school. German education, in Kant's words, needed "not reformation, but revolution." Basedow is a notable revolutionist. See Quiek's *Educational Reformers*; Williams's *History of Modern Education*. C. H. THURBER.

Basedow's Disease, called also **Graves's Disease** and **Exophthalmic Goitre**: a disease more common among women than men, and characterized by prominent eyeballs, enlarged thyroid gland, palpitation of the heart, and generally by anæmia. Basedow's disease sometimes, though very rarely, ends in recovery. Its cause is stated by Niemeyer to be probably a paralysis of the vasomotor nerves, but others look upon it as a disease of the sympathetic nerves or a general neurosis. It is best treated by electricity, digitalis, ergot, good food, gentle exercise, and hygienic measures.

Basel, *baa'zel*, or **Bâle**, *baal* (Fr. *Bâle* or *Basle*; Germ. *Basel*; anc. *Basili'a* or *Basile'a*, i. e. royal city): an important city of Switzerland; beautifully situated on both sides of the Rhine; 65 miles by rail N. of Bern, and about 3 miles from the frontier of Alsace; lat. 47° 34' N., lon. 7° 36' E. The Rhine, here crossed by a bridge, divides it into two parts, named "Great Basel" and "Little Basel." Basel is at or near the head of navigation on the Rhine, and is the most important commercial and manufacturing city of Switzerland. It was more populous in the Middle Ages than at present. An œcumenical council was held here, opening July 23, 1431. Among its public buildings is a fine cathedral, built by the Emperor Henry II. between 1010 and 1019, with towers 218 feet high, which were not completed till 1500. The University of Basel, founded in 1459, once had a high reputation, and was one of the centers of the Protestant Reformation, Erasmus and Ecolampadius dying while in its service. Luther's writings were printed here from 1519. This city also contains a valuable museum of natural history, a botanic garden, and the university library of 160,000 volumes and 4,000 MSS. The museum of art is noteworthy for its fine collection of the works of the younger Holbein. A large majority of the inhabitants are Protestants. Basel has extensive manufactures of ribbons, printed cottons, paper, gloves, jewelry, etc. It was first mentioned in 372 A. D., was destroyed by the Huns, and rebuilt by Henry I. in 917. The city, with its 14 sq. miles, since 1833 has formed a separate part of the canton, known as "Basel-Stadt." Pop. (1897) communal, 89,687.

Basel, or **Bâle**: canton of the Swiss Confederation; confronting Alsace on the W., and Baden on the Rhine frontier. It has an irregular dumb-bell sort of shape, and comprises 177 sq. miles. The Rhine tributaries of this canton are the Birz and the Ergolz. On the northern slope of the Jura Alps, which here reach an altitude of 3,400 feet, the region is one of hills and valleys, where cattle pasture and vineyards and orchards abound. The manufactures are ribbons (large), woollens, linens, and leather-work. After union with Switzerland the city engrossed the places of influence and authority, lost its preponderance during the first French Revolution, regained supremacy in 1814; but in the civil war of 1831-32 the union troops took possession of the canton, and the Diet in 1833 divided it into independent parts—the Basel-Stadt and Basel-Landschaft. The latter division contains 163 sq. miles. Together they send seven representatives to the Nationalrath. Pop. of Basel-Landschaft, exclusive of city (1888) 61,941. The capital of Basel-Landschaft is Liesthal.

Basel (or **Bâle**), **Council of**: a memorable œcumenical council of the Church held in Bâle; summoned by Pope Martin V., who died (Feb. 21, 1431) before the appointed time of its meeting. It was opened July 23, 1431, under the pontificate of Eugenius IV. (elected Mar. 3, 1431). It was the result of the decree of the Council of Constance, and was a response to the general demand for reform in the Latin Church, and the termination of the Bohemian schism. The position it immediately took of superiority to the pope naturally excited the latter's dislike and fear. So the pope tried repeatedly to dissolve the council, but in vain. It endeavored to end the Bohemian troubles by granting the cup to the laity (Nov. 30, 1433), and its action was ratified by the pope Dec. 15, 1533. A quarrel in regard to the manner and place of holding negotiations with the Greek Church led finally to a split. Many bishops, and all the cardinals but one, went off with Julianus Cesarini, the pope's legate, first to Ferrara (Jan., 1438), and thence to Florence (Feb., 1439). Those who remained chose a new president, and went on with their work. Excommunicated by Eugenius, they elected a new pope, Felix V., Nov. 17, 1439. Very few acknowledged him. This blunder broke the moral power of the council. Its forty-fifth and last formal session was held May 16, 1443, though the council was not technically "dissolved" till May 7, 1449, when it gave in its adhesion to Nicholas V., the suc-

cessor to Eugenius IV. The Roman Catholic Church acknowledges only the first twenty-five sessions of the council, before the split. See Wessenberg, *Die Allgemeinen Concilien des 15ten and 16ten Jahrhunderts*, 2 vols. (Constance, 1770); also Hefele's *Conciliengeschichte* (vol. vii.).

Revised by JOHN J. KEANE.

Basel (or **Bâle**), **Treaty of**: the name of an important treaty of peace signed at Basel, Apr. 5, 1795, between the French republic and Prussia. The latter then agreed to abandon the coalition against France, and to give up her possessions on the left bank of the Rhine. In July, 1795, another treaty was here concluded between France and Spain.

Base Level: the level below which a stream can not erode by reason of the height of its point of discharge. When the degradation of a region has progressed so far that all its slopes are very gentle, running water has but little erosive power, and the region is said to be reduced to base level or to have become a base-level plain.

G. K. G.

Basel'la: a genus of tropical plants; order *Chenopodiaceæ*. The *Basella alba* and *rubra* have twining stems, and are commonly used as potherbs in the East Indies. In the vicinity of Paris they are raised in hotbeds, transplanted to borders, and used as a substitute for spinach. The *Basella rubra* yields a rich purple dye.

Ba'shan [Heb. *בָּשָׁן*, of disputed significance]: a district in Palestine; E. of the Jordan; most of it high table-land, extending from Mt. Hermon in the N. to Gilead in the S., the Yarnuk (Hieromax), which enters the Jordan just below the Sea of Galilee, being the boundary between Bashan and Gilead. At the time of the Exodus it was occupied by Amorites ("highlanders") whose king, Og, was slain in battle with the Israelites, his people overpowered, and the whole territory assigned to the half-tribe of Manasseh. After the Captivity, Bashan consisted of four provinces: (1) Golan (modern Jaulan); (2) Argob, or Trachonitis (modern Lejah); (3) Hauran (name unchanged); (4) Batanæa (modern Bethanyeh). Iturea (now Jedur) in the N. W. was not strictly a part of Bashan, though taken by the Israelites. The whole district was, and still is, exceedingly fertile, and was famous for its oaks and its cattle. Remarkable ruins of ancient cities are found there. See Porter's *Damascus* (1855); Wetzstein's *Reisebericht über Hauran und die Trachonen* (1860); Porter's *Giant Cities of Bashan* (1865); and Selah Merrill's *East of the Jordan* (1881). The antiquity of these ruins is disputed; recent explorers have claimed that they are not earlier than the first century A. D.

Bashaw: See PASHA.

Bashford, JAMES WHITFORD, Ph. D., D. D.: president Ohio Wesleyan University; b. at Fayette, Wis., May 25, 1849; A. B., University of Wisconsin 1873, and A. M. 1876; Ph. D., Boston University 1880; held pastorates of M. E. churches at Harrison Square, Jamaica Plains, and Anburndale, Mass., and at Portland, Me.; in present position since 1889; contributor to periodical literature and author of numerous published sermons.

Bash'i-Bazouks [Turk., head-turned]: certain irregular troopers, ununiformed and generally mounted, in the service of the Turkish sultan. They serve without pay, except maintenance, are often under the municipal governors, and are wild, turbulent men much addicted to plundering.

Bashkirs, *baash'kēerz*: a Tartar-Finnish race; a mixture of Ostyaks and Tartars, inhabiting the slopes of the Ural Mountains and neighboring plains in the governments of Orenburg, Perm, Samara, and Viatka, European Russia. They first appeared in the tenth century, and formed originally a powerful independent state, but in 1556 submitted to Russia. They still preserve some elements of independence, and are governed by their own officials. A part are settled and engaged in cattle-rearing and agriculture; the remainder are still nomads. They are usually very poor and improvident, often suffering from famine. They are lazy and predatory, yet hospitable and good-natured, strong, and muscular, capable of enduring great hardships and privations. They are professed Mohammedans. They number about 760,000.

M. W. H.

Bashkirtseff, *baash-kēert-sef*, or **Bachkirtsev**, MARIE: Russian artist; author of a diary of some celebrity; b. at Gavontsi (district of Poltava), Nov. 11, 1860; d. in Paris, Oct. 31, 1884. She was well-born and received an extended education, learning Latin and Greek, as well as all the more

important modern languages. In 1878 she went to Paris and entered the studio of Rodolphe Julian. Her talent rapidly developed, and in 1880 she was able to exhibit a picture in the Salon. From this time till her death she worked eagerly at her art, and regularly exhibited. Soon after she died her family published her diary, kept by her in French from the age of thirteen. Here she appeared as one of those vehement, sensitive, emotional natures which use themselves up in their own passionate eagerness to live. On neither art nor literature, however, has she left a permanent impression. One of her pictures, *The Meeting*, has been purchased by the French Government and placed in the Luxembourg.

BIBLIOGRAPHY.—*Journal de Marie Bashkirtseff* (2 vols., Paris, 1887); *Catalogue des œuvres de Mlle. Bashkirtseff, avec préface de François Coppée* (Paris, 1885).

A. R. MARSH.

Basidiomyces [from *basidium* (dimin. from Gr. *βάσις*, base) + Gr. *μύκης*, a mushroom]: in fungology, a class of (mostly) saprophytic plants, related to the ASCOMYCETES (*q. v.*), from which they are apparently derived. Like the *Ascomycetes*, they produce large end-cells: these, however, do not divide internally into spores, but produce spores by means of protrusions from the surface, these becoming extended and finally enlarged at their extremities, the enlargement eventually separating as a spore. The spores thus formed are known as basidiospores, and the large end-cells from which they grew are *basidia* (sing. *basidium*). The class is naturally divided into two orders, viz.: (1) the puff-balls (*Gasteromycetæ*), and (2) the toadstools (*Hymenomycetæ*), each containing a number of families. Between 9,000 and 10,000 species of the higher fungi are known, many of which are very common. The mushroom (*Agaricus campestris*) and the larger puff-ball (*Calvatia marima*) are familiar examples.

CHARLES E. BESSEY.

Basil: an herb or shrub of the genus *Ocimum* and family *Labiata*; natives of tropical and other warm regions; generally have an aromatic smell and taste. The *Ocimum basilicum* (sweet basil) is an annual plant, a native of the East Indies, and is cultivated in Europe, where it is used to season food. The *Ocimum minimum*, or bush basil, another East Indian plant, is cultivated for the same use. The *Ocimum campechianum* is a native of Florida and of tropical America. Basil is also a common name for *Pycnanthemum*, a North American genus with numerous species, all erect, rigid herbs; also of the *Calamintha clinopodium* of Europe and North America, and other labiate herbs.

Basil, or **Basilius**, SAINT (surnamed THE GREAT): an eminent Greek Father of the Church; b. at Cæsarea, in Cappadocia, about 329 A. D. He was older by about two years than his brother, Gregory of Nyssa, and was an intimate friend of Gregory Nazianzen. From 351 to 355 he was a student at Athens. Then he traveled extensively. Afterward he spent some seven years of monastic retirement in Pontus. In 370 he succeeded Eusebius as Bishop of Cæsarea, and died there Jan. 1, 379, worn out by his ascetic habits. His works (in 3 vols., J. Garnier's ed., Paris, 1721-30; n. e. 3 vols., 1839; reprinted in Migne, *Patrologia Græca*, XXXIX.-XXXII.) consist of treatises, homilies, and letters. He excelled as a letter-writer. He was the author of monastic rules and a liturgy which bears his name, and is still used in the Russian Church. See G. Hermant, *Vie de Saint Basile* (1674); J. E. Feisser, *Dissertatio de Vita Basilii Magni* (1828); Klose, *Basilus der Grosse nach seinem Leben* (1835); Scholl, *Die Lehre des heil. Basil von der Gnade* (1881); and Hammond's *Liturgies, Eastern and Western* (1878).

Basil I. (surnamed THE MACEDONIAN): Emperor of the East; b. in Macedonia in 820 A. D. His origin was obscure. He gained the favor of the Emperor Michael III., who appointed Basil his own colleague in the empire in 866. After Michael was assassinated in 867, Basil became emperor. He obtained Asia Minor by conquest from the Saracens, whom he also drove out of Italy. He was an able ruler. D. Aug. 29, 886 A. D., and left the throne to his son, Leo VI. See G. Impaccianti, *Basilio il Macedone*, 2 vols., 1809.

Basil II.: Emperor of the East; a son of Romanus II.; b. in 958 A. D. He began to reign, in conjunction with his brother Constantine, in 975. He was an able commander, and waged war with success against the Caliph of Bagdad and the Bulgarians. He completed the conquest of Bulgaria in 1018. D. in Dec., 1025.

Basile'an Manuscript [Lat. *Codex Basilen'sis*, from *Basile'a*, the Lat. name of Basel, Switzerland]: the name of two very valuable manuscripts of the Greek New Testament, now in the library of Basel: 1. A nearly complete uncial copy of the Gospels, lacking only Luke iii. 4-15; xxiv. 47-53. It is technically known as E in the list of uncials. It is believed to belong to the eighth century, and to have been written at Constantinople. 2. A beautiful cursive manuscript of the whole New Testament except the Apocalypse. It dates from the tenth century.

Basilian Manuscript (*Codex Basilianus*): an important uncial manuscript of the Apocalypse, now in the Vatican library, technically known as B of the Apocalypse. It takes its name from the Basilian monastery at Rome, to which it once belonged. It is referred to the eighth century.

Basilian Monks, or **Monks of St. Basil**: a religious monastic order founded by St. Basil the Great in 361 A. D., and the exclusive order of the Greek Church. He composed a system of monastic discipline which was practiced by great numbers of monks both in the churches of the East and the Latin or Western Church. Spain, Italy, Asia Minor, and many other countries contain monasteries of this order at the present time. Those of Italy are chiefly of the Greek rite, and those of Spain, etc., of the Latin rite. In Asia Minor the United Melchite Greeks have many Basilian monks. There are convents of Basilians in Toronto and Sandwich, Canada. The monks of the Russo-Greek Church nearly all follow the rule of St. Basil, variously modified, even the so-called monks of St. Anthony following what is substantially the Basilian rule. The Armenian Church has also an order of Basilian monks. In 1557, at Tardon in Spain, Matteo de la Fuente established the Reformed Basilians, or Tardonites.

Basilian Nuns: founded by Maerina, the sister of St. Basil, and governed by a rule written by him, spread into the Occident, but scarcely exists there now. It is a contemplative order.

Basilica [Lat., from Gr. βασιλική (sc. *στοά*), royal, femin. of an adjec. deriv. of βασιλεύς, king]: among the ancient Greeks and Romans a public hall or court-house in which princes and magistrates administered justice. Among the Romans it attained the greatest importance, and became, besides a court of justice, a market-place and exchange. The first basilica mentioned in Roman history was the Basilica Porcia, built about 182 B. C. Great numbers were subsequently erected in Rome, and each provincial town had its basilica, which was usually adjacent to the forum. The most ancient basilicas were open to the external air, and surrounded by a peristyle of columns, for which an external wall was afterward substituted. After the reign of Constantine I. some basilicas were converted into Christian churches. The term basilica is still applied to the five great patriarchal churches in Rome and to several smaller ones, among them the cathedral in Quebec, Canada.

Basilica: a code of laws, the compilation of which was commenced by Basil I., Emperor of the East (867-886 A. D.), and completed by his son Leo. It is considered valuable for the interpretation of the Roman *corpus juris*, but a portion of it is lost. The *Basilica* was published by Heimbach (5 vols., 1833-50).

Basilica'ta (anc. *Luca'nia*): a province of Italy; bounded N. W. by Campania, N. E. and E. by Apulia, S. by the Gulf of Taranto, and S. W. by Calabria. It is also called Potenza. Area, 4,122 sq. miles. The surface is mountainous. It contains a large fertile plain next to the Gulf of Taranto. Wine, grain, tobacco, and hemp are the staple products. Capital, Potenza. Pop. (1890) 538,707.

Basil'icon Do'ron [Gr., royal gift]: the title of a work which James I. of England wrote for the instruction of his son Henry (1599). It is interesting chiefly as a literary curiosity.

Basilicon Ointment, sometimes written **Basilicum** [Gr. βασιλικόν (sc. φάρμακον, drug), royal, so named from its supreme virtue]: the *Cera'tum resi'næ* of the pharmacopœias, is composed of 5 parts of resin, 8 of lard, and 2 of yellow wax. It is much used as a stimulating application to ulcers, burns, etc.

Basilides (in Gr. βασιλείδης): a Gnostic, and founder of a sect called Basilidians; lived in Egypt in the reigns of Trajan and Hadrian, about 100-140 A. D. The events of

his life are not known. Like Zoroaster, he taught the existence of two independent creative principles or powers—Good, or Light, and Evil, or Darkness. See GNOSTICS.

Basilio da Gama, baã-sec'lêe-õ da-gaa'maã, JOSÉ: Brazilian poet; b. at S. José do Rio, 1740; d. at Lisbon, July 31, 1795. He was one of the poets of Minas Geraes and one of the founders of the Arcadia Ultramarina. He studied in Rome, and in 1763 was made a member of the Roman Arcadia, with the name of Termino Sepilio. From Rome he went to Lisbon, and attracted there the attention of Pombal. When the latter fell in 1777, the *protégé* was obliged to withdraw to Brazil; but here, too, he was rendered unhappy by the persecutions of his enemies. Once more he went to Lisbon, where he died in retirement. He is chiefly known for his epic *Uruguay*, an account of the contest between the Portuguese and Spanish troops under Gomes Freyre de Andrade, and the natives of Paragnay, incited by the Jesuits (1756). He wrote also a shorter epic, *Quitubia*, and a poem entitled *Cantico aos Campos Elysios*. The *Uruguay* has been often printed, but perhaps best in Varnhagen, *Épicos brasileiros* (Lisbon, 1845). A. R. MARSH.

Basilis'cus (in Gr. βασιλίσκος): Emperor of the East; was a brother of Verina, the wife of Leo I. In 468 A. D. he commanded a large armament which Leo sent against Genseric the Vandal, by whom he was totally defeated. He usurped the throne in 474, but was defeated and deposed by Zeno in 476. D. in 477 A. D. See Gibbon, *Decline and Fall of the Roman Empire*.

Bas'ilisk [from Gr. βασιλίσκος, little king; name of a serpent, dimin. of βασιλεύς, king]: a lizard of the genus *Basiliscus* and family *Iguanidae*; natives of the tropical parts of America. The basilisks are characterized by a thin triangular fold of skin rising from the occiput and inclined backward. They also have an elevated crest along the back and tail, capable of being erected or depressed at pleasure. They are well adapted for swimming and for climbing trees, and are innocuous and inoffensive animals. The tail is much longer than the body. The *Basiliscus mitratus* is from 25 to 30 inches long, including the tail. The term basilisk was also applied

Basilisk.

to a fabulous monster by ancient and mediæval writers, who supposed that it had the form of a snake or lizard, that it infested the deserts of Africa, and that it was hatched by a toad or serpent from an egg laid by a cock. According to popular opinion, its breath poisoned the air and burned up vegetation, and the glance of its eye was fatal to men and other animals. It was sometimes called cockatrice and the king of dragons. The only creature who could face the basilisk and live was believed to be the cock; and travelers were advised to carry loud-crowing cocks with them, for the basilisk was believed to stand in great dread of his near relative, the cock, and the crowing of the cock was considered the only means of driving him away.

Ba'sin (in Fr. *bassin*): in geography, a great natural depression or concavity on the earth's surface, without reference to the stratification. The basin of a river is the whole tract of land drained by that river and its tributaries. The basin of the Mississippi, for example, is coextensive with all the country between the Rocky Mountains and the Appalachian chain. The area of this is estimated at 1,244,000 sq. miles. The basin of a lake includes, besides the space occupied by the lake, the land drained by the rivers that flow into it. The highest line between two basins is the water-parting or divide. See VALLEYS.

BASIN, in geology, is applied to depressions in the strata in which beds of a later age have been deposited. Thus the site of the city of London, called the London basin, consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the S. and by the chalk-hills of Berks, Wilts, and Bucks on the N. The term is also applied to synclinal depressions of strata, especially in the coal-fields.

Ba'singstoke: a town in Hampshire, England; on the London and Southwestern Railway; 46 miles W. S. W. of London (see map of England, ref. 12-H). It has, in grain, malt, coal, and timber, considerable commerce, facilitated by the Basingstoke Canal. Here is a church built at the time

of Henry VIII. Basingstoke has been a market-town ever since the Norman Conquest, and was anciently of more importance than at present. Pop. (1891) 7,960.

Bas'kerville, JONX: an English printer and letter-founder; b. in Wolverley, Worcestershire, England, in 1706. He made great improvements in typography. From his press came editions highly prized of Vergil (1756), Milton, and the New Testament (1763), besides many other beautifully printed works. D. in Birmingham, Jan. 8, 1775.

Bas'ket [etymol. unknown]: a vessel made of willows, twigs, or splints interwoven. Baskets have been in use from very early ages. The monuments of ancient Egypt abound in representations of baskets. They are frequently mentioned in the Bible. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of basket-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Dieman's Land—and many tribes of American Indians display great skill and taste in making and ornamenting them. Willow, oak, and ash are chiefly made use of in the manufacture of baskets. In the U. S. the rattan, oak, willow, and black ash are employed extensively. The Chinese export many beautiful baskets made of finely split bamboo.

Basket-fish: any species of the genus *Astrophyton*, of the order *Ophiuroidea*; a group of brittle stars in which the arms are greatly branched, in some species the subdivisions of the arms being many thousands.

Basking-shark (*Cetorhinus maximus*): the largest of the sharks and the largest of fishes; the type of a peculiar family (*Cetorhinidae*). It attains a length of nearly 40 feet, but its teeth are very small, and it feeds on small animals and is harmless to man. It is a sluggish animal, found in the northern seas, and is often captured by whalers. A large specimen will yield six or more barrels of oil from the liver. It is also known as bone-shark, elephant-shark, etc.

Basnage de Beauval, baã'naazh'de-bõ'vaãl', JACQUES: a French scholar and theologian; b. at Rouen, Aug. 8, 1653. In 1676 he became a Protestant minister at Rouen, whence he emigrated to Holland in 1685, on the Revocation of the Edict of Nantes. Among his works are a church history in reply to Bossuet (Rotterdam, 1649, 2 vols.), and a *History of the Jews*, in continuation of Josephus (1766, 5 vols.; Eng. trans. London, 1708), both of which he brought down to his own day. D. at The Hague, Dec. 22, 1723. See his life by E. A. Mailhet, Geneva, 1880.

Basque Provinces (Sp. *Vasconga'das*): a part of Spain; bounded N. by the Bay of Biscay, comprises the four provinces, Navarre, Biscay, Guipúzcoa, and Alava. These coincided with the ancient *Cantabria*. Area, 6,827 sq. miles. Pop. (1887) 814,459. The surface is mountainous and presents much picturesque scenery. The tops of the hills are mostly covered with forests of oak, chestnut, beech, etc. Among the mineral resources are copper, tin, iron, marble, and porphyry. The chief towns are Bilbao, Tolosa, and Vittoria.

Basques [Fr.]: the name of a people speaking a peculiar language and now occupying a small extent of territory in and near the Pyrenees Mountains, about the bend of the Bay of Biscay. This territory includes a small portion of southwestern France and a larger part of Spain; the provinces in which it lies are Vizcaya (Biscay), Guipúzcoa, Alava, Navarra in Spain, and Labourd, Basse-Navarre, Soule in France (in the department of the Basses-Pyrénées), the coast-line running approximately from Bilbao in Spain to Bayonne in France. The people call themselves Eskalkunac or Euskaldunac, and their language Eskara or Euskara, names which have been connected with the name (in Latin authors) *Ausei*, applied to a people of Aquitania. The name Basques is connected with *Vascones*, the Latin form of a name corresponding to the modern name Gascons, and applied to a people dwelling in Spain. The *Vascones* were probably a branch of the Iberian stock which once occupied a large part of Spain and southwestern France, and the Basques are accordingly in all probability a remnant of the old Iberians, and their language is the only surviving form of the old Iberian speech. The Basques numbered in 1875 about 620,000, of which number 500,000 were in Spanish territory. Pride and a strong local patriotism are among their marked characteristics, and they have shown repeatedly evidences of a bold and adventurous spirit. It is of in-

terest to recall the defeat of Charlemagne's rear-guard by the Basques in the valley of Roncesvalles (Roncevaux), while his army was returning from an expedition into Spain in 778; for this defeat, with the death of Hrodland (Roland), furnished the basis for the most famous work of Old French literature, the *Chanson de Roland*. The independent spirit of the Basques is further shown by the special privileges (*fueros*) which they long enjoyed in Spain, by virtue of which they held in many respects, as in matters of taxation, finance, and military service, a semi-independent position. These privileges were not finally and entirely abolished until 1876.

The Basque language, which, as said above, is probably a modern form of Iberian, is peculiar in its vocabulary and its grammatical structure, and stands in an entirely isolated position, surrounded, except on the sea side, by languages belonging to the Indo-European family, to which it is wholly unrelated, and indeed it has not yet been shown to be related to any other language now spoken in Europe or elsewhere. As no early monuments of the language have been preserved, it is impossible to tell whether it has changed much or little since the time when we first learn of Iberians in Spain, and our knowledge of ancient Iberian is practically nothing. At present the language exists in several dialects, the phonology or sound system of which appears to resemble considerably that of Spanish, though there are differences. The following features may be mentioned: There is a cerebral *s* (the letter *z* is written for the sound *s*), the sound *f* is nearly or quite confined to words of foreign origin, instead of *v* (which seems to be lacking) occurs a bilabial spirant, perhaps the same as the Spanish sound of *v*, *b*, and there are two *r* sounds (perhaps like the two recognized in Spanish), neither of which ever begins a word. Some dialects have the aspirated sounds *kh*, *th*, *ph*, pronounced like *k*, *t*, *p*, followed by *h*. There exist also palatalized *l* and *n*, presumably pronounced like Spanish *ll* and *ñ* respectively. The written *ch* is pronounced as in Spanish and English, except in dialects in France, where the sound is that of *ch* in French. The written *j* represents different sounds in different dialects; sometimes it means the sound of German *j* or English *y*, sometimes that of the modern Spanish *j*, and sometimes that of modern French *j*. The words of the language seem to be in general developed from monosyllabic roots, noun roots and verb roots being distinct. Numerous suffixes are in use, some of which correspond to declensional endings in the Indo-European languages. There is an article, developed from an older pronoun, which is suffixed to the noun (*ur*, water, *ura*, the water), or, when an adjective follows, to the adjective. The singular subject of transitive verbs often appears with a peculiar suffix *k*, which is not added to the subject of intransitive verbs. Nouns have no grammatical gender. The inflexion of verbs is the most difficult part of the grammar, on account of the perplexing combinations of pronouns and suffixes and prefixes, which produce many forms very difficult to analyze and explain. Auxiliary verbs combine with verbal adjectives or nouns and with pronominal forms, and this periphrastic conjugation is now the commonest. There exist also special forms for three moods, indicative, imperative, and optative, and two tenses, present and imperfect. A few examples (taken from Gerland) will illustrate some of these features. *Ekarri* (properly a verbal adjective), to carry; *dakart*, I carry it (the prefixed *d-* = it, the suffixed *-t* = I); *nenkarren*, I carried; *iduki* (verbal adj.), to have; *dut*, I have it; *nuen*, I had; *niz*, I am (the prefixed *n-* = I); *ethorzen niz*, I come (am in coming, the ending *-en* = in); *ethorrico niz*, I shall come (am for coming); *ethorri niz*, I have come (*ethorri* is the verbal adj.); *ethortzen nitzauk*, I come to thee (man); *ethortzen nitzaukan*, I was coming to thee (man or woman). For the vocabulary of the language it should be added that there is a considerable number of words from other languages, naturally for the most part from the adjacent Romance languages or dialects. The Basque has also contributed somewhat to the vocabulary of the neighboring languages, particularly Spanish, though the number of these words is not very large, and in some cases the borrowing is perhaps rather from the old Iberian than from the modern Basque.

The native Basque literature is naturally not very large, nor are there any monuments which can be traced farther back than the fifteenth century. The most interesting productions are proverbs, lyric poems, satirical verses, historical ballads, certain dramatic works somewhat resembling

the mediæval mystery-plays, the subjects of which are taken from the Bible or from legends, stories, or history, and comedies and farces are also found. For further information on all the subjects treated in this brief sketch, reference may be made to the following works: G. Gerland, *Die Basken und die Iberer*, in Gröber's *Grundriss der romanischen Philologie*, i. 313-334; this is the main source for the present sketch, and contains most of the needed references to authorities. See also Schuchardt's review of this in *Literaturblatt für germanische und romanische Philologie*, ix. 225-234; Larramendi, *El imposible vencido, Arte de la lengua Bascongada* (1729), and his *Diccionario del Castellano, Bascuence y Latin* (1745); W. v. Humboldt, *Berichtigungen und Zusätze zum ersten Abschnitte des zweiten Bandes des Mithridates über die Cantabrische oder Baskische Sprache* (1816), and his *Prüfung der Untersuchungen über die Urbewohner Spaniens vermittelt der Vaskischen Sprache* (1821); Francisque Michel, *Le pays basque* (1857); C. A. F. Mahn, *Denkmäler der baskischen Sprache* (1857); Prince L.-L. Bonaparte, *Carte des sept provinces basques* (1863), and his *Le verbe basque en tableaux* (1869); W. J. van Eys, *Dictionnaire basque-français* (1873), and his *Grammaire comparée des dialectes basques* (1879), and *Outlines of Basque Grammar* (1883); P. Broca, *Sur l'origine et la répartition de la langue basque* (1875); A. Luchaire, *Les origines linguistiques de l'Aquitaine* (1877); J. Vinson, *Essai sur la langue basque par François Ribáry, traduit du hongrois avec des notes complémentaires, etc.* (1877), and his *Les Basques et le pays basque* (1882), *Le folk-lore du pays basque* (1883), and *Essai d'une bibliographie de la langue basque* (1891); A. Campion, *Gramática de los cuatro dialectos literarios de la lengua euskara* (1884); Aizquibel, *Diccionario basco-español* (1882-85); Friedrich Müller, *Grundriss der Sprachwissenschaft*, iii., ii. (1887); H. Schuchardt, *Romano-baskisches* in *Zeitschrift für romanische Philologie*, xi., 474-512; and various articles in the *Revue de Linguistique* and other philological journals.

E. S. SHELDON.

Bas-relief, baa'rēe-leef', or **Basso-rilievo**, baas'sō-rēel-yā'vō [Fr. *bas-relief*, It. *basso-rilievo*, low relief]: a term applied to that kind of sculpture in which the figures have but slight projection from the background. (Compare ALTO-RILIEVO.) The slabs of alabaster which lined the halls of Assyrian palaces were covered with elaborate bas-reliefs representing deities and their worshippers and scenes of hunting and war. In Egyptian monuments bas-reliefs are common, and some of these are of a peculiar character called cavo-relievo, that is, having the whole figure in relief kept below the general surface; a groove or channel being cut all around the figure, so that the relief occupies a sunken panel of exactly its own size and shape. The most famous bas-reliefs in the world are those which formed the frieze of the cella wall of the Parthenon at Athens. The sculptors of the fifteenth and sixteenth centuries in Italy produced bas-reliefs in which the figures have but the slightest projection, and reached very great excellence in these, both in truth of modeling and in expression. The most familiar bas-reliefs are the figures on coins, which are very low indeed.

RUSSELL STURGIS.

Bas-Rhin, baa'rān (Lower Rhine): a former department of France, in the northern part of Alsace, which was annexed to Germany in 1871. See ALSACE.

Bass, bāys, or **Base** [same as adj. *base*, but differentiated in spelling under infl. of Ital. *basso*; from Fr. *bas*, low]: in music, is the deepest or lowest part. In respect to harmony the base is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that important and effective figure in music called "organ-point." The term is also applied to the deepest and gravest quality of the human voice, the usual compass of which is from E or F below the bass staff to D or E above it. See FIGURED BASS.

Bass, bās, or **Basswood** [for *bast*, the inner bark of linden. O. E. *bæst*; Germ. *Bast*]: a tree (*Tilia americana*), also called **Linden** or **Lime-tree**. It is common in the U. S.; has serrate leaves, which are more or less heart-shaped, and bears a woody globular nut one-celled and one or two seeded. The wood is light, soft, and not of much value for fuel. It is used in carriage-building. Several species of *Tilia* are found in the U. S., one of which, the *Tilia heterophylla*, or white basswood, is found in the West and South, and sometimes grows to an immense size and height. The flowers of the basswood abound in honey of

excellent quality, and are eagerly sought by bees. The European linden (*Tilia europæa*) is planted as an ornamental tree in many cities of Europe and the U. S. This species yields the bark which is made into Russia matting. See **BAST** and **LINDEN**.

Bass, or **Bars** [also *Base*, and in dial. *Barse*; O. Eng. *bars*; Germ. *Barsch*]: the name of many species of fish of

European bass.

various genera, but appropriately belonging to the genus *Labrax*, of the perch family, and other closely allied genera. The typical species is a European sea-fish, which is prized as food, *Labrax* (or rather *Dicentrarchus*) *lupus*. The striped bass of the Eastern U. S. (*Roccus lineatus*), often called rock-fish, affords a valuable supply of food. It ascends rivers, and is caught in both salt and fresh water, and has been successfully introduced into the waters of the Pacific coast. The white bass or perch of the Great Lakes (*Roccus chrysops*), the white perch (*Morone americana*), the yellow bass (*Morone interrupta*) of the Mississippi, are examples of true bass. Equally well known are the two species known as black bass, of the rivers of America (*Micropterus dolomieu* and *Micropterus salmoides*), among our very best game-fishes. The grass bass (*Pomoxis sparoides*), the rock bass (*Ambloplites rupestris*), etc., are allied species. There are also several marine fishes known as sea bass (*Centropristis*), stone bass (*Polyprion*), etc., and the name bass is also applied to some fishes which have no claim to the name.

DAVID S. JORDAN.

Bass, EDWARD, D. D.: the first Protestant Episcopal Bishop of Massachusetts; b. at Dorchester, Mass., Nov. 23, 1726; graduated at Harvard in 1744. He was ordained in England in 1752 by Bishop Sherlock. During the Revolution, at the request of the wardens and vestry of his church (St. Paul's, Newburyport, Mass.), he saved his parish from disruption by omitting those parts of the public prayers which relate to the royal family and Government of Great Britain. He was also dismissed from his position as a missionary of the Society for Propagating the Gospel, for his supposed sympathy with the American cause. He was consecrated Bishop of Massachusetts May 7, 1797, and his episcopal authority was afterward extended over Rhode Island and New Hampshire. D. in Newburyport, Sept. 10, 1803.

Bass, EDGAR W.: soldier and scientist; b. in 1843 at Prairie du Chien, Wis. In 1862 he enlisted in the Eighth Minnesota Volunteers and as quartermaster-sergeant served against the hostile Sioux Indians until 1864, when he was appointed a cadet. Graduating at West Point in 1868, he was promoted to lieutenant of engineers. He twice served with the engineer battalion at Willets Point as lieutenant, adjutant, and commanding a company, and in the scientific work of the school of application. He was twice on duty at the Military Academy as Instructor in the Department of Natural and Experimental Philosophy. He served as assistant astronomer to observe the transit of Venus 1875, and resigned his commission as lieutenant in order to accept the professorship of mathematics at the Military Academy, to which he was appointed in Apr., 1878. Author of *Introduction to the Calculus* and *Differential Calculus*.

JAMES MERCUR.

Bassano, bãas-saa'nõ: a town of Northern Italy; province of Venice; on the river Brenta: 19 miles N. E. of Vicenza (see map of Italy, ref. 2-D). It stands on an eminence near the foot of the Alps, in a country which produces excellent wine and fruits. It is well built, has many churches and several fine palaces, also a theater, a picture-gallery, a bo-

tanic garden, and the celebrated old printing-establishment of Remondini. Bonaparte here defeated the Austrian general Wurmser, Sept. 8, 1796. Pop. 15,000.

Bassano, DUKE DE: See **MARET**.

Bassano, or **Ponte**, JACOPO, da: painter; b. in Bassano in 1510; educated by his father, Francisco (1475-1530), himself a pupil of Gio. Bellini, and in Venice. Settled in Bassano in 1510; was one of the earliest Italian genre-painters; excelled in chiaroscuro, color, and perspective; at first imitated his father, then studied the works of Titian; is said to have been prolific of paintings, but his genuine works are scarce. His latest manner is the best. He was extensively copied by two of his four artist sons, namely, Giocino (1553-1613) and Girolamo (1560-1630). His best work is an altar-piece, in Bassano, of *The Nativity*. Others of his canvases are *The Entombing of Christ*, at Padua; a *Family Concert*, in Uffizi gallery, Florence; and the *Mourning Maries*, at Chiswick, near London. D. Feb. 19, 1592.

Bas'saris [from Gr. *βασσαρις*, a fox]: the only genus of the North American family *Bassaride*, including only two species, and mostly nearly related to the raccoons. The *Bas'saris astuto*, known as civet-cat or cacomixtle, is found in Mexico, Texas, California, etc. These animals are about the size of a common cat, and very playful and easily tamed.

The ring-tailed bassaris.

They live in trees, catching rats, mice, and birds. The tail is bushy, and marked with rings like that of the raccoon.

Bassein, bãas-sayn': a city of British Burma; on an arm of the Irrawaddi, which joins the Bay of Bengal S. of Cape Negrais (see map of S. India, ref. 4-L). It is 90 miles from the sea, and large ships ascend to the city. Much rice is exported hence. Pop. (1881) 28,147.

Basselin, bãas'lân, OLIVIER: a French popular poet; b. at Vire, in the valley of the river Vire (*Val de Vire*), in Normandy, late in the fourteenth or early in the fifteenth century. He is chiefly notable as the inventor of the joyous popular song known originally from the place where it was written as *Vau de Vire*, which name was later corrupted into *Vaudeville*. Little is really known of Basselin's life. From a study of the documents, however, M. Armand Gasté thinks the following facts to be pretty well made out: Basselin was a fuller by trade; owner of a fulling-mill near Vire, in the Val, or Van, de Vire; he was a merry and dissipated fellow, the chief of a band of jolly comrades, who in time of peace composed and sang drinking and love songs of a popular kind, but in time of war campaigned it to the tune of their own patriotic songs; he was killed by the English either in the battle of Formigny (1450), or in an ambushade shortly before this battle. Several editions purporting to be of the poems of Basselin have been published in the nineteenth century (1811, 1821, 1833, 1858); but it is probable that none of the poems so printed are really by him.

The author of them was Jean le Houx, a poet of Vire belonging to the end of the sixteenth century, who wrote *Vaux de Vire nouveaux*, which he dared not sign because of the religious troubles of his time, and which were soon attributed to the great originator of such songs. Probably the only veritable remains of Basselin's works are to be found in three MSS. of the Bibliothèque Nationale in Paris, of which the first two were published by M. Armand Gasté in 1866, the third by M. Gaston, Paris (*Soc. des anc. textes fr.*, 1875).

BIBLIOGRAPHY.—Eug. de Beaurepaire, *Étude sur Basselin, Jean le Houx et le Vau de Vire normand* (*Mém. de la Soc. des Antiq. de Normandie*, t. xxiii.): A. Gasté, *Chansons normandes du XV^e Siècle*, Caen, 1866; A. Gasté, *Étude sur Olivier Basselin, etc.*, Caen, 1866; A. Gasté, *Olivier Basselin et le Vau de Vire*, Paris, 1877.

A. R. MARSH.

Basses-Alpes, baa'zaalp' (i. e. Lower Alps): a department in the southeast part of France; bounded N. by Hautes-Alpes, E. by Italy and Alpes-Maritimes, S. by Var, and W. by Vaucluse. Area, 2,685 sq. miles. The surface is mostly mountainous, with some fertile valleys. It is drained by the river Durance. Pop. (1881) 131,918; (1891) 124,285; (1896) 118,142. Capital, Digne.

Basses-Pyrénées, baas'pē'rāy-nāy' (i. e. Lower Pyrenees): a frontier department of France; bounded N. by Landes, E. by Hautes-Pyrénées, S. by Spain, and W. by the Atlantic. Area, 2,945 sq. miles. It is intersected by the river Gave de Pau, an affluent of the Adour, which forms its northwest boundary. The surface is partly mountainous; the soil of the lowlands is fertile. Copper, iron, and marble are found here. The chief towns are Bayonne and Pau. Pop. (1881) 434,366; (1891) 425,027; (1896) 423,572.

Basse-Terre, baas'tār (i. e. low land): a seaport; capital of the French island of Guadeloupe; on the southwest coast; lat. 15° 57' N., lon. 61° 44' W. (see map of West Indies, ref. 7-M). It is the residence of a bishop, and has a botanic garden. It has no harbor. Pop. 9,500.

Basse-Terre: a town of the British West Indies; capital of St. Christopher (or St. Kitts); on the west coast (see map of West Indies, ref. 6-L). It has a harbor and an active trade. Pop. 8,500.

Bas'set Horn (It. *cor'no di bassetto*): the richest and softest of all wind instruments; invented in Passau in 1770, and afterward improved. It is similar to a clarinet in tone and fingering, and its compass is two and a half octaves. It is, however, nearly obsolete in modern orchestration. Mozart has made fine use of two basset horns in his celebrated *Requiem*.

Bas'sett, JAMES: missionary; b. in town of Glenford, near Hamilton, Ont., Jan. 31, 1834; graduated at Lane Theological Seminary in 1859. He served in the U. S. volunteer army 1862-63; held pastorates in Presbyterian churches of Newark and Englewood, N. J., 1863-71; and the latter year became a missionary for the Presbyterian Board. He has traveled extensively in Europe; passed many years in Turkey and Persia; and, as a pioneer of missionary work in the latter country, gained an accurate knowledge of its people and languages. He was the first American to visit the tomb of Haroun al Rashid in Eastern Khorassan, and the appointment of a legation of the U. S. to Persia was largely due to his publications and efforts. He established the mission in Central and Eastern Persia, but since 1884 has resided in the U. S. Among his works are: *Among the Turcomans* (London, 1880); *Hymns in Persian* (Teheran, 1884); *Grammatical Note on the Simnuni Dialects of the Persian* (London, 1884); *Persia, the Land of the Imams* (New York, 1886).

Bassett, RICHARD: a statesman of Delaware: was a member of Congress in 1787, and of the convention of the same year which framed the U. S. Constitution. He was U. S. Senator (1789-93), Governor of the State (1798-1801), and U. S. district judge (1801-02). He was the father-in-law of Hon. James A. Bayard. D. in Sept., 1815.

Bassford, WILLIAM KIPP: See the Appendix.

Bas'sia: a genus of plants of the family *Sapotaceæ*; comprises several species of trees, natives of tropical or subtropical countries. It produces flowers remarkable for their fleshy corolla, and a pulpy fruit inclosing three or four seeds, which contain an abundance of oil or butyraceous fat, which is used as food and for other purposes. The *Bassia latifolia*, an East Indian tree called madhuca or mahowa, is valuable for timber, and bears seeds from which oil is obtained. The Galam or Shea butter, an important article of commerce in Central Africa, which is procured from the

seeds of *Bassia parkii*, is more solid and more palatable than the butter of cow's milk. It is asserted that it will keep for a year without salt.

Bassompierre, bāas'sōn'pi-ār', FRANÇOIS, Baron de: a French general; b. at Harnel, in Lorraine, 1579. He was an accomplished courtier, greatly addicted to intrigues, and gained the favor of Louis XIII., who raised him to the rank of marshal of France in 1622, and sent him on embassies to Spain and England. He fought against the Huguenots at La Rochelle. Having offended Cardinal Richelieu, he was confined in the Bastille about twelve years (1631-42). He died Oct. 12, 1646, leaving interesting *Mémoires* (2 vols., 1665), which were written in the Bastille, and are commended as attractive in style. See Puymaigre, *Vie de Bassompierre*, 1848.

Bassoon' [Fr. *basson*, deriv. of *bas*, low]: a wind instrument which consists of a perforated tube of wood in several pieces, which are fastened together, so as to bring the holes and keys within the reach of the fingers. At the end is attached a small tapering, crooked brass tube, at the termination of which is placed a reed to produce the tone. It has a compass of three octaves, from double B flat to B flat in alt.

Bassora, baas'sō-ra, or **Basra**, baas'ra: a city of Asiatic Turkey; province of Irak-Arabi, Mesopotamia; on the Euphrates (here called Shat-el-Arab); 70 miles from its mouth (see map of Turkey, ref. 8-L). It is surrounded by a brick wall nearly 8 miles in circuit, which incloses gardens, rice-fields, and groves of the date-palm. The houses are mean and the place is unhealthy. About half of the inhabitants are Arabs. Bassora has an extensive trade, being an entrepôt for the exchange of the productions of Turkey and Persia for the commodities of India. The river is navigable to this point for ships of 500 tons. Among the exports are horses, dates, raw silk, and precious metals. Bassora was founded by the Caliph Omār about 636 A. D., and was once a rich and populous city. Pop. 40,000.

Bassora Gum: a whitish or yellowish opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water. It was introduced into commerce from the vicinity of Bassora, on the Persian Gulf.

Basso-rilievo: same as BAS-RELIEF.

Bass Rock: remarkable island-rock near the mouth of the Firth of Forth, composed of volcanic material; about a mile in circumference; nearly round; 313 feet high; inaccessible on all sides except the south; cavern, accessible at low tide, tunnels the rock from east to west. St. Balthere, or Baldred, died here in a hermitage 1756; Charles II. purchased it for £4,000 in 1671, and in its dungeon many of the most eminent Covenanters were confined during his and the succeeding reign. Four young Jacobite prisoners captured and with twelve more held the rock for King James from June, 1691, till Apr., 1694, against all the force sent against them by William III., surrendering at last on honorable terms. See *Bass Rock*, by Hugh Miller and four others (1848), and *Pictorial History of England*.

Bass's Strait: separates Australia from Tasmania, and is about 140 miles wide. It was first explored in a whaling-boat by a surgeon, George Bass, in 1798, who sailed from Port Jackson, Australia. Prior to Bass's discovery Tasmania was thought to be part of Australia, and so appears in Capt. Cook's charts. The navigation of this strait is obstructed by small islands and coral reefs.

Bast, or **Bass** [O. E. *bæst*, Germ. *Bast*, inner bark of linden]: the fibrous inner bark of dicotyledonous plants (called also *liber* and *endophlæum*). consists mostly of fibers and sieve vessels. It is sometimes valuable for medicinal purposes, and is often used in the fabrication of cloths, ropes, mats, sacks, etc. The Russians apply the name bast especially to the inner bark of the linden tree (*Tilia europæa*), which is extensively used for making ropes, mats, and shoes. The trees are cut down in spring when the sap abounds. This matting is extensively imported, and used in packing furniture and other articles, for covering tender plants in gardens, etc. See FIBER.

Bast, baast, FRIEDRICH JACOB (1771-1811): Hessian ambassador in Vienna and Paris. Noted author of a work on Gregorius Corinthius, with a learned and still valuable palæographical commentary.

Bas'tard [O. Fr. *bastard*, Mod. Fr. *bâtard*, deriv. of O. Fr. *bast* (also M. Eng.), pack-saddle (used as bed by mule-

teers in inns): cf. proverb *filis de bast*, illegitimate child]: in law, a person born of parents not married to each other. It includes several distinct cases, as where the mother is unmarried, or she is a married woman, or where she was married at the time of conception, but not married at the time of birth—e. g. being then divorced from the bonds of matrimony or a widow. By the rules of the common law the fact of the marriage of the parents at the time of birth is the test of legitimacy, even though such marriage may have immediately preceded the birth. By the civil or Roman law, intermarriage after birth has a retroactive effect, and makes the child legitimate. This rule prevails in Scotland. This difference presents frequently an interesting question in private international law. Thus if a person owning both land and personal property in England should become domiciled in Scotland, and there marry the mother of his bastard child, the marriage would make the child legitimate, so that he could succeed to the personal property in England, but he would not inherit the land there situated. Some of the States in this country follow the common-law rule, while others by statute have adopted the Scotch, so that the same point may arise in our interstate jurisprudence. In the case where the mother is a married woman, and it is claimed that a child is the offspring of an adulterous connection, it will not be enough that the adulterer may have been the father. It must be proved that the husband could not have been, either by absence from the country or other sufficient reason. The presumptions of law favor legitimacy, and public policy requires that these should only be overcome by the most satisfactory proof. (For the details of this branch of the law, see Nicholas, *Law of Adulterine Bastardy*.) Public policy also requires that the mother should not be allowed, for the purpose of bastardizing the issue, to be a witness to prove want of access on the part of the husband. In the special case where the mother is at the time of the child's birth a widow, a question may arise as to the effect of the time intervening between the death of the husband and the birth of the child in raising a presumption of illegitimacy. No precise time is fixed by law, and the testimony of experts must be resorted to. Statutes sometimes fix a period after which the presumption of illegitimacy will arise. A similar question may arise after a divorce from the bonds of matrimony for the husband's fault. In the case of a divorce from bed and board, where a child is subsequently conceived it is presumed to be illegitimate, as it will be supposed that the parties have obeyed the decree of the court, and have lived apart. This presumption may be rebutted by satisfactory evidence.

By the common law, a parent is not bound to sustain an illegitimate child. By a series of statutes in England, commencing in the reign of Queen Elizabeth, the duty of support is imposed on the supposed father as well as the mother. This legislation proceeds upon the theory that it is a criminal act to bring such a child into the world and to cast its support upon the public. Accordingly, an inquiry is had before magistrates into the facts of the case, and if parentage is established an order is made for a periodical allowance for the child's support. Should the parent abscond, his or her property may be sequestered. Due provision is made for a review of the order of the magistrates. These statutes are substantially re-enacted in this country. This class of children do not have the same civil rights in all respects as those who are legitimate. They can not inherit land from either father, mother, or collateral relatives, or transmit land to them. Natural ties are, however, regarded, it being the same crime for bastard relatives to intermarry as for those who are legitimate. Such a child has no name except as it may acquire it by reputation. It is deemed to have its domicile of origin at the place of its birth. These disabilities in this country are to some extent modified by statutes in the respective States. Thus in New York an illegitimate child may inherit from its mother, in default of legitimate descendants; so the mother may in like circumstances inherit from the child. A bastard child may be made legitimate by a special act of the legislature both in England and in this country. Such an act can not, however, in the U. S. interfere with vested rights of others. It could not divest property which had been previously transmitted to legitimate relatives.

T. W. DWIGHT.

Bastia, *baäs-tee'a*: a fortified seaport of Corsica; on the northeast coast; 75 miles N. E. of Ajaccio; lat. 42° 42' N., lon. 9° 27' E. (see map of France, ref. 2-K). It is the rich-

est and most populous town in the island, of which it was formerly the capital. It is picturesquely situated on the slope of a hill which rises in the form of an amphitheater. It has a harbor which admits small vessels, and has a considerable trade in leather, wine, oil, coral, etc. Here are numerous tanneries. Bastia dates from 1383. Pop. (1891) 23,397; (1896) 22,552.

Bastian, *baas'tee-an*, ADOLF: German traveler and anthropologist; b. June 26, 1826, in Bremen; made an extensive journey to Australia, America, Asia, and West Africa 1851-59; traveled in the East 1861-65; in North and South America 1875-76; traveled through Asia, Pacific Ocean, North America, and the West Indies 1878-80; through Turkestan, Zanzibar and Australia 1889-91; professor in the University of Berlin and president of the Museum of Anthropology; president of the Geographical Society; joint editor of the *Zeitschrift für Ethnologie* 1869. His most important writings are: *Der Mensch in der Geschichte* (3 vols., 1860); *Die Völker des östlichen Asien* (6 vols., 1866-71); *Ethnologische Forschungen* (2 vols., 1871-73); *Schöpfung oder Entstehung* (1875); *Die Vorstellungen von der Seele* (1875); *Vorgeschichte der Ethnologie* (1881); *Allgemeine Grundzüge der Ethnologie* (1884); *Religionsphilosophische Probleme* (1884); *Der Fetisch an der Küste Guineas* (1885); *Indonesien oder die Inseln des Malaischen Archipels* (1884-89); *Allerlei aus Volks und Menschenkunde* (2 vols., 1888). No equally well-equipped ethnologist has ever traveled so extensively, and it is difficult to overestimate his services to science.
C. H. THURBER.

Bastian, HENRY CHARLTON, M. D., F. R. S.: b. at Truro, England, Apr. 26, 1837; was noted for a time as an advocate of the doctrine of the spontaneous generation of living organisms. He early gained fame as a pathologist. He has since his twenty-third year been officially connected with the London University, and in 1871 became Professor of Pathological Anatomy, and in 1887 of Clinical Medicine, in University College. He has published *Modes of Origin of Lowest Organisms* (1871); *The Beginnings of Life* (1872); *Evolution and the Origin of Life* (1874); *The Brain as an Organ of Mind* (1880), translated into French and German; *Paralysis* (1886); and important monographs on free and parasitic nematoids. He supplied many articles on nervous diseases to Quain's *Dictionary of Medicine*.

Bastiat, *baäs'tee-aa'*, FRÉDÉRIC: French political economist and advocate of free trade; b. at Bayonne on June 29, 1801. He wrote against the protective system in the *Journal des Économistes*. During a visit to England he became acquainted with Cobden, and on his return (1845) he produced translations of the speeches of British free-traders; was chosen a member of the Constituent and Legislative Assemblies of 1848 and 1849. His chief work is *Harmonies Économiques* (1849), in which he made unacknowledged use of the speculations of Henry C. Carey. D. Dec. 24, 1850.

Bastide, *baäs'teed'*, JULES: a French republican and journalist; b. in Paris, Nov. 22, 1800. He became chief editor of the *National* about 1836, and founded the *Revue Nationale* in 1846. He was Minister of Foreign Affairs under Cavaignac in 1848. He published important educational and historical works. D. Mar. 3, 1879.

Bastien-Lepage, *baäs'ti-ään' le-paazh'*, JULES: painter; b. at Damvillers, Meuse, France, Nov. 1, 1848; d. at Paris, Dec. 10, 1884. He was a pupil of Cabanel and one of the ablest men in the Government School of Fine Arts, but though he entered the competition for the Grand Prix de Rome, and, in the opinion of many artists and critics, was plainly the candidate with the best claim for the prize, his work was not considered quite conventional and academic enough by the classic-loving members of the Institute who made the awards, and he received only a second prize. He created a genuine sensation at the Salon of 1874 by the exhibition of the *Portrait of My Grandfather*, a picture of an elderly man painted in out-of-doors effect, and following it in succeeding Salons with such works as *The Haymakers*, *Portrait of My Parents*, *The Potato Gatherers*, and *Jeanne d'Arc*, he was soon recognized as a *chef d'école*. His influence on modern painting was far-reaching and beneficial. His methods have been imitated by a host of men. Bastien's small portraits—the marvelous one of his brother Émile, the architect, seated at a table with his drawing instruments, and those of the Prince of Wales and Sarah Bernhardt and Albert Wolf—have had the effect of stimulating this

style of portraiture, and the work of such excellent painters in this field as Chartran and Friant is directly traceable to him. In his pictures of outdoor life, those remarkable effects in *plein air*, he no doubt drew something from Courbet and from Manet; but he is decidedly original, and his work is distinguished from theirs by infinitely better drawing, and by a research for color that goes beyond Courbet and that Manet never approached. In the portrait of his parents, again, Bastien, with the most exquisitely sensitive drawing and an abundant sense of color, reaches a very high level. In the portrait of his mother, particularly, there is an exactness that is worthy of Holbein, with an unaffected sentiment that we find nowhere outside of the work of the great Dutch masters. Painted out of doors, as these portraits were, in the diffused light, there is an original side to them that is found in nobody else's work. The *Portrait of My Grandfather* is equally remarkable, and indeed says the last word in sincerity and truth in the outdoor school of painting. In *The Haymakers*, *The Potato Gatherers*, *The Woodman*, and other pictures of peasant life, while there is a different sort of sentiment from that which makes Millet's interpretations of similar themes such beautiful works of art, there is a sympathetic comprehension of the poetry of the life of the fields, and the most healthful, robust methods in representing it in pictorial form. In the picture of *Jeanne d'Arc*, where the young girl is seen standing under an apple-tree in a garden, listening to the voices of vision-like figures in armor, indicated as floating in the air behind her, Bastien attempted something more than truthful rendering of peasant character, and the figure of Jeanne d'Arc is a beautiful creation. This picture was purchased by Erwin Davis, of New York, and presented to the Metropolitan Museum in that city, where it may now be seen. It is the work of a master, and one in which the painter's surpassing qualities may be studied in one of the most complete manifestations of his talent. Bastien received medals at the Salons of 1874 and 1875 and at the Paris Exposition of 1878, and the Legion of Honor in 1879; but the full recognition of his ability did not come until the latter days of his short career. He is now considered one of the great painters of the century, and his advent really marked an important "movement" in the progress of modern art. See Theuriet's *Life* (Paris, 1892).

WILLIAM A. COFFIN.

Bastile, bäs-teel' or bäs'teel [Fr. *bastille*, from Late Lat. *bastir'e*, build]: a name at first applied to fortified buildings forming part of a system of defense, and once in general use in Paris. In 1369, by order of Charles V., Hugues Aubriot, provost of Paris, began to convert the two towers which flanked the gate of St. Antoine into a fortress of eight towers, connected by thick-curtained walls, the whole being surrounded by a moat 25 feet wide. Later alterations left the main features of the structure still dominant, and to this fortress the name "bastile" gradually became restricted. For many years its principal use was for military purposes, although state prisoners were occasionally confined here, according to a general French use of fortifications. The Frondeurs held possession of it for three years from 1649, and it was here that the great Condé took refuge when Turenne attacked Paris in 1652. Henry IV. had used the edifice as a royal treasury, and given its command to the Duc de Sully. Among the early traditions of the place is the story that its architect, Aubriot, was incarcerated for heresy within its walls. The Duc de Nemours was confined here thirteen years in an iron cage. During the reign of Louis XIII. it became the receptacle for state prisoners. It had accommodations for about eighty persons in its cells and dungeons, and it was often overcrowded during the reigns of Louis XIV. and XV. The stories of the cruelties practiced here are not well borne out by recent investigation. There were two classes of prisoners committed here by summary process: those detained as a precaution or for discipline in loyalty, and those against whom specific but untried

FIG. 1.—Plan of Bastille.

charges were laid. The term of incarceration which might elapse before a prisoner was released, either by royal command or by trial and acquittal, was undetermined, and occasionally some poor fellows grew old in the cells without learn-

ing why they were detained. Convicts were treated with the strictness and brutality of the times. The better class of prisoners, except in cases of state importance, had considerable comfort, could receive visitors under certain regulations, played games, and had open air exercise on the galleries and in the courts of the building. Among the famous inmates of this prison during the reigns of the two Louises named were the "Man of the Iron Mask," Fouquet, the Marshal Richelieu, De Sacy, Voltaire, Labourdonnais, Cardinal Rohan, and La Chalotais. There were incarcerations of able and upright men under arbitrary rule which were cruel and unjust, and in this way the Bastille became a symbol of despotic government in the revolutionary year of 1789. It was attacked by the Paris insurgents July 14, who killed Delaunay, the governor, and several officers, and captured the place. Three unknown prisoners and four forgers were set free. The next day the demolition of the fortress by the mob began. A bronze column on the site commemorates the destruction, while the day of its fall has become a national *fête* day. The historical documents of the prison which escaped destruction were stored in the Arsenal library, and have to some extent been elucidated by François Ravaisson in *Les Archives de la Bastille* (Paris, 6 vols., 1866-73). Carlyle has graphically described the downfall of this prison in his *French Revolution*.

FIG. 2.—The Bastille.

Bastina'do [from Span. *bastonado*, deriv. of Span. *baston*: Ital. *bastone*: Fr. *bâton*, stick]: a name given by Europeans to a form of punishment which is common in Turkey and several Oriental countries, and was practiced by the ancient Egyptians. It consists of blows inflicted with a stick on the soles of the feet.

Bas'tion [Fr. deriv. of *bastir*, *bâtir*, build]: a bulwark; a projecting tower erected to defend the wall of a town or fortification. An unbroken wall enveloping a city or other place for its defense would be unseen at its foot; hence during ancient times and the Middle Ages towers of various kinds projected at intervals, from which the intermediate portions of the wall could be observed and reached by defensive projectiles (i. e. flanked). The invention of gunpowder made it necessary to cover enveloping walls (the *enceinte*) by earth in the form of a glacis in front of the ditch, and to enlarge these flanking towers to receive artillery. Thus enlarged, their own walls would have been undefended had not their outline been so contrived that they should *flank* each other. Hence arises the *bastion*, the two faces of which, directed upon the inner extremities of the flanks of the adjoining bastions, are *flanked* (that is, defended) by them; hence a bastion has two faces and two

flanks; the fifth side of the figure, called the *gorge* (between the extremities of the *curtain* and toward the interior of the place), is usually open. That portion of the enceinte which fills the interval between two bastions, uniting with the inner extremities of their flanks, is called the *curtain*. The *ensemble* of a curtain and two half-bastions is called a *bastioned front*. See FORTIFICATION.

Bastrop: town; capital of Bastrop co., Tex. (for location of county, see map of Texas, ref. 5-11); on Colorado river: 35 miles E. S. E. of Austin City. It is in a corn and cotton growing district. Pop. (1880) 1,546; (1890) 1,634; (1900) 2,145.

Basutoland, ba-soo'tō-land: a British crown colony near the east coast of South Africa; on the N. E. of Cape Colony. It is an irregular oval, about 160 miles long by 100 broad, on both sides of the Maluti Mountains, inclosing the head-waters of the south branch of the Orange river, with Orange Free State on the W. and N. W., Natal on the N. E., Kaffraria on the S. E., and Cape Colony on the S. W. Area, 9,720 sq. miles. The country is elevated and rough, has a fine climate, is well watered, produces abundant grass for its immense herds of cattle, and is capable of great production of grain. The productions are wool, wheat, mealies, and Kaffre corn. Coal is produced for local supply. The colony was annexed to Cape Colony in 1871, but placed directly under authority of the crown in 1884. The revenue in 1890-91 was \$208,000, the expenditure about \$5,000 less. Pop. (1891) European, 578; native, 218,324. European settlement is now prohibited. In 1891 the colony possessed 81,000 horses, 321,000 cattle, 10,000 plows and 800 wagons.

M. W. H.

Bas'yle [from Gr. *βάσις*, base + *ύλη*, wood, stuff (as in benzoyl)]: the name given by Graham to a substance, whether simple or compound, which can unite with oxygen to produce a base. Thus all the metals are examples of simple basyles, while ammonium, ethyl, methyl, etc., are compound basyles.

Bat (in Lat. *vespertilio*): an animal belonging to the order *Cheiroptera*, mammals possessing a fold of skin which commences at the neck and extends on each side between the fore legs or arms and the posterior limbs, serving as wings which enable the animal to fly. Bats are the only mammals which have the power of flight. The anterior extremities and digits are usually very long, the eyes small, ears large, thumbs short and armed with a hook-like nail, as are each of the toes of the hind feet. The clavicle is generally long. Some species have a spur on the heel. Bats fly for the most part only in the night, living by day in hollow trees, caves, and

Flying fox bat.

dark buildings. Even when their eyes have been destroyed they can fly through narrow and tortuous passages without hitting. This is probably owing to their delicate sense of hearing and touch. Except in tropical climates they hibernate in cold weather.

Vampire bat.

Bats are divided into two groups: the so-called frugivorous and the insectivorous bats. The former are found only in the Old World tropical regions. They feed chiefly on fruits, but also eat birds, small mammals, etc. They number forty or more species, and include the rousettes, kalongs, "flying foxes," etc. Some of them can spread their wings 5 feet from tip to tip. The principal genus is *Pteropus*, and its species are remarkable as having only twenty-four vertebrae, a smaller number than any other known mammal possesses. The insectivorous bats are by far the most numerous, some 300 species being described. The most formidable of these are the vampires—tropical American bats of the genus *Desmodus*, having a leaf-like membrane

Long-eared bat.

on the end of the nose. They are famous for their habit of fastening upon sleeping animals and men for the purpose of sucking their blood. Such witnesses as D'Azara, Tschudi, Waterton, and Darwin confirm this disputed statement. The bats of the U. S. are not very numerous in species, though abundant in individuals. They are of the genera *Vespertilio*, *Atalapha*, *Plecotus*, etc. Europe is much more rich in species, the "long-eared bat," *Plecotus communis*, being one of the most common. Bats are extremely useful in destroying insects, and their excrement so accumulates in certain caves, as in Farther India, in Tennessee, Arkansas, etc., as to promise to become an important source of guano. See VESPERTILIONIDÆ.

DAVID S. JORDAN.

Batabano': See the Appendix.

Bata'vi: an ancient German tribe or nation who inhabited the country now called Holland, especially an island called *Batavia* or *Insula Batavorum*, which was inclosed by the Rhine, the Waal (Vahalis), the Meuse (Mosa), and the ocean. They were conquered by Germanicus, and became loyal subjects of the Roman empire. They were exempted from the payment of taxes. The Batavian cavalry served in the Roman armies, and had a high reputation.

Bata'via (formerly *Jacatra*): a city in the province of that name, and a seaport of Java: capital of the Dutch possessions in the East Indies; on the northern coast of the island and on the Java Sea: lat. 6° 8' S., lon. 106° 50' E. (see map of East Indies, ref. 8-C). It consists of the old and new towns. The latter is about 2 miles inland, and contains the government offices and residences of the merchants, and is beautifully and healthfully situated among groves and avenues of trees. The former is flat and marshy, intersected by canals, and was formerly very unhealthy, but has been improved by draining. The temperature is almost uniform throughout the year, the average being 78° F. It has a fair harbor, and is the greatest commercial emporium of the Malay Archipelago, though Singapore is a powerful rival. It has a stadt-house, an exchange, numerous churches, several Chinese temples, banks, a school of arts and sciences, and a botanic garden. A telegraphic cable connects it with Singapore, about 600 miles distant. The chief articles of export are coffee, sugar, pepper, indigo, hides, cloves, nutmegs, mace, tin, rice, and rattans. Among the imports are various articles of European manufacture. Pop. 96,000, of whom 8,000 are Europeans. This city was founded by the Dutch in 1619.

Batavia: town; Kane co., Ill. (for location of county, see map of Illinois, ref. 2-F); on branch lines of Chicago and Northwestern and Chicago, Burlington and Quincy R. Rs., and on Fox river; 38 miles W. of Chicago. Batavia has 8 churches, 6 public schools, an institute for the insane, city-hall, windmill-factories, wagon-factories, stone-quarries, and electric lights. Founded in 1834; incorporated as a village in 1856. Pop. (1880) 2,639; (1890) 3,543; (1900) 3,871.

EDITOR OF "NEWS."

Batavia: railroad center and capital of Genesee co., N. Y. (for location of county, see map of New York, ref. 4-D); on the Tonawanda creek, 36 miles E. of Buffalo and 32 miles W. of Rochester; on the main line of the New York Central and Hudson River R. R. The Lehigh Valley and New York, Lake Erie and Western R. Rs. also pass through Batavia, while it is the terminus of the Canandaigua, Niagara Falls, and Attica branches of the Central. It contains several important manufactories, including harvester-works, gun-works, carriage-wheel and wood-working factories, shoe-factories, plow-works, and a canning-factory, and has a high school, four handsome ward schools, public library, the building for which was donated by the widow of the late Dean Richmond, and the State institution for the blind. Pop. (1870) 3,890; (1880) 4,845; (1890) 7,221; (1900) 9,180.

EDITOR OF "THE DAILY NEWS."

Batavian Republic: Holland having been conquered by the French in 1795, the Prince of Orange was deposed and a new government was established, with the title of the Batavian Republic. This was an ally or tributary to the French republic, and as such was involved in a war against the British, who nearly ruined the Dutch navy. In June, 1806, this republic was converted into a kingdom, of which Louis Bonaparte became king.

Bate'man, KATE JOSEPHINE: actress; b. in Baltimore, Md., Oct. 7, 1842; daughter of H. L. Bateman and Mrs. Bateman, both well known in theatrical circles. Her sister Ellen (Mrs. Greppo) was also an actress before her marriage. The sisters were brought up almost from infancy upon the

stage. In 1862 Kate Bateman appeared at Boston as Leah, her greatest character, and won great applause in the U. S. and Great Britain. In 1866 she was married to George Crowe, a former editor of the *London News*.

Revised by B. B. VALLENTINE.

Bateman, NEWTON, LL. D.: b. July 27, 1822, in Fairfield, N. J.; removed to Illinois with his parents in 1833; entered Illinois College in 1840, and graduated in 1843; studied at Lane Theological Seminary a short time; traveled extensively in the U. S.; taught private school in St. Louis; Professor of Mathematics 1847-51 in St. Charles College, Missouri, and then became principal of public free school of Jacksonville, Ill.; was at the same time superintendent of schools for the city and commissioner of schools for the county; became principal of Jacksonville Female Academy in 1858, and before the close of the year was elected State superintendent of public instruction. He served five terms of two years each, and was actively engaged in establishing the Normal University. In 1862-64 he had charge of the correspondence of the provost-marshal-general of the State, and then resumed the State superintendency of public instruction. From 1875 to 1892 he was president of Knox College, Illinois. D. in Galesburg, Ill., Oct. 21, 1897.

Bates, ARLO: author; b. in East Machias, Me., Dec. 16, 1850; graduated at Bowdoin College 1876; editor *Boston Sunday Courier* (1880); author of *Patty's Perversities* (1881); *The Pagans* (1884); *A Wheel of Fire* (1885); *Berries of the Brier* (poems, 1886); *A Lad's Love* (1887); *Sonnets in Shadow* (poems, 1887); *The Philistines* (1888); *Prince Vance* (with Eleanor Putnam, 1888); *Albrecht* (1890); *A Book o' Nine Tales* (1891); *The Poet and His Self* (poems, 1891); *Told in the Gate* (1892), Oriental stories in verse.

Bates, CYRUS STEARNS, D. D.: clergyman and educator; b. at Chester, O., Dec. 31, 1840; graduated at Cincinnati Law College 1865, and at the Theological Seminary of the Diocese of Ohio at Gambier 1873; ordained 1873, and became rector Newark, O., 1873; Professor of Systematic Divinity in the Theological Seminary of the Diocese of Ohio 1878-84; rector St. Paul's, Cleveland, 1884.

Bates, EDWARD, LL. D.: lawyer and attorney-general of the U. S.; b. at Belmont, Goochland co., Va., Sept. 4, 1793; emigrated to Missouri in his youth. He became a political friend of Henry Clay, and was elected a member of Congress in 1827. He presided at the national convention of the friends of internal improvement in Chicago in 1847; opposed the repeal of the Missouri Compromise in 1854; was a candidate for the nomination in the Republican Convention of 1860; Mar., 1861, President Lincoln appointed him Attorney-General of the U. S.; resigned in 1864. D. in St. Louis, Mar. 25, 1869.

Bates, JOSHUA: b. in Weymouth, Mass., in 1788. He removed to London in 1826, and became a partner and eventually the head of the banking-house of Baring Brothers & Co.; was umpire in the contested international claims arbitration growing out of the war of 1812-15. He was the principal founder of the Boston Free Library, to establish which he gave \$50,000, on the condition that it should be "perfectly free to all, with no other restrictions than may be necessary for the preservation of the books." Bates Hall in the library perpetuates his name. He afterward contributed books to the value of \$50,000. D. Sept. 24, 1864. See *Memorial of Joshua Bates* (1865).

Bates, JOSHUA, D. D.: b. at Cohasset, Mass., Mar. 20, 1776; graduated at Harvard in 1800; was ordained pastor of the Congregational church at Dedham, Mass., in 1803; was president of Middlebury College, Vt. (1818-39); was for a time chaplain of the U. S. Senate; and pastor in Dudley, Mass. (1843-54). He published various discourses, sermons, and other writings. D. in Dudley, Mass., Jan. 14, 1854.

Bates, SAMUEL PENNIMAN, LL. D.: b. at Mendon, Mass., Jan. 29, 1827; graduated at Brown University in 1851; principal of Meadville Academy, Pa. (1852-57), where he did much to stimulate the cause of education. In 1857 he became superintendent of schools in Crawford co., Pa.; in 1860 deputy State superintendent; in 1866 State historian of Pennsylvania. He has published various works, among which are a *History of Pennsylvania Volunteers* (5 vols., 1873); *History of the Colleges of Pennsylvania*; *School Laws of Pennsylvania*. He also prepared *Armor's Lives of the Governors of Pennsylvania* (1873); *Battle of Gettysburg* (1878); *Life of Gen. O. B. Knowles* (1878); *Battle of Chancellorsville* (1882).

Bates, WILLIAM, D. D.: one of the most ornate and learned of the English Nonconformist writers; was b. Nov., 1625, and d. in Hackney, July 14, 1699. He assisted at the Savoy Conference for reviewing the Liturgy. Soon after the restoration of Charles II. he was made one of His Majesty's chaplains, and but for his Nonconformity might have become a bishop. His contemporaries called him the "silver-tongued." In 1681 he published (anonymously) *Vitæ Selectorum Aliquot Virorum*. His most valuable treatise is *The Harmony of the Divine Attributes in the Contrivance and Accomplishment of Man's Redemption*. His collected works were published in 1700, again in 1723, and again in 1815, the last time by Farmer, in 4 vols. 8vo.

Batesville: capital of Independence co., Ark. (for location of county, see map of Arkansas, ref. 2-E); on railroad and White river; 90 miles N. N. E. of Little Rock. It is the seat of Arkansas College. The river is navigable for steamboats to this point, and part of the year for 200 miles above. Batesville has woolen manufactures, flouring-mills, furniture-factory, and lumber-mills. Pop. (1880) 1,264; (1890) 2,150; (1900) 2,327.

EDITOR OF "GUARD."

Batesville: town: Ripley co., Ind. (for location of county, see map of Indiana, ref. 8-G); on C., C., C. and St. L. R. R.; 50 miles W. of Cincinnati, O.; has a graded school and 2 parochial schools, 7 furniture-factories, and a candy-factory. Pop. (1890) 1,169; (1900) 1,384.

EDITOR OF "INDEPENDENT RECORD."

Batfish (*Malthe vespertilio*): a fish of the West Indies and Florida waters, remarkable for its peculiar shape. Its pectoral and ventral fins resemble the legs of a frog. Its mouth is small, and its skin rough, with bony tubercles. It is of no value.

Bath: the application of water or other liquid, or of spray or vapor, to the body for the purpose of cleansing the surface or of preserving or restoring health. Water employed in the bath is an important agent in the treatment and prevention of disease. In ancient Greece, Rome, Germany, and Judea, in Mohammedan lands (by religious precept), as in modern Finland and some other countries, bathing may be regarded as almost universal, though in desert countries the Moslems use sand instead of the water which is there so precious. Some of the American Indians, though not otherwise remarkably clean, practiced bathing in water or steam even to excess. Surf-bathing is a nearly universal pastime on many islands of the Pacific. The ancient Romans had extensive public baths—institutions which of late have been revived in Europe and America on a smaller scale, but in a manner not liable to the serious abuses which disgraced the Roman baths. See ROMAN ARCHÆOLOGY.

The "hot" bath and vapor bath are above 99° F., the normal heat of the blood; warm, tepid, and cold baths being of lower temperature. The vapor bath of water or alcohol accelerates the heart's action, softens the skin, and produces profuse sweating, and is useful in various skin diseases, in chronic rheumatism, and in some diseases of the kidneys, etc. The hot bath is also stimulant. Locally applied, it relieves pain and allays inflammation. The hot bath is often employed in the convulsive diseases of children, but its effect may be a profound one; and the tepid or warm bath is much safer, since the skin of a child is extremely sensitive to heat and cold. The hot bath sometimes causes a sense as of choking, and a degree of giddiness or headache. When its action is favorable, profuse sweating results, and on this account it is sometimes a most valuable adjunct in the treatment of kidney disease when the excretion of urine fails. The warm bath is a sedative, usually inclining one to inactivity or sleep. It is useful in feverish or restless conditions and in eruptive diseases, but is not to be recommended in acute diseases of the chest, which may be aggravated by it. The cold and tepid baths are those most generally to be employed. Cold bathing ought never to be practiced while the person is exhausted or perspiring freely; and there are many nervous, thin, and sensitive persons who can not safely endure the shock and loss of heat which it occasions. It is also dangerous in old people, in whom the sudden shock with revulsion of the blood to the interior from contraction of the blood-vessels of the skin may cause rupture of fragile vessels of the brain. In a healthy person with good powers of reaction, and followed by vigorous friction, there is probably no greater general stimulant to healthy nutrition, no better tonic than the cold bath. In disease it has in recent years assumed a place of most positive value, and especially is this true of typhoid fever. Its general tonic influence, its effect

on temperature and on the nutritive processes, rob this disease of many of its untoward symptoms and of much of its danger. The mortality from this disease has been reduced from 15 to 20 per cent. to 5 per cent., and in one series of over a thousand cases less than 1 per cent. died. The apparent cruelty of plunging a fevered patient in a cold bath, and the involuntary groaning of the patient while being bathed, have militated against the acceptance of the bath by the public and some physicians; but those who have compared the method with the old plan of treatment, and statistics, give evidence to the relief of bad symptoms and the great decrease of mortality secured. Ten per cent. of all cases of typhoid fever now die who might be saved could physicians have the entire co-operation of the public in instituting this plan of treatment with cold baths. What has been said of typhoid fever applies also to other fevers, not excepting pneumonia. In cases of great prostration or other conditions rendering cold baths impracticable, cold sponging or the "cold pack" may be employed. The "cold pack" is given by wrapping the patient in wet sheets, and then covering him with a blanket.

Hip baths, foot baths, and other local baths are occasionally required. The hot foot bath especially has received popular and scientific sanction in "colds." Various sulphur and other springs have a direct effect in skin diseases, and useful saline and other principles are no doubt capable of absorption into the system by the skin. Various drugs are used in vapor baths, and act upon the patient after absorption. Sea-bathing has a peculiar tonic effect upon some patients. Besides the above, the "Turkish" and "Russian" baths have been devised, which combine a thorough and direct detergent effect upon the skin with the various advantages of the warm and tepid bath, adding thereto the often invaluable results of manipulation or "kneading" the patient, a process the importance of which in selected cases can hardly be overestimated. "Wine baths," "mud baths," and other devices have been tried in different diseases, often with more or less benefit to the patient.

Revised by WILLIAM PEPPER.

Bath (anc. *Aquæ Solis*): a city of England; capital of Somersetshire; beautifully situated in a valley on the river Avon; 20 miles from its mouth and 102 miles by rail W. S. W. of London; lat. 51° 23' N., lon. 2° 22' W. (see map of England, ref. 12-G). The houses are mostly built of white freestone, "Bath oölite," quarried in the vicinity. Bath presents perhaps a finer appearance than any other city of England, which is partly a consequence of the configuration of its site. This is in the form of an amphitheater, on the declivity of which the finest streets extend in successive terraces. The principal public buildings are the Abbey church, in the latest Gothic style, 210 feet long; St. Michael's church, the guild-hall, an elegant theater, a masonic temple, and the assembly and concert rooms. The beauty of the situation, the mildness of the climate, and the curative efficacy of its hot saline springs render Bath a fashionable place of resort. The temperature of the springs, four in number, varies from 97° to 117° F. They rise on the bank of the river, and discharge 184,320 gal. daily. This water is recommended for scrofula, palsy, gout, cutaneous diseases, etc. This city sends two members to Parliament. The Romans erected baths at this place in the first century, and called it *Aquæ Solis*. Numerous Roman antiquities have been found in and near Bath. Pop. (1891) 51,843; (1901) 49,817.

Bath: city and railroad center; capital of Sagadahoc co., Me. (for location of county, see map of Maine, ref. 10-C); on the right (west) bank of the Kennebec river; 12 miles from the ocean, 30 miles S. of Augusta, and 36 miles N. E. of Portland. It is built on uneven ground, is lighted with gas and electricity, is advantageously situated for navigation, and has steamboat communication with Boston and Portland. The principal business of Bath is ship-building, and a large iron ship-building plant has been established and has received several Government contracts. There are also many extensive manufactories of lumber, a large one of oil-cloth, a large iron-foundry, brass-foundry, cordage-factory, and machine and boiler shops. Bath has long been noted for the excellence of its schools, and has a fine system of water-works. Pop. (1890) 8,723; (1900) 10,477. EDITOR OF "TIMES."

Bath: railroad junction and capital of Steuben co., N. Y. (for location of county, see map of New York, ref. 6-E); on the Cohocton creek, and the main line of the D., L. and W. R. R.; on the Rochester branch of the N. Y., L. E. and W. R. R.; 99 miles E. of Buffalo, 74 miles S. S. E. of Rochester, 36 miles W.

of Elmira, and 310 miles from New York. It has a jail and court-house, six churches, a free library and reading-room, a soldiers' home, an orphan asylum, and shoe, sash, blind, door, harness, and other factories. Pop. (1880) 3,183; (1890) 3,261; (1900) 4,994. EDITOR OF "FARMERS' ADVOCATE."

Bath Brick: See BRISTOL BRICK.

Bath, Knights of the: a military order in Great Britain deriving its name from the ceremony of bathing which was performed at the initiation of the knights. The earliest authentic instance of this ceremony was at the coronation of Henry IV. (1399). The last occasion on which this ceremony was used was the coronation of Charles II. in 1660, after which the order fell into oblivion until it was revived by George I. in 1725. It is second in rank among the orders of England, the order of the Garter being first.

Bathometer [from Gr. βάθος, depth + μέτρον, measure]: any apparatus for the measurement of depths of water. In many cases it consists of a very elaborate system of sounding machinery and apparatus, and depths in the Pacific Ocean of 4,655 fathoms and over have been determined by such instruments with what is thought to be very considerable precision. The depth is indicated in some cases by the compression of a mass of air within a closed chamber, reached only by the pressure of the surrounding water through a narrow passage filled with oil, mercury, or water; in other instances by the use of other equivalent devices. The pressure-gauge thus made is sunk to the bottom by a sounding-line, and is again brought to the surface either by the line by which it is let down or it is detached at the bottom by contact with the earth and floats to the surface by its own levity. For considerable depths the sounding-line is of fine steel wire, and a steam-engine is employed to drive the windlass by means of which it is lowered and raised. See DEEP-SEA EXPLORATION.

Bathori, baa'tō-rē: name of a noble family of Hungary. —ELIZABETH, wife of Count Nádasdy, is infamous on account of her cruelty. She was shown to have murdered no less than 650 maidens for the purpose of renewing her youth from time to time by bathing in their warm blood. She was condemned in 1610 to imprisonment for life, and shut up in her fortress of Csej, where she died 1614. See Baring-Gould's *Book of Werewolves* (1865).

Bathurst: a thriving town of New South Wales; capital of Bathurst County; on the Macquarie river; 98 miles W. N. W. of Sydney (see map of Australia, ref. 7-I). It is connected with Sydney by a fine road leading over the mountains. It is in a mining as well as a pastoral district of New South Wales. Mr. Hargreaves, a California digger, first discovered gold on Bathurst Plains, Feb. 12, 1851. The diocese includes 120,000 sq. miles of New South Wales. Pop. (1891) 9,069.

Baths: See THERMÆ.

Bathurst: a port of entry; capital of Gloucester co., New Brunswick; on the Bay of Chaleurs; 175 miles N. by E. of St. John; has a good harbor and an extensive trade in lumber, trout, and salmon. Pop. 3,000.

Bathyl'ius [mod. from Gr. βαθύς, deep + βίος, life]: a name given by Huxley to a granular gelatinous substance of supposed albuminous or protoplasmic nature, which is believed to cover large areas of the ocean's bed, and to represent a very low form of animal life. Its existence is now generally denied.

Baton Rouge, băt'ūn-roozh: capital of Louisiana and of the parish of East Baton Rouge (for location of county, see map of Louisiana, ref. 10-E); on the left (east) bank of the Mississippi, 120 miles above New Orleans by river (89 by rail and 72 as the crow flies); on the Louisville, New Orleans and Texas and the Texas and Pacific R. Rs.; lat. 30° 28' N., lon. 91° 11' W. It stands on a bluff which rises about 25 feet above the highest inundations. The river below the city is bordered by plantations of sugar-cane, groves of tropical fruit-trees, and handsome villas and gardens. The seat of government was established here in 1847. The Capitol was completed in 1852 at a cost of \$246,000. It contains a State-house, which was burned by Federal troops during the civil war, but rebuilt in 1882 and now occupied by the officers of the State government, a State university, a collegiate institute, a seminary for young ladies, public and private schools, an institute for the deaf and dumb, a school and industrial home for the blind, two orphan's homes, a Catholic academy for young ladies, and a penitentiary, in which are about 800 convicts. A convention,

which met here Jan. 21, 1861, on the 26th adopted the ordinance of secession. The city was taken by the U. S. forces May 7, 1862. On Aug. 5, 1862, a Confederate force, numbering 5,000, under Gen. John C. Breckenridge, attacked the garrison under Gen. Thomas Williams, but was repulsed after a fierce contest of two hours' duration, in which Gen. Williams was killed. The place was shortly after evacuated by the Union forces, but about a month afterward was re-occupied, and held by Federal troops to the close of the war. The arsenal has been broken up. For several years from the close of the civil war New Orleans was the seat of the State government. Pop. (1870) 6,498; (1880) 7,197; (1890) 10,478; (1900) 11,269. EDITOR "CAPITOLIAN-ADVOCATE."

Batoo Khan: See **BATU**.

Batoom, or Batoum: See **BATUM**.

Batra'chia [from Gr. *βάτραχος*, frog]: one of the classes of vertebrate animals, including salamanders, frogs, toads,

Hatching and progress of the frog (from 1 to 10).

etc. Used in this sense, the name is synonymous with *Amphibia* (*q. v.*). Batrachians are cold-blooded and oviparous, and in most living species are without scales, and the blood is partly aerated through the skin. The young, for the most part, breathe by gills like those of fishes. They generally have limbs, but not always. The young assume a fish-like form (as the tadpole), and finally, when adult, with few exceptions, lose their gills and commence breathing by lungs.

Revised by D. S. JORDAN.

Batrachidæ: See **TOAD-FISH**.

Bat'rachomyoma'chia [from Gr. *βάτραχος*, frog + *μῦς*, mouse + *μάχη*, battle]: the name of a mock-heroic poem, the subject of which was the battles of the frogs and mice.

Battaks, called also **Battas**: a native race in the interior of Northern Sumatra. They are only partly subjugated by the Dutch, an independent territory still remaining between the parallels 2° N. and 4° N. They claim to be the aborigines, are brave but peaceful, and number in all about 300,000. They are cannibals, but those under the Dutch are easily dissuaded from this practice. They have little knowledge of the arts, but can usually read and write and have a literature. The books are written on bark or bamboo staves, are generally in prose, and relate to witchcraft and incantations, or consist of stories, riddles, etc. The language is poor in general terms but very rich in inflections, and it is doubtful whether most nearly related to the old Javanese or to the Malay. M. W. H.

Battal'ion (Fr. *bataillon*): a tactical unit of infantry; a body of infantry amounting to nearly 1,000 men. In the American cavalry and artillery service eight (in infantry ten) companies constitute a battalion. The full complement of a battalion of British troops is usually ten companies. The British infantry regiments in time of peace have each one battalion, but the regiment of the continental powers is mostly so large as to comprise several battalions. In the U. S. army an infantry regiment has one battalion, while regiments in the other arms of the service have two. A de-

tachment of infantry of more than one company, and less than one regiment, is sometimes called a battalion.

Bat'tel [orthographical variant of *battle*]: an ancient mode of trial by single combat, usually called "wager of battle." It had its origin among the German tribes, and was introduced into England by William the Conqueror at the time of the Norman Conquest. It was used, however, in only three cases—in the court of chivalry, in appeals of felony, and in the issue joined in a writ of right to determine the title to real property. In criminal cases the accuser and the accused fought in person; in civil cases, by champions. The leading reason for requiring a champion in civil cases was that if the parties should engage in combat, and one of them should be killed, the proceeding would terminate by his death, and the object of the contest would be frustrated. This barbarous mode of trial, which was based on the idea that heaven would give the victory to the injured or innocent party, though for a long time practically disused, continued to be recognized as part of the law of England till the year 1819, when it was abolished by statute. The details of the method of proceeding in the case of a writ of right will be found in the third book of Blackstone's *Commentaries*, p. 337.

Battering-ram (in Lat. *a'ries*): an engine of war used by the ancient Greeks and Romans to make a breach in the wall of a town or fortress. It consisted of a heavy beam of wood nearly 100 feet long, one end of which was armed with a mass of iron or bronze in the form of a ram's head. It was suspended by a chain or rope from a crane or trivet, and was made to swing backward and forward in a direction nearly horizontal. Sometimes a huge mass of stone, armed with a ram's head and placed on wheels, was driven against the walls with great force. About 100 men were employed in impelling it against the wall. To protect these men a wooden roof (*testudo*) was constructed, and the whole machine was mounted on wheels. The blows of the ram were directed against the same point with gradually increasing momentum, which, if continued long, hardly any wall could resist. These engines continued to be used in the Middle Ages until superseded by cannon.

Bat'tershall, JESSE PARK, Ph. D.: b. in Troy, N. Y., May 26, 1851; began his chemical education 1867 at School of Mines, Columbia College, New York; studied under Prof. Wöhler at the University of Göttingen, Germany, for a year, passed a semester at the University of Leipzig with Prof. Kolbe; spent two years under Prof. Fittig at the University of Tübingen, Würtemberg, where he received the degree of doctor of natural sciences; his inaugural dissertation is a description of several new derivatives of naphthalene, including the aldehyde of isonaphthoic acid (C₁₁H₈O), its amido-compound, hydroisonaphthamide (C₁₁H₈N₂), sulpho-naphthoic and isosulphonaphthoic acids (C₁₁H₇O₂S) and salts, and several isomeric oxynaphthoic acids (C₁₁H₈O₃). After attending the chemical course of Prof. Marignac in Geneva he returned to the U. S., where he was engaged as analytic and consulting chemist; an English translation by him of Naquet's *Legal Chemistry* has been published. D. Jan. 12, 1891.

Batterson, HERMON GRISWOLD, D. D.: b. at Marbledale, Conn., May 28, 1827; ordained 1861; has held charges in Texas, Minnesota, Pennsylvania, and New York; published *The Missionary Tune-book* (1867; 10th ed. 1870); *The Churchman's Hymn-book* (1870); *Sketch-book of the American Episcopate* (1878; 3d ed., enlarged, 1891); *Christmas Carols, and other Verses* (1878); *The Pathway of Faith* (1885; 2d ed. 1886).

Battery [Fr. *batterie*; from *battre*, beat, from L. *batu'ere*, beat]: a military term used in various senses. A battery employed in the defense of a fortress is a row of heavy guns mounted on an earthwork or other platform; any one of the lines of a fortress which is armed with siege-guns. If they have a bomb-proof cover, they are casemated batteries. A battery used in attacking a fortified place is a number of siege-guns or mortars placed in a line and covered with a parapet. These batteries receive various names, expressing their design, position, etc. In field operations a battery is a number of guns, with the necessary horses, gun-carriages, artillerymen, and officers to manage the guns. The Austrians and Italians have eight pieces to a battery, and so likewise do the Russians, except for their horse-batteries, in which six are used. All other nations have six pieces to a battery. In reference to the weight of the ordnance,

they are divided into *heavy batteries* and *light batteries*. The term battery is also applied in a narrower sense to the *personnel* or complement of men and officers who serve a set of guns.

Battery, in law: See ASSAULT AND BATTERY.

Battery, VOLTAIC OR GALVANIC: a device for the generation of the electric current by chemical action. The essential parts of the voltaic cell are: (1) A liquid capable of electrolytic conduction; (2) two metal terminals, submerged in the liquid and not in contact with each other below the surface. One of the metals must be acted upon chemically by the liquid.

Under these conditions there will be a difference of potential between the metals, and when they are connected with each other a current will flow through the circuit thus formed. In spite of this flow of electricity, the difference of potential between the terminals of the cell will be maintained by the chemical action going on within the cell, the activity of which will continue until the materials are exhausted.

A typical case is that of zinc and copper in dilute sulphuric acid. When the external circuit of a cell of which these are the active parts is closed, the following reactions occur:

The zinc is thus converted into zinc sulphate, and hydrogen is set free at the copper pole. The result of this reaction is to give the copper a positive charge, with respect to the zinc, and to send a current through the outside circuit from copper to zinc. This is the simplest of voltaic cell reactions. In practice it is necessary to modify it. On the one hand, the zinc must be protected from attack during such times as the cell is resting. This is done by amalgamating it. On the other hand, the presence of free hydrogen at the copper pole creates a counter electro-motive force, which soon overcomes the proper voltaic action. To prevent this "polarization of the cell" some substance rich in oxygen and capable of giving up its oxygen to the nascent hydrogen is introduced. Nitric and chromic acids are excellent "depolarizers." Dioxide of manganese and the black oxide of copper are also used. The depolarizer is frequently placed in a porous cup, with the positive terminal of the cell surrounded by it or submerged in it. Platinum or carbon is substituted for copper whenever the latter metal is liable to be attacked by the depolarizer. The number of combinations in use for the production of voltaic electricity are too numerous to be mentioned in detail here.

Voltaic cells are divided into three groups: (1) Open-circuit cells, which are designed to furnish a current for a moment only at a time, as in ringing electric bells, etc., but which should remain in working condition for a long time without attention or replenishing; (2) closed circuit cells, which are intended to furnish a current continuously for long intervals of time; (3) standard cells, which are not constructed for the generation of appreciable currents, but are used as standards of electro-motive force. Accumulators or storage batteries are "secondary" voltaic batteries, in which the chemical conditions necessary to the production of current have been obtained by previous electrolytic action within the cell itself. See ACCUMULATOR.

Strictly speaking, the term battery should not be applied to a single voltaic cell, but to a number of such cells used in combination. See ELECTRICITY AND ELECTROLYSIS; also Carhart, *Primary Batteries* (Boston, 1891).

E. L. NICHOLS.

Bat'tey, ROBERT, M. D.: b. in Augusta, Ga., Nov. 26, 1828; took his degree in medicine at the Jefferson Medical College; practiced his profession in Rome, Ga., and by his contributions to the journals (one to the London *Lancet* on vesico-vaginal fistula) soon acquired reputation; was called to the chair of Obstetrics in the Atlanta Medical College; claimed to have first performed strict ovariectomy or oöphorectomy (1872), an operation confined to ovarian tissue. D. at Rome, Ga., Nov. 8, 1895.

Batthyányi, báat'yaan-yeé, LOUIS, Count: a Hungarian patriot; b. at Presburg in 1806. He favored the liberal cause, and was appointed president of the ministry formed in Mar., 1848. Finding his position untenable, he resigned about six months later. After his friends had been defeated in battle by the Austrians, he was tried by a court martial, and, though his conduct had been moderate, he was shot Oct. 6, 1849. See Horvath, *Louis Batthyányi, ein politischer Martyrer* (1850).

Battle: See TACTICS.

Battle: a town of Sussex, England; about 7 miles N. W. of Hastings (see map of England, ref. 13-K); in a valley enclosed on three sides by wooded hills. It is noted for the manufacture of gunpowder. Pop. 3,500. It derived its name from the great battle (usually called the battle of Hastings, and sometimes the battle of Senlac) which was fought near it on Oct. 14, 1066, between William the Conqueror and the Saxon King Harold. The victorious Norman erected here a large abbey, called Battle Abbey, now in ruins.

Battle-axe: weapon used in warfare from the earliest times, but not by all peoples or at all epochs. The early Greeks used a double-axe (bipennis), which they seem to have borrowed from the Asiatics. Among the northern nations of Europe the single-bladed axe was used from the earliest times; this was at first made with a stone head, then with one of bronze, and finally with a head of iron or steel; the weapon being, in fact, merely the utensil modified. The battle-axe as used by foot-soldiers had naturally a long handle of wood, and was called pole-axe; that used by horsemen, requiring to be swayed by one hand alone, was, later, shorter and sometimes made entirely of metal.

RUSSELL STURGIS.

Battle Creek: city and railroad center; Calhoun co., Mich. (for location of county, see map of Michigan, ref. 8-I); at the confluence of the Kalamazoo and Battle Creek rivers, 120 miles W. of Detroit. It contains Battle Creek College, controlled by the Seventh-day Adventists, whose headquarters are here. It has also a large sanitarium, and its manufactures are extensive, especially in threshing-machines and farm implements. It has good water-power and several flouring-mills, etc. Pop. (1880) 7,063; (1890) 13,197; (1900) 18,563. EDITOR OF "DAILY MOON."

Battledoor, or **Battledore** [probably from Sp. *batidor*, an instrument of the same shape used in beating clothes in washing]: an instrument with a handle and a flat board, or piece of leather or network stretched tightly on a frame, and used to strike a ball or shuttlecock. Battledoor and shuttlecock, played with the above instrument, has been a favorite amusement in Europe since the fourteenth century or earlier.

Battleford: important trading-post in Saskatchewan, Northwest Territories of Canada; at the junction of the Battle river with the Saskatchewan; 70 miles N. of the Canadian Pacific Railway (see map of Canada, ref. 8-F); 1876-83, capital Northwest Territory. The insurrection of 1885, headed by Louis Riel, who was executed for his part in it, occurred near Battleford.

Battle-ground: on railroad, Tippecanoe co., Ind. (for location of county, see map of Indiana, ref. 5-C); where the celebrated battle of Tippecanoe was fought between Gen. Harrison and the Indians under Tecumseh and his brother, the "Prophet," Nov. 7, 1811. See TIPPECANOE RIVER.

Batu (**Batou** or **Batoo**) **Khan**, baä-too'kaän: nephew of Ogdai Khan and grandson of Gengis Khan; a Mongolian chief and governor in Kipchak. He was put in command, 1235, of the Mongol army ordered to advance into Europe. Crossing the Volga river, he appeared before Riazan, took it by assault, Dec. 21, 1237, and sacked it with savage slaughter; then he laid waste Moscow; at Kozelsk, near Kaluga, he held a "carnival of death"; razed Kieff to the ground. He now led his troops into Hungary as far as Pesth and Gran, inflicting a terrible defeat on the Hungarians near Tokay, Dec., 1241. Here he was recalled by the death of his uncle into Mongolia. He was rewarded with the government of the vast plains from the Carpathian Mountains to Balkash Lake. He established his headquarters on the Volga, and from his embroidered and gilded tent arose the Golden Horde. D. in 1255.

Bat'tue [Fr. femin. of partie. of *battre*; used subst., a beating]: a mode of hunting wild animals or killing game on a large scale. A number of men, arranged at equal distances, by beating the bushes drive the animals toward a stationary party of hunters, who are waiting to shoot them. Sometimes the array of beaters is circular, and they drive the game from different parts of a large tract of forest to a common center. Battues in Great Britain are chiefly practiced in extensive preserves of pheasants, rabbits, and hares.

Batum, baä-toom', or **Batoum**: important seaport on the southeast coast of the Black Sea; 110 miles N. E. of

Trebizond, 4 miles N. of the mouth of the Tchouk river (see map of Russia, ref. 12-E). It formerly belonged to Asiatic Turkey, but by the treaty of Berlin, July 13, 1878, it became a free Russian port. It was closed by Russia in 1886. It has considerable trade and the best harbor on the east coast of the Black Sea. Immense quantities of Russian petroleum are exported. It is the terminus of a railway to the Caspian, and is provided with enormous storage accommodations for the oil. Pop. (1897) 26,417.

Baudelaire, bōd'lār', CHARLES PIERRE: French poet; b. in Paris, Apr. 9, 1821. In 1857 his volume of poems *Fleurs du Mal* caused a commotion by its entire disregard of moral distinctions and its extreme frankness of style. In the second edition (1861) several poems had to be suppressed. Other productions were *Théophile Gautier* (1859); *Les paradis artificiels, opium et haschich* (1860); *Richard Wagner et Tannhäuser* (1861), etc. His translation of the works of Edgar Allan Poe into French (3 t., 1856-58) introduced this American author to his now numerous circle of French admirers. He is at his best in *Petits Poèmes en Prose*, while his *L'Art romantique* is a collection of essays in subtle and raffiné criticism. Since Baudelaire's death, his *Souvenirs Correspondances, etc.* (1872), and his *Œuvres complètes* (4 t., 1869) have appeared. He is still worshiped by the so-called naturalist and decadent schools of French writers. D. in Paris, Aug. 31, 1867. See Ch. Asselineau, *Charles Baudelaire, sa vie et son œuvre*, Paris, 1869. A. R. MARSH.

Baudelocque, bōd'lok', JEAN LOUIS: a skillful French surgeon; b. in Heilly, Picardy, in 1746. He was selected by Napoleon to attend the Empress Marie Louise as first accoucheur. He wrote an able work on the *Art des Accouchements* (2 vols., 1781). D. in Paris, May 1, 1810.

Baudissiu, bow'dis-sin, WOLF HEINRICH FRIEDRICH KARL, Count: German author; b. in Rantzau, Jan. 30, 1789. He translated, together with Tieck, a number of Shakspeare's works. Under the title of *Ben Jonson und seine Schule* (2 vols., 1836) he published translations of the works of other English authors. He also made translations of Molière's comedies (1865-67). D. in Dresden, Apr. 4, 1878.

Baudissin, WOLF WILHELM FRIEDRICH, Graf von: German theologian; b. in Sophienhof, Holstein, Sept. 26, 1847; studied at Erlangen, Berlin, Leipzig, and Kiel; became professor extraordinary in the theological faculty at Strassburg 1876; ordinary 1880; at Marburg 1881; known chiefly by his *Studien zur semitischen Religionsgeschichte* (Leipzig, 2 vols., 1876-78); and *Die Geschichte des Alttestamentlichen Priestertums untersucht* (1889). A. R. MARSH.

Baudrillart, bō'drē'laär', HENRI JOSEPH LÉON: French political economist; b. in Paris, Nov. 28, 1821; became professor in Collège de France 1852; Professor of the History of Political Economy 1866; editor *Journal des Économistes* 1855-92; d. Jan. 24, 1892. Author (in French) of *Philosophy of Political Economy* (2d ed. 1883); *History of Private and Public Luxury* (1878-80); *The Agricultural Population of France* (1880-88).

Baudry, bō'drē', PAUL JACQUES AIMÉ: b. at La Roche-sur-Yon, France, Nov. 7, 1828; d. in Paris, Jan. 17, 1886; one of the great artists of the modern French school; pupil of Drölling; Grand Prix de Rome 1850; first-class medal, Salon 1857; commander of Legion of Honor 1875; medal of honor, Salon 1881; member of the Institute 1870. Baudry is pre-eminently a stylist, and his work shows his love of the classic. It may be said of him that he was inspired chiefly by the great masters of the Italian Renaissance, and was faithful to the precepts upheld by M. Ingres, though, like most artists of his time, he also felt the influence of Delacroix. His greatest decorative works are those in the foyer of the Grand Opera-house in Paris, on which he spent some of the best years of his life (1866-74). He painted a number of beautiful pictures of nude figures and compositions, one of the finest (1857) of which is *Fortune and the Child*, in the Luxembourg Gallery. *St. John* (1861) and *The Wave and the Pearl* (1863) are two of his most beautiful works. His ceiling *Glorification of the Law* is in the Palae of Justice, Paris. Baudry was a portrait-painter of elegant taste and a technician of wonderful brilliancy. His full-length portrait of Gen. Cousin Montauban, Count of Palikao (1877), standing beside his horse, with his right arm resting on the saddle and his sword held with the butt of the scabbard resting on the ground, is such a work as can only be compared with the masterpieces of Velasquez or Van

Dyke. Baudry was a colorist of great distinction, and his drawing is subtle and refined. WILLIAM A. COFFIN.

Bauer, bow'er, BRUNO: a German rationalistic theologian and biblical critic; b. in Eisenberg in Saxe-Altenberg, Sept. 6, 1809; was the son of a painter on porcelain, and studied theology and philosophy in the University of Berlin, in whose theological faculty he became privat-doeent 1834; professor extraordinary at Bonn 1839. He was a pupil of Hegel, and at first belonged to the right wing of the Hegelians, holding to the idea that science and revelation, philosophy and theology, could be brought into perfect harmony with each other. His *Kritische Darstellung der Religion des alten Testaments* (Berlin, 1838, 2 vols.) was based on this view. But his critical studies of the Bible led rapidly to a rupture, as shown by his *Die evangelische Landeskirche Preussens und die Wissenschaft* (Leipzig, 1840); *Kritik der evangelischen Geschichte Johannes* (Bremen, 1840); and *Kritik der evangelischen Geschichte der Synoptiker* (Leipzig, 1841-42, 3 vols.). Then followed an equally boisterous breaking away from Hegel: *Posaune des jüngsten Gerichts über Hegel, den Atheisten* (1841), and *Hegel's Lehre von Kunst und Religion* (1842). The personal result of his extremely free biblical criticism was his deposition from his professorship in 1842. He then removed to Berlin, and produced book after book full of learning and full of speculation, but those on religious matters are almost worthless. He became a by-word for learned trifling carried to the verge of insanity. In 1843 he wrote *Das entdeckte Christenthum*, which was suppressed before its publication, and published a general critical review of the German radicalism of the period. In connection with Jungwitz and his brother Edgar he published *Geschichte Deutschlands und der Französischen Revolution unter der Herrschaft Napoleons* (Charlottenburg, 1846, 2 vols.). But after spending several years on political and historical researches, producing, beside the book named, *Geschichte der Politik, Cultur und Aufklärung des 18 Jahrhunderts* (1843-45, 4 vols.); *Die bürgerliche Revolution* (Berlin, 1849); *Der Untergang des Frankfurter Parlements* (1849), etc., he returned to the field of biblical criticism; if possible, still more antagonistic to the reigning views than formerly he had been. In his *Kritik der paulinischen Briefe* (Berlin, 1850), he attempted to show that the four leading Epistles, which had never before been questioned, were the production of the second century. According to his later works (e. g. *Christus und die Cæsaren*, Berlin, 1877; 2d ed. 1879, etc.) Seneca was the real founder of Christianity! D. in Rixdorf, near Berlin, Apr. 13, 1882. Revised by S. M. JACKSON.

Bauer, GEORG LORENZ: a German theologian and linguist; b. in Hilpoltstein, near Nuremberg, Aug. 14, 1755. He became Professor of Oriental Languages at Altdorf in 1789, and in Heidelberg in 1805. Among his works are *Hermeneutica Sacra Veteris Testamenti* (Leipzig, 1797), and *Biblische Theologie des neuen Testaments* (4 vols., 1800-02). He was a rationalist, and maintained that the Bible should be interpreted by grammatical and historical principles, as the ancient classics are. D. in Heidelberg, Jan. 12, 1806.

Bauer, WILHELM: a German inventor; b. at Dillingen, Dec. 23, 1822. He constructed a diving-boat for submarine operations, with which several successful experiments have been made. He also made improvements in torpedoes for the destruction of ships and in the firing of guns under water. Bauer served with distinction in the Schleswig-Holstein war of 1850, and afterward engaged in the service of Russia. D. in Munich, June 18, 1875.

Bauernfeld, bow'ern-felt, EDUARD, von: Austrian poet and dramatist; b. in Vienna, Jan. 13, 1802; perhaps the most prolific playwright of modern Germany. As a young man he took part in the political agitations, culminating in 1848, for a reform of the Austrian administration. Of his works we may cite *Vermischte Gedichte* (1852); *Gesammelten Schriften* (12 vols., 1871-73); *Die Verlassenen*, a romance (1875). D. in Vienna, Aug. 9, 1890. A. R. MARSH.

Bau'gher, HENRY LOUIS, D. D.: Lutheran divine; b. at Abbotstown, Pa., about 1803; Professor of Greek and Belles-Lettres (1832-50) at Pennsylvania College, Gettysburg, and its president (1850-68). D. in Gettysburg, Apr. 14, 1868.

Baugher, HENRY LOUIS, Jr., D. D.: Lutheran divine; b. in Gettysburg, Pa., Aug. 6, 1840; educated at Pennsylvania College, and its seminary in Gettysburg, Pa., and at Andover, Mass.; pastor in Wheeling, West Va., Norristown, Pa., Indianapolis, Ind., and Omaha, Neb.; Professor of Greek

Language and Literature in Pennsylvania College 1869 to the present, with the exception of three years in the pastorate, and as Professor of the Greek Language in Howard University, Washington, D. C. He supplied temporarily the chairs of Greek Exegesis (1870-74) and of Systematic Theology (1883-84) in the seminary at Gettysburg. Member of international committee on Sunday-school lessons since 1879, and from 1875 to the present has been editor of *The Augsburg Teacher*, Philadelphia. HENRY E. JACOBS.

Bauhin, bō'ān', GASPARD: a Swiss botanist and anatomist; b. in Basel, Jan. 17, 1560. He became Professor of Anatomy and Botany in his native city in 1588. He wrote valuable medical and botanical works, among which were *Prodromus Theatri Botanici* (1620), and *Pinax Theatri Botanici* (1623). D. in 1624. His brother John was co-laborator with him, and the *Bauhinia* genus of plants with its two-lobed leaves was named for them.

Baum, HENRY MASON, D. C. L.: editor of *The Church Review* since 1881; b. at Earl Schuyler, Herkimer co., N. Y., Feb. 24, 1848; ordained 1870; held pastoral charges in Western New York, Wyoming, New Jersey, Central Pennsylvania; published *The Rights and Duties of Rectors, Churchwardens, and Vestrymen in the American Church* (1879); editor of *Church Reunion Discussed on the Basis of the Lambeth Propositions of 1888*. Reprinted from the *Church Review* for Apr. and Oct., 1890.

Baumé, bō'may', ANTOINE: French chemist; b. at Senlis, Feb. 26, 1728. He improved the manufacture of porcelain, made several inventions, and simplified several processes in industrial chemistry. Baumé's hydrometer is in general use among chemists. Among his works is a *Manual of Chemistry* (1763). D. Oct. 15, 1804. See Cadet de Gassicourt, *Éloge de Baumé*, 1806.

Baumgarten, bowm'gāar-ten, ALEXANDER GOTTLIEB: a German philosopher; b. in Berlin, July 17, 1714; a disciple of Wolf. He became Professor of Philosophy at Frankfurt-on-the-Oder in 1740; was one of the first of moderns to give scientific form and place to aesthetics. He published, besides other works, *Metaphysica* (1739) and *Æsthetica* (2 vols., 1750, unfinished). D. in Frankfurt-on-the-Oder, May 26, 1762. See G. F. Meyer, *Leben A. G. Baumgarten's* (Halle, 1763), and J. Schmidt, *Leibnitz und Baumgarten* (Halle, 1875).

Baumgarten, MICHAEL: a German theologian; b. in Haseldorf, Holstein, Mar. 25, 1812; became Professor of Theology in Rostock in 1850. He published many books and periodicals in opposition to the State Church of Mecklenburg, in consequence of which he was removed from his professorship in 1858, and, afterward continuing his attacks, was imprisoned and fined. He was a founder of the Protestantverein (1865), which, however, he left in 1877, and an earnest advocate of disestablishment. He sat in the Reichstag in 1874, 1877, and 1878. He published many polemical writings and popular appeals in behalf of a people's Church; but of more account are his *Apostelgeschichte* (Halle, 1852, 2 vols.; 2d ed. Brunswick, 1859; Eng. trans. *The Acts of the Apostles*, Edinburgh, 1854, 3 vols.), and *Schleiermacher als Theologe für die Gemeinde der Gegenwart* (Berlin, 1862). D. at Rostock, July 21, 1889. See his *Life*, by H. H. Studt, Kiel, 1891.

Baumgartner, ANDREAS, von: a German savant and minister of state; b. at Friedberg, in Bohemia, Nov. 23, 1793. He became Professor of Physics at Vienna in 1823, and Austrian minister of trade and public works in 1851. About this date he was chosen president of the Academy of Sciences in Vienna. He published a work called *Naturlehre* (1823). D. near Vienna, July 30, 1865.

Baumgartner, GALLUS JACOB: a Swiss politician of the liberal party; b. in Altstätten, Zurich, Oct. 18, 1797. He took part in the revision of the constitution of St. Gall, and promoted the separation of the canton into Basel country and Basel city. He founded, Oct., 1842, the *Neue Schweizer Zeitung*, and published, among other works, *Die Schweiz in ihren Kämpfen und Umgestaltungen, 1830-50* (4 vols., 1853). D. in St. Gall, July 12, 1869.

Baumgarten-Crusius, LUDWIG FRIEDRICH OTTO: a German theologian; b. in Merseburg, July 31, 1788; became Professor Extraordinary of Theology at Jena 1812, and ordinary 1817. He played a prominent part as the defender of Schleiermacher's supernaturalism. Of his books may be mentioned *Lehrbuch der christlichen Sittenlehre* (Leipzig, 1827); *Lehrbuch der Dogmengeschichte* (Jena,

1831-32, 2 vols.), and *Kompendium der christlichen Dogmengeschichte* (ed. by Hase, Leipzig, 1840-46, 2 vols.). D. in Jena, May 31, 1843.

Baur, bowt, FERDINAND CHRISTIAN: Protestant theologian and historian; b. in Schmiden, near Cannstadt, Württemberg, June 21, 1792. He studied theology in the Blaubeuren Theological Seminary 1805-09, and in the University of Tübingen 1809-17; became Professor of Theology in the former 1817, and in the latter 1826. With the latter institution his fame is bound up, for there he produced those works in New Testament interpretation which for a time produced consternation in the conservative ranks, and created the Tübingen school of destructive criticism, which had its day. He had been a disciple of Schleiermacher, but became a Hegelian and applied Hegel's philosophy to Church history. The most striking statement of the school is that in the primitive Christian Church there was a feud between the followers of Peter (Judaic Christianity) and those of Paul (progressive Christianity), but it was not till the second century that there arose the Catholic Church, the resultant of the opposing forces. The New Testament, he claimed, bears witness to this struggle. The only portions of it produced before 70 A. D. were the four chief Pauline Epistles (Romans, 1 and 2 Corinthians, and Galatians)—the only ones whose Pauline origin he granted—and the Revelation, in which this alleged antagonism showed itself. The rest of the New Testament dates from the second century, and is "tendency-writing"—i. e. intended to promote unity. To this end the Acts and the Gospel of John especially were written. Even Matthew and Luke betray, he claims, the hand of partisans, while Mark is the bridge between them in the interest of peace. This theory is worked out with great learning and acuteness in Baur's *Paul* (Stuttgart, 1845; 2d ed. Leipzig, 1866-67, 2 vols.; Eng. trans. Lond., 1873-75, 2 vols.) and *Church History* (Eng. trans. covers only the first three centuries, 1878-79, 2 vols.; the orig., Tübingen, 1853-62, 5 vols., goes down to 1848). Of his untranslated works the chief are *Die christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841-43, 3 vols.); *Lehrbuch der christlichen Dogmengeschichte* (Stuttgart, 1847; 3d ed. Leipzig, 1867); and the posthumous *Vorlesungen über die christlichen Dogmengeschichte* (1865-67, 3 vols.). See Baur himself, *Die Tübingen Schule* (Leipzig, 1859); R. W. Mackay, *The Tübingen School* (London, 1863). D. at Tübingen, Dec. 2, 1860.

S. M. JACKSON.

Bantain, bō'tāin', LOUIS EUGÈNE MARIE: a Roman Catholic philosopher and theologian; b. in Paris, Feb. 17, 1796. He became Professor of Philosophy at Strassburg 1819; suspended in 1822 on account of his advocacy of Fichte's views; turned priest 1828; ultimately was a popular preacher at Paris; became director of the College of Juilly in 1849, and Professor of Moral Theology in the Sorbonne 1853. He published numerous discourses and *Philosophie du christianisme* (Paris, 1835, 2 vols.); *La philosophie morale* (1840, 2 vols.); and especially *Étude sur l'art de parler en public* (1856; 2d ed. 1863; Eng. trans., *The Art of Extempore Speaking*, London, 1858; 6th ed. 1878; repr. New York, 1859; London ed. 1874). D. in Viroflay, near Versailles, Oct. 18, 1867.

Bautzen, bowt'sen, or **Budissin**, boo'dis-sin: a town of Saxony; on the Spree; and on the railway from Dresden to Görlitz; 35 miles E. N. E. of Dresden (see map of German Empire, ref. 5-G). It has a royal palace, a cathedral, two public libraries; also manufactures of woollens, linens, leather, hosiery, paper, etc. Pop. (1895) 23,678. Here occurred a great battle (May 20 and 21, 1813) between Napoleon and the allies, who finally retreated. The loss of the allies is estimated at 13,000, and that of Napoleon at 20,000 men.

Bava'ria [New Lat. from Med. Lat. *Boiaria*, i. e. the country of the *Bo'i* or *Boia'rii*; in Ger. *Bay'ern* or *Bai'ern*]: a kingdom forming part of the German empire. It is, next to Prussia, the largest German state.

Geography.—It consists of two isolated portions: the eastern and larger portion is bounded N. by Prussia, Saxe-Meiningen, Saxe-Coburg-Gotha, Reuss, and Saxony; E. and S. by Austria; W. by Württemberg, Baden, and Hesse-Darmstadt; the western and smaller portion, known as Rhenish Bavaria or the Palatinate, is bounded by Prussia, Alsace, Hesse-Darmstadt, and Baden. Area, 29,282 sq. miles. The larger portion of the country is mountainous, the principal mountains being the Algäu and Bavarian Alps in the S., the former of which reach an elevation of 9,000 feet; the Bohemian and Bavarian

Mountain forests on the eastern frontier; the Fichtel Mountains in the N. E.; the Franconia, Jura, and the Hardt. The main rivers are the Danube, which receives in Bavaria thirty-nine affluents, and the Main in the N. The Rhine forms part of the frontier of the Palatinate. The Danube and the Main are connected by the Ludwig's Canal. The number of lakes, most of which are alpine, amounts to about fifty. The climate is, on the whole, temperate and healthy, but rough and severe in the mountains. The soil is fertile and rich in products, particularly in corn and cattle. There are celebrated mineral springs in Lower Franconia and Upper Bavaria (Kissingen and Brückenau).

Population.—The total population, according to census of Dec., 1895, was 5,818,544, of whom rather more than seven-tenths are Roman Catholics, and about one-fourth are Protestants. The Jews numbered 53,697 in 1885. It is divided into eight provinces, which, according to census of 1890, had the following population: Upper Bavaria, 1,102,027; Lower Bavaria, 664,131; Palatinate, 728,422; Upper Palatinate, 537,217; Upper Franconia, 572,189; Middle Franconia, 699,928; Lower Franconia, 617,680; Suabia, 667,788. As regards the descent of the inhabitants, about 1,820,000 are Bavarians (Old Bavarians or Bavarians proper), 2,330,000 Franconians, and 650,000 Suabians.

Education.—Bavaria has 3 universities—at Munich, Würzburg, and Erlangen—9 lyceums, 28 gymnasia (colleges), 10 normal schools, polytechnical institutions at Munich and Nuremberg, and about 7,200 public schools (school attendance is compulsory here from six to fourteen); also Latin, technical, and special schools. All the Kings of Bavaria have been liberal patrons of science and art. There is an academy of science and an academy of plastic arts in Munich, which is also celebrated for its rich collections of works of art.

Industries.—The principal occupations of the inhabitants are agriculture and the breeding of cattle; the latter chiefly in the mountainous districts, the former in the plains. Among Bavaria's chief products are cereals, fodder, potatoes, hops, tobacco, wine (in the Palatinate and in the region of the Main). About 10,000 sq. miles are covered with wood, one-half of which belongs either to the state or to the communities. The culture of the forests is well regulated and profitable. The most active industry is found in the provinces of Middle Franconia, Suabia, and the Palatinate. Prominent among the industrial cities are Augsburg, Kempten, Nuremberg, Fürth, Schwabach, Baireuth, Würzburg, Bamberg, Erlangen, and Hof. The most celebrated branch of Bavarian industry is the brewing of beer. The average quantity manufactured annually is 278,000,000 gal.; of this, however, only about 27,000,000 gal. are exported. Bavaria has also flourishing manufactures of linen, woolen, iron, and wooden ware, numerous glass-works, manufactories of paper, chinaware, and guns, and celebrated melting-houses at Oberzell. The manufactories of tobacco produce annually large quantities of tobacco and cigars. The total value of its leading mining products in 1889 was 6,548,577 marks.

Commerce.—The most important commercial cities are Nuremberg and Augsburg (bills of exchange), Hof, Bamberg, Schweinfurt, Würzburg, Speier, Munich, Ratisbon, Passau (navigation of the Danube). Bavaria in 1891 had 3,485 miles of railroad, of which 2,982 miles belonged to the state. The navigation of the Danube, the Rhine, and the Inn employs large numbers of vessels, including numerous steamboats, especially on the Danube and the Rhine. The chief articles of export are beer, corn, wood, cattle, wine, and hops.

Weights and Measures.—The metric system has been established in Bavaria, as in other parts of Germany, since Jan. 1, 1872.

Government.—Bavaria is a constitutional monarchy, the fundamental law of the state bearing date of May 26, 1818, and the electoral law now in force having been adopted on June 4, 1848. The crown is hereditary in the male line only, according to the right of primogeniture. The king exercises the administrative power; the legislative he shares with a legislature consisting of two chambers. The upper chamber, or chamber of the Reichsräthe (counselors of the empire), had, in 1889, 71 members, of whom 49 were entitled to a seat as being chiefs of noble families, and 7 by their office, while 15 were life-members appointed by the crown. The lower chamber, or chamber of representatives, had, in 1889, 159 members, who are elected for a term of six years. The chambers must be convoked at least once every three years. There are eight courts of appeal, and one supreme court of appeal in Munich. The receipts and expenditures of the state amounted in 1891 to 280,291,642 marks; the public debt to 1,333,-

189,690 marks; the civil list and appanages to 5,404,850 marks. The Bavarian army, according to the treaty of Nov. 23, 1870, forms two army-corps of the imperial army of Germany under the independent military administration of the King of Bavaria, though under the chief command of the emperor. The capital is Munich; the most important towns next to it are Nuremberg, Augsburg, Würzburg, Ratisbon, and Bamberg.

History.—Old Bavaria, or Bavaria proper, was originally inhabited by the Boii, a Celtic tribe. Under Augustus it constituted the Roman province of Noricum. During the great migration of nations in the fourth and fifth centuries the country was occupied by Germanic tribes, from which the confederation of the Boioari arose, which, though governed by its own princes, was dependent upon the Kings of Austrasia. At the head of the confederation was the family of Agilolfingians, who are mentioned for the first time in 556, and were deprived of the ducal dignity by Charlemagne in 777. From this time until 911, when the Carolingian house died out, Bavaria belonged to the Franconian empire. During the following 250 years Bavaria was disturbed by endless civil wars. In 1180 the Count Palatine, Otto von Wittelsbach, was invested with Bavaria. His descendants, with but short interruptions, have remained the rulers of the country to this day. Two of them were elected German emperors—Louis the Bavarian (as Emperor Louis IV., 1314–47) and the Elector Charles (as Emperor Charles VII., 1742–45). From 1255 the country was generally divided between two lines—the Counts of the Rhenish Palatinate and the Dukes of Bavaria. The electoral dignity repeatedly passed from one branch to the other, until the peace of Westphalia (1648) conferred the fifth electoral dignity permanently upon the Dukes of Bavaria, while an eighth electoral dignity was expressly created for the Palatine line. In 1777 the line of the electors of Bavaria became extinct, and the elector of the Rhenish Palatinate, Charles Theodore, became ruler of Bavaria. Austria, however, claimed a large portion of the country, and the weak elector was willing to concede this claim; but Frederick the Great supported the protest of the next agnate the Duke Charles of Zweibrücken, against this arrangement, and thus the bloodless “war of the Bavarian succession” arose, which was ended May 13, 1779, by the treaty of Teschen, which gave to Austria the region of the Inn, with the town of Braunau, and guaranteed the succession in the remainder of the dominions of Charles Theodore to the Duke Charles of Zweibrücken. In 1784 the Emperor Joseph I. made a new attempt to obtain the whole of Bavaria, by offering to the Elector Charles Theodore, in exchange for Bavaria, the Austrian Netherlands, with the title of king; but again the plan was foiled by the opposition of the Duke of Zweibrücken and Frederick the Great. Charles Theodore died Feb. 16, 1799, and, as in the meanwhile the Duke Charles of Zweibrücken had died childless, his brother (Maximilian IV.) Joseph, Duke of the Palatinate-Zweibrücken, became Elector of Bavaria and the Palatinate. In the history of Germany the Dukes of Bavaria are chiefly noted for the leading part which they took in the defense of the Catholic Church against the Reformation. Throughout the sixteenth, seventeenth, and eighteenth centuries they were the heads of the Catholic party among the princes and states of the empire. The Elector Maximilian lost in the peace of Lunéville the Zweibrücken Palatinate, but in place of these districts received a number of secularized bishoprics, the change adding to his dominions 2,100 sq. miles, with nearly 200,000 inhabitants. In the war of 1805 the elector joined France against the Emperor of Germany, and received a further increase of about 8,000 sq. miles and 800,000 inhabitants. On Jan. 1, 1806, the elector assumed the title of king, and in July of the same year he joined the Rhenish Confederation, which he left again in 1813, in order to unite with the allies against Napoleon. The peace of Paris and that of Vienna regulated the territory of Bavaria as it has remained since, with the exception of a very small district which in 1866 was ceded to Prussia. In 1818 the constitutional form of government was introduced. Louis I. (1825–48), the successor of Maximilian, was a liberal patron of the arts, and at the same time greatly favored the interests of the Catholic Church. His relation to the notorious Lola Montez led in 1848 to disturbances, in consequence of which he abdicated. The support which he had given to the insurrection of the Greeks against the rule of the Turks had secured the election of his second son, Otho, as King of Greece. In Bavaria he was succeeded by his eldest son, Maximilian II. (1848–64), who, like his father, liberally patronized science and art, but in politics had throughout his reign anti-liberal cabi-

nets. In the Schleswig-Holstein question the Bavarian Government acted as an ardent champion of the cause of German nationality. Maximilian, who died Mar. 10, 1864, was succeeded by his son, Louis II., who in 1866, in the war between Austria and Prussia, sided with Austria, and at the conclusion of peace had to pay 30,000,000 florins as expenses of war, and to cede a small district to Prussia. At the same time an offensive and defensive alliance was concluded with Prussia. The Catholic party was greatly opposed to the foreign policy of the Prime Minister, Prince Hohenlohe (appointed at the close of 1866), and still more to the educational and other reforms which he endeavored to introduce. When the new elections in 1869 gave to the Catholic party (the "Patriots") a majority in the second chamber, Prince Hohenlohe resigned (Jan., 1870). The new Prime Minister, Bray, remained, however, faithful to the treaties with Prussia, and after the outbreak of the war between France and Prussia, Bavaria at once joined Prussia, and placed two army-corps under the command of the Crown Prince of Prussia. In Nov., 1870, the Bavarian Government concluded a treaty providing for the entrance of Bavaria into the German empire, and in Jan., 1871, the treaty was ratified by both chambers. King Louis II. died June 13, 1886. Prince Luitpold was made regent during the occupation of the throne by King Otto, the insane successor of Louis II. Revised by C. K. ADAMS.

Bax'ter, DE WITT CLINTON: volunteer soldier; b. in Dorchester, Mass., Mar. 9, 1829; entered the army in 1861 as lieutenant, and passed through the successive grades to that of colonel of "Baxter's Fire Zouaves" (brevet brigadier-general U. S. volunteers). Wrote *Baxter's Manual and Company Tactics*, and was naval officer of the port of Philadelphia 1869-71. D. May 9, 1881.

Baxter, RICHARD: Nonconformist theologian; b. in Rowton, Shropshire, England, Nov. 12, 1615. He was not educated at any college. Having been ordained in 1638, he became Vicar of Kidderminster in 1641, and gained distinction as an eloquent preacher. He was the means of working there a moral reformation of a most thorough and permanent character. He was neutral or moderate in the civil war, being friendly to the Puritans, but favorable to a monarchy. In 1650 he produced the *Saint's Everlasting Rest*, which is highly esteemed. He took up his residence in London in 1660, just prior to the Restoration. Charles II. appointed him one of his chaplains, and Clarendon offered him the bishopric of Hereford, but he declined it. In consequence of the passage of the Act of Uniformity, 1662, he seceded from the Anglican Church. He continued to preach to the Nonconformists, and several times was persecuted and arrested. The notorious Judge Jeffries in 1685 fined him 500 marks on a charge of sedition, which was founded on a passage in his writings, which was construed into a libel on the Church of England. For failure to pay the fine he was imprisoned nearly eighteen months. D. in London, Dec. 8, 1691. He was a voluminous writer, having published 168 treatises. Among his numerous works are a *Call to the Unconverted* (1669); *Methodus Theologiae* (1674); and *Catholic Theology*. See his *Autobiography*; *Reliquiae Baxterianae* (London, 1696); and the biographies by E. Calamy (1713); W. Orme (1830); G. D. Boyle (1883). Revised by S. M. JACKSON.

Baxte'rians: the term formerly applied to the adherents of Baxter's theological system, the doctrines of which were—1, that though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2, the rejection of the dogma of reprobation; 3, that it is possible for even saints to fall away from saving grace. Dr. Isaac Watts and Dr. Philip Doddridge were noted Baxterians.

Baxter Springs: city; on railroad; Cherokee co., Kan. (for location, see map of Kansas, ref. 8-K); 159 miles S. of Kansas City, Mo.; 1½ miles from the State line. It has lead-smelting works, and is a shipping-point for Texas cattle. The principal minerals are lead, zinc, and coal. On Oct. 6, 1863, Quantrell, with 600 guerillas, attacked a U. S. escort and encampment of three companies at this place. The escort was dispersed and all the wounded murdered; the attack on the encampment was repulsed. Pop. (1880) 1,177; (1890) 1,248; (1900) 1,641. EDITOR OF "NEWS."

Bay (Fr. *baie*): in geography, an inlet of the sea, or a portion of the sea extending into the land. The terms *bay* and *gulf* are vaguely and promiscuously applied to bodies of water of various forms and dimensions. Hudson's Bay, for example, might properly be called a gulf. The word *bay* is generally applied to smaller portions than *gulf*.

Bay, or **Bay-tree**: the laurel-tree (*Laurus nobilis*); sometimes called sweet bay. The *Prunus laurocerasus* is sometimes called bay-laurel. Several other trees are popularly called *bay*. The "sweet bay" of the U. S. is the *Magnolia glauca*, which has fragrant flowers. The "red bay" of the South is the *Persea carolinensis*, an evergreen laurel-tree with fine red timber. The "loblolly bay" (*Gordonia lasianthus*) is a fine tree of the Southern States, with mahogany-colored wood. A smaller species (*Gordonia pubescens*) is cultivated at the North as a shrub, and has large and fragrant white blossoms. Some of the rhododendrons and azaleas are called rose bays. The leaves of the bay have long been subjects of popular superstition, and have been used with other evergreens to decorate churches at Christmas. *Bays* in the plural signifies an honorary garland or crown, bestowed as a prize for victory or meritorious action. It is not known what kind of tree is meant by the word in the Bible translated "bay-tree."

Ba'ya (*Ploceus philippinus*): a small East Indian bird of the family of *Ploceidae*, and allied to the weaver-bird. It has a large conical beak. Its color is yellow, spotted with brown. It builds a curious nest, shaped like a Florence flask, and suspended from a small twig of a high branch. The entrance is in the lower part of the nest. The baya can be easily tamed and trained to obey commands.

Bayadere' [Fr. from Port. *bailadeira*, danseuse, from *bailar*, dance; akin to E. *ball*, a dance]: a name given to the dancing-girls of India. The nauteh (Sanskrit *nāṭya*, pantomimic dance), as an adjunct of social entertainment, is of great antiquity, being mentioned in the early legends of Buddha. The nauteh-girls go about in small troupes from place to place. Their "dance" consists in slow, legato movements of hands, arms, head, body, and feet, which are said to require great technical skill and suppleness of joint, and remind one somewhat of the results of the modern Delsarte system, but whose general effect is, to Occidental taste, very dull indeed. Their pantomime, and the accompanying songs, portray despondent or exultant love and the like. In Southern India especially are found *Deva-dāsīs* (slaves of the god), who are regularly attached to some temple to sing and dance before the idol, and who correspond to the temple prostitutes of antiquity, Phœnician *Kedeshoth* and Greek *Hierodules*. C. R. LANMAN.

Bayard, bī'ard, Gen. GEORGE DASHIELL: b. in Seneca Falls, N. Y., Dec. 18, 1835; removed in boyhood to Iowa; graduated at West Point in 1856. He entered the U. S. cavalry, and became, after the civil war broke out, colonel of the First Pennsylvania Cavalry. In 1862 he was made brigadier-general of volunteers. He served with the highest honor in the Army of the Potomac, and was killed at the battle of Fredericksburg, Dec. 14, 1862, where he fought with the left wing, under Franklin. See his *Life* by Samuel J. Bayard (1874).

Bayard, JAMES ASHETON: U. S. Senator and lawyer; b. in Philadelphia, July 28, 1767; graduated at Princeton in 1784. He began to practice law in Delaware, and in 1796 became a Federalist member of Congress, in which he attained eminence as an orator. The contest between Jefferson and Burr in 1801 was decided in favor of the former by the votes of the Federalists, acting under the influence of Mr. Bayard. He was elected U. S. Senator for Delaware in 1804, and remained in that body until 1813. He was one of the commissioners that negotiated the treaty of Ghent in 1814. D. in Wilmington, Del., Aug. 6, 1815.

Bayard, JAMES ASHETON, second: b. in Wilmington, Del., Nov. 15, 1799; graduated at Princeton; was U. S. Senator from Delaware (1851-64 and 1867-69), twice resigning this office, to which he was four times elected, and once appointed to fill a vacancy. D. at Wilmington, Del., June 13, 1880.

Bayard, ba'yaar', JEAN FRANÇOIS ALFRED: French *littérateur*; b. in Charolles, Mar. 17, 1796; wrote over 200 popular comedies and vaudevilles, among which were *La reine de seize ans*, and *Les gamins de Paris*, which was performed with great success 463 times in succession. D. Feb. 19, 1853.

Bayard, PIERRE DU TERRAIL, Chevalier: an heroic French knight; called "le chevalier sans peur et sans reproche" (the knight without fear and without reproach); was b. at Castle Bayard, near Grenoble, in 1475. He was remarkable for his modesty, piety, magnanimity, and his various accomplishments. He served under Charles VIII. in his expedition against Naples in 1494, and distinguished himself at

the battle of Tornovo. After the accession of Louis XII. of France, Bayard performed several remarkable exploits in war against the Spaniards and English. In the service of Francis I. he took Prosper Colonna prisoner, and gained a victory at Marignano in 1515. He defended Mézières with success against the invading army of the Emperor Charles V. in 1522, and for this important service was saluted as the saviour of the country. He was killed in battle at the river Sesia, Apr. 30, 1524, having won the reputation of being a model of nearly every virtue. See Symphorien Champier, *La Vie et les Gestes de Bayard* (1525); W. Gilmore Simms, *Life of Chevalier Bayard* (New York, 1847).

Bayard, bī'ard, RICHARD HENRY: son of James A. Bayard; b. at Wilmington, Del., in 1796; graduated at Princeton in 1814, became a lawyer, was U. S. Senator from Delaware (1836-39 and 1841-45), and U. S. *chargé d'affaires* at Brussels in 1850. D. in Philadelphia, Mar. 4, 1868.

Bayard, THOMAS FRANCIS, LL. D.: b. in Wilmington, Del., Oct. 29, 1828; in 1869 succeeded his father (J. A. Bayard) in the U. S. Senate, and was re-elected for a second and a third term; and in 1876-77 was one of the Electoral Commission to determine who was elected President. Was elected president *pro tem.* of U. S. Senate Oct., 1881. He was Secretary of State during Cleveland's first administration, 1885-89, and was one of the commissioners appointed by the President to confer with a commission sent to Washington for the settlement of the Canadian fisheries dispute. In 1893 he was appointed first ambassador to Great Britain. D. in Dedham, Mass., Sept. 28, 1898.

Bayazid, bāā-yāā-zeed' (often called **Bajazet'**) I.: Sultan of the Turks or Ottomans, surnamed ILDERİM (i. e. the lightning); b. in 1347. He succeeded his father, Amurath (or Murad) I., in 1389, and soon conquered Bulgaria, the greater part of Asia Minor, and part of Greece. In 1396 he gained a victory at Nicopolis over Sigismund, King of Hungary (afterward emperor), and his allies, the Poles and French. His career of conquest was arrested by Tamerlane (or Timur), who invaded Asia Minor, and defeated Bayazid near Angora in June, 1402. Bayazid was taken prisoner here, and confined until he died, Mar. 9, 1403. See Von Hammer, *Geschichte des osmanischen Reichs*.

Bayazid II.: Sultan of the Turks; b. in 1447. He ascended the Ottoman throne on the death of his father, Mahomet II., in 1481. He built many mosques in Constantinople, his capital. He was involved in almost continual war against the Hungarians, Poles, Persians, and Venetians. D. near Adrianople, May 26, 1512.

Bayberry: the fruit of the bay tree; also the fruit of the wax-myrtle (*Myrica cerifera*), a shrub which produces a kind of wax, sometimes called "bayberry tallow," and used in pharmacy. It is also called candleberry, as it has also been employed in making candles. The bayberry grows chiefly along the U. S. Atlantic coast, becoming an evergreen tree in the South. It has active medicinal qualities. The wax is found on the outside of the berries, and is obtained by boiling.

Bay Bulls: a port of entry and post-town of Newfoundland; 19 miles S. of St. John's; lat. 47° 18' N., lon. 52° 47' W. (see map of Canada, ref. 8-0). It has an excellent harbor, which is much frequented as a port of refuge. Fishing and agriculture are carried on. Pop. 734.

Bay City: an important railroad center; capital of Bay co., Mich. (for location of county, see map of Michigan, ref. 5-J); on the right (east) bank of the Saginaw river; 4 miles from its mouth, and at the head of navigation. Its principal trade is in lumber and salt, immense quantities of which are produced. It has excellent schools, four parks, Holly water-works, and important manufacturing interests. Several lines of steamers connect it with all lake points. The census of 1890 showed 299 manufactories; capital, \$8,993,879; average number of persons employed, 4,356; wages paid during the year, \$1,870,036; value of products, \$8,600,385. Pop. (1880) 20,693; (1890) 27,839; (1900) 27,628.

EDITOR OF "TIMES."

Bayer, bī'er, JOHANN: b. in Rhain, Bavaria, 1572; a zealous Protestant pastor, but chiefly noted as the author of the excellent work *Uranometria*, containing fifty-one astronomical charts, and followed by explanations in his *Explicatio Characterum Aeneis Tabulis Insculptorum*. He introduced the method of designating the stars of a constellation by means of letters, naming the largest star of the constellation by the first letter of the Greek alphabet, and the others, in

the order of their brilliancy, by the succeeding letters. D. in Augsburg, 1660.

Bayeux, baa'yö' (anc. *Baicas'sæ*): a city of France; in Normandy, and in the department of Calvados; is on the river Aure, 21 miles by rail W. N. W. of Caen (see map of France, ref. 3-D). It has manufactures of porcelain, lace, damasks, calico, and leather. Pop. (1896) 7,912. Here is a majestic cathedral which is said to be the oldest in Normandy, in which was preserved for a long time the famous Bayeux tapestry.

Bayeux Tapestry: a web of canvas or linen cloth 214 feet long by 20 inches wide, on which is embroidered, with woolen threads of various colors, a representation of the invasion and conquest of England by the Normans. According to tradition, it was embroidered by Matilda, the wife of William the Conqueror. Some persons believe that she directed the work, which was performed by her maids or the ladies of her court. It is considered a valuable historical document, as it gives a correct and minute portraiture of the manners and customs of that age and of the Norman costumes. It contains the figures of 625 men, 200 horses, 55 dogs, 40 ships and boats, and numerous quadrupeds, birds, etc. The tapestry was discovered in the cathedral of Bayeux about 1730, and is now preserved in the hôtel de ville of that place. See Bruce, *Bayeux Tapestry Elucidated* (London, 1855); Ducarel, *Anglo-Norman Antiquities* (1767).

Bayfield: city and township; formerly capital of Bayfield co., Wis. (for location of county, see map of Wisconsin, ref. 2-C); on an arm of Lake Superior, 200 miles N. E. of St. Paul, Minn., and 281 miles N. N. W. of Madison, Wis.; is terminus of Chicago, St. Paul, Minneapolis, and Omaha and Bayfield Harbor, and Great Western R. Rs. It has one of the best harbors on the Great Lakes. Pop. of city (1880) 495; (1890) 1,373; (1900) 1,689.

EDITOR OF "BAYFIELD COUNTY PRESS."

Bayfield, HENRY WOOLSEY: rear-admiral of the British navy; entered the service in 1806; served against the U. S. in 1814 on the Great Lakes; surveyed the lakes, the St. Lawrence river and gulf (1815-27), of which he published valuable charts. D. in England, Feb. 12, 1885.

Bay Islands: a group of small islands in the Bay of Honduras. Ruatan, the largest, is about 30 miles from the north coast of Honduras. The other islands are named Bonacca, Utila, Barbaretta, and Helena. This group became a British colony in 1854, but in consequence of a protest of the U. S. they were restored to Honduras in 1856.

Bayle, bayl, PIERRE: a celebrated French philosopher and critic; b. at Carlat, now in Ariège, Nov. 18, 1647; son of a Protestant preacher. He studied at the College of Toulouse, and was employed for some years as a private tutor at Geneva and Rouen. In 1675 he obtained the chair of Philosophy in the Protestant College of Sedan, which was closed or suppressed by the Government in 1681. He then became Professor of Philosophy and History at Rotterdam, and commenced in 1684 a critical monthly review called *Nouvelles de la République des Lettres*, which he continued to edit until 1687. Instigated by Jurieu, who accused Bayle of heretical or unsound opinions, and of being a secret agent of France, the magistrates of Rotterdam deprived him of his professorship in 1693, and even of his right to teach privately. Bayle was a skeptic, an eloquent advocate of religious liberty, and a very independent thinker. His most important work is a *Dictionary, Historical and Critical* (*Dictionnaire historique et critique*, Rotterdam, 2 vols. folio, 1696; 11th ed. Paris, 1820-24, 16 vols.; Eng. trans. London, 1710, 4 vols.; 3d ed. 1734-38, 5 vols.), which exercised a great influence over literature and philosophy, and had a European reputation. Bayle was fond of paradox, was a subtle reasoner, a witty writer, and an excellent dialectician. He was amiable, courageous, and disinterested. According to Warburton, he had "a soul superior to the sharpest attacks of fortune, and a heart practiced to the best philosophy." D. in Rotterdam, Dec. 28, 1706.

Baylen, bī-len', or **Bailen'**: a town of Spain; province of Jaen; 22 miles N. N. E. of Jaen (see map of Spain, ref. 18-F). It has manufactures of linen, glass, soap, bricks, etc. The Spanish general De Castaños here gained a victory in July, 1808, over the French general Dupont, and took 18,000 prisoners. Pop. (1887) 8,580.

Bayley, Most Rev. JAMES ROOSEVELT, D. D.: a grandson of Dr. Richard Bayley and nephew of Mother Seton (who

founded the original American Congregation of Sisters of Charity); b. in New York city, Aug. 23, 1814; graduated at Trinity College, Hartford, Conn., in 1835; was for a short time a clergyman of the Protestant Episcopal Church, but became a Roman Catholic 1842; studied theology in Paris and Rome, and was ordained a priest in 1844. He became Professor of Belles-Lettres at St. John's College, Fordham, and was its president (1845-46). In 1853 he became Bishop of Newark, N. J., and in 1872 Archbishop of Baltimore, Md. He published *Sketch of the History of the Catholic Church on the Island of New York* (New York, 1853; rev. ed. 1869); *Memoirs of Bishop Bruté* (1860); and other works. D. in Newark, N. J., Oct. 3, 1877.

Bayley, RICHARD: physician; b. in Fairfield, Conn., in 1745; began the practice of medicine in 1772. He introduced a new method of treating the croup, which was extensively used. He became in 1793 Professor of Surgery in Columbia College, New York, and was the first health officer of New York. D. on Staten Island, N. Y., Aug. 17, 1801.

Baylies, WILLIAM, M. D.: b. in Uxbridge, Mass., Dec. 5, 1743; graduated at Harvard in 1760; practiced medicine many years at Dighton, Mass., of which town he was a representative in the General Court; member of the three Provincial Congresses of Massachusetts and of the State convention which adopted the Federal Constitution; State Senator 1783; was for a number of years a judge of the court of common pleas for Bristol co., Mass., and register of probate for that county; member of Congress 1805-09; member of Academy of Arts and Sciences, of Massachusetts Historical Society, and one of the founders of the Massachusetts Medical Society. D. at Dighton, Mass., June 17, 1826.

Bayliss, JEREMIAH HENRY, A. M., D. D., LL. D.: minister of the M. E. Church; b. at Wednesbury, England, Dec. 20, 1835; educated at Genesee College, New York; served with distinguished success in pastorates at Park Avenue and Trinity churches, Chicago; Roberts Park and Trinity churches, Indianapolis; Central church, Detroit; and Walnut Hills church, Cincinnati; elected editor of *Western Christian Advocate* in 1884 and 1888. D. at Bay View, Mich., Aug. 14, 1889.

Baylor University: chartered by the republic of Texas in 1845; named in honor of Hon. Robert Emmett Bledsoe Baylor, LL. D. (1793-1874), former member of Congress from Alabama and for twenty-five years a judge in Texas. It was situated in Independence, Tex. A university curriculum and classes were established in 1851 by Rev. Rufus C. Burleson, D. D., who presided over it from 1851 to 1861, when he and the entire faculty resigned and inaugurated Waco University at Waco, Tex. In 1882 the two universities were consolidated at Waco under the name Baylor University, with Dr. Burleson as president. The university is under the auspices of the Baptist denomination. The total number of students is (1900) about 747, and of instructors 39. Large additions have recently been made to the endowment.

Bayly, Miss ADA ELLEN: See LYALL, EDNA.

Bayly, LEWIS: Bishop of Bangor in Wales; worthy of mention as the author of *The Practice of Piety*, one of the most popular religious books ever written. It is mentioned by Bunyan as one of the books owned by his wife. In 1714 it had passed through fifty-one editions in England, besides several translations published in foreign lands. Eliot, the Indian apostle of Natick, Mass., translated *The Practice of Piety* into the Indian language, and it was published for circulation among his converts. Bayly was born at Caermarthen; educated at Oxford, and consecrated as bishop in 1616. D. in Bangor, Oct. 26, 1631. He must not be confounded with Thomas Bayly, Anglican Bishop of Killala in Ireland, who died in 1670.—Bishop Lewis Bayly had a son THOMAS, who became a zealous Roman Catholic, and published *The End of Controversy* (Douai, 1654), besides other works.

Bayly, THOMAS HAYNES: *littérateur*; b. near Bath, England, Oct. 13, 1797; was the son of a wealthy solicitor, and was educated at Oxford. He is best known by his very numerous songs, some of which will always be popular, though few are of a very high literary order. Among them are *Oh no, we Never Mention Her*, *The Soldier's Tear*, *Why Don't the Men Propose?* and *I'd be a Butterfly*. D. Apr. 22, 1839. See his *Songs, Ballads, and Other Poems*, with a memoir, London, 1844.

Bayne, PETER, LL. D.: journalist and author; b. at Foderty, Ross-shire, Scotland, Oct. 19, 1830; educated at Marischal College, Aberdeen; was successively editor of the *Glasgow Commonwealth*, *Edinburgh Witness*, *London Dial*, and *Weekly Review*; author of *The Christian Life in the Present Time* (1855); *Life and Letters of Hugh Miller* (1871); *The Chief Actors in the Puritan Revolution* (1878); *Life of Martin Luther* (1887); besides numerous contributions to current periodicals. D. at Upper Norwood, London, Feb. 10, 1896.

Baynes, ROBERT HALL: b. in Wellington, Somersetshire, England, Mar. 10, 1831. He was educated at Bath and at St. Edmond's Hall, Oxford, where he took his master's degree in 1859. He received a number of English church preferments. He is the author of numerous religious works, among which are *Lyra Anglicana* (1862); *Autumn Memories and Other Verses* (1868), etc.

Baynes, THOMAS SPENCER, LL. D.: b. in Wellington, Somersetshire, England, Mar. 24, 1823. He was educated at a private school in Bath, at Bristol College, and at the University of Edinburgh; was Professor of Logic in the latter institution 1851-55; assistant editor of the *London Daily News* 1857-64; contributed many articles on the civil war in the U. S. to the *Daily News*, and was also a contributor to the *Literary Gazette*, the *Athenæum*, etc.; became Professor of Logic, Rhetoric, and Metaphysics in the University of St. Andrews 1864; published a translation of *Port Royal Logic* in 1851, and an *Essay on the New Analytic of Logical Forms* (1852). He was editor of the ninth edition of the *Encyclopædia Britannica*, for which he wrote the article on Shakspeare. He contributed regularly to the *Edinburgh Review* (1869-75), and was also a contributor to the *North British Review*, *Fraser's Magazine*, *Pall Mall Gazette*, and the *Saturday Review*. D. at St. Andrews, May 29, 1887.

Bay of Islands: a large bay on the west coast of Newfoundland. It abounds in islands, and its scenery is very fine. Good timber, gypsum, and marble abound. About 30,000 barrels of herring are annually taken here, besides cod and other fish. Agriculture is pursued to some extent. Pop. of settlements, 947.

Bayonet [Fr. *baïonnette*, also formerly *bayonnette*; so called, it is said, because invented or first used at Bayonne, in France, about the middle of the seventeenth century]: a thrusting weapon attached to the muzzle of a musket or rifle. The bayonet, first used in France, A. D. 1671, had a solid handle which was inserted in the bore of the gun. This was succeeded by that with a hollow handle fitting over the barrel, and which allowed the gun to be fired without removing it. The introduction of the bayonet enabled the musket to be used as a pike also, and led to the abandonment of the latter. The blade of the common bayonet is of triangular cross section, and about 16 to 20 inches long; but various other forms have been and are now used, such as the "sword" or "saber bayonet," in the form of a short, straight sword, effective either as a sword or bayonet; the "trowel bayonet," designed to be used as a bayonet when fixed, and as an intrenching tool when unfixed; the "ramrod bayonet" or "rod bayonet," made by sharpening the end of the wiping-rod of the modern breech-loader, and fitting it with a catch which holds it in place when drawn out so as to project 8 to 10 inches. Many modern military writers have recommended the entire abandonment of the bayonet, considering it a useless addition to the modern rifle; but the great moral effect of a bayonet charge (which is still looked forward to as the culmination of an infantry attack) is urged by its advocates as sufficient reason for its retention, and it is an important feature in the arms of those nations which have been involved in the most recent great wars. See PIKE.

JAS. MERCUR.

Bayonne, bǎä'yün' [Basque *bayon, bayona*, a port]: a fortified city of France (anc. *Lapurdum*), near its southwest extremity; department of Basses-Pyrénées; on the river Adour; about 3 miles from the Bay of Biscay and 66 miles W. N. W. of Pau; lat. 43° 29' N., lon. 1° 29' W. (see map of France, ref. 9-C). It is pleasantly situated near the foot of the Pyrenees, at the mouth of the river Nive, and is well built. It has an old cathedral, a citadel built by Vanban, a mint, a theater, and schools of commerce and navigation. Here are shipyards, glass-works, sugar-refineries, and distilleries. The chief articles of export are timber, tar, corks, liqueurs, hams, etc. Here occurred an interview between

Charles IV. of Spain and Napoleon I., who extorted from the former and his son a renunciation of the crown in 1808. Pop. (1896) 26,918.

Bayonne, bā-yon': city; on railroad, Hudson co., N. J. (for location of county, see map of New Jersey, ref. 3-E); formed by the consolidation of the villages S. of Jersey City on the peninsula between the Raritan and New York upper bays; has large Standard oil refineries on New York Bay, with pipe-lines to New York, Philadelphia, Baltimore, Pittsburgh, Cleveland, etc. Pop. (1885) 13,080; (1890) 19,033; (1900) 32,722.

EDITOR OF "HERALD."

Bayou, bī'oo [corrup. of Fr. *boyau*, gut]: strictly, a stream which is not fed by springs, but flows from a lake or other stream. It is very often used in the Southern U. S. as synonymous with "creek," and for tidal channels.

Bayreuth: See BAIREUTH.

Bay Roberts: a port of entry of Newfoundland; 8 miles S. of Harbor Grace, on Conception Bay. Its inhabitants are chiefly engaged in the Labrador fisheries. It is visited by regular lines of coasting steamers, and has considerable imports. Pop. 2,600.

Bay Rum [*Spiritus myrciæ* of U. S. Pharmacopœia]: a fragrant liquid obtained by distilling with rum the leaves of the *Myrcia aeris*, and probably of other trees of the genus. These are large trees growing in Jamaica and other West India islands, and belonging to the *Myrtaceæ*. Bay rum is imported in large quantities, and is used as a perfume and as a cosmetic.

Bay Saint Louis: capital of Hancock co., Miss. (for location of county, see map of Mississippi, ref. 10-G); on L. and N. R. R., and on Mississippi Sound, Gulf of Mexico: 52 miles from New Orleans; has an academy and a business college, three churches, custom-house, oyster and shrimp canning factory, woolen-factory, and fruit and vegetable farms. The city is a popular summer resort, and has a shell road on the beach 8 miles long. It was founded about 1790 by the French. Pop. (1880) 1,978; (1890) 1,974; (1900) 2,872; summer population about 8,000.

EDITOR OF "GULF COAST PROGRESS."

Bay Shore, or **Bayshore**: village; Suffolk co., Long Island, N. Y. (for location of county, see map of New York, ref. 8-D; on Montauk Div. of L. I. R. R., and on Great South Bay; 41 miles from New York city; has graded schools, five churches, large hotels, a bank, electric lights, and water-works. Here are the South Side Field Club (athletic), Bay Shore Yacht Club, Great South Bay Yacht Club, and the Olympic Club. Bay Shore is a summer resort, and is the nearest village to Fire island and its fishing-grounds for bluefish. Pop. (1880) 1,615; (1890) 2,290; (1900) 3,135 (estimated).

EDITOR OF "BAY SHORE JOURNAL."

Baza, baā'thāā (medieval *Bastiana*): a city of Spain; province of Granada; about 52 miles N. E. of Granada; in a fertile plain (see map of Spain, ref. 19-G). It is famous for its red wine. In 1489 it was taken from the Moors by the Spaniards after a long siege. The French marshal Soult here defeated the Spaniards, Aug. 10, 1810. The principal trade of the place at present is in hemp. Under the Moors it was an important city with a population of 50,000—now 13,000.

Bazaar, or **Bazar** [Pers. *bāzār*, market]: an Oriental market-place, either open or covered with a roof; an Oriental assemblage of shops in which goods of various kinds are exposed to sale. Each bazaar is occupied by a number of retail traders, and is often divided into streets or passages having on each side a row of small shops, stands, or counters. The term is also applied in European and Western cities to a hall or suite of rooms fitted up with counters or stands for the sale of goods (mostly fancy articles).

Bazaine, baā'zayn', FRANÇOIS ACHILLE: b. in Versailles, Feb. 13, 1811; and, after passing through all the intermediate grades, marshal of France, Sept. 5, 1864. The son of a prominent and wealthy officer, he could have readily obtained an officer's commission, but he declared it his pride to seek his marshal's bâton from the knapsack, in which for "every French soldier" the proverb potentially places one; and that bâton, when found, bore the inscription "Simple soldat en 1831, Maréchal de France en 1864."

He served with distinction in Algeria, Spain, the Crimea, Italy, and in setting up the Maximilian empire in Mexico. He received the cross of the Legion of Honor in 1836; was promoted to commander of the Legion in 1856; received

the Grand Cross in 1863; and in 1869 became commander-in-chief of the imperial guard.

On the breaking out of the war with Prussia, Marshal Bazaine was at first in command of a single corps, but after the disasters of Woerth and Forbach, compelling the emperor to relinquish the command, he succeeded to the command of the Army of the Rhine. Reorganization and concentration compelled a falling back upon Metz, and thence upon Verdun, where the shattered commands of MacMahon's corps and the reserves of France were concentrating. His army was delayed in its movements by the battles of Borny (Aug. 14, 1870) and Mars-la-Tour (Aug. 16), and finally, in the battle of Gravelotte (Aug. 18) suffered a serious defeat, and was obliged to retire to Metz, which was immediately invested by the Germans under Prince Frederick Charles. Failing in all attempts to break the line of the besiegers, the marshal surrendered, on Oct. 27, 1870, an army of 160,000 men, Metz, "la Pucelle," and its fortifications, and 1,800 pieces of artillery.

He was arraigned Oct. 10, 1873, before a court consisting of the Duc d'Aumale (president), General de la Motte Rouge, Baron de Chabaud-Latour, Generals Tripier, Martimprey, Princeteau, and Martinez-Dechesnez, charged:

First—With having capitulated to the enemy, and surrendered the fortress of Metz, of which he had the superior command, without having exhausted all the means of defense.

Second—With having, as the head of the army before Metz, signed a capitulation in the open field, the result of which was to cause his troops to lay down their arms; and with not having done everything which he was bound by duty and honor to do before treating verbally and by writing—offenses punishable by articles 209 and 210 of the Code of Military Justice.

After a trial of two months' duration he was unanimously pronounced guilty, sentenced to be degraded and shot. His sentence was promptly commuted by President MacMahon to twenty years' imprisonment in a fortress, without military degradation.

On Aug. 9, 1874, Bazaine, aided by his wife, escaped from his fortress prison, Île Ste. Marguerite, pleading in justification (*Letter addressed to the Minister of War*), while alleging that "respect for the military uniform which he has very honorably worn for nearly half a century," would have deterred him from this step but for the "humiliating régime to which he was subjected, from which his past career ought to have saved him," that maxim of public law, that "no sentence is legal unless pronounced by the peers of the accused." Gen. Bazaine resided in Madrid, Spain, from Nov., 1874, till his death, Sept. 23, 1888.

That his conduct of the military operations from Aug. 13 to Aug. 18 was inefficient; that his so-called sorties had scarce the energy in them to reveal a serious intention to go out; that he allowed himself to waste the last precious days of his army's efficiency in what were futile—and some would call treasonable—attempts to negotiate with the empress; and finally crushed the rising and the last hopes of France by a premature surrender at the very moment when a protraction might have modified the history of the war, must be the conviction of all who have impartially studied his career.

Bazalgette, Sir JOSEPH WILLIAM, C. B.: an English civil engineer of French descent; b. in Enfield, Middlesex, 1819. He won great fame in the construction of sewers, street alterations, and other departments of city engineering. As engineer-in-chief to the Metropolitan Board of Works, London, he constructed many hundreds of miles of sewers and river embankments, and introduced subterranean passages for the carrying of gas and water pipes and telegraph wires, so that it is not necessary to break up the pavements for repairs. He planned and executed the Thames embankments of London, and bridged that river in three places with granite or iron structures. D. in London, Mar. 1, 1891.

Bazan, EMILIA PARDO: See PARDO-BAZAN, EMILIA.

Bazancourt, baā'zāān'koor', CÉSAR, Baron de: a French historian; b. in 1810; wrote a *History of Sicily under the Norman Rule* (2 vols., 1846); histories of the Crimean, Italian, Chinese, and Cochinchinese wars of Napoleon III. Under Louis Philippe, De Bazancourt was a director of the library of Compiègne, and under Napoleon III. he was official historiographer. D. at Paris, Jan. 25, 1865.

Bazard, SAINT-AMAND: founder of French Carbonarism; b. in Paris, Sept. 19, 1791. He organized societies of Carbonari about 1820, and afterward became a disciple of Saint-

Simon the Socialist, and editor of the *Producteur*, a Saint-Simonian journal. After the death of Saint-Simon (1825) Bazard and Enfantin were the chief priests of the sect, and they published an *Exposition of the Doctrine of Saint-Simon* (1828-30). Bazard became disgusted with the extreme innovations of Enfantin (who advocated a community of wives), and he seceded from the sect in 1831. D. in Country, near Montfermeil, July 29, 1832. See Michaud et Villenave, *Histoire du Saint-Simonisme* (1847).

Bazigars, baā-zē'garz: the gypsies of India; usually nomadic, and clearly distinct from the Hindus, with whom they do not intermix. They are scattered throughout the whole of India. Their chief occupation is the performance of feats of address and agility to amuse the public, the men as athletes, the women as dancers. Many are Mohammedans, some profess no religious faith, and a particular association among them has the fame of making human sacrifices. Their reputation is generally bad. They present many features analogous to the Western gypsies. Keeping themselves distinct from the people among whom they dwell, they have their own chiefs or kings, and a peculiar language which has a decided analogy to that of the gypsies. There are several groups of them known under different names, but the Bazigars are the best known and most civilized.

M. W. H.

Bazin, ANTOINE PIERRE LOUIS: b. Mar. 26, 1799; was a professor of the Chinese language, and published in 1856 a grammar of the Mandarin dialect. He also made many translations from the Chinese. D. in Jan., 1863.

Bazin, HENRI: inspector-general of bridges and roads, officer of the Legion of Honor; b. Oct. 20, 1829; graduated from the School of Bridges and Roads in 1851; was assigned to the railway from Tours to Bordeaux, in the department of Charente. In 1856 he was engineer in the department of Côte d'Or, on the Burgundy Canal, and matters connected with the inundations of the Saône, and in the same year was made assistant to Darcy in his experiments upon the flow of water in open channels. Henri Darcy first, in the water-works of Dijon, discovered and published the fact that the velocity of flowing water was affected by the degree of roughness of the bed and sides of the channel, which up to that time had not been admitted. Extensive experiments were made by him upon the water-pipes of Paris, and published by him in 1854. Those upon the flow of water in open channels were commenced in 1856, with Bazin as his assistant. The preparations were made, the channels constructed, and some experiments commenced when in 1858 Darcy died. The work was continued by Bazin, and completed by an analysis and discussion of the experiments in a memoir presented to the Academy, and published in 1865 with a *résumé* by Gen. Morin, who characterizes it as most valuable to the engineer, and which can not fail to be appreciated by the Academy. It is, indeed, the most valuable contribution to the science of the flow of water. The second part of the *Experiments* was published by the Academy in 1865. It treats of the "propagation of waves." Since 1886 he has been inspector-general of the fifth inspection department and a member of the Council of Bridges and Roads.

His published works are *Expériences sur l'écoulement des eaux dans les canaux découverts*; *Sur la propagation des ondes*; and numerous papers on kindred subjects in the *Annales des Ponts et Chaussées*. W. R. HUTTON.

Bazley, Sir THOMAS, Bart.: b. at Gilnow, Lancashire, England, in 1797. He learned cotton-spinning in his youth; went into business on his own account at Bolton in 1818; removed in 1826 to Manchester, where his manufactory of fine cotton and lace thread was the largest in the world, employing more than 1,000 persons, for whom he established schools, free lectures, and reading-rooms. An early anti-corn-law man and free-trader, he became a prominent Liberal politician, first entering Parliament in 1858. In 1862 he retired from business, and in 1869 became a baronet. D. Mar. 18, 1885.

Bdelium (Gr. βδέλλιον): a gum-resin resembling myrrh, but weaker and more acrid; esteemed by the ancients for its supposed medicinal virtues. It is not often used by modern physicians. Two varieties of bdellium are obtained from the *Amyris commiphora* of India and the *Heudelotia africana*, a tree or shrub of Senegal. It is used in both human and veterinary pharmacy in India, and for incense in temples.

Beach: the sloping surface of the land above low-water mark; covered with stones and sand brought by waves and

currents from neighboring cliffs or ledges, or from the bottom off-shore. A beach begins on a wave-cut bench under a cliff or ledge and extends along shore in the direction of the controlling current, often swinging in a smooth curve around the head of a bay or cove between two rocky points. As a headland is cut back into an even line, its beach may be prolonged as an embankment across the adjoining bay, thus simplifying the shore-line, as on the south side of Martha's Vineyard. The embankment is called a spit, or bar. Beach is also applied to the long off-shore bars or barriers now used as summer resorts on the coast of New Jersey, built of sand raised by storm waves from the shallow bottom, and now receiving additions on the outer side, while the inclosed lagoons and mainland are protected from the sea. Bars of the same kind on the coast of Carolina are locally called "banks." See COAST, DUNE.

W. M. DAVIS.

Beach, ABRAHAM, D. D.: a Protestant Episcopal divine; b. at Cheshire, Conn., Sept. 9, 1740; graduated at Yale College in 1757, and ordained by the Bishop of London in 1767. He was until 1783 rector of a church at New Brunswick, N. J., and afterward an assistant minister of Trinity church, New York (1783-1813). D. Sept. 14, 1828.

Beach, Mrs. H. H. A.: See the Appendix.

Beach, JOHN: Protestant Episcopal divine; b. in 1700; graduated at Yale in 1721; and was for some years Congregational minister of Newtown, Conn. He joined the Anglican Church in 1732; was ordained by the Bishop of London, and was for fifty years a minister of the Church of England, at Newtown and Reading, in Connecticut. He published sermons and polemical tracts. D. Mar. 8, 1782. In the church recently erected at Newtown a handsome tablet commemorates his half-century's service.

Beach, JOHN WESLEY, D. D., LL. D.: preacher of the Methodist Episcopal Church; b. at Trumbull, Conn., Dec. 26, 1825; graduated in 1845 at Wesleyan University, Middletown, Conn.; was for nine years a teacher; and in 1854 entered the ministry. His labors have been mostly in New York city and vicinity. In 1872 he received the degree of D. D. from his *alma mater*; in 1873 became pastor of a church in New Haven, Conn.; and was president of the Wesleyan University, Connecticut, 1880-87.

Beach, MOSES YALE: an inventor and publisher; b. at Wallingford, Conn., Jan. 7, 1800. He learned the trade of a cabinet-maker in youth, and afterward experimented in machines for propelling balloons. He invented a rag-cutting machine, now in general use in paper-mills. In 1835 he became interested in the *New York Sun*, and is regarded as a pioneer in the penny newspaper business. In 1857 he left his profession and retired to his native town, where he died July 18, 1868.

Beach Plum: See PLUM.

Beachy Head: the highest headland on the south coast of England; $2\frac{1}{2}$ miles S. S. W. of Eastbourne, Sussex. It consists of perpendicular chalk cliffs 564 feet high, forming the east end of the South Downs. Here is a lighthouse 285 feet high. The French fleet defeated the Dutch and English near this point in 1690.

Beacon [M. Eng. *bekene* < O. Eng. *bēacn*, a sign; akin to Eng. *beckon*]: Before other means of rapid telegraphy were invented, fires, kindled on the tops of mountains or prominent points of the coast, were an obvious resort as alarm-signals, giving warning of the approach of hostile fleets or armies. So, too, as a guide to mariners, for whom the dangers of a contiguous coast are enhanced by darkness, blazing fires or "lights" of some kind (see LIGHTHOUSE) were ever the most obvious beacons; hence a "fiery signal" is associated with the classic signification of the word. The word *beacon* (in a special signification) is now almost exclusively restricted to the last mentioned uses, denoting a mark or sign erected on coasts for guiding and preserving vessels at sea by night or by day. Practically, it is still further restricted by being divested, almost entirely, of reference to "light" or "fire," and applied to fixed structures or material marks erected on rocks or shoals in harbors or narrow channels; nevertheless, a small light-tower erected for no other than this limited purpose is sometimes called a *beacon-light* (as distinct from the lighthouse proper); while fixed un-illuminated signal structures are called "day-beacons."

Beaconsfield, bek'ūnz-fēld: small town in Buckinghamshire; 10 miles N. of Windsor (see map of England, ref.

12-I); notable as the home and burial-place of the poet Walter and of Edmund Burke, and as having given his earl's title to Benjamin Disraeli. Pop. about 1,500.

Beaconsfield, LORD: See DISRAELI.

Bead [M. Eng. *bede*, prayer, prayer-bead; O. Eng. *bed-, gebed*, prayer]: in Old English, a prayer, and hence one of the small perforated balls, of whatever material, used for keeping an account of the number of prayers repeated. Beads are small perforated globular bodies worn as ornaments by women and children around the neck and on other parts of the person, for which purpose they are arranged on strings. They are made of various materials—gold, amber, coral, pearl, crystal, glass, etc. More beads are made of glass than of any other material. They are often used in the ornamentation of slippers, purses, and other articles. The ancient Egyptians understood the art of making glass beads, which are now extensively manufactured at Murano, near Venice, and in China.

Bea'dle, WILLIAM H. H., LL. D.: b. at Liberty, Parke co., Ind., Jan. 1, 1838; educated at Rockville and in University of Michigan; entered the army in 1861 as first lieutenant of the Thirty-first regiment of Indiana infantry; served throughout the whole war, and was in 1864 brevetted a brigadier-general. After the war he studied law and began to practice in Wisconsin, when, in 1869, he was appointed U. S. surveyor-general over the Territory of Dakota. From that time he devoted his whole energy to the development, material as well as moral, of the Territory, as a member of the Legislature, and more especially as superintendent-general of public instruction (1879-85), in which last position he succeeded in organizing the whole school system of the Territory.

Bead-tree: See CHINA, PRIDE OF.

Bea'gle: a small variety of hound, formerly employed in Great Britain for hunting hares, but now nearly supplanted by the harrier. The beagle is about 10 inches high at the shoulder, is compactly formed, and has long pendulous ears and smooth hair. It is remarkable for its keenness of scent and perseverance. During the chase it utters a musical cry. A small variety is used as a lap-dog.

Beak, or Rostrum [from Fr. *bec*: Ital. *becco*, a word of Celtic origin, *bacc-*, hook]: the bill of a bird; in other words, the hard, horny mouth of a bird, consisting of two parts, called the upper and lower mandible. (See BILL.) The term is also applied to the sharp projecting part of the bow of modern ships of war used for ramming, and to the similar construction on the prows of ancient war-galleys.

Beal, WILLIAM JAMES, M. A., Ph. D.: botanist; b. in Adrian, Mich., Mar. 11, 1833; educated in University of Michigan and Harvard University. He was for two years Professor of Natural History in Chicago University, until he became Professor of Botany (in 1870) in the Michigan Agricultural College. He has written many papers on economic botany. His principal publications are *The New Botany* (1881) and *The Grasses of North America* (vol. i., 1887).

CHARLES E. BESSEY.

Beale, LIONEL SMITH, F. R. S.: an accomplished microscopist and physiologist; b. in London, 1828; graduated M. B. at the University of London in 1851, in which institution he was afterward appointed professor. Many remarkable books and monographs upon histology and biology have been published by Dr. Beale. His papers, written against the Darwinian hypothesis (1870), have attracted much attention. Among his numerous works are *How to Work with the Microscope* (1858); *The Structure of the Tissues of the Body* (1861); *Protoplasm* (1870); *Life Theories, their Influence on Religious Thought* (1871); *Our Morality and the Moral Question* (1887); in collaboration with others *The Physiological Anatomy and the Physiology of Man*, besides treatises on urinary and hepatic disorders.

Beam: any large piece of timber; the principal piece of timber in a building, that lies across the walls and serves to support the rafters; also a collection of luminous rays emitted from the sun or other luminary. The word has several technical applications. The part of a balance from the ends of which the scales are suspended is called a beam; a weaver's beam is a wooden cylinder on which the web is wound. The term is also applied to the part of a steam-engine to which the piston is sometimes attached to transfer motion to the crank shaft. In ships, a beam is a great main cross-timber, extending across the hull, supporting the deck, and preventing the sides from collapsing. Each of

these beams is made of one solid piece of good timber, if possible, and is upheld at or near the middle by a pillar or pillars. In large steamships iron beams are often used instead of wood. A ship is said to be "on her beam ends" when so much inclined to one side that the beams become nearly vertical. The word also occurs in the phrase "on the starboard beam," which is applied to the position of an object at sea which is seen toward the right by a person whose face is turned toward the bow. See FLEXURE and BRIDGES.

Beamsville: a post-village of Clinton township; Lincoln co., Ontario, Canada; on the Great Western Railway; 11 miles W. of St. Catharines (see map of Ontario, ref. 5-E); has manufactures of farming tools, carriages, etc. Pop. 1,000.

Beam-tree, White (*Py'rus a'ria*): a tree which is a native of Europe and Asia, and grows to the height of from 25 to 40 feet. It has ovate and serrate leaves, which are white and downy beneath, flowers in terminal corymbs, and bears a scarlet fruit about as large as a pea. This fruit, which is sometimes called sorb or service-berry, is acid and astringent, and is used to make beer. The hard, fine-grained wood is useful for cog-wheels.

Bean: a plant of the family *Leguminosæ*. The true bean of Europe is an upright plant with stiff and nearly straight stems, white black-eyed flowers in thick clusters and large broad pods. The beans are large and more or less flattened, often angular or even nearly square. This plant is the *Vicia faba* (or *Faba vulgaris*). It is sometimes grown in this country under the name of English bean, most frequently as the Broad Windsor and Mazagan varieties. It does not succeed in the hot and dry summers of America. The common garden and field beans of America belong to the species *Phaseolus vulga'ris*, although some botanists think that they represent several confused species. In Europe they are known as kidney-beans or haricots. About 150 varieties of these beans are now grown in this country, a few being grown for field crop and the product sold as dry beans, but the greater part being grown in the garden for "string" or "shell" beans. Beans demand a warm loose soil, and they are very susceptible to injury from frost. In 1890 12,607 acres were devoted to beans in the U. S. as a truck-garden crop, and 12,905 acres were devoted to beans for seed. The original home of the common bean is unknown. It has been cultivated from remote times. The Lima bean (*Phaseolus luna'tus*) is a climbing species which is sparingly cultivated in the northernmost States, but which succeeds well from New Jersey southward, and is grown in great quantities in California, whence most of the seed now comes. The species is supposed to be native to South America. The soy-bean (*Soja hispida*) is the popular bean of China and Japan, and is somewhat known in the U. S., especially in some parts of the Southern States. See SOY-BEAN.

Several beans are grown for ornament, as the scarlet-runner (*Phaseolus multifo'rus*) and species of dolichos, especially *Dolichos lablab*. Some species of dolichos are grown for culinary uses, especially the asparagus-bean (*Dolichos sesquipedal'is*). The cow-pea also belongs to this genus (*D. chinensis*). See LEGUMINOSÆ.

L. H. BAILEY.

Bean, TARLETON HOFFMAN, M. D., M. S.: ichthyologist; b. at Bainbridge, Lancaster co., Pa., Oct. 8, 1846; graduated at Columbian University, Washington, D. C.; was principal of Smyrna Seminary, Del., and of the high school of Wilkes-barre, Pa. In 1874 he accepted a position in the U. S. Fish Commission, and has been actively associated with its work ever since. In 1884 visited Alaska to investigate the shore fisheries, and again in 1889 to study and report on the salmon fishery. Dr. Bean is curator of the department of fishes, U. S. National Museum, ichthyologist and assistant in charge of the division of fish culture, U. S. Fish Commission, and editor of its publications. He has published numerous papers on fishes in the publications of the U. S. Fish Commission and U. S. National Museum; a *Report on the Fishes of Pennsylvania*; and, in conjunction with Dr. G. Brown Goode, an important memoir on the *Deep-sea Fishes of the Atlantic Basin*. He has also contributed many articles to *Forest and Stream*, of which he is editor of sea and river fishing.

FREDERIC A. LUCAS.

Bear [in Lat. *ur'sus*, female *ur'sa*]: a quadruped of the genus *Ursus* and order *Carnivora*; the type of the family of *Ursidae*. Bears walk on the soles of their feet, have five toes on each foot, and have claws which are not retractile, but are

adapted for digging in the earth or climbing trees. Their tails are very short. They have six cutting teeth in each jaw, and one canine tooth on each side in each jaw. Bears are found both in warm and cold climates in Europe, Asia, and America, but are scarce in Africa. The *Helarctos crowtheri* occurs in the Atlas Mountains. The species that inhabit cold climates are generally more fierce and carnivorous than those of tropical regions. Some species pass the winter in a state of torpidity and hibernation, during which they eat nothing and remain stationary in hollow trees or holes in the ground.

The brown bear (*Ursus arctos*) is widely distributed over the continents of Europe and Asia, but it has been extirpated from the British islands. It is generally believed to be the only European species. It is solitary, infests mountains and forests, eats fish and other animals, and subsists partly on fruits and vegetable food. The flesh of this bear is eaten by the people of Kamtchatka and other regions.

The black bear (*Ursus americanus*) is found in all parts of North America. Its total length is about 5 feet. It prefers vegetable food, but when pressed by hunger will kill and eat small animals. It kills its prey by hugging or squeezing with its fore paws. Great numbers of black bears are killed for their skins, which have a smooth, glossy fur, and are valuable for cloaks, caps, etc. This animal is an expert climber, is very fond of honey and green corn (maize), and is less fierce and dangerous to man than the brown bear.

The Rocky Mountains and adjacent parts of North America are infested by the grizzly bear (*Ursus horribilis*), which

Grizzly bear.

is much larger and more carnivorous than the black bear. It sometimes measures 9 feet from the nose to the tail, which is very short. The hair is long, and its color is a mixture of brown, white, and black. This bear, which is very tenacious of life, is the most formidable beast of prey on the continent of America. It is able to master a bison and carry away its

Polar bear.

huge carcass. It is stated that it hunts for prey both by day and night. It can run swiftly, but does not climb trees.

The largest of all the family of *Ursidæ* is the polar bear (*Thalarctos maritimus*), called also the white bear, the fur of which is an impure white. It sometimes measures nearly 10 feet long and 5 feet high. It is strictly marine in its habits, is never found far from the sea, and inhabits the most northern shores of Greenland, Asia, etc. It subsists chiefly on animal food, and pursues seals and fishes both on the ice and in the water. These bears display a remarkable affection for their cubs.

The bear mentioned in the Bible was probably the Syrian bear (*Ursus syriacus*), which resembles the brown bear in its habits, and has a stiff mane of erect hairs between the shoulders. The color of its hair is mostly dingy white or brown. Among the other species is the *Ursus labiatus*, or long-lipped bear of the East Indies, an inoffensive and gentle animal, which is often led about by Indian jugglers for exhibition. Among the Andes of Chili occurs the *Ursus ornatus*, called spectacled bear, which is black except two semi-circular yellow marks above its eyes. Remains of several extinct species of bears have been found in caves in England and Germany. Of these, *Ursus spelæus*, the cave-bear, is the best known. See the Appendix. Revised by D. S. JORDAN.

Bear-baiting: A custom was formerly prevalent in many countries of baiting bears with dogs. The place in which the bears were kept was called a "bear-garden." Bear-baiting was a favorite sport in England, not only for the common people, but also for the higher classes. Queen Elizabeth is said to have enjoyed it. It was hated by the Puritans, Macaulay wittily says, "not because it gave pain to the bear, but because it gave pleasure to the spectators." This coarse and inhuman entertainment gradually died out, and was finally prohibited by act of Parliament, Sept. 9, 1835.

Bear'berry (*Arctostaphylos uva-ursi*): a trailing shrub, with elliptical, evergreen leaves and red berries, found in the Northern U. S., Europe, and Asia. It is a member of the heath family, and is closely related to the madroña and still more closely to the manzanita of California.

CHARLES E. BESSEY.

Beard: a name applied to the hair which grows upon the lower part of the face of a man, and in exceptional cases upon the faces of women, or even children. The wearing of the beard is universal in the East, where it has long been regarded as a mark of honor and dignity. Some races of men, like the American Indians, carefully pluck out the beard, which with them and others, such as the Mongolians and Bedouins, is scanty. Most white races have beards with hairs differing decidedly in structure and appearance from those of the scalp. The wearing of beards in European nations has been regulated partly by fashion and partly by legal enactments for or against the practice. The beard is believed to protect the throat and chest from colds.

Beard, CHARLES, B. A., LL. D.: Unitarian minister and scholar; b. in Manchester, England, July 27, 1827; educated at Manchester New College and Berlin University; minister of Gee Cross chapel, Cheshire, and Renshaw Street chapel, Liverpool; editor of *The Theological Review* 1864-79; author of *Outlines of Christian Doctrine* (1859); *The Soul's Way to God* (1875); *The Hibbert Lectures* (1883); *The Universal Christ* (1888); *Martin Luther* (1889). His *Hibbert Lectures* are one of the most important courses given on a foundation that has been productive of the highest things. D. in Liverpool, Apr. 9, 1888.

Beard, GEORGE MILLER, M. D.: physician; b. at Montville, Conn., May 8, 1839; was educated at Phillips Academy, Andover, and at Yale, where he graduated 1862; attended one year at medical department of Yale, and, coming to New York, graduated from College of Physicians and Surgeons 1866, having for eighteen months (1863-64) been assistant-surgeon on the gunboat New London in the Western Gulf blockading squadron; commenced practice at once in New York, and with Dr. A. D. Rockwell made electrotherapeutics and nervous diseases his specialty; wrote many works, among them *American Nervousness, with its Causes and Consequences*; *The Scientific Basis of Delusions, being a New Theory of Trance and its Bearing on Human Testimony*; *Clinical Researches in Electro-surgery* (together with Dr. Rockwell); *Medical Uses of Electricity*; and *The Physiology of Mind-reading*; 1863-64 was acting assistant-surgeon in U. S. navy; in 1868 became lecturer in New York University on nervous diseases; gave special attention to mesmerism, and lectured in 1881 on *Artificial Trance*. D. in New York, Jan. 23, 1883.

Beard, JAMES HENRY: animal, genre, and portrait painter; b. in Buffalo, N. Y., in 1814; settled in Cincinnati and painted portraits in the earlier part of his career, including those of Henry Clay, John Quincy Adams, and Presidents W. H. Harrison and Taylor. National Academician 1872. D. in Flushing, N. Y., Apr. 4, 1893.

W. A. C.

Beard, RICHARD, D. D.: a clergyman of the Cumberland Presbyterian Church; b. in Sumner co., Tenn., Nov. 27, 1799. His early education was not without care, yet limited. His education preparatory to the ministry was conducted better than usual for the time in his church. He was licensed and commenced preaching in 1820, and was several years exclusively devoted to the work of the ministry. His health failing, he spent two or three years teaching. He was two and a half years at Cumberland College, Princeton, Ky., and graduated (1832). He was immediately appointed Professor of Languages in that college. He afterward spent five years at Sharon, Miss., in connection with Sharon College (1838-43). In 1843 he became president of Cumberland College, Ky., and remained there ten years and a half, giving a great impetus to the classic training of young men, especially those seeking the ministry. In 1854, when the Cumberland Presbyterian Church established a chair of Systematic Theology in Cumberland University, Lebanon, Tenn., his high character as a scholar and educator at once called him to that position, which he held till his death. He gave to the Church an able and standard work on *Systematic Theology*, in 3 vols. 8vo. It is regarded as the crystallization of Cumberland Presbyterian thought and faith. He published two octavo volumes of biographical sketches of ministers. Also *Why am I a Cumberland Presbyterian?* (1 vol.). His contributions to the *Quarterly* and general literature of the Church were constant and most valuable. He was the leading theologian of the denomination. His great dignity, purity, and gentleness of character marked him as a representative man, calling him frequently to the moderator's chair. His books were published at Nashville, Tenn. D. at Lebanon, Tenn., Dec. 2, 1880.

Beard, WILLIAM HOLBROOK: animal-painter; b. at Painesville, O., Apr. 13, 1825. He visited Europe in 1857 and studied and painted in Germany, Italy, and France. National Academician 1862. His work is principally of a humorous character representing animals, such as bears, rabbits, and monkeys dressed as men and women, and depicted as acting under human impulses. D. in New York city, Feb. 20, 1900.

WILLIAM A. COFFIN.

Beards'ley, EBEN EDWARDS, D. D., LL. D.: b. in Fairfield co., Conn., 1808; graduated at Trinity College, Hartford, in 1832, where he was for two years a tutor. He was for a time principal of the academy at Cheshire, Conn.; took orders in the Protestant Episcopal Church in 1835, and became rector of a church in New Haven in 1848. He was the author of a *History of the Episcopal Church in Connecticut*; a *Life of Samuel Johnson, D. D.*; a *Life of Samuel Seabury, D. D., First Bishop of Connecticut*; and a *Life of William Samuel Johnson, LL. D., Oxon.*, all valuable works. D. in New Haven, Conn., Dec. 21, 1891.

Beardsley, SAMUEL, LL. D.: jurist; b. in Hoosac, Rensselaer co., N. Y., Feb. 9, 1790; practiced law in Rome and Utica, N. Y.; held various State offices, as district-attorney of Oneida County 1821-25, as State Senator 1823, as U. S. district-attorney for the northern district of New York; was a member of Congress from New York (1831-36 and 1843-45); attorney-general of the State (1837); became a judge of the State Supreme Court in 1844, and its chief justice in 1847. D. in Utica, May 6, 1860.

Beardsley, SIDNEY BURR: jurist; b. in Monroe, Conn., Aug. 20, 1822. In 1874 he became a judge of the Superior Court of Connecticut, and in 1877 a judge of the Supreme Court of Errors of that State, resigning in 1889 on account of ill health. D. in Bridgeport, Conn., Apr. 24, 1890.

HENRY WADE ROGERS.

Beards'town: city; Cass co., Ill. (for location of county, see map of Illinois, ref. 6-C); situated on the bank of the Illinois river; 90 miles S. of Peoria, and 111 miles N. of St. Louis; is the official headquarters of St. Louis Div. of C., B. and Q. R. R., and terminus of O. and M. R. R.; has 6 churches, 3 large schools, including a high school, 2 banks, 2 flouring-mills, saw-mill, cooperage-works, baking-powder factory, screen-factory, feed-cutter factory, large machine-shops, shops of St. L. Div. of C., B. and Q. R. R., and water-works. The celebrated "Lithia Springs" are here.

There is a fine park near the business portion of the city. A railroad-bridge, with iron piers, crosses the river at this point, and is a fine structure, costing some \$300,000. Pop. (1880) 3,135; (1890) 4,226; (1900) 4,827.

EDITOR OF "ILLINOIAN."

Bear River: a port of entry of Digby co. and township, Nova Scotia; at the head of navigation (for location of county, see map of Quebec, ref. 3-A); has quite extensive manufactures of lumber, leather, etc.; ship-building is also carried on. It has a large trade in firewood and lumber, which are sent to the U. S. and West Indies. Pop. about 900.

Bear River: a river of the U. S.; rises in the N. part of Utah, flows northward into Idaho, and changes its course abruptly toward the S. Having again crossed the south boundary of Idaho into Utah, it flows southwestward, and enters Great Salt Lake about 25 miles N. W. of Ogden. The total length is about 400 miles.

Bears and Bulls: a phrase often used in connection with the purchase and sale of stocks; and applied to persons who speculate in Government securities and in the stocks of railroads and other corporations. The "bears" are those who wish to depress the value of stocks, and the "bulls" are those whose interest prompts them to act in the other direction. If two men have contracted, the one to deliver and the other to take a certain stock at a specified price on an appointed future day, the former will naturally belong to the bears and the latter to the bulls. See STOCK-EXCHANGE.

Bear's Grease, or Bear's Oil: said to be efficacious in promoting the growth of human hair. The genuine article being insufficient to supply the demand, perfumers and others sell under the name of bear's oil large quantities of beef-marrow, hog's lard, spermaceti, etc.

Beas'ley, FREDERICK, D. D.: a clergyman of the Protestant Episcopal Church; b. near Edenton, N. C., in 1777; graduated at Princeton in 1797; and was provost of the University of Pennsylvania from 1813 to 1828. Among his works, which attracted attention in Europe, are *A Search of Truth in the Science of the Human Mind* and a *Reply to the Views of Dr. Channing*. D. at Elizabethtown, N. J., Nov. 2, 1845.

Beasley, Gen. NATHANIEL: b. in 1751; was a pioneer of Ohio, and a noted Indian-fighter and scout; was in the campaigns of St. Clair and Wayne, and afterward settled in Chillicothe, O.; member of Ohio Legislature, a canal commissioner, and for many years major-general of militia. D. in Knox co., O., Mar. 27, 1835.

Beast-fables: the general name given to short stories, whether of popular or learned origin, in which the lower animals appear (usually by themselves, but sometimes in connection with men) associating with each other as reasonable beings endowed with the virtues and vices of humanity. Such stories are found everywhere, in all ages, and among races of all degrees of civilization. Their rationale is to be sought in the "animistic" philosophy of savage man, who makes no essential distinction between his own mental and moral faculties and those which he ascribes to other living creatures—not lower animals to him. (See ANIMISM; Tylor, *Primitive Culture*, i. 422 ff.; G. A. Wilken, *Het Animisme bij de Volken van den Indischen Archipel*, 1884-85.) In this stage of thought the savage, of course, feels no improbability in such a story about beasts as would seem to him credible if told about men.

Of the considerable number of beast-tales that have been collected, some may no doubt be myths in embryo or the detritus of myths; but any general application of the hypotheses of solar or meteorological mythology to this class of stories is now thoroughly discredited. Countless examples of this learned trifling may be seen in the *Zoölogical Mythology* of A. de Gubernatis (2 vols., London, 1872), where a day-and-night interpretation is devised for many stories which are obviously post-"mythopœic." Others of these beast-tales are clearly totemistic, owing their origin or their point to a supposed relation of descent between the tribe or family of the narrator and the animal that formed the tribal or gentile cognizance. (See J. G. Frazer, *Totemism*, Edinburgh, 1887; examples in Chamberlain, *Nanibozhu in Siouan Mythology, Journal of American Folk-lore*, v. 293 ff.) But a larger number fall into the two classes of (1) tales told merely for amusement, and (2) tales told to explain phenomena of the animal world.

(1) To the former class belong the exploits of the jackal (in Bleek, Koelle, Theal, Basset, etc.), the hare (in Casalis, Harris, Jones, Baissac, Steere, etc.), the tortoise (in Bleek, Hartt, Roméro, Harris, etc.), the spider (in Dasent, Schlenker, Milne-Home). These narratives are not properly moral (except that they celebrate the savage virtue of subtlety), nor are they in any just sense satirical. They chiefly aim to amuse, but are also meant to appeal in some sort to the intellect. Thus *The Lion and the Jackal*, we are informed, is often told by the Hottentots "to show how clever and wily the jackal is" (*Folk-lore Journal*, Cape Town, ii. 53). Such stories easily pass into satire: the narrator has but to call up in his hearers, by a tone or a turn of phrase, the reflection, "And this is the way of the world." But the very easiness of the transition makes the category *beast-satire* hard to define or establish. The great mediæval "beast-epic" *Reynard the Fox* is commonly regarded as satirical, but many of the adventures that compose it do not differ in kind from the jackal and tortoise tales of Africa and Brazil, which apparently have no such purpose.

(2) Tales of the second class, *les pourquoi*, are very numerous. Thus Georgia Negroes explain why the alligator never sleeps far from the river-bank (Jones, No. 1, p. 1), and why he does not molest the moor-hen (ib., No. 11, p. 24); the Iroquois, why the chipmunk has a black stripe on his back (Smith, p. 80); the Eskimo, why the raven is all black (Boas, *Report of Bureau of Ethnology for 1884-85*, p. 641); the Pawnees, why the deer has no gall and the antelope no dew-claws (G. B. Grinnell, *Pawnee Hero Stories and Folk-tales*, New York, 1889, p. 204); the Hottentots, why the hyæna's left hind leg appears to be shorter than his right (Bleek, No. 7, p. 14); Madagasear natives, why there is a deadly feud between the snake and the frog (*Antananarivo Annual*, 1877, p. 113), and so on. Like tales of the first class, *les pourquoi* do not die out with the animistic stage of thought. The folk-lore of civilized countries is full of them (see, for example, *Les pourquoi du eoucou*, *Revue des Traditions Populaires*, iii. 262 ff.; cf. iii. 267, vi. 314), and they show an interesting tendency to become legends, explaining the *why* of this or that phenomenon by reference to a miracle of Christ or some saint (see examples in Ralston, *Russian Folk-tales*, pp. 330 ff.; and cf. *Mélu-sine*, ii. 43).

So far the term *beast-fable* has been used in its popular acceptance as equivalent to *beast-tale*. In a narrower sense the term is restricted to such beast-tales as are in some measure allegorical or at least have a moral purpose, tacit or outspoken. The step from the beast-tale pure and simple to the beast-apologue is the easy, perhaps the inevitable, result of the growth of reflection. It is difficult to conceive a beast-tale, of whatever origin, that might not lend itself to moralizing. The process may be illustrated by the anecdote of the wife who contradicted her husband, as told by the Knight de la Tour-Landry (ed. by T. Wright for the Early English Text Society, 1868). We might imagine the knight's daughters asking him why a certain lady has a broken nose and getting in reply a bare statement of facts: how the lady had made herself so troublesome by her bad habit that at last her husband, finding expostulation useless, knocked her down, inflicting the injury in question. This answer would be paralleled, in the realm of beast-fable, by the story of the jackal's neglecting to break the fall of the hyæna, told to satisfy an inquiry about the hyæna's limping with his left hind leg (Bleek, No. 7, p. 14). Instead of such a report of facts, however, the knight reads his daughters a lecture on the enormity of insubordination on the part of a wife, and uses the unfortunate lady as a deterrent. This would be paralleled if the mishap of the hyæna were told to exemplify the dangers of bad company or to enforce the thesis that there is *no* honor among thieves. The remark that hyænas still limp might then be omitted. If retained, it would serve merely as a means of heightening the effect: the victim of bad company received an incurable injury which he has handed down to all his posterity. Once established, the allegorical or moralizing beast-fable would, of course, tend to draw into its circle other beast-tales, whatever their origin, and would, in addition, propagate its kind. On the completion of this process we have the didactic fable, as known to ancient and modern literature, firmly established.

The importance of this distinction between tale and fable is insisted on with much cogency by Mr. Joseph Jacobs in his brilliant *History of the Æsopic Fable* (vol. i. of his edition of Caxton's *Æsop*, London, 1889, pp. 204 ff.); but Mr.

Jacobs, in his desire to restrict as far as possible to Greece and India all claim to fable literature, is too much inclined to rule all savage beast-tales out of the category of fable. The line can seldom be drawn with certainty. The *Uncle Remus* stories, for instance, appear in many cases to be purely beast-tales; yet they sometimes lend themselves, in the mind of the narrator, to a more or less distinctly uttered didactic purpose. Mr. Harris, who collected them and who knows the Negro so well, will not venture to say how far they were all felt as embodying a moral, but suspects some such tendency. To some of Col. Jones's *Negro Myths* a rudimentary moral is appended: "Careless man like Buh Turkey Buzzard" (No. 2, p. 4); "Bad plan to hunt for trouble" (No. 18, p. 40). The application of the Zulu story that the hyrax has no tail because he sent for one instead of going himself is hard to miss (Callaway, i. 355; the same fable among the Basutos, Jacottet, *Revue des Traditions Populaires*, iv. 110). It is difficult to escape the moral of the Brazilian (Indian) story of The Opossum and the Man (Roméro, *Contos populares do Brazil*, p. 191); or the North American Indian story of The Eagle and the Owl (Petitot, *Traditions Indiennes du Canada Nord-Ouest*, Paris, 1886, p. 276). It is, then, unsafe to assert that the beast-tales of any given people have no claim to be regarded as fables merely because they have no formal moral, or because no traveler has ever heard them told except for amusement. It is obvious that the tale and the fable may exist side by side, the tale sometimes being used as a fable, the fable sometimes losing its moral and being told as a tale, as boys read Æsop and as the mediæval congregations often took the "examples" in their preachers' sermons. Further, there is no reason why the beast-tales of one race should not become the beast-fables of another.

The *diffusion* of beast-tales is a complicated subject. When we examine such of these stories as have been taken down from the lips of savage or half-civilized races, we observe at once two distinct classes: those that are apparently indigenous, and those that are identical with European tales, popular or literary. The latter class are in almost every instance certainly borrowed directly or indirectly from the whites, and such borrowing is easily accounted for. Nothing travels farther or faster than a good story. The white man has carried his Æsop and his *Reynard the Fox* to the ends of the earth, and by means of the slave-trade has brought the ends of the earth to his own door. A few examples will illustrate these points. The diverting story of how the fox stole the butter, of which Col. Jones gives an excellent version from Georgia (No. 24, p. 53), occurs in Meyrae, *Traditions des Ardennes*, p. 458; in Bladé, *Contes populaires de la Gascogne*, iii. 195; in Gittée and Lemoine, *Contes populaires du Pays Wallon*, p. 159; in Radloff, *Proben der Volksliteratur der türkischen Stämme Süd-Siberiens*, iii. 369, and elsewhere. The details are too remarkable to admit of accidental coincidence. The Æsopic fable of the Fox and the Crane turns up among Negroes in Brazil (Roméro, p. 159). Reynard's device for stealing fish from the wagon is found in South Africa (Bleek, No. 8, p. 16), and, combined with the trick by which the bear lost his tail, among the Iroquois (Smith, p. 77). In the thirty-second of Col. Jones's *Negro Myths* (p. 73) we actually recognize the Herodotean romance of the Egyptian king's treasure-chamber transmogrified into a tale concerning "Buh Lion, Buh Rabbit, Buh Fox, and Buh Rocoon." The facility with which literary matter becomes a part of popular tradition when once made known, in whatever way, to a tale-telling people, has been a fruitful source of perplexity to students of folk-lore. Besides this borrowing from civilized masters or visitors, savage or half-civilized races have, of course, borrowed largely from each other. This exchange may be observed in those countries in which an African slave population has been brought in contact with the aborigines. On the composite character of the folk-lore of such countries the Portuguese scholar Theophilo Braga has made many excellent observations in his essay *Sobre a Novellística Brasileira*, prefixed to Roméro's *Contos populares do Brazil* (Lisbon, 1885). For a discussion of the beast-epic and of the theories relating to a Northern and a Southern cycle of beast-tales, see article REYNARD THE FOX in this encyclopædia.

The oral literature of modern Europe abounds in unmoralized beast-tales differing in no essential from those of uncivilized races. Some of these are clearly wild-shoots from Æsop or *Reynard the Fox*; others are survivals or modern representatives of the indigenous European stories

to which *Reynard* and probably much of Æsop owe their existence; others are doubtless imitations of old models. The beast-tales included in Asbjörnsen and Moe's *Norske Folkeeventyr* (2d ed., Copenhagen, 1852), in Bladé's *Contes populaires de la Gascogne* (Paris, 1886), in Crane's *Italian Popular Tales* (Boston, 1885), in Coelho's *Contos populares Portuguezes* (Lisbon, 1879), and in that corpus of zoölogical superstitions, Rolland's *Faune populaire de la France* (Paris, 1877 ff.), will serve as examples. Russia is particularly rich in such narratives; see A. Gerber, *Great Russian Animal Tales*, in the *Publications of the Modern Language Association of America*, 1885 (chiefly from Afanasiév's collection). Specimens of gypsy stories may be seen in H. von Wislocki, *Volksdichtungen der siebenbürgischen und süd-ungarischen Zigeuner* (Vienna, 1890).

Clearly, then, a people may outlive the animistic stage of mental development without ejecting unmoralized beast-tales from its oral literature. But in *written* literature it is only in the form of the apologue that such tales can win or maintain a place. In this form, in the collection known as the Fables of Æsop, they have had no small influence on the mental and moral life of ancient, mediæval, and modern Europe. The history of this collection is inextricably bound up with the history of Hindu fables, and the two may be briefly sketched together.

Stainhöwel's Latin and German *Æsop* (about 1480), of which Caxton's *Æsop* is an English translation made through the medium of Machault's French version, goes back in general, though not without intermediaries, to the Latin fables of Phædrus (about 25 A. D.; see PHÆDRUS) and the Greek mythiambi of the Roman Babrius (about 230 A. D.; see BABRIUS). The Greek prose fables of Æsop are merely paraphrases of Babrius. The history of Greek fable before Phædrus and Babrius is obscure. Of the date and nationality of Æsop we have no satisfactory information. We can not even be sure that he is an historical person, though that is probable. It is certain, however, that from the time of Aristophanes the Greeks regularly referred to him the fables which they used in writing and conversation. About 300 B. C. Demetrius Phalereus made a collection (*λόγων Αἰσωπέλων συναγωγή*, Diogenes Laertius, v. 80), now lost, of these floating stories, and it is not improbable that this, in a later recension, was the original of our Phædrus (Jacobs, *History of the Æsopic Fable*, p. 35). The immediate source of Babrius was perhaps the *Δεκαμυθία* of Nicostratus (second century of our era), doubtless a handbook for rhetorical teaching (Rutherford, *Babrius*, p. xl.). What relation this bore to the compilation of Demetrius is purely a matter of conjecture.

The question whether the Æsopic fables of Phædrus and Babrius (which show many correspondences) are native Greek or borrowed from India has been much discussed. The Indian documents most concerned are the Pāli Jātakas, or birth-tales (about 400 B. C., though not put into their present frame till perhaps 500 A. D.; see PĀLI LITERATURE), and the so-called *Fables of Bidpai*. In the Jātakas various beast-fables (in the narrower sense) are strung together as accounts of the incarnations of the Buddha. In the *Fables of Bidpai* (lost in its original form, but preserved in whole or in part in several translations, Syriac, Arabic, Tibetan, etc., and in the Sanskrit abridgment entitled PANCHATANTRA, q. v.) similar, and in some cases identical, stories are used to make up a *Buddhistic De Regimine Principum*. The date of the original work is unknown, but may be put at about 300 A. D. A considerable portion of its contents reappears in the *Hitopadeśa* and the *Kathā-sarīt-sāgara* (see SANSKRIT LITERATURE). The many correspondences between Phædrus-Babrius and the Bidpai collection make borrowing certain. Benfey was of the opinion that the Indians had borrowed largely from the Greeks: but the early date of the Jātakas proves that the former had a large stock of beast-fables of their own, and the appearance of several of the Jātakas among the Æsopic fables suggests an Indian source for such other of the Phædrus-Babrius apologues as are found in the Bidpai collection. It is therefore pretty certain that not a few of Æsop's fables came from the East. That all of them are of Oriental origin is, however, improbable. Unless the Greeks were different from the rest of mankind, they must have had their own primitive beast-tales, and some of these they would inevitably have moralized. Besides, we have a few specimens of Greek fable (in the narrower sense) that date from a time so early as to make borrowing unreasonable. The Hesiodic apologue of the hawk and the nightingale (*Works and Days*, 203 ff.) is an

example (see Rutherford's *Babrius*, p. xxvii., and cf. Joseph Jacobs, *Æsopic Fable*, pp. 26-29). Except the Indians and the Greeks, no ancient nation can be said to have made important original contributions to fable literature.

The history of the Æsopic fable in the Middle Ages is full of difficulties. A tenth-century version of eighty-three fables of Phædrus, which is ascribed in the manuscripts to "Romulus," was the medium through which the Latin fabulist became known to a large part of Western Europe. Most of the Old French "Ysopets," for example, go back to it, though not immediately. Babrius became known through the incomplete Latin translation by Avianus (about 380 A. D.; see AVIANUS). The celebrated Marie de France translated into Norman French of the twelfth century more than a hundred fables, which she ascribed to King Alfred. For a very ingenious conjectural genealogy of her collection the reader may consult Mr. Joseph Jacobs's *History of the Æsopic Fable* (vol. i. of his edition of Caxton's *Æsop*, London, 1889). This is a work which goes over all the questions of Greek, Latin, and Oriental fable afresh (with abundant references to the investigations of Benfey, Hervieux, Rutherford, Mall, and other scholars), and contributes to the subject many facts and much interesting theory.

We have already seen that the oral traditions of modern Europe possess many tales which may be recognized as Æsop's fables without their morals. A fruitful source for the introduction of these stories from written literature into oral literature was certainly the *exempla* of mediæval sermons (see T. F. Crane, *The Exempla of Jacques de Vitry*, London, 1890; and the article EXAMPLE-BOOKS). The people have kept the tales but discarded the *hæc fabula docet*.

The *Fables of Bidpai* was translated into Latin (from a Hebrew version of the Arabic) by John of Capua in the latter part of the thirteenth century under the title of *Directorium Vitæ Humane* (edited by Derembourg, Paris, 1889), and this version (first printed in 1483) did not fail of its influence on the literature of the fourteenth, fifteenth and sixteenth centuries. The Spanish *Calyla è Dymna* (about 1250; edited by Gayangos, 1860) is an independent rendering from the Arabic. The *Directorium*, however, never became popular in the sense in which the fables of Æsop were popular. Sir Thomas North's version (*The Morall Philosophie of Doni*, 1570; excellently edited by Joseph Jacobs, London, 1888) has special interest for the student of English letters.

The only great fabulist of modern times is La Fontaine (1621-95), whose exquisite art made the Æsopic apologue his own, without robbing it of its individuality. The *Fabeln* of Lessing (published 1759) are still read with pleasure, but can not be compared with the masterpieces of La Fontaine. Of other fabulists only the Englishman Gay, the German Gellert and the Russian Krilof need be mentioned. The fable is still used to some extent for ephemeral purposes, as, for example, in political campaigns, but can hardly be expected ever to regain a place in literature.

BIBLIOGRAPHICAL NOTE.—Materials for the study of the beast-tales of savage or semi-civilized races may be found scattered up and down in the anthropological, ethnological, and folk-lore journals. (See FOLK-LORE.) The following books and articles will also be of service: Émile Allain, *Contes Indiens du Brésil*, recueillis par M. le Général Couto de Megalhães (Rio, 1883); H. N. Allen, *Korean Tales* (New York, 1889); C. Baissac, *Le Folk-lore de l'Île Maurice* (Paris, 1888); René Basset, *Contes populaires Berbères* (Paris, 1887); L. J. B. Bérengar-Féraud, *Contes de la Sénégambie* (Paris, 1885); W. H. I. Bleek, *Reynard the Fox in South Africa* (Lond., 1864; in German, Weimar, 1870); the same, *A Brief Account of Bushman Folk-lore* (London and Cape Town, 1875); D. Brauns, *Japanische Märchen und Sagen* (Leipzig, 1885); H. Callaway, *Nursery Tales of the Zulus* (Natal and London, 1868); E. Casalis, *Les Bassoules* (Paris, 1859); Sir G. W. Dasent, *Anansi Tales*, appended to his *Popular Tales from the Norse* (2d ed., London, 1859); G. Dumoutier, *Les Chants et les Traditions populaires des Annamites* (Paris, 1890); Alcéc Fortier, *Bits of Louisiana Folk-lore*, in *Transactions of the Modern Language Association of America*, iii. 100 ff.; W. E. Griffis, *Japanese Fairy World* (Scheneectady, N. Y., 1850); J. C. Harris, *Uncle Remus, his Songs and Sayings* (New York, 1880); the same, *Nights with Uncle Remus* (Boston, 1883); the same, *Daddy Jake* (New York, 1889); the same, *Uncle Remus and his Friends* (Boston, 1892); C. F. Hartt, *Amazonian Tortoise Myths* (Rio, 1875); C. C. Jones, Jr., *Negro Myths from the Georgia Coast* (Boston, 1888); S. W. Koelle, *African Native Literature* (Lon-

don, 1854); C. G. Leland, *Algonquin Legends of New England* (Boston, 1884); L. C. Lloyd, *A Short Account of further Bushman Material* (London, 1889); M. P. Milne-Home, *Mamma's Black Nurse Stories: West Indian Folk-lore* (Edinburgh, 1890); A. B. Mitford, *Tales of Old Japan* (London, 1881); Émile Petitot, *Traditions Indiennes du Canada Nord-Ouest* (Paris, 1886); J. C. Poestion, *Lapp-ländische Märchen* (Vienna, 1886); J. Rivière, *Recueil de Contes populaires de la Kabylie du Djurdjura* (Paris, 1882); S. Romero, *Contos populares do Brazil* (Lisbon, 1885); F. J. de Santa-Anna Nery, *Folk-lore Brésilien* (Paris, 1889); C. F. Schlenker, *A Collection of Temme Traditions* (London, 1861); J. F. Schön, *African Proverbs, etc.* (London, 1886); H. R. Schoolcraft, *Algie Researches* (New York, 1839); the same, *The Myth of Hiawatha and other Oral Legends* (Philadelphia, 1856); Erminnie A. Smith, *Myths of the Iroquois*, in *Report of the United States Bureau of Ethnology for 1880-81*; Edward Steere, *Swahili Tales* (London, 1870); Karl von den Steinen, *Die Bakairi-Sprache* (Leipzig, 1892); G. McC. Theal, *Kaffir Folk-lore* (London, 1882; 2d ed. 1886). See also ANIMISM, FOLK-TALES, and REYNARD THE FOX. GEORGE LYMAN KITTEDGE.

Beast, Number of the: See APOCALYPTIC NUMBER.

Beat: in Alabama and Mississippi, a primary division of a county; a precinct.

Beatifica'tion [Lat. *beatifica'tio*; *beatus*, blessed + *facere*, make]: in the Roman Catholic Church, the solemn act by which the pope declares "blessed" a deceased person who lived and died in the odor of sanctity as proved by the testimony for his virtues, or by his martyrdom, and confirmed by miracles wrought after his death through his intercession. Beatification is a step toward CANONIZATION (*q. v.*).

JOHN J. KEANE.

Beatific Vision: or the direct vision of God; a Christian doctrine directly founded on Scripture (1 Cor. xiii. 12; 1 John iii. 2; Rev. xxii. 3, 4), and universally accepted by the Churches. The time, however, at which the beatific vision is to take place has been the subject of some dispute. The Greek Church puts it after the day of judgment, and among the Protestant Churches this view has been adopted by both the Calvinists and the Lutherans. But it was condemned by the Council of Florence, 1439, which determined that "the souls of those who have remained pure and spotless after baptism, and of those whose sins after baptism have been pardoned, either in this life or in the next, are immediately received into heaven, and behold plainly the triune God as He is"; which decision was confirmed by the Council of Trent.

Beating the Bounds: a popular phrase used in England to denote the periodical survey or perambulation by which the boundaries of parishes are preserved. It is the custom that the clergyman of the parish, with the parochial officers and the boys of the parish school, should march to the boundaries, which the boys strike with willow rods. The boys themselves were sometimes whipped in proximity to an important landmark, in order to impress the subject durably on their memories.

Bea'ton, Beaton, or Bethune, DAVID: Scottish cardinal; b. in Fife, Scotland, 1494; a zealous opponent of the Protestant Reformation. He was appointed Lord Privy Seal in 1528, and was sent as ambassador to France in 1533. He became a cardinal in 1538, and succeeded his uncle as Archbishop of St. Andrews in 1539. On the death of James V., in 1542, Beaton produced a forged will of that king, appointing himself, with three others, regent of the kingdom; but his artifice failed, and the Earl of Arran became the regent. Cardinal Beaton was a cruel persecutor of the Protestants, and caused George Wishart to be burned at the stake. He was assassinated in his own castle in St. Andrews by Norman Leslie and others, May 29, 1546. See Knox, *History of the Reformation in Scotland*; Froude, *History of England*, vol. iv.; Robertson, *History of Scotland*.

Bea'trice: city and railroad junction; capital of Gage co., Neb. (for location of county, see map of Nebraska, ref. 7-K); on Big Blue river; 90 miles S. S. W. of Omaha. It has a public library, 2 opera-houses, 7 fine schools, 13 churches, Holly system of water-works, extensive manufactures, etc.: \$100,000 court-house, new \$60,000 Government building, 7 miles of brick-paved streets, electric lights, electric motor street railway; 7 lines of railway, including Rock Island main line, Union Pacific, C., B. and Q., and minor lines; is the third city in the State in population, second in manu-

factures; has 2 daily and 5 weekly newspapers. It is noted for its fine water-power and excellent building-stone. Pop. (1890) 13,836; (1900) 7,875. EDITOR OF "EXPRESS."

Beatrice Portinari, *bāy-āā-tree'chiaï pōr-tēē-naa'rēē*: See DANTE.

Bea'tie, JAMES, LL. D., D. C. L.: poet; b. in Laurencekirk, Kincardine, Scotland, Oct. 25, 1735. In 1760 he became Professor of Moral Philosophy in Marischal College, Aberdeen. To refute the doctrines of Hume he published his *Essay on Truth* (1770), which was extremely successful. His most popular poem is *The Minstrel* (1771-74). D. in Aberdeen, Aug. 18, 1803. See Sir William Forbes's *Life of James Beattie* (2 vols., 1806); Alexander Bower's *Life of James Beattie* (1804).

Beatty, JOHN, M. D.: b. in Bucks co., Pa., Dec. 10, 1749; graduated at New Jersey College in 1769; studied medicine with Dr. Rush, but entered the army early in the Revolutionary war, and became lieutenant-colonel in the Pennsylvania line in Sept., 1776; was taken prisoner at the capture of Fort Mifflin, and, having been exchanged, was appointed commissary-general of prisoners in 1778, with rank of colonel; resigned in 1780, and engaged in the practice of medicine at Princeton, N. J.; was delegate to the Continental Congress 1783-85; often a member of the State Legislature; was Speaker of the House; member of convention which adopted the Federal Constitution; member of Congress 1793-95; Secretary of State for New Jersey 1795-1805; president of Trenton bank 1815-26. D. in Trenton, May 30, 1826.

Beatus Rhenanus: See RHENANUS BEATUS.

Beaucaire, bō'kār' (i. e. *Bellum Quadrum*, the beautiful square): a town of France; department of Gard; on the right (west) bank of the Rhône, and on a railway from Cette to Tarascon; 15 miles by rail E. of Nîmes (see map of France, ref. 8-G). A bridge nearly one mile long here crosses the Rhône. It has an active trade, which is facilitated by a canal extending to the Mediterranean. Here is held annually a great fair (July 25-28), which was formerly perhaps the largest in Europe. It is said to have been instituted by Count Raymond II. of Toulouse in 1217, although we do not find it mentioned until 1315. It has declined in modern times, but it is still frequented by merchants from all parts of Europe and the Levant. The number of annual visitors was formerly estimated at 100,000, but has greatly declined. The chief articles sold at this fair are silks, wine, oil, drugs, wool, leather, and spices. Pop. (1896) 9,020.

Beauchamp, bō'shān', ALPHONSE, de: a French historian and publicist; b. at Monaco, in Italy, in 1767; resided in Paris. He contributed to the *Moniteur* and the *Gazette de France*, and published many works, among which are a *History of La Vendée* (3 vols., 1806); a *History of Brazil* (1815); and a *Life of General Moreau* (1814). D. in Paris, June 1, 1832.

Beauchamp, bee'cham, EARLS OF: Viscounts Elmley (1815); Barons Beauchamp (1806, in the United Kingdom), a noble family of Great Britain.—FREDERICK LYGON, the sixth earl, was born Nov. 10, 1830, and succeeded his brother in 1866. He was Lord of the Admiralty in 1859, member of Parliament for Tewkesbury 1857-63, and for West Worcestershire 1863-66. He died Feb. 19, 1891, and was succeeded by William Lygon, the seventh earl, b. 1872.

Beauchamp, RICHARD: Earl of Warwick; b. about 1380; served as general of the English army in France under Henry V., and succeeded the Duke of Bedford as regent in France. D. at Rouen in 1439.

Beauelerk, bō'klaark', TOPHAM: friend of Dr. Johnson; b. Dec., 1739; only son of Lord Sydney Beauelerk. D. in London, Mar. 11, 1780. After his death Johnson wrote to Boswell: "Poor dear Beauelerk, his wit, his folly, his acuteness and maliciousness, his merriment and reasoning are now over. Such another will not often be found among mankind."

Beaufort, bō'fort: a port of entry; capital of Carteret co., N. C. (for location of county, see map of North Carolina, ref. 4-J); at the mouth of Newport river, about 4 miles from the ocean and 168 miles E. S. E. of Raleigh. Its harbor is the best in the State, and is defended by Fort Macon. There is a lighthouse 156 feet high at Cape Lookout, 11 miles S. E. of Beaufort, in lat. 34° 37' 16" N., lon. 76° 31' 07" W. Pop. (1880) 2,009; (1890) 2,007; (1900) 2,195.

Beaufort, byn'fort: on railroad; a port of entry; capital of Beaufort co., S. C. (for location of county, see map of South Carolina, ref. 8-E); on Port Royal island, and on an arm of the sea called Port Royal river, about 55 miles W. S. W. of Charleston. It has a good harbor, with nearly 16 feet of water over the bar at the entrance. Lumber, rice, and cotton are exported. Pop. (1880) 2,549; (1890) 3,587; (1900) 4,110.

Beaufort, HENRY, Cardinal: an English prelate; b. about 1375; was a natural son of John of Gaunt and half-brother of King Henry IV. He became Bishop of Lincoln in 1398, Bishop of Winchester in 1405, Lord Chancellor in 1403, again in 1413, and a third time in 1424. He acted a prominent part in political affairs, for which he had superior abilities. During the minority of Henry VI. he was very powerful, and was a rival of his nephew, the Duke of Gloucester. He was suspected of complicity in the murder of that rival, but the insinuation is baseless. He was present at the Council of Constance, and voted for Martin V., who, in return for his services, made him a cardinal (1417), but the king (Henry V.) would not allow him to accept the position. In 1426 he was again nominated, and, Henry VI. not opposing this time, he realized his ambition. He was extremely wealthy. D. in Winchester, Apr. 11, 1447. See Lord Campbell, *Lives of the Lord Chancellors*.

Beaufort, bō'fōr', FRANÇOIS DE VENDÔME, Duc de: b. in Paris in 1616; a grandson of Henry IV. of France, and a son of César de Vendôme. He was a leader of the malcontents or opponents of the court in the civil war of the Fronde. Having returned to his allegiance, he was appointed commander of the fleet by Louis XIV. about 1662. He was killed at the siege of Candia in 1669.

Beaufort, DUKES OF (1682): Marquesses of Worcester (1642); Earls of Worcester (1514); Earls of Glamorgan, Viscounts Grosmont, and Barons Beaufort (1642); Barons Herbert (1461); Barons Herbert of Ragland, Chepstow, and Gower (1506); Barons Bottetourt (1308, in England), an old and prominent family of Great Britain.—HENRY CHARLES FITZROY SOMERSET, the eighth duke, was born Feb. 1, 1824, and succeeded his father in 1853. He was member of Parliament for East Gloucestershire 1846-53; master of the horse 1858-59 and 1866-68; and lieutenant of Monmouthshire.

Beaugency, bō'zhāñ-see': an old town of France; department of Loiret; on the right bank of the Loire, and on the railway from Paris to Bordeaux, 16 miles S. W. of Orléans (see map of France, ref. 4-E). It has manufactures of woolen and leather goods, and a trade in wine, grain, and wool. In the fighting here, Dec. 7 to 10, 1870, the Grand Duke of Mecklenburg was victorious over the French army of the Loire. Pop. (1891) 4,313.

Beauharnais, bō'āär'nay', ALEXANDRE, Vicomte de: French soldier and statesman; b. on the island of Martinique, May 28, 1760; fought under Rochambeau in America; married (1779) Josephine Tascher de la Pagerie, afterward wife of Napoleon I.; member of the National Assembly 1789, and twice its president; general in the Army of the North 1791; general of the Army of the Rhine 1793; accused of participation in the surrender of Mainz; executed in Paris, July 23, 1794.

Beauharnais, EUGÈNE, de: son of Vicomte Alexandre de Beauharnais; b. in Paris, Sept. 3, 1781. His mother, Josephine, became the wife of Bonaparte, whom he accompanied to Egypt in 1798. He was rapidly promoted in the army, was appointed Viceroy of Italy in 1805, and married the Princess Amalie Augusta, a daughter of the King of Bavaria, in 1806. His functions as viceroy were performed with ability, prudence, and moderation. He also displayed superior military talents in the campaign against Austria in 1809 and in the invasion of Russia in 1812. Having obtained command of the army in Russia after it had suffered great disasters, he acted with remarkable firmness and constancy, and made a masterly retreat. After the battle of Lützen, May, 1813, in which he took part, he went to Italy, which he defended against the Austrians until the deposition of Napoleon. He afterward resided at Munich, and obtained from the King of Bavaria the title and estate of Duke of Leuchtenberg. D. in Munich, Feb. 21, 1824. One of his sons married Dona Maria, Queen of Portugal, in 1835. See Léonard Gallois, *Histoire du Prince Eugène de Beauharnais* (1821); A. Aubriet, *Vie de Eugène de Beauharnais* (1824).

Beauharnais, HORTENSE: See HORTENSE.

Beauharnais, JOSEPHINE: See JOSEPHINE.

Beauharnois, bō'āär'nwāä': capital of Beauharnois co., Quebec; on branch of Grand Trunk Railway, and on St. Lawrence river; 27 miles S. W. of Montreal (see map of Quebec, ref. 5-B). It has flax-mills, potteries, and factories. Pop. (1881) 1,499; (1891) 1,590.

Beaujour, bō'zhoor', LOUIS FÉLIX: b. in Provence, France, in 1765; entered the diplomatic service in 1788, and in 1804 became consul-general and *chargé d'affaires* to the U. S.; wrote *A Sketch of the United States at the Commencement of the Nineteenth Century*; returned to France in 1814; became consul-general at Smyrna in 1816, and inspector-general for all the Levant in 1817; was made baron in 1819. D. July 1, 1836.

Beaumarchais, bō'māär'shay', PIERRE AUGUSTIN CARON, de: a French dramatist remarkable for his wit and versatility, whose adventurous career and vicissitudes of fortune obtained for him great celebrity; b. at Paris, Jan. 24, 1732; was the son of a clockmaker. Although sent to the college (Anglicè, *school*) at Alfort, he was at the early age of thirteen apprenticed to his father. He soon discovered a decided taste for literature and an excessive fondness for music, in which art he became so proficient that he was enabled to procure an introduction to the court of Louis XV., and was employed to teach the princesses, his daughters, to play upon the harp, in the performance upon which he was skilled, and in the pedals of which he introduced an improvement. At the concerts given at the court he made the acquaintance of Duverney, the celebrated financier of that period, whom he was enabled to aid, by his influence with the princesses, in the accomplishment of certain projects in which the banker was at that time engaged. In return, Duverney instructed him in the affairs of finance, and aided him with funds and credit. The first literary production which attracted attention to Beaumarchais was his drama of *Eugénie*, published in 1767, which, however, did not meet with success. In Nov., 1768, Beaumarchais's second wife died, and in July of the same year Duverney. Although one-half of his wife's fortune was in a life-annuity, and the settlement of Duverney's affairs discovered a balance in favor of Beaumarchais, a rumor prevailed that he had poisoned his wife, and he was accused by Comte de la Blache, Duverney's heir, of embezzlement, fraud, and forgery. A seven years' litigation in securing the amount due him from Duverney was the occasion of his masterly *Mémoires* in his defense, which obtained for him great notoriety. These productions are admitted to be masterpieces in their way, and the interest and excitement produced by them is described as magical and electrical. Although thus occupied in the law and in his favorite literary pursuits, Beaumarchais was still actively engaged in various business speculations. He was prompt to foresee the success of the American Revolution, and engaged by connivance with, though unaided by, the French Government in supplying the Americans with arms and ammunition.

In the midst of his manifold labors he undertook at this time an expensive reproduction of the works of Voltaire, one edition of which was to be in seventy-two volumes, by which he sustained a very heavy loss. Notwithstanding he gave his support to the principles of the French Revolution, and imported firearms for the use of the French, his property was confiscated, and he was for a time an exile from his native land. After undergoing persecution and accusation, he returned to France when the Revolution was over. His sufferings during this period were described by him in a published work entitled *Mes Six Époques*. He recovered possession of his beautiful villa at Faubourg St. Antoine, where he remained till his death. The evening of May 17, 1799, he passed with his family and a few friends; on the morning of the 18th he was found dead in his bed.

Besides the works already mentioned, he was also the author of various dramatic productions. *Le Mariage de Figaro*, his masterpiece, produced the greatest excitement in Paris, and his *Barbier de Séville*, which preceded it, was also a great success. The first formed an epoch in the dramatic, social, and political annals of France, and was styled by Napoleon "the Revolution already in action." It is but proper to add that no conception of its wit, vivacity, and telling social and political allusions and sarcasms can be had at the present day, especially from the opera librettos with which we are familiar. See L. de Loménie's *Beaumarchais, sa Vie et son Temps* (1852); St.-Marc Girardin, *Notice sur la Vie de Beaumarchais* (1835); E. Berger, *Essai sur la*

Vie et les Ouvrages de Beaumarchais (1847); E. Lintilhac, *Beaumarchais et ses Œuvres* (1887).

Beaumaris: a seaport of Wales; capital of the island and county of Anglesea; on the east coast of the island; 3 miles N. of Bangor, and about 2 miles from the north end of Menai Strait (see map of England, ref. 8-D). It is a favorite place of resort for sea-bathing. The Bay of Beaumaris affords safe anchorage. Here is a ruined castle built by Edward I. Pop. (1891) 2,202.

Beaumont: city and railroad junction; capital of Jefferson co., Tex. (for location of county, see map of Texas, ref. 5-K); 83 miles E. by N. of Houston, and 68 miles N. E. of Galveston, and at head of tide-water navigation on Neches river, which is navigable for 331 miles from the sea by steamers. The yellow pine and cypress lumber and shingles manufactured on the Neches river (which has four mills) are shipped by Southern Pacific R. R. and in steamers and schooners from Beaumont via Sabine Pass. An average of 1,720 car-loads a month is shipped by rail through Texas, etc. Beaumont has fine water-works, electric-light, ice-works, refrigerating company, furniture-factory, foundry, steam-laundry, street-cars, etc., and is one of the most progressive lumber and shingle manufacturing towns in the South. Pop. (1890) 3,296; (1900) 9,427.

EDITOR OF "ENTERPRISE."

Beaumont, FRANCIS: dramatic poet; b. at Grace Dieu, in Leicestershire, England, in 1584; educated at Oxford. He was an intimate friend of John Fletcher, in partnership with whom he wrote about a third of the fifty-two plays which pass under their joint names, among which are the excellent tragedies and tragi-comedies, *Philaster*, *The Maid's Tragedy*, and *A King and No King*. D. Mar. 6, 1616, and was buried in Westminster Abbey.

Beaumont, bō'mōn', GUSTAVE DE LA BONNIÈRE, de: French publicist; b. in Beaumont la Chartre, Feb. 16, 1802; sent to America with De Toqueville in 1831 to study the U. S. prison system; member of the Chamber 1840; ambassador to London under Cavaignac. D. in Tours, Apr. 2, 1866. He was author of *Traité du système pénitentiaire aux États-Unis et de son application en France*; *Marie, ou l'esclavage aux États-Unis*; *L'Irlande sociale, politique et religieuse*.

Beaumont, WILLIAM, M. D.: surgeon; b. at Lebanon, Conn., in 1785. While in the U. S. army in 1825 a young man (Alexis St.-Martin) was brought to him who had received a wound from a musket discharged at the distance of only a few feet. The wound healed, and left an aperture about 2½ inches in diameter, through which the process of digestion could be seen. Dr. Beaumont availed himself of this to make various experiments on digestion, the results of which are extremely interesting and of great importance to physiological science. They were published in 1838. D. in St. Louis, Mo., Apr. 25, 1853.

Beaune, bōn (anc. *Vellaunodunum*): an old town of France; department of Côte d'Or; on the river Bouzoise, and on the Paris and Lyons Railway; 23 miles by rail S. S. W. of Dijon (see map of France, ref. 5-G). It has the beautiful Church of Notre Dame, and a splendid hospital founded in 1443, which retains nearly unchanged its original Gothic buildings. Here are manufactures of woolen cloth, cutlery, leather, etc. Good burgundy wine is produced in this vicinity. Pop. (1896) 13,726.

Beauport: a post-village and parish of Quebec co., Quebec, Canada, 3½ miles N. E. of Quebec; on north shore of St. Lawrence river (for location of county, see map of Quebec, ref. 4-D). It has extensive manufactures and trade in flour, lumber, nails, etc., and is the seat of Beauport Lunatic Asylum, a large and well-conducted institution. Pop. 4,800.

Beaurain, bō'rān', JEAN, de: b. at Aix-en-Essart in 1696; appointed royal geographer in 1721. His best work is *Topographical and Military Description of the Campaigns of Marshal Luxembourg from 1690 to 1694*. D. 1771.

Beauregard, PIERRE GUSTAVE TOUTANT: soldier and engineer; b. near New Orleans, May 28, 1818; graduated at U. S. Military Academy July 1, 1838; second lieutenant of engineers July 7, 1838; was distinguished at the siege of Vera Cruz, in reconnoissances before the battle of Cerro Gordo, and in battles in the valley of Mexico, for which twice breveted; wounded in assault on Belen Gate, Sept. 13, 1847; captain of engineers Mar. 3, 1853; in charge of defenses in Louisiana 1853-60; appointed superintendent of U. S. Mili-

tary Academy Nov., 1860, but held this position a few days only. Resigned Feb. 20, 1861, and was made brigadier-general in Confederate army, in which capacity he directed the operations against Fort Sumter which opened the civil war. He commanded subsequently the forces which defeated Gen. McDowell at Bull's Run, July 21, 1861, for which victory he was next day made general; was second in command at the battle of Shiloh, Apr. 6, but opposed the plan of advance, and on Johnston's death assumed chief command, holding his ground until 2 p. m. next day against the Federal forces, re-enforced by the army of Gen. Buell; he then withdrew to Corinth, which place he held against the forces of Gen. Halleck till May 30, when he evacuated it, retreating to Tupelo. He subsequently commanded, with headquarters at Charleston, the defense of the Southern coast, signalized by the unsuccessful attack, Apr. 7, 1863, of Admiral DuPont's squadron, and by the combined operations of sea and land forces under Admiral Dahlgren and Gen. Gillmore. In 1864 he commanded in Virginia, successfully resisting Gen. Butler's forces at Drury's Bluff, and later, with a force of 5,700 men, increased to 10,500, resisted Gen. Grant's front attack upon Petersburg, holding that place till re-enforced by part of Lee's army, thus compelling the long-protracted siege. Was subsequently charged with resisting Gen. Sherman's march to the sea, having but 5,000 men, partly militia. The skillful withdrawal of Gen. Hardee's army from Savannah, invested by Sherman, to Pocotaligo, was due to Beauregard. At the time of the surrender of Gen. Johnston's army Beauregard was voluntarily assisting him. After the war he was engaged in railroad management. In 1866 the chief command of the Roumanian army was tendered him, and in 1869 that of the army of the Khedive of Egypt, both of which he declined. Became adjutant-general of Louisiana 1878, and eventually served the Louisiana State Lottery. D. in New Orleans, Feb. 20, 1893.

Revised by C. K. ADAMS.

Beauvais, bō'vay' (anc. *Bellovacum*): an old city of France; capital of the department of Oise; situated on the river Thérain, and in a rich valley inclosed by wooded hills; 64 miles by rail N. N. W. of Paris (see map of France, ref. 3-F). It has a fine large but unfinished Gothic cathedral, a public library, a museum, and a college. Here are extensive manufactures of woolen cloths, flannels, shawls, Gobelin tapestry, printed cottons, and carpets. Pop. (1896) 19,906. It was the chief town of the Bellovaci in the time of Cæsar. In 1443 it was besieged in vain by the English. The citizens of Beauvais repulsed Charles the Bold, Duke of Burgundy, who besieged the city in 1472 with 80,000 men.

Beaven, ROBERT: See the Appendix.

Beaver (in Lat. *castor*): a remarkable quadruped (*Castor fiber*) of the order *Rodentia*; a native of Europe, Asia, and North America. Beavers were once abundant in the U. S., but they have gradually disappeared before the advance of civilization. They are characterized by industry, sagacity, and instinctive skill in building dams and houses. They have strong incisors or cutting teeth, in which a sharp, chisel-like edge is always preserved by the unequal abrasion of the hard enamel and the other part, which is softer. The body of the beaver is about 2 feet long. The toes of the hind feet are long, spreading, and webbed to the nails.

Beaver.

Among its remarkable characteristics is a tail of an oval form, about 10 inches long, horizontally flattened, and about 3 inches wide. This is covered with horny scales, but the

body is clothed with a very fine and valuable fur, the color of which is sometimes chestnut-brown; this fur is used for making hats and caps. The food of the beaver consists of bark of trees, leaves, roots, and berries. Its favorite haunts are rivers and lakes which are bordered by forests. "Their work is all performed in the night," says Dr. Godman. When they find a stream that is not sufficiently deep for their purpose, they build a dam across it with wonderful ingenuity and industry. The dam, which is formed of sticks, roots, stones, and mud strangely combined, is water-tight, and presents a convex surface toward the current. To obtain material for it they cut down the trees growing on the margin of the stream above the dam, and float them down. They prefer small trees, but sometimes fell those that are 10 inches or more in diameter. It is stated that they have built dams nearly 300 yards long. The sides of the dam incline toward each other, so that the bottom of it is much thicker than the top. There is a popular opinion that beavers use their tails as trowels in plastering. It is more probable that the tail serves as a prop or support when they work with their fore feet or carry burdens with them. They pass the winter in houses or lodges which are 2 to 3 feet high, are built on the edge of the water, and afford them protection from wolves and other wild beasts. They also have holes or burrows in the ground (adjacent to their lodges), with entrances under the water, in which they take refuge if their lodges are destroyed or become untenable.

The houses or huts of beavers are not built of sticks first and then plastered, but all the materials, sticks, mud, and stones, are mixed together, and this composition is employed from the foundation to the summit. "The tops of the houses," says Godman, "are generally from 4 to 6 feet thick at the apex of the cone." "The outside of the hut is covered or plastered with mud late in the autumn, and after frost has begun to appear. By freezing it soon becomes almost as hard as stone, effectually excluding their great enemy, the wolverine, during the winter. The door or hole leading into the beaver-hut is always on the side farthest from the land, and is near the foundation of the hut or at a considerable depth under water." When they are much disturbed by the presence of hunters and settlers, beavers renounce their original programme, cease to build dams and houses, and, adapting themselves to their altered circumstances, excavate in the banks of rivers holes for their residence—a signal manifestation of sagacity.

Beavers are easily tamed, but no wooden cage will keep them confined, because they gnaw through. Many of them are caught in traps by the Indians and other trappers. In 1820 60,000 beaver skins were sold by the Hudson's Bay Company. Their numbers are rapidly diminishing in consequence of the exterminating warfare waged against them by hunters, who often kill the young before they have attained half their growth. The bait which is used to entice beavers is prepared from the substance called castor (*castoreum*), obtained from glandular pouches connected with the reproductive organs of the male beavers. "The only species of beaver known," says Dr. Godman, "is the one we have described," but others believe the Old World and New World beavers to be distinct species. The so-called extinct giant beaver, known as the *Castoroides ohioensis*, is not related to the beaver, but to the South American octodonts, a group represented by the COYPU (*q. v.*). It was first described by Col. J. W. Foster, and by him was called *Castoroides*. See Morgan, *The American Beaver* (1867).

Beaver: borough; on railroad; capital of Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4-A); on the right bank of the Ohio river, 2 miles below the mouth of the Beaver river, and 27 miles N. W. of Pittsburgh. It is the seat of Beaver College, a female seminary, an academy, and has good union schools; has water-power and natural gas. There is a fine park in the center of the village. Pop. (1880) 1,178; (1890) 1,552; (1900) 2,348.

Beaver: city; capital of Beaver co., Utah (for location of county, see map of Utah, ref. 6-L); on Beaver river; about 50 miles S. by W. of Fillmore. The chief productions are the cereals and wool. Copper and lead are found in the vicinity. Pop. of precinct, including Beaver city (1880) 1,911; (1890) 1,752; Beaver city (1900) 1,701.

Beaver Dam: on railroad; a city of Dodge co., Wis. (for location of county, see map of Wisconsin, ref. 6-E); on Beaver Dam creek; 61 miles N. W. of Milwaukee. Beaver Dam is the seat of Wayland University, and has a fine water-power, two woolen factories, a large seeder establishment,

etc. It is situated in an agricultural district, and is a place of summer resort. Pop. (1880) 3,416; (1890) 4,222, to which the enveloping township added 1,341; (1900) 5,128.

Beaver Falls: borough; on railroad; Beaver co., Pa. (for location of county, see map of Pennsylvania, ref. 4-A); on Beaver river, 4 miles above its junction with the Ohio; 31 miles N. W. of Pittsburgh. It has Geneva College, important manufactures, natural gas, plenty of coal, and water-power. Pop. (1880) 5,104; (1890) 9,735; (1900) 10,054. EDITOR OF "TRIBUNE."

Beaver Islands: a group of islands in the north part of Lake Michigan; a part of Charlevoix co., Mich. (for location, see map of Michigan, ref. 3-H). St. James, on Big Beaver island, is the chief town. Here a branch of the Mormons under James J. Strang settled in 1847. See Campbell's *Outlines of the Political History of Michigan*, and *An American King*, Harper's Magazine, Mar., 1882.

Bebber, beb'ber, WILHELM JAKOB, van, Ph. D.: German meteorologist and author; forecaster for the Seewarte meteorological service; b. at Grieth-am-Niederrhein, Rhine Province, Prussia, July 10, 1841; educated at the gymnasium at Emmerich, the academy at Münster, and the university at Bonn. After teaching for some years he became in 1875 rector of the Realschule at Weissenburg-am-Sand, and in 1879 chief of the division of weather-telegraphing of the German Seewarte at Hamburg, which position he still holds. Prof. van Bebber issues daily the weather forecasts for the German and other European coasts, and part of the interior. He has also prepared 130 or more publications of some length. Among these are two well-known and valuable books: *Handbuch der ausübende Witterungskunde* (2 vols., 1885 and 1886) and *Lehrbuch der Meteorologie* (1890). M. W. HARRINGTON.

Bebee'ria, or **Bebee'rine** (C₁₉H₂₁NO₃): a vegetable alkali or alkaloid obtained from the bark of the bebeeru, or green-heart, a tree of British Guiana. It is used in medicine as a substitute for quinine, which it resembles in properties.

Bebee'ru, **Bibiru**, or **Bibisi** (*Nectandra rodigi*): a tree of British Guiana: the timber is known in commerce as green-heart. It is of the family *Lauraceæ*. See GREEN-HEART.

Bebel, bay'bel, FERDINAND AUGUST: German socialist; b. in Cologne, Feb. 22, 1840; learned the turner's trade; settled in Leipzig; became prominent in labor organizations; associate editor of the *Volksstaat*, and later of *Vorwärts*; member of the North German Parliament 1867, of the German Parliament 1871-81 and 1883-; member of the Legislature of Saxony from 1881 to 1894; frequently sentenced to imprisonment; a gifted orator; author of *Our Aims* (10th ed.); *The German Peasant War* (1876); *Woman* (10th ed. 1891), etc. C. H. THURBER.

Bebel, HEINRICH: German humanist; b. in Ingstetten, 1472; Professor of Oratory and Poetry at Tübingen in 1497; poet-laureate by the Emperor Maximilian in 1501. He is the author of numerous poems, mostly written in Latin and in praise of the German emperor. His love for popular traditions and poetry is shown by his collections of German proverbs (*Proverbia Germanica*), and of popular jokes and stories which he published under the title *Facetie*, and which were read extensively, being directed chiefly against the Roman Catholic clergy. D. in Tübingen, 1518. See his *Life* by G. W. Zapf (Augsburg, 1802). JULIUS GOEBEL.

Beccafico, bek-ka-fee'kō [Ital., fig-pecker]: any one of several small European birds which feed or are supposed to feed on figs, as the BLUE-THROAT (*q. v.*) and especially *Curruca hortensis*; a small bird of the family of *Sylviidæ* or warblers, sometimes called the garden-warbler. It is abundant in Southern Europe as a summer bird of passage. The flesh of it is esteemed as a delicate food by the Italians. It has an agreeable song.

Beccaria, bek-kā-ree'ā, CESARE BONESANA, Marquis di: an eminent Italian economist and writer on penal laws; b. in Milan, Mar. 15, 1738. His principles were formed by the influence of Montesquieu. His most important work is a *Treatise on Crimes and Punishments* (*Trattato dei Delitti e delle Pene*, 1764), in which he advanced eloquent arguments against the severities and abuses of criminal law. It obtained great popularity, and was translated into many languages. Voltaire admired it, and wrote a commentary on it. In 1768 he was appointed Professor of Political Philosophy at Milan. D. in Milan, Nov. 28, 1794. See C. P. Villa, *Vita del Marchese C. Beccaria* (1821); P. Custodi, *Vita di C. Beccaria*.

Bêche-de-Mer, baysh'de-mâr' [Fr., sea-spade]: also called **Trepang**; a name given to the dried bodies of several species of *Holothuria*, or sea-cucumber, which are abundant in shallow lagoons and on reefs between Australia, the Fiji islands, and the southeast coasts of Asia. They are esteemed as an article of food by the Chinese. The Malay divers catch them and prepare them in large quantities for the Chinese market. This animal is usually about 9 inches long, but sometimes measures 2 feet. It is stated that 8,000 cwt. of the trepang are annually exported from Macassar to China. See **HOLOTHURIDÆ**.

Becher, bech'er, JOHANN JOACHIM: a German chemist; b. at Speyer in 1635; is called the author of the first theory of chemistry. He became aulic councillor at Vienna, but soon fell into disgrace, and removed to Mayence. He was addicted to speculation, and wrote, besides other works, *Physica Subterranea* (1669). His theory was the basis of that which was developed by Stahl. D. in London, Oct., 1682.

Becher, SIEGFRIED: political economist; b. at Plan, in Bohemia, Feb. 28, 1806; became Professor of History and Geography in the Polytechnic Institute in Vienna in 1835. D. in Vienna, Mar. 4, 1873. Among his works are *Das Oesterreichische Münzswesen von 1524-1833* (2 vols., Vienna, 1838); *Organization des Gewerbeswesens* (Vienna, 1851); and *Die Volkswirtschaft* (Vienna, 1853).

Bechman, GEORGES: civil engineer; in charge of the water-supply and sewerage of the city of Paris; b. in Paris, Jan. 1, 1848. In 1869 he finished his studies at the Polytechnic School, and entered the School of Bridges and Roads. Here he graduated in 1873, having lost one year by serving a term in the army during the Franco-Prussian war. After varied service on harbors and other works, he was attached to the water-supply of Paris. In 1886 he reached the grade of engineer-in-chief of bridges and roads, remaining still connected with the works of the city of Paris under M. Alphand. He designed the new water-supply of the city, to be brought from the department of the Eure. During the exposition of 1889 he constructed the illuminated fountains of the Champ de Mars. Since the death of Durand-Claye he has had charge also of the sewerage of Paris, and is the author of the great works for utilizing the sewage on the plain of Asnières, which are an extension of those of Gennevilliers, and those of the plain of Méry, which are now in course of execution. He has been often consulted upon the sewerage of other cities, among them Messina, Turin, and Toulon. He is an officer of the Legion of Honor, and member of many foreign orders. W. R. HUTTON.

Bechuana, bet-shwaa'na: an African race occupying the interior of South Africa, between the parallels 22° S. and 28° S., and the meridians 22° E. and 29° E., a nearly treeless area, including a large part of the Kalahari desert. The race numbers about 200,000. They are not nomadic, but live in towns of considerable size. They are industrious and bright, alive to whatever will increase their property or comfort, and many migrate for a time to Cape Colony, where they are highly prized as servants. While not exactly warlike, they are inured to warfare, but they have been unable to withstand the more savage Kaffres, Zulns, and Matabele on the E. They are well formed, dark brown or bronze: the lips are thicker and nostrils wider than with the Europeans, but they are not of a marked African type, and are often handsome. The hair is frizzled, but not kinky. They possess some of the arts, and the women practice agriculture to some extent. They have no particular religious system, but believe in witchcraft and practice circumcision. Rain is scanty with them, and the rainmaker is an important personage, whose commands are implicitly obeyed, but sometimes, when he fails, he is sacrificed to their wrath. The language is copious, and, like the Kaffre and Zulu, belongs to the Bantu family. Theodore Bent suggests that their name may be a corruption of *Baquaina* (i. e. children of the quaina, or crocodile), the native name of one of the most powerful tribes, whose totem is the crocodile. M. W. H.

Bechuanaland: a British protectorate in the interior of South Africa, extending (since Nov., 1895) from the Molopo river, the present northern boundary of Cape Colony, northward over the Kalahari desert as far as the Zambesi, and having Matabeleland and the Transvaal on the E. and German Southwest Africa on the W., the twentieth meridian (E.) being for the most part the dividing line; area, about 386,200 sq. miles. The British crown colony of the same name which lay S. of the Molopo river, and had an area of

51,574 sq. miles and a population (1891) of 72,736, was incorporated into Cape Colony on Nov., 1895. Within the limits of the protectorate are included the domains of the native chiefs Khama, Sebele, and Bathoen, each of whom rules his own people under the protection of the Queen, and with the assistance of a resident, and continues to enjoy the hunting privileges he has hitherto possessed. With these exceptions the whole region is administered by the British South Africa Company. A railway extending from Capetown, through Kimberley, Vryburg, and Mafeking, has now (1897) reached Palapye, the capital of Khama's country (pop. 25,000), and is being pushed on to Bnlwayo and Fort Salisbury in Mashonaland. A telegraph line has already been established as far as Fort Salisbury. A tax of \$2.50 is levied on each native hut. Cattle-rearing and agriculture are the chief industries, and the natives are peaceable.

Beck, JAMES B.: U. S. Senator; b. in Dumfriesshire, Scotland, Feb. 13, 1822; emigrated with his parents to Lexington, Ky.; admitted to the bar 1846; served in Congress as a Democrat 1867-75; elected to U. S. Senate 1877; re-elected 1882 and 1888. D. in Washington suddenly, May 4, 1890.

Beck, JOHANN TOBIAS: See the Appendix.

Becker, bek'âr', GEORGES: French figure-painter of note; b. in Paris in 1845; pupil of Gérôme; second-class medal, Paris Salon, 1872; Legion of Honor 1889; well known in the U. S. as the painter of a large picture, *Rizpah Protecting the Bodies of her Sons*, exhibited at the Centennial Exhibition, Philadelphia, 1876. Studio in Paris. W. A. C.

Becker, bek'er, HERMANN HEINRICH: a German politician, called DER ROTHE BECKER (i. e. the Red Becker, on account of his extreme radical views in politics); was b. in Elberfeld, Sept. 15, 1820; took part in the revolutionary movement in 1848, and was imprisoned for several years. In 1862 he was elected a member of the Prussian House of Deputies, and in 1867 and 1868 of the North German Parliament; became a recognized leader of the Liberal party; mayor of Dortmund 1870; of Cologne 1875. D. Dec. 9, 1885.

Becker, KARL FRIEDRICH: b. at Berlin in 1777; studied philosophy and history at Halle; was a teacher in Berlin, but gave up all kinds of business on account of ill health, and d. Mar. 15, 1806. From 1801 to 1805 he published his *Weltgeschichte für Kinder und Kinderlehrer* (9 vols., Berlin, 1801-05), which has been often reprinted and translated into other languages. On account of a singular felicity both in arrangement and style, it was to young readers a very pleasant and useful book, but since the death of the author it has been so much augmented, continued, corrected, and changed as to become nearly valueless.

Becker, MAX J.: civil engineer; b. in Coblenz in Rhenish Prussia, June 1, 1827; came to the U. S. in 1850. From 1856 to 1858 he was engineer of the board of public works of Ohio, and later engaged in railroad construction. Since 1867 he has been chief engineer of the Pittsburg, Cincinnati and St. Louis R. R. During 1889 he was president of the American Society of Civil Engineers.

Becker, THOMAS A.: first Roman Catholic bishop of the diocese of Wilmington, Del.; b. of German Protestant parents in Pittsburg in 1832; studied in Munich, where he joined the Catholic Church, and at the Propaganda in Rome; was ordained 1859. After serving as professor in St. Mary's College, Emmitsburg, Md., he was consecrated as Bishop of Wilmington, Aug. 23, 1868; transferred to the see of Savannah, May, 1886.

Becker, WILHELM ADOLF: German author; b. at Dresden in 1796. He attempted to reproduce the social life of ancient Rome in *Gallus* (1838), and that of ancient Greece in his *Charicles* (1840), both of which were translated into English by Metcalfe. His chief work is *Handbuch der röm. Alterthümer* (1843-46). D. in Weissen, Sept. 30, 1846.

Beckerath, bek'ke-räät, HERMANN, von: Prussian statesman; b. Dec. 13, 1801, in Crefeld; made a fortune as a banker; advocated German unity; member of National Assembly at Frankfort 1848; Minister of Finance 1848-49. D. in Crefeld, May 12, 1870.

Becket, THOMAS A': Archbishop of Canterbury; b. in London, Dec. 21, 1118; studied at Oxford and Paris, and was appointed High Chancellor in 1155, being the first native Englishman after the Conquest who filled a high office. His style of living was sumptuous in this part of his life, but when he became Archbishop of Canterbury in 1162 a remarkable change took place in his habits and deportment. He

practiced or affected great austerity, and appeared as a zealous champion of the Church against the aggressions of the king, whose policy tended to keep the clergy in subordination to the civil power. Becket having been involved in a conflict with Henry II., escaped in 1164 to France, and appealed to the pope, by whom he was supported. Henry confiscated his property and sequestered the revenues of his see, and received in return a menace of a papal interdict. In 1170 a formal but hollow reconciliation was made between the king and the obstinate and haughty prelate, who returned to England and resumed his office. He also renewed his defiance of the royal authority, but on Dec. 29, 1170, at the altar, in the cathedral in Canterbury, was assassinated by four knights, servants of the king. He was regarded as a martyr by many patriotic Saxons, as well as by the zealous votaries of the Church. He was canonized by the pope in 1173, and his bones were deposited in a splendid shrine at Canterbury, which became the object of one of the great pilgrimages of Christendom. Henry VIII. destroyed the shrine and scattered Becket's ashes. See *Lives* by J. C. Robertson (London, 1859); R. A. Thompson (1888); and *Materials for the History of Thomas Becket* (1875, sqq., 8 vols.); and *Chronicles and Memorials of Becket* (1880).

Beckford, WILLIAM: an English author; b. at Fonthill, Wiltshire, Sept. 29, 1759. He inherited from his father an immense fortune, including the estate of Fonthill. His annual income was about £100,000. He married in 1783 Lady Margaret Gordon, a daughter of the Earl of Aboyne. In 1784 he published his principal work, *Vathek*, an Eastern tale (written in French), which was highly commended by Lord Byron. He was elected to Parliament in 1790, resided some years in Portugal, and expended an enormous sum in the erection of Fonthill Abbey, which he filled with rare and expensive works of art. In 1822 he sold this palace and the estate of Fonthill, with all its collections, to Col. Farquhar for £330,000, and built another palace at Bath. He published in 1834 a series of letters entitled *Italy, with Sketches of Spain and Portugal* (2 vols., 1834), and *Memoirs of Extraordinary Painters* (1835). He was a witty and graphic writer, and had much talent for sarcasm. D. May 2, 1844. See *Memoirs of William Beckford*, by Cyrus Redding (London, 2 vols., 1859); *Quarterly Review* (for Mar. and June, 1834).

Beckwith, JAMES CARROLL: portrait and genre painter; b. at Hannibal, Mo., Sept. 23, 1852; pupil of Carolus-Duran, Paris; honorable mention, Paris Salon, 1887; third-class medal, Paris Exposition, 1889; associate member of National Academy of Design, member of the Society of American Artists (1881), and American Water-color Society. He began his studies in the school of the Academy of Design in Chicago about 1869, studied two years in New York in the academy schools, and went to Paris in 1873. He returned to New York in 1878, and has been a regular exhibitor at the Academy, the Society of American Artists, and other places ever since, sending pictures also from time to time to the Salon. He exhibited also at the Royal Academy, London, in 1892. He is a draughtsman of great skill, and a painter of much more than ordinary cleverness. His portraits are notable for sound construction as well as truth of line. Studio in New York. WILLIAM A. COFFIN.

Beckwith, JOHN WATRUS, D. D.: second Bishop of Georgia; b. in Raleigh, N. C., Feb. 9, 1831; graduated at Trinity College, Hartford, Conn., in 1852; ordained deacon in 1854, and priest in 1855. He ministered in North Carolina, Maryland, Mississippi, Alabama, and Louisiana, and was consecrated Apr. 2, 1868. D. in Atlanta, Ga., Nov. 23, 1890. Bishop Beckwith was distinguished for the brilliancy of his rhetoric, the splendor of his eloquence, and for his simplicity of character.

Bequerel, bek'rel', ANTOINE CÉSAR: French savant; b. at Chatillon-sur-Loing, Loiret, Mar. 8, 1788. He served in the army as an officer of engineers from 1810 till 1815, after which he gave special attention to the study of electricity, and made discoveries in electro-chemistry. He refuted and exploded Volta's theory of contact, and constructed the first constant pile. In 1837 he received the Copley medal of the Royal Society of London. He invented a method of electrotyping. He published, besides other works, *Traité expérimental de l'électricité et du magnétisme* (7 vols., 1834-40). He became a member of the Academy of Sciences in 1829. D. Jan. 19, 1878.—His sons, ALEXANDRE EDMOND (b. Mar. 24, 1820; d. May 12, 1891), a physicist, and LOUIS ALFRED, a physician (b. in 1814; d. in 1862), both attained distinction as scientific men.

Beese, bech'e, OLD (Hun. *O' Becse*): a market-town of Hungary; in the county of Bacs; 48 miles S. of Szegedin; on the Theiss (see map of Austria-Hungary, ref. 8-H). Pop. 16,850. *New Beese*, which has a population of 7,193, is in the county of Torontal; on the Theiss; 8 miles E. of Old Beese.

Beeskerek, Nagy, noj'bech-kā-rek' (Great Beeskerek): a town of Hungary; county of Torontal; on the left bank of the Bega; 59 miles S. W. of Temesvár, with which it is connected by a canal (see map of Austria-Hungary, ref. 8-1). It has a considerable trade. Pop. (1890), 21,934.

Bed: in geology, a stratum, or layer of stratified sedimentary rock of variable thickness. A bed often consists of numerous thin laminae or plates, resulting from intermissions in the supply of the materials, produced by such causes as the ebb and flow of the tide, and variable degrees of the turbidness of the water under which they were deposited. A thin bed, if different in kind from its neighbors, is sometimes called a seam. For an aggregate of several beds of the same kind of rock the term formation is used.

Bed-bug: a well-known hemipterous insect, the *Acanthia lectularia*, known to the Greeks as κόρις, infesting beds and houses, and it is said also dove-cotes, and the nests of swallows, bats, etc. The eggs are oval and white; the young vermin flat and transparent. In eleven weeks the insect reaches its full size. It is tenacious of life, and has been kept alive more than a year in a sealed bottle without food. Cockroaches devour them in large numbers. Mercurial solutions, benzine, etc., will extirpate these vermin, but prevention by cleanliness is best.

Bedchamber, Lords of the: twelve officers of the British royal household who in the reign of a king wait in turn on the person of the sovereign. They are under the groom of the stole, who attends his majesty only in public ceremonies and on occasions of state. During the reign of a queen these offices are performed by ladies of the bedchamber and the mistress of the robes, who is substituted for the groom of the stole. Queen Victoria had about eleven ladies and extra ladies of the bedchamber. These offices are usually filled by the "prime nobility" of the kingdom, who are appointed by the sovereign, and are not removed on each change of the ministry.

Bed'does, THOMAS, M. D.: an eminent English physician and writer; b. at Shifnal, in Shropshire, Apr. 13, 1760. He was educated at Oxford, and was well versed in the Latin and other languages. He married Anna, a sister of Maria Edgeworth, and in 1788 was appointed to the chemical lectureship in the University of Oxford. In 1792 he resigned this position. He wrote for the benefit of the working-classes a popular work called *The History of Isaac Jenkins*. In the year 1798 he opened at Clifton a hospital for the cure of disease by medicated gases, in which Humphry Davy was his assistant. Among his works is *Hygeia, or Essays, Moral and Medical* (3 vols., 1802). D. Dec. 24, 1808. See E. Stock, *Life of T. Beddoes* (London, 1811).

Beddoes, THOMAS LOVELL, M. D.: poet; son of Thomas Beddoes and nephew of Maria Edgeworth; b. at Clifton, England, July 20, 1803. He studied medicine and anatomy at Göttingen, and resided many years in Germany. In 1822 he produced *The Bride's Tragedy*. Among his poems is a tragedy called *Death's Jest-book* (1851), which displays great richness of imagery and passionate eloquence. He died at Basel, Jan. 26, 1849, in consequence of a dissection-wound received in 1848.

Bede (in Lat. *Be'da*): surnamed THE VENERABLE; English scholar and monk; b. in Wearmouth, county of Durham, in 673 A. D. He was ordained a priest at the age of thirty, and devoted much time to study and literary pursuits. His name is regarded as the greatest in the ancient literature of Britain. He wrote on astronomy, grammar, music, etc. His most important work is an *Ecclesiastical History of the English Nation (Historia Ecclesiastica Gentis Anglorum)*, which King Alfred translated into Anglo-Saxon, and which has often been reprinted. D. in the monastery of St. Paul's, in Jarrow, May 26, 735 A. D. His whole works were published by Dr. Giles (London, 6 vols., 1844), including an English translation of his *Ecclesiastical History*; a better one is that by L. Gidley, 1870. See Gehle, *De Bedæ Venerabilis Vita et Scriptis* (1838); J. A. Giles, *Life of Bede*, prefixed to his complete works (1844); and G. F. Browne (1879).

Bedeau, be-dō', MARIE ALPHONSE: general; b. in Vertou, near Nantes, Aug. 10, 1804. He served with distinction in Algeria (1836-47), and became a general of division in Sept., 1844. He had the command (under Bugeaud) of the troops in Paris when the Parisians revolted in Feb., 1848, and under the new republican régime he became commander-in-chief of that city. As a member of the National Assembly (1849-51) he acted with the republicans; opposed Louis Napoleon, and went for a time into exile. D. in Nantes, Oct. 29, 1863.

Bed'egar, or **Bedeguar** [viâ Fr. from Pers. *bādāwar*, wind-brought]: a gall (sometimes called sweet-brier sponge); found on the branches of the sweet-brier and other species of rose. It is produced by the *Rhodites roseæ* and other insects, and is often one inch or more in diameter. It was once used in medicine. See GALL INSECTS.

Be'del, TIMOTHY: a Revolutionary patriot; b. in Salem, N. H.; removed to Haverhill, N. H., and was a lieutenant in 1760, serving in Canada. He became in 1775 a captain of rangers, and in 1776 colonel of the first regiment of New Hampshire troops; served at Montreal and under Schuyler, and afterward was major-general of New Hampshire militia. D. at Haverhill, N. H., in Feb., 1787.

Bedell, GREGORY THURSTON, D. D.: the third Bishop of Ohio; b. in Hudson, N. Y., Aug. 27, 1817; was educated at Flushing, L. I., and Bristol College, Pennsylvania. After a rectorate at the Church of the Ascension, New York city, he was consecrated assistant bishop of the diocese of Ohio, Oct. 1859; bishop in 1873; resigned his see in 1889, from which the diocese of Southern Ohio was set off in 1875. D. in city of New York, Mar. 11, 1892. Author of *The Divinity of Christ*; *The Profit of Godliness*; *Sacredness of the Grave*; *The Principles of Pastorship*; *The Age of Indifference*; *Episcopacy—Fact and Law*; *A Canterbury Pilgrimage*; *A Volive Pillar: Memorial of Bishop McIlvaine*; and *Pastoral Theology*. Some of his sermons were published in Scotland as well as in the U. S.

Bedell, GREGORY TOWNSEND, D. D.: an Episcopal clergyman; b. on Staten Island, N. Y., Oct. 28, 1793. He graduated at Columbia College in 1811, was greatly admired as a pulpit orator, and wrote, among other religious works, *Onward, or Christian Progression*; *Renunciation*; and two volumes of sermons. He was the father of the bishop named above. D. in Baltimore, Aug. 30, 1834. See his *Life*, by Rev. Dr. Tyng, 1836.

Bedell, WILLIAM: a prelate of the Church of Ireland; distinguished for his wisdom and virtue; b. in Essex, England, in 1571. He went to Venice in 1604 as chaplain to Sir Henry Wotton, the English ambassador, and remained there eight years. In 1627 he was elected provost of Trinity College, Dublin, and in 1629 became Bishop of Kilmore and Ardagh. He reformed abuses in his diocese, and acquired much influence by his acts of charity and his other virtues. He procured the translation of the Old Testament into Irish. D. at Drumlor, Feb. 7, 1642. See Burnet, *Life of Bishop Bedell* (1685); H. J. Monck Mason, *Life of W. Bedell* (1842); *Life* published by the Camden Society (1872).

Bedford: an old market-town of England; capital of Bedfordshire; on the river Ouse, here crossed by two bridges; 48 miles by rail N. N. W. of London (see map of England, ref. 10-J). Several railroads pass here. It has more charitable institutions and public endowments, in proportion to its size, than any town in England. It has several fine Gothic churches, a public library, a famous grammar school, a lunatic asylum, a jail, a penitentiary, numerous schools and charities, including about sixty almshouses. Bedford has manufactures of farming implements, lace, and straw hats, and a trade in corn, malt, and timber. John Bunyan wrote *Pilgrim's Progress* in Bedford jail. Pop. (1891) 28,023.

Bedford: town; Missisquoi co., Quebec, Canada (for location, see map of Quebec, ref. 6-B); on Can. Pac. Ry.; 18 miles from St. Johns; has manufacturing of knitting-machine needles, paints, gloves, and farming implements. It has excellent water-power. Pop. (1881) 1,080; (1891) 1,571.

Bedford: railroad junction; capital of Lawrence co., Ind. (for location of county, see map of Indiana, ref. 9-D); 76 miles N. of Louisville, Ky.; has 3 public schools, an opera-house, 24 stone-quarries employing over 1,000 men, and a stone court-house. Pop. (1880) 2,198; (1890) 3,351; (1900) including suburbs, 6,115.

EDITOR OF "DEMOCRAT."

Bedford: town; on railroad; capital of Taylor co., Ia. (for location of county, see map of Iowa, ref. 7-E); is on a prairie and on the river One-Hundred-and-Two, about 100 miles S. W. of Des Moines, and has considerable trade. Pop. (1880) 1,763; (1885) 1,742; (1890) 1,643; (1900) 1,977.

Bedford: village; Cuyahoga co., O. (for location of county, see map of Ohio, ref. 2-H); on the C. and P. and C. C. and S. R. Rs., 5 miles S. E. of Cleveland. Bedford has graded schools, 3 churches, a fine public hall, 6 chair-factories, a grist-mill, feed-mill, saw-mill, and lumber-yard. Dairying is a thriving industry. The town was first settled in 1813, and organized as a municipality in 1823. Pop. (1880) 766; (1890) 1,043; (1900) 1,486.

EDITOR OF "NEWS REGISTER."

Bedford: railroad junction; capital of Bedford co., Pa. (for location of county, see map of Pennsylvania, ref. 6-D); on the Raystown Branch of the Juniata, and on Bedford Division of Pennsylvania R. R.; 94 miles W. S. W. from Harrisburg. Has 8 schools, including a high school, and 8 churches. Agriculture is the principal industry of the community. Bedford was laid out as a town in 1766. It contains several historic houses—the residence of Gen. Arthur St. Clair when he was prothonotary of the county; the house in which Gen. Washington, Gen. Knox, Alexander Hamilton, and others stopped when on the march to suppress the Whisky Rebellion of 1794 in Western Pennsylvania. Bedford Springs, about a mile distant, is a fashionable place of summer resort. Iron ores abound, and iron is here manufactured. Pop. (1880) 2,011; (1890) 2,242; (1900) 2,167.

EDITOR OF "GAZETTE."

Bedford, DUKES OF (1694): Earls of Bedford (1550); Marquess of Tavistock (1694); Barons Russell of Cheney (1539); Barons Russell of Thornough (1603); Barons Howland (1695, in England), a prominent family of Great Britain.—GEORGE WILLIAM FRANCIS SACKVILLE RUSSELL, the tenth duke (of this family), was b. Apr. 16, 1852, and succeeded his father Jan. 14, 1891; was M. P. for Bedford 1875-85; succeeded by his brother, Lord Herbrand Arthur, Mar. 24, 1893.

Bedford, GUNNING: a patriot of Delaware; b. in Philadelphia, about 1730; served against the French in 1755; an officer of the Revolutionary army; wounded at White Plains; became mustermaster-general in 1776; was a member of Congress (1783-85); Governor of Delaware (1796-97). D. in Newcastle, Del., Sept. 7, 1797.

Bedford, GUNNING: cousin of the preceding; b. in Philadelphia in 1747; graduated at Princeton in 1771; member of Congress from Delaware (1785-86), and of the convention (1789) that formed the U. S. Constitution. He was U. S. district judge (1789-1812). D. in Wilmington, Mar. 30, 1812.

Bedford, GUNNING S., M. D.: physician; b. in Baltimore in 1806, and graduated at Mt. St. Mary's College in 1825. After serving as professor in Charleston, S. C., and at Albany Medical College, he settled in 1836 in New York city, where he was Professor of Midwifery in the University of New York (1840-42). He published an excellent treatise on obstetrics and *Lectures on the Diseases of Women*, besides valuable translations from the French. D. in New York, Sept. 5, 1870.

Bedford, JOHN PLANTAGENET, Duke of: third son of King Henry IV. of England; b. in 1389. He was created Duke of Bedford in 1414; was commander-in-chief of the forces in England during the absence of Henry V., who was his brother. After the death of Henry V. (1422) the Duke of Bedford was regent of France, and waged war with success against the French dauphin. He gained a victory over the French at Verneuil in 1424, but his conquests were soon checked by Joan of Arc. D. in Rouen, Sept. 19, 1435. See Hume, *History of England*.

Bedford City (formerly **Liberty**): the county-seat of Bedford co., Va. (for location of county, see map of Virginia, ref. 6-E). It is situated in a beautiful rolling country, at the eastern base of the Blue Ridge Mountains, at an elevation of 1,000 feet above the level of the sea. It is a regular market for leaf tobacco raised in the surrounding country; has a number of factories for the manufacture of plug and smoking tobacco and cigars; a successful woolen-mill, a knitting-mill, foundry, planing-mills, two flouring-mills, and other industries. In recent years it has assumed importance as an educational center. In it are located Randolph Macon Academy (under control of the Methodists), Belmont Seminary for young ladies (Presbyterian), St. John's (Episcopal)

Institute for girls, and the Jeter Female Institute (Baptist) for young ladies. Pop. (1880) 2,191; (1890) 2,897; (1900) 2,416.

EDITOR OF "BEDFORD DEMOCRAT."

Bedford Level, or The Fens: a tract of flat land in the eastern part of England; bounded on the E. by the German Ocean; comprises parts of Huntingdon, Northampton, Cambridge, Lincoln, Norfolk, and Suffolk. Its inland boundary is a range of highlands in the form of a horse-shoe. Nearly all the marshy district called The Fens is included in the Bedford Level, which is intersected by the Cam, Ouse, Nene, and Welland rivers. It was formerly a vast morass, and was named in honor of Francis, Duke of Bedford, who in 1634 undertook to reclaim it, and expended £100,000 in draining it. The work was completed by his son, William, Duke of Bedford, who spent £300,000 on it. This tract now produces good crops of grain and flax, and grass for pasture. Its drainage has been improved in the present century.

Bedlam, or Bethlehem (of which *bedlam* is a corruption): a hospital for the insane in London, which was originally the priory of St. Mary of Bethlehem. When Henry VIII. suppressed the religious houses, this one, coming into the control of the corporation of London, was converted in 1547 into an asylum for the insane. In 1814 the insane patients were removed to a new asylum in St. George's Fields, Southwark, which has good accommodations for almost 500 patients, and is managed in an excellent manner. Bedlam is sometimes used as synonymous with a mad-house, or a place of uproar.

Bedloe's Island: an island in New York harbor; in the city of New York; 1½ miles S. W. of the Battery. It was named from a former owner. In 1800 it was ceded to the U. S. Government, and in 1841 Fort Wood, mounting seventy-seven guns, was erected upon it. Bartholdi's colossal statue of *Liberty Enlightening the World*, presented to the U. S. by the French people, now stands within the fort, the U. S. Government having allowed this island to be used for the erection of the statue. See NEW YORK CITY.

Bedmar, bād-maar', ALFONSO DE LA CUEVA, Marquis de: a Spaniard; b. in 1572. He was sent as ambassador to Venice by Philip II. in 1607, and formed a daring and nefarious plot to betray the Venetian city and state into the power of the King of Spain. The plot was detected one day before that appointed for its execution, and Bedmar was expelled from Venice. He became a cardinal in 1622, and died in 1655. His conspiracy is the subject of Otway's *Venice Preserved*. See Daru, *Histoire de Venise*; Saint-Real, *Conspiration contre Venise*.

Bed of Justice (in Fr. *lit de justice*): a term applied to the seat or throne occupied by the King of France when he was present at a session of Parliament; also to such a session, or the conference of the Parliament with the king, who came to overrule the decisions of Parliament and enforce edicts or ordinances to which that body was opposed. Decrees promulgated at such a session were more authoritative than the ordinary decisions of Parliament. The ceremony became synonymous with an act of arbitrary power. The last "bed of justice" was held by Louis XVI., in 1787.

Bedos de Celles, bā'dōs'de-sel', JEAN FRANÇOIS: a French Benedictine monk; b. at Caux in 1706. He made several good organs at Toulouse, and wrote a work called *L'Art du Facteur d'Orgues* (4 vols., 1766-78), which is highly commended. He wrote also *L'Art du relieur et du doreur des livres*, and an excellent *Gnomonique* (1760). D. 1779.

Bed'ouin, or Beduin, written also **Bedaween** and **Bedawee** (inhabitants of the desert): nomadic Arabs; according to tradition, the descendants of Ishmael and the aborigines of Arabia. They are a pastoral people, having no houses but tents, and no permanent places of residence. They form the greater portion of the population of Arabia, but are not confined to that country. Though they are not united by a strong national organization, they have never been entirely subjugated by any foreign conqueror, as the desert into which they can retreat forms an almost insuperable obstacle to an invading army. They are now widely distributed over Northern Africa, Syria, etc. As they have no general government or political institutions, religious traditions and customs form the only bond of order and union among them. They are divided into tribes, each of which is ruled by a sheik, whose authority is patriarchal. Their riches consist chiefly in flocks of sheep, camels, horses, goats, etc. They are ignorant, fierce, depraved, addicted to robbery and fighting, and reckless of the rights of property. They profess the Mohammedan religion, but are not very strict in the

practice of its discipline. Their complexion is brown of various shades. They are generally lean, sinewy, and active. An admirable picture of Bedouin life and character may be found in Palmer's *Desert of the Exodus* (1871), and in Selah Merrill's *East of the Jordan*.

Bedstraw (*Galium*): name of a genus of herbaceous plants of the family *Rubiaceæ*; distinguished by a wheel-shaped corolla, and a fruit which is dry or fleshy, two-lobed, separating when ripe into two seed-like, indehiscent, one-seeded carpels. It comprises numerous species, natives of Europe, Asia, and the U. S. The roots of several species, as *Galium verum*, *Galium tinctorium*, etc., contain a red coloring-matter which is said to be equal to madder. The *Galium verum*, which is a common weed in England, is sometimes called cheese rennet, because it has the property of curdling milk. It is naturalized to some extent in the U. S. The *Galium tuberosum* is cultivated by the Chinese, who eat its farinaceous roots. *Galium aparine*, or cleavers, is a valuable diuretic.

Bee (Gr. μέλισσα; Lat. *apis*; Fr. *abeille*; Germ. *Biene*): an insect of the order *Hymenoptera*, which feeds its helpless larvæ on pollen, honey, or food digested or secreted by the adult. There are two large families, *Andrenidæ* and *Apidæ*. To the former of these belong all those which live solitary, tunneling out galleries in the soil or boring out the dead stalks of pithy plants, as the sumac or blackberry. These they divide into several distinct compartments, placing in each a small ball of pollen, on which the egg is laid and on which the larva feeds. The species belonging to this family consist of two classes, males and females. The solitary bees can be distinguished from the social bees by their shorter tongue or labium. They are frequently called miner-bees or carpenter-bees. To the *Apidæ* belong the social bees, or those in which the tongue or labium is greatly elongated. It includes the parasitic and true honey-producing bees. The former are not parasites in the strict sense of the word, but they intrude themselves in the nests of other bees, being protected by their form and protective coloring. They are better known as *Inquinales*. Of these, as of the *Andrenidæ*, there are but two classes, males and females. The honey-producing bees, to which the common honey-bee belongs, live in immense colonies, in holes in the ground, hollow trees, old stumps, or hollow logs. There are three classes, males, females, and workers or sterile females.

Linnaeus included all bees in the genus *Apis*, but systematists are now agreed in restricting this term to the honey-bee. There is still great difference of opinion as to whether all of the varieties should be recognized as a single species or as several species. If naturalists were to find all the forms of pigeons that have been produced by breeding in nature, they certainly would recognize them as distinct species. As a species is only an idea, it seems best to recognize the several races as distinct species. Some excellent authorities consider them all as varieties of *mellifica*, the black-bee; others recognize as many as sixteen species. The genus *Apis* is a native of Europe, but has become, through the agency of man, almost cosmopolitan.

We should probably look for the type form in *Apis mellifica*, the black, brown, or German bee, which is found in its original condition in Middle and Northern Europe. This species is recognized by its brownish-black body, pilose with lighter hairs, together with its much shorter tongue. Under domestication it is known for its irritable temper, making it dangerous to handle; it is quarrelsome with neighboring bees and does not offer a good barrier against robbers; but it is a good honey-gatherer, excels as a comb-builder, and is less liable to swarm out, leaving unfinished sections.

There are several varieties of the German bee, of which probably the Carniolan, Krainer, or Hungarian is the best. Its distinctive character is the lighter rows of hairs, to be considered, perhaps, as a kind of albino. The queens are a little larger than those of typical *mellifica*. They winter well, having strong constitutions, are mild-tempered, good honey-producers, but free swarmers. They are natives of Southwestern Austria. Another variety, not differing in marking from the German bees, is found in Northern Germany, and is known as the heath-bee. It differs only in its swarming more frequently.

The Ligurian, Italian or yellow Alp bee, *Apis ligustica*, is easily recognized by the yellow-banded abdomen. This species is a native of Southern Europe, and is found as far E. as Asia Minor. There are two varieties of the Italian, but the differences shade insensibly into each other. In the Italians the abdominal segments two to five are trans-

versely banded with yellow hairs, while the first three rings beneath the hairs are yellow. In *mellifica* the black segments of the abdomen are banded with hairs not quite as light as in *ligustica*. The Italians are smaller than *mellifica*, the tongue is longer, the abdomen flatter and more pointed. The drones are not so yellow above as the workers, but are almost wholly yellow beneath. The queens vary from very light to almost as dark as those of *mellifica*. The Italians excel in their milder temper, making them much easier to handle; in the fruitfulness of the queens; in being excellent defenders of their stores; in their excellence as honey-gatherers, and in their industry. They are not so able to withstand severe winters as *mellifica*; the comb honey is not so fine in appearance; unless watched they are liable to convert great quantities of their stores into nursery food, and on slight encouragement to become robbers. It certainly produces a superior race to cross them with the Germans.

Another race, probably equaling either of the others in importance, is the Cyprians. They are natives of the island of Cyprus; are noted for their activity, the fertility of the queens, their industry as honey-gatherers, the production of queen-cells, and as rapid comb-builders. The serious objection to the Cyprians is their demoniacal temper when aroused; but with practical beekeepers they seem to be in favor. The Cyprians are smaller than the Italians, with more intense or brighter colors, though the arrangement of the markings is the same. The dorsum of the thorax and the scutellum is a brighter yellow. A variety found in the Holy Land and Syria, and claimed by some to be the progenitors of the Italians and Cyprians, does not differ materially from the Cyprians, although the colors are not so bright, and they are a little larger. Their tempers vary, but they are excellent foragers. Like the Cyprians they produce a great number of queens, one author recording over 150 queens from a single colony.

The Egyptian bees, *Apis fasciata*, date the time of their domestication before the building of the Pyramids, there being hieroglyphic writings concerning them near this time. They are in all probability the species kept by the ancient Egyptians on their floating apiaries or boats, in which they ascended the Nile, and, slowly drifting down, followed the growth of melliferous flowers produced by the annual inundations. They are blackish brown, with an abundance of whitish hairs. The wings are infuscated, the second and third abdominal segments in part dark orange. They are excessively vicious, and frequently produce fertile workers. Besides the above-named species or varieties there are several others which are not so well known. In Southern Africa there are two species, *Apis caffra* and *Apis scutellata*. The former is black, the second abdominal segment red at base; the latter has the abdomen brown, with the base of the segments grayish pubescent. They have a serious fault of producing many fertile workers, which are liable to find their way into other colonies. *Apis nigritarum* is found in the Congo region. It has the antennæ black, at base yellow; abdomen black, grayish pilose, first abdominal segment and the second in part yellowish. In Senegal is found *Apis adansonii*. The natives, when they collect the honey, stifle the bees, and hang the emptied hives in the trees, awaiting the arrival of a new swarm. They are similar to the Italians, but smaller. *Apis unicolor*, in which the abdomen is shining black, unifasciate, is a native of Madagascar, where it is domesticated, and has been introduced in the isle of Bourbon and Mauritius, also the Canary islands. The honey is unwholesome. *Apis indica* is indigenous to Hindustan and the East Indian Archipelago. It is small, black, pilose with grayish hairs, two basal segments of abdomen reddish brown. It has been cultivated by Europeans; the natives make rude hives of bamboo which are placed under the eaves of the houses. Although *indica* is generally a poor honey-producer in nature, it increases remarkably by domestication. The Bhootan bee is larger than *indica* and probably distinct. It is very dark, with light-colored hairs, and has an exceedingly mild temper. *Apis dorsata*, found in India, Sumatra, and Java, is the largest species of the genus, the smallest of the workers being larger than the largest of the Italians or Germans. The thorax is yellowish above, with brownish triangular spots; black beneath, with reddish hairs. In nature they build under the boughs of trees, frequently in caves. All attempts at colonizing have been futile. *Apis florea*, on the other hand, is the smallest species; the drones are strongly differentiated from the queen and workers.

As has been already stated, each colony is composed of three classes: the drones, or males; the queen, or fertile female; the workers, neuters or sterile females.

FIG. 1.—a, worker; b, queen; c, drone.

The males are usually present in the hive from May to November, but may be found at any time of the year. They are shorter than the queen, longer than the worker, and stouter than either. Their wings are larger, their flight more awkward, producing a loud, buzzing noise. The labium and maxillæ are shortened, the mandibles have a rudimentary tooth, the posterior tibia and metatarsus are convex, the pollen-basket being absent. The webbed hairs and the sting are wanting. The eyes are large and prominent. The antennæ are long and broad, and well supplied with olfactory cavities and sensory hairs. The wax glands and the pollen-digesting glands are wanting. The drones, though surrounded by an abundance of honey, would starve to death unless fed by the workers. The sole object of the drone is the fertilization of the queen. This always takes place on the wing outside the hive, and always results in the death of the male. When the supplies of the colony get low, or nectar is scarce, or just before winter sets in, the workers, either by constantly biting and worrying them or by withholding their food, kill off the drones. Neither the eggs, young larvæ, nor the chrysalis escape extermination. The longevity of the male, with the exceptions just stated, depends on accident. The eggs intended to produce drones are always unimpregnated, and are laid in cells that are deeper and broader than those of the workers. These are called drone-cells, and when not filled with young are used for storing honey.

The queen is a fully developed female and the mother of the colony. She is larger than either the drones or the workers; her abdomen is long and slender; wings short, reaching but little beyond the third abdominal segment. The labium and maxillæ are similar to those of the male. Although the posterior tibia is broad and flattened, it does not have the cavity and surrounding hairs, as in the workers. The webbed hairs are also wanting. The sting is longer than that of the worker, and is curved. It is very rarely used, except in contests with rival queens. The eyes are not as large as those of the drones, and do not meet above. She is followed, guarded, and fed by the workers. The function of the queen is the production of eggs for the perpetuation of the colony. During the summer a queen may lay over 3,000 eggs in a day, or over 1,000,000 during a lifetime. An egg is about $\frac{1}{16}$ of an inch in length; and if all the eggs produced by a queen were placed end to end, they would reach over a mile. Queens are developed only from impregnated eggs, and in cells prepared especially for them, which are usually on the edge of the comb or around an opening in it, extending vertically or diagonally downward. These cells are constructed of pieces of wax cut from old cells, and are very rough, much resembling a peanut. There are several things that may induce a colony to build queen-cells, as the loss of a queen, crowded quarters, poor ventilation, or inability of the queen to lay impregnated eggs. There is no difference in the eggs from which workers and queens are developed; the difference is wholly in the food. A queen can be produced from an egg or from a worker larva not more than four days old. To do this the workers remove the partitions of the adjoining cells, surround the larva by a royal cell, and feed it an abundance of rich food, called royal jelly. It usually takes from ten to twelve days to produce a queen from a worker larva; three to six days later she goes forth, if the day be sunny, on her marriage flight. The success of the queen is marked by the appendages of the drone which will be hanging to her. If the queen fails to mate the first day, she will go forth again and again; but if impregnation does not take place before the fifteenth day, she is likely to remain a virgin queen, and will lay only unimpregnated eggs which will produce only drones or males. After this the queen never

leaves the hive except with a swarm. Two or three days after impregnation the queen begins to lay worker eggs. The queen is longer lived than either drones or workers, living from three to five years. If the queen ceases to lay fertile eggs, the workers, before all the worker eggs are gone, raise a new queen and destroy the old one. If from some accident, however, a colony lose its queen and does not have any worker larvæ of the proper age, it will dwindle and die out, if another queen is not introduced.

The workers are the most numerous individuals of the hive, a good colony having from 15,000 to 40,000. They are developed only from impregnated eggs, which are usually laid in the small horizontal cells. The egg hatches in three days into a small, white, footless maggot. After this has been fed grudgingly for five days by the workers, the cell is capped over. The adult larva, having lapped up all the food placed before it, spins a silken cocoon, changes to a pupa, and emerges in about twenty-one days as an adult bee. The workers never attain an old age, their age depending on the season of the year in which they emerge; those emerging at the most active honey-gathering period wear out in about a month. As already stated, the workers are undeveloped females. When a colony becomes hopelessly queenless (and occasionally at other times), there appear workers that have the ovaries somewhat developed and are able to lay eggs. These eggs, of course, always produce drones, and such workers are called "fertile workers." No tenable explanation has yet been made of this fact, though many theories have been advanced. Upon the workers fall all the labor of the colony. The young bees do not go forth for a week or more after emerging as imagoes, but build the comb, feed the larvæ, drones, and queens, cap the cells, and ventilate the hive. Upon the old bees devolve the duties of collecting the honey, the pollen, and the propolis, defending the hive against intruders, destroying the drones and worthless queens, and leading forth a portion of the bees when circumstances impel them to swarm.

Nature never produces new organs for new functions she wishes performed, but modifies an already existing organ so as to perform the new function. So it is with the honey-bee. The work it does is varied, yet it does not differ from insects in general in the plan of its structure. In a grasshopper the mandibles are stout and toothed, the labium

muscles which move the ligula, and the salivary duct, which opens by a valve at its base. Other than this the mentum has no opening and is not tubular. At each side of the mentum are the maxillæ, which are attached to the head by slender pieces, the stipes and the lacinia. At the base of the lacinia are the rudimentary maxillary palpi. The stipes and lacinia are hollowed out, fitting close against the sides of the labium, while the labial palpi embrace the tongue or ligula before and behind respectively, forming with the maxillæ a tube in which is situated the ligula and which has the power of moving from side to side. The ligula is covered with transverse rows of hairs and spines, while scattered among these hairs are sensory hairs or papillæ. When a bee desires to feed on honey or other liquids the apical part of the epipharynx closes down on the opening left between the bases of the maxillæ; the labial palpi lie close together beneath and between the overfolding maxillæ; the maxillæ are alternately arched and flattened, causing the palpi to recede from and approach to the maxillæ. The nectar flows into the space thus made, and when the maxillæ contract flows on into the pharynx.

The numerous hairs on the ligula are a great aid to the bee in sucking up liquids when they are present in abundance; but when it desires to collect them in much smaller quantities, as in sipping the nectar of flowers, it must have recourse to another method, else the nectar would be evaporated before reaching the pharynx, cementing together the parts and clogging up the tube. If we examine a trans-section of the ligula, we will find on the under side a slit or opening which is continuous, extending the entire length of the ligula and opening at its base. There extend on each side of this slit within the walls of the ligula two lateral pouches or side ducts, which are convoluted and covered with minute hairs. Immediately above the slit and above the side ducts there is a small, rounded, trough-like hollow, its lower approximated edges being lined with a row of stiff bristles, forming a false tube. The bee in feeding on the nectar of flowers takes up the smaller drops by means of the subdivided hairs on the apex of the tongue, transferring them to the side ducts or the central duct, according to the amount of the liquid for transportation to the pharynx. It is claimed by some authorities that the ligula contains a closed duct. That there is no such duct can be easily demonstrated by taking a worker bee and squeezing its thorax so as to force the blood into the tongue, thus distending it. The two margins of the ventral slit will be spread apart, the side ducts forced out between them, and the central duct drawn down to the lower edge, where it can be seen to be composed of a groove edged with bristles. By the above operation the ligula has not been subjected to unnatural methods, as it is in this way that the worker bee is enabled to clean these ducts of grains of pollen; while if it had been a closed tube the grains would entirely clog it up.

When the food reaches the pharynx it is there mixed with saliva, which is secreted by salivary glands located in the head and thorax, and opening by ducts at the base of the mentum and in the pharynx. This changes the cane-sugar to the grape-sugar of honey. The liquid on leaving the mouth is carried by a long slender œsophagus through the head and thorax into the abdomen, where it is stored in a muscular sac or pouch, the "honey-stomach" or "sucking-stomach." While

in this sac the liquids are not changed except by being mixed with the saliva. The honey is kept from passing into the chyle stomach by the stomach-mouth, which is a small cylindrical organ at the end or bottom of the honey-sac. Its upper surface is divided into four triangular lips, which close the opening and separate the pollen from the honey. When the bee returns to the hive, it goes to the empty honey-cells, the strong muscles of the honey-sac contract, and it regurgitates the honey into the cell.

In the legs we find many interesting developments. Situated here are the organs used in cleaning the antennæ and in collecting and carrying the pollen. On the outer edge of the anterior metatarsus there is a row of long stiff bristles, which are used to comb out of the hairs placed between the facets of the eyes any grains of pollen or foreign substance that would impede vision. At the base of the metatarsus and on the opposite side is the antenna-cleaner. This consists of a deep, curved recess in the metatarsus, and an especially adapted spine or velum attached to the apex of the

short, the maxillæ short and fitted for biting and tearing. In the mouth-parts of the honey-bee we find the same identical parts, but here they are modified so as to serve as a sucking organ, and have been specialized into a long tube for sipping various saccharine juices, such as the nectar of flowers, the juices of ripe fruits, the sap of trees, or the honey-dew of aphids. The form of this tube is very complex. The apex of the epipharynx projects beneath the labium, forming the upper part of the mouth opening. The labium, or under lip, forming the underside, is composed of a number of pieces. The largest part is the mentum, which is at the base and bears at its apex the four-jointed labial palpi, and the ligula, which is a long, slender tongue placed between the palpi. On each side of the ligula and attached to the mentum is the paraglossa. The mentum lies a little behind and beneath the head, and can be moved backward and forward. At its base there is a small triangular sclerite, the submentum, by which it is attached to the head. In the mentum are located the strong

tibia. This mechanism is found not only in the workers, but also in the queen and drones. If the curved recess be examined carefully, there will be found many slender teeth in each comb. At the base of the middle tibia there is a long slender spine, by means of which the pollen mass is removed. The middle legs are brought back over the pos-

terior ones, and the spine, entering at the top, passes down behind the mass and turns it out. It is also used in cleaning the wings, and is present in the queen and drones. The posterior legs are the most specialized. The femora, as well as the anterior pairs of legs and the body, are covered with ciliate hairs which are useful in collecting the grains of pollen. The tibia is triangular, and meets the oblong metatarsus in a right angle. On the apical outer edge there is a row of strong spines, which fasten the metatarsus to the tibia by shutting down over a flattened plate in the former. On the under side of the metatarsi there are stiff combs, the teeth of which are straight, horny spines arranged in transverse rows. By means of these combs the pollen collected by the ciliated hairs is combed out, and when the combs are filled the pollen is transferred to the hollow side of the tibia. This cavity is glabrous; while the sides and bottom are lined with two rows of stiff bristles, a third bends over the front. This is the corbicular or pollen-basket. The pollen on the right metatarsus is transferred to the left tibia, and *vice versa*.

Propolis or bee-gum is carried in the same way as pollen. It is collected by the bees from resinous buds, such as the hickory and horse-chestnut, and is used to glue the combs to their supports, to fill all cracks, and to lessen the place of exit. Alcohol, ether, and chloroform dissolve it.

If the abdomen of a worker be elongated by gently separating the segments, and examined, there will be found at

FIG. 4.—Under side of worker carrying wax-scales.

the base of abdominal segments two to five, two smooth plates, called the wax-plates. These plates are smooth, and are strengthened by rims of chitine, which also give them a definite outline. The apex of each segment projects over the wax plates of the next posterior segment, and is

covered with webbed hairs. The true wax glands are situated beneath, the wax passing through by osmosis. A marked peculiarity of these glands is the great abundance of tracheæ or air-tubes with which they are supplied. Wax is like all animal secretions—the silk of spiders, for example—liquid at first. It is derived from the blood by cell

action, solidifying when brought in contact with the air. If a colony is placed in an empty hive, they climb the sides, the upper ones firmly securing themselves to the sides of the hive by means of their claws, and the next bee hooking its front claws into the hind claws of the one above, until the ladders of bees reach the bottom of the hive. Before leaving its old home the bee gorged itself with honey; this is now used in producing the wax. When the above arrangement is complete the bees remain perfectly still, and the wax flows over the thin membrane of the pocket. The wax having been secreted, a single bee starts the comb. The scales are removed by means of the stiff bristles at the apex of the posterior tibia, which are passed beneath the wax scales, scooping them out. By prolonged chewing it is made into plastic material, which is attached to a middle wall or the midrib, forming the base or end of the layer of cells covering it on each side. Wax can be produced only at the expense of many times the weight of the bee in honey or sugar. The bees, realizing this, economize, 35,000 or more worker cells being molded from a single pound of wax. The sides of the cells are liquid proof. If water mixed with dyes be placed in worker or drone cells adjacent to those containing clear water, they will not intermingle.

Swarming is the result of natural increase. The queen, in the spring or early summer, begins making preparations by the laying of drone eggs. When the drone brood is well under way queen-cells are started, the number varying with the race or variety of bees from three to fifteen, and in some varieties to over 100. When the queens begin to mature they are guarded by the workers, as the old queen would sting them to death. If the colony is crowded, the ventilation insufficient, or the hives unshaded, some sunny day, generally about eleven o'clock, there is a great uproar in the hive, the workers fill their honey-sacs, and the bees—queen, workers, and drones—come out with a rush. The swarm usually cluster upon the limb of a tree, or on a fence-post near, where they remain a short time. It is claimed by some that the workers look out a new home the day before swarming, by others while they are clustered. It is always the old queen that goes with the first swarm, and if the swarm miss the queen after leaving the hive they will return. In about one week the first queen will emerge; in two or three days she will or may lead a new colony forth. This is preceded by the peculiar note of the queen, known as the "piping of the queen." This noise is thought by some to be produced by rubbing the abdominal segments together, and is made sometimes before the queen is out of the cell. Swarms will issue in periods of from one to two days. As many as eight after-swarms have been recorded as issuing from the old home. If the swarming is not interfered with by man, the workers may destroy the queen-cells and drive the drones from the hive. See APICULTURE.

ALEX. D. MACGILLIVRAY.

Bee, BARNARD E.: Confederate general; b. in South Carolina 1824; graduated at West Point 1845 in the artillery; served with distinction throughout the Mexican war (wound-

ed at Cerro Gordo), and his native State presented him with a sword of honor. He was on frontier duty from 1848 to Mar. 3, 1861, when he resigned, and was made a brigadier-general in the Confederate army. At the first battle of Bull Run, July 21, 1861, he was killed.

Bee'be, BEZALEEL: b. at Litchfield, Conn., Apr. 28, 1741; a Revolutionary officer; joined the Rogers Rangers in 1758; became a captain Jan., 1776; was taken prisoner at the capture of Fort Washington; was exchanged, and became major in 1777, lieutenant-colonel in 1780, colonel in 1781, and afterward commanded the Connecticut troops raised to defend the seacoast; was often a member of the Connecticut Legislature between 1781 and 1795. D. in Litchfield, May 29, 1824.

Beech [O. Eng. *bēce*, a deriv. from word appearing in O. Eng. *bōc*; O. N. *bōk*; O. H. G. *buohha* (> Germ. *Buche*); c. f. Lat. *fāgus*, Gr. *φηγός*]: a tree of the genus *Fagus*, and family *Cupuliferæ*; natives of Europe, America, and Australasia. The sterile flowers have a bell-shaped calyx five to seven cleft, with eight to sixteen stamens. The fertile flowers grow on the same tree, the fruit of which is a triangular or sharply three-sided nut, two of which are inclosed in an urn-shaped, coriaceous involucre or husk. These nuts, called beechmast, are edible, and are valuable as food for swine. They yield a large proportion of a bland fixed oil which is used as food and burned in lamps by Europeans; the husks contain a volatile, narcotic, poisonous principle called *fagine*. The genus comprises several species of beautiful forest trees, with a close and smooth ash-gray bark and a light horizontal spray. The *Fagus sylvatica*, or common beech of Europe, forms whole forests in many parts of that continent. It grows to the height of about 100 feet, and sometimes has a diameter of 4 feet, and is a very ornamental tree, especially when it stands alone. The wood is hard and valuable for fuel, and, being durable under water, is employed in the erection of mills. The French use it extensively in the manufacture of *sabots* or wooden shoes. The *Fagus ferruginea* (American beech) is abundant in the Northern U. S., sometimes growing gregariously in forests which contain few other trees. Its leaves are oblong-ovate, taper-pointed, distinctly and often coarsely toothed or serrate. This is an ornamental tree, which sometimes attains a height of 100 feet, and surpasses most trees in the depth of shade produced by its rich green and shining foliage. The wood is hard, heavy, good for fuel, plane-stocks, shoe-lasts, tool-handles, and other purposes. The color of the wood is a light brown or reddish. Among the other species is the myrtle-tree of Tasmania (*Fagus cunninghamii*), a very large and ornamental tree, with evergreen and coriaceous leaves, which resemble birch leaves in form. *Fagus procera*, which attains a lofty stature in the Andes of Chili, is a valuable timber tree. The *Fagus antarctica* is a characteristic tree or shrub of far antarctic regions.

Beech Drops: See CANCER-ROOT and EPIPEGUS.

Beecher, CATHARINE ESTHER: eldest daughter of Lyman; b. at East Hampton, Long Island, Sept. 6, 1800. She conducted a female seminary at Hartford, Conn., 1822-32, and for two years afterward was at the head of an institution in Cincinnati, O., for female education. For many years afterward she was employed in developing a plan for female Christian education, which included the training and subsequent employment of teachers. She published, besides other works, *Treatise on Domestic Economy*; *True Remedy for the Wrongs of Women*; *Elementary Book of Instructive Theology*; and *Common Sense Applied to Religion*. D. in Elmira, May 12, 1878.

Beecher, CHARLES: preacher and writer; b. at Litchfield, Conn., Oct. 7, 1815; was ordained in 1844 pastor of a church at Newark, N. J., and was settled at Georgetown, Mass., in 1857; from 1870-77 he resided in Florida; became stated supply at Wysox, Pa., 1885. Author of *Redeemer and Redeemed*, and other works. He edited the *Autobiography* of his father, Lyman Beecher (1864, 2 vols.). D. in Georgetown, Mass., Apr. 21, 1900.

Beecher, EDWARD, D. D.: brother of Charles Beecher; b. at East Hampton, L. I., Aug. 27, 1803; graduated at Yale in 1822; was pastor of Park Street church, Boston (1826-30); president of Illinois College from 1831 to 1844; pastor of Salem Street church, Boston, from 1846 to 1856; editor of *The Congregationalist* (1849-53); pastor in Galesburg, Ill., 1856-71, and of Parkville Congregational Church, 1885-89. D. in Brooklyn, July 29, 1895. He published *The Conflict*

of Ages (Boston, 1853; 5th ed. 1855) and other works, including an able work on Baptism (New York, 1849); *History of Opinions on the Scriptural Doctrine of Retribution* (1878).

Beecher, HARRIET ELIZABETH: See STOWE, HARRIET BEECHER.

Beecher, HENRY WARD: author and divine; son of Dr. Lyman Beecher; b. at Litchfield, Conn., June 24, 1813. At an early age he had a strong predilection for a seafaring life, which, however, he renounced in consequence of the deep religious impressions which he experienced during a revival. Having graduated at Amherst College in 1834, he devoted himself to the study of theology at Lane Seminary under the tuition of his father, who was then president of that institution. He was pastor at Lawrenceburg, Del., 1837-39; then at Indianapolis, Ind., until 1847, when he was installed as pastor of Plymouth (Congregational) church in Brooklyn, where his genius and remarkable eloquence continued to attract one of the largest congregations in the U. S. He was equally successful as a lecturer and a popular orator. He was editor of the *Independent* from 1861 to 1863, when he visited Europe for the benefit of his health. His earnest addresses to large audiences on the subject of the civil war in the U. S. appear to have had considerable influence in turning the current of public opinion in Great Britain in favor of the Union cause. Mr. Beecher was also long a prominent advocate of anti-slavery and of temperance reform, and at a later period of the rights of women. He delivered three courses of lectures on *Preaching* (1872-74) at the Yale Divinity School, on the "Lyman Beecher" foundation. Among his published works are *Lectures to Young Men* (1850); *Star Papers* (1855); *Life Thoughts* (1858); *Royal Truths* (1864); a novel, *Norwood* (1864); *Life of Christ* (vol. i, 1871); *Evolution and Revolution* (1884); *Sermons on Evolution and Religion* (1885); and many volumes of sermons and addresses. He was founder and editor of the *Christian Union* (1870-81). D. in Brooklyn, N. Y., Mar. 8, 1887. See his *Biography* by William C. Beecher and Rev. Samuel Seoville, assisted by Mrs. Henry Ward Beecher (1888). His widow, Eunice White Bullard Beecher (b. Aug. 26, 1812), d. at Stamford, Conn., Mar. 8, 1897.

Beecher, LYMAN, D. D., theologian; b. at New Haven, Conn., Oct. 12, 1775; graduated at Yale College in 1797; studied theology under President Dwight; he was licensed to preach in 1798, and in 1799 was ordained pastor of the Presbyterian church in East Hampton, L. I., where he continued to preach till 1810, when he became minister of the Congregational church at Litchfield, Conn. He was a popular preacher, and acquired great influence among the orthodox churches. To oppose the rapid progress of Unitarian doctrines he removed to Boston about 1826, and preached in the Hanover Street church. He was president of Lane Seminary at Cincinnati 1832-51. Here he was brought to a stormy trial for heresy, and, although not condemned by the presbytery, this event was one of the great factors in the separation of the New from the Old School Presbyterians in 1837. He published, beside other works, *Views in Theology* and *Sermons on Temperance*, which had a great circulation. He was a man of very energetic character. D. at Brooklyn, N. Y., Jan. 10, 1863. His works were published in 3 volumes (Boston, 1852). See his *Autobiography* and *Correspondence*, edited by his son, Charles Beecher (2 vols., 1864-65).

Beecher, THOMAS KINNICUTT: Congregational minister; son of Lyman Beecher; b. in Litchfield, Conn., Feb. 10, 1824; graduated at Illinois College (Jacksonville, Ill.) in 1843. He was the author of *Our Seven Churches*, a volume of discourses (1870). He became (1854) pastor of Park Church in Elmira, N. Y. D. in Elmira, Mar. 14, 1900.

Beecher, WILLIS JUDSON, D. D.: Professor of Hebrew Language and Literature in Auburn Theological Seminary; b. in Hampden, O., Apr. 29, 1838; graduated at Hamilton College (1858) and Auburn Seminary (1864). Before entering upon his present work, in 1871, he had held two brief pastorates, and had been for three years teacher in Whites-town Seminary, N. Y., and for four years Professor of Moral Philosophy and Belles-Lettres in Knox College, Illinois (1865-69). He published many pamphlets and articles, mostly on sociological, statistical, and exegetical subjects; the most important being the series of Old Testament articles in the *American Supplement to the Encyclopædia Britannica* (1883-89), and three series of articles in the *Old and New Testament Student* (1885-90).

Beech'ey, FREDERICK WILLIAM: English navigator; b. in London, Feb. 17, 1796. He accompanied Sir Edward Parry in an Arctic expedition in 1819, and explored the northern coasts of Africa in 1821. He commanded an exploring expedition to the Polar Sea via Bering Strait; discovered Port Clarence and Port Grantley; returned in 1828, and published a narrative of his voyage in 1831. He became a rear-admiral of the blue in 1854. D. Nov. 29, 1856.

Beechey, SIR WILLIAM, R. A.: an English portrait-painter; father of Frederick William Beechey, the navigator; b. in Burford, Oxfordshire, Dec. 12, 1753. He became a pupil at the Royal Academy in 1772; was employed by the nobility; and in 1793 was made portrait-painter to Queen Charlotte and associate of the Academy. D. in Hampstead, Jan. 28, 1839.

Beeder: same as BIDAR.

Bee-eater: a bird of the family *Meropidae* allied to the kingfishers. The genus *Merops* comprises numerous species, found in Asia, Africa, and Europe, which feed on bees and other hymenopterous insects. The common bee-eater (*Merops apiaster*) abounds in the south of Europe as a summer bird of passage. It seizes bees as they fly in the

The Namaqua bee-eater.

air, and watches for them near their hives. It breeds in holes which it excavates in the banks of rivers. There are several other genera called bee-eaters. The Namaqua bee-eater (*Rhinopomastes cyanomelas*) is a West and South African bird.

Beef-eater: a bird of the genus *Buphagus*, belonging to the family of starlings; sometimes called ox-pecker. The beef-eaters are exclusively African, and have a remarkable habit of running over the backs of oxen, buffaloes, camels, etc., in order to feed on the larvæ of flies which they find in their hides, and which is said to be their principal food. This genus includes the South African species called buffalo-bird.

Beef-eaters [the common derivation from a supposed **buffetier* (buffet, sideboard) is groundless]: jocularly, one of certain British functionaries belonging to the yeomen of the guard, who form part of the train of royalty, and attend the sovereign at royal banquets, coronations, etc.

Beef Tea: an article of diet important in the treatment of the sick and the nurture of infants. To prepare palatable beef tea is a matter of some difficulty, but the following rules are excellent and easy to follow: Take 1 lb. of juicy, lean beef from the shoulder or the round, and mince it with a sharp knife on a board or a mincing-block. Put it with its juice into an earthen vessel containing a pint of tepid water, and let it stand for two hours. Strain off the liquid through a clean cloth, squeezing well the meat, and add a little salt.

Place the whole of the juice thus obtained over the fire, but remove it as soon as it has become browned. Never let it boil, otherwise most of the nutritious matter of the beef will be thrown down as a sediment. A little pepper or allspice may be added if preferred.

Beefwoods (*Casuarinaceæ*): a family of trees numbering twenty-three species, all of one genus (*Casuarina*); natives mostly of the Australasian region. Treub's recent studies of the ovules of *C. suberosa* appear to indicate that beefwoods are related to the gymnosperms, although they have usually been associated with the oaks, gallworts, etc.

CHARLES E. BESSEY.

Beelzebub [i. e. the god of dung or of flies; Gr. Βεελζεβούβ, *Beelzeboul*, or *Beetzebul*]: properly Baalzebub; a god worshiped by the people of Ekron, in Philistia (2 Kings i. 3). The name of Beelzebub came in course of time to be commonly applied to a prince or chief of evil spirits, and in this sense it is employed in the Gospels (Matt. x. 25, xii. 24, 27; Mk. iii. 22; Luke xi. 15, 18, 19). This name is found only in the New Testament. The original and authorized spelling is Beelzebub, which appears to have been afterward changed so as to resemble Baalzebub, which was the proper name of the heathen divinity.

Beer [O. Eng. *bēor*; Germ. *Bier*; probably connected ultimately with name for barley; cf. O. Eng. *bēo*]: the fermented infusion of malted barley, flavored with hops. In a wider sense the term *beer* is applied to beverages prepared from cereals, barley, rye, wheat, Indian corn, millet, etc., the chief constituent of which is starch. The treatment involves the preliminary operations of *malting* and *mashing*, or changing the starch to gum (dextrin) and sugar (glucose) by the aid of the natural process of germination. The term *wine*, on the other hand, is restricted to alcoholic liquids obtained by fermenting the saccharine juices of fruits, as the grape, apple, pear, currant, and gooseberry, or the sap of such plants as the sugar-cane, palm, American aloe, etc. There are, however, many beverages of inferior quality called beer, which consist of saccharine liquors more or less completely fermented, and flavored with various substances, such as spruce beer, ginger beer, root beer, etc.

The manufacture of beer from barley is divided into two distinct processes—*malting* and *brewing*—which are conducted in different establishments, the *malt-house* and the *brewery*; the brewer often purchasing his malt from the maltster.

Malting consists of four successive operations: (1) *Steeping*. The barley is placed in wooden cisterns, covered with cold water, and allowed to soak for two or three days, when the water is drained off. By this operation the barley absorbs from 10 to 50 per cent. of water, softening and swelling up at the same time. (2) *Couching*. The softened barley is thrown out upon the floor of the malt-house in heaps or *couches*, where it heats spontaneously and begins to germinate, throwing out rootlets or *radicles*, and shoots or *acrospires*. At the same time it evolves a portion of its water, the operation being called *sweating*. (3) *Flooring* is resorted to in order to check the germination by reducing the temperature. It consists in spreading the barley over the floor, and repeatedly turning and respreading it over a constantly widening area in layers of diminishing thickness. When the process of germination has proceeded as far as is desirable, it is completely stopped by (4) *Kiln-drying*. This is effected in a large room with brick or tile floors, the *kiln*, which is heated to the desired temperature. Here the germinated barley is rendered perfectly dry and crisp. It is then *malt*. The appearance of the malt, and the color of the beer made from it, depend upon the temperature of the kiln. At between 90° and 100° F. pale malt results; at 120° to 125°, amber malt; 150° to 170°, brown malt for porter and stout. Black malt is prepared by roasting the malt in cylinders, at 360° to 400° F., such as are used for roasting coffee. It is used as a coloring for porter. During the process of malting the barley increases in volume and diminishes in weight; 100 measures of barley yield 101 to 109 of malt, but 100 lb. yield only about 80 lb. of malt. The loss in weight is due largely to the perfect drying in the kiln, fresh barley containing 10 to 16 per cent. of water.

The object of changing the barley to malt is to render its constituents soluble, and bring them into a condition suitable for fermentation. During germination the albuminous substances are changed to *diastase*, a body which exerts a wonderful action upon starch. One part of diastase is said to change 2,000 parts of starch (which is insoluble) to dex-

trin (gum), and then to glucose (grape-sugar), both of which are soluble in water.

The diastase of malt is capable of changing to glucose a much larger quantity of starch than exists in the barley; hence unmalted grain is sometimes added to the malt during the subsequent operation of mashing. In Belgium potato-starch is largely employed.

Brewing.—The first operation of the brewer is the *bruising* or crushing of the malt, which is accomplished by passing it between iron rollers. It is then placed in the mash-tub with warm water, and raised gradually to about 167° F. It is here that the starch is transformed into dextrin and glucose, which, with the soluble albuminous and saline constituents, are taken into solution by the water. From 1 to 4 bush. of malt are used for each barrel of beer. When the price of malt is high, a portion of it is replaced by cheaper amylaceous or saccharine substances, such as potato starch, or glucose prepared from it by the action of sulphuric acid. The insoluble residuum from the malt is sold under the name of brewer's grains for feeding cows. The infusion is allowed to stand for a few hours to clarify or set, and the sweet clear *wort* is then drawn off into a copper boiler, when it is boiled with the hops. From 1 to 5 lb. of hops are added for each barrel of beer, the quantity varying with the strength of the beer, the length of time it is to be kept, and the climate to which it is going. The hops are the female flowers of the *Humulus lupulus*; they contain a peculiar essential aromatic oil, a bitter principle, *lupuline*, tannic acid, resin, etc. They communicate an agreeable flavor to the beer, add to its tonic and stimulating properties, aid in clearing it by the action of the tannic acid on the albumin, and diminish its liability to spoil on keeping. See HOPS.

The boiled wort is cooled as quickly as possible, either by placing it in shallow vessels or passing it over a series of tubes through which cold water circulates. It is then run into the fermenting vats or tuns, which in large breweries sometimes have a capacity of 1,200 or 1,500 barrels. The temperature of the wort best suited to successful fermentation depends upon the season. In summer, with the atmosphere at 75° F., it should stand at about 55°; with air at 55°, at 60°; while in the winter it should have a temperature of at least 64°. If a very quick fermentation is desired, it may be considerably higher. For every 100 gal. of wort about 1 gal. of yeast is added, which has been produced in a previous brewing of the same kind of beer. The yeast is usually mixed with a little wort, and left in a warm place till it begins to ferment. This *lobb*, as it is called, is then added to the tun. More yeast is employed in winter than in summer; twice as much at 50° F. as at 68°. In six or eight hours fermentation becomes active; the wort begins to work, the glucose, under the influence of the active ferment, *yeast*, undergoes decomposition, yielding alcohol and carbonic acid, the latter escaping in bubbles, and bearing to the surface particles of yeast, which form a scum. The yeast itself, being a plant, develops rapidly, largely at the expense of the nitrogenous albuminous matters of the wort, which are thus withdrawn. The temperature rapidly increases, rising many degrees. This fermentation continues for six or eight days. When it has reached the proper point, the beer is separated from the yeast, and transferred to the *cleansing butts*. Here a slow, almost imperceptible, fermentation takes place. The solid particles of the yeast rise to the surface and escape through the bung-holes of the casks. Finings are sometimes added to clear the beer; they generally consist of isinglass dissolved in a little sour beer. The beer is then transferred to store-casks, where a slow fermentation occurs, which produces no perceptible quantity of yeast; the beer develops its finer qualities, and is here finished for use. See FERMENTATION.

The composition of the water used in brewing is believed to exert an important influence on the success of the process. Lime salts are said to aid in clearing the beer, as they form insoluble compounds with some of the acids present. Sulphate of lime, or gypsum, is sometimes added to the water. The spring water at Burton-on-Trent is said to contain considerable sulphate of lime. The strength and taste of beer depend upon the quantities of malt and hops employed and the mode of conducting each of the several operations, especially the fermentation. *Strong* beers contain much alcohol; *substantial* beers are those which have not been fermented so thoroughly, and which consequently contain more of the extractive matters of the malt. Bitter beers contain more of the hop extract.

Ale is prepared from pale malt, and the active fermenta-

tion is checked while there still remains a considerable quantity of sugar unchanged. This, by subsequent fermentation in the barrel or bottle, keeps up the briskness. *Pale ale* is made from malt dried in the sun or by steam. It is not allowed to rise above 72° during the fermentation. The formation of acetic acid is thus prevented, and the unpleasant flavor due to the solution of the yeast by the alcohol is avoided. *Scotch ale* is a sweet strong ale. *Small beer* is a weak liquor made by using little malt, or by mashing with fresh water the malt residuum left after the wort for ale or porter has been drawn off. *Porter* is a dark-colored beer made from a mixture of pale, amber, brown, and black malt. *Stout* is strong porter. *Berlin white beer* (*weiss beer*) is prepared by quick fermentation from a mixture of 1 part of barley malt and 5 parts of wheat malt with half a pound of hops per bushel.

Lager Beer.—The beer of Bavaria, which has of late years been so extensively manufactured in the U. S. under the name of *lager beer*, owes its name (from *lager*, a store-house) to the fact that it is stored in cool cellars or vaults for several months before it is used, and its remarkable keeping qualities and highly prized properties to the peculiar kind of fermentation by which it is produced. The fermentation of ordinary beer and ale takes place at high temperatures; it is consequently rapid, and the carbonic acid, evolved in bubbles, carries a portion of the yeast to the surface, forming a thick scum. This scum protects the beer from the oxygen of the air. The fermentation of lager beer is conducted at a low temperature—between 40° and 50° F. It proceeds more slowly, and the carbonic acid does not carry the yeast to the surface. Consequently the air has a freer access, and the gluten is more completely converted. This beer is usually fermented in the winter, or, if in summer, in rooms cooled by ice. This is called sedimentary or under-fermentation, to distinguish it from the ordinary surface fermentation. The yeast, called bottom yeast, is quite different from ordinary yeast, and has a tendency to induce the kind of fermentation by which it was produced. The following is a brief outline of the process employed at one of the largest lager-beer breweries in New York. The barley is soaked two or three days, changing the waters; it germinates six to ten days, till the radicles are brownish; it is then kiln-dried. It is crushed between rollers, mashed at 120° to 140° F., the temperature being raised by the addition of boiling water to 160° or 170°. By adding hot water to the residue a second wort is obtained. The first wort is boiled with the hops; the second wort is let in, and the whole is boiled three or four hours. After cooling to between 44° and 50° F., it is run into open fermenting tuns. One gallon of yeast is added for every twenty to twenty-five barrels. Fermentation continues from ten to twenty days. There is a heavy froth at first, which subsides, leaving the surface clear. It is racked off into hogsheads, when the yeast is found at the bottom of the tuns. It stands in these hogsheads with the bung open. A few days before it is to be put in barrels for use the bung is driven in to accumulate carbonic acid for *life*.

Three varieties of this beer are made: (1) "*Lager*," or summer beer, for which 3 bush. of malt and 1½ to 3 lb. of hops are used per barrel, and which is not ready for use in less than from four to six months. (2) "*Schenk*," winter or present-use beer; 2 to 3 bush. malt and 1 lb. hops per barrel; ready in four to six weeks. (3) *Bock* beer, which is an extra strong beer, made in small quantity and served to customers in the spring, during the interval between the giving out of the schenk beer and the tapping of the lager. In its manufacture 3½ bush. of malt and 1 lb. of hops per barrel are used, and it requires two months for its preparation.

The barrels for lager are coated with pitch on the inside, to prevent the beer soaking into the wood and giving rise to acetic acid when they are empty. Lager is therefore the product of a peculiar slow under-fermentation, which takes place at low temperatures.

Chica, or maize beer, was used by the South American Indians before the Spanish conquest. *Bourza*, or millet beer, is made by the Crim Tartars. *Quass*, or rye beer, is a sharp acid beverage prized by the Russians. *Koumiss*, or milk beer, is prepared by the Tartars from mare's milk, which they dilute and ferment.

Composition of Beer.—The stimulant and tonic properties of beer are due to the alcohol and the bitter principle of the hop, while its nutritive value is ascribed to the extractive matters derived chiefly from the malt. The exact

character of many of the constituents of beer is not known. Besides water, alcohol, dextrin, and grape-sugar, the following substances have been identified: glycerin, succinic, acetic, lactic, propionic, glucic, and carbonic acids, albumen and albuminous principles, bitter and resinous matters and essential oil from the hop, and alkaline and earthy salts. The latter, which amount to from 0.15 to 0.28 per cent. of the beer, are from one-half to two-thirds alkaline and earthy phosphates. The unrecognized constituents of beer are grouped under the term extractive matters. In the following table the term *extract* includes all the substances left when the alcohol and water are removed by evaporation:

ANALYSIS OF BEER.

KINDS.	PERCENTAGES.		CONTENTS PER IMPERIAL PINT.	
	Alcohol.	Extract.	Alcohol, fl. ounces.	Extract, ounces.
Burton ale (Allsopp's).....	8.25	13.32	2.16	2.77

Munich bock.....	4.60	9.2	1.17	1.90

Adulteration of Beer.—There is a popular impression that beer is extensively and injuriously adulterated; that potato-starch, grape-sugar, glycerin, and molasses are added as substitutes for malt; pine bark, quassia, walnut leaf, wormwood, bitter clover, aloes, picric acid, cocculus indicus, and strychnine as substitutes for hops; and various chemicals to neutralize acidity or conceal dilution. A few of the first mentioned would not be unwholesome, and it is not probable that many, if any, of the others are ever used. Glucose, or grape-sugar, made from corn-starch, is extensively used whenever the relative prices of barley and grape-sugar make it profitable to do so. Grape-sugar is in no way unwholesome, but it is a very poor substitute for barley. It yields alcohol by fermentation, but does not contain the albumen, extractive substances, and inorganic salts which are contained in barley; consequently the beer is poor. It has been customary of late to omit the storage of beer before it is sold; the beer is sent to the consumers without waiting for the after-fermentation in the barrels; and to produce the effervescence which formerly came from fermentation compressed disks of sodium bicarbonate are introduced into the kegs and barrels through the bung-hole.

Revised by IRA REMSEN.

Beers, HENRY AUGUSTIN: b. at Buffalo, N. Y., July 2, 1847; graduated at Yale College 1869; spent two years in New York in the study of law; was appointed tutor in Yale in 1871, and Professor of English in 1875. Besides stories, essays, and sketches in the magazines, and special contributions to dictionaries, encyclopædias, and other reference books, has published the following books: *Odds and Ends* (verse, 1878); edited *A Century of American Literature* (1878); *Life of N. P. Willis* (1885); edited *Prose Writings of N. P. Willis* (1885); *The Thankless Muse*, a volume of poems (1885); *An Outline Sketch of English Literature* (1886): this was reprinted, with appendix, as *From Chaucer to Tennyson* (1890); *An Outline Sketch of American Literature* (1887): this was reprinted as *Initial Studies in American Letters* (1891).

Beer'sheba (i. e. the well of the oath, or well of the seven): an ancient frontier place of Palestine, situated about 50 miles S. S. W. of Jerusalem, and near the border of the desert. Abraham, Isaac, and Jacob often dwelt there. The phrase "from Dan to Beersheba" was used proverbially to express the whole extent of the land of Israel. There are still to be seen seven wells of ancient masonry, from 5 to 12½ feet in diameter; but only two of them now contain water.

Beestings: See COLOSTRUM.

Beeswax: a substance manufactured or secreted by the honey-bee; the material of which its cells and combs are constructed, and an important article of commerce. Purified beeswax is tasteless, odorless, and colorless. Its specific gravity is about .960. It fuses at 145° F., is insoluble in

water, and partly soluble in boiling alcohol. Beeswax is extensively used in the manufacture of candles and tapers, and for other purposes. It consists of (1) myricin, which is insoluble in boiling alcohol, and is chiefly myricyl palmitate, $C_{30}H_{61}.C_{16}H_{31}O_2$; (2) cerotic acid, $C_{27}H_{54}O_2$, which dissolves in boiling alcohol, but crystallizes out on cooling; (3) cerolein, which remains dissolved in the cold alcohol.

Beet (*Beta vulgaris*): a plant allied to spinach, and belonging to the family *Chenopodiaceæ*. It is native to the Mediterranean basin and western temperate Asia, and has been in cultivation for two thousand years or more. The beet is cultivated in five forms: (1) As an ornamental plant, it is grown for the rich markings of the leaves. A number of varieties have been produced for this purpose, with large leaves marked with several shades of red, orange, and silver-white. (2) As a leaf-vegetable in the form of Swiss chard. The leaf-stalks have been much broadened by selection, until, in rich soil, they reach a width of 2 or 3 inches. These thickened petioles are used as a boiled or pot vegetable. The young leaves of various kinds of beets are also much used for "greens." (3) As a root-vegetable, and this is probably its best-known form. It runs into several types, characterized by the shape and color of the root, but the commonest classification of the garden varieties is into the turnip-beets, which are comparatively small, rounded, and early, and the long-beets, which are usually late. About fifty varieties of garden beets are grown in the U. S. The beet demands a loose, rich soil. It can be sown early, even before the latest frosts are past. (4) As mangolds or mangel-wurzels, which are very large beets grown for cattle-feeding purposes. They demand the same culture as the ruta-bagas or Swedish turnips, although they are usually sown earlier. (5) As sugar-beets, an important source of cane-sugar. (See SUGAR.) These are very extensively grown in Central Europe, and the industry is now assuming some importance in many parts of the U. S., as California, Nebraska, and Kansas. It is probable that the range of adaptability of the sugar-beet in the U. S. is greater than has been supposed. Dr. Wiley writes: "It has been found in general that the coast valleys of California, and probably large areas near the coast in Oregon and Washington, certain parts of the Dakotas and Nebraska, localities in Minnesota, Iowa, Wisconsin, and Michigan, parts of Northern Illinois, Indiana, Ohio, and New York, present favorable conditions for sugar-beet culture, but in the localities thus broadly intimated there are certain restricted areas most suitable to the sugar-beet, and it is only these restricted areas to which we must look for success." See the *Annual Reports of the United States Dept. of Agr.*; *Special Rep. 28* (U. S. Dept. Agr.); *Bulletins 5, 27, 30*, Division of Chemistry (U. S. Dept. Agr.); and the bulletins of the experiment stations of California, Utah, Colorado, Nebraska, Kansas, Missouri, Iowa, South Dakota, Minnesota, Wisconsin, Indiana, Michigan, New York (Cornell).

L. H. BAILEY.

Beet, JOSEPH AGAR, D. D.: English Wesleyan theologian; b. in Sheffield, Sept. 27, 1840; graduated in Wesley College, Sheffield, and Wesleyan Theological College, Richmond, near London; entered the ministry, and in 1885 became Professor of Systematic Theology in his theological *alma mater*. He wrote the excellent commentaries upon Romans (London, 1877), Corinthians (1882), Galatians (1885), Ephesians, Philippians, Colossians to Philemon (1890), and other works, including *Through Christ to God: A Study in Scientific Theology*, 1892.

S. M. JACKSON.

Beethoven, bay'tō-ven, LUDWIG, van: musical composer; b. at Bonn, Dec. 17, 1770. He was the second of four children, of whom the first died an infant. His father, Johann van Beethoven, tenor singer in the chapel of the elector, being poor, mainly in consequence of bad habits, discerned the remarkable musical talents of his son, and prepared early to press them into service by teaching him to play the harpsichord before he was five years old. Having outgrown his father's instruction, the lad was put under the tuition of Pfeiffer, oboist in the chapel, and then under that of Van der Eder, reputed the best organist in Bonn. At the age of eleven he was transferred from Van der Eder to his successor in the chapel, Neefe, who spoke warmly of the boy's proficiency and mastery of the music adapted to the harpsichord. The master himself seems to have given him special instruction in the science of composition, and even had published some of his compositions. At this period the lad dedicated to the elector three pianoforte sonatas, which also were printed. From this time his reputation increased,

and his prosperity, under the auspices of eminent patrons, brightened. When but fourteen he was made assistant court-organist, and three years later was sent to Vienna, at the elector's expense, to pursue his studies under the direction of Mozart, then at the height of his fame. In Vienna he finally made his home, after an incidental residence of several years in Rome, where his efforts were required to support his two younger brothers. On his return to Vienna he studied hard with Haydn and Albrechtsberger, the celebrated contrapuntist, making himself perfect master of the science of musical composition. His favorite instrument at this time was the pianoforte, on which he soon rivaled the best performers. His technical education being completed, his powers trained, his method formed, works came from his hand with astonishing rapidity. There is difficulty in fixing the dates of his compositions, but before he was thirty years old he had published as many as 20 sonatas for the pianoforte, 9 for piano and instruments, 2 concertos for piano and orchestra, trios, quartets, quintets, septets, a ballet, *The Men of Prometheus*, and two orchestral symphonies. At this period he moved in the best society, was noticed by persons of rank, and recognized by all as a genius of the first order. These were his happy, hopeful days, but they did not last long; they were soon clouded by the one great calamity of his life—a misfortune that to a musician would seem almost fatal to achievement. Already in 1800 he speaks sadly of a defect in his hearing which occasioned serious inconvenience. It increased so rapidly that before long, in the course of two or three years, during which he had a violent sickness, he became totally deaf. This affliction clouded his inner life, made him distrustful, restless, suspicious, melancholy, and unsocial. From this time books, meditation, and solitary walks in the country were his sole recreation. His society was limited to a few select friends, with whom he could forget himself. He lived in his work, and his work went on increasing in volume, gaining in power, and deepening in intensity from year to year. The achievements of his genius can not be described in a few words. In less than five years were produced the *Heroic Symphony*; *Fidelio*; *Fourth, Fifth, and Sixth Symphonies*; with the grand mass in C. In 1813 came the *Seventh Symphony*; three years later the *Eighth*; in 1824 the *Ninth* or *Choral Symphony*, by many thought the most wonderful of all—by Beethoven himself regarded as the most significant; and in the intervals between these gigantic creations was produced some of his most perfect music. To give here any account of these works is impossible; they can not so much as be named, for they cover nearly every species of composition, and are so remarkable that nearly every one merits special notice. They are as extraordinary for their wealth of thought and feeling as for their mastery of the laws of composition. They constitute a musical library by themselves. The nine symphonies and the grand sonatas for the pianoforte are monuments of genius which alone would give immortality to their creator.

Beethoven died Mar. 26, 1827, of dropsy, following a violent inflammation of the lungs. His constitution, naturally strong, had been tried by severe shocks of illness. His life was solitary; he was never married. His strongest natural attachment was for a nephew who proved unworthy of his uncle's devotion. Though his deafness made him a recluse, he was not selfish, sordid, or narrow-souled. On the contrary, his human feeling was of the deepest, and, though he could never have been rich, he showed himself capable of generosity. An enthusiastic republican in his belief, and an ardent sympathizer with his countrymen in their struggles for political liberty, Beethoven suffered bitterly for the woes of his Fatherland, and poured out through his music the passion of his proud, agonized heart. There are worlds of sorrow in his compositions. They are, in every sense of the words, modern and living. Though so thoroughly accomplished in musical science, Beethoven was never scholastic; though so deeply charged with emotion, he was never sentimental. His works convey the profound, various, comprehensive feeling which was natural to a sensitive spirit, keenly responsive to all the joy and sorrow of the new age. To this is due their extraordinary hold on people who are quite unable to appreciate their technical excellence.

That Beethoven was a man of vast intellect his compositions testify. But he was something besides a musician. He read much and thought much; he was by no means unfamiliar with the literature of Germany, and even with Italian letters. When interested, his conversation was animated, brilliant, and instructive.

In person Beethoven is said to have been of middle size, stout, and apparently strong. His statues, busts, and portraits represent him with a massive head, broad brow, a dignified, somber expression of countenance, and features of harsh but heroic cast. The bronze statue erected in the public square of his native city in 1845 is of majestic aspect. His latest and most careful biographer, Mr. A. W. Thayer (1876-79), describes him as looking much like a mulatto, short and sallow, with wide nostrils and projecting teeth, heavy lips, and high cheek-bones. See Grove's *Dictionary of Music and Musicians*.

Beetle: a common name given to insects of the order *Coleoptera*. They may be recognized by the much thickened horny anterior pair of wings (elytra), which meet in a straight line down the back and conceal the second membranous pair of wings, the true organs of flight. The young hatch as grubs, and undergo a complete metamorphosis, and the mouth parts are in the form of jaws, fitted for biting. Many beetles are remarkable for their singular forms and the brilliant colors and ornamental markings of their elytra. See COLEOPTERA and SCARAB.

Beet-root Sugar: sugar made from beets. The beet-root contains about 10 per cent. of saccharine matter; chemically it is the same as ordinary cane-sugar. The Prussian chemist Aehard was the first who succeeded in extracting sugar from beets. A comparatively small amount is made in the U. S. The production for 1896-1901 was as follows:

COUNTRY.	1900-1901	1899-1900.	1898-99.	1897-98.	1896-97.
	(estimated).				
	Tons.	Tons.	Tons.	Tons.	Tons.

See SUGAR.

Beets, NICOLAAS: Dutch poet and writer; b. in Haarlem, Sept. 13, 1814. He studied at Leyden, and became in 1840 pastor at Heemsteê; in 1854 he was established as pastor in Utrecht, and in 1875 he became Professor of Theology in the University of Utrecht. Happy in his married life, in his success as a pastor, and in the respect of his countrymen, his career has been on the whole quiet and uneventful. As a writer he has passed through three somewhat different phases. As a youth he felt powerfully the influence of Sir Walter Scott, and his first publications show this. He made his poetical *début* in 1831 in the *Musen-Almanak*, with a poem on the death of a lady named Bilderdijk-Schweiekhart. This was followed by other poems, and by translations from Scott. Soon, however, he fell under the influence of Byron, though in a somewhat superficial fashion. Beginning with slight translations of Byron, in 1834 he published his *Jose, een Spaansch verhaal*, in which he attempted to give expression to his admiration for *Childe Harold* and *Manfred* by imitating them. In the same vein were his *Kuser* (1835), *Guy de Vlaming* (1837), and *Ada van Holland* (1840). The last poem, however, was his last Byronic experiment. In 1837 he had begun to write, over the name "Hildebrand," striking sketches of Dutch life in prose. In 1839 these sketches were published in a volume entitled *Camera Obscura*, and were at once felt by the public to be original and powerful. In 1838 had appeared *Gedichten*; in 1853, *Korenbloemen*; in 1857, *Nieuwe Gedichten*; in 1863, *Verstrooide Gedichten*; in 1869, *Madelieven*. His collected poems appeared in three volumes, Amsterdam, 1873-76. He also achieved success as a critic.

A. R. MARSH.

Beeville: town; capital of Bee co., Tex. (for location of county, see map of Texas, ref. 6-11); on San An. and Aransas Pass and a branch of Southern Pac. R. Rs.; 96 miles S. of San Antonio, and 56 miles from the coast; has five churches, graded schools, and high school. Beeville is situated in the same latitude as Tampa, Fla., in a region where oranges and bananas may be grown, and well adapted to market-gardening. Pop. (1880) 208; (1890) 1,311; not returned in 1900.

PUBLISHER OF "BEE."

Beg: See BEY.

Begas, bay'gāas, KARL: painter; b. at Heinsberg, Germany, Sept. 30, 1794. He was a resident of Berlin and court painter to the King of Prussia. He painted *The Finding of Moses* and other scriptural subjects; also portraits, including Humboldt and Schelling. D. Nov. 23, 1854.

Begg, JAMES: See the Appendix.

Beggar: a person who solicits charitable aid from the public at large. In all ages and countries persons have practiced various arts in order to enlist the sympathies of the benevolent. Severe enactments have from time to time been made against them. By a law of Richard II. (1388) able-bodied beggars were punished and compelled to labor, and provision was made for the helpless. By an act of Henry VIII. (1530) licenses were given to poor persons to beg within fixed limits, but unlicensed beggars were whipped, and all persons giving alms to such forfeited ten times the amount given. By an act of the reign of Elizabeth (repealed in 1593) beggars were grievously whipped, burned through the ear with a hot iron, and for the third offense put to death. The best method of regulating and suppressing the practice of begging is a matter much discussed and still unsettled. See CHARITY ORGANIZATION.

Begging Friars: See FRIARS, DOMINICANS, etc.

Beg'hards [O. F. *begard*; M. H. G. *beghart*, derived from name of Lambert le Bègne; cf. *Béguine*]: name applied to semi-monastic societies of men, originating in the Netherlands, and dating from the early part of the thirteenth century, or not very long after similar societies of women (the Béguines) had been formed, and spreading over Germany, France, and Italy. At first distinguished for piety and works of beneficence, they quickly degenerated into mere pious beggars. They were also joined by heretics of every description, and so fell under the ban of the church in the fourteenth century, and were severely hauled by the Inquisition, but continued down to the Reformation. See Mosheim, *De Beghardis et Beguinabus Commentarius* (Leipzig, 1790); Hallmann, *Geschichte d. Ursprungs d. belgischen Beghinen* (Berlin, 1843); L. Keller, *Die Reformation und die alteren Reformparteien* (Leipzig, 1885).

Begharmi: same as BAGIRMI.

Begonia: a genus of herbaceous ornamental plants, comprising between 300 and 400 species. The genus contains several well-marked sections. A rough classification of the garden kinds groups them into the "foliage" begonias (as shown in *Begonia rex*), the small-leaved flowering non-tuberous sorts and the tuberous species. The rex or foliage section comprises some of the choicest of ornamental-leaved plants. Some of the dark-leaved varieties are known as "beefsteak geraniums." They all demand a shaded situation in the greenhouse or window-garden. They are propagated by seeds and stem-cuttings, and many of them grow readily from leaf-cuttings. The tuberous-rooted section is gaining rapidly in public favor. The species are adapted both for indoor and outdoor cultivation. They profit by a partially shaded location. The flowers are very variable in size, shape, and color, sometimes attaining a diameter of over 4 inches. The tuberous begonias are grown from the tubers, from seeds, and from stem-cuttings, although the last method is perhaps not generally advisable with amateurs.

L. H. BAILEY.

Begonia'ceæ [so named from *Begonia*, one of the genera]: a natural order of exogenous plants, mostly herbaceous; have alternate leaves, oblique at the base, and eyes of unisexual pink flowers, with a colored perianth and numerous stamens. There are also white and deep scarlet varieties. They are nearly all tropical plants, but one species of *Begonia* grows on the Himalayas 11,500 feet above the sea. The order comprises about 160 species. Some of the Mexican species are used as drastic purgatives.

Béguines, bay'geen' [Fr. *Béguine*, a deriv. from the name of Lambert le Bègue, a priest of Liège in the twelfth century, founder of the order]: the name given to semi-monastic societies of women originating in Belgium, perhaps at Liège, about 1180 A. D. These societies grew in part out of the numerical inequality between the sexes caused by the crusades. The women, without assuming monastic vows, lived in houses by themselves, labored for their own support, and took care of the sick. They had similar fortunes with the BEGHARDS (*q. v.*), but being worthier survived their persecutions. There are now in Belgium twenty of these establishments, with about 150 members. For literature, see BEGHARDS.

Begum, be-gūm' [from Turk. *bégin*, princess; cf. Eng. *bey*]: a title of honor given in the East Indies to princesses and the sultanas of seraglios. Among the charges against Warren Hastings was his cruelty to two rich begums of Oude, the mother and the wife of Sujah Dowlah. In order to extort money from them, Hastings or his agents invaded the privacy of their zenanas, and reduced them to the alternative of delivering their treasures or exposing their faces to the view of strange men. They preferred the former of these two evils.

Behaim, bay'him, or **Behem**, bay'hem, MARTIN: an eminent cosmographer and navigator; b. at Nuremberg about 1459. He became a merchant, and visited foreign countries in that capacity. In 1484 and 1485 he accompanied the navigator Diego Cam in a voyage of exploration along the west coast of Africa. He gained distinction as a maker of maps and globes. A large globe which he made in 1492 is still preserved by his descendants in Nuremberg, and is prized as a monument and record of the progress of geography. D. in Fayal, July 29, 1506. See Ghillany, *Geschichte des Seefahrers Ritter Martin Behaim* (1853); C. G. von Murr, *Diplomatische Geschichte des Ritters M. Behaim* (1778).

Behaim, MICHAEL: mastersinger; b. at Sulzbach, 1416; a weaver by trade; burgomaster of his native village, where he was murdered in 1474. Though he wrote numerous poems of all descriptions, he must be considered the representative of the greatest decline of the art of poetry in Germany during the fifteenth century. JULIUS GOEBEL.

Beham, bay'ham, BARTHEL, or BARTHOLOMEW: a German portrait-painter and engraver; b. in Nuremberg in 1502; a pupil of Dürer. D. in Italy in 1540. He was a master of copper-plate engraving, of which his *Emperor Charles V.* is a fine specimen.—His nephew, HANS SEBALD BENAM; b. in Nuremberg, 1500; one of the best of the Nuremberg engravers, whose grotesque, sometimes coarse subjects. D. in Frankfort, Nov. 22, 1550.

Behar': a division of Bengal, British India; between the parallels 24° and 28° N., and the meridians 83° and 89° E., S. of Nepal and E. of the Northwestern Provinces. It is a generally flat country, divided by the Ganges into two nearly equal parts. Area, 44,163 sq. miles. Pop. (1891) 24,284,370, of whom 84 per cent. were Hindus and 13 per cent. Mohammedans. The population is rapidly increasing, and is now nearly 550 per sq. mile. Rice is the main staple of food; in elevated and drier localities, wheat, maize, millet, and pease are substituted. Potatoes and cabbages have been introduced by Europeans and are now largely grown. The commercial staples are oil-seeds, opium, indigo, sugar, cotton, and saltpeter, the opium being a government monopoly. The East Indian Railway runs through the division along the Ganges, and it is entered or crossed in part by several others. The climate is very hot from March to June, when the rains set in and last till the end of September. The rainfall is about 50 inches. The cool season lasts from October to March, and is the pleasantest part of the year.

Behar is the cradle of Búddhism. From the fourth century before our era to the fifth after, it was a part of the splendid kingdom of Magadha. In 1202 it fell into the hands of the Mohammedans. In 1765 it was acquired by the East India Company. It is now divided into twelve districts, and contains many important cities, as Patna and Chapra. Behar city is in 25° 10' N. lat., 85° 35' E. lon. It was formerly the residence of a governor, and is now the capital of the district of the same name. Pop. about 53,000. MARK W. HARRINGTON.

Beheading: See CAPITAL PUNISHMENT.

Behem, MARTIN: See BEHAIM, MARTIN.

Behemoth: a huge animal described in the book of Job (xl. 15-24). Some critics consider the Hebrew term a plural noun for cattle in general. Others think some extinct species of animal is referred to. Others think the elephant is meant. But most writers, including English commentators generally, say the hippopotamus.

Behistun, bay-his-toon' [Lat. *Bagista'nus*, Pers. *Baghistan'*, i. e. place of gardens]: an ancient and ruined town of Persia; in Irak-Ajemi, 21 miles E. of Kermanshah (see map of Persia and Arabia, ref. 5-F). Here is a remarkable limestone mountain (the ancient *Mons Bagistanus*, on the confines of Media), which rises to the height of 1,700 feet, and is almost perpendicular on one side. According to Dio-

dorus, the famous Semiramis, on her march from Babylon to Ecbatana, encamped here and prepared a residence, and having cut away the lower part of the rock of Bagistanus, caused her portrait to be carved or sculptured there. The geography of this locality has been carefully investigated by Rawlinson and Masson. A peculiar interest attaches to the rock of Behistun on account of its cuneiform inscriptions, which were made by order of Darius I., King of Persia, about 515 B. C., and have been deciphered by Sir H. Rawlinson. Close to these inscriptions are thirteen human figures, one of which represents Darius. "The labor," says Rawlinson, "bestowed on the whole work must have been enormous. . . . But the real wonder of the work consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequalled in the world. It is evident that after the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. The varnish is of infinitely greater hardness than the limestone rock beneath it. It has been washed down in several places by the trickling of water for three-and-twenty centuries, and it lies in flakes upon the foot-ledge like thin layers of lava." (*Journal of the Asiatic Society*, vol. x.) The Persian inscriptions which Rawlinson deciphered are contained in five columns, one of which has ninety-six lines, and each of the others nearly as many. There are on the same rock inscriptions in the Median and Babylonian languages. See Rawlinson's *Herodotus*, vols. i. and ii.

Behm, baym, ERNST: geographer; b. in Gotha, Jan. 4, 1830; founded 1856 the *Geographisches Jahrbuch*; began in co-operation with H. Wagner the publication of *Die Bevölkerung der Erde* (1872); succeeded Dr. Petermann as editor of the *Mitteilungen* (1878); statistician of the *Almanach de Gotha* (1876). D. in Gotha, Mar. 16, 1884.

Behn, ben, APIARA, or APIRA (*Johnson*): an English dramatist; b. at Wye, Kent, in 1640; daughter of a barber. She was married (about 1658) to an English merchant of Dutch descent, named Behn, who died before 1666, and she was employed as a spy at Antwerp by Charles II. She wrote under the name of "Astræa" some seventeen plays and a number of poems, epistles, and novels, the most noteworthy of which is *Surinam*, the story of a native prince of Oroonoko, in South America, whose acquaintance she had made during a short residence in that province in her youth. Her writings are witty, but immoral; latest reprint London, 1871, 6 vols. D. in London, Apr. 16, 1689, and was buried in the Poets' Corner of Westminster Abbey.

Behrends, ADOLPHUS JULIUS FREDERICK, D. D.: Congregationalist minister; b. at Nymwegen in Holland, Dec. 18, 1839; graduated at Denison University, Ohio, 1862; studied at Rochester Theological Seminary; became pastor of the Baptist church at Yonkers, N. Y., 1868; of the First Baptist church, Cleveland, O., 1873; then pastor of the Union Congregational church, Providence, R. I., 1876; and of the Central Congregational church, Brooklyn, N. Y., 1883. He was the author of *Socialism and Christianity* (1886) and the *Philosophy of Preaching* (1890), and was a frequent contributor to theological journals. D. in Brooklyn, N. Y., May 22, 1900. GEORGE P. FISHER.

Behring: See BERING.

Beilan, bay'-laan': a town and pass of Northern Syria; on the east side of the Gulf of Iskanderoon; one of only two passes between Cilicia and Syria. It is thought by some to be the same as the ancient *Amanian Gates*. The town of Beilan is situated on a hill-crest 1,500 feet above the sea. Pop. about 5,000. It has numerous aqueducts.

Beilstein, bil'stîn', FRIEDRICH CONRAD: chemist; b. in St. Petersburg, 1838; professor in the Technological Institute in that city since 1866. He has done much valuable work in the field of organic chemistry. He is probably best known by his *Handbuch der organischen Chemie* (3d ed. 1891), a work highly prized by all engaged in higher work on the compounds of carbon.

Beira, bay'-raã, or **Beyra**: a province of Portugal; bounded N. by Entre-Douro-e-Minho and Tras-os-Montes, E. by Spain, S. by Estremadura and Alentejo, and W. by the Atlantic. Area, 9,244 sq. miles. Besides the Douro, which flows along its north boundary, and the Tagus, which touches it in the southeast corner, Beira is also drained by the Mondegos. The surface is mountainous; the soil is gen-

erally poor. Among the staple productions are wine, grain, and olives. Marble, iron, and coal are found here. Capital, Coimbra. Pop. (1881) 1,377,432.

Beirut, or **Bairut**: See BEYROUT.

Beit-el-Fa'kih, bayt'el-faa'kêe (i. e. house of a saint): a town of Arabia; in Yemen; on the Red Sea; 90 miles N. of Mocha (see map of Persia and Arabia, ref. 10-D). The heat here is very great, the thermometer rising to 104° F. in the shade, and 145° in the sun. It has a citadel and a mosque. Pop. about 8,000. It is one of the largest marts in Arabia for coffee.

Beja, bay'zhaã (anc. *Pax Julia*): a town of Portugal; in Alemtejo; 57 miles by rail S. of Evora (see map of Spain, ref. 18-B). It has a castle, a cathedral, and manufactures of earthenware and leather. It is the seat of a Roman Catholic bishop. Two annual fairs are held here in the fall. Pop. 8,500.

Be'jan: name of the freshman class in universities of St. Andrews and Aberdeen, Scotland, and in earlier times in many of the continental universities.

Bejapoor: same as BIJAPPOOR.

Bejar, bay'-khaar': a Spanish town romantically situated on the Cuerdo de Hombro; 48 miles S. of Salamanca (see map of Spain, ref. 15-D). It has manufactures of wool, and is noted for hams. There are thermal silicate springs in the vicinity which are much frequented. Pop. (1887) 12,120.

Beke, CHARLES TILSTONE: English traveler; b. in London, Oct. 10, 1800. He early attracted attention by his biblical and archaeological writings, and in consequence received an honorary Ph. D. from the University of Tübingen (1834). He explored Abyssinia (1840-43), and after his return published, besides other works, an *Essay on the Nile and its Tributaries* (London, 1847), and *On the Sources of the Nile in the Mountains of the Moon* (1848). He has since made other visits to Africa and Asia, and performed many eminent public services, especially in Abyssinia. He claimed (*Discoveries of Sinai in Arabia and of Midian*, 1878) to have discovered that Mt. Sinai was Jebel-el-Nur, a grand mountain with a broad plain at its base, near the Gulf of Akabah, on the E. D. in Bromley, Kent, July 31, 1874.

Bekes, bay'-kesh': a county of Central Hungary; bounded N. by the county of Szaboles, E. by Bihar, S. by Csanad, and W. by Csongrad. Area, 1,321 sq. miles. The country consists of a plain, and is watered by the Black, White, and Rapid Körös. The climate is unhealthy, but the soil is extremely fertile, yielding large quantities of wheat of the first quality. Pop. (1890) 257,888.

Bekes, or **Bekesvár**, -vaãr': a town of Hungary; capital of county of same name; at the confluence of the White and Black Körös; 62 miles S. W. of Debreczin (see map of Austria-Hungary, ref. 7-I). It has considerable trade. Pop. 24,561.

Bek'ker, AUGUST IMMANUEL: philologist; b. in Berlin, May 21, 1785; was a pupil of F. A. Wolf at Halle. He became Professor of Philology at Berlin in 1810, and published *Anecdota Græca* (3 vols., 1814-21). He produced good editions of many classics, among which are *Plato* (10 vols., 1814-21); *The Attic Orators* (5 vols., 1823-24); and *Aristotle* (4 vols., 1831-36). D. in Berlin, June 7, 1871.

Bel: See BAAL.

Bela, bay'laã: name of four Hungarian kings of the Arpad dynasty. B. I. (1061-63) regulated the systems of measures, weights, and coinage, and introduced the representative system into the Diet.—B. II., The Blind (1131-41); addicted to drink; entirely dominated by his bloodthirsty wife, Helena.—B. III. (1174-96) introduced Byzantine customs and culture into the court.—B. IV. (1235-70); son of Andreas II.; fled before the Mongols to Austria 1241; afterward fostered the development of the country by the encouragement of colonists.

Belaia: same as BIELAYA.

Bel Air: capital of Harford co., Md. (for location of county, see map of Maryland, ref. 1-F); on Balt. and Lehigh R. R.; 22½ miles N. of Baltimore. It is a manufacturing town, and trade-center of an agricultural district. Pop. (1890) 1,416; (1900) 961.

Bel and the Dragon, History of: an apocryphal book of the Bible; regarded as a fable by St. Jerome and many eminent theologians. It is canonical in the Roman Catholic

Church, being part of the fourteenth chapter of Daniel in the Vulgate. By the Anglican Church it is recommended to be read for edification. It was written in Greek, probably in Alexandria, in the third century B. C. It has no historical value. Its object seems to have been to give a warning against idolatry. See PSEUDEPIGRAPHA.

Belcher, Sir EDWARD, F. R. S.: an English vice-admiral; b. in Halifax, N. S., 1799. As commander of the *Sulphur*, he sailed on a voyage around the world in 1836, and explored the western coasts of America. During this voyage he served in the naval operations against the Chinese in 1841. He became a post-captain in 1843, and commanded an expedition sent in search of Sir John Franklin in 1852. Returning without any success, and having lost his vessels, he was placed before a court martial, but acquitted. In 1864 he became rear-admiral of the red. He published, besides other works, a *Narrative of a Voyage round the World in the Sulphur*. D. Mar. 18, 1877.

Beleher, JONATHAN: merchant; b. in Cambridge, Mass., Jan. 8, 1681; graduated at Harvard in 1699. He was Governor of Massachusetts and New Hampshire from 1730 to 1741. Having been removed from office, he went to England to vindicate himself, and was appointed Governor of New Jersey in 1747. D. in Elizabeth, Aug. 11, 1757.

Belcher, JONATHAN: son of the preceding; b. at Boston, Mass., July 28, 1710; studied law at the Temple, London; was one of the first settlers in Chebucto, Nova Scotia; became lieutenant-governor of Nova Scotia in 1760, and chief justice in 1761. D. in Halifax, N. S., Mar. 29, 1776.

Bel'ding: city; Ionia co., Mich. (for location of county, see map of Michigan, ref. 7-I); on the D., L. and N. R. R.; 138 miles N. W. from Detroit. It is the seat of extensive manufacturing industries, the first silk-mill built in the West being placed here. There are now two silk-mills, employing over 600 operatives, mostly girls; a large refrigerator-factory, casket-factory, furniture-factory, basket-factory, washing-machine factory, a chemical fire-extinguisher factory, paper-box factory, besides other smaller concerns. Pop. (1880) 562; (1890) 1,730; (1900) 3,282.

PUBLISHERS OF "BANNER."

Bel'ed-el-Jereed' (i. e. the country of dates): an extensive region of Northern Africa; bordering on the Desert of Sahara; is bounded on the N. by Algeria, and on the W. by Morocco. The soil is mostly arid and sterile, except some oases which produce the date-palm, which affords the inhabitants their principal and often their only food.

Belem, baÿ-lei': a city of Brazil. See PARA.

Belem'nite [from Gr. *βέλεμων*, dart]: the common name of the internal *guard* of an extinct type of dibranchiate cephalopoda, of which the genus *Belemnites* is the main representative. See BELEMNITIDÆ.

Belemnitidæ: a family of extinct cephalopods of the sub-order *Decapoda*, of which *Belemnites* is the typical genus. The parts generally preserved in the fossil state are (1) the *guard*, a cylindro-conical, elongated calcareous shell, mainly solid, but with a shallow conical cavity in the larger end in which is inserted the *phragmacone*, (2) which is chambered and traversed by a marginal siphon on the ventral side; on the dorsal side the phragmacone is extended in a thin, extremely delicate plate (3) expanded and rounded in front, which is rarely preserved, representing the "pen" of the *Loligo*. This is called the *pro-ostracum*. Occasionally traces of the "ink-bag" and impressions of the arms are preserved, showing the animal to have been constructed on the plan of the recent *Loligo*. In the latter genus the "pen," representing the pro-ostracum of the *Belemnites*, is the only part of the internal skeleton developed.

The *Belemnitidæ* include the genera *Belemnites*, *Belemnitella*, *Xiphoteuthis*, *Beloptera*, *Spirulorostra*, and others, all of which are confined to the Mesozoic (Triassic, Jurassic, and Cretaceous) and the lower part of the Tertiary.

H. S. WILLIAMS.

Belfast': an important city and seaport of Ireland; in the county of Antrim and province of Ulster; situated on Belfast Lough (an arm of the sea), at the mouth of the river Lagan, 101 miles by rail N. of Dublin, and 118 miles S. W. of Glasgow; lat. 54° 35' N., lon. 5° 57' W. (see map of Ireland, ref. 5-J). The river is crossed by three bridges, the finest of which is the Queen's bridge. Railways extend from this point to Dublin, Armagh, and Londonderry. The site of the city is low and level, but is partly inclosed by the ridge

of Divis and Cave Hill, the former of which rises to the height of 1,567 feet. The houses are mostly of brick and are well built; the streets are regular, spacious, well-lighted, and macadamized. Belfast is the most prosperous commercial town of Ireland, except Dublin. The principal public edifices are Queen's College, a beautiful structure in the Tudor style (opened in 1849); a Presbyterian and a Methodist college; the Royal Academical Institution, affiliated to the London University; the museum, the theater, Linen Hall, the Corn Exchange, etc. It has about 80 churches, of which 28 are Presbyterian. Although the seat of the Roman Catholic bishop of Down and Connor, it is mostly Protestant, having only five Roman Catholic churches. The botanic garden of the Natural History Society occupies about 17 acres. Belfast is the chief seat of the Irish manufactures of linen and cotton, and is the great *dépôt* of the linen trade. The linen manufacture was established here in 1637. The other chief branches of industry are weaving of linen and cotton, bleaching, dyeing, calico-printing, and iron-founding. Numerous steamers, engaged in the Channel trade, ply regularly between Belfast and Liverpool, Glasgow, Dublin, London, etc. The chief articles of export are linens, cotton goods, grain, flax, cattle, and provisions. This city has also a large foreign trade. The adjacent country is extremely beautiful. Belfast returns four members to Parliament. It first became an important place about 1604, and was chartered in 1611. Pop. (1881) 207,671; (1891) 255,896.

Belfast: city and port of entry; capital of Waldo co., Me. (for location of county, see map of Maine, ref. 9-D). It is the terminus of the Belfast and Moosehead Lake R. R., and is situated at the head of West Penobscot Bay, 2 miles W. of Penobscot river, and about 30 miles S. by W. from Bangor. It has a spacious harbor, which is safe and sufficiently deep for large ships. Belfast has a good school system, including high school, public library of over 5,000 volumes in a handsome stone building, and churches of six denominations. The principal industries are the manufacture of shoes, patent medicines, doors, iron, and the quarrying of granite, and ship-building. It was first settled in 1770; was invested by the British in 1815; adopted a city charter in 1853. Pop. (1880) 5,308; (1890) 5,294; (1900) 4,615.

EDITOR OF "AGE."

Belford, JAMES B.: b. in Lewistown, Pa., Sept. 28, 1837; educated at Dickinson College; studied law; was appointed one of the judges of the Supreme Court of Colorado (1870-75). Since the admission of Colorado as a State he has been elected its representative in the 44th, 45th, 46th, 47th, and 48th Congresses, but was refused his seat by the Democratic majority in the 45th.

Belfort, bel'fôr': an important fortified town of France; at the foot of the Vosges and on the river Savourense; 60 miles by rail N. E. of Besançon (see map of France, ref. 4-I). Pop. (1891) 25,455. It has a citadel constructed by Vauban, a fine church, and a public library; also manufactures of iron, paper, and calico. It was ceded to France by Austria in 1648. In the winter of 1870-71 it was besieged by the Germans, and capitulated Feb. 16 with the sanction of the Government, but was afterward evacuated by the Germans. It once belonged to the department of Haut-Rhin; is now in the small territory of Belfort. Area, 235 sq. miles; pop. (1891) 83,670; (1896) 88,047.

Bel'gæ: the name given by Cæsar to the warlike tribes which in ancient times occupied one of the three great divisions of Gaul (*Gallia*). Their country, which was bounded on the N. W. by the ocean and on the E. by the Rhine, comprised the modern Belgium, part of Holland, and the north-east part of France. This region was sometimes called *Belgica* or *Gallia Belgica*. It was separated from the territory of the Celtæ by the river *Sequana* (Seine) and its affluent the *Matrona* (Marne). Cæsar represents the Belgæ as distinct from the Celtæ proper and the Aquitani in language, usages, and political institutions. A part of the Belgæ were probably Germans or of German origin, and a part are believed to have been Cymric Celts. Some of the Belgæ had crossed the Channel and settled in the southern maritime parts of Britain, and were found there by Cæsar when he invaded the island. The Belgæ were a brave, warlike people. See Cæsar, *Commentaries on the Gallic War*; Smith, *Dict. of Ancient Geog.*

Belgaum, bel-gawm': a district and city of the Bombay Presidency, British India. The district is near the west coast, in lat. 16° N., northeast of Goa. Area, 4,657 sq. miles. The

chief occupation is agriculture, but there are considerable manufactures of cloth, wood, metals, and shoes. Among the agricultural products are rice, wheat, sugar-cane, barley, and tobacco. The population is about 870,000, 57 per cent. of whom are Hindus, 7 per cent. Mohammedans, and 5 per cent. Bûddhists. The city of Belgaum is in about lat. 15° 50' N., lon. 74° 40' E. It is the capital of the district. Pop. 35,000.

Belgiojoso, bel-jō-yō'sō, CRISTINA, Princess of: b. at Milan, June 28, 1803; a daughter of Marquis Geronimo Isidoro Trivulzio; married on Sept. 14, 1824, Prince Emilio Barbian e Belgiojoso. She embraced the Italian cause with great enthusiasm; was expelled from Italy by the Austrian Government in 1830, and settled in Paris, where her salon soon became the center of a most brilliant political and literary circle. In 1848 she returned to Italy, equipped a corps of volunteers at her own expense, and took part most actively in the revolution in Milan and Rome. But in 1850 she was once more exiled; visited Greece and Turkey, and settled in 1855 once more in Paris, still working indefatigably for the cause of her country. In 1861 she finally returned to Italy, and d. in Milan, July 5, 1871. Besides being a frequent contributor to various French and Italian journals, she published *Essai sur la Formation du Culte dogmatique* (1846); *Souvenirs d'Exil* (1850); *Emina, Récits turco-asiatiques* (2 vols., 1856); *Asie mineure et Syrie*; and *Scènes de la Vie turque* (1858); *Histoire de la Maison de Savoie* (1860); and *Réflexions sur l'État actuel de l'Italie*, etc. (1869).

Belgium: a kingdom of Europe; on the German Sea between Holland, Prussia, and France; has an area of 11,373 sq. miles, and a population (est. 1898) of 6,669,732 inhabitants (see map of Holland and Belgium, under Holland). It is the most densely peopled country of Europe, having 540 inhabitants to the square mile. The soil is partly fertile, partly (in the E.) sandy and marshy. The only mountains are some offshoots of the Ardennes in the S. The coast has a length of 46 miles, and is flat and undiversified. The country is well watered by the Meuse and the Scheldt, and their affluents, the Sambre, Ourthe, Werze, Lys, Dender, and Rupel. There are no lakes of importance, but many canals. The climate in general is temperate. Among the chief products of Belgium belong cattle, fish, corn, fruit, wood; among those of the mineral kingdom, iron and coal. A coal region covering an area of 476 sq. miles traverses all Belgium, and embraces two large basins, one of which extends into France and the other into Prussia. Celebrated mineral springs are found at Spa. The people belong, in almost equal proportion, to two different nationalities, the Flemish (German) and the Walloon (French). The Flemish language, which is spoken by about 2,500,000, prevails in the provinces of East Flanders, Antwerp, Limburg, West Flanders, and Brabant, while the Walloon is the predominant language in the provinces of Liège, Hainaut, Namur, and Luxemburg, and is spoken by a population of about 2,000,000. The French, though the language of the minority, has since 1794 been the official language of the state authorities and the court; of late, however, the Flemings have begun an active agitation for the recovery of equal rights for their idiom. A considerable number of periodicals are published in the Flemish language. With the exception of about 15,000 Protestants and 3,000 Jews, the entire population belongs to the Roman Catholic Church, which has in Belgium one archbishop at Malines, and five bishops at Namur, Ghent, Bruges, Tournay, and Liège.

There are four universities—at Ghent, Liège, Louvain, and Brussels; the two first named are controlled by the state; the third by the Catholic bishops, and the last named by the Liberal party. Prominent among the other educational institutions of the country are the Academies of Fine Arts at Antwerp and Brussels, the Museum of Painting and Sculpture at Brussels, the Conservatories of Music at Brussels, Liège, and Ghent. The people are chiefly occupied with agriculture, and in this respect excel most nations of Europe. The working of mines is also a most important part of the national industry. First in order are the coal mines (with three great centers at Mons, Charleroi, and the city of Liège), which produced in 1898 22,088,000 tons. The annual produce of the iron mines amounted, in 1898, to 240,744 tons; 2,544,403 tons of iron ore were imported for manufacture, chiefly from Luxemburg. Wool is the object of an immense industry, and the Belgian woolen cloths are superior in quality. The linen cloths of Belgium

have long been highly valued; and the manufacture of lace, though now less prosperous than formerly, has nothing to fear from foreign competition. The breweries are very numerous, and beer is the common beverage of all classes. The commerce of the country is also in a very prosperous condition, being greatly promoted by a dense net of railroads, which in 1898 had an aggregate length of 2,867 miles. It is chiefly carried on with France, Holland, England, Prussia, North America, and Russia. The exports amount to about \$600,000,000, and the imports to a trifle more. The commercial fleet, in 1891, consisted of 56 vessels (46 steamers), with an aggregate of 75,946 tons. The aggregate length of the telegraph lines was, in 1898, 3,960 miles. The most important ports are those of Antwerp and Ostende; the most important centers of the commerce of the interior are Brussels, Ghent, Bruges, Liège, Namur, Courtray.

Government.—According to the constitution of Mar. 3, 1831, Belgium is a constitutional monarchy. The crown is hereditary, according to the right of primogeniture, in the male line only. The executive power is vested in the king alone; the legislative he shares with the Senate and the House of Representatives. The Court of Cassation at Brussels is the supreme court of the country; besides it there are three courts of appeal (Brussels, Ghent, and Liège). The jury has been introduced since 1831. The Code Napoléon is regarded as the judicial standard. The public budget for 1900 was, revenue, \$452,246,618; expenditure, \$450,929,726; public debt, \$2,603,787,175. The army on the war footing numbered (without officers) 163,000 men, 25,823 horses, and 240 pieces of ordnance; besides, the country has a civil guard consisting of 40,443 active and 90,000 non-active men. The navy is unimportant. The most important fortresses are Antwerp, Mons, Charleroi, Philippeville, Mariembourg, Ath, Tournay, Menai, Ypres, Ghent, and Namur. The measures and coins have been since 1817 the same as in France. In point of administration the country is divided into nine provinces: South Brabant, Antwerp, East and West Flanders, Hainaut, Namur, Liège, Limburg, Luxemburg. Brussels is the capital and residence of the king; during the summer months the king resides at Laeken. The national colors are red, yellow, and black, placed perpendicularly beside each other; the escutcheon, the lion of Brabant, with the inscription, "L'union fait la force."

History.—In the time of the Romans, the present Belgium, which was then inhabited by Celtic and Germanic tribes, formed, under the name of Gallia Belgica, a part of Gaul. The treaty of Verdun in 843 united the southern districts with France, the northern with Germany. After the termination of the Carolingian rule, the French districts were gradually converted into duchies and counties. In 1385 the county of Flanders fell to the House of Burgundy, which in the early part of the fifteenth century gradually obtained possession of all the provinces of the Netherlands. The marriage of Maria of Burgundy, the last scion of her house, with the Emperor Maximilian I., incorporated the Netherlands with the extensive dominions of the House of Habsburg, and, under the name of the "Circle of Burgundy" (*Burgundischer Kreis*), with the German empire. When, after the abdication of Charles V. (1555), his states were divided, Belgium remained united with Spain, and this union continued after the northern provinces had successfully established their independence. Only from 1598 to 1621, Belgium constituted an independent state under the rule of Isabel, daughter of Philip II., and her husband, the Archduke Albert. In the course of the seventeenth century Spain had repeatedly to cede portions of Belgian territory to France. The peace of Utrecht in 1713 gave Belgium to Austria.

In the Austrian war of succession the whole country was conquered by the French, but it was restored to Austria in the peace of Aix-la-Chapelle (Oct. 18, 1748). In consequence of the unpopular reforms and innovations which Joseph II. undertook to introduce, an insurrection broke out against Austrian rule in Dec., 1789, and on Jan. 11, 1790, the Belgian provinces (with the exception of Luxemburg) proclaimed their independence under the name of "United Belgium," but in Nov., 1790, the rule of the Austrians was re-established. After the battle of Jemappes (Nov. 7, 1792), Belgium was occupied by the French, and in 1794 the country was ceded by Austria to France. It was then divided into nine departments, and the administration wholly assimilated to that of France. In 1814 the first treaty of Paris united Belgium with Holland into the kingdom of the Netherlands. The union lasted until Aug., 1830, when the whole country rose in revolution against the Dutch Government. On Sept. 20,

a provisional government was formed, which, on Oct. 4, after the evacuation of the capital by the Dutch, proclaimed the independence of Belgium. On June 4, 1831, Prince Leopold of Saxe-Coburg was elected king. The preliminary treaty of 1833 between England, France, and Holland put an end to the efforts of the Dutch Government for the recovery of Belgium, but the definite acceptance of the articles drawn up by the London Conference in 1831 for the regulation of the frontier between Holland and Belgium did not take place until 1838. The subsequent history of Belgium under Leopold I. (d. Dec. 10, 1865) and his son Leopold II. has been one of quiet and steady development. The administration has been sometimes in the hands of the Catholic and sometimes in those of the Liberal party, but the peace of the country has never seriously been disturbed, not even by the European revolution of 1848. See Juste, *Histoire de Belgique* (2 vols., 4th ed. 1868). Revised by C. K. ADAMS.

Belgorod: a town of Russia. See BIELGOROD.

Belgrade, bel-grayd' (anc. *Singidunum*; Servian *Bielgorod*, white town): an important fortified town; capital of Servia; on right bank of the Danube, at the mouth of the river Save, 42 miles S. E. of Peterwardein, 215 miles S. S. E. of Pesth, and 234 N. N. W. of Vranja (see map of Austria-Hungary, ref. 9-1). The citadel, which is very strong, is situated on a point of land between the rivers, behind which rises the city with antique German edifices, a cathedral, and a palace. Belgrade had formerly an Oriental appearance, but it has been abandoned by many wealthy Turks, and mosques are partly superseded by churches. Here are manufactures of arms, cutlery, silk goods, saddlery, and carpets. It has a good port and an active trade, being the entrepôt of the commerce between Austria and Turkey. It is the seat of the chief authorities of Servia. In consequence of its importance as a strategical point, Belgrade has been the scene of many famous sieges and battles. It was besieged without success by the Turks in 1456, and taken by the Sultan Solymán in 1522. In 1688 it was stormed and captured by the Elector of Bavaria, but it was recovered by the Turks in 1690. Prince Eugène here defeated 200,000 Turks in 1717, after which it changed owners several times. Taken by Austria in 1789, it was given up to Turkey in 1891. Insurgent Servians held it from 1806-12; the Turks bombarded the town from the citadel in 1862; made capital of Servia same year. The principality became independent on July 13, 1878. Pop. (1884) 35,726; (1891) 54,458.

Belgrand, bel'grān', EUGÈNE: civil engineer; constructor of the new water-supply and sewers of Paris; b. at Ervy, Aube, April 23, 1810. From the Polytechnic School he entered the Ponts et Chaussées, being made engineer in 1836, chief engineer in 1852, inspector-general first class in 1875, member of the Institute of France, director of water-supply and sewers of Paris, and commander of the Legion of Honor. The system of sewers designed and executed by him is a truly gigantic work. So also are the water-works, supplying Paris with spring water from points distant 80 and 100 miles. He has published *La Seine; The Basin of Paris in Prehistoric Times; The Subterranean Works of Paris*, etc. D. April 8, 1878, in the midst of his most important work, the sewerage of Paris, a work to cost \$8,000,000. W. R. II.

Be'lial [Heb., worthlessness]: a term used in the Bible; frequently occurring in the phrase "a son of Belial," which, by a common Hebrew idiom, signifies merely a worthless or very bad person; but in 2 Cor. vi. 15, the only New Testament occurrence, it is used as a proper name of Satan. According to Westcott and Hort and other critical texts the reading is Beliar.

Bélicor, bay'lčē-dōr', BERNARD FOREST, de: French military engineer and writer; b. in Catalonia in 1697. He served in the German campaign of 1742. He wrote *Hydraulic Architecture* (Paris, 1737); a *New Course of Mathematics for the Use of Artillery* (1757); and *La Science des Ingénieurs*. D. Sept. 8, 1761.

Belief and Faith: See the Appendix.

Belisarius [Slavie, white tsar or chief]: a celebrated general to whom Justinian was chiefly indebted for the military glory of his reign; b. in Germania, in Illyria, about 505 A. D. Having been appointed general-in-chief of the army of the East, he defeated the Persians at Dara in 530, and suppressed a formidable rising of the Green or anti-royal faction at Constantinople in 532. He gained two victories over the Vandals in Africa, and took their king, Geli-

mer, a prisoner, in 534 A. D., for which he obtained a triumphal procession, the first accorded to a subject since the reign of Tiberius. He obtained the office of consul in 535. He also commanded the army of Justinian in a long war against the Ostrogoths, who had made themselves masters of Italy. He occupied Rome in Dec., 536, and gained some other advantages, but was recalled in 540; after which he suffered adverse fortune through the enmity of the Empress Theodora. In 544 A. D. he was again sent to Italy to oppose the Gothic King Totila, but his army was so inferior in numbers that he could not gain a decisive victory, although he maintained the war for five years and reoccupied Rome. He resigned the command in 548, and passed nearly ten years in inaction. He served with success against the Bulgarians in 559, and was imprisoned in 563 on a charge of treason. D. Mar. 13, 565 A. D. He was distinguished for his loyalty, humanity, and other virtues. The tradition that he died poor and blind is without sufficient support, for after six months' incarceration he was restored to all his honors. See Lord Mahon, *Life of Belisarius* (1829); Gibbon, *Decline and Fall of the Roman Empire*; C. F. Zeller, *Belisarius* (Tübingen, 1809); C. L. Roth, *Ueber Belisavs Ungnade* (1846).

Belize, bel-eez' [a corruption of the Spanish *Wallis*, itself a corruption of the English *Wallace*, the name of an English pirate who infested that region]: See HONDURAS, BRITISH.

Belize: the capital of British Honduras; on the Bay of Honduras, at the mouth of the Belize river; lat. 17° 29' N., lon. 88° 8' W. There is no port in the proper sense of the word, as vessels have to lie far off from shore, and the only protection seaward is formed by the numerous cays which render navigation dangerous. The town is backed by swamps, and the land on which it is built is made from ballast and other like sources. The town, consisting of a principal street along the shore, with small offshoots, is generally well built, and, notwithstanding its surrounding, is healthful for the latitude. It has a considerable trade. Pop. about 6,000.

Belknap, bel'nap, GEORGE EUGENE: rear-admiral U. S. N.; b. in Newport, N. H., Jan. 22, 1832; entered the navy as a midshipman Oct. 7, 1847. In 1856, while attached to the sloop of war Plymouth, he took part in the assault and capture of the Barrier Forts at the mouth of the Canton river, China; was executive officer of the ironclad *New Ironsides* from 1862 to 1864 in her numerous engagements with the forts and batteries of Charleston harbor. He commanded the ironclad *Canonicus* in both attacks on Fort Fisher. In 1874 he commanded the *Tusearora* while surveying the bed of the North Pacific to find a submarine cable route to Japan, and he invented improvements in the apparatus for deep-soundings. In 1885 he became superintendent of the U. S. Naval Observatory, and later president of the Board of Inspection and Survey.

Belknap, JEREMY, D. D.: b. in Boston, Mass., June 4, 1744; graduated at Harvard 1762; taught school four years; studied theology; was pastor of the Congregational church at Dover, N. H., from Feb. 18, 1767, until 1786, and of the Federal Street church at Boston from Apr. 4, 1787, for the remainder of his life; kept a diary in interleaved almanacs from his fifteenth year, and a series of MS. books called *Quotidiana Miscellanea*, in which he jotted down abstracts of his reading; was an active patriot during the Revolution, but declined the chaplaincy of the New Hampshire troops at Cambridge 1775; projected in 1790 the Massachusetts Historical Society, which recognizes him as its founder; delivered before it, Oct. 23, 1792, a tercentennial discourse on the discovery of America; devoted much of his life to historical and biographical labors, making good use of the library left by his early pastor, Rev. Thomas Prince, to the Old South church at Boston; received from the Legislature of New Hampshire a grant of £50 in aid of his publications, and became in 1792 an overseer of Harvard College. D. in Boston, of paralysis, June 20, 1798. Author of a *History of New Hampshire* (3 vols., 1784-92; new ed. 1813), which "has long ranked at the head of the local State histories of the country"; *A Discourse Intended to Commemorate the Discovery of America by Columbus, with Four Dissertations* (1792); *An Historical Account of those Persons who have been Distinguished in America*, etc. (vol. i. 1792; vol. ii. 1798), generally known as the *American Biography* (new ed. 3 vols.); and of a *Collection of Psalms and Hymns* (1795), etc. To him was attributed by Mr. Bryant "the high merit of being the first to make American history attractive." *A Life, with Selections from his Correspondence*, was published by a granddaughter (New York, 1847).

Belknap, WILLIAM GOLDSMITH: soldier; b. in Newburg, N. Y., Sept. 7, 1794; entered the service of the U. S. in 1813 as third lieutenant of infantry, and rose through successive grades to be lieutenant-colonel of the Fifth Infantry in 1847. He served with marked gallantry in the war with Great Britain (1812-15), in the Florida war against hostile Seminoles, and in the war with Mexico. For his services in Florida he was breveted lieutenant-colonel, and for gallant conduct in Mexico he won the brevets of colonel and brigadier-general; served on frontier duty from 1848 to 1851. D. near Fort Washita, Nov. 10, 1851.

Belknap, WILLIAM WORTH: son of Gen. William G. Belknap; b. in Newburg, N. Y., Sept. 22, 1829; graduated at Princeton 1848; studied law; settled at Keokuk, Ia., 1851; elected to the Legislature as a "Douglas Democrat" 1857; entered the army as major of Fifteenth Iowa 1861; served under Grant at Shiloh, Corinth, and Vicksburg; and was in Sherman's "march to the sea." At the battle of Atlanta, under McPherson, he so distinguished himself that he was promoted over his superior officers to be brigadier-general of volunteers; breveted major-general 1865; collector of revenue in Iowa 1866-69; and Secretary of War under Grant from 1869 to 1876, when he resigned, having been impeached in Congress on a charge of corruption, but the Senate held that its jurisdiction ceased with his resignation. His case in the civil court was dismissed. Committed suicide in Washington, Oct. 13, 1890.

Bell [O. Eng. and Low Germ. *belle*. Etym. uncertain, perhaps connected with E. *bell*, O. Eng. *bellan*, roar]; a hollow percussion instrument, usually metallic, and cup-like in form; so constructed as to yield a single dominant note. The history of bells is involved in obscurity. In the time of Moses (Exod. xxviii. 32, 35) bells of gold were used; and Layard discovered small bronze bells in the ruins of Nineveh. The Hindu and Burmese priests, as well as the Greeks and Romans, made use of bells in their temples. It is probable, however, that all the bells so used were insignificant in size. The large bells used in churches are supposed to have been invented by Paulinus, Bishop of Nola, about the year A. D. 400. We infer that they were introduced into England soon after, as they are mentioned by Bede in the seventh century, and as the Abbot of Croyland gave a large bell to the abbey in 870. Pope John XIII. consecrated a very large new bell in the Lateran Church in 968. In the twelfth century bell-founding flourished in the monasteries, and, as the badness of the roads interfered with the transportation of the completed bells, traveling bell-founders went about casting bells wherever they were needed. In the fourteenth century bells first began to reach a large size. The famous bell at Rouen, cast in 1501, weighed 36,364 lb., and one at Toulouse, cast a little later, weighed 66,000 lb. The largest bell in the world was cast in 1734 at Moscow, and is no less than 448,000 lb. in weight. Though the most celebrated bells and chimes are in Belgium and the Netherlands, excellent examples of the bell-maker's art are to be found in large numbers in France and in Great Britain. Bells cast in the U. S. are usually shorter than those of the same weight cast in Europe, and consequently are characterized by a somewhat different quality of tone. In the American bell the dominant overtone is a major sixth above the tenor note, instead of the minor sixth, as is usually the case in Europe. The major sixth gives to the bell a louder and more penetrating tone, but it generally lacks the softness and sweetness so often noticeable in the best bells of Europe.

The art of bell-making seems not to be a progressive art. It is impossible at the present day to make better bells than those cast one, two, or even three centuries ago. This inability is probably owing to the fact that the tone of a bell is dependent in part at least upon certain conditions that can not be controlled or even fully understood. The meaning of this statement will be comprehended if it is realized that the quality of a bell depends not only upon the perfection of its materials and workmanship, but also upon the exact relations of the numerous harmonics that go to make up the dominant note. A sensitive musical ear can detect in an ordinary church bell seven and sometimes as many as ten or more distinct tones, all of which in their blending go to make up the quality of the bell. When these harmonics seem to have been perfectly adjusted the result is that rich, soft, and perfect tone which is so delightful to the ear. But the conditions on which the relations of the harmonics depend are for the most part unknown. After every technical re-

quirement is satisfied in the making of a bell, there is still a large element of uncertainty in the result. If a bell once cast utters a jangling sound, indicating that the harmonics are wildly discordant, it is conceded at present that the fault is irreparable. There are, however, certain conditions that are considered indispensable to success in the making of a bell. The metal should consist of about four parts of copper to one of tin, and the thickness at the bow should be about one-thirteenth of its diameter. There is a fullness and softness in the sound of a thick bell which is never characteristic of a thin one. If the proper form and thickness are maintained, the weight of bells varies as the cube of their diameters. In a peal or chime an individual bell can be tuned so as to lower or raise the pitch of its note, though, as above stated, the quality of its tone can not be materially changed. The tone will be flattened by turning or filing off a small portion of the metal from the inside of the soundboard or thickest part, and will be sharpened by a filing from the outer edge so as to reduce the diameter of the mouth. A very excellent authority on this subject is Sir Edmund Beckett's treatise on *Clocks, Watches, and Bells*. See also numerous works by H. T. Ellacombe. In his book entitled *Chiming* Mr. Ellacombe has given an exhaustive catalogue of bell literature. See BELL-RINGING. C. K. ADAMS.

Bell, ALEXANDER GRAHAM: inventor of the speaking telephone; son of Alexander Melville Bell; b. in Edinburgh, Scotland, Mar. 3, 1847; educated at the high school and the university, and specially trained to follow his father's and grandfather's profession for the removal of impediments of speech. In 1872 he took up his residence in the U. S., and introduced his father's invention of visible speech in institutions for deaf mutes, and was subsequently appointed Professor of Vocal Physiology in Boston University. He occupied his leisure during many years in working out his telephonic discovery, and first exhibited it publicly, but in an imperfect form, at the Centennial Exhibition in 1876. Its success is now established throughout the civilized world. He received in 1882 diploma and decoration of National Legion of Honor of France.

Bell, ALEXANDER MELVILLE: inventor of visible speech, a system of universal alphabets which has been successfully used for teaching the deaf (and dumb) to speak; b. at Edinburgh, Scotland, Mar. 1, 1819, and educated under his father, Alexander Bell, author of a method for the removal of impediments of speech. From 1843 to 1865 he held classes in connection with the Edinburgh colleges, and in 1865 was appointed lecturer in University College, London. In 1870 he removed to Canada, and was appointed register in Queen's College, Kingston, in 1877, but settled finally in Washington, D. C., in 1881.

Bell, ANDREW: a Scottish teacher; noted as the founder of the monitorial system (or Madras system) of education; b. at St. Andrews, Mar. 27, 1753, and studied at that university, from which in 1787 he received the degree of D. D., and after 1800 LL. D. from the same. He took orders in the Anglican Church, sailed for India in 1787, and in ten years obtained eight lucrative army chaplainships, all of which he held at the same time. Being appointed in 1789 superintendent of the Madras Male Orphan Asylum for the sons of military men, he employed the scholars in mutual instruction, and after his return to Britain published a treatise on his new method in 1797. He became rector of Swanage, Dorset, 1801; master of Sherburne Hospital, Durham, 1809; prebendary of Hereford 1818, and of Westminster 1819. His great rival was JOSEPH LANCASTER (*q. v.*), who had introduced a somewhat analogous system among the Dissenters, the success of which was the occasion for the formation of the National Society for Promoting the Education of the Poor in the Principles of the Established Church throughout England and Wales, of which Bell was the first superintendent. D. in Cheltenham, Jan. 27, 1832; and left £120,000 for educational purposes. See his *Life* by R. Southey (London, 1844, 3 vols.); better by J. M. D. Meiklejohn (1881).

Bell, SIR CHARLES, F. R. S.: British anatomist and physiologist; the youngest brother of Andrew Bell; b. in Edinburgh, Nov., 1774. He removed in 1804 to London, where he lectured on anatomy and surgery, and published a *System of Operative Surgery* (1807). In 1814 he was elected one of the surgeons of the Middlesex Hospital. He gained distinction as a surgical operator, and excelled in the treatment of nervous affections. He made the important discovery that the nerve filaments of sensation are distinct from those of motion, which is expounded in his *Anatomy*

of the *Brain* (1811) and *Nervous Systems* (1830), his greatest contributions to physiology. In 1836 he became Professor of Surgery in the University of Edinburgh. Among his works are an *Exposition of the Natural System of the Nerves of the Human Body* (1824), and *The Hand, its Mechanism and Vital Endowments as Evincing Design* (1834). The last is one of the Bridgewater Treatises. D. at Hallow Park, near Worcester, Apr. 28, 1842.

Bell, CLAIBORNE HAWLEY, D. D.: president of the Board of Missions of the Cumberland Presbyterian Church; b. near the present site of Aberdeen, Miss. He graduated from the Cumberland University in 1853; had three pastorates, combining with the first the principalship of an academy, and with the second the presidency of Union Female College at Oxford, Miss. Since 1881 he has given his time to the mission work of his Church, filling also the chair of Homiletics and Missions in Cumberland University, and being active in the general work of the Church. W. J. B.

Bell, Rev. GEORGE CHARLES, M. A.: educator and scholar; b. in Streatham, England, July 9, 1832; educated at Lincoln College, Oxford, 1851; mathematical lecturer of Worcester College 1857-65; head master of Christ's Hospital 1868-76; master of Marlborough College 1876, succeeding Archdeacon Farrar; has published two sermons, *Increase of Faith and Confidence in Christ*.

Bell, HENRY: Scottish engineer; b. in Linlithgowshire, Apr. 7, 1767; was the first who obtained success in steam navigation in Europe. He worked in London under Rennie. A small vessel called *The Comet*, with an engine constructed by himself, was launched on the Clyde in 1812. D. in Helensburgh, Nov. 14, 1830.

Bell, HENRY HAYWOOD: rear-admiral U. S. N.; b. in Orange co., North Carolina, Nov. 17, 1807; entered the navy as a midshipman Sept. 1, 1823; commanded a vessel in the attack on the Barrier Forts, Canton, in 1856. In 1861 he commanded the steamer *Brooklyn*, West Gulf blockading squadron. In 1862 he was selected as fleet captain by Rear-Admiral Farragut, and while acting in this capacity led the second division of gunboats at the attack upon Forts St. Philip and Jackson, and was deputed to take possession of New Orleans, where his sound judgment and coolness were conspicuously shown and highly commended by the whole fleet. In 1863 he commanded, during the temporary absence of Admiral Farragut, the West Gulf blockading squadron. In 1865 he was appointed to the command of the squadron in the East Indies. In 1866 he became rear-admiral, and was retired in 1867, but was drowned, Apr. 12, 1867, in an attempt to pass, in his barge, over the bar at the mouth of the Osaka river, Japan, before the arrival of Rear-Admiral Rowan, who was to succeed him.

Bell, JOHN: surgeon; b. in Edinburgh, May 12, 1763; elder brother of Sir Charles Bell. He began in 1786 to lecture on surgery, which he also practiced with success in his native city. He published, besides other works, a *System of the Anatomy of the Human Body* (2 vols., 1793-98), to which his brother Charles added two more volumes; and *The Principles of Surgery* (3 vols., 1801-07). He was a good classical scholar, and one of the most skillful operators of his time. D. in Rome, Apr. 15, 1820, leaving *Observations on Italy*, which was published by his widow in 1825.

Bell, JOHN: statesman; b. near Nashville, Tenn., Feb. 15, 1797. He graduated at the University of Nashville in 1814. He was elected a member of Congress in 1827, and by successive re-elections continued in that body about fourteen years. He supported Gen. Jackson for the presidency in 1832, but joined the Whig party in 1833, and was chosen Speaker of the House of Representatives in 1834. He was an earnest advocate of a protective tariff. In Mar., 1841, he was appointed Secretary of War by President Harrison; resigned that office with the most of the cabinet in Sept., 1841, because he disapproved the policy of Mr. Tyler. He was elected a Senator of the U. S. for Tennessee in 1847; re-elected in 1853; opposed the repeal of the Missouri Compromise in 1854, and the Kansas Lecompton constitution in 1858. He was nominated in 1860 for President of the U. S. by the Constitutional Union party, having Lincoln, Douglas, and Breckenridge as his competitors. He received thirty-nine electoral votes. D. at Cumberland Iron Works, Tenn., Sept. 10, 1869.

Bell, ROBERT: journalist; b. at Cork, in Ireland, Jan. 10, 1800; passed his mature life in London. In conjunction with Sir E. Bulwer and Dr. Lardner he founded in

1841 *The Monthly Chronicle*, which he edited. Among his numerous works are a *History of Russia* (3 vols., 1836-38); *Lives of the English Poets* (2 vols., 1839); a *Life of George Canning* (1846); and several dramas and tales. D. in London, Apr. 12, 1867.

Bell, ROBERT, LL. D.: Canadian surveyor; b. in the township of Toronto, June 3, 1841; graduated at McGill University as a civil engineer in 1861; received the degrees of M. D., C. M., from that university in 1878; and was Professor of Chemistry and Natural Science in Queen's University, Kingston, 1863-68. In 1883 he was appointed assistant director of the Geological Survey of Canada. His surveys and explorations have extended from Newfoundland to the Western plains, and from Lake Erie to Baffin's Bay. His reports to the Government have been published almost every year since 1857, about which time he was engaged as an assistant by Sir W. E. Logan. He acted as scientist and medical officer to the Hudson Bay expeditions of the *Neptune* in 1884, and of the *Alert* in 1885. In 1886 he went overland to Hudson Bay, being his ninth visit there, and made extensive surveys in the Albany and Severn districts. He is the author of numerous papers and essays in scientific journals; also annual reviews of mining in Canada from 1862, and of annual reviews of the progress of science in Canada, published in the *Dominion Annual Register* from 1878 to 1884. NEIL MACDONALD.

Bellacoo'la Indians: See SALISHAN INDIANS.

Belladonna [Ital., literally, beautiful lady, possibly from the use of the plant as a cosmetic]: an herbaceous perennial plant (*Atropa belladonna*) of the natural order *Solanaceae*; sometimes called **Deadly Night-shade**. It is a native of Europe, has ovate leaves, bell-shaped flowers of a lurid, purple color, and berries which when ripe are black, shining, and sweetish in taste. All parts of the plant are narcotic and very poisonous, and contain an alkaloid called *atropia* or *atropine*, on which its active properties depend. The belladonna is considered a valuable medicine and a powerful remedy for certain nervous diseases, neuralgia, paralysis, etc. It is administered both internally and externally. There is an antagonism between atropia and morphia. When applied to the eye it has the remarkable property of greatly dilating the pupil, and it is often used by oculists both in examinations and operations. The medicinal preparation of belladonna commonly used in the U. S. is an extract from the leaves.

Belladonna Lily (*Amaryllis belladonna*): a beautiful rose-colored flower which grows wild about the Cape of Good Hope, and is cultivated in gardens. The drooping flowers are clustered at the top of a leafless stem, which is about 18 inches high, and which springs from an elongated bulb. It may be grown either in the window garden or in the open.

Bellaire': city and railroad center; Belmont co., O. (for location of county, see map of Ohio, ref. 5-I); on the Baltimore and Ohio, the Bellaire, Zanesville and Cincinnati, the Cleveland and Pittsburg, the Cleveland, Lorain and Wheeling R. Rs., and the Ohio river; 5 miles S. of Wheeling and 137 miles E. of Columbus. It has water, gas-works, and electric lights, and manufactures of glass, steel, iron, nails, etc. Coal, iron, cement, paving-brick clays, and limestone are abundant. Pop. (1880) 8,025; (1890) 9,934; (1900) 9,912. EDITOR OF "TRIBUNE."

Bellamij, bel'laä-mi. JACOBUS: Dutch poet; b. in Flushing, Nov. 12, 1757. He published a collection of verses in 1782, and on the occasion of the war of 1785 a volume of patriotic poems (*Vaderlandsche Gezangen*). Among his most popular works is *Roosje*, a poem. He had good taste and a glowing fancy, and contributed largely to the improvement of the national literature. D. Mar. 11, 1786. See Q. Knipers, *Notice sur Bellamy*.

Bellamy, EDWARD: journalist and romancer; b. at Chicopee Falls, Mass., Mar. 26, 1850; educated at Union College and in Germany; engaged in newspaper work in New York and in Springfield, Mass., from 1871 to 1876. Among his romances, which are ingeniously psychological and somewhat resemble Hawthorne's, are *Dr. Heidenhoff's Process* (1879); *Miss Ludington's Sister* (1884); *Looking Backward* (1888), a kind of socialistic Utopia, which had a sale of some half a million copies and has been translated into many languages. It led to the establishment of "Nationalist" societies and "Bellamy" communities, to the propagation of which, by periodicals and lectures, the author devoted him-

self. It was written with no anticipation of originating a socialistic agitation. *Equality* (1897); *The Duke of Stockbridge* (1900). D. in Chicopee Falls, Mass., May 22, 1898.

Bellamy, JOSEPH, D. D.: b. in North Cheshire, Conn., Feb. 20, 1719; graduated at Yale College (1735); and was pastor of the Congregational church at Bethlehem, Conn. (1740-90). He was a powerful preacher and a renowned teacher of theology. Among his published works are *True Religion Delineated* (a refutation of Antinomianism, prefaced by Jonathan Edwards, Boston, 1750; repub. by Congregational Publication Society, Boston); *Theron, Paulinus, and Aspasia; or, Letters and dialogues upon the nature of love to God, faith in Christ, assurance of a little to eternal life* (1759); *An essay on the nature and glory of the Gospel of Jesus Christ* (a supplement to preceding, 1762); *Letters and Dialogues* (1761). D. in Bethlehem, Conn., Mar. 6, 1790. His *Complete Works* were published in 3 vols. (New York, 1811); also in 2 vols. (Boston, 1850), with a memoir by Rev. Dr. T. Edwards.

Bell-animalcule: a microscopic animal; a peritrichous ciliated infusorian, belonging to family *Vorticellidae*. The most common form consists of a bell-shaped portion attached to a stalk by the apex of the bell, the mouth of the bell being generally turned upward. When the bell is expanded its mouth is occupied by a broad disk, around the margin of which is a row of cilia. At the edge of the disk on one side is a funnel-shaped opening, by which food passes into the interior. The stalk can contract quickly, throwing itself into a spiral, thereby retracting the whole animal. The bell can so contract as to form a ball, the cilia being drawn in. When the bell is expanded the cilia keep up a rapid motion, by means of which currents of water are formed which drive particles of food into the funnel, from which from time to time they pass into the body. As complicated as is the animal, it consists of a single cell, which possesses a nucleus, a contractile vacuole, and reproduces itself by division. It is commonly found in water in which are decaying substances, and is frequently made use of in biological studies for illustration and experiments. D. S. JORDAN.

Bellarmino, ROBERT (in It. *Roberto Bellarmino*): a theologian and cardinal; b. at Monte Pulciano, near Florence, Oct. 4, 1542. He entered the order of Jesuits in 1560, and became Professor of Theology at Louvain in 1570, and in Rome 1576. He was a zealous champion of orthodoxy, and was highly distinguished as an able controversial writer against heretics. His principal work is *Disputatio de Controversiis christianæ Fidei adversus hujus Temporis Hæreticos* (Ingolstadt, 3 vols., 1581-92). He became a cardinal in 1599; Archbishop of Capua in 1602; resigned 1605, and became librarian of the Vatican. D. in Rome, Sept. 17, 1621. Complete editions of his works appeared in Cologne, 1619 (7 vols.), and in Naples (1872, 8 vols.), and Paris (1873-74, 12 vols.). He was a man of mild and pacific disposition. "The Church of Rome," says Hallam, "brought forward her most renowned and formidable champion, Bellarmine. . . . His abilities are best tested by Protestant theologians, not only in their terms of eulogy, but indirectly in the peculiar zeal with which they chose him as their worthiest adversary." (*Introduction to the Literature of Europe*.) See G. Fuligatti, *Vita del Cardinal R. Bellarmino* (Antwerp, 1621; Rome, 1624), a work based upon an autobiography; Daniello Bartoli, *Della Vita di R. Bellarmino* (Rome, 1678); P. Frizon, *Vie du Cardinal Bellarmin* (Nancy, 1708). Bellarmine's autobiography, which had been suppressed by the Jesuits, and had become very scarce, was republished by Döllinger and Reusch, with a German translation (Bonn, 1887).

Bellary, bel-laa'rēe, or Balla'ri': a town of India; capital of a district of the same name; province of Madras; 270 miles N. W. of Madras (see map of S. India, ref. 5-D); one of the chief military stations in the province, and has a fort on an abrupt rock 450 feet high. The climate is one of the worst in India. Pop. (1891) 59,770.

Bellay', JOACHIM, du: French poet; b. at Lyré, near Angers, 1525; d. in Paris, Jan. 1, 1560, and was buried in the cathedral of Notre Dame, of which he had been a canon. Though an interesting poet, he is chiefly famous as having issued the manifesto of the so-called Pléiade, the poetical school of which Ronsard was the chief. The title of the manifesto was: *La Deffence et illustration de la langue françoise* (1549, old style; Feb., 1550, new style). The treatise is a violent onslaught upon the mediævalism of the followers of MAROT (*q. v.*), and a recommendation to French poets to turn to the

Greeks and Latins for guidance (*Ly donques, et rely premièrement (ô Poète futur), feuillet de main nocturne et journalle, les exemplaires Grecz et Latins, puis me laisse toutes ces vieilles poésies françoises aux Jeux Floraux de Toulouze, et au Puy de Rouan*). Evidently this marks the triumph of the Renaissance in French literature. The application of the principle, however, both by Du Bellay and by Ronsard, was crude and often ridiculous, affording ample opportunity for the later satire of Boileau. Du Bellay made his *début* as poet, in the same year in which his *Deffence* appeared, with a volume entitled *Recueil de poésies*, in which the most notable things are certain odes in attempted illustration of the poet's doctrine as stated above. In 1551 he went with his cousin, Cardinal du Bellay, then French Ambassador at the Papal court, to Rome. His first pleasure at the sight of the remains of ancient Rome led to the composition of his *Premier livre des antiquitez de Rome* (publ. 1558; trans. into English by Edmund Spenser, 1591, under the title of *The Ruins of Rome*). Soon, however, the intrigues he saw about him turned his pleasure into sorrow, and he composed a series of satiric sonnets, entitled *Regrets* (first printed 1558), of real power. As if in contrast with this sad picture, he published in the same year (1558) his *Jeux rustiques*, full of the charm of country things as seen by the poet. In 1555 Du Bellay had returned to France, but toward 1557, rather than curry favor with the great, he consigned himself to poverty and study. His contempt for the opposite course appeared in his *Poète courtisan*, a sharp satire upon court-poets. Already his own health was broken, and he soon died.

Trobat (2 vols., Paris, 1876); E. Lafargue, *Joachim du Bellay, etc.* (Angers, 1864); Léon Séché, *Joachim du Bellay* (Paris, 1880).

A. R. MARSH.

Bell-bird: a bird of the genus *Chasmorhynchus*, native to the West Indies and South America. The bell-birds belong to the family *Cotingidæ*, and are allied to the fly-catchers. Their voice has a metallic sound, resembling the tolling of a bell, and can be heard, it is said, at a distance of 3 miles. It is distinguished by a broad and depressed bill, which is soft and flexible at the base. One of the species, the "Campanero" (*C. niveus*), has on its forehead a curious horn-like and tubular appendage, which when empty is pendulous, but when the bird is excited is filled with air and rises to the height of 3 inches. The Australian bell-bird (*Myzantha melanophrys*), "one of the honey-eaters," produces a peculiar tinkling sound; it is an entirely different species from the above.

Bell, Book, and Candle: a form of greater excommunication from the Church, of which the first recorded instances occurred about 1190. The symbolism was much elaborated and of appalling significance. It was formerly used in the Western Church. The priest or ordinary read from a book the anathema which was largely founded on Deut. xviii. 15, *seq.*, with monkish additions which transcended the principles of canon law as to the effect of excommunications. The book being closed, attendants threw lighted candles to the ground, thus extinguishing them, to denote the going out of grace in the soul, and bells were jangled as a token of the disorder fallen upon the excommunicated. The practice has long been discontinued as a customary mode of discipline.

Belleau, bel'lō', REMI: French poet of the school of Ronsard; one of the Pléiade; b. at Nogent-le-Rotrou, 1528; d. 1577. He was tutor of Charles, son of Remi de Lorraine; and when his pupil became Duc d'Elbeuf and grand equerry of France, he continued to live with him—a splendid but quiet life. He was called "*le gentil Belleau*," and by Ronsard "*le peintre de la nature*." His merit is to have introduced into French literature charming, jewel-like descriptions of the external world. His first collection of poems, entitled *Petites Inventiones*, appeared in 1557. This was followed by his *Bergerie* (1565, and 2d part 1572), modeled upon the *Arcadia* of Sanazarro. His most original work, however, is his *Amours et nouveaux Eschanges des pierres precieuses, vertus et propriétés d'icelles* (1576), based upon the poems of the pseudo-Orpheus and the *Lapidarius* of Marbodius. Besides translations of little merit, Belleau wrote a comedy, *La Reconneue* (1577).

BIBLIOGRAPHY.—*Œuvres de R. Belleau*, ed. by Gouverneur

(3 vols. (Bibl. Elzéy.), Paris, 1867); Sainte-Beuve, *Tableau de la poésie française au XVI^e Siècle* (2 vols., Paris, 1876).
A. R. MARSH.

Bellefontaine: railroad junction; capital of Logan co., O. (for location of county, see map of Ohio, ref. 4-D); about 110 miles N. of Cincinnati, and 55 miles N. W. of Columbus. The Cleveland, Cincinnati, Chicago and St. Louis R. R. Co. has graded a tract of about 70 acres for car-shops, round-house, switch-yard, etc. It has the highest elevation of any town in the State, has a good trade, a fine court-house, and is noted for its healthfulness and beauty. Pop. (1880) 3,998; (1890) 4,245; (1900) 6,649. EDITOR OF "REPUBLICAN."

Bellefonte: borough; capital of Center co., Pa. (for location of county, see map of Pennsylvania, ref. 4-E); is beautifully situated at the foot of Bald Eagle Mountain, 87 miles N. W. of Harrisburg. It has a celebrated spring, and the surrounding scenery is very fine, and is a place of summer resort. It has 2 furnaces, 3 rolling-mills, 2 foundries, an axe-factory, car-works, glass-works, a number of smaller manufactories, and 7 newspapers. It is the starting-point of the Buffalo Run R. R., and the terminus of the Lewisburg R. R. Pop. (1880) 3,026; (1890) 3,946; (1900) 4,216.
EDITOR OF "NEWS."

Belle-Isle, bel'ee', CHARLES LOUIS AUGUSTE FOUQUET, Duke of: marshal of France; b. in Villefranche, Aveyron, Sept. 22, 1684; conducted the celebrated retreat of the French from Bohemia 1742; commander of the army of Italy 1748; Minister of War 1757. D. Jan. 26, 1761. He negotiated (1735) the treaty by which Lorraine was united to France.

Belle-Isle-en-Mer, bel'ee'-ään-mär': an island in the Atlantic belonging to the French department of Morbihan. It is 8 miles from the shore, and has an area of 32 sq. miles. Pop. 10,000, mostly engaged in the pilchard-fishery. Excellent horses and grain are raised here. Here is a fortified seaport named Le Palais.

Belle Isle: a fertile island, 9 miles long and 3 broad, in Conception Bay, Newfoundland. It has considerable fishing interests. Pop. 500. **BELLE ISLE, NORTH**: An island in the strait of the same name, between Newfoundland and Labrador; is 21 miles in circuit, and has a small harbor; lat. 52° 13' N., lon. 55° 19' 1" W. **BELLE ISLE, SOUTH**: an island at the entrance of White Bay, on the northeast side of Newfoundland; lat. 50° 49' N., lon. 55° 29' W. It is a fishing-station. Pop. 53.

Belle Isle, Strait of: between Labrador and Newfoundland; is 80 miles long, 12 miles wide, and dangerous of navigation.

Bellenden, or **Ballantyne**, JOHN: Scotch poet, whose personal history is obscure; b. near the close of the fifteenth century. D. about 1550; became Archdeacon of Moray about 1536; translated Boece's *History of Scotland* and the first five books of Livy from the Latin into Scotch prose, prefixing poetical prologues to both works. His works are interesting as specimens of the prose of the time.

Bellenden, WILLIAM: a Scottish author of whose personal history little is known. He was born probably in Lasswade, near Edinburgh, about 1555, and died about 1633; went to France in the train of Mary Queen of Scots, where he became a professor in the University of Paris, and was distinguished for the elegance of his Latin. He published in 1608 at Paris a compilation from the works of Cicero, entitled *Ciceronis Princeps*. Among his other works are *De Statu Prisci Orbis* (On the Condition of the Primitive World, 1615), and *De Tribus Luminibus Romanorum* (1634), his master-work, treating of Seneca, Cicero, and Pliny. Middleton plagiarized from him for his *Life of Cicero*, was accused of it by Warton, and convicted by Parr. Hallam regarded him as among the earliest of philosophical historians. His three principal works were reprinted in 1787, with a Latin preface by Dr. Parr. The preface was noted for its elegant Latin and its allusions to contemporary politics.

Belle Plaine: Benton co., Ia. (for location of county, see map of Iowa, ref. 5-1); on C. and N. W. R. R. Division and terminus of O. C. F. and M. R. R., and on Iowa river; 116 miles W. of Mississippi river, 257 miles W. of Chicago. Here are 3 school-buildings, 6 churches, 2 opera-houses, a city hall, numerous flowing wells (one the noted "gusher" "Jumbo"), round-house and machine-shops, furniture-factory, grist-mill, large creamery, foundry, house-heating manufactory, and broom-works. Founded 1862,

and named after the Indian trapper's name for the valley. Pop. (1880) 1,689; (1890) 2,623; (1900) 3,283.

EDITOR OF "UNION."

Bellerophon [Gr. Βελλεροφόντης, slayer of Bellerus]: originally called **Hipponous**, hip-pon'ō-ūs; a personage of the Greek mythology; son of Glaucus, King of Corinth. Having killed Bellerus by accident, he fled to Prætus, King of Argos, who was instigated by his wife in revenge for the rejection of her advances to send him to Iobates, King of Lycia. He carried a sealed letter requesting Iobates to kill him, but that king imposed on him the dangerous mission of fighting with the Chimæra. Mounted on the winged Pegasus, he slew the monster in mid-air, defeated the Amazons, and destroyed an ambush of Lycians, thus escaping three plotted snares. He figures in Homer and in Pindar, who tell the story of his attempted ascent to Olympus on Pegasus, his fall to the earth, and blindness. The myth of Bellerophon was worked over in the tragedies of Sophocles and Euripides.

Bellerophon: a genus of fossil univalve gasteropod mollusks. The shell is symmetrically convolute, with few and occasionally sculptured whorls, globular or discoidal, and having a dorsal keel, which terminates in a deep notch. Many species of it have been found in the Silurian, Devonian, and carboniferous rocks in various parts of the world.

Bellerose, JOSEPH HYACINTHE: Canadian senator; b. at Three Rivers, P. Q., July 12, 1820, and educated at the colleges of Nicolet and St. Hyacinthe. He held for a short time a captaincy in the 100th regiment; was commander of the whole militia force in military district No. 8 in 1859; subsequently commanded the Laval reserve militia. He represented Laval in the Canadian Assembly 1863-67, and the same constituency in the Dominion Parliament from that date until called to the Senate in 1873. He was member for Laval in Quebec Assembly 1867-75; on two occasions declined important appointments under the Government of Canada; refused a cabinet office after the death of Sir George L. Cartier. He was president of the Union Navigation Company, and was prominently connected with financial and other institutions.
NEIL MACDONALD.

Belle Vernon: borough; Fayette co., Pa. (for location of county, see map of Pennsylvania, ref. 6-B); on Pa. R. R., and on Monongahela river, 42 miles from Pittsburg. It has extensive manufactures, and is situated in an extensive natural gas region. Pop. (1880) 1,164; (1890) 1,147; (1900) 1,901.

Belleville, bel'veel': eastern suburb of Paris, now inclosed by the line of fortifications. Largely inhabited by the poorer classes, it is a center of communistic activity.

Belleville: a port of entry; the capital of Hastings co., Ontario, Canada; on the Bay of Quinté, and on the Grand Trunk Railway, 113 miles E. N. E. of Toronto, and in the heart of the dairying interests of Canada (see map of Ontario, ref. 3-F). It is a beautiful city, and has fine public buildings, including a court-house, a jail, numerous public and private schools, churches, and a custom-house. It is the seat of Albert University (Methodist Episcopal), which consists of Albert College for young men and Alexandra College for women. One mile W. of the town is the deaf and dumb asylum, a fine building opened in 1870. The river Moira furnishes water-power, and the lumber-trade is very extensive. There are various other manufactories. Pop. (1881) 9,516; (1891) 9,914. EDITOR OF "INTELLIGENCER."

Belleville: city and railroad center; capital of St. Clair co., Ill. (for location of county, see map of Illinois, ref. 9-D); 14 miles S. E. of St. Louis. It contains numerous manufactories of almost every description, and one of the largest rolling-mills in the West; also a fine convent, many churches, and splendid school-houses. It is in a region abounding in coal. Pop. (1880) 10,683; (1890) 15,361; (1900) 17,484.
EDITOR OF "NEWS DEMOCRAT."

Belleville: city; capital of Republic co., Kan. (for location of county, see map of Kansas, ref. 4-G); on Chicago and R. I. R. R., 206 miles from Kansas City; has 7 churches, 9 schools, and a court-house. The surrounding region is agricultural. Pop. (1880) 238; (1890) 1,868; (1900) 1,833.

EDITOR OF "FREEMAN."

Bellevue: city and railroad junction; Jackson co., Ia. (for location of county, see map of Iowa, ref. 4-L); beautifully situated on a high, gravelly bank of the Mississippi river, 24 miles below Dubuque, and 12 miles S. of Galena:

has beautiful high school building, five church buildings, manufactories of lumber, pumps, flour, wagons, baskets, butter, and iron-works. Water-works are now (1893) in course of construction. Founded in 1835. Pop. (1880) 1,581; (1890) 1,394; (1900) 1,607.

EDITOR OF "LEADER."

Bellevue: borough; Allegheny co., Pa. (for location of county, see map of Pennsylvania, ref. 5-B); on Pa. R. R., 6 miles N. W. of Pittsburg; is in a mining region. Pop. (1880) 915; (1890) 1,418; (1900) 3,416.

Bellevue: village; Huron co., O. (for location of county, see map of Ohio, ref. 2-F). It is situated at junction of three railroads, 45 miles S. E. of Toledo; is a manufacturing town, and a shipping-point for an extensive fruit and grain region. Pop. (1880) 2,169; (1890) 3,052; (1900) 4,101.

Belligerency: the state of being actually engaged in war. As regards its recognition by neutral states, no question will arise here in case of war between two sovereign powers; but when rebellion breaks out within a country, or a colony revolts against its mother country, every other power which regards the interests and trade of its subjects must define the new state of things. This state is somewhat indefinite. For this is a contest between a sovereign state, a friend of the neutral, and a revolutionary body which is not yet a state, but only trying to become one. It has therefore no international standing. Now, as has been said, the first duty of the neutral is to his own trade; to define on what terms it shall continue. It next owes the duties which humanity prescribes to both combatants. It will also possibly have to lay down the rules it intends to observe regarding the war operations of the non-sovereign combatant, how its ships shall be received, how its flag shall be regarded, whether or not the rights of war shall be accorded to it.

All such questions are settled by a proclamation which recognizes its belligerency. The expediency of this act must be governed by the seriousness of the struggle. The test is whether an actual state of hostilities exists, not trifling or localized, or likely to be temporary, but serious enough to affect the interests of other states. It thus becomes to a certain extent a question of probability, while the recognition of independence involves purely a question of fact, whether the attempt of the parent state to coerce its rebellious member has ceased.

The recognition of belligerency is by no means one-sided in its operation. It gives rights to both combatants. To the insurgent it grants the rights of belligerents, the recognition of its flag, a right to raise loans, a quasi-political status without diplomatic standing. The parent state, on the other hand, can no longer be held responsible for the acts of its rebellious subjects. It can employ the rights of blockade, of capture for carrying contraband, of search against its enemy, thus affecting neutral commerce. In short, all parties recognize as a fact that a war exists between two combatants, the subsequent question of independence being yet in abeyance. Judged by these tests, the recognition of the belligerency of the Southern Confederacy by Great Britain and France in 1861 was proper and necessary. The recognition of its independence was at no time justifiable.

THEODORE S. WOOLSEY.

Bel'lingham, RICHARD: lawyer; b. in England in 1592; emigrated to America in 1634. He was Lieutenant-Governor of Massachusetts for thirteen years, and Governor for ten years, first elected in 1641, in opposition to Gov. Winthrop; then in 1665 as successor to Endicott, continuing in office by annual elections until his death; refused in 1664 to obey a summons to England to give account of his administration; left his property to the support of a Congregational minister, but in the interests of his family the will was set aside. A widowed sister was hanged as a witch in 1650. D. Dec. 7, 1672.

Bellingham Bay: in the northern part of the State of Washington, Whatcom co.; is 14 miles long, 3 miles wide, with a depth of from 3 to 20 fathoms. Great quantities of lignitic coal are mined here, the shaft being only a quarter of a mile from the harbor. It is generally considered the best coal on the Pacific coast. Whatcom is the chief point of this coal-trade.

Bellini, bel-lee'něe, GENTILE: painter; b. in Venice in 1421; d. 1507; elder son of Jacopo. He was a pupil of his father and of Gentile da Fabriano, for whom he was named. He was employed by the Venetian Government in company with his brother. He went to Constantinople in 1479 on the invitation of the sultan, Mohammed II., and at the wish of

the Venetian authorities he returned to Venice bringing pictures of men and scenes in the Turkish empire of great, and at that time unique, interest. Some of these remain in tolerable preservation. We have also of his work several important scenes in Venice. Costume, splendid architecture, and stately ceremonies had great attractions for him. Perspective drawing, too, then a newly invented process, he had studied carefully, and excelled in. His paintings, though less lofty in character than his brother's, and marked with some of the stiffness and beauty of composition and color. His most noted picture was *The Preaching of St. Mark*, in the duomo of Venice.

RUSSELL STURGIS.

Bellini, GIOVANNI: painter; b. in Venice about 1428; d. 1516. He worked under his father Jacopo and his brother Gentile. During Gentile's absence in Turkey he continued the work in the ducal palace at Venice, which the two brothers had undertaken together, all of which was destroyed by a fire in 1577. Giovanni was especially a student of the art of oil-painting on canvas, which he was of the first to master completely. Moreover, he was a painter of religious subjects of the statelier and more monumental kind, in which he preserved a gentle and refined feeling, while combining it with splendor of color and grace of composition beyond his time. He was in this way the true forerunner of the still more powerful artists of the next generation, Titian, Paul Veronese, and Giorgione, and yet he kept much of the simple and frank religious concentration of earlier work, which those great men nearly abandoned. He is one of the small class of entirely great painters, an unsurpassed master of the art. Examples of his work may still be seen in Venice and Naples; his *Blood of the Redeemer* is in the London National Gallery.

RUSSELL STURGIS.

Bellini, JACOPO: painter; b. in Venice, 1395; d. 1470; he was a pupil of Gentile da Fabriano, who came to Venice when he was very young, and went thence to Florence in 1422, taking Bellini with him. During the first half of the fifteenth century the art of painting was backward in Venice, and it seems clear that Bellini was a powerful aid in its advance from about 1430 until his old age, although he can hardly have reached the skill of either of his sons, Gentile and Giovanni. Almost nothing of his larger work remains to us, but his style can be judged from the drawings contained in a book preserved in the British Museum, and admitted to be his own handiwork.

RUSSELL STURGIS.

Bellini, VINCENZO: Italian composer; son and grandson of musicians of moderate ability; b. at Catania, Sicily, Nov. 3, 1802. He was a pupil of Zingarelli. In 1827 he produced *Il Pirata*, an opera which was performed at Milan with great success. His fame was widely extended by *La Straniera* (1828); *La Sonnambula* (1831); and *La Norma* (1831); which latter two works were represented on every opera-stage in Europe. He afterward went to Paris and London, where he was warmly applauded, and composed *I Puritani* (1834). D. in Paris, Sept. 24, 1835. See A. Pougin, *Bellini, sa vie, ses œuvres* (Paris, 1868), and Miller's *Künstlerleben* (Cologne, 1880).

Bellinzo'na (Germ. *Bellenz*): a town of Switzerland; one of the capitals of the canton of Ticino; on the river Ticino, here crossed by a bridge; 16 miles N. of Lugano (see map of Switzerland, ref. 7-H). It is defended by several old castles, and has an active transit trade. Pop. (1882) 3,302.

Bellman, bel'mään, KARL MICHAEL: b. in Stockholm, Feb. 4 (15 N. S.) 1740; received a rather desultory education; vacillated for several years between business and literature; received in 1775 a small office in the state lottery from Gustavus III., but hired another to perform its duties, and gave himself up to his passion for gay company and poetry. D. in Stockholm in poverty and melancholy, Feb. 11, 1795. His works consist for the most part of songs, many of them set to music by Bellman himself. In some of these he gives a burlesque representation of the companions of his nightly revelries, and of their exploits. But these characters are drawn with the most exquisite elegance; their extravagances are blended with something which is exceedingly sweet and innocent; and the whole is remarkable for its joyous melody, in which, however, a peculiar undertone of romantic sadness now and then becomes very perceptible. These songs have made his name one of the most celebrated within the Scandinavian countries. They have been printed over and over again, and are sung at the courts and by the peasants. In Sweden they have given rise to a very rich song-literature of

considerable merit, both poetically and musically, and to innumerable and generally excellently trained singing associations which form a characteristic feature of Swedish social life. His statue has been raised in Djurgården, near Stockholm, and July 26 is celebrated there with an annual festival in his honor.

Revised by G. L. KITTREDGE.

Bell Metal: a hard, dense, brittle, and sonorous alloy of copper with tin, zinc, or some other metal. The proportion in English bells is usually 75 per cent. of copper and 25 of tin. The bell metal of commerce usually contains 80 of copper to 20 of tin, or else 78 of copper to 22 of tin.

Bello'na: the goddess of war in the ancient Roman mythology; was represented as the companion and sister or wife of Mars. She was described by poets as armed with a scourge and holding a torch in her hand. Her priests were called *Bellonarii*.

Bellot, bel'ō, JOSEPH RENÉ: Arctic explorer; b. in Paris, Mar. 18, 1826; lieutenant in the French navy; joined expedition in search of Sir John Franklin sent out by Lady Franklin, May, 1851; afterward joined Inglefield's expedition, and perished in a storm near Cape Bowden, Mar. 21, 1853. He discovered Bellot's Strait on the north coast of North America, 1852.

Bellotto, BERNARDO: See CANAL OF CANALETTO.

Bel'ows [M. Eng. *belu*, plur. *belves*; since the sixteenth century only the plural in use; the word is really an abbreviation of O. Eng. *blæstbelig*, cf. Germ. *Blasebalg*]: a very ancient contrivance for producing a blast of air. It consisted in its rudest form of a bag which was compressed, allowed to become full, compressed again, and so on. Representations of bellows have been found in some of the earliest Egyptian sculptures, and Sir Gardiner Wilkinson believes he has found a valve as early as the time of Moses. The natives of India and China have employed the bellows from time immemorial. Rude forms of the bellows are found in many of the lowest tribes of Africa. Ordinary bellows, as now used, are practically leather bags which are compressed and then expanded so as to allow air to enter through a valve opening inward, which on compression of the bellows allows no air to escape, except through the nozzle. The Chinese bellows consists of a rectangular chamber in which a close-fitting piston moves, and as it is withdrawn from the nozzle, valves open in the front of the chamber, admitting the air. The blacksmith's bellows supplies a continuous current. It consists of a top, center, and lower boards, the two latter being pierced with valves. The lower board is weighted, and automatically takes in air as it falls. The lever is attached to the lower board, and as it is raised the air is forced into the upper chamber, and the delivery continues while the lower chamber is again being replenished. See BLOWING-MACHINES.

Bellows, ALBERT F.: genre and landscape painter; b. at Milford, Mass., Nov. 29, 1829. D. in Auburndale, Mass., Nov. 24, 1883; pupil of the Antwerp Academy; also studied in Paris and in England. National Academician 1861; honorary member, Royal Belgian Water-color Society, 1868. His pictures in oil are mediocre productions technically considered, though interesting in their subjects, which are mostly drawn from scenes of New England life. His water-color painting was of better quality, and he was one of the first American artists who successfully practiced that branch of art.

W. A. C.

Bellows, HENRY WHITNEY, S. T. D., LL. D.: Unitarian minister; b. in Walpole, N. H., June 11, 1814; graduated at Harvard in 1832; in 1838 became pastor of the First Unitarian church in the city of New York, now called the Church of All Souls. He gained distinction as an eloquent public speaker, and lectured on a variety of subjects, especially social, educational, and patriotic enterprises. In 1846 he was one of the founders of the *Christian Inquirer*, and he was one of its editors for many years. Among his works are *Lectures on the Treatment of Social Diseases* (New York, 1857) and *The Old World in its New Face* (1868). He was the principal promoter and first president of the U. S. Sanitary Commission, established in 1862; was the prime mover in the organization of the "National Conference of Unitarian and other Christian Churches" in 1865, and later of the Unitarian Ministers' Institute. He had great organizing genius, and was an extemporaneous speaker of most brilliant power. There is a posthumous volume of his sermons (New York, 1886), and an earlier one, *Restatement of Christian Doctrine* (Boston, 1860). D. in New York city, Jan. 30, 1882.

Revised by JOHN W. CHADWICK.

Bellows Falls: railroad junction; Windham co., Vt. (for location of county, see map of Vermont, ref. 9-C); on west bank of the Connecticut river; 53 miles S. E. of Rutland, 114 miles N. W. of Boston, Mass. The location is picturesque and furnishes excellent water-power. Paper manufacturing is the chief industry, but there are here a very large dairy-utensil manufactory and a very fully equipped machine-shop. Communication by direct lines to important points gives good shipping facilities. Pop. (1880) 2,229; (1890) 3,092; (1900) 4,337.

EDITOR OF "TIMES."

Bellows-fish, or **Trumpet-fish** (*Macrorhamphosus scolopax*): a spiny-finned fish of the family *Centriscidae*; feeds upon small animals found at the bottom of the sea, chiefly

Bellows-fish.

in the Mediterranean and on the west coasts of Europe. It is good eating, though small, seldom exceeding 5 inches in length.

Bello y López, bel'yō-ee-lō'peth, ANDRES: Spanish American poet and writer; b. in Carácas, Venezuela, Nov. 29, 1781; undoubtedly the most important author Spanish America has had in the nineteenth century. His intellectual career dated from his acquaintance with Alexander von Humboldt during the latter's famous journey through South America in 1799. Bello shared several of Humboldt's expeditions in Venezuela, and through him his interest was aroused in the literary and scientific movements of Europe. He acquired the French, German, and English tongues, and was thus enabled in 1808 to serve as secretary and interpreter for the Governor and Council of Venezuela, then still under the control of Spain. In 1810 he took part in the revolt of Venezuela from Spain, along with his friend and former pupil, Bolívar. In the end of 1810 Bolívar was sent as representative of the country to Great Britain, and took Bello with him as secretary of legation. The next nineteen years of the latter's life were spent in Europe, chiefly in London. He endured great hardships, owing to the varying fortunes of his country's cause. At one time he was obliged to earn a living by giving lessons; at another he was employed by James Mill to decipher the MSS. left by Bentham. He made many interesting friends, however, among them Blanco White, Olmedo, and Fernández Madrid, and especially became known to the more influential of the large group of Spanish Americans then living in exile or quasi-exile in England. He was connected with several periodicals designed for these persons and to advance the cause of South American freedom, and thus he became a recognized leader of the Spanish American patriots. At the same time he was training himself to be a poet and scholar, studying the ancient literature of Spain and the new romantic literature of Europe. In 1829, after many hesitations, Bello decided to accept an offer made him by the Government of Chili, and thenceforth his career was indissolubly connected with that republic. He soon became a power in his new home, especially in everything connected with higher education. When the University of Chili was founded in 1843 he became its first rector—a position he held many years. He wrote extensively and on many different subjects, yet valuably upon all. As a lover and defender of the use of pure Castilian he wrote his *Principios de la Ortología y Métrica de la Lengua castellana* (1835); his *Análisis ideológica de los Tiempos de la Conjugación castellana* (1841); and his *Gramática castellana*, recognized in Spain itself as the best (1847). As jurist he published *Principios de Derecho de Gentes* (1832), and practically wrote the *Código Civil* adopted by Chili in 1855. His *Filosofía del Entendimiento* (published after his death, 1881) showed him to have reflected long and deeply upon philosophical questions. Finally, as poet (and this is his best title to fame) he has left a considerable body of work pure in style, elevated in manner, and full of a certain American spirit very distinct from anything to be found

in the poets of Spain or even in those romantic poets of France (André Chénier and Victor Hugo) whom Bello most loved and admired.

When Bello died the whole Chilian people mourned for him. In 1872 the Chilian Congress voted the publication of an edition of his works at the national expense (*Obras completas*, 8 vols., Santiago de Chili, 1881-85). In 1881 the hundredth anniversary of his birth was celebrated, especially in Santiago, with great splendor. A statue of him has been erected by popular subscription before the main entrance of the Congreso in Santiago. See *Vida de D. Andres Bello*, por Miguel Luis Amunátegui (Santiago de Chili, 1882). The poems and several prose works of Bello are also published in Madrid in the *Colección de Escritores castellanos* (1882, seq.). D. Oct. 15, 1865. A. R. MARSH.

Belloy, bel'wää', PIERRE LAURENT BUIRETTE, de: French dramatist; b. at St.-Flour 1727; went on the stage in St. Petersburg; returned to France and produced his tragedy *Titus* 1758; returned to St. Petersburg; again visited France 1762; wrote several successful tragedies. D. at Paris, Mar. 5, 1775.

Bell-ringing: There are two ways to ring a bell or a set of bells. In one the bells are stationary, and are struck either on the inside or outside near the rim with a hammer. In the other the bells are in motion, being swung with rope and wheel, or other contrivances, or being shaken by the hand. The desirable thing in ringing bells is to get a clear tone and a vibration that shall be resonant and shall reveal the full tone-qualities of these most common and most useful musical instruments. To obtain this tone circumstances alone must decide whether the bell shall be fixed or in motion. Bell-ringing requires a skill that comes only from long practice. It is an art also. The latter consists of making the vibrations constant and regular. This is especially sought for in ringing carillons, or peals of bells, known in the U. S. as chimes. In ringing one bell it is probable that a clearer note may be obtained by swinging it. Whether stationary or fixed, it is desirable that the hammer shall remain in contact with the bell for only the shortest space of time, and shall drop away or be lifted almost instantly after the sharp blow is given, so as not to dull or interfere with the vibrations that result. In ringing chimes it is therefore preferable that there shall be no long notes, or intervals between the notes, and it is better that a long note should be broken up into two or more shorter ones than that the vibrations should strike the ear of the listener at irregular intervals. The most successful bell-ringers employ this method, knowing that the finest effect is produced thereby.

On the Continent of Europe bells in sets are almost entirely stationary, and are called carillons, from the Italian *quadriglio*, or quadrille, "a dreamy kind of dance music" first played upon them. A carillon consists of from twelve to forty bells arranged in the diatonic scale. They are usually rung by one man. To ring them an instrument called the clavecin is often used. It is a sort of rough keyboard fashioned somewhat like that of a piano. The player strikes the keys with a gloved fist, and by a mechanical contrivance the hammer falls on the rim of the bell and at once is lifted away. In the U. S., where bells in sets are usually stationary, a series of levers is used. By pushing down the levers sharply the clapper or hammer inside the bell is drawn against the rim, and it drops away quickly of its own weight.

Another instrument in ringing carillons in general use on the Continent, and being developed greatly in England where the carillons rarely consist of more than twenty bells, is what is called the tambour, or "barrel." It is a contrivance on the principle of the cylinder of the well-known music-box. A large number of wooden pegs are fixed on a revolving drum, which loosens the hammers and drops each one on its bell at the proper time. This device is automatic, of course, and, although the resulting notes are not as clear as when struck by hand, it is possible to arrange more difficult music for it than one man can produce by the method of hand striking. The carillon, whether played by the clavecin or by the barrel, reached its highest development in the eighteenth century, in Belgium—still the home of the best bells—and probably the best performer that ever lived was the famous Matthias van den Gheyn, whose original music, found in Louvain long after his death, rivals in subtlety that of Bach, Mozart, and others, and which no one has since been able to play upon bells.

In England for several centuries the swinging method has

been used in ringing chimes, or peals, as they are known there. In the U. S. a peal would be a set of three or more bells, each bell tuned to itself and to the others. Eight or more bells similarly tuned would be called a chime. In England, with one man to each bell and a leader to give the signals for swinging, the development of that peculiar kind of bell-music called "changes" resulted. Changes (or change-ringing) consist of striking a set of bells in every possible order. Thus three bells may be struck in six ways without any repeat. Four bells may be struck in 24 ways without repetition; five bells in 120 ways, and so on until with ten bells we have 3,628,800 changes. To ring all these changes at the usual rate of speed would require one year and 105 days of constant performance. With twelve bells in the peal, to ring all the possible changes would require 37 years. These changes are based on that simple branch of mathematics known as combinations.

To many of these changes names have been given, and expert individual bell-ringers know just when and how often to strike their bells when any one of these figures is announced to be played. The most common of these changes are known as "plain-bobs," "bob-triples," "bob-majors," "bob-minors," "grandsire-triples," "grandsire bob-cators," and so on. In ringing the bells such methods as "hunting," "dodging," and "snapping" are used. Each man must not only ring his bell at the right time, but he must get the right expression and best tone from it.

In Great Britain the clavecin method of ringing bells, with electricity as the striking power, is now used to a considerable extent. With this contrivance perfected any ordinary piano performer may sit down at a keyboard, and by touching the keys ring the bells in the belfry and produce a high order of music.

In the U. S., as has been explained, the chimes are almost universally stationary, the usual number of bells being ten or twelve. When the levers connecting with the inside hammers of the bells are pushed down with skill, it is probable that better results follow than by any other method of ringing, except when there is a man to each bell.

In selecting a chime the fundamental bell, or key-note bell, must be first chosen. This must be true to itself first—that is to say, the note that results from striking it on the rim must be exactly an octave lower than the note obtained by striking it at the top at the center of the curve. The third and fifth octave tones, found by striking the bell at the required place along its length, must be true also. In addition to the combination of all these tones, the "drone" note or hum of the bell, a tone one-third lower usually than the key-note, and one usually overlooked, must be in harmony with the dominant note of the bell. Each of the other bells must be in harmony with the key-note bell and thus an approximately correct chime, peal, or carillon is secured.

ALBERT F. MATTHEWS.

Bells: in nautical language has a peculiar meaning, and is used as a substitute for those expressions by which people on land indicate the hour. The sailor's day or night is divided into watches or periods, each of four hours' duration, except the two "dog watches," which are two hours each, viz., from 4 to 6 and from 6 to 8 P. M., and the bell is struck once at the expiration of each half hour. The number of strokes denotes the number of half hours that have elapsed in that particular watch. If the watch commences at 8 P. M., eight bells would be a signal for the end of the watch at midnight.

Belluno, bel-loo'nō (anc. *Bellu'num*): a city of Italy; capital of province of same name; on the Piave: 49 miles N. of Venice (see map of Italy, ref. 2-D). It is a bishop's see; has a cathedral designed by Palladio, a rich hospital, a public library, a handsome aqueduct, and a beautiful triumphal arch; also manufactures of silk stuffs, hats, leather, and earthenware. Pop. 16,000.

Bellwood: borough (organized in 1888); Blair co., Pa. (for location of county, see map of Pennsylvania, ref. 5-D); on Penn. R. R. and Penn. and N. W. R. R.; 6 miles E. of Altoona; has a good school, six churches, and an opera-house. The chief industrial establishments are railroad-car repair-shops, foundries, etc. Pop. (1880) 366; (1890) 1,146; (1900) with suburbs, 1,545. EDITOR OF "BULLETIN."

Bellworts (*Campanulaceæ*): a family of mostly herbaceous dicotyledons, with inferior ovaries and gamopetalous corollas. They are related to the cucurbits, composites, honeysuckles, etc. There are about 1,000 species, very widely distributed. As here considered, this family includes the

lobelias, often separated as a distinct family (*Lobeliaceae*). *Campanula*, the principal genus, contains 230 species.

CHARLES E. BESSEY.

Bel'mont: a post-village of Mississippi co., Mo. (for location, see map of Missouri, ref. 7-K); on railroad and the Mississippi river, opposite Columbus, Ky., 197 miles S. S. E. of St. Louis. In 1861 this place was occupied as a Confederate camp. On Nov. 6 Gen. Grant, in command at Cairo, descended the river with about 4,000 troops, remaining overnight about 10 miles above Columbus, Ky. On the morning of the 7th this force was debarked on the Missouri shore a short distance above Belmont, and at once moved forward to the capture of the Confederate camp, supposed to contain about 3,000 men. After several hours' severe fighting, the Federal troops forced their way through the obstructions on either side. An irresistible charge carried the camp, drove the Confederates in all directions, and left the field in the possession of the Federals. The Confederate camp, with all its supplies, ammunition, and baggage, was fired and destroyed. The defeated Confederates were, however, strongly re-enforced by Maj.-Gen. Polk from Columbus, and in turn drove the Federal troops, fighting all the way against a now vastly superior force, back to their boats, while the batteries on the Kentucky side kept up a damaging fire which could not be returned. By 5 p. m. the troops were all on board their boats, without the loss of a gun, while they had with them two guns captured from the Confederates. The Federal loss was 120 killed, 383 wounded, and 104 captured or missing; total, 607. The Confederate loss is stated at from 500 to 600, killed and wounded.

Belmont: capital of Allegany co., N. Y. (for location of county, see map of New York, ref. 6-D); on the Genesee river and on Erie R. R., 92 miles W. by N. of Elmira, and 94 miles E. S. E. of Dunkirk. It contains a fine union school building, 6 churches, county court-house, 2 flouring-mills, machine-shop, and foundry. The surrounding country is principally agricultural. Pop. (1870) 795; (1880) 804; (1890) 950; (1900) 1,190.

EDITOR OF "DISPATCH."

Beloit': city and railroad junction; capital of Mitchell co., Kan. (for location of county, see map of Kansas, ref. 4-F); on Mo. Pac. and Union Pac. R. Rs., and on the north bank of Solomon river, 184 miles W. of Missouri river; has State Industrial School for Girls, excellent graded and high schools, extensive mills and manufactures, and is an important business center. Pop. of township (1880) 2,793, including 1,835 in city; of city (1885) 2,003; (1890) 2,455; (1900) 2,359.

EDITOR OF "GAZETTE."

Beloit: city; Rock co., Wis. (for location of county, see map of Wisconsin, ref. 7-E); on Northwestern and C., M. and St. P. R. Rs., and on Rock river, 91 miles N. W. of Chicago and 47 miles S. S. E. of Madison; is on the south boundary of the State. It is partly built on a plain which is about 70 feet higher than the river, and is the seat of Beloit College. It has considerable manufactures of paper, paper-machinery, windmills, steam-engines, shoes, plows, water-wheels, etc. Founded in 1836 by settlers from Colebrook, N. H. Pop. (1880) 4,790; (1890) 6,315; (1900) 10,436

EDITOR OF "FREE PRESS."

Beloit College: Beloit, Wis.; founded by the Congregationalists and Presbyterians of Wisconsin and Northern Illinois; received charter from Territorial Legislature of Wisconsin 1846. First building erected and first college class entered 1847. Jackson J. Bushnell (Yale, '41) and Joseph Emerson (Yale, '41) appointed professors 1848; Rev. Aaron L. Chapin (Yale, '37) elected president 1849; succeeded in 1886 by Rev. Edward D. Eaton (Beloit, '72); resigned Feb. 25, 1901.

The institution is of the New England type, and has from the first maintained a high standard of scholarship. About 3,500 young men have received education here, 649 having graduated.

The faculty numbers 26 members, besides lecturers. There are about 400 students. The college has a beautiful campus of 25 acres overlooking Rock river; also an athletic field of 16 acres. Of the ten buildings the most important are: Memorial Hall Library (erected 1868, containing 27,000 volumes); gymnasium (1874); Smith Observatory (1881); Scoville Hall (1889, for preparatory department); Chapel (1891); Chapin Hall (1891, dormitory); and Pearsons Hall (1892), containing extensive and well-equipped laboratories for physical science.

EDWARD D. EATON.

Belon, baŷ'lōn', PIERRE: French naturalist; b. at Soulletière, Maine, 1518; traveled extensively; murdered by robbers, April, 1564, in the Bois de Boulogne; established homologies of vertebrate skeletons. He formed two botanical gardens more than a century before the establishment of the Jardin des Plantes, and planted the first cedar in France.

Beloochistan: See BALUCHISTAN.

Belot, baŷ'lō', ADOLPHE: French dramatist and novelist; b. in Ponte à Pitre Nov. 6, 1829. Among his very numerous novels may be mentioned: *Mademoiselle Giraud, ma femme* (1870); *La Reine de Beauté* (1883); *La Princesse Sophie* (1883); *Alphonsine* (1887). Of his plays, *Le Testament de César Girodot* (1859) has been one of the most successful of modern plays, more than 800 representations having been given of it at the Odéon and the Comédie Française. Most of his novels have also been dramatized. D. in Paris, Dec. 18, 1889.

Bel'per: a market-town of Derbyshire, England; on the Midland Railway; 10 miles by rail N. of Derby (see map of England, ref. 8-H). It has several churches, a public library, and a stone bridge over the river Derwent. It has large manufactures of silk and cotton hosiery. Pop. (1891) 10,420.

Belpre': village; Washington co., O. (for location of county, see map of Ohio, ref. 7-H); on B. and O. S. W. R. R., 194 miles from Cincinnati, 36 miles from Athens. It has good schools and manufactures of wool, flour, etc. Pop. township (1890) 2,678; (1900) 2,761.

Belshaz'zar [*Bel-shar-uzur*; Fr. *Balthasar*]: son of Nabonidus (Labynetus), the sixth and last king of the second Babylonian period. His mother was a daughter of Nebuchadnezzar, and probably the widow of Neriglissar, the fourth king of the period. When of sufficient age he was associated with his father on the throne, and in the Book of Daniel is therefore called king. At the fall of Babylon in 538 B. C. he was slain, and his father, Nabonidus, then at Borsippa, was taken prisoner.

Bel'tane, or **Beltein** [Scottish from Gaelic *bealltainn*, May-day]: heathen festival once common to all Celtic nations, traces of which have survived to the present day. The great ceremony of this cult was held in the beginning of May, and a somewhat similar one apparently early in November, that is, at the beginning and end of summer. The ceremony was marked by the extinguishing of all the fires in the district, after which the *need fire* was kindled with great solemnity, and from it the domestic fires were relighted. The earliest mention of the Beltane is made by Cormac, Archbishop of Cashel, early in the tenth century. Two fires were lighted side by side. Men and cattle then passed between the fires, which were supposed to give them protection from accident and disease. Domestic animals are driven through the flames at Cornae in Brittany, and in the Irish South islands of Arran, at the present date with the same object. This worship of Beil is connected with similar worship among the Slavs, Scandinavians, and Teutons. Indeed, worship of the personification of the sun and light by kindling fires in similar ways was universal over all Europe in heathen times. The survival of this fire-worship is seen in the periodical lighting of bonfires.

C. H. THURBER.

Bel'ton: city; on R. R.; capital of Bell co., Tex. (for location of county, see map of Texas, ref. 4-H); situated on Leon river, 60 miles N. N. E. of Austin City; has cottonseed oil-mill, cotton compress, roller flouring-mills, and several small manufactories; also fine public and private schools. Baylor Female College, the oldest in the State, is here. Pop. (1880) 1,797; (1890) 3,000; (1900) 3,700. EDITOR OF "JOURNAL."

Belts, Great and Little: two straits which connect the Baltic with the Cattegat. The former separates the island of Fünen from Seeland, is 36 miles long, and has an average width of about 18 miles. The depth ranges between 6 and 26 fathoms, and the current is so strong that the Belt is seldom frozen over. The navigation of both Belts is dangerous or difficult. The Little Belt separates Fünen from Jutland. It is 32 miles long. The widest part of it is about 10 miles, and the narrowest about 2,500 feet. From these Belts (Lat. *balte*) the Baltic Sea is supposed to take its name.

Beluchistan: See BALUCHISTAN.

Belu'ga: a generic name formerly applied to dolphins of the genus *Delphinapterus*, distinguished by a blunt and broad head and the absence of a dorsal fin. They abound in the Arctic seas, are gregarious, and afford to the Green-

landers an important article of food. The white whale of the St. Lawrence (*Delphinapterus leucas*) is common in northern waters. It is caught in the St. Lawrence and the Saguenay, is from 10 to 15 feet long, and is prized for its excellent oil and its skin, which makes a very fine leather.

The name Beluga is often applied to a large sturgeon of Southern Russia (*Acipenser huso*), which affords great quantities of isinglass and caviare. See STURGEON.

Be'lus (in Gr. Βήλος): in classic mythology a King of Phœnicia; said to be a son of Neptune, a brother of Agenor, and the father of Egyptus. He is considered by some persons as identical with BAAL (*q. v.*).

Belus [in Gr. Βήλος, now called *Nahr Naaman*; perhaps the *Bealoth* of the Hebrew text of the Bible]: a small stream of Palestine, which enters the sea near Aere. On its banks it is said that the art of glass-making was invented by the Phœnicians.

Belus, Temple of: a famous temple of enormous size in the city of Babylon; rebuilt by Nebuchadnezzar shortly after 604 B. C. According to some authorities, it was destroyed by Xerxes, King of Persia. Some writers identify its ruins with *Birs-Nimrud* (a huge mound 6 miles S. W. of Hillah), which appears to have been originally about 156 feet high. Others identify its ruins with *Babil* (another mound some 6 miles N. of Hillah), whose height is about 140 feet.

Belvedere, bel-vě-deer', Ital. pron. bel-vaÿ-day'ray (i. e. fair view): an Italian word applied to a pavilion on the top of a house, or a structure designed to afford a fine prospect of the surrounding country; also an artificial eminence in a garden if so arranged as to command a prospect. In France and other countries of Europe the term is often used as the name of a palace, villa, or summer-house, but always with the general idea of something which commands a fine view. The famous statue called the Apollo Belvedere, also the Belvedere Torso, and other works of sculpture, derived their appellation from a court in the Vatican surrounded by galleries and bearing that name. RUSSELL STURGIS.

Bel'videre: city and railroad junction; capital of Boone co., Ill. (for location of county, see map of Illinois, ref. 1-E); on Chicago and N. W. R. R., and on the Kishwaukee river, 78 miles W. N. W. of Chicago. It has elegant churches, and fine schools, flouring-mills, and manufactories of butter, cheese, sewing-machines, woven-wire mattresses and springs, shoes, etc. Pop. (1880) 2,951; (1890) 3,867; (1900) 6,937.

EDITOR OF "NORTH-WESTERN."

Belvidere: town and railroad junction; capital of Warren co., N. J. (for location of county, see map of New Jersey, ref. 2-C); on the Delaware river, 13 miles above Easton, and 95 miles N. of Philadelphia. The Pequest creek enters the river here, and affords a valuable water-power. Belvidere has an academy, several mills, and a cotton-factory. Pop. (1880) 1,773; (1890) 1,768; (1900) 1,784.

Belvisia: See NAPOLEONA.

Belzo'ni, GIOVANNI BATTISTA: Italian traveler; b. at Padua, Nov. 5, 1778; emigrated to England in 1803, and gained a subsistence as an athlete. In 1815 he visited Egypt at the invitation of Mehemet Ali, who desired him to construct a hydraulic machine. He soon directed his attention to the exploration of Egyptian antiquities. He removed to England the colossal bust called *Young Memnon* which is now in the British Museum. He opened the temple of Ipsamboul and the pyramid of Cephren (or the second pyramid of Gizeh). He published in 1821 a very interesting *Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, etc., in Egypt and Nubia*. He undertook a journey to Timbuctu, but died near Benin, Dec. 3, 1823.

Bem, JOSEPH: a Polish general; b. at Tarnov, in Galicia, in 1795. He served in the Polish army in the revolution of 1830, after which he passed some years in France. In 1848 he joined the Hungarian patriots, and obtained command of the army of Transylvania. He defeated the Austrians in several actions, and took part in the battle of Temesvár (1849), which was disastrous to Hungary. Having fled to Turkey and conformed to Islamism, he was raised to the rank of pasha. D. Dec. 10, 1850. See Pataky, *Bem in Siebenbürgen* (1850); N. N. Lájos, *Le Général Bem* (Paris, 1851).

Bem'ba: African lake. See BANGWEOLO.

Bembecidæ, bem-bes'i-děe [from Gr. βέμβιξ, a top]: a family of hymenopterous insects, the popular name of which

is "sand-wasps"; mostly natives of warm climates. They resemble wasps or bees in appearance, and the females make burrows in sandy banks, in which they deposit their eggs. Some of them emit an odor like that of roses. The U. S. have several species.

Bem'bo, PIETRO: Italian scholar and cardinal; b. in Venice, May 20, 1470. He removed to Rome in 1512, and became secretary to Pope Leo X. 1513. There he met Morosina (d. 1535), who bore him two sons and a daughter. In 1520 he removed to Padua, and lived in princely style. In 1539 he was raised to the dignity of cardinal. He then entered the priesthood, radically altered his mode of life, and studied the Fathers and not the classics. He was made Bishop of Gubbio (1541) and of Bergamo, but he did not leave Rome. He wrote, besides other works, a Latin *History of Venice* (1551). D. in Rome, Jan. 18, 1547. As a humanist he is famed for his pure Latinity. His collected works were published at Venice in 4 vols., 1729. See L. Beccadelli, *Vita di P. Bembo* (Venice, 1718); J. delle Casa, *Vita Bembi* (same vol.); cf. J. A. Symonds, *Renaissance in Italy*, ii. pp. 409-15.

Bement': village (located in 1854); Piatt co., Ill. (for location of county, see map of Illinois, ref. 6-F); on Wabash R. R., 21 miles W. of Decatur. Bement has three large school-buildings, electric lights, creamery, brick, and tile works. The surrounding region is devoted to the raising of wheat, corn, oats, and broom-corn. Pop. (1880) 963; (1890) 1,129.

EDITOR OF "REGISTER."

Be'mis, EDWARD WEBSTER, Ph. D.: economist; b. at Springfield, Mass., Apr. 7, 1860; A. B., Amherst College, 1880, Ph. D., Johns Hopkins University, 1883; gave at Buffalo, St. Louis, and Canton, O., the first courses in the U. S. to which the term University Extension was applied, 1887-88; Professor of Economics and History, Vanderbilt University, Nashville, Tenn., 1889-92; Associate Professor of Economics, University of Chicago, 1892-95. Author of *History of Co-operation in the United States* (1888); *Municipal Ownership of Gas in the United States* (1891); *Relation of Labor Organization to the American Boy and to Trade Instruction* (Philadelphia, 1894), etc.

Be'mis's or Bemus Heights: a post-village of Stillwater township, Saratoga co., N. Y. (for location of county, see map of New York, ref. 4-J); on the Champlain Canal, and near the Hudson river; was the scene of the first battle of Stillwater with Burgoyne, Sept. 19, 1777.

Ben: a term derived from Gaelic *beann*, "peak," prefixed to the names of many mountains of Scotland, most important of which are: BEN LAWERS in Perthshire; flanking the northwest shore of Loch Tay; easy of ascent; rich in Alpine plants; height, 3,984 feet.—BEN LEDI in Perthshire; 4½ miles N. W. of Callender; celebrated in Scott's *Lady of the Lake*; height, 2,875 feet.—BEN LOMOND in the northwest of Stirlingshire; on the east side of Loch Lomond; the most famous of the Scotch mountains; summit commands a magnificent view, including the Lothians, the Firth of Clyde, the islands of Arran and Bute, the Irish coast, and Bens Lawers, Vuirlich, Ledi, Nevis, and others; height, 3,192 feet.—BEN MACDHU'1; one of the Cairngorms, in the S. W. of Aberdeenshire; height, 4,296 feet; formerly supposed to be higher than Ben Nevis.—BEN NEVIS; the highest point in Great Britain; in the county of Inverness; formerly very difficult of ascent; summit commands a magnificent view; height, 4,406 feet. A road was built in 1883 to the top, where a meteorological observatory was then erected. There is also at present a shelter for travelers. C. H. THURBER.

Ben: a Hebrew word signifying "son"; equivalent to the Arabic *Ibn*: forms the first syllable of many scriptural names, as Ben-hadad, Benjamin, etc. *Beni*, the plural of Ben, occurs in the names of many Arabian tribes.

Ben, OIL OF: a fixed oil extracted by pressure from the fruits of *Moringa aptera* and other species; leguminous trees growing in the Levant and the East and West Indies. It is colorless or slightly yellow, and odorless. It is used to extract the odoriferous principles of fragrant plants.

Benares, ben-aa'rez (anc. *Varanashi* and *Kasi*): a famous and populous city of Hindustan; capital of a division and district of the same name, and the most populous city in the Northwestern Provinces of British India; on the left bank of the Ganges; about 428 miles by rail N. W. of Calcutta, and 477 miles by rail S. E. of Delhi (see map of N. India, ref. 7-G). It is the holy city of the Brahmans, the chief seat of their science, and may be called the Hindu capital of

India. Flights of stone steps called *ghâts* lead down the steep banks of the Ganges, which is here about half a mile wide. The external appearance of the city, as seen from the river, is rendered very imposing by the minarets of about 300 mosques and the pinnacles of nearly 1,000 pagodas. The streets are very narrow, and the houses, which are mostly built of stone, are generally lofty, some of them six stories high. Among the remarkable public edifices are the great mosque of Auringzebe, 232 feet high, many Hindu temples, a vast and old astronomical observatory, and the Hindu Sanskrit College, the chief seat of native learning in India. As the holy city of the Hindus and the central seat of Brahmanical learning, Benares attracts on the occasion of certain festivals an immense multitude of pilgrims, estimated at 100,000. Benares is a wealthy and industrious city, having extensive manufactures of silk, cotton, and woolen stuffs. It is a great emporium for the shawls of the north and the diamonds of the south, and, when they were produced, it was the chief market for the famous native muslins of Dacca and the eastern provinces. The Hindu Sanskrit College was founded here in 1791, and an English department was added to it about 1827. The residences of the Europeans are mostly at Secrole, which is 3 miles from Benares, and contains many fine mansions. It is connected by a railway with Calcutta and Delhi. A mutiny of Sepoys broke out here in June, 1857, but was soon quelled. Pop. (1881) 207,570; (1891) 222,520.

Benbow, JOHN: an English admiral; b. in Shrewsbury, England, in 1653; entered the navy in 1678 as master's mate. He became a rear-admiral in the reign of William III., who reposed great confidence in him. On Aug. 19, 1702, he encountered a superior force under the French admiral Du Casse, near Jamaica. He maintained a running fight for four days with his own ship alone, the captains of the rest of the squadron refusing to support him, for which two of them were shot. He was mortally wounded, and died at Port Royal, Jamaica, Nov. 4, 1702. See Campbell, *Lives of the British Admirals*.

Bench [O. Eng. *benc*; O. H. Germ. *banch* > Mod. Germ. *Bank*; appears as loan-word in the Romance language; Ital. *banco, banca*; Fr. *ban, banque*]: in law—1. A court or tribunal for the administration of justice. The word originally meant the seat occupied by the judges in court. In England two of the leading courts are termed the king's or queen's bench and common bench. The latter tribunal is also called the court of common pleas. (See COURT.) The word is also used to designate the judges as contrasted with the practitioners in their court, as in the phrase "the bench and the bar." Revised by F. STURGES ALLEN.

Bench Warrant: an order issued by or from a bench for the arrest of a person, either in case of contempt or after an indictment has been found, or from a judge to apprehend a person charged with an offense.

Bench'ers: principal officers of the English inns of court, intrusted with their government and with the power of admitting persons to the bar, and of disbarring practitioners, though the exercise of these powers is subject to the supervision of the judges of the higher courts.

Bencoolen: a Dutch seaport-town on the southwest coast of Sumatra; lat. 3° 48' S., lon. 102° 3' E. (see map of East Indies, ref. 8-B). Pop. estimated at 5,000. It was founded by the English in 1685, but was ceded to Holland in 1825 in exchange for Malacca. The climate of the city is exceedingly unhealthful. Pepper is the chief article of export.

Ben'der, or Ben'dery: a fortified town of Russia; in Bessarabia; on the right bank of the Dniester; 65 miles N. W. of Odessa (see map of Russia, ref. 10-C). Bender has several paper-mills, forges, and tanneries. It was captured in 1770 by the Russians, who massacred the population; was restored to the Turks in 1774; stormed again and again by the Russians, into whose possession it permanently passed with Bessarabia in 1812. Pop. (1897) 32,934.

Bendigo: See SANDHURST.

Bendire, CHARLES EMIL: captain U. S. army; ornithologist; b. near Darmstadt, Germany, Apr. 27, 1836; removed to the U. S. in 1852; entered the army in 1854 as private in the First Dragoons. He remained in the army throughout the civil war, and during this time received his commission in the First Cavalry. At the close of the war he was transferred to the West, where he passed a great portion of the time until his retirement as captain, Apr. 24, 1886. During

this period he devoted much time to natural history, especially ornithology, and collected a large amount of material in various branches of natural history, most of which was presented to the U. S. National Museum. In 1870 he began the formation of a collection of eggs of North American birds, which ultimately contained over 8,000 specimens, and this unrivaled collection he presented to the U. S. National Museum, the only condition being that it should remain intact. Capt. Bendire was the leading authority on North American oölogy, and honorary curator of the section of oölogy U. S. National Museum. He published many ornithological papers, and since his retirement from service had devoted his time to the preparation of a comprehensive work entitled *The Life Histories of North American Birds, with Special Reference to their Breeding Habits and Eggs*. The first volume, published by the Smithsonian Institution and U. S. National Museum, appeared in 1892. D. Feb. 4, 1897. FREDERIC A. LUCAS.

Bendix, JOHN E.: b. on board the steamer Sarah on the St. Lawrence river, Aug. 28, 1818; learned the trade of a machinist in New York; joined the Ninth regiment, State militia, in 1847; organized the Seventh regiment of volunteers in 1860; took part in the battles of the Wilderness, Antietam, Fredericksburg, etc., and was made a brigadier-general in 1865. D. in New York, Oct. 8, 1877.

Bendix, MAX: See the Appendix.

Bend Sin'ister: a heraldic bearing, like the bend, but reversed, and reaching from the sinister chief to the dexter base. It is the mark of illegitimate descent, and the only abatement in use. See ABATEMENT and HERALDRY.

Benedek, bay'ne-dek, LUDWIG, von: an Austrian general; b. at Ödenburg, Hungary, in 1804; fought with the rank of colonel against the Italians in 1848; became a major-general in April, 1849; after which he served with distinction against the Hungarian patriots. He directed a corps in the Italian campaign of 1859 and at Solferino. In June, 1866, he took the command of the operations of the grand Austrian army in Bohemia, and was defeated by the Prussians at the decisive battle of Sadowa, July 3, 1866. D. Apr. 27, 1881.

Benedetti, bay'ne-det'tee, VINCENT, Count: a French diplomatist; b. in Bastia, Corsica, Apr. 29, 1817; entered the diplomatic service, and held consulates in Cairo, Palermo, Malta, and Tunis. He was sent as ambassador to the kingdom of Italy in 1861, and to Berlin 1864. In 1870 he was employed by Napoleon III. in secret negotiations with the court of Prussia, and it was an alleged affront from William I. of Prussia, offered him at Ems, which Napoleon made a pretext for declaring war.

Benedicite, ben-e-dis'i-te: the Latin title of the hymn which is found in the Septuagint version of the Book of Daniel and also in the Apocrypha, and is said to have been sung by Ananias, Azarias, and Mishael (called in Daniel, Shadrach, Meshach, and Abednego), when they were cast into the furnace of fire (Dan. iii.). The *Benedicite* bears a close resemblance to the 148th Psalm, and is considered by some to be its expansion. It was probably used in the Jewish worship, and so passed into use in the early Church. It was liturgically used in the days of St. Athanasius (A. D. 325-60); and St. Chrysostom (A. D. 425) calls it "that admirable and marvelous song, which from that day to this has been sung everywhere throughout the world, and shall yet be sung by future generations." It is found in the *Book of Common Prayer* of 1549, with the following rubric prefixed: "After the first lesson shall follow *Te Deum laudamus* in English daily throughout the year, except in Lent, all the which time in the place of *Te Deum* shall be used *Benedicite omnia opera Domini* in English, as followeth." In the first Prayer-book of King Edward VI. the hymn ran thus: "O all ye works of the Lord, speak good of the Lord; praise Him and set Him up forever." In the second Prayer-book of King Edward VI. (A. D. 1552) it was changed to its present form, and the restriction as to its use removed. It is generally sung from Septuagesima to Easter, and also during Advent. W. S. PERRY.

Ben'ediet (in Lat. *Benedictus*), SAINT: an Italian ascetic; called the founder of monachism in the West; b. in Nursia, Umbria, in 480 A. D. He renounced the world in early youth (494), passed three years in solitude in a cave, hence called The Holy Grotto, near Subiaco. His hiding-place was discovered, and he acquired a wide reputation for sanctity. He was compelled to undertake the spiritual direction of hundreds, whom he organized into separate societies of twelve,

each with an abbot. In 515 he composed as a substitute for the Oriental rule of Basil a system of monastic rules, which was largely adopted by the Western monks, and was known as the Rule of St. Benedict. Under this system the monks were employed in manual labor and in the instruction of the young. In 529 he founded the famous monastery of Monte Cassino, near Naples, and died there Mar. 21, 543 A. D. His life was written by Gregory the Great (Eng. trans. by P. W. Luck, London, 1880). His *Rule* has been several times translated (e. g. London, 1886). Cf. F. C. Doyle, *The Teachings of St. Benedict* (1887), and J. G. Waitzmann, *Leben und Wirken des heiligen Benedict* (Augsburg, 1835). See BENEDICTINES.

Benedict I. became Pope of Rome in 574 A. D. D. in 578.—**BENEDICT II.**, a native of Rome; was elected pope in 683 A. D. D. in 685.—**BENEDICT III.** succeeded Pope Leo IV. in 855. D. in 858, leaving a good reputation for piety.—**BENEDICT IV.** was elected pope in 900, as the successor of John IX. D. in 903.—**BENEDICT V.** was chosen pope in 964, but was banished from Rome by the Emperor Otho I. Leo VIII. was pope at the same time with him, and both are recognized by Roman Catholic historians. D. in 966.—**BENEDICT VI.** was elected pope in 972, and was killed by the rebellious Romans in 974.—**BENEDICT VII.** succeeded Pope Benedict VI. in 974. He is said to have ruled with ability. D. in 983.—**BENEDICT VIII.**, a son of the Count of Tusculum, became pope in 1012. He crowned the Emperor Henry II. in 1013, and defeated the Saracens, who had invaded the papal states. D. in 1024.—**BENEDICT IX.** (THEOPHILACTUS OF TUSCULUM), sometimes called the "boy-pope," was chosen pope in 1033. He was extremely licentious, and was expelled by the Romans. Sylvester III. became anti-pope. Benedict was deposed by the Emperor Henry III. about 1048. D. 1055.—**BENEDICT X.**, called THE STUPID, was chosen pope in 1058, removed through the influence of Hildebrand in 1059, and died in prison in the same year.—**BENEDICT XI.** (Saint), b. in 1240; native of Treviso; succeeded Boniface VIII. in 1303; noted for humility. D. in 1304.—**BENEDICT XII.** (originally JACQUES FOURNIER, native of France; chosen pope in 1334. He was the third pope who reigned at Avignon, and was eminent as a canonist and theologian. He wrote several works. D. in 1342, and was succeeded by Clement VI. Pope Benedict XII. was an excellent man.—**BENEDICT XIII.** succeeded Innocent XIII. in 1724. He was distinguished for moderation and other virtues, and promoted the peace of Europe. D. in 1730. (See Clemente da Cruz, *Vida de Benedicto XIII.*, 1739.)—**BENEDICT XIII.** (anti-pope) (PEDRO DE LUNA), b. in Aragon; elected pope by certain cardinals at Avignon in 1394. Another party elected Boniface IX. at Rome, and a schism of the Church ensued. This Benedict was deposed by the Council of Constance in 1417. D. in 1424.—**BENEDICT XIV.** (PROSPERO LAMBERTINI); b. at Bologna in 1675; was a man of superior talents. He was well versed in history, theology, and classical learning. He succeeded Clement XII. in 1740, and showed himself a liberal patron of literature and science. He was also distinguished for his moderation and enlightened piety, and was the author of several esteemed religious works, and especially of the standard authority on beatification, *De beatificatione* (Bologna, 1734-38; Eng. trans. in parts, *Heroic Virtue*, London, 1850, 3 vols.). D. in 1758. See Fabroni, *Vita di Benedetto XIV.*, 1787.

Benedict, Sir JULIUS: musician: b. at Stuttgart, Nov. 27, 1804; studied under Hummel at Weimar, and also under Weber. When nineteen years old conducted a series of opera performances at Vienna, and next at Naples, where his first work, *Giacinto ed Ernesto*, was produced in 1827. His second opera, *I Portoghesi in Goa*, was produced in Stuttgart in 1830. In 1836, on the advice of Malibran, visited London, where he remained till his death, as conductor, composer, pianist, and teacher. When Jenny Lind came to the U. S., Benedict came with her as pianist and accompanist. As a composer he was prolific and successful. His principal works are *A Year and a Day* (1836); *The Gypsy's Warning* (1838); *The Bride of Venice*, *The Crusaders*, *The Lily of Killarney* (1862), *The Bride of Song* (1864), all operas produced in England; *Undine*, a cantata for the Norwich festival (1860); *Richard Cœur de Lion*, cantata for the Norwich festival (1863); *St. Cecilia*, cantata for the Norwich festival (1866); *St. Peter*, oratorio for the Birmingham festival (1870); *Graziella*, cantata for the Birmingham festival (1882); besides several symphonies and overtures, many songs, part songs, and much piano music. He was knighted Mar. 24,

1871. He also received numerous orders and decorations from European sovereigns. D. in London, June 5, 1885.

D. E. HERVEY.

Benedict, LEWIS: lawyer and general of volunteers; b. in Albany, N. Y., Sept. 2, 1817; graduated at Williams College; studied law, and was admitted to the bar in 1841. He was actively engaged in politics for many years and held various important local offices. He entered the army as lieutenant-colonel Seventy-third New York volunteers; engaged at Yorktown; captured at Williamsburg; exchanged Sept., 1862; appointed colonel 162d New York volunteers, and was attached to the Army of the Gulf. He was in command of a brigade at the battle of Port Hudson and during the Red river expedition, where he greatly distinguished himself. Killed at battle of Pleasant Hill, La., Apr. 9, 1864, while leading his brigade to a charge. Brevet brigadier-general U. S. volunteers for gallant conduct.

Benedict, MORIZ: German neurologist: b. at Eisenstadt, Hungary, July 6, 1835; M. D., University of Vienna, 1859; Professor of Nervous Pathology, University of Vienna, 1868; author of *Elektrotherapie* (1868); *Nervenpathologie* (1874); *Anatomische Studien au Verbrechergehirnen* (1881); and a large number of monographs and articles on neurological subjects.

Benedic'tine Editions of the Fathers: The following is a complete list of these highly esteemed and now very costly works: 1, *Barnabas* (Menard), 4to, 1642; 2, *Lanfranc* (D'Achery), fol., 1648; 3, *Bernard* (Mabillon), 2 vols. fol., 1667; 4, *Anselm* (Gerberon), fol., 1675; 5, *Augustine* (Delfan and others), 11 vols. fol., 1679-1700; 6, *Cassiodorus* (Garet), 2 vols. fol., 1679; 7, *Ambrose* (Du Frisehe and Le Nourri), 2 vols., 1686-90; 8, *Hilary* (Constant), fol., 1693; 9, *Jerome* (Martian and others), 5 vols. fol., 1693-1706; 10, *Athanasius* (Montfaucon), 3 vols. fol., 1698; 11, *Gregory of Tours* (Ruinart), fol., 1699; 12, *Gregory the Great* (De Sainte-Marthe), 4 vols. fol., 1705; 13, *Hildebert* (Beaugendre), fol., 1708; 14, *Irenæus* (Massuet), fol., 1710; 15, *Lucius Cæcilius* (Le Nourri), 8vo, 1710; 16, *Prosper Aquitanus* (Marette and Mangeant), fol., 1711; 17, *Chrysostom* (Montfaucon), 13 vols. fol., 1718-38; 18, *Cyril of Jerusalem* (Toultée and Maran), fol., 1720; 19, *Basil* (Garnier and Maran), 3 vols. fol., 1721-30; 20, *Cyprian* (Maran), fol., 1726; 21, *Justin Martyr* (Maran), fol., 1742; 22, *Origen* (De la Rue), 4 vols. fol., 1733-59; 23, *Gregory Nazianzen* (Clemencet), 1 vol. fol., 1778; 2d vol., 1842.

Benedictines, or **Benedictine Order:** monks who observe the rule of St. Benedict. This order was one of the most ancient and learned religious orders of Western Europe. The first Benedictine monastery was that founded by St. Benedict on Monte Cassino, near Naples, in 529 A. D. The order spread rapidly and widely in several countries of Europe, and it is said had at one period 37,000 monasteries. The Benedictines boasted that their order had produced 24 popes, 200 cardinals, 4,000 bishops, 1,500 saints. The rule of St. Benedict was less severe than that which the Eastern ascetics practiced. It required that the monks should live frugally, avoid laughter, hold no private property, and be industrious. To them we are especially indebted for the preservation and transmission of many of the ancient classics through the Dark Ages down to the present time. Among the most celebrated houses or societies of this order was the Congregation of Saint-Maur (dating from 1621), on the river Loire, to which all the Benedictine houses in France were affiliated. Connected with it were many learned men, including Mabillon, Montfaucon, and Sainte-Marthe. They published good editions of the Fathers (see above), and numerous valuable works, among which are *L'Antiquité Expliquée* (15 vols. fol., 1719-24); *Veterum Scriptorum Spicilegium* (13 vols., 1653-77); *Acta Sanctorum S. Benedicti* (9 vols., 1688-1702); and *Histoire Littéraire de la France* (9 vols. 4to, 1733-49). The Cistercians, Carthusians, Camaldules, Clunians, Celestines, and Trappists were branches of the Benedictine order. There are also Benedictine nuns, with twelve convents, in the U. S. See *Annales Ordinis S. Benedicti* (6 vols., 1713-39); Tassin, *Histoire de la Congrégation de Saint-Maur* (1770); Montalembert, *The Monks of the West* (5 vols., 1860).

Benediction [from Lat. *benedic'tio*, deriv. of *benedi'cere*, praise, wish well, bless; *bene*, well + *di'cere*, speak. *Benison* is from the same Lat. source viâ O. Fr. *beneïsson*]: a solemn invocation of the divine blessing upon men or things; the ceremony is as ancient as religious feeling. The custom

was sanctioned by Christ, and in the primitive Church was greatly developed in various forms. In Protestant churches some form of benediction usually closes religious services. In the Roman Catholic Church the ceremony is more elaborate, and generally accompanied with the sprinkling of holy water, use of incense, and making the sign of the cross. On Easter Sunday in Rome the Pope pronounces after mass a solemn benediction *urbi et orbi* (on the city and the world). The papal benediction conveyed to a dying person carries with it a plenary indulgence. The name is also given in some countries to a brief and popular service of comparatively modern origin in the Roman Catholic Church.

C. H. THURBER.

Ben'edix, JULIUS RODERICK: a German author; b. in Leipzig, Jan. 21, 1811. He wrote very many successful plays, mostly humorous, among them *Bemoostes Haupt*; *Der Steckbrief*; *Der Störenfried*; *Mathilde*, etc., and a novel, *Bilder aus dem Schauspielerleben*. D. in Leipzig, Sept. 26, 1873.

Ben'efice [O. Fr., from Lat. *beneficium*, favor]: originally a bounty in land given to a meritorious Roman soldier. In mediæval history the term denoted an estate in land conferred by a superior by way of recompense for service. As late as the twelfth century the word was used synonymously with *fœdum*. The earlier historians of the Middle Ages adopted the view that benefices were given successively, as revocable, as temporary, as estates for life, and finally as estates in perpetuity. This view has been refuted by Guizot (see *Civilization in France*, vol. iii.). In the canon law the word "benefice" designates a right inhering in a clergyman of sharing the income of church property in return for the performance of spiritual duties. The Roman Catholic Church includes all clerical offices, even the papal, among benefices; but the Church of England, which long made the term include all preferments except bishoprics, now excludes also all cathedral preferments, such as deaneries, canonries, archdeaconries, etc. The term "dignity" is applied to bishoprics, deaneries, archdeaconries, and prebends; the term "benefice" to parsonages, vicarages, and donatives. For the right of presentation to benefices, see ADVOWSON.

Benefit of Clergy: in English criminal law the privilege of the clergy, a clerk's privilege. During the Middle Ages benefit of clergy in various European countries extended to a total exemption in favor of clergymen from the process of a secular judge in criminal cases. In England, however, it was not carried beyond an exemption from capital punishment in felony and petit treason. It was never granted in cases of high treason or offenses below felonies. Offenses were thus divided into those which were clergyable and not clergyable. This exemption, at first allowed only to clergymen, soon was extended to all the officers and clerks of the church, and then to every one who could read, an ability to read being confined almost wholly to those in the service of the church. But when learning became more generally diffused, a distinction was made between those in orders and laymen who could read, the latter being allowed the privilege only once, and then (unless they were peers or peeresses) being branded in the left thumb. A woman, unless she was a peeress, could not claim this exemption, though this inequality was rectified by statute. At first, the criminals who were allowed this privilege were handed over to the ordinary or bishop to be dealt with according to the canons of the Church; but in the reign of Elizabeth it was enacted that they should be discharged from prison, with the proviso that the court might in its discretion keep the offender in prison for a year; and by subsequent statutes various punishments, such as whipping, fine, and imprisonment, were imposed on criminals entitled to benefit of clergy, who were practically all convicts. Whenever Parliament desired to make an offense strictly capital, the practice was to introduce into the enactment the words "without benefit of clergy." By statute of 7 Geo. IV., c. 28, s. 6, benefit of clergy was abolished. Its retention for so long a time was plainly owing to the fact that it could be used to mitigate the rigor of the English criminal law. For details as to this exemption, consult 4 Blackstone's *Commentaries*, 365.

T. W. DWIGHT.

Benefit Societies: See CO-OPERATIVE INSURANCE SOCIETIES.

Beneke, bay'ne-ke, FRIEDRICH EDUARD: a German philosopher; b. in Berlin, Feb. 17, 1798. He became Extraordinary

Professor of Philosophy in the University of Berlin in 1832. Among his works are *Psychological Sketches* (2 vols., 1825-27); a *System of Logic* (2 vols., 1842); and *Pragmatic Psychology* (1850). His system of psychology is called "empirical." Raue's *Elements of Psychology* gives a good view of his system. He disappeared Mar. 1, 1854, and his body was found in a canal in June of the same year.

Revised by W. T. HARRIS.

Benét, ben-ay', STEPHEN VINCENT: b. at St. Augustine, Fla., Jan. 22, 1827; educated in Alexandria, Va., at the University of Georgia, and the U. S. Military Academy at West Point, N. Y., where he was graduated July 1, 1849. In 1853 he published a translation of Jomini's *Political and Military History of the Campaign of Waterloo*; assistant Professor of Ethics and Law at West Point (1859-61); instructor of ordnance (1861-64); inspector of ordnance (1864); commander of Frankford arsenal; major of ordnance corps (1866); chief in 1874; retired Jan. 22, 1891. Published *Military Law and the Practice of Courts Martial* (1862), a text-book at West Point; and *Electro-ballistic Machines and the Schultze Chronoscope* (1866).

Benevento, bay'-nay'-ven'tō: a province of Italy; bounded N. by Campobasso, E. by Foggia, S. by Avellino, W. by Caserta. Area, 688 sq. miles. The country is level, and the soil generally fertile. The chief articles of export are cattle, grain, wine, oil, etc. It has changed masters very often, and was annexed by Italy at the same time as Naples. Pop. (1890) 244,464.

Benevento (Lat. *Beneventum*): a walled city of Southern Italy; capital of the province of the same name; situated on a hill or declivity by the river Calore; 33 miles N. E. of Naples (see map of Italy, ref. 6-F). Pop. 22,700. It has a citadel or castle, a fine old cathedral, several palaces, and churches. It is the see of an archbishop, and has several annual fairs. Among the many ancient remains found here is the magnificent Arch of Trajan, erected in 114 A. D., now nearly perfect. Benevento is a place of great antiquity, having become a Roman town as early as 274 B. C., and it was an important city during the Roman empire. It was conquered in the sixth century by the Lombards, under whom it continued to flourish, and became the capital of the powerful duchy of Benevento. The city, with some adjacent territory, was given to the pope in 1053, and governed by a cardinal-legate with but small intermissions until 1860, when it was united to the kingdom of Italy. In 1806 it was erected into a principality by Napoleon, who gave Talleyrand the title of Prince of Benevento.

Benezet', ANTHONY: a philanthropist; b. in St.-Quentin, France, Jan. 31, 1713. He joined the Society of Friends, and emigrated in 1731 to Philadelphia, where he taught school for many years. He was eminent as an opponent of the slave-trade and slave-holding, and as a benefactor of the Negroes. He wrote several tracts on the subjects. D. in Philadelphia, May 3, 1784. See Vaux, *Memoir of A. Benezet* (1817).

Ben'fey, THEODOR: Sanskrit scholar; b. at Nörten, near Göttingen, of Jewish parents, Jan. 28, 1809; became privat-docent of Sanskrit at Göttingen in 1834, and in 1848 extraordinary professor; full professor in 1862. He published *The Hymns of the Sama-Veda* (1848); a Sanskrit reader and grammar; *Pantschatantra* (Leipzig, 1859), a work of prime importance for the origin and spread of the fables and tales of India; a great *Sanskrit-English Dictionary* (London, 1866); a *History of Philology (especially Oriental) in Germany* (Munich, 1869); and other books; also very many minor treatises. Many of the last, selected and edited by Bezzenberger, have been republished (Berlin, 1890-92) as *Kleinere Schriften* (with biography). He was a man of vast learning; but a lack of terse, lucid, and orderly statement lessens the usefulness of much of his work. D. in Göttingen, June 26, 1881.

C. R. LANMAN.

Bengal, ben-gawl': the largest and most populous of the local governments of British India; bounded N. by Nepal and Bhutan, E. by Assam and Burma, S. by the Bay of Bengal and Madras, and W. by the Northwestern and the Central Provinces. Area, 149,725 sq. miles. The greater part of Bengal consists of the alluvial plain or valley of the Ganges and Brahmaputra. The combined delta of these great rivers commences 280 miles from the sea, near which the delta islands, here called Sunderbunds, are covered with a very dense vegetation, and infested by serpents, crocodiles, and tigers. Farther N. the country is marvelously prolific of

rice, cotton, opium, sugar, indigo, and a great variety of tropical fruits. The chief exports are opium, saltpeter, rice, hides, and indigo. The climate of Bengal is subject to great extremes of heat, and is very destructive to the health of both Europeans and natives; but in this respect great improvement is reported in the last few years. Pop. (1901) 74,713,020. See FAMINE.

Among the most important cities of Bengal province are Calcutta, the capital, Delhi, Benares, Patna, Agra, and Murshidâbâd. The people are Hindus, Mohammedans, Sikhs, and various wild tribes in the hill-country. The native Bengalese are a facile, deceitful, cowardly race. Their morals are much debased. The English first established themselves in Bengal in 1656. From the smallest beginnings their great empire of the East has grown up. The Bengalese language has a basis of Sanskrit, but is modified by words of Arabic, Malay, and Persian origin. Its literature has been much neglected till of late. Since 1858 the history of Bengal has been one of steady and peaceful progress. Its external trade is practically confined to Calcutta. Chittagong is the rice port.

Bengal, Bay of (anc. *Ganget'ieus Si'nus*): a part of the Indian Ocean extending between Hindustan and Farther India. Its southern boundary is variously placed by geographers. According to some it is a line about 1,200 miles long drawn from Coromandel to the peninsula of Malacca. Others assign as its southern limit a line drawn from the delta of the Godavery to Cape Negrals. Its chief affluents are the Ganges, the Brahmaputra, and the Irrawaddy. There are no good harbors on the western coast, but several safe ports occur on the east side, as Aracan, Cheduba, Negrals, etc. The tide sometimes rises to the height of 70 feet in this bay. The northeast monsoon prevails here in summer and the southwest monsoon in winter. In this bay are the Andaman and the Nicobar islands.

Bengali, ben-gaw'leë, **Lan'guage**: the Aryan language of Eastern Bengal, the district about the mouths of the Ganges, of which Calcutta is the metropolis. It belongs to that group of neo-Sanskrit languages now spoken in Northern and Central Hindustan, which bear a relation to the Sanskrit quite similar to that of the Romance languages to Latin. These languages are: 1. The Bengâli (or Bangâli). 2. The Hindi, occupying a vast territory in Northern Hindustan, stretching from the Himalayas south to the Nerbudda and from the lower Ganges westward nearly 1,200 miles to the valley of the Indus, estimated in all at about 248,000 sq. miles. Hindustani is a *lingua franca* based largely on Hindi. 3. The Uriya, the language of Orissa, to the south of Calcutta. 4. The Marâthi, the language of ten million people in the province of Bombay, and to the eastward in the Nizam's Dominions and the Central Provinces. 5. The Gujarâti of Gujerat, on the west coast, north of Bombay. 6. The Sindhi along the lower Indus. 7. The Panjâbi in the Punjab, the district of the "five rivers." 8. The Cashmiri of Cashmere. 9. The Sinhalese of Southern Ceylon. Other divisions are of secondary importance, or may be like Nepâli and Assamese, subdivisions merely. Among all these the Bengâli ranks next to Hindi in extent and importance. It is spoken by about seventeen million people. Its colloquial form appears in many rather ill-defined dialects, from which the literary language of Calcutta has widely departed under the influence of a strong archaizing tendency. The necessities of its vocabulary in meeting the demands of modern life have been supplied by free recourse to the Sanskrit, which has also exercised an influence upon inflexion and syntax.

Calcutta, 1861); Yates-Wengler, *Introduction to Bengali Language* (2 vols., Calcutta, 1874); Beames, J., *Grammar of the Bengâli Language* (London, 1891); Haughton, G. C., *Bengali, Sanskrit, and English Dictionary* (London, 1833); cf. also Beames, J., *Comparative Grammar of the Modern Aryan Languages of India* (London, 1875); Cust, R. N., *The Modern Languages of the East Indies* (London, 1878); Blumhardt, J. F., *Catalogue of the Bengali Books in the British Museum* (1886).

BENJAMIN IDE WHEELER.

Bengal Light, or **Blue Light**: a brilliant signal-light used at sea during shipwreck, and in ordinary pyrotechny for illuminating a tract of country. It is produced by the combustion of a mixture of niter, sulphur, and trisulphide of antimony. These materials are first reduced to a fine powder, then dried and mixed in the proportions of 6 lb. of niter, 2 of sulphur, and 1 of the trisulphide.

Bengel, beng'el, JOHANN ALBRECHT, D. D.: German Lutheran theologian; b. at Winnenden, in Württemberg, June 24, 1687. He was probably the first Protestant who treated the exegesis of the New Testament in a thoroughly critical spirit. His edition of the Greek Testament (1734) is the foundation of modern criticism of the New Testament text. He wrote the celebrated *Gnomon Novi Testamenti* (1742) and an *Exposition of the Revelation of St. John* (1740), etc. D. in Stuttgart, Nov. 2, 1752.

Benghazi, ben-gaa'zëe (anc. *Beren'ce*): a seaport-town of Northern Africa; capital of Barca; on the east coast of the Gulf of Sidra; 420 miles E. S. E. of Tripoli (see map of Africa, ref. 2-E). The port is shallow, and nearly filled with sand. It has some trade in oxen, sheep, corn, and wool. It is supposed by some to be the site of the ancient *Hesperis* and the Gardens of the Hesperides. Pop. estimated at from 6,000 to 7,000.

Benguela, ben-gay'lää: a district of the Portuguese West African province of Angola. It is bounded on the N. by the Coanza river, which separates it from Angola proper, S. by Mossamedes, and W. by the Atlantic Ocean. The eastern limit is not definitely fixed. It is watered by numerous small rivers, which flow westward into the Atlantic. The surface is mountainous. The soil is fertile, and produces a very luxuriant and varied vegetation. The climate is hot, humid, and unhealthy, especially near the coast. The forests are infested by lions and other beasts of prey. Capital, Benguela (see map of Africa, ref. 7-D).

Benham, ANDREW E. K.: See the Appendix.

Benham, HENRY W.: military engineer; b. at Cheshire, Conn., 1816; graduated at West Point in 1837; colonel of engineers, brevet major-general U. S. A.; had charge of the principal engineer works on the Atlantic coast, of the Potomac aqueduct, and of the coast survey office; member of commission for New York docks 1855; engineer of New York quarantine commission 1859; breveted colonel as commanding at the rout of Garnett, Carrick's Ford, July, 1861; as brigadier-general volunteers commanding leading brigade at Carnifex Ferry, Sept., and at rout of Floyd through Fayetteville Nov., 1861; commanding district and troops at capture of Fort Pulaski, Apr., 1862; commanding engineer brigade, laid several pontoon-bridges under fire during Chancellorsville battles, his horse being shot under him; constructed and commanded defenses at City Point, 1864; breveted major-general volunteers and brigadier and major-general U. S. army for gallant conduct, etc., Mar., 1865; senior engineer Boston; president of engineer boards; devised pieket shovel and rapid construction of pontoon-bridges by "simultaneous bays." Retired 1882. D. in New York, June 1, 1884.

Beni, bay'nëe: a river of South America; in Bolivia; rises on the east slope of the Andes, and is formed by the junction of the Chuqueapo and Mapiri. It flows northward into the Madeira or Mamore after a course of about 650 miles.

Beni: a department of Bolivia; bounded N. and E. by Brazil, S. by La Paz, Cochabamba, and Santa Cruz, and W. by Peru. Area, 100,551 sq. miles. It comprises the whole northern part of the republic, and with the exception of a small part in the southwest corner, and a part of the province of Menos in the E., is entirely an unknown region, inhabited only by wild Indians. Chief town, Trinidad. Pop. (1888) 16,744 whites, and about 100,000 Indians.

Benicarlo, bay'nëe-kaar'lô: a seaport-town of Spain; province of Valencia; on the Mediterranean; about 82 miles N. N. E. of Valencia (see map of Spain, ref. 15-J). It is meanly built, and has a ruined castle and a fishing-port. A strong wine is made here and exported to Bordeaux, where it is used to adulterate claret. Pop. (1887) 7,916.

Benicia, bëe-nis'i-a: city; on railroad; Solano co., Cal. (for location of county, see map of California, ref. 7-C); on the north side of the Strait of Carquinez (which connects San Pablo and Suisun bays); 30 miles by rail and 28 miles by water N. E. of San Francisco. It was incorporated in 1850, and was formerly the capital of the State. The strait is nearly 2 miles wide, and is navigable for large vessels. Benicia has a law school, a girl's seminary, a convent, a U. S. arsenal and barracks, ship-yards, two very large tanneries, fruit and fish packing establishments, pottery and cement works, gas and electric lights. It is the seat of St. Augustine College (Episcopalian). The land in the vicinity is adapted to the growing of almonds and grapes. Pop. (1880) 1,794; (1890) 2,361; (1900) 2,751. EDITOR OF "NEW ERA."

Benign Growths, or Tumors: See TUMORS.

Beni-Hassan, bay'nēe-hāās'san: a village of Central Egypt; on the right bank of the Nile; 23 miles S. S. E. of Minieh. Here are twenty-two grottoes or catacombs excavated in a calcareous bank or hill. They are supposed to have been used as tombs by the people of Hermopolis, which stood on the opposite side of the river. Here are apartments 60 feet long and 40 feet wide, in which are pillars of the native rock 16 ft. 8½ in. in height and 5 feet in diameter. The sides of the grottoes are covered with paintings designed with skill and good taste. These tombs are among the most remarkable in Egypt. The earliest bears the date of the forty-third year of Ositarsen I., not far from 1800 B. C. Says J. P. Thompson: "I found one tomb, some 200 feet above the level of the river, almost a Doric temple hewn from the solid rock. . . . This chamber was cut from the solid rock with perfect precision: no modern square or line or plummet could make it more true."

Beni-Israel (sons of Israel): remarkable people, apparently of Jewish origin, in the W. of India, chiefly in Bombay and some coast towns. They acknowledge the law of Moses and retain many of the Jewish customs, although conforming to some of the idolatrous practices of the Hindus. Some of them know Hebrew, but Marathi is their ordinary language, and in it they have some literature. They rarely intermarry with ordinary Jews or with the Hindus.

Beni Khaibir': a tribe in Arabia, supposed by some, but without sufficient reason, to be a remnant of the ancient ascetic Rechabites. They number about 60,000. See RECHABITES.

Benin, beu-ēen': a maritime district of Western Africa; in Upper Guinea; W. of the river Niger, N. E. of the Bay of Benin; in the territory of the Royal Niger Company. Its limits in some directions are not well defined or ascertained. The interior is elevated and hilly, and mostly covered with forests. The soil is fertile, and supports a dense population. Sugar, rice, yams, palm oil, and cotton are the staple productions.

Benin: a town of Africa; on a river of the same name; 73 miles from the ocean (see map of Africa, ref. 5-C). The houses are built of clay. Pop. estimated at 15,000. Belzoni died near this town in 1823.

Benin, Bight of: portion of the Gulf of Guinea (*q. v.*), bordering on the above district.

Beni-Souef, ben'ēē-swef': a town of Central Egypt; on the Nile; 62 miles S. S. W. of Cairo. It has cotton-mills and quarries of alabaster, and is the entrepôt of the produce of the fertile valley of Fayoom. Pop. 7,000.

Ben'jamin: youngest son of the patriarch Jacob and of Rachel (who called him BEXONI). He was his father's favorite child, and the head of one of the twelve tribes of Israel. The territory of this tribe was bounded on the N. by that of Ephraim, on the E. by the Jordan, on the S. by the land of Judah, and on the W. by that of Dan. Its soldiers were distinguished as archers and noted for left-handed slingers. The tribe was nearly extirpated in the days of Phinehas, son of Aaron, by the other confederate tribes, for a gross breach of hospitality, but 600 men who had escaped were supplied with wives, partly by rapine at Shiloh, and thus it was re-established (Judges xix.-xxi). The first King of Israel, Saul, was a Benjamite. After the death of Solomon the tribes of Benjamin and Judah remained loyal to his dynasty when the other ten tribes revolted.

Benjamin, JUDAH PHILIP: a jurist and politician of Jewish extraction; b. in St. Croix, West Indies, Aug. 11, 1811. He practiced law in New Orleans; was elected a Senator of the U. S. for Louisiana in 1852; and re-elected in 1859. He acted with the Democrats, and became a secessionist. He was Secretary of War (1861), and Secretary of State of the Confederate States 1862-65. At the close of the civil war he fled to England and began the practice of law in London, where he rose to great fame and fortune. His *Law of Sale* (1883) is an authority in English courts. D. in Paris, May 7, 1884.

Benjamin, MARCUS: See the Appendix.

Benjamin, PARK: poet, journalist, and lecturer; b. at Demerara, in Guiana, Aug. 14, 1809. He graduated at Trinity College, Hartford, Conn., in 1829; and in 1840 became associated with R. W. Griswold as editor of the *New World*, a literary journal published in New York. He

wrote, besides many lyrical poems, a *Poem on the Meditation of Nature*. D. in New York, Sept. 12, 1864.—His son, PARK: b. in New York, May 11, 1849; entered the navy (1867); became a lawyer (1870); then a patent expert. Besides some tales and slight humorous essays, he edited *Appleton's Cyclopaedia of Applied Mechanics* (1880).

Benjamin, SAMUEL GREENE WHEELER: traveler, artist, and author; b. at Argos, Greece, Feb. 13, 1837. He was educated at Williams College; was for some time assistant librarian in the State Library, Albany, N. Y.; and from 1883 to 1885 U. S. minister to Persia. Has published a number of works on art, including *Art in America* and *Contemporary Art in Europe* (1877), as well as poetry; *Constantinople* (1860); *Persia and the Persians* (1886), etc.

HENRY A. BEERS.

Benjamin-Constant, baān'zha-mān' kōn'stāān', JEAN JOSEPH: painter of portraits and of Oriental subjects; b. in Paris, June 10, 1845; pupil of Cabanel; officer Legion of Honor 1884; awarded a first-class medal at the Paris Exposition of 1889, but refused to accept it. He has visited the U. S. several times, and has painted portraits in New York and other cities. He is an artist with a strong sense of color and a brilliant technician. *The Cherifas*, exhibited at the Salon of 1885, is one of the best of his pictures of life in the East, and is in the museum at Carcassonne. He painted three large decorative panels for the New Sorbonne in Paris, viz., *Literature*, *The Academy of Paris*, and *Science*, which show intelligent artistic intention and a desire to obtain color-harmony in painting on a large scale without sacrificing local tints. He has painted a large number of pictures, and in some of them has not attained the level that made his earlier works so notable. Many of his pictures are owned in the U. S. Studio in Paris.

WILLIAM A. COFFIN.

Benjamin Gum: See BENZOIN GUM.

Benjamin of Tudela: a Jewish rabbi and traveler; commenced about 1159 a journey through Palestine, Persia, and Egypt, in which he passed fourteen years. He wrote an account of his travels, which was translated into Latin, English (London, 1840), and French. D. in 1173. See E. Carmoly, *Notice sur B. de Tudèle et ses Voyages* (Brussels, 1837, 2d ed., 1852, 2 parts).

Benjamin-tree: See BENZOIN ODORIFERUM.

Ben'kelman: capital of Dundy co., Neb. (for location of county, see map of Nebraska, ref. 11-C); situated in a rich agricultural district; on Bur. and Mo. R. R., and on Republican river; 89 miles from Akron, Col.; has fine school-building, and three churches. Was first settled about 1880. Pop. (1890) 357; (1892) estimated, 600.

Benloew, LOUIS: philologist; b. in Erfurt, Germany, Nov. 15, 1818; studied at the universities of Berlin, Leipzig, and Göttingen. Most of his life was, however, spent in France, and from 1847 he was connected with the Faculty of Letters of Dijon, becoming later the dean of the faculty. D. in 1884. His works are numerous. Among them may be mentioned *De l'accentuation dans les langues indo-européennes, tant anciennes que modernes* (1847); *Théorie de l'accentuation latine* (with Weil, 1855); *Aperçu général de la science comparative des langues* (1858); *Précis d'une théorie des rythmes* (1862); *De quelques caractères du monde primitif* (1862); *Les Sémites à Ilion* (1863); *La Grèce avant les Grecs, étude linguistique et ethnographique* (1877); *Les lois de l'histoire* (1881).

B. I. W.

Benne-plant: See SESAME.

Bennett, CHARLES WESLEY, D. D., LL. D.: Methodist Episcopal minister and educator; b. at East Bethany, N. Y., July 18, 1828; educated at Wesleyan University, where he graduated in 1852; was teacher and principal in several schools 1852-61; joined East Genesee Conference 1862; studied in Berlin 1866-69; principal for the second time of Genesee Wesleyan Seminary 1869-71; Professor of History and Logic in Syracuse University 1871-85; and Professor of Historical Theology in Garrett Biblical Institute, Evanston, Ill., 1885-91. He published *National Education in Italy, France, Germany, England, and Wales, Popularly Considered* (Syracuse, 1878), and *Christian Art and Archaeology of the First Six Centuries* (New York, 1888). D. at Evanston, Apr. 17, 1891.

ALBERT OSBORN.

Bennett, EDMUND HATCH, LL. D.: jurist; b. at Manchester, Vt., Apr. 6, 1824; graduated at the University of Vermont 1843; admitted to the bar 1847; resided at Taun-

ton, Mass., 1848-84; judge of probate and insolvency for Bristol County 1858-83; mayor of Taunton 1865 and 1867; lecturer in Harvard Law School 1870-72; since 1876 professor in and dean of the Boston University Law School; has published *Bingham on Infancy*; *Greenleaf's Reports* (9 vols.); *English Law and Equity Reports* (3 vols.); seven editions of Justin Story's works; *Massachusetts Digest of Decisions* (3 vols.); *Fire Insurance Cases* (5 vols.); *Blackwell on Tax Titles*; *Goddard on Easements*; *Pomeroy's Constitutional Law*; *Inderman's Principles of the Common Law*; *Cushing's Reports of Massachusetts Decisions* (3 vols.); *Benjamin on Sales*; *Story on Sales*; *Leading Cases in Criminal Law*, etc. D. in Boston, Mass., Jan. 2, 1898.

Bennett, JAMES GORDON: journalist; b. near Keith, Scotland, Sept. 1, 1795; educated for the Roman Catholic priesthood; emigrated to the U. S. in 1819; took to newspaper work, and was for several years connected with several journals published in the city of New York; became chief editor in 1833 of the *Pennsylvanian*, a daily paper of Philadelphia. In 1835 he founded the *New York Herald* as a penny paper, into which he introduced the features of news-gathering, special correspondence, telegraphic reporting, and distribution by carriers, subsequently common features of journalism. D. in New York, June 1, 1872.—His only son, of the same name, b. in New York, May 10, 1841, who resides chiefly in Paris, is distinguished for fitting out the Jeanette polar expedition, for sending H. M. Stanley to search in Africa for Livingstone, and for establishing in connection with J. W. Mackay a new line of submarine cable between Europe and the U. S.

Bennett, Sir JAMES RISDON, M. D., F. R. S., LL. D.: ex-president of the Royal College of Physicians; b. at Romsey, Hampshire, England, in 1809; M. D., University of Edinburgh, 1833; appointed assistant physician to St. Thomas's Hospital, London, 1843; elected president of the College of Physicians in 1876, and annually re-elected until 1881; knighted in 1881; has published translations from the German of Kramer on *Diseases of the Ear*; *An Essay on Acute Hydrocephalus*, etc. C. H. THURBER.

Bennett, JOHN HUGHES, M. D.: physician and medical writer of Edinburgh; b. in London, Aug. 31, 1812; took his degree at Edinburgh in 1837, and in 1848 was made Professor of the Institutes of Medicine in that city. Dr. Bennett was especially distinguished for his studies in histology and therapeutics, and his advocacy of the expectant treatment of disease. Among his works are *Clinical Medicine* (1856); *Practice of Medicine*; *Treatment of Pulmonary Consumption*; *Text-book of Physiology* (Edinburgh, 1871). D. at Norwich, Sept. 25, 1875.

Bennett, JOSEPH: journalist and music-critic; b. in Berkeley, Gloucestershire, England, Nov. 29, 1831; studied music in early life, especially the organ, violin, viola, and violoncello; went to London in 1855, and wrote for the *Sunday Times*, the *Musical Standard*, and since 1870 to the present for the *Daily Telegraph*. He edited Novello's *Concordia* (May 1, 1875, to Apr. 22, 1876), and has for years written largely for Novello's *Musical Times*. He has furnished the librettos for Barnett's *Good Shepherd*; Mackenzie's *Rose of Sharon*, *Story of Sayid*, *Dream of Jubal*; Cowen's *Ruth*, *Thorgrim*, and *St. John's Eve*; Bottesini's *Garden of Olivet*; Madame Sainton-Dolby's *Thalassa*; Williams's *Gethsemane* and *Last Night at Bethany*; and Sullivan's *Golden Legend*, adapted from Longfellow. Some of his studies of The Great Composers in the *Musical Times* have been put in book form. In 1885 he visited the U. S., and made a music-literary tour, afterward publishing his impressions in London. D. E. HERVEY.

Bennett, Sir WILLIAM STERNDALÉ: musician; b. in Sheffield, England, Apr. 13, 1816. When eight years old he became a choir-boy at King's College, Cambridge, and two years later was taken to London to study in the Royal Academy of Music, remaining there from 1826 to 1836. He was then sent to Leipzig, and associated with Mendelssohn, Schumann, and Ferdinand Hiller. While there he composed considerable music, including his very beautiful *Naiades* overture. In 1856 he was appointed conductor of the London Philharmonic Society, but soon relinquished the post. In the same year he was appointed Professor of Music in Cambridge University, from which he received the Bachelor and Musical Doctor's degrees. Oxford made him a D. C. L. In 1858 he produced his cantata *The May Queen*, for the Leeds festival, and in 1867 his *Women of Samaria*

was produced at the Birmingham festival. In 1871 he was knighted, and on Feb. 1, 1875, he died in London at the early age of fifty-nine. He composed much, mostly in the instrumental field. His two cantatas mentioned, four church anthems, and a setting of Tennyson's *Ode on the Death of the Duke of Wellington*, and Charles Kingsley's *Ode on the Duke of Devonshire*, comprise most of his vocal music, but his works for orchestra and solo instruments are in the front rank. From 1868 till his death he was the principal of the Royal Academy of Music. D. E. HERVEY.

Ben Nevis: a mountain of Scotland. See BEN.

Ben'nigsen, or Benningsen, LEVIN AUGUST THEOPIL, Count: Russian field-marshal; seion of a noble Hanover family; b. in Brunswiek (Lüneburg) in 1745; brought up at court; married an Austrian and lost his employment; became an adventurer, and obtained a commission in the Russian army in 1773. Catherine II. employed him in Poland and promoted him. He joined the Pahlen conspiracy against Paul I., and actually strangled him. He distinguished himself at the head of an army-corps at Pultusk (1806); was given the command of the army opposing Napoleon in the following winter, broke through the French lines, separating his foes, and forcing Napoleon to take the field with reinforcements. He chose the position at Eylau, and at night, after the desperate battle of Feb. 8, 1807, held his position. He retired for the sake of supplies. He fought as a subordinate commander at Friedland and Borodino; beat Murat at Tarantino, Oct. 12, 1812; commanded the Russian army of reserve at Leipzig, and for his impetuosity and skill in the great battle was made a count on the field. In 1818 he retired to his Hanover estates. D. in 1826.

Bennington: on railroad; capital of Bennington co., Vt. (for location of county, see map of Vermont, ref. 9-B); 55 miles S. W. of Rutland, and 36 miles from the Hudson river at Troy. The town contains three villages—Bennington, North Bennington, and Bennington Centre—the latter being Station A of the Bennington post-office. Gen. Stark, at the head of a column of "Green Mountain Boys" (New Hampshire and Massachusetts troops), defeated a British detachment in force, commanded by Lieut.-Col. Baum, sent from Gen. Burgoyne's army to capture the public stores near North Bennington, Aug. 16, 1777; 600 British prisoners were captured. The dedication ceremonies of the Bennington Battle Monument (301 ft. 10½ in. high) and centennial of the admission of Vermont into the Union were celebrated Aug. 19, 1891. The town contains extensive graded schools, large manufactories of knit goods, and one of the largest woolen-factories in the country. Bennington is one of the largest manufacturing villages in the State, and has a soldiers' home. Pop. of township, including village (1880) 6,333; (1890) 6,391; (1900) 8,033; of village (1890) 3,971; (1900) 5,656.

EDITOR OF THE "BANNER."

Benoit, baý' nwaã', PIERRE LEOPOLD LEONARD: musician; b. in Harelbeke, West Flanders, Belgium, Aug. 17, 1834; one of the most remarkable of the extreme modern school composers. Educated at the Brussels Conservatory, studying under Féti's; composed his first opera in 1857. Produced his opera *Le Roi des Autnes* in Paris 1861; returned to Belgium, and has since produced many important and remarkable works, both sacred and operatic; was appointed in 1867 director of the Flemish School of Music in Antwerp, which position he still retains. His *Lucifer* (1866); *L'Escaut* (1869); *Drama Christi* (1871); *La Guerre* (1873), are among his greatest oratorios; besides which he has composed several cantatas and operas. He is a strong advocate of a strictly national Flemish school of music. D. E. HERVEY.

Benoît de Sainte-More, or Sainte-Maure: mediæval French poet. Little is known of his life. He was probably a Norman by birth, although attempts have been made to prove him a native of Sainte-More in Champagne, and also of Sainte-More in Touraine. He attached himself to the court of Henry II. of England; and he is probably the Beneit of whom Wace somewhat enviously speaks (*Roman de Rou*, vv. 16526-31) as having at Henry's command written the long versified history, of some 43,000 lines, known as the *Chronique des ducs de Normandie*—being preferred for the task to his older contemporary and rival, Wace himself (*q. v.*). He is chiefly famous, however, for his *Roman de Troie*, one of the most popular poems of the Middle Ages. Though Benoît in this work speaks admiringly of Homer, he really found his material in the *De excidio Trojæ* of DARES (*q. v.*) and the *Ephemerides belti Trojani* of DICTYS (*q. v.*). He by no means, however, followed closely even

these authorities. He gave to the whole story a frankly mediæval and chivalric character; and he enlarged, or even added, wherever his fancy suggested. Some of these additions proved the most attractive parts of his poem—e. g. the episode of Troilus and Briseida (vv. 13235, *seq.*)—and were subsequently used by famous writers. Boccaccio told the tale of Troilus in his *Filostrato* (Briseida becoming Griseida); Chaucer also in his *Troilus and Criseyde*. Shakspeare made, or helped make, a play on the subject. But the whole *Roman de Troie* was also imitated and translated into other languages. The German poet, Herbolt von Fritzlar, made it the basis of his *Lied von Troie* (twelfth century); the Sicilian Guido delle Colonne (thirteenth century) rendered it into poor Latin, but without naming his original, and succeeded in passing for many centuries as the true author; Binduccio dello Scelto turned it into Italian (thirteenth century); and there were at least two Italian versions of Guido's Latin. A Dutch version was made by Jacob van Maerlant (thirteenth century), and it was even translated into Greek (fourteenth century). In the fifteenth century, perhaps earlier, it was turned into French prose, and supplied material for dramatic compositions—e. g. *Le Mystère de la destruction de Troie la Grant*, by Jacques Millet.

Another poem of 10,000 verses, the *Roman d'Énéas*, though anonymous in the MSS., is so similar in language, style, and execution to the *Chanson de Troie* that it is commonly attributed to Benoît. It is based upon the *Æneid* of Vergil, but again freely mediævalized. This work also had great popularity, and was translated into German (1175-84) by Heinrich von Veldeke, the first poet of courtesy (*courtoisie*) north of the Rhine.

The *Roman de Thèbes*, based upon the *Thebais* of Statius, has also been assigned to Benoît. In all probability, however, it was written by some poet eager to win fame by imitating the assured success of the *Roman de Troie*. Nor is it correct to attribute to Benoît, as has sometimes been done, the metrical *Life* of St. Thomas of Canterbury.

BIBLIOGRAPHY.—*La Chronique des ducs de Normandie, par Benoît, etc.*, ed. by Fr. Michel (3 vols., Paris, 1836-44); *Benoît de Sainte-More et la Roman de Troie, etc.*, ed. by A. Joly (2 vols., Paris, 1870-71); Fr. Settegast, *Benoît de Sainte-More, etc.* (Breslau, 1876); G. Paris, in *Romania*, v. p. 389, and viii. p. 300; K. (1871) pp. 169-225; W. Greif, *Die mittelalterlichen Bearbeitungen der Trojanersage* (Munich, 1886).
A. R. MARSH.

Benouville, băy'noo'veel', JEAN ACHILLE: French landscape-painter; pupil of Picot; b. in Paris, July 15, 1815; celebrated for his pictures of views of the Campagna. First-class medal, Paris Salon, 1863; Legion of Honor 1863. D. in Paris, Feb. 6, 1891.
W. A. C.

Benozzo Gozzoli: See GOZZOLI.

Benseler, ben'se-ler, GUSTAV EDUARD: Greek scholar and lexicographer; b. in Freiberg, Saxony, Feb. 28, 1806; d. in Leipzig, Feb. 1, 1868. Best known by his work on the Attic orators (especially Isocrates, Demosthenes, and Æschines), and as the author of *Hiatus in the Attic Orators* (1841).

Ben'son, EDWARD WHITE, D. D.: Archbishop of Canterbury and Primate of all England; b. near Birmingham, England, July 14, 1829; graduated at Cambridge in 1852; was for several years assistant in Rugby School; head-master of Wellington College from its establishment in 1858 to 1872; chancellor of Lincoln Cathedral 1872; consecrated Bishop of Truro 1877, where he raised nearly \$500,000 for the erection of his cathedral; became Archbishop of Canterbury, England, Dec., 1882; author of various sermons and essays: *Work, Friendship, Worship* (1871); *Boy Life, or Sundays at Wellington College* (1874); *Single-heart* (1877); *The Cathedral, its Necessary Place in the Life and Work of the Church* (1879); *The Seven Gifts* (1885); *Communings of a Day* (1886); *Christ and His Times* (1889). D. at Hawarden, while on a visit to Gladstone, Oct. 11, 1896.

Benson, EGBERT, LL. D.: born in New York city, June 21, 1746; graduated at Columbia College in 1765; was an eminent lawyer; a member of Congress (1784-88, 1789-93, and 1813-15); a regent of the university (1789-1802); judge of the Supreme Court of New York (1794-1801); and of the U. S. Circuit Court. He published a *Vindication* of the captors of André (1817), and a *Memoir on Dutch Names*. D. in Jamaica, L. I., Aug. 24, 1833.

Benson, FRANK WESTON: genre and portrait painter; b. at Salem, Mass., Mar. 24, 1862; pupil of the Museum of Fine Arts, Boston, and of Boulanger and of Lefebvre, Paris; third Hallgarten prize, National Academy (1889); Clarke prize, National Academy (1891); member of the Society of American Artists (1888). His pictures, which are principally of figures painted in out-of-doors effects, are marked by good qualities of color, and show truth of observation in the study of nature; his portraits are good in drawing and refined in character. Studio in Salem.
W. A. C.

Benson, HENRY C., D. D.: preacher and writer in the Methodist Episcopal Church; b. near Xenia, O., in 1815; joined the Indiana Conference in 1842; was elected Professor of Greek in Indiana Asbury University in 1850; went to California in 1852; was editor of the *Pacific Christian Advocate* at Portland, Or., from 1864 to 1868; elected editor of the *California Advocate* in 1868, in which office he long continued. He is author of *Life among the Choctaws*, among whom he labored for some time as a missionary.

Benson, JOSEPH: Methodist minister; b. in Cumberland, England, Jan. 25, 1748; acquired much influence in the Church. He was a popular preacher, and author of numerous works, among which are an *Apology for the Methodists* (1801); a *Life of the Rev. John Fletcher*; and a *Commentary on the Holy Scriptures* (1811-18). D. Feb. 16, 1821.

Bent, JAMES THEODORE: See the Appendix.

Bent-grass: any grass of the genus *Agrostis*, which comprises numerous species, natives of Europe, the U. S., and many other countries. The *Agrostis vulgaris* or *A. alba*, forms a principal part of the pasture in the more elevated districts of England, and resists drought better than some other grasses. It is called "fiorin" or "redtop" in the U. S., where it is an important meadow grass.

Bentham, ben'tam or ben'tham, GEORGE, F. L. S., F. R. S.: English botanist, and nephew of Jeremy; b. in what is now a part of Portsmouth, Sept. 22, 1800; educated on the Continent of Europe; secretary to his uncle (1826-32); wrote a *New System of Logic* (1827), in which he clearly anticipated Hamilton's doctrine of the "quantification of the predicate," but the publishers failed, and the credit of the discovery was delayed until 1850. He abandoned law for botany; catalogued the flora of the Pyrenees, of Hongkong, and of Australia. Gave his collections to the Kew Gardens, and passed his later years there. The *Genera Plantarum* (1862-83) was the joint work of Bentham and Sir Joseph Hooker, and is an exhaustive summary of botanical science to its date. His most important publications are *Labiatarum Genera et Species* (1832-36); *Flora Hongkongensis* (1861); *Flora Australiensis* (1863-70). D. in London, Sept. 10, 1884.

Bentham, JEREMY: philosopher and reformer; apostle of the modern school of utilitarianism; b. in London, Feb. 15, 1748. He graduated at Queen's College, Oxford, in 1766; studied law and was called to the bar in 1772, but he never practiced that profession. He published in 1776 an acute and critical *Fragment on Government*, which abounds in sound and original ideas, and in 1787 an exhaustive argument entitled a *Defense of Usury*. His next important work was his *Introduction to the Principles of Morals and Legislation* (1789). He adopted the theory that "utility is the test and measure of virtue," and that laws should promote "the greatest happiness of the greatest number." He devoted his time and talents chiefly to the reform of legislation and government, and advocated universal suffrage, the vote by ballot, etc. He inherited from his father an easy fortune. About 1792 he formed a friendship and literary partnership with M. Dumont, who translated into French several of Bentham's works—namely, *Treatise on Civil and Penal Legislation* (3 vols., 1802) and *Theory of Penalties and Rewards* (1811). Among his other works are *Panopticon* (1791), which treats on prison discipline, and *The Rationale of Judicial Evidence* (5 vols., 1827). By habitual temperance, activity, and self-control he prolonged his life to the age of eighty-four. D. in London, June 6, 1832. He has great merits in the English jurisprudence, "which," as Macaulay says, "he found a gibberish and left a science." But on the public in general his influence was small, on account of the unreadableness of his writings. He represents French ideas, especially those of the French Revolution. His works were more admired on the Continent than in England. See *Memoirs of Jeremy Bentham*, prefixed to his works by Dr. Bowring; John Hill Burton, *Benthamiana*; Sir James

Mackintosh, *View of the Progress of Ethical Philosophy*; *Edinburgh Review* for Oct., 1843.

Ben'tinck: English noble family; the most notable members were: WILLIAM, first Earl of Portland; b. in Holland, 1649, of a noble family which had migrated from the Palatinate to Gelderland in the fourteenth century, where it is still represented by a younger line. He was the favorite and friend of William III., by whom he was constantly employed in military and diplomatic services. D. 1709.—WILLIAM HENRY CAVENDISH, third Duke of Portland; b. Apr. 14, 1738; became Prime Minister and First Lord of the Treasury 1783; distinguished as Pitt's Home Secretary, and as charged with Irish affairs in the turbulent times of 1794–1801; again Prime Minister in succession to Grenville, and First Lord of the Treasury 1807; d. Oct. 30, 1809.—WILLIAM HENRY CAVENDISH, son of the preceding; b. Sept. 14, 1774; served with distinction as an army officer in Flanders, Egypt, Italy, Portugal, and Sicily; Governor of Madras (1803–07), of Bengal (1827–33), when he was made Governor-General of India, and served till 1835; distinguished in India for suppressing suttee and thuggism, for developing systems of internal transportation, and for engaging natives in Government service; d. in Paris, June 17, 1839.—WILLIAM GEORGE FREDERICK CAVENDISH, nephew of the preceding; b. Feb. 27, 1802; entered the army; private secretary to his uncle, George Canning; member of Parliament 1826; was greatly engrossed in horse-racing, which he did much to make respectable, and to other field-sports. He joined the party of country squires, who were Conservative, during Peel's administration, and was offered a seat in his cabinet, but declined. On the repeal agitation (1845) of the corn-laws he was made the leader of the protectionists, and suddenly assumed great importance. As a parliamentary leader he struck hard, evinced a mastery of details unexpected in a man of his tastes, kept his party compact, and contributed materially to Peel's overthrow in 1846. In religious politics he advocated the removal of disabilities from Jews, and an endowment of the Irish Catholic Church. D. suddenly near Welbeck Abbey, Nottinghamshire, Sept. 21, 1848. Earl Beaconsfield wrote a life of him (8th ed. 1872).

Bent'ley, RICHARD, D. D.: critic and classical scholar; b. at Oulton, in Yorkshire, England, Jan. 27, 1662. He entered St. John's College, Cambridge, in 1676, and having taken the degree of bachelor became in 1683 tutor to Dr. Stillingfleet's son, with whom he went to Oxford. He was ordained a priest in 1690. In 1692 he was appointed to deliver the Boyle lecture on the evidences of religion, and in 1694 became keeper of the Royal Library. He published in 1699 a celebrated *Dissertation on the Epistles of Phalaris*, which procured for him a European reputation. He maintained that these Epistles were spurious, which involved him in a controversy with Atterbury, Charles Boyle, Pope, and other writers, who resorted to sarcasm and personality. Bentley defended himself in another *Dissertation on the Epistles of Phalaris* (1699) to the confusion of his adversaries, and by it he established his place as the first in time and learning of English historical critics. He was appointed master of Trinity College, Cambridge, in 1700, and married Joanna Bernard in 1701. In 1711 he published a good edition of Horace. His arrogance and their traditionalism provoked a series of quarrels and litigations with the fellows of Trinity College. He was appointed Regius Professor of Divinity in 1717, and was deprived of all his academic degrees and honors by the senate of the university in 1718, but he was reinstated by a mandamus of the court of king's bench in 1724. Among his productions was an edition of Homer, which he left unfinished. He proposed to revise and correct the text of the Greek Testament by comparing it with all the manuscripts. He failed to perform this task, but his principles of criticism have since been adopted, and have triumphed over all opposition. He died in Cambridge, July 14, 1742. His daughter was the mother of Richard Cumberland, the dramatist. See his *Life* by J. H. Monk (London, 1830) and R. C. Jebb (1882).

Bentley, ROBERT, F. L. S.: medical botanist; b. at Hitchin, England, Mar. 25, 1821; member of Royal College of Surgeons 1847; president of the British Pharmaceutical conferences 1866–67; was member of many English and American pharmaceutical and botanical societies. Author of *Manual of Botany*; *Text-book of the Organic Materia Medica*, etc. D. in London, Dec. 28, 1893.

Benton, JAMES GILCHRIST: soldier; b. in Lebanon, N. H., Sept. 15, 1820; graduated at West Point in 1842; major of

ordnance, Sept. 15, 1863. He served at various arsenals and on special duties 1842–57; as member of the ordnance board 1854–56; at Military Academy as instructor of ordnance and gunnery 1857–61. In the civil war he was an assistant in the ordnance bureau at Washington 1861–63; in command of Washington arsenal till June 14, 1864, and since of Springfield armory, Mass. Brevet lieutenant-colonel and colonel Mar. 13, 1865, for faithful and meritorious services in the ordnance department. He made great improvements in the Springfield rifle, seacoast gun-carriages, and the system of loading barbette guns under cover; also invented the Benton electro-ballistic pendulum, a velocimeter, a spring-dynamometer, and minor devices in the use of arms. His reports to the Government on his experiments were valuable in their time. He was author of *A Course of Instruction in Ordnance and Gunnery for the use of the Cadets of the United States Military Academy* (1860). D. in Springfield, Mass., Aug. 23, 1881.

Benton, THOMAS HART: Senator; b. near Hillsborough, N. C., Mar. 14, 1782. He removed to Tennessee, where his father, then dead, had acquired a vast tract of land; studied law, and began to practice at Nashville about 1810. In the war of 1812 he served as colonel under Gen. Jackson. He became a resident of St. Louis, Mo., in 1815, and was elected a Senator of the U. S. for Missouri in 1820. Having been re-elected in 1826, he supported Gen. Jackson, opposed the U. S. bank, and advocated a gold and silver currency, for which reason he was often called "Old Bullion." For many years he was the most prominent public man of Missouri. He was a member of the National Senate for thirty years, and opposed the extreme State Rights policy of Calhoun. In 1852 he was elected to the House of Representatives, in which he opposed the repeal of the Missouri Compromise. He was opposed by a powerful party of State Rights Democrats in Missouri, who defeated him as a candidate for Governor in 1856. His life in Tennessee was turbulent with hot-blood, and involved a bitter quarrel with Gen. Jackson. In the Senate he was a persistent advocate of opening the public lands of the West to actual settlers; promoted surveying and exploring expeditions, foreseeing a great empire to grow up even to the Pacific. He introduced the "expunging resolutions" which removed from the Senate record its censure of President Jackson; opposed Polk's 54° 40' N. boundary line for Oregon, and facilitated the settlement on the existing line; resisted Calhoun's influence, and the two contended bitterly in the forum and in political combination. He was the father-in-law of J. C. Fremont, but opposed his candidacy for the presidency in 1856 as promoting sectional politics. He published a *Thirty Years' View, or a History of the Working of the American Government for Thirty Years, 1820–50* (2 vols., 1854–56). D. in Washington, D. C., Apr. 10, 1858. See his life by Theodore Roosevelt in American Statesman Series, 1887.

Benton Harbor: city and railroad junction; Berrien co., Mich. (for location of county, see map of Michigan, ref. 8–G); on Ch. and W. Mich. and Cl., Cin., Ch. and St. Louis R. Rs., and on the east side of St. Joseph's river, and the Benton Harbor ship-canal; 1½ miles from Lake Michigan, and about 60 miles E. by N. from Chicago. It has a large trade in grain and lumber, and an immense one in fruit, large manufactories of fruit packages, wood and iron machinery, furniture, flour, barrels, vinegar, pickles, cider, vehicles, and canned fruit, and an undeveloped water-power. Regular lines of steamers and sailing vessels connect it with Chicago and Milwaukee. Pop. (1880) 1,230; (1890) 3,692; (1900) 6,562. EDITOR OF "PALLADIUM."

Bentonville: town; connected by a branch road with St. Louis and San Francisco R. R.; capital of Benton co., Ark. (for location of county, see map of Arkansas, ref. 1–A); 170 miles N. W. of Little Rock. It is the center of a fruit-growing country; has an active trade in tobacco, etc., and has a large fruit-evaporating industry. Here are nine churches (two colored) and a public school. Pop. (1880) 696; (1890) 1,677; (1900) with suburbs, 1,843. EDITOR OF "DEMOCRAT."

Bentonsville: a post-village of Johnston co., N. C., in a township of its own name; about 17 miles W. of Goldsboro. After the battle of Averysboro (Mar. 16, 1865) the army of Gen. Sherman advanced toward Goldsboro, but Gen. Johnston, who had been concentrating at Smithfield, N. C., slipped out at night in light marching order, expecting to crush the left wing of Sherman's army, under Gen. Slocum, before support could reach him. Gen. Slocum, marching toward

Goldsboro, struck Johnston at about 6 A. M., Mar. 19, and was at first driven back, but throwing up rifle-pits, assumed the defensive, Kilpatrick with his cavalry supporting his left. Johnston failed to dislodge the veterans of Slocum from their position, while the artillery fire upon the Confederates was very damaging. By morning re-enforcements had arrived to Slocum's aid, and during the day the original line was reoccupied and strengthened. The Confederates spent the day in fortifying their position. On the morning of the 21st the right wing arrived, and the day was spent in placing it in position on three sides of Johnston and pressing the troops close to his works, but Johnston hastily retreated during the night of Mar. 21 on Smithfield and Raleigh. The Federal loss was upward of 1,600, killed and wounded; the Confederate loss is reported as 239 killed, 1,694 wounded, and 673 prisoners; total 2,696. Pop. of township (1880) 1,076; (1890) 1,004; (1900) 1,184. Revised by JAS. MERCUR.

Benue (i. e. the mother of waters): a large river of Central Africa; the principal tributary of the Niger or Quorra. It rises in the mountains of Adamawa and flows nearly westward, making the southern boundary of Sokoto, and enters the Niger at Lokoya, about 300 miles from its mouth. Dr. Barth in 1851 crossed it near lon. 12° 30' E., and found it there about 800 yards wide. Dr. Baikie in 1850 ascended the Benue to Dulti or Dolti, which is about 400 miles from its mouth. A second expedition to explore this river was undertaken by Dr. Baikie in 1861. In 1867 Gerhard Rohlfs traveled up this river from Dagbo to its entrance into the Niger at Lokoya, a distance of about 150 miles.

Benwood: town; Marshall co., W. Va. (for location of county, see map of West Virginia, ref. 4-G); on B. and O. and O. River R. Rs.; 4 miles S. of Wheeling, in the midst of an iron-mining region. Pop. (1890) 2,934; (1900) 4,511.

Benyowsky, baŷ-ně-ōv'skěe, MAURICE AUGUSTUS, Count de: Hungarian adventurer; b. at Werbo, 1741; taken prisoner 1761 while fighting for the Polish confederation; banished to Kamtchatka; tutor in the family of the governor; gained the affections of the governor's daughter, who assisted him to escape after a struggle in which the governor was killed; with ninety-six companions sailed in a ship well armed and provisioned, and reached France in 1772; invited by the French Government, he sailed to Madagascar to found a colony, and was there made king in 1776, adopting the native costume; becoming involved in difficulties with the French, he was killed in battle, May 28, 1786. See *Memoirs and Travels of Benyowsky*, written by himself (1790).

Ben'zene, or **Ben'zol**: C₆H₆; the first member of an important series of compounds containing carbon and hydrogen (hydrocarbons), other members being toluene, C₇H₈, xylene, C₈H₁₀, mesitylene, C₉H₁₂, etc. It was first found in iron vessels in which coal-gas was kept under pressure. It was afterward made by distilling benzoic acid with lime, but is now obtained in enormous quantities from coal-tar, an extremely complex mixture of organic compounds formed in the distillation of coal for the manufacture of gas. When coal-tar is distilled, the oil that first passes over floats on water and is hence called "light oil." It is from this that benzene is obtained.

Benzene is a colorless liquid, of pleasant odor, that boils at 85° C. When cooled down to about the freezing-point of water it solidifies, forming a mass of crystals. It burns easily with a bright flame. It is a good solvent for caoutchouc, gutta-percha, wax, and fatty substances. With nitric acid it forms nitrobenzene, from which in turn aniline is made. All aniline used in the arts is made in this way.

IRA REMSEN.

Benzert: See BIZERTA.

Benzidine: a base made by heating NITROBENZENE (*q. v.*) with caustic soda and zinc-dust. The nitrobenzene is thus converted into hydrazobenzene. When this is treated with strong hydrochloric acid it is transformed into benzidine. There is a close relationship between this compound and ANILINE (*q. v.*). The latter is an amido derivative of BENZENE (*q. v.*), and is represented by the formula C₆H₅.NH₂. Benzidine is an amido derivative of the hydrocarbon diphenyl, C₆H₅, and is represented by the formula $\begin{matrix} C_6H_5 & & C_6H_4.NH_2 \\ | & & | \\ C_6H_5 & & C_6H_4.NH_2 \end{matrix}$. Valuable dyes are obtained by converting it into a diazo compound, and treating this with phenols and amido compounds. See BENZIDINE DYES.

IRA REMSEN.

Benzidine Dyes: products of the action of various PHENOLS (*q. v.*) and amido compounds on the diazo compounds

obtained from BENZIDINE (*q. v.*) and TOLIDINE (*q. v.*). The first important dye of this class known was *Congo-red*, which is prepared by the action of diazotized benzidine on naphthionic acid. (See NAPHTHALENE.) Congo-red and the other benzidine dyes dye cotton without the aid of a mordant, and are known as *substantive dyes*. Other dyes belonging to this class are *chrysamine*, formed from diazotized benzidine and salicylic acid; and *benzopurpurin*, formed from diazotized TOLUIDINE (*q. v.*) and naphthionic acid. (See NAPHTHALENE.) This is one of the most extensively used dyes.

IRA REMSEN.

Benzine: See PETROLEUM.

Benzo'ic Acid: a substance, C₇H₆O₂, first obtained from gum benzoin. It occurs also in a number of natural resins, and in some sweet-smelling flowers. It is now prepared from gum benzoin, from the urine of the cow or horse, and from toluene. In the urine of herbivorous animals there is a compound known as hippuric acid, which breaks down easily by putrefaction or by treatment with hydrochloric acid into benzoic acid and glyecoll or glycine. TOLUENE (*q. v.*) is a hydrocarbon closely allied to benzene, and obtained like it from coal-tar. By oxidation, or, better, by treatment with chlorine and subsequent oxidation, toluene yields benzoic acid, and most of the acid that comes into the market at the present time is obtained from toluene. Benzoic acid crystallizes in lustrous leaflets; it is easily sublimed. It is used in medicine, the natural product from gum benzoin being alone suitable for this purpose. The artificially prepared acid is used in the manufacture of aniline blue.

IRA REMSEN.

Benzo'in, or **Gum Ben'jamin** (Lat. *benzo'inum*): a fragrant resinous substance; is the concrete juice of a tree called *Styrax benzoin*, which is a native of Sumatra, Siam, and Borneo, and belongs to the natural order STYRACACEÆ (*q. v.*). The resin is obtained by making incisions in the bark of trees which are cultivated for that purpose. It is extensively used as incense in Roman Catholic and Greek churches; is also used in perfumery, and in medicine as a stimulant, emetic, and styptic. A tincture of benzoin is sometimes applied to wounds, and is employed in making a cosmetic called virgin's milk.

Benzo'in odoriferum: a shrub more correctly called *Lindera benzoin*, of the family Lauraceæ, a native of the U. S., popularly called benjamin-tree, spice-bush, etc. Its bark is aromatic, stimulant, and tonic, and has been used as a remedy for intermittent fevers.

Benzol: See BENZENE.

Benzopurpurin: See BENZIDINE DYES.

Beothukan Indians: the Beothuks; a linguistic stock or family of North American Indians which, so far as is known, consisted of a single tribe. Their only known habitat was the valley of the Exploits river in Newfoundland. It is, however, probable that the entire area of Newfoundland was in their possession at the time of its discovery by Cabot in 1497. The name Beothuk, or Beothik, is derived from a native word meaning "men," or perhaps "human beings"; but King reported that *Shavatharott* was the name which these Indians claimed for themselves. They were also called by Latham the "Good-night" Indians, from a mistranslated word which resembled the term Beothuk in sound. The term "Red Indians," or, better, "Red-men," is a literal rendering of a Micmac name for them, bestowed from the fact that the Beothuks painted their bodies and their property with red ochre.

Before the examination by Mr. Gatschet, of the U. S. Bureau of Ethnology, of the scanty accessible material of their language established its position as constituting a distinct linguistic stock, it had been considered as distantly related either to the Eskimauan or to the Algonquian family, although the appearance, manners and customs, lodges and canoes of the people as described distinguished them from the tribes of either of the families mentioned.

Owing to wars with the Micmacs, and to famine, the Beothuks became extinct, or were absorbed by other tribes, within the decade ending with 1830. See INDIANS OF NORTH AMERICA.

GARRICK MALLERY.

Berabera: See BARABRA.

Be'owulf: the title of a celebrated Anglo-Saxon poem, written not later than the eighth century, and having for its subject a semi-fabulous hero of Denmark. There is only one MS. of it in existence: this belongs to the tenth century, and is in the British Museum. It was first edited by Thor-

kelin (Copenhagen, 1815); by Harrison and Sharp (Boston, 1883; 3d ed. 1888); Eng. trans. first by Kemble (1833); other trans. by H. W. Lumsden (London, 1881; 2d ed. 1883); J. M. Garnett (Boston, 1882).

Béranger, baÿ'raän'zhay', JEAN PIERRE, de: French lyric poet; b. in Paris, Aug. 19, 1780. He passed about three years as an apprentice to a printer, and never received a very liberal education. He was neglected by his father, and spent many of his early years with an aunt, who imbued his mind with virtuous and republican principles. His first essays in verse, which were written under the pressure of poverty, obtained for him in 1804 the patronage of Lucien Bonaparte. He was employed for nearly twelve years as a clerk or subordinate secretary in the University of Paris. He published in 1815 a volume of songs (*Chansons morales et autres*) which became very popular. Some of his verses were political, and contained satirical passages which were offensive to the royalists, then the party in power. Having produced another volume of poems in 1821, he was prosecuted and sentenced to an imprisonment for three months. This increased the popularity of his songs, but failed to restrain the freedom of his satire or abate the ardor of his republicanism. He published a third volume in 1825, and in 1828 a fourth volume, for which he was sentenced to pay a fine of 10,000 francs and to be imprisoned for nine months. In 1830, however, convinced that the time had not yet come for a republic, he did much by his advice to his friends, the leaders of the revolution of July, toward establishing Louis Philippe on the throne. He refused to accept royal favor as a reward, nevertheless; and, with the exception of the brief episode of his unwilling election to the Assembly in 1848, he spent the rest of his life in retirement, revising his poems, preparing his memoirs, and corresponding with many of the best spirits in France. His songs, which had so remarkable an influence over his countrymen, are wonderful for the clearness and perfection of their style, at the same time that they are beautifully various with gayety and with pathos. D. in Paris, July 16, 1857. See his memoirs, *Ma Biographie* (1858); his *Correspondance* (1860); P. Boiteau, *Vie de Béranger* (1861); A. Arnould, *Béranger, ses amis, ses ennemis, et ses critiques* (1864); J. Janin, *Béranger et son Temps* (1866); Sainte-Beuve, *Portraits Contemporains* (vol. i.).

Revised by A. R. MARSH.

Berar, baÿ'raar', or **The Berars'**: a commissionership of Central India; between lats. 19° 30' N. and 21° 46' N., and longs. 76° and 79° 13' E.; bounded on the N. and E. by the Central Provinces, on the S. by Haiderabad, on the W. by Haiderabad and the Bombay Presidency. Area, 17,714 sq. miles. It falls into two distinct sections—the lowlands of the north and the Balaghat or highlands of the south: the first are fertile, but unattractive and nearly treeless; the second picturesque and with forests, but not so suitable for cultivation. Cotton is the chief crop, and is of fine quality; millet, wheat, rice, linseed, the castor-plant, and the sugar-cane are also cultivated. There is little manufacturing—chiefly cotton-cloth of poor quality, carpets, and saddlery. The Nagpur branch of the Great Indian Peninsular Railway traverses the province from east to west. The Berars were ceded to the British by the Nizam of Haiderabad in 1853 as payment for a debt. Pop. (1901) 2,752,418, of whom about 86 per cent. are Hindus. The principal towns are Elichpur, a former capital, Amraoti, Akat, Akola, and Karinja.

M. W. H.

Berat': a town of European Turkey; in Albania; on the river Ergent, here crossed by a bridge; 30 miles N. E. of Avlona (see map of Turkey, ref. 4-B). It contains a citadel, several Greek churches, and a number of mosques. It is the seat of a Greek archbishop. The population is estimated at 12,000, a majority of whom are Greeks.

Béraud, baÿ'rō'. JEAN: genre-painter of subjects taken almost exclusively from Parisian life, and an artist of much talent, whose work is notable for good drawing and great truth of observation; b. at St. Petersburg of French parents about 1845; pupil of Bonnat; first-class medal, Paris Exposition, 1889; Legion of Honor 1887. His latest works (1890-92) have been modernized conceptions of scenes in the life of Christ. *La Madeleine* represents a woman in the costume of to-day at the feet of Christ, who sits at a table in a supper-room in a Paris restaurant, and the scene of *The Descent from the Cross* is placed on Montmartre overlooking the city of Paris, with a group of people who are working men and women of the vicinity. Studio in Paris.

WILLIAM A. COFFIN.

Ber'ber, or **El Mesherif**: a town of Nubia, on the Nile (see map of Africa, ref. 3-G). Roads lead from here to Egypt and Khartum. It has considerable trade. Pop. 8,000.

Ber'bera: a seaport station of Eastern Africa, in Somali; on the Gulf of Aden, 160 miles E. S. E. of Zeyla (see map of Africa, ref. 4-II). Here is held an annual fair, which is attended by 10,000 to 20,000 persons from various foreign countries. They bring coffee, gold-dust, ivory, slaves, cattle, etc., to exchange for cotton, rice, and Indian piece-goods. The fair begins in November, and continues nearly six months. It has an excellent and capacious harbor.

Berberida'ceæ: See BARBERRY FAMILY.

Ber'bers [from the Arabic name, *barbar*, *berber*]: a name given to the uncivilized, nomadic tribes of aborigines who inhabit the mountainous regions of Barbary and the northern part of the Desert of Sahara. They include the Kabyles, Tuaregs, and other Saharan peoples. They are the descendants of the aboriginal or ancient inhabitants of Northern Africa, who occupied the country before it was conquered by the Arabs, and they are the most numerous part of the present population. The Berbers vary in complexion with situation. Those who inhabit the high valleys of the Atlas have light hair and eyes, while those who occupy the oases of the Sahara are dark, approaching the Negroes in complexion, though their features are entirely unlike theirs. Their language is allied to the Semitic in type, and has received from F. W. Newman the name of sub-Semitic. Language, customs, and physical type seem to indicate affiliation with the Semitic races of Asia and Eastern Africa. They are warlike, cruel, and very tenacious of their independence. In religion they are bigoted Mohammedans. They keep cattle and sheep, cultivate fruit-trees, and practice agriculture in a rude manner. Many of them live in tents or in clay huts.

Berbice, ber-bees': the eastern division of BRITISH GUIANA. See GUIANA.

Berchta, bārch'ta: name given in south of Germany and Switzerland to a spiritual being apparently the same as the Hulda of Northern Germany. This being represented originally one of the kindly aspects of the unseen powers, and Hulda is still so traditionally represented; but Berchta developed rather into an object of terror used frequently to frighten children. She has the oversight of spinners. The last day of the year is sacred to her, and if on that day she finds any flax left on the distaff she spoils it. She is represented as having a long iron nose and an immensely large foot. She is the original of all the myths of the White Lady.

C. II. THURBER.

Berchtesgaden, bārch'tez-gaa'den: county in the Salzburg Alps in the S. E. of Bavaria. Area, 155 sq. miles. The country is mountainous and unproductive, but extremely picturesque. Formerly an ecclesiastical territory, it became in 1803 a principality of the Electorate of Salzburg, and since 1810 has belonged to Bavaria. The capital, of the same name, much visited by travelers, has a royal château, interesting salt mines, and is celebrated for the manufacture of toys and articles of wood, iron, and ivory, and other things famous as *Berchtesgaden* wares. Pop. of town (1890) 2,300.

C. II. THURBER.

Berek'mans, PROSPER JULES ALPHONSE, A. M.: one of the leading horticulturists of the U. S. and president of the American Pomological Society; was born at Aerschot, Belgium, Oct. 13, 1830. His father was author of *Album de Pomologie*, a leading Belgian work. He removed to the U. S. in 1850, and in 1857 moved to Georgia, where he has since resided. He was one of the commissioners of the World's Exposition at New Orleans in 1884.

Berdiansk, bār-dēe-aansk': a seaport-town of Russia; government of Taurida; on the north shore of the Sea of Azof; 184 miles N. E. of Simféropol (see map of Russia, ref. 10-D). It has a good roadstead and an active trade, and has been remarkable for its rapid growth. It was founded in 1827, was recognized as a town in 1835, and became capital of a circle in 1842. Its principal industries are the boiling of tallow and the manufacture of bricks, tiles, and macaroni. It derives its prosperity partly from the coal mines and salt lakes of the vicinity. Pop. (1882) 20,849.

Berditchef': a town of Russia; province of Kiev; 194 miles N. W. of Elisabetgrad (see map of Russia, ref. 9-C). It is meanly built, but is an important commercial town,

having four annual fairs, held between Aug. 15 and Sept. 15. The value of the goods, cattle, corn, wine, etc., sold here annually is estimated at \$3,000,000. Pop. (1882) 52,563; (1897) 53,728.

Bere'a: village (founded in 1829); Cuyahoga co., O. (for location of county, see map of Ohio, ref. 2-II); on Cl., Cin., Chi. and St. Louis and Lake Sh. and Mich. S. R. R.s.; 12 miles S. W. of Cleveland, with which it is connected by an electric railway line. Berea is noted for its extensive quarries of sandstone, 18,000 carloads having been shipped in a year. It is the seat of Baldwin University and German Wallace College, both Methodist Episcopal; has excellent public schools and seven churches; is lighted by natural gas and electricity. Pop. (1880) 1,682; (1890) 2,533; (1900) 2,510.

EDITOR OF "ADVERTISER."

Berea College: in the southern part of Madison co., Ky.; 40 miles S. of Lexington. Its founders and promoters were Rev. John G. Fee and Rev. J. A. R. Rogers, natives, respectively, of Kentucky and Connecticut. It long enjoyed the fostering care of the American Missionary Association. For twenty years from 1869 Rev. E. H. Fairchild was president. Always anti-slavery in character, its leading friends were driven from the State just before the war. At its close some returned. A college charter was obtained, and since 1873 classes have been graduated yearly. There are three courses: classical, philosophical, and scientific (for males and females). White and colored are admitted, the colored slightly predominating. In 1900 about 700 students, chiefly from the mountain districts of Tennessee, Kentucky, Virginia, and North Carolina, were on the roll, with 26 professors and teachers. Endowment, \$500,000: value of buildings about the same. President, Wm. H. Frost, Ph. D., D. D. L. V. DODGE.

Bere'ans: an obscure sect seceding from the Established Church in Scotland; founded by Rev. John Barelay (b. in Muthill, Perthshire, 1734; d. in Edinburgh, July 29, 1798) in 1773. They take their name from Acts xvii. 11; deny natural theology; make all the Psalms Messianic; hold assurance to be of the essence of faith, and unbelief the unpardonable sin. Their numbers are small and diminishing. Barelay's *Works*, with memoir, were published, Glasgow, 1852.

Revised by S. M. JACKSON.

Beregh, báy-reg': a county of Hungary; bounded N. E. by Galicia, E. by the county of Marmaras, S. by the counties of Ugocsa and Szatmar, W. by the county of Szabolcs, and N. W. by the county of Ungvear. Area, 1,440 sq. miles. The country is mostly mountainous, and produces wine. Pop. (1890) 179,208. Chief town, Munkacs.

Berengarius of Tours: a mediæval theologian; b. at Tours about 1000; d. in the neighboring island of St. Cosme, 1088; a pupil of Fulbert of Chartres; became in 1031 the director of the cathedral school in his native place, and in 1040 Archdeacon of Angers. He was a man of both talent and learning, and he soon brought the school into a most flourishing condition. But he was an independent character, of a somewhat rationalistic turn of mind. Concerning the Lord's Supper he held views very different from those which, since the days of Paschasius Radbertus (ninth century), had become generally adopted by the Church, preferring the older view advocated in the same century by Ratramnus. He ascribed to this sacrament only the character of a commemorative act, decidedly rejecting the idea of its being a constantly renewed sacrifice; and the change which the elements were believed to undergo during the celebration he considered to be merely symbolical, declaring the doctrine of transubstantiation an absurdity. People soon became aware that the great teacher of Tours deviated from the commonly accepted course of the Church, and Berengarius himself contributed much to call forth a conflict by his letter to Lanfranc. His view was condemned by the synods of Rome and Vereelli, both in 1050, and he was for a time imprisoned. Hildebrand (later Gregory VII.) came to his aid, and persuaded the Council of Tours (1054) to accept a general statement that the elements after consecration were the Body and Blood of Christ. In 1059 he was forced in a synod in Rome to retract his real views, but on his return to Tours renewed their advocacy. In 1079 he was by another synod in Rome compelled to retract a second time. Again when safe home he repented of his recantation, and recalled it, but, convinced that he could not make headway against the reigning theory, he retired to the island of St. Cosme, and lived in solitude, but he had, nevertheless, many followers. His works are in Migne, *Pat. Lat.*, CLXXVIII,

sep. ed. by A. F. and F. T. Vischer of his chief book *De sacra cœna* (Berlin, 1834). See H. Sundendorf, *Berengarius Turonensis, oder eine Sammlung ihre betreffender Briefe* (Berlin, 1850); cf. Hefele, *Koncilien-geschichte* (vol. 5, 2d ed. 1886).

Revised by S. M. JACKSON.

Bereni'ce: a daughter of Magas, King of Cyrene; married to Ptolemy Euergetes, King of Egypt. During his absence on a military expedition she made a vow to sacrifice her hair to Venus for his safe return, which vow she performed. The hair having disappeared over night, the astronomer Conon reported that Jupiter had transformed it into the constellation now called *Coma Berenices* (Berenice's Hair). She was put to death by her son, Ptolemy Philopator, in 222 B. C. See Ramler's *Ptolemäus und Berenice*.

Berenice (called **Bernice** in the New Testament): a daughter of Agrippa I., King of Judea; b. in 28 A. D. She was married to her uncle, Herod, King of Chalcis, and, after his death, to Polemon, King of Cilicia. During a visit to Rome she captivated Titus, the son of the Emperor Vespasian, as she had done Vespasian himself. She was a sister of King Agrippa, before whom St. Paul spoke in his own defense. See Acts xxv. 13, 23; xxvi. 30.

Berenice: an ancient city of Egypt; on the Red Sea; 20 miles S. W. of Ras Bernass. It was founded by Ptolemy Philadelphus, who named it after his mother, and was a great emporium of the trade with India. The modern name is *Sakayt-el-Kublee*. Here are the ruins of a temple of Serapis and other interesting antiquities.

Beresford, Lord CHARLES: See the Appendix.

Beresford, ber'es-fürd, WILLIAM CARR, Viscount: general; b. in Ireland, Oct. 2, 1768; a natural son of the first Marquis of Waterford. He took command of the Portuguese army in Feb., 1809, and fought against the French in the Peninsula. In May, 1811, he defeated Soult at Albuera. He received the title of Duke of Elvas in Spain; was created a viscount in 1823, and was master-general of the ordnance in 1828-30. D. Jan. 8, 1854.

Berezina, báy-re-zee'náá, or **Beresina**: a river of Russia; rises in the government of Minsk, flows southward, and enters the Dnieper above Rechitza. Its length is about 325 miles. It is navigable, and is connected with the Düna by a canal which opens a communication between the Baltic and Black seas. The French army, retreating from Moscow in Nov., 1812, suffered a great disaster in the passage of this river. The French constructed hastily two bridges over the river, but while they were crossing they were attacked by the Russians, who took about 16,000 prisoners. The French loss, besides the prisoners, amounted to nearly 12,000, many of whom were drowned in the river.

Bergaigne, ABEL: Orientalist; b. at Vimy, Pas-de-Calais, Aug. 31, 1838; became Professor of Sanskrit at the Sorbonne. He devoted himself to the criticism and exegesis of the *Vedas*, and published *La religion védique* (Paris, 1883). D. Aug. 6, 1888.

C. R. LANMAN.

Ber'gama (anc. *Pergamum* or *Pergamus*): a ruined city of Asia Minor; in Anatolia; situated in a beautiful valley, on the river Caicus; 46 miles N. N. W. of Smyrna (see map of Turkey, ref. 5-D). Pop. about 6,000. The ancient city was the capital of the kingdom of Pergamus, and the seat of one of the seven churches of the Apocalypse. Here are extensive ruins of a palace, temple, amphitheater, and other edifices.

Bergamo, bãr'gã-mô: a province of Italy; in Lombardy; bounded N. by Sondrio, E. by Brescia, S. by Cremona, and W. by Como and Milan. Area, 1,088 sq. miles. The northern part is mountainous. The soil of the plains and valleys is fertile. Silk is among the products. Pop. (1890) 412,393. Capital, Bergamo.

Bergamo (anc. *Bergomum*): a city of Italy; capital of province of same name; on several low hills, 39 miles by rail N. E. of Milan (see map of Italy, ref. 2-C). It presents a very picturesque appearance, and is well built. It has a castle, a cathedral, a college, a library, a theater, many convents and churches; also extensive manufactures of silk, cotton, linen, and woolen fabrics. *Bergomum* was destroyed by Attila in 452 A. D., after which it became an important city of the Lombard kings. Pop. 39,000.

Ber'gamot: the fruit of a tree which is a species or variety of the genus *Citrus*; also called **Bergamot Orange**, or **Mellaro'sa**. According to most botanists, it is a variety of the orange (*Citrus aurantium*). It is cultivated in the

south of Europe. The fruit is pear-shaped, of a pale yellow or green color, and has a green, sub-acid, and fragrant pulp. From its rind is obtained by distillation the oil of bergamot, which has a very agreeable odor, is extensively used in perfumery, and is an ingredient in eau-de-cologne and several fragrant essences. *Wild bergamot* is a name applied to the *Monarda fistulosa*, a common wild mint, because of its odor.

Berge, bār'ge, WILLIAM: organist; b. in Witzenhausen, Hesse-Cassel, Germany, in 1824; studied under his father, Spohr, and Volckmar. When seven years old he played the organ in church. Studied first for the ministry in the Reformed Church, but afterward became a Roman Catholic. Moved to New York in 1846, and was appointed organist of several churches, finally becoming organist of St. Francis Xavier church in Sixteenth Street, remaining there till within two years of his death, which occurred on Apr. 6, 1883. In 1847 appointed Professor of Music in the College of the Sacred Heart; founded and conducted the Berge Choral Union, which produced Beethoven's *Ninth Symphony* with Thomas's orchestra in 1866. He composed some organ pieces and several masses. His playing was brilliant, quick, and accurate, and his sight-reading remarkable. D. E. HERVEY.

Bergen, bār'gen: an important city and seaport of Norway; capital of province of Bergen; at the head of a deep bay (fiord) of the Atlantic; 184 miles W. N. W. of Christiania; lat. 60° 24' N., lon. 5° 18' E. (see map of Norway and Sweden, ref. 10-A). It is picturesquely situated at the foot of a mountain, and inclosed on nearly all sides by water. The harbor is deep and safe, and is defended by several forts. Bergen is well built, has a cathedral, several hospitals, a theater, a public library, a national museum, and a college. It is the seat of one of the three public treasuries, and is probably the most commercial town of Norway. A large portion of the population is employed in the fisheries, and fish and cod-liver oil form the chief articles of export. It is stated that in the spring 600 fishing-vessels may be seen at once in the harbor. These vessels bring cargoes of fish, caught in the preceding winter on the northern shores. Bergen was founded in 1070, and was once a Hanse town. Pop. (1891) 53,686.

Bergen-op-Zoom, bār'gen-op-zōm', or **Berg-op-Zoom**: a strongly fortified town of Holland; in North Brabant; on the river Zoom, at its junction with the East Scheldt; 27 miles by rail W. S. W. of Breda (see map of Holland and Belgium, ref. 8-D). It is important as a military position, and has often been besieged. The Spaniards made unsuccessful attempts to take it in 1588, in 1605, and in 1622. In the last-named year General Spinola lost about 10,000 men in the siege. It was taken by the French in 1747, and again in 1794. A British army attacked it without success in Mar., 1814. Pop. (1890) 12,667.

Berger, bār'zhay', GEORGES: French civil engineer and administrator; b. in Paris, 1834; began life as a mining engineer, but soon left that career to devote himself to the fine arts, developing his tastes by many travels in Egypt and the East. His erudition was both varied and profound, and so great that he was selected to organize the foreign section of the Exposition of 1867. In the Exposition of 1878 he was in charge of the same section; and was director-general of the Exposition of 1889. He has also organized other expositions. He was in 1876-77 adjoint professor at the School of Fine Arts. He has published his views on the *Exposition internationale* of 1869; *Projet d'organisation administratif* (1885); and *l'École française de peinture depuis ses origines jusqu'à la fin du règne de Louis XIV.* (1879). W. R. H.

Berger, PHILIPPE: French Semitic scholar; b. in Beaucourt, Sept. 15, 1846; studied theology under the Protestant faculty at Strassburg; became Professor of Hebrew in the Faculty of Protestant Theology at Paris 1877. He has taken part in the editing of the *Corpus Inscriptionum Semiticarum*, and is the author of various articles and books, of which may be mentioned *L'Arabie avant Mahomet d'après les inscriptions* (Paris, 1885). C. H. TOY.

Berger, SAMUEL: brother of the preceding; b. in Beaucourt, May 2, 1843; studied at Strassburg and Tübingen; became assistant preacher in the Lutheran Church in Paris 1867; librarian to the Faculty of Protestant Theology there 1877. Of his works may be mentioned *La Bible au seizième Siècle* (Paris, 1879); *La Bible française au moyen-âge* (1884); *Le palimpseste de Fleury* (1889).

Bergerac, bār'zhāy'raak': a town of France; in Dordogne; situated in a fertile plain on the right bank of the river Dordogne, here crossed by a fine bridge of five arches; 27 miles S. W. of Périgueux, and 51 miles E. of Bordeaux (see map of France, ref. 7-E). It has a college, a public library, and manufactures of paper, hosiery, serges, and copper-ware. The Bergerac wine produced in this vicinity is highly esteemed. Pop. (1896) 15,642.

Bergerac, SAVINIEN CYRANO, de: French dramatist; b. in Périgord about 1620; served in the army; a celebrated duelist; author of *Agrippina*, *Le Pédant joué*. D. in Paris, 1655.

Bergh, HENRY: philanthropist; b. in New York, 1823; educated at Columbia College; author of *Love's Alternative*, a drama; *Married Off*, a poem; *The Portentous Telegram*; *The Ocean Paragon*; *The Streets of New York*, etc. In 1863 Mr. Bergh was made secretary of legation to Russia, and also acted as vice-consul there. He was the founder and first president of the American Society for the Prevention of Cruelty to Animals. The society was incorporated Apr. 10, 1866, and there are in all thirty-eight States and Territories of the U. S. and Canada which have followed the example of New York. The crowning act of Mr. Bergh's life was the establishment of the Society for the Prevention of Cruelty to Children, which has its duplicate in every State and Territory of the U. S. D. in New York city, Mar. 12, 1888.

Berghaus, bārch'hows, HEINRICH: German geographer; b. at Cleves, May 3, 1797; geographical engineer in the War Department at Berlin 1816; Professor of Mathematics, Academy of Architecture, 1824; published *Elements of Geography* (1842); *Ethnography* (1846); *Nations of the Globe* (1845); German edition of Catlin's *Indians of North America*. D. in Stettin, Feb. 17, 1884.

Berghaus, HERMAN: cartographer; nephew of the preceding; b. at Herford, Westphalia, Germany, Nov. 16, 1828; entered the Geographical Institute of Justus Perthes at Gotha in 1850. Among his numerous publications may be mentioned his *Karte des Oetzthales Gletschergebietes* (1861); *Chart of the World* (1863), which has gone through many editions; *Physikalische Wandkarte von Europa* (1875); *Karte der Alpen* (1878); *Physikalische Wandkarte von Afrika* (1881); *Berghaus's Physikalischer Atlas* (still in process of publication 1893). In the last he was aided by all the best scientific men of German speech. D. at Gotha, Dec. 3, 1890.

Berghem, bārch'hēm, NIKOLAAS: Dutch landscape-painter; original name *Van Haertem*; b. in Haarlem, 1625; pupil of Van Goyen, Jan Wils, and Weenix; painted with great facility and on a great variety of subjects. His pictures are noted for graceful touch, harmonious coloring, and natural composition. D. in Haarlem, 1683.

Bergk, bārch, THEODOR: classical scholar and critic; b. in Leipzig, May 22, 1812. He studied in his native city from 1830-35, and took his degree in Rostock in 1836. Called in 1842 as Professor of Classical Literature to Marburg, and in 1857 to Halle. Continued illness compelled him to resign his position in 1867. He died in Ragatz, July 20, 1881. Among his most noteworthy publications are his work on Aristophanes, his edition of the Greek lyric poets, and an unfinished history of Greek literature (4 vols.). See A. Schäfer, *Biogr. Jahrb.*, iv., pp. 105-110 (1881).

Bergmann, bārch'maan, CARL: musician; b. at Ebersbach, Saxony, Apr. 11, 1821, and when six years old was placed under the instruction of Adolf Zimmermann. His parents moved to Hesse, and there he continued his studies, becoming a proficient performer on the violoncello, and afterward a leader of the orchestra. Having taken part in the rebellion of 1848, he was forced to leave Germany, and came to New York in the autumn of 1849. He became leader of the Germania Society, and a few years later was chosen conductor of the Philharmonic Society, which position he retained until his death in Aug., 1876. He was also elected leader of the Arion Society in 1855, and in the season of 1865 he conducted the opera in the Academy of Music. He also conducted several singing festivals. He was one of the earliest advocates of Wagner's music in this country. He composed an opera, a symphony, and some concert pieces before he had attained his twenty-seventh year, but it is as a conductor of eminence that his fame is secure. D. E. HERVEY.

Bergmann, ERNST, von: German surgeon; b. in Riga, Dec. 16, 1836; studied in Dorpat, Vienna, and Berlin; served with the armies of Prussia and Baden in the wars of 1866 and 1870; Professor of Surgery in University of Würzburg 1878-82; appointed Professor of Surgery and director of the surgical clinic, University of Berlin, 1882. Among his more important writings are *Ueber Fettembolie*; *Das putride Gift*; *Das Sepsin*; *Zur Lehre von der putriden Intoxication*, etc.

Bergmann, TORBERN OLOF, Ph. D.: a Swedish chemist; b. at Catherinberg, West Gothland, Mar. 20, 1735. He was educated at the University of Upsal, and devoted himself to natural history, physics, and mathematics. He obtained the chair of Chemistry at Upsal in 1767. He discovered sulphuretted hydrogen, and first obtained important results from the use of the blowpipe. He laid the foundation of the science of crystallography. Among his works are an *Essay on Electric Affinities* (1775) and *Opuscula Physica et Chemica* (6 vols., 1779-90). D. in Medevi, on the Wettersee, July 8, 1784. See P. F. Aurivillius, *Aminnelse-Tal öfver T. O. Bergmann* (1785); Biot, article in the *Biographie Universelle*.

Bergmehl, bārch'māyl [Germ., mountain-meal]: an extremely fine powder found in geological strata of recent (Eocene) formation, and composed of effete and indestructible silicious frustules of *Diatomaceæ*, which are microscopic plants of the class *Algæ*. Vast beds of these fossils occur in Germany, Lapland, Virginia, Maryland, Vermont, New Hampshire, and other regions. This powder is mixed with flour, and used as food by the people of Sweden and Norway in seasons of scarcity. It is used in making water-glass and the floating bricks of Southern Europe, and as polishing powder.

Bergslien, bārg'slēn, BRYNJULF: a Norwegian sculptor; b. in Vors, Norway, Nov. 11, 1830; a pupil of Jerichan and Bissen. His best-known work is his bronze statue of Karl Johan in Christiania. R. B. ANDERSON.

Bergslien, KNUT: a Norwegian painter; brother of the sculptor; b. in Vors, May 15, 1827. His pictures of the early history of Norway have given him a wide reputation. R. B. ANDERSON.

Bergsøe, bārg'sö, JORGEN VILHELM: Danish author; b. in Copenhagen, Feb. 8, 1835; was in youth a zoölogist, and as such attained distinction. But in consequence of the failure of his eyesight, and of a long and severe illness, he was disqualified for his favorite study, and went to Italy for his health. He became a successful writer of romances. His first venture, *Fra Piazza del Popolo* (1866), had great success. He has also published *Fra den gamle Fabrik* (The Old Factory, 1869); *I Sabinerbjergene* (In the Sabine Hills, 1871); *Bruden fra Rørvig* (The Bride of Rørvig, 1872); *Gjengangertællinger* (Ghost Stories, 1872); *Italienske Noveller* (Italian Tales, 1874); *Fra gamle Dage* (From Old Days, 1885); *Fra sollyse Strande* (From Sunny Shores, 1886); and other volumes, including several collections of poems. His most ambitious work is *Rome under Pius IX.* (1874-77). Revised by G. L. KITTEDGE.

Berhampur, ber-ān-poor': a town of British India; in the presidency of Bengal, on the Bhagirathi river; 6 miles S. of Murshidābād, and 118 miles by land N. of Calcutta (see map of N. India, ref. 7-1). It is one of the principal British military stations in India, and has an appearance of grandeur and importance. Sanitary improvements have rendered it one of the most healthy places in Bengal. Pop. 24,000.

Bering, bay'ring (commonly but incorrectly spelled **Behring**), **VITUS:** a Danish navigator; b. in Jutland in 1680. He entered the Russian navy at an early age, and fought with distinction against the Swedes. In 1725 he was appointed the commander of an expedition sent to explore the Sea of Kamtchatka. During this voyage, which occupied several years, he discovered Bering Strait (1728), and ascertained that Asia was not joined to America. In a subsequent voyage he was wrecked on Bering's island, where he died Dec. 8, 1741. See his *Life* by P. Lauridsen (Chicago, 1889).

Bering (or *Behring*), bay'ring, **Sea** (also called *Sea of Kamtchatka*): the most northern part of the Pacific Ocean, extending between the peninsulas of Alaska and Kamtchatka. It is connected by Bering Strait with the Arctic Ocean.

Bering (or *Behring*) **Strait:** connects the Pacific Ocean with the Arctic Ocean, and separates Asia from America.

It was discovered by Vitus Bering in 1728. Its width is about 45 miles at the narrowest part, between East Cape (Asia) and Cape Prince of Wales (America). The depth of this strait near the middle is about 30 fathoms.

Bering Sea Controversy: a question in dispute between the U. S. and Great Britain in regard to certain rights connected with seal-fishing in Bering Sea. An understanding of the controversy requires a brief description of the points at issue. The seal-fisheries of the Alaskan coast form the most important item in the commercial activities of that Territory. It was largely in consideration of this fact that the Government of the U. S. acquired possession of Alaska by purchase from Russia in 1867, and since the acquisition of the Alaskan territory the seal-fisheries have afforded a very considerable revenue to the Government. But in order that this revenue may be continued the fishing industries must be protected; and such protection, owing to the peculiar habits of seals, came to involve the international question at issue. The home of the seals is upon the Alaskan coast, which is unmistakably within the domain of the U. S. At a certain season of the year, however, the seals are in the habit of going in great numbers to the Pribyloff islands for the purpose of breeding. These islands also belong to the U. S., having been ceded as a part of Alaska by Russia. But in crossing from the mainland to the islands the seals are obliged to cross Bering Sea, when they are subject to interception by fishing vessels from Canada and elsewhere. In this way great depredations have been committed. Many of the seals killed at this season of the year sink in the sea and are lost, while many of those recovered are of inferior value. These depredations very greatly reduced the value of the industry to the U. S. The Secretary of State, in a dispatch published in 1890, made the statement: "From 1870 to 1885 the seal-fisheries, carefully guarded and preserved, yielded 100,000 skins a year. The Canadian intrusions began in 1886, and so great has been the damage resulting from the destruction of seal life in the open sea surrounding the Pribyloff islands that in 1890 the U. S. limited the Alaska Company to 60,000 skins, but the company was able to secure only 21,000 skins."

The question presented was whether the U. S. Government had a right to protect its property in waters that would ordinarily be regarded as a part of the open sea, where, according to international usage, every nation and people ordinarily has the right to hunt and fish according to its own free will. The claim of the U. S. to this right was asserted in 1887; but in order to avoid a diplomatic issue a proposal was made to Great Britain that a convention should be entered into between the two nations, in which Russia should be invited to join, limiting the periods in the year in which seals might be taken, and prescribing a time covering the period of breeding during which they should not be molested. The expediency of the convention was at once conceded by Great Britain, and the U. S. was invited to prepare and furnish a draft of such regulations as were deemed necessary to accomplish the object. Such a draft was prepared and transmitted, and no question arose as to details. The Russian Government accepted the invitation to join in the convention, and there was every reason to anticipate that the whole question would be satisfactorily adjusted. But an unexpected obstacle arose. It came to be understood that Canada, whose people were profiting by the depredations, declined to assent to the proposed restrictions. As the objections of Canada could not be overcome, the attempt to secure a convention came to an end. The U. S. Government was thus driven to assert its rights under international law or to abandon its claims.

The claim set forth by the U. S. was that the waters in which the depredations were committed are not a part of the open sea but are within the jurisdiction of the U. S. It was evident, however, that this claim must be established, if at all, on unusual grounds; for Bering Sea is more than half as large as the Mediterranean, and is accessible through Bering Straits by a passage more than 30 miles in width and by still wider passages from the S. By ordinary international usage, therefore, Bering Sea, except within a 3-mile line from the shore, would be open to the fishermen of all nations. But the question was complicated by claims set up by Russia, and to some extent admitted in the early part of this century. By general consent all the rights of Russia passed to the U. S. at the time of the purchase. As early as 1799 the Russian Government issued a ukase which

claimed exclusive jurisdiction over Bering Sea down to the fifty-fifth degree of north latitude, and under the protection of this ukase the Russian American Company was formed. It does not appear that any power entered a protest against this claim. But in 1821 the edict of 1799 was reaffirmed by Russia, and was so far enlarged as to extend the claim down to the fifty-first degree. Against this ukase of 1821 both Great Britain and the U. S. entered formal protest; but whether the protest related to the general claim maintained by Russia, or merely to an extension of the limit from the fifty-fifth to the fifty-first degree, is one of the questions involved in the controversy which can not be determined by documentary evidence. As a consequence of these protests Russia made important concessions in the treaties of Apr. 17, 1824, and Feb. 28, 1825. It was agreed that for ten years the contracting powers should have the right to visit the "interior seas, gulfs, harbors, and creeks for the purpose of fishing and trading." At the end of ten years, however, Russia refused to renew the agreement, and consequently, since 1834, the owners of the region have rested upon the rights maintained prior to the treaties of 1824 and 1825. In the treaties of 1843 and 1859 between Russia and Great Britain the privileges of the Russian American Company were specifically recognized, but nothing in the treaties throws any light on the question as to the geographical limits of Russia's claim. In 1870, three years after the purchase of Alaska by the U. S., the Government gave to the Alaska Commercial Company the privilege of killing annually 100,000 seal on the Pribyloff islands. It was subsequently found, however, that the seal in their passage to and from the islands were interfered with by poachers. Accordingly, Congress, by special enactment, declared that the U. S. had jurisdiction over all the "mainland, islands, and waters" ceded by Russia to the U. S., and that "no person shall kill any otter, mink, marten, or fur seal, or other fur-bearing animal within the limits of Alaskan territory or the waters thereof." In this law there was no statement as to whether the waters referred to included the whole of the region lying between the Pribyloff islands and the mainland. While the U. S. has never formally claimed that the whole of the waters involved are a part of a "closed sea," Great Britain has maintained that the special rights of the U. S. are limited by the 3-mile line prescribed by ordinary international law. If this position is admitted, the claim of the U. S. must rest upon the question whether seal in passing through open waters from one part of U. S. territory to another are entitled to exemption from molestation. The contention of the U. S. might be thus stated. The right to fish in the open sea is not disputed. But the seal is not a fish. On the contrary, it has its abiding-place on the land, to which it regularly resorts and where it may be said to belong. It thus becomes the property of the owner of the land on which it lives, and in passing to the open sea it is entitled to the same protection as any other property. Moreover, even if the seal were to be regarded as a fish, it would be entitled to exemption from pursuit by any method that would result in its extermination. The methods resorted to by the poachers between 1886 and 1890 threaten such extermination. In preventing such a disaster Great Britain is as much interested as the U. S., inasmuch as all sealskins, though belonging to people of the U. S., are taken to London to be dressed and dyed. It was further urged that the sea is not and never has been absolutely free for any purpose whatever that is injurious to the rights, the property, and the honor of a nation that is able to defend itself. It is held that no nation has more frequently or more resolutely asserted this principle than Great Britain, and instances are cited for the purpose of showing that she has never permitted any abstract theory of freedom on the high sea to become a justification for inflicting serious injuries upon her interests or her property for the sake of the profits to be realized by the assailant. In answer to these contentions the Government of Great Britain expressed a willingness in 1891 to submit several of the questions at issue to arbitration by other friendly governments. There was much diplomatic discussion over the questions to be submitted, but the terms of arbitration were finally agreed upon. The Government of Great Britain agreed to a *modus vivendi* for one year to prevent depredations upon the seals. At the end of the year, the matter in arbitration not yet having been settled, she declined to renew the *modus vivendi*. After some correspondence, however, the British Government consented to a renewal in modified form after the U. S. Senate should have ratified the treaty providing

for submitting the questions involved to arbitration. The treaty ratified by the Senate Mar. 29, 1892, provided for submitting the questions in dispute to a commission of seven persons, two appointed by the President of the U. S., two appointed by the Queen of England, one by the King of Sweden, one by the President of the French Republic, and one by the King of Italy. For the outcome of the whole matter, see FISH-ERY RELATIONS OF THE UNITED STATES. The subject is best studied in the diplomatic correspondence; in *Harper's Weekly* for Mar. 7, 1891; in *The Forum* for Nov., 1889; and in *Harper's Monthly Magazine* for Apr., 1891. C. K. ADAMS.

Berja: a town of Spain; province of Almeria; on the south slope of the Sierra de Gador; 22 miles W. S. W. of Almeria (see map of Spain, ref. 20-F). It is in the midst of lead mines, and has manufactures of linen, hats, hardware, etc. Pop. 16,000.

Berke'ley: town; on railroad; Alameda co., Cal. (for location of county, see map of California, ref. 7-C); the seat of the University of California, five preparatory schools, the State Agricultural College, and the California Institution for the Deaf, Dumb, and Blind; is 9 miles E. of San Francisco, across San Francisco Bay, and 5 miles N. of Oakland. Pop. (1880) not given in census; (1890) 5,101; (1900) 13,214 (increase partly due to annexation of territory).

EDITOR OF "ADVOCATE."

Berkeley, baar'kle, GEORGE: philosopher and bishop; b. at Killerin, Ireland, Mar. 12, 1684. He studied at Trinity College, Dublin, where he formed a friendship with Dean Swift, and became a fellow of that college in 1707. He published in 1709 his *Essay towards a New Theory of Vision*, a work of wide reputation. He propounded his celebrated theory of idealism in a *Treatise Concerning the Principles of Human Knowledge* (1710), in which he affirmed that there is no proof of the existence of a material world. The objects of which we are conscious in perception he called "ideas." Their presence he held to be due to the constant agency of the Almighty, who causes them to pass in a real and orderly succession before the mind. His views are the result of the application of rigid logic to the principles which Locke and his school had adopted from Descartes. His method was allied to that of Malebranche, though his conclusions were drawn with a boldness from which the French philosopher recoiled. As distinguished from the egoistic system of Fichte, Berkeley's views have been called theistic idealism. His object was to undermine materialism and counteract skepticism, and he laid the basis of that intuitional philosophy which has ever since been the basis from which Christian metaphysics have opposed the reasoning of inductive skepticism. In 1713 he removed to London, and wrote several essays for the *Guardian*. He accompanied Lord Peterborough as chaplain to Italy, and returned to London in 1720, and to Ireland in the autumn of 1721. In 1724 he became Dean of Derry, worth £1,500 a year. His abundant charity and zeal induced him to engage in an enterprise for the conversion of the American savages, for which purpose he proposed to found a college in America for the education of missionaries. Having received a promise of pecuniary aid from the Government, he married Anna, a daughter of John Forster, Speaker of the Irish House of Commons, in 1728, and sailed to Rhode Island. He purchased a country seat and estate about 3 miles N. E. from the State-house, Newport, within the limits of the present town of Middletown. Naming his place Whitehall, he resided here for two years and a half. About a mile and a half from his house he had his chair and writing apparatus placed in a natural alcove among the hanging rocks on the beach, and in this natural retreat he wrote the greater part of *The Minute Philosopher*. During his residence in Rhode Island he officiated in Trinity church, Newport, and on his return to England in 1733 he sent to the parish an organ, still preserved. His library was distributed among the neighboring clergy. He gave to Yale College a thousand volumes of valuable works and the deed of his farm, the rents of which were to be appropriated to the support of three post-graduate students. He did not succeed in his enterprise because the ministers failed to perform their promise, and he returned to London 1732, and was appointed Bishop of Cloyne in 1734. Among his works are *Aleiphron, or the Minute Philosopher* (1732); *The Analyst* (1734); a *Word to the Wise* (1740); and several books on the virtues of tar water, in whose curative qualities he had great faith. He died at Oxford, Jan. 23, 1753, leaving an excellent reputation as a model of virtue. See Dr. Stock's *Life of Berke-*

ley, prefixed to his works (2 vols. 4to, 1784); G. M. Wright's *Life of George Berkeley* (prefixed to his works, 1843). Berkeley's works have been edited, with a life annexed, by Prof. A. C. Fraser, in 4 vols. (Oxford, 1871).

Revised by WILLIAM STEVENS PERRY.

Berkeley, Rev. MILES JOSEPH, F. L. S.: English botanist; b. in Oundle, Leicestershire, in 1803; educated at Rugby and Christ's College, Cambridge. He obtained several Church preferments, but his chief distinction was won in science. He published *Gleanings of British Algae* (1833); the last volume of the *English Flora* (1836); *Handbook of Cryptogamic Botany* (1857); *British Fungology* (1860); *British Mosses* (1863). He was an authority on fungi, and published many valuable papers on this subject. D. in his rectory, Sibbertoft, July 30, 1889.

Berkeley, Sir WILLIAM: colonial governor and proprietor; b. near London about 1610. He was appointed Governor of Virginia in 1641, and held that office for many years. He was a royalist in the civil war, and was removed from power in 1651 by Cromwell, but became Governor again in 1660. He rendered himself unpopular by his cruelty in putting to death the adherents of Nathaniel Bacon. D. in England, July 13, 1677. See BACON'S REBELLION.

Berkeley, EARLS OF, and Viscounts Dursley (1679): Barons Berkeley (1416, in England); a prominent family of Great Britain.—THOMAS MORETON FITZ-HARDINGE BERKELEY, the sixth earl, b. Oct. 19, 1796; d. Aug. 27, 1822; his father died in 1810, leaving his estates to his oldest son, born before the marriage (1796) of the countess. The title was adjudged to Thomas Moreton, first child born in wedlock; but he did not assume it until 1881. D. in 1882, and was succeeded by RANDAL MOWBRAY THOMAS BERKELEY, b. 1865.

Berkley, Sir GEORGE: civil engineer; b. in London, Apr. 26, 1821; educated in private schools; in 1835 apprenticed to Samuda Brothers, with whom he worked in the shops and on designs of atmospheric railways, steam-engines, etc. From 1841 to 1849 he was assistant to Robert Stephenson, during which time he was engaged on experiments with locomotives, change of gauge, and rolling-stock of the Eastern Counties and Northeastern Railways. From 1849 to 1859 he was engaged on examinations for the water-supply of Liverpool for Robert Stephenson, the engineer to the London and Blackwall, the North and the Southwestern Junction, and other railways. In 1851 he represented Robert Stephenson as engineer of the Great Indian Peninsular Railway, and upon the death of Stephenson in 1859 took his place. In 1874 he was made one of the consulting engineers to the Colonial Office for Railways in Natal, and for viaducts in Cape Colony, in 1885 consulting engineer to the Indian Midland Railway, and in 1887, with his son, became engineer to the Argentine Northeastern Railway. He entered the Institute of Civil Engineers as an associate in 1845, was made full member in 1861, and president in 1892. He was one of the managers of the Royal Institution. He wrote for the institution upon atmospheric railways in 1845, and upon the strength of iron and steel in 1870, bridges founded upon brick walls, communications in Brazil, etc. Knighted in May, 1893; d. Dec. 20 same year. W. R. HUTTON.

Berkley: town; Norfolk co., Va. (for location of county, see map of Virginia, ref. 7-J); on Nor. Southern R. R., and on Elizabeth river; has ship-building, cotton, and lumber industries, and is connected with Norfolk, a mile distant, by ferry. Pop. (1890) 3,899; (1900) 4,988.

Berkley Springs: a village of Morgan co., W. Va.; 2½ miles S. of the Potomac river and the Baltimore and Ohio R. R., at Sir John's Run; 128 miles W. N. W. of Baltimore (for location, see map of West Virginia, ref. 5-M). Here are medicinal springs, which are much frequented, and have a temperature of 74° F. They are useful in rheumatic, calculous, nervous, and catarrhal diseases. It has a large tannery. Pop. (1880) 534; (1890) not separately returned; (1900) 781.

Berkshire: an inland county of England; bounded N. by Oxford and Bucks, E. by Surrey, S. by Hampshire, and W. by Wiltshire; area, 722 sq. miles. The river Thames forms its entire boundary on the N. and N. E. The surface is beautifully diversified by hills and valleys. In the S. E. is Windsor Forest and Park. Wheat, oats, horses, and swine are the staple products. Pop. (1881) 218,363; (1891) 176,119; (1901) 180,366. Capital, Reading.

Berlad, bār'laat': a town in Roumania; on the Berlad; 63 miles S. of Jassy (see map of Austria-Hungary, ref. 7-II). It is an entrepôt for grain. Pop. 26,568.

Berlichingen, bār'lich-ing-en, GÖTZ or GOTTFRIED, von: famous German knight; surnamed OF THE IRON HAND; b. in 1480 at Fasthausen, in Würtemberg. He lost a hand at the siege of Landshut, and supplied its place by an iron hand. He was a daring and turbulent subject, was involved in several feuds with neighboring barons, and fought for the insurgent peasants against the nobles in the Peasants' war, which closed in 1525. For this offense he was placed under the ban of the empire by Maximilian I. He died in 1562, and left an autobiography (1731). His exploits form the subject of Goethe's drama of *Götz von Berlichingen*.

Berlin, bër-lin': the capital of the Prussian monarchy and of the German empire; the third largest city of Europe; on the river Spree, in lat. 52° 30' N., lon. 13° 24' E. (see map of German Empire, ref. 3-G). The city during the Middle Ages was the capital of the Mark of Brandenburg, and became chief city of the consolidated territory of Brandenburg and Prussia when these were united into a kingdom. The city received an important impulse from its connection with the Hanseatic League, and from the remarkable political and military activity of the Great Elector. Under Frederick the Great the population increased, until at his death it numbered about 115,000. In 1817 it had grown to 188,000; in 1844 to 311,000; in 1851 to 436,000; and in 1867 to 702,000. The greatest impulse, however, was given to the city when, in consequence of the Franco-Prussian war of 1870-71, it became the capital of the new German empire. In the next twenty years its growth was so rapid that in 1891 the population was 1,579,244. Of these, about 135,000 were Roman Catholics and 80,000 Jews. The others were Protestants, and, for the most part, members of the United Evangelical State Church. Pop. (1900) 1,843,000. The principal streets are the Unter den Linden, with its four rows of lime-trees and stately Brandenburg gate, the Wilhelmsstrasse, the Königsstrasse, and the Leipzigerstrasse. The city abounds in public places of unusual interest, among which may be mentioned the Opera-house, the Old Palace, known as the Schloss, the Lustgarten, the Gensdarmenplatz, the Wilhelmplatz, the Thiergarten, the Belle Alliance Platz, the Leipziger Platz, the Pariser Platz, and the Charlottenburg Mausoleum. The statue of Frederick the Great, by Rauch, at the head of Unter den Linden, is one of the most imposing ever erected. In other parts of the city are to be seen statues of Schwerin, Winterfeld, Seidlitz, Keith, Zieten, Von Bülow, Leopold of Dessau, and the Great Elector. The Castle Bridge, built in 1824 upon two massive stone arches, is decorated with eight interesting allegorical groups in marble. The Old and the New Museums have many features that are unsurpassed in the world. What is known as the Old Museum was built in 1828 by Schinkel, and contains the celebrated picture gallery, which is rich, not only in early Italian and German masters, but also in collections of ancient sculpture and other antiquities. The New Museum, erected nearly twenty years later, contains a remarkable collection of Egyptian antiquities brought together by Lepsius.

Institutions of Learning.—The most renowned of the institutions of Berlin is the University, which was established in 1810, under the direction of Wilhelm von Humboldt, and an account of which is given below. The Royal Library numbered in 1890 about 900,000 volumes and more than 18,000 manuscripts; and the library of the University has about 300,000 volumes. The Polytechnicum, erected with a part of the indemnity money received from France after the war of 1870, is one of the most elaborate and imposing educational structures in the world. Other important institutions of learning are the Academy of Science, the Building Academy, the Naval Academy, the Mining Academy, the Pharmaceutical School, the Artillery School, the Singing School, and several institutions for the deaf, dumb, and blind. The city contains ten colleges of the rank of gymnasias and Real schools for the preparation of students for the University and Polytechnicum.

Methods of Administration.—The government of Berlin is republican, but with a method of organization which places virtual control of the city in the hands of those who own the property. Every male inhabitant of Berlin who is a Prussian and twenty-four years of age is a voter, provided: (1) he has lived in the city for one year; (2) is not dependent upon a father or guardian, and enjoys control over his

own household and property; (3) has for a year received no alms from public funds; (4) has paid all his municipal taxes during the last year; (5) (a) possesses a house, or (b) pursues a trade with two employees, or (c) pays an income tax, or (d) pays a class tax. The proportion of the inhabitants who under these regulations have the right to vote in the city is about one in seven, or 13 per cent. less than those who have the right to vote at the imperial elections. The most noteworthy characteristic of the government of Berlin, however, is the method by which the voters are divided into classes in such a way as to give to the men of wealth a predominant influence in the government. The voters are divided into three groups or classes, according to the amount of their taxes. The highest taxpayers, beginning with the citizen who pays the highest tax, include so many of the richest men as pay a sum total equal to one-third of all the taxes paid by the citizens of the municipality. The second class begins where the first leaves off, and goes far enough down the list to include those who pay the second third of the entire tax. The remaining citizens form the third class. The first class embraces about $2\frac{1}{2}$ per cent. of the voters and the second about $7\frac{1}{2}$ per cent. The remaining 90 per cent. constitute the third class. Each class elects one-third of the city council. In other words, $2\frac{1}{2}$ per cent. of the citizens elect one-third of the city government, the next $7\frac{1}{2}$ per cent. elect one-third, while the 90 per cent. belonging to the third class elect one-third. The city assembly, consisting of 108 members, is elected for six years, the term of one-third expiring every two years. The office of city assemblyman or councilman is considered one of honor, and no salary is received. The assembly meets every Thursday afternoon, and its meetings are public. The executive branch of the government is in the hands of the mayor and a body of thirty-four magistrates. One-half of the magistrates receive salaries, and are expected to give their whole time to the work. The mayor and paid magistrates are elected for twelve years, and have the right to a pension in case they are not re-elected. The other members of the magistracy are elected for six years. The municipal assembly has the ordinary functions of a legislative body. It discusses matters pertaining to administration, but is not allowed to enter upon executive work, this being left exclusively to the mayor and magistrates. The higher city officers are appointed for life, invariably after a long term of service in subordinate positions. The mayor himself must have graduated in law from a German university. The system of civil service in the various bureaus provides for permanence of tenure, and for punishing and even dismissing officers who do not discharge their duty in every respect. Under such a system of civil service, leading as it does to promotion, it is manifestly not for the interest of an officeholder to be dishonest. The salaries paid in the bureaus and the city treasury range from \$1,275 to \$1,500, while several hundred secretaries and assistants receive no more than from \$450 to \$1,000. But the offices are considered desirable on account of their permanency.

Condition of the Streets and Drainage.—The excellence and thoroughness of the government of Berlin is in no way more conspicuously shown than in the habitual cleanliness of the streets, and in the admirable system of drainage. The streets are every day cleaned between midnight and daybreak; and the stranger is everywhere impressed with the thoroughness with which the work is done. Berlin is less advantageously provided with natural drainage than almost any other of the world's great cities. Paris is drained by the Seine; London by the Thames; Vienna by the Danube; and New York is surrounded by deep water. In Chicago alone of the world's large cities is the drainage question so awkward as it is in Berlin. So long as the city was small, the diminutive and sluggish river Spree sufficed fairly well to carry off refuse matter. Underground sewerage was not well developed, and the houses were provided with cess-pools and underground vaults, rather than with modern plumbing and sewer connections. But the recent development of the capital of the new German empire made it imperatively necessary that something should be done that should be adequate to the situation. Obviously the removal of waste water by a large swift-flowing channel to disinfection and disappearance in salt water was quite out of the question. Sewage farms had been tried experimentally and with some success elsewhere, particularly at one or two places in England. The Berlin municipal council gave the matter much scientific consideration, and at length hit upon a general plan embodying the following essential features: The city should be provided with a complete modern system

of underground sewers, with which all the houses should be brought into direct connection. The city should be divided into some twelve drainage districts, regard being had to the minor topography of Berlin. Each of these districts should have a complete sewer system of its own, which should be called Radial System No. 1, No. 2, and so on. The sewers of each radial system or district should be made to converge to the district pumping station, so that each district should be wholly independent of all the rest. At the lowest point in a given drainage district it was decided to locate a large receiving station for the reception and partial filtration of sewage, and at some point to locate powerful pumping machinery. From each one of these pumping stations there should be a large tunnel of sufficient size to carry off the regular sewage of the entire district, and through this tunnel the pumping machinery should force the sewage out of the city into receiving and subsidence tanks located upon tracts of land purchased by the authorities as sewage farms. These farms are considerable areas of what was almost waste and worthless land, lying at different distances but at an average perhaps of from 7 to 10 miles out of Berlin in several different directions. As rapidly as a district of the city was prepared, the system was put into operation for that particular district. It is only since 1890 that the entire system has been in operation, after perhaps ten years spent in making the great transformation. It is now the completest and most satisfactory system for the disposition of liquid waste that any great city possesses. A scientific agriculture is practiced upon the farms, and by a system of irrigation—a description of which would involve merely technical considerations—it is found possible to make the soil swallow up and disinfect without offense to surrounding farms and villages the entire sewage product of the great metropolis. The system is capable of expansion at both ends to meet the enlarged requirements of the future. From an engineering point of view it is highly successful, while from an economic point of view it has carried with it as little cost as any system that could be devised for the accomplishment of this necessary service. From the sanitary point of view it is above all praise. It is administered as a distinct department of the municipal government with great thrift and success. The waste lands have been made highly productive, and the municipality of Berlin puts upon the market a very large quantity of garden products. Even the water of the sewage, after it has been disinfected, is so perfectly pure as to be brought back to the city for ordinary use. The best account, in English, of the government of Berlin will be found in an article in the *Contemporary Review* for 1884, p. 769, by Prof. Rudolph Gneist, who has been a member of the Berlin city government more than forty years. A more elaborate account will be found in the regular reports annually published by the Berlin city magistracy. See also Von Möller's *Preussisches Stadtrecht*.

C. K. ADAMS.

Berlin: the capital of Waterloo co., Ontario, Dominion of Canada; on the Grand Trunk R. R.; 62 miles W. of Toronto, at the junction of the Galt, Waterloo, and Elmira branches (see map of Ontario, ref. 4-C). It has many important manufacturing interests, including 6 furniture and chair factories, 2 immense tanneries, 3 boot and shoe factories, 2 shirt-factories, piano, button, suspender, glue, and box factories, 5 printing establishments, water-works, electric light, street-cars, a Catholic college, 14 churches, elegant business blocks, and splendid hotels. Pop. (1881) 4,056; (1891) 7,425; (1892) about 8,000. EDITOR OF "NEWS."

Berlin: city; on railroad; Green Lake co., Wis. (for location of county, see map of Wisconsin, ref. 6-E); on Fox river; 94 miles N. W. of Milwaukee. Steamboats ply between this point and Green Bay, etc. Berlin has eight churches, and good graded schools. Its industries are diversified, and include flouring-mills, foundry, and manufactures of turbine-wheels, woolen goods, the manufacture of gloves, whips, washboards, brooms, shoes, the quarrying of granite, canning of fruit, marketing of produce, etc.; and it has water-works and electric lights. The vicinity produces largely cranberries and dairy products. Pop. (1880) 3,353; (1890) 4,149; (1900) 4,489. EDITOR OF "EVENING JOURNAL."

Berlin Blue: See PRUSSIAN BLUE.

Berlin Congress: the meeting in Berlin in 1878 of the plenipotentiaries of the great powers of Europe to decide certain important questions growing out of the Russo-Turkish war of the preceding year. The occasion of the congress was what was regarded as the threatening attitude of Russia

in the East, in consequence of her victory and the Treaty of San Stefano. The general fear was that Russia had acquired a preponderance of power over the Northern Turkish provinces, which might ultimately threaten Constantinople and the approaches to the Black Sea. As this fear involved also the question of controlling the mouth of the Danube, the nation most immediately interested was Austria. But the interests of Great Britain, though more indirect, were not less positive and important, inasmuch as, since the treaty of Paris in 1856, Great Britain had maintained such relations with Turkey as enabled the British Government to have very large influence, and in some respects even control, over Turkish affairs. While the preliminary arrangements for the congress were progressing, Lord Carnarvon probably gave expression to British opinion and feeling when he pointed out to the House of Lords "how convenient for a time it had been to have a power commanding the Dardanelles and the Bosphorus which was not strong enough to stand alone, but was strong enough to stand by the aid of Great Britain, and how hopeless it would be to find any exact equivalent for such an arrangement." He further said that the only substitute would grow up gradually in the general improvement and increasing power of the subject races of Turkey, and it was their interest which Great Britain ought to go into the congress to guard. These two sentences well expressed the spirit of Great Britain in going into the congress. The initiative suggestion of the congress was made by Austria. The place indicated was Berlin and the president Prince Bismarck. Those responding to the suggestion generally recognized the fact that the interests of Europe were so involved in the condition of Turkey and the dependent provinces that all the details of the Treaty of San Stefano (Mar. 3, 1878) might properly come before the congress for review. But at first there were difficulties in the way. At length, however, Russia, owing to the urgent representations of Count Schouvaloff, agreed that the whole Treaty of San Stefano might be submitted for consideration. Accordingly, Germany, acting upon Austria's suggestion, invited the European powers to a congress at Berlin for June 13. On the 15th of that month the plenipotentiaries of Germany, Great Britain, Austria, Russia, France, Italy, and Turkey met at the palace of Prince Bismarck, and organized by the appointment of Prince Bismarck as president. The congress was made up of the most distinguished officials of the several governments. Great Britain was represented by Lords Beaconsfield and Salisbury, and Mr. Odo Russell (afterward Baron Amptill); Russia by Prince Gortschakoff, Count Schouvaloff, and Baron d'Onbril; Germany by Prince Bismarck, Prince Hohenlohe, and Gen. Von Bülow; Austria by Count Andrassy, Count Karolyi, and Baron Haymerlin; France by M. Waddington and the Comte de Saint-Vallier; Italy by Counts Corti and Launay; and Turkey by Carathéodori Pasha, Sadoullah Bey, and Mehemet Ali Pasha.

It was evident from the first that the congress would work toward peace. A sensation was produced when it came out that in May a treaty had been signed between Russia and England agreeing to a settlement of one of the most important questions in dispute. By this treaty Bulgaria was to be divided into two provinces, the northern of which should be independent, and the southern should be governed like a British colony, the governor being appointed for five or ten years with the consent of Europe. Southern Bulgaria was not to reach the Ægean, nor were Turkish troops to enter Bulgaria except in case of war or threatened insurrection. In consideration of Russia's assent to these articles, Great Britain agreed "not to dispute the articles of the preliminary Treaty of San Stefano." When the Bulgarian question, which touched so closely the interests of Austria and Turkey, as well as those of Russia, came before the congress, it was finally settled by the formation of an independent Bulgaria extending from the Danube to the Balkans, with an elective prince and an army of its own, and with the control of all the fortifications. Turkey was given the control of the Balkans, with as many fortifications as she desired. In the region south of the Balkans, "Eastern Roumelia" was established, to be governed by a hospodar, to be appointed for five or ten years, and to be nominated by the sultan and the powers. It was decided to intrust Austria with the task of occupying Bosnia and Herzegovina in the interests of European peace; but the duration of Austrian occupation was not determined. This plan for Austrian occupation was reluctantly accepted by Italy and Turkey. Serbia received independence with a territorial extension. The Montenegrin question was settled by giving

to the little state a considerable increase of territory and access to the sea. The Greek question evoked much interest and discussion, but the congress limited itself to passing a resolution recommending an extension of Hellenic territory, inviting the Porte to come to an understanding with the Greek Government in regard to the frontiers, and tendering the good offices of the powers in case of disagreement. In the course of the meetings of the congress a second great sensation was created by the revelation that on June 4 Great Britain had signed a secret treaty with Turkey by which the two contracting powers entered into mutual obligations. Great Britain, on the one hand, agreed for all future time to defend the Asiatic dominions of the Ottoman empire "by force of arms," while Turkey, on the other, promised, first, to introduce all necessary reforms, as agreed upon with its ally, and, secondly, to assign the island of Cyprus to be occupied and administered by Great Britain, so long as Russia should occupy Batum, Ardahan, and Kars.

It was universally conceded that the part of Great Britain in the congress was played with great skill and brilliancy. By the terms finally adopted the Dardanelles were restored to their condition before the recent war; the stability and ultimate independence of the Northern Turkish provinces were secured; Russia was required to destroy her fortifications at Batum; Turkey was required to reform her government; while Great Britain, by establishing herself in Cyprus, assumed virtual control of the eastern part of the Mediterranean Sea. Many of the most influential newspapers of Europe regarded the results of the congress as henceforth securing the preponderance of British influence in Asia. At the final sitting of the congress it was determined, on motion of Prince Bismarck, that each power should watch over the execution of the clauses agreed upon affecting itself, and should be at liberty to address the Porte such personal observations as it might deem advisable. The congress concluded its work on July 13, just one month from the date for which it was called. The treaty, which is said to be the longest ever written, was signed by a larger number of plenipotentiaries than had ever before fixed their names to a treaty.

C. K. ADAMS.

Berlin, Treaty of: See BERLIN CONGRESS.

Berlin, University of: founded soon after the crushing defeat of Prussia by Napoleon at Jena, at a time when it seemed as though the national life and spirit were at their lowest ebb. Under the inspiring leadership of men like Fichte and Humboldt, however, the country set about recovering its lost prestige with a wisdom and determination that has perhaps never been equaled in history. The inauguration of the great Prussian school-system dates from this period, and of this system the University of Berlin may very properly be considered the crown. The university was founded in 1809 and opened in 1810. The faculty was recruited from the most eminent scholars of Germany, and such leaders as Niebuhr, Wilhelm von Humboldt, Ritter, Fichte, Hegel, Neander, and Schleiermacher soon attracted the attention of Europe to the young institution. The reputation thus established has been maintained by men like Ranke, Mommsen, Curtius, DuBois-Raymond, Helmholtz, Virchow, Droysen, Von Sybel, and Koch. The main building of the university is the old palace of Prince Henry, brother of Frederick II., erected in 1754-64, and appropriated to the use of the university in 1809. It stands on Unter den Linden, opposite the Royal Library and the Opera-house. This building contains some of the museums and scientific collections. The garden in front is adorned with statues of Wilhelm and Alexander von Humboldt. The university also occupies some seven or eight other buildings in adjacent parts of the city. The university library, containing 300,000 volumes, is supplemented by the Royal Library of 900,000 volumes, just across the street, to which students have easy access.

Instruction.—Instruction is given mainly by lectures and in the laboratories. There are also several seminaries. There are four faculties: *Theology*, with 17 professors; *Jurisprudence*, with 26 professors; *Medicine*, with 112 professors; and *Philosophy*, which includes all branches of learning pertaining to general culture and not to professional training, with 181 professors. Using the word professor to indicate instructor of whatever order, there are then 336 professors in these four faculties. No fewer than 757 courses of instruction were offered during the year 1890-91. Of these, 30 were in the Oriental languages. The year is divided into two terms or semesters, the winter semester extending from

the middle of October to the middle of March, and the summer semester from the middle of April to the middle of August.

Students.—The number of matriculated students in 1899 was 4,997. Of the total number, some 400 are usually from the U. S. The expenses are not high. Many of the courses are free. For the others, the fees average about five dollars for a course of four hours a week through one term. In medicine and in the laboratories they are somewhat higher. The use of the academic reading-room, with 250 newspapers, 200 magazines, and 3,000 volumes, costs seventy-five cents a semester.

Graduation.—The German term is "promotion" (to the doctorate), not graduation. The degree conferred is that of Doctor of Medicine, Philosophy, etc. The candidate for the degree of Doctor of Philosophy must present a thesis that shows satisfactory original investigation, must undergo an oral examination, and must maintain his thesis in an open disputation. With his application for a degree the candidate must present a petition to the faculty for admission to this honor, and a short history of his life, both in Latin, a certificate of ripeness for admission to the university from a gymnasium, a certificate of honorable dismissal from the university, a certificate of three years' attendance upon a university, and his dissertation, which, in cases where it would be proper, must be in Latin. The oral examination is public. Certain professors are designated by the faculty to conduct it, but any one present may put a question to the candidate. The disputation is also open, and the candidate has to maintain his position against at least three opponents. There are four degrees of success, designated as *summa cum laude*, *magna cum laude*, *cum laude*, and simply *sustinuit*. Two hundred and fifty copies of the thesis or dissertation and 100 copies of the diploma are printed at the expense of the candidate. The total cost of a "promotion" is about ninety dollars. The regulations in regard to the degree of Doctor are more strict at Berlin than anywhere else, and are more rigidly enforced. Consequently, a degree from Berlin is highly esteemed.

C. H. THURBER.

Berlioz, bār'li-ōz', HECTOR LOUIS: French musical composer; b. at Côte-Saint-André, Isère, Dec. 11, 1803; a physician's son; sent to Paris to study medicine; entered the Conservatory, following a passionate bent for music. He composed *Symphonie fantastique*; overtures to *Waverley* and *King Lear*; *Harold* (1833) and *Romeo et Juliette* (1839), symphonies; *Benvenuto Cellini*, an opera in two acts; *Symphonie Funèbre et Triumphale* (1840); *Damnation de Faust* (1846), a symphony; *Enfance de Christ*, a trilogy (1854); and *Les Troyens*, a grand five-act opera, played without success in 1863. His works bespeak an ardent and independent genius, and have elicited diverse criticism. So far as purely musical invention is concerned, Berlioz can scarcely be ranked with the great tone-poets. But in the science of orchestration, more especially in novel combinations and effects, he remains a supreme master and worthy colleague of Wagner in this specific sense. He was also a talented author and critic, and has published *Traité d'instrumentation et d'orchestration moderne* (1844); *Voyage musicale en Allemagne et en Italie*; *Études sur Beethoven, Gluck, et Weber* (1845); *Soirées de l'orchestre* (1853); *Les Grottesques de la musique* (1859); and *Mémoires* (1870). D. in Paris, Mar. 8, 1869.

Revised by DUDLEY BUCK.

Bermu'da Grass (*Cynodon dactylon*): a grass extensively cultivated in India (where it is called *dhak*), and which has been introduced into the West Indies, Europe, the Southern U. S., and the Sandwich islands. It is valuable both for pasture-grass and for hay, and is especially prized in warm climates, where the grass crop is generally poor; but in light soils, especially northward, its perennial roots cause great trouble to the farmer.

Bermuda Hundred: in Chesterfield co., Va.; on the right bank of the James river, just above the mouth of the Appomattox, and 1½ miles above City Point (for location of county, see map of Virginia, ref. 6-II). The tortuous course of the James river here incloses a neck of land which Gen. Butler occupied and fortified in May 6, 1864, and from which he was to co-operate with Gen. Grant by menacing Richmond and Petersburg. On the morning of May 16, 1864, Gen. Butler, who had moved out of his works, was fiercely attacked by the Confederate force under Beauregard, and after a severe struggle, which lasted till noon, driven back into his intrenchments with severe loss. Beauregard erected a line of works across the peninsula in front of Butler's. Subse-

quent expeditions were made from these works, and the line finally formed a part of the investment lines of the combined armies against Petersburg.

Bermuda Islands, or Bermudas; also called **Somers' Islands**: a group of small, low islands in the Atlantic Ocean, belonging to Great Britain (see map of North America, ref. 7-I). They take their name from Juan Bermudez, who discovered them in 1522. They are about 624 miles E. S. E. of Cape Hatteras, which is the nearest land, and are in lat. 32° 20' N., and lon. 64° 50' W. The extent of the group is only 19 miles by 6 miles, although the number of islets is nearly 400. Area, 20 sq. miles. They derive importance from the commanding position which they occupy between the West Indies and the other parts of British America. They are inclosed on several sides by formidable coral-reefs, which are said to be the only coral-reefs occurring in the central expanse of the Atlantic. The climate is so mild and delightful that these islands are covered with perpetual verdure. Between December and March the temperature ranges from 60° to 66° F. The chief articles of export are potatoes, onions, and arrowroot. The largest of these islands are Bermuda, 15 miles long; St. George's, 3½ miles; Somerset, 3 miles; and Ireland, 3 miles. Capital, Hamilton, on the isle of Bermuda. St. George's isle has a good, landlocked harbor, which is defended by strong batteries. These isles are separated by narrow and intricate channels, and have no streams, and but few pools of fresh water. Many of the inhabitants are employed in building cedar vessels, which are durable and swift. Pop. (1891) 15,884.

Bermudez, bār-moo'dāyth: a maritime state of Venezuela; extending from the peninsula of Paria to the Orinoco river; bounded N. by the Caribbean Sea, E. by the Gulf of Paria and the delta of the Orinoco, S. by Bolivar, and W. by the state of Guzman Blanco. It is also called the Estado de Oriente, or Eastern State. Its eastern boundary is the Rio Manamo, the westernmost mouth of the Orinoco, and on the latter river it extends westward to the Rio Suata. It includes the former provinces of Cumana and Barcelona. Chief towns, Cumana and Barcelona (ports), and Maturin. Area, 32,243 sq. miles. Pop. 297,466.

M. W. H.

Bernadotte, Charles XIV., JOHN: King of Sweden; a French marshal; b. at Pan, Jan. 26, 1764. His original name was JEAN BAPTISTE JULES BERNADOTTE. He enlisted as a private in the army in 1780; served as general of division under Kléber and Jourdan in Flanders in 1794, and under Bonaparte in 1797. In 1798 he was French minister at Vienna, and married Mademoiselle Clary, a sister of Joseph Bonaparte's wife. He was Minister of War for a short time in 1799. Napoleon created him a marshal of France in 1804, and in June, 1806, Prince of Pontecorvo. He fought at Austerlitz in 1805, and defeated the Prussians at Halle in Oct., 1806. He quarreled with Napoleon, who censured his conduct at Wagram (1809), and he resigned his command just after that battle. In Aug., 1810, the Swedish Diet elected Bernadotte as heir to the throne of Sweden, then occupied by Charles XIII., who had no son, and he was immediately associated with the old king in the exercise of royal power. Early in 1812 Bernadotte, who took the name of Charles John, negotiated with Russia a secret treaty of alliance against Napoleon. He openly joined the coalition of the allies in the spring of 1813, and led an army of about 28,000 men into Germany. His army defeated Oudinot at Gross-Beeren in Aug., 1813, but his conduct was considered equivocal and lukewarm by the allies. He forced Prince Christian of Denmark, who had proclaimed himself King of Norway, to resign, and on Nov. 4, 1814, Charles XIII. was proclaimed king, and Bernadotte crown prince. When the allies entered France in 1814, he led his army back to Sweden and conquered Norway. He began to reign alone on the death of Charles XIII. in Feb., 1818, after which a long peace ensued. D. in Stockholm, Mar. 8, 1844, and left the throne to his son, Oscar I. See Erik G. Geijer, *Konung Karts XIV. Johan Historia* (1844); W. G. Meredith, *Memorials of Charles (XIV.) John, King of Sweden* (1829).

Bernard, CLAUDE: French physiologist; b. at Saint-Julien, in dept. of Rhône, July 12, 1813. He wrote *Researches on the Uses of the Pancreas*, which gained the grand prize of the Institute in 1849. He was admitted into the Institute in 1854, and became Professor of Physiology in the College of France in 1855. Bernard discovered the glyco-genic function of the liver. He was created grand officer of the Legion of Honor in 1862. Among his works are *Leçons de*

Physiologie (1855) and *Mémoire sur la Chaleur animale* (1856). D. in Paris, Feb. 10, 1878.

Ber'nard, Sir FRANCIS: lawyer; b. in Nettleham, Lincolnshire, England, 1714; became Governor of New Jersey in 1758, and of Massachusetts in 1760. After nine years of successful administration, during which he acquired Mt. Desert island, he became unpopular in Massachusetts because he brought troops into Boston and opposed liberal measures. He was accused of misconduct, recalled, and made a baronet in 1769. D. in Aylesbury, England, June 16, 1779. His *Letter-books* are in Harvard Library.

Bernard, bār'naar', SAINT: Abbot of Clairvaux; mediæval theologian, and a doctor of the Western Church; b. in his father's castle at Fontaines, near Dijon, in 1091. He became an inmate of the monastery of Cîteaux in 1113, and founded in 1115 a community of the Cistercian order at Clairvaux, in Champagne, of which he was the first abbot. His ascetic life and eloquence and combination of piety, mysticism, and sound practical sense rendered him a very influential and powerful person in the Church. He was regarded as an oracle by all Christendom, and was consulted and obeyed in politics as well as in Church affairs. He did much to encourage monasticism, and founded many monasteries. Yet intensity of conviction made him a persecutor; so he appears as an implacable adversary of Abelard, whose condemnation at the Synod of Paris (1140) was effected by his influence; of Arnold of Brescia, a pupil of Abelard, whom he drove out of France and Switzerland; of the Cathari; and of Gilbert of Portiers. In 1128 he drew up the rule for the new order of Knights Templars. The same intensity led him to arouse Europe to the second crusade, that of 1146, which failed disastrously. Bernard in consequence was denounced, and his disappointment and chagrin hastened his death at Clairvaux, Aug. 20, 1153. He was canonized 1173. His works are numerous. He wrote five famous and beautiful Latin hymns, including the *Jesu dulcis memoria* and the *Salve mundi salutare*, portions of which appear in all hymn-books—in English as, *Jesus, the Very Thought of Thee*, and *O Sacred Head! Now Wounded*, respectively. See his complete works (ed. Mabillon, repr. by Migne, *Pat. Lat. CLXXXIII.-CLXXXV.* Eng. trans. by S. J. Eales, London, 1889, seq.). The best modern lives are by A. Neander (Berlin, 1813; 3d ed. 1865; n. e. Gotha, 1889; a classic Eng. trans., London, 1843); J. C. Morison (London, 1863; 3d ed. 1877); M. T. Ratisbonne (Paris, 1841; 9th ed. 1883; Eng. trans., New York, 1878); S. J. Eales (London, 1890); R. S. Storrs (New York, 1892). Revised by S. M. JACKSON.

Bernard, SIMON: French engineer; b. at Dôle, Apr. 28, 1779; aide-de-camp to Napoleon I.; employed by him in important duties incidental to his branch of the service. He was invited to this country by President Madison in 1816 to assist in the organization of a system of seacoast defense by fortification. The chief engineer, Gen. Swift, and another officer, Col. McRee, sent in their resignations, and Col. W. K. Armistead succeeded as chief engineer. As "assistant engineer," Gen. Bernard was associated with Col. (subsequently general and chief engineer) J. G. Totten, constituting a "permanent board," upon which the labor of working out the fundamental principles of the system and of elaborating the projects of defense for the great seaports devolved. Bernard also had part in the inauguration of some of our earlier works of civil engineering, e. g. the Chesapeake and Ohio Canal, the Delaware breakwater, etc. He resigned in 1831, and returned to France; became aide-de-camp to Louis Philippe, and subsequently Minister of War of France. D. in Paris, Nov. 5, 1839.

Bernard, THOMAS DEHANY: clergyman and author; b. in Clifton, Bristol, England, Nov. 11, 1815; was educated at Oxford, and ordained 1840; select preacher at Oxford 1856, 1862, 1882, and Bampton lecturer 1864. Became canon residentiary at Wells Cathedral in 1868, and chancellor in 1880. Author of *The Witness of God*, University sermons (1863); *The Progress of Doctrine in the New Testament*, Bampton lectures (1864; 4th ed. 1878); *Before His Presence with a Song* (1885); *Central Teaching of Jesus Christ* (1892).

Bernard, Great St.: a famous mountain-pass of the Pennine Alps; upward of 8,000 feet in height; between the Swiss canton of Vaud and the valley of Aosta. Near the summit is the celebrated hospice, said to have been founded in 962 by St. Bernard of Menthon in Savoy for the succor of travelers crossing the mountain. In the humane efforts of the monks of this hospice the valuable dogs known as the

St. Bernard breed, and noted for their size and sagacity, were valuable assistants. In 1800 Napoleon crossed the Alps here with an army of 30,000 men, with cavalry and artillery.

Bernard of Cluny: not to be confounded with his more celebrated countrymen and contemporary, Bernard of Clairvaux; b. at Morlaix, in Brittany, of English parents, probably not far from the year 1100. He was a monk at Cluny under Peter the Venerable, who was abbot there from 1122 to 1156. He wrote a poem, *De Contemptu Mundi*, in about 3,000 lines, portions of which were translated by the Rev. John Mason Neale (1818-66) in 1851 and 1862. Dr. Neale pronounces these verses of Bernard "the most lovely, in the same way that the *Dies Iræ* is the most sublime, and the *Stabat Mater* the most pathetic, of mediæval poems." Hymns taken from this poem, such as *The World is Very Evil*, *Brief Life is Here Our Portion*, and *Jerusalem the Golden*, are among the finest gems in recent English and American collections.

Bernardo del Carpio, bār-naar'dō-del-kaar'pě-ō: Spanish hero of the ninth century; nephew of Alfonso the Chaste; displayed brilliant courage in the war against the Moors; according to tradition, defeated Roland at Roncesvalles; and the hero of several dramas by Lope de Vega and of many Spanish ballads.

Bernay, bār'nay': a town of France; department of Eure; on the railway from Paris to Caën; 25 miles W. N. W. of Evreux (see map of France, ref. 3-E). It has a college, and manufactures of woolen cloths, linens, paper, and leather. A horse-fair, the largest in France, is held here annually. Pop. (1891) 8,016.

Bernardin, bār'naar'dān', SAINT, of Siena: b. at Massa, near Siena, Sept. 8, 1380; entered the order of St. Francis in 1402; visited the Holy Land, and became famous throughout Italy as a preacher; was made vicar-general of his order in 1437. D. May 20, 1444, and was canonized in 1450. His works, strongly mystical, appeared last at Venice (1745, 4 vols.); his biography by J. P. Toussaint (Regensburg, 1873) and by L. Bianchi (3 vols., Siena, 1888).

Bernays, ALBERT JAMES, Ph. D.: chemist; b. in London, Nov. 8, 1823; educated at King's College School and University of Giessen; Lecturer on Chemistry at St. Mary's Hospital Medical School 1854-60; since that time at St. Thomas's Hospital; author of *Household Chemistry*; *Science of Home Life* (1862); *Notes on Analytical Chemistry for Students in Medicine* (3d ed. 1889); *Food* (1876).

Bernays, bār'nīs, JACOB: classical philologist and brilliant stylist; b. in Hamburg, Sept. 18, 1824, of Jewish parents. He took his doctor's degree in 1848, and began his academic career as privat-docent in Bonn at the urgent request of his teacher, Fr. Ritschl. In 1854 he was appointed professor extraordinary and librarian, which positions he retained till his death there, May 26, 1881. Bernays's work was chiefly confined to ancient Greek philosophy, and possesses permanent value. His most noted publications are his treatises on Aristotle's theory of the drama, on the Dialogues of Aristotle, on Phocylides, Theophrastus, the apocryphal letters of Heraclitus, and a masterly biography of Scaliger. His opuscula have been collected and edited by Usener (1885). For an account of his life and a full list of his writings, see C. Schaarschmidt, *Biogr. Jahrb. IV.*, p. 65-83 (1881). ALFRED GUDEMAN.

Bernburg, bār'n'boorkh: a town of Germany; formerly capital of the duchy of Anhalt-Bernburg; on the river Saale, here crossed by a bridge; 24 miles S. S. W. of Magdeburg. It is connected by railway with Berlin and Dresden. It has a gymnasium, a Realschule, a valuable library, a ducal castle, and manufactures of porcelain, paper, and starch. Pop. (1880) 18,593; (1885) 21,464; (1890) 28,257.

Berne, bār'n (Fr. *Berne*; Germ. *Bern*; Lat. *Ber'na*): the most populous canton of Switzerland, and the most extensive except the Grisons. It is bounded N. by Alsace, E. by Basel, Soleure, Aargau, Lucerne, Unterwalden, and Uri, S. by Valais, and W. by Vaud, Fribourg, Neuchâtel, and France. Area, 2,657 English sq. miles. It is traversed by the river Aar, and also drained by the Emmen. The Aar expands into two lakes called Brienz and Thun. The surface is mountainous, and the northern part is occupied by the Jura Mountains. Several high peaks of the Alps—namely, the Finsteraarhorn, 14,032 feet, the Jungfrau, 13,514 feet, Schreckhorn, 13,393 feet—are in Berne. The valleys of the Simmenthal, Lauterbrunnen, and Grindelwald in the Bernese Oberland are celebrated for their beauty. The valleys

of the Aar and Emmen are fertile and adapted to pasturage. Among the mineral resources of the canton are copper, lead, iron, marble, and granite. It has important manufactures of watches, paper, woolen goods, linens, etc. It is intersected by several railroads. Capital, Berne. Pop. (1880) 530,411, of whom 66,015 were Roman Catholics; (1894) 541,051.

Berne, or **Bern** [said to be derived from the Germ. *Bären*, "bears," figures of which are on the armorial bearings of the city]: a city of Switzerland; capital of the canton of Berne; situated on the river Aar, which incloses it on three sides; 65 miles by rail S. of Basel and 92 miles by rail N. E. of Geneva (see map of Switzerland, ref. 4-D). Berne is the seat of the federal government of the republic, and is considered to be the finest city in Switzerland. It is built of freestone, and the houses are massive structures, resting on arcades which form covered promenades on both sides of the streets. Magnificent Alpine scenery is visible from this point. Berne has a Gothic cathedral, a public library, a university, a museum of natural history, a mint, and an arsenal. One of the finest buildings is the new federal palace. The river is here crossed by four large bridges. Several railroads connect it with Geneva, Basel, and other towns. Berne was founded in 1191, and became a free town of the empire in 1218. It joined the Swiss Confederation in 1352. In 1849 it became the permanent capital of the whole republic. Pop. (1880) 44,087; (1885) 47,793; (1897) 49,030, communal.

Berne-Bellecour, bār'n'bel'kooor', ÉTIENNE PROSPER: genre and military painter; b. at Boulogne, June 29, 1838. Pupil of Picot and Barrias; first-class medal, Paris Salon, 1872; Legion of Honor 1878; second-class medal, Paris Exposition, 1889. His pictures of episodes in the Franco-Prussian war have gained him an excellent reputation, second only to such masters as De Neuville and Detaille, and a considerable number of his works are in American collections. Studio in Paris.

WILLIAM A. COFFIN.

Berners, JULIANA: reputed author of the *Boke of St. Albans* (1486); a collection of treatises on hawking, hunting, and heraldry. To the edition of 1496, printed by Wynkyn de Worde, was added a *Treatyse on Fysshynge with an Angle*. During the sixteenth century the *Boke* was very popular, and was often reprinted. The authorship of it is uncertain, and the traditionary life of Dame Juliana is probably mythical.

HENRY A. BEERS.

Bernhard, bār'n'haärt, Duke of Saxe-Weimar: German general; b. in Weimar, Aug. 6, 1604; was a younger son of John III. of Saxe-Weimar. He fought for the Protestant cause in the Thirty Years' war; distinguished himself at Wimpfen in 1622; became a colonel in the army of Denmark, which he quitted in 1628. In 1631 he joined the standard of Gustavus Adolphus. The victory which the Swedes gained at Lützen in 1632 is attributed to the skill and energy of Bernhard, who in 1633 was appointed to the command of the Swedish army. Having made a personal treaty of alliance with France in 1635, he afterward commanded a French army and defeated the imperialists. D. in Neuburg-on-the-Rhine, July 8, 1639. See Schiller, *History of the Thirty Years' War*; J. A. C. von Hellfeld, *Geschichte des Bernhard des Grossen*, etc. (1797); Bernhard Roese, *Herzog Bernhard der Grosse von Sachsen-Weimar* (2 vols., 1828-29).

Bernhardt, bār'n'haärt, ROSINE, better known as SARAH: French actress; b. in Paris, Oct. 22, 1844. Her Jewish parents, after she had passed some years with her grandfather, an Amsterdam optician, placed her in a convent at Versailles, where her ambitions fluctuated from theatrical prominence to the nun's veil. At fourteen, however, she entered the Paris Conservatoire, took prizes in tragedy and comedy, made her *début* in 1862 as Iphigénie in Racine's tragedy at the Théâtre Français, and acted the leading rôle in Scribe's *Valérie*. Received without interest, she withdrew for study, but acted in burlesque in the comic theaters. In Jan., 1867, she took up legitimate comedy, and by the impersonation of the Queen in *Ruy Blas* at the Odéon gained such renown that she was recalled to the Français, and began a career recognized as foremost in French tragedy. In 1879 a company from the Français, of which she was a member, played with brilliant results in London. Bernhardt soon after withdrew from the Théâtre Français, for which breach of contract she was mulcted in the courts in \$20,000; but her tours in Italy, Russia, and the Americas replenished her purse. She played in New York in 1880,

1887, 1891, and 1900, and in 1891 went to Australia. In 1882 she married in London M. Damala, a Greek stock-actor, from whom she was soon divorced. She has exhibited pictures and statues by her own hand in the Paris Salon, and written a play, *L'Aveu* (produced in 1888). She has impersonated the title rôles of Racine's great plays, acted Shakspearean characters, and plays have been written to elicit her highest powers.

Bernhardy, bār'n-haar'dē, GOTTFRIED: German classical scholar of encyclopædic erudition; b. Mar. 20, 1800; privat-docent and professor extraordinary at Berlin 1823-25. In 1829 he was called to Halle as the successor of Reisig, where he remained till his death, May 14, 1875. Author of a *History of Greek Literature*; of *Roman Literature*; *Eratothénica*; *Wissenschaftliche Syntax der griech. Sprache*; and of a monumental edition of *Suidas*. Cf. R. Volkmann, *G. B.* (Halle, 1887).

Berni, bār'nēē, FRANCESCO: Italian satiric poet; b. about 1496; known chiefly by his satiric *rifacimento* of Boiardo's *Orlando Innamorato*. (See BOIARDO.) This was first published in 1541, and soon quite eclipsed the fame of the original. His *Rime Burlesche* (Venice, 1538) were very famous in their time. From him a burlesque style is called by the Italians "Bernesque." See Antonio Virgili, *Francesco Berni, con documenti inediti*, Florence, 1881; *Opere di F. Berni*, 5 vols., Milan, 1806. D. May 26, 1535. A. R. MARSH.

Bernice: See BERENICE.

Bernier, bār'ni-ay', CAMILLE: landscape-painter; b. at Colmar, France, 1823; pupil of Léon Fleury; Legion of Honor 1872; medal of honor, Paris Exposition, 1889. An artist of real merit, who has painted numerous excellent pictures. One of the best of his works is *The Abandoned Lane* (1879), in the museum at La Rochelle. Studio in Paris. W. A. C.

Bernina, bār-nēē'nā: an imposing mountain-group in the Swiss canton of Grisons; rises 13,407 feet above the level of the sea, and has a remarkable glacier. The Pass of Bernina, the altitude of which is 6,671 feet, affords a communication between the Upper Engadine and the Valtelline.

Bernini, bār-nēē'nēē, GIOVANNI LORENZO: an Italian architect and sculptor; b. in Naples, Dec. 7, 1598; lived at Rome. His works, the best among which are the colonnade to St. Peter's church, the Scala Regia of the Vatican, and the Barberini Palace at Venice, possess some excellences, but show the beginning of the decline of art into the *baroque* or Jesuit style, to which his influence greatly contributed. D. in Rome, Nov. 28, 1680.

Bernoulli, bār'noo'lee, or **Bernouilli**, DANIEL, F. R. S.: mathematician and philosopher; b. in Groningen, Feb. 9, 1700; son of Jean (1667-1748). He became in 1733 Professor of Anatomy and Botany at Basel, where he afterward obtained the chair of Physics and Speculative Philosophy. He gained many prizes of the French Academy of Sciences, and wrote in Latin and French many scientific works. He was one of the three greatest members of this famous family. D. in Basel, Mar. 17, 1782. See Condorcet, *Éloge de Daniel Bernoulli* (1782).

Bernoulli, JACQUES: a mathematician; uncle of the preceding; b. in Basel, Dec. 27, 1654. He became Professor of Mathematics in that city in 1687. He solved Leibnitz's problem of the isochronous curve, discovered the properties of the logarithmic spiral, and wrote several treatises on mathematics, etc. D. in Basel, Aug. 16, 1705. See Battier, *Vita Jacobi Bernoulli* (1705).

Bernoulli, JEAN or JOHN: one of the mathematicians of the Bernoulli family; b. in Basel, July 27, 1667. He was the father of Daniel and brother of Jacques (1654-1705). He discovered the exponential calculus, and ascertained the curve of swiftest descent. In 1705 he succeeded his brother Jacques as Professor of Mathematics at Basel. His works were published in 4 vols., 1742. D. in Basel, Jan. 1, 1748.

Bernoulli, JEAN: son of the preceding; b. in Basel, May 18, 1710. He became Professor of Mathematics at Basel in 1748, and wrote several treatises. D. July 11, 1790.—BERNOULLI, JEAN: b. in Basel, Nov. 4, 1744; son of the preceding. He became astronomer royal at Berlin in 1764, and wrote various works. D. July 13, 1807.—BERNOULLI, JÉROME: naturalist; b. in Basel, 1745; d. in 1829.—BERNOULLI, NICOLAS: son of Jean and a brother of Daniel, noticed above; b. in Basel, Jan. 29, 1695. He was Professor of Mathematics at St. Petersburg, where he died, July 26,

1726.—BERNOULLI, NICOLAS, LL. D., F. R. S.: cousin of the preceding; b. in Basel, Oct. 10, 1687. He made several discoveries in mathematics. D. in Basel, Nov. 29, 1759.

Bernstorff, bār'nstōrf, ALBRECHT, Count: a Prussian diplomatist and statesman; b. Mar. 22, 1809; became in 1857 Prussian ambassador in London; Minister of Foreign Affairs from 1861 to 1862; returned to London in 1862, and represented the German empire in the London Conference of 1871. D. in London, Mar. 26, 1873.

Bernstorff, JOHANN HARTWIG ERNST, Count von: statesman; b. in Hanover, May 13, 1712. Having entered the civil service of Denmark, he was appointed Minister of Foreign Affairs (prime minister) in 1761. He was a liberal patron of learning and the arts, and he promoted the commerce and manufactures of Denmark. He retained power till 1770. D. in Hamburg, Feb. 19, 1772. See G. H. Ahle-mann, *Ueber das Leben und den Charakter des Grafen von Bernstorff* (1777); G. Navarro, *Vie du Comte J. H. E. Bernstorff* (1822).

Beroaldo, bāy-rō-aal'dō, FILIPPO (1453-1516): professor at Bologna, his native city. Editor and commentator of Plautus, Cicero, and of numerous post-classical Latin writers. See Roscoe's *Life of Leo X.*; Burekhardt's *Die Cultur der Renaissance*.

Ber'oe: a genus of jellyfishes belonging to the class *Ctenophora*, and notable for the absence of tentacles. They are phosphorescent marine animals, with an oval or nearly globular body of a delicate jelly-like substance, the whole body cavity serving as a stomach. As in all the other members of the class, the sides of the body are provided with eight rows of vibratile plates, by which the animal is propelled through the water.
DAVID S. JORDAN.

Berē'a, or **Berea**: a large and ancient city of Macedonia; situated at the foot of Mt. Bermius; about 30 miles from Pella. It was attacked by the Athenians in the war which began about 430 B. C. St. Paul visited Berea, and preached there. (See Acts xvii. 10.) Its site is occupied by the modern town of Veria, 35 miles W. of Salonica. See VERIA.

Bero'sus (in Gr. Βηρωσός): historian; priest of Bel in Babylon; b. under Alexander the Great; dedicated his history of Chaldaea (Χαλδαϊκά) in three books to Antiochus Soter, who reigned 280-261 B. C. His accounts have been largely confirmed by the cuneiform inscriptions. Fragments in Müller's *Fragmenta Historicorum Græcorum*, ii. 495-510.

Berquin, bār'kăn', LOUIS, de: b. at Passy, France, about 1490; studied law and became a counselor of Francis I.; was a friend of Erasmus and active in circulating his works; accused of Lutheranism and imprisoned in 1523, 1526, and 1529; condemned first to imprisonment for life, then to be burned alive; the last sentence was executed in Paris, Apr. 17, 1529, and he became the first Protestant martyr in France.

Berri: See BERRY.

Berrien, ber'ri-en, JOHN MCPHERSON, LL. D.: lawyer and politician; b. in New Jersey, Aug. 23, 1781. He removed to Georgia, and was elected a Senator of the U. S. in 1824. He was Attorney-General under President Jackson in 1829-31, and was again chosen Senator in 1840 and 1846. D. in Savannah, Jan. 1, 1856.

Berry: a fruit which consists of a pulpy pericarp without valves, containing seeds, which have no covering except the pulp or rind; as the grape, gooseberry, currant, barberry, service-berry, and cranberry. Some of them have the calyx adherent to the ovary and the placenta parietal, as the gooseberry. Others have the ovary free and the placenta in the center, as the grape. The term berry is popularly applied to several small fruits which are not berries in the scientific sense, as the strawberry, which bears seeds (*achenia*) on the external surface of an enlarged and pulpy receptacle. The orange is a berry with a leathery rind, and is also called a *hesperidium*.

Berry, or **Berri**: a former province of France, near its center; now forms the departments of Cher and Indre. Capital, Bourges. Berry was erected into a duchy about 1360, after which it was held by many princes of the royal family of France. The last Duke of Berry was the younger son of Charles X.

Berry, or **Berri**, CHARLES FERDINAND, Duc de: b. at Versailles, Jan. 24, 1778; the second son of Charles X. He emigrated with his father in 1793; returned to France in

1814, and married in 1816 Caroline Ferdinande Louise, a daughter of the King of Naples. He was assassinated by Louvel, in Paris, Feb. 14, 1820. He was the father of the Count de Chambord (Henry V.), who was recognized by the Legitimist party as the heir to the French throne. See Chateaubriand, *Mémoires touchant la Vie et la Mort du Duc de Berry* (1820).

Berry, IRAM G.: major-general of U. S. volunteers; b. at Rockland, Me., Aug. 27, 1824; killed at the battle of Chancellorsville, Va., May 2, 1863. He was a member of the Maine Legislature several times, mayor of his native city, and president of Lime Rock bank. At the first call for troops to suppress the Confederate movement he raised three full companies, and himself entered the service as colonel of the Fourth Maine volunteers. He was made a brigadier-general Mar. 17, 1862, and major-general Nov. 29, 1862. Killed at the head of his division by a shot while leading a bayonet charge on the morning of May 2, 1863.

Berryer, bār'i-ay', ANTOINE PIERRE: French orator and lawyer; b. in Paris, Jan. 4, 1790. He defended Gen. Cambronne about 1815, gained distinction as an advocate of defendants in political trials, and was elected to the Chamber of Deputies in 1830. After Charles X. had been dethroned (July, 1830), he remained in the Chamber as the orator of the Legitimist party, although the other members of that party all retired. He made an eloquent speech against the abolition of hereditary nobility in 1831. During the first years of the reign of Louis Philippe he was regarded as the foremost orator in the Chamber. In 1840 he defended Louis Napoleon, who was tried for his attempt to excite a revolution at Boulogne. He was elected to the Constituent Assembly in 1848, and the Legislative Assembly in 1849. In 1850 he went to Wiesbaden to offer homage to the Count de Chambord. He opposed the republic, and protested against the *coup d'état* of Dec., 1851, after which he retired from political life. In 1852 he was elected a member of the French Academy. D. in Paris, Nov. 29, 1868. See Louis Marie de la Haye de Cormenin, *Biographie parlementaire de M. Berryer* (1837).

Ber'yville: on railroad; capital of Clarke co., Va. (for location of county, see map of Virginia, ref. 3-G); is situated 5 miles W. of the Shenandoah river and 10½ E. of Winchester. It contains an academy, and is often called "Battle-town," owing to the many contests there of Gen. Morgan of Revolutionary fame. Washington, in surveying the lands of this county when it was a part of Frederick, had his headquarters at a beautiful spring just beyond the town. Pop. (1870) 580; (1900) 938.

Bersaglieri, bār-sāal-yā'rēē: the Italian name of the riflemen or sharpshooters who served in the army of Victor Emmanuel when he was King of Sardinia. They took part in the Crimean war, 1854-55, and fought against Austria in 1859. They wear a dark-green uniform.

Ber'serker [Icel. *berserkr*, probably meaning bear-coat]: a hero of Scandinavian mythology, who fought without coat of mail. He was the grandson of Starkader, and overcame all opponents by his irresistible valor. The name has also been given to a class of warriors who fought naked and performed extraordinary feats under the influence of a kind of demoniac possession.

Bert, bār, PAUL: b. at Auxerre, in the department of Yonne, France, Oct. 17, 1833; studied medicine in Paris; was appointed professor in the faculty of sciences at Bordeaux 1866, and Professor of Physiology in Collège de France 1869; achieved a great reputation by his interesting physiological researches, and more especially by his bold experiments for ascertaining the conditions of human existence at different altitudes, for which he received in 1875 the grand biennial prize of the Académie des Sciences (20,000 francs). See his *Notes d'Anatomie et de Physiologie comparées* (1867-70); *Recherches sur le Mouvement de la Sensitive* (1867-70); *Recherches expérimentales sur l'influence que les modifications barométriques exercent sur les phénomènes de la vie* (1874); *La Pression barométrique* (1874). He also took a part in politics; was prefect of the department of Le Nord in 1871; elected a member of the Chamber of Deputies in 1872; joined the *Union républicaine*; spoke with great ardor in favor of making elementary instruction compulsory and secular; was Minister of Public Instruction in Gambetta's cabinet. See his *La Morale des Jésuites* (6th ed. 1880); *La première année d'enseignement scientifique et instruction civique à l'École* (1882). D. in Hanoi, Nov. 11, 1886.

Berthelot, bār'te-lō', MARCELLIN PIERRE: chemist; b. in Paris, Oct. 25, 1827; Professor of Chemistry in the Collège de France in his native city. He has contributed largely to our knowledge of synthetical processes, and especially of the relations between the phenomena of heat and of chemistry. His principal larger works are: *Chimie organique fondée sur la synthèse* (1860); *Mécanique chimique fondée sur la thermo-chimie* (1879); *Les origines de l'alchimie* (1885); *Chimie des anciens* (1889).

Berthier, bār'ti-ay, LOUIS ALEXANDRE: Prince of Wagram; general; b. at Versailles, Nov. 20, 1753. He served as captain under La Fayette in the U. S. 1778-82. In 1796 he became general of division, and chief of the staff of Bonaparte's army of Italy. He gained the confidence of the general-in-chief, retained for many years the position of chief of the staff, and accompanied Bonaparte to Egypt in 1798. About the end of 1799 he was appointed Minister of War. He became a marshal of France in 1804, and rendered important services in the campaign against Austria, 1805. He usually rode in the carriage of Napoleon, whose plans he digested, and whose orders he dispatched with remarkable rapidity and precision. For his conduct at the battle of Wagram (1809) he received the title of Prince of Wagram. He entered the service of Louis XVIII. in 1814, but when Napoleon returned from Elba Berthier retired to Bamberg, where he was killed by a fall from a window, Jan. 1, 1815.

Berthierite, or **Hardingerite**: a steel-gray, bronzy mineral containing FeS + Sb₂S₃.

Berthold, bār'tōlt, von **Regensburg**: the greatest German preacher of the Middle Ages; b. probably in Regensburg about 1220; d. there Dec. 13, 1272. His sermons are valuable not only as specimens of early German pulpit oratory which he created, but also as documents of early German prose. See Franz Pfeiffer, *Berthold von Regensburg Predigten* (Vienna, 1862); Franz Göbel, *B. v. R. Missionspredigten* (1873); Unkel, *B. v. R.* (Cologne, 1882). J. G.

Berthollet, bār'to-lay', CLAUDE LOUIS, M. D., Count: chemist; b. in Talloire, Savoy, Nov. 9, 1748. He discovered the composition of ammonia, and invented the process of bleaching by chlorine, that of filtration through charcoal, and several fulminating powders. Author of *The Elements of the Art of Dyeing* (1799), and *Essai de statique chimique* (1803). He was associated with Lavoisier in forming a new chemical nomenclature, and was one of the chief originators of modern chemistry. D. near Paris, Nov. 6, 1822.

Bertholle'tia: a genus of trees of the family *Myrtaceæ*. It contains *B. excelsa*, which produces BRAZIL-NUTS (*q. v.*).

Berti, DOMENICO: See the Appendix.

Bertillon, ALPHONSE: anthropologist; b. in Paris, 1853. In 1880, as chief of the identification bureau of the police service of Paris, he established a system of measurements that made the recognition of recidivists or lapsed criminals practically a certainty. In the 700 identifications, which had been transmitted by him to the examining magistrate during the preceding six years, not a single error had been found. His method was adopted throughout France, with a central bureau in Paris, where there occurred a speedy and most marked decrease in the number of professional criminals, who by various disguises had hitherto been able to elude identification by photograph. Belgium and adjacent countries soon adopted the method in self-defense, and it is now general in Europe. It was adopted in Chicago during the World's Fair in 1893 with good results. The principles upon which in practice the system rests take a threefold form: (1) *Anthropometric* (see ANTHROPOMETRY), consisting of measurements of the bony and least changing parts of the adult—e. g. the length and breadth of the head, length of the spine, forearm, finger, nose, ear, etc.; (2) *descriptive*, giving color and other characteristics of the eye, color and quality of the hair, etc.; and (3) *pathological*, giving marks resulting from disease, wounds, or tattooing, warts, moles, etc. These are recorded in a regular order, and by clever abbreviations written on cards and filed away in groups according to some prominent measurements. The chances of error in identification are one in 13,000,000. The system has been used to some extent in the U. S., but a central bureau is needed where duplicates of every case may be kept. The advantages are self-evident; photographs are uncertain, as all men are subject to change in face and appearance whereas the bony parts and iris of the adult never change; photographs can not be sent by telegraph, while these measurements can be sent cheaply and

correctly, the order of facts being the same everywhere. Bertillon has written several works on the subject of criminal anthropology. See his *Identification Anthropométrique* (1893); and *The Theory and Practice of Anthropometric Identification*, by R. W. McClaughy (Chicago and New York, 1896). W. M. F. ROUND.

Bertin, bār'tān', LOUIS FRANÇOIS; called **Bertin l'Ainé**, laÿ'nay': journalist; b. in Paris, Dec. 14, 1766. He founded in 1800, together with his brother (LOUIS FRANÇOIS, surnamed DE VEAUX), the daily *Journal des Débats*, a literary and political journal, which obtained great influence and success. He was hostile to Napoleon, who banished him. On Napoleon's fall he returned and revived his journal in 1814, and continued to edit it until his death, Sept. 13, 1841.—His son LOUIS MARIE ARMAND, b. Aug. 22, 1801, succeeded him as editor. D. in Paris, Jan. 12, 1854.

Bertramus: See RATRAMNUS.

Bertrand, bār'traān', HENRI GRATIEN, Count de: a French general; b. at Châteauroux, Mar. 18, 1773. He followed Napoleon to St. Helena in 1815. D. in Châteauroux, Jan. 31, 1844, leaving *Memoirs of the Campaigns of Egypt and Syria, Dictated by Napoleon at St. Helena* (2 vols., 1847).

Berwick-on-Tweed (often called simply **Berwick**): a fortified seaport-town of England; in Northumberland; on the left (north) bank of the Tweed, at its entrance into the North Sea; 58 miles by rail E. S. E. of Edinburgh; lat. 55° 46' N., lon. 1° 59' W. (see map of England, ref. 2-G). The river is here crossed by an old stone bridge of fifteen arches, 924 feet long, and by a magnificent viaduct, over which the trains of the North British Railway pass. It is crossed by the Northeastern, the Midland, and the Great Northern Railways. It has a Gothic church, a theater, a public library, a town-hall, also large manufactures of steam-engines, mill-machinery, etc. Coal mines are worked in the vicinity. Pop. (1891) 13,378. The history of Berwick is full of interest. It was one of the chief seaports of Scotland in the Middle Ages, and in the border wars was often taken and retaken by the English and Scotch, who regarded it as an important military position. It was finally ceded to England in 1502, and became by treaty a free town, independent of both states. These privileges were confirmed on the accession of James I. to the English throne. Down to the time of George II. it was customary in parliamentary statutes to mention specifically their application to "Berwick-on-the-Tweed."

Berwickshire: a county of Scotland; forming its south-east extremity; bounded N. by Haddington, N. E. by the German Ocean, and S. E. by the river Tweed, which separates it from England, S. by Roxburgh, and W. by Edinburgh. Area, 463 sq. miles. It is drained by the Blackadder, the Whiteadder, and the Eye. The surface is partly hilly in the northern part, occupied by the Lammermuir Hills. The Merse district in the south part, and near the Tweed, is nearly level, and is one of the most fertile and well-cultivated tracts in Great Britain. Carboniferous limestone, porphyry, and old red sandstone occur here. Pop. (1901) 30,785. Capital, Greenlaw.

Ber'yl (Gr. *βήρυλλος*): a mineral (silicate of beryllia) which crystallizes in six-sided prisms, generally green, varying to blue, yellow, or even colorless. The sides of the prisms are often striated longitudinally, but the terminating or truncating planes are generally smooth. The hardness is 7.5 to 8. Those that have clear tints of sky-blue or sea-green form, when transparent, beautiful gems, called by jewelers aqua marine. The clear yellow ones are also used as gems, under the name of golden beryl. The deep rich green variety is the EMERALD (*q. v.*). Beryls are not uncommon in regions of metamorphic rock (gneiss, mica-slate, etc.), such as New England. Gigantic crystals occur at Acworth and Grafton, N. H.—in one case 4 feet long and weighing over a ton, but rough and opaque. Beryls of fine quality occur in Brazil, the Urals, North Carolina, Maine, Colorado, and at other localities. See EMERALD. GEORGE F. KUNZ.

Ber'yx: name of a genus of fishes of the family *Beryce-dæ*, of which few species are living in the present seas, while a large number are found fossil. It begins with the first of the teleosts in the chalk. Three species are found in the chalk of England, and several in the tertiary, especially in the fish-beds of Monte Bolea, near Verona in Italy. This is therefore one of the oldest genera of living fishes.

Berze'lius, JOHAN JACOB, M. D., F. R. S., Baron: Swedish chemist; b. in East Gothland, Aug. 20, 1779. He stud-

ied medicine and chemistry at the University of Upsal, and published in 1606 a *Treatise on Animal Chemistry* (2 vols.). He acquired great excellence as an analyst, and made important discoveries in chemistry. He was the author of the system of chemical symbols, and he discovered the elements selenium and thorium. His most important work is a *System of Chemistry* (Lärebok i Kemien, 3 vols., 1808-18), which was translated into every European language. He was Professor of Medicine and Pharmacy at Stockholm 1807-32. He contributed largely to *Memoirs of Physics, Chemistry, and Mineralogy* (6 vols., 1806-18), a work founded by Berzelius and Hisinger. D. Aug. 7, 1848. See G. Forehammer, *J. J. Berzelius* (1849).

Besa: an ancient city of Egypt, on the site of which the city of Antinoöpolis was built by the Emperor Hadrian in honor of Antinous. It was situated on the east bank of the Nile, near the modern village of Ababde.

Besançon, baŷ'zaän-sön' (anc. *Vesontio*): a city of France; capital of the department of Doubs; on the river Doubs; 58 miles by rail E. of Dijon (see map of France, ref. 5-H). It is connected with Paris and Lyons by several railways, is well built and strongly fortified, having a citadel which is considered impregnable. It was formerly the capital of Franche-Comté. The most remarkable edifices are a Gothic cathedral, a town-hall, a theater, the palace of Cardinal Granvelle, and the prefecture. It has also a college, a public library, a museum, an academy of sciences and arts, and extensive manufactures of watches, jewelry, porcelain, carpets, etc. *Vesontio* was an important town in the time of Cæsar, who in 58 B. C. expelled the Sequani from it. It has Roman antiquities and the remains of an amphitheater and aqueduct. Pop. (1891) 56,065; (1896) 57,556.

Besant, the coin: See **BEZANT**.

Besant, WALTER: novelist; b. at Portsmouth, England, in 1838; graduated at Christ's College, Cambridge; was chosen to a professorship in the Royal College of Mauritius, and afterward served as secretary to the Palestine Exploration Fund. In conjunction with James Rice he published between 1871 and 1882 some dozen novels, including *Ready Money Mortiboy* (1871); *The Monks of Thelema* (1878); *By Celia's Arbour* (1878); and *The Seamy Side* (1880). After the death of his collaborator in 1882 he published a number of books. Among the most popular of these are *All Sorts and Conditions of Men* (1882), which dealt with the social problems of cities and led to the establishment of a public hall in the East End of London; *Dorothy Foster* (1884); *Children of Gibeon* (1886); *The World Went Very Well Then* (1887); *Herr Paulus* (1888); *For Faith and Freedom* (1889); *Armored of Lyonesse* (1890); *A History of London* (1893); *Beyond the Dreams of Avarice* (1894); *The City of Refuge* (1896). He was founder and first president of the Society of Authors. He was knighted May 24, 1895. D. June 9, 1901.

Besnard, bes'naar', PAUL ALBERT: contemporary figure-painter of the French school; pupil of Cabanel, and winner of the Grand Prix de Rome in 1874. He is identified with the most advanced "impressionists" in his methods, and is an artist of great individuality and surpassing technical skill. His portraits are remarkable for beauty and harmony of color, and he has done notable work in decoration. He is one of the most original figures in modern art, and is considered a master by those most in sympathy with his artistic purposes. Second-class medal, Salon, 1880; Legion of Honor 1888. Studio in Paris. W. A. C.

Bessara'bia (after Prince Bessaraba): a province in the southwest part of Russia; bounded N. by Podolia, E. by Podolia, Cherson, and the Black Sea, S. W. and W. by Roumania and Galicia. Area, 17,619 sq. miles. By the treaty of Paris (1856) part of Bessarabia adjacent to the Black Sea was ceded to Turkey, but by the treaty of Berlin in 1878 it was ceded to Russia again. The surface is mostly low and flat; the soil is fertile, producing wheat, barley, maize, tobacco, etc. The chief articles of export are cattle, wool, tallow, and salt. The most of the land is in pasturage. The population is composed of Russians, Germans, Bulgarians, Moldavians, Greeks, Jews, Poles, etc. Pop. (1897) 1,936,403. Capital, Kishinef.

Bessa'rion, JOHN: Greek cardinal; b. in Trebizond in 1403; was a disciple of Gemistus Piethon in philosophy. He favored the union of the Latin and Greek Churches; accompanied the Greek Emperor John II. to the Council of Ferrara (1438-39); was appointed a cardinal in 1439 by Pope

Eugenius IV., and Bishop of Frascati by Nicholas V.; received in 1463 the title of patriarch of Constantinople *in parlibus*. He wrote several works in defense of the philosophy of Plato, translated the *Metaphysics of Aristotle* into Latin, and was an efficient promoter of Greek learning in Italy. At his death he left his library to Venice, and it became the basis of the Library of St. Mark. D. in Ravenna, Nov. 19, 1472. See A. Bandini, *De Vita et Rebus gestis Bessarionis Cardinalis* (1777); also G. Voigt, *Die Wiederbelebung des classischen Alterthums* (2d ed. 1880); Vast, *Le Cardinal Bessarion* (1878); E. Legrand, *Bibliographie hellénique* (2 t., 1885).

Bess'borough, EARLS OF (1739): Viscounts Duncannon (1723), Barons of Bessborough (1723, in Ireland), Barons Ponsonby (1749, in Great Britain), Barons Duncannon (1834, in the United Kingdom), a prominent family of Great Britain.—JOHN GEORGE BRABAZON PONSONBY, the fifth earl; b. Oct. 14, 1809; succeeded his father in 1847. He was member of Parliament for Bletchingley in 1831, for Higham Ferrers in 1831, and for Derby 1834-37. D. Jan. 28, 1880.

Bes'semer: town; Jefferson co., Ala. (for location of county, see map of Alabama, ref. 3-C); on Queen and Crescent Route, and Louis. and Nash. R. Rs.; 11 miles from Birmingham. Bessemer is in an iron and coal mining district, and its principal industry is iron-working; it has also brick-making and wood-working industries. Pop. (1890) 4,544; (1900) 6,358.

Bessemer: city (founded in 1880); Pueblo co., Col. (for location of county, see map of Colorado, ref. 5-E); on Rio Grande R. R. and on Arkansas river, joining Pueblo on the south. The city has 4 public schools and 5 churches; its principal industry is furnished by a great steel-works, employing 1,200 men, with a monthly pay-roll of \$100,000. Pop. (1890) 3,317; annexed to Pueblo since 1890.

EDITOR OF "INDICATOR."

Bessemer: city (founded in 1884); capital of Gogebic co., Mich. (for location of county, see map of Michigan, ref. 2-D); on Du., So. Sh. and At., Mil., L. S. and W., and Wis. Central R. Rs.; 47 miles from Ashland, Wis., in a district noted for its beautiful scenery. Bessemer has a fine high school, six churches, and a stone court-house costing \$50,000. Its industries are chiefly manufacturing and iron-mining. Pop. (1890) 2,566; (1900) 3,911.

EDITOR OF "PICK AND AXE."

Bessemer, Sir HENRY: an English inventor, whose name is coupled with a revolution in the manufacture of steel. He was born at Charlton, in Hertfordshire, Jan. 13, 1813; the youngest son of Anthony Bessemer, a French refugee. Beginning life in London at the age of eighteen as a modeler and designer, he turned his attention first to improving the method of stamping deeds, which was adopted without compensation to Bessemer by the English Stamp Office. He successively turned his inventive skill to devising machinery for making figured Utrecht velvet, to working out a type-casting machine, and to the manufacture of bronze powder. The latter proved a conspicuous commercial success, and is still produced by his successors. Between 1844 and 1853 a series of other inventions occupied his attention. In 1854 he brought before Emperor Napoleon an invention relating to projectiles. This brought him into contact with the manufacture of steel, and led him to make a series of experiments at an old factory at St. Pancras, which led to the invention of the pneumatic process bearing his name. The first public announcement of it was made on Aug. 11, 1856, at the Cheltenham meeting of the British Association. It was received with skepticism and ridicule by the majority of iron-makers. Experiments which proved successful in some localities were discredited by disastrous failures in others. A series of laborious and costly investigations followed, which proved that the pig iron to be used must be low in phosphorus, and that a manganese carbon alloy must be added at the end of the operation, the latter discovery having been made by Robert Mushet. Again Bessemer came before the public, reading a paper on May 24, 1859, before the Institution of Civil Engineers. It was not until he had established works at Sheffield, and had become an active and dangerous competitor, that other makers availed themselves of the process. It made such rapid progress that ten years after the first announcement Bessemer was deriving from it an income of £100,000 per year, his total revenue from the patents having been £1,057,748. The Sheffield works yielded in fourteen years eighty-one times the origi-

nal investment. In 1869 he entered a new field of invention, aiming to check the rolling motion of vessels and prevent seasickness. A vessel with a swinging saloon was launched in 1874, but after a few voyages she was abandoned. Later he devoted himself to the improvement of telescopes. D. in London, Mar. 15, 1898. C. KIRCHHOFF.

Bessemer's Process for Refining Iron: See BESSEMER, HENRY, and STEEL.

Bes'ser, WILLIAM FREDERICK, D. D.: Lutheran preacher and commentator; b. at Warnstedt, in the Harz, Sept. 27, 1816. He was a pupil of Tholuck, Hengstenberg, and von Gerlach. The most of his life was spent in the pastorate in Pomerania and Silesia. From 1853-57 he was associate director of the Leipzig Society for Foreign Missions. He was a preacher of great power who sought to faithfully expound the meaning of the text of the Bible, and whose expository lectures (*Bibelstunden*) cover nearly all the books of the New Testament. They are extensively read in devotional meetings in Germany. Several volumes have been translated into English: *Christ the Light of the World*; *Christ the Life of the World*, an exposition of the Gospel of John (Edinburgh, 1861); an admirable translation by Mrs. Huxtable. D. in Niederlössnitz, near Dresden, Sept. 26, 1884.

HENRY E. JACOBS.

Bes'sey, CHARLES EDWIN, Ph. D.: botanist; b. in Milton, Wayne co., O., May 21, 1845; educated in the common schools and academies of Ohio, in Michigan Agricultural College, and in Harvard University; Professor of Botany in Iowa Agricultural College 1870-84; Professor of Botany in University of Nebraska 1884; associate editor (botany) of *American Naturalist* 1880; president of Iowa Academy of Sciences 1875-84; president of Society for the Promotion of Agricultural Science 1883-85; president of Nebraska Academy of Sciences 1891; acting chancellor of University of Nebraska 1888-91; fellow of American Association for the Advancement of Science; principal publications are *Reports on Insects* (1873-74); *Geography of Iowa* (1876); *The Erysiphei of North America* (1877); *Botany for High Schools and Colleges* (1880); *Essentials of Botany* (1884); *Reports of the State Botanist of Nebraska* (1887 to 1892); *Preliminary Report on the Native Trees and Shrubs of Nebraska* (1891); associate editor of *Johnson's Universal Cyclopaedia*, in charge of the department of Botany, 1893.

Bessières, bes'si-âr', JEAN BAPTISTE: Duke of Istria; French marshal; b. near Cahors, Lot, Aug. 5, 1768. He entered the army as a private in 1792, served with distinction in Italy and Egypt, became a general of division in 1802, and marshal of France in 1804. He rendered important services at Austerlitz, Jena, Friedland, and Eylau. Having obtained in 1808 command of an army in Spain, he gained a victory at Medina del Rio Seco. He had the chief command of the cavalry of the grand army in 1813, and was killed on the day before the battle of Lützen, May 1, 1813. See Miramont, *Vie de J. B. Bessières*; *Victoires et Conquêtes des Français*.

Best, WILLIAM THOMAS: organist; b. in Carlisle, England, Aug. 13, 1826; devoted himself to the study of the organ, and received his first appointment in 1840 in Liverpool, where with few intervals he had since remained. Since 1855 he had been organist of St. George's Hall there. He was one of the most remarkable organists of the century. His compositions include a few church services and anthems, and an immense number of organ pieces, original and arranged, a few pieces for pianoforte, and two or three orchestral pieces. D. May 10, 1897. D. E. HERVEY.

Bestia'ris: books treating of beasts. See PHYSIOLOGUS.

Betanzos, baÿ-taan'thōs (anc. *Fla'vium Brigantium*): a town of Spain; province of Corunna; 12 miles S. E. of Corunna (see map of Spain, ref. 12-B). It is said to be the oldest town in Galicia, and has remains of ancient fortifications. Here are manufactures of linen, leather, and pottery. Pop. (1887) 8,122.

Be'tel, or Pawn: a narcotic stimulant extensively used as a masticatory by Oriental peoples, especially by tribes of the Malay race. It consists of a portion of the nut of the *Areca catechu* (called the betel-nut or *pinang*), rolled up with lime in the leaf of the *Piper betel* or other species of pepper. The leaf is plucked green, and is smeared with moistened quicklime before the slice of areca nut is wrapped in it. This mixture is chewed continually by men, women, and children, and the use of it is so general that a Malay presents his betel-box as a European offers his snuff-box.

This practice appears to be very ancient, having prevailed before the Christian era. The betel causes giddiness in those who are not accustomed to chewing it. The habitual use of it blackens the teeth, and perhaps destroys them. According to Sir James E. Tennent, the betel is beneficial, acting as a tonic, antacid, and carminative.

Beth: a Hebrew noun, meaning "house" or "habitation"; employed some fifty times in the Scriptures as a prefix in naming places, such as Bethel, Bethlehem, and Bethany.

Betham-Edwards, Miss MATILDA BARBARA: author; b. at Westerfield, England, 1836; has contributed to *Punch*, *Graphic*, *Macmillan's Magazine*, and other periodicals, and published numerous novels which have been reprinted in other languages, *The White House by the Sea* appearing in 1855. In 1885 she published a volume of poems, and in 1889 edited Arthur Young's *Travels in France*.

Beth'any [Heb., house of dates]: a village of Palestine; on the east slope of the Mount of Olives, nearly 2 miles (15 stadia) E. of Jerusalem. As the home of Mary, Martha, and Lazarus, it was the scene of interesting events in sacred history. (See Matthew xxi. 17; xxvi. 6; John xi. and xii.; Luke xix. 29.) From some point near the village Christ ascended into heaven. (Luke xxiv. 50.) Here is a cave or excavation in a rock, which, according to a worthless tradition, is the grave of Lazarus. The descent into it is effected by twenty-six steps cut into the solid rock. The modern village contains about forty families of Moslems.

Bethany: town; capital of Harrison co., Mo. (for location of county, see map of Missouri, ref. 1-E); on Chicago, Burlington and Quincy R. R.; 62 miles N. E. of St. Joseph; is in an agricultural and stock-raising district, and has wagon, broom, and canning factories. Pop. (1880) 994; (1890) 1,105; (1900) 2,093.

Bethany: a village of Brooke co., West Va. (for location of county, see map of West Virginia, ref. 3-II); on Buffalo Creek; 7 miles from the Ohio river, and 16 miles N. E. of Wheeling. It is situated in a beautiful and fertile region, and is the seat of Bethany College, established in 1841 by Alexander Campbell. (See DISCIPLES OF CHRIST.) Pop. (1880) 335; (1890) about 400; (1900) 245.

Beth'el (Arab. *Beitin* or *Beiteen*): an ancient town of Palestine; noted as the scene of the dream of the patriarch Jacob; was 10 or 12 miles N. of Jerusalem. It was near the boundary between Judea and Samaria. Here are ruins of ancient churches and other buildings.

Bethel: borough; Fairfield co., Conn. (for location of county, see map of Connecticut, ref. 11-D); on branch of Housatonic R. R.; 62 miles from New York city; has large hat-shops, farming industries, and street railroad to Danbury, 3 miles distant. Pop. (1880) 1,767; (1890) 2,335; (1900) 2,561.

Bethel: on railroad; Windsor co., Vt. (for location of county, see map of Vermont, ref. 7-C); 25 miles N. W. of White River junction; has manufactures of lumber, leather, flour, shoes, meal, etc. Pop. of township (1880) 1,693; (1890) 1,448; (1900) 1,611. EDITOR OF "COURIER."

Bethel College: in McKenzie, Tenn.; an institution of learning founded, with a liberal charter, in 1850. Obligated to close its doors during the civil war, it was successfully reorganized at its close, and has since had a successful career. The college is under the control of the Synod of West Tennessee of the Cumberland Presbyterian Church. A liberal Christianity and a high standard of moral character are inculcated, yet no peculiar sectarian or political principles are allowed in the literary department. Candidates for the ministry of all denominations receive tuition free of charge. Both sexes are admitted. The course of study is thorough and of an eminently practical character. Charles E. Starke, A. M., is president. At present (1900) there are 6 teachers in all departments, 3 permanent lecturers, and 87 students.

Bethes'da [Heb., house of mercy]: a pool or tank at Jerusalem where the lame man was miraculously healed (John v. 1-9). Some identify it with Birket Israil, a large reservoir inside the city walls, near St. Stephen's Gate; others with the Fountain of the Virgin (intermittent), about 300 yards S. of the Temple area; and others with the pool of Siloam, about 300 yards farther S.

Beth'lehem [Heb., house of bread; so called from its fertile soil]: a town frequently mentioned in both the Old and New Testaments, and especially distinguished as the

birthplace of our Saviour, as well as of his ancestor, King David (see map of Palestine, ref. 10-D). Anciently it was called "Bethlehem Judah," to distinguish it from another Bethlehem in the northern part of Palestine (Josh. xix. 15). It is mentioned as existing in the time of Jacob, but was probably never very large or commercially important. It has at present about 5,000 inhabitants, all Christians. The principal trade of the place is in crosses, beads, and relics. Here are Greek, Latin, and Armenian convents; and the monks show a cave which they claim to have been the stable where our Lord was born. See Robinson's *Biblical Researches*; Hackett's *Illustrations of Scripture*; Ritter's *Geography of Palestine*.

Bethlehem: borough and railroad junction; Northampton co., Pa. (for location of county, see map of Pennsylvania, ref. 4-J); on the left bank of the Lehigh river, 57 miles N. of Philadelphia and 5 miles E. of Allentown. It is pleasantly situated on the slopes of several hills. Two bridges across the river connect it with South Bethlehem, the seat of Lehigh University, founded by Asa Packer in 1866, and richly endowed, having fine stone edifices on a high and commanding position. Bethlehem was founded in 1741 by the Moravians, who have here a large stone church 142 feet long, a theological seminary, an ancient chapel, a young ladies' seminary, and an extensive parochial school. There are a large number of manufactories, chiefly in South Bethlehem, including three silk-mills, several foundries, the Bethlehem Iron Company's rolling-mills, machine-shops, etc.—one of the largest establishments of the kind in the U. S.; Lehigh Zinc Company's rolling-mill, zinc oxide and spelter works; Lehigh Brass-works, gas-works in both boroughs, etc. South Bethlehem also contains the main offices of the Lehigh Valley Railroad Company. Pop. (1880) 5,193; (1890) 6,762; (1900) 7,293; of South Bethlehem borough (1880) 4,925; (1890) 10,302; (1900) 13,241. EDITOR OF "TIMES."

Bethlemites: an order of monks established at Cambridge, England, in 1257; also, an order of monks and nuns instituted at Guatemala about 1665. They are found in Central and South America and the Canary islands.

Bethlen-Gabor, bet'len-gaa'bōr: Magyar general and ruler; b. 1580; through aid of the Turks was chosen Prince of Transylvania 1613; aided the Bohemians in defense of their religious and political rights against Austria 1619; King of Hungary 1620, but soon abdicated, receiving important concessions from Ferdinand II. of Austria; took part in the Thirty Years war. He did much to advance the cause of learning. D. 1629.

Bethmann-Hollweg, bāt'maan-hōl'vāch, MORITZ AUGUST: jurist and statesman; b. at Frankfort-on-the-Main, Apr. 8, 1795. He was Professor of Civil Law at Berlin, and subsequently at Bonn, and was Prussian Minister of Public Instruction from 1858 to 1862. He published several valuable legal works. D. in his castle, Rheineck, on the Rhine, near Andernach, July 14, 1877.

Beth'phage [Heb., house of figs]: a locality in Palestine, near Jerusalem; appears to have been on or near the Mount of Olives. The name occurs in Luke xix. 29 and Matthew xxi. 1. Its site has not been exactly ascertained.

Bethsa'ida [Heb., fish-houses]: an ancient town in Palestine; on the west shore of the Lake of Galilee, the home of Andrew, Peter, and Philip (John i. 44). Dr. Robinson identifies it with Ain-et-Tabigbah, in a little bay or cove between Khan Minyeh (Capernaum?) and Tell Hum (Chorazin?). Another Bethsaida, afterward called *Julias*, was situated near the head of the lake, on the east side of the Jordan, about 2 miles from its mouth. It was near this Bethsaida that Christ fed the 5,000. (Luke ix. 10-17.)

Beth'shemesh [Heb., house of the sun]: the name of four places mentioned in the Scriptures, the most important of which was a sacerdotal city of Judah, about 15 miles W. S. W. of Jerusalem, and about 2 miles from the great Philistine plain. It was here the ark rested on its way home from Ekron (7 miles). It was here that Amaziah, King of Judah, was worsted and taken prisoner by Jehoash, King of Israel (2 Kings xiv. 11-13). In the reign of Ahaz it was captured by the Philistines (2 Chron. xxviii. 18), and is not again mentioned in sacred history. It stood on a low ridge. Only ruins now mark the spot, which bears the name of *Ain-Shems* (fountain of the sun). The greater part of Samson's exploits were in its immediate neighborhood.

Béthune, bay'tün': a fortified town of France; department of Pas-de-Calais; 23 miles by rail N. N. W. of Arras (see map of France, ref. 2-F). It has a fine castle, a college, and a Gothic church; also manufactures of oil, soap, and woolen goods. It was taken from the Spaniards in 1645, retaken by Prince Eugène in 1710, and restored to France in 1713. Pop. (1896) 11,627.

Bethune, CHARLES J. S.: See the Appendix.

Bethune, GEORGE WASHINGTON, D. D.: divine and poet; b. in the city of New York, Mar. 18, 1805; graduated at Dickinson College 1823, and studied at the Princeton Theological Seminary in 1823-25. In 1827 he became pastor of a Dutch Reformed church in Rhinebeck, N. Y. He was afterward settled in Utica, and still later in Philadelphia. In 1851 he removed to Brooklyn, N. Y., and 1859 to New York as associate pastor of the Twenty-first Street church. He was a distinguished orator and most lovable man, a poet and a wit. In 1861 he went to Europe for the benefit of his health, but died at Florence, Apr. 27, 1862. He published an edition of *Walton's Complete Angler* (N. Y., 1846); *A Commentary on the 130th Psalm* (1847); and *Lays of Love and Faith* (1847). Several of his hymns are widely used. See his life by A. R. Van Nest (New York, 1867).

S. M. JACKSON.

Betlis: See BITLIS.

Béton, bay'tōi': an artificial stone made by the thorough mixing of sand and hydraulic cement. It was invented by François Coignet, and is hence often called *Béton-Coignet*. The word has been sometimes used as synonymous with concrete, but this designation is now mostly abandoned. See CEMENT, CONCRETE, and STONE.

Betterments: improvements put on real estate which enhance its value more than mere repairs. According to the common law, if a *bona fide* holder of real estate under a defeasible title made improvements while in possession of the land, they became a part of the realty, and could not be removed therefrom without the consent of the lawful owner, neither could any compensation be had therefor. Where the true owner, in an ejectment suit, asked judgment for mesne profits, the *bona-fide* disseisor was allowed to offset the same by a claim for his improvements. In some States statutes have been passed under which the disseisor is now allowed to bring an original action to recover the value of his improvements. Statutes will be found in the several States which provide that after recovery in ejectment, if the improvements were made in good faith, the defendant shall be entitled to recover of the plaintiff the value of the same; but the plaintiff is given the right to elect to have the value of the land without the improvements assessed, and the defendant must then purchase the same at the price assessed within a given time or lose the benefit of his claim for improvements. HENRY WADE ROGERS.

Bet'terton, THOMAS: English actor; b. in London in Aug., 1635. He performed with great success the parts of Hamlet, Macbeth, and Othello. He was the chief ornament of the English stage for nearly fifty years. His wife was a popular actress. D. in London, Apr. 28, 1710. See Charles Gildon, *Life of T. Betterton* (1710).

Betting, or **Wagering**: the laying or making of a bet or wager. (See WAGER.) This is a vicious practice which prevails more or less in all countries. The English are addicted to betting on horse-races to a ruinous extent. The British Parliament passed an act, 16 and 17 Vict. c. 119, to suppress the haunts of betters, called betting-houses, which it declares to be a common nuisance and contrary to law. But it provides that its enactments shall not extend to stakes or deposits due to the winner of any race or lawful sport. The U. S. laws prohibit betting on elections.

Betts, BEVERLEY ROBINSON, A. M.: b. in the city of New York, Aug. 3, 1827; graduated at Columbia College in 1846, and at the General Theological Seminary of the Protestant Episcopal Church in that city in 1850; ordained in 1850. After a short charge of Trinity church, Rockaway, he was in 1855 made rector of St. Saviour's church, Maspeth, Long Island, which position he held for nearly fourteen years; in 1865 he was appointed librarian of Columbia College; prepared for the press a full catalogue of the library of the college (1874); was a frequent contributor to Church reviews and journals. He retired from the librarianship in 1883. D. May 21, 1899.

Betts, SAMUEL ROSSITER, LL. D.: jurist; b. in Richmond, Mass., June 8, 1787; graduated at Williams College in 1806;

practiced law in Sullivan co., N. Y.; served in the war of 1812; became judge advocate; was a member of Congress (1815-17). He was a judge of the circuit court of the State (1823-26), and U. S. district judge (1826-67). D. in New Haven, Conn., Nov. 2, 1868. He published a treatise on *Admiralty Practice* (1838).

Betul, bāy-tool': a district of Nerbudda, Central Provinces, British India; the westernmost part of the great Satpura plateau; between the parallels 21° 20' N. and 22° 35' N., and meridians 77° 20' E. and 78° 35' E. It is a hilly highland tract, averaging 2,000 feet above the sea. The northern and southern parts are sparsely settled and comparatively sterile, while the central portion has a very rich soil, is well watered, and densely populated. Wheat and pulses form the principal crops, while cotton, rice, sugarcane, and opium are raised to some extent. Coal occurs in many parts, but is not worked. Extensive forests occupy about one-fifth of the area, and yield much good timber. Area, 3,905 sq. miles. The climate is comparatively salubrious, but fevers of a severe type prevail in the jungles. The rainfall is about 40 inches per year. Pop. 300,000. The aboriginal Gonds can still be found in the jungle towns.
M. W. H.

Beugnot, bōn'yō', ARTHUR AUGUSTE, Comte de: writer and liberal statesman; b. at Bar-sur-Anbe, Mar. 25, 1797. He wrote an *Essay on the Institutions of Saint Louis* (Paris, 8vo, 1821); *The Jews of the West* (Paris, 8vo, 1824); and a *History of the Destruction of Paganism in the West* (2 vols., 1835). He became a peer of France in 1841. As a member of the Legislative Assembly of 1849 he promoted freedom in public instruction. D. in Paris, Mar. 15, 1865.

Beulé, bō'lay', CHARLES ERNEST: a French archæologist; b. in Saumur, June 29, 1826; took part in 1849-53 in the excavations of the Acropolis in Athens, and became in 1854 Professor of Archæology in the Imperial Library in Paris. He wrote, among other works, *L'Acropole d'Athènes* (2 vols., 1854); *Études sur le Péloponnèse* (1855); *Fouilles de Carthage* (the results of his excavations in Carthage in 1858); and *Auguste, sa Famille*, etc. (1867). D. in Paris, Apr. 4, 1874.

Beurmann, boir'mään, KARL MORITZ, von: explorer; b. in Potsdam, July 28, 1835. In 1860 he attempted to explore the country of the Bogos, but did not succeed in reaching it until Mar., 1861. In Dec., 1861, he was engaged to look for Vogel, who, it was supposed, had been murdered in Wadai. Beurmann was to start from Tripoli, while at the same time Heuglin should attempt to reach Wadai from Abyssinia. He reached Kuka in Bornu in Aug., 1862. As it was impossible to reach Wadai at that time, he made a trip to Jacoba in Bantchi, from which he returned to Kuka Dec. 13. Soon after he attempted the voyage to Wadai, and, having succeeded after several futile attempts, he was murdered in Feb., 1863, in Moa, in the most western province of Wadai, by the command of the governor.

Beust, boist, FRIEDRICH FERDINAND, Count von: b. in Dresden, June 13, 1809. He studied law and political economy at Leipzig and Göttingen; entered the diplomatic service of Saxony in 1831; was made minister of foreign affairs in 1849. In this position he made himself noticed by his opposition to Prussia, which often assumed the aspect of mere rivalry with Bismarck. After the battle of Sadowa he resigned his position, and removed to Vienna; in 1867 he was made chancellor of the Austrian empire, notwithstanding his Protestant faith. The complete reorganization of the empire—political, financial, military, etc.—was the problem placed before him, and the present constitution, which made great concessions to the Magyars, placing them on an equal footing with the Germans, but paying little regard to the Slavs, was his work. Following his advice, Austria simply canceled the concordat with the Pope in spite of the protest of the Cnria, removed Jewish disabilities, and authorized civil marriages. In 1871 he went to London as Austrian ambassador; he remained till 1876, when he was appointed Austrian ambassador at Paris; held the office till 1882. D. in Vienna, Oct. 24, 1886. See his *Memoirs* (Eng. trans. by H. de Worms, London, 2 vols., 1887).

Beuthen, boi'ten: a town of Prussia; in Silesia; 50 miles E. S. E. of Oppeln (see map of German Empire, ref. 5-J); has manufactures of woolen cloth, zinc-ware, and pottery. Pop. (1880) 22,823; (1890) 30,823.

Beveridge, WILLIAM: Orientalist and bishop; b. at Barrow, Leicestershire, England, early in 1636-37 (baptized

Feb. 21), and was educated at Cambridge. He was a man of great learning, and of profoundly religious character. He published a *Treatise on Chronology* (1669); a work *On the Canons of the Greek Church* (1672); and several devotional treatises. In 1704 he was appointed Bishop of St. Asaph. D. in London, Mar. 5, 1707-08. See Thomas H. Horne's *Memoir of Bishop Beveridge*, prefixed to an edition of his works (9 vols., London, 1824); another edition was published in twelve volumes of the Anglo-Catholic Library at Oxford (1842-48). His favorite production, *Private Thoughts upon Religion*, appeared posthumously (1709); often reprinted (e. g. 1871).

Beverland, bev'er-laänt, ADRIAAN: a Dutch classical scholar and heterodox writer; b. at Middelburg about 1654; was a friend of Isaac Vossius. He wrote *Peccatum Originale* (place of publication called "Elentheropolis in Porto Hesperidum," 1678; 2d ed. Leyden, 1679; French translation in Paris, 1714; 6th ed. 1774); *De fornicatione cavenda* (Augsburg, 1697; 2d ed. Amsterdam, 1698); and other works which were censured for impiety. He wrote also *De stolata virginitatis jure* (Leyden, 1680). He was banished from Utrecht, and removed to England, where he died insane in 1712.
S. M. JACKSON.

Bev'erley: a market-town of Yorkshire, England; 1 mile W. of the river Hull, and 10 miles N. N. W. of the city of Hull (see map of England, ref. 6-J). It is the chief town of the East Riding of Yorkshire, and is handsomely built. The origin of the name is said to be *Beverlac*, a "lake or dam of beavers." It has an ancient and beautiful Gothic minster, called the Church of St. John, which exhibits several styles of Gothic architecture, and ranks next to York Minster among the ecclesiastical structures of England. The oldest part of this was erected in the thirteenth century. A priory was founded here about 700 A. D. Beverley has an active trade in corn, coals, and leather, and is on the railway from Hull to York. It was made a suffragan episcopal see in 1889. Pop. (1891) 12,539.

Beverly: city; on main line of B. and M. R. R., Essex co., Mass. (for location, see map of Massachusetts, ref. 1-1); is on a small inlet of the ocean, 2 miles N. N. E. of Salem and 18 miles N. N. E. of Boston. A bridge across the inlet connects it with Salem. It derives its prosperity chiefly from manufactures of shoes, oiled clothing, leather belting, earriages, and other staple merchandise. Has a high school, fine system of water-works, a well-equipped fire department, and two street-railway systems. Its tax valuation in 1891 was \$13,168,155. Pop. of township (1880) 8,456; (1890) 10,821; (1900) 13,884.
EDITOR OF "CITIZEN."

Beverly: a city of Burlington co., N. J. (for location of county, see map of New Jersey, ref. 5-D); on railroad and the Delaware river; 15 miles above Philadelphia. It has a woolen mill, an oil-cloth factory, a very extensive rope-walk, and is a place of summer resort. Pop. (1880) 1,759; (1890) 1,957; (1900) 1,950.

Bewick, byu'ik, THOMAS: English engraver; b. near Newcastle-on-Tyne, Aug. 12, 1753; a pupil of Beilby. He was the founder of the modern English school of wood-engraving, and none of his numerous pupils has excelled him. He illustrated Gay's *Fables* (1779). Beilby and Bewick published in 1790 a *History of British Quadrupeds*, with engravings, which procured for Bewick a high reputation. He was assisted by his brother John in the designs of Goldsmith's *Traveller* and *Deserted Village*. Among his best works are *Æsop's Fables* and a *History of British Birds* (2 vols., 1804). D. at Gateshead, Nov. 8, 1828. See Dobson, *Bewick and his Pupils* (1884).

Bey, or **Beg** [Turk., prince, governor]: a title of the Turkish empire. The ruling officers of Tripoli and Tunis are beys, and the same title is given to some local magistrates, to colonels and generals of the army, and to the sons of pashas. In other cases it is a merely honorary title.

Beyle, bayl, MARIE HENRI: French *littérateur*, who wrote under the assumed name of *Stendhal*; b. at Grenoble, Jan. 23, 1783. He held several high civil offices under Napoleon. Among his chief works are a *History of Painting in Italy* (2 vols., 1817); *Le Rouge et le Noir*, a novel; a *Life of Rossini* (1824); *Memoirs of a Tourist* (1838); *Rome, Naples, and Florence*; and a novel called *The Carthusian Nun of Parma* (1839). He passed many years in Italy. D. in Paris Mar. 23, 1842. See Honoré de Balzac, *Études sur M. Beyle*.

Beyrout, or **Beyrut**, **Beirut**, or **Bairut**, pronounced in Arabic bay'root', but in Turkish bī'root' [supposed by some

to be identical with the *Berothai* of 2 Sam. viii. 8, and the *Berothah* of Ezek. xlvii. 16; Gr. Βηρυτός; Lat. *Berytus*]: a flourishing commercial town and seaport of Syria; finely situated on the Mediterranean, at the foot of Mt. Lebanon, 58 miles W. N. W. of Damascus (see map of Palestine, ref. 2-E). The harbor admits only small vessels, but in the bay about 3 miles from the city there is good anchorage for large ships. This is the chief seaport of Damascus and Syria, and has an extensive commerce, which is increasing. French steamers ply weekly between Beyrout and Marseilles, and British steamers ply regularly between this city and Liverpool. The chief articles of export are madder, silk, wool, olive oil, and gums. Here are important manufactures of silk stuffs. Pop. about 85,000. *Berytus* was besieged and taken by Baldwin, King of Jerusalem, about 1110, and retaken by the Saracens in 1187. American missionaries have been there since 1823. The Protestant Syrian College was opened in 1866.

Be'za (Fr. *De Bèze*), THEODORE: Calvinistic theologian; b. in his father's castle in Vezelay, Burgundy, June 24, 1519. In his youth he enjoyed two benefices in the Catholic Church, and lived in Paris the careless life of a Humanist and poet; but he was converted in 1548 and went to Geneva, where he avowed himself a Protestant. He became Professor of Greek at Lausanne 1549, and an intimate friend of Calvin. In 1554 he published a treatise, *De Hæreticis a Civili Magistratu Puniendis*, in which he defended the burning of Servetus. He removed to Geneva in 1558, and became Calvin's ablest coadjutor, and his successor as Professor of Theology in 1564. He afterward ruled the Genevan Church with energy for forty years. At the same time he played a very prominent part in French religious history, for which his aristocratic birth, courtly bearing, and rare learning fitted him. He was the chosen spokesman of the Huguenot party, and frequently appeared in their behalf before kings and other potentates. After Calvin's death he was recognized more than ever as the great Reformed theologian. But he lacked Calvin's genius, and made his system too inflexible. Thus he prepared the way for the reaction which Arminius, one of his pupils, brought about. The Calvinistic party in the Church of England revered Beza and sat at his feet. One of his great services was the completion of Clement Marot's French translation of the Psalms (1560), which furnished the Huguenots with their song-book; another was his editions of Stephen's Greek Testament (Geneva, 1565, *sqq.*), with a superior Latin translation, first issued separately 1557, and notes; all of which were popular and affected King James's revisers. He also presented to the University of Cambridge the uncial codex D (1581). Among his other works are a *Life of Calvin*, the best of the contemporary biographies of the Reformers (Eng. trans. Edin. 1844). The *History of the Reformed Churches in France from 1521 to 1563* (3 vols., 1580), attributed to Beza, is his only in the sense that he suggested it, edited and supplied matter for it anonymously; but he was not the writer of the greater part of it (best ed. by Baum, Cunitz, and R. Reuss, Paris, 1883-89, 3 vols.; there is no Eng. trans.). D. in Geneva, Oct. 13, 1605. See Baum, *Th. Beza* (2 vols., 1843-51); Heppe, *Th. Beza* (1861).

SAMUEL MACAULEY JACKSON.

Bezant', or **Besant** [O. Fr. *besan*, plur. *besanz*, from Lat. *byzantius*, sc. *nummus*, coin, Byzantine]: a gold coin struck at Byzantium, or a circular piece of gold or silver without any impression; supposed to be a part of the old coinage of Byzantium. Some of these were brought home by the crusaders, and were current in England. Their value was 10s. sterling, but some gold bezants were worth £15 sterling. They occur in heraldic charges, especially Cornish coat-armor, and in the arms of banks or bankers (hence the "three balls" of the pawnbroker's shop). *Bezant* in heraldry is a globe *or*, or a circle *argent*.

Béziers, bay'zhay' (anc. *Bæterræ*): a city of France; in the department of Hérault; on the river Orb and the Canal du Midi; 27 miles by rail E. S. E. of Cète (see map of France, ref. 9-F). It is on the railway which connects Montpellier with Toulouse, and has a delightful situation, with a mild climate. It has a college, a public library, a theater; also manufactures of silk, hosiery, gloves, etc. Béziers was the scene of a massacre of the Albigenes in 1209. Pop. (1896) 48,012.

Bezique, be-zeek' [from Fr. *bésigue*; etymol. unknown]: game at cards; played by two persons with a double pack,

containing only the aces, tens, kings, queens, knaves, nines, eights, and sevens, which rank in the order named. Eight cards are dealt each player, and after each trick each player draws one from the top of the stock, the winner of the trick drawing first. Trump is determined either by the suit of the first marriage or sequence scored, or by turning the top card of the stock, which is then placed right side up beside the stock and constitutes its bottom card. The lead belongs to the non-dealer for the first trick; thereafter to the winner of the previous trick. The leader wins the trick unless his opponent plays a higher card of the same suit or (when trump is not led) a trump. After the stock is exhausted, the second player must follow suit if possible and take the trick if possible; before this he is under no restriction whatever as to what card to play.

He who first scores 1,000 points wins the game; if his opponent has scored less than 500 the game counts double; a *partie* is the best three games of five. The winner of the last trick of each hand scores 10; each brisque (ace or ten) taken in a trick counts 10; and if trump is turned, 10 each is scored for turning the seven, for exchanging from one's hand a seven of trumps for a turned trump not a seven, and for declaring the second seven of trumps. Besides this, certain combinations of cards when declared count as follows: Class I.—Marriage (king and queen of the same suit), 20; royal marriage (same for trump suit), 40; sequence of five highest trumps (i. e. ace, ten, king, queen, and knave), 250. Class II.—Bezique (queen of spades and knave of diamonds), 40; double bezique (both queens of spades and knaves of diamonds), 500. Class III.—Any four aces, 100; any four kings, 80; any four queens, 60; any four knaves, 40. Except for the seven of trumps, a declaration is made by placing the declared cards (which still form part of the player's hand) face up on the table, where they remain until played, or until the stock is exhausted. A declaration (or exchange of the seven of trumps) can be scored only after winning a trick and before drawing, and only one can be scored at a time. It can not be scored after the stock is exhausted. After a card has scored in one combination, it may form a part of other combinations, with the restriction that it can not be used in an *equal* or *inferior* one of the same class. A player is not obliged to declare or score any combination he may hold, but after each trick he should repeat what he has to score for new combinations of declared cards.

RUBICON BEZIQUE is a modification of the above game played with four packs instead of two, and differing somewhat in its method of counting.

Be'zoar [viâ Span. and Arab. from Pers. *pâdzahr*, antidote]: a calculous concretion found in the stomachs or intestines of goats, deer, and other ruminant animals; formerly prized for its supposed medicinal virtues and as an antidote to poisons. That of the antelope was especially prized. The bezoar is usually composed of phosphates of lime. It is quite worthless as a medicine.

Bezold, bay'tsolt, JOHANN FRIEDERICH WILHELM, von, Ph. D.: meteorologist; director of the German Meteorological Institute and professor in the University of Berlin; b. at Munich, Bavaria, June 21, 1837; educated at the Gymnasium in Munich and at the universities of Munich and Göttingen; became privat-docent, then professor at the former university, from which station he was called to Berlin as professor in the university there and director of the official meteorological institute. Dr. von Bezold is a physicist as well as a meteorologist, and he holds an eminent position as a student of the more abstruse problems of meteorology. His publications have been very numerous; among them may be mentioned *Die Farbenlehre im Hinblick auf Kunst und Kunstgewerbe* (Brunswick, 1874; Boston, 1876); *Beobgn. der met. Stationen im Königr. Bayern* (6 vols., 1879-84; with Dr. Lang); *Ergebnisse der met. Beobgn. in Prussia* (1885-91); many publications in Poggendorff's and Wiedemann's *Annalen*, more especially on electricity and physiological optics; *Beobachtungen über die Dämmerung* (*Pogg. Annalen*, 1864); *Ein Beitrag zur Gewitterkunde* (*ib.*, 1869); *Die Kältenrückfälle im Mai*, *Abhandlungen d. bayer. Akad.* (1883); four papers *Zur Thermodynamik der Atmosphäre*, in the *Sitzungsberichte der Berliner Akad.* (1888-92); *Zur Theorie der Cyklonen* (*ib.*, 1890).

MARK W. HARRINGTON.

Bezenberger, ADALBERT: See the Appendix.

Bhagalpur: See the Appendix.

APPENDIX.

Abstract of Title: in conveyancing, a brief statement or summary of the instruments and facts composing the evidence necessary to prove a title to real estate, and the evidence of the charges and liens upon the property. The abstract is intended to enable a purchaser or mortgagee, or their counsel, to judge exactly the state of the title to the property, and to this end should set forth briefly, in chronological order, the facts affecting the title. The abstract usually contains a caption showing the contents and method of arrangement, and drawings and an index if needed, and sets forth the particulars of all patents, deeds, powers, wills, judicial sales, execution sales, tax sales, dedications to public use, titles by descent, and liens and incumbrances. The last mentioned usually include, in the U. S., liens to State and Federal Government, official bonds, taxes, special assessments, judgments and executions, recognizances, attachments, *lis pendens*, mechanics' liens, vendors' liens, decedents' debts, legacies and annuities, mortgages and deeds of trust, dower and curtesy, easements, and miscellaneous liens.

In the U. S. the universal practice and necessity of recording instruments affecting real estate, in order to make them effectual as notice to innocent third parties and the title secure, makes it possible for any one to make an abstract of title of any particular piece of real estate, and abstracts are usually prepared at the expense of the purchaser, the vendor being required only to be able to deliver a marketable title, and not to furnish an abstract in the absence of an express agreement to that effect.

In England, where mortgages by custom were created by delivery of the title-deeds, this abstract is usually prepared at the expense of the owner, and his failure to deliver an abstract of title relieves the purchaser from his contract in law. In the U. S. the abstract is carried back a varying number of years; in England, by virtue of the act of 38 and 39 Vict., c. 78, it is sufficient if it be carried back forty years prior to the date of the intended sale.

See Comyns on *Abstracts of Title* (5th ed. London, 1895); Gover's *Hints as to Advising on Titles* (3d ed. London, 1896); and Warvelle's *Treatise on Abstracts and Examinations of Title to Real Property* (2d ed. Chicago, 1892).

F. STURGES ALLEN.

Accommodation and Adaptation: terms common to psychology and biology, and both denoting the process by which the mind or the organism is brought into living adjustment with its environment or surrounding conditions. Accommodation is the more recent term and has certain special applications: (1) Accommodation of the eye is the process of adjustment to the varying distances at which the object seen presents itself. It is accomplished by a very exact reflex muscular adjustment, by which the convex surface of the crystalline lens is made more or less convex for the focusing of the rays upon the retina. (See VISION.) (2) Accommodation considered as a principle of mental action is the general process of taking in new facts, sensations, and experiences generally, and learning them so that they can be treated suitably in the future. It is opposed to "habit," which covers the mind's treatment of its knowledge under certain regular rules of action. Accommodation usually involves the violation or modification of one or more habits of action. Mental growth is by a continuous series of new accommodations to the social, scientific, artistic, and literary environments. There are two great questions to be answered in any theory of mental accommodation: First, how the muscular system becomes adapted to secure suitable action upon the objects of the external world. This is necessary in order that we may anticipate by our action the recurrence of this or that sensational experience. According to a school of thinkers who follow J. S. Mill, the essence of our belief in the external world is just our sense that by suitable (i. e. properly ac-

commodated) action we can reinstate the objects of the external world in our experience at any time. (See BELIEF.) And, second, the accommodation of the attention whereby we are able to bring the attention into focus with the proper concentration directly upon this or that object of thought. (See ATTENTION.) In both of these cases many psychologists believe that accommodation is secured by the production of "overproduced or excessive movements" made in the line as near as possible to that which seems suitable to acquire the new adjustment. From these excessive movements those elements are repeated and refined which succeed in some measure, and by going through the process again and again the activity aimed at is secured; thus accommodation becomes perfect. A common illustration of this is the child's learning to control his hands for writing or any delicate piece of manipulation. He throws his whole body into excessive and convulsive efforts, centering about his hand, and thus increases the chance of producing the right combinations. As he succeeds, the unnecessary and uncouth movements are allowed to die away.

In biology accommodation is used for the process whereby the organism becomes adjusted to the conditions of its environment. All the adjustments which the animals learn in their individual lifetime, by functional activity, are accommodations, such as changes of color with change of temperature, or other forces in the surroundings, etc.

Adaptation is used in biology for adjustments which are anatomical and due to constitutional differences (see VARIATION) rather than to functional processes. Yet adaptation is often used in a loose sense to denote simply the fact that there is an adjustment without asking how it came about. In this usage accommodations become cases of adaptation which involve functional adjustment. For literature, see the works given under EVOLUTION and GENETIC PSYCHOLOGY, and the titles cited under *Accommodation and Adaptation* in *Baldwin's Dictionary of Philosophy and Psychology* (Macmillans, 1899-1900).
J. MARK BALDWIN.

Acetylene: a compound of hydrogen and carbon having the composition represented by the formula C_2H_2 . It was discovered in England in 1836 by Edmund Davy, a relative of the great chemist Sir Humphry Davy. In 1807 the latter discovered potassium by electrolysis of fused potassium hydroxide; later Curaudau calcined potassium tartrate, thus obtaining a mixture of potassium carbonate and carbon, which on distillation yielded potassium. Edmund Davy, experimenting with this method, obtained a black substance which decomposed water, yielding a combustible gaseous compound of carbon and hydrogen; the black substance was impure potassium carbide, C_2K_2 , the gas acetylene, C_2H_2 . In 1862 Berthelot in Paris prepared acetylene by different methods, two of which deserve mention: First, by heating ethylene gas, which at red heat breaks down into acetylene and hydrogen, $C_2H_4 = C_2H_2 + 2H$; secondly, by direct synthesis from the elements; in a glass vessel filled with hydrogen he caused an electric arc to play between two carbon points, thus vaporizing carbon, which at the heated points combined with hydrogen, forming acetylene, $2C + 2H = C_2H_2$. Berthelot studied the properties of acetylene and gave it its name. He also discovered a method of making acetylene by the incomplete combustion of coal-gas, which is still the usual laboratory method of preparation. In the same year, 1862, Wöhler in Göttingen heated an alloy of calcium and zinc together with carbon to a very high temperature and obtained calcium carbide, C_2Ca . He noted particularly its remarkable property of decomposing water, forming acetylene and slaked lime. Thus both acetylene and calcium carbide have been known for many years, and various other methods of preparation have been devised. But all these methods are so costly that both substances had only a scientific interest until the period 1892-95, when

Thomas L. Willson, of Canada, in his works at Spray, N. C., and Prof. Henri Moissan, of Paris, discovered, each without knowledge of the other's work, practically the same method of making calcium carbide cheaply, a method applicable on the large scale, by the action of very high heat, generated by a powerful electric arc, on a mixture of lime and carbon, the products being calcium carbide and carbon monoxide, $3C + CaO = C_2Ca + CO$. The calcium carbide decomposes water, yielding calcium hydroxide (slaked lime) and acetylene, $C_2Ca + 2H_2O = C_2H_2 + CaO_2H_2$. Curiously enough, the discovery of Willson and that of Moissan were both accidental. With these discoveries the industrial value of carbide and of acetylene was established.

Physical Properties and Chemistry of Calcium Carbide.—Calcium carbide is a hard, brittle, reddish-brown, crystalline substance of brilliant metallic luster; its specific gravity is 2.2. One cubic foot of carbide weighs $137\frac{1}{2}$ lb. No known reagent dissolves it without complete decomposition; hydrogen does not act on it, nor do most metals. Water changes it quantitatively into slaked lime and acetylene, 1 kilogramme of carbide yielding 349 liters, or 1 lb., 5.62 cubic feet of acetylene.

Calcium carbide is formed by bringing together metallic calcium or any of its compounds with carbon at sufficiently high temperature. This fact is of great importance with relation to the present condition of the sun and stars, to the condition of the surface rocks of the earth in earlier periods of its geological history, and to the condition of the heated interior of the earth at the present time. Upon the facts that other common metals resemble calcium in this power of forming carbides at high temperatures, and that most metallic carbides are decomposed by water or dilute acids yielding inflammable gaseous or liquid hydrocarbons, Moissan bases his theory of the formation of natural gas and of petroleum. For full information on carbides the reader is referred to Moissan's book (see *Bibliography*). Among the known carbides those of sodium, potassium, lithium, barium, strontium, and calcium decompose water, yielding acetylene. Owing to the cheapness of the raw material, calcium carbide is the only one which has or will have industrial value as a source of acetylene. Other uses of carbide are for carbonizing steel (experiments in Germany having led to its introduction in some steel-works for this purpose) and as a germicide. It is claimed that it is the most effectual remedy against black rot, and especially against phylloxera. It is probable that much of the enormous output of carbide for 1899 will be used in French, Spanish, and Italian vineyards for the latter purpose. The action of the carbide as a germicide seems to be due to the slow generation of acetylene, which is deadly to the phylloxera.

Physical Properties and Chemistry of Acetylene.—Pure acetylene is a colorless gas of pleasant ethereal odor. The unpleasant garlic odor of commercial acetylene is due to impurities, which can be removed by passing the impure gas through solutions of chloride of lime, metallic salts, and water successively. Acetylene is lighter than air; its density is 0.92. It contains 92.3 per cent. of carbon and 7.7 per cent. of hydrogen by weight. Heated to above 600° , it polymerizes, forming other hydrocarbons. At 760° it is decomposed into carbon and hydrogen. The weight of a cubic meter is 1.12 kilogrammes. At 20° C. 10 volumes of water absorb 11 volumes of acetylene; 100 volumes of a saturated aqueous solution of salt absorb 5 volumes; 1 volume of alcohol dissolves 6 volumes; 1 volume of acetone dissolves 15 volumes; at 12 atmospheres pressure 1 liter of acetone dissolves 300 liters of acetylene. These solubilities are of practical importance in generating and storing acetylene. Acetylene is very slowly decomposed by direct sunlight, yielding a mixture of dense, gaseous, liquid, and solid hydrocarbons. Acetylene heated to a red heat yields benzene, $3(C_2H_2) = C_6H_6$. This is not an industrial method of making benzene, but the fact is of great importance in its bearing on acetylene generators and burners. With very cheap carbide acetylene would prove useful in many ways in chemical industry, and its use would have the most widespread effect on industry and agriculture. For example, alcohol can be made from it, and a method for making sugar from acetylene has been patented in Germany. These processes are of no practical interest with the present prices of alcohol, of sugar, and of carbide.

The work of Moissan, of Gerdes, and of others has proved conclusively that neither pure acetylene nor commercial acetylene attacks copper, lead, tin, zinc, iron, brass, or any other common metal or alloy. A. Gerdes, working with

Julius Pintsch in Berlin, hung plates of various metals in cylinders filled (a) with acetylene, (b) with a mixture of 80 per cent. acetylene and 20 per cent. oil-gas, and (c) with a mixture of 20 per cent. acetylene and 80 per cent. oil-gas. The acetylene cylinders were at atmospheric pressure, the mixture at a pressure of 10 atmospheres. The cylinders were placed on a roof and exposed for nine months through the hot and cold seasons, but the metal plates were not attacked. Acetylene is decomposed, however, at ordinary temperatures with incandescence by platinum sponge, and by finely divided and freshly reduced iron, cobalt, and nickel, because metals in this condition are very porous and absorb the gas so energetically that enough heat is generated to raise the temperature to the decomposing-point of acetylene, 760° C.

Acetylene is absorbed by ammoniacal solutions of cuprous salts, and of silver salts, forming cuprous acetylide, C_2Cu_2 , and silver acetylide, C_2Ag_2 . These acetylides, if dry, are very explosive. Acetylene also attacks commercial solutions of cupric salts, such as copper sulphate, precipitating slowly, but quantitatively, all copper, as black cupric acetylide, C_2Cu . This also is very dangerous when dry, friction or heating to only 50° C. causing explosion. Repeated statements have been published in the daily press and in technical and scientific journals to the effect that it is dangerous to use copper or brass in apparatus for generating or storing acetylene, because the explosive cuprous acetylide could be formed. (The equally explosive cupric salt is a recent and not generally known discovery.) These statements lack foundation, as acetylene does not act on metallic copper or brass, and the conditions necessary to change the metal into an ammoniacal cupric or cuprous salt could hardly be realized in generators, gas-holders, or storage-cylinders. Still, as acetylene from impure carbide is always more or less contaminated by ammonia, such conditions are not impossible, and it is well to exclude the use of copper or brass from generators. The use of these metals in small lamps such as bicycle-lamps, which are made of brass, is entirely safe.

Combustion of Acetylene.—Acetylene ignited in an open vessel burns with a luminous and very smoky flame, giving off clouds of fine soot, owing to imperfect combustion. If mixed with enough air to render the combustion complete, the flame is white and clear. Two volumes of acetylene burn with 5 volumes of oxygen, forming 2 volumes of water-vapor and 4 of carbon dioxide, $2(C_2H_2) + 5O_2 = 2H_2O + 4CO_2$. The same products with addition of nitrogen are formed when 2 volumes of acetylene burn with 25 volumes of air. The actinic power of the clear acetylene light is high; light colors appear lighter and dark colors darker than in sunlight. The light is white and has none of the bluish tint of the electric arc light, or the greenish tint of the gas-flame of the Welsbach burner. When acetylene is formed from carbon and hydrogen heat is absorbed—i. e. the reaction is endothermic. The molecular weight of acetylene (C_2H_2) is 26—i. e. 26 grammes of acetylene are made up of 24 grammes of carbon and 2 grammes of hydrogen; 24 grammes of carbon burned to carbon dioxide give $24 \times 8.08 = 193.9$ calories; 2 grammes of hydrogen burned to water-vapor give $2 \times 34.5 = 69$ calories. In making 26 grammes of acetylene 55 calories are absorbed, which are given up on burning, $193.9 + 69 + 55 = 317.9$ calories; 1,000 grammes (= 1 kilogramme) generate 12,230 calories, or 1 cubic meter of acetylene generates 13,697 calories; 1 cubic foot generates 407 calories. Actual tests confirm these figures. As a cubic meter of illuminating-gas has an average heat of combustion of 5,500 calories, that of acetylene has over two and a half times as much—i. e. 4 cubic feet of acetylene burned in a gas-stove would do the same work as about 9 cubic feet of illuminating-gas; yet, for illuminating purposes, with an equal light, acetylene gives off much less heat than illuminating-gas, because one light-unit is produced by the combustion of 7 liters of acetylene per hour, generating 98 calories, while to obtain the same light from illuminating-gas, using the most improved Welsbach burner, 25 liters must be burned, generating 125 calories. The only inflammable mixtures of acetylene with air, i. e. those in which combustion can spread through the mass, lie for unconfined volumes between 2.8 per cent. of acetylene as the lowest and 65 per cent. as the highest limit; in tubes the limits approach each other gradually as the diameter decreases, till in tubes of 0.5 mm. diameter no combustible mixture of air and acetylene can strike back. These facts are important as applied to the construction of

acetylene burners with the Welsbach mantle. Acetylene has a kindling temperature of 480°C .; that of average illuminating-gas is 600°C .

Temperatures of Combustion.—A mixture of air and acetylene containing 7.74 per cent. acetylene burns with a temperature of $2,420^{\circ}\text{C}$. The Walther process for making carbide depends upon this fact. Burned with an equal volume of pure oxygen it gives a temperature of $4,000^{\circ}$ —i. e. $1,000^{\circ}$ higher than the oxyhydrogen flame—and the products of combustion are pure carbon monoxide and hydrogen, two combustible gases, and both of them reducing agents, a double property which will render acetylene very valuable for many laboratory uses and metallurgical reactions. When used as an illuminant, however, it has been experimentally proved by Grehant that with a proper burner the combustion of acetylene to carbon dioxide and water is complete; not a trace of carbon monoxide or other combustible gas containing carbon is formed; but with an inefficient burner the poisonous carbon monoxide is formed to some extent.

Toxic Properties of Acetylene.—The experiments of Breiner, of Malooz and Crismer, of Frank, and especially of Grehant, show that, while acetylene is poisonous in large doses, it is much less poisonous than coal-gas or water-gas, as these contain carbon monoxide. Acetylene simply dissolves in the blood-plasma, while carbon monoxide forms a compound with the hæmoglobin of the blood. Acetylene made in poor generators from commercial carbide contains impurities, which, when the gas is burned, yield combustion products not toxic, but injurious to persons with weak lungs. With good generators, however, only harmless traces of these impurities remain in the acetylene.

Liquefaction of Acetylene.—Acetylene liquefies when it is subjected to a pressure of 39.76 atmospheres at 20°C . (68°F .), at which temperature it has a density of 0.33 as compared with water; i. e. 1 liter of liquid acetylene at 40 atmospheres pressure weighs 330 grammes. A cubic meter of gaseous acetylene is compressed to 2 liters when liquefied, or 500 cubic feet of gas give 1 cubic foot of liquid. If liquid acetylene is allowed to escape in a jet from a cylinder of the liquid into the air, it becomes gaseous, and in so doing absorbs so much heat that the temperature is reduced to -90°C ., freezing a part of the liquid acetylene to a white solid like snow. These properties of liquid acetylene suggested its use for storage for house illumination, and methods were devised for liquefying the gas. Those of Dickerson and Suckert, Bullier, and Pictet may be mentioned. Dickerson and Suckert in New York were the first to liquefy acetylene commercially. By their method the gas is developed by dripping water on carbide in a closed generator, passes mixed with water-vapor through a cool condenser which condenses the water-vapor, the gas passing into a drying-chamber containing trays of calcium carbide, which absorbs the last traces of moisture. From the drying-chamber the gas passes into a cooled condenser, where it is liquefied by the pressure of the gas in the closed generator, and runs into a receiver from which a pipe leads to the shipping-cylinders. The strong steel shipping-cylinders contain about half a cubic foot or 9 lb. of liquid acetylene, which gives 250 cubic feet of gaseous acetylene, or they are of double that capacity. Bullier's method of liquefaction is in the main similar to Suckert's, as, indeed, is Pictet's. As a cylinder containing half a cubic foot of liquid acetylene would furnish 250 cubic feet of gas, equivalent in illuminating power to 2,500 cubic feet of illuminating-gas, and without the inconvenience of laying gas-mains in the streets, the attention of inventors was at first chiefly turned to this method of supply. It may in the future come again into prominence despite the present strong feeling against it, its use in some cities and some countries being prohibited. This feeling was caused by a number of explosions of liquid acetylene, accompanied by loss of life, and destruction of buildings by explosions and subsequent fire. Several of these explosions occurred in buildings where the acetylene was liquefied, some in the houses of consumers. In every case the evidence showed that the explosions were caused by gross carelessness.

Liquid Acetylene Compared with Calcium Carbide and with Acetone Solutions of Acetylene as a Means of Storing or Transportation.—One cubic meter of acetylene is compressed to 2 liters in liquid form. Two liters of carbide weigh 4.44 kilogrammes, which will produce $1\frac{1}{2}$ cubic meters of acetylene, reckoning 300 liters to the kilogramme, which is the average guaranteed yield of French commercial carbide.

Then the light carbide drums occupy less space and weigh much less than the heavy steel cylinders, while the generation of the gas is simple and with proper generators perfectly safe. These facts must be granted, and, with the existing feelings and laws regarding acetylene, the only practical method of illumination by acetylene at the present time consists in transporting the carbide and generating the gas at the place of consumption. Still, as will be seen, this method involves the use of generators which have to be refilled and cleaned from time to time, and the waste products removed. For consumers who object to this care, the solubility of acetylene in acetone suggests a convenient method.

Solutions of Acetylene in Acetone under Pressure.—Claude and Hess in France have recently suggested the use of such solutions under moderate pressure. One liter of acetone dissolves 15 liters of acetylene at 15°C . under the atmospheric pressure, and 300 liters under a pressure of 12 atmospheres. A rise of temperature of 35° only doubles the pressure within the vessel, whereas with liquid acetylene a rise of but 18° increases the pressure from 40 atmospheres initial pressure at 19° to 68 atmospheres at 39° . Hence solution in acetone greatly diminishes the danger of storage and transportation as compared with liquid acetylene.

Explosiveness of Acetylene.—Berthelot and Violle have published in the *Comptes Rendus* of the French Academy of Sciences the results of a series of elaborate experiments on the explosiveness of gaseous and of liquid acetylene, and of solutions of acetylene in acetone. The general method of experiment was to fill a steel bomb with the acetylene, or with the solution, and start the decomposition of the acetylene by exploding a cap of fulminating mercury inside the bomb and connected by a wire with a battery, so that a spark could ignite it. With gaseous acetylene the decomposition does not spread beyond the point of contact with the cap, unless the acetylene is under more than two atmospheres pressure; if the pressure is greater the decomposition spreads instantaneously, causing a violent explosion. The decomposition represented by the equation $\text{C}_2\text{H}_2 = 2\text{C} + 2\text{H}$ causes the temperature to rise to $2,750^{\circ}\text{C}$. The pressure produced is eleven times the initial pressure. Liquid acetylene (liquefied under a pressure of 40 atmospheres) is instantly decomposed by the spark, exerting a pressure of 79,138 lb. per square inch, liquid acetylene thus having about the same explosive force as gun-cotton. Bombs filled with gaseous or liquid acetylene and crushed by the fall of a heavy ram do not explode, unless friction of the fragments of the iron bomb cause a spark. Solutions of acetylene in acetone are absolutely safe and can not be exploded by a shock or spark within the bomb at pressures not exceeding 10 atmospheres: if, however, the pressure approaches 20 atmospheres, the explosion is even more violent than that of liquid acetylene, as both the acetylene and the acetone are decomposed into their elements; the liability to explosion is equal to that of liquid acetylene, but the danger from accidental rise of temperature is much less. Berthelot concludes that acetylene explosions can be prevented (1) by using gaseous acetylene under low pressure; (2) by using solutions of acetylene in acetone under such conditions that the pressure can not exceed 10 atmospheres; (3) by not using liquid acetylene; (4) by not allowing water to drip on an excess of carbide in the generator, which causes over-heating. See *Generators*.

Acetylene as an Enricher of Water-gas and of Coal-gas.—It was hoped that acetylene would be found valuable for these purposes, but experiments by Lewes and others proved that it was not a good enricher of water-gas. It is an excellent enricher of coal-gas, but elaborate experiments by Vautier show that at the present prices of carbide acetylene can not be profitably used abroad. The experiments of American observers show that, if carbide could be bought at \$50 a ton, acetylene could compete with other enrichers.

Diluents of Acetylene.—A common objection to the acetylene light is that the very high illumination coming from a small source is a strain to the eye, unless the source of light is shielded, while at the same time it causes dark shadows, so that the actual illuminating effect to the user is not as great as the value shown by the photometer would indicate. This trouble, as well as that of smoky burners, disappears when the acetylene is diluted. Air, water-gas, hydrogen, carbon dioxide, carbon monoxide, and nitrogen have been suggested and experimented with. Suffice it to say that none of these has a practical value.

Pintsch Oil-gas and Acetylene Light.—The only diluent in actual use is the Pintsch oil-gas. A. Gerdes, working

with Julius Pintsch, the inventor of the oil-gas lighting method now in common use in Europe and in this country, has made excellent experiments on mixtures of oil-gas and acetylene. He has proved that a mixture of oil-gas with 20 per cent. of acetylene, used at 10 atmospheres pressure, is perfectly safe, and gives double the light given by oil-gas alone, raising the candle-power from 19 to 38. The best proof of the safety and value of this light, which is primarily intended for railroad use, is that it has been adopted by the Prussian state roads after thorough tests by Government experts, and is now in use for lighting cars on all of the Prussian state lines.

Marsh-gas as a Diluent.—Prof. Vivian B. Lewes, perhaps the foremost English expert on gas-lighting and on acetylene, while engaged in studying the relative illuminating values of the different constituents of coal-gas, was struck by the value of methane (marsh-gas) in increasing the size of the flame and keeping up its illuminating power. He has recently tried the effect of methane as a diluent for acetylene, and finds (a) that mixtures of methane and acetylene give a higher value than $2\frac{1}{2}$ candles for each per cent. of acetylene added; (b) that with a mixture of methane and 10 per cent. of acetylene the enrichment value is over 3 candles for each per cent. of acetylene added; (c) that the addition of methane to a mixture of carbon monoxide and acetylene, or to one of hydrogen and acetylene, or to one of water-gas and acetylene, at once raises the enrichment value of the acetylene. Pure methane would be too expensive a diluent, but Lewes has devised a new form of water-gas generator which makes a water-gas containing 45 per cent. of hydrogen, 15 per cent. of carbon monoxide, and 30 per cent. of methane, at a cost of from 15 to 20 cents per 1,000 cubic feet (in London), and which has an initial illuminating value of 10 to 12 candles. This mixed with 5 per cent. of acetylene has 18 to 20 candle-power, and it is proposed that it should be distributed and burned in exactly the same way, and with the same burners, as coal-gas, having the same specific gravity and illuminating value. Mixtures of this methane water-gas with 50 per cent. of acetylene compressed in cylinders for railroad lighting was proved to be absolutely safe like the Pintsch gas-mixture. Lewes thinks that this method of utilizing acetylene is pre-eminently the one which promises for it the largest and most remunerative future. It will be noted that this result of Lewes is really simply solving the problem by using acetylene to enrich water-gas. Lewes himself was the first to point out that a small percentage of acetylene simply vanishes in water-gas without enriching it appreciably. This curious fact was noted by all other observers. Now Lewes shows that he can enrich water-gas with acetylene by adding enough methane. There is no doubt of the great practical value of these studies if a working generator for the methane water-gas proves a commercial success.

Commercial Calcium Carbide—Priority of Invention.—The priority of making carbide by an electric furnace is claimed by Willson in America, for Moissan in France by his friends, and by Borchers in Germany. Space can not be given to details of the dispute. Willson's priority is established. The German Government, recognizing it, has annulled the patent it had granted to Bullier, who had patented Moissan's process. Borchers's claims are too vague to mention. It is an American invention. Willson's co-workers, Dr. G. de Chalmot, chemist, and J. M. Morehead,

Section of Willson's first furnace.

A, masonry; B, carbon crucible or hearth; C, movable carbon electrode; D, dynamo; w w', wires carrying current; d, tap-hole. Bullier's furnace is similar, differing only in detail.

electrician, worked up the details of the furnace process in the early days at Spray, N. C., and the purity and yield of

the carbide per horse-power as well as the yield from weight of material obtained by De Chalmot and Morehead have never been excelled.

Carbide Furnaces.—Electric furnaces are of two classes, *electrolytic*, in which electrical energy is transformed into chemical energy to bring about chemical decomposition by electrolysis, and *electrothermic*, in which electrical energy is transformed into thermal energy to produce high temperature. Carbide furnaces are all of the latter type; the heat in the arc of the carbide furnace ranges from 2,000° C., the minimum, to 3,800°, the maximum. Of the many electric furnaces patented or used for making carbide, drawings of a few of the most important are given. They all have this essential principle in common, that the heat is generated by an arc current between two carbon electrodes, in most furnaces one electrode being the crucible itself or its carbon bottom, the other electrode having a vertical carbon rod dipping into the melted carbide. The drawing of Willson's first furnace at Spray, N. C., shows these features.

In the first Niagara Falls furnace built under Willson's patents by Messrs. de Chalmot, Morehead & King, the bottom of the furnace is an iron car running on rails. In this car the carbide is formed; the bottom is covered with 4 to 8 inches of carbon; the movable carbon electrode (a) is raised as the carbide is formed. When the car is full the current is cut off for a moment, and the full car is replaced by an empty one. This furnace is now replaced by the Horry furnace.

Section of old Niagara Falls furnace.

The furnaces in actual use in Europe are of the Willson or Bullier type, or modifications of these types. The Heroult furnace, thirty-two of which are in use at Notre Dame de Briançon, on the Isere in Savoy, at Froges, near Grenoble, and at the Neuhausen works at the falls of the Rhine, resembles the old Niagara Falls furnace. The furnaces of the British Acetylene Illuminating Company at Foyers, Scotland, are a modification of the Willson type. At St. Catharines, Canada, Willson is running his own furnaces. The Horry furnace is now in use at Niagara Falls and at Sault Ste. Marie. This furnace is the invention of W. S. Horry.

The furnaces at Niagara are 9 feet in diameter, with a capacity of 20 tons daily; larger furnaces are building to increase the output to 50 tons daily. The following description of the new Horry plant at Sault Ste. Marie is a brief abstract from an article in the *Electric World*, Aug. 6, 1898: The plant is on the shore of the St. Mary's river, through which Lake Superior empties into Lake Huron. The power canal is designed for an ultimate development of 40,000 horse-power. The portion of the power-house now in construction will be capable of containing 40 generators, 60 carbide furnaces, 80 turbine wheels, and supplementary machinery. The generators consist of a battery of Walker alternating current dynamos, of 500 horse-power or 375 kilowatts each. Each machine will deliver about 2,000 amperes at 200 volts pressure. The capacity of each generator expressed in yield of carbide will be 3 to 4 tons each twenty-four hours. For each four generators there are six furnaces, but four being in operation at one time. The Horry furnaces are of the continuous type. Each consists of a huge short cylinder or hollow wheel, mounted to revolve slowly on a horizontal shaft. The periphery of the cylinder is closed by a number of cast-iron slats which are readily removable. As the cylinder is revolved on its axis from time to time by a worm and hand-wheel, the slats are taken off from one side and replaced on the other, thus leaving the top always open. The cylinder is filled on one side with the mixture of finely

powdered coke-dust and lime, and into the mixture two carbon electrodes project downward. As the carbide is formed the cylinder is revolved, lowering the mass from the electrodes. The fused carbide cools, hardens, and is broken off and removed as it rises on the other side of the cylinder. New material is constantly fed in to maintain the level around the electrodes.

Front of Horry furnace.

This new plant shows the latest improvement in carbide manufacture, unless certain features in the Nicolai smelter constitute a further advance. This smelter is in the main a Horry furnace turned on its side, with the axis vertical instead of horizontal, and with the necessary changes of detail incident to this change of position. It has just been introduced by Nicolai, director of the German Electric Company, in Berlin.

The *Walther process*, introduced at Leipzig, does not use electric power, but burns acetylene at considerable pressure as the source of heat, to form carbide from coke and lime.

Percentage of Pure Carbide in Commercial Carbide.—The actual ingot of good commercial carbide is nearly pure—96 to 99 per cent. In making carbide, however, the ingot is surrounded by a crust of carbide mixed with unchanged material. The crust contains from 40 to 70 per cent. of carbide. As there is no demand for the crust abroad, foreign manufacturers break and blend ingot and crust to standard size. The best foreign manufacturers guarantee 90 per cent. pure or 5 cubic feet of acetylene per pound (pure carbide gives 5.89 cubic feet); 8 to 9 lb. per horsepower in twenty-four hours of carbide averaging 5 cubic feet is considered very satisfactory. The Union Carbide Company, which controls the sale of carbide in the U. S., is selling graded carbides under guarantee. The first grade is nearly pure. The lower grade is the crust.

Packing Carbide.—As the moisture of the air decomposes carbide, it is broken up as soon as made and packed in air-tight tin cans, varying in size from 1 to 400 lb.

Price of Carbide.—The present price of carbide in all foreign countries averages \$96.80 per ton in large lots packed, and \$7.26 per hundredweight (112 lb.), or \$145.20 per ton, in small lots. The prices at Niagara Falls are, for car-load lots of 12 tons, \$70 per ton; for lots of 1 ton, \$75 per ton; for lots of 1,000 to 2,000 lb., per pound, 4 cents; for lots of 100 to 1,000 lb., per pound, 4½ cents—the demand exceeding the supply. The table at the end of this article shows an enormous output of carbide for 1899. Probably much of this will be in demand as a germicide and for metallurgical purposes, but the increased production will certainly lower the price.

Impurities of Commercial Carbide.—These consist of magnesium nitride, calcium phosphide, aluminium sulphide, and iron silicide. In good carbide the total amount is small, and the admirable experiments of Lewes have shown that with a good generator there is no danger possible from the impurities, and that the acetylene generated is practically freed from the impurities of the carbide, these impurities or

their decomposition products remaining in the generator sludge.

Acetylene Generators.—The perplexing and the most important question to the consumer of acetylene at the present time is what generator to buy. The carbide manufacture is so organized that it is everywhere under the control of powerful responsible companies, which sell a guaranteed product at a definite price. With generators it is different. The market is flooded with them at all prices, ranging in value from worse than useless to very good, as regards safety, economy, and quality of light. No individual generators will be mentioned here, for obvious reasons. The generator question has been carefully studied of late, the most exhaustive experiments being those of Lewes. His results agree with those reached by other observers. Lewes classes generators as follows: (1) Those in which water drips or flows slowly on a mass of carbide; (2) those in which water rises, coming in contact with a mass of carbide suspended in a basket within a bell; (3) those in which water rises, coming in contact with layers of carbide suspended on trays, one tray above the other, and without a bell; (4) those in which the carbide is dropped or plunged into an excess of water. He proves that the first two classes are dangerous on account of overheating, the heat generated in experiments with generators of class (2) being in some cases so great that the temperature may rise to over 800° C., at which temperature all acetylene in contact with the glowing mass is decomposed into carbon and hydrogen, while at temperatures above 650° C. acetylene is polymerized, forming benzene and tar. He shows, further, that the heat decomposes the acetylene in part, lessening the yield of gas and greatly impairing its illuminating power; and that the decomposition products (tar and benzene) ruin the burners. Many generators of the third class are good; those of the fourth are the best.

Acetylene Burners.—The best burners are those of the type of the Napheys burner invented by E. J. Dolan, of Philadelphia. It may suffice to say that the general principle is that of the Bunsen burner, causing a thorough mixture of the acetylene with enough air to insure the best illumination. While acetylene thus far is burned with a flat luminous flame, inventors in Germany are now utilizing its great heat of combustion by burning in burners of the Welsbach type using modified Welsbach mantles, with very promising results.

Acetylene Lamps.—Lamps with a generator in the base for domestic use have been put on the market, but have not proved a success. The bicycle-lamps in which, generally, water drips through a needle valve on a cartridge of carbide, or on loose lumps, are successful; there is no gas-holder, the gas being burned as fast as made.

Size of Burners and Cost of Illumination.—The acetylene burners are for ¼, ½, or 1 cubic foot per hour. A ½-foot burner gives a flame of 17 candles. A pound of carbide of 5-cubic-foot quality will give (allowing for loss in the domestic generator) 4½ cubic feet of acetylene per hour. With carbide at \$75 per ton, the acetylene costs (reckoning nothing for the generator, care, or cost of outfit) \$7.44 per 1,000 cubic feet, ⅔ of a cent per half-foot, giving 17 candle-power light for one hour. It is useless to print comparisons of the price of acetylene with that of gas or electricity, as conditions vary for every locality. The chief use of acetylene hitherto has been for lighting country houses where a good light was sought without question as to the cost. While carbide doubtless will be much cheaper in the future, it must be remembered that the continued improvements in incandescent gas-burners, and the introduction at the present moment of greatly improved processes for making and cheapening water-gas, like the Delwyk process, will give a better and cheaper gaslight.

Patents.—The Willson patents cover, in the U. S., Canada, and the South American states, the manufacture of crystalline carbide, and, as all carbide made by electric furnaces is crystalline, no carbide can be made independently of these patents in these countries. The Willson patents in the U. S. are controlled by the Electro Gas Company, the Union Carbide Company acting as distributors of carbide. Willson patents have been applied for, but are contested, in France, Germany, and some of the Australian colonies. In England patents have been granted to both Willson and Bullier. Bullier holds patents in France, and did in Germany, but the German patents were annulled on the ground that Willson's carbide antedated Moissan's. The Horry furnace is controlled by the Electro Gas Company.

Carbide Plants.—From notes in current journals and consular reports, the following imperfect data up to January, 1899, are taken; as manufacturers often withhold information, it is impossible to get full statistics:

COUNTRY.	Town and province.	Present yearly output.	Proposed yearly output in works to be finished, 1899.	Total capacity of new work.	Horse-power of new works.
		Long tons.	Long tons.	Long tons.	
United States..	Niagara Falls.	3,000	6,000	15,000	17,500
	Sault Ste.-Marie.	900	6,000	36,000	40,000
Canada	St. Catharines.	750
Great Britain..	Foyers, Scotland.	387
	Birmingham, Ingleton.
Germany	Rheinfelden (and three others).	5,000
	Meran.	1,500
Austria	Lend-Gastein, Tyrol.	8,000	75	7,500
	Tajce, Bosnia.....	9,000	8,000
Switzerland....	Four factories, of which Soc. Genevoise is enlarged.
	Gampel, Wallis. Neuhausen is a very large factory.	2,790	2,500
Sweden	One factory.
Belgium	One factory.
Italy	Three factories, of which S. Martini.	1,000
	La Prag.	3,000
Spain	Brega, Catalonia.	2,790	2,500
	A new factory on the Ebro.	30,000
Norway.....	Sarpborg.	5,580
France	Ten factories running, four factories building.	1,000 to 5,000 each.	2,500 to 3,000 each.

Insurance Regulations.—The New York Board of Fire Underwriters has prohibited the use of liquid acetylene, and allows generators only in well-ventilated, fire-proof, separate buildings. There are special clauses as to lighting and heating the generator buildings, charging generators with carbide, etc. The storage of a limited amount of carbide in the generator buildings is allowed. The gas-pressure must not exceed 4 inches of water in the pipes of the building lighted. London, Paris, Berlin, and indeed most cities have stringent police regulations governing the use of liquid acetylene, and the use of generators is everywhere controlled by regulations similar to those above.

BIBLIOGRAPHY.—The best book on electric furnaces and the work done in them is Moissan's *Le Four électrique*; it is difficult to say enough in praise of this fascinating book, which, while scientific, can be read with pleasure by the general reader. A German book by Borchers is of little merit. Books on calcium carbide and acetylene have been published in French by Pellissier, Pietet, Claude and Hess, Lafevre, and De Perrodil. The last work is now appearing in translation in the *Progressive Age*. German books are those by Dommer, Liebetanz, and Panatovic. There is one in English by W. E. Gibbs, of New York. The best are those of Dommer, Pellissier, and De Perrodil. Journals specially devoted to the subject are published, one in France, two in Germany, and one in Italy, while articles appear from time to time in the various trade journals devoted to illumination. The *Progressive Age*, published in New York, has from the start been very reliable and full, and in March, 1896, sent a commission of three scientific men (two electrical experts and a chemist) to Spray, N. C., where the Willson works were put at their disposal to make actual tests of power, yield, cost, etc., with the view of getting reliable data (which the journal published) and putting an end to contradictory reports.

In conclusion, the writer acknowledges obligation to several of the works mentioned, to the scientific journals, *Comptes Rendus*, *Berichte der deutschen chemischen Gesellschaft*, *Journal of the London Chemical Society*, and *Journal of the Society for Chemical Industry*; to the editor of the *Progressive Age* for the use of engravings, and for personal information; and to *The Engineering Journal* for the engraving of the Horry furnace.

EDWARD RENOUF.

Acland. Rt. Hon. ARTHUR HERBERT DYKE: English public man and educator; b. in 1847; educated at Rugby and

Christ Church, Oxford; B. A. 1870, M. A. 1873; honorary fellow and senior bursar Baliol College and steward of Christ Church; principal of the Oxford Military School, Cowley, 1875-77; in Parliament since 1885. Both in and out of Parliament he has been very active in promoting the cause of intermediate and technical education. He was vice-president of the Council of Education 1892-95, a position that placed him at the head of the educational system of Great Britain. He is the author of a *Handbook of Political History of England*, *Workingmen Co-operators*, and editor of *Studies in Secondary Education*.

C. H. THURBER.

Activity: Any series of changes of a sufficiently regular and continuous character we call activity. The cases may be looked at as of two general sorts: "transient" activity, on the one hand, in which one object is acted upon by another; and "immanent" or "self"-activity, in which the series of changes observed take place within the active object with little or no influence from other things. The activities of physical science are almost entirely of the transient sort: one body, molecule, atom, or system acts upon some other so that the results of the changes in the other are taken as a measure of the activity of the first. In the biological and mental sciences we have activity of the "immanent" type: the series of changes seems to evolve within the organism or the mind, from a kind of determination called self-determination or immanence. They can not be entirely or even largely construed as having been produced by the influence of things outside the organism or the mind. Theories of life and mind, however, turn just upon this question, as to whether both life and mind can be reduced ultimately to changes illustrating activity of the transient type. The controversy between freedom and determinism turns upon the interpretation of mental activity in answer to this question.

LITERATURE.—Stout, *Analytic Psychology* (vol. i., bk. ii., chap. i.); Bradley, *Appearance and Reality* (pp. 95 ff.); Baldwin's *Dictionary of Philosophy and Psychology* (Macmillans, 1899-1900), art. *Activity* (with references).

J. MARK BALDWIN.

Adami, JOHN GEORGE, M. A., M. D.: educator; b. in Manchester, England, Jan. 12, 1862; educated at Owens College, Manchester, and at Cambridge, subsequently studying physiological science at Breslau, Germany, and completing his course of medical study at the Royal School of Medicine, Manchester, in 1887. He was elected fellow and director of natural science studies at Jesus College, Cambridge, in 1891, and held the position until Oct., 1892, when he became Professor of Pathology at McGill University, Montreal, Canada. He was pathologist of the Montreal General Hospital 1892-95, and has been pathologist of the Royal Victoria Hospital since 1894; became Middleton Goldsmith lecturer of the New York Pathological Society in 1896. He has written for various scientific journals on *The Nature of the Glomerular Activity of the Kidneys*, *Overstrain of the Heart*, *Observations upon the Physiology and Pathology of the Mammalian Heart*, *Heart-beat and Pulse-wave*, etc.

Adler, CYRUS: librarian; b. in Van Buren, Ark., Sept. 13, 1863; graduated at the University of Pennsylvania in 1883, and then entered the Johns Hopkins University, where he became a fellow, instructor, and then an associate in Semitic languages. In 1888 he was made honorary assistant curator of historic archaeology in the U. S. National Museum and arranged the collections there. Since 1895 he has been custodian of the collection of historic religious ceremonies in the National Museum, which division was developed by him, and in 1892 he was made librarian of the Smithsonian Institution. In 1890-91 he visited Egypt, Turkey, Serbia, and Persia as an agent for the authorities of the World's Columbian Exposition for the purpose of placing the exposition in its true light before these Governments, and to secure exhibits. He represented the U. S. at the conference held in London in 1898 for the purpose of deciding upon a complete catalogue of scientific literature which is to be begun in 1900 under the auspices of the Royal Society. He is a member of various scientific societies, and is secretary of the Jewish Historical Society, also an editor of its publications. Besides his regular reports as curator and librarian, Dr. Adler has contributed *Progress of Oriental Science in America during 1888* (Washington, 1888), *The Shofar, its Use and Origin* (1893), and, with I. M. Casanowicz, *Biblical Antiquities at the Cotton States Exposition, Atlanta, 1895* (1897), to the Smithsonian publi-

ations. He has also contributed papers to the proceedings of the American Oriental Society, the American Philological Society, the Jewish Historical Society, and to various magazines, as well as editing *Told in the Coffee-house*, a collection of Turkish tales (New York, 1898). M. B.

Æpyornis: the generic and popular name for the members of a group of gigantic and recently extinct birds whose remains are found in the sands and swamps of Southern Madagascar. They constitute the order *Æpyornithes*, and are most nearly related to the cassowaries among living birds. In bulk the type species, *Æpyornis maximus*, exceeded an ostrich, although it stood much lower on its legs; *Æ. titan* and *Æ. ingens* were still larger, the thigh-bone of the largest species exceeding in size that of an ox. The egg of *Æpyornis maximus* is larger than that of any other bird, measuring 13 × 9 inches, and having a capacity equal to 148 eggs of the hen. It has been suggested that reports of these great birds, or of their eggs, may have given rise to the fable of the roc. F. A. LUCAS.

Agrarianism: the Agrarian political movement in Germany. The multiplication of political movements in Germany has been a feature of recent European history. In the case of the particular impulse which has resulted in the issue known as Agrarianism, the genesis of the matter is to be sought in the physical nature of the country. Germany, while favored in some respects, does not rank high among the lands blessed by Nature in soil, climate, or variety of resources. It can not compare with the U. S., and is inferior to France or Russia. A large part of the old Brandenburg, of the provinces of East and West Prussia, of Pomerania, and of other portions of Northern Germany, is naturally infertile; it is productive and lucrative by hard labor, science, and Government encouragement.

The beginnings of the Agrarian movement are to be found in a conference held at Breslau in 1869, under the lead of Ziendorf and Elsner von Gronow. From time to time congresses of German agriculturists met, and the *Deutsche Landeszeitung* became their recognized organ. The Franco-German war, so decisive in a military and political sense, was not followed by unmixed economic gains. By 1876 there was formed in Berlin an association of reformers bent on effecting material changes in taxation and desirous of aiding industry. Freer trade and tax reforms indicate the scope of these earlier agitations, but the tendency of the movement became in time strongly protectionist. In fact, it was about this period (1879) that Bismarck, then omnipotent, developed into an avowed protectionist, and a wave of protectionism was noticeable in many quarters.

The Agrarian feeling grew in strength without taking political shape. After Bismarck's retirement in 1890, several modifications occurred in the commercial relations of the German Empire. In particular the treaties with Austria-Hungary and Italy were renewed, to the supposed detriment of German agricultural interests, and strong opposition was aroused. The "hard times" of the period accentuated the opposition, and out of the sentiment arose the Agrarian League, formed in February, 1893, by delegates at Berlin. The league was not a party, but it had adherents from several of the heterogeneous groups into which the members of the Reichstag and Prussian Landtag are gathered. It welcomed support, in fact, from all the political groups, except the Radicals and Social Democrats. In the election of 1893 for the Prussian Landtag the influence of the league was thrown for the Conservative party, which showed gains. The same year the elections for the Reichstag took place. Out of 397 members the Agrarian League had 130, whose party affinities were with the Conservative, Free Conservative, National Liberal, Anti-Semitic, and Independent factions. The Conservatives, indeed, adopted Agrarianism in their platform. The Agrarian demands were by this time formulated, and included high duties on cereals, tax privileges favoring the agricultural interests, the exclusion from Germany of food products suspected of taint, bimetallicism (as a desirable adjunct in the checking of low prices), and various administrative reforms.

The attempt to negotiate a commercial treaty with Russia led to bitter strife, and a tariff war ensued between the two countries in 1893-94. The Government, however, effected treaties with Roumania, Servia, and Spain, in the face of Agrarian opposition. The league argued against reduction of duties on cereals, and in the objections to the treaty with Russia Bavarian farmers joined forces with

the Prussian Junkers, and the reactionary Conservatives and Imperialists were joined by many National Liberals and Ultramontanes. Great excitement attended the attempt of the imperial Government to push this treaty in 1894. The emperor and his ministers entered the lists in its behalf. Threats were made to dissolve the Reichstag, and the measure passed, to remain in force until 1903. This Russian treaty contained numerous clauses, but the most noted feature was a mutual reduction of rates on cereals from the other country; the German duty on Russian grain was lowered from 7½ to 3½ marks. Many members of the Prussian nobility belong to the Agrarian League, and in this campaign numerous nobles found themselves in opposition to the emperor. It was in this year that William II. made his "right divine" speech at Königsberg, in the very heart of the landed aristocracy. In this address he severely denounced the factious opposition of a nobility to its hereditary chief. Indirectly the party strife led to Caprivi's resignation; the formulation of repressive Anti-Socialist laws followed the Agrarian agitation; the emperor and his chancellor were not in harmony on this subject, and the count resigned his office.

The Social Democrats had considered Agrarianism, but the party trended away from the policy, and in 1895 it formally decided not to support the league. Already in 1894 the league's chief spokesman, Von Kanitz, a Conservative, had proposed a drastic measure in the Prussian Landtag; this was that the Government should have a monopoly of trade in foreign cereals, and should fix the price of domestic cereals. This proposition passed the Herrenhaus. In 1895 it came before the State Council, and was rejected on the following grounds: That trade would be injured thereby; that the work proposed did not fall within the proper functions of government; and that the measures proposed were not consistent with existing treaties. Nothing daunted, the Agrarians introduced the Kanitz bill into the Reichstag. They were recruited from the Conservative, Imperialist, and Anti-Semitic groups, and were in this year (1896) increasingly aggressive. Still they were defeated, two to one, in their bill for state monopoly of imported cereals. They brought in another measure calling for increased taxation of sugar and for bounties on exports of sugar. This bill engendered sectional opposition, on the plea that it would especially benefit the central group of states and provinces; the sugar bounty had been reduced; it was now doubled. And so strong was the league that it carried a margarine bill, placing difficulties in the way of the manufacture and sale of margarine. Yet another act was the one to build grain warehouses and to facilitate the transportation of grain.

Perhaps the law which awakened the most interest outside of Germany was the Stock Exchange Bill. Here the Agrarian League was re-enforced by a contingent of National Liberals and Ultramontanes, and a drastic enactment was carried. It prohibited time contracts for the purchase or sale of grain, placed the bourses under Government control, put a strong agricultural representation on the controlling boards, affixed penalties for undue promoting and speculating, and imposed stringent regulations on the listing of securities. This law went into operation in the beginning of 1897. It elicited great opposition among commercial circles, and the grain-dealers "struck" and boycotted the exchanges. The other principal question associated with the Agrarian League in 1897 was the passage of an emigration bill designed to encourage purely German colonies (in Brazil, etc.) and so to help the congested home population.

Henceforth the league lost ground, while the Radicals and Social Democrats gained. In 1898 the organization, with a membership of perhaps 200,000, elected only 4 avowed Agrarians to the Reichstag. It commands, nevertheless, about 90 votes in that body, drawn from the same conservative, or, as the French would say, *Rightist* groups. The Agrarians continue to demand high duties on the chief agricultural imports, bounties on various exports, more country banks, and reduced railway rates. The Conservative and Agrarian organ has been latterly the *Kreuz-Zeitung*.

The movement finds some parallels in American political history. The demands remind one at times of the platforms of farmers' alliances and of Populists, at times of Republican policies. A conservative landed interest desiring exclusive class privileges is not an anomaly in political history. It remains to be seen whether the league will become identical with a political party, whether it will broaden its field,

whether it will antagonize its apparently natural ally the crown, or whether it will disintegrate.

EDMUND K. ALDEN.

Agricultural Law: See FARM LAW.

Albacore: *Orcynus germa*, a large fish of the mackerel family, closely related to the tunny, or horse-mackerel, but with longer pectoral fins. It reaches a length of 6 feet. It is found in tropical waters around the globe, preying on small fishes and pursuing and capturing the flying-fish.

F. A. LUCAS.

Albert, EUGENE d': See D'ALBERT.

Alcorn, JAMES LUSK: politician; b. near Golconda, Ill., Nov. 4, 1816; educated at Cumberland College. His first office was that of deputy sheriff of Livingston co., Ky., which position he held for five years. In 1843 he was elected to the Kentucky Legislature. In 1844 he went to Mississippi and began to practice law, became a member of the Legislature of that State in 1846, and served, sometimes in one branch and sometimes in the other, until 1865. In 1852 he was chosen elector at large on the Scott ticket, and in 1857 was nominated by the Whigs for Governor, but declined, became a candidate for Congress, and was defeated by J. Q. A. Lamar. He founded the Mississippi levee system, and in 1858 was made president of the levee board of the Mississippi-Yazoo delta. In 1861 the State convention elected him brigadier-general, but Jefferson Davis refused to give him a commission. He was elected to the U. S. Senate in 1865, but not allowed to take his seat. In 1869 he was elected Governor as a Republican, and in 1870 he resigned, and was U. S. Senator 1871-77. In 1873 he was an independent candidate for Governor, but was defeated. D. in Coahoma co., Miss., Dec. 20, 1894.

Allen, GRANT (full name CHARLES GRANT BLAIRFINDIE): author; b. in Kingston, Ontario, Feb. 24, 1848; educated privately and at Oxford, and became a teacher in Spanish Town, Jamaica, and studied the tropical vegetation and the peculiarities of West Indian life. He wrote many novels and scientific works, among which are *Physiological Aesthetics* (1877); *The Color Sense* (1879); *The Evolutionist at Large* (1881); *Anglo-Saxon Britain* (1881); *Vignettes from Nature* (1881); *Colors of Flowers* (1882); *Colin Clout's Calendar* (1883); *Flowers and their Pedigrees* (1884); *Life of Charles Darwin* (1885); *Postprandial Philosophy* (1894); *The Woman Who Did* (1895). D. in London, Oct. 25, 1899.

Almy, JOHN JAY: naval officer; b. in Newport, R. I., April 25, 1814; entered the navy as a midshipman in 1829, became a lieutenant in 1841, served in the Mexican war and in the Nicaragua and Paraguay expeditions, became a commander in 1861, a captain in 1865, a commodore in 1869, and rear-admiral in 1873. During the civil war he captured four blockade-runners with valuable cargoes, and ran ashore and destroyed four others. In 1867 he was assigned to the command of the Brooklyn navy-yard, and subsequently served as chief signal officer, and retired April 24, 1877, after a cruise in the Pacific. D. in Washington, D. C., May 16, 1895.

Alvary, MAX: singer; b. in Düsseldorf, on the Rhine, in 1856, the son of Andreas Achenbach, a well-known painter of that city. As a young man he sang tenor in the local singing societies and choirs. Then he studied, first with Lamperti in Milan, and next with Stockhausen in Frankfort-on-the-Main. He made his first appearance in opera in Weimar, and then adopted his mother's family name, Alvary, as his stage name. His first visit to New York was in the season of 1885-86, as a member of the German company singing in the Metropolitan Opera-house. His first part was Don José in *Carmen*. The next season he sang Walther in *Tannhäuser*, Merlin in Goldmark's opera of that name, and other parts. On Nov. 9, 1886, Wagner's *Siegfried* was produced for the first time in this country with Alvary in the title part. He made a great success. He left New York in 1889, but returned in 1895, adding Tristan to his repertory. On his return again to Europe he met with an accident on the stage at Mannheim from which cancer of the stomach developed. D. at Tabarz, Thuringia, Nov. 8, 1898.

D. E. HERVEY.

Alvord, HENRY ELIJAH, B. S., C. E.: soldier and educator; b. in Greenfield, Mass., Mar. 11, 1844; educated in Massachusetts public schools and in Norwich University, Vermont. He enlisted as a private in 1862, and passed through every grade until he became major in the Second Massachusetts Volunteer Cavalry in 1865; was captain of cavalry in the

regular army 1866-72; chief engineer on the staff of Gen. Sheridan 1868-69. He was a teacher in Williston Seminary, Easthampton, Mass., 1872-81; general manager of the Houghton farm, Orange co., N. Y., 1881-86; Professor of Agriculture in the Massachusetts Agricultural College, Amherst, 1886-88; president of the Maryland Agricultural College 1888-92. He was an officer of numerous agricultural organizations 1872-93; chairman of the executive committee of the Association of American Agricultural Colleges and Experiment Stations 1887-93; vice-president of the American Association for the Advancement of Science, section of Economics, 1887. He has been a frequent contributor to various agricultural journals in America and Europe, and is author of the American section of *Dairy Farming* (London and New York, 1881).

Andrée, S. A.: scientific man, mechanical engineer, and aeronaut; b. in Sweden, Oct. 18, 1854; directed experiments and observations in atmospheric electricity (1882-83) in Spitzbergen; occupied a chair (1886-89) in the leading Swedish school of technology; and had charge of engineering works for some years in the Swedish Government service. He had long been interested in ballooning, and made some notable ascents, one of which was across the Baltic Sea. In 1895 he communicated his plans for a balloon journey into the unknown Arctic area to the Swedish Academy of Science and the Sixth International Geographical Congress in London. His idea was to provide a balloon to carry three persons with necessary instruments, provisions, etc., for four months, and ballast, and that might be kept afloat for thirty days, and be, to some extent, steerable. He had been able by means of a sail and one or more guide-ropes dragging on the ground to cause a balloon to deviate 27° from the direction of the wind. He proposed to erect a balloon-shed on Danes island, Northwestern Spitzbergen, 710 statute miles from the north pole, fill his air-ship with gas in the shed, and await a favorable south wind to waft him and two companions toward the north pole. If the conditions were most favorable he believed he might reach the pole in ten hours. If possible he desired to cross the entire unknown area and make land somewhere, preferably on the North American mainland, depending upon the sledge and boat carried with him to reach some inhabited district. His detailed plans were severely criticised, but he won the respect of learned men by the scientific data and practical experience with which he upheld the plausibility of his scheme of exploration.

The money he desired—\$36,000—was provided mainly by the late Mr. Alfred Noble, the late Baron Osear Diekson, and the King of Sweden. His balloon, the Ornen (Eagle), was constructed in Paris at a cost of \$10,000, and taken to Danes island in the summer of 1896; but Mr. Andrée was compelled to return to Sweden with his equipment, as there was no wind favorable for his purpose during the few summer weeks in which he might start with hopes of success. He enlarged his balloon to a capacity of 170,000 cubic feet. The place for work was the roof of the car, somewhat protected from the weather by a tarpaulin curtain. Here were all the scientific instruments, and here two of the aeronauts were to take observations and manage the balloon, while the third rested in the inclosed car, which was reached through a trap-door.

Mr. Andrée returned to Danes island late in the spring of 1897. His companions for the voyage were Nils Strindberg and Knut Fraenkel. The party was provisioned for nine months. To steer and control the balloon Mr. Andrée had provided three sails, with a total surface of 800 square feet, and three guide-ropes. Arriving at Danes island in May, everything was ready for the start by July 1, but the essential south wind did not come till ten days later. In a brisk south wind the balloon ascended on July 11. It reached a height of about 3,000 feet, moved to the N. E., and disappeared in about an hour.

Four days later a carrier-pigeon alighted on the sealer Alken, and was shot. In a small tube it bore a message in Mr. Andrée's handwriting dated two days after the ascent. It read: "Latitude 82° 2' : longitude 15° 5' east. Good progress eastward; 10° south. All well on board. This is the third pigeon dispatched.—ANDRÉE." Other traces, mostly unable to bear investigation, have been announced from time to time. When he sent his dispatch he was only 145 miles N. and 45 miles E. of his starting-point. Prof. Eckholm assumes that the balloon's slow progress northward in two days was due to the fact that the wind in which it ascended was part of a cyclonic or whirling storm, the air-currents

carrying it into the center or area of calm, whence the airship finally emerged and was borne eastward. It was thought that if the party had made a safe landing it was probably in Franz Josef Land, but no traces of them were found there by Wellman in July, 1898. C. C. ADAMS.

Andrews, GEORGE PIERCE: lawyer; b. in New Bridgeton, Me., Sept. 29, 1835; son of Solomon Andrews and Sibyl Ann Farnsworth, both of Puritan stock; attended the high school, graduated at Williston Seminary, East Hampden, Mass., and in 1858 from Yale College; then studied law in Portland, Me., and after several years' study, with intermissions, was admitted to the bar in New York, where he has since resided. Was appointed assistant district attorney for the southern district of New York under Buchanan's administration, and held the office for six years; from 1872-82 was assistant corporation counsel of New York city, and his distinction in this office led to his nomination and election as justice of the Supreme Court for the first judicial department (New York city) in Nov., 1883, where he served until the close of his term in 1897. He was nominated and elected as justice of the Supreme Court for the same department in 1898. F. STURGES ALLEN.

Annenkoff, Gen. MICHEL: civil engineer and officer in the Russian army; b. in St. Petersburg in 1838; entered the army in 1863, and at the age of twenty-eight had reached the rank of colonel. He was Russian military *attaché* with the German army during the Franco-Prussian war. He served under Gen. Skobelev in the Merv campaign, in which one of his arms was shattered by a shot. Distinguishing himself in the superintendence of strategic railroad-building, he was assigned to the great work of building the Trans-Caspian railroad, the first railroad built through a desert. The new problems involved in this undertaking were ingeniously solved, and the road was built with remarkable celerity, being completed from the Caspian Sea to Samarcand on May 27, 1888. He then devoted himself to the study of the Trans-Siberian railroad project, and was most prominently identified with the building of that road. D. in St. Petersburg, Jan. 22, 1899. C. C. ADAMS.

Ant-thrush: a common name for the members of the family *Formicariidae*, a group of small, sober-colored birds, comprising some 250 species, and eminently characteristic of the forests of tropical South America. The name is given from the fact that they feed largely on ants, and the approach of a band of foraging ants, *Eciton*, is usually announced by the calls and movements of small flocks of these birds. F. A. LUCAS.

Archer, FREDERIC: musician; b. in Oxford, England, June 16, 1838; received his musical education first in London and later in Leipzig; organist of Merton College, Oxford, and later of the Alexandra Palace, London; conductor, on the resignation of Mr. Weist Hill, till 1880, and also conductor, 1878-80, of the Glasgow Select Choir. In 1881 he came to the U. S., and was for a year organist of Plymouth church, Brooklyn, then for a year of the Church of the Incarnation, New York; edited the *Keynote* for several years. Leaving New York, he visited several Western cities professionally, finally settling in Pittsburg, Pa., where he has remained teaching, playing the organ, and conducting a local orchestral society. D. E. HERVEY.

Arens, FRANZ XAVIER: musician; b. in Germany, on the banks of the Moselle, Oct. 28, 1856, and was first a pupil under his father. Came to the U. S. when very young, and when eighteen years old was organist in a small town near Cleveland, Ohio. Later he went to Milwaukee and continued his studies in St. Francis Normal School, taking courses in organ-playing, violin, singing, harmony, and counterpoint. Next he was for three years musical director of Canisius College, Buffalo, N. Y., and then went to Europe, remaining for two years studying under Rheinberger, Abel, Wullner, Janssen, and Kirehner. On his return to the U. S. he became conductor of the Cleveland Gesang Verein and the Cleveland Philharmonic Society. His compositions are mainly in the higher forms. D. E. HERVEY.

Arensky, ANTON STEPANOVITCH: musician of the young Russian school; b. in Novgorod, July 30, 1862; studied in the St. Petersburg Conservatory 1879-82, and from the latter date Professor of Harmony and Composition in the Moscow Conservatory. His compositions are of the most modern school and are very interesting, as well as in many cases very difficult, especially his works for piano solo. D. E. H.

Arnth, ALFRED, Chevalier d': Austrian historian; b. in Vienna, July 10, 1819; studied law in Vienna; was appointed vice-director of the Austrian imperial archives in 1858, and director in 1868. He became known as one of the leading historical authorities for the period preceding the French Revolution. In 1848 he became a member of the National Assembly, in 1861 of the Landtag of Lower Austria, and in 1869 was made a life member of the Austrian Reichsrath, where he was prominent in the debate on the confessional laws. He was elected president of the Vienna Academy of Sciences in 1879. Among his published works are: *Life of Prince Eugene of Savoy* (1858); *Correspondence of Maria Theresa and Marie Antoinette* (1865); *Correspondence of Marie Antoinette, Joseph II., and Leopold II.* (1866); *Jean Christophe Bartenstein and his Time* (1872); *Secret Correspondence of Marie Antoinette and Count Mercy-Argeuteau* (1874). D. in Vienna, July 31, 1897.

Arnold, JURY (YOURIJ VON): musician; b. in St. Petersburg in 1811. In 1827-30 he studied in Dorpat University, and then took up the study of music both in St. Petersburg and Germany. In 1831 he took part in the Polish campaign and was promoted to be an officer of the first rank. After the close of the campaign he resigned his position and devoted himself entirely to music in company with Glinka, Dargomyjsky, Lvoff, Prince Odoevsky, and others. Arnold composed many small pieces for different instruments, and conducted the musical department of the Moscow Vedomosti. He translated many Russian operas into German, and contributed critical and descriptive articles to the *Leipziger Zeitung* and *Neue Zeitschrift*. He lectured on counterpoint and fugue in the Moscow Conservatory at the request of Anton Rubinstein. He composed music for the liturgy of St. John Chrysostom. His *Theory of the Old Russian Church Music* was first published in the *Moscow Musical World*, and subsequently in a volume in 1886. The full title of this work, which is a standard authority on its subject, is *Harmonization of the Old Russian Church Song, according to Greek and Byzantine Theory and Acoustical Analysis*. In the same year he conducted a chorus in Moscow. In 1871 he accepted the position of Professor of Musical History and Theory in Moscow University, which he held until his death on July 19, 1898. He wrote also *Theory of Musical Composition* and *The Æsthetic Laws of Musical Science*. D. E. HERVEY.

Art, Psychology and Philosophy of: The psychology of art constitutes one of the two great divisions of the subject of æsthetics, the other division being the philosophy of art. Both are contrasted with the application of the principles of æsthetics, which constitutes the technical treatment of the fine arts, together with the principles of art criticism. The two departments of æsthetics, known respectively as the psychology and the philosophy of art, have different problems and methods. The former seeks to determine the mental processes involved both in the production and in the appreciation of works of art; the latter seeks to determine what it is in objects which constitutes them objects of art—what, in short, are "beauty," "ugliness," and the other forms of determination connected with them.

I. Taking up the psychology of art, we have to attempt to find an answer to two great questions: first, What are the processes in the artist's own mind?—the question of art from the "producer's point of view"—and second, What are the processes in the mind of the person who sees the work of art and pronounces it beautiful?—art from the "spectator's point of view." In discussing the producer's point of view, we have to consider what is called the "art-impulse" in the artist or producer. This question has been taken up by various writers, both *analytically* (that is, by an analysis of the actual motives in the artist's or inventor's mind when producing a new creation), and also *genetically* (that is, by tracing the history of art from its primitive beginnings among rude peoples, in children, and even in animals, and finding the least degree and kind of mental endowment which will account for the actual form which the art-product has taken on). These two methods of study must go hand in hand, and together they have given a very interesting body of data. The results of the study may be indicated briefly.

The origin of art is to be connected with certain fundamental impulses. Early in the history of the subject it was suggested (Schiller and Herbert Spencer) that the play-impulse was the source of art. According to this theory, as

originally stated, the animal plays when he has a surplus of physical energy (see PLAY), and it is when he has energy and time to play that he and the man fall to doing things to secure and to give pleasure; such productions are the beginnings of art. From the rude beginnings thus made, the more refined and higher forms of art have developed. It had already been pointed out, however, by Aristotle that there is a very large amount of imitation in art. A great class of art-products are distinctly imitative, so much so that a school of art critics say that art is entirely imitative, and that strict realistic reproduction of nature is the sole province of art. Recognizing imitation, Spenceer made it the channel of expression of the play-impulse. In play the child and the animal imitate serious activities, so the play theory of art came to include the impulse to imitate.

This theory has recently been very severely criticised (see especially the work of Gross cited below). The main criticism is that this theory makes art a useless thing, a mere matter of using up surplus energy, a by-play, so to speak, in human evolution. As such, it has no reason for existence or for taking on any consistent and continuous development in the history of man. It is said, moreover, by the critics of this theory that play is not mere using up of surplus energy, but a serious channel of practice to the young in the activities which their adult life requires. If this be true, and if art arise in connection with play, we have a view which brings art within the utilities of life, and confines it to those useful channels which are employed also by the play-impulse. This, we are then told, is the reason that art is to such a great degree imitative—i. e. because imitation, both when playful and when earnest, is the most useful mode of acquisition of the various functions of adult life. Accepting this criticism of the Schiller-Spenceer theory, we have the result, so far, that the art-impulse involves (1) the imitative impulse, but only when (2) it is playfully exercised. The first clause (1) indicates the requirement the artist is under of being in the main true to reality, of imitating a situation which is possible in real life, and the second clause (2) distinguishes his procedure from the strenuous purposes of real life in which his motive is strictly utilitarian. This latter distinction becomes very important when we come later on to take the spectator's point of view.

But both analytic and genetic study agree that this is not all that there is in the artist's attitude when he makes a work of art—not his whole motive or impulse. There is another sort of art which does not seem to be imitative. It is what we call "decorative." When the savage puts a smudge of red paint on his breast, or when the bird displays his gorgeous plumage before his mate—and together with these simple instances we may take the highest triumphs of the "court of honor" and the details of rococo ornamentation—in these cases the producer has another motive and reason for it all: he does it to *excite admiration in others*. In early art, it is almost entirely a matter of showing off to other individuals. This is called in psychology the self-exhibiting impulse. It is found also in very marked degree in the animals. And both in men and animals it is strongest as between the sexes and at the mating season. It may have had its origin in what Darwin called "sexual selection." At any rate, it must be acknowledged as a part of the producer's motive, to win the applause of others. Genetically it probably had its beginning in the sexual life—in the necessity of winning a mate by exhibitions of personal excellence, prowess, beauty, etc. Some writers regard the self-exhibiting impulse as additional to the decorative impulse, since the animals have distinct instincts to decorate. The present writer thinks, however, that in human art, at least, these two things flow together. On this view we may say, finally, that art involves two fundamental motives: *Imitation* and *Self-exhibition*; and that these two motives, when they realize themselves in a playful way, produce art, directing the actual construction by the IMAGINATION (*q. v.*).

The condition that these two impulses work "in a playful way" is seen in what is called by psychologists the "make-believe" state of mind, which is always present in producing and also in enjoying a work of art. Make-believe is a peculiar double consciousness in which one finds himself, consisting in a proper sense of the true realities of serious life at the same time that one allows himself to be absorbed in the situation which the work of art depicts. The best illustration is the so-called "illusion" of the theater. The spectator allows himself to enter fully into the situation of

the plot and to follow it through as if it were a real series of events, but all the while he knows that it is an indulgence of his imagination, a "make-believe" situation, and that he can break off at any time and withdraw. The same is true of the artist and the actor; while throwing himself into his part in order to realize it and perform it well, he at the same time preserves his consciousness that he is really Mr. A., the actor, not Macbeth nor Hamlet. The element of make-believe is also very strong in animal and human play, and seems to be present whenever the sense of beauty is aroused. It contributes a strong feeling of pleasure to all experience into which it enters, and furnishes a motive to art indulgence and pursuit. Some writers emphasize it to the exclusion of all other criteria of the aesthetic (*v. Hartmann, K. Lange*), and so make aesthetics a department of so-called hedonics—the science of pleasure and pain.

Coming to consider art from the spectator's point of view, we have to ask the questions when and why we pronounce an object beautiful. Granted that there is an artist at work before us, working under the impulses of imitation and self-exhibition, and setting up the imaginary situation which throws us into the state of "make-believe," we ask why the result is really pronounced artistic or beautiful by us who look on. This is the question in psychology of the marks or "coefficients" of the beautiful. It is easy to see that all products of imagination are not equally beautiful, some not being beautiful at all; and also that there are several kinds of beauty according as the work is in one or other of several spheres of creation. We have a number of arts, and while we use the term beautiful for all of them, we in each case have in mind a particular and definite product.

The spheres apart, what psychology is interested in is the question, What is it in the thing perceived or imagined which leads us to admire it? Not in the thing itself—that is the philosophical question—but in our perception or imagination of the thing. What are the marks or coefficients involved? First, there must be the criteria of possible truth; that is, we must always feel that the work of art might actually represent real things. This is made necessary by both the art-motives explained above. It represents to the spectator the same mental movements, i. e. imitation, which demands a more or less true reproduction of what actually exists, and also self-exhibition, which demands the agreement of other spectators. This latter is especially important here. The spectator finds what is called the property of "universality" in a work of art. He holds the beauty of it equally valid for all spectators, anticipating that others will approve of what he himself approves. Even in the lower biological world there must be correspondence between those marks, adornments, etc., which the male bird, for example, displays before the female, and those qualities which the female admires; otherwise, there would be no result from the former's display. So we find all through; there are certain relationships, certain formal combinations, which must be present both in the production and in the appreciation of a work of art. These have been developed by various thinkers and may be stated under certain well-recognized principles:

1. *The principle of "unity in variety."* According to this principle, the work of art must be in some evident way a whole, not a mere aggregation of different elements; it must have one meaning or design toward which all the details essentially contribute. Evident examples are relatively complex geometrical figures, in which the whole has an apparent design within which the details are held together on some consistent plan. In the matter of such geometrical forms it is probable that the requirement of unity is in part explained by the relative ease in the movements of the eyes in sweeping over the contour of the figure. That is, it is a matter of motor adjustment in affecting the visual unity in which all the parts are held together. So for the aesthetic forms reported by the other senses. The same general requirement is operative, also, in the higher and more abstract sorts of artistic production, where the attention has a similar adjustment. The need of unity is probably the need of synthesis found in all mental construction and thinking, a unity secured by the motor processes which give concentration to the attention. (See SENTIMENT, ÆSTHETIC.) In the aesthetics of visual form we have a number of minor requirements, all of which involve this principle and its nervous mechanism—e. g., balance, proportion, contrast. (See GOLDEN SECTION.) In "perspective" new elements are introduced by the apparatus of visual "accommodation" and "convergence." In the actual exe-

cution, departures from true measurement are often necessary in order to allow for certain OPTICAL ILLUSIONS (*q. v.*).

2. *The principle of "consistency."* By this is meant the necessity of keeping the work of art in all respects within the particular sphere in which the self-illusion or "make-believe" is begun. If we start out to secure an æsthetic effect on canvas, we can not finish it with music, unless we at the beginning agree that the two arts are to be included in a larger æsthetic scheme. Hence the incongruity to us moderns in painting a marble statue; our plastic sense has become accustomed to neutrality of coloring, and the violation of the convention breaks in upon our sense of imitative make-believe. So in the theater, while we do not respect the unities of time and place as regards the actual dates and localities assigned to this scene and that, yet we do demand consistency in the representation itself—e. g. we do not allow two costumes of different periods on the stage at the same time, nor do we allow the characters of Shakespeare to use the telephone. These things would intrude elements from what is felt to be the background of prosaic reality into the make-believe situation upon which our æsthetic attitudes are terminating.

Within the limits set by these principles we find certain characteristics of art which are insisted upon with different degrees of emphasis by writers on the psychology of art.

The character of "freedom," which attaches to art; as opposed to science and actual experience, follows from the fact that in art we are conscious of a personal indulgence in the make-believe situation, and with it of our ability to put an end to the situation at any time and return to prosaic reality. Art thus becomes a development apart, in this sense, from the stern realities of life, not explainable in terms of direct utility. A large part of the pleasure of art-appreciation comes from this sense of relief from the pressing necessities of our every-day vocations, from the necessity of fulfilling a task, together with the ability to choose the form of æsthetic enjoyment which will bring to the individual the greatest positive pleasure and recuperation.

With this freedom there goes also what is called the "idealization" of art. While held, in the matter of æsthetic construction, within the possibilities of imitative creation by the principles of "unity in variety" and "consistency," there is, however, within those bounds no limit to the carrying out of the tendency to idealization. The actual is not sufficiently complex, or not sufficiently unified, or not entirely consistent; we therefore go on to improve on reality at the same time that we imitate it. Here comes in the artistic device of so-called "suggestion," which is one of the great resources of idealistic art. The actual imitation is made the vehicle of a larger suggested situation in which the progress of the same kind of construction toward the ideal is depicted. Art thus becomes a stimulus to all the higher emotions and sentiments, and a pedagogical instrument of the highest value both to the individual and to society. The mission of the artist is essentially perverted and his functions corrupted when he uses the principle of suggestion to minister to impure or unæsthetic cravings rather than to stimulate and purify the ideals of the spectator.

It is also just at this point that the matter of "association" comes in, of which some psychologists make so much. By association is meant the fact which we see, in exaggerated form, when we find that, with suitable suggestions thrown about it, a thing which is in itself neutral takes on positive æsthetic value. There is a pathetic song entitled *My Mother's Hands*, the emotion suggested being that of gratitude and affection aroused by the suggestion of a life of devotion and a character of beautiful self-denial. A brass gun seems beautiful to the smoke-stained gunner, and the flag which has lost its beauty of color from exposure takes on a deeper sentimental beauty from the very completeness of the ruin wrought in it by shell and bayonet. So far from affording an explanation of art, that it arouses emotional associations—a view which the "association" school of thinkers urge with great insistence—the force of these facts bears toward a theory which construes art in idealistic and sentimental categories. For, as we have seen, but for the tendency of the imagination to build its constructions away from a servile imitative creation, to go beyond strict association, to build up a more perfect and ideal product, the principle of suggestion would not work at all. In fact, we have to invoke first the synthetic or apperceptive function, working under the principles laid down above, before there is room for association to come in at all. Associations which

do not fulfill these requirements do not yield the sort of enjoyment called æsthetic.

II. *The Philosophy of the Beautiful.*—Coming to the second topic, we find a different question asked: the question as to what it is in objects which makes them beautiful. Here, as in other problems of philosophy, we have certain great historical solutions suggested. The realists say that beauty is a positive quality or property inherent in beautiful things. We call an object beautiful because it really is beautiful; this is supported by the fact that we so largely agree in our judgments and appreciations in æsthetic matters. The idealist, however, says: "Quite impossible! Beauty, like the other properties of things, is entirely relative to us. There are certain stimulating conditions which affect us in certain ways, and when an object thus stimulates us, that is the only and the sufficient reason that we pronounce it beautiful." With others still it is possible to admit the result of the psychological analysis of the idealist, and at the same time to make more of beauty than the production of a certain state of mind in the spectator. The point may be made that all knowledge and sentiment are in some way expressions of the reactions of the individual upon reality; and they must be held to reveal in some way what reality is. The æsthetic and other sentiments must have a meaning just as knowledge has a meaning. Inasmuch as these emotional states involve intellectual constructions also, they can not be divorced from the realities which knowledge reveals. So in present-day thought there is a wide-spread view which draws a distinction between the so-called "world of description or science," which deals with knowledge and reality as we are able to get it, and "the world of values or worths," which deals with our attitude of appreciation toward the realities which come to us through knowledge and science. In the world of values we ask, What is this worth?—as in the world of science we ask, Is this true? In the world of values æsthetic worths enter with the religious and moral, as essential parts of a final view of reality. That is, our doctrine of what is the ultimate principle of reality in the world must account not only for the possibility of our having and using the knowledge, but also for our having the æsthetic and other impulses and appreciations of value. This seems to the present writer a necessary position. See PHILOSOPHY AND METAPHYSICS.

Emotions Allied to the Æsthetic.—The violation of certain elements in the requirements of beauty, while the other elements are present, gives rise to distinct emotions. In the *comic* we have violations of the law of consistency. The comic is the æsthetically abortive. A joke turns on a misplaced grammatical or logical relation which would have been æsthetic if properly placed. A comic situation is an incongruity, where the conceptual process demands congruity and anticipates it. Hence the elements of surprise, disproportion, and disharmony in all humor and wit. Not only is the comical the unexpected, as Dunont maintains, but it is that which we have no right to expect, which we have every right not to expect; and negatively, the sense of fun often arises from the simple absence or failure of what we do expect. Another requisite is that the subject be trivial and involve no important consequences. We often say an event would be ludicrous if it were not so serious. The comic is a matter largely of meaning. The *grotesque*, on the other hand, is the comic of form. The *picturesque* illustrates a similar departure from normal beauty, but not sufficiently so to lead to positive inconsistency. It applies especially to form, and is found in the bold, sharp, irregular, unexpected in outline. In the *sublime*, the meaning attaches to particular feelings, those aroused by the large, massive, forceful, and destructive; it seems also to include a coloring of fear and awe.

LITERATURE.—See the general treatises on psychology given under that topic, especially those of Volkmann, Bain, Baldwin, Ladd. Also see Lotze, *Outlines of Æsthetics*; Fechner, *Vorschule der Æsthetik*; Guyau, *Problèmes de l'Esthétique Contemporaine*; Marshall, *Pain, Pleasure, and Æsthetics*, and *Æsthetic Principles*; Gross, *The Play of Animals*; Baldwin, *Social and Ethical Interpretations* (sections on Play and Art); Grosse, *The Beginnings of Art*; Brown, *The Fine Arts*; Bosanquet, *History of Æsthetics*.

J. MARK BALDWIN.

Arthur, ALFRED: musician; b. in Pittsburg, Pa., Oct. 8, 1844; studied in Boston, first under private teachers, and later under Julius Eichberg at the Boston Conservatory of Music. While in Boston he sang tenor in the choir of the

Church of the Advent. In 1871 he settled in Cleveland, Ohio, and taught and directed musical societies there, including the Germania Orchestra. In 1878 he founded the Bach Choir of the Woodland Presbyterian Church, which soon attracted much attention. In 1873 he founded the Cleveland Vocal Society and conducted it. He visited Europe in 1879 and again in 1887. Among his compositions are three unpublished operas: *The Water-Carriers* (1876); *The Roundheads and Cavaliers* (1878); and *Adaline* (1879). Besides these he has composed much in the smaller forms. D. E. H.

Assessments, Municipal: See MUNICIPAL ASSESSMENTS.

Atkinson, JOHN, M. A., D. D.: Methodist clergyman and author; b. in Deerfield, N. J., Sept. 6, 1835. He held pastorates in Newark and Jersey City, N. J., Chicago, Ill., Bay City and Adrian, Mich., and in Haverstraw, N. Y., where he died Dec. 8, 1897. He was the author of the hymn *We shall Meet Beyond the River*. Among his published works are *The Living Way* (1856); *Memorials of Methodism in New Jersey* (1860); *The Garden of Sorrows* (1868); *The Class Leader* (1874); *Centennial History of American Methodism* (1884); and *The Wesleyan Movement in America*.

Attention [from Lat. *ad + tendere*, stretch]: the turning of the mind toward an object or idea indicated by such expressions as "being occupied with," "concentrating upon." The two sorts of attention commonly distinguished are "reflex," "passive," sometimes inappropriately called "spontaneous," and "voluntary," or "active"; attention being reflex when drawn without the subject's foreknowledge by an unexpected stimulation, such as a long peal of thunder, and voluntary when foreseen and intended. To these may be added, though not correlative with them, "primary attention," which indicates the supposed form of attention or its organic analogue in organisms so low as to be incapable of having a life of presentation. It is probably in these low organisms simply a concentration of the vital energies in certain channels appropriate to the particular stimulation.

Other distinctions are marked by the phrases: (1) "Expectant" attention, or "pre-attention," with the variations "preperception" and "ideational preparation," for all which anticipation is synonymous. This state of mind is the necessary preliminary of effort: we must attend very vigorously to the intended act in order to perform it. (2) "Diffused" or "scattered" attention, characteristic of states of indifference, lack of interest, and apathy—all these are terms of degree used (in contrast with "strained," "concentrated," "effortful" attention) in reference to mental objects which are clearly taken in, but quickly passed over. (3) "Selective" attention, having reference to the nature of the outcome which our special attention aims to secure. States of attention are also distinguished by their objects as "sensorial" (attention to a sensation) and "ideational," "ideal," or "intellectual" (attention to an idea of any sort). For example, attention to a toothache is sensorial, while attention to a mathematical calculation, going on in the head, is intellectual.

With some notable exceptions (Wolff, Kant, and James Mill) the attention was greatly neglected until more modern times, notably by the English empiricists. It was considered an unanalyzable attribute of the soul, and direct evidence of the independent activity of the mental principle (Hamilton, Carpenter, McCosh). With Leibnitz it was the essential mode of receiving new experiences, which he termed APPERCEPTION (*q. v.*).

Recent literature, however, is full of theories which may be grouped under certain headings with authorities. There are (1) the affective theories, which reduce attention to feeling (Ribot); (2) the conative, "psychical energy," and original activity theories, which identify it with will (Ward, Ladd, Stout); (3) the motor theories, according to which it is a function of motor habit (Münsterberg, Baldwin); (4) the "intensity" and "re-enforcement" theories (Bradley); (5) the inhibition theory (Külpe).

Each of these theories has reference to some well-known characteristic of the act of attention. These characteristics are briefly as follows: Attention intensifies all the mental or physical processes to which it may be directed. We may interfere not only with our emotions and beliefs by attention, but also with our digestion and our color-perception. This general fact, that attention makes a state of mind more vivid, is called the "re-enforcing function" of the attention. At the same time we find that the re-enforcement of one element in consciousness is at the expense of

other elements. What we do not attend to tends to disappear or to withdraw to the margin of consciousness; in psychological phrase, it tends to be "inhibited," and so the effect of attention in thus reducing the intensity and clearness of those things which are not being attended to is called its "inhibiting function." These two functions, the re-enforcing and the inhibiting, always go together, and no theory of attention is true which does not include them both.

Moreover, attention has not only such effects, but also a mechanism. We feel certain changes taking place when we concentrate attention: changes in the muscles of the eye or ear (or other sense, according as we attend through one or another). The muscles are set, the skin is drawn, the heart-beat is quickened, the respiration-rhythm is changed. By the recognition of these changes many psychologists have been driven to distinguish between the attention as a process and that which is attended to, called the "content." On this distinction the "motor" theories rest, attention being considered a reaction of the motor apparatus upon the mental content. It is on this distinction, also, that the theories are based which consider attention a purely spiritual and ultimate activity.

The differences of opinion on the question as to whether attention is a separate or independent faculty or a function of the content in mind, are now reflected in the question as to whether it be, if a function, a common and constant or a variable and specialized function. It has recently been argued (Baldwin), in opposition to the "constant function" view (Wundt, Külpe), that attention is a variable function; that we have not one attention, but many attentions. On this view, while there is a constant element in the different reactions of attention to different contents, there are nevertheless both "typical" (visual, auditory, etc.) and also individual or special elements characteristic of each. To express this the following attention formula has been proposed by Baldwin:

Att (attention) = A + a + α : a formula showing the mental elements which enter into an act of attention, apart from the object attended to.

A = elements common to all acts of attention.

a = elements special to acts of attention to different classes of objects, but common to acts of attention to all the objects of each class.

α = elements special to acts of attention to a single object, but common to repeated acts of attention to the same object.

This formula was interpreted, when suggested, in terms of "motor elements" entirely. The advantage of the symbols, however, is that they can be used in the discussion of any of the theories of attention—that is, they can be given motor, affective, or intellectual values. It does not even require the view (also supported by its proposer) that all the symbols have positive values; for on the theories which consider attention as a constant faculty or function the formula reduces itself to A = A, the other symbols being each zero.

A question which is very important both in education and in ethics concerns the control of the attention. How far and by what means can we keep our attention under control? Of course this question can be asked only of voluntary attention; for attention which is drawn without our preparatory knowledge and intention is quite outside of our control. Of voluntary attention one theory holds that it is also outside of our control, being a purely reflex thing dictated by the strength of the influences which arise to call the attention in this direction or that. Admitting the fact that we do have a moderate degree of control or management of the direction of the attention, we may distinguish two sorts of such control or management: first, "direct," and second, "indirect" control of the attention. Under the head of direct control those who hold that the attention is a mental principle of absolute power of mental initiation place the case in which we deliberate and then deliberately choose what we will, or what we attend to. They say that all voluntary movement of the body involves attention of this sort; so also all voluntary direction of the stream of thought. In this latter case they hold that we can by turning attention to this or that one of our motives so re-enforce it as to make it the controlling one, and so determine our choice. In current discussion the possibility of the mind's getting in any real initiation of changes in the flow of the mental life is put here—i. e. in the possibility of direct control of the attention.

By indirect control of the attention is meant the view that the mind can not directly, without preliminary motives, reasons, etc., interfere and control the stream of thought, but that its control is always "indirect," or through earlier states of mind. In indirect control we proceed upon motives or reasons for wishing to give the stream a turn in this or that direction; that is, we are under preliminary motives, interests, preferences, even when we by attention re-enforce one of a set of possible alternatives. It is true, say the advocates of this theory, that we choose by attending; but it is also true that the attention is itself determined by an earlier choice, and so on. This preceding choice sets the elements which are really operative, and it is by identifying ourselves with these elements that we get our control. This indirect control is certainly a fact—whether it explains all the cases of seeming direct control or not. It is shown in interesting pathological cases. Patients are reduced to complete inability to move a limb simply because they can not attend to it, and the reason that they can not attend to it is that, through injury to the brain, they have no images to represent the movement. This shows that the attention, so far from being a self-sufficient activity, depends upon getting certain equivalents of what is to be attended to, and by them of controlling or "setting" the direction of the mental life. No acts can be voluntarily carried out, whether by sensorial or by intellectual attention, unless the elements of earlier acts of attention in the same direction can be brought up in mind. These elements are held to be the indirect means by which a particular case of attention is realized and held under control. Put in general psychological terms, the attention is always a function of some content in consciousness, and to carry out an act of attention this content, or something equivalent to it, must be present first.

J. MARK BALDWIN.

Atwood, ISAAC MORGAN, D. D.: Universalist minister; b. in Pembroke, N. Y., Mar. 24, 1838; entered the Universalist ministry in 1859; edited the *Universalist* 1867-72, and the *Christian Leader* 1873-75, and since 1875 has been associate editor; in 1879 he became president of the theological seminary connected with St. Lawrence University, Canton, N. Y., and in it is Dockstader Professor of Theology and Ethics. He is the author of *Have we Outgrown Christianity?* (Boston, 1870); *Glance at the Religious Progress of the United States* (1874); *Latest Word of Universalism* (1878); *Walks about Zion* (1882); *Episcopacy* (1884); *Revelation* (1889); *Balance-sheet of Biblical Criticism* (1895).

Aus der Ohe, ADELE: pianist and composer; b. in Germany in 1857; studied piano-playing under Kullak and Liszt. After completing her studies she began a series of concert tours which have included the U. S. From 1886 to the present year (1899) she has visited this country many times, and has always met with great success. Of late years she has done much work in composition, including some songs, but chiefly for the piano; but all her works are of the highest class, as well as very difficult to play.

D. E. HERVEY.

Austin, MRS. JANE GOODWIN: author; b. in Worcester, Mass., Feb. 25, 1831; lived in Cambridge and in Concord, Mass., but nearly all her married life in Boston; was first known as a magazine writer, but afterward mainly as the writer of historical tales of the Pilgrim Fathers and their descendants. Among her books are *Dora Darling* (1864); *Outpost: a Novel* (1866); *Cipher: a Romance* (1869); *The Shadow of Moloch Mountain* (1870); *Moonfolk: a True Account of the Home of the Fairy Tales* (1874); *Mrs. Beauchamp Brown* (1880); *A Nameless Nobleman* (1881); *The Desmond Hundred* (1882); *Nantucket Scraps* (1882); *Standish of Standish* (1889); *Dr. Le Baron and his Daughters*

(1891); *Betty Alden* (1891); *David Alden's Daughter, and other Stories* (1892). D. in Boston, Mar. 30, 1894.

Babcock, JAMES FRANCIS: chemist; b. in Boston, Mass., Feb. 23, 1844; graduated from the Lawrence Scientific School in 1862; was Professor of Chemistry in the Massachusetts College of Pharmacy 1869-74, and in the Boston University; State assayer and inspector of liquors 1875-85; city inspector of milk in Boston, 1885-89. D. in Boston, July 10, 1897. He published many reports on sanitation and the chemistry of food, invented a fire-extinguisher, and was widely known as a scientific lecturer.

Bacon, JOHN EDMUND: b. in Edgefield, S. C., Mar. 3, 1832; graduated at South Carolina College in 1851; admitted to the bar in 1854. His accomplishments as a linguist led to his appointment as secretary of legation at St. Petersburg, Russia, in 1858; he acted as *chargé d'affaires* until F. W. Pickens arrived as minister, and he married ex-Gov. Pickens's daughter, Rebecca Calhoun, in 1859. On the election of Mr. Lincoln to the presidency he resigned, and in 1861 entered the Confederate army as a private, afterward becoming a major. In 1866 he went to Washington with Gov. James L. Orr to arrange for South Carolina's restoration; served a short time in 1867 as district judge; in 1872 was an unsuccessful candidate for Congress; in 1886 was appointed U. S. *chargé d'affaires* in Uruguay and Paraguay. D. in Columbia, S. C., Feb. 19, 1897.

Bailey, LORING WOART, Ph. D., LL.D.: b. in West Point, N. Y., Sept. 29, 1839; educated at Brown University and at Harvard; was assistant to the Professor of Chemistry at Harvard until Sept., 1861, when he became Professor of Chemistry and Natural Science in the University of New Brunswick. The results of his investigations into the geology and natural history of New Brunswick have been published in reports by the Geological Survey of Canada, and he has contributed to various scientific periodicals.

Baker, JAMES HUTCHINS, A. M., LL.D.: educator; b. in Harmony, Me., Oct. 13, 1848; graduated from Bates College. He has served as principal of high schools in Yarmouth, Me., and Denver, Col., and president of the University of Colorado. He was a member of the committee of ten of the National Council of Education on Secondary School Studies, and has been president of the National Council of Education, author of *Elementary Psychology*, and of numerous essays and addresses on educational questions. C. H. T.

Baker, WILLIAM SPOHN: author; b. in Philadelphia, Pa., Apr. 17, 1824; educated in private schools, and practiced conveyancing till 1880, but afterward devoted all his time to historical work, especially with reference to George Washington. D. in Philadelphia, Sept. 8, 1897. He published various works treating of Washington, and his other publications included *American Engravers and their Work*; *William Sharp, Engraver, and his Works*; *The Antiquity of Engraving and the Utility and Pleasures of Prints*.

Balakireff, MILY ALEXEJEVITCH: musician; b. in Novgorod, Russia, 1836; was a student in the University of Kazan, but in music was mainly self-taught. He was for a time conductor of the opera in Prague, and also of the imperial concerts in St. Petersburg. His compositions include overtures and symphonies for full orchestra, and much piano music. His fantasia *Islamey* has the reputation of being the most difficult piano composition ever written.

D. E. HERVEY.

Balatka, HANS: musician; b. in Hoffnungsthal, Moravia, Mar. 5, 1828. At an early age he was a choir-boy in Olmutz Cathedral. He pursued his musical studies while singing in church and conducting societies in Vienna until the revolution of 1848 forced him to flee to the U. S. In 1849 he settled in Milwaukee, where, in 1857, he founded the Milwaukee Musik Verein and conducted it for nine years. In 1860 he went to Chicago and became conductor of the Philharmonic Society there, continuing for six years. In 1862 he became conductor of the Musical Union, in 1862 of the Germania Männerchor. He has conducted saengerfests and musical festivals in Cleveland, 1855; Cincinnati and Milwaukee, 1856; Chicago, 1857, 1868, 1881; Detroit, 1857; Pittsburg, 1858; Indianapolis, 1867; Louisville and Quincy, 1877. In the great Chicago fire of 1871 he lost a valuable music library and moved back to Milwaukee, but returned to Chicago in 1873. The fiftieth anniversary of his service as a musical director was celebrated in 1895 in Chicago, his first conductorship being of the Academical Singing Society of Olmutz in 1845, and at the celebration he conducted the

cantata *Solomon's Temple*, by Titl, being the first work conducted by him fifty years before. His compositions include *The Power of Song*, double choruses for male voices, awarded first prize at the Cincinnati Saengerfest of 1856, *Festival Cantata* for soprano and orchestra, 1869, many fantasias and transcriptions for orchestra, and numerous songs, part songs, and choruses, for both male and mixed voices, with and without accompaniments. D. E. H.

Banister, HENRY CHARLES: musician; b. in London, June 13, 1831. For fifty-one years he was connected with the Royal Academy of Music, London, entering as a King's scholar in 1846, and being re-elected in 1848 for another period of two years, appointed assistant professor in 1851, and soon afterward Professor of Harmony, which position he held until his death. His compositions include four symphonies, five overtures, and many smaller works. His textbook on harmony, entitled *Music*, was published in 1872, and ran through sixteen editions. He also wrote *Musical Analysis*, a *Life of George A. Macfarren*, and many other musical-literary works. D. Nov. 20, 1897. D. E. H.

Bankruptcy: On July 1, 1898, an act of Congress was approved and took effect, which institutes in the U. S. a bankruptcy law intended to afford an opportunity for insolvent debtors to transfer all their property to a trustee for the benefit of their creditors, and to resume their business free from debt. Three such bankruptcy laws have been passed prior to the act of 1898 by the Congress of the U. S.: the first, Apr. 4, 1800, repealed Dec. 19, 1803; the second, Aug. 19, 1841, repealed Mar. 3, 1843; the third, Mar. 2, 1867 (and amendments), repealed June 7, 1878, the last repeal taking effect Sept. 1, 1878. These various acts were amended by various other minor acts relating to them, and the final act taking effect Sept. 1, 1878, removed from the statute-books all bankruptcy laws, and since that time the State insolvent laws have been in force. The purpose of the present bankruptcy laws is threefold: first, to secure to the creditor means to compel the insolvent debtor to undergo liquidation and to punish fraudulent debtors; second, to benefit the public by enabling insolvent debtors to obtain a release from their obligations by an honest application of their entire property to the payment of their debts; third, to benefit the debtor himself by enabling him to conduct his business free from the inconvenience and disability occasioned by prosecutions for the collection of his debts.

Under and by virtue of the Bankruptcy Act of 1898 there were created as courts of bankruptcy the district courts of the U. S. in the several States, the supreme court of the District of Columbia, the district courts of the several Territories, and the U. S. courts in the Indian Territory and the district court of Alaska, with such jurisdiction in law and in equity as would enable them to exercise original jurisdiction in bankruptcy proceedings, in vacation in chambers, and during their respective terms. The power given to these courts was (1) to adjudge persons bankrupt who had their principal place of business, or resided or had their domicile, within their respective territorial jurisdictions for the preceding six months or the greater part thereof, or who, not having their principal place of business, residence, or domicile within the U. S., have property within their jurisdictions, or who have been adjudged bankrupts by courts of competent jurisdiction without the U. S. and have property within their jurisdictions; (2) to allow claims, disallow claims, reconsider allowed or disallowed claims, and allow and disallow claims against bankrupts' estates; and besides these powers such additional powers are given to these courts as are necessary to enable them to carry into practical effect the terms of the Bankruptcy Act and administer the affairs and estates of bankrupt debtors.

Acts of Bankruptcy.—Under the terms of this act an act of bankruptcy by a person consists of his having (1) transferred, conveyed, sold and removed, or permitted to be sold or removed, any part of his property with intention to hinder, delay, or defraud his creditors or any of them; or (2) transferred while insolvent any portion of his property to one or more of his creditors with intent to prefer such creditor over his other creditors; or (3) having suffered or permitted while insolvent any creditor to obtain a preference through legal proceedings, and not having at least five days before a sale or final disposition of any property affected by such preferences vacated or discharged such preference; or (4) made a general assignment for the benefit of

his creditors; or (5) admitted in writing his inability to pay his debts and his willingness to be adjudged a bankrupt on that ground.

The petition must be filed against the bankrupt within four months after the commission of the act of bankruptcy; but it is a sufficient defense against such a petition to prove that the alleged insolvent debtor is not insolvent.

Who may Become Insolvent Debtors.—Any person who owes debts, except a corporation, is entitled to become a voluntary bankrupt. Any natural person except a wage-earner or a person engaged chiefly in farming or the tillage of the soil, any unincorporated company, and any corporation engaged principally in manufacturing, trading, printing, publishing, or mercantile pursuits, owing debts to the amount of \$1,000 or over, may be adjudged a voluntary bankrupt. Private bankers may be adjudged involuntary bankrupts, but not national banks or banks incorporated under State or Territorial laws. A partnership may be adjudged bankrupt during the continuance of its business, or after its dissolution and before the final settlement thereof, and jurisdiction over one of the partners confers jurisdiction upon all, and over all of the partnership and individual property.

Exemptions of Bankrupts.—The act does not affect the allowance to bankrupts of the exemptions which are prescribed by the State laws in force at the time of the filing of the petition in the State where the bankrupt has had his domicile for the six months, or the greater portion thereof, immediately preceding the filing of the petition.

The bankrupt is required, among other things, to execute and deliver to his trustee transfers of all his property both in the U. S. and in foreign countries, and to assist them to schedule all his property, and to comply with all lawful orders of the court in the settlement of his estate; but he can not be required to attend a meeting of his creditors or an examination more than 150 miles distant from his home or principal place of business, or to examine claims except when presented to him, except by order of the court.

Protection and Detention of Bankrupts.—A bankrupt is exempted from arrest upon a civil process except for contempt or disobedience of a court of bankruptcy, or for an action in a State court upon a debt the claim from which his discharge in bankruptcy would not have been a release. The judge may at any time after the filing of the petition in bankruptcy and before the expiration of a month after the qualification of the trustee restrain the bankrupt from leaving the district in which he resides or has his principal place of business for the purpose of avoiding examination, where such departure may defeat the proceedings in bankruptcy.

During the pendency of proceedings in bankruptcy all suits against the bankrupt from which the discharge in bankruptcy would effect a release are stayed and the trustee may be directed by the court to appear and defend any suit pending against the bankrupt, and the trustee may, with the approval of the court, prosecute as trustee any suit commenced by the bankrupt. Suits can not be brought by or against a trustee of a bankrupt's estate subsequent to two years after the estate has been closed.

Compositions of the Bankrupt with his Creditors.—A bankrupt may not offer terms of composition to his creditors until he has been examined in open court or at a meeting of his creditors and has filed in court the schedule of his property and the list of his creditors required to be filed by bankrupts. An application for the confirmation of a composition may be filed after it has been accepted in writing by a majority in number of all creditors whose claims have been allowed, representing a majority in amount of the claims allowed; and the judge must confirm the composition if he be satisfied that it is for the best interests of the creditors, and that the bankrupt has not been guilty of any of the acts or failed to perform any of the duties which would be a bar to his discharge, and that the offer and its acceptance are made in good faith and have not been procured by any means or acts forbidden by the law. Upon the confirmation of such a composition the consideration must be distributed as directed by the judge, and the case dismissed.

Discharge in Bankruptcy.—A bankrupt may, after the expiration of one month, and within one year subsequently to being adjudged a bankrupt, file an application for a discharge, and the judge must hear the application, and after the hearing upon due notice to all parties concerned must discharge the bankrupt, unless he has committed an offense punishable by imprisonment as provided by the law, or has

with fraudulent intent concealed his true financial condition, and in contemplation of bankruptcy destroyed, concealed, or failed to keep books of account or records from which his true condition might be ascertained. The confirmation of a composition acts as a discharge of the bankrupt from his debts, other than those agreed to be paid by the terms of the composition and those not affected by the discharge.

Co-debtors of Bankrupts.—The liability of a person who is a co-debtor with, or guarantor or in any manner a surety for, a bankrupt shall not be altered by the discharge of such bankrupt.

Debts Not Affected by a Discharge.—A discharge in bankruptcy does not release a bankrupt from debts which are (1) due as a tax levied by the U. S., the State, county, district, or municipality in which he resides; or (2) due as judgments in actions for frauds, or obtaining property by false pretenses or false representations, or for willful and malicious injuries to the person or property of another; or (3) debts which have not been duly scheduled in time for proof and allowance, with the name of the creditor, if known to the bankrupt, unless such creditor had notice or actual knowledge of the proceedings in bankruptcy; or (4) debts created by his fraud, embezzlement, misappropriation, or defalcation while acting as an officer in any fiduciary capacity.

Courts and Procedure.—The procedure under which the Bankruptcy Act is administered is specially prescribed by statute, and under the authority of the statute by the supreme court of the U. S., the method of procedure so prescribed substantially conforming to that which was followed in the administration of the Bankruptcy Act of 1867. The supreme court of the U. S., the circuit court of appeals of the U. S., and the supreme courts of the Territories are vested with appellate jurisdiction for bankruptcy proceedings.

Officers, their Duties and Compensation.—By the terms of the act, referees in bankruptcy and trustees in bankruptcy are created, and the courts of bankruptcy are required to appoint referees for a term of two years, designating the district or limits within which the said referees shall act. Any such referee must not be an office-holder under the U. S. or any State, or be related within the third common-law degree of consanguinity or affinity to any of the judges of the courts of bankruptcy or circuit courts or appellate courts of the districts wherein he is appointed, and must have his residence and office in the district for which he is appointed. These referees are invested with the power to consider the petition in bankruptcy referred to them by the clerks, and may exercise the powers vested in the courts of bankruptcy for administering oaths and the examination of witnesses and documentary evidence, for taking possession and releasing property, and for doing certain other acts necessary to the proper performance of their duties.

The creditors are vested with the right of appointing one or three trustees; or, upon failing so to do, the court is vested with the right to appoint as trustees persons or corporations competent to take this office. The trustees are required to receive, administer, and account for the estate of the bankrupt and receive as full compensation for their services a fee of \$5 deposited with the clerk at the time the petition is filed (except when a fee is not required from a voluntary bankrupt), and such commissions on sums to be paid as dividends and commissions as may be allowed by the courts, not to exceed 3 per cent. on the first \$5,000 or less, 2 per cent. on the second \$5,000 or part thereof, and 1 per cent. on sums in excess of \$10,000. In the event of there being three trustees instead of one the fees and commissions are apportioned by the court according to the services actually rendered, so that the total sum paid shall not be greater than in the case of one trustee.

F. STURGES ALLEN.

Banks, Mrs. ISABELLA VARLEY: poet and novelist; b. in Manchester, England, Mar. 25, 1821. She managed a successful school in Manchester for some years, and in 1846 was married to George Linnæus Banks, a journalist and poet. In 1844 she had published *Ivy Leaves: a Collection of Poems*, and a volume of poems by her and her husband was entitled *Daisies in the Grass* (1865). Soon after marriage she published a *Lace-knitter's Guide*, and her next book, after a long interval, was *Light Work for Leisure Hours*. Her first novel, *God's Providence House* (1865), made her famous as a novelist. Among her later works are *Stung to the Quick* (1867); *The Manchester Man* (1872);

Glory (1877); *Caleb Booth's Clerk* (1878); *Ripples and Breakers*, poems (1878); *Wooers and Winners* (1880); *More than Coronets* (1881); *Through the Night: Tales of Shades* (1882); *Forbidden to Wed* (1883); *The Watchmaker's Daughter and other Tales* (1883); *Sybilla and other Tales* (1884); *In His Own Hand* (1885); *Geoffrey Oliphant's Folly* (1886). Mr. and Mrs. Banks wrote many popular songs. D. in London, May 5, 1897.

Banner, MICHAEL: violinist; b. in Sacramento, Cal., Oct. 20, 1868, and began the study of the violin when five years old. On the recommendation of Wilhelmj he was sent to Cincinnati to study under Jacobsohn, where he made rapid progress. In Feb., 1882, he played at one of Dr. Damrosch's symphony concerts in New York. In October of that year he went to Paris for further study, and in 1884 was awarded the first prize at the Conservatory. D. E. HERVEY.

Baptist Young People's Union of America: a union representing the various societies of young people connected with the Baptist churches in the United States and Canada. Its constitution states that "The object of this union shall be to secure the increased spirituality of our Baptist young people; their stimulation in Christian service; their edification in Scripture knowledge; their instruction in Baptist doctrine and history; and their enlistment in all missionary activity through existing denominational organizations." Active members take the following pledge: "Relying upon Divine help, I hereby promise to strive to be true to Christ in all things and at all times; to seek the New Testament standard of Christian experience and life; to attend every meeting of the union, unless hindered by reasons approved by a good conscience, and to take some part in the services, aside from singing, if it is possible to do so with sincerity and truth." The local societies composing this union number about 5,000, with a membership of 250,000.

Baracoa, bā-ra-kō'a: a town of Santiago de Cuba province, north coast of Cuba, not far from the east end of the island. The first Spanish settlement in Cuba was founded near this town by Diego Columbus, son of Christopher, in 1511. It was near this town that Antonio Maceo and nineteen followers landed (Feb. 25, 1895) and started the revolution that resulted in the liberation of Cuba from Spain. Its remoteness from the fertile central districts, its unhealthy climate, and dangerous navigation in the channel leading to the harbor have kept the place small. It does some trade with the U. S. in tropical fruits, produces cocoa and cocoa-oil, and the caves near the town are remarkable for their stalactites and fossil human remains. Pop. 5,200.

C. C. ADAMS.

Barnes, EARL, M. S.: educator; graduated from Oswego Normal School; studied at Cornell University 1886-87, 1888-89; at the University of Zurich 1887-88; graduated from Indiana University 1890; M. S. Cornell University 1891; Professor of History, Indiana University, 1889-91; Professor of Education, Leland Stanford Junior University, 1891-97; author of *Studies in Education* (1897), and joint author, with Mary Sheldon Barnes, of several text-books in history. He is a leader in some of the newer fields of educational activity, particularly child-study. C. H. T.

Barnett, JOSEPH ALFRED: one of a well-known family of English musicians, younger brother of JOHN BARNETT (*q. v.*), and father of JOHN FRANCIS BARNETT (*q. v.*); b. June 15, 1811. When a boy he possessed a beautiful soprano voice, and was frequently engaged for operatic performances and concerts. As a composer he was largely self-taught. He was for many years a teacher of singing in London. He composed a number of popular songs and duets and some Roman Catholic Church music which attained much favor. D. Apr. 29, 1898. D. E. HERVEY.

Barrett, WILLIAM ALEXANDER: journalist and musician; b. in Hackney, London, Oct. 15, 1834; was chorister in St. Paul's Cathedral at an early age, afterward choirmaster at St. Andrew's, Wells Street, and Magdalene College, Oxford, from 1859 to 1865. While at Oxford he edited a monthly paper called the *Penny Post*. Took the degree of Mus. B. 1871. In 1866 he was appointed assistant vicar choral in St. Paul's Cathedral. In 1867 he became music critic of the *London Morning Post*, remaining till his death. He was also successively editor of the *Orchestra*, the *Monthly Musical Record*, and the *Musical Times*, holding this last position at his death. He was a fellow of many societies. He received the degree of Mus. D. from Trinity College, Toronto. He composed only a few pieces, but his literary

works are all of high authority. They include a *Life of Balfe*, *The Choristers' Guide*, *English Church Composers*, *English Folk Songs, Glees, and Madrigals*, an edition of standard English songs, a *Dictionary of Musical Terms* (with Dr. STAINER, *q. v.*), several albums of songs, and many articles and critiques in various papers and magazines. D. Oct. 17, 1891. D. E. HERVEY.

Bartlett, HOMER NEWTON: musician; b. in Olive, N. Y., Dec. 28, 1846; studied in New York under S. B. Mills, Max Braun, Jacobson, and others for seven years, fitting himself both as a pianist and organist. He has always resided in New York city, teaching, playing the organ in church, and taking part in numerous concerts. He has composed much in many forms, including many songs, piano pieces, part songs and choruses for both male and mixed voices; *La Vallière*, opera (1885); *The Lost Chieftain*, cantata (1888); *Samuel*, oratorio (1888); quartet for harp, organ, violin, and violoncello (1888); several pieces for orchestra, sextet for strings and flute, and a concerto for violin and orchestra, first performed at the meeting of the Music Teachers' National Association in New York, June, 1898. D. E. HERVEY.

Barus, CARL: physicist; b. in Cincinnati, Ohio, Feb. 19, 1856. Studied at the Columbia College School of Mines and at the University of Würzburg, where in 1879 he received the degree of Ph. D., and where he was assistant to Prof. F. Kohlrausch. In 1880 he became connected with the U. S. Geological Survey, and then devoted himself to the examination of problems in physical geology under Prof. F. W. Clarke. Twelve years later he was appointed Professor of Meteorology in the U. S. Weather Bureau and took up the study of the condensation of atmospheric moisture. In 1893 he entered the service of the Smithsonian Institution and was given charge of the work in physics there, continuing this work for two years, when he returned to his studies on atmospheric moisture under a special grant from the Smithsonian Institution. In June, 1895, he was elected Hazard Professor of Physics in Brown University, Providence, R. I., where he has since remained. He was elected a member of the National Academy of Sciences in 1893, and during 1894-95 he was a member of the Congressional committee for drawing up specifications for the electrical standards of the U. S. Besides membership in various scientific societies he was in 1883 elected a member of the American Association for the Advancement of Science, and in 1896 chosen one of its vice-presidents, delivering an address on *Long-range Temperature and Pressure Variables in Physics*. In 1899 he was elected a corresponding member of the British Association for the Advancement of Science. The results of his various investigations are for the most part contained in Government reports, especially in those of the Geological Survey, to whose series of bulletins he has contributed *The Compressibility of Liquids* (Washington, 1892); *The Mechanism of Solid Viscosity* (1892); *The Volume Thermodynamics of Liquids* (1892); and *High Temperature Work in Igneous Fusion and Ebullition, chiefly in Relation to Pressure* (1893). He has also been a large contributor to the *American Journal of Science* and other like periodicals. MARCUS BENJAMIN.

Bassford, WILLIAM KIPP: musician; b. in New York, Apr. 23, 1839; received his entire musical education in New York from local teachers. He has always resided in that city, practicing as pianist, organist, and teacher. His compositions are numerous, mainly songs and piano pieces. In 1874 he produced a fine mass in E flat. He composed a two-act opera, *Cassilda*, which still remains in manuscript. He was selected by the widow of the late William Vincent Wallace to complete that composer's opera *Estrella*, left unfinished at his death. D. E. HERVEY.

Batabanó, baa-ta-ba-no': a small port on the south side of Cuba, in Havana province, 45 miles from Havana, with which it is connected by rail. It is over against the Isle of Pines, where a military station was established in 1828 to defend the approaches to Havana from the south side. Pop. 1,800. C. C. ADAMS.

Bayamo, baa-yaa'mō: the chief town in the basin of the Cauto river; Santiago de Cuba province, Cuba; 94 miles N. W. of the city of Santiago. A few miles S. W. the ten years' war (insurrection of 1868-78) began, and the town figured prominently in Garcia's campaigns in the insurrection of 1895. It is in the midst of the great eastern plain of the island, whose surface is broken by groups of

mountains, and is a trading center for the grazing and farm districts around it. Pop. 3,634. C. C. ADAMS.

Beach, Mrs. H. H. A. (maiden name, AMY MARCY CHENEY): composer; b. in Henniker, Merrimack co., N. H., Sept. 5, 1867; showed musical talent at a very early age, and soon began writing little compositions. Her first teacher was her mother. Later she studied pianoforte under Junius W. Hill, C. L. Capen, Ernst Perabo, and Carl Baermann, and harmony under J. W. Hill, of Wellesley College. Then she took up counterpoint, fugue, form, and instrumentation, studying by herself with the aid of text-books. She made her first public appearance as a pianist on Oct. 24, 1883, in Music Hall, Boston. Since that date she has appeared regularly almost every season at concerts and recitals, playing many important concertos and other works. She was married in 1885 to Dr. H. H. A. Beach, of Boston, and since then her principal musical activity has been in composition. She has published a mass in E flat, sung by the Boston Handel and Haydn Society in 1892; *The Rose of Arontown*, cantata for female voices; *Gaelic Symphony*; *Festival Jubilate*, for mixed voices; *The Minstrel and the King*, ballad for male voices; many songs and piano pieces, and a sonata for piano and violin. D. E. HERVEY.

Bear: Several new species have been described from North America. The most remarkable of these is the glacier bear, *Ursus emmonsii*, a species related to the black bear, but smaller and resembling in color a silver fox. It appears to be confined to a small area in the vicinity of Mt. St. Elias. The great Kadiak bear, *Ursus middendorfi*, of the Alaskan peninsula, is the largest of living bears, the cranium being 18 inches long. It is brown, and is related to the brown bear of Kamchatka. F. A. LUCAS.

Beaven, ROBERT: statesman; b. in Leigh, Staffordshire, England, Jan. 28, 1836; engaged for several years in gold-mining on the Pacific coast, afterward settled in Victoria, B. C. He was first secretary of the Confederate League in the agitation for confederation with the Dominion of Canada, and after the union, in 1871, became a member of the first British Columbian Assembly. He was chief commissioner of lands and works for several years, and afterward Minister of Finance and Premier.

Beck, JOHANN TOBIAS; Protestant German theologian; b. in Balingen, 40 miles S. W. of Stuttgart, Feb. 22, 1804. He studied at Tübingen 1822-26, was a pastor 1827-36, Professor Extraordinary of Theology at Basel 1836-43, and the rest of his life Ordinary Professor of Theology at Tübingen and also chief preacher. He lectured on dogmatic, ethic, New Testament exegesis, practical and pastoral theology. He founded no school, but had some devoted followers. His life was essentially unworldly, and he rebuked sin and called to repentance like a Hebrew prophet. He won more respect than affection, for many failed to learn his kindness of heart and heard only his denunciations. He was particularly severe with what he considered the departures from Christianity which he observed all about him. His own theology was strongly biblical and anti-speculative. In English he appeared his *Outlines of Biblical Psychology* (Edinburgh, 1877) and *Pastoral Theology of the New Testament* (1885). D. in Tübingen, Dec. 28, 1878. See his biography by B. Rigenbach, Basel, 1888. S. M. J.

Begg, JAMES: Free Church of Scotland minister; b. in New Monkland, Lanarkshire, near Edinburgh, Oct. 31, 1808; graduated at Glasgow University; entered the ministry of the Church of Scotland and held various charges before the Disruption (1843), when he joined the Free Church and became minister of the Free church in Newington, a suburb of Edinburgh. He received the honorary degree of doctor of divinity from Lafayette College, Pennsylvania, 1847, and was moderator of the Free Church General Assembly 1865. He was the leader of a formidable and fanatical minority, mainly composed of Highlanders, united in a tireless and sometimes successful effort to make the Free Church as closed to all progress as possible. He and his sympathizers opposed the union of the Free and the United Presbyterian Churches, the use of hymns and of church organs, and any relaxing of the strictest sabbatical ordinances or of the terms of subscription for office-bearers. The mere mention of the name of the Church of Rome greatly excited them, for all that was bad was to their minds centered in her. He won in this way an unenviable reputation; but as he thought himself the divinely appointed guardian of religious purity, he considered reproach by the majority a

compliment. D. in Edinburgh, Sept. 29, 1883. See his biography by Prof. Thomas Smith (London, 1885-88, 2 vols.).

S. M. J.

Belief and Faith: the consciousness of the personal indorsement of something thought of as being real. It is one of the conquests of modern psychology that it has marked off the field of belief and so brought to an end the historical controversies which turned upon differences of definition. These differences have characterized certain great ways of distinguishing belief from other mental states: (1) Belief has been used to include all states of mind in which the object presented was not explicitly declared unreal. This made it possible to say that we believe in our sensations as well as in our reasoned conclusions, in our intuitions as well as in our hopes. Under this definition the uncritical attitude of the child in not rejecting anything is called belief or credulity. (2) Belief is considered by another school of thinkers as a positive indorsement, not merely a negative acceptance, of something as real—that is, it is an attitude over and above the uncritical consciousness of bare experience itself. On the basis of these two forms of definition theories of belief have fallen into two great classes.

According to the first class of theories, belief is considered a spontaneous and immediate attribute of consciousness, a "first intention," and as such it has been considered a form of feeling (Hume, in the *Enquiry*), of will (Bain, in *Emotions and Will*), or of intelligence (James Mill, Herbart). Opposed to this general way of looking at belief is the second class of theories, which consider it a matter of reflection, a "second intention," a new phenomenon added to the mere presence of presentative consciousness. According to this view, belief is only present when a certain complexity of the mental life affords the requisite conditions. The line of development made possible by this distinction is rapidly gaining ground. It is well to recognize the distinction of fact between the lower form of acceptance of experience, on the one hand, called by Bain "primitive credulity," and described more explicitly by Baldwin under the term "reality feeling," and, on the other hand, the higher attitude of mind which accompanies the weighing of evidence, the attaining of conviction, and the asserting of a reflective judgment. The latter alone should be called belief. The distinction is the same as that long current in logic between "simple apprehension" and judgment.

As thus defined, belief is explained in various ways by different authorities. It is held (1) that belief is a sentiment, an "emotion of conviction" (Bagehot), aroused by a complex interplay of presentations and ideas; or a feeling of "vividness" and intensity in ideas (Hume, in the *Treatise*, Taine, Dugald Stewart). Or (2) it is an intellectual fact (Bain's second view, in *Mental and Moral Science*, Appendix, p. 100), an irresistible or inseparable "association" (James Mill). Or (3) it is an active determination, either voluntary or spontaneous, of a personal attitude toward the play of presentations. This last view is possibly the best supported to-day and is becoming dominant, either taking the form of the postulate of an ultimate principle of "assent" (J. S. Mill), or of making the attitude of belief the result of an assimilation of new elements into the group of motor processes which constitute (Royce, Baldwin) or express (Stout) the activity of the personal self. This view may be expanded in some little detail (following the writer's work on *Feeling and Will*).

Kinds of Belief.—Broadening our outlook, we are able to distinguish several aspects or phases of belief, which we may call respectively *belief in the external world*, *belief in memory*, *logical belief*, *belief in ideals*, etc. The "motor" theory set forth holds that in each case there must be an impulse or tendency to a particular kind of experience, and that belief in the reality of the object of that experience must depend upon its capacity to satisfy the tendency involved. Calling, in each case, this ability to satisfy, the "coefficient," we have as many coefficients of reality as there are fundamental tendencies toward objects.

Belief in External Reality: its Coefficient.—A few words may be said about external reality as contrasted with the other kinds of reality in which we believe. The question suggests itself: What, in consciousness, is the sensational coefficient? Granted such a nervous process whenever a real object is present, what mental changes does it work?

The grounds of belief must be the marks which give the semblance, the coefficient, of reality. Most generally speaking there are two, first *very high intensity* and second *uncontrollableness*. Whenever a mental state is intense, be it

sensation or image, and resists all endeavor of ours to modify or banish it, it carries our belief, it is real, so far as sensational tests are concerned, i. e., so far as the sensational coefficient goes. I may often have grounds for distrusting such a state—other coefficients which I invoke as of more worth to me in deciding the case than the sensational tests; but if I had only the latter, if I were merely a being of sensations and reactions, intense persistent states would always and invariably sum up reality for me.

Of these two elements of the sensational coefficient, however, the latter is more important and essential. Simple reality feeling attaches to intense and feeble images alike, provided no impulse arise which fails to find its satisfaction in the feeble ones. But in the element of uncontrollableness we have a confirmation of the impulse origin of all belief. Our impulses, our life-needs, are fixed and permanent, not subject to our will or control: so are their satisfactions, the realities we have reached in our life-experience.

Even seeming contradictions in such sense-reports are not sufficient in themselves to controvert belief. Do I hear a voice when my eyes tell me no one is near—hear it with its coefficient of reality? Then I believe it, and believe my eyesight too. The principle of consistency, of such supreme importance in logical belief, has only a subordinate application here. If I do compare my senses and judge which of them to believe, it is either because one or more of them has not the energy or persistence of others, or because I appeal to higher considerations—coefficients—to help me out. In actual fact we do find a class of sensations which realizes the coefficient most directly and distinctly, and thus becomes the arbiter or referee of sensible reality.

Primacy of Muscular Sensations as Giving External Reality.—Touch—with muscular sensibility—has been called the "controlling sense," because questions of reality are referred to it for decision. We now see why this is so. It is through muscular movement that will and impulse and appetite, that all outgoing processes, are realized. If natural satisfactions therefore are the basis of belief in external reality, then the medium of such satisfactions must be the medium also of the sense of reality. And further, motor-reaction is itself an impulsive, original thing, and takes place largely through the stimulus of resistance: consequently the presence of resistances is itself the gratification of the need of motor-development—perhaps the most general and fundamental sensational need that we have. If we could get satisfactions without muscular sensations, then the latter would not be tests of external reality.

Primary Criterion of External Reality.—Consequently it is only what we would expect that sensations of *resistance* become the primary criterion of all external reality. Anything that resists my will is believed to have present reality. And it is not simply resistance through contact, but, by generalization, resistance in any of the classes of sensation. A stifling smoke resists my will to be rid of it, that is, the physiological effort I make to banish it shows me that I have no control over it. But that this is derived from muscular resistance is seen in the fact that I confirm my belief derived from the smell of smoke by searching the house to find the fire.

It is clear that it is the element of *present* reality in the external world that sensations of resistance guarantee, not, to a great extent, future reality. The element of *persistence* in the world without depends rather upon the memory-coefficient, to be next discussed. Persistence comes through the sensational coefficient only as far as resistances have duration, i. e., stand constant in opposition to prolonged effort or in gratification of prolonged appetite. There is also probably an element contributory to the notion of persistence in the accidental recurrence of old resistances when we do not expect them; but such accidental anti-associational occurrences also come in the shape of pure imaginations, and the test of present resistance is the final appeal in cases of such unexpected experiences.

To the objection that pure imaginations may have the quality of uncontrollableness (fixed ideas), it may be pointed out that in most cases they can not stand the test of actual muscular resistance, and that when they are abnormally imperative they *are* considered as realities—i. e., we have the beginning of delusion.

Belief in Memory: the Memory-coefficient.—By memory-coefficient is meant the coloring of reality which some images have, as representing former states of consciousness: that by which I distinguish a memory from a dream or a

creature of the imagination. Belief in memory is the feeling which attaches to images recognized.

As feeling two very distinct forms of reality-consciousness attach to memory: first, what we may call the simple sense of revival or recurrence, and second, the belief that what is thus recognized was itself a real objective experience. I may remember a dream, recognize it, and believe in it as a real memory, and yet be in doubt as to whether it was a dream or a real occurrence when I first experienced it.

The memory-coefficient of belief attaches properly only to the first of these states: it answers the question, What shall I recognize? The further point of feeling—that which attaches to the answer to the question, Is what I recognize a reality?—requires further inquiry into the nature of the memory in question. Does the memory recognized include memory of the sensational coefficient? Did I believe it to be a real object when I first experienced it? This question determines whether I shall feel it to be the memory of an objective thing or no. So with any other of the higher kinds of reality-coefficients yet to be spoken of. Do I recognize a former image of a beautiful face? Yes; but do I recognize it as a living beautiful face? That depends upon the kind of coefficient, sensational, imaginery, æsthetic, etc., of my earlier view of the face. The dependence of belief in many cases upon the sensational coefficient is well put by Hume in his definition of belief as “a lively idea related to or associated with a present impression (sensation).” (*Treatise*, pt. iii., § 7.) He also points out that false images may get the sensational coefficient by repetition and emphasis. (*Loc. cit.*, pt. iii., § 5.)

Memory-coefficient Proper.—The question then, Why do I recognize anything consciously at all? has its answer in the memory-coefficient proper, viz. *because I can reproduce it voluntarily by starting a chain of associations leading up to it.* I have control over it in this sense, that it is at my command for reproduction. My past is mine only in as far as I can utilize it in my present. I refresh my memory by rehearsing details, and thus bringing up points which, if simply suggested to me without their earlier connections, I might have failed to recognize. So we reach two kinds of present reality: present external reality, guaranteed by its independence of my will, and present memory-reality, guaranteed by subjection to my will. Moreover, there are further modifications of memory due to volition. We can by attention bring out details of outline, strengthen, intensify, or, by neglecting, practically banish a memory: all of which influences external things stubbornly resist.

Completed Criterion of External Reality.—Besides the primary criterion of external reality found in feelings of resistance, a secondary criterion is therefore supplied by memory. Of the two kinds of memories, both having the memory-coefficient, those which represent external realities and those which do not, the former are important factors in the development of our idea of the world without. Among the trains of association by which memories may be voluntarily brought up are certain muscular trains themselves accompanied by resistances, and the memories brought up by them also resist. It is only these muscular resisting trains terminating in a resisting experience which carry belief in external things remembered. For example, I remember equally a salesman and a merman. I can get the shopman again as a present (resisting) reality by reproducing the series of muscular (voluntary, but resisting) sensations required to revisit his shop. But I can only get the merman as an image (unresisting) by a train of ideal (voluntary, non-resisting) associates. The former alone I do and must consider externally real. The secondary criterion of external reality, therefore, is *my ability to reinstate resisting experiences at will.*

In this secondary criterion the element of persistence included in our idea of external things seems to take its rise. In saying things are, we mean also that they continue. That is, as we have seen, we mean that we are able to go and find them again, and find them with the same resistance they showed when we experienced them before. To a creature without memory, reality would be simply successive resistances: but with memory as recognition comes also persistence.

The history of opinion regarding belief in objective things shows that the twofold nature of the complete criterion has been generally overlooked. Hume, Mill, Pikler, James, emphasize the voluntariness (memory side) of reality. The same is seen in Mill's famous definition of external reality as “the permanent possibility of sensation.” Bain, Spencer,

Stout, Lipps, give corresponding emphasis to the resistance side. The latter certainly are more just, since resistance is the last test even of images which persist: but the memory side of externality just as certainly requires due recognition, and a true view means the theoretical union of the two. Of recent writers, the treatment of Lipps and Stout is, in the writer's opinion, among the most adequate.

Belief in Concepts and Thought: Thought-coefficient.—The demand of thought in general is agreement, consistency; its opposite is contradiction: this it can not abide and be satisfied. Consequently, consistency, the absence of presentative or conceptual contradiction, is the thought-coefficient of belief. Where no other coefficient conflicts, mere consistency carries intellectual assent. But by intellectual assent, it must be carefully noted, is meant formal assent, logical assent. My belief is evidenced from the fact that I go right on and form my general class, until some inconsistency leads me to break it up.

Emotional Belief.—No detailed argument is required to show that strong emotion has an influence on belief. So evident is this that the emotional method of persuasion is universally recognized. An idea which strongly excites us to some definite emotion, hope, fear, anger, love, is easily believed in, and the cherishing of the emotion is a means of intensifying conviction in reference to its object.

The emotional coefficient therefore consists, like the sensational coefficient, in *intensity* and *uncontrollableness*. While mere intensity does strengthen conviction, yet it may be questioned whether it is not mainly because it is through intensity that we lose control. As soon as we can get our emotion under our will, and can say to ourselves, “think calmly,” the distorting influence of feeling disappears.

It is necessary for completeness of treatment to indicate that there are beliefs in æsthetic and moral truths; that these beliefs accompany satisfactions which arise from the gratification of corresponding æsthetic and moral impulses.

General Conclusion on Reality and Belief.—The consideration of the different coefficients of belief leads us to conclude that there are as many kinds of reality. There is moral and æsthetic reality no less than logical and sensational reality; and there is the same reason for believing in one that there is in another, for both rest upon the fact that our mental nature demands certain kinds of satisfaction, and we find it possible to get them. Sensational reality will not satisfy our logical demands, for nature is often refractory and illogical. Neither will logic satisfy our moral and æsthetic demands, for the logically true is often immoral and hideous. It is well, therefore, to write large the truth that logical consistency is not the whole of reality, and that the revolt of the heart against fact is often as legitimate a measure of the true, in this shifting universe, as is the cold denial given by rational conviction to the vagaries of casual feeling.

Composite Realities.—The outcome of our life of belief is the more or less complete adjustment of these kinds of reality to one another. We find ourselves constantly denying, minimizing, scouting the external world, as we abstract our higher selves from connection with it. Idealistic philosophy is more a revolt from the sensational coefficient in the name of the moral coefficient, than the logical system of belief which as philosophy it claims to be. Materialism, on the contrary, is the worship of the sensational coefficient as more real than any other. Religious truth either tells us which to put under and which to embrace, or bids us await a future state when all the demands upon us will be harmoniously adjudicated.

What I, as an individual, therefore, believe, is a composite thing, a mixture of truths representing the degree of harmony I have succeeded in reaching among things which, taken singly, I am obliged to accept. Among them the largest place is given to external or sensational reality. I bring things wherever possible to the test of sensation. No doubt this is because my connection with the external world is most intimate and direct, and the penalties of its disregard are most quick and sure. Next in practical importance is the world of logic or demonstrable truth, which holds its sway imperatively when sensation does not vote a negative. The disregard and violation of æsthetic, moral, and religious truth is due to the difficulty of deciding just what these coefficients are and of disentangling them from the swarm of temporary emotional states which have not the same claim to satisfaction.

Self the Ultimate Reality.—Amid the variations of composite and varying reality, the most fixed point of reference

is now seen to be the feeling of *self*. This is as far as psychology can go with its analysis of belief and reality. All reality is given us through our own experience, and the center of experience is self and its needs.

In "disbelief" we have belief in a negative truth. It involves the same sort of reflective determination as positive belief, and so it does not differ psychologically from it. Logically expressed, disbelief is the same as "negative judgment." The negative of belief is, accordingly, not disbelief, but *doubt*.

"Conviction" is a loose term whose connotation, so far as exact, is near to that here given to belief. "Making up one's mind," "being convinced," "weighing evidence," etc., are phrases describing the complex play of ideas preparatory to belief.

As compared with the term "judgment," we may say that belief is the psychological and judgment the logical side of the same state of mind, called succinctly by Stout the "yes-no" consciousness.

What we mean by *faith* in relation to belief is a much-discussed matter. Faith properly attaches to statements, thoughts, etc., which are taken to be worthy of belief on the authoritative assurance of some one else, or on the basis of some general belief which guarantees the lesser matter of faith. Faith, therefore, seems to be belief of the kind which acknowledges its inability to secure personal conviction or knowledge, but rests in a condition of trust. It is evident that the room for emotional and voluntary determination is great in faith, since it comes into play in a region where the logical coefficient is not exclusively invoked. This is especially evident in religious thought, where the attitude of faith is contrasted with the "rational" attitude.

LITERATURE.—HUME, *Treatise on Human Nature*, §§ 7 ff., and *Enquiry*, § 5, pt. ii.; James Mill, *Analysis of the Phenomena of the Human Mind* (ed. J. S. Mill); J. S. Mill, *Notes* in preceding, i., p. 412 f.; *Dissertations*, iii.; *Examination of Hamilton*, chap. xi.; Dugald Stuart, *Philosophy of the Human Mind*, pt. i., chap. iii.; Fehner, *Drei Motive und Grunde des Glaubens*; Ulrici, *Glaube und Wissen*; Newman, *Grammar of Assent*; Bain, *Emotions and Will*, "Belief," and *Mental and Moral Science*, Appendix; Ward, *Encyclopædia Britannica*, article *Psychology*; Brentano, *Psychologie*, ii., chap. vii.; Lipps, *Grundriss der Seelenlehre*, chap. xvii.; James, *Principles of Psychology*, vol. ii., chap. xxi.; *The Will to Believe*; Stout, *Analytic Psychology*, bk. i., chap. v., and bk. ii., chap. xi.; Baldwin, *Handbook of Psychology: Feeling and Will*, chap. vii.; art. *Belief* in *Baldwin's Dictionary of Philosophy*; Balfour, *The Foundations of Belief*; Adamson, *Encyclopædia Britannica*, art. *Belief*; Verbrot, *Die Psychologie des Glaubens*; Bagehot, *Literary Studies*, i., p. 412 f.; Royce, *Religious Aspect of Philosophy*, chaps. ix., x.; Höfding, *Outlines of Psychology*, v. d.

J. MARK BALDWIN.

Bendix, MAX: violinist; b. in Detroit, Mich., Mar. 28, 1866: first instructed by his father, then by Richard Arnold 1876-78, and S. E. Jacobsohn at Cincinnati 1879-81. Theodore Thomas chose him as concertmaster of his orchestra, and he was the assistant of the great violinist Ysaye on his concert tour. He has been for several years the leader of the violins in Thomas's Chicago Orchestra, and is in charge of the violin class in the Chicago Conservatory.

D. E. HERVEY.

Benham, ANDREW ELLICOTT KENNEDY: naval officer; b. on Staten Island, N. Y., Apr. 10, 1832. He entered the Naval Academy in 1847; while serving on the *Dolphin*, in the East India squadron, was slightly wounded in the capture of a piratical Chinese vessel; became passed midshipman 1853; was commissioned master and promoted to lieutenant 1855; served in the Coast Survey 1857-58; was attached to the *Crusader*, home squadron, 1860-61, and at the beginning of the civil war became executive officer of the *Bienville*, in the south Atlantic blockading squadron, taking part in the capture of Port Royal, S. C.; was made lieutenant-commander 1862, and commanded the *Penobscot*, of the western Gulf blockading squadron, until the close of the war, during which service he blockaded the coast of Texas for thirteen months without entering port: was advanced to commander 1866; after duty at the Brooklyn navy-yard, as lighthouse inspector and as commander of the ironclad *Canonicus* from 1874 to 1878, he rose to the rank of captain 1875; commanded the flagship *Richmond*, Asiatic station, 1878-81; was promoted to commodore 1885, and had charge of the

Mare island navy-yard; was made rear-admiral 1890, and was on waiting orders 1891-92; commanded the south Atlantic station 1892; in 1893 was ordered to Rio de Janeiro, Brazil, where a revolution was then in progress, to protect American interests, and was retired in 1894.

Benjamin, MARCUS, A. M., Ph. D., F. C. S.: chemist and editor; b. in San Francisco, Cal., Jan. 17, 1857; graduated in the chemical course of the School of Mines of Columbia College in 1878. After various minor engagements he became, in 1882, editor of the *American Pharmacist* and then of its successor, the *Weekly Drug News*. In May, 1883, he was appointed chemist to the U. S. laboratory of the apaiser's store in New York, which place he held until 1885, and then for a short time was a sanitary engineer on the New York Board of Health. Meanwhile, during 1884-86, he was lecturer on chemistry at the New York Woman's Hospital Medical College, also, during 1883-86, he prepared the chapters on *Mineral Paints* for the yearly volumes of the *Mineral Resources of the United States*, issued by the U. S. Geological Survey. He then joined the editorial staff of Appleton's *Cyclopædia of American Biography*, and has since served on the staffs of the *Standard Dictionary*, for which he prepared the definitions in chemistry, *Johnson's Universal Cyclopædia*, the *Encyclopædic Dictionary*, and the *American Educator*. In 1895 he was called to Washington to assist Dr. G. Brown Goode in the preparation of a history of the half-century of the existence of the Smithsonian Institution, to which work he contributed the chapters on *Chemistry* and *Meteorology*. On Apr. 1, 1896, he was appointed editor of the U. S. National Museum in Washington, in charge of the annual volumes of the *Proceedings and Reports*, and *Bulletins*, which place he still holds. The degree of A. M. was conferred on him by Lafayette College in 1888; that of Ph. D. by the University of Nashville in 1889. He is a life fellow of the London Chemical Society and of the American Association for the Advancement of Science, of which latter he was elected a vice-president in 1898. Besides membership in other scientific societies, he has been active in various patriotic societies, and is now historian of the Society of the Sons of the American Revolution and of the Society of Colonial Wars, president of the Society of the War of 1812, and vice-president of the Society of Mayflower Descendants in the District of Columbia. He served on the international jury of awards at the World's Fair in Chicago in 1893, and was a member of the jury at the Tennessee centennial exposition in 1897, and of the Trans-Mississippi and international exposition in 1898. He has been a large contributor to the technical journals of the country, serving at various times on staffs of the *Oil, Paint, and Drug Reporter* and *Engineering and Mining Journal*, and has contributed to the *Chautauquan*, *Harper's Weekly*, *Popular Science Monthly*, and other periodicals. He compiled *May Time*, a collection of poems (New York, 1889); and edited *Gems and Precious Stones* (1890); *Dictionary of New York City* (1890); *Handbook of Winter Resorts* (1890-96); *General Guide of the United States and Canada* (1891-99); *Handbook of Summer Resorts* (1891-97); *Picturesque America* (revised edition, 1894); and the *Canadian Guide Book* (1898-99).

Bent, JAMES THEODORE: traveler; b. in Liverpool, Mar. 30, 1852; graduated at Oxford in 1875; superintended excavations in Greece for the British Museum and the Hellenic Society. Among his writings are *A Freak of Freedom, or The Republic of San Marino* (1879); *Genoa: How the Republic Rose and Fell* (1880); *Life of Giuseppe Garibaldi* (1881); *The Cyclades, or Life among the Insular Greeks* (1885). D. in London, May 6, 1897.

Beresford, Lord CHARLES WILLIAM DE LA POER: rear-admiral; b. in Philpottown, County Dublin, Ireland, Feb. 10, 1846; entered the British navy in 1859; lieutenant 1868; commander 1875; captain 1882; rear-admiral 1896. He accompanied the Prince of Wales as naval aide-de-camp to India in 1875. During the bombardment of the forts of Alexandria in 1882 he commanded the gunboat *Condor*, and was specially active in organizing and controlling a police system, which was prominent in the suppression of looting. In 1884 he accompanied Lord Wolseley up the Nile, and commanded the naval brigade that went with Sir Herbert Stewart across the desert. He was a member of Parliament 1874-80 and 1885-86. Lord Salisbury appointed him Junior Lord of the Admiralty in 1886, but he resigned in 1888 because of disagreement on matters relating to the strength of the navy, and again entered Parliament. In 1889 he was

assigned to service in the Mediterranean in command of the armored cruiser *Undaunted*. He was sent to China in the summer of 1898 to obtain information as to the value of recent British concessions in that country.

Berti, DOMENICO: statesman; b. in Cumiana, Italy, Dec. 17, 1820; acquired an education with great difficulty, because of poverty, but at an early age taught in the normal school at Novara; wrote political letters to a Liberal journal in 1846, and in 1848 was elected to the Chamber of Deputies from Savigliano. In 1849 he became Professor of Philosophy in the University of Turin, and during his professorship of ten years he wrote a *History of Philosophy in Italy from the Time of St. Thomas, Pico de la Mirandola, and Giordano Bruno: His Life and Works*. He edited Cavour's unpublished letters and wrote studies on Gioberti, Cesare and Vittorio Alfieri, and King Carlo Alberti. He was at several times Minister of Instruction, and of Agriculture, Industry, and Commerce; proposed various measures of reform in the relations of capital and labor, including employers' liability and accident insurance. From 1871 to 1877 he was Professor of the History of Philosophy in the University of Rome. He was nominated as Senator in 1895. D. in Rome in April, 1897.

Bethune. Rev. CHARLES JAMES STEWART, M. A., D. C. L.: b. in West Flamboro, Ontario, Aug. 11, 1838; educated at Trinity College, Toronto; ordained deacon in the Church of England 1861, and priest 1862; was curate of St. Peter's, Cobourg, Ontario, and afterward of Carlton, Selby, Yorkshire; head master in Trinity College School, Port Hope, Ontario,

since 1870. He was editor of the *Canadian Entomologist*, a monthly magazine, for a while edited the entomological department of the *Canadian Farmer* and of the *Weekly Globe*, and resumed the editorship of the *Canadian Entomologist* in 1886. His annual reports on entomology have been printed by the Ontario Legislature. He was for five years president of the Canadian Entomological Society, is a fellow of the American Association for the Advancement of Science, and a corresponding member of various scientific societies in the U. S.

Bezenberger, bet'sen-bārch-er, ADALBERT: philologist; b. in Cassel, Germany, Apr. 14, 1851; educated at the gymnasium in Cassel and at the universities of Göttingen and Munich; has been tutor and assistant professor in the University of Göttingen and professor in the University of Königsberg. Among his published works are: *Beiträge zur Geschichte der litauischen Sprache* (1877); *Litauische Forschungen* (1882); *Lettische Dialektstudien* (1885); *Über die Sprache der preussischen Letten* (1888); *Die jurische Nehrung und ihre Bewohner* (1889).

Bhagalpur, baw-gal-poor', or Bhaugulpur (also *Bogli-poor*): a city of India; capital of a district of the same name; in Bengal; on the right bank of the Ganges, here seven miles wide in the rainy season (see map of N. India, ref. 7-H). It is about 265 miles by rail N. W. of Calcutta. It has several mosques and an English seminary; also manufactures of coarse silk fabrics. Here are two curious round towers, the origin of which is unknown. Pop. (1881) 68,238; (1891) 68,780.
