## B O O

B OOK-Binding is the art of gathering together and fewing the theets of a book, and covering it with a back, \&c." It is performed thus: The leaves are firf folded with a folding-ltick, and laid over each other in the order of the fignature; then beaten on a ftone with a hammer, to make them fmooth and open well; and afterwards preffed. They are fewed upon bands, which are pieces of cord or packthread; fix bands to a folio book; five to a quarto, oflavo, \&c.; which is done by drawing a thread through the middle of each fhect, and giving it a turn round each band, beginning with the firft and proceeding to the laft. After this the books are glued, and the bands opened and fcraped, for the better fixing the pafteboards; the back is turned with a hammer, and the book fixed in a prefs between two boards, in order to make a groove for fising the pafteboard; thefe being applied, holes are made for fixing them to the book, which is preffied a third time. Then the book is at laft put to the cutting prefs, between two boards; the one lying even with the prefs, for the knife to run upon; the other above it, for the knife to run againft ; after which the patteboards are fquared.

## B O O

The next operation is the fprinkling the leaves of the book; which is done by dipping a brufh into vermilion and fap-green, holding the brufh in one hand, and fpreading the hair with the other; by which motion the edges of the leaves are fprinkled in a regular manner, without any fots being bigger than the other.

Then remain the covers, which are either of calffkin or of theep-fkin: thefe being moiftened in water, are cut out to the fize of the book; then fmeared over with palte made of wheat Hour; and afterwards ftretched over the pafteboard on the outfide, and doubled over the edges withinfide; after having firlt taken oft the four angles, and indented and platted the cover at the head-band: which done, the book is covered, and bound firmly between two bands, and then fet to dry, Afterwards it is wathed over with a little pafte and water, and then fprinkled with a fine brufh, unlefs it fhould be marbled; when the fpots are to be made larger by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at laft polifhed with a polifhing iron paffed hot over the glazed cover.

## B O OK-K E EPING

IS the art of recording mercantile tranfactions in a regular and fyftematic manner.

1. A merchant's books fhould contain every patticular which relates to the affairs of the owner. They flould exhibit the ftate of all the branches of his bufinefs, the comuexion of the different parts, the amount and fuccefs of the whole. They fhould be fo full and fo well atranged, as to afford a ready information in every point for which they may be conlulted.

The matter which the books foould contain iscomprehended under the three following heads: Firf, The debts which are owing to the owne1, and the debts which he owes to others. Secondly, The goods and other articles of proierty which belonged to him; the quantity and value fold, or otherw: fe dilpofed on ; and the quantity and value which fill remain in his pofleffion. Thirdly, The amount of his ftock when the books were of ened; the profits he has obtained, and
Tol. 1V, Part I.
the loffes he has fuffered, fince; and the amount of his flock at prefent.

The method of book-keeping which anfwers thefe purpofes moft clearly and concifely, is the beft. The Italian method, by double entry, is generally preferred; at leaft, it is founded upon the moft univerfal principles, and is the moft convenient in extenfive and complicated bufinefs: and the accountant who underftands it, will find little difficulty in following, or even in inventing, other methods that are better accommodated to any particular purpofe.

The Italian method requires three principal books; the Wafte-Book, Journal, and Leger.

## Sect. L. Of the Waste-Book.

2. The wafte-book, or day-book, contains an exact regifter of all occurrences in bufinefs in the fame order

Book. binding.

Book: kecping.

WaneBook.
as they take place. It begins with an inventory of every thing belonging to the owner, a lif of the debts due to him, and of the debts he owes to others: It is carried on with a fu!l relation of all the money he receives or pays; of all the goods he buys or fells; and of every other occurrence in his bufincfs. Each articie hould be entered as foon as the tranfacion takes place, and thould be clearly expreffed in the plaineft language. It fhould require no fupply from the accountant's memory, but fhould be fully intelligible to any perfon, however unacquainted with the bufinefs; at the fame time, it flould be written with all convenient brevity ; and, therefure, fometimes refers to invoices and other accounts, for particulars. The accountant's firft care fhould be to have nothing defective or ambiguous; his fecond, to have nothing fuperfuous.
3. The date is written in text on the top of each page. The articles are feparated from each other by 2 line: and the tranfations of one day are feparated from thofe of another by a double line, in the middle of which there is left a blank fpace for inferting the day of the month. This book mult be kept with the greater care, as it contains the materials from which the other books are compofed; and any error or defect will occafion a like one in the others. Befides, it is the book whofe authority is trufted to, and which muft be exhibited to judges, or arbiters, when an account is difputed. As the journal is filled up from the wattebuok, the zuthority of the former is eftermed more authentic, unlefs there be an obvious miftake through hurry; and either of thefe books is depended on rather than the leger, which, from its form, is more lisble to error, and may be more cafily vitiated by a fraudulent defign.
4. As the wafte-book contains the whole fubtance of the bufinefs, it may be applied fo as to afford any information that can be wanted: but the labour of confulting it would be very great. For inftance, if it werc required to know how much any perfon owes us, we muft look over the book from the beginning, and mark down every article in which we have dealt with bim; or, if it were required to know what quantity of goods we mould have on hand, we muft look over the whole book, and mark down every article bought or fold. This operation would not only be found very tedious, hut much expofed to the rik of omiflions. To prevent thefe inconveniences, another book is ufed in which the articles are arranged in a methodical order. 'This book is called the Leger, and we thall confider it next ; becaufe the journal, though it comes before it in the order of writing, cannot be well underftood, till the nature of the leger be explained.

## Sect. II. Of the Leger.

5. In the leger, articles of the fame kind are colleeted together; and, for tbat purpofe, it is divided into many accounts, under which the different branches of bufinefs are arranged. Each account is introduced by 2 proper title, to explain the nature of the articles it contains; and articles of oppofite kinds, which belong
to the fame account, are placed on the oppofite pages of the fame folio: for inflance, money received on the one fide, and money paid on the other; or books bought on the one fide, and goods fold on the other. The lefthand page is called the Dcloor or Dr. Fide of the account, and the right-hand page the Crediter or Cr. fide. The difference between the fums of the Dr. and $\mathrm{Cr}_{\mathrm{r}}$. fides is called the Balance.

Accounts in the leger are of three kinds, which anfwer to the three purpofes of book-keeping mentioned § 1.
6. Firft, Perfonal Accounts. It is neceffary to open an account for every perfon or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the Dr.; but if he be indebted to them, it is entered on the Cr. During the courfe of the bufiriefs, goods fold on truft, money paid, and every thing for which they are accountable to him, is entered on the Dr.; but goods bought on trulf, money received, and every thing for which he is accountable to them, is entered on the Cr . The balance fhows how much they owe him, when the Dr. fide is greateft : and how much he owes them, when the Cr. fide is greater.
7. Secondly, Real accounts. By this we underfand accounts of property, of whatever kind, fuct as ready money, goods, houfes, lands, Mips, mares in public companies, and the like.

The account of ready money is entitled Cafb. On the Dr. fide, the money on hand at opening the books is entered, and afterwards every article of money received. On the Cr. fide, there is entered every article of money paid out; and the balance hoows how much ought to be on hand. The fum of the Dr. fide of this account is always greater than that of the Cr . fide.
8. Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the Dr. fide of the refpective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the fame manner, and goods fold are entered on the Cr . fide; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the Dr. fide ; and, when an incidental advantage arifes from them, fuch as public bounty, it is entered on the Cr.

If the fums of the inner columns on the oppofite fides be equal, it fhows that the goods are all fold, and then the balance of the money-column flows the gain or lofs. If the Cr . fide be greater, it is gain : if the Dr. fide be greater, it is lofs. If the fum of the inner column be greater on the Dr. fide, it thows that part of the goods are on hand; and their value mult be added to the fum of the Cr . fide, in order to determine the gain or lofs.
6. If there be two or more kinds of the fame fort of goods, they may be entered in the fame account, allowing as many inner columns as there are kinds, and entering the quantitics of each kind in the inner column referved for it. 'This method exhibits the gain or lofs on the whole goads; but does not fhow how much of it arifes from each kind.

Leger.

## B O O K - K E E P I N G.

Leger. Or, a feparate account may be opened for each kind, diffinguifhing the titles by the qualities, or by fome other mark. Thus, one account may be kept for fine linen, another for coarfe linen ; one for port-wine crop 1787, another for portwine crop 1788; one for rum from Jamaica, another for rum from Barbadoes. This method thows the gain or lofs on each kind.

When there are more kinds than can be conveniently introduced in the fime account, they may be divided into feveral claffes, each clafs being placed in a feparate account ; and the particular kinds diftinguifhed in inner columns. Thus the account of fine linen may be divided into feveral columns, for different kinds, diftinguifhed by the number of threads in the breadth, or by any other convenient character.
10. Accounts of fhips contain on the Dr. the value of the fhip when the books are opened, and all expences laid out thereon ; on the Cr . all freights received. In like manner, accounts of houfes or lands have the value of the fubject, and all repairs, or other charges, entered on the Dr. and all rents or other profits received on the $\mathrm{Cr}_{\mathrm{r}}$. If the fubject be fold in wbole or in part, the fale is entered on the Cr . And the balance after valuing the fubject (if any) on hand, fhows the gain or lofs.

Accounts of property in the public funds, or llares in companies, public or private, contain the value, or money paid in, on the Dr. and the dividends received on the Cr . and are balanced as other real accounts.

Some perfons open accounts for houfehold furniture, plate, jewels, books, or the like. The entries on thefe accounts are made in the fame manner.

In general, real accounts contain the value of the property, and all charges, on the Dro and the fales and other returns on the Cr. When the account is to be balanced, if any property remains, the value thereof is placed on the Cr . ; and then the balance fhows the lofs or gain, according as the Dr. or Cr. fide is greateft.
11. Thirdly, Accounts of Stocr, Profit and Loss, and its fubfidiary accounts, which are fometimes called figitious accounts.

The fock account contains on the Dr. the amount of the debts which the owner owes when the books are opened; and on the Cr . the amount of ready moncy, goods, debt's, and property of every kind belonging to him: therefore the balance fhows what his nett fock is; or, in cale of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced: and then, if the bulinefs has yielded profit, the nett gain is entered on the Cr . ; if it has been unfucceffful, the nett lofs is entered on the Dr: after which, the balance flows the nett flock at the time the books are clofed.
12. The Profit and Lofs account contains every article of gain on the Cr . and every article of lofs on the Dr. The balance thows the nett gain or lofs, and is transferred to the proper fide of the flock-account, as mentioned above. This account is partly compofed of articles that occur while the books are running. For exiflence, legacies received are entered on the Cr. goods deftroyed on the Dr. The reft of the articles are thofe
of gain and lofs, arifing from the real accounts, which Leger. are collected when the books are balanced.
13. It has been found convenient to open feveral fubfidiary accounts, in order to thorten and methodize that of profit and lofs. Thefe contain certain articles of gain or lofs, which may be reduced under diftinet heads. They are in effect fo many parts of the profit and lofs account, and their balances are entered on the proper fide of that account when the books are clofed. The chief of thefe accounts are the following.

Intere/l accoant, Which contains on the Dr. fums paid or incurred tor intereft ; and on the Cr. fums received, or become due for the lame.

Commifion account, Which contains on the Cr. ar. ticles of gain received or owing us for our trouble in tranfacting bufinefs for others. There are feldom any entries on the Dr.

Charges merchandife, Which contains on the Dro all charges paid or jucurred on the bufinef, which do not belong to any particular account, as mop-rent, public burderis for tracie, clerks wages, poflages, and the like. If any of thefe fhould afterwards be charged to fome other account, the fum fo charged is entered on the $\mathrm{Cr}_{\mathrm{r}}$.

Proper exjences, Which contains on the Dr. money or any thing elfe, withdrawn from the trade for our private ufe. There are feldom any entries on the Cr . The amount of this account, as well as the former, is not properly lofs; but as it has the lame cffect in diminithing the flock, it is placed in the fame mannes to the Dr. of profit and lofs.

Lofs by bad debis, Which contains or the Dr. fuch debts as we reckon defperate; and on the Cr. any of thefe which may happeti to be unexpectedly recovered.

Account of abatements, Which contains on the Dr. difcounts allowed by us on payments received; on the Cr. difcounts (if any) allowed to us on payments made. It is particularly ufeful in retail bufinefs, where difcounts are often given, to flow how much they amount 10.

Infurance account, Which contains on the Cr. premiums received for making infurances ; and, on the Dr. loffes fuflained on the fame. There may be feveral accounts of this kind, fuch as infurance againft fea-hazard, which is the moft common; infurance againt fire ; infurance of lives; and infurance of debts. The balance flows the gain or lofs which arifes from being concerned in infurance.
More or fewer of thefe accounts may be ufed, according as the articles are frequent; and others may be invented to fuit the purpoles of the bufinefs which the books are kept for.
14. Every fimple tranfaction in bufinefs belongs to two accounts, and mult be entered on the Dr. of the one and on the Cr. of the other. Thus, when a perfon becomes indebted to us, the article he owes mult be entered on the Dr. of his account; and, if it be for moncy paid him, it is alfo entered on the Cr. of calh; if for goods fold, it is cntered on the Cr . of the account of gonds; if for any thing delivered him 5 y another perlon at our defire, it is entered on the Cr . of the delivercr's account : if for any waçer or barg in, by which we are gaincrs, it is entesed on the $\mathrm{Cr}_{\mathrm{r}}$. of profit and
lofs.
lops. Thus, in whatever way the debt arifes, it is en. tered on the Cr . of fome other account, as well as on the Dr. of the perfon's account who owes it.

In like manner, when we become indebted to any perfon, the article we owe muff be entered on the Cr . of his account. If it be for money received, it is aldo entered on the Dr. of cath; if for goods bought, it is entered on the Dr. of the account of goods; if for any thing delivered to another perfon at our define, it is entered on the Dr. of the receiver's account; and if it be in confequence of a lofing bargain, it is entered on the Dr. of profit and loss.

Again, when goods are received, the tranfaction is entered on the Dr. of the account of goods. If they be bought for ready money, it is alfo entered on the Cr. of cath; if on trull, it is entered on the Cr. of the feller; if they be exchanged for other goods, it is enteed on the Cr. of the goods delivered; if they be obtaine by forme profitable bufinefs, without any return, it is entered on the Cr . of profit of lops.

When goods are delivered, the transaction is entered on the $\mathrm{C}_{\mathrm{r}}$. of the account of goods; and, if they be fold for ready money, it is alpo entered on the Dr. of call.; if on credit, it is entered on the Dr. of the purechafer; if exchanged for other goods, it is entered on the Dr . of the goods received; and, if they be given gratis, or deftroyed, it is entered on the Dr. of profit and lops.

Lefty, When any article of lops occurs, the transaction is entered on the Dr. of profit and loft; and as we mut either pay it in money or goods, or remain indebited to forme perfon for it, it mull be entered on the Cr. of caff, or of goods delivered, or of the perfon entitled to receive it. And, when an article of gain occurs, it is entered on the Cr. of profit and lofs, and alfo on the Dr. of cath or goods, if money or goods be received; and on the Dr . of the perfon accountable it, if not immediately paid.

Thus, every article in any account, whether perfonat or real, or belonging to profit and lofs, correfponds to forme other article on the oppofite of a different account. The fame fum is entered on the Dr. of one account and on the Cr . of the other; and it follows from this, that, If all the accounts in the leger be addcd, the amount of the fums of the Dr. will be equal to tho fe of the Cr.

## Sect. II. Of the Journal.

15. The journal is a fair record of all the tranfactons compiled from the wafte-book, in the fame order as they find there; but expreffed in a technical file, that it may be-transferred to the leger with noose cafe.

When we are to enter any article in the journal, we mull confider which accounts in the leger it will require to be placed to, both on the Dr. and Cr. and write [the former account] Dr. to [the Ratter account]; then we annex an explanation of the article, and place the furn in the money-column.

## Example.

Wafte-book). Sold for ready money, 30 yards Iithen, at $3^{\text {e. }}$ L. 410 -

Journal.) Caff Dr. to Liner. Sold 30 yards, at $3^{5}$. Jumna?.

1. $+10-\sim^{0}$

Here we confider, that the article muff be entered on the Dr. of cath, becaufe money is received; and on the Cr . of linen, because linen is delivered: Therefore we write Cab Dr. so Linen, to which we annex the nature of the transaction. The article thus entered is called a journal-pof: $C a / b$ is called the $D r$.; Linen the $C r$. ; the words "Caff Dr. to Linen," the Entry, and the following words the Narration.

The purpofe of expreffing the article in this form, is to point out the accounts in the leger, to which it will require to be pofted, and thereby enable the accountant to write the leger with more earle than he could do if it were filled up immediately from the wafte-book.

The learner will be able, from this example, to enter any dimple article in the journal, providing he knows the accounts to which it flould be profited on the Dr. and Cr. of the leger. This muff be collected from the defcription of the leger accounts already given § 6-1 3. and the nature and tendency of the article.

## 16. General Rules for the Journal-entries.

## I. Every thing received, or perfon accountable to us, is

 Dr.II. Every thing delivered, or perform to whom ave are accountable, is Cr .
37. As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we foal give forme particular rules fur the mot common cafes, and a few examples for the illuftration and practice of each.

Rule I. The perfon to whom any thing is delivered is Dr . to the thing delivered, when nothing is received ins return.

Therefore when money is paid, the receiver is Dr. to caff.

When goods or other property is fold on credit, the purchaser is Dr. to the thing fold. Thus,

Wante-book.) Paid John Bell in full
Journal.) John Bell Dr. 10 Cal, paid him in full
Wofte-book.) Sold 50 yards cloth to
J. Hill, at 124.

Journal.) Y. Hill Dr. to Cloth, fold him
50 yards, at 12 s .
L. 52 ——
18. Rule II. A thing received is Dr, so the per en from whom is is reccived, when nothing is delivered in re. turn.

Therefore, when money is received, Cath is Dr. to the payer: when goods are bought, the goods ate Dr. to the feller. Thus,
Waite book). Received from Thomas
Gay in tull
Journal.) Caff Dr. $t 0$ Thomas Gay, re-
ceived in full
L. 72 -

Wafte-book.)

Journal. Wafte-book.) Bought from J. Hawley Golb. wool, at gd.
Journal.) Woot Dr to $\mathcal{F}$. Hawley, bought Golb. at 9 .

25 -
19. Rule III. A thing received is Dr. to the thing giern for it.

Therefore goods bought for ready money are Dr. to eafh.

When goods are fold for ready money, Ca:h is Dr. to the goods.

When goods are bartered, the goods received are Dr. to the goods delivered. Thus,
Watte-book.) Bought for ready money rohds. wine, at 1 gl. L. 150 - -
Journal.) Winc Dr. to Ca/m, bought rohdc. at 15 . 150 — -
Walte-bouk.) Sold for ready money 100 gallons rum, at 9\%.
Journal.) Cafb Dr. 10 Rum, fold 100 gallons, at 9 .
Watte-bo k.) Baterred 3hds. wine, at 151. for 100 gallons rum, at 9 ©

Journal.) Rum Dr. to Wine, received 100 gallons at 9 g . in barter for $3^{\text {hdds. at } 15 \text { li: }} 45$ — —
20. Rule IV. Goods and other real accounts are Dr. for all charges loid out on thern. If money be laid out they are Dr. to Cath; if any thing elfe be delivered, they are Dr. to the thing delivered: if the charge bo taken in truf, they are Dr. to the perfon to whom it is due. Thu,
Wafte-book.) Paid for repairs to hip Traffick
Journal.) Ship Traffick Dr. to Cafls, paid for repairs.

45 - -
45 - -
45 - -

Wafte-book.) Delivered wood from my timber-yard for repairing the Angeltavern.
Journal.) Argel Tavern Dr. to Wood, delivered 'or repairing the farne
Wafte Book.) Due to William Carpenter for repairs to the A agel-tavern
Journal.) Angel-tavern Dr. to William Carpenter, due him for repairs
21. Rule V. When rents of boufes or lands, freights of flips, bounties on goods or ony olber profits from real accounts. art received, $C \cap \beta_{b}$ i, Dr. to the account froms which the profit arifes: if any thing befides money be received. the article received is Dr.: if they remann unpail, the perfon who owes them is Dr. Thus,
Watte-hook.) Received freight of the thip Traffick for a voy.ue to Lordun L. 35 - -
Journal.) Sbip Traffick Dr. to Ca/h, recsived freiglit to London
Wafte-book.) Received 100 barrels fal. mon, being the rent of lnver filhery, at 525 . 260 — —
Jourval.) Salmon Dr. to Inver fikery, received the rent, being 100 barrels, at 52 s .

## B O O K - K E E P I N G.

Wafte-book.) John Public owes ine a
22. Rule VI. Itben an articic of lofs occurs, Profie and Lofs, or fome fubfidiary account, is Dr. If the offs be paid in ready money,, it is Dr. 10 Cafls: if it be paid in any thing ctfe, it is Dr . to the thing delivered. If it remain unpaid, it is Dr. to the perfon to whom it is awing. Thus,
Wafte-book.) Given my daughter at her marriage.
Journal.) Profit and Lo/s Dr. to Ca/b, given my daughter at her marriage $\quad 500$ - -
Wafte-book.) Taken for family ule from my granary 3 bolls meal, at $13^{\circ} .4^{d}$.
Journal.) Profit and Lofs [or Proper expences] Dr. to Meol, taken for family ufe, 3 bolls, at 13 s .4 d :

2 - -

Wafte-book.) Due James Rich for a year's intereft on roool. at 4 per cent.
Journal.) Profit and Lofs [or Intered axcount] Dr. to Gomes Rich, due him a year's sutereft on 10001 . at 4 per cent. 40 - -
23. Rule VII. When an article of gain occurs, that is not immediately connectid with any real account, Ca/b, the article receiged, or the perfon accumatable for it, is Dr. to Profit and Lofs, or to fome fubfidiary account. Thus,
Wafte-book.) Received in a gift from my father I.. 100 - -
Journal.) Cafb Dr. 10 Profit and $L_{9 f s}$, 100 -
seceived from my father
Wafte-book.). Received in like manner at opening fhop, 100 yards cloth at $128.60-\ldots$
Journal.) Cloth Dr. to Profit and Lofs, received from my father at opening fhop 100 yards, at 52 c .
Wafte-book.) James Barhour owes me a year's intereft of L. 1000
Journal.) Famcs Barbour Dr. 10 Profit
Journal.) Famcs Barbour Dr. to Profit
and Lofs $[$ [or Interef account $]$ due by
24. Rule Vllif. TYben one perfon pay's money, or delivers any thing effe to ancther on our occount, the perfon who receives it is Dr. to the parfon whbo fays it. Thus,
Wafte-book.) James Goldfmith has paid the bank of Scotland on my account, L. 100 -
Journal) Bank of Scotiand Dr. to Yames Goldfmith, paid them by him 100 - -
Wafte-book.) Arthur Young has delivered James Baker 100 quarters wheat, for which I am to account to him, at 3os. 150 ——.
Journal.) Games Baker, Dr. 10 Artbur Young, for 100 quarters of wheat delivered him on my account, at 30 s.
$150-$ Payments of this kind are often tranfacted by bills of exchange..
25. Thefe cxamples will make the learner acquainted with the form of the jourral, and the rules extend to the greatef part of the fimple tranfactions that occur in domeftic trade. We may obferve, that the technical fenfe of the words Dr. and Cr. has an analogy to their meaning in common language, but is not precifely the fame. Thus, in E.x. 1. Rule V1lI. the joursal entry is, Bank of Scotland Dr. $t 0$ James Goldfmith; by which we are not to undertland that the bank is indebted to James Goldfinith; for a deht hetween them has no connection with our bufinefs; and therefore ought not to be entered in our books; the meaning of the entry is, that the bank becomes indebted to us by the tranfactions narrated; and that we become indebted to James Goldimith by the fame.
26. An article which contains more Drs, or more Cis. than one, is called a complex pofl. The form of thefe will appear from the following examples.
E.r. 1.] Sold William Drapier,

25 pieces cloth, at 15 l.
per piece L. 375 - -
131 fones wool, at 5s 6d
per ftone

$$
\underline{3515-1.41015 —}
$$

If the two articles fold to William Drapier were en tered fepatately in the Wafte-book, and ransferred to the Journal by Rule I. they would fand thus:

William Draper Dr. to Closb, fold him 25 pieces, at 15 . William Drapier Dr. to Wool, fold him 150 flones, at 556 d

## L. 375 - -

And if thefe were pofted to the leger, there would be two articles placed to the Dr. of William Drapier, one to the Cr . of Cloth, and one to the Cr . of Wool.

But the fales may be entered in the form of one complex journal pof, as follows:

## William Drapier Dr. to Sundries,

To Cloth, for 25 pieces,
at 1 5l. L. 375 - -
To Wool, for 130 fones
at 5 s 6 d

$$
\xrightarrow{3515-} 1.41015 \text { - }
$$

And then there is only one article on the Dr. of William Drapier in the leger.

Ex. 2.] Sold 10 picres cloth to W. Drapier,
at $151 . \quad \mathrm{Y} .150$ - -
12 ditto to J.
${\underset{22}{22}}_{\text {Mercer, at do. } 180-\text { L.330-- }}$
This example allo falls under Rule I. But whereas there was one Dr. and two Cis. in the former example; there are two Dra. and one C . in this: William Drapier and John Mercer, the purchafers, are Drs. for their refpective quantities; and cloth, which is the only thing delivered, is Cr . for the whole quantity. The journal poit is,

29. It is neither practicable nor neceffary to enumerate all kinds of complex pofts that may occur in bufinefs. We fhall here only mention the entries which occur at opening the books.

The firf journal poft contains the fubftance of the inventory. The entry is Sundries Drs, to Stock; the particular Drs. are Caft, the different kinds of goods and other property belonging to $u s$, and the perfons in. debted to us,

## BOOK-K E E PIN G.

Po in: ant Balin- The enery is, Stock Dr. io S: ndries ; the particular Crs.

The fecond journal-pon rontains the debts due by us. are the pertons to whom wis are udebred.

The torm of thefe entries is more fully exhibited at the begimning of the following fets.
30. The journal th suld be written by one perfon, in a lar hand and at levfure hours. The articles are fepusted, and the titles and cates marked in the fame manner as in the wafle-book. \& 3. The entries are writen in halfext for orn macnt allu diltinction. In the inventory, the defignation (or the bulinels, Atation, and the place of refidence) of every perfon is mentioned; and the fame is done the firl tume that any name occurs in journal-entry. At other times in is fufficient to enter the name without the defignation, unlefs we hase dealings with two perfons of the fane name; in which cafe, it is always neceflary to annex the defignation, in order to diftirguith them. The narration fhould be complete, without referring to the walte-book; and foclear, that efery perfon, acquainted with the dyle of the journal, may underitand it with eafe. When the poit is written, we mark a dafl / againft the article, on the margin of the wafte-book, to how how far the writing of the j urnal is advanced.

## Sect. IV. Of Posting and Balancing the Leger.

35. The firt thing to be done in the leger, is to allot a proper fpace for each account. The accounts may be either opened in the fame order that they occur in the journal; or accounts of the fame kind may be placed together, the perfonal accounts in one part of the leger, and the real accounts in another. The accounts of Stock and Profit and Lofs are generally placed at the begrnning. The room which each will require cannot be exactly known, but muft be conjectured from the number of tranfactions that are likely to follow.

The number of the folio is marked in ftrong text at each corner of the top-line; and the titles of the acm counts are written in fair text through both folios, if neceflary. The defignations of the perfonal accounts may be written in half text, or Italian hand : and fome write the titles in Saxon hand for ornament. The word $D r$. is prefixed to the title on the left-hand page; and Conero Cr . annesed to it on the right-hand page.
32. Next, An Index muft be provided, for pointing out the falios uncre the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio arnexed. Perfonal accounts are entered by the firl letter of the furname; companies, by the firft letter of the furname of the firth partner; and all other accounts by the fird letter of the frif word. 'The mof convenient kind of index is a long narrow book, of 24 leaves, one for each letter of the alphabct. $\Lambda$ is marked on the top of the firft leaf, and the paper pared atway below it; $B$ is mark. ed on the fecond leaf, under $A$; and the other letters on the ollowing leaves, in the fame manner; by means of which we can turn at once to any letter required.
33. In polling the leger, proceed by the following dirctions. Firt, look for the Dr. of the juurnal-poft
in the index, under the proper letter, and this dircets you to the folio of the leger where the account is, if and it be already opened: if not, you muf allot a fpace for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title of the former artucle, by writing the date on the margin, and the name of the cseditor on the line, with the word To prefixed, and a ftort narra. tion of the tranfaction amexrd, and interting the fum in the money column, and the quantity, if it be an ac. count of goods, in the inner column. Then turn to the account of the Cr. ol the journai-polt, and cnter the article in the right-hand page, prefixing the word By to the name of the Dr.
34. This being done, turn to the journal, and mark on the margin the number of the folios to which the article is polted. The figures which point out the res ference to the Dr. and Cr. folios thould be leparated by a line: for esample, If the Dr. entry be on the third folio, and the Cr. entry or the fifth, the reference is marked $\frac{3}{5}$. Thefe figures flow how far the pofting is advanced, and are uffful in comparing the books.

The figures for dates or references fhould be written in a lighter hand than the figures in the columns for money or quantity.
35. There is often a reference-column ruled in the leger, for pointing out the othet entry, correfponding to any article. In this column, the folio of the Cr . entry is m.sked againll the Dr. article, and the folio of the Dr. entry againft the Cr. article.

Sometimes the accounts are numbered according to their order in the leger; and the references, both in the journal and leger, point out the number of the ac. connt inftead of the folio.
36. In complex pofts turn to the feveral Drs. or Crs. in their order, and enter the articles according to the foregoing directions; placing the fums belorging to each in the money-column againft their refpective entries.
37. An article in the leger is generally comprehended in one line. The narration thould be as full as can be comtaned in that hounds. It it cannot be narrated completely, the jourual in referred to for further particulars, by writing per Journal, (or $p$. $\mathcal{F}$ ), either after an incomplete narration, or immediately after the Dr. or Cr. when there is no room for a proper narration. In complex fofts there can feldom be any narration annexed to the fingle Di. or the fingle Cr. The entry is generally To Sinnirues per $\mathcal{Y}$ or, By Sundries per $Y$. If the lenfe of the whule article can be narrated, it thoula be done; but it is improper to narrate the firft or any other part of the alticle, and omit the others.
38. When the face allotted for an account in the leger is filled up, the account muth he tranfported to another folio. For this purpole add the colunms ori both fides, and write againlt the fum, Tran/porsed so folio, inferting the number of the tolow shese the new account is opened, in the rterence columm, in on the line, if no reference-column be uled. Then, after titling the new account, and entering the numbe: of thac folio in the ndex, write on the Dr. To amount lrought from folio , inlerting the number of the fo-

Pofting lio where the old account was; and on the Cr. By and Eaian• mount, brought from folio ; and place the fums cing the $\underbrace{\text { Leger. }}$ and quantities, if any, in the proper columns.

When either fide of an account is full, both fides fhould be tranfported, and diagonal lines drawn, to fill up the vacant fpace of the fide which requires it.
39. The books thould be written up as frequently as can be done conveniently; fo that the journal may keep pace nearly with the wafte-book, and the leger with the journal. Each book thould be carefully revifed, and compared with the book from which it is potted. In comparing the leger, obferve the following directions:

Begin with the firt journal poft, and turn to the folio of the leger where the Dr. is entered, which you are dire $\mathcal{C l d}$ to by the marginal reference, and compare the date, entry, and fum. If you find them to correfpond, it is well ; if"not, the leger mult be altered till it correfpond with the journal. Then place a dot before the reference-figure in the journal, and a mark a before the fum in the leger.

Proceed in the fame manner to compare the $\mathrm{C}_{\mathrm{r}}$. of the journal-poft, and all the following pofts in their order. The dots in the journal fhow how far the com. parifon is advanced, and the marks in the leger how what articles are compared.

The fums of accounts tranfported fhould be left blank till the books be compared ; as an error in any article will occafion an alteration in the fum.
40. Some accountants correct all errors in the leger, without erazing any thing, by the following me. thod;: ift, If the fum be entered too fmall, they make a fecond entry for the deficiency. 2d. If it be entered too large, they make an entry on the oppofite fide for the excefs. 3 d, If it be entered on the wrong fide of the account, they enter it twice on the other; once, to counterbalance the error, and a fecond time for the true entry. 4 th, If it be entered on a wrong account, they charge the wrong account Dr. to, or Cr. by, the right one.
41. We do not much approve of thefe methods, as they give the books a confufed appearance; and would rather recommend the following rules; iff, If an article be omitted, do not attempt to interline at the place where it flould have been; but infert it under the laft article when you difeover the omiffion, and mark a crofs $x$ againtt it on the margin, and another at the place where it fhould have been. $\quad 2 \mathrm{~d}$, If you difcover a miftake immediately when committed, correct it without cancelling any thing, as in this example. To Calh, fay, To Yames Speirs received to accoum. 3d, If you have written a line entirely wrong, or in a wrong place, write the word Error at the end, prefix a crofs, and omit or cancel the fum. $4^{\text {th }}$, Cancel ertors, by drawing a line lightly through them, fo that the old writing may fill be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpofe. The fame method fhould be followed in correcting errors in the journal.
42. When the comparifon of the books is fulihed, glance over the leger, to obferve if the mark of comparifon be affixed to every article. If not, you mult turn to the journal, and obferve if the articles be right which had been marked.
43. Becaufe the whole fum of the Dr. fide of the Vos. IV. Past I.
leger flould be equal to the whole fum of the Cr. \& 14 . it is proper to try if they correfpond. For this pur and Ralanpofe, you may add the Dr. of every account, except cing the fuch as are already balanced, placing the fums in an Leter. inner column, and extending them at the end of one or more folios, as you find moft convenient, to the outer column; and as you go along add the Cr . in the fame manner. If the fum total of hoth fides be equal, it gives a prefumption that the books are right; if they differ, there is certainly fome miftake. This is called the Trial-balance. The labour beflowed upon it is not loft, as the fums may be referved for affriting us to collect the balances; the method of which will be ex. plained afterwards.
44. If the fums of the trial-balance do not correfpond, the books mutt be exarnined again. For this purpofe, begin with the firft article on the Dr, fide of the firft account, and turn to the account where the cortefpording entry is, which you will find by the figure in the reference-column. If the articles agree, mark them with a dot. Proceed in like manner with the other articles on the Dr. of the firf account ; then with the articles on the $\mathrm{Cr}_{\text {r }}$. of the fame; and then with the following accounts in their order, till the error or crrors be difoovered. In complex entries, obferve it the amount of the fums on orie fide be equal to the fum on the other. When you come to a dotted article, you may pafs it by, becaufe it has been exami. ned already.

If the errors be not difcovered at the firt revifal, you muft repeat the fame operation again, till you bring the books to balance. Marks different from the former ones, or differently placed, may be ufed, to fignify that an article has been examined a fecond or third time. As the detection of errors is the mof tedious and difagreeable part of book-keeping, the accountant will be induced to guard agaiuft them with all poffible care, when he has once experienced the trouble which they occafion.
45. Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we fettle accounts with any perfon, and afcertain how much is owing at either hand, it is neceffary to balance lis account in the leger, and open a new one, beginning with the fum that was due according to the fettlement; and when we clear accounts again, we mufl go back to that article, and no farther.

If any articles be charged on either fide, at the time of fettling, they mult be immediately entered on the wafte-book; from which they will pafs in courfe to the journal and leger; and a remark muft be entered in the wafte-book, that the account was fettled, and the balance transferred to the proper fide of the new account. This remark is tranferibed in the journal; and the leger account is balanced, when it occurs, in the courfe of porting.

If the balance be due to you, write on the Cr. By balance due to bim to Dr. new accoumt and infert the fum due you; after which, the amount of both fides will be equal. Add the account, placing the fums oppofite to each other; and, if the fides be unequal, draw a diagonal line through the vacant face of the fhorter fide, and clofe the old account by drawing lines under the fums. Then open the new account imme-

Pofting diately under the old one, or in a new folio, if the old and Balan- one be full, by writing on the Dr. To balance of forcing the mer account due by bim. If the balance be due by you Leger. to him, the entries are made on the oppofite fides, with the neceflary alterations. When the new account is opened in the fame folio, it is unneceflary to repeat the title; but the year and month, as well as the day, are repsated at the date of the firf article.
46. Sometimes when an account is balaneed, one or more articles are left out on purpofe: For example, goods lately bought on credit may be left out, and the fettlement may only relate to articles of longer ftanding. When this is the cale, if the articles omitted be on the Dr. of the leger, we write on the Cr. thus, By articles fold bim fince $1 / f$ Jonuary replaced: and when we have balanced the account, and opened a new one, we write on the Dr. To arlicles replaced at fetling, furnifhed fince $1 / 2$ Yanuary: or, if the articles were left out for any other reafon, we explain the fame in the narration. If the omitted articles be on the Cr. the like entries are made on the oppofite fides. It thould be noticed in tbe wafte-book and journal when this operation is neceffary.
47. When we paft any common article from the journal, we enter the fum on the Dr. of one account, and on the Cr . of another: when we balance an account, we place the balance fum on the Dr. of the old account, and on the Cr . of the new one, or contrarywile : and when we replace an article, as above direct. ed, to the Dr, or Cr. of the old account, we place it aiter balancing to the Cr. or Dr. of the new one. Thus, in the fe entries, as well as in common pofts, there ase like fums entered on the Dr. and Cr. of the leger, and the genersl equality of the fides is fill preferved.
48. Merchants generally balance their books once a-year. The defign of this operation is, to collect the various branches of their bufinefs, diffufed through the books, into a concife abftract; to afcertain their gain or lofs firce the latt balance; and exhibit the prefent flate of their funds. If the bulinefs be of fuch a kind, that moft of the branches naturally come to an iflue at a certain time of year, that time is the proper one for making the balance. Otherwife the end of the ycar, or the lealt buly time, may be chofen.
49. It is proper, before balancing, to fettle as many perfonal accounts as poffible; to clear all arrears and fmall charges; to take an exact inventory of the goods on hand, as far as can be done; and affix a moderate value to each article, according to the current prices at the time; fuch a value as you would be willing at prefent to buy for. It is mure proper to value the goods on hand in conformity to the current prices, than at prime coft; for the defign of affixing any value is to puint out the gain or lofs, and the gain is in reality obtained fo foon as the prices rife, or the lofs fuffered fof fonn as they fall; therefore it is impoffible to make up a juf tlate of the affairs, unlefs the ptefent prices be attended to.
50. 'I'hele things being done, proceed in make the balance as follows: Prepare two theets of paper, ruled with monev-columns, in the form of Dr. and Cr.; write Proftl and Lofs as the titie of the firt, and Balance is the title of the fecrud.

Prepare alfo fome paper for computing the balances, and mark down the folios, titles, and fums of each
account in the leger, in a regular order. If a trial-ba- Pofting lance was made, the fums may be tranfcribed from it. and Balan. Pafs by fuch accounts as are already clofed; alfo the cing the accounts of Stock and Profit and Lofs, which are always the laft of being balanced. Then fubtract the lefter fum from the greater, and enter the difference on either of the fleets that the nature of the article points out, and on the fide of that flecet which correfponds to the greater fum of the account. More particularly,

In perfonal accounts, enter the difference, which is the debt owing to you, or by you, on the proper fide of the balance-theet.

In the calh-account, enter the difference, which is the money in hand, on the Dr. fide of the balancetheet.

In accounts of goods or other property, if there be nothing remaining on hand, enter the difference, which is the gain or lofs, on the proper fide of the profit and lofs theet.

If the whole be ftill on hand, enter the prefent value on the Dr. of the balance-Theet; and, if this be different from the prime con, charges included, enter the difference in the proper fide of the profit and lofs meet.

If part be fold, and part on hand, place the value of the quantity on hand under the fum of the Cr . and add them. The fum is the whole return that will be obtained, if the reft of the goods be fold at the eftimated value; and this, being compared with the fum of the Dr. which is the whole expence, foows the gain or lofs. Enter the fame in the proper fide of the pro. fit and lofs fieet, and enter the quantity and value on hand on the Dr. of the balance-heet.

Obferve if the quantities in the inner columns be equal on both fides, when the goods are all fold; or, if the differcnce, when only part is fold, be equal to the quantity on band. If they correfpond, you have a juft account of the goods. If the Dr. be greater, there is fomething amifing, which you muft enter on the Dr. of the balance-theet, and mark the caufe of the deficiency, as inlake, wafte, or the like. If the Cr. be greater, there is an excefs, which you mult enter on the Cr . of the b?lance-lhect, together with the occafion of $i t$, as difference of meafure, or the like.

In arcounts fubfidiary to profit and lofs, enter the difference on the proper fide of the profit and lofs fheet.

When there is nothing written on one fide of an account, enter the fum of the article or articles on that Aheet which the kind of the account points out.
51. When you have collected all the balances, fum up both fheets, and add to the profit and lofs theet the fums of the profit and lols account in the leger: then fubtract the lefler fum of each Ateet from the greater.

This being done, mark the fums of the Itock-account on your computation paper, and add thereto the balance of the profit and lofs fheet on the fide which correfponds with the greater fum of that account: then fubtract the leffer fum from the greater. The remainder will be equal to the difference of the fides of the balance-fleet, if the books be right, and the balances exactly collected.
52. We thall prove that this equality muft always hold,

Polting and Balan cing the Leger.
hold, from the nature of the articles collened. The Dr. of the balance-fheet contains every kind of property belonging to you, and every debt owing to you; and the Cr, contains every debt owing by you: therefore the diflerence of the fides fhows what your nett eftate amounts to. The profit and lofs Aheets, whens the articles from the leger are included, contain every thing you have gained on the Cr . and every thing you have loft on the $\mathrm{Dr}_{\mathrm{r}}$; and the difference of the fides is your nett gain or lofs. The flock-account contained your effects and debts at the time the books were open. ed; and therefore, when the gain or lofs is added to the proper fide, it muft fhow the extent of your nett effate at prefent. Thus the flock-account and the ba-lance-fheet both point out how much you are worth at prefent; the one from your former ftock, allowance being made for your gains or leffes; the other from a view of your prefent effects and debis; and they will correfpond, becaule both muft be agrecable to the truth, if the books be correct.
53. Though the books mult balance, if free from error, yet it is fometimes difficult to adjuf them exactly, efpecially when the bufinefs is extenfive, and the errors trifing. If there be fill a difference, which we do not think it worth while to make further fearch for, we may clofe the books, by making Profit and Lofs Dr. or Cr. for the fame. This introduces an article on one fide of the leger, which has none correfponding to it on the other, but is balanced by fome undifcovered error.
-54. The balance being ftruck, your next work is to clofe the books. Every article in the leger thould be polted from the journal ; therefore, the molt regular way of finifhing both is by inferting the following articles in the journal, and pofting them in the common manner to the leger.

1tt, Profit and Lo/s Dr. to Sundries, for lofs, on the following accounts. The particulars are taken from the Dr. of the Profit and Lofs theet.

2d, Sundries Dr. to Profit and Lofs, for gain, on the following accounts. The particulars are taken from the Cr. of the Profit and Lofs theet.

3d, Balance-account Dr. 10 Sundries, for debts and property belonging to me.
$4^{\text {th, Sundries Dr. to balance-account, for debts due }}$ by me. The particulars of this and the former are taken from the refpective fides of the balance-fheet. 5th, Profit and Lofs Dr. 10 Slock for nett gain; ot Stock Dr. to Profit and Lofs, for nett lofs.
6th, Balance-account Dr. 10 Stock for neti flock.
55. When the four firft of thefe articles are pofted
in the leger, all the perfonal, real, and fubfidiary ac. counts will balance, and you may add them as you go along. In accounts of goods, if there be any deficiency, you muft enter it on the Cr . in the inner column; and, if there be any outcome, you mut enter it on the Dr. before yoa add the account. Then the fums of every account and every column on the oppofite fides will be equal.
The only accounts that remain open are, Profit and Lofs, Stuck and Balancc. The fifth polt balances the profit and lofs account, and the fixth balances the flock-account. It was noticed, \& 14. that the whole fums of Dr. and Cr. of the leger arc equal; and there-
fore, if the fides of every account, excent one, be bafums of Dr. and Cr. of the leger arc equal ; and there-
fore, if the fides of every account, except one, be balanced, that one will balance of its own accord. The balance-account alone remains open, and, upon trial, you will find that the fides are equal. This affords an additional proof, or, at leaft, a different view, of what
was demonfrated, with refpect to the balance of the additional proof, or, at leaft, a different view, of what
was demonfrated, with refpect to the balance of the books, in $\$ 52$.

The lines above and under the fums, at a general
balance, may be drawn with red ink; and, at the balancing of particular accounts, with black ink, for diftinetion.
56. Some choofe to infert the patticulars of the profit and lofs and balance fhects in the refpective accounts of the leger. If this be done, it is unneceflary counts of the leger. If this be done, it is unneceflary
to enumerate them alfo in the journal. - Some choofe to balance the accounts of goods, whenever the quan-
tity is fold off; and we approve of this method, as it to balance the accounts of goods, whenever the quan-
tity is fold off; and we approve of this method, as it leffens the work at the general balance, which is al ways fufficiently laborious.
57. Thus is the ftate of a perfon's affairs brought
together, in a flort compafs, under his view; and the articles of the balance-fteet fupply materials for a new articles of the balance-fheet fupply materials for a new
inventory. It is convenient, however, to alter the order, and arrange the real accounts together, and the perfonal ones together.
58. It is not neceffary to begin new books, nor open
the accounts anew, unlefs the old folios be full. The accounts may be continued in the former folios; but it is beft to begin a new leger, if the old one be not likely to hold all the bufinefs of the next year. When
one comes to have feveral fets of books, it is common likely to hold all the bufinefs of the next year. When
one comes to have feveral fets of books, it is common to diftinguifh them by the letters of the alphabet. The firf wafte-book, journal, and leger, are marked $A$, the fecond, $B$; and fo on. In the following fpecimen, the walte-book and journal are placed on oppofite pages, that the learner may eafily compare them; and the rules are referred to by their numbers.

## PROFIT and LOSS SHEET.

## BALANCE-SHEET.

The prefeat article, it is hoped, will appear fufficiently extended for a work of this nature. It contains the general principles of Italian book-keeping; and is fulficient to unfold the nature and defign of that art to the fpeculative inquirer, to direct the accountant in common and eafy cafes, and prepare him for underflanding thofe that are more complicated. In fact if he has a clear apprehenfion of the fenfe of the tranfactions, the tendency of the journal entries, and the import of the balances in the leger, he will feldom be at a lofs how to proceed.

## Sulfidiary Booss ufed by Mercbanes.

Though all merclaats accounts may be kept by the Wafle-book, Yournal, and Leger, slone; yct men of great bufinels find it convenient, either for abridging thefe, or for other ends, to ufe fome others, generally called Subfidiary or Subfervien: Books; the molt common of which are thefe nine following, viz.

1. Ca/b-Book. This book is kept in a folio form, like the leger, and ferves to abridge the cafh-account there. $\mathrm{O}_{\mathrm{i}}$ the left-hand page, or Dr. fide, $\mathrm{Ca} / \mathrm{h}$ is charged D : for all the furns received; and on the righthand page $C a / b$ is made creditor for all the fums paid. Once a week, or which is more ordinary, once a month, this book is potted to the leger; or, if you pleafe, firit to the journal, by two entries, viz. Cafb Dr. to Sunriries, for all the receipts, and Sundries Drs. to Caff, for all the payments. By this means the calh account in the leger will be fo far contracted as to confitt of 12 lines, viz. one for each month in the year.
2. Book of Charges of Merchanlife. This book is only paged, and defigned to abbreviate the cafh-book. It contains particular charges on goods and voyages; fuch as carriage, cuftom, freight, carriage, wharfage, \& c: as alfo other expences that affect trade in general; fuch as, warehoufe-rent, hop-rent, accountant's wages, poftage of letters, and the like. At the end of each month the money-columns of this book are added up, and the fum carried to the credit-fide of the cath book.
3. Book of Houfe-expence. This book is allo paged, and defigned likewife to eafe the cath book. It contains all difburfements for family provifions, fervants wages, houfe-rent, apparel, utenfils, \&c. The moneycolumns of this book are alfo added up at the end of each month, and the fum transferred to the credit fide of the call-book.
4. Invoice book. This book, which is ufed chietly by facturs, is paged, and contains doubles or copies of the invoice of goods fent to fca, or of goods received from abroad.
5. Sales.Rook. This book too is chiefly ufd by factors; and into it are polted, trom the wafte-book, the particular fales of every configned catgo ; by whirh means the feveral articles of a fale, that lie fcattered in the watle-book, are brought together, and reprefented under one view, and that in a manmer more full and minute than they are collected in the leger account. 'This book exhibits the fales of every confignment leparately and by themfelves: 10 which are fubjoined the refpective charges, fuch as freight, cuftom, the factor's commiffon, as alfor abatements allowed to buyers, \&c. whofe fum fubtrafted from the grofs amount of fales fives the neat froceeds. From this book, when a car-
go is fold off, an accoun: of fales is drawn out, in order Subfidiary to be tranfritted to the employer.
6. Bitl-book. The defign of this Bill-book, or Alonthbook, is to furnith a merchant with a ready way of knowing the time when bitls or other debts become payable to or by him. It confifts of 12 folios, one for each month in the year. The left-hand page contains the debts that fell due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the fame month.
7. Receip-book. In this book a merchant takes receipts of the payments he makes. The receipt thould contain the date; the fum received, expreffed in words at large, and alfo in figures in the money-columns; the reafon why; and whether in full or in part; and mult by figned by the perfon receiving. But there is no occafion to mention the merchant's name; for the book being his own, fufficiently implies that.
8. Lefter-book. It is very imprudent in any perfon to fend away a letter of bufinefs, without keeping a double of it to himfelf; and therefore to prevent the bad confequence of fuch a carelefs practise, merchants are provided with a large book in folio, isto which is copied verbation every letter of bufinefs before it be fent off. So that this book, together with the letters received (which mult alfo be carefully kept in files or boxes), make a complete hiftory of all the dealings that pals betwixt a merchant and his correfpondents; which may be very ufeful and neceffary on many occafions.
9. Pocket-book. This is a fmall book, of a portable fize, which a merchant carries in his pocket when bufinefs calls him abroad to a tavern, a fair, the country, or other places, In this he fets down the bargains he makes, the expences he is at, the debts he pays, or fums he receives, with every other part of bufnefs he tranfacts while abroad; as alfo any occurrence or piece of news he thinks worth while to record. And when he comes home to his countitug houfe or fhop, he transfers the things contained in this book, each to their proper places in the wafte-book, or book fubfidiary.
Factors of great bufinefs fometimes keep another fimall book, called the Memorandum-book. Into this hook is copied, from letters as they come to hand, fhort notes of the feveral commiffions for buying goods contained in them; and as the commiffions are effected, the notes are croffed, or have fome mark aftixed to them. This is more convenient in doing butinefs, than to be continually running to the letters themfelves.

The above are the fubfidiary books mof in ufe: but a merchant is not tied down or reftrifted to them; he may kcep fume, and neglect others, or invent more as the naturc of his bufinefs requires, and he finds convenient.

## New Melliod of Book-keeping by Mr Fones.

A new method of keeping books, entitled the Englifh Sulem of Bonk-keeping, has been propofed by Mr Edwand Thomas Jones of Briftol, for which a patent was gransed in Jathuary 1796.

Thirec bouks are required in the Englifls fyfem of boak-kefing, viz. a Day book or Yournat, an Alpbabet, and a leger. The day-book muft have three columns on eacla page; one of which to seceive the amount of

## B O O K-K E E P I N G.

A new Me-debits and credits; one column to receive the debits thod. only; and one column to receive the credits only; or it may be ruled with only two columns on each page, one of which to receive the amount of the debts, and the other to receive the amount of the credits. On each page of the day-book, there mutt alfo be four other columns ruled, two on the left fide next the amount of the debts, and two on the right fide next the amount of the credits. Thefe columns are intended for receiving the letter or mark of pofting, and the page of the leger to which each amount is to be poff. ed. It is not neceffary that the alphabet be rulcd, but it muft contain the name of every account in the leger, the letter annexed to it as a mark of potting, and the page of the leger. The leger is to be ruled with three, four, five, or feven columns on each page, as may be mof agreeable, for receiving the amounts of the tranfactions which are entered in the day-book. The plan of making up books of accounts, according to this fyftem is the following:

When a perfon begins trade, either as an individual or in company, he mult open an account with himfelf in the leger. He muft firf enter in the day-book, and then to the credit of his account in the leger, the amount of the property which he bas advanced into the trade. His name only may be placed at the head of the account, or it may be called fock-account.

When goods are purchafed, give the perlon credit of whom they are bought; when goods are fold, debit the perfon to whom they are fold. When you pay money, debit the perfon to whom it is paid, not only for the amount you pay, but alfo for any difcount or abatement that may be allowed, and give the caltier credit for the neat amount paid. When money is received, credit the perfon of whom it is received, not only for what he pays, but alfo for any difcount you have allowed, and debit the caflier for the neat fum received. In thefe entries a plain narrative of the fact fhould only be introduced. Technical phrafes, excepting the terms debit and credit thould be avoided. Thefe are the only terms applicable to every tranlaction, and may be affixed to every entry.

In the hurry of bulinefs, entries may be made to the debit inftead of the credit of an account in the daybook, and vice verfa. To obviate this evil, Mr Jones propoles to have only one column for receiving the amount of every tranfaction, whether debit or credit, at the time of making the entry; and that the debits may be conveniently feparated from the credits, previous to pofting, which is neceffary to prevent confufion, he has two other columns in the fame page; the column on the left fide receives the amount of every debit, and the column on the right fide receives the amount of every credit. Thefe columns muft be caft up once amonth. The column of debits and credits of itfelf forms one amount; the columan of credits forms a fecond amount ; and the column of credits a third $x-$ mount. The fecond and third amounts, when added together, it is plain, muft agree with the firf amount which includes both the debits and credits, otherwife there muft be fome error, either in making the entry or in the addition.

In this manner the accountant may obtain an ac. curate fatement of the tranfeftions recorded in his books for every month, which will dhow how much
he owes for that month, and how rnuch is owing to A new fre him; and by fubtracting the amount of the credit thod. from the whole amount of the debits for any gisen time, with the value of the flock of goods on hand, the profits of the trade for that period will at once appear.
'Ihe next part of the operation in this Cyferm is that of polting. An account is opened in the leger $\because$ fint every perlon to whole debit or credit an entr: 末as lueen made in the day-book; and to each account a letier is affixed, which is to be uled as a mark of potting. 'The name of the perfon, his place of abode, and the folio of the leger, muft then be entered in the alphabet, with the fame letter preffed to each name, as is affixed to the account in the leger. 'The next ftep of the procel's is to aftix to each amount in the day-book in the column for that purpole, the page of the leger on which each account is opened. This will be feen in the alphabet. The date and amount of eacli debit are thon to be pofted in the proper columns in the leger, on the left or debit fide of that account to wlich it rclates; taking care to enter as a mark of polting in the day. book, againft each amount, the fame letter that is affixed to the account in the leger to which f.id amount may be pofted. The debits of January, Fe. bruary, March, \&ic. it is to be oblerved, nuft be poft. ed into the column for thofe months in the leger, and the credits mult alfo be pofted in like manner, each account being filled up in the centre, at the expiration of every month, with the whole amount of the month's tranlactions. Thus may the whole ©atement of each perfon's account for the year be included in a fmall fpace. The columns to the right and left contain the feparate amount of each tranfaction. The column in the centre exhibits a monthly ftotement.

Having ftewn in what monner the eniries are to be made and carried through the different books, according to this fyftem; the next thing is to defcribe the method of examining them, fo as to afcertain with certainty their accuracy; and not only to difcover if each tranfaction has been correctly pofted, with regard to its amount, but alfo that it has been rightly entered to the debit or credit of its proper account. The mode of examination propofed by this fyftem is difierent from thofe which have been hitherto practifed, boilh in expedition and accuracy. All that is neceffaly is to add together the different fums in the debit and credit coJumns, through the leger : and the amount of thefe columns, if right, mult agree with the columns in the day-book for the fame period. This examination fhould take place once every month ; and if the amounts do not agree, the pofting mult be called over, and when the time alloted to each column of the leger, whether it be for one or more months, has expired, the amount of each column floould be put at the bottom of the fint page, and carried forwasd to the bottom of the next, and foon to the end of the accounts. 'The amount in the day-book for each montl's tranfactions, muft be brought into one grofs amount for the fame time.

But this procefs, although it proves that the leger comtains the whole contents of the day-book, is not to be confidered as complete without fome mode of afcertaining if each entry be polled to the right account. To difcover this the following method is adopted. It is to be admitted as a rule, that a letter, which may be

A new Me-ufed alphabetically in any form or fhape, is to be afthod. fixed to each account in the leger, and the fame letter prefised to the names in the alphabet. Thefe letters are to be ufed as marks in pofting, and affixed to each account in the day-book as it is pofted. It is therefore only neceflary to compare and fee that the letter affraed to each entry in the day book is the fame as that which is prefixed to the fame name in the alphabet. If there be no difference, it mun be right, otherwife there mult be fome error.

When the accounts are to be balanced at the end of the year, or at any other time, if the profits of the trade are to be fated in the books, the value of the fock of goods on hand at prime coll, either in one fum, or by fpecifying the amount of every article, may be entered in the day-book, and an account opened for it in the leger, to the debit of which it is to be
pofted. The cafting up of the leget is then to be com. A new Mepleted; and when it is found to agree with the day. thor. book, and the amount placed at the bottom of each column, fubtract the credits from the debits, and the difference will hiew the profit of the trade ; but if the credits be the greater amount, then a lofs has followed. To avoid error in taking off the balances of the leger, one rule mult be oblerved. Firf, find out the difference between the whole amounts of the credits and debits on each page for the year, with which the differences of the outftanding balances of the feveral accounts on each page muft exattly agree, otherwife the balances have not been taken right. Proceeding in this way every page will be proved, and the balances of any number of legers, according to this plan, cannot be taken off wrong without being obferved.

## B O O

Bookfeller. BOOISSELLER, one who trades in books, whether he pronts them himfelf, or gives them to be printed by others.

Bookfellers, among us, are the fame with the libliopolie of the ancients, whofe office was diftinet from that of librarii. Petty dealers, or venders of fmall ware, were diftinguifhed by the diminutive appellation libelliones. At Rome, the Argiletum was the mart of books, as Paul's Church-yard, or Fleet-ftreet, and Pa-ternofter-row, have been in London: whence that of Martial.

## Argiletanas mavis habitare tabernas, Cum tibi, parve liber, fcrinia nofra vacent.

Bookfellers in many places are ranked among the members of univerfities, and entitled to the privileges of Audents: as at Tubingen, Salt Burg, and Paris, where they have always been diftinguifhed from the vulgar and mechanical traders, and exempted from divers taxes and impofitions laid on other companies.

Formetly, the offices of bookfellers and printers were united in the fame perfons. Labbe gives a lift of learned hookfellers; moft of whom were alfo authors. Of late, bookfellers have drawn their bufinefs into lefs compals, and leaving the labour of compofing books to one fet of perfons, and that of printing them to another, content themfelves with the gainful part ; thus miniftering to the republic of letters not with the head or the hand. but the purfe only. In this view, they have been very important and ufeful agents between authors and the public ; and lave contributed, in no fmall degree, to the encouragement of genius and literary indultry, and the fpread of fcience. There are few authors, who have undertaken the printing and publifh. ing of any work likely to be tranfmitted to pofterity without being connected with fome boukfeller, or bookfellers, eminent in their profeffion.

The fairs of Francfort and Leipfic are famous for the refort of bnokfelle-s, not only from all parts of the empire, but Hollansl, Flanders, \&ic. They have each their fhop or warehoufe, over which is infcrited the

## B O O

name of fome celebrated bookfeller of former times; Bookfeller. Officina Elweviriana, Frobeniana, Morelliana, Janfoni- Bcom. ana, \&c.

An acquaintance with the bookfellers marlis or figns, frequuently exprefled on the title-pages of their books, is of fome ufe; becaufe many books, efpecially in the laft century, have no other defignation either of printer, bookfeller, or even city. The anchor is the mark of Raphelengius at Leyden; and the fame with a dolphin twifted round it, of the Marutii at Venice and Rome; the Arion denotes a book printed by Oporinus at Ba fil ; the caduceus, or Pegafus, by the Wecheliufes at Paris and Francfort; the cranes, by Cramoify; the compafs, by Plantin at Antwerp; the fountain, by Vafcofan at Paris ; the fphere in a balance, by Janfon or Blaew, at Amfterdam ; the lily, by the Juntas at Venice, Florence, Lyons, and Rome; the mulberrytree, by Morel at Paris; the olive-tree, by the Stephenfes at Paris and Geneva, and the Elzeviers at Amfterdam and Leyden; the bird between two ferpents, by the Frobeniufes at $B a^{2} f_{2}$; the truth, by the Commelins at Heidelberg and Paris; the Saturn, by Colia reeus; the printing-prefs, by Badius Afcencius, \&xc.

The trallic of books was anciently very inconfider. able, infomuch that the book-merchants of England, France, Spain, and other countries, were diftinguifhed by the appellation of fationers, as having no Grops, but only ftalls and ftands in the ftreets. During this ftate, the civil magiflates took little notice of the bookfellers, leaving the goverument of them to the univerfities, to whom they were fuppofed more immediate setainers; who accordingly gave them laws and regulations, fixed prices on their books, examined their correctnefs, and punifhed them at diferction. But when, by the invention of printing, books and bookfellers began to multiply, it became a matter of more confequence ; and the fovereigns tonk the direction of them into their own hands, giving them new ftatutes, appointing officers to fix prices, and granting licenfes, privileges, \&c.

BOOM, in the fea-language, a long piece of timber

Doom with which the clew of the fudding-fail is fpread out; and fometimes the boom is uled to fpread or boom out the clew of the main-maft.

Boom, denotes alfo a cable fretched athwart the mouth of a river or harbour ; with yards, top mafts, battling or fpars of wood lafhed to it, to prevent an enemy's coming in.

BOOMLNG, among failors, denotes the application of a boom to the fails. A hip is faid to come boom. ing forwards, when the comes with all the fail the can make.

BOONEN, Arnold, portrait painter, was born at Dort in 1660 , and at frit was a difciple of Arnold Verbuis, a painter of hiftory and portrait. Afterwards he placed himfelf with Godfrey Schalcken, and continued with that artift for fix years. The fweetnefs of his colouring, and the neatnefs of his touch, with a friking likenefs in his portraits, procured him a number of admirers. He painted in the manner of his mafter, particularly fubjects by candlelight, which were very delicate, and very natural; and much more of his work was requetted by the lovers of the art than it was poffible for him to undertake. He had the honour to paint the portraits of the czar of Mufcovy; of Frederick I. king of Pruflia; of the victorious duke of Marlborough, as well as many of the princes of Germany; and mott of the noblemen who attended the czar. His ftyle of colouring was extremely good, and he had an elegant manner of difpoling the attitudes of his figures; his handling was neat, and the whole had fo much harmory that he was juftly ranked among the ableft artifts of his time. The fmall pictures of Roonen are in the tafte of his matter Schalcken; but his exceflive application, to anfwer the multitude of his engagements. impaired his bealth, and deltroyed while it enriched him. He died in 1729.

BOOPTHAL.MUS, a kind of agate with large circles in it, bearing fome refemblance to an ox's eye, from whence it has got this name.

BOOPS, in Zoology, the trivial name of a fpecies of balæna. See Balena, Cetology Index.

BOOSHATTER, formerly the city of Utica, famous for the retreat and death of Cato, lies about feven miles inland from Porto Farina in the bay of Tunis. Nothing remains of its ancient grandeur except part of a large aqueduet, fome cifterns, and other magnificent ruins, which cover a large extent of ground, and fhow it to have been a very confiderable place. The fea, it is known, came up anciently to this city, though now feven miles diftant.

BOOT, a leathern cover or defence for the leg, ufed on horfeback, both to keep the body more firm, and defend the part from the injuries of the weather. Boots feem to have taken their name from the refemblance they bear to a fort of jacks or leathern bottles formerly in ufe, and called botle, in the old French bouts. Barel derives the name from the old French word bot, a ftump, by reafon the boot gives the leg this appearance. The Chinefe have a kind of boots made of filk or fine ftuff lined with cotton, a full inch thick, which they always wear at home. This people are always booted; and when a vifit is made them, if they happen to be without their boots, their gueft mult wait till they put them on. 'They never Rir out of doors without their
boots on; and their fcrupuloufnefs in this refpeet is the more remarkable as they are always carried in their chairs.

The boot was much ufed by the ancients, by the foot as well as by the horfemen. It was called by the ancient Romans ocrea; in middle-age writers, greva, gamberia, bainterga, bembarga or benbarga. The boot is faid to have been the invention of the Carians. It was at firft made of leather, afterwards of brafs or iron, and was proof both againft cuts and thrufts. It was fom this that Homer calls the Greeks brazen-booted. The boot only covered half the leg; fone fay the right leg, which was more advanced than the left, it being advanced forwards in an attack with the fword; but in reality it appears to have been ufed on either leg, and fometimes on both. Thofe who fought with darts or other miffile weapons, advanced the left leg foremoft, fo that this only was booted.

Fijbing-Boots, are a thick ftrong fort ufed in diagging ponds and the like. Hunting-boots, a thinner kiid ufed by fportfmen. Jack-boots, a kind of very ftrong boots ufed by the troopers.

Boor, is likewife a kind of torture for criminals; to extort a confeffion, by means of a boot, ftocking, or bukin of parchment; which being put on the leg moift, and brought near the fire, in fhrinking fqueezes the leg violeatly, and occafions intolerable pain.

There is alfo another kind of boot; confifting of four thick ftrong boards bound round with cords: two of thefe are put between the criminal's legs, and the two others placed one on the outlide of one leg and the other on the other; then fqueezing the legs againit the boards by the cords, the criminal's bones are feverely pinched, or even broken, \&c.

The boot is now difufed in England and Scotland ; but it fubfifs fill in fome other countries.

Boot-Tree, or Boot-laff, an inftrument uled by floemakers to widen the leg of a boot. It is a wooden cylinder flit into two parts, between which, when it is put into the boot, they drive by main force a wedge os quoin.

BOOTES, a conftellation of the northern hemifphere, confilting of 23 ftars according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of $52^{\circ}$ in Hevelius's, and of 57 in Mr Flamitead's catalogue.
booth, Barton, a famous Englih actor, born in Lancahire in 1681, and educated in Weftminfter fchool under the celebrated Dr Bulliby, where his furcefs in the Latin plays cultomarily performed by the fcholars gave him an inclination for the ftage. He was intended for the church; but running away from fchool to Dublin, he there commenced actor. His fir: appearance was in the part of Oroonoko, in which he came off with every teftimonial of approbation from the audience. From this time he continued daily improving; and, after two fuccelfful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the Eng. lifh ftage. To this end, he firf, by letter, reconciled himfelf to his friends; and then, as a farther ttep towards infuring his fuccefs, obtained a recommendation from Lord Fitzharding (one of the lords of the bekchamber to Prince George of Denmark) to Mit Betterton, who with great candour and good nature took him under his care, and gave him all the affiltauce it

## B O O

Fookh.
his poser. The rirt part Mr booth appeared in at London was that of Maximus in Lord Rochefter's Valentinian, his reception in which excerded even his moft fanguine expectations; and very foon after his performance of Artaban, in Ruwe's Ambitious Stepmother, which was a new tragedy, eftablifhed his reputation as fecond at leaft to his great inllructor. Pyrrhus, in the Dittrelled Mother, was another part in which he fhone w thout a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr Addifon, in 1712. For this play being confidered as a party one, the Whigs, in favour of thofe principles it was apparently written, thought it their duty ftrongly to fupport it, while at the fame time the Tories, who had too much fenfe to appear to confider it as a reflection on their adminiftration, were ftill more vehement in their approbation of it, which they carried to fuch a height, as even to make a collection of 50 guineas in the boxes during the performance, and prefent them to Mr Booth, with this compliment, "That it was a night acknowledgment for his honeft oppofition to a perpetual dictator, and his dying fo bravely in the caufe of liberty." Befides this, he had a prefent of an equal fum from the managers, in confideration of the great fuccefs of the play, which they attributed in a good meafure to his extraordinary merit in the performance ; and certain it is, that no one fince that time has ever equalled, or even nearly approached, his excellence in that character. But thefe were not the only advantages which were to accrue to Mr Booth from his fuccefs in this part; for Lord Bolingbroke, then one of the principal fecretaries of ftate, in a little time after procured a fpecial licenfe from Queen Anne, recalling all the former ones, and nominating Mr Booth as joint manager with Wilkes, Cibber, and Dogget; none of whom were pleafed at it ; but the laft efpecially took fuch difguft as to withdraw himfelf from any further fhare in the management. In 1704, Mr Booth had married a daughter of Sir William Barkham Bart. who died in 1710, without iffue. Being now eftablifhed in the management, he once more turned his thoughts towards matrimony; and in the year 1719 unted himfelf to the celebrated Mifs Hefer Santlow, a woman of a moft amiable difpofition, whofe great merit as an actrefs, added to the utmon diferetion and prudential economy, had enabled her to fave up a confiderable fortune. During the 20 years in which Mr Buoth continued a manager, the theatre was in the greatef credit; and his illnefs and death, which happened on the 10th of May 1733, contributed not a little to its decline.

Mr Booth wrote a dramatic entertainment called Dido and Fineas; hut his matterpiece was a Latin infeription to the memory of Mr William Smitls, a celebrated actor, who died while he was young.-As an aftor, his excellency loy wholly in tragedy, not being able to endure fuch parts as had not flrong pafion to infpire hin. And even in this walk, dienity rather than comalacencv, rage ratber than tendernefs, feemed to be his tafte. Fur a particular idea of his abilities, we nula refer to the defeription Mr Cibber has given of him in his Apology; and the adminable character drawn of him by that excellent judge of dramatic per-
fection, Arron Hill, Efq. in a political paper publifhed by him cailed the Prompter, which may be feen at length in Theoph. Cibber's Lives of the Poets, and Chetwood's History of the Stage.-His character as a man was adorned with many amiable qualities, among which, a goodnefs of heart, the bafis of every virtue, was remarkably confpicucus; and fo particularly was he diftinguitted and careffed, and his company fought by the great, that, as Chetwood relates of him, not one robleman in the kingdom had fo many fets of horfes at command as he had.
$130 O^{\prime \prime}$, whatever is taken from any enemy in time of war.-Among the Greeks, the booty was divided in common among the army, the general orily claiming a larger thare. By the military difcipline of the Ko. mans, fpoils taken from the enemy belonged to the republic, particular perfons having no right to them. The generals who piqued themfelves on their probity carried it wholly to the public treafury. Sometimes indeed they divided it among the foldiery, to animate them, and ferve in lieu of a reward. But this diftritution depended on the generals, who were to conduet themfelves herein with great equity and moderation; otherwife it became a crime of peculate to lay hands on the pillage, as regularly belonging only to the ftate. The confuls Romulus and Vaturius were condemned for having fold the booty taken from the Equi.-Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of diftribution obtained.- Among the Mahometans, two thirds of the Spoils are allowed to the army : the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims. Among us, formerly the booty was divided among the foldiery. If the general be in the field, every body takes what he can lay hold on: if the general be abfent, the booty is dillributed among the Coldiery, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten flares, a lieutenant fix, and a cornet four.

ROPPART, a town of Germany, in the circle of the Rhine, and electorate of Treves; it is feated at the foot of a mountain near the Rhine, in E. Long. 7. 35. N. Lat. 50. 19.

BOPSINGEN, a town of Suabia in Germany, feated on the river Egar, in E. Long. 9. 55. N. Lat. 48. 51.

BOOUINIANS, in church hiftory, a feet of heretics, lo called from Boquinus their founder, who taught that Chrift did not die for all mankind, but only for the faithful, and confequently was only a particular Saviour.
bor ago, Borage. See Botany Index.
BORAK, among Mahometans, a fabulus animal, fuppofed to be of the m:ddle kind between an afs and a mule, whereon their prophet was carried in his nocturnal llight from Jeudalem into the heavens. This animal the Arabiansealled Al Borak, q. d. Jhining. The night when the journey was performed is called Lailot al Meeraga, i. c. the nighe of afcenfion ; and the flight ittelt Al Mifra; concerning which there is a multitude of treditions.

BOR : $X X$, in Comifiy, a falt in appearance Comewhat fimilar to cryttals of alum, brought originally

## B O R [ 31 ] B O R

from the Eaft Indies in an impure nate, and afterwards freed from its impurities by certain procefles in the European countries. It was long a matter of un. certainty whether this falt be a natural or factitions fubfance in thofe countries from whence it is brought; but it is now beyond a doubt, that it is naturally produced in the mountains of Thibet, from whence other parts of the eaftern continent are fupplied.

According to an account in the Philofophical Tranf. ationc, vol. lexvii. by Mr Blane, it is produced in the kingdom of Jumlate, ahout 30 days journey north from Betowle, a fimall principality about 200 miles northeaft of Lucknow. The place shere it is found is faid to be a fmall valley furrounded with frowy mountaine, in which is a lake about fix miles in circumference; the water of which is contantly fo hot that the hand camot bear it for any time. Around this lalie the ground is perfectly barren, not producing even a blade of grafs; and the earth is fo full of a faline matter, that after falls of rain or fnow it concretes in white flakos on the furfice like the natron of Hindoflan. On the banks of this lake, in the winter feafon, when the falls of fnow begin, the earth is formed into fmall refervoirs fix inches high: when theie are filled with fnow, the hot water from the lake is thrown upon it; which, together with the water from the melted fnow, remains in the refervoir, to be partly abforbed by the earth and partly evaporated by the fun; after which there remains at the bottom a cake of fometimes half an inch thick of crude borax, which is taken up and referved for ufe. It can only be made in the winter fealon, becaufe the falls of fnow are indifpenfably requifite, and alfo becaule the faline appearances upon the earth are ftrongeft at that time. When once it has been made on any foot, it cannot be made again on the fame until the fnow has fallen and diffolved three or four times, when the faline efflorefcence appears as before. See Chemistry and Mineralogy Index.

BOR BETOMAGUS, in Ancient Geograply, a city of the Vangiones on the Rhine; now Worms, in Germanv.

## BORBOVIA. See Botant Index:

BORBORITES, in church-hiftory, a fect of Gnoftics, in the fecond century, who, befides embracing the errors of thefe heretics, denied the laft jadgment. Their name comes from the Greek Borbores, " filth ;" on account of a cultom they had of daubing their faces and bodies with dirt and filth.

BORCEI, a town of the duchy of Magdeburg in Lower Sasony, feated on the river Elbe, in E. Long. 12. 14. N. Lat. 52.25.

BORCHLOEN, a town of the bifhopric of Liege in Germony, fituated in E. Long. 5 28. N. Lat. 50. 50.

BORCOVIUM, ia Aucient Geography, a town of the Ottadini in Britain, now Borwick on Tweed.

BORD-halfernny, a fmall toll by cuftompaid to the lord of the town for fetting up boards, tables, booths, \&ir. in fairs and markets.

Bord-Lands, the deme Tnes which lords keep in their hands for the maintenance of their board or table.

Bord-Lode, a felvice required of tenants to carry timber out of the woods of the lord so his houfe. It is alfo ufed to fignify the quantity of provition
which the bordarii or bordmen paid for their bord. Eordfur. lands.

Bord-Service, the tenure of bord-lands, by which fome lands in certain places are held of the bilhop of London, and the tenants now pay fixpence per acre, in lieu of fending provifion anciently for their lord's table.

BORDAT, in commerce, a fmall narrow fuff, which is manufactured in fome parts of Egypt, particularly at Cairo, at Alevandria, and Damictta.

BORDE, Andrew, a phyfician, was born at Pevenley in Suffex, early in the 1 Gth century, and fuppofed to have been educated at Wefminfler fchool. In his Introduction to Knowledge, he Cays, that he was a fudent of Oxford ; but of what college he does not mention. He left the univerfity without a degree, and entered himelf a brother of a Carthufan convent in or near London; but not liking the fevere diccipline of that order, he returned to O.ford, and applied himfelf t) the ftudy of phyfic. Some time after, he embarked for the continent ; and, as himfelf exprefles it, "travelled through and round about Chriftendom, and out of Chriftendom into fome parts of Africa." In the years 154 and 1542, he refiled at Montpelier in France, where he was made doctor of phyfic, and after his return to England was incorporated into the fame degree at Oxford. From the preface to his introduction above mentioned, it appears that he bad been in Scotland, which probably was foon alter his return from France. Having now fati,fied his inclination for travelling, he fettled fift at Pevenfey where he was born, afterwards at Winchefter, and finally in London, where he is faid to have become a fellow of the college of phyficians, and firt phyfician to King Henry VIII. But notwithltanding his eminence in his profeffion, he had the misfortune to fpend the latter end of his life in the Fleet prifon, where he died in the year 1549. As to his character, Wood fays that " he was efteemed a noted poet, a witty and ingenious perfon, and an exce'lent phyfician." Pits calls him a man of fufficient learning, but too volatile and inconftant. Bale and fome others, on the contrary, abufe him grofsly. His writings are, 1. A book of the introduction of knowledge, the whych doth teach man to fpeak part of all manner of languages, \&ic. Lond. 1542 , to ; dedicated, from Montpelicr, to the lady Mary daughter to Henry V1II. It is written partly in verfe, and partly in profe, containing 39 chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of fickneffes and difeafes, \& ec. Lond. is47, \&ic. 4to. 3. Dietary of health, Lond. $1576,8 v o$. 4. The merry tales of the madmen of Gotham. Printed, fays Wood, in the time of Henry VIII. in whofe reign, and after, it was accounted a book full of wit and mirth by fcholars and gentlemen. Afterwards being often printed, it is now only fold on the fialls of ballad fingers. 5. A right pleafint and merry hiftory of the myluer of Abington, with his wife and his fair danghter, and of two poor fcholars of Cambridge. Lond. printed by Richard Jones, to. 6. A book of every region, country, and province; which flows the miles and leagues diflance from city to city, and from town to town, with the noted things in the faid cities and towns.

Burder Woud bays, that the author lent the manufcript of this book to his friend Thomas Cromwell, who loft it, to
the great gricf of the author, who would otherwife have publifhed it. In this infance, however, the antiquary was mininformed ; for it has fince been publifhed by 1 fearree at the end of Benedictus abbas Peterb. de eita Hontici IL. Oxf. 1735, 8vo. 7. The principles of aftronomy, the whych diligently perfecuted is in a manner a prognoftication to the world. Lond. printed by Robert Copland, 12 no. 'The author fays that he wrote this liztle book in four days, with one old pen without mending.

BORIDER, in gardening, is made to cnclofe parterres, that they may not be injured by walking in them. Borders are made either circular, ftraight, or in cants; and are turned into knots, fcrolls, volutes, and other compartiments. They are rendered very ornamental by the flowers, fhrubs, yews, \&c. that are raifed in them. They are always laid with a flarp rifing in the middle; becaufe, if they are flat, they are noways agreeable to the eye: and as for their breadth, the largelt are allowed five or fix feet, and the fmalleft commonly four.

BORDUNI, or Bordone, Paris, an excellent Italian painter, was born at Venice about the year 1512 ; and, being of a noble family, had a polite education. He was the difciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great efteem for hin, and for whom be drew not only abundance of hiftory-picces, but the portraits of feveral court-ladies, in fo fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1587 , aged 75.

BOR DURE, in Heraldry. See there, No 10.
BORE, among engineers, denotes the diampter of the barkel of a gun or cannon, or rather its whole cavity.

BOREAS, a Greek name, now in common ufe for the north wind. Pezron obferves, that anciently Boreas fignified the north-eaf wind blowing at the time of the fummer foltice. The Greeks erected an altar to Boreas. He is reprefented on the temple at A. thens with his robe before his mouth, as if he felt the cold of the climate over which he prefides, agreeably to the defcription of Ovid, who calls him gelidus tyrannus, " the hivering tyrant," Met. vi. ver. 71 r. But he is ufually defcribed by the Roman poets as violent and impetuous; ibid, ver. 686 -ver. 707. In painting, he is generally reprefented like an old man with a horrible look, his hair and beard covered with fnow or hoar froft, with the feet and tail of a dragon. M. Spierlingius has a treatife in praife of Boreas, wherein he fhows the honours paid to him by antiquity. Boreas, according to this author, purifies the air, renders it calm and falubrious, preferves buildings from decay, drives away the plague and other noxious difeafc; and expels locufts and other vermine hurtful to the grounds.

BOREL, Peter, a learned phyfician, was the fon of James Borel who publified feveral poems, and was
born at Caltres in 1620. He applied himfelf to the Audy of phyfic, of which he was created doctor, and practifed with great fuccefs in the city of Caftres. Towards the end of the year 1653 , he went to Paris, and was foon after made phyfician in ordinary to the king. In 1674 , he was received into the academy of fciences, and diftinguithed himfelf by writing a great number of works. The moft efleemed are, 1. Hiforiarum et objervationum melico-phylicarum centurice quinque. 2. Bibliotbeca cbymica, duodecimo. 3. De vero telefcopii inventore, cum brevi omnium confpiccillorum biforin. He died in 1678 .

BORELLI, John Alphonso, a famous philofopher and mathematician, born at Naples the 28th of January 1608. He was profeffor of philofophy and mathematics in fome of the molt celebrated univerfities of Italy, particularly at Florence and Pifa, where he became highly in favour with the princes of the houfe of Medicis; but having been engaged in the revolt of Meffina, he was obliged to retire to Rome, where he fpent the remainder of his life under the protection of Chriftina queen of Sweden, who honoured him with her friendfinip, and by her liberality towards him foftened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St Pantaleon, called the pious fchools, where he infructed the youth in mathematical fiudies. He died there of a pleurify, the 31 lf of December 1679, in the 72d year of his age. He wrote in Latin, 1. Euclid reftored. 2. The theory of the influence of the planets in medicine, deduced from phyfical caufes. 3. Of perculfive force. 4. Of natural motions depending upon gravity, 5: An hiftorical and meteorological account of the burning of Mount Ætna, in the year 1669. 6. Of the motion of animals; and feveral other works, fome of which are in Italian.

BORGIA, Cefsar, natural on of Pope Alexan. der VI. was a brave general, but a moft abandoned villain. See (Hifory of ) Italy.- It is incredible what numbers he caufed to be taken off by poifon, or by the fword; and it is notorious that fwarms of affaffins were conftantly kept in pay by him at Rome, for the fake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune ; and was fometimes very profperous, fometimes the reverfe. He very narrowly efcaped dying by poifon in 1503 ; for having concerted with the pope a defign of poifoning nine newly created cardinals at once, for the fake of poffeffing their effects, the poifoned wine, deftined for the purpofe, was by miftake brought to and drank by themfelves. The pope died of it; but Cælar, by the vigour of his youth, and the force of antidotes, after many fruggles, recovered. He only secovered to outlive his fortune and grandeur, to fee bimfelf depreffed, and his enemies exalted; for he was foon after divefted of all his acquifitions, and fent a prifoner to Spain, in order to free Italy from an incendiary, and the Italian princes from thofe dangers which the turbulent and reftlefs fpirit of Cxfar made them fear, even though he was unarmed. He efcaped from thence ; and got fafe to Navarre to King John his bro-ther-in-law, who was then at war with his fubjects. Cæfar ferved as a volunteer in that war, and was killed in 1507.

BORGO

BORGO, an ancient town of Sweden, feated on the gulf of Finland in the province of Nyland. E. I.ong. 26. 25. N. Lat. 60. 34.

Borgo de St Sepulchro, a town of Tufcany, in Italy, fituated in E. Long. 13. c. N. Lat. 43. 35.

Borco de Val de Faro, a town of Italy, in the duchy of Parma, in E. Long. 10. 36. N. Lat. 44.35.

Borgo Forte, a town of the Mantuan in Ltaly, fituated at the condiuence of the rivers Po and Menzo. E. Long. if. O. N. Lat. 44. 50.

Borgo San Domino, a town of Italy, in the duchy of Parma, with a bifhop's fee. E. Long. Io. 31. N. Lat. 4 T. 53.

BORGOGNONE, a celebrated painter, whofe true name was Giacomo Corteff; but he is commonly call. ed Borgognone, from the country where he was born, about the year 1605 . He was much admired and highly applauded for his admirable guifo and grand manner of painting battles. He had for feveral ; ears been converfant in military affairs, was an officer of confiderable rank in the army, made the camp his fchool, and formed all his ideas from what he had feen performed in the field. His tyle is roughly noble, full of fire and fpirit, and there are a few prints etched by his own hand. Towards the clofe of his life he retired to the Jefuits convent at Rome, where he is faid to have taken fanctuary to rid his hands of an ill bargain he had got of a wife; but happily furviving her, he lived in great efleem and honour till after the year 1675.

BORIA, a fmall town of Spain, in the kingdom of Arragon. W. Long. 2. 2. N. Lat. 4 t. 50.

BORING, in a general lerfe, the art of perforating, or making a hole through any folid body.

Boring of Water-pipes. The method of boring wa-ter-pipes is as follows. The poles of alder, which is a very ufeful wood in making pumps, water pipes, \&c. being laid on horfes or traffels of a foot height, to reft the augre upon while they are boring, they fet up a lathe to turn the lealt end of the poles, to fit them to the cavities of the great end of the others. They turn the fmall ends of the poles about five or fix inches in length, to the fize they intend to bore the bigger ends about the fame depth, viz. five or fix inches. This is defigned to make a joint to fhut each pair of poles together, the concave part hcing the female part, and the other the male of the joint. In turning the male part, they turn the channel in it, or a frall groove at a certain diftance from the end; and in the female part they bore a fmall hole to fit over this channel. This being done, they bore the poles through ; and to prevent them from boring out at the fide, they ftick great nails at each end to be a guide in boring. It is ufual, however to bore them at both ends; fo that if a pole be crooked one way, they can bore it through and not fpoil it.

Boring, in Farriery, a cruel and abfurd method of treating a wrenched fhoulder. See Farriery Index.

Boring, in Mineralogy, a method of piercing the earth with fcooping irons, which being drawn back at proper times, bring up with them famples of the different frata through which they have paffed; by the examination of which the $\mathbb{k i l f f}$ ul mineralogif will be able to guefs whereabouts a rein of ore or a fratum

Vol. IV. Part 1.
of coal may lie, or whether it will be worth ubile to open a mine for the purpole of working it.

BORIQUEN, one of the Caribbee Illands in North America, near that of Porto Rico. The Engl: Qi formerly had a fettlement there, but were driven away by the Spaniards. It is at prefent without inhabitants, though agreeable and fertile; the air being wholeforie. and the water good. There are a great number of land-crabs, whence fome have called it Crab-Ifland. W'. Long. 64. 35. N. Lett. 18. 0.

BORISTHENES, in Ancient Geography, the largeft river of Sarmatia Europea, thus defcribed by Me. la, who copies verlatinn from Herodotus: " lit runs through a cognominal people, is the molt pleafant of all the rivers of Scythia, and calmer than all of them in its courfe, and very agreeable to drink: it feeds very rich paftures, and produces large fifh of the beft tlavour, and without bones; it comes a great way, riling foom fprings unknown; its courfe is a diftance of 40 days, and fo far is it navigable." It is now called the Drieper or Nieper.

BORKELU, a ftrong town in the United Provin. ces, in the county of Zutphen, feated on the river Borkel, in E. Long, 6. 30. N. Lat. 52.15.

BORLASE, $D_{r}$ Edmund, an eminent phyfician and Englilh writer in the ryth century, was the fon of Sir John Borlafe, mafter of the ordnance, and one of the lord juftices of Ireland in 1643 . He fludied in Dublin college, and afterwards at the univerfity of Leyden, at which laft place he took the degree of doctor of phyfic. He afterwards practifed phyfic with great fuccefs in the city of Chefter, and was incorporated doctor of the faculty in the univerfity at Oxford. Among the books which he wrote and publifhed are the following. I. Latham Spaw in Lincalhire, with fome remarkable cafes and clires performed by it. 2. The reduction of Ireland to the crown of England. 3. The Hitory of the Irih rebellion. 4. Brief reflections on the earl of Caftlehaven's memoirs, \&ic. He died after the year 1682.

Borlase, William, a very ingenious and learned writer, was of an ancient family in Cornwall, and born at Pendeen, in the parifh of St Juf, Feb. 2. 1695-6. He was put early to fchool at Per zance, and in 1709 removed to Plymouth. March 1712-13, he was entered of Exeter college, Oxford; and, June I719, took a mafter of arts degree. In 1720 , he was ordained a prieft; and, in 1722, inftituted to the rectory of Ludgvan in Cornwall. In 1732, Lord chancellor King prefented him to the vicarage of St Juft, his native parifh; and this, with the rectory aforefaid, were all the preferments he ever had. In the parifh of Ludgvan were rich copper works, which abound with mineral and metallic foffils; and thefe, being a man of an active and inquifitive turn, he collect. ed from time to time, and thence was led to ftudy at large the natural hifory of his native county. He was ftruck at the fame time with the numerous monuments of remote antiquity that are to be met with in Cornwall; and enlarging therefore his plan, he determined to gain as accurate an acquaintance : poffible with the Druid learning, and with the religion and cultoms of the ancient Britons, before their converfion to Chriftianity. In 1550 he was admitted a fellow of the Royal Society; and, in 1752 , publifhed E

## B O R

Borlale
in folio at Osford his "Antiquities of Cornwall:" a fecond edition of which was publifhed, in the fame form, at London, ${ }^{17} 69$, with this title, "Antiquities hillorical and monumental, of the county of Cornwall; confifing of feveral effays on the ancient inlabitants, Druid fuperfition, cuftoms and remains of the rooft remote antiquity in Britain and the Britifh ifles, exemplified and proved by monuments now extant in Carnwall and the Scilly illands; with a vocabulary of the Cornu-Britift language. Revifed, with feveral additions, by the author; to which is added a map of Cornwall, and two new plates." His next publication was, "Obfervations on the ancient and prefent flate of the illands of Scilly, and their importance to the trade of Great Britain; Oxf. 1756," 4to. This was the extenfion of a paper which had been read befure the Royal Society in 1753. In 1758 came out his " Natural hiftory of Cornwall; Oxf." fol, After thefe publications, he fent a variety of foffils and remains of antiquity which he had deferibed in his works, to he repofited in the Aflmolean mufeum: for which, and other benefactions of the fame kind, he received the thanks of the univerfity, in a letter from the vice-chancellor, Nov. 18.1758; and, Mirch 1766, the degree of doctor of laws. He dicd in 1772 , aged 77 years, leaving two fons out of fix, whom the had by a lady he married in 1724 . Befides his literary connexions with many ingenions and learned men, he had a particular correfpondence with Mr Pope; and there is thill exifting $\&$ large collection of letters written by that poet to Dr Borlafe. He furnithed Pope with many of the materials which formed his grotto at 'Twickenham, confiting of curious foffils; and there may at prefent be feen Dr Borlafe's name in capitals, compofed of cryftals, in the grotto. On which occafion Pope fays to Borlafe in a letter, "I am much obliged to you for your valuable collection of Cornilh diamonds: I have placed them where they may befk reptefent yourfelf, in a loade, but ßining ;" alluding to the obfcurity of the doctor's fituation, and the brilliancy of his talents. Befides the above works, he font many curious papers to the Philofophiral Tranfactions, and had in contemplation feveral - her works.

BORMIO, a county depending on the republic of the Grifons in Switzerland. It is bounded on the fouth ty the flate of Venice, on the eaft by the territory of the houfe of Aufria, and on the fouth and wefl bv Caddea. It is 15 miles over both ways; and is divited into five communitics, vizo the town of Bonrmion, the valley of Forbia, the Interior Valley, the Lower Valley, and the Vallcy of Luvino. Bormio is the only town in this diftriet; and has a governor coll. C. a p podela, fent by the Grifons to prefille in civil and crimimal uffuirs. It is frated at the contluence of the tivers $A$ ldo and Ifalacua, in E. Long. 10. 10. N. Lat. 46.45

BORNL, a market town of Lincalnflire in Englan4. IV. loong. O. 20. N. Lat. 52. 40.

Borni:n, an illand of Afia, in the Eaft Indies, and oren of the thece great Sunda in.unds. It is thought to tee the largeft illand in the world, next to New Holland; b-ing 1500 miles in circumference. It is feated funder the equator, that lific cutting it almont through the middle. It is alinoft of a circular figure; abounds

## B O R

with gold; and the fineft diamonds in the Indies are Borneofound in its rivers, being probably wathed down from the hills by torrents. Here are alfo mines of iron and tin, and loadfones. Bird's nefts * are to be bad in this * See Birds ifland, which are eatable, and reckoned a great deli- $\Lambda_{e} / f_{s}$. cacy. The beafts arc, oxen, buffalocs, deer, goats, elephants, tigers, and monkeys. This ifland has fine rivers, efpecially towards the well and fouth. In their monfoon from April to September, the wind is wefterly; and they have continual heavy rains, attended with violent florms of thunder and lightning. The rainy feafon continues for eight months of the year ; and as during that time all the flat country near the coaft is ovetlowed, the air is rendered very unhealthful, and the inhabitants are forced to build their houfes on floats, which they make faft to trees. The houfes have but one floor, with partitions made with cane; and the roofs are covered with palmetto leaves, the eaves of which reach within four or five feet of the bottom. The welt and north-eall fides of the illand are almof defert, and the ealt is but little known. The inland parts are very mountainous; and the foutheaft, for many leagues together, is a flinking morals, which, being overflowed in the wet feafon, is very unhealthy.

The Portuguefe, who firl difcovered Borneo, had arrived in the Indies above 30 years before they knew any thing of it more than the name, and its fituation, by reafon of their frequently paffing by its coant. At laft one Captain Edward Corril had orders to examine it more natrowly; and bcing once acquaisted with the worth of the country, they made frequent voyages thither. They found the coafts inlabited by Malayan Moors, who had certainly eflablithed themfelves there by conquell ; but the original inhabitants fill remain. in the mountains, and are Ayled Beajus, which in the Malayan language fignifies a wild man. The mon authentic account of thefe people is the following, which was extracted from the papers of Father Antonio Ventimiglia, an Italian mifinonary. He was fent to Borneo from Macao, on board a Portuguefe flip, converted great numbers to Chriftianity, and died on the ifland about the year 1691. The Beajus have no kings, but many little chiefs. Some are fubject to the Moorifh kinge, and pay them tribute; but luch as live far up the country are altogether independent, and live according to their own cuftoms. They are generally very fuperilitious, and nuch addicted to augury. They do not adore idols; but their facrifices of fiveet wood and perfumes are offered to one God, who, they believe, rewards the juft in heaven, and punifbes the wicked in hell. 'They marry but one wife; and look upon any breach of conjugal laith, either in the man or woman, as a capital ollence. The Beajus are naturally honelt and indullious, and have a brotherly affection for one another. They have a notion of property, which yet does not render them covetous. They low and cultivate thair lands; but in the time of harveft, each reaps as much as will ferve his family, and the refl belongs to the tribe in common; hy which means they prevent necefflyy or difputes. With the Moars on the coalts the l'ortuguefe for fome time carried on a confider.able trade, and at their requeft fettled a fictory there; which, however, was afterwards furprifed and plundered by the Mooors, who put moll of

## B O R

Enonhola, the people to the fword. The mon confidetable river $\underbrace{\text { Bornout, in Porneo is called Banjar, at the nouth of whichour }}$ Eaft India Company have a factory.

BORNHOLM, an illand in the Baltic fea, to the fouth-eall of the province of Schonen in Sweden. It is twenty-one miles in length, and above thirteen in breadth. It has three confiderable towns, Rattum, Sandwick, and Nexia; with a great number of villages; and is fertile and populous. It was conqquered by the Swedes in 1658 : but the inhabitants, under the conduct of Jens Roefods, voluntarily furrendered it to the king of Denmark, on account of the bad ufage they received from the former. $\ln 16_{7} 8$, a body of 5000 Swedilh troops, in their paflage from Pomerania to Sweden, being flipwrecked on this illand, fuch of them as remained were made prifoners of war. The inhabitants defend the illand by their own militia, without any expence to the crown. The commandant or governor refides at Rattum. E. Long. 14. 56. N. Lat. 55.15.

BORNOU, a kingdom or province of Zaara in Africa, extending from 12 to 22 degrees of ealt longitude, and from $t y$ to 21 degrees of north latitude. The northern part is poor, and like the reft of the provinces of Zaara: but all the rell is well watered by fprings and rivers that tumble down with a dreadlul noife from the mourtains; rendering the country prolific in corn, grafs, and fruits, and giving it a pleafing afpect. The eaftern and weftern frontiers are divided into mountains and valleys, the latter being all covered with flocks of cattle, fields of rice and millet, and many of the mountains with wood, fruit-trees, and cotton. On the north-weft flands the mountain of Tarton, having plenty of good iron mines; and on the fouth flows the river Niger, which, it is faid, after running a great many leagues under a long chain of mountains, rears up its head again, and mingles its 1treams with the waters of the lake Bornou in its courfe, from whence it wathes the walls of the capital of this kingdom. The compilers of the Univerfal HiIlory, however, are of opinion, that in thefe mountains the river Niger hath its fource, becaufe no river hath been traced to the eaftward, except the Nile, which runs in a different courfe from north to fouth, and the White river, on the weftern frontiers of Abylfrnia, which is a branch of the Nile. 'The eaflern and welters parts of Bornou are inhabited by a pcople of a roving difpofition, who live in tents, and have their women, children, and every thing elfe, in common; the word froperty, or any idea equivalent to it, being utterly unknown among them. 'They have neither religiun, laws, government, nor any degree of fubordination; and hence they have been fuppofed by Cluverius to be the lineal defcendents of the ancient Garamantec, and this to have been the refidence of that people. In thefe parts, the natives are almoft to a man heepherds and hutbandmen. In fummer they go naked, except a thort apron before; but in winter they are warmly clothed with the foftefl theep Akins, of which they alfo form their bedclothes; and indeed this is farce a futficient defence againft the inclemency of the weather at certain feafons of the year, when a coid piercing wind blows from the northern mountains that chills the blood in proportion as the pores of the body bave been opened by the fcorching heats of fummer.
3. ] B O R

Baudrand and Draper allirm, that the natives are fearce Boromeus fuperior in their undertanding to bsutes; not cven having any names whereby to diflinguith each other, एorough. except what they take from lome perfonal defect or fingularity; fuch as lean, fat, iquinting, humpbached. \&c. In the touns, however, it is acknowleged that they are fomething more civilized and poli'e, erfig many of them merchants; but of thefe towns, or indeed of the kingdom in general, very little is known.

BOROMAEUS. See Lorromeus.
BORONLUN, St, an ilhand in the Atlantic o. cean, mentioned by fome writers, particularly Liafo chotten, in their defcription of the Canary ifland., as fomething fupernatural. It is laid to be about 100 leagues diftant from Ferro, probably welt, though no writer has pretended to lay down its exaet fruation. Here it is aflirmed feveral hips have touched by accident, and all agree in their relation of the llate of the intrabitants and ifland. I'hey alfirm, that it is perpetually clothed with a great vantety of wood, chiefly fruit-trees: that the valleys are in a perpetual flate of verdure; and continually decked with tlowers, grafs, and plants, the fontaneous productions of the carth; or with corn and pulfe, cultivated with great care by the inhabitants : that the foil is fo prolific as to taife large quantities of corn for exportation; and that the dhips that call here never fail of meeting with refrefh. ments of every kind. It is faid to be peopled by ChriAians, who have a language of their own, apparently combined of a variety of modern langu..ges; for, lay they, whoever underftands the European tongues may make mift ta hold converfation with this people. It is remarkable, that no fhips, exprefsly fent upon this difcovery, werc ever furtunate enough to fall in with the ifland of St Burondon, though the Spatiards have feveral times attempted it from the Canaries. Hence it has been called the marvellous ifland; and hence indeed we may conclude, either that it exills wholly in imagination, or at lealt that it is furrounded with fuch currents as inlenfibly carry fipips out of their courfe, and prevent their meeting with it. Some writers affirm that it actually difappears upon certain occafions, and fhifts its pofition : while others, with more appearance of truth, allege, that it is frequently overcaft with thick and impenetrable clouds, which occadiun the difappointment of all the adventuress who have gone in fearch of it.

BOROUGH, Burrough, Borow, or Burgb, is frequently ufed for a town or corporation which is not a city.

Borough, in its original Saxon lorge, or lorgh, is by fome fuppofed to have been primarily meam of a tithing or company confifing of cen families, who were bound and combined together as each others pledge. Afterwards, as Verftegan intorms us, bnrough came to fignify a town that had fomething of a wall or inclofure about it : fo that all places which among our anceftors, had the denomination borough, were one way or other fenced or forlified. But, in latter times, the fame appellation was allo belluwed on feveral of the villa infigniores, or country towns of more than ordinary note, though not walled.

The ancient Saxons, accurding io Spelman, gave the name burgh to thole call. $d$, in otier cuuntric:, cities. But divers canons being made fur removirg the

## B O R <br> $B \quad 0 \quad R$

epifcopal fees from rillages and fmall towns to the chief cities, the name city becante atteibuted to epifcopal towns, and that of borough retaincd to all the rell; though thefe too had the appearance of cities, as being governed by their mayor, and having laws of their own making, and fending reprefentatives to parliament, and being fostified with a wall and cafte, and the like.

Borovgr, or burgh, is now particularly appropriated to fuch touns and villages as fend burgeffes or reprefentatives to parliament. Buroughs are equally fach, whether they be incorporate or wot ; there being great numbers of our Englifh boroughs not incorporated; and, on the contrary, feveral corporations that are not boroughs; e. gr. Kington, Deal, Kendal. \&c.

Boroughs, in Scotland. See Law.
Royal Borovges, in Scotland, are corporations made for the advantage of trade, by charters granted by fcveral of their kings; having the privilege of fending commifioners to reprefent them in parliainent, befides other peculiar privileges. 'T.ee royal boroughs are not only fo many diftinet corporations, but do alfo conllitute one entire body, governed by, and accountable to, one general court, anciently called the court of four boroughs, held yearly to treat and deternine concerning matters relating to the common advantage of all boroughs. The four boroughs which compofed this court were, Edinburgh, Stisling, Roxburgh, and Berwick; which two laft falling into the hands of the Englifh, Linlithgow and Lanark were put in their places; with a faving to the former whenever they thould return to their allegiance. But this court not being fufficient to antwer the neceflaties of the royal boroughs, they were all emporvered under James Ill. in 1487 , to fend commiffioners to a ycarly conventian ef their own, which was then appointed to be held at Inverkeithing, but is now held at Edinburgh, under the denomination of the convention of borouphs, vefted with great power, and having for their object the benefit of trade, and the general intereft of the boroughs.

Boкоисн-Courts, are certain courts held in boroughs, by prefcription, charter, or act of parliament : fuch are the fheriff's court, and court of huftings, in Londan.

Borougn Englifs, a cuflomary defcent of lands or tenements, in fome ancient boroughs and copyhold manors, by which the youngeft fon, and not the eldefl, fucceeds to the burgage renement on the death of his father. For which Littleton gives this reafon; becaufe the younger fon, by reafon of his tender age, is not fo capable as the refl of his brethren to help himfelf. Other authors have indeed given a much flranger reafon for this cuftom; as if the lord of the fee had atciently a right to break the feventh commandment with his tenant's wife on her wedding night; and that therefore the tenement defcended, not to the elden, but to the youngs, fon, who was more certainly the offepring of the tenant. But it cannot be proved that this cufom ever prevailed in England, though it certainly did in Scotland, (under the name of mercheta, or marcheta), till abolithed by Matcolm III. But perbaps a more rational account than either may be brought from the practice of the Tartars; among
whom, according to Father Duhalde, this cuftom of Eoroughdefcent to the youngelt fon alfo prevails. That nation head is compofed totally of fthepherds and berdfmen; and Borromeus. the elder fons, as foon as they are capable of leading a $\underbrace{\text { Borromeus. }}$ paftoral life, migrate from their father with a certain allutment of cattle, and go to feek a new habitation. The youngeft fun, therefore, who continues lateft with his father, is naturally the heir of his houfe, the re? being alieady provided for. And thus we find, that among many other northern nations it was the cultom for all the fons but one to migrate from the father, which one became his leeir. Su that poffibly this cufrom, wherever it prevail, may be the remnant of that paftoral flate of the ancient Britons and Germans which Cxliar and Tacitus defcribe.

Borovgh-bead. or Head lorough, called alfo boroughhoider, or burgolder, the chief man of the decenna, or hundred, choten to fpeak and act in behalf of the seft.

Head-borcugh alfo fignifies a kind of head conitable, where there are feveral chofen as bis affiftants, to ferve warrarits, \&c. See Constable.

BOROUGHSRIDGE, a town in the north riding of Yorkthire in England, feated on the river Your, over which there is a handfome fone bridge. The town is not large, but commodious, and lends two members to parlament. W. Long. 1. 15. N. Lat. 54. 10.

BOROZAIL, or the zeal of the Ethiopians, a difeafe epidemic in the countries about the river Senegal. It principally affects the pudenda, but is different from the lues venerea. It owes its rife to exceflive venery : in the men this diftemper is called $a f a b$, in women affaturs.
borrachio. See Cautchouk.
borrage. See Borago, Botany Index.
BORRELIISTS, in church-hifory, a Chriftian feet in Holland, fo denominated from their founder Borrel, a perfon of great learning in the Hebrew, Greek, and Latin tongues. They reject the ufe of the facraments, public prayer, and all other external nets of worlhip. They affert, that all the Chriftian churches of the world have degenerated from the pure apoflolical ductrines, becaufe they have fuffered the word of God, which is infallible, to be expounder, or rather corrupted, by doctors who are not infallible. They lead a very auftere life, and employ a great part of their goods in alms.

BORRICHIUS, one of the mol learned men of his age, the fon of a Lutheran minifier in Denmark, was born in 1626. He applied himfelf to phyfic in the univerfity of Copenhagen, and began to practife during a mof terrible plagoe that made great havoc in that city. He travelled : but before his departure, in 1660, he was appointed proteffor in poetry, botaly, and chemillry; and at his return dilcharged his dutics with great afliduity, of which the works he publifted affurd full proof. He was railed to the office of counfellor in the fopreme council of juflice, in 1686 ; to that of coundellor of the royal chancery, in 1689 ; and died of the operation for the flone, in 1690 . He publithed, 1. Lingua pbarmacopcorum. 2. Differtationes de poencis Giracis et Latmes. 3. De ortu et progrefir chey'e; and leveral other woaks.
bORKOMEUS, St Charles, cardinal, and archbilhop

Borromeus. bifhop of Milan; a perfonage of great note in the Romifh kalendar, and whofe fincere piety, fimplicity of manners, and zeal for reformation, render him indeed a character equally interefting and inftructive to the members of any church. He was the fon of Gilbert Borromeus count of Arena and of Mary of Medicis, and was born at the caftle of Arona upon Lake Major in the Milancle, in Ottober $153^{8}$. Wher he was about 12 years old, Julius C $\mathfrak{i}$ far Borromeus refigned an ahbacy to him of a confiderable revenue, which was confidered as an hereditary inheritance of the family; which Charles accepted, but applied the revenue whol. ly in charity to the poor. Having acquired a fufficient knowledge of the languages at Milan, he Mudicd the civil and canon law at Pavia, where he lived like another Lot in Sodom, preferving his innocence among a thoufand fnares by which it was endangered. He received great adrantage from the company and converfation of Francis Alciat, one of the moft learned men of the age, for whom he afterwards procured the purple. He would accept no new benefice but upon condition that he fhould be at liberty to apply the revenue to public ufes. In the year 1557 , Charles being then 16 years old, his father died, an event which brought him back to the caftle of Arona; where, though he had an elder brother, Count Frederick, he was requefted by the family to take upon him the management of the domeltic affairs, to which at length he confented.

After fome time he returned again to his fudies, which, in the year 1559, being then jull 21 , he finilhed by a folemn aet, and took his doctor's degree. The promotion of his uncle to the pontificate, by the name of Pius $I V$. which happened the year following, feeme 1 to have very little effed upon him; but he was very foon made pronotary, and entrunted both with the public and privy feal of the ecclefiaftical Atate: he was alfo, at the fame time, created cardinal deacon, and foon after archbithop of Milan. In obedience to the will of his uncle the pope, he lived in great fplendour, having a brilliant retinue and a great number of domeftics; yet his own temperance and humility were never brought into quetion. In order to render even his amuements ufeful, he eftablithed an academy of felect and learned perfors, as well ecclefialtics as laics, from among his houfehold and dependanti, who were employed in fome exercife which tended to infpire a love of virtue, and to form a jufl tafie. Each of them was to write on fome chofen fubjeef, either in verfe or in profe, and to communicate to each other in frequent conferences the fruits of their Atudies. The works produced by this fociety have been publifted in many volumes, under the title of Notzes Vaticrnes, becaule thefe ufeful affemblies were held at the Vatican, and at night, after the bufinefs of the day was over. About this time Charles alfo formed a defign of founding a college at Pdvia, which flould at the fame time be a fchool of fcience and an afvlum from the vices and vanities of the world. In profecution of this defign, he raifed a large edifice upon the foundations of feveral houfes which belonged to the fanily of Burromens in that city; he obtained from the pope fereral benefices, which he attached to his building; he provided it with all things neceffary for the you:g
fcholars out of his own revenue; and he dedicated his Borromeus. college to St Julina virgir and martyr.

Upon the death of his only brotlier Frederick, his relations, his friends, and even the pope himfelf, adviled him to change his fate, to quit the church, and marry, that his family might not become extinet. Charles, however, contrary to this advice and the expectations of the world, received the priefthood, and addreffed the pope in thefe terms: "Do not complain of me, Holy Father, for 1 have talien a fpoufe whom I love, and on whom my wifhes have been long fixed." From this time he became more fervent in exercifes of piety and ecclefraftical knowledge: He perceived that fome literati who had departed from the faith had alfo corrupted the writings of fome holy doctors of the church, and be thought he fhould render religion good fervice if he could rettore the get tine reading: He therefore employed Achilles Statius, a Portuguefe of great learning, in this work, whom for that purpofe he retained at Rome. To his zeal and attention alfo is cwing the congregation of eight cardinals, fill fubfifting, to refolve doubts and obviate difficulties which frould arife in explanations of the council of 'Trent.
'Ihere was a very intimate friendthip between Bor. romeus and Don Barthelcmy des Martyrs archbilhop of Prague, and author of a work entitled Stimulus Paflorum. This work talling into Borromeus's hands gave him an earnef defire to become a preacher, as he was now convinced that preaching was one of the principal duties of a prelate. An almoft inconceivable multiplicity of bufinefs, ill health, a feeble voice, and a difficult promuriciation, were no inconfiderable objections to his defign, yet be furmounted them all; and though his beginnings were weak, yet perfeverance crowned them with fuccefs.

Having obtained permiffion to vifit his church, which the pope had hitherto refufed as he found his prefence neceflary at Rome, he prepared to fet out for Milan. He had before fent thither his grand ricar Ormanetus, whofe labours at firf had not been unfucceffful, but who foon found oppofitions fo pertinacious and obitinate as put an end to his hopes: Borromeus therefore faw the necellity of going in perfon, and he was received with the moft dillinguilhed honours. He was, however, foon recalled in Rome, where many things made his prefence nectflary: the pope was gradually dying; and Charles arrived juft time enough to adminiter to him the laft facraments.

Pius IV. died on the 7 th of January 1566 , and 28 days afterwards Cardinal Alexaudrine monnted the papal chair, and affumed the name of $P$ ius $I$. the dkill and diligence of Borromeus having contributed not a little to prevent the cabals of the conclave.

As foon as this event had taken place, and all was quiet at Rome, Borromeus gave himfelf wholly up to the reformation of his diocefe, where the moft flagitious irrcgularities were openly practifed, having first made another reform in his own family. He began by m-king paftoral vifits in his metropolis, where the canons were bot diftinguifled for the parity of their manners. He foon reflored proper decency and dig. nity to divine fervice, by a variety of wile and necelfary regulations: In conformity to the decres of the council of 'I'rent, he cleared the cathedsal of many
nompous

$$

Borromeur pompous tombs, rich ornaments, banners, arms, and in general of all the trophies with which the vanity of man had disfigured the houfe of God; and in order to give a lanction to his zeal by his example, he fpared not the monuments of his neareft relations. Nor did lis zeal ftop here: he divided the nave of the church through its whole length into two parts, by frong thick planks, that the two fexes, being leparated, might perform their devotions without any attention to each other, and with a modefty and recollection more fuitable to the place.

This paftoral care cxtended from the cathedral to the collegiate churches, and even to the fraternities or focieties of penitents, particularly that of St John the Baptift. The duty of this fociety was to attend criminals to the place of punifiment, to affif, comfort, and prepare them for death; but the fpirit of the inflitution was now forgotten, and the wretches who were condemned to death were commonly dragged to execution like beafls, without any firitual affiftance or confolation. But the archbifhop revived the original fervour of this order, in the exercife of their peculiar duty, and perfuaded many of the nobility and principal perfons of the city to lecome members of a fociety appropriated to fo eminent a branch of Chriftian charity. The reformation of the monafteries followed that of the churches, and the vigilance of the paflor fuon extended itfclf from the city to the country round it, which abounded with irregularities that required his correction. The great abufes and irregularities which had overrun the church at this time arofe principally from the grofs ignorance of the clergy; in order therefore to attack thefe evils at their root, Charles eftablifted feminaries, colleges, and communities, for the cducation of young perfons intended for holy orders. He met with many difficulties, and much oppofition in his endeavours to bring about a reformation of manners; but he prevailed againf every obftacle by on inflexible connancy, tempered with great fweetnefs of manners.

The governor of the province, and many of the fenators, were apprehenfive that the cardinal's ordinances and praceedings would encroach upon the civil jurifdiciot, and become inconfiftent with the rights of his Catholic majefty, to whom the duchy of Milan was then in fubjection. And this was a fruitful fource of remonftrances, reprefentations, and complaints, which long troubled the courts of Rome and Madrid, and wlich the king of Spain, Philip II. refericd entirely to the decifion of the pope. But Borromens had a more formidable oppofition to ftuggle with, that of feveral religious orders, particulatly the Brothers of Hanility. Three provefts of the fociety entered into a confpiracy to cut him off; and one of their confederates, called Ferum Donat, whofe furname was Farina, took upon him to carry the defign into execution. For this purpofe he mixed with the crond that went into the archiepilcopal chapel, where the cardinal fpent an hour every cevening in prayer with his domeRices and other pious perfons; and having watched his opportunity, he fired a largucbufs at him, which was loaded with a ball fuited to the bore of the piece, and with a confideratle charge of leaden ftot. It is faid that the ball ftruch lim on the fpinal bone, but fell down it his feet without doing any other damage than foil-
ing his rochet, and that one of the flot penetrated his Eotromeus. clothes to the 1 kin, and there fopped, without imprinting any wourd, which was confidered as a miracle, efpecially as the other frot tore away part of a wall, and wemt quite througl a table.

In the year 1576 , the city and diocefe of Milan were vifited by the plague, which fwept away incredible numbers; and the behaviour of Borromeus, on this occafion, was truly Chriftian and heroic: He not only cuntinued on the fpot, but he went about giving directions for accummodating the fick, and burying the dead, "ith a zeal and attention that were at once ardent and deliberate, minute and comprehenfive : and his example ftimulated others to join in the good work. He avoided no danger, and he fpared no expence; nor did he content himfelf with eftablihing proper regulations in the city, but went out into all the neigh. bouring parifies where the contagion raged, diftributing money to the poor, ordering proper accommodations for the fick, and punithing thofe, efpecially the clergy, who were remifs in the duties of their calling. Charles, notwithftanding the fatigue and perplexity which he fuffered by thus executing his paftoral charge, abated nothing of the ufual aufterity of his life, nor omitted any of his ftated devotions; for, whatever approached to luxury or magnificence, he confidered as incompatible with the propricty of his character. It happened, that being once on a vift to the archbilhop of Sienna at his palace, a very fumptuvus entertainmont was provided for him. Borromeus, though be had been ufed to content himfelf with bread and water, yet fat down at the table, where however he ate but little, and gave fufficient intimation that he was much difpleafed with fuch oftentatious prodigality; but what was his furprife when he faw the table again covered with a deffert, confifting of whatever was moft rare, exquifite, and coftly! He inmediately rofe hafily from his feat, as if he had fuddenly recollected fome preffing bufinefs, and gave orders for his departure, notwithftanding the rain, and the moft earnett entreaties of the archbihop. "My Lord," faid the cardinal, " if I ftould tarry here to-sight, you would give me another fuch treat as that I have jufi feen, and the poor will then fuffer another lofs, great numbers of whom might have been fed with the fuperfluities that have been now let before us."

I'he continual labours and autterities of Borromeus naturally fhortened his life ; he went to Vercal to put an end it polfible, to the divifions which threatened the moff fatal confequences ; and, when he was there, he received a meflage from the duke of Savoy, requefting bis prefence at 'Turin. from Turin he retired to a place called the Sepulcbore, on the mountain Varais, where he was feized with a intermitent fever, which farce permitted him to return alive to Milan, where he anived on the 3 d of Novenber 1584, and died the next day. He was lamented by the city and the whole province with fuch maks of fincere formes as ate rarely feen; and he was immediately wothipped as : laint without waiting for the pope's approbation. The pope, however, when he was told of it by Cardinat l3aronius, gave directions that the devotion of the people thould not be reftrained, though Borromeus was nut canonized till the 1 ft of November 1610 , in the pontificate of Leo XI. Since that time many

Eorromous, churches and chapels have been erected in honour of Borrowing. this faint, and many religious focieties inflitutcd and put under his protection.

The foregoing particulars are extracted from an account of the life of Borromeus, written fome years ago by Father Anthony Touron. Upon a comparifon of this life with that written by Ribadeneira a Spanifh Jefuit above a century ago, it appears that the improvement of knowledge has made a very litiking difference in this kind of biography. Ribadeneira, who lived in the midit of ignorance find fuperllition, did not fufpect that the time was at: hand when the incredible and ridiculous fables the recites could not be believed: his life of this faint therefore abounds with particulars which Touron his juftly omitted. We are told that a miraculous light was feen over the chamber of Borromeus's mother when the was in labour: 'That Borromeus, feeing two perfons carried violently down a rapid river on their horfes, and juft ready to perifh, caufed their horfes fuddenly to leap with them out of the water, by giving them his benediction: That Octavian Varefe, a gentleman of Milan, who was confined to his bed by ficknefs, when Barromens died became inftantly well, by recommending himfelf to the faint's interceffion. That a daughter of Julius Bonaciria was inflantly cured of a diforder in her eye, which had taken away the fight of it, by performing an act of devotion in honour of this faint: That a count of Ferrara was inflantly feized with a violent difeafe upon fpeaking irreverently of Borromeus's picture, but was cured upon confeffing his fault. It would certainly be a work of infinite fervice to the Romifh church, to new-write the lives of her faints in fuch a manner as can now be believed, fince the lives already written might by that means be gradually fuperfeded, which are a better antidote againf Popery than the arguments of the beff reafoner in the world.

Borrowing and Hiring, in Laze, are contrachs by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or itipend, or additional recompenfe; borrowing is merely gratuitous. But the law in both cafes is the fame. They are both contracts, whereby the poffelion and tranfient properiy is transferred for a particular time or ufe, on condition and agrecment to reftore the goods fo hired or borrowed, as fors as the time is expired or the ufe performed, together with the price or flipend (in cafe of hiring) either exprefly agreed upon by the particc, or left to be implied by law, according to the value of the fervice. By this mutual contract, the hircr or borrower gains a temporary property in the thing hired, accompanied with an implied condition to ufe it with moderation, and not to abule it ; and the owner or lender retains a reverfionary interell in the fame, and asquires a new property in the price or reward. Thus, if a man hires or borrows a horfe for a month, he has the pofieflion and a qualified property therein during the period ; on the expiration of which his qualified property determines, and the owner becomes (in cafe of hiring) ertitled alfo to the premium or price for which the horfe was hired.

There is one fpecies of this price or reward the moft ufual of any, but concerning which many good and learned men have in former tines very much perplexed
themfelves and other people, by raifing doubts abour its legality in foro confocicntic. 'That is, when money is lent on a contract to receive not only the irincipal fum again, but alfo an increafe by way of compenfation for the ufe, which is gencrally called interef by thofe who think it lawful, and ufury by thofe who do not fo. But as to this, fee the article Interest.

BORROWSTOIVNESS. Sce Burrowstow. ness.

BORSEHOLDER, among the Anglo-Saxons, one of the loweft magiftrates, whofe authority extended only over one free burgh, tithing, or decemary, confifting of ten families. Every freeman who wifted to enjoy the protection of the laws, and not to be treated as a vagabond, was under the neceffity of being admitted a member of the tithing where he and his $\mathrm{fa}_{\mathrm{a}}$ mily refided; and in order to obtain this admiffion, it was as neceffary for him to maintain a gnod reputation ; becaufe all the members of each tithing being mutual pledges and fureties for each other, and the whole tithing fureties to the king for the good behaviour of all its members, they were very cautious of admitting any into their focicty who were of bad or doubeful characters. Each tithing formed a little fate or commonwealth within itfelf, and chofe one of its molt refpectable members for its head, who was fometimes called the alderman of fuch a tithing or freeburgh, on account of his age and experience, hut moft commonly borfebolder, from the Saxon words horh, "a furety," and alder, "a head or chief." This magiffrate had authority to call together the members of his tithing, to prefide in their meetings, and to put their fentences in execution. The members of each tithing, with their tithing-man or borfeholder at their head, conflituted a court of jullice, in which all the little controverfies arifing within the tithing were determined. If any difpute of great difficulty or importance happened, or if either of the parties was not willing to fubmit to a fentence given in the tithing-court, the caufe was referred or appealed to the next fuperior court, or court of the hundred.

BORSET, or Borsett, celebrated for its baths, a place about half a league from Aix-la-Chapelle in Germany. The abbey here is a very magnificent pile of building. It was formerly a monaftery; but ferves for a numery, whofe abbefs is a princefs of the empire, and lady of Borfet. The waters are warm, and of the nature of thofe of Aix-la-Chapelle; but they are o:tly ufed as baths for the difeafes in which the waters laft mentioned are recommended, and alfo in dropfical and oedematous cafes. The waters are diftinguifherl into the upper and lower fprings. The former ween found by Dr Simmons to raife the thermometer to $15 \varepsilon^{\circ}$; the latter to only $127^{\circ}$. All the baths are fupplied by the firl. Dr Simmons obferved, that thefe waters were much lefs fulphureous than thofe of Aix-la.Chapelle, probably on account of thcir greater heat. He likewife found that they abounded much with lelenites, which incruft the pipe through which the water paffec, and likewife the fides of the bath.

BORYSTHENES. See Borithfaes.
bos, John Baptist du, a celebriscd author and member of the French academy, was born at Beauwais in 1670 , and fanithed his Italies at the Sorbonne. In 1695, he was madic one of the commitiee for foreign

Borron:
affairs under Mr Torez; and was afterwards charged with fome important tranlabtions in Englatid, Germany, Holland, and Italy. At his return to Paris, he was handfomely preferred, made an abbé, and chofen perpetual fecretary of the Frencl academy. IHe was the author of feveral excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols 12 mo . 2. The hiftory of the four Gordians, cunfirmed and illuftrated by medals. 3: A critical hiftory of the eftabliftment of the French monarchy among the Gauls, 2 vols 4 to, 4 vols 12 mo . He died at Paris on the $\mathbf{2 3 d}$ of March 1742.

Bos, Lewis Ganfin, an efteemed painter, was born at Bois-le-Duc. Having been carefully inftructed in the art of painting by the artifts of his native city, be applied himfelf entrely to ftudy after nature, and rendered himfelf very eminent for the truth of his colouring and the neatnefs of his handling. His favourite fubjects were flowers, and curious plants, which he ufually reprefented as grouped, in glafles, or vales of cryftal, half filled with water; and gave them fo lively a look of nature, that it feemed fcarce poffible to exprefs them with greater truth or delicacy. It was frequent with this mafter to reprefent the drops of dew on the leaves of his objects, which he executed with an uncommon tranfparence; and embellifhed his fubjects with butterflies, bees, wafps, and other infects, which, Sandrart faye, were fuperior to any thing of that kind performed by his cotemporary artilts. He likewife painted portraits with very great fuccefs; and fhowed as much merit in that fyle as he did in his compofitions of fill life. He died in 1507.

## Bos. See Mammalia Index.

Bos, in antiquity, was peculiarly ufed for an ancient Greek filver coin, which was didrachmus, or equivalent to two drachms. It was fo called as having on it the impreffion of an ox, and chiefly obtained among the Atherrians and Delians; being fometimes alfo ftruck of gold. From this arofe the phrafe Bos in lin. gua, applied to thofe who had taken bribes to hold their tongue.

BOSA, a maritime town in the weftern part of the Ifland of Sardinia, with a caftle, a good port, and a bilhop's fee. It is feated on the river Bofa, to the north.eaft of an ifland of the fame name; and has good falt pits. E. Long. 8. 30. N. Lat, 40, 19.

BOSCAGE, the fame with a grove or thicket.
Boscace, in a law fenfe, is that food which trees yield to cattle; as malt, \&c. But Manhood fays, to be quit of bofeage is to be difcharged of paying any duty for windfall wood in the foreft.

Boscage, among pailiters, denotes a landfeape reprefenting much wood and trees.

BOSCAN, Jons, a Spanifly poct of the 16 th century, born at Barcelon?. He was the friend of Garcilafo de Vega, another Spanifl poet. Thefe two were the firt who made any great improvement in the poetry of their nation, and their pieces were printed together. Bofcan, who died about the year 1542, principally fucceeded in fonnets.

BOSCAWEN, EDWARd, a brave Britifh admiral, was the fecond fon of Huyh late lord vifcount lial. mouth. Having early entered into the navy, be was, in 1740, captain of the Shoteham; and behaved with
great intrepidity as a volunteer under Admiral Vernon, at the taking of Purto Bello. At the fiege of Carthagena, in March 1/42-1, he had the command of a party of feamen who relosetely attacked and took a battery of 16 twenty-four pounders, though expofed to the fire of another fort of five guns. Lord Aubrey Beauclerk being killed at the attack of Boca-Chica, Captain Bofeawen fucceeded him in the command of the Prince Frederic of 70 guns. In May 1742, he returned to England, and married Frances daughter of William Glanville, Efq; and the fame year was $\epsilon$ lected reprefentative for Truro in Cornwall. In 1744, he was made captain of the Dreadnought of 60 guns; and foon after he took the Medea, a French man of war commanded by M. Hoquart, the firf king's fhip taken in that war. May 3.1747, he fignalized himfelf under the admirals Anfon and Warren, in an engagement with the French fleet off Cape Finifterre, and was wounded in the fhoulder with a mufket ball. Here M. Hoquart, who then commanded the Diamond of 56 guns, again became his prifoner ; and all the French flhips of war, which were ten in number, were taken. On the 25 th of July he was made rearadmiral of the blue, and commander in chief of the land and fea forces employed on an expedition to the Eal Indies; and, on the 4 th of November, failed from St Helen's, with fix thips of the line, five frigates, and 2000 foldiers. On the 29 th of July 174S, he arrived at St David's, and foon after laid fiege to Pondicherry; but the men growing fickly, and the monfoons being expected, the fiege was raifed, and $\mathrm{Mr}_{5}$ Bofcawen fhowed himfelf as much the general as the admiral in his retreat. Soon atter he had news of the peace, and Madrafs was delivered up to him by the French. In April 1750, he arrived at St Helen's in the Exeter, and found that in his abfence he had been appointed rearadmiral of the white. He was the next ycar made one of the lords commiffioners of the admiralty, and chofen an elder brother of the Trinity-houfe. In February 1755, he was appointed vice-admiral of the blue. On the 9 th of April, failing in order to intercept a French fquadron bound to North America, he fell in with the Alcide and Leys of 64 guns each, which were both taken : ont this oceafion M. Hoquart became his prifoner a third time, and he returned to Spithead with his prizes and 1500 prifoners. In 1756, he was appointed vice-admiral of the white; and in 1758 , admiral of the blue, and commander in chief of the expedition to Cape Breton; when, in conjunction with General Amheift, and a body of troops from New England, the important fortrefs of Louifoourg and the whole ifland of Cape Breton was taken, for which he afterwards received the thanks of the houfe of commons. In 1759, being appointed to command in the Mediterranean, he arrived at Gibraltar, where hearing that the Toulon fleet. under M. de la Clue, had paffed the Straits, in order to join that at Breft, he got under fail, and on the 18 th of Augult faw, purfued, and engaged the enemy. His fhip, the Namur of 90 guns, lofing her main-malt, he flifeed his tlag to the Newark; and, after a flarp engagement, took three large flips, and burnt two in Lagos bay, and the fame year arrived at Spithead with his prizes and 2000 prifoners. On December 8. 1760, he was appointed
B
gencral of the marines with a falary of 30001 . per annum, and was alfo fworn one of the privy-council. He died in 170:.
bosch, Jacob Vanden, a painter of lill life, was born at $\Lambda$ milerdam, in 1635 , and painted fummer fruits of various kinds, peaches, pears, apples, plums, nectarines, and cherries, with extraordinary neatnefs of pencil. He painted all his objects after nature, and imitated every fort of fruit with fo great truth and delicacy, with fuch natural and tranfparent colour, that they appeared delicious, and almoft real. He died in 1676 .

BOSCHAERTS, Thomas Willeborts, a celebrated painter, was born at Bergen-op-zoom ; and, like the great painters who flourifhed at that time, began to draw, when very young, in the booksthat were intended for other fudies. Preferring his pencil to every thing elfe, he drew his own pifture, by his refemblance in a looking-glafs, fo like, that thofe who faw it were aftonifhed. This he did before he had the leaft inftruction from any one, and when he was only 12 years of age. Upon this his parents fent him to a mafter, that he might follow the bent of his genius; but his firt mafter being only an indiferent painter, and incapable of fatisfying his earneft defire of learning, he left him, and engaged himfelf with Gerard Segers; under whom, after four years practice, he proved a molt accomplifted artift. Antwerp being at that time the feat of arts, where there was a cortfux of the mof eminent painters, he thought it the fittelt place for his improvement; and there executed fuch a number of noble pieces as added greatly to the \{plendour of that wealthy city. In $16{ }_{42}$, Henry Frederic prince of Orange, and his fon Prince William, employed him in their fervice; in which he continued feveral years, and made thofe excellent pieces that are to be feen in that prince's palace at the Hague and other parts of Holland, and painted portraits for moft of the perfons of quality that were then living. He died in the flower of his age, in 1670.

BOSCO, or Boschi, a town of Italy, in the Milanefe, feated on the river Orbe. E. Long. 9.44. N. Lat. 44. 53.

BOSCOI, or Boscr, in ecclefiaftical hiftory, denotes a fpecies or tribe of monks in Paleftine, who fed on grafs like the beafts of the fields. The word is Greek, Booxoo, q. d. "grazers;" formed from Booxa, pafco, "I feed." The Bofcoi are ranked among the number of Adamites, not fo much on account of their habit, as food. They took no care about provifion; but when eating-time came, or any of them was hungry, went into the fields, with each his knife in his hand, and gathered and ate what he could find.

BOSCOVICH, Roger Joseph, the founder of an original and fublime theory of natural philofophy, deferves to be particularly noticed in a work of this nature; but we have to regret that the materials from which our biographical memoir mult be compiled, are infufficient to fatisfy the curiofity concerning the literary habits, and the characteriftic features of this very illultrious man.

His rank, indeed, as a philofopher, we are enabled to appreciate by perufing fome of the immotal works which be has bequeathed us; hut, for a knowledge of his moral charater, difpofition, and temporal con-

Yol. IV. Part I.
cerns, we can only have recourfe to the elogies of his Bofcuvi : friends. Thefe are certainly entitled to much of our confidence; and when the names of M. de la Lande, M. Fabroni, Stay, and Zamanga are mentioned, we may be thought fafidious, in implying the leaft diftruil of their teftimony. It is our refpea for the public and for truth, and it is our knowledge of the nature of elogies, which have made us fo.

W'e have, therefore, endeavoured, rather to relate the incidents in the life of Bofcovich, than to give a tranfeript of friendly effution; and yet perbaps it may be difcovered, that our portrait is luminous with culugium, whillt its outlines are poorly defined.

Bofcovich was born on the 1ith of May 1711, at Ragufa, a fea port on the coaft of the Adriatic, arid capital of a fmall republic of the fame name, under the protection of the Turks and the Venetians. We know fo little of his parents, that we can only conjedure at their circumftances and capacity, from the education which they gave to their fon being liberal and judicious.

It does not appear that our author gave any tokens of fuperior genius, till he was fent to learn grammar and philofophy in the fchools of the Jefuits, who were at that time the principal teachers in Ragufa, and throughout Italy. Amongit them, his docility and obedience could not pals unnoticed, but were fufficient to mark him as a likely fubject for future eminence, and confequently to procure to him particular attention. In his $15^{\text {th }}$ year, after he had gone through the ordinary courfe of education, and when it was neceffary to determine his further purfuits, application was made to admit him into the order; and for the reafons we have mentioned, was readily complied with. This was agreeable to his own inclination, and proved the fource of that diftinction in learning to which he afterwards attained.

The Jefuits, it is well known, had much intereft and authority to promote in the city of Rome; whither it was cuftomary in them to fend thofe members whom they knew to be qualified for that purpofe, and thofe youths of whom they had great expectations, for more inllruction. As Bofcovich was fent there in the year 1725, we may realonably imagine he had profited much by his teachers, and was fignalized for his abilities. This zeal in the cultivation of youth, which the Jefuits ever preferved, and which perhaps tended more to the prefervation of their power than all their religious artifices, was attended with conlequences the moft beneficial to humanity; and when we recolleat how many and how great the geniules were which it difcovered, and fuftered and brought to maturity, we are almoft induced to belicve that it countcrbalanced all the ill effeets of their order. Had this education been confined to fome limited fuhere; had it embraced the prattling doctrines of cafuiftry and the unwieldy mafs of cloiftered theology alone; unfortunate and melancholy for the world would have been this zeal : bo refuge for the venial penitent, no. fecurity againft boifterous feet.rifm would have remained; an unmanly lethargy would have debafed the mind, and the moral and the intellectual world would have funk to a dread chaos of confufion. But the Jefuis knew well the benigmant influence of literature, and the falutary elevatio: of fcience ; they faw that wealth, and power, and ho-

## B O S [ 42 ] <br> B O S

Eofcovich. nour, followed philofophy; and that philofophy had driven famine, wretchednefs, and vice, from their habitations. We dare not fay that the intereft and aggrandizement of their order were fecondary confiderations, but we will avow it as our opinion, that the ftort reign of the Jefuits, and the objects at which they aimed, and ahove all the means which they employed, were more infruftive, promifed better, and effected more to humanity, than all the accumulated humility and $r_{\text {anctity }}$ of all the religious focieties of the Romifh church. We have been led into this digreffion by the coincidence of certain confiderations operating at the time on our minds. Bofcovich was of the order of Jefuits; that order is no more; its deftruction took place in his life-time; gratitude for the delight and the inflruction we have received from him and many others of the order; the prefent difpofition among mankind to detract from its merits, to magnify its imperfections, and to corfound it with the fanatical and enthufidtic groups of every perfuafion which have difgraced the name and the dignity of religion. But to return; our author on his arrival in Rome, entered the noviceflhip of the order, where his lludies wore a new afpect, but were fill parfued with diligence. Chrifion morality, the rules and conflitutions of the order, claimed his attention for two years; after which he was inftructed in rhetoric, and became well verfed in general literature, in a particular manner in Latin poetry, which at that time was very much cultivated.

From the noviciate he was fent to the Roman college to fudy mathematics and phyfics. It was in thefe fciences that his elcvated genius and uncommon abilities thone forth fo confpicuoufly, and procured to him the admiration of his fuperiors. In three years time he was able to give private lefforis on mathematics; and was then exempted from a law, by which the roviciates were bound to teach Latin and the belles lettres for five years before they commenced the ftudy of theology. This exemption was in corfequence of his great predilection to the mathematics, of which he was foon afterwards made public profeffor. It would appear to us, that the feience of theology, as it was then inculcated, had little attraction for the mind of Bofcovich; for it is not likely that a mind intimately acquainted with truth, and accullomed to find her ever plain and undifguifed, conld relith the retiring obfcuritics of fophifry, or the fimfy decorations of a myflical religion; nor can we wonder, that during the four years in which he was conftrained to the fludy, be frould become more farsiliar with Leibnitz, Maclaurin, and Newton, than with Loyola, and Laynez, and Aquaviva.

For the profefforthip of mathematics he was eminently qualificd, as, befides a thorough knowledge of all the modern productions in the fcience, he had acquired a priftine feverity of demonflration hy fudying the works of the ancient geometricians; and he conjoined withal an obliging accommodation of his own powers to the deficiencies of his pupils. It was for their benefit he at this time compofed elemeritary treatifes on arithmetic, algebra, geometry, and trigonometry. But notwithfanding the arduous dutics of his fituation which he invariably fulfilled, he found time to inftrnet and enlighten more than boys; for about this pe-
rios, he entertained fome of thofe original notions $\underbrace{\text { Eofcovich. }}$ which were deflined to grow up into fyftem, and one day to aftonith the whole world of fcience. Thefe, as they grew, were ftrengthened by folid arguments in the public difputations, by anticipating obitacles, overcoming and removing them, and by mighty efforts in extending and applying them to the moft remote and difcretive actions of the univerfe. The animating fpirit of difcovery and invention led him to confider every portion of phyfical fcience; and indeed fo verfatile and fo vigorous was his mind, we would be at a lofs to rpecify one portion, which, within a ferv years, it did not comprehend, elucidate, and advance. In confirmation of this we beg to prefent our readers with an enumeration of the principal fubjeets to which be turned his attention, and concerning which he publifhed differtations whill he continued in the profefforlhip. The tranfit of Mercury over the fun; the foots in the fun; the aurora borealis; the conftruction of Spherie trigonometry; the figure of the earth; a new telefcope to determine celeftial objects; the anciert arguments for the rotundity of the earth; ofcillating circles; on infinites and infinitely little quantities; the motion of bodies in unrefiffing fpaces : the aberration of the fixed fars; the inequalities in terreflial gravity; on aftronomy; on the limits of certainty in aftronomical obfcrvations; on the fulid of greateft attraction; the cycloid; the logiftic curve lines; the vires viver; the comets; light; tides; the rainbow; the calculation of fractions; the centre of gravity; the moon's atmufphere ; the law of continuity; lenfes and dioptrical telefcopes; the objective micrometer; the divifibility of matter. Some of thefe are fhort, but all of them contain curious and valuable matter. It is only by perufing them we are able to difcover the gradual progrefs of his mind ; and to underftand the manner in which he arrived at the theory of natural philofophy, which alone will iender bis name immortal.

About this time a tafte for philofophical poetry was much prevalent amongtt the learned, and fome of our author's acquaintances had laboured in it with fuccefs. Of thefe we may mention Father Noceti who wrote on the rainbow and the aurora horealis, and the juflly celebrated Benedict Stay, whofe poems on the philofophy of Defcartes, and on the more modern philofophy, are excellent examples of fine Lutia compofition and fcientific inveftigation. Bofcovich publifhed their works with annotations and fupplements, in which a fplendid fund of information and learning is difplayed.

By fuch undertakings, the fime of our author was widely diffufed, and he became an object of general admiration. The learned focieties of many countries in Europe conferred on him unfolicited honours, and feveral foreign princes invited him to their courts. His opinions on various fubjcets of civil architeCture, topograply, and hydrodynamics, were akked and entertained by Pope Benedict XIV. John V. of Portugal, and others. Thefe neceffarily required bis prefence in different flates, where he never failed to increafe his reputrtion, and often terminated difputes which might otherwife have gone on to open warfare.

He was employed to corred the maps of the papal dominions, and to meafure a degree of the meridian
paffing
$\underbrace{\text { Boforich; paffing through them. In this he was affilted by an }}$ Engliih Jefuit, Chritlopher Maire. An account of their expedition was printed at Rome and Paris, and is interfperied with fome curious anecdotes, concerming the opinions which the peafants of the Apcunines formed of them, and the operations which they had to perform ; but it is valuable on account of the accurate detail which is given of their obfervations.

In the year 1757, he was fent to Vienna by the republic of Lucca, to reconcile fome differences concerning the draining of a lake, in which the grand duke of Tufcany, the emperor Francis I. and that republic, were concerned. It was after he had fucceeded in the object of his vifit to that city, that he publifhed there his Theoria Pbilofopbice Naturnlis in 1758; and that he gained the efteem of the emprefs queen.

Another occafion for his mediating powers foon prefented itfelf, and which more nearly interefted him, as his native city of Ragufa required them. It had been fufpected by the Britifh government, that fome fhips of war were fitted out at that port for the fervice of the French, thereby infringing the neutrality. Such a fuficion having no juff foundation, alamed the fenate of Ragufa, and required fpeedy removal, as the confe. quences of it might be extremely prejudicial to their commerce. Bofcovich, who had often been fucceffful in fimilar circumflances for other powers, appeared to them the molt proper perfon for this purpofe, and was accordingly intrufted with it. He repaired to London, and here allo effected the object of his miffion with honour to himielf. He vifited the Royal Society, which received him with diftinguifhing marks of refpect, and which he foon afterwards complimented with an excellent Latin poem on the folar and lunar eclipfes. This was in the year 1760, when Dr Johnfun was in London. Mr Murphy fpeaks of an intervicw which took place between out author and Johnfon; but in order to magnify the unruly powers of the zremendous companion, he rather unhandfomely tells us of the eafy cant with which a prieft might travel through Italy and France. We are unwilling to mention what effects on fome minds may have been produced by the formidable fociety of a Johnfon; but if they are a contempt of elegant fimplicity and ingenuous eafe, and an affeted devotion to repulfive pomp and authoritative offentation, be our lot far from his intuence, amid the peace and liberty of focial life.

Bofcovich was invited by the Royal Society to be of the party of their members fent to America, to obferve the tranfit of Venus over the fun's difk, which happened in the year 1762. The nature of his embally, and the ueceffity of returning home, bowever, prevented his acceptance of the invitation. Soon after his return, and when his embaffy was fulfilled, he was appointed by the fenate of Milan to the mathematical chair in the univerfity of Pavia, and to fuperintend the obfervatory of the royal college of Brera. He continued in this fituation for fix years, when he was made profefior of aftronomy and optics in the Palatine fchools of Milan by the emprefs queen; who alfo requefted him to continue his attention to the obfervatory. This be expected to be the mof agreeable part of his life. Admired by the learned; beloved by his friends; having an adequate income, and a conftitution found and vi-
gorous; he promifed to himfelf, lappy, lecaufe ufful Bofcovicho days, in the tranquil cultivation of the fciences: but a cloud long impending now burft over his head, and thefe bright days never came.
'l'be myftctious regulation in the political conflitution of the Jefuits, though it lad attracted the kicen curiofity of the world, had, for very fubflautial reafons never been explored; nay, fuch was the influence of the order over the minds of the moft enlightened fatefmen, that this impenetrable myftery was held facred by the civil power in many countries, as if no danger could exill in what was not underflood. But the rapid progrefs of fcience, and the gradual decay of fuper. fition, required fome evidence of fecurity, and fome proof that it was ever neceffary to conceal good inten. tions, and to cover virtuous principles with any other garb than what truth could beffow. Thefe it is well known, the Jefuits either could not, or were unsilling to give; and they, therefore, juftly incurred the fufpicion of men. The moft trivial circumflances viould augment this fufpicion, and the leaft deviation from rectitude in any of the order would ferve to juflify it : thefe were not wanting, and foun became invincible; the intereft of the Jefuits rapidly declined for many years, and at laft, in 1773 , their order was totally abolifhed.

No exemption from the edict for its downfall could be procured: all who held offices were difmified; and Bofcovich fought refuge in the city of Paris. Thither indeed he was invited by the minifter, (we believe Turgot) by whofe means he was made one of the directors of optics for the fea fervice, and received a penfion : but it does not feem that his fituation was agreeable to him; for it is well known that the peculiar nature of his circumftances was the fole caufe of his long refidence in Paris.

Whether his dillike arofe from the envy of fome of the French, his own irritability of temper, or the incongruity of the prevailing manners with his own, we cannot determine : but it is reafortable to imagine, that the ruin of his order, and the fubfidence of his own importance, would leave fome indelible mark in his mind; and perhaps when he contemplated the apparent levity and the real fcepticifm of the age, he might be brought to fear that the degradation or the downfall of the world was concomitant. Sertiments very oppofite to thofe of the Ftench, would thence naturally arife; morofity and difcontent uould invade him, and he wifhed to revifit the feenes of his youth. Be all this, however, as it may, certain it is, he applied for leave of abfence for two years, after he had reficted in Paris for ten years: this he eafily procured, and accordingly fet out for Baffano in the republic of Venice. At this place he publifted in five vols. quarto, a col. lection of the works which he had finifled in Paris. This forms a body of optical and aftronomical knowledge, well worthy the attention of the philofophical and mechanical cultivators of the fciences. It may be worth mentioning, that by proceeding on the principles contained in one of the differtations in this collection, an amiable philofopher of our own country (Dr. Robifon) believed it poffible to afcertain the motions of the earth, though the obferver fhould be confined in a cellar; in profecuting the fubject, however, be

## B O S [ 44 ] B O S

Borcorich. found that an error into which Bofcovich had fallen, concerning the aberration of light, undermined the principles on which he had erected fuch a wonderful but legitimate problem. The candid and very interefting acknowledgement of the crror, and his extreme difappointment in the difcovery of it, which the doctor made in the 3 d vol. of the Edinburgh Tranfaclions, is at once an eviderice of his own liberality, and an undefcafibie teftimony to Bofcovich's genius.

We beg to recommend to our readers the perufal of the worl:s which we have now mentioned ; they would tend to form the mind to the true mode of inventigating slic phenomena of nature, and will fatisfactorily fhew that this mode is always rewarded by difcovery. The following is a pretty juft account of their contents: A new inftrument for determining the refracting and diverging forces of diapharous bodies; a demonfration of the fallehood of the Newtonian analogy between light and found; the algebraic formulie regarding the focufes of tenfes, and their application for calculating the fphericity of thofe which are to be ufed in achromatical telefcopes; the corrections to be made in ocular lenfes, and the error of the filiericity of certain glafles; the caufes which hinder the exact union of the iolar rays by means of the great burning glaffes, and the determination of the lofs arifing from it; the method of determining the different velocities of light paffing through different mediums by means of two dioptrical telefcopes, one common, the other of a new kind, containing water between the objective glafs and the place of the image; a new kind of objective micrometers; the defects and inutility of a dioptrical telejcope propofed and made at Paris, which gives two itnages of the fame object, the one direct the other inverfe, with two contrary motions of movcable objects; malles floating in the atmofphere, as hail of an extraordinary fize, feen on the fun with the telefcope, and refembling fots; the aftronomical refractions, and various methods for determining them; various methods for determining the orbits of comets and of the new planets, with copious applications of thefe doetrines to other aftronomical fuhjects, and fill more generally to goometry and to the feience of calculation ; the errors, the rectifications, and the ufe of quadrants, of fextants, of aftronomical fectors, of the meridian line, of telefcopes called the inftruments of tranfits, of the meridian, and of the parallactic machine; the trigonometrical differential formula, which are of fo much ufe in aftronomy; the ufe of the micrometrical rhombus, extended to whatever oblique pofition; the error arifing from refractions in ufing the aftronomical ring for a funsdial, and the correction to be made; the appearing and the difappearing of Saturn's ring; the methods of determining the rotation of the fun by means of the fpots, propofed formerly by the author, and now perfected;
the greateft exactnefs poffible in determining the lergth Boforich. of a pendulum ofcillating cvery fecond of middle time by the comparifon of terreftrial and ccleftial gravity; a compend of allronomy for the ufe of the marine, containing the elements of the heavenly motions, and of the aftronomical inftruments, to be explained to a prince in the courfe of one montls; a method for determining the altitudes of the poles with the greatell exactnefs, by means of a gnomon alone, where other infruments are not to be had; the determination of the illuminated edge of the moon to be oblerved on the meridian; a method of ufing the retrograde return of Venus to the fame longitude, for determining the lefs certain elements of her orbit; a method for correcting the elements of a comet, of which the longitude of the node is given, and the inclination of the orbit has been found nearly; another method for the fame purpofe, and for finding the elliptical orbit, when the parabolic one does not agree with the obfervations; a method for correcting the elements of a planet by three obfervations ; the projection of an orbitinclined in the plane of the ecliptic; the projection of an orbit inclined in any other plane; the calculation of the aberration of the flars, arifing from the fucceffive propagation of light; fome beautiful theorems belonging to triangles, which are of great ufe in aftronomy, reduced to moft fimple demonilrations.

After the publication of thefe works, our author left Baffano, and went to Rome to vifit the companions of his youth. From Rome, he proceeded to Milan, where he revifed fome of his own works, and prepared for publication the two laft volumes of Stay's poems.

In fuch occupations, and amidf friends whom equal misfortune and temporary feparation had fill more endeared, he had remained happy, and might perhaps have been ftill further ufeful to the world; but his leave of abfence was now nearly expired, and his diflike to a refidence in Paris was aupmented by the contraft which his prefent abode affurded. He was too delicate to apply for more leave of abferice; and though he was ferifible of the gratitude which he owed to France, he could not reconcile it with the defruction of his oun repofe. About this time alfo he had feveral attacks of gout, but he would admit no medical aid. Under thele diflrefles, and others which we have before mentioned, our illuftrious author at laft funk: a melancholy defpondency fcized on and fubjugated his mind, fo that for five months he remained perfectly fatuous; and an impofthume havirg burf in his breaft, terminated his exiftence on the $13^{\text {thi }}$ of February 1787 , in the 76th year of his age.

The following infcription was compofd by Benediat Stay, and engraved on marble by order of the fenate of Ragufa, in memory of their ufeful citizen the illuf. trious Bofoovich.

Befiedes the works which we have meutioned, he wrote feveral others on various fubjects, as, on the project of turning the navigation to Rome from Fiumicino to Maccarefe; a third on two torrents in the territory of Perugia; a fouth on the bulwarks on the river Ponaro; a fifth on the river Sidone in the territory of Placentia; a fixth on the entrance into the fea of the Adige. He wrote other fuch works on the bulwarks of the $\mathrm{Po}_{5}$ on the harbours of Ancona, of Rimini, of Magna Vacca, and Savona, befides others, almoft all which were printed. He bad likewife received a commifion from Clement XIII. to vifit the Pomptin lakes, on the draining of which he drew up his opinion in writing, to which he added further elucidations at the defire of Piws V1.

We have fooken of Bofcovich as the founder of a new fyltem of natural philofophy, which has occupied much of the attention of the learned, and which alone will render the name of its author immortal. It becomes us therefore to give fuch a fynopfis of it, as may fatisfy the general reader, or induce the fludent to fearch for more information in the work from which we ourfelves have derived it.

In a fubject fo abfirufe and remote from obfervation
as many of the principles which we have to confider in this theory, mucls dificulty in inveftigation is to be expected, and perhaps the metaphorical language which we are conltrained to employ, will tend not a little to embarrafs and millead us. We are alfo aware of the many obftacles which a theory of fuch mag. nitude has to encounter in the improved mode of philofophifing of the prefent day; we are aware that at the bare mention of a new theory in natural phiJofophy, fome of our readers will revolt from our page, affect a contempt of our labours, and call to their aid the authority of Bacon. But we would afk fuch, from whence does their firit arife? we have found it in thofe who never Aludied a page of Bacon; and we have known it accompanied by indolence, and by a fupine indifference to aught that dignifies and elevates humanity. It is furely no hard matter to condemn a theory, merely becaufe it is a theory; nor is it at all demonftrable that luch condemnation requires any great effort of genius or underftanding. Now the fpirit of Bacon is a 1pirit of zeal, and labour, and perfeverance, and above all, of invefligation. Not then from his writings lias this contempt arifen, but from a total ignorance of them; not from his doctrine, but from an imaginary infpiration of his principles.

## $3 \quad 0 \quad$ S $\quad\left[\begin{array}{ll}46\end{array}\right]$ <br> B O S

Bofcovich's W"e have reafon to believe that the theory of BofSyftem of covich would have receired the fanction of the illufNatural Phlorophy. trious Baron: becaufe the foundation on which it is erected is confecrated by irradiation from his works. Be this, however, as it may, we are convinced that fuch an example of true genius will be acceptable to every friend of humanity, and to every cultivator of fience.

That we may do juftice to our author in giving a fynopfis of his theory, we fhall follow the order which he himfelf has adopted; and fhall fubjoin fome general obfervations and iernarks which have occurred to us in the courfe of the work.

Bofcovich's Theoria Philofophix Naturalis is divid-
divided into three parts; ed into three parts, of which the firl contains the explication of the theory, its analytic deduction, and its vindication.

The fecond contains the application of the theory to mechanics, and

The third the application of the theory to phyfics. Of thefe in order, and firfl of the explication of the theory.

This theory has fomething in common with the Leibnitzian and the Newtomian.

With the former it admits that the elements of matter are fimple and inextended; but it differs from it, in denying the cuntinued extenfion of the elements, and in afferting thet the elements are perfectly homogeneous.

Like the Newtonian, it allows the exiftence of mutual powers or forces, which vary according to the diltance by certain laws; but it goes further, in that it afferts thefe powers are both repulfive and attractive, and that when either of thefe terminates the other begins: but it differs from the Newtonian in explaining by one principle phenomena to which the latter applies threc.

This one principle may be exprefled by an algebraic formula, or by one continued geometrical curve; and it is the law by which the powers of repulfion and attraction ast. As continued extenfion of bodies is rejected from this theory, it is obvious, that as on the one hand a repulive power muft render it impoffible, to on the other an attractive power muft give rife to the apparent examples of it, to the phenomena of cohefion: this accordingly is one effential characteriftic of the theory.

From thefe few remarks we may deduce the principles of the theory.

The firf elements or atoms of matter are indivifible, inextended, but fimple, homogeneous, and finite in number. They are difperfed in an immenfe face, in fuch a manner as that any two or more may be diffant from each other any affigmable interval. This interval may be indefinitrly augmented or diminilhed, but cannot entirely vanifh. Alual contact of the atoms is therefore impofible, fecing that the repulfive power which pievents the entire vanifling of the interval, muft be fufficient to deftroy the greatef velocities by which the atoms tend to unite. The repulive power mofl (ncircle every atom, muft be equal at equal difances thom the atoms, and moreover, mult increafe as the diftance from the atoms diminiftes. On the contrary, if the difance from the atoms increafes, the repulfive power will diminifh, and at laft become equal to nothing, or vanifh: then, and not till then, an at-
tractive power commences, increafes, diminiflies, va- Bofrovich's rifles. But the theory does not foop he:e; for it fup. $\begin{gathered}\text { Syflem of } \\ \text { Natural }\end{gathered}$ pofes, that a repulfive power fucceeds to the fecond or Natural attractive, increafes, diminihies, vanifies; and that $\underbrace{\text { Phlofophy }}$ there are feveral alternations of this kind, till at the lat an attractive power prevails, and though dimitiftsing fenfibly, as the fquares of the diftances increafe, extends to the mofl diflant regions of our fyfem.

Such a procefs as we have now mentioned may feem A geome. complicated and confufed; but the curve line which trical curve expreffes it is fo fimple, that we are perfuaded, our will exprelis readers, though unacquainted with geometry, will com- of the prehend it, and hence will be able to underfand the theory. theory itfelf.

We fuall now proceed therefore to exhibit this curve, and to thew in what manner it clucidates the principles of the theory.

The axis $C^{\prime} A C$ has an afymptote of a curve in the point $\Lambda$, viz. the indefinite right line $\Lambda \mathrm{B}$; on each fide of which are placed two equal and fimilar branches of a curve, viz. $D^{\prime} E^{\prime} \mathrm{F}^{\prime} \mathrm{G}^{\prime}, \& \mathrm{c}$. and DEFGHIKI. MNOPORSTV ; the latter of thefe having the afymptotical arch ED, though indefinitely produced toward, the right line $A B$, will never touch it; but it accedes to the axis $\mathrm{C}^{\prime} \mathrm{AC}$, and touches it in forne point E. From this point it recedes on the oppofite fide of the axis to fome point $F$, bends again to the axis $C^{\prime} A C$, and cuts it in the point G ; from this it recedes in a fimilar manner, on the fide of the axis from whence it originated, and arrives at the point $H$. From the point $H$ it bends to the axis $\mathrm{C}^{\prime} \mathrm{AC}$, and cuts it in the point I ; and fo on in alternate fits of acceffion and receffion till it has completed the remaining arches IKL,LMN,NOP, PCR, RST; after which it becomes afymptotical, forming the arch $T p_{s} \mathrm{~V}$, which approaches the axis $\mathrm{C}^{\prime} \mathrm{AC}$ on the fide oppofite that from which it originated, in fuch a manner as that the diffances from the axis fiall be in the reciprocal duplicate ratios of the diftances from the alymptote BA.

Now, if we raife and let fall perpendiculars on the axis $\mathrm{C}^{\prime} \mathrm{AC}$ in the points $a, b, d, \& \mathrm{c}$. the fegments of the axis fo formed, viz. A $a, \operatorname{Ab}, \mathrm{~A} d, \& c$. are abfciffes, and will reprefent the diftances between any two atoms or points of matter; and the perpendiculars fo conftructed, viz. ag, $l r, d h$, are ordinates, and will reprefent the intenfity of the repulfive or attractive powerc, according to their fituation with refpect to the axis $\mathrm{C}^{\prime} \mathrm{AC}$; for, if on the fame fide with the afymptote AB as a $g$, $b r$, they reprefent the former; and if on the fide oppofite to the afymptote, as $d b$, the latter power.

From what we have faid, it is manifeft, that the ordinate $a g$ may be increafed beyond any affignable limit, provided the correfponding abfiffa $A$ a be diminificd beyond any affignable limit; feeing that the limb of the curse ED is afymptotical which terminates the ordinate $a_{\delta}$, and confequently never touches the right line $A D$; but that, if the abfiffa be increafed as to $\mathrm{A} l$, then the ordinate will be diminifhed to lr ; and that by perpetually increafing the abfoifia to the point E, the ordinate will be perpetually diminified till at the point E it will totally vanifh.

Moreover, if we fuall increafe the abfciffa to Ad, we fiall find that on the oppufite fide of the axis $\mathrm{C}^{\prime} A \mathrm{C}$, there will appear the ordinate $d h$, which, by continuing

Plate
xav.
f.g. x.

B O S
Bofovich's the fame increafe of the ahfciffa will increafe to the Syftem of
Natural $\underbrace{\text { Philo「opl' } y}$ point F , and then will diminifh perpetually, as it approaches to the point $G$, where it will totally vanift. If the abfcifli be fill increafet, an ordinate arifes on the oppofite fide, increafes to $H$, diminihes to $I$, and vanifhes, appears again, increafing to K , diminithing to L, vanifhing; and fo on through all the remaining points and fituations of the curve, till at length coming to $p \circ$ and $s v$, it continues to diminilh perpetually, but never again totally vanifhea.

Such then is the nature of the curve, and fuch, it mull be admitted, will comply with the defcription of the repulfive and attraEtive powers, and the manner in which they alternate, fo eflential to the theory. The firf power or that next the atoms is repulfive, and is greatelt at the leaft diflances from them ; by increafing the diftances it diminithes, vanifnes; is fucceeded by attraction, which increafes, diminifhes, vanilhes; is in like manner fucceeded by repulfion; and thofe two powers alternate repeatedly, when the attraction fucceeding, conftitutes the general gravity of Sir llaac Newton, and reaches to the planets, and the far diftant comets of the fyftem of the fun.

It is obvious, that the tranfitions which we have defcribed muft occur in the infenfible diftances, being all comprehended betwixt the atoms and the exterior attractive power; but it is alfo obvious that this law of the forces differs much from the Newtonian gravity, as the curve which exprefies the latter is a hyperbola of the third order, lying all on one lide of its axis which it never cuts; confequently it does not admit of any iranfitions, as we have before hinted at. It is of confequence to remember this difinction, for we thall find that on it depends much of our reafoning in the application of the theory to phyfics.

Some further explanation of the curve remains to be given in the fecond part: in the mean time we proceed to take notice of certain geometrical properties effential to it, as anfwering the conditions of the priciples of the theory.

Bofcovich, in an after part of the work, demonftrates ftrietly that the curve is poffeffed of thefe properties; but we do not think it neceffery to detail his demonftration, as it is only acceffible to thofe who are verfed in the high geometry, and as we imagine that a bare thatement of the conditions required will fatisfy the generality of our readers.

The conditions neceffary in the curve are fix in number. Firft, That it be regular, fimple, and not au aggregate of arches of different curves. Secondly, That it fhall cut the axis $\mathrm{C}^{\prime} \mathrm{AC}$ in certain given points only, and at the two diftances $A E^{\prime}, \mathrm{AE} ; ~ \Lambda \mathrm{G}^{\prime}, ~ \Lambda \mathrm{G}, ~ \& \& \mathrm{c}$. which are equal on both fides of the afymptote, the right line AB. Thirdly, That there flall be ordinates to correfpond to every abfcifia. Fourthly, That there flatl be equal ordinates at equal abfeifles on each fide of $A B$. Fifthly, That the right line $A B$ be an afymptote to the curves on each fide of it; the area BAED afymptotical and therefore indefinite. Sixth1s, That the arches which are terminated by any two interfections may be varied in any manner, recede from the axis $\mathrm{C}^{\prime} \mathrm{AC}$ to any diflance, and accede to whatever arches of whatever curves, cutting, touching, or ofcillating them wherefoever and howfoever we pieafe.

47 ] B O S
If the fe conditions be anfwered, it muft he evident Bof ovich, that by this curve we can exprefs any intenfity of any $\mathrm{Sy}^{1}$, it 1 force, in any direftion we pleafe; and of conlequence, $p$, hephy. that by orie law of the forces, every thing in the uni- $\underbrace{-\quad \text { - }}$ verfe, connected in any manner with motion, may be explained.

We come notr to confider the analytic deduction of the theory, in which we thall follow clofely the Iteps of Botcovich.

Bolcovich fets out, by examining the nature of the The analyo law of continuity, and the principles on which it is tic deducfounded. In the year 1745 he publified a differtation tion of the De Viribus vivis, in which he was led to confider the phenomenon of the collifion of bollies, and in confequence, the dilemma into which former philofophers had fallen by their mode of invelligating it, and the breach of the law of continuity which fome had allowed to extricate themfelves from the dilemma.

Maclaurin, of whom Bofoovich fpeaks in terms of the higheft refpect, "Summus noftri eevi geometra et philofophus," was the principal advocate for the breach of the law of continuity in the collifion of bodies, and fooke with fume indignation of thofe who afferted, that this law was univerfal. He of courfe, believed in the production of motion by impulfe, and in the immediate contact of bodies. Now, Bofcovich, as we have before mentioned, rejects bath of thefe fuppofitions, and confequently explains the phenomenon in a very different manner from Maclaurin, and endeavours to prove that the law of continuity is univerfal, and that no inflance of a breach of it is ever obfervable or polfible.

Before proceeding to his reafoning on this fuhject, we flall cxplain what is meant by the law of continuity, and give one example of it, to which all others are referable.

The law of continuity (lays Bofcovich) confifts in from the this, that any quantity whilft paffing from one magni- law of cono tude to another, muff pafs through all the intermediate ${ }^{\text {tinuity }}$ magnitudes of the fame kind: or, according to the law of continuity, al! changes in nature are produced by infenfible and infinitely fmall degrees; fo that no body can in any cafe pafs from motion to refl, or from ref to motion, without paffing through all poffible intermediate degrees of motion. Maclaurin's Newton, b. r. c. 4 .

Let there be a right line AB (fig. 2.), to whichanother line CDE is related; let $A B$ reprefent the time, and from any points of it, $\mathrm{F}, \mathrm{H}$, let there be erected the perpendiculars FG, HI, which (ordinates) may reprelent any quantities continually variable, and will correfpond to the moments of time, $\mathrm{F}, \mathrm{H}$; but to the intermediate moments $\mathrm{K}, \mathrm{M}$, other magnitudes KL, MN, will correfpond; and if from the point G to the point I there goes a continued and firite part of the line CDE, it is evident that there is no intermedi. ate point of the line $A B$, as $K$, to which fome ordinate KL. does not correfpond; and converfely that there is no ordinate of magnitude intermediate betwixt FG, IHI which does not correfpond to fome point interm. di te betwixt I, II. Now the variable quantity exprel $\cdot \mathrm{d}$ by this variable ordinate, changes according to he law of continuity; becaufe from the magnitude $F G$, which it has in the moment of time F , to 4 - magnitude HI, which it has in the moment of cince If, it

## B O S $\quad[48$ ] <br> $13 \quad 0 \quad \mathrm{~S}$

Boicuvich's paties through all the intermediate magnitudes KL , syltem of
Natural Philofophy. MN correfponding to the intermediate moments, $K$, $M$, and to every moment a determinate magnitude cor- refponds.

This then may be fufficient to explain the nature of the law of continuity, about which we may remark there can be no ambigulty; for the terms which exprefs it are precife, it is a matter of fact, and one example of it is enough to give us an adequate idea of it. We proceed, therefore, to confider on what its univerfality is founded; and here two queftions naturally occur: Have we difcovered the univerfality of this law by a laborious induction ? or does it neceffarily refult from the nature of continuity? Bofcovich anfwers both of thefe queftions in the affirmative.
I. It is difcovered by induction. Here we beg to tranfcribe the words of our author, as much more fatisfaCtory than any thing we can give: "Quin immo
in motibus ipfis continuitas fervatur etiam in eo, quod motus omnes in lineis continuis funt nufquam abruptis. Plurimos ejufmodi motus videmus. Planetæ et cometæ in lineis continuis curlum peragunt fuum, et omnes retrogradationes funt paullatim, ac in flationibus femper exiguus quidem motus, fed tamen habetur femper, atque hinc etiam dies paullatim per auroram venit, per vefpertinum crepufculum abit, folis diameter non per faltem, fed continuo motu fupra horizontem afcendit, vel defcendit. Gravia itidem oblique projecta in lineis itidem pariter continuis motus exercent fuos, nimirum in paraholis feclufa aeris refitentia, vel ea confiderata, in orbibus ad hyperbolas polius accedentibus, et quidem femper cum aliqua exigua obliquitate projiciuntur, cum infinities infinitam improbabilitatem habeat motus accurate verticalis inter infinities infinitas inclinationes, licet exiguas, et fub fenfum non cadentes, fortuito obveniens, qui quidem motus in hypothefi telluris motze a parabolicis plurimum dillant, et curvam continuam exhibent etiam pro cafu projectionis accuratc verticalis, quo quiefcente penitus tellure, et nulla ventorum wi deffectente motum, haberetur afcenlus rectilineus, vel defcenfus. Immo omnes alii motus a gravitate pendentes, omnes ab elafticitate, a vi magnetica, continuitatem itidem fervant, cum eam fervent vires illa ipfe, quibus gignuntur. Nam gravitas, cum decrefeat in ratione reciproca duplicata diftantiarum, et diftantix per faltum mutari non poffint, mutatur per omnes intermedias magnitudines. Videmus pariter vim magneticam a difantiis pendere lege continua; vim elafticam ab inflexione, uti in lamintis, vel a diftantia, ut in particulis aeris compreffi. In iis, et omnibus ejufmodi viribus, et motibus, quos gignunt, continuitas habetur femper, tam in lineis, qua defcribuntur, quam in velocitatibus, quæ pariter per omnes intermedias magnitudines mutantur, ut videre - A in pendulis, in afcenfu corporum gravium, et in aliis mille cjufnodi, in quibus mutationes velocitatis funt gradatim, nee retro curfus reflectitur, nifi imminuta velocitate per omues gradus. Ea diligenciffù è continuitatem fefvant omnia. Hinc nec ulli in naturalibus motibus habentmr anguli, fed femper mutatio directionis fit paullatim, nec wero anguli exacti habentur in corporibus iplis, in quibus utcunque videatur tenuis acies, vel cufpis, microfoppii faltem npe videri folet curvatura, quam ctiam habent alvei fluvinrum femper, Sabent arborum Solia, et frondes, ac rami, babent la.
pides quicunque, nifi forte alicubi cufpides continuat Fofocich's occurrant, vel primi genesis, quas natura videtur affec- Sydtem ot tare in fpinis, vel $\mathrm{f}_{\mathrm{c}}$ cundi generis, quas videtur affectare Philofophy. in avium unguibus, ct roftro, in quibus tamen manente in ipfa cufpide unica tangente continuitatem fervari videbimus infra. Infnitum effet fingula perlequi, in quibus continuitas in natura obfervatur. Satius ef? generaliter provocare ad exhibendum cafum in natura, in quo continuitas non fervetur, qui omnino cxhiberi non poterit." (Theoria, p. 18.)

From thefe and other examples, in which the law of continuity is manifeftly held, Bofcovich infers, that it is univerfal; and that in fo far as induction fupports us, we are at liberty to apply it in the explanation of phenomena. Nay, we are by the fame principle compelled to admit it in cafes where obfervation fails us; becaufe to imagine that in fuch cafes this law is broken and fome other is adopted, is to tranfgrefs one of the fundamental principles of true philofophy: it is to multiply caufes unneceflarily; it is to limit the power of the Creator by the imperfection of our own ferfes; and it will plunge us into difficulties which no effort of human reafon will remove. Befides this, it is very eafy to conceive that the law is permanent; and as no abfurdity, therefore, accompanies the fuppofition, and no fact can be brought to overthrow it, whereas the contrary is unfupported by any fact, but is plainly repugnant to all, it is furely rational to make ufe of it, and to hold it as the general principle, till fome higher one be difcovered on which it depends.

From induction alone, therefore, we may infer the 13 univerflity of the law; but Poforich has other arguiverflity of the law; but Bofcovich has other argu-fality evinments which he calls pofitive, to fupport and evince it. ced by a This leads us to the fecond queftion, Does this univer- pofitive ar fality neceffarily arife from the nature of continuity? gument. The limit which joins the precedent and confequent of any thing, is common to both, and is therefore indivifible. Thus, a fuperficies feparating two folids, wants thicknefs, and is that in which a tranfition from the one to the other occurs; a line dividing two parts of a continued fuperficies wants breadth ; a point difcriminating two fegments of a continued line wants every dimenfion. So it is with regard to time, for the limit of two conjunct portions is common to both, and indi. vilible ; and, as every change of a variable quartity from one magnitude to another muft be made in time, fo every change muft be influenced by the continuity of time. But to every moment of time, a certain magnitude of the variable quantity correfponds, and the limit of two moments of time is common and indivifible; therefore, the limit of two magnitudes correfponding to thefe two moments, mult be common and indivifible. Moreover, it is impoffible for any quantity to have two magnitudes at the fame time, and when contimually varying, that it fhall have the fame magnitude at different inies; much more impolible, therefore, that in the limit of two moments of time it flall have two magnitudes, the one correfponding to the piccedent, and the other to the contequent moment, or foall not have gone through the intermediate mannitudes in the intermediate muments of time. For the fame realon, a body cannot have two velocitics at the fame time, and therefore cannot have two velocities in the limit common to wo moments of time ; and when continually changing its velocity, cannot have the

## B O S

Bolfovich's fame velocity in different moments of time, but muft

Sytem of Natural Philorophy mediate moments of time. Hence then, in paffing from the magnitude 8 to the magnitude 12 , the variable quantity paffes through the magnitucles 9,10 , 11. In going from the velocity 7 to the velocity 11 , a body muft go through the velocities $8,9,10$. The increafe of temperature goes on gradually: the mercury in the thermometer rifes gradually, going through every intermediate degree from one to another. Now as this reafoning is uninfluenced by any confiderations of the hardnefs, foftnefs, elaflicity or other property of bodies; thefe, it is evident, do not influence the univerflity of the law as refulting from the nature of continuity.

From thefe arguments, therefore, and from induction, Bofcovich concludes, that the law of continuity is effentially univerfal, and that a breach of it is metaphyfically impoffible. The ufe made of this deduction
${ }^{1} 4$
therefore actual con. tact imporGible. in explaining the collifion of bodies, mult at once be underflood by our philofophical readers. If in this and all other phenomena, the law of continuity is preferved, there can no actual contant take place amongit bodies; and it is from the univerfality of the law fo eftablifhed that Bufcovich derives this original principle of his theory.

To apply this then in the collifion of bodies, we argue in the following manner. Since the bodies cannot come into immediate contact with the preceding relocities, it is neceffary that their refpective velocities be changed before contact, that either the velocity of the antecedent body fhall be augmented, or that the velocity of the confequent body fhall be diminifhed, or that both of thefe changes thall occur. Now the caufe operating betwixt the bodies, fo as to retard the one, and to accelerate the other, mult be a power, and mult act from the bodies, and muft alfo be fufficient to overcome the greateft velocities with which the bodies tend to unite, and be mutual, becaufe action and re-action are equal. In fine, this is the interior repulfive power according to the definition. This mode of explaining the phenomena, we may obferve, is general, feeing that no hardnefs, foftnefs, or elafticity of the bodies, has any influence on the general principle from which it is deduced; but thefe properties will influence the particular cales of the phenomenon, and caufe certain modifications, which, however, do not concern us at prefent.

In this manner we derive evidence for the exiftence of the interior repulfive power; but for this we have alfo the light of induction to affift us, as we flall prove in the conclufion of our article.

As the repulfive power may be increafed to infinity, by diminifhing to infinity the diffance betwixt the atoms of matter, it is obvious, that no part of matter can be contiguous to another part; from which it follows, that the primary elements of matter are fimple and uncompounded. From fimilar arguments, and from others deduced from the abfurdities involved in the contrary fuppofition, Bufcovich maintains, that they are alfo inextended and indivifible.

The exiftence of an attractive power is allowed on all hands; we need not therefore enumerate Bofcovich's arguments on the fubject. For proofs of the

Vos. IV. Part I,
tranfitions from one power to another, we are refured forc :i ! : to the phenoniena of effervefonce, fermentation, co- Syllear of hefion, \&:c.; the confideration of which belongs to phillurgaliy the thind patt of our fubject.

To prove the homogeneity of the atoms, Lofcovich makes ufe of the fame reafons which bave been enc.-Homoze ployed by other philolophers; and he removes the ub- raty of 1 : jections made to it by Leibnitz, on the principle of acomo the fufficient reafon, and the rifible diverfity of bo. dies : the former he contends to be rafe, being founded on that doctrine of neceffity which Leeibnitz maintained; and with refect to the latter, he defcribes a beautiful and ntriking analogy, which we cantot refrain from tranfcribing.
" Fieri poffent nigricantes litere, non duču atramenti continuo, fed punctulis rotundis nigricantibus, et ita parun a fe invicem remotis, ut intervalla non nif ope micuofoopii difcerni poffent, et quidem ipfox literarum forme pro typis fieri pofient ex ejufmodi rotundis fibi proximis cufpidibus conllantes. Concipiatur ingens quredam bibliotheca, cujus omnes libri cor:ftarent literis impreflis, ac fit incredibilis in ea multitudo librorum confcriptorum linguis variis, in quibus omnibus forma characterum fit eadem. Si quis fcripture hujufmodi et linguarum ignarus circa tjufmodi 1 i bros, quos omnes a fe invicem difcrepantes intueretur, obfervationem inftitueret cum diligenti contemplatione, primo quidem inveniret vocum farraginem quandam, quæ in quibufdam libris occurrerent frepe, cum in aliis nufquam apparerent, et inde lexica pofiet qliædam componere totidem numero, quot idiomata funt, in quibus fingulis omnes ejufdem idiomatis voces reperirentur, quæ quidem numero admodum pauca efferst, difcrimine illo ingenti tot, tam variorum librorum reda Eto ad illud ufque adeo minus difcrimen, quod continerentur lexicis illis, et haberetur in vocibus ipfalexica conftituentibus. At inquiftione promota, facile adverteret, omnes illas tam varias voces conflare ex 24 tantummodo diverfis literis, difcrimen aliquod inter fe babentibus in ductu linearum, quibus formantur, quarum combinatio diverfa pareret omnes illas voces tam varias, ut earum combinatio libros efformaret ufque adeo magis a fe invicem difcrepantes. Et ille quidem $f_{1}$ aliud quodcunque fine microfcopio examen inffitueret, nullum aliud inveniret magis adhuc fimile elementorum genus, ex quibus diverla ratione combinatis orirentur ipfoliterx; at microfcopio arrepto, intuerctur utique illam ipfam literarum compofitionem e punctis illis ro. tundis prorfus homogeneis, quorum fola diverfa fofitio ac diftributio literas exhiberet. Hxc mihi quredam imago videtur effe eorum quæ cernimus in natura. Tam multi, tam varii, illi libri corpora funt, et qux ad diverfa pertinent regna, funt tanguam diverfis confcripta linguis. Horum omnium chemica ansly fis principia quedam invenit minus inter fe diffornia, quan fint libri, nimirum voces. Hxc tamen ipfre inter fe habent difcrimen aliquod, ut tam multas oleorum, terrarum, falium fpecies eruit chemica analyfis e diverfis corporibus. Ulterior analyfis horum veluti vocum literas minus adhuc inter fe difformes invenitet, et ultima juxta theoriam meam deveniret ad homogenea punctula, qua ut illi circuli nigri literas, ita ipfa diverfas diverforum corporum particulas per folam difo pofitionem diverfan efformarent: ufque adeo analogia

19
Objections to the the ny obvi. ared.
mitatem, fed ad conformitatem elementorum nos du. cit." (Tbeoria, p. 49.)

It is from thefe fimple princioles which we have enumerated that Bofcovich deduces analytically the whole of his fyftem; and he now proceeds to remove or explain away the objections to it.

It has been objected in the firl place to the mutual powers, that they are occult qualities, and that they induce action at a diftance. But in reply, fo far froms being occult they are very manifett, an idea of them cas! eafily be formed, their exiftence is evinced by a politive argument, and their effects are contimally before our eyes; ive may add alfo, that the fame objecion was made to the Newtonian attraction, and that the fame arguments ferve to remove it from both. As to the mutual powers inducing action at a diftance, much indeed may be faid, but it is very queftionable if all that can be faid will ever clear up the obfcurity that perpetnally involves this inextricable phenomenon. We referve fome remarks on the commonly received notions on the fubject, for our conclufion; in the mean time, we may affirm, that it is as eafy to conceive motion produced by the powers we have fpoken of, i. e. at a dilance, as proluced by immediate impulfe. We know, indeed, that till of late, philofophers were accuftomed to coufider the connexion between impulfe and motion fo effential, and their notions on the fubject fo clear and fundamental, that whenever they could reduce any phenomenon to that picdicament, they flattered themfelves every difficulty vanifhed, and confequently farther inveftigation was fuperfluous. But we allo know, that till of late, water was held to be a fimple body, and that whon it could be thewn to arife in any chemical experiment, it was cuftomary in chemifts to believe it had previoully exifted in the fubjects of their experiment. Do we coincide in this belief in the prefent day?

It has been objected, that the theory itfelf admits a fudden tranfition from one power to another; but a due infpection of the curve, and the explanation of it which we have given, will convince that this is impoffible, for that every change is made by pafling through cvery intermediate degree.

The principal objections, as might have been expeefed, have been made to the rejection of contact, to the itextenfon of the atoms, and to their indivifibility. But it is allowed, that bodies approach fo near to each cther, as to leave no Ceufible diflance between them; and that the refi?ance which ue experience is made by the repulfive power which gives us the fame fenfation as actut] contant. We can form no idea, it is true, of an inestended indivifible atom of matter, becaufe all our idtas of matter are affociated with extenfion and pirts; and fo difficult is it to break the affociation, we imagine thefe are effential to it. Bofcovich directs us to confider the nature of a mathematical point, in which there is involved no notion of extenfion or parts, and that from this we can form an idea of an inextended atom. The notion of an inextended and fimple atom is not peculiar to the theory of Bofcovich. Zeno and his followers among the ancients, and the modern Lecibnitzions, adopted it. But Bufcovich, by denying actual contact and continued extenfion, gets rid of :lac abfurdisies whis! refulted fium their opinions.

Some have afferted that the atoms of this theory do not differ from firits, becaufe they have not extenfiun, which is the characteriftic of matter. Does then extenfion conftitute matter, and the want of it firit? VVe apprehend not. The difcrimination of matter and fpirit confifts in thefe two circumftances: the former is perceptible by our lenfes, and is incapable of thought and volition ; whereas, the latter does not affeet our fenfes, but can both think and will. But the perceptibility of matter ariles from its impenetrability, not from continued extenfion. Befides this, the atoms have repulive and attraclive powers, though they do not therefore refemble fpirit. For were we to admit the exiftence of a kind of being poffeffed of thele active powers, conjoined with inertia, and having at the fame time cogitation and volition; it would neither be matter nor fpirit, but a tertium guid, diftinguifhed from the former by cogitation and volition, and from the latter by inertia, and by powers which induce impenetrability.

Bofcovich treats the other metaphyfical objections to his theory in a fimilar manner; but we think it very unnecefliary to dwell longer on them, and thall therefore proceed to the fecond part of our fubject.
II. We are obliged to be concife in our account of Applica. the application of the theory to mechanics, becaufe, tion to methuugh very valuable in iffelf, it can hardly be a-chanics. bridged, and would prove interefting to thofe only who are verfed in mechanical fcience. There remains, however, fome further circumitances of the curve to be confidered, which are eflential to the fully underftanding the theory itfelf, and the manner in which it is to be applied either to mechanics or to phyfics. We propofe to deliver them in this place in conformity with our author's plan, though they are equally fuitable to any of the three parts.

The circumitances we mean are of three kinds. Further re1 ft , ' lhe arches of the curve. 2dly, The areas coni-matks on prehended betwix the axis, and the arches which the the curve. ordinates generate by continually flowing. 3 dly, The points in which the curve cuts the axis.

1. The arches are either repulfive or attractive, ac- ${ }_{22}^{22}$ cording as they are fituated on the fame fide of the axis with the afymptotic limb ED, or on the fide oppofite, and termin te the ordinates exhibiting the repul. five or the attractive powers. The arches may bend towards the axis, and turn again from it without touching or cutting it, as in the arch P ef; this bending may be repeated, and may occur on either fide of the axis, and it may admit of many varieties in figure and fize, fo as to exprefs every pollible action and mode of action.
2. The areas may be of any magnitude however Areas ${ }_{2}^{23}$ great or fmall, or they may be infinite, according as the arches depart more ur lefs from the axis, or become afymptotical with refpect to $i t$. The abfiffes reprefent the diftances betwist the atoms, and the ordinates the prefent force by which they are acting: the areas which the ordinates run through, exprefs the increment or the decrement of the figuares of the velocities which are gencrated. From thefe principles it is eafy to fee in what manner the doetrine of dynamics may be applied in the theory. And from this vary circumftance it is clear that this theory does not interfere with principles in mechanics which are deduced from rafoning abAraEtedly

B O S [5
Sofcovich's Aractedly on fpace, velocity, and time, and in which

## Natura

 Philofophy. the nature and propenties of matter have no place. This remark is momentous, becaufe it ferves us in forming an adequate opinion of the merits of the theory, and it completely overthrows the feepricifn concernings mechanical knowledge into which fome have been led by imperfectly underllanding the object and the principles of Bolcovich. Wre beg to imprels this on the minds of our readers, and to affure them, that though the theory of Bofcovich be moll fatisfactorily eftablifhed, there will not one fundamental principle in the fcience of mechanics be overturned. This will no doubt mortify the ignorant fceptic, but it will animate the true ftudent to greater exertions, and it may open to him a field in which glory and fame remain yet to be reaped. To return, the alymptotic area included betwixt any afymptote and ordinate may be either infinite, or finite of any magnitude however great or fruall: or more generally, the area is infunte if the ordinate increafes in the fimple reciprocal ratio; but if the ratio be lefs in any degree, the area is finite.3. The points in which the curve cuts the axis are of two kinds, one where the tranfition is from repulfion to attraction, the other where it is from attraction to repulfion. Now thefe are called limits, and though they have fomething in common with each other, yet do they effentially differ. They have this in common, that if two atoms be placed at the ditance of any limits from each other, no mutual power is exerted by them; confequently if they are refpectively at refl, they continue fo. But if they be moved from their refpective relt, then an effential difference is obfervable betwixt thefe two kinds of limits. In the limit of the firft kind, viz. where the tranfition is from repulfion to attraction, the atoms refilt forther feparation, and endeavour to regain their former diftance by the attractive power then operating; and they refift nearer approach than the limit, and endeavour to regain their former diftance, by the repulfive power then operating. This therefore is called a limit of cobefion, feeing that if an atom be any way removed from it, it endeavours to regain it.

But in the limit of the fecond kind, if the diflance betwixt the atoms be in the leaft increafed, then will thefe atoms tend from each other more and more, by the repulfive power then operating; and if the diftance betwixt them be in the leaft diminithed, then they will tend to each other more and more, by the attractive power then operating. I'his therefore is called a limit of nor-cobefion, feeing that if an atom be any way removed from, it departs more and more from it. Now the limits of cohefion may be very Itrong or very weak; for if the corve cuts the axis perpendicularly, it is evident that the ordinates on each fide of the limit are the greateft, and therefore the forces which they exprefs the greateft. On the other hand, if the curve cuts the axis in a very fmall angle, it is alfo evident that the ordinates on each fide of the limit are very fmall, and therefore the forces which they cepprefs very fmall; and thefe in any proportion. Of the limits of non-cohcfion we may obferve that, in a fimilar manner, according to the angle formed by the curve in cutthis the axis at the points reprefenting them, the atoms will recede from, or accede to each other with greater or fmaller velocity, when their refpective diftance is changed.
'The remarks which we have now made, together Bocovich's with the former explanation of the curve, arc fufficient Syiftem of to acquaint our readers with the general principles of Pharlofuphy the theory, and will ferve to exhibit the manner inl which it may be applied to mechanics and to phyfics. Of the lomer; we have already mentioned, it is difilcult to give even an abridument; we propole then to employ the remainder of this part in enumer:tirg the particular lubjects in mechanics to which our aurhor has applied his theory, and in giving our opinion of the degree of fuccefs with which his application is attended.

He commences by flowing in what manner mafles Combina. of matter may be formed by the atoms, fuppoling them tion of the endowed with the powers of repulfion and attraction; atoms and firlt of the combination of two atoms, then of three, and fo to the moft complicated bodies. He proves that the maffes fo formed will be poffefied of different properties, in confequence of the difpolition of the powers which in certain cafes will always attract, in others always repel, and in others again will do nether, i. e. will be neutral. From thefe differences will necefrarily refult peculiarities in the mode of the action of different mafles, and thefe fo endlefs and diverffied, as to include every poffible phenomenon in nature. It is eaify to conceive that the varieties in figure will readiy refult from the pofition of the atoms, and the influtnce of the powers in refpect to each other. Thus a pyramid may be formed of four atoms, and a cube of eight; thefe fmaller or primary mafles may be combined to 28 form fecondary, and fo on to any order. Regular and form'ng dir. irregular bodies will thence be formed; and yet it mayferent be dhown that the moft irregular and complicated may be reduced to the primary or original forms, from whence they were confructed. The cryftallization of falt, for example, may in this manner be accounted for, and the reduction of them into the primitive forms be explained on the principles of the theory. 'Thele phenomena imply compofition and equilibrium of lorces, which ftrictly belong to mechanics; our author therefore proceeds to contider thefe and other tubjects connected with them: as the centre of gravity; the equality of attion and reaction; the collifion of bodies ; the centre of equilibrium ; the centre of ofcillation; the centre of percuffion. In all of thele we may obferve ${ }^{29}$ his law of the forces is ftictly applicable: that by it mechanical lome very difficult prohlems are folved, and fome in-phenomena. tricate plenomena explained, with an accuracy and precigon highly creditable to Bofcovich, and ftrongly prefumptive of the value of his theory. The formula which his inveftigations afford arc certainly corious and interelting to the fpeculative, and may be ufeful to the practical mechanic. He adds a few remarks on the preflure and velocity of lluids, which are equally clear, and in our opinion fativfactory.
III. W'e have already anticipated fome of the prin-trplication ciples which more properly belong to this part, in which to phyws. we confider his application of the theory to phylics. This neceffarily comprehends all the general properties of matter, fome of which have already congaced our attention when treating of the anslytic deduction and vindication of the theory, but alill require fome particular obfervations.

The impenetrability of the atoms is a neceffary con-In penetra. fequence of the interior repulfive power increafing as intity.

## B O

Bitovich's the difance dimininas; but it alro arifes from the inSyiten of extenfion of the atoms, and their indivifibility: becaule Ratural $\underbrace{\text { Phioloiphy, }}$ as lpace is infinitely divifible, it is in antely improbable that any two atoms frould ever meet in the fame part of it, though no repuifive power exifted, feeing that they may move in an infinite number of the parts of fpace which are unoccupied. So that, independent of any repulfive power, it is infinitely improbable that any compenetration thould occur.

## $\stackrel{32}{3^{2}}$

Phyfical extenfion neceffarily arifes from the impenetrability of the atoms; becaufe by it, no two atoms can occupy the fame part of fpace, and are therefore kept wuithout each other; but it is not mathematical or continued extenfion, feeing that fome fpace muft intervene betwixt all the atoms. Our fenfes, it is true, camot perceive this fpace on accourt of its finalluefs; no more can they perceive the difances betwist the particles of water or other huid, and yet from certain phenomena it is demonftrable that fuch diftances exill.

From extenfion arifes figurability, feeing that by the comtination of the atoms certain forms mult be produced : it can be eafily thown that, on account of the various limits of cohefion, there may be very different quantities of matter under the fame figure; and this involves the confideration of den/ity. The mafs of a body is the whole quantity of matter pertaining to it, or the number of atoms which compofe it. But it may be remarked that our idea of the mafs is very vague, arbitrary, and confufed, owing to the apparent heterogeneity of bodies.

The inertia of bodies is the confequence of the inertia of the atoms and of the mutual powers; and by it we underfland the determination to perfevere in the fame ftate of reft or uniform motion in a right linc, unlefs fureed by fomething external to change from it.

Mobility, one of the general properties of bodies, being cfiential to the atoms, is fo to the maffes formed of them. It is a conftquence of the mutual powers of the theory. Now all the motion we obferve is merely relative, cither in refpect of the carth, the planetary fyltem, or the fyllem of the fixed thars. From this perhaps we may derive an argument for the univerfality of the law of continuity in the cale of motion, feeing that the inflances where the law appears to be broken, muft be explained by the combined influence of moving powers which act continually and gradually ; and that therc is not one example of abfolute rell in the 36 univerfe.
Componiti- Though continued extenfion and divifibility be denibiey. ed to the atoms, it is allowed that they may be infinitely compounded; and hence componibility is contrafted with divifibility in the theory.

General gravity, according to the Newtonian prin- ciples, is allowed in this theory, as we have before mentioned; and we may now remark, that the ohjection u.ged againftit, as tending to produce an aggregate of all the matter in the univerfe, by drawing the planets, comets, and fixed flars, into one portion of fpace, may be obviated by fuppofing that a repulfive power fueceeds the attractive after it has reached to the conces of our fyftem; or that as by the curve, the limb TpsV ceafes to be afymptotical, and cuts the axis fo as to exhibit an arch of repulfion on the oppofite fide.

Of all the general propertics of matter, that of co.
$52] \quad \mathrm{B} \quad \mathrm{S}$
Lefion is mofl fimply and beautifully explained Ly this Fuicorich's theory; but as we have already fpoken of its limits and sy fem of their varieties, we need not now enlarge on it. We philusol 1 s. have to confider certain other properties of bodies, which $\underbrace{\text { Anorbs. }}$ from not being general have been called fecondary. Of $3^{38}$ thefe the principal are folidity and Aluidity.

Cohefion.
Fluidity.-Bulcovich imagines that the particles of Fiudiny. fluid bodies are fpberical, and that their forces are more directed to their centres than to their furfaces: by which motion is allowed freely when any force is applied to them from without; and that when at reft all the particles are in equilibrium in refpect of each other, but that the preflure of incumbent bodies, and containing veffels, slways caufes fome deviation from it. He fays, there are three kinds of fluids: one in which the particles or maflules have no mutual power; one in which they have repulfive power, and the other in which they have an attractive power. Of the firt we have examples in fand and fine powders; of the fecond are the claftic fluids, as air; and of the third, all liquors, as water, mercury, \&c. Now thefe thrce kinds are produced by the original differences in the prisary particles which compofe them; and we are able on the principles of the theory to fecify the caufes of the diverlity in the phenomena which they exhibit.

Solidity is the confequence of the irregular figure of Solidity. the particles and their great deviation from fphericity, by which free motion among them is prevented, and their cohefion better fecured. Now the diverfity in folids arifes from the various degrees of flrength in the limits of cohefion; and the fame principles will give ife to a clafs of bodies intermediate betwixt folids and fluids, viz. the vifcous, whofe particles attract each other more ftrongly than the fluids, and not fo Atrongly as the folids.

If we imagine the particles to be fo formed as to Organizaattract on fume fides, and to repel on others, and to at-tion. trad certain particles fimilarly conftructed, and to repel others, we may conceive in what manner the regular bodies denominated organized are compounded; and for thefe the varieties admitted in the limits of cohefion, fituation, and combination of atoms, will abundantly fuffice. Humidity is only relative, feeing that water, e. g. adheres to our fingers, and may be eafily fpread out on glafs, wood, \&c. whereas it does not affect oleaginous and refinous bodies: now this is in confequence of the partial arrangement of the powers in different bodies, and the varieties in the combination, \&ic. of the paticles.

Of the chemical operations Bofcovich remarks in Chemical gencral, that they may be all traced to the fame prin- phenomen?. ciple, the law of the forces, and the differences in the particles which thence arife; and that were the: fub. jected to the obfervation of our lenfes a general reafon for them would be dilcovered; but for this there are required an intimate knowledge of the texture of all the particles, and a power of geometry and analyfis which far exceeds the human mind. He explains fome of them in the following matiner: And firf of folution. The particles of fome folids liave a lefs attraction for each other than for the particies of fome fluids, and confequently when thefe are applied to each other, the patticles of the former will feparate and combine with thofe of the latter, fo as to form a mixture in which the two bodies arc fufpended in combination.

Bofcovich"s Bat the feparation of the particles of the folid can onSytum of ly take place fo long as the particles of the thuid are Philofophy. in the fplicre of their attraction; and when either of them get beyond it, or when the attraction of the mix. ture fo formed, becomes equivalent to the attraction of the particles of the folid for each other, then no more folution will take place, and the menftrum is faid to be laturated. But if into this mixture another folid, whofe particles have a greater attraction for the menltruum than thofe of the former, be thrown, then the menllrum will leave the former folid, or its particlea, and a.here or combine with the latter; in which cale the fornuer folid in the form of powder will fall to the bottom, or what is called precipitation will occur. In thort, he gives pretty nearly the common explanation of the phenomena; and on fimilar principles he accounts for the mixture of lluids. Now if the particles of two Ruids which are mixed together, come into the limits of cohefion, a folid will be thereby generated, of which we have fome examples. On the other hand, two lolids triturated together may compole a flaid, in confequence of the particles of each departing from the limits of cohefion.

If we confider that the firf limb of the curve exhibits impenetrability, the lall gravity, and the juterfections the various kinds of cohefion, we may form fome notion of the manner in which fermentation, evaporation, deflagration, \&c. are caufed; for whilf atoms accede to each other with any velocity, they increafe the velocity in every attractive arch, but they diminifh it in every repulfive arch; whereas on the contrary, whillt they recede from each other, they increafe it in every repulfive arch, and diminih it in every attractive arch, until in the former cale they arrive at a repulfive arch, or in the later an attractive one, which is fufficiently frong to extinguifl the whole velocity. When they do fo, they are reflected in the fame courfe, and ofcillate backwards and forwards. Befides this, if bodies compofed of particles which have different properties, in confequence of the different fituation and combination of the powers, be mixed together, an agitation among them mult neceffarily arife in order to attain an equilibriam; hence of. cillations, perturbations of various kinds, will follow, and caufe the great diverfity of phenomena which are obferved. Now all of thefe take place within the fphere of general gravity, which does not immediately infuence the operations. Suoftances which are diffolved may not only be obtained again by precipitation, but allo by evaporation of the menflruum in which they are difiolved. In this latter cafe the bodies generally affume fome regular forms, denominated cryftals. Now this arifes from the particles coming gradnally into the fphere of the attractive power of each other, and confequently attairing to fome limit of cohefion by the menitruum, which formerly kept them alunder, being gradually removed; whereas in the former cafe, where we obiain them by precipitation, the menftruum is fuddenly removed from betwixt the particles, which are conlequently left beyond the fplere of attraction of each other, and do not therefore affume any regular form. It will follow from this, that the more flowly evaporation is performed, the more regular will be the cryftals which are deponted; and this is verified by obfervation.

We profefs not to underfand Bofcorich's notion of Eoforich' the nature of fire; but lef our readers may require Syftni of it, we bcg to trantcribe his own words: "Ignem ego Natural arbitror efle quoddam fermentationis genus, quod ac= $\underbrace{\underbrace{-1 n t o p h y}}$ quirat vel potiflimum, vel ctiam fola, fulphurea fulfarssio, cum qua fermentat materia lacis vehementilime, Fire. fi in latis magna copia collecla fit. Ignem autem voco eum, grii non tantum ratefacit motu fuo, fed et calefacit, et lucet; quee onınia habentur, quando materia illa fulphurea fatis fermentefcit." And he obferves in another place, that if fire be excited only by a fermentation of lulphurcous fubfance, where there is wone of this fubtance there is no dariger of fire!

Bofcovich ret ins the Newtonian opinion concerning Light. light, wiz. that it is an effluvium or cmifion from the fun, propagated with immenfe celerity, and retained in certain bodies, from which it may be extricated by certain means. Ite holds the atoms of light to be immenfe, but fthll finite in number, and endeavours on the principles of his theory to account for the wonderful properties with which light is endowed. In doing fo, he makes exterfive ufe of the repulfive poner, the varieties in the limits of cohefion, and we may add, with much plaufibility and fuccels. Sir Ifaac Newton, in explaining the reflexion of light, found it neceffary to admit the exillence of a repulive power, for which, bowever, he had made no provifon in his fyftem. The late experiments in optics by Mr Brougham ferve to confirm the fuppofition of the exifence of a repulfive power in regard of light at leaft. Bufcovich refers his reader to his differtation $D e$ Lumine for more information concerning the reflexion, retraction, \&c. of light and colours, and for the application of the principles of his theory to them.

He proceeds to explain mary of our fenfations isenfations. but we mult confefs there is very little praifeworthy in his remarks concerning them: indecd we can fee no reafon why they fhould be introduced at all into a fyltem of natural philofophy, erected on fuch or any other foundation which concerns the external world only. In the fraall example of the ardour of fyftematic arrangement and application of phyfical principles to the intelledual world, which Bofcovich has given us, we obferve a triking coincidence with the doctrine of Hartley; but our opinion of that doctrine is not in the leaft meliorated by fuch coincidence. It is a doc trine which affects to teacb more than it is given to man to know; a doctrine by which we are induced to depart from the humble but lecure path of obfervation, and to wander in the boundiefs incomprehenfible field of tranfcendentals, and which, howsoever harmlefs its confequences may be, as it augments the vanity of man, prevents the employment of his faculties in the inquiry into familiar truths.

Bofcovich allopts Franklin's hypothefis of electri- Electricity city, which he detends on the principles of his theory; and magbut we matt refer our readers to the work itfelf, fornetifm. his reafoning on electricity and magnetifin. We would only remark, that as our knowledge of thefe curious phenomena is much augmented even fince the time of Bofoovich, his theory was appled to them with diladvantage; but perhaps thele very phenomena afford the beft proofs of the truth of lome of its pronciples.

Wre have now followed Bolcovich through the confideration of his theory, and we flatter ourfelves that, Concluding
$\mathrm{B} O \quad \mathrm{~S} \quad[5$ Fan-ovich's in fo doing, we lave given fuch an exhibition of its Sytem of peculiar principles as will at leath excite the curiofity of Philolophy. our readers, though it may not gratify it; and indeed, little more could be expected from us in detailing a fyltem of fuch magnitude, and affecting to comprehend fo much. W'e have, however, engaged ourfelves to give fuch obfervations and remarks as may have been fuggefted to us in the courfe of the work. In conformity with this, we beg the retrofpection of our readers to thofe circumaftances in the theory which are moft peculiar to it, and which ferve to fix on it the charachetiltic feature of originality. Of thefe the rejection of contak, as it is the mult confpicuous, fo it requires the moft particular attention, as on it refts the greatelt part of the reafoning and fabric of the fyftem.
We have feen that Bofcovich fupports this principle on the univerfality of the law of continuity, and on the exiftence of the interior repulfive power. Of the former we have to obferve, that the mode of proving it by induction is ilrictly philofophical, jult, and con:incing; but that the metaphyfical or pofitive arguments ufed for the fame purpofe are by no means fo. We do not mean to affert that thefe arguments have no weight, but only that they are not fo far removed from a confiderable fource of error and mifconception, as to prevent all fufpicion of their accuracy, and to entitle them to an ungualified application to the fubject we confider. It is true indeed, that no appeal to obfervation can directly determine the queftion, and therefore, it may be faid, we mulf have recourfe to fome other authority. But, to us at leaf, it feems as true, that the proof by induction is the only fatisfactory one we can have; and that if we are careful to keep in view that precept of philofophy which teaches us not to multiply caufes unneceffarily, and to reafon from analogy on the fimplicity and fleady uniformity of nature, there will be no occafion to have recourfe to other authority.

We are difpofed to believe, that the metaphyfical arguments which Bofcovich employs may be retorted on the theory itfelf. Does not the theory feem to admit a breach in the law of continuity, when it denies the continued extenfion of bodies? Or, as it rejects the divifibility and extenfion of atoms, mult we not imagine and believe, on the faith of the law of continuity, that thefe atoms are mere nuclei of repulfive powers? Or ftall we admit that the law of continuity depends on fome higher principle not yet difcovered, a principle in which extenfion or duration are concerned; that where there is neither extenfion nor duration, the law does not hold; that confequently, in the cafe of the atoms and their mode of union, this law fuffers a breach; i. e. that the metaphyfical arguments do not prove its univerfality, or that a breach of it is impoffible? Such are the myfterics in which we are enveloped, when we wander from that path which is afligned to human reafon.

As to the exiftence of the interior repulfive power, it may be obferved, that if it be proved or evincel to us, the impoffibility of contact muft be admitted. Now we are of opinion that a power of repulfion does exilt in the neareft vicinity of mary bodies; but we pretend not to know the law by which it operates, is even that it increafes to infinity on the diminution of the diftance. Whe ate fatisfed that it occafions many very curious phe-
nomena, fome of which have been explained by it; Eoícovici's and we fincerely believe that the inveftigation of its Sytem of laws and the extent of its influence will fabricate a Natural crown as unfading as that of Newton. But we are $\underbrace{\text { Philofoply. }}$ convinced that were the theory of Bofeovich concerning it tacitly confided in, fuch a crown could never te obtained. Nay we infif further, that though by reafoning it could be determined that fuch a power does exir, it would be ufelefs to us, till the moft labolious induction be practifed to difcover how far it influences obfervable phenomena, and how far it may be fubjected to human artifice and ingenuity.

The plenomena which give evidence of the exiftence of a power of repulfion are chiefly optical ; but it belongs not to this article to explain them. We may howcver juft mention that we allude to the experiments of the oljee-glaffes of long telefcopes, the brilliancy of dew drops while fupported on leaves or rolling on the furface of water, in which it is demonfrable that a certain face intervenes betwixt bodies which are apparently in contact, and that this fpace can be caufed by repulfive powef alone. Sir Ifaac Newton himfelf virtually admitted the exiltence of fuch a power, as appears from the laft queltion of his optics; indeed it is very certain that the attractive power alone will not produce many of the plenomena of which he fpeaks.
Concerning the other pinciples of the theory we have little to remark, feeing that moll of them refult from thofe we have now confidered. The tranfitions of the powers are in our opinion to be afcertained only by obfervation, and this it mult be confeffed is no ealy matter: the phenomena of fermentation, effervefcence, $\& \mathrm{c}$. to which we are referred for proofs of the exiftence of thefe tranfitions, feem to be eafily explained on fuch a fuppofition; but it is neverthelefs probable that the fuppofition was prior to the obfervation of the laws by which thefe phenomena are regulatec!. It may be worth while remarking, that if we are able to conceive thefe tranfitions as exifting, we can alfo conceive how mation may be produced at a dillance, which was held up as an abfurdity in the fchools. It muft be very evident to our rtaders that the theory of Bofcovich fuppofes this production of motion, and that any other mode is impolfible, feeing that contact is fo. But we are not therefore to believe that the repulfive or attractive powers are efficient caufes; though they certainly are phyfical ones, i. e. they are higher principles than the phenomena which fucceed them, and may for aught we know depend on lome one more general principle which this theory does not comprchend. Wee do not therefore forefee any dangerons conleģuences of the fuppofition of matter acting on matter at a dillance; nor can we belicve that thefe two expreffions are equivalent or confecutive, viz. if matter act where it is not, it may act when it is not. The one is a reference to face, the other to time, and betwist thefe we know no mean of comparifon.

We fee then that the theory of Bofcorich is intimately connecled with the molt abftrufe metaphyfical inquiries and difquifitions that can employ the mind of man; in particular, that which attempts to diforer the mode in which our perception of the material world is carried on. For fuch, we confcfs, we have not talents of inveligation, and indeed we are convinced that no invelligation has yet been, or ever will be, fuccefs

## B O S

Bofovich's ful; but we are alfo convinced, that if the theory of Syltem of Natural Pinitotophy

Bofcovich be ellablithed, many prepoflerous dogmas will be overturned: as fuch we picfer it to any that has hitherto beell ollered to the wolld. But it is to
be conflered as walid, in fo far only as imduction fatis. fies us of its principles; that it can be fatisfactorily :ppplied to the folution of any phenomena where other theories fail us; that it does not in anywife inform us of the nature, or fuperfede inquiry into the laws of matter. We are of opinion that it was his very intimate knowledge of thefe laws, and his diligent inquiry into matters of fact, that led Bofcovich to the difcovery of the law of continuity and of the forces, and made him fee the propriety of erecting fome new fyltem in which thefe might bear a part. 'The merit of Bofcovich conlifs not in having difcovered the caufe of motion, or on what it depends. He attempted a mure humble flrain: lie inseftigated familiar operations, and acquainted himfelf with vulgar things. No mylterious analogy indeed conducted him cither to the harmony or to the beauty of the fpheres; but then, no flupendous vacuum imtercepted his path, and no unruly vortices whirled him from rectitude. That be fopped not where prudence might have directed, and beyond which his guide could go no farther, was the failing of genius elevated by fuccefs, the lot of the refplendent few who are dazzled by thair own lufter. Fut it would ill become his followers to attempt continuing to the end on that path which he pointed out; moderate minds thould accompany him as their friend, only fo long as they perceive he is directed by a friend which is greater than him: let them remember that it is his obfervations alone which are valuable, the fimple arrangement of them which they fhould efteem; it is the plain narrative of the honeft traveller which will affilt them, not the pompous fabric of the felf-deInded novelitt.

The only theory with which we can properly compare this of Bofcovich, is the Newtonian, and in fo doing its fuperiority will appear ; but for very obvious reaforis we enter not minutely into the comparifon, and will only add that in the Newtonian, we
muf have recourfe to the three griucigles of gravito, "os ov $1.0^{\circ}$, cohefion, and fermentation, for the explatati $n$ of far. ${ }^{2}=4$ nomenis; and even thefe are infuflicirst in th modern in la, chemiftry: but we le orn from the forme: that the e tere only portions of a more genesal principle, thit they refult from one fundani "ut d law, and hat tor that las may be refered as wedt the formation of a dew drop, as the rulling of the fpheres (A.).

Some of the admirers of IB lcovichmat b farp if 1 that we allirm, his theory gives no inturmation of ar $f$ orse ellicient caufe in noture, and that all the diforery he has made is, that of lome events which precode the Newtonian gravity. Wte have alrendy loorne ample teflimony to the merit of Bseovich, and we thit be we are fccure from any fulpicion that we chueavour to depreciate the value of his theory; fuch indeed on bar from our thoughts, but we mull lay it is firther from our thoughts to confiler it as the ulim $m$ in $i$ :ural phitufuplay, or that it difclofes to us the wit ifpereme procels in nature. We will verture forther; for we will maintain, that though all the priaciples of the theory were eflabliftied on a firm and inviriable foundation, as they are not, it would be impolible for any one to determine what thatl be the confequences refulting from them, prior to experience of the regulari$t y$ and the confancy of the conjunction of events; and that of confequence the fame, nay greater, labour of induction and obfervation is required in the phenomena of the material world; greater, becaufe the objects are increafed in number by the difcovery which Bofcovich has made. But this affertion concerns the laws of nature alone, not the laws of human thought, of which, in our opinion, Bofcovich has made too free ufc. He tells us that one confequence of the interior repulfive power is, the impolfibility of contact, and tha: another is the impenctrability of the atoms. Now it requires no great exertion of underflanding to perceive that he is dilplaying a law of human thouglat, for thede conlequences of which he fpeaks are paris of the fame conception, and that no reafosing a priori is cmployed to determine their connexion; for we cannui pulibly imagine, that contact or penctrability of the dioms thould
(A) It may be a fatisfaction to our readers to know that Sir Iface Newton entertained notions very fimilar to thofe of Bofcovich concerning the caufes of motion at infenfible difances, though it is to be regretted that he had made no provifion for them in his fyftem. The laf queftion in his optics plainly indicates that he himfelf was convinced that no law by which an attractive force might be fuppofed to act would be fulticiene for the explanation of certain phenomena which take place in the immediate vicinity of the atoms of matter. "And if all thefe things are fo, then all nature will be very fimple, and confiftent with itfelf, effecting all the greut motions of the heavenly bodies by the attraction of gravity, which is mutual between all thofe bodits, and almolt all the lefs motions of its particles by another certain attractive and repulfive force, which is mu:ual between thafe particles. Now it feems that thefe elementary particles not only have in themfelves the elis inerfies, and thofe palive laws of motion which neceflarily arife from that force, but that they likewife perpetually receive a motion from certain active principles; fuch as gravity, and the caufe of fermentation, and of the cobefinn of hodies. And I confider thefe principles, not as occult qualities, which are feigned to how from the fuecific forms of things, but as univerfal laws of nature, by which the things themfelves were formed. For that truly fuch principles exilt, the phenomena of nature thew, dthough what may be their caufes has not as yet heen explained. To affirm that every fpecies of things is endued with fpecific occult qualitics, by which they liave a certain power, is indeed to fay nothing; but to deduce two or three general principles of motion from the phenomen.s. of nature, and then to explain how the properties and action of alt corporeal things follow from thwie principlethis truly would be to have made a great advancement in philofophy, although the caufes of thofe pail if'es were not as yet known. Wherefore I do not hefitate to maintain the above f.id principles of motion, leat they extend widely through all nature." Newton's Oprics.

## B O S [ 56 ] B O S

Botiovich's mould occur, if fuch a repulfive power exifs, or that
syttem of Natural Philofophy.
the impolfibility of the former, and impenetrability, thould be caufed by any thing clle than fuch a power.

The moft ignorant of the fons of men are as well qualified to underftand this as the greateft philofophers Who have adorned humanity; and if it be entirled to the name of difcovery, it is one in which all mankind have !hared : but for laving expreffed it in words, and incorparated it with others which fome kindred genius alone could have made, all are indebted to Bofcovich, and mult acknowledge that in his hands it has ferwed to fabricate a lafting monument of genius, induftry, and fagacity. We are not therefore to confider that thefe are inflances wherein any confequerces have been determined a priori; and they do not affcet our affertion, that prior to experience of the reguarity and the conftancy of the conjunction of events, it would be im. pofible for any one to determine a priori what fhall be the confequences refulting from the principles of the theory. To illuftrate our meaning in the affertion, we thall fuppofe that the tranfitions of the powers have been difcovered to exift in the conftitution of matter; and we then afk, if, prior to the knowledge of the phenomena of fermentation, \&c. it could have been determined that thefe phenomena fhould neceffarily refult from them: we apprehend it could not, and our seafon is, that we cannot find any mode of connexion betwixt any tranfitions of any forces and thefe phenomena; for we can conceive the former to exift with. out the latter, and this might have been the cafe, for aught we know to the contrary; and we think we are authorized in faying, that thefe tranfitions are only rules or methods obferved in the production of fuch phenomena, that they are events prior to fermentation, \&ic. and remain themfelves to be accounted for. We may fay the fame of the repulfive and attractive powers, and of all the other principles in the theory which are not laws of human thought. Caufation is infcrutable, the labours of every age ferve only to add to its myItery, feeing that they conduct us nearer to the boundaries of human oblervation, and difcover to us the delufive glare of every weak meteor which promifed permanent and enlightening luftre.

We have feen that the general properties of matter may be well explained by the theory; and fo far therefore we mult admit that the theory is applicable to the objects of inveftigation, and may be ufeful to conneft together fome general principles. There remains to us to make one remark concerning one of thefe, viz. Newtonian gravity. The fuppofition that it terminates beyond the comets of our fyftem, and is fucceeded by repulfion, appears to us very unncceffary, not to fay unlikely, though highly worthy the accommodating genius of Bofcovich. We are of opinion, that the objections urged againft Sir Ifaac Newton on this fubject, may be much better and more fimply obriated by a fuppofition which the modern improvements in affronomy have nearly confirmed, viz. that there are fyftems of funs and revolving plancts, fimilar to, and reaching to the limits nf, our own; and that thofe are fufficient to counteract the neceffary effects of univerfal gravity or attraction. If fuch be the rafe, inequalities in our fyftematic motions, relative to others, may arife from the varying fituations of the other fyftem; and, if we confider the fixed flars as forming thefe, we roay ob-
ferve differences in their poffions and magnitudes, in Roforich's confequence of luch variations. Our aftronomical Sy ften oit reader will perceive that we allude to the apparent philofophy, approach of our fun to the conftellyiors Hercules in $\underbrace{\text { Phlotophy. }}$ the narthern hemifphere, the gradual widening of the fiars in that quarter of the heavens, and the confequence of it. But without any fuch confirmation it muft be acknowledged, tiat our fuppofition is much more probable, and vives a more elevated notion of the great Artificer's Aill than that of Bofcovich, and we are the more ansious to retain it, that one of the principles in the theoiy may not be broken, that the tranfitions of the powers occur in the infenfible diftances. We requell the attention of our readers to Bofcovich's frovidem fuppofition on another account. Does it not indicate one of the modes by which the theory was formed? Does it not plainly hlew us how far genius will be exerted when obfervation fails? Does it not fatisfactorily demonftrate that part of this fplendid theory is the offspring of an imagination heated by fyftematic love, and animated by a recorciling enthu. fiafm? Indeed when the imagination is the provider, the reafon can be well fatisfied; for what is wanting can be readily fupplied, what is difpleafing can be eafily rejected, what is unfhapely can be fafhioned to conformity, and all can be decorated and adorned, till at laft there arifes fome fine fabric to pleafe and to delight. But we require more than delufive ornament, and yet we expect not perfection; we know that every theory of natural philofophy has failed hitherto, not from a deficiency but rather from a luxuriancy in grandeut, which, furpaffing, has eclipfed the minute gems that glitter below; no one has failed in explaining the fupendous ftructure and the mighty rollings of worlds, which no eye ever comprehended, and no hand ever approached; but take it from its godlike work to the mean purpofes and the trivial ufes of man, and behold the airy phantom thrink from our view. It is in explaining familiar circumflances, or, fo to fpeak, the events of our neighbourhood, that every one has failed; but it is confoling to mankind to know, that in every fucceeding one, there is a greater approximation to perfection, a greater cxtent and more lacility of application; and we will acknowledge that this of Bofcovich, though not totally invulnerable, certainly leaves the leaft uncovered.

The obfervations which we have now made feem to us very proper to introduce thofe we have to offer on the application of the theory to phyfics. We are of opinion that Bofcovich, in his account of folidity and fluidity, has rather given a defcription, and related fome properties, than propofed àn explanation or deduction on the principles of his theory: but in a fyltem of fuch extent, and promifing fo much, we require more than this, and it is our opinion that more may be given. Without pretending that we have complete fuccefs in our attempt, or vilhing to prcclude others, we offer the following as at leaft a probable ope.

We can inagine, that any number of atoms fhall come into the limits of coliefion of each other in fuch a manrier as that a mafs of fome determined form thall be produced; and that the powers on each fide of thefe limits are fo Arong, as to witheftand confiderable divellent force from without. Now in a mals fo con-

Bolcovich's fructed every atom is retained in its fituation by

Syftem of
Natural $\underbrace{\text { Philotophy. }}$

保 which cannot be increafed or dimininied by any other means than varying the diflance betwixt thefe atoms. The powers io influenced are thofe only which belong to the particular atoms whofe refpective diflances are changed; for the powers of the atoms whofe diftances are not changed remain the fame; therefore a portion of the mals may be feparated, or the whole mals may be inoved, without caufing any relative motion among the atoms; for, in the former cafe, a few only, in the latter, none, of the limits of cohefion are difturbed. This then is the Aructure which the atoms of matter would form, did fuch laws as we have confidered exift; and it appcars to us that it is the natural ftructure; for we ourfelves cannot conceive how a fuid body flould be compofed by fuch laws independent of compofition of them. But admitting compofition, we would explain fluidity in the following manner: As in a mafs, fuch as we have defcribed, there are fpaces betwixt all the atoms; it is poffible that other atoms may be introduced witbin it, or that in the vacant intervening fpace the powers of other atoms may operate. Now, it is eafy to conceive, that in the former cafe very various effects will refult in confequence of the differences in the proximity of the atons; for fome will quit the limits of colefion in which they were prior to the introduction of the adventitious atoms, and will enter into new ones, and will vibrate from one to another, if there be a conftant addition of atoms made, or if any of thofe which have been introduced be removed; and that in the latter cafe, in conlequence of the compofition of forces, very different effeets will refult, according as the compofition is of fimilar or different powers afting in the fame or different directions, and of different intenfities: in either cale relative motion among the particles will occur, and the mafs will yield to the leaf extrinfic force; an equilibrium will fometimes be produced, but it will be deftroyed very readily in different ways, as by the addition or fubtraction of the adventitious atoms, and by the application of forces to the mafs. We might fpecify fome of the particular circumfances which would tend to the production of different fluids did our limits permir; but as this would be prolix, we flall only mention fome of the confequences which may be deduced from the principles we hive flated, and granting that they are well founded, we fhall confider how far they coincide with the phenomena we obferve. Every fuid muf be a compound body. This will be pretty generally admitted by modern chemifts; for though they well know that the compofition of feveral fluids is not yet difcovered, they will allow that the rational prefuraption from analogy is, that when our analytical powers are augmented, we thall be able to difcover the compofition of all of them; nor is it any objection to the rationality of the prefumption that many of the gafoous lluids are fimple or elementary, for it mult be remembered, that all of them are combined with caloric or the matter of heat. Nay caloric itfelf, which we hold to be a fubflance, may, for ought we know to the contrary, be a folid body; it is indeed almof univerfally believed to be fluid, and effentially fo; but, for this belief we can find no other reafon than that it caufes fluidity, and furely that is a very Vos. IV. Part I,
unphilofophical one; for in a fimilar manner, and we Bofoovich's venture to fay, with as much truth, if matter or its yhen of atoms be conftructed in the way Bofcovich defcribes, plitora phy. and if they poffefs the power of tepulfion and attrac- $\underbrace{-\quad \text { enorper }}$ tion, then all matter is fluid, for all the atom of it will caufe fluidity in certain circunflances. We do not deny that when it combines in fufficient quantity with bodies it caufes fluidity; but we beg to remind our readers that there are cafes of tluids being ger:erated by the trituration of folids together, and forely they will acknowledge, that what is tue in the one cafe, is at leaft poffible in the other; but we will even admit, that caloric is the principal caufe of tludity (though we are aware that in admitting it, we depart from true philofophy), and yet we do not peto ceive, that the leaft objection to our fuppofition will thence arife. May not caloric be compofed of the very fmalleft, or the primary atoms of matter, and confequently be more eafily infinuated betwixt the atoms of other bodies which are compofed of the ag. gregates of thefe primary atoms? Do we not find that it correfponds pretty accurately with the defcription of thefe atoms which Bofcovich has given? Does it not feem in the lealt ditances to repel its own particles, and at greater diffances to be attra\&ted by the pasticles or atoms of other bodies?

The conftant addition of adventitious atoms to the interfices in a folid body, as we have before mentioned, will caufe vibrations, and will at laft, by totally feparating the atoms from the limits of cohefion and the fphere of the attractive power, render them fufceptible of the influence of furrounding bodies, fo that they leave each other, and combine with thofe which furround tham. When caloric is the body added, the moft general effect which refults from its repeated and conftant addition is evaporation. Now the particles of an evaporated fluid will recombine if the fuperabundant caloric which holds them afunder be withdrawn, provided the bodies with which they unite do not attran them more powerfully than they do each other. But it is poffible that fuch an addition will in certain cafes firengthen the combination of a folid, i. e. that fluidity will not always be the confequence of infinuating atoms into the vacaut fpaces, for it is poffible to fpecify circumfances, in which a body already fluid, may be rendered folid by interpofing amongtt its particles, the paticles of another fluid.

When the adventitious atoms are removed, one of two confequences will occur, either the atoms of a folid which has been rendered fluid by fuch infinuation, will be left within their fpheres of attraction, and confequently will enter into limits of cohefion, but to form a folid again, or they may be left beyond thefe fphere:. fo as not to enter into limits of cohefion, but to form a loofe uncombined pulverulent fubftance. It may happen that in the latter cafe, the particles being feparated from each other beyond their fpheres of attraction, will enter into combinations with other bodies, of thofe in. fluence they are now fufceptible. We have inftances of both of thefe in the fufion of metals: fometimes on cooling thefe form again into folids; others, having their atoms too far feparated from each other, cannot fo unite, but combine with other bodies, (generally oxygen) and form powders which retain no characteriftics of metals; and fome combine with other metals, conflituting alloys.

## B O S

Bnforich's We recommend the profecution of this fubject to the
Syftem of
Natural philofophy; philofophical chemiff; and though we encounter the charge of vanity, we cannot belp flattering ourfelves with having pointed out a mode by which, though no- thing fhould be difcovered, yet to refolve fome apparently unconnedted phenomena into one gencral principle, aird hence to abridge the labour of acquiring the fcience of chemitry, and to facilitate the application of it to the practical purpofes of life. We are of opinion that the facts in chemiftry are now fo numerous, as to require a generalizing fpirit to reduce them into fome kind of order, to fhew their comexion in the chain of nature, and to derive from them by induction, certain principles which may be employed in the fynthetic procefs. Indeed, without fuch it will foon be found that no ordinary mem sry can retain what may be ufeful, but certainly is tlegant in the art, and that a great body of evidence is infufficient to enforce convietion, if it be huddled together in chaotic confufion: pillars and porticoes, and carved fones may be collected, and may allonith us by their grandeur ; but unlefs they be methodized, connected, and combined, our aftonifhment will refemble that which we feel, when we consemplate the prepofterous flrudure of fome natural monAter, whofe linbs are individually clegant, hut ferve by their elegance to magnify the error of their polition. We do not wih to depreciate the merits of modern chemifts, but we mult confefs, they appear to us more fcrupulous about afcertaining the few grains of earth in fome cockle foelf, than anxious to erect a temple to their fcience; and are themfelves too much elevated by the difcovery of a femi metal, to be concerned about the deities which prefide. What we have faid may be thought mere declanation, if we do not accompany it with fome example of the employment of fuch a generalizing firit; we know not how far it may become us to do fo, but as the confideration of the theory of Bofcovich, in which we have been engaged, has naturally led us to thofe phenomena which feem beft qualitied to admit of its application, and as therefore, in fome fort refulting from, or connected with our fubject, we fhall attempt to give a froall fpecimen of it. It is well known to chemifs, that although certain individual or fingle bodies of the laline clafs be very foluble in water, the compounds formed of them are very in foluble in that fluid, $i$. e. that though alkalits or acids be fingly very foluble in water, the meutral falts formed by them are very foluble; and that many varieties in the degrees of folubility are to be met with in the compound bodies or neutral falts, which are contrary to what we llould expeet from reafoning on the varieties of thefe degrees, in the fimple or elementary bodies which compofe them.

For exmple, the fulphuric acid is very foluble in water, and $\mathrm{f} u$ is the vegetable alk:li or putafs; but the fulphate of potafs, which is a compound of thele, is fo difficult of fulutuon, that 16 times its own weight of water, at the timperatue of $60^{\circ}$, is required to effect it. The acetite of putafs affords another example, though not foremarkable, requiring only abour 10 rimes its ounn weight of water at the fame temperature. In. deel, there are many inflances of a compound or neutral falt being lefo foluble than cither the alkali ot the acid which enter into its compolition ; but in thofe we have mentioned, she difference is fo great as to have
merited much attention, though as far as we know, Rofecvich's there has not been affigned a reafon for it. Now we SyRem of apprehend the reafon to be, that as both the fimple bo- Natural dies have an attraction for water, or that as there is Philofephy. an attraction betwixt water and thefe two bodies, the degree of attraction will be equal to the difference only of the feparate attractions betwixt water and the bodies individually; or, in other words, the attraction betwixt water and one of the bodies will be leffened by the attraction betwixt water and the other body, fo that the difference only of thefe two will influence. Now, in certain cafes, this difference will be equal to nothing, when the attractions are equal ; but in every cafe, it is evident, it will be lefs than the greater of the attractions, and, of confequence, the folubility of the compound will be lefs than that of the fimple bodies which compofe it. Now this confequence is not affected by the abfolute folubility of the fimple bodies, but by their folubility in refpect to each other, i. e. relative alone; therefore, the compound of fimple bodies, which themfelves are highly foluble, may be no more foluble than the compound of fimple bodies, which themfelves are very little foluble.

The principle is univerfal. Other confequences will refult, which are not only curious, but in our opinion important; and we do not in the leaft befitate to affert, that the principle may be applied to determine a priori the degrees of folubility of neutral falts, provided we are fufficiently acquainted with the relative folubility of the fimple bodies which compofe them. One confequence will be, that a compound formed of a very foluble and a very infoluble fimple body will be nearly, or quite, as foluble as the former, feeing that the attraction betwixt it and water will be little or not at all diminithed by the attraction betwixt the other very infoluble body and water. As a proof of this, we may take the inftance of the fulphat of magneffa, which is foluble in its own weight of water at temperature 60: Now in this cafe, the magnefia is foluble to a very im.ll amount only; but the acid, it is well known, is fo to a great degree; even the fmall folubility of the magnefia, however, does in a certain degree impair the folubility of the compound. The fame is true of the nitrat and muriat of magnefia; and, did our limits permit, we might adduce very many examples of the fame: we night thew, that the compounds of very foluble acids with the metallic oxyds are loluble, if thefe oxyds are not fo; but if they are, the folubility of the compound is impaired: and we might alfo apply the principle to bodies foluble in alcohol and other menffrua, where it will be found to hold. But we leave the profecution of the fulject to our chemical readers, confffing, however, that we have found exceptions to its univerfality, which as yet we have not been able to reconcile. Perhaps, a principle Alll more general, and higher in the order of e vents, may intluence or modify this uhich we have fpeciffed; it may be connected with fome of thefe varicties in the cunupolition of forccs, which muf take place in the inferfible dillances, changing the limits of cohefion, and modifying the pofition and the action of the atoms of matter. We have ventured lar in the expofition we have given! did we perfevere, there might be imputed to us temerity.

We have attempted to apply Bofcovich's theory to
feveral

## $\mathrm{B} O$ S $\quad\left[\begin{array}{ll}59 & \end{array}\right.$ <br> B O S

Boocovich's feveral other chemical phenomena, particularly thofe

Syifem of
Natural
Pbilotophy
i
Bofhies-
Men.
of elective attraction and difpofing allinity; but though our fuccels has been fomewhat fattering, we have not been able hitherto to collect and arrange our principles and refults, fo as to prefent them properly to the public. At fome future flage of this mork, however, fuch may be in our power, when we hope to convince our readers, that the theory is fufficiently accommodated to that object, and that it will affift us in deducing principles more general, than any yet received in chemical fcience.

It is now time for us to conclude our account of the theory of Bofcovich; and in fo doing, it becomes us to recommend to our readers, that they endeavour to form a juf and an adequate opinion of its merits, of the objects which it has in view, and of the means which it employs to accomplifh them. Confidered in refpect to itfelf only, as the production of a great and an enlightened mind, no labour to comprehend it can be in vain or worthlefs, and no one can comprehend it without receiving the moft elevated pleafure; but there is another inducement for us to effect this purpofe, dif= ferent from any we have yet mentioned : we mean the tendency it will have to modify, and to fubvert, many of the leading doctrines in the metaphyfics of the day. Nor ought this to alarm any of our readers, for if thefe doctrines be true and legitimate, they will be paramount to all objections, and the improvements made in every other fcience will ferve to confirm them ; but if they are not fo, furely the fooner they are fubverted the better it will be for fcience and for us all; at all events, an inquiry into them is rational, and it may do good. This, however, we dare not now propofe to ourfelves, and will therefore recommend our readers to perufe the Effays on Perception, by Profeflors Reid and Stewart, where they will find fentiments which derive moft of their validity from fome of the Bofcovichian principles. They are fentiments in which we have the honour to agree with thefe true philofophers; though it is fomewhat mortifying to us to confefs, that they have convinced us that the phenomenon of which they treat is inexplicable.

It is indeed very mortifying to humanity to be convinced, that for many, very many centuries, our forefathers have been unceafingly attempting to explain phenomena intellequal and material by a nullity, on principles which do not exift; but it would be ftill more mortifying to find, that though there is ground for fuch convictions, men calling themfelves philoSophers thould perfevere ftedfafly in the fame invariable courfe of error and abfurdity. In our own days, a light, clear and authoritative, has arifer to direct and to animate us in the fearch after truth; it is our own faults if we thut our eyes againft its fplendour, and fuffer the interior man to be dark and unenlightened. Of this IIght the theory of Bofeovich forms a part: it has fucceeded and furpaffed that of Newton; it will be the parent of a greater than either; it profefles to conduet us to the interior veil of the temple of nature; but it has failed in this very fublime attempt, failed, however, only after it has conducted us beyond Defcartes, Leibnitz, and Newton.
bosea, golden-rod tree. See Potany Index.

BOSHIES-MEN, a fpecies of Hottentots, fo call-
ed, according to Dr Sparman, from their dwellis) in woody or mountainous places. They are fworn ene- mies to a paftoral life. Some of their maxims are, to live on hunting and plunder, and never to keep any animal alive for the face of one night. By this means they render themfelves odious to the reft of the inhabitants of the Cape; and are pusfued and exterminated like the wild beafts, whofe manners they have affumed. Others of them again are kept alive, and made flaves of. Their weapons are poifuned arrows, which fhot out of a fmall bow will fly to the diftance of 200 paces, and will hit a mark with a tolerable degree of ceitain. ty at the diftance of 50 or even 100 paces. From this diftance they can by fealth, as it were, convey death to the game they hunt for food, as well as to their fues, and even to folarge and tremendous a beaft as the lion; this noble animal thus falling by a weapon which perhaps it defpifed, or even did not take notice of. The Hottentot, in the mean time, concealed and fafe in his ambulh, is abfolutely certain of the operation of his poifon, which he always culls of the moft virulent kind; and it is faid he has only to wait a few minutes in order to fee the wild beaf languifh and die. The dwellings of thefe foes to a paftoral life are generally not more agreeable than their maxims and manners. Like the wild beafts, bunfes and clifts in rocks by turns ferve them inftead of houfes; and fome of them are faid to be fo far worfe than beafts, that their foil has been found clofe by their habitations. A great many of them are entirely naked; but fuch as have bcen able to procure the flin of any fort of animal, great or fmall, cover their bodies with it from the Thoulders downwards as far as it will reach, wearing it till it falls off their back in rags. As ignorant of agriculture as apes and monkies, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants (which they eat raw), in order to fuftain a life that this miferable food would foon extinguith and deftroy, were they ufed to better fare. Their table, however, is fometimes compofed of feveral other dithes, among which may be reckoned the larvie of infects, or that kind of cater. pillars from which butterfies are generated; and in like manner a fort of white ants (the termes), grathoppers, fnakes, and fome forts of fiders. With all thefe changes of diet, the Bofhies-man is neverthelefs frequently in want, and famifhed to fuch a degree as to wafte almoll to a fhadow. "It was with no fmall a. fonifhment ( fays Dr Sparrman), that 1 for the firf time faw in Lange Kloof a lad belorging to this race of men with his face, arms, legs, and body, fo monArounly frall and withered, that I could not have been induced to fuppofe but that he had been brought to that fate by the fever that was epidemic in thofe parts, had I not feen him at the fame time run like a lapwing. It required bat a few weeks to bring one of thefe farvelings to a thriving flate, and even to make him fat; their forachs being ftrong enough to digef the great quantity of food with which they are crammed, as they may rather te faid to bolt than eat. It fometimes happens indeed that they cannot long retain what they have taken in ; but this cireumftance, it is faid, does not hinder them from beginning again upon a new icore."

The capture of Noies from among this race of men H 2

Bohies is by no means difficult ; and is effected (Dr Sparrman iten. informs us) in the following manner. "Several far-
mers that are in want of fervants join together and take a journcy to that part of the country where the Bohies-men live. They themfelves, as well as their Iego-Hottentots, or elfe fuch Boonies-men as have been caught fome time before, and have been trained up to fidelity in their fervice, endeavour to fpy out where the wild Bolhies-men have their haunts. This is belt difcovered by the fmoke of their fires. They are found in facieties from 10 to 15 and 100, reckoning great and fmall together. Notwithftanding this, the farmers will venture in a dark night to fet upon them with fix or eight people, which they contrive to do by previoufly fationing themfelves at fome diftance round about the craal. They then give the alarm by firing a gun or two. By this means there is fuch a conflernation fpread over the whole body of thefe farages, that it is only the moft bold and intelligent among them that have the courage to break through the circle and fteal off. Thefe the captors are glad enough to get rid of at fo eafy a rate; being better pleafed with thofe that are flupid, timorous, and ftruck with amazement, and who confequently allow themfelves to be taken and carried into bondage. They are, however, at firf treated by gentle methods; that is, the vi\&tors intermix the fairef promifes with their threats, and endeavour, if poffible, to fhoot forne of the larger kinds of game for their prifoners, fuch as buffaloes, fea-cows, and the like. Such agreeable baits, together with a little tobacco, foon induce them, continually cockered and feafted as they are, to go with a tolerable degree of cheerfulnefs to the colonift's place of abode. There this luxurious jurketting upon meat and fat is exchanged for more moderate portions, confifting for the mofl part of butter-milk, frnmenty, and hafty-pudding. 'This diet, neverthelefs, makes the Bo. files-man fat in a few weeks. However, he foon finds his goad living embittered by the maundering and grumbling of his matter and miftrefs. The words 'guzcri and i'gaunatf, which perhaps are beft tranflated by thofe of "young forcerer," and "imp," are expreflious which he munf frequently put up with, and Sometines a few curfes and blows into the bargain; and this for negleew, remifliefs, or idenefs: which lalt Sailure, if it camot be faid to be boin with him, is however in a manner maturalized in him. So that, both by nature and cuftom detefling all manner of labour, and now from his greater corpulency becoming fill more flothful, and having befides been ufed to a watidering life fubject to no controul, he noff fenfibly feels the want of his liberty. No wonder, then, that he generally endeaveurs to regain it by making his efeape: but what is really a fobject for wonder is, that when ooe of thefe poor devils runs away from his fervice, or more properly bondage, he never takes with him any thing that does not helong to him. This is an inflarice of moderation in the favages towards their tyrants wheh is univerfally attefted, and at the fame time praifed and adsnired by the colonifts themfelves; which, however, 1 cannot eafily reconcile with what I have learned of the human heart. Is it in cosfequence of their fearing to mcet with harder ufage in cafe they fhould be relaken? This far, however, is certa:n, that noas o! this fpecies of Hottentots are
much given to violence or revenge. Free from many wants and defires that torment the reft of mankind, they are little, if at all, addicted to thieving, if we except brandy, yictuals, and tobacco. It is not improbable likewife, that the advantages accruing from a theft may be overlooked by them, when their thoughts are taken up with regaining their liberty, the greatent of all treafures. It is neceffary to obferve here, that fome of the Hottentots or Bohlies-men, who are thus forced into the fervice of the colonifts, live in friall focieties peaceably and quietly in defert tracts, where the colonifts cannot eafily come at them, and are fome. tincs in the pofleffion of a few cows. Thefe people probably originate from Bothies-men who have run away from the colonifts fervice.
"I mult confefs (continues our author), that the Boflies-men in fome hufbandmen's fervice are treated in the genitlet manner, and perhaps even without ever having a harfh word give them; live very well with regard to provifions; are well clad, relatively to their condition in life; and are very comfortably lodged, in comparifon of what others are, in their own flaw cottages. The chief of their bufinefs perhaps confilts in tending a herd of cattle or Hock of meep during the heat of the day, when they have an opportunity of getting into a gentle flate of intoxication by fmoking tobacco; a flate which excites in them ferfations of as agrecable a nature as the frenzy produced by (pirituous liquors and opium feems to afford to many others, who are never at eafe but when they can procure to themfelves this delicious pleafure. And yet, though they may thus agreeably pafs away the otherwife tedious hours of their lives in fmoking and fleep, they neverthelefs generally run away. The colonitts wonder at this, as a procedure entirely devoid of reafon; without perceiving, that in fo doing they fuppofe the Hottentots not enducd with a defire, which has its immediate foundation in nature, and which is common to the human race, and even to mof brute anlinals, viz. an earneft longing after their birthplace and familics, and efpeciatly after their liberty.
"The flave bufinefs, that violent outrage to the natural rights of mankind, always in itfelf a crime, and which leads to all mamer of mifdemeanors and wickednefs, is exercifd by the colonifts in general with a crucley towards the nation of Bofhies men which merits the abhorrence of every one; though 1 have been told that they pique themfelves upon it: and not only is the capture of thofe Hottentots confidered by them merely as a party of pleafue, but in cold blood they deffroy the bands which nature has knit betwecn hufbands and their wives and children. Not content, for inflance, with having torn an unhappy woman from the embraces of her hulhand, her only protection and comfort, they endcavour all they can, and that chiciclly at night, to deprive her likewife of hor infants; for it has been obferved, that the mothers can feldom petfuade themfelves to flee from their tender offspring. The amiable tendernefs of the mother, which perhaps glows with a more lively tlame in the brealt of this poor heathen than in thofe of her Chriftian tyrants, is the very circumflance laid hold on by their plerfecutors in order to rivet the chains of this wretched femalc fo much the faller. There are fome mothers, however, that fet themfelves free, when they have loft

Bothies. Men.

## $B \quad 0 \quad \mathrm{~S} \quad\left[\begin{array}{lll}61 & ] & B\end{array}\right.$

Borna- all hopes of faving their children. After having made ferago Borquets their efcape, they fometimes keep fecretly about the neighbourthood, in hopes of finding fome opportunity of reeovering their infants again."

BOSNA serago, a larze and frong town of Turkey in Europe, and capital of the province of Bofuia. E. Long. 18. 57. N. Lat. 44. 40.

BOSNIA, a province of lurkey in Europe, feated between Solavonia and Dalmatia. It belongs entirely to the Turks; but they were on the point of being expelled from it by the Chrillians, when the Spaniards invaded Sicilv, and obliged the emperor to conclude the peace of Pafiarowitz in 1718 , by which he gave up Bofnia to the 'Turke. It is 200 miles in length, and 75 in breadth. It is a barren country, and but little cultivated: the principal revenuc arifing chietly from the filver mines. Among the gante there are falcons, which are held in great efteem.

BOSphorus, or Bosporus, in Gegoraphy, a long and narrow fea, which it is fuppofed a bullock may fwim over. In a more general fenfe, it is a long narrow fea running in between two lands, or feparating two continents, and by which two feas, or a gulf and a fea, are made to communicate with each other: In which fenfe, bofphorus amounts to the fame with what we otherwile call an arm of the fea, chamel, or frait; the Italians, faro; the Latins, fretum; and the French pas, mancbe. The word is Greek, Bogrogos, formed from $\beta_{8 j}$, bullock," and rogos, "paffage.

The name bofphorus, is chiefly confined to two ftraits in the Mediterranean Cea, viz. the bofphorus of Thrace, commonly called the fraits of Confantinople, or channel of the Black Sea; and the Cimmerian or Scytbian bofpborus, fo called, it feems, from its refemblance to the Thracian; now more commonly the Arnits of Kapha, or Kiderleri, from two cities Alanding on it.

The origin of the name is better agreed on than the reafon why it was firf given to the Thracian bofphorus. Nymphius tells us, on the authority of Accarion, that the Phrygians, defiring to pals the Thracian frait, built a veliel, on whofe prow was the figure of a bullock; and which was hence called $\beta_{5}$, " bullock; and ferved them for a ferry-boat. Dionefius, Vallerius Flaccus, Callimachus, Apollodorus, Marcellinus, \&e. fav, that Io, being transformed into a cow by Juno, paffed this frait fwimming, which hence was called bofphorus. Arian, tells us, that the Phrygians were enjoined by the oracle, to follow the route which a bullock fhould mark out to them; and that, upon ftirring one up, it jumped into the fea to avoid their purfuit, and fwam over this Arait. Others fay, that an ox, tormented by a gad-fly, threw itfelf in, and fivam over: and others, that anciently the inhabitants of thefe coafts, when they would pafs over, joined lit. the boats together, and had them drawn over by bullocks, \&ic.

BOSOUETS, in Garidening, groves fo called from bofchetto, an Italian word which fignifies a little wood. They are compartments in gardens formed by branches of trees difpofed either regularly in rows, or wildly and irregularly, according to the fancy of the owner. A bofquet is either a plot of ground enclofed with palifadoes of horn-beam, the middle of it bcing fillell with tall trees, as elm or the like, the tops of which make

2 tuft or plume; or it confifts of only high trees, as horfe.chefnut, elm, \& c. The ground formuld be kept very fmooth and rolled, or clfe covered with grafs, atter the manner of green plots. In planting bofquets, care fhould be taken to mix the trees which produce their leaves of different flapes, and various thades of green and hoary or mealy leaves, fo as to afford an agreeable profpect. Bofquets aic only proper for fpacious gardenc, and require a great expence to keep them up.

BOSSAGE, in Arcbiteciure, a term uled for any fone that has a projecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, \&c. Boffage is alfo that which is otherwife called rufic-work; and confifts of foncs which advance beyond the naked or level of the building, by reafon of indentures or channels left in the joinings. Thefe are chiefly uled in the corners of edifices, and thence called ruffic quoins. The cavities or indentures are fometimes round, fometimes chain-framed, or bevelled, fometimes in a diamond form, fometimes enclofed with a cavetto, and fometimes with a lifeel.

BOSSE, Abraham, an able engraver, born at Tours, was well fillled in perfpective and architefure He wrote two treatifes, which are elleemed; the ore on the manner of defigning, and the other upon wgraving.

BOSSINEY, or Boss-castle, a town of Cornwall, in England, which fends two members to parliament. W. Long. 5.O. N. Lat. 50. 40.

BOSSU, Rene le, born at Paris in 1631 , was admitted a canon regular in the abbey of St Genevive, in 1649 ; and after a year's probation, took the habit. He taught polite literature with great fuccefs in feveral religious houfes for 12 years, when he gave up the talk for retirement. He then publifhed a parallel betwixt the principles of Arifotle's natural philofophy and thofe of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatife was on epic poetry; which Boileau declared one of the beft compofitions on that fubjeet in the French language, and which produced a great friendnip between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St John de Chartres.

BoSSuet, James Bengene, bihop of Meux, was born at Dijon, on the 27 th of September, 1627 . He diflinguifhed himfelf by his preaching, and the zeal he difcovered in his endeavours to bring over the Proteilants of France to the Romilh church; by his oppofition to quietifm; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols 4 to. This famous divine died at I'áris, in 1704 , aged 77.

BOSSUPI', a town of the Aultrian Netherlands, in the province of Brabant. E. Long. 4.30. N. Lat. 53. 52 .
bOSSUS, Matrhew, difinguifted by his virtue and his lcarning, was born in 1427 . He devoted himfelf to the ecclefattical flate in ${ }^{1} 45$ t, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his fermons, and his letters, have been often printed. He alfo wrote a fort of an apology for Phalar.s, and other works. He died at Padua in 1502 , aged 75.

BOST, a very flong town of Perfia, and capital of

Ioftangis, the province of Zableftan. E. Long. 64. 15. N. Lat. Eotton. 31.50.

BOSTANGIS, in the Turkift affairs, perfons employed in the garden of the feraglio, out of whofe numbes are colleeted thofe that are to row in the Grand Signior's brigantines, when he has a mind to divert himfelf with fifhing, or to take the air upon the canal. They who row on the left hand are only capable of mean employments in the gardens: but they who row on the right hand may be promoted to the charge of boftangi-bachi, who has the general intendency of all the grand fignior's gardens, and commands above 10,000 boftangis.

BOSTON, a corporation town of Lincolnthire in England, which fends two members to parliament. It is commodioully feated on both fides the river Witham, over which it has a handfome high wooden bridge; and, being near the fea, enjoys a good trade. It has a fpacious market place, and the largeit parifh church without crofs aifles in Europe, the fteeple of which ferves for a land-mark to failors. Bofton is a barony in the Irby family. E. Long. C. 15. N. Lat. 53.3 .

Eoston, the capital of New England in North America, built in 1630 , in a peninfula of about four miles in circumference, at the bottom of Maffachufets bay, in a very convenient fituation for trade. The following is a defcription of this capital before the commencement of the late American war. "The town ftands in W. Long. 71.5. N. Nat. 42. 24. about nine miles from the mouth of the bay. At the entrance of this bay are feveral fmall rocks which appear above water, and upwards of a dozen of fmall illands, fome of which are inhabited. There is but one fafe channel to approach the harbour ; and that fo narrow, that two fhips can hardly fail through abreaft; but within the harbour there is room for 500 fail to lie at anchor in a good depth of water. On one of the iflands of the bay flands Fort William, the moit regular fortrefs in Britifh America. This cafle is defended by 100 guns, 20 of which lie on a platform level with the water, fo that it is farce poffible for an enemy to pafs the caftle. To prevent furprife, they have a guard placed on one of the rocks, at two leagues difance, from whence they
make fignals to the catte when any lhips come near it. Eofwerth, There is alfo a battery of guns at each end of the town. At the bottom of the bay is a noble pier near 2000 feet in length; along which on the north fide exterids a sow of warehoufes for the merchants; and to this pier flips of the greateit burden may come and unload without the help of boats. The greatef part of the town lies round the harbour in the form of a half moon, the country beyond it rifing gradually and affording a delightful profpect. The neck of land which joins the peninfula to the continent is but 40 yards over ; which fituation, if properly improved, might render the town impregnable on the land fide. Bofton contains only about 18,000 inhabitants. They were more numerous 50 years ago ; but the furprifing increafe of Newbury port, Salem, Marble-head, Cape Ann, Plymouth, Dartmouth, and the illand of Nantucket, checked the growth and trade of the capital. The trade of Boflon, however, was fo confiderable, that, in 1768 , 1300 fail entered and cleared at the cuftom-houfe there. The predominant religion is the independent; though there are other perfuafions, and ten churches ferve for them all, but the lndependents have fix." Bofton thas frequently fuffered by fire, but the houfes that were thus deftroyed have always been rebuilt to advantage. The late American war began here by the attack at Bunkers-hill, when many brave men loft their lives."

BOSWORTH, a town of Leicefterhire in England; fituated in W. Long. 1. 24. N. Lat. 52. 25. It has a lofty fituation on a hill, and the country about it is fertile in corn and grafs. It is memorable for the decifive battle fought near it between Richard ILI. and the earl of Richmond, afterwards Henry VII. wherein the former lof his crown and life.

BOTALLUS, Leonard, phyfician to the duke of Alerçon, and to Henry III. was born at Afti in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty ; but foon after his death it came into practice with all the phyficians. He publifted feveral. books in phyfic and furgery; and the beit edition of his works is that of Leyden in 1660 , octavo.

## B O T A N Y

IS that fcience which arranges, diftinguifhes, and names all plants or vegetables, to enable us to fludy their properties and ufes.

Vegetables confift of an innumerable fucceflion of individuals which it is impoffible to examine, and would be ufelefs if it were poffible. It is therefore neceffary to diminifl the lalsour by forming them into groups or claffes, that the fame name may apply to a great number of individuals. Now certain individual plents lave fo clofe a refeablance to others in their Sower, fruit, leaves, and generat appearance, that alnoot every man at firf fight would give them the fame name. Thus every man who has feen the com. mon daify once, and knows its name, will probably apply the fame name without mifake to cuety other
individual of the fame fpecies. This forms the firft ftep in botany, or what is called arranging and neming plants according to their fpecies. Nor is it only the firit, but the eafieft flep in botany. It is alfo the moft important ; for all the individuals of the fame fecies muft in fimilar circumftances poffefs the fame qualitie: For example, we have no reafon to doubt that each individual plant of commun hemlock, or of foxglove, poffeffes the fame medical qualities, though from their place of growth thefe qualities may differ in degree. It is therefore the individuals of the fpecies alone that are ufeful; and the whole value of any arrangement confifts in enabling the boianif to diftinguift and name the individuals, with the greateft cafe and accuracy. If the number of foccics were finall, definitionc, or de-
friptions
$\underbrace{\text { Ele }+ \text { nes. }}$ [cripfions of them would alone be fufficient; but as they amount perhaps to 40,000 or 50,000 or more, to fearch for every fingle fpecies amid fuch a multitude would be a tak for which neither human patience nor human life would be fufficient.

To thorten the lahour, it has been found very expedient to arrange plants into various divifions ; firf into fome very general divifions which may reduce the:n into a fmall compafs, then to fubdivide thefe general divifions into others lefs comprehenfive, and thefe into others, till we arrive at the particular lipecies which we are in fearch of. Thus the arrangement defeends from a general divifion of all plants to every particular fpecies.

Many plans of this kind have been attempted by various botanifts, but the arrangement of the celebrated Linnæus is incomparably the moft ingenious, mott accurate, as well as the fimpleft ant eafiefl. That ilIuftrious botanift divided all plants into claffes, the claffes into orders, the orders into genera, and the genera into fpecies. The orders too, and the fpecies, when numerous, he frequently fubdivided into fections.
Objections have been made to the arrangement of Linnæus, becaufe it admits divifions which do not appear natural. But fuch perfons, though diftinguifhed botanifts, feem to us to have mifunderifood the ufe and intention of that arrangement. It is not, and ought not to be, its object to give what has been called a natural arrangement ; for nature does not clafs her productions. She places before us innumerable individuals, and leaves us to claffify them according to the purpofe which we have in view. If nature had formed plants into claffes, orders, and genera, the botanift would have nothing to do but to fludy thefe. Bat in none of her works has nature done this. Claffification is the work of man; and it is neceflary for man merely on account of the limited nature of the faculties of his mind. Claffification enables us to accomplifh by feveral fleps or operations what we cannot accomplifh by one. But were our facultits much more exalted, were our penetration much more acute, and our memories perfectly retentive; could we at once furvey all the qualitics of obje:ts, difcern their relations to one another, and retain the remembrance of thefe accurately, we flumbld have no occation to generalize at all. As generalization or claffification is neceffary to aid our li-
mited faculties, the beft claflification is that which Elements. leads us without crror, and by the eaficft procefs, to the particular object which we have occafion to inveftigatc.

The arrangement of Linneus is therefore the beft: It is, however, not fo perfect in fome of its parts as it may yet be rendered. This is the cafe in fome of the genera which are diftinguiftied by marks that are too minute. But when we coufider the indefatigable mind of that illultrious man, the chaos in which he found botany, and the beautiful arrangement which he gave to it, we may juftly inroll the name of Linneus in the fame lift with Bacon, and Newton, and Locke.

A botanical fyftem is a dictionary by which a perfon who bas fludied the rudiments of the fcience may find out the name of every plint which he meets with. This dietionary has been much enlarged by the labours of the great many eminent botanifts of the prefent time. We fhall therefore point out the method of confulting it, after giving a very concife view of the principles upon which it is founded. We will give a concife view, becaufe we think mofl or perhaps all the elementary books of this fcience tend to confound and difgult beginners by phyfiological definitions, and by the multiplicity of terms which they require to be fludied at the very firft outfet. Their plan is juft as if a teacher of Latin was to require his pupils firlt to make themfetres mafters of a Latin dictionary before he allowed them to tranflate. Our plan is to require of a beginner no more elementary knowledge than what is fufficient to enable him to confult the fyftem as he would do a dictionary. The meaning of the reft of the botanical terms we think can beft be learned by having recourfe to an explanation in an alphabetical form, as they occur in the invefligation. This we intend to add to the prefent atticle. And we wihh fincerely that cyery man who publifhes a fyftem of botany would do the fame; for we have ftrong reafons to believe that different writers ufe the fame words in different fenfes from one another. Linuæus, indeed, has defined his botanical terms; but in his two works, Delineatio Plantarum and Pbilofophia Botanica, he fometimes defines the fame word differently. Now we ought to know which of his definitions fucceeding botanifts have adopted. Befides almoft every botanift introducesterms of his o sn , which we thall look for in vain in the defiations of Linnæus.

## ELEMENTSOFBOTANY.

The parts of a plant which it is neceffary for the young botanif firft to know, are the flower, and fruit. Trefe include feven; the calyx, corolla, Atomen, piftil, pericarp or feed-veffel, feed, and receptacle. We will defcribe thefe in the order which will make them moft eafily diftinguithed.
I. The corolla, which in common language is call. ed the flower, and in fruit-trees the blofom, is the part which is molit beautifully coloured, which is of the fineit texture, and is often odorous. It is to be found of every colour, except green, a hue which it very [d. dom affumes. It is white, as in the blofioms of the cherry; yellow, as in the primrofe and ranunculus or butter-cup; red, as in the rofe; blue, as in the violet. It is functimes of one piece, and fumetimes diviued in-
to diftinct pieces, called petals. When the corolla confints of one petal, the outer or upper part which is broad is named the limb or border ; and the lower part, which is narrow and hollow, by which it is fixed, is called the tube. When the corolla confifts of more than one petal, the lower patt is called a clow, and the upper lamma.

In the corolia it is neceffary to attend to its form, its divifions, the number of it: petals, its colour and the pirt to which it is attached. See Plate XCV. Fig. 11. a corolla of one petal: $a$, the tube; $b$, the laminac. lig. i3. a corolla of more than one petal: $a$, the claw; $b l$, the lamins.
2. The calys is fituated on the outfide of the corolla, and cnclofing it commonly at the bate. It is geperally
nerally of a greenith colour and of a coarfer texture than the corolla. It confits of one part, or of two, three, \&e. and is then faid to be one-leaved, twoleaved, three-leaved, many-leaved. The calyx is of various flapes, tubular, globular, inflated, \&c.

There are feven fpecies of calyx, periath, involucre, glume, ament, fpathe, calyptre, and volve. For explanation of thefe confult the vocabulary and Plate XVC. Fig. 18. $a$, the caly $x$.
3. The piftil, or piltils, commonly appear in the centre of the corol a, from which they rife like fo many columns. There are from one to twelve in the fame flower, and fometimes mose.

A piftil confifts of three parts, the figma, the Ayle, and the germen. 1. The fligma is the higheft part of the piftil; which is fometimes globular, fometimes cleft, fometimes crofs-fhaped, \&cc. 2. The flyle is the pillar or thread which fupports the figma. 3. The germen is the pedeffal or bafe of the piftil, moft commonly of a youndifh or globular fhape; but fometimes long and flender. Sometimes there are feveral germens rogether. See Plate XCV. fig. 12. $c$. the Atigma; $b$, the ftyle; $a$ the germen.
4. The famens, which refemble threads or pillars, ufually fand between the corolla and the piftil, are placed in regular order sound the piltil, or alternate with the petals. They are in number on one flower from one to feveral hundreds. But it is not neceffary to count them when they are more than twenty.

A ftamen confifts of two parts, the anther and the filament. 1. The anther is the fummit of the Itamen, containing a mealy or powdery fubflance called pollen, and is generally of a different colour from the filament. They are of different forms, globular, hormed, \&c. 2. The filaments are the threads or pillars which fupport the anthers. The ftamens are attached to the coroll, to the calyx, to the receptacle, or to the fyle. See Plate XCV. fig. 18. Filaments marked by $e, e, c, e$, $e, e$. Anthers $f, f, f, f, f, f$.
5. The pericarp, or leed-veffel, is the cafe or covering of the feed, and is the external part of the germen come to maturity. It is of various flapes; globular, as in the poppy; long, as in the pod of the common gardenl or field pea: it is pulpy with a fone in the middle, as in the plum ; pulpy, containing feeds enclofed in a cafe, as in the pear ; juicy, and containing feeds which liave only an external cale, as the currant and goofeberry.

There are eight fpecies of pericarp ; capfule, filique, legume, follicle, drupe, pome, berry, and frobile. A defcription of thefe will be given in the vocabulary. Confult alfo Plate XCV. fig. 23. to 30 .
6. The feeds are fo well known, that they require no defcription in the elements of the fcience.
7. The receptacle is a point, line, or broad bafe, to which fome or all of the fix parts now deferibed are attached. When it is the bafe of all thefe parts, it is called the receptacle of the fructification. When the calyx, corolla, and llamens only are attached to it, it is called the receptacle of the flower. When the germen together with the piftil only is fixed to it, it is called the receptacle of the fruit. It is called proper when orly one Rower with its fruit is inferted into it. It is called commen when many flowers are attached to

## A N Y

it, as in the common daifies, dandelion. See Plate XCV. Elements, Fig. 13. c, a proper recepacle. Fig. 9. 10. a cornmon receptacle.

Attention to the receptacle is mof neceflary chictly in claffes tith, $13^{\text {th }}$, and 19 th.

Befides thefe feven, which are called the parts of fruc. tification, becaufe when they exif together, they are fuppofed neceffary for producing proper fruit, there is another past which Limazus calls the neclary, that requires attention, as it is the foundation of fome genera. It is difficult for beginners to diflinguifh it, as it varies much in its appearance, and is not very difcernible in a great many fpecies. It is fometimes the name of a fmall gland; fometimes of a fcale or a number of fcales; fometimes of a cup; fometimes of a horn or fpur on the corolla, as in larkfpur and violet; fometimes of a groove or excavation. In fhort, it appears to be a name for any fingular or irregular appearance of any of the patts of the flower. In all accurate and perfpicuous fyीtems, it is fo well defrribed that it can be eafily found out. If this be done the name may be admitted, but if not it muft lead to ambiguity and want of precifion.

## OF THE CLASSES.

The defcriptions now given are fufficient to enable the young botanif to underftand the clafles and orders.

All plants are arranged into 24 divifions, called claffes. In 23 of thefe claffes, the flowers, or the piftils and famens, or at leaf the figmas and amhers, are evident. The $24^{\text {th }}$ clafs comprehends all plants in which the flowers are invifible to the naked eye, as moffes, ferns, mulhrooms.

The principles upon which the claffes are formed are few, fimple, and beautiful. All plants which have only orie flamen, are of the firft clafs; thofe that have only two, are of the fecond; thofe that have only three, are of the third: and fo on, the number of fta: mens being the fame with the number of the clafs in the firft ten claffes. See Plate XCIV. fig. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10.

In the next three claffes, the place to which the famens are fixed muff be attended to as well as the number of the flamens. Thus the istl contains thofe plants which have from 12 to 19 famens inclufive, fixed to the receptacle. The 12 th thofe that have 20 flamens fixed to the infide of the calyx. In this clafs the place of infertion is more to be relied on than the number of the flamons, for they arc fometimes lefs than 20, often more. The $13^{\text {th }}$ clafs comprehends thofe that have more than 20 flamens attached to the recep. tacle. See Plate XCIV. fiig. 11, 12, 13. For an example of the 12 th clafs a rofe may be examined, and for an example of the $13^{\text {th }}$ a poppy, or a ranunculuc.

The 14 th and 15 th claffes depend upon the number and proportion of the famens. When there are four ftamens in a flower, of which two are longer, it belongs to the 14th clafs. When there are fix flamens, of which four are longer, it belongs to the 15 th clals. For an example of the $14^{\text {th }}$ clafs the flowers of the dead nettle, mint, thyme, or fox-glove, may be exa-

Fiements. minced, and for a fpecimen of the $15^{\text {th }}$ clafs, infpect the flowers of flepherds purfe, or muflard. See alfo Plate XCIV. fit. 14. and 15 .

The 16 th, 17 th, 18 th , and $19^{\text {th }}$ claffes depend upon the manner in which the flamens are connected, whether they be joined by their flaments into one fet, or two fets, or nore than two ; or be united by the anthers into a cylinder.

In the toth clafs the flamens are united by their filameints into one fet, forming a cafe round the lower part of the pirtils, but feparating at the top. A geranium forms a feecimen of this clafs. In the 17 th the corollas are papilionaccous, like the bloffom of a bean; the ftamens are connected by their filaments, but divided into two fets or parcels, one of which is thicker and forms a cafe round the piftil; the other is fmaller and leans towards the pittil. Specinzens of thefe may be found in the ilowers of peas and beans. In the 18 h clafs, the ftamens are united by their filaments into more than two lets, or parcels. See Plate XCIV. fig. I8.

The 19th clafs is difficult to a begimner. It confifts of compound flowers, as the common daify, dandelion. They are called compound, becaufe each fingle flower confits of a collection of little flowers or florets, attached to the fame broad rectptacle, and contained within one calyx. Each floret confifs of a corollet, or little corolla, five ftamens united by their anthers into a hollow or tubular cylinder, and a pititil which paffes up through the tube of the cylinder. See Plate XCIV. fig. 19. and examine a dandelion, or thiftle, or common groundfel, or a fun-flower. See alfo the beginning of the igth clafs in the fyftem, where a fuller account will be given of this clafs.

In the 20th clafs, the flamens are attached to the piftil. An orchis will afford a fpecimen of this. See alfo Plate XCIV. fig. 20.

In the three next claffes, the pifils and ftamens are fituated on feparate flowers, or diftinet plants, of on plants which bear flowers with piftils and famens, others with ftamens or with piftils, or flowers of both kinds.

The 21 fl clafs contains thofe plants which have flowers of different kinds on the fame plant, fome bearing piftils, and others beating ftamens only. The flowers with piftils we fhall call piflillar or figmate, and thofe with flamens Aaminal or anthered. The birch aflords an exmmple of this clafs. See alfo fig. 21 .

The 22d clafs confifts of thofe fpecies which have famens on one plant and piftils on another. Iniftances of this may be found in the willow, poplar, and junipet. See fig. 22.

The 23 d clalis comprehends thofe plants which have at lean two and fometimes three kinds of flowers. 1. Some anther-figmate, or with piftils and ftamens on the fame flowet. 2. Others having piflils only, or ftamens only. 3. Or having flowers with piftils only, or flowers with itamens only. This may be exprefted more concilely. Some having flowers anther ffigmate, fome fitgmate, or fome anthered, or having both anthered Howers and figmate flowers. The common ath tree may be examined for a fpecimen of this clafs. See alfo fig. 23.

Ths names of the ciafles are formed from Greek words, and exprefs the characteriftic of each clafs. The firt ten clafles are named from the Greek nuVol. IV. Part I.
metals and the word andria, which the botanift muf Elenenta. confider as fynonymous with ftamens.

1. Mon -andria.
2. Di -andria.
3. Tri andria.
4. Tetr -andria.
5. Put -andria.
6. Hex -andrid.
7. Hept -andria.
8. Oct -andria.
9. Enne -andria.
10. Dec -andria.
11. I) sdec-andria, I2 Atamens.
12. Icos -andria, 20 ftamens.
13. Poly -andria.
14. Di dynamia, 2 powers.

15 . ''etra -dynamia, 4 powers.
16. Non adtlphia, one brotherhood,
17. Di -adelphia, two brothethoods.
18. Poly -adelphia, many brotherhoods.
19. Syn -genefia means origin or production together, fo called from the flamens being united by the anthers.
20. Gyn -andria, piftils and ftamens together.
21. Mon-øecia, one houle.
22. Di -ocia, two houfes.
23. Poly-gamia, mary kinds of flowers. The etymology here would throw no light upon the clafy to a beginner; nor does it throw any on the next clafs.
24. Crypto-gamia, therefore, is to be underftood to mean invifible fousers.

## OF THE ORDERS.

The formation of the orders is as ingenious and fimple as that of the claffes. In the firf thirteen claffes, the names and characters are taken from the number of pifils or Atyles; when thefe are wanting, from the number of ftigmas. Thus:
Mono -gynia, 1 flyle.
Di -gynia, 2 fyles.
Tri -gynia, 3 fyles.
Tetra -gynia, 4 fyles,
Penta -gynia, 5 fyles.
Hexa -gynia, 6 fyles.
Hepta -gynia, 7 fyles.
Deca -gyia, of fyles,
Dodeca-gynia, 12 fyles.

Poly gynia, many ftyles.
In the $1^{\text {th }}$ clafs Didynamia there are only two orders, which depend on the prefence or ablence of the pericarp or feed-veffel.

1. Gymnospermia. Four naked feeds in the bottom of the calyx; as in mint, dead-nette, thyme.
2. Arigiospermia. Seedsenclofed in a pericaip; as in fox-glove, eye-bright, toad-flax, fig-wort.
In the $15^{\text {th }}$ clafs, Tetradynamia, there are alfo $t$ o ordets, which are taken from the form of the pericarp.
3. Siliculosa. Seeds enclofed in a filicle or roundifh feed-veffel confifting of two pieces called valves, and the feeds fixed to both edges or futures, as in Thepherds purfe, fcurvy-grafs.
4. Silicuoza. Seeds enclafed in a filique or long feed-veflel; as in muftard.

In the $16 \mathrm{~h}, 17^{t h}$, and $18 \cdot \mathrm{~h}$ claffes, the names and characters of the orders are taken from the number of ftamens.

In the 1 gth $^{\text {th }}$ clafs there are fix orders, which it is dificult at firf to diftinguifi accurately.
: Polygamba EQualis. Fiorets anther-lligmate, or having both flamens and piftils in the fame floret; as in dandelion, thillle, fow-thiltle, artichoke.
2. Polygamta Superfiua. When the flower is compoled of two parts, a difk or central part, and rays projecting outwards ; as in corn-marygold, tanfy, daify, golden rod, 乡round fel, chamomile, milfoil. The florets of the difk are an-ther-ftigmate; thofe of the ray figmate.
3. Polygamia Frustranea. Florets of the dif-anther-ligmate; thole of the rays with ftyles but no Itigmas; as blue-bottle, knapweed.
4. Polygamia Necessarta. Florets of the difk an-ther-ftyled, without ftigmas; thofe of the rays tigmate. Garden marygold will afford a fpecimen.
5. Polygamia Segregata. When each of the florets has a calyx, befides the common or general calyx of the flower. Specimens of this can only be found in botanic gardens.
6. Monogamia. When the flower is not compound but fingle, and the anthers united. This order ought to be transferred to the clafs Pentandria, as, indeed, has been done in fome very valuable fyftems. Examples of it may be found in the violet.

In the claffes Gynandria, Monœcia, and Diœcia, the orders are formed from the number of ftamens, with three of a different kind, monadelphia, fyngenefia, and gynandria, in the claffes Moncecia and Dioecia.

In the $23^{\mathrm{d}}$ clafs there are three orders.
2. Monoecia. When the flowers are anther-figmate and anthered; or anther-lligmate and Atigmate, on the fame individual plant.
2. Dioecta. When the flowers are anther-ftigmate and amthered, or anther-figmate and ftigmate, on two different individual plants.
3. Trioecia. When the flowers of one individual plant of the famefpecies are anther-ltigmate ; upon a fecond individual plant, anthered; and upon a third individual plant, Atigmate.
The orders into which the $24^{\text {th }}$ clafs, Cryptogamia, is divided, will be explained in the introduction to that clafs.

## OF THE SECTIONS.

The orders are generally fubdivided into what may be called fections. Thefe may vary in number, according as the fyllem is partial or univerf.l; hut bhey are almolt as well ellablithed as the clafies and orters. Sections are not cmployed in the 11 th, $12 t h, 16 t h, 8: h$, 19:h, 20 th, $21 \mathrm{ft}, 22\}, 23^{1}$ claffes. The prisciples on whicb they are formed are few and very fimple.

## A N Y.

In the firf ten claffes they depend upon the follow. Elemente. ing circumflances; on the fower being fuperior or inferior or naked, complete or incoruplete, calycled, enclofed in a lpathe or glume, aggregate, umbelled, involucred; on the number of petals, the feeds being naked or enclofed; on the number of feeds, and the num. ber of cells in the capfule or feed-velfel, or number of berries.

The flower is faid to be fuperior when the recepthcle of the flower is above the germen, and inferior when the receptacle is below the germen. A flower is faid to be naked when the calyx is abfent; it is called complete when it has both a calyx and corolla, and incomplete when either of thefe is wanting. It is faid to be calycled when the calyx has a fmall calyx or calyclet at the bale. An aggregate flower, is a flower compoled of florets ftanding on footftalks, attached to a broad receptacle.

An umbelled plant, is one which fends out towards the top, from the fame point or centre, a number of branches like the fokes of an umbrella, and bearing flowers on the top. All the Cpokes, with their flow. ers, form a univerfal umbel. On the top of each fpoke arifes an umbellet, or partial umbel. At the bafe of the fpokes of the umbel, or univerfal umbel, is a fort of calyx, called an involucre, or univerfal involucre; and at the bafe of the fpukes of the umbellet is a partial involucre, or an involucret. This will fuffice for explaining the lections of the firlt ten claffes. The feetions of the $13^{\text {th }}$ depend on the number of petals.

In the $14^{\text {th }}$ clafs, Didynamia, the fections depend up. on the calyx ; which is faid to be cleft when it is cut or divided into fo many parts, and two-lipped when its mouth has a refemblance to two lips.

In the $15^{\text {th }}$ clats the fections depend on the filicle and calyx. The filicle in one rection is notched at the point, and in another unnotched or entire. In the firft fection of the order filiquofa, the calyx is clofed by its own leaflets. In the lecund it is not clufed, and the leaflets are feparated at the upper end.

In the 17 th clafs, Diadelphia, and the order decandria, there are fix fections. 1. The firf comprehends thofe flowers which have their famens all united as in the clafs Monadelphia, and therefore forms an exception to the regularity of the clafs. 2. In the fecond, the Aigma is pubefont or hairy. The ftamens not. 3. The feed-veffel or legume, has two cells, without the connected matks of the former fections. 4. The legume contains only one feed, without the matks of the former three fections. 5. The legume is fomewhat jointed, without the marks of the former. 6. The legume has only one apartment, but many feeds, without the marks already mentioned.

The only remaining clafs, whofe orders are divided into fections, is the 1gth, Syngenefia. 1. In the firft fection of the firlt order, the corollets are ligulate, that is, flat towards the exterior or upper end, and tubular only at the bife. 2. Capitate or headed, when the flowers grow in globular forms ; as the thitle. 3. Difcoid, when the corollets are all tubular, not ligulate. 1) the order polygamia fupertua are two fections. 1. Lifcoid corollets. 2. Rayed os radiate, when all the corollets are ligulate.

## B $\quad \mathrm{O} \quad \mathrm{T}$ A N Y.

Flements. We will now prefent a conne Ated view of the Claffes and Orders in a Table.
I. Monandria, iftamen.

1. Monogynia, 1 fyle.
2. Digynia, 2 ftyles.
II. Diandria, 2 flamens.
3. Monogynia, 1 Atyle.
4. Digynia, 2 ftyles.
5. Trigynia, 3 fyles.
III. Triandrla, 3 ftamens.
6. Monogytia, Ifyle.
7. Digynia, 2 ftyles.
8. Trigynia, 3 fyles.
IV. Tetrandria, 4 flamens. If the two neareft flao mens be fhorter, the plant belongs to clafs 14 th.
9. Monogynia, ifyle.
10. Dizynia, 2 fyles.
11. Tetragynia, 4 ftyles.
V. Pentandria, 5 famens.
12. Monogynia, ifyle.
13. Digynia, 2 Ryles.
14. Trigynia, 3 fyles.
15. Tetragynia, 4 fyles.
16. Pentagynia, 5 flyles.
17. Pulygynia, more than 5.
Vi. Hexandria. 6 ftamens. If the two oppofite ftamens be fhorter, the plant is of the 15 th clafs.
I. Monogynia, I tyle.
18. Digynia, 2 Ayles.
19. Tetragynia, 4 fyles.
20. Polygynia, more than 4 .

Vil. Heptandria, 7 ftamens.

1. Monogynia, I Ayle.
2. Digynia, 2 flyles.
3. Tetragynia, 4 ftyles.
4. Heptagynia, 7 Ayles.
vili. Octandria, 8 flamens.
5. Monogynia, 1 fyle.
6. Digynia. 2 fyles.
7. Trigynia, 3 ftyles.
8. Tetragynia, 4 Ayles.
IX. Enneandria, 9 famens.
9. Monogynia, iftyle.
10. Trigynia, 3 fyles.
11. Hexagynia, 6 Ayles.
X. Decandria, 10 ftamens.
12. Monogynia, I fyle.
13. Digynia, 2 ftyles.
14. Trigynia, 3 fyles.
15. Pentagynia, 5 fyles.
16. Decagynia, 10 ftyles.
XI. Dodecandria, i2 to 19 flamens, inferted in the receptacle.
17. Monogynia, i fyle.
18. Digynia, 2 fyles.
19. Trigynia, 3 flyles.
20. Pentagynia, 5 fyles.
21. Dodecagynia, 12 flyles.
XII. Icosandraa, 20 ftamens or more faftened to the $\underbrace{\text { Elements. }}$ infide of the calyx.
22. Monogy nia, 1 fyle.
23. Digynia, 2 Ryles.
24. Trigynia, 3 ftyles.
25. Pentagynia, 5 fyles.
26. Polygynia, more than 5 Ayles.
XIII. Polyandria, more than 20 flamens faltened to the receptacle.
27. Monogynia, i Ayle.
28. Digynia, 2 flyles.
29. Trigynia, 3 dyles.
30. Tetragynia, 4 fyles.
31. Pentagynia, 5 ftyles.
32. Hexagynia, 6 nlyles.
33. Polygynia, more than 6 ftyles.

XIT. Didynamia, 4 Atamens, 2 longer than the reft.

1. Gymnofpermia, 4 naked feeds in the bottom of the calyx.
2. Angiofpermia, feeds enclofed in a feed-veffel.
XV. Tetradynamia, 6 famens, 4 lorger than the reft.
r. Siliculofa, feeds contained in a filique or roundith feed-vefiel.
3. Siliquofa, feeds contained in a filique or long feed-veffel.
XVI. Monadelphia, famens united by their filaments into one let or body.
4. Triandria, 3 famens.
5. Pentandria, 5 famens.
6. OEtandria, 8 ftamens.
7. Enneandria, 9 ftamens.
8. Decandria, 10 ftamens.
9. Endecandria, II ftamens.
10. Dodecandria, 12 ftamens.
11. Polyandria, more than 12 ftamens.
XVII. Diadelphia, flamens united by their fila= ments into two bodies.
12. Pentandria, 5 ftamens.
13. Hexandria, 6 famens.
14. OCtandria, 8 ftamens.
15. Decandria, 10 ftamens.
XVIII. Polyadelphia, filaments united and divided into more than two fets.
16. Pentandria, 5 ftamens.
17. Icofandria, 20 ftamens.
18. Polyandria, more than 20 flamens.
XIX. Syngenesta, anthers united into a cylinder.
19. Polygamia aqualis, florts all anther-figmate.
20. Polygamia fuperflua, tlorets of the difis antherftigmate; florets of the ray figmate.
21. Pulygamia fruftranca, florets of the difk an-ther-fligmate; florets of the ray ftyled, but not itigmate.
22. Polygamia neceffaria, florets of the difk antherAlyled; Horets of the ray anther-ftigmate.
23. Polygamia fegregata, feveral calyclets in one calyx.
24. Monogamia, flowers fingle, not compound, with anthers united.

Eiements. XX. Gyxandria, flamens faftened to the piftils.
$\xrightarrow{\text { 1. D.andria, } 2 \text { ftamens. }}$
2. Triandria, 3 ीamens.
3. Tetrandria, 4 Atamens.
4. Pentandria, 5 flamens.
5. Hexandria, 6 famens.
6. Decandria, 10 ftamens.
7. Dodecandria, 12 ilamens.
8. Polyandria, more than 12 ftamens.
XXI. Monoecha, llamens and pitils not in the fame Howers, but in the fame plant.

1. Monandria, Itamen.
2. Diandria, 2 famens.
3. Triandria, 3 Atamens.
4. Tetrandria, 4 Atamens.
5. Pentandria, 5 famens.

6 Hexandria, 6 flamens.
7. Heptandria, 7 Atamens.
8. Polyandria, more than 7 .
9. Monadelphia, filaments united.
10. Syngenefia, anthers united.
11. Gynandria, Aamens fixed to piftils.
XXII. Dioecha, flamens and pifils on diffrent plants.

1. Monandria, y famen.
2. Diandria, 2 flamens.
3. Triandria.
4. Tetrandria.
5. Pentandria
6. Hexandria.
7. OAandria.
8. Entieandria.
9. Decandria.
10. Dodecandria.

1r. Polyandria.
12. Monadelphia.
13. Sungenefia.
14. Gynandria.
XXIII. Polygama.

1. Monoecia, anther-figmate and figmate, or anthered in the fame plant.
2. Dioccia, anther-ftigmate and Aigmate, or anthered in two plants.
3. Tricecia, anther-lligmate in one plant, figmate in a fecond, and anthered in a third.
XXIV. Cryptogamia.
4. Filices, or ferns.
5. Mofies.
6. Algx, or fea-weeds.
7. Fungules.

## OF THE GENERA.

Having now thewn how plants are arranged into claffes, orders, and fertions, we come to the next divifion called generd. The characteriftic marks of the genera are derived from the flower and fruit. A genus confift of a certain number of fpecies, which refemble one another in forr. parts of the flower or of the fiuit, or both. By way of illuftrating the principles on which the formation and diftinction of genera are found.d, we thall run over the Britilh genera in each clafs.

A N Y.
I. In the firft clafs, Order I. fect. 1. the calyx is Elements, one-lcaved or indilingt, corolla abfent. Sect. 2. the berry contains many feeds, the fadix contains many flowers, and the capfule is one feeded. Order 11. genus 5. calyx wanting, two petals prefent ; feeds, four, not enclofed in a feed-vefiel.
II. In the 2 d clafs, Diandria, Order I. the genera depend upon the figure of the corolla, which is divided, wheel-fhaped, ringent, furnihed with a fpur, or iwo-petaled; on the calyx being cleft or being twoleaved; on the number of feeds which the berry contains; on the fhape of the capfule, and the number of feeds enclofed in it; on the flamens being dilkant, or flanding on a foottalk.

In the 2 d order, the only genus is a grafs, the calyx and corolla of which are called glumes.
III. In the $3^{d}$ clafs, Triandria, Order I. fect. i. the diffinction of the genera depends on the number of divifions of the calyx and fingularities of the ftigma. In fect. 8. the genera are diflinguified by the peculiasities of the glumes and feeds.

In the 2 d order, Digynia, fect. 1, 2, 3, and 4, the genera are diftinguifhed,

1. By the number of valves or pieces of which the glumes or corolla and calyx confift.
2. By the peculiarities of thefe valves.
3. By the number of flowers contained in the calys.
4. By the peculiarities of the figma and feed.
5. By the form of the fikelets, and
6. By the pesuliarities of the fpine or thread, or form of the receptacle.

In the 3 d order, Trigynia, the genera are diftinguifhed,

1. By the number of leaves of which the calyx is compoled.
2. By the number of petals.
3. By the form of the capfule, the number of valves compofing it, and feeds contained in it.
IV. In the $4^{\text {th }}$ clafs, Tetrandria, Order I. the genera are determined,

## Sę. ı.

1. By the peculiarities of the common and partial calyx, or of the calyx and calyclet.
2. By the corolla being fuperior.

Sesl. 2. and 3 .

1. By the form of the corolla.
2. By the peculiaritics of the fruit.

Sect. 4 .

1. By the number and the peculiarities of the nectaries.
2. By their ablence.
3. By the nature of the feed-veflel; by its fituation, and the number of cells or feeds it contains.
Sect. 5 .
By the peculiarities of the calyx and feed.
Digynia and 'Trigynia, Order I. and II.
I. By the number of petals, and by their abfence.
4. By the nature of the pericarp, and by the number of its valves and cells, and feeds.
V. In the 5 th clafs, Pentandria, Order I. the genera are difinguifhed,
5. By the thate of the corclla, by the peculiatio ties of its throat.
6. By the flape of the calyx, and the number of its divifions.
7. By the peculiarities of the feeds.

Sect. 2, 3. 4, and 5 .

1. By the number of values and cclls of the feed-veffel, and other peculiarities.
2. By the thape and divifions of the corolla.
3. By the fituation and figure of the famens and peculiarities of the anther.
4. By the divifions and flape of the fligma.
5. By the flape of the calyx and number of its divifions.
Sect. 6.
6. By the number of feeds and fituation of the capfule.
7. By the number of divifions of the calys, and its relation to the flamens.
Digynia, the genera are diffinguifhed,
Sect. 1, 2, and 3 .
I. By the nature and fhape of the capfule, and the number of cells and feeds it contains.
8. By the flape of the corolla and the abfence or prefence of pores.
9. By the flape, number, and fituation of the feeds.
Sect. 4. comprehending the umbelled plants, is formed into three fubdivifions.
I. Plants that have an involucre and involucret.
10. Thofe that have only involucrets.
11. Thofe that have neither, or only a fmall involucre.
The gehera are difinguithed,
12. By the flowers being formed into heads.
13. By the flowers being tubular, by being radiate or rayed, that is, fome tubular and fome flat, by their being fertile or abortive, producing feed or not producing it.
14. By the form of the petals.
15. By the calyx being entire or divided, or indi$1 l$ inct.
16. By the peculiarities of the involucres or involucrets.
17. By the peculiarities of the fligmas and fruit.

The other orders have nothing peculiar.
Vl. Hexandria, the genera are difinguifled,

1. By the number of petals, thape, divifions, and fituation of the corolla.
2. By the number of leaves, form, and fituation of the caly...
3. By the number of cells and feeds of the feedveflels, and thape of the feed.
4. By the peculiarities of the flamens.
5. By the form and number of the fligmas.

The next feven claffes form their genera in fo fimilas a manner to thofe already defcribed, that we omit them.
XIV. In the $14^{\text {th }}$ clafs, Diofnamia, Order I. Gymnofpermia, the genera are determined,

1. By peculiarities of the antliers and filaments.
2. By peculiarities of the lips and throat of the corolla.
3. By peculiarities of the calyx.

Order II. Augiofpermia.

1. By the number of cells and direations of the partitions of the caplule or feed-veffel.
2. By the form and number of the feeds.
3. An.l by wher marks of the calyx and corolla, which require no explanation.
XV. Tiftradynamia.
I. Siliculota, the genera are diflingufhed,
4. By the filicle or flort roundith feed-veftel, ty the flape and pofition of its valves or piece, by its being eatire or notched, and the number of leeds it contains.
II. Siliquofa. The genera are diflinguifhed,
5. By the flape of the filique or long feed-veffel, which is compofed of two valves or pieces, with the feeds faftened to both futures, or joinings of the valves; by the manner in which the $\mathrm{f}_{\mathrm{t}}$. lique opens.
6. By peculiar glands.
7. By the calyx being open or fpreading.
8. By the pofition of the petals.
9. By the fligma being notched or entire.
XVI. In the 16 th clafs, Monadelphia, the genera are diftinguilled,
10. By the number of Ayles.
11. By the divifions of the outer calyx.
12. By the pofition of the capfules and number of feeds contained in each.
13. By the feeds being beaked fpirally or backwards.
XVII. Diadelphia. Here it is meceffary to defcribe the corolla, which is called papilionaceous, or pea-blofomed, and ufually confifts of four petals. The lower petal, flaped like a boat, is called the keel; the upper petal, which fpreads and rifes upwards, is called the flandard, and the two fide petals are called the wings. The feed-veffel is called a legume, and confills of two pieces or valves, and the feeds are fixed to one of the futures or joinings.

In the order Decandria, the genera are diftinguilhed.

1. By the form and divifions of the calyx.
2. By the form and roughnefs of the flyle and Itigma.
3. By the peculiarities of the flandard, keel, and wings.
4. By the legume; its form, length, and the number of lieds it contains.
XIX. In the $19^{\text {th chafs, Syngenesia, the gencra }}$ are diftinguifled,
5. Wy the nature and form of the receptacle, by its fmoothnefs or roughnefs, its being dotted, or. like a honeycomb.
6. By the nature of the pappus, which is the feathery or llying, or winged crown of the feed by which it Hies.
7. By the peculiaritics of the calyx, its refembling. tiles, being double, accomparied with fcales, \&c.
8. By the number of florets in the ray.
XX. Gynandria, Diandria, the genera are difinguifhed.

By the form of the nectary, which is the lower lip of the corolla.
XX1. In the 21 th clafs, Monoecia, the genera are diftinguifhed;

E'ements. $\underbrace{\text { Etements. }}$

1. By peculiarities in the male or anthered flower of the calys and corolit.
2. By fimilar peculiarities in the female or ftig. mate flowers.
3. By the form of the ament. The ament is a fpecies of flower confilling of a thread-form receptacle, to which a number of chaffy fcales are attached. A fpecimen of it may be feen in the flowers of the fir, birch, hazel, beech, and oak.
XXII. XXIII. In the $22 d$ and 23 d clafles, Dioecia and Polygama, the genera are difirguihed in a manner fimilar to thofe already defcribed. We have only to remark, that what in other fyftems is called hermaphrodite flowers, in the clafs Polygamia we call anther-figmate, or piftil-faminal, that is, flowers raving both anthers and ftigrnas, or piftils and ntamens.

## OF THE SPECIES.

The fecies confift of fuch groups or collections of plants as have certain refemblances, which render it convenient to clafs them under one genus. The fpecies are diftinguifhed from one another, either by marking in a few words the moft friking differences, or by giving a minute defeription of each fpecies. In the foreign plants, we have adopted the firf method for the fake of brevity. But in the Britifh, which it is of confequence we fhould fludy more perfectly, we have adopted the fecond. The firt is a tranlation of Wildenow's Species Plantarum, the molt complete fyltem hitherto publifhed, and the fecond, or the defcription of the Britift plants, is a tranflation from Dr Smith's F/ora Eritannica, which we have no hefitation in faying is a model of botanical defeription. For precifion it is worthy of Linneus, and is fo minute that nothing peculiar to any fpecies feems to have efcaped the author.

The fpecies, when numcrous, are formed into fubdivifions. This we think fhould always be done, when it can be done with propriety. There are fome eminent botanifts who difapprove of this practice, becaufe, fay they, it feparates fpecies that have the clofeft refemblance to one another. This, however, is of no confequence; for it is not the object of batanical arrange. ment to place thefe plants next one another, which are moft like; but to point out the fpecies, and moft certain method of difoovering the names of fuch plants as we have occafion to examine. We cannot help regretting therefore, that Mr Salifury in his new arrangement of Erica, a genus contifting of more than 240 fpecies, fhould, in order to clafs them according to their affinities, have neglecied to form them into fubdivifions: the fubdivifion of the fuecies diminifles the unneceflary labours of the botanit, and tends to increafe the precilion of inquiry. For csample, 32 fpecies of the campanula, have leaves fmooth polifhed, and the rel have leaves rougl to the touch. 'This circumft ince forms a very convenient fubdivifion. Agair, 44 fpecies of the folanum have neither prickles not thorns, Bg are prickled, and one is tharny or Ppinows. Thess in exsmining, a folanum, we cau have no occafion is run over 84 fpecies: we are required only to go over 4.4, or 39, or one. There is as much propiticty in formaing the numerous fpacies of a genus into fubdivifions,

A $N \quad \mathrm{I}$.
as there is in feparating plants that have a clofe referm- Elemente. blance into different genera. Who would have luppoled that the botanift who has feparated the Erica vulgaris or conmmon heath, from the genus to which it has hitherto belonged, would have thought it improper to arrange fo extenfive a genus into fubdivifions. We can only account for it by fuppofing that an eminent botanift may fometimes forget the principles of the Linnean claffification, to feek after a natural claffification; a thing which we fufpect is iike the government of Utopia, that exilts only in the mind of the inventor.

## of VARIETIES.

Every part of a plant is fubject to variation from climate, foil, cultivation, and difeafes, or injuries produced by intects, winds, \&c. The corolla and leaves are moft liable to change. Variations arifng from fuch accidents are not permanent; they may indecd be propagated by llips, but vanifh in thofe plants which are ralled from leeds. It is by rearing plants from feeds that we can determine whether a plant be a variety or a diftinct fpecies.

## Rules for directinc the young Botanist in investigatinga Ylant.

After the young botanift underftands the principles upon which the claffification is formed, he ought immediately to proceed to the examination of plants.
I. I. The botanift ought to felect flowers in different fiates, fome expanded, lome unopened, and if poffible, fome that are tipened into fruit.
2. If the flower contain both famens and pifils, it belongs to fome one of the firtt 20 claffes. If either the piffils or ftamens be wanting, it belongs to the 21 ft , 22 d , or 23 d . To this rule there are a few exceptions, which if the young botanift cannot overcome, he may pafs them over till he has made fome progrefs in the art of inveftigation.
3. He muft next examine whether the ftamens be comected or feparate, and whether two of them be uniformly fhorter than the reft. If the famens be not connefed, and two of them be not uniformly florter, the plarit belongs to one of the 13 firft clafles. If the flamens do not amount to 12 , the number of the flamens and number of the clats is the fame. If the flamens be 12 or more, then, befides counting them, it is neceff, ry to obferve whether they be fixed at the lowicr end to the calyx or receptacle. This may be bent known by tearing off the calyx; if the flamens do not come away with the calyx, the plant belongs to the clafs dodecandria. If the flamens be about 20 , lefs or more, and fixed to the calyx, the plant belongs to icofandriz. If 20 or more, and attaclied to the calyx, the clats is polyandria.

In all thefe claffes the orders may be krown by examining the piftils.
4. If the thamens be four or fix, and two fhorter than the reff, the plant belongs to didynamia or tetrady. namia. The corolla in didynamious plants is one petal divided into two lips; and the corolla of tetradynamious plames confifts always of tour petals, placed fomewhat in the form of a crofs: hence called cruciform.

The orders of the claf didynamia may be known ty obferving whether the fecds te enclofed in a leed-

Elements, veffel, be four in number, and naked in the bottom of the calyx.

In tetradyinmia, the orders are diftinguihed by the form of the feed-veffel. If long, the order is filiquoff; if roundith it is filiculofa.
5. If the ttamens be connedted by the filamente into one let round the piftil, but leparated at the top, and the petals fire, the clafs is monadelphia. If the flamens be formed into two fet, and the corolla like the bloffom of a ped or bean, the clafs is diadelphia, and if formed into more than two \{ets, the clats is polyadelphia. The orders depend upun the number of the ftamens.
6. If the flower be compound, that is, if one calyx contain a great many corollets, each of which has five ftamens united to a cylinder at the anthers, the flower belongs to the clafs fyngenefia.

The orders are to be determined by examining the florets, that is, the corollets of the dink and ray, in order to know whether they both contain pinils and flamens, or anthers and Itigmas, or otherwife. I. It all the florets contain ftamens and a piftil, the order is polygamis equalis. 2. If the dik or central part have horets with a piftil and Itamens, but the rays contain only a piftil, the order is polygamia fupertlua. 3. If the florets of the dift have famens, and pitils, or be an-ther-ftigmate, but thofe of the rays have only a llyle, the order is polygamia fruttranea. 4. If the Horets of the dik have famens and Ayles, but no fligmas, and thofe of the rays a piftil only, the order is polygamia ncceffaria. 5. When each of the florets has a fmall calyx, the order is the polygamia fegregata. 6. And when the flower is not compound, but fingle with anthers united, the order is monogamia. But fisch plants are commonly now added to the clafs pentandria.
7. If the famens be fixed to the piltil, the clafs is gynandria. The flower hasfomething of a monftrous or irtegular appearance. The petals are five, the fyle grows from the inner petal of the lower lip of the corolla, fo as fearcely to be ditinguifhable.

The orders are determined by the number of the ftamens.
8. When the flowers are imperfect, that is, when fome in the fame individual plant have only pifiils and fome only ftamens, the plant belongs to the clafs monocia. When the piftils are in one plant, and the famens on another, the clafs is dicecia; and when ferfeet and imperfect flowers occur on the fame plant, o: on two or three different plants, the clafs is polyfamia.

The orders of monœcia and dicecia, are known by the nuraber of famens; and in poiygamia, if imperfeet and perfect flowers, that is, anther-!tigmate and figmate or anthered, be found on the fame plant, the order is monœcia; if on two plants, the order is dicesia; and if anther-Rigmate flowers be on one plant, ftigmite on another, and anthered on a third, the order is triœcia.
9. Different fluwers hould be examined, and efpecially thole that are unopened, it t've number of famens and piftils Mould vary. And if, after this examination, different unnpened or unexpanded Howers thoull ray, a preference fhould be given to the fluwers that telainate the falk. We ought alwars, therefore, to compare different Howers before we inquire alter the clafs or orders.

A N Y.
II. I. After determining the clafs and order, the bo- Element; tanif onght to compare with the flower which he is inveffigating the different fections of the order when it is divided into lections. He may then proceed to ex. annine the genus.
2. In the begimning of each clars he will find all the genera arranged as they agree and differ in fome efIential chatacters of the Rower and fruit. But they are numbered in that order which brings thofe that have the clofef refemblance next to one another. After the fection is determined, then the fower muft be compared with each of the genera of that fection, or of the order when it is not divided into fections.
3. If nowe of the effential charasters agree with the fower and fruit of the plant which is examined, then the plants which are named at the end of the orders are to he fought for and exmmined.

In this fyttem we have firft given the effential marks of all the genera at the beginning of each clafs in Latin, and alfo in Englih.
4. After determining the genus, the plant may be compared with the defcription of the fpecies. In foreign plants we have in general given only the effential character of the fpecies, Bu: in fome Britih plants we have added alfo, from Dr Smith's Flora Britannica, a minuter and fuller account, as an example of botanical defcription.

We have not referred to thofe books which give plates of the fpecies, becaufe they are acceffible but to very ferf, and becaufe we do not think that a man will ever be a botanift whofe knowledge is indebted to plates. It is much better to confult an experienced batanilt than a book of plates. Thofe, howerer, who wifh to confult plates may do fo from this fyftem as we!l as from any other, after afcertaining the clafs and order.

As to the language which is employed in the following fyttem, we need fay very little. We have en. deavoured to make it as much Englith as poffible. We have always preferred words of Englifh origin when we thought them fufficientiy accurate; but when we had reafon to believe that fuch words were fo varue that they might lead into error, we thought it betier to adopt the Linnean terms, and to give them an Eñlifh termirdtion. In a few cafes we have retained the Linnean terms unaltered, as corolla, bractea, ftipula, becaufe we thought any fuch change would be unpleafant to the ear, as corol, bracte. ftipule. Befides it would be no difadvantage to the harmony of our language to have mose words ending with vowels.

We nnce intended to have given Englifh names to many of the genera, and to all the fpecies, and had done fo through the firff four or five claffes; but it was objected, that this would increafe the lynonymes, which are alieady too numerous; and conlequently would oftener tend to miftead than to be ufeful. It would certainly be much better that plants were known in all nations Ly the fane name.

## Of the Method of forming an Herbarium or Horius Siccus.

Every man who withes to be a complete botanill will find it neciffary to preferve and to form into a coilec. tion the plants which be has examined.

Thie beft method of preferving them is by drying them: fpecimens ought to be collected wlen dry, and carried home in a tin box. Plants may be dried by prefing, in a box of fand, or with a hot fmoothingiron. Each of thefe has its advantages.

1. If preffure he employed, a botanical prefs may be procured. The prefs is made of two finooth boards of hard wood, 18 inches long, 12 broad, and two thick. Screws mult be fixed to each corner with nuts. If a prefs cannot eafily be had, books may be employed.

Next, fome quires of unfized bloffom blotting paper mult be provided. The fpecimens when taken ou: of the tin box mult be carefully fpread on a piece of palteboard covered with a fingle theet of the bloffom paper quite dry; then place threc or four fheets of the fame paper above the plant, to imbibe the moifture as it is preffed ont ; it is then to be put into the prefs. As many plants as the prefs will hold may be piled up in this manner. At firft they ought to be prefled gently.

After being preffed for twenty-four hours or fo, the plants ought to be examined, that any leaves or petals which have been folded may be fpread out, and dry freets of paper laid over them. They may now be replaced in the prefs, and a greater degree of preffure applied. The prefs ought to fland near a fire, or in the funfhine. After remaining two days in this fituation, they fhould be again examined, and dry fheets of paper be laid over them. The preffure then oughi to be confiderably increafed. After remaining three days longer in the prefs, the plants may be taken out, and fuch as are fufficiently dry may be put in a dry ficet of writing paper. Thofe plants which are fucculent may require more preffure, and the bloffom paper again renewed.

Plants which dry very quickly, ought to be preffed with confiderable force when firf put into the prefs; and if delicate, the bloflom paper fhould be changed every day. When the fem is woody it may be thinned with a knife, and if the flower be thick or globular as the thiftle, one fide of it may be cut away; as all that is neceffary, in a fpecimen, is to preferve the character of the clafs, order, genus and fpecies.
2. Plants may be dried in a box of fand in a more expeditious mantier, and this method preferves the colour of fome plants better. The fpecimens, after bcing preff-d for ten or twelve hours, muft be laid within a fleet of bloffom paper. The box muft contain an inch deep of fine dry fand, in which the fheet is to be plared and then covered with fand an inch thick; another Sheet may then be depofited in the fame manner, and fo on, till the box be full. The box mult be placed near a fire for two or three days. 'Then the fund mult be carefully removed, and the plants examined. If not fufficiently dried, they may again be replaced in the fame manner for a day or two.
3. In diyins plants with a hot fmnothing iron, they muit be placed within feveral fhects of blotting paper, ond ironed till they becom" fufficiently dry. This method anfwers belf for drsing fucculent and mucilaginous plants.
4. When properly dried, the fecimens nould be plared in theets of writing paper, and may be flightly fathiced by making the tup and buttom of the falk $F^{\text {als }}$ through a flig of the paper, cut neatly for the prur-

A N Y.
pofe. Then the name of the genus and fpecies thould Elements. be written down, the place where it was found, nature of the foil, and the feafon of the year. Thefe fpecimons may be collected into genera, orders, and claffes, and titled and preferved in a pottfolio or cabinet. The method of preferving many of the cryptogamous plants is more difficult, on account of the greater quantity of moifture which they contain, and the greater delicacy of their texture.

We will now conclude this introduction with particular references to the plates.

## EXPLANATION of the PLATES.

Plate XCV. exhibits the $2+$ CLASSES; fig. s. reprefenting the firft clafs, or Monandria; fig. 2. the fecond clafs, or Diandria; fig. 3. thelthird clafs, or Triandria; and fo on, according to the enumeration in the table.
Plate XCV. reprefents the parts of a plant upon which the inveltigation of the GENUS depends.
Parts of the Flower.-Fig. I. Spathe. Fig. 2. Spadix. Fig. 3. Gluma, or glume ; b b, arifa, or awn. Fig. 4. Umbella and involucrum: a, Umbella univerfalis, or univerfal umbel; b, partialis, or partial umbel: c, Involucrum univerfale, univerlal involecre; $d$, partiole, or partial involucre. Fig. 5. Calyptra, calyptre, or veil; $a$, capitulum; $b$, operculum; parts of mofles. Fig. 6. Amentum. Fig. 7. Strolitus, flrobile. Fig. 8. a, Pileus, cap ; b, vilua; c, fipes; parts of fungi or mufhrooms. Fig. 9, a, Receptaculunn commune nudum, the common receptacle, or bafe of the flower when the flamina, piltillum, capfule, \&rc. are taken off. Fig. 10. Recoptaculum commune paleis imbricatum, or common receptacle imbricated with palex or membranaceous lamellæ. Fig. $11 . a$ the tube, $B$ the edge or margin, of a one-petaled corolla. Fig. 12, is a flower laid in a proper pofition for flowing its different patts. a, Germen, which includes the feeds and capfule in which they are enclofed; b, fyle, a continuation of the germen; c. Jigma, cr top of the flylus; dddddd, filaments, or threads; eeeee, antbers; fffff, pctals. Fig. 13. a, the claws, $b$, the lamince or plates, of a many-petaled corolla. Fig. 14. a, Bell-fhaped nectary of the narciffus. Fig. 15. Horned ne Etaries of monkshood. Fig. 16. Horned neclary in the calyx of the tropreolum. Fig. 17.a a a a, The neclarics of the parnaffia grafs, five in number, each of which has 13 Atyles, with round buttons on their tops.

Paits of Fructification.-Fig. 18. a, Perianth; b, germin; c, fiyle; d, figma; ece, flaments; ff , anthers, fome fledding the pollen or duft; $g$, the appearance of the anther before it hueds the pollen. Fig. 19. $a$. the filament, and $b$, the anther, feparated from the flower. Fig. 20. $a$, one grain of the pollen magnified by a microlcope; $b$, an elaftic aura fuppoled to be neceflary for impregnating the feeds. Fig. 21. a, Germen; b, Ay/e; c c, figma. Fig. 22. Follicle: The feeds not adhering to the future, are encloled in a particular receptacle, a. Fig. 23. Legume, or a doublevalved pericarp, having the feeds fixed only to one of the furures $a$ a. Fig. 24. Silique, or a double-valved pericarp, with the feeds fixed to both futures of margins, a b. Fig. 25. Pome, or a flefhy pericarp, contain.

$$
\text { 43. Гraxinus, the } A f b
$$

Cal. none or 4 -parted. Cor none or 4 -partud. Capp . fuperior, 2 -celled, leafy above, compreffed. Sceds fa' litary, pendulous. Some of the flowers have piftils only.

* Frax. with leaflets ferrated, flowers deflitute of a cacelfior. calyx and corolla. Common AB Tree. There is a v ricty with pendulous brauches, called weepring a/b. $\mathrm{K}_{2}$. Flowers in IV. and V. and theives beff in calcareous foils on mountains. It is a very lofty and beau. tiful tree, its bark is of the colour of wood afhes, it, buds are large and llack. The thowers grow in loote panicles piftoflaminal, intermixed with pittils fometimes very numerous. The anthers are large, darkpurple. When thefe fall off, the leaves unfold themfelvec. This is the laten of all our native trees of coming into leaf. 'The leaves are pinnate term nated by an odd one, lerrated, fometimes fimple, very eafily injured by frott in autumn. The capfules foon fall. The feeds are flat.

44. Circeat, Enchanter's Nigbeß Bade.

Cor. 2-petaled. Cal. 2-leaved, fuperior. Capf. 2-celled. Seeds fingle.

* 1. Circ. with flem upright, leaves egg-fhaped, luretiana, edged with fmall teeth, opaque, pubefcent. Common enchanter's nigbefbade. Grow's in thady moilt places. Europe and North America. 2f. Flowers in Vl. and VII. The root crecps, and can fcarcely be eradicated. The flem is ereet, not much branched, having commonly but one raceme, which is terminal. The leaves when full grown are egg-haped, faintly green, pubefcent, opaque, fomewhat repand, edged with fmall teeth not ferrated. The calys not mombranaceous.
* 2. Circ. with a fem afcending, leaves heart-fha-aloina. perl, lerrated, and gloffy, the calyx membranaceous. Mountain enchanter's nightfrade. Grows in flady moif places in mountains and rocks; in Lancafhire, Weftmorland, and Cumberland, at the foot of the mountains; about Loch Broom, Rofffhire, and in Hamilton Wood, Scotland; and in the cold countries of Europe. 24. Flowers in VII. and VIII. The root creeps, and the whole plant is lefs pubefcent than the former. The flalk is fhort, fprcading at the bafe; the knee-joints red, the leaves tender, pale-green, glofy, heart-llaped, tooth-ferrated, the leaf-talks cdged with a membrane.

## 45. Veronica, Spcedwell.

Cor. 4 cleft, wheel-(haped, the loweft fegment lean.
C.dpfo fuperior, 2 -celled.
Subdiv. t. Spiked.

* 1. Ver. with a terminating fike; the leavis oppo-fpicatu. fite, bluntih, notched-ferrulated, very ontire at the extremity; the llalk afcending, very fimple. Spiked sperdsucll. Grows in meadows and calcareous foils. On Newmarket heath and Gogmagogh hills; on Cavenham heath near Bury; and near Penny-bridge, Lancalhire. Flowers in Vll. and often continues in flower till IX. The falks are feven inches high, afcerding, fimple,
round leafy, fomewhat woody, pubefent. The leaves oppofite, commonly blunt, fometimes a little tharppointed, crenate-ferrulated, entirc at the extremity, hairy. Spike erect, many flowered. The flowers are of a deep blue, the throat of the corolla bearded. This〔pecies varies, with leaves linear and almof entire.
bybrida. 2. Ver. with fikes terminating, leaves oppofite, elliptical, blunt, unequally crenate-ferrated, the falk fomewhat ereet. $W_{t} / J_{0}$ Jpeedwell. Grows on the fides of mountains, but is very rare. It is found on Craig Wreidhin, Montgomery lhire, and at Cartmell Fells, Lancafhire. \%. Flowers in VII. Nearly allied to the preceding, but twice as large in every part; the Tpikes generally numerous; the ftalk and leaves more rugged above, and more deeply ferra:cd: the leaffalk in the former is often found winged.
officinalis. * 3. Ver, with lateral fikes on footifalks, leaves oppofite, fcabrouc, ftalk procumbent. Europe. Male or common fpeedwell. Grows commonly in barren fandy pafures. Flowers in V. and VI. The flatk has widefpreading branches; the leaves pale, a little fliff and roughift ; the filkes axillary, folitary, on foot llalks, ma-ny-fowered, hairy, longer than the falk; the flowers of a faint blue, with deeper veins.

## Subdiv. 2. Corymb. racemous.

faxatilis. * 4. Ver. with a corymb terminating and bearing few flowers, the leaves elliptical, ftalks ipreading, capfule egg-haped, 4 -valved. Blue rock fpeedzell. Grows on Ben Lawers, Perthflire; and on the Alps. $\psi$. Flowers in YII. 'The flalks decumbent at the bale, fomewhat fhrubby branched; the branches afcending, fimple, leafy; the leaves oppofite, fmall, elliptical or elliptical-lanceolate, blunt, very entire, fometimes but feldom ferrated on the middle, light green, fomewhat Hefly, fmooth, crowded at the base of the branches, more dillant above; the flowers three or five in a terminating corymb, on footllalks which are three or four times longer than the floral leaf or bractea, large, beautiful, of a blue-violet hue, the throat red. The calyx 4 -cleft, almoft equal, blunt, pubefcent; the capfule pubefcent, egg-fhaped, 4 -valved. It differs from the jruticulofa in having generally broader leaves, flalks more fpreading, in having a larger corolla, which is blue and not llefl-soloured; and is fill more difinguifhed by having longer fuotifalks, fewer, and in being corymbous, not Ppiked.
fruticulofa.* 5. Ver. with a corymb terminating many-fiowered, Ppiked, leaves elliptico-lanecolate, ftalks ersect, capfule egg-?hajed, 4 -valved. Fle/b-coloured, hirub$1 y$ Soceduell. Grows in Cruachan, Argylefhire, and Ben Lawers, Perthhaire. Alfo on the Alps and Pyrences. 26. Flowers in V1I. The falks are tranched at the bafe, twiffed, lying upon the ground, a littie florubby, afterwards becoming erect, ftiff, and firaight, feven inches long, fiunple leafy, round, a litule pubefcent. The leaves are oppofite, el-liptico-lanceolate, moft commonly entirc, fonctimes ferrated, palc green, hollowifh, and a little fhagky on the edge. The corymb is terminating, pubefrent, a little fpilied, and afterwards exiended into a long leafy raceme. The flower-bearing footfalks are of the fatne length with the brieteas, and thufe which hear the fruit half as jong again. The calyx is fourclct, almoft ergual, blunt, haygy. The corolla of a

A N .
pale flefh colour, with purple lines lefs than the preceding. The capfule egg-thaped, flaggy, fuur-valv. ed.

* 6. Ver. with a corymb terminating, a little fpiked; alpina. leaves oval, fmooth, flightly ferrated, the calyx ciliate, fiem afcending and fimple. Alpine fpeedruell. Grows on wet fongy places, on mountains about Garwaymoor, on Ben Nevis, and on the mountains of Badenuch, and on the Alps. 26. Flowers in VII, and VIII. The flalks are a finger long, afcending, fimple, leafy, ruoting at the bafe. The leaves oppofite, elliptic-oval, thin, ilightly lhaggy, often entire, fometimes notched, commonly three-nerved, palc-green, thining. The flowers are fmall, blee, on a fmall corymb, which afterwards extends into a thort raceme. The fruitflalks are of the fame proportion as in the preceding. The calys is nearly equal, bluntifls, ciliate, and often flagey. The hairs jointed like the pubefence of the leaves. The capfule elliptical, emarginate, two-valved, pubefcent, terminated with a fhort perfifirg ityle.
* 7. Ver. with a raceme terminating approaching to a ferpyllifofpike; the leaves oval, a little notched, three-neived, lia. fmooth; the capfule obcordate, fhorter than the fyyte. Europe and N. America.
в. Ver. Humifufa. Smooth Speedzuell, or Paul's Betony.

The firft variety grows in meadows and paflures; the fecond on the highell mountains in Scotland, unsder wet Mady rocks. 4. Flowers in V. and V.T. The plant is hining, fomewhat flefly; in moin places fmooth, in mountains rough-haired. The falks decumbent and taking root, leafy; the branches commonly erect. The leaves on foottalks oval or roundifh, more or lefs crenated, three-nerved. The raceme terminating, long, loofe, many-Howered, oftener pubefeent. The bracteas elliptical. The fegments of the calyx are obovate-0lliptical, fmoothilh, equal. The corolla of a blue or Hefl-coloured whitifh colour, with violet freaks. The capfule obcordate, double, of the length of the תyle or a little fltorter.

The variety called bumifufa, has a procumbent form with a thoter raceme.

- 8. Ver. with racemes lateral, leaves elliptical and Eeccabuaga plane, and falk creeping. Brooklime. Europe. Grow's frequently in rivulets and ditcles containing clear water. 2f. Flowers in VI. and VII. The plant is very frooth and glolly. The falks decumbent or fuimming, columnate. The leaves on thort footflalks, elliptical, broad pointed, indiflinctly ferrated, of a beautiful green, fomewhat flefly. The racemes axillary, oppofite, on footfalks, many-flowered. The bracteas linear lanccolate, fhoter than the fruitilalks. The fegments of the calyx farp pointed. The corolta blue. The capfule almon double.
- 9. Ver. with racemes lateral and oppofite, leaves anagallis. lanceolate and ferrated, flalk erect. Water fpeedwell, or long-leaved lrooklime. Europe and the Levant. Grows in ditches and marfles. 24. Flowers in VII. It is difinguifhed from the former by leaves lanccolate, longer, a little ovate or elliptical, and by an erect flalk. The racemes are longer and more pointed.
* 10. Ver. with racenies lateral and alternate, fruit. foutellara. falklets divaricate, leaves linear and denticulate. Narrow-leaved marflo fpeeduell. Lurope. Grows in mathes and places that have been overfluwed with
water in a fandy foil. 2f. Flowers in VII. and VIII. The falks are feeble and have fpreading branches. The leaves are linear huceolate, feldom very entire, often dentletted, fornetimes ferrated. The racemes are axillary, folitary, alternite, never oppolite, lonfe, divaricate, varying in length. The thowers are fmall, of a blue fleth colour, ftreaked. The capfule appionching to double. Sometimes its flalk and leaves are pubefcent.
moniana.
* if. Ver. with racemes lateral, long, thread-7aped, Yew-flowerd; leaves ovate, ferrated, on footfalks, the falk hairy on all fides. Mountain fpecdwell, or mountain madwort. Italy, Switzerland, an I Germany. Grows in wood-, in moilt thady places, and befide hedges in a calcareous foil. It is found in Charlion wood, Kent; in the Devil's ditch, Newmarket heath; at Linton, in Gamlingay park and Kington wood, near Worcefter, near Virginia water, about Kirkftal abbey near Leeds, at Shortwood, Pucklechurch, Gloucefterhire; and is very common in Yorkfhire. Alfo in the woods at Dunglals, near the river, Berwickihire, and on the banks of the Efk near Roflin, Midlothian. 2f. Flowers in V. and VI. The root is fibrous. The ftaiks decumbent, feeble, hairy on all fides, leafy. The leaves grow on footfalks ovate, ferrated with teeth of unequal fize, flender, glofyy, formewhat hairy. The racemes axillary, alternate, flaccid, few-Howered. The Howers light blue, direrfified with purple. The capfule circular, double, flit, acutely edged, ciliated.
chamadrys I2. Ver. with lateral racemes, leaves ovate, feffile, wrinkled, incifed, ferrated; the flalk hairy on two fides. Europe. Germander focedwell, or wild germander. Grows in meadows and paflures, and under hedges. and is very common. 4. Flowers in V. The ftalks form an acute angle with the branches, are decumbent, and have a longitudinal line of hair on each fide. The leaves are feffile, ovate, lerrated with unequal teeth, the edge very hairy. The racemes are axillary, oppofite, many-flowered, longer than the Aalk. The flowers are large, beautiful, of a fine blue colour in the intide, and flefh-soloured on the outfide. The capfule is obcordate and fmall.
Subdiv. 3. Flowers folitary.
agrefis. * ${ }^{1} 3$. Ver. with Howers folitary, leaves ovate, incifed, ferrated, fhorter than the flower-ftalk, fialk procumbent, feeds pitcher-haped. Procumbent Speedwell, or germanaier cbickweed. Grows in cultivated grounds, and among rubbih. ©. Flawers from 1V. to IX. The ftalks are feveral, procumbent, fimple towards the top. The leaves fcattered, almont feffile, heartfiapcdovate, widely ferrated. Footitalks axillary, folitary, one-fowered, of the length of the leaves or longer; the fruitfalks curved downwards. The fegments of the calyx ovate-lanceolate, broad at the points, ciliated. The corolla fmall, and of a bright blue colour. The capfule double, fwelling in the middle, rough-lazired. The feeds fisfold on each fide, dimpled and wrinkled.
* 14. Ver. with flowers folitary, leaves ovate, incifed, ferrated; Howers lanceolate, longer than the leafitalk, flalk erect. Europe. Wall. Speedwell, or peedwell cbick weed. Grows frequently in dry cultivated grounde, on walls, and among rubbifl. ©. Flowers in V.
A. N .

The falk is often branchy at the bafe, ereet, feven inche, high. The flowers are foffile, ifluing trom the axils of lanceolate bracteas, whach ate q $1 . \therefore$ difimilar to the leaves. For which rea'un, thes fy. am nught have been arranged among the Spiked Veronias, were it not for its afinity to the preceding and fullosing fpeciec. 'The legment, of the calys ate lanceolate, unequal and acute. The corolla is pale blue. The capfule is leffile, erect, obcordate, flattened. The fueds are elliptical, plane and furrowed in the middla.

* 15. Ver. with flowers folitary, leaves hearu-fh. peil, Foderifolia plane, five-lobed, the fegments of the calyx neartthaped, the feeds pitcher-flaped. Europe. Ivy-liavid fpeedwell, or fmall benbit. Grows in cultavated grousds and among rubbilh. ©. Flowers from [V. to 1 X . The ftalks are procumbent and unbranched. T ie leaves alternate on longer footfalks, bidney-heart. thaped, five-lobed, the central lobe being largell. Tise fruittalks are louger than the leaves. The fegments of the calyx are widely heart-haped, acute, ciliate. The corolla is pale blue. The capfule is double, and fwelling in the middle. The feeds are large, two on each fide, dimpled, wrinkled.
* 16. VER. with folitary Howers, fuperior leaves divid. trifhyllos. ed to the bafe, fruititalks longer than the calyx, feed; flattened. Europe. Fingered Jpeedwell, or upright chickueed. Grows in fandy cultivated grounds, but rare. It is found on the borders of Norfolk and Suffolk, near Bury, and near Roffington, Yorkthire. ©. Flowers in IV. The talk commonly branchy, Hexuofe. The loweft leaves entire, feldom lobed, the higher almoft felfile, three-parted, the central lobe largelt, obovate, the lateral lobes commonly two parted. The Howers on long foottalks and erect, as well as the fruit. The fegments of the calyx are obovate-oblong, blunt, ciliate, unequal. The corolla a deep blue. The capfule circular emarginate, Hattened. The feeds numerous, obovate-Hattened. The plant becomes black. ifh when dried.
* 17. VER. with flowers folitary, leaves deeply divid- verna. ed, the fruithalks fhorter than the calyx; the flalk ftif and ftraight. Gemany, Sweden, and Spain. Vernal peedruell. Grows in dry fandy cultivated fields. Is found near Bury, and at Foulden, Norfolk. ©. Flowers in 1V. It refermbles the arven/is in its babit, in the figure of its feeds and fituation of its llowers; but is of a pale colour, and never grows blackifh when dried. It is fufficiently difinguified by leaves deeply divided, by the central lobe being obovate; the floral leaves are three-parted. The ftall is fcarcely a finger length, ftiff and flraight, often branchy. The fegments -f the calys are lanceolate, acute, nearly equal. 'I he capfule obcordate flattened.

fpikes four-cornered, imbricated; caly.xcs trifid. Italy.
47. Salv. lower leaves lyrated, higheit heart-fharabyfinica. ped, flowers verticilled, the caly xes dagger-pointed and ciliated. Africa. \%'.
48. Saly. leaves heart-fhaped, crenate-dented; ver-verficillaticils almoft naked; flyle of the corolra leaning uponta. the lower lif. Gernany and Switzerland. \%.
49. Salv. leaves heart-1haped, crenate-dented, the napifclia. lower ones haflate and lyrated; verticils almoft naked, upper lip Thorter. Italy and France.
50. Salv. leaves heart-fagittate, ferrated, and acute. glutinofa. Europe. 4 . Obf. The calyx is three-lobed; the corolla fickle-fhaped, yellow, dotted with brown; the middle lobe of the lower lip crenated.
51. Salr. leaves unequally dented, awl-pointed, barrelieri. heart-fhaped, angle-haftate at the bafe; verticils almoft naked. Spain. 4.
52. Salv. leaves haftate-triangular, oblong, crena-canariented, blunt. Canaries. h.
53. Saly. villous, with leaves ovate, dented, ear-aurita. haped; Howers verticil-fpiked. C. of Good Hope.
54. Salv. leaves roundifh, ferrated, truncated at the africana. bafe and dented. Cape of Good Hope. h.
55. Salv. leaves roundifh and very entire, trunca- aurea. ted at the bafe and dented. C. of Good Hope. $\%$.
56. Salv. leaves elliptical, almof quite entire, colurata. downy; the limb of the calyx membranaceous and coloured. Cape of Good Hope. 24.
57. Salv. leaves obovate wedge-fhaped, flightly paniculars. dented, and naked; Atem fhrubby. Africa. 12 .
58. Saly. leaves obovate and dented; calyxis bell- acetatuloAraped, lorming an acute angle, hairy; flem llirubby.fa. Levant. $r_{2}$.
59. Salv. leaves oblong and repand; calyxes thorny; /pinofa. bracteas heart-fhaped, dagger-pointed, hollow. Egypt. 4.
60. Salv. leaves heart-flaped, erofe-dented; calyxes tingitana. thorny; bracteas very entire, heart-haped, daggerpointed, hollow, ciliated. Africa. 12. Olf. Smell very fetid.
61. Salv. leaves wrinkled, heart-fhaped, oblong, flarea. villous, ferrated; floral brakteas longer than the calyx, hollow, awl pointed. Syris and Italy. of.
62. SALv. leaves ovate-lanceolate, ferrated; flowersinvolucrafpiked, terminating, the largeit bracteas coloured.ta.
Mexico. $h$. Obf. This is a very beautiful plant in the number and magnitude of its Howers.
63. Salv. leaves wrinkled, pinnatifid, woolly; the cerato. higheft verticils barreriv Perfia, $\delta$.
64. Saly. leaves oblong, gnawed, woolly; verticils athiops. woolly; bracteas arched downwards, a little thorny.
V. 2. with laciniated leaves. Greece, Africa, and France. 8. The lower lip coheres on the fore part, and forms a lack.
65. Salv. leaves lanceolate, almof entire; ftemphlomoi-wholly-vifcous. Spain. dis.
66. Salv. leaves oblong, dent-angled, woolly; high-argentea. eft verticils barren, bracteas hollow. Crete. 4. This fpecies conneets the felarea and athiops.
67. Salv. leaves pinnated and very entire, the ter-vulneraminating, leaflet greatef. Levant. $h$. rijolia.
68. Salv. leaves pinuated, pinnas gnawed. Crete pinnata, and the Levant. of.
6. Saly.

* ini. Schornus. Glumes chaffy, crowded, the ex. terior one barren. Seeds roundih.
* iti. Cypervs. Glumes chaffy, tiled in two ranks.
* 113. Scirpus. Glumes chaffy, tiled on all fides.
* 115. Eriophorum. Glumes claffy, tiled on all fides. Seed furrounded with very long wool.
ifo. Mapania. Cor, O. Cal. G-valved. Invo. lucre 3 -leaved.

117. Nardus. Cor. a 2-valved glume. Cor. 0.

1r4. Miegia. Cor 2 -valved. Neet I-valved, inclofing the germen.
109. Kyllingia. Cor. 2 -valved. Cal. 2 -valved. Ament imbricated.
119. Cenchrus. Cor. 2-valved. Cal. 2-valved. 3 or 4 flowered. laciniztet and echinated.
118. Lygeum. Cor 2-valved. Cal. a fpathe. Nut 2-celled.
if6. Pommereulia. Cor. 3 or 4 bivalve, awned. Cal, top-flaped bivalve.
108. Fuirena. Cor. 3-valve. Cal. O. Ament. imbricated, the feales awned.

## Order II. DIGYNIA.

127. Panicum. Cal. s-valved, the third valve leaf.
128. Cornucopite. Cal. 2-valyis, Cor. i-valvis. Involucrum commune 1 -phyllum multiflorum.
129. Aristid. Cal. 2-valvis. Cor. I-valvis, apice arillis tribus.

* 129. Alopecurus. Cal. 2-valvis. Cor. x-valvis apice fimplici.
* i28. Phleum. Cal. 2-valvis, truncatus, mucronatus, feffilis.
* 125 . Phalaris. Cal. 2 valvis: valvis carinatis $x-$ qualibus, corollam includentibus.

126. Paspalum. Cal. 2 -valvis: valvis fubrotundis figura corol'

* 130. Milium. Cal. 2-valvis: valvis ventricofis corolla majoribus, fubæqualibus.
* 131. Agrostis. Cal. 2-valvis: valvis acutis corolla brevioribus.
*. 137. Dactylis. Cal. 2-valvis: valva majore longiore compreffa carinata.
- 14 r. Stipa. Cal. z-valvis. Cor. arifta terminali inarticulata.

143. Lagurus. Cal. z-valvis villofus. Cor. arifis 2 terminalibuset \& dorfali.
144. Saccharum. Cal. 2-valvis, lanugine extus veflitus. Cor. 2 valvis.
145. Muhlenbercia. Cal. 1-valvis. Cor, 2-val. vis.
146. Perotis. Cal.o. Cor. 2-valvis, lanugine extus veflita.
147. Leersia. Cal. O. Coto 2 -valvis claufa,
'Sect. II. Flores bifiori, vagi.

* 132. Arra. Cal. bivalvis. Flofculi abfque rudio mento tertii.
* 133. Melica Cal. 2-valvis. Rudimentum tètrii inter fofculos.

Hozess. Calos-valvis, Cor, ariflata。

## Sect. III. Flores multifori, vagi.

136. Unioza. Cal. multivalvis, carinatus.

* I35. Brıza. Cal. 2-valvis, Cer. cotdata: valvis ventricofis.
*134. Poa. Cal. 2-valvis. Cor. ovata: valvis acutiulculis.
* 139. Festuca. Cal. 2-valvis. Cor. oblorga: valvis mucronatic.
* 140. Bromus. Cal. 2-valvis. Corooblonga : valvis fub spice ariflatis.
* 142. Avens. Cal. 3 -valvis. Cor, oblonga: valvis dorlo arifta contorta.
* 144. Arundo. Cal. 2-valvis. Cor. bafi lanata, mutica.

145. Pappophorum, Cal. 8 -valvis Cor, 8 valsis multi-ariftata.

Vor.. IV. Part I.
120. Cornucopie. Cal. 2-vaived. Cor. p-valved. Common involucre I-leaved, many-lowered.
146. Aristida. Cal. 2 -valved. Cor. I-valved, 3 awns at the apex.
*129. Alofecurus. Cal. 2-valved. Cor. 1-valved, the apex fimple.

* 128. Pheeum. Cal. 2-valved, truncated, dagger. pointed and leflice
* 125. Phalaris. Calo 2-valved; the valves keeled, equal, enclofing the corolla,

126. Paspalum. Cal. 2 valved; the valves round. ifl, of the higure of the corolla.

* 130 . Milivm. Cal. 2 valved; the valves ventricofe, greater than the corolla, neatly equal.
* 131. Agrostis. Cal. $z$-valved; valves acute, fhorter than the corolla. Stigmas feathered.
* 137. Dactrlis. Cal. 2-valved, Hattened; the greater valve keel-fhaped.
* 141. Stipa. Cal. 2*valved. Cor, with terminating awn, jointed at the bafe.

143. Lagurus. Cal. 2-valued, awns villous.
144. Saccharum. Cal. 2-valved, covered with down on the oulfide. Cor. 2-valved.

12i. Mumlenbergia. Cal. i-valved. Cor. 2. valved.
123. Perotis. Cal. o. Cor, 2-valved, covered with down on the outfide.
124. Leersia. Cal. O. Cor. 2 -valved, thut.

Plants belonging to the third Sect. of this order re: fembling thefe.

## Arundo epigeios, calamagrofis, arenaria.

Sect. II. Flowers fattered, 2 in each calyx.

* 132. Aira. Cal. 2-valved. Florets without the rudiments of a third.
* I 33. Melica. Cal. 2 -valved, commonly 2 -flowered, wilh the rudiment of a third.

Holcus. Cal. 2-valved. Cor, awned.

## Triandria.

B $O \quad \mathrm{~T}$
officinalis. $\quad 6_{0}{ }^{*} \mathrm{~V}$. leaves all winged and toothed -lt is this fpecies which is in fo much repute as a medicine. The root has a Atrong, but not an agreeable fmell. Its tafte is warm, bitterifh, and fubacrid. It communicates its properties to wine, water, and fpirit ; but it is beft in fubftance, and may be taken from half a drachm to two drachms for a dofe. There is no doubt of its poffefling antifpafmodic virtues in an eminent degree. It is often prefcribed with advantage in byfterical cafes, and infances are not wanting where it appears to have removed fome obltinate epilepfies. In habitual coftivenefs it is an excellent medicinc, and frequently loofens the bowels when other ftronger purgatives have been tried in vain. Cows eat the leaves. Sheep are not fond of them. Cats are greatly delighted with the roots. Rats are faid to be equally fond of them, and that the rat-catchers employ them to draw the rats together.
7. V. with ftem-leaves winged, thofe iffuing from the root undivided. Europe. 24 .

As we have already given to our readers an example of the mode in which the different fpecies of plants are difcriminated by botanifs, and as fuch extreme minutenefs might feen inconfiftent with the nature of out work, we fhall avoid purfuing it, unlefs where the peo culiar nature of any fpecics may appear to require fuch a degree of attention, either as an obje? of fcientific curiofity, or of general utility. At the commencement of the fucceeding clafs, however, we fhall give a further example, taken from the extenfive genus Proo tea, of the manner in which the fpecies of plants ought to be defined. With this exception, however, we fhall confine ourfelves to the defnition of the mose important plants. At the fame time that our work may be as complete as its nature will permit, we fhall tate the names of all the fpecies included under every genus, (excepting the almoft boundlefs clafs of Cryptogamia) taking care to diftinguifh the foreign from the Britifh plants, by affixing to the latter the ufual mark ( ${ }^{*}$ ). Thus there will be exhibited to the reader, nearly a complete enumeration of the objects contained under this extenfive and corious branch of fcience; together with an account of whatever it contains mof intereft. ing or ufeful.

## 76. Otybaphus

Contains one fpecies; viz. vifcofus.

## 77. Olax.

One fpecies; viz. zeylanica. Ceylon.

## 78. Macrolobium.

Three fpecies; viz. pinnatum, hymenæoides, fplixrocarpum.

## 79. Ropria.

One fpecies ; viz. petioliflora. Cape, Japan, Weß Indies.

So. Rumphia.
One fpecies; viz. amboinenfis. Amboyna;
81. Cseorum, Widow-wail.

One fpecies; viz. tricoccon. S. Europe.
82. Comocladia, or Maidet-plume.

Four fpecies; viz. integrifolia, dentata, ilicifolia, angulufa。 Jamaica, S. America.

S3. Wilifichia.
One fecies; viz. repens. Mexico,
84. Melothria, or Small C'reeping Cucumber.

One Species; viz. pendula. N. America.
85 Rotala.
One fecics; verticillaris. E. Indie?.
86. Ortegia.

Two Species; viz. hifpanica, dichotoma. S. Euro
87. Loeflingia.

Two \{pecies; viz, hifpanica, indics. India, Spain.
88. Polycnemum.

Five fpecies; viz. monandrum, fclerofpermum, arvenfe, falfum, oppofitifolium. S. Eusope.

## So. Hippocratea.

Three fecies; viz. volubilis, indica, comofa. S. Am.
90. Tonsella.

Two fpecies; wiz. fcandens, africana. Guiana.
gi. Fissilia.
One \{pecies; viz. pfittacorum. Ine Bourbon.
92. Crocus, or Saffron.

Two fpecies; viz. * lativus, * vernus.

* C. Sheath one value rifing from the root ; tube of the bloffom very long.-The furmmits of the piltils of the Cr. officinalis carefully collected, and moderately dried, are the faffron of the Chops. That collected in England is preferred to all other. It affords a beautiful colour to water, wine, or fpirit, and gives out the whole of its virtues to them. It has been held in high repute as a cordial; but modern practice pays no great attention to it, fince it has been found to produce no fenfible effect, even when given in dofes greatly larger shan thofe generally prefcribed.

## 93. Ixia.

47 \{pecies : viz. fruticofa, minuta, rofea, chloroleuca, * bulbocodium, cruciata, fragrans, humilis, pilofa, hirta, fecunda, villofa, rubrocyanea, pumicea, purpurea, crifpa, cinnamomea, corymbofa, heterophylla, anemonæflura, cœleftina, lpicata, plantaginea, linearis, incarnatd, patens, capillaris, flexuofa, angufta, radiata, virgata, longifora, fcillaris, ariftata, pendula, bulbifera, leucartha, erecta, maculata, deufta, crocata, \{qualida, lancea, pentandra, aulica, falcata, excifa. Alps, Africa, China, Magellan.

## 24. Gladiolus, or Corn-fag.

50 โpecies; viz, montanus, parviforus, flexuofus, recurvus, falcatus, biflorus, tenellus, dichotomus, ftriatus, crifpus, cufpidatus, trillis, albidus, hyalinus, gracilis, carinatus, galeatus, imbricatus, brevifolius, communis, carneus, hirfutus, watfonisus, mevanellus, merianus, laccatus, iridifolius, refrâtus, alatus, bicolor, anceps, feffifolius, filenoides, rofeus, junceus, fetifolius, marginatus, augufus, undulatus, flarus, fecuriger, tubiflorus, tubatus, floribundus, blandus, plicatus, frictus, mucronatus, fpathaccus, gramineus. Europe, Africa.

## 95. Antholyza.

Six fpecies; viz. lucidior, rethiopica, nervofa, cunonia, ringens, plicata. Perfia, Africa.

> 96. Aristea.

One fpecies; viz. cyanea. Cape of Good Hope. 97. Iris

Contains 53 fpecies; viz, the following: ciliata, minuta, pumila, lutefcens, criftata, fufiana, florentina, flıviffima, biflora, aphylla, varicgata, fqualens, japonica, fambucina, lurida, germanica, pallida, comprefa, dichotoma, tripetala, tricufpis, xiphium, xiphioides, *pfeur-acorus, * fetida, virginica, verficolor, halophilæ, ochroleuca, fpathacea, ramofa, fifyrinchium, verna, perfica, juncea, augufta, fetacea, tenuifolia, ventricofa, graminea, enfata, fpuria, orientalis, fibirica, martinicenfis, pavionia, ccifpa, papilionacea, edulic, triftis, polyfachya, vifcaria, bituminofa, tuberofa. Europe, Barbary, Perfia, N. America. Of thefe the following deferve notice.
I. every other fegment of the cor. or bloffom fmallof than the fummit.-The juice of the freb fruit of
this fpecies is very acrid, and has been found to produce plentiful evacuations from the bowels, after other powerful means had failed. It may be given for this purpofe in dofes of 80 drops every hour or two: but the degree of its acrimony is fo uncertain that it can hardly ever come into general ufe. In fome cafes it proves diuretic. The freth roots have been mixed with the food of fwine bitten by a mad dog; and they efcaped the difeafe when others bitten by the fame dog died raving mad. The root lofes moft of its acrimony by drying. Goats eat the leaves when frefh; but cows, horfes, and fwine refufe them: cows will eat them when dry. The roots are ufed in the ifland of Jura to dye black.
I. flem with one angle. The juice of the root, $f a x t i d{ }^{2}$ both of this and the preceding fpecies is fometimes ufed to excite fneezing; but it is an unfafe prachice. Violent convulfions have fometimes been the confequence. Neither horfes, fheep, nor cows eat it. The fcarlet feeds difplayed by the opening capfules give the hedge banks in England a gay appearance in autumn. The leaves when bruifed fmell like rancid bacon.

## 98. Moraza.

This genus chiefly inhabits the C. of G. Hope, and has 17 fpecies; viz. melaleuca, fpralis, pufilla, magellanica, gladiata, aphylla, filiformis, fpathacea, fexuofa, polyanthos, cærulea, plicata, umbellata, " crilpa, iriopetala, iridioides, chinenfis.
99. Martca.

Has one fpecies; viz. marica paludofa. Guiana.
100. Dilatris

Has three fpecies; viz. corymbofa, vifcofa, paniculata. C. of G. Hope.

## 10i. Witsenia

Has one f pecies; viz. witlenia maura. $C$. of $G$. Hope.
102. Xiphidium.

Has two fpecies; viz. album, cæruleum. Guiana.
103. Wachendorfia.

Has five fpecies; viz. thyrffifora, paniculata, hirfuta, tenella, graminea. C. of G. Hope.

## 104 Commelina, or Day-flower.

Has 13 \{pecies; viz. communis of America, airicana, benghalenfis, ereeta, virginica, longicaulis, mollis, tuberofa, vaginata, nudifora, cucullata, japonica, fpirata; chiefly Indian, unlefs otherwife denoted by the name.
805. Callisia

Has one fpecies; viz. callifia repens. S. America.
106. Syena

Has one fpecies; viz. fyena fluviatilis. Guiana.
107. Xyras

Has four fpecies; viz. indica, paucifora of Malabar, americana, capenfis.
108. Fuirena

Has one fpecies; viz. fuirena umbellata. Surinam.

## 109. Kyllingia

Has eight fpecies; viz. munocephala, brevifolia, triceps, panicea, filiformis, umbellata, cyperina, incompleta. Surinam, lndia E. \& W.

Has one fpecies; viz. mapaniia fylvatica. Guiana.

## 111. Schoenus, or Bafe Cyprefs,

Has 39 fpecies; viz. marifcus, junceus, mucronatus, pilofus, filiformis, Ariatus, capitellum, fcariofus, nigricans, ferrugineus, fufcus, triftachyos, culpidatus, aritlatus, compar, flexuofus, capillaceus, uftulatus, fpicatus, bobartix, Itellatus, bulbofus, inanis, cephalotes, cyperoides, cymofus, glomeratus, cladium, effufus, reftioides, furinamenfis, thermalis, levis, lanceus, albus, gracilis, \{ctaceus, pufillus, capillaris. Chiefly tropical.

## 112. Cyperus, or Grealer Galangale.

Has 76 fpecies; viz. minimus, fetaceus, arenarius, prolifer, effufus, articulatus, marginatus, complanatus, texilis, compactus, monoftachyos, diftachyos, tritlorus, nanus, filiformis, dubius, capitatus, niveus, pannonicus of Auftria, mucroratus, laevigatus, fquarrofus, nitens, polyftachyos, conglomeratus, civentus, ariftatus, luzule, confertus, vifcofus, ligularis, glomeratus, imbricatus, maderas-patanus, caltaneus, elegans, furinamenfis, flavidus, flavefcens, fufcus, virefeens, difformis, jemenicus, ftrigofas, tenuis, tuberofus, pumilus, foloniferus, compreflus, pulcher, vegetus, albidus, rotundus, glaber, odoratus, efculentus, tenuiforus, pangorei, denudatus, lanceus, longus, fafigiatus, canaliculatus, monti, iria, fantonici, corymbofus, racemofus, hafpan, elatus, diftans, diphyllus, papyrus, flabelliformis, alternifolius, fpathaceus. Chiefly Arabia, C. of G. Hope, S. of Europe, and tropical.
113. Scirpus, or Rufb-grafs,

Has 70 fpecies; viz. mutatus, tpiralis, articulatus, plantagineus, nutans, * paluftris, geniculatus, caricis, * cæfpitofus, bæthryon, campeftris, capitatus, ovatus, aftropurpureus, polytrichoides, * acicularis, * fluitans, * lacuffris, glomeratus, arvenfis, truncatus, laciniatus, membranaceus, pilofus, hyfrix, * holofchœenus, auftralis, * romanus, nodofus, radiatus, * fetaceus, fupinus, natans, vaginatus, triftachyos, uncinatus, ariftatus, autumnalis, diphyllus, faftigiatus, globulofus, globiferus, capillaris, trifpicatus, lateralis, * triqueter, mucronatus, dichotomus, echinatus, retrofractus, ferrugineus, fpadicens, anomalus, miliaceus, * maritimus, groflus, luzulæ, * fylvaticus, corymbofus, æffivalis, fquarrofus, dipfocus, junciformis, micheliamus, ciliatis, hottentotus, antarcticus, argenteus, menander, cephalotes. S. Europe, E. \& W. Indies, America. Of thefe S. lacuffris is worthy of notice. It is thus defcribed : Straw cylindrical, naked; fpikes feveral, egg-flaped on fruit-ftalks, terminating; calyx fringed, 3 -cleft, middle fegment awlfhaped. When fodder is exhaufted, cattle will live upon this fpecies. Cottages are fometimesthatched, and packfaddles ftuffed with it. Bottoms of chairs are very common'y made of this rufh. If cut at one year old it makes the fine bottoms. Coarfe bottoms are made of it at two years old; and fuch as are fill older, mixed with the leaves of the iris pfeudacorus, make the coarfeft botioms of all. Mats are likewife made either of the fcirpus lacuftris alone, or mixed with the aforefaid leaves. Goats and fwine eat it, cows and theep refufe it.

> 114. Miegia.

Has one fecies; viz. miegia maritima. Cayenne.
115. Eriophorum, or Cottor-grafs,

Has fix fpecies; viz. vaginatum, polyftachyon, ano
guflifolium, virginicum, cyparinum, lypinum. European, except the fpecies called virginicum.
it6. Pommereullia
Has one fpecies; viz. pommereullia cornucopis. In. dia.
117. Nardus, or Matt-grafs,

Has four fpecies; viz. Atricta, ariliata, indica, ciliaris. Two firft, Europe; two laft, India.

## if 8 . Lygeum

Has one fpecies; viz. lygeum fpartum. Spain.
119. Cenchrus, or Hedgehog-gra/s,

Has ten lpecies, viz. lappaceus, capitatus, echinatus, tribuloides, ciliaris, fetofus, geniculatus, hordtiformis, purpurefcens, frutefcens. Generally hot climates.

## Order II. DIGYNIA.

It is highly worthy of being remarked, that under this fecond order of the clafs of triandria in the Linnæan fyitem are included a confiderable number of the plants that are very valuable in agriculture, efpecially the grafles. This branch of botany, therefore, deferves the attention of thofe engaged in the culture of artifcial grafles, and even of all perfons in any way engaged in the cultivation of the foil. Several advantages refult from being able to difriminate the particular graffes that naturally rife upon a field, and the name which they bear. A farmer or other cultivator of lands may thus, in the firf place, be erabled to derive greater beneft from the perufal of publications upon the art on which he is engaged. In the next place, it is to be remarked, that fome graffes rifing fpontaneoully upon a foil indicate that it is of bad quality, or that it has been impoverifhed by fevere cropping; whereas there are other graffes, which demonftrate, by their fpontaneous growth, that the land is in excellent condition. It is of obvious utility to be able to difcriminate fuch plants. It is alfo of importance, when artificial graffes have fprung up, to be able to difcern the kinds to which they belong, and confequently to know whether the proper forts of feed have been fown, and which of the forts may have failed to fpring up. For thefe and other reafons we fhall give the botanical defcription, in as concife terms as poffible, of a corifiderable number of the fpecies of this order.

## 120. Cornucopie, or Horn-of-plenty grafs,

Includes two fpecies; * cucullatum, with an awnlefs fpike, and a fcolloped cone; and alopecuroides, with an awned fpike received in a hemifpherical cone.

## 121. MUhlenbeggia

Has one fpecies, viz. diffula.
122. Saccharum, or the Sugar Cane,

Contains eleven fpecies, viz. teneriffie, fpontaneurn, japonicum, officinarum, polyffachyon, arundinaceum, benghalenfe, repens, ravenne, cylindricum, thunbergii. Tropical.

## 123. Perotis

Has two fpecies; viz. latifolia, and polyftachyle. Tropical.

## 124. Leersia.

Four fpecies; viz. orizoides, virginica, monandra, hexandra, Tropical.

Sylvatica, pumila, ciliata, capenís, tremula, virginica, pungens, fpicata, mexicana, verticillata, coromandelina, tenaciffima, purpurefcens, indica, procera, linearis, lenta, Acllata. Chicfly of Japan, India, America, and S. of Europe.

> 132. A18A, or Hair-gra/s.

Cal. 2-valved, 2 -flowered, without any intervening fubltance between the florets.

* 1. A. florets awnlefs; panicle expanding, fmooth, aquatica. longer than the calys; leaves flat.
* 2. A. leaves flat; panicle expanding ; petals wool-carpiog fo. ly and awned at the bafe; awn flraight, fhort.
* 3. A. leaves like brifles; ftraws almoll naked; pa- Rexuofa. nicles diverging; fruitfalks zigzaf.
* 4. A. leaves like briftles; panicle flender and com-moniane. paet; florets hairy and awned at the bale; awn twilled and longer.
* 5. A. leaves like brifles; theaths rough ; flowers in cancfocns. a panicle; awn not longer than the cal.
* 6. A. leaves like briftles; theaths fmooth, angular, pracos. with furrows; panicle fpike-like; awn taller than the cal.
* 7. A. leaves like briftles; fheaths fmoothilh, fur-caryopbylrowed; panicle wide \{preading when ripe; awns tal-lea. ler than the cal.
'To thefe add the fpecies called a rundinacea, minuta, involucrata, pubefcens, of N. of Europe: 〔ubfinicata and alpina, of the Alps: antarctica of N. Zealand : chinenfis, of China : fetacea.

## 133. Melica, or Melic or Rope-grafs.

Cal. 2-valved, 2 -tlowered, with a little fubftance on a pedicle betwixt the florets; nect. I leaf; flamens dilated at the bafe.

* 1. M. petals not Cringed; panicle diooping, undi-nutans. vided.
* 2. M. panicle compaed; flowers cylindrical ; ftraw cerulca. without knots.
* 3. N. panicle thinly fet; cal. with 2 florets, 1 ber-znifora. maphrodice, the other neutral. Add to thefe ciliata, gigantea, geniculata, decumbens, racemola, ramofa, саpenfis, minuta, papilionacea, altiffima. Chierly of Cape of Good-Hope.

## 134. Poa, or Meadow-grafs.

Cal. 2-valved, many Howered; fpikets cgg-inaped; valves thining at the edge, rather acute.

* 1. P. panicles fpreading ; fpikets Rrap-贝aped, 6-aquatica. flowered.
* 2. P. panicles with fubdivided branches; fpiketsdifans. 5 -howered; florets difant, blunt; cal. valve very unequal.
- 3. I'. panicle fpreading ; fpikets 5 -llowered, fmooth ; praterffis, ftraw cylindrical; upright fheath; fale fhort and blunt. This is an excellent grafs, when fown upon rich loams.
*. P. panicle fpreading, very much branched; fpi-alpinc. kets 6 -Hlowered, heart-Raped.
* 5. P. panicle fpreading; fpikets 4 -flowered, pubef-angufifo cent; Rraw cylindrical, upright; root-leaves doubledtia. together, very flender; fleaths imooth; fbeatb-fcale Mort, lopped.
* 6. P. little fikes egg-flaped; florcts fmoothish, bulunfa. acute; Araw uptight, bulbous at bottom.
* 7. P. panicle fpreading horizonta!ly ; brametes in armada paits;
pairs; fpikets mofly 4 -flowered; leaves flat; fueaths fmooth.
rrivialis. * S. P. panicle fpreading ; fpikets flowered, woody at the bafe; firaw upright, rough ; thearh--fale tapering to a point.-It is faid that Mr Boys of Bethanger in Keat lias been the largeft cultivator of this fpecies in the kingdom, and fold large quantities of the feed; but gave it up for want of a demand. It is an excellent grafs on good and found and noilt loams. It is accounted in Lombardy "the queen of meadow plants" (la regina dell crbc), whether for dry paflures or water meadors; multiplying lifelf much by feed and little by the root; fo that if attention be not paid to permit fome feed to fall, its quantity will fenfibly diminifh. Excellent for all forts of cattle.
Eriflata. * 9. P. panicie fpike-like. Cal. hufks rather hairy, 2 or 3 (rarely) 4 -fiowered, langer than the little fruitתalk; petals awned, awn pointed.
nemoralis. * ro. P. panicle flender, open when in tower; fpikets moftly 2 -flowered, pointed, zough; flraw feeble.
minima. * it P. cal. I-flowered.
rigida.
rupefris.
marilima. * 12. P. panicle fpear-finaped, fomerwhat branched; branches alternate, pointing one way; fruitfalk bordered.
* I3. P. panicle fpear-fhaped, branches alternate; cal. ribbed, 3 or 4 -flowered; Atraw kriee-jointed. 1. P. panicle compact, branched; branches in pairs; \{pikes oblong ; florets blunt; leaves fharp, edges rolled in ; Rraw cylindrical, flanting.
comprefa. * 15. P. panicle compact; Araw llanting, compreffed. decumbens * 16. P. panicle clofe; outer petal hairy at the edge; fraw lying down.
glauca. *17. P. panicle open; fikets moflly 3-flowered; florets tapering to a point, woolly at the bafe; leaves awl-fhaped.

To thefe add the fpecies called laxa of Europe; biflora, of India; hirta and ferruginea, of Japan; cilianenfis, nervata, trinervata, fudetica, rubens, anceps, flava, barbata, pilofd, palufris, glutinola, prolifera, $^{2}$ amabilic, eragroftris, badenfis, cynofuroides, unioloides, racemofa, cyperoides, verticillata, abyffinica, capillaris, japonica, malabarica, chinenfis, punctata, nutans, tenella, fpinofa, farmentofa, firiata, amboynenfis, vif. cofa, contracta, filiformis, difticha, bifaria, bromoides, fpicata, divaricata, peruviana, glomerata, ciliaris, filumofa. Chiefly of the warmer climates.
135. Briza, or Vyaking-grafs.

Cal. 2-valved, many-flowered; Ppiket 2 -rowed; valves heart-flaped, blunt ; the inner minute.
minor. * 1. B. fpikets triangular; cal, longer than the floret.
media. * 2. B. fpikets egg-fhaper, forming a bunch. Add virens, of S. Europe; geniculata and capenfis, of C. of Good IIope; and eragroftis, of S. Europe.

## 136. Uniola, or Sea-fide Oats of Carolina,

Has thrce fpecies, viz. paniculata; mucronata, Cpícata, of America or India.
337. Dactulis, ot Cock's-foot Grafs.

Cal. 2-valved, many-flowered; valves brnader on one fide. Cor. 2 -valved, inclofing the feed. Nectaries 2.
firilla. * 1. D. Ppikes terminating fometimes in pairs; florets not expanding ; flraw and leaves ftiff and flraight.

* 2. D. panicle crowded, pointing one way.-Thisglomorata. grafs is cultivated to advantage on wet loams on a clayey marl bottom, upon which the finer graffes are apt to give way to the indigenous produce. If fuffered to rite high, it is tery coarfe; but, when fed clofe, is a very valuable theep-pafture. Women and chilo dren are faid to make good earnings in gathering the feed at 4c. a bufhel. Upon an Englifh acre two bufhels may be fown, with ten pounds of common red clover. When the clover wears out, the grafs covers the land, and abides well in it. It grows well in winter.

Add the fpecies cynofuroides, cefpitofa, littoralis, levis, villofa, ferrata, ciliaris, hifpida, geniculata, brevifolia, lagopoides, pungens, of America, India, and Africa,
138. Cynosurus, or Dogs-tail Grafs.

Cal. 2 -valved, many-Howered, cqual; cor. 2 -valved; 1 valve concave, longer. Nect. 2-leaved.

* 1. C. foral leaves, with winged clefts,-The crefted crifatu:。 dogstail is highly fpoken of in the Milanefe. The Rev. Atthur Young fpeaks thus of it: "To judge Commanicafrom the appearance of the bents of this grafs, in poor tion to the upland but moilt paftures, a man would think it a very unpromifing plant ; but the rich marfhes of Bridge- voli, iii. water and Bofton; the famous pafturages of Paniton in Devonflire, and thofe clofe to Mr Buller's caftle near Lefkeard in Cornwall ; Mr Thorne's bullock ground, on Dunfone bottom, near Taviftock; Mrs Williams's at Little Malvern in Worcefterthire, (which are among the richeft patlures in the kingdom) all abound very greatly in this grafs; in forme of them it is the predominant herbage. Mr Marfhal places it as the moit prevailing plant in the beft grafs meadows of the vale of Pickering ; fome of which will feed a large cow from Mayday to Michaelmas. Very fortunately it abounds much with feed; fo that I have had many buthels gathered in a feafon by poor women and children, at 15. a pound, and laid down many acres of it fuccefffully. Attention fhould be paid to its being ripe; for I once ordered eight bufliels to be fown on eight acres, and it failed from deficiency in ripenefs."

2. C. foral leaves winged, fegments awned. echinatuse
3. C. floral leaves entire; fpike nearly egg-flhaped. currulcuso The remaining fpecies are the following, calcatus, of Cape of Good Hope ; crucæformis of Europe; paniculatus, of C. of G. Hope; lima of Spain ; olurus, of Europe; retrotexus, fpherocephalus, uniolx, filifotmis, monoftachyos, coracanu, floccifolius, penicillatus, pafpaloidcs, ægyptius, indicus, virgatus, aureus,

## 139. Festuca, or Fefoue-grafs.

Cal. 2-valved; fpikes oblong, roundifh; hufks tapering to a point, or terminating in an awn.

* r. H. Cpikes upright, fmooth. Cal. valves, one cu-bromoidese tire, the other tapering to an awn-like point. * 2. H. panicle fike-like, drooping. Cal. fmaller, myurus. valve very minute ; florets rough, awns very long.
* 3. H. paniclc compaet, awned; Araw four corner- rubrao ed, almoft naked; leaves brifte-fhaped.-It flourifhes beft in a dry fandy foil. Cows, horfes, and goats will eat it; but it is the favourite food of freep : they prefer it before all other grafs, and are faid fooneft to grow fat upon it; for, though fmall, it is fucculent. The Tartar!, who lead a wandering life, tending their

## Triandria.

B O T
flocks and herds, always choofe thofe fpots where this grafs abounds. Such may be its juft character in the uncultivated wilds of nature; and, as it prefers a dry foil, its growth is an indubitable indication of the falubrity of fuch places for flocks of theep: but in a more rich and cultivated country, it is faid to be of little value as a pafure grafs, being extremely dimitutive; not will it remain long in the ground of lown, but will foon give place to more luxuriant $r$ affes.
subra. * 4. F. panicle rough; fikets 6-Howered, awned; floret at the end awnlefs; flaw femi-cylindrical.
duriufcula.* 5. F. panicle oblong; fpikes oblong, fmooth; leaves brifte-flaped.-A very excel!ent grafs for the agriculturift, as fpringing very early, being productive, and grateful to all kinds of cattle, and is found in moft good meadows and paftures.
dimidorum * 6. F. panicle fike-like, pubefcent; leaves threadflaped.
glabra. * 7. F. panicle branched, upright, compact ; fpikets awl-fhaped, 3 -flowered, awned, fmooth.
cambrica. * 8. F. panucle oblong, upright, branched; fpikets awned. fmooth; leaves flat, naked.
senuifolia. * 9. F. leaves like brilles, rather long, upright; ftraw naked, fpikets rough.
elatior. * 10. F. panicle upright; fpikets fcarcely awned, the outer ones cylindrical. It makes an exte!lent pafure, but requires a rich foil. Horfes, cows, hecp, and goats eat it.
fuitans. * 11.F. panicle branched, upright; fpikets nearly fitting, cylindrical, arwnlefs.-The feeds are fmall, but very fweet and nourithing. They are collected in feveral parts of Germany and Poland under the name of manra feeds; and are efteemed a delicacy in foups and gruels, on account of their nutritious quality and excellent flavour. When ground to meal, they make bread very little inferior to that in common ufe from wheat. The bran, feparated in preparing the meal, is given to horfes that have the worms; but they mult be kept from water for fome hours afterwards. Geefe are very fond of the feeds, and well know where to look for them. The plant affords nourihment to the phalena feflucu. Horfes and fwine will run rifks to get at it.
zoliacea. $\begin{aligned} & * 112 . \text { F. fpiked; fpikets alternate, fitting, compreffed, } \\ & \text { awnlefs. }\end{aligned}$
zoliacea. $\begin{gathered}* 12 . \text { F. fpiked; fpikets alternate, fitting, compreffed, } \\ \text { awnlefs. }\end{gathered}$ decumbens.* ${ }_{13} . \mathrm{F}$. panicle upright; fipets nearly egg-fhaped, awnlefs; cal. larger than the florets; Araw lying down.
pinnata. ${ }^{*}$ I4. F. fpikets fitting; fraw undivided; awn fhorter than the blofioms.
Ty/vatica. $\quad 15$. F. fpikets fitting; Araw undivided; awn as long as the bloflom. To thefe add the following fpecies; riz. tenella, pumila, amethyftina, reptatrix, heterophylla, fciuroides, mioglumis, fpadicea, feabra, fufca, pauciflora, criftata, mifera, indica, calycina, pungens. Mild climates.

> 1+2. Bromus, or Brome-grafs.

Cal. 2. valved; fpikets oblong, cylndrical $z$-rowed; awn beneath the point. This genus includes 33 fpecies; viz. fecalinus, multiflorus, mollis, pectinatus, lanceolatus, alopecurus, fquarrofus, japonicus, bifidus, purgans, catharticus, inermis, afper, littoreus, ciliatus, Iterilis, arvenfic, geniculatus, tectorum, giganteus, rubens, fcoparius, rigens, racemofus, triflorus, madritenfis, rigidus, ramofus, gracilis, pinnatus, criftatus, dittachyos, Atipoides. Chietly Eurorean. The following are thus deferibed.

A N Y.

* B. panicle expanding; fpikets egg-haped; awnotymor-Atraight.-Its merit or demerit in an agricultural view phus. does not feem fufficiently afcertained. It is faid to be difliked by farmers, as lyeing in corn fiells a troublefome weed, and in paftures and mowing grounds of little value, fince it has generally thed its feed by the time of mowing, and produces very few root-leaves.
* B. panicle drooping; fpikets egg-flaped; awnsfyuarrofus Ataddling; panicle imbranched.
* B. panicle upright, ending abruptly; fpikets ob-erectus. long, hairy, awned, about 5 tlorets in each; Atraws upright; leaves hard. A coarle grafs difliked by cattle, as are all the bromes. Properly a fefcue, but has the habit of a brome.
* B. panicle diffufe, upright but open; fpikets Arap-madritch thaped, the middlemoft in pairs; pedicles thickeft at $/ t s$. the top.
* B. panicle drooping, rough; fpikets hairy, awned; afper. leaves rough.
* B. panicle fpreading; fpikets oblong; florets two-Rerilis. rowed; cal. taper-pointed; awns very long.
* B. panicle drooping ; lipikets egg-oblong. arveņs.
* B. panicle drooping; fipikets four-flowered, hhortergiganteus. than the awns.
* B. Atraw undivided ; fpikets alternate, nearly fitting; pinnatus. cylindrical, fomewhat awned.

> 141. Stipa, or Featber-grafs.

Cal. 2-valved, 1 -Rowered. Cor. outer valve ending in an awn; awn jointed at the bafe. This genus includes 11 fpecies; viz. pennata, juncea, capillata, ariftella, paleacea, tenacifima, capenfis, fpicata, bicolor, avenacea, membranacea. Europe, and Cape of Good Hope. The following is thus delcribed.

* S. awns woolly.
pennata.

142. Arrina, or Oats.

Cal. 2-valved, many-fowered. Awn from the back of the cor. twitted. This genus includes 34 fpecies; viz. fibirica, elatior, Aipiformis, ariftidoides, triftata, pallida, penfylvanica, loeflingiana, brevis, alba, Atrigofa, orientalis, fativa, forlkaeli, nuda, fatua, elephantina, fequitertia, lutea, tenuis, pubefcers, ferilis, flavefcens, lupulina, purpurea, antarcta, fragilis, hifpida, pratenfis, verficolor, diftichophylla, filiformis, ficica, bromoides. Chiefly C. of Good Hope and mild climates. The following are thus defrribed.

* A. panicled; cal. 3 -flowered; male floret awned; elatiop. hermaphrodite floret fometimes awnlefs. Cows, fheep, and goats eat it. The roots are fometimes very troublefome to the farmers in arable lands, producing 3 kind of fquitch. It produces a large crop, but is unpalatable to cattle, efpecially to horfes, as are the avence in genersl.
* A. panicled; cal. 3-howered, fhorter than the re-nuda. ceptacle; petals awned upon the back; the third floret awnlefs. This is mearly as good as the cultivated oat ; it will make gruel or oat cake, and fced cattle, as well as that. Ray lays it fells in Cortwall at the price of wheat.
* A. panicled; cal. 3 -Howered, all the florets awn-fatuaed and hairy at the baile. Horfes, fleep, and goats eat it. The awns are ufed for hygrometers. Sometimes fo prevalent amongit barley as almoit entirely to choke it. It may be extirpated by repeated fallorving, or lay. ing down the land in grals.

106
B O T
pubefcens.

* A. panicle frikc-like; cal. 3-flowered; cor. bearded at the bafe; leaves Hat, downy.
fiavefoens. * A. panicle looíe; cal. 3-howered, fhort, all the florets a wned.
fratenfis. $*$ A. panic!e fpike-iihe; cal. 5-fowered.
Arigofa. $\Rightarrow$ A. panicie oblong, compact, pointing ore way; florets in pairs, with 2 awns 3 t the end, and a jointed awn on the back.

1\&5. Laguaus, or Hares-ail Grafs.
Cal. 2-va'ved, aun woolly. Cor. entire, petal with 2 awns at the end, and a twifed awn at the back. This genus includes one feccies; viz.
ozatus. * L. Cpike egg-hlapes, awned.
147. Arusim, or Reed.

Cal. z-valved. Cur. awnices, furrounded with down at the bafe. This genus includes in [pecies; viz. donax, pheagmites, bifaria, benghalenfis, tenax, karka, confpicua, cpigejos, calamagroßis, colorata, arenaria. Chierly of warm climates, except the following, which are thus defcribed.
phrazmites * A. cal. 5 -flowered; panicle fpreading. The panicles are $f_{a}$ id to be ufed by the country people in Sweden to dye woollen green. The reeds are much more durable than fraw for thatching: Sereens to keep off the cold winds in gardens are made of them; and they are laid acrofs the frame of wood-work as the foundation for plafter iloors.
efigejos. * A. cal. i-fluwered; panicle upright; leaves fmooth underneath.
calama- * A. cal. 1-flowered, fmooth; bloffoms woolly ; ftraw grofis.
arcnaria. brancbed.

* A. cal. 1-flowered ; ledves rolled in at the edges, Sharp-pointed.

145 Parpaphorum
Has onc ipecies; viz. alopceuroideum.

> 146. Aristida, or Oat grafs,

Includes uen fpecies; viz. adfcenfionis, ameticana, gigantea, liyitrix, veflita, plunoliz, capenfis, Setacea, depreffa, arundinacea. Cipe, and milder climates.

## 1'\%. Lonlum, or Darasf or Ryegrafs.

Ca!. 1. leaf fixed, many- 1 swered ; fpikets alternate. - This genus includes five fpecies; vizo percnne, tenue, temulentun, mafimun, dillachyon. The following are thus defcribed :
perentis.

* L. fpike awnlefs; fpikets comprefied, many-tlowered, longer than the cal.- It makes an excellent hay upon dry chalky or fundy fuils. It is cultivated with advantage along with elover, and fprings earlier than the other graffe, thereby lupplying food for cattle at a feafon when it is most ciflicult to be obtais.ed. Cows, horfes, and neep eat it. Goats are not fond of it. Though it fucceeds bel\} upon light foils, it will flourifi on any land except fist clay, and will grow cevell orn that; but upon rich fands and loams it becomes not only a good fpring grals, but if properly managed by due mixtures, turns out well as permanent pafture land; alwaya, howewer, mot valuable by being fleep-fed, for which it is fingularly adapted. It is worthy of remark, bowever, that there is reafon to think that the commen cultivated rye-grat's has degeneraied from its natural qualities; and that it is inferior in mary refuecte, parricularly in it duration, to the

A $\mathrm{N} Y$.
rye-grafs which grows naturally in the bet Britifl meadows and paftures.

* L. Spikes awned, compreffed, many-fowered, not ecrerslen. longer than the cal.; flraw rough.-The feeds mixed ture. with bread corn produce but little effect, unlefs the bread be eaten hot ; but, if malted with barley, the ale foon occafions drunkennefs.
* L. Spikets awnlefs, rather fhorter than the calyx; arvenfe. cal. 2 -valved; flraw fmooth.-It is very injurious to a wheat crop, but may readily be avoided as it is fown along with the feed.
*. L. panicle undivided, pointing one way: fpiketsbrcmoides. awned.

148. Rottboellia, or Sea bard-grafs.

Cal. of 1 or $2{ }_{4}$ valves, egg-fpear-fhaped, flat. Florets alternate, on a zigzag fpike-flalk. Cor. 2 -valved, awnlefs. This genus includes 16 fpecies; viz. incurvata, filiformis, cylindrica, thomaca, repens, lævis, pilofa, compreffa, hirfuta, cymbachne, cœlorachis, dimidiata, esaltata, corymbofa, muricata, fanguinea. Chiefly of Europe and India. The following is thus de. fcribed.

* R. fpike cylindrical, awl-fhaped; cal. hukk aw!-incurvate. fhaped, contiguous, divided into two.

## 149. Elymus, or Lime-grafs.

Cal. lateral, 2-valved, feveral together, many-flower-
ed. This genus contains 12 \{pecies; viz. arenarius, giganteus, fibiricus, tener, philadelphicus, canadenfis, caninus, virginicus, flriatus, curopæus, caput medufx, hyllrix. Chiefly of Europe and America. The following are thus defcribed.

* E. fpike upright, compact; cal. woolly, longerarenarius. than the floret.-It reffits the fpreading of the loofe fand on the fea thore. It is not capable of being formed into ropes as the flipa tenaciffima is in Spain. Cows, horfes, and goats eat it ; Heep refufe it.
* E. Spike compact, leaning; fpikets upright without caninus. an involucrum, the lowermott in pairs.
* E. Spike upright ; fpikets 2 florets in each, as long curopeus. as the cal.

## 150. Secale, or Rye,

Contains four fpecies; viz. cereale, villofum, orientale, creticum.

## 15\%. Hordeum, or Barlej.

Cal. lateral, 2 -valved, I-flowered; three together. This genus includes ten 反pecies; viz. vulgare, hexattichon, diftichon, zeocriton, bulbofum, nodofum, murinum, fecalinum, maritimum, jubatum. The following are thus defcribed.

* H. lateral florets male, awned, fnooth on the heel ; marinum. involucrum of the intermediste florets fringed. Sheep and horles eat it. It feeds the brown moth (phalena granella), and the barley Hy (mufca frit).
*. H. lateral florets malc, awnlefs; involuerum brifle-protenfc. thaped, rough. In moin maeadows it produces a confiderable quantity of hay, but is not to be recommendcd as one of the beft graffes for the farmer.
* H. lateral florets male, awnlefs; middle foret ber-maritimaphrodite, witl a long awn. mum. * II. all the florets hermaphodite, awned; cal. grow-fylvaticurr. ing together at the bife, florter than the awns.

52. 1"Riticum, or Wheat.

Cah. 2-valised, fulitary, moflly 3 -llowered; floret
bluntifh. This genus includes 18 fpecics; viz. xffivum, hybernum, compofitum, turgidum, polonicum, fpelta, monococcum, hifpanicum, proftratum, pumilum, junceum, diflichum, repens, maritimum, tenellum, unioloides, loliaceum, unilaterale. Of mild clinates. The following are thas defcribed:
iunceum. epers.

* T. cal. 5 -flowercd, lopped; leaves edges rolled in.
* T. cal. 4 -flowered, awl-haped, tapering to a point ; leaves flat.-It is a mof troublefome weed in arable lands, and can only be deftroyed by fallowing in a dry fummer. At Naples the roots are collected in large quantities, and fold in the market to feed horfes: they have a fweet taft, fomething approaching to that of liquorice: when dried, and ground to meal, they have been made into bread in years of fcarcity. The juice of them drank liberally is recommended by Boerhaave in obftructions of the vifcera; particularly in cafes of fcirrhous liver and jaundice. Cattle are frequently found to have fcirrhous livers in the winter, and they foon get cured when turned out to grafs in the fpring. Dogseat the leaves to excite vomiting; horfes eat thein when young, but leave them when fully grown; cows, fheep, and goats eat them.
carinum. * T. cal. pointed, moltly 4 -flowered; awns longer than the cor.; fikets upright.
boliaceum. * T. fpike fimple, compreffed; fpikets egg-fhaped, but pointed ; cal. many-flowered.

## 153. Lappago

Has one fpecies, called racemofa. Europe, India, and Arabia.

## Order III. TRIGYNIA.

## 154. Eriocaulon, or Net-work,

Has cight fpecies; viz. triangulare, quinquangulare, fexangulaıe, fetaceum, decangulare, repens, fafcicula. sum, umbellatum. India, and S. America.

A N Y.
155. Montia, or Small W'ater Click-weed.

Cal. 2 leav s. Cor. 1 petal, irregular. Capf. 1-celled, z-valved. It has only one fpecies, called * fontana。

> 156. Proserpinaca.

One fepecies, called paluftris. Virginia.

## 157. Holosteum

Has five 〔pecies; viz. cordatum, diandrum, fucculen* tum, hirfutum, * umbellatum. Chiefly hot climates,
158. Foenicia.

One fpecies, called illandica. Iceland.
159. Polycarpon.

One fecies, called tetraphyllum. Europe.
160. Donatia.

One fpecies, called fafcicularis. Ter. del Fuego.
161. Mulzugo, or African Chick-qveed,

Has five fpecies; viz. oppofitifolia, ftricta, hirta, pen. taphylla, verticillata. Hot climaies.
162. Minuartia

Has three $\oint_{1}$ ecies; viz. dichotoma, campeftris, mono tana. Spain.
163. Queria

Has three fpecies; viz. hilpanica, canadenfis, trichotoma. The laft of Japan.

$$
{ }^{16} 6_{4} \text { Lecaea }
$$

Has three fpecies; viz. miner and major, of Candia; verticillata of E. Indies.

## In the clafs Triandria are

90 Genera, including 920 Species, of which 14 are found in Britain.

## CLASSIS IV.

TETRANDRIA.

S. Petals concave. Cal. 4 -partite. A berry, 4 -feeded.
M. Petals ftrap-fhaped. Cal. 4-cleft. Berry $2 \cdot$ called.
S. Petals with a pitted bafe. Cal. 4-partite. A roundifh i'rupe. Stigma funnel-fhaped.
H. Pit. expanding. Cal. 5 -cleft. A drupe with a nut and 2 iteds.
C. or Hoflogay-tree. Pet. obtufe. Cal. 4 -partite. A drupe, and 4 or 5 cells.
F. The petals fhorter than the ftamens. Cal. 4 -cleft. Capf. 4-valued, Ifeed.
O. Pe. fpear-hraped. Cal. 4 -partite. Stigma fitting. Capf.
O. Per. fyear-haped. Cal. 4 -partite. The figma with a head. Capro
A. Pet. rarely prefent. Cal. tubulous 8 -toothed, Capi. 4 -celled.

## Sect. ‥ Flowers four-petaled, fuperior.

T. or Floating Water-Caliraps. Cal. 4 -partite. A nut armed with oppofite conical thorns.
C. Cal. furrounding the feed-bud. A berry with i feed.
G. Cal. 4 -toothed. A drupe with a nut, and I feed.

* C. or Dogwond, or Cornel-eberry. Cal. 4-toothed, deciduous. A drupe with a 2 -celled nut.
L. or Bofe Virginian Loofefrife. Cal. 4 -partite. Capf. 4-celled, 4 -cornered.
S. or Sanders. Cor. 4. Pet. fixed in the cal. A berry with Ifeed.

## Sect. XI. Flowers incomplete, inferior.

S. Cor. 4 -cleft. A berry with 1 fecd, dry. Nectary with 8 glands.
O. Cor. 4 or 5 -cleft. The flamens inferted in the receptacle. The feed folitary, funk in the receptacle.
165. Protea. Cor. 4 -fida. Authere infra apices curolle inferte. Nux I-fperma.
167. Rupala, Cor, q-pctala. Stamina medio petalorum inferta. Bacca i-fperma.
166. Вanskia. Cor. 4-petala. Stamina limbo inferta. Capf. 2 valvis, 2 -fperma. Scmina alata.
168. Embothrium. Cor. 4 petala, Stam. limbo inferta. Follicuius polyfpermus. Sem. alata.

245 . Pothos. Cor. 4-petala. Spatha 1 -phylla. Bacca 2 -locul.
253. Krameria. Cor. 4-pctala. Bacca ficca iEperma, echinata.
255. Rivina. Cor. 4-petala. Bacca r-fperma. Sem. fcabrum.
248. Chloranthus. Petalu:n 3-lobum. Bacca 1-Sperma.
256. Saltadora. Cal. 4 fídus. Cap. i-fperma. Sem. arillatum.
257. Саmphorosma. Cal. 4-fidus. Capf. i-fperma.
258. Alchemilia. Cal. 4-fidus. Sem. s, calice inclufum.
244. Dorstenia. Cal. recept. planum, carnofum, commune.
246. Cornetes. Umbella 4-phylla, 3-Hlora. Capf, 3-сосса.

+ Corcborus coreta. Convallaria bifolia. Ammannia.
Sect. XII. Flores incompleti fuperi.

250. Gonatocarpus. Cor. 4-fida. Drupa nuce 1 - fiperma.
251. Acento Cal. 4-phyllus. Bacca echinata sfperma.
252. Isvardia Cal. campanulatus, perfiftens. Capf. 4 -locularis.
253. Eleagnus. Cal. campanulatus, deciduus. Drupa.

## + Thefum Alpinum.

## Ordo II. DIGYNIA.

262. Bufonia. Cor, 4 -petala. Cal, tetraphyllus. Cap!. I-locularis, 2-valvis, 2 -fperma.
263. Hypecoum. Cor. 4-pctala, inæqualis. Cal. 2 -phyllus. Siliqua.
26 I . Hamameus. Cor. 4.petala longifima. Cal. duple.. Nux 2 locularis ticornis.

* 262. Cuscuta. Cor. f-fida, ovata. Cal. 4 fidus. Capfo a-locularis circuinfciff.
$26+$ Nerteria. Cor. campanulata. Cal. o. Baca 2-locul.

265. Garopina. Cor. campanulata. Cal. o. Sem. 2 muricat?.
266. Cruzita. Cor. o. Cal. 4-phyllus, exterior 3 -phyllus. Sem. I.
$\dagger$ Herniaria fruticofa. Gentenx quadrifila. Suersia corniculata dichotoma.

A N Y.
P. or Silver-trec. Cor. 4 -cleft. The anthers in. ferted below the points of the cor. A rut, i feed.
R. Cor. with 4 petals. The flamens itferted in the middle of the petals. A berry with 1 fetd.
B. Cor. with 4 petals. The flamens inferted in the border. Capf 2-valved, 2 -feeded; the feeds winged.
E. Cor, with 4 petals. The flamens inferted in the border. An air-bag, many-feeded; feeds winged.
P. or Scunkwecd. Cor, with 4 petals. Sheath ileaved. A berry with 2 cells.
K. Cor. 4 -petaled, A dry berry, I feed, prickly.
R. Cor, 4 -petaled. A berry with one feed. Seed rough.
C. or Tca-leaved Cbu-lan. Pet. 3-lobed. A ber:y with I feed.
S. Cail. 4 -cleft. A berry with one feed. Seed coated.
C. Cal. 4 -cleft. Capf. I feed.
A. or Ladies Mantle, Cal. a cleft. Seed s , in the calyx.
D. or Contraycrva. Cal. and receptacle flat, flefty common.
C. an umbel 4-leaved, 3 -Howered. Capfo 3 -celled.

Sect. XII. Flozucrs incomplete, fuperior.
G. Cor. 4 -cleft. A drupe with a I-feeded nut.
A. Cal. 4 -leaved. A prickled 1 -feeded berry.
I. Cal. bell-fhaped, permanent. Capf. 4 -cleft.
E. or Oleafer, or Wild-olize. Cal. bell-hhaped, deciduous. Adrupe.

## Order il digynia.

B. or Toad-gra/s. Cor. 4-petaled. Cal. 4-leaved. Capf. i cell, 2 valves, 2 feeds.
H. Cor. 4 -petaled, unequal. Cal. 4 -leaved. A pod.
H. or IVitch-kazel. Cor. 4 -petaled, very long. Cal. double. A nut, z-celled, 2 -horned.

* C. or Dodder. Cal. 4 -cleft, oval. Cal. 4 -cleft. Capf. 2-ctlled, cut round.
N. Cor. bell-flaped. No cal. A berry with 2 cells.
G. Cor. bell-fhaped. No cal. A feed, thorny on two fides.
C. Na cor. Cal. 4 -leaved. On the outfide 3 leaved. Secd I.

## Ordo III. TRIGYNIA.

266. Boscia. Cor. 4-petala. Cal. 4-dentatus. Capf. 4 -locularis.

## Ordo IV. TETRAGYNIA.

267. Ilex. Cor. I-petala. Cal. 4-dentatus. Bacса 4 -fperma.
268. Coldemia. Cor. i-petala. Cal. f-phyllus. Sem. 2, bilocularia.

27I. Sagina. Cor. 4-petala. Cal. 4-phyllus. Capfo 4-locularis, polyfperma.
272. Tillea. Cor. 3 f. 4 -petala. Cal. 3 f. 4 phylius. Capf. 3 f. 4 , polyfperme.
273. Myginda. Cor. 4-petala. Cal. 4-partitus. Drupa 3 -โperma.
269. Potamogeton. Cor. o. Cal. 4-phyllus. Sem. 4, feffilia.
270. Ruppia. Cor. O. Cal. o. Sem. 4, pedicellata.

## Order III. TRIGYNIA.

B. Cor. 4 -petaled. Cal. 4 -toothed. Capf. 4 -cell. ed.

## Order IV. TETRAGYNIA.

I. or Holly. Cor. r-petal. Cal. t-toothed. A berry, 4 -feeded.
C. Cor. I-petal. Cal. 4-leaved. Two feeds, 2 celled.
S. or Pearlwort. Cor. 4 -petaled. Cal. 4-leaved. Capf. 4 -cellen, many feeds.
T. or Small Annual Houfeleek. Cor. 3 or 4-petaled. Cal. 3 or 4 -leaved. Capf. 3, or 4, manyfeeds.
M. Cor. 4 -petaled. Cal. 4 -partite. A drupe with 1 feed.
P. No cor. Cal. 4-leaved. Seeds 4, fitting.
R. or Sea or Tajel-gra/s. No cor. Nocal. Seeds 4, on a pedicle.

## Order I. MONOGYNIA.

decumbens. 1. P. with leaves 3 -cleft, thread-fhaped; the fem decumbent. C. of G. Hope, $h_{2}$.
2. P. with leaves 3 -cleft, winged, thread-flaped; ftem erect, with folitary little heads, furrounded by leaves. C. of G. Hope. $\quad$.
3. P. with leaves 3 -cleft, winged, thread-fhaped; flem ereet, naked, folitary, little heads. C. of G. Норе. $\hbar$.
4. P. with leaves 3 -eleft, thread-fhaped; ereef ftem, little heads incorporated. C. of G. Hope. $\quad$.
5. P. with leaves double-winged, fmooth, threadflaped, with terminal heads, club-fhaped, without floral leaver. New Holland. h.
6. P. with double-winged thread-flaped leaves; fruit. ftalks thorter than the tops. with the feales of the cal. oval, woolly at the bafe. C. of G. Hope. $\mathrm{I}_{2}$.
7. P. with double-winged, thread-flaped, hairy leaves; fruitfalks longer than the tops; with the feales of the cal. egg-fpear-flapped and hairy. Cape of Good Hope. $I_{2}$.
8. P. with double-winged, thread-flaped, fmooth leaves. The fruithalks longer than the head, with the feales of the call. fpeat-fhaped and hairy. C. of Good Hopc. $h_{2}$.
slomerata. \%. P. with double-winged thread-flaped leaves; and naked, common, elongated fruitfalk; the pedicles longer than the knobs. C. of G. Hope. h.
phylicoides. 10. P. with double-winged, thread-flaped leaves; and terminal knobs, folitary, and cottony. C. of G. Hope. $\mathrm{h}^{2}$.

I I. P. with double-winged, thread-flaped leaves; and lagopus. agsregate knobs in fuikes. C. of G. Hope. h. 12. P. with double-winged thread-fhaped leaves;/picata. and heads fiked and diftinct. C. of G. Hope. $h_{2}$.
13. P. with double-winged inferior leaves; the fu-fceptrum. perior being 3 -eleft and entire. C. of G. Hope. $h$.
14. P. with fmooth 5 -cleft leaves; ftem erect ; and crinita. terminal heads by three's. C. of G. Hope. h.
15. P. with 5 -toothed fmooth leaves; flem erect and conocarpa. a terminal head. C. of G. Hope. h.
16. P. with 3 -toothed, fmooth, elliptical leaves; elliptica. erect fem and terminating heads. C. of G. Hope. $h$.
17. P. with 3 -toothed fmooth leaves, a decumbent bypophylla. flem and terminal head. C. of G. Hope. I2 .
18. P. with 3 -toothed fmooth leaves and lateral heads. cucullata. C. of G. Hope. $h_{2}$.
19. P. with 3 -toothed cottony leaves. C. of Good tomentofa. Hope. $\quad$ :
20. P. with 4-toothed entire leaves, and ftem decum-heterobent. C. of G. Hope. h.
phylla.
2 I . P. with thread-fhaped leaves, and fowers bunchy pinifolia. and fmooth; cal. not double. C. of G. Hope. $T_{2}$.
22. P. with leaves thread-?haped ; flowers cottony, racemofuo in bunches, with a double eal. C. of G. Hope. $\mathrm{I}_{2}$. 23. P. with leaves thread-fhaped, bent inwards, and incurva. fmooth, and bunchy fpiked cottony knobs. C. of G.
Hope. $I_{2}$.
24. P. with hairy thread-haped leaves, and fitting, caudata. fpiked heads or knobs. C. of G. Hope. $1_{2}$.
25. P. with thread-haped channelled leaves, a ter-brasteata. minal knob, and many-cleft Horal leaves. C. of G.
H.pe. $\quad 2$.
26. 1. with inferior thread-flaped leaves, the fupe comofo. rior frear-flaped, and a terminal or terminating knob.
C. of G. Hope. $\quad$.
27. P. with ftrap-hhaped, bent-back leaves, crooked purpurce. terminal terininal knobs，and decumbent ftem．$k_{2}$ ．C．of $G$ ． Hope．
prolifera．28．$P$ ，with awl－fhaped compreffed leaves，and a flower－bearing ftem．h．C．of G．Hope．
corymbofa．29．P．with flrap－awl－fhaped contiguous leaves，and little Hat－topped branches in whirls．h．C．of G． Hope．

Of this genus there are 8 fpecies，viz．Cerrata，gran－ dis，integrifolia，pyriformis，dentata，fpinulofa，ericie． folia，gibbofa．N．Holland．

167．Rupala．
This genus has two fpecies；viz．montana，and Ief－ fifolia．

## 168．Embothrium．

Eight fpecies；viz．「peciofiftimum，coccineum，gran－ diflorum，umbellatum，hirfutum，buxifolium，fericeum， filaifolium．

169．Globularia，or Blue Daify．
Nine fpecies；viz．longifolia，nana，nudicaulis，o－ rientalis．S．Eur．
syo．Cephalanthus，or Butlon－wood，
Has one fpecies；viz．occidentalis．N．America．

## 171．Dipsacus，or Teazel，

Has four fpecies；viz，＊fullonum，＊fylve fris，laci－ niatus，and＊pilofus．
＊D．leaves fitting，ferrated；chaff bent backwards．fullonumo It is cultivated for the ufe of the clothiers，who employ the hedds with crooked awns，to raife the knap upon woollen cloths．For this purpofe they are fised round the circumference of a large broad wheel，which is made to turn round，and the cloth is held againft them． The plant flowers in June and July，and the heads are collected in Auguf．It is fometimes fown along with caraway and coriander；by which means three crops are on the foil at once，without inconvenience，as they ripen at different periods．

## 172．Scabiosa，or Scabious，

Has 41 fpecies；viz．alpina，uflulata，rigida，atte nuata，fcabra，tranfylvanica，fyriaca，leucanthia，＊fuc－ cifa，integrifolia，amplesicaulis，humilis，decurrens，
taiarica, arvenfis, uralcufis, fylvatica, gramuntia, *olumbaria, pyrenaica, ficula, rutá\{olia, * maritima, ftellata, prolifera, atropurpurea, argentea, indurata, africana, monfpelienfis, pumila, cretica, limonifulia, graminifolia, lyrata, paleftina, ifetenfis, ucranica, ochrolenca, pappofa, and pterocephala. S. Eur. Ind. Afr. * S. blofoms 4 cleft, cqual ; tlem undivided; branches approaching; leaves !'pear-egg thaped.-Thedried leaves are ufed to dye woal yellow or green. (Linn.) A ftrong decoction of it continued for a confiderable length of time, is an cmpirical fecret for gonorrheas.

* S. bloffoms 4 -cleft, radiating; leaves wing-cleft, and jagged; ftem rough with frong hairs. Sheep and goats eat this fpecies. Horfes and cows are not fond of it. It is flightly altringent, bitter, and fapenaceous.

173. Knautia,

Has four fpecies; wiz. orientalis, propontica, palafo tina, and plumofa. Levant, Archipel.
174. Allionia,

Has two 货cies; viz. violacea, and incarnata. Am,
175. Opercularia,

Has threc fpecics; viz. umbellata, afpera, diphylla. N. Hollard.

## 176. Hedyotis,

Has If fpecies; viz. fruticofa, racemofa, auricularia, hyfpida, manitima, pumila, diffufa, herbacea, graminifolia, virgata, rupeftris. E. and W. Ind. S. Amer.
177. Spermacoce, or Button-weed,

Has 20 fpecies; viz. tenuior, latifulia, ccerulefcens, alata, hexagona, proftrata, radicanc, longifolia, verticillata, furmatrenfis, afpera, hirta, villofs, bifpida, feabra, articularis, fri\&a, linifolia, procumbens, fpinofa. E. Ind. $\Lambda$ fr. Amer.
178. Sherardia, or Lirtle Field-madder,

Contains three Ipecies; viz, arvenfis, muralis, fruticofa. Eus. Ine of A fcenfion.

## 179. Asperula, or Woodroof,

Has feven Cpecies; viz. adorata, hexaphylla, arvenfis, taurina, craflifolia, calabrica, ariftata, tinctoria, pysenaica, cynanchica, lavigata. Eur.
cdorata.
A. leaves 8 in a whirl. ipear-haped; flowers in bundles on Truitfalks. The feent of it is faid to drive away ticks and other infecte. (Linn.) It gives a grateful flavour to wine. Caws, horfes, theep, and goats eat it.
180. Diodia,

Has 6 fpecies; viz. virginica, fimplex, verticillata, jroflrata, fcandens, farmentofa. Amer. Jamaica.
181. Hydrophylax,

Contains only one fpecies; viz. maritima.
182. Knoxia,

Irs under it two fpecies; zeylanica, and corymbofa. Ceylon.
183. Carphalea.

Ilas one fpeces; viz. corymbola. Madagafcar.
184. Houstonia.

Has three fpecies; ccerulen, longifulia, and purpurea. N. Amcrica.
185. Galium, or Ladies Bed-hraw.

Includes 50 fpecies, viz. rubioides, paluflre, trifidum, fruticofum, montanum, tinctorium, capcife, mucronatum, expanfum, afperum, glabrum, aufriacum, bocconi, vifcofum, fayatile, tonuc, juffici, gyrenaicum,
minutum, * fufillum, * fcabrum, verum, moliugo, fylvaticum, linifolium, rigidum, ariftatum, hierofolymitanum, pafchale, glaucum, purpureum, rubrum, mega. lofpermum, Spurium, harcynicum, * uliginofum, * bureale, rotundifolium, bermudianum, ericoides, hirtum, ruthenicum, aparis, * aparine, album, microcarpum, parifienfe, pilofum, maritimum, grecum, Eur, Arab. N . Amer. Of thefe the following deferve notice.

* G. leaves 8 in a whirl, ilrap-fhaped, furrowed; Hower- terum. isg branches thort.- The tlumers will coagulate boiling milk; and their juice changes blue infufions to a red calour, thereby difcovering marks of acidity. The French prefcribe them in hyfteric and epileptic cales. Boiled in alum-water they tinge wool yellou. The roots dye a very fine red, not inferior to madder, and are ufed for this purpofe in the ifland o! Jura. (Pen. nant 1772. p. 212.) Sheep and goats eat it. Horfes and fuine refufe it. Cows are not fond of it. It is fubject to a difeafe, in which the ftem and plants are fet with flefhy balls, about the fize of a pea, hollow within and covered with a purplilh ikin.
* G. leaves 4 in a whirl, !pear-fhaped, fmooth, 3 -fibred; boreale. ftem upright.-The roots afford a red dye for woollens. * G. leaves 8 in a whirl, fpear-maped; keel rough aparine. with prickles pointing backwards; joints woolly.-The branches are ufed by the Swedes inflead of a foi to ftrain milk. Young geefe are very fond of them. The feeds may be ufed inftead of coffee. The plant is eaten by horfes, cows, fheep, and goats. Swine refufe it. (Linn.) The expreffed juice of the fiem and leaves, taken to the amount of four ounces night and morning, is very efficacious in removing many of thofe cutaneous cruptions, which are called, although improperly, fcorbutic. It muft be continued for feveral weeks.

## 186. Cruciayella, or Petty madder.

Nine fpecies; viz. anguftifolia, latifolia, ægyptiaca, patula, ciliata, pubefcens, maritima, capita, monfpeliaca. S. Eur. Arab.
187. Rubia, or Madder.

Seven fpecies; tinctorum, or dyers madder, with annual leaves and a prickly ftem, $\Psi$; chilenfis, peregrina, lucida, fruticofa, anguftifolia, cordifolia, Siber. S. Eur. Canar.
188. Mattusche天a.

One fpecies; viz. birfuta. Carolina.
18g. Siphonanthus.
Two fpecies; viz. indica, and angullifolia. India,
190. Roussea.

One fpecies; viz. fimplex. Mauritius.
191. Froelichia.

One fpecies; viz. paniculata.
192. Scolosanthus.

One fecies; viz. verficulur.
193. Catesbea, or Kily Thorm.

Two fpecies; viz. fpinofa, and parvifora. Jam. lle of Providence.
194. Ix@ra, or American Jeffaminc.

Six fperies; viz. coccinca, parvitlura, alba, americana, fafciculata, and multifora. E. Ind. Jam. S. Am.

## 195. Pavetta.

Five fpecies; viz. iudica, villofa, longifora, caffra, pentandra. C. of G. Hope.
296. Ernodea.

Ore fpecies; called littoralis. Jamaica.
197. Siderodendrum.

One fpecies ; called triflorum. S. Amer.
198. Petesia.

Three 〔pecies; viz. Alipularis, carnea, tomentofa.
199. Haffmannia.

One fpecics; called pedunculata. Jamaica.
200. Сhomelia.

One fpecies; called fpinolí.
20f. Petitia.
One fpecies; called domıngenfis. St Domingo.
202. Myonima.

Two fpecies; viz. obaratd, lanceolata. Ihe of Bourb.
203. Pyrostr1a.

One fpecies; viz. falicifolia.
204. Cunninghamia.

Two fpecies; viz. farmentofa, verticillata. Guiana, Ihe of Bourbon.
205. Ægiphila.

Eight fpecies; viz. martinicenls, elata, mixia, villofa, arborefcens, lavis, feetida, trifida. W. Indies.
206. Mitchella.

One fecies; viz. repens. N. America.
207. Coccopcysilum.

Three fpecies; viz. repens, uniforum, biflorum. Jam.
208. Wallenia.

One fpecies; viz. laurifolia. Jamaica.
209. Callicarpa, of Yobnfonia.

Ten fpecies; viz. americana, cana, lanata, macrophylla, Serruginea, reticulata, longifolia, integrifolia, villofa, japonica. N. Amer. Jap. Jamaica.
210. Aquartia.

Two fpecies; viz. aculeati, microphylla. S. Amer.
211. Witheringia.

One fpecies ; viz. folanacea, S. Amer.
212. Myrmecia.

One fpecies; viz. Icandens. Guiana.
213 . Polyphremum, or Carolina Flax:
One fpecies; viz. pror umbens. N. Amer.
214. Labatia.

Two fpecies; viz. feflilitora, pedunculata. Hifpan. 21 5. Lasiostoma,
One fpecies; viz. cirrhofa. Guiana.
216. Manettia.

Five $\{$ pecies; viz. reclinata, lygıfum, coccinea, picta, lanceolata. S. Amer. Jamaicd.
217. Bellardia.

One \{pecies; viz. repens. Guian3.

## 218. Penta.

Nine fpecies ; viz. farcocolla, mucronata, marginata, laterifora, tomentofa, fucata, fquamofa, fruticulofa, snyrtoides. C. of G. Hope.
219. Bleria.

Nine fpecies; viz. cricoidec, fcabra, fafcicula, articulata, purpurea, mufcofa, pufilla, glabella, ciliaris. Cape.

$$
220 \text {. Buddlela. }
$$

Nine Species; viz. americana, occidentalis, globofa,
falvifolia, madagafcarienfis, falicifolia, diverfifulia, virgata, incompta. Cape, S. America, Weft Indies.
221. Exacum.

18 Species; viz. vifcofum, pedunculatum, albets, aureum, feffile, cordatum, punctatum, quadrangulare, gujanenfe, diffufum, tenuifolium, * filitorme, aphyllum, heteroclitum, fpicatum, ramofum, verticillatum, hyffo pifoliurr. Afia, Africa.

> 222. Plantago, or Plartoin.

33 fpecies; viz. *major, craffa, afiatica, maxima, * media, virginica, altifima, *lanccolata, capenfis, lagopus, lufitanica, patagonica, albicans, hirfuta, alpina, bellardi, cretica, barbata, * maritima, fubulata, recurvata, macrorhiza, โerraria, "coronopus, loeflingii, cornuti, amplexicaulis, pfyllium, fquarrofa, indica, pumila, cynops, afra. Eur. Egypt, China, N. Amer. * P. leaves Spear-hhaped; fipike nearly egg-haped, na lancoolatc. ked; ftaik angular.-It is ufually called rib-wort or rib-grafs. Linnæus fays it is eaten by horfes, theep, and goats, and that cows refufe it, but Haller attributes the richnefs of the milk ia the famous alpine dairies to this plant, and to the alchemilla vulgaris. The total abfence of this plant in marlhy lands, is a certain criterion of the wretched quality thereof: in proportion as fuch foils are meliorated by draining, this plant will flourifh and abound. When fown for pafturage upon rich fands and loams, this plant gives a confiderable herbage; and on poorer and drice foils, it does well for theep, but is inferior to fome others. Mr Marfhall obferves that it has food the teft of 20 years eftablighed practice, in Yorkfhire, and is in good eflimation, though not well affeeted by horfes, and bad for hay from tetaining its fap. The plantago major or great plantain, is called feptinervia, from its having 7 large nerves or ribs running olong each leaf; the narrow-leaved fort, above defcribed, has only five ribs, and hence it is called quinquenervia. The leaves are lightly aftringent, and the leeds are fard to be for; and hence they it nd recommended in hemorrnag:s arad other cafec of this kind where medicines of this kind are proper. The leaves bruifed a little are the conmon application of the common people to dight ileth wounds.

Plantain has been alleged to be a cure for the bite of the rattle-fnake; but for this there is probably little foundation, although it is one of the principal ingredients in the remedy of the negro Caftr, for she ditcovery of which be received a confiderable reward from. the affembly of S . Carolina.

> 223. Scoparia.
'Three fpecies; viz. dulcis, procumbens, arborea. Egypt, N. America.
224. Centunculus, or Bafe Pimpernel.

One fpecies; called minimus. Germ. S. Eur.
225. Sanguisorba, or Great Wild Burnet.

Thrte fipecies; viz. *ofricinalis, media, canadenfis. I Europe, N. America.

## 226. Cissus.

18 Cpecies; viz. vitiginea, capenfis, repanda, latifolia, corditolia, rotundifulia, ficyoidce, quadrangularis, acida, cirrhofa, trifoliata, microcarpa, crenata, carnofa, obovata, japonica, pentaphylla, pedata. Arabia, Ind. Jam.

> 227. Epimedium, Barrer-wor:.

One fpecies; viz,* alpinum.
228. Cornus, or Dog-wuod, Cornel Cherry.

12 fpecies; viz. * fuecica, canadenfis, florida, mafcula, japonica, " fanguinea, alba, fericea, circinata, flriata, paniculata, alternifolia. Afia, Amer.
fonguinea. * C. branches ftraight; leaves egg-flaped, green on both fides; tuft flatted. -The wood is very hard and fmooth, fit for the purpofes of the turner. The leaves change to a blood-red in autumn ; the berries ace bitter and flyptic, they dye purple. Horfes, theep, and goats eat it. Swine and cows refufe it.

## 229. Glossoma.

One fpecies; viz. arborefcens. Guiana.

> 230. Samara.

Four fpecies; viz. læeta, coriacea, pentandra, floriburida. Cape, E. Ind. Jan. Guiana.

> 231. Fagara.

12 fpecies; viz. triphylla, evodia, pterota, piperita, tragodes, zanthoxyloides, horrida, capenfis, armata, avicenne, oftandra, elaphrium. W'. Ind. Japan.

23z. Hartogia.
One fpecies; viz. capenfis. C. of G. Hope.
233. Monetia.

Tiwo \{pecies; viz. barlerioides, diacantha. E. Ind.
234. Blackburnia.

One fpecies; wiz. pinnata.

> 235. Ptelea, or Sbrul T'refoil.

One \{pecies; viz. trifoliata. N. Amer. S. S. illes.
2j6. Stimmia.
One โpecies; viz. japonica. Japan.
237. Othera.

One fpecies; viz. japonica. Japan.
238. Orixa.

One fpecies; riz. japonica.
239. Ludwigia, or Bafe Virginian Loofe-Arife.

Five [pecies; alternifolia, hirfuta, juffiacoides, oppofitifolia, erigata. India, Amer. Jam.

## 240. Oldenlandia.

13 fpecies; viz. verticillata, digynia, trinervia, depreffa, capenfis, uniflora, biflora, pentandra, umbella\&a, corymbofa, hirfuta, debilis, foctida.

## 241. Ammania.

Seven fpecies; latifolia, ramofior, debilis, fanguinolenta, octandra, baccifera, pinnatifida. Ind. Virginia.
242. Isnardia.

One fpecies; viz. paluflis. Eur. China, N. Amer. W. Ind.
243. Traps, or Floating Water-caltrops. Two Species; viz. natanc, bicornis. Eur. China.
24.4. Dorstensia, or Contrayerva.

Ten Species; viz. cordifolia, braffilienfis, arifolia, houftoni, contrajerea, drakena, caulefcens, lucida, pubefcens. Arab. S. Amer.

## 245. Pornos, or Scunk-weed.

12 frecies; vz. Fcandins, acaulis, lanceolata, crenata, viulaces, craffinervia, cordata, macrophylla, pinnata, palmata, digitata, pentaphylla. Ind. Amer.

> 246. Conmetes.

Une fpecies; viz. alternifloria.
E. Ind. Surat.
247. Curtista, or Hafugay tree.

One fpecics; viz, faginea. C. of G. Hope.
248. Chloranthus, or Tca-leaved Cbu-lain.

One fipecies; viz. inconfpicuus. Cape, China, Jap.
249. Eleagnus, or Ollafler or Wild Olive.

Ten lpecies; viz. angulifolia, oriental:s, Cpinofa, pungens, latifolia, crifpa, multitlora, umbellata, glabra, macrophylla. S. Eur. China, Japan.

$$
250 \text {. Gonatocarpus. }
$$

One fpecies; viz. micranthus. Japan.
25 i. Santalum, or Sanders.
One fpecies; viz. album.-What is ufually called Whice Sanders wood, is brought from the Eaft Indies, in billets about the fize of a man's leg, of a pale whitifi colour. It conflitutes the outer part of the timber, or that part of the tree which is nearef the bark. This white part has little fenfible fmell or tafte. The inner part of the timber, which ufually receives the appellation of Yellow Sanders wood, is of a pale yellowift colour, of a pleafant !mell and a bitterifl aromatic tafte, accompanied with an agreeable fort of pungericy. Diftilled with water it yields a fragtant effemial oil, which thickens in the cold to the confflence of a balfam. Digefted in pure fpirit it imparts a rich yellow tincture, which being committed to dillillation, the firit arifes without bringing over any thing confiderable of the virtues of the fanders. The refiduum contains the virtues of fix times its weight of the wood. Hoffman look s upon this extract as a medicine of fimilar virtues to ambergis, and recommends it as an excellent reflorative in great debilities.
252. Struthiola.

Five fpecies; viz. virgata, nana, juniperina, erecta,
ovata. C. of G. Hope.

$$
253 \text {. Krameria. }
$$

One fpecies; viz. ixina. S. Amer.

> 254. Acana.
> One fpecies; viz. elongata. Mexico,
> 255. Rıvina.

Four fpecies; viz, bumilis, levis, braflienfis, oftan dra. W. Indies.
256. Salvadora.

One fpecies; viz. perfica. Perfia, India.
257. Camphorosma.

Five $f_{\text {pecies }}$; viz. paleacea, nonipeliaca, acuta, glabra, pteranthuc. S. Eur. Cape.

> 2j8. Alchemilla, or Ladiesmantle.

Six fpecies; viz. caperfis, ${ }^{*}$ vulgaris, *alpina, pentaphylla, aphanoides, aphanes. Alps of Eur.
-A. leaves gaflied.-The whole of this plant is aftin- vulgaris, gent. In the province of Smolandia in Gothland, they make a tincture of the leaves, and give it in fpafmodic or convulfive difeafes. Horfes, fheep, and goats eat it. Swine refufe it. Cows are not fond of it.

## Order II. DIGYNIA.

259. Cruzita.

One fpecies; viz. hifpanica.
260. Bufonia, or Toad-grafs.

One fpecics; viz. "tenuifolia.
variegation of the leaves or thorns, and the colour of the berries. Sheep are fed in the winter with the croppinge, as are alfo deer. Birds eat the berries, The bark fermented, and afterwards wafhed from the woody Gbres, makes the common bird-lime. It makes an impenetrable fence, and bears cropping; nor is its verdure, or the beauties of its fearlet berries cver obferved to fuffer from the fevereft of our winters. The wood is ufed in veneering, and is fometimes fained black to imitate ebony. Handles for knives and cogs for mill wheels are made of it.-It is faid to have been obferved by Linnreus, that the lower branches within reach of cattle bear thorny leaves, whild the upper ones which ftand in need of no fuch defence are without thorns.

> 268. Coldenia.

One fpecies; viz. procumbens. E. Indies,
269. Potamogeton, or Pond-weed.

14 fpecies; viz, natans, fluitans, heterophyllum, perfoliatum, denfum, * lucens, * crifpurn, ferratum, ${ }^{*}$ compreflum, * pectinatum, * fetaceum, * gramineum, * ma. rinum, * pufillum. Europe, N. America.

* P. leaves oblong egy-flaped, on leaffalks, floating-natano -The leaves of this plant floating upon the furface of water, afford an agreeable thade to filh, and are the habitation and food of the phalæna potamogeton. The roots are a favourite food of the fwan.

## Order ill. Trigynla.

266. Boscla,

One fpecies; viz. undulata.

## Order IV. TEtragynia.

267. Ilex, or Holly.

19 \{pecies; viz. ${ }^{*}$ aquifolium, japonica, opaca, crocea, ferrata, latifolia, perado, prinoides, caffine, vomitoria, crenata, emarginata, falicifolia, afiatica, integra, rotunda, obcordata, acuminata, cuneifolia. Afia, N. America.
ofuifolium* I. leaves egg-fhaped, acute, thorny, on leaf-ftalks; flowers in a kind of umbel, axillary.-All the varieties which gardeners reckon, to the amount of 40 or 50 , are derived from this one fpecies, and depend upon the
270. Ruppia.

One fpecies; viz. * maritima.

> 271. Sagina, or Pearl-wort.

Five fpecies; viz. * ceraftoides, * procurmbens, * apetala, * erecta, and virginica of Virginia.

> 272. Tilema, or Small Annual Houfe-leck.

Eight fpecies; viz. aquatica, proftrata, vaillantii; capenfis, perfoliata, umbellata, decumbens, mufcofa. Eur. C. of G. Hope.
273. Myginda.

Three fpecies; viz. vragoga, rhacoma, latifolia, N: America, W. Indies.

## In the clafs Tetrandria are

${ }_{117}$ Genera, which include 638 Species. Of thefe 56 Species are found in Britain.

## CLASSIS V. <br> PENTANDRIA.

A. Cor. 5 -petaled. Capf. 1-celled, 10 -feeded.
* D. Cor. 5 -petaled. Capr. r-cellcd, opening at the top.
M. Cor. 5 -petaled. Capf. 5 -celled, fmooth.
C. Cor. 5 -petaled. Capf. 5 -celled, prickly.
* S. Cor. 5 -petaled. Seeds 5. Cal. ro-cleft.
* S. Cor. 5 -partite. Seed 1, covered by a funnel. fhaped calyx.

## Order vi. Decagynia.

S. Cor. 5 -petaled. Capf. Io-celled, with $t$ feed in each cell.

## Order Vil polygynia.

* M. Cal. 5-leafed. Nectaries 5, tongue-fraped. Seeds numerous.
Z. No cal. Petals 5. Nectaries 5, on pedicles. Capf. 5, I-feeded.

## Order I. MONOGYNIA.

274. Heltotropium, or Turn-fole,

Includes 22 fpecies; viz. peruvianum, amplexicaule, indicum, parviforum, inundatum, villnfum, europæum, coromandelianum, malabaricum, marifolium, fupinum, undulatum, lineatum, frigofum, curaffivicum, zeylanicum, perficum, fcabrum, orientale, gnaphaloides, ternatum, pinatum. S. Eur. Afia, W. Indies, Peru.

## 275. Mrosotis.

12 Species; riz. fcorpivides, " arvenfis, nana, fruticofa, fpathulata, rupeflris, virginian7, lappula, fquarrof, echinopiora, fpinocarpos, pectinata. Europe, North America.

> 276. Lithospernum, or Gromwell.

16 fpecies; viz. * officinale, arvenfe, incanum, papillofum, virginia um, tinetorium, apulum, fcabrum, orientale, * purpureo-cœruleum, fruticofum, callofum, ciliatum, tenaiforum, difpermum, retortum. Europe, Eyvpt, Virgin'a.
arvenfe. * L. feeds wrinkled; corolla or blonoms hardly longer than the calywes on cups.-The girls in the north of

Tol. IV. Part 5.

Europe, it is faid, paint their faces with the juice of the root of this plant upon days of feftivity. The bark of the root tinges wax and oil of a beautiful red, fimilar to that which is obtained from the root of the foreign alkanet that is kept in the fhops. Sheep and goats eat it. C.ows are not fond of it. Horfes and fwine refufe it. * L. feeds fmooth; corol. fcarcely longer than the officinali. calyx ; leaves lanceolate or fpear-haped.-This fecies is found wild in dry fields and hedges. Its feeds are roundifh, hard, of a whitifh colour, like little pearls; and from thefe circumfances, they were at one time fuppofed peculiarly ferviceable in calculous diforders. Their tafte is merely farinaceous.
277. Aschusa, or Buglofs.

13 fpecies; viz. paniculata, capenfis, officinalis, italica, anguftifolia, undulata, tinctoria, hifpida, virginica, lanata, * fempervirens, parviflora, cefpitofa. Europe, Madeira, N. America.
278. Cynoglossum, or ILounds-iongue.

24 fecits; viz. * olficinale, pictun), lanceolatum, virginicum, linenfe, cheirıfolium, apenninum, hifpidum, hisfutum, echinatum, nuricatum, angutifolium, levi-
gatum, gidifolium, critaiurs, luftanierm, linifolium, lanatum, jpanicum, lateriflorum, forpioides, omphalodes, cappadocicum, myofotoides. S. Europe, Japar, Virgini.s.
2fic nuhe. *C. flateres horter than the bloffom; leaves broad, fpear-haped, fitting, cottony.-Both the root and leaves of this plant have been fufpected to poffers natcotic properties, but fome will not admit of the fact. It is difarded from the prefent pratice; though fome individuals are faid to ufe a decoction of the roots inwardly, and cataplaims of them outwardly, in frumous and ferophulous cafce. Its feent is very difagreeable, and very much refembles that of mice. Goats eat it. Cows, horfes, theep, and fwine, refufe it. It furnifhes food to the pbalcena domina.
279. Puimonaria, or Lung-wort.

Seven fpecies; viz. * angultifolia, * officinalis, fuffuticofa, paniculata, virginica, fibirica, * maritima. Europe, N. America.
officinalis. * R. root-leaves egg-heart-haped, rough ; upper leaves egg-flaped, acute.-This plant, when burnt, is faid to aford a larger quantity of afhes than almoft any other vegetable; often 1 -7th of its weight. Sheep and goats eat it. Cows are not fond of it. Horfes and fwise refufe it. The chryyomela nemorum feeds upon it.

## 2So. Symphytum, or Comfrey.

Th:ee fpecies; viz. oflicinale, * tuberofum, orientale. Ger. Fir. Spain, India. * S. leaves egg- 1 apped, decurrent. The particles of the pollen are taid to appear in the microfoope like two globuirs united rogethor. The leaves give a grateful havour to cakes and panada, and the young ftems and leaves are exce!lent when boiled. The roots are glutinous and rauciaginons, and a decoltion of them is ufed by dyers to extratt the colouring natter of gum 13c. Cows and freep eat it. Horfes, goats, and fwine, $\approx=$ fufe it .
231. Cerinthe, or Ilonej-wort.

Three fpecies ; iz. major, afpers, minor. Auftria, S. Europe.

## 282. Onosma.

Eight fpecies; viz. fimplicillima, orientalis, echioides, furicea, cuerslea, temuitlora, calpica, mierantha. Europe, India.

## 283. Boraco, or Borage.

Seven fpecies; viz. officinalis, indica, africana, lonpifolia, zeylanica, orientalis, cretica. E. Indies, $\Lambda$ frica.
sfisinalis. * B. all the leaves alternate; cal. expanding.-It appears by experiment that the juice of this plant affords a true nitre. It is feldom ufed inwardly, but as an ingredient in cool tankards for fummer drinking, though the young and tender leaves are good in fallads, or as a pot lierb. It is faid to afford nouriftment to the phalana gamma. Horfes are faid to have eaten i.

> 284. Asprpuco, or Small Wild Buglofs.

Two fpecies; viz. *procumbens and sezyptiaca. Lurope, Figypt.

## 285. Livcopsis.

Nine fpecies; viz. veficaria, pulla, ciliata, obrufitolia, variegata, * arvenfis, cehioides, ofientalis, virgisicca. Germ, S. Eur. Virginia.
286. Echiym, or Vipers Buglo/s.

26 fpecies; viz. fruticofum, candicans, giganteum, frictum, argenteum, fericeum, fetofum, trichotomum, hifpidun, paniculatum, trigonum, capitatum, lævigatum, glabrum, incanum, (picatum, caudarum, plantagineum, * italicum, rubrum, * vulgare, * violaceum, maritimum, creticum, orientale, lufitanicum. S. Europe, Cape, Canaries.

* E. ftem rough with brifles and tubercles; Atem-aulgare. leaves ipear-fhaped, rougb with hair ; Glowers in daterail fikes.-Cows and fleep are faid not to be fond of this plant. Horfes and goats refufe it. Bees are fond of the flowers, but get their wings torn by its Arong hairs.

## 287. Messerschmidia.

Three fpecies; viz. fruticofa, arguzia, canccllata. Siberia, Camaries.
288. Tournefortia, or Bafet Withe.

Eleven fpecies; viz. ferrata, hirfutiflima, volubilis. fyringrefolia, foctidiffima, humilis, bicolor, cymol:, argentea, fericea, fuffruticola. Ceylon, Wref Indits, S. America.

## 289. Nolana.

One fpecies; viz, proftrata. Peru.

> 290. Diapensia.

One fpecies; lapponica. Lapland.
291. Aretia.

Three fpecies; viz. helvetica, alpina, vitaliana. Alps, Pyrenees.

## 292. Androsace.

Ten fpecies; viz. maxima, elongata, filiformis, feptentrionatis, odoratiffima, villofa, chamæjalme, obtufifolia, lactea, carnea. N. Eur. Archipclago.
293. Prinula, or Primrofe.

18 fpecies; viz. verticillata, * veris, * elatior, * farinofa, cortufoides, villofa, nivalis, lorgifora, glurinofa, marginata, auricula, gigantea, minima, integrifolia, carniolica, finmarchica, vifcola, fibirica. Europe.

* P. leaves toothed, wrinkled, fcape many-flowered, weris.
lumbus of the cor. concave.-This is a low plant growing wild in woods and tredges, and producing pale yellow flowers in the furing. The leaves have an herbaceous tafte. The roots are lightly bitter, with a kind of aromatic flavour, which fome compare to that of anifefeeds; their expreffed juice purified by fettling is fometimes ufed as a fernutatory. The flowers have an agreeable flavour, but very weak; an infufion of them in wine, and a firit diftilled from them, are ufed in fome places as cordial and nervinc.

294. Cartusa, or Bears-car, Saniclc.

Two feecies; riz. mathioli, gmelini. Alps of $\mathrm{Si}_{\mathrm{L}}$ beria and Aullria.

## 295. Tricratus.

One fecies; viz. admirabilis.

> 296. Solmanella, or Soldanel.

One fpecies; viz. alpina. Alps of Auftia and Switzerland.
297. Dodecatheon, or Virginian Corefip.

One lipecies; viz. meadia. North Americal.

> 298. Cyclamen, or Sow-brcar!.

Five fpecies; viz. coum, "europicum, perficum, bedersfolium, indicum. AuRria, S. Lurope, Ceylon.
299. Menyinthes, or Bog-bean.

Four fpecies; viz. *nymploides, ovata, indica, * trifoliata. Europe, Cape, Ceylon, Mal.

* M. leaves growing by threcs; cor. legments entire at the edge, thaggy on the upper furface.-An infufion of the leaves of this plant is faid to be extremely bitter, and is prefcribed in rheumatifms and dropfies. A dram of them in powder, purges and vomits. It is fometimes given to deftroy worms. In a fcarcity of hops, this plant is wled in the north of Europe to bitter the ale. Two ounces fupply the place of a pound of hops. Some people fmoke the dried leaves. The powdered roots are fometimes ufed in Lapland inflead of bread, but they are unpalatable. Some poople fay that heep will eat it, and that it cures them of the rot. But from the ufual experiments, it appears that though goats eat it, fheep fometimes will and fometimes will not. Cows, horfes, and fwine, refufe it.

300. Dorena.

One 〔pecies; riz. japonica. 301. Hottonia, or lVater-viole:。

Four fpecies; viz. * paluttris, feffilitlora, indica, ferrata. North of Europe and India.
302. Bacopa.

One fpecies; viz. aquatica. Guiana, Cayenne.
303. Hydrophyllum, or Water-leaf.

Two fpecies; viz. virginicum, canadeufe. North Americe.

> 304. Elifisi.

One fpecies; viz. nyctelea. Virginis.
305. Lysimachia, or Loofe-grife.

15 fpecies; viz. * vulgaris, decurrens, ephemerum, atro-purpurea, dubia, Atricta, * thyrfifora, quadrifolia, punctata, linum, flellatum, mauritiana, * nemorum, japonica, * nummularis. Europe, Janan, N. America. * L. leaves fomewhat cordate, forvers folitary, fem creeping.-This frecies, called Moneywort, or Herb Twopence, grows fpontancoully in moitt watery places, and creeps on the ground with two little roundilh leaves at each joint. Theis tafe is fubaftringent and very flightly acid; hence, they fland recommended by Boerhaave in the hot fcurvy, and in uterine and other hemorrhagies. But their effects are fo inconfiderable, that common pratice takes no notice of them.
306. Anagallis, or Pimpernel.

Six Species; viz. ${ }^{*}$ arvenifs, pumila, monelli, latifolia, linifolia, * tenella. Europe, Jamaica.
307. Theophrasta.

Tro feccies; viz. americana, longifolia. Amer. 308. Spigela, or Horm-gra/s.

Two fpecies; viz. antlelmia, marilandica. North America, W. Indies.-This $\ln f$ f fecies grows wild in the fouthern parts of North America. The roots are celebrated as an anthelmintic, particularly for the expulfion of lumbrici from the alimentary canal. Some order it in dofes of ten or ffteen grains, and allege it is apt to occafion nervouc affections if given in larger dofes; while others order it ia dram dofes, alleging that the bad effects mentioned more readily bappen from fmall, as the large ones often purge or puke: fome prefer the form of infufion. An emetic is gene-
rally premifed; and is purgative effed affifed by fome fuitable additions.
309. Ophiorrhiza, ot Serpents-tongue.

Three fpecies; viz. mungos, mitreola, fubumbellata. E. Indies, S. America.
310. Lisianthus.

15 fpecies; viz. longifolius, glaucifolius, cocrule?cens, alatus, chelonoides, purpurafcens, grandillorus, exfertus, glaber, frigidus, latifolius, umbellatus, cordifolius, carinatus, trinervius. Weft Iudiec, Surinam.

31 f Fagrata.
One fpecies; viz. zeylanica. Ceylon.
312. Azalea, or Amer. Upright Honegfuckle.

Six fpecies; viz. pontica, indica, nudillora, vifcofa, lapponica, * procumbens. N. Europe, N. America,
$3^{13}$. Sheffieldia.
One fpecies; triz. repens.

## 3i4. Sprengelia.

One fpecies; viz. incarnata.

> 315. Epacris.

Four fpecies; riz. grandiflora, longifolia, rofmarinifolia, pumila. Caribbee Illes.
316. Styphelia.

Eight fpecies; viz. tubillora, ericoides, ftrigof, foyparia, daphnoides, lanceolata, elliptica, juniperina.

3r7. Weigelia.
Two fpecies; viz. japonica, coraennfis. Japan.
318. Plumbago, or Lead-wort.

Seven fecies; viz. europard, lapathifolia, capenfis, zeylanica, rufea, Jcandens, auriculata. S. Europe, E. Indies, S. America.
319. Triguera.

Two fpecies; viz. ambrofisca, inodora. Ifle of Bourbon.
320. Pulox, or Bofe Lycbnis, Licbnidea.

12 fpecies; viz. paniculata, undulata, fuaveolens maculata, pilcfa, carolina, glaberrima, divaricata, ovata, fubulata, fibirica, fetacea. Siberia, N. America.

> 32I. Retzia.

Onc fpecies; viz. ipicata. Cape of Good Hope.
322. Porama.

Orie fpecies; volubilis. Eaft Indies.

## 323. Convolvulus, or Bind-weed.

120 fpecies; viz. *arvenfis, * fepium, wheleri, fcamnonia, involucratus, fibiricus, rupeftris, farinofus, lanuginofus, incanus, emarginatus, medium, flicaulis, tridentatus, angultifolius, japonicus, haftatuc, panduratus, bracteatus, bicolor, trilobus, platanifolius, acuminatus, carolinus, hederaceus, nil, purpureus, obfcurus, flavus, angularis, batatas, maximus, billorus, gemeilus, ftriatus, pentanthus, gujanenfis, capitatuc, hifpidus, parviflorus, triforus, verticillatus, violacens, umbellatus, tuguriorum, cordifolius, bifidus, malabaricus, coeleRis, canarienfis, ferrugineus, muricatus, triqueter, anceps, turpethum, grandiftorus, fpeciofus, trinervius, peleatus, jal-pa, macrofpermus, tenellus, fericeus, tomentofus, quinģe florus, bermanix, arenarius, altheooides, cairicus, ouii quelobus, copticus, vitifolius, diffectus, mucronatus, macrocarpus,
paniculatus, macrorhizos, quinquefolitrs, venofus, glaber, pentaphyllus, tenuifolius, ficulus, pentapetaloides, lineatus, laxatilis, cneorum, linearis, cantabrica, amanni, pilofellafolius, dorycnium, proliferus, lanatus, hyftrix, fuinolis, fcoparius, enotheroides, floridus, cuneatus, corsmbofus, \{pithamæus, perficus, tricolor, acetofitfolius, repens, reptans, edulis, birtus, * foldanel1a, imperati, pes capre, brafilienfis, multifidus, fublobatus, capenfis, layittatus, littoralis, martinicenfis. Europe, Alia, Africa, America.

* C. leaves arrow-lhaped, lopped at the bafe; fruitftalk four-cornered, bearing iflower.-The infpiflated juice of this plant in dofes of 20 or 30 grains, is faid to be a powerful draftic purge. Scammony is the infipiffated juice of a fpecies of convolvulus, fo much refembling this, that they are with difficulty diftinguithed. Though an acrid purgative to the human race, it is eaten by hogs in large quantities without any detriment. Sheep, goats, and horfes eat it. Cows refufe it.
fulddaella. * C. leaves kidney-flaped; fruititalks with 1 Hower.It is faid, that half an ounce of the juice, or a drachm of the powder of this plant, is an acrid purge. The leaves applied externally, are faid to diminifh droplical fwellings of the feet. The different fpecies furnift nourifhment to the fphinx comvoludi, and phalena el-

The root of the fpecies termed jalapa, is brought to us in thin Alices from Xalpa, a province of New Spain. Such pieces thould be chofen as are moft compaet, hard, weighty, dark-coloured, and abound moft with black circular ftrix. Slices of bryony root are faid to be fometimes mixed with jalap. Thefe may be eafily diftinguifhed by their whiter colour and lefs compact texture. This root has no fmell, and very little tafte upon the tongue; but when fwallowed it affects the throat with a fenfe of heat, and occafions a plentiful difcharge of faliva. Taken in fubitance in a dofe of about half a drachm, (lefs or more, according to the circumltances of the patient) in plethoric or cold phlegmatic habits, it proves ans effetual, and, in general, a fafe purgative; performing its office mildly, feldom occafioning naufea or gripes, which too frequently accompany otber itrong cathartics. In hypochondriacal cales, and hot bilious temperaments, it gripes violently if the jalap be good; but rarely takes due effect as a purge. An extract made with water purges almoft univerfally, but weakly; and, at the fame time, has a confiderable effect by urine: the root remaining after this procefs gripes violently. The pure refin, prepared by firit of wine, occafions mof violent gripings and other diftreffing circumftances, but proves farce a: all cathartic. Triturated with fugar or with almonds, into the form of an emulfion, or diffolved in firits and mixed with fyrups, it purges plentifully in a fmall dofe, without occafioning much diforder. 'the part of the jalap remaining after the feparation of the sefin, yields to water an extract, which has no eflect as a cathartic, but operatey powerfully by urine.

Frederic Hoffman particularly cautions againft giving this medicine to childrerr, and aflures us that it will dellroy appetite, weaken the body, and perhaps occ ifion death. In this point this celebrated practitioner was probably deccived. Children, whofe vef.
fels are lax, and their foud foft and lubricating, bear thefe kinds of medicines, as Geofrcey oblerves, better than adults; and, accordingly, inoculators make much ufe of the tincture mised with fimple fyrup. A compound powder of it is employed in droply as a hydragogue purge : and where llimulus is not contra-indicated, jalap is confidered as a fafe cathartic.

The fecies of the genus convolvulus, called fam-fcammony. monia, is a climbing plant, which grows in Afiatic Turkey, and affords a gum refin. The belt forts of the gum refin come from Aleppo, in light fpongy maifes, eaffly friable, of a fhining afth-colour verging to black; when powdered, of a light gray or whitifh colour. An inferior fort is brought from Smyrna in more compact ponderous pieces, of a darker colour, and full of fand and other impurities. This juice is chietly of the refinous kind. Rectified fpirit of wine diflolves five ounces out of fix ; the remainder is a mucilaginous fubllance mixed with drofs: proof lpirit totally diffolves it, the impurities only being left. It has a faint and uupleafant fmell, and a bitterifh fomewhat acrimonious talte. Scammony is an efficacious and a ftrong purgative. Its dofe is from three to 12 grains.
324. Cantua.

Four fpecies; viz. pyrifulia, buxifolia, hoizzia, coronopifolia. Peru.
325. Ipomoea, or शuamoclit.

28 fpecies; viz. quamoclit, diffeck, umbellata, carolina, coccinea, lacunofa, leucantha, folanifolia, tuberofa, digitata, bona nox, campanulata, violacea, verticillata, carnea, repanda, filiformis, hattata, glaucifolia, fimplex, hederacea, triloba, fanguinea, hederifolia, parviflora, hepaticifulia, tamnifolia, pes tigridis. Eaft and Weft Indies, America.

## 326. Polemonium, or Greek Valerian.

Five fuecics; viz. * coruleum, reptans, dubium, roelloides, campanuloides. N. Eur. Alia, C. of G. Hope, America.

327 . Iightfootia.
Two fpecies; viz. oxycoccordes, fubulata. C. of $^{\text {f }}$ G. Hope.
328. Jasione, or Sheep's Scabious.

One fpecies; viz. * montana. Europe, C. of G. Hope.
329. Campanula, or Bell-fozuer.

85 fpecies; viz. cenefia, unitlora, bellardi, pulla, zoyfii, gracilis, glauca, grandillora, tetraphylla, triphylla, verticillata, * rotundifolia, linifoli,, pubefcens, limarioides, carpatica, lubelioides, porufa, undulata, linearis, feffiliflura, *patula, * rapunculus, unidentata, fafciculata, perficifolia, pyramidalis, americana, nitida, ldtifolia, enffolia, rhombordea, *a*ifolis, utticifolia, flylofa, rapuriculoides, bononienlis, vefult, ptarmicxfolia, graminifolia, *traclselium, *glunerata, cervicaria, marginata, thyffoiden, peixa, adprefla, fubulata, hifpidula, paniculata, cinerea, peregrina, cernua, allionii, punctata, medium, barbata, fpicata, ftrigofi, alpina, mollis, laxatilis, alliarixfolia, fibirica, tridentata, laciniata, flriftt, aurea, fruticofa, fpecuJum, * hybrida, prifmatocarjus, cochlcarifulia, limonifolia, pentagonia, peffoltati, capenfis, procumbens,

Pentandria.
tenella, elatines, diffufa, * hederacea, crinoides, beterophylla, erinus. Europe, N. America, Cape, Japan.
rapunculus* C. leaves waved; root-leaves ¢peat-oval; panicle compact.- The roots of this plant are faid to be eaten raw in fallads, or boiled like afparagus. In gardens they are blanched.
330. Roella.

Five fpecies; viz. ciliata, fquarrofa, decurrens, mufcofa, Spicata. Africa.
331. Phyteuma, or Rampions.

16 fpecres; viz. paucitlora, fcheuchzeri, michelli, hemifphxrica, comofa, * orbicularis, nigra, betonicx. folia, fpicata, ovata, virgata, lobelioides, lanceolata, rigida, amplexicaulis, pinnata. Europe.
332. Trachelium.

Three fpecies; viz. cœruleum, diffufum, tenuifoliun. Italy, Levant, Cape.
333. Samozus, Water Pimpernel.

One fpecies; viz. * valerandi. Europe, Afia, America.

> 334. Sphenoclea.

One §pecies viz. zeylanica. $^{\text {a }}$
335. Nauclea.

Six Species; viz. orientalis, purpurea, parvifolia, aficana, aculeata, cordifolia. E. Indies, Guiana.
336. Rondeletia.
${ }_{3}$ fpecies; viz. americana, odorata, trifoliata, virgata, pilofa, thyrfuidea, racemofa, laurifolia, tomentofa, umbellulata, incana, hirfuta, liirta. Ealt and Weft Indies.
337. Macrocnemum.

Three feccies; viz. jamancente, caudidifimum, coccineum. Jamaica.
338. Bellonia.

Two fecies; viz. afp ra and lpinofa. America.
339. Thouinia.

One fpecies; viz. fpectubilio. Jamaica, Hifpanio!a.
340. Portlandic.

Four fpecies; yiz. tetrandra, grandiflora, coccinea, hexandra. Jamaica, S. America.

## 3f1. Solandra.

One feecies; riz. grandiflora. Jamaica.

$$
34^{2 .} \text { Lobelia, or Cardinal fozer. }
$$

$4^{8}$ Species; viz. linearis, fimplex, pinifolia,.* dortmanna, tupa. kalmii, paniculata, graminea, grandis, cornuta, depreflid, columnex, arbarea, bellidifolia, triquetra, cinerea, longiflara, tomentofa, fecunda, acuminata. Itricta, patula, affurgens, cardinalis, ferruginea, debilis, fiplilitica, furimamenfis, infata, cliffortiana, * urens, minuta, laurentia, radicans, campanuloides, evinus, erinoides, anceps, repens, thermalis, puteficens, zeylanica, lutea, angulata, hirfura, pygmaa, coronopifolia, crenata. Cape, Eaft and Weft ludier, America.
The fpecies called fipbilitica grows in moif places in Virginia, and bean our winters. It is permial, has an erect flalk three or foar feet high, blue foness,
$\Lambda \mathrm{N}$ Y゙。
a milky juice, and a rank fmell. The root confifts of white libres about two inches long, refembles tobacco in the talle, which remains on the tongue, and is apt to excite vomiting. It is ufed by the North Americun Indians as a fpecific for the venereal difeafe. The form is that of decoction ; the dofe of which is ordered to be graduaily increafed till it bring on very confiderable purging, then to be intermitted for a little, and again uled in a more maderate degree till the cure be completed. The ulcers are alfo wathed with the decoction, and the Indiars are faid to furinkle them with the powder of the inner bark of the fipruce tree. The fame flrietnefs of regimen is ordered as during a falivation or mercurial courfe. The benefit to be derived from this article has not, fo far as we know, been confirmed either in Britain, or by the practitioners of Virginid $;$. for there, as well as in this country, secourfe is almon univerfally had to the ufe of mercury. Hence the London college have omitted it in their lif of medical plants; though in fome cafes it would feem to deferve trial.
343. Сурина.

Six fpecies; viz. volubilis, digitata, bulbofa, cardamines, incifa, phyteuma.

## 344. Goodenia.

Nine fpecies ; viz. ovata, albida, lxvigata, paniculata, bellidifolia, Atricta, ramofifima, heterophylla, hedcracea.

345: Scavola.
Three fpecies; viz. lobelia, koengii, fericea. South America.
346. Cinchona, or Tefuits-Lark Tree

Nine ipecies; viz. officinatis, pubefcens, macrocarpa, caribæ?, cotymbifera, lineata, floribunda, bram cliycarpa, anguftifolia. Peru, Wefl Indies, Sou:h fea.

The cinctona officinolis (Peruvian or Jefuits-bark tree), is defcribed as being in general about 15 feet high and fix inches thick. It fomewhat refembles our cherry tree, grows promifcuoutly in forefts, particularly in the hilly parts of Quito in Peru, and is fpontaneoully propagated from its own feeds. The batk bas fome odour, to moof people not unpleafant, and very perceptible in the diftilled water, in which tloating glabules, like effential oil, have been obferved. Its talte is bitter and allringent, accompanied with a degree of pungency, and leaving a confiderably lafting imprefion on the tongue. Two forts are mentioned, viz. the coloured ard the white. The culoured includes the pale, the red, the yellow, and the knotty; their barks being coloured, having the cimchona talle and fmell, and the trees having very fmooths laves and purplifl flowers. The whte includes four varieties, their barks being of a whitih colour, witls very little tathe or fmell, and the trees having broan hairy leaves, very fragrant red thowers, with hairs on the infile. The proper red bark, and one of the white kinds, have been found in the province of Santa Fe.

Dr Wright has defcribed very accurately a fpecies of cinchona, under the appellation of cinchora jamai. cenfer, from its being found chictly in Jamaica. It is there called the feaffule teesh, and grows from 20 to

40 feet high. The whitc-furrowed thick outer balk, is not ufed; the dark brown inner bark has the common tlavour, with a mised kind of tafte at firle of the horfe-raddith and ginger, becoming at laf bitter and altringent. It feems to give out more extractive matter than the officinaiic. Some of it was imported from St Lucia, in confequence of its having been fuccefsfully ufed in the army and navy; and Dr Kentih has treated of it at great length, under the name of $S t L u$ cia bark. When frefh, it is confiderably cathartic and emetic, but is faid to lofe thefe properties on drying.

The pale and the red are chielly ufed in Britain. The pale is brought to us in pieces of different fizes, either flat or quilled, and the powder is rather of a lighter colour than that of cinnamon. The red is generally in much larger thicker flattifh pieces, but fometimes alfo in the form of quills, and its powder is reddith, like that of the Armenian bole. It is much more refinous, and poffeffes the fenfible qualities of the cinchona in a much ligher degree, than the other forts; and the more nearly the other kinds refemble the red bark, the better they are now confidered. The red bark is heavy, round, and dry; friable between the teeth; does not feparate into fibres; and breaks, not hivery, but frort, clofe, and fmooth. It has rliree layers; the outer is thin, ragged, of a reddifhbrown colour, but frequently covered with mofy matter : the middle is thicker, more compact, darker-coloured, very refinous, brittle, and yields firf to the pefle. The inmoft is more woody, fibrous, and of a brighter red.

The Peruvian bark yield's its virtues both to cold and boiling water ; but the decoetion is thicker, gives out its tafte more readily, and forms an ink with a chalybeate more fudderily, than the frefin cold infulion. The infufion, however, contains at leaft as much extractive matter, but more in a flate of folution; and its colour, on ftanding fome time with the clalybeate, becomes dasker, while that of the decoction beromes more faint. When they are of a certain age, the addition of a chalybeate renders them green; and when this is the cafe, they are found to be in a flate of fermentation, and effete. Mild or caufic a! k lies, or lime, precipitate the extractive matter, which in the cale of the caufic alkali is re-difflled by a farther addition of the a!kali. Lime-water precipitates lefs from a frefli infufion, than from a frefh decoction; and in the precipitate of this laft fome mild earth is perceptible. The infufion is by age reduced to the fame Rate with the frell decoetion, and then they depofite nearly an equal quantity of mild earth and cstractive matter; fo that lime-water, as well as a chalybeate, may be ufed as a tit of the relative frengh and perifiable nature of the differeit preporations, and of different batks. Accordirgiy, cold infufions are found, by experimente, to te lefs rerithable than decoctions: infurgons and decurtiotis of the red batk than thofe of the palc: thore of the red bark, however, are found, by length of time, to feparate riole mild eath with the lime-water, and more extractise matior. $1 . \mathrm{ime}$ wnicr, as precifitaring the extras, appears an erfually improper and difagrecable menftinum.

The prower of difierent menfour, 35 aceting upon Peruvian batk, is comparacti:ciy in the following order; the molt powet ful foltent beine placed fatt.

1. Dulcified fpirit of vitriol, S. Dulcified fpirit of nitre, 2. Cauftic ley,
2. French brandy,
3. Soft water,
4. Vinegar and water,
5. Mild volatile alkali,
6. Realified fpirit of wine,
7. Mild vegetable alkali, $1=$ Lime-water.

The antifeptic powers of vinegar and bark united, are double the fum of thofe taken feparately. The aftringent power of the bark is increafed by acid of vitriol; the bitter talle is deftroyed by it. The officinal preparations of the bark are,

1. The powder. Of this, the firft parcel that pafles the fieve, being the moft refinous and brittle layer, is the ftrongef.
2. The extrach. The watery and firituous extracts conjoined form the moft proper preparations of this kind.

## 4. Spirituous tincture. This is beft made with proof

 fpirit.4. The decoction. This preparation, though fre. quently employed, is inferior to a fimple watery infufion.

The bef form is that of powder; in which the confituent parts are in the mof effectual proportion. The cold infufion, which can be made in a few minutes by agitation, the firituous tinclure, and the extrac, are likewife proper in this refpect. For covering the tafte, different patients require different vehicles, liquorice, aromatics, acids, port-wine, fmall beer, porter, butter milk, brandy, rum, currant-jelly, \&ec.

According to fome, the Peruvians learned the ufe of the bark, by obferving certain animals affected with intermittents, inftinctively led to it ; while others fay, that a Peruvian, having an ague, was cured by having drank of a pool, in which fome felled trees had fo long foaked, as to give the tafte of their bark to the water; and its ufe in gangrene is faid to have originated from its curing one in an aguifh patient. About the vear 1640 , the lady of the Spanifl viceroy, the Comitiffa del Cinchon, was cured by the bark, which has therefore been called cortex or putvis comitifre, cinchona, chinachina or cbinchina, kinakina or kinkina, quinaquina or quinguina; and from the intereft which the cardinal de Lugo and the Jefuits took in its diftribution, it has been called cortex or $\neq u k i s$ Cardinalis de Inso, Teficiticus, Pairum, \&c.

As it was firf introduced into practice for the cure of intermittent fevers, fo it feldom fails of fuccefs, when properly exnibited in thefe. Practitioners, howcuer, have differed as to the beft mode of exhbiting it; fome prefer giving it jult before the fit, fome during the fit, others immediatcly ofter it. Some again, onder it in the quantity of an ounce between the fits, the dofe being the more frequent and larger, ascording to the ficquency of the fits: and this mode of exhibition, although it may fometimes lead to the cm ployment of more bark than is neceffary, is thought, upon the whole, preferable, from being the beft fuited to mof ftomachc. The requifite quantity is very different in different cafes, and in many vermal intermittents it feems even hardly nectffay.

It often pukes and purges, and fonctimes oppreffes the flomach. Thefe, or any other irregular effects that may take place, are to be counteracied by remedies pasticulatly apprepriated to them. Thus, vomit-
ing is often reftrained by exhibiting it in wine; loofenefs, by combining it with opium; and opprelition at ftomach, by combining it with an aromatic. But, unlefs for obviating particular occurrences, it is more fuccefful when exhibited in its limpleft fate, than with any addition.

It is now given from the very commencement of the difeafe, and is to be continued, not only till the paroxyms ceafe, but till the nutural appetite, flrength, and complexinn, return. Its ule is then to be gradually left oft, and repested at proper intervals to lecure againft a relanfe, to which there is a tendency, efpecially when the wind blows from the eaft. An emetic is often advantageounly employed before commenciner the we of it, but other evacuents feem hurtful.

The Peruvian bark feems not only fuited to intermittent fevers, both latent and formed, but to that fate of the conftitution on whizh all difeafes, rigidly periodical, feems to depend; as periodical pain, inflummation, hemnerthagy, fpafm, cough, lof, of external fenfe, \&c. Burk is now ufed by lome in all conti. nucd fevers, taking care to keep the bowels clean, and to promote, when neceflary, the evacuation of redundant bile. In confluent fraal!pox it promotes lanzuid eruption and fuppuration, diminithes the fever through the whole courle of it, and prevents or corrects putrefcence or gangrene. In gangrenous fore throats it is much ufed, as it is externally and internally in all cafes of gangrene. In contagious dyfentery, after due eracuation, it has been ufed by the moutl, and by injeation, with and without opium.

In all thofe hemorrhagies called pafive, which all hemorrhasies are very apt to become, and likewife in all other increafed difcharges, it is much ufed; and, in certain undefined cales of hesmoptyfis, fome allege that it is remarkably effectual, when joined with an abforbent. It is uled for obviating the difpofition to nervous ind convulive difeafes; and fome have great confidence in it, joined with the acid of ritriol, in cafes of phthifis, fcrofula, ill-conditioned ulcers, rickets, fcurvy , and in ffates of contalefcence. In thefe cafes, however, it ought, in general, to be joined with a milk diet.

In droply, not depending on any particular local af. fection, it is often alternated or conjoined with diuretics or other evacuants; and by its early exhibition after the water is drawn off, or even begins to be freely difcharged, a frefli accumulation is prevented, and a radical curc obtained. In obfinate venereal cafes, particularly tho!e which appear under the form of pains i: the bones, the Peruvian bark is often fuccefffully fubjoined to mercury, or even given in conjunction with it. On the whole this remedy is ufeful in fuch a valt variety of cafes, that its virtues cannot be fufficiently esplained, by confidering it merely as an ordinary tonic or aftringent; and hence many pratitioncrs corfider it as poffeffing fecinic qualities peculiar to itfelf, the nature of which is by no means well underficod.

347 Solena.
One fpecies; viz. longifora.
348. Ucriama.

One fectits ; viz. Іpeciofa.
349. Psychorpra, or Ipeccenania.

39 fpecies; viz. afiatica, glabrata, asillani, luurifolid, parvillora, hirfita, fictens, citrifulia, nitida, raarginata, teruifolia, nervofa, carthaginenfis, myriftiphyllum, laxa, parafitica, horizontalis, nutans, Speciola, involucrata, flesuofn, racemofa, violacea, brachiata, grandis, patens, uliginofa, felpens, herbacea, emetica. corymbola, pubefcens, pedunculata, crocea, alpina, paniculata, palicurea, latea, longiflora. E. and W. Indies, S. America, China.

The root of the Pfychotria cmeticn, or common ipecacuan is brought from the Spanifh W. Indice. It is divided into two forts, the Peruvian and Brazilaan: but the cye diftinguilhes three; aft-coloured or gray, brown, and white. The ailh coloured or Peruvian ipecacuan of the thops is a fmall wrinkled root, ben: and comtorted into a great variety of figures; brought over in fhort pieces full of wrimkles, and deep circular filfures, quite down to a fmall white woody fibre that runs in the middle of each piece, The cortical part is compact, brittle, looks fimooth and rcfinous upon breaking. It has very little fmell: the tafte is bitterifh and fubacrid, covering the tongue as it were with a kind of mucilage. The brown is finall and fomewhat more wrinkled than the foregoing; of a brown or blackifin colour without and white within : this is brought from Brafil. The shhite fort is woody and has no wrinkles, and no perceptible titternefs in tafte. The firfl fort, the a fhe coloured or gray ipecacuan, is that ufually preferred for medicinal ufe. The brown has been fometimes obfer. ed, even in a fmall dofe, to produce violent effects. The white, though taken in a large one, has farce any effect at all: MIr Geofitey calls this fort baftard ipecacuan, and complains that it is an impofition upon the public. Genfrey, Newmar, Dale, and Sir Hans Sloane inform us, that the roots of a kind of Apocynum (dog's-bane), are fiequently brought over iniltead of it; and inftances are given of ill confequences following from the ufe of thefe roots. If the marks above laid down, particularly of the afl-colour, brittenefs, deep wrinkles, and bitterih tatte, be carefully attended to, all mittakes of this kind may be prevented.

Ipecacuan was firf brought to Europe about the middle of the century before the laft, and an account of it publifhed about the fame time by Pifo; but it did not come into general ufe till about the year 1686 , when Helvetius, under the patronage of Lewvis XIV. introduced it into practice. This root is one of the mildelt and fafeft emetics with which we are acquainted; and has this peculiar advantage, that if it fhould not operate by vomit, it paffes of by the other emurictories. It was firf introduced among us with the character of an almoft infallible remedy in dyfenteries and other inveterate Huxes, as menorrhagia and leucorrhea, and alfo in diforders proceeding from obftructions of long flanding: nor has it loft much of its reputation by time. In dyfenteries it almoft always produces happy effects, and often very fpeedily performs a cure. In other fluxes of the belly, in beginning dyfenteries, and fuch as are of a malignant kind, or where the patient breathes a tainted air, it has not been equally fuccefsful: in thefe cafes it is neceflary to continue the ufe of this medicine for feveral days, and to join with it opiates, diaphoretics, and the like. This root given in fubfance is as effectual, if not more fo, than any of the prepa-
rations of it : the puse refin acts as a frong irritating emetic, but is of little fervice in dyfenteries; whill an extract prepared with water is almoft of equal fervice in thefe'cales with the root itflf, though it has little eff. if as an ewetir. Geoffrey concludes from hence that the chief virtue of ipecaruan in dyfenteries depends upon it gummy fubflance, which, lining the intellincs with a foft mucilage when their own mucus has been abraded, occafions their exulcerations to heal, and defends them from the acrimony of the juices; and that the refinou- part, in which the emetic quatity refides, is required where the morbific matter is lodged in the glands of the ftomach and intefines. Water affilited by a boiling heat takes up from all vegetables a confiderable portion of refinous along with the gummy matter: if the ipecacuan remaining after the action of water be digefled with pure fpirit, it will not yield half fo much refin as at frit; fo that the aqueous extraet differs from the crude root only in degree, being proportionably lefs refinous, and having lefs effect both as an emetic, and in the cure of dyfenteries. The virtues of ipecacuan in this diforder depend on its producing perfpiration, the freedom of which here is of the utmoft importance, and an increafe of which, even in healthful perfons, is generally obferved to decreafe the evacuation by fool. In dyfenteries the flin is for the moft part dry and tenfe, and perfpiration obftrufted : the common diaphoretics pafs off without effect through the inteftinal canal ; but ipecacuan, if the patient after a puke or two be covered up warm, brings on a plentiful fweat. After the removal of the dyfentery, it is necoflary to continue the ufe of the medicine for fome time longer, in order to prevent a relaple; for this purpofe a few grains divided into feveral dofes, fo as not to oceafion any fenfible evacuation, may be exhibited every day : by this means the cure is effectually eftablified. And indeed fmall dofes given even from the beginning have been found to have better effects in the cure of this difeafe than larger ones. The only officitial preparation of this root is a tincture made in wine, which bas the appellation of Vinum Ipecacuanbe both in the London and Eainburgh Pharmacopoeias. Ipecacum, particularly in the flate of nowder, is now advantageoufly employed in almoft every difeafe in which full vomiting is reqquifite; and when combised with opium, it furnifhes us with the moft ufeful and ative fweating medicine that we poffefs. It is alfo often given with advantage in fmall dofes, fo as neither to operate by vomiting, purging, nor fweating. The full dofe of the powder is a feruple or half a dram, and double that in furm of watery infufion. The full dofe is recommended in the paroxyfm of fpafmodic afthma, and a dofe of three or four grains every morning in habitual aflomatic indifpofition: a dofe of one third or half a grain rubbed with fugar, and given cvery four hours or oftener is recommended in uterine hemorrhagy, cough, pleurify, hemoptö̈, \&re and has often been found highiy ferviceable. Dr lrving found that by long boiling, the activity of the root is almof totally deftroyed; but that its emetic property was moft effec. twally counteracted by means of the acctous acid; infomuch that 30 grains of the powder, taken in two ounces of vinc gar, produced only fome loofe nouls.
350. Cmmarrhis.

One fpecies; viz. cymofa. Martinico.

One fpecies; viz, repens. Suuth fea ifles.
352. Virecta.

One fpecies; viz. villuta. Cayenne, Surinam.
353. Coffea, or Coffie-tree.

Eight fpecies; viz. fambucina, opulina, odorata, arabica, trifora, gujanenfis, paniculata, occidentaliso Yemen in Arabia, Weft Indies, S. Americ?

The cuffea arabica, though it c:me orieinally from. Arabin, is now cultivated in the Weft Indies. Its fruit is employed rather as food than as a medicine. The medical cffets expected from it are to affilt digeftion, promote the natural fecretions, and prevent or remove a tendacy to fleepinefs. It has been recom. mended in fpafmodic afthma; and in fome cafes it is found highly ufeful in alleviating fevere headarh. In the influenza, or epidemic complaint of Spring 1803 , the ufe of coffee as the chief article of food was fuand to be attended with the beft effects, paticularly in removing that extreme debility which was the molt univerfal and remarkable fymprom of the diteafe.
354. Chicocca, or Snow-berry.

Two fpecies; viz. racemofa and barbata. Jamaica, S. America.

## 355. Vangueria.

One fpecies; viz. edulis. Inte of Madagafcar.

shaphfus.

* V. leaves decurrent, cottony on both fides; ftem unbranched; fummit globular.- This plant externally ufed is $f_{\text {did }}$ to be emollient. Dr Hone advifes a decoction of it, two ounces to a quart, in diarrhœeas of an old ftarding. It eafes the pains of the intellines: it is ufed as an injection in tenefmus with advantage; and is often applied externally to the piles. It is faid to intoxicate fifh fo that they may be taken with the liand. In Norway they give it to cows that are confumptive. The down ferves, for tinder: Neither cows, goats, heep, horfes, or fwine will eat it.

377. Datura, or Thorn-apple.

Seven fpecies; viz. ferox, ftramonium, tatula, faftuofa, metel, lævis, arborea. Europe, Afia, Africa, America.
flramo-
sium. * D. feed-venel thorny, upright, e g -haped; leaves egg-thaped, fmooth.-At night the leaves, particularly the upper ones, rife up and enclofe the flowers. An ointment prepared from the leaves gives eafe in exter.

Voln IV. Part I.
nal inflammations and hemorshoids. The Edinburgh college directs an extract to be prepared by evaporating the expreffed juice of the leaves. This has been given with great advantage in convulfive affeltions and epilepfies : out of 14 epileptic patients 8 were entirely cured by it at Stockholm. The dofe from 2 to 16 grains a-day. The feeds or leaves given internally bring on delirium, tremors, fwelling, itcling, eruption, and inflammation on the $\mathfrak{i k i n}$; thefe cffects were produced by a dofe of a drachmand a half in a girl nine years old. Cows, goats, fheep, and horfes, refufe it.

## 378. Hyoscyamus, or Henbane.

Eight fpecies; viz. * niger, reticulatus, albus, aureus, muticus, pufillus, phyfaloides, fcopolia. S. Europe, Siberia, Perfia.

* H. leaves embracing the fem, indented flowers fit-niget. ting.-The feeds, the leaves, and the roots taken internally are reputed poifonous; and well-atiefed inftances of their bad effects are recorded: madnefs, convulion, and death, are the general confequence. But Dr Smith fays, he has often eaten the feeds with impunity. It is faid that the leaves fcattered about a houfe will drive away mice. The Edinburgh college order the exprefled juice of the plant to be evaporated to an extract: and perhaps in this fate it may be advantageounly joined with opium, where the effects of that medicine are defirable, and coltivencfs is to be avoided. There is no doubt of its being an ufful medicine under proper management. The dofe is from balf a fcruple to half a drachm. Goats are not fond of it ; horles, cows, fheep, and fwine refufe it; fheep are, however, faid fometimes to eat it when young: Cbryfomcla byofcyami and the cimex byofyami are found upon it.

## 379. Nicottana, or Tobacco.

Seven fpecies; viz. tabaccum, fruticofa, * ruftica, paniculata, urens, glutinofa, pufilla. America, Ciina,

The fpecies called $N$. tabaccum was firlt brought into Europe about the year 1560 from the iffand of Tobago in America; and is now fometimes cultivated for medicinal ufes in our gardens, but in general imported from America in large quantities. The leaves are about two feet long, of a pale green colour while frefl, and when carefully dried of a lively yellowilla caft. They have a ftrong difagreeable fmell, like that of the nircotic plants, and a very acrid burning tafte. Taken interrally, they prove virulently cathartic and emetic, occafoning almoft intolerable cardialgic anxieties. Byy boiling water their virulence is abated, and at length deffroyed: an extract made by long contion is reconamended by Stahl and other German phyficions, as a frfe and mof effectual aperient, expectorant, detergent, \&c.; but this medicine, which is extremely precarious and uncertain in ftrength, has never come into efleerm among us. Of late, however, tobacco, under the form of a vinous or watery infufion, and taken in fuch fmall dofes as to produce little effect from its a? ion on the flomach, has been recommended by Dr Fowler. He found it to be a very ufeful and powerful diurelic, and publifhed many cafes of dropfy and dylury in which its employment was attended with the befl effects. Thefe good effects have been conffimed by the obfervation of other pliyfician:.

Tobacco is fometimes ufed extemally in unguents for deftroying cutaneous infects, cleaning oldulcers, \&c.

Beater

Beaten into a mafh with vinegar or brandy, it has fometimes proved ferviceable in removing hard tumours of the hypochondres. Injections by the anus of the fmoke or decoction have been ufed with advantage in cales of obftinate conflipation threatening ileus, of incarcerated hernia, of afcarides, of fpafmodic afhma, and of perfons apparently dead from drowning or other fudden caufes. It has been ufed internally in form of fyrrup, conferve, and infufion, incafes of worms, epilepfy, amenorrhea, afthm?, \&c.; but it is certainly too active to be thus ventured on.

The $N$. ruffica is found wild on dunghills in feveral parts of England. It is faid to be often fubftituted in the market for true tobacco, from which, however, it may be known by the leaves being much fmaller and the flowers not reddith like thofe of the proper fort, but of a yellowifh green colour.

## 38. Jaborosa.

Two fpecies; viz. integrifolia, runcinata. Mon. Viedo, Buen. Ayr.

## 381. Atropa, or Deadly Nigbe/Bade.

Seven ipecies; viz. mandragora, * belladonna, phyfalloides, procumbens, folanacea, arborefeens, frutefens. Earope, Pesu, Lima.
bellaidonna* A. Item herbaceous; leaves egg-haped, entire.-The whole of this plant is poifonons; and children, allured by the beautiful appearance of the berries, have too often experienced their fatal effects. 'Tumours of the breafts, even of the cancerous kind, are faid to have been refolved by a topical application of the frefh leaves. Dr Graham fays he found great benefit from a poultice made of the rooic, boiled in milk, and applied to hard ill-conditioned tumours and ulcers: and relates a deplorable cafe in which this poultice effected a perMed. Com. Fect cure. There is no doubt but their external appli. 1nun. vol. :. cation may be productive of good effects in feveral F419.
cafec, but the following inflance hows us that their application is dangerous when the fkin is broken: A lady who had a frall ulcer, a little below one of her eyes, which was fuppufed to be of a cancerous nature, put a fmall bit of the green leaf uponit. In the morring the uvea of that eye was fo affected, that the pup 1 would not contract even by the brightell light ; whillt the other eye retained its ufual powers. The leaf being removed, the eye was gradually reftored to its former Itate. This could not be an accidental effect, for it was repeated three feparate times, and the fame circumfances attended each application. The juice of the ripe berries flaius paper of a beautiful and durable purgle.

## 382. Physalis, or Alkekengi ITmer Cberry.

17 fpecies; vz. fumsifera, arnilata, flexuofa, abo-refcen-, curall: vica, tomentofa, vifcolà, pennlylvanica, alkekenei, peruviana, angulata, puheferne, barbade nfis, chenopor'rolia, minima, pruinola, prollrata. Europe, E. and W. Indies, Carolina.
383. Eolaxum, or Nighibade.

83 Specie; ; iz. hanitolum, verbatiolium, auriculdum, pubefcens, bombenle, pleudo capficum, micro. carpum, terminale, paucifurum, diphyllum, fugax, geminatum, retrofractum, fecliatum, " Juleamara, iriquerrum, Fandenc, ly rasum, tegote, quercifilium, 1:6iniath.m, radicans, has anmerde, trille, racemulum, corym-

A $N \quad Y$.
bofum, quadrangulare, repandum, bonarienfe, macrocarpon, tuberoium, pimpinellifolium, lycoperficum, pieudc-lycoperficum, peruvianum, montanum, rubrum, nodiflorum, * nigrum, xthiopicum, melongena, fubinerme, longiflurum, muricatum, infanum, torvum, volubile, ferox, campechienfe, fufcatum, mammofum, hirtum, paniculitum, aculeatifimum, virginianum, aquini, xanthocarpum, coagulans, jamaicenle, indicum, carolinenfe, linuatum, Jodomeum, capenfe, inarginatum, Ilramonitolium, vefpertilio, fanctum, hybridum, tomentofum, polygamum, bahamenfe, obfcuium, giganteum, flexuolum, lanceæfolium, lanceolatum, eleagnifolium, polyacanthos, igneum, milleri, trilobatum, lycioides. Eur. Afia, Africa, Am.

* S. ftem without prickles, rather fhub-like, zigzag : dulcamara upper leaves halberd-flaped: flowers in tuft-like bunches. - Boerrhave fays it is a medicine far fuperior to china and farfaparilla as a fweetener and reflorative. Linnæus fays, an infufion of the young twigs is an admirable medicine in acute rheumatifms, inflammations, fevers, and fupprefion of the lochia. Dr Hill fays he has found it very efficacious in the afthma. Dr Hallenberg advies it in ifchiatic and rheumatic pains, jaundice, fcurvy and lues venerea. He directs a pint of boiling water to be poured upon two drachms of the flalko fliced and dried after ftanding half an hour. It mult be boiled 15 minutes. The dofe is two cups fult or more, morning and evening. The flalks may be gathered early in fpring, or at the end of autumn. The root has the fruell of the potato. Sheep and goats eat it ; horfes, cows, and fwine refufe it.
*S. ftem without prickles, herbaceous: leaves egg. nigrum. fhaped, toothed, angular, bunches nodding, pointing two ways.-From one to three grains of the leaves infufed in boiling water and taken at bed-time occafions a copious perfpiration, increafes the fecretion by the kidneys, and generally purges more or lefs the following day. Thefe properties judicioully apphed render it capable of doing effential fersice in feveral difeafes. But its effects on the riervous fyltem art fo uncertain, and fometimes fo confiderable, that it nuft ever be adminiltered with the greatelt caution. The leaves externally applied abate inflammation and affuage pain. The Howers fmell like mulk. Horfes, cows, goats, flueep, and fwine refufe it.

## 384. Capsicum, or Guinea Pepper.

Six fecies; viz. anhuum, baccatum, fineufe, groffum, frutelcens, cerafiforme. E. and W. Inders. The capficum annuum is cultivated in our gardens. It ripens its leeds in September and Ogober. The tatie of capficum is extremely pungent and acrimoniou, fetting the mouth as it were on fire. It is chetly employed for culinary purpofec, and has long bienl ufed in that way; but of late it las beet employed alfo in the practice of medicine. And there can be little doubt that it furnifics us with one of the pureft and Alrongeft Atimulants which can be introduced into the human Homach, while at the fame time it has nothing of the narcotic (ffeet of ardent lpirit. Dr Mackitrick Adent, who was perhaps the firlt who employed it as a medicine, directs its be n, given to the extent of fix or eight grains under the furm of pils, or under the form of tincture, by infufing hatf all ounce in a pound of rectified fisist, and giving this from one to three drachms,
diluted, fur a dofe. He found it ufeful in a varicty of affeltions, particularly in that morbid difpofition which he calls the cachexia africona, and which he confiders as a moft frequent and fatal predifpofition to difeafe anong the feves. 'This pepper has alfo been fuccefsfully employed in a fpecies of cynanche maligna (putrid fore throat), which proved fatal in the W. Indies, refilting the ufe of Peruvian bark, wine, and the other remedies commonly employed. A variety of it called in the Weft Indies bird-pepper, is the bafis of a powder brought us from thence under the name of cayan pepper.

385 . Strychnos, or Poifon-nut.
Three fpecies; viz. nux-vomica, calubrina, potatosum. E. Indies.
386. Igmatia, or St Ignatius's Beans.

One fipecies; viz.amara. India.

## 387. Cestrum.

11. §pecies; viz. laurifolium, nocturnum, parqui, auriculatum, fcandens, vefpertinum, diurnum, venenatum, tomentofum, hirtum, latifolium. Welt Indies, Peru.

## 388. Lycium, or Bor-thorn.

II fpecies; viz. afrum, rigidum, ruthenicum, tetrandrum, barbarum, cinereum, europæum, horridum, barbatum, boerhaaviæfolium, capfulare. Europe, Afia, Africa, America.
389. Serissa.

One โpecies; viz. foetida.
392. Cryptostomum.

One fpecies; viz. laurifolium. Guiana.

## 391. Ardisia, or Aderno.

Nine fpecies; viz. tinifolia, coriacea, ferrulata, acuminata, humilis, folanacea, Iaterifora, excelfa, parafitica. Madeira, Ceylon, W. Indies.
392. Jaceuinia.

Five fpecies; viz. arborea, armillatis, venofa, rufcifolia, linearis. W. Indies, So America.
393. Bassovia.

One fpecies; viz. lylvatica. Guiana.
394. Chironia.

16 \{pecies; viz. uinervia, jafminoides, lychnoides, mudicaulis, campanulata, augularis, * pulchella, chilenfis, * centaurium, inaperta, maritima. fpicata, linoides, baccifera, frutefeens, tetragona. Ceylon, Cape, N. America.

* C. herbaceous; leaves fpear-fhaped ; calyx florter than the tube of the bloffom.- This plant is extremely bitter. It is the bafis of the famous Portland puwder, which prevents fits of the gout, when taken in a large quantity, and a long time logether; but brings on hardnefs of the liver, paify, and apoplexy. A tincture of the leaves, and the upper part of the root, is a good medicine in weak fomachs and cachectic habits. A decoction of the whole plant deftroys lice, and cures the itch. Cows are not fond of it, and in fheep-paflure it is frequently left untouched.

## 395. Lita.

Two fpecies; viz. rof, cœrulea. 396. Cordia, or Sebefien Plum.

18 fpecies; v’z. myxa, obliqua, monoica, fpint §enc, febeftena, afpera, dichotoma, gerafchanthus, flavefeens,

A N T.
toquere, macrophylle, micramhus, ellip'ica, colocorca, hirfuta, tetrandra, patagonula, tetraphylla. Guiana.
397. Ehretia, or Bafe Cberygerce.

Nine fpecies; viz. tinifolia, afpera, lier is, interro. dis, fpinofa, butreria, virgata, cxfucca, buxifolia. It: Indies, S. America.

39S. Varronta.
Nine fpecies; viz. lineata, bullata, mirabiloides, martinicenfis, globofa, curaffavica, angullfolia, alba, monofpermé. W. Indies, S. America.
399. Laugerta.

Five fpecies; viz. odorata, lucida, coriacea, refin:ofa, tomentofa. WV. Indics, S. America.
400. Chrysanthemem, or Slar-apfle.

Sever fpecies; viz. cainito, monopyrenum, microcarpum, argenteum, rugofum, pyriforme, glabrurn. W. Indies, So America.

## 401. Bumelia.

12 fpecies; viz. nigra, pallida, teriax, retufa, foetidiffima, falicifolia, manglillo, montana, nervofa, penta gona, rotundifolia, cuneata. W. Indies.
402. Tectona, or Indian Oak, or Teak-zeod.

One fpecies; viz. grandis.-The teak-wood is extremely valuable for fhip-building, on account of its refinting in the lindian feas the worms which fo fpeedily defroy oak and all other forts of timber. That which is ufed at Calcutta is chiefly or rather entirely imported from Rangoon, a port belonging to the Birman empire in the ealtern peninfula of India. See As1A, $\mathrm{N}^{\circ} ı 6$. 403. Sideroxylon, or Iron-weod.

Nine (pecies; viz. mite, inerme, melanopheum, cymofurn, fericeum, argenteum, tomentofum, lycioides, decandrum. Morocco, Cape, N. America.

404 Schrerera.
One fpecies; viz. albens. C. of G. Hope. 405. Rhamess, or Buck-thorn.
$3^{2}$ fpecies; viz. * catharticus, infectorius, lycioides, erythroxylon, eleoides, crenulatus, faxatilis, theezans, farcomphalus, ferreus, levigatus, tetragonus, polifolius, valentinus, cubenfis, colubrinus, dauricus, a!pinus, pumilus, * frangula, latifolius, glandulufus, cllipticus, prinoides, myfacinus, almifolius, Iphar ofpermus, hybridus, alaternus, carpinifolius, capenfis, circumfeifus. Europe, E. and W. Indies, Africa, N. America.

* R. thorns terminating: flowers 4 -cleft; male and catiartio female on different plants: leaves egg-haped; ftem cus. upripht.-A purgative fyrup prepared from the berries of this plant is kept in the hops. About an ounce of it is a moderate dole; but it generally occafions fo much ficknefs and griping that it is falling into difufe. The flefh of birds that feed upon the berries is faid to be purgative. The juice of the unripe berries is of the colour of faffron, and is ufed for ftaining maps or paper. Thefe are fold under the name of Frencli berries. The juice of the ripe berries mixed with alum, is the fap-green of the painters; but if they are ga. thered late in the autumn the juice is purple. The batk affords a beautiful yellow dye. Goats, fheep, and horfes eat it : cows refufe it.
* R. without thorns: flowers hermaphrodite, with y frongsila: pilit: leaves very enrie.-It is fuid, that from a
quarter to half an ounce of the inner bark of this plant boiled in fmall beer, is a tharp purge. In dropfies or conftipations of the bowels of cattle, it is a very certain purgative. The berries gathered before they are ripe, dye wool green. The bark dyes yellow, and with preparation of iron black. Charcoal prepared from the wood is preferred by the makers of gunpowder. The 月lowers are particularly grateful to bees: goats devour the leaves voracioully, and fheep will eat them. The papilio rtamni and argus live upon both the fpecies.

> 406. Z1zyphus.

Ten fpecies; viz. lineatus, volubilis, paliurus, lotus, napeca, jujuba, xylopyrus, cenoplia, vulgaris, fpina chrifti.
407. Ventilago.

One fpecies; viz. maderafpatana.
408. Corymbium.

Four fpecies; viz. fcabrium, filiforme, glabrum, vil. jofum. C. of G. Hope.

## 409. Phylica, or Bafe Alaternus.

19 fpecies; viz. ericoides, lanceolata, bicolor, capitata, eriophoros, plumofa, villofa, imberbis, ftipularis, pinifolia, cordata, dioica, buxifolia, fpicata, callofa, paniculata, imbricata, racemofa, parviflora. C. of $G$. Hope.
410. Carpodetus.

One fpecies; viz. ferratus. South fea illes.
41\%. Colletia.
One fpecies; viz. horrida. Brazil, Peru.
412. Ceanothus, or Nezu-Ferfey Tea.

Five fpecies; viz. americanus, macrocarpus, afiaticus, atricanus, capfularis. N. America, Cape, Ceylon.

$$
413 . \text { Scopolia. }
$$

Two fpecies; viz. aculeata, inermis. South fea ifles.
4i4. Ruyschis.
Two fpecies; viz. clufirfolia, furubea. W. Indies. Guiana.
415. Arduina, or Cape Buckthorn.

One fpecies ; viz. bifpinofa. C. of G. Hope.
4i6. Camax.
One fpecies; viz. fraxina. Guiana.
4i\%. Buttneria.
Seven fpecies; viz. fcabra, tereticaulis, microphylla, ovata, cordata, herbacea, catalpefolia. S, America.
418. Ayenia.

Four fecies; viz. pufilla, lxvigata, tomentofa, magna. Jamaica, Cumana, Peru.
419. Gluta.

One fpecies; viz. benghas. Java.
420. Polycardia.

One fpecies; viz. madagafcarenfis. Madagafcar.
42I. Myrsine, or African Box-tree.
Two fpecies; vizo africana, retufa. Azores, Africa, 422. Bladila.

Four fecies; viz. japonica, glabra, villofa, crifpa. Japan.

## 423. Celastrus, or Staff-tree.

32 fpecies; viz. lucidus, microphyllus, bullatus, lau. rinus, roftratus, undulatus, octogonus, filiformis, fcan-
dens, paniculatus, procumbens, acuminatus, caffinoides, friatus, ceruis, undatus, edulis, crenatus, dilatatus, myrtifolius, maytenus, tetragonus, auticulatus, alatus, linearis, integrifolius, emarginatus, phyllacanthus, buxifolius, pyracanthus, rotundifolius, parviflorus. Amer. Cape, ifle of Bourbon, Japan.
424. Evonymus.

Seven Species; viz. tobira, japonicas, * europæus, verrucofus, latifolius, atro-purpureus, americanuc.

* E. flowers mofly 4 -cleft; leaves fitting. -The ber- europaus. ries vomit and purge violently. They ate fatal to fleep. Powdered, and frinkled upon the hair, they deftroy lice. If the wood is cut when the plant is in bloffom, it is tough, and not eafily broken; and in that flate is ufed by watch-makers for cleaning watches, and to make kewers and toothpicks. Goats and theep eat it; horfes refufe it; cows are fo fond of the fhoot in the fpring as conftantly to break down the banks of the fields wherever a plant of it Alands.

425. Pilocarpus.

One feecies; viz. racemolus.
426. Diosma, or African Spiraa.

30 fpecies; viz. oppofitifolia, obtufats, linearis, virgata, alba, hirfuta, rubra, pectinata, ericoides, hıfpida, ciliata, bifurca, bifida, capitata, villofa, cupreffina, imbricata, marginata, lanceolata, pubefcens, latifolia, crenata, tetragona, uniflora, rugofa, ovata, barbigera, pulchella, betulina, orbicularis. C. of G. Hope.
427. Hovenia.

One $f_{\text {pecies }}$; viz. dulcis. Japan.
428. Brunia.

Eight fpecies; viz, nodiflora, paleacea, lanuginofa, verticillata, abrotanoides, fuperba, fragarioides, ciliata. C. of G. Hope.
429. Stacirta.

Two fpecies; viz. radiata, glutinofa.
430. Walkera.

One fpecies; viz. ierrata. India.
43I. Pittosporus.
One feecies ; viz. coriaceum. Madeira, Canary illes,
432. Barberta.

One fpecies; viz. theabronxfolia. Guiana.
433. Itea.

Two fpecies; viz. virginica, cyrilla. N. America.
434. Galax.

One fpecies; viz. aphylla. Virginia.
435. Humboldtia.

One feccies; viz. laurifolia.
436. Cenrela, or Barbadoes Bafe Cedar.

One Ipecies; viz. odorata. Weft Indies.
437. Calodendrum.

One fpecies ; viz. capenfe. C. of G. Hope.
438. Eleodendrum.

Two fpecies; vizo orientale, argan. Cape, ille of Mauritius.
439. Escalonia.

Two fpecies; viz. myrtilloides, ferrata. S. America.

## Pentandria,

One fpecies; viz. feandens.
441. Mangifera, or Mango-trce.

Three fpecies ; viz. indica, laxiflora, axillaris. Eaft Indies.
442. Hirtella.

Three §pecies; viz. americana, triandra, paniculata. W. Indies, Cayenne.
443. Strumpfia.

Oue fpecies; viz. maritimh. America.

## 444. Plectronia.

One fpecies; viz. ventofa. C. of G. Hope.
445. Rises, or Currant and Goofeberry.

16 fpecies; viz. rubrum, petræum, procumbens, glandulofum, alpinum, fragrans, trilte, nigrum, floridum, diacantha, faxatile, reclinatum, groffularia, uva crifpa, oxyacanthoides, cynofbati. Europe, N. America.
446. Viola, or Violet.

39 fpecies; viz. palmata, pedata, pinnata, fagittata, lanceolata, obliqua, cucullata, primulifolia, * hirta, magellanica, paluffris, * odorata, * canina, montana, nummularifolia, cenifia, canadenfis, ftriata, pubefcens, mirabilis, biflora, uniflora, decumbens, * tricolor, grandiflora, zoyfii, calcarata, cornuta, capenfis, arborefcens, ftipularis, parvifora, enneafperma, fuffruticofa, calceolaria, oppofitifolia, hybanthus, ipecacuanha, diandra. Alps, Pyren. Cape, America.

* V. leaves heart-fhaped; fuckers creeping.-The flowers and feeds of this plant are faid to be mild laxatives. The powdered root, in dofes from 40 to 80 grains, vomits and purges. The petals give the colour to the fyrup of violets, for which purpofe they are cultivated in large quantities at Stratford-upon-Avon. This fyrup is very ufeful in many chemical inquiries, to detect an acid or an alkali, the former changing the blue colour to a red, and the latter to a green. Slips of white paper ftained with the juice of the petals, and kept from the air and light, anfwer the fame purpofe.
* V. ftem branched; leaves egg.fhaped, toothed; cal. fmooth, but half the fize of the blofiom.- Some allege that it infallibly cures the fcabby complaints in young children, called crufa lactea. Boil a handful of the $f_{\text {frefh, }}$ or half a dozen of the dried leaves, in half a pint of milk, and give this milk morning and evening, for fome weeks.

447. Impatiens, or Balfam balfamine.

12 fpecies; viz. bifida, chinenfis, latifolia, capenfis, oppofitifolia, fafciculata, cornuta, balfamina, biflora, triflora, natans, ${ }^{*}$ nolitangere. Europe, N. America, E. Indies, China.

* I. fruitfalks many-flowered, folitary; leaves egg-fhaped; ftem fwoln at the joints.-The whole of this plant is confiderably acrid. Goats eat it. Horfes, cows, and theep refufe it. The Jphinx elpenor lives upon it.

448. Gronovis.

One fpecies; viz. fcandens. Jamaica, Vera Cruz.
449. Leea.

Three fpecies; viz. fambucina, æquata, crifpa. Cape, Eaft Indies.
450. Argophyllum.

One fpecies; viz. nitidum. Ncw Caledonia.

A $\mathrm{N} Y$.
45 I . Corynocarpus.
One fpecies; viz. 1ævigatd. New Zealand.
452. Hedera, or Iuy.

Four fperies; viz. helix, pendula, mutans, terebinthinacea. Europe, N. Amer. Jamaica.

* H. leaves fome egg-flatped, others lobed. -The roots belix. are ufed by leather-cutters to whet their knives apon. Its evergreen leaves adorn our walls, and cover the naked trunks of trees. Apricots and peaches covered with ivy during the month of February, have been obferved to bear fruit plentifully. The leaves have a naufeous tafte. Some fay they are given in Germany as a Specific in the atrophy of childrerio The common people apply them to iffues. The berries have a little acidity. They purge and vomit. In warm climates a refinous juice exudes from the llalks. Horfes and fheep eat it. Goats and cows refufe it. Sheep are fond of it, and in fevere weather it is fripped off the trees as food.

453. Vitis, or Vine.

12 fpecies; viz. vinifera, palmata, indica, flexuofa, labrufca, vulpina, heterophylla, laciniofa, hederacea, heptaphylla, pinuata, arborea. Tempcrate parts of the world.
V. with leaves gafhed, indented, naked.-The leaves vinifera. of this fpecies, which is the proper vine tree, were formerly celebrated as aftringents, but have for a long time been entirely difregarded; their tafte is herbaceous with only a ilight degree of roughnefs. The trunk of the tree wounded in the fpring produces a limpid watery juice; this, called the tear of the vine, has been accounted excellent for fore eyes, and by fome recommended alfo in ardent and malignant fevers, and as a diuretic. The flowers bave a pleafant fmell, which water elevates from them in diftillation; along with the water a friall portion of an elegant elfential oil is faid to arife, poffeffing in great perfection the fragrance of the flowers. The unripe fruit is of a very harfl, rough, four tafte; its expreffed juice, called verjuice, was in great efteem among the ancients, and fill continues fo in fome places, as a cooling aftringent medicine; a rob and a fyrup were formerly prepared from it. The ripe fruit or grapes, of which there are many kinds, properly cured and dried, are the raifins of the fhops. The juice by fermentation affords wine, vinegar, and tartar, of which mention will be made under their proper heads.

## 454. Euparea.

One fpecies; viž. amœna. New Holland.

## 455. Egiceras.

Two fpecies; viz. majus, minus.

## 456. Lagoecia, or Wild Cumin.

One fpecies; viz. cuminoides. Crete, Levant.
457. Roridula.

One fpecies; viz. dentata. Cape of G. Hope.

## 458. Sautagesia.

One fpecies; viz. ereCta, Jamaica, St Dumingo, Su* rinam.

## 459. Claytonia.

Three fpecies; viz. virginica, fibitica, perfoliata. Siberia, N. America.
460. Heliconia, or Bafe or $h^{r}$ ild Plantain.

Five fecies; viz. caribra, behai, humilis, pfittacorum, birfuta. Cape, W. Indics.

> 46t. Strelitzia.

Two fpecies: viz. regina, angulta. C. of G. Hope.
462. Achyranthes.

I6 Species; viz. argentea, afpera, lappacea, echinata, muricata, patula, proftata, farmentofa, alternifolia, polygonoides, altiffuna, nivez, ftellata, corymbofa, tenuifolia, dichotoma. S. Europe, E. and W. Indies.
463. Celosia, or Cock's Comb.

18 fpecies; viz. argentea, albida, margaritacea, crif. tata, comofa, paniculata, nitida, coccinea, cafrenfis, monfonix, corymbofa, caudata, trigyna, virgata, polygonoides, baccata, gnaphaloides, nodiflora. China, E. and W. Iudies, Senegal.
464. Chenolea.

One fpecies; viz. diffufd.
465. Illecebrum, or Mountain Knot-grafs.

19 fpecies; viz. brachiatum, fanguinolentum, lanatum, javanicum, * verticillatum, arifatum, canarienfe, cymofum, paronychia, capitatum, divaricatum, benghalenfe, arabicum, achyrantha, frutefcens, polygonoides, ficoideum, leffile, alfinefolium. S. Europe, Ean Indies, South America.

> 466. Glaux, or Seo Mill-wort.

One fpecies; viz. maritima. Europe.
467. Plocama.

One fpecies; viz. pendula. Canary ines.
468. Hedycrea.

One fpecies; viz. incana. Guiara.
469. Thesium, or Bafe Toad-flax.

19 fpecies; viz. *inophyllum, alpinum, humile, lineatum, fquarrofum, frifea, funale, fpica:um, capitatum, friefum, umbellatum, fragile, fcabrum, paniculazum, amplexicaule, triforum, euphorbioides, colpoon fpinofum. Alps of Europe, Cape, N. America.
470. Quinchamala.

One fpecies; viz. chitenfis. Chili.

> 471. RAUWOLFIA.

Four fpecies; viz. nitida, glabra, canclecns, tomentofa. W. Indies, S. America.
$47^{2}$ Pateria.
Two fpecies; viz. foetida, fragrans. India.
473. Carissa.
 ermis, mitis. India, Arabia.
474. Gynopogon.

Three fpecies; viz. fellatum, alyxia, fcandens. South fea illes.
475. Cep.aera.

Five Species; viz. ahuvai, ovata, parviflora, manghas, shevetia. South America.

47б. Weblka.
Three feccies; viz. curymbola, cymofa, tetrandra.
477. Gardenia, or Cafe Yefomine.

2y fpecics; vi\% radicans, flotida, thunbergia, lui-
folia, clufiafolia, gummifera, muffeada, genipa, rothmannia, uliginofa, asmata, fpinofa, dumetorum, randia, micranhus, icandens, multifora. Cape, E. and W. Indies. Japan.
478. Willughbeja.

Two $f_{\text {pecies }}$; viz. acieca, Ieandens. Guiana.
479. Allamanda.

One fpecies: viz. cathartica. Surinam, Cayenne,
480. Unica, or Periuinkle.

Five fpecies; viz. * minor, * major, lutea, rofea, parviflora. Ger. Fr. Sp. E. Indies, N. America.

* U. Atenas railing ; leaves fpear-egg-haped; flowersminor. on fruititalks. - The fruit of this plant leldom comes to maturity. It may, however, be eafily obtained by planting the $U$. major in a pot, where the roots not having free room to extend themfelves, the juices are more copioully propelled towards the pitlil, which then expands into well-furmed feed-veffels.

## 48 I . Nerium, or Oleander, or Rofe Bay.

Eight fpecies; viz. oleander, odorum, lalicinum, obefum, zeylanicum, divaricatum, antidyfenterıcum, coronarium. S. Europe, E. Indies.
482. Echites, or Savanna-fower.

22 fpecies; viz. bitlora, quinquangularis, annularis, tomentofa, fuberecta, domingenfis, agglutinata, afperuginis, torulofa, umbellata, circinalis, flonibunda, trifida, repens, corymbofa, coflata, fpicata, fiphilitica, candata, fcholaris, lucculenta, bifpinola. W. Indies, Surinam, Carolina, Cape.
483. Plumeria, or Red Jeffamine.

Four fpecies; viz. rubra, alba, obtula, pudica. W. Indies, S. America.
484. Cameraria.

Four fpecies; viz. 1atifolia, zcylanica, lutea, angufo tifolia. W. Indies, S. America.

## 485. Tabernemontana.

32 fpecies; viz. citntolia, laurffolıa, echinata, grandiflora, cymofa, amydalifolia, difcolor, perficarisfolia, elliptica, alternifolia, amfonia, anguftifolia. E. and W. Indies, N. America, Japan.

## Ordek II. Digynia.

## 486. Pergularia.

Five fpecies; viz. glabra, edulis, tomentofa, pur. purea, japonica. ludia, Japan.
487. Perifloca, or Virginian Silk.

11 Pecies; viz. graca, fecamulic, lwvigata, atrguftifolia, efculcnta, emetica, indica, capfularis, africana, tunicata, fylveftris. Syria, Cape, India.
488. Cynanchum, or Bafe Dogstane. *

25 fecies; viz. viminale, filiforme, crilpum, tene]lum, obtufifolium, capenfe, acutum, planiflorum, rof. tratum, grandiflorum, nigrum, racemofum, maritimum, fuberolum, carolinenfe, obliquam, hirtum, cilipifiorum, proffratum, monfeliacum, extenfum, reticulatum, undulatum, parviflorum, eicellum. S. Europe, Cape, E. Indies, America.
489. Apocrinum, of Dogs-lane.

If feccies; viz. filiforme, hidtatum, androfiemifo-
lium, cannabinum, bypericifolium, venetum, frotefeers, paniculatun, umbellatum, reticulatum, cordatum, lan. ccolatum, triflorum, lineare. Am. Iflec, Adriatic, India.
490. Ascleplis, or Swallow-wort.

4s 「pecies; viz. aphylla, undulata, cri/pa, pubefcene, mucronata, procera, gigantes, grandillora, carmof?, fyriaca, amoena, purpurafcens, varicgata, curafavica, nivea, lanifora, parvifora, incarnata, pulchra, critifolia, decumbenc, lactifera, vincetoxicum, nigra. foetida, convolvulacea, volubilis, alexiaca, allhmatica, vimimalis, arborefeens, fruticofa, fibirica, davurica, fetofa, filiformis, velticillata, inexicana, I:naria, rubra, tuberofa. Lurope, Africa, Ealt Indics, America.

## 491. Hios te.. <br> One fpecies ; viz. viridithora.

## 492. Melodinus.

One fpecies; riz. fcandenc. New Caledonia.
493. Ceropegla.

Eight fpecies; viz. candelabrum, tubernfa, bulbofa, bifora, juncea, acuminata, fagitata, tenuilora. Cape, Ceylon, Malabar.
494. Stapelea, or Africa: Swallow-wort.

49 Ipecies; viz. ciliata, revoluta, hirfuta, fororia, gratsitlora, ambigua, pulvinara, afterias, gemmiflra, divaricata, rufa, acuminata, reclinata, elegans, cafpitofa, arida, parviflora, fubulata, concinna, glandulifera, pedunculata, aperta, gordoni, pilifera, candata, articulata, mımmillaris, prainofa, ramofa, pulla, adfeendens, quadrangula, incarnata, punctata, geminata, decora, pulchella, vetula, verrucofa, irrorata, mixt, variegata, campanulata, barbata, venufta, guttata, humilis, retieulata, clarata. C. of G. Hope.

## 49 5. Linconta.

One fpecies; viz. alopecuroidea. C. of G. Hope.

> 496. Herniaria, or Rupture wort.

Six fpecies; viz. ${ }^{*}$ glabra, hirfuta, alpina, fruticofa, lerticulata, polygonoides. Germany, Spain, Italy, Chili.

* H. Plant fonoth.-This plant is a little faltifh, and aftringent. It is faid to increafe the fecretions by the kidneys, and that the juice takes away fpecks in the eye; but, to the virtue for which it has been moft celebrated, that of curing ruptures, it has no tile. Corse, fleep, and horles eat it. Goats and fwine refufe it.

497. Chenopodium, or Goofefoot, or ITild Orache.

26 fpecies; viz *bonus fienricus, mucronatum, triandrum, "urbicum, atriplicis, *rubrum, guiternfe, * murale, quinoa, lerotirum, *aluum, *viride, * hybridum, botrys, ambrofioisec, multifidum, aushelnaisticum, * glaucum, * vulvaria, * polyfpermum, eandatum, laterale, fooparia, maritiaum, cppofitifolitum, ariftatura. Eutope, China, America.

## bonus

 benricus.* C. Le ives trangulir, arrow-flaped, verv entice; fpikes compound, leafl fs, axillary. - This plant is faid to he cultivited as pinage by the poor people at B tlon in Lincolnhire. The young hoots, pecled and boiled, may be enten as afparasue, which they refemble in flavour. Thev are gentlv laxative. The leaves are of ten boiled in breth. The reots are given to 风erep that
have a cough. Goats and theep are not fond of it. Cows, horfes, and fwine, refufe it.
* C. leaves diamond-triangular, gnawed, entire behind, album. the mpermolt oblang; bunches upright.-Cows, goats, and fheepeat it. Horfes refufe it. Swine are extremely fond of it. A black apbis feeds upon it, and fometimes dethons it.
* C. leaves awl-flaped, femi-cylindrical.-It is an ex-maritimum cellent pot-herb. The phalaua lubricipeda feeds upon moft of the fpecies.
C. with leaves oblong indented; branches naked, botryr. many-cleft. Called Yorufolem oak.- It is cultivated in gardens. It has altrong, not difagreeable fmell, and a warm, fomeuhat pungent talle. It is recommended as a carminative pectoral, and it has alfo been recommended as an emmenagogue. Infufions of the leaves and feed may be drank as tea; and in this form it has been recommended in cales of chronic catarrh. But the proper menflruum, both for the leaves and feed, is reftrfied fpirit.
* C. with entire, diamond-haped, oval leaves, withvulvaria. Hlowers incorporated at the bofom of the leaves. Stirkinf orach. It is a low plant, iprinkled all over with a kind of whitili clammy meal ; it grows about dung. hills, and wafte places. The leaves have a flrong fetid frell, with which the hand, by a light touch, becomes fo impregnated, as not to be eafily freed from it. Its frmell has gained it the character of an excellent antihyfleric; and this is the only ufe it is applied to. Tournefort recommends a fpirituous tincture, others a decoction in water, and others a conferve of the leaves, as of wonderful cfficacy in uterine diforders; but in the prefent practice it is little employed.

## 498. Beta, or Beet.

Four fpecies; viz. vulgaris, patula, cicla, maritima. France, Portugal, Madeira. - The beta vulgaris has of late attrated much notice on the continent, from the difcovery of M. Achard of Berlin, that fugar may be extracted from it in large quantities with profit. See Sugar.

## 499. Microtea.

One fpecies; viz. debilis.

## 500. Salsola, or Glafs-werto

25 fpecies; viz. *kali, tragus, rolacea, foda, fativa, lipicata, altinima, triguna, falfa, nud flora, flavefcens, hiifora, laniflora, byfopifolia, polyclonos, proftrata, monandra, vermiculata, arbulcula, aplylla, arborelcens, * fruticofa, indica, ledoides, muricaia. Europe, F.gypt, Cape. Afia, Carnatic.

## 501. Anabasis, or Berry-bearing Glafs-uart.

Five fueciss; wiz. aphylla, cretacea, sohula, fi:sofiffima, tamarifcifolio. Spain, Calpian tea, Egypt.

## 502. Cressi.

Tuo fpecies; viz. cretica, maciea. Crete, Arabia.
so3. Goaphrena, or Glole An arant/.
Ten Ipecies; viz. gio ola, peremis, tuppda, angufdifolis, vermicul ris, brafilienfis, ferrata, interrufta, tlawa, artorefens. India, S. Amer. New Gran.
504. Posea, mi Golden-red Ties.

One flecies; v zo y ramori. C: fary ifles.
50:. Ulimus, or E.lm-irce.
Sesen fpecies; viz. campeltuis, fuberofa, ciffa,
americana, nemoralis, pumila, imtegrifolia. N. Elrope, N. America. * U. leaves roubly ferrated, unequal at the bafe; flowers almoil fitting, coronated together.-A decoction of the inner bark, drank freely, has been known to carry off the water in dropfies. It cures the lepra ielbyyfis of Sauvages. The bark dried and ground to powder has been mixed with meal in Norway, to make bread in times of fearcity. The flowers have a violet fmell. The wood, being hard and tough, is ufcd to make axle-trees, mill-wheels, heels of boots, chairs, and coffins. The tree is beautiful, and well adapted to make fhady walks, as it does not deffroy the grafs; and its leaves are acceptable to cows, horfes, goats, theep, and fwine; for this purpofe, it Thould be grafted upon the U. glabra, and then the roots will not fend out fuckers, which the common elm is very apt to do, and give a great deal of trouble to keep the ground clear of them. It loves an open fituation, and black or clayey foil. It bears to be tranfplanted. Papilio polychloros and Co album, phalre. na lulricipeda, pavonia betularia et vellica, cimex ulmi et Ariatus, cicada ulmi, aphis ulmi, feed upon it. The latter generally curl the leaves fo as to make them a fecure fhelter againft the weather. Silk worms will devour the tender leaves with great avidity.
506. Nama.

One fpecies; viz. jamaicenfis. Jamaica.
50\%. Hydrolea.
Three fpecies; viz. fpinofa, trigynia, zeylanica E. and WV. Indies, America.

## 508. Rochefortia.

Two fpecies; viz. cuneata, ovata. Arabia. 509. Heuchera, or Virginian Sanicle.

One fpecies; viz. americana. Virginia.
5io. Velegia.
One fpecies ; viz. rigida. Spain.
511. Swertia, or Mar/b-Gcnian.

Six fpecies; viz. *perennis, difformis, decumbens, corniculata, dichotoma, tetrapetala. Siberia, Auftria, Virginia, Canada.
512. Gentiana, or Gentian.

5 f fpecies; viz. * lutea, purpurea, pannonica, punctata, campanulata, feptemfida, afclepiadea, montan3, cruciata, macrophylla, adfenderns, preumonanthe, rriflora, frigida, algida, faxofa, faponaria, ochroleuca, -illofa, linearis, quinqueflora, aurea, glauca, exaltats, acaulis, altaica, pyrenaica, verna, utriculofa, bavarica, imbricata, proftrata, * nivalis, pumila, aquatica, fcilbides, unifora, germanica, * amarella, obtufifolia, uliginofa, pratenfis, * campeffris, auriculata, tenella, glacialis, dichotoma, nana, carinthiaca, fulcata, rotata, ciliata, crinita, barbata, detonfa, ferrata.-The sentiona lucta, is faid to be found wild in fome parts of England; but the dried routs are rnof commonly brought from Germany. They are much ufed in medicirce. They hrould be chofen freth, and of a yellow or bright colour within. This root is a llrong bitter, and as fuch, very frequently made ufe of in practice: in tafte it is lefs exceptionable than moft other bitters. Infufions of it, flavoured with orange-pect, are fufficiently grateful. It is the capital ingredient in the
bitter wine, tincture, and infufion of the druggifts. An extract from it is likewife prepared. This uleful bitter is not ufed as a powder, as it lofes confiderably by the drying, which is requifite for giving it that form. As a very trifling quantity of it gives tafte to a large quantity of water, it is faid to be fometimes fraudulently ufed in malt liquors, to fave the more expenfive ingredient of hops.

## 13. Dichondra.

'Гwo fpecies; viz. repens, fericea. Jamaica, South fea ifles.
514. Vahlia.

One fpecies ; viz. capenfis. C. of G. Hope.
515. Bumazda.

One fpecies; viz. trifolia. Japan.
516. Phyllis, or Brfe Horeseeat.

One frecies; viz. nobla. Canary ifles.

## 517. Cussonia.

Two fpecies; viz. thyrliflora, fpicata. C. of G. Hope.

## 518. Eryngium, or Sea-bolly.

11 fpecies; viz. fotidum, aquaticum, planum, pue fillum, triculpidatum, ${ }^{*}$ maritimum, ${ }^{*}$ campeftre, amethyftinum, triquetrum, alpinum, bourgati. Europe, N. America, W, Indies.

* E. root leaves roundift, plaited, thorny; flowering mariiztium beads on fruitfalks; chaff 3 -pointed. - The leaves are freetifh, with a light aromatic warmth and pungency. The roots are fuppofed to have the fame aphrodifiac virtues as the orchis tribe. They are kept in the fhops, candied.

5 19. Hydrocotyle, or W'ater Navel-zoorl.
18 fpecies; viz. *vulgaris, umbellata, bonarienfis, americana, hirfuta, mofchata, afiaticn, erefta, villofa, glabrata, fpananthe, ranunculoides, faniculcefolia, fo. landra, tridentata, chinenfis, linifolia, virgata. Eur. N. America, India.

$$
520 . \text { Azorella. }
$$

Two fpecies; viz. filamentofa, cefpitofa.

> 521. Sanicuia, or Sanicle.

Three fpecies; viz. *europra, canadenfis, marilandica. Europe, N. America.

## 522. Astrantia, or Black Mafer-wort.

Five fecies; viz. epipactis, major, carniolica, minor, ciliaris. Alps of Europe.

## 523. Bupleurum, or Maresear.

23 Ppecies; viz. * rotundifolium, feilatum, petraum, graminifol:um, angulofum, pyrenaicum, longifolium, falcatum, caricifolium, odontites, femicompofiton, ranunculcides, rigidum, *tenuifimum, batdenfe. gerardi, junceum, nudum, fruticofum, coriaceum, frutefcenc, fpinofum, difforme. Germany, Switzetland, S. Europe.
425. Echinophora, or Prickly Parfrip.

Two fpecies; viz. * fpinofa, tenwifolia. Apulia, Med. fea-fhores.

## 426. Hasselquistia.

Two fpecies; viz. ægyptiac3, cordata. Egypt, Levant.

52\%. Turdylium, or Hart-rware of Crete.
Six \{pecies; viz. fyriacum, " ofticinale, percgrinum, apuluru, "maximum, fiifolium. Aultria, Italy, Crete, Syria.
528. Caucalis, or Bafe Parfoy.
${ }_{13}$ Species; viz. grandiflora, *daucuides, * latifo lia, mauritanica, pumila, orientalis, africana, leptophylla, platycarpos, * arvenlis, * anthrifcus, japonica, * nodofa. S. Europe, Egypt, India.

## 529. Artedia.

One 〔pecies; viz. iquamata. Levants
530. Daucus, or Carrot.

Six fpecies; viz. * carota, mauritanicus, luciduc, vifnaga, eingidium, muricatus. Europe, Barb. Ca-rolina.-For the culture and promerties of the carrot, fee Agriculture, $\mathrm{N}^{\circ} 40,341$ - 353.

$$
531 \text {. Amm1, or Bi/nop's weed. }
$$

Four fpecies; viz. majus, copticum, glaucifolium, daucifolium. Aufria, S. Europe, Egypt.
532. Bontum, or Pig or Earth nut.

Three fpecies; v.z. bulbocaftanum, majus, aromaticum. Germany, France.
533. Conium, or Hemlock.

Four feccies; viz. * maculatum, rugofum, rigens, africanum. Europe, Cape.
sratulatum* C. feeds without prickles; Aem greatly branched, fmooth, fpotted. -The whole plant is poifonous, and many inftances are recorded of its deleterious effects; but modern experience has proved it to be lefs virulent than was formerly imagined, and though it may not cure cancers, it is cert inly a very ufeful medicine when properly prepared. The powder of the dried leaves is now only prefcribed. Let the leaves be gathered about the end of June when the plant is in flower. Pick off the leaves and throw away the leaffalks. Dry thefe felected little leaves in a hot fun on a tin dropping-pan or pewter difh, before a fire. Preferve them in bags made of ftrong brown paper; or powder them, and keep the powder in glals phials, in a drawer, or fomething that will exclude the light; for the light foon diflipites the beautiful green colour, and with its colour the medicine lofes its efficacy. From 15 to 25 grains of this powder may be taken, twice or thrice a-day. It has been found particularly ufeful in chronic rheumatifme, and alfo in many of thofe difeafes which are ufually fuppofed to arife from acrimony. This plant is recommended as well worth the medical pracitioner's attention.
534. Seltivum, or Milk Parhey.

Nine fpecies; viz. fylveftre, * paluitre, auftriacum, fibiricum, carvifolia, chabrxi, feguieri, monnieri, decipiens. Europe.
535. Athamanta, or Bafe Spignel.

Is fpecies; viz. * libanotis, cervaria, fibitica, conden'ata, incana, oreofolinum, ficula, mathioli, cretenfis, amnia, chinenfis. Europe.-The feeds of the $A$. Cretenfis or Candy Carrot, are brought from the Levant. It is an umbelliferous plart which grows in the illand of Candy and the fouth of Europe. The feeds have a warm biting tafte, and an aromatic fonell. They are faid to be diuretic, but are not at prefen! regarded in medical practice.

Yoz. IV. Part 1.
y: fpecies; viz. *olficinale. alpefre, capillaceum, tenuifolium, fibiricum, japonicum, * filaus, alfaticum, aureum, nodofum, geniculatum. Alps, Canaries, Japan.

* P. leaves five times divided into three; thread-Arapo officinale. Maped.- The roots have a flrong fetid fmell, and an acrid, bitterifh, unctuous tafte. Wounded in the fpring, they yield a confiderable quantity of yellow juice, which dries into a gummy refin, and retains the frong feent of the root. Its vistues have not yet been afcertained with precifion.

## 537. Crithmum, or Samphire.

Two feecies; viz. *maritimum, latifolium. Sea Mores Europe, Canary.
*. C. leaves ipear-fhaped, flefhy--Poor people on the narition fea coaft eat it as a potherb, and gather it for fale, it being much ufed as a pickle. Sheep and cows eagerly feed, and are faid to grow fat upon it.

## 538. Cachrys.

Seven Species; viz. odontalgica, libanotis, morifoni, ficula, tnurica, cretica, panacisfolia. Spain, Sicily.
539. Ferula, or Fennel.giant.

12 fpecier; viz. communis, fibirica, glauca, rablenfis, tingitana, ferulago, orientalis, meoides, nodiflora, camadenfis, affafoctida, perfica. Europe, Perfia, N. America.

The large umbelliferous plant, with obtufe lealiets, alternately indented, called ferula afofectida, is a native of Perfia, and produces a valuable concrete juice. This juice exudes from wounds made in the root of the plant, liquid and white like milk. On being expofed to the air it turns of a brownifh colour, and gradually acquires different degrees of confiffency. It is brought to us in latge irregular maffes, compofed of various little fhining lumps or grains, which are partly of a whitith colour, partly reddift, and partly of a violet hue. Thefe maffes are accounted the beft, which are clear, of a pale reddifi colour, and variegated with a great number of elegant white tears, This drug lias a ftrong fetid finell, fomewhat like that of garlick. It lofes, with age, of its fmell and Itrength, a circumftance to be attended to in the ufe of it. It confins of about one third part of pure refin, and two thirds of gummy matter; the former folable in rectified Spirit, the latter in water. Proof fpirit diffolves almof the whole into a turbid liquor; the tineture in rectified 反pirit is tran@parent.

Affafortida is the Atrongeft of the fetid gums, and of frequent ufe in byfteric and different kinds of nervous complaints. It is likewife of confiderable efficacy in flatulent colics, and for promoting all the fluid fecretions in either fex. The ancients attributed to this medicine many other virtues, which are not at prefent expected from it. This gurnmy refin is an ingredient in the gum pills of the druguits, fetid tincture, tinc. ture of foot, and fetid volatile firit.

## 540. Laserpitium, or Lefier-wort.

23 fpecıes; viz. latifolium, libanotıs, capenfe, trilobum, aquilegifolium, gallicum, angultifimum, formofum, angultifolium, aureum, prutcnicum, dauricum, Alafolium, aciphylla, pcucedanoides, filex, arclange-
sica, clironium, lucidum; ferulaceum, hirfutum, fcabrum, fimplex. Europe, New Zealand.

## 54:. Heracluem, or Cow-parfrip.

ro fpecies; viz. * \{phondylium, tlavelcens, angufifolium, elegans, fibiricum, panacea, tuberofum, auftriacum, alpinum, purnilum. Siber. Autria, Alps, Italy. * H. leafets wing-eleft, even; flowers radiated. In Puland and Lithuania the poor people are faid to prepare a liquar from the leaves and feeds of this plant, which undergoes a fermentation, and is drank inflead of ale. The ftalks, when peeled, are eaten by the Kamtfchatkans. The Ruffians take the leaf-falks of the root-leaves, peel them, and hang them in the fun to dry a little: then they tie them in little bundles, and lang them up again till they become yellow: in this fate they put them into bags, and a mealy fubflance like fugar forms upon the furface of them. This they thake off, and treat their guefs with it as a great delicacy. They likewife diftil an ardent fpirit from it. The peelings of the falks are acrid. The leaves are a favourite food of rabbits, hogs, and affes. Cows, goats, and theep eat thom ; but horfes are not fond of them.
542. Ligusticum, or Lozage.
! 3 fecies; viz, levifticum, * \{coticum, aquilcgifolium, noditorum, peloponenfe, auftriacum, * cornubienfc, pyrenacurn, candicans, peregrinum, balearicum, gingidium, longifolium. Alps, Auftia, Portucal, Barbary.

* L. leaves doubly threefold.-This plant is much valued in the ille of Skyc. The root is reckoned a good carminative, and an infufion of the leaves a good purge for calves. It is, befides, wfed as food, either as a falad, or boiled as greens. Hoifis, liteep, and goats edt it. Cows refule it.

## 543. Angelica.

Six fpecies; viz. * archangelica, * fylventis, razoulii, verticillaris, atropurpurea, lucida. N. Europe, N. America.

* A. leafets eqqual, cgg-fpear-ftraped, ferrated.-It is warm, acrid, bitter, and aromatic: but the fpecies cultivated in our gardens, poflefling thefe properties in a higher degree, this has been long neglected. Papidio machara fecds upon jt. Cows, goats, and fwine eat it. Horfes refufe it.

### 5.74. Sıum, or Water Parfnip.

18 Species; viz. filifolium, * latifolium, anguftifo. lium, nodiflorum, * repens, fifarum, rigidius, japonicum, falcaria, paniculatum, grandiflorum, patulum, graecum, decumbens, ficulum, afperum, hifpidura, villofum. Europe, China, Japan, N. America.
lotifolium.* S. lcaves winged; leafets egg-fpear-fhaped, regularly and Sharply ferrated; the terminating leafet 3 -cleft; umbels terminating. Horles and fwine eat it. Sheep are not fond of it. The roots are noxious to cattle.
कodiforum." S. leaves winged; leafets tooth-ferrated; umbels lateral, oppofite the leaves, fitting or on fruitftalk:- It is faid, that a young lady, fix years old, was cured of an obftimatc cutancous difeafe, by taking three large fpoonfuls of the juice twice a-day. Threc or four ounces have been repeatedly giver to adults, every morging, in fimilar complaints, with the greateft advantage.

It is not naureouc, and children take it readily, if mixed with milk. In the dofes given, it neither affects the head, the flomach, nor the bowcls.
545. Sison, or Bafe Sione-parfacy.

Eight fpecies; riz. * amomum, * legetum, canadenfe, ammi, *inundatum, * verticillatua, falfum, crinitum. Europe, N. America.

## 546. Bubon, or Macedonian Parfey.

Five fpecies; viz. macedonicum, galbanum, lavigatum, gummiferum, rigidius. Greece, Barb. Cape.

## 547. Cuminum, or Cummin.

One fpecies; viz. cyminum. Egypt, Ethiopia.This umbelliferous plant refembles fennel in appearance, but is much finaller. The feeds ufed in Britain are brought chiefly from Sicily and Malta. Cummin feeds have a bitterith warm tatte, accompanied with an aromatic flavour, not of the moft agreeable kind. An effential oil is obtained from them by diftillation, in which their activity is concentrated; and they are no: unfrequently ufed externally, giving name both to a plafter and cataplafm in medical practice.
548. Oenanthe, or TVater Drop-wart.
if feecies; viz. * fiftulofa, * crocata, prolifera, globulofa, peucedanifolia, pimpinelloides, inebrians, temuifolia, ferulacea, interrupta, exaltata. Europe, Carolina.

* O. Rending forth fuckers; Rem-leaves winged, fifulofa, thread-thaped, hollow.-Cows and horfes refufe this plant, though, from experiments made on purpofe, it does not appear to be in the leaft degree noxious to the former.
* O. all the leaves many-cleft, blunt, nearly equal.-croiaic.

The whole of this plant is poifonous; and Dr Pulteney remarks, that the root is the moft virulent of all the vegetable poifons that Great Britain produces: many inttances of its fatal effects are recorded. It is faid, that an infufion of the leaves, or three tea fpoonfuls of the juice of the root taken every morning, cffected a cure in a very obftinate cutaneous difeafe, but not without occafioning very great difturbances in the conftitution. Some fay, that the country people in Weltmorland apply a poultice of the herb to the ulcer which forms in the fore-part of the cleft of the hoof in horned catle, and is called the foul. Sheep eat it. Cows and horfes refule it.

## 549. Phellandrum.

Two fpecies; aq̧aticum, mutellina. Europe.

* P. ramifications of the leaves fraddling. -The teedsaquasicur. are recommended in intermittents, and are faid to be diuretic, antifeptic, and expectorant: dofe from one to threc drams daily. The leaves are fometimes added to difcutient cataplafms. It is generally eftcemed a fatal poifon to lorfes, occafioning them to become paralytic: but this effect is owing to an infect (curcatio paroplecticus), which generally inhabits within the Rems. Tlae ufual antidote is pig-dung. In the winter, the roots and flems diffected by the influence of the weather, afford a very curious fheleton or net-work. Horfes, ftecp, and goats eat it. Swiue are not fond of it. Cuws scfufc it. Cbryfomsla pbeilandrin, and the gill leptura, are found upon the roots, and the curculio parapleclicus within the Items.

550. 

550．Cicuta，or Water－Hemlock．
Three fpecies；viz．＊visofa，bulbifera，maculata．－ Europe，N．America．
＊C．umbels oppofite the leaves；leaf－ftalks bordered， blunt．－This is one of the rankeft of our vegetable poi－ fons．Numerous infances are recorded of its fatality to the human fpecies．Early in the fpring，when it grows in the water，cows often eat it，and are killed by it ；but，as the fummer advances，and its fcent becomes fironger，they carefully avoid it．Though a certain and fatal poifon to cows，goats devour it greedily，and with impunity．Horfes and theep eat it with［afety．

55t．下thesa or Fools－par／feg．
Four fpecies；viz．＊cynapium，bunius，＊meum，fa． tua．Europe．
 plant，from its refemblance to common parfley，has fometimes been miftaken for it，and when eaten，it oc－ cafions ficknefs．If the curled－leaved parfley only was cultivated in our gardens，no fuch miftakes would hap． pen．Cows，horles，ficep，and fwine eat it．It is noxious to geefe．
＊E．all the leaves divided into many brifte－fhaped fegments；involucrum 1 leaf；fruit egg－oblong，ta－ pering at each end．－Linnseus fays，that the radical fibres of this plant form the bafis of the calculus a－ gragopila．The roots and feeds are aromatic and acrid． They have been ufed as fomachics and carminatives． They are fometimes given to cure tertians；and there is no doubt but they will often anfwer as well as pep－ ger，and other acrid aromatics．

552．Coriandrum，or Coriander．
＇Two fpecies；viz．＊fativum，tefticulatum．S．of Eur． ＊C．fruit globular．－The leaves have a very ftrong and difagrecable fcent．＇The feeds are grateful to the talte，and incrufted with fugar are fold by the confec－ tioners，under the name of coriander comfts．The Edin－ Lurgh college ufe them as correctors in the bitter in－ fufion，and the preparations of fennas nothing fo effec－ tually covering the difagreeable tafte of that medicine． They have been confidered as fufpicious，if not deleteri－ ous；but fix drams of them have been taken at once， without any remarkable efied．

553．Scandix，or Shepherds－medls．
is ipecies；viz．＊odorata，＊peeten，chilenfis，＊ce－ refolium，＊anthrifcus，auftralis，nodofa，trichofperma， infefta，grandiflora，procumbens．Eur．Virginia，Chili． ＊S．feeds furrowed ：angular．－The feeds are ufed in the north of England，for polifhing and perfuming oak floors and fumiture．
cereforiitm．＊S．feeds glofty，cylindrical and beaked；umbels late－ ral，neariy fitting．It is cultivated in our gardens as a pot－herb，and for falads．It is nightly aromatic and aperient．Cows are extremely fond of it．Sheep and goats eat it．Horfes refufe it．

554．Cherophyllum，or IFrild Coervil．
II Species；viz．＊\｛ylveftre，bulbofum，ariftatum， ＊temulum，capenfe，fcabrum，hirfutum，aromaticum， coloratum，aureum，arborefcens．Eur．Virginia．Japan． ＊．C．Atem fmoothifh，foored，a little fwoln at the knots． The roots eaten as parfnips，have been found poifonous． ＇The un．bels afford an indifferent yellow dyc；the leaves and Renas a beautiful green．Its profonce indicates a
fruitful foil．Neither horfes，flecp，or goate，are ford of it．Swine refufe it．Rabbits are fond os it．In fome parts of the lingdom，in times of fcarcity， it is ufed as a pot－herb．Cours are fo fond of it，that， when a pafture is over－run with it，as is often the cafe about Dudley，they always turn them in to eat it up．

555．Imperatoria，or Maffer－wor：．
One ípecies；viz．ollruthium．Alps of Aufria， Switzerland．－Root warm and aromatic，a fudotific， diuretic，and fialagogue ；recommended in dropfy， debilities of the fomach and bowels；and an infurion of it in wine is faid to have cured quartans that have refiffed the bark．When chewed，it excites a copious flow of faliva，exciting a warm and not difagreeable fenfation in the gums，and frequently curing the rheu． matic toothach．

556．Seseli，or Hari－zuort of Marfeilles．
15 fpecies；viz．filifolium，pimpinelloides，montanur， friatum，glaucum，ariftatum，annuum，cherophylloi－ des，ammoides，tortuofum，turbith，hippomarathrum， pyrentum，faxifiagum，elatum．Germany，S．Europe

557．Tmapera，or Deadly Carrot．
Tive 〔ptcies；viz．villofa，foctida，afclepium，garganio ca，trifoliata．France，Spain，Portugal，Lev．Virginia．

> 558. Pastinaca, or Parfip.

Three fectes；viz．lucida，fativa，opoponas．South of Eutope．

P．leaves fimply winged．－The roots，when culti fariva vated，are fweeter than carrots，and are much ufed by thofe who abfain from animal food in Lent；they are highly nutritious．In the north of Ireland，they are brewed inftead of malt，wish hops，and fermented with yeaf．＇The liquor thus obtained is agreeable．The feeds contain an eflential oil，and will often cure intermit－ tent fevers．Hogs are fond of the roots，and quickly grow fat with them．See Acriculture Index．

559．Smyrnium，or Alcxanders．
Seven $\Gamma_{p e c i e s ; ~ v i z . ~ p e r f o l i a t u m, ~ æ g y p t i a c u m, ~ l a t e-~}^{\text {－}}$ rale，olufarrum，apiifolium，aureum，integcrimum． Italy，Crete，Erypt，N．Amcrica．

S．Atem leaves growing by threes on leaf－falks，ofugatern ferrated．－It was formerly cultivated in our gardens， but its place is now better fupplied by celery．It is boiled，and greedily eaten by failors returning from long voyages，who happen to land at the fouth weft corner of Anglefea．

## 560．Anethum，or Dill．

Three 〔pecies；viz．graveolens，fegetun，＊fornicu－ lum．Germany，Spain，Portugal．
＊A．leaves with many divifions，har－like；feeds cgg．forniculturn oblong，tapering at each end，not bordered．－The ten－ der buds are ufeful in falads．The leaves，boiled，are ufed in fauce for feveral kinds of fill，and eaten raw with pickled filh．In Italy the falks are blanched as a winter falad．The feeds abound with ani effential oil，which is carminative and diuretic，but not heating． The pasilio machact feeds upon it．

> 561. Carum or Carazayys

## Two fpecies；viz．carui，fimplex．Europe．

＊C．The young roots，are faid to be better eating than artiat， partinips；the tender leaves may be boiled with foi－ herbs．The feedsare ufed in cakes．Incrufted with fu－
gar，
gar, they are called caraway comfis, and are difilled with fpiritious liquors, ior the fake of the flavour they afford. The feeds were formerly recommended by Diofcorices to pale-faced girls, and in more modern days their ufe is not forgotten. - They are no defpicable remedy in tertian agnee. They abound with an eftential oil, which is an. ${ }^{\circ}$.movic, and carminative. She:p, goats, and fwine, tat it. Cows and horfes are not fond of it.

## 56z. Piminella, or Burnet Savifrage.

Tin lpecies; viz. faxifraga, nigra, * magna, diffecta, glauca, capenfis, peregrina, anifum, dichotoma, * dioica. Europe, Lgypt.
magna. * P. leaves uniform, winged; leafets fpear-fhaped, irzegularly ferrated; floral leaves wing-cleft.-This and the faxifraga partake nearly of the fame qualities. The root is very acrid, burning the mouth like pepper. It affords a blue oil. Its acrimony hath occafioned it to be ufed to curc the toothach, and to cleanfe the fkin from freckles. It is chewed to promote the fecretion of faliva, and is ufed in gargles for diffolving vifcid mucus in the throat. In Germany it is prefcribed in the afthma and droply. The papilio machoon is found upon both fpecies.

## 563. Arium, or Parfey.

Two fpecies; viz. petrofelinum, * graveolens. Sardinia, Carolina.
graveotens。* A. ftem-leaves wedge.fhaped.-The root in its wild ftate (when it grows near water) is fetid, acrid, and noxious; but when cultivated in dry ground it lofes thefe properties, and the root and lower part of the leaf-ftalks and ftem, blanched by covering them up with earth, are eaten raw, boiled in foups, or flewed. In this latter flate it is called celcry. They are faid to be hurtful to people fubject to nervous complaints. They are certainly good antifcorbutics. The fecds yield an effential oil. Sheep and goats eat it ; cows are not forid of it ; horfes refufe it.

## 56. Agopodium, or Gout-weed. One fpecies; viz.

podagraria* A. upper leaves three together; lower ones in triple threes.-The leaves may be eaten early in the fpring with other pot-herbs. Cows, fheep, and goats eat it; horfes are not fond of it. Europe.

## Order III. TRIGYNIA.

## 565. Semicarpus.

One fpecies; viz. anacardum. Ceylon.

## 566. Rhus, or Sumach, or Poifon-trec.

33 fpecies; siz. coriarıa, tiphynum, javanicum, glabrum, clegans, vernix, fuccedanium, fumialatum, copallinum, alatum, pauciflorum, metapium, digitatum, cirshillorum, tridentatum, radicars, toxicodendron, aromaticurn, fuaveolens, dentatum, finuatum, cuneitolium, incifum, tomentufun, villofum, pubefcens, viminale, anguftitoltum, rofmarinifolium, levigatum, lucidum, cotii us, aflrum. S. Europe, Cape, China, N. An:er.
K. with winged leaves, and leafets clliptical, thuntly toothed, woolly leneath. Called common fumach.-This trec or flrub is cultivated in the louth of Europe on accoent of thr culinary ufes of its fruits, and for the purpofes of the dyers, \& $c_{\text {. Among us it is met with only }}$

A N $Y$.
in the gardens of the curicus. The feeds and berries are of a red colour, in fhape round and flat. Both thefe and the leaves are moderately aftringent, and have fometimes been exhibited with this intention by medical prackitioners; but they are not at prefent ufed.
R. with winged entire leaves, with a membranaceous copallizurni jointed leaf-ftalk.-This tree grows in New Spain, and produces a refin cailed cotal, which is brought to us in irregular lumps, fome tranfparent, of a ycllow or brown colour; others femitran:farent and whitifh. It is ufed for making a very pare and hatd varnifl by painters. It has never come into ufe in medicine in this country, though it is introduced into fome of the foreign pharmacopreias, and may be confidered as an article deferving attention.
567. Tiburnem, or Plians Mealy-iref.

23 fpecies; viz. tinus. tinoides, villulum, feandene, nudum, primifolium, davuricum, dentatum, plicatum, erofum, *lantana, tomentofum, hirtum, acerifolium, orientaic, * opulus, dilatatum, nacrophyllum, cufpičatum, lentago, cafinoides, nitidum, levigatum. S. of Europe, N. America.

* V. leaves heart-lhaped, ferrated, veined, cottony lantanas underneath.-The bark of the root is ufed to make bird-lime. The berries are drying and aftringent.

568. Cassine, or Cafberv-berry-bufh, South-Sea Tea. Four lipecies; viz. capenfis, colpoon, barbara, maurocenia. C. of G. Hope.
569. Sambucus, or Elder-tree.

Tive fpecies; viz. *ebulus, canadenfis, ${ }^{*}$ nigra, ja-ebufus ponica, racemofa. Europe, China, N. America.

* S. tufts with three divifions; flipula leaf-like; ftem herbaceous. - This plant has the fame medical properties with the $S$. nigra, but in fome refpecto more violent, and therefore lefs manageable: 1 dram and a half of the root is a ftrong purge: The berries give out a violet colour: The green leaves drive away mice from granaries, and the Silclians ftrew them where their pigs lie, under a perfuafion that they prevent fome of the difeafes to which they are liable. Neither cows, goa's, theep, horfes, or fwine will eat it.
* S. tufts "ith five divilions; leaves winged; leafets rigrn. nearly egg.flaped, ferrated; flem tree-like.-The whole plant has a narcotic fmell; it is not well to fleep under its made. The wood is hard, tough, and yellow. It is commonly made into okewers for butchers; tops for angling-rods; and needles for weaving nets. It is not a bad wood to turn in the hathe. The iuner green bark is purgative, and may bo uled with advantage where acrid purgatives are requifice. In finaller dofes it is diuretic, and has done eminent fervice in obftinate glandular obfructions, and in doppies. If fleep that have the rot are placed in a fituation where they can get at the bark and the young fhoots, they will foon cure themfelves. It is an ingredient in the black dye. The leaves are purgative like the bark, but more nauleouc. They are an ingredient in leveral cooling ointments. If turnip-cabbages, frait-trees or corn, which are ful jeet to blight from a variety of inCects, are whipred with the green leaves and Lianches of elder, the infects will not attack them. A decuction of the flow, rs taken internally, is faid to promote expectoration in pleurifies. If the flowers are treth
gathered they loofen the belly．Externally they are ufed in fomentations to cafe pain and abate inflamma． tion．Many people ufe them to give a flavour to vine－ gar．＇They are fatal to turkies．A rob prepared from the berries is a gentle opener，and promotes perfpira－ tion．The juice of the berries is employed to give a red colour to taifin or fugar wines．The berries are poifonous to poultry．The pith，being exceedingly light，is cut into balls ufed in electrical experiments． Sheep eat it ；horfes，cows，and gnats refufe it．The aphis fambuci and the phalena anbucaria are found upon it．

## 570．Spathelta．

One fpecies；viz．fimplex．Jamaica．
571．Staphylea，or Bladder－nut．
Three fpecies；viz．occidentalis，pinnata，trifolia． S．Europe，Virginia，Jamaica．

572．TamıRIX，or Tamarife．
Four fpecies；viz．＊gallica，fongarica，germanica， articulata．Germany，France，Spain，Italy，Barbary．

573．Xylophylla，or Love－flover．
Sevenfpecies；wiz．iongifolia，latifolia，arbufculn，fal． cata，anguflifolia，montana，ramifora．Siberia，Jamaica， Bahama ifles．

## 574．Reichelia．

One fpecies；viz．paluftris．

> 575. Salmasia.

One fpecies；viz．гacemofa．Guiana．
576．Turnera，or Nettle－leaved Cifur．
Nine feecies；viz．ulmifolia，pumilea，rupefris，fi－ doides，frutefcenc，rugofa，ciftoides，racemofa，gujanen－ fis．Jamaica，Martinico，Guiando

577．Telefhium，or True Orpine．
Two fpecies；viz．imperati，oppofitifolium．South of France，Italy，Barba－y．

578．Corrigiola，or Bafe Kototgrafs．
Two fpecies；viz．＊littoralis，capenfis．Germany， France，Arabia．

579．Pharnaceum．
${ }^{14}$ ．fpecies；viz．cerviana，lineare，terctifolium，mi－ cropuyllum，marginatum，mollugo，glomeratum，ferpyl－ lifolinm，quadrangulare，incanum，albens，dichotomum， diftichum，cordifolium．Rufira，Spain Alia，Alrica．

580．Alsine，or Chek－weed．
Three fpeces；viz．＊media，legetalis，mugronata． S．Europe，Egypt．

581．Drypis．

$58 z$ Basella or Malabar Nightflade．
Five ípecies；siz．r－rra，sloa，lucid，cordifolia，ve－ ficaria．Eat Indies，Clma．

583．Sarothra，or Bafe G mian．
Onc fpecies；viz．enentianoides．Vargimia，Pen＇yl－ vania．
$5^{8}$ ．Portulacarta，or Parfane－itee．
one lpecies；v：z．atri．Africa．

## Order IV，TETRAGYNiA．

585．Parnassia，＂Gr＇s of P．enifus． One fpecies；viz．＊paluftris．Europe．

## 586．Evolvulus．

Seven fpecies；mammilarius，gangeticus，emargina－ tus，alfinoides，hirfutus，linifolius，fericeus．Eaft Indies， Jamaica．

## Order V．PENTAGYNIA．

587．Aralia，or Berry－bearing Angelica．
10 fpecies；viz．arborea，capitata，cordata，japonica， pentaphylla，fciodaphyllum，fpinofa，chinenfis，racemofa， nudicaulis．China，W．Indies，N．America．

## 588．Glossopetalum．

Two fpecies；viz．glabrum，tomentofum．Guiana，
589．Statice，or Thrift，or Sea－pink．
37 fpecies；viz．＊armeria，juniperifolia，alliaces． cephalutes，graminifolia，＊limonium，gmelini，fcoparia， latifolia，oleæfolia，incana，auriculæfolia，cordata，fca－ bra，tetragona，＊reticulata，echiodes，fpeciofa，tatarica， echinus，月lexuofa，purpurata，longifolia，minuta，pecti－ nata，fuffruticofa，monopetala，axillaris，cylindrifolia， linifolia，aurea，ferulacea，pruinofa，finuata，lobata， fpicata，micronata．Europe，Barbary，Canary，Amer． －S．falk fimple，with a head of flowers；leaves 』rap－armeria． Thaped．－It is much ufed in gardens as an edging for borders，and，when in full blofom，gives a glowing tinge to paftures on the fea－coaft．Horfes and goats eat it；fheep are not fond of it．

## 590．Linum，or Flax．

29 โpecies；viz．＊ufitatifimum，＊perenne，vifcofurn， hirfutum，aquilinum，narbonenfe，reflexum，＊tenuifo－ lium，felaginoides，proftratum，gallicum，maritimum，al－ pinum，aulliacum，virginianum，tlavum，monopealum， flrictum，mənogynum，fufiruticofum，arboreum，cam－ panulatum，africanum，æthiopicum，nodiflorum，＂cathar－ ticum，＊radiola，quadrifolium，verticillatum．Europe， Afica，America．
＊L．cal．and capfules dagger－pointed ；petals fcol－ufraciff－ loped；leaves fear－fhaped；ftem generally folitary．－numm． This valuable plant originally came from thofe parts of Egypt which are expofed to the inundations of the Nilc．The feeds yield，by expreffion only，a large proportion of oil，which is an excellent pectoral，as is likewife the mucilaginous infufion．They make an ealy and uleful poultice in cafes of external inflamma－ tion；and they are the food of feveral fmall birds． After the cil is exprefled，the remaining farinaceous part，called oil－cake，is given to oxen，who foon grow fat upon it．Thisol itfelt differs in feveral refpects from other expreffect oils；it does not congeal in winter，nor dors it form a folid foap with fixed alkaline falts；and it acts more powerfully as a menflruam upon lulphure－ ous bodies．When lest is applied during the expre？－ fion it gets a yellowift colour，and a peculi a fmell． 1：this ilate it is ufed by the paintere and the varnifhers． The fir res of the ftem arc manufactured into linen， and this linen，when worn to rags，is made into pap． r ． ＊L．leaves oppolite，egy－fpear－fhaped，flem foiked．catharti－ Core puinter．－As infufion of two drams or more of cum． the dried plant is an excellent purge，and has teen given with artvantage in many obllinate rheumatifms． It frequertly acts as a diuretic．Horfes，fletep，and goats eat it，

59r. Aldrovanda.
One fpecies ; viz. veficulofa. Italy, India.
592. Dresera, or Sun-dew.
ro fpecies; viz. acaulis, * rotundifolia, cuncifolia, burmanni, *longifolia, capenfs, lufitanica, cififolia, peltata, indica. Europe, Afia, Africa, America.

* 1). flalks from the root; leaves circular.-The whole plant is acrid, and fufficiently cauftic to erode the fk in ; but fome ladies know how to mix the juice with milk, fo as to make it an innocent and fafe application to remove freckles and funburn. The juice that exfudes from it unmixed will deftroy warts and corns. The plant has the fame effect upon milk as the pinguisula vulvaris, and like that too is fuppofed to occafion rot in theep. The four coagulated milk of the Syrians, called leban or leven, is fuppofed to be at firft prepared with fome plant of this kind. The name fundew feems to be derived from a very friking circumftance in the appearance of thefe plants; the leaves are fringed with hairs, fupporting fmall drops or globules of a pellucid liquor like dew, which continue even in the hotteft part of the day and in the fulleft expofure to the fun. Perhaps the acrimony of the plant refides in this fecreted liquor.

593. Gischia.

One fpecies; viz. pharnacioides. E. Indies,

## 594. Crassula, or Leffer Orpine.

71 fpecies; viz. coccinea, cymofa, flava, pubefcens, pruinofa, fcabra, corallina, veflita, argentea, perfoliata, perforata, fruticulofa, ramofa, mollis, tetragona, muricata, imbricata, obvallata, cultrata, obliqua, Spathulata, punctata, marginalis, cordata, lactea, arborefcens, rupeftris, pinnata, fpinofa, retroflexa, lineolata, centauroides, dichotoma, glomerata, pulchella, ftrigofa,
mufcofa, pyramidalis, columnaris, hemifpherica, aleoides, capitella, cotyledonis, barbata, c:liata, thyrfflora, fpicata, fubulata, alternifolia, rubens, ceipitofa, minima, rnofchata, verticillaris, expanfa, dentata, nudicaulis, tecta, cephalophora, montana, turrita, alpeftris, marginata, tomentofi, crenulata, deltoidea, orbicularis, fparfa, diffufa, proftrata, pellucida. Switzerland, Italy, Cape, China.
595. Mahernia.

Eight \{pecies; viz. verticillata, pinnata, pulchella, diffufa, incifa, glabrata, lieterophylla, biferrata. C. of G. Hope.
596. Commersonta.

One fpecies; viz. echinata. Otaheite.
597. Sibbalda.

Three fpecies; viz. *procumbens, erefa, altaica. Siberia, Alps in Europe.

Europe, N. America, Jamaica.

* A. umbel globular; Alamens 3-pointed, petals rough ampelopra. on the hecl.-This is eaten along with other pot-herbs. fum. It communicates its Havour to the milk and butter of cows that eat it.
* A. filaments undivided; leaves femi-cylindrical, oleraceum. rungly furrowed underneath; (leaves not rough.) -The tender leaves are very commonly boiled in foups, or fried with other herbs. Cows, goats, fheep, and fwine, eat it.
* A. ftalk 3 -โquare; leaves fpear-fhaped on leaf-Ralks; urfinumo umbel Hat-topped.-An infufion of this plant in brandy is efteemed a good remedy for the gravel. Other plants growing near it do not Hourifh. Cows eat it in the fpring when grafs is fcarcc ; but it communicates an offenfive flavour to the milk and butter.
* A. The roots of this plant, which is the proper gar-fatioum. lick, are of an irregularly roundill thape, with feveral fibres at the buttom; each root is compofed of a number of lefler bulbs, called cloves of garlick, enclofed in one common membranaceous coat, and eafily feparated from each other. All the parts of this plant, but more efpecially the roots, have a Itrong offenfive fmell, and an acrimonious, almolt caultic, tafte. The roct applied to the flin inflames and often exulcerates the part. Its fmell is extremely penetrating and diffufive. When the root is applied to the feet, its fcent is foon difcoverable in the breath; and when taken internally its fmell is communicated to the urine, or the matter of an iflue, and perfpires through the pores of the $\mathbb{R} \mathrm{kin}$.

This pungent root warms and fimulates the folids, and attenuates tenacious juices. Hence in cold leucophlegmatic habits, it proves a powerful expećtorant, diuretic, and, if the patient be kept warm, fudorific; it has alfo been by fome fuppofed to be an emmenagogue In catarrhous diforders of the breall, flatulent colics, byfterical and other oifeafes, proceeding from laxities of the folids, it has generally good effects; it has likewife been found ferviceable in many hydropic cafes. Sydenham relates, that he has feen the droply cured by the ufe of garlick alone; he rccomnsends it cliefly as a warm ftrengthening medicine in the begin. ning of the difeafe.

Garlick is with fome alio a favourite remedy in th: cure of intermittents; and it has been faid to have fometimes fucceeded in obftinate quartans aifer the Peruvian bark had failed, particularly when taken in the extent of one or two cloves daily in a glafs of brandy or other fpirits. The liberal ufe of garlick, howcver, is apt to occafion headachs, fiatulencies, thirit, febrile heats, inflammatory diftempers, and fometimes difcharges of bluod from the bxmorrhoidal veffels. In hot bilious confitutions, where there is already a degree of irritation, and whese there is reafon to fufped an unfound flate of the viccra, this Almulating medicine is manifefly improper, and never tails to aggravate the diftemper.
The mof commodious furm of taking garlick, a medicine to mont people not a little unpleafant, is that
of a bolus or pill. Infufions in ipitit, wine, vincgar, end water, although containing the erhole of its virtues, are fo acrimonious as to be unfit for general ufe. A fyrup and oxymel of it were formerly kept in the thops; but it does not tow enter any officinal prepa:ation in our pharmacopocias; and it is proper that even the pills thould always be an extemporaneous prefcription, as they fuffer much from keeping.

Garlick made into an oinment with oils, \&c. Sxc. applied externally, is fiid to refolve and difcufs cold tullours, and has been by fome greatly efteemed in cutaneous difeafes. It has likewife fometimes been enployed as a repellent. When applied under the form of a poultice to the pubes, it has fometimes proved offectual in producing a difcharge of urine, when retention has arifen from want of a due action of the bladder; and fome have recommended, in certain cafes of deafnefs, the introduction of a fingle clove, wrapt in thin mullin or gauze, into the meatus auditorius or paffage of the ear. Sydenham alfures us, that among all the fubfances which occafion a derivation or revul. fion from the head, none operates more powerfully than garlick spplicd to the foles of the feet; hence he was led to make ufe of it in the conlluent fmallpox. About the eighth day after the face began to fwell, the root cut in pieces, and tied in a linen cloth, was applied to the foles, and renewed twice a-day till all dancer was over.

The roots of the nllium cepa, or onion, are confidered rather as articles of food than of medicine. They :are fuppoifd to afford little nourifiment, and when eaten liberally in their raw fate, produce flatulencies, occafion thiff, headachs, and troublefome dreams. In cold phlegmatic habit, where vifcid mucus abounds, they doubtlefs have their ufe; as by their flimulating quality they tend to excite appetite, attenuate thick juices, and prom te their expulfion: by fome they are ifrongly recommended in fuppreffions of urine, and in dropfies. The chief medicinal ufe of onions in the prefent practice is in external applications, boiled as a cataplafm, for fuppurating tamours.

## 627. Lilium, or Lily.

16 Species; viz. cordifolium, longiforum, candidum, japonicum, lancifolium, bulbiferum, catefbei, fpeciofum, pomponium, chalcedonicum, fuperbum, martagon, canadenfe, maculatum, kamfchatcenfe, philadelphicum. Europe, Japan, N. America.-The Lilium candidum, or white lily, is cultivated in gardens more for its beauty than utility. The mucilaginous root is ufed by fome as a poultice; but it porfeffes no advantage over the poultices formed of vegetable farinx.
628. Fritillar1a, or Croun-inperial, Fritillary.

635. Gethyllis.

Five fpecies; viz. \{piralis, ciliaris, villofa, plicata, lanceolata. C. of G. Hope.

## 636. Curculigo.

One โpecies; viz. orchioides.
637. Hypoxis, or Bafe Star-fowter.

15 fpecies; viz. etecta, foboliteria, villola, dccum. bens, obliqua, aquatica, minuta, alba, ovata, veratrifolia, ftellata, ferrata, juncea, fafcicularis, feflilis. N, Amer. Jamaica, Cape, Japan.

## 638. Ertospermum.

Three fpecies; viz. latifolium, lariceafolium, parvifolium.

## 639. Ornithogalum, or Star of Beehlebem.

43 lpecies; viz. unitlorum, ftriatum, bulbiferum, fpathaceum, bohemicum, luteum, minimum, circinatum, paradoxum, niveum, * umbellatum, * pyrenaicum, flachyoides, lacteum, ovatum, ciliatum, crenula. tum, pilofum, revolutum, conicum, narbonenfe, latifolium, altifinuum, fcilloides, longebracteatum, japonicum, comofum, pyramidale, tenellum, odoratum, luaveolens, fecundum, fufcatum, barbatum, polyphyllum, juncifolium, rupefte, arabicum, thytloides, aureum, coarctatum, candatum, nutans. Eur. Egypt, Maueira, Cape.

* O. flalk angular, 2-leaved; fruittalks in an un-luteum, branched umbel. - The bulbous roors of all the frecies are nutritious and wholefome, and thofe of this fpecies have been employed for food in a fearcity of provifion. Horfes, goats, and theep eat it ; fwine are not fond of it; cows refule it.

## 640. Scilla or Squill.

16 fpecies; viz. marituma, lho nyacinthus, italica, tetraphylla, peruviana, japonica, amoena, pracox, campanulata, * bifolia, " verna, lufitanica, orientalis, hyacinthoides, * autumnalis, unifolia. Eur. Barb. Madeira, Japan.
S. Howers naked ; flural leaves bent backwards as if broken. -This is the fquill or fea onion well known in medicine. It is a kind of onion growing fpontaneoufly upon dry fandy thores in Spain and the Levant, from whence the root is ammally brought into Europe. It thould be chofen plump, found, freft, and full of clammy juice: fome have preferred the red fort, others the white, though neither deferves the preference to the other. The only difference perceivable between them is that of the colour, and hence both may be ufed promifcuoufly. This root is to the taffe very naufoous, intenfely bitter, and acrimonious. Much handled it ulcerates the 隹it. With regard to its me-
dical virtues, it powerfully flimulates the folids and attenuates vifid juices; ard by thefe qualities promotes expectoration, urine, and, if the patient be kept warm, fiveat : if the dofe be confiderable it proves emetic, and fometincs purgative. The principal ufe of this medicine is where the prime sit ahound with mucous matter, and the lungs are oppreted by tenacious phlegen. Dr Wagner, in his clinical obfervations, recommends it given along with nitre in hydropical fwellings, and in the nephritis; and mentions feveral cures that he perforned by giving from four to ten grains of the powder for a dofe, mixed with a double quantity of nitre: he fayc, that thus managed, it almokt always operates as a diuretic, though fometimes it vomits or purges. In dropfy, dried fquills are often combined with mercury. The moft commodious form for the taking of fquills, unlefs when deligned as an ennetic, is that of a bolus or pill: liquid forms are to moft people too offenfive, though thefe may be rendered lefs difagreeable both to the palate and fomach by the addition of aromatic diffilled waters. This root gields the whole of its virtues both to aquecus and to vinous menftrua, and likewife to vegetable acids. Its officinal preparations are a conferve of dried fquills, a fyrup, and vinegar, an oxymel, and pills.

6 6. Cyanella.
Four fpecies; viz. capenfis, orchidiformis, lutea, alba. C. of G. Hope .
642. Asphodelus, or Afphodel, or Kings-fpear.

Seven fpecies; viz luteus, creticus, ramolus, albus, fiftulofus, altaicus, liburnicus. Auftria, S. Europe.

> 6+3. Anthericum, ot Spider-worf.

55 fpecies; viz. * ferotinum, fragrans, filifolium, flexifolium, filiforme, exuviatum, elongatum, grecum, planifolium, fquameum, comofum, floribundum, revolutum, ramofum, elatum, falcatum, contortum, vefpertinum, gramınifolium, japonicum, longifolium, hirfutum, adenanthera, reflexum, pilofum, undulatum, triflorum, * canaliculatum, albucoides, filiago, liliaftrum, fpirale, frutefcens, roftratum, alooides, nutans, incurvum, latifolium, pugoniforme, præmorfum, afphodeloides, longifcapum, aunuum, hif̣idum, muricatum, ciliatum, cauda felis, triquetrum, fcabrum, cirrhatum, crifpum, * offfragum, phyfodes, pufillum, * calyculatum. Alps of Swed. S. Eur. Cape, Japan.
eSfifragum. * A. It is believed in Sweden to be noxious to theep, and has heen fuppofed to foften the bones of animals that eat it. Cows and horfes eat it ; fheep and fwine refufe it.

## 644. Leontice, or Lions Leaf.

Five fpecies; viz. chrylogonum, leontopetalum, veficaria, altaica, thalietroides. Levant, N. Araerica.

$$
6+5 . \text { Polla }
$$

One fpecies; viz. japonica. Japan.
6;6. Asparagus.
20. fpecies; viz. ${ }^{*}$ uthicinalis, declinatus, decumbens, flesuofus, fcandens, falcatus, racemofus, retrofrachus, rethiopicus, afiaticus, albus, acutifolius, fubulatus, dependens, horridus, aphyllus, lanceus, capenfis, farmentofus, verticillaris. S. Ear. Afia, Africa.

* A. ftem herbaceous, cylindrical, upright; leaves briftle-fhaped; leaf-fcales folitary or in pairs; male and female fowers fometimes on diftind plants.-The
young froots of this plant, in its cultivated fate, are very univerfally cfteemed for their fíivour and nutritious qualities. They impart to the urine the feent of water in which they have been boiled. The fparagus chrybamcla lives upon it.

## 647. Draciena, or Dragontrce.

14 feecies; viz. draco, indivifa, umbraculifera, auftraiis, certua, ferrea, terminalis, marginata, ftriata, undulata, erecta, enfifolia, borcalis, graminifolia. Cape. L:. Indies, China, N. America.

> 648. Sanseviera.

Three fpecies; viz. guineenfis, zeylanica, lanuginaโ.
649. Convallaria, or Lily of the Valley.

11 (pecies; viz. *majłlis, japonica, (亻picata, * verticillata, * polygonatum, * multitlora, latifolia, racemofi, llellata, trifolia, bifulia. N. Eur. N. America, Japan.

* C. fralk naked, femi-cylindrical ; flowers fpiked, majolis. modding.-Tbe flowers are highly fragrant, but when dried are of a narcotic fcent : reduced to powder, they excite fneezing. An extract prepared from the flowers, or from the roots, partakes of the bitternefs as well as of the purgative properties of aloes. The dole from 20 to 30 grains. A beautiful and durable green colour may be prepared from the leives by the affiftance of lime. Sheep and goats eat $1 t$; horfes, cows, and fwine, refufe it.
* C. leaves alternate, embracing the ftem; ftem z-pclygonae edged; fruitfalks axillary, moftly a-flowered.-In a tum. fcarcity of provifions the soots have been made into bread. Sheep and goats eat it; horfes, cows, and fwine refufe it.
* C. leaves alternate embracing the flem ; ferm cylin. mulififora. drical: fruit-ftalks axillary, many-flowered. - The young fhoots are eaten by the Turks as afyaragus, and the roots have been made into bread as the C. polyge. natun. Cows, goats, and fheep eat it.

> 650. Polyanthus, or Tuberofo.

Two fpecies; viz. tuberofa, pygmza. E. Indies,
6ji. Drimia.
Five fpecies; viz. ciliaris, elata, pufilla, undulata, media.
652. Hyacinthus, or Hyacinth.

13 fpecies, viz. * non-fcrıptus, cernuus, amethyftinus, orientalis, flexuofus, corymbofus, convallarioides, brevifolius, romanus, mufcaris, comofus, betryoides, racemofus. S. Eur. Levant.

* H. bluffums tubular-bellihaped, with fix divifions, nor-foriffegments rolled back; floral leaves in pairs.- The freth sur. roots are poifunous: They may be converted into Rarch. Pbalara plantaginis lives upon it.

## 653. Phormium.

One fpecies; viz. tenax.

## 654. Lacheralia.

24 fpecics; viz. glaucina, orchioides, pallida, hyacinthoides, angultifolia, contaminata, viridis, ferotina, pufilla, patula, fragranc, liliiflora, pultulata, purpureocoerulea, violacea, purpurea, lancerefolia, matulia. hirta, ifopetala, tricolor, tubida, punetata, pendula. Cape, New Zealand.
655. Lantria.

One Epecies; viz. plumofa. C. of G. Hope. 656. Veltheimia.

Four fpecies; viz. viridifolia, glauca, uvaria, pumila.
657. Aletris, or Bafe Aloe.

Two fpecies; viz. farinofa, fragrans. Afr. N. $\Lambda$. mer. Ceylon, Japan.
658. Yucca, or Adam's Needle.

Four fpecies; viz. gloriofa, aloifolia, draconis, filamentofa. Amer.
659. Aloe.

17 fpecies; viz. dichotoma, fpicata, perfoliata, picta, finuata, humilis, arachnoides, margaritifera, verrucofa, carinata, maculata, lingua, plicatilis, variegata, vifcofa, fpiralis, retufa. Afric...

Thefe plants are chiefly or rather only valuable, on account of the medicinal virtues of their infpifited juice. The ancients diftinguihed two forts of aloes: The one was pure and of a yellowih colour inclining to a red, refembling the colour of a liver, and thence named hepatic ; the other was full of impurities, and hence fuppofed to be only the drofs of the better kind. At prefent various forts are met with in commerce, which are diftinguilled from the place in which they are produced, or from their fenfible qualities.

1. The Socotorine aloes, faid to be obtained from a variety of the aloe perfoliata. This is the purell fort. It is brought from the ifland Socotora in the Indian ocean wrapt in flins. It is of a glofly furface, clear, and in fome degree pellucid; in the lump, of a yellowifh red colour, with a purple caft; when reduced to powder, of a bright golden'colour. It is hard and friable in the winter, and fomewhat plisble in fummer, and grows foft betwixt the fingers. It, tafe is bitter, accompanied with an aromatic flavour, but infulficient to prevent its being difagreeable; the fmell is not very unpleafant, and fomewhat refembles that of myrrh.
2. Barbadoes or hepatic aloes. Hepatic aloes is not fo clear and bright as the foregoing fort : it is alfo of a darker colour, more compact texture, and for the moft part drier. Its fmell is much ftronger and more difagreeable : the tafte intenfely bitter and naufeous, with little or nothing of the fine aromatic flavour of the Socotorine. The beft hepatic aloes comes from Barbadoes in large gourd fhells: an inferior fort of it (which is generally foft and clammy), is brought over in cafks.
3. Fetid, caballine, or borfe aloes, may eafily be diftinguificd from each of the foregoing, by its frong rank fmell ; although in other refpects it agrees pretty much with the hepatic, and is not unfrequently fold in its fead. Sometimes the caballine aloes is prepared fo pure and bright, as not to be diftinguifice by the eye from the Socotorine; but its offenfive fmell, of which it cannot be divefted, readily betrays it. It has not now a place in almoll any pharmacopaia, and is employed chiclly by farriers.

All the forts of aloes diffolve in pure fpirit, proof fpitit, and proof fpirit diluted with half its weight of water; the impuritics only being left. They difulve alfo by the affifance of heat in water alone; but as the
liquor grows cold, the refmous part fubfides, the gummy remaining united with the water. The hepatic aloes is found to contain more refin, and lefs gum than the Socotorine, and this than the caballine. The refins of all the forts, purified by firit of wine, have little fmell: that obtained from the Sucotorine has fcarce any perceptible tafte; that of the hepatic, a flight bitterifu relifh; and the refin of the caballine a little more of the aloetic flavour. The gummy ex. tracts of all the forts are lefs difagreeable than the crude aloes: the extract of Socotorine aloes has very little fmell, and is in tafte not unpleafant; that of the hepatic has a fomewhat fironger fmoll, but is rather more agreeable in tafte than the extract of the Socotorine; the gum of the caballine retains a confiderable Mare of the peculiar rank fmell of this fort of aloes, but its tafte is not much more unpleafarit than that of the extracts made from the two other forts.

Aloes is a flimulating cathatic bitter: if given in fo large a dofe as to purge effectually, it often occafions an irritation about the anus, and fometimes a difcharge of blood. Small dofes of it, frequently repeated, not only cleanfe the primue vic, but likewife warm the habit, quicken the evacuation, and promote the uterine and hemorrhoidal fuxes. This medicine is particularly ferviceable in habitual coflivenefs, to perfons of a phlegmatic temperament and fedentary life, and where the flomach is oppreffed and weakened. In day bilious habits, aloes proves injurious, immoderately heating the body and inflaming the borvels.
The juice is likewife, on account of its bitternefs, fuppofed to kill worms, either taken internally, or applied in plafters to the umbilical region. It is alfo celebrated for reflraining external bamorrhagies, and cleanfing and healing wounds and ulcers.

The ancients gave aloes in much larger dofes than is cuitomary at prefent. Diofcorides orders half a dram or a dram for gently loofening the belly; and three drams where intended to have the full effect of a cathartic. But modern practice rarely exceeds a fcruple, and limits the greateft dofe to two fcruples. For the common purpofes of this medicine ten or twelve grains fuffice; taken in thefe or lefs quantities, it acts as a gentle flimulating eccoprotic, capable of renoving if duly continued, very obfinate obllruations. Aloes are much lefs frequently ufed to operste as a purgative than merely to obviate coflivenefs: and indeed their purgative effect is not increafed in proportion to the quantity that is taken. Perlaps the chief objection to aloes, in cafes of habitual coflivenefs, is the tendency which they bave to induce and augmeht hecmorrhoidal affections; and with thofe liable to fuch complaints they can feldom be employed. Their purgative effect feems chiefly to depend on their proving a fimulus to the rectum.

Some are of opinion that the purgative virtue of aloes refides entirely in its refin: but experience bas flown that the pure tefin has little or no purgative quality; and that the gemmy prart, feparated from the refinons, acts more powerfully than the crude aloes. If the aloes indeed be made to undergo long coction in the preparation of the gummy extract, its cathartic power will be couliderably leffencd, not from the feparation of the refin, but from an alteration made in the
juice
juice iffelf by the heat. The ffrongeft vegetable cathartics become mild by a like treatment, without any remarkable feparation of their parts.

Socotorine aloes, as already obferved, contain more gumnny matter than the hepatic; and hence are likewife found to purge more, and with greater irritation. The firft fort therefore is molt proper where a ftimulus is required, as for promoting or exciting the menllrual hux; whil!! the latter is hetter calculated to act as a common purge. It is fuppofed that the vuinerary and ballamic virtues of this juice refide chielly in the refin, and hence the hepatic aloes, which is moll refinous, is mof Terviceable in external application.

Aloes enter many of the officinal preparations and compofitions, particularly different pills and tinctures; and according to the particular purpofes for which thefe are intended, fometimes the Barbadoes, fometimes the Socotorine aloes are the mofl proper.
660. Agave, or Common American Aloe.

Seven fpecies; viz. americana, vivipara, virginica, cubenfis, lurida, tuberofa, lœtida. America.

66t. Alstroemeria.
Six fpecits; viz. pelegrina, pulchella, ligtu, falfilla, ovata, multifora. Peru, Lima.
662. Hemerocaleis, or Day-lily.

Four fpecies; viz. flava, fuiva, lancifolia, japonica. Siberia, Hungary, Levant, Japan.

> 663. Acorus, or Sweet-finelling Rufo.

Two fpecies; viz. caldrus, gramineus. Europe, India.
calamis.
*. A. foral leaf very much longer than the fpike.-The root powdered might fupply the place of our foreign fpices. It is our only mative truly aromatic plant. The powder of the root has cured agues, when the Peruvian bark has failed. The roots have a ftrong aromatic fmell, and a warm pungent bitterifh taffe. The flavour is greatly improved by drying. They are commonly imported from the Levant, but thofe of our own growth are full as good. The Turks candy the roots, and think they are a prefervative againft contagion. Neither horfes, cows, goats, theep, or fwine will eat it.
664. Orontium, or Floating Aicum.

Two fpecies; viz. aquaticum, japonicum. N. America, Japan.
665. Tacca.

One fpecies; viz. pinnatifida. E. Indies, Otaheite. 666. Corypha, or Mountain Palm.

Two \{pecies; viz. umbraculifera, rotundifolia. Eaft Indies, Carolina.
667. Licuala.

One fpecies; viz. fpinofa. Africa, Amboyna.
668. Thrinax, or Small Gamaica Fan-palm.

One £pecies; viz. parviflora. Jamaica, Hípaniola.
669 . Calamus.
Eight fpecies; viz. rotang, verus, draco, niger, viminalis, rudentum, equeftris, zalacca. India.

[^2]grandilorus, magellanicus, rubens, * trifidus, * fruarrofus, capitatus, capenfis, punctorlus, nodolu., "articulatus, fylvaticus, fubverticillatus, tenageja, * bulbofus, teruis, *bufonius, cephalotes, ftygius, jaçuini, *biglumis, *triglumis, "pilofus, maximus, facliceuc, luteus, parvithorus, ferratus, albidus, niveus, "campeltris, fudeticus, " Spicatu. Europe, Cape, N. America. $^{2}$ * J. Itraw ftiff and liraight; panicle lateral, loofe; effufios flowers egg.thaped, blurr, 3 1lamens in each.-Ruthes are fometimes ufed to make lietle bafkets. The pith of this fpecies is ufed inflead of cotton to make the wick of rufh lights. Horfes and goats eat it.
*. I. Araw rigid ; leaves like brillles; panicle termina-fouarrofit" $=$ ting, leaflefs.-Horfes eat it. The leaves lying clofe to the ground elude the flroke of the fcythe. It indio catcs a barren foil.

6yi. Richardia.
One fpecies; viz. fcabra. Vera Cruz.
672. Duroia.

One fpecies; viz. eriopila. Surinatn.
673. Achras, or Sapota.

Three fpecies; viz. diffceta, mammofa, fapota. W. Indies, S. America.

674 . Prinos, or Winter-berry.
Seven fpecies; viz. verticillatus, montanus, dioicus, nitidus, glaber, lucidus, fideroxyloides. N. America, Jamaica, Montferr.
675. Cossignea.

Two §pecies; viz. triphylla, pinnata. India.
676. Barbacenia.

One fpecies; viz. brafilienfis.
677. Berberis, or Barberry, or Pipperidge Bufi.

Five fpecies; viz. * vulgaris, ilicifolia, microphylla, cretica, libirica. Europe, Canada, Terra del Fuego.

* B. fruitfalks forming bunches; thorns 3 together. - vulgaris, The leaves are gratefully acid. The flowers are offenfive to the fmell when near, but at a proper diflance their ollour is extremely fine. The berries are lo very acid that birds will not eat them, but boiled with fugar they form a molt agrecable rob or jelly. They are ufed, likewife, as a dry fweetmeat, and in fugar plumbs. An infufion of the bark in white wine is purgative. The roots boiled in lye dye wool yellow. In Poland they dye leather of a mof beautiful yellow with the bark of the root. The inner bark of the flems dyes linen of a fine yellow, with the affiftance of alum. This that thould never be permitted to grow in corn lands, for the ears of wheat that grow near it never fill, and its infurnce in this refpect has been known to extend as far as 3 or 4 hundzed yards acrofs a field. This very extraordinary fact well merits invelligation.

678. Psathura.

One fpecies; viz. borbonica. lite of Bourbon.
679. Nandina.

One fpecies; viz. domeftica. Japan.
6So. Lindera.
One fpecies; viz. unbellatz. Japan.
68t. Fisarges.
One feccies; viz.marginaia. 'resra dei fucge
682. Philesia. One fpecies; viz. buxifolia. Straits of Magellan.
683. Capura.

One fpecies; viz. purpurata. India.

$$
68 \text { _. Loranthus. }
$$

${ }_{2} 6$ Species; viz. fcurrula, tetrapetalus, glaucus, biflorus, parvifolius, falcatus, uniforus, europazus, longibracteatus, buddlejoides, nodofus, elevatus, longiflorus, elafticus, americanus, emarginatus, occidentalis, loniceroides, pedunculatus, felilitis, marginatus, ftelis, pauciflorus, brafilieufis, pentandrus, fpicatus. Europe, E. Indies, Jamaica, America.
685. Schradera.

Two fpecies; viz. capitata, cephalotes.
686. Stephania.

One fpecies; viz. cleomoides. Guiana.
687. Hillba.

Two Species; viz. longiflora, tetrandra. Jamaica, South America.
688. Isertia.

Two fpecies; viz. coccinea, parviflora. Guiana.
689. Canarina, or Canary Bcll-forver.

One fpecies; viz. campanula. Canary lifes.
Ggo. Franken:a, or Sea-beath.
Four fpecies; viz. *levis, nothia, hirfuta, *pul. verulenta. Europe, Arabia.

> 691. Peplis, or Water Purfain.

Two fpecies; viz. * portula, indica. Europe.
692. Gahnia.

Two fpecies; viz. procera, ichoenoides. New Zealand.
693. Bambusa.

Two fpecies; viz. arundinacea, verticillata.
69. Fhrharta.

Five fpecies; viz. cartilaginea, buibofa, longiffora, panicea, calycina. Africa,

## Order II. DIGYNIA.

695. Oryza, or Rice.

One fpecies; viz. fativa. E. and W. Indies, N. A. merica.- Rice is the produce of many countries, particularly of the Eaft Indies; but as ufed in Britain, it is broug!t cliefly from Carolina, where this plant is cultivated in large quantities. It is fufficiently nutritious, and affords an ufful food in diarrhocas, dyfenterics, and other difordets from a thin acrimonious fate of the juices.

6g6. Nectris.
One fecies; viz. aqquatica. Guiana.
697 Falxia.
One fperies; viz. repens. Cape of Good Hope.
6g8. Atraphaxis.
Two 「petsins; viz. fpinofd, undulata. Levant, Cape.

## Order III. TRIGYNIA.

699. Rumex, or Dock
${ }^{6} 6$ \{pecies; viz. patentia, * languineus, fpathulatus, verticillatus, britamica, * hydrolapathum, *crifpus, nemolapathum, perficarioides, xgyptiacus, dentatus, * ma. ritimus, divaricatus, * acutus, * obtufifolius, * pulcher, bucephalophorus, aquaticus, lunaria, veficarius, rofeus, tingitanus, fcutatus, nervofus, * digynus, lanceolatus, alpinus, fpinofus, tuberofus, multifidus, * acetofa, * a. cetofella, aculeatus, luxurians, arifolius, bipinnatus, Europe, Egypt, Barbary.

* R. valves frongly veined; leaves fpear-fhaped, acute, crifpus. waved and curled at the edge.-In Norfulk this plant is the peft of clover fields. The frefh roots bruifed, and made into an ointment or decoction, cure the itch. The feeds have been given with advantage in the dyfentery. Cows, goats, and horfes refufe it.
* R. valves veinlefs; leaves oval-fpear-hhaped, uneven acutus. at the edges. - Cows and horfes refufe it. It is infected by the aphis rumicis. The root is ufed by the dyers.
 a pretty fine olive, and a fine deep green to cloths which have been previoufly blued.
* R. leaves fpear. fhaped, fmooth, acute, very entire, bydrolatapering at the bafe-It is a medicine of confiderable patbum. efficacy, both externally applied as a wafh for putrid fpongy gums, and internally in fome fpecies of fcurvy. In rheumatic pains and chronical difeafes, owing to obfructed vifcera, it is faid to be ufeful. The powdered root is one of the beft things for cleaning the teeth. The root has fometimes a reddiff tinge, but foon changing to a yellowith brown when expofed to the air. The curculio lapatbi is found upon the leaves.
*R. leaves heart-oblong, bluntif, finely notched. - obtuffolic. Fallow deer eat this and the $R$. acutus with avidity, biting it clofe to the root, fo that it is very rare to fee a dock growing in a park.
* K. leaves oblong, arrow-fhaped.-The leaves are acetofod. eaten in fauces and in falads. The Laplanders ufe them to turn their milk four. In France they are cultivated for the ufe of the table, being introduced in foups, ragouts and fricaffees. In fome parts of Ireland they eat them plentifully with milk, alternately biting and fupping. The Irifh alfo eat them with filh, and other al calefcent food. The dried root gives out a beautiful red colour when boiled. Horfec, cows, gaats, theep, and fwine eat it. The aphis aceeofs feeds upon it.

## 700. Flagellarta.

One $\int_{\text {pecies }}$; viz. indica. Eaft Indies, Guiana.
701. Scheuchzepla, or Leffer Flowering Rufh. One Species; viz. paluftris. Lapland, Sweden, Helvetia.
702. Triglocilln, or Arrour-handed Grafs.

Three Species; viz. palluftre, buibofum, mariti-
mum. Europe.

- T. capfule 3 -celled, nearly ftrap-fhaped.-Cows are polufre extremely fond of this plant. Horfes, theep, goass, and fwine eat it.
* T. capfule 6 -celled, egg.flaped.-It is fult to the marititalle; but horfes, goats, illecpl, and fwine ate very mum fond of it.

717. Esculus, or IIorfo-cbrfmut.

Three fpecies, viz. hippocaftanum, pavia, flava. N. of $A$ fia, Amcrica.

The fruit of this plant has been ufed as food for fheep and poultry, and as foap for walling. It was much employed in powder as a fernutatory by an itipierant oculif, and has been recommended by fome others in certain cafes of ophthalmia, headach, \&c. in which errhines are indicated.

Its cffect, as a fermutatory may alfo be obtained by ufing it under the form of infufion or decoction drawn up into the nuflrits; and it is entirely with a view to its errhine power that it is now introduced into the Pharmacopcria of the Edinburgh college. But befides this, the bark has alfo been reprefented by fome as a cure for intermittent fevers, and it is probably with this intention, that this part of the hippocaftanum is introrluced as an officinal article in the Pharmacopaia Roffica.

## 754．Hedwigia．

One fpecies；viz．bafamifera．Hifpaniola．
755．Amyr1s，or Sbrully Sweetwood．
19 fpecies；viz．polygama，elemifera，fylvatica， martum？，kataf，gileadenfis，opobalfamum，ennean－ dra．heternpilylla，gujanenfis，ambrofiaca，decandra， altifima，ioxifera，protium，dentata，anifata，zeyla－ nic：．ballamitera．E．Indies，Carolina，Jamaica．

The A．eiemifera produces a refin，which is brought frout the Spanith W．Indies，and fometimes from the E． Indies，in large roundih cakes，generally wrapped up in flag leaves．The beft fort is foftif，fomewhat tranf－ parent，of a pale，whitith yellow colour，inclining a little to green；of a frong，not unpleafant fmell．It almoft totally diffolves in pure fpirit，and fends over fone part of its fragrance along with this menfruum in difillation：diftilled with water it yields a confide－ rable quantity of pale coloured，thin，fragrant effential oil．This refin gives name to one of the officinal un－ guents，and is at prefent fcarce any otherwite made ufe of；though it is certainly preferable for internal pur－ pofes to fome others，which are held in greater efleem．

The fruit of the amyris gileadenfis is the product of the tree that yields the opobalfam，or balfan of Gilcad． It is about the fize of a pca，of a whitifl colour，en－ clufed in a dark－brow13 wrinkled bark．This fruif， when in perfection，has a pleafant warm glowing tafte， and a fiagrant frocll，refembling that of the opohalfam itfelf．It is very rarely found in the Mops；and fuch as we now and then do neet with，has almuft entirely loft its fmell and talle．It had formerly a place in the mithidate and theriaca formula，now banilhed from our pharmacopexi．s；but even then the college permit－ Icd cubebs in lor employed as a fubtitute for the carpo－ bulfamum，which could feldom be procured；and it is probably on this account that it has now no place in our lits．

755．Chmota．
Ore 「recies；viz．longifolia．Guiana．
757. Ximéria.

Three fpecies; viz. americana, elliptica, incrmis. Weft Indies, Guiana.
758. Fuschia.

Four fuccies; viz. triphylla, coccinea, excorticata, multitlors. Jam. Chili, New Zealand.

## 759. Chlora, or Yelloze Contaury.

Five fpecies; viz. * pertoliata, quadrifolia, dodecandra, feffilis, imperfoliata. S. Eur. Lev. Virginia.
760. Michauxia.

One fpecies; viz. campanuloides. Levant.
761. Dodonea.

Three fecies; viz. vifcofa, triquetra, angunifoliz. Tropical clinates, Cape.
762. Valentinba.
O.e fpecies; viz. ilicifolia. Cuba, Hifpaniola.
763. Lawsonia.

Four fpecies; viz. iner:nis, purpurea, acronychia, Spinofa. Egypt, Eaft Indies.
764. Melicope.

One fpecies; viz. ternata. South fea ifles.
Onefuecies: 765. Dimocarpus.
viz. litchia.
766. Memecylon.

Four fpecies; viz. capitellatum, tinetorium, grande, cordatum. Ceylon.
767. Buginvilleta.

One fpecies; viz. fpectabilis. Brazil. 76S. Vaccinium, or Bill-terry, or Whartle-berry.
27 fpecies; viz. ${ }^{*}$ myrtillus, palldum, hirtum, tamineum, * uliginofum, album, mucrontum, difufum, anguftifolium, corymbofus,, bracteatum, ciliatum, fufcatum, frondofum, venuftum, liguftrinum, refinofum, amonenum, virgatum, tenellum, arefoftaphyllos, meridionale, cereum, *vitis-idæa, * oxycoccus, hifpidulum, macrocarpon. N. Europe, Levant, N. America, Jamaica. * V. fruit-ftalks i-flowered; leaves ferrated, egg-haed; ftem angular,-The berries of this plant are very acceptable to children, tither eaten by themfelves, or with milk, or in tarts. The moor game live upon them in the autumn. The juice ftains paper or linen purple. Goats eat it. Sheep are not fond of it. Horfes and cows refure it.
uliginofun.* V. fruit-falks 1-flowered; leaves very entire, inverfely egg-fiaped, blunt, fmooth.-Chiidren are laid fometimes to eat the berries; hut in large quantities they occafion dizzinefs and a flight headach, efpecially when full grown, and quite ripe. Many vintners in France are faid to make ufe of the juice to colour their white wines red. Horfes, cows, fheep, and goats, eat it. Swine refufe it.
wilis-idea. * V. bunches terminating, nodding; leaves inverfely egg-flaped; edge very entire, and rolled back, dotted underneath. - The herries are acid, and not very grateful ; but they are eaten by the Finlanders, and by the country people in Sweden, and are fent in large quantities from W. Bothnia to Siockl:olm for pickling. They are alfo made inio tarts, rob, and jelly. Goats eat it. Cows, freep, and horfes, refufe it.
orycocius. * V. fruit-Ralks finclc or in pairs; lcaves egg-faraed,
very entirc, cdgcs rolled back; Rem theacilliapu',
 much cheemed; but on account of a picculsar thovor: are diliked by fome. They may bekepl fir feveral yer:s if wiped clean; and then clofely corked in cry trathes, or the bottles may be filled with water.-At Lonstown in Cumberland, 20 or 301.'s vartin are fold by the poor people each market day, for five or fix wecks together. The moft general name, cranberry, Roblably originated from the fruitfall:s being ronoked at the top, and before the expanfion of the blofium, refembling the neck and hacad of a crane.

## 769. Menziest.

Onc fyecies; viz. ferruginca.

## 770. Erica, or IIeath.

137 fpecies; viz. glutinofa, lutea, paniculata, depref. fa, halicacaba, monfoniana, dilcolor, denfifolia, cruenta, nigrita, phylicoides, regerminans, urccolaris, marifolia, planifoli., hirta, bicolor, articularis, viridi-purpurea, pubefcens, perfoltata, gracilis, ftrigofa, caffra, arborea, ftricta, florida, mucofa, pitulifera, amoena, ictralix, intlata, gilva, abietina, verticillata, patterfonia, mammola, empetrifulia, fpicata, octophylla, fafcicularis, obliqua, * vulgaris, gnaphaloides, corifolia, calycina, trifora, fcoparia, bergiana, formofa, rubens, incarnata, * cincrea, auftralis, ramentacea, quadriflora, lateralis, margaritacea, baccans, pendula, phyfodes, cernua, retorta, * daboccia, tenuifolia, albens, bra@cata, thunbergii, tetragona, umbellata, nudiflora, petiolaia, bryantha, felleriana, fucata, axillaris, imbricata, fexfaria, melanthera, leucanthera, taxifolia, fpumofa, capitatag. bruniades, pafferina, totta, abfyrithioides, ciliaris, caerulea, hifpidula, petiverii, bankfii, febana, monadel phia, plukenetii, verficolor, perficicua, aitoni, cephalotes, pulchella, longifolia, vellita, pinea, leen, coccinea, purpurea, concimna, grandifora, cylindrica, curviflora, fimplicifora, tubillora, lanata, procera, confficun, glandulofa, tranfparens, cerinthoides, fparrmanni, nafforit, ventricofa, ampullacea, fifligiats, incurva, globofa, comofa, denticulata, mufcari, vilcaria, pyramidalis, meditcrranes, maltitlora, hetbacea, purpurafeens, * vagans, cubica, racemofar Europe, Madeira, Cape.

* E. leaves arrow-dhaped.-This plant, but lithe re-vulyares, garded in happier climates, is made fubfervient to a great variety of purpofes, in the bleak and barren highlands of Scotland. The poorer inliabitants make walls for their coitages, with alternate layers of heath, and a kind of mortar made of black earth and fraw, the woudy roots of the heath being placed in the centre, the tops externally and internally. They make their beds of it, by placing the roots downwards, and the tops only bcine uppermoft, they are fufficiently foft to ileep upor. Cabins are thatched with it. In the ifland of llay, ale is frequently made by brewing onc part malt and two parts of the yourg tops of heath ; fometimes they add hope. It is faid, that this liquor was much ufed by the Piefs. Woullen cloth boiled in alum water, and afterwards in a flrong decoction of the tops of leath, comes out a fine orange colour. The fallis and tops will tan leather. In England befums are made of it, and faggots to burn in ovenc, or to fill up drains that are to be covered ovcr. Shcep and goats will lemetimes eat the tender floots, but they are net fond of them. Bees extract a great cieal of boney fom.
the fowers; but tihere heath abounds, the honey has a reddift caft.

57. Ophisa.

Ooe fpecies; viz. triç: Afica.
772. Grusbla.

One fpecies; viz. rofmarinitolin. C. of G. Hope.

30 ipecies ; viz. " mezereum, thymelita, dioica, calycina, pubefcens, vermiculata, villofa, tarton-raira, nitida, alpina, * laureola, pontica, pendula, lagette, polyftachya, monoftachya, tinifolia, gnidium, indica, foetida, rotundifolia; odora, octidentalis, encotum, altaica, fquarrofa, glomerata, oleoides, fericea, collina.-Europe, China, Jipan, W. Indies.
D. Honers fitting on the fem, mofly three together; leaves fpear-fhaped, deciduous; berries globular.-An ointment prepared from the bark or the berries, has been fuccesffully applied to ill-conditioned ulcers. The whole piant is very corrolive; fix of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter, who had a quartan ague; fle vomited blood, and died immediately.-A decoction made of two drams of the cortical part of the root, boiled in three pints of water till one pint is wafted, and this quas,tity drank daily, is found very efficacious in refolving venereal nodes, and other indurations of the peri-, ofteum. It is faid to have been once given, in a cale of difficulty in fwallowing, feemingly oceafioned by a paralytic affection. The patient was directed to chew a thin flice of the root, as often as the could bear to do it ; and in about two months, fhe recovered her power of fwallowing. This woman bore the difagreeable irritation, and the ulcerations its acrimony occafioned in her mouth, with great refolution; but the had been reduced to fkin and bone, and for three years before, had fuffered extremely from hunger, without being able to fatisfy her appetite, for fhe fruallowed liquids very imperfectly, and folids not at all. This complaint came on after lying in.

* D. bunches of about five flowers \& asillary leaves fpear-fhaped, fmooth.-Very happy effects have been experienced from this plant in rheumatic fevers. It operates as a brifk and rather fevere purgative. It is an eflicacious medicine in worm cafes; and upon many accounts deferves to be better known to phyficians; but in lefs fkilful bands, it would be dangerous, as it is poffefied of confiderable acrimony. The whole plant has the fame qualities, but the bark of the root is the ftrongeft. Dr. Alfton fixes the outfide dofe at ten grains.

> 774. Dirca, or Leather-wood.

One fpecies; viz. paluीris. Virginia.

## 775. Gnidic.

i 6 fpecies; viz, pinifulia, radiata, filamentofa, carinata, feabra, fimplex, capitata, lrevigata, biflora, racemofa, tomentofa, argentea, imbricata, fericea, oppofitifolia, daplinefoli?. Cape, Madagafcar.
776. Stellera, or German Groundfel.

Two fpecies; viz. pafferima, chanaxiafme. Europe.
777. Passerina, or Soarrozu-wort.

783. Codia.

One fpecies; viz. montana. New Caledonia.
784. Móehringia, or Mountain Cbickweeds One fpecies; viz. mulcofa. Alps, S. of Eur.

## Order III. TRIGYNIA.

78.5. Polygonum, or K'mot-grafs.

43 Species; viz. truteicens, grandiflorum, * biforta * viviparum, virginianum, lapathifolium, * amphibium, ocreatum, * hydropiper, filiforme, tinctorium, * minus, * perficaria, incanum, glabrum, barbatum, tomentofum, orientale, penfylvanicum, maritimum, * aviculare, bellardi, fetolum, erectum, articulatum, divaricatum, al. pinum, undulatum, fericeum, ferratum, corymbofum, chinenfe; fagittatum, arifolium, craffifolium, perfoliatum, tartaricum, emarginatum, * fagopyrum, * convolvulus, dumetorum, fcandens, multiflorum. Eur. E. Indies, China, N. Amer.
${ }^{4}$ P. fowers with cloven piftils; ftipulx fomewhat bydrofter. fringed; leaves fpear-fiaped.-The whole plant has an acrid burning talle. It cures little aphthous ulcers in the mouth: It dyes wool yellow. The afles of this plant, mixed with foft foap, is a noftrum in a few hands for diffolving the ftone in the bladder; but it may be reafonably ģueftioned, whether it has any advantage over other lemi-cauftic preparations of the vegetable alkali. Its acr mony rifes in diftillation, and the diftilled water drank to the amount of two or three half pints daily, has been found very effectual in fome nephritic cafes. Horfes, cuws, goats, theep, and fwine, refufe it.

* P. Ayl-s 2 ; pikes egg-oblong; leaves fpear- fhaped ; perficaris. flipula fringed.-Its tafte is nightly acid and aftiongent. W nollen cloth, dipped in a folution of alum, obtains a ycllow colour from this plasto Gnats, fleep, and horfes, cat it ; cows and fwine sefufe it.
* P. leaves egy-flaped, extended at the bafe along the biforic. leaf-italks.-The root is one of the frongef vegetable affringents. The young floots ate eaten in herlb-pudding in the nortb of England; and about Manchefter they are fubflituted for greens, under the name of patience dock,

## Octandria.

viviparum. * P. leaves fpear-fhaped; fuihe terminating.-Plants culcivated for four years in a gardon, conitantly prue duced perfect feeds in July, and Howered as con antly a fecond time in Scptember. Thete latter germs vegetated on the ftem.
suiculare. * P. flowers axillary; leaves fperr-haped; flem trail-ing.- The feeds are uffeful for every purpofe in which thole of the next fop cies are employed. Great namhers of fmall birds feed upon them. Cows, $\%$ its, theep, horfes, and fwitre eat it. The flubbles in sweden are purpled over with this plant. It affords nourifhenent to the chryfomcla polygoni.
fagopyrum.* P. leaves heart-arrow-hlaped; ftem nearly upright, without prickles; angles of the feds equal.-This plant is very impatient of cold, dying at the very firf attack of frotl. The feeds furnilh a nutritious meal, which is not apt to turn acid upon the "tomach. It is made into thin cakes in fome parts of England called crumpits. It is ufual with farmers to fow a crop of buck wheat, and to plough it under when Fully grown as a manure to the latu. The feeds are excellent food for poultry. Sheep that eat this plant become unhealthful. As ir flowers late in the fummer, MI. du Hamel, in his obfervations upon the intnagement of bees, adviles to move the hives in the autumn to a fituation where plenty of this plant is fown. Cows, goats, and theep, eat in; fwine and horfes sefufe it. * P. leaves heart-haped; ftem twining, anyular; flowers blunted.-The feeds of this plant are quite as good for ufe as thofe of the preceding fpecies, are produced in greater quantity, and the plant bears cold better. Cows and goats eat it ; fheep, fwine, and borles refufe it. The phalena lubricipeda is found upon feveral of the fpecies.
786. Coccoloba, or Sea-Fide Grape.

13 fpecies; viz. uviferd, auftralis, pubeffens, oiverfifolia, flavefcens, excoriata, nivea, punctata, obtuffolia, microftachya, emarginata, barbadenfis, tenuifolia. IV. Indies, S. America.
787. Paullinia, or Supple-jack.

14 fecies; viz. nodofa, curuvu, carthaginenfis, caribæa, curaffavica, barbadenfis, polyphylla, tetragona, vefpertilio, pinnata, tomentofa, caulitlora, japonica, diverfifulia. E, and WY. Indies, Japan, S. America.

## 793. Lavrus, or Bay-tree.

34 fpecies; viz.cinnamomum, caffia, camphora, culilaban, montana, chloroxylon, glauca, pedunculata, caufica, nobilis, indica, foetens, perfica, borbonia, martinicenfis, exaltata, al pigena, triandra, fanguinea, furinamenfis, hexandra, falicifolia, coriacea, leucoxylon, membranacea, patens, parviflora, pendula, floribunda, lucida, umbellata, æffivalis, benzoin, fallafras. Of thefe we fhall take notice of the following, as of confiderable importance.

1. The nobilis, or evergreen bay-tree, is a native of Italy, and hath an upright trunk branching on every fide from the bottom upward; with fpearfhaped, nervous, Aifr, evergreen leaves, three inches long and iwo broad; and fmall, yelluwih, quadrifid, diœcious flowers, fucceeded by red berries in autumn and winter. Of this fpecies there are varicties, with broad, narrow, Atriped, or waved leaves. 2. The eftivalis, or deciouous bay, grows naturally in North America. It rifes, with an upright nem, covered with a purplifh bark; having oblong, oval, acuminated, veined, deciduous leaves, wo or three inches long, and half as broad, growing oppofite; with fmall white flowers, fucceeded by red berriec. 3. The benzoin, or benjamin tree, is alfo a native of North America; grows 15 or 20 feet ligh, divided into a very branchy head; with oval, acute, deciduous Itaves, three or four inches long, and half as broad; and fmall yellowith flowers, not lueceeded by berries in this country. 4. The faffafras is a native of the fime country. It hath a flumblike Araight ftem. garnifled with both oval and threelobed, frining, deciduous leaves, of different fizes, from three to fix inches long, and near as broad, with fmall yellowill fowers, fucceeded by blackiff berries, but not in this country. 5. The indica, or Indian bay tree, rifes with an upright flraight trum, branching regularly 20 or 30 feet ligh: adomed with very large, fpear-haped, plane, nervous, evergreen leaves on reddifi footfelhs; and bunches of frall whitih green flowers, fucseeded by large oval black berries which do not ripen in this country. G. The borbonid, or Carolina red bay tree, sifes with an upright flraight flem, branching 15 or 20 fect bigh; with large, fear-flap-
ed, evergreen leaves, tranfucrfely veined; and long bunches of flowers on red footftalks, fucceeded by large blue berries fitting in red cups. 7. The camphora, or camphire tree, grows naturally in the woods of the weftern parts of Japan, and in the adjacent iflands. The root fmells flronger of camphire than any of the other parts, and yields it in greater plenty. The bark of the falk is outwardly fomewhat rough; but in the inner furface fmooth and mucous, and therefore eafily feparated from the wood, which is dry and of a white colour. The leaves fland upon flender footfalks, have an entire undulated margin, running out into a point: have the upper furface of a lively and fhining green, the lower herbaceous and filky; and are furnifhed with a few lateral nerves, which flretch archwife to the circumference, and frequently terminate in fmall warts; a circumftance peculiar to this fpecies of laurus. The flowers are produced on the tops of footfalks, which proceed from the armpits of the leaves; but not till the tree has attained confiderable age and fize. The flower-ftalks are flender, branched at the top, and divided into very fhort pedicles, each fupporting a fingle flower. Thefe flowers are white, and confiit of fix petals, which are fucceeded by a purple and thining berry of the fize of a pea, and in figure fomewhat top-flaped. It is compofed of a foft pulpy fubflance that is purple, and has the tafte of cloves and camplite; and of a nucleus or kerncl of the fize of a pepper, that is covered with a black, Mining, oily corticle, of an infipid tafte. 8. The cinnamomum, or cinnamon tree, is a native of Ceylon. It hath a large root, and divides into feveral branches, covered with a bark, which on the outer fide is of a grayifh brown, and on the infide has a reddith call. The wood of the roots is hard, white, and has no fmell. The body of the tree, which grows to the lieight of 20 or 30 feet, is covered, as well as its numerous branchec, with a bark which at firft is green and afo terwards red. The leaf is longer and narrower than the common bay tree; and it is three-nerved, the nerves vanifhing towards the top. When fift unfolded, it is of a dlame culour: but after it has been for fome tince expofed to the air, and grows dry, it changes to a decp green on the upget furface, and to
a lighter on the lower. The flowers are fmall and white, and grow in large bunches at the extremity of the branches: they have an agrceable fimell, Comething like that of the lily of the valley. 'The fruit is dlaped like an acorn, but is not fo large. 9. The caffia, or bafe cinnamon, has lanceolated leaves, iriple-nerved. 10. The perfea, avocada pear tree, or alligator pear, rifes to a confiderable height, with a flraight trunk, of which the bark and wood are of a grayilh colour. The leaves are long, oval, puinted, of a fubitance like leather, and of a beautiful green colour. The flowers are produced in large knots or clufters at the extremities of the branches, and confift each of fix petals difpofed in the form of a flar, and of a dirty white or yellow colour, with an agreeable odour, which diffufes itfelf to a confiderable diftance. It is a native of the TVe $\mathbb{T}$ Indies. The perfea begins to bear two years and a half, or at moft three years, after being planted; and, like molt of the trees in warm climates, bears twice a year. The other fpecies of this genus are poffefied of no remarkable properties.

The firlt ipecies are propagated by layers, or by the berries. In order to raife a quantity of thefe trees by layers, fome flools thould be planted for the purpofe; and after thefe being fhot about a yard high, the branches mult be brought down to the ground in the winter, all the preceding fummer's flonts laid on it, and pegged down (being firf flit in the juint, and the leaves taken off, which would otherwife be under ground. In one year's time thefe layers will have taken root; and iris the fpring they fhould be taken up, and planted in the nurfery a foot afunder, in rows two feet diftance. After they are planted out, if the weather fhould prove dry, they muft be conftantly watered; for without fuch eare, it is difficult to make this tree grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raife this tree from the berries, they ought to hang on the trees till about January before they are gathered. A well-feltered lipot of ground for the fem'nary mult be made choice of: and baving the mould fmooth and fine, they fhould be fown foon after they are gathered, in beds or drills, rather more than half an inch deep. Towards the clofe of the fpring the plants will come up, and during fummer muit be daly attended, by watering and weeting. In the winter following, their haltered fituation mult not be trufted to, to defend them from the froft : Furze bulhes, or fome fucb things, ought to be fluck in rows between the beds or drills, to guard them from the black frofts. Indeed, without this precaution, if the winter fhould prove very frofty, few of the youns, feedlings will be alive in fpring. During the following fummer, weeding and watering mult be obferved, and the winter after that they fhould be defenferl with covering as before; for they will be Itill in danger of being deftroyed bv levere frofts. In the enfuing fpring, the ftongent may be taken out of the feed-beds, and planted in the narfory way; though, if they have not by that time made good Roots, it will be advifable to let them remain in th-ir beds till the third foring; for a fim 11 plint of this kind is with more diculty made to grow than one which is larger. When they are flanted in the nur-
fery, the diflance which flould be allowed them is the fame as the layers, a foot afunder and two feet diftince in the rows; and this will not be found too clufe: for notwithlanding the greatef care is exerted in planting them in the nurfery, even making choice of sainy and cloudy weather, which mutt always be obferved in fetting them out, many of them will be loft by being tranflanted. After they are thus planted out in the nurlery, whether layers or feedlings, they mult be nill watered in dry weather, kept frec from weeds, and the rows dug between every winter. You will even find, that thofe plants which tuffer leaf by being tranfplanted will have met with a chock, which they will not recover in two or thrce years; and till they have acquired new Arength they flould not le taken from the nurfery; but when they appear to be good ftiff plants, having the year before $m$ de a vigorous Hhoot, they will be then proper plants for planting out where they are to remain. Holes fhould be got ready fur their reecption; and as foon as the finf autumnal rains fall, the work thould be fet abotr. efpecially if the land be gravelly or dry; but if it be moin, the Spring will do as well. Being now planted at one yard ditauce, they will make a poor progrefs for two or three years more; but after this, when they have overcome all thefe diflicultics, they will grow very fart, and arrive to be good trees in a few years. Al. though this tree flourithes bef in old gardens, where the foil has been made rich and deep, and loves the Made, Hambury iells us. " it thrives neverthelefs excecdingly well in our hottelt gravels and fands; and after it has furmounted the hardhips of tranflanting, will grow in fuch fituations extremely falt, and arrive to a large bulk."

The propagation of the three next forts of trces may be performed two or three sways: 8. By the feeds. Thefe we receive, from the places where the trees grow, naturally, in the fpring. They thould be preferved in' fand; and as foon as they arrive, hould be fown in largith pots an inch deep. The foil for their recep. tion lhould be taken from a rich paflure at leat a year before, with the fward. It fhould allo be laid in a heap, and frequently turned, until the fuas 3 is grown roiten, and the whole appears well mixed and fine. If the palture from whence it was taken rear the furface is a fandy loan, thic is the beft compoll for the fe feeds; if not, a fmall addition of drift or fea fand fhould be added, and well mixed with the other mould. After filling the pots with this foil, the feeds fhould be fown an inch deep; and then they flould be plunged into common mould up to the rim. If the foil be naturally moin, it w' 11 keep them cooler, and be better; and if the place be well theltered and chaded, it will be better itill. Nothing more than weeding, which muft be conftantly obferved during the fummer, will be neceffiry ; and in this flation they may 1 tmain until the Mirch following : about the midule of which month, hiving prepared a good ho:-bed, the pots lliould be taken up and plunged therein. Soon after the feeds will come up: and when the young plants hove fufficientIy recived the benefit of this bed. they thould be inured by degrees to the open air. Wecimp, and watering wult be obferved during the fummer: and at the approach of the cold weather $1:$ the autumn, they Thould be reroored under a hotbod frame, or fiome
cover, is be protefed from the frofts during the winter. In the fring, when this danget is over, they Chorld refume their firll thation; namely, the pots fhould be plunged up to the rim, as when the feeds were firf fown; and if this place be well theltered, they may remain there all winter: if not, and fevere frofts threaten, they fhould be taken up and placed under cover as beforc. After they have been thus managed three years from the feeds, they flould be taken out of the pots with care, and planted in the nurfery ground at fimall ditances, where they may remain until they are flrong enough to be finally fet out. By lowing the feeds in puts, and affifting them by a hotbed, a year at leaft is foved; for they hardly ever come up, when fown in a natural border, under two years from the feeds; nay, they have been known to remain three, and even fome plants to come up the fourth year after fowing; which at once flows the preference of the former practice, and fhould caution all who have not fuch convenience, not to be too hafty in difurbing the beds when the feeds are fown in the natural ground ; as, efpecially if they are not well preferved in mould or fand, thefe may be fome years before they appear. Indeed, it is the long time we are in obtaining thefe plants, either by feeds, layers, \&c. that makes them at prefent fo very fearce amongt us. 2 . Thefe plants may alfo be increafed by layers; but very flowly; for they will betwo, and fometimes three, or even four years, before they have ftruck out good roots; though the benjamin tree is propagated the fafteft by this method. The young twigs fhould be haid in the ground in the autumn ; and it will be found that twinting the wire round the bud, fo as in fome degree to flop the progrefs of the Cap, and taking away witls a knife a little of the bark, is a more effectual method of obtaining good roots foon than by the ilit or twifting, efpecially wheri practifed on the faffafras tree. 3. Plants of thofe forts are likewife fometimes obtained by fuckers, which they will ar all times thro:v out, and which may be often taken off with pretty good toots; but when they are weak, and with bad roots, they thould be planted in pots, and afififted by a modesate heat in a bed: with fich $m$ magement they will be good plants by the autumn, and in the fpring may lee planted out anywherc. \&. Cuttings of thele trees, when planted in a good bark bed, and duly watered, will alfo oftentimes grow. When this method is practifed, and plants obt ined, they muft be inured by degrrees to the open air, till they are hardy enough to be finally plarted out.

The Indian bay, the camphire, the avocado, and the cinnamon tree, require the treatment commun to greenhoufe plants; the latter, however, is tather a fove plant in this country,-Of its culture or propagation in its native places, no particular accuunt has been given by botanical writers; but it muft nuw becom" an important confideration with us, fince the in ind of Ceylor, where cinnamon chiefly grows, now belongs to Great Britain. Of the advantages promifed by this acquifition we are indebted for the firft accounts to Dr Wright in 1787 ; from whom alfo we learn, that its propagation is very ealy, and its culture requires little care, as more partirularly naticed below. Since that time, fome obfervations by Dr Dancer, relative to its cultivation, have appeared in the Tranlactions of the Society of Arts,

A N Y.
\&c. Thefe obfervations confirm, without adding any thing efiential to, the concife notice of Dr Wright. We are informed, that as the tree " puts out numerous fide branches, with a denfe foliage, from the very bottom of the trunk; this furnilhes an opportunity of obtaining plenty of layers, and facilitates the propagation of the tree, as it does not perfert its feeds in any quantity under fix or feven years; when it becomes lo plentifully loaded, that a fingle tree is futticient almoll for a culuny. It feems to delight in a locfe moill foil, and to require a fouthern afpect; the trees, thus planted, flourifhing better than others growing in loam, and not fo well expofed to the fun. When healthy, it is (from layers) of pretty quick growth, reaching in eight years the height of fifteen or twenty feet, is very fpreacing, and furnifhed with numerous branches of a fit fize for decortication. The feeds, however, are a long time in coming up, and the plants make fmall progrefs for the firl year or two." It is added, that "the birds appear to be very fund of the berries, and will probably propagate this tree in the fame way they do many others everywhere over the ifland; fo that in a thort time it will grow fpontaneoully, or without cultivation." The age for decortication, faid above to be eight years, it will be obferved, is different from that fpecified belo:v for the trees in Ceylon.

Evelyn fays, he has feen bay trees near 30 feet high, and almoft two feet in diameter ; and enumerates the bay amonglt ufful trees. Hanbury catches at this idea, and tells us in general terms, that "it will grow to 30 feet in height, with a trunk of two feet in diameter;" and accordingly he arranges it among his foreft trees: he acknorledges, however, at the fame time, that the wood is of little value. The bay is neverthelefs a fine aromatic and a beautiful evergreen: It is faid to be the true laurus or laurel of the ancients, with which they adorned the brows of their fuccefsfu] generals. Like the holly, box, and laurel, the bay will bear the flade and drip of taller trees; and it is, upon the whole, a very defirable, as bcing a very ornamental, evergreen.

The leaves and berries of this tree have a moderately ftrong aromatic fmell, and a warm, bitterifl, pungent tafte: the berries are ftronger in both refpects than the leaves, and afford in diftillation a larger quantity of cflentid] aromatic oil ; they yield alfo an almoft infipid vil to the prefs, in confequence of whichs they prove unctuous in the mouth. They are warm carminatives, and fometimes exlibited in this intention againft flatulent colics, and likewife in hyfterical diforders. Their principal ufe in the prefent practice is in glyfters, and fome external applications. The deciduous bay, in a moift rich foil, in which it principally delights, will grow to be about 16 feet high; but in fome foils, that are poffefied of the oppofite qualities, it will hardly arrive at half that height. The flowers are fucceeded in May by lange red berries, uhich never ripen in England: fo that, notwithtanding the leaves in fummer are very pretty, and the colour of the bark makes a variety in winter, it is prin. cipatly the fcarcity of this plant which makes it valuable.

The benzoin tree will grow to a much larger fize than the other, and its branches are more numerous.

They are fmooth, ard of a fine light green colour. The leaves on their upper furface are frooth and of a fine light green colour, but their under furface is venole, and of a whitith calt. When bruifed, they emit a fine fragrance. This tree was formerly miftaken for that which produces the drug called lenzoin; which is now known to be obtained from a fpecies of ftyras.

The faflafras will grow to ncarly the height of the others, though the branches are not fo numerous. Its bark is finooth, and of a red colour, which beautifully diftinguilhes it in winter; whill the fine fhining green of its leaves conflitutes its greatef beauty in fummer. In thefe, indeed, there is a variety, and a very extraordinary one. Some are large and of an oval figure; others are fmaller, and of the fame flape; whilf others again are divided into three lobes, fo as to refemble the leaves of fome forts of the fig tree. In America, the faffafras generally ftands fingle in the rroods, and along the fences round the fields. It flowers in May before the leaves come out; and being entirely covered with them, it is diftinguifhed at a great diftance by their beantiful yellow colour.

The root of the faffifras has a fragrant fmell, and a fweetifh, aromatic, fubacrid talte: the bark taftes much ftronger than any other part, and the fmall wigs ftronger than the large pieces. It is a warm aperient and corroborant, and frequently employed with good fuccefs for purifying and fiveetening the blood and juices. For thefe purpofes, infutions made from the ralped root or bark may be drank as $t \cdot a$. In fome conflitutions indeed, fuch liquors are, by their fragrance, apt, on firft taking them, to affect the head; but in fuch cales they may be advaritageoufly freed from their flavour by boiling. A decoation of faff:fras, boiled down to the confiftence of an extract, proves fimply hitterift and fabaftringent. Hoffman allures us, that he has frequently given this extradt to the quantity of a fcruple at a time, with remarkable fuccefs, for itrengthening the tone of the vifcera in cachesies; as alfo in the decline of internittent levers and in hypocl:ondriacal fafme. Safiafras yields in difillation an extremely fragrant oil of a penetrating pangent tafte, fo ponderous (notwithfanding the liphtrefs of the drug itfelf) as to fink in water. Rectified fpirit extracts the whole tafte and fmell of faffafras; and elevates nothing in evaporation: hence the fuirituous extraft proves the mof elegant and elficacious preparation, as containing the virtue of the root entire.

The bark of this tree is uf-d by the women in Pennfylvania and other parts of North America in dycing worted a fine lafing orange colour, which does not fade in the fun. They ufe urine inttead of alnm in dyeing; and boil the dye in a brafs boiler, becaufe in an iron veffel it does tot yield fo fine a colour. The wood is made ufe of for polts belonging to the enclofures, for it is faid to lafl a long time in the ground: but it is likewife faid, that there is hardly any kind of wood which is more -ttacleed by worms than this when it is expufer to the air without cover; and that in a fhort time it is quite worm-eaten through and through. On cutting fome part of the fillifras trec, or its finots, and holding it to the nofe. it has a frone but pleafant fraell. Some people peel the root, and boil
the peel with the beer which they are brewint, becaufe they believe it wholefome. For the fune reafon, the peel is put into brandy either whilf it is dintilling or after it is made. Profeffor Kalm informs us, that a decoettion of the root of fafiafras in water, drank every morning, is ufed with fuccefs in the droply. When part of a wood is deftined for cultivation, the faffafras trees are commonly left upon it, becaule they have a very thick foliage, and afford a cool thade to the cattle during the great heats. Some people get their bedpoits made of faflafras wood, in order to expel the bugs; for its ftrong fcent, it is faid, prevents thofe vermine from fetting in them. For two or three years together this has the defired effeet, or about as long as the wood keeps its ftrong aromatic fmell ; but after that tine it has betn obferved to lofe its effect. In Pennfylvania fome people put chips of fafifafras into their chells, where they keep all forts of woollen ftuffs, in order to expel the moths (or larvx of caterpillars of moths or tinies) which commonly futtle in them in fummer. The root keeps its fmelt for a long while: Profeflor Kalm faw one which had lain five or fix years in the drawer of a table, and fill preferved the ftrength of its feent. The people alfo gather its flowers, and ufe them as tea.

The perfen, or alligator pear-tree, is cultivated univerfally in the Well Indies by all ranks of poople. The fruit is pear-flaped, and from one to two pounds in weight. On removing a green flin or covering, we come to a yellow butyraceous fubrance; and in the heart find a large round feed or tlone, which is unequal in the furface, and exceedingly hard and woody. This fruit is ripe in Augult and September, and confitutes one of the molt agreeable articles of diet for fix or eight weeks to the negroes. Thefe pears, with a little falt and a plantain or two, afford a hearty meal. '1lley are alfo forved up at the tables of white people as choice fruit. When the peat is ripe, the yellow or eatable fubfance is firmer than buttcr, and tailes fonsewhat like butter or marrow: hence it is called by fome the evegtable marrow. But however excellent this fruit is when rupe, it is very dangerous when pulled and eaten before maturity. Dr ifright Gays, he has repeatedly known it to produce fever and dyfentery, which were removed with difficulty. The leaves of this tree and thofe of the bead vine or wild iifquorice are made into pectoral decuetions by the commun people. The large itune is ufed for marking linen. The cloth is ried or held over the fione, and the letters are pricked out by a needle through the cloth and into the feed. The flain is a reddihh brown, which never wathes out. - The buids of the alligator tree are faid to be ufed with fuccefs in prifans againft the venercal difeafe. An infufion of them in water, diank in the morning fafting, is frongly recommended for diflodg. ing coagulated blood in the ftomach produced by a fall or a levere Atroke on thia important entrail. "The wold buars in the E it Indies (i..ys Labat) eat greediiy of the mammees and avocado peats, which give their flefh a luftious and mont agreeable favour.

Cafina. The burk of this fecies is known in the flops by the nume of calfia lignea. This bark, which is imporied from differ 't yeis of the E \& Indies and from China, has a wery niar refem'latece to the cinnamon; though diftinguid ble from it by being of a
thicker and coarfer appearance, and by its breaking flort and fmooth, while the cinnamon breaks fibrous and Thivery. It refembles cinnamon fill more exactly in its aromatic flavour than in its external appearance; and feems only to differ from it in being fomewhat weaker, in abounding more with a vifcous mucilaginous matter, and in being lefs aftringent. Accordingly, it has not only a place in the Edinburgh Pharmacopœiz, but is alfo the bafis of a diftilled water. It is perhaps furprifing that the London College have given it no place in their litts. But although it does not enter their Pharmacopeia, yet we may venture to affert, that it will not be neglected by the apothecariea. At prefent it is very common with many of them to fubfitute the caffia in every cafe for the more expenfive article cinnamon: and indeed almof the whole of what is at prefent fold under the title either of fimple or fpirituous cinnamon water is entirely prepared from caffia; and not even entirely from the bark, but from a mixture of the bark and buds.

Cinnamon is the under bark of the cinnamomum. The bell feafon for feparating it from the outer bark, which is gray and rugged, is the fpring, when the fap flows in the greateft abundance. It is cut into thin flices, and expofed to the fun, and curls up in drying. The old trees produce a coarfe kind of cinnamon; the fice is in perfection only when the trees are not older than three or four years. When the trunk has been fripped of its bark, it receives no further nourifhment ; but the root is ftill alive, and continues to throw out frefh thoots. The fruit of the tree is Ghaped like an acorn, but is not fo large. Its feed, when boiled in riater, yields an oil which fwims at top, and takes firc. If left to cool, it hardens into a white fubflance, of which candles are made, which have an agrecable fmell, and are referved for the ufe of the king of Ceylon. 'The cinnamon is not reckoned excellent unlefs it be fine, fmooth, brittle, thin, of a yellow colour inclining to red, fragrant, aromatic, and of a poignant, yet agreeable tafte. The connoiffeurs five the preference to that, the pieces of which are lorg, but flender. That which comes to us is generally mixed with the caflad bark; but this laft is eafily diftinguifhed. Cinnamon fplinters in breaking, and has a roughnefs along with its aromatic Mavour; while the cantia breaks over (mooth, and has a mucilaginous talle. Cinnamon is a very elegant and ufeful aromatic, more grateful both to the palate and fomach than mof other fubfances of this clafs. By its aftringent quality it likewife corroborates the vifcera, dnd proves of !ereat fervice in feveral kinds of alvine fluxes, and immoderate dicharges from the uterus.

The cinnamon plant, with other valuable ones, was taken in a French flip 1 y Admiral Rodney in the lat war, and prefented by him to the affembly of Jemaica. Une of the trees was pitated in the butanic garden in St 'lhomas in the La' ; the other hy Hinton Eaft, Efq. in his nohle garden at the inct of the Llue Mountains. From the fe parent trees fome furdseds of ynung trees are already produced from layers and cuttirges, and difperfed ts diffeent iarts of the country, in all which it thrives luxuriantly with litale tomble: we may tierefore hope it will fonn be a valuathe arddition to our commerce. Upon companing the patso of the tree with the defeription and figure given hy Burman

A N
and other botanifts, it appears to be the real Ceylon cinnamon, and of the beft kind, called by the natives Rafle Coronde: but the fpecimens of bark taken put it out of all doubt, being, in the opinion of the beft judges, of an equal, if not fuperior, quality to any imported from India. The fmalleft bit of the bark, Dr Wright affures us, is quite a cordial. The cinnamon we have from Holland, he obferves, is often inert, and gives room to fufpee that it has been fubjected to a Лlight procefs in diftillation.

In regard to the trees growing in Jamaica, Dr Dan. cer informs us, in his paper already quoted, that st The beft cinnamon bark, according to the different trials I have made, is taken from the fmall branches, of about an inch diameter, the larger limbs not being fo eafily decorticated, and not yielding fo good or. fo ftrong a cinnamon. The fmaller twigs, or thofe that have not acquired a cineritious bark, are too full of $f_{3} p$ and mucilage, and have little aroma. It is the liber, or inner bark, that conftitutes the cinnamon; from which the two external barks muft be carefully and entirrly feparated, or they vitiate the flavour of the cimamon; to do which with dexterity, and to raife the bark from the wood, requires fome practice. The bark being feparated, the fmaller pieces are to be placed within the larger: which, by expofure to the fun or the air, prefently coil up, and require no further preparation. A dry feafon is the proper one for taking the baik; as it is found to be weakened after long or heavy rains. Cinnamon, though more retentive of its virtucs than any of the other fpices, yet requires to be protected when taken, from the air and moifture, by clufe packing in cedar chefts. The leaves of this tree, whether recent or dried, are fo ftrongly impreginated with an aroma, as to afford a good fuccedaneums for the bark both in cookery and medicine. Diftilled, they give an excellent fimple and fpirituous water, and an elfential oil. Powdered, they are a good aromatic fpecies, or marefchal perfume."

Camphor, though folid, is the effential oil of the lourus camphora; and is obtained from it by diftillation in the Eall Indics. (Sce the article Camphora).The tree is another of the captured plants given to the inhabitants of Jamaica; and, if cultivated with care, will allo l:e an uleful acquifation.

The Abhé Groffer informs us, that in China fome of thele trees are found above 100 cubits in height, and fo thick that 20 perfons cannot enclofe them. The tree is there called tchang; and it is faid that the trunk, when old, emits fparks of fire, but of fo fubtle a mature as not even to injure the hair of thofe whoare near it. Common camplire cofts only a penny the ounce at Pe-king ; but it is inferion to that of Borneo, in the judgmeat cuen of the Chinefe.

The manner in which fome authors bave fooken of camphire (the abbe obferves), gives us reafon to conclude that they have been entirely ignorant of the procefs employed to obtain this falutary gum. The camphire clues not drop to the earth, like the gums of certain tefinous trees, which are preferved by difchargines that part of their fuhfance which is too oily; nerither does it ciftil from the top to the botiom of the tree through an incifion made in it. The Chincfe would praklife this method could it be emplnyed with faccels; for it is very common in China to make fuct
kind
kird of incifions in refinous trees. The method ufed by the Chinefe for obtaining camphire is as fullows.They take fome branches frefh from the tchang, chop them very fmall, and lay them to fleep in fpring-water for three days and three nights. After they have been foaked in tbis manner, they are put into a kettle, where they are boiled for a certain time, during which they keep continually flirring them with a flick made of willow. When they perceive that the fap of thefe fmall chips adheres fufficiently to the flick in the form of white froft, they frain the whole, taking care to throw away the dregs and refufe. This juice is afterwards poured gently into a new earthen baion well varnifhed, in which it is fuffered to remain one night. Next morning it is fourd coagulated, and formed into a folid mafs. To purify this firlt preparation, they procure fome cath from an old earthen wall, which, when pounded, and reduced to a very fine powder, they put into the bottom of a bafon made of red copper; over this layer of earth they fpread a layer of camphire, and continue thus until they have laid four frata. The laf, which is of very fine earth, they cover up with the leaves of the plant fobo, or pennyroyal; and over the whole they place another bafon, joining it very clofely to the former by means of a kind of red earth that cements their brims together. The bafon thus prepared is put over a fire, which, mult be managed fo as to keep up an equal heat : experience teaches them to obferve the proper degree. But above all they mult be very attentive left the plafter of fat earth whicb keeps the bafons together fhould crack or fall off; otherwife the ipirituous part would evaporate, and ruin the whole procefs. When the bafons have been expofed to the neceffary keat, they are taken off and left to cool; after which they are feparated, and the fublimated campiaite is found adhering to the cover. If thi operat on be repeated two or three times, the camphire io found purce and in larger pieces. Whenever it is necelfary to ufe any quantity of this fubftance, it is pat between two earthen veffels, the edges of which are furrounded with feveral bands of wet paper. Thefe veffels are kept for about an hour over an equal and moderate fire; and when they are cool, the camphire is found in its utmoft perfection and ready for ufe. This metliod of procuring camphire, even from the heart of the tree, may be practifed in all feafons of the year; which would not be the cafe (our author oberve-), were it extrafied like other refinous fubfances that ouly duy: during a certain flort fpace of time. Befides, by lopping the branches of the camphire tree, lefs hurt is done to it than by making incilions, which are alxays hazardous.
799. Anacardium, or Caflew-nut, or Acajou. One fpecies; viz. occidentale. E. and W. Indies.

## 800. Panite.

> 8os. Plegorhiza.

One fecies; viz. adilringens. Chilf.

> Soz. Cassyta.

Two fpecies; viz. filiformis, corniculata. Egypt, E. Indies, S. Amcrica.

A N Y.

## Order II. trigyina.

803. Rheum, or Rhaćarl.

Eight fpecies; viz. rhaponticum, undulatum, pal matum, compactum, tartaricum, ribes, hybridum, leticorrhizum. Siberia, Levant, Tartary, India, China.

The rbeum palmatum, which is of the dock kind, grows fpontaneoufly in China, and endures the cold 6 of our own climate. Two forts of rhubarb are mat with in the fhops. The firlt is imported from Turkey and Ruffia, in roundilh pieces, freed from the bark, with a hole through the middle of each; they are externally of a yellow colour, and, on cutting, appear variegated with lively reddifh Areaks. The other, whicls is lefs efteemed, comes principally from China, in Iongith pieces, harder, heavier, and more compat than the foregoing. The firf fort, unlefs kept very dry, is apt to grow mouldy and worm-eaten; the lecorid is lefs fubjeet to thefe inconveniences. Somc of the more indufrious artifts are faid to fill up the worm holes with certain mixtures, and to colour the outfide of the damaged pieces with powder of the finer forts of rhubarb, and fometimes with cheaper materials; this is often fo nicely done, as effectually to impofe upon the buyer, unlefs he very carefully examines each piece. The marks of good thubarb are, that it be firm and folid, but not finty; that it be eafly pulverable, and appear, when powdered, of a fine bright yellow colour: that upon being chessed, it impart to the fpittle a faffron tinge, without proving llimy or mucilaginous in the mourb. Its tafte is fubacrid, bitterifh, and fomewhat aftringent; the froell lightly aromatic.

Rhubarb is a mild cathartic, which opcrates without violence or irritation, and may be given with lafety even to pregnant women and to children. In foms peofle, however, it always occafions fevere griping. Befides its purtative quality, it is celebrated for ato aftringent one. by which it Arengthens the tone of the ftomach and intectines, and proves ufeful in diartooa, and diforders procceding from a lexity of the libres. Rhubarb, in fusfance, operates more powerfully as a cathatic than any of the preparations of it. Watery tinclures purge more than the fpirituous ones; whild the latter contain, in greater proportion, the aromatic, antingent, and corrokorating vintues of the thubarb. The dofe, when intended as a purgative, is from a friuple to a dram or mure.

The Turkey rhubarb is, among us, univerfally preferred to the Eaft India fort, though this laft is, for fome purpofes, at leaft equal to the other; it is maniferly mive allringent, Lut has fomewhat lefs of an aromatic flavour. Tinetures drawn from both, with rcctified fpirit, have nearly the fame tafte; on diftilling off the menfruum, the extract left from the tinfure of the Eaft India rhubarb, proved confiderably the frongef. Tincy are both the produce of the fame climate, and probably the roots of the fame plant, taken up at different times, or cured in a different manner.

Rhubarb is now raifed in Britain equal to any that is imported.

The olficinal preparations of this drug are a watery
and a vinous infution, a imple and a compound tinctore. It is alfo an ingredient in different compofitions, fuch as the clixir ex aloc et rheo, the pillilice fomachice, and fome others.

## Order ifi. hexagynia.

So.4. Butomus, or Fiowering.rufo. Jne fpecies; viz. umbellatus.

* B.-Neither cows, horfes, fleep, fwine, or goats, umbellatus. will eat it. It is an ornamel to the banks of our rivers and marfly ditches. Europe.

## In the clafs Enneandria are

7 Genera, including 49 Species, of which one only is found in Britain.

CLASSIS X.

## DEC.ANDRIA.

## Ordo I. MONOGYNIA.

Sect. I. Flores polypetali irregulares.

So5. Sophora. Cor, papilion, vexillo adfeendente. Lomentum monilifonne.
806. Podalyria. Cot. papilion, vexillo adfendente. Legumen ventricofum polyfpermum.
807. Pultenaa. Cor. papilion. Alæ vexillo breviores. Legunen difpermum.
808. Anagyris. Cor. papilion, vexillo brevi recto. Carina alis longiore.

80g. Cercis. Cor. papilion. alis vexilliformibus. Nect. gland. ftyliformis, fub germine.

8ıг. Bauhinia. Cor. patens, unguiculata, adfcendens. Petala lanceolata.
81. Hymenea. Cor. fubxqualis. Legum. lignofum, pulpas farinofa.

S29. Myroxylon. Cor. petalo fupremo latiore. Legumer, 1-fipermum apice dilatatum.
812. Parkinsonia. Cor petalo infimo reniformi. I. gurn, terce, tortuofum.
815. Corsalpinia. Cor. petalo infimo pulchriore. Cal. lacinie insequalis. Leegum. compreffum.
823. Toluifera. Cur. petalo infimo majore. Cal. campenuliztus.
813. Cassta. Cor. inxzualic. Anth. roftrate. -Lomaitum planum.
814. Cubar. Cor. fubwqualis, petalis a deflexis. Legumen coriaccum ventricofum. Semina fubreniformi..

8ig. Guilanma. Cor. fubrequal. Calyci infidens. Legun rhombeum. Sem, offea.
817. Hyperampirera. Cur. fubaqualis. Legum•n 3 rals. Sem. alata.
837. Gifrtmera. Cor. fubaqualis. Cal. 4-partitus. Sam ron nu dianata.
951. Compini. Cor. fubiequalis. Bacex plures receptacula m 氏日: infertic.
82. Dictamive Cor. patula. Filam. pulveracea. C tpf. 5 , comex: Ce . Sem. arillata.
 dentatus. Capl. 5 loculares.

CLASS X.
DECANDRIA.

## Order I. Monogynia.

S. Cor. papilionaceous or buttertly-thaped. The flandard afcending. The lomentum bracelet-fhaped.
P. Cor. papilionaceous. The flandard afcending. A legumincus plant, bellied, maty-feeded.
P. Cor. papilionaceous. Wings florter than the ftandard. A leguminous plant, 2 -feeded.
A. Cor. papilionaceous. A fhort flraight ftandard. The keel of the wing long.
C. Cor. papilionaceous; with flanelard-fhaped wings. The glands of the nectary flyle-fhaped, under the germen.
B. Cor. expanding, clawed, afcending. Petals fpear-fhaped.
H. Cor. liearly equal. Leguminous, woody, with a farinaceous pulp.
M. Cor. with the laft leaf broader. Leguminous, 1. feedech, dilated at the extremity.
P. Cor. with the towelt petal kidney-flaped. Leguminous, tapering, twifted.
C. Cort. with the loweft petal beautiful. Cal. unequal fegments. Leguminous compreffed.
T. Cor, lowefl leaf larger. Cal. bell-fhaped.
C. Cor. unequal. Authers beaked. Lomentum nat.
C. Cor. nearly equal, with 2 leaves bent downwards. Leguminous, bark-like, bellied. Seeds nearly kidrey-flaped.
G. Cor. nearly cqual, fitting in the cal. Leguminous, diamond-llared. Secds bony, i. e. hining.
II. Cor, nearly equal. Leguminous, $\hat{3}$-valved. Seeds winged.
G. Cor. nearly equal. Cal, 4-partitc. Seed-vcfiel 4 -winged.
G. Cor. nearly equal. Berries, feveral inferted in a large receptacle.
D. Cor. open. Filaments dufly. Capf. 5 conneहीed. Secds coated.
R. Cor, unequal, 3 -petaled. Cal. 5 -toothed. Capr. 5 cells.

Scet. II. Flores polypetali, aquades.
820. Cfnometra. Cal. 4 -plyyllus; lacin. oppof, ma. jor. Legum. i-fpermum, carnotum.
831. Prosopis. Cil. hemifphericus, 4-dentatus. Legum. polyfperirum.
818. Schotia. Cal. 5 -fidus, æqualis. Legum, compreflum, polyfpermum.
832. Cadra. Cal. 5 -fidus. Fetala obcordata. Le. gumen puly fiermum.
836. Adenantaera. Autheris glandula infidens.

Leg. comptelium membranaceum.
830. Inemitoxylon. Piftilli figma emarginatum.

Legumen valvis navicularibus.
839. Gilibertia. Nectar. tubulofum truncatum. Anthere fefiles. Capf. f-locularis.

84ว. Trichilia. Nectar. tubulofum, 5 -dentatum. Capf. 3 -loculatis, 3 -valvis. Sem. baccat?.
8.r. Turrasa. Nectar. tubulofum, 10-dentatum, Capl. 5 -cocca. Sem. binan
845. Melia. Nect. tubulofum, 10 -dentatum. Drupa nuce ro-localari.
842. Savdoricum. Neq. tubulofan, io-dentatum. Drupa nucibus 5.

8 4 3. Swietenia. Necto tubulofum, ro-dentatum. Capf. lignofa, 5 -valvis. Sem. imbricata, margine membranaceo.
819. Gualacum. Cal. lacinix 2 exteriores minores. Capf. carnofa, 3 f. 5 -locularis, angulat.a.
827. Ruts. Germen punctis 10 melliferis. Cap? 5-fida, 5 -loculais, polyfperma.
8ұ8. Tribulus. Pifilli fylus nullus. Capf. 5, connex: polyfiermx.
847. Fagonia. Cor ungues calyci inferte. Capf. 5-locularis, 10 -valvis, I-fperms.
846. Zygophyllum. Nect. fquame 10.flaminifere. Capf. 5-locularis, polyfperma.
850. Zwingera. Capf. 5, coriacex, non-dehifcenter.
349. Quassta. Capf. 5, bivalve, r.fpermx, inferre rectptaculo carn $\sqrt{\text { fo. }}$
861. Ceratopetalum. Cont. 5-petala, pinnatifida. Ca'. 5-fiduc, flaminiferus. Capho z-loculariso

S52. Thryallis. Cor. 5 -petala. Capf, tricocca.
\$35. Lixebergia. Cor. 4-petala. Bacca 5 -fperma.
85. Schousboed. Cor. 5 -petala calyci inferta.

Bacea infera 5 -gona monofperma.
826. Petaloma. Cor. 5 -petala inter calycis lacinias inferta. Bacca i-locularis.
853. Limonia. Cor. 5 -petala. Bacea 3 -fperma。
844. Conkia. Cor. 5 -petala. Pomum 5 -loculare, loculis monofpernis.
858. Heisteria. Cor. 5-petala. Drupa infidens ralyci colorato grandifacto.
859. Cuspualis. Cor. 5 -petala, calyci infidens filiformi.

* 854. Monotropa. Cal. corollinus, bafi gibbuc. Capl. 5 -locularis, monofperma.
* 872. Ceethra Piltilli flignata tria. Capfo j-locul. polyiperiua.
- 873. Pyroza. Anthera furfum bicornes. Capf. 5-locularis, polyfperma.

865. Lenum. Cor. plana, 5-partita. Caff. 5-locul. polyfperma.

Vol.IV. Part I.

## Sect. II. Flowers potypetalous, cqual.

C. Cal. f-leaved; largelt fegments oppofitc. Legu. minous, I-feeded, Reflyy.
P. Cal hemifpherical, 4 -toothed. Leguninour, many -feeted.
©. Cat. 5 -cleft, equal. Leguminous, compreffed, many-feeded.
C. Cal. 5 -eleft Petals heart-flaped reverfed. Leguminous, many fecded.
A. Gland fitting in the anthers. Leguminous, comprefied, membranaceous.
H. Stigma of the piftil notched at the end. Leguminous, with boat-fhaped valves.
G. Nectary tubular-lopped. Anthers fitting. Capf. 4 -celled.
T. Tubular nectary, 5 -toothed. Capf. 5 -celled, $3^{-}$ valved. Seeds berried.
'I'. Nectary tubular, 10 -toothed. Capf. 5 -cclled. Seeds duuble.
M. Neflary tubular, 10 -toothed. Drupe with a rocellent nut.
S. Nettary tubular, 10 -toothed. Drupe with 5 nutc.
S. Ne€ीary tubular, rotoothed. Cap?. woody, 5valved. Seeds tiled, with a membranous border.
G. Two outcr fegments of the cal. fmall. Capfo flehy, 3 or 5 -celled, angular.
R. Germen with so boney-bearing points. Capf. 5 -cleft, 5 -celled, many-feeded.
T. No fyle of the pillil. Capf. 5 , connected, manyfeeded.
F. Claws of the cor. inferted in the cal. Capr. 5 celled, 10 -valved, 1 -feeded.
7. Nectary of 10 thamen-bearing fcalcs. Capf. 5celled, many-fecdeds
7. Capl. 5, bark-like, not gaping.
Q. Capf. 5, 2-valved, I-fceded, inferted in a flolyy receptacle.
C. Cor. 5 -pstaled, wing-cleft. Cal. 5 -cleft, bearing the flamens. Capr. 2 -celled.
T. Cor. 5 -petaled. Capf. 3 -cellec.
E. Cor. 4 -petaled. Berry 5 -feeded.
S. Cor. 5 petals inferted in the calyx. Berry inferior, 5 gotl, 1 -feeded.
P. Cor. 5 petals inferted betwicen the fegments of the cal. Berry a-celled.
I. Cor. 5 -petaled. Berry 3 -feeded.
C. Cor. 5 retalcd. Apple 5 -celled, with 1 -feeded cell.
H. Cor. 5 -petaled. Drupe futting in the cal. coloured, enlarged.
C. Cor. 5 -petaled, fitting in a thead-flhape: cal.

* M. Cal. corol-like, bulging at the bafe. Capf. 5 celled, one feeded.
* C. 3 -ftigmas of the pifti]. Capl. 3 -celled, many. fecded.
* P. Anthers 2 -horned upwards. Capf. 5-celled, many. feeded.
L. Cor. flat, 5 partitc. Capf. 5 -culld, many feecied.

Z 855.
855. Diones. Cal. 5 -phyllus. Stigma fimbriatum. Capl. t-l cularis. Sim. bafi capfulx.
833. Nlurraya. Bacca i-fperma. Cor. 5 -petala. Nectarium margine cingens germen.
834. Bergera. Bacca 2 -fperma. Cot. 5-petala. Stigma turbratum.
862. Melastoma. Cor. calyci infidenso Anther. refrecto. B cca 2-locularis, calyce veftita.

S63. Merianla. Cor, calyci infidens. Antherre sefractro. Capl. 5 -locularis, diffepimentic contrariis. 856. Jussieva. Cor. 4 f. 5 -petala. Capf. infera.

ITis confundenda funt Rbexi \& nonnullic. Concocarpus racon:ofn. Combretum decandrum, alternifolizm. Yacquinia racemofa. Amyrir decandra. Gerania aliguat. Iythrum cordf lium, ciliatum. Melaniumo Grijleca tomentofa. Anacardium occidentale.

## Sect. III. Flores monopetali, aquales.

S22. Panzera. Petalum unicum laterale. Cal. 4-partitu:- Legumen.
825. Nicandra. Cor. tubulofa, iofida. Cal. 4fidu, inaqualis. Bacea 3-locularis.
823. Codon. Cor. campanulata, 10 -fida. Cal. 10-partitus. Capf. polyfperma.
875. Inocarfus. Cor. tubulofa, 5 -fida. Cal. 2. fidu:. Drupa x -1perma.
838. Strigilia. Cor. 5 -fida. Nectar. io-partitum. Fructus 6-locularis.

* 868. Andromeda. Cor, campanulata, rotunda. Capf. 5 -locularis.

867. Rhododendron. Cor. infundibulif. Stam. declinata. Câpl. 5-locularis.
868. Kalmis. Cor, limbo fubtus, 4 -corniculato. Capf. 5 -locularis.
869. Epiget. Cal. exterior, 3-phyllus. Interior 5 -phyllus. Capf. 5 -locularis.
870. Gualtheria. Cal. exterior, 2 -phyllus. Interior 5 -fidus. Capf. 5-locul. calyce baccato.

* 87 r. Arbutus. Cor, ovata, bafi diaphana. Bacea 5 -locularis.

874. Styrax. Cor.infundibulif. Drupa difperma.

Vaccinia nonnulla. Gardenia Thunbergia.

## Sect. IV. Flores apetali, feu incompleti.

860. Dars. Cor. 1-petala. Involucr. 4-phyllum, multhloruin.
861. Aquilaria. Cal. 5 -fidus. Nectar. 5 -fidum, lobis hifidic. Capf. 2-locularis, 2-valvis.
862. Augea. Cal. 5-partit. Neç. ro-dentatus. Capl. ro-locul.
863. Samyda. Cal. 5-partitus. Nectar. 10-fidum, cingens germen flaminiferum. C.pp. baccata, unilocularis, 4 -valvis.
864. Casearia. Ca]. 5 -phyllus. Nert. 5-plyylum, furolis cum filamentis alternantibus. Capf. baccats, $t$-locul. 3 -valvis.
865. Bucid. Cal. 5 -partitus. Bacca 1 -fperma.

82 i. Crudia, Call 4 -partitus, Cor. o, Samara

1. Cal. 5 -leaved. Stigma fringed. Capfo socelled. Seeds at the bafe of the capr.
M. Perry 1 -feeded. Cor. 5 -petaled. Neftary furrounding the germen with a border.
B. Berry 2 -feeded. Cor, 5 -petaled. Stigma turbaned.
M. Cor. fitting in the cal. Anthers bent back. Berry 2 -cellerl, covered with a cal.
M. Cor. fitting in the cal. Anthers bent back. Capf. 5 -celled, with partitions oppofite.
J. Cor. 4 or 5 -petaled. Capfo inferior.

Sect. III. Florvers I-petalous, equal.
P. One lateral petal. Cal. 4 -pattite. Legumi. nous.
N. Cor. tubular, so-cleft. Cal. 4 -cleft, unequal. Berry 3-celled.
C. Cor. bell-fhaped, 1o-cleft. Cal. 1o-partite. Capf. many-feeded.
I. Cor. tubular, 5 -cleft. Cal. 2 -cleft. Drupe 1feeded.
S. Cor. 5 -cleft. Nectary 10 -partite. Fruit $G$ celled.

* A. Cor. bell-fhaped, round. C3pf. 5 -celled.
R. Cor. funnel-flaped. Stamens bent downward. Capf. 5-celled.
K. Cor. with a border beweath. Capf. 5 -celled.
E. Exterior cal. 3-leafed. Interior 5-leafed. Capf. 5 -celled.
G. Exterior cal. 2 -leafed. Interior 5 -ckft. Capfo 5 -celled, with a berried cal.
* A. Cor. oval, with a tranfparent bafe. Berry 5celled.
S. Cor. funnel-flaped. Drupe 2 -feeded.

Sect. IV. Flozvers witbout petals, or incomplete.
D. Cor. I-petaled. Involucrum 4 -leafed, manyfluwered.
A. Cal. 5 -cleft. Neetary 5 -cleft, with cleft lobes. Capf. 2-celled, 2-valved.
A. Cal. 5 -partite. Nectary 10 -toothed. Capl. 10. celled.
S. Cal. 5 -partite. Neftary 10 -cleft, furrounding a germen bearing the ftamens. Capfo berried, i-celled, 4 -valved.
C. Cill. 5 -leafed. Neet. 5 -leafed, leaflets alternating with the filaments. Capf. berried, s-celled, $3^{-}$ valved.
B. Cal. 5 -partite. Berry 1 -feeded.
C. Cal. 4-partite. No cor. Seed-veffel round and flat.

## Decandria.

880. Coparyera. Cal. o. Cor. 4 -petala. Legumen 1 -fperinum.

Stellcra cbamejafime. Conocarpus racemofa. Forfo kolea.

## Ordo II. DIGYNIA.

* 890. Scleranthus. Cor.o. Cal. 5 fidus, inferus. Sem. 2.

885. Trianthema. Cor.o. Capfo circumfififa. * 886. Cbrysosplenium. Cor. o. Cal. fuperus. Cap!. 2-Ioculatis, 2-roftris.
886. Royena. Cor. r-petala. Cal. ventricofus. Capf. 4-fperma, 4-valvis.
887. Hyorangea. Cor. 5 -petala. Cal. $s$-fidus, fuperus. Capf. 2-locul. 2-roftris, circumfciffa.

* 887. Satifraga. Cor. 5 -petala. Cal. 5 -partitus. Capl: x-licularis, 2 -roftris.

888. Trarella. Cor. 5 -petala. Cal. corolliferus. Capf. bivalvis, altera majore.
889. Mitella. Coro 5-petala. Cal. corolliferus. Capf. bivalvis. Petala pectinata.
890. Cunonia. Cor. 5 -petala. Cal. 5 -phyllus. Capf. 2-locularis, acuta.
891. Gypsopitila. Cor. 5-petala. Cal. 5 -partit. campanulatus. Capf. i-locul. globofa.

* 892. Saponaria. Cor. 5 -petala. Cal. tubulofus. bafi nuduc. Capf. 1-locul. oblonga.
* 893. Dianthus. Cor. 5-petala. Cal. tubulofus, bafi fquamofus. Capfo 1 -locul, oblonga.

## Ordo III. TRIGYNIA.

goo. Brunnichia. Capfo 1-fperma. Cor.o. Calo 5 -fidus.

* 897. Arenaria. Capfo relocul. Pet. integra, patentia.
* 896. Stellarla. Capf. f-locul. Pet. 2 partita, pat mid.

899. Deutzia. Capf. 3.locul. 3-roftrata. Pet. in ${ }^{\circ}$ еда.

* 894. Cucubalus. Capf. 3-locul. Pet. bifida, fauce nuda.
* 895. Stlene. Capf. 3-locul. Pet. bifida. fauce coronata.

## * 898. Cherleria. Capf. 3-locul. Nectar. peta-

 loidea calyce mirora.901. Garioella. Capf. 3, diftinctx. Pet. calycina. Neelar. hilabiata.
902. Erythroxylon. Drupa e-fperma, Pet. bafífquama inttructa.

902 . Malpighta. Drupa 3-fperma. Pet. 5, unguiculata. C.I. glanduloius.
903. Banisterla. Samare 3, unialatre. Pet. 5, unguiculata. Cal. glandulofus.
904. Hirea. Samare 3, alis binis oppofitis, fo ala circumdtate. Pet. 5, unguiculata. Cal. eglandulofuc.
905. Triopteris. Samaræ 3,3f.4-alatx. Pet. anguiculata. Cal. glandulofus.
C. No cal. Cor. 4 -petaled. Leguminous, r -feed. ed.

## Order II. DigYNia.

*S. Nocor. 5 -cleft, inferior. Seeds 2.
T. No cor. Cal. cut round.

* C. No cor. Cal. fuperior. Capf. 2-celled, with 2 beaks.
R. Cor, x-petaled. Cal. buiging. Capf. 4 -feeded, 4 -valved.
H. Cor. 5 petaled. Cal. 5 -cleft, fuperior. Capf. 2-celled, 2 -heaked, cut round.
* S. Cor. 5 -petaled. Cal. 5 -partite. Capro 2-celled, 2-beaked.
T. Cor. 5 -petaled. Cal. beazing the cor. Capf. 2 valved, unequal valves.
M. Cor, s-petaled. Cal, bearing the cor. Capfo z-valved. Petats comb ihaped.
C. Cor. 5 -petaled. Cal. 5 leafed. Capfo 2-celled, acute.
G. Cor. 5 -petaled. Cal. 5 -partite, bell-fhaped. Capf. i-celled, globular.
* S. Cur. 5 -petaled. Cal. tubular, nalked at the bafe. Cipf. 1 -celled, oblong.
* D. Cor. 5 -petaled. Cal. tubular, foaly at the bafe. Capf. I-celled, oblong.

## Order III. TRIGYNIA.

B. Capf. $r$-feeded. No cor. Cal. 5 -cleft.

* A. Capf. 1-celled. Petals entire, expanding.
* S. Capf. r-celled. Pet. 2-partite, expanding.
D. Capf. 3-celled, 3 -beaked. Petals entire.
* C. Capf. 3 -celled. Pet. z-cleft, with a naked mouth.
* S. Capf. 3-celled. Pet. 2-cleft, with a crowned mouth.
* C. Capf. 3 -celled. Nectary petal-like, lefs than the calyx.
G. 3 diftinet capfules. Petals cup-like. Nectary 2-lipped.
E. Drupe 1 -feeded. Pet. at the bafe, fcaled.
M. Drupe 3 -feeded. Petals 5, clawed. Cal. glandular.
B. Seed-veffels 3, one-winged. Pet. 5. clawed. Cal. glandular.
H. Seed-vefiels 3, pairs oppofite, or furrounded with a wing. Pet. 5 , clawed. Cal, not glandular.
T. 2 feed-veffels, 3 or 4 -winged. Petals clawed. Cal. glandular.

## Orno IV. PENTAGYNIA.

911. Onestis. Capf. 5, monofpermæ. Cor. 5 petala.

* 912 . Cotyledon. Capf. 5 ad neetaria. Cor. I. petala.
* 913. Sedum. Capr. 5 ad nectaria. Cor. 5-petala.

914. Penthorum. Capf. 5-loba. Cor. fetala raviord.
915. Bergia. Capf. 5-locul. 5 -valvis; valvis horizontaliter defcendentibus.
916. Ionquetra. Capf. i-locul. 5-fperma. Pet. integra. Cal. 5-phyllus.

* 922. Spergula. Capf. 1-locul. polyfperma. Pet. integra. Cal. 5 -phyllus.
* g2i. Cerastium. Capf. i-locul. Pet. 2-fida.

Cal. 5-phyllus.

* 919. Agrostemma. Capf. i-locul. oblonga. Cal. tubulofus, coriaceus.
* 920. Lexchis. Cap. 3-locul. oblonga. Cal. tubulofus, membranaceus.
* 918. Orazas. Capf. 5-lucularis, angulata. Cur. bafi fubcoharens.

9ro. Roberghta. Drupa nuce i-loculari. Cal. I-phyllus.
009. Spondias. Drupa nuce 5-loculari. Cal. Iphyllus.
207. Averhoa. Pomum 5-loculare. Cal. 5phyllus.
917. Gkielum. Sem. 5 diftineta mutica. Cor. 5petala. Styli nulli.

9i6. Suriana. Sem. 5, fubrotunda. Cor. 5-petain. Styli filiformes, laterales.

Adoxia. Coriaria. Gerania. Drofera Lufitanica.

## Ordo V. DECAGYNIA.

223. Neurada. Cil. 5-partitus. Cor. 5-petala. Capf. 10-cocca.
224. Phytolacca. Cal. 5-plyylluc, corollines. Cor. nulla. Bacca 10-cocca.

Order IV. pentagyinia.
O. Capf. 5, one-fecdec. Cur. 5 petaled.

* C. Cap!. 5 to the nectaries. Cor. I-petaled.
* S. Capf. 5 to the nectaries. Cor. 5 -petalcd.
P. Capf. 5 -lobed. Petals rare.
B. Capf. 5 -celled, 5 -valved, the valves horizontally defcending.
I. Cap!. 1-celled, 5 -feeded. Petals entire. Cal. - 5-leafed.
* S. Capf. 1-celled, many-feeded. Pet. ertite. Cal. 5-leated.
* C. Capf. 1-celled. Pet. 2-cleft Cal. 5-leafed.
* A. Capf. i-celled, oblong. Cal. tubular, bark-like.
* L. Capf. 3 -celled, oblong. Cal. subular, membranaceous.
* O. Capf. 3 -celled, angular. Cor. adhering to the bafe beneath.
R. Drupe, with a r-celled nut. Cal. 1-leafed.
S. Diupe, with a 5 -celled nut. Cal. 1-leafed.
A. A 5 -celled apple. Cal. 5 -leafed.
G. 5 diftinćt awnlefs feeds. Cor. 5-petaled. Na Ayles.
S. Seeds 5, nearly round. Cor. 5 -petalcd.

## Order V. decagyNiA.

N. Cal. 5 -partite. Cor. 5 -petaled. Capf. 10 -celled.
P. Cal. 5-leafed, corol-like. Cor. nonc. Berry $10 \cdot \mathrm{ccllcd}$.

## Order I. MONOGYNIA.

805. Sophora.

Nine fpecies; viz. tetraptera, microphylla, havefcens, alopecuroides, tomentofa, occidentalis, japonica, heptaphylla, monofperma. Levant, Africa, W. Indies, New Zealand.

## 806. Podalyria.

15 fpecies; viz. capenfis, aurea, argentea, genifloides, ternata, auftralis, tinctoria, alba, lupinoides, rifoliata, calyptrata, bifora, myrtillifolia, hirfuta, buxifolia.
807. Pultenea.

Six fpecies; "vi\%. Ripularis, paleacea, Linophylla, juncea, villofa, dapbroićcs.
808. Anagyris, or Stinking-bean Trejoil.

One fpecies; viz. foetida. Spain, Italy.
809. Cercis, or Yurdas-tree.

Two fpecies; viz. filiçuaftrum, canadenfis.
S. Europe, Levant, N. America.

8ic. Bauhinia, or Mountain Ebony.
15 feccies; viz. fcandens, parviforum, racemofa, aculeata, divaricata, aurita, porrecta, ungulata, variegata, candida, purpurea, tomentofa, acuminata, gujanefis, rubefcens. Egypt, E. and W. Indies.
811. Hymenea, or Lacul-trec.

Three fpecies; viz. courbaril, renofa, verrucofa. Weft Indies.
812. Parkinsonia, or Jcrufalem Thorn.

Onc feccies; viz. aculeata. Weft Indies.

Sî. Cassia, o: Whi Suna.
57 fpestes; viz. diphylla, abfue, vimilica, bacilfa: is, tagera, tora, bicaplularis, emarginata, obtuffolia, fennoides, acuminata, corymbofa, longifiliqua, falcata, fervicea, occidentalis, planifiliqua, patula, lineata, atomaris, pilof, arhorefcens, 「emm, rufifolin, billora, chinentis, multiglandulofa, hirfuta, tomentofa, ferpens, mexicana, angutifolia, liguftrisa, tlorida, fipulacea, alata, marilandica, falligita, frondofa, tenuifima, virgata, f.phera, braiteata, auniculata, brevifolia, mullis, javinica, grandis, nigricaus, polyphyll. chamecriith, glimdulofa, nimofoides, microphylla, flexunfa, capenfis, litula, mictitans, procumbens. Egypt, Eatt and Weft falies, America.
The frui: of the caffir fipula is a cylindrical pod, fearcely an inch in diaineter; a foot or more in length. The outfle is a hard brown bark: the inlide is divided by thin tranfverfe woody plate, covered with a loft black pulp, of a fweetill talle, with lume degree of acrimory. There are two forts of this drug in the Mops; one brought from the Eaft Indies, the other from the Weft : the canes or pods of the latter ate generally large, rough, thick-rinded, and the pulp naufeous; thofe of the former are lefe, fmother, the pulp blacker, and of a fweeter tafte: this lort is preferred to the other. Such pods fiould be choien as are weighty, new, and do not make a rattliny noife (from the feeds being loofe within them) when flaken. The pulp fhould be of a bright Chining black colour, and a fueet talte, not harth, which happens from the fruit being gathered before it has growa fully ripe, or fourith, which it is apt to turn upon keepiag. It thould neither be very dry nor very moilt, nor at all mouldy, which from its being kept in damp cellass, or moitened, in order to increafe its weight, it is very fubject to be. Greatelt part of the pulp difiolves both in water and in rectified fierit, and may be extracted frona the cane by either. The flops employ water, boiling the bruifed pod thercin, and afterwards evaporating the folution to a due confiftence.

The pulp of caflia is a gentle laxative medicine, and frequently given, in a dofe of fome drams, in coftive habits. Some direct a dofe of two ounces or more as a cathartic, in inflammatory cafes, where the more acrid purgatives have no place; but in thefe large quantities it generally naufeates the ftomach, produces flatulencies, and fometimes gripings of the bowels, efpecially if the caffia be not of a very good kind: thefe effeets may be prevented by the aldition of aromatics, and exhibiting it in a liquid form. Some fay it does excellent fervice in the painful tenfion of the belly, which fometimes fullows the imprudent ufe of antimonials; and that it may be advantageoufly acuated with the more acrid purghtives or antimonial emetics, or employed to abate their force. Vallifinieri relates, that the purgative virtue of this medicine is remarkably promoted by manna: that a mixture of four drams of caflia, and two of manna, purges as much as 12 drams of caflia, or 32 of manna alone. Sennertus obferves, that the urine is apt to be turned of a green colour, by the ufe of callia, and fometimes, where a large quantivy has been taken, blackifh. This drug gives name to an onicinal clectuary, and is an ingredient alfo in another.

815. Cesalpista, or Brafílto.

Nine fpecies; bijuga, pulcherrima, elata, coriori, braflicofis, echinat?, lappan, crifta, minofoices. I. and W. Indies.
816. Guilindina, or Bompuc, or Nickar Trec.

Five fpeces; viz. boadue, bonducella, ruga, paniculata, axillaris. E. and W. Indies.

S17. Hyperanther i, or Mepbrific-wood.
Your tpecies; viz. decandra, moringa, femidecand:a, cochinchinenilis. Egypt, Ceylon, N. America.
818. Schotia.

One $\oint_{2}$ ecies; viz. §peciolis. C. of G. Hope.
Si9. Guabacum, or Lignum-vita, Pockwood.
Three fpecier; viz. dubium, oficinale, (ancturn. Africa, Cuina, W. Indies.

The wood of the guaiacum officinale is very ponderous, of a clofe compat texture; the outer part is of a yellow colour, the heart of a deep blackifh green, of varimgated with black, green, pale, and brown colours; the bark is thin, tmooth, externally of a dark grayilh hue: both have a lighty aromatic, biterifl, pungent tafle; the bark is fomewhat the weaketl. The refin, which exudes from incifions made in the trunk of the tree, is brought to us in irreguiar malies, ufitaliy friable, of a dulky greenifh, and fometimes of a seddita call, with pieces of the wood among them: its talle is more acrid and pungent than that of the wood or bark.

Their general virtues are thole of a warm fimulating medicine: they flengthen the fomach and other vifeera; and remaskably promote the utinary and cuticular dijcharge. Hence, in chtancous defedations, and other diforders, proceeding from obltrutions of the excretory glands, and where floggith ferons humaurs abound, they are cminently ufefol ; rhsumatic and other pains have often been relieved by them. They are alfo laxative. The relin is tlee molt ative ot thefe drugs; and the efreacy of the others depends upon the quantity of this part cortained in them. The refin is extracted from the wood in part by watery liquors, but much more effectually by firituous oner. The watery extract of this wood kept in the noops, proves not only lefs in quantity, but confiderably weaker, than one malle with fpirit. This laft extrat is of the fime quality with the native refin, and differs from that brought to us only in being purer. The gum or extrats, are given from a few grains to a fcruple or half a dram; which laft dofe proves, for the molt part, confiderably purgative. The olticinal preparations of guaiacum are, an extract of the wood, a folution of the gum in rectified 「pirit of wine, and a folution in volatile firit, and an empyreunatic oil dintilled from. the wood.

Guaiac, in form of decoction, has been faid to cure the vencreal difeafe; and in this country it is frequently ufed as all adjuvant to mercury. The refin, dilfolved in rum, or combined with water by means of raucilage or the yolk of egrgs, or in the form of the volatile tiacture or elixir, is much employed in gout and chronic theumatifm. The in there or elixir has bee:at
been given to the extent of half an ounce twice a-day, and is fometimes ufefully combined with laudanua.
820. Cynometra.

Two fpecies; viz. cauliflora, raniffora.
821. Crudia.

Two feecies; viz, fpicata, aromatica. Guiana,
822. Panzera.

One fpecies; viz. falcata. Carolina.
823. Codon.

One fpecies; viz. royeni. C. of G. Hope.
824. Dictamnis, nr Fraxinella, White Dittany.

Oue fpecies; viz. albus. Germany, Fiance, ltaly.
The diEtamnus altus grows wild in the mountainous parts of France, Italy, and Germany. From thence the cortical part of the root, in a dry flate, rolled up in little quills, is fometimes brought to us. It is of a white colour, of a weak, not very agreeable fmell, and of a durable bitter, lightly pungent tafle, It bas been recommended as an alexipharmac, a tonic, and an anthelmintic; but it is very feldom ufed, and has no place in the London Pharmacoposia.

8z 5. Nicandra.
One fpecies; viz. amars. Guiana.

## 826. Petaloma.

Two fpecies; viz. myrtilloides, muriri, Weft In dies, Guiana.

## 82\%. Ruta, or Rue.

Seven fpecies; viza graveolens, montana, chalepen. fis, pinnata, patavina, linifolia, fruticulofa, S. Eu* rope, Africa.

The rala graveolens is a fmall Phrubby plant met with in gardens, where it tlowers in June, and holds its green leaves all the winter. We frequently find in the markets a narrow-leaved fort, which is cultitated by fome, in preference to the other, on account of its leaves appearing variegated during the winter with white flreaks.

Rue has a flrong ungrateful fmell, and a bitterifh penetrating tafte. The leaves, when in full vigour, are extremely acrid, infomuch as to inflame and blifter the K in if much handled. With regard to their medicinal wirtues, they are powerfully ttimulating, attemuating, and detergent. And bence, in cold phlegmatic habits, they quicken the circulation, diffolve tenacious juices, open obftructions of the excretory glands, and promote the fuid fecretions. The writers on the materia medica, in gencral, have entertained a very high opinion of the virtues of this plant. Boer. haave is full of its praifes; particularly of the dittilled oil and the diffilled water, cohoboted or re-diftilled feveral times from frefh parcels of the herb: atter fome.what extravagantly commending other waters prepared in this manner, he adds, with regard to that of rue, that the reate? commendations he can befow upon it fall thort of its merit. "What medicine (fays he) can be more eflicacious for promnting fweat and perfpiration, for the cure of the hylleric paffion and of epilepfies, and for expelling poifon." Whatever fervice rue may be of in the two laft cafes, it undoubted. ly bas its ufe in the others: the cohobated water, how. ever, is not the moff efficacions preparation of it. An extract, made by reftified fpirit, contains, in a fmal! compafs, the whole virtues of the rue; this men!ruum
taking up by infufion all the pungency and flavour of the plant, and elevating nothing in diffillation. With water its peculiar fivour and warmth arife; the bitternefs, and a confiderable fhate of the pungency, remaining behind.

The only officinal preparation of rue now retained in our pharmacopexias is the extract; but it is an ingredient in the compound powder of myrrh and fome other compofitions.

## 828. Tolvifera, or Balfam of Tolu tree.

One fuecies; viz. balfamum. Carthagena.
The toluifera balfamum fiows from a tree growing in Tolu in the Spanifh Weft Indies; from whence the balfam is brought to us in little gourd fhells, It is of a yellowifh brown colour inclining to red; in confift. erice thick and tenacious; by age it grows hard and brittle, without fuffering any great lofs of its more valuable parts. The fmell of this balfam is extremely fragrant, fomewhat refembling that of lemons; its tafte warm and fweetifh, with little of the pungency, and nothing of the naufeous relifh, which accompany the other balfams. It has the fame general virtues with the balfamum rahafiri, but is much milder; and for fome purpofes, particularly as a corroborant in gleets and feminal weakneffes, is fuppofed to be more efficacious.

## 829. Myroxylon, or Balfam of Peru.

Three Ipecies; viz. peruiferum, pedicellatum, fru* tefcens. Mexico, Peru.

The myroxylon peruiferum, as brought to us, is nearly of the confiftence of thin honey, of a xeddifh brown colour, inclining to black, an agreeable aroma. tic fmell, and a very hot biting tafte, Difilled with water, it yields a fmall cquantity of a fragrant effential oil of a reddifh colour; and in a flong fire, without addition, a yellowih red oilo

Balfam of Peru is a very warm aromatic medicine, confiderably hotter and more acrid than copaiva. Its principal effects are to warm the habit, to ftrengthen the nervous fyltem, and attenuate vifcid humours, Hence its ufe in fome kinds of aflhmas, gonorrheeas, dyfenteries, fuppreffions of the uterine difcharges, and other diforders proceeding from a debility of the folids, or a fluggillmefs or inagivity of the juices. It is alio employed externally for cleanfing and healing wounds and ulcers, and fometimes againft palfies and rheumatic pains.

This balfam does not unite with water, milk, exprefied oils, animal fats or wax; it may be mingled in the cold with this laf, and likewite with the febaceous fubfance called exprefled oil of mace; but if the nixture be afterwards liquefied by beat, the balfam fe parates and falls to the hottom. It may be mixed with water into the form of an emulfion, after the fame manner as the balfam of Copaiva, Alkaline lixivia diffolve great part of it; and rectified lpirit the whole.

It is an ingredient in feveral oflicinal compofitions, in fome of which it has rather a bad than a good effect.

There is another fort of balfam of Peru of a white colour, and confiderably more fragrant than the for mer. This is very rarely brought to us. It is faid to be the produce of the fame plant, which yields the common or black balfam, and to exude from incifions
made in the trunk；while the former is alleged to be obtained by boiling．Befides the white，there is alfo $\beta$ third kind，commonly called the red or dry．This is fuppofed to obtain a different flate from the white， merely in confequence of the treatment to which it is fubjected，after it is got from the tree．In its fra－ grance it in fome degree approaches to the balfam of Gilead，held in fo high efteem among the eaftern na－ tions；but it is very rarely in ufe in Britain，and al－ molt never to be met with in our fhops．

## 830．Hematoxylon，or Logzood．

One fpecies；viz．campechanum．Campeachy，$S$ ． America．－This fpecies is bruaght chiefly from Cam－ peachy in the bay of Honduras．It is ufually in large loge，very compact and hard，of a red colour，and an aftringent fweet tafte．It has been for a long time uled by the dyers，but not till very lately as a medi－ cine ；a decoction of it，and the extract，are in ufe in our hofpitals，and laid to have proved very ferviceable in diarrhes．It frequently tinges the flools，and fome－ times the urine．The extract is now received into the flops，and it is found to be a very ufeful aftringent．

Four fpecies ；viz．＊officin！e，nrandiolium，benzoins lxvigatum．Italy，Lcvant，S，Carolina．

The $\Omega_{y r a x}$ officinale is an cdoriferous refinous fub－ fance，exuding from a trec growing in the warmes climates．

It has been cuftomary to dilinguifh three forts of forax，though only one is ufually met with in the flops．

8．Styrax calamita，or Storex in the cane ；lo cailed from its having been formerly brought inclofed in receds from Pamphylia．It is cither in fmall diftinct tears，of a whitifh or reddifh colour，or in larger maffes cum－ pofed of fuch．

2．Storax in the lump，or red forax．This is in m．afics of a uniform texture，and yctlowifh ated or brownifh colour；though fometimes，likewife，inter－ fperfed with a few whitifl grains．Of this fort，there has been fome lately to be met with in the flops，un－ der the name of furas in the tear．

3．The common thorax of the Thops，is in large maffes， colfiderably lizhter and lefs compatt than the fureguz ing；it appears upon examination，to be compofed of a refinous juice，mixed with 「aw－duff．For what pur－ pofe this addition is made，it is difficult to fay；but it can frarcely be fuppofed ta be done with any fraudulent view，fince the f．w－dult appears at fight．This com－ mon florax is much lefs effecmed than the twa birlt forts；hough，when freed from the woody matter，it preves fuperiur in puint：of fragrance to eitleer of them．

Keflifed firit，the common menfrumm of refins，dif－ folves the florax，leaving the wood behind；nor does this tiricture lofe confiderably of its valuable part．，in being infpifatced to a folid confiftence；whilf aqueous liquors elevate almoft all the fragrancy of the florax．

Storax is one of the mof agreeable of the odori－ ferous refins，and may be exhibited to great advantage in languors，and debilities of the nervous fyftem；it is not，however，much ufed in common pratice．

875．Inocarpus．

One fpecies；viz．ovata．Weft Indies．
879．Augea．
One fpecies；viz．capenfis．
880．Copalfera，or Balfam of Capivi trec．
One fpecies；viz．officinalis．Brazil，Antilles．
The tree which produces this ballam，is a native of the Spanih Welt India illands，and of fome parts of the continent of South America．It grows to a large fize， and the balfamum copaiva Hows，under the form of a sefinous juice，from incifions made in the trunk．

The juice is clear and tranfparent，of a whitih or pale yellowifh colour，an agreeable fmell，and a bit－ terih purgent tafte．It is ufually about the confiftence of oil，or a little thicker；when long kept，it becomes nearly as thick as honey，retaining its clearnefs；but has not been obferved to grow dry or folid，as moft of the other refinous juices do．We fometimes meet with a thick fort of balfam of copaiva，which is not at all tranfparent，or much lefs fo than the foregoing，and generally has a portion of turbid watery liquor at the bottom．This fort is probably either adulterated by the mixture of other fubftances，or has been extracted by coction from the bark and branches of the tree；its fmell and tafte are much lefs pleafant than thofe of the genuine b．Jfam．

Pure balfam of copaiva diffolves entirely in reatifed fpirit，efpecially if the menfluum be previoufly alka－ lized；the folution has a very fragrant fmell．Diftil－ led with water，it yields a large quantity of a limpid effential oil，and in a ftrong heat，without addition，a blue oil．

The balfam of copaiva is a ufeful corroborating de． tergent medicine，accompanied with a degrec of irrita． tion．It ftrengthens the nervous fyftem，tends to loo 有 the belly；in large dofes proves purgative，promotes urine，and cleans and heals exulcerations in the urimary paffages，which it is fuppofed to perform more effectual． ly than any of the other balfams．Fuller obferves，that it gives the urinc an intersfly bitter tafle，but not a violet fmell，as the turpentines do．

This balfam has been principally celebrated in gleets and the fluor albus，and externally as a vulnerary，－ Vol．IV．Part I．

The author above－mentivied recommends it likewife in dyfenteries，in fcorbutic caclexies，in dife．fes of the breall and lunge，and in an acrimonions or putrefent Aate of the juices：he fays，he has known very dan－ gerous conghs，which manifefly threatencd a confunp－ tion，cured by the ufe of this balfam alone；and，that notwithtanding its being hot and bitter，it has good effects，even in he alic cafes．Moft phyficians feem now， however，to confider balfams and refins too fimulant to be ventured on in phthifical affections．

The dofe of this medicine rarely excceds 20 or 30 drops，though fome direat fixty，or more．It may be conseniently taken in the form of an elxofaccharum， or in that of an emulfion，into which it may be reduced by triturating it with almond，or rather with a thick nucilage of gumarabic，till they are well incorporated， and then gradually adding a proper quantity of water．

are faid to receive the vapour arifing from a decoction of it into their mouths to cure the toothach. Goats and theep eat it ; cows refule it.
ferennis. * S. cal. fegments blunt, clofed when the fruit is sipe. -The Polifh cochineal (coccus polonicus) is found upon the roots in the fummer months.
891. Gypsophila.
${ }_{13}$ fpecies; viz. repens, prolltata, paniculata, vifcofa, adiceudens, altifima, arenaria, Atruthium, fafligiata, perfoliata, muralis, rigida, faxifraga. Europe.

## 892. Saponaria, or Soap-quort.

Nine fpecies; viz. * officinalis, vaccaria, cretica, Forrigens, illyrica, ocymoides, orientalis, lutea, bellidifolia. Europe.

The faponaria officinalis grows wild, though not very common, in low wtt places, and by the fides of running waters; a double-flowered fort is frequent in our gardens. The leaves have a bitter not agreeable tatte; agitated with water, they raife a faponaceous froth, which is faid to have nearly the fame effects with folutions of foap itfelf in taking out fpots from clothes and the like. The roots tafte fweetifh, and fomewhat pungent, and have a light fmell like thofe of liquorice ; digefled in redified fpirit, they yield a frong tincture, which lofes nothing of its tafle or flavour in being infpiflated to the confiftence of an extract. This elegant root bas not come much into practice among us, though it promifes from its fenfible qualities to be a medicine of corfiderable utility. It is much efteemed by the German phyficians as an aperient, corroborant, and fudorific, and preferred by the college of Wirtemberg, by Stahl, Neumann and others, to farfaparilla.

## 893. Dianthus, or Pint, Carnation.

32 fecies; viz. * barbatus, carthufianorum, atrorubens, ferrugineus, * armeria, japonicus, * prolifer, diminutus, * caryophyllus, fylveftris, pomeridianus, * deltoides, alben, crenatus, chinenif, monfpeliacus, libanotis, plumarius, crinitus, fuperbus, attenuatus, purgens, virgineus, arenarius, repens, * caefius, cefpitofus, icaber, alpinus, pumilus, arboreus, juniperinus. Europe, Cape, China, America.

Of the fpecies called caryopby/hus, or clove julyfouver, a great varicty is met with in our gardens; thofe made ufe of in medicine ought to be of a deep crimfon colour and a plealant aromatic fmell, fomewhat like that of cloves; many forts lave fearce any fmell at all. The caryopbylla rubra are faid to he cardiac and alexipharmac. Simon Paulli relates that he has cured many malignant fevers by the ufe of a decoction of them, which he fays powerfully promotes fweat and urine, without greatly irritating nature, and alfor raifes the fpirits and quenches thirft. At prefent the tlowers are chielly valued for their pleafant illavaur, which is entirely loft even by light coction; hence the college direct the fyrup, which is the only officinal preparation of them, to be made by infufion.

## Ordo III. TRIGYNIA.

804. Cucubalus, or Berry-Learing Cbickwed.

18 \{pecies; viz. "behen, fabarius, vitcolus, tlellatus, agypriacus, itali us, mult iflorus, fruticulofus, tartaricns, Ebuicus, catholicus, mollifinmes, *otites, parvitlorus,

A N Y.
reflexus, faxifragus, fpergulifolius, polygnoides. Europe, Egypt, North America.

* C. cal. nearly globular, fmooth, with a net-work of beben. veins; leaves egg-fpear-fthaped, glaucous, fmooth.-The leaves boiled have lomething of the Havour of peafe, and proved of great ufe to the inhabitants of the ifland of Minorca in the year 1685, when a fwarm of locufts had deflroyed the harveft. The Gothlanders apply the leaves to eryfipelatous eruptions.

> 8ys. Silene, or Iifgous Campion.

56 fpecies; viz. * anglica, lufitanica, * quinquevulnera, ciliata, fericea, notturna, gallica, cerafloides, mutabilis, chlorantha, * nutans, amœena, paradoxa, fruticoia, bupleuroides, longiflora, gigantea, craflifolia, viridiffora, * conoidea, * conica, bellidifolia, dichotoma, vefpertira, behen, ftricta, pendula, baccifera, * maritima, procumbens, * noctiflora, ornata, undulata, virginica, antirrhina, fedoides, apetala, subella, inapcrta, clandeftina, portenfis, cretica, mulcipula, polyphylla, * armeria, orci.idea, ægyptiaca, catefbei, cordifolia, chlorafolia, alpeftris, ruptlris, faxifraga, vallefia, pumila, * acaulis. Europe, Perfia, Africa, N. America.
896. Stellaria, or Greater Chickweed.

17 fpectes; viz. * nemorum, dichotoma, radians, bulbofa, * holoflea, * graminea, paluftris, craffifolia, aline, undulata, * cerafloides, multicaulis, humifufa, billora, greenlandica, atenaria, fcapigera. Europe, North America.

## 897. Arenarta, or Sandwort.

36 Species; viz. *peploides, tetıaquetra, biflora, lateriflora, * trinervia, cilista, balearica, multicaulis, * Terpillifolia, procumbens, polygonoides, triflora, montana, * rubra, * media, bavarica, gyplophiloides, cucubaloides, dianthoides, fasatilis, cæolpitofa, * verna, hifo. pidd, verticillata, * juniperina, * tenuifolia, * laricifolha, recurva; lanceolata, ftriata, filifolia, fafciculata, auftriaca, grandiflora, linitlora, ger。rdi. Europe.

## 899. Cherlerta.

One fpecies; viz. * fedoides. Alps of Auftria, Switzerland.

Four fpecies; viz. glabra, polyphylla, corniculata, trifolia. Ifle of Madagafcar.
912. Соtyledon, or Navel-wort.
${ }^{2}+$ 个pecies; viz. orbiculata, paniculata, fafcicularis, cuneata, fpuria, purpurea, teretifolia, cacalioides, reticulata, pupillaris, maniillaris, hemifpherica, triflora, coccinea, malacophyllum, ferrata, * umbilicus, * lutea, lanceolata, laciniata, alternans, nudicaulis, hifpanica, vilcofa. Sib. France, Spain, Cape, Eaft Indies.

## 913. Sedu:s, or Leffer Houfeleck, Stoncriop.

29 fpecies; viz. verticillatum, * telephium, anacampferos, divaricatum, aizoon, hybridum, populifolium, ftellatum, alfnefolium, сер:са, libanoticum, * dafyphyllum, * reflexum, virens, * rupeflre, faxatile, nuadrifidum, lifpanicum, lineare, coeruleum, * abbum, * acre, * fexangulare, * anglicum, annuum, pubefcens, * villofum, atratum, nudum. Europe, Madeira, Japan.
seleppium. *S. leaves fattifb, ferrated; corymbus leafy ; ftern upright.-A decoction of the leaves in milk is a forcible diuretic. It has been given with fuccefs to cure the piles. Cows, goats, fleep and fwine, eat it. Horfes, refufe it.
s.cre.
bulging, nearly upright, alternate; tuft with three di-vifions.-This fpecies of fedum is a fmall perennial, fucculent, evergretn plant; growing in great abundance on the tops of walls and roofs of houfes. It has a faint fmell, and at firt an herbaceous tafle; but it afterwards flows confiderable acrimony, exciting a fenfe of biting heat in the mouth and fauces. In its secent flate is thows very a dive powers, proving emetic, purgative and diurtic. 'The expreffed juice, taken To the quantity of a table fpoonful, has been faid to prove a very draftic medicine; but the plant in its dried Alate flows little or no activity. In this country it is bardly employed, and has no place in our pharmacopocias. Its activity, however, points it out as a fubject deferving attention. Goats cat it ; cows, horfes, theep, and fwine, refufe it.

A N Y.

* S. leaves arrl-flaped in five rows, crowded, loofe at rupefre. the bafe; flowers in tufts.- Both this and the S. reflesum are cultivated in Holland and Germany, to mix with lettuces in falads. It is acrid to the tafle.

914. Penthorum.

One fpecies; viz. fedoides. Virginia.
215. Bergia.

Two fpecies; viz. verticilldta, glomerata. Cape of Good Hope.

## 9tG. Suriana.

One fpecies; viz. maritma. Jamaica.
917. Grielum.

One fpecies; viz. tenulfolium. Ethiopia.

## 918. Oxalis, or IVood-forrel.

93 fpecies; viz. monophylla, lepida, rofrata, afmina, lanceefolia, leporina, crifpa, fabafolia, laburnifolia, fanguinea, ambigua, undulata, fufcata, glandulofa, tricolor, rubro-flava, thaccida, exaltzta, variabilis, grandiflora, fulphurea, purpurea, brevifcapa。 fpeciofa, * acetofella, magellanica, margmata, pulchella, obtufa, lanata, truncitula, flrumofa, punctata, luteola, macrogonya, fallaw, tenella, minuta, pufilla, compreffa, fericea, megalorhiza, tetraph 113 , violacea, caprina, cernua, dentata, livida, ciliaris, arcuata, linearis, cuneata, cuneifolia, glabra, bifida, flicaulis, longifoora, nutans, convesula, verficoior, elongata, reclinata, polyplyylla, tenuifolia, macroftylis, hirta, tubiflora, fecunda, nultiHora, rubella, rofacea, repens, reptatrix, dificha, in= carnata, conorhiza, crenata, lateritlora, dillenii, ftriQs, * corniculata, plumieri, pentantha, rhombitolia, rofea, barrelieri, burmanmi, tomentofa, lupinifolia, pectinata, flabellifolia, flava, lenfitiva. S. Europe, Caper, North Americ?.

* O. falk with one Hlower; leaves three together ; acetofitim, leafets inverfely heart-fhaped, hairy.-An infufion of the leaves is an agreeable liquor in ardent fevers, and boiled with milk they make an agreable whes. Sheep, goats and fwine eat it. Cows are not fond of it. Horfes refufe it. The juice is gratefully acid. The London college directs a conferve to be made of the leaves, beaten with thrice their weight of fine fugar. The expreffed juice depirated, properly evaporated, and fet in a cool place, affords a cryflalline acid lialt in confiderable quantity, which may be ufed whenever tegetable acids are wanted. It is employed to take iron moulds out of linen, and is fold under the name of ef. fential falt of lemons. We are lately affured, that the leaves and flalks wrapped in a cabiuge leaf, and macerated in warm athes until reduced to a pulp, have been fuccefffully applied to fcrophulous uicers. This poultice fhould remain on the fore 24 hours, and be repeated four times. Afterwards the ut er is to be drefled with a poultice made of the roots of the mea-dow-fweet bruifed, and mixed up with the foum of four butter-milk.

919. Agrostemma, or Rofe Car fion, Irild Lyclanis.

Four fpecies; viz. * gitlago, coronana, toos jovic, colli-rofa. Europe.
920. Lychisis, or Campion.

II fecies; viz. cralcedenica, Blo cuculis, coronata, quadridentata, * vifcaria, alpina, mage llanica, Aa 2
fbiricas,

Sibirica, leta, dioica, apetala. Rufia, Alps of Europe, China.

92 I . Cerastium, or Moufe-ear Cbickweed.
20 Ípecies; viz. perfoliatum, * vulgatum, anomalum, * vifcofum, * femidecandrum, pentandrum, * arvenfe, lineare, dichotomum, longifolium, "alpinum, repens, ftrictum, fuffruticofum, maximum, * aquaticum, dioicum, * latifolium, * tomentofum, manticum. Eur.
922. Spergula, or Spurrey.

Severi fpecies; viz. * arvenfis, pentandra, nodofa, laricina, faginoides, * fubulata, glabra. Europe.
arvenfis. * S. leaves in whirls; flowers with more than five ftamens; Atems thick at the joints.- Poultry are fond of the feeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Experience flows it to be very nutritious to the cattle that
eat it. Horfes, heep, goats, and fwine eat it. Cows refufe it.

## Order ill. DECAGYNIA.

923. Nevada.

One fpecies; viz. procumbens. Numidia, Egypt.
924. Phytolacca, or American Nigbefuade.

Six fpecies; viz. octandra, frricta, abyffinica, de candra, icofandra, dioica. Eaft Indies, Africa, America.

## In the clafs Decandria are

119 Genera, which include 987 Species. Of thefe $8+$ are found in Britain.

## 925. Asarum, or AJarabaca.

Thrce fpecies; siz. * europrum, canadenfe, virginicum. Europe, N. America.
europsum. * A. leaves kidney-fhaped, blunt, in pairs.-This is a very low plant, growing naturally in France, Italy, and other warm countries. It grows readily in our gardens; and although the dried roots have been generally brought from the Levant, thofe of our own growth do not feem to be weaker. Both the roots and leaves have a naufeous, bitter, acrimonious, hot tafte. Their fmell is Arong, and not very difagree. able. Given in fubflance from half a dram to a dram, they evacuate powerfully both upwards and downwards. It is faid, that tinktures made in firituous menftrua, poffefs both the emetic and cathartic virtues of the plant: that the extract, obtained by infpiffating thefe tinctures, atts only by womiting, and with great mildnefs: that an infufion in water proves cathartic, rarely ¢̧metic: that aqueous decoetions, made by long boiling, and the watery extract, have no purgative or emetic quality, but prove good diaphoretics, diuretics, and emmenagogues. The principal ufe of this plant among us is as a fternutatory. The root of afarum is perhaps the ftrongeft of all the vegetable errhines, white hellebore itfelf not excepted. Snuffed up the nofe in the quantity of a grain or two, it occafions a large cyacuation of mucus, and raifes a plentiful $\int_{\text {pit }}$. ting. The leaves are confiderably milder, and may be ufd to the quantity of three, four, or five graine. Geoffrey relates, that after fnuffing up a dofe of this esshine at night, he has frequently obferved the difcharge from the nofe to continue for three days together; and that he has known a paralylis of the mouth and tongue cured by one dofe. He recommends this medicine in fubborn diforders of the head, proceeding from vifcid tenacious matter, in palfies, and foporific diftempers. The leaves are the primeripal ingredient in the pulvis fernutatorius, or pulvis ofari com$f$ frus, as it is now termed, of the flops.

One fpecies; viz. alba. Weft Indics.
The bark of the canclla alla is brought to us rolled
into long quills，thicker thon cinnamon，and both out－ wardly and inwardly of a whitifh colour，lightly inclin－ ing to yellow．It is the produce of a tall tree，grow－ ing in great plenty in the low lands in Jamaica，and other American illands．Infufions of it in water，are of a yellowith colour，and fmell of the canella；；but they are rather bitter than aromatic．Tinctures in rec－ tified firit have the warmth of the bark，but little of its fmell．Proof firit diffolves the aromatic，as well as bitter matter of the canella，and is therefore the bell menllruum．The canclla is the interior bark，freed from an outward thin rough one，and dried in the flade．The thops diftinguilh two forts of canella，dif－ fering from each other in the length and thicknefs of the quills；they are both the bark of the fame tree， the thicker being taken from the trunk，and the thin－ ner from the branches．This bark is a warm pungent aromatic，not of the moft agreeable kind，nor are any of the preparations of it very grateful．Cantella alloa is often employed where a warm flimulant to the flo－ mach is necellary，and as a corrigent of other articles． It is now，however，little ufed in compofition by the London college，the only officinal formula which it enters being the palvis aloëticus ；but with the E．din－ burgh college it is an ingredient in the tinfura amara， zimum amarum，vinum rbei，\＆ec．It is ufeful as co－ vering the tafte of fome other articles．

Eur. Afia, Afr. Am.

The Euphorbia officinarum, or gummi-refinous fubflance, is a fpontaneous exudation from a large oriental tree. It is brought to us immediately from Barbary, in drops of an irregular form, fome of which, upon being broken, ate found to contain little thorns, fmall trige, Aowers, and other vegetable matters; others are hollow, without any thing in their cavity. The tears are in general of a pale yellow colour externally, fomewhat white withinfide; they eafly break between the fingers. Slightly applied to the tongue they affect it with a very fharp biting tafte; and upon being held for fome time in the mouth, prove vehemently acrimonious, inflaming and exulcerating the fauces, \&c. Euphorbium is extremely troublefome to pulverize, the finer part of the powder, which flies off, affecting the head in a violent, manner. The acrimony of this fubfance is fo great, as to render it abfolutely unfit for internal ufe; 位eral correctors have been contrived to abate its virulence, but the beft of them are not to be trufted to; and as there feems to be no real occafion for it, unlefs for fome external purpofes, fome think that it ought to be expunged from the catalogue of internal medicines; and accordingly, it has now no place in the Loridon or Edinburgh pharmacopeias; but it is Alll retained in moft of the foreign ones, and is fometimes ufed as a fternutatory.
choracias. * E. umbel with many fpokes, fpokes forked; involucellums perforated, notched at the end; leaves very entire; ftem fhrub-like.-The powdered leaves in dofes of 15 to 25 grains operate as a purge. The juice of
every fpecies of fpurge is !o acrid, that it corrodes and ulcerates the body wherever it is applied; fo that phy. ficians have feldom ventured to ufe it internally. Warts or corns anointed with the juice prefently difappear. A drop of it pat into the hollow of a decayed and aching tooth, deftroys the nerve, and confequently removes the pain. Some people rab it betind the ears, that it may blifter and by that means give relief.

One fpecies; viz. mocanera. Canary ifies.

## Order IV. TETRAGYNIA.

961. Calligonum.

Three fpecies; viz. polygonoides, comofem, pallofà o Ruffia, Siberia.

## Order 1. MONOGYNIA.

## 966. Cactus, or Mclon Thigle.

24 〔pecies; viz. mamillatis, melocaetus, pitajaya, hepragonus, tetragonus, hexagonus, pentagouts, repandus, lanuginofus, peruvianus, royeni, grandiflorus, flagelliformis, parafiticus, triangularis, moniliformis, upurtia, ficus indica, tuna, cochenillifer, curaflavicus, phyllanthus, percfhia, prortucaccifolius. Wcit Indies, America.

9「7. Philadflepues, or Mock Orange, Syringa.
Tivo lpectes; viz. coranarius, inodurus. S. Eur. Carclina, New Suuth W'ale.
971. Psidium, or Guara, or Bay Plum.

Three fpecies; $v$ z. pyriferum, poniterum, decafpermum. Eatt and W, ft lndies.
972. Eugenia, or Pomiy-rofe, Yamboo.

Seven fincies; viz. milaceenfis, jambur, pleudo-pfidium, unifura, cotinifulia, acutanguha, racemofa. E. Indies, Jamaica, S. America.
973. Myrtus, or Myrile.

14 fpccies; viz. communis, brafiliana, biflora, anguftifulia, lavis, lucida, cumini, dioica, chytraculia, ruzyginum, zeylanica, androliemoides, caryophyllata, pimenta. S. Europe, Afia, Africa, America.-The myrtus communis is an evergreen thrub, growing in Italy, and cultivated in our botanic gardens. The leaves and berries have been fometimes made ufe of as aftringents, but not at prefent regarded. The pimenta is the fruit of a large trec growing fpontaneoufls in the mountainous parts of Jamaira. called by Sir Hans Sloane, myrtus arborea aromatica, foliis laurinis. The fmell of this fpice refembles a mixture of cinnamon, cloves, and nutmegs; its tafte approaches to that of cloves, or a misture of the thrce foreguing; whence it has received the name of all.frice. The flops have been for fume time accullomed to employ this aromatic as a fuccedatioum to the more conlly fpices, and from them it has been introduced into our hofpitals.

Pimento is now in our phamaropuas the hafio of a diatilled water, a fpirit, and an effentril oil; and thefe
are not unfrequenty employed, where aromatics are indicated.
983. Punica, or Poncgranate-trec.

Two fpecies; siz. granatum, nana. Spain, Itaiy, Barb. W. Indies.- The ponegranate is a low tree, or rather thrub, growing wild in Italy, and other countries in the fouth of Lurope: it is fometimes met with in our gardens; but the frusi, for which it is chiefly valued, rarely comes to fuch perfection as in :warmer climates. This fruit has the general qualities of the other fwect fummer fruits, allasing heat, quenching thint, and gently loofening the belly. The rind is a ftrong antringent. and as fuch, is occafionally made ufe of. The tlowers are of an elegant red colour, in appearance refembling a dried red rofe. Their talle is bitterifh and allingent. They are recommended in diarrhoeas, dylenteries, and other cafes where aftringent medicines are proper.

## 981. Ampgbalus, or Almond tree.

Four fuecies; viz. periica, communis, pumila, nana. Perfia, Jordan, Barbary.-The flowers of the amysdaius perfica lave an agrea le lineli, and a bitterifh tafte. Diftilled without any addition, by the heat of a water bath, they yield one-fixth their weight, or more, of a whitilh liquor; which, as Mr Bolduc obferves, communicates to a large quantity of other liquids, a flavour like that of the kesnels of fruits. An intufion in water, of half an ounce of the freth gathesed flowers, or a dram of them when dried, fweetened with fugar, proves for children an ufeful laxative and anthelmintic; the leaves of the tree are, with this intention, forrewhat more efficacious, though lefs agreeable, The fruit has the fame quality with the other fweet fruit, that of abating heat, quenching thirft, and gently loofening the belly.

The almond of the camysdalus communis, is a flattifh kernel, of a white colour, covered with a thin brownith Ihin, of a foft freet tafte, or a difagreeable bitter one. The flains of both forts are unpleafant, and covered with an acrid powdery fubtance; they are very apt to become rancid on keepirig, and to be preyed on by a kind of infect which eats out the internal part, leaving the almond to appearance entire. To thefe circumftances regard ought to be had, in the choice of them.

The fruit which affords thefe kernels, is the produce of a tree nearly refembling the peach. The eyc difringuifhes no difference betwixt the trees which produce the fweet and bitter, or beiwixt the kernels themfelves; it is faid, that the fame trec, has by a difference in culture, afforded both.

Both forts of almonds yield, on expreffion, a large quantity of oil, which has no fmell, or any particular tafte; this oil feparates, likewife, upon boiling the almonds in water, and is gradually collected on the furface; but on triturating the almonds with water, the oil and water unite tozether, by the mediation of the other matter of the kernel, and form an unctuous milky liquor.

Sweet almonds are of greater ufe in food than as medicines, but they are reckoned to afford litile nourifhment; and when eaten in fubftance, are not eafy of digeftion, unlefs thoroughly comminutcd. They are fuppofed, on account of their foft unctuous quality, to obturd acrimonions juices in the prima via. Peeled
fweet almonds, eaten fix or eight at a time, fumetimes give prefent relief in the heartburn.--Bitter almonds have been found poifonous to dogs, and lundry other animals; and a water dillilled from them, when made of a certain degree of Atength, has had the fame effects. Neverthelefs, when eaten, they appear innucent to men, and have been not unfrequecntly ufed as medi. cines. Boerhave recommends them in fubftance, as diuretics which heat but moderately, and which may therefore be ventured upon in acute difeafes.

The oils obtained by expreflion from both forts of almonds, are in thcir fenfible qualities the fame. The general virtues of thefe oils are, to blunt acrimonious humours, and to foften and relax the folids; hence their ufe, internally, in tickling coughs, heat of urine, pains and inflammations; and externatly in tenfion, and rigidity of particular parts.-The milky folutions of almonds in watery liquors, commonly called emulfions, contain the oil of the fubject, and participate in fome degree of its emollient virtue; but have this advantage above the pure oil, that they may be given in acute or inflammatory diforders, without danger of the ill effects which the oil might fometimes produce; fince cmulfions do not turn rancid or acrimonious by heat, as all the oils of this kind in a little time do. Several unctuous and refinous fubftances, of themfelves not mifcible with water, may, by trituration with almonds, be eafly mixed with it into the form of an emulfion; and are thus excellently fitted for medicinal ufe. In this form camphor and the refinous purgatives may be corrmodioutly taken. The only officinal preparations of almonds, are the expreffed oil and emultion. The commoss emulion, or the lac amygdala, as it is now called by the London college, is prepared from the fweet almond alone; but in the emulfion of the Edinburgh college, a fmall proportion of bitter almonds is added, which has a much better effect in improving its tafte, than the fugar added by the London college.-An emulfion formed entirely of bitter almonds, taken to the quantity of a pint or two daily, is faid to have been given in obftinate intermittents with fucceifo

## 982. Prunus, or Plum-tree

22 fpecies; * padus, virginiana, canadenfis, Jufitanica, lauro-cerafus, elliptica, paniculata, mabaleb, armeniaca, fibirica, pumila, * cerafus, * avium, penfylvanica, * dorneflica, * infititia, * fpinofa, afpera, japonica, glandulofa, incifa, tementofa. Europe, N. America, W. Indies.

* P. Howers in bunches; leaves deciduons with two paduz. glands at the bafe on the under fide.- This plant grows well in woods, groves, or fields, but not in a moill foil. It bears lopping, and luffers the grafs to grow under it. The fruit is naufeous, but bruifed and infufed in wine or brandy, it gives it an agreeable th vour. A frong decoction of the bark is ufed by the Finlanders to cure venereal complaints, which prattice is cormborated by the teftimony of M. Broerland. He dircat fix ounces of the dry, or eight of the frefh balk, to be boiled in eight to four pints of water. The dole is four onnces, four times a dody. It alone cures the fleghter infections, and combined with mercury facilicates the cure of the feverer flates of the difeafe; and a decoetion of the berries is fometimes siven with fuccefs in the dy fentery. The wood being lmooth and tough, is made into han
dees ior kuives ather whips. Sincep, goass, and fwite eat it. Cews are not fond of it. lionipes refute i'. - P. umbels mofly on thont fiutitalks; leaves coge-feer-fhaped, fmouth, doubled together.- This plant loves a faidy foil and an clerated fituation. The gum that exudos from this tree is equal to gum aratic. It is fid, that more than 100 men duting a fiege were l.ept alive for near two months, withuat any other fuftenance than a litte of this gum taken intu the mouth fumctimes and fuffered graduatly to diffolve. The cemtron poople cat the fruit cither frefo or dried; and it is frequently infufed in brandy for the fake of its flan r)ur. The wood is hard and tough. It is ufed by the turner, and is formed into chairs, and fained to imitate mahogany. This tree is the original fock from which many of the cultivated kinds are derived.
ovium. * P. umbels fitting; leaves egg-fpear-fhaped, downy $\mathrm{u}_{12}$ derneath, doubled together. - This plant grows beft in a tich foil on the fide of hills, unmixed with other trees. It bears cropping, and fuffers the grafs to grow under it. In Hertfordfhire there is a cultivated variety called carrons, which are larger and much finer flavoared than the common fort.
dzmefica. * P. fruitfalks monly folitary; leaves fpear-egg-fiaped, coiled; branches thornlefs.-This plant loves a lofty expofure, and is farourable to pafturage. The raricics have probably originated from the red and white cultivated plums, cither fown by defign or accident. The cultivated garden plums are derived from this fpecice. The bark dyes yellow. Its medical effects are to abate heat and gently loofen the belly; which they perform by Iu'ricating the pafige, and fufening the e:crement. They are of confferable fervice in coilivenef, accompanied with heat and irritation, which the more nimulating cathartics would tend to aggrai.te. Where prunes are not of themfelves fufficient, their effe?s may be promated by joining with them a lietle rhubarb or the like; to which may be added fome carminative irgredient, to prevent their oceafioning flatulencies.
$\because$ mitia.
$\rightarrow$ P. fruittalks in pairs; leaves egg-haped, flightly woolly, cuiled ; branches with thorns.- The fruit is acid, but So tempered by a fiveetnefs and roughnefs, as not to be unpleafant, particularly after it is mellowed by the frofls. A conferve is prepared by mixing the pulp with thrice its weight of fugar. The bark of the root and branches is confiderably nyptic. An infurion of the flowers, fweetencd with fugar, is a mild purgarive, not improper for children.
. $\begin{aligned} \text { iniofa. }\end{aligned}$
* P. fruitfalks folitary; leaves fpear-ीaped, fmooth; branches thorny, -This plant is not well adapted to grow in hedges, becaufe it fpreads its roots wide, and encroaches upoll the patlerage; but it makes a good dead fence. 'Tise wood is hard and tough, and is formed into teeth for rakes, and walking-flicks. From fome effeets which have been repeatedly obfersed to follow she prick of the thorns, there is reafon to believe there . is fomething poifonous in them, particularly in autumn. The tender leaves dried are fometimes ufed as a fubliitate for tea, and are though the beff fubflitute that has yet been tried. 'lhe fruit bruifed and put into wine, gives it a beautiful red colour, and a pleafant fubacid roughnefs. An infufion of a handful of the Rowers is a $f_{f} f c$ and enfy purge. The bark porsdered, ial dofes of 2 drams, will cure fume agurs. Letteis

A N Y.
witten upon limen or :xalion whit the juice of the fruit will not wall out. Shecp, goats, and horfes eat the leaves. The different fiscies of Prunus furnih nourih.ment to various iafect:
9. $5_{3}$. Plini..

Two fpecies; riz. crocea, pendunculat?. Suritian, Brazil.
994. Chrysobolasus, or Cocua Pliam.

One Ipecies; wiz. icaco. WY. Indies, S. America.

## gSG. Sonimeratia.

One fipecies; viz. acida. Eaft Indies, China.
968. Leptospermum

Has 12 โpecies; viz. fcoparium, thea, flavefcens, attenuatum, lanigerum, pubefers, patrifolium, atachnoideum, juniperinum, baccatum, ambiguum, virgatum. New Holland.

96g. Fabricia
Has two Species; viz. myrtifolia, lxvigata. New Holland.
970. Metrosideros.

14 fpecies ; viz. hifpida, tloribunda, coRata, diffufa, villofa, florida, glomulifera, angufifolia, ciliata, linearic, lanceolata, faligna, viminalis, capitata. N. Holland, N. Zealand, C. of G. Hope.

## 974. Calyptranthes.

Six fpecies; viz. fuzygium, guineenfis, caryophyllifolia, jambolana, chrytraculia, rigida. Jamaica, Guinea, Eafl Indies.

## 975. Eucalyptus.

I2 fpecies; siz. robuna, pilularis, tereticornis, refinifera, capitellata, faligna, botryoides, læmafoma, piperita, obliqua, corymbofa, paniculata. N. Holland.

9j6. Bamara.
One feceies; viz. fagifulia. Cayenne.
977. Antherylium.

One fpecies; viz. rohrii. W. Indics.
978. Foetidia.

One fpecies; viz. mauritiana. Ifle Mauritiu:
979. Scolopia.

Ore fpecies; viz. pufilla. Ceylon.
985. Robinsonta.

One fpecies ; viz. melianthifolia. Guiana.

## Order II. Digynia.

987. Crat meves, or With Serevice Trce.

15 fecios; viz. * avia, * corminalis, coccinea, viridis, punchata, crus galli, tomentofa, indica, * oxyacantha, monogyna, azarolus, maura, villofa, leevis, glabra. Europe, Indi:, N. America.

* C. leaves egh-haped, cut, Serrated, cottony under-avia. neath.-It loves dry hills and open expofures, and ीlourifhes cither in gravel or clay. It bears lopping, and permits the grafs to grow. The wood, being hard, tough, and fmooth, is ufed for axle-trees, whecls, walking ficks, carpenters and other tools. The fruit is catable when mallowed by the autumal frofts, and an ardent fpirit may be diffilled from it. It feldom bears a good crop of fruit two years together. Slacep

## Icoiandria.

cyロant:-
and goats eat it. The wood affords an excellent charcoal for the makers of gunpowder. - Uoan account of the fliffnefs of its branches, the tharpacfs of its thorns, its roois wot fpreading wide, and its capability of bearing the feverctl winters without injury, this plant is univerfally preferred for making hedges, whether to clip or to grow at large. The wood is tough, and is formed into axic-trees and handles for tools. The berries are the winter food of thraihes and many other birds. Its different fpecies afford nouriflment to various infects.

9SS. Whldstenia.
One fpecies; viz. geoides. Hungary.

## Order III. TRIGYNIA.

989. Sorbus, or Sersicc-trec.

Threc fpecies; viz. * ancuparia, * hybrida, * domellica. Europe.
ancuparia. S. leaves winged, fmooth on both fides.-It grows either in woods or open fields, but beft on the fides of hills and in fertile foil. It will not bear loppins. Plants grow well in its fhade. The wood is fofe, tough, and folid. It is converted into tables, fpokes for wheels, flafts, chairs, \& \& . The roots are formed into handles for knives and wooden fpoons. The berries, dried and reduced to powder, make wholeforne bread; and an ardent fpirit may be diflilled from them, which has a fine flavour, but it is fmall in quantity. The berries too, infufed in water, make an acid liquor fomerwat like perty, which is drank by the poorer poople in Wales. In Germany, the fowlers ufe the berries to entice the redwings and fieldfares into noofes of hair, fufpended in the woods; hence its trivial name.
domefica. *S. leaves winged, woolly underneath.-The fruit is mealy and auftere, not much unlike the medlar. The wood is valuable for making mathematical rulers and excifemen's gauging flicks.
990. Sesuvium.

One feceies; viz; portulacaltrum. W. Indies.

## Order IV. PENTAGYNIA.

991. Mespilus, or Medlar-trce.

Eight fpecies; viz. pyracantha, *germanica, arbutifolia, amelanchia, chamæ-mefpilus, canadenfis, juponica, gotoncafter. Europe, N. America.
germania. * M. thornlefs; leaves §pear-haped, cottony underneath; flowers folitary, fitting.-Alany people are fond of the fruit when it becomes foft by keeping ; it is fomewhat auftere, and binds the bowels.

## 992. Pyrus, or Pear-trce.

Nine fpecies; viz. * communis, pollveria, * malus, baccata, coronaria, cydonia, nivalis, falicifolia, japonica.
communis. * P. leaves ferrated, faooth ; flowers forming a co-rymous.-This plant loves a fertile foil and floping ground ; but will not thrive well in maift bottoms. It fands the fevereft winters, and does not deftroy the grass. The wood is light, fmooth, and compact ; it is ufed by turners, and to make joiners tools; and fer
piture frames to be fained black. The leaves afteret a yellow dye, and may be ufed to give a green to blued cloths. The fruit is auftere: but when cullivated, highly grateful, as is proved ty the great variety of excellent pears which the indulary of mankind has raifed, for they all origmate from thit. The juice of the fruit, fermented, is called perry, latge quantities o: which are raifed in Worcelterthire and Herefordhire for that purpofe. The Squafl, the Olffield, and the Barland perrys are reckoned the beft, ard are little inferior to wine. Holfes, cows, fluecp, and goats, eat the leaves, which afford nouridment to varicus inlects.

* P. leascs ferrated; flospers in umbels, fiting. This mitus. plant fourillies better on declivities and in thady places, than in open expofures or boagy lands. Grafs, and even corn, will grow beneath it. It is much ufed as a flock, on which to ingraft the betier kind of apples, becaufe its fruits are neither killed by froft nor caten by field-mice. The bark affurds a yellow dye. The wood is tolerably hard; it turns very clean, and when mate into cogs for wheels, obtains a polifi and wears a long time. The acid juice of the fruit is calied by the country people varruice, and is much ufed in fpring and in other cafes, as an aftringent or repelleat. With a proper addition of fugar, it is probable, that a vers grateful liquor might be made with the juice, but little inferior to old hock. IIorfe, cows, lheep, and goat;, eat it. Swine are very fond of the fruit.

The fruit of the pyrzs cydonia have a very auRcre acid tafte; taken in fmall quantity, they are fuppofed to reftrain vomiting and alvine Ruxes, and, more liberally, to loofen the belly. The feeds abound with a macilaginous fulfance of no particular tafte, which they readily impart to watery liquors; an ounce will render three pints of water thick and ropy, like the white of an egg. A mucilage of the feeds is kept in the thops. A fyrup of the fruit had formerly a place, but is now rejerted.

## 993. Tetragoma.

Seven fpecies; viz. fruticola, herbaces, iraefolia, hirfuta, fpicata, expanfa, japonica. Capz, Peru, New Zealand.
994. Mesembryanthenunt, or Fig-marygold.

50 fpecies; viz, nodillurum, cryftallinum, copticum, geniculiflorum, nodillorum, fplendens, umbellatum, expanfum, tripolium, calamiforme, apetalum, crinitorum, cordifolium, bellidifolium, deltoides, barbatum, hifpidum, villofurn, fcabrum, emarginatum, uncinatum, fpinofum, tuberofum, tenuifolium, ftipulaceum, crafifolium, glemeratum, loreum, filamentofum, falcatum, forfcatum, edule, bicclorum, ferratum, micans, glancum, corniculatum, tortuofum, pomeridianum, veruculatum, papulofum, pinnatifidum, rollratum, ringens, dolabriforme, difforme, albidum, lingueforme, pugioniforme, capillare. Greece, Capc, New Zealaud.

## 995. Aizoon.

Ten fpecies; riz. canarienfe, hifpanicum, lanceola. tum, farmentofun, paniculatum, perfoliatun:, glinoides, fecundum, fruticofun, rigidum. Spain, Cape, Canary.
996. Spirea, or Spikentitilloge, Dropzurt. 18 frecics; viz. lacrigata, "hliciólia, tomentofa,
callofd, bypericifolia, chamiedrifolia, incifa, crenata, argentea, triloba, opulifolia, forbifolia, aruncus, * filipendula, *ulmaria, lobata, palmata, trifoliata. Europe, N. America.
filipenciula. * S. leares interruptedly winged; leafets ftrap-fpearThaped, irregularly ferrated, very imooth; flowers in tufts.-The tuberant pea-like roots of this plant, dried and reduced to powder, make a kind of bread, which in times of fearcity is not to be defpifed. Hogs are very fond of them. When expanded and enlarged by cultivation, it is a beautiful addition to the flowergarden.
ulmaria. * S. leaves interruptedly winged; leafets egg-fhaped, double ferrated, hoary underneath; flowers in tufts.The flowers, infufed in boiling water, give it a fine flavour, which rifes in diflillation. Sheep and fiwe eat it. Goats are extremely fond of it. Cows and horfes refufe it.

## Order V. poligiviá.

## 997. Rosa, or Rofe.

it fpecies; viz. eglanteria, * rubiginofa, cinnamomea, * arvenfis, pimpinellifolia, * fpinofifima, rugofa, carolina, * villofa, finica, fempervivens, centifolia, gallica, pumila, alpina, canina, collina, indica, pendulina, alba, multifora. Europe, Perfia, China, N. America.
Apinofifima* R.germens and fruittalks fmooth ; Aem and leafAalks fully fot with fraight prickles; leafets circular, fmooth.-The ripe fruit is eaten by children; it has a grateful fubacid tafte. The juice of it, diluted with water, dyes filk and mullin of a peach colour, and, with the addition of alum, a deep violet; but it has vely little effect on woollen and lisen. Its dwarfifh growth, and the fingular clegance of its little leaves, which refemble thofe of the upland burnet, entitle it to a place in the flower-garden.
sanina. * R. germens and fruitfalks fmooth; flem and leafftalks prickly.-A perlumed water may be diftilled from the bloffums. The pulp of the berries, beat up with fugar, makes the conferve of hips of the London difpenlatory. Mixed with wine, it is an acceptable treat in the north of Furope. Several birds feed upon the benries. The leaves of every fpecies of rofe, but efpecially of this, ate recommended as a fubfitute for tea, giving out a fine colour, a fub-aftringent tafte, and a grateful fmell, shen dried, and infufed in boiling water. It is a difficult matter to fay, which are fpecies, and which are varieties only, in this genus; fome think that there are no certain limats preferibed by nature. Various infects are nourithed by the different fpecies; and thofe inoffy prickly excrefcences which are frequently fund upon the branches of rofes, efpecially upon the laft fpccies, are the habitations of the cynips rofa. This excrefcence was formerly in repute as a tredicince, and was kept in the thops under the name of a bed guar. An infufion of the full blown blufioms of all the rofes, efpecially the paler kinds, is purgarive; but the petals of the red rofes, gathered before they expand, and dryed, are aftringent.

The rofa contifolia is an elcgant Rower, common in our earier. Its fincll is very pleafant, and almof univerfally admired; its tafte bitterim and fubacrid. In diftillation with water, it yields a fmall proportion of

A N I .
butyraceous oil, whofe flavour exactly refembles that of the rofes. This oil, and the diftilled water, are very ufeful and agreeable cordials. Hoffman frongly recommends them as of a fingular efficacy for raifing the ftength, cheering and recruiting the fpirits and allaying fain; which they perform without raifing any heat in the contitution, rather abating it when inordinate, Datmak rofes, belides their cordial aromatic virtue, which refides in their volatile parts, have a mildly purgative une, whicl remains entire in the decoction left after the diffillation ; this with a proper quantity of fugar forms an agreeable laxative fyrup, which has long kept its plare in the thops.

The rofa gallica has very little of the fragrance of the foregoi:g pale furt, and inflead of its purgative quality, a mild gratefully aftringent onc, efpecially before the Hower has opentd: this is confiderably improved by laally exficcation; but both the afringency and colour are improved by flow drying. In the frops there are prepared a conferve, an infufion, a honey, and a fyrup of this Hower.

## 998. Rubus, or Rofplerry.

20 fpecies; viz. * idieus, occidentalis, hifpidus, parvifolius, jamaicenfis, triphyllus, * cafius, * fruticofus, canadenfis, odoratus, moluccanus, palmatus, villofus, incifus, japonicus, trifidus, * faxatilis, * arctius, * ehamæmorus, dalibarda. North Europe, Afia, America.

* R. leaves winged with five or three leafets, ftem idous, prickly; leaf.falk channelled.-The fruit of this plant is extremely grateful as nature prefents it, but made into a fiventmeat with fugar, or fermented with wine the fluour is improved. It is fragrant, fubacid, and cooling. It diffolves the tartarous concretions of the teeth; but for this purpofe it is inferior to the firawberry. The white berries are fweeter than the red, but they are generally contaminated by infects. The frefi leaves are the favourite food of kids.
* R. leaves winged with three or five leafets; fiem and fruticofuso leaf-talks prickly ; panicle oblong.-The berries when ripe are black, and do not eat amils with wine. The green twigs are of great ufe in dyeing woollen, filk, and mohair, black. Cows and horles cat it. Sheep are not fond of it. Silk worms will fometimes feed upon the leaves in defect of thofe of the mulberry.
* R. leaves fimple, lobed; fem without prickles, with chamarmo. one flower; male and females flowers on different ruso plants.- The berries are not unpleafant, and held to be an excellent antifcorbutic. The Norwegians pack them up in wooden veffels and fend them to Stockholm, where they are ferved up in delierts or made into tarts. The Laplanders bury them under the finaw, and thus preferse them frefin fiom one year to another. They bruife and eat them whth the milk of the rein deer. In the Ilighlands of Scutland alfo they are fometimes brought to table with the defiert.

> 999. Fragara, or Strawlerry.

Three fipecies; viz. * vefca, monophyila, * fierilis. North Eurape, America.

* F. Icaves three together; rumers creeping. - The vefad berries eaten either alone or with fugar, or with milk, are miverfally cfteemed a mond delicious fruit. They are grateful, cooling, fubacid, juicy, and have a delighful fmell. 'Taken in large quantitics, they feldom difagree

## Polyandria.

difagree with the fomach. They promote perfiration, impart a violet fcent to the urine, and difiolve the tartarous incruftations upon the teeth. People afflicted with the gout or Rone, have found great relicf from ufing them largely. The bark of the root is aftringent. Sheep and goats eat it. Cows are not fond of it. Eforfes and fiwine refufe it.

## 1005. Putentilla, or Cinqucfoil.

3 I fpecics: viz. * fruticofa, * anferina, \{eracea, multifida, tragarioides, * rupettris, bifurca, pimpinelloides, penfylvanica, fupina, refta, argentea, intermedia, hirta, ftipularis, opaca, * verna, * aurea, aftracanica, canadenfis, *alba, caulcicens, elufiana, nitida, valderia, * reptans, monfpelienfis, norvegica, nivea, grandithora, fubacaulis. Europe, Narth America.
fruticofa. * P. leaves winged, fem Arub-like. -The beautiful appearance of its numerous flowers kas gained it admittance into gardens. Befoms are made of it. Cows horfes, goats, and ftreep eat it. Swine refufe it.
anferina. * P. leaves winged, ferrated; ftem creeping; fruitftalks with one flower. - The leaves are mildly aftringent. Dried and powdered they have been given with fuccefs in aguts. The ufual dofe is ameal fpoonful of the powder every three hours between the fits. The roots in the winter time eat like parfnip. Swine are fond of them. Cows, horfes, goats, and furine eat it. Sheep refufe it.
reprians. *P. leaflets five together, ftem creeping; fruit-ftalks one-flowered.-The red cortical part of the root is mildly aftringent and antifeptic. A decoction of it is a good gargle for loofe teeth and fpongy gums. Horfes, cows, goats, and fieep, eat it.

## 1001. Tormentilla, or Tormentil.

Two fpecies; viz. erecta, 济 reptans. EuropeThe tormentil is found wild in woods and on commons; it has long flender ftalks, with ufually feven long narrow leaves at a joint ; the root is for the moft part crooked and knotty, of a blackilh colour in the outfide, and reddifh within. This root has an auftere flyptic tafte, accompanicd with a night kind of aromatic flavour; it is one of the molt agreeable and efficacious of the vegetable aftringerts, and is employed with good effect in all cafes where medicines of this clats are proper. It is more ufed both in extempo-
raneous prefcription, and oflicinal compofition, than any of the other frong vegetable aftringents. It is an ingredient in the two compound powders of chalk. A tinsture made from it with rectified fpirit, poffeffe= the whole aftringency and flavour of the root, and lofes nothing of either in infpiffating.

## rcoz. Geum, or Avens, Herb-bennet.

Eight fpecies; viz. virginianum, * urbanum, canadenfe, japonica, *rivale, hybridum, nontanum, reptans. Europe, North America.

* G. flowers upright; fruit globular, woolly; awns urbanum, hooked, bare; root-leaves lyre-haped; ftem-leaves in threes.- Ihe roots gathered in the Spring before the ftem grows up, and put into ale, give it a pleafant flavour, and prevent its growing four. Infufed in wine it is a good ftomachic. Its talte is mildly auftere and aromatic, efpecially when it grows in a warm dry fituation; but in fhady and moift places it has little virtue. Cows, goats, fheep, and fwine, eat it.
* G. Howers nodding, fruit oblong; asvns feathered, rivale twifted; petals blunt, roundifl, wedge-fhaped; leaves winged.-The powdered root will cure tertian agues, and is daily ufed for that purpole by the Canadians. Sheep and goats eat it. Cows, horfes, and fwine are not fond of it. It is made ufe of to cure ropy malt liquor.

## I כO3. Dryas.

Three fpecies; viz. anemonoides, geoides, *octopetala. Alps of Europe, Kamtchatka.

```
r004. Comarum, or Mar/b-cinquefuil.
```

One \{pecies; viz. jif paluttre. Europe.

* C. leaves winged, petals fmaller than the calvx. paluffic The soot dyes a dirty red. The Irih rub their milking pails with it, and it makes the milk appear thicker and richer. Goats eat it. Cows and hecp are not fond of it. Horfes and fivine refufe it.

1005 . Calycanthus, or Carclina All-Jpice.
Two fpecies; viz. floridus, priecox. Carolina, Florida, Japan.

## In the elafs Icofandria are

39 Genera, including 346 Species, of which 42 are found in Britain.
1006. Marcgratia. Cal. 6.phyllus, imbricatus. Cor. I-petala, claufa. Bacca multilocularis.

Order I. monogyniA.
10:6. Marcgravia.
Two fpecies; viz. umbellata, coriacca. Welt Indies.

## 1007. Ternstroemis.

Five fpecies; viz. meridionalis, elliptica, punctata, japonica, dentata. Japan, Weft Indies, Guiana.

> 1008. Trilix.

One fpecies; viz. lutea. Carthagena. 1009. Ludla.

Three fpecies; viz. heterophylla, myrtifolia, feffiliflora. Inte of Mauritius. joro. Capparis, or Caper-bu/b.
30 〔pecies: viz. 〔pinofa, ovata, agyptia, tomentofa, scuminata, zeylanica, horrida, erythrocarpos, fepiara,
citrifolia, corymbofa, mariana, panduriformis, baddec. ca, torulofa, longifolia, frondofa, ferruginea, grandis, jamaicenfis, odoratifima, verrucofa, amplifima, cynophallophora, faligna, pulcherrima, tenuifiliqua, linearis, breynia, haftata. S. Europe, Eaft and Well Indies, South America. - The bufh of the capparis foinofa is a low prickly bufh, found wild in Italy and other countries; it is raifed with us by fowing the feeds upon old walls, where they take root between the bricks, and endure for many years. The bark of the root is pretty thick, of an ath colour, with feveral tranfverfe wrinkles on the furface; cut in flices and laid to dry, it rolls up into quills. This bark has a bitterifh acrid tafte; it is reckoned aperient and diuretic, and recommended in feveral clironic diforders for opening obflructions of the vifcera. The buds pickled with vinegar, \&\&. are ufed at table. They are fuppofed to
excite appetite and promote digeftion; and to be parricularly ufeful, as detergents and aperients, in obefructions of the liver and fpleen. Their tafte and virtues depend more upon the faline matter introduced into them, than on the caper buds.

## rons. Actea, or Harb-cbrifopher.

Three §pecies; $^{\text {r viz. * }}$ §picata, racemofa, japonica. Europe, N. America, Japan.

* A. bunch egg-dhaped; fruit berry-like.-The plant is a powerful repellent. The root is ufeful in fome nervous cafes, but it nuft be adminifered with caution. The berries are poifonous in a very high degree. It is faid that toads, allured by the footid fmell of this plant, refort to it; but it grows in thady places, and toads are fond of damp and fiady fituations. Sheep and goats eat it. Cows, horfes, and fwine refufe it.
iol 2. Sanguinaria, or Puncoon, Blood.root. One fpecies; viz. canadenfis. N. America.
rorz. Podophyllum, or Duck's foot or May-apple. Two fpecies; viz. peltatum, diphyllum. North America.
ior.f. Chelidonium, or Cclandine. Five $£$ pecies; viz. * majus, j.ponicum, * glaucium, * corniculatum, * hybridum. Kur. Egypt, Japan.
* C. fruithalks forming umbels.-This plant grows upon old walls, among rubbim, and in wate thady places. The bark is of a bluin green colour; the root of a deep red; both contain a gold-coloured juice. Hheir fmell is difagreeable, the tahe fomewhat bitterifh, very acrid, biting and burning the mouth; the root is the moll acrid. The juice of celandine has long been celebrated in diforders of the cyes; but it is too fharp, unlefs plentifully diluted, to be applied with lafery to that tender organ. It has been fometimes ufed, and it is faid with good fuccefs, for extirpating warts, cleanfing.old ulcers, and in cataplafms for the berpes miliaris. This acrimonious plant is zarely given internally. The virtues attributed to it are $t$ ' ofe of a ftimulating aperient, diuretic, and fudo:iffe; it is particularly recommended in the flow kind of jaundice, where there are no fymptoms of inflammation, and in dropfies. Some fuppofe the root to have been Helmont's rpecific in the bydrops ofcites. Half a dram or a dram of the dry root is directed for a dofe; or an infufion in wine of an ounce of the freft root.

$$
1015 \text { Papater, or Popoy. }
$$

Nine fpecies; viz. *hybridum, ${ }^{*}$ argemone, alpinum, nudicaule, rhœeas, dubium, *Somiferum, * cambricum, orientale. Europe.

* P. capfules fmooth, urn-thaped; ftem hairy, manyflowered; leaves wing-cleft, jagged. The petals give out a fine colour when infufed, and a fyrup prepard from the infufion is kept in the frops. It partakes in a [m311 degree of the propertics of opium.
* P. calyx and capfuies fmooth; leaves embracing the fers, jagged.-Opium is the juice of this plant. This juice has of late been collected by way of experiment, by certain individuals, from poppies cultivated in Great Britain, and has been found not inferior quality to that brought from the warmet climates. It is ohtained by making wounds with a fmall fharp inftrument in the fisooth carfuic of the plant when nearly tipe, and

A N T.
thereafter collecting the juice that exfudes from the wounds. It is probable, however, that the high price of labour will fcarcely permit the rearing of Britifh opium to become an important object of agriculture. Egypt, Perfia, atd Hindoftan, have hitherto fupplied tis with this commodity: in thofe countries large quantities of poppies are cultivated for this purpufe. The opium prepared about Thebes in Egypt, hence named Thebaic opium, has been wfually efteemed the beft ; but this is nut now diflinguithed from that collected in other places. This juice is brought to us in cakes or loaves covered with leaves and other regetable matters, to prevent their flicking together : it is of a folid confiftence, yet fomewhat foft and tenacious, of a dark reddifh-brown colour in the mafs, and when reduced into powder yellow; of a faint difagreeable (mell, and a bitterifh tafte, accompanied with a pungent heat and acrimnny.

In the province of Bahar in the Eaft Indies, it is faid, the poppy feeds are fown in Oftober or Novernber, at about eight inches diftance; and are well watered till the plants are about half a foot high, when a comport of nitrous eatth, dung, and aflics, is fpread over the areas; and a little before the flowers appear they are again watered profufely till the capfules are half grown: and then the opium is collected; for when fully ripe they yield little juice. Two longitudinal incifions, from below upwards, without penetrating the cavity, are made at fumfet for three or four fuc. ceffive evenings; and then they are allowed to ripen their feeds. In the morning the juice is fcraped off with an iron fcoop, and worked in an earthen por, in the fin's heat, till it be of a confifence to be formed into thin cakes of about four pounds weight, which are covered over with the leaves of poppy or tobacco, and dried. It is faid to be adulterated with various unknown fubftances, with the extract of the poppy plant procured by boiling, and even with cow-dung. It is purified by reducing it to a pulp with hot-water, and flrongly prefling it while hot through a linen cloth from its impurities. It is then evaporated by a waterbath, or other gentle heat, to its original confiftence. This extract is found to contain a refin, a kind of effential oil, a principle of odour, an effential lalt, and a foapy extract.

Opium has a reddifi brown colour, a frong peculiar Imell, a tafte at firf nalfeous and bitter, but foon becoming acrid, with a flught warmth: and it appears to have lome aftringency, as a watery tincture of it forms an ink with a chalybeate Folution.
'The external and internal effects of opium appear to be various in different conlitutions, and in the fame at different times. By fume, when applied to the tongue, the nofe, the eye, or any part deprived of $\mathfrak{k i n}$, it has been faid to flimulate, and to induce, in the eye in particular, a flight degree of rednefs. But if this effect do take place, it is at the utmon extremely inconfiderable, particularly when compared whth the effeet of volatile alkali, ardent fuirit, or a varicty of other articles applied to the fame organ. And there can be no doube, that in a very fhort time the fenfibility of the part to which it is applied, even when there has not taken place the flightelt mark nf preceding fimulus or inflammation, is very confiderably diminifled. Some allege, that when applied to the Rkin, it allays pain
and f patm, procures fleep, and produces all the other falutary or dangerous effeets which refult from its internal ufe; while others allege, that thus applied, it has little or no effed whatever. 'This varicty probably arifes from differences in the condition of the fubcutaneous nerves, and of the fenfibility of the furface, as being more or lefs defended. But there is no doubt that when mixed with cauftic, it diminithes the pain, which would otherwife enfue, probably by deadening the fenfibility of the part. It fometimes allays the pain from a carious tooth; and a watery folution of it has been ufid in various ulcers, certain ophthatmias, and virulent gonorrbeea, when pain and inflammation have before that gisen very great diltrels.

Opium, when taken into the flomach to fuch an extent as to have any fenfible effect, gives rife to a pleafant ferenity of mind, in general proceeding to a certain degree of languor and drowfinefs. The action of the fanguiferous fyltem is diminifhed, the pulfe becoming for the molt part fofter, fuller, and flower than it was before. There often take place fwelling of the fubcutaneous veins, and fiveating; both probably the confequence of a diminution of refifance at the furface, from a diminution of mufcular action, as is particularly exemplified in its effect of binding the belly. Opiun taken into the flomach in a larger dofe, gives rife to confufion of head and vertigo. The power of all dimulating caufes, as making impreffions on the body, is diminifhed; and even at times, and in fituations, when a perfon would naturally be awake, lleep is irrefiftibly induced. In Atill larger dofes, it acts in the fame manner as the narcotic poifon, giving rife, not only to vertigo, headseh, tremours, and delirium, but to convulfious alfo; and thefe terminating in a flate of ftupor, from which the perfon cannot be roufed. This fupor is accompanied with flownels of the pulfe, and with flertor in breathing; and the feene is terminated in death, attended with the fame appearances as take place in apoplexy.

From the fe effects of opium, in a 月ate of health, it is not wonderful that recourfe fhould have been had to it in difeafe, as mitigating pain, inducing fleep, allaying inordinate action, and diminifhing morbid fenfibility. That thefe effects do refult from it is confirmed by the daily experience of every obferver; and as anfwering one or other of thefe intentions, moft, if not all, of the good confequences derived from it in actual practice are to be explained. If, therefore, by a fedative medicine, we mean an article capable of allaying, afluaging, mitigating, and compofing, no fubftance can have a better title to the appellation of fedative than opium.

As anfwering the purpofes of mitigatirg pain, inducing fleep, allaying inordinate action, and diminithing fenfibility, it naturally follows, that opium may be employed with adyantage in a great variety of different difeafes. Indeed there is hardly any affection in which it may not, from circumftances, be proper ; and in all defperate cafes, it is the molt powerful means of alleviating the miferies of patients.

Some practitioners are averfe to its ufe where there takes place an ative inlammation; but others have recourfe to it in fuch cafes, even at an early period, efpecially after blood-letting; and where fuch affections are attended, not only with pain and fafra, but with
watchfolnefs and cough, it is often productive of the greater benefit. Opium, combined with calomel, has of late been extenfively employed in every form of active inflammation, and with the greaterf fuccefs. It is found alfo to be of very great fervice in allaying the pain and preventing the fymptomatic fever liable to be induced by wounds, fractures, burns, or fimitar accidents.

In intermittents, it is faid to have been ufed with good effect before the fit, in the cold flage, in the hot Atage, and during the interval. Given even in the hot Aage, it has been obferved to allay the heat, thirt, headach, and delirium ; to induce fweat and fleep; to cure the difeafe with the lefs bark, and without leaving abdominal olofructions or droply.
It is often of very great fervice in fevers of the typhoid type, when patients are diftreffed with watchfulnefs or diarrhoea. But where thefe or fimilar circumflances do not indicate its ufe, it is often diftreffing to patients, by augmenting thirst and conftipation.

In linallpox, when the convulfions before eruption are frequent and confiderable, opium is liberally ufed. It is likewife given from the fifth day onwards; and is found to allay the pain of fuppuration, to promote the ptyalifm, and to be otherwife uleful.

In dyfentery, after the ufe of gentle laxatives, or along with them, opium, independently of any effect it may thave on the fever, is of confequence in allaying the tormina and tenefmus, and in obviating that laxity of bowels which is fo frequently a relick of tha: difeale.

In diarrhoea, the difeafe itfelf generally carries off any acrimony that may be a caufe, and then opium is ufed with great effect. Even in the worf fymptomatic cafes it feldom fails to alleviate.

In eholera and pyrofis it is almoft the only thing trufted to. In cholic it is employed with laxatives; and no doubt often prevents ileus and inflammation, by relieving the fpafm. Even in ileus, and in incarcerated hernia, it is otten found to allay the vomiting, the Spafnes, the pain, and fometimes to diminith the inflammation, and prevent the gangrene of the ftrangulated gut. It is given to allay the pain and favour the defcent of calculi, and to relieve in jaundice and dyluria proceeding from fpafm.

It is of acknowledged ufe in the different fpecies of tetanus, afiords relief to the various fpafmodic fympm toms of dyfpepfia, hyfteria, hypochondriafis, afthma, rabies canina, \&c. and has been found ufeful in fome kinds of epilepfy.

Of late, in dofes gradually increafed to five grains, three, four, or even fix times a-day, it has been ufed in fyphilis; and fome inflances are recorded in which is would feem, that by this remedy alone a complete cure had been obtained: In other inftances, howerer, after the faireft trial for a confiderable length of time, it has been found ineffectual; and upon the whole, it feems rather to be ufeful in combating fymptonis, and in counteracting the effects refulting from the impreper ule of mercury, than in overcoming the venereal viruc.

It is found ufeful in certain cales of threatened abortion and lingering delivery, in convulfions during par . turition, in the after pains and exceffive flooding.

The only form perhaps neceffary for opium, is that
of pill; and as it is fo foluble in every mentruum, there feems the lefs occafion for the addition of either gum or foap. This form is more apt to fit on the ftomach than any liquid form, but requires rather more time to produce its effects. The adminiftration of opium to the unaccuftomed, is fometimes very difficult. The requifite quantity of opium is wonderfully different in different perfons, and in different flates of the fame perfon. A quarter of a grain will, in one adult, produce effects, which ten times the quantity will not do in another ; and a dofe that might prove fatal in cholera or colic, would not be perceptible in many cafes of tetanus or mania. The loweft fatal dofe to the unaccuftomed, as mentioned by authors, feems to be four grains; but a dangerous dofe is fo apt to puke, that it has feldom time to occafion death. When given in too fmall a dofe, it is apt to produce difturbed fleep and other difagreeable confequences; and in fome cafes, it feems impoffiole to be made agree in any dofe or form. Often, on the other hand, from a fmall dofe, found fleep and alleviation of pain will be produced, while a larger one gives rife to vertigo and deiirium. Some prefer the repetition of fmall dofes, others the giving of a full dofe at once. In fonse, it feems not to have its proper effect till after a confiderable time. The operation of a moderate dofe is fup. pofed to laft, in general, about eight hours from the time of trking it.

Pure opium is partially foluble in water and in rec. tified fpirit, and totally in proof fpirit, wine, or vinegar. Water, rubbed with opium, and decanted repeatedly till it come off colourlefs, yields, on gentle evaporation, an extract which fome ufe and recommend as one of the beft preparations of this fubftance, and which requires to be given in double the dofe of common opium.

It is raid that alkalies diminifh its foporific effecs; that the fixed render it diuretic, the volatile determine it to the fkin; and that acids deflroy its activity almoft entirely. But when conjoined with acids, particularly the diluted vittiolic acid, it often fits eafily on the fomach, when it would not otherwife be retained, and afterwards produces all its fedative effects.

The chief officinal preparations of opium are, the opiump purificatum, piluhe ex opio, pulvis opiatus, tinctura opii, and tinctura opii camphorata. Befides this, it ertters a great variety of different compofitions, as the pulvis fudorifcus, balfamum anodynum, eletiuarium japonicum, pulvis è creta compoftus, \&c.

The occafional bad effects of opium may refult from the fame power, by which in other flates of the fynem it proves beneficial. The methods, therefore, propofed of correcting thefe by roafting, fermentation, long-continued digeftion, repeated folutions and diftillations, have not fucceeded.

> 1016. Argenone, or Prickly Poppy.

Three โpecies; viz. mexicana, armeniaca, pyrenaica. W. Indies, Mexico, P'yrenecs.
1017. Muntingia.

One fpecies; viz. calabura. W. Indies.
1ot8. Sarracenta, or Side-faddle-focuer.
Four fpecies; viz. flava, minor, rubra, purpurca N. America.

10ig. Nymphea, or IVater Lily.
Seven fpecies; viz. * lutea, advena, * alba, odorata, ftellata, viz. lotus, pubefcens. Europe, India, Africa, America.

* N. leaves heart-fhaped, very entire ; cal. 5 -leaved, futea. much larger than the petals. - The soots rubbed with milk deftroy crickets and cockroaches. Swine eat it. Goats are not fond of it. Cows, fheep, and horfes refufe it. An infufion of a pound of the frefh root, to a gallon of water, taken in the dofe of a pint night and morning, cured a leprous eruption of the arm.
* N. leaves heart.fhaped, very entire; calyx 4 -cleft. alba.
- It extends itfelf by long runners, which form a root at the end, and fend up leaf-falks in deep water. The root is bulbous. It is one of the moft beautiful of the Englifh plants, and may be propagated by tranfplanting the bulbous root in winter. The petals gradually leffen as they approach the centre of the flower, where the cuter filaments expanding in breadth, gradually affume the form of petals, as is generally the cafe in the double flowers of our gardens. The roots are ufed in Ireland, and in the illand of Jura, to dye a dark brown. Swine eat it. Goats are fond of it. Cows and horles refufe it.

> 1020. Bira, or Anotta.

One fpecies; viz. orellana. Weft Indies.
1021. Sloanea, or Apeiba of the Brazils.

Three fpecies; viz. dentata, mafloni, finemarienfis. Brazil, Caribbee ifles.

## 1022. Aubletia.

Four fpecies; viz. tibourbon, petonmo, afpera, lixvis. Guiana.

1046. Freziera.

Two fpecies; viz, theacoides, undulata.
1047. Thea, or Tea-tree.

Two fpecies; viz. bohea, viridis. China, Japan.
The feveral forts of tea met with among us, are the leaves of this fame genus collected at different times, and cured in a fomewhat different manner; the fmall young leaves very carefully dried, are the finer green, the older afford the ordinary green and bohea. The two firit have a lenfible flavour of violets, the other of rofes; the former is the natural odour of the plant, the latter, as Neumann oblerves, is probably introduced by art. Some of the dealers in this commodity in Europe, are not ignorait that boheatea is imitable by the leaves
of certain plants, artificially tinctured and impregnated with the rofe flavour. The tafte of both forts is lightly bitterifh, fubaftringent, and fomewhat aromatic. The medical virtucs attributed to thefe leaves are fufficiently numacrous, though fow of them have any foundation; little more can be expected from the common infufion than that of a diluent acceptabie to the palate and flomach; the diuretic, diaphoretic, and other virtues for which they have been celebrated, depend more on the quantity of warm fluid, than any particular qualities which it gains from the tea. Nothing arifes in difillation from either fort of tea with rectified fpirit ; water elevates the whole of their flavour.

Good tea, in a moderate quantity, feems to refreft and frengthen; but if taken in a recent highly flavoured flate, and in confiderable quantity, its ufe is apt to be fucceeded by weaknel's and tremors, and other fimilar conlequences, refulting from the narcotic vegetables; yet it is highly probable that many of the bad, as well as good effects, faid to refult from it, are confequences of the warm water.
1048. Cisrus, or Rock-rofe.

79 fpecies: viz. capenfis, villofus, populifolius, laurifolius, vaginatus, ledon, ladanifcrus, monfpelienfi:, Iaxus, falvifolius, heterophyllus, incanus, creticus, parviflorus, albidus, fericeus, hybridas, crifpus, formofus, halimifolius, elongatus, libanotis, umbellatus, læripes, calycinus, fumana, canus, leabrofus, cinercus, ocymoides, italicus, marifolius, origanifolius, mollis, dichotomus, * anglicus, vinealis, celandicus, alternifolius, globularifolius, tuberaria, plantanineus, ferratus, * guttatus, canaderfis, punctatus, ledifolius, * falicifolius, niloticus, ægyptiacus, fquamatus, lippii, feffiliflorus, ellipticus, * furrejanus, polyanthos, glaucus, nummularius, canarienfis, ferpillifolius, violaceus, linearis, lævis, Atrictus, glutinofus, thymifolius, pilofus, lavandulifolius, racemofus, ciliatus, anguftifolius, * heliantherrium, mutabilis, feetidus, croceus, hirtus, apenninus, * polifolius, arabicus. Alps, S. Europe, Egypt, Cape.

1073. Liriodendron, or Tulip-stree.

Four fpecies; viz. tulipifera, coco, figo, liliifera. Amboyna, N. America.
1074. Magnolis, or Laurel-leaved Tulip-tree.

Eight fpecies; viz. grandifora, plumieri, glauca, obovata, tomentofa, acuminata, tripetala, auriculata. N. America.
1075. Nelumbium.

Four feccies; viz. feriofum, luteum, pentapetalum, reniforme.
1076. Michelia.

Two fpecies; viz. champ:ca, tiamprea. Indies.
1077. Uvaria.

11 fpecies; viz. zeylanica, lanceolata, cerufoides, fuberofa, tomentofa, odorata, monofperma, lutea, ligularis, longifolis, japonica. Ceylon, Japan, Jamaica, Surinam.
1078. Annona, or Cuflard-apple.

18 Species; viz. muricata, tripetala, fquamofa, paludofa, longifolia, punctata, hexapetala, paluftris, glabra, txilobz,
triloba, afiatica, ambolay, africana, pygmæea, obovata, granditlora, amplexicaulis. Egypt, E. and WV. Indies, Americi.
1079. Xyloria, or Biller. wond.

Three fpecies; viz. muricata, frutefcens, glabra. America.

## 108\%. Unona.

Four feccies; viz. difcreta, tomentofa, difcolor, concolor.

## 109i. Anemone, or Wind-fower.

29 fpecies; viz. hepatica, patens, cernua, vernalis, halleri, * pulfatilla, * pratenfis, alpina, apiifolia, coronaria, hortenfis, palmata, fibirica, baldenfis, fylveftris, virginiana, decapetala, triternata, penfylvanica, dichotoma, trifolia, quinquefolia, * nemorofa, * apennina, reflexa, *ranunculoides, narciffihora, umbcllata, thalictroides. Europe, N. America.

* A. leaves double winged; petals the ends turned back.-This is the moft acrid of the anemonies; and is recommended by Dr Stoerk in the quantity of half an ounce of the diftilled water, or five grains of the extract, twice or thrice a-day, in venereal nodes, pains, ulcers with caries, chronic eruptions, amenorrhœ.?, various chronic affections of the eye, particularly blindnefs from obfcurities of the cornes. Its common effects are naufea or vomiting, an augmented difcharge of urine, diarthœa, and increafed pain at firf in the affected part.
oulfatilla. * A. leaves doubly winged: petals ftraight. - The whole plant is acrid, and blifters the $\mathfrak{k i n}$. The juice of the petals ftains paper green. Goats and Theep eat it. Horfes, cows, and fwine, refufe it.
* A. feeds pointed; leafets fnipt ; petals roundifh ; ftem moftly 2 -flowered.- The flowers fold up in a curious manner againft rain. The whole plant is acrid. When fheep are unaccuftomed to eat it, it brings on a bloody flux. Goats and fheep eat it. Horfes, cows, and fwine, refufe it. This plant is fometimes found with yellow dots on the under furface of the leaves.

## 1082. Atragene.

Six fpecies; viz. alpina, ochotenfis, japonica, capenfis, tenuifolia, zeylanica. Alps of Europe, Ceylon, Cape.
1083. Clematis, or Virgin's-bozuer.

24 fpecies; viz. cirrhofa, Horida, viticella, viorna, crifpa, calycina, orientalis, glauca, hexapetala, triflora, virginiana, japonica, trifuliata, dioica, indivifa, paniculata, * vitalba, chinenfis, flammula, maritima, anguftifolia, erecta, ochroleuca, integrifolia. Europe, N. A. merica.-The clematis erecta is introduced into but few of the modern pharmacopecias, and has never been found in Britain. As well as many other active articles, fuppofed to be of a poifonous nature, it was fome time ago recommended to the attention of practitioners by Dr Stoerk of Viemna. Its leaves and flowers are fo acrid as to blifter. Dr Stoerk recommends it in venereal, cancerous, and other cutaneous affections, in thofe headachs, pains of the bones, and waflings of the habit, the confequences of lues vienerea. Externally the acrid powder is fprinkled on the ulcers, and the forms for internal ufe are thofe of infufion and extract.
1084. Thalictrum, or Meadow-rbe.

33 fpecies; viz. *alpinum, fætidum, tuberofum,
Vos. IV. Past I.

A N i゙.
cornuti, dioicum, elatum, wajus medium, minus, rugofum, fibiricum, fquarrofum, purpurafcens, angullifolium, * flavum, nigricans, fimplex, lucidum, aquilegifolium, contortum, petaloideum, nyloideum, japonicum. Europe, N. America.

* T. Aem furrowed, leafy; leafets acute, 3 -cleft; pa favam. nicle much branched, upright, compact ; Howers up-right.-A cataplafm made of the leaves has been known to give relief in the friatica. The root dyes wool yellow. Cows, horfes, goats, and theep, eat it. Swine are not fond of it.

1085. Adonis, or Pheafants Eye.

Eight fpecies; viz. * ettivalis, * autumnalis, flammea, vernalis, apenuina, filia, capenfis, veficatoria. S. Europe, Сарс.
1086. Ranunculus, or Crow-fost.

6 fpecies': viz. * Hammula, * reptans, * lingua, now diflorus, * gramineus, pyrenæus, parnaffifolius, ophiogloffoides, amplexicaulis, bullatus, falfuginofus, * fica~ ria, frigidus, thora, creticus, caffubicus, * auricomus, abortivus, trilobus, * fceleratus, aconitifolius, platanifolius, fpicatus, illyricus, flabellatus, afiaticus, japonicus, rutæfolius, glacialis, feguieti, nivalis, montanus, gonani, alpeltris, lapponicus, hyperboreus, monfpeliacus, penfylvanicus, ternatus, * bulbofus, philonotis, polyrhizos, * repens, polyanthemos, * acris, cappadocicus, lanuginofus, chærophyllus, millefoliatus, parvulus, oxyfpermus, * arvenfis, muricatus, * parvilorus, orientalis, grandiflorus, falcatus, polyphyllus, * hederaceus, * aquatilis, fluviatilis. Europe, Afia, N. America.

* R. leaves heart-flaped, angular, on leaf-ftalks; ftem ficarie. I-flowered; flowers with eight petals; calyx with three leaves.-This is a very fmall plant, found in mofl meadows, and by bedge fides. The roots confift of flender fibres with fome little tubercles among them, which are fuppofed to refemble the hæmorrhoids: from thence it has been concluded, that this root muft needs be of wonderful efficacy for the cure of that diftemper. To the tafte it is little other than mucilaginous; and although fill retained in feveral of the foreign pharmacopocias, it is bardly in ufe in this country.
* R. leaves egg-fpear-hhaped, on leaf-ftalks; ftem de-famma/s clining.-This plant is very acrid ; applied externally, it inflames and blifters the kin . Horfes eat it. Cows, fheep, goats, and fwine refufe it. Its acrimony rifes in diftillation. Some years ago, a man travelled in fereral parts of England adminiftering vomits, which like white vitriol, operated the inftant they were fwallowed. The diffilled water of this plant was his medicine. It is faid, that in the cafe of poifon being fwallowed, or other circumftances occurring, in which it is defireable to make a patient vomit inftantaneoully, it is preferable to any other medicine yct known, and does not excite thofe painful contractions in the upper part of the flomach, which the white vitriol fometimes does, thereby defeating the intention for which it was given.
* R. lower leaves hand-fhaped, the upper fingered; fcelerotus fruit oblong.-The whole plant is very corrofive ; and beggars are faid to ufe it to uicerate their feet, which they expofe in that fate to excite compaffion. Goats eat it. Cows, horles, and theep refufe it.
* R. cal. expanding; fruit-ftalks cylindrical ; leaves acris, with three divifions, and many clefts, the uppermoft D d

210
frap-nlaped.--Sheep and goats cat it. Cows, hories, and fwine refufe it. Cuws and horfes leave this plant Lntouched, though their pafture be ever fo bare. It is very acrid, and eafily blifters the $\mathbb{k} i n$.
arvenfis.

* R. Seeds prickly; upper leaves doubly compound, ftraf-fhaped.- It has lately been faid that cows, horfes, and foeep, in Italy, eat it greedily, though it is fo acrid as to poifon the latter. Three ounces of the juice killed a dog in four minutes. lts growing chicfly, if not folely, in corn-fields where catile are excluded, may pofibly be the reafon why we have nct lieard of mifchief being done by it in this country.
- ic87. Troluvs, or Glote-ranunculus.

Tiso fpecies; riz. * europæus, afiaticus. Europe, Al:3.

## io88. Isopyrem.

"Three 〔pecies; viz. fumarioides. thal!êroides, aquilegioides. Siberia, Alps of Auftria, Italy.

## ic8g. Heleeaorus, or Black Hellebore.

Eight fpecies; vizo byemalis, ranunculinus, niger, * viridis, orientalis, * fcetidus, lividus, trifolius. AuAtria. Italy, Conada.
fatidus.

* H. Alen manv-flowered; leafy; leaves bird-footed. Bearsfoot, or Helliborafier. - The leaves of this plant, taken in feveral different forms, have been by fome recommended as a very powerful anthelmintic. They are particularly extolled by Dr Bifett, in his effay on the medical conflitution of Great Britain, efpecially under the form of fyrup, made by moittening the leaves of the freft herb in vinegar, and then preffing out their juice, which was formed into a fyrup with coarfe lugar. Of this fyrup, Dr Biliett gave to children from two to fix years of age, onc tea-?poonful at bed-time, and another in the morning, fortwo or three days fucceffively. The dofe was increafed or diminifhed according to the frength of the palient; and in this way he found it bery fucceffful in the expultion of lumbrici.

Where the helleborafter is to be employed, this form is perhaps the beff, and we doubt not that it may fucceed where others have failed; but it Phould not, we apprehend, be employed till fafer anthelmintics have been tricd in vain. For we have heard of fome infances whete the imprudent adminiftration of it has been attended even with fatal confequences.

The fyccies called belleborus niger, black hellehore or melampodium, grows wild in the mountainous parts of Switzerland, Auftria, and Stiria; the earlinefs of its flowers, which fonetimes appear in December, has gained it a plice in our gardens. In fome parts of Germany, a fpecies of hlack hellebore las been made ufe of, which nut unfrequently produced violent and fometimes deleterious effects; this the Wirtemburg college particularly caution againf, though without mentioning any marks by which it may be difringuifhed, or even giving the precife name of the plant. It appears to be the futid hellebore of Limmeras, called in Erigland, where it grows, fetterwort, fettlewort, or baflard hellebore; the roots of this may be diftinguifhed from the officinal Sort by their being lefs black. The roots of the poifonous aconites refemble in appearance thofe of thie black hellebore; and in the Breflaw collections we find fome inftances of fatal effeets occafioned by milaking the former fur the latter:

A N Y.
thefe allo are happlly difonerable by their colour; the aconitum being lighicer coloured than even the palett of the black hellebores. The faculty of Paris, by alJuwing tle ufe of one of the paler hellebores (the green-flowered which grows wild in Ergland, and is called by our farriers peg.root) bave in fome degree deprived the thops of the benefit of this criterion. Since, therefore, the two noxious roots which the buyer is moft apt to milake for thic, are diftinguiliable from it by their colour, but have no other external mark by which they may be with certainty known, particular regard ought to be had to this circumflance; only the deepeft black being chofen, and all the paler roots rejected.

The tafte of the bellebore is acrid and bitter. Its acrimory is firt felt on the tip of the tongue, and then Spreads immediately to the middle, without being much perceived on the intermediate, part; on chewing it for a few minutes the tongue feems benumbed and affected with a kind of paralytic ftupor, as when burnt by eating any thing too hot; the fibres are more acrimonious than the head of the root from which they iflue. Black hellebore root, taken from fifteen grains to haif a dram, proves a frong cathartic, and as fuch has been celebrated for the cure of maniacal and other diforders proceeding from what the ancients called the atralifis; in thefe cales medicines of this kind are doubt. lefs occafionally of ufe, though they are by no means poffefted of any fpecific power. It does not however appear, that our black hellebore akls with fo much violence as that of the ancients, whence many have fuppofed it to be a different plant; and indeed, the deicriptions which the ancients have left us of their hellebore, do not agree to any of the forts ufually taken notice of by modern botanifts. Another fpecies bas been difcovered in the Eaftern countries, which Tournefort diftinguithes by the name of black oriental hellebore, with a large leaf, a lofy ftem and purplift flower; and fuppoles to be the true ancient hellebore, from its growing in plenty, about Mount Olympus, and in the ifland of Anticyra, celebrated of old for the production of this antimaniacal drug; he relates that a fcruple of this fort given for a dole, occafioned convulfions.

Our hellebore is at prefent looked upon principally as an alterative; and in this light is frequently employed in fmall dofes, for attenuating vifcid humours, promoting the uterine and urinary difcharges, and opening inveterate obftructions of the remoter glands; it often proves a very powerful emmenagogue in plethoric habits, where fteel is ineffectual or improper. An extract made from this roct with water, is one of the mildeft, and, for the purpofes of a cathartic, the mofl effectual preparations of it: this operates fufficiently, without occafioning the irritation which the pure refin is accompanied with. A tinclure drawn with proof firit contains the whole virtue of the hellebore, and fecms to be one of the beft preparations of it whendefigned for an alterative ; this tincture and the extract are kept in the flops.

The melampodium is the bafis of Bacher's tonic pills for the droply. The root is ordered to be macerated in rectificd fpirit of winc; the liquor exprefled is repeatedly mixed with water, and duly evaporated. This is rade up into pills, with an extract of mytrh
and powder of carduus benedictus. They are faid to be cathartic and diuretic, and at the fame time ftrength. eners of the folids.

## 1090. Caltha, or Marfb-marygold.

Two fpecics; viz. *paluftris, natans. Europe.
palufris. * C. The flowers of this plant gathered before they expand, and preferved in falted vinegar, are a good fubftitute for capers. The juice of the petals, boiled with a little alum, fains paper yellow. The remarkable yellownefs of butter in the fpring has been fuppofed to be catefed by this plant; but cows will not

A N I.
eat it, unlefs compelled by extreme hunger, and then, as fome fay, it occafions fuch an inflammation that they generally dic. Upon May-day the country people in England firew the flowers before their doors.
rogr. Hudrastis, or Yellow-root.
One fpecies; viz. canadenfis. Carolina, Canada.

## Order I. GYMNOSpERMIA.

1092. Ajuga, or Bugle.

10 \{pecies; viz. orientalis, decumbens, * pyramidalis, alpina, * genevenfic, * reptans, * chamæpithys, chia, iva, falicifolia. Europe.

* A. leaves 3 -cleft, flrap-fhapcd, very entire; flowers fitting, lateral, folitary; ftem freading.-This plant has a degree of bitterne?s and acrimony; bat
its real ufe is far from being afcertained. It ftands recommended in the gout, jaundice, and intermitting fevers.

1093. Teucrium or Germander.

64 fpecies; viz. campanulatum, lxvigatum, orientale, parviflorum, botrys, nifolianum, trifidum, pfeu-do-chamæpithys, fruticans, brevifolium, creticum, marum, quadratulum, multiflorum, regium, laxmanni, fibiricum, afaticum, cubenfe, arduini, canadenfe, virginicu:n,
ginicmm, japonicum, inflatum, villofum, hyreanicum, abutiloides, * fcorodonia, pleudo-fcorodonia, betonicum, refupinatum, maffilienfe, falviaftrum, * fcordium, fcordioides, * chamxdrys, heterophyllum, braEteatum, lucidum, nitidum, flavum, montanum, fupinum, thymifolium, pyrenaicum, rotundifolium, buxifolium, aureum, flavefcens, gnaphalodos, achæmenis, polium, trifoliatum, pfeudhyflopus, valentinum, capitatum, lufitanicum, pycnophyllum, verticillatum, libanitis, pumilum, anguftilimum, coelefte, fpinofurn. Europe, Perfa, N. Ámerica, W. Indies.
fiorodonia. *T. leaves heart-fhaped, ferrated, on leaf-ftalks; flowers in lateral bunches, pointing one way ; ftem up-rigbt.-The people of Jerfey are fald to make ufe of this plant in brewing. It poffelfes the bitternefs and a good deal of the flavour of hops; but, upon trial, it gave too much colour to the liquor.
fcordium. *T. leaves oblong, fitting, toothed, nakedifh; flowers in pairs, on fruitfalks, axillary; ftem pubefcent, fpreading.-The frefh leaves of this plant are bitter, and fomewhat pungent. Powdered, they deftroy worms. A decoction of this plant is a good fomentation in gangrenous cafes. If cows eat it, when compelled by hunger, their milk gets a garlick flavour. Sheep and goats eat it. Horfes, cows, and fwine, refufe it.
chuma=
drys.

A N Y.
fcrophularifolius. Siberia, S. Europe N. America-The leaves of hylfop have an aromatic fmell, and a warm pungent tafte. Befides the general virtues of aromatics, they are particularly recommended in bumoral afthmas, coughs, and other diforders of the breaft and lungs; and faid to promote expectoration : but fo little dependence is put upon any property of this kind, that hyffop has now no place in the Pharma. copceia of the London collge.

## 1097. Nepeta, or Nep, or Cat-mint.

27 fpecies; viz, * cataria, anguftifoliz, crifpa, heliotropifolia, pannonica, corrulea, violacea, incana, japonica, ucraniea, neperella, nuda, melifiafolia, hirfuta, italica, multibracteata, reticulata, tuberofa, lanata, f.ordotis, virginica, malabarica, indica, amboinica, madagafcarienfis, multifida, botryoides. Europe, India, N. America.

* N. Howers in fpikes; whirls on thort fruit-falks:cataria. leaves on leaf-Ralks, heart-haped, tooth-ferrated.-An infufion of this plant is deemed a fecific in chlorotic cafes. Tho ounces of the expretfed juice may be given for a dofe. Cats are fo delighted with this plant that they can hardly be kept out of the garden wherein it grows. Mr Miller fays, that cats will not meddle with it if it is raifed from feeds; and in fupport of this opinion quotes an old faying, "If you fet it, the cats will eat it ; if you fow it, the cats will not know it." It cannot well be planted without being more or lefs bruifed. Sheep eat it; cows, horfes, goats, and fwine, refufe it.

## tog8. Elisholtzia.

Two fpecies; viz. criftata, paniculata.

## 1099. Lavandula, or Lavender.

Eight fpecies; viz. fpica, foechas, viridis, dentata, pinnata, multifida, abrotanoides, carnofa. S. Europe, Madeira, Eaft Indies.

There are different varieties of the lavendula foica, particularly the narrow and broad leaved. The Howers of both have a fragrant fmell, to mof people agreeable, and a warm pungent bitterifh tafte; the broad-leaved fort is the frongeft in both refpects, and yields in diftillation thrice as much effential oil as the other; its oil is alfo hotter and fpecifically heavier: hence in the Southern parts of France, where both kinds grow wild, this only is made ufe of for the diflillation of what is called oil of fpike. The narrow-leaved is the fort commonly met with in our gardens.

Lavender is a warm fimulating aromatic. It is principally recommended in vertigoes, palfies, tremours, fupprefion of the menftrual evacuations; and in general in all diforders of the head, nerves, and uterus. It is fometimes alfo ufed externally in fomentations for paralytic limbs. The diffilled oil is particularly celebrated for deftroying various cutancous infeas. If foft fpongy paper, dipt in this oil, either alone or mixed with that of almonds, be applied at night to the parts infelted by the infects, they will certainly be all found dead in the morning. The officinal preparations of lavender are, the effential oil, a fimple fpirit, and a compound tincture.

The Lavendula Rachas is a fhrubby plant, confiderably fmaller than the common lavender. The flowery heads are brought from Italy and the fouthern parts of

France; they are very apt to grow mouldy in the paf. fage; and even when they efcape this inconvenience, are gencrally much inferior to thofe railed in our gardens. The beft flochas which we receive from abroad has no great fmell or tafte : Pomet affirms, that fuch as the flops of Paris are fupplied with is entirely deftitute of both; whill that of our own growth, either when frefh, or when carefully dried, has a very fragrant frell, and a warm, aromatic, bitterifh, fubacrid tafte: diftilled with water, it yields a confiderable quantity of a fragrant effential oil; to rectifed fpirit it imparts a frong tincture, which infpiffated proves an elegant aromatic extract. This aromatic plant is rarely met with in prefcription; the only officinal compofitions into which it was admitted were the mithridate and theriaca.

There is another plant called fachas, which from the beauty and durability of its flowers has of late years had a place in our gardens, and whofe aromatic qualitics render it worthy of attention; this is the gnaphalium arenarium, the golden focchas, goldilocks, or yellow caflidony: its flowers fland in umbels on the tops of the branches; they are of a deep fluining yellow colour, which they retain in perfection for many years; their fmell is fragrant and agreeable, fomewhat of the mufky kind; their tafe warm, pungent, and fubaftringent; they impart their flavour to water in diftillation and by infulion to rectified fpirit.

## 1100. Sideritis, or Iron-wort.

20 Species; viz. canarienfis, candicans, cretica, montana, elegans, romana, fyriaca, taurica, diltans, perfoliata, ciliata, incana, virgata, glauca, hyfopifolia, fcordioides, fpinofa, hirfuta, ovata, lanata. S. Europe, Canary, Madeira.

## iol. Bystropogon.

Seven fpecies; viz. pectinatum, fidæfolium, fuaveolens, plunofum, origanifolium, canarienfe, punctatum. Madeira, Canary, Japan.
1102. Mentha, or Mint.

22 fpecies; viz. auricularia, * fylveftris, nemorafa, gratilima, niliaca, glabrata, * siritic, * rotundifolia, crifpa, * hirfuta, *aquatica, citrata, *' piperita, * fativa, dentata, * gentilis, * arvenfis, auffriaca, canadenfis, *pulegium, cervina, perilloides. Europe, Egypt, Canada.
viridis.

* M. Spikes oblong; leaves fpear-flaped, naked, ferraied, fitting; flamens longer than the bloffom.-The flavour of this fpecies being more agreeable than that of the others, it is generally preferred for culinary and medicinal purpofes. A conferve of the leaves is very grateful, and the difilled waters, both fimple and firituous, are univerfally thought plealant. The leaves are ufed in fpring falads; and the juice of them, boiled up with fugar, is formed into tablets. The difilled waters, and the effential oil, are often given to flop re:ching, and frequently with fuccefs. Dr Lewis fays, that dry mint digefled in rectified fpirit of wine, gives out a tincture which appears by daylight of a fine darkgreen, but in candlelight of a bright red colour. The $f_{\mathrm{a}} \mathrm{Ct}$ is, that a fmall quantity of this tincture is green either by daylight, or by candelight; but a large quantity of it feems impervious to common daylight;

Vol. IV. Part 1.
however, when held betwecn the eye and a calbie, or between the eye and the fun, it appears red; fo that if put into a flat bottle, it appears cither grec: or red, as it is viewed through the flat fide or through the edge of the bottle.

* M. leaves egg-haped, on leaf-falks; Alamens thorter fiperita. than the blofom.-The Rem and leaves of it are befet with numbers of very minute glands, containing the effential oil, which rifes plentifully in difillation. Pep. permint-water is well known as a carminative and antifpafmodic. The effience of peppermint is an elegant medicine, and pofiefies the molt adive properties of the plant.
* M. leaves egg-flaped, acute, ferrated; ftamens as arven/is. long as blofloms.-This feecics prevents the coagulation of milk; and when cows have eaten it, as they will do largely at the end of fummer when the paflures are bare, and hunger diftrefies them, their milk can hardly be made to yicld cheefe; a circumftance which fometimes puzzles the dairy-maids. Horfes and goats eat it; hieep are not fond of it; cowi and fwine refufe it.
* M. leaves egz- Riaped, blunt, fomewhat folloped ; pultosium. fiems roundilh, creeping; famens longer than the blofom. - The exprefled juice of this plant, with a little fugar, is not a bad medicine is the hooping cough. A fimple and a fpirituous water, difilled from the dried leaves, are kept in the frops. They are prefcribed in hylterical affections, and are not without confiderable antifpafmodic properties. An infufion of the plant may be uled with the farme intention.

> noj. Parilea.

One fpecies; viz. ocymoides. India.
1104. Hyprss.

Four fecies; viz. verticillata, capitata, radiota, chämadrys.

## IIc5. Glechoma, or Gill, or Ground-Izy.

One fipecies; viz. hederacea. N. of Europe.
G. leaves kidney-fhaped, folloped.- The leaves of this plant, thrown into the vat with ale, clarify it and give it a flavour. Ale thus prepared is often drank as an antifcortutic. The expreffed juice, mixed with a little wine, and applied morning and evening, dell reys the white fpecks upon horfes eyes. Tbe plants that grow near it do not Rourilh. It is faid to be hurtful to horfes if they eat much of it. Sheep eat it; horfes are not fond of it ; cows, goots, and fwine, refufe it. Little protubcrances, compofed of many cells, are fome. times found upon the leavcs, and are occafioned by infects.
inev. Lamium, or Dead-nithle.
13 fpecies; viz. ovvala, litvigatum, rugofum, garganicum, maculatum, * abbum, * molle, *purpureum, incifum, bifidurn, tomentofum, * amplexicaule, multifidum. Europe.

* L. leaves heart fhaped, tapering to a point, forrated, on leaf-talks; flowers about 20 in a whirl.-This plant grows wild in hedges; and flowers in April and Nay. The Howers have been particularly celebraied in uterine tluors and other female we linefles, and :1o in diforders of the lungs; but they appear to be of very weals virtue, ard are at prefent litele ufed in Britain.

Ec
1107.

110\%. Galeopsis, or Medse-netle.
Fuar 反pecies; viz. *ladanum, * granditora, * tetrahit, * camabina. Europe.
1108. Betonich.

Eight fpecies; viz. * officiralis, ftricta, incana, orientalis, alopecuros, hirfuta, grandiflora, heraclea.
oficinalis. * B. Pike interrupted: bloffoms, upper lip entire; In:"er lip, the urper legment notched: calyes fmooth-iti.- This is a low plant, growing in woods and fhady places, in feveral parts of fingland; the tlowes come forth in Junc or fuly; they are of a purplifh colour, and Itand in fpikes on the tops of the llalks. The leaves and flowers have an herbaceous, soughilh, fomewhat bitterith tafte, accompanied with a ve:y weak aromatic Havour. This herb has long been a favourite among writers on the materia medica, who have not been wanting to attribute to it abundance of good qualities. Experience does not difcover any other virtue in betory than that of a mild corroborant; as fuch, an infufion or light decoction of it may be drank as tea, or a faturated tincture in rectified fpirit given in fuitable clufes, in laxity and debility of the vifcera, and diforders proceeding from thence. The powder of the leaves, fnuffed up the nofe, provokes fneezing; and hence betony is fometimes made ant ingredient in fternutatory powders: this effect does not feem to be owing, as is generally fuppofed, to any peculiar fimulating quality in the leerb, but to the rough hairs which the leaves are covered with. The roots of this plant differ greatly in quality from the other parts; their tafte is bitter, and very naufeous; taker in a fmall dofe, they vomit and purge violently, and are fuppofed to tave fomewhat in common with the roots of hellebore. It is pretty fingular, if true, that betony affeets thofe who gather any contiderable quantity of it; with a diforder refembling drunkennefs, as affirmed by Simon Paulli and Barthollinus. From thefe fenlible qualities and operative effects, although it has now no place in our pharmacofceias, yet it is perhaps to be confidered as a regetable deferving farther attertion.

## 11еg. Stacays, or Bafo Horchound.

26 fpecies; viz. * fylvatica, circinata, coccinea, * paluftris, alpina, *germanica, intermedia, lanata, cretica, heraclea, tenuifolia, glutinofa, fpinofa, orientalis, palxllina, maritima, æthiopica, hirta, lavanduli§olia, rugofa, refta, arenaria, annua, * arverfis, latifolia, artemifa. Europe, Barbary, Cape, Carolima.
ffleution. * S. fix flowers in a whirl; leaves heart-fhaped, on leaf-flalks.-It will dye yellow. The whole plant has a lectid fmell, and toads are thought to be fond of living under its farde. Sheep and goats eat it. Horfes, cows, and fwine refufe it.

## 1110. Ballota, or Black Horehound.

Four feecies; viz. nigra, alba, dunata, difficha. Europe, Fift Indies.
13. leaves heart-fhaped, undivided, ferrated; calyx, lecth tapering to a point.-It flands recommended in hyRerical cafes. The Swedes reckon it almoft an univerfal remedy in the difeafes of their cattle. Horfes rows, heep, and goass rufufe it.

## ifis. Marrubium, or Worchound.

14 fpecies, viz. buflum, attracanicum, percgrinum, creticum, candidifrinum, fuperium, catarixtolium,

* vulgare, africanum, crifpum, hirfutum, hifpanicum, pfeudo-dictamnus, acetabulofum.
* M. teeth of the calyx, brifle flaped, hooked.-It vulgare. is very bitter to the talte, and not altogether unpleafant to the fmell. It was a favourite medicine with the ancients in obfructions of the vifcera. In large dofes it loofens the belly. It is a principal ingredient in the luegro Crefar's remedy for vegetable poifons. A young man who had occalion to take mercuriat medicines, was thrown into a falivation which continued for more than a year. Every method that was tried to remove it rather increafed the complaint. At length Linmeus prefcribed an infufion of this plant, and the patient got well in a flort time. Horfes? cows, theep, and goats refure it.

## 1112. Leonurus, or Lions-tail.

Seven fpeeies; viz. crifpus, * cardiaca, marrubiaftrum, galeobdolon, fupinus, tataricus, fibiricus. Ruffia, Siberia, Auftria.

* L. Hem-leaves (pear-flaped, 3 -lobed. The leaves cardiaca. have a flrong but not agreeable fmell, and a bitter tafte. Goats, fheep, and horfes eat it. Cows are not fond of it. Swine refufe it.

11i3. Phlomis, or Jerufalem Sage.
27 fpecies ; viz. fruticofa, purpurea, italica, nifolii, armenica, lychnites, laciniata, famia, crinita, biloba, pungens, herba venti, alpina, tuberofa, zeylanica, martinicenfis, urticifolia, decendentata, billora, chinenfis, indica, moluccoides, glabrata, alba, nepetifolia, leonurus, leonites. South Europe, Cape, Eaft and Weft Indies.

## 1114. Moluccella, or Molucco Balm.

Six fpecies; viz. Cpinofa, lievis, tuberofa, perfica, frutcfeens, grandiflora. Siberia, Levant, India.
1115. Cinnopodium, or Field Bafil.

Three fpecies; viz. *vulgare, ægyptiacum, inca.. num. Europe, Egypt, North America.

## 1ir6. Origanum, or Wild Marjoram.

16 โpecies; viz. :xgytiacum, dictamnus, fipyleum, tournefortii, ciliatum, benghalenfe, creticum, finyrnæum, heracleoticum, * vulgare, glandulofum, onites, §yriacum, maru, majorana, majoranoides. S. Europe, Egypt, Carolina.

* O. fpikes roundinn, panicled, cluftered; floral leaves vulyarez egg-haped, longcr than the calyx.-The whole plant is a warm aromatic. The dried leaves, ufed inftead of tca, are exceedingly grateful. The effential oil of this plant is fo acrid, that it may be confidered as a cauntic, and is much ufed with that intention by farriers. A little cotton wool moifened with it, and put into the hollow of an aching 10oth, frequently relieves the pain. The country people ufe the tops to dye purple. Goats and heep eat it. Horles are not fond of it. Cows refufe it.
The orignnum ditlamnus is a kind of origanum faid to grow plentifully in the in:and of Candy, in Dalmatia, and in the Morea; it has been found hardy enough to bear the ordinary winter of our climate. The leaves, which are the only part in ufe with us, come from Italy. The beft fort are well covered over with a thick white down, and now and then intermixed with purplifi flowers. In fmell and talle they fomewhat refemble lemon thyme: but have more of an aromatic

## Didynamia.

ftavour, as well as a greater degree of pungency. When froth they yield a confiderable quantity of an excellent eflential oil; but they have now no place cither in the London or Edirburgh Pharmacopreias.

The origanum majorana is raifed annually in our gardens for culinary as well as medicinal ules; the leeds ate commonly procured frum the fouthern parts of France, where the plant grows wild. It is a modcrately warm aromatic, yielding its virtues both to aqueous and fpirituons liquors by infufion, and to water in dillillation. It is principally ufed in diforders of the liead and norves, and in the humoural anthmas and catarths of old people. An efintill oil of the herb is kept in the fhops. The powder of the leaves proves an agreeable errhine, and enters the othcinal 隹nutatory powder.

## 1II7. Thymus, or Tbyme.

22 fpecies; viz. * ferpyilum, lanuginofus, lavigatus, vulgaric, lanceolatus, numidicus, zygis, marftal. lianus, inodorus, * acinos, patavinus, alpinus, montanus, piperella, brownei, filiformis, cephalotus, ftriatus, villofus, mallichina, tragoriganum, virginicus. Europe, N. America, Jamaica.

* T. flowers in heads; fems creeping; leaves flat, blunt, fringed at the bale.- The whole plant is fragrant, and yields an effential vil that is rery heating. An infufion of the leaves removes the headach occafroned by the debauch of the preceding evening. A general opinion prevails, that the fleft of theep that feed upon aromatic plants, particularly upon thyme, is much fuperior in flavour to common mutton: but fome fay this is a vulgar error, that theep are not fond of aromatic plants; that they will carefully pufh afide the thyme to get at the grafs growing beneath it ; and that they never touch it unlefs when walking apace, and then they will catch at any thing. The attachment of bees to this and other aromatic plants is well known. Sheep and goats eat it. Swine refufe it.

## ini8. Melissa, or Balmo.

Seven fpecies; viz. officinalis, grandifora, * calamintha, * nepeta, pyrenaica, cretica, fruticofa. South of Europe.

The meliffa officinalis, when in perfection, has a plea. fant fmell, lomewhat of the lemon kind, and a weak roughilh aromatic talle. The young hoots have the ftrongeft flavour ; the flowers, and the herb itflf when old, or produced in very moilt rich foils, or rainy fea. fons, are much weaker both in fmell and tafte. Balm, the herb of this plant, is appropriated by the writers on the materia medica, to the head, Romach, and uterus; and in all diforders of thefe parts is fuppofed to do extraordinary fervice. So high an opinion have fome of the chemifts entertained of balm, that they have expected to find in it a medicine which thould prolong life beyond the ufual period. The prefent practice, however, holds it in no great efteem, and ranks it, where it certainly deferves to be, among the weaker corruborants. In diftillation it yields an elegant effential oil, but in very fmall quantity; the remaining decoction taftes roughifh. Strong infufions of the lierb, trank as tea, and continued for fome time, have done fervice in a weak lax tate of the vifcera; thefe liquors, lightly acidulated with juice of lemons, turn
A. $\mathrm{N} \quad 1$.
of a fime reddifh colour, and prove an ufeful, and to many a very grateful, drink in dry parching fevers.
ifig. Dracocephalum, or Dragon's-bead.
18 fpecies; viz. virginianum, denticulatum, canarienfe, pimatum, origanoides, palmatum, peregrinum, fruticulofum, auftriacum, ruyfchiaua, grandithorum, altaienfe, fibiricum, moldavica, canefcens, peltatum, tu tans, thymiRorum. N. Europe, N. America, Canaries.

> 1120. Melirris, or Bafe-balm.

Two fpecies; viz. * melifophyllum, japonica.
1t21. Ocimum, or Bafil.
27 Species; viz. thyrfiflorum, inflexum, virgatum. monachorum, gratilimum, album, tomentofum, grandiflorum, bafilicum, minimum, integerrimum, fanctum, rugofun, crifpum, fcabrum, anericanum, verticillatum, acutum, tenuiforum, polyfachyon, Cerpyllifolium, menthoides, molle, adfcendens, fcutellarioides, proftratum, capitellatum. Perfia, E. Indies, Japan, Chili.

## 1122. Plectranthus.

Six fpecies; viz. fruticofus, galeatus, nudiforus, for dioeli, craftifolius, punctatus. Africa.

## I: 23 . Trichostema.

Two fpecies; viz. dichotoma, brachiata. Nortb America.

## imz. Scutellaria, or Scull-cap.

I 7 fpecies; viz. orientalis, albida, alpina, lupulins, laterifora, * galericulata, haftifolia, minor, integrifolia, havanenfis, purpurafcens, hyffopifolia, peregıina, columnæ, indics, altiflima, cretica. Europe, China, N. America.

* S. leaves heart-โpear-thaped; fcolloped fowers axil salericư-lary.-When the bloffom falls off, the cup clofes upon lata. the feeds, which when ripe, being fill fmaller than the cup, could not poflibly open its mouth, or overcome its elaftic force, as the down of the feeds do in the com. pound flowers. and muft confequently remain ufelefs, without a poffibility of efcaping. But nature, ever full of refources, finds a method to difcharge them. The cup grows dry, and then divides into two parts; fo that the feeds, already detached from the receptacle, fall to the ground. Cuws, goats, and fleep eat it; horfes and fwine refufe it.

## 1125. Prúnella, or Sclf-beal.

Three fpecies; riz. * vulgaris, granditlora, hyfopifolia. Europe, Barbary.
1126. Cleonia.

One fpecies; viz. lufitanica. Spain, P.rtugal.
II27. Prastum, or Sbrubby IUedge-riettle.
Two fpecies; viz. majus, minus. Spain, Italy, Carolin3.

1Iz8. Phryma.
Two fpecies; viz. leptultachia, dehifcens. North America.

II29. Selagc.
20 fpecies; viz. corymboia, cinerea, polyftachya, verbenacea, rapunculoides, fpursa, lurta, rotunditolia, fafciculata, polygaloides, ovata, coc inea, caneicens, geniculata, divaricata, capitata, triquetra, fruticofa, hifpida, ciliata. C. of G. Hope.

Eez
Orper
1138. Gezardia.

Order 1I. ANGIOSPERMIA.
1izo. Bartsia.
Five fpecies; viz. coccinea, pallida, * vifcofa, oymnandra, *alpina, Alps of Europe, Hudfon's Bay.

## iiji. Rhinatrule, or Elephants-head.

10 fpecies; viz. orientalis, elephas, ${ }^{* *}$ crita-galli, trixago, maximus, verficolor, capenfis, indicue, virginicus, tifidus. Europe, Cape, India, Virginia.

1Ij2. Euphrasta, or Eyc-lright.
I2 fpecies; viz. latifolia, ${ }^{*}$ oficinalis, falifburgenfis, tricufpidata, cuneata, * odontites, lutea, linifolia, vifcofa, purpurea, longifora, afpera. Europe.
officinalis.

* E. leaves egg-fhaped, ferrated, fharyly toothed.-It is a weak aftringent, and was formerly in repute as a remedy for inplaired vifron. It will not grow but when furrounded by plants taller than itfelf. Cows, horfes, goats, and fheep eat it. Swine refufe it.

## if33. Melampyrun, or Cozu-zubeat.

Seven fpecies; viz. * criftatum, * at venfe, barbatum, nemorofum, *pratenfe, * fylvaticum, lineare. Eur.
arvenje. * M. fpikes conical, loofe ; thoral leaves, with briftlemaped teeth, coloured.- The feeds when ground with corn give a bitterift and grayifb caft to the bread, but do not make it unwholefome. Cows and goats eat it. Sheep refufe it.
pratenfe. * M. flowers lateral, pointing one way: leaves in diftant pairs; bloffoms clofed.- Where this plant abounds, the butter is yellow and uncommonly good. Swine are very fond of the feeds. Sheep and goats eat it. Cows are very fond of it. Horfes and fwine refufe it.

## 1134. Lathreta.

Three fpecies; viц. clandeltina, aublatum, * fquamaria. Europe.
1135. Schwalbea.

One fpecies; viz. americana. N. America.
1136 . Tozzia.
One fpecies; viz. alpina. Alps of Auftria, Italy, Pyrenuees.

1×37. Pedicularis, or Rathe-coxcomb.
34 โpecies; viz. * paluifris, * fylvatica, euphrafioides, myriophylla, fpicata, refupinata, fceptrum carolinum, triftis, lapponica, afplenifolia, Hlava, Atriata, fudetica, recutita, elata, foliofa, canademis, groenlandica, incarnata, uncinata, interrupta, verticillata, acaulis, Hammea, hirfuta, rofea, roftrata, tuberofa, gyroflexa, fafciculata, rubens, compacta, achilleifolia, comofa. Europe, N. America.
paluftis.

* P. ftem branched; calyx crefted with callous dots; lip of the bloffom flanting.-This plant is an unwholefome gueft in meadows, being very difagreenble to cattle. Goats eat it. Horfes, fheep, and cows refure it. Swine are not fond of it.
fylvatica. *P. ftem branched; calyx oblong, angular, fmooth; lip of the bloffom heart-flaped.- The expreffed juice, or a decoetion of this plant, has been ufed with advaritage as an injection for finuous ulcers. It is faid, that if the healthieft flock of fleep be fed with it, they become feabby and feurfy in a Chort time; the wool will get loofe, and they will be ovcrun with vermine. Cows and fwine refufe it.

12 โpecies; viz, tuberofa, delphiniolia, purpurea, tenuifolia, tubulofa, nigrina, flava, fcabra, pedicularia, japonica, glutinofa, fuffilifolia. E. Incies, China, Japan, N. America.
1139. Chelone, or Humming-Zird Trce.

Four fpecies; viz. glabra, obliqua, ruellioides, barbata. N. America.

## ilyo. Pentsternon.

Four fpecies; viz. hirfuta, pubefcens, lævigata, campanulata. N. America.

II4I. CyRilif.
One fpecies; viz. pulchella. Jamaica.
iffz. Gloxinat.
One fpecies; viz. maculata. Guiana.

## it +3 . Gesneria.

II fpecies ; viz. lumilis, corymbofa, acaulis, pumila, $^{\text {, }}$ craniolaria, grandis, tomentola, fcabra, exferta, calycina, ventricofa. Jamaica, Hifpan. S. America.

## 1144. Antirrhinum, or Snap-dragon, Calves-fnout.

70 fpecies; viz. * cymbalaria, pillfum, lanigerum, dentatum, heterophyllum, * elatine, elatinoides, * fpurium, ${ }^{\text {ºirrhofum, ægyptiacum, fruticofum, hexandrum, }}$ triphyllum, latifolium, virgatum, triornithophorum, purpureum, verficolor, linarioides, * repens, monfpeffulanum, fparteum, bipunctatum, amethyftinum, laxiflorum, trifte, helava, thymifolium, fupinu:n, fimplex, * arvenfe, pelifictianum, parviflorum, Havum, faxatile, micranthum, vifcofum, aparinoides, multicaule, reticulatum, ruarginatum, glaucum, alpinum, aphyllum, bicorne, macrocarpum, villofum, origanifolium, Hexuofum, * minus, dalmaticum, hirtum, geniftifolium, junceum, * linaria, linifolium, lagopodioides, canadenfe, chalepenfe, reflexum, pedunculatum, * majus, ficulum, fempervirens, * orontium, papilionaceum, afarina, molle, pinnatum, unilabiatum. Europe, Egypt, Barbary, Cape.

* A. leaves heart fhaped, 5 -lobed, alternate ; Atems cymbala~ trailing.-Its trailing branches, varioufly interwoven, ria. often cover old moift walls with a thick tapeltry, and when in bloffom, make a beautiful appearance.
* A. leaves halberd-flaped, alternate ; ftems trailing- elatine. -This is confiderably nore bitter than the other fpecies, and is faid to have been ufed fuccefffully in cafes of foul ulcers, and in cutaneous eruptions.
* A. leaves fpear-itrap-fhaped, crowded; Atem upright ; linaria. fikes terminating, fitting.-An infufion of the leaves is diuretic and purgative. An ointment, prepared from them, gives relief in the piles. The exprefled juice, mixed with milk, is a poifon to flies, as is likewife the fmell of the flowers. Cows, horfes, and fwine, refufe it. Sheep and goats are fond of it.
* A. blofloms without a fpur ; flowers in fikes; cups majus. rounded.-Though the feeds of this phat vegetate on the ground, it is only in diy foils and fituations that the plant continues to live long enough to produce flowers.

1145. Anarrhinum.

Five fecies; viz. bellidifolium, pedatum, futicofum, craffifulium, tencllum.
1146. Cymbaria.

One fpecies; viz. daurica. Dauria.

## Didynamia.

1147. Tourrettia.

One fpecies; viz. lappacea. Ifte of Bourbon.
1年8. Martynha.
Four fpecics; viz. diandra, carnioiasin, probofiden, longillora. Cipe, America.

1hy. Torexia.
Two fpecies; viz. sfiatica, hirfuta. India.
1150. Besleria.

Eight fpecies; riz. multifulia, lutea, violacea, incamta, ferrulata, crifuta, coccinea, bivalvis. Welt Insies, S. America.

## hist. Drunfelsha.

Two fpecies; viz. amcricana, undulata. WT. Indies.
1152. Sciophularia, or Fig-wort.

26 fpecits; viz. marilandica, ${ }^{*}$ nodofa, ${ }^{*}$ aquatica, auriculata, appendiculata, * fcorodonia, glabrata, betonicifolia, orientalis, frutefiens, rupeitris, heterophyl1a, altaica, ${ }^{*}$ vernalis, arguta, trifoliata, fambucifolia, mellifera, hifpida, canina, lucida, variegata, chinenfis, meridionalis, coccinea, peregrina. Europe, Barbary, Madeiva, America.
nodifa. * S. leaves oblong-heart-flaped, 3 .fibred at the bafe; corners of the ftem acute. This plant is hardly known in modern practice; but the rank fmell and bitter tafte of the leaves feem to indicate fome active properties. Swine that have the fab are cured by wafhing them with a decogtion of the leaves. Goats eat it. Cows, horfes, hieep, and fwine refufe it.

## 1153. Celsia.

Five fpecies; viz. orientalis, ardurus, coromandelina, cretica. Ciete, Levant, E. Indies.
1154. Hemimeris.

Five fpecies; viz. mostana, fabulofa, diffufa, urticifolia, coccinea. C. of G. Hope.
1155. Digitalis, or Fox-glore.

12 fpecies; viz. * purpurea, minor, thapfi, parviflora, lutea, ambigua, ferruginea, orientalis, lanata, obfcura, canarienfis, fceptrum. S. Europe, Canary, Madeira.
aurpurea. * D. fegments of the calyx egg-fhaped, acute; bloffom blurt, upper lip nearly entire.-This fpecies is certainly a very active medicine, and merits more attention than modern practice till very lately beftowed upon it. It grows wild in woods and on uncultivated hearlis: the elegant appearance of its purple flowers (which hang in fpikes along one fide of the flalk), has gained it a place in fome of our gardens. The leaves have been frongly recommended, externally, againit fcrophulous tumours, and likewife internally, in epileptic diforders; what fervice they may be capable of doing in thefe cafes, is not afcertained by accurate experiments. Several examples are mentioned by medical writers of their occafioning violent vomiting, hypercatharfis, and difordering the whole conflitution; infomuch that Bocrhaave accounts them poifonous. Their tafte is bitter, and very naufeous. Digitalis, however, has lately been employed with great fuccefs in other difeafes. A treatife has lately been publithed hy Dr Withering, profeffedly on the fubject of its ufe in medicine, and containing many inporiant and ufeful obfervations.

An infufion of two drams of the leaf, in a point of water, given in half-ounce dofes every two hours or
fo, till it hegin to puke or pwire, i. warmentued in dropfy, particularly that of the breall. It is faid it have produced an evacuation of water fo copious and fudden, in afcites, by tiool and urine, that the compreffion of bandages was found necefrary. The plentiful ufe of divents is ordered during its operation. The remedy, however, is inadmifible in many weakly patients. But befides being given in irfufion, it has alfo been employed in fubfance; and when taken it bed-time, to the extent of one, two, of three grai:s of the dried powder, it often in a fhort time operates as a very powerfu! diuretic, without producing any other evacuation. Even this quantity, howerer, will fumetimes excite very fevere vomiting; and that too, occurting uncxpectedly. During its operation, it has often very remarkable influence in rendering the pulfe nower ; and it frequently excites very confiderable ver. tigo, and an affection of vifion.

Belides dropfy, cligitalis has of late been employed in forme inflances of hiemopty fic, of phethifis, and of mania, with apparent good effeets. But its ufe in thefe difeafes is much le!'s common than in dropfy.
1156. Incarvillata!

## One fecies; viz. finenfis.

1157. Bignonia, os Trumpet-fo:wer.

54 Ppecies; viz. catalpa, longithma, tomentofa, li-neari-, fempervirens, tenuifliqua, callinoides, obtufifolia, microphylla, unguis, ftaninea, æquinoctialis, alliacea, fpectabilis, laurifolia, rigefcens, Iadifiora, paniculata, elongata, corymbifera, crucigera, grandifolia, capreolata, pubefcens, villofa, echinata, heterophylla, riphylla, mollis, hirfuta, pentaphylla, orbiculata, cheyfanth, fluviatilis, leucoxylon, ferratifolia, radiata, radicans, grandiflora, fians, africara, bijuga, racemofa, compreffa, fpathacea, cleclonoides, variabilis, alba, peruviana, indica, longifolia, proccra, cerulea, brafiliana. E. and W. Indies, Amcrica.

## In the clafs Didynamia are

123 Genera, which include 1006 Species. Of ther72 are found in Britain.

CLASSIS XV.
TETRADYNAMIA. (E)

## Ordo IV. SILICULOS $£$.

Seet. I. Silicu'a integra, nec apice emarginata.

* 1225. Draba. Silic, valvulis planiufculis. Stylus nullus.

1234. Lunaris. Silic. valvulis planis pedicellata. Stylus exfertus.

* 1224. Subularia. Silic. valvulis femiovatis. Sty. lus brevior filicula.
* 1216. Myagrum. Silic. valvulis concavis. Stylus perfiftens.

CLASS XV.
TETRADYNAMIA, or four long A:d fwn SHORT STAMENS.

Order I. Siliculos $E$, or thofe having a Pouch, or broad Pod.

Sect. I. The Pouch entive, not notched at the point.

* D. Pouch with flattened valves. No flyle.
L. Pouch on a pedicle with flat valves. Style protruding.
* S. Pouch with half-oval valves. Style fhorter than the pouch.
- M. Pouch with concave valves. Style ferma. nent.
* 1222 。
(E) In the flowers of this clafs of plants there are fix flamens, four of them long and two fhort. It is allo moit worthv of notice, that the flowers of this clafs have uniformly four petals, a circomfance which renders it eafy to difinguifh them. The difference in length of the flamens is not always very obvious, but as the $\mathrm{H} \cdot \mathrm{x}-$ andria clafs contains no plants with four petale, th's laf circumflance readily dillinguifles the plants of the prefent clafs. The orders are two , and are diftinguifthed by the figure of the feed-velfel, which in the firf order is a broad and thort pouch; that is, a roundih fat feed-veffel furnihed with a flyle, which is fometimes as lngg as the feel-veffel itlelf. In the fecond order, the feed-vefil is a long pod; that is, a very long feed-veffel, without any reatork b'e tlyle. 'This is a natural rather than an artificial clate. The plants belonging to it are called antiforbutic, and their tafte is acrid and watery: They lofe molt of their virtuts by drying. None of them
* 1222. Velela. Silic, valuelis difiepimento dimidio brevioribus.

* 1244. Turritis. Peiala crecta.
* 1256. Demtaria. Silifz. valvis revolutis dehifcentibus.

1235. Ricotia. Siliq. unilocularis.

Seat. II. Caly: bians, folislis Juperne diflantibus.
1249. Cleome. Siliq. dehifcens, unilocaibris.

A N Y.
Tetradynamia.

* V. Pcuch with valves fhortet by half than the partition.
C. Pouch fpear-fhaped, 2 -jointed, with 1 -feeded joints, the laft joint retiring.
P. Pooch placed crofsways, beaked on both fides, no valves, 1 -feeded.
* B. Pouch 4 -fided, without valves, 2 or 4 -celled, wrinkled.
* C. Pouch bulging, I-celled, 1 -feeded, without valves.

## Sect. II. Pouch with a notched end.

## * I. Two outer petals large.

A. Some filaments in the inner fide toothed. Pouch 2.celled.
C. Pouch round and flat, with flat valves, deciduous.
P. Pouch round and flat, compreffed plane, not opening.

* C. Pouch heart-fhaped, with blunt bulging valves.
* L. Pouch heart-fhaped, with valves fharply keeied.
* T. Pouch heart-fhaped, reverfed ; valves keel-bordered.
* I. Pouch heart-reverfed ; keeled valves, divifible in. to 2, I-feeded ; window-flaped partition.
B. Pouch 2-lobed above and beneath, with a keelfliaped border.
A. Pouch bluntly notched at the end. Valves long, with a dagger-pointed partition.

Order II. SILIOUOSA, or thofe having a long Pod.

Sect. I. Caljx /but by leafets clofing lengthwife.

* R. A jointed pod.
* E. Pod 4-gon.
* C. Pod, with a feed-bud marked on both fides with a gland.
* H. A gland between the frorter flamens. Petals oblique.
* A. Four glands between the leafets of the calyx. Stigma undivided.
* B. Two glands betwixt the fhorter flamens, 2 beyond the longer famens.
C. Pod a little fwelling out, with the laff feed in a feparate joint.
* T. Petals erect.
* D. Pod with valves rolled back, open.
R. Pod I-celled.

Sea. II. Caljx open, with Leafets dijant above.
C. Pod open, i-celled.
are poifonous. It is not a little fingular, that they are moft acrimonious in moilt fituations, and wet feafons. Thus the cucblicario armoracin (horfe-radifl), growing near water, is fo very acrimonious that it can hardly be ufed; and the brafica rapa (earnip) wliofe root i:n a dry fandy foil is fucculent and fwect, in ftiff wet lands is hard and acrimonious.

* 1237. Cardartaeo Siliq. dehifcens, valvulis revolutis.
* t246. Stmapıs. Siliq. dehifcens. Cal. horizontaliter patens.
* 1238. Sisymbrium. Siliq. dehifcers, valvis rectiufculis. Cal. patuluc.

1241. Heliophila. Siliq. dehifecns. Nectaria 2 recurvata.

- G. Pod open, with valves rolled back.
* S. Pod open. Cal. horizontally expanding.
* S. Pod open, with valves rather flraight, Cal. open.
H. Pod open. Nectaries 2, bent back.

## Order I. Siliculos se.

## 12:6. Myagrum, or Gold of Pleafure.

12 fpecies; viz. pereme, orientale, rugofum, hifpanicum, perfolratum, chlorafolium, fativum, dentatum, auftriacum, paniculatum, fasatile, ægyptium. Europe, Egypt.
1217. Bunias, or Sea Rocket.
is fpecies; viz. Ipinofa, erucago, afpera, orientalis, cochlearioides, tatarica, fyriaca, myagroides, ægyptiaca, balearica, proftrata. Europe, Africa, America.
t218. Pugionium.
One fecies; viz. cornutum.
1219. Cakile.

Two fpecies; viz. maritima, exgyptiaca.

## 1220. Crambe, or Sea-sabbage, or Kale.

Eight fpecies; viz, * maritima, tatarica, orientalis, hifpanica, reniformis, filiformis, fruticofa, frigofa. Sea fhores of Europe, Madeira.
mariitima. * C. leaves and ftem fmooth. -The young and tender plants are boiled as cabbage; but when full grown they occafion giddinefs. Horfes, cows, goats, theep, and fwine eat it.

## 1227. Isatis, or $\mathscr{W}^{\prime}$ oad.

Four fpecies; viz. * tinctoria, lufitanica, armena, alpina. Sea Mores of Europe, Egypt.
fincloria. * I. root-leaves fcolloped; flem-leaves arrow.flaped; pouches oblong. -With the juice of this plant, it is faid, the ancient Britons painted their bodies to render themfelves more terrible to their enemies. It is much ufed by the dyers for its blue colour, and it is the bafis of many other colours. It is cultivated for their ufe. Cows eat it ; horfec, fheep, and goats refufe it.

> 1222. Vella, or Spanifb Crefs.

Two fpecies ; viz. * annua, pfeudo-cytifus. Siberia, Spain.
1223. Anastatica, or Rofe of Jericho.

One foecies; viz. hierochuntica. Auftria, Levant.
1224. Subularia, or Awh-qurt.
'T'wo fpecies; viz. * ąquatica, alpina. N. of Europe, $t$ rabia.
1225. Draba, or Whitlow-grafs.

16 fpecies; viz. aizoides, rigida, ciliaris, alpina, hifpida, * verna, caroliniana, nivalis, * ftellata, androfacea, pyrenaica. * muralis, nemoralis, hirta, *incana, magellanica. Alps of Europe, N. America.

Voz. IV. Part I.

* D. ftalks naked; leaves fparingiy ferrated; petalsverne. $\mathrm{d}_{\mathrm{ivi}}$ ided.-This is one of our earlieft flowering plants. It is good as a falad. Goats, fleep, and horfes eat it ; cows are not fond of it; fwine refufe it.

## 1226. Lepidium, or Dittander.

29 fpecies; viz. perfoliatum, veficarium, nudicaule, procumbeas, alpinum, calycinum, * perrxum, cardamines, fpinofum, fativum, lyratum, craffifolium, * latifolium, amplexic aule, glaftifolium, oleraceum, pifcidium, fubulatum, graminitolium, apetalum, fuffruticofum, * didymum, * ruderale, virginicum, divaricatum, iberis, pollichii, bonarienfe, chalepenfe. Europe, Cape, America, New Zealand.

* L. leaves egg-fpear-fhaped, entire, ferrated.-This is latifoliwne one of the antifcorbutics, and was formerly ufed in the place of horfe-radij). An infufion of it excites vomiting.

1227. Thlaspi, or Treacle Mufard.
if fpecies; viz. peregrinum, arabicum, * arvenfe, alliaceum, pfychine, faxatile, hirtum, * campeflre, * montanum, alpinum, * perfoliatum, * alpefre, * burfa paftoris, ceratocarpon. Europe.

Two forts of the thlafpi areinfe are ufed promifcu. oufly; they both grow wild : their feeds have an acrid biting tafte like common muftard, with which they agree in medical qualities.

The thlafpi burfo pafloris is common in wafte places, and is found in flower all the fummer. Shepherds-purfe, or the leaf, has long been celebrated as an aftingent. and flrongly recommended in diarthœeas, dyfenteries, uterine tluors, and in general in all difeafes where aftringents of any kird can avail. Some have efteemeed it fo powerful a Atyptic as fcarce to be fafely exhibited internally. Others have thought it to be of a hot fery wature, and fuppofed it to fop fluxes and hemorrhagies, by coagulating the juices like alcolol, and burning or fearing the orifices of the veffels. The fenfible qualities of flrepherds-purfe difcover little foundation for either of thefe opinions: it has no perceptible heat. acrimony, pungency, and farcely any aftingency: the taite is almon merely herbaceous, fo as fufficiently to warrant the epithet given to this plant fatuano it is hardly in ufe in Britain.

> 1228. Cochlearia, or Scuriy-grafs.

II fpecies; viz. * officinalis, *danica. * anglica, * groenlandica, fibirica, acaulis, * coronopus, * armoracia, macrocarpa, glaftifolia, draba. Europe.

* C. root-leaves heart-circular ; fem-leaves oblong, aoffrinariss little indented.-Notwithfanding this plant is a mative of the fea coaft, it is cultivated in our gardens withont any fenfible alteration of its properties. It poffeffes a
comiderabie destere of fatamony, and this acrimony feems to refide in a very fubtile efiential oil. Its effeets as an antifeorbutic are univerfally known, and it is a powetful remsdy in the pituitous allhma, and in what Sydenhan calls the Ccurbutic theumatifm. A diakilled water and a conferve are prepared from the leaves, and its juice is prefcribed along with that of vanges, by the name of antifcorbutic juices. It may be caten as a falad. Cows eat it. Hurfes, goate, and freep, refufe it.
cimbuat: - C. root-leaves fpear-fiapled, fcolloped; fiem-leaves faipt.-The root of this plant, fcraped, is in conmon Lee in Engiand as a condiment for fifl, roall beef, \&sc. and i: is cifed for many cther culinary purpofes. An infufion of it in cold milk makes one of the foftelt and beft cofinetice. In paralytic and dropfical cafer, it is a ufeful fimulant and diuretic. A ftrong infufion of it excites romiting. A diffilled water is prepared from it. Horfes, cows, goats, fleep, and fivine, refure it.
azstica. * C. a!! the leaves egg. Pear-finaped. - This is a pungent fimulating medicine; capable of diffolving vifcid juices, opening obflrutions of the vifcera, and the more diftant glands, and promoting the fluid lectetions; it is particularly celebrated in fcurvics, and is the principal herb employed in thefe kinds of diforders in the Borthern countries.

1229. Iberts, or Canduriuft.
i\& fecies; viz. fempertlorens, cappadocica, femper$\therefore$ :rens, gibzaltarica, faxatilis, vermiculata, rotundifolia, ecpafolia, carnofa, ciliata, parviflora, nana, umbellata, - amara, linifolia, odorata, * nudicaulis, pimata. S. Europe, Arabia, Perfia.

## 12jo. Alyssum, or Mudzaort.

3 fpecies; viz. fpinofum, maritimum, halimifclium, tenuifolium, faxatile, lunarioides, argentoum, slpefte, ierpyllifulium, atanticum, orientale, hyperboreum, incanum, minimum, ffricium, calycinum, fibiricum, fpathulatum, montanum, cortuofum, campefte, 注ifolium, clypeatum, cheiranthifolium, fenuatum, creticum, gemonenfe, dafycarpum, utriculatum, veficaria, deltoideum. Europe, N. America.
1231. Ciypeols, or Treasle-muhard.

One fpecies; viz. jonthlafpi. Italy, France, Caro!ina.

## 1232. Peltaria.

Three fpecies; viz. alliacea, garcini, capenfis. Cape.

## 1333. Biscutella, or Buchler-mufard.

Ten fpecies; viz. auriculata, apula, lyrata, raphaniSolia, coronopifolia, levigata, fubipathulata, montana, Sempervirens, peruviana. Europe, N. America.

1234 Lunaria, or Moon-wort, Flonefy.
Two fpecies; viz. rediviva, amua. N. of Europe.

## Order II. SILIQUOSE.

## 1235. Ricoria. <br> Onc fpecies; viz. :egyptiaca. Egypt.

123G. Dentaria, or Toolh-wort.
Seven fpecies; viz. ennesphylla, glandulufa, laciniata, " bulbifera, microphylla, piumata, pentaphyllos. Alps of Auftria, S. Europic.
1237. Cardm1:5E, or Lady's fmoct.

द2 fpecies: viz. * bellidifolia, alpina, afarifolia, nudicaulis, nivalis, refeditolin, tritolia, fcutata, atricama, chelidonia, thatictroides, macrophylla, *impatiens, farvifora, penfylvanica, greeca, *hirfuta, latifolia, * protenfis, " amara, granulofa, virginica. Europe, America.

* C. leafets of the root-leaves roundilh, thofe of the pratenfis. ftem-leaves fpear-duaped, wery entire.-This is a perennial plant which grows in meadow grounds, fends forth pupplifh tlowers in the fpring, and in its fer fible qualities refembles the naflutium aquaticzm. Long ago it was employed as a diuretic, and of late it has been introduced in nervons difeafes. A dram or two of the powder is given twice or thrice a-day. It has little fenfible operation, except that it lometimes fuieatsGoats and fheep eat it. Horfes and fwine refufe it. Cows are not fond of it.
* C. leaves winged; fuckers from the bofom of the amara leaves; leafets of the ftem-leaves angular, fitting. Sheep eat it. Cows are not fond of it. The young leaves are actid and bitterifh, but do not tafte amifs in falads. They are much ufed for that purpofe in Lancafhire. The leaves are pungent, bitter, and aromatic, in fuch a degree as to promife very confiderable ufes.

## 1238. Sisymbrium, or Thater creffis.

53 fpecies, riz. * maflurtium, * fylveltre, palufte, * anuphibium, pyrenaicum, tanacetifolium, ceratophy!lum, coronopifolium, tenuifolium, fagittatum, amplex:caule, fupinum, polyceratium, filifolium, burffolium, torulofum, * murale, * monenfe, fepandum, tillieri, vimineum, barrelieri, arenofum, valentinum, parra, afperum, levigatum, millefolinm, * fophia, album, cinereum, altifimum, echart facrgenfe, pannonicum, eryfimoides, * irio, columna, locfelii, obtufangulum, orientale, barbarex, lyratum, catholicum, beterophyllum, glaciale, ftrictifimum, pendulum, hifpanicum, pumilum, falfuginofum, integrifulium, indicum, hifpidum. Europe, Canaries, India.

* S. leawcs winged; leafets egg. fhaped.-This plant a afuris rery univerfally ufed as an early and rholefome fping tiun?.
falad. It is an excellent antiforbutic and fomachic, with lefs acrimony than the fcurvy-grafs. It is an ingredient in the antifcorbutic juices. It is recommended as of fingular efficacy for accelerating the circulation, flrengthening the vifcera, opening obftructions of the glands, promoting the fluid fecretions, and purifying the blood and humours; for thefe purpofes the exprefled juice, which contains the peculiar tafte and pungency of the herb, may be taken in dofes of an ounce or two, and continued for a confiderable time.
* S. pods oblong egg-flaped ; leaves wing eleft, fer- cmminirated; petals longer than the cup. - The ends of the bium. gencral fruit- $\_$lalks are often fwoln into a caulifowerlike fubitance, purplifh, and containing fnall grubs of the fame colour. Cows refufe it. Stecep and goats are not fond of it.
* S. petals fimaller than the cups; leaves doubly com-fopizia. pound, winged. -The pods retain the feeds all winter, and fmall birds feed upon them. The plant has been fometimes prefcribed in hylteric and dyenteric cales; and the feeds are given to deflroy woms. Sheep and and cows eat it. Horfes and goats are not fond of is. Swine refufe it.

14 fpecies; viz. "ollicinale, " barbarea, praccor, * aliaria, repandum, "cheiranthoides, hieracifoliun, odoratum, virgatum, diffufum, angullifolium, junceum, bicorne, quadricornc. Earope, Barbary, Canary, Carolina.
* E. pods preffed to the fpike-ftalk; lcaves notched. This plant is warm and acrid to the tafte; and when culcivated is ufed as a fpring pot-herb. Birds are fond of the feeds. Sheep and goats eat it. Cows, horles, and fwine refufe it. By means of it a hoarfenefs, occafioned by loud fpeaking, is faid to have been cured in three days by Rondcletius. L. pods indiftinetly four-cornered; leaves lyre-fhaped, the terminating fegment circular.- The common people in Sweden are faid to ufe this plant in falads, early in the fpring, and late in the autumn; they alfo boil them as kale. It is fown in gardens as an early, fpring falad; and alfo in England, where it is called French crefs. Cows eat it. Horfes and fiwine refufe it. Goats and heep are not fond of it.
* E. leaves heart-1haped.-The Pruflians are faid to eat the leaves along with falied meats in the fpring. They are ufeful with lettuce and the colder [3lads. The feeds excite fneezing. Cows and goats eat it. Horfes, theep, and fwine refufe it. When it grows in poultry yards the fowls eat it, and it gives ass intolerably rank tafte to their fleth. In Wales it is much ufed as a frying herb.
cheiran:boides.
. hem very mucb branched; leaves fpear-fhaped, oblique, waved and toothed; pods expanding.-Tine country people give the feeds of this plant to dell roy worms, and with good effect. Horfes, cows, goats, fheep, and fwine, eat it.

## 12to. Cheranthus, or Stock jubly-fower.

$3 \nmid$ fpecies: viz. eryfimoides, helveticus, alpinus, lanceolatus, * cheiri, fruticulafus, callofus, frictus, tenuifolius, mutabilis, apricus, chius, maritimus, patvilori, falinus, bicufpidatus, incanue, fenellralis, annuus, littorems, contortuplicatus, leucanthenus, triftis, trilobus, palchellus, piinnatifidas, tricufpidatus, tomentofus, odoratifimas, finuatus, taraxacifolius, cufpidatus, quadrangulus, farfetia. Alps, S. Europe, Egypt, Madeira.
theirio * C. leaves fpear-hlaped, acate, fimooth; branches angular; ftem thrub-like.-This plant ha, found a place in our gardens, where it has produced a confiderable number of varieties, but tone which have a more delightful fcent than the wild one. The fiowers have a pleafant fmell, and a fubacrid, biterih, not agreeable tate; they are faid to be cordial, anodyne, ape. rient, and emmenagogue, but are wholly neglected in the prefent practice.

## 1241. Heliophila.

12 §pecies; wiz. integrifolia, incana, circaoides, amplexic:alic, flava, canefcens, pufill, filiformis, pendula, pimata, coronopifolia, digitata. C. of G. Hope.
1242. Hesperis, or Dames ciolet, Rucket.

Ten fpecies; viz. trillis, lanciniata, matronalis, *inolora, tatarica, africana, ramofifina, arenaria, verna, iscera. Siberia, S. Europe. Africi.

[^4]nutams, lymata, hifpida, "Aricta, halleri, ovivenfis, cisnadenfis, lucida, penidula, 'turrita, faxatilis, afpers. N. Liurope, N. America.

## 1244. Territis, or Touct-muffic*

Eight fpecies; viz. * glabra, levigata, ftricta, * his futa, patula, pubefeens, ciliata, alpina。Europe.
1245. Beassica, or Cabbage.
${ }^{2}+$ fpecies; viz. * orientalis, autriaca, * campeftic, arvenfis, alpina, *rapus, "rapa, * oleracea, richerin, cretica, fuffruticofa, chinenfis, violacea, fublaftata, polymospha, teretifoiia, erucallrum, eruca, pinnatifida, elongata, cheiranthus, veficaria, lyrata, craflifolia. Europe, China.

* 13. the root a regular continuation of the ftem, rapaso fpindle-flaped.-The roots of the cultivated rariety may be eaten like the turnip, but they have a fronger tafte; and its feeds, which are called cole-feed, afford a large quantity of exprefied oil, called rafe oil: what remains after exprefing the oil, is called oil-cake, and is ufed for fattening oxer. In Norfolk, the cales are broken to pieces, and Itrewed on the land as a ma. mure. It is thought to be a very efficacious one, and is fold from $4^{1 \text { t. }}$ to 6l. per ton. About half a ton is Jaid on an acre. Cows, goats, and fiwine eat it.
* B. the root a regular continuation of tise fem, crlin-rapa. drical, flefhy. Turnip.-The roots of it are cither eaten ranl, boiled, or roafted. Pepper is commonly ufed with them. They relax the bowels, and are fuppofed to Ewecten the blood. They are hurfful to pregnant and hylterical womert, and to thofe who are fubject to flatulencies. The juice well fermented affords by difillation an ardem fipitit. The sind is acrimonious. If the roots are kept in fand, or in a cellar, during the winter, they fend out white floots, and yellowill leaves, which being rather fixeet, and not unpleafont to the palate, are ufed as falad, when other efculent plants are not to be had. But the greatell ufe of turnips is in feeding oxen and freep in the winter.
* B. the root a segular cominuation of the facm, cylir- cleracea. drical, flethy. Sea and Commen Callage.- Early in the fyring the fea-cablage is preferred so the cultivated kinds, but when gathered on the fea-coaft, it mult be toiled in two waters, to take away the faltnef. The roots may be eaten l:ke thofe of the preceding ffecies, but they arc niot fo tender. The differems sarietics of cultivated garden cabbage originate from this, all of which are much in wife at our tables. The sed cabbage is chiefly ufed for pickling. In forne countries they bury the white cabbage when fully grown in the autumn, and thus pre. ferve it all winter. The Germans cur them to piccec, and along with fome aromatic herbs and falt frefs theen clufe down in a tub, where they foon ferment, and are then eaten under the name of four-cro:t. If cabbages are fowed or planted for feveral years together in the fane foil, the heads become fmaller, and the roots knotty. This is occafioned by the larsice of fliec. Horfes eat the leavec, but do not feem fond of them. Caws grow fat upen them.

The lemfica iruca was formerly much cultivated in garden tur mocticinal ufe, and for Calads; but is at Frefert lefs cemnon. In appeatance it refemlles muftard. but it is eafly diftinswithable, by the fmootheis of its leaves and ins difagreeable fmell. The feeds have a pungent tafte of the multard kind, but weaker; they
have long been celebrated as aphrodifiacs; and may probanly have in fome cafes a title to this virtue, in common with other acrid plants.
1246. Sinapis, or MIußard。

19 fpecies; viz. * arrunfis, orientalis, braflicata, *alba, higra, fyrenaica, pubefcens, hifpida, chinenfis, juncea, allioni, erucoides, cormua, hifpanica, japonica, incana, frutefcens, radicata, lævigata. Europe, China, Madeir?.

* S. Pods with many angles, fwoln and bunched out by the feeds; fmooth, longer than the $z$-edged beak. -The Scandinavians are faid to boil and eat it as a cabbge, and in Ireland the tender tops are collected for the fame purpofe. Cows, goats, and fwine eat it. Sheep are very fond of it. Herfes generally refufe it.
* S. Pods rough with hair; beak very long, flanting, fword-haped.-It is fown in the winter and early in the fpring, to fupply our tables with falading. The feeds have nearly the fame properties as thofe of the next fpecies.
* S. pods fmooth, laid flat to the fpike-ftalk.-The feeds of this plant reduced to powder, make the common muftard fo much in requef at our tables. They yield a confiderable quantity of exprefled oil, which partakes but little of the acrimony of the plant. The feeds when unbruifed impart but little tafte to boiling water. Taken inwardly, in the quantity of a table Spoonful or more, they gently loofen the bowels, and are of fervice in afthma, chronic rheumatifm, and palfy. The powdered feeds curdle milk, and give a ftrong impregnation to boiling water. This infufion taken in confiderable quantity vomits, in fmaller dofes it is an ufeful aperient and diuretic. Cataplafms formed with crumbs of bread, vinegar, and powdered muflard feed,

A N Y.
are rery commonly applied to the folcs of the feet, as fimulants, in fevers that require fuch treatment; they are ufed with advantage, topically applied, in fixed rheumatic and ciatic pains. Upon the whole, whereever we want a Arong Atimulus, that acts upon the nervous fyftem, without exciting much heat, we know none preferable to muftard feed. Its acrimony confilts in an effential oil.
1247. Raphanus, or Radifb.

Eight fpecies; viz. fativus, caudatus, * raphanif. trum, fibiricus, tenellus, arcuatus, lanceolatus, pilofus. Europe, Egypt, China.

* C. pods round, jointed, fmooth, of one cell.-In raphanifwet feafons it grows in great quantity amongt the bar- trum. ley in Sweden, and the common people who eat barley bread, are aflicted with very convulfive complaints, in thofe provinces, and in thofe feafons, wherein this plant abounds. Horles eat it. Cows refule it.

124. Cordylocarpus.

Two fpecies; viz. muricatus, lævigatus.
1249. Cleome, or Bafe-mufard.

23 Species; viz. juncea, heptaphylla, pentaphylla, triphylla, polygama, icofandra, vilcofa, dodecandra, felina, chelidonii, gigantea, aculeata, fpinofa, 反errata, ornithopodioides, violacea, arabica, tenella, filifolia, gujanenfis, monophylla, capenfis, procumbens. Portugal, Cape, Eaft and Weft Indies.

## In the clafs Tetradynamia are

34 Genera, including 436 Species, of which 58 are found in Britain.

## CLASSIS XVI. <br> MONADELPHIA(r).

## Ordo I. TRIANDRIA.

1253. Galaxia. Monogyna. Spatha if. 2-phylla. Cor. r -petala, 6 -fida.
1254. Sisyrinchium. Monogyna. Spatha 2. playlla. Petala 6, fubexqualia.

## Order I. Triandria, or 3 Stamens.

G. One pittil. Sheath I or 2-leaved. Cor. 1petaled, 6 .cleft.
S. One piftil. Sheath 2 -leafed. Petals 6 , nearly equal.
1252.
(F) In this clafs the filaments are all united together at the bottom, but feparate at the top. The union at the boottom gives rife to the name Monadelphia or one brotherbood. The orders are determined by the number of famens. The plants of this clafs were confidered by Tournefort as having ouly one petal. But all the petals are diftinct at the bafe; though, by the intervention of the united filaments, they cohere all together as one body; on which account they may properly be confidered as having five petals. Linnaus remarks, that the fruit does not afford fufficient marks whereby to diflinguifh the genera in this clafs; but that the calyx is of the utmof importance, as it furnifhes invariable characters. Withering obferves, that the petals are truly a continuation of the cylindrical fheath formed by the united filaments, which inclofeg the flyles and germens as it defcends; when rifing upwards it fprcads out into petals.
1252. Ferrarta. Monogyna. Spatha 2 -phylla. Petala 6, tribus exterioribus latioribus.
1254. Aphytela. Monogyna. Cal. 3 fidus. Pctala 3. Bacca polyrperma.
1250. Tamarindus. Monogyna. Cal. 4-partitus. Petala 3. Legumen.

## Ordo II. PENTANDRIA.

1263. Erodium. Monogyna. Arilli 5, monofpermi , ad bafin receptaculi roftrati. Cal. 5 -phyll. Cor. 5 -petals. Nect. fquame 5.

## Order I. Triandria.

12j0. Tamarindus, or Tamarind-tree.
One fpecies; viz. indica. Egypt, Eaft and VVeft Indies. - The fruit of this fpecics is a pod refembling that of a bean, including feveral hard feeds, together vilih a dark-coloured vifcid pulp of a pleafant acid tafte: the Eaft India tamarind are larger than the Weft India fort ; the formor containing fix or feven feeds each, the latier rarely above three or four. The pulp of thefe fruits, taken from the quantity of two or three drams to an ounce or more, proves gently laxetive or purgative; and at the fame time, by its acidity quenches thirf, and allays immoderate heat. It iscreafes the action of the purgative fweets, caflia and namna, and weakens that of the refinous cathartics. Some have fuppofed it capable of abating the virulence of antimonial preparations; but experience flows that it has rather a contrary effect, and that all vegetable acids aigment their power. Tamarinds are an ingredient in the electuary of caffia, the lenitive electuary, and decoction of tamarinds with fenna.

125T. Sisprinchiu:s, or Bermudana.
Eight fpecies; viz. elegans, collinum, grandiflorum, bermudiana, anceps, micranthum, palmifolium, fria:am. I3crmad, Weft Indies.

## 12;2. Firrarta.

Four fpecies; viz. undulata, ferrarioly, paronia, ixioides. Cape, Mexico.
1253. Galaxia.

Three \{pecies; viz. ovata, graminea, narcifioides. Cape of Good Hope.
1254. APHYTEJA.

One fpecies; hydnora. C. of G. Hope.

## Order II. PENTANDRIA.

1255. OZOPHYLLUM.

One 「pecies; viz. trifoliatum.
I256. SYMPHONIA.
One \{pecies; viz. globulifera. Surinam, Guianz.
1257. Lerchea.

One fpecies; viz. longicauda. Eaft Indies.
1258. Waltherid.

Six fpecies; viz. americana, indicn, lophanthus, ovata, ariguftifolia, elliptica. Eaft and Weft Indies, S. America.
1259. Hermanya.

30 Species; viz. althreifolia, plicata, candicans, difticha, falvifolia, micans, involnerata, fcordifolia, denudeta, difermafolia, alnifolia, cuncifolia, holofericea, lisfuta. Coabra, multhicra: Aammen, angulatis, hyfopi-

I+ fpecies; viz. pyramidata, tomentofa, crerata, depreffia, truncata, renofa, hirfuta, concatenata, odorata, lupulina, caracafana, nodiflora, corchorifolia, fupina. E. and W. Irdies, Brazil.

## 1261. Ochroma, or Down-trce, or Cork-zcood. One fpecies; viz. lagopus. Jam. Hifpan.

## 1262. Passiflora, or Poffion-flower.

46 fpecies ; viz. Serratifolia, palida, adulterina, cuprea, tiliæfolia, maliformis, quadrangularis, alata, laurifolia, coccinea, mucronsta, glandulofa, multiflora, perfoliata, rubra, normalis, lunata, murucuja, vefpertilia, oblongata, capfularis, rotundifolia, orbiculata, punclata, lutea, anguftifolia, minima, fuberofa, peltata, hederacea, glauca, holofericea, hirfuta, foetida, ciliata, 保rulata, aurantia, cuncifolia, incarnata, tomentofa, mixta, ccerulea, filamentofa, ferrata, pedata, heterophylla. Weft Indies, S. America.
1263. Erodium.

34 Species; viz. craflifolium, fephanianum, tatasicum, fupracanum, petræum, abfinthoides, glandulofum, bipinnatum, alpinum, ciconum, cicntarium, pimpinellifolium, romanum, mofchatum, precos, pulverulentum, hirtum, laciniatum, gruinum, chium, afplenoides, hymenodes, murcicum, guttatum, glaucophyllum, incarnatum, arduinum, ribifolium, arborefcens, heliotropioides, malacoides, maritimum, malopoides, chamædryoides.

## Order ili. heptandria.

126q. Pelargonium.
120 fpecies; viz. longifolium, longiflorum, dipetalom, oxaloides, ficaria, ciliatum, auriculatum, auritum, hirtum, punchatum, bifolium, hirfutum, atrum, trifidum, heterophyllum, triphyllum, nervifolium, pinnatum, barbatum, melananthon, carneum, rapaceum, lobatum, trifte, appendiculatum, flavum, nonutherix, chamædrifolium, ovale, trichofomon, blattarium, erioftemon, elegans, ftipulaceum, articulatum, tabulare, alchimilloidcs, odoratiflimum, groffularioides, anceps, altheoides, columbinum, coronopifolium, capillare, tricolor, fenecioides, myrrhifolium, lacerum, multicaule, coriandrifolium, caucalifolium, minimum, glaucum, diverffolium, betulinum, acetofum, fcandens, ftenopetalum, hybridum, zonale, inguinans, hetcrogamum, menftum, crafficaule, peltatum, lateripes, tetragonum, cordatum, cucullatum, angulofum, acerifolium, papilionsccum, cortufeefolium, fufcatum, faniculafolium, patulum, grandiflorum, varicgatum, corylcdonis, cchinatum, aufrale, vitifolium, capitatum, glutinofum, hifpidum, tomentofum, ribifolium, quercifolium, graveolens, afperum, balfamcum, radula, denticulatum, biculor, tricufpidalium, fcabrum, fpinofum, rigidum, crifpum, hermannifolium, adultesinum, femitrilobum, tripartitum, fulgidam, gibbofum, exflipulatum, ternatum, lavigatum, fragile, incifum, carnofum, ferulaceum, alterrans, cesatophyllum, crithmifolium, ramofifimum, abrutanifo. Dium, fruticofum, hirtum, tenuifolium.
1266. Aitonta. America.

One fpecies; viz. capenfis. C. of G. Hope.

## Order V. Decandria.

1267. Crinodendrum.

One fpecies; viz. patagua. Chili.
i268. Connarus, or Ceylon Sumach.
Seven $\oint_{\text {pecies }}$; viz. africanus, afiaticus, pentagynus, decumbens, pinnatus, fantaloides, mimofoides. Ceylon, Africa.
1269. Hugonia.

Three fpecies; viz. myftax, lerrata, tomentofa. India.

> j270. Senrea.

One fpecies; viz. incana.
1271. Geranium, or Cranes-lill.

39 fpecies; viz. fpinofum, feffliflorum, fibiricums * languineum, tuberofum, anemonefolium, macrorhizum, * phæurn, fufcum, reflexum, lividum, * nodofum, friatum, anigulatum, ibericum, * fylvaticum, paluffre, afphodeloides, aconitifolium, collinum, * pratenfe, maculatum, pilofum, canefeens, incanum, argenteum, varium, * pyrenaicum, bohemicum, divaricatum, * lucidum, molle, carolinianum, * columbinum, * dif. fectum, * rotundifolium, pufillum, * robertianum, purpureum. Europe, Africa, N. America.

## Order Vi. Endecandria.

1272. Brownea.

Four fpecies; viz. coccinea, grandiceps, rofa de monte, paucifora. S. America.

## Order VII. DODECANDRIA.

## 1273. Acia.

Two fpecies; viz. dulcis, amara. Guiana.
1274. Monsonia.

Five fpecies ; viz. tenuifolia, Ipeciofa, lobata, ovata, Spinofa. C. of G. Hope.
1275. Plagianthus.

One fpecies ; viz. divasicatus. S. S. ifles.

## 1276. Helicteris, or Screw-etree.

Eight fpecies; viz. baruenfis, jamaicentis, ifora, hirfura, anguttifolia, pentandra, casthaginenfis, a petala. Malabar, China, Jamaica.

- 1277. Cienfuegia.

One fpecies; viz. digitata. Senegal.

$$
\text { 1278. } \Lambda \text { ssonia. }
$$

One fecies; viz. populnea. llle of Bourbon.

## 1279. Dомblya.

12 fpecies; viz. palmata, acntangula, angulata, tilixfolia, tomentofa, umbellata, ferruginea, erythroxyo lon, decanthera, velutina, ovata, punctata. Chili.

One Species; viz. phoenicea. Arabia, India, St Melera.

128s. Pterospermum.
Two fpecies; viz. fuberifolium, acerifolium.

## Order T'ili. polyandria.

## 1282. Carolinea.

Two fpecies; viz. princeps, infignis. W. Indies.
1283. Adansonia, or Sour-gourd, Monkies-bread. One fpecies; viz. digitata. Senegal, Egypt.

## 1284. Bomat, or Sill Coton-tree.

Six fpecies; riz. pentandrum, erianthos, ceibs, heptaphyllum, globofum, goffypinum. E. and W. Indies, S. America.
1285. Laguxea.

Three fecies; viz. lobata, ternata, aculeata. Coaft of Coromandel.

## 1286. Sida, or Indian Millow.

99 fpecies; viz. Inifolia, angulitolia, acuta, canarieniis, lanceolata, לpinofa, frutefeens, carpinifolia, jamaicenfis, orientalis, glomerata, maculata, fuberofa, capenfis, microphylla, micans, pufilla, rhombifolia, canefcens, retufa, alnifolia, ciliaris, periplocifolia, excelfor, hernandioides, nudiflora, triquetra, fragrans, lignofa, reflexa, humilis, repens, bivalvis, ulmifolia, multifora, microfperma, vifcofa, foetida, calycina, crifpa, perfica, fylvatica, arborea, mauritiana, occidentalis, americana, abutilon, abutiloides, afiatica, populifolia, hirta, indica, molliffroa, fonneratiana, pubefeens, althæifolia, glutinola, exftipularis, nutans, borbonica, favefcenc, radicans, arguta, multicaulis, pilofa, rotundifolia, fupina, truncata, herbacea, emarginata, alba, cordifolia, hederifolia, verticillata, urens, umbellata, pyramidata, paniculata, dumofa, ramofa, fpicata, terminalis, veficaria, craffifolia, bifora, obtufa, gigantea, javenfis, haftata, criftata, dilleniana, triloba, ternata, pterofperma, ricinoides, jatrophoides, napæa, dioica, phyllanthus. E. and W. Indies, Cape, America.

## 1287. Palavia.

'Two โpecies; viz. malvifolia, mofchata. Lima, Peru.
1288. Malachra.

Si: Species; viz. capitata, fafciata, alcæfolia, radiata, bracteata, plumofa. W. Irdies.

$$
\text { 1289. Aцтнла, or Mar } \text { B-mallow. }
$$

Nine fpecies; viz.* officinalis, narbonenfis, canmabina, hirfuta, ludw!gii, acaulis, rofea, pallida, ficifolia. Europe, Hifpaniola.
Aficirtalis. * A. leaves undivided, angular, cottony.-This plant grows wild in marhes and other moilt places in feveral parts of England, though freguently cultivated for medicinal ufe in gardens. All the parts of it have a filimy tafte, and abound with a foft mucilaginous fubflance which is readily extracted by water : the mucilage of the roots appears to be the frongett; and hence this part is generally made ufe of in preference to the others.

This plant has the general virtues of an cmollient medicine, and proves ferviceable where the natural

Yoz. IV. Part I.
mucus of the inteftines is abraded. It is chiefly recommended in flarp defluctions upon the lunge, hoaric. nefs, dyfenteries, and likewife in nephritic and calculous complaints; not, as fome have fuppofed, that this medicine has any peculiar power of diffolving or expelling the calculus, but as, by lubricating and relaxing the veffels, it procures a uore free and eafy poffage. Althas root is fometimes employed externally for foftening and maturating hard tumours; chewed, it is faid to give eafe in difficult dentition of children.

## 1290. $\mathrm{N}^{\boldsymbol{r}} \mathrm{alva}$, or Mallow.

55 .pecies; viz. fpicata, polyifachya, tomentofa, fcoparia, gangetica, coromandeliana, americana, calycina, cuneifolia, anguftifolia, fubhaftata, fcabra, peruviana, limenfis, capitata, bryonifolia, umbellata, abutiloides, abulenfis, lobata, faftigiata, bonarienfis, ftricta, lactea, operculata, fragrans, capenfis, balfamica, groflularifolia, virgata, miniata, retufa, tridactylides, althæoides, caroliniana, proftrata, cretica, parvillora, ricxenfis, * rotundifolia, acaulis, fherardiana, *fylveftris, mauritiana, hifpanica, verticillata, crifpa, papaver, ftipulæca, alcea, * mofchata, elegans, tournefortiana, agyptia, trifida. Europe, Barbary, Cape, China, America.

* M. ftem rough; leaves 5 or 7 lobed, toothed; out-Syluefrru, er calys leafets partly united at the bafe. -The leaves of this plant have a fomewhat mucilaginous fweetifh talte. They are ranked the firft of emollient herbs: they were formerly in fome efteem as food of a laxan tive quality; at prefent decoctions of them are fometimes employed in dyferteries, heat and marpnefs of urine, and in general for obtunding acrimonious humours; their principal ufe is in emollient glyfters, cataplafms, and fomentations. The leaves enter the officinal decoction for glylers, and a conferve was formerly prepared from the flowers.

1291. Lavatera, or Nallow-iree.

12 fpecies; viz. * arborea, micans, hifpida, olbiz, triloba, lufitanica, maritima, thuringiaca, cretica, flava, punctata, trimeftris. Europe.

## 1292. RUizsa.

Three fpecies; viz. cordata, lobata, variabilis. Ifle of Bourbon.

## 1293. Malope, or Bafe Mallow.

Three fpecies; viz. malacoides, multiflora, trifida. Hetruria, Mauritania.
1294. Kıtalbella.

One fpecies; viz. vitifolia.
I295. Urena, or Indian Mallowi.
Eight fpecies; viz. lobata, reticulata, tricufpis, americana, finuata, multifida, procumbens, viminea. China, E. Indies, Surinam。
1296. Gossurium, or Cotton-tree.

Ten fpecies; viz. herbaceum, indicum, micranthum, arborcum, vitifolium, hirlutum, religiofum, latifolium, barbadenfe, peruvianum. Levant, E. and W. Indies.

## 1297. Hisuscus, or Syrian Mallacu.

66 fpectes; viz. mofcheutos, incanus, lafiocarpus, paluftris, militaris, haftatus, ferrugineus, cordifolius, populneus, tiliaceus, elatus, lampas, membranaceus, lunarifolius, rofa finenfis, 〔piralis, brafilienfis, unil.ateralis, acuminatus, phoœniceus, ovalifolius, clandeftinur, G g
rigidus,
rigifuq, mi, ranthes, gofypinus, cratus, athiopicus, micropbyllus, urens, calycinus, mutabilis, fyriacus, rhombifolius, liliitlorus, bifurcatus, trilobuc, diverffolius, domingenfis, ficulneu, faludariffa, 「peciofus, camabinus, fratcrnuc, fororiuc, furattenfis, radiatus, manihot, digitatul, flavefcens, fpicatus, micans, abelmofehus, columratis, peduiculatus, efculentus, longifolius, clypeatus, fenegalenfis, tubulofus, obtuffifius, vitifolius, tricufpis, virg:nicus, pentacarpoc, veficarius, trionum. Syria, Cipe, E. and W. Indies, N. America.

The feeds of the bibifcus abelmofcbus are the product of a plant indigenous in Egypt, and in many parts both of the Eaft and Weft Indies. They are of a fimall fize and reniform hlape; they are very remarkable from poffefing a peculiar and very fragrant odour ; the friell which they give out may be compared to that of mußk and amber conjoined; thofe brought from the ifland of Martinico are generally efteemed the mott odorous, but we have feen fome, the product of hat-houfes in Britain, which in point of flawour feemed not inferior to any imported from abroad.

Thefe feeds, although introduced into fome of the foreign pharmacopœiss, have hitherto been ufed principally, if not only, as a perfume; and as their medical powers fill remain to be afcertained, it is perhaps with propriety, that hitherto no place has been given them in the lift either of the London or Edinburgh colleges. But their flavour as well as other fenfible cqualitics point theru out as a fubjeet well deferving a particular inveftigation.

> 1298. Pavonia.

15 fpecies; viz. premorfa, leptocarps, typhalea, haThata, fpinifex, papilionacea, cancellata, racemof, corymbofa, paniculata, odorata, coccines, columella, urens, zeylanica. Erand W. Indies, Afisa, S. Ame:! Cz

Three fpicies; viz. malvaiffus, mallis, pilofa. Jamaica, S. America.

1zoc. Stuartia.
Two fpecies; viz. malachodendion, pentagyra.
1301. Gordonia, or Bcblolly-bay.

Four fecies; viz. lafanthus, bæmatoxylon, pubef. cens, franklini. N. America.
1302. Camellita, or Japan-roje.

Two fpecies; viz. japonica, ífanqua. China, Ja• pan.
1303. MESUA, or Indian Rofe-chefnut.

One fpecies; viz. ferrea. Egypt, India.
r 304. Myrodia.
Two fpecies; viz. tuibinata, longiflora. Guiana.
1305. Morisonia.

One fpecies; viz. americana.
1 job. Pouraetia.
One fpecies; viz. arborea.
1307. Crossostylis.

One fpecies ; viz. biflora. South fea illes.
1308. Barringtonia.

One fpecies; viz. fpeciofa. Chili, Moluc. South fea inles.

## I 3 g. Gustavia.

Two fpecies; viz. anguila, faftuof. Surinam, Cay. enne.

## In the clafs Monadelphia are

60 Genera, including 68 a Species, of which 16 are found in Britain.

## CLASSIS XVH. <br> DIADELPHIA(6).

## Ordo I. PENTANDRIA.

8js. Monneria. Cal. 5-partitus. Cor, ringens. Eijamentum fuperus antheris 2 ; inferius 3. Caplu3x 5.

CLASS XVII.
DIADELPHIA.

## Order I. Pentandria.

M. Cal. 5 -parted. Cor. gaping. Superior $6 l \mathrm{am}$. with 2 anthers, inferior with 3. Capfules 5.

Or.o
(G) This elafs comprehends the butterfly-fhaped flowers, and the leguminous plants of fome authors. Linnæus takes the character of the clafs from the number of the famens, and the character of the orders from their number. From the title of this clafs, Diadelphia or two lrotherboods, it might be fuppofed, that the filmments are always found in two fets. This, however, is by no means always correctly the cafe. The papilionaceous or butterfly fhape of the corolla or bloffom, as in a garden pca, will therefore be a furer guide. 'The clafs is not
 obliquely pendent. The feeds of this clafs furnifh food for men and other animals: they are farinaceous and fatulent. The leaves arc food for cattle. None of them are poifonous.

## Ordo II. HEXANDRIA.

* 8 q9. Fumaria. Cal. 2 phyllus. Cor. ringens, bafí gibbofa nettarifera. Filamenta antheris 3 .

S. Cal. 3 -leafed. No fandard. Legume 1 -feeded, wing Atrap-llaped.
D. Filam. of the famens 2, with the apex 4 -cleft. Fruit pedicled, not open, leguminous, comprefledly membranaceous, feed-bearing.

## Order IV. DECANDRIA.

Sect. I. All the famens conneEved.
N. A legume, i. e. leguminous plant, i-feedef, terminated by aftrap-fhaped wing.
P. Legume leafy. Two ftamens, 3 -anthered.
A. Wings and keel none.
E. Wings and keel very fhort. Cal. with a melliferous little hole.
A. Filam. 9, connected at the loweft bafe, on the upper fide difinct. Seeds fpherical.

* S. Filam, adhering to the germen. Stigma connected, woolly.
* G. Piffil depreffing the keel. Stigma roiled inwards.
L. Anthers alternately round and oblong. Legume leather-like.
* A. Cal. fwelling, including a pod.
P. Legume, with 4 longitudinal wings.

13. Legume dagger-pointed. Stigma notched at the end.

* U. Cal. 2-leafed. Legume fcarce longer than the caly.
A. Cor. horizontally turned upfide downo Legume leather-like.
E. Cor. with obfcure wings. Legume 1 .feeded.
A. Legume awniefs, oval, nearly 2 feeded.
* O. Legume diamond-fhaped, fitting. Standard fteaked.
C. Legurne pedicled, turgid.

Scet. II. Stigma pubefont, i. e. dowury (not markei like the añove.
C. Legume inflated, open above the bafe.
P. Feel and ftyle firal.
D. Standard, with 2 calli or hardneffes at the hafe. G g 2 R1.

* 8yr. Orobus. Stylus lineanis, teretiufculus, fupra villofus.
* 870. Pisum. Stylus fupra carinatus villofufque.
* 87 z. Lathyrus. Stylus fupra planus villofufque.
* 873 . Vicia. Stylus fub figmate barbatus.

Sect. III. Legumen fub-biloculare (nec priornm).

* S92. Astragalus. Legum. 2-loculare, rotundatum.

893. Bisserrula. Legum. 2-loculare, planum, dentatum.

89ı. Phaca. Legum femibiloculare.
Sect. IV. Legumina fubmonofperma (nec priorum.)
S94. Psoralea, Cal. punctis glandulofis.

* Sg6. Trifnlium. Legum. vix calyce longius, 1 f. 2-1permum. Flores capitati.

882. Glycyrrhiza. Cil. 2-labiatus, fuperiore 3. fide.

Sect. V. Legumen fubarticulatum.

888. Æschynomene. Iegum, articulis monofpermis. Cal. bilabiatus.

* 887. Hedysarum. Legum. articulis fubrotundis, compreffis. Carina obtufifima.

883. Coronilla. Legum. ifthmis interceptum, rectum.

* 884. Ornithopus. Legum. articulatum, arcuatum.

886. Scorpiurus. Legum. ifthmis interceptum, teretiufculum, involutum.

* 88 . Hiprocrepis. Legum. compreflo-membranaceum; altera futura emarginaturis ad medium excifa.
* 899. Medicago. Legum. Spirale, membranaccocomprefum. Piltillum carinam defledens.

Sect. VI. Legumen uniloculare polypermun (nee priorum.)

S98. Trigonella. Vexillum alæque patentes quafí tripetale. Carina minuta.
868. Glycine. Carina vexillum refledens.
869. Clitoria. Vexillum amplum, alas obtegens. Cor. refupinata.
879. Robinia. Vexillum reflexo-patens, fubrotundum.
889. Iadigofera. Carina utrinque denticulo.
875. Cicer. Calycinis 4 lacinix fuperiores vexillo incumbentes.

- 874. Ervum. Cal. 5 -partitus, fubrequalis, longitudine fere corollise.

1319. Lifaria. Calycis lacinia infima elongata, Ala inferius bilobx.
1320. Cytisus. Legum. pedicellatum. Cal. bilobiatus.
1321. Mullera. Pericarpium elongatum, carnofur, moniliforme, globulis monofpermis.
1322. Galega. Legum. lineare, ftriis obllquè tranfverfis.

* So7 Lorus. Legum. teres, farctum feminibus cylindric..

878. Geoteroym Dsupa, nacleo ligneo.

* O. Style Atrap-flaped, rather tapering, woolly above.
* P. Style kceled and woolly above.
* L. Siryle above flat aud woolly.
* V. Style barbed urder the figma.

Sect.III. Legume nearly z-eclled (not marked as abore.)

* A. Legume z-celled, rounded.
B. Legume 2 -celled, flat, toothed.
P. Legume half a celled.

Sect. IV. Leguminous, nearly I-fecded (not as abori.)
P. Cal. with glandular points,

* T. Legume fearce longer than the cal. s or 2 -feeded. Flowers growing in heads.
G. Cal. 2-lipped, upper 3 -cleft.

## Sect. V. Legume nearly jointed.

瓦. Legume, with-t-feeded joints. Cal. 2-lipped.

* H. Legume, with joints nearly round, compreffed. Keel very obtufe.
C. Legume interrupted by necks, fraight.
* O. Legume jointed, bowed.
S. Legume interrupted by necks, tapering, rolled inwards.
* H. Legume compreffed, membranous; one feam notched, cut at the middle.
* M. Legume fpiral, membranous compreffed. Pifill bending away the keel.

Sect. VI. Legume 1-celled, many-fecded (not as above).
T. Standard and wings expanding, as if 3 -petaled. Keel minute.
G. Keel bending back the flandard.
C. Standard large, covering the wings. Cor. horizontally turned upfide down.
R. Standard bent back, expanding, nearly round.
I. Keel toothed on both fides.
C. Four upper fegments of the cal. leaning on the flandard.

* E. Cal. 5 -parted, nearly equal, almoft of the length of the cor.
L. Lower fegments of the cal. long. Wings z= lobed below.
C. Legume pedicled. Cal. 2-lobed.
M. Pericarp. elongated, fleflyy, bracelet-flaped, with 1 -feeded globules.
G. Legume ftrap-fhaped, with flreaks obliquely tranfuerfe.
* L. Legume tapering, filled with cylindrical feeds.
G. Drupe, with a woody kerncl.

# Order 1. PENTANDRIA. 

851. Monniera.

Onc feccics; viz. trifolia.

Order I1. HEXANdria.

1267. Saraca.

One fpecies; viz. indica. India.
849. Fumaria, or Fumitory.

14 fpecies; viz. cucullaria, \{pectabilis, nobilis, bulbofa, fempervirens, lutea, fibirica, * capnoides, cnneaphylla, * officinalis, *" capreolata, fpicata, * claviculata, veficaria. Europe, Barb. Cape, N. America.

* F. feed veffels in bunches, 1 feed in each; ftem fpreading.m-Cows and theep eat it. Goats are not fond of it. Horfes and fwine refufe it. The leaves are fucculent, faline, and bitter. The expreffed juice, in dofes of two or three ounces, is ufeful in hypochondriacal, fcorbutic, and cachectic habits. It corrects acidity, and frengthens the tone of the fomach. Some prefer it to all other medicines as a fweetener of the blood. There is no doubt of its utility in obftructions of the vifcera and the difeafes arifing therefrom. An infufion of the leaves is ufed as a cofmetic to remove freckiles and clear the fkin.

## Order III. OCTANDRIA.

85 . Polygala, or Milk-wort.
$3^{8}$ fpecies; viz. incarnata, afpalatha, braflienfic, trichofperma, amara, * vulgaris, major, monfpeliaca, paniculata, fibirica, bracteolata, umbellata, myrtifolia, oppofitifolia, fpinofa, teretifolia, theezans, trinervia, penaca, diverfifolia, microphylla, cefuans, chinenfis, chamæbuxus, alopecuroides, mista, fquarrofa, heifteria, Atipulacea, fenega, lutea, viridelicens, triflora, glaucoides, ciliata, fanguinea, verticillata, cruciata. Europe, Cape, India, N. America.
sulgaris.

* P. Howers in bunches; flems herbaceous, fimple, trailing: leaves ftrap-fpear-hlhaped.-This plant has been found to poffefs the properties of the Senega rattlefnake root (polygala fenega), but in an inferior degree. The powdered root may be given in dofes of half a dram, Cows, goats, and theep eat it. Suine refufe it. An infufion of the herb, which is very bitter, taken in the morning falting, about one fourth of a pint daily, promotes expectoration, and is good for a catarrhons cougl.

The polygala fenega grows fpontantoufly in Virginia, and bearsthe winters of our own climate. This root is ufually about the thicknefs of the little finger, varioully bent and contorted, and appears as if compufed of joints, whence it is fuppofed to refemble the tail of the animal whofe name it bears: A knid o! membranous margin runs on each fide, the whole length of the rout. Its tafte is at firft acid, afterwards veiy hot and pungent.

The Senegavo Indians are faid to prevent the fatal effects which follow from the bite of the rattlefrake, by giving it internally, and by applying it externilly to the wound. It has been ftrongly recommended in pleurifies, peripneumonies, and orher inflammatory difempers. Its more immediate effects are thofe of a diu-
retic, diaphoretic, and cathartic; fometines it proves emetic: the two laft operations may be occafionally prevented by giving the root in fmall dofes along with aromatic fimple waters, as that of cinnamon. The ufual dofe of the powder is 30 grains or more.

Some have likewife employed this root in hydropic cafes, and not without fuccefs. Therc are examples of its occafioning a plentiful evacuation by fool, urine, and perfpiration; and by this means removing the difeafe, after the common diuretics and hydragogucs had failed. Where this medicine operates as a cathartic it gencrally proves fucceffful; if it acts by liquefying the blood and juices, without occafioning the due difcharge, it hoould either be abftained from, or affifted by proper additions.

## 852. Securiofea, or Hatchet-vecth.

Two fecies; viz. erecta, volubilis. W. Indies.

## 1416. Daleergia.

Two fpecics; viz. lanceolaris, monetaria. Surinam, Ceylon.

## Order IV. DECANDRIA.

853. Nissolia.

Two fpecies; viz, arborea, fruticofa. S. Amer.
1286. Abrus, or Famaica $H$ Ild Liguorice.

One fpecies; viz. precatorius. E. and W. Indies.

## 854, Prerocarfus, or Red Sanders.

Five fpecies; viz. draco, lunatus, fantalinus, ecaf taphyllum, buxifolius. E. and W. Indies.

## 85. Erythrina, or Coral Tree.

Five fpecies ; viz. herbacea, corollodendrum, pieta, crifta galli, planifiliqua. Carolin?, E. and IV. Indies, Brazil.
856. PiscidiA, or Dogwood Tree.

Two fpecies; viz. erythrina, carthaginenfis. We日t Indies.
857. Borbonia.

Six fpecies; viz. cricitolia, lievigata, trinervia, lanceolata, cordata, tuenata. C. of G. Hope.

> 858. Spartium, or Broom:
${ }_{1} 6$ fpecies; viz. contaminatum, fepiarium, junceum, monofpermum, fpherocarpon, purgans, aphyllum, fcorpius, angulatum, patens, fupranulium, complicatun, * fcoparium, radiatum, cytifoides, Ipinofum. S. Europe, Larbay, Cape, Madeira.

* S. leaves in thrtes, and fulitary ; branches without fooparinm. prickles. - The young flowers are fometimes preferved as pickles. The plant when burnt, affords a tolerable pure alkaline falt. Dr Mead relates the cafe of a droplical patient, that was cured by taking half a pint of a decoction of green broom-tops, with a fpoonfal of whole muffard leed, every morning and evening. The patient had been tapped three times, and tried the ufual remedics before. An infufion of the feeds, drank freely, has been known to produce fimilar happy effects; but whoever expects thefe effects to follow in every dropfical cafe, will be greatly deceived. A Arong lixivium of the afhes was ufed in the Swedith army in the year 1759 , to cure dropfies, confequential to a catarthal epudemic fever. The urine became plentiful, and the dropfics foon difagpeared. Some ule the leeds
fecds ionlied, fo as to make a kind of coffee. The plant, whea growing large, mestits a place ataong our flowering-farebs, on account of the profufion of its gol-den-zoloured blofiom. Cows, horfes, and theep, refase it.

## 8j9. Gemista, or Dyers Broom:

14 fpecies: viz. canarienfis, candicans, linifolia, fagittals, tridentata, * tinctoria, libirica, Horida, * pilofa, humifufa, * anglica, germanica, hifparica, lufitanica. Europe, Cinaries.
sinçoria.

* G. branches fcored, cylindrical, upright; lentes $\int_{\text {fear-finped, fmooth; }}$; legumen cylindrical.-A yellow colour may be prepared from the llowers; and for wool that is to be dyed green, the dyers prefer it to all others. A dram and a half of the powdered feeds operates as a mild purgative. $\Lambda$ decoction of the plant is formetimes diuretic, and therefore has proved ferviceable in dropfical cafes. Horfes, cows, goats, and fletep, eat it.

The wood or root of the genifa canarienfis is chietly brouglte to us from the Canary iflands. In the ीlops of the apothecaries it ufually receives the appellation of ligmum rhodium. It is in long crooked pieces full of kiobs, which when cui, uppear of a yellow colour like box, with a reddifh caft. The largen, fmoothef, moll compart, and deepeft coloured pieces, fhould be cho!cn; and the fmall, thin, or pale ones, rejected. 'The tatte of this wood is lightly bitterifu, and fomewhat pungent; its fmell very fragrant, refembling that of rofes: long kept, it leems to lofe its fmell; but, on cutting or rubbing one piece againt the other, it fmells as well as at firn. Diftilled with water, it yields an odoriferous effential oil, in very fmall quantity. Rhodium is at prefent in efteem, only upon account of its oil, which is employed as a high and agreeable perfume in feenting pomatums and the like. But if.we moy reafon from analogy, this odoriScrous fimple might be advantageoufly applied to more ufeful purpofes; a tincture of it in rectified fpirit of wine, which contains in fimall volume the virtues of a confiderable deal of the wood, bids fair to prove a ferriceable cordial, not inferior perhaps to any thing of this kind.

## 8G0. Aspalatius, or African Broom.

35 fpecies; viz. fpinofa, verrucofa, capitata, glomerata, aftroites, chemopoda, albens, thymifolia, ericifoIi, nigra, carnofa, ciliaris, genittoides, hyfrix, galioides, retrofesa, unithora, araneofa, afparagoides, foricea, canefcens, heterophylla, indica, ebenus, cretiea, guinquefolia, tridentata, pilofa, anthylloides, laxata, argrentea, callofa, oricutalis, mucronata, pinrata. Crete, Cape, E. Indies.

> 891. Ulex, or Firze, Hins, Gorfe.

Twio fipecies; viz. entropeus, capenfi. Germany, Yriose, Cipe.

- U. leaves worlly, ncute ; thorns featerct.-Trofe is in fume refpects a very hardy plant, and will make fences upon the bleaken mountains and clofe to the Fe:-fide, where the firay of the fra dentioysalmotl every other flrut; hut it is impatitut of cold, is often deflonyed by fevere frof, and is ratcly found in the nonthern parts uf our illand. In Carnuall, : her: fuel is featee, it is culisated in aovantage, and it is genera'. y cut to make eaggots for heatirg ovene, which it

A N Y.
does very foon, burning rapidly, and with a great degree of heat. The athes are ufed to make ley. Tean borfes may be fupported by this plant, if it is cut young and bruifed in a mill to break the thorns. Goats, cows, heep, and horfes feed upon the tendep tops.
861. A morpha, or Shrubby Bafe Indigo.
One Ipecies; viz. fruticofa. Carolina.
862. Crotalaria, or Rahlezuort.

23 fpecies; viz. perforata, perfoliata, amplexicauli s fagittalis, chinenfis, juncea, imbricata, retufa, feffiliHora, tritlora, verrucofa, biflora, oppolita, linifolia, bifaria, latifolia, lunaris, laburnifolia, cordifolia, incana, incanefcens, heterophylla, quinquefolia. Eaft and Weft Indies, Africa, America.

## 863. Ononis, or Refl-barrozu.

$3^{1}$ 〔pecies; viz. antiquorum, * Ipinofa, * arvenfs, repens, minutifima, mitiffima, alopecuroides, variegav ta, pubefcens, hircina, cernua, umbelldta, argentea, involucrata, fliformis, capenfis, proftrata, reclinata, cenifia, cherleri, vifcofa, ornithopodioides, pinguis, natrix, tridentata, crifpa, hifpanica, fruticofa, sotundifolia, microphylla, mauritanica. Europe, Cape.

* O. Hlowers in bunches, folitary; leaves folitary or /pinoja. three together; branches thorny,-A decoction of the soots has been recommended in cafes of fone and jaundice. Cows and goats eat it. Sheep are very fond of it. Horfes and fwine sefufe it. A horfe is faid to have refufed the whole branch, but ate of the younger fhoots when picked off.

## 864. Anthylizs, or Lady's Finger, Kidney-vetch.

15 fpecies ; viz. tetraphylla, * vulneraria, montana, cornicina, lotoides, gerardi, quinqueflora, involucrata, linifolia, barba-jevis, heterophylla, vifciflora, cytifoides, hermanire, erinacea. Europe.

* A. herbaceous; leaves winged, unequal ; flowers in eufincraria a double head.-The country people get a yellow dye from it. It makes an excellent palfurage for theep. Where the foil was a reddifh clay, Linnstus obferved the blofloms to be red, but in white clay white. Goats and cows eat it.

## 876. Arachis, or Ground Nut.

One โpecies; viz. lyypogrea. Carolina, S. Amer.

> S95. Erenus, or Ebony of Crete.

One fpecies; viz. cretica. Crete, Levant, Barb.

## 865. Lurinus, or Lupine.

Seven fpecies; viz. perentis, albus, varius, hirfutus, pilofus, anguflifolia, lutcus. S. Europe, Egypt, Virginia.

The feeds of the lupinus allus have a leguminous talle, accompanied with a difagrecable bitter one. They are faid to be anthelmintic, both internally taken, and applied externally. Hofiman cautions againft alicir internal ufe, and tells us that they have fometimes occafioned deat2. Simon Paulli alfo obferves, that lie faw a boy of eight or ten years of age, after thling a dram of thefe feeds in powder, feized with expuifite pains of the abdomen, a dilliculty of ref piration, and almof total lofs of voice; and that he was relieved from thefe complaints by a glyfler of milk and furear, which brought anay a vaft quantity of noums. But Mr Geoffroy oblerves, vesy jufly, that cither

## 1)iadelphia.

the'e fympto:is wers owing to the form, and not to the medicine; or that thefe feeds, if they have any noxiuus quality, lofe it, with their bitternels, in buil. ing, fince th:y were commonly uled among the Greeks as fonil, and recommended by Galen as very wholefuns.
866. Pulseolus, or Kirlmey Bran.

17 fpecies; viz. vulgaris, lunatus, bipunetatus, inamosnus, farinofus, vexillatus, helvatus, femierectus, alatus, caracallt, aconitifolius, nanus, rasiatus, max, mango, hathyruides, fiharofpermus. E. and W. InLies, Affica, America.
857. Dolichos, or Coutition.

31 Pipecies; viz. benghalenfis, lablab, finenfis, uncinatue, luteolue, unguiculatus, tranquebaricus, enfiformis, tetragonolobus, fefquipedulis, altillimus, pruricns, urens, minimus, lineatus, capenfic, fratabroides, incurvis, buibofus, trilobus, arifatus, fliformis, purpureus, regularis, lignofus, polytachios, enfiformic, faja, catiang, biftorus, repens. Egypt, E. and W. Indies, Cape, Ancrica.

The dulichos pruriens is a plant growing in great abundance in warn climates, particularly in the Weft India iflands; and there it is very troublefume to cattle and other domeflic animals: for on account of the ficula of the feed-pod, it excites, when touched, a very unealy itching. Tliefe ficule have been long ufed in South America, in cafes of worms; and have of late been frequently employed in Britain. The fpicula of one pod, mixed with fyrup or molafles, and taken in the morning fahing, is a dofe for an adult. The worms are faid to appear with the fecond or third dofe; and by means of a purge in fome cales, the ftools are faid to have conffied almont entirely of worms; and in cafes of lumbrici it is faid to produce a fafe and effectual cure. Thofe who have ufed it moit affirm, that they have never feen any inconvenience refulting from the internal ufe of it, notwithtanding the great uneafinefs it occafions, on the llighteft touch, to any part of the furface.
963. Glycine, or Kiduey-bean tree.

15 fpecies; viz. fubterranea, monoica, triloba, villofa, javanica, comofa, tomentofa, bituminofa, nummularia, labialis, firiata, fuaveolens, apios, frutefcens, monophylla. Cape, Eaft and Weft Indies, North A. merica.
869. Clitoria.

Five fpecies; viz, ternatea, brafiliana, virginiana, maiiana, galxtia. Eaft and Weft Indics, America.
870. Prsum, or Pea.

Fou: fpecies; viz. fativum, arvenfe, * maritimum, ochrus. Europe, North America.
nariiti- P. leaf-Italks flattifh above; ferm angular; Alipu. le arrow-fhaped; fruit-ftalks many-fowered.- $\ln 1555$, during a time of great featcity, the people about Or. ford in Suffex were preferved from perihing by eating the feeds of this plant which grew there in great abun. dance upon the fea coaft. Cows, horfes, fleep, and goats eat it.

[^5]A N N.
 napen!, very entire; ferm limple-The row, whe. boiled, are fav ury and nstritious; cronad to powies they may be made intu bre d. 'liney are lelld in hi, th eltecm by the Heghanders of Sentlind, wh, chew them as our people do iobicco, and find the they prevent the uncaly fenfation of hunger. They imagine that they promote expecturation, and are very efficacious in curing diforders of the lungs. They know how to prepare an intoxicating liquor from them. Horfes. cows, gonts, and theep cat it.

Lathrrus, or Cbicking Ietch.
21 fpecies; viz. * apliaca, * niilolia, amphicarpos. cicera, fativus, inconfpicuus, 'fetifolius, angulatus, articulatus, odoratus, annuus, tingitanus, clymenum, * hirfutus, tuberolis, * pratenfí, * fylveltris, thatifolius, heterophyllus, "paluftris, pifformis. Europe, Barbary, Ceylon.

* L. tendrils with two leaves, quite fimple, leafetspratioffor fpear-illaped.-This has been tecommended as a new plant for the experiments of the farmers, and premiuns have been offered for its cultivation. But it does not feem to be a plant at all agreeable to cattle, as where they have a choice of food they feldom touch it. Befides it produces very few feeds, and thofe are for the moft part devoured by a fpecics of curculio.

$$
\text { 8-3. Victa, or } V^{Y} \text { etch, Bean, Ture. }
$$

$2 כ$ โpecies; viz. pifformis, dumetorum, * fylvatica, caffubica, * cracca, geraddi, onobrychioides, niffoliana, biemnis, benghalenfis, * fativa, * lathyroides, * lutea, *hybrida, peregrina, * fepium, * bithynica, ratbonenfiv, faba, ferratifulia. Europe, Egypt, India.
*'V. legunsens moftly in pairs, upright; leafets inverfe-fative.
ly fpear-fhaped, blunt, notched; ftipule toothed; feeds comprefled.-In Gloucefterhire and Worceferhire, they fow it as pafurage for horfes, and eat it off early enough to allow of turnips being fuim the fame year.Thie feeds are excellent food for pigeons. IIoffes, cows, Theep, and goats, cat it.

* V. legumens moftly fous together, upright; leafets $\sqrt{\text { eftiunz }}$ egg-fhaped, very entire, the outer ones gradually fmal-ler.-This plant froots earlier in fpring than any plan: eaten by ca:tle, vegetates late in the autumn, and continues green all winter ; but it is difficult to collect the feeds, as the pods burft and fcatter them abou:, and moreover, hardly a third part of them will regetate, being made the nidus of an infect. A path of them fown in drills in a gatden was cut five times in the courfe of the fecond year, and produced at the rate oí ${ }^{2}+$ tons per acre of green food, which when dry would weigh near $4 \frac{1}{2}$ tons.

The feeds of the vicia fala, or common bean, are a ftrang fatulent food, furficiently nutritious, but not eafy of digeftion, efpecially when growing old. A water diftilled from the flowers has been celebrated as a cofmetic, and fill retains its character among fome female artifts.
874. Errum, or Bitter l'tctch.

Six fpecies; viz. lens, *tetrafpermum, ${ }^{*}$ hifutum, folonien!c, monanthos, crvilia. Europe. Afia.

* E. fruit-1lalks many fowercd; feeds 2, globular- - hirfurim. Hories, cows. goats, and fheep cat it. In wet feafons whole fields of corn have beca overpowered and wholly deftroyed by it.

S75. Cicer, or Cbick-peafo.
One fpecies; viz. aristinum. S. Europe, Levant.
1319. Liparia.

Five fpecies ; viz. Iphierica, graminifolia, umbellata, villo「a, 「ericea. C. of G. Hope.

S76. Cytisus, or Trefoil-tree.
17 Species; viz. laburnum, rigricans, wolgaricus, feffilifolius, cajan, patens, hiffutus, capitatus, auftriacus, fupinus, prolifer, argenteus, pendulinus, purpureus, glaber, gracus, tener. Europe, Cape, E. Indies.

## 1417. Mullera.

One fpecies, 3 viz. moniliformis. Surinam.
878. Geoffroya, or Bafe Cabbage-tree. One fpecies; viz. fpinofa. Jamacta, Brazil.
879. Robinia, or Falfe Acacia.

Nine fpecies; viz. pfeud-acacia, violacea, hifpida, mitis, holodendron, caragana, fpinofa, frutefcens, pygmæa, Siberia, 'Tartary, N. America, W. Indies.
880. Colutea, or Bladder-fenna.

Four fpecies; viz. arborefens, frutefcens, perennans, herbacea. Auftria, Italy, Levant, Africa.
882. Glycirrhiza, or Liquorice.

Four fpecies; viz. echinata, glabra, hiffuta, afperrima. Spain, Italy, Levant, Apulia.
883. Coronilla, or Foint-podded Colutea.

II fpecies; viz. emerus, juncea, vatentina, glauca, coronata, minima, argentea, fecuridæa, varia, cretica, fcandens. S. Europe, America.
884. Ornithopus, or Birds-foot.

Four §pecies; viz. * $^{\text {* }}$ perpufilus, compreffus, fcorpioides, tetraphyllus. S. Europe, Jamaica, Barbary.

## 885. Hippocrepis, or Horfe-floo Vetch.

Four fpecies; viz. urifiliquofa, multifiliq̧uofa, * comola, balearica. S. Europe.
886. Scorpiurus, or Caterpillars.

Four fpecies; viz. verniculata, muricata, fuicata, Subvillofa. S. Europe.
888. Eschynomene, or Bafe Scnfitive plant.

Eight fpecics; viz. grandifora, arborica, coccinea, afpera, americana, indica, fefban, pumila. Egypt, E. and W. Indies.

## 887. Hedysarvar, or Frencla Honeyfucklc.

67 fpecies; viz. alhagi, bupleurifolium, linifolium, nummularifolium, moniliferum, ftyracifolium, reniforme , fororium, vefpertilionis, gangeticum, maculatum, latebrofum, vaginale, imbricatum, triquetrum, Arobiliferum, diphyllum, pulchellum, (partium, lineatum, retrotlexum, umbellatum, biarticulatum, heterocarpon, vifcidum, canadenfe, cancfeens, marilandicum, frutefcens, vir:dillorum, hirtum, junccum, violaceus, panicolatum, nudiflorum, repens, hamatum, triforum, barbatum, lag,opodioides, microphyllum, racemofum, caudatum, tomentofum, fericcum, virgatum, pilofum, friatum, volubile, gyrane, argentalum, alpinum, obfcurum, coronarium, flexuofum, humile, fpinofifimum, virginicum, fruticofum, pumilum, * onobrychis, faxatile, caput gal. li, crifta galli, trinjtum, cornutum, incanum. S. Europe, R., and W. Indies; N. America.

* H. leaves winged; legunscris with one feed, prickly; onolrychis wings as long as the calyx; Atem growing long.-This plant is cultivated the clover for feeding cattle, and is particularly advantageous in diy hilly fituations and chalky foils.

889. Inpigofera, or Indigo.

23 fpecies; viz. fenicea, ovata, trifolhata, phoraloides, procumbens, farmentofa, denudata, mexicana, trita, filiformis, digitata, ftricha, frutefcens, enneaphylla, pentaphylla, glabra, cytifoides, hirfuta, anguflifolia, anil, tinctoria, difperma, argentea, Arabia, E. and W. Indies, Cape, Carolina.

## 89o. Galega, or Goats-ruc.

12 Species; viz. oficinalis, cinerea, littoralis, viro giniana, villofa, fpinofa, maxima, purpurea, caribæa, cœerulea, tinctria, fenticofa. S. Europe, E. and W. Indies. America.

The galega officinalis was celebrated as an alexipharmac ; but is fenfible qualities difcover no foundation for any virtues of this kind; the tafte is merely leguminous, and in Italy, where it grows wild, it is faid to be ufed as food.

> 891, Phaca, or Bafe Milk-vetch.

Ten fpecies; viz. bxtica, alpina, falfuta, fibirica, aultralis, tritoliata, veficaria, profrata, niicrophylla, muricata. Lapland, Siberia, S. Europe.
892. Astragalus, or Liquorice, or Milk-velch.

45 fpecies; viz. alopecuroides, chriftianus, capitatus, pilofus, fulcatus, galegiformis, chinenfis, onobrychis, uliginofus, carolinlanus, afper, canadenfis, cicer, micro. phylluc, * glveyphyllos, hamofus, contortuplicatus, bæticus, lixmanni, ftella, fefameus, auftriacus, leontinus, pentaglottis, epiglottis, * hypoglottis, fyriacus, arenarius, glaux, finicus, alpinus, ammodytes, trimefris. verticillaris, montanus, veficarius, phyfodes, caprinus, * uralenfis, monfpeffulanus, incanus, campeftris, deprefus, uncatus, exfcapus. Europe, Egypt, Barbary.
893. Bisserrula, or Bafe Hatchet-vetch.

One Ipeciss; viz. pelecinus. South of Europe.

## 894. Psoralea.

23 (pecics; vix. rotundifolia, pinnata, aculeata, brac. teata, fpicata, axillaris, flachydes, aphylla, tenuifolia, capitata, hirta, repens, bituminofa, glandulofa, palefo tina, americana, tetragonalia, corylifolia, pentaphylla, proftrata, dalea, enneaphylta, levigata. S. Europe, India, Africa, America.

## Sg6. Trifolium, or Trefoil, Clozer.

46 fpecies; viz. crerulea, indica, meffanenfe, polonica, * officinalis, italica, cretica, * ornithopodioides, lupinafta, reflexum, ftrictum, * hybridum, ${ }^{3}$ reןcens, comofum, alpinum, * fubterraneum, globofum, chacrleri, lappaceum, rubens, * pratenfe, alpefte, pannonicum, fquarrofum, incarnatum, * ochroleucum, anguftifolium, * arvenfe, ftellatum, clypeatum, • feabrum, "glomeratum, ${ }^{*}$ friaturn, alexandrinum, uniflorum, fpinofum, refupinatum, tomentofum, * fragiferum, montanum, agrarium, fpacticcum, * procumbens, * filiforme, biflorum, * fufocatum. Europe, India, Africa, Noth America.

* T. capfules in bunches, often 2 .fecded, wrinkled, officinalis. acute; flem upright.-This plant is anore fragrant
when dry than when green. A water diftilled from the tlowers poffefles but little odour in itfelf, but improves the flavour of other fubllances. Hor'es are cxtremely fond of it. Cows, goats, fheef, and fwine eat it.
* T. heads like umbels; legumens $\downarrow$-feeded; fem crecping.-Horles, cows, and goats eat it. Sheep are not fond of it. Swine refufe it. The Icaves fland up. right againf rain. Wherever this plant abounds fpontaneoufly, it is confidered as an indication of the goodnefs of the foil, and this is a thing well known to farmers. The richnefs of meadows and paflures is naturally owing to their abounding principally with the trefoils, and nthers of the fame clafs, with a due mixture of the more acceptable graffes.
tratenfe.
* T. fpikes crowded; bloffoms uncqual ; calyx with four of the teeth equal; flipule awned; flems afcend-ing.-In a great fcarcity of provifions, bread has been made of the flowers. The beads are ufed in Sweden to dye woollen green. With alum they give a light, with copperas a dark green.

> 897. Lotus, or Birds-foot Trefuil.

18 fpecies; viz. maritimus, filiguofus, tetragonolobus, conjugatus, tetraphyllus, edulis, percgrinus, anguftifimus, arabicus, ornithopodioides, jacobeus, creticus, hirfutus, gracus, rectus, * corniculatus, cytifoides, dorycnium. Europe, Arabia, Madeira.
cornicula- * L. heads of the fowers flatted at the top ; flems her-

## tus.

baccous, trailing : legumens cylindrical, expanding.The flowers of this plant become greenill when dried, in which refpect they refemble the flowers of the plants which produce indigo. Cuws, goats, and hor!es eat it. Sheep and fwine are not fond of it. In Hertfordflirc it is cultivated as patlurage for fheep. There is no doubt but it might be cultivated to great advantage. In moill meadows it grows to a great height, and makes extremely good hay.

S98. Trigonell. , or Fenugreck.
12 fpccies; viz. ruthenica, platycarpos, friata, polycerata, hamofa, fpinofa, corniculata, monfpeliaca, la.
$\Lambda \mathrm{N}$ Y. $24_{r}^{4}$
ciniata, fonnum grecum, fylveflis, indica. Siberia, S. Europe, Egype, India.
'The trigonella fonum gracum is cultivated chiefly is, the fouthern parts of France, Germany, and Italy; from whence the feeds are brought to us. They are of a yellow colour, rhomboidal figure, a difagrecable ftoong fmell, and a mucilaginous tatle: 'Their principal $u f e$ is in cataplafins, fomentations, and the like, and in: cmollient glyfters.

## S99. Medicago, or Medich, Moon-trefail.

24 Pecies; viz. arborea, virginica, radiata, circin nata, * fativa, * falcata, * lupulina, marina, polymor pha, proftrata, orbicularis, fcutellata, tornata, turbinata, intertexta, * arabica, coronata, ciliaris, hirfuta, rigidula, * minima, * muricata, nigra, laciniata. Europe, North America.

* M. flowers in bunches; legumens narrow, regular, falitu twifted; Acm upright, fnooth. - Modern writers upon hufbandry frongly recommend the cultivation of this plant, for the purpofe of feeding cattle; but it is not ytt generally adopied.
* M. nowers in bunches; legumens crefcent-ftaped ; faliona. flem proftrate. -In hot, dry, barren fandy places it is well worth the trouble of fowing for the furpofe of making hay; a praftice long firice adopted in fome parts of Sweden. Cows, holfes, goats, and fheep cat it.
* MI. fpikes oval; feed-veffels kidney-fhaped, with 1 hipulinat cell and I feed; flems trailing.-Cows, horfes, goats, and theop eat it ; but it is lefs grateful to them than the other fpecics. It is cultivated in Nuffolk under the name of nonfuch, and is ufually fown mixed with rye-grafs. The crop is then called black and white nonfucl. It has been fown in the life of Wight. It is fometimes form along with clover and rye grafs.

In the clufs Diadelpbia are.
56 Genera, including 710 Species, of which 5 ? are found in Britain.

900. Theobroma, or Chocolate-nut iree.

Two fpecies; viz. cacao, guamma. Jamaica, S. America.-The nuts of the thcobroma cacao are the fruit of an American tree refembling the almond. The tree, though fmall, bears a large fruit, Maped like a cucumber, which contains 30 or more of the nuts. Thefe, by preflure, yield a confiderable quantity of a fluid oil. Boiled in water, they give out a large portion of a febaceous matter, which congeals on the furface of the liquor as it coods. The principal ufe of thefe nuts is for the preparation of the dietetic liquor chocolate. This is a mild, unctuous, nutritious fluid, capable of loitering acrimonious humours, and of great fervice in confumptive diforders, efyecially if made with milk, and with only a fmall proportion of aromatics.
1418. Abroma.

One fpecies; viz. augufts. California.

## Order II. DODECANDRIA.

## 3268. Monsonia.

Three feecies; viz. 5lıa, fpeciofa, lobata. C. of l. Hope.

## Ordo III. ICOSANDRIA.

901. Citrus, or Lemon-orange, Shaddock.

Four fepcies ; viz. medica, aurartium, decumana, japonica. Afia, India.

The citron, or the citrus medica, is an evergreen tree or fhrub, of the fame genus with the orange and lemon ; it was firft brought from Affyria and Media (whence the fruit is called mala a.flyria, mala medica) into Greece, and thense into the fouthern parts of Europe, where it is now cultivated. Citrons are rarely made ufe of among us; they are o? the fame quality with lemuns, except that their juice is fomewhat lefs acrid. They are with us frequently employed as a condiment.

The juice of lemons is fimilar in quality to that of oranges, from which it differs little otherwife than its being more acid. The yellow peel is an excellent aromatic, and is frequently eroployed in fomachic tinctures and infufions: it is confiderably lefs hot than orange peel, and yields in difillation with water a lefs quantity of effential oit; its flavour is neverthelefs more periftable, yet does not arife fo readily with fpirit of wine; for a fpirituous extra氏t made from lemon peel poffeffes the aromatic tafte and fmell of the fubject, in much greater perfection than an extract prepared in the fame manner
from the peel of oranges. In the fhops a fyrup is prepared from the juice, and the peel is candied: the peel is an ingredient in the bitter infufions and wines: the effential oil enters the volatile aromatic firit, or fpiritus ammonic compofitus, as it is now called, and fome other formule.

The orange or the citrus anrantium is a beautiful evergreen tree, or rather fhrub; it is a native of the warmer climates, and dots not eafily bear the winters of this.

The flowers are highly odoriferous, and have been for fome time paft in great efteem as a perfume; their tafte is fomewhat warm, accompanitd with a degree of bitternefs. They yield their flavour by infufion to rcctified fpirit, and in diftillation both to fpirit and water : the bitter matter is diffolved by water, and on evaporating the decotion, remains entire in the extract. An oil diftilled from thefe flowers is brought from Italy, under the name of oleum or efentia neroli.

Orange flowers were at one time faid to be an ufeful remedy in convulfive and epileptic cafes; but experience has not confirmed the virtues attributed to them. The leaves of the orange have alfo been recommended for the fame purpofe, but have by no means anfwered the expectations entertained by fome.

The outer yellow rind of the fruit is a grateful aromatic bitter; and proves an excellent fomachic and carminative, promoting appetite, warming the habit, and Atrengthening the tone of the vifcera. Orange peel appears to be very confiderably warmer than that of lemons, and to abound more with effential oil: to this circumftance, therefore, regard ought to be had in the ule of thefe medicines. The flavour of the firf is likesvife fuppofed to be lefs perifkable than that of the other; hence the London college employ orange-peel in the fpirituous bitter tincture, which is defigned fer keeping; whild in the bitter watery infufion, lemonneel is preferred. A fyrup and diftilled water are for the fame reafon prepared from the rind of oranges in preference to that of lemons.

The outer rind of the orange is the bafis of a conierve both in the Edinburgh and London pharmacopocias; and this is perhaps one of the moft elegant and convenient ferms for exhibiting it.

The juice of oranges is a grateful acid liquor, of conliderable ufe in febrile or inflammatory diftempers, for allaying heat, abating exorbitant commotions of the blood, quenching thirft, and promoting the falutary excretions; it is likewife of ufe in genuine fcorbultus or fea-fcurvy. Although the feville or bitter orange, as it is called, has alone a place in our pharmacoperias, yet the juice of the china, or fweet orange, is much more employed. It is more mild and lefs acid; and it is employed in its moft fimple flate with great advantage, both as a cooling medicine, and as
an ufeful antifeptic in fevers of the worl kinde, as well as in many other acute difeafes, being highly beneficial, in alleviating thirft.

## Order IV. POLYANDRIá.

1320. Glabraria.

Oate §pecies ; viz. terfa. E. Indies. $^{\text {Pr }}$
132f. Munchhausia.
Onc fpecies; viz. fpeciofa.
Durio.
One fpecies; viz. zibethinus. E. Indies.
126g. Melaleuca, or Cayputi Iree.
Five Species; viz. leucadendron, latitulia, angufifolia, lucida, villofa, fcoparia, virgata. New S. Wales, New Zealand.
1270. Hopea.

One 〔pecies; viz. tinctoria. Carolina.
677. Symplocos.

One fpecies; viz. martinicenfis. Jamaica, Martinico.
902. Hypericum, or St. Yoln's Worto

42 Species; viz. balearicum, kalmianum, cayanenfe, bacciferum, calycinum, guinecnfe, petiolatum, patu. lum, afcyton, * androfemum, olympicum, petiolatum, canarienfe, hircinum, ægyptium, orientale, fcabrum, repens, prolificum, oricoides, canadenfe, virginicum, mexicanum, reflexum, * quadrangulare, * perforatum, *humifufum, crifpum, * montanum, barbatum, * hirfutum, tomentofum, perfoliatum, * elodes, "pulchrum, nummularium, japonicum, erectum, coris, mutilum, fetofum, monogynum. Europe, Azores, China, N. Ameríca.

* H. ftem 2-edged; leaves blunt; with pellucid dots. -This plant has long held a place in the materia medica, but its ufe is very much undetermined. The femi-tranfparent dots on the leaves are the receptacles of an effential oil. The leaves given in fubflance are faid to deftroy worms. The flowers tinge fpirits and oils of a fine purple colour, which is probably derived from the little glands upon the anther, and upon the edges of the petals. Cows, goats, and fieep eat its Hories and fwine refufe it.

903. Ascyrum, or St Peter's Wort.

Three fpecies; viz. crux andreæ, hypericoides, viliofum. N. America.

## In the clafs Polyadelphia are

12 Genera, which include 65 Species. Of thefe $\&$ are found in Britain.

CLASS XIX.
SYNGENESIA.(1)

## CLASSIS XIX.

SYNGENESIA, or compound flowers.

Order I. polygamia equalis, or with both ftamens and pittils in the fame florets.

## Sect. I. Senififocular of Tournefort, all the forets ligulate, or frap--Jlaped.

S. Recept. chaffy. No down. Cal. tiled, prickly.

* C. Recept. nearly chaffy. Down nearly 5 -toothed. Cal. calcyled, i. e. having a double calyx.
C. Recept. claffy. Down awned, fitting. Cal. tiled, fkinny.
S. Recept. chaffy. Down fomewhat hairy. Cal. fimple.
* H. Recept. chaffy. Down feathered. Cal. tiled.
G. Recept. chaffy. Down of the difc feathered, of the radius 5 -awned. Cal. fimple.
A. Recept. woolly. Down hairy, fitting. Cal. nearly equal, rounded.
* T. Recept. naked. Down feathered, pedicled. Cal. fimple.
* P. Recept. naked. Down feathered, pedicled. Cal. calycled.
* L. Recept. naked. Down feathered, pedicled. Cal. tiled with loole fcales.
S. Recept. naked. Down feathered, pedicled. Cal. tiled, with a $k$ kinny border.
* C. Recept. naked. Down hairy. Cal. calycled, with irregular fcales.
C. Recept. naked. Down hairy, pedicled. Cal. calycled, many-flowered.
* P. Recept. naked. Down hairy. Cal. calycled, nearly 5 -flowered.
* L. Reccpt. naked. Down hairy, pedicled. Cal. tiled, with a dkinny border.
* 913. 

(1) This clafs comprehends thofe flowers which botanifts have very generally agieed to call compound. The effential character of a compound Hower, confifts in the anthers being united fo as to form a cylinder, and a fingle feed being placed upon the receptacle under each floret. The dandelion and thitle are compound flowers; that is, each of thefe flowers is compofed of a number of fmall Howers called forets. The plants of this clafs are fuppofed to have various fpecific virtues. Moft of them are bitter; almolt none of them are poifonous.- The lactuca virafa, when growing in fady fruations, is however faid to be an exception to this laft rule.

The elallicity of the calyx in the picris, carduus, and many other genera, is too remarkable to pafs unnoticed by the flighten obferver. It feems as if the expanfion of the plants firf burf the calyx open, and when thefe wither it clofes again. The downy haiss that crown the feeds, before upright, now begin to expand, and by this expanfion again open the leaves of the calyx, and bend them quite back. The feeds now efcape, and the salyx, becoming dry and withered, no longer retains its elaftic poner.

The hairy or downy appendages of the feeds occafion them to be wafted about in the air, and diffeminated far and wide. The fructure of this down ceferves our notice; there is hardly a child that is infenfitle to its curiuns and beautiful appearance in the lecontodon or dardelion.

In this clats bie orders are detcrmined by the flate of the florets with_regard to famens and piffilso

* 9 r3. Hieracium. Reccpt. nudum. Pappus pilo$f_{\text {uss }}$, fefflis. Cal. imbricatus, ovatus.
* go8. Sonerus. Recept. nudum. Pappus pilufus, fegilis. Cal. imbricatus, gibsus.
* 919. Lapsana. Recept. nudum. Pappus nullus. Cal, calyculatus.
* gif. Hyoseris. Recept. nudum. Pappus caly. culo coronatus. Cal. fubrequalis.

## Sect. II. Capitati.

930. Atractylis. Corolla radiata.
931. Barnadesia. Cor, radiat?. Cal. nudus, imbricatus, pungens. Pappus radii plumofus; difci fetofus, retrofractus.

* 929. Carlina. Cal. radiatus, radiis coloratus

926. Cnicus. Cal. bracteis obvallatus.

* 923. Arctium. Cal. fquamis apice incurvato-hamofis.

951. Carthamus. Cal. fquamis fquarrofus foliaceis.
952. Cynara. Cal. fquamis fquarrofus canaliculatis, finofic.

* 92 . Carduus. Cal. fquamis fpinofis, ventricofus.
*927. Onopordon. Cal. fquamis ventricolus fpinofis. Recept. favofum.
* 924. Serratula. Cal, fquamis acutiufculis muticis imbricatus, fubcylindricus.

> Sect. III. Difcoidei.
934. Ethulia. Recept. nudum. Pappus nullus. Cal. sequalis.
936. Ageratum. Recept. nudum. Pappus 5ariftatus. Cal. fubæqualis. Corollulæ 4 -fidæ.
933. Bacalta. Recept. nudum. Pappus pilofus. Cal. caly culatus.
939. Chrysocoma. Recept. nudum. Pappus pilo. fus. Cal. imbricatus. Pift, breviflima.

* 935. Eupatorium. Recept. nudum. Pappusplumofus. Cal imbricatus. Pif. longiflima.
* 942. Santolina. Recept. palceaceum. Pappus nullus. Cal. imbricatus, hemifphæricus.

941. Calea. Recept. paleaceum. Pappus pilofus. Cal. imbricatus:
942. Athanasia. Rccept. paleaceum. Pappus paleaceus. Cal. imbricatus.

* 932 . Bidens. Recepto paleaceum. Pappus ariftatuc. Cal. imbricatus.

938. Stehelima. Recept. paleaceum. Pappus plumofus, ramofus. Antheræ caudatæ.
939. Pteronia. Recept. fetis partitis. Pappus fubplumofus. Cal. imbricatus.
970 Trachonanthus. Recept. pilofum. Pappus pilofus, veftiens. Cal. turbinatus, monophyllus.

## Ordo V. POLYGAMIA SUPERFLUA.

## Sect. I. Difcoidei.

* 945. Artemista. Recept. fubnudum. Papp. nullus. Cor. radii nulla.
* H. Recept. naked. Down bairy, fitine Cal. th'ed, ova].
* S. Recept. naked. Down hairy, fitting. Cal. tiled, bulged.
* L. Recept. naked. No down. Cal. calycled.
* H. Recept. noked. Down crowned with a calyele. Cal. nearly equal.

## Sect. II. Capitate, or growing in Beads.

A. Cor. radiated.
B. Cor. radiated. Cal. naked, tiled, pungernt. Down of the radius feathered; of the dilc brifly, breken backwards.

* C. Cal. radiate (or with the outer different from the central florets); radii (outer florets) coloured.
C. CAl. furrounded by floral leaver.
* A. Cal. with fcales hooked, curved at the point.
C. Cal. fcurfy, with leafy fcales.
C. Cal. fcurfy, with channelled fcales, thorny.
* C. Cal, bellied, with thorny feales.
* O. Cal. bellied, with thorny fales. Recept. honey: combed.
* S. Cal. tiled with fharp awnlefs fcales, nearly cyline drical.

## Sect. III. Difcoid (florets tubular.)

E. Recept. naked. No down. Cal. equal.
A. Recept. naked. Down 5 awned. Cal. nearly equal. Cor. 4 -cleft.
3. Recept, naked. Down hairy. Calo calycled.
C. Recept. naked. Down hairy. Cal. tiled. PiR. very fhost.

* E. Recept. naked. Ninwn feathered. Cal. tiled. Pil. very long.
* S. Recept. chaffy. No down. Cal. tiled, hemifpherical.
C. Recept. chaffy, Down hairy. Cal. tilcd.
A. Recept. chaffy. Down chaffy. Cal. tiled.
S. Recept. chaffy. Down 2-toothed. Cal. nearly equal.
* B. Recept. chaffy. Down awned. Cal. tiled.
S. Recept. chafiy. Down feathered, branched. Anthers tailed.
P. Recept. with parted brifles. Down nearly feathered. Cal. tiled.
T. Recept. hairy. Down hairy, covering. Cal. turban-like, i-leaved.

## Order II. POLyGamia superflua.

E. Perianth. 1-flowered. Down pubefcent. Polygamy equal.
E. Perianth. 4-flowered. Down briftly. Polygamy equal.
G. Recept. 5 -flowered. No down. Polygamy fruft. (See p. 66.)
J. Recept. chaffy. Perianth. common, 3 - fowered. Florets tubular, z-lipped ; outer lip Arap-fiaped, the inner 2 -parted.
S. Recept. many-flowered. No down. Polygamy neceffary. (See p. 66.)

## Order VI. MONOGAMIA.

S. Cal. 5 -toothed. Cor. 5 -petaled, regular. Berry inferior, 1 -feeded.
S. Cal. tiled. Cor. 1 -petaled, regular. One oblong feed.
C. Cal. 2-leafed. Cor. r-pctaled, regular. One cottony feed.
L. Cal. 5 -toothed. Cor. 5 -petaled, regular. Capf. inferior, 2 .celled.
V. Cal. 5 -leaved. Cor. 5 -petaled, irregular. ${ }^{\circ}$ Capf. fuperior, 3 -valved.

1. Cal. 5 -leaved. Cor. 5 -petaled, irregular. Capp. fuperior, 5 -valved.

## Order I. polygamia eounlis.

904. Gerapogon, or Old Man's Bcardo
l'hree fpecies; viz. glabrum, hirfutum, calyculatum. Italy.

> 205. Tracolocion, oit Gonts Beatd.
${ }^{14}$ fpecies; viz. * pratenfe, mutabile, undulatann, orientale, majus, * porrifolium, crocifolium, villosum, dalechampii, picroides, afperum, dandelion, lanatum, viseinicum. Europe, North America.
taratenfo. * 'I. calyx as long as the rays of the blofiom: leaves entire, quite flrdight; fruit-lalk cylindrical. Nitiow gouts-beard.- Before the lems moot up, the roots buled like efparagus bave the firme flavour, and are nealy as nutritious. Cows, fhecp, and horfes cat it. Swise devuur it grcedily. Goats are nut fond of it.
906. Scorzonera, or l'ipers Grofs.

1+f fecies; viz. tomentof, humili,, parviflora, hifo $f^{\text {mica }}$ graninifolia, purpurea, angufiiolia, birluta, refedifulia, laciniata, orientalis, taraxacifolium, tingitana, picroides. 1.unope, Arabia, Burbary.
SO7. Picris, or Ox Tingut.

Vour fpecies; w.z. * echivid", biseracioides, japoneici, afplenioucs. Girmatiy, Mialice, ltaly, Inpm.
908. Sonchus, or Sow-thifle.
${ }_{13}$ fpecies; viz. * canadenfis, * arvenfis, * palufris, * olcraceus, maritimus, fruticofus, tencrrimus, plumieri, alpinus, fioridanus, fibiricus, tataricus, tuberofus. Europe, Madeira, N. Amer. "Jam.

* S. fruit and calyxes rough with hair in a fort of um-arvenfis. bels; leaves naked, heart-flaped at the bafe. Corn or fow-thifle-The flowers follow the fon very regularly. Cows and goats eat it ; horfes are very fond of it.
* S. fruittalks cotony; calyxes fmootl. `Commonoleracius. fow-tbiflc.- Ithe leaves are good among other pothierbs. They are a very favourite food with hares and rabbits. Sheep, goats, and fwine eat it. Horfes are very fond of it.

## 909. Lactuca, or Lethuce.

Ten feccies; viz. * fcariola, * virofa, * falizna, quercina, intybacea, fativa, tuberofa, canadenfis, indic:a, perennis. Europe, E. Indies, N. America.

* I. all the leareshorizontal, toothed; therir mid-:ibevirofa. prickly on the back. Wild lettuce. - The juice fmells like opium. It is milky, acrid, and bitter. Dr Cullen telates 24 cafes of dropfy, out of which 23 were cured by tak:ing the extratt prepared from the exprefed juice
in dofes, from 18 grains to three drams in the 24 hours. It commonly proves laxative, promotes urine and gentle fweats, and remuves the thirf. It muft be prepared when the plant is in llower.

9:0. Chondrilla, or Gum Succory.
Three Tpecies; viz. juncea, crepoides, nudicaulis, Germany, Switzerland, France.
211. Prenanthes, or Wild Leftace.

19 fpecies; viz. tenuifolia, chinenfis, viminea, purpurea, *muralis, altiflime, chondrilluides, japonica, alba, repens, pinnata, integra, debilis, dentata, haflata, humili, multifora, lyrata, fquarrofa. Europe, Japan, N. America.

## 912. Leontodon, or Dandelion.

10 〔pecics; viz. * taraxacum, bulbofum, aureum, hattile, tuberofum, *autumnale, alpinum, * hifpidum, * hirtum, tomentofum. Europe, Africa, N. Amer.
913. Hieracium, or Hacukqued.

39 .pecies; viz. incanum, pumilum, * alpinum, *taraxaci, alpeftre, venofum, * pilofella, * dubiun, * auricula, cymofum, premorfum, aurantiacum, gronovii, gmelini, fanctum, capenfe, pontanum, paniculatum, porrifolium, chondrilloides, * murorum, humile, * paludofum, lyratum, cerinthuides, amplexicaule, pyrenaicum, blattarioides, pilofum, alltriacum, helveticum, * molle, flipitatum, * villofum, glutinofum, kalmii, , prengerianum, * \{abandum, * umbellatum.
alpinum. * H. leaves oblong, entire, toothed; flalk almof naked; calyx hairy.-This differs from the other lactefcent piants, being lefs bitter and more aftringent. It is efteemed hurtful to fheep. Goats eat it. Sheep are not fond of it. Horfes and cows refufe it.

## 914. Crepis, or Bafe Hawlweed.

16 fpecies; viz. pyomxa, burfifolia, barbata, veficaria, alpina, rubra, * fotida, afpera, rhagadioloides, fibirica, * teftorum, * biennis, virens, diofcoridis, pulchra, neglecta. Siberia, Alps, Azores, Arabia.

9ry. Andryala, or Dozung Sow-bbifle.
Three ipecies; viz. integrilolin, tagufina, lanata. E. Europe, Archipelago, Canary.
916. Hyoseris, or Tellow-eye.

Nine fpecies; viz. feetida, radiata, lucida, fcabra, virginic?, * minima, hedypnois, shagadioloides, cretica. Europe, N. America, Msdeira.
917. Seriola.

Four fecies; viz. lævigata, æthnenfis, cretenfis, urens. S. of Europe.

## 9iS. Hypocharis, or Gobmorc.

Four fpecies; viz. helvetica, * maculata, * glabra, *radicata. Europe.
*raculata. * H. ftem almofi bare, with a folitary branch; leaves egg-oblong, entire, toothed.-The leaves of this plant are boiled, and eaten as cabbage. Horfes arc fond of this plant, when green, but they do not like it when dry. Cons, goats, and fwine eat it. Sheep are not fond of it. The country people believe it a cure for tetters and other cutaneous cruptions, poffibly though a vulgar prejudice, founded on its fpotted leaves.

9rg. Lapsana, or Nipplc-wort.
Five fpecies; viz. * communis, zacintha, fellat?,
-olpinii, rhagadiolus. Siberia, S. of Europc.
920. Catanimehe, or Candia Lion'sfoo:

Three fpecies; viz. cœulea, lutea, greeca. South of Europe.
921. Cichorium, or Succory, Endive.

Three fpecies; viz. * intybus, endivia, fpinofum. Europe.
*. C. Howers in pairs, fitting ; leaves notched. -The intsbure leaves, when blanched, are eaten early in the fpring in falals. They lofe their bitternefs by cultivation The roats, gathered before the ftem fhoots up, are eatable, and when dried, will make bread. Sheer, goats, and fwine eat it.

The leed of the cichorium endition is raifed in gar. dens for culinary ufe. It is a gentle cooler and ape rient, nearly of the fame quality with the former fpecies. The feeds are ranked among the four leffer cold feeds
922. Scolymus, or Goldch Thifle.

Two fpecies; viz. maculatus, hifpanicus. S. Eur.

> 923. Arctium, or Burdocko

Three rpecies ; viz lappa, perfonata, carduelis, $^{\text {a }}$ Europe.

* A. leaves heart-flaped, without thorns, on lcaf-laps.z. Atalks.-Beforc the flowers appear, the ftems, fripped of their rind, are boiled, and eaten like afparagus; when raw, they arc goud with oil and vinegar. A decuction of the roots is eneemed by fome very fenfible phyficians, as equal, if not fuperior to that of Carfaparilla. Boys catch bats by throwing the prickly heads up into the air. Cows and goats eat it. Sheep and liurfes"refufe it. Swine are not fond of it.

924. Serratula, or Sau-zuort, Traj-thjigle.

15 'pecies; viz. * tinctoria, coronata, jıponica, *a]pina, falicifolia, multiflora, noveboracenfis, prealta, glauca, fquarrofa, feariofa, fpicata, amara, centauroidec, * arvenfis. Europe, N. America.

* S. leaves lyre-haped and wing-cleft; the terminat-tintoria. ing legment very large; florets all alike.-This plant is very mach ufed by the dyers to give a yellow colour, but is i:2ferior to the refeda; therefore its ufe is confined to the coarfer woollen cloths. Goats eat it. Harfes are not fonll of it. Sheep, fwine, and cows refure i:。
* S. leaves toothed, thorny.-This fpecics is faid toarvenfit yield a very pare vegetable alkali when burnt. Goats eat it : neither cows, horfes, flieep or fiwine are fond of it. Ilurfes fometimes eat the young tops.

## 925. Carduus, or Thifle.

3 S fecics; viz. leucographus, * lanccolatus, arabicus, * nutans, * acanthoides, crifpus, polyanthemus, * paluftris, pycnocephalus, argentatus, auttralis, diffectus, cyanoides, canus, pexinatus, delloratus, moufo peffulanus, panoonicus, tuberofus, chius, parvifluru:, linearis, calabonte, Atellatus, *mırimus, fyriacus, "eriophorus, alsillimac, virginianuc, heterophyllu: * liele:ioides, ferratuloides, tataricus, ciliatus, flavefcen:, rivularis, mollis, * acaulis. Europe, North America, Barbary, Japan.
 banches, uprisht; fruitfalks without thorns.- Thi, and almont all the other lp:ci-s of this genus, may be eal? en like the burdock, Lefore the flowers are forncicl. Swine cat it. Horfes are very forl of it. Cuass sefrite it.

250 B O T
Vancolaths * C. leaves with winged clefts, hifpid; fegmentsfradling; calyx egg-fhaped, thorny, woolly; ftem lairy. - Few plants are more difregarded than this, and yet its ufe is very confiderable. If a heap of clay is thrown up, nothing would grow upon it for feveral years, did not the feeds of this plant, wafted by wind, fix and vegetate thereon. Under the fhelter of this other vegetables appear, and the whole foon becomes fertile. The Howers, like thofe of the artichoke, have the property of curdling milk. Sheep and fwine refufe it. Neither horfes, cows, nor goats are fond of it.
marianus.

* C. leaves embracing the fter halberd-fhaped and wing cleft, thorny ; calys without any leaves near it ; thorns channelled and fet with other little thorns.This plant is eaten as a falad when young. The young ftalks, peeled and foaked in water to take off the bitternefs, are excellent. The fcales of the cup are as good as artichokes. The root is good to eat early in the fpring.
coaulis. * C. ftemlefs; calyx fmooth.- Cows refufe the plant. It kills all plants which grow beneath it, whence it is very injurious in meadows.

> 926. Cnicus, or Bleffed Thifle.

Nine fecies; viz. oleraceus, erifithales, ferox, pygmæus, acarna, fpinofifimus, centauroides, uniforus, cernuus. Europe.

## 927. Onopordum, or Woolly or Cotion Thifle.

Five fpecies; viz. * acanthium, illyricum, arabicum, græcum, acaulon. Europe, Arabia.
acantbium.* O. calyx feales expanding, their points ftanding out; leaves egg-oblong, indented.-The receptacle and the young ftems may be boiled and eaten like artichoke. The ancients thouglat this plant a fpecific in cancerous cafes. Cows, fheep, and horfes refufe it.
928. Cynara, or Artichokc.

Four fpecies; viz. fcolymus, cardunculus, humilis, acaulis. S. Europe, Madeira, Barbary.

> 929. Carlina, or Carline Tbifle.

Eight fpecies; viz, acaulis, lanata, corymbofa, * vulgaris, racemofa, pyienaica, xeranthemoides, atractyloides. Europe, Cape, Barbary.
2ulgaris. C. ftem, with many flowers in a corymbus; flowers terminating; rays of the calyx yellow white.-Its flowers expand in dry, and clofe in moift, weather. They retain this property a long time, and therefore are employed as liygrometers. It is faid to be an excellent remedy in hyfterical cafes. Goats eat it. Cows sefufe it. Its prefence indicates a very barren foil.

The carlina acoulis is a very prickly fort of thiftle, growing fpontancoufly in the fouthern parts of France, Spain, Italy, and the mountains of Switzerland; from whence the dried roots are brought to us. This root is about an incle thick, extcrnally of a pale rulty brown colour. corroded, as it were, on the furface, and perforated with numerous fmall holec, appearing, when cut, as if worm-eaten. It has a ftrong fmell, and a fubacrid, bitteriah, weakly aromatic tafte. Carlina is looked upon as a warm diaphoretic and alexipharmac ; and has been for fome time greatly efteemed by foreign phyficians, but never came much into ufe among us: the prefert practice has entirely rejeded it, nor is it often to be met with in the fliops.

A N Y.
930. Atractylis, or Diffaff Thifle.

Eight lipecies; viz. gummifera, humilis, cancellata, lancea, ovata, oppolitifolia, purpurea, mexicana. S. Europe, Mexico, Japan.

## 1419. Barnadesta.

One fpecies; viz. Ipinofa. S. Amcrica.
931. Carthamus, or Bafe Saffrom.

10 fpecies; viz. tinctorius, lanatus, creticus, tingitanus, cœruleus, mitifimus, carduncellus, arborefcens, falicifolius, corymbofus. S. Europe, Barbary, Madeira, Carolina.

The cartbamus tindorius is a foft kind of thifte, with only a tew prickles about the edges of the leaves. It is cultivated in large quantity in fome parts of Germany, from whence the other parts of Europe are fupplied with the flowers as a colouring drug, and the feeds as a medicinal one. The flowers, well cured, are not eafily diftinguifhable by the eye from faffron; but their want of fmell readily difcovers them. The feeds are white, fmooth, of an oblong roundifh hape, yet with four fenfible corners, about a quarter of an inch in length, fo heavy as to fink in water; of a vifcid fweetifh tafte, which in a little time becomes acrid and nauleous. Thefe feeds have been celebrated as a cathartic: they operate very flowly, and for the mon? part diforder the bowels, efpecially when given in fubflance. Triturated with aromatic ditilled waters, they form an emulfion lefs offenfive, yet inferior in efficacy to more common purgatives.

## 1287. Spilanthus.

Seven fpecies; viz. urens, pfeudo-acmella, acmella, falivaria, atriplicifolia, infipida, oleracea. E. Indies, Peru, Jamaica.
932. Bidens, or Watcr Hemp-agrimony.

12 \{pecies; viz. * tripartita, minima, nodiflora, tenella, * cernua, frondofa, pilofa, bipinnata, nivea, verticillata, fcandens, bullata. Europe, E. and W. Indies, America.

## 933. Cacalia, or Foreign Colfs-foot.

27 fpecies; viz. papillaris, anteuphorbium, cuncifolia, kleinia, ficoides, laciniata, repens, fuffruticofa, laurifolia, cordifolia, afelepiadea, appendiculata, tomentofa, porrophyllum, fonchifolia, incana, faracerica, haftata, fuaveolens, atriplicifolia, alpina, echinata, albifrons, bipinnata, acaulis, radicans, articulata. Alps, E. Indies, N. America.
934. Ethulia.

Five fpecies; viz. conyzoides, fparganophora, diva. ricata, tomentofa, bidentis. India, Jam. Carolina.

## 935. Eupatorium, or Hemp Agrimony.

28 \{pecies; viz. dalea, hyffopifolium, fcandens, houftonis, zeylanicum, feffilifolium, album, chinenfe, rotundifolium, altiffimum, haftatum, fyriacum, trifoliatum, * cannabinum, cinereum, purpureun, maculatum, fcabrum, perfoliatum, cceleftinum, aromaticum, ageratoides, odoratum, ivefolium, urticæfolium, ftechadifolium, microphyllum, japonicum. Europe, America, E. and W. Indies, Japan.

* E. calyx 5 -lowered; leaves with finger-like divi- canrabi-fions.-An infufion of a handful of it vomits and pur- num.
ges fmartly. An ounce of the root, in decoation,
is a full dofe. In finitar dofes the Dutch peafants take it as an alterative, and as an antifcorbutic. Goats eat it. Cows, horfes, fleep, and fivine refure it.

936. Ageratum, or Bafe Hemṕ-agrimony.

Two feccies; viz. conyzoides, ciliare. America.
937. Petronia.
${ }^{17}$ fpecies ; viz. camphorata, oppofitifolia, flexicaulis, retorta, hirfuta; glabrata, inflexa, fcatiofa, glomerata, cinerea, villofa, membranacea, fpinofa, cephalotes, pallens, minuta, fafciculata. C. of G. Hope.
938. Stachelita.

Eight fpecies; viz. gnaphaloides, dubia, arborefcens, fruticofa, ilicifolia, corymbofe, chamæpeuce, imbricata. S. of France, Spain, Cape. S. America.
939. Chrysocoma, or Goldjlocks.
${ }^{1} 3$ fpecies; viz. oppofitifolia, comaurea, dichotoma, fericea, patula, cernua, ciliata, tomentofa, fcabra, línofyris, billora, graminifolia, villofa. Europe, Cape, Carolina.
940. Trachonamthus, or Sbrubly African Flea-bane.

Three fpecies; viz. camphoratus, glaber, ericoides. C. of G. Hope.

## 94t. Calea, or IIalbert-quesd.

Four fpecies; viz. jamaicenfis, oppofitifolia, amellus, fcoparia. W. Indies, S. fea iffes, Carolina.
942. Santolia, or Lavender Cotion.

Four fpecies; viz. chamacypariftus, rofmarinifolia, alpina, anthemoides. S. of Europe.

## 943. Athanasia.

20 fpecies; viz. iquarrofa, feffiliflora, pumila, crenata, unifora, capitata, maritima, genififolia, pubercens, annua, trifurcata, crithmifolia, linifolia, dentata, parviflora, pinnata, pectinata, dentata, filiformis, cinerea. S. Europe, Africa, Carolina.

## Order II. POLYGAMIA SUPERFLUA.

## 944. Tanacetum, or Tanfey.

Seven fpecies; viz. fibiricum, incanum, cotuloides, annuum, monanthos, * vulgare, balfamita. Europe, C. of G. Hope.

Frigares

* T. leaves doubly winged, cut, ferrated.-This plant is a warm deobftruent bitter, and its fiavour not ungrateful. The tender leaves are fometimes ufed to give a colour and flavour to puiddings. If a dead animal fubfance is rubbed with this plant, the flefh-fly will not attack it. The Finlanders obtain a green dye from it. Cows and theep eat it. Horfes, goatsy arid fwine refufe it. The feeds are an excellent vermifuge.

The sanazetum balfamita was formerly a very common garden plant, and of frequent ufe both for culinary and medicinal purpofes; but it is at prefent very little regarded for either, though it fhould feem from its fenfible qualities to be equal or fuperios, as a medicine, to fome aromatic herbs which practice has retained. The leaves have a bitterifl warm aromatic tatte; and a very pleafant fmell, approaching to that of mint, or a mixture of mint and maudlin. Water elevates their flavour in diftillation, and rectified fpirit extracto it by infufion, It has bece recommended in
hyferical affections; and by fome it has been fuppofed to be very powerful in curiecting the influence of opium. The leaves flould be collected in the morith of July or Auguft.
945. Artemista, or Wormswood, Mugwort.
29. Ppecies; viz. vermiculata, capillaris, judaica, $x$ thiopica, contra, abrotanum, arborefcens, fantonica, * campeftris, paluftris, crithmifulia, maritima, glacialis, rupeftris, Spicata, pontica, auftriaca, annua, tanacetifolia, * abfinthium, * vulgaris, pectinata, integrifolia, japonica, * cœerulefcens, dracunculus, chinenfes, maderafpatana, minima* Eur. Cape, E Eypt, China. * A. leaves many-cleft, cottony; bunches on crooked maritima foottalks; female florets 3.-This plant, in its wild flate, fmells like marum or camphor ; but in our gardens it is lefs grateful, though fill much more grateful than the next fpecies, It is uled as an ingredient in difilled waters, and beat with thrice its weight of fine fugar, it is formed into a conferve. Its virtues are the fame with thofe of the next fpecies, but in a weaker degree. Horfes eat it. Cuws, goats, and Sheep, refule it.

* A. leaves compound, many-cleft; flowers fomewhat abfinthoum. globular, pendant; receptacle woolly.-The leaves and flowers of this fpecies are very bitter: the roots are warm and aromatic. A confiderable quantity of effential oil rifes from it in diftillation. This oil is ufed both externally and internally to deftroy worms. The leaves, put into four beer, fon deftroy the acefcency: They relift putrefaction, and are therefore a principal ingredient in anifeptic fomentations. An infufion of them is a good fomachic; and, with the addition of fixed alkaline falt, a powerful diuretic in fome dropfical cafes. The athes afford a more pure alkaline falt than mof other vegetables, excepting bean-ftalks, broom, and the larger trees. Linnæus mentions two cafes, wherein an effence prepared from this plant, and taken for a confiderabie time, prevented the formation of fones in the kidneys or bladder : the patients forbearing the ufe of wine and acids. It might be fufpected, that, like other bitters, its long continued ufe mult weaken the action of the nervous fyifem; but in thefe inflances no fuch effect took place. An infufion of it given to a woman that fuckles, makes her milk bitter. It gives a bitternefs to the flefh of fheep that eat it. Horfes and goats are not fond of it. Cows and fwine refufe it. Turkeys are fond of it. The plar:t, fteeped in boiling water, and repeatedly applied to a bruife, will remove the pain in a fhort time, and prevent the fwelling and difcoloration of the part.
* A. leaves wing-cleft, Hat, cut, cottony underneath; sulgaris bunches fimple, bending; florets of the circumference 5.-In fome countries this plant is ufed as a culinary aromatic. A decoltion of it is taken by the common people to cure the ague. The Chinefe make ufe of it in healing wounds, applying the frefh plant bruifed. A dram of the leaves, powdered; was given four times a-day, by Dr Home, to a woman who had been affected with hyfteric fits for many years. The fits reafed in a few days. Sheep and fiwine refufe it. Neither horfes, cows, or goats, are fond of it. Dr Anderfon -informs us, that fteep are very fond of it, devouring it with great greedimefs, efpecially the roots, which feem to form a moft delicate morfel.

The artemifia abrotanum, or fouthernyood, is a farut-
by plant，clothed with very fine＇y divided leaves，of a light－green colour．＇The flowers，which are very fmall and yellowifh，hang downeard＝，feveral together，from the middle of the branches to the top．It is not，like fome other fpecies of the arteniffa，indigenous in Bri－ ：ain；but although a native of warm climates，it readi－ ly bears the viciffitudes of ours，and is eafily cultivated in gradenc；from thence alone it is obtained when em－ proyed for medical purpufes．The leaves fall off eve－ ry winter，but the roots and flalks continue for many years．

Southert：wool has a firong fmell，which to mont people is not difagreeable．It has a pangent，bitter， ond fomewhat naufcous taite．The qualities are very completely extract－d by reatified fpitit；and the tinc－ to：e，thus formed，is of a beautiful green colour．They are lefs perfeetly extracted by watery liquors，the in－ fufion being of a light krown colour．

Southernwood，as well as fome other fpecies of the fome genus，particularly the abjonthiun and fantani－ cum，has been recommended as an arthelmintic；and it has alfo been fometimes ufed as a flimularit，deter－ gent，and fudorific．It has likewife been employed e：sternally in difcutient and antifeptic fomentations．It lias alfo been ufed under the form of lotion and oint－ inent for cutaneous eruptions，and for preventing the hair from falling off．It is at prefent very little em－ ployed in practice．

The worm－feed of the artemifia aufriaca is the pro－ duce of a plant of the wormiwood or mugwort kind， growing in the Levant．It is a fnall，light，chaffy feed，compofed，as it were，of a number of thin mem－ hranous coats，of a yellowifh colour，an unpleafant finell，and a very bitter tafle．Thefe feeds are celc－ brated for anthimintic virtues，which they hare in common with other bitters；and are lometimes taken with this inte tion，either mixed with molafies or cax－ died with fugar ：their unpleafant tafte renders the form of a powder or decoction inconvenient．

## 946．Guaphalium，or Everlafing，or Cudzued．

59 fpecies；viz．eximium，arborcum，grandiflorum， fruticans，crifpum，appendiculatum，cornatum，difco－ lorum，muricatum，ericoides，teretifolium，mucronatum， ftoechas，ignefcens，dentatum，ferratum，patulum，pe－ tiolatum，craffifolium，maritimum，repens，umbellatum， hifpidum，cylindricum，orientale，arenarium，rutilans， milleflorum，imbricatum，cymofum，nudifolium，＊lu－ teo－album，pedunculare，odoratifimum，fanguineum， fceridum，undulatum，crifpum，heliznthemifolium，fquar－ rofum，nellatum，obtufffolium，＊margaritaceum，plan－ tagincum，＊dioicum，alpinum，indicum，puspureum， denudatum，＊fylvaticum，verticili：tum，oculus cati， pilofellum，declinatum，coronatum，＊fupinum，uligino－ fum，glomeratum，japonicum．Eur．Ind．Africa，N． America．

12 fpecies；viz．aıandria，dentata，nutans，alpina， difcolor，fylvettris，＊farfara，japonica，frigida，alba， ＊hybrida，＊petafites．Europe，Japan，Newfoundland， Jamaica．
＊T．Ralks with one flower，tited；leaves fomewhat farfor． heart－flisped，angular，finely toothed．－This is the firlt plant that vegetates in marle，or limeflone rubble， The downy fubflance on the under furface of the leaves， wrapped in a rag，dipped in a folution of faltpetre，and dried in the fun，makes the beft tinder；the leaves are the bafis of the Britifh herb－tobacco．They are fome－ what auftere，bitterifl，and mucilaginous to the talte． They were formerly nouch ufed in coughs and confump． tive complaints；and perhaps，not without reafon，for Dr Cullen has found them to do confiderable fervice in ferophulous cafes：be gives a decoction of the dried leavics，and finds it fucceed where fea－water has failed． And Fuller relates a cafe of a girl，with 12 fcrophulous fores，who was cured by drinking daily as much as the could，for above four months，of a decoction of the leaves made fo flrong as to be fwcetifi and glutinous．Goats and fheep cat it．Cows are fond of it．Horfes and frine sefufe it．It may be deflroyed by cutting off the crown of the root in March．
＊T．paricle egg－haped；female florets few．－Its roots petafites． abound with a refinous matter．They have a ftrong fmell，and a bitterifh acrid tafte．Horfes，cows，goats， and theep，eat it．Its large leaves afford thelter from flowers to poultry and other fmall animals．

## 953．Senecto，or Groundfcl，Ragzuort．

59 fpecies；viz．hieracifolius，purpureus，cernuus， perficifolius，virgatus，divaticatus，pfeudo－chyna，recli－ natus，vulgaris，araticus，peucedanifulins，japonicus， triflorus，ægyptius，lividus，trilobus，＊vifcofus，＊fylva－ ticus，nebroicnfis，glaucus，varicofus，haflatus，pubigc－ rus，elegans，fqualidus，erucifolius，incanus，abrotanifo－ lius，canaderfis，diffufus，＊jacobrea，＊tenuifolius，au－ reus，lyratus，alpinus，umbellatus，limifolius，rofmatini－ folius，＊paludofus，nemurenfic，＊farracenicus，fibiricus， dorea，dotonicum，langifulius，cruciatus，juniperinus， byzantinus，balimifolius，ilicifolius，rigidus，polifolius， angulatus，maritimus，erofus，marginatus，lanatus，cor－ difolius，glatitolius．Europe，Africa，E．Indies，Ja－ pan，N．America．
: S. laves witsed, indented, embracing the Atem; nowers featered.-A Atrong infufiun of t!.is plant vomits. The bruifed leaves are a gool application to bouls. The feeds are rery acceptable to linnets and goldfinches when confined in eages. Cuws are not fond of it. Goats and fwine eat it. Horfes and theep refule it.

* S. leaves lyre-fiaped, almof winged; legments finely jugged; flem upright.-If thic pl nt is gathered before the flowers open, and uled freil, it dyes wool of a full sreen, but the colour is apt to lade. 11 woollen cloth is boiled in alum water, and then in a decuction of the tlowere, it takes a beautiful deep yellow: Horfes and heep refufe it. Cows are not fond of it. Horfes and cows, hoswever, cat it when young.

## 954. Aster, or Siarwort.

39 fpecies; viz. taxifolius, rellexus, crinitus, fruticulofur, tenellus, alpinus, fibiricus, * tripolium, amellus, divaricatus, hifupifolius, dumofuc, ericoides, tenuifolius, Jinariifolius, linifolius, acris, concolor, ifidus, nova.. anglix, undulatus, grandiflorus, cordifolins, puniceus, annuus, vernus, indicus, lrevic, mutabilis, tradefcanti, movi-belgii, tardiflorus, mifer, macrophyllus, chinenfis, tataricus, hifpidus, fcaber. Europe, Cape, N. Afia, America.
tripolium. * A. leaves Arap-fpear-fhaped, Hefty, fmooth, 3-fibred; calyx fcales blunt, fomewhat membranaceour,--Goats and horfes eat this fecies. Cows and fwine refufe it. Sheep are not fond of it.

## 955. Solidago, or Gclden Rod.

if fpecies; viz. fempervirens, canadenfis, altiflima, lateriflora, bicolor, lanceolata, cæfia, mesicana, flexicaulis, latifolia, * virgaurea, minuta, rigida, noveboracenfis. Europe, N. America.
Girgaurea. *. S. fem ferpentine, branched; leaves mofly fitting; flowers in crowned panicles.- This plant is found wild on heaths and in woods, producing fpikes of yellow flowers in Auguf. The leaves have a moderately altringent bitter tafte; and hence prove ferviceable in debility and laxity of the vilcera, and diforders proceeding from that caufe.

## 957. Cineraria, or Spyffower.

26 fpecies; viz. geifolia, cymbalarifolia, fibirica, glauca, fonchifolia, cordifolia, crifpa, *integrifolia, longifolia, * palufris, aurea, maritima, canadenfis, capillacea, linifolia, purpurata, amelloides, americana, alata, elongata, cacalioides, denticulata, perfoliata, lineata, hatifolia, japonica. Europe, Africa, N. Amcrica, Jamaica.
956. Invla, or Elecampane.

29 fpecies; viz. * helenium, odora, fuaveolens, odo-rus-chrilli, britannica, * dyfenterica, undulata, indica, pulicaria, arabica, fpiraifelia, fquarrofa, bubonium, falicina, hirta, mariana, germanica, japonica, dubia, enfifolia, crithmifolia, provincialis, mantana, æftuans, bifrons, ccerulea, aromatica, pinifolia, foctida. Europe, Cape, E. Indies, N. America.
beteriun. * I. leaves embracing the fem, egg-fhaped, wrinkled, cottony underneath; fcales of the calyx egy-fhaped.This is a large downy plant, fometimes found wild in moift rich foils. The elecampane, or toot, effecially when dry, has an agreeable aromatic fmell; its tafe on firf chewing, is glutinous, and as it were fomewhat ran-
 wheh by degrees becomes corfiderably actid and fur. gent. Elecampane zoot poffelles the gemeral virtues of alexiph:rmacs ; it is principally recommended fur promoting expectoration in humoral allhmas and coughs; liberally taken, it is laid to excite urine, and loufen the be!ly. In fome parts of Germany large quantitics of this root are candicel and wed as a tomachic, for firengthening the tone of the vifccra in general, and for attenuating tenacious juices; fpinitucus liquors extract its wirtues in greater perfection than watery ones: the former farce elevate any thing in dittillation; with the latter an efleatial oil arifes, which concretes into white flukes; this poffeffes at firf the flavour of the elecampane, but is very apt to lofe it on keeping. An extract made with water, pofteres the bitternefs and pungency of the root, but in a lefs degree than one made with fpirit. The root is efleemed a good pectoral. Dr Hill fays, he knows, from his own experience, that an infufion of the frefli roor, fwectened with honey, is an excellent medicine in the hooping-cough. A decoetion of the roct cures theep that have the feab. Horfes and goats eat it. Cows, hleep, and frine, refufe it.

* I. leaves embracing the fem, heart-oblong; Aem woolly, forming a kind of panicle; fcales of the c:lyx brittle-fhaped.-It has a peculiar feent, compared by fome to that of fosp. The Reflian foldiers in the Perfian expedition under General Keit whe much tronbled with the bloody flux, which was cured by the ufe of this plant. Cows are not fond of it. S'.eep and goats refufe it.

95S. Arnica, or Leofard's Banc.
11 Species; viz. montana, pilote!loides, foorpioides, doronicum, matitima, crocea, ciliaa, japonica, palmata, gerbera, coronopifolia. Europe, Africa, Japan.

The arnica montana had formerly a place in our phamacopceias under the title of doronicum setrmanicum. Then, however, it was little known or uled; and being jufly confidered as one of the deleterions vegetables, it was rejected: but it has again been introduced into the lit both of the London and Edinburge colleges on the authority of freth obfervations, particularly of thofe of Dr Collinis of Vienna, who has lately publifhed a dififertation on the medical virtues of the arnica.

This plant grows in different parts of Europe, par. ticularly Germany. It has an acrid bitter tafte, and when bruifed, eniits a pungent odour, which excitts freezing. On this account the country people in fome parts of Germany ufe it in fnuff, and fmoke it like tobacco. It was formerly reprefented as a remedy of great efficacy againlt effurions and fuffufions of blood from falls, bruifes, and the like; and it was then alfo mentioned as a remedy in jaundice, gout, nephritis, \&c. but in thefe affections it is now very little if at all employed.

Of late it has been principally recommended in paralytic affections, and in cafes where a lofs or diminutiun of fenfe arifes from an affection of the nerves, as in inflances of amaurofis. In thefe it has clietly been employed under the form of infufion. From a dram to half an ounce of the flowers has been directed to be infufed in a pint of boiling water, and taken ia differ-
ent dofes in the courfe of the day; fometimes it produces vomiting, fometimes fireating, fometimes diurefis: but frequently its ufe is attended with no fenfible operation, unlefs it can be confidered as fich, that in fome cafes of paralyfis, the cure is faid to be preceded by a peculiar prickling, and by fhooting pains in the affected parts.

Befides being employed in paralytic affections, it has alfo been of late reprefented as a very powerful antifpafmodic; and it is faid to have been fuccefffully employed in fevers, particularly thofe of the intermittent .hind, and likewife in cafes of gangrene. In thofe difeafes it has been faid to prove as efficacious as the Peruwian bark, when employed under the form of a pretty flrong decoction, taken in fmall dofes frequently repeated, or under the form of an electuary with honey.

But thefe alleged virtues of the arnica have not been confirmed by any trials made in Britain, with which we are acquainted; and we are of opinion that its real influence fill remains to be determined by future oblervations. It is, however, one of thofe active fub. flances from which fomething may be expected.
959. Doronicum, or Leopard's Bane.

Three fpecies; viz. * pardalianches, plantagineum, bellidiaftrum. Europe, N. America.
960. Perdicium.

Five fpecies; viz. femiffofculare, radiale, braflienfe, magellanicum, tomentofum. Cape, Japan, Jamaica, S. America.
1421. Mutisia.

One fpecies; viz. clematis. New Granada.
961. Helenium, or Bafe Sun-fower.

One fecies; viz. autumnale. N. America.
962. Pellis, or Daify.
fryennis.
Two fpecies; viz. * perennis, annua. Europe.

* B. Atalk naked. - The leaves are flightly acrid. The soots have a penetrating pungency. No attention is paid to it, except what it claims from the beauty of its flowers. The flowers clofe at night. Horles, fheep, and cows refufe it.

1322. Pellium, or Bafe Daifg.

Two fpecies; viz. bellidioides, minutum. Levant, India.
964. Tagetes, or African Marygold.

Three fpecies; viz. patula, erecta, minuta. Mexico, Chili.

## 963. Leysera.

Three fpecies ; viz. gnaphalodes, callicornia, paleacea. Cape, California, Carolina.
974. Zinnia.

Two fecies; viz. paucifora, multiflora. N. America, Peru.
965. Pectis.

Three fpccies; viz, ciliaris, punctata, linifolia. A. merica.

> 966. Chrysanthemum, or Corn Marygold.

24 fecies; viz. frutefcens, ferotinum, atratum, al. pinum, * leucanthemum, montanum, graminifolium, tuonfelienfe, balfamita. *inodorum, achillæa, corymbofum, indicum, pinnatifidum, arcticum, pectinatum, ${ }^{\text {T0 }}$ Segetum, myconis, italicum, millefoliatum, bipimatum,
coronarium, flofculofum, japonicum. Europe, India, Africa, N. America.

* C. leaves embracing the ftem, oblong, ferrated up-leucantbes wards, toothed at the bafe.-The young leaves may be mum. eaten in falads. Horfes and goats eat it. Cows and fwine refufe it.
* C. leaves embracing the ftem, jagged upwards; fogetuma tooth ferrated towards the bafe.-This fpecies was intported into Sweden along with cora from Jutland about the end of the laft century. In Denmark there is a law to oblige the farmers to root it up from their corn fields. It may be deftroyed by dunging the ground in autumn, followed by a fummer fallow, and harrowing the land about five days after fowing the grain. Its yellow flowers, however, which follow the fun in a very remarkable manner, give a very remarkable bril. liancy to the fields in tillage, and pleafe the eye of the paffing traveller.-A large quantity which grew on forme arable land, was cut when in flower, dried and eaten by horfes as a fubftitute for hay. It is ufed by the Germans for dyeing yellow.

## 967. Matricaria, or Feverferv.

Six fpecies; viz. * parthenium, *maritima, fuaveolens, * chamomilla, argentea, afteroideso Europe, Curaçoa, S. America.

* M. leaves compound, flat; leafets egg-flhaped, cut:partheniun fruittalks branched.-The whole plant has a Arong fmell and a bitter tafte, and yields an efential oil by diftillation. A horfe refufed it.
* M. receptacle conical, rays expanding; calyx fcales chamo. equal at the edge.-Its propertics refemble thofe of millas anthemis nobilis. The Finlanders ufe an infufion of it in confumptive cafes. Cows, goats, and heep eat its Horfes are not fond of it. Swine refufe it.

1420. UNR1A.

One fpecies; viz. camphorata. Surinam.
968. Cotula, or May-ruced.

13 fpecies; viz. anthemoides, aurea, flricta, coronopifolia, umbellata, quinqueloba, vifcofa, turbinata, tanacetifolia, verbefina, capenfis, pilulifera, fervicea S. Europe, Barbary, Cape, Jamaica.

## 969. Anacyclus.

Four fpecics; viz. creticus, orientalis, aureus, valentinus. Europe.
970. Anthemrs, or Chamomile.

18 fpecies; viz. cota, altifima, * maritima, tomentofa, mixta, alpina, chia, * nobilis, * arvenfis, auftriaca, * cotula, pyrethrum, valentina, repanda, trinervia, americana, * tinctoria, arabica. Europe, Africz, N. America.

* A. reccptacle conical; chaff brifte-fhaped; feedscotulda naked.-Toads are faid to be fond of this plant. It is very ungrateful and difpleafing to bees. Goats and theep are not fond of it. Horfes, cows, and fwine refufe it. It frequently blifters the if in of reapers, and of children who happen to gather it. The heads rubbed hetween the fingers fmell intolerably difagreeable.
* A. leaves winged compound, ftrap-fhaped, acute nobilis, fomewhat woolly.-The leaves and flowers have a ftrong not ungrateful fmell, and a bitter maufeous tafte. They afford an effential oil. An infufion of the flowers is of ten ufed as a ftomachic, and as an antifpafmodic. In large quantitics it excites vomising. The powdered

Howers in large dofes have cured agues, even when the bark had failed. Both the leaves and flowers poffefs very confiderable antifeptic properties, and are therefore ufed in auftifeptic fomentations and poultices. From their antifpafmodic powers they are frequently found to relieve pain, either applied externally or taken internally. Ray recommends the flowers in calculous cafes.
tinctoria. * A. leaves doubly winged, ferrated, cottony underneath ; ftem fupporting a corymbus.-The flowers afford a remarkably clean and good yellow dye. 'The flowers of the cbryfantbemum fegetum refemble them much in appearance, but experience proves they cannot be fubflituted in their place. Horfes and goats eat it. Sheep are not fond of it . Cows and fwine refufe it.

Achillea, or Milfoil, Tarrove.
21 fpecies; viz. fantolina, ageratum, falcata, tomentofa, pubefcens, abrotanifolia, bipinnata, ægyptiaca, macrophylla, impatiens, clavennæ, * ptarmica, alpina, atrata, mofchata, nana, magna, * millefolium, nobilis, odorata, cretica. Europe, Africa.

* A. leaves frap fpear-fhaped, embracing the ftem; finely ferrated. -The roots have a hot biting tafte. The young tops are harp and pleafant in fpring falads. The powdered leaves excite fneezing. Horfes, cows, fheep, goats, and fwine eat it.
millefolium * A. leaves doubly winged; fegments of the wings ftrap-haped, toothed.-The flowers of this plant yield an effential oil. The leaves are celebrated by the materia medica writers for a variety of purpofec, but they are little attended to at prefent. Sheep and fwine refufe it. Horfes, cows, and goats are not fond of it.

972. Tridax, or Trailing Star-wort.

One fpecies; viz. procumbens. Vera Criz.
978. Amellus, or Sur-flower.

Two fpecies; viz. lychnites, umbellatus. Caps, Jamaica, Carolina.

## 1321. Eclipta.

Four fpecies ; viz. erecta, punctata, latifolia, proftrata. E. and W. Indies.

### 97.3. Sigesbeckia.

Two feecies; viz. orientalis, occidentalis. India, China, Virginia, Peru.
975. Verbesina, or Indian Hemp-agrimony.

II fpecies; viz. alata, chinenfis, virginica, lavenia, dichotoma, biflora, calendulacea, nodiflora, fruticofa, gigantea, bofvallea. E. and W. Indies, China, North America.
997. Buphthalmum, or Ox-eye.

II fpecies; viz. frutefcens, arborefcens, fericeum, fpinofum, aquaticum, maritimum, durum, falicifolium, grandiflorum, fpeciofilimum, helianthoides. Europe, N. America, Arabia, Jamaica.

## Order III. POLYGamia frustranea.

979. Helianthus, or Sun-forwer.

982 \text {. Gorteria. }
$$

12 fpecies; viz. perfonata, rigens, fquarrofa, fetofa, ciliaris, afteroides, herbacea, hifpida, lpinofa, cernua, unillora, barbata. C. of G. Hope.

Two fpecies; viz. leptaurea, caperfis. C. of G. Hope.
1984. Centaurea, or Bluc-boctle, Knapweed.

66 fpecies ; viz. crupina, mofchata, erucifolia, lippii, alpina, centaureum, purygia, capillata, unifora, li. nifolia, pectinata, * nigra, pullata, montana, * cyanus, paniculata, peinofa, ragufina, cineraria, argentea, $^{2}$ fibirica, fempervirens, * fcabiofa, tatarica, ftoebe, acaulis, orientalis, behen, repens, jacea, amara, alba, fplendens, rhapontica, babylonica, glaftifolia, conifera, forchifolia, feridis, romana, fpherocephala, ifnardit, napifolia, alpera, benedicta, eriophora, ægyptiaca, * calcitrapa, calcitrapoides, * folfitialis, melitenfis, ficula, centauroides, collina, rupeftris, verutum, falmantica, cichoracea, muricata, peregrina, radiata, nudicaulis, crocodilium, pumila, tingitana, galactites. Europe, Egypt, Arabia, Perfia.

* C. calyx fcales ferrated; leaves firap-haped, very cyantiso entire ; the lower ones toothed. - The exprefled juice of the petals is a good blue ink; it ftains linen of a beautiful blue, but the colour is not permanent in the mode it has hitherto been applied. Mr Boyle fays, the juice of the central florets, with the addition of a very fmall quantity of alum, makes a lafting tranfparent blue, not inferior to ultramarine. Cows, goats, and theep eat it. Horfes and fwine refufe it.

The centaurca centaurium is a large plant cultivated in gardens. The root has a rough, fomewhat acrid tafte, and abounds with a red vifcid juice; its rough talle has gained it fome efteem as an aftringent ; its acrimony as an aperient ; and its glutinous quality as a vulnerary. The prefent practice takes little notice of it with any intention.

The centaurea benedicta is an annual plant cultivated in gardens; it flowers in June and July, and perfects its feeds in the autumn. The herb fhould be gathered when in flower, dried in the fhade, and kept in a very dry airy place, to prevent its rotting or growing mouldy, which it is very apt to do. The leaves have a penetrating bitter tafte, not veryffrong or durable, accompanied with an ungrateful flavour, which they are in a great meafure freed from by keeping. Water extracts, in a little time, even without heat, the lighter and more grateful parts of this plant; if the digeftion be continued for fome hours, the difagreeable parts are taken
up ; a frons decuEtion is vciy naufeous nnd offenmve to the Itomach. Rectified fpirit gains a very plealant bitter tanc, which remains uninjured in the extract.

The virtues of this plant feem to be little known in the prefent practice. The naufeous decoction is fome. times uled to provoke vomiting, and a frong infufion to promote the operation of other emetics. But this elegant bitter, when freed from the offenive parts of the herb, may be advantageounly applied to other pu:poles. Excellent effeds have frequently been experienced from an infufion of this plant, in lofs of appetite, where the fomach was injured by irregularities. A ftronger infufion made in cold or warm water, if drank frecly, and the patient kept warm, occafions a plentiful fweat, and promotes all the fecretions in general.

The feeds of this plant are alfo confiderably bitter, and have been fometimes wfed with the fame intentions as the leaves.

Order IV. POLYGAMIA NECESSARIA.

## 9 9-. Milleria.

Two fpecies; viz. quinqueflora, biflora. Panama, Vera Cruz.

## 1323. Baltimora.

One fpecies; viz. recta. Maryland, Virginia.
986. Silphium, or Bafe Cbryantbemum.

Eight fpecies ; viz. laciniatum, terebinthinaceum, perfoliatum, connatum, afterifcus, folidaginoides, trifoliatum, trilobatum. N. America.
987. Polyminia, or Dwarf Sun-flower.

Seven fpecies; viz. canadenfis, carnofa, uvedalia, tetragonotheca, abyffinica, fpinola, wedelia. Africa, Canada, Virginia.
989. Chrysogonum.

One fpecies; viz. virginianum. Virginia. 989. Melampodium.

Two fpecies; viz. americanum, auftrale. Jamaica, St Domingo, S. America.
990. Calendula, or Marygold.

Nine fpecies; viz. * arvenfis, fancta, officinalis, pluvialis, lyybrida, nudicaulis, graminifolia, fruticofa, tomentofa. Europe, Cape.

* C. feeds boat-fhaped, prickly, turned inwards; the innermoft crowded together, the outermoft upright, furnilhed with a tail.- This is a very common plant in the corn fields, and in the vineyards in Portugal; and is ufed as food for milch cows. It is found in England near Fdmouth, to which place it has prolably been it ported from Portugal, in confequence of the frequent enmmunication by the packets and otherwife. The milk yiclaed by the cows which are fed upon it is very good.

Tlie herb of the calendela efriciralis is common in seardene, where it is found in flower preaten port of ilie fummer. Marygold flowera are fuppofed to be aperient and atienuating, and a!fo cardiac, alexiplarmac, and fuderife: they have leen parincifally celebrated in uterine obfructions, in the jaundice, and for chrowirg out the fmall pny. Their fenfible qualities give lis:le foundintion for the fe viruse; they lave farce-
ly any tafte and no confidcrable imell. The leaves of the plant difcover a vifcid fweetifhnefs, accompanied with a more durable faponaccous pungency and warmth: thefe feem capable of anfwering fome ufeful purpofes as a timulating and aperient medicine; but at prefent they are fo little cmployed in Britain, that they have now no place in our pharmacorxias, and they are al. fo rejected from feveral of the lateft and beft foreign ones.

## 991. Arctotis.

12 Species; viz. calendulacea, hypochondriaca, triftis, corufcans, fuperba, ferrata, tenuifolia, plantaginea, anguftifolia, afpera, paradoxa, dentata, anthemoides, tenuifolia, acaulis. Cape, Carolina.
992. Osteospermum, or Hard-feeded Cbryantbemum.

15 fpecies; viz. fpinofum, pififerum, moniliferum, jlicifolium, ciliatum, junceum, triquetrum, corymbofa, imbricatum, herbaceum, niveum, perfoliatum, polygaloides, calendulaceum, arctotoides. Cape, E. Indies.
993. Othonna, or African Rag-wort.

26 fpecies; viz. bulbofa, tagetes, trifida, pectinata, abrotanifolia, athanafix, ciliata, pinnata, trifurcata, munita, coronopifolia, cheirifolia, craffifolia, parviflora, tenuiffima, linifolia, digitata, lingus, lateriflora, heterophylla, cacalioides, ericoides, capillaris, virginea, frutefcens, arborefcens. Africa.
1324. Hippia, or Shrubby Tanfy.

Three fpecies; viz. integrifolia, minuta, frutefeens. Cape, E. Indies, America.

## 994. Eriocephalus.

Two fpecies; viz. africanus, racemofus. C. of $G$. Hope.
995. Fizago, or Cotton, or Cud-zueed.

Seven ppecies; viz. acaulic, * germanica, pyramidata, * montana, * gallica, * arvenfis, lcontopodium. Europe.
996. Micropus, or Bafe Cud-weed.

Two fpecies; viz. fupinus, ercctus. Spain, Portugal, Italy, Levant.

## Order V. polygamia segregata.

997. Elephantorus, or Elethant's-foot.

Two lpecies; viz. fcaber, tomentufus. E. and W. Indies.

## 332. Oedera.

Two fpecics; viz. prolifera, aliena. C. of G. Hope.
998. Spheranthus, or Globefower.

Three fpecies; viz. indicus, africanus, chinenfis. E. Indies, China.
999. Echinops, or Globe-rbifle.

Four fpecits; viz. fpharocephalus, fpinofus, ritro, ftrigofus. Siberia, Auftria, lirance, Spain, Italy.

## 1000. Gundelia.

Onc fpecics; viz. toumefortii. Syria, Alcppo, Amer
1122. JUncis.

One fpecies; viz. ferruginea. S. America.
1001. Stoebe, or Bafc Elliopian Elychrifunt.

Nine fpecies; viz. xethinpica, chicoides, proftrat?,
gnaphaloides, gomphrenoides, fcabra, reflexa, rhinocerotis, difticha. C. of G. Hope.

## Order Vi. Monogamia.

i003. Seriphium.
Four fpecies; viz. cinereum, plumofum, fufcum, ambiguum. C. of G. Hope.
1002. Strumpfia.

One fpecies; vizemaritima. Anerica.
1004. Corymbium.

Four fpecies; viz. fcabrum, glabrum, filiforme, villofum. C. of G. Hope.

1005. Jasione, or Sbeep's Scabious.

Two fpecies; viz. * montana, perennis. Eur. Cape.
1006. Lobelta, or Cardinal-fozer.

42 fpecies; viz. fimplex, pinifolia, * dortmanna, tupa, anceps, kalnjii, paniculata, grandis, cornuta, phyteuma, columneæ, bellidiflora, bulbofa, triquetra, lonyiflora, tomentofa, fecunda, patula, affurgens, cardinalis, levigata, ferruginea, debilis, fiphilitica, furinamenfic, inflata, cliffortiana, urens, minuta, volubilis, bulbofa, laurentiz, erinus, erinoides, zeylanica, lutea, hiffuta, coronopifolia, comofa, tenella, deprefla. Cape, E. and W. Indies, Amhrica.

The lobelia fiphilitita grows in moift places in Virginia, and bears our winters. It is perennial, has an erect flalk three or four feet high, blue flowers, a milky juice, and a rank fmell. The root confifts of white fibres about two inches long; refembles tobacco in tafte, which remains on the tongue, and is apt to excite vomiting. It is ufed by the North American Indions as a feccific in the venereal difeafe. The form is that of decoction; the dofe of which is ordered to be gradually increafed, till it bring on very confiderable purgings, then to be intermitted for a little, and again ufed in a more moderate degree till the cure be completed. The ulcers are alfo wafted with the decoation, and the Indians are faid to frinkle them with
the powder of the inner bark of tine firuce tree. The frme flitatnefs of regimen is ordered as during a fali. vation or mercurial courfe. The benefit to be derived from this article, has not, as far as we know, been confirmed either in Britain or by the pratitioners in Virginia; for there, as well as in this country, recourfe is almoft univerfally had to the ufe of mercury; and it is probably from this reafon that the London college have not received it into their lif. It, how. ever, feems to be an article which, in fome cafes at. leaf, deferves a trial.

1007. Viora, or Tiolet.

28 fpecies; viz. palmata, pedata, pinnata, lanceo. lata, primulifolia, *hirta, "paluftris, \# odorata, * cav nina, montana, cenifia, canadenfis, mirabilis, biflora, unitlora, decumbens, * tricolor, * granditiora, calcara. ta, cornuta, arborefcens, enneafperma, fuffruticofa, calceolaria, oppofitifolia, hybanthus, ipecacuarha, diandra. Alps, Pyrenecs, Cape, America.

The viola odorata is often found wild in hedges and fardy places, and flowers in March : the thops are generally fupplied from gardens. In our markets we meet with the flowers of different fpecies; thefe may be diftinguifhed from the others by their being large, of a pale yellow colour, and of no fmell. The officinal flowers have a very pleafant fmell, and a deep purplifh blue colour, denominated from them violet. They impart their colour and flavour to aqueous liquors: A fyrup made from this infufion has long maintained a place in the flops, and proves an agreeable and ufeful laxative for children.

100S. Impatiens, or Balfam, Balfamine
Seven โpecies; viz. chinenfis, latifolia, oppofitifolid, cormuta, ballaminx, triflora, noli-tangere. Europe, N. America, E. Indies, Chiria.

## Order I diANDRIA.

yoo9. Orchis, Orch or Butterfly Flower:
50 fpecies; viz. bicornis, biflora, cornuta, fpathutata, flexuof, tripetaloides, fagittalis, barbata, dracopis, tenella, fancta, fufannæ, ciliatis, habenaria, * bis folia, ornithis, flexuofa, cucullata, globofa, * pyramidalis, coriophora, cubitalis, * morio, * mafcula, * uStulata, " militaris, fufca, moravica, papilionacea, fubra, pallens, hifpidula, /peciofa, *latifolia, incarnata, fambucina, * maculata, odoratifima, * conopfea, flava, frifcefcens, ftrateumatica, hyperborea, * abortiva, plycodes, fpectabilis, filicornis, tipuloides, japonica, falcata. Europe, Cape, Afia, W. Iridies.

* O. lip of the nectary 4-lobed, finely fcollopeo ; horn blunt; upper petals turned back.-This fpecies is called fatyrion, or early orchis. It is frequent in flady places and moift meadows. Each plant has two oval roots of a whitith colour, a vifcid fweetifh tafte, and a faint unpleafant fmell. They abound with a glutinous flimy juice. With regard to their virtues, like other mucilaginous vegetables, they defend the folids againft acrimonious humours: they have alfo been celebrated, though on no good foundation, for analeptic and aphrodifiac virtues, and frequently made ufe of with thefe intentions. Salep, a celebrated reftorative among the Turks, is the prepared root of plants of this gemus. It has been fuccefffully imitated by means of the roots of this fpecies. Mr Moult, in a letter to Dr Percival, defcribes his method of making falep. He obferves, that the beft time to gather the roots, is when the feed is formed and the falk going to fall, for then the new bulb, of which falep is toade, is arrived at its full fize. The new roots being feparated from the falk, are to be wahhed in water, and the outer thin 0kin taken off. They are then to be fet on a tin-plate in an oven, heated to the degree of a bread oven. In fix, eight, or ten minutes, they will have acquired a tranfparency like horn, without being diminifed in fize. They are thes to be removed inte another room to dry and
harden, which will be done in a few days; or they may be finifhed in a very flow heat in a few hours. Sao lep, thus prepared, may be fold for lefs than a milling a pound, and affords a mild nutriment, which in times of fearcity, in cafes of dyfentery and frangury, and on flipboard, may be extremely ufeful. The falep, hitherto imported from Turkey, may thus be prepared at home. The plants mult be propagated by the roots, as the feeds feldom come to perfection.
iolo. Satyrium, or Lizard-fower.
15 Species; viz. hircinum, tabulare, trille, gigan. teum, aculeatum, viride, nigrum, albidum, epigogium, plantagineum, repens, capenfe, hians, orobanchoides, pedicellatum. Europe, Cape, America.

## 1027. Xylopia, or Bitter-zuoad.

Two fpecies; viz. muricata, glabra. America.
1026. Gretwis.

Six fpecies; viz. occidentalis, orientalis, afiatica, malococca, falvifolia, microcos. Afia, Cape, America, South feas.
1228. Ambrosinia.

One fpecies; viz. baffi. Palermo, Turkey.
1023. Arum, or W゙ake-robin, Dragon.

25 fpecies; viz. * maculatum, dracunculus, dracontium, pentaphyllum, triphyllum, ternatum, colocafia, efculentum, macrorhizon, peregrinum, divaricatum, trilobatum, fagittæfolium, virginicum, probofcideum, arifarum, pítum, ovatum, tenuifolium, cannæfolium, mufcivorum, arborefcens, hederaceum, lingulatum, auritum. S. Europe, E. Indies, America.

* A. leaves halberd-flaped, very entire; fpikeflalk macilatum club-haped.-This root grows wild under hedges, and by the fides of banks in moll parts of England. It fends forth in March three or four triangular leaves, which are followed by a naked falk, bearing a purplifh piffil, enclofed in a long fheath: this is fucceeded in July by a bunch of reddith berries. In fome parts the leaves are fpotted with black, in others with white frots, and in others not fotted at all : the black fpotted fort is fuppoled to be the mon efficacious in medicine. All the parts of the arum maculatum, particularly the root, have an extremely pungent acrimonious. tafte; if the root be but lightly chewed, it continues to burn the tongue for fome hours, occafioning at the fame time a confiderable thirit : thefe fymptoms are alleviated by butter milk and vily liquors. Dried and kept fome time, it lofes much of its acrimony, and becomes at length an almoft infipid farinaceous fubftance. The root is a powerful fimulant and attenuant. It is reckoned a medicine of great eficacy in fome cachectic and chlorotic cafes, in weakuefs of the flomach occafoned by a load of phlegm. Great benefit it faid ro-
have been obtained from it in decply feated rheumatic pains. In thefe cafes it may be given from 10 grains to a fcruple of the freh root, twice or thrice a.day, made into a bolus or emulfion, with uncluous or mucilaginous fubtances, which cover its pungency, and prevent its making any painful impreffion on the tongue. Neither wine nor fpirits extract its virtues. The root, dried and powdercd, is ufed by the French to wafl the fkin, and is fold at a high price under the rame of cyprefs powder. It is undoubtedly a good and an innocent cofinetic. Starch may be made from the roots.

1029. Dracontium, or Dragons.

Tive fpecies; viz. polyphyllum, fpinofum, fcetidum, canfchatcenfe, pertufum. Ceylon, W. Indies, Ame sica.

103J. Calla, or Ebbiopian Arum.
Two frecies; viz. sethiopica, palultris. Europe, Cape.

103:. I'orass, c. Somberuen'
Seven fpecies; viz. Icardesis, acaulis. Lunce.ulat?, crensta, cordata, pinsata, palmata. India, America. 1032. Zostrpa, of Grafs-zract.

Two fpecies; viz. *marin, * oceavic?.

* \%.. feed-veffels fitting, ftems much branched; leaves marina. tloating, long, grafs-like, blunt from leatofeales.-It is thrown on the fa fhore by the tids in great plenty. and mounds or walls are built with it to refitt the encroachment of the fea. Expofure to the weather. bleaches it white. Buildings are thatched with the green leaves, and it will endure chwards of a century. It is ufed by the inhabitants of Gothland in Sueden, as a manure, arid alfo for llufling beds, in preference to hay, as being fofter. Horfes and fwinc eat it. Cows are not fond of it.
In the chafs Gynandria are

32 Genera, including 273 Species, of which 28 are found in Britain.

## Order I. MONANDRIA.

1034. Zannichellia, or Three-bcaded Porid-weed. One fpecies; viz. paluffris.

> Io35. Ceratocarpus.
> One fpecies; viz. arenarius. Tattary.

## ry26. Artocarpus, or Bread-fruit.

Two fecic; ; viz. incifa, integrifolia.-It has a cylindric amentum or catkin, which thickens gradually, and is covered with fowers; the male and female in a different amentum. In the male, the calyx is two-valved, and the corolla is wanting. In the fomale, there is no calyx nor corolla; the flylus is one, and the drupa is many-celled.

Though this tree had been mentioned by many voyagers, prrticularly by Dampier, by Rumphius, and by Lord Anfon, yet very little notice feems to have been taken of it till the return of Captain Wallis from the South feas, and fince that time by others who have touched at Otaheite and fome countries in the Eaft Indies. Captain Dampier relates, that in Guam, one of the Ladrone iffands, "there is a certain fruit called the bread-fruit, growing on a tree as big as our jarge apple-trees, with dark leaves. The fruit is round, and grows on the boughs like apples, of the bignefs of a good penny-loaf; when ripe, it turns yellow, foft, and fiveet; but the natives take it green, and bake it in an oven till the rind is black; this they ferape off, and eat the infide, which is foft and white, like the infide of new-baked bread, having neither feed nor fone; but if it is kept above 24 hours it is harfh. As this fruit is in feafon eight months in the year, the natives feed upon no other fort of bread during that time. They told us that all the Ladrone iffands had plenty of it. I never heard of it in any other place."

Rumphins, after defcribing the tree, obferves, that " the fruit is fhaped like a heart, and iucreafes to the fize of a child's head. Its furface or rind is thick, green, and covered everywhere with warts of a quadragonal or hexagonal figure, like cut diamonds, but without points. The more flat and fmooth thefe warts are, the fewer feeds are contained in the fruit, and the greater is the quantity of pith, and that of a more glutinous nature. The internal part of the rind, or peel, confifts of a flethy fubitance, full of twifted fibres, which have the appearance of fine wool; thefe adhere to, and in fome sneafure form it. The fleflyy part of this fruit becomes fofter towards the middle, where there is a fmall cavity formed without any nuts or feeds, except in one fpeciec, which has but a fmall number, and this furt is not grod, unlefs it is baked or prepared fome other way; but if the outward rind be taken off, and the fibrous theth dried and afterwards boiled with meat as we do cabbage, it has then the tafte of artichoke bottoms. The inhabitants of Amboyna drefs it in the liquor of cocna-nuts ; but they prefer it roafted on coals till the outward part or peel is burnt. 'They aftrowards cut it into pieces, and eat it with the milk of the cocoa-110. Some people make fritters of it, or fry it in oil ; and others, as the Sumatrans, dry the internal foft part, and keep it to ufe inflead of bread with o:hct food. It affords a great deal of sourifh-
ment, and is very fatisfying, therefore proper for hardworking people: and being of a gentle aftringent quality, is good for perfons of a laxative habit of body.

It is more nourifhing boiled in our manner with fat meat than roatted on coalc. The milky juice which dittils from the trunk, boiled with the cocoa-nut oil, makes a very flrong bird lime. This tree is to be found on the eaflern parts of Sumatra, and in the Malay language is called focous and forcumi capas. It grows likewife about the tuwn of Bantam in Java, and in Ballega and Madura, and is known there by the name of foccum."

In Anfun's voyage we are informed, "that the rima, or bread-fruit tree, is common in all the Ladrone iflands and fome of the Philippines. It is fomewhat larger than our apple tree, and bears a broad darkcoloured leaf with five indentures on each fide. The fluit hangs on the boughs like apples; and is of the fize of a penny loaf, with a thick tough rind, which when full ripe turns yellow. The natives gather it before it is quite ripe, and bake it till the cruft is pretty black; then they rafp it, and there remains a pretty loaf, with a tender yellow cruft, and the crumb of it is foft and fwect as a new baked roll : it is without any feeds or flones. This fruit the inhabitants enjoy for about feven months; during which they never eat any other kind of bread: but they are obliged to bake it every day; for when it grows a little ftale, it becomes harfh and hufky, fomewhat like the potato bread made in the wefl of England. There is, however, a remedy for this; which is cutting the loaf into flices when it is new, and drying it iu the fun, by which it is changed into the pleafanteft rufk that can be eaten."

Captain Cook, in his voyage, obferves, that this fruit not only firves as a fublititute for bread among the inbabitants of Otaheite and the neighbouring inlands, but alfo, varioufly dreffed, compofes the principal part of their food. It grows on a tree that is about the fize of a middling oak; its leaves are frequently a foot and a half long, of an oblong flape, deeply finuated like thofe of the fig-tree, which they refemble in colour and confiftence, and in the exuding of a milky juice upon being broken. The fruit is abont the fize and flape of a new-born child's head; and the furface is reticulated, not much unlike a truffle; it is covered with a thin f min , and has a core about as big as the handle of a fmall knife. The eatable part lies between the ikin and the core; it , is as white as fnow, and fomewhat of the confiftence of new bread; it muft be roafted before it is eaten, being firf divided into three or four parts; its tafte is infipid, with a flight fweetnefs fomerwhat refembling that of the crumb of wheaten bread mixed with a Jerufalem artichoke. This fruit is alfo cooked in a kind of oven, which renders it foft, and lomething like a boiled potato; not quite fo farinaceous as a good one, but more fo than thofe of the middling fort. Of the bread-fruit they alfo make three difhes, by putting either water or the milk of the cocoa nut to it, then beating it to a pafie with a llone peflle, and afterwards mixing it with ripe plantains, bananas, or the four pafte which they call mabie.

The mahie, which is likewife made to ferve as a fuccedaneum for ripe bread-fruit before the fealun comes on, is thus made: The fruit of the bread tree is gathered
thered juft before it is perfectly ripe; and being laid in heaps, is clofely covered with leaves: in this ftate it undergoes a fermentation, and becomes difagreeably fweet; the core is then taken out entire, which is done by gently pulling out the flalk, and the reft of the fruit is thrown into a hole which is dug for that purpofe generally in the houfes, and neatly lined in the bottom and fides with grafs: the whole is then covered with leaves and heavy fones laid upon them; in this flate it undergoes a fecond fermentation, and becomes four, after which it will fuffer no change for many months. It is taken out of the hole as it is wanted for ufe; and being made into balls, it is wrapped up in leaves and baked: after it is dreffed, it will keep five or fix weeks. It is eaten both cold and hot; and the natives feldom make a meal without it, though to Europeans the tafte is as difagreeable as that of a pickled olive generally is the firft time it is eaten. The fruit itfelf is in feafon eight months in the year, and the mahic fupplies the inhabitants during the other four.

To procure this principal article of their food (the bread-fruit), cofts thefe happy people no trouble or labour except climbing up a tree : the tree which produces it does not indeed grow fpontaneoully; but if a man plants ten of them in his life time, which he may do in about an hour, he will as completely fulfil his duty to his own and future generations, as the native of our lefs temperate climate can do by ploughing in the cold of winter, and reaping in the fummer's heat, as often as thefe feafons return; even if, after he has procured bread for his prefent houlehold, he fhould convert a furplus into money, and lay it up for his children.

We have faid that there are two fpecies of artocarpus, viz, the incifa, with gathed leaves; and the integrifolia, with entire leaves. There is alfo faid to be another diftinction, into that which bears fruit with ftones or feeds, and that in which the fruit has none. The parts of fructification of that tree which bears the fruit without ftones are defective. The amentum, or catkin, which contains the male parts, never expands. The fyli, or female parts of the fruit, are likewife deficient. From which it follows, that there can be no fones or feeds, and therefore that this tree can be propagated only by fuckers or layers; although it is abundantly evident, that it mult have originally proceeded from the Seed-bearing bread-fruit tree. Inftances of this kind we fometimes find in European fruits; fuch as the batberry, and the Corimthian grape from Zant, commonly called currants, which can therefure be increafed only by layers and cuttings. Dr Solander was affured by the oldeft inhabitants of Otaheite and the adjoining iflands, that they well remembered there was formerly plenty of the feed-bearing bread-fruit; but they had been neglected upon account of the preference given to the bread-fruit without feeds, which they propagate by fuckers.

The Britifh government fent Lieutenant Bligh in the Bounty in 1787 to Otaheite to procure and tranfport to our Weft India colonies this valuable plant. The project was at that time unfucceffful, in confequence of a mutiny of the flip's crew, who feized the veffel, and carried her back to Otaheite. The ohject, bowever, was accompliihed at a future period, and the

A N Y.
bread-fruit is now reared in Jamaica an? the other Weft India inands. Plants of this genus have alfo been brought to his majefly's gardens at Kew. The tafte of the fruit is faid to be a fort of medium between the tafte of common wheaten bread, and the rate of a boiled potato. Thofe who prefer potatoes to ordinary bread alfo prefer the bread-fruit to it.
1033. Cynomorium.

Onc fecies; viz. coccineum. Jamaica. Nifa.
One fpecies; riz. fruticans. Africâ.
1203. Chara.

Four fpecies; viz. ${ }^{*}$ Hexilis, ${ }^{*}$ hifpida, ${ }^{*}$ tomento fa, * vulgatis.

One fpecies; viz. difficha. India. 1052. Betula, or Birch-trce.

Eight fpecies; viz *alba, * alnus, * nana, dalecarlica, nigra, lenta, pumila, incana. Europe, N. America.
1053. Buxus, or Box-tree.

One fecies; viz. fempervirens.-The wood is very hard and fmooth, and not apt to warp, and therefore well adapted for the ufe of the turner. Combs, mathematical inftruments, knife handles, and button moulds, are made of it. An empyrematic oil, difilled from the fhavings, is often ufed as a topical application for the piles, and feldom fails to procure eafe. It will frequently relieve the toothach, and has been given internally in epilepfies. The leaves, powdered, deftroy worms. In the fouth of Europe it is cultivated in gardens, and kept in flower-pots, with as much attention as we beftow upon myrtle.
1054. Urisica, or Netlie.

28 fpecies; viz. * dioica, " pilulifer, *urens, balearica, dodartii, pumila, grandifolia, cannabina, alienata, cylindrica, parietaria, ciliaris, fpicata, macrophylla, rhombea, wftuans, capitata, divaricata, canadenfis, interrupta, nivea, baccifera, arborea, capenfis, frutefcens, fimulans, japonica, villofa. Europe, N. Amcrica, E. and W. Indies.
disica.
*U. leaves oppofite, heart-ीhaped; bunches in pairs. -This feecies is the common nettlc. Its aings are
very curious microfcopic objects: They confint of an exceedingly fine-pointed tapering hollow fubfance, with a perforation at the point, and a bag at the bafe; or they are fharp tubes feated upon a bag. When the Marp point of the tube, that is to fay the fling, is preffed upon, it readily punctures the tkin , and the fame preflure forces up an acrimonious fluid from the bag, which is fquirted into the wound, and produces an effect which moft perfons have experienced. The plant was formerly ufed as an aftringent, but is now difregarded. A ftalk of it, when the leaves are in their prime, put into milk; coagulates it, and may ferve to prepare it for being made into clieefe. A leaf, put upon the tongue, and then preffed againft the roof of the mouth, is pretty efficacious in flopping a bleeding at the nofe. Paralytic limbs have been recovered by ftinging them with nettles. The young fhoots are gathered early in the fpring to boil in broth or grael. Cows eat the leaves when they are a little withered. The leaves are cut to pieces to mix with the food of young turkeys and other poultry. Cows, horfes, fineep, goats, and fwine, refufe them. Afies are fond of it, and cows eat it in hay. The ftalks may be dreffed like tlax or hemp for making cloth or paper. In Kamefchatka they make ufe of no other material in the manufacture of cordage or failcloth, and linen; and confider thefe fabrics, when produced from nettles, as fuperior in every refpect to thofe made from hemp and flax. As the nettle feems of all plants the moft congenial to our foil and climate, growing in all fituations both fertile and barren, in fpite of every attempt to extirpate it; and as there exits no doubt, that as a material of manufacture, it is not inferior to either flax or hemp, it is a fingular circumftance that it has never come into general ufe. This, perhaps, is chiefly to be accounted for from the difficulty of collecting its feeds and handling it; difficulties however, which a little attention and induftry would probably foon enable us to overcome.
1055. Morus, or Mulberry-tree.

Seven \{pecies; viz. alba, nigra, papyrifera, zubra, indica, tatarica, tinçtoria. Italy, China, Japan, America. -The mulberry is chietly remarkable on account of the value of its leaves, as the food of that valuable infect the filk-worm. The itr alba or white mulberry, with leaves obliquely heart-haped and level, grows in Britain in the open air, as far northward as the frith of Forth, and filk-worms may be fed with it. The fruit of the black mulberry has the common qualities of other fweet fruits, abating heat, quenching thirft, and promoting the groffer feeretions; a fyrup, made from the juice, is kept by the apothecaries. The bark of the roots has been in confiderable efteem as a cure for worms: its tafte is bitter and fornewhat aftingent.

## Order V. Pentandria.

## 1277. Nephrlium.

One fpecies; viz. lappaceum. India.
1056. Xanthium, or Leffer Burdock.

Five 'pecies; viz.* Strumarium, orientale, echina. tum, fpinofum, fruticofum. S. Eiurops, Ceylon, China, Peru.

* X. ftem thornicfs; leaves heart-haped, threc-fibred. -The leaves are bitter and aftringent. A decoction of the whole plant affords a Mowy yellow colour ; but it is better if only the tlowers are ufed. Horfes and goats cat. Cows, theep, and fwine, refufe it.

1057. Ambrosia.

Four fipecies; viz. trifida, clatior, artemififolia, manitima.
1058. Parthenium, or Bafe Feverfew.

Two fpecies; viz. hylterophorus, integrifolium. Virginia, Jamaica.
1059. Iva, or Falfe Fefuits-Bark trce.

Two fpecies; viz. annua, trutefcens. Virginia, Carolina, Jamaica.

## 1329. Clibadium.

One fpecies; viz. lurinamenfe. Surinam.
icbo. Amaranthus, or Flower-gentle.
24 \{pecies; viz. albus, græcizans, melancholicus, tricolor, polygamus, gangeticus, mangollarus, triftis, lividus, oleraceus, blitum, viridis, detexus, polygonoides, fcandens, hybridus, paniculatus, fanguineus, retroflexus, flavus, hypochondriacus, cruentus, caudatus, fpinofus. Europe, E. and W. Indies, America.

## 1276. Leea.

Two fpecies; viz. æequata, crifpa. Jamaica.

## Order VI. IIEXANDRIA.

1062. Zizania, or Water-oats, Tare-grafs.

Three fpecies; viz. aquatica, paluftris, terreftris. Matabar, N. America, Jamaica.
ic63. Pharus.
One fpecies; viz. latifolius. Jamaica, S. Amer.

## Order Vif. heptandria.

1064. Guettarda.

One fpecies; viz. fpeciofa. Java, W. Indies.

## Order VIII. POLYANDRIA.

ig65. Ceratophyllum, or Hornwort.
Two fpecies; viz. "demerfum, * fubmerfum.
1066. Myriophyllum, or Water-Milfoil.

Two fpecies ; viz. * fpicatum, * verticillatum.
1067. Sagittaria, or Arrowbead.

Five fpecies; viz. ${ }^{*}$ fagittifolia, obtuffolia, lancifolia, acutifolia, trifolia. Europe, Afia, America. * S. leaves arrow--fhaped, acute.-It grows in ditches and on the banks of flow running rivers. There is always a bulb at the lower part of the root, growing in the folid earth beneath the mud. This bulb conftitutes a confiderable part of the food of the Chinefe, and upon that account they cultivate it. Horfes, goats, and fwine, eat it. Cows are not fond of it.
1156. Begonia.

Three fpecies; viz. ferruginca, capenfis, urtica. Cape, E. and W. Indies.
1098. Theligonum, or Dugs cabbage.

One fpecies; viz. cynocrambe, S. of Europe.

A N Y.
Three fpccies; viz. * languiforba, by bridum, fipinofum.

* P. without thorns; ficms fomewhat angular. - The funguiforn leaves and feeds of this plant are mildly aftringent, and $l a$. have been ufed if dytenteries and hemorrhagics. The feeds, when bruiled, fmell like cucumbers. There are large tracls of the fineft parts of what are called the South Downs in England, upon which this plane forms half the indigenous palturage. It feems to grow naturally without being fown) only on chalky foils; but it will flourith, when fown, on any foil; on fand, clay, peat, \&c. It is chietiy valuable for theep fdflures that are to be kept fully flocked. It formis a fine herbage when clofe bitten; but when fuffered to run to a height it is rather coarfe.

## 1070. Cuercus, or Oak-free.

20 fpecies; viz. * phellos, molucea, glabra, acuta. glauca, cufpidata, ferrata, ilex, fuber, coccifera, prinus, dentata, nigra, rubra, alba, efculus, * robur, egilops, cerris, *femina.

* Q. leaves on leaf-italk, oblong, brozdeft towardsrobur. the end; indentations rather acute, angles blunt; fruit nearly fitting.
* Q. leaves oblong, on fhort leaf-talks, blunt, wing-femina。 cleff, with indentations; fruit mofly folitary, on long fruitftalks. W'ilbering, vol. iii. p. 387. The oak is a rative of the temperate climates. It loves hilly better than boggy ground, and thrives beft, while young, in large plantations. Its roots defcend deep into the earth, and therefore will not bear to be tranflanted. Much lopping deflroys it. Grafs will hardly grow beneath it. The wood is hard, tough, tolerably flexible, not eafily fplintering; and therefore is prefersed before all other timber for building hips of war. It is well adapted to almoft every purpofe of the carpenter; but an attempt to enumerate the ufes of this well-known wood, would be equally fuperfluous and difficult. Oak faw-duft is the principal indigenous vegetable ufed in dyeing fuftian. All the varieties of drabs and different thades of brown are made with oak faw-duft, differently marraged and compounded. The balls or oak apples are likewife ufed in dyeing, as a fubfitute for galls. The black, got from them by the addition of copperas, is more beautiful than that from galls, but not fo durable. The bark is univerfally ufed to tan leather; and it is faid that the fawduit has been ufed for the fame purpofe with equal fuccefs. The bark is ufed to make writing ink. Its altringent properties might be rendered ufful in medicine. An infufion of it, with a fmall quantity of copperas, is ufed by the common people to dye woollen of a purplifif blue: the colour, though' not very bright, is durable. The balls or galls upon the leaves, are occafioned by a fmall infect with four wings, called cynips quarci folii, which depofits an egg in the fubitance of the leaf by making a finall perforation on the under furface. The ball prefently begins to grow, and the egg in the centre of it changes to a worm; this worm again changes to a nymph, and the nymph to the flying inleet, with four wings. Horfes, cows, fheep, and goats, cat the leaves. Swine and deer fatten on the acorns. The oak grows in a good foil fometimes to a moft immenfe fize. At Little Shelley in Worceffer-
fhire, an oak meafured clofe to the ground nearly 48 feet, and about two yards from the ground 22 feet four inches. Lightfoot mentions one growing near Ludlow in Shrophire in 1764 , the trunk of which meafured 68 feet in girth, and 23 in length; fo that allowing 90 fquare feet for the larger branches, it contained 1455 feet of timber. An oak near Welbeck meafured in girth, at II feet from the ground, 38 feet; and one growing at Cowthorpe ncar Wetherby, Yorkfhise, meafured 48 feet in circumference at three feet from the ground, and $7^{8}$ feet clofe to the ground.

1071. Juglans, or I'álnut-tree.

Five feccies; viz. regia, alba, nigra, cinerea, baccata. Perfia, N. America.-This tree, when planted in Scotland, feldom ripens its fruit. 1072. Fagus, or Beech, Swect Cb. fnut.

Three fpecies; viz. *caftanea, pumila, *fylvatica. Europe, N. America.
caftanea.

* F. leaves fpear-hhaped, with tapering ferratures, naked underneath. - In the ftade of this fpecies, called the chefnut, nothing will thrive. The wood is applicable to the fame ufes that oak is. Pipes made of it to convey water under ground, are faid to laft longer than thofe made of oak. Poles for efpaliers, \&c. made of it without removing the bark, alfo latt very long. Some of the oldef buildings in Loridon are faid to be conftructed of the wood of the chefnut tree. At Tortworth in Gloucefterfhire, is faid to be a tree 52 feet round, which is proved to have flood fince the year 1150, and was then very old. Is is fuppofed to be 1100 years old. In 1759, its girth, at fix feet from the ground, was 46 feet fix inches. The nuts are ufed to whiten linen cloth, and to make farch. They conflitute a great proportion of the food of the common people in the fouth of Europe; and hogs, feeding on them as they run wild in the forefts, are reckoned particularly excellent. * F. leaves egg-haped; inditinctly ferrated. Comnoon beech.-This tree is large and beautiful, but no verdure is found under its Glade. It retains its old leaves during the winter, and may be trained to form very lofty hedges. The wood is brittle, foon decays in the air, but endures under watcr. It is formed into tool handles, planes, mallets, chairs, and bedfeads. Split into thin layers, it is ufed to make fcabbards for fwords. It is cxcellent fuel, and its afhes afford much potafh. The leaves, gathered in autumn before they are much injured by frof, make much better mattreffes than ftraw or chiff, and lafl feven or eight years. The nuts or maft, when eaten, occafion giddinefs and headach; but when well dried and powdered, make wholefome bread. They are fometimes roafled and fubtituted for coffec. They fatten fwine, and are devoured greedily by mice, fquirrels, and birds. The poor people in Silefia ufé the expreffed oil inftead of butter. Sheep and goats eat the leaves.

## 1073. Carpinus, Hornbeam-tree.

Two 炧ccies; viz. "betulus, ollrya. Europe, N. America.
*. Ccales of the concs flat.-This, which is the common hornbeam, loves a poor tliff foil on the fides of hills, is cafily tranfplanted, and bears lopping. Catale eat d:e leaves, but no pafture grows under its

Alade. The wood barns like a candle : it is very white, very tough, harder than hawthorn, and capable of fupporting a great weight. It is ufeful in turning, and for many implements of hufbandry. Coggs for millwheels made of it are fuperior to thofe of yew. The inner bark is ufed in Scandinavia to dye yellow.

## ro74. Corylus, Hazel, or Nut-tree.

Two fpectes; viz. * avellana, colurna. Europe, N. America.

* C.-This wood is profitably planted in many places avellana. in hedges and coppices, for the purpofe of cutting down portions in rotation, to be converted into charcoal for forges. The wood is ufed for fifhing-rods, walking-fticks, hoops, \&c. The roots are preferred where beautiful wood is wanted for inlaying or faining. It is a practice in Italy, to put chips of hazel into turbid wine to clear it, which it does in 24 hours. In countries where yeaft is fcarce, they twift together hazel twigs, fo as to leave a multitude of chirks: thefe they fleep in their ale while it is fermenting; then hang them up to dry, and when they brew again they put them into the wort inflead of yeaf. Charcoal of hazel, when ufed in drawing, leaves ftains which are eafily rubbed out. The nuts, which are agreeable to moft people, afford, by preflure, an oil for the ufe of painters.

## 1075. Platanus, or Plane-tree.

Two fpecies; viz. orientalis, occidentalis. Levant, N. America.
1076. Lieuidambar, or Sweet Gum.

Two fpecies; viz. Alyracitlua, peregrina. Levant, N. America. - The refinous juice of the former of thefe fpecies, brought from America, was once ufed as a perfume, but is now neglected.

## Order IX. MONADELPHIA.

## 1077. Pinus, or Pine-irce.

I2 (pecies; viz. *1ylveftris, pinea, tæda, cembra, Atrobus, cedrus, larix, picea, balfamea, canadenfis, abies, orientalis. Europe, north of Afia, America.

* P. leaves in long pairs, rigid; cones egg-conical, fylvefris, moftly in pairs, as long as the leaves; fcales oblong; blunt. Scolch fir. - This fpecies, which is a native of our ifland, tlourilhes beft on a poor fandy foil. In a grove the trunk is tall and naked; in open places branched. It does not hear the leaft clipping, as the terminating buds fend forth the branches. The roots fpread near the furface of the earth, except the central root, which pufhes perpendicularly downwards. If it is either broken off or interrupted in its paffage, the ftem ceafes to thoot upwards, and the tree remains a dwarf. Hence it is apt to fuffer by tranfplanting. The bark will tan leather. In the north of Europe bread is thus made from it by the inhabitants: They choofe a ftraight tree, as thele have leaft sefin, and frip off the baik in the fpring, when it feparates moth readily. This they firf dry geretly in the thade : then in a greater heat, and reduce it to powder. With this powder they mix a fmall quantity of corn meal, and with water they knead it into bread. This they eat, not only in times of fcarcity, hut at other times, from an apprehenfion, that lung difufe might render it dila-
greeable to them. Their children are very fond of the fiefh bark in the fpring time, either flaved with a kuife or grated with a rafp. The young hoots, diftilled, afford a fragrant effential oil. Sheep and goats are not fond of it. Horfes refule it. Burnt with a clofe fmothering fire, the wood of this fpecies yields tar. The Species called larix has rifen into confiderable reputation in this country, on arcount of its beauty, rapid growth, and the value of the timber. It is extremely hardy, growing in Siberia almof to the coatls of the Icy fea; but this very hardinefs, or capacity of vegetating with a very fimall degree of heat, renders it in this country delicate when young. The firf warmsh of the fpring is fufficient to bring forth its buds, which are thus, by the unfteadinefs of our climate, expofed to frequent pernicious froffs. In this way nurferymen often fuffer great loffes by the larix, in confequence of an early fring and a prematurc vegetation, which is afterwards nipt by frofly weather. From the trees of the genus pinus the different turpentines are extracted by blceding the trees, by wounds in the bark or branches.

## 1079. Cupressus, or Cypre/s-trec.

Six fpecies; viz. fempervirens, dilticha, thyoides, juniperoides, pendula, japonica. Crete, Cape, Japan, N. America.
1080. Plukenetia.

One fecies; viz. volubilis. E. and W. Indies.
1081. Dalechampia.

Two fpecies; viz. colorata, fcandens. W. Indies, New Granada.
1082. Acalypha.

Five fpecies; viz. virginica, virgata, indica, villofa, auftralis. N. America, E. and WV. Indies.
1083. Croton, or Bafe Ricinus, Tallow-tree.

23 Species; viz. variegatum, cafcarilla, caltaneifolium, paluftre, glabellum, tinctorium, glandulofum, argenteum, febiferum, japonicum, acutum, tiglium, lucidum, lacciferum, balfamiferum, aromaticum, humile, ricinocarpus, moluccanum, flavenfe, capenfe, lotum, fpinofum. China, Japan, W. Indies, N. America.
279. Cupania.

One fpecies; viz. americana. W. Indies, Coromandel.
1084. Jatropha, or Caflada, Manibor.

Nine fecies; viz. goflypifola, moluccana, curcas, multifid, manihot, janipha, urens, herbacea, claftica. Africa, S. America.

## 1085. Ricinus.

Four fpecies; wiz. inermis, communis, tanaricus, mappa. Vera Cruz - The Ppecies called $R$. communis $_{\text {a }}$ produces nuts about the fize of fmall beans, which like bitter almonds are deleterious. An oil is obtained from them by exprefion, called cufor oil, which is ufed as a fafe and mild laxative; half an ounce or an ounce for an adult, and a dranı for an infant.
1086. Sterculia.

Three fpecies; viz. ballanghas, fretida, plutanifo. lium. Arabia, E. and W. Indies, China.

A N Y.
1088. Hippomane.

Three โpecies; viz. mancinella, biglandulofa, fpinofa.
1279. Stilling 1:.

One fpecies; viz. fylvatica. Carolina.
1278. Gnetum.

One fpecies; viz. gnemon. India.
1087. Hura, or Sandlox-tree.

One fpecies; viz. crepitans. Mcxico, W. Indies.
Order X. syngenesia.
1089. Trichosanthes, or Serpeni-cucumber.

Four fipecies; viz. anguina, nervifolia, cucumerina, amars. E. Indies, China.
1090. Momordica, or Male Balfam-apple.

Eight fpecies; viz. ballamina, charantia, operculata, luffa, cylindrica, trifolia, pedata, elaterium. S. Europe, India, America.
rogi. Cucurbita, or Gourd.
Seven feecies; viz. lagenaria, hitpıda, ovifera, pepo, verrucofa, melopepo, citrullus. E. and W. Iṇdies, America.

## 1092. Cucumis, or Cucumbre.

13 Species; viz. colocynthis, prophetarum, arrguria, africanus, acutangulus, melo, dudaim, chate, fativus, anguinus, flexuofus, conomon, maderafpatanus. Levant, India, Alrica, Jamaica.-The fpecies called futivus, is the ordinary garden cucumber. It is lefs apt to grow rancid by keeping than others of the clafs. The C. colocynthis, called coloquintida or bitter apple, is a native of Turkey. The fruit is about the fize of an orange. Its medullary part, freed from the rind and feeds, is light, white, and fpongy, compofed of membranous leaves, of an extremely bitter, naufeous, acrimonious tafte. Colocynth is one of the mof powerful and violent cathartics; but is accounted dangerous by the beft phyficians. The belt mode of abating its virulence, confilts of triturating it with gummy farinaceous fubflances, or oily feed. Without this precaution, a few grains of it will often diforder the body, and even occafion a difcharge of blood. The $C$. melo is ufed in hot countries as a cooling and agreeable food.

## 1093. Bryonia, or Bryony.

It Species; viz. alba, *dioica, palmata, grandis, cordifolia, laciniofa, africana, cretica, fcabra, fcabrella, japonica. Crete, Africa, E. Indies.

* B. leaves hind-fhaped, rough on both fides, with dioica, callous points; male and female flowers on different plants. - The root is purgative and acrid. A dram of it in fubtauce, or halt an ounce of it infufcd in wine, is a full dofe. A cold infulion of the root in water is ufed extertally in fciatic pains. A catapla?m of it is a moll powerful difcutient. A decoction, made with one pound of the frefh root, is the beit purge fur horned cattle. The plant is rough, growing on dry banks under hedges, and climbing upon the bufhes. The roots are large, fometimes as thick as a men's thigh. Their juice, when frefh, foon excuriates the \&kin, but in drying they lofe much of their acrimony.

1094. Sicyos, or Single-feeded Cucumber.

Three fpecies; viz. angulata, laciniata, garcini. America.

## Order XI. GYNANDRIA.

1095. Andrachne, or Bafe Orpine.

Two fpecies; viz. telephioides, fruticofa. Italy, Levant, Egypt.

## In the clafs Monacia are

78 Genera, including 392 \{pecies; of which 83 are found in Britain.

C. (1) Cal. 5 -leaved. Cor. 5 -petaled. Stamens 5 . (2) Cal. 5 -leaved. Cor. 5 -petaled. Styles 3. Capf. 3 -celled.

## Order I. MONANDRIA.

1430. Pandanus, or Screw-pine.

One fpecies; viz. odoratifina. Eaft Indies, South Sea Incs.

> rog6. Najas.

One fpecies; viz. marina. Europe.

## Order il. Diandria.

jo97. Vallisneria.
One \{pecies; viz. fpiralis. Italy.
1099. Cecropia, or Trumpet-etrce.

One feccies; viz. peltata. Jamaica.
rog8. Salix, or Willow.
$3{ }^{4}$ fpecies; viz. * acuminata, *alba, * amygdalina, * aurita, * caprea, * cinerea, * fragilis, * fufca, * herbacea, * lanata, * lapponum, * monandra, * myr-
finites, * pentandra, * repens, * reticulata, * retufa, * rofmarinifolia, * rubra, * triandra, * viminalis, * vitellina, phylicifolia, japonica, haflata, ægyptiaca, babylonica, helix, arbufcula, myrtilloides, integra, glauca, arenaria, incubacea. Europe, America.

* S. leaves flrap-flaped. upper leaves oblique; catkins monandra.
downy; one ftamen.-Rofe willow, or purple willow.
Withering. Called by Linneus, $S$. purpurea, Bafkets, cradles, and all forts of twig work are made of its long, llender, and flexible flsoots.
- S. leaves oblong, fpear-lhaped; llowers with threetrinndra. ftamens, fometimes two. Smooth willow. -The bark, in dofes of one or two drams, cures agucs.
* S. leaves egg-haped, acute; flowers with five fta-peniandru. mens. Sweet rillow, or bay-leaved willow. Cailed by Linnæus $S$. bermapbroditica. The wood crackles greatly in the fire. The dried leaves afford a yellow dye. Ufed in Yorknire to make the large fort of balkets
* S. leaves egg-fpear-fhaped, acute, frooth above, fer-viscllina,
rature like grinle. Tellow willore-The wood is white and very tough. The fhoots are ufed by balketmakers.
* S. leaves egg-fpear-fhaped ; leaf-ftalks toothed with glands. Crack quillow.-A quick groner, and bears cropping. Thrives in any foil if moift. The bark in dofes of one or two drams cures agues.
* S. leaves frap-fpear-fhaped, acute. Red-zuillow.The twigs much fought after by bafket-makers.
* S. leaves fear-Atrap-flaped, very long, acute, filky underneath; branches rod-like. Ozier.-Much ufed for making hoops, and the larger bafkets. Is planted to prevent the banks of rivers from being wathed away by torrents.
aiba. * S. leaves Spear-flarad, tapering to a point, ferrated, downy on both fides; the lowermoft ferratures glandular. White willow.-Grows quick, and bears lopping. The bark collêted in fummer when full of fap, and dried by a gentle heat, is extremely valuable, as a fubfitute for Peruvian bark, in the cure of intermittent fevers. It will $\tan$ leather. Horfes, cows, fheep, and goats, eat the leaves and young fhoots. If a fhady walk with willows is wanted, male fets only ought to be planted, otherwife they will fpeedily multiply fo as to form a thicket infead of a grove.

## Order III. TRIÀNDRIA.

## 1101. Empetrum, or Berry bearing Heath.

Two fpecies; viz. ${ }^{*}$ nigrum, aibum.

* E. with ftems trailing.-The berries boiled uith alum afford a dark purple dye. Eaten in quantities they occafion headach.

1101. Osyris, or Poets-ciffra.

Two fpecies; viz.alba, japunica. South Europe, Japan. i43'. Maba.
One fecies; viz. elliptica. Tongataboo, Namoka. 133I. Restis.
Nine fpecies; viz. paniculatus, verticillaris, dichotomus, vimineus, triflorus, fimplex, elegia, cernuus, tectorum. C. of G. Hope.

> 1102. Excorcaria, or Aloes wood.

One feccies; viz. agallocha. Amboyna, Malacca, China.
1280. Caturus.

Two fpecies; viz. ipiciflorus, ramiflorus. Eaft and Weft Indies.

## Order IV. TETRANDRIA.

ilo3 Trophls.
One โpecies; viz. americana. Jamaica.
1104. Batis.

One fpecies; viz. maritima. Jamaica.
1105. Viscum, or Mifletoe.

Nine fpecies; viz. *album, rubrum, purpureum, opuntiodles, capenfe, venticillatum, paucillorum, terreftre, rotundifolium. Europe, Cape, Weft Indies,
silum.

North America.
*V. leaves fpear-fhaped, blunt; ftem forked; fpikes axillary. Whbise mifletoe.-A fingular parafitical evergreen plant. The barren plant oppofite to the fertile or.e. The root infinuates itfelf into the fubflance of

A $N \quad Y$.
Diœcia
the tree on which it grows. Bloffum greenifh white. Berries whitilh. Birdlime may be made from the berries or the bark. Birds having fwallowed the berrics, void them unchanged upon trees, where they take root. No alt has hitherto been able to make them take root in the earth. Sheep eat it greedily; and in the fouthern Englifh counties, where chiefly it grows, it is often torn from the trees to feel them. It is faid to preferve them from the rot. If the berries, when fully ripe, be rubbed on the fmooth bark of almof any tree, they will adhere clofely, and produce plants the follosing winter.
1432. Montinta.

One fpecies; viz. acris. C. of G. Hope.
11of. Hippophae, or Sea-buckithorn.
Two fpecies; viz. * rhamnoides, canadenfis.

* H. leaves Spear-fthaped.-Cows refufe it. Horfes, rbamgoats, and fheep eat it. The berries are very acid, with noides. an auftere vinous flavour. The fifhermen of the gulf of Bothnia prepare a rob from them, which imparts a grateful flavour to frefh fifh. In funny and fandy fituations it is planted for hedges.

1107. Myrica, or Candle-berry Myrtle, Gale.

Seven fpecies; viz. *gale, cerifera, æthiopica, quercifolia, cordifolia, trifoliata. Europe, Madeira, Cape, North America.

* M. Leaves fpear-fhaped, fomewhat ferrated; ftem gale. fhrub-like. Sweet uillow, Dutch myrtle, gale, goulc.Dyed in autumn, it dyes wool yellow. It is uled to tan calfkins. The Welch lay bunches of it under their beds to keep off fleas and moths, and give it as a vermifuge in powder and infufion, applying it alfo externally to the abdomen. Its effential oil rifes in dif.. tillation. The catkins boiled in water throw up a waxy fcum fit to make candles. From the M. ccrifera the myrtle candles are prepared.

## Order V. PENTANDRIA.

## 1108. Pistacia, or Pifacia-nut.

Five fpecies; viz.tr.fona, narbonenifs, vera, terebin. thus, Bentifcus. Suurb Europe, Barbary, Perfia, India.

The $P$. vera, with leaves unequal winged, leaflets nearly egg-th ped, bent back, products a moderately large nut, coutaining a pale greenifh kernel, with a reddifh Kkili. The tiee grows fontaneoufly in Perfia, Arabia, and the Archipelago; and has been tound able to produce fruit in England. Piftachio nuts have a pleafant, freet, unctuous tafte, refembling almonds, and are eftemed by fome in certain weakneffes, and in emaciated habits.

The P. Icnifeus with leaves abruptly winged, and fpear-flaped leattets, in like mamer bears our winters. The wood is brought to us in thick knotty pieces, with an aflo-coloured bark and white within, of a rough fomewhat pungent tafte, and a grateful but faint finell. A decoction of it, under the pompous appellation of aurum polabile, potable gold, is rece mmended by the Germans in catarrhs, naufea, arid weaknefs of fomach. In the ifland of Chio, this tree affords maffich, which is a refinous fubtance brought from thence in fnall yellowihh tranfparent grains or tears of a pleafant fmell, efpecially wheh heated. It is recommended in old coughs, dyfenteries and all cafes of laxity.

Two fpecies; viz. clava herculis, trifoliatum.
jilit. Astronitim.
One frecies; viz graveulenc. South America.
iz8f. Canarium.
One fecies; viz. commune. India.
illo. Anfidesma, or Cbinefe Lanrel.
One fpecies; viz.alexiteria. E. lndies, China, Japan.
11IJ. Iresine.
One fpecies; viz. celofia, Virginia, Jamaica.
11t2. Spinicia, or Spinage.
Two fpecies; viz. oleracea, fera. Siberia.
1114. Acnida, or Virginian Hemp.

One §pecies; viz. cannabina. Virginia.
1ti5. Cannabis, or Hemp.
One fpecies; viz. fativa. India. See Agriculture Inde.

1i16. Humulus, or Hops.
One fpecies; viz. * lupulus. Europe.-Cultivated in England to preferve malt liquors. The young Shoots are eaten in the fpring inftead of afparagus. Strong cloth is in Sweden made from the falks, which are foaked in water all winter, and in the fpring dreffed like flas. A decoction of the roots, or from 20 to 30 grains of the extract, is faid to be fudorific.
1117. Zanona.

One fpecies; viz. indica. Coalt of Malabar.
iif8. Fevillea.
Two fpecies; viz. trilobata, cordifolia. W. Indies.

## Order VI. HEXANDRIA.

1119. Tamus, or Black Bryony.

Two fpecies; viz. * communis, cretica. South Europe, Cape.
ifzo. Smilax, or Rough Bindweed.
14 โpecies; viz. dipera, excella, zeilanica, farfaparil3a, china, rotundifolia, laurifolia, tamnoides, caduca, bona nox, herbacea, tetragona, lanceolata, pfeudochina. South Europe, Eall Indics, North America.
itil. Rajania.
Five fpecies; viz. hallata, cordata, quinquefolia, quinata, hexaphylla. Japan, North America, Weft Indies.

> 1122. Dioscorea, or Indian Tam.

12 Species; viz. pentaphylla, triphylla, trifida, aculeata, alata, bulbifera, fativa, villofa, oppofitifolia, 「eptemloba, quinquelobata, japonica. Eaft and Weft Indies, North America.

## Order ViI. octandria.

## 1123. Populus, or Poplar-tree.

Five โpecies; viz. *alba, * nigra, *tremula, balfamifer, heterophylla. South Afia, Italy, Archipelago, North America.

* P. leaves nearly triangular, toothed, and angular ; cottony underneath. White Poplar.--It loves low fituations, and flourifhes beft in clay. It grows quick and bears cropping, but is unfavourable to palturage. The wood is foft, white, and ftringy, and makes good wain-
fcating, being little fubject to fwell or flrink. Filnors, laths, packing boxes, and turners ware, are made of it. Horfes, fhcep, and goats eat it. Cows are not fond of it.
* P. Ieaves circular, toothed, and angular; fmooth on tremula. both fides. Afp, a/pen tree, trembling poplar. - This tree grows in all foils, but worf in clay. It impoverithes the land, deffroys the grafs; and the numerous fhoots of the roots fpread fo near the furface of the earth, that they permit nothing elfe to grow; but rife in all quarters, whether they are wanted or not. It is eafily tranflanted. The wood is extremely light, white, fmooth, woolly, foft, durable in the air. The bark is the principal food of beavers. The bark of the young trees is made into torches.
* P. leaves trowel-fhaped, tapering to a point, ferrated, nigra. fmooth on both fides. Blaek poplar. - It loves a moilt black loil, grows rapidly, and bears cropping. The bark being light like cork, fupports the nets of fihermen. Cattle eat it.

## Ii 24. Rhodiola, or Rofe-root.

One fpecies; viz. *rofea.-The root, particularly when dried, has the fragrance of a rofe; but cultivated in a garden it lofes moft of its fweetnefs.

> i493. Margaritaria.

One fpecies; viz. nobilis. Surinam.

## Order VIII. ENNEANDRIA.

## 1125. Mercurlalis, or Mercury.

Three fpecies; viz. ${ }^{*}$ annua, * perennis, tomentofa Europe.

* M. Hem undivided, leaves rough. Dogs mercury. - perennis, It is noxious to theep, and deleterious to man. In drying, it turns blue. Stecped in water it affords a fine deep blue colour; which, however, is deftructible both by alkalies and acids.

1126. Hydrocharis, or Frogs-bit.

One fecies; viz. * morlius rame.

## Ordfr IX. DECANDRIA.

1127. Carica, or Papaw trec.

Two fpecies; viz. papaya, pofopuf. E. and W. Indies.
1128. Kiggelaria.

One feccies; viz. africana. C. of G. Hope. $^{\text {P }}$
1130. Schinus, or Indian Mafich tree.

Two fpecies; viz. molla, areira. Peru, Brazil, Chili.

1t2g. Coriaria, or Myrtle-leaved Sumach.
Two fpecies; viz. myrtifolia, rulcifolia. Spain, $S$. France, Peru.

## Order X. DODECANDRIA.

## Euclea.

One fpecies; viz. racemofa. C. of G. Hope.
1132. Datisca. or Bafe Hemp.

Two fpecies; viz. cannabina, hirta. Crete, N. America.
1131. Menispermun, or Moon-fect.
if fpecies viz. canadenfe, virginicum, japonicuni, carolinum,
carolinum, cocalus, crifpum, acutum, orbiculatum, hirfutum, myoftoides, trilobum. N. America, Japan.

## Order XI. POLYANDRIA.

1133. Cliffortia.

18 fpecies; viz, odorata, ilicifolia, rufcifolia, ferruginea, graminea, polygonifolia, filifolia, crenata, pulchella, trifoliata, farmentola, Atrobilifera, obcordata, ternata, juniperina, falcata, teretifolia, ericæfolia. C. of G. Hope.
t432. Hedycaria.
One Ipecies; viz. dentata. N. Zealand.

## Order Xif. MONADELPHIA.

## if34. Juniperus, or Guniper-tree.

10 fpecies; viz. * communis, thurifera, barbadenfis, bermudiana, chinenfis, fabina, virginiana, oxycedrus, phomicea, lycina. Europe, Bermudas, America. longer tha tore It exp in foils and fir lions, and to a correfponding variety of fizes. It is eafily tranfplanted, and bears cropping. Grafs will not grow beneath it, but the avena praten/is deftroys it. The wood is hard and durable. The bark may be made into ropes. The berries are two years in ripening.When bruifed they afford a pleafant diuretic liquor, but it is not eafy to prevent its growing four. It is efteemed a good antifcorbutic. Ardent fipirts, impregnated with the effential oil of thofe berries, is termed gin, though it is faid that fome diftillers know how to produce the fame effect, by means of the firit of turpentine. Gum fandarach, more commonly called pounce, is the product of this tree. Horfes, fteep, and goats, eat it. From the $\mathcal{F}$. lycina, a gum refin called dibanum is produced. From the $\mathcal{F}$. Jalina, is extra\&ted an effential oil, which is accounted a moft powerful emmenagogue. It is a warm, irritating, aperient medicine.
1135. Taxus, or Yew tree.

Four fpecies; viz. * baccata, nucifera, macrophylla, verticillata. Eur. Cape, Jap. N. America.

A N Y.

* T. leaves folitary, ftrap-fhaped, prickle-pointed, near baccata. together; receptacle of the male flowers fomewhat globular.-It grows beft on a moif loamy 「oil, and languihes in bogs and dry mountains. It bears tranfplanting, even when old; and, as an evergreen hedge, is a valuable fereen to delicate plants. The wood is hard, finooth, and beautifully veined with red. It is ufed for bows, axletrees, fooons, cups, cogs for millwheek, and floodgates for fifh ponds, withich hardly ever decay. The berries are fiweet, vifcid, and harmlefs. The frell leaves ate fatal to the human fpecies.

1136. Ephedra, or Sbrubby Horfe-tail.

Two fpecies; viz. diftachya, monollachya. Sibe. ria, France, Spain.
1138. Cissampelos.

Five fpecies ; riz. pareira, caapeba, finilacina, fruticofa, capenfis. Cape, America.

> 836. Naptea.

Two fpecies; viz. levis, fcabra. Virginia.
I!37. Adelia.

Three fpecies; viz. bernardia, ricinella, acidoton. Jamaica.

## Order XIII. SYNGENESIA.

1139. Rusces, or Knee-bolly, or Butchers-broom.

Five fpecies; viz. * aculeatus, hy pophyllum, hypogloflum, androgynus, racemofus. Hungary, Fr. Italy, Canaries.

## Order XIV. GYNANDRIA.

ifo. Clutia.
Nine fpecies; viz. alaternoides, polygonoides, pulchella, hirta, tomentofa, retufa, eluteria, ftipularis, acuminata.

In the clafs Diacia are
55 Gencra, including 219 Species, of which 38 are found in Britain.

## Order I. moncecia.

Hifi. Musa, or Plantain-trce.
Three fpecies; viz. paradifaica, "fapientum, troglodytarum. E. and W. Indies.

## 114. Veratrum, or White Hellebove.

Three lpecies; viz. album, nigrum, luteum. Ruffia, Auftria. Italy, N. America.-The $V$. allum grows fpontaneoufly on the mountains of Switzerland and Germany. The root is naufeous and acrid. If wounded, when frefl, it emits an acrid juice, which is faid to prove dangerous when mixed with the blood by an wound. The powder of the dry root applied to an iffue, occafions violent purging. Snuffed up the nofe, it is a flrong, but not always a fafe fternutatory. It is alfo a violent emetic. The ancients ufed it in defperate cafes; but modern practice rejects it, though it is faid to have been given with fuccefs to the amount of a fcruple in cafes of mania.

## 1333. Spinifex.

One fpecies; viz. fquarrofus. E. Indies.

## 1145. Andropogon, or Beard-gra/s.

25 fpecies; viz. caricofum, contortum, crinitum, divaricatum, gryllus, nutans, ciliatum, ferratum, cotuliferum, cymbarium, fquarrofum, proftratum, alopecuroides, diffachyum, fchœenanthus, virginicum, bicorne, hirtum, infulare, barbatum, nardus, muticum, ifchæmum, fafciculatum, polydaEylon. S. Europe, E. and W. Indies, America.

The A. nardus, Indian nard or fpikenard, as it comes from the Eaf Indies, is a matted congeries of fibres iffuing from one head, and probably forming the root of the plant. Spikenard has a warm, pungent, bitterifh tafte, and a flrong not very agreeable fmell. It is ftomachic and carminative ; and faid to be alexipharmac, diuretic, and emmenagogue ; but is at prelent little emplayed.

## 1146. Holcus, or Indian Millet.

14 Species; viz. * avenaceus, * lathatus, * mollis, fpicatus, bicolor, forghum, halepenfis, faccharatus, laxus, flriatus, ferratus, odoratus, latifolius, pertufus. N. Europe, India, N. America.

* H. hufks two-llowered, woolly ; hermaphrodite floret awnlefs; male floret with a bent awn, inclofed in the calyx.-This grafs flourifues well on any moift foil, and grows very generally, exeept on the moft dry and barren ones. It hhould be fown chiefly with a view to pafturage by fheep. It makes a foft foongy hay unfit for horfes.

## 1147. Apluda.

Four fpecies; viz. mutica, ariftata, zeugites, digitata. E. and W. Indies, N. America.

## 1148. Іschemum.

Two fpecies; viz. muticum, arifatum. India, China, Carolina.

## 1149. Cenchrus, or Ilcdgeliog grafs.

Nine fecies; viz. racemofus, lappaceus, muricatue, capitatus, echinatus, tribuloides, ciliaris, gramulais, frutefcens. S. Europe, Virginia, W. Indieso

VoL. IV. Part I.
1550. たgilops, or Ilaril-grafs.

Fout fpecies; viz. ovata, caudatia, humeiali, fruarrofa. S. Earope, Caroliua.
1334. Manisuris.

One fpecies; viz. myurus. 1.. and TV. Indies, N. America.
1151. Valantia, or Cro/s-ivort.

Eight §pectes; viz. * aparme, * cruciata; muralis, hifpida, cucullaria, atticulata, glabra, hypocarpa. Auftria, S. Europe, Canaries, Jamaica.
1152. Pariftapia, or Pelítory.

Eight §pecies; viz. * oflicinalis, indica, judzica, lufitanica, urticufolia, cretica, zeylanica, micsophylla. S. Europe, Canaries, Ifle of Bourbon.
1153. Atriplex, or Orache, Sea Purflane-iree.

12 fipecies; viz. * haftata, * laciniata, * littoralis, * patula, * pedunculata, * portulacoides, halymus, glauca, rofea, fibirica, tatarica, hortenfis. Europe, Tartary, America.

## 1283. Terminalla, or Benzoin.

Two fpecies; viz. catappa, benzoin. E. Indies.From the laft of thefe fpecies a refin of the fame name is fuppofed to be extracted, though others reprefent it as the product of another plant called fyrax benzoe. Benzoin is ufed in perfumes, and as a cometic.

## 160. Brabeium, or African Almond.

Оле โpecies; viz. ftellulifoliur.
1154. Clusia, or Balfam-tree.

Four fpecies; viz. rofea, alba, flava, venofa. A. merica, Jamaica.

## ilyz. Ophioxylum.

One fpecies; viz. ferpentinum. E. Indies.
115 5. Acer, Maple-tree.
I 7 feecies; viz. * campeftre, * pfeudoplatanus, fempervirens, tataricum, rubrum, faccharimm, diftectum, japonicum, palmatum, feptemlobum, piCtum, platanoides, penfylvanicum, monfpeflulanum, creticum, trifidum, negundo. Europe, N. America, Japan.

* A. leaves 5 -lobed, blunt, unequally ferrated; flowers Afertioin compound pendent bunches. Syeamore iree, fy- platanus, camore maple-- It flourifhes belt in open places and fandy ground, but will thrive in a richer foil. It grows quick, is eafily tranfplanted, bears cropping, and the grafs flourifhes under its fluade. It is faid to grow well near the fea, and that a plantation of thefe trees, at 50 feet afunder, with three fea-fallow thorns between every two of them, will make a fence fufficient to defend the herbage of the country again $f$ the fea fpray. Gent. Mag. 1757, p. 252. 'The wood is foft and very white, and is ufed by the turners. By boring a hole into the body of the tree, when the fap rifes in fpring, a fweetifh watery liquor is obtained, which is ufed in making wine, and, if infpiffated, affords a fine fugar. From the A. Sactharinum large quantities of fugar are amually thus made in North Americi. See United States, and Sugar.

1143. Celtis, or Lore, Netle-trce.

Three fpecies; viz. auflralis, occidentali, orienta. lis. S. Europe, Virginis, W. Indies.
3157. Gowana, or Cbaw-Aick.

One fpecie。; viz. domingenfis. Weft Indiés.
1332. Hermas.

Five fpecies; viz. depauperata, gigantea, capitata, quinquedentata, ciliat: C. of Good Hope.
1158. Mimosa, or Senfitive Plant.

53 Species; viz. fimplicifolia, inga, fagifolia, nodolì, natans, begemina, unguis-cati, tergemina, latifolia, purpurea, reticulata, viva, circinalis, cinerea, cafta, lenfitiva, pudica, entada, fcandens, plena, virgat.d, punctata, pernambucana, arborea, lebbeck, odoratifima, ipeciola, vaga, latifiliqua, polyflachya, muricata, peregrina, glauca, cinerea, cornigera, catechu, horrida, eburnea, latronum, tortuofa, farnefiana, nilotica, pigra, afperata, fenegal, cæfia, pinnata, intfia, femifpinofa, quadrivalvis, tenuifolia, ceratonia, tamarindifolia. Egypt, E. and W. Indies, New Holland. -The plants of this genus poffefs the fingular property of frinking or drawing in their leaves, when touched, which has obtained for them the Englifh appellation of fenflive plants. From the fpecies M. catechu a vezetable extract is obtained, which las long improperly rectived the appellation of terra japonica or Japan earth. 'This extract is outwardly of a reddifh colour, internally of a dark brown, with a flight caft of red. It is capable of beirig reduced to the flate of a powder; and is a mild but powerful aftringent. It is particularly ufeful in alvine fluxes; and where thefe require aftringents, no one is to beneficial. It is likewife employed in uterine profluvia, and in laxity and debility of the vifcera in general. It is often fuffered to difoive leifurely in the mouth, as a topical aftrin. gent, for laxities and exulcerations of the gums, for apthous ulcers in the mouth, and fimilar affections: and it is in fome other cafes applied externally under the form of folution, and as an ointment. Catechu diffolves in water, with the exception of its impurities, which amount to an eighth part of the mals. Rectified fpirit diffolves feven-eighths of the pure matter into a red liquor, leaving, undiffolved, an infipid mucilaginous fubftance. The beft form of adminiftering it is that of fimple infufion in warm water, with the addition of fome cinnamon or caffia. From the M. nilotica gum arabic exudes, the ufes of which are well known to be extremely numerous. The infpiffated joice of the unripe fruit of this tree is termed acacia, and is ufed as a mild aftringent medicine.

## Order II. dicecia.

## 1159. Gleditsia, or Three-borned Acacia.

Two fpccies; viz. triacanthos, inermis. Java. N. America.

## 1160. Fraxinus, or A/betree.

Three fpecies; viz. *excelfior, ornus, americana. S. Europe, N. America.

* F. leafets ferrated; flowers without petals.-It floutilles beft in groves, but grows in a fich foil, though in the open feld. It bears tranfplanting and lopping. Horfes, cows, flcep, and goats, eat it ; but it is faid
to fpoil the milk of cows. It will give a good, though not a beautiful green, to cloths that have been dyed blue. The wood is nearly as good when young as when old. It is hard and tough, and much ufed to make the tools employed in hulbandry. The bark is ufed to tan calf-ikin. An infufion of the leaves, from half an ounce to an ounce, is a very good purge; and a decoction of two drams of the bask, or of fix drams of the leaves, has been ufed to cure agues.

1161. Diospyros, or Indian Date-plum.

Five fpecies; viz. lotus, virginiana, kaki, hirfuta, ebenum. Italy, Barbary, Ceylon, N. America, Japan.

1163 . Nyssa, or Tupelo-tree.
One fpecies; viz. aquatica. N. America.
1164. Anthospermum, or Amber-trce.

Three fecies; viz. æthiopicum, ciliare, herbaceum. C. of G. Hope.

> j336. Stileb.

Three fpecies; viz. pinaftra, ericoides, cernua. C. of $G$. Hope.

1165 . Arctopus.
One fecies; viz. tchinatus. C. of G. Hope.
い62. Pisonia, or Fingrido.
Two fecies; viz. aculeata, inermi.. W. Indies.
1166. Panax, or Ginfeng.

Five โpecies; viz. quinquefolium, trifolium, fpinofa, arborea, froticofum. China, North America, Welt Indies.-The root of the P. quinquefolium is the ginfeng of the Chinefe, of which they have an extraordinaty opinion, regarding it as an univerfal reftorative in all decays from age, intemperance, or difeafe. It is alfo found in North America, and frequently exported from thence to Clina. It has a very fweet tafte, accompanied with a flight bitternefs and warmth.
1335. Chrysitrix.

One fpecies ; viz. capenfis. C. of G. Hupe.

## Order III. Tricecia.

1168. Ceratonia, or Crab-tree, St Yolon's Bread.

One fpecies; viz. filiqua. Spain, Sicily, Levant, Chili.
1168. Ficus, or Fig-tree.

15 Species; viz. carica, fycamorus, religiofa, benjamina, benghalenfis, indica, racemofa, pertufa, pumila, toxicaria, maculata, trigona, hifpida, heterophylla, microcarpa. S. Europe, India, China, America.-The dried fruit of the F. carica, or ordinary fig-tree, is fometimes ufed in medicine as a foft emollient fueet fubtance. It is moch efleemed by lome as a fuppurative; in which cafe it is applied as warm as it can well be endured.

## In the clafs Poljamiata are

34 Gencra, including 222 Species, of which 15 are found in Britain.

CLASSIS XXIV.

* A. A fpot occupying the whole difc.
* P. Diftinct dots on the difc.

N $\mathrm{n}_{2}$
1176.
(o) This clafs contains a number of vegetables whofe ftamens and piftils are too minute to admit of that mode of inveftigation which prevails through the preceding claffes. The Aruafure too of thefe vegetables differs confiderably from that of other plants.

The Filices or Ferns conftitute the firf order. Their flowers are generally difpofed in fpoty or lines on the under furface of the leaves, but fometimes in fpikes. In the male flowers the anthers are found fittirg or fupported on a very hort filament, egg-haped or globular, fcattered on the under furface of the leaves. The male flowers unite fo as to form a fike or bunch, or form lines or dots underncath the leaves, either on the furface at the edge, or at the point. In fome cafes they entirely cover the under furface, None of the flowers have any corolla, or even a calyx, excepting perhaps a fcale formed from the leaf, opening, containing globales. The feeds are very minute, and globular.

The fecond order, called Mufci or Mofer, have the female parts of fructification inclofed in a veil, which adheres to the top of the ripe capfule, and covers it. Capfule opening tranfverfely. Stems leafy. Leaves membranaccous, reticulated; after being dead, reviving when foaked in water. In general the ftamens and pifils are on feparate flowers on the fame or dillinct plants.

The third order, or Alge, includes a divifion of plants which fcarcely admit of a diftinetion of root, ftem, and leaf; much lefs can the parts of their flowers be defcribed. Their fubitance is fleh-like or leather-like, membranaceous or fibrous, jelly-like or horn-like, or refembling calcareous earth. The femalc fructifications are either found in faucers or tubercles, as in lichens; in hollow bladders, as in fucus; or difperfed through the fubflance of the plant, as in ulva. The aquatic genera, which grow on the fea-coaft, are called, in ordinary language, fen-zvecds, or fen-ware, and, by incineration, produce foda or mineral alkali. The lichens are of much importance in the economy of nature. They grow on the bareft rocks, and their remains form a foil on which better vegetables afterwards flourifh. Some of them afford valuable colours.

The order of Fungi, or Mufbrooms, confifts of plants moftly of a cork-like texture, and Chort duration, bearing their feeds either in gills or tubes, or attached to fibres or to a fpongy fubftance. As little is known of their fructification, the generic charaters are taken from their external form.

## if=6. Hemionitis. Lineæ difi decuffanteq.

* 1178 . Asplenium. Lineæ difci fubparallciæ, varix.
* ri75. Blechnum. Lineæ difci coftreutrinque adjacentes.

* T. A. gelatinous.
* U. A. membrannus.
* F. A. ieather-like.
* C. A. capillary.

## Order IV. FUNGI.

## Sect. I. Witb a cap.

* A. Cap gilled underneath.
* B. Cap porous underneath.
* H. Cap prickly underneath.
* P. Cap fmooth beneath,

## Sect. II. Without a cap.

* C. F. latticed.
* H. F. turban-fhaped.
* P. F. bell-hhaped.
* C. F. oblosig.
* L. F. globalar.
* M. F. little bladders on a pillar.

Without reciting the names of the fpecies of this clafs, we fhall fate their numbers, and fuch circumftances relative to particular kinds of plants belonging to it as feem molt worthy of attention.

## Order I. FERNS.

1169. Equisetum.

Seven fpecies; of which fix are Britifh.
byemale.

* E. ftem naked, rough, fomewhat branched at the bafe. Rough borfetail, ßave-grafs, pewter-wort, Dutch ru/bes. -The turners or cabinet-makers ufe it to polihh their work. It is faid to be wholefome to horfes, but hurtful to cows. Sheep dillike it.

1222. Cycas, or Todda Pana. Two fpecies. E. Indies, China, Japan.
1223. Zamia.

Two fpecies. Cape, E. Florida, W. Indies,
1170. Onoclea, or Senflble Fern.

Two fpecies. N. America.
1171. Ophioglossum, or Alder's Tongue.

Nine fpecies; one Britifh. Europe, Eaft and Weft Indies, America.

1:72. Osmunds, or Flowering-fern.
21 fpecies; 4 Britifh. Europe, America.
1173. Acrostichum, or Forked-fern.

35 fpecies; 2 Britif. Europe, Africa, America.
1179. Polypodium, or Polypody.

78 \{pecies; 18 Britilh. Europe, Madeira, India, America.
filix-mas. * P. leaves almoft doubly winged; leafets ftarp-fpearthaped; ftem and midribs chaffy. Male fern, male
polypody.-The Siberians boil it in their ale, and are fond of the flavour it imparts. The powder of the root is a remedy for expelling the tape-worm. A liquid lubricating fupper is given to the patient ; and, if coftive, a common glyfer. Early next morning two or three drams of the root in powder are mixed with water, and fwallowed. If thrown up, the dofe muft be repeated. The patient muft faft two hours, and then take a ftrong purge.

1if6. Hemionitis, or Mules-fern.
Four fpecies. Jamaica, South $A$ merica.
1ifs. Asplenium, or Spleenzort.
28 fpecies; 9 Britilh. Europe, Java, America.
1175. Blechnum.

Six fpecies; one Britufh. America, Cape, E. Indies,
1177. Lonchitis, or Rough Spleenzort.

Four fecies. Jamaica, South America.

> :17+. Pteris, Brakes or Female fern.

23 fpecics; two Britilh. Europe, E. and W. Indies, N. America, China.

* P. leaves more than doubly compound; leafets wing- aquilina.
ed; wings fear-fiaped; the lowermoit wing-cleft, the upper ones fmaller. - The common people in many parts of England mix the afhes with water, and form them into balls; thefe balls are afterwa:ds made hot in the fire, and then wfed to make an alk aline ley for foouring linen. It makes very durable thatch, and is excellent litter for horfes and cows. It affords a violent heat, and, where coal is licarce, is ufed to burn limeftone and heat ovens.

> il8o. Adiantum, or Mailen-bair.

27 fpecies; one Britith, Europe, Arrica, America.
1181. Trichomanes, or Tunbridge Mailen-bair. 13 fpecies; two Britifl. S. Europe, Cape, China, America.
if82. Marsilea.
Three fpecies. Siberia, France, Italy, S. Amer.
ri83. Pilularia, or Pepper-gra/s.
One fpecies; Britift.
1I84. Isoetes, or शuillwort.
Two fpecies ; one Britifl. Coromandel.

## Order II. MUSCI.

1185. Lycopodium, or Club-mo/s. 29 Species; three Britifh. E. and W. Indies, Madeira, America.

* L. leaves fcattered, terminating in threads; fpikes cylindrical, on fruitfalks, in pairs. Common club-mofs, Wolf's claw.-In Sweden they form it into mats or bafies, which lie at their doors to clean thoes upon. It reflores ropy wine in a few days. The feeds flain when caft into a flame, and are faid to be fometimes ufed in theatres to imitate lightning. They are with difficulty made wet, and if fcattered on a bafon of water, the hand may be dipped to the bottom without wetting it.
if86. Porella.
One fpecies. Pennfylvania.

1287. Sphagnum, or Bog-mofs.

Three fpecies; all found in Britain.
ifi. Splachnum, or Bollle-mofs.
13 Species; 12 Britifh. Europe.
1192. Polytrichum, or Golden Maiden-hair. 18 〔pecies; 16 Britilh. Jamaica, Magellan.
iif3. Mniun.
20 fpecies; all Britilh.
if89. Phascum.
13 fpecies; 1 I Britifh. Europe, N. America.
1194. Bryum.

93 fecies ; Britilh.
1195. Hypnum.

To fpecies; all Britift. W. Indies, \&cc.
1190. Fontinalis, or Water-mofs.

Si. Species; Britifl.

* F. capfules lateral ; leaves acute, keeled, doubled together, difpofed in three rows, Greater water-mofis -Contrary to the riature of all other moffes, this feecics is fcarctly combullible. Accordingly, the Scandinavians line the infide of their chimnics with it to defend them againt firc.

> m88. Buxbaumia.

Two fpecies; onc Britifh. Europe.

## Order III. ALG 压.

ifg8. Marchantia, or Liver-green.
Seven Species; five Britilh. N. America, W. Ind.
119G. Jungermannia, or Sur-lip.
48 fpecies; Britifh.

Two fpecies; Britifh. S. Europe.
1201. Anthoceros.

Three Species; two Britifh. N. Amer. Jam.
ij99. Blasia.
One fpecies; Britih.
1200. Riccia, or Marflo Liverwori.

Five fpecies; Britifı. Jamaica.

## 1202. Lichen, or Liverwort.

219 fpecies; all Britilh. Alfo Cape, India, America.

Lord Dundonald obtaired a patent, dated July 3 r . 1802, for the difcovery of a fubflitute for the forcign gums, to be obtained from the plants of this genus. The fpecification of his lordihip's patent is in thefe terms : "My invention confifts in procuring a fubfitute or fubltitutes for gum fenegal, or other gums, from the clafs of plants called in botany lichens; from the plants of hemp and flax, previous to being fleeped in water, or after being fleeped; likewife from the bark or rind of the willow or lime tree. The procefs for obtaining the gum may be varied accordirg to circumftances, and is done by wafhing the materials in water, digeftion, and boilings, and with or without the aid of fixed or volatile alkaline falts or their folutions.
" It does not appear, from fuch trials as I have hitherto made, that there is any very great difference of the produce of gum from the lichen collected from different trees or thrubs: all of them anfwer equally well for yielding a gum fit for calico-printing. The lichen is moft abundant on the trees which grow on a poor fiff clay foil, and particularly if fituated at fome confiderable height above fea level. It fhould be pulled in dry weather, otherwife it is apt to break in the pulling ; befides, in this cafe, requiring to be dried before it can with fafety be laid up in the forehoufe, where, if put in dry, it may be kept for years. Should a fufficient quantity of it not be found in this country, it may be had in almoft unlimited abundance in Sweden, Norway, and in the northern parts of America, where it grows to the length of from a foot to 18 inches, depreffing the branches of the tree by its weight. There is, however, every reafon to believe that a fufficient quantity is to be had in this country. Aceording to information received from botanifts, it takes three or four years in coming to maturity or its full fize; fo that a crop from the fame tree may be had every fourth year. The lichen does not confif entirely of a gummy matter ; there is the outer fim or cuticle, below that a green refinous matter. The remainder of the plant confifts of partly gum, partly fomewhat analogous to animal fubfances, and a fmall proportion of fibrous matter, which eannot be diffulved by boiling, or the action of alkaline falts.
"The firn procefs in preparing gum from the lichen, is to free it of the outer fkin of the plant and the refinous matter. This is doue by falding the lichen two or three times with boiling water, allowing it to remain folong in the water as by abforbing it to fwell; in doing this the Rin cracks, and comes off along with the greatel part of the refinous matter ; or it may be freed from them by gently boiling the lichen for about 15 or 20 minutes, then wafhing it in cold

## Cryptogamia.

water, laying it afterwards on a flone or brick floor, where it thould lie for 10 or 12 hourc, perhaps morc. The reafon for this is, that the expofure for that time to air, greatly facilitates the fubforquent extraction of the gum.
"The falded lichen is then to be put into a copper boiler, with a due proportion of water, fay threc Scots pints, or two wise gallons, to every pound of lichen, and boiled during 10 or 12 hours, adding about a quarter of an ounce of foda or pearl alles, for every pound of lichen; or intlead of thefe falts, about two ounces of volatile alkali. The boiling fhould be continued until the liquor acquires a confiderable degree of gummy confiftence. It is then to be taken out of the boiler, allowed to drain or dip through a wise or haircloth fearcc. The refiduum to be put into a haircloth bag or bags, and to be fqueczed in a prefs fimilar to that which is ufed by the melters or rinders of tallow.
"The firf boiling does not extract the whole of the gum. The lichen hould be boiled a fecond, or even a third time, repeating the procefs as above defcibed, diminithing at each procefs the quantity of water and the quantity of alkali, which a little experience will foon point out : when three boilingsare employed, the gummy extract of the latt boiling fhould be kept for the firft boiling of a frefh batch of lichen; the extratt proceeding from the firlt and fecond boilings hhould be mixed together, and evaporated to the confiftence neceflary for block or prefs printing. The evaporating veffels fhould be of tin or thin lead, placed over a range of foves, and moderately heated by fire, or the fteam of water. - It has been neglected to Atate, that before evaporating the gummy extract to the confiftence neceffary, it thould be kept 10 or 12 hours, fo as to allow the fediment or dregs to fubfide. The clean liquor may either be drawn of by a fyphon, or the dregs may be drawn off by a cock at the bottom of the wooden veffel; the bottom of which fhould be made floping, higher at the back than the fore part, in order that the dregs may run more completely off. The proportion of gummy matter remaining in the dregs may be got off by mixing them with a due proportion of boiling water, allowing the liquor to clear, and proceeding as above directed, employing this weak folution for boiling the next batch of lichen. When wolatile alkali is ufed, the boiler thould be of iron, as volatile alkali acts on copper. Hemp, flax, and the bark of the willow and lime trees, or fea weed, are to be heated in a fimilar manner, to extract the gum or mucilage contained in them. Likewife it is intended that this patent fhall include every tree, plant, or vegetable, of whatever kind, from whence a mucilage or gum is to be obtained by the action of volatile or fised alkaline falts, or their folutions, when ufed in the proceffes of maceration, digeftion, or boiling thefe vegetable matters; being a method of obtaining a mucilage or gum never before practifed and adopted by any other perfon."

The above invention was for fome time practifed to a great extent by the calico-printers in the weft of Scotland, where it was found to anfwer for almoft all colours. We have heard, however, that the ufe of it has been difcontinued; whether from the price of gum fenegal, for which it was employed as a fubflitute, ha-

A $\mathrm{N} \quad \mathrm{Y}$.
ving fallen, or that it has othersife failed of its cifect, we have not heen informed.

* T. tubercles black, crult clear whitc.-Grows only calcarcus. on limeftone rocks. When dritd, powdesed, anil Ileeped in urinc, it is ufed to dye fearlet by the Welfo and the inhabitants of the Orkneys. The colour is fiid to be very fine.
* L. faucers white, mealy, with yellowin white, thicle, parcllue. blunt borders; cruft yellow white.-Grows on rocks, walls, trunks of tree,, \&cc. Litmus is prepared from this fpecies. For this purpofe it is collected from the rocks in the north of England, and fent to London in cafk s .
* L. faucers yellow, with a white border; cruft whit-tartareus ih.-Grows on rucks and ftones. In Derbythire it is gathered for the dyers. It gives a purple colour.
* L. faucers dull purple; leaves hoary, fmooth, blunt, omptha-many-cleft, 〔prinkled with rifing dots. Cork, corkerlodes. or arcell. - It dyes wool a reddifh brown, or a dull but durable crimfon or purple, paler but more lating than that of orchal. In Ireland it is prepared by fteeping in tlale urine, adding a little falt to it, and making it up into balls with lime. Wool dyed with it, and then dipped in the blue vat, becomes of a beautiful purple. With rotten oak it makes a dark brown. It has been ufed as a ftyptic.
* L. tubercles brown; plant hoary, hollow, muchrangiferi branched; terminating branches turned downwards.-nus.
The Laplanders could not exif without this plant, which feeds, and even fattens, their rein-deer.
* L. plant lemon-coloured, upright, much branched; vulpinuso branches nearly of a length, angular; angles uniequal. - In Norway they mix this plant with powdered glafs, and frew it upon dead carcafes to poifon wolves.
* L. \{aucers brown, white on the outfide, on pedicles;prumafira. foliage nearly white, quite white and cottony underneath; pitted rather than upright.-It imbibes and retains odours in a remarkable degree, and is therefore the balis of many perfumed powders.
* L. faucers red brown, moftly on the edges of the fo-pulnonaliage; leaves green, jaxged, blunt, fmooth; pitted, rius. downy underneath. Lungwort, bazel-rar or bazd-croiles.- It is recommended for confumptive cales. Woollen cloth, boiled in it, is faid to become of a durable orange. In Herefordhire it is ufed to dye ftockings of a durable brown.
* L. faucers red brown; foliage pale green, wrinkled, caperatus, waved at the edge, creeping.-In Ireland atid the Ithe of Man, it is ufed to dye wool of an orange colour. Serge, dyed with it, becomes of a lemon colour; but, if previoufly infufed and boiled in urine, of a rufiet brown.
* L. faucers black, flattifi; foliage gray brown, corifift-puffulatus. ing of a fingle leaf, circular, flightly lobed. ©prinkled with a black bran-like powder; pitted underneath.A beautiful red colour may be prepared from it (Linneus). It may be converted into an exceedingly bl:ck pairit.

1208. Byssus.

12 \{pecies; Britifh.
120.4. Tremella, or Star-jclly.

19 fpecies; Britifh.
1206. Ulva, ot Laver.
14. fpecies; Britifl.
1205. Fucus, or Wrack, Sea-wced. 85 fpecies; Britith.
1207. Conferva, or Crazu-fike. 53 frecies; Britih.

Order IV. FUNGI.
1209. Agaricus, or Agaric. 278 fpecies; Pritifh.
1210. Boletus.

50 fpecies ; Britifl. China, America.
121. Hydnum.

11 fpecies; Britifh. N. America, W. Indics.
1212. Phallus, or Stink-borns.

Four fecies ; three Britith.
1213. Clathrus.

Four fpecies. S. Europe.
1214. Helvella, or Turban-top.

13 fpecies; Brition.
1215. Peziza, or Cup-mufloroom.

39 fpecies ; Britith.
1216. Clavaria, or Club-mufloroom.

24 Species; Butifh.
1217. Lycoperdon, or Trufle, Puff-ball.

25 fpecies; Britih.
1218. Mucor, or Mould.

17 fpecies; Britifh.

(p) Thefe, though capable of being arranged in the feveral claffes of the fyftem, yet on account of their fingul.r Itructure, have been placed in an appendix, containing fuch genera as have a fpadix and fpatha, i. e. whofe flowers and fruit are produced on that particular receptacle or feat called a Spadix, protruded fiona a common calyx in form of a fleath called Jpatha. This order confifts of trees and flrubs only. Thefe have always a fimple fem, nut branched, bearing leaves at the top, refembling thofe of fern, being a compofition of a leaf and a branch, called frondes; and the corolla hath always three petals, or three decp divifions. The known genera arc to in number.
1219. Chamerops, or Duarf Palm, Palmetro. Two lipecies; viz. humilis, cxcella. S. Europe.
s220. Borassus, or Fan Palm.
One fpccies; viz. Habelliformis. Malabar.
1221. Coryplia, or Mountain Palm.

Two fqecies; viz. umbraculifera, minor.
E. Indies, Carolina.
1223. Cocos, or Cocon-nul Tree.

Three fpecies; viz. nucifera, butyracea, guineenfis, Guinea, E. and W. Indies.-This tree is well known on account of the rich milky juice that its nut contains. The fuecies, llyled butyracea, yields what is called palno oil. This oil, as brought to us from the Weat Indies and Africa, is about the confiftence of an ointment, and of an orange colour. It has a ftrong, not difagreeable fmell, but very little tafte. By long keeping it lofes its high colour, and becomes white, when it ought to be rejected as no longer fit for ufe. The inhabitants of the Guinea coalt are faid to make this oil part of their food, and to cmploy it for the fame purpofes as we do butter. With us it is rarely given inwardly, and ufed only in fome external applications for pains and weakneffes of the rerves, cramps, fprains, and the like. The common people apply it for the cure of chilblains; and when early made ufe of, not without fuccefs.
1224. Phoenix, or Common Palm, Datc-tree.

One fpecies; viz. dactylifera. Levant, IndiaDates, the fruit of this tree, are imported into Britain in the flate of a half-dried fruit, about the fize of an acorn, but generally larger, confifting of a fweet pulpy part, and a hard ftone: the beft are brought from Tunis. They were formerly ufed in pectoral decoctions; and fuppofed, beffdes their emollient atd incrafiating virtue, to have a flight aftringency. They form the principal part of the food of the inhabitants of fome of the oafes, or inhabited fpots, of the great African defert.

> 1284. Elefis.

One fpecies; viz. guineenfis. Guinea.
1225. Areca, or Cabbage-tree.

Two fpecies; viz. catechu, oleracea. E. and W. Ind.

## HISTORY OF BOTANY.

HAVING thas fated the botanical arrangenient contrived by Linnaus, which proceeds upon the fuppofition of the exiftence of a fexual fyftem in the vegetable world ; we proceed to take notice of fume other important circumfances conne e ed with this branch of fcience, more particularly its hiftory, and the natural orders, as oppofid to the above artificial claffification of plants.

## Sect. I. Ancient Writcrs upon Botany.

The origin of this fcience, like that of moft others, cannot be found out from the moll ancient hiftories; but it is very probable, that fome degree of botanical knowledge has exifted in every age of the world. The firft botanical writings of which we have any account

Vol. IV. Part I.
are thofe of Solomon, who we are informed by Scripture wrote a treatife upon this fubject; which, however, is abfolutely loft, not being quoted by any ancient author, nor the leaf fragment of it remaining. Among the Greeks, Anaxagoras, Pythagoras, and other ancient philofophers, wrote treatifes on plants; but their works are alfo loft : and from the quotations that yet remain in the works of Theophraftus, Diofcorides, and Pliny, we learn, that thofe firft botanical writings could conrey but very little information.

The hiftorical ara of botany, therefore, commences with Theophraflus the difciple of Arifotle. He was born at Erefium, in the illand of Lefbos; and flourilhed in the third century before the Chiftian sera, being about 100 years pofterior to Hippocrates. His work is entitled The Hifory of Planks, and treats of their

Oo origin,
origin, proplation, anatomy, and conftruction; of vegetable life, and of vegetatior. It confilled originally of ten books; but of which only nine are nuw extant. In thefe, vegetables are difributed into feven claffes or primary divifions; which have for their object, the generations of plants; their place of growth; thair fize, as trees and Mirubs; their ufe, as pot.herbs, and efculent graius; and their lastefcence, ar the liquar, of whatever colour, that flows from plants when cut. In his work, above 500 different plants are defcribed.

The next botanif of any note was Diofcorides, a Grecian by birth, but under the Roman empire, being near 300 years pofterior to Theophrallus. He deforibe about 600 plants; and thefe he has arranged, from their ufes in medicine and domeflic cconomy, into four claffes, which are thus defigned: aromatics; alimentary vegetables, or fuch as ferve for food; medicinal, and vinous plants.

Almoft cotemporary with Diofcorides flourifhed Antonius Mufa, Cato, Varro, Virgil, and Columella; the f.rl, author of a treatife ftill cxtant on the plant lectony; the four others celebrated for their ufeful tracts on agriculture and rural economy.

Pliny the Elder, in his voluminous work entitled The Hiffory of the World, hath a botanical patt which is contained in 15 book?. In thefe, befides the plants of Theopbraftus and Diofcorides, he has given defcriptions of feveral new fpecies, extracted probahly from works which would otherwife have been totally lon. pliny ufes fearce any mode of arrangement, except the ancient, but very incorrect, dillinction into trees, forubs, and herbs. His plan, however, extends not only to botanical diffinctions, but to gardening, agriculture, and whatever is connefted either more nearly or remotely with the fcience of plants. He gives defcriptiuns of above 1000 different fpecies; but from the want of a proper fyttematic arrangement, it is often difficult, and perhaps impofible, to determine what plants he or other ancient botanifts do really defcribe.

This want of precifion in properly arranging their plants was the reafon why the botany of the ancients was always very limited, and after the time of Pliny declined fo rapidly. On the deftruction of the weflern empire by the Goths and other barbarous nations, it is not to be thought that botany could furvive any more than the other fciences. It was not till near the clofe of the eighth century, that the ancient botany began again to appear in Arabia. Serapion, well known in medicine, ftands firf in the Arabian catalogue of botanills; to him fucceeded Razis, Avicenna, Averrhoes. Actuarius, \&c. An authar known by the name of Plato, Apuleius, or Apolienfis, of whofe lierbarium very old manufeript copies are pecferved in fome curious librarieg, is fuppofed to have lived near this period. The works of moll of thefe botanills, however, were only tranflations and compilations from the Greek writers: So that, for want of a proper fyltematic arrangement, the feience furk a fecund time into total oblivion. For near 403 years after $A$ benguefit, an Arabiant phyfirim wha flourifled in the end of the 12 th century, farce any attempts were made in the botanical way. Some obfeure writers indecd appeared in feveral parts of Earope; as Armoldus de Ville Nova; Platearius; Matheus Sylvaticus; and Bartholomew Glanvil,

A N Y.
commenly called Buriholomers Anglus, a Fiancifcan monk, defcended of the family of the carls of Suffulk, who lived in the reign of King Edward lil. and wrote a boak of natural hillory, entitled De proprietatilus rerum, which was tranlated ino Englilh by John de Trevifa in 1398; but though all thefe wrote of plants, they were lo totally deftitute of method, that their works remain one great chaos, from whence it is impoffible tu cxtract any thing intelligible.

On the revival of letters in the begiming of the $16 \%$ century, the botany of the ancients was reftored a fecond time. The Gieck writings were tranflated into Latin, the common language of Europe. Gaza, a Greek refugee at Rome, made elegant tranflations of Arifotle and Theophraflus, who afterwards were commented upon by Scaliger and Stapel. Diofcorides was alfo tranllated and commented on. His beft commentators are Hermolaus Barbarus, Fuchfcius, Ruellus Cordus, Gefner, and Matthiolus. 'Ihe moll diflinguifhed commentators on Pliny are Dalechamp in 1604, Salmafius in y 689 , Harduin and Guilandinus. Meurfius and Urfinus have written commentaries upon Cato; Campegius and Monardes upon Mefue the Arabian, and Lonicer upon Avicenna. This latt hath been tranflated by feveral writers, particulaly Alpagus, Coftrus, and Plempius into Latin; and by one writer, Amalthrus, into Hebrew.

Hieronymus Bock, or Bouc, a German, generally known by the name of Tragus, is the firf modern who has given a methodical diftribution of vegetables. In 1532, he publifhed a Hiftory of Plants, in which he delcribes 800 \{pecies; and thefe he divides into three claffes, founded on the qualities of vegetables, their figure, habit and fizc. The fame method of arrangement was followed by Lonicer, Dodonxus, L'O'el, Clufius, Brunsfelfius, Monardes, Cordus, and fome other botanists of this period. How far fuch a method was deficient, thall be confidesed in the following fection; honever, it was not till 1560 that Cunad Gefner firft propufed to the world an arrangement of vegetables from the parts of the flower and fruit. He did not efiablith any plan founded upon this principle; but having fuggefted the i'ea, lett the application to be made by ousers: and in 1582, Dr Andrew Calalpinus, phyfician at Pifi, and afierwards profeflor of botany at Parlua, fort availing himielf of the ingenuity of his predecefiar, propulcol a mothod of arrangement which has the fruit for its hafis; and thus gave origin to fyitematic botany, the fecond grand sera in the hiftory of that fcience.

Even this improved methad of Cefalpinus was not withuut very grat inconveniences, which thall be taken rotice of hercaiter. As it was, however, fogreatly fuperior to every thing that had happencd before, it might have been expected that the iearned would have immediately adupted it, and that all the former cquivocal and infufficient characters would have been rejected. But the fact was otherwife. Coefalpinus's mcthod of arrangement died with him; and it was not till near a century alter, that Dr Robert Morrifon of $A$ berdeen, attaching himfelf to the principles of Gefner and Codalpinus, re-eltablifhed fcientific arrangement upon a folid foundation; fu that, from being only the reforer of fyftem, he has been gencrally celehrated as its founder. In the long iaterval between Cefflpimus
nnd Morrifon flourifted fome eminent botanifts. The moft noted are, Dalechamp, author of A general Hiflory of Plants; Theodore, furnamed Taberncemontanus, and Thalins, two German writers; Porta, an lealian, famous for an arrangement of plants from their relations to the flars, to men, and other animals; P:ofper AI. pinus, author of a Catalogue of the Plants of Egypt; Tabius Columna, inventor of many of the botanical terims now ufed; the two Bauhins; Gerard, and Parkinfon; Zaluzianfki, a Pole, author of an arrangement from the qualities and habits of plants; Margrave and Pio, celebrated for their natural hiftory of Brazil; Hermandez, equally celebrated for his hifory of Mexico; Pdfieus, or Du Pas, author of an arrangement of plants from the time of thowering, of all charaders the molt uncertain and infufficient ; Johniton; Bontius, a Dutehman, author of a Natural Hiffory of the Eant Indies; Aldrovandus, the eelebrated naturalift ; and Rheede, governor of Malabar, and author of the wellknown Hortus Malabaricus.

The method propofed by Morrifon has the fruit for its bafis, as well as that of Cæfalpinus; to which, however, it is greatly inferior both in the plan and execution. It is indeed of all others the moll difficult in practice, and was therefore not adopted by any fucceeding writer, except Bobart, who in 1669 completed Morrifon's Univerfal Hillory of Plants, and an anonymous author whofe work appeared in 1720 . Imperfect, however, as his method is, it furnifhed many ufeful hints, which fucceeding botanifts have not failed to improve. Ray and Tournefort have owed him much, and are not athamed to own the obligation. The fame has been done even by Linnæus; who hath eftablifhed the fcience of botany on the moft folid foundation, by introducing a method of arrangement, if not abfolutely perfect, at leaft as nearly approaching to perfection as can be expected; and whieh therefore hath been defervedly followed, in preference to every other, by all botanifts, fince its firft publication. But to give a particular account of all the different botanical fyftems, with the particular advantages and difadvantages attending each, fhall be the bufinefs of the fubfequent fections.

## Sect. II. Of the Ancient Metbod of arranging Vegetables.

jefects of the arrangement of Diofco. sides.

In giving an account of the works of Theophraflus and Diufeorides, we have already taken nutice that the former chofe feven diftinguifhing characters, viz. the generation of plants; their place of growth; their fize, as trees and thrubs; their ufe, as pot herbs and efculent grains; and their lakefcence, or liquor that flows from them when cut. Dinfcorides divided them into aromatics, alimentary, medicinal, and vinous plants. The good properties of this method are, that the botanift as it were eomes to the point at once; and when he knows the plant, knows alfo its virtues and ufes, or at leaft part of them : but this convenience is greatly overbalanced by innumerable difadvantages ; for the qualities and virtues of plants are neither fixed and invariable, nor are they impreffed in legible charaters on the plants themfelves. The different parts of a plant often poffefs different and even oppofite virtues; fo that foppofing the virtues to be known, and applied to the
purpofe of vegetable arrangemen, thic root, nuaf fiequently fail mader one divifion, the leaves under a focond, and the llower and frumt under a third. Beader, if we tetlect that the fole end of fuch arrmgement is to facilitate the knowledge of plants to others, the infufficiency and even abfurdity of methods founder upon their virtucs will immediately appean. A fatk of vervain, for inltance, is prefented to me, which I am to inveftigate from a prefuppofed k:owledge of the virtucs of plants. Before I can lettle the clafs to whieh it Ielongs, I mult difcover whether or not it has the virtues belonging to any of the plants 1 know; and thin dif. covery being the refult of repeated experimerts on vad rious parts of the human body, may require many years for its accompliftoment.

The fame caufes which render methods founded on the virtues of plants unfavourable for the purpofe of inveftigation, mult evidently difqualify all their other variable quantities and accidents from having a place in a genuine fyflematic arrangement. The natale folunt of plants, which is one of 'Theopliraflus's divitions, af- Defeets of fords no better diftinctive eharacters than their powers Theoplraland virtues. Many countries as well as many foils pro. Atus'sarduce the fame individual plants. The fame fpecies rangement. which crown the mountains, frequently cover the fens; and plants which have long been reckoned the peculiar inhabitants of lome parts of $\Lambda$ lia and America, are now found to grow naturally in equal perfection in the very different climates of Lapland and Siberia. The fize of plants, which fuggetted the ancient divifion into trees and fhrubs, is no lefs an equivocal mark of dillinction than the circumftances already mentioned. The vine, which modern botanifls denominate a fhrub, was ranged by Theophraftus in his third elafs containing trees. In fact, every thing refpecting fize is fo much affected by differences of foil, climate, and culture, that the fame plant, in different circumflanees, fhall difter exeeedingly in height; and in a method founded upon the fize, would fometimes be ranged as a tree, aud fometimes as a fhrub, or even an under-hrub, according as it happens to exceed, equal, or fall thort of, a given dlandard. No lefs infufficient are chara\&terifical marks drawn from the colour, tafle, and fmell of plants. Of all the attributes of vegetahle nature, colour is perhaps the mofl inconflant. Heat, elimate, culture, foil, \&c. contribute to the production of endlefs diverfities of colour, and render the tratifition from one to another natural and eafy. Red and blue pafs cafily into white, white into purple, yellow into white, red into blue, blue into yellow, \&c. In the fame leaf or flower, different colours are frequently obferved. Variations too in point of colour are frequently obfcrved to take place not only in different individuals of the fame fpecies, but even in fimilar parts of the fame plant. Marvel of Peru and fweetwilliam produce flowers of nifferent colour upon the fame fatk. Objections equally valid lie againt charaferillical marks drawn from the tafe and fmell. The former varies in different individuals frem differences of age, and even in the fame individual at different times, according to the morbid or found llate of the organ. The latter is different in dif. ferent lubjects, and vaies in each; nor are the effluvid fent forth from the fame body always of cqual intenfity. In plants, tafe is fubjec to continual variations, from diferences of climate, foil, and culturc.

Garlic in fome climates, particularly in Greece, is faid to lofe its ranknefs; apples and pears, that grow naturally in the woods, are intolerably acid; celery and lettuce, which culture renders fweet and palatable, are in their wild uncultivated fate bitter, difagreeable, and in fome cafes roxious.

Thefe confiderations are abundantly fufficient to fhow the imperfection of the ancient fyltem of botany; and, indeed, confidering the vague and uncertain marks by which the ancients diftinguifhed one plant from another, we may rather wonder how fuch a fcience as botany came to have an exiftence among them, than that they arrived at no greater perfection in it, or fuffered it io foon to fall into oblivion.

Sect. III. Of the diferent Botanical SyRems from the
time of Gefuer to that of Iimnaus. time of Gefner to that of Limncus.

The infufficiency of the ancient botanical fy fem being fo fully flown in the lall fection, we think it needlefs to take much natice of the methods ufed by Tragus and his cotemporaries and followers. The vitues of plants being found an infufficient charảteriltic, fucceeding botanitts bad taken in the root, ftem, and leaves; but thefe being alfo found infufficient and variable, Gefner tuened his eye to the hower and fruit, as being the moft permanent and unchangeable parts of the plant. In propofing the parts of fructification, however, as the molt proper for arranging plants, he comnunicated no hints refpectiog the choice of fome of thefe parts in preference toothers. Each particular organ of the flower and fruit furniflies fufficient variety to lerve as the foundation of a method; but all of then
Cexalpinus, are not equally proper for this purpofe. Crelalpinus, the firt follower of Gefner, made a mitake in his choice, and took his diftinguifhing characteriftics only from the fruit. The parts of the flower, therefore, being $\mathrm{cm}-$ ployed by the firlt fyltematic writers only as fubaltern directions in finding out orders and genera, it is evident that the plant could not be fully invefligated for feveral months. Suppole a plant ripens its fruit in Oztober, and does not produce flowers till the following May: the clafs, upon infpection of the fruit in the month of Oetober, is immediately afeertained; but the plant frill remains unknown, and will contitue fo upwards of fix months after, if the characters of the order and genus have been made to depend on any part of the flower. Mcthods founded on the fruit have another inconvenience; plants contantly ripen their fruit in thefe countries where they grow natually, but not always in the countries to which they may be accidentally tranfported. So far from this, that many plants that are natives of a warm climate, neither ripen nor form fruit is a cold one. Few of the African, Afiatic, and Welt Indian plants produce fruit in Britain. A method, therefore, founded upon the fruit, could only facilitate the knowledge of fuch platits to the inbabitants of thofe countries where they grow: to the Englif botanift they could be of little or no fervice. The fame objection cannot reafonably be urged againft methods founded on the flower, fince the influence of climates much colder than that of Britain has not been able to deftroy the facuity of producing flowers in many, perhaps in moft, of the plants juft mentioned.

Crefalpinus fets out with an ancient difinction of

A $\mathrm{N} \quad \mathrm{Y}$.
vegetables, from their duration, into trees and herbs. With the former he combines thrubs; with the latter, under-lhrubs; and diftributes his plants into the 15 following clafles: 1. Trees with the germ (radiele or principle of life in the feed) on the point of the leed. 2. Trees with the germ on the bafe of the leed. 3. Herbs having oue feed only. 4. Herbs having two teeds. 5. Herbs having four feeds. 6. Herbs having many feeds. 7 . Herbs having one grain or kernel. 8. Herbs having one capfule, 9. Herbs having two capfules. 10. Herbs having fibrous rootc. 12. Herbs having buibous roots. 12. Herbs having fuccory or endive-like flowers. 13. Herbs having common fowers. 14 . Herb having feveral follicles or feed-bags. 150 Herbs having neither flower nor feed.

The inconveniences of this method have been already pointed out pretty fully, and will evidently appear upon an attempt to refer any common plant to one of the 15 above-mentioned claffes. Lis fections, orders, or fecondary divifions, are 47 in number, and depend upon a variety of parts and circumilances. The principal of thefe are, the difpofition, fituation, and figure of the Howers; the nature of the feed-vefiel, or cover of the feeds; the firuation of the radicle in the feed; the number of feed-lobes, or feminal leaves; the difpofition of the leaves, and colour of the flowers. The lactefcence too, or milkinefs, which is obferved in the compound Rlowers with flat florets, is made a characterific diftinction, and diferiminates the firf order of the 12 th clafs. Thus, in the firf fyftematic arrangenents, the characters of the clafles ouly were borrowed from the parts of fruelfication; while thole of the fubaltern divifions were numerous, and refpected cvery part of the plant; but that fuch divifions might be perfect, they thould be contlituted, like the clafies, from the moditications of a fingle part of the fructification.

The great object had in vicw by Morrifon, who comes Mortifon's next in order to Cifalpinus, was to invelligate the method. order of mature, not to fabricate an caly method of arranging plante. Hence his fyftem is devoid of uniformity, and clogged with a multiplicity of characters; his clafles are freņuently not fulficiently ditlinguifhed from one another, and the key of arrangement ieems totally lof. He fets ont with a divifion of plants from their conlifence, into ligneons or woody, and herbaceous. He founds his fyitem on the fruit, the corollze or blofloms, and the habit, of the plants. His claffes are as follows: 1. Trees. 2. Shrubs. 3. Under-lhrubs. 4. Herbs climbing. 5. Herbs leguminous or papilionaceous. G. Herbs podded. 7. Herbs tricapfular or with three capfules. 8. Herbs with four or five capfules. 9. Herbs corymbiferous. 10. Herbs having a milky juice, or downy tops. 11 . Herbs culmiferous, as graffes. 12. Herbs umbelliferous. 13. Herbs having three kernels. 14. Herbs having helinet-flaped floweas. 15. Herbs having many capfules. 1G. Herbs berrybearing. Herbs called capillary plants, as the fern kind. 18. Anomalous or irregular herbs.

Of thefe claffes, the fourth and eighth poffefs no ge. nuine diflinctive character; nor are the ninth and tenth claffes fulliciently ditinguithed; the fifteenth clafs is not fufficiently difinguilhed from the eighth nor the 16 h from the fourth. His fections or fecondary divifions, which are 108 in number, arife from the fio gure and fubflance of the fruit; the number of feeds,
leaves,
leaves, and petals; the figures of the root; the direction of the ftem; the colour of the Hlowers; the place of growth ; and, in one clafs, from the medicinal virtues of fome of the plants that compofe it.

Ia 1682 , Ray propofed his method to the world, two years after the publication of Morrifon':, which ferved in fome meafure as its batis. It confilted originally of the following 25 clafles: i. Trees. 2. Shrubs. 3. Herbs imperfect. 4, Herbs having no flowers. 5. Capillary plants. 6. Staminous herbs having only the ftamina. 7. Thofe having one naked leed. 8. Umbelliferous herbs. 9. Verticillated, amnular, or ringfhaped ones. 10. Rough-leaved plant:. it. Stellated or flar-llaped ones. 12. Apple-bearing herbs. 13. Ber-ry-bearing berbs. 14. Herbs having many pods. 15. Monopetalous uniform, or regular herbs. 16. Monopetalous irregular, or having different forms. $17 . \mathrm{Te}$ trapetalous, having large pods. i\&. Tetrapetalons, having fmall pods. 19. Papilionaccous. 20. Pentapetalous herbe. 21. Corns. 22. Graffec, 23. Grafsleafed plants. ${ }^{2} 4$. Bulbous-rooted plants. 25 . Plants near akin to the bulbous.

This method Ray carefully corrested and amended at different times; fo that the plan of arrangement which now bears the name of that author, and was firft publifhed in 1700, is entirely different from what had appeared in 1682. It now comfifts of 3,3 claffes. Their ditinguifhing marks are taken from the port or habit of the plants; their greater or lefs degree of perfection; their place of growth; the number of feed-lobes, or feminal leaves, petals, capfules, and feeu's; the fituation and difpofition of the flowers, fower-cup, and leaves; the abfence or prefence of the buds, Hower-cup, and petals; the fubitance of the leaves and fruit; and the difficulty of claffing certain plants. They are as follow: 1. Submarine. or fea plants. 2. Fung;. 3. Molles. 4. Capillary plants. 5. Thofe without petals. 6. Planipetalue, thofe with compound flowers; femillofculous, or half-florets. 7. Thofe with compound flowers radiated. 8. Thofe with compound flowers, Hofculous, or with whole florets. 9. Plants with one feed. 10. Plants umbellated. 11. Thafe ftellated or farfhaped. 12. Rough-leafed plants. 13 . Plants verticillate or whorled. I4. Thofe with many feeds. 15. Apple-bearing herbs. 16. Berry-bearing herbs. 17. Thole with many pods. 18. Monopetalous herbe. 19. Thofe with two and three petals. 20. Thofe with great and fmall, or long and fhort pods. 21. Leguminous plants. 22. Pentapetalous ones. 23. Bulbe, and bulbous-like plants. 24. Stamineous ones, or thofe having only the flamina. 25. Anomalous plants, or thofe of an uncertain family. 26. The palms. 27. Trees without petals. 28. Trees with an umbilicated fruit. 29. Trees with fruit not umbilicated. 30. Trees with a dry fruit. 31. Trees with podded fruit. 32. Anomalous or irregular trees.

The diftinction into herbs and trees with which Ray's method fets out, acknowledges a different, though not more certain principle than that of Calalpinus and Morrifon. The former, in making this diftinction, had an eye to the duration of the ftem; the latter, to its confiftence. Ray called in the buds as an auxiliary; and denominates trees, "all fuch plants as bear buds;" herbs "fuch as bear none." But againft this auxiliary there lies an unanfwerable objefion; namely, that
though all herbaceous plarits rife without buds, all trecs are not furnilied with them: many of the largeft trees in warm countries, and fome flrubby plan*s in coicry country, being totally deflitute of that fealy appearance which comituies the effence of a butl. In other refpects, it is evident that neither Mr Kay's plin now execution is in any degree calculated to faculitate the knowledge of plants. ln fact, it feems to bave been Ray's great object, no lefs than Morrifon's, to collect as many natural claffes as poffible; and thefe being leparately inveltigated, a muliiplicity of charaviers and lleps was neceftarily required to connect them: and hence the intricacy complained of in both the fe methods, which mult always take place where the clafles give rife to the connecting characters, not the charas ters to the clalles. The charakters of the orders, or fecondary divifions, in Ray's method, are no lefs multifarious than thofe of the clalles. They refpect the place of growth of plants; their qualities; the figure of the fem; the number, fituation, fubltance, and divifion, of the lcaves; the fituation and difpofition of the Howers and calyx; the number and regularity of the petals; with the number and figure of the fruit. In his improved method, Ray has adopted Tournefort's characters of the genera, wherever his plan would permit. His general Hiftory of Plants contains 18,655 fpecies, and varieties. The third volume, which was not publified till 1704, and was defigned as a fupplement to the two former, contains the plants difcovered by Tournefort in the Levant, and by Camelli at Luzon one of the Philippine illands. Ray's method was followed by Sir Hans Sloane, in his Natural Hiftory of Jamaica; by Petiver, in his Britift Herbal; by Dillenius, in his Synoplis of Britilh plants; and by Martin, in his Catalogue of plants that grow in the neighbourhood of Cambridge.
'To Ray's original method fucceeded that of Chrifto- Chrifopher plier Knaut, a German; which acknowledges the fame Kinaut's arprinciple, and is manifeftly founded upon it. In his rangemen. enumeration of the plants that grow round Hal in Saxony, publimed in $\mathbf{1} 687$, be divides vegetables inio 17 clafes, which have for their bafis the fize and duration of plants, the prefence or abfence of the petalc, the difpofision of the flowers, the fubfance of the fruit, the number of capfules or feeds, the number and figure of the petals and the prefence, abfence, or figure of the calyx. His claffes are, 1 . Herbs berry-bearing. 2. Aonopetalous, or with one flower-leaf. 3. Tetrapetalous and regular, with four petals. 4. Tetrapet.lous and irregular. 5. Pentapetalous, or with five petals. 6. Hexapetalous, or fix petals. 7. Polypetalous, or many petals. Multicapfular, or many capfule: 9. Naked feeds. 10. Solid, or not downy. i is. Duwny feeds. 12. Without petals. 13. Stamineous, without petals or calyx. 14. Imperceptible. ${ }^{25}$. Imperfeft. 16. Trees. 17. Shrubs.

The fections or fubdivifions of the claftes in Knau:"; method are 62 in number; and arife from the figure of the ftem and petals, the number of capfules and cells, their figure, the number of feeds and leaves, and fituation of the flower.

In 1696 , a new method, propofed by Dr Herman Herman $;$ profeffor of botany at Leyden was publilited by Zum- method. bac, who arranged according to it the plants contained in the public garden of Leyden. Rudbeckius the Younger, in a differtation publifhed the lume yest on
the fundamental knowledge of plants, adopted Herman's method, with a few inconfiderable variations. 'The clafles of Dr Herman are 25 in number. They are founded on the fize and duration of the plants; the prefence or abfence of the petals and calyx; the number of capfules, cells, alid naked feeds; the fubftance of the leaves and fruit; the form and confiftence of the roots; the fituation and difpofition of the flowers, leaves, and calyx; and figure of the fruit. 1. Herbs having one naked feed and a fimple flower. 2. Having one naked feed and a compound flower. 3. With two naked ferds, and ftellated or flar-fhaped. 4. Two maked feeds, and umbelliferons. 5. Four naked feeds, and rough leaves. 6. Four naked feeds, and verticiliated or whorl-flaped. 7. With many naked feeds. S. Having feed-veffels, bulbous and tuicapfular. 9. Having one feed. veffel. 10. With two feed-veffels. 11 . Winh three feed-veffels. 12. With four feed-veffels. 13. With five feed-veffels. 14. Podded, which are always tetrapetalous. 15. Leguminous and papilionaceous. 16. With many capfules. 17. Having flefhy fru:t, berry-bearing. 18. With Hefly-fruit, apple-bearing. 19. Without petals, but having a calyx. 20. Without petals, chaffy or flaminous. 21. Without petals, calvx, chaff, or flamina, i. e. a naked antherre, as the moffes. 22. Trees. Imperfect fructification, bearing catkins. 23. Trees with a flethy fruit umbilicated. 24. Tiees with a flefly fruit not umbilicated. 25 . Trees with a dry fruit.
The claffes in Herman's method are fubdivided into 82 fections or orders; which have for their bafis the number of petals, feeds, capfules, and cells, the figure of the feeds and petals, and difpofition of the flowers.

To the method of Dr Herman fucceeded that of Dr Boerhavee, who fucceeded to the botanical chair of Leyden in 1709 . His method is that of Herman, blended with part of the fyltems of Tournefort and Ray; and contains the following claffes. 1. Herbs fubmarine, or fea plants. 2. Imperfect land plants. 3. Capillary plants, or the fetn kind. 4. Many naked feeds. 5. Four naked feeds, and verticillated. 6. Your naked feeds, and rough leaves. 7. Four naked feeds, and four petals. 8. Plants having one feed-veffel. 9. Two feed-velfels. io. Three feed-veffels. in. Four feed-veffels. 12. Five feed-veffels. 13. Many feedveffels. 14. Two naked fceds, and umbelliferous. 15. Two naked feeds, and flar-fhaped, 16. One naked feed, and a fimple flower. 17. One naked feed and compound flowers femiflofculous. 18. One naked feed, and compound flowers radiated. 19. One n.ked feed, and compound flowers corymbiferous. 20. One naked feed, and compound flowers flofculous. 21. Berry. bearing herbs. 22. Apple-bearing herbs. 23. Without petals. 24. Onc cutyledon, and having petals. 25. One cotyledon, and without petals. 26. Tiees having onc cotyledon. 27. Many podded. 28. Podded. 29. Tetrapetalous and cruciform. SO. Leguminous. 31. Having no petals. 32 . liearing catkias. 33 . Munoprtalous flowers. 34. Rufacenns tlowers.

Thefe $3+$ claftes of Dr luecrhave are fubdivided ir.to 104 fections, which have for tiveir chatracters, the figure of the leaves, ftcm, calyx, petals, and feeds; the number of petals, feeds, and capfules; the fubltance of the leaves; the fituation of the flowe:s, and their diffe. werres in point of $\mathcal{f e x}$. By this method, Dr Boerhaave

A N N .
arranged near 6000 phants, the produce of the botanical garden at Leyden, which he carefully fuperintended for the fpace of 20 years, and left to his fucceffor Dr Adrien Ruyen, in a much more tlourifhing flate than he himfelf had received it. His Index or Catalogue of the Leyden plants was publillied in oflawo in 1710; and afterwards, with great additions, in quart., in 1720. This latt edition contans defriptions of 5650 plants; of which number upwards of two-thirds had Leen introduced into the garden fince the time of Herman, by his illuftrious fucceffor. Boerhave's characters are derived from the habit or general appearance of plants combined with all the parts of fructification 3 So that, as Linnæus very properly obferves, he was the firft who employed the calyx, ftamina, and Ayle, in determining the genus. About 17 new genera werc eftablifhed by this author; among others, the very fplendid family of the protea and filver tree, which, although partly defcribed by Morrifon, had remained gencrally unknown till this period. His method was adopted by one Emning, a German, in a treatife called The firf Principle of Botany, publifhed in oclavo at Wolfenbuttle, in 1748.
Hitherto all the botanifts had been intent upon inve-Rivinus's fligating the order of nature, sather than facilitating methorl. the arrangement of vegetables; therefore their methods wete very intricate and perplexed; and their writinas, however entertaining to the learned, could afford but very little inffruction to the young botanif. In 1690 , however, Augullus Quirinus Rivinus, a German, profefior of botany at Leipfic, relinquifing the purfuit of natural affinities, and convinced of the infufficiency of characteriftic marks drawn only from the fruit, attached himfelf to the flower, which, he was fenfible, would furnifi characters no lefs numerous, permanent, and confpicuous, than thofe drawn from the fruit. The calyx, petals, Atamina, and fiyle, or pointal, whichs conflitute the flower, are fufficiently diverffied in point of number, figure, proportion, and fituation, to ferve as the bafis of a mode of arrangement; yet all are not equally proper for this purpole. Rivinus made ufe of the petals as the largelt and moft beautiful part, and that from which the flower itfelf is commonly characterized. His method confifts in the fullowing 18 claffes, which have for their bafis the perfection and difpofition of the Howers, and segularity and number of the petals. 1. Regular monopetaluus, or having one petal. 2. Dipetalous. 3. Tripetaluus. 4. Tetrapetalous. 5. Pentapetalous. 6. Hexapetalous. 7. Pulypetalous, or having many petals. 8. Ir regular monopetalous. 9. Irregular dipetalous. 10. Ir regular tripetalous. 11. Irregular tetrapetalous. 12. Irregular pentapetalous. 13. Irregular hexapetalous. 14. Irregular polypetalnus. 15. Compound flowers of regular florets. 16. Compound flowers of regular and irregular florets. 17. Conpound flowers of irregular filucts only. 18. Incomplete, or imperfect plants.
A. Rivinus fet out with the profffed defign of imparting facility to untany, he judered vely properly in divelting his method of all extrancous matter, and rendering it as fimple and uniform as the nature of the fcience would admit. The diflindtion into herbs and trees had been adopted hy eveiy writer on plants fince the time of Arifotle. Rendered in fome meafure facred by its antiquity, this diftinction maintaincd a kind
of importance to which it was by no means effentially entitled. Rivinus was the frle who in this matter dired to think for himlelf. He was early ferfible of the ineonveniences to which thofe had fubmitted who employed it as a primary divifion; and therefore refolved at once to get rid of a dithation that is frequenty uncertain, always deilrudive to uniformity, and in its mature repugnant to the genuine fpirit of lyltem, becaufe totally unconnested with the prest of fructification. In the miformity of its orders or lecomlary divifons, which are 9: in number, and acknowledge the fruit for their principle, Rivinus's method equals, perlaps excels, all that went beforc or fucceeded it. Only threc clafies of his methot were publified by Rivinus himfelf. Thefe are the $1 \mathrm{Ith}^{2} 14$ th, and 15 th, which were offered to the public at different times, illuftrated with very fplendid figures. The method was completed and publifhed entire by IIcucher, in a work entitled Hortus Wirtenbergenfis, printed in quarto at Wirtenberg in 1711.

Several German authors have followed Rivinus's method, either whoily or in pert, without offering any confiderable amendment. 'The principal of thefe are, Koenig, in a work on vegetables, publifhed at Bafil in 1696; Welch, in his Ba/ts Bolanica, pinted at Leipfic in octavo, in 1697; Gemeinhart, in a catalogue of plants publiffed in $\mathbf{5} 725$; Kiramer, in a work entitled Tentamen Botanicum, publilhed at Drefden in 1728, and afterwards reprinted with additions at Vienna in 174.; and Hecker in a dillertation on botany publihed at Hal in Saxony, in 1734 . To thefe may be adL'ed Hebenfteit, an ingenious botanif, who in a treatife on plants publifhed at Leipfic in 1731, jult before his famous Atican expedition, eftablithed generical characters, which had hitherto been wanting in Rivinus's method.
The writers who have attempted to improve upon Rivinus's method are Bernard Ruppius, Chrifiopher Lustwiz, and Corillian Knaut. Ruppius, in his Flora Fenenfis, publifhed at Francfort in 1718 , has arranged the 1250 plants there deferived by a method partly Rivinus's and partly his own. It confuls of 17 clafles, and fets out with the fame divifions and fubdivifions as that of Rivinus's; with this difference, however, that, whereas in Rivinus's method all perfect flowers are divided into fimple and compound, is Ruppius the divifion of regular and irregular flowers precedes that juft mentioned, and fimple and compound thowers are made fubdivifions of the regular flowers only.

Chriftopher Ludwiy's mothod which was publifhed in 1737, and confifts of 20 clafles, differs but little from that of Rivinus. The author accompanied Heberiftreit on his expedition to Africa, and feems to have made plants his favourite fudy. The improvement, however, which he has made on Rivinus's plan, confilts oully in rendering it more univerfal, having enriched it with a multitude of genera collected from the works of Tournefort. Ray, Buerhave, Dillenius, and other eminent botanife, whofe generical charkters he has likewite adopted. His plan of arrangement has been followed by two fucceeding writers: MJ. Wedel, in a botznieal effiy publifhed in 1747 ; and three years after by M. Bochmer, in his catalogue of the plants which grow in the garden of Leipfic.

The method of Chriftian Knaut is much more pro-
perly his own, and departs in a much greater degree from that of Rivinus than either of the two former. 'lhe regularity and number of the petals furnifhed the clafical divifions in Rivinus's method: in that of Knaut, Chrifinn mumber takes place of ecgularity; fo that it is very pro-kimat's perly termed by Linnavis, "The fyftem of Rivinus in-mentiod. verted." "This method was puiblifted in 1716 ; and fets out with a divifion into tlowers which have one petal. and fuch as have more than one. It confills of the 17 following clafics. 1. Monopetaluus uniform or regular. 2. Monopetalous difform or irregular. 3. Monopetalous compound uniform or regular. 4. Monopetalous compound difform or irregular. 5. Monopetalous compound uniform and difform together. 6. Dipetalous uniform or regular. 7. Dipetalous difform or irregular. 8. Tripetalous minform or regular. 9. Tripeta. loun difform or irregular. 10. Tetrapetalous uniform or regular. 11. 'Tetrapetalous difform or irrezular. 12. Pentapetalous uniform or regular. 13. Pentapetalous difform on irregular. 14. Hexapetalous uniform or regular. 15. Hexapetalous difform or irregular. 16. Polypetalous uniform or regular. 17. Pulypetalous difform or irregular.

The fections or lecondary divifions in Knaut's method are 12t, and depend upon the internal divifions of the fruit; and upon this his opinions are fomervlat fingular. Every kind of fruit, whether pulpy or membranaceous, is termed by our author a capfille. Neither is the term reftricted to fruits properly fo called : it is extended alfo to thofe termed by botanifts naked feeds, the exiftence of which Knaut ablolutely denies. Agreeable to this opinion, capfules, he fays, with refceet to their conffifence or fubitance, are of two forts; pulpy, or membranaccous. 'The former correfpond to the fruits of the apple, berry, and cherry kind; the latter to the capfules properly fo called, and naked feeds of other botanits. Again, with refpect to their cells or internal divifons, capfules are either fimple or compound. Simple capfules have an undivided cavity or a fingle cell; compound eapfules are internally divided into two or more cells. With other botanifts, the umbelliferous towers bear two, the lip howers four, naked feeds; according to Knaut, the lormer projuce two, the later four, fimple caplules. Ranunculus, awonis, anemony, herb bennet, and fome other plants, have their flowers fucceeded by a number of naked feeds collected into an angregate or head; each of thele feeds pafies with Knaut for a fimple capfule; fo that the whole is an acgregate of feveral caplules with an undivided cavity or fingle cell. In numbering the cells or internal divitirns of the pulpy fruits, our author has adopted a very fingular methud. Some fruits of the apple kind enclote a capfule that is oivided into five membranceous ceils, it might then be very reatonably expected to find furh fruits arranged with $\mathrm{com}-$ pourd capfules of five cells: but, inftead of this, the author whimfic .Hy enough combines in their arrargement the idea both of a fimpie and compound cepfule. The pulpy part is undiviled; in uther wors, it is a firple caplule furaifued with one cell; the compound eaplule enclofed contains five cells, which added to that of the pulp mate the numoer tix; and thus thefe kinds of fruits are arranged with thofe having caplules of fix eells. By the lame kind of realoning, the truit of the doywood, which is of tise clicerry lisind, and contains a
ftone
fone with two cells or cavities, is placed by Knaut among compound capfules with three cells; the pulp paffing for one divifion, and cavities of the flone or nut for the remaining two. This method of calculation is not the only fingularity for which Knaut is remakable. The effence of the flower is made by Ray, Tournefort, Rivinus, and moft other botanifts, to confilt in the flamina and ftyle. This pofition Knaut abfolutely dunies; and has eftablifted for a principle, that the flower is effentially conftituted by the petals only. With him, the flower cup, flamina, and flyle, are of little fignificance: their prefence does not conflitute a flower, if the petals are wanting; neither is their abfence fufficient to deffroy its exifience, if the petals are prefent: from this it follows, 1. That there can be no flowers without petals; and, 2. That the regularity or irregularity of the flower can never depend on the flamina and fyle, which are only occafionally prefent, and nowife effential to its exiffence; both of which are evidently falfe to every botanical reader.

Since the time of Rivinus, no leading method in botany has appeared except that of Tournefort and Linnæus. Tournefort fets out with reviving the diftinctiun of plants into herbs and trees, which had been exploded by Rivinus. His fyltem is founded on the regularity and figure of the petals, together with the twofold fituation of the receptacle of the flowers; his orders, on the piflillum or caly:. The claffes are, 1. Herbs with fimple flowers monopetalous, and bellflaped. 2. Simple flowers monopetalous, funnel and wheel-thaped. 3 . Simple tlowers monopetalous, labiated or lipped. 4. Simple flowers monopetalous, anomalous or irregular. 5. Simple flowers polypetalous, cruciform or crofs-fhaped. 6. Sinuple flowers polypetalous, and rofaceous or role-like. 7. Simple tlowers polypetalous, umbellated. 8. Simple flowers polypetalous, caryophyllaceous, or clove-form. 9. Simple flowers polypetalous, liliaceous or lily-form, Io. Simple flowers polypetalous, papilionaceous, or butterfly-form. II. Simple Howers polypetalous, anomalous or irregular. 12. Compound flowers, flofculous, tubular or whole florets. 13. Compound flowers, femiflof fulous, flat or half florets. 14. Compound flowers radiated, like the fpokes of a wheel. 15. Apetalous, having no petals. 16. No flower, but bearing feed. 17. No flower nor fecd, in the vulgar eflimation. 18. Trees with no petale, but bare flamina. 19. Trees with no petals teasing catkins, 20. Trees monopetalous. 21 . Trees rofaceous. 22. Trees papilionactous.

The fecondary divifions in Tournefort's method, which are 122 in number, have obtained the name of fections. Their gencral difinctions are founded principally upon the fruit, as thofe of the claffes are upon the flower.

Tournefort hath heen followed by a vaft number of botanical writers, of thom the molt confiderable are, Dr William Sherard, an eminent botanift of the latt and prefent centuriec. In 1689 , he publifthed the firf fiketch of ''ournefort's method, under the title of Schola Branices; or a catalogue of the plants demonftrated by Dr Tournefort, in the royal garden at Paris. It was not till five years after, that the Elementa Botanica, a work which contains the rudiments and illuffration of his method, was publified by Toumefort himfelf.-

A $N \quad Y$.
Father Plumier, termed by way of eminence the Tournefort of America, publifled in 1703 , at Paris, a defcription of American plants, which he has arranged according to the fyltem of Tournefort. In this work he accurately characterized 96 new genera. Falugi, an Italian, has defcribed, in pretty elegant Latin verfe, all the genera of Tournefort, in a work entitled Profo. poporic Botanice, publified at Florence, $12 \mathrm{mo}, 1705$. Several celebrated French academicians, particularly Marchant, Dodart, Niffole, Joffieu, and Vaillant, have alfo occafionally paid their tribute of acknowledgment to this author, from the year 1700 to 1740 . The other authors of note who have followed Tournefort's method, are, M. Petit, an ingenious French botanif; Johren, a German, author of a treatife publifhed at Colberg in 1710, entitled Vade mecum Botanicum, Siu Odegus Botanicus; Fueille, in his defcription of the plants of Chili and Peru, publifhed at Paris in quarto, 1714; Clriftopher Valentin, a German author of a book entitled Tournefortius Contractus, publifhed at Francfort, in folio, 1715 ; Ripa, an Italian, in a work entitled Hiforia Univerfalis Plantarum ConforiLendi Propofitum, publifhed in 4to, at Padua, in 1718 ; Michael Yalentin, a German, in his Viridarium Reformatum, publifhed in folio, at Francfort, in 1719 ; the celebrated Dillenius, profeffor of botany at Oxford, and author of feveral much efteemed publications on botany, particularly the Hortus Elthamenfis, and Hillory of Moffes, in his Flora Giffemfis, printed at Francfort in 1719 ; Pontedera, an Italian, author of the delintation of a method which combines thofe of Tournefort and Rivinus, publithed at Padua, in his botanical difo fertations, in 1720 ; Monti, an Italian, in a work pub. lifhed at Bologna in $17^{2} 4$, under the title of Indiccs Plantarum Varii; Lindem, a German, in his Tournefortius Alfaticus, firf publifthed in 1728 ; Signior Micheli, author of feveral curious difooveries refpecting mofles and mufhrooms, in his Nova Genera Plantarum, publifhed in folio at Florence in 1729 ; Elvebemes, a Swede, in a work publifhed in the Swedifl language at Upfal in 1730 ; Fabricius, a German, author of a work entitled Primitia Flora Butibaconfis, fou fev Decades Plantarum Rarioram, publified in 1743; Sab. bati, an Italian, in his catalogue of the plants that grow in the neighbourhood of Rome, printed at Rome in 1745 ; and the ingenious 1) Charles Alfon, late profeflor of botany at Edinburgh, in his Tyrocinium Botanicum, publifhed at Edinburgh in $1753^{\circ}$

Of all this numerous liff of writcrs, Father Plumier Plumier's and Pontedera alone have ventured to quit the track nacthod. pointed out by Tournefort. The former, in his arrangement of American plants, has relinquifhed the diflinction into herbs and trees; but the latter has attempted more confiderable variations. His claffes are, 1. Uncortain. 2. Having no fowers. 3. Without buds, imperfect plants. 4. Anomalous or irregular. 5. Labiated. 6. Bell-fhaped. 7. Saucer-flaped. 8. Whecl-fhaped. y. Tunnel-fhaped. 10. Flofculons. 11. Semiffofculous. 12. Radiated. 13. Irregular. 14. Papilionaceous. 15. Liliaceous. 16. Caryophyllaceous. 17. Cruciform or crofs-liaped. 18. Umbellated. 19. Staminous, or with naked flamina. 20. Bearing buds apctalous, or withont petals. 21. Bearing buds irregular. 22. Bcaring buds bell-fhaped. 23. Bear-

Magnol's method.
ing buds wheel-flaped. $2_{4}$. Bearing buds tumelflaped. 25. Bearing buds papilionaceous. 26. Bearing buds rofaceous.

Befides all thefe methods, there have been invented two others, founded upon the caly.. The firft of thefe was the invention of Peter Magnol, a celebrated profeflor of botany at Montpellier, and publifhed in 1720 , five years after the author's death. The other was delineated by Linnæus, and publifhed in his Clafes Plantarum in 1738 , three years after the publication of the fexual lyftem. Magnol diftinguifhes two kinds of calys; one cxternal, which envelopes and fuftains the flower, and is the flower-cup properly fo called; the other internal, which is the feed-vefiel or fruit. According to this idea, all plants, whether herbaceous or woody, are furnihed with either the external calyx only, or with both. His claffes are, 1. Herbs with the calyx external, including a flower unknown. 2. Calyx external, including a flower ftaminous. 3. Calyx external, including a flower monopetalous. 4. Calyx external, including a flower polypetalous. 5. Calyx external, including a flower compound. 6. Calys external, fupporting a flower monopetalous. 7. Calyx external, fupporting a flower polypetalous. 8. Calyx internal only, which is the corolla. 9. Calyx external and internal, flower monopetalous. 10. Calyx external and internal, flower with two and three petals. II. Calyx external and internal, tetrapetalous. 12. Calyx external and internal, polypetalous. 13. Trees with the calyx external only. 14. Calys internal only. 15. Calyx external and internal both.

The characters of the orders, or fecondary divifions, in Magnol's method, are derived chiefly from the figure of the calys, petals, and feeds; from the difpofition of the flowers; from the number of petals, and fubflance of the fruit. Fifty-five fections or orders arife from the combination of thefe characters with thofe of the claffes; and thefe are again fubdivided into genera, which poffefs this fingularity, that, in place of diftinctive charaEters hitherto employed, they exhibit complete defcriptions of all the parts of fructification of one or two fpecies of each genus. From this improvement Linnæus manifeftly borrowed the hint of his generical characters.

Sir John Hill, in his Vegetable Syflem, endeavours to clafs plants according to their internal flructure *. "Perhaps (fays he), upon the foundation of a true anatomy of plants a natural method may be effablithed: for it is certain, the forms of all the external parts of vegetables depend on the difpofition of the internal ; and all their differences are founded there. On the different inner ftructure of the vegetable body, under certain courfes of its veffels, evidently depend the differences which characterize the feven firlt families, to the dillinctions of which all claffes are fubordinate; and as thefe original diflinctions are truly natural, we may here begin very fafely.
"The feven familics are thofe: 1. The muflaroons. 2. The algre, or foliaccous fea and land plants. 3. The mofles. 4. The ferns. 5. The grafleso 6. The palm. 7. The common race of plants. Their dillinctions one from another are thefe:
" I. The mulhrooms are flefyy and are deflitute of leaves and vilible flowers. 2. The alge are metely foliaceous, the entire plant confling of a leafy matter

Vos. IV. Part I.
without other vifible patts 3. The moffes have proceffes of the inner rind for leaves. 4. 'The ferns confilt of a fingle leaf raifed on a $\mathrm{flalk}_{\text {; }}$; and bear their flowers upon its back. 5. The graffes lreve jointed ftalks and undivided leaves, and hufks to hold the feed. 6. The palms have a fimple trunk, with leares only on the top, and have the flowers and fruit in divided ears."

Laflly, The feventh clafs, which he calls the con:mon race of plants, are fuch as have their roots, leaves, llalks, Howers and fruits, diflinct and obvious; and have not the characters of any of the other fix families.

To this natural method his artificial one, confifting of 43 claffes, and which takes up the whole of his voluminous work, is defigned only as an index; but as this is univerfally allowed to be inferior to Linnæus's, though he intends to improve that fyftem, we think it needlefs to take any further rootice of it.

Befides the fexual fyftem of Limnews, which is now Linnæu's almoft univerfally followed, he formed another, which, arrangelike that of Magnol, had the calyx for its bafis, but ment hy greatly fuperior both in the idea and execution, be the calys. ing indeed fingularly ferviceable to the nu...ce in bor tany, by familiarizing to him various appearances of an organ fo important in its nature, and fo diverfified in its form, as the calyx is. The claffes are, I. Spathaceous, like a fheath or hofe. 2. Glumofe or chaffy. 3. Amentaceous, or catkins. 4. Umbellated. 5 . Common calyx or flower-cup. 6. Double calyx. 7. Flowering ; the petals and flamina inferted into the flower-cup. 8. Crowned, or crown-hlaped, with a radius. 9. Irregular. 10. Difform, or different thapes. 11. Caducous, which fall off or fled their leaves. 12 Not caducous, uniform and monopetalous. 13. Not caducous, uniform and polypetalous. 14. Not caducous, difform and monopetalous. 15. Not caducous, difform and polypetalous. 16. Incomplete calys. $1 \%$ Apctalous, or a bare calys without petals. is. Na. ked, or neither petals nor calys.

## Sect. IV. Of the Sexes of Plants.

As many philofophers and botanilts deny that fuch a thing as the diftinction of fexes takes place in vegetables, it will be beceflary to give a flatement of the arguments employed by both parties on this fubject. We thall begin with the arguments in favour of the fexes.

1. Linnexs is at great pains in tracing the notion Sexual of fexes in plants to the remotelt periods of antiquity. fyncient. He informs us, that Empedocles, Anaxagoras, and other ancient philofophers, not only attributed the difinction of fexes to plants, bot maintained that they were capable of perceiving pleafure and pain.

Hippocrates and Theophrallus are next introduced as diftinguifting the conyza, the abies, the filix, \&c. into male and female. The latter of thefe writers allirms that the fruit of the female palm will not germinate, unlefs the pollen of the male be haken over the fpatha of the female previous to the ripening of the feed.

Diofcorides takes netice of a malc and female mandragora, mercurialis, cifus, \&c.

11
Pliny

Pliny does not confine his views of fex to animals, but exclaims, that every thing this earth produces is characterized by the diftinction of fex.

From the days of Pliny to thofe of Cæfalpinus, who lived in the 16 th century, the analogy between the vegetable and animal feems to have been entirely neglected. Caffalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren ; and that the females of thefe plants only bear fruit.

After Cæfalpinus, we find Dr Grew and Sir Thomas Millington engaged in a converfation concerning the utility of the ftamina and ftyli of plants. The refult of this converfation was the mutual agreement of thefe two eminent naturaliffs, that the famina and fyyli of vegetables were analogous to the organs of generation in animals, and that they were adapted by nature to anfiwer the fame purpofe. Dr Grew, in his anatomy of planto, after emmerating the aralogies between plants and animale, concludes, that the pollen probably emits certain virific eflluvia, which may ferve for the impregnation of the leeds.

Mr Ray gave further fanction to the doctrine of fexes, by concurring with Grew, and adding fome further illultrations from analogy.

In the year 1695, Camerarius attempted to prove the fexes of plants. But, as he trufted Colely to the palm-tree, and withal feemed to be doubtful as to the authenticity of the fact, he cannot be confidered as having done ary thing in confirmation of the fexual hypothe fis.

Mr Morland, in the year 1703, adopted the fame hypothefis; but gave it a ne:v modifration, by fuppofing that the pollen contained the feminal plant in miniature, and confequently that it behoved one pollen at leaf to be conveyed into every feparate feed before it could be properly impregnated. Analogy and the ftructure of the parts are the only arguments he employs.

Some years after this, Mr Geoffroy wrote a treatife on the fexes of plants: but as he advanced nothing new, we flitl take no farther notice of him.

Vaillant, in the year 1717, judiciouly confidering that the canal in the fylus of molt plants was too narrow to admit the pollen itfelf, republifhed Dr Grew's thenry of impregnation by means of a fubtile feminal aura.

Thcfe are the fentiments of the principal botanifts with regard to the generation of plants, till the celcbrated Linnxus made his appearance as a botanical writer, who has extended the idea fofar as to compufe a complete fyitem upon it.

Although Linnzus can have no claim to the fuppofed difenvery of the fexual hyputhefir, his being prerifely the fame with that of Dr Grew; yet, as he is the chief fupporter and improver of this dootrine, we flatl give a fuccinct narration of the argumerts he makes ufe of in order to prove that vegetables propagate their fpecies by a regular commerce of fexec.

In a treatilc enti:les, Sponfalia Plantarum, publ:hhed as on inaugural difiertation isy Wahlbom, in the filf volume of the Amantates Academica all the arguments made ufe of by Linızeus in his Fundamenta Botanica, and other works, are collecled and arranged in one
view. But as Wahlbom honeflly attributes all the me. rit of this differtation to his great mafter, we fhall here drop his name altogether, and give the arguments as the property of Linnæus, by whom they were originally employed.
Linnexs, then, firf attempts to mow, that vegetables are endowed with a certain degree of life; and, fecondly, that they propagate their fpecies in a manner fimilar to that of animals.
"That vegetables are really living beings (fays he), vegetables muft be obvious at firft fight; becaufe they poffefs all poliefs life. the properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, Vila eff fpontonea propulfio bumorum. But univerfal experience teaches, that vegetables propel humours or juices : hence it is plain that vegetables mult be endowed with a certain degree of life."

Not trufting folely to a fyllogifm founded on a definition, Linnaus proceeds to fupport the life of vegetables by arguments drawn from the following particulars in their economy; the firf of which he entitles,
" 1 . Nutritio.-The very idea of nutrition implies a propullion of humours, and of courfe the idea of life. But vegetables derive their nourifhment from the earth, air, \&c. and confequently mull be confidered as living creatures.
" 2. Etas.-Every animal muft not only begin to exif, and have that exiltence diffolved by death, but muft likewife pafs through a number of intermediate changes in its appearance and affections. Infoncy, youth, manhood, old oge, are characterized by imbecility, leauty, fertility, dotage. Are not all thefe viciflitudes confpicuous in the vegetable world? Weak and tender in in fancy; beautiful and falacious in youth; grave, robuft, and fruitful, in marbood; and when old age approaches, the head droops, the liprings of life dry up, and, in fine, the poor tottering vegetable returns to that $d u f$ from whence it fprung.
" 3. Motus.-No inanimate body is capable of felfmotion. Whatever moves fpontentoufly, is endowed with a living principle: for motion depends on the fpuntaneous propulfion of humours: and wherever there is a foontaneous propulion of bumours, there alfo is life. That vegetables are capable of motion, is evident from the following facts: Plants, when confined within doors, always bend towards the light, and fome of them even attempt to make their efcape by the windows. The flowers of many plants, efpecially thofe of the fyngenefia clafs, purfue the fun from eaft to weft, rejoicing in his heams. Who then can deny that vegetables arc poffeffed of living and felf-moving powers?
"4. Morlus.-The term dijeafe means nothing more than a certain corruption of life. It is well known, that vegctables are fubject to difeafes as well as animals: when over-heated, they turn thirfty, languifh, and fall to the ground; when too coll, they are tormented with the chilblain, and not unfrequently expirc: they are fometimes afflicted with cancers; and every plant is infelled with lice peculiar to its fpecies.
" 5. Mors.-Death is oppofed to life, the-former being only a privation of the latter. Experience fhows that every living creature muft die. But as vegetables are daily cut of by internal difeafes and external injurics; as they arc fubject to death from the attacks of lunger,
hunger, thirf, heat, cold, \&c. with what propriety could vegetables be thus faid to die, uulefs we allow that they previoully lived?
"6. Anatomia.-Uuder this article we are referred to Malpighius and Grew for the organic fibres, membranes, canals, veficles, \&c. of plants, as additional proafs of their living powers.
" 7. Organizatio.-Vegetables not only propel humours, but allo prepase and fecern a number of different juiees for the fruit, the nectar, \&c. analogous to the various fecretions in animal bodies."

From thefe facts and obfervations, Linuæus concludes, that plants are unquefiionably endowed with life as well as animals; and then proceeds in the following manner to thow how the fe animated vegetables propagate their Species.
Arguments After difcufling the long-exploded doctrine of equifor the fex- vocal generation, he lays hold of another maxim of Dr ual fytem. Harver, viz. Omne vivum ex vivo.-" It being fully evident (fays he), from the foregoing chain of reafoning that vegetables are endowed with life, it necefia rily follows, agreeable to this maxim of Harvey's, that every vegetable mult in like manner derive its exiftence from an egg. But as vegetables proceed from eggs, and as it is the diftinguifting property of an egg to give birth to a being fimilar to that which produced it, the feeds mutt of courfe be the eggs of vegetables.
"Granting then that the leeds of vegetables are intended by nature to anfwer the fame end as the eggs of animats, and confidering at the fame time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the feed or eggs of veget.bles camnot be fecundated by any other means. Hence alfo the neceflity of vegetables being provided with organs of generation. But where are thefe orgaris fituated? The anfwer is eafy:-We have already found impregnated feeds within the flowers of plants; and it is natural to expect that the genitalio fhould not be at a greater difance. Now, as copulation always precedes birth, and every flower precedes the fruit, the generasing faculty muft be afcribed to the fower, and the birth to the fruit. Again, As the anibere and Bigmata are the only effential parts of flowers, thefe parts muft necelfaily be the organs of generation."

Being thus far advinced, Linneus affirms, that the antberce are the teftes, and that the pollen performs the oftice of the male femen. Thefe affirmations he attempts to eftablift by the following arguments; the firlt of which he terms
" I. Precedentia.-The antheræ, or vegetable tefles, always precede the fruit; and as foon as the anthere cone to maturity, which conftantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lafts; but decay and fall off whenever the fruit comes to perfection.
" 2 . Situs.-The anthere of all plants are uniformly fituated in fuch a manner that the pollen masy with the greate f facility fall upon the fitigma or female organ.
" 3 . Tempus.-The anthere and ftigma always flourin at the fame time, whether the flowers be of the hermiphrodite or dioicous kind.
"4. Loculamenta,-When the antherse are dificeted, they difcover as great a variety of flructure as the pericarpia or feed-capfules; for fome of them have
one cell, as the mercury; fome two, as the hellebore, \&c.
"5. Cafiratio.-If all the anthera be cut off from an hermaphrodite plant, jull bo sore the tlowers begin ta expand, taking care at the fanc time tuat no plant of the fame fpecies grow near it, the fruit will either prove entirely abortive, or produce barren feeds.
" 6. Figura. When the pollen of different plants is examined by the microfope, it exthibis as great a variety of figures as is dilcoverable in the feeds themfelver.
"The accumulated force of thefe argumerits (concludes Linnæus) amounts to a full demonftration that the antherat are the tettes, and that the pollen is the femen or genitura of vepetables.
"The male oryan beng thus inveftigated, we hope (rays Limazas) that none will hefrate to pron one the fligma to be the female organ, efpecially whan the following obfervations are attended to.
"The pillillum is compofed of the germen, Aylus, and figma. The germen, being only a kund of sudiment of the future fuetus or fced, ceafes to cit as foon as the flower comes to maturity. Ncither is the ftylus an effential part, as many flowers have no fylus. But no fruit ever comes to maturity whout the affiftance of the litigma. It follows, that the figmi muft be the female organ adapted by nature for $t$ : re ception of the pollen or impregnating lubllance. This will appear ftill clearer from the following chain of reafoning.
" I. Situs.-The figmata are always fituated fo that the pollen may with moft cafe fall upon them. Befides, it is remarkable, that in moft plants (though not in all) the number of the figmata exactly correfonds with the loculamenta or cells of the pericarpium.
" 2. Tempus.-Here the obfervation, that the figmata and anthere conflantly flourill at the fame time, is repeated.
" 3. Decidentio.-The figmata of moft plants, like the anthere, decay and fall off as foon as they have difcharged their proper function; which evidently flows, that their office is not to ripen the fruit, but folely to anliver the important purpofe of impregration.
"4. Abriffio. - The argument here is precifcly the fame with the caftration of the anthere; and the refult is likewife the fame, namely the deftuction of the fruit.
" Thefe arguments (concludes Linnæus) are fufficient to demonftrate, that the lligma is the female organ of generation, or that organ which is fuited for the reception and conveyance of the femen to the segutable eggs. Herice plants may be faid to be in acfu ceneris, when the antheree or tefliculi fpread their pollen over the fitigma or female vilva."

To thow how the coitras of regetables is effefted, is our author's next object of invelligation. He aftirm, that the pollen is conveyed, by means of the wind or infects, to the mnill fligma, where it remains until it difcharges a fubtile fluid, which being abforbed by the veffels of the frigma, is carried to the feedr or ova, and impregnates them. His proofs are taken from the following particulars.
" 1. Oculus.-When the flowers are in full blow, and the pollen flying ahout, every one may then fee the pollen adhering to the ftigma. This he illultrates by
mentiouing as examples the viola tricolor, iris, campanula, \&c.
" 2. Proportio.-The flamina and piftilla, in mont plants, are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility, fall upon the ftigma.
" 3. Locus.-The flamina of moft plants furround the pultillum, to give the pollen an opportunity of falling upou the fligma at every breeze of wind. Even in the monocia clafs, the male flowers fand generally ahove the female ones, to afford an eaficr conveyance of the pollen to the fligma.
" 4 . Tempus.-It is remarkable that the ftamina and piftilla conftantly appear at the fame time, even in plants belonging to the monocia clafs.
" 5. Pluvice. - The flowers of molt plants expand by the heat of the fun, and ftut themfelves up in the evening or in rainy weather. The final caufe of this mult be to keep the moifture from the pollen, left it hould be thereby coagulated, and of courfe prevented from being blown upon the ftigma.
"6. Palmicole.-That the cultivators of palm-trees were in ufc to pull off the fpadices from the males, and fufpend them over the $f_{\text {pathe }}$ of the feniales, is attefted by Theophraftus, Pliny, Profper Alpinus, Kempfer, and many others. If this operation happened to be neglected, the dates were four and deffitute of nuts. Kempfer acids this fingular circumftance, that the male〔padix, after being thoroughly dried and kept till next leafon, flill retained its impregnating virtue.
" 7. Flores nutantes.-As the pollen is fpecifically heavier than air, fuch flowers as have their pillillum longer than the ftamina, hang down, or incline to one fide, e. g. the fritillaria, campanula, \&c. An eafy admiffion of the pollen to the fligma is the final caufe of this appearance.
"8. Submerfi.-Many plants that grow below water, emerge when their flowers begin to blow, and fwim upon the furface till they receive their impregnation, and then fink down.
"9. Omnium fiorum genuina confideratio."-Here a number of particulars are recited. We flall confine ourfelves to thofe that are moft Atriking and applicable to the fubject.
" When the flowers of the male hemp are pulled off before thofe of the female are fully expanded, the females do not produce fertile feeds. But as a male flower is fometimes found upon a female plant, this may be the reafon why fertile feeds are fometimes produced even after this precaution has been obferved.
"The tulip aflords another experiment of the fame purpofe. Cut off all the anthere of a red tulip before the pollen is emitted; then take the ripe anthere of a white tulip, and throw the pollen of the white one upon the figma of the red; the feeds of the red tulip being thus innpregnated by one of a different complexion, will next feafon produce fome red, lome white, but mon variegated Alowers."

In the ycar 1744, Linnseus publifhed a defeription of a new genus which he called feloria, on the fuppofition of its being a loybrid or male plant, i.e. a plant produced by an unnatural commixture of two difierent genera. The root, leaves, caulis, \&c. of this plat are exceedingly fimilar to thofe of the antirrhinum linaria; but the flower and other parts of the frutification axc
totally different. On account of its fimilarity to the linaria in every part but the flower, Limneus imagined it to have been produced by a fortuitous commixture of the linatia with fome other plant, although he has never yet been able to point out the father. This doctrine of the production of mule plants has fince been greatly prized, and carefully propagated, by Limmeus and the other fupporters of the fexual hypothefis. In the third volume of the Amanitates Academica, there is a complete differtation, entitled Plante Hylride, wherein the doatrine of vegetable mules is much improved and extended. This differtation contains a lift of 47 mules, with their fuppofed fathers and mothers. For example.
The Veronica fpuria is faid to be a mule plant begot by the Verbena officinalis upon the Veronica maritima.
The Dclphinium hybridum, a mule begot by the $A$ conitum napellus upon the Delphinium elatum.
The Arctotis calendula, a mule legot by the Calendula pluvialis upon the Arctotis triftis.
The Afclepias nigra, a mule Eegot by the Cynanchum acutum upon the Afclepias vincetoxicum. \&c.
From the examples given in this differtation, Linneus draws this conclufion, That only two fecies of each genus exifted aborigine; and that all the variety of fpecies which now appear have been produced by unnatural embraces betwist fpecies of different genera.

Under this head Linnæus likewife quotes from Ray the flory of Richard Baal gardener at Brentford. This Baal fold a large quantity of the feeds of the braffica florida to feveral gardeners in the fuburbs of London. Thefe gardeners, after fowing their feeds in the ufual manner, were furprifed to find them turn out to be plants of a different fpecies from that which Baal made them believe they had purchafed; for, inltead of the brafica florida, the plants turred out to be the brafica longifolia. The gardeners, upon making the difcovery, commenced a profecution of fraud againlt Baal in Weltminfter.hall. The court found Baal guilty of fraud, and decerned him not only to reflore the price of the feeds, but likewife to pay the gardeners for their loft time, and the ufe of their ground. "Had thefe judges (fays Linneus) been acquainted with the fexual hypothefis, they would not have found Baal guilty of any crime, but would have afcribed the accident to the fortuitous impregnation of the braffica florida by the pollen of the braffica longifolia.

Linneeus next proceeds to celebrate the utility of infects, becaufe they convey the pollen of the nale to the ftigma of the female. "In this way (fays he), it is realonable to think that many dioicous plants are impregnated. Nay, even the hermaphrodices themfelves are greatly obliged to the different tribes of infects, which, by fluttering and treading in the corolla, are conttantly fattering the pollen about the fligma.
" Upon the whole then (concludes Linnzeus), the coitus of veget:bles is evident to a demonflration. This coitus is nothing more than the conveyance of the pollen to the fligma, to which it adberes till it burfts, ard difcharges a lubtile elaftic tluid. 'This thid or aura is abforbed by the velfels of the ilylus, and caried ditectly to the ovariun or germen, where the mylterious work of impregnation is fully completed."

These are the arguments cmployed by Linnous and other
other adrocates for the fexual commerce of vegetables. Let us next attend to thofe employed by the oppofers of this hypothefis.
Objections to the fexuat lyftem.

It is admitied by Pontedera, Dr Allon, \& c. that fome of the ancients applied the terms male and fomale to leveral plants. But then they deny that thefe terms conveyed the fime ideas to the ancients that they do to the moderns. Male and fema!', when applied to plants, were to the ancients mere terms of diftnction, furving only as trivial mames to dillinguifl one fpecies or variety from another. 'The ancients were ignorant of the very characters which conflute the difference between what is called a male and fomale plant among the moderns. 'Theophraftus, Diofcorides, Pliny, and, in a word, the whole ancient botanical writers, confound the very notion of the mudern fexes: they call the real female, or feed-bearing plant, the male; and the male, or barren plant, the female. N.y, they have even applied the terms male and female to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controverfy, that it cannot be determined with any degree of certainty, but by experiments made upon dioicous plants. If a female plant can produce fertile feeds without having any com:nunication with the pollen of the male, the ufe of this pollen with relpect to the impregnation of feeds mult of neceflity be entirely fuperfeded.

Now, both Camerarius and Dr Alfton tried thefe experiments with the fame fuccefs. Thefe two eminent botanifts took female plants of the mercury, fpinage, and hemp; tranfplanted them at a great diftance from any males of the fome genus, and belides had them enclofed by double rows of hedges. The refult was, that each of thefe plants produced great quantities of fertile feeds. Tournefort made the fame trial upon the lupulus, Miller upon the bryony, and Geoffroy upon the mays; and all of them declared that the feeds of thefe plants were as fertile as if they had been furrounded by a thoufand males.

Linnæus, in his firf argument for the coitus of plants, refers every man to the cvidence of his fenfes.
"Do we not fee (fays he) the figma of almoft every hermaphrodite flower covered over with the pollen or impregnating fubltance? Do not we fee the parietaria, the urtica, Exc. by violent explofions, difcharging their pollen in the open air, that it may be carried in that vehicle to the ftigmata of their refpective females ? - All this is admitted by the oppofers of the fexes: but then they deny that the fe explofions, \&xe. are intended to create ary intercourfe berween the male and the fem ale; and further allege, that this ejection of the pollen is intended by nature to throw off fomething excrementitious, or at leaft fomething which, if retained, would prove noxious to the fructification.

Limmeus takes his fecond argument from the proportion which the famina bear to the ftylus, alleging that they are generally of the fame height.-This obfervation (fay the anti-fexualifs) is not only contrary to expericnce, but, allowing it to be miverlal, no conclufion can be drawn from it either for or againf the fexual hypothcfis.

The third argument is taken from the locus or fituation of the ftamina with refpect to the fly'us: "and as the male Howers in the moncecia clafs fand alw.ys above the female flowers, it muft be concluded (fays

Lionseus), that the intention of nature, in this difiouf. tion of the parts, is to allow a free and ealy accefs of the pollen to the lligma." - But the ftamina cannot be fid to furround the piftillum in the monandria and diandria claftes: and the pofition of the male flowers in the monoecia clafs is a mere chimera; for in the ricinus, one of the examples which Linnaus mentions in conimation of his dostrine, the female flowers Atand uniformly fome inches above the males.

That the Itamina and pillilla generally come to perfection at the fame time, and that this happens even in the dioicous plants, is Limneus's fourth argument. But, as it is acknowledged by Linnacus himfelf, that there are many exceptions with refpect to this fact, the oppolers of the fexual hypothefis allege that it carries the bell anfwer in its own bofom.

The fifth argument is founded on the circumfance of fome tlowers thutting up their petals in rainy or moilt evenings.-But many hlowers do not hut themfelves up, either in the night or moift weather, as the paffionHower, \&c.: the lychnis noctiflora, mirabilis peruriana, \& c. open their flowers in the night, and fhut them at the approach of the fun. Hence this is another fio nal caufe (fay the anti-fexualifts) perverted to fupport a favourite hypothefis.

W'e come now to the culture of the palm tree, which is the fixth and moft plaufible argument employed by the fexualifts. Of this, the moft authentic account we have is the following by Dr Haffelquift, in one of his letters to Linnæus, dated Alexandria, May 18. 1750. "The firlt thing I did after my arrival was to fee the date tree, the ornament and a great part of the riches of this country. It had already bloflomed; but I had, neverthelefs, the pleafure of feeing how the Arabs affift its fecundation, and by that means fecure to themfelves a plentiful harveft of a vegetable, which was fo important to them, and known to them many conturies before any botanift dreamed of the difference of fexes in vegetables. The gardener informed me of this before I bad time to enquire; and would how me as a very curious thing, the male and female of the date or palm trees: nor could he conceive how I, a Frank, latcly arrived, could know it before; for (lays he) all who have yet come from Europe to fee this country, have regarded this relation either as a fable or miracle. The Arab feeing me inclined to be further informed, accompanied me and my French interpreter to a palm tree, which was very full of young fruit, and had by him been wedded or fecundated with the male when both were in bloffom. This the Arabs do in the following manner : when the fpadix has female flowers, that come out of its lpath', they fearch on a tree that has male Howers, which they know by expernence, for a lpadix which has not yet buriled out of its lpatha: this they open, take out the fpadix, and cut it lengthevife in fcveral pieces, but take care not to hurt the flowers. A piece of this Spadix with male fowers they put lengthwife between the finall branches of the Ipadix which hath female tlowers, and then lay the leaf of a palm over the branches. In this lituation I yet law the greatelt part of the fpadices which bore their young fruit; but the male fluwers which were pur betwecn were withered. 'l'ine Arab befiles gave me the tollowing anecdotes: Fïrlt, Unlefs they in this manner wed and fecundate the date trcc, it bears no fruit. Se cond!y,
condly, They always take the precaution to preferve fone unopened fathæ with male flowers from one year to another, to be applied for this purpofe, in cafe the mate tlowers flould mifcarry or fuffer damage. ThirdJy, If they permit the fpadix of the male flowers to burft or come out, it becomes ufelefs for fecundation: it muft have its maidenbead (thefe were the words of the Arab), which is loit in the fame monent the blofloms burf out of their cafe. Therefore the perfon who cultivates date trees mult be careful to hit the right time of affifting their fecundation, which is almof the only article in their cultivation. Fourthly, On opening the fpatha, he finds all the male flowers full of a liquid which refembles the fineft dew ; it is of a fweet and pleafant tafte, refembling much the tafte of frefh dates, but much more refined and aromatic; this was likewife confirmed by my interpreter, who hath lived 32 years in Egypt, and therefore had opportunities enough of tafting both the nectar of the bloffoms and the frefh dates."

Now, though this account feems fully to confirm the fact, v.z. that fuch a practice obtains among the Arabs, and that they affert its efficacy in fecundating the trees, it is certain ( lay the oppofers of this doctrine), that no intelligent perfon, who is not already wedded to an hypothefis, will attempt to found an argument 1:pon the affertions of a people fo full of ridiculous fu. perfitions. Before Dr Haflelquift, or any other perfon, can draw any argument from the above-mentioned account, he ought to fee the experiment feveral times repeated, with his own eyes, and not take it upon the word of a people who, befides their fuperflition, may very probably find it their intereft to impofe upon travellers.

Mr Milne, author of the Botanical Dictionary, how. ever, relates an experiment, near akin to the above mentioned, which merits fome attention: "In the garden of M. de la Serre, of the Rue S. Jacques at Paris, was a female turpentine tree, which flowered every year, without furnifhing any fruit capable of ve.. getation. This was a fenfible mortification to the owner, who greatly defired to have the tree increafed. Mefficurs Dubamel and Jeffieu very properly judged that they might procure him that pleafure by the affiftance of a male piffachio tree. They fent him one very much loaded with flowers. It was planted in the garden of M. de la Serre, very near the female turpentine tree, which the fame ycar produced a great quantity of fruits, that were well conditioned, and rofe with facility. The male plant was then removed; the confequence of which was, that the turpentine tree of M. de la Serre in nowe of the fucceceding years bore any fruit that, upon examination, was found to germinate."

Upon this experiment it is ohferved by the antifex. ualiffs, that, though it were a thoufand times repeated, it never could be decifive. The nature of the controverfy, fiy they, is fuch. that one experiment is more decifive in favour of their opinion, than 10,000 can be againf them. The reafon is plain: If there is fuch a thing as a fexual intercourfe in vegtrables, it is as wonderful that any feed, frould be peifected without that intercourfe, as that a virgin floolf have a child ; the laf is not in the leaft more extrecmonary than the firft. One experiment, thercfore, which flows that feeds may
be perfected without fuch fexual intercourfe, is either to be refolved into a miracle, or muft prove abfolutely decifive againfl the fexual fyftem; while numberlels experiments fuch as that above mentioned could prove nothing, becaufe we know not what effect vegetables may have by growing in each other's ueighbourhood, independent of any fexuzl intercourfe.

In Milne's Botanical Dictionary, under the article Sexus Plantarum, the author quotes Dr Alfton's experiments partially. The facts recorded by Dr Alfton are as follow: 1. Three fets of finach, planted at a great diAtance from each other, proved all of them fertile, and ripened plenty of feeds, which were found to anfwer as well as other fpinach feed. 2. A plant of hemp growing by itfelf, being taken care of, produced about 30 good feeds, though in a fituation very much expofed, and plucked up too foon, on account of bad weather, in the autumn. 3. This experiment, which is the moft remarkable of the three, we fhall give in the Doctor's own words. "In the fpring of $177^{1}$, I carried two young feedling plants of the French mercury, long before there was any in, from this city phyfic garden, the only place where it was then to be found in this country, to the King's garden at the Abbcy; which are more than roo yards diflant from one another, with many high houfes, trees, hedges, and part of a high hill between them; and planted one of them in one enclofure, where it was thaded from the fun the greateft part of the day; and the other in another 25 yards diftant, expofed to the fouth and weff. Both plants ripened fertile feeds; and the laft fhed them fo plentifully, that it proved a troublefome weed for feveral years, though none of the fpecies was to be found in that garden for more than 20 years preceding."

Of this experiment Mr Milne hath not taken any notice; but upon the other two, has the following remark: "The refult of thefe, and fuch like experiments, can be accounted for, on the principle of the fexes, in no other way than on the fuppofition that fome male flowers have been intermixed with the female, and operated the fecundation in queflion. This appears the more probable, as only a part of the feeds in the above experiments attained to perfect maturity, fo as to be capable of vegetation.

The feventh argument of Linmas is taken from the fores nutantes.-The piftils of thefe flowers, according to Linnows, are always longer than the ftamina; and rature has affigued them this penfile pofture, that the pollen, which is Specifically heavier than air, may the more convenienly fall upon the figma. But the pifils of the campanula, lilium, and many other fores nutantes, are not longer than the famina. Befides, granting this were uniformly the cafe; yet, as the pollen is heavier than air, this poflure muft of nectfity either make the pollen mifs the piltillum altogether, or, at any rate, it can only fall upon the back part of the pilli] in place of the fligma; and, of courfe, fuch a direction would rather tend to fruftrate than promote the impregnation of the feed.

The eighth argument is taken from the plantre fubmerfs, which are faid to emerge as foon as thelr Howers begin to blow, leff the pollen flould be coagulated or wafled off by the water. But many fubmatine and aquatic plants fructify entircly below water; and, fuppofing they did not, the fame argument would equally
prove it to be the intention of nature, that the pollen fhould be blown away by the winds, as that it thould be fublervient to the impregnation of the fees.

The ninth and laft argument is entitled Omvium forum genuina confideratio; which (fay the antifexualifts) is nothing more than a collection of vague obfervations upon the liructure and economy of particular plants, fome of them true, others falfe, but all of them evidently thruft in as fupports to a favourite hypothefis.

Farther arguments by Linnau

Thus the difpute refled fome years ago; but of late there has appeared a tranflation of one of Linneus's works upon the fubject, which, though publitied in 1759, was but little known in this country. A treatife on the Sexual Syftem had alfo been publifhed by the Abbe Spalanzani, in which he not only oppofed the Linnean doetrine, but treated it with ridicule, though without taking any notice of this laft publication, which he feems to have been ignorant of. In this he mentions an experiment with hemp fimilar to fome of thofe already related; but which was alfo tried by Linnxus, and in his hands turned out the very revenfe of what it did with Spalanzani. In the treatife alluded to, Linnæus mentions Sir Thomas Millington as the firt among the moderns who thought of the diftinction of fexes in plants. He was Savilizn profeffor at Oxford ; and Dr Grew, in bis Anatomy of Plants, relates, that in a converfation on the nature of the anthere of flowers, Sir Thomas hinted, that thofe parts inight probably be amalogous to the male organs of animals, and ferve for the impregnation of the fruit. Grew improved on the idea, and purfued it. That the fubject, however, may be properly underfood, our author is of opinion, that we thould firft accurately underftand the nature of vegetable bodies; and in order to do this, we ought firft to confider the operations of nature in the human frame, and from thence continue our refearches through the satious tribes of inferior animals, till at haf we arrive at the vegetable creation. In like manner, to illuftrate the generation of plants, we mult likewife take our firf lights from the animal kingdom, and purfue the fame chain till we come to vegetables. This fubject, indeed, he owns to be fo obfcure, that no naturalift bas hitherto been able to fay any thing fatisfactory conccraing it; he only mentions fome remarkable facts concerning the production of mule animals from the copulation of two individuals of different fecies. In the horfe kind we fee two different kinds of mules produced. "From the mare and male als (fays he) proceeds the mule properly fo called, which in its nature, that is, in its medullary fubftatice and nervous fyftem, agrees with its mother; but in its cortical fubftance and outward form, in its mane and tail, refembles the afs. Between the female afs and the horfe, the other kind nf mule is engendered, whofe nature or medullary fubflance refembles that of the afs; but its cortical fructure that of a horfe. If the he-goat of Angora copulates with the common nle-goat, the kid, by that means procured, inherits the external flruquie and valuable coat of its father; while, on the other hand, if the conmon he-goat impregnates the goat of Angora, the kid produced has the fame external form, and bears the fame worthlefs hair with its father. Hence i: feems nrobable, that the medullary fubftance, with

## A N Y.

what Malpighi calls the keel (carina), amit the ser. vous fyftem, are latent in the cgg of the mother; the cortical fubftance, or vafcular fyftem, being derised from the father."
Thefe cortical and medullary fubftances are previoufly explained by our author to be thofe of which both animal and vegetable bodies are compofed. By the medullary fubitance in animal bodies, he means the fpinal marrow arifing from the organized brain, and fend. ing off the nerves; by the cortical fubfance the veffels with the heart attaclied to them, by which the medullary part is nourilhed. In vegetables, the cortical part nourithes the plant, not only by its roots, but with its whole furface. Yor a fmall branch torn from the parent ftem, and placed in water, inbibes nourifhment at its pores. Thus the Fuci, and other marine vegetabics, are nourifted without a root, folely by the pores difperfed through their whole fubftance. The bark of trecs every year depofites its gelatinous internal layer, which is added to the wood, and affimilates itfelf to it. The medullary, which is the other effential part of vegetables, is multiplied and extended without end; and whenever it is entirely loft, the death of the plant necefiarily follows. In examiuing this fubftance, we mult be careful, in two cafes, that we be not mifled; firft, by the flraws of graffes, and by other hollow ftems, where the medulla lines the infide of the bark; and fecondly, by large irees, whofe trunks become perfealy folid throughout, except in the tery fummits of the branches. The wood parforms the office of boncs, when there is no longer any occafion fur the medulla in that part; and trees, although become hollow, continue neverthelefs to grow fo long as this fubftance remains in the extreme branches. It is by no means neceflary that the medulla fhould have any connexion with the root, as it is only nourithed by the contucal fubftance of the plant, and is therefore increaled at its upper extremity without end if it meets with no refifince. In thofe arimais whofe fpinal marrow is furrounded by a bony covering, as in the larger and more pertect kinds, this fubleance never comes out of it: confinement; and the harder its cafe, the more abfolutely is is increale prevented; but in the fmaller tribes of worms, where this covering is lefs rivid, a perpetual and unlimited increafe of the mimal takes place.
"The mofl imporrant paris of the flower, and which are abfolurely efiential to it, (our author proceeds to otferve*), are the famina and pinilla. So ceeds to otferve
effential are they, that among the many thoufands of , Difre. cs flowers with which we are acquainted, no one can plexes of be found not furniftied with both thefe organs. The Smunts flamina derive their origin from the fubfance of the Trann. wood, which was originally formed from the imner po 2s. feq. bark, and they may therefore be faid to fpring from the cortical fubfance of the vegetable. This is perfectly evident in the afarum (afarabacca), whofe twelve atamina proceed from trelve filres in the inner bark. Double flowers illultrate the fame fat: in them, the ीamina being weakened and diffolved by exeefs of nouriflment, the woody fubfance realiumes the loftefs of the inner bark, of which it was originally formed. All tlamina confir of veffels containing the pullen, or impregnating powder, which they difcharge in due time, not without the frifen obfervance of certan natural laws. The form of thefe vifels, the that of
the capfules of the fruit, is accurately defined, as well as their cells, their particular manner of burfing, and the pollen which they contain; this pollen, likewile, is no lefs certain and uniform in its figure, fize, and colour, than the feeds themfelves.
"The piftillum is the only part which originates from the medullary fubftance, and is therefore invariably fituated in the centre of the flower. It always contains the rudiments of the feed, which, in procefs of time, ripen into fruit. The rudiments of the fruit are called the germen, or feed-bud; this has conftantly another organ connected with it, named the figma, which is in its higheft degree of vigour and perfection during the time of flowering.
"A nother circamflance worthy of attention is, that the root, which the firt year of its growth is large and filled with medullary pulp, the following feafon becomes hollow, in producing the ftem, flowers, and feed; all this pulp being conveyed to the flower, and feeming to be only deftined to the formation of feed, fo many new and diftinct animations being formed from it as there are rudiments of new plants. This is particularly obfervable in the turnip.
"Thus vegetables, like infects, are fubject to a metamorphofis; with this difference only, that their flowers are fixed to one fpot, inflead of being able, like infects, to fly from place to place; and that their nourifhment is not given them by means of peculiar organs for the formation of chyle. We have feen, that the outer bark becomes calyx, the internal bark corolla, the wood Itamina, and the medulla piftillum; the fructification exhibiting the internal parts of a plant naked and unfolded. We have likewife feen, that the fructification puts an end to vegetation in the part from whence it arifes, fopping the progrefs of the medulla, which would otherwife have extended itfelf without end by the branches, and occafioning the divifion of that medulla into a number of feeds, cach endowed with a feparate living principle. But as the medulla exilts naked in the germen, it cannot fupport itfelf, or make any farther progrefs, without the alfiftance of the cortical fubftance which it has left; it mult therefore receive this atfifance by fome means or other, and in fact does receive it from the ftamina and their pollen, which owe their origin to the woody matter derived from the inner bark, and originally generated by the outer bark. But if it happens that the cortical fubfance is able to inveft the medullary rudiments of the fced in the flower itfelf, the plant becomes viviparous, as in fefluca, aira, and poa vivipara, in which wearly the fame thing takes place as in the medulla of other plants, which remains in the branches, and is varioully diftributed, being at once both clothed and nourithed by the balk, and enabled to form new loranches, juf as it happens in the compound animals, or firtulariz.
" I'he organs common in general to all plants are, 1. The root, with its capillary veffel, extracting nou. rillment from the ground. 2. The leaves, which may be called the limbs, and which, like the feet and wings of animal, are organs of motion; for being themfelves ftalien by the external air, they fhake and exerwife the plant. 3. The trunk, containing the merlulJary fubftance, which is nourifled by the bask, and for she moit part multiplied into feveral compound plants.

A N Y.
4. The fructification, which is the true body of the plant, fet at liberty by a metamorphofis, and confifts only of the organs of generation ; it is often defended by a calyx, and furnifhed with petals, by means of which it in a manner flutters in the air.
"Many flowers have no calyx, as feveral of the lily tribe, the hippuris, \&c.; many want the corolla, as graffes, and the plants called apetalous; but there are none deflitute of flamina and pitilla, thofe important organs deflined to the formation of fruit. We therefore infer from experience, that the flamina are the male organs of generation, and the piltilla the female; and as many flowers are furnilhed with both at once, it follows that fuch flowers are hermaphrodites. Nor is this fo wonderful, as that there fhould be any plants in which the different fexes are in diftinat individuals; for plants being immoveably fixed to one.fpot, cannot, like animals, travel in fearch of a mate. There exifts, however, in fome plants, a real difference of fex. From feeds of the fame mother, fome individuals fhall be produced, whofe flowers exhibit flamina without piftilla, and may therefore be properly called males ; while the reft, being furnifhed with piftilla without famina, are therefore denominated females: and fo uniformly does this take place, that no vegetable was ever found to produce female flowers, without tlowers furnilied with ft amina being produced, either on the fame individual, or on another plant of the fame fpecies, and vice verfa.
"As all feed-veffels are deftined to produce feeds, fo are the flamina to bear the pollen, or fecundating powder. All feeds contain within their membranes a certain medullary fubftance, which fwells when dipped into warm water. All pollen, likewife, contains in its membrane an claftic fubftance, which, although very fubtile and almofl invifible, by means of warm water often explodes with great vehemence. While plants are in Hower, the pullen falls from the anthera, and is difperfed abroad, as feeds are diflodged from their fituation when the fruit is ripe. At the fame time that the pollen is fcatered, the pifillum prefents its ftigma, which is then in its highef vigour, and, for a portion of the day at lean, is moittened with a fine dew. The ftamina either furround this figma, or, if the flowers are of the drooping kind, they are bent towards one fide, fo that the pollen can eafily find accefs to the fligma; where it not only adheres by means of the dew of that part, but the moilure occafions its burfing, by which means its contents are difcharged. What iflued from it, being mixed aith the fluid of the fligma, is conveyed to the rudiments of the feed. Ma. ny cvident intances of this prefent themfelves to our notice; but 1 have nowhere feen it more manifell than in the jacobean lily (amaryllis formoflima), the pittillum of which, when fullefient heat is given the plant to make it flower it perft. dion, is bent downwards, and from its Itigma iffuce a drop of limpid fluid, fo luge that one would think it in danger of falting to the ground. It is, however, gradually ic-abforbed into the flyle about three or four o'clock, and becomes invifible till about ten the next morning, when it anpears again; by noon it attain its largef dimeufions; and in the afternoon, by a gentle and fcarcely paceptible derreafe, it returns to its furce. If we thake the anthere over the ftigma, fo that the pollow may
fall on the linipid drop, we fee the fluid foon after become rorpid, and affume a yellow colour ; and we perccive little rivulets, or opake flreak, running from the fligma towards the rudiments of the feed. Some time afterwards, when the drop has totally difappeared, the pollen miy be obferved adhering to the fligma, hut of an irreqular figute, having loft its original form. No one, the relore, can affent to what Murland and others have afferted, that the pollen puffes into the fligma, pervades the Ayle, and enters the tender tudiments of the feed, as L.ecuwenhock luppoled his worms to enter the ova. A moft evident proof of the falfehood of this opinion may be obtaind from any fpecies of mirabilis (marvel of Pcru), whofe pollen is fo very large, that it almont exceeds the ftyle itfell in thicknef, and, falling on the lligna, adheres firmly to it; that organ fucking and exhauting the pollen, as a cuttle-fifh devours every thing that comcs within its grafp. One evening in the month of Augult I moved all the flamina from three flowers of the mirabilis lonsifora, at the fame time deftroying all the reft of the flowers which were expanded; [ fprinkled thefe three flowers with the pollen of miralilis galappa: the feed-buds fwelled, but did not rupen. Another evening I performed a fimilar experiment, only fprinkling the flowers with the pollen ot the fame fpecies; all thefe flowers produced ripe feeds.
"Some writers have believed, that the flamina are parts of the fructification, which ferve ouly to difchatge an impure or excrementitious matter, and by no means formed for fo important a work as generation. But it is very evident. that thefe authors have not fufficiently examined the fubject; for as, in many vegetables, fome flowers are furnifhed with famina only, and others onlv with piltilla, it is altogether impofible, that flamina fituated at fo very great a diftance from the fruit as on a different branch, or perhaps on a feparate plant, fhould ferve to convey any impurities from the embryo.
"No phyfialogift could demonftrate, ${ }^{a}$ priori, the neceffity of the malculine fluid to the rendering the eggs of animals prolific; but experience has eftablithed it beyond a doutle. We therefore judge à poferiori principally of the fame effect in plants.
"In the month of January 1760 the antholyza cumonia flowered in a pot in my parlour: but produced no fruit, the air of the roum not being fufficiently agitated to waft the pollen to the ftigma. One day, about noon, feeing the ftigma very moift, I plucked off one of the anthere. by means of a fine pair of forceps, and gently rubbed it on one of the expanded figmata. The fpike of flowers remained eight or :en days longer; when I obferved, in gathering the branch for my herbarium, that the fuit of that flower only on which the experiment had been made had fweliect to the fize of a bean. I then diffected this fruit, and difcovered that one of the three cells contained leeds in confiderable number, the other two being entitely withered.
"In the montl of Apiil I fowed the feeds of hemp (cannalis) in two different pots. The young plants came up to plentifully, that each pot contained 30 or 40. I placed each by the light of a window, ist in diff rent and remote apartments. The hemp gres ex. tremely "ell in buth pots. In one of thema I permitVol. IV. Part I.
ted the male and f. male plants to remain together, to flower and bear fruit, which ripened in July : and being macerated in water and commiterl to thie carsh, fprung up in twelve diys. From the other, how, v, $\mathrm{r}_{\text {, }}$ Itemoved all the male plants as fon an they were old enough for me to ditlinguifl them from the temoles. The remaining temales grow vely well, and prelented their long pistilla in great abundance, thefe flowers continuing a very long time, as if in expectation of their mates; while the plants in the other pot bad already ripened their fruit, the pisthla hatring, quite in a dfferent marner, faded, as foon as the male, liad diccharged all their puller. It was ce:tanly a beautiful and truly admirable fpeetarle, to the the unimiramated females preferve their fulfil: folenge greet: and flourihing, not permitting ther to lessin to face till they had been for a coniderible time es oled, in va.n, to the accefo of the male pollen. Attewares, when thefe virgin plants began to dec y though ance, l examined all their calyses in the prefence of leveral botanifts, and found them large and flundlaing, ithough every one of the fead-buds was brown, cempreffed, membranaceous, and dry, not exhibiting any appearatice of cotyledons or pulp. Hence I am perfectly convinced, that the circumfance which outhors have lecorded, of the temalc heinp having produced feeds, although deprived of the male, could only have happened by means of pollen brought by the wind from fome diftant place. No experiment can be more eafily performed than the above; none more fatisfactory in demonftrating the generation of plati.
"The clucia senella was in l ke manner kept growing in my window through the nonths of June and July. The male plant was in one pot, the female in another. The latter abounded with fruit, not one of its flowers proving abortive. I removed the two pots into different windows of the fame apartment: flill all the female flowers continued to become fruitful. At length I took away the male entirly, leaving the female alone, and cutting off all the flowers which it had already bonne. Every day new ones appeared from the axilla of every leaf; each remained eight or ten days; after which their foo:falks turning yellow, they fell barren to the ground. A botanical friend, who had amufed himfelf with obferving this phenomenon with me, perfuaded me to bring from the fore in the gardtit a fingle male flower, which he placed over one of the female ones, then in perfegion, tying a piece of red filk round its piftillum. The next day the male Hower was taken away, and this fingle feed-bud remained and bore fruit. Afterwards I took another male flower out of the $\uparrow$ me flove, and with a pair of flender forceps pinched uff one of its anthrix, which I afterwards gently Ieratched with a fearher, fo that a very fmall portion of its pollen was difcharged upon one of the thee ftigmata of a female flower, the other two figmita being covered with paper. This fruit likewife attained its due fize; and on being cut tranfverfely, exhbibited one cell fill.d with a large feed, and the other tho empty. Ti:e reft of the flowers, being unimpregnated, faded and fill off. This experiment may be performed with as link trouble as the former.
"' The datifa cannalino came up in my garden from feed ten years agu, ind has every vear been plentifully increafed by means of its perennial root. Flowers in

Ereat number hare been produced by it; but being all Semale, they proved abortive. Being defirous of procuring male plants, I obtained more feeds from P.ris. Some more plonts wore raifed; but thefe likewife, to any great mortification, all proted females, and bore alowers but no fruit. In the year 1757,1 received another parcel of feeds. From thefe 1 obtained a few maie plants, which flovered in 1758 . Thefe were planted at a great diffance from the females; and when their flowers were juft ready to emit their pollen, holding a paper under them, I gen:ly flock the fpike or panicle with my finger, till the paper was alnoft cover. ed with the yellow pouder. I carried this to the females, which were flowering in another part of the garden, and placed it over them. The cold ninhts of the year in which this experiment was made, deflroyed thefe datifcas, with many other plants, much earlier than ufual. Neverthelefs, when I examined the flowers of thofe plants which I had fprinkled with the fertilizing powder, I found the feeds of their due magnitule; while in the more remote datijcas, which had not been impregnated with pollen, no traces of feeds were vifible.

Several P pecies of moniordica, cultivated with us, $^{2}$ like other Indian vegetables, in clofe foves, have frequently borne female flowers; which, although at firft .very vigorous, after a fhort time have couftantly faded and turned yellorr, without perfecting any fecd, till I inflrufted the gardener, as foon as he obferved a female flower, to gather a male one and place it above the female. By this contrivance we are fo certain of obtaining fruit, that we dare pledge ourlelves to m ke any female flowers fertile that fhall be fixed on.
"The jatropbo urens has flowered every year in my hot-houfe; but the female flowers coning before the males, in a week's time dropped their petals, and faded hefore the latter wese opened; from which caufe no fruit has bcen produced, but the germina themfelves have fallen off. We have therefore never had any fruit of the jatropha till the year 1752 , when the male flowers were in rigour on a tall tree at the fame time that the females began to appear on a fmall jatropha which was growing in a garden pot. I placed this pot under the other tree, by which means the female flowers bore feeds, which grew on being fown. I have frequently fince amuled myfclf with taking the male flowers from one plant, and fattering them over the female flowers of another, and have always found the feeds of the latter impregnated ly it.
"Two years ago 1 placed a piece of a paper under fome of thefe male flowers, and afterwards folded up the pollen which had fallen upon it, preferving it fo folded up, if I remember right, four or fix weeks, at the end of which time another branch of the fame jatropha was in flower. I then took the pollen, which I had fo long preferved in paper, and frewed it over three female flowers, the only ones at that time expanded. Thefe three females proved fruitful, while all the reft which grew in the fame bunch fell off abortive.
"The interior petals of the ornithogalum, commonly, but improperly, called canadenfe, cohere fo clofely together, that they only juft admit the air to the germen, and will fearcely permit the pollen of another Bower to pafs: this plant produced every day new
flowers and fruit, the fructification never failing in any inftance; 1 therefore, with the utmof care, extracted the antherex fram one of the fowers with a boched needle; and, as I hoped, this fingle flower pruvedibarren. This experiment was repeated about a weck after "ith the fame fuccels.
"I removed all the arthere out of a flower of chelidonium corniculatian (carlet horned popps), which Was growiag in a remote patt of the garden, upon the firft opening of its petals, and Atripped off all the reit of the flowers; another day I tieated arother flower of the fime plant in a fimilar manner, but fprinkled the piftillum of this with the pollen borrowed from another plant of the Came fyecie:: the refult was, that the firft flower produced no fruit, but the fecond afforded very pertect foed. Miydefign in this experiment was to prove, that the mere removal of the antheix flom a llower is not in itfelf fufficient to render the germen abortive.
"Having the nicotiana frut:cofa growing in a gar-den-pot, and producing pletty of flowers and feed, I extracted the antheroe from a newly-expanded flower before they had burft, it the fame time cutting away all the other flowers; this germen p:oduced no fruit, nor did it even fivell.
"I removed an urn, in which the afphoteias fiffulofus was growing, to one corner of the garden, and from one of the flowers which had lately opened I extracted its anthere; this caufed the impregnation to fail. Another day I treated another flower in the fame manner: but bringing a flower from a plant in a different part of the garden, with which I fprinkled the pifillum of the mutilated one, its germen became by that means fruitful.
"Ixia cbinenfis, flowering in my flove, the windows of which were thut, a'l its flowers proved abortive. I therefore took fome of its antherx in a pair of pincers, and with them fprinkled the fligmata of two flowers, and the next day one figma only of a third flower; the feed-buds of thefe flowers remained, grew to a large fize, and bore feed; the fruit of the third, however, contained ripe feed only in one of its cells.
"'To relate more experiments would only be to fa. tigue the reader unneceffarily. All mature proclaims the truth I have endeavoured to inculcate, and every flower bears witnefs to it. Any perfon may make the experiment for himfelf, with any plant he pleafes, ouly taking care to place the pot in which it is growing in the window of a room fufficiently out of the reach of other flowers; and I will venture to promife him that he will obtain no periect fruit, unlefs the pollen has accef's to the piftillum."

## Sea. v. Of the Natural Mettod of Claflification.

Besides all the abovementioned methods of claffing and dillributing plants into their different orders, genera, \&c. which are deduced from the fructification, and are therefure, called artficial, Linnzus and moft other botaniffs are of opinion that there is a natural method, or narure's fy Atem, which we fhould diligently endeavour to find out. That this fyflem, fay they, is no chimera, as fome imagine, will appear particularly from hence, that all plants, of what ordes foever, fhow an affuity to fome others; and this, as formerly oh.
ferved ${ }_{3}$.
ferved, not only the virtues of a great number of $f_{p}$ ec. cies may be afcertained, but we may know with certainty how to find a proper fuccedancum for plants which cannot eafily be had.-Linnæus divides vegetables into the 58 natural methods following.

1. Palme. Thefe are perennial, and montly of the fhrub and tree kind. The llem is in height from 2 to 100 feet and upwards. The roots form a mals of fibres which are commonly fimple and without any ramifications. The tlem is generally fimple, without branches, cylindrical, and compofed of frong longitudinal fibres. The leaves, which are a compofition of a leaf and a branch, by Linnæus called frondes, are of different forms; being fometimes thaped like an umbrella or fan; fometimes fingly or doubly winged; the fmall or partial levves, which are often three feet in length, being ranged alternately. The branches, or principal leaves, are fix, eight, ten, or twelve feet long; the length varying according to the age and fize of the plant. They are covered at firf with a thick brown duft, like thofe of the ferns. The bafe of the leaves frequently embraces the greater part of the ftem. The flowers are male and female upon the fame or different roots. The flowers are all difpofed in a panicle or diffufed Cpike, except in the hydrocharis, ifratiotes, and vallifneria; in which they proceed fingly from the wings or angles of the leaves. The common calys, in this order, is that termed a foatba or fleath, and has either one ur two valves. The padis, or head of flowers protruded from the fheath, is generally branched. Each Hower is generally furnithed with a perianthium or proper flower-cup, confilting of three leaves or divifions that are fmall and permanerit. The petals are three in number, of a fubfance like leather, and permanent like the leaves of the calyx. The flamina are from 2 to 20 and upwards, cohering flightly at their bafe. The feed-buds are from one to three in number, placed in the middle of the flower, and fupporting a like number of dyles, which are very thort. The feed-veffel is generally a pulpy fruit of the berry or cherry kind, containing one cell filled with fibrous fleih, and covered with a fkin which is of a fubltance like leather. The feeds are in number from one to three in each pulpy frust, of a hard bony fubflance, round or ov l, and attached by their bafe to the bottom of the fruit,-Thefe plants, particularly the feeds, are aftringent, and of efficacy in dyfenteries.
2. Piperike. Thefe plants are moflly herbaceous and perennial. The ltalks of pothos creep along rocks and trees, into which they frike root at certain difances. The greatef height which any of them is known to attain is 15 feet; the greater part do not exceed three or four. The theify roots of many of thefe plants are extremely acrid when freth. They lofe this pungent quality, however, by being dried, and become of a foapy nature. The fmell of many of them is extremely fetid, frequently refembling that of human excrements. The flowers, however, of an Ethiopian dracunculus or arum, and the cuver in which they are involved, are fard to emit a very fragrant odour. With regard to their virtues, thefe plants are commonly attringent.
3. Calamaris. In this clufs the bale of the leaf,
which embraces the falk like a glove, has no longitudinal aperture, but is perfectly curire. The falk is generally triangular, and without knuts or joists. The roots of fome are long and knotty ; in others they are compofed of flethy fibres which pierce deep into the ground: and in others, of a bulb. The flowers are cither hermaphrodite, or malc and female upon the fame roat. The mode of intlorefcence in this order is gene. rally a fpike; fometimes a capitulum or head. The calyx is cither a gluma or an amentum. The corolla is wanting. The filaments of the Itdmina are three in number, fhort, llender like a hair, and fometimes briftly. The anthera are generally long, fender, and erect. 'The feed-bud is very fmall, blunt, and cometimes three-cornered. The llyle is thread-flaped, and of the length of the fealy caly.. The figmata are generally three in number; flender, haity, and fometimes permanemt. 'The virtues, ufes, and fenfible qualities, of this order of plants are the fame with thofe of the following.
4. Gramina. Moft of thefe plants are annual or perennial herbs; fonie of them creep upon the ground, others are erect. The roots, in the greatelt number, are creeping, and emit fibres from each knot or joint; in others they are fimply branching and fibrous. The flems and branches are round. The leaves are fimple, alternate, entire, vesy long, and commoaly narrow. They form below a fort of theath, which embraces or furrounds the llem, and is generatly cleft or divided on one lide through its whole length. The flowers are either hermaphrodite, male and female on the fame root, or hermaphrodite and male en-the fame root. They proceed either firgly from the theath of the leaves, or are formed into a panicle or loufe fpike. The calyx and corolla in this order are not fufliciently afcertained; in fome a fingle fcale or hufk, in others two, fupply the place of both covers; fome graffes have four hufky fcales, two of which ferve for the calyx, and the other tivo for the corolla; fome lave five; others fix, four of which cunflitute the calyx, and the other two are termed improperly enough the bufky petols. The corolla is fometimes compofed of orie petal with two divifions; and in general the hurks of the calyw are always placed oppofite to thofe of the corolla. The ftamins are generally three in number, and placed irregularly with regard to the fituation of the calys and corolla. 'the anthere are long, furnilhed with two cells, and flightly attached to the filaments. The feed-bud is placed upon the fame re. ceptacle as the caly.x, corolla, and famina. The flyle is generally double, and crowned with a hairy Atigma or fummit. The feed-veffel is wanting. The feedsare fingle, oval, and attached below to the bottom of the Hower. - The roots of the graffes are opening; fuch as have an aromatic friell are nomachic ; their feeds are mealy, mucilaginous, and nourihing. All the parts of thefe plants are wholefome.
5. Tripetoloidue (from tres, three; and petalum, a petal). Thefe plants have no very itroking charagers. and are nearly allicel to the grafles. All the gencas of this order have not the circumftance expreffed in the title.
6. Enfutce. This order, which is very nearly ailied to the grailis and liliacenus plantc, furnithes a very C? 2 beausiful
beautiful collection of perernial herbs, which are of diferent heights, from one inch to r 5 feet. The roots are tuberous or flefhy, and garnihhed with Gbres; the ftalks are fimple, and commonly flat or compreffed on the fides. The leaves are fimple, alternate, entire, fwerd-fhaped, and, like the liliaceous plants, form at their origin a theath or glove, which in the greateft number is cleft or divided through the whole length, except at the bafe, where it is entire, and embraces the ftalk like a ring. The flowers are hermaphrodite, and generally proceed from the furmmit of the ftalks either fingly, in an umbel, a fpike, or in a panicle. In pontederia they proceed from the wings or angles of the leaves either fingly or in an umbel. Moft of thefe plants want the perianthium or flower-cup; the flowers burfl from a common cover or theath, termed by Linnæeus Spatha, which in this order is frequently permanent. The petals are in number from one to fix. The flaminäare generally three. The feed-bud is placed fometimes above the flower, fometimes below it. The ftyle is generally fingle, and crowned with a triple ftigma. This feed-veffel is a dry capfule, generally of an oblong flape, and opens at three valves, difcovering the fame number of cells, each inclofing a quantity of roundifh feeds.-Thefe plants refemble the liliaceous in their powers and Cenfible qualities; very few of them, however, are ufed in medicine.
7. Orcbidece. The routs of many of thefe plants are compoled of one or more thelhy tubercles or knobs, attached to the lower part of the ftem, and fending forth fibres from the top. Thofe of orchis bear an obvious refemblance to the forotum in animals: from which circumfance the genus has derived its name. The leaves are of a moderate fize, infcribed with a number of longitudinal nerves or ribs, and without any footftak. At their origin they form round the ftalk a kind of theath, which is long, entire, cylindrical, but not furnifhed, like the graffes and fome other plants, with a crown at tor. The flowers are hermaphrodite, and placed at the fummit of the ftalk either in a fpike or in a panicle. The calyx is that fort termed by Linneeus a $\int p a t b a$ or Jhenth, that burfling open protrudes a head or clufler of flowers, termed the fpadix, which have no perianthium or flower-cup. The petals are five in number, and very irregular. The nectarium in this order is remarkably confpicuous; yet fo different in the different genera, that Limmeus has employed it for bis primcipal character or mark of diftinction, inflead of the root, which had chiefly engaged the attention of former botanilts. It has the appearance of a fixth petal. The filaments are always two in number, and placed upon the pifillum or female organ. The antherit are erect, and generally covered by the upper ${ }_{1}{ }_{1}$ ' of the neetarium. The feed-bud is either oblnag or pillar-flaped, twifted like a ferew, and univerfaily placed below the receptacle of the flower. The flyle is fingle, very fhort, and forms one fubflance with the inner margin of the nectarium. The feed-veffel is generally a capfule with one cavity or cell, and three valves or openings, which are keel-fhaped, and open on the angular fides, being jointed bath at the bottom and top. The feeds are numerous; very fmall, like faw-dult; and attached, without footfalks, to a flender receptacle or rih, which extends itfelf lengthwife

A N I.
in the middle of each inclofure or valve. The plants of this order are reckoned ftrorg aphrodifiacs.
8. Scitaminect. This clafs confifts of beautiful exotic plants, all natives of very warm countries. Some of them furnith exquifte fruits; but though the plants rife very high, they are perennial only by their roots. Thofe which have only one filament, have in all their parts an aromatic odour, and an acrid or poignant tafle; qualities, however, poffeffed in a much greater degree by the roots, which are hot and refinous.
9. Spathacere, fo called becaufe their flowers are protruded from a $\sqrt{p} a t b a$ or theath. They are nearly allied in habit and ftructure to the liliaceous plants, from which they are chiefly diftinguithed by the fpatha out of which their flowess are protruded.
10. Coronaric. Thele plants are herbaceous, perennial, and from one inch to 15 feet high. The roots are either bulbous, fibrous, or compofed of Imall felliy knots, which are jointed at top. The bulbs either confift of feales laid over each other like tiles, or are folid. The flem of the liliaceous bulbous plants is properly wanting; what fupplies its place being nothing elfe than the bafe of the leaves, which, wrapping or enfolding each other, form at bottom a inundifh flefhy bulb bitherto dillinguifhed, though perhaps improperly, by the name of root. In the others the ftem is fimple, that is, has few branches, and is either furnifhed with leaves, or rifes naked. The branches are alternate and cylindrical. The leaves are fimple, alternate, and entire. Thofe next the root, termed radical leaves, generally form at their origin a theath, which in a great number is entire, that is, goes all round ; whilit in others, it is cleft or divided longitudinally on one fide. The flowers are univerfally hermaphrodite, except in white hellebore, which has both male and hermaphrodite flowers mixed together on the fame root. The flowers are fometimes fingle, and terminate the fem; fometimes they form an umbel, fometimes a fpike, and fometimes a panicle. The calyx or ilower-cup, in this order, according to Limæus, is generally wanting. In ftrict propriety, however, the fingle cover that is prefent in mof of there plants, though beautifully coloured, ought to be denominated a calyx; as its divifions, generally fix in number, are placed oppofite to the flamina. 'The petals, or, to feak more properly, the coloured leaves of the flower, are in number from one to fix. Plants which have a fingle petal, bave the limb or upper part fplit into fix divifions or fegments. The petals in fome Species are rolled or turned back. The nectarium is various; in the lily it is a longitudinal line which runs through each petal, and reaches from the bafe to the middle. In crown imperial, it is a fmall hollow or pore, formed at the bafe of each petal; in afphodel it confifts of fix very fmall valves, which, approaching, form a globe, and are inferted into the bale of the petal; in hyacinth, it is compofed of three melliferous pores, fituated on the top of the feed-bud. In pineapple, it is a finall fcale lying within the fubflance of each petal above the bale; and in albuca, or baftard flar of Bethlehem, it confits of two fharp-pointed bodies proceeding from the furrows of the feed-bud, and covertd by the broader bafe of the three fertile filaments. In fome fpecies of lily the nequarium is hairy; in others it is naked. The flamina are fix in number;
erect,
erect, and inferted into the common receptacle, if the Hlower confifts of many petals; into the tube, or divifions of the corolla, if it confits of one. 'The anthere are long, commonly divided below, and flightly attached by their fides to the filaments on which they turn like a vane or the needle of a compats. The feed-bud is fingle, and placed either within the fower-cup or below it. The tlyle is fingle, thread-ftraped, and genesally of the length of the pctals. The Aigma is generally fingle, of a conic form, and fhaggy or hairy at the extremity. The feed-seftel is generally a caplule, divided externally into three valves, internally into three cells. - With relpect to the powers of the plants of this order, it may be atfirmed in general, that fuch as have Iittle talte or freell, as the roots of tulip, and Atar of Bethlehem, are perfectly innocent; whilft thofe which have a heavy naufesus fmell, as fquill, hyacinth, crown imperial, and fipider-wort, are at leall fufpicious, and frequently prove noxious.
it. Sarmentofa, (from farmentum, a long fhoot, like that of a vine.) I his order conffits of plants which have climbing Items and branches, that, like the vine, attach themfelves to the bodies in their neighbourhood for the purpofe of fupport. Thefe plants are far from being a true natural affemblage; in fact they fcarce agree in a fingle circumftance, except that exprefled in the title, which is far from being peculiar to this order.
12. Holeracee. This order confits of plants which are ufed for the table, and enter into the ceconomy of domeltic affairs: it contains trees, Ahrubs, perennial, and annual herbs. Some of the woody vegetables retain their green leaves during the winter. The roots are very long, and frequently fpindle-fhaped; from the knots on the fems and branches of fuch plants as creep on the ground, or float on the water, proceed fibrous and branching roots. The ftems and young branches are cylindric; and in the greatelt part of the aquatic plants of this order, the flalks are hollow within. The buds are of a conic form, and naked; that is, not accompanied with fcales. The leaves are generally fimple, entire, alternite, and attached to the branches by a cylindric foot-Itaik, which is fometimes very long, but commonly very thort. Some plants of this kind have two ftipulx or fcales which are attached to the branches near the origin of the foot-Italk of each leaf. In many others, intead of ftipulæ, each leaf bears on its footftalk a membranactous fheath, which is cylindric, frequently fringed on the margin, and pierced or penetrated by the flem. The flowers are either hermaphrodite; male and female upon the fame root; male and female upon different roots; hermaphrodite and male on the fame root; hermaphrodite and female on the fame root; or hermaphrodite and male on different roots.
13. Succulenta. This order confifts of flat, flemy, and juicy plants, mof of them evergreens. They are affringent, refrelhing, and very wholefome.
14. Gruinales (from grus a crane). Thefe confilt of geranium, vulgarly called cranes-bill, and a few other genera which Linnæus confiders as allied to it in their habit and external itructure. The order furnifhes both herbaceous and woody plants. The roots are fometimes fibrous, fometimes tuberous. In fome fpecies of woodforrel they are jointed. The flems are cylindric; the

## A $\mathrm{N} \quad \mathrm{Y}$.

young branches, in fome, nearly fquare. The buds are of a conic form, and covered with icales. The leaves are either finiple or compound. The flowers are hermaphrodite; they proceed from the wings of the leaves cither fingly or in clufters. 'I'he calyx or flower-cup confits of five dillinet leavee, or of one leaf divided almoft to the botoon into five parts. It generally accompanies the feed-bud to its maturity. The petal3 are five in number, fpreading, and frequently funne!flhaped. The ftamens are generally ten in number, awl-ftaped, erect, and of the length of the petals. The flamina are generally oblong; and frequently attached to the filaments by the middle, fo as to lie, and fome. times to veer about, upon them. 'The feed-bud is cither oblong or five-corncred. The number of Ayles is either one or five. In tribulus, the fyle is wanting. The feed-veffe! is generally a five-coniered capfule, with one, three, five, or ten cells. The feeds are generally equal in number to the internal divifions or the cells of the leed-vefiel; one feed being placed on each cell.
15. Inundata. The plants of the order are aquatic, of low ilature, herbaceous, and mofly perennial. The soots are fibrous. The ftem is generally wanting. In its place is an affemblage of leaves, which wrapping or enfolding each other mutually form a fheath; and from the middle of this theath is produced the footItalk of the Hower. The leaves are fometimes alternate, fometimes placed in whirls round the ftem. In a great many genera the foot ftalk is extended at its origin into a membranaceous fubftance, which forms a fheath that is cleft through the whole length, on the fide oppofite to the leaf. The flowers are hermaphrodite, or male and female on the fame root. The flower-cup is either wanting, or confifts of threc, four, or five divifions or leaves, which accompany the feed-bud to its maturity. The petals are generally wanting. 'The flamina are in number from 1 to 16 and upwards. The filaments in fome genera are fo thort, that they feem wanting. The antheræ are fhort, and generally marked with four longitudinal furrows. The feed buds are in number from one to four, the ftyle is frequently wanting. The feed-veffel is univerfally wanting, except in elatine, which has a dry caplule, with four external openings, and the fame number of cells. The feeds are generally four in number.
16. Calycifore, (from calyx the flower cup, and fos the flower), confifting of fuch plants as have the Ha mina (the Hower) inferted into the calyx. All the plants of this order are of the fhub and tree kind. Some of them rife to the lieight of 12 or 14 feet; others not above two or three. The roots are branching, fibrous, and woody. The flems are cylindric. The branches, when young, are cornered; the buds of a conic form, and without fcales. The leaves are fimple, alternate, and attached to the branches by a very fhort foot-Italk. The flowers are either male or female upon dittinet roots, or hermaphrodite and male on the fame root. The calyx is a perianthium compofed of one leaf divided into two, three, or four fegments. It is commonly placed upon the germen or leed-bud, which accompanies it to maturity. The corolla is univerfally wanting, except in trophis, the male plants of which, according to Linneus, have four obtule and fpreading petals. The ftamina are generally four in number,

Alender líne a hir, noot, placed at a confiderable diftance from the nyle, and inferted into the tube of the calyx. The piftilum is compofed of a rourdifh germen, cro:vned with the calys; a fingle thread-fhaped fyle; and a cylindric digma. The feed-veffel is either ar obrufe oval fruit of the cherry kind, or a globular berry with one cell, containing a roundint leed. The plants of this order are aftringert.
17. Calyantheme, (from calys the flower-cup, and cuso; the fower); confifting of plants, which, among other characters, have the corolla and Itamina inferted in the calys. This order furninhes trees, thrubs, and annual, biennial, and perennial herbs. The heibaceous annuals are by much the mol numerous. The roots are branching and fibrous; the ftems and branches cylindric, fquare, or four-corncred while young. The buds are of a conic form, and without fcales. The leaves are generally either alternate, fimple, and attached to the branches by a hort foot-ftalk, or oppofite to the bottom of the ftem; and, in fome, alternate towards the top. They are univerfally feffile; that is, attached to the branches, without any foot-falk. The calyx is univerfally a perianthium, and generally monophyllous, or compoled of one leaf. The corolla confitts of four, five, and fix petals, which are attached to the tube of the calyx, and are fometimes placed alternate, fometimes oppofite to the divifions of the limb. The famina, which are in number from 4 to 20 and upwards, are attached to the tube of the calyx either on its margin or lower down. When the number of flamina is double the divifions of the calyx, the flamina which fland oppofite thefe divifions are a little longer than the reft. The anthera are generally of a hemifpherical figure; frequently cleft or hit below; and by that aperture attached 』ightly to the filaments, on which they ofien veer about like a vane or needle. They are furrounded langitudinally, and open on the fides into two loculi or cells. The pollen, or male duft, confifts of a number of minute particles, of an oval figure, yellow and tranf. parent. The germer, or leed-bud, is placed either above or under the receptacle of the fluser. The ftyle is fingle, threat-haped, and of the length of the itamina. The figmi is generally fingle and undivided. The feed-veffel is a capfu!e, which is generally divided internally into four loculi or cells. The feeds are numerous, minute, and frequently three-cortiered. The plants of this order are reckoned altringent.
18. Bicornes, (from Lis twice, and corm, a horn), plants whofe anthere have the appearance of two horns. 'This appearance, however, is not very confpicuous, unlefs in a few genera. The plants of this order are all of the flrub and tree kind. The roots are branching and fibrous. "1":ie flems and branches are cylindric. The buds conic, fometimes covered with fcales, and fometimes maked. 'I'ise leases are generally alternate. In moll plats of this order they are cither feffle, or fupported by a very fhort foot-ftalk, which is femicylindric, and tlat above. The flowers are univerfally hermaphrodite, except in one genus, the Indinn dateplum, where hermaphrodite and male Howers are produced in the fame fuecies upon ditinet roots. They proced either folitary, or in a corymbus, from the angles formed by the leaves and b:anclies: of hang down in fpikes and cluffers at the end of the branches; each llower having a fma!? fos!e or t!oral leaf placed
under it. In mof plants of this order the calyx is placed around or below the germen. The calyx is univerlally a perianthium, and gencrally monophyllous or of one piece, deeply diviued into four or five fegments, which are permanent, that is, accompany the germen to its maturity. The fegments are ofter acute, and fometimes coloured. The corolla is generally monopetalous, and bell or funnel-haped ; the figure, however, is not very conflant, even in plants of the fame genus. The limb, or upper part of the petal, is generally divided into four or five fegments, which are fometimes rolled back, fometimes bent inwards. The limb too is fometimes flightly cut, fonetimes divided almof to the bottom. The tube, or lower part of the petal, is cylindric, and generally of the fame length with the calyx. The number of Aamina is from 4 to 20 . Thefe are generally erect, and attached to the lower part of the tube of the corolla. The antherx are bifid or forked below, and, being flightly attached to the filaments, are frequently inverted in fuch a manner as to exhibit the appearance of two horns at top. The germen or feedbud, is generally roundifh, and feated above the receptacle. The flyle is fingle, thread-haped, of the lame length with the corolla, and in a few genera permanent. The feed-veffelis eitheracapfule with five cells, a round ill berry, or an oblong four-cornered rut with two cells. -The plants of this order are aftringent.
19. Hesperidece, (from the Hefperides, whole orchards are faid to have produced golden apples). The plants of this order are of the flrub and tree kind, and moltly evergreen. The bark of the flalks is flender, and comes off in thin plates. The leaves are generally oppofite, and covered with fmall tranfparent points. In fume, the leaves are placed oppofite at the bottom of the ftalks, and alternate above. The buds are of a conic form, the Howers generally hermaphrodite; they proceed from the wings of the leaves either fingly, or in clufters like ivy-berries. The calys is placed above the feed-bud, and accompanies it to its maturity. The petals are three, four, or five in number, and fland upon the brims of the tube of the calys. The feed-bucl is large, oblong, and placed below the receptacle of the fluwer. The llyle is fingle, awl-haped, of the length of the flamina, and terminated with a fingle figma. The feed-veflel in fome genera is a berry furninhed with one or three cells; a capfule with four cell:, or of the nature of the cherry, containing a flone. 'The fecds are generally numerous, fmall, and oblong. The leaves and fruits are aftringent, the berries efculent.
20. Rotacee (from roia, a wheel), confiting of plants with one wheel-fhaped petal without a tube. Thefe refemble in quality thofe of the order of Precia, to which they are in all refpects very neasly allied; tut very few of them can be faid in flriet propriety to pol. fefs the character fpecified in the title.
21. Precie (from precius early). Thefe confift of primrofe, an early flowesing plant, and fome others which agree with it in habit and 11 ructure, though not alsays in the character or circumftance exprefled in the title. Thefe plants, which polfefs no llriking uniform characters, are, in general, innocent in their quality; yet the root of fow-bread is dangerous, if taken intern:lly.
22. Caryophyllca. $\Lambda$ Il the plants of this order arc liesbaccous, and mollly annual. Sume of the creceping
kinds do not rife above an inch, ard the talleft exceed not feven or eight feet. The roots are branching, fibrous, and of a moderate length. The ftems are cylindrical. The branches procced from the wings or angles of the leaves, and are generally opporite, and as it were fointed at each knot. In fome foccies of ceraftium the branches are foure. The leaves are generally placed oppofite in pairs, fo as to refemble a crof; : and are flightly united at the botem by their foot-thalks, which form a fort of glove round the fem. The hairs are fimple, like fill. The flowers are hermaphrodite: but lome have male and female flowers upor diftinat roots. They eithe: ftand fitggle on their footha'ks, and procecd from the wings or angles of the leare and branches, or are difpofed in a fpike, corymous, unb-1, or panicle. The calys is permanent. and compof either of one piece with five indentments, or of four or five diftine leaves. The corolla generally confifts of five petals, which have claws of the length of the calys: aud a fpreading limb, fometimes entire, but offener cleft or divided in two. The flamina are in numier from 3 to 15 , and of a moderate length. When thair number is double the divifions of the calys, they are attached alternately to the claws of the potals, thofe fo attached being florter than the reft; the remaining of emina are inferted into the cornmon receptacle, and fland oppofite to the fegments of the calys. In fome genera of this order the number of flamina is found to vary, even in the differcht llowers of the fame plant. The anthere are fhort, hemipherical, marked with four longitudinal furrows, frequently divided or cleft below, moll commonly erect ; fometimes, howerer, incumlent, that is, fallened to the flaments by the fides. The pointal is compofed of a fingle feed-bud, which is generally roundifh, fometimes cornered. The ftyles are thread flaped, of the length of the famina, and crowned with a fimple figma, which is fleek or fmooth externaily, and flightly bollowed or vaulted within. The feed-veffel is a dry caplule, of an oval form, of the length of the calyx, and confifts of one or three celle. The plants of this order are innocent in their quality; they abound in a watery fort of phlegm, and have bitter feeds. With sefpeet to their virtues, they are reckoned aff ringent, attenuating, and deteffive.
23. Tribilatic (from tres three, and bilum an external mark on the feed); confifting of plants with three feeds, which are marked diftinctly with an external cicatrix or fcar, where they are faftened within to the fruit.
24. Corydales (from xogss, a helmet); confifting of plants which have irregular flowers, fomewhat refembling a belmet or hood. Thefe plants are moftly herbaceous and perennial. The rnots are taberous or knobby. The fems are generally branching. The leaves are alternate, fometimes fimple, but mof commonly winged. The foot-ftalk of the leaves is ftrait or narrow, except in epimedium, where it is large, and has a membranous edge or border. The flowers are univerfally hermaphrodite. They proceed either fingly from the wings and angles of the leaves, or are collected in clufters at the end of the branches. The caly. confifts of two, four, five, or fix leaves, which are frequently coloured, and commonly fall off immediately before, or very foon after, the expanfion of the petals. The corolla is generally irregular; of one, or many
peces; gaping; and furnihed with a neetarium, which is very different in the different gencra. The famina are in number from two to fire, and of a propotionate length, except in honcy flower, which has two flouter than the relt. 'l'he filaments are difinet, except in two genera, fumitory and momicria, which have two Fet, nf: Atrings or flaments united in a cylinder. The anthere the uniserfal'y dilmint, except in intataichs, where they are formed into a cylinder divided at the bafe. The feed-bud is "ecucrally rountifly, but fometimes angular or cornered. The fiyle is commonly frugle, extremely flort, flender, or thread fhaped, and crowned with a fimple lligma. The [ect-veffel is either a hollow blown up beriy, a capfule of one cell, a longifh, or a roundith pod. The feeds are gencrally numerons and round.
25. Putarniace (from putamen, a fhell): conffing of a few genera of plants allied in liabit, whofe thefly feed-veflil or fruit is frequently covered with a hard woody flell. Niout of thefc plants are acrid and pcnetrating; and yicld, by burning, a great quantity of fixed alkali. With refpect to their rirtues, they ate poserful aperients. The Indians pretend that the fruit of a fpecies of caper-buth, which they call laducca, extinguifles the flames of love.
26. Distifilique (from maltus many, and filigua a pod) ; confifing of plants which have more feed-veffels than onc. From the etymology of the term, one would tratarally imagine that the feed-veficls in quefion were of that kind called by Linnseus frliqua, or pod; but the fact is, that not a fingle phant of this order bears pods; the greater part traving many dry capfules, and the remainder being fornifhed properly with no feed-vefiel, but bearing numerous diftinct feeds. Plants of this order are mofly perennial heibs: the ficms of fome are ereat; others creep upon the ground, and produce roots near the origin of each leaf; lafly, others climis, and attach themfelves to the bodics in their neighbourtood, either by the foot flalk of the learec, or by tendrils and clafpers which terminate the footfalk. The greateft height of thofe which rife creat, feldom exceeds eight feet. Thofe which climb rarely excced 15 or 20 feet. The roots are generally illefhy. In tome they are hand-flaped; in others finger-fhaped, or cylindric. In forme fpecies of hellebore and ranunculus they are divided into fpherical knobs. Laftly, In fome plants of this order, the roots are fibrous. The ftems and young branches are cylindric. The leaves, which are of different forms, being fometimes fimple and entire, fometimes hand-fhaped or winged, are generally alternate. The foot-ftalk, which is fometimes cylindric, fometimes angular, is membranous, and very large at its origin, furrounding a great part of the fem from which it proceeds. The tlowers are bermaphrodite. They proceed either fingly from the wings of the leaves or termination of the branches, or terminate the branches in a fpike, panicte, or head. The calyx and fome is wanting; in others it is generally compofed of five pieces, which fall off with the petals. The petals are in number from 4 to 15 ; generally equal, and fometimes difpoled in two or three feries; five is the prevailing number. The famina are in number from 5 to 302 , dillinet, and attached g.nerally in feveral rows or lieries to the receptacle. The feed-buds are generally numerous; the Ryle is frequently wanting. In
fome the feed veffel is wanting; in others it is compofed of feveral dry capfules, each containing a fingle cell. The feeds are numerous, and frequently angular. Mioft of thele plants are acrid, and many of them poifonons. In :ceneral, plants that hove a great number of itamina ere noxious in their quality. When burnt, thefe plants furnith a fixed alkali; by diftillation there is drawn from them a kind of nitrous and aluminous fubftance. With refuect to their virtues, they are cauflic and purgative.
27. Rbeedce, confifling of poppy, and a few genera which relemule it in habit and flructure. Thele platats, upon being cur, emit plentifully a juice, which is white in poppy, and yellow in the othere. With refpect to their sirtues, they fe-m to upera'e principally upon the nerses. Their juice is Soporific and narcotic, their feeds lef. fo, their roots aperient. Applied externally they are flightly corrofive.
28. Lurida, confilting of plants whofe pale and ominous appearance feems to indicate fomething baleful and noxious in their natural quality. Moft of thefe plints are herbaceous and perennial. Many of them are of the m Ned tribe of flowers; others refemble thefe in their general appearance, but differ from them effentially in the equality of their ftamina. The roots are generally branched, fonsetimes tuberous. The flems and branches are $c y l i n d r i c$. The leaves are generally fimple, and placed alternate. The flowers are hermaphrodite. They proceed either fingly or in clufo ters from the angle formed by the leaves and branches. In fome fpecies of lycium, they terminate the branch. es. The calyx is generally of one piece, deeply divided into five parts. The corolla confifls of one petal, which is either bell, funnel, or wheel-lhaped. The flamina are four or five in number; and thofe either of equal lerigths, as in the greater, or unequal. The feedbut is placed above the receptacle of the Hower. The ftyle is fingle ; and is terminated by a fummit which is hemifpherical, and frequently channelled or furrowed. The feed-vefiel, in fuch as have equal iftmina, is a berry; in the reff, it is generally a capfule. The feeds are numerous, and frequently kidney-h iped. Thefe plants in general are poilonour. They have an infipid tafte, and a naufeous difagreeable fmell.
29. Campanaces (from cam?ana, a bell); plants with bell-fla aped flowers. The plants of this order are herbaceous and perennial. The roots are either finindleflaped, or branching and fibrous. The flems are round. The branches are generally alternate. The leaves are fimple alternate, and commonly attached to the branches by a femi-cylindric foot-filk, which is furrowed above. The indentments are terminated by a fmall white tuhercle or knob, which renders them confpicuous. The flomers are hermaphrodite; and proceed either folitary from the wings of the leave,, or are collected into a fpike and head at the end of the fowerfalk. The calyx is univerf.lly a perianthium fituated upon or round the germen, and penerally compored of one leaf deeply livided into five fegments. The coroll+ is monopetalous, and of the be H1, funnel, or wheelftape. The tube, in flowers of the bell and wheel-flape, is very floort; in thofe of the funne!-flape, very long. In Greek valerian, the tuhe is flat with five valves, whichare placed on its apex or top. The limb or upper part of the corolla is deeply divided into five fag.

A N T.
ments, which frread, and are alternate with the divifions of the calyx. The cotolla is generally permanent. The Al mina are five in tumber, attached to the bate of the wile of the corolla, alternate with its divifien, and oppofite to thofe of the calyx. The filaments are diflinet; very laige at their orgin ; and frequently ap. proach fo as to form a fort of vault, which cuvers the lummit of the germen. They are flender and awla flaped above. The artheree are very long; oval; marked with four longitudimal furrows, either diftinet, or usited in a cylinder. The pollew is cumpoled of very fmall, Ipherical, white, flining, and tranfparent particles. The germen is roundifh, and fituated either wholly or in part under the flower. The flyle is generally fingle, and of the length of the flamina or co. rolla. The figma is commonly fingle. but deeply divid. ed. The fecd-veffel is a roundifh captule, generally divided into three ce'ls, and furnifhed externally with the fame number of valves. The feeds are Imall, numerous, attached to a receptacle in the centie of the fruit, generally rounded, and lometimes cornered. $\rightarrow$ This order luanfles many excellent medicines. The plants abound with a white milky juice, which, upon the ftalk being $\mathrm{cn}^{\text {t }}$, flows out in great quantities.
30. Conturta, (from con together, and torqueo to twill) ; confithng of plants which have a fingle petal that is twitted or bent towards one fide. This order furnilhes trees, flirubs, and fat fucculent plants, fume of which retain their leaves during the winter. The herbaceous vegetables in this order are generally peren. nial. The roots are fometimes branching, but com.. monly flefthy, fuccalent, and garmilhed with fibres or flrings like thofe of turnip. The llems are round and in fome genera pulpy and fucculent. The branches are fometimes placed altenate, and fometimes oppofite. The buds are of a conic form, and naked or without fcales. The leaves are fometimes alternate, fometimes placed oppofite in pairs, and not leldom furround the ffem in shirls. They are attached to the branches by a cylindrical toot-lialk, which is fhort, and frequently united to the fout-flalk of the oppofite leaf. The defenfive and offenfive neapuns in this order are a downy fort of pubefcence, and fimple or forked prickles, which, in fome genera, iffue from the wings of the leaves. The flowers are hermaphrodite; and fand either fingly upon their footflalks, or are collested into umbels and clullers. Thefe bunches or collections of flowers fometime terminate the branches, fometimes proceed from the angles of the branches, and fometimes ftand at the fide of the wings without ifluing from them. The flower cup is compofed of one leaf divided almoft to the bale in five uncqual fegments, which embrace each other, and are permanent, or accompany the feed-bud to its maturity. The corolla confills of one petal, which in the rifferent gencra is bell, falver, funnel, or wheel-(lhaped. The limb, or upper fpreading part of the petal, is generally divided into five equal parts. Which are flightly bent or cwifled to the leff, and embrace or entold each other like the petals of the mallow thiber. The tube is generally long and culindricil; fomet mes club-haved, and often wanting. In feveral fluwers of this ofder the petal is accompanied with that fpecies of fuperfluity termed a neffrium. In the different genera, however, it aftumen very iffer. ent appearances. The llamina are five in number, flort,
equal, attuched at the fame height to the tube of the petal, alternate with its divilions, and oppofite to thofe of the calys. The anthers are generally erect, and frequently approach fo as to form a compact budy in the middle of the flower. The leed-bud is cither fingle or double. In fome the ftyle is wanting. The Itigma is frequently double. The feed-veffel in fome genera is a pulpy fruit, of the berry and cherry kind; but moft frequently that fpecies termed by Linnæus concepraculum, and folliculus, which has one valve or external enclofiure, opens lengthways on oue fide, and has not the feeds faftened to it. Two of thelic dry fruits, with a fingle cell, compofe the feed-veffel of moit plants of this orde:. The feeds are generally numcrous, and in feveral genera rowned with a long pappus or downy wing like that of the compound flawers, by means of which they eafily difperfe and fow themfelves. -The plants of this order heing cut, emit a juice which is generally milky, and fometimes of a greenifh white. From the circumftarce of their abounding in this milky juice, the greater part are deemed poifonous; repeated oblervations having eftablifhed this aphorifm, That milky plants, except thofe of the plain compound flowers, are generally of a baneful deftructive nature, and ought at leaft to be adminiftered with caution. With refpect to their fenfible qualities, they are bitter; particularly the feed, roots and bark, in which refides their principal virtue.
31. Vepreculie, (from vapres, a briar or bramble), confifing of plants refumbling the dapline, dirca, gnidia, \&ic. but which, however, do not conflitute a true natural aflemblage.
32. Papilionacce, plants that have papilionaceous flowers, i.e. fome what refembling a butterfly in flape; of which number are all the leguminous plants. The plants of this order are of very different duration; fome of them being herbaceous, and thofe either annual or perennial; others woody vegetables of the fhrub and tree kind, a few of which rife to the height of 70 feet and upwards. The herbaceous plants of this order generally climb: for, being weak, and as it were helplefs of themfelves, they are provided by nature with tendrils, and even fharp-pointed hooks, at their extremities, to faflen upon the neighbouring trees or rocks; or the ftalks are endowed with a faculty of twitting themfelves, for the purpofe of fupport, around the bodies in their neiglabourhood. The pea, vetch, and kid-ney-bean, afford familiar examples of this appearance. The fhrubs and trees of this order are moftly armed with ftrong fpines. The roots are very long, and furnified with fibres; but forse genera have flefly knobs or tubercles placed at proper intervals along the fibes. The ftems are cylindric, as likewife the young branches, which are placed alternately; thofe which climb, twint themfelves from right to left, in a direction oppofite to the apparent motion of the fun. The bark of the large trees is extremely thick and wrinkled, fo as to refemble a net with long melhes; the wood is very hard in the middle, and commonly coloured or veined. The buds are hemifpherical, without fcales, and proceed from the branches horizontally a little above the angle which they form with the leaves. The leaves are alternate, and of different forms, being either fimple, finger-flaped, or winged. This laft form is very common; the lobes or leffer leaves are entire, and fonctimes placed

Vol. IV. Part I.
in pairs, but mof commonly the winged leaf is terminated by an odd lobe. The winged or pinuated lenies of this order have a daily or periorical motion, depending upon the progrefs of the luo in his durnal courfe. The common footfa!k of the winged ard compound leaves is marked on the upper lurface with a cavity or furrow which runs through its whole length. The flawers are hermaphrodite; and procced either Iron the wings of the leaves, or from the extremity of the branches. The calyx is a perianthium of one leaf, bellAlaped, bunching out at the bottom, and cut on iss brim or margin inta five irregular divifions or teeth; the lowermof of which, being the odd one, is longer than the relt : the other four itand in pairs, of which the uppermoll i, Nlortell, and flands farthelt afunder. The bottom of the caly: is moilterced with a fweet liquar litic honey, fo may be deemed the nectarium of thefe plants. The petals are four or five in number, very irreguldar, and from their figure and pofition bear an obvious refemblance to a buttertly expanding its wings for flight. Thefe petals have been characterized by diftinct names: the upper one, which is commonly the largeft, is termed the flandard, (vexillum) ; the two fids petals, the vings, (alc) ; and the lowermoft, which is generally united at top, and divided at bottom, the keel, (carina). The ftamina are gencrally ten : thefe are tither totally diItinct, or united by the filaments into one or two bundles involving the feed-bud. In the later cife, where there are two fets of united filaments, one of the fets is compofed of nine flamina, which are united into a crooled cylinder, that is cleft on one fide through its whole length; along this cleft lies the tenth filament or llamen, which conftitutes the fecond fet, and is often fo clofely attached to the fecond buncle, that it cannot be feparated without fome difficulty. The antherx are fmali, round, marked with four longtudinal furrows, and flightly attached to the filaments. In lupine, the anthere are aiternately round and oblong. The feed-bud is fingle, placed upon the receptacle of the flower, oblong, cylindrical, flightly compreffed, of the length of the cylinder of the united ftamina by which it is involved, and fometimes elevated by a flender footfalk which iffues from the centre of the calyx. The ftyle is fingle, flender, and generally crooked or bent. "The ftigma is commonly covered with a beautiful down, and placed immediately under the antheræ. The feed-veffel is that fort of pod termed a legumen, which is of an oblong figure, more or lefs comprefled, with two valve", and one, two, or mure cavities. Thefe cavities are offen feparated, when ripe, by a fort of joints. The feeds are generally few in number, round, imooth and flethy. Jointed pods have generally a fingle feed in each articulation. The feeds are all faftened along one future, and not alternately to both, as in the other fpecies of yod termed flifina--The plants of this famaly are, in general, mucilaginous. From the inner batk of moft of them flows, cither naturally or by incifion, a clammy liquor, which dries and hardens like gum; the juicc of others is fweet like fugar; fome tafte bitter, and are purgative, cmetic, or even mortal. A pecies of eaftern aftragalus, with goats-rue leaves, is faid to be remarkably cauftic, and to burn the tongue exceffively whon chewed. In general, however, thefe plants are foft and clammy. With refpect to their virtues, the plants of this order are highly emollient; fome of them are R .
vulnerary
valnerary and aftingent ; and the root of anouis, or rath-harrow, is diuretic.
33. Lomentaces, (Irom lomentum, a colour ufed by painters). Many of thefe plants furnilh beautiful tinctures, and fone of them are much uled in dyeing. They very much refemble the laft order, differing only in the following particulars. i. In all plants of this order, except milk-wort, the famina are diftinct. The flower is not theped like a butterfly, but is lefs irregular, and frequently confifts but of one petal. The leaves are fometimes fimple, but moll commonly winged. The feeds are commonly marked with a circular furrow on both fides. Like thofe of the leguminous tribe, the plants of this order are generally mucilaginous. Fron the inner bark of the greater number exudes, either naturally or by incifion, a mucilaginous liquor, which fometimes dries upon the plant, and becomes a gummy fubfance.
34. Cucurlitacea, (from cucurlita, a gourd); confifting of plants which refemble the gourd in external figure, habit, virtues, and fenfible qualities.-The plants of this order, which generally climb, and have long diffufed branches, are mofly herbaceous and perennial. The roots in the perennial plants of this order are flaped like thofe of the turnip; in the annuals they are branching and fibrous. The fems are cylindric and fucculent. The young branches have gene. rally five corners. In fome feecies of paffion-flower they are fquare. The leaves are alternate, angular, and fometimes hand-fhaped. They are attached to the branches by a foot-ftaik, which is pretty long and cylindrical, without any furrow. From the wing or angle of e:ah of the upper leaves proceeds a tendril, which is either firmple or branching, and twifts itfelf fpirally round the different bodies in its neighbourhood, for the purpofe of fupporting and training of the branches. The lower leaves have no tendril. The flowers are either hermaphrodite or male and female. In this laft, the male flowers are generally feparated from the female upon the fame root; and that either in the fame wing or angle of the leaves, or in different angles. The flowercup, in the female flowers, is placed upon the feedhud; and generally confiffs of one bell-flaped leaf, that is deeply divided into five unequal fegments, and unlike the other plants which have the calyx feated upon the fruit, falls off with the petals and the other parts of the flower. The corolla confifts of one petal, with give cqual divifions, which adhere to the tube of the calyx, as if glucd to it. A fpecies of paftion-flower, termed by Linneus pa/fifora fuberofa, wants the petals. The flamina are in number from one to five, fiort, and generally inferted into the caly. The filaments are diflinct; the antherre of many genera are united in a cylinder. In the pallion-flower they are flightly attached to the filanents, of which they turn like a vane or the needle of a compafs. The feed bud is fingle, and placed below the receptacle of the flower. The fyle is generally fingle, cylindrical, of the length of the calys, and crowned with a triple figma. The feed-veffel is yenerally pulpy, of the apple or berry kind, and confifts of one, two, or three cells. The feeds are numerous, generally flat or compreffed, and fometimes covered with that kind of proper coat called by Linnaus arillus-The fruit of the?c plants is generally purga-

A N Y.
tive and refrefling ; that of fome of them proves a very violent entetic when ufed too freely.
35. Senticefe (from fentis, a briar or bramble); confifting of the role, bramble, and other plants which refemble them in port and external flructure. Tiefe plants are fo nearly allied in form, habit, and ftructure, to thofe of the matural order Pomaceex, that they ought never to have been feparated from it. The leaves have a flyptic tafte; the fruits are acid and cooling. With refpect to their vistues, the leaves are vulnerary and affringent, the roots are diuretic. The acid fruis, as fl raw berry and rafpberry, are ufed with fuccefs in putrid and hilious fevers, as likewife in contagious and epidemic dyfenteries, which prevail in fummer and autumn, and are occafioned by a fudden tranfition from a hot to a cold air, or by the acrid humour which flows into the inteftincs.
36. Pomacec, (from pomum an apple); confifting of thofe which have a pulpy efculent fruit, of the apple, berry, or cherry kind. The plants of this order, which furnith many of our moft efteemed fruits, are moftly of the flirub and tree kind. The roots are branched, fibrous, and in the greater part very long. The flems and branches are cylindric. Thefe laft are placed alternate; and, when young, are, in fome genera angular. The bask is thick and wrinkled, The buds are of a conic form, placed in the angles of the leaves, and covered with fcales which lie over each other like tiles. The leaves, which differ in form, being in fome genera fimple, in others winged, are, in the greater number, placed alternate. The footitalk of the leaves is furrowed above, and frequently accompanied by a number of knobs like glands. Moft of thefe plants are furnifhed with two flipulx at the origin of the young footfalks of the leaves. Thefe, in fome genera are pretty large : in others, they are fo fmall as fcarce to be perceived; and in cocoa-plum, in particular, they by their minutenefs refemble hairs. The flowers are univerfally hermaphrodite, except in fpirca aruncus, in which male and female flowers are produced on diftinct plants. In the greater number of genera they are produced in clufters or heads at the end of the branches. The calys is of one piece, with five fegments or divifions, which are permanent, and placed above the feed-bud in fome; in the reft, they either fall off with the flower, or wither upon the flalk. The petals are five in number, and are inferted into the tube of the calyx. The famina are generally 20 and upwards, and attached like the petals to the margin of the tube of the calyx. The antherre are fhort, and nightly attached to the filaments. The feed-bud is fingle; and in thofe genera which have the calyx permanent, it is placed below the receptacle of the flower. The feed-veflel is a pulpy fruit of the apple, berry, or cherry kind. Thofe of the apple kind are divided internally into a number of cavities or cells. The feeds are numerous. - ']he pulpy fruits of this order are acid, efculent, and of great efficacy in putrid and bilious fevers.
37. Columnifira, (from columna a pillar, and fero to bear) ; confifting of plants whofe flamina and piftil have the appearance of a column or pillar in the centre of the flower. This order furniftes a choice collection of herbs both annual and perennial, fluubs and trees. Thefe are very different in fize and hicight, from :he
creeping mallows, and low flrubby tea-tree, to the fle ihy limes, and the more lofty filk-cotton trees, which by fome modern writers are aflirmed to be fo large as not to be fathomed by 66 men , and fo tall that an arrow cannot reach their top. The fhrubs and trees of this order are deciduous, pretty thick, of a beautifut appearance, with an erect flem, which is formed by its branches and foliage into a round head. The roots are extremely long, branch but little, and either run perpendicularly downwards, or extend themfelves horizontally below the furface. The ftems are cylindric. The young branches, though commonly of the fame figure, are fometimes angular. The bark is thick and pliant. The wood, in general, is very foft and light. The buds are of a conic form, naked, or without licales; and fituated either at the extremity of the branches, or in the angle formed by the branch and leaf. The leaves are alternate, fimple, divided into fevernl lobes, and frequently hand or finger-fhaped. The ribs or nerves on the back of the leaf, in fome genera of this order, are provided near their origin with a number of hollow furrows or glands, which, being filled with a clammy ho-ney-like liquor, have been confidered as fo many vefiels of fecretion. The footfalk of the leaves is cylindric, fwelled at its origin, and appears jointed at its junction with the branch. The flowers are univerfally hermaphrodite, except in bigzeleria, and a 〔pecies of Virginian marfhmallow, called by Linnæus naprea dioica; the former of which bears male and female, the latter male and hermaphrodite, flowers on different roots. In many plants of this order, the flowers generally open about nine in the morning, and remain expanded till one in the afternoon. The flowers either terminate the branches, proceed from the argles of the leaves, or are difpofed either fingly, or in a corymbus, along the branches or ftem. In mott of thefe genera the calyx is fingle, but in others frequently double. In thefe laft the inner calyx is always of one piece, generally divided into five fegments; the outer confifts either of one leaf, of three diftinct leaves, or of many. The calyx, when fingle, is fometimes compofed of one leaf which is permanent, or of feveral diftinet leaves which are generally coloured, and fall off with the petals. In plants that have a double calyx, both flower-cups are generally permanent. The petals in this order are from four to nine; five is the prevailing number. The ftamina, which are in number from 5 to 20 and upwards, are generally inferted into the common receptacle of the calys, or into the piftillum or feed-bud. The filaments are either difinct, or united in a cylinder, which, proceeding from the receptacle of the calys, furrounds the feed-bud, and attaches it felf to the bafe of the petals, with which it nightly unites. The anthere are frequently roundif, and placed erect on the filament ; mof commonly, however, they are oblong or kidney-thaped, and flightly attached by the middle, or fides, to the filaments, on which they turn like a vane or needle. This laft is, particularly, the characerintic of all the mallow tribe. The feed-bud is generally roundilh or conic ; and fometimes, as in the tea-tree, angular. The feed-veffel is gene. rally a capfulc ; Cometimes a pulpy fruit of the berry or cherry kind. In fome, it is a woody or membranous capfule, divided into as many cells internally as there were partitions in the feed-bud. The feeds are generally folitary, fometimes angular, and fometimes
kidney-fhaped. - Thefe plants are mucilagiraos and lubricating.
38. Tricoccez (from ress, lbree, and rowxos, a yrain): confifing of plants with a fingle three-comerel cap. fule, having three cells or internal divifions, each containing a fingle feed. The fingle feed-veliel of the fo plants is of a fingulir form, and refembles three capfules, which adhere to one common fuotitalk as a centre, but are divided externally into threc pretiy deep partitions. This family is not completely natural. It man be obferved, however, that the character expreffed in the title is a lriking one; and that though the plants which poffefs it are not connected by fuch numerous: relations as to form a truc natural affemblage, yet they are by that circumflance dillinguifled from all other plants with as great, nay greater facility, than by any artificial character yet known. Bat all the genera of this order have not the friking chara凡ter juft mentioned.
39. Siliquofa, (from filiqua a pod); confining of plants which have a pod for their feed-veffel. This order chietly furnifhes biemial and perennial herbs of an irregular figure. The roots are long, branched, crooked, and fibrous. In fome they are fucculent and flefly, in others jointed. The ftems and young branches are cylindric. The leaves, which differ in point of form, being fometimes fimple, fometimes winged, are generally flaced alternate. The flowers are hermaphrodite, and in the greater numiver ditpofed in a fpike at the extremity of the branches. The flower-cup is compofed of four leaves, which are obJong, hollow, blunt, bunched at the bafe, and fall with the flower. Thefe leaves are fometimes erent, and fometimes fpread horizontally. The pctais, which are four in number, fipread at top, and are difpoled like a crofs : the claws or lower part of the petals are ereet, flat, awl-haped, and fomewhat longer than the calyx. The upper part widens outward. The famina are fix in number; two of which are of the length of the calys, and the remaining four fomewhat longer, but florter than the petals. The antherse are of an oblong figure, pointed, thicker at the bafe, and ereat. Betwixt the flamina, in plants of this order, are generally lodged one, two, or four, round greenih, knote, which in fome genera are fo fmall as to elucle the fight. Thefe glands, called by Linnaus glandula neflarifere, and ufed very improperiy by that author as an ctiential charater in difcriminating the gencra, feem to be prominences of the receptacle of the flower, occafioned by the Atamina being deeply lodged in its fubutance. The feed-bud is fingle, and itands upon the receptacle of the Hower. The Ayle, which is either cylindric or flat like a fcale, is of the length of the four longer Atamina in fome genera : in others it is very thort, or even wanting. It accompanies the feed-bud to its maturity. The nigma is blunt, and fometimes deeply divided into two parts. The feed-veffel is cither a long pod, or a hlort and round one. Either fort has two valves, or external openinge, and in a great many genera the fame number of internal cavities or cells, the partition of which projects at the top beyond the valves. The feeds are roundik, fmall, and attached alternatciy by a flender thread to both fueures or joinings of the valves. Tliefe plants have a wasery, tharp, lisivial taftc; and are ch.rged with a faxed alkaline

R 13
falt,
falt, which is drawn from then by burning, and being diftilled without any addition produces a volatile alkali. Mun of them have a finking fmell. With refper to their virtues, they are diuretic, attenuating, deterfive, and antifcorbutic. Thefe qualitios, however, ate mott eminently poffeffed hy the live plants; when dried, they either entircly difappear, or are greatly diminifhed. Applied externally, thefe plarits are uffeul in difeafes of the fini, as the itch, leprofy, \&\&c.
40. Perfonata, (from ferfona, a mafque) ; confifting of a number of plaris whofe flowers are furnithed with an irregular, gaping, or griming petal, in figure fomewhat refembling the fnont of on animal. This order furnithes both herbaceous and woody vegetables of the flarub and tree-kind. The roots are generally fibrous and branched. The ftems and branches are cylindric when young, except in fome fpecies of fig. wort, in which they are figure. The leaves are fimple, generally placed oppofite in pats at the bottom of the branches, but in many genera fand alternate toways the top. The fowers are univerfally leermaphrodite; they proceed either fingly or in clufters from the wings of the leaves, or terminate the branches in a fpike, panicle, or head. The calyx is of one leaf, which is cut into two, three, four, or five fegments, or divifons, that are permanent. The corolla is compofed of one irregular petal, with two lips, refembling, as was already obferved, the head or frout of an animal. In fome plants the flamina are two or four in number, and of an equal length; in others they are univerfally four in number, two of which are lung and two fhort. The fecd-bud is fingle, and placed above the receptacle of the flower. The calyx is fingle; thread-haped; bent in the direction of the ftamina; and crowned with a lligma, which is generally blunt, and fometimes divided into wo. The fred-vefiel is a capfule, gencrally divided intertally into two cavities of cells, and exteinally into the fame number of valves or enclofures. The feeds are nomerous, and affixed to a receptacle in the middle of the capfulc.- Thefe plants foficfs nearly the fame qualities with the lip flowers, though: in a lcfs degree. With refpee to their virtues, many of them are aperient, anodyne, porgative, and ceven emetic. The internal ule of many of them is extremely pernicions; applied exiernally, they are anodyne, and powerfol refolvents.
41. Afierifolic, rough-leafed plants. The greatelt past of thicfe are herbaceous and perennial. The roots are branching and fibrous; the fems and branches rouided; the buds of a conic furm, naked or without fales. The leaves are fimple, atternate, commonly rety rough to the touch, and in molt of the herbaceous plants feffile, or attached to the ftem and branches without any footfalk. In the few trees, lowever, of this order, the leaves have a footlitk, the lower patt of which, after the fall of the leaves, remains likic a fpile or thorn. The hairs are fimple, and gencrally very rough to the touch. The flowers are in fome Enera Klitary; but communly rollected in a pike or corymbur. They do not procecd from the angle formed by the new or branch with the leaf, as in mary plants; but from the fide of the leaf, or from that part of the fem which is opporite to the leaf. They are alrsot univerfally hermaphrodite: in a few fiecies or curdia, male ard female flowers are pro-

A N Y.
duced upon different roots. The calyx is compofed of one leaf, which is divided from three to ten equal or unequal parts. Thofe with four maked feeds have the calyx deeply divided into five patts which are permanent. The corolla is monopetalous, or comspofed of one petal, which in different plants is bell, fuinel, folver, and wheel- hhaped. The divifions of the limb or upper part of the petal are gencrally five, alternate with thofe of the calyx; equal and regular, except in cobium. The flamina are fise in number, alternate with the divifions of the corolla. They are equal, attached to the tube of the corolla a little above its origin, and of the fame height. The antherre are in fome genera connivent ; that is, approach and form a compact body above the filaments. The piftillum is generally compofed of a flender flyle of the fame length with the flamina, and crowned with a timple figna. It procceds fiom a germen or feed-bud, which in fome plants is divided, but generally fplit into four. The feeds are generally four in number, and lodged in the bottom of the calyx. Moft of the rough-lesved plants are uled in medicine: the flowers are elleemed cordial; the leaves and roots vuherary and aftringent; and the hard bony feeds are rechoned powerful pimoters of urine. Externally, thefe plants are ufed for burnings and peifonous bites; they extirpate wats, and relieve diforders of the loiris.
42. Vertiillara, confifting of herbaceous regetables, having four maked feeds, and the flowers placed in whorls round the fiaiks. The roots are branched and fibroos. The flems are round when old, but fquare when young; as are likenife the young branches, which thand oppofite. The leaves are appofite, and in the greater number covered with tranfparent points. Thofe which are placed next the flower generally diffier from the Ream leaves. In the greater number of plants of this kind, the leaves are fupported upon a long cylindrical footitalk that is furrowed abure. The flowers are univerfally hormiphrodite, except in a fpecies of thyme mentioned by Mr Adanfon, which appears to have male or barren thowers on one root, and female or fertile flowers on the other. They are dilpofed round the flem in whorls or fmail heads with חtort foottalks. The calys is of one piece, that is yenerally cut into five unequal divifions, whofedifpofition fometimes reprefents two lips; the uppermof of which has commonly a lefs number of divifions: it accompanies the feeds, which it nouriflics in its bofum, to theis maturity. The petal is of the gaping or lip kind, and in the different genera is more or lefs irregular or unequal, either in its trbe, or in the divifions of the lips; the number of which varies from two to five. Thefe divifions fre. quently form two lips; of which the uppermofl, termed the criff and the helmet, is fometimes entire, fometimes more or lefs decely cut into two; the lowermof, termed the beard, gencrally into thrce. The flamina are two or four in number. In the greater part there are four Aamina of unequal length, tho of them being long and two hiort. Thele four uncequal flamina are frequently difimilar, and approscla by pairs: they are inclined towards the back of the petal, and parallel: the two imoneofl leing flurteft, and attached fomewhat Jower thar the two others to the tube of the Rowers. The feedbud, which confifts of four difinct ova:ics, is placed opon the fat of the flomer, and ele-
vates from their centre a common fyle. which is thender, bent in the fime manner as the filaments, which it fome what exceeds in length, and terminated by a double fligma or fummit, the divifions of which are unequal, and turned backwards. The feed-venit! in this order is wanting. The feeds are four in munber, ind louged in the buttom of the calys as in a matrix or feed etfict. Exch feed has two covers; the one external, of a cartilaginous or leathery fubftance; the other internal, membranaceous, of a very fine texture, and placed immediately above the radicle or embryo plant. The plants of this order are fragrant, warm, penetrating, and accounted cordial and cephatic. Their chief virtue refides in the leatres.
43. Dumofe, (frum dumus, a buhh) ; confiting of a number of nrubby plants, which are thick fet with irregular branches, and bufly. The plants of this order are all of the flurub and tree kind, thick and bulhy, rifing from 6 to 25,30 , and even 40 feet high. Many of them too, as ballard alaternus, holiy, iron wood, New Jerley tea, flar apple, viournum, winter berry, and forme others, rctain their beautiful leaves during the whole year. The roots are branched and fibrous. The ftems are cylindric; the young branches fometimes angular. The buds are naked, that is, without fcales, in the evergreen hlubs of this order; covered with feales in molt of the others. The leaves, which in fome gencra are timple, in others compound, are placed alternate in fome, and oppofite in others. The flowers are molly hermaplirodite. They proceed from the wings of the leaves either ingly or in cluflers; or they terminate the flem in that fori of flowering head called a corymbus. The calys is generally very fmall, placed below or around the feed-bud; and corfifts of one leaf, with four, fivc, or fix divifions, which are permanent. The rhamous has no calya. The petals are in number from one to five. The Itamina are either four, five, fix, or ten. The feed-bud is generally roundih, and placed within the fower. The flyle is commonly fingle, and fometimes wanting. The figma, is either fingle or tripie. The feed veffel is generally a berry, fometimes a dry capfule; the feeds are generally fingle and egg-flaped. The berries, bark, and flowers of many of thefe plants are purgative, and act porticularly on the lympta and bile.
44. Sepinrice, (from fopes, a hedge); confifting of a beautiful col!ection of woody plants, fome of which, from their fize, elegance, and other circumflances, are very proper furniture for hedges. This order furnifhes woody plants both of the thrub and tree kind, molt of which do not drop their leaves till nearly the time when the new leaves begin to appear.
45. Unbellate, (from umbella, an umbel); confifing of plants whofe flowers grow in umbels, with five petals that are often unequal, and two naked feeds, that are joined at top and feparated below. Thefe plants are herbaceous, and chiefly perennial. The roots are either tuberous or fpindle-flated, and fometimes forked. The fems are cylindric, full of pith, and frequently hollow. The branches are alternate. The leaves, which like the brancles are put on aiternately, are very different in point of form; being fimple and entire in fome; target-fhaped, in a feccies of na-vel-wort; finger or hand-flaped, in fome others; and winged or pinnated with numerous minute divifions,
as in the greater number. They arc fupported by a foothalk, which is very broad and memtranous at i's origin, and commo:ly embraces the whole cuntour of the 1 lem and branches. The Rlowers are in peneral hermaphodite. 'There are, howeser, fome that havo male or barren Howers in the fame umbel. This is pe:ticularly the cale with thofe umbelliferous plants which have the petals in the llowers of the circumference large and anequal. In thefe plants the Howers in the circumference only prove fertie; thole in the centre, or dik, proving abortice. Oenanthe and imperatoria, on the contrary, have the flowers in the circumference abortive. In ginfong, hermaphrodite and male howers are produced upon dillinet plants. The flowers are difpofed in an unibel, which is either fimple or compound. The common calyx in this order is that fort termed very properly by Limmxus involucrum, or the flower-cover; which in the greatcr number confints of one or more leaves placed under the partial or univerfal umbel, or both, for the purpofe of fupport. The prefence or abfence of one or both of thefe covers affords excellent marks in difcriminating the geriera of this very fimilar order of plants. The proper calyx of each hlower, in the aggregate, confifts of five minute indentments placed upon the feed bud, which it enve.. lopes, and accompanies to its maturity. The petals are five in number, and difpofed upon the edges of the Hower-cup in form of a rufe. In the florets of the centre, the petals are generally pretty equal and finall; in thofe of the circumference, they are frequently unequal and larger; in the greater number, they are heartfhaped, and cut almoft to the middle in two. The ftamina are five in number, placed oppofite to the divifions of the flower-cup, and alternate with the petals. The feed-bud is univerfally placed under the feat of the flower, and fupports two ftyles which are turned backwards, and crowned with fimple fummits which do not differ in appearance from the flyles. The feed-veffel in this order is wanting. 'The feeds are two in number, which, when ripe, feparate below, but remain clofely att.ched at top. The plants of this order, which grow in dry places, are fudorific, ftomachic, and warming. Their virtue refides chiefly in the liceds and leaves. Thofe which grow in marlhy places are generally poifonous; but, notwithitanding the extreniely warm and even cauftic quality of moft of the fe plants, many of them are employed in the kitchen, and in the economy of domeltic affairs.
46. Hederacee (from bedera, ivy); confifting of ivy and a few other genera that feem nearly allied to it. This order furnifhes both herbaceous and hurubby plants; moft of which, particularly ivy and vinc, have creeping branches, which attach themlelves by roots or tendrils to the bodies in their neighbourbood. The roots are long, with few branches. The thems and young branches are cylindric. In fome foecies of vine they are fquare. The leaves are altenate; Cometimes fimple, fometimes winged, in which the lirface of the leaves is covered with points. The footlatk of the leaves is cylindrical, and without any fur or. The buds are of a conic form, and without any feales. The flowers are either hermaphrodite, male and female upon different roots, or hermaphirodite and male upon difo ferent roots. In fome thay terminate the brawies in an umbel; in others they proceed in clufters from the
fide oppofite to the leaves; and in fome, they are produced dlong the branches. The calyx confitts of one leaf divided in five paits, which are frall and general. ly permanent. The flamina are in number five; awlthaped, erezt, and generally of the length of the petalc. Cillus has only four flamina, which are inferted into the nectarium, a fort of border furrounding the feedbud. The anthere are roundifh, and fometimes, as in ivy, attached to the filaments by the fides. The feedbud is fometimes round, fometimes flhaped like a top or pear, and ends in one, two, or five awl-flaped flyles, which are crowned with a fimple fligma. The fowers of the vine have no flyle. Tre feed-veffel is of the berry kind, with one, two, or five flyles. The feeds are from one to five in number; placed either in diftinct cells, or difperfed through the pulp without any partition.
47. Seellate, (from fella, a ftar); confifting of plants with two naked feeds, and leaves difpofed round the ftem in form of a radiant far. This order contains herbs, flurubs, and trees. The herbs, which are moft numerous, are chietly annual, and creep along the furface of the ground. The fhrubs and trees are monly evergreens, which rife erect, and are of an agreeable conic form.-Thefe plants are opening; fome of their feeds, particularly thofe of coffee, are bitter and cordial; forme of them are ufed in dyeing, and others in medicine.
48. Aggregata, (from aggregare, to affemble or colleet) ; comprehending thole plants which have aggregate flowers, confifting of a number of florets or fmall howers, each of which has a proper and common calyx.
49. Compofits, confifting of plants with compound flowers. In this order Linnews bas confructed his firlt or primary divifions from the different fexes of the florets, which he terms poligamy; the fubaltern divifions are confructed from the figure of the petals, the difpofition of the flowers, the pappus or crown of the feed, the common receptacle, and other circumitances which characterize the fubaltern divifions in other authors.
50. Amentacea (from amentum a catkin), plants bearing carkins; as falix, populus, plantanus, \&c.
51. Conifere, (from conus a cone, and fero to bear); confifting of plants, whofe female flowers, placed at a diftance from the male, either on the fame or difinct roots, are formed into a cone. In this character, the only one exprefled in the title, the plants in quellion feem to be nearly allied to the family of moffes: from which, however, they are eafily diftinguifled by their habit, as well as by the fructure of the fmall Howers, in which the flamina are united below into a cylinder, and diftinct at top. The plants of this order are mofly of the Mrub and tree kind, and retain their leaves all the year. The form of thefe plants is generally conic, and extremely beautiful, from the difpofition of the branches, which cover the ftems even to the roots, ex. tending themfelves horizontally and circularly like lo many rays. The height of fome genera of this order does not exceed half a foot, that of whers approaches to a hundred. The routs are flort, branching, not very fiorous, and extend horizontally. The ftems and branches are cylindric. The bark is thin, and fulit into fender fcales. The wood. except that of the yew tree, poifelfes iitille hardnefs. The buds ate of a conic fusm,

## A N Y.

and naked, or without fcales. The leaves are entire, linall, and thick, frequently triangular, and generally pointed. Juniper has a prickly and thorny leaf. With refpect to fituation, they admit of great varicty, being either alternate, oppofite, placed in whorls round the ftem, or collected into fmall bundles which proceed from a fingle point. They are placed on the branches without any fenfible footitalk. The flowers in this order are univerfally male and female. In fome genera, the male flowers are collected into a fpike or cone at the end of the branches; in others, they proceed fingly from the wings of the leaves, or termination of the branches. The fermale flowers are generally collected into a cone; but in yery tree and fhrubby horfe-tail they are fingle, and terminate the branches. The calyx of the male flowers is a catkin; of the female, a cone. The petals of this order are wanting; except in the femate flowers of juniper, which have three flarp, rigid, and permanent petals. The famina are in number from 3 to 20 and upwards; united by their filaments into a cylinder or pillar, which rifes out of the centre of the calyx. The anthere are erect, difinet, of a roundifa form, and divided into internal partitions or cells, which, in the different genera, are in number from two to ten. The feed-buds are generally numerous, and placed betwixt the fcales of the cone, which ferve for a calyx. From each feed-bud arifes a very fhort cylindric flyle, crowned with a fimple ftigma, of a conic form. 'Thefe plants have probably no feedveffel or frnit; the feeds being naked, and involved only by the fcales of the caly.. In fome genera thefe fcales are of a bony nature, and almolt united; in others, they are of a fubftance like leather; in juniper, they are united, and become flefly and fucculent like a berry. The feeds in this order, being nourihed, as in a feedveffel, by the fales of the cone, or common calyx, dif. fer in nothing from the germina or feed-buds.-Moft of the cone-bearing plants are refinous, or gummy; and the gums proceedirig from them have a bitter tafte, but generally a very agreeable fmell.
52. Coadunata, (from coadunare, to join or gather together) ; fo termed from the general appearance of the feed-veffels, which are numerous, and being flightly attached below, form all together a fingle fruit in the flape of a fphere or cone; the parts of which, however, are eafily feparated from one another. This order, which confifts of exotic plants, furnifhes a beautiful and cloice collection of flrubs and trees, both evergreen and deciduous. The trees are often 60 feet high, and garnifhed from the bottom to the top with fprcading branches and leaves of a bright green colour, which affume a very agreeable conic form. The roots are branching and fibrous. The ftems are cylindric, and the wood very hard. The buds are conic, Hat, and generally without fcalcs. The leaves are univerfally fimple and alternate. The footfalk is cylindric, without furrows, frequently fwelled at its origin, and appears jointed at it inlertion into the branch. The flowets are hermaphrodite, and are generally produced either along or at the end of the branches. The caly: generally contifts of thrte obilong plain leaves, like petals, wlich fall off wilh the flower. The petals are in number from 6 to 18, oblotg, concave, and frequently difpofed in two or three ferres or rows, the outernoin of which are largeft. The dlamina are numerous, thust, wid inferted into the
common reccptacle in fome, and into the feed-bud in others. The filaments are very flort and flender, fome genera having fearce any at atl. 'I he antherse are numerons, flender, and placed round the feed.bud. The piftillum generally confilts of a number of feed-buds difpofed in the form of a cone, and feated upon a receptacle which rifes like a fmall pillar above the receptacle of the calyx. From each fetd-bud generally arifes a cylindsic ftyle, which is very thort. The figma is commonly blunt. Whe feed-veffel is commonly a berry; but in mannolia it is an oval cone, confiling of a number of roundifh caplutes laid over each other like tilec. The fruits or feed-veffels, whether of the berry, capfule, or cherry kind, are equal in number to the feed-buds, and gencrally !ightly attached below. The feeds are numerous, hard, roundilh, and fometimes cornered. The plants of this order have a frong, agreeable, and aromatic fmell ; the fruits and leeds have a pungent talte like pepper: the bark and wood are bitter.
53. Scabride, (from faber, rough, rugged or brifty), confiling of plants with rough leaves. There feems to be fome impropricty in characterizing thefe plants by a name exprefive of the roughnefs of their leaves, as that circumftance had previoully furniftied the clafic character of the Afperifolia. The degree of roughnes, however, is much greater in the plants which make the fubject of the prefent article.-The plants of this order are in general of an aftringent nature: their talle is bitter and Ityptic.
54. Mifcellanee, mifcellaneous plants. This order confifts of fuch genera as are not connected together by very numerous relations. They are, datifca, poterium, refeda, fanguiforba, lemna, piftia, coriaria, empetrum, achyranthus, amaranthus, ccleofia, gomplirena, irefine, phytolacca, nymphæa, faracenia, cedrcla, fwietenia, corrigola, limeum, telephium.
55. Filices, ferns; confifting of plants which bear their Hower and fruit on the back of the leaf or ftalk. Thefe plants, in figure, approach the more perfect vegetables; being furnifhed, like them, with roots and leaves. The roots creep, and extend themfelves horizontally under the earth, throwing out a number of very llender fibres on all fides. The flem is not to be diftinguifhed from the common footlalk, or rather middle rib of the leaves: fo that in ftrict propriety the greater rumber of ferns may be faid to be acaules: that is, to want the ftem altogether. In fome of them, however, the middle rib, or flalk proceeding from the root, overtops the leaves, and forms a ftem upon which the flowers are fupported. The leaves proceed either fingly, or in greater number, from the extremities of the branches of the main root. They are winged or hand-fhaped in all the genera except in adders-tongue, pepper-grafs, and fome fpecies of \{pleen-wort. The flowers, whatever be their nature, are, in the greater number of genera, faftened, and as it were glued, to the back of the leaves; in others, they are fupported upon a ftem which rifes above the leaves; but in fome, are fupported on a flower-flalk, as already mentioned. The flamina are placed apart from the feed bud in a genus termed by Mr Adanfon palmafilix; in the other ferns, where we have been able to difcover the Atamina, they are found within the fame covers with the feedbud. Moft of the ferns have a heavy difagreeable
frell: as to their virtucs, they are opening and aftenuating.
56. Mufci, moffe:. Thefe plants refemble the pinee, firs, and other evergrcens of that clafs, in the form and d. lpolition of their leaves, and manner of growth of the female lowers, which are generally formed into a coric. They frequently creep, and extend themfelves like a carpet upon the ground, trecs, and fones, being generally collected into bunches and tufis: the fmalleft are only one-third of an inch in height, and the largelt do not exceed five or fix. Few of the moffes are annual : fmall as they are, the greater number are peremial and evergreens. Their growth is remarkably fluw, as may be judged by the time that the anthere take to ripers. This, reckoning from the firft appearance of the antheree to the difperfion of its powder or male duft, is generally four or fix months. Although preferved dry for feveral years, thefe platuts have the fingular property of refu: ing their original verdure upon being moiftened. It would be worth while to determine whether they do not alfo refume their vegetative quality. The roots of plants of this order are fhrous, nlender, branched, and fhort. The ftems ate cylindric and weak, as are alfo the branches; they cretp upon the ground, and ftike root on every fide. The leaves are very fmall and undivided. They differ with refpeet to fituation; being either alternate, oppofite, or placed by fours round the flalk. They have no perceptible footftalk nor middle rib, and are feated immediately upon the flems. The flowers are univerfally male and female: in fome, the male llowers are produced upon the famc plants with the female, and ftand before them; in others, they are produced fometimes on the fame, and fometimes on diftinet plants. The male flowers confiat entirely of antheræ. and their covering; proceed either fingly, or in clufters, from the extremity of the branches, or angles of the leaves; and are either feated imme. diately upon the branches, or fupported by a long footftalk. The female flowers, which generally refemble capfules or cones, are all placed imniediately upon the ftem or branches, without any footftalk; and proceed fingly either from the wings of the leaves, or fummit of the branches; when produced upon the fame plant with the male they are always placed under them. The female cones of the mofies greatly refermble thofe of the pines and evergreen trees of that clafs; the fcales which form them are true leaves, each containing in its wing or angle a fingle feed. When the feeds are ripe, the cones probably open for their difperfion. When llut, they refemble buds, and have fometimes been ignorantly miftaken for fuch. The calys, in this order, if it can be called fuch, is that appearance refembling a veil or monk's cawl, which in the male Hower covers or is fufpended over the tops of the flamina lake an extinguifher, and is termed by Limæus calyptra. The petals are univerfally wanting. The mofles in general are almoll taftelef, have few juices, and being once dried do not readily imbibe moifture from the air. Thofe which grow in water, being thrown into the fire, grow red, and arc reduced to athes without receiving or communicating any flame; on which account fome fuperllitious people, the Siberians in particular, place water mofs in their chimines as a prefervative againf fire. Moft of the mofics are purgative ; fome violcntly fo, and even emetic. They are all of wonderful efficacy in pre-
ferving dry fucl bodies as are fulceptible of moifure; and in retaining, for a long time, the humidity of young plante, without expofing them to putrefaction. For this reafon, fucl plants as are to be fent to any confiderable diftence, are generally wrapped up in them.
57. Alge, flags; confifting of plants whofe root, leat, and liem, are all one. Under this defcription are comprctiended all the fea weeds, and fome other aquatic plants.
58. Fungi, mufhrooms. Thefe plants are rarely branched, fometimes creeping, but moft commonly ereet. Such as are furnifhed with branches have them of a light fpongy fubftance like cork. Muthrooms differ from the fuci, in that thofe which, like the fuci, have their feeds contained in capfules, are not branched, as that mumerous claifs of fea weeds are. The greateft part of mufhrooms have no root: fome, inftead
of roots, have a number of fibres, which, by their inofculations, frequently form a net with unequal meftes, fome of which produce plants fimilar to their parent vegetable. The flamina in thefe plants are ftill undetermined. The feeds are fpread over the furface of the plant, or placed in open holes or cavities, refembling the open capfules of fome of the fuci. In nuflirooms which are branched, the feeds ate frequently vifible by the naked eye, and always to be diftiuetly obferved by the affiftance of a good microfcope. Thefe plants are very aftringent, and fome of them are ufed for fopping violent hamorrhagies. As a vegetable food, they are at bett fufpicious: fome of them are rank poifon.

Dubii ordinis. Under this name Linnaus clafles all the other genera which camot be reduced to any of the abovementioned orders, and which are near 120 in number.

## Alphabetical Explanation of Botanical Terms.

A.

Abrupt (abruptus), when a winged leaf ends without a little leaf.
Acorn, the feet of the oak.
Acolyledones, feeds without lobes, which produce no feminal leaves.
Acute (acutus), tapering to a flender, but not thorny termination.
Air-bag (folliculus), a diftended feed-vefiel opening on one fide.
Alternate (alternus), applied to branclies, leaves, or flowers, tpringing out regularly one above another.
Androgynous, having fome flowers on the fame plant, bearing famens, but no piftils; and other flowers bearing piftils, but no flamens.
Angia/permia, feeds in a capfule.
Angular (angulats) having corners; oppofed to cylindrical.

- capfule, as in flower-de-luce.

Annual (annuus), living only one year.
Anomalous (anomalus), irregular.
Anther (anthera), the top of the ftamen fixed on the filament, and containing the pollen.
Apce, termination.
Spopbyyss, excrefcence.
Approaching, fee Converging.
Arrow-flaped (fagittatus), leaf-haped like an arrow head, as forrel.
Afcending, growing firf horizontally, and then bent upwards.
Atten itle (attenuatus), tapering.
Aw! fouped (fubularus), fiender.
Awn (aritai) or beard, the flarp fubflance growing to the v lves of corn or prafa.
Awnlefs (muticus), without awns.
Axillary (axillaris) at the bafe of the laves or branches.
B.

Bark (cortex), the covering of the Acms, roots, and braw hes of vegctables.
Barren (maiculf, aburtivi), tlowers or florets, which produce no perfect feeds; generally wanting piails.

Bafe, fee Axillary.
Battledore-/baped (Spatulatum), roumled with a neck.
Beaded (granulatus), confifing of many little hnobs, connected by fmall ftrings.
Beak or Bill (roftrum), a projecting appendage to fonse feeds.
Bearded (barbatus), befet with ftraight parallel hairs.
Bell-fhaped (campanulatus), like the bloflom of the convolvulus.
Bellying (ventricofus) diftended.
Beneath (inferus). A bloffom is beneath, when it includes the germen, and is attached to the part immediately below it. A germen is faid to be beneath whon it is not included in the corolla or bloffom.
Berry (bacca), a pulpy feed-vefiel without valves.
Biennial, continuing alive for two years.
Bird-footed (pedatus), refembling the foot of a land fowl.
Bitten, ending in no regular form, not tapering.
Bill (roftrum), a long fubftauce attached to a fecd.
Bladders, air-bags on fome lipecies of fucus.
Bladder-/baped (inflatus), inflated or diftended.
Blifered, when the urtace of a leaf rifes high above the veins.
Blofom (corolla), part of a tlower, confifting of one or more leaves called petals. It is an expanfion of the inner bark of the plant, and is the ornamented cover of the flamens and piftils.
Bluat (obtufus), oppofed to acute.
Boat-fouped (navicularis), like a little keel-bottomed boat.
Border (limbus), the upper part of a corolld of one petal.
Bowed (arcuatus), bent.
Branched (ramolus), having lateral divifons.
Brifles (leta), iliff cylindrical hairs.
Briflle-fbaped (fetaceus), tlender, and like a brifte.
Bud (gemma), a protubetance on the flem or branches, contaiming the rudiments of the leaves or flowers to be expanded the following ycar.
Bulb (bulbus), a bud placed on the root or ftem.
Bulging (gibbus), irregularly fwollen out.
Bunch

Bunch (racemus), a fruit falk with fhort lateral branches.
Bundle (fafciculus), Several flowers rifing to the fame point from their refpective fruitfalks, as in fweetwilliam.
Bundled, applied to leaves, as in the larch.
Butterfly-floped (papilionaceus), as the pen and broom flowers.

## C.

Galycled (calyculatus), having a double calyx.
Calypere, veil.
Calyw, or empalement, a continuation of the outer bark of the plant, forming part of the flower, is called a cup, as in primrofe, involucrum in carrot, catkin in hazel, calyptre in the mofles, a hulk in oats, a theath in the narciffus, and a curtain in fome fun. guffes.
Capfule, a dry hollow feed-veffel opening in fome determinate manner.
Cotkin (amentum), a compofition of flowers and chaff on a long thread-fhaped receptacle; the whole like a cat's tail ; e. g. the willow.
Cell (loculamentum), vacuity in the capfule to lodge the feed.
Central florets (flores flofculofi) ; thofe which occupy the middle part of a compound flower, as the yel. low ones in a common daify.
Cbaff (palea), thin membranaceous fubflance feparat. ing the forets from each other, and growing on a common receptacle.
Ckannelled (canaliculatus), naving a furrow from the bafe to the end.
Cicatrized, fcarred.
Ciliate, fringed.
Circumference, the florcts fartheft from the centre of a compound flower, as the white ones in the common daify.
Clammy (vifeofus), adhcfive like birdlime.
Claw (unguis), the part of a petal neat the bale, din Itinguifhed from the limb or upper part.
Cleft, divided half-way down.
Climbing (fcandens), plants that rife by the aid of others.
Cloatbing (pubes), hairinefs on the furface of plants.
Cloven, fee Cleff:
Club-fluperd (clavatus), thinner at the bafe, and thicker upwards.
Clufler (thyrfus), flowers collected in fomewhat of an egg-flaped form like the lilac.
Coaied (tunicatus) root, compofed of layers like the onion.
Cobwchbed (arachnoideus), covered with a fubfance refembling a cobweb.
Coloured (coloratus), not grecn.
Column (columella), the little pillar in the centre of fome capfules to which the feeds are fixed.
Comb (coma), a collection of Horal leaves terminating the lowering ftem, as in the pine-apple.
Comb-like (pectinatum), a fort of winged leaf, the leafets of which are like the teeth of a comb.
Common calyx, including feveral flowers, as in thinles.
Compact, growing clofe together.
Compound flowers (eumpofiti flores) confifi of many florets or litule flowers, on a receptacle or feat, as in thifles.

Vol, IV. Part I.

Compreffed (compreffus), a cylindrical fubfance, more or lefs flatted.
Cone ( 11 robilus,) a feed veffel, formed by a catkin, with hardened feales, as in the pine and fir.
Cone-Jloped (cucullatus), applied to leaves rolled up, as the grocers roll up paper to hold fpices, fugar, \& e.
Confluent (confluentia folia), running into one another at the bale.
Congregated (glomeratus), fpikes, \&c. crowded together, fomewhat in a globular form.
Connected (adnatus) leaves, having their upper furface at the bafe, growing to the ftem or branch.
Contiguous (adprefins) leaves, \&c. clofe to the fem.
Converging (connivens), approaching at the top.
Convex, rifing like the furface of a globe.
Convolute, twifted firally.
Corolla, bloflom.
Corymb, a collection of flowers fanding each on its own fruitfalk, with fruitfalks of fuch a length, that the whule collection forms a flat broad furface at the top, as in the pear-trec.
Cotton, Cottony (tomentum, tomentofus), downy, co. vered with a whitifl foft fubftance.
Cotylcdones, feed-lobes.
Creeping (repens) Atern; creeping along the ground, as isy.
$\ldots$ root, as fpearmint.
Crefent-flaped (lunaris, lunatus), nlaped like a wasing moon, like the anthers of the flrawberry.
Criffed (crillatus) flowers, tufted.
Crooked (cernuus) fruitfalk, with the flower facing the earth, and fo fiiff, that it cannot be ftraighted without breaking; as in the crown imperial.
Crofs-pairs (decuifatus), leaves in pairs, each pair pointing in a direction different from the pair above or below it.
Crofs-floped (cruciatus, cruciformis) flowers, having four petals in form of a crols; called cruciform plants.
Crowned (coronatus) feed, a feed to which the calyz adheres, er. gr. teazel.
Cruciform, fee Crofs-/baped.
Cryprogamia, ftamens and piftils indiftinct.
Cup (perianthium), a calyx contiguous to- the othes parts of the flower.

- double (calyculatus), when the bafe of one cup is fursounded by another cup.
Curtain (volva), the calyx of agarics and boleti.
Cut-round (eircumfciflus), when a feed-veffel opens in a circle, and rot longways.
Cylindrical (teres), round like a walking fick.

## D.

Dagger-pointed (mucronatus), ending, not gradvally, but fudderily in a fiarp point.
Deciduous (deciduus) leaves, which fall at the approach of winter.

- cup or calyx, falling off before the blof. fom.
_-_ feed-reffel, falling off before it opens.
Declining (declinatus), bent like a bow, with the arch downwards.
Decurrent (decurrens) leaf, without a leaf.falk, but where the leaf runs down the ilem.
Si Deneed

Dented (retufus), a biunt leaf with a blunt notch at the end.
Depreffed (depreffus), when the furface of a leaf is fightiy Junk.
Diadelphia, the $17^{\text {th }}$ clafs of plants, having the filamerts united into two fets.
Diamond-flaped (rhombeus), applied to leaves refembling a diamond on cards.
Diandria, two flamens.
Didynamia, the $14^{\text {th }}$ clafs, having two ftamens longer. Digynia, two pittils.
Dimpled (umbilicatus), having a hollow dot.
Diacia, dioecious, having the flowers bearing flamens, and thofe bearing piftils or different plant:.
$D i / k$ (difcus) of a leaf is its furface; of a compound Hower is its central florets; thus, in a daify, the minute yellow florets form the difc, and the larger white ftrap-flaped ftorets form the ray.
Diffant (diftans), far afunder, as the ftamens of mint.
Difended (ventricofus), as the cup of the rofe.
Diverging (divergens), (preading wide from the fem almel horizontally, oppofed to compact.
Divided (partitus), or parted, partite, fignifies that a cup, leaf, or petal, is parted more than half way down.
Dodecandria, 12 Itamens.
Dorfal, fixed to the back.
Dotted (punctatus), marked with little hollow dots.
Double (didymus), applied to two anthers on one filament.
Doubly-compound (decompofitus) leaves, having the primary leaf-llalk divided, fo that each divifion forms a compound leaf. They are twin-fork (bigeminus), when a forked leaffitalk has feveral leafets at the end of each fork; or, doubly-threefold (bi-ternatus), when a leaf-ftalk, with three divifions, has three leafets on the end of each divifion or fork ; or, doubly winged (duplicato-pinnatum, bi-pinnatum), when a leaf-ftalk has lateral ribs, each of which forms a winged leaf.
Down (pappus), the fine hair or feather-like fubftance, crowning the feeds of fome plants, and wafting them abroad.
Downy leaf, fee Cottony.
Drupe, a pulpy feed-veffel, without valves, confifing of a nut, furrounded by a pulpy fubftance, ex. gr. a cherry.
Dufled (pulveratus), applied to fome plants which appear covered with a kind of powder.

## E.

Ear-flaped (auriculatus), fomewhat refembling a human ear.
Egg-haped (ovatus), in form of an egg.
Egg/pear-flaped (ovato-lanceolatum), fee Spear-rgg/lsaped.
Ellipric, oval.
Embracing (amplexicaulis) the fem, when the bafe of a leaf nearly furrounds the ftem.
Eniire (integer), oppofed to cleft, gahed, \&c.
Equal (xqualis), regular.
Ereq, upright.
Even (levis), furface; level, regular.
Excrefcence (apophyfis), a fubllance growing on fome of the muffes from the feat of the flower.
Expanding (patens), between upright and horizontal.

A $N \quad Y$.
Eye (hilium), the fcar by which a feed is fixed to the feed-veffel.

## F.

Feathered (plumofum), the down of feeds when it fends out lateral hairs.
Feeble (debilis), unable to ftand upright.
Female Howers or florets, fuch as have one or more pifils, but no llamens.
Ferns, the 1 it order of the clals of cryptogamia.
Fertile (fertiles vel feminei), flowers, thole that produce feed capable of vegetation. Thofe that have flamens only are always barren. Thofe that have piftils only, are only barren when placed beyond the reach of the pollen, coming from the anthers of ftaminiferous Howers.
Fibres (nervi), woody flrings running along a leaf.
Fibrous (fibrofus), roots, compofed of fmall threads os fibres.
Fiddle-floped (panduriformis), oblong, but narrow in the miadle, and broader below.
Filament or thread (filamentum), the flender part of a ftamen fupporting the anther.
Fifulous, hollow.
Finger-like (digitatus) leaves, expanded like a man's hand, in pairs, threes and fives.
Flat-topped (faftigiatus), rifing to the fame beight fo as tu torm a flat furface.
Flefby feed-veffel, ex. gr. an apple.
Floral leaves (bractra) are generally on the fruittalk, fo that they are fometimes miftaken for the calyx; but the calyx withers when the fruit is ripe, whereas the floral leaves endure as long as the other leaves of the plant.
Floret (flofculus), one of the fmall flowers forming a compound or incorporated flower.
Flower (flos), a temporary pair of a plant fubfervient to the formation of the feed. It confifts of eight parts, a caly., corolla or bloffom, ftamens, piftils, feed-veffel, feeds, receptacle, and a neetary. Wanting any of thefe parts, a flower is incomplete.
Forked (furcatus, dichotomus), divided.
Fringed (alatus), as the bloffom of the buck-bean.
Fruil (fructus), a part of a flower confifting of the feedveffel, feeds, and receptacle.
Fruifalk (pedunculus), a part of a branch or ftem bearing fowers, but not leaves.
Fnngus, the laft order of the clafs of cryptogamia.
Funnel-/haped (infundibuliformis), when a one-petaled bloffom is tubular at the bafe, and conical at the top.
Furrowed (fulcatus), marked with lines running lengthwile.

## G.

Gaping (ringens, perfonatus) bloffom, fo called from its refemblance to a gaping mouth.
Gafbed (lobatus), divided nearly half-way down into lobes, convex at the edges, and diftant from each other.
Gelatinous, jelly-like.
Gem, a bud.
General involucrum, a calyx at the bafe of a general umbel, as in carrot.
Germ, germen, feed-bud.
Gibbous, bulged, or bulging.
Gills (lamellix), thin plates on the under fide of the
pileus
pileus or hat of an agaric; remarkable in the common muftroom.
Glafs-flaped (cyathiformis), tubular, but widening towards the mouth.
Glaucous (glaucus), hoary, as the back of a cabbageleaf.
Globular (globofus), like a round ball.
Glume (gluma), hunk.
Gnawed (crofum), when an indented leaf hems as if bitten at the edges.
Granulated, refembling beads.
Gymnofpermia, naked feeds.
Gynandria, flamens on the pistils.

## H.

Hair-like (capillaris), lender, undivided, and cylin. drical.
Hairs (pili), by forme thought fecretory duets.
Hand-fbaped (palmatus), like the human hand with the fingers expanded.
Hat (pileus), the upper broad part of funguffes.
Hatchet-fbaped (dolabriforme) leaf, like an axe of un. equal thickner:.
Headed (capitulus) talk, supporting one compact knob of flowers at its extremity.
Heads (capitatus) of flowers, growing in compact knobs, as in peppermint.
Heart (corculum), that part of a feed which is the fusure plant in miniature.
Helmet (galea), the upper part of a gaping bloffom.
Hemijpherical, like a half globe.
Herbaceous Item, fucculent, opposed to woody.
Hermaphrodite flowers or florets, fuch as contain both a flamen or flamens, and a piftil or piffils, as the greater part of flowers.
Hexagonal, or fix-fided.
Hexagynia, having fix piltils.
Hexandria, fix-ftamened.
Hoary (incanus), covered with a filvery-looking fabfrance.
Honey-combed (favofum), a receptacle with cells open at the top, and having a feed in each.
$H u / k$ (gluma), the calyx of a grails plant.
Hybrid (hybrida), a plant produced by the pollen of one plant fertilizing the germen of a plant of a diffferment species. A mule.

Jagged (laciniatus) leaves, irregularly divided and fabdivided into lobes.
Icofondrin, 20-ftamened.
Imperfia flowers, wanting anther or pistil, or both.
Incomplete it wears want the cup. the corolla, or forme other important part. See Flower. The tulip wants a cup, and the nettle has no bloffom or corolla.
Incorporated (aggregates), when little flowers or florets form a compound flower, as a deify.
Incumbent, anthers fixed by the fides, or flamens leaning or refiling aging.
Indented leaf, having the edges deeply followed, and the lobes far afunder.
Inflated. as if blown up like a bladder.
J. ferior. fee Beneath.

Interrupted, broken in its regular form, as a pike by leaves intervening.
Inversely hcart-flanped (obcordatus), with the point of the heart next the flem.

Involucellum, a partial involucrum.
Involucrum or fence, the calyx of an umbel placed at a diflance from the flower.
Jointed (articulates), ex. gr. a wheat flaw.
Keck, the loweft petal in a butterfy-fhaped corolla.
Keeled (catinatus), bent.
Knob, fee leads.

## L.

Latefcent, having a milky juice.
Laminated. when the flat furfaces of leaves lie clofe on each other.
Lateral branches, growing from the fides of the flem, opposed to terminating.
Leaf, the part of a plant correfponding to the lungs, and alto to the organs of motion of mimas.
Leafet, or little leaf, one of the ingle leaves of a compound leaf.
Leaf-halk (petiolus), the footillik of a leaf.
Lentber-like (coriaceous), tough like leather.
Legume (hegumen) or dell, a feed-viffel of two valves with the feeds fixed to one eam, as in the pea.
Level, when Several branches or fruitfalks grow to equal heights.
Lid (operculum), a cover to the capfuls of feveral. moffes.
Ligulate, ftrap-fhaped.
Limb, the upper fprealing part of a petal.
Limber (Haccidus) bending with its own weight.
Lip, the upper or under divifion of a gaping corolla.
Lobes, the divisions of a gaffed leaf.
Lopped (truncatus), looking as if cut off by fciffars.
Mi.

Male flowers, which have flamens, but no piltils.
Matted (cæfitofus), thickly interwoven.
Membranous, membranaceous, thin, thingy, and Semi. tranfparent.
Monadelphia, united filaments.
Nonntiria, one flamen.
Monccir, one houfe, or plants having the flamens and piftils in different flowers, but on the fame plant.
Monogyzia, one pistil in each flower.
M-nopetnlous, onic-petaled.
Mouth (faux), the upper or opening part of the tube in a one-petaled corolla.
Mules, fee Hybrid.

$$
\mathrm{N} .
$$

Naked, without leaves or hairs.
Nectary, or honey-cup, the part of the flower which fearetes the honey.
Nut, a feed covered by a hard woody hell.
O.

Oblong-egs-/baped, oblong at the bale, but egg-fhaped towards the end.
OGandria, eight-ftamened.
Oalugynia, eight piltils.
P.

Paleaceous, chaffy.
Panicle, an irregular affemblage of flowers.
Prpuitonaceous flowers, butterfly-ltaped, as the pea.
Paraficical plants, which grow not on the earth, but on other plants.
$P_{t}$ diddle, a little fruitfalk.
Pentagon, five-cornered.
Pentagynia, five pistils.

Pentandria, fire-ft mened.
Perennial, continuing more than two years.
Petals, (petala), the leaves which conflitute the corolla or bloffom.
Pillar (ftipes), the pedicle of the down of fome feeds, as in dandelion.
Pimpled (papillofus), befet with little hard protuberances.
Pifil, a part of a flower confifing of the germen, the nyle, and the fummit.
Pitcber-haped (urceolatus), bellying like a jug.
Pith, a foft fubitance filling the cavity of fome plants.
Plailed, follled.
Pod (filiqua), feed-vefiel of two valves, within which the feeds are alternateiy fixed to each feam.
Pollen (farina), a fine powder in the anthers of flowers.
Polyadelpbia, flamens in three or more fets.
Polyandria, many famen:.
Polygamia, fee Introduction to the 23 d clafs.
Pores, little holes.
Pouch, a flort pod.
Prifin-jhaped, different from cylindrical, in having the circumference angular.
Prolifercus, when one flower, \&cc. Springs out of another.
Pubefcent, clothed with foft wool or hair.
R.

Radiate, compound flowers in which the florets of the centre differ from thofe of the circumference. See Dik.
Rays (radii), outer florets of a radiate compound flower. See Dif.
Receptacle, the feat or bafe of a flower.
Reflected, ben: back.
Remote whirls, having a confiderable length of flem between each.
Rhomboidal, nearly diamond-flaped.
Rigid, inflexible.
Root-leaves (radicalia), thofe which proceed immediately from the root.
Rufle or ring, the part of the curtain of an agaric which adheres to the ftem after the outer part is gone.
Runner (flagellum), a barren twig lying on the ground.
S.

Salver-floped (hypocrateriformis), when a one-petaled corolla has its lower part tubular, and its higher part flat and expanded.
Scaly (fquamofus), like the fkin of a fith.
Scurfy (fquarrofus), applied to the rough cup of fome compound flowers.
Seed, that which contains the rudiments of the new plant.
Seed-lobes (cotyledones), the perifhable part of a feed which affords food to the reft in germination.

Seminal leaves, thofe which rife from the feed-lobes.
Scratcd, like, the teeth of a faw.
Sheath (fpatha), a kind of calyx like that of the crocus. Simple, undivided.
Sitting leaves or flowers, without leaf or flowcr-ftallis.
Solitary, only one in a place.
Spear-egg: Phaped, like a Spear at the bafe, and an eqg at the extremity.
Spike (ficica), a collection of flowers placed alternately
on each fide of a common frnitftalk without little fruitfalks.
Stamen, confifts of a filament and anther.
Staniniffrous, bearing flamens.
Streaktd, marked with deprefied lines.
Syngenffia, united anthers.
T.

Target-floped leaf, having the flalk fixed, not in the edge, but the centre.
Tetragynia, four piffils.
Tetradynamia, four ftamens longer.
Tiled, one leaf or fcale partly covering another.
Tootb-ferrated, when the edge of a leaf is marked with little ferrated teeth.
Triandria, three ftamens.
Trigyni, three pifils.
Tulercled, having folid warts; applied to certain lichens. Tubcrous root, having many roudifi krobs in a bundle.
Tubular, hollow like a tube.

## U.

Umbel (umbella), an affemblage of flowers in which a number of flender fruitfalks, proceeding from the fame centre, rife to nearly the fame height, fo as to form a regular furface at the top, as in hemlock or carrot.
Unequal florets (radiati), when the florets of an umbel are larger in the circumference than in the centre.
Valve, the pieces of a capfule are callicd valves.
Vaulted (fornicatus), like the roof of the mouth.
Veil (calyptra), the calyx of moffes.
W.

Wheel-fhaped, a corolla of one petal, with a flat border and a hort tube.
Whirls of branches, leaves or flowers; ex gr. the branches of the fir.
Wings, the lateral petals of a butterly-fhaped bloffom.
Winged leaf-ftalk, with a thin membrane on each fide. leaf, when an undivided leaf-ftalk has many little leaves growing from each fide.
Wing-cleft, a leaf deeply cut.
Woody, oppofed to herbaceous.
Wooly, curly haired clothing on fome plants. 2.

Zigzag, having many contrary bendings.

## B O T

Butany-
Bay
11
Bothnia.

BOTANY-BAY, fo called from the great number of sew plants which were difcovered by the naturalifts who firf vifited it. See New-Holland.
 divination), an ancient fpecies of divination, by means of plants ; efpecially fage and fig leaves. The mariner of performing it was thus: the perfons who confulted wrote their own names and their queftions on leaves, which they expofed to the wind; and as many of the letters as remained in their own places were taken up, and being joined together, contained an anfwer to the queftion.

BOTARGO, a kind of faufage, made with the eggs and blood of the mullet, a large fink common in the Mediterranean. The befl kind comes from Tunis in Barbary: It mut be chofen dry and reldift. The people of Provence ufe a great deal of it, the common way of eating it being with olive oil and lemon juice. There is alfo a great confumption of it throughout the Levant.

BOTE, (Sax.), lignifies a recompenfe, fatisfaction, or amends : hence comes manbote, compenfation or amends for a man lain, \&c. In King Ind's laws is declared what rate was ordained for expiation of this offence, according to the quality of the perfon flain. From hence likewife we have our common phrafe, toboot, i. e. compenfationis gratia. There are boufe-hote, plough-bote, \&c. privileges to tenants in cutting of wood, \&c.

BOTELESS, ( (ine remedio). In the charter of Hen. I. to Tho. archbihop of York, it is faid, "that no judgment or fum of money fhall acquit him that commits facrilege; but he is in Englifh called botedefs, viz, without emendation." We retain the word glill in common fpecch: as, It is bootlefs to attempt fuch a thing; that is, It is in vain to attempt it.

BOTH, John and Andrew, Flemifl painters, and pupils of Bloemart. The union of thefe brothers was very fingular ; they were infeparable in their fludies, travels, and paintings, John painted the landfcape part of their pictures ins the manner of Lorrain, and Andrew the figures and animals in the fyle of Bamboche. They both died in 1650. John's tafte in landfape is elegant; his ideas are grand; his compofition beautiful; and his execution tich and mafterly in the higheft degree. His light is not always well dillributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the beft landfcapes we have.

BOTHNIA, a province of Sweden, at the end of

## B $\quad \mathrm{O} \quad \mathrm{T}$

the gulf of the fame name. It is divided into two parts called eafl and weff Botbmia, the former of which belongs to Finland. Weft Bothnia is full of mountains; the earth is fatdy, and yet a fcarcity of provifions is feldom known. Cattle and game are fo common, fal. mon and a fort of herrings fo plenty, and the trade of fkins is fo gainful, that the inhabitants can command what they want from their neighbours. There are onIy two towns worth mentioning, viz. Tornea and Uma. The inhabitants of this province are Proteflants; and are a civil well-behaved peopie.

BOTR Y'S, Botrus, or Bofra, in Ancient Geography, a town of Phoenicia, on the Mediterranean, built by Saturn, (a proof at leaf of antiquity); twelve miles to the north of Byblus, and twenty to the foutls of Tripolis. Now almoft in ruins, and called Boteron, or Boturn, (Poßellus). E. Long. 37. 30. N. Lat. 34. 6.

BOTT, among bone-lace weavers, a kind of round cuftion of light matter placed on the knee, whereon they work or weave their lace with bobbins, \&c.

Botr, in Zoology. See Botrs.
Borticelli, Saniro, or Alesandro, born at Florence in 437 , learned the rudiments of painting under Fllippo Lippi. He executed feveral pietures for Pope Sixtus IV. and others for the city of Florence : for thefe he received large fums of money, all of which he expended, and died at laft in great diffrefs, aged 78 . He was not only a painter but a man of letters. Baldini, according to the general report, communicated to him the fecret of engraving, then newly difcovered by Finiguerra their townfman. The famous edition of Dante's poem of Hell, printed at Florence by Nicholo Lorenzo della Magna, A. D. 148 I , and to which, according to fome authors, Botticelli undertook to write notes, was evidently intended to have been ornamented with prints, one for each canto; and thefe prints (as many of them as were finillied) were defigned, if not engraved, by Lotticelli. It is remarkable, that the two firlt plates only were printed upon the leaves of the book, and for want of a blank fpace at the head of the firft canto, the plate belonging to it is placed at the bottom of the page. Blank Ipaces are left for all the reft; that as many of them as were finifhed might be patted on. Mr Wilbrahan poffefles the finell copy of this book extant in any privatc library; and the number of prints in it amounts to ninetecn. The two firlt, as ufual, are printed on the leaves; and the other feventeen, which follow regularly, are pafted on the blank faces; and thefe apparently were all that Botticelli ever exccuted. About

## B O T [ 333$] \quad \mathrm{B}$ O T

Botice, the year r460, it is faid that he engraved a fet of Sotting plates, repreleming the Propbets and Sibyls. Bafan
tells us that he marked thele plates with a monograns compofed of an $A$ and a $B$ joined together.

BOTTLE, a fnall veffel proper to contain liquors, made of leather, glafs, or thone. The word is formed from butellus, or lotellus, ufed in barbarous Latin writers, for a leffer veffel of wine; being a diminutive of bota, which denoted a butt or calk of that liquor.

The ancient Jewith buttles were cags made of goats or other wild beafts fkins, with the hair on the infide, well fewed and pitched together ; an aperture in one of the animals paws ferving for the mouth of the veffel.

Glafs-bottles are better for cyder than thofe of fone. Foul glafs-bottles are cured by rolling fand or finall ftoot in them; mufty bottles, by boiling then. Sce Glass.

Bottles are chiefly made of thick coarfe glafs: though there are likewife bottles of boiled leather made and fold by the cafe-makers. Fine glafs botles covered with Itraw or wicker, are called fafke or bettees. The quality of the glafs has been fometinies found to affect the liquor in the bottle.

Dr Percival cautions againft the practice of clearing of wine bottles with leaden flot. It frequently happens (he think-), through inatention, that fome of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poilon will flowly diffolve, and impregnate thofe vinous liquors with its deleterious qualitie. The fweetnefs which is fometimes perceived in red port wine may arife from this caufe, when fuch an adulteration is neither defigned nor fufpected.-Potafth is recommended for cleanfing bottles: a fmall quantity in the water will clean two grofs.

BOTTLING, the operation of putting up liquors in botties corked, to keep, ripen, and improve. The writers on good hubbandry give divers rules concerning the bottling of beer, cyder, and the like. The vintues of Spaw, Pyrmount, Scarborough, and other waters, depend on their being well bottled and corked, otherwife they lofe both their tafte and fmell. To preferve them, it is necefliary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is alfo further fecured by a cement. Some improve their bottled beer, by putting cryllals of tartar, and wine or malt fpirits, and others, by putting fugar boiled up with the effence of fome herb, and clove‘, into each bottle.

Cyder requires feecial precautions in the bottling; being more apt to lly, and burit the bottle, than other liquors. The beft way to fecure them, is to have the liquor thoroughly fine hefore it be bottled. For want of this, fome leave the bottles open a while, or open them after two or three days bottling to give them vent. If one bottle break, through fermentation, it is heft to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some foak the corks in fcalding water, to render them more pliant and ferviceable. Another particular to be obferved is, to lay the bottles fo as that the liquor may aliways keep the cork wet and fwelled. Something alfo depends on the place where the bottles are fet, which
ought to be fuch as expofes them as little as pofibibe to the alterations and impreffions of the air ; the ground is better for this purpofe than a frame; fand better th in the bare ground; and a running water, or a fpring often changed, beft of all.

To haflen the ripening of bottled linuors, they are fometimes fet in a warm place, or even expofed to the fun, when a few diys will bring them to maturity.

BOT TOM, in a general fenfe, denotes the loweft part of a thing, in contradillinction to the top or up. permolt part.

Воттом, in Navigation, is ufed to denote as well the clannel of rivers and harbours, as the body or hull of a thip. Thus, in the former fenfe, we fay, gravelly bottom, chayry bottom, findy bottom, \&c. and in the Latter fenfe, a Britifb Lotiom, a Dutch Lottom, \&c. By llatute, certain commodtties imported in foreign bottoms pay a duty called petty cufom, over and abuve what they are liable to if imported in Britifh bottons.

BOTTOMRI, is Commerce, (a pratice which originally arofe from permuting the mafter of a hhip in a foreign country to hypothecate the hip in order to raife money to refit,) is in the nature of a mortgage of a thip; when the owner takes up moncy to enable him to carry on his voyage, and pledges the keel or bottom of the flip (pars pro 1000) as a fecurity for the repayment. In which cafe it is underftood, that if the fhip be loft, the lender lofes alfo his whole money; but if it return in fofety, then he hall receive back his principal, and alfo the premium or intereft agreed upon, however it may exceed the legal rate of interef. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reation of the extraordinary hazard run by the lender. And in this cafe, the frip and tackle, if brought home, are anfiverable (as well as the perfon of the borrower) for the money lent. But if the loan is not upon the veffel, but upon the goods and merchandife, which mult ncceffarily be fold or exchanged in the courfe of the voyage, then only the borrower, perfonally, is bound to anfwer the contract; who therefore, in this cafe, is faid to take up the moncy at refpondentia. Thefe terms are alfo applied to contracts for the repayment of money borrewed, not on the thip and goods only, but on the mere hazard of the voyage itfelf; when a man lends a merchant $1 c 00$ l. to be employed in a beneficial trade, with condition to be repaid with extraordinary interelt, in cafe fuch a voyage be fafely performed ; which kind or agreement, is fometimes called fonus nauticum, and fometimes ufura maritima. But as this gave an opening for ulutous and gaming contracts, efpecially upon long voyages, it was enacted by the fatute 19 Geo. II. c. 27. that all monies lent on bottomry, or at refondentia, on veffels bound to and from the Eaft ludres, thall be exprefsly lemt only upon the thip, or upon the merchandife; that the leader thall have the benefit of falvage; and that if the borrower has not on bourd cffects to the value of the fum borrowed, lie thall be refpomible to the lender for fo much of the principil as hath not been laid out, with legal intereft and all other charges, though the fhip and merchandife be totally loit.

BOTTONY. A crofs bo:tony, in Hiraldry, termi-

Dollom

## B O T [ 3.34 ] B O T

Botrigaro, nates at each end in three buds, knots, or buttons, reBots. fembling, in fome meafure, the threc-leaved grafs; on which account Segoing, in his Trefor Heraldique, terms it croix treflee. It is the badge of the order of St Maurice. Sce Hiraldry Places.
bottrigaro, Hercole, a perfon eminently Rkilled in the fcience of mulic, though not a mufician by profeflion. He was a man of rank in Bologna; and appears, from feveral letters to him that have been printcd, to have had the title of Count. He publifhed feveral centroverfial pieces on the fubject of mufic.。 It feems that he entertained firong prejudices in favour of the ancient mufic; and that he attempted, as Vincentine and others had done, to introduce the chromatic genus into pratice, but with no better fuccefs than had attended the endeavours of others. He corrected Gogavino's Latin verfion of Ptoleny in numberlefs inifances; and that to fo good a purpofe, that Dr Wallis has in general conformed to it in that tranflation of the fame author which he gave to the world many years after. He alfo tranlated into Italian Boetius de Mufica, and as much of Plutarch and Macrobius as relates to mufic : befides this, he made annotations upon Arifoxenus, Franchinus, Spataro, Vicentino, Zarlino, and Galiflei ; and, in thort, on almolt every mufical treatife lee could lay his hands on, as appears by the copies which were once his own, and are now repofited in many libraries in Italy. Of Bottrigario's works it is faid, that they contain greater proufs of his learning and fkill in mufic, than of his abilities as a writer, lis Ayle being remarkably jnelegant: neverthelefs, he affected the character of a poet; and there is extant a collection of poems by him, in 8 vo , printed in 1557. Walther * reprefents him as an able mathematician, and a collector of rarities; and $f_{\text {ays }}$ that he was poffe $f_{-}$ fed of a cabinet, which the emperor Ferdinand II. had a great defire to purchafe. He died in 1609.

BOTTS, in Zoology, a fpecies of worms which can be produced and nourifled only in the inteftines of a borfe. It is there alone they can enjoy the proper temperature of heat, and receive the nourifloment neceffary for them. See Oestrus, Entomology Index.

Befides the long worms which have been obferved in the bodies of horfes, there are alfo flort ones.-By thefe are to be underftood what we call boits.

All authors, both ancient and modern, who have treated of the difeafes of horles, have talken notice of thefe worms; but M. Vallifnieri is the firft who has traced them to the laf Rage of their cransformation, and lias feen them change into a hairy kind of fly like the drone.

The flies from which thefe botts are produced inhabit the country, and do not come near houlcs, at leaft not near thofe of great towns; and therefore horfes are never liable to have the worms (i. e. botts) in their bodies, if they have been kept in the houfe, efpecially in a town, during the fummer and autumn.

It is in the former of thefe feafons, and perhaps too in the beginuing of the latter, that the females of thele flies apply themfelves to the anus of horfes, and endeavour to gain admittance, in order there to depofite their eggs, or perhaps their worms.

The precife inflant of their entrance will farce admit of an cye-witnefs, but by the mereft chance; yct M. Vallifnieri fays, that Dr Gafpari had attained this
very uncommon fight. The Doctor (he tells us) was one day looking at his mares in the field; and from being very quiet, he obferved, that on a fudden they became very reflefs, and ran about in great agitation, prancing, plunging, and kicking, with violent motions of their tails. He concluded, that the fe extraordinary effects were produced by fome fly buzzing about them, and endeavouring to fettle upon the anus of one of them; but the fly not being able to fucceed, he abferved it to go off with lefs noife than bcfore, towards a mare that was feeding at a dikance from the reft ; and now the lly taking a more effectual method to obtain its defign, pafted under the tail of the mare, and fo made its way to the anus. Here at firf it occafioned only an itching, by which the inteftine was protruded with an increafing aperture of the anus; the tly taking the advantage of this, penetrated further, and fecured itfelf in the fold of the inteltine: - this effected, it was in a fituation proper for laying its eggs. Soon after this, the mare became very violent, running about, prancing, and kicking, aud throwing herlelf on the ground ; in fhort, was not quiet, nor returned to feeding, till after a quarter of an hour.

The fly then, we fee, can find means of depofiting its eggs, or perhaps its worm (i. e. tolts), in the fundament of the horfe; whieb once effected, it has done all that is neceffary for them. If thefe bott-worms are not hatched when firf depofited in the horfe, but are then only eggs, it will not be long before it happens, from the nutritive heat they there receive.

Thefe bottworms foon make their way into the inteftines of the horfe: they occupy fuch parts of this region as are to them mof convericnt; and fometimes (as we fhall fee prefently) they penetrate even to the fomach. All the hazard they appear to be expofed to, is that of being carried away from the places they have fixed on by the excrement, which may feem likely to drive all before it. But nature has provided for all things; and when we thall have further defcribed thefe bott-worms, it will feem that they are able to maintain their fituation, and to remain in the body of the horfe, as long as they pleafe.

There is a time when thefe bott-worms are of themfelves defrous to leave this their habitation, it being no longer convenient for them after the purpoles of their growth are anfwered. Their transformation to a fly muft be performed out of the horfe's body : and accordingly, when the time of their transformation draws near, they approach towards the anus of the horle; and then leave him of their own accord, or with the excrement, with which they then fuffer themfelves to be carried along.

According to M. de Reaumur's oblervations, the bott-worms have two unequal claws, by which they are enabled to remain in the inteftines of the horfe in oppofition to all effurts of the excrement to force them out.-'Ihefe claws are a fort of anchor, diflerently difpoled from thofe of common anchors, but contrived to produce the fame eflect. Betides thefe wo cliws, nature has given them a very great number of triangular Cpines or briftles, very fufficient to arm them againft the conts of the intellines, and to refift the force employed to drive them towards the anus, provided the head be directed towards the fomach of the horfe.

It will be aflecd, no doubt, if thefe bott worms are

## B O T [ 335 ] B O U

Botwne not dangerous to horfes?- The mares which affolded M. de Reaumur, for feveral years, thofe on which he made his obfervatione, did not appear to be lefs in tealth than thole which had nonc; but it may fome. times happen, that they are in fo great a quantity in the body of the horfe as to prove fatal to him. M, Vallifnieri huppofes thefe bott-wurms to have been the caufe of an epidemical difeafe that deftroyed a great many horles about Verona and Mantua in the year 1713. -The obfervations communicated to him by Der Gafpari fufficiently confirm his fuppofition. This sentleman, upon difiecting fome horfes that dicd of this diftemper, found in their fomachs a furprifing quantity of fhort worms; of which to give us fome iden, he compares them to the kernels of a pomegranate opened: each of thefe, by gnawing on the coat of the flumach, had made to itfelf a kind of cellule therein, each of which would eafily contain a grain of Indian wheat. It is ealy to imagine by this means the flomach muft be reduced to a wretched condition; the outer menabranes were inflamed, and the inner ones ulcerated and corrupted; a very fmall quantity of thefe worms were found in the fmall inteffines, and only a few in the larger, to which laft they were found affixed, but had not'corroded them. It is unly perhaps when thefe bott-worms are in great numbers, and thereby incommode each other in the inteftines of the horfe, that they make their way towards the fomach; and indeed a very few Hies mult be enough to overftock the infide of a horfe, provided they thould depofite all their eggs, and fuch frould all be animated, M. Vallifnieri having counted 700 and odd in the body of one fingle fly.

When one of thefe botts has left the anus of the horfe, it falls on the ground; an limmediately feeks out for fome place of fafety, where it may retire, to prepare for the laf flage of its zransformation, by which it is to become a fly. And now by degrees the fkin hardens and thickens; and at length forms a folid mell or cod, the form of which fcarce differs from that of the worm. It is firft of a pale red colour, which changes into chefnut ; and at lenesth, by the addition of gradual and fuccetive fardes of brown, the flell is rendered black. The worms or batt, before it paftes into a nymph, is of the furm of an oblong ball; it remairs in this furm muck longer than worms of the Aefl-Ay kind. M. de Reaumur met with worms that retained this figure five or fis days: as yet, one can perceive no traces of the legs, wings, and head of the nymph. Flence he firf learned, that thufe bott-worms do not become nymphs immediately upon their firft chance; but that, in order to become flics, they mult undergo one change more than catcrpillars ordinarily do ts become hatiember.- For the cure of horfes troubled with botts, fee Farriery Index.

BOTWAR, a town of Germany, in the circle of Suabin, and fubject to the duke of Wirtemberg. E. Long. 9. $15 . \mathrm{N}$. Lat. 49.0.

BOT"ZENBURG, a town of Germany, in the duchy of Mecklenburg. It had a caltle, which was irftroyed by the Danes in 1202 . It is feated on the Elbe, and the veffels that pafs by are ubliged to pay a conliderable toll. E. Long. 10. 48. N. Lat. 53.34.

BOV A, an epifcopal town of Italy, in the kingdom of Niples, feated near the Apenninc mountains. E. Long. 1G. 15. N. Lat. 37.15.

BOUCHAIN, a fortified town of the French Ne- Pruchoin therlands, in the province of Hainault. It is divided into two parts by the river Scheld. It was taken by the French in 1676 ; and by the allies under the duke of Marlborough in IyIt, which was the laf military achievement of that great general; but the following year it was retaken by the French. F. Lons. 3. 15. N. Lat. 5c. 17.

BOUCHE OF COURT, the privilege of having meat and drink at court foot-frec. The word is alfo witten Lowge, bouge, and budge; it is mere Irench, where it fignifies mouth. - The French Aill ufe the phare, Avair bouche ì la cour; that is, to bave bable er dict at cours. This privilege is fometimes only extended to bread, beer, and wine: it was a cuffom anciently in ufe, as well in the houfes of noblemen as in the king's const. Thomas earl of Lameafter retained Sir John de Liwre, to ferve him with ten men at arms in time of war, allowing them bouge of court, with livery of hay and oat: horfe-thoes and nails. Sir Hugh Merril had the fame privilege for life, on condition of ferving King Ed. ward II.

BOUCHET, John, a Fienclı poct and hillorian, Hourithed in the I6th century. I'le mont conliderable of his writings are the Annals of Aquitaine, and his Cbapelet der Princes.

BOUDRY, a finall town of Swifterland, in the province of Neufchatel, and capital of a chitelainry of the fame name. E. Long. 7. 5. N. Lat. 47. 11.

BOVEY coal, an intrmmable form found in England, France, Italy, Swifferland, Germany, Ireland, \&c. Its colour is brown or brownih black; and of a liminar fructure. It is compofed of wood, penetrated with petrul or bitumen; and frequently contains py. rites, alum, and copperas.

BOUFLERS, Lewis Francis, Deke of, a peer and marthal of France, and a general oi diftursuilhed reputation, was the for of Francis count of Bontter. He was born in the year 1674 , and entering early into the army, was raifed in 1669 to the rank of colonel of dragoons, and in the conquelt of Lorraine, ferve. under Marfial Crequi. In the war againt Holiand he ferved under the celebrated Tureme, and frequently diftinguifhed himfelf by his $\mathfrak{k i l l}$ and bravery; and when that general was killed, in 1675 , he commanded the rear-guard during the retreat of the French army. After performing various militery fervices in Germany, in Flanders, and on the frontiers of Spain, he gradually rofe in rank as well as in reputation. In 169ว, he was created general of the army of the Nufeile. In the following year, he acted as lieutenant-general, under the ling in perfon; and while he invefed Nons was wounded in an attack on that place. He conducted the bombardment of Liege, although it was defended by a fuperior enemy, and he forced the allied generals to abandon Luxemburgh. He was entrufed with the command of the cuvering army, againf King WVilliam, atthe fiege of Namur ; ind for this and many uther important fervices, he was raifed int $10 g 3$ to the high rank of marthal of France. In 1694 , he was appointed governor of French Flanders, aud of the torn of dilic. By a dkilful manccurre he threw himfelf into Namur, in 1605 , and hell out for fixty-iliree days, agaiat the combined armies of the allics under King Willian. Havin's agreed to a capitulation, lec was arbelted prituber of

## $\mathrm{B} O \mathrm{U} \quad[336] \quad \mathrm{B} O \quad \mathrm{U}$

Bougeant war, becaufe the French had not performed the ftipuEougie. lated terms on which the garrifon had furrendered; and when be remonfrated that the garvifon fhould have
been retained rather than himfelf, he received a fine compliment, by being anfwered, that he was eftimated at 10,000 men. In the conferences which were held with the earl of Portland, and which terminated in the peace of Ryfwick, he had a principal thare.

During the following war, when Lille was again threatened, in 1 708, with a fiege by the duke of Marlborough and Prince Eugene, Boutlers was appointed to the command, and made a very obftinate refiflance of four months. His magnanimity was not lefs remarkable than his military conduet ; for when a partifan reprefented to him that it would not be difficult to kill Prince Eugene, he was told by the marfhal, that he might exped a great reward for taking him prifoner, but the levereft punifhment if any thing were attempted agairoft his life. He was rewarded and honoured by the king for his defence of Lille, as if he had been victorious. When the affairs of France were threatened with the moft urgent danger, though a fcnior officer to Villars, he made an offer to ferve under that general, and was with him at the battle of Malplaquet. Here he again difplayed his military fkill, by conducting the retreat, fo that he loft neither cannon nor prifoners. He died at Fountainbleau in the year I7II, at the age of 68, and left the character of a true pairiot, as well as of a great commander. Madame de Maintenon, faid of him, "that his heart was the laft pirt that died." His conduet was unintluenced by private interelt, and fuperior to court intrigue. When he was ordered to take upon bim the defence of Lifle, and permitted to have the choice of his licuterants, he waited not to arrange or regulate his private affairs, or even to take leave of his family, but flew to the place, and carried with him only two officers, one taken from the Baftile, and another who had been in difgrace ; preferring merit obfcured in the thades of retirement, to the gaudy flutterer in the furftine of court favour.

BOUGEANT, William Hyacinth, a famous Jefuit, firf taught humanity at Caen and Nevers, and afterwards fettled at the college of Louis the Great, where he employed himfelf in writing feveral works; the principal of which were, 1. A collection of phyfical oblerwations, extracted from the beft authors. 2. A hiftory of the wars and negotiations which preceded the treaty of Weftphalia. 3. The female doztor, a philofophical amufement on the language of beafts, \&c. He dicd in 1743.

BOUGH, denotes much the fame with branch.Green boughs anciently made part of the decoration of altars and temples, efpecially on feitival occafions. Oaken boughs were offered to Jupiter; thofe ol laurel, to Apollo; of olive, to Minerva; myrtle, to Venus; ivy, to Bacchus; pine, to Pan; and cyprefs to Pluto. Some make them the primitive food of mankind before acorns were invented.

BOUGIE, in the 「rench lançuagc, fignifies a wax candle, and is applied to a machine which (as the wax candle formerly was) is introduced into the urethra for removing obfructions therc. Monf. Daran, a French furgcon, lately boafted of his introducing them as an improvement in his art, and acquired confderable
profit by making and felling them. Scultetus, about the midJle of the tyth century, ufed bougies in difeafes of the urethra, and Monf. Daran probably took rhe hint from him. Different compofitions have been ufed, and generally mercury was a part of them. Riverius made a plafter as tollows: $\beta_{0}$ ol. oliv. lb iv. cerac citrin. It ii. minii \& ceruff. āa ft ifs tereb. venet. \& rcz. alb. āa $\overline{3}$ iii m . Whether the bougies are made up of this or any other compofition, they muft be of different fizes, from the bignefs of a knitting needle to that of a goofe quill. They are made of linen rags, fpread with a proper matter, and then rolled up as follows. Having fpread any quantity of the linen rag with the compofition that is chofen for the purpofe, cut it into fips from fix to ten inches long, and from lralf an inch to an inch broad: then dexteroufly roll them on a glazed tile into the form of a wax candle: and as the end of the bougie that is to be entered firt into the urethra fhould be fomewhat fmaller than the rell, it would be as well to cut the Mips a little tapering. It fhould alfo be obferved, that when the bougies are rolled up, that fide muft be outward on which the plafter is fpread.

Monf. Daran, and fone others, attributed the action of their bougies to the compofition they made ufe of in forming them. Mr Sharp apprehended, that as much of their efficacy was owing to the compreflion they made on the affeeted part, as to any other principle; and Mr Aiken very juflly fays, As it is evident that bougies of very different compoftions fucceed equally well in curing the fame diforders in the urethra, it is plain that they do not act by means of any peculiar qualities in their compofition, but by means of fome property common to them all. This mult be their mechanical form and texture, therefore their mode of action mult be fimple compreffion. The efficacy of mere compreftion in many cafes of conftriction is well known, from the ufe of fponge tents for widening parts that are ftraitened by cicatrices; and admitting obflructions in the urethra to be from a conftriction formed by cicatrized ulcers, or a projection of the fongy fubftance of the urethra into the canal, we may eafily conceive, that a gentle continued elanic compreffion will in time overcome the difeafe. We may alfo readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of fwelling with moifture, and therefore not making fo equal a compreffion. As to bougies procuring a difcharge of matter, there is no doubt but the mechanical ftimulus of a foreign body in fuch a tender part, though free from difeafe, muft produce it in fome degree; and that this will be varied according to the chemically irritating quality of the compofition, and the irritable ftate of the urethra: but it feems an abfurdity to apply a topic, made uniform throughout, to the whole length of a canal, with a view of producing cxtraordinary ef. feets upon a maticular part of it, by means of fome powerful quality in the ingredients. As to that part of the bongie which was in contan with the difeafed part, being particularly covered with matter ; this circumfance is probably owine to the greater irritation of that part of the urethra where the diforder is, than any other.

BOUHOURS, DOMINIc, a celebrated French cri-

## B O U

suillon. tic, was born at Paris in 1628 ; and has been by fome coufidered as a proper perfon to fucceed Mitherbe, who died about that time. He was entered into the fociety of Jeluits at the age of 16 ; and was appointed to read lectures upon polite literature in the college of Clermont at Paris, where he had nudied: but he was fo inceffantly attacked with the headach, that he could not purfue the deftined tafl. He afterwards undertook the education of two fons of the duke of Longueville, which he difcharged with great applaufe. The duke had fuch a regard for Bouhours, that he would needs die in his arms; and the "Account of the pious and Chrifian death" of this great perfonage was the firf work which Buahours gave the public. He was fent to Dunkirk to the Popifh refugees from England; and in the midft of his miffionary occupations, found means to compofe and publith books. Among thefe were, En. sretiens a"Arife et d"Eugene, or "Dialogues between Ariftus and Eugenius ${ }^{\prime \prime}$ a work of a critical nature, and concerring the French language. His book was printed no lefs than five times at Paris, twice at Grenoble, at Lyons, at Bruffels, at $\Lambda$ mfterdam, at Leyden, \& $c$. and embroiled him in quarrels with a great number of cenfors, with Menage in particular, who, however, lived in friendflip with our author before and after. The fame of this piece, and the pleafure he took in reading it, recommended Bouhours fo effectually to the celebrated miniter Colbert, that he trulted him with the education of his fon the marquis of Segnelai. He wrote afterwards feveral other works; the chief of which are, I. Remarks and doubts upon the French language. 2. Dialogues upon the art of thinking well in works of geniuc. 3. The life of St Ignatius. 4. The art of pleafing in converfation. 5. The life of St Francis Xavier, apoftle of the Indies and of Japan. This laft work was tranflated from the French into Englifh hy Mr Dryden, and publifhed at London in the year 1668 , with a dedication prefixed to James II.'s queen.

BOUILLON, a town of France, in the duchy of the fame name, and in the county of Luxemburg, with a fortified cafte, which is feated on a rock that is almoft inaccelfible. The French took it in 1676 ; upon which it was given to the duke of Bouillon. This duchy is a fovereignty, independent of France; and in 5792, the king of Great Britain granted to Philip d'Auvergne, captain in the royal navy, his licenfe to accept the fucceffion to the faid duchy, in the cafe of the death of the hereditary prince, only fon of the reigning duke, without iffue male, purfuant to a declaration of his ferene highnefs, in 1791, " at the defire, and with the exprefs and formal confent of the nation." Accordingly, Captain d'Auvergne has fince affumed the title of prince of Bouillon. In May 1794 this town was taken by form, by General Beaulieu, after defesting a confiderable body of republicans, and given up to pillage; 1200 French were killed, and 300 taken prifoners. It is feated near the river Se mois, 12 miles north of Sedan. E. Long. 5. 20. N. Lat. 49.45.

Bouillon, in the manege, a lump or excrefeence of feth that grows either upon or juft by the frufl, infomuch that the frufh floots out, juft like a lump of fleth, and mokes the horfe halt; and this is called the fefb blowirg upon the fruf). Manege horfes, that never v.ct
their feet, are fubject to thefe excrefcences, which make them very lame. See Frush.
of II coud harm caufed by a worm lodging between the fkin and the Helh, and perforating the fame. This dittemper is not mentioned by the ancient Greeks, and is but little known in Europe.

BOVINES, a fmall town of the Aufrian Netherlands, in the province of Namur, feated on the river Maefe or Meufe, in E. Long. 4-50. N. Lat. 49-45.

BOVINO, an epifcopal tuwn ol It ily, in the Capitanata, feated at the foot of the Apennune mountains, in E. Long. 16. 15. N. Lat. 41. 17.
BOVIUM (Itunerary); a town of the Silures, is Britain, fifteen miles to the fouth of Ifca Silurum, or Caer-leon, in Monmouththire: Now called Cowiridge; according to Baudrand, Bangor in Caernarvonflure.
BOULAINVILLIERS, Henry de, Lord of St according to Baudrand, Bangor in Caernarvonflure.
BOULAINVILLIFRS, Henry de, Lord of St Suife, and an eminent French writer, was defcended
from a very ancient and noble family, and born at St Suife, and an eminent French writer, was defcended
from a very ancient and noble family, and born at $S t$ Saife in 1658 . His education was among the fathers of the oratory; where he difcovered from his infancy thofe uncommon abilities for which he was afterwards
dittinguifhed. He applied himfelf principally to the thofe uncommon abilities for which he was afterwards
ditlinguifhed. He applied himfelf principally to the ftudy of hiftory; and his performares in this way are numerous, and confiderable. He was the author of a hillory of the Arabians; fourteen letters apon the ancient parliaments of France; a hiflory of France to ancient parliaments of France ; a hillory of France to hiftorical memoirs concerning the ancient government of that monarchy, to the time of Hugh Capet, "writ-
ten (Cays M. Montefquieu) with a fimplicity and hoof that monarchy, to the time of Hugh Capet, "writ-
ten (Cays M. Montefquieu) with a fimplicity and honeff freedom worthy of that ancient family from which their author was de?cended." M. Boulainvilliers died
at Paris in 1722 ; aud after his deatla was publifhed his their author was defcended." M. Boulainvilliers died
at Paris in 1722 ; and after his deatla was publimed his Life of Mahomet.

BOULANGER, Nicholas Anthony, a very fin-
gular Frenchman, was burn at Piris in 1722, and died there in 1759, aged only 37. During his education, he is faid to have come out of the college of Beaurais almoft as ignorant as he entered into it; but fruggling hard againt his unaptnefs to learn, he at length overcame it. At feventeen, he began to fudy mathematics and architecture ; and in three or four years made fuch a progrefs, as to be ufeful to the baron of 'l hiers, whom he accompanied to the army in quality of engineer. Afterwards he had the fupervifion of the highways and bridges; and he executed feveral public
works in Champagne, Burgundy, and Lorrain. Tha highways and bridges; and he executed feveral public
works in Champagne, Burgundy, and Lorrain. Tha author of his life, in the Diaionnaire des Hommes cele-
bres, writes, that in this province a terrible foutit difbres, writes, that in this province a terrible fprit difcovered itfelf in him, which he himfelf did not fufpect before; and this was, it feems, the firit of "thinking philofuphically." In cutting through mountains, ditecting and changing the courfes of rivers, and in breaking up and turning over the frata of the earth, he faw a multitude of different fubfrances, which (he thought) evinced the great antiquity of it, and a long feries of revolutions which it mult have undergone. From the revolutions in the globe, he paffed to the changes that mult have happened in the manners of men, in focieties, in governments, in religion; and he formed many conjectures upon all thefe. To be farther fatisficd, he wanted to know what, in the hiftory of ages, had been faid $\underset{U}{\mathrm{up}} \mathrm{u}$ thefe patticulars; and of ages, had been faid upon thefe particulars; and

 Britain, hifteen miles to the fouth of Ifca Silurum, or tecting and changing the courles of rivers, and in Fries of revolutions which it mull have afled to the

Furarger that he might be irformed from the fountain-head, $\|$ be learned firft Latin and then Greek. Not yet Boulitre. content, he plunged into Hebrew, Syriac, Chaldaic,
and Arabic; and acquird fo immerife an erudition, that, if he had lived, he would have been one of the moft learned men in Europe: but death, as we have obferved, promaturely took him off. His works are, 1. Trailé da Defpotifime Oriental, 2 vols 12 mo ; o very bold work ; but not fo bold and licentious as, 2. L'Antiquite devoille, 3 vols 12 mo . This was pont humour. 3. Hc furnifted to the Encyclopedié the articles Deluge, Corité, and Sociect́. 4. He left behind dim in MS. a Dictionary, which may be regarded as a concordance in ancient and modern language. As a man, he is faid to have hcen of a fweet, calm, and engaging temper; which, however, it is very difficult to reconcile with the dark, impetoous, ardent fpirit, that appears to have actuated him as a writer.

Boulanger, yobn, an engraver, who flourifled towards the end of the lat century, was a native of

France. His firt manuer of engraving appears to have been copied, in fome degree, from that of Francis de Poilly; but foon after he adopted one of his own, which, though not original, he however greatly im1roved: He frifhed the faces, hands, and all the naked parts of his figures, very neatly with dots inftead of Arolies, or ftrokes and dots. The effect is fingular enough, and by no means unpleafing: onity, in fome tew inflances, he has oppofed the coarfe graving of his daperies, and back-ground, fo violently to the neater work of the feht, that the outline of the latter is thereby rendered hard, and the general appearance of it flat fnd chalky. This tlyle of engraving has been carried to its greateft perfeflion in the prefent day, particularly in England. Ile did not draw the naked parts of his figures correcly, or with fine tafte. His drapesits are aft to be heary, and the folds not well marked. However, his beft prints puffefs much merit, and are defervedly held in great efteem.
boUlay, Cfsar Egasse du, in Latin Bulaus, was born at St Ellicr, a village of Maine in France; and became profellor of humanity at the college of Na sarre, regiter, rector, and hiftoriographer of the univerfity of Paris. He died in $\mathbf{6} 678$, after having publifhed Several works. The principal of them are, A Hifory of the Luiverfity of Paris, in Latin, 6 vols folio; and the Trafure of Roman Antiquities, in 1 vol. folio.
BOULCOL.ACA, among the modern Greeks, denotes the fpectre of fome wicked perfon who died excommunicated by the patriarch, reanimated by the devil, and caufing great diflurbance among the people; of which many flrange fories are told. The word is

 and $\lambda \pi \times x o s$, a " ditch," on account of the filthinefs of the fight.

BOULDER-wall, a kind of wall built of round fints or pebbles, laid in ftrong mortar, and ufed where the fea has a beach calt up, or where there are plenty of finte.

BOULETTE, in the manege. $A$ horfe is called loulite, when the fetlock, or paftern-joint, bends forward, and out of its natural fituation, whether through violent riding, or by reafon of leing too hort-jointed, in which cafe the leaft fatigue will bring it.

BOUILOGNE, Lewis, painter to the French Boullogre king, and profeflor of the academy of paining, diftisu Eouicgnoic, guilhed himfelf by his ant; and dicd at Paris in $1674, \underbrace{\text { Eouicgnois }}$ aged 65 . There are thiee of his pictures in the church pillungtan. of Notre Dame.-He left two fons who were admired for their fkill in painting. The elder, who is well known under the name of Bon Boullonne, was fint inftucted by his father; after which he went to perfeat himfelf in Italy, and for that purpofe the king allowed him a penfion: at his return, he was made profeffor of the academy of painting. Louis XIV. employed him in adorning feveral of his palaces; and there are a great number of his pictures at Paris. His talents for copying the pictures of the great Italian mafters were fo very extraordinary, that he frequently deceived the greateft judges. He died in 1717 .-Lervis Boullorne his brother, after being alfo inflructed by his father, gained the prize of painting at 18 years of age; upon which be obtained the king's penfion. He fet out for Italy at his brother's return, and acquired great fkill in defigning and colouring. At his return to Paris he was much employed ; and at length became director of the acadcmy of painting, kuight of the order of St Michael, and firf painter to the king. Louis XIV. allowed him feveral penfions, and raifed him and his pofterity to the rank of nobility. He embellifthed the church of the Invalids, the chapel of Verfailles, \&c.

Boullogne, Bon de, a painter of fome eminence, was born at Paris in 1649. From his father Louis de Boullogne he learned the firft principles of the art: but went to Rome in order to perfect himfelf from the works of the beft mafters. He abode in Italy five years. He excelled in hiftory and portrait. His talents for copying the pictures of the great Italian painters were fo very extraordinary, that he frequently deceived the greateft judges. He died at $\mathrm{Pa}-$ ris in 1717 , aged 68.

Boullogne, Louis de, born at Paris in 1654 , was the younger brother of the preceding; and like him learned from his father the firt principles of painting, and afterwards went to Rome to complete his ftudies. His works, on his return, were fo much efteemed, that Louis XIV. honoured him with the order of St Michael, and, after the death of Antony Coypell, appointed him his principal painter. He chietly excelled in hiftorical and allegorical fubjects. He died at Paris in 1734, aged 80 years.

BOULOGNE, a large fea-port town of Picardy in France, and capital of the Boulognois, now called the department of the fraits of Calais, with a harbour, and formerly a bilhop's fee. It is divided into two towns; the higher, and the luwer. The former is Atrong both by nature and art ; and the latter is only furrounded with a fingle wall. The harbour has a mole for the fafety of flipping, which , at the fame time prevents it from being choked up. 'The lower town is inhabited by merchants, and has three large ftrects, olle of which leads to the high town, and the other two run in a line on the fide of the river. It is fituated at the mouth of the river Lianne, and 14 miles fouth ot Ca lais. E. Long. 1. 42 . N. Lat. 50. 42.

BOULOGNOIS, a tertitory of France, in the north part of Picarty, :about 30 miles in length and 20 im breadth. The chief town is Boulogne, and the chief

## B O U

Poulter. trade is in pit-coal and butter. It now forms the dcpartment of the ftraits of Calais.

BOULTER, Dr Huch, was born in or near London, of reputable and wealthy parents. He was educated at Merchant-taylors fchool; and, before the Revolution, was from thence admitted a commoner of Chrill-church in Oxford. Some time after, he was chofen a demy of Magdalen collage, at the fame election with Mr Addifon and Dr Wilcox. From the merit and Iearning of the perfons elected, this was commonly call. ed by Dr Hough, prefident of the college, the golden clection. He afterwards became fellow of the fame college ; in which fation he continued in the univerfity till he was invited to London by Sir Charles Hodges, principal fecretary of flate, in the year 1700 , who made him his chaplain, and recommended him to $\mathrm{Dr}_{\mathrm{r}}$ Tenifon archbihop of Canterbury ; but his firf preferments were owing to the earl of Sunderland, by whofe intereft and influence he was promoted to the parfonage of St Olave in Southwark, and the archdeaconry of Surry. Here he continued difcharging very faithfully and diligently every part of his paftoral office, till he was recommended to attend George I. as his chaplain when he went to Hanover in 1719. He had the honour to teach Prince Frederic the Englifh language ; and by his conduct he fo won the king's favour, that be promoted him to the deanery of Chrift-church, and the bilhopric of Brifol, in the fame year. As he was vifting his diocefe five years afterwards, he received a letter from the fecretary of flate, acquainting him that his majefty had nominated him to the archbifhopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and defired the fecretary to ufe his good offices with his majefty to excule him from accepting it. Ireland happened to be at this juncture in a great flame, occafioned by Wood's ruinous project; and the miniftry thought that the bifhop would greatly contribute to quench it by his judgment, moderation, and addrefs. The king therefore laid his abfolute commands upon him: to which he fubmitted, but with fome reluctance. As foors as he had taken poffeffion of the primacy, he began to confider that country, in which his lot was caft for life, as his own ; and to promote its true interef with the greateft zeal and affiduity. Accordingly, in innumerable inftances, be exeited himfelf in the nobleft acts of beneficence and public fpirit. In feafons of the greatef fcarcity, he was more than once inftrumental in preventing a famine which threatened that nation. On one of thefe occafions he difltibuted vaft quantities of corn throughout the kingdom, for which the houfe of commons paffed a vote of public thanks; and at another time 2500 perfons were fed at the poor-houle in Dublin, every morning, and as many every evening, for a confiderable time together, mofly at the primate's expence. When fchemes were propofed for the advantage of the country, he encouraged and promoted them not only with his counfel but his purfe. He had great compaffion for the poor clergy of his diocefe, who were difabled from giving their clildren a proper education ; and he maintained feveral of the children of fuch in the univerfity. He erected four houfes at Drogheda for the reception of clergymen's widows, and purchafed an eftate for the endowment of them. His charities for augmenting fmall livings and buying glebes amounted to upwards
of 30,000 . befides what he deviled by will for the like purpofes in England. In thort, the infances he gave of his generofity and bencvolence of heart, his virtue, his piety, and his wifdom, are almof innumerable, and the hiftory of his life is his uobleft panegyric. This excellent prelate died at London, on the 2 d of June 1742 , and was interred in Wettminfter-abbey, where a beautiful monument of fincly polifhed marble is erected to his memory.

BOUL'TINE, a term which workmen ufe for a. moulding, the convexity of which is jull one fourth of a circle; being the member juft below the plinth in the Tulcan and Doric capital.

BOUL.UKE, in the military orders of the Fusks, a body of the janizarics, with an officer in the place of a colonel at their head, fent upon fome particular enterprife; they are felected out of the body for this, and as foon as the buffnefs is over, are received again into their former companies.

BOUM, in Ancient Geggraply, a town in Ethiopia beyond Egypt, on the weft fide of the Nile,

Boum solis stabula, in Ancient Gengraphy, the territory of Mylie, fo called : A peninfula on the eak coaft of Sicily, to the north of Syracufe; remarkable for its fertility and rich paflures (Theophraflus): and hence arofe the fable of the oxen of the fun feeding there (Scholiaft on Apollonius). Pliny and Seneca fay, that fomething like dung is thrown out on the coaft of Mylx and Meffana, which gave rife to the fable of the oxen of the fun being falled there ; and at this day the inhabitants affirm the fame thing (Cluverius).

BOUNCE, in Icbitbyology, the Englill name of a〔pecies of fqualus. See Squalus.

BOUND, in Dancing, a fpring from orle foot to the other; by which it differs from a hop, where the fpring is from one foot to the fame. It alfo differs from a half coupee, as in the latter the body always bears on the looor, either on one foot or the other; whereas, in the bound, it is thrown quite from the floor.

Bound-Bailiffs, are fheriffs officers for executirg of procefs. The theriffs being anfwerable for their mil'demeanors, the bailiffs are ufually bound in a bond for the due execution of their office; and thence are called bound-bailiffs, which the common people have corrupted into a much more homely appellation.

Bounds of lands. See Abuttals.
BOUNTY, in Commerce, a premium paid by goverument to the exporters of certain Britih commodities, as fail-cloth, gold and filver lace, filk-flockings, fifh, corn, \&c. The happy influence which bounties have on trade and manufactures is well known : nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all poffible encouragement to thofe who hall eitablif or improve any hazardous branch of trade.

All undertakings, in refuct eithcr to morcantile en- Campbells terprifes, or in the citablithment of manufactures, are $P_{\text {chuisal }}$ weak and feeble in their beginnings; and if unfucceßfal, $\mathcal{S}_{\text {urvery }}$ of cither fink entirely, or at lealt are feldom revived in Brifain. the fame age. Accidents of this mature are not only deftruative to private perfons, but exceedingly detrimental to the public intereft. On this principle, more

Bounty.
efpecially

## B O U [ 340 ] B O U

Bounty. efpecially fince trade, for which Providence defigned us, hath been attended to, fuch attempts have been thought deferving, and have been favoured with, public fupport. This in former times ufually flowed from the crown, in the form of letters-patent, charters, or other grants of privileges, which, however requifite they might be, were notwithftanding very frequently objects of cenfure. If fuch as obtained them failed in their endeavours, they were reputed projectors; if, on the other hand, they fucceeded, they were confidered as monopolizers. Corporations, which imply the uniting certain individuals into a body, that they may thereby become more ufeful to the community, are created by the crown. Many of thefe were formed for promoting trade; and, according to the old fytem of our government, were neceffary and ufeful. On the fame principle, privileges were granted to private perfons, on a fuggeftion, that what was immediately of ufe to them would terminate in public utility. Thefe alfo did good in bringing in many arts and manufactures; though, in fome cafes, tending to private intereft more than public emolument, they were liable to legal correction. In later times, and in concerns of moment, a much better method has been adopted, as often as it hath been found practicable, by rejecting private or particular intereft, and propofing the defigned advantages to fuch as fhould perform the flipulations on which they are granted. Thefe bounties, as they are paid by the public, fo they are folely calculated for the benefit of the public. They are fometimes given to encourage induftry and application in raifing a neceflary commodity; which was intended by the bounty on exporting corn. The intention of this bounty was to encourage agriculture ; and the confcquence hath been, that we now grow more than twice as much as we did at the effablifhment of the bounty; we even confume ruice as much bread as twe then grew; yet in A. D. 1697, we exported a fifteerth part of what we grew, of late years a twenty-ninth part only. The bounty on this twenty-ninth part amounted to fomewhat more thar $50,000 \mathrm{l}$. and the produce to more than 400,0001 . It is evident that all this is fo much clear gain to the nation. But this is far from being all that we have annually gained. For if our cultivation is double, as indeed it is, then the rent of lands, the fubfitence of working hands, the profits of the tradefmen fupplying them with utenfils, clothes, the value of horfes employed, \&e. mult all be taken into the account. Befides this, we mult add the freight (amounting to half the bounty), to make the idea of the advantages complete.

Sometimes bourties are given with a view to promote manufacturs s, as in the cafe of thofe made of filk. Many laws are to be found in our flatute books in favour of the filk manufacture, made with great wifdom and propriety, for the encouragement and fupport of many thoulands of induftrious perfons employsd therein. By fatute 8 Gco I. cap. 15. § 1. a bounty was given on the due exportation of ribbons and ftuffs, of filk only, of three fthillings upon a pound weight; filk, and ribbons of filk, mixed with gold and filver, four fhillings a-pound; on filk gloves, filk flockings, filk tringes, filk laces, and fewing filk, one flilling and threepence a-pound; on ftuffs of filk and grogram yarn, cightpence a-pound; on filks mixed with inkle or cotton,
one flilling; on fuffs of filk mixed with wortied, fix. Eouretyo pence a-pound, for three years; and, from experience of their utility, thefe were continued by fubfequent flatutes.

Sometimes bounties are given to fupport a new manufacture againtt foreigners already in poffefion of it, as in making linen and fail-cloth. The promoting of the manufacture of Britifh fail-cloth was undoubtedly a very important national cbject, as the confumption was very large, and of confequence the purchafe of it from foreigners a heavy expence on the public. Many methods were therefore devifed, and countenanced by law, both here and in Ireland, for introducing and encouraging our own in preference to that of ftrangers. more efpecially in the royal navy. By ftat. 12 Annce, cap. 16. 2. a bounty was given of one penny per ell on all that was exported for a term, and continued by: fubfequent flatues. By 4 Geo. II. cap. 27. § 4 . an additional bounty of another penny an ell is granted. Thefe bounties were to be paid out of an additional duty on imported fail-cloth. By the fame flatute every mip built in Britain, or in the plantations, is, under the penalty of 501. to be furnifhed with a complete fuit of fails of Britifh manutacture. The amount of thefe bounties mark the progrefs of the marufacture, which is alfo adifted by the fund on which the payment is affigned.

The affiftances, however ${ }_{7}$ are never beftowed but on mature deliberation, in virtue of ftrong proofs, and with a moral certainty of a national benefit. The great intention of bounties is to place the Britifl trader on fuch ground as to render bis commerce beneficial to his. country. In order to this, fome. profit mull accrue to hinfelf, otherwife he would not embark therein; but this, whatever it be, mult prove inconfiderable in comparifon of what refults to the public. For if, by the help of fuch a bounty, one or many traders export to the value of $1000,10,000$, or 100,000 pounds worth of commodities or manufactures, whatever his or theirprofit or lofs (for the latter, through avidity and overloading the market, fometimes happens) may be, the nation gains the 10001 . 10,0001 . or 100,0001 .; which was the object of the legillature in granting the bounty. Upon this confideration, that the entire produce of what is exported accrues to the nation, the legiflature, when an alteration of circumfances required. it, have made no fcruple of augmenting a bounty; as in the cafe of refined fugar exported, trom three to nine millings per hundred weight. In like manner, the ori.. ginal bounty of one pound per ton in favour of veflels. employed in the whale-fifhing hath been doubled, and many new regulations made, in order to render this fifhery more advantageous to the public. As a bounty is given on malt when allowed to be exported, fo an equivalent of 30 hillings per ton hath been granted on all Britifh-made malt-lpirits when exported, which is a common benefit to land, manufactures, and commerce.

It is indeed true, that on whatever account, or to whatever amount, this reward is given, the public feem to pay; and private perfons feem to receive. But thefe private pertons receive it as the hire from the public for performing a fervice which otherwife they would not perform, the benefit of which accrues to the public, and who can therefore very well afford to pay that soward in reality, which, as we have ftated it, fle on-

Sounty, ly feems to do. For, looking a little clofer, we cannot help obferving, that the buunty is paid to individuals, who, as fuch, make a part of the public. But the commodities or manufacturs exported are fold to foreigners, and the whole produce of them, be it what it will, comes into the purle of the public. By attending to this felf-evident doctrine, every reafonable and public-fpirited man will be eafily reconciled to bounties; and the three following confiderations will be fufficient to obviate the moft common objections that have been made to the practice of giving them. I. That no bounty can be defired but on the plea of national utility, which always deferves notice, and cannot be miftaken. It muft likewite be alleged and proved, that this is the only means whereby the national benefit can be attained. 2. The fums iffued on this account not only fhow the clear expence of the bounty, but alfo indicate the profit gained by the public; for as the one cannot exild without the other, that amount mult be the incontellable index of both. 3. It muft be remembered (and of this too fome inftances might be given), that if bounties fhould be improperly beftowed, they will of courfe prove ineffectual, and after a few fruitlefs trials will remain unclaimed, and confequently produce no expence. There is indeed another objection which hath been made againft the giving of bounties. This is grounded on the frauds to which they are fuppofed to be liable; and particularly the relanding of the goods on which the bounty hath been paid, and thereby deceiving and cheating the public. But whoever purfues the laws made on this head, and attentively confiders the numerous precautions taken to fix every circumftance relative to the obtaining the bounty, the checks on the fhipping of goods, the fecurities taken for their due exportation, the certificates required to afcertain their being actually delivered and fold in a foreign market, muft be convinced, that to difcharge all thofe fecurities, in cafe of an intended fraud, is a thing very difficult, if not impoffible.

To thefe remarks we may add, that bounties are ufually granted only for a linited time, and then expire; are always. liable to be lufpended ; and of courfe can never be the caufe of any great national lofs. There is no doubt that, exclufive of frauds, the immoderate thirft of gain may tempt interefted men to aim at converting what was calculated for public benefit to its detriment, for their own-private advantage. Thus, on a profpect of flort crops in other countries, men may take meafures within the letter, but directly againft the fpirit, of the law, to fend fo much of our con abroad as to endanger a famine at home. Fur this the wifdom of parliament provides, not barely by fulpending the bounty, but by protibiting exportation and opening the ports for foreign fupplies. We canrot with any thadow of juftice afcribe fearcity to the bounty on the exportation.. If this was the cafe, fufpenfions would be frequent, whereas there have been but five in a courfe of 70 years. If the bounty had any hare, the larger the exportation, the greater would be the fcarcity. In A. D. 1750 we exported more than one fifth of our growth of wheat, which was notwithfanding but at four fhillings per bufhel; whereas a century before, A. D. 1650 , when we had neither boutity nor exportation, wheat was at nine fhillings and fixpence per bulbel. The caufes of farcity are unkindly fea-
fors; which though human policy cannot prevent, jet their fad effects have been evidently leffened by our increaled growth, fince the taking place of bounty and exportation.

Queen Anne's Bountr, for augmenting poor livings under 501. per annum, confilts of the produce of the firf fruits and tenths, after the charges and penfions payable out of the fame are defrayed. A corporation fur management of the fame was fettled, \&c. in 1704. See Augmentation.
bourbon, or Mascarenhas, Ifle of, an illand in the Indian ocean, lying on the eall of Madagafcar, in E. Long. 58. 30. S. Lat. 2 1. 23. This inland has no port, and is in fome places inacceffible. Its length and breadth have not been well determined; but the circumference, according to the account of a perfon who refided there fome time, is about 57 leagues. It is for the molt part mountainous, but in fome places there are very beautiful and fertile plains. In the fouth part of the ifland there is a burning mountain, which has thrown out valt quantities of bitumen, fulphur, and other combuftible materials; neither does it ceafe throwing them out ftill, fo that the country about it is ufelefs, and is called by the inhabitants pays lrule, that is, burnt land. The fhore is high and rocky all round; but though on this account it hath no ports, there are feveral good roads, particularly one on the well, and another on the north-eafl: As to its form, this inland is irregular, fo that it is difficult to judge from the maps whether it is round or long. The air is equally pleafant and wholefome, informuch that the people live to a great age without feeling either infirmities or difcafes. This is occafioned by the hurricanes, of which they have one or two every year. Thefe purge and cleanfe the air fo as to render it highly falubrious; the certainty of which is thus diftinguifhed, that when they fail of making their annual vifits, as fometimes they do, difeales and death find an entrance into the ifland ${ }_{2}$, which otherwife would foon be overfocked with inhabitants. The climate is loot, but not to fuch a degree as might be expeeted from its fituation, the breezes from the mountains being conflant and very refrefhing. The tops of thefe mountains are in winter covered with fnow ; which, melting in the fummer, furnifhes abundance of rivers and rivulets, with which the country is plentifully watered: fo that the foil, though nut very deep, is wonderfully fruitful, producing. Turkey corn and rice twice a-year, and the latter in great abundance. Moft forts of cattle are found here, good in their kind, and are very cheap: wild goats and wild hogs are found in the woods and on the tops of the mountains; here alfo are valt quantities of wild fowl of different kinds, fift, and land tortoifcs, affording at once the moft delicate and wholefonse food. As to fruits, they have bananas, oranges, citrons, tamarinds, and other kinds; neither does it want valuable commodities, particularly ebony, cotton, white pepper, gum benzoin, aloes, and tobacco; a 4 excellent in their kind, when compared with thofe of other countries. This ifland is alfo happy in its deficiencies; for no animals that are venomous are to be found therein, and only two lorts that are difagreeable to the fight, viz. fpiders of the fize of a pigeon's egg, which weave nets of a furprifing ftrength, reckoned by fome capable of being treated fo as to become as va-

Pourbon. luable as filk; and bats of a moft cnormous fize, which - are not only finned and eaten, but efteemed alfo the greateft delicacy that they have.

The inand of Bourbon was difcovered by the Portuguefe in 1545, as appears by a date inferibed by them upon a piliar when they firft landed; but when the French fettled in Madarafear, this ifland was totally defolate. Three Frenchmen being banifhed thither, and left there for three years, made fuch a report of it at their return as furpriled their countrymen. They lived moft of that time upon pork; and though they were in a manner naked, yet they affirmed that they never had the leaf pain or ficknefs whatever. 'This tempted one Anthony Taurcau to go over thither in 1654 , accompanied by feven French and fix negroes, who carried with them the cattle from which the illand has been flocked ever fince. The firf thing they did was to erect the arms of France, by order of M. Falcourt who was governor of Madagafcar, and to befow upon the illand a new name. Then they fet up huts, and laid out gardens, in which they cultivated melons, different forts of roots, and tobacco; but juft as the laft became ripe, the whole plantation was deAroyed by a hurricane. The French, however, went to work again; and by having fome acquaintance with the climate, fucceeded better, and added aloes to the reft of their plantations; but receiving no fuccour from Madagafcar, and being tired of living by themfelves in the ifle of Bourbon, they very readily embraced the offer of an Englifh captain, and in the year 1658 cm barked for Madras. When the laft great blow was given to the French at Madagafear by the natives, who furprifed and cut them off in one night, there efeaped as many mell as, with their wives, who were natives, filled two canoes; and thefe being driven by the wind on the ille of Bourbon, were the next fet of people who inhabited it. This laft colony, for want of an op. portunity to remove, were conftramed to cultivate this new country of theirs, and to remain in it. It was not long before a further flock of inhabitants arrived. A pirate that had been cormmitting depredations in the Indies, returning to Europe, ran aftore and was fplit to pieces on the rocks, io that the crew were forced to join themfelves to the former inhabitants; and as they had on board their veffel a great many Indian women whom they had made prifoncts, they lived with them, and in procefs of time had a numerous pofterity. As Eaft India hips touched frequently here, when too late to double the Cape, many of the failors, for the lake of the women, deferted at the time of their departure, and Ataying behind became planters in the ife of Bourbon. As the place grew more populous, the people naturally becarme more civilized, and defirous of living in a more commodious manner; which induced them to build fmall veffels, that in thefe they might fometimes make a trip to Madagafear, in order to furchafe flaves, whom they employed in their plantations to cultivate aloes, tobacco, and other things, with which they drove a fmall trade, when hips of any nation anchored in their roads for the fake of refreflimente. In this fituation they were, when the Firench Eaft India company put in their claim; and afluming the property of the ifland. fent thither five or fix families and a governor. At firft the inhabitaris cxpected to reap
fome bencfit from their new mafters; but finding very Bourbor. little, and thinking the governor took too much upon him, they revolted at the infligation of a prief, feized their governor and put him into a dungeon, where be died of hunger and grief. For this fome of the ringleaders were punifhed, a kind of fort was erected, fome guns placed on it, and the French flag kept flyirg; but in other refpects, fo little care was taken, that, till within thefe 40 years, the ifland was in no flate of de. fence.

The number of inhabitants in the year 1717 was computed at 2000 ; viz, 900 free, and 1100 ीlaves. Amoright thefe people the ufual diftinction of whites and blacks entirely fails: for even the free are of different colours; and a French writer affures us, that he faw in a church one family, confifting of five generations, of all complexions. The eldeft was a female, 108 years of age, of a brown black, like the Indians of Madagafcar; her daughter, a mulato: ber grand-daughter, a meftizo; her great-grand-daughter, of a dufky yellow; her daughter agan, of an olive colour; and the daughter of this latt, as fair as any Englin girl of the fame age. Thefe people are, ger crally fpeaking, of a gentle quiet diffontinn, very inautrous, and fubmiffive enough to antionty, provided it is exercifed with a tolerable degree of equity and decency; for otherwife the whole of them are apt to rife in rebillion at once; and the flaves have fo litile realon to complain of their mafters, that they are always on the famie fide. The illand is divided into four quarters. The firlt is that of St Paul, which is the largeft and beft peopled: their houfes are built at the foot of a lleep mountain, on both fides of a frefh water lake. As fol .he plantations, they are on the top of a mountain, which they afcend by a very rough and troublefome paffage. On the fummit there is a fpacious plain, a great part of which is divided into plantations of rice, tobacco, corn, fugar, and fruits. The quarter of St Dennis lies feven leagnes from that of St Paul, towards the eaff, and there the governor refides. It is not fo well peopled as the former ; but the country is more pleafant, and the fituation better. At two leagues diffance, proceeding along the fea-coaft, is the quarter of St Mary's, which is lout thinly peopled. The laft and moft fertile quarter is that of St Sufannah, which is at the diftance of four leagues from St Dennis. The road between thefe two quarters is tolerable, though part of it has been cut with much difficulty through a wood; but the paflage from St Dennis to St Paul is only hy fea.

When the prefent company of India became, by their perpetual eftablifhment, poffeficd of the ifland of Bourbon, they began to improve it exceedingly; rajfing new forts and batterics, fo as to render it in a manner inacceflible; and importing coflec-trees from Arabia: ; which have fucceeded fo well, that it is belicved they produce an cighth, according to fome a fixth, part as much coffee as is raifed in the kingdom of Xemen in Arabia, and it is likewife held next in goodnefs to that. -In 1763 , the population amounted to 4627 white people, and 15,149 blacks; the cattle confitted of 8702 beeves, 4084 hreep, 7405 goats, and 7619 hogs. Upon an extent of 125,969 acres of cultivated land, they gathered as much caffava as would feed their llaves, 1,135,000 pounds weight of cern, 844,100 pounds of

## B O U [ 343 ] E O U

Bumbon rice, $2,8-9.100$ pounds of maize, and $2.535,100$ pounds of coftee; wheh lalt the company buuglit up at about 3 - per pound.

In 1748 , Admiral Bufcawe:a appeared before this inland with a Britifh Aleet; but found it fo well fortified, both by nature and art, that he was obliged, after fome canmonading to very little purpofe, to purfuc his voyage.

Bourbon, Nicholas, a famons Latin poct in the 16 hh cemtury, was a native of Vandeure near Langres, and the fon of a weaithy man who was mafter of feveral forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albert of Navarre, the mother of King Heary IV. At length he retired to Conde, where he had a benefice, and died about the year 1550 . He wrote eight books of Epigrams; and a poem on the forge, which he has entited Ferraria. IIc had great knowledge of antiquity and of the Gieek language. Erafmus praifes his Epigrams.

Bourbon, Nicholas, a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in feveral colleges of Paris; and the cardinal dc Perron caufed him to be nominated profeflor of elcquence in the Roval College: he was alfo canon of Langres, and one of the 40 of the French acadeniy. At length he retired to the fathers of the oratory, where he died in 16 ft, aged 70. He is efteemed one of the greatelt Latin poets France has produced. His poems were printed at Paris in 1630 .

Bourson-Lancy, a town of France, in the demartment of Saone and Loire. It is remarkable for its caftle and baths; and there is a large marble pavement, called the great bath, which is a work of the Romans. It is feated near the river Loire, in E. Long. 3. 46. N. Lat. 46. 37.

Bourbon L'Archambaud, a town of France, in the department of Allier, remarkable for its baths, which are exceedingly hot. E. Long. 3.28. N. Lat. 46.35 .

Family of Bourbon, the late soyal family of France. Henry IV. in 1589 , though of the 10 h generation, was the nearef heir, and fucceeded Henry III. (the laft of the Valois race), whofe brother Fraticis I1. married Mary queen of Scots, and both died without iffue. Louis XVI. was the 5 th king of this family in fucceffion. This family alfo mounted the throne of Spain in 1700, by Philip V. grandfon to Louis XIV. which was the occafion of the long and bloody war that ended in the peace of Utrecht. A branch of the Spanifls family likewife mounted the thronc of the two Sicilies in 1734. Thefe three branches, entered into a treaty offenfive and defenfive in 1761, which goes by the name of the family -compact.

BOURBONNE-LE-bains, a town of France, in Champagne, and in the Baffigni, famous for its hot baths. E. Long. 5. 45. N. Lat. 47. 54.

BOUR BONNOIS, a province of France, with the title of a duchy; buunded on the north, by Nivernois and Berry ; on the weft, by Berry and a fmall part of Upper Marche; on the fouth, by Auvergne; and on the eaft, hy Burgundy and Forez. It abounds in corn, fruits, paftures, wood, game, and wine. Its principal town is Moulins; and the rivers are the Loire, the Allier, and the Chur.

BOUR BOURG, a town in French Flanders, whofe fortifications are demolificd. It is feated on a canal
 50.55.

JBUURCHIER, JOHN, lord Bemars, grandion and $\underbrace{\text { Bcurde: }-.}$ heir of a lord of the fame name, who was defcended from Thomas of Wood'fock, dukic cf Glouceller, and had been knight of the garter, and confable of Wine-for-caftle. Under Edward IV. our lord John reas created a knight of the Bath, at the marriage of the duke of York fecond fon of Edward IV. and was firf known by quelling an infurrection in Cornarall and Devonfhire, raifed by $M$ chael Jofeph a blackfmith, in 1495 , which recommended him to the fávour of Henyy Vill. He was a captain of the pioncers at the ficge of 'Therounne, under Herry VIII. by whom he was made chancellor of the exchequer for life, licutenant of Cllais and the Marches, appointed to conduct the lady Mary, the king's fifter, inio France on her marriage with Louis XII. and laal the extraordinary happinefs of continuing in farour with Ifenry VIII. for the face of 18 years. He died at Calais in 1532 , aged 63. He tranीated, by ling Henry's command, Froiffart's Chronicle; which was printed in 1523, by Richard Pufon, the fcholar of Caxton, and the fitth on the lift of Englifh printers. His other works were a whimfical medley of tranflations from French, Spanif, and Iialian norels, which feem to have been the mode then, as they were alterwards in the reign of Charles 1]. Thefe were, The life of Sir Arthur, an Armoricanknight; The famous evploiss of Sir Hugh Bourdeaux; Marcus Aurelius; and, The Caftle of Love. He compofed arfo 2 boo: of the duties of the inhabitants of Calais; and a comedy ertitled Ite in Vineam, which is mentiuned in none of our catalogucs of Englifh plays. Anthony Wood fays it wasufunlly acted at Calais after vefpers.

BOURDALOUE, LEw 1 s , a celebrated preacher among the Jefuits, and one of the greatcit orapors France has produced, was born at Dourges on the 20 ih of Auguit 1632 . After having preached in Provence, he in 1699 went to Paris; and there me: with fuch applaufe, that the king refolved to hear him; on which he was fent for to court, and frequently preached before Louis XIV. He affitted the fick, vifited the prifoners and hofpitals, and was very liberal in giving alms. He died at Paris on the $13^{\text {th }}$ of May 170 f. $^{\circ}$ The beft edition of his fermons is in oflavo.

BOURDEAUX, an ancient, large, handfome, and rich town of France, in the department of Gironde, is the capital of Guienne, and an archbifhop's fce; has an uniserfity and an academy of arts and fcien. ces. It is built in the form of a bow, of which the river Garonne is the ftring. This river is bordered by a large quay, and the water rifes four yards at full tide, for which reafon the largel veffels can come up to it very readily. The caftle called the Trumper is feated at the entrance of the quay, and the river runs rourd its walls. Moft of the great dreets lead to the quay. The town has 12 gates; and near another caftle are fine walks under feveral rows of trees. The ancient city of Bourdeaux, thuugh confiderable in point of fize, was ill built, badly paved, dangerous, without police or any of thofe municipal regulations indifpenfably requifite to render a city fplendid or elegant. It has cntirely changed its appearance within thefe laft thirty years. The public edifices are very noble, and all the fircets newly built are regular and handome. The quays are

## B O U [ 344 ] B O U

Beurdeatr. four miles in length, and the river itfelf is confiderably broader than the Thames at London bridge. On the oppofite fide, a range of hills covered with woods, vineyards, churches, and villas, extends beyond the view. Almoft in the centre of the town is a fine equeftrian fatue in bronze erected to Louis XV. in 1743, with the following infcription :

> Ludivico quindecimo
> Sape qiClor, femper pacyficatori; Suos omncs, quam latè regnum patet,
> Paterno peqore gerenti; Suorum in animis penitus babitanti.

The beauty of the river Garonne, and the fertility of the adjoining country, were probably the caules which induced the Romans to lay the foundations of this city. The ruins of a very large amphitheatre yet remain, conftructed under the emperor Gallienus; it is of brick, as are moft of the edifices of that period, when the empire was verging to its fall, and the arts began rapidly to decline. During the irruptions of the barbarous nations, and particularly in thofe which the Normans repeatedly made, Bourdeaux was ravaged, burnt, and almoft entirely deftroyed. It only began to recover again urider Henry II. of England, who having united it to the crown by his marriage with Eleanor of Aquitaine, rebuilt it, and made it a principal object of his policy to reftore the city again to the lufle from which it had fallen. The Black Prince received all Guienne, Gafcony, and many inferior provinces, in full fovereignty from his father Edward III. He brought his royal captive, King John of France, to this city, after the battle of Poictiers in 1356 ; and held his court and refidence here during eleven years. His exalted character, his uninteriupted feries of good fortune, his victories, his modefty, his affability, and his munificence, drew Atrangers to Bourdeaux from every part of Eu. sope; but all this fplendour foon difappeared. He lived to experience the ingratitude of Peter the Cruel, to whom he had reftored the kingdom of Caftile; he became a prey to diftempers in the vigour of life; he faw his dominions reunited again in many of their branches to the crown of France, by Charles V ; he loft his eldeft fon Edward, a prince of the higheft expectations; and at length, overcome with forrow at this laft afliction, he quitted Bourdeaux, and re-embarked for England, there to expire a memorable example of the hafly revolution of human greatnefs! In 1453 , Charles VII. king of France, re-entered the city, and fubjected the whole provinre of Guienne, which bad been near three centuries under the Englift government. Confcious of the importance of fuch a conqueft, he ordered the Chateau Trompette to be built to defend the paffage of the river; and Louis XIV. afterwards employed the celebrated Vauban to erect a new fortrefs in the modern ftyle of military architecture, on the fame fput.-Madame de Maintenon, whom forture feemed to have chofen as the object of her extremeft rigour and extremeft bounty, was removed from the prifons of Niort in Poictou, where the was born, with her father the Baron d'Aubigne, to this caftle. where fhe ufed to play with the daughter of the turnkey, in the greateft indigence. Bourdeaux prefents few remains of artiquity. The cathedral appears to be very old, and has fuffered confiderably from the effects of
time. Louis XI. who was poifoned in 1473 , lies buried before the high altar. The adjacent country, more particulasly the Paj's de Medoc, which produces the fineft claret, is exceedingly pleafant, and at the feafon of the vintage forms one of the moft delicious landfcapes in the world. W. L.ong. O. 39. N. Lato 44. 50.

BOURDELOT, Јонк, a learned French critic, who lived at the clofe of the t th and beginning of the $17^{\text {th }}$ centuries. He diftinguilhed himfelf by writing notes on Lucian, Petronius, and Heliodorus; by an Univerfal Hiftory; Commentaries on Juvenal; a Trea。 tife on the Etvmology of French words; and by fome other works which were never publifhed.-There was alfo an Ab'é Bourdelot, his fifter's fon, who changed his name from Peter Michon to oblige his uncle. He was a celebrated phyfician at Paric, who gained great reputation by a Treatife on the Viper, and other works. He died in 1685.

BOURDINES, a town of the Auftrian Netherlands, in the province of Namur. E. Long. 5. O. N. Lat. 50.35.

BOURDON, Sebastran, a famous painter, born at Montpellier, in r 619 . He itudied feven years at Rome; and acquired fuch a reputation, that at his return to France he had the honour of being the firf who was made rector of the academy of painting at Paris. He fucceeded better in his landfcapes than in his hiftorypainting. His pieces are feldom finibhed; and thofe that are fo, are not always the finell. He once laid a wager with a friend, that he hould paint 12 heads after the life, and as big as the life, in one day. He won it: and thefe are faid not to be the worft things he ever did. His moft confiderable pieces are, The gallery of M. de Bre. tonvilliers, in the aifle of Notre Dame; and, The feven works of mercy, which he etched by himfelf. But the molt efteemed of all his performances is, The martyrdom of St Peter, drawn for the chureh of Notre Dame: It is kept as one of the choicelt rarities of that cathedral. Bourdon was a Calvinift; much valued and refpected, however, in a Popifincounery, becaufe his life and manners were good. We have alfo by this malter a great number of etchings; which are executed in a bold mafterly flyle, and much more finithed than thofe we generally meet with from the point of the painter. They are juftly held in the higheft eftmation by the generality of the collectors. He died in 1673 , aged 54.

BOURDONE'E, in Heraldry, the fame with Po. MEE.
BOURG, the capital of the illand of Cayenne, a French culony on the coalt of Guiana, in South America; in W. Long. 52. O. N. Lat. 5. 0.

Bourg-en-Breffe, a town in France, and capital of Brefle, in the province of Burgundy. It is feated on the liver Refouffe, almoft in the centre of Breffe, in E. Lonv. 4. 19. N. Lat. 46.13.

Bourg-fur-1/er, a fea-post town of France in Guienne, and in the Bourdelois, with a tolerable good harbour: feated at the confluence of the rivers Dordogne and Garonne, in W. Long. 3. 35. N. Lat. 45. O.

BOURGES, an ancient town of Fiance, in the department of Cher, and formerly an archbifhop's fee, with a famous univerfity. 'The archbifhop affumes the

Thonsct. title of Patriarch of the Siquitains, and enjoys the rights of prim.acy with regard to Albi. It is feated betweentwo fmall rivers, the Every and the Orion, upon a hill that has a gentle detcent down to thefe rivers, by which it is almolt furroumded, for there is but one avenue to it by land, which is that of Port Bourbonnoux. It Itands upon a great de ll of ground ; but one part of it is with. out houfes; and the relt is but thinly peopled with gentlemen, fludents, and ecclefattics, the whole number of fouls amounting only to about 1800 . They have no manner of thade but for their own neceflaries. It is divided into the old and new town. The walls of the old are almolt entire, and the new town is almont as large as the old. Thereare feveral churches, convents, and nunneriec. The parilh-church, dedicated to St Stephen, is a fine old Gothic ftructure: it is feated in the higheft part of the city, and on each fide of the front are two handfome high towers. The new one, which is built in the room of one which fell down, is almolt 200 feet high. Bourbon fyuare is the largell in the city, where there was formerly an amphitheatre, and now a market. T'here is a fine walk from St Nichacl's gate into the fields, and three alleys, formed by four ranks of trees, the middlemolt of which is fpacious; befides which, there is a very long mall. The univerfity is $\mathrm{f}_{\mathrm{a}}-$ mous for the fludy of the law. This city flandialmoft in the centre of France. E. Long. 2. 30. N. Lat. 47. 10.

BOUGET, Dom Jorn, an ingenious French antiquary, was born at the village of Beaumains near Falaife, in the diocefe of Seez, in 1721. He was educated at the grammar-fchool at Caen, whence he was removed to that univerfity, and purfued his thudies with great diligence and fuccefs till 1745 . when he became a Benedictine monk of the abbey of St Martin de Seez. Sume time after this, he was appointed prior claullral of the faid abbey, and continued fis years in that office, when he was nominated prior of Tiron en Perche: whence being tranflated to the abbey of St Stephen at Caen, in the capacity of fub-prior, he managed the temporalties of that religious houfe during two years, as he did their fpiritualties for one year longer; after which, according to the cultom of the houfe, he refigned his office. His fuperiors, fenfible of lis merit and learning, removed him thence to the abbey of Bec, where he refided till 1764. He was elected an honorary member of the Society of Antiquaries of London, Jan. 10.1765; in which year he returned to the abbey of St Stephen at Cien, where be contirued to the time of his death. Thefe honourble offices, to which he was promoted or account of his great abilities, enabled him not only to purfue his favourite ftudy of the hiftory and antiquities of fome of the principal Benedictine abbeys in Normandy, but likewife gave him accefs to all their charters, deeds, regifter-books, \&cc. \& cc. Thefe he examined with great care, and left behind him in MS. large and accurate accounts of the abbeys of St Peter de Jumieges, St Stephen, and the Holy Trinity at Caen (founded by William the C.nnqueror and his queen Matilda), and a very particular hiftory of the abbey of Bec. Thefe were all written in French. The "Hiftory of the Royal Abbey of Bec" (which he prefented to Dr Ducarel in ${ }^{1764}$ ) is only an abftract of his larger work. This ancient abbey (which hath produced feVox. IV. Part I.
veral arehbiflops of Canterbury and other illuntious prelates of this kingdom) is frequently mentioned by our old hiftorians. The death of our worthy Benedictine (which bappened on new-year's day 1776) was occafioned by his unfortunate neglect of a hust he got in his leg by falling down two or three fteps in going from the hall to the cloitter of the abbey of St Sicphen at Caen, being deceived by the ambiguou, light of a glimmering lamp that was placed in the paffige. He lived univerfally efteemed, and died fincerely regretted by all thofe who were acquainted with him; and was buried in the church of the faid abbey, Jan. 3. 1776.

BUURGET, a town of Savoy, fubject to the king of Sardinia, feated at the fouthern extremity of a lake of the fame name. E. Long. 5. 55. N. Lat. 45. 45 .

BOURGOGNE, or Burgundy, as it is called; a confiderable province of France, with the title of a duchy. It is 130 miles in length, and 75 in breadth. It is bounded on the eaft, by the Franche Compte; on the well, by Bourbonnois and Nivernois; on the fouth, by Lyonnois; and on the north by Champagne. It is very fertile in corn and fruit, and produces excellent wine. It is watered by the rivers Seine, Dehune, Brebince, Armançon, Ouche, Souzon, Tille, and Saone. There are four mineral fprings at Apoigny, Primeau, Buarbon-Lancy, and St Reine. The firt are oblcure, and the two lalt in high reputation. In the canton of Breffe, there are two fubterranean lakes which often overflow in times of the greatef drought, and lay a large tract of ground under water: one of them has no apparent fpring or opening ; and yet in a dry feafon, it throws out water enough to ovelflow the meadow-land near it. The grottocs or caves of Arcy are feated about 18 miles from Auxerre, and over them is foil ajout 10 feet deep. The entrance into thefe cavities is 200 paces long, but narrow. There are arches which form feveral vaults, from whence drops clear water, which turns into a brilliant hard fonc. Twenty paces from the entrance is a Jake, which teems to be formed by that part of the water that will not petrify. The higheft of thefe vaults is not above eight feet. About $S$ paces from the entrance there is a kind of hall, with a coffeecoloured ceiling, wherein there are a thouland odd figures, which have a very agreeable effect. Dijon is the capital town.

BOURGUIGNONS, or Burgundians, one of the northern mations who overran the Roman empire, and fettled in Gaul. They were of a great 17 ,tate, and very warlike; for which reafon the emperor Valentinian the Great engaged them in his fervice againlt the Germans. They lived in tents which were clofe to each other, that they might the more readily unite in arms on any unforefeen attack. "hefe conjunctions of tents, they called burgs; and they were to them what towns are to us. Sidonius Apollinaris tells us, that they wore long hair, took great pleafure in finging, and were fond of praife for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unction very ornamental. Their crorrn was at firll elective, and the authority of their kings expired with their fuccefs. They were not only accountable for their own mifconduct, but likewife for the calamities of nature, and the caprice of fortune. They

X $\times$ werg

## $\mathrm{B} O \mathrm{U} \quad\left[\begin{array}{lll}3+6\end{array}\right] \quad \mathrm{B} O \quad \mathrm{~W}$

3omignon were depofed if the had heta batte; if they fucceeded ill in any coterprife; or if, in Ruort, any great event had not correfpunded wish the hopes of the public. They were not more f.wourabl; treated in cafe of a bad harveft or vintage, or if any epidemical diltemper had ravaged the fate. At firt they wore govermed by many kinge, and benden was the title of the royal dignity. List in latter times they were fubject to one fovereign ; and they grew humane and civilized, efpecially when Carifi mity was propagated in their country. Before that epocha, their religion was mucls the fame with that of the other northern nations. They had many priefts, the chief of whom was diftinguithed by the name of finiffrus. He was perpetual, and they paid him great refpec and venctation.

BOURIGNON, Antonierta, a famous enthufafic preacher and pretended prophetefs, was horn at Lille in 1616. At her birth the was fo deformed, that it was debated fome days in the family whether it was not proper to flille her as a monfer: but her deformity diminilhing, the was fpared; and afterwards attained fuch a degree of besuty, that fhe had her admirers. From her childhood to her old age fhe bad an extraordinary turn of mind. She fet up for a reformer, and publifred a great number of books filled with rery fingular notions; the moft remarkable of which are entitled The ligbs of the Horld, and the Tifimony of Truth. She was an enemy to reafon and common fenfe, which fhe maintained ought to give place to the illumination of disine faith; and afferted, that whenever any one was born again by embracing her doctrine, fhe felt the juins and throws of a woman in labour. Of her pretended vifions and revelations we fhall give one inllance is a fample. In one of her ectacies fhe faw Adam in the fame form in which lac appeared before his fall, and the manner in which he was capable of procreating other men, fince be himfelf poffefled in himfelf the prin-
tween the Moluccas and Celeber. Is is weli cultisated; and is roow fubject to the Dutch, who have built a fortrefs here. Some mountains in it are excceding high, and the fea on one fide is uncommonly deep. It produces nutmegs and cloves, as well as cocoa and banama trees; befides many vegetables introduced by the Dutch. It is about 50 miles in circumference. E. Long. 129. S. Lat. 4. 30.

BOUTANT, or Arch-Bourant, in architecture, an arch, or part of an arch, abutting againft the reins of a vatalt to prevent is giving way.

A Pillar Boutant, is a large chain or pile of fone, made to fupport a wall, terrace, or vault.

BOUTE', in the manege. A horfe is called loute when his legs are in a fraight line from the knee to the coronet: flart-jointed horfes are apt to be boute, and on the other hand long-jointed horfes are not.

BOUT'S rimes, a popular term in the French poetry; fignifying certain rhymes, difpofed in order, and given to a poct together with a fubject, to be filled up with verfes ending in the fame words, and the farne order. The invention of the bouts-rimes is cring to one Dal Lot, a poet, in the year $16+9$. In fixing the bouts, it is ufual to choofe fuch as feem the remoteft, and bave the leaft connexior.

Some goed authors fancy that thefe shymes are of all others the eafieft, that they affift the invention, and furnif the moft new thoughis of all others. Sarrafin has a poem on the defeat of the bouts-rimes. The academy of Lanternifts at 'Thouloufe have contributed towards keeping in counterance the bouts-rimes, by propofing each year a fet of fourteen, to be filled up oil the glories of the grand monarque; the victorious fonnet to be rewarded with a fine medal.-An inftance hereof may be given in the following one, filled up by P. Commire.

Tout of grand dans le roi, l'afpect feul de fon bufte Rend nos fuers cnuemis plus froids que des glaçons. Et Guillaume n'attend que le terns des Pour fe voir foccomber fous un bras fi श'on we nous vante plus les mirasles d' Louis de bien regner lui feroit des

BOUTON, an inland in the Eall Indian ocean, about 12 miles diflant from the fouth-eaft part of the illand of Macaffar, or Celebes. The inhabitants are fmall but well Mraped, and of a dark olive complexion. The principal town is Callafujung, which is about a mile from the fea, on the top of a fmall bill, and round it a ftone wall. The houfes are not built upon the ground, but on pofts. The seligion of the inhabitants is Mahometanifm. E. Long. 122. 30. S. Lat. 4 . 30.

BOUV1ILION, a city of Luxemburg in the Aufrian Netherlands, fituated in E. Long. 5. O. N. Lat. 49. 55.

BUW, (arcus), a weapon of offence made of wood, horn, or other clallic matter, which, after being ftrongly bent, by means of a ftring faftened to its two ends, in returning to its natual fate throws out an arrow with great force. It is alfo called the long-bow, by way of dillinetion from the crofs-bow or arbalef.

The bow is the moft anciest, and the molt univerfal

## $\mathrm{B} O$ W $\quad\left[\begin{array}{lll}377\end{array}\right] \quad \mathrm{B} O \quad \mathrm{~W}$

Bow.
$\xrightarrow{-m+}$ of all weapons. It has been found to obtain among the mofl barbarous and remote people, and who had tlee leaft communication with the reft of mankind.

The ufe of the bow and arrow was frit abolithed in France under Louis XI. in 148r, and in their place were introduced the Swifs arme, that is, the halberd, pike, and broad-fword. The long-bow was formerly in great voguc in England; moft of our victories in France were acquired by it ; and many laws were made to regulate and encourage its ufe. The parliament under Henry V1II, complain "of the difufe of the long-bow, heretofore the fafeguard and defence of this kingdom, and the dread and terror of its cnemies." 33 Hen. VIII. cap. 6.

The art of ufing bows is called archery, and thofe practifed therein, arcbers, or bowmer. See Archery.

The flrength of a bow may be calculated on this principle, that its fpring, i. e. the power whereby it reftores itfelf on its natural pofition, is always proportionate to the diftance or fpace it is removed therefrom.

The moft barbarous nations often excel in the fabric of the particular things which they have the greatedt neceffity for in the common offices of life. The Liplanders, who fupport therrfelves almof entirely by hunting, have an art of making bows, which we, in thefe improved parts of the world, have never arrived at, Their bow is made of two picees of tough and flrong wood, flaved down to the fame fize, and flatted on each fide ; the two flat fides of the pieces are brought clolely and cvenly together, and then joined by means of a glue made of the fkins of perch, which they have in great plenty, and of which they make a glue fuperior in flrength to any which we have. The tiso pieces, when once united in this manner, will never feparate, and the bow is of much more force to expel the arrow, than it could poffibly have been under the fame dimeafions if made of only one piece.

Among the ancients, the bow-firing, called reswors, was made of horfes hair, and hence alfo called intese; though Homer's bow-llrings are freq tently made of hides cut into frall thongs: whence robys Bostor. The uppermof part of the bom, to which the Atring was fallened, was called rogara, being commonly made of gold, and the laft thing towards firithing the bow. The Grecian borws were frequently beauified with gold or filuer; whence we have mention of aurei arcus; and Apollo is called Agrugerog23. But the matter of which they were ordiaarily compoled, feems to have been wood: though they were anciently, Seythianlike, made of horn, as appears from that of Pandarus in Homer, Iliad. 今̀. v. 105.

The invention of the bow is ufuzlly aferibed to A. pollo, and was communicated to the primitive inha. bitants of Crete, who are laid to have been the firlt of mortals who underftood the ufe of bows and arrowa. And bence, even in later ages, the Cretan bows were famou, and preferred by the Grecks to all others. Some, however, rather choofe to homour Perfes, the fon of Perfeus, with the invention of the bow; while others afcribe it to Scythes, fon of Jupiter, and progenitor to the Scythians, who were excellent at this art, and by many reputed the firit maflers of it. Frons them it was derivell to the Greciais, fome of whofe ancient nubility were inftructed by the Scyehians in the ufe of the Low, which in thofe days piffed for a
moft princely education. It was firft introduced into the Roman army in the fecond Punic war.

The Indians thill retain the bow. In the repofitory of the Royal Society we fee a Weft Indian bow two yards long.

The Scythian bow was famous for its incurvation, which diftinguifhed it from the bows of Greece and other nations; being fo great as to form an half moon or femicircle: whence the fhepherd in Athenxus, being to defribe the letters in Thefeus's name, and exprefing cach of them by fome oppafite refemblance, compares the third to the Scythian bow; meaning not the more modern character $\Sigma$, but the ancient $C$, which is femicircalar, and bears the third place in ehcevc.

Crofs-Bom, is allo called arbalifa or arbalet; which word is derived from arbalifa, c. i. arcubalifa, "a bow with a lling." The arbalet confifts of a lieel bow fet in a flaft of wood, furnilhed with a ftring and a trigger; and is bent with a piece of iron fitted for that purpofe. It ferves to throve bul!ets, large arrows, darts, \&sc. The ancients had large machines for throwing many arrows at once, called arbalets or baliftr.

Bow, is alfo an inftrument ufed at fea, for taking the fun's altitude; confilling of a large arch of $90^{\circ} \mathrm{gra-}$ duated, a flank or ftaff, a fille vane, a fight rane, and an horizon vane. It is now out of ufe.

Bow, among tuildcrs, a beam of wood or brafs, with threc long ferews that ditect a lathe of wood or ficcl to any arch; chiefly ufed in drawing draughts of fhips and projections of the fphere, or wherever it is requifite to draw large arches.

Bow, in Mufic, a fmall machine, which, being drawn over the flrings of a mufical inftrument, makes it refound. It is compofed of a fmall fick, to which are faftened 80 or Ico horfe hairs, and a fcrew which ferves to give thefe hairs a proper tenfion. In order that the bow may touch the frings brifkly, it is ufual to rub the bairs with rofin. The ancients do not appear to have been acquainted with bows of hair: in lieu hereof they touched their infruments with a plectrum; over which our bows have great advantage, for giving long and flort founds, and other modifications which a pleetrom cannot produce.

Bow, among irtificers, an inftrument fo called from its lizure ; in ufe among gunfmiehs, lockfmiths, watchmakers, \&ec. For making a drill go. Among turners it is the name of that foll fixed to the ceiling, to which they faften the cord that whills round the piece to be turned.

Bow, a town of Devonflire in England, 188 miles well from London, and a little to the weft of Crediton, has a weekly market, and tro fairs in the year. The court of the ducly of Lancafter is commonly kept here.

Borrs of a Suddle, are two pieces of wood laid archwife to rcceive the upper part of a horfe's back, to give the faddle its due form, and to keep it tight.

The fore-bow which fuftains the pominel, is compofed of the withers, the breafts, the points or tots, and the corking.

The bind-bow bears the tolfequin or quilted roll. The bows are covered with finens, that is, with bulls pizzles beaten, and fo run all over the bows to make them fironger. Then they are if engthened with bands

## 

Eow. of iroin to keop them tight: and on the lorer fide are nailed on the faddle-ftraps, with which they make faft the girths.

Bor, (Epaule), in Sbip-building, the rounding part of a flip's fide forward, beginning at the place where the planks arch inwards; and terminated where they clofe, at the flem or prow. It is proved by a variety of experiments, that a fhip with a narrow bow is much better calculated for Cailing [wiftly, than one with a broad bow; but is not fo well fitted for a high lea, into which fte always pirches or plunges her fore part very deep, for want offufficient breadth to repel the volume of water which fhe fo eafily divides in her fall. The former of thefe is called by feamen a lean, and the other a bluff, borv. "The bow which meets with the leaft refifance in a direct courle, not only meets with the leaft refiftance in oblique courfes, but allo has the additional property of driving the leaf to leeward; which is a double advantage gained by forming the bow fo as to give it that figure which will be leaft re"Bouguer's fifted in moving through any medium *."

On the Borr, in Navigation, an arch of the torizon comprehended between fome diftant object and that point of the compars which is right a-head, or to which the flip's ftem is directed. The phrafe is equally applicable when the object is beheld from the fhip, or difcovered by trigonometrical calculations: As, We faw a fleet at day-break bearing three points on the farboardLow: that is, three points from that part of the horizon which is right a-head, towards the right-hand. See the article Bearing.

Bow dye, a kind of fcarlet red, fuperiur to madder; but inferior to the true fcarlet grain for fixednefs and duration. It was brought into England, and firt practifed at the village of Bow, near London, by Kephler, a Dutchman, in the ycar $1 \sigma_{43}$.

Bon-grace, in the fea-language, a frame or compofution of old ropes or junks of cables, uled to be laid out at the bows, ftems, and fides of fhips, to preferve them from great flakes of ice, chiefly when they fail in high north or fouth latitudes.

Bow-net, or Bew-whcel, an engine for catching fith, chictly lobfters and craw-fifl, made of two round wicker bafkets, pointed at the end, one of which is thruft into the other; at the mouth is a little 1 im , four or five inches broad, fomewhat bent inwards. It is allo ufed for catching fparrows.

Borr-hgged, or Landy-lcgged. Some children are bow-legged from their birth: others become fo from fetting them on their fect too early. The tibia of fome is crooked; the knees of others are diftorted; from a fault in the arikle, the feet of fome are turtied inwards. Thefe are called eari; and in others, who are called valy $i$, they are turned outwards. The beft method of preventing thefe diforders in meakly children is to exercife the m duly, but not violently, by dancing or toffing them about in one's arms; and not fetting them much upon their feet, at leaft not without propesly fupporting them: if the diforder attends at the hirch, or ircreafes after it is begun, apply emollients, then apply boots of frong leather, wood, \&c. 位 as gradually to difpofe the crooked legs to a proper form ; or other inftuments may be ufed intead of boots, which, when not too contly, are ufually to be preferred.

Slighter inftances of thefe diforders yield to careful nurling, without inflruments.

Bor-Line, or Bowling, a rope fattened near the middle of the leech, or perpendicular edge of the fquare fails, by three or four fubordinate parts called liridles: It is only ufed when the wind is fo unfarourable that the fails mu\{l be all braced fideways, or clofe hauled to the wind : in this fituation the bow-lines are employed to keep the weather or windward edges of the principal fails tight, forward, and fleady, without which, they would always be thivering, and rendered incapable of fervice. To check the bow-line is to flacken it, when the wind becomes large.

Bor-Pieces, are the pieces of ordnance at the bow of a hip.

Rain-Borr. Sec Rsin-Bow.
Bon-Bearer, an inferior officer of the foreft, who is fworn to make inquifition of all trefpafles againft vert or venifon, and to attach offenders.

BOWELS, in Anatomy, the fame with inteflines. See Anatomy Inder.

BOWER, in Gardening, a place under covert of trees, differing only from an arbour, as being round or fquare, and made with a kind of dome or ctiling at top; whereas the arbour is always built long and arched.

Bower, in the fea-language, the name of an anchor carsied at the bow of a Thif. There are generally two bowers, called firf and fecond, grent and litlle, or bofl and fmall bower. See Anchor.

BOWESS, or Bowet, in Falconry'; a young hawk, when the draws any thing out of her neft, and corets to clamber on the boughs.

BOWL, denotes either a ball of wood, for the ufe of bowling : or a veffel of capacity, wherein to hold liquors.

BOWLDER-stones, frall Rones of a roundifi figure, and no determinate fize, found on the fea-more, and on banks or rather channels of rivers.

BOWLING, the art of playing at bowls.-Ihis game is practifed cither in open places, as barcs and bowling.greens, or in clofe-bowling-alleys.

The dkill of bowling depends much on a knowledge of the ground, and the right choice of a bowl fuitable to it: for clofe alleys, the flat bowl; for green Cwards, plain and level, the bowl as round as a ball is preferred.

The terms uled in bowling are, to bowl wide, which is when the bias does not hold, or is not frong enough; narrose, when it is too flrong, or holds too much; finely bozelded, is when the ground is well cholen, and the howl paffes noar the block, even though it goes much beyond it: bowling through, or a yard over, is done in order to move the block; an over-bowe, that which goes beyond it; a bowl laid at band, is that put down within the gamefter's reach, to be in the way of the next bowler, and hinder lais having the advantage of the beft ground; lowling at length. neither bowling througla nor thort; a dead length, a juf or exact one ; throwing or finging, is difcharging a bowl with a ftrength purpolely too great for a length, in order to carry off either the block or fome near bowl; bowlroom, or miffing-wood, is when a bowl has free pafiage, without ftriking on any other ; get off, is when a bow

Jonling- being warrow, is wanted to be wider; bowl bch ab block, Cbeen that nearett the block: drawing a cafl or bowh, is to win it by bowhing nearer, without flirting either the bowl or block; a bowl is faid to rub, when it mects with fome obftacle in the ground, which retards its motion, and weakens its force; if is gone, when far beyond the block. Block fignifies a little buwl laid for a mark, allo called a jack. NIark, is a proper bowling diltance, not under fo many yards; and being at leaft a yard and a half from the edge of the green. Ground, a bag or handkerchief laid down to mank where a bowl is to go. Lead, the advantage of throwing the block, and bowling firlt. $C a / t$, is one beft bowl at an end. End, a hit, or when all the bowls are out. The game, or $u p$, is five calts or beft bowls.

Bonling-Green, in Gardening, a kind of patterre in a grove, laid with fine turf, requiring to be frequently mowed, Jaid out in compartments of divers figures, with dwarf-trees and other decorations. Bowlinggreens are of Englilı origin, but have been adopted by the Srench and Italians, who have them only for ornament; being unacquainted with or not fancying the exercife, on account of which they were firft made in England.

Bowling-Bridles, are the ropes by which the bowline is faftened to the leech of the fail.

BOWSE, in the fea-language, fignifies as much as to bale or pull. Thus bowfing upon a tack, is hauling upon a tack. Bowe areay, that is, Pull away all together.

BOWSPRIT, or Boltsprit, a kind of maft, refting flopewife on the head of the mair Atern, and having its lower end faftened to the partners of the fore-manf, and farther fupported by the fore ftay. It carries the fprit-Cail, fprit-top-fail, and jack-ftaff; and its lengtb is ufually the fame with that of the fore-malt.

BOWYER, WILlam, the moft learned printer of his age, was born at White Friars in London. December 17. 1699. His father, whole name alfo was William, had been eminent in the fame profeffion; and his maternal grandfather (lcabod Dawks) was employed in printing the celebrated Polyglott bible of Bilhop Walton. At a proper age, be was placed for grammatical education under the care of Mr Am brofe Bonwicke, a nonjuring clergyman of known piety and learning, who then lived at Headly, near Leatherhead in Surry. Here Mr Bowyer made great advances in literature, and a firm attachment commenced betwist him and his mafter. On the 30 th of January 1713, the whoic property of the elder Mr Bowyer was deltroyed by fire; on which occalion Mr lionwicke generoufty undertook the education of his pupil for one year. In I\%16, young Mr Bowyer was adinitted a fizar at St John's college, Cambridge, where Dr Robert Jenkin was at that time mafter. He continued at the college of Cambridge under the tuition of the reverend Dr John Newcombe till Juns 1722, during which period he probibly took his degree of bachelor of arts; and it appears that he was defirous of obtaining a fellowihp, though it is not certain that he ever food a candidate for that honour. Soon after this he had an opportunity of repaying the kindnefs which Mr Bonwicke had fhown him, by officiating fome time after his death in the capacity of a fchoolmater for the beneft of his family.

Mr Bowyer now entered into the printing-bufinels fomyer along with his father. One of the firfl books which $\underbrace{\text { an- }}$ received the benefit of his currettion was the complete edition of Selden, in three valumes folio, by Dr I) arid Wilkins. This edition was begun in 1722 , and finilled in 1726; and Mr Bower's great attention to it appeared in his drawing up an epitome of Selden dc Syncdriis, as be read the proof theets. In 1727, he drew up an excellent Retch of William Baxter's Glof. Pary of the Roman Antiquities. This was called "A view of a book entitled Religuice Baxtcriance. In a letter to a friend." A fingle heet 8 vo . By this firf public proof of Mr Bowycr's abilities, Dr Wotton and Mr Clarke were highly pleafed; but as it was never publifhed, and very few copies printed, it is very feldons found with the gloffary. In 1727 Mr Bowyer loft his mother ; on which occafion be received a letter of confolation from Mr Chifhull the learned editor of the Antiquitates Afatica. In October 1728 he married Mifs Aun Prudom, his mother's niece, a very accom plifhed lady, by whom he had two fons, William and Thomas; the former of whom died an incant, and the latter furvived his father. In 1729 Mr Bowyer publifted a curious treatife, entitled, "A Pattern for young Students in the Univerfity; fet forth in the Life of Ambrofe Bonwic'se, fome time fcholar of St John's College, Cambridge:" but though this treatift was generally afcribed to Mr Bowyer, it was in reality the production of Mr Ainbrofe Lionswicke the elder. About this time it appears, that Mr Bowyer had written a pamphlet againft the Separatifls, though ncither the title nor the occafion of it are now remembered. The fame year, through the friendhlip of the Right Hon. Arthur Onflow, he was appointed printer of the votes of the houle of commons; which office he held, under three fucceffive fpeakers, for near fifty years. In 1731 Mr Bowyer publithed, and, it is believed, tranflated, Voltaire's Life of Charles X1I. This year alfo his wife died; on which occafion his friends Mr Clarke and Mr Chilhull wrote him very affectionste and Chrillian letters. He remained a widower till 1747, when he married a very benevolent and worthy woman, Mrs Elizabeth Bill, by whom he had no children. $\ln 1733$ he publifhed a piece in two flezts qto, $^{2}$ entitled, "The Beau and the Academic;" being a tranlation from a Latin poem recited that year at the Sheldonian theatre : and in 1736 he was admitted into the Society of Antiquarians, where he became an active and uffeful member. In 1737 Mr Bowyer loft his father; and on this occafion Mr Clarke again addreffed to him a letter of confolation. In $174^{2}$ our author publifhed a tranflation of Trapp's Latın leectures on Poetry, in which he was affifed by Mr Clarke, though the litter had a contemptible opinion of the performance.

In $\begin{aligned} 1 \\ i\end{aligned}+9, \mathrm{Mr}$ Bowyer, alung with Dr Burton, was virulent!y attarked by Dr King in a piece entitled Efoginn fama tufervicns Yacci Etonenfis five Cigantis: or ". The praifes of Jak Eaton, commonly called Fack the Giant." - This abule was probably occation. ed by Mr Bowyer's having Ihinted in converitation fome doabts concerning the Doctur's skill in Latin. Oar auther drew up fome ftrictures in his own defence, which he intended to infert at the conclufion of a preface to Miontefquicu's Retlections; but by $\mathrm{D}_{\mathrm{r}} \mathrm{Clims}$ 's's advice they y：ere umited．In 1750 ，a prefatory ct：ical dif－ fertation and fome rotes were annesed by our author to Kufler＇s T＇reatifs Do uffueverboruna mediorum；a nets edition of which，with farther improvements，ap－ peared in 15：3．He wrote likewife aboat the fame time a Latin prefzee to Leedes＇s Vetercs pocia ci：cti， \＆．－Being foon after employed to print an edition o：Col．Biaden＇s tranflation of Ciefar＇s Commentaries， that work received confderable improvements from Mr Bonyer＇s hands，with the addition of fuch notes in it as are $f_{\text {ghe }}$ ned Typogr．In the fabfequent editions of this work，though printed by another perfon during our author＇s liretime，the fame fignature，though contrary to decorum，and even to juftice，was thill retained．In 175 t，he wrote a long preface to Montefquieu＇s＂Re－ flections on the rife and fall of the Roman Empire；＂ tranflated the dialogue between Sylla and Socrates； made feveral correstions to the work from the Baron＇s ＂Spirit of Laws；＂and improved it with his own noter．A new edition，with many new notes，was printed in 1750 ．In 175 t he alfo publifhed the firtt tranflation that ever was made of Rouffeau＇s paradoxi－ cal oration，which gained the prize at the academy of Dijon in 1750；and which firft announced that fingu－ lar gerius to the attention and admiration of Europe． On the publication of the third edition of Lord Orrery＇s ＂Remarks on the Life and Writings of Dr Swift，＂in ${ }^{1752}$ ，Mr Puwyer wrote and printed，but never pub－ lilhed，＂Two Letters from Dr Bentley in the Shades below，to Lord Orrery in a Land of thick darknef．＂ The notes figned B ，in the ninth quarto volume of Swife＇s works，are extrated from thefe Letters．In 1753，he endeavoured to allay the ferment occafioned by the Jew bill；with which view he publifhed，in quarto，＂Remarks on the fpeech made in common：－ council，on the bill for permitting perfons profefing the Jewifl religion to be naturalized，fo far as prophe－ cies are fuppofed to be affected by it．＂This little tract was written with firit，and well received by thofe who were fuperior to narrow prejudices．Its defign was to fhow，that whatever political reafons might be alleged againt the bill，Cariftianity was in no danger of being prejudiced by the intended protection promifed to the Jews．The fane year fome of Mr Bowyer＇s notes were annexed to Bifhop Claton＇s tranflation of＂A Journal from Grard Cairo to Momnt Sinai and back again．＂－In 175t，Mr Boxyer with a view of leffen－ ing his fatigue entered into partne1flip with a rela－ tion；but fome difagrement arifing，the connection was diffolved in three years．On the death of Mr Richardfon in 1；61，Mr Bowyer fucceeded him 23 printer to the Roval Society，through the favour of the late Earl of Macclesfield；and，under the friend－ hiip of five fucceffive prefidents，enjoyed thist othice till his deatl．

In $17 \mathrm{O}_{3}$ ，Mr lower publithed an excellent edition of the Greek Tetlament，in two vols 12ins．It ap－ peared under ti．e following title：Nowun Tiflamminm Graccunn ；a．l fulcm Gracormm fo＇un Codicnm MISS． nunc frimum intreffunr，adjipulante Yorime Yocob，

 oliero volvininc，Emenderiones co．j garule cirorum doc－ torsm unterunque collefa．This foll wid，great rapi－ d．ty：da：Carjenara！Emendat oas wore well raccived

des Leti:e.". In 1 Yit lee corrected a ne:v edition of Schrevelius's Greel Lexicon; to whinh he has ad. ded a number of words, difingaitheal by an atterifta, which he himfulf lard collected in the coutfe of his fiudies. Confiderable additions, llill in manufeript, were made by him to the lexicons of Medenic and Buxturf, the Latin ones of Faber and Littleton, and the Eriglith Dietionary of Builey ; and he left behind lim many other proofs of his critical fill in the learncd languages. In I77t was publithed, "The Origin of printing, in two ellays. 1. The fubflance of Dr Nlidoleton's Diftestation on the Otigin of Printing in Englind. 2. Mr Meerman's Account of the Inven:tion of the - -1rt at Harrlem, and its progrefs to Mentz, with occafional Remarks, and an Appendix." The original idea of this valuable tract was Mr BowYer's, bu: it was completed by Mr Nichols.

Although our author, during the lall ten ycars of his life, had been afflicted with the palfy and fone, he not only preferved a remarkable cheerfulrefy of terrper, but was crabled to lupport the labour of almolt juceffant reading; and he regularly correfted the learned works, efpecially the Greck books, which came from his prefs. This he continued to do tiil within a few weeks of his death, which happened in Novem. ber 1777 , when !e liad nearly completed his 7 Sih year. For more tban half a contury Mr Bowyer was unriva!led as a learned printer; and many of the molt maiterly productions of this kingdom have come from his prefs. To his literary and profeffional abilities he added an excellent moral charafer; and he was particularly diftinguithed by his inflexible probity, and an uncommon alacrity in relieving the neccfitous.

BOIVYERS, artificers whofe bufinefs is to m*ke bows: in which fenfe, bowyers ftand diftinguifhed from fletchers, who made arrows.

The bowyers company in London was incorporated in 1620 : and confits of a mafter, two wardens, twelve afiftants, and 30 on the livery. Sce Archery.

BOX, in its molt common acceptation, denotes a fmall cheft or coffer for bolding things.

Dice-Box, a narrow deep cornet, channelled within, wherein the dice are flaken and thrown. This anfwers to what the Romans called fritillus; whence, crepitrnies fritilli; and, in Seneca, refonante fritillo. The fame author ufes alfo concutere fritillum, figuratively, for playing.-Befides the fritillus, the Romans, for greater fecurity, had another kind of dice-box called pyrgus, roeges, and fometimes turricula. It was placed immoveable in the middle of the table, being perforated or open a: both ends, and likewife chanmelled within; orer the top was placed a kind of funnel, into which the dica were calt out upon the fritillas; whence defcending, they fell through the bottom on the table; by which all practifing on them with the fingers was effectually prevented. For want of fome contrivance of this kind, our flarpers have opportunities of plaving divers tricks with the box, as palming, flopping, flabbing, \&ic.

Box, is alfo ufed for an uncertain quantity or meafure: thus a box of quickfilver contains from one to two hundred weight; a box uf prunellas only 14 pounds; a box of rings for keys, two grofs, \&ic.

Box-Trec. See Buxus, Botany Index.

 tend for victory with their all. Iucsess anner. $10^{\circ}=$ fame with what among the Rum.i.s was c a.td /riot. The ancient boxers battled with freat force ard fury, infonuch as to dafis out cach eabers :cetion break bones, and ofen kill ench other. The ftarene disligutmenis thefe bexers underwent were fuch that they frequently could not be known, and renderect them tic fat jed of many railleries. In the Greck anthology there are four epigrams of the peet Lucilius, and cne of Lexcian, wherein their di-figurements are pleafantly enough $6 \mathrm{x}-$ pofed. See Boxing.

BOXHORNIUS, MARc ZUeruUs, a Icarncd c:itic boin at Bergen-op-Zooni in 1612 , w.ws profeflor of eloquence at Leyder, and at length of politics at hiflory in the room of Heinfuc. He publifhed, 1. Thea:rims urlinen Hollandice. 2. Scriploras bijforie Aitgulde. ctum notir. 3. Poetar falyrici minores, czm commeni. 4. Notes on Jußin, Tacitus; and a great number of cther warks. He died in 1053 , aged 41 .

BOXING, the exercife of fighting with the filts, either maked or with a fone or leaden ball grafped in them: in whic!) fonfe, boxing coincides with the prgitlatirs of the Romans, and what on our amphitheatres is fonctimes called trial of mashood. WYlien the champions had cfasegse, or balls, whether of lead or fone, it was properly denominated cpargousitx. The ancient boxing differed from the purna cofluum, in which the combatants liad leathern thongs on their hards, and balls to offend their antagonills; though this diftindtion is frequently overlooked, and fighting with the captus ranked as a part of the bufinefs of pue giles. We may ditinguif threc Species of boxing ; viz. where both the head and hands were naked; where the loands were armed and the head naked; and where the head was covered with a kincl of cap, called contplatiotcr, and the trands alfo furnihed with the cofous.

Boxing is an ancient esercife, havirg been in ufe in the-heroic ages. Thofe who piepared themfilues for it, uled all the means that could be contrived to render themfe!ves fat and flefly, that they might be better able to endure blows: whence corpulent men or women were ufually called pugiles, according to "Lerence: Siqua off babilior paulo, pergilem effe aiunt.

In modern times this art has been in a manner appropriated by the Englifh. About half a century ago it formed as regular an cxhibition as we now fee at any of the places of public amufement, the theatres alone excepicd. It was encouraged by the firf ranks of the mobility, patronized by the firft fubject in the realm, and tulerated by the magiftrates. Before the eftablif:ment of Broughton's amphitheatre, a booth was erected at Tottenham Court, in which the proprietor, Mr George Tinlor, invited the profeffors of the art to difplay their fkill, and the public to be present at its exhibition. The bruifers then had the reward due to their prowefs, in a divifion of the entrance-moncy, which fometrmes was 1001 . or 1501 . The general mode of flating was for two-thirds to go to the winning champion, while the remaining third was the sight of the lufer; though fometimes by an exprefs agreement of the parties, the conqueror and the vanquinted thared alike. The nobility and gentry having conmpained of the inconveniences futtained at Taylur's Booth, presailed on Mr Broughton, who was

## $\mathrm{B} O \mathrm{I} \quad\left[\begin{array}{ll}352\end{array}\right] \quad \mathrm{B} O \quad$ Y

E.wing then rifing into note as the firft bruifer in London, to Pnos 1 tuild a place better adapted for fuch exhibitions. This was accoajingly done in $17 t^{3}$, principally by fubfcription, behind Osford-road. The building was called Broughton's New Amphitheatre; and, befides the ftage for the comb tants, had feats correfponding to the boxec, pit, and galleries, much in the fame manner with thofe at Antey's. After a courfe of years, however, thefe exhibitions became gradually lels pa. tronized and frequented, owing probably to the refinement of our manners. Some time ago, indeed, they feemed to be revived, and very confiderably engaged the attention of the public; but a fatal iffue which attended one of them, brought the practice egain into dilrepute. One of the combatants was killed on the fpot. His royal highnefs the prince of Wales was prefent, and declared that he would have fome fettlement made on the nearelt relation of the deceafed, but that, on account of the dieadful example he had then witneffed, he would never more either fee or patronize another ftage-fiyht.

Boxing, among failors, is ufed to denote the rehearling the feveral points of the compafs in their proper order.

Boxing is alfo ufed for the tapping of a tree, to make it yleld its juice. The boxing of maple is performed by making a hule with an axe or chiffel into the fide of the iree, about a foot from the ground; out of it llows a liquor of which fugar is made.

BOXTEHUDE, a town of Germany, in the circle of Lower S xony, fubjeet to the Danes. It is feated on the rivulet Effe, which falls into the Elbe, in E. Long. 9. 35. N. Lat. 53. 40.

BOXTEL, a town in Dutch Brabant, with ीluices, feated on the river Bommel. E. Long. 5. 15. N. Lat. 51. 30.

BOY AR, a term ufed for a grandee of Ruffia and Tranfylvania. Becman fayc, that the boyars are the upper nohility; and adds; that the Czar of Mufcovy, in his diplomas, names the boyars before the waywodec. See Waywode.

BOYAU, in Forification, a ditch covered with a parapet, which ferves as a communication between two trenchec. It runs parallel to the works of the body of the place; and ferves as a line of contravallation, not only to hinder the fallies of the belieged, but alfo to fecure the miners. But when it is a-particular cut that runs from the trenches to cover fome fpot of ground, it is drawn fo as not to be enfiladed or fcoured by the flot from the town.

LOYD, Mark Alexander, an extraordinary genius, was fon of Robert Boyd, who was eldeft fon of Ad.m Boyd ol Pakhill, brother to Lard Boyd. He was born in Galloway on the 13 h of January 1562 ; and came into the world with terth. He learned the rudiments of the Latin and Greck linguages at Glafgow under two grammarians; but was of fo high and untractable a fpirit, that they defpuired of ever making him a fcholar. Having quarrelled with his mafters, he beat them both, thurnt his books, and forfwore learning. While he was yet a youth, he followed the court, and did his utmof to pull his intereft there ; but the fervour of his temper foon precipitated him into quarrele, from which he came off with honour and fafety, though frequently at the hazard of his life. He, with
the approbation of his friends, went to ferve in the French army, and carried his litele patrimony with him, which he foon diflipated at play. He was hortly after roufed by that emulation which is natural to great minds, and applied himfelf to letters with unremitted ardour, till he became one of the moft confummate fcholars of his age. He is faid to have tranflated Casfar's Commentaries into Gieek in the fiyle of Herodo. tus, and to have written many Latin poems which werc little inferior to the finf productions of the Auguflan age. He alfo left feveral manufcripts on philological, political, and hiforical fubjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility diftate to three amanuenfes at the fame time, in different languages, and on different fubjects. He was alfo one of the belt Scottift poets of the age. To all this we muft add, that his perfonal beauty and accomplifhments were equal to his mental fuperiority. He died at Pinkhill in Scotland, in 1601 . The following works, which are all that have been printed, were publithed in the Delicice Poctorum Scotorum; Amftel. 1637, 12 mo . 1. Epigrammata, lib. ii. 2. Heroidum Epiffole XIV. Jib. ii. 3. Hymni XIV.

BOYER, Abel, a well-known gloffographer and hiftoriographer, born at Caftres in France, in 166 Upon the revocation of the edict of Nantz, he went fift to Geneva, then to Franeker, where he finifhed his Itudies; and came finally to England, where he applied himfelf fo affiduoully to the fludy of the Englifh language, and made fo great a proficiency therein, that he became an author of confiderable note in it, being employed in the writing of feveral periodical and political works. He was for many years concerned in a newfpaper called the Pof-boy, of which he had the principal management. He likewife publifhed a monthly work entitled the Pofitical Atate of Great Britain. He wrote a life of Queen Ame in tolio, which is eileemed a very good chronicle of that period of the Englifh hiflory. But what has rendered him the molt known, and has moft firmly eftablifhed his reputation, are the excetlent Didionary and Grammar of the French language, which be compiled, and which are fill rec. koned the beft in their kind. He alfo wrote, or rather tranlated from the French of M. de Racine, the tragedy of Iphigenia, which he publifhed under the title of The Viaim. It was performed with fuccefs at the theatre of Drury-Lane, and is far from being a bad play. Nor can there perhaps be a flronger intiance of the abilities of its author, than fuccels in fuch an attempt; fince writing with any degree of correctnefs or elegance, even in prufe, in a foreign language, is an excellence not very frequently attained; but to proceed fofar in the perfection of it as to be even tolerable in poetry, and more efpecially in that of the drama, in which the diction and manner of expreffion require a peculiar dignity and force, and in a language fo difficult to attain the perfect command of as the Englifh, is what has been very feldom accomplifhed. He died in 1729 .

Moyer, in Navigation, a kind of Flemifl floop, or fmall veffe! of burden, having a bolfprit, a caftle at each end, and a tall maft; chiefly fit lor the mavigation of sivers, and in many of its parts refembling a frmack.

BOY'ES, idolatrous prielts among the favages of Florida. Every prieft attends a particular ilol, and the natives aildrefs themfelves to the prielt of that idol to which they intead (t) pay their devotion. The idol is invoked in hymns, and his ufial offering is the fmoke of tobacen.

BOY'LE, Richarn, one of the greatef fatefmen of the $1 \%$ th century, and generally fyled the Grent carl of Cork, was the youngett fon of Mr Roger Boyle, and was born at Canterbury, on the 3 d of OAober, 1566. Hefludied at Bennet college, Cambridge, and afterwards became a fudent in the Middle Temple. Having loft his father and mother, and being unable to fupport himfelf in the profecution of his fludies, he became clerk to Sir Richard Manhood, one of the chief barons of the exchequer ; but finding that by his employment he could not improve his fortune, he went to lreland in 1588, with fewer pounds in his pocket than he afterwards acquired thoufands a-year. He was then about 22, had a graceful perfon, and many accomplifhments, which enabled him to render himfelf ufeful to feveral of the principal perfons cmployed in the government, by dra wing up for them memoriale, cafes, and anfwers. In 1595, he married foan the daughter and coheirefs of William Anfley, who had fallen in love with him ; and The dying in 1599 in labour of her firft child, which was fillborn, left him an eftate of 5001 . a year in land. In confequence of various fervices, and the grcat abilities he difplayed, he gradually rofe to the highett offices, and even to the dignity of the peerage of Ireland; to which he was raifed by King James I. on the 2gth of September 1616, by the Ayle and title of baron of Tougball, in the county of Cork: four years after, he was created Vifcount Dungarvan and earl of Cork; and in 1631 was made lord treafurer of Ireland, an honour that was made hereditary to his family. He particularly difinguifted himfelf by the noble fand he made, when the fatal rebellion broke out in that kingdom, in the reign of Charles I. ; and in his old age acted with as much bravery and military fkill, as if he had been trained from his infancy to the profeffion of arms. He turned the caftle of Lifmore, his capital feat, into a fortrefs capable of demanding refpect from the Irifh. He immediately armed and difciplined his fervants and Proteftant tenants; and by their affifance, and a fmall army raifed and maintained at his own expence, which be put under the command of his four fons, defended the province of Munfter, and in the fpace of a year took leveral frong calles, and killed upwards of 3000 of the enemy: during which time he paid his forces regularly; and when all his money was gone, like a true patriot converted his plate into coin. This great man died on the 15 th of September, 1634.

Boyle, Richard, earl of Burlington and Cork, fon to the former, was a nobleman of unblemified loyalty in rebellious times, and of untainted integrity in tinies of the greatell corruption. He was born at Youghall, O qober 20. 1612, while his father was in the beginning of his profperity, and only Sir Richard Boyle. He diftinguifted himfelf by his loyalty to King Charles I. He not only commanded troops, but raifed and for a long time paid them, and continued to wait epon the king as long as any one place held out for him in England, and then was forced to compound for Vor. IV. Part I.
his ellate. He contributed all in his power to the Re. Boyte. foration; on which King Charles II. tailed him to the dignity of carl of Burlington, or Bridlington, in the county of York, in the year 1663 . He died Jan. 15 . 1697-8, in the 86th year of his age.
isoyle, Rager, earl of Orrcry, younger brother of the former, and the fifth fon of Richard, ftyled the Greas earl of Cork, was born April 25.1621; and by the credit of his father with the lord deputv Faulkland, raifed to the dignity and title of Baron Boosbill, when only feven years old. He was educated at the college of Dublin, where he foon diltinguifhed himfelf as an early and promifing genins. He afterwards made the tour of France and Italy; and at his return affifted his father in oppofing the rebellious Irifh, in which he bebaved with all the firit of a young, and all the difcretion of an old, officer. Upon the murder of the king, he retired to Marfon in Somerfethire, and hid himfolf in the privacy of a clofe retirement; but being at length aftuamed to fit the tame fectator of all the mifchief that appeared round him, he refolved to attempt fomething in favour of the king; and under the pretence of going to the Spa for the recovery of his health. he determined to crofs the feas, and apply himfelf to King Charles II. for a commifion to raife what forces he could in Ireland, in order to reftore his majefty, and recover his own eftate. To this purpofe, be prevailed on the earl of Warwick to procure a licenfe for his going to the Spa; and baving raifed a confiderable fum of money, came up to London to profecute his vay. age : but he had not been long in town when he receired a meliage from Cromwell, who was then gene. ral of the parliament's forces, that he intended to wait upon him. The lord Broghill was furprifed at this melfage, having never had the leatt acquaintance with Ciomwell; and defired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the meffenger, Cromwell entered the room; and after mutual civilities had paffed between them, told him in few words, that the committee of flate were apprifed of his defign of going over and applying to Charles Stuart for a commiffion to raife forces in Ireland; and that they were determined to makc an example of him, if he himfelf had not diverted them from that refolution. The lord Broghill interrupted him, by affuring him that the intelligence which the committce had reccived was falfe, and that he neither was in a caprcity nor had any inclination to raile difurbances in Irelaud: but Cromswell, inftead of making any reply, drew fome papers out of his pocket, which were the copies of feveral letters which the lord Broghill had fent to thofe perfons in whom he mof confided, and put them into his lands. The lord Broghill, upon the perulal of thefe papers, finding it to no purpofe to diffemble any longer, afked his excellency's pardon for what he had faid, returned him his humble thanks for his protection againt the committee, and intreated his direction how to behave in fuch a delicate conjuncture. Cromwell told him, that though till this time he had been a feranger to his perfon, he was not fo to his merit and character: he had heard how g.tld ntly his lordflip had behaved in the Irifh wars; and therefore, fince he was named lord licutenant of Ireland, and the reducing that kingdom was now become his province, he had

Y y
obtained

## $\mathrm{B} O \quad \mathrm{Y} \quad\left[\begin{array}{lll}3 \Xi 4\end{array}\right] \quad \mathrm{B} O \quad$ Y

Tronle, ohtained leare of the committe to offer hi, lurdhip the command of a general aticer, it be would ferve ia that war ; and he lisould have no oaths or engagements impofed upon him, nor be obliged to draw his fword againit any but the Irifl sebels.

The lord Broghill was infinitely furprifed at to generous and unexpected an offer. He faw himelf at liberty, by all the rules of honour, to ferve againft the Irif, whole rebelion and barbarities were equally detefted by the royal party and the parliament. He defired, liowever, fome time to confider of what had been propofed to him. But Cromwell brilisly tuld him, that he mult came to fome refolution that very inflant: that he himtelf was returning to the committee, who were 1lill fisting; and if his lordhip rejefted their offer, they had determined to fend him to the tower. Upon this, the lord Broghill, finding that his liberty and life were in the utmoft danger, gave his word and honour that he would faithfully ferve him againlt the Irifh rebels: on which Cromwell once more aftured him, that the conditions which he had made with him fhould be punctually obferved; and then ordered him to repair to Briftol, adding, that he himfelt would foon follow him into Ireland. Lord Broglill, therefore, having fettled the bufinefs of his command, went over into that country; where, by his conduct and intrepidity, lie perfurmed many important fervices, and fully jultified the opinion Cromwell had conceived of him. By his own interef he nuw raifed a gallant troop of borfe, confiting chiefly of gontlemen attached to bim by perfonal friendhip; which corps was foon increafed to a complete regiment of 1500 men. Thefe he led into the field againft the Iriph rebels; and was fpeedily joired by Crom sell, who placed the lighef confidence in his nes ally, and found him of the greatelt confefuence to the interef of the commonsealth.
imong other confiderable exploits performed by Lard Broghtill, the fallowing delerves to be particulasls mentioned. Whilal Cromwell laid fiege to Clonmell, Broghill being detached to difperfe a body of 5000 men who had affembled to relieve the place, he, with 2000 horfe and dragoons, came up with the enemy at Miccrooms on the loth of May 1650; and, without watirg for the arrival of his foot, immediately attacked and ruuted them, making their general prifoner. Then proceeding to the caftle of Carrigdrohid, he fent a fummons to the garrifon to furrender before the arrival of his hattering cannon, otherwife they were to expeet no quarter. His ourn army was furprifed at this fummons, as knowing lie had not one piece of heavy cannon : but Broghill had ordered the trunks of feveral large trees to be drawn at a diltance by his baggage horfes; which the befieged perceiving, and judging from the llawnefs of the motion that the guns muft be of a vaft bore, immediately capitulated. He afterwards relieved Cromwell himfelf at Clonmell, where that great commander happened to be fo dangeroufly fituated, that he confeffed, nothing but the feafonable relief afforded him by Lord Broghill could have faved him from defruction. When Ireton fat down befure I.imeric, be gave Broghill 600 foot arid 400 horfe, with orders to prevent Lard Mufkerty's joining the pope's suncio, who had gut together a body of 8000 men, and was determinerl to attemnt the sclief of Limeric. Mukerry was at the head of 1000
horfe and diagome, and abont 2000 fuot: notwithtanding which, Lord liroghibl fell refolutely upon him. The Irifh, havine the advantage of th:e ground and numbers, would have conquered, but fur a flratagem of Lard Broghill. In the heat of the action he defired thofe about him to repeat what he fiis; and then cried out as loud as be could, "They run, they run." The firt line of the Irith looked round to fee if their rear broke; and the rear feeing the faces of their friends, and hearing the flouts of the enemy, imagined that the firl line was routed, and Aled. The taking of Limeric, which put an end to the war in Ireland, was the conferpuence of this defeat.

When Cromwell became protector, he fent for Lord Broghill, merely to take his advice occafionally. And we are told, that, not long after his coming to Eng. land, he formed a project for engaging Cromvell to rellore the old conititution. The bafis of the fcheme was to be a match between the king (Charles II.) and the protefor's daughter. As his lordfhip maintained a fecret correfpondence with the exiled monarch and his friends, it was imagined that he was beforehand pretty fure that Charles was not averfe to the fcheme. or he would not have ventused to have propofed it ferioufly to Cromwell; who at firf feemed to think it not unfeafible. He foon changed his mind, however, and told Broghill that he thought his project impracticable: "For (faid he) Charles can never forgive nee the death of his father." In fine, the bufinefs came to nothing, although his lordthip had engaged Cromwell's wife and daughter in the foheme; but he never durf let the protector know that he had previoully: treated with Charles about it.

On the death of the protector, Lord Broghill continued attached to his fon Richard, till, when he faw that the honefy and good-nature of that worthy man would infallibly render him a prey to his many enemies, he did not think it advifable to fuk with .1 man that he could not fave. The dark clouds of anarchy feemed now to be hovering over the Britifh illand. Lord Broghill faw the ftorm gathering, and he deemed it prudent to retire to his command in Ireland, where he thortly after bad the fatisfaction of feeing things take a turn extremely favourable to the defign he had long been a well-wifher to, viz. that of the king's reftoration. In this great event Lord Broghill was not a little inftrumental; and, in confideration of his eminent fervices in this refpeet, Charles created him earl of Orrery by letters-patent bearing date September 5. 1660 . He was foon after made one of the lords justices of Ireland; and his conduct, while at the head of affairs in that kingdom, was fuch as greatly added to the general cfteem in which his character was held before.

His lordthip's active and toilfome courfe of life at length brought upon him fome difeafes and infirmities which gave him much pain and uneafinefs; and a fever which fell into his feet, joined to the gout with which he was often aflicted, abated much of that vi. gour which he had fown in the early part of his life: but his induftry and application were ftill the fame, and bent to the fame purpofes; as appears from his Lettere, which lnow at once a capacity, and an attention to bufnefs, whitit do honour to that age, and may ferve as an example to this.

Poy＇e．Notwithtanding his infirmitics，on the king＇s defir－ ing to fee his lordihip in England，he went over in 1665. He found the court in fome diforder；where his mat $\mathrm{j}=\mathrm{Al} \mathrm{y}$ was on the point of removing the great earl of Cla－ rendon，lord high chancellor；and there was alfo a great mifunderilanding between the two royal brothers． Lard Orrery undertook to recencile the king with the duke of York；which he effected by prevailing on the latter to ald his majefty＇s pardon for fome tleps he had taken in fupport of the lord chancellor．

Oa his return to Ireland，he found himfelf called to a new fene of action．The Dutch war was then at its height；and the French，in confederacy with the Hollanders，were endeavouring to fir up the afhes of rebellion in Ireland．＇The duke de Beaufort，admisal of France，had formed a fcheme for a defcent upon Ireland；but this was rendered abortive by the extra－ ordinary diligence，military fkill，and prudent mea－ fures，of Lord Orrery．

But，in midft of all his labours，a difpute arofe， founded on a mutual jealoufy of each other＇s greatrefs， betwixt him and his old friend the duke of Ormond， then lord lieatenant；the bad effects of which were foon felt by both difputants，who reforted to England to defend their refpective interefts and pretenfions， both having been attacked by lecret enemies who fug－ gefted many things to their prejudice．This quarrel， though of a private begiming，became at laft of a pu－ blic nature；and producing fift an attempt to frame an impeachment againft the duke of Ormond，occa－ fioned in the end，by the way of revenge，an actual impeachment againft the earl of Orrery．He defend－ ed himfelf，however，fo well againft a charge of ligh crimes，and even of treafon itfelf，that the profecution came to nothing．He neverthelefs loft his public em－ ployments；but not the king＇s favour：he flill came frequently to court，and fometimes to council．After this revolution in his affairs，he made feveral voyages to and from Ireland；was often confulted by his ma－ jefty on affairs of the utmoft confequence；and on all occafions gave his opinion and advice with the freedom of an honeft plain－dealing man and a fincere friend； which the king always found him，and refpected him accordingly．

In 1678 ，being attacked more cruelly than ever by his old enemy the gout，he made his laft voyage to England for advice in the medical way．But his dif－ order was beyond the power of medicine；and having in his laft illnefs given the ftrongeft proofs of Chriftian patience，manly courage，and rational fortitude，he breathed his laft on the 16 th of Ottober 1679 in the $59^{\text {th }}$ year of his age．His lordnhip wrote，1．A work entitled＂The Ait of War．＂2．Parthenifla，a ro－ mance，in one volume folio．3．Several poems． 4. Dramatic pieces，two volumes．5．State－trads，in one volume folio，Scc．Mr Walpole，\｛paking of this nobleman，fyys，he rever made a bad figure，but as a poet．As a foldier，his laravery was diflinguifhed，his ftratagems remorkable．As a flatefman，it is fufficient to fay，that he had the confidence of C－omisell．As a man，he wa＊grateful，and would have fupported the fon of his friend：but，Iike Cicero and Richelieu，he could not be content without being a poet；theugh he was ill qualified，his writings of that kind being that and trivial．

Buyle，Roberf，one of the grearelt philofophers as well as befl $m \cdots n$ that our own or indeed any other na－ tion his produced，was the leventh fon and the suelh clitd of Richard earl ot Cork，and horn at Lifmore in the province of Mumber in Incland，January 25 ． 1626－7．Before he nent to fchool，he was taught to write a very fair hand，and to fpeak French and Laa－ tin，by one of the carl＇s chaplains，and a Frunchman that he kept in the houfe．In the year $\mathbf{1 6 3 5}$ ，his fa－ ther feat him over to England，in order to be educa－ ted at Fton fehool，under Sir• Henry Wutton，who was the carl of Cork＇s old friend and acquaintance．Here he foon difcovered a force of underflanding which pro－ milcd great things，and a difpofition to cultivate and improve it to the utmoil．While he remained at Eton， there were feveral very extraordinary accidel．ts that befel him，of which he has given us an account ；and three of which were wery near proving fatal to him． The firt was，the fudden fall of the chamber where he was lodged，when himfelf was in bed；whett，be－ fides the danger tie run of being crufhed to pieces，tie had certanly been choked with the duft during the time he lay under the ruobilh，if he lad not had pre－ fence of mind enough to have wrapped his head up in the theet，which gave him an opportunity of breathing without hazard．A little after this，lue had been crulla－ ed to pieces loy a ftarting horfe that rofe up fuddulul， and chrew hinuelf bachwards，if he had not happily difengaged his feet from the tirrup，and call himiflf from his back before he fell．A third accident pro－ cecded from the carclefiefs of an apothecary＇s fervant， who，by miltaing the phials，brought him a ftrang vo－ mit inflead of a cooling julep．

He remained at Eton upon the whole，betucen three and four years；and then his father carried him to his own feat at Stalbridge in Dorfetfhire，where he remained for fome time under the care of one of his chaplains who was the parfon of the place．In 1638 ， he attended his father to London；and remained with him at the Savoy，till his brother Mr Francis Boyle efpouled Mrs Elifabeth Killigrew；and then，towards the end of October，within four clays after the mar－ riage，the two brothers，Francis and Robert，were fent abroad upon their travels，under the care of Mr Mar－ combes．They embarked at Rye in Suffex，and from＂ thence proceeded to Dicppe in Normandy：then they travelled by land to Roucm，fo to Paris，and from thence to Lyons；from which city they continued their journey to Geneva，where his grovernor had a family ； and there the two gentlemen purfued their itudies witls－ out interruption．Mr Boyle，during his flay bere，re－ fumed his acquaintance with the mathematics，or at leatt with the elements of that fcience，of which he had before gained fome knowledge．For he tells－us， in his own memoirs，that while he was at Eton，and afficted with an ague，before he was ten years old，by way of diverting his melancholy，they made him read Amadis de Gaul，and other jomantic books，which produced fuch a retilcfinel＇s in him，that he was obliged to apply himfelf to the extraction of the fquare and cube roots，and to the more laborious uperations of algebra， in order to fis and fettle the volatile operations of his fancy．

In September 164 ，he quited Geneva，after lia－ ving ipent 21 months in that ci：y；and paffing through

Enyit．

Boyie. Swizzerland and the country of the Grifons, entered Lombardy. Then, taking his route through Bergamo, Brefcia, and Verona, he arrived at Venice; where, having made a flort ftay, he returned to the continent, and fpent the winter in Florence. Here he employed his fpare hours in reading the modern hiftory in Italian, and the works of the celebrated aflronomer Galileo, who died in a village near the city during Mr Boyle's refidence in it. It was at Florence that he acquired the Italian languge; which he underftood perfectly, though he never fooke it fo fluently as the French. Of this indeed he was fuch a mafter, that as occafion required he paffed for a native of that country in more places than one during his travels.

About the end of March 16 12 , he began his journey from Florence to Rome, which took up but five days. He furveyed the numerous curiofities of that city; among which, he tells us, " he had the fortune to fee Pope Urban VIII. at chapel, with the cardiuals, who, feverally appearing mighty princes, in that affembly looked like a company of common friars." He vifited the adjacent villages which had any thing curious or antique belonging to them; and had probably made a longer ftay, had not the heats difagreed with his brother. He returned to Florence; from thence to Leghorn; and fo by fea to Genoa: then paffing through the county of Nice, he croffed the fea to Antibes, where he fell into danger from refufing to honour the crucifix : from thence he went to Marfeilles by land. He was in that city, in May 1642, when he received his father's letters, which informed him that the rebellion had broken out in Iteland, and how difficultly he bad procured the 2501 . then remitted to them in order to help them home. They never received this money; and were obliged to go to Geneva with their governor Marcombes, who fupplied them with as much as leaft as carried them thither. They continued there a confiderable time, without either advice or fupplies from England; upon which Marcombes was obliged to take up fome jewels upon his own credit, which were afterwards difpofed of with as little lofs as might be; and with the money thus raifed, they continued their journey for England, where they arrived in the year $16+4$. On their arrival, $\mathrm{Mr}_{5}$ Boyle found his father dead; and though the earl had made an ample provifion for him, by leaving him his manor of Stalbridge in England, as well as other confiderable eftates in Ireland, yet it was fome time before he could receive any money. However, he procured proiections for his eftates in both kingdoms from the powers then in being; from which he alfo obzained leave to go over to France for a llort fpace, probably to fettle accounts with his governor Mr Marcombes.

In March 1646, he retired to his manor at Stalbridge, where he refided for the molt part till May 1560. He made excurfions fometimes to London, fometimes to Oxford; and in February 1647, he went over to Holland: but he made no confiderable ftay anywhere. During his retirement at Stalbridge, he applied himfelf with incredible induftry to ftudies of various kinds, to thofe of natural philofophy and chemifry in particular. He omitted no opportunity of obtaining the acquaintance of perfons diftinguificd for
parts and learning; to whom he was in every refpect a ready, ufeful, generous aftiftant, and with whom he held a conltant correfpondence. He was allo one of the firlt members of that fmall but learned body of men which, when all academical fludies were interrupted by the civil wars, fecreted themfelves about the year 1645 ; and held private meetings, firft in London, afterwards at Oxford, for the fake of canvaling fubjects of natural knowledge upon that plan of experiment which Lord B icon had delineated. They flyled themfelves then Tbe philofopbic college; and, after the Reftoration, when they were incorporated, and diftinguilhed openly, they took the name of the Royal Saciety.

In the fummer of 1654 , he put in execution a defign he had formed for fome time of refiding at Oxford, where he chofe to live in the houfe of one Mr Croffe, an apothecary, rather than in a college, for the fake of his health, and becaure he had more room to make experiments. Oxford was indeed the only place at that time in England where Mr Boyle could have lived with much fatisfaction; for here he found himfelf furrounded with a number of learned frienids, fuch as Wilkins, Wallis, Ward, Willis, Wren, \&c. fuited exaetly to his talle, and who had reforted thither for the fame reafons that he had done, the philolophical fociety being now removed from London to Oxford. It was during his refidence here that he improved that admirable engine the air-pump; and by numtrous experiments was enabled to difcover feveral qualitics of the air, fo as to lay the foundation for a complete theory. He was not, fowever, fatisfied with this; but laboured inceffantly in collecting and digefting, chiefly from his own experiments, the materials requifite for this purpofe. He declared againt the philofophy of Ariftotle, as having in it more words than things $\rho$. promifing much, and performing little; and giving the inventions of men for indubitable proofs, inftead of building upon obfervation and experiment. He was fo zealous for, and fo careful about, this true method of learning by experiment, that though the Caitefian philofophy then made a great noife in the world, yet he would never be perfuaded to read the works of Des Cartes, for fear he flould be amuled and led away by plaufible accounts of things founded on conjecture, and merely hypothetical. But philofophy, and inquiries into nature, though they engaged his attention deeply, did not occupy it entirely ; fince we find tha: he lli!l continued to purfue critical and theological lludies. In thefe he had the affiftance of fome great men, particularly Dr Edward Pocock, Mr Thomas Hyde, and Mr Samuel Clarke, all of great eminence for their Akill in the oriental languages. He had alfo a frict intimacy with Dr Thomas Barlow, at that time head keeper of the Bodleian library, and afterwards biflop of Lincoln, a man of various and extenfive learning. In the year 1659 , Mr Boyle, being acquainted witls the unhappy circumflances of the learned Sanderfon, afterwards biftop of Lincolv, who had loft all his preferments on account of his attachment to the royal party, conferred upon him an honorary llipend of sol. a-year. This flipend was given as an encouragement to that excellent mafter of reafoning to apply himfelf to the writing of "Cafes of Confcience:" and accord-

## $13 \quad \mathrm{O} \quad \mathrm{Y}$

Beyle. ingly he printed his leaures De oodigatione confcientix, which he read at Oxford in 1647 , and dedicated them to his friend and patron.

Upon the reftoration of Charles II. Mr Boyle was treated with great civility and refpect by the king, as well as by the two great minifters the lond treafurer Southampton and the lord chancellor Clarendon. Hc was folicited by the latter to enter into holy orders, not only out of regard to him and his family, but chiefly with a view to ferve the church itfelf; for Mr Boyle's noble family, his diftinguiftied learning, and, above all, his unblemilhed reputation, induced Lord Clarendon to think that any ccclefiaftical preferments he might attain would be worthily difcharged, fo as to do honour to the clergy, and fervice to the eftablifhed communion. Mr Boyle confidered all this with due attention: but, to balance thefe, he reflected, that, in the fituation of life in which he was, whatever he wrote with refpect to religion would have fo much the greater"weight as coming from a layman: fince he well knew that the irreligious fortified themfelves againg all that the clergy could offer, by fuppofing, and faying, that it was their trade, and that they were paid for it. He confidered likewife, that, in point of fortune and charafter, he necded no acceffions; and indeed he never had any appetite for either. He chofe, therefore, to purfue his philofophical ftudies in fuch a manner as might be moll effectual for the fupport of religion; and began to communicate to the world the fruits of thefe fludies.

The firft of thele was printed at Oxford in 1660, in $8 v o$, under the title of, 1. New experiments, phyficomechanical, touching the fpring of the air and its effects. 2. Seraphic love; or fome motives and incentives to the love of God, pathetically difcourfed of in a letter to a friend. 3. Certain phyfological effays and other traets, 1661 , 4to. 4. Sceptical chemitt, 1662 , §vo; a very curious and excellent work, reprinted about the year 1579,800 , with the addition of divers experiments and notes about the produciblenefs of chemical principles.

In the year 1663 , the Royal Society being incorporated by King Charles II. Mr Boyle was appointed one of the council ; and as he might be juftly reckoned among the founders of that learned body, fo he continued one of the moft ufeful and induffrious of its members during the whole courfe of his life. In June $166_{3}$, he publifhed, 5 . Confiderations touching the ufefulnefs of experimental natural philofophy, 4 to. 6. Experiments and confiderations upon colours; to which was added a letter, containing Ohfervations on a diamond that thines in the dark, $166_{3}, 8 \mathrm{vo}$. This treatife is full of curious and ufeful remarks on the hitherto unexplained duetrine of light and colours; in which he hoows great judgment, accuracy, and penetration; and may be faid to have led the way to that mighty genius, the great Sir Ilaac Newton, who has fince fet that point in the cleareft and mof convincing light. 7. Confiderations. on the ftyle of the Holy Scriptures, $1663,8 v o$. It was an extract from a larger work, entitied, "An Effay on Scripture;" which was afterwards publithed by Sir Peter Pett, a friend of Mr Bryle's.

In 1664, he was elected into the company of the soyal mines; and was all this ycar taken up in the
profeeution of various good defigns, which probably was the reafon why he did not fend abroad any treatife cither of religion or philofophy. The year followng, came furth, 8. Occafional reflections upon feveral fubjects; whereto is prefixed a difcourfe about fuclakind of thoughts, 1665,8 vo. This piece is addrefted to Sophronia, under whofe name he concealed that of his beloved fifter the vifcountefs of Ranelagh. The thoughts themfelves are on a valt variety of fubjects, writen many years before; fomc indeed upon trivial occafions, but all with great accuracy of language, much wit, more learning, and in a wonderful ilrain of moral and pious reffection. Yet this expofed him to the only fevere cenfure that ever was pafied upon him ; and that too from no lefs a man than the cclebrated Dean Swift, who, to sidiculc thefe difcourfes. wrote A pious mediation upon a broomfick, in the Pyle of the bonourable Mr Boyle. But as his noble relation the late Lord Orrery has faid, "To what a height muft the fpirit of farcafn arife in an author, who could prevail on himfelf to ridicule fo good a man as Mr Boyle? The fword of wit, like the fcythe of time, cuts down friend and foe, and attacks every object that lies in its way. But, fharp and irreffifible as the edge of it may be. Mr Boyle will always remain invulnerable."

The fame year, he publifhed an important work, entitled, 9. New experiments and obfervations upon cold, $1665,8 v o$. In the year 1666, he publified, 10. Hydroftatical paradoxes made out by new experimentes, for the moft part phyfical and eafy, in 8 vo . 11. The origis of forms and qualities, according to the corpurcular philofphy, illuftrated by confiderations and experiments. This treatife did great honour to Mr Boyle, whether we confider the quicknefs of his wit, the depth of his judgment, or his indefatigable pains in fearching after truth. We muft not forget to obferve, that, both in this and the former year, he communicated to his friend Mr Oldenburgh, who was fecretary to the Royal Suciety, feveral curious anc excellent flort treatifes of his own, upon a great variety of fubjects, and others tranfmitted to him by his learned friends both at home and abroad, which are printed and preferved in the Philofophical Tranfactions.

In the year 1668, Mr Boyle refolied to fettle in London for life: and removed for that purpofe to the houfe of his fifler, the lady Ranelagh, in Pall-Mall. This was to the infinite benefit of the learned in general, and particularly to the acivantage of the Royal Socitty, to whom he gave great and continual affiltance, as the feveral pieces communicated to them from time to time, and printed in their Tranfactions, do abundantly teftify. Thofe who applied to him, either to defire his help, or to communicate to him any new difcoveries in fcience, be had his fet hours for receiving; otherwife it is eafy to conceive that he would have had very litte of his time for himfel?. But, befides thefe, he kept a very extenfive correfpondence with perfons of the greateft figure, and moft famous for learning, in all parts of Europe. In the year 1669, he publiftsed, 12. A continuation of new experiments touching the weight and fpting of the air; to which is added, $A$ difcourfe of the atmofpheres of confiftent bodies: and the fame year he revifed and made many additions to feveral of his former tracts, fome of

## $13 \mathrm{O} \quad \mathrm{Y}$

 which were now tranflated into Latin, in order to gratify the curious abrond. 13. Trals about the cofmical qualities of things; culmical fufpicions; the temperature of the fubterraneous regions; the botton of the fes: to which is prefixed an introduction to the hittory of particular qualities. This book occafioned much fpeculation, as it feemed to contain a vaft treafure of knonledge which had never been commenicnted to the world before; and this too grounded upon actual experiments, an.l arguments jufly crawn foom them, infead of that notional and conj Gural phitoloply which in the beginning of the spth centary had beeal fo much in farion.In the year 1671, he publihed, 14. Confiderations on the ufefurnef of experimental and natural philofophy; the fecond part, 4to. And, 15. A collection of traks upon feveral ufeful and important points of practical philufophy, 4to. Both of which works were received as new and valuable gifts to the learned world. 16. An effay about the origin and virtues of gems, $1672,8 \mathrm{vo}$. 17. A collection of tracts upon the relation lietween flame and air; and feveral other ufeful and curious fubjects: befides furnilhing, in this and the former year, a great number of fhort differtations upon a vaft variety of topics, addreffed to the Royal Society, and inferted in their Tranfactions. 18. Eflays on the frange fubtilty, great efficacy, and determinate nature, of eflluvia; to which were added a variety of experiments on other fubjecto; $1673,8 \mathrm{vo}$. 19. A collection of tracts upon the faltnefs of the fea, the moillure of the air, the natural and preternatural ftate of bodies; to which is prefixed a dialogue concerning cold; 1674, 8vo. 20. The excellency of theology compared with philofophy, 1673,8 vo. This difcourle was written in the year 3665 , while Mr Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the couritey, and had little or no opportunity of confulting his books. It contains a great number of curious and ufeful, as well as juft and natural obfervations. 21. A collection of tracts containing fufpicions about hidden qualities of the air; with an appendix touching celeftial magneto; animadverfions upon Mr Hobbcs's problem about a vacuum; a difcourfe of the caufe of attraction and fuction; $167.1,8 \mathrm{vo}$. 22 . Some confiderations about the recuncileablenefs of reafon and religion. By T. E. a layman. To which is annexed a difcourfe about the pofinibity of the refurrection. By Mr Buyle, $1675,8 \mathrm{vo}$. "The reader mut be informed, that both thele pieces were of his writing; ouly he thought fit to maik the former with the final letters of his name. Among other papers that he comnunicated this year to the Royal Sucicty, there were two connequed iuto one difcourfe; the firit was entitled, An experimental difcourfe of quickfilver growing hot veish gold; the other related to the lame fubject; and buth of them consained difcoveries of the utmoll innportince.

In the year 167 , he publimed, 23. Experiments art notes about the mechanical origin or produllion of particular $q$ malities, in feveral difcourfes on a pre at viriety of fubject., and among the reft on clecticity. In 1678 , he commanicated to Mir Ho ke a that memotial of fome obfervations made upon an artifi is fubnance that flimes without any preceding illulira-
tion; which that gentleman thought fit to publifh in his Lertiones Cutlerianc. ${ }^{2} 4$. Hiftoricalal account of a degradation of gold inade by an anti-elixir. This made a great noife both at home and abroad, and is looked upon as one of the moft remarkable pieces that ever fell from his peri; fince the facts contained in it would have been efleemed incredible, if they bad been related by a man of lefs integrity and piety than Mr Boyle. The regard which the great Newton had for Mr Boyle, appears from a very curious letter, which the former wrote to him, at the latter end of this year, for the fake of laying before him his fentiments of that etherial medium, which he afterwards confidered in his Optics as the caufe of gravitation. This letter is to be found in the life of our author by the reverend Dr Birch.

In the year 1680, Mr Boyle publifhed, 25. The acrial noctiluca; or fome new phenomena, and a procefs of a fuatious feltorhining lubfarice, 8 vo . This year the Royal Society, as a proof of the jult fenfe of his great worth, and of the conflant and particular fervices which through a courfe of many years he bad done them, made choice of him for their prefident; but he being extremely, and, as he fays, peculiarly tender in point of oaths, declined the honour done hini, by a letter addrefied to " his much refpected friend Mr Robert Huoke, profefior of mathematics at Grefham college." 26. Difcourfe of things above reafon; inquiring, whether a philofopher fhould admit any fuch; 1681, 8vo. 27. New experiments and obfervations upon the icy noctiluca: to which is added a chemical paradox, grounded upon new experiments, making it probable that chemical principles are tranfmutable, fo that out of one of them others may be produced: $1682,8 \mathrm{vo}$. 28. A continuation of new experiments, phyfico-mechanical, touching the fpring and weight of the air, and their effeas, 1682, 8vo. In 1683 , he publibed nothing but a flort letter to Dr Beale, in thation to the making of fre $\mathrm{h}_{1}$ water out of falt. In 1684, he publifited two very confiderable works, viz. 29 Memoirs for the natural hifory of human blood, efpecially the fpirit of that liquor, 8vo; and, 30. Experiments and confiderations about the porofity of bodies, \&c.

In 1685 , Mr Boyle obliged the world with, 31. Short memoirs for the natural experimental hiftory of mineral waters, with directions as to the feveral methods of trying them; including abundance of new and ufcful remarks, as well as feveral curious experiments. 32. An eflay on the great effects of even languid and unheeded motion; whicreunto is amesed an experimental difcouife of fome hitherto little regarded caules of the falubrity and infalubrity of the air and its effects. None of his treatifes, it is faid, were ever received with greater or more general applaufe than this. 33. Of the reconcileablencis of feecific medicines to the corpufu'ar philofoyity; to which is annexed a difcourfe atout the advantages of the ute of fimple medicines; 8 vo . Befides thefe philofophical track, he tave the world the fame year, an excellent thenogical une, 34 . Of the high veneration man's intelleet oves to Giud, peculiatly for his wiffom and poser, 8vo.

At the rintrance of the fuccecding year, came abroad his, 35. Free inquiry inte the vulgarly seceived notion
poote. of rature; a piece which was then, and will always be, greatly admired by thofe who have at true qeal and relifh for pure religion and philofophy. In 1637, he pubiifhed, 36. The mattyrdom of Theodora and Didymia; a work he had drawn up in his youth. 37. A difquiftion about the final caufes of natural things; wherein it is inquired, whether, and (if at all) with what caution, a naturalif hould admit them; with an appendis about vitiated light; 1688, 8vo. In the month of May this year, our author, though very unwilling, was conftrained to make his complaint to the public, of fome inconveniences under which he had long laboured; and this he dil by an advertifement, about "the lufs of many of his writings addreffed to J. W. to be communicated to thofe of his friends that are vittuof ; which may lerve as a kind of preface to mof of his mutilated and unfinihed writings." He complains in this advertifement of the treatment he hall met with from plagiaries both at home and abroad; and though it might have been difficult in any other mon to have done fo without incurring the imputation of folf-conccit and vanity, yct Mr Boyle's manner is fuch as only to raife in us a higher eiteem and admiration of him. This advertifement is inferted at length in his life by Birch.

He began now to find that his health and firength, notwithtanding all his care and caution, gradually declined, as he obferves in a letter to M. le Clerc, conted Miy 30. 1689; which put him upon uling cvery poffible method of huftudine his remaining time for the benefit of the le irned. It was with this siew that he no longer communicated particular difcouries, or new difcoverics, to the Royal Society; becaufe this could not be done without withdrawing his thoughts from taks which he thought of fill greater importarice. It was the more fleadily to attend to thefe, that he refigued his poft of governor of the corporation for propagating the gofpel in New England; nay, he went fo far as to fignify to the world that he could no longer receive vifits as ufual, in an advertifement which begins in the following manner: "Mr Boyle finds himfelf obliged to intimate to thofe of his friends and acquaintance, that are wont to do him the honour and favour of vifiting him, 1 . That be has by fome unlucky accidents, namely, by his fervant's breaking a bottle of oil of vitriol over a cheft which contained his papers, had many of his writings corroded here and there, or otherwife fo maimed, that, without he himfelf fill up the lacunæ out of his memory or invention, they will not be intelligible. 2. Tlat his age and ficklinefs have for a good while admonilled him to put his fastered and partly defaced wrilings into fome kind of order, that they may not remain quite ufelefs. And, 3. That his $\mathbb{1 k i l f f u l}$ and friendly phyfician, Sir Edmund King, feconded by Mr Boyle's beft friend;, has preffingly advifed him againft Ipreaking daily with fo many perfons as are wont to vifit him, reprefenting it as whint cannot but wafte his fuirits, \&c. He ordered likewife a board to be placed over his donr, with an infcription fignifying when he did, and when he did not, receive vifits."

Anong the other great works, which by this means he gained time to finith, there is great reafon to helieve, that one was a collection of clatorate procefles in chemintry; concerning which he wrote a letter to
a limend, which is liall extent; whereia we r.o?, tis t poyle. "he left it as a kind of leermetic legacy to the fu. dious difeiples of that att." B. fides thefe papers committer to the care of one whom be attemed $l$ is fiicnd, he left very many behind him ai ! is death, retiting to chemillry; which, as appears by a letice directed os one of his executors, he defired might be isfpected by three phyficians whom he mamed, and that lome of the moit valuable might be preferved.

In the mean time, Mi Bosle putlificel fome othor woiks before his death; as, 33. AIcdicina IIydrofatica; or, Hydroltatic, applied to the materia medica, ilicuing how, by the weight that divers bulics ulfed in phyfic have in water, one may difcover whether they be gemuinc or adulterated. I'o which is fubjoined a previous hydroftatical way of eftimating ores, 1690, Svo, 39. The Chrilian vurtuofo: thowing, that, by being audicued to experimental philofophy, a man is rather affifted than indifpofed to le a good Chriftian. To which are fubjoined, 1. A difcourfe about the diftinetion that reprefents fome things as above reafon, but not contrary to reafon. 2. The firt ctrapters of a difcourle entitled Greatnefs of mind promotid by Ciriflianity. 'The lat work which be publihhed himfelf, was in the fpring of 1691 ; and is entitled, fo. Experimenta es Obfervationes Pbybce: wherein are brichly treated of feveral fubjects relating to natural philofophy in an experimental way. To which is added a fmall collection of frange reports, Svo.

About the entrance of the fummer, he began to fecl fuch an alteration in his bealth as induced him to think of fettling his affairs; and accordingly, on the 18 th of July, he figned and fealed his laft will, to which he afterwatds added feveral codicils. In October, his diltempers increafed; and on the laft day of December 1691 , he deparied this life, in the 65 th year of his age. Ile was buried in Si Martin's church in the Fields, Wedlminter, on the $7^{\text {th }}$ of Janary following; and his funeral fermon was preached by Dr Gibert Butnet, Lithop of Salifbury. The bithop made choice upon this occafion of a text very appofite to the ful.ject; namely, " For God giveth to a man that is good in his fight, wifdom, knowledge, and joy "." After cxplaining the "Ectef. ix. meaning of the words, he applied the doctrine to the 26 . honourable perfon deceafed ; of whom, he tells us, he was the better able to give a chardeter from the many happy hours he had fpent in converfation with him, in the courf of 29 years. He gives a large account of Mr Boylc's fincere and unaffected piety; and more efpectally of his zeal for the Chrittian religion, without having any natrow notions concerning it, or millaking, as fo masy do, a bigotted heat in fasour of a particular lec, for that zeal which is an ormament of a true Chritian. He mentions as a proof of thic, his noble foundation for lectures in deferice of the golpel againft infidels of all forts; the effects of which have becu fo conficuous in the many volumes of excellent difcourfes whicla have been publithed in confequence of that noble and pious foundation. He was at the charge of the tranfation and impreffion of the New Teftament into the Malayan tongue, which he fent over all the Eaft Indies. He gave a noble reward to him that trantlated Grotius's incomparsble book "Of the tuath of the Chintian religion" into Arabic: and was at the harire of a whole impecfion, which he took care

Vovle. fiould be difperfed in all the countries where that language was underfood. He was refolved to have carried on the imprefion of the New Teflament ir the Turkith language; but the company thought it became them to be the doers of it, and fo fuffered him only to give a large fhare towards it. He was at gool. charge in the edition of the Irift bible, which te ordered to be diftributed in Iteland; and he contributed liberally to the impreflion of the Wellh bible. He gave, during his life, 3001 . to advance the defign of propagating the Chritfian religion in Ameriea; and as foon as he heard that the Eafl India Company were entertaining propofitions for the like defign in the taff, he fent 1001, for a heginning, as an example, but intended to carry it much farther when it fhould be fet on foot to purpofe.

In other refpects his charities were fo bountiful and extenfive, that they amounted, as this prelate tells uc, from his own knowiedge, to upwards of roool. ai-year. But as our limits will not allow us to follow the bihop in the copious and eloquent account he has given of this great man's abilities, we muft therefore content ourfelves with adding the fhort eulogium by the celebrated phyfician, philofopher, and chemin, Dr Herman Boerhaave; who, after having deelared Lord Bacon to be the father of experimental philufophy, afferts, that "Mr Boyle, the ornament of his age and country, fucceeded to the genius and inquiries of the great chancellor Verulam. Which (fays he) of all Mr Boyle's writing, thal! I recommend? All of them. To him we nwe the fecrets of fire, air, water, animals, vegetables, foffils: fo that from his works may. be deduced the whole fyftem of natural knouledge." The reader perhaps may here be pleafed to know, that Mr Boyle was born the fame year in which Lord Bacon died.

As to the perfon of this great man, we are told, that he was tall, but nender; and his countenance pale and emaciated. His conflitution was fo tender and delicate, that he had divers forts of cloaks to put on when he went abroad, according to the temperature of the air; and in this he governed himfelf by his thermometer. He efcaped indeed the fmall-pox; but for almoft forty years he laboured under fueh fecblenefs of body, and fuch lownefs of flength and fpirits, that it was aftonifing how he could read, meditate, make experiments, and write, as he did. He had likewife a weaknefs of his eyes; which made him very tender of them, and extremely apprehenfive of fuch diftempers as might affect them. He imagined likewife, that if ficknefs firould confine him to his bed, it might raife the pains of the fone to a degree which might be above his fitength to fupport; fo that he feared his latt minutes thould be too hard for him. This was the ground of all the caution and apprethenfion with which he was obferved to live ; but as to life itfelf, he had that juft indifference for it which beeame a philofopher and a Chriftian. However, his fight hegan to grow dim not above four hours before he died'; and when death came upor him, he had not been above three hours in bed before it made an end of him, with fo little pain that the fame appeared to go out merely for want of oil to maintain it.

Mr Boyle was never married; but Mr Evelyn was -ffured, that he courted the beautiful and ingenious
daughter of Cary earl of Monmouth, and that to this paffion was owing his "Seraphic Love." In the memorandum of Mr Boyle's life fet down by Bifhop Burnet, it is remarked that he abfained from marriage, at firt out of policy, afterwards more philcfophieally; and we find by a letter of Dr John Wallis to him, dated at Oxford, Juiy 17 th, $: 66$ g, that he had an overture made him with refpect to the L-dy Mary Hadlings, fiffer to the earl of Huntingdon: But it does not appear from any of tis papere, that he had ever entertained the leaft thoughts of that kind; nay, there is a letter of his, wrote when he was young, to the Lady Barrymore his niece, who had informed him of a report that he was actually married, which almoft frows that he never did. The letter is written with great politenefs, and in the true fpirit of gallantry; and is a clear proof that though Mr Boyle did not choofe to marry, yet it was no mifanthropic cyncal hunour which reflrained him from it. It is impoffible to entestain the reader better than by prefenting him with that part of it which concerns the point in queftion. "It is high time for me to haften the nayment of the thanks I owe your lady haip for the joy you are pleafed to wifl me, and of which that wift poffibly gives me more than the occafion of it would, You have certainly reafon, madan, to luipend your belief of a marriage, celebrated by no prieft but fame, and made unknown to the fuppofed bridegroom. I moly poffibly ere long give you a fit of the lileen upon this theme; but at prefent it were incongruous to blend fuei pure raillery, as I ever prate of matrmony and amours with, among things I am fo ferious in as thofe this feribble prefents you. I fhall therefore only tell you, that the little gentleman and I ase ftill at the old defiance. You have carried away too many of the perfeations of your fex to leave enough in this country for reducing fo fluhborn a heart as mine; whofe conqueft were a t fk of fo much difficulty, and fo litte worth $\mathrm{it}_{\text {, }}$ :hat the latter property is alays likely to deter any that lath beauty and merit enough to overcome the former. But though this untamed heart be thus infenfible to the thing itfelf called love; it is ytt very acceffible to things very near of kin to that paffion; and efteem, filendhip, refpect, and even admiration, are things that their poper oljects fail not proportionably to cxact of me, and confequently are qualities which in their highell degrees are really and conftantly paid my lady Barrymore by her mof obliged humble fervant, and aff ctionate uncle, Robrrt Boyle."

We thall conclude this account of Mr Boyle with the mentiun of his pofhumans works, which are as follow. 1. "The general Hiftory of the air defigned and begur. 2. "Genetal heads for the natural hiftory of a countiy, great or fmall; drawn out for the ufe of travellers and navigators." 3. "A paper of the honourable Robert Bovle's, depofited with the fecretaries of the Royal Socicty, October 14 th, $: 680$, and opened fince his death; being an account of his making the phopphorus, September 30th, 1680 ." Printed in the Philofophical Tranfactions. 4 . "An account of a way of examining waters as to fre finefs or faltuef." 5 ."A free difcourfe againf cuftomary fwearing, and a difs fuafive from curfing," $1695,8 \mathrm{vo}$. 6. "Medieinal experiments, or a collection of choice remedies, chiefly fimple and eafily prepared, ufeful in families, and fit for the fervice of the country people. The third and laft
volume,

## 

Boyle. volume, publilhed from the author's original manufcript; whereunto is added leveral ufefulnotes explicatory of the fame," 1698 , 12 mo . Beautiful editions of all his works have been printed at loondon, in 5 voIumes folio, and 6 volumes 4 to.

Boybe, Charles, earl of Orrery in Ireland, and baron of Mafton, in the county of Somerfet, was the fecond ton of Rager, the fecond earl of Orrery, and was born in Augutt 16\%9. He was educated at Chrit-church in Oxford, and foon diftinguilhed himfelf by his learning and abilities. Like the firlt carl of Orrery, he was an author, a foldier, and a Itatefman. He tranlated the life of Lyfander from the Greek of Plutarels; and publifhed a new edition of the epifles of Phaldris, which engaged him in a literary difpute, in which he defended the genuinenefs of thefe epiftles againkt Dr Bentley. He was three times member for the town of Huntingdon; but his elder brother, Lionel earl of Orrery dying on the 23d of Augult 1705 without iffue, he fucceeded to that title; and, entering into the queen's \{ervice, had a regiment given him, when he behaved with fuch bravery, that in 1709 he was raifed to the rank of major-general, and fworn one of her majefty's privy council. At the famous battle of the Wood, he gave the ftrongeft proofs of his intrepid courage, remaining at the head of his regiment in the warmeft part of the action, till the victory was complete, whis, as it was one of the moft glorious, fo it was the dearent bought, of any of that war. His lordthip had the honour of being appointed the queen's envoy to the ftates of Brabant and Flanders; and having honourathly difcharged the trult, was raifed to the dignity of a Dritilh peer, by the title of Lord Boyle, baron of Matton in Somerfethire. He enjoyed feveral other addititional honours in the reign of King Geotge I.; but having the misfortune to fall under the fufpicion of the government, his lurdfip was committed to the tower: he was, however, at length, admitted to bail ; and nothing being found that could be efteemed a fufficient ground for a profecution, he was dif. charged. His lordflip died after a flight indifpofition, on the 21 it of Auguft 1731. To his tutor, Mr Atterbury, he probably owed a good part of that fine relift he had for the writings of the ancients. He made thefe his conftant fudy, and expieffed a bigh contempt, fays Budgell, for the grester part of our modern wits and authors. He was delighted with the company of two forts of perfons; either fuch as were really geniufes of the firft rank, who had fine underftandings, ftrong judgments, and true taftes; or fuch as had a few foibles, and an eye of ridicule in them, which ferved to make him laugh. He would rally thefe in fo agreeable, and yet in fo tender a manner, that, though it diverted himfelf and others, it was never offenfive to the perfon rallied. The inftrument which was invented by him, and bears his name, reprefenting the folar fyftem according to the fentiments of the new aftronomers, is an undeniable proof of his mechanic genius. His lordfip had alfo a turn for medicine; which led him not only to buy and read whatever was publified on that fubject, but alfo to employ his friends to fend him accounts of herbs and drugs in foreign countries.

Borle, Jobnn, earl of Cork aud Orrery, a nobleman diltinguilhed by his learning and genius, was the only fon of Charles earl of Orrery, and was born on the Voz. IV. Patt I.

2d of January 1707. He was educated at Clirif-cliureh college in Oxford; hut, as he himfelf declares, carly difappointments, indifferent health, and many untoward accidents, rendered hire fond of retirement, and of im .

Eny!e's Lecturcs

Doyie. proving his talerts for polite literature and poetry; of which 1 if art he gave feveral excellent fecimens. He alfo wrote a 'l'randation of Pliny the Younger's letter, with various notes, for the fervice of his eldeft fon the Lord Boyle, in two volumes, $4^{\text {to }}$. This was firft publifhed in 1751. The year following, he publifted the Life of Dean Swift, in feveral letters, addrefled to his fecond fon Hamilton Boyle; and afterwirds printed Memoirs of Robert Cary earl of Monnonth, a manufcript prefented to him by a relation, with explanatory notes. He died in 1762 .

Borte's Lectures, a courfe of cight fermans or lectures preached annually, fet on foot by the honour. able Robert Boyle, Efq. by a codicil annexed to his will in 1691 ; whofe delign, as exprelfed by the inttitutor, is, to prove the truth of the Chriftian religion againit infidels, without defcending to any controverfies among Chriflians; and to anfwer new difficulties, fcruples, \&c. For the fupport of this lecture he affigned the rent of his houfe in Crooked-lane to fome learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late Archbithop Tennifon and others. But the fund preving precarious, the falary was ill paid; to remedy which inconveniences, the laid archbifhop procured a yearly Atipend of 50l. for ever, to be paid quarterly. charged on a farm in the parifh of Brill in the cous;ty of Bucks. To this appointment we are indebted for many elaborate defences both of natural and reveal ed religion.

BOY゙NE, a river in Ireland, which rifes in Queen's county in the province of Leinfter, and runs north-ealt by Trim and Cavan, falling at laft into the Irith channel a little below Drogheda. It is memorable for a battle fought on its banks between James II. and King William III. in which the former was defeated.

BOYSE, Boys, or Bors, Gohn, one of the tranflators of the Bible in the reign of James I. Was fon of William Bois, rector of Wef Stowe, near St Edmunfbury, Suffolk, and born at Nettleftead in Suffolk on the $3^{d}$ of January 1560 . He was taught the firf rudiments of learning by his father ; and his capacity was luch, that at the age of live years be read the Bible in Hebrew. He went afterwards to Hadley fchool; and at I4 was admitted of St John's college, Cambridge, where he dillinguilhed himfelf by his fkill in Greek. Happening to have the fmallpox when he was elected fellow, he, to preferve his feniority, caufed himfelf to be carried in blankets to be admitted. He applicd himfelf for fome time to the ftudy of medicinc; but, fancying himfelf affected with every dileafe lie read of, he quitted that foience. He was ter yeari chief Greek lecturer, in his college, and read every day. He voluntarily read a Greek lecture for fome years at four in the morning, in his own chamber, which was frequented by many of the fellows. On the death of his father, he fucceeded him in the rectory of Weft Stowe. At the age of 36 , he married the daughter of Mr Holt, rector of Boxworth, in Cambridgeflire; whons he fucceeded in that living, October 13.1596. On his quitting the univerfity, the college gave him $\mathrm{Zz}_{\mathrm{z}}$ IOOl.

## B O Y [ 362 ] B O Y

10pl. His young wife, who was bequeathed to him with the living, which was an advowfon, proving a bad economift, and he himfelf being wholly addicted to his ftudies, he foon became fo much involved in debt, that he was obliged to fell his choice collection of books, confifing of almoft every Greek author then cxtant. When a new tranflation of the Bible was by King James I. direeted to be made, Mr Boyfe was elected one of the Cambidge tranflators. He performed not only his own, but alfo the part affigned to another, with great reputation; though with no profit, for he had no allowance but his commons. He was alfo one of the fix who met at Stationcrs Hall to revife the whole; which tafk they went through in nine months, having each from the company of Atationers, during that time 3os. a-week. He afterward affilted Sir Henry Saville in publithing the works of St Chrvfofion. In 1615, Dr Lancelot Andrews, bithop of Lly, beftowed on him, unafked, a prebend in his church. He died on the 14th of January 1643, in the $8 \neq$ h year of his age. He left a great many manufcripts behind him, particularly a Commentary on almolt all the books of the New T'eftament. - When he was a young fludent at Cambridgc, he reccived from the learned $\mathrm{Dr}_{\mathrm{W}}$ Whitaker three rules for avoiding thofe diflempers which ufually attend a fedentacy life, to which he adhered with equal conftancy and fuccefs. The fitf was, To ftedy always flanding; the fecond, Never to fudy in a witsow; and the third, Never to go to bed with his feet cold.

Korse, $\mathcal{F} o f e p h$, a late eminent diffenting minifter in Dublir, much refpected not only for learning and abilities, but his extenfive humanity and undiffembled piety. During his minifterial charge at Dublir, he publithed many fermons which compofe feveral folio volumes, a few poems, and other tran?; but what chietly dillinguilhed him as a writer, was the controverfy he carried on with Dr King, archbiftop of Dublin, and author of the Origin of Evil, concerning the office of a feriptural bilhop. This controverted point was managed on both fides with great force of argument and calmnefs of temper. The biftop afferted, that the epifcopal right of juriflictions had its foundation in the Now Teftment: Mr Bryfe, conffifent with his principles, denied that any ecclefiattical fuperiority appeared there, with the greatelt canduur and good manners. He was father to

Boyse, Samuel, the poet, a man remarkable for the finenefs of his genius, the lownefs of his manners, and the wretchednefs of his life. He was born in $\mathbf{r} 708$, and reccived the rudimerts of his education in a private fehool in 1)ublin. When he was but 18 years oid, his lather, who probably intended him for the minifery, font him to the univerfity of Glafgow, that he might firinh his education these. He had not been a year at the univerfity, when he fell in love with the daughter of a tradefman in that city, and was imprudent enongh to interrupt his education by mariying her before he had entered into his 2eth year. The natural extravagance of his temper foon expofed him to want; and as he had now the additional charge of a wife, his reduced circumitances obliged him to quit the univerfity, and go over with his wife (who alfo carried afifer with her) to Dublin, where they relied on the old gentleman for fapport. Young Boyfe was of all men the furtheft re-
moved from a gentleman; he had no graces of perfon, and fewer ftill of converfation. Never were three people of morc libertine characters than young Boyfe, his wife, and Gifter in-law ; yet the two ladies wore fuch a mank of decency before the old gentleman, that his fondnefs was never abated. The eftate his father poffeffed in Yorkfthire was lold to difcharge his debts; and when the old man lay in his la!f ficknefs, he was entirely fupported by prefents from his congregation, and buried at their expence. We have no further account of Mr Boyfe, till we find him foon after his father's death at Edinburgh. At this place his poetical genius raifed him many friends, and fome patrons of very great eminence. He publifhed a volume of poems in 1731, to which are fubjoined The Tablature of Cebes, and $A$ Letter upon Liberty, inferted in the Dublin yournal 1726 ; and by thefe he obtained a very great reputation. They are addreffed to the countefs of Eglinton. This amiable lady was the patranefs of all nien of wit, and greatly diftinguifhed Mr Boyfe while he refided in that country. Upon the death of the vifcountefs Stormont, Mr Boyfe wrote an elegy, which was very much applauded by her ladymip's relations. This elegy he entitled Tbe Tears of the Mufes, as the deceafed lady was a woman of the moft refined tafte in the fciences, and a great admirer of poetry. The lord Stormont was fo much pleafed with this matk of efteem paid to the memory of his lady, that he ordered a very handlome prefent to be given to Mr Boyfe by his attorney at Ediaburgh. The notice which Lady Eglinton and the lord Stormont took of our poet, recommended him likewife to the patronage of the duchefs of Gordon; who was fo folicitous to raife him above neceffity, that the employed her intereft in procuring the promife of a place for him. She gave him a letter, which he was next day to deliver to one of the commiffioners of the cultoms at Edinburgh. It happened that he was then fome miles dillant from the city; and, the morning on which he was to have rode to town with her grace's letter of recommendation proved to be rainy. This flender circuniftance was enough to difcourage Boyfe, who never looked beyond the prefent monient: he declined going to town on account of the rainy weather; and while he let flip the opportunity, the place was beftowed upon another, which the cummiffirner declared he kept for fome time vacant in expectation of feeing a perfon recommended by the duchefs of Gordon. Boyfe at lait having defeated all the kind intentions of his patrons towards him, fell into contempt and poverty, which obliged him to quit Edinburgh. He communicated his defign of going to London to the duchefs of Gordon; who, having fill a very high opinion of his poetical abilities, gave him a letter of recommendation to Mr Pope, and obtained another for him to Sir Peter King the lord chancellor of England. Lord Stormont recommended him to the folicitor-general his brother, and many other perfons of the firll fathion. Upon receiving thefe letters, he, with great caution, quitts Edinburgh, regretted by none but his creditors. Upon his arrival in London, he went to Twickenham, in order to deliver the duchefs of Gordun's letter to Mr Pope; but that gentleman not being at home, Mr Boyfe never gave himfelf the trouble to repeat his vifit. He wrote poems; but thofe, though excellent in their kind, were loft to the world, by bcing introduced with no advantage.

## B O Y [ 363 ] B R A

 He had fo frong a propenfity to grovelling, that his acquaintance were generally of fuch a calt as could be of no fervice to him; and thofe in higher life he addrefled by letters, not having fufficient confidence or politenefs to converfe familiarly with them. Thus unft to fupport himfelf in the world, he was expoled to a variety of diftreffes, from which he could invent no means of extricating himfelf but by writing mendicant letters. It will appear amazing, that this man, of fo abject a fpirit, was voluptuous and luxurious; he had no talte for any thing elegant, and yet was to the laft degree expenfive. Can it be believed, that often when he had received but a guinea in confequence of a fupplicating letter, he would go into a tavern, order a fupper to be prepared, drink of the richent wines, and fpend all the money that had juft been given him in charity, without having any one to participate the regale with him, and while his wife and child were llarving at home.It was about the year 1740, that Mr Boyfe, reduced to the laft extremity of human wretchednefs, had not a Shirt, a coat, or any kind of apparel, to put on; the Aheets in which he lay were carried to a parvn-broker's, and he was obliged to be confined to his bed with no other covering than a blanket. He bad little fupport but what he got by writing letters to his friends in the mofl abject ftyle; but was perbaps afhamed to let this inftance of his diftrefs be known, which probably was the occafion of his remaining fix weeks in that fituation, During this time he had fome employment in writing verfes for the Magazines; and whoever had feen him in his ftudy, mult have thought the object fingular enough; he fat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to admit his arm, and, placing the paper upon his knee, fcribbled in the beft manner he could the verfes he was obliged to make: whatever he got by thofe, or any other of his begging letters, was but jult fufficient for the prefervation of life. And perhaps he would have remained much longer in this diftreffful ftate, had not a compalfionate gentleman, upon hearing this circumftance related, ordered his clothes to be taken out of pawn, and enabled him to appear again abroad.

About the year 1745, Mr Boyfe's wife died. He was then at Reading, and pretended much concern when be heard of her death. His bufinefs at Reading was to compile a Review of the molt material tranfactions at home and abroad during the laft war: in which he has included a fhort account of the late rebellion. Upon his return from Reading, his behaviour was more decent than it had ever been before; and there were fome hopes that a reformation, though late, would be wrought upon him. He was employed by a bookfeller to tranflate Fenelon on the Exifience of God; during which time he married a fecond wife, a woman in low circumflances, but well enough adapted to his tafte. He began now to live with more regard to his character, and fupported a better appearance than ufual; but while his circumftances were mending, and his irregular appetites lufing grouud, his health vilibly declined. He had the fatisfaction, while in this lingering illnefs, to obferve a poern of his, entitled The Deily, recommended by two eminent write,'s, the ingenious Mr . Fielding,
and the reverend Mr James Harvey author of $\mathcal{T}$ ise Me ditations.

Mr Boyre's mind was often religioully difpofed; he frequently talked upon that fuhject, and probably fuffered a great deal from the remorfe of his confcience. The early impreftions of his good education were never entirely obliterated; and his whole life was a continued fruggle between his will and reafon, as he was always violating his duty to the one, while he fell under the fubjection of the other. It was in confequence of this war in his mind, that he wrote a beautiful poem called The Recantation. In May s 749, he died in obfcure lodgings near Shoe-lane; but in Centiments, there is the greateft reafon to believe, very different from thofe in which he had fpent the greateft part of his life. An old acquaintance of his endeavoured to collect money to defray the expences of his funeral, fo that the fcandal of being buried by the parilh might be avoided; but in vain: the remains of this fon of the mufes were, with very little ceremony, hurried away by the pariftiofficers.

Never was a life fpent with lefs grace than that of Mr Boyfe, and never were fuch diftinguifhed abilities given to lefs purpofe. His genius was not confined to poetry only: he had a talte for painting, mulic, and heraldry; with the latter of which he was very well acquainted. His poetical pieces, if colleqed, would make fix moderate volumes. Many of them are fcattered in Tbe Gertleman's Magazine, marked with the letter $\Upsilon$, and Alceus. Two volumes were publifhed in London. An ode of his in the manner of Spenfer, entitled The Olive, was addreffed to Sir Robert WValpole, which procured him a prefent of ten guineas. He tranflated a poem from the High Dutch of Van Haren, in praife of peace, upon the conclufion of that made at Aix-laChapelle; but the poem which procured him the greateft reputation was that upon the attributes of the Deity. He was employed by Mr Ogle to trandate fome of Chaucer's tales into modern Englift, which he performed with great fpirit, and received at the rate of three pence a line for his trouble. Mr Ogle publithed a complete edition of that old poet's Canterbury Tales modernized; and Mr Boyfe's name is put to fuch tales as were done by him. In :743, Mr Boy fe publihed, without his name, an ode on the battle of Dettingen, entitled Albion's Triumph.

BOZOLA, a town of Italy, in the duchy of Mantua, capital of a tertitory of the lame name, and fubject to the houfe of Auftria. E. Long. 10.25.N. Lat. 45. 9.

B QUADRO, Ouadrato, or Durnle, in mufic, called by the French $b$ quarre, from its figure h. This is what we call B natural or flarp, in diftinction to $B$ mol or flat. See Flat and Shars,

If the Hlat $b$ be placed before a note in the thorough bafs, it intimates, that its third is to be minor ; and if placed with any cypher over a note in the bafs, as b 6 , or $b 5$, \&ic. it denotes, that the fifth or fixth thereto are to be flat. But if the quadro $\ddagger$ be placed over any note, or with a cypher, in the thorough bafs, it has the contraty effect: for thercby the note or interval thereto is raifed to its natural order.

BRABANCIONES, in middle age writers, a kind of Netherland fuldiery, infamous for rapine, being lit.

## Boyre

Braion Bratian-
ciones.

Erabant tle better than commiffioned banditti, who hired themfelves to fight for any that could pay them beff. The word is varioully written by the hiforians of thefe days; all given them from the country of Brabant, which was the chicf nurfery of thofe troops. They are allo frequently confounded with the Routiers, Roturiers, Reptirii, Ruterarii, Corteraux, \&c.

BRABANT, a large province of the Netherlands, with the title of a duchy. it is bounded on the north by the province of Holland and the cluchy of Guelderland; on the eaf, by the fame duchy and the bifhopric of Liege; on the fouth, by the province of Namur and Hainatlt ; and on the weft, by Zealand. It is divided into Dutch Brabant ard Auftian Brabant; watered by feveral rivers, of which the Scheid, the Ruppel, and the Dommel, are the chief. The foil is very fertile; and it contains 26 fortified towns, of which Brufiels is the capital.
brabejum, the African Almond. See Botany Inder.
brabeutes, or Brabeuta, in Antiquity, an officer among the Greeks, who prefided at the public games, snd decided controverfies that happened among the antagonifts in the gymuifical exercifes. The number of brabeute are not fixed; fometimes there was only one, but more commonly they amounted to nine or teri.

BRACCIANO, a town of St Peter's patrimnny, about 12 miles north of Rome, fituated on the weff fide of a lake to which it gives name. E. Long. 1 s . N. Lat. 42.

BRACCIOLIN1, Francis, an Italian poet, a native of Poftoia, and the friend of Pope Urban VIII. was bornabout the ycar 1566. Removing to Florence, he was admitted into the academy thecre, and devoted hinfelf to literature. At Rome he cntered into the fervice of Cardinal Maffeo Barterini, with whom he afterwards went to France. After the death of Clement VIll. he returned to his own country, and for fome years profecuted his lludies in retirement. When his patron barberini was tleched pope, under the name of Urban VIII. Bracciolini repaired to Rome, where be was well received, and made fecretary to the pope's brother, Cardinal Antonio. He had allo the honour conferred on him of taking a furname from the arms of the Barberini family, which were Bees; and thenceforth he was known by the name of Bracciolini dell'Api. He refided in Rome during the whole of that pontificate, frequenting the mof illuftriwus acadernies, and liftened to with general applaufe, but at the fanse time, cenfured for his fordid avarice. He returned at length to his native city, where he died in the year $16+5$.

Bracciolini was a copious writer. There is fcarcely any frecies of poetry, epic, dramatic, paforal, lyric, and burlefque, which he did not attempt. He is primcipally ruted for his mock heroic poem, entitled Scber. no degli Dci, which is a ridicule of the heathen mythology, and which difputes priority of date with Traffon's Sacchia Rapita. In merit, indeed, its inferiority is acknowledged, yet it obtained confiderable applauf. Of his ferious beroic poems, the mofe celcbrated is the Croce Racquifata," which by lome is placed next to the great works of Ariofto and Taffo, sut not witheut a laribe interval. He celebrated the elevation of his
patron Urban VIII. in a poem of twenty-three books, which flows with what facility he could write verfes. His dramatic pafioral, entitled I'Amorofo Sdegno, is acrounted olie of the bell productions of the age in which it was written; and fome of his tragedics met with much applaufe, particularly his Evandro.

BRACE is commonly taken for a couple or pair, and applied by hunfmen to feveral beafts of game, as a brace of bucks, foxes, hares, \&c.

Brace, or Braffe, is alfo a foreign meafure, anfwer. ing to our fathom. See Fathom.

Brace, in Architecture, a piece of timber framed in with bevil joints, the ufe of which is to keep the build. ing from fwerving either way. When the brace is framed into the kinglefes or principal rafters, it is by fome called a frut.

Brace, in writing or printing, a crooked line enclofing a paffage, as in a triplet.

Braces, in the fea-language, are ropes belonging to all the yards of a thip, except the mizen, two to each yard, reeved through blocks that are faftened to pennants feized to the yard-arms. Their ufe is either to fquare or traverfe the yards. Hence to brace the yard, is to bring it to cither fide. All braces come aftward on; as, the main brace comes to the poop, the main-iop fail brace comes to the mizen-top and thence to the main-fhrouds; the fore and fore-top fail braces come down by the main and main-top-fail llays, and fo of the ref. But the raizen-bowline ferves to brace to the yard, and the crofs-jack braces are brought forwards to the main-fhrouds, when the fhip fails clofe by a wind.

Braces of a Coach, thick fraps of leather on whicls it hangs.

MRACELET, an ornament woin on the wrift, much ufed among the ancients: it was made of different materials and in different fallions, according to the age ard quality of the wearer. The word is French, bracclet; which Menage derives further from braceltturn, a diminutive of bracilt, a word occurring in wisters of the Juftinian age ; all formed from the Latin trachium, arm. It amounts to the fame with what was called by the ancicnts, armilla, trachiale, occabus; in the middle age, boga, lauga, armippatha.

Bracelets are much worn by the lavages of Africa, who are fo exceffively fond of them, as to give the richeft commodities, and even their fathers, wives, and children, in exchange for thofe made of no sicher materials than Reells, glafs-beads, and the like.

They form alfo, in modern civilized countries, a very common part of the othaments of the ladies.

BRACHINEUS, the name of a mufcle. Sce Anaтому, Talle of the Mufcles.

Coruco-bRACHIALiS. See Anatomy Index:
13RACHIUM, or Arm. See Anatomy Index.
BRACHMINS, or Bracumans, a branch of the ancient Gymnofophifts, or philofopliers of India, remarkable for the feverity of their lives and manners. Sec the article Gymnosofhists.

Some fay they derive their name from the patriarch Abraham, whom they call in their language Brachma, or Brama. Others deduce it from the name of their god Bracluma; which fome ngain take to be the fame will Abraham: whence Pofel calls them Abrachw:anes.
F. Thomafia

## B R A

Brachygra- F. Thomafin derives the word from the Hebrew baracb,
phy to fly or efirape; becaufe the Brachmans retire into the country and live in deferts. The fame author gives us another derivation, viz. from the Hebrew barach (benedicere, orare), to blefs or pray; in regard this is their principal occupation. -l'he Grecks aferibe to them the doatrine of the immortality of the foul, and certain notions concerning the nature of the Supreme Being and future rewarls and puniftments. To this fpecies of knowledge the 13rachmans added an infuite number of religions obfervances, which were adopted by Pythagoras in his fchool ; fuch as fafting, prayer, filence, and contemplation. They were looked upon as the friends of the gods, becaule they affeeted to pay them fo much regard; and as the proteqors of mankind, becaule they paid them no regard at all. No bounds were therefore fet to the refpect and gratitude that were flown them: princes themfelves did not fcruple to confult thefe reclufes upon any critical conjuncture, from a fuppofition, no doubt, that they were infpired ; fince it was impof. fible to imagine that they had the advantages of experience. We can fcarcely, however, deny, that there might be anong them fome men of real virtue, whofe minds relifted the pure and ingenious delights of ftudy and fcience; and who, by nobly raifing their thoughts to the contemplation of the Firft Being, mult have had more powerful incitements to render themfelses worthy of his care, and none to jultify them in deceiving and tyrannizing over their fellow creatures.

There appear itill fome remains of the ancient brachmans in the eaft, under the denomination of Bramins. See Braneins.

BRACHYGRAPHY, the art of fhort-hand-writing. See Short Hand.

BRACHYLOGY, (from $\beta_{\zeta} \neq \chi^{\prime}{ }_{5}$ and $\lambda_{0}$ oos, "expre(fion"), in Rbetoric, the expretling any thing in the moft concife manner. This, fo far as confiftent with perfpicuity, is a virtue and beauty of Atyle; but if obfcurity be the confequence, which is often the cafe, it becomes a blemifh and inexcufable defect.-Quintilian gives an inflance of brachylogy from Salluft: AIthridiates corpore ingenti perinde armatus; "Mithridates, as it were, armed with the hugenefs of his ftature."

BRACHYPTERA, a term ufed by Willoughby, to denote thofe hawks which have their wings fo fhort as not to reach to the end of the tail. Of this kind are the gofs-hawk, fparrow-hawk, \&c.

BRACHYPYRENIA, in the hiftory of foffils, a genus of feptarix, with a flort roundilh nucleus. See Eeptarie.

BR ACHYTE LOSTY L A, in Natural Hifory, the name by which Dr Hili calls thofe cryftals which are compofed of a thort bexangular column terminated at each end by an hexangular pyramid. See Crystal.

BRACKET, among carpenters, \&c. a kind of wooden ftay, ferving to fupport fhelves and the like.

Brachets, in a hlip, the fmall knees, ferving to fupport the galleries, and commonly carved. Alfo the timbers that fupport the gratings in the head are called Lrackets.

Brackets, in Guanery, are the cheeks of the carriage of a mortar: they are made of ftrong planks of wood, of almoft a femicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called bed-bolts; they rife up on

365 〕 B R A
cach fide of the mortar, and ferve to keep her at any elcuation by means of fome frong iron bolls, called lirocket-boles, which go through thefe checks or brackets.

BRACKLAU, a ftrong town in Poland, capital of a palatinate of the fame name. The houfes are built of wood. It was taken by the Turks in 1672, but retaken three years afterwards. It is feated on the river Bog, in L. Long. 29. 20. N. Lat. 48. 5.

BRACKLAW, a palatinate of that name, which is the eaftern part of Podolia; it is alfo called Lower Podolia, and is of greater extent than Upper Podolia, but is more defolate, on account of the neighbourhood of the Tartars.
BRACKLEY, a borough-town in Northamptonflite, in England, feated on the edge of the county, next Buckinghamfire, on a branch of the river Oufe. It is an ancient and large corporation-town, containmes two parifl-churches; is governed by a mayor and aldermen; and fends two members to parliament. It had formerly a college, which is turned into a free fchool. W. Long. 1. 15. N. Lat. 52. 0.

BRACTEA, in Natural Hifory, denotes a fpangle, or thin tlake of any fubllance.

Bractea, in Botany, a thin leaf or plate of any folium forale, ranged by Linnæus among the fulcra of plants. Thefe floral leaves differ in flape and colour, from the other fulia of the plant; are generally fituated on the pedunculus, and often fo near the corolla as to be eafily miftaken for the calyx ; than which, however, the braicere are generally more permanent. Examples of the floral leaves are feen in the tilia, fumaria bulbofa, lavendula, and horminum.

BRACTEARIA, in Natural Hifory, a genus of talcs, compofed of friall plates in form of fpangles, each plate cither being very thin, or fiffile into very thin ones.

Of this genus there are a great many fpecies, called from their different colours, nica aured, or gold-glimmer; and mica argentca, filver-glimmer, or cats-filver, \&c.
brackton, Henry, lord chief juntice of England in the reign of Herry III. was probably a native of Devonftire. He was educated at Oxford, where he took the degree of doctor of laws, and was made one of the itinerant judges about the year 12.4. Ten years after he became chief juftice, and had the earl of Derby's houfe in London affigned him for his town refidence, during the minority of that nobleman. He is faid to have filled this importart office with fingular reputation during 20 years. When he died is not known; probably it was in the reign of Edward I. He vrote De legibus et confuetudinibus Anglicr, which is one of the moft ancicnt, and alfo moft methodical books on our laws. His method is copied from Juftinian. This work as printed at London in 1569, fodio; and in $1640,4^{\text {to }}$. The firf is very incorrect.

BRAD, a town of Sclavonia, feated on the north fide of the river Save, in E. Long. IS. 40. N. Lat. 45. 20 .

BRADFIELD, a town of Effex in England, in E. Long. ©. 30. N. Lat. 51. 34.

BRADFORD, a town of Wilthaire in England, feated in W. Lon. 2. 40. N. Lat. 51. 20.

Bradford, Tobm, a divine, and mastyr to the pe-

Eradiord formation, was born in the former part of the reign of Henry VIII. at Manchefter in Lancafhire. Being a remarkable penman and accountant, he became fecretary to Sir John Harrington, who was feveral times employed by King Henry, and his fucceffor Edward VI. as paymafter to the troops ahrodd. Bradford at this time was a gay man, and to fupport his extravagance made free with the king's money; but being at laft unable to fupport the reflection of his guilt, he determined to make reftitution, and actually repaid the money. Quitting his employment of fecretary, about the year 1547 , he took chambers in the inner temple, and for fome time fludied the law; but finding in himfelf an inclination to preach the gofpel, in the following year he removed to Catharine-hall in Cambridge, where he applied with fuch uncommon affiduity to the fudy of divinity, that in a much fhorter time than ufual he was admitted to the degree of mafter of arts, and foon after made fellow of Pembroke-hall. Bifhop Ridley, who, in 1550, was tranflated to the fee of London, charmed with Bradford's application and zeal, now fent for him to the metropolis, ordained and appointed him his chaplain. In 1553, he was alfo made chaplain to Edward VI. during which time he became one of the mof popular preachers in the kingdom. Such, a reformer was too dangerous to be fuffered in the fucceeding reign. Mary was hardly in poffcffion of the crown, before Bradford's perfecutions began. He was firf confined in the tower for fedition, where lie continued a year and a half; during which time he wrote feveral epiftles that were difperfed in various parts of the kingdom. He was afterwards removed to other prifons, and at laft brought to his trial before that infernal court of inquifition in which Gardiner fat as chief inquifitor, where he defended his principles to the laft, in contempt of their utmoft power. They condemned him to the flames; and be was accordmgly burnt alive in Smithfield, on July 1. 1555 . His works are, I. Seventy-two letters, written to various people, whilft the author was in prifon ; printed in Bilhop Coverdale's collection. 2. 'Ten letters, printed in Fox's acts and monuments. 3. Complaint of verity, 1559 , 8 vo. 4. Three examinations before the commiffoners, and his private talk with the priefts, with the original of his life, 156 r , octavo. 5. 'Two notable fermons 1574, octavo, 163 r. 6. Godly meditations and prayers 3614, 2 fto. 7. Treatife of repentance, 1622 . With feveral tranllations and other picces.
$B R \triangle D F O R T H$, a town in the weft of Yorkhire, feated on a branch of the river Are, in W. Long. I. 35 . N. Lat. 53.40.

BRADLEY, Dr James, a famous Englifı aftronomer, was the third fon of William and Jane Bradley, and was born at Sherborne in Dorfethire in the year $\mathrm{s}_{692}$.

He was educated for the univerfity at North Leach - by Mr Egles and Mr Brice, who kept a boarding. fchool there; and from North Leach he was fent to Oxford. His friends intended him for the church, and his fludies were regulated with that view; and as foon as he swas of fufficient age to receive holy orders, the bifhop of Hereford, who had conceived a great eftecas for him, gave him the living of Bridfow, and foon after he was inducted to that of Welfrie in Pembrokeflire. But notwi:hftanding thefe advantages, from which he
might promife himfelf ftll father advancement in the church, he at length refigned his livings, that he might be wholly at liberty to purfue his favourite ftudy the mathematics, and particularly aftronomy. He was nephew to Mr Pound, a gentleman who is well known in the learned world by many excellent obfervations, and who would have enriched it with more, if the journals of his voyages had not been burnt at Pulo Condore, when the place was fet on fire, and the Englifh who were lettled there cruelly maffacred, Mr Pound himfelf very narrowly efcaping with his life. With this gentleman, Mr Bradley paffed all the time that he could fpare from the duties of his function; and perhaps he fometimes trefpafied upon them: he was then fufficiently acquainted with the mathematics to improve by Mr Pound's converfation ; yet it does not appear that, in this fudy, he had any preceptor but his" genius, or any affiftant but his labour.

It may be eafily imagined, that the e imple and converfation of Mr Pound did not render Bradley more fond of his profeflion than he was before; he continued, however, as yet to fulfil the duties of it, though at this time he had made fuch oblervations as laid the foundation of thofe difcoveries which afterwards diftinguifhed him as one of the greateft aftronomers of his age. Though thefe obfervations were made as it were by fealth, they gained him at firf the notice, and then the friendftiip, of the lord chancellor Macclesfield, Mr Newton, afterwards Sir Ifac, Mr Halley, and many other members of the Royal Society, into which he was foon elected a member. About the fame time, the chair of Savilian profeffor of aftronomy became vacant by the death of the celebrated Dr Keil; and Mr Bradley was elected to fucceed him on the 3ift of October 172 I , being then juft 29 years old; and his colleague was Mr Halley, who was profeffor of geometry on the fame foundation. Bradley, upon his being elected into this profeformip, gave up both his livings, and with great joy quitted a fituation in which his duty was directly oppofite to his inclination. From this time, he applied himfelf wholly to the ftudy of his favourite fcience; and in the year 1727 he publinhed his theory of the aberration of the fixed llars, which is allowed to be one of the moft ufeful and ingenious difcoveries of modern aftronumy. Three years after this difcovery, by which Mr Bradley acquired very great reputation, he was appointed lecturer in allronomy and phyfics, at the muleum of Oxford.

He purfued his ftudies with equal application and delight; and in the courfe of his obfervations, which were innumerable, lie difcovered that the inclination of the earth's axis upon the plane of the ecliptic was not always the fame, but that it varied backwards and forwards fome leconds, and that the period of thefe variations was nine years. This period feemed altogether unaccountable, as it could not be luppofed to have any thing in common with the revolution of the earth, which is performed in one year. Mr Bradley, however, difcovered the caufe of this phenomenon in the Newtonian fyetem of attraction. He pulblihed this difcovery in 1737, fo that in the fpace of about ten ycars he communicated to the world two of the finct difcoveries in modern aftronomy, which will for ever make a memorable epocha is the hiflory of that Science.

## $\mathrm{B} R \mathrm{~A} \quad[367] \quad B \quad R \quad A$

Bradley. Mr Bradley always preferved the effeem and triendfoip of Mr Halley; who, being worn out by age and infirmities, thought he could do nothing farther for the lervice of aftronomy, than procure for Mr Bradley the place of regius profeffur of allronomy at Greenwich, which he had poffefled himfelf many years with the greatell reputation. With this vicw, he wrote many letters, which have been fince found among Mr Bratley's papers, defiring his permiffiun to apply for a grant of the reverfon of it to him, and even oftering to refigu in his favour, if it thould be thought neceffary : but before Mr Halley could bring this kind project to bear, he died. Mr Bradley, however, obtained the place afterwards, by the favour and interelt of Lord Macclesfield, who was afterwards prefident of the Royal Society. As foon as the appointment of Mr Bradley to this place was known, the univerfity of Os ford fent him a diploma creating him doctor of divinity. The appointment of aftronomer at Greenwich placed Mr Bradley in his proper element, and he purfued his obfervations with unwearied diligence. How. ever numerous the collection of aftonomical inftruments at the obfervatury at Gicenwich, it was impolfible that fuch an obferver as Dr Bradley fhould not defire to increafe them, as well to anfwer thofe particular views, as in general to make obfervations with greater exactucfs. In the year 1748 , therefore, he tuok the opportunity of the annual vifit made by the Royal Society to the obfervatory, in order to examine the inftruments and receive the profeffor's obfervations for the year, to reprefent fo ftrongly the neceflity of repairing the old inftruments, and purchafing new, that the fociety thought proper to reprefent it to his majefty, and his majefty gave them roool. for that purpofe. This fum was laid out under the direction of Dr Bradley, who, with the affitlance of the late celebrated Mr Graham and Mr Bird, furnithed the obfer. vatory with as complete a cullection of attronomical inftruments, as the moft fkilful and diligent obferver could defire. Dr Bradley, furnifhed with fuch affiftance, purfued his obfervations with new affiduity, an incredible number of which were found after his death, and put into the hands of the Royal Society.

It has been already oblerved, that when Dt Bradley was elected to the profeffor's chair at Osford, he gave up his two livings, which were at fuch a dillance, that he could not poffibly fultil the duties of them himfelf; but it happened that after he was fettled at Greenwich the living of that parith became vacant, which is very confiderable, and which was offered to him, as he was upon the foot to perform the duty, and had the claim of ancommon merit to the reward. This living, however, Dr Bradicy, very greatly to his honour, refufed, fearing the duties of the aftronomer would too much interfere with thofe of the divine. His ms. jelty, however, hearing of the refufal, was fo pleafed with it, that he granted him a penfion of 2501 . i-year in confideration of his great abilities and knowledge in aftronomy and other branches of the nathematics, which had procured fo much advantage to the commerce and navigation of Great Britain, as is particularly mentioned in the grant which is dated the 15 th of February 1752 . Dr Bradley, about the fame time, was admitted into the council of the Royal Suciety. In the year 1748 , he was admitted a member of the royal
academy of fciences and belles lettres of Berlin, upon the death of M. Crevier, fild phyfician to his Catholic majelly; in the year 1752, a member of the imperial academy at l'eterfburg; and in 1757 , of that inflituted at Bulogna.

Dr Bradley was fill indefatigable in his obfervations, and whatever honour he received became an incitement to obtain new diftinction; his corporeal abilities, however, at length declined, though his intellectual fuffered no abatement. In the year $\mathbf{x} 760$, be becamc extremely weak and infirm; and rowards the end of June 1762, he was attacked with a total fuppreflion of urine, caufed by an inflammation of the reins, which on the 12 th of July following put an end to his life, in the 7oth year of his age. He was buried at Mit-chin-Hampton, in Gluncellerfhire, in the lame grave with his mother and his wife. In the year 1744, he married Sufannah Peach, the daughter of a getateman of that name in Gloucellerihire, by whom he had only one daughter.

As to his character, he was remarkable for a placid and gentle modefty, very uncommon in perfons of an aftive temper and robuft conflitution. It was fill more remarkable, that, with this untroubled equanimity of temper, be was compationate and liberal in the higheft degree. Although he was a good fpeaker, and poffefled the rare but happy art of exprefling his ideas with the atmoft precifion and perfpicuity, yet no man was a greater lover of filence, for he never fpoke but when he thought it abfolutely neceflary. He did indeed think it neceffary to fpeak when he had a fair opportunity to communicate any ufeful knowledge in his own way; and he encouraged thofe that attended his lectures to afk him queftions, by the exactnefs with which he anfwered, and the care he took to adapt bim. felf to every capacity. He was not more inclined to write than to \{peak, for he has publifthed very little ; be had a natural diffidence, which made him always afraid that his works thould injure his character; and therefore fuppreffed many, which probably were well worthy of the public attention. He was even known, as it wete, in fuite of himfelf; and, in fpite of himfelf, he was krown much, and confequently much efteemed. He was acquainted with many of the firft perlons in this kingdom, perfons eminent as well for their rank as their abilities; he was honoured by all men of learning in general ; and there was not an aftronomer of any eminence in the world, with whom he had not a literary correfpondence. Upon the whole, it may be faid of Dr Bradley, that no man cultivated great talents with more fuccefs, or had a better claim to be ranked among the greatelt aftronomers of his age.

BRADNINCH, : inws of Devonfhire, once a confiderable place, but fome time ago totally dellroyed by fire. WV. Long. 3. 35. N. Lat. 50. 45.

BRADS, anoong artificers, a kind of nails ufed in building, which have no fureading heacis as other nails have. They are diftinguilhed by ironmongers by fis names; as joiner's brads, flooring-brads, battentrads, bill-brads, or quarter-bicads, \&ec. Joiners-brads are for hard wainfcot; baiten-brads are for loft wainfcot; bill-brads are ufed when a floor is laid in hafte, or for flallow joifls fubjecl to warp. Sie Nall.

BRADSHAlV, Henry, a Benedictine monk, was boris at Chefler, about the middle of the 15 th century.

## B $\mathrm{R} \quad \mathrm{A}$

Bradwar- Difcovering an early propenfity to religion and literadin, Brady. ture, he was received while a boy into the monaftery of St Werberg in that city; and having there imbibed
the rudiments of his education, he was afterwards fent to Gloucefter college, in the fuburbs of Osford, where for a time he fudied theology with the novices of his order, and then returned to his convent at Chefter; here, in the latter part of his life, he applied bimifelf chiefly to the fudy of hiftory, and wrote feveral books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his cotemporaries. His works are, 1. De antiquitate et mag. nificentia urlis Ccflria. 2. Chronicon. 3. The life of the glorious virgin of Se Werberg. Printed Lond. $152 \mathrm{I}, 4$ to, in verfe. The life of St Werberg makes only part of this work; for it contains alfo a delcription of the kingdom of Mercia, life of St Etheldred, the life of St Sexburg, the foundation and hiftory of Cheller, and the chronicles of fome kings. Poffibly this work may include the two firf. Bilhop Tanner fays, that he wrote a chronicle in Englifh verfe, extracted from Bede, Malmbury, Geraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN, Thomas, archbillop of Canterbury, was born at Harffield in Suffex, about the clofe of the $13^{\text {th }}$ century. He was educated at Merton, College, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound fcholar, a filful mathenatician, and confummate divine. Authors are not agreed as to his firft preferments. Pitt fays he was profefior of divinity at Oxford. They agree, however, in affcrting, that from being chancellor of the diocefe of London, he became a courtier and corifeffor to Edward I11. whom he conftantly attended during his war with France, affifting that victorious prince with his advice, animating the troops, and fervently praying for their fuceefs. After his return from the war, he was made prebendary of Lincoln, and afterwards archbilhop of Canterbury. He died at Lambeth in the year 1349, forty days after his confecaation: and was buried in St Anfelm's chapel, near the fouth wall. His works are, 1. De caufa Dei, printed at London, 1618 , publifhed by J. H. Savil. 2. De geometria Jpeculativa, \&c. Paris, 1495, 1512 , 1530. 3. De aritbmetica pradica, Paris, $1502,1512$. 4. De proportionitus, Paris, 1.495. Venice, 1505 , tolio. 5. De quadratura circuli, Paris, 1495 , folio.

BRADY, Robert, born in Norfoll: in 1643 , was mafter of Caius college, Cambridge, regius profeffor there, and twice reprefentative of that univerfity in parliament. In 1685 , he was made keeper of the records in the tower, and was phyfician in ordinary to James II. He wrote, An introduction to the Old Englift hiftory; $\Lambda$ hiftory of England, from the time of the Romans to the end of the reign of Richard 11.; and, A treatile on Englifh boroughs. He died in 1700 .

Brady, Nicholas, an excellent divine and poet, hurn at Bandun, in the county of Cork, October 28th 1659. He fludied at Weftminfler.fhool, and afterwards at Oxford and Dublin college. He was a zealous promuter of the Revolution; and, in $16 g 0$, when the troubles broke out in Ireland, by his interell with M.C.rty, King Janes's general, he thrice preverted the turning of the town of Bandon. Having quitted Several preferments in 1reland, he fetticd in Loondon,
where he was fucceffively promoted to feveral livings; and at the time of his death was reEtor of Clapham, miniller of Richmond, and chaplain to the duke of Ormond's troop of horfe-guards. He wrote part of the new verfion of the Pfalms, now fung in many churches in Enyland and Ireland; the AEneids of Virgil, in 4 vals; and 3 vols of fermons. He died May 2oth ${ }^{1} 7^{2} 6$.

BRADYPUS, or Sloth, a genus of quadrupeds, belonging to the order of bruta. See Mammalia Index.

BRAE-mAR, a mountainous territory of Scotland, in the thire of Aberdeen, where the laftearl of Mar, began to raife a rebellion in 1715 . It is 27 miles northwell of Aberdeen.

Bras-Murray, a mountainous and woody tract of land, lying in the thires of Elgin and Nairn in Sco:land.

BRAG, an ingenious and pleafant game at cards, where as many may partake as the cards will fupply; the eldeft hand dealing three to each perfon at one time, and turning up the laft card all round. This done, each gamelter puts down three fakes, one for each cord. - The firft fake is won by the beft catd turned up in the dealing round; beginning from the ace, king, queen, knave, and fo downwards. When cards of the fame value are turned up to two or more of the gameRers, the eldeft hand gains; but it is to be obferved, that the ace of diamonds wins, to whatever hand it be turned up. - The fecond fake is won by what is called the brag, which confifts in one of the gamefters challenging the reft to produce cards equal to his: Now it is to be obferved, that a pair of aces is the bell brag, a pair of kings the next, and fo out and a pair of any fort wins the flake from the moft valuable fingle card. In this part confifts the great diverfion of the game; for by the artful management of the looks, geflures, and voice, it frequently happers, that a pair of fives, treys, or even duces, out-brags a much higher pair, and even fome pairs royal, to the no fmall merriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal. - The third flake is won by the perfon who firf makes up the cards in bis hand one and thirty; each dignified card going for ten, and drawing from the pack, as ufual in this game.

BRAGA, the capital of the province of Entre-minhoduro, in Portugal, fituated on the river Cavado, in W. Long. 8. 40. N. Lat. 4I. 20.

BRAGANZA, a city of Portugal, and capital of a duchy of the fame name. It is feated on an eminence, by a brook called Farvanca; and is divided into wo parts, the old city and the town. The former is upon an eninence, and fortified with a double wall That part next the town has five baftions, but no ditch; the citadel is on the oppfite fide joined to the wall. The town is in a plain, and defended by a fort with four ballions. It is feated near the river Sahor, on the frontiers of Galicia, in W. Long. 6. 15. N. Lat. 41. 27.

BR AGGOT, a kind of dink made of malt, honey, and frices, much uled in Wales.

BRAHE, Tycho, a celebrated aftronomer, defcended of an illullrious family originally of Sweden, but fettled at Denmark, was born December 14. 1546,

Eradypas
if

## B R A

Brahe. at Kinudnorp in the county of Schoner. He was taught Latin when feven gears old, and Audied five years uader private tutors. His father dying, his uncle fent him, in April 1559, to Audy philofophy and rhetoric at Copenhagen. The great eclipfe of the fun on the 2st of Auguft 5560, happening at the precife time the aftronomers had foretold, he begars to louk upon altronomy as fomething divine; and purchafing the tables of Stadius, eained fome notion of the theory of the planets. In 1.562, he was fent by his uncle to Leipfic to fludy law; but aftronomy wholly engrofied his thoughts, and in purchafing books on that fcience he employed all his pocket-money. Having procured a finall celeftial globe, he was wont to wait till his tutor was gone to bed, in order tu examine the conftelIations and learn their names; and when the fky was clear, he fent whole nights in viewing the ttars. In 1565, a difference arfing between Brahe and a Danith nobleman, they fought, and the former had part of his nofe cut off; which defeet he fo artfully lupplied with one made of gold and filver, that it was nut perceivable. It was about this time that he hegan to apply to chemiftry, propofing nothing lefs than to obtain the philufopher's foone. In 1571, he returned to Denmark; and was fivoured by his mother's brother, Steno Belle, a lover of learning, with a convenient plice at his cafle of Herritzvad near Knudilorp, for making his obfervations, and building a laboratory. Hi, marrying a country girl, beneath his rank, occafioned fuch a violent quarrel between himi and his relations, that the king was obliged to interpofe to reconcile them. In 157t, by his majelly's command, he read lesures upon the theory of the comets at Copenhagen. The year following he began his travels through Germany, and proceeded as far as Venice: he then refolved to remove his family, and fettle at Bafil; but Frederic 1I. king of Denmark being informed of his defign, and unwilling to lofe a man that was capable of being fuch an ormament to his country, promifed to enable him to purfue his fludies, to beflow upon him for life the ifland of Huen in the Sound, to erect an obfervatory and laboratory there, and to defray all the expences neceffary for carrying on his defigns. Tycho Brahe readily embraced thit propofal ; and accordingly the firf fone of the obfervatory was laid Augull 8. 1576. The king alfo gave him a penfion of 2000 crowns out of his treafury, a fee in Norway, and a canonry of Rofchild, which brought him in 1000 more. James Vl, of Scotland, after. wards raifed to the crown of England, going to Denmark in order to marry the princefs Amme, paid a vifit to our author in his retirement at Uraniaburg, made him feveral prefents, and with his own hand wrute a copy of verfes in his praife; but, foon after the death of King Frederic, he was deprived of his penfion, fee, and canonry; upon which, finding himfelf incapable of bearing the expences of his obleivatory, he went to Copenhagen, whither he brought fome of his inftruments, and continued his alltonomical obfervations in that city, till Vilkendorf, chamberlain to the houfehold of Chritlian IV. commanded him by the king's order to difcontinue them. He then removed his family to Roftock, atid afterwards to Holltein, in order to folicit Henry Ramzou to introduce him to the emperor; and that gentleman complying with his requeft, Voz. IV. Part I.
he was received by the emperor at Prague with the Bratma, utmoft civility and refpect. That prince gave him a $\underbrace{\text { Braidalbn }}$ magnificent houfe, till he could procure one for him more fit for aftronomical obfervations; afligned him a penfion of 3000 crowns; and promifed upon the firt opportunity, a fee for him and his defcendants: but he dirf not long enjoy this happy fituation; for, upon the $2 t^{\text {th }}$ of Ottober 160 , he died of a retention of urine, in the $55^{\text {th }}$ year of his age, and was interred in a very magnificent manner in the principal church at Prague, where a noble monument was erected to him. -His fkill in aftronomy is univerfally known, and he is famed for being the inventor of a new fyftem, which he endéavoured, though without fuccefs, to efablifh upon the ruins of that of Copernicus. He was very credulous with regard to judicial affrology and prefages. If he met an old woman when he went out of doors, or a hare upon the road in a journey, he ufed to turn back immediately, being perfinaded that it was a bad omen. When he lived at Uraniaburg, he had at his houfe a madman, whom he placed at his feet at table, and fed himfelf. As he imagined that every thing fpoken by mad perfons prefaged fomething, he carefully oblerved all that this man laid; and becaufe it fometimes proved true, he imagined it might ahways be depended onl. A mere trifle put him in a paffion; and ag:inft perfons of the firft rank, with whom it was his duty to keep on good-terms, he openly difcovered his refentment. He was very apt to rally others, but highly provoked if the fame liberty was taken with himfelf. His principal works are, 1. Progymmafmala afronomice. 2. De mundi atherci recentioribus pharomenis. 3. Epifolarum afronomicarum liber.

## brahma. Sie Brama.

BRAIDALBIN, a dillrict of Perthnire in Scotland, fietching 32 miles from eaft to weft, and 13 where broadeff from louth to north. It is a mountainous country, lying among the Grampian hills, fuppofed to be the country anciently known by the name of Albanii; whence the Highlanders to this day call themfelves Albinick. It is bounded on the weft by Lochaber, Lorn, and Knapdale ; on the north and eaft, by part of Luchaber and part of Athol ; and on the fouth by Strathern and Munteith. It produces pleaty of game and black cattle ; is inhabited by Highlanders faid to be the mof ferocious in all Scotland; and gives the title of earl to a branch of the Camptell family, which is poffeffed of a noble and magnifictnt feat in this divifion. Nuch flax is cultivated bere. Some years ago, when premiums were given for the greatelt crops, from 70 to 120 hogheads of linfeed were annually fown, each peck yielding two fluner of dreffed flax; and when the yarn fold highef, 20001 . worth has been folld out of the country. Oats and potatoes are the other crops. Oats yield from four to fis fold at the moft, oftener lefo; bear from eight to ten, at an average fix. The corn raifed feldom fuffices the number of inhabitants, fo they are often obliged to have recourfe to importation. From their potatoes fome have diffilled a very ftrong firit, which has been found cheaper than what is difillied from any grain. Starch is alfo made from them; and, in fome places, bread. Corcur, or the lichen omphalaides, is an article of commerce; great quandities have been fcraped fiom the rocks, and exported for the we of the dyers,

## 13 R A [ $3 ; 0]$ B R A

at the price of 1 . or $16!$. per bione. A gacd many fheep are reared here, and much wool is fent out of the country. There are few hoifes saifeci in this country: fuch as feed on the tops of the higher hills are often aflicted with a diftemper that commonly proves fatal, if a remedy is not applied within 24 hours. It attacks them in the months of July and Augut, ufually after a fall of rain, or before the dery wifes in the morning. An univerfal fwelling fpreads over the body; the remedy is exercife, chafing, or any other method that promotes urine and perfpiration. 'The common people attribute this evil to a certain animal that fcatters its paifon over the grafs; but, more probably it arifes from fome noxions vege:able, hitherio unobferved. Before the year $17+5$, Lord Braidalbin was obliged to keep a conflant guard for the protection of his vallals cattle, or to retain fpies among the thievith cians; having too much firit to fubmit to pay an infamous tax, called blackmeal, to the plundering chieftans, as the price of their fafety.

BRAIL, or Bralls, in a hlip, are fmall ropes made ufe of to furl the fails acrofs: they belong only to the two courfes and the mizen-fail ; they are recved through the blocks, feized on each fide the ties, and come down before the fail, being at the very fkirt thereof faftened to the cringles; their ufe is, when the fail is furled acrofs, to hale up its bunt, that it may the more eafily be taken up or let fall. Hale up the brails, or brail up the fail; that is, Hale up the fail, in order to be furled or bound clafe to the yard.

BRAILOW, a town of Poland, in the province of Pudolia, feated on the river Bag, in E. Long. 29. O. N. Lat. 43. 50.

BRAIN, in Anatomy, is that large, fuft, whitioh mals, enclofed in the cranium or dull; whertin all the oryans of fenfe terminate, and the foul is fuppofed principally to refide. See ANatomy Inder.

Brain le Come, a town of the Aufriin Netherlands, in the province of Hainault. E. Long. 4. 11. N. Lat. 50.35.

BRAINTREE, a large town of Enex in England, fituated in E. Long. O. 30. N. Lat. 51.50.

BRAKE, denotes female ferm, or the place where it grows.-Alfo a flarp bit or fnaftle for horfes; and a baker's kncading-trough.-Alfo an inftrument with teeth to bruife flax or hemp. See Flas-Drefing.

BRAKEL, a tonn of Germany, in the circle of Weftplalia, and in the bimopric of Paderborn, fetted on the rivulet Brught, in E. Long. 9.8. N. Lat. 51. 46.

BRAMA, or Bruma, a pagan deity of the Eaf Indies. He is the firf perfor of a kind of trinity in their theology; is the great progenitor of tnankind; and has created as many worlds as there are confiderable parts in his body. Sce the articles Brachmans, Bramins, and Indostan.

Brama, in Ichlbyology, the trivial name of a fpecics of cyprinus. See Cyprinus.

BRAMANT, a town of Savoy, in the valley of Maurich, feated on the river Arck, in E. Long. 4. 15. N. Lat. 45.0.

PRAMBER, a town of Sufiex in England, formerly of fome account, but has neither market nor fair; however, it fends two members to parliament. IV. Long. 0.15. N. Isat. 50.50.

BRAMIRLE, in Botany, the Englith name of the Itimote Rubus. See Botaisy Indux.

Bramble Net, otiocrwife callel ballier, is a net to caten birds in of fereral fizes: the great mahles mult be four inches fquare; thofe of the leanf fize are three inclies fquare; and thofe of the biggen, five. In the depth thity thould not be above three or four incles; but as for the length, they may be enlarged at pleafure; the fhortef being 18 feet long.

Bramble, or Brambling, in Ornibology, the trivial name of a fpecies of Fringilla.

BRAMER, Leonafd, hiftary-painter, was born at Delft in 1596 ; but learned the att of painting is the fchooi of Rembrandt, and imitated the manaer of lis mifter in imall. In the t © th year of his age he went to Rome for his improvement; but although he continued in Italy for fome years, and acquired fomewhat in his fyle rather more grace[ul than Rembrandt, yet he could never divelt himfelf of the Fiemifh gout. Pilkington's He had a fine talle of defign; his expreflion is gene- Dict. rally good, and in fome of his compofitions truly noble. His pencil is delicate, and his colouring very peculiar in the tints, being alfo remarlably thin in many paris, fo as barely to cover the pannel; yet, by great fkill in the management of the chiaro fcuro, his colouring is bright, hold, and full of luffre ; particularly in the vafes, which he was fond of introducing in every fubject that couid admit them, as he knew hout to give them a rich and fine relievo. He had accuitomed himfelf to paint with a very thin body of colour, efpecially in the browns and fhadowy parts, in order to give his piciures a greater tranfparence. At Venice, Naples, Florence, Mantua, and other cities of Italy, as ivell as at Rome, be left many proofs of his extraordinary merit, which rendered bis name defervedly famous; and his works are rarely to be met with out of Italy, where he paiated moft; but whenever they are to be purchafed they are bought at confiderable prices, if they are entire and undamaged. One of the molt capital pictures of $\mathrm{B}_{1}$ amer is the Raifing of Lazarus, in which there is a charming oppofition of light and hadow; and another is the Denial of St Peter: They are both painted in his beft man. ner ; they are bright, tranfparent, and finely penciled, and are fill preferved at Rome. Likewife at the pan lace of Ryfwick, there are feveral valuable paintings by this matter; in which the invention and execution are tighly commendable. But none of his works can be more admired than a fmall picture on copper reprefenting the fory of Pyramus and Thifbe.

BRAMHALL, Dr Jонn, archbifhop of Armagh, was born of an ancient iamily at Pontefract in Yorknime, about the year 1593. He was invited over to Ireland by the lord depsity Wentworth ; and foon after obtained the arch-deacoury of Meath, the beft in that kingdom. In 1643 , he was made bithop of Londonderry, which fee he improved very much; but the greatelt fervice he did to the church of Ireland, was by getting, with the deputy's affillance, feveral acts paffed for abolifhing fee-farms, recovering impropriations, \&c. by which, and by other means, he regain. ed to the church in the fpace of four years $30,000 \mathrm{l}$. or 40,000 . a-year. In the convocation he prevailed upon the church of Ireland to unite in the fame faith with the church of England, by adopting the 39 arti-

## B R A [ 371$]$ B R A

Branins. " cles of that church; and would willingly have introduced the Englift canons, but could only prevail on their accepting fuch as they deemed proper. Articles of treafon were exhibited againf him in the Irih parliament; and at the treaty of Uxbridge in 1644 , the Englifh parliament made it a preliminary article, that Bilhop Bramhall, with Archbihop Laud, and others, fhould be excepted from the general pardon. He went abroad ; but on the reftoration was appointed archbihop of Armagh, primate and metropolitan of all Ireland, and was chofen fpeaker of the houfe of lords. He died in $\mathbf{6 6 3}$; and was the author of leveral works, which are collected in one vol. folio.
lBRAMINS, the name of the priefts among the idolatrous Indians; the fucceffors of the ancient Brachmans. Sce the title Brachmans.

Their name is formed from Brama, their particular deity. They are found in Siam, Malabar, China, Coromandel, and mof other eaftern mations anywife ci-

* Sce Indo- vilized; but their chief feat is in Indoftan ${ }^{*}$, or the Mogul's country. They have a language peculiar to themfelves, which they call Sbanfobrit; in which they have feveral ancient books, written, as is alleged, by their great prophet Brahna; as the Shafram, whicla is their bibie; and Porane, a hifory which they effeem facred, and pretend to have been diftated by God himfelf.

There are feveral orders of Bramins. Thofe who mis in fociety are for the mon part very corrupt in their morals : they believe that the water of the Ganges will wafl away all their crimes; and, as they are not fubject to any civil jurifdiation, live without either reftraint or virtue, excepting that character of conspafion and charity which is fo commonly found in the mild climate of India. The others, who live abitracted from the world, are either weak-minded men or enthufiafts; and abandon themfelves to lazinef, fuperftition, and the dreams of metaphyfics. We find in their difputes the very fame ideas that ocrur in the writings of our moft celebrated metaphyficians; fuch as, fubflance, accident, ptiority, pofteriozity, immutability, indivifibility, \&s.
'Their religion, which was ancientiy of the allegorical and moral kind, hath degenerated into a heap of extravagant and obfcene fuperititions, owing to their having realized thofe fictions which were intended merely as fo many fymbols and emblems. Were it pofitible to obtain a dight of their facred books, the only remains there are of the Iadias antiquities, we might in fome meafure be enabled to rerrone the veil that envelopes thofe numerous myfteries; but the following Rory will fhew how little reafon there is to hope that we thall ever be intrufted with fuch a communication.
Rival's The emperor Mahmoud Akbar had an inclination Mifl. of tbe to make himfeif acquainted with the principles of all Jnlies.
wiil not admit any perfon whatever to the participa. Bramis. tion of their mylteries. Neither the authority nor promifes of Akbar could prevail with the l'ramins to difclufe the tenets of their religion; lie was therefore obliged to have rccoutfe to artifice. The fratagem he made ufe of, was to caufe a boy, of the namc of Feizi, to be onnmitted to the care of thefe priefts, as a poor orphan of the facerdotal line, who alone could be initiated into the facred rites of their theology. Feizi, having received the proper inftruations for the part he was to act, was conveyed privately to Benares, the fat of knowiedge in Indoltan; he was received into the houfe of a learned Bramin, who educated him with the fame care as if he had been his cwn fon. After the youth had fpent ten years in fludy, Abkar was defirous of recalling him: but he was ftruck with the charms of the daughicr of his prcceptor. The women of the facerdotal tribe are looked upon as the greatelt beauties in Indoftan. The old Bramin laid no reAtraint upon that growing paflion of the two lovens: he was fond of Feizi, who had gained his affection by his addrefs and docility; and offered him his daughter in marriage. The young man, divided between love and gratitude, refolved to conceal the fraud no longer; and falling at the feet of the Bramin, difcovered the impoiture and afked pardon for his offence. The prieft, without reproaching him in the lealt, feized a poignard, which hung at his girdle, and was going to plunge it in his breafl, if Feizi had not prevented hin by taking hold of his arm. The young man ufed eveiy means to pacify lim, and declated bimfelf ready to do any thing to explate his treachery. The Bramin, burting into tears, promifed to pardon him on cond:tinn that he ftould fivear never to tranflate the Bedas or facred volumes, or difclofe to any perfon whatever the fymbol of the Bramin creed. Feizi readily promifed all that the Bramin required: how far he kept his word is not known; but the facsed books of the Indians have never been tranflated by him, or any cne clfe, to this day. As the Bramins are the only perfons who undertand the language of the facred books, their comments on the tex: are the fame as thofe that have ever been made on religious books; all the max. ims which fancy, intereft, paflion, or falfe zeal can fuggeft, are to be foutd in thefe volumes. See the articles Shaftah and Vidais.

They own a fupreme God, who created Brama, an 1 gave him a power to create the world. They have alfo their fubaltern deities, their pagods or temples, and idols, whom they fan to defend from flies, dancing before them. They allo hold a fealt in honour of the fun confidered as the fource of light and heat, whereby all nature is fecundified.

Their pagods or temples confif of three pats. The firlt is a vaulted roof, fupported on Rotie columms: it lies open, and all perfon:, without diftinction, are allowed to enter into it. It is adorried with tymbolical figures made of wood, as elephants, oxen, and horfes. The fecond part is open in the day-time, and thut at night. It is filled with grotefgue and moriltrous figures. as men with many heads and arms. The third, which is a kind of chancel, is hept always haut, with a very flrong gate. In this is placed the tlatue of the deity to whon the pagod is dedicated. A great t.em-

## B R A [ 372 ] B R A

Brampour ber of lamps burn day and night beforc the idol. The
11 Bramits, before they go into the pagod, pull off their
Erain. flocs, and leave them at the door.

The Bramins of Siam and Coromandel maintain that the earth will be deflroyed by fire; and the former affert that another will rife out of its afhes; in which there flall be no fea, nor any change of feafons, but an eternal fpring; and the latter maintain a plurality of worlds, which are alternately deftroyed and renewed.
Rubert de Nobili, an Italian Jefuit, and one of the Iadian mifionaries, in the beginning of the 17 th century, in order to fecure fuccefs to his miffion, affumed the title and appearance of a Bramin, and at length periuaded the credulous people that he was in reality a member of that venerable order. He forged a deed in the ancient Indian characters, frowing that the Bra. mins of Rome were older than thofe of India, and that the Jefuits of Rome defcended in a direct line from the god Brama. He farther declared on oath, that he derived his origin from this Indian deity. By this impofure he profelyted twelve eminent Bramins, whofe influence proved very favourable to his miffion. Afier his death, the Portuguefe Jefuits carried on the impoflure with very confiderable fuccefs. Thefe miffions, however, were fufpended and abandoned in confequence of a papal mandate, iffued out in the year 1744, by Benedict XIV. who declared his difapprobation of the artifices that had been ufed in the converfion of the Indians. See further under the article $\mathrm{Ob}^{\text {. }}$ servatory.

BRAmpOUR, or Brampore, a city of Afia, in the dominion of the Great Mogul, and capital of Candifh. It formerly ftood on as much ground as London; but is now greatly decayed, and chiefly inhabited by Banians. The flreets are numerous but marrow, with low thatched houfes made of earth, though a few are covered with varnifined tiles. In rainy weather many of the fiteets are overflowed. In the mar-het-place is the ftatue of an elephant in red flore, as hig as the life. On the other fide of the river they have built a new town, which is in a better fituation. A great trade is carried on in this town, and throughout all the province, where there is made a prodigious quantity of cotton-cloths, as cotton is in greater plenty here than in any other place of the empire. E. Long. 77. 25 . N. Lat. 21. 10.

BRAMPTON, a town of Cumberland in England, feated not far from the Piets wall, and on the river Itthin. It is a very ancient place, but at prefent is very fmall. W. Long. 2. 40. N. Lat. 54. 50.

IBR $A N$, the fkins or hulks of corn, efpecially wheat, ground, leparated from the tloar by a fieve or boulter. It contains, befides, a portion of the farimaceous matrer; this is lefs glutinous than the finer flour, and is fuppofed to have a detergent quality. Infufions of bran are not unfrequently employed in this intention externally, and fometimes likewife taken inwardly.

Among the ancicmes bran was ufed as an crotic, to excite love. Bran builed purges fcurf, dandref, and cleanfes the hands in lieu of foap. The dyers reckon it among the nut-coloured drugs; and ufe it for making what they call the four zenters, with which they preparc their feveral dyer. Bran is alfo ufed as a medicinc for horfes. Sie Fargiery Index.

BRANCH, in Botany, an arm of a tree, or a part which, fprouting out from the trunk, helps to form the head or cruwn thereuf. Branches do not fpring out of the mere furface of the truak, but are profoundly rooted therein, fo as not only to penetrate into the cortical, but alfo the woody fubftance, and even the pith. The conflituent parts therefore of a tranch are the fame as of the trunk, riz. Rain, bark, wood, and pith. See the article $P_{\text {Lants }}$.
$B_{\text {RANChes }}$ of the Bridle, in the manege, are two pieces of iron bended, which, in the interval between the one and the other, bear the bit-mouth, the crofs-chains, and the curb; fo that on one end they anfwer to the head-ftall, and on the other to the teins, in order to keep the horfe's bead in fubjection. With regard to their form and fructure, branches are either flraight, in form of a piffil, for young horfes to form their mouth; or after the conflable of France's fallion, proper for a horfe that carries his head well. Some are in form of a gigot or leg, which will prevent horfesfrom carrying too low: Some are in form of a bent knee, contrived for horfes that aım themfelves againf the operation of the bit ; and others after the French faflion, which is hardly above $\frac{\mathrm{r}}{3}$ of an inch at the fevile hole, and kneed $1 \frac{3}{4}$ inch at the jarret or ham.

It is to be obferved, 1. That the farther the branch is from the horfe's neck, the more effect it will have. 2. That fhort branches, cateris parilus, are ruder, and their effects more fudden, than thofe of longer. 3. That the brauch is to be proportioned to the length of a horfe's neck; and one may fooner err in choofing one too fhort than too long.

Branches of Ogives, in Architecture, are the arches of Gothic vaults. Thefe arches, traverfing from one angle to another diagonal-wife, form a ciufs betwecn the other arches, which make the fides of the fquare, of which the arches are diagonal.

Branch-Stand, with falconers, a term ufed to fignify the making a lawk leap from tree to trec, till the dog Pprings the game.

BRANCHER, among fportfmen, a young bawk, newly taken out of the nefl, that can hop from bough to bough.

BRANCH1E, or Gills, in the anatomy of fifies, the parts correfpouding to the lungs of land-animals. All filhes, cxcept the cetaceous ones, and the pteromyzum, which have lungs, ate furnithed with thcfe organs of refpiration. See Anatomy Index.

BRANCH1D E, in Grecian antiquity, priefts of the temple of Apollo, which was at Didymus in Lonia, a province of Lefler Afra, towards the Negean fea, upon the frontier of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unfafe to flay in Greece, they fled to Sogdiana, on the other fide of the Cafpian fea, upon the frontiers of Perfia, where they built a city called by their own hame: but they did not ofcape the punifhment of their crime; for Alexander the Great having conquered Darius king of Perfa, and being informed of their treachery, put then all to the fword, and razed their city, thus punifhing the impiety of the fathers in their polterity.

BR ANCHIOSTEGI, in Ichelyology, a ferm ufed to exprefs one of the general claffes of filies; the charoders of which are, that the says of the fins are of a

BRANCHON, a town of the Aufrian Netherlands, in the province of Namur, feated on the river Mehaigne. E. Long. 4.40. N. Lat. 50. 32.

BRAND Sundsy, Dimanche des Brandons, in French ecclefialfical writers, denotes the firlt Sunday in I,ent, which is thus called on account of an ancient pradtice in the Lyonnois, where the pcafante, in the night of this day, walked about their orchards, gardens, \&c. with torches lighted, or fire-brands in their hands; in which plight they vifited every tree, and addreffing themlelves to them one after another, threatened, that if they did not bear fruit well the cufuing feafon, they hould be cut down to the ground and burnt. This is evidently a relick of Paganilm; the like of which was practifed by the ancient idolaters in the month of February; hence called Februarius, à februando.

BRANDEIS, a town of Bohemid, feated on the river Elbe. E. Long. 14. 25. N. Lat. 50. 15 .

BRANDENBURG, Marquifate of, a large country of Germany, having Mecklenburg and Pomerania on the north; Poland, on the eaff; Silefia, with the Lufatias, the electorate of Saxony, Anhalt, and duchy of Magdeburg, on the fouth ; and part of the fame duchy, and that of Lunenburg, on the weff. Its greatef length is near 200 miles, and its greatelt breadth near 100 . Its northern fituation makes it very cold for feven or eight months in winter. The foil in general is far from being fruitful, a great part of it confifing of fand: yet there are feveral fruitful fpots in it ; and the whole, under the laf and prefent reign, has been greatly improved, and much better peopled. In fome parts there is great plenty of potatoes and turnips; in others of buck-wheat, millet, and Hax; in others of tobacco, woad, and other herbs for dyeing. All forts of colour-earth, together with alum, faltpetre, amber, iron, fone, and medicinal fprings, are found in it. Abundance of cattle, efpecially ftieep, are bred here; and the woods not only fupply the inhabitants with fuel, but with timber, charcoal, tar, and wood-athes, both for domeftic ufes and for exportation. The culture of filk alfo is carried on in this country with great fuccefs. The principal rivers by which it is watered are the Elbe, the Oder, the Prignitz, the Havel, the Warte, and the Spree. Some of the rivers and lakes abound in filt, and are united by canals for the benefit of navigation. They reckon in the whole Mirk 120 towns, above 2500 rillages, and about $800, n 00$ inhabitants. The fates here confill of the nobility and towns, whore affembly-houre is in the Spandau-llreet at Berlin, and who liill enjoy fome fimall remains of their ancient privileges. The hereditary office:s of the marquifate are a markal, chamberlain, cup-bearer, purveyor, fewer, treafurer, arid ranger. The king of Pruflia, who is alfo elector of Brandenburg, with his whole court, are Calviuifts; but the seligion of mott of the inliabitants is Lutheranifm. The charches of both perfuafions are well endowed, and the laity jointly employed by the government. The Roman Catholics are allo tolerated bere. In Stort, every inliabitant enjuys full liberty of confcience. A great variety of manufactures, moft of which were
introduced by the Fiench refugees, are carried on in Pisue the marquifie, elpecially at Berlin and l'utdam; where are alfo excellent painters, flatuaries, and engravers. By means of thefe manufactures, fabrics, and arts, not only large fums are liept in the country, but alfo imported from other parts, to which confiderable quantities of the manufactures and natural productions are exported. For the education of youth atid the advanceraent of learning, befides Lestin fchools in Ceveral places, and gymnafia, there is an univerfity at Frankfort on the Oder, and an academy of feiences at Berlin.

The Branderburg family is of great antiquity. Seme hiftorians fay it was founded by the Sclavonians, who gave it the name of Branber, which fignifies the "Guards of the Forells;" and the Germans called it Branburgh. Henry 1. furnamed the Fowler, fortified this place in the year 923 , to ferve as a rampart againd the Huns, a warlike nation, who were extremely troublefome by their frequent incurfions. He beflowed the government on Sifio, count of Ringelheim, with the title of Margrave or Marquis, which fignifies Protector of the Marches or Frontiers, in 923 . It defcended to Gerod, margrave of Lufatia; and in fuccefion of time paffed into the families of Staden, Afcania, Bellenftadt, and that of Bavaria, till the $t$. peror Sigifmund, with the confent of the llates of the empire, in 1416, gave perpetual inseftiture to Frederick VI. of Nuremberg; who alfo the following year received from tlse emperor, at the diet of Conflance, the inveftiture of the county of Braudenturg as Fredcrick 1.; having had previoully conferred upon him the dignity of elector and arch-chamberlain of the Holy Roman empire.

Brandenburg remained long in fubjection to Poland; and the inveltiture of Pruflia was granted by the Polifh kings to each fucceeding margrave. FrederickWilliam, having concluded a treaty with the king of Poland was acknowledged to be forereign of Ducal Pruffia by an afiembly of the ftates at Konigfuerg A. D, 1663 . By the treaty of Vienna the emperor confirmed this title; and Frederick, the fon of Frede-rick-William, was proclaimed ling of Pruffa, January 18. 1701. He was fucceeded by his fon, who performed the greatelt fervices to his country, and prepared the materials of the future grandcur of the late fovereign, Frederick III. who began his reign on the 31 it of May 1740 , at the age of 28 . See Prussia.

Among the electors he poffefles the ferenth place. As arch-chamberlain, he carries the fceptre before the emperor at his coronation, and brings him water in a filver bafon to waih with. In the college of princes of the cmpire he has five voices. His afleffent, as elector, is 60 horfe and $=77$ foot, or 1828 florins in lieu of them. To the chamber of Wetzlar, his quota is 811 rix-dollars 58 kruizers, each term. As to the orders of the knights of the Plack Eagle, and of Merit, is is futincient here to oblerve, that the former was indituted by Frederick I. at his coromation, and the other by the prefent king. For the grovernment of this country and the adminiftration of jultice, there are feveral fupreme colleges and tribunals; particularly for the departments of war, foreign affairs, and the fnances, there are didinct boards. Here is a lupreme cecleffatical council and confittory for the Lutherins; a fupreme. disectory
dire itury of the Calvinit chark; a fupreme madicinal cullerzc a fobreme mine-o!ize; a cullege or board of trade, \&c. 'Thofe of the 「ecnchantion, fettled in this coulatry, are alowed particular courts of their onna. The amourt of the yearly revenues of the Mork, arifiam from the domains, protcetion money paid by the Jews, tulls, land-tax, mines, forcits, duties on lamppaper, falt, and variety of other intpolts and excifes, is compuicd at about $2,502,000$ crowns; but the money is fail to be mach inferior in goodnefs to that of Saxony and the dominions of fanover. During the late continental war it was extremely debaled. Some eflimate the whole number of the inhabitants of the royal and electural dominions at $5,000,000$, and the revenues at alout 2,000,000 ferling. Upwards of 100,000 men are kept on foot in time of peace, which are faid to coll mere than half of the royal revenue. Thefe troops are under ftrict difcipline, vory expert at their exercife, alwavs in readinels to march, and always complete. Each regiment has a particular canton or diftrict allotted it for its quarters and raifing recsuits. The infantry are clothed in blue, and the horfe and dragoons in white; and both are required to hear fermon twice 2-day when in quarters or garrifons. In time of peace they are allowed, for feveral months in the year, to hire themfelves out, or to follow their bufinefs either as burghers or peafants, in the canton where they are quartered; but they are not allowed to marry. A confiderable part of thefe troops are ftationed in the Mark, particularly at Berlin and Potdom. The corps of liuffars alone amounts to about 10,000 men. The Mark of Brandenburg is dividef, in general, into the clectoral and new Marks. The former is again fabdivided into the old Mark, the Pregnitz, the middle Mark, and the Ucker Mark. The old Mark, which lies on the welt fide of Elbe, between that river and Lumenburg, is about 50 miles in length, and $3 \supset$ in breadth.

Brandenburg, a city of Germany, and capital of the marquifate of that name, fituated on the river Harel, in E. Long. ${ }^{1} 3$. O. N. Lat. 52 25. It is divided into the old and new town, and was anciently the fae of a bifhop. The mountain in the neighbnurhood, called MIarienterg, is planted with vines. Here is a fmall colony of lrench Calvinits, with a manufacture of cloth, fullian, and canvai; and a pretty good trade is carried on by the Havel. The fort here looks like a fuburb, and contains a riding fehool, with the cathedral church. 'lhe greatef part allo of the members of the chapter which thill fubfifts, and is compoled of a I.utheran provolt, dean, fenior, fubfenior, and three other canone, refide in it. They are diftinguifled by a crofs of gold enamelled with viniet, terminating in eight points; and have a curfiderable eflate. Near the town is a large like.

ISRANDEUM, in ecclefimieal writers, a linen cluth or veil put over the dombs of the apollles St i'eter ari-1 St l'aul, and left there for fome tince; by which it is fuppofid to acquire a degree of Canciity, fo as to be worslipped as a relic; and for that purp li: frezaenily fent by the pope as a prefent to fome prince. lothis fenfe, Btin! !eurn amounts to the fame with wh. wis orherwile calied fanchuarium. fudariun, crainm, and celum. 'The ufe of brondea was introduced as a mesmes of difufing and propamein? the virlu"s and in-

Huences of relics, without moving, or ary way impair. Eranding ing, the fublance of them; the tranflation of relics in early days lien ing forbidden.

LRANDING, in the face or hand, denotes a puniftument inflicted by law on various offences, by burning with a hot iron, after the offender bath been once admitted to benefit of clergy.

BRANDON, a towr of Suffolk in England, feated on the little river Oule, over whirh it has a bridge, and a ferry at a mile's diffance : whence it is divided into Brandon, and Brandon ferry; which laft has the moft bufinefs, becaufe commodities are brought thither from the ifle of Ely. This place gives the Britilh title of duke to the family of Hamilton in Scotland. E. Long. o. 55. N. Lat. 52.30.

BRANDRI'H, denotes a trevet or other ison fland, whereon to fet a veffel over the fire.

Brandrith, among builders, denotes a fence or rail about the mouth of a well.

BRANDT, Gerard, a learned divine of the reformed religion, was born at Amfterdam in 1626, and was fucceffively minifter in feveral places of the Netherlands. He wrote fome works which are efteemed, particularly the Hittory of the reformation of the Netherlands, 4 vols 4 to; and The Life of Admiral Ruyter; both written in the Fleminh tongue. He died at Rotterdam in 1685.

BRANDY, a fpirituous and inflammable liquor, extracted from wine and other liquors by diftillation. See Distillation.

Wine-brandy, made in France, is efteemed the beft in Europe. They make it wherever they make wine, and for that purpofe ufe wine that is pricked rather than good wine. The chief brandies for foreign trade, and thofe accounted beft, are the brandies of Bourdeaux, Rochelle, Cogniac, Charenton, the ifle of Rhe, Orleans, the county of Blafois, Poictou, Touraine, Asijou, Nantz, Burgundy, and Champaign.

BRANK, an inftrument ufed in fome parts of Scotland, and in Staffordfhire, for correcting fcolding women. It is a fort of head-piece, which opens and enclofes the head of the impatient, while an ison, hasp as a chiffel, enters the mouth, and lubdues the more dreadful weapon within. Thus harweffed, the offender is led in triumph throngh the freets. Dr Plott, in his Hillory of Staflordhire, has favoured the world with a minute defcription atid figure of the inflrument*, which * Page $3_{3} E$. is there called a folding lridle; and tells us, he looks Mab. $3_{2}$. upon it " as much to be prcferred to the ducking-flool, which not only endangers the health of the party, but alfo gives the tongue liberty betwixt every dip; to neither of which this is at all liable."

I3R.INLIN, in Ichtiyn $\log v$, a fecies of falmon, with feveral tranfverfe black Itreaks, refembling the impreffron of fo many fingers.

YRANNODUNUM (Notitix), with a garrifon of the Elputes Jalmatix, a town of Rritain, on the Sinus Metaris : now Branceller, in Norfolk, on the 1Vather.

1BRANOGENIUM, or Branowium, a town of lie Coritani, a people in the heart of latitan: from lise difarecs of the I:incrary, Camden fuppofes it to be Worcefter.

BK ANSLiA, a town of l'ranfilvania, fituated on the jiver Marilh. E. Long. 23.15. N. Lat. 46.0.

BRASIDA,

## B R A

yrefita PRASIDA, an anniverfary fukmuity at Srarta, in m:mory of Brafidas, a Iacedemonian captain, famons fur his achicvonents at Mcthone, Pylos, and Ampinipolis. It was celcbrated with factifices and games, wherein none were permitted to atiend Lut free-born :partans. Whocver neglected to be profent at the folemnity was funcd.

BRASIDAS , a colebrated seneral of the Lacedcmonians, albout 424 years before the buth of Chrilt. He defeated the A:henians by land and fea, took many p!ices, and rendered his country formidable to all the neithhbouting tates. He conquered the dthenians on tieeir sttemping to furprife Amplipolis, but died of the wounds he received in that batle. See attica and Iacedemon.

BRASIL, a large country of South America, being the eallemmoll part of that continent, lying beiween the equinoctial line and the tropic of capricorn. It is about 1560 miles in the length, and 1000 in breadth; but meafuring along the coalt, it is 2000 miles loing, and is bordered with mountains that open from time io time, and form good harboure where veflels may lie in fafety. It was accidentally difcovered by the Portugucfein 1 500. Einmanuel king of Portugalhad equipped a \{quadron of 13 \{dil, carrying 1200 foldiers and failors deftined for the Ealt Indies, under the concluet of Peter Alvarez Cabral. This admiral, quitting Lifbon on the 19 th of March 1500 . Atruck out to fea to avoid the coalt of Guinea, and llecred bis courfe fouthward, that he might the more eafly turn the Cape of Good Hope, which projects a good way into the ocean. On the 24th of April, he got fight of the contincnt of South America, which he judged to be a large ifland at fome ditance from the coatt of Afric?. Coafting along for fome time, he ventured to fend a boat on hore; and was aftonifhed to obferve the inlıabitants entirely difierent from the Africans in features, hair and complexion. It was found, hovever, im. praticable to feize upon any of the Indians, who retired with great celerity to the mountains on the approach of the Portuguefe; yet, as the failors had difcovered a good harbour, the admiral thought proper to come to an anchor, and called the bay Puerto Seguro. Next day he fent another boat on flore, and had the good fortune to lay hold on two of the natives, whom be clothed and treated lindly, and then difmiffed, to make a proper report to their countrymen. The fratagem had the defired effect. The Indians, having heard the relation of the prifoners, immediately crowded to the fhore, finging, dancing, and founding horns of different kinds; which induced Cabral tu hand. and ake folemn poffelion in the name of his Portuguele majelty.

As foon as the court of Lifbon had ordered a furvey to be taken of the harbours, bays, rivers, and coafts of Brafil, and was convinced that the country afforded neither gold nor filver, they held it in fuch contempt, that they fent thither none but condemned criminals and abandoned women. Two thips were fent every year from Portugal, to carry the refufe of the kingdom to this new world, and to bring home parrots and woods for the dyers and cabinet-makers, Ginger was afterwards added; but foon after prohibited, lelt it fhould interfere with the fale of the fame article from India.

In I548, the Jews, many of whom had taken re-
 i:nquaitiun, bece ftrippe \& of latis fultur nes, and ! an
 tirely torfaker. Mi.nn of the:a found hind telations and fainful frimes; uthers, sho were known to be men ot protity and underlarding, wbtaned meney in advance form merthates of difererit natic: whith whem they had formerly had twatactions. By the affatance of fome cnterprifing men, they were chabled to cultivirtc fugar canes, which they fiff procured from the ill mud of Madeira. Sugar. which till ticn had been ufed only in mediciac, lecame in arcicle of lixists. Princes and gleat man were ali eager to procure themfelves this new fpecics of indulgence. 'I'i.is circumflance proved farourable to Brafil, and crabled it to extend its fupar plantationc. The rourt of Lifon, rotwit:Anading its prejudices, beynn to be linfibie, that a colony misht be beneficial to the mother country, without producing gold or filver; and this fettement, which biad been wholiy left to the capricious manage mant of the colonilts, was now thought to deferve lume lind of attention ; and accordingly Thomas de Souza was fent thither, in $15+2$, to regulate and fuperintend it.

This able governor began by reducing thefe men, who had always lived in a tate of anchey, into proper fubordarion, and binging their fcattered platatations clofer together: after which he applied himfelf to açuire fome information sefpecting the natives, with whom he kaew he mutt be fufficiently engaged either in thafic or war. This it was no eafy matter to accomplifli. Brafil was full of fmall nations, fome of which inbabited the forefts, and others lived in the !lains and along the rivers. Some had fettled habitations; but the greater number of them led a roving life, and mofl of them had no intercourfe with each other. It is not to be fuppofed that fuch a peop?e would be at all difpofed to lubmit to the yoke which the Portugucfe wanted to put upon thern on their arival. At firt they only declined all intercourle with thefe frangers : but finding themfelses purfued in order to be made flares, and to be cmployed in the labours of the field, they took the refolution to murcier and devour all the Europeans they cou!d feize upon. The friends and relations of the favages that were taken prifoners alfo ventured to make frequent attempts to refue them, and were fometimes fuccefsful: fo that the Purtuguefe were forced to attend to the double emplovments of labour and war.

Sonza did nut bing a fuflicient number of forecs to change the fituation of affairs. Indeed, by building San Salvador, he gave a centre to the colony; but the honour of fettling, extending, and making it really ufcful to the mother country, was referved for the Jefuits who attended him. Thefe men, whofor their arts of infinuation and addrefs have been equalled by none, difperfed themfelves among the Indians. When any of the miffionaries were murdered, they were immediately replaced by others; and feeming to be infpired only with fentiments of peace and charity, the Indians, in procefs of time, grew not only familiar to but palfionately fond of them. As the miflionaries were too few in number to tranfact all the bufnefs themiclves, they frequently deputed fome of the moll intelligent Indians in their Itcad. Thefe men having diftributed hatchets, knives, and looking-glafies, among the favages they
niet with, reprofented the Purtuguefe as a harmlefs, humane, and good fort of people.

The profperity of the colony of Brafil, which was vifible to all Europe, excited the ensy of the French, Spaniards, and Dutcly fucceflively. The latter, irideed, bid fairen for the conquelt of the whole., Theirat. mi:al Heniy Lookk arrived, in the beginning of the year 1630 , with 46 men of war, on the cuall of Fernambucca, one of the largelt and belt fortified captainmi:ps of thefe parts. He reduced it after feveral obilinate engagemente, in which be was always victorious. The iroops he left behind fabtued the captainhthips of Tamarcca, Pareibs, an. 1 Rio Grande, in the years 1633,1634 and 1635 . Thele, as well as Fernambucca, furnibed annually a large guantity of fugar, a great deal of woud for dyeing, and other commodities. The Ifcllanders were fo elated with the acquifition of this wealth, which tlowed to Amlierdam inftead of Lifbon, that they determined to conquer all the Brafils, and intrufted Manrice of Nallau with the conduct of this enterprize. That general reached the place of his deftination in the beginning of the year 1637 . He found the foldiers fo well difciplined, the commanders fuch experienced men, and fo much readinefs in all to engage, that he directly took the field. He was fucceffively oppofed by Albuquerque, Banjola, Lewis Rocca de Burgia and the Brafilian Camero:, the idol of his people. paffionately fond of the Portugucfe, brave, active, cumning, and who wanted no qualification necef. fary for a general, but to have learned the art of war under able commanders. Thefe feveral chiefs exerted their utmof efforts to defend the poff: fions that were under their protection; but their endeavours proved iseffectual. The Dutch feized upon the captainh hips of Siara, Seregippe, and the greater part of that of $\mathcal{E}$ hima. Seven of the 15 provinces which compofed the colony had already fubmitted to them, and they flattered themielves that one or two campaigns would make them mafters of the reft of their enemies poffeffions in that part of America; when they were fuddenly checked by the revolution happening on the banifhment of Philip $1 \mathbf{V}$. and placing the duke of Braganz on the throus. After this, the Portugucfe recovering their fpirits, foon drove the Dutch out of Brafil, and have continued mafters of it ever fince.

The country of Brafil is divided into the following provinces, viz. Paria, Maragmano, Sira, Rio Granle, Pareiba, 「amaraca, Fetnambucca, Seregippe, Bahia, Porto Seguro, Efperito Santo, Rio de Janeiro, Angra, St Vincent, and Del Rey. See thefe articlec.

The firft alpeet of the country from the fea is rather unfavourable, as it appears high, rough, and uncqual ; but, on a more rarrow infpection, nothing can be more delightful, the eminences being covered with woois, and the valleys and fivannahs with the moft refreftuing verdure. In fo vaft a tract of land, it cannot be imagined that the climate will be found at all equal, or the feafons uniform. The worthern provinces are fubject to heavy rains and variable winds, like other countries under the fame parallels. Comadnes, forms, and the utmoft fury of the elements, wreak their vengeance here; while the foutherly repions are bleffed with all the comforts which a fine fertile foil and temperate climate can afford. In fome of the provinces, the heat of the climate is thought to prove favourable to the gene-
ration of a great variety of poifonous reptiles : fome of which, as the liboy or roebuck fnake, are faid to extend to the length of 30 feet, and to be two or three yards in circumference. The rattefrake and other eptiles of the fame kind, grow likewife to an enormous fize; and the ferpent called ibihahota is affirmed to be 7 yards long, and half a yard in circumference, poffeffed too of a poifon inflantaneoufly fatal to the human race. Here alfo are forpions, ant-bears, tygers or raadilloes, porcupines, janonveras, and an animal called tapiraflon, which is the production of a bull and an afs, havinn: great refemblance to both. No country on earth alfords a greater number of beautitul birds, nor variety of the molt exquifite fruits; but the chief con.modities are Brafil wood, ebory, dyeing woods, ambergris, rofin, balfans, indigo, fweetmeats, fugar, tobaccosgold, diamonds, beautiful pebbles, cryfal, emeralds, j afper, and other precious tones; in all which the Portuguefe carry on fuch an amazing trade, as may jultly be reputed the lupport, and indeed the vital fountain, of the mother country. The gold and diamond mines are but a recent difcovery: they were firl opened in the year 1681; and have fince yielded above five millions ilerling annually, of which fum a fifth belongs to the crown. So plentiful are diamonds in this country, that the court of Portugal hath found it neceflary to relliain their importation, to prevent too great a diminution of their value. They are nether fo hard nor fo clear as thole of the Etfl Indies, nor do they fparkle fo much, but they are whiter. The Brafilian diamonds are fold ten per cent. cheaper than the Oriental ones, fuppofing the weights to be equal. The largeft diamond in the world was fent from Brafil to the king of Portugal. It weigh 168 ว carats, or $12 \frac{1}{2}$ ounces; and has been valued at $56,787,500$. Some ikilful lapidaries, however, are of opinion that this fuppoled diamond is only a topaz ; in which cafe a very great abatement muft be made in its value. The chown revenue arifing from this colony amounts to two millions feeling ingold, if we may credit fome late writers, befides the duties and cuftoms on merchandife imported from that quarter. This indeed is more than a firth of the precious metal produced by the mines; but, every other confequent advantage confidered, it probably does not much exceed the tuath. The excelive confluence of people to the Brafil colonies, as well from other countries as from Portugal, not only enlarges the imports of gold, hut, what is of infinitely more importance to Europt ingeneral, the exportation of the manofactures of this hemi$\mathrm{f}_{\mathrm{p}}$ here; of which the principal ase the following. Great Britain lends woollen manulachures; fuch as fibe broad medley cloths, fine Spanifl cloths, farlet and black cloths; ferges, duroys, druggets, fagathies, thalloons, camblets, and Norwich ftufls; black ColcheHer baife; fays, and perpetuanas, called long ells; bats, flockin,s,s, and gloves. Holland, Germany, and France, chiefly export fine hollands, hone-lace, and fine thread: filk manufactures, pepper, lead, bluck tin, and other articles, are alfo fent from different countries. Befides the particulars already fpecified, England likewife trades with Portugal, for the ufe of the Brafils, in copper and hrafs, wrought and unwrought pewter, and all kinds of hardware : all which articles have fo enlarged the Portuguefe trade, that, inflead of 12 frios ufually employed in the B:afil commerce, there are now never
fewer

Brafil-wood fewer than 100 fail of large veifels confantly going and
11 returning to thofe colonies. To all this may be added the wafl lave-trade carried on with the coalt of Africa for the ufe of the Brafil colonies; which, we may believe, employs a great number of flupping, from the multitude of llaves that are annually tranfported. Indeed the commerce of Brafil alone is fulficient to raife Portugal to a confiderable height of nayal power, as it maintains a contant nurfery of feamen : yet a certain infatuation in the policy of the country has prevented that effect, even amilit all thefe extraordinary advantages. All the fhips in this trade, being under the direetion of the government, have their appointed feafons of going and returning, under convoy of a certain number of men of war; nor can a firgle flip clear out or go, escept with the fleet, but by a fpecial licence from the king, which is feldom granted; though it is eafily determined, that fuch reftrictions can prove no way beneficial to the general commerce, though poffibly the crown revenue may be better guarded thereby. The fleets fail in the following order, and at the following Atated periods: That to Rio de Janeiro fets fail in January ; the fleet to Bahia, or the bay of All Saints, in February; and the third fleet, to Fernambucca, in the month of March.

Brasil Woods or Brazil wood, an American wood of a red colour, and very heavy. It is denominated varioully, according to the places from whence it is brought: Thus we have brafil of Fernambucca, Japan, Lamon, \&c. For its defcription, \&c. fee Cefalpinia, Rotany Index.

BRASILETTO, the fame with Brafil wood.
BRASLAW, a confiderable town of Poland, in Lithuania, and palatinate of Wilna, with a caflle. It is feated on a fmall lake, in E. Long. 17.5. N. Lat. 55. 45.

BRASS, or, as the French call it, yellow copper, is a factitious metal, compofed of copper and zinc. See Chemistry Index.

The firlt formation of brafs, as we are affured by fcripture, was prior to the food, and difeovered even in the feventh generation from Adam *. But the ufe of it was not, as is generally believed, and the Arundelian marbles affert, previous to the knowledge of iron. They were both firf known in the fame generation, and firft wrought by the fame difcoverer. And the knowledge of them mull have been equally carried over the world afterwards, with the fpreading of the colonies of the Noachidx. An acquaintance with the one or the other was abfolutely recellary to the exiftence of the colonifts; the clearing away of the woods about their fettlements, and the erection of houfes for their habitation.

The ancient Britons, though acquainted from the remotef periods with the ufe of both thefe metals, remained long ignorant that they were to be obtained in the inland. Before this difcovery they imported all their iron and brafs from the continent. And when they had at length detected the former in their own hills, and had ceafed to introduce it, they continued to receive the latter. Their want of the metal remained, and no mines of it were opened in the illand. In the earlieft ages whofe manners have been delineated by hiftory, we find the weapons of their wartiors invariably framed of this faclitious metal; and the moft auEhentic of all the profane records of antiquity, the A-

Vol. IV. Part 1.
rundelian marbles, for that reafon, miltakenly date the firlt difcovery of iron a couple of centuries below the Trojan war. Every military nation, as fuch, is naturally thudious of briglatnefs in its arms; and the Britons, particularly, gloried in the neatnefs of theirs. For this reafon the nations of the world fill fabricated their arms of brafs, even long after the Arundelian cra for the difcovery of iron; and the Britons continued to import it from the continent, though they had found iron to be a native of the country, and could have fupplied themfelves with a futficient quantity of it.

Mr Whitaker $\dagger$ fuppofes, that when the Britons de- $\dagger$ Hiff. of rived their iron and brafs from the continent, they pur- Mancbepe. chafed the latter at an eafier expence than the former. The Gauls had many large brafs works carried on in the kingdom, but feem to hare had but few iron forges within it. And this would naturally induce the Belgis to be lefs diligent in their inquiry after the veins of copver and calamine at home, than for the courfes of iron ore ; thougla the one was equally difcoverable in the inland as the other, and lay equally withim the Belgic regions of it. Brafs being thas cheaper than iron, they neceflarily formed with it fome domeflic as well as military implements. Such were common among the Gauls; and fuch were familiar to the Britons, either imported into the ifland, as fome actually were, or manufactured within it, as others alfo affuredly were. The Britons had certainly brafs founderies erected among them, and minted money, and fabricated weapons of brafe.

In this condition of the works, the Romans ertered the ifland. And feeing fo great a demand among the natives for this article, they would fpeedily inftruct them to difcover the materials of it among themfelves. This muft unavoidably have refulted from the conqueft of the Romans. The power of furprifing their new fubjects with fo unexpected a difcovery would naturally fimulate the pride of the Roman intelleet; and the defire of obliging themfelves with fo cheap a fupply of that ufeful metal, Atationary as they were in that kingdom, would allo equally actuate the felfinnefs of the Roman brafs. The veins of copper and calamine would be eafily found out by an experienced inquirer after them; and the former metal is therefore diftinguifhed among the Welf, only by the Rcman appellation of cyprimm, koppr or copper. And many foun. deries of brafs appear to have been eftablithed in the illand. Some bad been erected before, one perhaps within the confines of every kingdom, and probably in the vicinity of every capital. One at leaft would be neceffary, in order to fupply the armoury of the principality: and one perhaps was fufficient for moat of the Britifh ftates. But feveral appear now to have been fettled in every kingdom, and one perhaps near every ftationary town. Two have been difcovered in the fingle county of Effex, and within a narrow portion of it, at Fifield and Danbury. And a third was placed upon Eafterly Moor in Yorkfhire, 12 miles to the north-weft of York, and in the neighbourhood of Ifurium or Aldborough.

Corinthian $B_{R A S S}$, famous in antiquity, is a mixture of gold, filver, and copper. L. Mummius having fack ed and burnt the city of Corinth, 146 years before Chrif, it is faid this metal was formed from the im menfe quantities of gold, filver, and copper, wherewitl?

Bi...f: that city abocinded, thus melted and run iogether by the violence of the conthayration.

Erass, in the glafotrade- Thrice calcined brafs is a preparation which ferves the glafimen to give many very beautiful colours to their metal. The manner of preparing it is this: Place thin plates of brafs on tiles ca the leet of the furmace near the occhis; let it fand to be calcined there for four days, and it will become a black powder Aticking together in lumps. Pouder this, dift it func, and recalcine i: four or five days more; it will not then Rick together, but remain a loofe powder, of a rufet colour. This is to be calcined a third time in the fame manner; but great care mufl be taken in the third calcitation, thit it be net overdone nor underdone : the way tu be certain when it is right is, to try it feveral times in glafs while melting. If it makes it, when well purified, to fwell, boil, and rife, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is uled, a fea-green, an emerald-green, or a turcoife colour.

Brafs, by long calcination alone, and without any nisture, affords a fine blue or green coluur for glafs; but they have a method of calcining it alfo with powlered brimflone, fo as to make it afford a red, a yolJow, or a chalcedony colour, according to the quantity and other variations in the ufing it. The method of making the calciuation is this : Cut thin plates of brefs inso fmall pieces with fhears, and lay them liratum fuper Aratum, with alternate beds of powdered fulphur, in a crurible; calcine this for 24 hours in a Arong fire: then posider and fift the whole; and finally expofe this powder upontiles for 12 days to a reverberating furnace ; at the end of this time powder it fine, and keep it for ure. The glaft-mikers have allo a method of procuring a red powder from brafs, by a more fimple calcination, which ferves them for many colours. The mothed of preparing it is thin: They put fmall and thin plates of brafs into the arches of the glafs furnaces, and leave thean there till they are fufficiently calcined, which the heat in that pince, not being enough to melt them, does in great perfection. The calcised matter, powdered, is of a dulky red, and requires no farther preparation.

Brass-Colour, one prepared by the braziers and co-lour-men to imitase brafs. There are iwo forts of it ; the red brafs or bronze, and the yellow or gilt brafs; the laiter is made only of copper-filings, the fmalleft ard brighteft that can be found ; with the former they mix fome red ochre, finely pulverized; they are both ufed with rarnifh.-In order to make a fine brafs that will not take any rufl or verdigris, it muft be dried with a chafing dift of coals as foon as it is applied.The finefl brafs-colour is made with powder.trafs imparted from Germany, diluted into a varnilh, made and ufed after the following manner: The varnifh is compoíed of one pound four ounces of firit of wine, two ounces of gurn-lac, and two ounces of fandarac ; thele two laft drugs are pulverized feparately, and afterwards put to diffolve in fuirit of wine, taking care to fill the bottle but half full. The varnifl being made, you mix fuch quantity as you pleafe of it with the pulverized lirafs, and apply it with a fmall brufh to what 3 ou would brafs over. But you muft not mix too much at vice, becaufe the varnifh being very apt to dry, you
would not have time 10 cmploy it all feon enouch; it is therefore better to malue the mixture at feveral times. After this manner they brafs over figures of plafter,

## Erafion

 11 Trafica. which look as well as if they were of can brats.Brass I.eof in made of copper, beaten out into very thin plates, and afierwards sendered yellow. The Gernan artiths, particularly thofe of Nuremberg and Aughurg, are faid to poffefs the beft method of giving to thefe thin plates of copper a fue yellow colour like gold, by fimply expofing them to the fumes of zinc, without any real mixture of it with the metal. Thefe plates are cut into little pieces, and then beaten out fine like leaves of gold; after which they are put into books of coarfe paper, and fold at a low pice for the vulgar kinds of gilding. The parings or flureds of thefe very thin yellow leaves being well ground on a marble plate, are reduced to a powder fimilar to gold; which ferves to cover, by means of gum-water, or fome other glutinous fluid, the furface of various mouldings or pieces of curious work manfhip, giving them the appearance of real bronze, and even of fine gold, at a very trifing expence, becaufe the gold colour of this metallic powder may be eafily raifed and inproved by flirring it on a wide earthen bafon over a flow fire.

Brass-Lumps, a common name given by miners to the globular pyrites. Sce Pyrites, Nineralogy Index.

BRASSAW, or Cronstadt, a flong town of Tranfilvania in Burczland; feated on the iiver Buxel, in E. Long. 22.35. N. Lat. 46. 30.

BRASSE, a jpecies of perca. Sie Ichthyo. logy Indes:

BR ASSICA, cabbage, in Botany; for the claffification of which fee Botany Index. But as many of the 〔pecies of this genus are of confiderable importance as articles of food, we fhall here lay before our readers a more particular account of their ules and mode of culture, under the names known to practical gardeners.

The fpecies called campefris grows raturally on the fea-fhore near Dover, has a perennial branching falk, and in this it differs from all the other fpccies. In very fevere winters, when the other forts are deftroyed, this is a neceffary plant, for the mof fevere frofts do not injure it. The flower-ftalks grow from the end of the branches, and fpread out horizontally; but thole which arife from the centre of the plants grow crect, and feldom put out branches. The caulifiower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland has been often fupplied with them from Britain. In many pats of Gemmany there were none of them cultivated till within a few years palt, and moft parts of Europe are fupplied with feeds from Britain. That which is generally known by the title of rape or colc-feed is mouch cultivated in the ille of Fly, and fome colier parts of England, for its feed, from which rape-oil is drawn; and it hath alfo been cultivated of late years, in other places, for feeding of cattle, to great advantage. The cole-feed, when cultivated for feeding of cattle, flould be foun about the middle of June. The ground for this flould be prepared for it in the fame manner as for turnips. The quantity of feeds for in acre of land is from fix to eight pounds; and as the price of the feed is not great, fo it is better to allow

## B R A

Brafica. eight pounds; for if the plants are too clofe in any part they may be eafily thinned when the ground is hoed, which mult be performed in the fame manner as is practifed for tarnips, with this difference only, of leaving thefe mueh nearer together; for as they have fibrous roots and flender ftalks, fo they do not require nea: lo much room. Thefe plants thould have a fecond hoeing about five or fix weeks after the firft, which, if well performed in dry weather, will entirely deftroy the weeds, fo they will require no $f_{\text {drther culture. Where }}$ there is not an immediate want of food, thefe plants had better be kept as a referve for hard weather, or fpring feed, when there may be a licarcity of othergreen food. If the heads are cut off, and the falks left in the ground, they will fhoot again early in the fpring, and produce a good fecond crop in April; which may be either fed off, or permitted to run to feeds, as is the praftice where this is cultivated for the feeds: but if the finlt is fed down, there thould be care taken that the cattle do not defroy their Atems, or pull them out of the ground. As this plant is fo hardy as not to be deftroyed by froft, fo it is of great fervice in hard winters for feeding of ewes; for when the ground is fo hard frozen as that turnips cannot be taken up, thefe plants may be cut off for a conftant fupply. This will affurd late food after the turnips are run to feed; and if it is afterwards permitted to ftand for feed, one acre will produce as much as, at a moderate computation, will fell for five pounds, clear of charges. Partridges, pheafants, turkeys, and molt other fowl, are very fond of this plant; fo that wherever it is cultivated, if there are any birds in the neighbourhood, they will conftantly lie among thefe plants. The feeds of this plant are fown in gardens for winter and fpring falads, this being one of the fmall Calad herbs.

The common white, red, flat, and long-fided cabbages, are chiefly cultivated for autumn and winter ufe. The feeds of thefe forts muft be fo:vn the beginning or middle of April, in beds of good fref earth; and when the young plants have about eight leaves, they fhould be pricked out into thady borders, about three or four inches fquare, that they may acquire frength, and to prevent their growing long hanked. About the middle of June you mult tranflant them out, where they are to remain. If they are planted for a full crop in a clear fpot of ground, the diftarice from row to row fhould be three feet and a half, and in the rows two fect and a half afunder: if the feafon thould prove dry when they are tranfplanted out, you mult water them every other evening until they have taken frefh root; and afterwards, as the plants advance in height, you fhould draw the earth about the ftems with a hoe, which will keep the earth moilt about their roots, and greatly ftrengthen the plants. Thefe cabbages will fome of them be fit for ule foon after Michaelmas, and will continue until the end of February, if they are not deliroyed by bad weather ; to prevent which, the gardeners near London pull up their cabbages in November, and trench their ground up in ridges, laying their cabbages againft their ridges as clofe as poffible on one fide, burying their ftems in the ground: in this manner they let them remain till after Chrifmas, when they cut them for the market ; and although the outer part of the cabbage be decayed (as is often the care in very wet or bard
winters), yet, if the cabbages were large and hard Eratace. when laid, the infide will remain found.

The Rullian cabbage was formerly in much greater efteem than at prefent, it being now only to be found in particular gentlemen's gardens, who culcivate it for their own ufe. This mult be fown late ist the lpring of the year, and managed as thofe before directed, with this difference only, that thefe muft be fooner planted out, and muit have an open clear fpot of ground, and require much lefs diftance every way, for it is but a very finall hard cabbage. This fort will not continue long before they will break and run up to feed.

The early and fugar loaf cabbages are commonly fown for fummer ufe, and are what the gardeners about London commonly call Michaelmas cablages. The feafon for fowing of thefe is about the end of July, or begimning of Auguft, in an open fpot of ground; and when the plants hare got eight lcaves, you mult prick them into beds at about three or four inches diftance every way, that the plants may grow frong and thort thanked; and toward the end of October you fhould plant them out: the diftance that thefe require is, three feet row from row, and two feet and a half afunder in the rows. The ground muft be kept clean from weeds, and the earth drawn up about your cabbage plants. In May, if your plants were of the early kind, they will turn in their leaves for cabbaging; at which time, the gatdeners near London, in order to obtain them a littie fooner, tie in their leaves clofe with a flender ofier-twis to blanch their middle; by which means, they have them at lealt a fortnight fooner than they could have if they were left untied.

The early cabbage being the firt, we flould choofe to plant the fewer of them, and a greater quantity of the fugar-loaf kind, which comes after them; for the early kind will not fupply the kitchen long, generally cabbaging apace when they begin, and as foon gro: hard and burt open; but the fugar-loaf kind is longer before it comes, and is as flow in its cabbaging; and being of a hollow kind, will comsinue for a good long time. The fugar-loaf kind may be planted out in Fe bruary, and will fucceed as well as if planted earlier; with this difference only, that they will be later before they cabbage. You thould alfo referve fome plants of the early kind in fome well fheltered fot of ground, to fupply your plantation, in cafe of a defect; for in mild winters many of the plants are apt to run to feed, efpecially when their feeds are fown too early, and in fevere winters they are often deftroyed.

The Savoy caboages are propagated for $u$ inter ufe, as being generally efteemed the better when pinched by the frolt: thefe mult be fown about the end of April, and treated after the manner as was directed for the common white cabhage : with this difference that thefe may be planted at a clofer dillance than thofe; two feet and a half fquare will be fufficient. Thefe are al ways much better when planted in an open fituation, which is clear from trees and hedges; for in clofe places they are very fubject to be eaten almof up by caterpillars and other vermin, efpecially if the autumn prove dry.

The broccoli may alfo be treated in the fame mar:ner, but need not be planted above one foot afunder in the rous, and the rows two feet ciftant ; thele are ne-

## $\mathrm{B} R \mathrm{~A} \quad[380] \quad \mathrm{B} R \mathrm{~A}$

braftica. ver eaten till the froft "lath rendered them tender; for otherswife they are tough and bitter.

The feeds of the broccoli (of which there are feveral kinds, viz. the Roman or purple, the Neapolitan or white, and the black broccoli, with fome others, but the Roman is prefcrred to them all), fhould be fown about the latter end of May, or beginning of June, and when the plants are grown to have eight leaves, tranfplant them into beds (as was directed for the common cabbage) ; and towards the latter end of July they will be fit to plant out, which ftrould be done into fome well-fheltered fpot of ground, but not under the drip of tres : the diftance thefe require is about a foot and a half in the rows, and two feet row from row. The foil in which they thould be planted onght to be rather light than heavy: if your plants fucceed well (as there will be little seafon to doubt, unlefs the winter prove extremely hard), they will begin to Wow their fmall heads, which are fomewhat like a cauliffower, but of a purple colour, about the end of December, and will continue eatable till the middle of April. The brown or black broccoli is by many perfons greatly efteemed, though it doth not deferve a place in the kitchen garden where the Roman broccoli can be obtained, which is much fweeter, and will continue longer in feafon: indeed, the brown fort is much hardier, fo that it will thrive in the coldeft fituations, where the Roman broccoli is fometimes deftroyed in very hard winters. The brown fort fhould be fown in the middle of May, and managed as hath been directed for the common cabbage, and fhould be planted at the fame difance, which is about two feet and a half afunder. This will grow very tall, fo foould have the easth drawn up to their ftems as they advance in beight. This doth not form heads fo perfeet as the Roman broccoli ; the fems and hearts of the plants are the parts which are eaten. The Roman broccoli (if well managed) will have large heads, which appear in the centre of the plants like clufters of buds. Thele heads fhould be cut before they run up to feed, with about four or five inches of the flem ; the fkin of the ftems flould be Etripped off before they are boiled. After the firl heads are cut off, there will be a great number of fide-fhoots produced from the fiems, which will have fmall heads to them, but are full as well flavoured as the large. The Naples broccoli hath white heads very like thofe of the cauliflower, and eats fo like it as not to be diftinguifleed from it.-Befides this firft crop of broceuli (which is ufually fown in the end of May), it will be proper to fow another crop the beginning of July, which will come in to fupply the table the latter end of March and the beginning of $\Lambda$ pril ; and being very young, will be extremely tender and fweet.

In order to fave good feeds of this kind of broccoli, you foould referve 2 few of the largeft heads of the firft crop, which fhould be let temain to run up to feed, and all the under-floots flould be conftanty fripped off, leaving only the main Atem to Nower and feed. If this be duly obferved, and no other fort of cabbage permitied to feed near them, the feeds will he as good as thofe procured from abroad, and the fort may be preferved in jerfection many years.
'I'he turnip-rooted cablage was formerly more cultivated in Britain than at prefent; for fuce other forts have been iutroduced which are much better flavoured,
this fort has been neglected. There are fome perfons Braffica. who efteem this kind for foups, but it is too firong for moft palates; and is feldom good but in hard winters, which will render it tender and lefs ftrong. At the end of June the plants fhould be tranfplanted out where they are to remain, allowing them two feet difance every way, obferving to water them until they liave taken root; and as their flems advance, the earth flould be drawn up to them with a hoe, which will preferre a moifture about their roots, and prevent their fems from drying and growing wcody, fo that the plants will grow more freely; but it hould not be drawn very high, for as it is the globular part of the falk which is eaten, fo that fhould not be covered. In winter they will be fit for ufe, when they flould be cut off, and the flalks pulled out of the ground and thrown away, being good for nothing after the fiems are cut off. As food for cattle, however, the cultivation of this fpecies deferves particular attention. See Agriculture Index.

The curled colewort or Siberian broccoli is now more generally efleemed than the former, being exiremely hardy, fo is never injured by cold, but is always fweeter in fevere winters than in mild leafons. This may be propagated by fowing of the feeds the beginning of July; and when the plants are frong enough for tranflanting, they ftould be planted in rows about a foot and a half afunder, and ten inches diftance in the row's. Thefe will be fit for ufe after Chriftmas, and continue good until April, fo that they are very ufeful in a family.

The mufk cabbage. 'This may be propagated in the fame manner as the common cabbage, and fhould be allowed the fame difance: it will be fit for ufe in October, November, and December; but, if the winter proves hard, thefe will be deftroyed much fooner than the common fort.
