The arsenic ores treated at this plant consisted mainly of arsenical pyrites containing, on the average, about 14 per cent. of arsenic and 0·7 oz. of gold and 3 oz. of silver per ton. A part of the ore treated contained only 2 per cent. of sulphur, the arsenic being present chiefly in an oxidised form. The by-product plant for the condensation and collection of the white arsenic consists of a long brick flue, 20 ft. high, connecting the Wethey mechanical six-hearth 60-ton roasting furnace with the dust chamber, which latter is 5 ft. high and covers an area of about 125 to 150 ft. This chamber is built of 4-in. brick walls, and is divided into four equal parts, so arranged that by the use of valves or dampers any one section can be cut out from the other, and the condensation may thus be carried on continuously. The arsenical compounds in the ore are decomposed during the roasting, and are transformed chiefly into volatile arsenious oxide, which passes out with the waste gases of the furnace, and is subsequently condensed by their cooling and lessened velocity, and settles on the floor of the dust chamber or becomes attached to the sides and roof in beautiful festoons of pure white crystals resembling snow. At stated intervals each section is cut out from the system, and the accumulated deposit of white arsenic is shovelled into hand barrows and carried to storage bins until needed for subsequent refining in a small reverberatory furnace. After the arsenic has been expelled by the roasting, the ore is discharged from the furnace and treated with lead ore in a shaft furnace for the extraction of the gold and silver.

Despite the fact that the domestic output of arsenical compounds is not sufficient to supply more than one-quarter of the total consumption of the United States (large quantities being annually imported from Canada, Germany, and Spain), the development of this industry is of exceedingly slow growth. During 1903 there were imported from Canada, England, Germany, and Spain 1,211,299 lb. of arsenious acid, valued at 38,505 dols., and 7,146,362 lb. of arsenic sulphide and orpiment, valued at 256,097 dols., as compared with 1,385,700 lb. of arsenious oxide, valued at 42,424 dols., and 6,725,198 lb. of arsenic sulphide and orpiment, valued at 237,631 dols. in 1902.

A recently discovered deposit of arsenic is being exploited at Pilot Mountain, 17 miles from Christiansburg, Montgomery County, Va. The capacity of the plant, when completed, is placed at 140 tons of refined arsenic per month. The region is wild and mountainous.

The white-arsenic plant at Anaconda, Mont., was nearly completed on January 1st, 1904. Large brick settling chambers have been erected alongside of the flue of the Brunton roasting furnaces, in order to condense and collect the arsenical fumes formed during the roasting. The arsenic-refining department has been equipped with suitable reverberatory furnaces, in which the crude flue deposit will be refined and the purified product subsequently ground and packed for the market in air-tight barrels, each of a capacity of 400 lb. The daily capacity of the by-product plant is reported to be several tons of flake arsenic.

An interesting discovery of metallic arsenic was made during 1903 at Washington Camp, Santa Cruz County, Ariz. The deposit is in masses attached to the walls of small pockets in dolomitic limestone. The size of the masses is generally small, although in one instance a piece weighing 20 lb. was found.

The world's production of arsenic in 1903, so far as reported, was as follows:—Canada, 233 tons, value 15,420 dols.; Germany, 2768 tons, value 253,500 dols.; Spain, 1088 tons, value 87,040 dols.; United Kingdom, 917 tons, value not given; United States, 554 tons (611 short tons), value 36,691 dols. A relatively small quantity of arsenic is produced in Italy, Japan, Portugal, and Turkey, but the statistics of these countries are not yet available for 1903.

The significance of the importation of arsenic and its compounds for the manufacturing industries of the United States may be appreciated from the statistics given in the following table for the past five years, showing the imports of metallic arsenic, white arsenic (arsenious acid), and arsenic sulphides (orpiment and realgar):—

Year.	Quantity.	Value.
	Lb.	Dols.
1899	9,040,871	386,791
1900	5,765,559	265,500
1901	6,989,668	316,525
1902	8,110,898	280,055
1903	8,257,661	204,602

LIME; VIENNA ——: U.S. CUSTOMS DECISION.

Sept. 26, 1904.

Vienna lime was held to be dutiable at 20 per cent. *ad valorem* under section 6 of the present tariff, as a "manufactured article unenumerated." The assessment of duty at 35 per cent. *ad valorem* as an "article composed of mineral substances," under paragraph 97, was overruled.

—R. W. M.

IX.—BUILDING MATERIALS, Etc.

ASPHALT MASTIC: U.S. CUSTOMS DECISION.

Oct. 18, 1904.

It was decided that asphalt mastic was dutiable at 3 dols. per ton under paragraph 93 of the present tariff, overruling the claim of the importers that it was dutiable at 50 c. per ton as "crude asphalt" under the same paragraph.

—R. W. M.

CLAY MATERIALS; PRODUCTION OF —— IN 1903.

Eng. and Mining J., Oct. 13, 1904.

According to the United States Geological Survey, the total value of the various clay products manufactured in the United States last year was 130,962,618 dols. This total was made up of the following items:—Common brick, 50,532,075 dols; front brick, 5,308,908 dols.; paving brick, 6,453,849 dols.; fancy brick, 892,256 dols.; fire-brick, 14,062,369 dols.; drain-tile, 4,639,214 dols.; sewer pipe, 2,525,369 dols.; terra cotta, 4,672,028 dols.; fireproofing, 8,708,143 dols.; hollow blocks, 1,153,200 dols.; tile other than drain tile, 3,505,929 dols.; pottery, 25,136,052 dols.; miscellaneous, 3,073,856 dols. As compared with the output for 1902, there was an increase of 8,793,117 dols.

X.—METALLURGY.

MINERAL OUTPUT OF CALIFORNIA.

Eng. and Mining J., Sept. 22, 1904.

The mineral production of California during 1903, as compiled from reports made to the State Mining Bureau at San Francisco, is shown in the following table:—

——		Quantities.	Value.
			Dols.
Asphalt	Tons	41,670	503,659
Bituminous rock	"	21,944	53,106
Borax, crude	"	34,430	661,400
Cement	Bbl.	640,868	968,727
Chrome ore	Tons	150	2,250
Chrysoprase	..	..	500
Clay, brick	Million	214,403	1,999,546
Clay, pottery	Tons	90,972	99,907
Coal	"	93,026	265,383
Copper	Lb.	19,113,861	2,520,997
Fullers' earth	Tons	250	4,750
Gold	..	..	16,471,264
Granite	Cb. ft.	498,625	678,670
Gypsum	Tons	6,914	46,441
Infusorial earth	"	2,703	16,015
Lead	"	55	3,960
Lime and limestone	..	..	592,268
Lithia mica	Tons	700	27,300
Macadam	"	605,185	436,172
Magnesite	"	1,361	20,515
Manganese	"	1	25
Marble	Cb. ft.	84,624	97,354
Mica	Tons	50	3,800
Mineral paint	"	2,370	3,720
Mineral water	Galls.	2 056,340	558,201
Natural gas	M. Cb. ft.	120,134	75,237
Paving blocks	Million	4,834	134,642
Petroleum	Bbl.	24,340,839	7,313,271
Platinum	..	..	1,052
Pyrites	Tons	24,311	94,000
Quartz crystal	..	..	1,968
Quicksilver	Flasks	32,094	1,335,954
Rubble	Tons	1,610,440	1,237,419
Salt	Bbl.	102,895	211,365
Sand	Tons	7,725	7,725
Sandstone	Cb. ft.	353,002	585,309
Serpentine	"	99	800
Silver	..	..	517,444
Slate	Squares	10,000	70,000
Soapstone	Tons	219	10,124
Soda	"	18,000	27,000
Tourmaline	..	..	100,000
Turquoise	..	..	10,000
Total value		..	37,759,040

In the previous year the mineral production of the State was valued at 35,069,105 dols., showing an increase in 1903 of 2,689,935 dols.

LEAD; THE CANADIAN BOUNTY ON ——.

Eng. and Mining J., Oct. 13, 1904.

The text of the Canadian order in council, which permits the application to exported lead ores of any unappropriated portion of the bounty on lead is as follows:—

"Whereas by clause 3 of the Act 3 Edward VII. Chap. 31, intituled, 'An Act to provide for the payment of bounties on lead contained in lead-bearing ores mined in Canada,' it is provided that if at any time it appears to the satisfaction of the Governor-General in Council that the charges for transportation and treatment of lead ores in Canada are excessive, the Governor in Council may authorize the payment of bounty at such reduced rate as he deems just on the lead contained in ores mined in Canada, and exported for treatment abroad, and

"Whereas, it appears that the lead smelters in Canada are unable at present to treat the whole of the lead ores mined in Canada, except at an excessive rate:

"Therefore, the Governor-General in Council is pleased to order that, after the payment of the full amount of bounty payable under the Act above referred to and amendments thereto, upon lead ores mined and smelted in Canada, and dating from the 1st day of April, 1904, until the 30th day of June, 1905, a rate of 50 c. per 100 lb. of lead contained in lead-bearing ores mined in Canada, and exported for treatment to Europe, shall be paid, provided that the quantity of lead upon which such bounty shall be paid shall not exceed 11,000 tons, of 2000 lb., in any one fiscal year." (See also this J., 1904, 886.)

Lead in Ontario.

Eng. and Mining J., Oct. 13, 1904.

According to the *Canadian Mining Review*, the existence of ores of lead in Ontario, Quebec, and Nova Scotia has been known for more than 30 years, and various and spasmodic attempts have been made to work these ores. The deposits in Tudor, Ontario, occur in calcareous and micaceous schists, associated with limestones and dolomites of Silurian age. Some of these deposits occur associated with a gangue of barytes and calcspar, and are small in extent; others are from 18 in. to 24 in. in width, the ore appearing in bunches, and as disseminated grains in the gangue. Some larger masses of galena are occasionally found, but the characteristic of the region is a lack of continuity to the deposits.

In both Tudor and Lake townships there appear to be two distinct sets of deposits, one striking north-west, the other north-east, and where two veins cross each other there is usually an enlargement at the surface which does not continue in depth. There are, in addition, other veins, usually with a quartz gangue, which are somewhat larger, and which cut through the gneisses of Elzevir township.

The association of arsenical and antimonial ores with the galenas of this section is not infrequent; their values in silver are low, running from 3 to 8 oz. of silver to the ton of galena, and the majority of samples show no gold whatever.

Mines in Korea

Le Mercure, July 31, 1904. *U.S. Cons. Reps., No.* 2084, *Oct.* 18, 1904.

Korea possesses gold mines whose output has increased from 1,158,000 dols. in 1898 to 2,509,000 dols. in 1902. It has also mines of iron, silver, copper, coal, &c. The greater part of the gold is exported to Japan. Iron, although present in large quantities, can hardly be said to be exploited. As a matter of fact, iron used in Japanese foundries comes from China. Coal of medium quality is equally abundant, but it is hardly exploited. Copper is extracted in several districts. During the last two years 564,433 lb., valued at 51,044 dols., were mined.

Chrome Ore Supplies.

Eng. and Mining J., Oct. 6, 1904.

The rapid expansion of the chrome ore industry of New Caledonia recently has begun to have a very noticeable influence upon the general trade conditions. In fact, the competition from this source has become so sharp that some apprehension is felt that it may seriously affect the industry in other countries. So far, the most important result connected with the increased exports from New Caledonia has been a decline in the quotations of about 5 dols. per ton for 50 per cent. ore at New York.

For many years the trade in chrome ore has been practically controlled by the Turkish producers. The exports from this country have averaged 40,000 tons annually, which, up to 1903, about equalled the aggregate output from all other countries. The mines are situated in the European provinces of Salonica, Kossovo, and Monastir, and the Asiatic provinces of Aidin, Konia, Adana, Angora, Broussa, and Macri. Most of the product imported into the United States comes from Macri and Broussa, and is known under the trade names of "Macri" and "Daghardi," the latter being the largest mine in Broussa. The ores contain from 48 to 54 per cent. of Cr_2O_3; the Macri ore carries from 48 to 51 per cent., and the Daghardi ore up to 54 per cent. There has been some effort put forth to restrict the output within reasonable bounds, as the resources of the country are very extensive, and could be made to yield much more than the present output. The Turkish government exacts a royalty of 20 per cent. on the value of the ore mined, and also imposes a duty of 1 per cent. on the exports. In spite of this heavy burden, however, the cost of producing the Macri ore and delivering it at the seaboard is said to be only 35*s.* per ton.

The growing importance of New Caledonia as a producer of chrome ore is well shown by the statistics of exports, which have increased from 1042 metric tons in 1894 to 10,474 tons in 1900, and 21,437 tons in 1903. During the first four months of the present year the shipments amounted to 12,225 metric tons. The chromite is mined principally in the north-western and south-western portions of the island, the mineral occurring in association with serpentine, which also yields the nickel and cobalt ores. Some of the deposits are of great size; as much as 20,000 tons of ore have been taken from a single ore-body. The principal factor in the industry is the Société le Chrome, a combination of producing interests which came into existence in 1902. At present mining is most actively carried on at Tiepaghi, where the ore is especially rich. The Société le Chrome has leased the mining rights on this property to tributers, who paid the sum of 200,000 dols. for the privilege of working it for three years. It is said that the output for this period may reach 100,000 tons. The ore requires no mechanical concentration, and is shipped in large lots with an average content of 56 per cent. chromic oxide.

Aside from Turkey and New Caledonia, chromite is mined quite extensively in Canada, Newfoundland, Greece, Russia, India, and Australia. The deposits in the United States are of small importance at present, although they occur quite widely among the altered rocks of the Appalachians from Pennsylvania southward, and also in California. In recent years, the output has amounted to only a few hundred tons, most of which was mined in California and consumed locally. As to the other countries, Australia has come into some prominence lately, due to the fact that the ore is high grade and is exported to the United States as ballast in wool-laden ships, thus getting a very low transport rate. Important discoveries of ore have recently been reported from India, and it is now being offered in the American market. The Canadian chromite is obtained from the eastern townships of Quebec. According to J. Obalski, a good deal of development has been done lately, and an increased output may be expected from this region. The production in 1903 amounted to 3020 tons. Newfoundland is known to possess large deposits of concentrating ore, favourably situated as to transport, but so far they have not been very actively exploited.

The consumption of chromite in the United States at present is probably about 30,000 long tons per annum. The imports for the last three years have been as follows: 1901, 20,112 tons; 1902, 39,570 tons; 1903, 22 931 tons. There are three important applications to which the ore is put: the preparation of bichromates and other compounds of chromium, the manufacture of ferro-chromium, and in making linings for blasts and reverberatory furnaces. For the latter purpose it is sometimes used in the form of bricks. The Kalion Chemical Company, of Philadelphia, Pa., controls the manufacturing business in chromium compounds, while the Wilson Aluminium Company, of New York, is the principal manufacturer in this country of ferro-chrome. Chrome bricks are made by the Harbison-Walker Company, of Pittsburg.

Precious Metal Producton of the United States in 1903.

Eng. and Mining J., Oct. 6, 1904.

The corrected figures for the production of gold and silver in the United States during 1903 (see this J., 1904, 142) are as follows:—

Gold: 3,560,000 fine ounces, valued at 73,591,700 dols., a decrease of 6,408,300 dols., or 8 per cent., as compared with 1902.

Silver: 54,300,000 fine ounces, valued at 29,322,000 dols., an increase of 93,000 dols. over 1903, solely due to the higher average price of the metal.

Lead Production of United States.

Eng. and Mining J., Oct. 13, 1904.

The production of lead in the United States in 1903, from domestic ores, showed a slight decrease from that reported in the previous year. The total, as shown by the figures furnished for *The Mineral Industry* by producers, was 276,694 short tons, and the decrease from 1902 was 3830 tons, or 1·3 per cent. The decline in production was entirely in desilverised lead, the output of soft lead, chiefly from the Missouri mines, showing a gain of 11 per cent. During part of the year the smelters restricted their purchases of ore, and consequently the production of the metal.

In addition to the lead made from domestic ores, smelters and refineries turned out 92,794 tons of metal from foreign ores and base bullion, making the total lead put into merchantable form, at works in the United States, 369,488 short tons.

In the table below is given a statement of the imports, exports, &c., as shown by the reports of the Bureau of Statistics, the figures being in short tons:—

Foreign Lead in the United States.

Imports.	1902.	1903.
Lead, metallic	2.529	3,023
Lead in ores and base bullion	105,186	103,384
Total imports	107,715	106,407
Less re-exports of foreign	78,967	81,915
Less smelters' allowance on lead re-exported	7,897	8,192
Total deductions	86,864	90,107
Net imports	20,851	16,300
Add lead in bond, Jan. 1	16,622	23,939
Total supply	37,473	40,239
Deduct lead in bond, Dec. 31	23,939	10,694
Approximate consumption of foreign	13,534	29,545

By far the greater part of the lead imported last year—93,068 tons, or 87·5 per cent. of the total—came from Mexico, the quantity received from Canada having been comparatively small, only 9,600 tons. The Mexican lead comes chiefly in the form of base bullion, to be refined in bond.

The total supplies of lead for the year, and the disposition made of them, are shown in the following table, the figures being in short tons:—

Lead Production and Consumption.

——	1902.	1903.
Desilverised	199,615	188,913
Soft	70,424	78,298
Antimonial	10,485	9,453
Total production	280,524	276,694
Add stocks, Jan. 1	70,316	30,500
Add net foreign	13 534	29,545
Net total supplies	36,374	336,739
Domestic lead exported	3,271	56
Estimated consumption	330,603	315,683
Total	333,874	315,739

Iron Sand: U.S. Customs Decision.

Oct. 17, 1904.

Merchandise invoiced as "chilled iron," "diamond grit," and "steel grit" was assessed for duty at 45 per cent. *ad valorem* as "manufactures of metal" under paragraph 193 of the present tariff. Analysis having shown them to be iron, the claim of the importer that it was "steel," dutiable under paragraph 135, was overruled.—R. W. M.

XII.—FATS, FATTY OILS, Etc.

Wool Grease: U.S. Customs Decision.

The United States Circuit Court decided the wool grease, highly refined, but dealt in commercially as wool grease, is nevertheless "wool grease" and dutiable at ½ c. per lb. as such under paragraph 279 of the present tariff. The assessment of duty at 25 per cent. *ad valorem* as "rendered oil" under paragraph 3, was overruled.—R. W. M.

Recovered Grease: U.S. Customs Decision.

Aug. 10, 1904.

Grease recovered from wool, and consisting of wool grease, olive oil, and a small amount of petroleum, was held to be dutiable at ½ c. per lb., as "wool grease," under paragraph 279 of the present tariff. The assessment of duty at 25 per cent. *ad valorem* as an "expressed or rendered oil" was overruled.—R. W. M.

Bone Grease; U.S. Customs Decision.

Aug. 19, 1904.

Crude bone grease was held to be dutiable at 20 per cent. *ad valorem*, under section 6 of the present tariff, as a "manufactured article unenumerated." The claim of the importer for free entry, under paragraph 568, as "grease for stuffing or dressing leather, and fit only for such uses," was overruled on the ground that the exclusive use of bone grease for such a purpose was not established by the evidence.—R. W. M.

Sesamé and Peanut Oil: U.S. Customs Decision.

Sept. 26, 1904.

A mixture of sesamé and peanut oil, each of which is free of duty if imported separately, was held to be dutiable at 25 per cent. *ad valorem*, under paragraph 3 of the present tariff, as a "combination of expressed oils."
—R. W. M.

Oleine: U.S. Customs Decision.

Sept. 26, 1904.

It was decided that oleine, commercially known as red oil, and consisting of oleic acid, was dutiable at 25 per cent. *ad valorem* under paragraph 1 of the present tariff as an "acid not specially provided for." The claim of the importer for free entry under paragraph 568 was overruled on the ground that oleine is not exclusively used for soap making, but is also employed for oiling wool and as a constituent of certain polishing materials.—R. W. M.

XIII. B.—RESINS, VARNISHES, Etc.

Sealing Wax: U.S. Customs Decision.

Sept. 9, 1904.

Sealing wax, which on analysis was shown to have the following composition:—Volatile at 100° C., 1·68 per cent.; resins, 72·65 per cent.; ash (calcium sulphate), 8 per cent.; colouring matter, &c. (sulphide of mercury), 18·07 per cent., was held to be dutiable at 20 per cent. *ad valorem* as a "manufactured article unenumerated" under section 6 of the present tariff. The assessment of duty at 25 per cent. *ad valorem* under paragraph 448, as a "manufacture of wax," was overruled.—R. W. M.

XIV.—TANNING; LEATHER; GLUE, Etc.

Quebracho Extract: U.S. Customs Decision.

July 30, 1904.

"Quermos" extract was held to be dutiable at ½ c. per lb. as "quebracho extract," under paragraph 22 of the present tariff, and not at ⅞ c. per lb. as "bark extract," under the same paragraph.—R. W. M.

Bone Size Substitute: U.S. Customs Decision.

The United States Circuit Court decided that bone size substitute, consisting of starch, dextrin, magnesium chloride, and silica, was dutiable at 25 per cent. *ad valorem*, under paragraph 3 of the present tariff, overruling the assessment of duty at 1½ c. per lb., as a "preparation fit for use as starch," under paragraph 285.—R. W. M.

XV.—MANURES, Etc.

Potash in Agriculture.

U.S. Cons. Reps., No. 2083, *Oct.* 7, 1904.

Official statistics show that the German mines produced, in 1903, 1,557,243 tons of kainite, worth at current prices 5,208,154 dols., and 2,073,771 tons of other potash salts, valued at 4,979,912 dols. Of the kainite and sylvinite 501,385 tons were exported, and of this amount 275,302 tons, or more than 54 per cent., was taken by the United States, where it was used mainly in the manufacture of chemical fertilisers. The remainder, something over a million tons of crude mineral, was used for fertilising purposes in Germany with excellent results. Exact official records, in which only the percentage of potash contained in the raw minerals used is taken into account, show that the consumption of potash salts in German agriculture increased from 51,282 tons in 1892 to 150,000 in 1903. During this period there has been a steady advance in the yield of the staple farm crops, which corresponds closely from year to year to the amount of potash used. Thus, when the consumption declined from 64,103 tons in 1894 to 58,974 tons in 1895, there was a corresponding falling off in yield of all the spring crops planted and harvested that year.

XVII.—BREWING, WINES, SPIRITS, Etc.

Brewing Sugar; Method of Denaturing ——.

P. Petit. Ann. de la Brass., 1904, **7**, 363—364.

To enable sugar to be used in France free of duty, it is proposed to treat the sugar with half a litre of a 30 per cent. alcoholic hop extract per 100 kilos. by mixing the two for a few minutes in a hydro-extractor. The hop extract would be prepared under excise supervision, by treating hops with boiling 90 per cent. alcohol for at least 30 minutes, the quantity of solvent used being 3 litres per kilo. The product would be packed in sealed bottles.

The work of denaturing would be performed in specially authorised establishments, under excise supervision, the sugar being received in bond and supplied only to brewers. The latter would be empowered to use the sugar in the most convenient manner, without restriction.—C. S.

Spirit; Drawbacks of Excise on —— in Holland.

Bd. of Trade J., Oct. 27, 1904.

A Dutch Decree, dated the 29th August last, provides for the exemption from excise duty, subject to certain restrictions, of (1) spirit for use in vinegar factories and in public national, provincial, or communal institutions for instruction in natural sciences; and (2) spirit of a strength of at least 85 per cent., which by mixture with pyroligneous acid is rendered unfit for the preparation of beverages.

The Decree further provides that drawback of the excise duty paid on the spirit contained in sweet liqueurs, bitters, or other similar spirituous liquors, and in liquid perfumes, shall be allowed on the exportation of these articles to foreign countries, subject to compliance with the prescribed formalities.

XVIII. B.—SANITATION.

Pollution of German Waterways by Factories.

U.S. Cons. Reps., No. 2084. *Oct.* 18, 1904. *From Deutsche Industrie Zeitung, July* 29, 1904.

The industrial council of Düsseldorf deals in its last report with methods of preventing pollution of waterways by refuse from factories emptying into them, and proposes the erection of basins in which such matter can be purified before entering into the waterways. This plan has been approved by the minister of commerce and industry, who now asks the president of the government to report the matter to the inspectors, to be acted on by them.

The question of protecting rivers from pollution by refuse from factories is becoming more and more important, especially for large rivers like the Rhine. Since factories are subject to approval, the respective concession methods furnish a means to combat improper pollution of streams by prescribing suitable conditions before concessions to build are granted. Numerous experiences in this region, however, have shown that the fulfilling of such conditions, and especially the official supervision, are accompanied by almost insurmountable difficulties if at the beginning the conditions have not been studied thoroughly. In the case of large chemical factories, with independent branches emptying different kinds of refuse into large, deep canals, this official supervision is almost impossible, the more so since during different parts of the day different kinds of refuse are discharged. The best method to overcome the difficulty is the erection of reservoirs in which the refuse may be diluted by the addition of pure water.

XX.—FINE CHEMICALS, Etc.

Saccharin: U.S. Customs Decision.

Merchandise invoiced as sodium benzoic sulfinide and benzoic acid sulfinide was assessed for duty as "saccharin," at 1 dol. 50 c. per lb., and 10 per cent. *ad valorem* under paragraph 211 of the present tariff. The importers claimed it to be dutiable at 25 per cent. *ad valorem* under paragraph 1 as an "acid not specially provided for," at the same rate under paragraph 3 as a "chemical compound," or at 20 per cent. *ad valorem* as a "preparation of coal tar not a colour or dye," under paragraph 15. The Board of General Appraisers, after an exhaustive investigation, affirmed the assessment of duty.—R. W. M.

Bromofluorescic Acid: U.S. Customs Decision.

Aug. 3, 1904.

Bromofluorescic acid was held to be dutiable at 20 per cent. *ad valorem* as a "preparation of coal tar not a colour or dye," under paragraph 15 of the present tariff. This decision is based on the ground that the provision for coal-tar preparations is more specific than that for "chemical compounds" in paragraph 3, or for "acids not specially provided for" in paragraph 1.—R. W. M.

Methylpyrocatechin Carbonic Ester: U.S. Customs Decision.

July 30, 1904.

Merchandise invoiced as above, and in a crude state, unfit for administering as a medicine, was held to be dutiable as a "preparation of coal tar not a colour or dye" at 20 per cent. *ad valorem*, under paragraph 15 of the present tariff. The assessment of duty at 25 per cent. *ad valorem* as a "chemical compound" under paragraph 3 was overruled.
—R. W. M.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 22,633. Woolford. *See under* X.
„ 22,679. Ebers. Method of producing granular substances from molten materials. Oct. 20.
„ 22,794. Perks. Crucible furnaces and the like. Oct. 22.
„ 22,868. Michelbach. Condensers. Oct. 24.
„ 22,878. Salenius. Separating liquids.* Oct. 24.
„ 22,951. Gutensohn. Treatment of by-products. Oct. 25.

[A.] 23,066. Lake (Caspar). Apparatus for drying granular and like materials.* Oct. 26.

„ 23,070. Bamber. Centrifugal separators. Oct. 26.

„ 23,081. Kent. Furnaces.* Oct. 26.

„ 23,183. Wells. Drying apparatus.* Oct. 27.

„ 23,204. British Thomson-Houston Co., Ltd. (Gen. Electric Co.). *See under* XI.

„ 23,261. Wilson. Filters. Oct. 28.

„ 23,336. Burgess. Condensers. Oct. 29.

[C.S.] 22,559 (1903). Prinsep. Furnaces fired with powdered coal. Oct. 26.

„ 22,845 (1903). Boutcher and Boutcher. Means for discharging acids and other liquids from carboys and other receptacles by pneumatic pressure. Nov. 2.

„ 23,091 (1903). Austin. Centrifugal separators. Oct. 26.

„ 23,900 (1903). Paul. Apparatus for regulating temperature. Nov. 2.

„ 24,379 (1903). Schneller and Koeleman. Apparatus for bringing gas and liquid into intimate contact. Nov. 2.

„ 11,854 (1904). Kathol. Filters. Nov. 2.

„ 12,358 (1904). Soc. l'Air Liquide. *See under* VII.

„ 14,621 (1904). Bonnet. Apparatus for mixing, emulsifying, and homogenising liquids. Oct. 26.

„ 16,604 (1904). Smith. Funnels for liquids. Oct. 26.

„ 17,536 (1904). Steele. Furnaces. Oct. 26.

II.—FUEL, GAS, AND LIGHT.

[A.] 22,342. Körting und Mathiesen Act.-Ges. Arc lamp electrodes. [German Appl., Oct. 31, 1903.]* Oct. 17.

„ 22,470. Carolan (Whitney). Filaments of the kind used in incandescent electric lamps, and processes of manufacturing said filaments. Oct. 18.

„ 22,593. Brotherhood. Producer gas manufacturing apparatus. Oct. 20.

„ 22,815. Boult (Cie. pour le Fabr. des Compteurs et Matériel d'Usines à Gaz). Gas purifiers.* Oct. 22.

„ 22,843. Whitfield. Gas producers. Oct. 24.

„ 22,917. Oliphant and Scott. Apparatus for converting oil into gas. Oct. 25.

„ 23,184. Russell and Russell. Means for producing and utilising inflammable gas.* Oct. 27.

„ 23,352. Hellstern. Carbons for electric arc lamps. Oct. 29.

„ 23,386. De Lachomette. Coking ovens. Oct. 29.

[C.S.] 22,090 (1903). Cornaro. *See under* XI.

„ 23,616 (1903). Heenan. Apparatus for the manufacture of crude gas from coal and other material. Nov. 2.

„ 15,860 (1904). Derval. Retort benches for the manufacture of illuminating gas. Nov. 2.

„ 16,460 (1904). Clarke. Incandescent gas burners and mantles. Nov. 2.

„ 17,661 (1904). Redfern (Poetter and Co.). Coking ovens. Oct. 26.

„ 20,277 (1904). Abel (Siemens und Halske A.-G.). Manufacture of incandescence bodies for electric glow lamps. Oct. 26.

„ 20,371 (1904). Rincker and Wolter. Production of oil gas. Nov. 2.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 23,379. Zimpell. Sulphate of ammonia saturators. [German Appl., March 30, 1904.]* Oct. 29.

[C.S.] 22,091 (1903). Thompson (Ges. zur Verwerthung der Boleg'schen Wasserlöslichen Mineralöle u. Kohlenwasserstoffe). Production of water-soluble or easily and permanently emulsifiable hydrocarbon derivatives. Oct. 26.

„ 22,092 (1903). Thompson (Ges. zur Verwerthung der Boleg'schen Wasserlöslichen Mineralöle u. Kohlenwasserstoffe). Production of water-soluble or emulsifiable vaseline. Oct. 26.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 22,735. Johnson (Badische Anilin und Soda Fabrik). Manufacture of azo colouring matter. Oct. 21.

„ 23,072. Newton (Bayer and Co.). Manufacture of new tetrazo dyestuffs. Oct. 26.

„ 23,193. Imray (Meister, Lucius und Brüning). Manufacture of blue and violet to black dyestuffs by oxidation on the fibre. Oct. 27.

„ 23,198. Johnson (Badische Anilin und Soda Fabrik). Manufacture of rhodamine colouring matters and intermediate products. Oct. 27.

[C.S.] 24,930 (1903). Johnson (Badische Anilin und Soda Fabrik). Manufacture of sulphur colouring matters and intermediate products. Nov. 2.

„ 26,182 (1903). Imray (Meister, Lucius und Brüning). Manufacture of dyestuffs derived from anthracene. Nov. 2.

„ 712 (1904). Johnson (Badische Anilin und Soda Fabrik). Manufacture of colouring matters of the anthracene series. Oct. 26.

„ 1389 (1904). Newton (Bayer and Co.). *See under* XIII. A.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 22,295. Walker. Bleaching cloth. Oct. 17.

„ 23,193. Imray (Meister, Lucius und Brüning). *See under* IV.

„ 23,306. Mellor. Method of and means for cleaning or clearing silk and like yarns or threads. Oct. 29.

[C.S.] 24,637 (1903). Howorth (Soc. Franç. de la Viscose). Dressing of yarns and like material. Oct. 26.

„ 26,591 (1903). Watson and Hoyle. Manufacture of woven fabrics and production thereon of figured or variegated effects. Oct. 26.

„ 1867 (1904). Johnson (Badische Anilin und Soda Fabrik). Discharge of halogenated indigo colouring matters. Nov. 2.

„ 15,395 (1904). Venter. Process for bleaching textile materials. Nov. 2.

VI.—COLOURING WOOD, PAPER, LEATHER, ETC.

[A.] 22,547. Lake (Chem.-Techn.-Fabrik, Dr. A. R. W. Brand und Co.). *See under* IX.

„ 23,292. Lake (Chem.-Techn.-Fabrik, Dr. A. R. W. Brand und Co.). *See under* IX.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 22,323. Johnson (Badische Anilin und Soda Fabrik). Manufacture of stable hydrosulphites. Oct. 17.

„ 22,348. Szek. Means for the formation and utilisation of ozone. Oct. 17.

„ 22,540. Johnson (Badische Anilin und Soda Fabrik). Production of technically pure cyanogen compounds. Oct. 19.

„ 22,940. Reaney. Manufacture of hydrated lime from quicklime.* Oct. 25.

[A.] 23,036. Spence, and Peter Spence and Sons, Ltd. Manufacture of aluminous compounds. Oct. 26.

„ 23,379. Zimpell. *See under* III.

[C.S.] 23,550 (1903). Hemingway. Kilns applicable for use in the manufacture of oxide of iron. Nov. 2.

„ 2655 (1904). Keogh and Broughton. Methods of making aluminium compounds and bye products. Oct. 26.

„ 12,358 (1904). Soc. l'Air Liquide (Soc. Anon. pour l'Étude et l'Exploitation des Procédés G. Claude) and Lévy. Method of separating air and gaseous mixtures into their elements, and apparatus therefor. Nov. 2.

„ 19,924 (1904). Cie. des Prod. Chimiques d'Alais et de la Carmarque. Manufacture of alumina. Oct. 26.

„ 20,797 (1904). Fink-Huguenot. Preparation of metallic oxides by the direct combustion of metals, and apparatus therefor. Nov. 2.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 22,655. Imray (Pressed Prism Plate Glass Co.). Manufacture of glass sheets or slabs.* Oct. 20.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 22,366. Herdman. Apparatus for the production of slag wool. Oct. 17.

„ 22,423. Fairweather (Nettleton). *See under* XIII. A.

„ 22,547. Lake (Chem.-Techn.-Fabrik Dr. Alb. R. W. Brand und Co.). Process for colouring natural stone.* Oct. 19.

„ 22,678. Ebers. Method of producing a building material having the properties of trass and similar products. Oct. 20.

„ 22,940. Reaney. *See under* VII.

„ 22,990. Lake (Rütgerswerke Act.-Ges.). Preservation of wood.* Oct. 25.

„ 23,292. Lake (Chem.-Techn.-Fabrik Dr. Alb. R. W. Brand und Co.). The colouring of stone. Oct. 28.

„ 23,364. Van der Vijgh. Manufacture of artificial stone. Oct. 29.

[C.S.] 23,213 (1903). Bond. Apparatus and process for utilising gas lime or other calcium compounds and clinker, slag, or other siliceous or aluminous material for the manufacture of cement or moulded articles. Oct. 20.

„ 25,374 (1903). Michell and Michell. Manufacture of material suitable for use as a non-conducting covering for steam-pipes, boilers, &c. Oct. 26.

„ 20,018 (1904). Ridley, Tate, and Williamson. Slag or scoriæ bricks or blocks. Oct. 26.

X.—METALLURGY.

[A.] 22,346. Huntington. Alloying metals. Oct. 17.

„ 22,422. Auchinachie. Process of obtaining metallic vanadium from its ores or other vanadium compounds. Oct. 18.

„ 22,438. Carson and Ogle. Treatment of zinc and other ores. Oct. 18.

„ 22,633. Woolford. Oxidising and sublimation furnaces. Oct. 20.

„ 22,659. Morgan Crucible Co., Ltd., and Spiers. *See under* XI.

„ 22,688. Zobrab. Manufacture of steel, and the smelting or reduction of iron or other ores and metals. Oct. 21.

„ 22,814. Richardson. Processes for smelting and refining metals, and apparatus therefor. Oct. 22.

[A.] 23,111. Wynne. Machines for the concentration of ores or other substances of different specific gravities. Oct. 27.

„ 23,153. Crowley and Blackman. Furnace or crucible for the reduction or refining of metals. Oct. 27.

„ 23,255. Lett, and Metalia, Ltd. Extraction of copper from its ores. Oct. 28.

„ 23,256. Lett, and Metalia, Ltd. Vats used in the extraction of metals from their ores. Oct. 28.

„ 23,331. De Dion and Bouton. Manufacture of case-hardened articles of chrome-nickel steel. [Fr. Appl., April 23, 1904.]* Oct. 29.

„ 23,380. Soc. Electrométall. Française. *See under* XI.

[C.S.] 20,419 (1903). Sulman and Kirkpatrick - Picard. Separation of minerals from ores and gangue. Nov. 2.

„ 23,299 (1903). Fitzmaurice. Treating molten or semi-molten metal. Nov. 2.

„ 23,457 (1903). Alexander and Shiels. Annealing of metals, and apparatus therefor. Nov. 2.

„ 25,950 (1903). Cockburn. Manufacture of steel. Oct. 26.

„ 18,746 (1904). Goodsell. Method of and apparatus for treating sheet iron and steel. Oct. 26.

„ 19,140 (1904). Swyny and Plucknett. Ore separators and classifiers. Nov. 2.

„ 20,797 (1904). Fink-Huguenot. *See under* VII.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 22,659. Morgan Crucible Co., Ltd., and Spiers. Composition or compound for brushes of dynamo electric machines, for bearings, and other articles. Oct. 20.

„ 22,743. British Thomson-Houston Co., Ltd. (General Electric Co.). Apparatus for the electrical treatment of gases. Oct. 21.

„ 23,204. British Thomson-Houston Co., Ltd. (General Electric Co.). Electric heating apparatus. Oct. 27.

„ 23,380. La Soc. Electro-Métallurgique Française. Process for smelting nickel ores in an electric furnace, and an improved crucible therefor. [Fr. Appl., Oct. 30, 1903.]* Oct. 29.

[C.S.] 22,090 (1903). Cornaro. Manufacture of electrodes and resistances. Oct. 26.

„ 15,952 (1904). Berg. Electrode for electrical accumulators. Nov. 2.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 23,187. Markel. Process of and apparatus for producing bars of soap. Oct. 27.

„ 23,308. Berry. Semi-solid lubricants, and process for manufacturing same. Oct. 29.

[C.S.] 25,868 (1903). Iveson and Wilson. Cooling melted fats or fatty substances, or the like. Nov. 2.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

[A.] 22,423. Fairweather (Nettleton). Composition of matter for fireproof paint or coating.* Oct. 18.

„ 22,732. Kollinger. Manufacture of paint. [Ger. Appl., Oct. 21, 1903.]* Oct. 21.

[C.S.] 23,550 (1903). Hemingway. *See under* VII.

„ 1389 (1904). Newton (Bayer and Co.). Manufacture of new colour lakes. Nov. 2.

(*B.*)—RESINS, VARNISHES.

[A.] 23,173. Staeding. Manufacture of linoleum.* Oct. 27.

[C.S.] 16,800 (1904). Bucklin. Lac derivatives. Nov. 2.

(*C.*)—INDIA-RUBBER.

[A.] 23,168. Frost. Vulcanising apparatus. Oct. 27.

[C.S.] 17,579 (1904). Tiehsen. Manufacture of an improved substitute for india-rubber. Nov. 2.

XIV.—TANNING; LEATHER, GLUE, SIZE, ETC.

[A.] 22,395. De Marneffe. Process of and apparatus for tanning leather. Oct. 18.

,, 23,952. Wetter (Thüringer Gelatinefabrik E. Jetter und Krause). Gelatine or gelatinous foodstuffs. Oct. 25.

,, 23,016. Dougherty. Machines for mechanically seasoning, oiling, or otherwise treating skins.* Oct. 25.

XV.—MANURES, ETC.

[A.] 23,045. Bollé (Conrad Schmidt and Co.). Process of and apparatus for manufacturing artificial manure from offal and the like. Oct. 26.

[C.S.] 3170 (1904). Laer. Fertiliser, and process of making same. Oct. 26.

XVI.—SUGAR, STARCH, GUM, ETC.

[C.S.] 27,186 (1903). Gray, Osborn, Stocks, and White. Manufacture of gum tragasol from locust kernels. Nov. 2.

XVII.—BREWING, WINES, SPIRITS, ETC.

[A.] 22,704. Hornof. Malt kilns.* Oct. 21.

,, 23,277. Schrottky. Manufacture of material for use in the production of fermented liquors. Oct. 28.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—FOODS.

[A.] 22,358. Provoyeur. Manufacture of chocolate.* Oct. 17.

,, 22,476. Glas. Production of desiccated milk and milk preparations. [German Appl., Nov. 12, 1903.]* Oct. 18.

,, 22,512. Williamson. Meat extracts or preparations. Oct. 19.

,, 22,513. Williamson. Cocoa, chocolate, and preparations of same. Oct. 19.

,, 22,639. Hatmaker. Cacao, sugar, and milk compounds in dry, flaky form. Oct. 20.

,, 22,927. Preisz. Method of sterilising foodstuffs and the like. [German Appl., Oct. 28, 1903.]* Oct. 25.

,, 22,952. Wetter (Thüringer Gelatinefabrik E. Jetter und Krause). *See under* XIV.

,, 23,100. Dollner. Production of desiccated milk and milk preparations. [Ger. Appl., Nov. 12, 1903.]* Oct. 26.

,, 23,177. Müller. Food preparation.* Oct. 27.

[C.S.] 5946 (1904). Butler. Manufacture of milk in powder form, applicable also to the treatment of other solutions containing fatty matter. Nov. 2.

,, 20,291 (1904). Kennedy. Treatment of milk. Oct. 26.

(*B.*)—SANITATION; WATER PURIFICATION.

[A.] 22,724. McLean and Paterson. Treatment of sewage. Oct. 21.

,, 23,045. Bollé (Schmidt and Co.). *See under* XV.

[C.S.] 24,651 (1903). Byrne, Scott, and Wheatley. Compound for preventing incrustation in steam boilers. Nov. 2.

,, 28,379 (1903). Taylor. Means or apparatus for distributing sewage or sewage effluent upon filter beds. Nov. 2.

XIX.—PAPER, PASTEBOARD, ETC.

[A.] 22,381. Parkin and Williams. Process for rendering celluloid or nitric cellulose compounds non-inflammable. Oct. 18.

,, 22,385. Castiglione. Treatment of pulp. Oct. 18.

[C.S.] 28,212 (1903). Parkin, Williams, and Casson. Process for rendering celluloid non-inflammable. Nov. 2.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 22,806. Imray (Meister, Lucius und Brüning). Manufacture of dialkylmalonic acid derivatives and dialkylmalonyl ureas. Oct. 22.

[C.S.] 25,481 (1903). Ashworth. Production of saccharin. Oct. 26.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 23,988. Soc. Anon. Plaques et Papiers Photographiques A. Lumière et ses fils. Process of colour photography. [Fr. Appl., Dec. 17, 1903.]* Oct. 25.

,, 23,064. Lucas. Photographic negative. Oct. 26.

,, 23,098. Gärtner. Process of and means for the production of relief photographs or the like. Oct. 26.

[C.S.] 19,940 (1904). Smith. Photographic plates and films. Oct. 26.

XXII.—EXPLOSIVES, MATCHES, ETC.

[A.] 22,390. Bennett and Castiglione. Explosives for machine guns and other purposes. Oct. 18.

,, 23,051. Tyler. Matches. Oct. 26.

,, 23,269. Dickson. Manufacture of blasting cartridges. Oct. 28.

,, 23,366. King's Nerton Metal Co., Ltd., Bayliss and Brownsdon. Additions to the materials employed in the manufacture of percussion caps, detonators, igniters, &c., for the ignition or detonation of explosives. Oct. 29.

[C.S.] 26,978 (1903). Talbot. Explosive compounds and the manufacture thereof. Oct. 26.

,, 4699 (1904). Haddan (Führer). Manufacture of explosives of the nitrate of ammonia group. Oct. 26.

,, 7490 (1904). Rusher and Baudinet. Explosives. Nov. 2.

Harold Van der Linde.
Hon. Treasurer: M. J. Taylor, 77, Front Street East, Toronto.
Hon. Local Secretary:
Alfred Burton, 42, Front Street West, Toronto.

Liverpool Section.

Chairman: Eustace Carey.
Vice-Chairman: Frank Tate.
Committee:
T. Lewis Bailey.
G. C. Clayton.
J. T. Conroy.
A. Foden.
G. Watson Gray.
C. Longuet Higgins.
Max Muspratt.
E. L. Peck.
Alf. Smetham.
H. B. Stocks.
J. W. Towers.
Hon. Treasurer: W. P. Thompson.
Hon. Local Secretary:
W. R. Hardwick, 13, Batavia Buildings, Hackins Hey, Liverpool.

London Section.

Chairman: A. Gordon Salamon.
Vice-Chairman: R. J. Friswell.
Committee:
H. G. Colman.
J. N. Connah.
Bernard Dyer.
Oscar Guttmann.
J. T. Hewitt.
D. L. Howard.
J. Lewkowitsch.
A. R. Ling.
Wm. Pearce.
Boverton Redwood.
Walter F. Reid.
L. T. Thorne.
Thos. Tyrer.
Chas. Wightman.
Hon. Local Secretary:
Julian L. Baker, 7, Addison Road, Bedford Park, W.

SESSION 1904—1905.

Monday, Dec. 5, 1904:—
E. Divers, M.D., D.Sc., F.R.S. "Raschig's Theory of the Lead Chamber Process."
E. Divers, M.D., D.Sc., F.R.S. "Theory of the Action of Metals on Nitric Acid."
Mr. Llewellyn J. Davies. "A Rapid and Accurate Method for the Estimation of Phosphorus in Iron Ores."
Mr. C. S. Stanford Webster, F.I.C. "Fluorescope for comparing Substances under the Influence of Radium Rays."
Monday, Jan. 9, 1905.—Mr. Walter F. Reid, F.I.C. "Some Chemical Aspects of the St. Louis Exhibition."

Manchester Section.

Chairman: J. Carter Bell.
Vice-Chairman: F. Scudder.
Committee:
J. Allan.

F. W. Richardson.
A. Smithells.
Geo. Ward.
Thorp Whitaker.
Hon. Local Secretary and Treasurer:
T. Fairley, 17, East Parade, Leeds.

Official Notices.

ST. LOUIS EXHIBITION, 1904. ADDITIONAL LIST OF AWARDS TO BRITISH EXHIBITORS.

The Royal Commission has furnished an additional list of awards to British exhibitors at the St. Louis Exhibition, from which are taken the following :—

Department of Liberal Arts.

Group 23.—*Chemical and Pharmaceutical Arts.—Gold Medal :* Wellcome Chemical Research Laboratories ; Read Holliday and Sons ; Jeyes' Sanitary Compounds Company (Limited). *Silver Medal :* Dr. G. Barger (collaborator to the Wellcome Physiological Research Laboratories) ; Dr. Frederick B. Power (collaborator to the Wellcome Chemical Research Laboratories).

Department of Agriculture.

Group 80.—*Fertilisers.—Grand Prize :* The United Alkali Company (Limited).

Group 87.—*Farinaceous Products and their Derivatives.—Gold Medal :* Allen and Hanburys (Limited).

Group 94.—*Fermented Beverages.—Silver Medal :* E. Dyer and Co.

Department of Mines and Metallurgy.

Group 116.—*Ores and Minerals.—Gold Medal :* The British South Africa Company (Rhodesia). *Silver Medal :* J. C. Burrow (collaborator to the Home Office).

Group 118.—*Metallurgy.—Grand Prize :* The Monk Bridge Iron and Steel Company (Limited) ; The Farnley Iron Company (Limited).

The total number of awards secured by Great Britain now stands thus :—Grand prizes, 142 ; gold medals, 250 ; silver medals, 170 ; bronze medals, 134. Total, 696.

THE JOURNAL.

From the beginning of next year the Society's Journal will be printed and published by Messrs. Vacher and Sons, Great Smith Street, Westminster, S.W., to whom all communications regarding subscribers' copies and advertisements should be sent.

SUBSCRIPTIONS FOR 1905.

Foreign and Colonial Members are reminded that the subscription of 25*s*. for 1905, payable on January 1st next, should be sent in good time to the Hon. Treasurer (Mr. Samuel Hall), in order to ensure continuity in the receipt of he Society's Journal. Any changes of address to appear o the new List of Members now in course of preparation should reach the General Secretary not later than January 5th, 1905.

List of Members Elected

23rd NOVEMBER 1904.

Aston, Francis William, Tennal House, Harborne, near Birmingham, Chemist.
Bryant, Arthur P., 661, Winthrop Avenue, Chicago, Ill., U.S.A., Chemist.
Calvert, Harry Thornton, West Riding of Yorkshire Rivers Board, Wakefield, Chemist.
Clark, Dr. Homer, c/o The Vacuum Varnish and Chemical Co., 6, Seaview Avenue, East Norwalk, Conn., U.S.A., Chemical Manufacturer.
Cowee, Harvey D., 161, River Street, Troy, N.Y., U.S.A., Chemist.
Dempwolf, Chas., jun., 713, S. George Street, York, Pa., U.S.A., Chemical Manufacturer.
alk, Milton J., 16, East 81st Street, New York City, U.S.A., Teacher of Chemistry.
letcher, William E., Foreite Powder Co., Landing, N.J., U.S.A., Chemist.
oust, Thomas B., c/o Bon Air C. & I. Co, Allen's Creek, Tenn., U.S.A., Chemist.
Frasch, George B., 543, Morris Avenue, Elizabeth, N.J., U.S.A., Chemist.
Goodier, Herbert, 16, Hall Royd, Shipley, Bradford, Yorks., Textile Engineer.
Heurich, Christian, 1307, New Hampshire Avenue, N.W., Washington, D.C., U.S.A., Brewer.
Lane, C. Cyril P., c/o The Avon India-Rubber Co., Melksham, Wilts., Chemist.
Law, Herbert, 72, Belvedere Road, Liscard, Cheshire, Analytical Chemist.
Lesley, R. W., Pennsylvania Building, Philadephia, Pa., U.S.A., Cement Manufacturer.
Mabee, Fred Carleton, McMaster University, Toronto, Ontario, Canada, Assistant in Chemistry.
Marckworth, O. S., Ohio Testing Laboratory, 19 and 25, Board of Trade, Columbus, Ohio, U.S.A., Analytical Chemist.
Miller, William Exley, c/o The Arizona Copper Co., Ltd., 29, St. Andrew Square, Edinburgh, Secretary.
Mukerjee, Dr. S. C., Imperial Pharmacy, Umballa Cantonment, Punjab, India, Pharmacist.
Pickett, Chas. E., 26, East 23rd Street, Bayonne, N.J., U.S.A., Superintendent, Borax Refinery.
Rapelje, Walter S., 957, Liberty Avenue, Brooklyn, N.Y. U.S.A., Chemist.
Remington, Prof. Joseph P., 1832, Pine Street, Philadelphia, Pa., U.S.A., Author, U.S Pharmacopœia.
Richardson, Wm. S., 201, High Street, Lincoln, Chemical Manure Manufacturer.
Robinson, Prof. Franklin C., Bowdoin College, Brunswick, Maine, U.S.A., Professor of Chemistry.
Rosenblatt, A.H., c/o Toch Brothers, 52—62, 9th Street, Long Island City, N.Y., U.S.A., Superintendent and Chemist.
Schniewind, Heinrich, jun., Susquehanna Silk Mills, 62, Greene Street, New York City, U.S.A., Vice-President and Treasurer.
Schultz, Carl R., 440, First Avenue, New York City, U.S.A., Mineral Water Manufacturer.
Setzler, Dr. Horace B., c/o Lake Carriers Oil Co., Coraopolis, Pa., U.S.A., Superintendent.
Skowrioski, S., Republic Rubber Co., Youngstown, Ohio, U.S.A., Chemist.
Smallman, J. E., c/o Canada Chemical Manufacturing Co., Ltd., London, Ont., Canada.
Speiden, C. C., Summit, N.J., U.S.A., Chemical Merchant.
Toyne, Francis D., c/o Messrs. Henry Ashwell and Co., New Basford, near Nottingham, Chemist.
Trubek, M., Wood Ridge, Bergen County, N.J., U.S.A., Manufacturing Chemist.
Tunnell, Raymond W., 425, West Walnut Lane, Germantown, Philadelphia, Pa., U.S.A., Manufacturer.
Turnbull, R. H., c/o MacAndrews and Forbes Co., Smyrna, Turkey, Asia Minor, Analytical Chemist.
Young, James, c/o Flax Pulp, Ltd., Weston Point, Runcorn, Cheshire, Chemist.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Archbold, Dr. Geo., l/o Ontario ; c/o Omo Manufacturing Co., Research Laboratory, Middletown, Conn., U.S.A.
Bousfield, E. G. P., l/o York ; Ozonised Oxygen Co., Ltd., 20, Mount Street, Manchester.
Boyd, Wm., l/o Johannesburg ; P.O. Box 143, Germiston, Transvaal.
Brown, Wm., l/o Great Clowes Street ; Terrace House, The Cliff, Higher Broughton, Manchester.
Chemical Trade Journal, l/o Manchester ; Dane's Inn House, 265, Strand, London, W.C.

Craven, Jas., l/o Manchester; c/o Columbia Creosoting Co., Shirley, Ind., U.S.A.

Dodd, A. J., l/o Riverview; Heathfield House, Belvedere, Kent, Works Manager.

Holmes, F. G., l/o Liverpool; Northcroft, Tewit Well Road, Harrogate, Yorks.

Jones, Wm. App, l/o New York; c/o Boston Artificial Leather Co., Stamford, Conn., U.S.A.

Jonker-Czn., H., l/o Wörth; Hotel Europaischer Hof, Hagenau, Elsass, Germany.

Kibble, W. Oakes, l/o Denver; Journals to General Delivery, St. Louis, Mo., U.S.A.

Koebig, Dr. J., l/o East Third Street; 127, West First Street, Los Angeles, Cal., U.S.A.

Le Maistre, Fred. J., l/o Montreal; Henry S. Spackman Engineering Co., 1619, Filbert Street, Philadelphia, Pa., U.S.A.

Lindsay, Robt., l/o Alexandria; Geldenhuis Deep G.M. Co., Cleveland, Johannesburg, Transvaal.

Millar, J. H., l/o Greytown; Box 440, Durban, Natal.

More, A., l/o Government Laboratory; 19, Ryecroft Street, Fulham, S.W.

Moses, Herbert B.; Journals to c/o Berkely Hotel, Buffalo, N.Y., U.S.A.

Quinan, Wm. R.: Journals to the General Manager, De Beers Explosive Works, Dynamite Factory, Cape Colony, South Africa.

Ratcliffe, Chas. F., l/o Leeds; c/o Brotherton and Co., Ltd., Provan Chemical Works, Millerston, Glasgow.

Ripley, Philip F., l/o Providence; 48, Central Street, Andover, Mass., U.S.A.

Schlichtung, E., l/o Hicks Street; 38, Cranberry Street, Brooklyn, N.Y., U.S.A.

Seligman, Dr. R.; Journals to 17, Kensington Palace Gardens, London, W.

Shields, Dr. John, l/o Willesden Green; Minas de Rio Tinto, Prov. de Huelva, Spain.

Taylor, Jno., l/o Great Crosby; c/o Brotherton and Co., Ltd., Tar Works, Litherland, Liverpool.

Thatcher, E. J., l/o Knowle; The Manor House, Chew Magna, near Bristol.

Tyler, Charles R., l/o West 57th Street; c/o Dr. Francis Wyatt, 402, West 23rd Street, New York City, U.S.A.

Warden, Jno. B., l/o Deadwood; Sevier Mine, Kimberley, Utah, U.S.A.

Wense, Dr. W., l/o Griesheim; c/o Herrn H. Schultz, Graalstrasse, Lüneberg, Germany.

Wilkins, A. D., l/o Elizabeth; Bellevue P.O. Station, Allegheny, Pa., U.S.A.

Wilson, A. Poole, l/o Nova Terrace; 81, Botanic Road, Glasnevin, Dublin.

CHANGE OF ADDRESS REQUIRED.

Jones, G. Poole, l/o Park Hotel, Williamsport, Pa., U.S.A.

MEMBERS OMITTED FROM LIST.

1902. Forster, Ferdinand E. P., c/o Messrs. Bass and Co., 19, Guild Street, Burton-on-Trent, Chemist.

1900. Richardson, Wm. Derrick, 4306, Forestville Avenue, Chicago, Ill., U.S.A., Chemist (Swift and Co.).

1893. Welch, J. Cuthbert, Montreal and Boston Cons. Mining and Smelting Co., Boundary Falls, B.C., Canada, Chemist and Metallurgist.

CORRECTION.

Sir Michael B. Nairn, Bart., is the father of Mr. Michael Nairn, member of this Society.

Death.

Newton, John, Park Green, Macclesfield.

Annual General Meeting,

NEW YORK, 1904.

PITTSBURG, Thursday, Sept. 15th.

Reception Committee.

K. F. Stahl, Chairman.
Jas. O. Handy, Secretary.
H. K. Porter, Treasurer.

Chester B. Albree.
Edward E. Armstrong.
Jas. M. Camp.
H. W Craven.
John E. Hurford.
Geo. A. Macbeth.
A. G. McKenna.
Walter H. Stietel.
F. Schniewind.
Emil Swensson.
C. P. Tiers.

Ladies' Committee.

Miss Mary Lynne, Chairman.

Mrs. Chester B. Albree.
Miss May Lynne.
Mrs. J. F. Hurford.
Mrs. W. H. McKenna.
Mrs. H. K. Porter.
Mrs. K. F. Stahl.
Mrs. Emil Swensson.
Mrs. C. P. Tiers.

On arrival at the Pittsburg station the visitors were received by Dr. K. F. Stahl, Mr. Jas. O. Handy, and other members of the Reception and Ladies' Committee, and conveyed to the Hotel Schenley. After dinner the Pittsburg Exposition was visited.

Friday, Sept. 16th.

The ladies visited the Phipps Conservatory, in Schenley Park, and then went for a drive, lunching *en route* at the County Club. In the afternoon they visited the Ward-Mackey Bakery, and in the evening went to the theatre.

The gentlemen in the morning visited the Westinghouse Electric and Manufacturing Co. and the Westinghouse Machine Co., and were conducted through the works by the managers, assisted by a large staff of guides.

The Westinghouse Electric and Manufacturing Co. was organised in 1886; the works were then situated in Pittsburg, and employed 200 men. In 1895, increasing business necessitated removal of the premises to the present site in East Pittsburg, and in 1899 further extension was commenced, and has been continued, until now the works contain a total floor space of about 47 acres, and employ 9000 men, exclusive of the 3000 employed in the various branch works in the United States. The scope of the works may be gauged by the fact that, in the engineering department alone, a staff of 350 mechanical and electrical experts is employed. The offices and works are connected by a local telephone system, which has 400 instruments, and a pneumatic tube system. The erecting shops consist of three aisles, two of which are 1184 ft. long and 70 ft. wide, whilst the third is 1760 ft. long by 70 ft. Among the work turned out by the company may be mentioned the 5500-k.w turbo-generator unit and eight 5000-k.w. alternating current generators supplied for the Manhattan Elevated Railway (New York), and the nine 5000-k.w. alternating current generators supplied for the subway division of the New York Interborough Rapid Transit System. The company is now building transformers of 2750 k.w. capacity, and motors up to 2000 h.p.

The party were then conveyed on special cars to Kennywood Park, on the further side of the Monongahela River, where lunch was served.

After lunch a portion of the party visited the Duquesne Blast Furnaces, Steel Works, and Rolling Mill, while the remainder went to the Homestead Steel Works and Rolling Mill, both belonging to the Carnegie Steel Co.

The Duquesne plant includes four blast furnaces, two 10 gross ton Bessemer converters, and fourteen 50 gross ton basic open-hearth furnaces. The product consists of billets, blooms, slabs, sheet, bars, splice bars, and merchant bars. The annual capacity of this plant is 600,000 tons of Bessemer steel ingots and 480,000 tons of open-hearth steel ingots.

The Homestead plant includes five blast furnaces, fifty 50 gross ton basic open-hearth furnaces, and two 10 gross ton Bessemer steel converters. It produces blooms, billets, slabs, structural shapes, structural work, boiler plates, ship plates, tank plates, universal plates, armour plates, and open-hearth steel castings. The annual capacity of the plant is 425,000 tons of Bessemer steel ingots and 1,550,000 tons of basic open-hearth steel ingots. The blast furnaces are on the other side of the Monongahela River, and the molten metal is conveyed across a bridge to the steel furnaces. This takes three-quarters of an hour, which, seeing that the metal would require some four and a half hours to solidify, leaves an ample margin of time. What strikes the visitor is the economy of labour in handling the great blooms resulting from these operations. Electrically driven machinery rolled ingots of steel weighing more than 10 tons into 40 ft. of steel plate, 5 ins. thick, with the utmost ease. A pyramidal framework, 30 or 40 ft. high, moved about at the bidding of one man seated at the apex, seized an ingot with tongs, put it through the rollers, received it in a new spot, put it through again and again, and then took it to a fresh place and repeated the operation. All this was done by electrically transmitted power. Every now and then water was thrown on the surface of the ingots, then a phosphate, and, though the water created no explosion, the addition of the salt did. Economy of handling and perfection of organisation and arrangement were the lessons taught by this day's visits. Every care and consideration seemed also to be given to the comfort and happiness of the workpeople.

The Union Switch and Signal Co., the Westinghouse Air Brake Co., and the McKeesport Tin Plate Co. were also open to members.

In the evening a smoking concert was held in the banquet hall of the Hotel Schenley.

SATURDAY, SEPT. 17TH.

In the morning one party visited the Phœnix Glass Co.'s works at Monaca, the works of the Pressed Steel Car Co., and the Lake Erie Railroad shops. A second visited the Allegheny Plate Glass Co.'s works. A third visited the Ward-Mackey Co.'s bakery and the food products factory of the H. J. Heinz Co. The ladies joined in this visit, and were each presented with souvenirs by the H. J. Heinz Co. All were impressed with the extreme cleanliness of the factory. A fourth party visited a coal mine, and a fifth went to the Atlantic Refining Co.'s oil works, and thence to the Nernst Lamp Co.'s factory. Another coal mine, the Harbison-Walker Refractories Co.'s works, and those of the Armstrong Cork Co. were also thrown open. Messrs. Heeren Bros. and Co., manufacturing jewellers, also specially invited inspection by the ladies. Accounts of these visits will be published as received.

The Nernst Lamp Co.—The Nernst lamp is the only electric incandescent lamp the filament of which glows in the open air. Certain rare earths, notably zirconia and thoria, belong to the class of "secondary conductors," *viz.*, they permit the passage of an electric current only under certain conditions, of which heating is one. It is therefore necessary to induce this condition before the current can pass. This is done by means of heaters consisting of hollow cylinders made of pure kaolin, looking like a piece of the stem of a clay pipe, wound round with platinum wire, protected in its turn with a coating of some silicate, which also acts as a radiator. This heater may again be wound into a spiral, through which the glower or filament is inserted; or a heater may be placed on either side of the glower. When the current is turned on, it first passes through the heater, which in its turn heats the glower until the temperature rises sufficiently to permit a current to pass through that, whereupon, by an ingenious automatic arrangement, the current is cut off the heater and passes solely through the glower. The number of glowers to a lamp varies from one to six. They are usually made in the form of a slender rod, with a little ball at each end, and consist of a mixture of rare earths, such as zirconia, thoria, and yttria, with admixtures, in varying proportions, of other earths to graduate the colour of the light. The principal sources of these oxides are: allanite, cyrtolite, fergusonite, gadolinite, nivenite, rowlandite, thero-gummite, yttrialite, and zircon. At Pittsburg one or more of these minerals are fused with soda in an iron cauldron heated by a blast of natural gas. Small incandescent beads appearing on the top of the fusion have been ascribed to the liberation of sodium in the reaction, but may only be bubbles of hydrogen gas sufficiently impregnated with soda to give the flame—though, on the other hand, the Castner process has demonstrated the ability of iron to reduce soda under favourable conditions. The product of the fusion consists of rare-earth oxides, mixed with some silicate of soda, which, after purification and separation, form the basis of the glower.* In order to make contact, the little balls at each end of the glower are made white hot in the electric arc by a workman, whose face is protected by a screen, and who only sees a darkened reflection of what he is doing in a mirror. At the right moment he embeds a platinum bead in the white-hot ball, and they fuse together in such wise that any tendency to shrink on the part of the glower material only makes the contact closer, and thus maintains intimate union. A lead wire is then fused on to the embedded platinum beads. This device is called the Hanks terminal. The glower is a secondary conductor, but is also an electrolyte. The presence of oxygen seems to be at least desirable. No electrolytic action is apparent when an alternating current passes, but with direct current a black deposit at the negative end of the glower spreads gradually towards the positive terminal, and the candle power and efficiency fall off. Great improvements are being made in direct-current glowers. A "ballast" or steadying resistance is required with each glower, and this consists of fine iron wire fused to platinum terminals and enclosed in a glass bulb filled with hydrogen.

Enough has been said to show the complicated nature of the manufacture when put into practice, and, seeing that nearly every detail is made on the premises, it was not to be wondered at that the visit soon passed the limits of the ordinary Saturday morning's work. The staff and employees, however, willingly remained working for the Society's benefit for half an hour longer.

All the visitors assembled at 1.30 at the Union Club on the 19th floor of the Frick Building. They were then entertained at luncheon by the Reception Committee. After lunch the party went up the Monongahela River by steamer as far as McKeesport.

An "Abschiedstrunk" terminated a most enjoyable visit to this interesting city, to which the hearty welcome given by the local members, their ladies, and friends contributed much. The thanks of the members are also due to the Engineers' Society of Western Pennsylvania and the local members of the American Chemical Society. At 10 p.m. the special train left for St. Louis.

ST. LOUIS, SUNDAY, SEPT. 18TH.

RECEPTION COMMITTEE.

F. W. Frerichs, Chairman.

Chas. E. Caspari.
August H. Hunicke.
Edw. H. Keiser.
Sherman Leavitt.
H. M. Whelpley.

Honorary Committee.

Edw. Mallinckrodt, Chairman.

R. S. Brookings.
W. S. Chaplin.
Chas. P. Nagel.

With a ladies' committee consisting of Mrs. F. W. Frerichs, Mrs. H. M. Whelpley, Miss Roever, and many others.

On arrival at St. Louis the visitors were received by representatives of the local committee, the St. Louis Chemical Society, and Mr. Walter F. Reid, late Chairman of the London Section and one of the jurors. The bulk of the members remained on the train, which was placed in a siding in the exhibition grounds.

---

* This is made by expressing from a die a dough of rare earths mixed with a suitable binding material, cutting the porcelain-like string thus made into lengths, drying, roasting, and finally attaching lead wire.

Monday, Sept. 19th.

Members devoted their time to studying the Exposition, which covers so vast an area, 250 acres, that four days were far too few to do more than form a general idea of it. In the afternoon, many assembled in the Festival Hall to witness the opening of the Science Congress and to hear Prof. Simon Newcomb's opening address. Sir Wm. Ramsay also addressed the meeting in place of the Rt. Hon. James Bryce, M.P., who was unable to be present in time. He expressed the thanks of Great Britain for the courtesies which had been shown to her representatives who had come to attend the Congress.

In the evening the St. Louis Chemical Society gave a banquet at the Southern Hotel to the members of the Society of Chemical Industry and the other foreign chemists who were attending the Congress. Dr. F. W. Frerichs occupied the chair. Among those who were present were Sir William Ramsay, Dr. Theodor Lewald (Imperial German Commissioner), Count Limburg-Stirum, Major-Gen. Waterhouse, Col. Conburgh, Profs. Ostwald, Arrhenius, J. H. Van't Hoff, Erdmann, Oscar Liebreich, C. E. Caspari, J. M. Goad, V. Coblentz, M. T. Bogert, F. W. Clarke, Ernest Rutherford, W. O. Atwater, A. B. Prescott, and S. P. Sadtler; Drs. M. Benjamin, H. M. Whelpley, Otto Zwingenberger, R. Messel, J. Lewkowitsch, R. Möhlau, J. T. Conroy, W. Hermsdorf, J. Holmes Joy, L. Rostosky, and H. W. Wiley; Messrs. Gustave Cramer, Edw. Mallinckrodt, George Merck, C. F. G. Meyer, Theo. F. Meyer, Thos. Tyrer, Eustace Carey, Walter F. Reid, and many others. Chancellor Chaplin, of the Washington University, St. Louis, was the toastmaster, and speeches were made by Sir Wm. Ramsay, Profs. Arrhenius, Van't Hoff, and Atwater, Dr. Wiley, and Mr. Tyrer.

Tuesday, Sept. 20th.

A visit was paid to the German Chemical Exhibit, and the ladies were entertained at luncheon by the ladies' committee at the Imperial German House. Dr. Chapzki gave a demonstration of Carl Zeiss' ultra-microscopic apparatus.

Wednesday, Sept. 21st.

Sir Wm. Ramsay read a paper on the present problems of Inorganic Chemistry before the Science Congress. Prof. Moissan also addressed the meeting. In the afternoon Prof. W. A. Noyes addressed the Congress on Organic Chemistry.

Mr. J. E. Petavel gave a lecture on liquid and solid hydrogen, with experiments. In the afternoon and evening there were receptions at the French Building and at the Imperial German House respectively.

Thursday, Sept. 22nd.

Thursday was again devoted entirely to the Exhibition. In the evening the Society left for Chicago. By an unfortunate change in the arrangements of the International Congress, the date of the Technical Chemistry sectional meeting was altered at the last moment to Friday 23rd. Those who wish to obtain further particulars of the St. Louis Exhibition will find them in a paper to be read by Mr. Walter F. Reid before the Society of Arts on Dec. 7th next. Mr. Reid will also discuss the chemical and pharmaceutical aspects of the Exhibition before the London Section of this Society on Jan. 9th, 1905. The list of awards to British exhibitors in the chemical and allied sections has been published on page 1014 of the Nov. 15th number of the Journal, and on page 1059 of this issue. For those who desire more general information the September numbers of the "Cosmopolitan Magazine," New York, and "The World to-day," Chicago, both devote their space entirely to the Exhibition.

CHICAGO, Friday, Sept. 23rd.

Local Committees.

Executive.

T. B. Wagner, Chairman.
W. A. Converse, Secretary.
John A. Lynch, Treasurer.

C. E. Calm.
John A. Wesener.
John H. Long.
Jacob Baur.
J. P. Grabfield.

Entertainment and Programme.

C. E. Calm. Chairman.
Julius Hieglitz.
C. H. Propach.

Hotel and Transportation.

Jacob Baur.

Invitation and Press.

John A. Wesener.

Ladies' Committee.

Mrs. Theodore Brentano, Chairman.
Mrs. C. E. Calm.
Mrs. T. B. Wagner.
Mrs. John H. Long.
Mrs. J. A. Wesener.
Mrs. C. M. Eddy.
Mrs. W. A. Converse.
Mrs. H. E. Harrison.
Mrs. C. Propach.
Mrs. Alexander Finn.

The above were assisted by a large reception committee and many others, who gave willing help in entertaining the visitors.

The members assembled at headquarters, the Auditorium Annex, at 10.30, and proceeded to visit the "Board of Trade" or Corn Exchange, on which between three and four times the equivalent of the United States wheat crop was bought and sold in 1903. The First National Bank and the Illinois Trust and Savings Bank were also visited. A little before 1 p.m. the visitors proceeded to the Stockyards. These establishments cover an area of about 500 acres, and here are handled daily 75,000 cattle, 300,000 hogs, 125,000 sheep, and 6,000 horses. The Chicago Junction Railway handles the transportation with 300 miles of track, while 45,000 men are employed within the yards. Chicago deals with three-fourths of all the fat cattle marketed in the country, and packs and ships three-fourths of the meat products exported by the United States. On arrival at the yards, luncheon was provided by the courtesy of Messrs. Swift and Co. After lunch, the slaughtering houses were inspected, then the manufacture of oleomargarine at the factory of Messrs. Nelson, Morris, and Co., and the canning of foods at that of Messrs. Libby, McNeill, and Libby; while the laboratories of Messrs. Armour and Co., who make glandular preparations for therapeutic purposes, were also open for inspection. Soap, glycerin, glue, gelatin, bone, hoofs, ammonia, isinglass, curled hair, neatsfoot oil, and fertilisers are turned out in large quantities by these firms. Souvenirs of the visits were presented to each of the visitors. In the evening there was a reception in the banquet hall of the Auditorium Hotel.

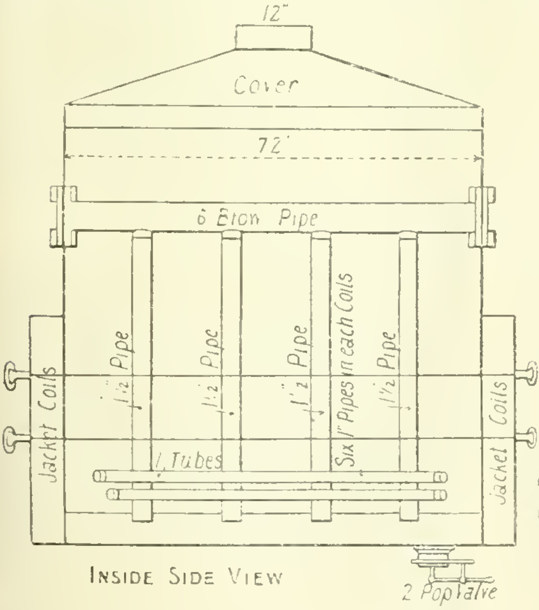
In the daytime the ladies visited Marshall, Field, and Co.'s Retail Store and the Art Institute, joining afterwards in the evening reception.

Saturday, Sept. 24th.

The members divided into several parties. Some visited the Standard Oil Co.'s works at Whiting, Ind., where the plant for the desulphurisation of the oil aroused much interest, some the Matthiessen-Hegler Zinc Works at La Salle, Ill., some the Elgin Watch Co.'s works, and some the Drainage Canal by which the sewage of Chicago is passed over the watershed into the basin of the Mississippi, whereby the death rate of the city has been materially lowered. Visits were also organised to the works of the Liquid Carbonic Co., the Illinois Steel Co.'s Cement Works both at Chicago, and the Milk Products Co., at Carey, Ill., a branch of the Union Condensed Milk Co. of New York, where oxygenated milk is prepared according to the following process, for the description of which the Society is indebted to Mr. F. L. Kneeland, a director of the company.

The Evaporation of Milk.—By an invention of Dr. J. H. Campbell, of New York, milk is now evaporated to any desired density at a temperature not above 145 F.; the accompanying diagram shows the apparatus employed. A rectangular tank is surrounded by a jacket-coil system one-half its height, and contains inside two sets of heating coils. By means of a pump, hot water is rapidly circulated through the outer and inner coils into a receiving tank, which is heated by exhaust steam, the same water being pumped through the coils again and again. A 6-in. pipe extends across the inside of the tank, near the top, and connects with perpendicular 1½-in. pipes extending below the interior coils within 3 ins. of the bottom of the tank. By this means, a root blower drives a large volume of sterilised air into the fluid contained in the tank. If the temperature of the water in the circulating coils is 185° F., the temperature of the milk in the evaporator will be 140° F., owing to the passage of the air through it. This air, saturated with vapour, is drawn off by means of a fan placed in the opening at the top. As the air blast passes through the milk, it carries off the vaporisable impurities and destroys the bacteria in the milk. The process requires from a few minutes to two hours, according to the evaporation desired. The low temperature of the milk causes no coagulation of the casein and lactalbumin, and by adding the amount of water taken from the milk, the resultant product is normal milk, thoroughly sterilised and chemically and physically unchanged. The solid impurities are removed by a separator beforehand, and the separated cream is added to the blown skim milk only towards the close of the blowing, otherwise there would be a risk of churning.

The party which visited the Milk Products Co. travelled by special train, and then proceeded to Lake Geneva, in Wisconsin, where they were met by Prof. Barnard, and conveyed in Mr. Martin Ryerson's yacht "Hathor" to inspect the Yerkes Observatory. The dome of the observatory can be revolved at will, and the floor can be raised or lowered by hydraulic pressure. All these mechanical adjuncts are absolutely necessary; even then observations are made under considerable difficulties, especially in winter, when no artificial heat is admissible. In the library were shown magnificent photographs of star clusters and nebulæ, all taken direct by the professors and their assistants. The refracting telescope weighs 20 tons, and is 63 ft. long; it is so perfectly balanced that a touch on a wheel suffices to move it wherever desired. The opening is 40 ins. in diameter, and the lens is composed of flint and crown glass. The telescope is said to have the best definition in the world. With its aid Prof. Barnard discovered the ninth satellite of Saturn, a star of the seventeenth magnitude, and established its connection with the solar system.



INSIDE SIDE VIEW

Prof. Frost described the spectrographic work, and Dr. Schlesinger explained the arrangements for direct photography. The party then returned to the yacht and sailed the full length of the lake, at the end of which they rejoined the train for Chicago.

On Saturday evening a concert was given in the Auditorium Theatre by Sousa's Band. The whole of the boxes were reserved by the Committee for the Society, the theatre was decorated with intertwined flags, and a special programme was performed in honour of the visitors.

SUNDAY, SEPT. 25TH.

In the afternoon the visitors drove through Washington and Jackson Parks, past the site of the Chicago Exhibition and the Field Museum, to Chicago University. There Prof. Nef showed the Chemical Laboratory, and Prof. Michaelson gave a spectroscopic demonstration in the Physics Laboratory. Tea was served at the Reynolds Club, after which the party drove back to Chicago, and left for Detroit at 10 o'clock.

(*To be continued.*)

London Section.

Meeting held at Burlington House, on Monday, November 7th, 1904.

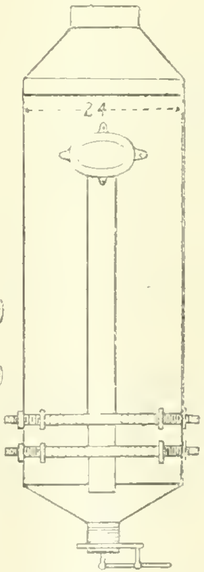
MR. A. GORDON SALAMON IN THE CHAIR.

The CHAIRMAN, after warmly thanking the members for electing him to the office of Chairman, announced that Mr. R. J. Friswell had been elected Vice-Chairman of the Section.

THE TREND OF INVENTION IN CHEMICAL INDUSTRY.

BY J. FLETCHER MOULTON, K.C., F.R.S., M.P.

When your Committee paid me the compliment of asking me to address this formidable scientific assembly, I felt the difficulty of the task even more keenly than I appreciated the honour. I knew too well the men who would form the audience before whom I should have to speak. Throughout my professional life I have been continually brought into contact with the leaders of our scientific industries, and have learnt to appreciate the knowledge and skill they bring to their work. The position that I occupy tonight belongs naturally to them. They can speak to you weighty words of guidance as to your daily difficulties, and by the narration of their triumphs lead and stimulate you to equal successes. But one like myself, who stands outside your sphere of work, has neither the experience to guide nor the knowledge to teach. He is fortunate if only he can understand and sympathise with your labours.



INSIDE END VIEW.

And if this were primarily an assembly of chemists, these considerations would probably have led me to decline the honour. But you represent chemical industry, and not chemistry simply. Theoretical chemistry has long been the land of the chemical specialist alone, and it is idle for any other to affect to be a citizen of it or to attempt to form an independent judgment of its progress. But it is otherwise with chemical industry. Pray do not think that I regard its sphere of effort as less worthy or less difficult than that of theoretical chemistry. But it is different. The chemist seeks after knowledge; chemical industry applies it. The sole test for the one is "truth," for the other "result." That which your profession has under its charge is a part of the practical work of life, and though its leaders and workers must be skilled chemists, and derive their guidance and inspiration from the discoveries of theoretical chemistry, to which many of them have contributed so largely, they take their rank to-night by the practical success of their work, and not by its theoretic merit. The triumphs of chemical industry are economic, however much they may depend on scientific knowledge and research; and thus they are justly open to the contemplation and reverent criticism of all who study the world's work and the world's progress.

This distinction becomes clearer when we look to the forces which are at work to cause progress in these two great branches of human effort. While the one derives its development from the insatiable thirst for knowledge which, in thoughtful minds, is the splendid result of knowledge itself, the other has a far ruder but not less efficient stimulus in the unceasing, though friendly, competition that goes on in the markets of the world. It is here made to feel that its work is practical, and that, like every other branch of industry, its task is to satisfy actual needs of mankind; and its triumph can but consist in doing this well and easily. Hence, progress means that a lessened amount of human labour and sacrifice is required to satisfy such a need; and inasmuch as, broadly speaking, that amount is measured by cost, we may say that the advance to which chemical industry is continually spurred by the pressure of competition is the reduction of the cost of production—in other words, increased cheapness.

Do not think that I am taking a low view of your profession when I speak of cheapness being its aim and the test of its success. I have no sympathy with those who think scorn of cheapness. To me it speaks of a lighter burden in production and a wider possibility of enjoyment—if I may use such a term in connection with the usually uninviting products of chemical manufacture. But while I feel how great is the advantage to mankind of this competition, I appreciate none the less fully how stern and unsleeping a master you have and how you must often groan under his sway. I know that evolution through the struggle for cheapness is not peculiar to your industry, but in no branch is the pressure so keen or the problem to which it gives rise so difficult. In none is the interworking of action and reaction so immediate or so complex. In olden days the chemical manufacturer made the one product he sought and was content. All that which was left was waste. But the pressure of competition soon drove him to seek some contribution to his working costs from that which he had previously thrown away, and the utilisation of by-products began. This has grown to such a pitch that there is scarcely a single important chemical industry that could afford to trust to a single product. Groups of products thus take the place of single products, and the production of a member of a group is linked by quantitative relations to that of the other members, and is no longer regulated independently by the laws of supply and demand. Now turn to the selling side. The needs of mankind measure the demand for your products. Many of these needs are imperative but limited. The demand does not grow with the supply. If too little is produced the price will go up to its highest limit, *viz.*, the equivalent of its value in use. If too much is produced the price will fall, and if by reason of its being a by-product, that production cannot be checked there is no limit to such fall. A change of process may glut the market in some article which has become a by-product, and may send it to a nominal price. The manufacturer has to steer his way among all these difficulties, and, verily, his task is no light one.

I do not know whether his hopes or his fears trouble him most. The selling price is ruled—in the absence of disturbing causes—by the ordinary cost of production. Hence, the pioneer who introduces and works a cheaper method, reaps the difference of cost of production as his reward so long as his method remains exceptional. But the exceptional of to-day becomes the ordinary of to-morrow and brings about a corresponding readjustment of prices, so that the old methods must be abandoned if manufacture is to bring any profit at all, and fresh progress must be made by those who seek exceptional returns. It is this which makes the work of the chemical manufacturer so arduous. Chemistry is too rich in possibilities. The stimulus to advance is keen and the opportunities for it numerous, and when a genuine advance is made all must follow—if not to get the pioneer's reward, at least, to escape the laggard's punishment.

To-night I have to deal with the advance made in this restless field of human effort under this unceasing stimulus. As you will suppose, I find no lack of material.

To give order to my remarks, let me analyse for a moment the forms in which advance may be made in the domain of chemical industry. Like every other department of industry its province is to satisfy practically the wants of mankind, and the aim of those who direct it is to do this as cheaply and in as efficient a way as possible. Hence advance may consist in its extending the scope of its manufactures by taking in new products to satisfy new wants, or more effectually to satisfy old ones. But chemical industry must seek somewhere the necessary materials for its manufactures, because chemistry does not create matter, it only rearranges it, and therefore advance may consist in the choice of new sources from which those materials are derived. These are no doubt two important types of advance, but at the present moment the main line of advance of chemical industry is not to be sought in the list of its products or the sources from which its materials are derived, but in the improved method by which it works. It is in these three divisions I shall consider the subject, *viz.*, the trend of invention in—(1) the products, (2) the sources of material, and (3) the processes of chemical industry.

So far as new products are concerned, the present moment is specially characterised by the initiation of a crowd of small manufactures. No epoch-making change is manifesting itself. This is natural. Some 30 years ago two gigantic chemical industries took their rise, *viz.*, that of modern explosives and that of coal-tar dyes, and the world has ever since been working out in detail the almost revolutionary changes they brought about. I do not suggest that their fertility in new products is checked. New explosives are still being introduced, mainly such as are designed to meet the special difficulties of particular uses, such as the flameless explosives for coal mines, or the almost detonating explosives which can yet stand safely the shock of being fired in shells. New dyes are constantly being invented, and the names of fear which they bear become more terrible each year. But the triumphs of these great industries in the past have been so magnificent that no developments of to-day can overshadow or displace them, and the description of their growth in recent years, however sound and vigorous it may have been, would consist of a detailed list of products wholly beyond the scope, and foreign to the nature of this address.

One victory, however, of the coal-tar dye industry cannot be passed over, and that is the commercial manufacture of synthetic indigo, which has taken such proportions, that it threatens to supplant the natural product, and produce far-reaching economic consequences in our Indian Empire. It is the greatest industrial triumph of synthetic chemistry, and one hardly sees where it will find another like conquest to make. Its history illustrates well how independent, and yet how inter-dependent are the domains of chemistry and chemical industry. It is properly classed as an invention of to-day, although the synthesis of indigo has been possible to chemists for some years past, for it did not pass into the domain of chemical industry until a long series of improvements in the processes for its production, made under the stimulus of industrial development, enabled it to compete in cost with the natural dye.

In my opinion, however, there are two departments in chemical industry, which are of great interest at this moment from the inventive development they manifest in their products. The first is that of pharmaceutical products. A field of research and its practical application is here opening out, the importance of which it is difficult to estimate, but which may be very great. I say this, because one can see, though perhaps as yet only dimly, and with little clearness of outline, the rise of great principles such as those which gave birth to the great chemical industries of which I have just spoken. Physiologists are beginning to associate specific effects on the human organism with specific chemical groups. These groups appear in countless combinations in organic chemistry, and their effect may be masked or hindered by the setting in which they are placed. This may arise in many ways. It may be that their effect is produced in the body by their being set free to form new combinations, so that too great stability in the original substance will paralyse them. It may be that their effect is produced by the selective absorption which is so characteristic of the organs and tissues of the human body, and in such cases the overlading of the molecule may render them inert. Again, it may be that the setting of the group, the combination of atoms with which it is associated to form the molecule may itself be capable of producing conflicting or otherwise deleterious effects. In all such cases the group may be present without producing the characteristic result. But the belief is growing that the tendency of the group to produce its specific effect is real and inherent, and that with a right choice of its setting it will produce it without these extraneous effects. It may well be that we are still in the infancy of pure therapeutics. Few drugs are known which, side by side with the effects they are intended to produce, do not bring with them other consequences, unsought for and often undesirable. So far as these take their rise in the organism as a physiological consequence of the original effect they must be accepted. But physiologists are raising the question whether it is certain that they are of physiological and not of pharmaceutical origin. It may well be that many of the forms in which the effective groups have up till now been administered, have influenced and distorted the normal action of the group itself, and a line of genuine research and invention is being pressed forward, seeking practical solutions of the problem of the best way to use these operative groups. Taking at hazard a concrete example, let me instance the salicylic group which is so potent, but the effects of which on the heart are held in many cases to prohibit the use of it in its ordinary forms. It is claimed now that if, instead of administering it in the shape of salicylic acid, or its salts, you take it in an acetyle setting as salicylic-acetyle, those ill effects are not produced. I am not concerned with the question whether this has or has not yet been demonstrated, but, assuming it to be so, it gives a clear instance of the nature and object of the research to which I am referring. It has already given rise to the discovery and manufacture of a large number of new pharmaceutical products, many of which have been looked for and found by applying the principles I have outlined. Unfortunately it is difficult to prophesy how many of these new manufactures will live. Some have won for themselves a permanent position, but in a department where experiment is so difficult, progress cannot be at once rapid and certain, and, indeed, the chief difficulty in forming a correct opinion on the subject is that in the case of pharmaceutical products, invention too often does not cease with their manufacture, but extends itself to the results of their administration.

The other department of chemical industry to which I wish to refer in this connection is that of foodstuffs. In my opinion the present moment is characterised by a very serious attempt, in a variety of ways, to stop the vast waste of nutritious matter that is going on all around us. There are two forms of this waste. On the one hand, with the exception of cereals, foodstuffs are essentially perishable articles, the preservation of which by existing methods s often more costly than their production, and they are wasted because they cannot be used where and when they are produced. On the other hand, there are many subtances treated as waste which would be capable of giving nutrition if they were in a form suitable for assimilation. I would cite milk as an example of the first of these lasses, and yeast as an example of the second. Now it s a very worthy aim of chemical industry to stop this waste. It may be an excellent advertisement for an xtract of beef company to represent an ox as squeezed into a small earthenware pot, but to the industrial chemist he very existence of such a caricature emphasises the wful waste that is accepted as necessary in order to preserve even any portion of the food. How great would be he consequences of an advance in this department can be measured by the economic value of the system of cold storage at the present time. It would stagger those who have not made a study of the subject to figure out the monetary importance of this system in its present applications, although they are still crude and imperfect in many respects, and need, and will, I think, undergo, great improvement.

The past history of this branch of chemical industry has not shown many successes of which we need be proud. Chemical preservatives are loved but little, and enjoy a social status not much above that of the criminal classes. The difficulties of the problems that present themselves are immense, but personally I think we are at a moment of real advance. For instance, I believe that milk will soon cease to be a perishable article so far as its substantial use for human food is concerned. I should like to see a substantial part of the ability, which is devoted to the practical solution of difficult chemical questions in our existing industries, applied to the preservation of foodstuffs. With one or two exceptions the men who have best succeeded in this department have done so rather by their practical skill and good sense than by their technical knowledge, but I can myself see a change coming, and I hope that I am not wrong in considering it as one of the directions in which invention is about to be most vigorous. It is the great boast of the leaders of our chemical industries that waste has been banished from their factories, and I trust that they will not long be content to see going on around them this enormous waste of that which is necessarily in most universal demand.

These new manufactures, though important in themselves and still more important in their aggregate, are, after all, in point of scale, only the fringe of chemical industry. The main chemical wants of mankind are almost as stereotyped and unchanging as its staple foodstuffs. The overwhelming importance of the alkali industry or of that of sulphuric acid will not materially alter, whatever be the developments in our industrial products. Hence it is that the list of the great chemical industries is so rarely added to. It is rare to find a new want which gives rise at once to a great manufacture. The only approach to this state of things, at the present time, is the cyanide manufacture, which has grown so suddenly to the proportions of a great industry that it almost merits a place in the list of new products. Before 1895 the annual production of cyanides in the world was below 500 tons. Now it amounts to about 8,000 tons. This is entirely due to the MacArthur-Forrest system of gold extraction, to which the world owes the recovery of some 9,000,000 of ounces of gold from its ores, and it is a worthy example of the obligations of chemical industry towards inventors. The demand has been met by the invention and practical introduction of new and ingenious processes of manufacture which have wholly superseded the old methods, and though I do not propose to refer further to them in this connection, they illustrate the abundant resources of chemical industry to deal with newly arising demands.

I turn now to the sources from which chemical industry derives its materials. Here development depends on purely industrial considerations. For the purposes of inorganic chemistry the possible sources from which each element can be obtained have long been known, and organic chemistry has full reason to be satisfied with the inexhaustible mine furnished by our gas industry. But although there is little addition to our knowledge of possible sources, there may come from time to time a shifting of the industrial source from which some element is practically obtained. Take your minds back to the momentous change, extending through the length and breadth of chemical industry, which took place when pyrites were substituted for brimstone as the industrial source of sulphuric acid. The reduction in the cost of producing that king of reagents was not due solely to the fact that fresh sulphur-bearing deposits of enormous extent were made available, but also to the fact that thereby the production of sulphuric acid became linked with, and formed a step in, metallurgical operations themselves of great industrial importance, so that the development of the two industries thereafter went hand in hand, and each shared in the prosperity of the other. Are we on the eve of any such change as this? Not in respect of any element.

strictly so called. But it may be so in respect of something that merits to be considered an element from an industrial point of view. I refer to combined nitrogen.

We all know that nitrogen is the element which is present with us in the greatest and the most useless abundance. It forms five-sixths of the atmosphere, and yet this huge store of nitrogen is substantially useless for practical industry on account of the difficulty of inducing it to combine. But so soon as it is combined it is one of the most tractable of elements. It can be made to pass from its most fiercely acid form of nitric acid to its most alkaline form of ammonia, and through countless intermediate combinations without any attempt to escape from the bondage into which it was so reluctant to enter. It is like the wild horse of the fairy tale that had but to have the magic bridle thrown over him to become the most manageable of steeds. Therefore it is that for industrial purposes we must consider the sources of combined nitrogen rather than those of nitrogen itself, and in this sense combined nitrogen is industrially an element of the widest possible usefulness. In the form of ammonia it is one of those substances to the use of which no limit can be assigned, because it approximates to the position of a food stuff by reason of its manurial value, so that it is hardly possible to think of any abundance so great that it would exceed the demand, provided the price of production be low enough.

It is in connection with combined nitrogen that there is the promise of such a change of source. Important as is the use of pyrites ores it is small in economic importance compared with the generation of power. Engineers have never forgotten the prophecy of the late Sir Frederick Bramwell, that the steam engine would in fifty years be found only in museums, and even though that prediction be somewhat poetic in its phraseology, it is based on the prose fact that the use of the internal combustion engine is developing with a rapidity which promises soon to make it the main source of motive power. To realise the presence of ammonia as an available by-product in the manufacture of gas for such engines, and to work out a practical process which will substantially extract the whole of that which is present in the waste products of combustion in such a manufacture, is to open out a source of combined nitrogen on the most gigantic scale, growing with the growth of all our industries, and specially adapting itself to that tendency to concentrate the generation of power which has followed the development of electricity as a distributing agent. This has been the work of Dr. Ludwig Mond. It is too early to speak of its results, but if the practical and commercial success of the Mond process can be fully established, so that it normally forms part of our power plants, we may expect a change of great and wide-reaching character throughout many branches of chemical industry, similar to, but even more important than, that which followed the substitution of pyrites for brimstone in the sulphuric acid manufacture.

Side by side with this bold endeavour to collect ammonia as a by-product of the production of motor gas, humble, but still, I think, successful efforts are being made to solve the problem which has been attempted so often of getting it from the nitrogenous contents of peat. These attempts are complementary to the work of Dr. Mond and the gas companies. So far as I can see, it is probable that we owe all the combined nitrogen of the world to the patient but humble work of bacteria through the long prehistoric ages, and our business is to recover it from the remains they have left. This combined nitrogen is mainly stored up in coal and peat, small as may be the actual percentage present in these substances, and the choice of these poor but extensive sources of ammonia illustrates the present tendency of invention. The most paying gold mines are those which have an abundance of low grade ore. So is it here. The improvements in plant and the advance in the skill with which it is used have led to a preference for sources which are large in scale over those that are small, even though rich and easily worked. To take infinite trouble to secure success on a large scale is the characteristic of modern developments in industrial chemistry.

But, as I have already said, the main advance in chemical industry is in the processes used. Indeed, the fertility of invention in this respect is so great that it is bewildering to anyone who is striving to classify it or to detect its dominant tendencies. This is especially the case in organic chemistry, where, side by side with the ceaseless stream of new substances, there is poured forth an equally ceaseless and even more abundant stream of new processes for making known ones. Complex molecules are arrived at from different starting points by different routes through different intermediate products. Now one part of the structure is built up first, and now another. Is it possible to detect any definite trend or direction in all this invention?

We must not lose sight of the fact that we are dealing with industrial chemistry, and that, therefore, the invention that concerns us has been developed under the stimulus of competition with a view to obtain economy of production. No doubt there are cases where this is obtained by devising or modifying a process so as to utilise some by-product or cheap raw material. But apart from such cases I think there is a tendency, or perhaps I ought rather to call it an aim, which is so general, that it may fairly be regarded as characteristic of the advance of to-day, taken as a whole. It relates to the question of yield. Both in the modifications of existing processes, and in the choice of new processes, the aim is to increase yield by more perfectly producing the conditions that make for it. It is based on a belief that imperfect returns are due in large measure to our own fault, and that with greater knowledge, and more skilful use of it, the partial successes which now content us could be made complete. Let me try to make my meaning clear.

Consider for a moment a chemical operation which yields various products, one of which is the one sought. Assume that the yield is found to vary. The aim of the chemist is to induce the necessary elements of the combination to be unanimous in arranging themselves so as to form that product, and in avoiding the alternative arrangements which are open to them, so as to give what is known as the theoretical yield. Now in most cases, if not in all, it would be dangerous to dogmatise as to what are the actual chemical changes which go on in producing what are to us the results of the combination. Many steps may intervene in the shape of momentary intermediate combinations, which form the paths to the ultimate products. But it is clear from the variations in the yield that those paths must be so nearly equivalent as alternatives, that very slight variations in the surrounding circumstances will decide in the case of the individual molecules whether they will take the one path or the other. On the break up of the original groupings "moments of molecular indecision" (if I may use such a phrase), evidently occur during which the presence of an otherwise insignificant influencing cause may decide the behaviour of the molecules, and thus determine the ultimate result of the combination.

Let me illustrate my meaning by an example. I will take the manufacture of the toluol sulpho-chloride from which saccharin is ordinarily produced. It was well known that sulpho-acids and sulpho-chlorides could be formed directly from toluol by the action of chlorhydrin, but only a portion of the toluol was thus turned into sulpho-chlorides, and of these only a portion consisted of the ortho-sulpho-chloride —which was the body sought, the para-sulpho-chloride, an isomer of no industrial value, being present in substantial quantities. By using an excess of chlorhydrin, it was found that a total conversion of the toluol into sulpho-chlorides could be obtained, but this helped little inasmuch as the early results showed the chief product to be the useless isomer. But Monnet found that if while using this excess of chlorhydrin you kept the temperature below certain limits you could cause the useful body to be produced in preponderating quantity. This discovery caused the commercial yield of the useful product to rise from 25 to 60 per cent., and diminished the cost of the manufactured article by nearly one-half.

Here we have a striking example of the existence of alternative paths. The two resulting products are isomers, *i.e.*, identical in chemical composition though not in chemical structure. They differ only in the orientation of the entering sulphochloride group, and on that depends whether the result is useful or useless. We know little or nothing of the forces that determine into what position the group shall go, but the conditions that decide for the one or the other must resemble one another so closely that they are both present in the same mixture, under the same external circumstances. The yield is composite, yet there is no ground for supposing that under identical circumstances there would be any variation in the behaviour of the different sets of combining molecules. The variation in the yield must therefore come from slight but decisive variations in the momentary local conditions. It is this which constitutes the difficulty of the problem, *viz.*, that such slight variations of the circumstances that attend the combination of individual sets of molecules can produce such grave practical consequences.

I will take the example one step farther. It has since been discovered that these limits of temperature may be considerably relaxed, if instead of technical chlorhydrin, you use such as has been raised to a high state of purity. Thus between the old and the new limits of temperature we find that the place taken by the entering sulphochloride group is changed from the useful to the useless, from the ortho to the para position by the presence of small traces of impurities, chiefly, I believe, sulphuric anhydride. Now, suppose for a moment that it had been the para body that had been of industrial value, we should here have a case in which the addition of a small amount of sulphuric anhydride—a body having apparently no connection with or relation to the reaction—largely increased the industrial result by influencing, in the right direction, the choice of which of the two alternative paths the combining molecules should take.

The example I have chosen recommended itself to me solely because it happened to come under my notice in my own professional work. Far better instances will occur to the skilled chemists before me. The case is now classical in which the yield of a difficult reaction in the synthesis of indigo was suddenly and unexpectedly increased, and this desirable result was traced to the fact that the mercury thermometer used in the operation had broken and thereby introduced a minute quantity of sulphate of mercury into the combining mass. Such a history makes one almost believe in the truth of the story one was told in childhood about certain pieces of imperial Nankin china preserved in the Summer Palace. The story ran that they owed their surpassing beauty to the addition—trifling from a purely chemical standpoint—of the master workman to the contents of the furnace in which they were being burnt. Cases such as those to which I have referred are not rare. Again and again I have had inventions before me of this type. Even the nomenclature of chemistry recognises them, and the term of "catalytic action" is applied freely wherever it is found that the presence of a foreign body influences reactions in which it apparently takes no part. But catalytic action is only one special case of the results of comparatively small influences at critical moments of molecular earrangement. Any variation in the surrounding circumtances may determine a choice which may be permanent nd irrevocable.

I have said that the fact that slight variations in the urrounding circumstances may have such grave conseuences constitutes the difficulty of the problem. But it lso constitutes its hopefulness. It is clear that the condiions of success are close at hand. We only need the skill o secure them. There is everything to make us believe hat we are here pursuing no dream, but are striving for the racticable. If we compare the knowledge and hopes of o-day with those of, say, five centuries ago, we must feel hat we can do things utterly undreamt of then, but that much at which they hopefully laboured is not only untained, but is known to be unattainable. Science adds aily to the list of the practicable, but side by side there rows a still longer list of the things that she pronounces mpossible. To the fancy of that age nothing seemed beyond ope. All achievements seemed worth attempting. But we ave become wiser and sadder. We have become aware of he walls of our prison house by knocking up against them, ometimes very roughly. The hopes that had supported enturies of search after perpetual motion were scattered for ver by the discovery of the first law of thermo-dynamics. he hope and aim of all mediæval chemistry, namely, the ansmutation of metals, is made more and more clearly impossible by all the discoveries that have taught us so much of the probable identity of their substance. In every branch of practical science we know that sharply marked boundaries exist over which we cannot step, and within which all our work must lie. To disregard these would be to show the worker to be mad. I know that besides those definite laws which have already been formulated, there are others which experience has indicated, but has not accurately ascertained, which it would be unwise to disregard if one would not labour in vain. But in the endeavour by uniformity of conditions to better the practical results attained, there is nothing which should lead us to expect failure, and though, in some instances, it may be found that laws at present unknown to us stand in the way of complete success, the cases in which this is probable are not so numerous as to discourage the prudent worker.

This is to my eye the main trend of invention in chemical industry—rendering certain and complete in their action processes formerly unmanageable or unprofitable by reason of the uncertainty of the reactions that actually and locally took place. Oftentimes this uncertainty grew during the process; the processes worked well at first, but gradually became worse. Others would work in the laboratory, but broke down when tried on a large scale. In others the working loss of some costly reagent was too large. I designedly class this under the same head. For working loss is only negative yield. It signifies that the recovery process is failing to give its full results, and the causes at work and the considerations to which they give rise are the same whether the product sought be a reagent to be recovered, or the direct object of a manufacturing process. The most important and most solid advance that is being made in chemical industry consists in turning these failures into successes by securing certainty and uniformity in the conditions present at each point of the reacting mass throughout the operation.

The realisation of the necessity of uniformity of conditions, in order to obtain full yield, manifests itself not only in the efforts that are being made to improve existing processes, but also in the choice of new ones. That process is a good one which permits the necessary conditions for right choice to be secured at every point and every moment. Here come in the two most common causes of industrial shortcomings. The result of a reaction is the sum total of the results at each point of the mass. Whenever, therefore, there is the possibility of a wrong choice that is irrevocable, the conditions must at no point be such as would lead to it. However narrow the margin between that which would lead the molecules to a right, and that which would lead them to a wrong choice, it must not be overstepped at any point. Average conditions do not determine the result, for it is the sum of local actions each depending on its own local conditions. And, further, this must be maintained throughout the operation. The changes which the operation itself works must not so alter the local conditions that they transgress these limits. Those processes, therefore, are to be chosen where there is a large margin of safety between the conditions which bring failure and those which bring success, where the local conditions are capable of due control, and where the changes due to the reaction itself are either non-injurious or can be kept in check.

Let me take, as an example, the new developments in the manufacture of sulphuric anhydride—new as far as public knowledge is concerned, for there has never been any published account of the process which the well-known English chemists, Messrs. Squire and Messel, have worked for many years at Silvertown. The reaction by which the sulphuric anhydride is formed is an old one—sulphuric acid and atmospheric oxygen passed over platinum black at a fairly high temperature combine to form the anhydride. But though the reaction had long been known to chemists, and had often been proposed as an industrial process, it had failed to win a place in practical manufacture. The results were uncertain, and after a comparatively short run the combination usually ceased to take place. It is now known that one cause of this failure was the difficulty in preserving uniform the local conditions in the contact mass. The action of platinum black depends on its intimate structure being unclogged, and above all on its being untainted with arsenic. Minute traces of dust or solid impurity or of arsenic, even in gaseous form, are fatal to it. But there was another cause of failure of even greater interest. The difficulty of alternate paths here presents itself in a curious form. The reaction is itself reversible. At temperatures well within the limits between which combination can take place, the sulphuric anhydride, though successfully formed, resolves itself back into its components, oxygen and sulphurous acid, and this reverse action becomes more and more energetic the higher the temperature, and the greater the percentage of sulphuric anhydride present. Now the combination itself liberates considerable heat, so that this is a case in which the two products of the reaction—heat and sulphuric anhydride—by accumulating, tend to increase the energy of the reverse reaction. Success thus leads the way to failure. Years of work were worthily spent by Dr. Kneitsch in the complete solution of this great industrial problem. The pyrites fumes cooled, and purified to an almost ideal freedom from solid impurities or arsenic, are made to pass round and then through the tubes that contain the contact agent They thus become raised to the necessary temperature by drawing off the heat given out by the reaction. The combination is made complete by having a long range of the contact mass, and the sulphuric anhydride that is produced is kept from accumulating by the stream of gas being passed at a proper velocity through sulphuric acid of that particular strength which has the property of instantaneously absorbing the anhydride. The result is a process which will work continuously for months and years in place of the previous unsuccessful attempts, and the difference is due to the fact that the necessary uniformity of conditions is secured. Even the difficulty introduced by the reversibility of the reaction is turned to account. The reaction is fiercest near the entering end, and there it is difficult to prevent undue heating. But thanks to the reversibility of the process, the mischief thus done is subsequently undone in the passage through the long and less intensely heated column of contact mass that follows. Thus the limits of safety at any point are widened, and the efficiency of the process is no longer imperilled by local irregularities of temperature. I want no better example of the tendency of the invention of to-day to develop processes in which certainty and fullness of yield are obtained by securing uniformity of conditions throughout the operation.

In considering chemical combination from this point of view, *viz.*, how to direct aright the choice of each molecule, one is at once reminded of the force that is so characteristically a director of molecules—electricity. Is there any evidence of progress in the application of chemistry to chemical industry? A few years ago men's minds were full of expectation in this respect. The greatest of all the chemical industries—the alkali industry—seemed at the mercy of the new method, and people spoke confidently of the abandonment of the older processes, and of obtaining all our soda by electrolysis. These bright anticipations have been only imperfectly realized. Certain forms of the process have, after long and expensive apprenticeship, established themselves commercially, and in any discussion as to the future of the alkali industry, electrolytic production must be taken into account as a factor. But the supremacy of the older methods, as measured by their comparative production, is as yet unchallenged, and personally it seems to me that of late the Le Blanc and Solvay processes have gained rather than lost ground through the increased demand for their by-products. Opinions will differ as to the reason why the success of electrolysis in the alkali industry has been so limited. I attribute it in great measure to the difficulty of preserving uniformity of conditions throughout the operations, and I am strengthened in this view by the fact that the two forms of the process which have met with the greatest practical success with us are those in which the conditions are not altered during the process, but remain unchanged, the products formed being wholly removed. But if the advance is not rapid in this department of industry, I see evidence of steady progress in the use of electrolysis at high temperatures, especially in electro-metallurgy. I am not forgetting the disappointments that have attended many promising processes of electrolysis of fused salts. But these were mainly due to technical difficulties arising out of the new and unfamiliar conditions. Equally great difficulties have been surmounted in processes of older standing, and these will in like manner be ultimately conquered.

The most disappointing branch of this department of chemical industry is the slow advance of the industrial applications of electricity in connection with organic chemistry. It is, of course, easy to see why metallurgy and alkali-making were its first applications. In them it has only to separate an element—a metal—from the electrolyte, and for that it is specially adapted. But the results of electrolysis on a solution containing elaborate coal-tar products can hardly be foreseen. The rude violence which can safely tear an element from its inorganic combinations, may make sad havoc when applied to these complex structures. It may be counted on to produce strong oxidising or reducing action, but nothing but experiment can decide what the ultimate result will be. I have long expected great developments in this direction, but I hear of few of industrial importance. I suspect that one cause is that to which I have already referred—the difficulty of maintaining uniformity in the contents of the cell. The products of the process remain in the elecrolyte, and continually alter its composition. If the yield is to be a full one, these contents must be profoundly different at the end of the operation from what they were at the beginning, and secondary decompositions are likely to arise. I have still great hopes, but whether from the cause I have assigned or not, electrolysis has not up to the present time taken its expected place in industries dealing with organic bodies.

There is, however, another gift of electricity to chemical industry, the value of which is daily becoming more highly appreciated and around which inventions cluster thickly—I mean the electric furnace. It has been rightly said that electricity enabled man for the first time to concentrate, in the form of heat at any point, and in any quantity, energy generated elsewhere. It abolished, therefore, the limitations of temperature which necessarily attend combustion. The bodies exposed to its action could be isolated from the disturbing influences of chemical action, and, indeed, in the form introduced by Moissan, and in that in which the heat is radiated from incandescent carbon rods, the bodies are shielded even from electrolytic action. Already it is the basis of important industries, such as those of sodium, phosphorus, carbide of calcium and carborundum. It specially lends itself to combinations which are endothermic. The heat can be used economically owing to its being concentrated on the bodies operated on, and to its being subject to accurate control. The one great drawback is that you derive your heat from motive power, which usually is itself an expensive product of combustion, but this makes it suitable for use in connection with the water powers that are now being utilised in all parts of the world.

I have now laid before you what, to my eyes, is the trend of invention in chemical industry, whether in its aims, the sources of its materials, or its processes. You will, perhaps, ask yourselves why I use the term invention, and where I draw the line which marks off invention from that judicious use of means and apparatus which fairly belongs as of right to everyone. I am not anxious to treat the advances in your great industry as the subject of legal subtleties, but I feel that I ought to express my personal opinion, that as practical result is the test of success, so it ought to be the main factor in determining the existence of that novelty which our laws hold to merit protection. The step between the discovery and the utilisation of a reaction is the most useful and often the most difficult step in the initiation of a successful manufacture, and should be, and I think generally is, recognised as having a correspondingly high claim to be regarded as invention. Speaking for myself, let me assure this assembly of practical chemists that my own appreciation of your efforts, your difficulties and your successes, is in entire sympathy with the views of those workers who, feeling how great is the work before them, have but one standard by which to measure the value of a new process, *viz.*, by how much does it enable them better to do that work.

Discussion.

Dr. Ludwig Mond said it had rarely been his good fortune to listen to a paper so full of suggestion. He agreed with everything of importance which Mr. Moulton had brought forward, and more particularly with the remark at the end of the paper in which the author referred to the value of the work done by the man who worked out a discovery into a practicable manufacturing industry. There might not be many there that evening who were present at the first meeting of the Society when he brought forward some views on the Patent Laws in general, but those who were, might remember that he dwelt at some length on this very question, and made some suggestions for an improvement in the law.

Prof. Capper said it was impossible to criticise a paper like this off-hand, and, as an engineer, he felt great diffidence, for he was aware that in the development of chemical industry, probably more than in any other branch of industrial development, the chemist and the engineer were both concerned, and the difficulty was to keep the two apart and prevent the one swallowing up the other. The engineer suggested to the chemist that he wished to find out more completely the efficiency of his engineering plant—that he wanted to be able to analyse more precisely the gaseous products of his gas-engine, and the chemist gave him information which obliged him to entirely reform the whole of his gas engineering. He had to scrap all his plant, and to start afresh; and he found that the lines on which he had been developing before were in some respects radically wrong. But, on the other hand, the engineer sometimes had his revenge. Dr. Ludwig Mond had suggested a method by which an internal-combustion engine might, and probably would, in a short time altogether replace the steam engine as a prime mover. Immediately Dr. Mond had shown that, the engineer at once became a producer of ammonia, and therefore, to a certain extent, cut out the work of the industrial chemist. In a case of that sort, the question was how far was it wise in an engineer to develop his knowledge of industrial chemistry, and how far was it wise for an industrial chemist to become an engineer. Probably the best method was to try to live in harmony one with the other, and to take the suggestions of the industrial chemist to help to develop the engineering undertaking. A case recently came under his notice in which an engineer asked a chemist to give him a metal which would have a very minute coefficient of expansion, for producing standards, and the result was the chemist supplied him with a metal which opened out great possibilities, and would probably entirely reorganise engineering industry in working to minute fractions such as they had never had before. Electricity had been referred to, and it seemed to him that one of the great reasons why the use of electricity in chemical industry had been confined to the comparatively small field it had at present was that the engineer had not been able to give the chemist what he demanded, *viz.*, electricity at a very low cost. Now that the demand was rising, there seemed a hope of getting to the position, by the help of the industrial chemist, in which they would be able to supply electricity at a fraction of 1*d.* per unit, instead of the multiples of 1*d.* which were the rule at present; and probably the efforts of the industrial chemists using electricity would enable them to reduce the cost still farther.

Prof. J. M. Thomson congratulated the Society and the Chairman on having induced the author, occupying an entirely different sphere, to put his ideas before the members of the Society, in an aspect, perhaps, somewhat different from that in which they were sometimes inclined to regard them.

The Chairman informed the meeting that Sir William Ramsay had written to express his regret at being unable to be present that evening.

Mr. David Howard said it was many years since first he had to do with industrial chemistry, and he could emphasise the truth of the conclusions arrived at by the author and the reasons given for them. It was on those lines they ought to look for progress. The distinction between the purely theoretical and the practical was one which they had constantly to bear in mind. There was a wide distinction between a theoretical result, which was often of profound interest, where 5 per cent. of the theoretical yield was most satisfactory, and the process which had to be worked out on the large scale, when 95 per cent. was a poor result. They had had the great privilege of hearing one who, not content with the glorious certainties of the higher mathematics and the glorious uncertainties of the law, had brought to bear on their industries a clear preception of their needs of which many of those who are at work upon them were only dimly conscious. The one thing they had to warn one another against was that narrowing up of their studies into the minute point which was before them—that microscopic point of view which was so tempting and so prominent. It was by that wide grasp—bringing to bear on a new subject the ability and experience of studies widely different—that great progress was made, and they would have great chemists just in proportion as they were not chemists and nothing more.

Dr. Divers expressed his admiration of the paper, and full agreement with the views of its author.

Mr. Walter F. Reid said this was a paper which certainly should be in the hands of every industrial chemist and every inventor, whether chemist or not. It contained many pieces of advice, the result of long practical experience, which could not but be useful to any inventor, and he might say he had learned much from it. Recently he had met with some hundreds of inventors at St. Louis, many of whom were too sanguine, and he could only have wished that some months previous to the opening of that Exhibition they could have had a copy of this paper, for he thought it would have saved the juries much trouble. But at the same time there was one word to be said about the sanguine inventor, especially in the United States. Where they in England made scientific experiments on a very small scale, there they made them by the ton. In experimenting on a large scale, enough product could be obtained to send out many samples, thus the material would become known, and other people could try it. For instance, the increase in the consumption of carborundum was enormous. Until two or three years ago it was regarded simply as an interesting chemical. Last year 2,500 tons were manufactured, and the consumption was increasing so rapidly that it might very likely be doubled this year. That showed the advantage of doing things on a rather large scale. Not everybody could afford it, but it was to be encouraged. Some of them had seen the gigantic factories which were being erected at Niagara for making use of the water power. Hitherto caustic soda had not been produced there on the industrial scale, but he was informed of a close approach to the economic production of caustic soda on Niagara Falls.

The question of new industries was one which might entirely upset not only the politics of a nation, but the whole economy of nations. Thus, in the war in the East they saw an enormous loss of life, and it was found that those who were defending their lives could not even locate the batteries by which they were attacked. When he was first connected with explosives, the difficulty was to hide a battery, now there was no difficulty at all. Again, with regard to the use of explosives, there were possibilities undreamed of when these things were first used. A curious case happened in St. Louis. A complaint was made by the owners of some incubating apparatus, that the chickens were spoiled by the detonations from two shows there. The whole atmosphere reverberated with explosions at times, and when these chickens came out of the eggs, some remarkable monstrosities resulted, showing a certain amount of distortion of the chick which was attributed to the explosions. Here was a new modification brought about in the processes of nature by a chemical reaction. In the same exhibition were shown some modern anæsthetics which were of a striking nature. He was assured in one case by an eminent French professor and other authorities that a patient could be anæsthetised sufficiently for an abdominal operation by using six drops of a 1 per cent. solution of the anæsthetic. The manufacture of such preparations frequently produced serious effects on the workmen employed.

Cold storage had completely revolutionised the food of mankind. They now got products from distant places to an extent that formerly was never dreamed of. In the United States cold storage was reduced to an art. He had had to judge apples of last year which were placed side by side with this year's apples, and it required a greater expert than himself to tell the difference. The chemist and the engineer had worked together to effect this; neither the chemist nor the engineer alone could do it, but both together they had done it, and it was one of the greatest advantages of our Society that it brought the two together.

Whilst in America he obtained some interesting information about sulphur. There was a large production now in Louisiana by a process of melting the sulphur in the earth. There were large deposits of sulphur there, but they had never been worked because of the difficulty and expense of sinking shafts and mining. Now water was heated to above 300° C., and passed into the earth, the sulphur being melted and pumped into tanks, where it solidified. This was a new process, which would doubtless have considerable influence on the production of sulphur.

It was open to some doubt whether all the combined nitrogen existing on the earth was due to bacterial action; some of it was at least due to electrical action. He thought probably a large proportion of nitrate of soda owed its origin to electrical discharges in the atmosphere.

The author had very rightly referred to the extreme importance of infinitesimal quantities in chemical reactions, and one of the most valuable portions of the paper was that in which he showed how extremely minute a quantity of a substance might altogether alter an expected reaction. Mr. Watson Smith had shown them not very long ago how, in testing aluminium, the test tube itself played the part of a reagent; that small quantities of material were dissolved from the test tube and affected the reaction so much that previous experiments on metallic aluminium with different solutions were rendered practically valueless.

With regard to the reactions taking place at different temperatures, they stood in face of an enormous revolution in chemical industry. The production of liquid air gave them opportunities of using low temperatures in chemical reactions in a way they had never been able to do before. It might interest those present to know that the largest quantity of liquid hydrogen ever produced in one day was turned out, one day last September, by the Low Temperature Research Apparatus at St. Louis, which had been sent out and erected by the Royal Commission.

Dr. **Squire** said there were one or two points which he should like to allude to, the first being his experience with sulphuric anhydride, which showed how investigators might go utterly astray for a long time. In his original patent for the manufacture of sulphuric anhydride by catalytics he simply utilised a process of Deville's for making oxygen. In that process concentrated sulphuric acid was poured upon very hot platinum foil, which resolved it into sulphurous acid, oxygen and steam; the sulphurous acid was removed by milk of lime or a solution of an alkali, while the oxygen went on its way. When sulphuric anhydride was the product sought, the sulphurous acid was, of course, not removed, but both gases were very thoroughly dried. The other half of the process was really known before, namely that sulphurous acid and oxygen could be combined by means of spongy platinum. It was platinum black at the commencement, but it very soon became spongy platinum. Winckler suggested precisely the same process which he (Dr. Squire) had already patented, only Winckler published his process a few months later. Dr. Messel and himself worked on this process for a long time, and generally on the wrong lines, as was so often the case first. It was thought that neutral or indifferent gases interfered very much with the reaction. Both Winckler and Scheurer-Kestner said so, but as a matter of fact this was not the case. The temperature was kept up to about 450° C. by means of a fire under the vessel containing the spongy platinum. Some hundreds of tons of sulphuric anhydride had been make at that temperature, but it was afterwards discovered that this temperature was far too high and really the heat ought to have been got rid of instead of maintained. The decomposition of sulphuric acid turned out to present a great many difficulties, and was far too expensive. Practically no apparatus lasted for any time. Iron retorts were rapidly destroyed and clay retorts leaked. The fact was the conditions were not at all the same as they were in gas works. In gas works the retorts became lined with graphite, which kept them tight, and if no graphite was produced these clay retorts leaked very badly, and in this case of course no graphite was produced. The next step was to produce a cheap sulphurous acid and mix it with the requisite quantity of air. This process he carried out in the first place at Scheurer-Kestner's works in Alsace. It was accomplished by compressing to four atmospheres the gases from burnt sulphur and treating the gases with water, while in a state of compression. Nitrogen passed away and a strong aqueous solution of sulphurous acid was obtained. This solution was afterwards boiled to evolve the sulphurous acid. The compression of these gases on a large scale presented many difficulties, for it was found that nothing but indiarubber and lead, neither of which had any mechanical strength, should come in contact with the gases, but the mechanical difficulty once overcome, this modified process worked very well. But it was ultimately abandoned, for it was found that the presence of indifferent gases did not as a matter of fact interfere with the process when a much lower temperature was used for the catalytics, and eventually the process became a workable one when applied directly to the gases evolved by burning pyrites without any compression at all. Mr. Moulton, in alluding to cold storage, said that yeast was among the substances which could be kept for a long time at a low temperatute, but cold storage, although it suspended the activity of the bacteria which brought about the decomposition of the yeast, was not a complete success. The best temperature for keeping yeast was about 4° C., it must not go below zero, for freezing completely spoilt it. But if the low temperature were kept perfectly uniform, it did not seem to prevent the growth of the moulds, which grew on the yeast bags almost as well at a low as at a high temperature, and that gave the yeast an unpleasant smell and taste.

Dr. F. B. **Power** said it would be needless to attempt to emphasise the great interest which this paper possessed. He experienced the difficulty of many preceding speakers, that of not being able to deal in an impromptu manner with a paper covering so wide a range and including so much in its scope. Those who had worked in the domain of pharmacological chemistry would recognise the significance and interest attached to the facts brought forward. He was sure this address would stimulate all chemical workers, and afford many ideas which would be useful to them in their investigations.

Mr. **Leon Gaster** said he would like to mention one or two instances in which waste still occurred. One was in the case of blast-furnace gases, which were not as yet sufficiently utilised. They were made use of in Dr. Ludwig Mond's and other ingenious processes for making producer gas for gas engines, but it remained as yet to be proved that the efficiency of the large gas engines came up to expectations, and that they could keep their place against large units of reciprocating steam engines or of steam turbines. The latter had gained favour with central station engineers for greatly contributing to reduce the price of power generation in connection with electric central power stations, whence the current was distributed at a distance for lighting and motive power for industrial purposes. On this occasion he wished to emphasise another waste, and to help to dispel the erroneous idea, which prevailed too much in this country, that the existing water power could not be turned into account. In view of the great improvements made in the modern construction of turbines, governors, and hydraulic plant generally, it might safely be expected that in the future those powers now wasted would be utilised to the advantage of many industries. It must be borne in mind that if, owing to the great fluctuations of the head of water and the amount of available water power, the erection of a reserve steam or gas-power plant were required, so long as the item representing the fuel, which must continually be consumed, was greater than the interest on capital for erecting the water-power plant, there would be more than one reason for utilising the water power, and saving the fuel.

Mr. Oscar Guttman said, if the purport of the paper were summarised, it was that the trend of invention lay in two directions, namely, cheapness, or increase in economy, and increase of yield; but it appeared to him that the author omitted a third direction, which he believed to be the ultimate factor in production, namely, quality. If the cost of production were continually being reduced, a certain limit would be reached when the general expenses amounted to more than the cost of labour, and it was then almost impossible to make any further reduction. If an increase of yield were aimed at, there was also a limit beyond which it was not possible to go. When these two limits were reached there was only one thing left, and that was quality. In many inventions that had come under his notice, the aim was for quality more than for anything else, because the other means had been exhausted. If a manufacturer could get a yield of 98½ per cent. of something at a cost which had beaten every competitor for some time, but was now on a level with everybody else, he turned his attention to producing a product which was free from all possible impurity, and could thereby secure a more ready sale; he might not always patent that method, he might keep it to himself, but he would produce an article which obtained a well-deserved reputation for him, and would secure his market. It appeared to him that the British chemical industry had been kept from decay through having always been able to produce articles of good quality, and insisting on this standard being maintained.

The Chairman asked Mr. Moulton whether any recent progress had been made in the economical conveyance of electricity generated at a distant spot where there was adequate water power. He had seen so much of water-power schemes, where the power was undoubtedly cheap, but where it cost so much to take the raw material there, and so much to bring the manufactured material away, that the cheapness of the water power was useless. He understood that progress had been recently made in connection with this subject, and he thought it would be of much interest if Mr. Moulton would enlighten them upon it. One other point struck him that Mr. Moulton might possibly have included in the scope of his remarks. He had laid such stress upon the fact that aboratory research led to industrial developments in chemistry, that one would like to know his views as to the ndustrial possibilities of present research in connection with stereo-chemistry. He, of course, recognised that at the present moment it was not industrial, but the suggestion was that there might be a possibility of its becoming so, and that it would be well that this possibility should be put before those interested in industries in which it might become a competitor, just as it would have been of enormous advantage to them if the indigo planters of India had taken sufficient notice of Sir Henry Roscoe's discourse years ago at the Royal Institution on the synthesis of indigo from rthonitrophenylpropiolic acid.

Mr. Moulton, in reply, said he had been greatly interested n many of the speeches, and had felt the same difficulty hat they had felt with regard to the paper. It was difficult o take hold of the speeches at the moment so as to keep hem vividly before one's mind. Mr. Reid had tried to correct him on the subject of the combined nitrogen of he world, which he had attributed to the humble but patient work of bacteria, suggesting that it might be due o lightning. He could assure Mr. Reid he had thought of primeval thunderstorms also as a possible source, but his sense of humour had prevented him trying to drive team of bacteria and thunderstorms together. Later on Mr. Guttmann took him to task for not having emphasised he importance of quality. He certainly thought of that, but he viewed it rather as a corollary from what he had aid than as naturally forming part of the paper itself. The whole of that part of the address consisted in emhasising the necessity for absolute control even of the mall forces that influenced local combination, and the onclusion he drew in his mind was that if they were to enter upon a part of progress of that type the first thing hey must insist upon was perfect purity of the reagents. f you were to have uncertainty in your reagents, if you id not know whether they were going to be pure, how in he world could you get certainty in local action. He was delighted to find that so great an authority gave a high place to English productions from that point of view. Might they ever keep it, and then they would have a sure foundation for future progress. The Chairman had attempted to draw him on the subject of conveying electricity to a distance. He was delighted to think the world was getting so wise as to see that it was better to take electricity to their centres of population rather than make centres of population where there was electricity. Raw material and workmen required roads and railways, but a high tension current was well content with three wires, and it was an economic absurdity to attempt to convey cumbrous products, including workmen, that required careful handling, to almost inaccessible places instead of bringing the electricity to the town. Certainly on the other side of the Atlantic they had no doubt about it. They carried electricity of a high potential from 120 to 150 miles, and he thought the time was very near when the great sources of electricity would all be made to supply motive power to centres of industry which were determined by totally different considerations. Then the Chairman had touched on stereo-chemistry and all the wonderful work done with regard to the sugars, which was a marvellous specimen of brilliant chemical research. He had been preaching throughout the paper on the great gulf that existed between theoretical chemistry and industrial. Theoretical chemistry sought the truth, industrial sought the result. Now the Chairman wanted him to treat stereo-chemistry as being part of industrial chemistry. With all due respect to his auditors he must tell them it was their fault that it was not but they must not take him to task because the members had not yet succeeded in making this industrial. Recent researches could not be read, he might say, in any branch of chemistry without seeing the vast possibilities of industrial processes. But to-night they were not dealing with the possible, but with the progress which made them actual. Therefore the synthesis of the sugars was not yet ready for him. Nothing was more charming than that department of chemistry, and nothing that he so much longed to see made industrial, and he trusted there were many present who would distinguish themselves by the conquest over industrial chemistry of that great triumph of theoretical chemistry.

Nottingham Section.

Meeting held on Wednesday, October 26th, 1904.

MR. J. T. WOOD IN THE CHAIR.

NOTE ON COLLIN.

BY J. T. WOOD AND S. R. TROTMAN.

The paper on "A New Method for the Analysis of Tannin and Tanning Materials, and the Identification of Admixtures in Tanning Extracts and Liquors," by Dr. J. Gordon Parker and E. F. Munro Payne, read before this Society on June 6th, 1904, is a very valuable contribution to the history of tannin analysis (see this J., 1904, 648–651). The authors treat the tannin solution with lime water, allow to stand for four hours, filter off the precipitate and titrate the lime remaining in the filtrate, using phenolphthalein as indicator. The figure obtained represents what they call the *total absorption*. They then remove the tannin by means of a neutral solution of "collin" (for preparation see J., 1904, 649). The lime absorption of the detannised solution is now taken. This they call the *acid absorption*, the difference between the two figures being the true tannin.

In the present note we do not wish to criticise the process proposed, but to examine the author's statement that collin is a pure form of collagen (*loc. cit.*, p. 649), but deprived almost entirely of its calcium base. This statement appears to us of importance, inasmuch as, if it can be shown to be correct, it will have an important bearing on the constitution of gelatin. We do not propose to examine the question whether lime forms an essential part of the gelatin molecule (we have not previously heard this maintained), but to show that collin consists of a mixture of hydrolysed gelatin and gelatoses in varying proportions depending on the temperature and length of time the solution is heated, and further to show that this variation in the constitution of the solution has an influence on the precipitation of tannin.

To simplify matters it may be well to state that we adopt Allen's definition for gelatin (Comm. Org. Anal., IV., p. 461), *viz.*:—a proteïd resulting from the hydrolysis of collagen or ossein by boiling with water or dilute acids. The properties of gelatin are given by Allen (*loc. cit.*)

We prepared a 5 per cent. solution of Coignet's Gold Label gelatin, and estimated the nitrogen in 50 c.c. by Kjeldahl's method; 0·343 grm. nitrogen was found, which multiplied by the usual factor 5·42 gives 74 per cent. of gelatin. We then saturated the solution with zinc sulphate which precipitates the whole of the gelatin, and again estimated the nitrogen in the precipitate: 50 cc. of the 5 per cent. solution gave 0·333 grm. nitrogen or 72·22 per cent. of gelatin. The difference between the two results indicated the amount of nitrogenous matter *not* gelatin in the sample.

From the above gelatin a solution of "collin" was prepared exactly as prescribed by Parker and Payne, containing 5 per cent. pure gelatin calculated from the above experiment. The solution was saturated with zinc sulphate to precipitate unchanged gelatin. The resulting precipitate contained only 0·1625 grm. of nitrogen in 50 c.c., indicating 35 per cent. of the original gelatin. The clear filtrate from the zinc sulphate was treated with bromine to precipitate the peptones, shown to be present in the filtrate by the biuret reaction, and nitrogen in the precipitate determined by Kjeldahl's method. The nitrogen found was 0·203 grm. or a total of 0·4655 grm. nitrogen, which corresponds very well with the total nitrogen previously found. We then examined, in the same way, a collin solution which had been heated on the water-bath for 40 minutes instead of 20 minutes as prescribed, the nitrogen precipitated by zinc sulphate amounted to 0·068 grm. in 50 c.c. whilst the bromine precipitate gave 0·371 grm. nitrogen. There was a further 0·020 grm. nitrogen in the filtrate from the bromine precipitate, indicating the presence of 3 per cent. lower compounds of nitrogen.

The results are shown in the following table:—

Nitrogen in 50 c.c. original solution of gelatin—
0·469 grm.

—	A.	B.
	Grm.	Grm.
Nitrogen precipitated by zinc sulphate (gelatin and gelatoses).	0·1625	0·0868
Nitrogen as peptones (bromine precipitate).	0·3030	0·3710
Nitrogen as lower compounds..............	Nil	0·0200

A.—Collin prepared as prescribed by Parker and Payne.
B.—Do. do. heated for 20 minutes longer.

The appearance of lower nitrogen products indicates that the solution is undergoing decomposition, and as these products do not precipitate tannin, it appears to us that a serious source of error may here be introduced into the process. The composition of a gelatin solution heated with caustic soda is so sensitive to change of temperature or time of heating that we have found it practically impossible to prepare solutions of the same composition.

A still more important fact, in view of the purpose for which the collin is to be applied, is that the combining proportions of the unchanged gelatin with gallotannic acid differ considerably from the combining proportions of peptones with gallotannic acid. We hope to give some figures relating to this in a future note. The conditions sought for in a body used to separate tannin from other matters seem to be:—(1) The body should precipitate tannin only and combine with it in definite proportions. Collin appears to precipitate gallotannic acid only, but not in constant proportions. (2) It should be easily procured in a state of purity. It appears to us that these conditions might be fulfilled by selecting a proteid of simple and known constitution, such as the protamines described by Kossel (Rev. Gen. d. Sciences, 1889, p. 380), and which form the nucleus of the proteid molecule.

In conclusion, if collin were a pure collagen or gelatin, it should give constant reactions with different reagents and be of constant composition. We have shown that it does neither of these things. Collin cannot therefore be purified gelatin or collagen.

Discussion.

Dr. Parker said he was afraid the authors had taken the paper published by Mr. Payne and himself a little too literally. They claimed that collin acted in the same manner as a pure form of collogen. Collin was first of all made in 1898 by Mr. Payne, who was then working up pharmaceutical preparations, and he used it for dissolving morphia for the purposes of injecting into blood. He (Dr. Parker) had tested various solutions of collin, and only in one sample was he enabled to get a precipitate of gelatin by means of zinc sulphate, when they had prepared in the manner prescribed by heating for 20 minutes at 90° C., using the correct amount of soda. He and Mr. Payne were pleased that their paper had raised such an amount of criticism, and hoped that much good might arise from it. Accepting the authors' statement, he found from his figures that 35 per cent. of his solution was unaltered gelatin. Even then that would not have altered the process in regard to the estimation of tannin, because in the process Mr. Payne and himself devised in the estimation of tannic acid they used such an excess of collin that even if 35 per cent. of gelatin were present there would still be sufficient collin to precipitate the tannic acid. The taking of a skin and not a bone gelatin was one of the essential features of the process. He further thought that the results obtained by the author were in some measure due to the use of Coignet's gelatin, which was a bone product, and hence contained a considerable quantity of chondrin.

Mr. Trotman considered that more exact directions for the preparation were required. If as Dr. Parker said the nature of the original gelatin influenced the result, then he should have specified a particular form to be used. Secondly, if, as the authors had shown, the preparation of collin solution by the method given did not ensure the hydrolysis of all the gelatin, the importance of the method of analysis was largely discounted, owing to the fact that the collin solution would no longer differentiate between gallic and tannic acid.

Prof. Kipping said he disagreed with Dr. Parker in regarding collin as a definite substance. What he (Dr. Parker) called collin was doubtless a mixture of a great number of substances which were derived from the breaking down of the gelatin. As the object of the analysis was to obtain a substance which would precipitate tannic but not gallic acid, would it be possible to merely take a pure gelatin and boil it until there resulted a solution which gave no precipitate with the latter acid; such a solution might serve as a standard "collin."

The Chairman said, from the experiments which had been carried out, he was of opinion that the action was not quantitative, because the gelatoses appeared to precipitate varying quantities of tannin. He considered it was impossible to make a solution of constant composition by following out the directions given. With regard to their not having used the right gelatin, Parker and Payne specify "a good commercial gelatin," they (the authors) used the *best* they could obtain.

Dr. Parker said it was his custom to test the solution of collin, and if it precipitated gallic acid he rejected it, and made a fresh solution.

THE DIFFERENTIATION OF THE DIFFERENT FORMS OF NITROGEN IN GLUE.

BY S. R. TROTMAN AND J. E. HACKFORD.

Chemists who have had experience in the analysis of glue are well aware of the difficulties attending the operation and connected with the interpretation of the results of the analysis. In our experience there is no class of bodies so difficult to report upon in a satisfactory way, nor in which the ordinary chemical constituents have hitherto given so ittle ground for forming an opinion. In the following paper we hope to indicate a method of analysis which will o a certain extent remove these difficulties. That much ime and trouble has been devoted to the subject is evident from the following brief summary of the methods used by various chemists for the determination of the gelatinous constituents of glue, on the one hand, and its physical haracteristics on the other.

It is of course admitted by all that an analysis must nclude determination of water and ash. So far as these go there is little room for divergence, and we propose o confine ourselves to the nitrogenous constituents only. The following methods are the most important of those roposed for their determination :—

(1) Determination of total nitrogen by Kjeldahl's method nd calculation to gelatin.

(2) Determination of total nitrogen by soda lime (Noffat, Wagners Jahresb., 1867, 672).

(3) Precipitation by tannin and either measuring nitrogen n the precipitate or titrating excess of tannin in filtrate A. Muller, Zeits. angew. Chem., 1902, **15**, 482).

(4) Precipitation by chlorine and determination of itrogen in the precipitate.

To all these methods one fatal objection may be urged, *iz.*: that in every case peptones and other non-gelatinous itrogenous bodies are thrown down or coestimated while he composition of the tannates of gelatin are too uncertain to make the method (3) reliable.

(5) Determination of non-gelatinous constituents by recipitation with alcohol, filtering, and weighing. This is ifficult and somewhat uncertain.

(6) Precipitation of gelatin by tannin and determination f unprecipitated matters in filtrates to which of course the bjection mentioned above applies.

The physical tests for glues are numerous and are affected y so many conditions as to make them unreliable or at ny rate incomparable. Some largely exaggerate differnces, while others do not draw any sufficiently distinct line etween good and bad samples :—

(1) Water absorption figure (Shattermann, Dingler's olyt. J., 1845, **96**, 115).

(2) Consistency and bearing weight of jelly (Lipowitz, eue Chem.-techn. Unters., Berlin, 1861, 37—42).

(3) Determination of melting point (Kissling, this J., 901, 510).

(4) Determination of viscosity (Engler, this J., 1890, 4).

After a long experience of these tests we have discarded l except a consistency test communicated to Mr. Trotman Mr. H. S. Garry, which we find to give reliable comparave results, and which agrees well with those obtained by e method of estimation of nitrogenous constituents which e now employ.

In this method the glues are compared with a standard ue or gelatin, of which it is necessary to keep a stock.

A 10 per cent. solution of the standard, and various rength solutions of the glue under examination are made, d allowed to stand overnight. The consistency is tested the morning by pressing the jelly with the finger tips, in der to ascertain which strength solution of the glue rresponds to that of the standard.

n the subjoined table it will be seen that the consistency of me of the examples is 150, 120, &c., which indicates that se samples are respectively 50 and 20 per cent. better an the particular glue which we take as our standard.

Although the above method may appear crude, the ults obtained are very consistent, and, in our opinion. e error never exceeds 10 per cent. As a rough test for nufacturers, naturally a simple physical test has its vantages, although those which are usually applied are y intelligible to the person who makes them, and while ing comparative figures, are of no absolute value. reover, the physical test is no real check on manufacture, a chemical analysis should be.

—	Consistency by Experiment.	Consistency by Calculation.	Total N × 5·33 by Kjeldahl = Gelatin.	N precipitated by $ZnSO_4$ × 5·33 = Albumoses.	Peptones by Difference.
No. 1, best gelatin.	150	150	74·03	72·22	1·81
No. 2 = No. 1 boiled two hours.	..	143	74·03	71·36	2·67
No. 3	135	131	71·64	69·54	2·10
No. 4	120	124	74·62	68·05	6·57
No. 5	110	112·5	74·30	67·0	7·3
No. 6	90	87	71·04	64·18	7·86
No. 7, a bad over-boiled glue.	40	37	73·02	57·99	15·03

The weak point of all the above methods of analysis is, that they totally fail to differentiate between gelatin proper and hydrolised gelatin and peptones, or lower nitrogenous bodies which may be produced by a faulty method of manufacture. Since these peptones, &c. not only have no glue-like properties themselves but actually prevent glue from properly setting, it is obvious that their determination should be an important factor in the analytical opinion of a glue, and that if this operation be also accompanied by a determination of the gelatin proper, we have in our hands at the same time both the positive and negative sides of the problem to be solved. If, further, a total nitrogen determination be made, we have also a measure of what the glue might or should have been, and the nearer the gelatin figure approaches to the total nitrogen the better the glue.

Briefly, the method we have used is :—

(1) The determination of nitrogen by Kjeldahl's method.

(2) The determination of albumoses by determining the nitrogen in the precipitate thrown down by zinc sulphate (Factor = 5·33).

(3) The estimation of lower nitrogenous bodies either by (*a*) precipitation by bromine, or (*b*) by taking the difference between the figure for albumoses and that for total gelatin as estimated above.

Method.—One grm. of finely powdered glue, or its approximate equivalent of size, is dissolved in a quantity of water not exceeding 20 c.c. While still hot, zinc sulphate crystals are added in excess to saturate the solution. It is then well stirred by a rod or mechanical stirrer, filtered through a funnel containing a plug of glass wool forced into the stem, and washed with saturated zinc sulphate solution. The glass wool and precipitate are subjected to analysis by Kjeldahl's method, the nitrogen found multiplied by 5·33, giving the albumoses present.

Alternative Method.—The solution is made of the same strength as before. Zinc sulphate crystals are used in considerable excess, so that the solution becomes semisolid. It is then stirred with a rod—keeping the solution hot—whereupon the albumoses cling to the rod and to the sides of the vessel, leaving the solution practically clear. Should the precipitated albumose be seen to still float after stirring, the addition of more zinc sulphate will cause it to coagulate and stick to the rod. The remaining liquid is decanted off, the precipitate washed with saturated zinc sulphate solution. The precipitate is dissolved in about 10 c.c. of concentrated sulphuric acid, and the nitrogen determined by Kjeldahl's method. The latter method of estimation is identical with that in which the albumoses are filtered, and is much quicker in operation. The filtrate from the albumoses may be rejected, but if the determination of peptones and of bodies lower than peptones should be required (*e.g.*, creatinine, creatine, asparagine, &c.), the peptones may be estimated in it by Allen's method, and the lower nitrogenous bodies by the estimation of nitrogen in the filtrate from the bromine precipitate. These lower nitrogenous bodies only occur in cases in which the glue has undergone considerable decomposition by hydrolysis, caused by excessive boiling, or by the glue having an excessive acid or alkaline reaction when boiled. The value of a glue depends upon the percentage of albumoses present, and moreover, anything which tends to deduct from the percentage present deteriorates the quality of the glue. In a perfect glue the amounts of albumoses and of gelatin present, as determined by Kjeldahl's method should be identical. Other nitrogenous bodies should be absent, since they have no adhesive properties; whether the amount of these lower nitrogenous bodies acts only as diluents, or whether they are actively deleterious, is not yet quite clear, and we are still experimenting in this direction. It is by no means necessary to estimate the peptones by Allen's bromine method, and then the simpler bodies, since the "peptone" figure obtained by difference is equal to the sum of the above two figures, and this difference figure is a measure of the loss of gelatin by the manufacturer, and thus the care that has been used in manufacture can be criticised.

In the case of No. 2, a pure gelatin (No. 1) was boiled for two or three hours under a reflex condenser. It will be seen from the tables that while the total figure for the Kjeldahl has not diminished, yet the albumoses have done so, illustrating its deterioration in quality. Also in the case of No. 7, an over-boiled glue, while the total nitrogen figure is 73·02 per cent., showing the quality the material might have attained, yet the figure for albumoses is only 57·99, showing that only this percentage of the glue by weight, and not 73·02, is available for adhesive purposes. It will also be seen in this sample that a considerable quantity of the peptones have been converted into simpler nitrogenous bodies, thus indicating that the glue has been considerably over-boiled.

Since the consistency test is made a means of testing the quality of the glue it follows that there should be some analogy between the qualities as given by the albumen figure and that given by the consistency. That such is the case is shown by the figures given in the table, and which are comparable with a set of figures in which the consistency has been estimated from the albumoses by taking a mean difference of 1.4 per cent. in the albumoses to correspond with a difference of 10 in the consistency figure.

Discussion.

Prof. Kipping said that there seemed to be a certain analogy between the changes which glue and gelatin underwent on boiling with water and those brought about in the treatment of an equally complex substance—starch, with acids or with diastase. In both cases the hydrolysis probably results in the production of a great number of products and not merely one or two. The authors had distinguished the two sources of nitrogen, namely, albumoses and peptones, but there was little doubt that under the head of albumoses they were dealing with a great number of compounds, likewise with the peptones. The suggestion for the analysis of glue was obviously a very good one, and the only other point which he might raise was whether the authors of the paper had thought of using the polarimeter, which was so useful in observing the progress of decomposition in the case of starch. So far as protoses were concerned, the Chairman had remarked that no pure specimens had been obtained, but the recent researches of Fischer, in Germany, had already advanced to such a stage that a complex compound related to the protosis could be obtained in a state of purity.

Mr. H. S. Garry said that, on account of the difference of consistency as shown by the statistics, it was evident that a first-class quality of gelatin had been employed. It was possible from the consistencies given to tell exactly where the glues came from, and that in the lowest consistency glue there was a conglomeration of sinews and blood boiled up together. The total amount of nitrogen was due to the source from which the matter was derived.

Dr. Parker said there was no doubt that in the various gelatin factories there was an enormous amount of ignorance as to the nature of gelatin, because it was not definitely known how many gelatins there were. A good many of the tests which chemists employed were worth nothing, but if the method which the authors of the paper suggested would precipitate all the albumoses it would prove to be a very valuable thing.

Mr. Watson said the quality of the resultant gelatin depended upon the percentage of nitrogen of the bodies employed in manufacture.

Mr. Trotman said they did try the polarimeter but the deflexions were not great enough to give satisfactory results. He disagreed with Mr. Garry that the analysis necessarily pourtrayed the origin of the materials used in the manufacture. It seemed to him a curious thing that they always got about 74 per cent. of gelatin by the Kjeldahl method, which went to show that the total amount of nitrogen did not depend upon the origin of the nitrogenous materials used. Whatever they made gelatin from, if they made it properly they could get a good glue. They could make a good bone gelatin and they could make a good skin gelatin. The value of their process was that it showed the manufacturer what amount of gelatin he had got and what amount he ought to get. That was a distinctive advantage.

They did not claim any originality in regard to this, but thought that the examination of glue upon the lines they had suggested was an advance in many of the methods now in use and could give the manufacturer valuable information

NEW METHOD FOR THE ANALYSIS OF TANNI AND TANNING MATERIALS, &c.

BY DR. J. GORDON PARKER AND E. E. MUNRO PAYNE.

(This J., June 30th, 1904, 648—651.)

Discussion on the Total Lime Absorption Figure.

Mr. S. R. Trotman said that in experimenting with thi process he had found that in a few cases the total lim absorption, if taken immediately after shaking, was distinctly greater than at any subsequent period. The difference was sufficiently great to alter the final results to th extent of 5 per cent. As the point seemed somewhat interesting and might require further investigation by thos interested in the process he took advantage of Dr. Gordo Parker's presence to call his attention to it.

Dr. J. Gordon Parker said, in reply, that under certain conditions, especially noted in sumacs, the lime solutio formed at first a precipitate by basic gallate with gallic acid which subsequently dissolved, thus accounting for the fina reading being lower than the first. This point was somewha intimately connected with another he had noted in connection with sumacs, viz., that in some cases practically th whole of the total lime absorption was due to gallotann acid, while in others it was largely due to gallic acid, onl two or three per cent. being gallotannic. This was an important point for tanners, since the gallic acid did no produce true leather. If used merely for bleaching effect these sumacs, containing much gallic acid, might answe very well, but would undoubtedly produce poor leather.

Meeting held at Queen's Hotel, Leeds, on Monday, October 31st, 1904.

CHAIRMAN'S ADDRESS.

THE UNIVERSITY AND TECHNOLOGY.

BY H. R. PROCTER.

The present year is memorable in the history of scienc in Yorkshire as having witnessed the birth of its fir university. Independence has been forced upon it without i desire, but the necessity having arisen, difficulties have bee met with the accustomed energy of the Yorkshireman, an by private and public liberality funds are being found t make the university one worthy of the county. It therefore an appropriate time to consider in what way the funds can best be administered to promote the well-bein of those, both richer and poorer, who have made conside able sacrifices to provide them; and what objects shoul form the particular aim of a Yorkshire university.

While we cannot hope to compete socially with Oxford and Cambridge, we may reasonably look forward to the time when our university will become a centre of thought and culture for many to whom the older universities are inaccessible, and we hope that it may do much to spread that interest in arts and literature without which no high civilisation is possible, and which is the access to so many of the pleasures of educated life. Much weight must also be laid on the important work which has hitherto been done by the Yorkshire College, and which will be continued and extended by the university, in training teachers for our schools; and it is difficult to estimate the gain to our young people of all classes from being brought under the influence of properly educated teachers, whose mental horizon is not limited to the primary school and the "pupil-teachers' centre."

These services, however, important as they are, are not those which appeal most directly to us as a scientific and technical association; and what I wish more especially to consider, is the direct influence which the university may exert on technology and on trade, and the lines on which, in these respects, it can render the greatest help to the community.

We shall hardly dispute the necessity of a sound foundation of general science for all technology, nor question the wisdom of building up the most perfect teaching departments which we can achieve in order to give it; but what may not be quite so obvious is the need that these departments should not merely teach the elements of their respective sciences, but should be capable of carrying their instruction up to the highest and most recent developments of knowledge. I do not say that the old-fashioned common-places of elementary chemistry are played out, for we all know of industries in which the law of combining proportions would be high science, and of mistakes which the merest schoolboy knowledge should have prevented; but new industries arise out of new knowledge, and it is impossible to say how soon the most abstruse investigation may become the source of important practical progress. How many chemists of the older school are able to discuss the wandering of the ions and their electric potentials, which are subjects of earnest thought to those engaged in the chemistry of such processes as electrolytic soda and bleach nanufacture, or the electrolytic separation of metals; yet we have seen how soon such processes may completely revolutionise an old-established chemical industry. How nany of us have studied, as they ought to be studied, the henomena of catalysis as they affect the sulphuric acid "contact" process, or have fully mastered the intricacies of the "phase-rule" which is shown to have governed the natural separation of the various salts in a salt deposit, and which equally may be applied to the separation by crystallisation of salt-solutions in a chemical works? It is needless to multiply instances; but we want to place in he hands of our young men those weapons which were unknown in our student days, and which we handle, if at ll, with something of the stiffness of middle age. Such eaching needs the resources of a university, and can only be effectively given by the co-operation of the ablest men n the various related sciences working in well-provided aboratories. It is not merely the professors who take heir part in such a training, but of perhaps equal value is he influence of one student upon another, and only those who, like myself, have acquired most of their knowledge y laborious private study, often in loneliness and unsympathetic surroundings, can fully appreciate how our ay would have been smoothed, and how much higher it ight have led, if we had had the advantages which a niversity would have put at our disposal.

In England we have not yet succeeded in enlisting fficiently the highest scientific ability in the cause of dustry. Our greatest masters of pure science rank with ose of any country: but though we can point to many rilliant exceptions, I do not think that the average of ur technical chemists can compare in training, or perhaps en in ability, with their German competitors. As an my depends for success on its officers, so also does an dustry; and if our chemists are inferior, we are bound be driven ultimately from the field, though for a time e may hold the positions which we have won. If my assertion is admitted, and I do not think it will be disputed by anyone to whom both countries are familiar, it is of the utmost importance that we should search for the cause, for I cannot for a moment admit that it lies in any natural inferiority of the English race. Rather, I should be inclined to say, and I have had rather unusual opportunities of observing students of many nationalities, that the Englishman would be well capable of holding his own, if he started with anything like an equal training. Unfortunately this is not usually the case. It is exceptional to find the student fresh from school possessed of a good working knowledge of arithmetic and elementary algebra outside the regular school examples; and this is even more the case with youths from public and upper middle class schools, than with those from the excellent higher grade and modern schools of our cities. A reading knowledge of modern languages is generally conspicuous by its absence, while the foreign student can avail himself of the literature of at least one or two other languages beside his own. This is certainly due to no incapacity in the Englishman, but rather to the conviction on the part of the schoolmaster that a language is mostly important as an exercise in philology and grammar. A mere reading knowledge of any one of the latin or teutonic languages can be attained by most people in a few months of well-directed work, and forms an excellent basis for the more complete study which is needed to write and speak it correctly.

A still more serious difficulty, however, than the want of preliminary training is the lack of inducement to first-rate men to adopt technical chemistry as a profession. It is not to be expected that an able man will encounter the expense and loss of time involved in a four or five years' training such as is common with German chemists, unless he can feel some reasonable certainty of a comfortable livelihood as its ultimate result. If he is possessed of energy and business capacity he will probably find more remunerative ways of spending his time, while the scientific enthusiast finds quite as hopeful a pecuniary result in pure chemistry, and recoils from the narrow routine into which many technical chemists are forced. This condition of things is largely due to the scientific ignorance of manufacturers and business men, to many of whom (I fear I might say to most), a chemist is merely a man who can wash bottles and make an analysis. Now there are plenty of men who can do this, at least when the analysis is not out of their routine, who can be got for from 30s. to 50s. a week, and are very possibly not worth more. A prospect of this sort will not pay for five years' education after school years, or be much inducement to the man who can afford it; and the manufacturer will not see why he should pay more than appears to him to be the market price of the article he wants. Clever as he may be in judging his wares, he does not see that he is getting a chemical labourer instead of a chemist. The labourer has his uses, and is abundant in German laboratories, but he is not there called a chemist, but a "laborant." The only way out of this difficulty seems to me to lie in the better education of the manufacturer. It is in most cases useless for him to suppose, even if he has had an adequate chemical training, that burdened as he is with the business control of a large affair, he can himself devote the time and continuous study necessary to keep his manufacture abreast of the latest scientific thought, and introduce all possible improvements, though, in many cases, if he had adequate aid to develop his practical suggestions, he might do much. But even a far less knowledge than this would enable him to realise the directions in which a first-rate chemist might assist him, and to judge the capabilities of the men at his disposal. Having found the man that he needs, it is a short-sighted policy, commoner I fear in England than in America, to continue to pay him less than his real value. The profits that might be made in many industries by a first-rate chemist under first-rate business management are so large that liberal payment can well be afforded, and if this were given, the fear that your chemist, having learned your technical secrets, might carry them to some better market, would be much less likely to be justified. In this direction, of course, personal reliability is as important as scientific attainments.

Another mistake, which is not confined to English manufacturers, is, having got your ideal chemist, with the rare power of originating and carrying out new ideas, not to give him adequate assistance, but to keep him at routine work, which could be done equally well by the chemical labourer. No man can do more than a limited amount of work, or develop new ideas without time for thought, and I have in my mind a case, not this time in England, where a firm is losing hundreds if not thousands in this way, to save a few pounds a week.

So far I have spoken mainly of purely scientific training, but there are few manufactures in which a chemist trained only in the chemical laboratory can make himself of much use till he has gained experience in the works, and this is true in industries of a purely chemical character, though not to the same extent as in those like my own special branch, in which chemical and mechanical operations are of equal importance. It is not possible that any university or college training can entirely do away with this necessity, but if the gap cannot be entirely avoided, it is worthy of consideration how far it can be bridged or narrowed. This is one of the aims of technological as distinguished from purely scientific teaching. Another aim is to present to the student in a scientific and systematic way the special chemical problems of an industry, and to make clear the underlying reasons for operations, which at the works are often carried on in a purely empirical way, and with little clear understanding of the relation between cause and effect. In order to do this with effect, certain knowledge of the practical methods of the trade is obviously needful. In order to carry out experiments, machines and special apparatus are often necessary, and in the partially mechanical trades a degree of manual skill is required to imitate sufficiently for experimental purposes the processes of the factory. All this must obviously be provided if the university is to undertake technical teaching of more than a purely theoretical kind; and this being so, the question naturally arises as to how far this practical side of the work is to be carried; and the answer will to a considerable extent depend on the circumstances of the trade. The idea which has found favour with the authorities of technical schools has usually been to imitate as far as possible the conditions of the factory in order to give what is called "practical experience." I do not say that this is in every case a mistaken course, but I think very special circumstances are required to render it a wise one, and that these very circumstances usually place it outside the scope of university work. The ordinary evening school technology may in most cases be dismissed as almost a pure waste of public money as regards improvement of trade—a sowing of seeds in untilled and often infertile soil. To improve an industry something more than evening class knowledge is required, and however admirable a little knowledge may be, the working man is rarely in a position to put it in practice. Of course in this estimate I do not include such work as that of the Bradford Technical College, or our own evening classes, which appeal to the class of foremen and works managers, who both need and can use the special information given them. There are also cases in which the actual teaching of a trade in evening schools seems to be justified by public needs. A good instance of this is shoe manufacture. In old times the village shoemaker bought his leather of the village tanner and the village currier, and did the work with his own hands from start to finish. Now a man may spend his entire working life in cutting soles with an eccentric press, or lasting uppers with a lasting machine. However intelligent such a man may be, the factory affords him no scope to learn his trade as a whole, and when a foreman or a works manager is required, it is impossible to find one who has a practical knowledge of the whole manufacture. In this case the trade school comes in to complete the training of the clever workman, and to enable him to realise the relation of his own part of the work to the whole.

A somewhat similar need may be felt in the higher walks of technical education in trades like leather manufacture, where the apprenticeship system has almost completely broken down, and the only way for a young man of moderate means to gain access to leather works is to make himself of sufficient immediate practical value to obtain a post. Apart, however, from these exceptional cases, it is my deliberate opinion that it is no part of the work of a university to teach the manual dexterities of a trade beyond the point which is necessary for successful study and experiment. In fact I think the English manufacturer is apt to waste too much of his son's time on such attainments. For an employer or even a manager it is necessary to know how every part of the work should be rightly done, but he can hardly hope to rival his workmen in manual skill, while it is questionable wisdom to court the possibility of failure. He must know much of which his workmen are ignorant, but need not compete with them in their own department. It is impossible, too, for the University really to give the experience of a factory without transforming itself into one, and as soon as work is on a sufficient scale to give experience, the commercial element must needs come in, and the possibilities of instruction are much lessened. No better teaching in many directions can be given to a student than by the deliberate production of failures in order to ascertain their causes, but this is only possible when the work is on so small a scale that profit and loss can be disregarded. At the same time one may strongly condemn that academic attitude which regards money considerations as of no moment. The cost and practicability of a process should never be lost sight of from the time that any question of practical application arises, though in the study of principles they have no importance.

I have already implied that the University has no place for the slight and superficial technology which is often called "elementary;" but the real scientific elements of the subject it must teach in order to lay a sound foundation, while in my opinion, whatever technology it does touch, it should aim at carrying to the very highest standard which can be attained. To do this, the departments must be staffed with the very best men in their respective branches, and as such men will always have careers open to them outside the academic world, liberal inducements must be offered to secure them, either in direct stipend, or the possibilities of profitable outside work. Again, the maintenance of such departments is necessarily costly, the number of students is at present generally limited, and the space and material required is much larger per student than in the ordinary science course. How then are these expenses to be met? Fees in England are already very high as compared to those in Germany, and many of the young men to whom it is most desirable in the public interest to give a complete education in technology already find the expenses difficult to meet. If fees were raised to such a standard as to pay the present actual cost, the number of students would be so much reduced as again to heavily increase the cost per head, while the numbers educated would be uselessly curtailed. Such education cannot be self-supporting, and we have only the alternatives of letting it drop, or of supporting it by public funds or private liberality. Whatever might otherwise be the economically correct course, we are left little practical choice, since Germany has set the pace and we cannot afford to drop out of the race. Having started we must do it thoroughly, for the prize is only to the winner.

The difficulty, however, is only half overcome when we have found the teaching, we have still to attract the right sort of students in sufficient numbers, and these are not found exclusively or even mainly among the wealthier classes. Originality of mind and the power of continued application to a difficult problem are rare gifts, and still more rare when combined in the same individual, yet they are absolutely necessary for the advanced technical chemist. Men who have them are worth educating even at the public cost, but it is questionable whether we succeed in getting them under our present system of scholarships; the powers which make for success in a school examination often count for very little in after life, and in fact originality rather tends to failure. I think it is worth consideration whether some of the money now spent in scholarships would not be better devoted to a general lowering of fees, so as to make the struggle a more open one, and trust to the "survival of the fittest." But if we are to continue the scholarship system, I should like to see it less dependent on mere examination results than on the opinion of the teacher. It would be no difficult matter for the intelligent schoolmaster to pick out a limited number of his most promising pupils for a year's preliminary university training from those who had passed the test of the school-leaving or matriculation examination. These would come specially under the notice of the University Professors, who would again select or recommend those who should continue for a complete course. No favouritism would be possible, as the Professors would not act individually, but as a board of selection, and would judge not only by the regular examinations but by their personal observation of the work done in classes and laboratories. It would rarely happen that men so chosen would turn out practical failures, though other than purely scientific qualities might be taken into reckoning.

There is, however, another inducement which is needed in addition to scholarships, and which is even more efficient—I mean the reasonable prospect of a remunerative post in the future. It is not necessary, as Sir W. Ramsay remarked in his interesting presidential address, that all the prizes should be large if there are some good ones, and a reasonable chance for the rest. Employers might remember that in offering posts to young men they are not merely in many cases doing a very profitable thing for themselves, but are performing a public service in assisting the great work of education which is to train the captains, if not the generals, of the army of British industry.

So far I have spoken of the University merely as a teaching organisation, but there is another function which I regard as of, at least, equal importance, and which has been carried on in the past under the greatest difficulties—I refer to research, not merely in pure science, but in technology. As regards the application of practical processes already worked out in the laboratory, the manufacturer may be trusted to take care, but there are all sorts of broader issues, which at the moment show no prospect of profit, but which are the foundations of future advance. Unless these are investigated by scientific men, who work not merely for instant reward, and who are independent of the immediate financial result, they will not be investigated at all, and there is nowhere where the work can be done so well or so cheaply as in a university, where both the men and the appliances must be provided for teaching. Even from the teaching point of view there is nothing more calculated to develop the growing mind in the direction of practical and productive work than to see investigation and discovery going on around it, and there is no other way in which a teacher can become a living exponent of advancing science.

If, however, research is to be recognised as an important part of the duty of a university, it must be provided for and encouraged.

Discovery is a thing which cannot be commanded, but must be long and patiently sought, sometimes without result, and always with much planning how the problem is to be attacked, and meditation as to the meaning of the results actually attained. It is often necessary to spend hours apparently doing nothing, but inwardly thinking strenuously. Though this is obvious enough to the discoverer, it is often quite incomprehensible to others. I remember an inventor in the somewhat humbler walks of knowledge complaining to me that when he sat over the fire at nights thinking over his schemes, his wife could not conceive what he was doing and blamed his laziness. I fear that too often the world in general, and specially the employer, adopts the attitude of the wife; and your discoverer is often a sensitive man who dislikes being even tacitly blamed, and turns for safety to the old routine in which immediately tangible results can be shown. It is difficult to put a limit on what might be accomplished in industry by the employer who had sufficient knowledge and tact to sympathise with the intelligent young chemist, to discuss with him the possibilities of advance, and to point out the difficulties which his practical experience told him to expect.

In a university, this want of sympathy and comprehension is not so likely to occur, but on the other hand the want of quiet and uninterrupted time for work is a great bar to success. It is but rarely that odd half hours or even odd hours can be successfully utilised; apparatus takes time to set up, and experiments must often be carried through at one sitting, but above all, time is needed for unbroken thought, only those who have tried can know how a chance visitor or a ring on the telephone can break up a laborious and intricate chain of thought, and how long it takes to get ideas in train again. It is not merely professors but the younger staff whose opportunity for research should be amply provided and carefully guarded, and to the latter it is especially important, since published research is the only means by which they can recommend themselves for the higher posts, the hope of which induces them to work at the low salaries at present paid. For advanced students also simple experimental work on practical problems is the best possible training. For this purpose the University has decided to admit postgraduate students at very much reduced fees, and it is much to be wished that a certain number either of scholarships, and, what would probably be better, of junior posts as research assistants to professors could be created to enable promising students to complete their training in research. Such posts should of course be of a temporary character, say, for one year only, and should be awarded, not by examination, but in recognition of practical work already done.

Discussion.

Prof. A. **Smithells** fully agreed with Prof. Procter's ideas and had never heard a more succinct account of the subject. Many factors had to be considered. Employers said the workmen's attitude often prevented successful application of science to industry. The state of affairs had much improved in the last 20 years, but was still unsatisfactory. He could not see that the professors were to blame. Material was available, but employers expected immediate returns and it was difficult to convince them that time and capital must be spent before results could be obtained. They were often reluctant to let their chemists get practical experience by having the run of the works. In ordinary business valuable services were proportionally well paid, and a good chemist would not be tempted to take his knowledge and experience elsewhere if it were made to his interest to remain.

Mr. F. W. **Richardson** asked what a young man's aim and object was in taking up chemistry. If compelled to become a secondary chemist the outlook was poor. Manufacturers kept chemists testing samples only and expected immediate increases in income, instead of providing time and money for them to improve processes. Chemists often became managers or commercial travellers on account of the low salaries paid. He thought it was important to employ men of originality, and, as examinations were most imperfect tests, some other system was wanted to secure the man of most promising practical ability.

Mr. **George Ward** took exception to the depreciation of technical schools, which he thought were likely to produce in workmen-students more sympathy with, and inclination to try, new and improved processes. He thought a system of bursaries to enable promising workmen to go to universities from technical schools might be useful.

Mr. E. **Breffit**, speaking from an employer's point of view, said that college students although requiring at least three years to learn sufficient to be of value, expected high salaries at once. It had occurred to him that arrangements might be made for scholarship holders to study specified manufactures. He offered to let a college student study glass manufacture at his company's works. The worst manufacturer spoilt the trade of the best, by selling below cost price. In England practically no attention had been paid to the cost of glass manufacture. In Germany and the United States the relative cost of production in all countries had been investigated. He believed that if English industry could not prosper by the application of scientific methods it could not in any other way.

Mr. **Barber** thought examinations did not encourage originality or advance technical knowledge. Unsuccessful candidates often did better work afterwards in research and technology. Manufacturers were now more ready to give their sons technical training. The talent was present in both working and middle classes if only means were devised for getting the original men rather than those who were merely successful in examinations.

Mr. Procter, in reply, said that even if workmen had useful ideas, it was not often that they were in a position to introduce them in practice, and their want of general scientific education rendered it very difficult for them to benefit by advanced technological instruction. It was often difficult to obtain manufacturers' consent for students to see their works, and he thanked Mr. Breffit for his offer.

Obituary.

WILLIAM CHATTAWAY, F.C.S., F.I.C.

Member of the Society of Chemical Industry,
Chief Chemist and Manager for the Society of Apothecaries of London, &c.

William Chattaway was born in 1861, and commenced his professional career in 1877 with Mr. Joseph Young, chemist, Leicester, who with his pharmaceutical profession also united an extensive analytical practice. It was under such auspices that Mr. Chattaway's practical knowledge was gained. Leaving Leicester he proceeded to Paris, where he made the acquaintance of Chevreul. This acquaintance ripened into close friendship, the aged chemist and the younger one keeping in touch with each other until the death of the former. After passing his minor and major examinations, in 1883 and 1885 respectively, William Chattaway went to Sheffield as senior assistant to the late Mr. A. H. Allen, with whom he was associated for seven years, latterly as a partner in a branch laboratory which Mr. Allen had opened in London. Mr. Chattaway rendered Mr. Allen considerable assistance in the compilation of portions of his Commercial Organic Analysis. When the late Mr. R. H. Davies was taken ill, Mr. Chattaway was temporarily appointed as chief chemist and manager of the Apothecaries' Hall, and was confirmed in the appointment when Mr. Davies died in 1893. Mr. Chattaway was also public analyst for the boroughs of Hammersmith and Colchester. He was, moreover, recently commissioned by the Pharmacopœia Committee of the General Medical Council to prepare a digest of published researches and criticisms bearing upon the matter of the latest edition of the British Pharmacopœia. Mr. Chattaway was greatly interested in photography, and had done some good work on colour photography. He died on Oct. 7th, at the age of 43.

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d*. each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s*. each, to the Secretary of the Society.

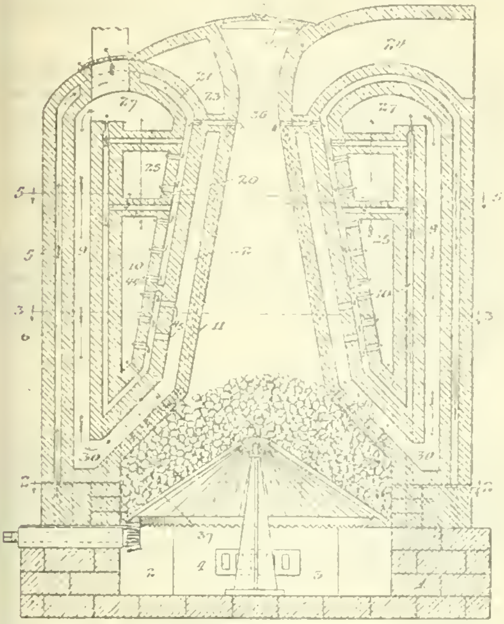
French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3e).

I.—PLANT, APPARATUS, AND MACHINERY.

English Patents.

Furnaces; Impts. in ——. F. J. Doyle, Chicago. Eng. Pat. 22,057, Oct. 13, 1903.

The furnace consists of an outer cylindrical shell 5, supported on a suitable base 1. The dome-shaped grate 37 is supported above the ash-pit 2 by the pillar 38, and can be rotated by the mechanism 42, 40, and 39. The ash-pit 2 has a door 3 provided with an adjustable damper 4 for controlling the supply of the "initial air." Openings in the shell, not shown in the figure, are left at intervals around the grate for stoking. The fuel chamber is formed by the inner sloping wall 11, which, after contracting to the throat at 36, widens again to allow the fuel to be easily charged through the opening at the top, which is closed by the cover 43. The products of combustion pass from the lower part of the fire-box to the primary combustion chamber 25, and thence through the space 27 to the downtake passage 9, through the openings 30, and the uptake passage 22 to the final mixing chamber 23, and away by the passage 24. The air for combustion enters by the passage 6, and flows through the heating passages 21, 20, and 10, one portion going by the openings 44 to the primary combustion chamber 25, and another portion by the perforations 45 to the uptake 22, the direction of the air and gases being indicated by the arrows. Another form of the furnace, applicable to firing a boiler, has an annular fuel chamber,



vith suitable charging hoppers. The gases and heated air, ifter circulating in a somewhat similar manner, finally pass hrough a central vertical chamber to the boiler flues.

—W. H. C.

Pasty or Fluid Substances; Apparatus for Drying ——. A. Huillard, Paris. Eng. Pat. 24,931, Nov. 16, 1903.

An endless band of metal netting is caused to dip in a rough containing the substance to be dried; it thus carries orward a certain quantity of the substance in its meshes, and is passed into a chamber divided by a series of baffle-plates into a number of compartments. The metal band ravels over and under a series of upper guide rolls and a eries of lower driving rolls, arranged alternately, and is hus conducted in a zigzag path through all the compartments, whilst a current of heated air is passed in an opposite lirection. When the metal band emerges from the drying hamber, the dried material is removed by a number of otary brushes. A tension arrangement is provided which eleases the tension on the cloth intermittently by the action f a cam.—J. F. B.

Mixing, Emulsifying, and Homogenising Liquids; Apparatus for ——. G. A. Bonnet, Paris. Eng. Pat. 14,621, June 29, 1904. Under Internat. Conv., July 1, 1903.

See Addition, of June 21, 1904, to Fr. Pat. 333,501 of 1903, ollowing these. —T. F. B.

United States Patents.

Drying Apparatus. F. Meyer, Chicago. U.S. Pat. 771,994, Oct 11, 1904.

A rotary drum, having two annular rows of shelves and a entral tube extending throughout its length, is mounted in heating chamber. The fire gases pass first along the utside of the drum, and return through the same to the utlet. Means are provided for feeding the material to be lried, and for drawing the gases through the drum.

—W. H. C.

Drying Apparatus. H. Hencke, Berlin. U.S. Pat. 773,390. Oct. 25, 1904.

A continuous band passes over and between a series of otating hollow cylinders, which have perforated surfaces, nd are provided with means for sucking air and liquid from their interior. The largest of the cylinders is partly surrounded by a perforated casing, the space between the surface of the cylinder and the casing decreasing in the direction of the rotation of the former, and an outer tank surrounds cylinder and casing. Means are provided for removing the dried material from the band, and for washing the latter.—W. H. C.

Distilling and Evaporating Apparatus. W. H. Gesner, Assignor to the Caribbean Manufacturing Co., New York. U.S. Pat. 773,139, Oct. 25, 1904.

A screw conveyor has a portion of its convolutions solid, and a portion hollow and perforated, with means for supplying heat to the latter. The whole is situated in a perforated tubular case, which is surrounded by a larger, outer, non-perforated casing. The space between the two cases is connected to a condenser, and a current from the apparatus to the condenser is induced by a fan.

—W. H. C.

Centrifugal Machine. T. S. Patterson, New York, Assignor to the Oil and Waste Saving Machine Co., Rochester, N.Y. U.S. Pat. 773,220, Oct. 25, 1904.

The rotating drum of the machine is provided with perforations on its side wall, and is mounted vertically in a steam casing, having a suitable steam inlet and outlet, and a trapped cover. The drum is rotated by means of a turbine placed directly beneath it and in the casing. A pipe is arranged to deliver steam against the vanes of the turbine.

—W. H. C.

Centrifugal Machine [Separator]. A. J. Ericsson, Assignor to Aktiebolaget Separator, Stockholm. U.S. Pat. 773,489, Oct. 25, 1904.

See Fr. Pat. 342,115 of 1904; this J., 1904, 895.—T. F. B.

Furnace. E. Lane, Kansas City, Mo. U.S. Pat. 773,328, Oct. 25, 1904.

The furnace has front and rear combustion chambers, which increase in cross-sectional area from front to rear, and which are separated by a wall, and connected by an opening in the wall and by a flue. A boiler having a flue of increasing cross-sectional area from front to rear, is interposed between the rear combustion chamber and the stack.

—W. H. C.

Filter-Press. J. W. Neill, Salt Lake City, Utah. U.S. Pat. 772,472, Oct. 18, 1904.

The press consists of a vertical cylinder, the bottom of which is formed by the filtering medium, supported by a suitable plate. A reciprocating plunger works in the cylinder and forces the liquid through the filtering medium. Means are provided for actuating the plunger, for feeding the liquid to be filtered, and for controlling the feed.

—W. H. C.

Filtering Apparatus. H. R. Cassel, Colorado Springs, Colo. U.S. Pat. 773,473, Oct. 25, 1904.

A tank is combined with enclosed filtering cells having a suction-pump connected thereto. The apparatus has a removable bottom, with means for raising and lowering the same. Means are provided for withdrawing the "pulp" from the bottom of the apparatus and distributing it at the top.—W. H. C.

French Patents.

Retort Furnaces; Inclined ——. E. Derval. Second Addition, dated June 4, 1904, to Fr. Pat. 321,154, May 3, 1902.

See Eng. Pat. 21,964 of 1903; this J., 1904, 859.—T. F. B.

Liquids; Process for Desiccating [Evaporating] ——. W. D. Neel. Fr. Pat. 344,072, June 15, 1904.

See Eng. Pat. 13,186 of 1904; this J., 1904, 814.—T. F. B.

Heating Fluids of all kinds; Utilising the Heat of [Chemical] Reactions for ——. A. Lang. Second Addition, dated June 17, 1904, to Fr. Pat. 331,997 of May 12, 1903.

In order to set fire to the mixture which, on combustion, is to give out heat, there is embedded in it a conical cup containing a layer of aluminium mixed with some peroxide, and this is covered by a layer of a mixture of magnesium and potassium chlorate. The layer of magnesium is hermetically covered by a plate of celluloid; and this may be ignited by means of a match. (See also this J., 1904 537.)—L. F. G.

Heat liberated by the Crystallisation of Saturated Solutions; Utilising ——. L. J. J. B. Chèneau. Fr. Pat. 344,513, July 1, 1904.

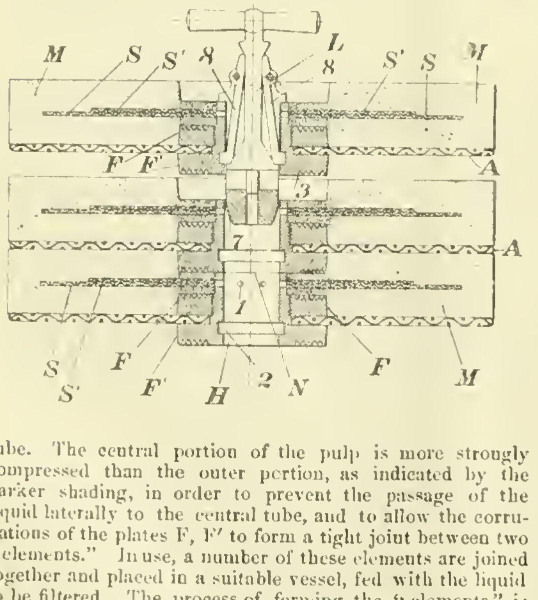
Crystallised strontium hydroxide is dissolved in boiling water to saturation, and the solution is run into suitable vessels, as into the warmers for railway carriages, for supplying heat continuously as long as crystallisation proceeds. The product when cold is stated to be, not a solid, but a pasty mass, putting no strain upon the containing vessel.—E. S.

Filtering Liquids; Apparatus for ——. A. J. Hosier, A. Whatley, and W. Kelly. Fr. Pat. 344,089, June 17, 1904.

The liquid filters through a fine copper or brass sieve contained in a drum suitably rotated, and the residue accumulating on the sieve is swept out by a rotating brush, driven by a belt and pulleys from the shaft rotating the drum, and falls into an outer casing, from which it is removed.—L. F. G.

Filter Element, and Method of Construction. K. Kiefer. Fr. Pat. 344,251, June 24, 1904.

Each "element" of the filter is formed of a metal tube H, having a flange F′ and a collar F, between which a disc of coarse wire gauze A is held, and which serves to separate the "elements" from one another, and to allow the liquid which is to be filtered, to reach the filtering medium. The latter, which consists of two layers of compressed paper pulp M, between which layers of fine wire gauze S, S′, of less diameter than the layer of pulp, are placed. The mesh of this gauze is of sufficient fineness to prevent the fibres of the pulp passing through, but allows the filtered liquid to flow through and away by the openings 1, to the central tube. The central portion of the pulp is more strongly compressed than the outer portion, as indicated by the darker shading, in order to prevent the passage of the liquid laterally to the central tube, and to allow the corrugations of the plates F, F′ to form a tight joint between two "elements." In use, a number of these elements are joined together and placed in a suitable vessel, fed with the liquid to be filtered. The process of forming the "elements" is as follows: A suitable quantity of paper pulp is put into a circular vessel, having a central vertical core, and filter bottom which can be forced upwards. The fine gauze discs are next placed on the surface of the pulp, and then another portion of the latter. The vessel having been closed by a lid, the bottom is forced upwards and the pulp compressed. After releasing the pressure, lowering the central core, and removing the cover, the coarse gauze disc and the central tube are inserted, and the complete "element" removed by a special instrument and placed in the filter.—W. H. C.



Filters; Impts. in ——. Mme. H. Breyer, *née* Mitterbacher, and A. Jurnitschek de Wehrstedt. Fr. Pat. 344,351, June 27, 1904.

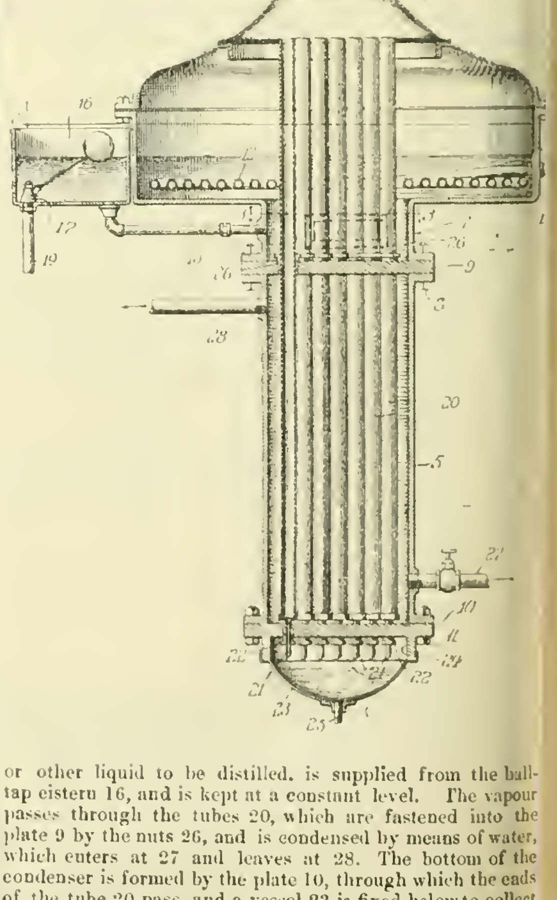
The filtering medium is composed of well-burnt bricks or tiles, reduced to a sufficiently fine condition that the particles adhere to the filter cloth, which is supported on a vertical perforated plate.—W. H. C.

Emulsifying and Mixing Liquids; Apparatus for ——. G. A. Bonnet. First Addition, dated June 21, 1904, to Fr. Pat. 333,501, July 1, 1903.

The liquids to be mixed are forced under pressure into a vertical cylinder, in which slides a piston on which a certain pressure is exerted by a spring. The liquids are then forced through a series of fine holes into a central exit channel, and thus mixed.—L. F. G.

Distillation; Apparatus for ——. I. H. Jewell. Fr. Pat. 344,363, June 28, 1904.

A boiler or still 6 having a cylindrical extension 7, is bolted to a flanged cylinder 5, which forms the condenser. The plate 9, interposed between the flanges, serves to separate the still from the condenser. The still, which may be heated by a steam coil 12, 13, as shown, or by a ring of gas burners placed below, has a dome-shaped cover, part of which, 100, is easily removable. The water, or other liquid to be distilled, is supplied from the ball-tap cistern 16, and is kept at a constant level. The vapour passes through the tubes 20, which are fastened into the plate 9 by the nuts 26, and is condensed by means of water, which enters at 27 and leaves at 28. The bottom of the condenser is formed by the plate 10, through which the ends of the tube 20 pass, and a vessel 23 is fixed below to collect the distillate.—W. H. C.



II.—FUEL, GAS, AND LIGHT.

Benzene in Illuminating Gas; Determination of ——. O. Pfeiffer. XXIII., page 1116.

Soap and Candles; Manufacture of ——. J. Lewkowitsch. XII., page 1100.

English Patents.

Fuels; Method and Apparatus for Determining the Heating Value of Gaseous and Liquid ——. H. Junkers. Eng. Pat. 18,437, Aug. 26, 1904. XXIII., page 1116.

Gas Producers. J. G. Nash, Adelaide, Australia. Eng. Pat. 17,712, Aug. 15, 1904.

A feeding device, comprising a cylinder and reciprocating plunger, is arranged upon the side of the producer for charging bituminous fuel into the incandescent zone of the fuel within the producer. At suitable intervals a quantity of the coal may be allowed to rest in the cylinder until it has become coked by the heat from the interior of the producer, whereupon the coke is withdrawn through a side shoot. At the top of the producer is provided an arrangement for feeding coke or the like, and at the bottom is a water-sealed fire-grate and an inlet for the air blast. The valves controlling the air blast and a blow-off pipe for surplus gas are connected to a gas-holder, so that the production and storage of gas cease when the gas-holder is full. The apparatus is provided at various points with pokers, working through ball-and-socket bearings, for loosening fuel, clearing flues, &c.—H. B.

Gas Retorts [Continuous Carbonisation]. J. Verdier and P. Teulon, Marseilles. Eng. Pat. 18,364, Aug. 24, 1994. Under Internat. Conv., Sept. 2, 1903.

A vertical retort is provided at the top with a feeding device, and at the bottom with a discharging device, each of these consisting of a rotatable plug provided with a cavity. The feeder and discharger are rotated continuously by means of suitable gearing, whilst a conveyor serves to bring fresh coal to the charging hopper and to remove the coke as discharged.—H. B.

Gas-testing Apparatus. A. H. Lymn. Eng. Pat. 23,771, Nov. 3, 1903. XXIII., page 1113.

Cement or Moulded Articles; Apparatus and Process for Utilising Gas Lime or other Calcium Compounds and Clinker, Slag, or other Silicious or Aluminous Material for the Manufacture of ——. J. Bond. Eng. Pat. 23,213, Oct. 27, 1903. IX., page 1091.

Incandescence Bodies for Electric Glow Lamps; Manufacture of ——. C. D. Abel, London. From Siemens und Halske A.-G., Berlin. Eng. Pat. 20,277, Sept. 20, 1904.

Incandescence filaments are made of molybdenum, thorium, tungsten, zirconium, or an alloy of any of these metals with each other, or with other metals fusible with difficulty, the metal or alloy being completely free from all non-metallic substances. The metal is used in the form of drawn wires, preferably drawn from metal which has been fused previously, as, for instance, by passing an electric current through it in a vacuum or in an indifferent atmosphere.—H. B.

United States Patents.

Carbon Analysis; Method of ——. G. O. Seward, Assignor to Eimer and Amend. U.S. Pat. 773,529, Oct. 25, 1904. XXIII., page 1115.

Gas; Apparatus for Manufacturing ——. R. Dempster, Marietta, Ohio. U.S. Pat. 772,224, Oct. 11, 1904.

The apparatus consists of a retort formed of a number of superposed chambers connected together and heated externally. Inside the chambers, perforated tubes, surrounded with a finely-divided packing material, extend from one end to the other. Air-supply pipes lead into one end, and air- and oil-supply pipes into the other end of each of the chambers, the volumes of gas being intermingled by passing through the packing material. See also U.S. Pats. 692,771, 703,901, and 743,468; this J., 1902, 600, 1128; 1903, 1287. —W. C. H.

Gas Producers. J. A. Herrick, Philadelphia, Pa. U.S. Pat. 773,143, Oct. 25, 1904.

The producer is provided with a grated lid, in the openings of which, bricks are seated which extend beyond the inner face of the grating, and their surfaces are exposed to tarry products distilled from fuel in the producer.—W. C. H.

French Patents.

Gas-Retort Furnaces. E. Derval. Fr. Pat. 339,015, Sept. 5, 1903.

The furnace is constructed so as to have a gas-producer and a recuperator situated entirely beneath the retort bench, and separated from one another by the flue which leads to the chimney.—H. B.

Gas-Producer. G. zur Linden. Fr. Pat. 344,069, June 15, 1904.

To prevent the adhesion of clinker to the interior walls of the producer, the walls are kept cool by means of currents of steam. For example, the whole of the lining of the chamber may be provided with perforations and horizontal and vertical slits, through which steam is introduced; or the lining may have the form of a succession of annular, sloping projections, beneath which, when the producer is filled with fuel, there are left open annular spaces into which steam is introduced.—H. B.

Gas or Vapour and Air, or a Mixture of Gas and Air, for Combustion; Method and Apparatus for Obtaining ——. The Scott-Snell, Phillips Syndicate, Ltd. Fr. Pat. 344,020, June 16, 1904.

The apparatus comprises a water-sealed bell, a motor which, acting through a mechanism similar to that used in phonographs, alternately raises and lowers the bell, and a hollow valve (either a slide valve or a rotating valve), which is caused to move synchronously with it, and is brought successively into communication with an air-inlet, a gas-inlet, and an outlet to the main for the mixed gas. During the ascent of the bell, the valve-opening remains in communication first with the air-inlet, and then with the gas-inlet, so that definite proportions of air and gas are aspirated into the bell; whilst during the descent of the latter, the valve opening communicates with the main, into which the combustible mixture is expelled under pressure. An automatic check is provided between the motor and the intermediate driving mechanism, such that the motor does not begin to operate until the latter requires to be wound up again. By enclosing the whole bell within a casing communicating with a modified form of valve, the apparatus may be rendered double-acting, the bell, whilst rising, acting as a compressor upon the gaseous mixture which it has drawn into the casing during its descent, and simultaneously drawing air and gas into its interior, as in the arrangement first described above.—H. B.

Gas-Producers. G. Gautier. Fr. Pat. 344,102, June 17, 1904.

The producer, which is adapted for use with bituminous coal, has an annular boiler surrounding the foot of the combustion chamber, and part of the steam generated is led, along with air, up beneath the rotating conical fire-grate for the production of gas as usual. Another portion of the steam generated, is led through a coil immersed in cold water, and the saturated water-vapour thus obtained is introduced, at various heights, into the interior of the producer, so as to mix with the gas as it is formed. It is said that the water particles bring about a condensation of the heavier tarry matters within the producer itself, where they are burned. The gas is passed through a vertical, tubular washer, where it encounters showers of water, and after further washing it enters a gas-holder, which, when it is quite full of gas, automatically shuts off the supplies of steam and air to the producer.—H. B.

Air Gas; Process of Manufacturing —— in the Cold by means of Liquid Hydrocarbons, Alcohol, &c. E. Gersabeck. Fr. Pat. 344,205, June 22, 1904.

The air is passed through a fixed or rotary carburetter having partitions which cause the air to pursue a tortuous course, the compartments being provided with porous material, the lower portion of which dips into the carburetting liquid.—H. B.

Producer for Weak Gas. N. A. Mongeotte. Fr. Pat. 344,243, June 23, 1904.

A casing, provided with a refractory lining, which constitutes the combustion chamber of the producer, is suspended within two concentric casings, which thus form two concentric annular spaces, at the top of which there is a steam generator surrounding the fuel hopper. The hot gases produced, are led down the outer annular space, so that the entire apparatus is bathed in them, and loss of heat is reduced to a minimum. Two intertwined helical pipes fixed within the outer annular space conduct the air required for combustion, from the outer air to the steam generator, the air thus becoming highly heated. The mixture of steam and air is led down the inner annular space to the foot of the combustion chamber, whence it ascends through the fuel. The elimination of dust from the gas is favoured by the gas having to pursue a helical course between the coiled pipes in the outer jacket, and additional devices for the removal of dust are provided at the base of the apparatus near the outlet.—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM AND MINERAL WAXES.

Lignite Tar; Bases in ——. H. Ihlder. Z. angew. Chem., 1904, **17**, 1670—1671.

The author has previously isolated from the bases of lignite tar the three picolines and the $\alpha\alpha'$-, $\alpha\beta'$-, and $\alpha\gamma$-dimethylpyridines. He has sought to isolate, though without success, the $\alpha\beta$- and the $\beta\beta'$-isomerides, the latter of which Ahrens and Gorkow found in coal tar (this J., 1904, 654): but from the fraction of b. pt. 160°—165° C., by fractional precipitation with mercuric chloride, he has obtained, besides the $\alpha\gamma$-isomeride, compounds which he has identified as those of $\beta\gamma$-dimethylpyridine. From the fraction of b. pt. 220°—230° C. he has further obtained a precipitate with mercuric chloride. The small quantity of base regenerated from this did not allow of the determination of its b. pt., but the behaviour of its oxidation product leaves little doubt of its being $\alpha\beta\gamma\beta'$-tetramethylpyridine.—J. T. D.

Petroleum and its Distillation Products; Action of Formalin on —— [Formolit]. A. Nastjukow. J. russ. phys.-chem. Ges., 1904, **36**, 881—898. Chem. Centr., 1904, **2**, 1042—1043.

If sulphuric acid (1 vol.) and formalin ($1\frac{1}{2}$ vols.) be added to refined petroleum (1 vol.), a vigorous reaction ensues, and a solid product separates, which the author names "*formolit.*" It is a yellowish-brown amorphous substance (probably a mixture), infusible, and insoluble in the ordinary solvents. The yield of "formolit" from the distillates of a specimen of petroleum increases with the boiling point of the fraction. The yield of "formolit" from different kinds of petroleum varies; for example, petroleum from Ssurachan and Tiflis yields less than 5 per cent.; that from Tscheleken, Ljakan (Ferghana), Bioagady (near Baku), and part of that from Balachany yield 17—18 per cent.; that from Grosny and Balachany yields 23—24 per cent.; and petroleum from Bibi-Eibat and Kuban yields 37—38 per cent. of "formolit." Experiments with a large number of different hydrocarbons showed that only cyclic, unsaturated hydrocarbons react with formalin. When "formolit" is subjected to destructive distillation, saturated hydrocarbons are mainly obtained; only 6·16 per cent. of the distillate is capable of again reacting with formalin. From the yield of "formolit" the amount of unsaturated cyclic hydrocarbons in a specimen of petroleum can be determined. If the yield of "formolit" be less than 50 per cent., the proportions of sulphuric acid and formalin given above will answer the purpose, but if the yield be 50 per cent. or more, the proportions of petroleum, sulphuric acid, and formalin should be 1 vol. : 2 vols. : 1 vol. The weight of "formolit" multiplied by 0·8 gives the amount of unsaturated cyclic hydrocarbons.—A. S.

English Patents.

Hydrocarbon Derivatives; Process for the Production of Water-Soluble or easily Emulsifiable ——. W. P. Thompson, London. From Ges. z. Verwerthung der Boleg'schen Wasserlöslichen Mineralöle und Kohlenwasserstoffe G. m. b. H., Berlin. Eng. Pat. 22,091, Oct. 13, 1903.

Vaseline; Process for Production of Water-Soluble or Emulsifiable ——. W. P. Thompson, London. From Ges. z. Verwerthung der Boleg'schen Wasserlöslichen Mineralöle und Kohlenwasserstoffe G. m. b. H., Berlin. Eng. Pat. 22,092, Oct. 13, 1903.

See Fr. Pat. 338,640 of 1903; this J., 1904, 655.—T. F. B.

United States Patent.

Pine Oils from Wood; Process of Manufacturing ——. F. S. Clark and E. A. Harris, Assignors to Georgia Pine Turpentine Co., New York. U.S. Pat. 771,859, Oct. 11, 1904.

The tar and heavy oils are removed by condensation from the vapours arising from the distillation of wood, and steam is introduced into the residual vapours, which are then treated with a caustic alkali (*e.g.*, lime) to remove acetic acid and creosote, the temperature being maintained during this treatment above the boiling point of the lighter oils. The purified vapours are subjected to fractional condensation, to separate the "bad-smelling oils" from the pine oils. —T. F. B.

French Patents.

Pitch; Apparatus for Running-off and Cooling ——. Cie. Paris. d'Eclairage et de Chauffage par le Gaz. Fr. Pat. 344,485, June 30, 1904.

The molten pitch falls from a number of small openings in a tank into a similar number of small troughs situated side by side on the circumference of a wheel, which is rotated in a plane perpendicular to the line in which the orifices in the tank are disposed. This wheel is fixed near the top of a large tank filled with water to such a height that only the small troughs at the top of the wheel at any time are out of the water. Small jets of water are projected on to the pitch as it flows into the troughs, thus causing a sudden cooling. The troughs are normally bottomless, but temporary bottoms are provided for those at the top of the wheel, in the form of plates, which are pressed by springs against the under-side of the troughs. The pieces of pitch in the troughs thoroughly cooled by passing through the water, fall out of the troughs when they reach the lowest position of the wheel, and are received on an endless conveyor, which rotates in the tank, passed thence on to a convenient number of other rotating conveyers, and finally deposited in the buckets of an elevator, which removes them from the tank. A device for forcing the pieces of pitch out of the small troughs when necessary is described, and forms the subject of one of the claims.—T. F. B.

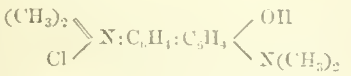
Petroleum; Process for Refining ——. A. J. Durupt. Fr. Pat. 344,129, June 18, 1904.

Petroleum, freed from sulphur compounds, is mixed with stated proportions of such mineral oil as "vaporine," &c., denatured alcohol, and middle oils of coal tar, previously freed from naphthalene and anthracene. The mixture is distilled, the first portion of the distillate being suitable for motor purposes, whilst the remainder is said to consist of a very pure petroleum. The residue, when mixed with rosin or pitch, is stated to be suitable for caulking purposes. —T. F. B

IV.—COLOURING MATTERS AND DYESTUFFS.

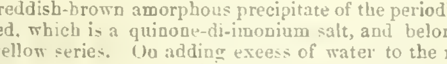
Quinonoid Derivatives of Benzidine. R. Willstätter and L. Kalb. Ber., 1904, **37**, 3761—3775.

Benzidine and its alkyl derivatives give rise, on gentle oxidation, to coloured compounds which form two series of coloured salts, a green series and a yellow one. If tetramethyl benzidine, which is prepared by the oxidation of dimethylaniline, be oxidised with ferric chloride in presence of hydrochloric acid, dark green needles separate out which appear to have the formula $C_{16}H_{21}ON_2Cl + 2H_2O$, but cannot be accurately analysed, as they decompose very rapidly and smell strongly of formaldehyde. The dry substance forms a black-violet powder, and dissolves in water or acetic acid with a deep green colour; mineral acids change the colour to orange yellow. The green salt appears to be half a quinoneimonium salt and half an amino-quinol, and to have the formula—



$$\begin{matrix}(CH_3)_2\\Cl\end{matrix}\!\!>N:C_6H_4:C_6H_4<\!\!\begin{matrix}OH\\N(CH_3)_2\end{matrix}$$

On reduction this gives tetramethyl benzidine. If chlorine be led in excess into a cooled solution of tetramethylbenzidine in alcohol and sulphuric acid, an acid sulphate of the oxidation product crystallises out in red prisms. Analysis agrees fairly with the formula $(C_{16}H_{20}N_2)SO_4.H_2SO_4 + 2H_2O$, but this sulphate is still less stable than the green chloride, and also smells of formaldehyde. It dissolves in water with an orange-yellow colour. The yellow salts appear to be quinone-di-imonium salts, and the sulphate to have the following formula: $HO_4S(CH_3)_2:N:C_6H_4:C_6H_4:N:(CH_3)_2.SO_4H + 2H_2O$. The green chloride dissolves in dilute hydrochloric acid with formation of the yellow chloride, which may be precipitated with platinum chloride as a double salt of the composition $C_{16}H_{20}N_2Cl_6Pt + 2H_2O$. If potassium iodide be added to a solution of the green chloride in 10 per cent. hydrochloric acid, a reddish-brown amorphous precipitate of the periodide is formed, which is a quinone-di-imonium salt, and belongs to the yellow series. On adding excess of water to the red periodide suspended in water, it changes at a certain dilution, into a black body with green reflection; this belongs to the green series, and an atom of iodine has been replaced by a hydroxyl group—



$$I(CH_3)_2:N:C_6H_4:C_6H_4:N:(CH_3)_2.I.I_2 + H_2O =$$
$$HI + \begin{matrix}OH\\(CH_3)_2N\end{matrix}\!\!>C_6H_4:C_6H_4:N<\!\!\begin{matrix}(CH_3)_2\\I.I_2\end{matrix}$$

Sulphur dioxide reduces the green chloride and forms a mixture of a mono-sulphonic acid of tetramethylbenzidine, m. pt. 261°·5 C. and of tetramethylbenzidine. The symmetrical N, N′-dimethylbenzidine is prepared as follows:—Benzidine is dissolved in water and treated first with toluene sulphochloride and then with caustic soda; the ditoluene sulphamide, $(.C_6H_4.NH.SO_2.C_7H_7)_2$, is then methylated with dimethyl sulphate, and the compound formed, $(.C_6H_4.N(CH_3).SO_2.C_7H_7)_2$, is heated with sulphuric acid to liberate the free N, N′-dimethylbenzidine, $CH_3.HN.C_6H_4.C_6H_4.NH.CH_3$, which crystallises from ligroin in snow-white feathery crystals, melting at 74°—76° C. On oxidation, dimethylbenzidine shows very similar colour reactions to the tetramethyl compound. Ferric chloride forms a green quinonoid chloride. Platinum chloride precipitates a double salt in golden-brown prisms, from a solution of the green chloride in 20 per cent. hydrochloric acid. This has the formula $C_{14}H_{16}N_2Cl_6Pt + H_2O$, and is a quinone-di-imonium salt of the yellow series.—A. B. S.

Acetone-dioxalic Ester (Desmotropy and Dyeing Properties). R. Willstätter and R. Pummerer. Ber., 1904, **37**, 3733—3740.

Acetone-dioxalic ester, which is obtained by the action of sodium ethylate on a mixture of acetone and oxalic ester, consists of a mixture of two desmotropic forms. One of these, which forms the chief product of the reaction, is nearly colourless, and forms prisms melting at 104° C. This body has no dyeing properties, and appears to be the mono-enolic form, and to have one of the following formulæ:—$COOR.CO.CH:C.(OH).CH_2.CO.COOR$ or $COOR.CO.CH_2.CO.CH:C(OH).COOR$. The second form can be obtained from the first by treating it with caustic soda solution, and liberating the free ester with hydrochloric acid. It is apparently the di-enolic form with the following formula: $ROOC.C.(OH):CH.CO.CH:C.(OH).COOR$. It forms lemon-yellow needles, m. pt. 98° C. The alcoholic solution dyes wool a deep yellow fast to spirit; acid prevents the dyeing. On chrome-mordanted wool it gives a brownish-yellow shade at once, but on long boiling, the ester is decomposed and the saponification products fixed on the wool. Alkalis convert the mono- into the di-enolic form, whilst acids have a "ketonising action" and reverse the process. It is interesting to note that this is the first nitrogen-free dyestuff of the fatty series.

—A. B. S.

Triphenylmethyl. X. M. Gomberg and L. H. Cone. Ber., 1904, **37**, 3538—3547. (See this J., 1904, 711.)

It has been shown previously that triphenylmethyl is oxidised by the air to triphenylmethyl peroxide. Determinations of the amount of oxygen absorbed showed that the reaction proceeds quantitatively according to the equation—

$$2(C_6H_5)_3C + O_2 = (C_6H_5)_3C.O.O.C(C_6H_5)_3.$$

Determinations of the amount of the peroxide produced by weighing the oxidation product after purifying it by washing with ether, in which the peroxide is insoluble, gave results corresponding to a yield of 80 per cent. The low yield appears to be due to the decomposition of the peroxide formed, an oily substance soluble in ether being produced. By the action of sulphuric acid, triphenylmethyl peroxide is decomposed at the ordinary temperature, according to the equation—

$$(C_6H_5)_3C.O.O.C(C_6H_5)_3 + H_2O = 2(C_6H_5)_3C.OH + O,$$

a yield of 80 per cent. of the theoretical amount of triphenylcarbinol being obtained. The oxygen produced is not evolved in measurable quantities, but acts, in the nascent state, on a portion of the carbinol. Triphenylmethyl peroxide dissolves in sulphuric acid to a deep red solution, in the same way as triphenylcarbinol, the colour being probably due to formation of triphenylmethyl sulphate. The latter compound was prepared by acting with silver sulphate on triphenylchloromethane dissolved in liquefied sulphur dioxide. It is a dark red substance, and forms solutions of an intense red colour. By treating triphenylmethyl peroxide with halogens under varying conditions, triphenylbromomethane pentabromide, triphenylmethyl bromide, triphenylbromomethane penta-iodide, and triphenylmethyl chloride were prepared. By the action of phosphorus pentachloride on triphenylmethyl peroxide above 100° C., the primary reaction products appear to be benzophenone chloride and triphenylmethyl chloride, but the latter decomposes further with formation of diphenylenephenylmethane. A solution of triphenylmethyl in benzene is rapidly decolorised when exposed to direct sunlight, the weight of the product after the exposure amounting to 105 parts for each 100 parts of triphenylmethyl; 65 per cent. of the final product consists of triphenylmethane. In carbon tetrachloride solution the decomposition proceeds more rapidly, but no triphenylmethane is produced. In neither case could hexaphenylethane be detected in the product after exposure to light.—A. S.

Rosaniline; The Triboluminescent Parent-Hydrocarbon of ——. A. Bistrzycki and J. Gyr. Ber., 1904, **37**, 3696—3699.

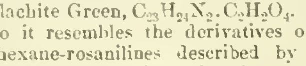
Specimens of diphenyl-*m*-tolylmethane obtained by the authors (this J., 1904, 542) and by Hemilian synthetically, and of the root hydrocarbon of rosaniline, prepared by E. and O. Fischer, are found to be identical as regards melting point, behaviour towards sulphuric acid, and crystalline structure; also they all exhibit a feeble blue triboluminescence; that shown by Fischers' hydrocarbon is much feebler than in the other specimens, but this property appears to depend largely upon the size and form of the crystals. Hence there appears to be no doubt as to the identity of the three specimens. Neither diphenyl-*o*-tolylmethane, nor diphenyl-*p*-tolylmethane, nor diphenyl-*m*-tolylcarbinol exhibit this triboluminescence. On gentle oxidation, diphenyl-*m*-tolylmethane is converted into the carbinol, whilst more energetic oxidation results in the formation of triphenylcarbinol-*m*-carboxylic acid.—T. F. B.

Tetrahydroxycyclohexane-Rosanilines. J. Schmidlin. Comptes rend., 1904, **139**, 676.

LAMBRECHT and Weil have recently described a colourless oxalate of Malachite Green, to which they ascribed the formula $C_{23}H_{26}ON_2.2C_2H_2O_4.3H_2O$. This salt loses 4 mols. of water when heated at 70° C., forming the coloured oxalate of Malachite Green, $C_{23}H_{24}N_2.C_2H_2O_4$. In its other properties also it resembles the derivatives of the tetrahydroxycyclohexane-rosanilines described by the author (this J., 1904, 979), who considers that the 3 mols. of water shown in Lambrecht and Weil's formula do not represent water of crystallisation, but enter into the constitution of the compound, which may be represented by the formula $[C_2H_2O_4.(CH_3)_2N.C_6H_4](C_6H_5)CH[C_6H_6(OH)_4.N(CH_3)_2.C_2H_2O_4]$. It is probable, however, that one of the hydroxyl groups is united to the methane carbon, as the colourless oxalate is obtained by the direct action of oxalic acid on Malachite Green carbinol. This fact is considered by the author to be a proof of the intermediate formation of hexahydrobenzene derivatives in the transformation of the benzenoid carbinol compounds into the coloured quinonoid rosaniline salts.—A. S.

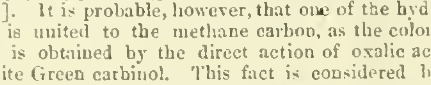
Methinammonium Dyestuffs. H. Rupe and G. L. M. Schwarz. Z. Farben- u. Textil-Ind., 1904, **3**, 397—402.

IF acetylated-β-naphthylamine be melted with phosphorus pentasulphide a thioacetnaphthalide is formed, which, on oxidation with potassium ferricyanide, gives β-naphthothiazole. The latter condenses with benzaldehyde and its derivatives when heated together with zinc chloride in an atmosphere of carbon dioxide. Benzaldehyde gives cinnamenylnaphthothiazole—



$$C_{10}H_6\langle S, N \rangle C.CH:CH.C_6H_5$$

o-Aminocinnamenyl-β-naphthothiazole is obtained by reducing *o*-nitrocinnamenyl-β-naphthothiazol. The hydrochloride of this base dyes tannined cotton in yellow shades, which are, however, not fast. Its formula may be written in the quinonoid form thus—



$$C_{10}H_6\langle S, N \rangle C.CH_2.CH(1):C_6H_4:NH_2Cl(2)$$

The corresponding meta compound has no dyeing properties, and cannot be represented by a quinonoid formula. The para compound dyes better than the ortho. The corresponding compounds of α-naphthothiazole show similar dyeing properties. The amino derivatives of both cinnamenylnaphthothiazoles are dyestuffs when the NH_2 group is in the ortho or para position to the $-CH=CH-$ group. The meta derivatives have no dyeing properties. A quinonoid formula can be written for the former, but not for the latter.—A. B. S.

Aromatic Esters; Electrolytic Reduction of ——. C. Mettler. XI. A., page 1096.

English Patents.

Sulphurised [Sulphide] Dyestuffs; Manufacture of New ——. E. E. Naef and I. Levinstein (Levinstein, Ltd.), Manchester. Eng. Pat. 26,700, Dec. 7, 1903.

PARANITROSOPHENOL, *p*-nitroso-*o*-cresol, or homologous or analogous compounds are condensed with aminosulphonic acids of the benzene or naphthalene series which have the *p*-position to the amino group unoccupied. The resulting solution is precipitated by means of sodium carbonate, and the precipitate either converted directly into a sulphide dyestuff by treatment with sodium polysulphides, or reduced to leuco-indophenol (*e.g.*, with sodium sulphide), and then converted into the dyestuff, which is separated from the melt by treatment with mineral acid or with air. Dyestuffs obtained as above dye unmordanted cotton greenish-blue shades, fast to acids and light.—T. F. B.

Anthracene Series; Manufacture of Colouring Matters of the —— [Anthracene Dyestuffs]. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 712, Jan. 11, 1904.

French Patents.

Yellow Monoazo Dyestuff; Manufacture of —— from o-Amino-p-sulphobenzoic Acid and Phenylmethylpyrazolone. Cie. Parisienne de Couleurs d'Aniline. First Addition, dated July 23, 1903, to Fr. Pat. 338,531 of March 30, 1903.

ACCORDING to the original patent (this J., 1904, 657, and 1903, 862) a yellow dyestuff suitable for the preparation of lakes is obtained by diazotising *o*-aminobenzoic-*p*-sulphonic acid and combining the diazo compound with phenylmethylpyrazolone. According to the present addition the *o*-aminobenzoic-*p*-sulphonic acid is replaced by either o-toluidinesulphonic acid ($CH_3 : NH_2 : SO_3H = 1.2.4$) or its isomer ($CH_3 : NH_2 : SO_3H = 1.2.5$). The diazo compounds are combined with phenylmethylpyrazolone in alkaline solution. The dyestuffs form yellow powders soluble with difficulty in cold, but easily in hot water. The lakes obtained from them are redder in shade than those from the compound described in the original patent. They are said to be very fast to light.—E. F.

p-Acetylalkylamino-o-aminophenol-o-sulphonic Acid, and Monoazo Mordant Dyetuffs [Azo Dyestuffs] Derived therefrom; Preparation of ——. L. Cassella and Co. Fr. Pat. 338,980, Aug. 12, 1903.

ACETYLALKYL-*p*-PHENYLENEDIAMINE is diazotised and boiled, thus forming *p*-acetylalkyluminophenol. On sulphonation at 50°—60° C. with 100 per cent. sulphuric acid, this forms 1-phenol-4-acetylalkylamino-2-sulphonic acid, which is nitrated at 10°—15° C. by addition of nitrosulphuric acid to the sulphonation mixture, forming 6-nitro-1-phenol-4-acetylalkylamino-2-sulphonic acid. This is reduced to 6-amino-1-phenol-4-acetylalkylamino-2-sulphonic acid by means of sodium sulphide. This acid is converted by nitrous acid into a readily soluble yellow diazo compound which combines with amines and phenols, for instance, with resorcinol, β-naphthol, 1.5- and 2.3-dihydroxynaphthalene 1.4-naphtholsulphonic acid, 1-naphthol-3.6-disulphonic acid, β-naphthol-β-sulphonic acid, 2.7-naphtholsulphonic acid, β-naphtholdisulphonic acid R, 1.8-dihydroxynaphthalene-4-sulphonic acid, 1.8-dihydroxynaphthalene-3.6-disulphonic acid, *m*-phenylenediamine, *m*-toluylenediamine, 1.5-aminonaphthol, 2.8-aminonaphthol-6-sulphonic acid, 1.8.4-, 1.8.5-, 1.6.3-, and 1.7.3-aminonaphtholsulphonic acids, 2.3-aminonaphthol-6-sulphonic acid, 1.8-aminonaphthol-3.6-disulphonic acid, and 1.8-aminonaphthol-2.4-disulphonic acid, to form monoazo mordant dyestuffs, said to give bright, even shades of great fastness. The diazotised acetylethyl acid combines with β-naphthol to form a dyestuff which dyes wool in reddish-brown shades, turning to violet-black on after-treatment with bichromate. With 1.8-dihydroxynaphthalene-3.6-disulphonic acid it forms a dyestuff which gives violet shades on wool, turning to bright blue on after-treatment with bichromate.—E. F.

Tetrazophenol Sulphonic Acid, and an Azo Dyestuff Derived therefrom; Process for making a ——. Farbwerke vorm. Meister, Lucius und Brüning. Fr. Pat. 339,004, Aug. 27, 1903.

See Eng. Pat. 18,283 of 1903; this J., 1904, 818.—T. F. B.

Orthohydroxyazo Dyestuffs Susceptible to Chroming on the Fibre; Production of ——. Badische Anilin und Soda Fabrik. Second Addition, dated April 27, 1904, to Fr. Pat. 338,819, Dec. 17, 1903.

Instead of using chlorine or hypochlorites for replacing the *o*-sulphonic group of 1.2- or 2.1-diazonaphthalenesulphonic acids, or the sulpho- or chloro-derivatives of these, by a hydroxyl group, other oxidising agents may be employed, for example, hydrogen peroxide, alkali peroxides or persulphates, &c. (See this J., 1904, 820 and 1026.) —T. F. B.

Dyestuff containing Sulphur [Sulphide Dyestuff]; Process for Producing a Deep Blue ——. K. Oehler. Fr. Pat. 344,274, June 13, 1904.

See Eng. Pat. 12,270 of 1904; this J., 1904, 863.—T. F. B.

Lakes; Production of —— [from Azo Dyestuffs]. Farbenfabr. vorm. F. Bayer et Cie. Fr. Pat. 344,395, June 28, 1904.

Orange to bluish-red lakes are obtained by precipitating on a suitable substratum, in the usual way, the azo dyestuffs produced by combining the diazo derivative of aniline-*o*-sulphonic acid or its homologues or derivatives with naphtholsulphonic acids. Yellowish-red lakes are produced by combining the diazo derivatives of aniline-*o*-sulphonic acid or of 1.2.4-anilinedisulphonic acid with 1.4-naphtholsulphonic acid. Orange lakes are obtained from aniline-*o* sulphonic acid and 1.5-naphtholsulphonic acid or 2.6.8-naphtholdisulphonic acid. Red lakes result from combining the diazo derivative of monoacetyl-*p*-phenylene diaminemonosulphonic acid ($NH_2:CH_3.CO.NH:SO_3H$ = 1.4.6) with 2.8-naphtholsulphonic acid, or of *p*-toluidine-*m*-sulphonic (1.4.6) with 1.4-naphtholsulphonic acid, whilst a bluish-red lake is obtained from the above-mentioned acetyl-*p*-phenylenediaminesulphonic acid and 1.3.8-naphtholdisulphonic acid.—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Silk and Wool as Dyestuff Components. H. Pauly and A. Binz. Z. Farben- u. Textil-Chem., 1904, **3**, 373—374.

Among the products into which albumin can be resolved, two compounds, namely, tyrosine, $HO.C_6H_4.CH_2.CH(NH_2).COOH$, and histidine, probably of the formula $(C_3N_2H_3)CH_2.CH(NH_2).COOH$, are found, which are capable of combining with diazonium compounds. With diazobenzenesulphonic acid the first of these gives, in a solution rendered alkaline with sodium carbonate, a deep red, the second a bluish red coloration. In acid solutions both yield yellowish-orange colorations. The compounds thus formed, dye wool from acid baths, but the baths are not exhausted. The compound derived from tyrosine dyes wool in the same shade as this fibre is dyed by the diazo compound itself. No other albumin decomposition product as yet examined gives similar compounds. The above and similar dyestuff compounds may be obtained with tyrosine and histidine while these are in the combined state, in the form of albuminoids. Moreover, those albuminoids which on hydrolysis are resolved into tyrosine and histidine yield them, but, on the other hand, those, *e.g.*, salmin, scombrin, and clupein, which, when so decomposed do not furnish tyrosine or histidine, do not give them. On hair, finger-nails, wool (keratin) and raw silk (fibroin and sericin), which, when decomposed, yield tyrosine but no histidine, the colorations produced by diazo compounds are hence, it would seem, formed through the intermediary of the tyrosine which these products contain. The colorations formed upon wool, in which 3—4·58 per cent. of tyrosine is present, are less intense than those produced upon silk, from which up to 10 per cent. of the base has been obtained. Those produced upon wool are, however, slightly deeper, when the fibre, before treatment with the diazo compounds, is boiled with 4 per cent. of its weight of sulphuric acid, diluted with water, as in the application of azo dyestuffs to it. Raw silk is coloured more highly than boiled-off silk. This may be due to the fact that more tyrosine is present in sericin than in fibroin, or it may be that the latter substance, in the process of boiling-off, loses some of the tyrosine present in it. When wool and silk are jointly oxidised (by bromine) with dimethyl-*p*-phenylenediamine, in a bath containing sodium acetate and acetic acid, the fibres are dyed grey, while the solution is coloured crimson. These colorations are not produced when the fibres and the diamine compound are oxidised separately. When a solution of tyrosine is used instead of the fibres, a compound of the same color as that of the dyed fibres is formed and precipitated. Similar colorations are obtained with 1.4-aminonaphthol. The colorations thus obtained resemble those produced upon hair and feathers by the oxidation upon them (by the air) of *p*-diamines and *p*-aminophenols (see Eng. Pat. 2525 of 1889; this J., 1890, 174), compounds of the same class being no doubt produced in each case.—E. B.

Dyeing; Theory of ——. R. Willstätter. Ber., 1904, **37**, 3758—3760.

The author has investigated the action of racemic compounds on wool with a view of obtaining evidence as to whether the dyeing of animal fibres depends on chemical or physical changes. Assuming the dyeing to be occasioned by chemical reactions, *i.e.*, by the formation of salts, it follows that the fibre, being optically active, would split up the racemic dyestuff. The author's experiments do not, however, support this contention. Decomposition does not occur; in each case racemic material was found in the bath and on the fibre. Owing to the want of suitable material the experiments were not performed with racemic dyestuffs, but with alkaloids, it having been proved that substances such as atropine, homatropine, and tropacocaïne behave like basic dyestuffs towards animal fibres. From solutions of their salts the alkaloids are taken up as such by fibres, and in this respect they resemble the tannin dyestuffs. Excess of acid was found to retard the progress of absorption, whilst with an insufficient quantity of acid a larger proportion of alkaloid was taken up. Neither the alkaloid absorbed by the fibre nor that left in the bath had undergone any change in optical character.—D. B.

Acid Indigo Discharge Bath [Calico Printing]; Omission of Oxalic Acid from the ——. Schaposchnikoff and Kadygrob. Z. Farben- u. Textil-Chem., 1904, **3**, 374—377.

Schaposchnikoff and Michirew have already pointed out the possibility of dispensing, with considerable economy, with the use of oxalic acid in the acid bath employed in discharging indigo-dyed tissues printed with alkali chromates, and of using for this dilute sulphuric acid alone, the necessary oxalic acid being added to the potassium chromate printing mixture in the form of potassium oxalate. Prud'homme (this J., 1903, 359) has also made some experiments with the same object (see also this J., 1904, 932). In the present series of experiments a cotton tissue dyed on the large scale a dark shade of indigo was used. The proportion of chromic acid required to discharge the indigo upon this was determined by dipping strips of it in solutions containing various proportions of potassium bichromate, squeezing, and immersing for 15 seconds, at a temperature of 65° C., in a bath containing 120 grms. of concentrated sulphuric acid and 60 grms. of crystallised oxalic acid per litre. The minimum proportion required was thus found to be that contained in a solution of 30 grms. of potassium bichromate (equivalent to 39·6 grms. of potassium chromate) per litre.

The Proportions of Chromic and Oxalic Acids which are most Effective in Discharging Indigo.—Strips of the dyed tissue were saturated with solutions containing various proportions of potassium chromate and oxalate, squeezed, and steeped for 15 seconds, at a temperature of 65° C., in a bath containing 120 grms. of concentrated sulphuric acid per litre. Complete discharges of the indigo were produced with the following mixtures:—(i) 1 mol. proportion (39·6 grms. per litre) of potassium chromate and 3½ mol. proportions (1 mol. prop. = 37·6 grms. per litre) of potassium oxalate; (ii) 1½ and 3; (iii) 2 and 2½; (iv) 2½ and 2; and (v) 3 mol. prop. of the first and 1½ mol. prop. of the second salt, the best results being, however, obtained with mixtures (ii) and (iii).

Influence of Temperature.—At a temperature of 65° C. 60 grms. of concentrated sulphuric acid per litre were required to produce a discharge. At 80° C. this proportion could be reduced to 50 grms., and at 100° C. to 30 grms. per litre, without detriment to the result.

Duration of the Action.—The action is complete in 15—20 seconds.

Influence of Thickening Agents upon the Reaction.—A portion of a solution containing per litre 112·8 grms. of potassium oxalate and 59·4 grms. of potassium chromate was thickened with British gum at the rate of 400 grms. per litre. It was then applied to the tissue by machine-padding, the tissue being dried and immersed in sulphuric acid. The effect of the gum on the reaction was found to be slight, the admixture of the proportion mentioned reducing the discharging action to the extent of about 5 per cent.

Printing Mixtures Recommended.—Proportions considered suitable for printing, for discharging with dilute sulphuric acid, are, for a white discharge upon dark indigo dyed tissues, 103 grms. of potassium oxalate and 87 grms. of potassium chromate, dissolved together in 250 grms. of hot water and thickened with 560 grms. of British gum (1 : 1); and for a yellow discharge, 500 grms. of lead chromate (75 per cent. paste), 210 grms. of blood-albumin solution (2:3), 170 grms. of gum-tragacanth paste (6:100), and 40 grms. of water, to which, after stirring well together, 60 grms. of potassium chromate and 50 grms. of potassium oxalate, both salts in a state of fine powder, are added.

—E. B.

Monobromo-Indigo in Dyeing and Printing. A. Sansone. Rev. Gén. Mat. Col., 1904, **8**, 321—323.

The shades obtained with monobromo-indigo are more beautiful and redder than those obtained with artificial indigo; they are also faster to rubbing and bleaching agents, but not so fast to light in pale shades. The ordinary sulphate of iron and lime or zinc and lime vat do not give good results with the monobromo-indigo. Hydrosulphite gives good results. The following is an example of the method of preparing the vat. Mix 500 grms. of monobromo-indigo with 1000 grms. of zinc powder and a little water, so as to make a paste, then add 2 litres of sodium bisulphite solution (30° B.), and 500 grms. of caustic soda in small pieces, allow to stand for one hour with occasional stirring, and then make up to 100 litres with water.

—A. B. S.

Silk Printed with a Fatty Reserve; Dyeing ——. J. Haas. Oesterr. Wollen- u. Leinen-Ind., 1904, **24**, 1135. Chem.-Zeit., 1904, **28**, Rep. 313—314.

The method of dyeing silk which has been printed with a fatty reserve gives small white effects on coloured grounds. The reserve is prepared by heating together for one hour 3 kilos. of colophony, 250 grms. of wax, 200 grms. of spermaceti, 200 grms. of paraffin, and 200 grms. of talc, and then, after cooling somewhat, adding 1½ litres of turpentine. The "mastic" so obtained can be made thicker or thinner by reducing or increasing the amount of turpentine. During the printing the "mastic" is gently warmed, and the fabric is strewn with "Terre de Sommière," a white chalky earth. The reserve dries in the course of 2—3 days. The material is then passed through cold water acidulated with hydrochloric acid to remove the chalky earth, and is finally dyed in a cold bath acidulated with hydrochloric acid. Basic dyestuffs are used, except for black, which is produced by passing the material once or twice during 1—2 hours through an "iron bath of 5° strength," well washing, and dyeing for 1—2 hours in a cold bath of logwood together with some fustic. For Navy blue, a mixture of Malachite Green and Diamond Fuchsin is used, and for reds, mixtures of Safranine, Rhodamine 6 G, Grenadine, Auramine, and Phosphine. After dyeing, the material is washed, wrung out, dried, and the reserve removed by treatment with petroleum benzine for 20—30 minutes in a suitable apparatus.—A. S.

Fabrics for Binding; Finishing of ——. O. Picquet. Rev. Gén. Mat. Col., 1904, **8**, 328—340.

Colouring.—Calico for coloured bindings is either dyed (common colours) or printed (extra colours). It is very important for the colours to be fast to rubbing and also to light. They must also be fast to glue. For the dyed colours the material is usually mordanted with tannin, and fixed with tartar emetic or an iron salt, according as a light or dark shade is needed; it is then dyed with a suitable basic dyestuff. After dyeing, the material is frequently brought to the required shade by means of a coloured finish. In some cases the cotton is dyed with acid dyestuffs from a concentrated salt bath. For printed colours, alumina lakes are usually employed, thickened with starch. The mineral colours, such as Prussian Blue, Chrome Yellow, Ultramarine, &c., are also used, as well as Aniline Black. The pieces are passed through the printing rollers (which are engraved with fine lines or dots) from four to six times, being moistened between each passage.

Finishing.—If the material is sufficiently coloured it is finished with a white finish containing 36 kilos. of white starch, 1½ kilos. of gelatin, and 3 kilos. of tallow or lard per 200 litres. The dyed cloth is usually finished with a coloured finish, which contains, besides the starch flour and gelatin, the requisite dyestuffs, together with a tannin material if basic dyestuffs be used, or alum if acid dyestuffs be employed. The finish is applied to the cloth on one side, two or more times, as necessary, and is always used hot. The pieces are then thoroughly moistened and left rolled up over night in readiness for the next process.

Calendering.—The moistened pieces are then passed between heated steel friction rollers, which smooth the surface and do away with any irregularities in the material.

Embossing.—The pieces which are required to have a raised pattern are then passed, still in a slightly moist state, between two rollers, one of which is made of copper or steel and is engraved with the required design, whilst the other is made of paper or compressed cotton.—A. B. S.

English Patents.

Alkaline Chlorides and Oxychlorides; Preserving the Strength and Keeping Powers of Solutions of —— employed for Bleaching, Disinfecting, Separation of Metals, and other such like purposes. G. J. Atkins, and Oxychlorides, Ltd. Eng. Pat. 25,972, Nov. 27, 1903. VII., page 1088.

Yarns and Fabrics; Dyeing of ——. A. R. Donisthorpe, G. White, and G. E. Ellis, Leicester. Eng. Pat. 25,400, Nov. 21, 1903.

The yarn is dyed in the hank, parts of the hank being in turn immersed in dye-baths of different colours, so that the dyed yarn has definite lengths dyed with different colours. On weaving, the various colours show up in the cloth as if the latter had been woven with different-coloured yarns.

—A. B. S.

Multi-coloured Dyeing of Yarns, &c. A. R. Donisthorpe and G. White, Leicester. Eng. Pat. 25,611, Nov. 24, 1903.

The wool rovings are reeled into hanks, and the latter are then dyed in several colours by immersing only part of the hanks into each colour, so as to get various colours on the same hank. The parti-coloured rovings are then spun, either alone or with other rovings, so that the yarn obtained shows mixed effects.—A. B. S.

Dyeing Hanks of Yarn. L. Destrée and A. Wiescher, Haren-lez-Vilvorde, Belgium. Eng. Pat. 17,240, Aug. 6, 1904.

Several hanks of yarn are spread out side by side, in the form of skeins, upon two sticks, placed parallel to each other, and provided with devices to prevent lateral slipping. The sticks are then fastened by means of hooks or clips, externally to the skeins, each to a stick belonging to another pair of sticks, upon which hanks are similarly spread, this being repeated with the sticks at the ends, until the chain produced is long enough for conveyance by means of rollers through a dye-bath. The hanks are then dyed in the same manner as tissues.—E. B.

Printing of Textile Fabrics; Machine for ——. Sir W. Mather, Manchester. Eng. Pat. 21,595, Oct. 7, 1903.

In a printing machine with several rollers, some of which are only needed to print at intervals, as in the cross borders of scarves, automatically adjustable cams are arranged so as to hold either set of rollers out of printing contact during the whole or a fractional part of the revolution of the main printing bowl.—A. B. S.

Dressing of Yarns and like Material. F. W. Howorth, London. From Soc. Franç. de la Viscose, Paris. Eng. Pat. 24,637, Nov. 12, 1903.

See Fr. Pat. 335,598 of 1903; this J., 1904, 251.—T. F. B.

Coating Fabrics; Machine for ——. The Velvril Co., Ltd., London, and J. S. R. Howkins, Thornton Heath. Eng. Pat. 27,202, Dec. 11, 1903.

The cloth passes over a roller, and the desired waterproofing or other material is spread over it by means of a small roller which is in contact with the cloth, and is driven at a different speed from the large roller. The smaller roller is pressed in contact with the cloth by means of adjustable weights or springs, and the distance between the faces of the two rollers can be regulated according to the amount of material it is required to impregnate the cloth with.

Copper Solutions; Alkaline —— which can Produce Concentrated Solutions of Cellulose easily made into Threads, and which improve the Appearance and Texture of Cotton Threads and Fabrics. M. Prud'homme. Fr. Pat. 344,138, June 18, 1904.

Ammoniacal copper solutions to which alkali hydroxide has been added, are found to possess considerable solvent power for cellulose, giving solutions very suitable for pressing into threads. Cotton, when treated in such a solution, swells up, and assumes the appearance of parchment. After washing in dilute acid and drying, the fabric is found not to have shrunk, whilst the appearance and texture of the cotton are said to be improved by such treatment.

—T. F. B.

Textile Fabrics; Method for rendering —— Waterproof. F. Sauerland. Fr. Pat. 343,977, June 14, 1904.

The fabric, after being mordanted in the usual manner and coated with some water-resisting substance, is treated for a short time with a weak boiling solution of rosin soap. The following method also gives good results:—Mordant the goods for one hour with a liquor of 3° B. strength containing 100 parts of alum, 160 parts of calcium carbonate, 100 parts of sulphate of alumina (free from iron), 15 parts of oxide of zinc, and 150 parts of acetate of lead. Now coat each side of the material with a layer composed of 60 parts of paraffin, 20 parts of Japan wax, 17½ parts of stearine, and 2½ parts of a 10 per cent. solution of Para rubber. The right side is further treated with a solution of some sticky substance, such as Para rubber. This treatment is advantageously performed in a specially designed machine, consisting of a series of rollers, between which the fabric passes, whence it is conducted through heated troughs containing the solutions.—F. D. T.

VII.—ACIDS, ALKALIS, AND SALTS.

Electrolysis of Potassium Chloride and Sodium Chloride; Differences in ——. F. Winteler. Electrochem. Ind., 1904, 2, 391—392.

Common salt is generally much less pure than commercial potassium chloride is, and the impurities cause trouble in the diaphragm process of alkali production. The fact that the temperature coefficients of the solubility of sodium and potassium chloride are so different further gives rise to a difference in the methods for obtaining caustic soda or caustic potash by evaporation; with the caustic soda evaporation to 50° B. removes all the sodium chloride except 1 per cent., whereas with the potassium salts several per cent. of chloride remain dissolved at the high temperature. In the production of chlorates, the low solubility of the potassium chlorate is undoubtedly an advantage, especially where chromates are added to the electrolyte to increase the efficiency of the process. The potassium chlorate crystallises out, and is thus separated from the chloride, whereas to obtain sodium chlorate it is first necessary to crystallise out the greater part of the sodium chloride.—R. S. H.

Litharge and Sodium Nitrite; Manufacture of ——. M. Liebig. Z. angew. Chem., 1904, 17, 1673—1674.

The sodium nitrate in the melting-pot is kept at the melting point of lead. The lead is cast in thin plates, and added to the melted nitrate till in slight excess. After all the lead has been added, the temperature is kept up for about 20 minutes, till the yellow mass turns brown. The litharge produced is tested for metallic lead, the nitrite for its content of pure nitrite. Litharge for accumulators must be free from metallic lead, and must not contain more than 0·006 per cent. of chlorine. Hence the extraction of the nitrite (when the litharge is prepared by the action of metallic lead on nitre) must be done with distilled water.

—J. T. D.

Magnesium Peroxide ; So-called ——. O. Ruff and E. Geisel. Ber., 1904, **37**, 3683—3688.

By adding 20 grms. of 30 per cent. hydrogen peroxide to a solution of 10 grms. of crystallised magnesium sulphate in 200 c.c. of water, and treating the liquid with 500 c.c. of 2N-alkali, a slimy precipitate was obtained, which in the moist condition yielded 1 atom of peroxide oxygen for each mol. of magnesium oxide. On drying the precipitate, oxygen was lost, the partially dry compound having the composition $MgO.MgO_2.aq$. This product gradually lost more oxygen, until a compound of practically constant composition was left, containing 0·39 atom of peroxide oxygen per mol. of magnesium oxide, corresponding to the formula, $MgO_2.3MgO.aq$. In presence of water, the product rapidly lost oxygen, the peroxide in part dissolving and in part being decomposed according to the equations: $Mg(OH)_4 = Mg(OH)_2 + H_2O_2$; and $Mg(OH)_4 + H_2O_2 = Mg(OH)_2 + 2H_2O + O_2$.—A. S.

Salts in other than Aqueous Solutions ; Reactions of ——. A. Naumann. Ber., 1904, **37**, 3600—3605.

The following substances are soluble in dehydrated ethyl acetate: stannic chloride, cupric chloride, mercuric chloride, bromide and iodide, potassio-mercuric iodide, platinic chloride, cadmium chloride, iodide and nitrate, iodine, uranium bromide and iodide, potassio-cadmium iodide, antimony trichloride, oxalic acid, sulphur, potassium permanganate, lithium chloride, nitrate, fluoride, and bromide, palladious chloride, ferric chloride, zinc chloride, uranium nitrate and chloride, cobalt chloride and nitrate, magnesium chloride, potassium iodide. The following are insoluble: Cuprous chloride, silver nitrate, sulphate, chloride, and carbonate, lithium carbonate, sulphate, borate, metaborate, hydroxide, silicate and silico-fluoride, ferrous chloride and sulphate, zinc sulphate, arsenic trioxide, lead acetate, cadmium oxide, carbonate, bromide and sulphate, calcium chloride, sulphide, sulphite, oxide, carbonate, and hydroxide, potassium chromate, bichromate, bromide, chloride, cyanide, ferrocyanide, ferricyanide, chlorate, bromate, nitrate, sulphate, nitrite, sulphide, pyroantimonate, acid tartrate, oxalate, carbonate, arsenite, arsenate, hydroxide and thiocyanate, sodium chloride, acid sulphite, carbonate, hydroxide, and arsenite, borax, ammonium chloride, sulphate, carbonate, and oxalate, barium chloride, nitrate, carbonate and sulphate, strontium carbonate, magnesium oxide, carbonate and sulphate, cobalt sulphate, potassium cobaltinitrite, nickel sulphate, manganese sulphate, uranium sulphate, uranium acetate, mercuric chloride.

Mercuric Chloride.—A solution saturated at 18° C. contains 1 grm. of salt in 3·5 grms. of solvent, and has a sp. gr. of 1·11. It is completely precipitated by an ethyl acetate solution of stannous chloride, the mercury being converted into calomel. Dry hydrogen sulphide gas passed through the solution gives a yellow precipitate of $HgCl_2.2HgS$. Ammonia gas precipitates the whole of the mercury as $HgCl_2.2NH_3$. Cadmium iodide reacts with it, and forms a precipitate of cadmium chloride.

Cupric Chloride.—1 grm. of salt dissolves in 249 grms. of solvent sp. gr. of solution, 0·9055. Ammonia gas gives a bluish-green precipitate of $CuCl_2.6NH_3$. Hydrogen sulphide precipitates the copper completely as CuS. Hydrochloric acid gas precipitates $CuCl_2.2HCl$. Stannous chloride precipitates cuprous chloride. Cadmium iodide precipitates cuprous iodide, free iodine remaining in solution.—J. T. D.

Lead Compounds ; Raw Materials for the Preparation of ——. M. Liebig. XIII. A., page 1102.

English Patents.

Sulphuric Acid ; Manufacture of [*Chamber Process*] ——. H. H. Lake, London. From the Firm of Società Anonima Ing., L. Vogel per la Fabbricazione di Concimi Chimici, Milan, Italy. Eng. Pat. 6846, March 21, 1904.

A pair of iron cylinders is set in the dust-collecting chamber of a pyrites kiln, to be heated by the effluent gases, such cylinders communicating with a series of Gay-Lussac towers. One of the cylinders is charged with sulphuric acid, to which, from time to time, as the acid is heated, portions of sodium nitrate are added. When the charge in one cylinder is exhausted, the second cylinder is similarly charged. The nitrous acid contained in the Gay-Lussac towers, strengthened by the nitric compounds obtained as described, is conducted back to the Glover tower, where it encounters the gases from the pyrites kiln, whereupon the circulation takes place through the lead chambers, and thence, through the Gay-Lussac towers, to the stack.—E. S.

Alkaline Chlorides [*Alkali Chlorides*] *and Oxychlorides ; Preserving the Strength and Keeping Powers of Solutions of* ——, *employed for Bleaching, Disinfecting, Separation of Metals, and other such-like Purposes.* G. J. Atkins, Tottenham, and Oxychlorides, Ltd., London. Eng. Pat. 25,972, Nov. 27, 1903.

It is claimed that the strength and keeping powers of solutions of alkali chlorides and oxychlorides employed for bleaching, disinfecting, separation of metals from their ores, and other purposes, are preserved by the addition of an alkaline salt, such as carbonate or hydroxide of sodium or potassium, calcium oxide, or borax.—E. S.

Ammonia Stills ; Construction of ——. G. E. Davis, Knutsford, Cheshire. Eng. Pat. 26,996, Dec. 9, 1903.

In ammonia stills constructed with serrated caps (see Eng. Pat. 16,349 of 1888 ; this J., 1889, 884), in which fixed ammonia is set free by lime, such caps are, according to the present invention, fixed to the plates forming the tops of the chambers in which they rest, so that the serrations hang free in the liquid, admitting a small rake to be inserted underneath the caps for withdrawal of the deposit. Several methods for fixing such serrated caps are described and illustrated.—E. S.

Aluminium Compounds and By-products ; Methods of Making ——. L. R. Keogh and B. Broughton, Hamilton, Canada. Eng. Pat. 2655, Feb. 3, 1904.

See U.S. Pat. 744,765 of 1903 ; this J., 1903, 1317.—T. F. B.

Alumina ; Manufacture of ——. Cie. des Prod. Chim. D'Alais et de la Camargue, Salindres, France. Eng. Pat. 19,924, Sept. 15, 1904. Under Internat. Conv., Sept. 19, 1903.

Sodium aluminate solution is heated under pressure of, say, 6 kilos. per sq. cm., in a closed vessel for some hours, with agitation, whereby a precipitate containing most of the silica present is stated to be formed. The pressure required may be obtained by passing into the containing vessel high-pressure steam, in such manner as to cause agitation, a small orifice being provided for escape of a little of the steam. Alumina, suitable for application in the manufacture of aluminium, may be prepared from the filtered aluminate solution thus obtained.—E. S.

United States Patents.

Lime ; Machine for Hydrating ——. J. Reaney, jun., Sherwood, Md. U.S. Pat. 773,029, Oct 25, 1904.

Within a rotating inclined cylinder is secured centrally a perforated screen, tapering towards the discharge end, and having an imperforate extension at the charging end, at which the lime to be hydrated is received from a shoot. Water is conducted from an elevated tank by a pipe which discharges automatically within the screen, when the gate to the shoot is opened. A perforated pipe connected to a boiler traverses the length of the screen centrally to maintain a discharge of steam within it. Between the outer cylinder and the inner perforated screen is an intermediate imperforate screen, tapering to a lesser degree than the perforated one. There is a number of discharge openings, one registering with the shorter outer cylinder or jacket: and the other arranged to receive the overflow of the longer inner screen.—E. S.

Quicklime; Process of Converting —— into Powdered Hydrated Lime. J. Reaney, jun., Sherwood, Md. U.S. Pat. 773,030, Oct. 25, 1904.

A WEIGHED portion of quicklime is subjected, in an apparatus such as that described in the preceding abstract, to tumbling with simultaneous wetting with a predetermined quantity of water, and to slow sifting, the hydrated fine particles being then rapidly moved to a point of discharge, whilst the non-hydrated particles remain for further hydration by the action of steam.—E. S.

Alkali Salts; Making and Separating —— from Insoluble Combinations. H. S. Blackmore, Mount Vernon, N.Y. U.S. Pat. 772,206, Oct. 11, 1904.

SOLUBLE alkali salts are obtained from their insoluble combinations by subjecting the latter to the action of water and of a "gas" (such as carbon dioxide), under varying pressure, above and below that of the atmosphere. Lithium carbonate is obtained from insoluble lithium compounds by exposing them to the action of water and carbon dioxide, under pressure. A continuous process of making soluble alkali carbonates from insoluble combinations, consists in mixing the latter with water, withdrawing air by subjecting the mixture to reduced pressure, then admitting carbon dioxide under increased pressure, and diminishing and increasing the pressure at intervals. The soluble salt separated is then withdrawn, and the process is continued after renewing the materials.—E. S.

Refractory Silicates; Method of Decomposing ——. W. T. Gibbs, Buckingham, Canada. U.S. Pat. 772,612, Oct. 18, 1904.

THE method consists in treating the silicate with a decomposing solution containing a catalytic agent and a reagent hat will combine with the base or bases and leave the catalytic agent free for further action. The decomposing olution contains a small proportion of hydrofluosilicic acid and a large proportion of sulphuric acid.—W. C. H.

Refractory Silicates; Process of Decomposing ——. W. T. Gibbs, Buckingham, Canada. U.S. Pat. 772,657, Oct. 18, 1904.

THE silicates are reduced to a finely-divided condition and reated with an amount of hydrofluosilicic acid, which is in xcess of that required to combine with the bases of the ilicates; the silico-fluorides of the bases are subsequently reated to recover the hydrofluosilicic acid.—W. C. H.

Salt; Process of Making Pure ——. O. Sachse, Assignor to the firm of Triplex, Ges. f. Soole-Verdampfung im Vacuum M.B.H., Lüneburg, Germany. U.S. Pat. 773,343, Oct. 25, 1904.

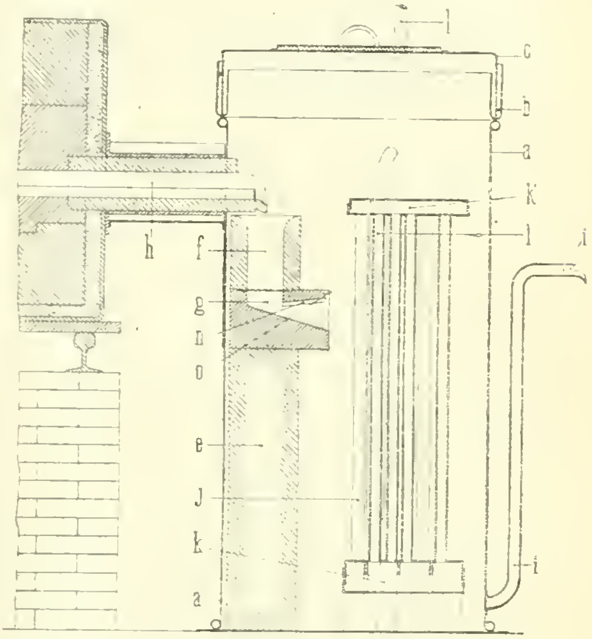
BRINE containing salts of calcium and magnesium is treated with sodium carbonate, slightly in excess of the proportion ecessary to precipitate the calcium as carbonate. The iquid, cleared from the precipitate, is concentrated in a acuum to separate the salt; and the mother-liquor, rich n magnesium sulphate, is added to another portion of untreated brine.—E. S.

Electrically Treating Gases [Air]; Process of ——. K. Birkeland. U.S. Pat. 772,862, Oct. 18, 1904. XI. A., page 1097.

French Patents.

Sulphuric Acid: Apparatus for the Concentration of —— in contact with Heated Gases. J. L. Kessler. First Addition, dated June 20, 1904, to Fr. Pat. 283,752 of Dec. 6, 1898. (See Eng. Pat. 25,169 of Dec. 10, 1898; this J., 1900, 246.)

THIS apparatus is intended to effect the rapid cooling of the concentrated acid down to the point at which it does not materially attack lead, while simultaneously heating chamber acid, or acid for concentration, admitted into a series of vertical lead pipes set in the cooler. Referring to the drawing, the hot concentrated acid is admitted in contact with heated gases (or otherwise, if desired, under the present addition) into the lead cylinder *a*, through the channel *h*, into the short cylindrical stone receptacle *f*, whence it flows until the cylinder is charged nearly up to the level of the piece *f*, the height being determined mainly by the passage of the cooled acid from the exit tube *i*. The dilute acid enters the tubular lead system through the jacketed pipe *l*, and has passage, after being heated by the surrounding hot concentrated acid, to the concentrator through an exit pipe not shown. The stream of concentrated acid entering *f*, when the apparatus is charged, is deflected upwards through grooves formed in the outlet *n*, *o*, and, owing to its less specific gravity than the cooler liquid of the mass, rises to the surface, carrying with it other layers of the acid, where it is cooled. Compare Eng. Pat. 21,376 of 1900; this J., 1901, 807.—E. S.



Sulphuric Acid; Apparatus for Concentrating ——. J. L. Kessler. First Addition, dated June 20, 1904, to Fr. Pat. 305,781 of Nov. 28, 1900. (See Eng. Pat. 21,376 of Nov. 26, 1900; this J., 1901, 807.)

THE arrangements, &c. claimed in the addition to Fr. Pat. 283,752 (see preceding abstract) are claimed also in the present addition.—E. S.

Carbonic Acid; Manufacture of ——. E. A. and J. G. Behrens. Fr. Pat. 343,903, June 11, 1904.

THE products of the combustion of water-gas or of generator-gas are compressed, and passed, still under pressure, into a solution of potassium carbonate, maintained at the temperature of decomposition of hydrogen-potassium carbonate. The unabsorbed nitrogen is allowed to escape, and the hot carbonated solution is conducted away, and as soon as it ceases to be under more than atmospheric pressure, the carbon dioxide absorbed is set free, and is collected for liquefaction.—E. S.

Alumina and Alkalis: Extraction of —— from Alkaline Silicates of Alumina, such as Leucite. G. Levi. Fr. Pat. 344,296, June 25, 1904.

Leucite, or other similar mineral, is treated with a strong solution of an alkali or alkaline earth hydroxide in an autoclave at a pressure exceeding six atmospheres (preferably at about 16 atmospheres) with agitation. Alumina, iron oxide, &c., remain undissolved, and are separated by filtration, whilst from the solution, containing an alkali or alkaline earth silicate, the alkali is recovered by known means. The aluminous residue is mixed with a concentrated alkaline solution to a pasty mass, to which lime is added, and the mass is heated. An alkali aluminate is dissolved out of the product, from which alumina is obtained, as, for instance, by injection of carbon dioxide. —E. S.

Alumina: Preparation of —— by an Electro-metallurgical Process. Soc. Anon. Electro-Metallurgique, Procédés P. Girod. Fr. Pat. 344,549, July 4, 1904. XI. B., page 1098.

Sulphates: Reduction of Alkaline-Earth and Alkali —— to Sulphides, and of Metallic Oxides to Metals. C. Castiglioni and L. Calastretti. Fr. Pat. 343,926, June 13, 1904. Under Internat. Conv., June 26, 1903.

The substance to be reduced is contained in a receptacle heated externally, and is subjected to the action of a reducing vapour or gas obtained by the dry distillation of organic matter, by the decomposition of steam by charcoal heated to incandescence, or by the action of water on alkaline-earth carbides.—A. S.

Nickel Ores: Treatment of ——, and Apparatus therefor. G. H. Gin. Fr. Pat. 344,203, June 22, 1904.

Nickel oxide, or an ore of the oxide, is subjected to the action of sulphuric acid of about 53° B., at a temperature of about 155° C., involving a pressure of 4 kilos. to the sq. cm. The apparatus consists of a pair of lead-lined autoclaves heated by a single furnace, and operated alternately. The solution obtained is cooled by a current of cold air, and by addition of a cold saturated solution of nickel sulphate containing basic nickel sulphate in suspension. The filtered liquid is crystallised.—E. S.

VIII.—GLASS, POTTERY, ENAMELS.

English Patent.

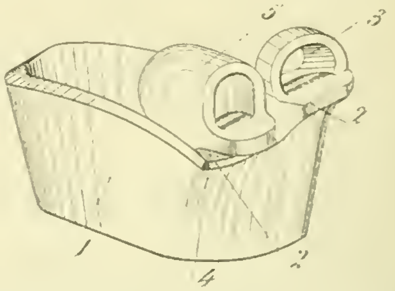
Vitreous Cement [for Porcelain, &c.]; Manufacture of ——. P. Steenbock, Deutsch-Wilmersdorf, Germany. Eng. Pat. 15,176, July 7, 1904.

A solution of basic beryllium nitrate is precipitated with sodium silicate, and the precipitate washed, dried, and slightly calcined. This product is finely ground and may be used by itself or mixed with glass or pure clay. The cement is made by triturating the powder or mixed powders with a solution of orthophosphoric acid almost saturated with aluminium phosphate, with the addition of a little zinc phosphate. See also Eng. Pat. 15,181, July 7, 1904; J., 1904, 901.—W. C. H.

French Patents.

Crucible for Glass for Continuous Working. F. Lang. Fr. Pat. 343,309, May 19, 1904.

The crucible shown allows of constant working, the glass in it being kept at a constant level, and withdrawn by a ladle without cooling the molten mass. It consists essentially of the crucible proper (1), which is placed in the furnace opposite one of the openings. The crucible is provided with a mouth (3) in the shape of an arch, through which the cold materials are fed, and with a vessel (5) cemented on to the wall of the crucible. The front of this vessel is also in the shape of an arch and serves for the introduction of the ladle; the other end of the vessel reaches nearly to the bottom of the crucible, tapering off to an open pipe, through which the molten glass enters from below as fast as it is removed from above by the ladle. In case of damage this vessel can be replaced without interrupting the fusion. For making crystal glass the crucible may be provided with a dome-shaped cover, so as to prevent the flame from coming in contact with the glass. —A. G. L.



Quartz Glass; Manufacture of ——. J. Bredel. Fr. Pat. 344,169, June 21, 1904.

The quartz is fused and run by means of a heated channel into a heated mould, preferably placed below the furnace. Both channel and mould are previously evacuated, to prevent the quartz from being chilled during its flow. —A. G. L.

Quartz Glass; Manufacture of Objects of ——. J. Bredel. Fr. Pat. 344,170, June 21, 1904.

The material is first repeatedly subjected to a cooling process, and is then fused. While still fluid it is treated with a jet of cold air or vapour which transforms it into silica wool; this is then moulded into the required shape and afterwards fused.—A. G. L.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

Cement; Specifications for ——, submitted to the American Society for Testing Materials. Engin. News, 1904, **51**, 619—620. Science Abstracts, 1904, 7, B, 860—861.

The Cement Committee of the American Society for Testing Materials recommend that the acceptance or rejection of samples of cement be based upon the following requirements, the tests being made in accordance with the methods proposed by the Committee on Uniform Tests of Cement of the American Society of Civil Engineers:—

Natural Cement.—*Definition:* The finely-pulverised product obtained by the calcination of an argillaceous limestone at a temperature only sufficient to expel the carbon dioxide. *Specific Gravity:* The material dried at 100° C. should have a specific gravity not less than 2·8. *Fineness:* Residue on a No. 100 sieve, not more than 10 per cent.; and on a No. 200 sieve, not more than 30 per cent. *Time of Setting:* Initial set in not less than 10 mins., and hard set in not less than 30 mins. nor more than 3 hours.

Portland Cement.—*Definition:* The finely-pulverised product obtained by the calcination to incipient fusion of an intimate mixture of argillaceous and calcareous materials in proper proportions, and to which no addition greater than 3 per cent. has been made subsequent to calcination. *Specific Gravity:* The material dried at 100° C. should have a specific gravity not less than 3·1. *Fineness:* Residue on a No. 100 sieve, not more than 8 per cent.; and on a No. 200 sieve, not more than 25 per cent. *Time of Setting:* Initial set in not less than 30 mins., hard set in not less than 1 hour nor more than 10 hours. *Tensile Strength:* Briquettes, 1 in. square in section should give the following results, and should suffer no retrogression in strength within the periods specified:—

	Strength after:		
—	24 Hours in Moist Air.	7 Days, 1 in Air and 6 in Water.	28 Days, 1 in Moist Air and 27 in Water.
	Lb.	Lb.	Lb.
Natural cement, neat.............	50—100	100—120	200—300
Portland cement, neat............	150—200	450—550	550—650
1 of natural cement and 3 of sand .	..	25—75	75—150
1 of Portland cement and 3 of sand	..	150—200	200—300

Constancy of Volume.—Pats of neat cement about 3 ins. diameter, ½ in. thick at the centre, and tapering to a thin edge, shall be kept in moist air for 24 hours. (*a*) A pat is then kept in air at the ordinary temperature and examined at intervals during at least 28 days. (*b*) Another pat is kept in water maintained at 70° F., and examined at intervals during at least 28 days. (*c*) (For Portland cement only.) A third pat is exposed in an atmosphere of steam above boiling water, in a loosely-closed vessel for 5 hours. In all three tests the pats should remain firm and hard, and show no signs of distortion, "checking," cracking, or disintegration.

Content of Sulphuric Acid and Magnesia.—The cement shall not contain more than 1·75 per cent. of sulphuric anhydride, nor more than 1 per cent. of magnesia.—A. S.

Cement; Notes on the Boiling Test for ——. F. H. Lewis. Eng. Record, 1904, **50**, 33—34. Science Abstracts, 1904, **7**, B, 865.

The author finds that the higher the silica and iron oxide, and within certain limits, the higher the sulphuric acid and lime, the better the results given by a cement when subjected to the boiling test. Magnesia appears to have no influence, but alumina should only be present in small quantity. He suggests as a cement suitable for passing the boiling test, one having the composition: lime, 66; silica, 25; iron oxide, 7; sulphuric anhydride, 2 per cent.—A. S.

English Patents.

Wood; Method for Preserving ——. C. F. Reichel, Grüna, Germany. Eng. Pat. 21,578, Oct. 7, 1903.

See Fr. Pat. 335,781 of 1903; this J., 1904, 254.—T. F. B.

Paving Blocks from Towns' Refuse. W. Weaver, London. Eng. Pat. 22,042, Oct. 3, 1903.

The clinker formed in "destructors" from towns' refuse is crushed, and about 80 parts are mixed with 15 parts of asphalt, and 5 parts of fine lime-stone or other dust, and consolidated into paving blocks under pressure.—W. C. H.

Cement or Moulded Articles; Apparatus and Process for utilising Gas Lime, or other Calcium Compounds and Clinker, Slag, or other Silicious or Aluminous Material for the Manufacture of ——. J. Bond, Leeds. Eng. Pat. 23,213, Oct. 27, 1903.

The materials named in the title, after being mixed and ground, are fed into the top of an upright kiln or tower having a number of horizontal inverted U-shaped flues, open at the ends and bottom, and fixed alternately in sets throughout the whole height of the kiln. Spaces are left between the flues to allow the material to fall around and on their outer surface. The U-shaped flues are connected with vertical flues so as to allow the hot gases from a furnace to travel through the sets in a zigzag course. The material that has passed through the kiln is mixed, ground with clinker, and moulded, and the bricks or slabs are subjected to the action of steam and carbon dioxide under pressure. —E. S.

United States Patents.

Carborundum Article; Self-bonded ——. F. J. Tone, Niagara Falls, N.Y. U.S. Pat. 772,262, Oct. 11, 1904.

A refractory coherent article, or a refractory coherent facing for less refractory articles, is composed of superficially-oxidised particles of amorphous or crystalline carborundum, which are bound together by the oxidation and subsequent cohesion of the particles.—W. C. H.

Lime or Cement Kiln. W. S. Speed, Louisville, Ky. U.S. Pat. 772,184, Oct. 11, 1904.

The kiln is vertical, and has a discharge opening at the bottom. Below this opening is a grid-like feeder with projections on its upper surface, that is worked backwards and forwards continuously by means of a shaft and crank arm. The forward movement of the feeder carries forward the lime deposited on it from the discharge opening of the kiln, and the backward movement causes this lime to fall off the front of the feeder, means being provided to prevent lime falling off the back end.—W. C. H.

Lithographic Stones; Substitute for ——, *and Method of Making same.* G. Bower, St. Neots, and T. W. Gauntlett, London. U.S. Pat. 773,368, Oct. 25, 1904.

See Eng. Pat. 6155 of 1903; this J., 1904, 325.—T. F. B.

French Patents.

Wood; Treatment of —— *by the Injection of Antiseptic Substances by passing it through Vaporisation and Absorption Baths in various Receptacles.* Conti-Vecchi. Fr. Pat. 344,201, June 22, 1904.

The wood to be treated is placed in one of a number of vessels connected with each other and is given a preliminary heating by means of the steam disengaged in the next vessel. Hot water from this vessel is then run into the first, the water being maintained at the boiling-point by circulating it through a suitable heater. The hot water is then run into the next vessel of the series, and its place taken by a cold antiseptic liquid, which is kept cool by circulating it through a cooler. This operation may take place under ordinary or increased pressure. The entry of the cold liquid into the wood is exceedingly rapid as the pores of the latter have been opened and filled with steam in the preceding operation, the steam condensing on contact with the cold liquid. If it is desired to treat the wood with two distinct preservatives, *e.g.*, creosote and a saline solution, one may be run into the bath after the other, or the two liquids may be emulsified and applied together. In the last case a suitable agitator must be placed in the vessel to maintain the emulsion. The cold liquid is then run into the next vessel and the wood removed, after which the same cycle of operations is repeated.—A. G. L.

Fire-Bricks and other Clay Objects; Continuous Furnace for Burning ——. D. F. Henry, jun. Fr. Pat. 344,332, June 27, 1904.

The interior of the furnace is divided by a number of vertical partitions, reaching alternately to the top and to the bottom of the furnace, into vertical compartments. The hot gases are consequently forced to pass through these compartments in a zigzag course, and in so doing meet and impart their heat to the objects to be burnt, which are placed on hollow supports cooled by a current of water. These supports are moved by an endless chain arrangement, situated outside the furnace, in a direction opposite to that in which the gases move, so that the raw bricks, &c., enter the furnace at one end and emerge fully burnt at the other. In the side walls of each compartment are left vertical slits to enable the supports for the bricks to be fastened to the endless chain. The supports themselves come back to the starting point through a channel formed in the bed of the furnace.—A. G. L.

Fire-Bricks and other Clay Products; Apparatus for Turning [during Drying] ——. D. F. Henry, jun. Fr. Pat. 341,333, June 27, 1904.

The moulded bricks are delivered on to a table, of the form of a paddle-wheel, which revolves horizontally in an inter-

mittent fashion, and which also carries certain boards capable of a lateral movement, which support the bricks during one stage of the operation. The whole mechanism is worked by an endless chain arrangement, which alternately works the turning table and the laterally-moving boards.
—A. G. L.

X.—METALLURGY.

Charcoal [*for Blast Furnaces*]; *Varieties of —— in the Ural.* E. Juon. Stahl u. Eisen, 1904, **24**, 1230—1238.

All the pig-iron produced in the Ural district is smelted with charcoal, which is manufactured in furnaces or by the old heap process, according to the relative facilities for transporting the felled timber. No attempt is made in either case to recover any of the by-products, there being no demand except for small quantities of tar for lubricating purposes. The three chief kinds of charcoal are birch, fir and pine; and it was to determine the relative value of these for smelting purposes that the author's experiments were made. The ultimate analysis of numerous samples of furnace-made charcoal gave the following mean results:—

——	Carbon.	Hydrogen.	Oxygen (together with Nitrogen).	Ash.	Calorific Power.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Cals.
Birch	75·04	3·49	19·83	0·90	6,380
Pine	75·38	4·13	17·17	1·24	6,500
Fir	73·41	3·45	20·63	1·26	6,210

The sp. gr. was determined in three different ways; first, that of the powdered charcoal; secondly, that of small cubes coated with molten paraffin; and thirdly, in bulk, *i.e*, by the basketful (1·8 cb. m.) The mean results were:—

——	Powdered.	Cubes.	Bulk.
Birch	1·46	0·40	0·190
Pine	1·40	0·27	0·148
Fir	1·38	0·215	0·131

The smaller difference in the bulk tests was due to the more brittle character of the fir charcoal, and the consequently larger amount going to the basketful. The relative porosity of the three kinds was 72·3 per cent., 80·6 per cent., and 84·7 per cent. in the order given, a result corresponding with figures published by Gubanof for Ural charcoals. The crushing strength of cubes, of 3·5 cm. side, was tested parallel and tranversely to the fibres, the birch charcoal having a mean strength of 204·0 kilos. per sq. cm. in the one case and 24·8 kilos. in the other, whilst for pine charcoal the figures were 81·1 and 11·3 kilos., and for fir charcoal 52·3 and 8·1 kilos. respectively. By correlating these various results to the lowest grade, *i.e.*, fir charcoal, as unity, the relative constants for the other two kinds work out as follows:—

——	Birch.	Pine.
Carbon content	1·02	1·03
Calorific power	1·02	1·05
Sp. gr. of the powder	1·06	1·01
„ „ cubes	1·88	1·25
„ „ bulk	1·45	1·13
Strength (diagonal)	3·45	1·48

so that bulk for bulk, birch charcoal is worth $1\frac{3}{4}$, and pine charcoal $1\frac{1}{4}$ times as much as fir charcoal. These figures coincide with the smelting values of the three charcoals, the relative amounts of iron produced per unit of charcoal being 1·8, 1·2, 1·0.

Similar results were obtained in the case of heap-made charcoals, but the mean carbon content of the latter is 11·80 per cent., and the calorific value 12·01 per cent. higher than with the furnace-made article. Taking heap-made birch charcoal as unity, the value of the furnace-made charcoal is 0·81; the two kinds of pine charcoal are worth respectively 0·68 and 0·57, and the two kinds of fir charcoal 0·54 and 0·41 respectively.

The differences between heap-made and furnace-made charcoal are due to the different temperatures employed in their production, the maxima being respectively 700° C. and 350° C. The higher temperature gives an increased carbon content, which is the chief factor in determining the calorific value for blast-furnace purposes, since the hydrogen in the charcoal does not reach the combustion zone, but goes to enrich the blast-furnace gas.

Another point of investigation was the causes of deterioration in blast-furnace charcoal. These are three in number: underburning, overburning, and bad storage. The first occurs when the temperature is kept so low (284° C.) that the percentage of carbon does not exceed 70, the charcoal being then brown in colour and of high sp. gr. Over-burnt charcoal on the other hand is of normal composition and calorific power, but brittle and rotten, with an increased power of occluding gases and moisture. Damp or prolonged storage unfavourably influences the quality by facilitating the absorption of moisture, which renders the charcoal brittle.

Finally, with regard to the problem whether a charcoal with high or low carbon content is the more economical for blast-furnace work, it is pointed out that if the charring has to be performed in the furnace the latter is uneconomically deprived of energy; but when the furnace gas is to be utilised as motive power, the carbon content of the charcoal should not exceed 85 per cent.—C. S.

Blast-Furnace Smelting; Finely-Divided Ores as a Source of Trouble in ——. A. Weiskopf. Stahl u. Eisen, 1904, **24**, 1225—1230.

In smelting finely-divided iron ore in the blast-furnace, the output is liable to diminution owing to obstructions caused by the agglomeration of fine carbon, and to irregular reduction of the fine and coarse material. At the same time the charge of coke has to be increased, and the furnace works irregularly owing to the "scaffolding" of the charge. The increased blast pressure entailed by these obstructions carries away a larger proportion of dust, thus increasing the strain on the blowing engines and the labour of cleaning out the dust collectors, &c. The fine carbon settles in crevices of, and corrodes, the brickwork, and largely increases the expense of repair. The furnace gas is of inferior quality, containing an excess of carbon dioxide and dust. These evils may be prevented by using coarse ore or briquetting the fine ore, the latter a somewhat expensive process. Of the various ore-briquetting processes introduced, the author considers that only two are suitable for practical application: the Dellwik-Fleischer process and the scoria process. In the former, the ore is maintained at its sintering temperature by means of water-gas, so that the particles cohere; whilst in a modification by Elbers the agglomeration is facilitated by the addition of 3—5 per cent. of powdered slag as a flux, the total cost being about 3*s.* 6*d.* per ton. In the scoria process the ore is treated with granulated blast-furnace slag, disintegrated by steam, the mixture being then exposed to steam at a pressure of 8 atmospheres for 10 hours. The briquettes are strong, highly porous, and of homogeneous composition. Whilst the addition of slag increases the amount of residue, the hydrating action of the steam probably results in the formation of colloidal calcium hydrosilicate or of a metasilicate, distributed uniformly throughout the mass; and the water of condensation dissolves out injurious metallic salts, alkalis, sulphates, &c.—C. S.

Open-Hearth Steel: Influence of Carbon, Phosphorus, Manganese, and Sulphur on the Tensile Strength of ——. H. H. Campbell. Iron and Steel Inst., Oct. 1904.

The author concludes from the results of a large number of experiments that the tensile strength of an open-hearth steel may be expressed by a formula, showing the effects of each of the important constituent elements. The effects of different amounts of the elements were found to be as follows :—

Carbon.—In acid steel, each 0·01 per cent. of carbon, as determined by combustion, causes an increase in the strength of 1000 lb. per sq. in. In the colorimetric determination, all the carbon present is not determined, and the strengthening effect consequently works out as 1140 lb. for each 0·01 per cent. of carbon.

In basic steel, the strengthening effect is 770 lb. per sq. in. for each 0·01 per cent. of carbon determined by combustion and 820 lb. for 0·01 per cent. determined colorimetrically.

Phosphorus.—Each 0·01 per cent. of phosphorus causes an increase of 1000 lb. per sq. in. in the tensile strength of open-hearth steel.

Manganese.—The strengthening effect of manganese on steel is greater as the content of carbon increases. When the amount of the manganese is small, the effect produced is complicated, probably by the presence of iron oxide, so that a decrease in manganese in very low-carbon steels is accompanied by an increase in strength. In acid steel, each increase of 0·01 per cent. in manganese above 0·4 per cent. raises the strength an amount varying from 80 lb. in an alloy containing 0·1 per cent. of carbon to 400 lb. in steel containing 0·4 per cent. of carbon. In basic steel each increase of 0·01 per cent. above 0·3 per cent. raises the strength an amount varying from 130 lb. in an alloy containing 0·1 per cent. of carbon to 250 lb. in steel containing 0·4 per cent. of carbon.

Sulphur.—The effect of sulphur on the strength of open-hearth steel is very small. The following formulæ are given for the strength of open-hearth steels :—

(1) For acid steel, with carbon determined by combustion : $40{,}000 + 1000\,C + 1000\,P + x\,\mathrm{Mn} + R =$ ultimate strength.

(2) For acid steel, with carbon determined colorimetrically : $39{,}800 + 1140\,C + 1000\,P + x\,\mathrm{Mn} + R =$ ultimate strength.

(3) For basic steel, with carbon determined by combustion : $41{,}500 + 770\,C + 1000\,P + y\,\mathrm{Mn} + R =$ ultimate strength.

(4) For basic steel, with carbon determined colorimetrically : $42{,}000 + 820\,C + 1000\,P + y\,\mathrm{Mn} + R =$ ultimate strength.

C, P, and Mn represent 0·01 per cent. of carbon, phosphorus, and manganese respectively : R is a number varying according to the heat treatment to which the steel is subjected ; the strength is given in lb. per sq. in. Tables are given showing the variation of x and y with the carbon content of the steel.—A. S.

Banket Ore [Gold] ; Finer Crushing of —— *[on the Witwatersrand].* W. A. Caldecott. Inst. of Mining and Metall., Oct. 20, 1904.

The crushed ore as it leaves the amalgamating plates is composed of : (*a*) silicious grains, mainly barren ; (*b*) granular auriferous pyrites ; (*c*) quartz grains with adherent pyrites ; and (*d*) very finely divided quartz, clay, and a little auriferous pyrites and free gold, constituting the slime. The results of experiments are quoted showing that higher extractions are obtained if the portion of the pulp comprised under (*b*) and (*c*) be subjected to fine crushing before being treated with cyanide. In practice it would probably be most satisfactory to pass the "spitzlutte" concentrate continuously through a re-grinder, then over amalgamating plates, returning it thence to the mill pulp launder delivering to the tailings wheel, so that any insufficiently reduced particles might gravitate back again from the "spitzlutte" for further grinding. The author estimates that with this secondary fine crushing the present 90 per cent. recovery of the gold contents of 10 dwt. banket ore would be raised to 95 per cent. at an increased expense of less than half the additional 5 per cent. of gold recovered. It should also be possible to successfully treat the large "residue dumps" on the Rand by means of a system embracing washing out the soluble gold contents, together with concentration of the coarser and pyritic portion, followed by fine grinding of this product to render its encased gold contents susceptible to subsequent treatment.—A. S.

Lead-Tin Alloys ; Action of Dilute Acids on ——. O. Sackur. Arb. Kais. Ges. A., **22**, 205—234. Chem. Centr., 1904, **2**, 1106. (See this J., 1904, 255, 791.)

Pure lead is acted upon by dilute acids only in presence of oxygen. The rate of solution is nearly independent of the strength and concentration of the acid (acetic, lactic, and hydrochloric acids), but depends upon the concentration of the dissolved oxygen, and the rate at which the acid is stirred. Pure tin is scarcely attacked, even in presence of oxygen, by dilute acetic acid (more dilute than N/10 solution) and lactic acid (more dilute than N/100 solution). With acids of stronger concentration, the solvent action is greater, but not so great as on lead. In the case of lead-tin alloys, the solvent action of dilute acid increases continually with the proportion of lead in the alloy. Dilute acids dissolve almost exclusively lead, with but little tin from the alloys ; more concentrated acids, on the other hand, dissolve more tin than lead. By the action of dilute acids on lead-tin alloys, in the first place, the lead is dissolved, but is subsequently in part precipitated again by the tin, this precipitation being more complete the greater the acidity of the solution.—A. S.

Alloys ; Structure of ——. W. Campbell. J. Amer. Chem. Soc., 1904, **26**, 1290–1315.

Aluminium-Copper Alloys.—Alloys containing from 0 to 54 per cent. of copper form a simple series with a eutectic point at about 32 per cent. of copper. Between 0 and 32 per cent. of copper, grains and dendrites of aluminium occur in an increasing ground-mass ; between 32 and 54 per cent. of copper, crystals of the compound Al_2Cu occur in a decreasing ground mass of the eutectic. In neither case are the dendrites or crystals pure ; they contain about 2 per cent. of copper or of aluminium, as the case may be, in solid solution. From 54 per cent. of copper, the ground-mass of the compound Al_2Cu decreases, whilst a new constituent in the form of dendrites and then irregular masses increases, until at about 78 per cent. of copper, the alloys are homogeneous. The alloys remain homogeneous from 78 per cent. (Al_2Cu_3) to about 83 per cent. of copper ($AlCu_2$). It is not certain whether the new constituent is AlCu, Al_2Cu_3, or $AlCu_2$, since it forms solid solutions ; there may even be two isomorphous compounds present. The alloys containing from above 83 per cent. to about 90 per cent. of copper solidify as solid solutions, which at a lower temperature rearrange themselves, according as the alloy contains more or less than 87 per cent. of copper—the eutectoid point. This change is similar to that which takes place in steel and in the bronzes. The alloys containing from 92 per cent. to 100 per cent. of copper form a series of solid solutions isomorphous with copper and show no rearrangement in the solid state.

Ternary Tin-Antimony Alloys.—An alloy containing 75 per cent. of tin and 25 per cent. of antimony was melted with 10 per cent. of various metals, and the structure of the resulting products examined. It was found that three types of structure are produced :—

(1) When the third metal is lead or bismuth, the alloy is formed of cubes of the compound SbSn in a ground-mass of tin dendrites, surrounded by the eutectic of tin and lead or bismuth.

(2) With silver or copper as the third metal, crystals of a compound of this metal and tin, together with cubes of the compound SbSn, are found set in the eutectic of tin and the compound of tin and the third metal.

(3) When the third metal is aluminium or zinc, this forms a compound with the antimony. The ground-mass consists of : (*a*) crystals of aluminium in its eutectic with tin ; and (*b*) in the case of zinc, crystals of the compound SbSn in a solid solution rich in tin. Cadmium appears to behave like zinc. Arsenic probably belongs to a sub-group of (2) where the compound SbSn and crystals of a compound of tin and the third metal occur in a ground-mass, which is a solid solution of tin.—A. S.

Alloys of Tin and Antimony. W. Reinders. Appendix III. to 6th Report to the Alloys Research Committee. Proc. Inst. Mech. Eng., 1904, **1**, 209—214. Science Abstracts, 1904, **7**, A, 831.

The freezing-point curve of tin-antimony alloys consists of four branches. The first begins with pure tin and ends with an alloy containing 8 per cent of antimony, melting at 243° C. There is no eutectic point. The crystals which separate from alloys corresponding to the first portion of the curve, consist of isomorphous mixtures of tin with varying amounts (up to 11 per cent.) of antimony. The next branch of the curve is considerably steeper, and corresponds to the separation of crystals of a definite compound, Sn_2Sb, which forms small glittering cubes. The third branch of the curve begins with an alloy containing about 20 per cent. and ends with one containing about 50 per cent. of antimony. The crystals corresponding to the lower portions of this branch of the curve are not well defined, but at 50 per cent. of antimony they again have a definite form, being thick plates of the composition Sn_4Sb_3. The crystals corresponding to the final portion of the curve are probably a solid solution of tin in antimony.—A. S.

Vanadium; Extraction of —— from Lead Vanadate, and Production of Some Alloys. H. Herrenschmidt. Comptes rend., 1904, **139**, 635—637.

The lead vanadate (12—14 per cent. of vanadic acid and about 50 per cent. of lead) is melted with sodium carbonate in a reverberatory furnace. Argentiferous lead is reduced and a slag is formed, containing sodium vanadate, aluminate, and silicate, and ferric oxide. The slag is again melted, air blown through to peroxidise all the vanadium, and the mass is then granulated by pouring into boiling water. This water, and the water of three washings, dissolve out practically all the vanadate, with some silicate but no aluminate. To remove the silicate, one portion is evaporated to syrup, sulphuric acid added to precipitate most of the vanadic acid, the mixture agitated with the rest of the impure solution, and the whole passed through a filter-press. The silica is thus precipitated, and the solution contains fairly pure vanadate. To prepare from it vanadic acid, it is evaporated to small bulk, excess of sulphuric acid added, the whole evaporated to dryness, heated till the excess of sulphuric acid is driven off, and the residue well washed with water. To make ferro-vanadium the purified sodium vanadate solution is precipitated by ferrous sulphate and sodium carbonate in such proportions as to yield on reduction 33 per cent. of vanadium. Nickel-vanadium is made by mixing oxide of nickel and vanadic acid in proportions to yield 25 per cent. of vanadium, compressing into cubes with the quantity of reducing substance necessary, and heating in crucibles packed with charcoal.—J. T. D.

Gold; Influence of Sunlight on the Solution of —— in Aqueous Potassium Cyanide. W. A. Caldecott. Chem. Soc. Proc., 1904, **20**, 199.

The fact that the formation of potassium thiocyanate in aqueous solution, under the conditions indicated by the equation $PbS + KCN + O = PbO + KCNS$, is accelerated by bright sunlight was noted some years ago by Bettel and Feldtmann (Proc. Chem. Metall. Soc. S. Africa, 1896, **1**, 267). In a paper published last year (J. Chem. Metall. Soc. S. Africa, 1903, **4**, 51) by E. H. Johnson and the author, the analogy between potassium aurocyanide and potassium thiocyanate with regard to their formation and reduction was discussed.

The following experiments were carried out with the view of ascertaining whether sunlight accelerated the formation of potassium aurocyanide, as well as that of potassium thiocyanate.

A strip of gold foil weighing 832·5 mgrms. and having a total superficial area of 852 sq. mm. was immersed in a 0·5 *per* cent. potassium cyanide solution, contained in clear glass litre bottle at about 19° C. In another similar glass vessel, coated with three layers of black varnish, was placed a corresponding amount of the potassium cyanide solution and a strip of gold foil weighing 900 mgrms., but with a superficial area equal to that of the other strip. The two bottles were then exposed to direct sunlight for about a $5\frac{1}{2}$ hours daily during five days, and the loss of weight of the gold foil strips was noted, the maximum temperatures of the solutions being recorded daily.

The results showed that the rate of solution of the gold in the clear glass bottle was 43 per cent. greater than that in the blackened vessel, although the temperature of the solution was on an average 3·8° C. lower than in the former case.

The lately published researches of Berthelot (this J., 1901, 786) indicate that the absorption of oxygen by aqueous solution of potassium cyanide is accelerated by sunlight. The greater rapidity with which gold dissolves in potassium cyanide solution in bright sunlight may hence be considered as being due to the liberation of more nascent cyanogen, in proportion to the additional oxygen absorbed, with the consequent increased formation of aurous cyanide.

English Patents.

Steel; Manufacture of ——. C. E. Cockburn, Swanley, Kent. Eng. Pat. 25,950, Nov. 27, 1903.

Iron ore, with or without scrap iron, is placed in, for example, a cupola furnace having the usual adjuncts, with a quantity of "dried cohesive peat-moss briquettes," which are fired, and at a certain stage of the heating, a mixture of air and water-gas is injected in regulated quantity. It is an essential condition that the reduction of the ore should be effected in an atmosphere containing an excess of carbon monoxide with hydrogen.—E. S.

Sheet Iron and Steel; Method of and Apparatus for Treating ——. H. H. Goodsell, Leechburg, Pa., U.S.A. Eng. Pat. 18,746, Aug. 30, 1904.

Sheets of iron or steel are passed through a longitudinal chamber heated by flues, which also heat a pan containing water, the steam from which enters the chamber. The steam at the entrance to the chamber is at 212° F., and the plates are sufficiently heated before entering to prevent deposition of moisture upon them. As the plates are carried forward by suitable mechanical means, they reach a "blueing" compartment, in which the steam is heated to 900° F. or more. Beyond this compartment the temperature of the steam becomes gradually lower, and the plates are cooled to 212° F. before passing out by being drawn through the water-pan.—E. S.

Blast Furnaces; Impts. in ——. F. A. E. Samuelson, Thirsk, and W. Hawdon, Middlesbrough, Yorks. Eng. Pat. 28,279, Dec. 23, 1903.

The well of the furnace is made long in one direction and narrow in the other; for example, in the form of an ellipse or of a rectangle with or without rounded ends, so that with an increased area of the well the distance of the tuyères from the central line of the well remains so short that, without increasing the power of the blast, the latter is able to penetrate to the interior of the charge. In order that the charge may descend evenly, the boshes and shaft of the furnace are constructed with the same cross-section as the well.—A. S.

Furnaces [Crucible ——]. D. R. Steele, Curtis Bay, Md., U.S.A. Eng. Pat. 17,536, Aug. 11, 1904. Under Internat. Conv., Aug. 11, 1903.

See U.S. Pat. 743,947 of 1903; this J., 1903, 1297.—T. F. B.

Alkaline Chlorides and Oxychlorides; Preserving the Strength and Keeping Powers of Solutions of —— employed for Bleaching, Disinfecting, Separation of Metals, and other such like Purposes. G. J. Atkins and Oxychlorides, Ltd. Eng. Pat. 25,972, Nov. 27, 1903. VII., page 1088.

Metals from their Ores; Extraction of ——. P. J. Ogle and The Rapid Cyanide Treatment, Ltd., London. Eng. Pat. 26,391, Dec. 3, 1903.

See Fr. Pat. 340,238 of 1904; this J., 1904, 792.—T. F. B.

United States Patents.

Blast Furnace. A. Latto and J. C. Callan, Braddock, Pa. U.S. Pat. 772,723, Oct. 18, 1904.

A conduit communicating with the interior of a blast furnace near the top of the latter, is provided at its end with an "explosion door," and is connected to a dust collector having a curved elbow and a portion extending downward leading to a dust receptacle. On the outer bend of the elbow of the dust collector are arranged angularly disposed plates, spaced apart, the spaces between the plates communicating with the open air. There are means for spraying water within the dust collector.—E. S.

Furnace; Roasting and Smelting ——. H. Cockell and W. H. Fish, Columbus, Ohio. U.S. Pat. 772,925, Oct. 25, 1904.

The products of combustion from the smelting furnace pass around an ore-feeding and roasting chamber. The discharge pipe from the ore-roasting chamber into the smelting furnace is connected with air-inlet and fuel-supply pipes.—A. S.

Slimes Washer. L. E. Porter, Camp Rochester, Cal. U.S. Pat. 773,221, Oct. 25, 1904.

A vertical cylindrical tank, open at the top, is provided with a central, vertical, tubular shaft, and with means for rotating the latter. To the bottom of the shaft horizontal distributing arms are fixed, and connections are provided for introducing air or water into the hollow shaft. A "pervious material" is disposed around the inner upper edge of the cylinder, whilst on its outer edge is an annular trough to receive the liquid passing through the pervious material.—W. H. C.

Slimes Washer; Continuous ——. L. E. Porter, Camp, Rochester, Cal. U.S. Pat. 773,222, Oct. 25, 1904.

The apparatus in the preceding abstract is modified by having a conical bottom to the cylinder, with a valve at the apex of the inverted cone. A scraper is attached to the rotating shaft having its edge parallel to the slope of the conical bottom, and a funnel is arranged in the upper portion of the cylinder concentric with the shaft.
—W. H. C.

Alloys; Process of Making ——. R. S. Anderson, Seattle, Wash., Assignor to W. F. Horner, W. C. Meeker, and H. U. Woodin. U.S. Pat. 773,450, Oct. 25, 1904.

Copper and tin are fused together in about the proportions of 93 lb. of copper to 7 lb. of tin, and to the mixture there is added first a quantity of copper sulphate, and then aluminium in about the proportion of 2 lb. of aluminium to 5 oz. of copper sulphate, copper, and tin. The fused mass is poured off and allowed to cool in the form of pigs.—A. S.

French Patents.

[Steel] Plates; Process and Apparatus for Locally Softening Hardened ——, Permitting them to be worked in the Cold. Schneider & Co. Fr. Pat. 338,998, Aug. 24, 1903.

See Eng. Pat. 19,167, 1903; this J., 1903, 1246.—T. F. B.

Nickel Steel; Impts. in ——. A. de Dion and G. Bouton. Fr. Pat. 344,095, June 17, 1904.

It is claimed that by the addition of silicon to nickel steel the breaking stress and elastic limit are considerably increased, especially in the case of the alloys of martensitic structure, without the resistance to percussion being diminished. The proportions claimed are 0·5—2 per cent. of silicon for pearlitic steels and 0·5—3 per cent. for martensitic steels.—A. S.

Gold from Auriferous Minerals; Process for Extracting ——. Worsey-Hoal Gold Extracting Synd., Ltd. Fr. Pat. 344,301, June 25, 1904. Under Internat. Conv., June 29, 1903.

See Eng. Pat. 14,398 of 1903; this J., 1904, 1031.—T. F. B.

Slag; Process for Making Briquettes from Blast-furnace ——. H. Schulte-Steinberg. Addition, dated June 6, 1904, to Fr. Pat. 334,737, Aug. 19, 1903.

See Eng. Pat. 3235 of 1904; this J., 1904, 444.—T. F. B.

Aluminium and its Alloys; Industrial Process for Perfectly Soldering ——. R. Fortun and E. Semprun. Addition, dated June 10, 1904, to Fr. Pat. 330,609, March 26, 1903.

See Eng. Pat. 13,328, 1904; this J., 1904, 986.—T. F. B.

Minerals containing Lead and Zinc; Treatment of ——. C. H. T. Havemann. First addition, dated June 13, 1904, to Fr. Pat. 318,590, Feb. 11, 1902 (this J., 1902, 1457).

In the main patent, the fumes from the melting furnace are subjected to the action of a forced draught, whereby, the sulphides of lead and zinc are almost completely converted into sulphates, which are subsequently separated. According to the present addition, the conversion of the sulphides into sulphates becomes complete if (1) the composition of the furnace-charge be maintained within the limits:—zinc, 18—20; lead, 18—20; and sulphur, 12—13 per cent.; and (2) the draught be so regulated that the mud obtained on condensing the fumes is white. The process is also applicable to the treatment of minerals containing lead, zinc, and copper. A large proportion of the copper is obtained in the form of a matte rich in copper and silver, whilst the remainder is converted into sulphate with the lead and zinc. From the solution of zinc and copper sulphates obtained, the copper is precipitated by iron.—A. S.

Sulphates; Reduction of Alkaline-Earth and Alkali —— to Sulphides, and of Metallic Oxides to Metals. C. Castiglioni and L. Calastretti. Fr. Pat. 343,926, June 13, 1904. VII., page 1090.

Alloy. U. Travaglini and F. Fabiani. Fr. Pat. 344,255, June 21, 1904.

The alloy is constituted of electrolytic copper, 1·90 to 1·95 kilo.; silver, 0·2 to 0·3 kilo.; ferro-manganese, 0·6 to 1·5 kilo.; aluminium, 4·8 to 9·9 kilos.; and red phosphorus, 5 to 15 grms. The density of the alloy is stated to be 8·187, and its fusing point, 700 C.—E. S.

Air; Method and Apparatus for Extracting the Moisture from ——, and for Supplying such [Dried] Air to Cupola Furnaces, Converters, or the like. J. Gayley. Fr. Pat. 344,399, June 28, 1904.

Air is led into a refrigerating chamber in which, by the oscillation of wings and other suitable means, it is so agitated and circulated as to come into contact with a cooling tubular system, until the greater part of its moisture is deposited. The air thus dried is conveyed to a blower, preferably under a feeble initial pressure, and then forced at a higher pressure into the tuyères of the furnace or converter.—E. S.

Copper; Fusing Sulphide Ores of —— with Simultaneous Concentration in the Matte. N. Lébédeff. Fr. Pat. 344,550, July 2, 1904.

Three parts of copper sulphide ore, two parts of limestone or dolomite, and three parts of quartz sand, all in fine powder, are intimately mixed, and the mixture is exposed to an oxidising flame in a reverberatory furnace, with addition of a suitable flux. The rich matte formed on fusion is withdrawn from the liquid layer of scoria.—E. S

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

Temperature in Electric Furnaces; Testing the ——. F. A. J. Fitzgerald. Electrochem. Ind., 1904, **2**, 415.

The increase of density of pure amorphous carbon with rise of temperature is suggested as a suitable method of gauging the temperature of electric furnaces. Even after the transformation into graphite, the density increases with elevation of temperature. The examples of the application of the method refer to temperatures of a blowpipe and muffle furnace.—R. S. H.

Electrolysis and Catalysis. W. Ostwald. Electrochem. Ind., 1904, **2**, 393—395.

The author considers in detail the reactions occuring at the electrodes during the passage of a current through an electrolytic cell. He shows that even in the simplest cases these are made up of a number of changes which follow each other step by step, and with very different velocities. Means exist for altering the speed of some of these changes. The positive or negative (retarding) catalytic action either of the electrode material or of some substance added to or present in the electrolyte is considered as effecting this alteration of speed. Examples are given to show how these views may be applied both synthetically for favouring any particular reaction at the electrode, and also analytically for studying what reactions occur in any special case.—R. S. H.

Nitrogen [Nitric Acid] from the Air; Electrical Extraction of ——. J. S. Edstrom. Electrochem. Ind., 1904, **2**, 399—400.

The process of C. Birkeland and S. Eyde, of Christiania, is described (this J., 1904, 193). Their method consists in magnetically deflecting an arc at right angles to the direction of the electrodes, and thus causing it to be carried upwards and downwards, and to be broken. The speed of formation and breaking can be made very rapid, but in practice only some hundred arcs per second are used. The effects vary according to whether the arc and magnetic field are excited with direct or alternating current. If the arc be fed with alternating current, and the electro-magnet with direct current, the phenomena will appear as shown in Fig. 1, the arcs vibrating between opposite sides of the electrodes. This is the arrangement chiefly used by the inventors. The electric furnace employed is shown in vertical section at right angles to the electrodes in Fig. 2. Air passes through the channels A, into the arc chamber B, around and in the neighbourhood of the electrodes, E, and out by the channel C. The gases contain 2 to 3 per cent. of nitric oxide. A 200-kilowatt furnace fed with alternating current of 50 cycles at 5000 volts gave a yield corresponding to 900 kilos. of nitric acid per kilowatt per year. The nitric oxide (NO) is converted into nitrogen peroxide (NO_2) in a reaction tank of thin sheet iron enamelled on its inner surface. The gases pass thence t an exhauster of clay, where they meet drips of dilute nitric acid. The gases now pass through four water towers and one fed with caustic soda solution. In each towe the liquid is passed through several times for the sake o concentration. Finally, a mixture of sodium nitrite an nitrate is obtained, and from this pure sodium nitrite i manufactured, nitrates being prepared from the residua solution.—R. S. H.

Aromatic Esters; Electrolytic Reduction of ——. C. Mettler. Ber., 1904, **37**, 3692—3696.

The methyl and ethyl esters of benzoic acid can be reduced by subjecting them in alcoholic solution, acidifie with sulphuric acid, to the action of an electric current using a lead cathode. Benzyl alcohol and benzyl-methy or benzyl-ethyl ether respectively are produced, accordi to the equations—

$$C_6H_5COO.R + 4H \begin{matrix} \nearrow C_6H_5.CH_2OH + ROH \\ \searrow C_6H_5CH_2OR + H_2O \end{matrix}$$

The halogen derivatives of benzoic acid esters can b reduced in a similar manner, the chief products being th corresponding halogen-benzyl-alkyl ethers, whilst only sma quantities of halogen-benzyl alcohol are formed. B suitable oxidising agents, these halogen-benzyl-alkyl ethe can be easily converted into the corresponding haloge benzaldehydes, many of which are of value in the manufacture of dyestuffs.—A. S.

Batteries; Storage ——. W. Fairweather, London. From Vesta Storage Battery Co., Chicago. Eng. Pat. 8365, April 12, 1904.

A suitable metallic cell, lined with insulating material, is connected to a horizontal cylindrical positive element of copper wire gauze or cloth, and a cylindrical negative element, consisting of a perforated copper tube, is arranged and maintained concentrically within the positive element by means of rubber insulating rings. The negative copper ube is covered first with paper, then with a cylindrical ayer of linen, and finally with a tightly-fitting perforated rubber tube; copper rings or bands surround the positive element, and serve to bind the positive and negative elements together. Insulating discs are inserted within the ends of the positive element, and serve to close the ends of he negative element, the latter being provided internally and concentrically with a copper conductor, embedded in active material which fills the interior of the negative element. A screen of wire gauze of finer mesh than the positive element separates the latter from the sides and bottom of the cell. The active negative material may be oxidised silver and nickel, or silver and cobalt, which is prepared by dissolving the metals simultaneously in nitric acid, precipitating the oxides of the metals with a strong solution of potassium or sodium hydroxide, finally washing several times by decantation, and drying. The alkaline zincate electrolyte is prepared by placing a solution of potassium zincate within the battery, then, by charging the atter, depositing zinc on the positive element. The liquid s poured off, the battery cleansed, filled with a solution of pure potassium hydroxide and the battery discharged. An alternative arrangement is described with vertical elements and with an active sponge metal, containing silver, nickel, and mercury, filling the negative element, which consists of a copper shell perforated with elongated parallel apertures. The active material is prepared by dissolving the metals in nitric acid, then precipitating with potassium hydroxide and finally reducing the precipitate with zinc and hydrochloric acid. An amalgam containing 45 per cent. of silver, 5 per cent. of nickel, and 10 per cent. of mercury is obtained. An alternative form is described with a vertical positive element, consisting of rolls of copper gauze, disposed concentrically, the annular space being filled with ctive material of oxides of copper and cadmium, prepared by a method similar to the preparation of the oxides of ilver and nickel. The copper gauze is coated electroytically with cadmium and mercury, and with a zinc eposit on the coating. A sponge-like silver amalgam is aid to be useful as active material for this type of battery, nd may be prepared by dissolving silver in nitric acid, precipitating with hydrochloric acid, reducing with zinc, and drying the spongy silver. Nine pounds of sponge silver re mixed with 14 pounds of mercury, and the amalgam formed is exposed to the air for three days to bring about xidation, "before it is placed in the negative element of he battery."—B. N.

Electrodes and Resistances; Manufacture of ——. G. Cornaro, Turin, Italy. Eng. Pat. 22,090, Oct, 13, 1904.

See Fr. Pat. 336,817 of 1903; this J., 1904, 377.—T. F. B.

United States Patents.

Mercurial Alkaline Processes; Apparatus for ——. C. W. Roepper, Germantown, Pa., and W. E. Harmon, Mechanics Falls, Me. Assignors to American Electrolytic Co., Delaware. U.S. Pat. 771,833, Oct. 11, 1904.

Apparatus is described suitable for mercurial alkaline processes, and comprises an amalgamating compartment nd a de-amalgamating compartment separated by a main partition, with a groove or passage beneath the partition. The bottoms of both compartments slope downwards and away from the edges of the groove, the edge on the side f the amalgamating compartment being higher than the dge on the side of the de-amalgamating compartment. A return way and sluice-way for the mercury is provided, with a partition between the sluice-way and the amalgamating compartment, and with a groove underneath for the passage of the mercury. A number of such amalgamating and de-amalgamating compartments may be arranged in a gradually descending series, the series being in two rows and sloping in opposite directions. The highest point in each pair of compartments is the edge of the groove under the main partition on the side of the amalgamating compartment. Means are provided for returning the mercury, which occupies the bottom of each compartment, from the lowest level at the extremity of one row to the highest level at the extremity of the other. Inflow and outflow pipes are provided for the solution to be electrolysed; these traverse the entire length of the partitions, and communicate with the amalgamating compartment by a series of spaced apertures above the level of the mercury. Aprons protect the apertures and guide the flow of the electrolyte, so that the latter is evenly distributed across the width of the amalgamating compartment.—B. N.

Electrically Treating Gases [Air]; Process of ——. K. Birkeland, Christiania, Norway. U.S. Pat. 772,862, Oct. 18, 1904.

An electric arc is established and spread into the form of a sheet in a uniform magnetic field, and "transverse to the flux of the same." A current of the gas to be treated, such as air, is passed through the arc in a direction parallel to the surface of the sheet, and the oxide of nitrogen produced is afterwards removed from the remaining gases.—B. N.

French Patents.

Hydro-Electric Pile, which can be chemically Regenerated, and Method and Apparatus for its Operation. H. Jone. Fr. Pat. 339,020, Sept. 7, 1903.

Carbon Electrodes for Primary Cells: Process for Preparing ——. T. Mann. Fr. Pat. 344,312, June 25, 1904.

In order to prepare an electrode of good conductivity, the carbon is compressed around a piece of gauze or foil, formed of a metal which is a good conductor and is not acted upon by the electrolyte to be employed. The piece of gauze or foil may be provided on one side with projecting filaments, so that more perfect contact with the carbon is obtained.—A. S.

(*B.*)—ELECTRO-METALLURGY.

Iron and Steel; Electro-Metallurgy of ——. P. L. T. Héroult. Electrochem. Ind., 1904, **2**, 408—409.

The different processes which the author has worked out for the electric furnace manufacture of ferro-chromium, crude iron, and fine steel are briefly described. The electric treatment is considered to be particularly suitable for refining ordinary grades of steel, *e.g.*, the molten product of a Siemens-Martin furnace, so as to obtain a fine metal containing less than 0·01 per cent. of sulphur and 0·01 per cent. of phosphorus, and with as low a carbon content as desired. The product obtained is at least equal in quality to the best grades of crucible steel.—R. S. H.

Nickel Steel from Magnetic Sand; Preparation of ——. E. A. Sjöstedt. L'Electricien, 1904, **27**, 270. Chem.-Zeit., 1904, **28**, Rep. 330.

The magnetic sand obtained at Sudbury, Canada, contains 2—3 per cent. of nickel and 1—2 per cent. of copper. After mechanically separating the portion rich in copper, the average composition of the sand is found to be:—Nickel, 3 per cent.; copper, 0·5 per cent.; sulphur, 28 per cent.; iron, 50 per cent.; and phosphorus, 0·01 per cent. This is roasted and then smelted with coke and lime in an electric furnace of the usual type; the product contains about 8 per cent. of nickel, 53 per cent. of iron, and 3 per cent. of sulphur. By this means it is stated that 27 kilos. of nickel steel can be produced in one hour, by employing 108 kilowatts, the cost being computed to be 105·5 marks per ton.—T. F. B.

Electro-plating; Chemistry of ——. W. D. Bancroft. Electrochem. Ind., 1904, **2**, 389—391 and 400—401.

The following conclusions are illustrated by details of special cases occurring in practice. A non-adherent deposit is always due to the precipitation of some salt or metalloid along with the metal; the function of many additions to plating baths being solely that of dissolving these salts or metalloids. Any beneficial action due to the presence of a reducing agent in the bath is probably owing to the removal of the dissolved oxygen. A fine-grained deposit is favoured by high current-density and potential difference, by the use of acid or alkaline solutions, by low temperature, and by the addition of colloidal substances to the bath.—R. S. H.

Electrolytic Deposition of Aluminium from Ethyl Bromide Solutions. H. E. Patten. Electrochem. Ind., 1904, **2**, 413.

A solution of aluminium bromide in ethyl bromide gives a deposit of crystalline aluminium, provided the solution is sufficiently concentrated and the current density exceeds 0·0023 ampère per sq. cm.—R. S. H.

Metal Deposition from Rapidly-Stirred Electrolytes; Theory of ——. R. Amberg. Z. Electrochem., 1904, **10**, 853—855.

Instead of considering the effect of rapid stirring as connected with the virtual volume of the electrolyte, as in a previous communication (this J., 1904, 684), the author applies Nernst's theory of reaction velocity in heterogeneous systems. According to this theory, the velocity of reaction is conditioned only by the rate at which the differences of concentration between the bounding layer, and the two phases are equalised by diffusion.—R. S. H.

Anodic Solution of Metals and their Passive State. O. Sackur. Z. Elektrochem., 1904, **10**, 841—844.

The author considers the anodic solution of all metals to be conditioned by one and the same reaction, *viz.*, the discharge of hydrogen ions. For instance, with a divalent metal $M + 2H^{\cdot} \rightleftarrows M^{\cdot\cdot} + H_2$. If the removal of the hydrogen can be effected by reaction with one of the discharged anions present, the metal will continue to dissolve; this is, for instance, the case with chlorides, bromides, &c.; the velocity of reaction of the discharged oxygen ions from most of the other salts is, however, sometimes very low. The greater the catalytic influence of the particular metal used for electrode upon this reaction, the more easily will that metal dissolve. The author therefore considers that the power which metals possess of assuming the passive condition is inversely proportional to the magnitude of their catalytic effect in the reaction between hydrogen and oxygen.—R. S. H.

English Patents.

Metals such as Lead and Silver; [Electrolytic] Process for Extracting —— *from Ores.* S. Ganelin, Friedenau, and Accumulatoren Fabrik Akt.-Ges., Berlin. Eng. Pat. 1767, Jan. 23, 1904.

See Fr. Pat. 339,849 of 1904; this J., 1904, 718.—T. F. B.

Zinc from Sulphate Solutions; Producing —— *by Electrolysis.* C. D. Abel, London. From Siemens and Halske A.-G., Berlin. Eng. Pat. 16,396, July 25, 1904.

The current density at the anode, either over its entire surface or at separate parts, is from 20 to 50 times greater than that at the cathode. Platinum or platinum alloys may therefore be used as the anode, and electrolytic zinc, hard, smooth, dense, crystalline, and free from sponginess and nodules, is obtained.—B. N.

French Patents.

Electric Induction Furnace; New System of ——. Schneider et Cie. Fr. Pat. 339,010, Sept. 2, 1903, and Addition thereto of Nov. 12, 1903.

See Eng. Pat. 28,805 of 1903; this J., 1904, 549.—T. F. B.

Electrostatic Separation: Process of ——. F. O. Schnelle. Fr. Pat. 344,068, June 14, 1904. Under Internat. Conv., June 15, 1903.

The invention relates to the separation of minerals, the individual constituents of which possess varying degrees of electric permeability. The material is fed uniformly over the surface of a body of suitable shape, the sides of which are inclined, and the lower edge horizontal, and which is connected with one pole of a source of electric current. A field of intense electrostatic force is produced around the edge of the charged body by connecting the receivers placed below, with the earth, or with the other pole of the source of electric current. The particles of material, in falling from the electrically charged body, are projected varying distances according to their electric permeability and are collected in separate receptacles. An oscillating movement may be imparted to the electrically charged body.—A. S.

Titanium; Electrolytic Extraction of —— *from its Oxides.* Elektrochem. Werke G. m. b. H. Fr. Pat. 344,099, June 17, 1904. Under Internat. Conv., June 18, 1903.

The electrolyte used consists of dry halogen salts of the alkaline-earth metals heated to moderate redness. Before or during electrolysis the titanium oxide is introduced into the containing vessel, as near as possible to the cathode. When sufficient current has been passed to reduce the titanium oxide, the electrolysis is discontinued, and, after cooling, the titanium is separated from electrolyte by lixiviating it with water and with dilute hydrochloric acid, the alkaline-earth chlorides being recovered from the solution by evaporation and calcination, and used over again.—A. S.

Nickel or its Alloys; Manufacture of ——. G. H. Gin. Fr. Pat. 344,202, June 22, 1904.

Nickel oxide, or an ore of the oxide, is reduced in an electric furnace in presence of silica and carbon, to obtain either a nickel silicide, or a double silicate of iron and nickel. These are refined in a "four-canal" (Ger. Pat. 148,253), mixed with calculated proportions of nickel oxide or iron oxide, or a mixture of the two, according to whether it is desired to obtain pure nickel or ferro-nickel. Sulphur may be eliminated in the process by addition of a small proportion of manganese silicide.—E. S.

Alumina; Preparation of —— *by an Electro-Metallurgical Process.* Soc. Anon. Électro-Métallurgique, Procédés P. Girod. Fr. Pat. 344,549, July 4, 1904.

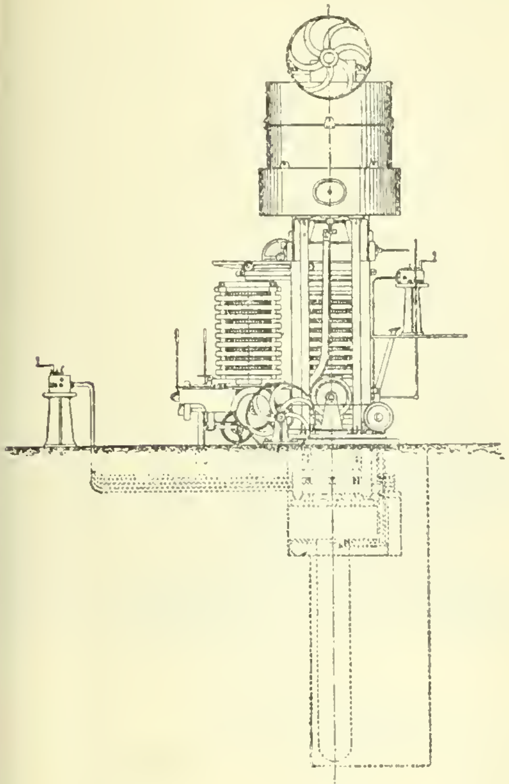
The alumina is obtained as a by-product in the manufacture of ferro-chromium by utilising bauxite as a flux in place of lime. During the process the bauxite becomes thoroughly dehydrated, and any silica and iron oxide it contains are reduced, so that the slag consists of nearly pure alumina. —R. S. H.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Oils and Fats; Uses and Applications of ——. J. Lewkowitsch. Cantor Lectures. J. Soc. Arts, 1904, **52**, 795—805, 809—815, 819—832.

Raw Materials.—In this country cocoanut oil and palm and palm kernel oils are still the principal vegetable fats extensively used, but on the Continent other fats are largely employed, *e.g.*, Chinese vegetable tallow and shea butter in Marseilles and the North of Europe. Only small quantities of these fats and other fats, such as mowrah-seed oil and mahwah butter, are imported into England. The use of fast steamers in place of sailing vessels has led to a great development of the commercial fish oil industry. As regards animal fats our chief sources of supply are now Australia, New Zealand, and the Argentine. Russia no longer exports tallow, but imports it largely from Australia.

Recovery of Oils by Expression.—In modern installations seeds rich in oil are frequently expressed in a hydraulic press known as a "clodding press," to avoid the exudation of the mass through the cloth in the plates of the ordinary Anglo-American press. This press (see figure) is provided



with a seed kettle at the top, in which are openings corresponding with the chamber in the head of the press or series of presses. The material is introduced into the circular press box, and each successive layer covered with a circular metal plate until the press is full, when pressure applied by the ram forces the box against the block at the head of the press. The press cake is broken up and pressed a second time in the Anglo-American press. In modern improved processes this second expression is also done in a press of the same type as the "clodding press," so that the work becomes practically continuous.

Recovery of Oil by Extraction with Solvents.—The solvents employed on a large scale are still petroleum spirit and carbon bisulphide. The use of carbon tetrachloride in technical processes has been prevented by its high price, and by its physiological effect on the workmen, which resembles that of chloroform.

Purification.—In the author's experience manganese dioxide with hydrochloric acid is the best bleaching agent for tallow, and bichromate with hydrochloric acid for palm oil. Bleaching by ozone or oxygen is only used to a limited extent. The author has found that the colour of oils bleached by certain ozone processes eventually becomes dark again. The old natural process of "demargarination" for cotton-seed oil has become too expensive, owing to the large storage room required, and has been largely replaced by an artificial process of refrigerating the oil and separating the "stearin" by means of filter- or hydraulic presses. This has led to the introduction of various oils (*e.g.*, arachis and Tunisian olive oils) as edible oils, which hitherto were objectionable on account of depositing "stearin."

Lard Substitutes.—Special cooling machinery is largely employed. The melted mixture of fats is cooled by means of a hollow cylinder through which flows chilled brine, and the sheet of fat deposited on the surface is removed at once by means of a pump.

Chocolate Fats.—The most suitable substitutes for cacao butter are prepared from the harder portions of palm-nut and cocoanut oils, which are made to crystallise at a temperature slightly over the normal atmospheric temperature, and the crystalline mass is expressed. To raise the melting points of such fats, animal fats are sometimes added as stiffening agents, but, unless carefully refined, animal fats, such as tallow and tallow stearine, may impart an unpleasant flavour to the chocolate. The author suggests the use of some of the tropical vegetable fats of higher melting point as suitable for this purpose, *e.g.*, margosa oil, mowrah-seed oil, &c. (see this J., 1903, 593).

Burning Oils.—Rape oil is still largely used on the railways in this country, whilst in America lard oil, and in Italy olive oil, are employed for the same purpose. The whiter qualities of whale and seal oil are still in demand for illuminating lighthouses.

Lubricating Oils.—Rape oil is still the favourite lubricant for railways, and it is a curious fact that India should export nearly the whole of the rape-seed crop to this country, and import rape oil for her railways. The high price of castor oil a few years ago gave an impetus to the manufacture of "blown" cotton-seed, maize, seal oils, &c. as substitutes. The author states that the suitability of these oils for lubricating purposes is still open to question, and that their tendency to gum and their low flashing points have been mentioned by many engineers as objections to their use.

Paint Oils.—Attention is called to the suitability of safflower oil and candle nut oil for this purpose. Linseed oil bleached by sunlight still holds the first place as the oil for artists' colours. The author has investigated several of the processes of bleaching linseed oil by means of ozone, and considers that they offer no advantage over the method of bleaching by sunlight.

Boiled Oils.—At the present time most of these are prepared by heating linseed oil with "driers" to a temperature not exceeding 150° C., the process being carried out in a cylindrical vessel provided with a heating coil and stirring arrangement.

Sulphonated Oils.—The price of castor oil is now so low that at the present time it would not pay to use other oils for this purpose.

Hydrolysis of Oils and Fats (see this J., 1903, 67, 1094).—Twitchell's reagent, prepared by the action of sulphuric acid in excess on a solution of oleic acid in aromatic hydrocarbons, gives a better emulsion with fats than either hydrochloric or sulphuric acid, practically complete hydrolysis being effected on heating the fat with 1 to 1½ per cent. of the sulpho-aromatic compound in a current of steam, the initial reaction being promoted by the presence of a small amount of free fatty acids. In the following experiments 100 grms. of the oil or fat were heated with 1 per cent. of the reagent in open flasks :—

The most thorough emulsion of all is obtained by means of enzymes, and this supports the author's theory that the various agents used to bring about hydrolysis act as accelerators or "catalysts," the actual hydrolysis being effected by water. Moreover, in the case of basic materials, *e.g.*, calcium oxide and caustic alkalis, a similar view can be held. Thus it is possible to effect complete hydrolysis by heating the fat with 1 per cent. of lime (as accelerator) in an autoclave under pressure, whilst in the case of caustic alkalis the more rapid hydrolysis may be attributed to the formation of a water-soluble soap, which assists the emulsification of the fat.—C. A. M.

Soap and Candles; Manufacture of ——. J. Lewkowitsch. Cantor Lectures. J. Soc. Arts, 1904, **52**, 833—842.

Candle Industry.—In the older processes of hydrolysing the fats to obtain the free fatty acids, the reaction is somewhat slow, which the author considers may be due to incomplete admixture of the fat with the water. In the recent method of using seed enzymes in the hydrolysis, there is much more thorough emulsification, and in experiments on a manufacturing scale cotton seed oil has been hydrolysed up to 90 per cent. Tallow is much more refractory in this process. Since, however, enzymic hydrolysis at its best has not been quite complete, the author regards it as useless to the candle-maker. As regards Twitchell's reagent (see preceding abstract) the author has obtained the best results with the sulpho-compound of naphthalene.

In working on the large scale it is necessary to use a fat with the addition of a small percentage of free fatty acids, since otherwise the reaction does not start rapidly. This process has been introduced into several works in the United States as specially suitable for low-class material that could not be profitably worked in an autoclave. It has the drawback of yielding somewhat dark-coloured fatty acids, which are unsuitable for soap-making. In the processes in which the hydrolysis is carried out by means of an accelerator in an autoclave, the high pressure is liable to cause bulging eventually. Hence spherica autoclaves (see Fig. 1) have been introduced. Th oleic acid, separated by hot pressure from the soli fatty acids, contains a considerable amount of "stearin," which is deposited by cooling the mixture in tanks, o more rapidly by means of Petit's refrigerating wheel This consists of a hollow wheel through which passe chilled brine. As it revolves it dips into a trough containing the oleic acid, and carries up a thin film, whic rapidly cools, and deposits "stearin" crystals. The crystalline mass is removed by means of a scraper, and fall into a tank, whence it is pumped into a filter-press The separated crystals may then be added to a fres lot of candle material at a suitable stage, whilst the olei acid may be partially converted into solid compounds This conversion of oleic acid takes place to some exten in the acid saponification process, where sulphuric acid i used as the reagent, and the latter process is therefore favourite one for working up poor material containin little glycerin. The loss from the destruction of glyceri is compensated by the increased yield of solid candl material. Thus taking the yield of palmitic and steari acids from tallow to be 45 to 47 per cent. in the autoclave process, the yield of solid material from the same fa by the acid saponification process is about 63 per cent.

Soap Industry.—A machine devised by the autho (this J., 1893, 597) for rapidly cooling soap has prove unsuitable for household soaps, owing to its destroyin their crystalline structure. But the same principle (that o the candle-moulding machine, Eng. Pat. 4581 of 1893 has been embodied in a recent patent by Schnetzer Klumpp's apparatus for the same purpose resembles copying press with closed sides, in which the hot soa can be rapidly cooled and compressed, whilst Schrauth'

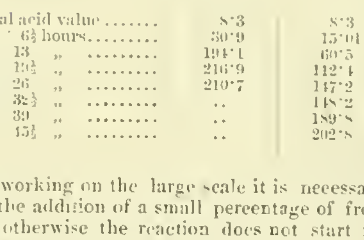

FIG. 1.

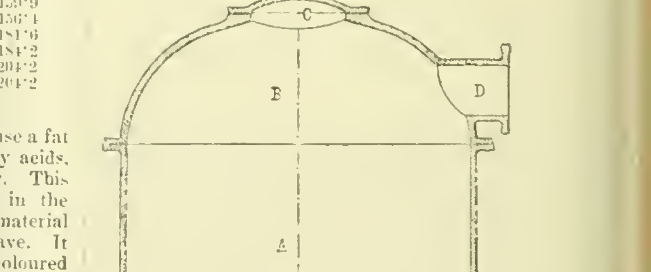

FIG. 2.

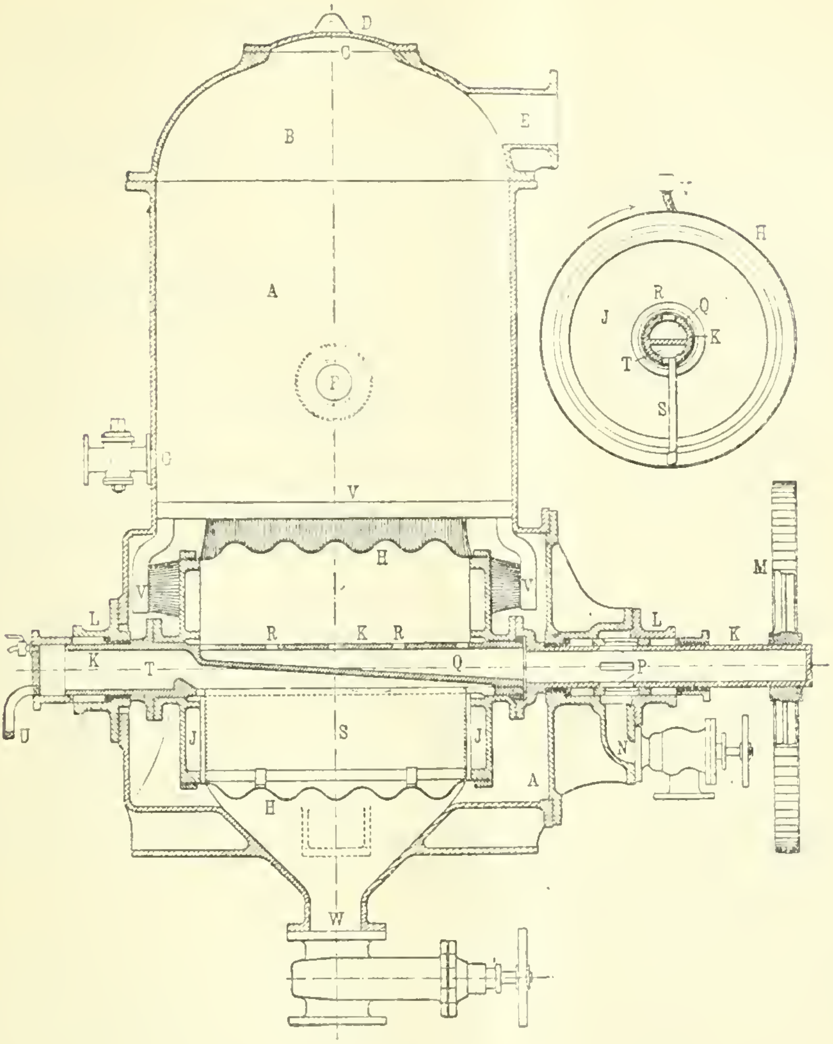

Fig. 3.

atent is based on the principles underlying both the preeding patents. The development of the uses for nitroglycerin as made it profitable to recover glycerin from the soap leys, nd in England, America, and France this is done in the most mportant soap works. Numerous attempts have recently een made to obtain the glycerin from the fats first, and then convert the fatty acids into soap. Autoclave methods ied and found wanting in this country are being revived n the Continent, and, in order to lessen the darkening ffect of the autoclave process on the fatty acids, reduced ressure has been employed, with the result that whilst a etter-looking product has been obtained, there is from 15 20 per cent. of unsaponified fat present, the glycerin which it does not pay to recover subsequently from the oap leys. It is, however, acknowledged, even on the Connent, that first-rate soap cannot be produced by the utoclave process.

Soft Soaps, made from autoclave material, and so conining little glycerin, are dark in colour, unpleasant in ppearance, and will not "hold water." Moreover, the bsence of glycerin from soft soaps is objected to by oollen manufacturers, since the glycerin gives a gloss nd soft feel to their best materials, *e.g.*, cashmeres.

Recovery of Glycerin.—In modern works the old Wetzel an has been replaced by a vacuum-tube evaporator similar those used in sugar works. In the case of glycerin solutions from the acid saponification process, it is necessary to use similar apparatus to that illustrated in the preceding for soap-lye glycerin, since otherwise the calcium sulphate that separates out on concentrating the liquid would form a crust on the tubes and reduce the evaporating effect. In the earlier attempts to recover glycerin from soap lyes the concentration was carried out in fire-heated pans, the sides of which were kept free from deposit by stirring and scraping devices. Then tube evaporators heated by steam were tried, but it was found that the tubes were liable to be completely stopped. The author has therefore patented the apparatus shown in the Figs. 2 and 3, which have proved suitable in practice for the concentration of such leys. It will be seen that the heating surface is kept clean by a mechanical arrangement, so that the salt falling to the bottom can be drawn off into a vessel beneath. This apparatus, is constructed in single effect and double effect, the latter combining a tube evaporator with the apparatus as illustrated by Figs. 2 and 3. The soap leys are concentrated in the vessel, B, until they reach the point at which the salt begins to deposit. They are then transferred to the vessel A, and the boiling continued, the salt being meanwhile removed as it falls out, until eventually the glycerin reaches a concentration of 1·3 sp. gr., when it is withdrawn. A triple effect apparatus is constructed on similar lines.—C. A. M.

Olive Oil; Formation of Free Acid and Production of Rancidity in ——. R. Marcille. Essay at the Oil Culture Congress at Sfax (Tunis). Chem. Centr., 1904, **2**, 1064.

The formation of free acid is due chiefly to the action of lower organisms, especially mould fungi, which secrete a ferment capable of hydrolysing fats and assimilating the glycerin produced. The formation of acid frequently occurs in the olives themselves, when they are badly preserved. The production of rancidity, on the other hand, is caused by the absorption of atmospheric oxygen; the unsaturated fatty acids become saturated and in part are decomposed. The absorption of oxygen is accelerated by heating and still more by exposure to light. The harsh and astringent taste characteristic of rancid olive oil is due to the formation of volatile fatty acids. The author recommends that the freshly-picked olives never be preserved for more than three to four days in heaps: that separation of the oil from the "margines" be effected more expeditiously; and that the oil be preserved in flask-shaped vessels of yellow glass filled up to the neck.—A. S.

Cholesterol. A. Windaus and G. Stein. XXIV., page 1117.

Yeast; Some Constituents of ——. O. Hinsberg and E. Roos. XVII., page 1107.

English Patents.

Substances of Fatty Nature that are Hard at Ordinary Temperatures; Method of Rendering —— Plastic. F. Lausen, Aarhus, Denmark. Eng. Pat. 17,866. Aug. 17, 1904.

The material is subjected while in a soft condition to the action of a current of cold air or other inert gas. The gas may be introduced under pressure, and then allowed to expand suddenly, with the result that the heat absorbed by the expansion causes the material to solidify and retain particles of gas distributed throughout the mass.—C. A. M.

Glycerin and Other Products from Distillers' Wash and other Industrial Liquids; Process for Obtaining ——. L. Rivière, Paris. Eng. Pat. 16,836, July 30, 1904.

See Fr. Pat. 338,962 of 1903; this J., 1904, 1035.—T. F. B.

United States Patent.

Hydroxystearic Acid; Process of Making ——. W. M. Burton, Assignor to Standard Oil Co., Chicago. U.S. Pat. 772,129, Oct. 11, 1904.

Oleic acid is diluted with a liquid hydrocarbon of the paraffin series, and is converted into a "saturated oleic acid" by adding a suitable polymerising agent, *e.g.*, sulphuric acid; steam is blown through the mixture, and the aqueous portion is separated. On adding hot petroleum spirit to the oily portion and cooling the solution, hydroxystearic acid crystallises out.—T. F. B.

French Patents.

Oils and Sulphonated Fats; Manufacture of Compounds from ——. J. Stockhausen. Fr. Pat. 344,125. June 18, 1904.

Claim is made for emulsions miscible with water in all proportions prepared by mixing an oil (notably mineral oil) or carbon tetrachloride with the gelatinous soap obtained by saponifying sulphonated castor or other oils. (See Fr. Pat. 253,578.)—C. A. M.

Glycerin; Extraction of —— from Industrial Liquids containing it, and notably from Distillery Residues. E. A. Barbet. Fr. Pat. 344,036, April 16, 1904. XVII. page 1108.

Soap; Machinery for Manufacture of ——. Soc. Talvande Frères and Donault. Fr. Pat. 344,006, June 15, 1904.

The liquid soap runs from an upper tank into a series of vertical rectangular moulds, round which circulates a current of cold water. Above the tank is a funnel in which the pressure of the liquid soap compensates for the contraction caused by the solidification of the material in the moulds. When the soap has set, the upper tank and funnel are removed and the moulds emptied by means of pistons which force the slabs upwards against a system of cutting wires.—C. A. M.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—PIGMENTS, PAINTS.

Lead Compounds [White Lead]; Raw Materials for the Preparation of ——. M. Liebig. Z. angew. Chem., 1904, **17**, 1671—1672.

The lead for white-lead preparation must be as pure and soft as possible. A trace of bismuth favours the oxidation of the metal; iron and copper hinder it. The latter metals are estimated colorimetrically by dissolving in nitric acid, precipitating the lead as sulphate, evaporating to small bulk, and adding to one half potassium thiocyanate, to the other ammonia. The colours struck are compared with those of iron and copper solutions of known strengths. The coke used to prepare carbonic acid must be thoroughly burnt and desulphurised, or lead sulphate will be formed, which protects the metal from the action of the acetic acid. For the German (chamber) process 15 per cent. acetic acid, for the French (drum) process 80 per cent. acetic acid is used. Its strength is determined by titration with alkali and phenolphthalein. The sodium nitrate for litharge and nitrite preparation is "refined saltpetre," containing 96—97 per cent. of sodium nitrate. It is usual to determine in samples of it the moisture and the chloride; the latter should not exceed 0·05 per cent. A direct determination of the nitrate by the nitrometer is also sometimes advisable. —J. T. D.

White Lead; Manufacture of ——, by the German (Chamber) Process. M. Liebig. Z. angew. Chem., 1904, **17**, 1672—1673.

Several indications help to control this process. The temperature should be kept at 59°—60° C. A slight excess of acetic acid should always be present, so that the lead acetate draining away should be faintly acid. The percentage of acetic acid in the evaporation pans should be 0·6—0·9. If a test shows more than this, there is too much acid or too little water; if the former, the lead-acetate drainage will be high, both in acidity and in lead content. Lack of water and of carbon dioxide is shown by the formation of stalactites of acetate or basic lead acetate. Too much carbon dioxide is to be avoided, as it converts the lead hydroxide into carbonate, and lessens the covering power of the final product. If the chamber, on inspection after 14 days, does not show a sufficient corrosion, the cause is hard lead, sulphur in the coke, or lack of air. In the first case, a repacking with new lead is the only remedy. In the second, a thorough washing with water may be effective. In the third, additional air must be allowed to enter. With insufficient air, a yellowish or reddish tint in the product, due to the formation of suboxides, is often seen; this disappears on further working of the chamber. In the grinding process, any adhering acetate is precipitated by alkali; the waste waters must be tested to see that neither lead acetate nor excess alkali is contained in them. The white lead should not be dried at a temperature above 70°—80° C., or it is apt to assume a yellow or brownish tint.—J. T. D.

White Lead; Manufacture of —— by the French [Drum] Process. M. Liebig. Z. angew. Chem., 1904, **17**, 1674.

The litharge used must be calcined to oxidise any metallic lead and decompose any peroxide it may contain. To tes when sufficient carbon dioxide has been added to the basic acetate prepared from this litharge, a 1 per cent. mercuric chloride solution is used, and the process judged by the amount of the precipitate formed. In the grinding process metallic lead, lead acetate, and lead sulphate should be tested for.—J. T. D.

Red Lead; Manufacture of ——. M. Liebig. Z. angew. Chem., 1904, **17**, 1674—1675.

The temperature in the furnace should not exceed 300°—350° C., or loss of oxygen is likely to occur. In red lead used as paint only the tint and the fineness are of importance. The latter is judged by suspending 10 grms. in water in a tall narrow cylinder, and noting the times of clearing by settlement through each successive 10 c.c. Impurities of lower specific gravity can also be sometimes detected in this way. Red lead for glassmaking must be free from adulterations, and from iron and copper. To test, the sample is dissolved in nitric acid (sp. gr. 1·24), and oxalic acid added till all peroxide is reduced. Any residue s examined for barium sulphate, ferric oxide, ground brick, &c. The filtrate, after removal of lead, is tested for copper by ammonia, and for iron by thiocyanate. Red lead for matchmaking is valuable in proportion to the peroxide it contains: this may vary from 28 or 30 to 33 per cent. Orange lead is usually made from white lead produced by he French method; it is less dense than ordinary red lead, and has a more vivid colour.—J. T. D.

United States Patent.

Lakes from Sulphur [Sulphide] Dyes; Process of Making ——. R. Gley, Assignor to Act.-Ges. f. Anilinfabrik., Berlin. U.S. Pat. 772,931, Oct. 25, 1904.

Gutta-Percha; Occurrence of Cinnamic Acid Esters in Different Kinds of ——. P. van Romburgh. Ber., 1904, **37**, 3440—3443.

From the resin of a specimen of gutta-percha from Dutch New Guinea, the author isolated an amorphous substance, which, when boiled with alcoholic caustic potash, yielded cinnamic acid and an alcohol melting at 177°—178° C. and containing 84·2 per cent. of carbon and 11·85 per cent. of hydrogen. From the resin of gutta-percha from *Palaquium calophyllum*, two substances were isolated, melting at 145° and 228° C. respectively, both of which were found to be esters of cinnamic acid. A compound closely resembling the high-melting product from the gutta-percha of *Palaquium calophyllum* was isolated from a low-grade commercial gutta-percha from Amsterdam; after repeated crystallisation from ethyl acetate, it melted at 237·5° C. (corr. 242° C.). When boiled with alcoholic caustic potash, it yielded cinnamic acid and an alcohol melting at 210° C. The same alcohol was also prepared from the high-melting ester of cinnamic acid isolated from *Palaquium calophyllum*. Tschirch's crystal-alban (this J., 1903, 1250) was found to be identical with the ester of cinnamic acid, melting at 237·5° C., described above. The presence of esters of cinnamic acid was also proved in a number of other kinds of gutta-percha. Gutta-percha from *Payena Leerii* is, however, free from esters of cinnamic acid.—A. S.

Vulcanisation-Coefficients. C. O. Weber. Gummi-Zeit., 1904, 83—84.

The author originally introduced the vulcanisation-coefficient of india-rubber entirely on technical grounds, and agrees with Esch that they should be calculated as the percentage of sulphur to pure india-rubber and not the percentage of sulphur in the vulcanised product. When given in this manner, different coefficients can be compared directly without further calculation. The author cannot confirm Frank's statement that some rubbers contain resins which are converted during vulcanisation into sulphur compounds insoluble in acetone. On the other hand, he has almost invariably found the amount of matter soluble in acetone greater after, than before, vulcanisation.—J. K. B.

India-Rubber; Behaviour of —— *towards Solvents.* G. Fendler. Gummi-Zeit., 1904, **19**, 41—45.

Owing to the very contradictory statements made by different writers, the author undertook the determination of the solubility of some 26 varieties of india-rubber, in ether, light petroleum spirit, benzene, and, in one or two cases, in chloroform and carbon bisulphide. The results, which are given in the table overleaf, show that Weber's statement that rubber is absolutely insoluble in ether, is quite incorrect, ether being, on the contrary, a good solvent, in most cases equal, or nearly equal, to petroleum spirit and benzene. Some kinds of rubber are not entirely soluble in any of the rubber solvents, but contain insoluble rubber-like constituents which swell up but do not dissolve. These insoluble portions vary in their behaviour towards the different rubber solvents, and their presence can only be accounted for by assuming them to be either oxidation-products formed during the coagulation process, or the result of the action of sulphurous acid given off by the burning Urikuri nuts. Further experiments by the author show that petroleum spirit dissolves the least highly oxidised constituents of india-rubber, and probably could be used for a rough separation, as in fat analysis for the separation of oxidised from non-oxidised unsaturated fatty acids. The portions insoluble in petroleum spirit but soluble in benzol contained, in two out of three cases, considerably more oxygen than the portion soluble in petroleum spirit. Closely associated with these partially oxidised constituents of india-rubber is the question whether they are estimated as pure rubber by Harries' "nitrosite" method (this J., 1903, 875), and from the analyses given it appears they are, so long as they retain their rubber-like condition. The author concludes that the valuation of rubber by precipitation from its solution in petroleum spirit and estimation of the resins is the only reliable method, and the nitrosite method is only applicable to the analysis of vulcanised rubber, where the amount of rubber substance originally used is required to be known. Chemical analysis of rubber alone is not sufficient, but should go hand in hand with technical valuation, as the conditions resemble those in the valuation of wine, which cannot be determined by mere analysis.

He suggests that the presence of albuminoid matters in fruit juices may exercise a retarding action on the inversion. —L. J. de W.

Sugar Solutions ; Boiling-Points of ——. H. Claassen. Z. Ver. deutsch. Zuckerind., 1904, 1159—1169.

Two series of determinations were made. In the first solutions of pure sugar, and syrups such as occur in the manufacture of beet sugar, were brought to boiling in a steam-jacketed copper pan of 22 cm. diameter and 25 cm. height by passing in well-dried live steam. The concentration corresponding to each temperature of ebullition was ascertained by taking out samples and estimating the total solids and rotatory power. The second series of experiments was made upon factory syrups only, in the full-scale vacuum-pans of a sugar works. For the tables of figures obtained, the original must be consulted; they go to prove that the increments by which the boiling points of saccharine solutions rise with concentration, are the same in vacuo and under atmospheric pressure.—W. A. C.

Defecation [Sugar] ; Electrolytic ——. H. Claassen. Z. Ver. deutsch. Zuckerind., 1904, 1157—1158.

Against the view of Gurwitsch (this J., 1904, 993), the author maintains that electrolytic methods have no prospect of competing successfully with existing processes of defecation. In the treatment of molasses by the strontia or lime process the products are (1) a bright syrup from which a high yield of sugar is directly obtained, and (2) the whole of the non-sugar originally present, which is worked up into whatever is most profitable, *e.g.*, cyanides at the present time. By Gurwitsch's electrolytic process (this J., *ibid*), on the other hand, only about one-half of the non-sugar is recovered, whilst the purified syrup has only 75 degrees of purity, and leaves about 50 per cent. of the original molasses as an uncrystallisable syrup. The proposed sale of the latter as an edible syrup is deprecated on account of the mercury with which it has come into contact. Finally, the initial cost of an electrolytic plant would certainly not be less than that incurred in the rival process.—W. A. C.

Dextrose : Indicator for Use in the Quantitative Determination of —— *with Fehling's Solution.* C. Griggi. XXIII., page 1117.

Milk Sugar ; Process of Making ——. S. R. Kennedy, Philadelphia. U.S. Pat. 772,517, Oct. 18, 1904.

Milk is concentrated to a density between 11° and 27° B., the condensed product is subjected to a temperature approaching 32° F. until the sugar crystallises, the sugar crystals are removed in a centrifugal apparatus, and washed with alkaline water at a temperature below 50° F. The salts of the milk may be recovered by evaporation of the washing liquors and recrystallisation.—J. F. B.

French Patents.

[Sugar Extraction] Protection of Beetroots and Sugar Cane from the Action of the Air during Treatment. G. Tauer. Fr. Pat. 338,999, Aug. 24, 1903.

The process of reducing the beetroots or sugar canes to chips, pulp, &c., is conducted in a closed vessel, from which the air is expelled by an inert gas at a suitable temperature (*e.g.*, the gases from the boiler flues). The material is also conveyed to the diffusion vessels, presses, or heaters in a closed apparatus in an atmosphere of inert gas, which precludes the entry of air at any stage.—J. F. B.

Sugar Juice ; Preparatory Treatment of Beetroots or Sugar Cane for the Extraction of ——, *in order to Increase the Yield.* G. Tauer. Fr. Pat. 339,000, Aug. 25, 1903.

The saccharine material (beetroot or cane) is reduced to pulp or ground, and before extraction of juice, is heated by means of waste flue-gases (previously cooled to a temperature preferably not below 90° C.) to between 50° and 100° C. (preferably 85° C.) before the juice is extracted therefrom. The gases which have served for heating the reduced material may be subsequently utilised for protecting the latter from the action of the air during conveyance to the heaters and during the process of reduction.—J. F. B.

XVII.—BREWING, WINES, SPIRITS, Etc.

Barley ; Methods and Apparatus for Testing the Germinative Capacity of ——. H. Wichmann. Allgem. Zeits. f. Bierbrau. und Malzfab. ; through Woch. f. Brau., 1904, **21**, 686—688.

The author has carried out a series of comparative tests on the germinative power of different barleys, determining (*a*) the germinative energy, *i.e.*, the proportion of corns which had germinated after 72 hours ; (*b*) the total germinative capacity. The value of the different methods and apparatus was judged by the magnitude of the results obtained and by the closeness with which the germinative energy approached the total germinative capacity. Only three of the apparatus tested were in any degree satisfactory ; these were : Aubry's germinating box, with a germinating bed consisting of filter-paper on a glass plate, 500 corns per test ; Schönjahn's apparatus, with a germinating bed of sea-sand on a perforated porcelain plate, 100 corns per test ; Schönfeld's germinating funnel, without germinating bed, 1,000 corns per test. Of these, Schönjahn's apparatus is perhaps the most reliable, but it does not quite answer all requirements, on account of the small number of corns tested, and it would be necessary to perform five determinations simultaneously for testing one sample. It may, however, be relied on as a convenient means for controlling results yielded by other apparatus in important cases. Schönfeld's germinating funnel was found to be very simple and generally satisfactory, giving maximum values within 72 hours, but in one case of a freshly harvested barley it gave very deficient results as compared with two other apparatus.—J. F. B.

Barley-Germination Tests : Comments on Wichmann's Article (see preceding abstract). F. Schonfeld. Woch. f. Brau., 1904, **21**, 688—689.

In reply to Wichmann's criticisms, the author points out that with all germinating apparatus small errors in manipulation readily lead to incorrect results ; this is most marked in the case of over-steeping. As the result of hundreds of tests on different barleys, carried out with the glass germinating funnel, the author prescribed a period of five hours' steeping. With sound barleys this period scarcely ever leads to over-steeping, but it may easily do so in the case of freshly-harvested, unmatured barleys, especially with small-corned and rain-damaged samples. The defect of over-steeping, which causes a very large decrease of the germinative capacity, may easily be remedied by curtailing the time of steeping to 3—4 hours, and any operator can detect such errors due to excessive steeping by conducting two parallel tests, one with three hours' and the other with five hours' steep. In this way experience is gained by which the period of steeping may be judged in accordance with the constitution of the barley, so as to give the maximum germinative values. With due discretion in this particular, Schönfeld's germinating funnel will be found to give results in three days, which are almost identical with the total germinative capacity.—J. F. B.

Malt Analysis. H. A. Hunicke. J. Amer. Chem. Soc., 1904, **26**, 1211—1209.

The author has examined the effect of variation in the moisture content of malt on the yield of extract. Some of the results obtained with Wisconsin malt are shown in the following table. The fine meal was obtained by grinding the malt in a coffee-mill, whilst the three coarse grades were obtained by grinding in a Seck mill set at the marks indicated.

Percentage of Moisture.	Percentage of Extract on Dry Material.			
	Fine.	0.	25.	50.
4·45	74·26	73·12	71·23	53·65
6·32	73·91	72·13	69·99	70·02
7·99	74·26	71·66	68·58	48·31
9·69	73·91	70·58	65·47	37·69
11·45	73·71	69·41	60·70	30·76
13·22	74·28	68·66	55·55	25·47

The decrease of yield of extract with increase of the moisture content appears to be due principally to the grains becoming softer and less brittle, whereby the quality of the ground product is affected, and probably also to increased dilution of the charge in the determination of the extract. The influence of stirring on the yield of extract was also examined, and it was found that with coarsely-ground products, the yield is perceptibly decreased when the mash is not stirred at all, and that stirring at intervals of five minutes does not give such high results as stirring every minute. It is essential that the mash be well stirred while the temperature is being raised. The author also discusses the influence on the yield of extract of the lack of uniformity of the samples of malt, the formation of dust during the grinding, and the rate of grinding.—A. S.

Yeast Ferments; Some ——. K. Shiga. Z. physiol. Chem., 1904, **42**, 502—507. Chem. Centr., 1904, **2**, 1327.

The author found that in the course of the auto-digestion of the expressed juice of yeast, the amount of xanthine increases continuously, whilst that of guanine decreases, even if it be added in the free state. No definite rule could be observed with regard to adenine and hypoxanthine, the amounts of these bases increasing and decreasing in an irregular manner during the course of the digestion. The expressed juice of yeast is stated to contain an *arginase*, which produces ornithine from arginine, but does not attack guanidine.—A. S.

Yeasts; Fermentation and Respiration of Different Kinds of —— *in Roll Cultures.* M. Leschtsch. Centr.-Bl. f. Bakter. u. Parasitenk, 1904, **12**, 649—656; **13**, 22—28. Chem. Centr., 1904, **2**, 1350.

By observing the separation of carbon dioxide in roll cultures in different media (beer wort, "plum decoction," and saline solutions containing peptones and sugar), the various races of yeast may be divided into three classes, typical representatives of which are *Sacch. cerevisiæ*, *Sacchar. Pombe*, and *Sacch. membranæfaciens*. With *Sacch. cerevisiæ* in the first two days, nearly equal amounts of carbon dioxide are disengaged, whether the surrounding atmosphere be one of hydrogen or of air. Afterwards, the production of carbon dioxide ceases at an earlier period in hydrogen than in air; if the hydrogen be replaced by air, an increased evolution of carbon dioxide is caused for a short time. *Sacch. Pombe* produces more carbon dioxide in air than in hydrogen. In air, the curve representing the evolution of carbon dioxide rises sharply, and subsequently sinks rapidly. In hydrogen, on the other hand, the rise and fall of the curve are very gradual. Replacement of the hydrogen by air causes an increased production of carbon dioxide for a short time. *Sacch. Pombe* does not propagate so well as *Sacch. cerevisiæ* in an atmosphere free from oxygen. *Sacch. membranæfac.* is a typical aerobe. The amount of carbon dioxide evolved is much less in hydrogen than in air. If the hydrogen be replaced by air, the amount of carbon dioxide produced increases rapidly, but the increase is not maintained.

—A. S.

Yeast; Researches on the Respiration and Respiratory Enzymes of ——. J. Grüss. Z. ges. Brauw., 1904, **27**, 686—692, 699—704, 721—724, 734—739, 752—754, 769—772.

Determination of Glycogen.—The amount of glycogen was calculated from the iodine absorption value of the yeast before and after storage in the moist state for 48 hours at 28°—30° C., during which period the glycogen was used up. The differences between the two iodine values were standardised in terms of glycogen by the acid hydrolysis of the yeast at the two stages in question. Average results indicated that 1 per cent. of iodine is equivalent to 3·2 per cent. of glycogen.

Formation and Disappearance of Glycogen in relation to the Respiratory Quotient.—The yeast plasma is capable of producing and storing up glycogen in equal quantities during the fermentation of either dextrose or fructose under similar conditions. The glycogen is therefore built up, not directly from the sugar, but from the atomic groupings into which the sugar must first be split up by the zymase or other fermentative enzyme. The respiration experiments showed that the store of glycogen is first converted by hydrolysis into dextrose, and that this latter, serving as the respiratory material proper, is then resolved into carbon dioxide and varying quantities of alcohol.

Respiratory Enzymes: Oxydase and Hydrogenase.—When the yeast cells are in a state of vigorous fermentative activity, *i.e.*, when the sugar molecule is being broken up with the greatest intensity, the oxydase reaction ["tetra-base" reaction] is suppressed. This stage corresponds with the formation of glycogen and with a considerable rise in the respiratory energy, *i.e.*, the quantities of oxygen absorbed and carbon dioxide exhaled in unit time. These conditions exist at a maximum after the yeast has been fermenting for some time out of contact with the air. Since the disappearance of the oxydase reaction takes place when the respiratory energy is relatively high, it is probable that the reducing substance which interferes with this reaction attracts the oxygen through the cell wall more strongly than the "tetra-base." It is suggested that the reducing substance in question is nascent hydrogen and that it is produced from the constituent groups of the glucose [hydrolysed glycogen] by the action of a hydrating ["wasser-addierendes"] enzyme, *e.g.*, according to an equation of the type $CH(OH) + H_2O = CO_2 + 4H$. This hydrogen is not liberated, but combines with any reducible substances present, or, in default, with the oxygen fixed by the oxydase, thereby masking the reaction of the latter. In absence of air this nascent hydrogen would tend to form alcohol according to the equation $2CH(OH) + 4H = C_2H_5(OH) + H_2O$. The hypothesis explains the increase of the respiratory energy after fermentation, the occurrence of direct reducing actions such as reduction of sulphur or colouring matters, the absence of the oxydase reaction after fermentation, the fluctuations of the respiratory quotient, the disappearance of the glycogen and the reappearance of the oxydase reaction when the glycogen has been used up or when fermentative activity is inhibited by the addition of sodium chloride. If it be valid, the addition of a reducible body such as sulphur should result in a decreased yield of alcohol, which appears to be the case. The author shows that the enzyme which is the anti-enzyme of the oxydase and which produces nascent hydrogen by hydration is identical with the enzymes described by other authors under the names of "philothion," "catalase," and "hydrogenase." Whether it can be assumed to be identical with Buchner's zymase depends on whether the fermentative action can be proved to take place in two such stages as are illustrated in the above equations or whether it is a direct specific breaking up of the sugar molecule into carbon dioxide and alcohol.—J. F. B.

Yeast; Some Constituents of ——. O. Hinsberg and E. Roos. Z. physiol. Chem., 1904, **42**, 183—192. Chem. Centr., 1904, **2**, 1062—1063. (See this J., 1903, 920, 1012).

In the method previously given by the authors (*loc. cit.*) for the preparation of yeast-fat, the alcoholic extract of the yeast was evaporated, and the residue dissolved in a solution of caustic soda or sodium carbonate and extracted with ether. It is now found that only by using sodium carbonate can a fat rich in lecithin be obtained; when caustic soda is used the fat undergoes considerable decomposition. For medicinal purposes, the yeast-fat containing lecithin is to be preferred, as the lecithin "contains active unsaturated acids."—A. S.

Glycerin; Formation of —— *during Alcoholic Fermentation.* W. Seifert and R. Reisch. Centralbl. Bakt., 1904, **12**. [2], 574. Z. Spiritusind., 1904, **27**, 441.

The authors have studied quantitatively the formation of glycerin during the alcoholic fermentation of grape must. The formation of glycerin is at a maximum in the earlier stages, when the degree of fermentation and of yeast propagation is greatest; towards the end of the fermentation, hardly any glycerin is produced. There is no connection between the formation of glycerin and that of alcohol, but the presence of large quantities of alcohol hinders considerably the formation of glycerin. Glycerin is not a direct fermentation product, but a product of metabolism of the yeast, and the amount of it formed depends upon the vital energy and nature of the yeast. Substances which have the power of increasing the vital energy of the yeast, *e.g.*, sugar, at certain concentrations, cause also an increase in the formation of glycerin.—A. S.

Fusel Oils; Origin of ——. O. Emmerling. Ber., 1904, **37**, 3535—3538.

Many experiments with various races of yeast and several different fermentable carbohydrates showed that, under normal conditions of alcoholic fermentation, only infinitesimal quantities of fusel oil are produced, so long as the fermenting wort remains pure. On the other hand, many bacteria possess the property of forming higher alcohols, especially butyl alcohol, from carbohydrates. Amongst these may be mentioned *Granulobacter butylicum*, *B. orthobutylicus* and the "amylic" ferment of Péreire and Guignard (this J., 1902, 558 and 1090). Bacteria which are especially active in this kind of fermentation occur on the skins of potatoes. The production of fusel oil takes place only under anaërobic conditions. The most suitable carbohydrates appear to be starch and cane-sugar, especially in the unhydrolysed state. For instance, 1,000 grms. of boiled potatoes and 50 grms. of wheat grist, suspended in 3 litres of water with a little chalk, and infected with potato peel, yielded 25 c.c. of insoluble fusel oil; 500 grms. of molasses, containing 48 per cent. of sugar, yielded 19 c.c. of fusel oil under the same conditions. The fermentations were carried out anaërobically for four weeks at 37° C. Hydrogen, carbon dioxide, and butyric acid were obtained as by-products. The same materials saccharified by malt or inverted yielded only 1·8 and 1·5 c.c. of fusel oil respectively. The products consisted of propyl, butyl, and amyl alcohols with only traces of ethyl alcohol. The author found that the addition of nitrogenous materials, such as decomposed yeast, was not favourable to the production of fusel oil.—J. F. B.

Fine Spirits. K. Windisch. Z. Untersuch. Nahrungs u. Genussmittel, 1904, **8**, 465—505.

The author details the examination of samples of cherry brandy, plum brandy, apple brandy, quince brandy, currant brandy, and grape brandy, including the determination of the higher, insoluble fatty acids, formic acid, acetic and butyric acids, and the free and combined hydrocyanic acid; also the determination of fusel oil in various kinds of raw spirit, over 100 samples of "cognac" (mean 0·339 per cent.), 33 samples of rum (0·234 per cent.), 7 of arrack (from 0 to 0·47 per cent.), 36 of cherry brandy (mean 0·457 per cent.), 31 of plum brandy (0·313 per cent.), 12 of grape brandy (0·95 per cent.), and 20 of apple brandy (0·527 per cent.). In addition the paper deals with judging fine spirits on the basis of chemical analysis, and the limitation of the various appellations for these spirits, such as "cognac," "cherry brandy," &c. The author opposes the view that the presence of furfural is an indication of purity and *vice versâ*, nor does he agree with the proposed "coefficient of impurity" as a criterion, since the amount of impurities will depend on the nature of the raw material and the method of distillation. Dealing with the improvement of spirits, he advocates distillation accompanied by slight dephlegmation, this having been found to furnish superior products to the old method of distilling with direct fire heat. Still more can be done by properly controlled fermentation with pure yeasts. It is considered desirable to express analytical results in grms. per 100 c.c., the fusel oil values, obtained by the Roese method, being multiplied by 0·814 for that purpose. The volatile acids and esters, fusel oil and aldehydes, should be referred to 100 c.c. of absolute alcohol to make the results independent of the actual alcohol content of the spirits. Owing to the practice of adding sweet wines to spirits, the volatile acids and total acidity should be determined, the latter by titration with alkali in presence of phenolphthalein (for white spirits) or violet litmus (for coloured); the volatile acids by steam distillation, and titration with phenolphthalein as indicator, the results in both cases being expressed as acetic acid. The esters are determined by boiling for half an hour with excess of alkali under a reflux condenser, and titrating the residual free alkali. In the case of spirits containing extract, sugar or colouring matters, which would falsify the titration by consuming alkali, the esters must be separated by distillation. The results should be expressed in terms of ethyl acetate.—C. S.

Alcohometric Tables for each Integral Percentage by Weight, and for each Degree of the Hydrogen Thermometer from 15° to 22°. E. W. Morley. J. Amer. Chem. Soc., 1904, **26**, 1185—1193.

Tables are given showing the true specific gravity of mixtures of alcohol and water for each integral percentage by weight (from 0 to 100), for each degree of the centigrade hydrogen thermometer from 15° to 22°, according to the results of Mendeléeff. The specific gravity given is the quotient of the weight of the liquid divided by its volume, increased by the correction for displaced air.—A. S.

Beer or Malt Extract; Nutritive ——. J. Moberts. Fr. Pat. 343,896. June 11, 1904.

Beer brewed with pure malt is mixed with 0·4 kilo. of crystallised sugar-candy per 100 kilos. of malt, or 2 grms. per litre of beer. The wort is boiled for 60 hours and subjected to a slow fermentation for nine days.—J. F. B.

Phlegms, Wines and Fermented Washes; Continuous, Direct Rectification of ——. A. Baudry. Fr. Pat. 338,992. Aug. 19, 1903. (See also this J., 1904, 725.)

The fermented liquor is fed into a first distilling column which communicates above with a separatory column and below with a second distilling column. The light volatile impurities from the first distilling column rise into the separatory column, where they are concentrated and separated from any alcoholic vapours; the purified alcoholic liquor descends from the first to the second distilling column, the alcoholic vapours from which are passed to a rectifying column. The heavy "tail" products from the

rectifying column descend into a third distilling column where they are freed from alcohol and discharged.
—J. F. B.

Phlegms, Wines and Fermented Washes; Continuous, Direct Rectification of ——. A. Baudry. First Addition, dated Jan. 6, 1904, to Fr. Pat. 338,992, Aug. 19, 1903. (See preceding abstract.)

The improved arrangements provide for the return of some of the impure alcoholic liquors from the lower plates of the rectifying column to the first distilling column in which the phlegms are first distilled.—J. F. B.

Wine; Automatic Conversion of Newly Fermented —— *into Wine suitable for Bottling.* E. Faller. Fr. Pat. 343,999, June 15, 1904.

The wine or other alcoholic beverage is caused to flow from the cask through a worm immersed in a water-bath, in which it is heated to any desired temperature. The precipitated matters are removed by passing the wine from the heating worm through a filter, from which it flows through a worm immersed in cold water, in which it is cooled to a temperature suitable for bottling. It is important that this worm should be so narrow that the whole of its section is filled with the liquid, in order to avoid any loss of alcohol or "bouquet" by volatilisation.—J. F. B.

Glycerin; Extraction of —— *from Industrial Liquids containing it, and notably from Distillery Residues.* E. A. Barbet. Fr. Pat. 344,036, April 16, 1904.

The liquid is concentrated to about 40°—42° B. and treated with powdered lime in the proportion of, say, 1 to 1¼ kilos. to 1 kilo. of the syrup, from which, if necessary, crystals have been previously separated by means of a turbine. The porous mass is then treated with alcohol of as high a strength as possible (95—98 per cent.), and the alcoholic extract evaporated by means of a current of hot air or gas. The residual mass ("vinassate") from the alcoholic extraction forms a good manure. (See this J., 1903, 502; 1904, 1035.)
—C. A. M.

Centrifugal Separators (for Cream, &c.). H. Austin, Birmingham. Eng. Pat. 23,091, Oct. 26, 1903.

The plates of the separator are formed with curved upper edges, forming weirs over which the milk to be separated flows, and pockets in which the separated cream collects. A number of short tubes extend from these pockets, inwardly, into vertical slots formed in the central pillars and up which the separated cream flows. In this way the cream does not come into contact with the inflowing stream of milk, which flows up the central aperture of the plates and over the curved edges between the tubes.—W. H. C.

Milk; Treatment [Condensation] of ——. [*Preparation of Milk Sugar*]. S. R. Kennedy, Philadelphia, U.S.A. Eng. Pat. 20,291, Sept. 20, 1904.

See U.S. Pats. 770,909 and 772,517 of 1904; this J., 1904, 996 and page 1105.—T. F. B.

Food and other Substances; Sterilisation of ——. A. Schröder, Berlin. Eng. Pat. 12,113, May 27, 1904.

The process described consists in adding peroxides to the article, such as foods, water, milk, butter, &c., to be preserved, and decomposing the peroxides by means of carbon dioxide (under pressure), carbonates, bicarbonates, or acid phosphates. The peroxides employed are those of calcium, magnesium, or sodium. For decomposing the two former, calcium or magnesium acid phosphates may be used with or without the aid of carbon dioxide. The articles before or after treatment may be subjected to a temperature of 40° to 50° C.—W. P. S.

(*B.*)—SANITATION; WATER PURIFICATION.

English Patents.

Paving Blocks from Towns' Refuse. W. Weaver. Eng. Pat. 22,042, Oct. 13, 1903. IX., page 1091.

[*Water*] *Filters: Aeration of* ——, *and Apparatus for use in connection therewith.* F. Candy, London. Eng. Pat. 23,772, Nov. 3, 1903.

In the case of a pressure filter, such as is described in Eng. Pat. 5242, 1898 (this J., 1899, 391), air is forced into the upper part of the filter by means of an air-pump or fan. The suction-pipe of the pump may be either (1) connected to the bottom of the filter, (2) open to the air, (3) connected to an air-sterilising chamber, or (4) to an ozone-producing apparatus. Instead of forcing air through the filter, the pump may be employed as a suction-pump at the bottom of the filter, this alternative process being also applied to open filters. In place of a pump or blower a closed tank may be used provided with means for admitting and withdrawing water therefrom and connected to the filter by a pipe. By the introduction of water to this tank, air is forced into the filter, and, when the tank is emptied, air is drawn through the bed. The object of the process is to remove water mechanically retained by the filter-bed, and it is applied after the filter has been washed or cleansed from suspended matter.—W. P. S.

Sewage or other Liquid; Apparatus for Distributing ——. J. B. Alliott, Nottingham, and W. D. Scott-Moncrieff Staines. Eng. Pat. 24,838, Nov. 14, 1903.

For distributing sewage uniformly and intermittently ove a filter-bed, two vehicles are provided, each comprisin a trough-shaped receptacle mounted on wheels, wit mechanism causing the trough to tilt gradually as i travels to the end point of a pair of inclined rails. Th two vehicles are connected together by chains and trave reciprocally down and up the two inclined tracks. Th sewage supply is situated at the highest point of the track and supplies the vehicles alternately; one vehicle havin been filled, it travels down the track distributing its sewag contents uniformly in its path as the trough tilts over During the upward course the trough is tilted back int an upright position ready to receive a fresh charge.—J. F. B

Sewage; Filtering and Purifying ——. S. Barwis Duffield, Derbyshire. Eng. Pat. 25,480, Nov. 23, 1903.

This is a process for assisting and increasing the natura action of filter-beds. For this purpose air is drawn in a the top of the filter-bed by means of a fan (or othe mechanism) fixed on a pipe coming from the bottom c the bed. From this pipe, branch pipes and subsidiar branch pipes, terminating in perforated earthenware sagger extend to all points of the floor of the filter. The sewage is supplied to the filter by a revolving spreader and leaves by an effluent channel, the effluent reaching the latter through suitably placed trapped pipes. The sides of the filter-bed are composed of air-tight material and the air and effluent pipes may be combined or separate.—W. P. S.

Bacteria Beds and the like; Apparatus for Use with ——. H. L. Doulton and R. J. Pleace, London. Eng. Pat. 26,466, Dec. 3, 1903.

The first part of the invention relates to an apparatus for the automatic delivery of sewage to two or more bacteria beds in succession. A chamber has two or more outlets at its bottom, each outlet communicating with a separate filter-bed. Above these outlets is fixed a revolving plate provided with one opening, the latter, as the plate revolves, passing over the outlets. An automatic siphon is fixed in a second chamber and discharges into the first chamber. As the sewage rises in the second chamber it raises a floating ball, which, in its turn, by means of a ratchet wheel, shafting, and cog-wheels, causes the plate in the first chamber to revolve. The opening in the plate is thus brought over a separate outlet between each discharge of the siphon. The second apparatus claimed consists of a device for the automatic discharge of sewage from a chamber after it has been retained some pre-arranged period. The sewage flows into a chamber containing a siphon in which air is compressed and from which the air must be released before the siphon acts. The top of the pressure-chamber of the siphon is connected by a pipe to a valve in a second chamber. This valve is operated by a floating ball and lever, the ball being raised by allowing part of the sewage to flow into this second chamber through a regulated valve. The ball-valve is so arranged that it opens quickly. A small siphon is provided for emptying the second chamber and discharges into the first siphon.—W. P. S.

United States Patents.

Water; Method of Purifying ——. T. Jones, Acme, Tex. U.S. Pat. 773,395, Oct. 25, 1904.

To remove gypsum and carbonates dissolved in water, the patentee adds milk of lime to the latter, and then to the residual water a solution of orthosilicate of soda of the consistency of syrup.—W. P. S.

Sea or Hard Water; Composition for Purifying ——. A. Gutensohn, Southend, Eng. U.S. Pat. 773,494, Oct. 25, 1904.

The composition consists of rosin, prepared by repeated heating and cooling, dissolved in a solution containing sodium carbonate, sodium hydroxide and sodium silicate, mixed with a solution of zinc hydroxide in sodium hydroxide.—W. P. S.

French Patents.

Sewage and other Refuse; Treatment of ——. J. L. F. Garrigou. First Addition, dated June 16, 1904, to Fr. Pat. 340,740, Feb. 26, 1904. (This J., 1904, 833.)

The modification described consists in heating the refuse, &c., without the addition of chalk or other materials, in order to directly obtain the ammonia contained in the refuse.—W. P. S.

Sewage; Apparatus for [Electrically] Treating ——. W. J. Schweitzer. Fr. Pat., 344,192, June 21, 1904.

See U.S. Pat. 763,026 of 1904; this J., 1904, 758.—T. F. B.

Ammonia from Waste Waters; Process for Extracting ——. R. Schilling and C. Kremer. Fr. Pat. 344,420, July 1, 1904.

See Eng. Pat. 14,966 of 1904; this J., 1904, 947.—T. F. B.

Water; Clarification of ——. L. E. Vial. Fr. Pat. 344,174, June 21, 1904.

The turbid water is allowed to settle in a long tank or basin, having its greatest depth at the middle and being shallow at each end. The sides of the tank slope inwards to form a channel along the bottom. A series of walls or partitions are placed at certain distances apart along the channel. The upper edge of each partition is just below the surface of the water, whilst the lower edge reaches to within a short distance of the bottom of the tank. The entrance to the tank consists of a horizontal slab over which the water flows in a shallow layer.—W. P. S.

(C.)—DISINFECTANTS.

Mould Fungi; Influence of some Salts and Monatomic Alcohols on the Development of ——. K. S. Iwanoff. Centralbl. Bakteriol., 1904, **13**, [2], 139. Chem.-Zeit., 1904, **28**, Rep., 310.

The experiments were carried out with four different nutrient solutions:—Solution G: Wehmer's modification of Henneberg's solution of N/30 *l*-asparagine, N/6-dextrose, N/30-potassium dihydrogen phosphate, and N/100-crystallised magnesium sulphate: Solution N: solution G with the asparagine replaced by ammonium nitrate: Solution S: solution G with the dextrose replaced by saccharose: Solution DG: solution G with the amount of dextrose doubled. The fungi used were *Amylomyces β*, *Aspergillus niger*, *Mucor spinosus*, *Mucor racemosus*, *Oidium lactis*, and *Trichothecium roseum*. The substances of which the action was examined comprised the sulphates of magnesium, zinc, cadmium, manganese, nickel, cobalt and copper, mercuric chloride, methyl, ethyl, propyl, normal and secondary butyl, isopropyl, isobutyl, iso-amyl and allyl alcohols, trimethylcarbinol and amylene hydrate. It was found that in the case of the metals of Mendelejeff's second group, the poisonous action on the fungi increases with the atomic weight: Mg < Zn < Cd < Hg. Of the other metals manganese was the least poisonous in solution N, and then cobalt, nickel, copper, in the order given. The poisonous action of the metallic salts varies according to the nature of the nitrogenous food supplied to the fungi; for example, in solution G, the order is Mn < Cu < Co < Ni. The different action exhibited by the same salt in different nutrient solutions is due partly to chemical reactions, and partly to physiological causes. The nature of the nutrient material containing carbon has also an influence on the action of the salts; this is likewise due partly to chemical and partly to physiological causes. In the cultures of *Mucor spinosus* the metallic salts produce coloured crystalline precipitates. With regard to the action of the alcohols, the poisonous effect increases with the length of the carbon chain in the case of primary, monatomic alcohols. With the butyl alcohols the poisonous action increases in the order, trimethylcarbinol, secondary normal butyl alcohol, primary isobutyl alcohol, primary normal butyl alcohol. Primary propyl alcohol is more poisonous than the corresponding secondary alcohol, primary iso-amyl alcohol more than the corresponding tertiary alcohol, and allyl alcohol more than normal butyl alcohol.—A. S.

English Patents.

Alkaline Chlorides and Oxychlorides; Preserving the Strength and Keeping Powers of Solutions of ——, *employed for Bleaching, Disinfecting, Separation of Metals, and other such like Purposes.* G. J. Atkins and Oxychlorides, Ltd. Eng. Pat. 25,972, Nov. 27, 1903, VII., page 1088.

Insect-Killer adapted for Use as a Manure. R. and M. Jenkner and J. Pleyl, Floridsdorf, Austria. Eng. Pat. 19,068, Sept. 3, 1904.

Potassium cyanide and other cyanogen compounds are found not to affect the growth of plants, whilst they destroy *phylloxeræ* and other parasites and insects. The insecticide-manure to which the present invention relates consists of a mixture of potassium cyanide and quicklime, also ammonium salts, and a decolorising agent, such as magnesium hydrosilicate, or alumina. The cyanogen compounds are used in the form obtained in the purification of coal-gas by the ferric oxide process.—T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

Sugar-cane Fibre ; Hydrolytic Products of ——. C. A. Browne, jun. J. Amer. Chem. Soc., 1904, **26**, 1221—1235.

The author has studied the products obtained by the hydrolysis of sugar-cane fibre with dilute caustic soda solution. 200 grms. of purified fibre obtained by washing finely-cut bagasse successively with water, 2 per cent. hydrochloric acid, and again with water, were digested for eight hours with 3 litres of a 5 per cent. solution of caustic soda. The residual pulp was washed several times with small quantities of cold water and the washings added to the caustic soda solution. The pulp was then further purified by washing with hot water till free from alkali, and finally with strong alcohol. From the caustic soda solution the cane-gum was precipitated by alcohol, and purified by treatment with an alcoholic solution of hydrochloric acid, followed by washing with alcohol and then with ether. On hydrolysis with 4 per cent. hydrochloric acid, the cane-gum yielded *l*-xylose and *l*-arabinose, the latter being isolated in the form of its benzylphenylhydrazone. Xylan and araban make up nearly 80 per cent. of the cane-gum; the presence of galactan could not be detected. From the filtrate from the cane-gum, lignin was precipitated by dilute sulphuric acid after expelling the alcohol. After purification the lignin formed a brown-coloured powder, which, when treated with chlorine, yielded a product apparently identical with the lignone chloride, $C_{19}H_{18}Cl_4O_9$, prepared by Cross and Bevan from jute and other fibres. The acid filtrate from the lignin yielded acetic acid when distilled in a current of steam. The cellulose obtained by digesting the cane fibre with caustic soda amounted, in the dry condition, to only 42 per cent. of the original fibre. This low yield of cellulose, compared with the result obtained by Cross and Bevan's chlorination method, is due to the solvent action of the alkali, especially on the pith. The following figures show the relative resistance of the different tissues of the cane to various chemical treatments:—

——	Pith.	Fibro-vascular Bundles.	Rind.
	Per Cent.	Per Cent.	Per Cent.
Cellulose by chlorination (Cross and Bevan).	49·00	50·00	51·09
Cellulose by treatment with 1·25 per cent. sulphuric acid and 1·25 per cent. caustic soda solution (Weende).	42·86	48·64	54·76

These results have an important bearing upon the utilisation of cane-fibre for paper-making, since a chemical treatment necessary for the proper preparation of the rind would result in a large loss of pith. Drewsen (U.S. Pat. 731,290 of 1903; this J., 1903, 876) has patented a process by means of which this loss is avoided, the pith being separated from the sugar-cane, corn-stalks, &c., before digestion, The pith is not fibrous, and has no felting properties, but paper prepared from it is stated to possess the quality and strength of parchment. The cellulose prepared from the cane-fibre by digestion with caustic soda yielded dextrose on hydrolysis with sulphuric acid.

The yields of the different products, calculated to the fibre free from protein, ash, fat, &c., were:—Cellulose (including oxycellulose), 55; xylan, 20: araban, 4; lignin, 15; and acetic acid, 6 per cent. The sugar-cane fibre resembles very closely in composition the pithy stalks of maize, both being allied to the cereal straws, a distinguishing characteristic of which group is a cellular complex low in cellulose and high in pentosans.—A. S.

Printing Papers ; Production of Dust by ——.
X. Wochenbl. f. Papierfab., 1904, **35**, 3270—3271.

The production of dust on low-grade printing papers, which clogs the type and makes the printing on the high-speed "news" machine almost impossible, is due either to imperfections in manufacture or to inferior raw material. As regards manufacture, the continual fall in the price of "news" makes it imperative that the paper-machines should be run at ever-increasing speed. When a mill thus increases its output it is very seldom provided with more beating engines, nor is the construction of the paper-machine altered by increasing the length of the wire and the number of the drying cylinders. Under these conditions the increased output is only obtained at the expense of the quality of the paper; the short-fibred stuff has to be beaten "free," it does not have time to felt properly, and the paper is dried far too quickly. Paper prepared thus will nearly always make a large quantity of dust on the printing machine. As regards raw material, "news" paper generally contains 20 per cent. of chemical wood-pulp, and 80 per cent. of mechanical wood-pulp, and is loaded with about 20 per cent. of clay. The quality of the clay is of great importance, it should have a fatty feel and should suspend well in water; gypsum and the cheap, "thin" qualities of clay are quite unsuitable as loading materials for printing papers. But the quality of the paper is chiefly dependent on that of its main constituent, the mechanical wood-pulp. A cheap, free-ground quality of wood-pulp, ground with coarsely sharpened stones, cannot be made into good paper whatever the care bestowed on the beating; it will also frequently prove dearer than a wet-ground pulp, higher in price, because it causes more loss and will not retain the clay. The best sort of pulp is prepared by stones which have a fine grain and are delicately sharpened; above all, the wood employed should not be old and dry, but as fresh as possible. The quality of the paper can best be tested by pressing the palm of the hand on the reel as it is being wound up; if the hand become covered with a layer of fine white dust, composed mainly of wood-fibres, the paper will be quite unfit for high-speed printing.
—J. F. B.

United States Patents.

Paper-Making ; Means for Dissolving Size for ——. B. Kniffler, Milwaukee, Wis. U.S. Pat. 771,986, Oct. 11, 1904.

The apparatus consists of a large water-tank, and two small tanks provided with steam coils. The size is placed in one of the small tanks and is heated by the coil, the steam from which is utilised for disintegrating and discharging the size, by means of an injector, into a pipe dipping below the surface of the water in the large tank. During its passage through this pipe, the size is intimately mixed with atomised hot water discharged through a second injector fitted to the second small heating tank.
—J. F. B.

Paper; Process for Making —— Moisture or Grease Proof. J. Kitsee, Philadelphia. U.S. Pat. 772,103, Oct. 11, 1904.

Paper is treated superficially with a mixture of nitric and sulphuric acids, in such a manner as to make the surface soluble whilst leaving the interior unchanged. The treated surface is then subjected to the action of a solvent.
—J. F. B.

Pulp Washer or Condenser. H. G. Turner, Montreal. U.S. Pat. 772,192, Oct. 11, 1904.

The apparatus consists of a vertical, cylindrical tank in which is situated a vertical, cylindrical strainer capable of being rotated. The space between the walls of the tank and the strainer is divided horizontally into a number of superposed, annular compartments, communicating with each other by openings which are disposed in different angular positions, each opening being separated from the next one by means of transverse partitions. The pulp is fed in at the bottom of the tank and is caused to travel upwards through all the compartments: a series of doctors is provided, one in each compartment, and pressed against the screening cylinder by springs, so that when the cylinder rotates, the pulp is agitated and scraped off the screen, whilst being subjected to the action of jets of water.—J. F. B.

French Patents.

Cellulose Xanthate ; Purification of —— for the Preparation of Viscose. Soc., Franç. de la Viscose. Second Addition, dated June 11, 1904, to Fr. Pat. 334,636, Aug. 14, 1903.

In place of using alkali or alkaline-earth sulphite solutions for toughening crude cellulose xanthate, it is found more advantageous to use alkali or alkaline-earth bisulphites, either alone, or in conjunction with aluminium sulphate, alkali chloride, sulphate, &c. (See this J., 1904, 75 and 501.)—T. F. B.

Celluloid Non-inflammable ; Process for Rendering ——. G. E. Woodward. Fr. Pat. 344.048, May 25, 1904.

Celluloid is rendered non-inflammable by incorporating with it, for each kilo. of celluloid, 1·5 kilos. of fish glue, 400 grms. of gum arabic, 100 grms. of gelatin, and 40 grms. of colza oil.—T. F. B.

Celluloid or Nitrocellulose : Rendering Non-inflammable ; Process for ——. W. C. Parkin. Fr. Pat. 344,501, July 1, 1904. Under Internat. Conv., Dec. 23, 1903.

Celluloid or nitrocellulose may be rendered incombustible by incorporating with it aluminium chloride, strontium chloride, magnesium chloride, and calcium chloride. Two parts of celluloid dissolved in 3 parts of acetone are added to a solution of 1 part of one (or a mixture) of the above salts in 2 parts of methyl alcohol. The solvents are distilled off and the celluloid obtained in powder form suitable for working up in the usual manner.—T. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Esterification ; New Method of ——, for Organic Acids. A. Werner and W. Seybold. Ber., 1904, **37**, 3658—3661.

By the action of dimethyl sulphate on aqueous solutions of the alkali salts of organic acids, good yields of the methyl esters of the acids can be obtained. The reaction proceeds according to the equation:—$R.COOX + (CH_3)_2SO_4 = R.COOCH_3 + CH_3.X.SO_4$. 5 grms. of the acid are treated with a slight excess of N/1 alkali, and about 2 molecular proportions of dimethyl sulphate are added. If the mixture be shaken continuously, the reaction is complete in half-an-hour. The excess of dimethyl sulphate is decomposed by heating the product on the water-bath, and after cooling, the ester is separated from the free acid by adding excess of alkali. The methyl esters of acetic, isovaleric, stearic, 2.4.6-tribromobenzoic, 2.4.6-trinitrobenzoic, β-methoxy-α-naphthoic, and β-methoxy-β-naphthoic acids have been prepared by this method. The method is stated to give good yields in cases where the usual method of esterification with the corresponding alcohol fails, *e.g.*, in the preparation of esters of 2.4.6-tribromo-, and 2.4.6-trinitrobenzoic acids. —A. S.

Quinine ; Refining of ——. C. Martinotti and G. Castellini. Boll. Chim. Farm., 1904, **43**, 529—536. Chem. Centr., 1904, **2**, 1154—1155.

After a description of the known methods for the separation of quinine sulphate from the amorphous and resinous substances accompanying it, the authors propose a new process based on the following facts:—(1) The resinous, uncrystallisable substances remain in solution in perfectly neutral and in acid liquids. (2) On adding alkali to liquors poor in quinine, but still contaminated by amorphous substances, the latter are precipitated first, separating as a viscous magma. For the separation of quinine from the mother-liquors, the authors recommend working with the basic quinine hydrochloride, $C_{20}H_{24}N_2O_2.HCl.2H_2O$ converting it into the dihydrochloride, $C_{20}H_{24}N_2O_2.2HCl$.—A. S.

Essential Oils ; Treatment with Sulphuric Acid for the Identification of ——. M. Duyk. XXIII., page 1116.

Patchouli Oil ; Composition of ——. H. v. Soden and W. Rojahn. Ber., 1904, **37**, 3353—3355.

Patchouli oil, freshly prepared from the leaves, was resolved by distillation into four fractions of equal weight, having sp. grs. 0.946, 0.964, 0.984, and 1.002 (at 15° C.), and optical rotations − 44°, − 52°, − 64°, and − 70° respectively. The last two fractions consisted mainly of patchouli alcohol, with small amounts of another liquid sesquiterpene alcohol. The first two fractions, which contained the sesquiterpenes and also the aromatic constituents of the oil, were repeatedly fractionated, distillates of like sp. gr. and rotatory power being mixed together and further fractionated. Finally, four products were obtained, viz., small quantities of the aromatic substances, larger quantities of patchouli alcohol (these two were not examined further), a fraction (A) of sp. gr. 0.93—0.94 and $\alpha_D = - 50°$, and a fraction (B) of sp. gr. 0.93—0.94 containing both, feebly, dextro- and levo-rotatory substances. Fractions A and B were treated with alcoholic potash, washed, and repeatedly fractionated as above. The chief component of fraction A was a new liquid sesquiterpene, colourless, of sp. gr. 0.9335 (at 15° C.), b. pt. 264°—265° (750 m.m.), α_D (20° C.) = − 58° 45′; it absorbs bromine, hydrobromic acid, and hydrochloric acid (the latter forming a liquid hydrochloride) ; it somewhat resembles cedrene (this J., 1897, 555) as regards physical constants, but is not identical with it. Fraction B yielded mainly another sesquiterpene, of sp. gr. 0.930 (15° C.), and b. pt. 273°—274° ; $\alpha_D = + 0° 45′$. It forms with hydrochloric acid a liquid hydrochloride. Cadinene, found by Wallach (Annalen, 1887, 81) in patchouli oil, was not detected in either fraction.—T. F. B.

Birch Leaves ; Essential Oil of ——. Haensel's Report, Oct. 1904. Apoth.-Zeit. 1904, **19**, 854.

The leaves of *Betula alba* yield 0·049 per cent. of an olive-green oil, which solidifies at normal temperatures, from the presence of an unidentified crystalline constituent. The oil is fluid at 35° C., at which temperature its sp. gr. is 0·9074 ; it is optically inactive in 10 per cent. alcoholic solution at 30° C. ; acid value, 99 ; saponification value, 146·7. It is wholly soluble in absolute alcohol only on warming. By filtering the oil from the stearoptene, 57 per cent. of a thickly fluid oil was obtained with an acid reaction : sp. gr. 0·8723 at 20° C. Its acid and saponification values are very close to those of the original oil.—J. O. B.

Raspberries ; Essential Oil of ——. Haensel's Report, Oct. 1904. Apoth.-Zeit., 1904, **19**, 854.

By distilling raspberry press-marc, a small quantity of essential oil was obtained, of a greenish colour and acid reaction, having an intense raspberry aroma, sp. gr. 0·8883 at 15° C. ; $\alpha_D = + 2·8°$; saponification value, 193 ; saponification value after acetylating, 215 ; solubility in 80 per cent. alcohol 1:30.—J. O. B.

Burdock Leaves ; Essential Oil of ——. Haensel's Report, Oct. 1904. Apoth.-Zeit., 1904, **19**, 854.

Air-dried burdock leaves yielded 0·0285 per cent. of a dark brown oil, resembling that obtained from burdock root in taste and odour, entirely fluid at 30° C. ; not entirely soluble in 96 per cent. alcohol. The stearoptene deposited at ordinary temperatures is probably palmitic acid, similar to that isolated from the essential oil of the root. This leaf oil has the sp. gr. 0·9562 at 20° C. ; acid value, 76 ; saponification value, 91·5. On re-distilling, 39 per cent. of brown, faintly acid, rectified oil was obtained, readily soluble in 96 per cent. alcohol, not wholly soluble in 80 per cent. alcohol : sp. gr. 0·9407, at 20° C. ; acid value, 18 ; saponification value, 70 ; $\alpha_D = + 0·28°$ in 20 per cent. alcoholic solution for 25 mm. tube.—J. O. B.

White Peruvian Balsam ; Constituents of ——. H. Thoms and A. Biltz. Allgem. Oester. Apoth. Verein, 1904, 943. Apoth.-Zeit., 1904, **19**, 1732.

White Peruvian balsam contains myroxocerin, free cinnamic acid, a crystalline body, m. p. 270° C., myroxol, cinnamic esters of cinnamyl and propyl alcohols, and probably a hydrocarbon. White Peruvian balsam does not contain benzyl alcohol nor peruviol, which are present in ordinary dark balsam of Peru.—J. O. B.

Bergamot Oil and other Oils of the Citrus Series: Note on ——. H. E. Burgess and Th. H. Page. Chem. Soc. Proc., 1904, **20**, 181–182.

Acetic acid, octylene, pinene, camphene, and limonene have been identified as constituents of a specimen of pure oil of bergamot. The pungency of the first fractions of this oil on distillation is accounted for by the presence of acetic acid, which was also found in smaller quantities in lemon oil, and is probably present in the other oils of this series. The octylene found in lemon oil was identical with that in bergamot oil, for both gave butyric acid on oxidation with potassium permanganate. It is probably a normal constituent of the citrus oils. A second phenylurethane isolated from the terpineol fraction of distilled oil of limes melts at 132° C., is more soluble than that obtained from ordinary terpineol, crystallises in tufts of needles, and gives on hydrolysis an oil with an intense odour of distilled oil of limes.

Aromatic Esters; Electrolytic Reduction of ——. C. Mettler. XI.A., page 1096.

Atropine: Contributions to the Knowledge of Alkaloid Reactions.—III. C. Reichard. XXIII., page 1116.

Yeast; Some Constituents of ——. O. Hinsberg and E. Roos. XVII., page 1107.

English Patent.

Saccharin; Production of ——. A. Ashworth, Bury, Lancs. Eng. Pat. 25,481, Nov. 23, 1903.

If, in the oxidation of o-toluenesulphonamide to saccharin, an alkaline earth permanganate be used in place of an alkali permanganate, the yield is found to be much improved. A mixture of 100 lb. of o-toluenesulphonamide, 23 lb. of slaked lime, and 200 gallons of water is heated to 70°–80° C., and 180 lb. of calcium permanganate (98 per cent.) dissolved in 50 gallons of water is added gradually with stirring; the precipitate of manganese compounds is removed by filtration, and the saccharin recovered from the filtrate in the usual way.—T. F. B.

United States Patent.

Ureide of Dialkylacetic Acid and Process of making same. E. Fischer, Berlin, and J. von Mering, Halle a Salle. Assignors to the Firm of E. Merck, Darmstadt, Germany. U.S. Pat. 773,251, Oct. 25, 1904.

See Eng. Pat. 1944 of 1903; this J., 1903, 880.—T. F. B.

French Patent.

Dialkylbarbituric Acids: Process for Preparing ——. Farbenfabr. vorm. F. Bayer und Co. Fr. Pat. 343,976, June 14, 1904. Under Internat. Conv., Oct. 21, 1903.

See Eng. Pat. 22,967 of 1903; this J., 1904, 76.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Photographic Plates; Action of certain Substances on —— [in the Dark]. J. Blass and P. Czermak. Phot. Ind., 1904, 923. Chem.-Zeit., 1904, **28**, Rep., 332.

The action of a variety of substances on photographic plates in the dark is described. Brown wrapping paper is the most active, followed by other kinds of paper, wood, straw, shellac, leather, silk, and cotton in the order given; glass and metals (other than zinc) and most minerals and inorganic substances had little or no action. Photographic films and films removed from their support were not sensitive to any substances. Thin sheets of metal, glass, quartz, or mica also prevent the action of the substances on glass plates. Sheets of gelatin, through which blue or violet rays can pass, have no influence on the action, but yellow sheets of gelatin completely prevent it. (See also Russell, this J., 1904, 998, and von Aubel, this J., 1904, 560.)—T. F. B.

English Patent.

Photographic Plates and Films. J. H. Smith, Zürich, Switzerland. Eng. Pat. 19,940, Sept. 16, 1904. Under Internat. Conv., Sept. 17, 1903.

Compound plates or films for use in multi-colour photography are produced by superimposing on a support of glass, paper, &c., the requisite number of sensitive films, each one being separated from the adjacent one by a thin layer of collodion or celluloid. After exposure, a temporary support, coated with some adhesive, is pressed on the uppermost film, which can then be transferred to a permanent support; the collodion or celluloid layer is dissolved away, and the film is then treated in the usual way. All the other sensitive films, with the exception of the lowest one, are removed in the same manner, a series of negatives suitable for colour-work being thus obtained by a single exposure.—T. F. B.

United States Patent.

Photograph on Linen, and Process of making same. O. Fulton, Chiswick, and W. M. Gillard, Twickenham, England. U.S. Pat. 773,384, Oct. 25, 1904.

See Eng. Pat. 11,219 of 1903; this J. 1904, 622.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

Nitrocellulose; Decomposition of —— below the Temperature of Ignition. A. Saposchnikow and M. Borissow. J. russ. phys.-chem. Ges., 1904, **36**, 836—841. Chem. Centr., 1904, **2**, 1030.

The authors represent the decomposition at 150° C. (in the course of 20—25 hours) of two specimens of nitrocellulose (mixed with quartz sand) containing 13·25 and 12 per cent. of nitrogen, respectively, by the equations:—

$$(1)\quad C_{24}H_{29·31}(NO_3)_{10·7}O_{9·31} = C_{20·14}H_{8·27}N_4O_{22·55} + 2·58NO + 1·88CO_2 + 1·98CO + 2·06N_2 + 10·52H_2O.$$

$$(2)\quad C_{24}H_{30·72}(NO_3)_{9·28}O_{10·72} = C_{20·82}H_{[illegible]}N_{2·76}O_{19·5} + 1·52NO + 1·42CO_2 + 1·76CO + 2·50N_2 + 12·96H_2O.$$

If the nitrocellulose be not mixed with sand, the decomposition is more complete and proceeds more rapidly. The brown pitch-like residue is readily soluble in acetone. The decomposition at 135° C. proceeds in the same manner qualitatively as at 150° C. The limit of temperature beyond which nitrocellulose is unstable and has a tendency to readily decompose is 137°—138° C.—A. S.

English Patents.

Nitroglycerin; Apparatus for Weighing Substances such as ——. G. E. Arnold. Eng. Pat. 26,575, Dec. 4, 1903. XXIII., page 1113.

Explosive Compounds and the Manufacture thereof. M. S. Talbot, Durban, Natal. Eng. Pat. 26,978, Dec. 9, 1903.

An explosive mixture of the following composition is claimed: Potassium chlorate, 56 parts; camphor, 4 parts; castor oil, 4 parts; burnt umber, 8 parts; manganese dioxide, 4 parts; and potassium bichromate, 12 parts. It is said to evolve very little smoke on explosion.—T. F. B.

Explosives of the Nitrate of Ammonia Group; Process for the Manufacture of ——. R. Haddan, London. From J. Führer, Vienna. Eng. Pat. 4699, Feb. 25, 1904.

See Fr. Pat. 341,633 of 1904; this J., 1904, 882.—T. F. B.

French Patents.

Powders [Artillery, Sporting and Mining]; Manufacture of ——. J. Luciani. Fr. Pat. 339,022, Sep. 8, 1903.

The explosive in the form of sheets is passed through a machine consisting of two cylinders travelling at the same rate of speed. The upper cylinder has a design of any required form engraved on it in relief. The distance between the cylinders is regulated by a screw of fine pitch. By this means cuts or indentations can be made in the sheet to any desired depth, and with a given thickness of sheet the rate of combustion of the powder can be varied as may be required.—G. W. McD.

Nitrated Hydrocarbons [Explosives] and Process for Manufacturing the same. A. Hough. Fr. Pat. 343,907, June 11, 1904. Under Internat. Conv., June 13, 1903.

See U.S. Pat. 751,076 of 1904; this J., 1904, 385.—T. F. B.

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

Rotating Cathodes; Materials and Forms for ——. H. E. Medway. Amer. J. Science, Silliman, 1904, **18**, [4], 180–182. Chem. Centr., 1904, **2**, 1019. (See this J., 1903, 823; 1904, 952.)

For electrolytic determinations the author has recently used as rotating cathodes crucibles of silver and nickel, as also a plate-electrode of platinum. In the electrolysis of copper sulphate solution, accurate results were obtained with a silver crucible as cathode, but a nickel crucible was attacked both during the electrolysis and in the subsequent separation of the deposit. The deposited copper was detached from the silver crucible as far as possible by mechanical means, the last portions being removed by treatment with hot concentrated hydrochloric acid. The plate electrode recommended by Shepherd is not quite so satisfactory; the deposited metal does not adhere very firmly at the edges of the plate, and greater care is therefore necessary in washing it. Aluminium proposed by Hough is not a suitable material for a rotating cathode.—A. S.

Refractometer Scale for Use with Fats and Oils; Comparative ——. A. E. Leach and H. C. Lythgoe. J. Amer. Chem. Soc., 1904, **26**, 1193—1195.

The variation of the butyro-refractometer (Zeiss) readings of oils and fats with the temperature is not regular, and in order to obtain scale readings at temperatures other than that at which the determination has been made, it is necessary to transform the refractometer readings into the corresponding values for $[n]_D$, apply the correction for temperature, and re-transform into scale readings. The authors give a description and illustration of a slide-rule, by means of which readings may be obtained on the scale of the butyro-refractometer at different temperatures, without first transforming them into indices of refraction; readings in indices of refraction may be obtained at different temperatures without calculation; and readings on either refractometer scale may be readily transformed into readings on the other.—A. S.

English Patents.

Gas Testing Apparatus. A. H. Lymn, London. Eng. Pat. 23,771, Nov. 3, 1903.

The method of ascertaining the value of illuminating gas from the length of its flame, when burned under standard conditions, is not easily applied to the testing of non-luminous gases, such as water-gas, owing to the comparative invisibility of the flame. The patentee renders the length of the flame of such gases more apparent by placing in the flame a vertical rod or wire, or a ladder-like arrangement of horizontal wires of some material which readily becomes incandescent, or by inserting some substance, such as a salt of sodium, strontium, or the like, which is capable of rendering the flame readily visible.—H. B.

Weighing Substances such as Nitroglycerin; Apparatus for ——. G. E. Arnold, Faversham, Kent. Eng. Pat. 26,575, Dec. 4, 1903.

To obviate the danger incurred by using ordinary weights in weighing nitroglycerin, an apparatus is described consisting of a pair of scales, one of the pans of which is designed to receive the substance for weighing, having fixed upon it a graduated receptacle, the other scale-pan being in the form of a graduated reservoir for a liquid such as water, and provided with an inlet and outlet. To use the apparatus, sufficient water is run into the liquid vessel until it attains the load corresponding to the weight of the nitroglycerin, &c. required, and the said substance is then introduced into its receptacle until equilibrium of the scale-pans is restored.—G. W. McD.

INORGANIC—QUALITATIVE.

Bismuth; Reactions of ——. C. Reichard. Chem.-Zeit., 1904, **28**, 1024—1026.

If to the solution of a bismuth salt, there be added preferably a fragment of brucine, or a concentrated solution of a brucine salt, a deep red colour is at once struck, which, on heating, becomes more intense. The colour is permanent only when the brucine is present in considerable excess. The same colour is yielded by a basic bismuth salt, provided a trace of hydrochloric acid is added to it before adding the brucine. None of the other metals of the hydrogen sulphide group gives a similar reaction save antimony, and, the coloration in the case of antimony is developed only after heating, and does not appear at all in the cold. The bismuth reaction might possibly be confused with the well-known coloration given by nitric acid with brucine, but the latter fades to yellow on heating.

—J. T. D.

Boric Acid; Detection of [by means of Tincture of Mimosa Flowers]. L. Robin. Annales de Chim. Analyt., 1904, **9**, 336—338.

In a Mixture of Salts.—The solution, rendered faintly alkaline with sodium carbonate, is boiled and filtered. A drop of tincture of mimosa flowers (this J., 1904, 561) is placed in a porcelain capsule, and a few drops of the filtrate are added, followed by sufficient hydrochloric acid to discharge the yellow tint. The mixture is then evaporated to dryness. In the presence of boric acid a yellow residue is obtained, which gives a red colour when treated with a few drops of a 10 per cent. solution of sodium carbonate. If no boric acid be present, the residue is greyish, turning yellow with the alkali carbonate solution. In the presence of mere traces of boric acid, bibulous paper moistened with a little of the tincture of mimosa and dried may be used instead of the tincture itself, as giving a more delicate reaction. In this case the filtrate, after acidifying with hydrochloric acid is evaporated to a small volume in a capsule and a band of the test paper 2 to 3 cm. long and 1·5 cm. wide is immersed in the concentrated liquid; evaporation is then carried to dryness. The dry paper then affords the above colour reactions.

In Wine, Cider, &c.—Ten or 15 c.c. of the liquid are evaporated to dryness, and the residue incinerated. The ash is taken up with 20 drops of water, the solution filtered, rendered very faintly acid with hydrochloric acid and then tested with the test paper as above.

In Milk.—Fifteen or 20 c.c. of milk are coagulated with two drops of acetic acid, the casein is filtered off, the filtrate neutralised with sodium carbonate, using phenolphthalein or mimosa tincture as the indicator, boiled, filtered, and evaporated to dryness. The residue is then incinerated and treated as in the case of wine.—J. O. B.

INORGANIC—QUANTITATIVE.

Sulphuric Acid in Commercial Acetic Acid; Determination of Free ——. C. Rossi. L'Industria chimica, 1904, **6**, 253–254. Chem. Centr., 1904, **2**, 1165—1166.

In certain solvents, *e.g.*, alcohol, formaldehyde, and especially acetone, the degree of ionisation of acetic acid is diminished to such an extent that the acid becomes indifferent to Methyl Orange. The degree of ionisation of strong inorganic acids, on the other hand, is affected only slightly or not at all, by the solvents mentioned. It is possible, therefore, in presence of one of these solvents to determine directly the free sulphuric acid in commercial acetic acid by titration with alkali in presence of Methyl Orange. The amount of the solvent required, varies with the concentration of the acetic acid. The author used 6·5 c.c. of acetone with 10 c.c. of 40 per cent. acetic acid. The method is stated to give accurate results.—A. S.

Nitric Acid; Electrolytic Determination of ——, with a Rotating Anode. L. H. Ingham. J. Amer. Chem. Soc., 1904, **26**, 1251—1255.

The electrolytic determination of nitric acid has been already studied by Vortmann (this J., 1890, 1066) and by Easton (this J., 1903, 1258). The author finds that the time can be materially shortened by using a rotating anode. The following conditions were found to be the most satisfactory:— 25 c.c. of copper sulphate solution (containing 0·2533 grm. of metallic copper), 25 c.c. of "standard" sulphuric acid, 0·5 grm. of potassium nitrate, 4 ampères, 10 volts at the outset, or 17 volts at the end of the reduction, and the anode rotating at a speed of 230 revolutions per minute. The time occupied was 30 minutes. When the electrolysis was complete, the excess of acid in the electrolyte not neutralised by the ammonia produced, was titrated with "standard" ammonia solution, with litmus or Methyl Orange as indicator.—A. S.

Lime: Determination of —— in presence of Phosphoric Acid. K. K. Järvinen. Z. anal. Chem., 1904, **34**, 559—562.

In the precipitation of solutions of calcium phosphate by ammonium oxalate, some lime always remains in solution, and some phosphoric acid always contaminates the oxalate precipitate. This is so whether the solution be simply treated with excess of ammonium oxalate, whether it be neutralised with ammonia after precipitation, or precipitated in acetic acid solution, or in acetic solution followed by neutralisation. Accurate results, however, are obtained in the following way:—To the solution, as free as possible from ammonium salts, ammonia is added till a permanent precipitate appears, and this is redissolved in the least possible quantity of hydrochloric acid. The liquid is heated to boiling, and poured very gradually into a mixture of ammonium oxalate and oxalic acid (say, 10 c.c. of N/1 oxalate and 5 c.c. of 2N-oxalic acid diluted to 50 c.c.). The calcium oxalate separates slowly in small crystals. When precipitation is complete 1 per cent. ammonia solution is very gradually added till the liquid is just alkaline. The precipitate is collected on the filter, washed, and treated as usual.—J. T. D.

Bauxite; Analysis of ——. Taurel. Ann. Chim. anal. appl., 1904, **9**, 323—327. Chem. Centr., 1904, **2**, 1251—1252.

The presence of titanic acid frequently exerts a disturbing influence in the analysis of bauxite. Leclère (this J., 1903, 926) observed that titanic acid is precipitated along with silica from formic acid solution, and the author makes use of this fact in the following method: 2 grms. of the bauxite are fused with 8—10 grms. of a mixture of equal parts of sodium and potassium carbonates, until the melt ceases to effervesce. After cooling, the mass is dissolved in water and 20 c.c. of sulphuric acid of 66° B. and the solution evaporated till white fumes appear, the residue diluted with water and the silica filtered off. To determine the titanium dioxide and ferric oxide together, the filtrate is diluted to 1 litre, and 100 c.c. are run gradually into a mixture of 10 c.c. of ammonia and 50 c.c. of water. The ammoniacal solution is boiled, the precipitate filtered off, washed with boiling water, dissolved in hydrochloric acid, and reprecipitated with ammonia. The liquid is now treated with excess of formic acid, 1 grm. of sodium sulphite added or a current of sulphur dioxide passed through, and the whole boiled gently for one hour, whereby titanium dioxide is precipitated. Ammonium citrate or tartrate (8—10 times, the amount of alumina present) is then added, followed by, excess of ammonia, and the iron is precipitated by ammonium sulphide. The weight of the precipitate after ignition gives the amount of titanium dioxide and ferric oxide. For the separate determination of titanium, the filtrate from the silica is neutralised with ammonia, 10 c.c. of formic acid are added, and the solution is boiled gently whilst a current of sulphur dioxide is passed through for one hour. The titanic acid is filtered off, and the filtrate made up to 1 litre. In 100 c.c., the alumina and iron are precipitated by ammonia, and in another portion of 500 c.c., the iron is precipitated with ammonium sulphide in presence of ammonium citrate.
—A. S.

Iron; New Method for the Volumetric Determination of ——. N. Tarugi and S. Silvatici. Boll. Chim. Farm., 1904, **43**, 637—641. Chem. Centr., 1904, **2**, 1341—1342.

The method depends upon the titration of ferric chloride solution with potassium oxalate solution, in presence of thiocyanate as indicator. The iron salt is dissolved in concentrated hydrochloric acid, converted into the ferric condition by means of nitric acid or potassium chlorate, the excess of acid neutralised, and the filtered solution made up to a definite volume. An aliquot portion of the solution is then treated with a few drops of a N/10-thiocyanate solution and titrated with N/10-potassium oxalate solution (1 c.c. = 0·00186673 grm. of iron) till a characteristic yellowish-green colour is produced. The method is especially suitable for iron ores, as tungsten, silicon, iron and manganese can be determined in one and the same sample.—A. S.

Silicon in Iron and Steel; Determination of ——. J. Thiel. Z. anal. Chem., 1904, **34**, 552—553.

In Drown and Shimer's method of determining silicon, the evaporation with sulphuric acid of the nitric acid solution of the metal absorbs much time; it must be done on the water-bath, or the risk of loss by bumping and spirting is very great. The author mixes a litre of strong sulphuric acid with an equal bulk of water, and after cooling, adds a litre of nitric acid (sp. gr. 1·40) and a litre of solution of ammonium chloride containing 240 grms. of the salt. To the weighed sample (1—2 grms.) in a 400—500 c.c. beaker he adds 50—70 c.c. of this mixture, covers with a watch-glass till solution is complete, and heats on wire gauze over a Bunsen flame. The liquid can be rapidly boiled down till fumes of sulphuric acid escape, without any danger of loss. After cooling, 100 c.c. of water are added and the solution is warmed, filtered, and the residue on the filter washed with hot water, then with warm dilute hydrochloric acid and finally with hot water; the filter is then placed moist in a platinum crucible, and dried and burnt off in the muffle.
—J. T. D.

Nitrogen in Iron and Steel; Rapid Determination of ——. H. Braune. Oesterr. Z. Berg.-Hütt., **52**, 491. Chem. Centr., 1904, **2**, 1167.

The author makes use of the colour reaction of ammonia with Nessler's reagent. 250 c.c. of water and 20 c.c. of a solution of alkali of an equivalent strength to hydrochloric acid of sp. gr. 1·124 are heated to boiling in an Erlenmeyer flask of 1500 c.c. capacity, provided with a rubber stopper, carrying a funnel and a tube connected to a condenser. 1 grm. of the iron or steel is dissolved in 10 c.c. of hydrochloric acid free from nitrogen compounds, and the filtered solution allowed to drop into the boiling alkali solution. The distillate is treated in a graduated tube, 35 mm. diameter, with a solution made by diluting 2 c.c. of the ordinary Nessler reagent to 10 c.c. The coloration produced is matched by one obtained from a known volume of a solution of ammonium chloride containing 0·038147 grm. per litre (1 c.c. = 0·01 mgrm. of nitrogen).—A. S.

Silver in Zinc; Determination of —— and Silver-content of varieties of Commercial Zinc. K. Friedrich. Z. angew. Chem., 1904, **17**, 1636—1644.

The author has examined critically the methods of determining silver in zinc adopted by Karsten (solution in nitric acid and precipitation with hydrochloric acid); Malaguti and Durocher (oxidation, fusion of oxide with litharge and black flux, and cupellation); Kerl (fusion with excess of lead and borax, and cupellation); Pufahl (solution in hydrochloric acid, fusion of residue with potassium cyanide and cupellation). The considerable solubility of silver chloride in various acid and saline solutions makes the first method valueless, and the loss of silver due to the reaction on it of potassium cyanide at high temperatures is an objection to Pufahl's method. Kerl's method is excellent in the case of zincs rich in silver, but for poorer alloys the large quantities which must be dealt with make it impracticable. A combination of Pufahl's and Kerl's methods, however, has proved most satisfactory with all classes of zinc, and the method is employed as follows:—The sample is granulated, and a suitable quantity (100—1000 grms., according to the expected richness) weighed off into a beaker (or beakers, in case of large amounts). A small quantity of hydrochloric acid is added, and when nearly saturated is poured off through a filter, and a second quantity poured on the sample; by this plan solution is greatly hastened. As soon as, or just before solution is complete, the whole residue is rinsed on to the filter and washed free from chlorides. The filter is placed in a crucible, dried and incinerated; to the residue 7.5—15 grms. of assay lead and some borax are added, and the whole heated to fusion. The button of alloy is then cupelled, alongside of a lead-silver button of about the same content, from which the unavoidable loss of silver by volatilisation is determined and allowed for in the usual way. The author has established by experiments on alloys of known composition that: (1) The cupellation method gives accurate results when zinc as well as lead is present in the alloy; (2) If the excess of acid, after dissolving the zinc, be allowed to stand upon the residue, the silver gradually goes into solution: hence the direction to filter off before complete solution of the zinc; (3) In presence of hydrochloric acid or zinc chloride, very considerable quantities of silver chloride may be formed and volatilised during the incineration of the filter; hence the need for thorough washing of the residue. A table is given showing the amount of silver (in grms. per metric ton) in various specimens of commercial zinc.—J. T. D.

Gold; Determination and Separation of —— Electrolytically. S. P. Miller. J. Amer. Chem. Soc., 1904, **26**, 1255–1269.

In Cyanide Solution.—From 150 c.c. of a solution containing 1 grm. of potassium cyanide and 0·1291 grm. of gold, the latter was completely deposited in 2½ hours with a current of 1·8 volts. and $N.D_{100} = 0·02—0·04$ ampère during the first 1½ hours and then increased so as to maintain a voltage of 1·8; temperature, 55°—65° C. Gold was quantitatively separated from iron by working under the following conditions:—125 c.c. of solution containing 0.1286 grm. of gold, 0·13 grm. of iron and 3 grms. of potassium cyanide; current, 2·3—3 volts and $N.D_{100} = 0·13—0·36$ ampère; temperature, 65° C.; time, 2½ hours.

In Phosphate Solution.—Satisfactory conditions for the determination of gold and for its quantitative separation from cadmium, iron, zinc, cobalt, and nickel are shown in the following table:—

——	Gold Present.	Foreign Metal Present.	Disodium Hydrogen Phosphate Solution (Sp. gr. 1·028.)	Phosphoric Acid. (Sp. gr. 1·35).	Dilution.	Time.	Temperature.	Current, $N.D_{100}$.	Volts.
	Grm.	Grm.	c.c.	c.c.	c.c.	Hours.	° C.	Ampère	
Determination of gold	0·1196	..	20	5	125	3	60	0·03	1—2
Separation of gold from cadmium	0·1696	0·1107	20	5	125	4½	65	0·02	1—1·7
" " " iron....	0·1188	0·1100	40	10	150	5	62	0·02—0·08	1—2·7
" " " zinc....	0·1117	0·1150	30	6	150	2	67	0·04	2—2·5
" " " cobalt ..	0·1237	0·1200	30	6	150–200	2	66	0·04	1·1—2
" " " nickel..	0·1256	0·1200	40	6	150	4	68	0·04—0·06	1—2·2

In Sodium Sulphide Solution.—10 c.c. of a solution containing 0·1276 grm. of gold chloride were treated with 50 c.c. of water, 15 c.c. of sodium sulphide solution (sp. gr. 1·19) were added, the liquid was warmed until it became clear, diluted to 150 c.c. and electrolysed at 61 C. with a current of 0·1—0·2 ampère and 2·4—3 volts. A quantitative yield of gold was obtained in 2 hours. Gold was also satisfactorily separated from arsenic, molybdenum and tungsten under similar conditions.—A. S.

Electrolytic Separations possible with a Rotating Anode. D. S. Ashbrook. J. Amer. Chem. Soc., 1904, **26**, 1283—1290.

The author has examined whether Exner's method (this J., 1903, 1150) of using a high current density and strong pressure with a rotating anode gives satisfactory results in the electrolytic separation of metals. It was found that copper could be quantitatively separated from aluminium, chromium, iron, and magnesium in sulphuric acid, nitric acid or phosphoric acid solution, from arsenic in ammoniacal or nitric acid solution, from cadmium and cobalt in nitric acid solution, from manganese and uranium in sulphuric acid or nitric acid solution, and from zinc in sulphuric acid or phosphoric acid solution. Cadmium was separated from aluminium, iron, magnesium, and manganese in sulphuric acid or phosphoric acid solution, from chromium in phosphoric acid solution, and from nickel in sulphuric acid solution. Silver was separated from aluminium, cadmium, chromium, cobalt, iron, lead, magnesium, manganese, nickel, and zinc in nitric acid solution. Mercury was quantitatively separated from aluminium and magnesium.—A. S.

United States Patents.

Carbon Analysis: Method of ——. G. O. Seward, Holcombs Rock, Va., Assignor to Eimer and Amend, New York. U.S. Pat. 773,529, Oct. 25, 1904.

The amount of carbon contained in a substance is determined by mixing it with an oxidising agent, and placing the mixture in a crucible suspended in a cylindrical glass vessel. The stopper of this vessel is pierced by gas-inlet and outlet tubes, by a funnel for the admission of liquid, and by the terminals of an electric generator, the ends of which dip into the mixture in the crucible. The gaseous products of combustion are passed through a carbon dioxide absorption apparatus; sulphuric acid is then added to the residue in the crucible through the funnel, and a current of purified air is passed through the contents of the crucible, driving the remaining products of combustion through the absorption apparatus.—T. F. B.

French Patents.

Hydrogen Contents of Gaseous Mixtures; Process for the Continuous Determination of the ——. Verein. Maschinenfabrik Augsburg und Maschinenbau. - Ges. Nürnberg, A.-G. Fr. Pat. 344,340, June 27, 1904.

See Eng. Pat. 15,706 of 1904; this J., 1904, 951.—T. F. B.

ORGANIC—QUALITATIVE.

Quebracho Extract; Detection of Adulteration in ——. T. Koerner and P. Düllberg. Deutsch. Gerber Zeit., 1904, **47**, 115—126. Chem.-Zeit., 1904, **28**, Rep., 328.

The following method is proposed for the detection of adulteration of quebracho extract, especially by mangrove bark:—

The sample is dissolved in a small quantity of hot water, and alcohol is added to it when cool, until the solution ceases to become turbid. An equal volume of ether is added to precipitate the first fraction of the tannin, and a further quantity to precipitate the remainder. The two fractions are dissolved separately in alcohol, and again precipitated in two fractions by ether. The second of the two fractions in each case is subjected to elementary analysis. A pure quebracho extract should give 62—63 per cent. of carbon, or at any rate not less than 60 per cent.; a smaller percentage indicates adulteration (since mangrove bark gives only 56·15 per cent. of carbon when its alcoholic solution is precipitated with ether). Attempts to detect adulteration by determining the percentage of alkyloxy-groups present gave negative results.—T. F. B.

Watered Milk; Detection of ——. A. E. Leach and H. C. Lythgoe. J. Amer. Chem. Soc., 1904, **26**, 1195—1203.

The authors find that the addition of water to milk perceptibly affects the degree of refraction of the serum. For determining the degree of refraction, the Zeiss immersion refractometer is recommended, but, the Abbé refractometer may also be employed. 100 c.c. of the milk at a temperature of about 20° C. are treated, in a beaker, with 2 c.c. of 25 per cent. acetic acid (sp. gr. 1·0350); the beaker is covered with a watch glass, and heated on the water-bath for 20 minutes at 70° C. It is then placed in ice water for 10 minutes, the solution filtered, and the degree of refraction of the clear filtrate determined immediately. Tables are given of: (1) readings on the immersion refractometer at temperatures of from 15° to 25° C. reduced to the corresponding values at 20° C.; and (2) refractive indices as read on the Abbé refractometer, corresponding to the scale readings on the immersion refractometer. Of the numerous samples of pure milk examined, the immersion refractometer reading of the serum was nearly always above 40° at 20° C., and in no case was it below 39°. The authors propose that milks of which the serum gives a reading on the immersion refractometer below 39° at 20° C. should be declared fraudulently admixed with water.
—A. S.

Yeast Extract; Detection of —— in Meat Extract. M. Wintgen. Archiv der Pharm., 1904, **242**, 537—538.

When albumins are salted out from meat extract by means of zinc sulphate solution, a clear filtrate is obtained; with yeast extract, however, the resulting filtrate is cloudy. 20 c.c. of freshly-prepared 10 per cent. aqueous solution of the extract are acidified with 2 c.c. of 20 per cent. sulphuric acid, and treated with excess of powdered zinc sulphate. After standing one or two days, the solution is filtered, only the first c.c. which runs through being returned to the filter. In the presence of yeast extract, or a mixture of 20 to 30 per cent. of yeast extract with meat extract, the filtrate will be turbid when first filtered.
—J. O. B.

Formic Acid; New Reaction of ——. E. Comanducci. Estr. aus Rend. della R. Accad. delle Scienze, Fisiche e Matematiche di Napoli, 1904. Chem. Centr., 1904, **2**, 1168.

Formic acid gives a characteristic yellow coloration with sodium bisulphite, and this reaction can be used for its detection (as small a quantity as 1 per cent.) in formalin, methyl alcohol, glycerin, and acetic acid. 2·5 c.c. of the liquid to be examined are diluted with an equal volume of water, 15 drops of a concentrated solution of sodium bisulphite (5 grms. in 5 c.c. of distilled water) are added, and the mixture is shaken and warmed. In presence of formic acid a yellowish-red coloration is produced.
—A. S.

Atropine; Contributions to our Knowledge of Alkaloid Reactions. III. C. Reichard. Chem.-Zeit, 1904, **28**, 1048—1050. (See this J., 1904, 458.

(1) When atropine sulphate is warmed with mercurous nitrate, reduction takes place, and a highly characteristic fragrant odour is produced, this odour being also produced when atropine is warmed with concentrated sulphuric acid. (2) If atropine sulphate is warmed with platinic chloride solution and sulphuric acid, metallic platinum separates out and the same fragrant odour is produced. With palladium chloride a similar reaction ensues. (3) A very characteristic reaction is with bismuth chloride. When a solution of this salt is mixed with atropine sulphate there is no change; but if concentrated sulphuric acid is added there is an immediate egg-yellow coloration. This reaction only takes place in the cold. (4) Sodium nitroprusside produces a reddish precipitate as with cocaine. (5) When atropine is ground with cane-sugar and hydrochloric acid, a fine rose-red colour is produced on warming. (6) When atropine sulphate is treated with arsenious or arsenic acid and sulphuric acid, rings of reduced arsenic are slowly formed. (7) If a drop of concentrated antimony trichloride solution be warmed with a trace of atropine sulphate, a bright green liquid is formed, permanent on further heating or evaporating. Stannous chloride does not change the green residue. This reaction can be used to distinguish between atropine and morphine. (8) When a trace of solid atropine sulphate is evaporated with dilute cobalt nitrate solution, a green coloration is produced. The most delicate and characteristic reaction of atropine is the odour produced with sulphuric acid.—F. S.

Essential Oils; Treatment with Sulphuric Acid applied to the Identification of ——. M. Duyk. Les Corps gras ind., 1904, **31**, 70—72. Chem. Centr., 1904, **2**, 1348—1349.

According to the author, the Maumené test used in the examination of vegetable oils may also be applied to the identification of essential oils. 4 c.c. of *Paraffinum liquidum* are well mixed with 1 c.c. of the oil in a glass tube, then 2 c.c. of pure sulphuric acid are introduced at the bottom of the tube by means of a pipette, the tube is closed with a cork carrying a thermometer, the temperature observed, then the contents of the tube are well mixed, and the highest temperature attained is noted. The 4 c.c. of paraffin give a rise of 1° C. with 2 c.c. of sulphuric acid. The following values have been determined by the author:—Cymene, 4°; pinene, 36°; limonene, 26°; carvene, 26°; thymene, 13°; cedrene, 15°; anethol, 22°; thymol, 7°; safrol, 33°; carvacrol, 4.5°; apiol, 32°; eugenol, 27°; sandal-wood oil (*a*) 22.5°—33°, (*b*) 12°—18°; lemon-oil, 25°—26.5°; geraniol, 31.5°; menthol, 9°; linalool, 38°; eucalyptol, 22°; terpineol, 26°; santalol, 33°; cedar-wood oil, 16°—18°; peppermint oil, 13°—26°; eucalyptus oil, 24°; citral, 40°; anisaldehyde, 14°; benzaldehyde, 9°; menthone, 11°; citronellone, 33°; carvol, 30°; lavender oil, 33°—37°; and geranium oil, 24°—25° C.—A. S.

ORGANIC—QUANTITATIVE.

Fuels; Method and Apparatus for Determining the Heating Value of Gaseous and Liquid ——. H. Junkers, Aachen, Germany. Eng. Pat. 18,487, Aug. 26, 1904. Under Internat. Conv., Sept. 1, 1903.

An improvement on the method described in Eng. Pat. 13,083 of 1892, requiring the measurement of only one magnitude. The fuel and cooling agent are supplied to the calorimeter in constant proportions, so that both may be made positively dependent on the time occupied in feeding. The heating value is then obtained directly from the difference of temperature of the cooling agent as it enters and leaves the calorimeter. The pressure of either the fuel or the cooling agent may be utilised for driving the meters through which the supply passes. By employing some form of differential thermometer or by keeping one of the two temperatures constant, the readings may be recorded directly in terms of the calorific value of the fuel.—J. F. B.

Benzene; Determination of —— in Illuminating Gas. O. Pfeiffer. Chem.-Zeit. 1904, **28**, 884—885.

The author in 1899 (J. f. Gasbeleucht, **42**, 697) modified Harbeck and Lunge's method of determining benzene in illuminating gas (conversion into dinitrobenzene by sulphuric-nitric acid) by using for the determination a measured volume instead of a stream of the gas, by which means several advantages are claimed. Whilst, however, the modified method is accurate with pure benzene, Korbuly has found it to give with illuminating gas much higher results than Harbeck and Lunge's method. This has been found to be due to another constituent of the gas, which forms, on treatment with the acid mixture, a bright yellow solid substance which is weighed with the nitrobenzene; this substance can be removed by means of animal charcoal, however, and when this is done the author's method gives results in accord with the methods of Harbeck and Lunge and of O'Neill. The author has introduced a further modification of the method, and now, instead of weighing the dinitrobenzene formed, titrates it by means of stannous chloride. An ordinary stoppered separating funnel of about 500 c.c. capacity (the exact capacity being in the first instance determined) is used. It is inverted, filled with the gas by displacement from above, closed, and the gas adjusted to atmospheric pressure by momentarily easing the stopper or opening the stopcock. Now 2 c.c. of the mixture of equal volumes of strong sulphuric and fuming nitric acids are introduced through the stem and stopcock, spread over the surface of the glass by inclining the funnel, and allowed to act for half an hour. The funnel is then turned right side up, and 30 c.c. of strong solution of sodium hydroxide are introduced. After all acid gases have been absorbed, hydrochloric acid is added till the liquid is faintly acid, and any carbon dioxide formed, is, as far as possible, expelled by shaking; then 50 c.c. of ether are added, the whole is well shaken for five minutes, and the ether decanted into a flask containing 1 grm. of well-dried potassium carbonate and half a grm. of animal charcoal. This treatment is repeated with a second 50 c.c. of ether, and the united ethereal extracts are shaken with the charcoal at intervals during several hours. The ether is then filtered into a 200 c.c. flask, the residue on the filter washed with ether, and the whole of the latter evaporated. To the residue about 10 c.c. of alcohol and exactly 10 c.c. of stannous chloride solution are added, the whole is heated for ten minutes on the water-bath, cooled, the liquid made up to the mark with distilled water, and 20 c.c. (one-tenth of the whole) are titrated with iodine and starch. Into a second 200 c.c. flask, 10 c.c. of alcohol and 10 c.c. of stannous chloride solution are introduced, and this mixture is heated similarly, cooled, made up to the mark, and 20 c.c. withdrawn for titration. The difference between the two titrations represents the amount of stannous chloride oxidised by the dinitrobenzene present.

$$C_6H_4(NO_2)_2 + 6SnCl_2 + 12HCl = C_6H_4(NH_2)_2 + 6SnCl_4 + 4H_2O.$$

The stannous chloride solution is made by dissolving 150 grms. of tin in hydrochloric acid, adding 50 c.c. of the strong acid and diluting to a litre.—J. T. D.

Petroleum and its Distillation Products; Action of Formalin on ——. A. Nastjukow. III., page 1082.

Rubber, particularly Crude Rubber; New Methods for the Analysis of ——. G. Fendler. Ber. deutsch. Pharm. Ges., 1904, 208 and 215. Through Monit. Scient., 1904, **18**, 834—838.

Various samples of rubber were examined by the author's method (this J., 1904, 764), and also by the methods of Harries, and Weber (see this J., 1901, 1123; 1902, 1404; 1903, 1211), and the following conclusions are drawn:—Harries and Weber's methods give results agreeing fairly well as regards percentage of pure caoutchouc, Weber's method being perhaps preferable, on account of its greater simplicity, when slightly modified in small details suggested by the author. With certain kinds of rubber, however, these two methods indicate a much too high percentage of caoutchouc, since certain resins present in rubber give compounds with nitrous acid, soluble in acetone and insoluble in benzene. Harries' and Weber's methods also give too high a value to the insoluble matter in many cases. The author's method appears the best on account of its greater accuracy and simplicity.—T. F. B.

Dextrose; Indicator for use in the Quantitative Determination of —— *with Fehling's Solution.* G. Griggi. Boll. Chim. Farm., 1904, **43**, 565—567. Chem. Centr., 1904, **2**, 1169—1170.

In the determination of dextrose with Fehling's solution, the author recommends as a suitable and sensitive indicator Bach's reagent (this J., 1893, 401, 519), so-called formaldoxime, CH_2NOH, the alkaline solution of which gives a violet coloration with copper salts. For the preparation of the indicator, 5·6 grms. of pure potassium hydroxide dissolved in water and 2·9 grms. of formaldehyde (7·25 c.c. of a 40 per cent. aqueous solution) are added to a solution of 6·95 grms. of hydroxylamine hydrochloride in cold water, and the whole diluted to 100 c.c.—A. S.

Fine Spirits; [*Examination of* ——]. K. Windisch. XVII., page 1107.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Radium in American Carnotite. A. H. Phillips. Eng. and Mining J., 1904, **78**, 673.

The author carried out some experiments with 25 lb. of an ore from Richardson, Utah, containing about 10 per cent. of carnotite. From the radio-activity of the product obtained, he estimates that 1 ton of the ore would yield 1 grm. of chlorides having a radio-active power of 60,000, as compared with that of uranium. A specimen of "radium" prepared in Nov. 1902 is stated to be as active now as when first prepared.—A. S.

Colloidal Solutions; New Method of Preparing ——, *and their behaviour towards Barium Sulphate.* L. Vanino and P. Hartl. Ber. 1904, **37**, 3620—3623.

The mould *Aspergillus oryzae* possesses strong reducing powers, and readily produces colloidal solutions. A solution of 0·01 grm. of gold chloride in 100 c.c. of water, to which has been added a few grains of rice with this mould growing on it, gives in a few days a blue solution of colloidal gold. For rapidly demonstrating the formation of colloidal solutions, Faraday's solution of phosphorus in alcohol is excellent; when added to a solution of gold chloride, it instantaneously produces a red solution, which gradually deepens in colour and becomes more bluish, then remaining permanent. Nearly all these colloid solutions (arsenic trisulphide, antimony trisulphide, cadmium sulphide, copper sulphide, silver sulphide, and metallic silver) when shaken with pure precipitated barium sulphate, become colourless, and deposit their contained substance. The action is purely mechanical (in some cases filtration through kieselguhr, or even prolonged agitation of the solution, produces the same effect), and furnishes another argument in favour of the view that these colloidal solutions are in reality suspensions of solid particles.—J. T. D.

Cholesterol. A. Windaus and G. Stein. Ber., 1904, **37**, 3699—3708.

The authors conclude from the results of their study of the decomposition products (oxidation products, &c.) of cholesterol, $C_{27}H_{44}O$, that it may be regarded as a complex terpene, composed of five reduced rings, of which one contains a double linking, and another a secondary hydroxyl group. It is pointed out that nearly all the resin acids of the conifers will give the characteristic reactions of cholesterol.
—A. S.

New Books.

Technisch-Chemisches Jahrbuch, 1902. Ein Bericht über die Fortschritte auf dem Gebiete der chemischen Technologie. Herausgegeben von Dr. Rudolf Biedermann. 25ter Jahrgang. Friedrich Vieweg und Sohn, Braunschweig. 1904. Price M. 15.

8vo volume, containing 580 pages of subject-matter, a classified Review of New Books on Pure and Applied Science, filling 27 pages, and the alphabetical index of names of authors and subjects, followed by a Register of Patents, classified, and paged with reference to the body of the Jahrbuch. There are 72 illustrations. The matter is classified as follows:—I. Iron. II. Aluminium and Rare Earth Metals. III. Gold and Silver. IV. Copper. V. Zinc. VI. Lead. VII. Nickel, Cobalt, Manganese, and Chromium. VIII. Tin, &c. IX. Sulphur and Sulphuric Acid. X. Alkali Industry. XI. Electro-chemistry. XII. Ammonia and Cyanogen Compounds. XIII. Alkaline Earths, &c. XIV. Gases. XV. Phosphorus, Boron, Silicon, and Carbon. XVI. Glass. XVII. Earthenware. XVIII. Cements and Artificial Stone. XIX. Explosives, &c. XX. Illuminants. XXI. Fuels. XXII. Sugar. XXIII. Starch, Dextrin, and Glucose. XXIV. Fermentation Industries. XXV. Fats, Soaps, and Resins. XXVI. Ethereal Oils and Perfumes. XXVII. Water. XXVIII. Foods. XXIX. Organic Products. XXX. Albumins, &c. XXXI. Dyestuffs. XXXII. Textile Fibres. XXXIII. Paper. XXXIV. Photography. XXXV. Tanning, Glue, &c. XXXVI. Manures, Disinfection, &c. Following each of the foregoing groups, is a Section devoted to Statistics.

Handbook of Chemical Engineering. Illustrated with Working Examples and Numerous Drawings from Actual Installations. By George E. Davis, Chemical Engineer, &c. 2nd Edition. Davis Bros., 32, Blackfriars Street, Manchester. 1904. Price 2*l.* 2*s.*; for all Foreign Countries, 2*l.* 5*s.*

This work is complete in two 8vo volumes, each with an alphabetical index, Vol. I. containing 524 pages of subject-matter and 282 illustrations, and Vol. II. 515 pages of subject-matter and 257 illustrations.

The subject-matter of Vol. I. is classified as follows:—I. Introduction. II. The Technical Laboratory. III. Materials used in the Construction of Plant. IV. Weighing and Measuring. V. Steam Production and Distribution. VI. Power and its Application. VII. Moving Solids, Liquids, and Gases. VIII. Treating and Refining Solids. Vol. II.:—I. Application of Heat and Cold. II. Separating Solubles from Insolubles. III. Absorbing and Compressing Gases. IV. Evaporation and Distillation. V. Crystallisation and Dialysis. VI. Application of Electricity. VII. Construction of Packages. VII. Organisation and Building.

The Chemical Synthesis of Vital Products and the Inter-Relations between Organic Compounds. Vol. I. By Raphael Meldola, F.R.S., &c., Professor of Chemistry in the City and Guilds of London Technical College, Finsbury, London. Edward Arnold, 41 and 43, Maddox Street, Bond Street, London, W. 1904. Price, 21*s.* net.

Large 8vo volume, containing preface, table of contents, list of synthetical products, titles of journals quoted, and subject-matter filling 293 pages, followed by an alphabetical index. In his preface the author points out that, with Wöhler, our own countryman, Henry Hennell, must take equal rank, as being among the first to produce an organic compound independently of the living organism. Hennell was the first to synthesise alcohol from olefiant gas, and this synthesis was effected at practically the same time as that of urea by Wöhler. The work is arranged in the dictionary form, and the matter treated of is classified as follows:—I. Hydrocarbons. II. Alcohols and Terpene Alcohols. III. Ketone Alcohols. IV. Glycols and Polyhydric Alcohols. V. Aromatic Alcohols and Phenols. VI. Aldehydes and Ketones: Fatty Group. VII. Aromatic Aldehydes and Ketones. VIII. Carbohydrates and Glucosides. IX. Sulphur Compounds. X. Cyanogen Compounds. XI. Camphor and Terpene Group. XII. Flavone Group.

A Text-Book of Quantitative Chemical Analysis by Gravimetric, Electrolytic, Volumetric, and Gasometric Methods. With Seventy-two Laboratory Exercises, giving the Analysis of Pure Salts, Alloys, Minerals, and Technical Products. By J. C. Olsen, A.M., Ph.D., Professor of Analytical Chemistry in the Polytechnic Institute of Brooklyn, &c. D. van Nostrand Company, 23, Murray, and 27, Warren Streets, New York. 1904. 4 dols. net.

Large 8vo volume, containing 468 pages of subject-matter, 21 pages of tables, and the alphabetical index. The text is illustrated with 68 engravings.

The matter is classified as follows:—I. The Balance. II. General Operations. III. Determination of Water. IV. Determination of Metals. V. Determination of Acids. VI. Analysis of Alloys. VII. Analysis of Minerals. VIII. Electrolytic Methods. The Ionic Theory; Electrolytic Apparatus and Manipulation. Electrolytic Determination of Metals. IX. Volumetric Analysis. X. Acidimetry. XI. Standard Acids. XXII. Standard Alkalis. XXIII. Oxidation and Reduction Methods. XXIV. Precipitation Methods. XXV. Technical Analysis. A. Iron, Steel, and Coal. B. Water Analysis. C. Analysis of Oils and Fats. D. Gas Analysis. E. Stoichiometry.

The Textile Fibres: their Physical, Microscopical, and Chemical Properties. By J. Merritt Matthews, Ph.D., Head of Chemical and Dyeing Department, Philadelphia Textile School. First Edition. John Wiley and Sons, New York. 1904. Price 15*s.* net. Chapman and Hall, Ltd., London.

8vo volume, containing 271 pages of subject-matter, with 69 illustrations, and an appendix with Bibliography of the Textile Fibres, followed by the alphabetical index. The matter is classified as follows:—I. Classification of the Textile Fibres. II. Wool and Hair Fibres. III. Chemical Nature and Properties of Wool and Hair Fibres. IV. Shoddy and Wool Substitutes. V. Other Hair Fibres. VI. Silk: its Origin and Cultivation. VII. Chemical Nature and Properties of Silk. VIII. The Vegetable Fibres. IX. Cotton. X. Physical Structure and Properties of Cotton. XI. Chemical Properties of Cotton, Cellulose. XII. Mercerised Cotton. XIII. Artificial Silks: Lustra-Cellulose. XIV. Linen. XV. Jute, Ramie, Hemp, and Minor Vegetable Fibres. XVI. Qualitative Analysis of the Textile Fibres. XVII. Quantitative Analysis of the Textile Fibres. Appendix:—I. Microscopic Analysis of Fabrics. II. Machine for Determining the Strength of Fibres.

The Cultivation and Preparation of Para Rubber. By W. H. Johnson, Director of Agriculture, Gold Coast Colony, West Africa, &c. Crosby Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill, London. 1904. Price 7*s.* 6*d.* net.

8vo volume, containing frontispiece showing a "flowering branch of the Para rubber tree," preface, 96 pages of subject-matter, with five illustrations, and the alphabetical index. The subject matter is classified as follows:—I. Introductory. II. The Para Rubber Tree (*Hevea brasiliensis*) at Home and Abroad. III. Cultivation of the Tree. IV. Insect Pests and Fungoid Diseases. V. Collecting the Rubber. VI. Preparation of Rubber from the Latex. VII. Yield of Para Rubber from Cultivated Trees. VIII. Establishment and Maintenance of a Para Rubber Plantation. IX. Commercial Value of the Oil in Hevea Seeds.

Trade Report.

I.—GENERAL.

NORWAY: PROPOSED REVISION OF CUSTOMS TARIFF OF ——.

Bd. of Trade J., Nov. 10, 1904.

The following statement shows certain proposed changes in the Norwegian customs tariff which are under consideration :—

Article.	Unit.	Present Rate of Duty.	Duty Proposed by the	
			Customs Committee.	Government.
		Kroner	Kroner	Kroner.
Starch and potato meal.......... ...	Kilo.	0·10	0·13	0·10
Calcium carbide ...	*ad val.*	Free	15 per cent.	Free
Celluloid manufactures	Kilo.	1·00	1·20	1·20
"Patent" glass	„	Free	0·06	Free
Glass tiles and floor slabs	„	„	0·06	0·06
Printing paper (except that made from wood pulp)..	..	0·03	0·08	0·03
Sulphuric acid......	100 kilos.	Free	0·50	Free
Gunpowder.........	Kilo.	0·10	0·12	0·10
Smokeless powder ..	„	0·10	0·50	0·10
Dynamite and similar explosives	..	0·10	0·20	0·10
Sugar...............	..	0·20	0·15	0·20

On most manufactures of metal increased duties are proposed both by the Customs Committee and by the Government.

YOKOHAMA IMPORTS OF DRUGS AND CHEMICALS.

Chem. and Druggist, Nov. 1, 1904.

A return of principal articles of import at the port of Yokohama during 1903 and 1902 includes the following drugs, chemicals, &c. :—

BOSNIA; CHEMICAL INDUSTRY AND TRADE OF ——.

Foreign Office Annual Series, No. 3297.

The ammonia-soda factory at Lukavac near Tuzla gave as usual a high interest on the capital engaged. The production during the past year was about 18,000 tons, of which 17,000 tons were exported to Austria-Hungary and the Balkan States. The petroleum refinery "Danica," in Bosnian Brod, which is a dependency of the above-mentioned ammonia-soda factory, has not hitherto given very satisfactory results; last year it produced about 9000 tons of refined oil, of which 6000 tons were exported to Austria-Hungary and Servia. The crude oil comes from Galicia.

The sugar factory in Usora seems to have done no better in 1903 than heretofore. The culture of the beet, owing to the great care it requires, does not seem to find favour with the native population. About 5000 tons of sugar were produced last year, of which 4000 tons were consumed in the province, and the remainder exported to Dalmatia. The alcohol distillery in Tuzla continues to thrive. Of the 220,000 galls. produced in 1903, 176,000 galls. were sold in the province, and the remaining 44,000 galls. exported. The brewery at Serajevo is also very prosperous; 1,100,000 galls. of beer were brewed in 1903, the greater part of which was consumed in the country, the remainder being exported to Dalmatia and Montenegro.

The chemical works known as the "Elektricitäts-Aktien-Gesellschaft-Jajce" appears to be still suffering from the general over-production of carbide, but since the works have taken to producing chloride of lime and caustic soda they have paid a small dividend. The production in 1903 was 5000 tons of calcium carbide, of which 4500 tons were exported, and 3000 tons of chloride of lime and caustic soda, the whole of which was exported.

The "Holz-Verwerthungs-Gesellschaft" at Teslic in 1903 produced about 9000 tons of methylated spirit and acetate of lime, all of which was exported to Austria-Hungary. Also large quantities of charcoal were burnt, which is all delivered under contract to the iron works at Vares.

The iron mines and works at Vares proved as remunerative in 1903 as heretofore, and paid a dividend for the year of 9 per cent. About 40,000 tons of raw iron were produced, of which 25,000 tons were exported, chiefly to Hungary, and the remainder found a market in the country. 4000 tons of cast iron wares were produced and the greater part exported, and also about 40,000 tons of iron ore were exported to Trieste and Italy. The iron works at Zenica seem to have achieved rather better results in 1903 than hitherto. About 5000 tons of iron and steel from these works were sold in the country, and about 10,000 tons were exported to Austria-Hungary, Servia, Roumania, and the sandjak of Novi-Bazar. The match factory at Travnik, which is only on a small scale, and is content with a modest profit, sells its produce chiefly in the province, and exports a small quantity to the sandjak of Novi-Bazar.

Mining.—The mining industry does not seem to have been very active during the past twelvemonth. There was a falling-off in all minerals except in coal and iron pyrites, although the total result in value was an increase 3733*l.* over 1902. The three mines of Kreka, Zenica and Kakanj-Doboj supplied all the requirements in coal of Bosnia and Herzegovina, but did not export more than 70,000 tons, the state of the market not being favourable. The gross production of all foundries, smelting works and salt works during the year 1903 shows an increase in all products both as regards quantity and value, except copper-work and raw iron, the total increase in value being 22,104*l.* The salt springs at Tuzla yielded 33,244,740 galls. of brine, of which 18,390,080 galls. were supplied to the ammonia-soda factory at Lukavac, and 14,854,660 galls. to the salt works, from which 13,126 tons of fine salt, 5154 tons of coarse salt, and 180 tons of briquettes, or a total of 18,460 tons of table salt, were produced.

In the subjoined table are particulars of imports and exports of chemical interest into and from Bosnia and the Herzegovina during the year 1903.

Caoutchouc and guttapercha.....	325,000	314,000
,, manufactures of	111,000	137,000
Perfumery.......................	142,000	150,000

II.—FUEL, GAS, AND LIGHT.

COKE FROM BY-PRODUCT OVENS.

Eng. and Mining J., Oct. 20, 1904.

The total coke made in the United States in 1903 was 25,262,360 net tons, as compared with 25,401,730 net tons in 1902. Of the 77,188 active ovens in 1903 there were 1,956 by-product ovens which produced 1,882,394 tons, or an average of 962·4 tons per oven. The average output of beehive ovens was 311 tons. The by-product ovens made 7·4 per cent. of the total coke, against 5·5 per cent. in in 1902. The output of the by-product ovens in the current year will show a large increase, chiefly from the new plant of the Lackawanna Steel Company at Buffalo.

NATURAL GAS PRODUCTION OF THE U.S.A.

Bd. of Trade J., Nov. 10, 1904.

A report by the United States Geological Survey upon the production of natural gas in 1903 states that, notwithstanding the decreasing pressure in several of the most important fields, the production in that year was greater than in any previous year, being valued at 35,815,360 dols., as compared with 30,867,863 dols. in 1902. Four States, namely, Pennsylvania, West Virginia, Indiana, and Ohio, produced 94 per cent. of the value of natural gas in 1903, and in the aggregate the United States produced 99 per cent. of the entire world's production.

IV.—COLOURING MATTERS AND DYESTUFFS.

Indigo; East Indian ——.

Chem. Trade J., Nov. 12, 1904.

The first general memorandum of the indigo crop of the season 1904 states that the reports of the area planted are still incomplete, but they indicate that the slight improvement of last year was only a temporary arrest of the decline in cultivation characteristic of recent years. In Bengal, where the estimated area sown this year is 223,100 acres, against 249,700 last year—a decrease of 10 per cent. —the plant has yielded badly, and the output is the lowest on record, about 60 per cent. of a normal crop for Bengal proper, 56 per cent. for North Bihar, and 80 per cent. for the other Bihar districts. For the whole province, it may be estimated at not less than 60 per cent. The total yield will probably not be more than 35,000 factory maunds. In the United Provinces the area in 1902 was 135,800 acres, and increased in 1903 to 140,800; but the reports received this spring indicate a contraction in the present season. The seed germinated well, and up to July a normal output was expected. Since then the prospects have deteriorated, serious damage being done by the heavy and continuous rains in the second half of July and throughout August. The output is now estimated at not more than 75 per cent. of the normal for the province as a whole. In the Punjab, the estimated area in the four principal growing districts is 73,900 acres, the area finally ascertained in 1903 being 74,200 acres. The crop, on the whole, is in good condition. In Madras, the area sown is only half that of the corresponding period of last year, the returns from the Raijatwari villages up to the end of August showing 71,300 acres, equal to about 48 per cent. of that in the preceding year. It is less than the average of five and ten years by 54 and 68 per cent. respectively. The decrease is marked in Kistna, Nellore, Kurnool, and Duddapah, and is attributed to the fall in prices and to want of timely rains. The crop is reported to be generally good, but to require rain in parts.

V.—PREPARING, BLEACHING, Etc., TEXTILES, YARNS, AND FIBRES.

Alizarin Assistant: U.S. Customs Decision.

Nov. 1, 1904.

It was held that a preparation obtained by sulphonating allow and treating with an alkali, processes used to make Turkey Red oil, is dutiable at 30 per cent. *ad valorem* as " other alizarin assistant not specially provided for," under paragraph 32 of the present tariff. This article had been he subject of a decision of the United States Circuit Court, which held that it was dutiable at 20 per cent. *ad valorem* under Section 6, as a "manufactured article unenumerated," on the ground that it was used as a softener. Further evidence taken by the Board led them to the different conlusion above given, as it was shown that Turkey Red oil was used as a finisher and softener for cotton goods.

VII.—ACIDS, ALKALIS, Etc.

Magnesite in the United States.

Eng. and Mining J., Nov. 3, 1904.

In a recent report by the United States Geological Survey u the production of magnesite, it is stated that in the United States the entre product of magnesite comes from California. During 1903 the quantity reported was 3744 hort tons crude, valued at 10,595 dols., equivalent to 1361 ons calcined, worth 20,515 dols.

The production of crude magnesite is practically in the ands of one firm at present. The crude product is sent to the manufacturers of carbon dioxide gas for calcination, and the calcined product is used by the paper mills. The demand for both crude and calcined magnesite is limited on the Pacific coast. Owing to a freight rate of 13 dols. to 15 dols. a ton on shipments to eastern points, it is not shipped out of California except to the paper mills in Oregon. The production of California could be quadrupled if the demands of consumption warranted the increase.

The principal producing point in California is in the vicinity of Portersville, Tulare county, though small quantities still come from Chiles valley and Pope valley, Napa county. The most extensive deposit in California is in Placer county, but it is in an almost inaccessible mountain region, where a very costly road would be necessary to get the product out, and the deposit therefore has not been utilised. Near Sanger, Fresno county, is another deposit, which is now being opened. A deposit has been discovered also near Walkers Pass, Kern county, but it has never been developed. There are also unutilised deposits near Morgan Hill, Santa Clara county.

Iron Pyrites, &c.: Opening for —— in Russia.

Foreign Office Annual Series, No. 3253.

H.M. Consul at Warsaw states that there is a large and growing demand for imported iron pyrites in factories in Poland, and indeed throughout the empire, as those found in the Urals, Twer district, and the Caucasus do not nearly suffice. This demand, which is put down at 40,000 tons for Poland alone, is partly covered by a Berlin firm to whom a British firm, who have large mines in Spain and Portugal, have given the monopoly of the sale of their pyrites for Eastern Europe, but it appears that there is plenty of room for others to come in, and other nations are already about it. The Germans are beginning to compete with Westphalian pyrites, and the Hungarian mines at Schmöllnitz have already come in to a considerable extent and, as their present output is pretty nearly covered by the home demand, are specially enlarging their works with a view to obtaining a larger portion of the Russian trade. A British firm in a position to supply iron pyrites would do well to look into the matter.

The colour factory at Skarzysko, which seems to be doing well in spite of the war, complains of the length of time it takes to get red oxide from England, especially in winter, when it takes three months to come. The import of it is, however, small, and chiefly for three factories in the district. Complaint is also made that the Russian Customs refuse to recognise pure iron ore from India as a pure mineral product, and charge duty on it under paragraph 125b of the tariff as if it were a colour like red oxide. At present the iron factories import almost all Greenland cryolite, tin oxide, and calcium fluoride, for enamelling from Berlin, and there seems no reason why British firms should not compete.

IX.—BUILDING MATERIALS, Etc.

Sand-Lime Brick.

Eng. and Mining J., Oct 27, 1904.

According to the United States Geological Survey, there are in America at present about 50 plants, with a total capacity of approximately 1,000,000 bricks a day. The experience of these plants indicates that sand lime brick can usually be manufactured at a cost below that of common clay brick. Sand lime bricks have been in use long enough, both in America and in other countries, to prove that when properly made they have sufficient strength and sufficient water- and weather-resisting qualities to make them a safe building material.

The commercial development of the industry dates back only 15 years in foreign countries, and not more than four years in the United States. In 1896 Germany had only five factories where sand-lime brick was made, but now it has about 200, with an annual output of between 350,000,000 and 400,000,000. Early in 1901 a plant was built in Michigan City, Ind. In 1902 about 20 plants were in existence and 6,000,000 bricks were actually sold. Full data are not obtainable as to the actual output in 1903, but about 26,000,000 bricks have been reported as sold in that year. Many of the factories had just started, and were not manufacturing to their full capacity during the year.

Portland Cement; Amended Definition for ——.

Scient. Amer. Suppl., Oct. 29, 1904.

An amended definition of the term Portland cement has been adopted by the Association of German Portland Cement Manufacturers. It is, in this, defined to be a hydraulic cementing material of specific gravity not less than 3·1 in the calcined state, and containing not less than 1·7 parts by weight of lime to each one part of silica + alumina + iron oxide, the material being prepared by mixing the ingredients intimately, calcining them to not less than clinkering temperature, and then reducing the whole to the fineness of flour.

Lumber; Fireproofed —— : U.S. Customs Decision.

Oct. 25, 1904.

It was decided that lumber which had been treated with solutions of ammonium sulphate and phosphate to render it fireproof was dutiable at 2 dols. per 1000 ft. as "sawed lumber not specially provided for," under paragraph 195. The assessment of duty at 35 per cent. *ad valorem* as a "manufacture of wood" under paragraph 25 was overruled on the ground that the fireproofing treatment had not changed its character sufficiently to remove it from the category of lumber. The Treasury Department, Nov. 1, 1904, has appealed against this decision to the United States Circuit Court, and pending their decision the higher rate of duty will be levied.—R. W. M.

X.—METALLURGY.

British Mineral Output in 1903.

Mines and Quarries: General Report and Statistics for 1903. *Part III., Output. Home Office* [*Cd.* 2283]. *Eyre and Spottiswoode, East Harding Street, E.C. Price* 1s. 6*d.*

Part 9 [Cd. 2283] of the General Report on Mines and Quarries for 1903, issued by the Home Office as a Blue-book, gives the account and value of the minerals produced, in general and in detail. The introductory summary shows that the total value of the minerals raised during the year amounted to 101,808,404*l.*, a decrease of 5,296,480*l.* as compared with 1902. This decrease is to be accounted for by the fall in the average price of coal from 8*s.* 2·84*d.* per ton in 1902 to 7*s.* 7·93*d.* in 1903. The total output of coal was the highest hitherto recorded, *viz.*, 230,334,469 tons, but the value was only 88,227,547*l.*, as against 93,521,407*l.* in 1902, when the output was less by more than 3,000,000 tons. The quantity of coal exported, exclusive of coke and patent fuel and of coal shipped for the use of steamers engaged in foreign trade, was 44,950,057 tons, an increase of nearly 2,000,000 tons on the exports for 1902. Germany, France, and Italy each received over 6,000,000 tons, Sweden over 3,000,000 tons, and Russia, Spain, Denmark, and Egypt each over 2,000,000 tons. Adding the 2,055,414 tons exported in the form of coke and patent fuel, and the 16,799,848 tons shipped for the use of British and foreign steamers engaged in foreign trade, the total quantity of coal which left the country was 63,805,349 tons. The amount of coal remaining for home consumption was 166,529,120 tons, or 3·930 tons per head of the population; 18,302,240 tons were used in the blast furnaces for the manufacture of pig iron, as against 17,649,137 tons in the previous year. The output of iron ore, 13,715,645 tons, shows a further increase of 289,643 tons, but the value, 3,229,937*l.*, is less by 58,164*l.* than in 1902. The ore yielded 4,500,972 tons of iron, or about one-half of the total quantity of pig iron made in the country; 6,314,162 tons of iron ore were imported during the year, 78 per cent. of which came from Spain. Copper, gold, lead, silver, and zinc all show an increase on the figures of 1902 both in the amount and value of the metal obtained, and in the case of tin, although the amount obtained is less, the value is greater. Among non-metallic minerals the increase in the output of natural gas at the Heathfield workings, from 150,000 to nearly 1,000,000 cubic feet, may be noticed.

Gold Production of Canada.

Eng. and Mining J., Nov. 3, 1904.

Official returns show that the gold produced in the Canadian Yukon for the nine months ending with September this year was 8,593,734 dols., that being the amount on which the Government royalty of 2·5 per cent. was paid. Adding two districts from which returns were incomplete, and also some gold which may have escaped royalty, the total for the nine months was about 10,000,000 dols. As the Yukon working season is over, the probability is that the total for 1904 will be somewhat less than the 12,500,000 dols. reported last year.

Iron and Steel Production of the World.

Eng. and Mining J., Oct. 20, 1904.

The figures collected for the *Mineral Industry*, Vol. XII., show that the total production of pig iron in 1903 was 46,733,000 met. tons. Although the United States output was nearly stationary, and several countries, such as Canada and Russia, showed decreases, the total exhibits a gain of 5·5 per cent. over the previous year, and is evidence of the activity of trade and construction all over the world.

The following table gives the quantity of pig iron made in 1902 and 1903, the figures being reduced to met. tons, for purposes of comparison :—

——	1902.	1903.
United States	18,003,448	18,297,400
Germany	8,402,660	10,085,634
Great Britain	8,653,976	8,952,183
Three chief producers	35,060,084	37,335,217
Austria-Hungary	1,335,000	1,355,000
Belgium	1,102,910	1.216,500
Canada	324,670	265,418
France	2,427,427	2,827,668
Italy	24.500	28.250
Russia	2,566,000	2,210,000
Spain	330,747	380,284
Sweden	524,400	489.700
Other countries	615,000	625,000
Total	44,310,738	46,733,037

The increase was largely due to the gain of 20 per cent. by the German blast furnaces, though it was assisted by other European countries, all of which, except Russia, had a prosperous year. The German increases kept up the proportion of the total made by three leading producers, which was 79·9 per cent. of the total in 1903, against 79·1 per cent. in 1902; although the proportion furnished by the United States alone fell from 40·6 per cent. in 1902 to 38·9 per cent. last year.

The proportion of pig iron made into steel, which had been steadily increasing for a considerable period, received a slight check last year. The total steel produced showed a gain of only 2·5 per cent., as against 5·5 per cent. in pig iron. This was due to a decline in American steel production, and to a greater output of foundry iron in Germany and Great Britain.

The total steel production of the world is given in the following table, also in metric tons :—

——	1902.	1903.
United States	15,186,406	14,768,593
Germany	7,780,682	8,801,515
Great Britain	5,102,420	5,114,647
Three chief producers	28,069,508	28,684,755
Austria-Hungary	1,143,900	1,146,000
Belgium	776,875	981,740
Canada	184,950	132,500
France	1,635,300	1,854,620
Italy	119,500	116,000
Russia	1,730,250	1,525,000
Spain	163,564	198,642
Sweden	283,500	310,000
Other countries	412,000	418,000
Total	34,519,347	35,368,257

The United States showed a decrease of 2·8 per cent., while Germany's gain in steel was 13·1 per cent. and that of Great Britain 0·2 per cent. only, against increases of 20 per cent. and 3·4 per cent. respectively, in pig iron. The United States last year made 41·8 per cent. of the total steel, against 44 per cent. in 1902; while the three leading producers reported 81·1 per cent. of the total, as compared with 81·3 per cent. in the preceding year. Germany, which took the second place as an iron producer for the first time in 1903, has long been far ahead of Great Britain in steel. The British iron-masters have kept up the manufacture of wrought or puddled iron to a greater extent than those of any other country.

A marked feature of the iron trade in 1903 was the withdrawal of the United States, to a large extent, from the list of exporting nations. The active condition of trade at home during a large part of the year induced manufacturers to give up their foreign business, and in some cases they found it necessary to import iron and steel. It was largely to this that the increase in German output and trade was due. This year, conditions have been reversed, but the export business has hardly been recovered.

IRON AND STEEL IN GREAT BRITAIN.

Eng. and Mining J., Oct. 20, 1904.

The production of pig iron in Great Britain for the first half of 1904, as reported by the British Iron Trade Association, was less than that of the first half of 1903 by 330,033 tons, or 7·5 per cent. If a further comparison is made with the first half of 1902, a decrease is shown of 47,513 tons, or 1·2 per cent. It is necessary to go back to 1901 to find a lower output.

The production of pig iron for the half-year is shown in he following table, in long tons, in comparison with the first half of last year:—

——	1903.	1904.
Foundry and forge	2,096,313	1,850,463
Bessemer pig	1,716,069	1,606,660
Basic pig	456,371	506,970
Spiegel and ferro	110,245	84,872
Totals	4,378,998	4,048,965

Of the 15 ironmaking districts into which Great Britain s divided for the purposes of these returns, 11 show a lecrease, and the remainder show an increase in 1904 compared with 1903. The most notable declines appear to have aken place in Scotland, in West Cumberland, in Lancashire, n Notts and Leicestershire, in South and West Yorkshire, nd in Cleveland.

The total production of steel ingots for the first half of 904 was as follows, in long tons:—

——	Acid.		Basic.		Total.
	Tons.	Per ct.	Tons.	Per ct.	Tons.
Bessemer	553,071	21·8	312,612	12·3	865,683
Open-hearth	1,326,883	52·3	343,247	13·6	1,670,129
Totals	1,879,953	74·1	655,859	25·9	2,535,812

There were 480 open-hearth furnaces in existence at the lose of the half year. A notable change took place in the leveland district, the two works which formerly made acid teel having adopted the basic process, so that all the steel nade in that district in 1904 was basic steel.

The production of rails from Bessemer steel during the alf year was 523,771 tons, which compares with 483,964 ns in the first half of 1903, and 410,420 tons in 1902. he greatest increase in rails was in the South Wales strict.

The total production of steel ingots in the half-year was s follows, in long tons, comparisons being made with the rst half of 1903.

The total decrease this year was 0·6 per cent. Openarth steel this year was 65·9 per cent. of the total, and Bessemer, or converter, steel was 34·1 per cent., against 64·3 and 35·7 per cent. respectively in 1903. The open-hearth process continues to make steady gains.

——	1903.	1904.
Bessemer	911,670	865,683
Open-hearth	1,639,239	1,670,129
Totals	2,550,909	2,535,812

INDIA; MINERAL PRODUCTION OF ——.

Ch. of Commerce J., Nov., 1904.

The production of salt in India averages about a million tons annually, the total in 1903 being 894,840 tons owing to the much smaller production in Bombay and Madras. More than two-thirds of the Indian production is sea salt. Saltpetre is most largely produced in Bihar, whence the article is sent to Calcutta for export after refinement; the average annual exports thence of refined saltpetre in the last five years amount to 374,629 cwt.

Although the output of coal last year (7,438,386 tons) was progressive the figures show an arrest of the rapid expansion of recent years. India now takes the lead as a coal producer in the British Empire outside Great Britain. The quantity exported last year rose slightly and now amounts to nearly half a million tons. India is yearly approaching a state of being able to supply all her own wants in fuel, the import of foreign coal shrinking gradually; this amounted in 1903–4 to 180,040 tons imported as merchandise, and 26,789 tons as Government stores, or one-fourth of the quantity imported nine years previously. The greatest development has occurred in Raniganj, in which the collieries are from 120 to 140 miles only from Calcutta, but Jherria, some 40 miles further from the port, is being developed and is rapidly overtaking Raniganj as a producer.

The development of the petroleum resources of Burmah and Assam has exceeded the rate of growth in the coal trade. In 1902 the production was nearly 57 million gallons, and in 1903 it rose to nearly 88 million gallons, of which over 85 million gallons were raised in Burmah. Though this is far from meeting the total demand in India, the home production has already affected the imports of foreign oil, which has steadily decreased, during the past three years, from nearly 99 million gallons in 1901–2 to 80½ million gallons in 1903–4. The exports from Burmah of the products of petroleum were:—

Mineral Oil.	1902-3.	1903-4.
Kerosene (gallons)	17,271,151	35,586,378
Other kinds (gallons)	3,454,638	3,235,803
Paraffin wax (cwt.)	51,470	35,969

Besides the steady rise in output from Kolar, where the gold-mining industry has gradually expanded since 1885, and during the past year reached an output of 600,000 oz., work has commenced in the Nizam's dominions, and during the 10 months, Feb.—Dec., 1903, 34,114 oz. of gold were raised. The Burmah output declined from 2179 oz. in 1902 to 1905 oz. in 1903. The ancient native industry of smelting iron has undergone a gradual decline, but it still lingers in parts of Madras and the Central Provinces. Except in Barakar, where the conditions for manufacturing pig-iron are favourable owing to the proximity of ore supplies and good coking coal, no successful attempt has been made to manufacture iron on a large scale in India. Of graphite the output in Travancore was 3,394 tons only, as against 4,575 tons in 1902.

The most remarkable development has taken place in the quarrying of manganese ore. In 1903 the total output reached a record of 171,800 tons, which places India amongst the first two of the countries producing high-grade manganese ore. That produced in the Central Provinces is of very high grade, ranging from 51 to 54 per cent. of the metal, and in consequence of its high quality is able to pay the heavy tax of freight over 500 miles of railway, besides the shipment charges to Europe and America, the whole of the ore being exported to Great Britain, Germany, and the United States. The largest proportion of ore is raised in the Nagpur district, though work has been begun in Bhandara and Balaghat, and prospecting in Chatisgarh district, in the Jhabua State in Central India, and a few other places, besides Vizianagram, where mining still continues. The work hitherto has been little more than quarrying, and no approach to exhaustion can be said to have occurred in the chief deposits, which, however, are being worked for the highest grade of ore only. India still retains the lead amongst the producers of mica, the exports of which in 1903–4 were 21,548 cwt., value Rs. 12,94,453, as against 20,412 cwt., value Rs. 13,13,909 in 1902–3. The centres of production are still in the Nellore district in the south, and a belt of pegmatites near the borders of the Hazaribagh, Gaya, and Monghyr districts in Bengal. Little or no work has been done in the other areas where the mineral is known to occur in plates of marketable size and quality.

Amongst other minerals of value the magnesite deposit of the so-called "Chalk Hills," near Salem, have attracted attention on account of the great purity of the mineral; 3,540 tons were raised in 1902, and 826 tons in 1903. Tin mining continues on a small scale in Southern Burmah and the Karenni. In the Tenasserim division the ore raised in 1903 amounted to 110 tons, valued at Rs. 1,37,295. The quarrying of slate is an important industry along parts of the outer Himalayas, near Rewari in the Punjab, and in the Kharakpur hills of Monghyr district, but accurate statistics are only available for the two or three large companies producing slate.

GOLD AND SILVER PRODUCTION OF THE WORLD IN 1903.

Bd. of Trade J., Nov. 3, 1904.

The following figures are taken from a statement issued by the Director of the Washington (U.S.A.) Mint :—

The production of gold in the world amounted to 325,527,200 dols. in 1903 against 295,889,600 dols. in 1902.

The world's production of silver in 1903 amounted to 170,443,670 fine ounces, valued at 92,039,600 dols., compared with 166,955,639 fine ounces, valued at 88,486,500 dols. in 1902.

GOLD PRODUCTION IN AUSTRALIA.

Eng. and Mining J., Oct. 20, 1904.

Official figures, compiled by the Mines Department of New South Wales, show that, during the eight months of the current year ending with August, there was a slight decrease in the gold production of Australia, as compared with the corresponding period in 1903. The following table shows the production of the different States for the eight months, four of them being official, while the comparatively small production for South Australia and Tasmania is estimated. The figures are in ounces of fine gold :—

——	1903.	1904.	Changes.
West Australia	1,390,660	1,313,865	D. 76,795
Victoria	484,860	502,839	I. 17,979
Queensland	429,963	414,389	D. 15,574
New South Wales	152,337	178,644	I. 26,307
South Australia and Tasmania.	32,000	32,000	..
Totals	2,489,820	2,441,737	D. 48,083

It will be noted that the principal decrease is shown in the reports from Western Australia; and this is due to the fact that the output from the mines at Kalgoorlie is a little below that of the previous year. Notwithstanding this, the production of this State is 55 per cent. of the total output for the present year. In Queensland also there is a slight falling off. This was confined to the Charters Towers and Gympie fields, the Mount Morgan and the minor fields having shown considerable gains. The production reported from Victoria shows a satisfactory growth; this is largely due to satisfactory yields reported this year from the Bendigo goldfield.

COPPER PRODUCTION OF UNITED STATES IN 1903.

Bd. of Trade J., Nov. 10, 1904.

The official figures of the Geological Survey give the production of copper in the United States in 1903 as 311,627 tons (of 2,240 lb.), the figures for the preceding year being 294,423 tons. The output from Montana represented 38·9 per cent. of the whole; that from the Lake Superior District, 27·5 per cent.; and from Arizona, 21·1 per cent.; the three districts combined thus contributed 87·5 per cent. of the total output in 1903.

THERMIT: U.S. CUSTOMS DECISION.

Oct. 26, 1904.

Thermit, a mechanical mixture of four parts of powdered aluminium and one part of powdered oxide of iron, and used to produce high heat for welding purposes, was held to be dutiable at 45 per cent. *ad valorem*, under paragraph 193 of the present tariff, as "an article not specially provided for in this Act, composed wholly or in part of aluminium or other metal."—R. W. M.

XII.—FATS, FATTY OILS, Etc.

OLIVE OIL PRODUCTION IN ITALY.

U.S. Cons. Rep., No. 2100, *Nov.* 5, 1904.

According to the *Moniteur Officiel du Commerce*, Italy produced 86,119,700 gallons of olive oil during the year 1903–4, or 37,248,000 galls. more than in 1902–3; 1,585,200 galls. more than in 1901–2, and 5,811,700 galls. more than the annual average.

Much of this year's olive crop was being abandoned because of its abundance. It hardly paid to pick the fruit in some parts; besides, the drought from July to October had ravaged Italy and seriously affected the quality. The fruit, though abundant, was small and poor, hence of little value for making oil. This is to be regretted, for it was otherwise free from disease and well skinned.

The cultivation of the olive is increasing constantly, though slowly. The area devoted to olives increased from 2,673,666 acres in 1901 to 2,683,550 acres in 1902, and 2,690,963 acres in 1903. The oil yield per acre last year was 32 gallons, or 13·8 gallons more than the yield of 1902–3, 0·3 gallons more than the yield of 1901–2, and 2 galls. more than the average.

XIII. B.—RESINS, VARNISHES, Etc.

GUM GUAIAC: U.S. CUSTOMS DECISION.

Nov. 3, 1904.

It was decided that gum guaiac which had been freed from mechanical impurities by straining, was dutiable at ¾ c. per lb. and 10 per cent. *ad valorem* under paragraph 20 of the present tariff. The claims of the importer for free entry under paragraph 548, as a "crude gum," or under paragraph 617, as a "crude vegetable substance," or at 10 per cent. *ad valorem* under section 6, as an "unmanufactured article unenumerated" were overruled.—R. W. M.

XIII. C.—INDIA-RUBBER, Etc.

RUBBER IMPORTS INTO FRANCE.

Dépêche Col.; through U.S. Cons. Rep., No. 2100, *Nov.* 5, 1904.

The development of the bicycle and automobile industries, the use of rubber in the manufacture of garments, and the extension of electric lighting and the telephone have caused enormous importations of raw rubber into Europe.

Brazil last year exported over 30,000 tons, of which one-fifth was consumed by France. The production of the world is estimated at 50,000 tons, one-eighth of which goes to France. The industrial consumption of raw rubber and gutta-percha in France in 1902 was 6,217 tons, of which 5,000 tons came from the principal foreign producing countries, and the remainder from the French colonies.

Brazil, despite foreign competition (especially from occidental Africa), is the principal furnisher of France, entering more than 2,000 tons annually; England enters some 1,400 tons; India, 500; Peru, 280; Germany, 260; the United States, 245; Belgium, 140; and divers little countries of the Antilles, Central America, and elsewhere, 350.

The English market, which on account of its great importations of Brazilian rubber is the principal intermediary between production and French industry, is of much greater importance than all the other markets. The Belgian and German markets do not furnish France with half as much as do its own colonies.

Within the last few years Bordeaux has become an important rubber market. Considering the length of time it has existed it compares favourably with that of Antwerp. The latter market, at its creation in 1891, imported 210 tons. Since that year the imports, by tons, have been as follows: in 1892, 629; in 1893, 1,671; in 1894, 2,745; in 1895, 5,310; in 1896, 11,158; in 1897, 17.241; in 1898, 20,145; in 1899, 34,028; in 1900, 56,980; in 1901, 58,492; in 1902, 54,089; in 1903, 57,264. Bordeaux imported 510 tons in 1898; 1,755 tons in 1899; 2,395 tons in 1900; 2,353 tons in 1901; 6,784 tons in 1902; and 11,130 tons in 1903.

XVII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOLIC PRODUCTS IN SPAIN; MANUFACTURING AND CONSUMPTION DUTIES ON ——.

Ch. of Commerce J., Nov. 1904.

A Spanish law, dated July 19th, imposes manufacturing and consumption duties on alcoholic products. The consumption duties, which are leviable on both native and imported products, and take the place of the surtax of 37·50 pesetas per hectol. previously levied on such products, are fixed at the following rates:—

		Pesetas.
Neutral spirits and alcohols, anise-seed spirits, with or without sugar, rum, cognac, gin, and other spirituous compositions;* also liqueurs	litre (liquid)	0·50
Denatured alcohol	hectol.	5·00

Drawback of the manufacturing and consumption duties paid on the alcohol contained will be allowed on the exportation of the following products: Wines fortified with alcohol; alcohols, spirits, and liqueurs manufactured in the country; "*mistelas*"†; chemical products, perfumery, varnishes, and medicines prepared with alcohol. A similar drawback will also be allowed at the time of their entering into consumption, on spirits of wine which have been rectified. The Government are authorised to impose additional import duties at varying rates, to countervail the consumption duty on the alcohol used in the manufacture of similar articles of domestic production, on chloroform, ether, pharmaceutical products, and perfumery containing alcohol, and on dari and yeast. The importation of mixtures of alcohol and ether is prohibited.

XXII.—EXPLOSIVES, MATCHES, Etc.

DANGEROUS GOODS AND EXPLOSIVES IN SHIPS; REVISED AND CONSOLIDATED INSTRUCTIONS RELATING TO THE CARRIAGE OF ——.

F. J. S. Hoopwood and W. J. Howell. Bd. of Trade, Sept. 1904.

Explosives.—The regulations are those of the Explosives Act of 1875, licensed explosives being divided into seven classes, viz.:—(1) Gunpowder. (2) Nitrate mixtures. (3) Nitro compounds. (4) Chlorate mixtures. (5) Fulminate. (6) Ammunition. (7) Firework. Gunpowder, &c., must be conveyed in a single or double package of such construction that it will not be broken or become defective whilst being conveyed. The interior of the package must be kept clean and free from grit, and no iron or steel must be used in the construction unless same is effectually covered with tin, zinc, &c. The nature of the explosive and the name and address of the sender must be conspicuously attached by a mark on the outside of the package

Inodorous Felt and India-rubber Solution are classed as "dangerous goods" and are not accepted as general cargo.

The following packing regulations are stipulated for the undermentioned goods:—

Methylated Spirit.—Substantial iron drums properly closed and secured.

French Polish.—Hermetically sealed tins packed in a wooden iron-bound case containing not more than 15 tins.

Carbide of Calcium.—Hermetically sealed tins enclosed in wooden cases or air-tight and damp-proof iron drums.

Sulphuric Acid.—Electrically welded steel drums.

Liquid Ammonia.—Iron vessels tested up to a pressure of 675 lb. per sq. in.

Aqueous Solution of Ammonia (sp. gr. 0·880).—Twelve-gallon drums, capable of withstanding a pressure of 66 lb. per sq. in. with an empty space of 5·33 per cent. in each drum.

Carbon Bisulphide.—Strongly made and perfectly tight two-gallon drums tested to 40 lb. per sq. in. with an empty space of at least 10 per cent., packed in perforated wooden cases with not more than two drums in each case.

Sodium Sulphide and Potassium Sulphide.—Strong air-tight steel drums.

Oiled Materiols.—Perforated cases.

Potassium Chlorate.—Iron drums or strong paper-lined cases.

Amorphous Phosphorus.—Tin cases.

Collodion Cotton.—When not intended to be used by itself as an explosive, it is not regarded as coming within the meaning of the Explosives Act when it is—

(1) In solution in alcohol and ether.
(2) Wet.
(3) Saturated in methylated spirit and contained in air-tight cases.

Marking and Packing of Poisons.—To be marked according to the terms of section 17 of Sales of Poison and Pharmacy Act, 1868.

Sodium Peroxide.—Strong iron or steel drums.

Carbolic Acid.—Thoroughly sound casks.

Liquefied Carbonic Acid.—Cylinders after the pattern recommended by the Committee appointed by the Home Office in 1895 on the manufacture of compressed gas cylinders.

Naphtha.—Gas-tight drums with not less than 5 per cent. clearance packed in sawdust in iron tanks.

Lamp Black.—Printed paper should not be used in packing lamp black.

Sheep Dips and Similar Preparations.—To be marked "Poison" in conspicuous character.

Petroleum Spirit.—Steel barrels or drums.

Carbon Papers.—Air-tight tins within a suitable case.

—G. W. McD.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 23,600. Petavy. Furnaces. [Fr. Appl., Nov. 3, 1903.]* Nov. 1.

„ 23,938. Grossmann. Method and apparatus for the condensation, absorption, and chemical combination of gases in the presence of liquids, or of liquid and solid substances. Nov. 5.

---

*Including varnishes prepared with alcohol; pharmaceutical products and perfumery containing alcohol; ether, chloroform, and other products manufactured with alcohol.

† Wines made with sugar, cinnamon, &c.

[A.] 23,942. Allison (Niles-Bement-Pond Co.). Filter press plate.* Nov. 5.
,, 23,983. Ray. Process of and apparatus for continuous distillation.* Nov. 5.
,, 24,033. Kestner. Means for moistening or washing air or other gases.* Nov. 7.
,, 24,038. Crawford. Rotary kilns. Nov. 7.
,, 24,231. Harvey and Wilson. Crucible furnaces. Nov. 9.
,, 24,261. Baker. Means for compressing gases. Nov. 9.
,, 24,363. Green. Separation of volatile compounds by distillation, and apparatus therefor. Nov. 10.
,, 24,446. Meura. Filter-press frames. Nov. 11.
,, 24,511. Oxford, Buxton, and Oxford. Apparatus for drying semi-liquids. Nov. 12.
,, 24,547. Birrell. Furnaces. Nov. 12.
,, 24,587. Thompson (Best). Furnaces.* Nov. 12.
[C.S.] 26,386 (1903). Shaw. Nozzles for discharging liquids. Nov. 16.
,, 27,935 (1903). Van Steenkiste. Drying apparatus. Nov. 16.
,, 28,791 (1903). Houghton, and The United Aklali Co., Ltd. Apparatus for separating liquid from solid matter, and partially drying the solid matter. Nov. 9.
,, 2002 (1904). Hauberg. Centrifugal separators. Nov. 9.
,, 13,489 (1904). Schnelle. *See under* XI.
,, 19,186 (1904). Suzuki. Vacuum evaporating apparatus. Nov. 16.
,, 20,857 (1904). Kostalek. Filters. Nov. 9.

II.—FUEL, GAS, AND LIGHT.

[A.] 23,444. Nairn. Manufacture of incandescent gas mantles.* Oct. 31.
,, 23,787. Griffin and Cox. Production of gas. Nov. 3.
,, 23,984. Brunck. *See under* VII.
,, 24,040. Crawford. Treatment of peat for fuel. Nov. 7.
,, 24,242. Arzt and Baron. Gas for illuminating and heating purposes. Nov. 9.
,, 24,248. Winkler. Incandescent light mantles. Nov. 9.
,, 24,293. Breckon. Method of producing superior coke in connection with gas works and the like.* Nov. 10.
,, 24,308. Redman and Redman. Inclined retorts. Nov. 10.
,, 24,333. Desgraz. Process and apparatus for obtaining producer gas free of tar and of high calorific value.* Nov. 10.
,, 24,336. Carpenter and Davis. Artificial composition fuel. Nov. 10.
,, 24,400. Sutton and Rudd. Incandescent gas mantle. Nov. 11.
,, 24,467. Kirkham, Hullett, and Chandler, Ltd., and Hersey. Apparatus for washing and scrubbing gas. Nov. 11.
[C.S.] 24,995 (1903). Little. Inclined gas retort beds. Nov. 9.
,, 28,342 (1903). Bell and Masters. Furnaces of gas producers. Nov. 9.
,, 28,498 (1903). Bowing. Manufacture of combustible gas. Nov. 9.
,, 544 (1904). Armstrong. Manufacture of producer gas, and apparatus therefor. Nov. 9.
,, 4995 (1904). Schlickeysen. Process for converting raw peat into solid peat fuel. Nov. 16.
,, 16,766 (1904). Colson. Manufacture and purification of illuminating gas. Nov. 9.
,, 21,318 (1904). Neuman. Combined double gas producers and steam generators for producing water gas and producer gas, and generating steam by the heat of such gases. Nov. 16.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 23,680. Rud. Rütgers Chem. Fabr. f. Theerprodukte. Treatment of heavy tar oils for the manufacture of pitch or of a special kind of tar. [Ger. Appl., July 1, 1904.]* Nov. 2.
,, 23,727. Kuess. Process for transforming into soap mineral oils in general and petroleum in particular. [Fr. Appl., Nov. 3, 1903.]* Nov. 2.
,, 24,297. Gittings. Manufacture of volatile oils. Nov. 10.
,, 24,554. Scholvien. Manufacture of benzenes, and hydroxyl derivatives of the same. [Ger. Appl., May 27, 1904.]* Nov. 12.
[C.S.] 26,366 (1903). Lothammer and Trocquenet. Process for saponifying petroleum and other like hydrocarbons. Nov. 9.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 24,045. Newton (Bayer and Co.). Manufacture of new azo dyestuffs. Nov. 7.
[C.S.] 26,379 (1903). Johnson (Kalle and Co.). Manufacture of black sulphur dyes. Nov. 16.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 23,426. Shearer and O'Brien. Process for retting flax or degumming rhea, ramie, or china grass. Oct. 31.
,, 23,493. McNaught. Wool washing machines. Oct. 31.
,, 23,635. Walker (Kestner). Ageing or conditioning yarn and the like. Nov. 2.
,, 23,647. Graham and Cope. Preparation for bleaching cotton and other vegetable fibres. Nov. 2.
,, 23,651. Wray and Wray. Apparatus for spraying and conditioning yarn. Nov. 2.
,, 23,861. Stillie. Dyeing woollen goods. Nov. 4.
,, 23,950. Lye and Lye. Dyeing wool, hair, cotton, and linen fibres in sliver, yarn, or thread, and apparatus employed therein. Nov. 5.
,, 24,207. Robertson. Process of dyeing cotton and linen in mixture, textiles, goods, &c., composed of wool and cotton; wool, cotton, and linen; wool, silk, and cotton; and wool, silk, cotton, and linen. Nov. 9.
,, 24,285. De Keukelaere. Machine for dyeing and otherwise treating textile materials. Nov. 9.
,, 24,329. Mycock. Process of producing figured indigo dyed textile fabrics. Nov. 10.
,, 24,412. Owens. Machine for dyeing or otherwise treating fibrous material in cop or other compact form. Nov. 11.
,, 24,505. De Naeyer. The dyeing or otherwise treating with liquor of textile materials in rolls, spools, cheeses, or the like. [Appl. in Belgium, Nov. 26, 1903.]* Nov. 12.
,, 24,545. Spivey. Apparatus for distributing oil or other liquid upon fibres. Nov. 12.
[C.S.] 24,666 (1903). Tomlinson (Haas and Haas). Apparatus for treating textile piece goods with air or other gas or vapours for dyeing, bleaching, carbonising, or other processes. Nov. 16.
,, 25,891 (1903). Wood, Secombe, and Lang Bridge, Ltd. Cotton printing machines. Nov. 16.
,, 51 (1904). Morton. Manufacture of figured fabrics. Nov. 16.
,, 13,485 (1904). Thompson (Wickels Metallpapierwerke G.m.b.H.). Method of producing a silky appearance on cotton and other fabrics. Nov. 9.
,, 18,330 (1904). Beckmann. Machines for finishing fabrics. Nov. 9.
,, 21,793 (1904). Hofmann. Machines for printing yarns in several colours. Nov. 16.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

[A.] 24,456. Soc. C. et E. Chapal Frères et Cie. Machines for dyeing furs and carotting skins. [Fr. Appl., Nov. 14, 1903.]* Nov. 11.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 23,465. Hunter. Apparatus for use in the manufacture of carbonic acid gas. Oct. 31.

„ 23,473. Gibbs. *See under* IX.

„ 23,515. Johnson (Badische Anilin und Soda Fabrik). Manufacture of stable hydrosulphites. Oct. 31.

„ 23,984. Brunck. Extraction of ammonia from distillation gases. Nov. 5.

„ 24,014. Taylor. Recovery of mineral acids and other products from residual liquors containing iron. Nov. 7.

„ 24,156. Davis and Davis. Treatment of galvanisers' " waste " or " spent " pickle and obtaining useful products therefrom. Nov. 8.

„ 24,198. Howles, McDougall, and McDougall. Utilisation of crude sulphides of arsenic. Nov. 8.

„ 24,328. Gittings. Oxidising and deoxidising agents. Nov. 10.

[C.S.] 26,148 (1903). Jaubert. Preparation of oxygen. Nov. 16.

„ 28,585. (1903). Tixier, Cambier, and Adnet. Manufacture of a barium permanganate. Nov. 9.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 24,199. Frugier. Process and apparatus for disintegrating kaolinic stone and the like, and for separating the constituents thereof. [Fr. Appl., Nov. 9, 1903.]* Nov. 8.

[C.S.] 20,879 (1904). Bredel. Manufacture of quartz glass from quartz, sand, silica, and the like. Nov. 9.

„ 20,880 (1904). Bredel. Manufacture of articles from quartz glass. Nov. 9.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 23,473. Gibbs. Decomposing refractory silicates. [U.S. Appl., Oct. 30, 1903.]* Oct. 31.

„ 23,492. Gacon. Manufacture of artificial emery.* Oct. 31.

„ 23,587. Johnson. Manufacture of cement. Nov. 1.

„ 24,426. Hamblet. Brick kilns and the like. Nov. 11.

„ 24,451. Boult (Hülsberg und Co.). Impregnation of wood and other porous materials. Nov. 11.

„ 24,589. Burnet. Treatment of wood and other porous material for rendering it non-porous and impermeable to the passage of fluids. Nov. 12.

[C.S.] 23,786 (1903). Gare. Solutions for treating wood and other fibrous and porous materials or compounds. Nov. 9.

„ 28,731 (1903). Middleton. Process of manufacturing refractory material. Nov. 9.

„ 28,733 (1903). Thompson. Manufacture of bricks, tiles, slabs, &c. Nov. 9.

„ 4275 (1904). Nelson. Manufacture of slag wool, silicate cotton, or mineral wool. Nov. 9.

„ 15,057 (1904). Muller. Manufacture of a pulverulent product for coating and joining masonry or brickwork of furnaces, ovens, pipes, retorts, and the like. Nov. 16.

X.—METALLURGY.

[A.] 23,436. Angel. Concentration of zinc and other metals from sulphide ores. Oct. 31.

„ 23,508. Weiller and Weiller. Process for extracting copper from its ores. Oct. 31.

„ 23,713. Dupré (Dupré). Process for dissolving gold. Nov. 2.

„ 23,826. Davies and Clark. Metallurgical furnaces. Nov. 3.

„ 23,906. Schwarz. Process for extracting metal from ores, and apparatus for performing same.* Nov. 4.

[A.] 23,909. Barber (Kingsley). Apparatus for and process of treating sulphide and other ores.* Nov. 4.

„ 24,082. Tresidder. Manufacture of steel. Nov. 7.

„ 24,136. Angel. Reduction of sulphide ores and recovery of the metals therefrom. Nov. 8.

„ 24,175. De Dion and Bouton. Manufacture of nickel steel. [Fr. Appl., July 17, 1904.]* Nov. 8.

„ 24,231. Harvey and Wilson. *See under* I.

„ 24,232. Bayliss, Jones, and Bayliss, Ltd., and Milner. Method of melting pig iron in puddling furnaces. Nov. 9.

„ 24,445. Witter. Process of obtaining and utilising tin from tin slags. Nov. 11.

„ 24,563. Rouse and Cohn. Briquetting manganese ores or oxides and mixtures of manganese ores and iron ores. Nov. 12.

„ 24,585. Blenkinsop. Treatment of copper ore.* Nov. 12.

[C.S.] 23,861 (1903). Soc. Anon. La Neo-Métallurgie. Alloy. Nov. 16.

„ 27,172 (1903). Cowper-Coles and Co., Ltd., and Cowper-Coles. Hardening of metals and alloys. Nov. 16.

„ 28,464 (1903). Edwards. Furnaces for calcining or roasting mineral ores and desulphurising the same Nov. 9.

„ 263 (1904). Brand. Extraction of zinc. Nov. 9.

„ 3628 (1904). Brand. Extraction of zinc. Nov. 9.

„ 4706 (1904). Cunnington. Extraction and purification of zinc. Nov. 16.

„ 14,985 (1904). Cie. du Réacteur Métallurgique. Manufacture of steel and treatment of copper, nickel, and like matts. Nov. 16.

„ 20,159 (1904). Gillies. Apparatus for separating and recovering sulphides from their ores. Nov. 9.

„ 20,468 (1904). Duncan. Manufacture of steel. Nov. 9.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 23,622. Möllmann. Galvanic batteries.* Nov. 1.

„ 23,765. Rudenick. Insulating material for electrotechnical purposes. Nov. 3.

„ 23,768. Wilson, and the East Anglian Engineering Co., Ltd. Electro-magnets for extracting magnetic impurities from liquefied materials. Nov. 3.

„ 24,286. Cowper-Coles. Anodes. Nov. 9.

[C.S.] 13,489 (1904). Schnelle. Process of and apparatus for the electrical separation of granular material. Nov. 9.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 23,448. British Oil and Cake Mills, Ltd., and Pearson. Treatment of linseed oil. Oct. 31.

„ 23,727. Kuess. *See under* III.

„ 24,023. Boardman. Manufacture of soap. Nov. 7.

„ 24,100. Garrigues. Processes for the recovery of glycerin from spent soap lye, and apparatus therefor. Nov. 8.

„ 24,375. Hunter. *See under* XVII.

„ 24,440. Holoubek. Manufacture of soap, and apparatus therefor. Nov. 11.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

[A.] 23,915. Scott. Machine for the manufacture of white lead, and for use in similar processes.* Nov. 5.

„ 24,238. Gebr. Heyl und Co., and Wultze. Process for manufacturing white lead. [Ger. Appl., June 11, 1904.]* Nov. 9.

(*C.*)—India-Rubber.

[A.] 24,105. Livesay. Vulcanisers. Nov. 8.

„ 24,330. Gittings. Manufacture of india-rubber. Nov. 10.

XIV.—TANNING; LEATHER, GLUE, SIZE, Etc.

[A.] 23,569. Lauch and Voswinkel. *See under* XX.
,, 23,619. Notelle and Leroux. Method of treating corneous substances. Nov. 1.
24,408. Fell. Treatment or finishing of hides or skins. Nov. 11.
,, 24,456. Soc. C. et E. Chapal Frères et Cie. *See under* VI.

XV.—MANURES, Etc.

[A.] 23,850. Seaman. Scheme to preserve and use bacteria for fertilisers. Nov. 4.
[C.S.] 494 (1904). Myers. Manufacture of a fertiliser or manure. Nov. 16.

XVI.—SUGAR, STARCH, GUM, Etc.

[A.] 24,374. King (Bertels). Process for the separation of alkaline salts contained in sugar-juice and the subsequent extraction of crystallisable sugar. Nov. 10.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 23,597. Rübsam. Processes of preparing beer wort. Nov. 1.
,, 24,368. Hewer. Process for infusing and extracting hops. Nov. 10.
,, 24,375. Hunter. Method of and means for treating or purifying wines, spirits, or the like; applicable also to oils and certain other substances. Nov. 10.
[C.S.] 5774 (1904). Mead. Apparatus for use in fining malt liquors. Nov. 16.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 23,616. Fulda. Preserving animal food substances. Nov. 1.
,, 24,174. Overbeck. Method of separating arsenic from liquid food materials, whether used as a liquid or treated or combined with other material to produce a more or less solid food. Nov. 8.
,, 24,430. Mitchell. Producing proteid. Nov. 11.
,, 24,527. Mitchell. Process for the production of proteid. Nov. 12.
[C.S.] 6720 (1904). Rayner (Maemecke). Manufacture of milk powder. Nov. 16.

(*B.*)—Sanitation; Water Purification.

[A.] 23,640. Spence, Spence, and Peter Spence and Sons, Ltd. Treatment of sewage and other similar sludges. Nov. 1.
,, 23,641. Spence, Spence, and Peter Spence and Sons, Ltd. Treatment of certain waste waters. Nov. 1.
,, 23,747. Bolton and Mills. Apparatus for the automatic filtration or treatment of sewage or other impure liquid. Nov. 3.
,, 23,924. Spence, Spence, and Peter Spence and Sons, Ltd. Treatment of certain waste waters. Nov. 5.
[C.S.] 20,889 (1904). Kremer and Schilling. Method of and apparatus for the bacterial purification of sewage and the like. Nov. 9.
,, 21,777 (1904). Schou. Water-purifying apparatus. Nov. 16.

(*C.*)—Disinfectants.

[A.] 23,463. Hawliczek. Disinfectant and detergent compounds. Oct. 31.
,, 24,015. The Scottish Peat Industries, Ltd., and Meilke. Disinfecting powders. Nov. 7.
[C.S.] 16,715 (1904). Woollard and Batten. Insect destroyer and disinfectant powder. Nov. 9.
[C.S.] 21,053 (1904). Morgan. Method and process of disinfecting. Nov. 9.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 24,083. Johnson (Badische Anilin und Soda Fabrik). Manufacture of acetylated cellulose. Nov. 7.
[C.S.] 27,738 (1903). Strange, Garle, and Longsdon. Treatment and utilisation of residual matters containing alkaline and organic substances, such as the residual matters resulting from the treatment of esparto grass, straw, wood, and the like, with alkali in the preparation of paper pulp. Nov. 16.
,, 21,101 (1904). Birkbeck (Brooks). Process of making a substitute for cork. Nov. 9.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 23,569. Lauch and Voswinkel. Manufacture of condensation products from tannin like substances and urea by means of formaldehyde.* Nov. 1.
,, 23,578. Knoevenagel. Manufacture of odoriferous compounds or perfumes. [Ger. Appl., Nov. 10, 1903.]* Nov. 1.
,, 23,729. Luttke, Arndt, und Löwengard. Preparation of condensation products from *p*-aminophenol with aldehydes.* Nov. 2.
,, 23,974. Abel (Act.-Ges. f. Anilinfabr.). Manufacture of o-oxybenzene carboxylic acid esters of the phenyl or naphthyl series. Nov. 5.
,, 24,297. Gittings. *See under* III.
,, 24,298. Gittings. Manufacture of menthol and camphor. Nov. 10.
,, 24,494. Dakin. Manufacture of a chemical substance and of allied bodies and intermediate products. Nov. 11.
,, 24,536. Ewan and Young. Manufacture of guanidine salts. Nov. 12.
[C.S.] 24,631 (1903). Fourneau. Preparation of amino alcohols and their derivatives. Nov. 16.
,, 449 (1904). Fehrlin. Production of compounds of pyrocatechuicmonoalkylethers, and especially of guaiacol and guaethol with protein substances. Nov. 9.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 23,766. Höchheimer. Photographic pigment paper. Nov. 3.
,, 23,900. Boguerts. Reproduction of pictures. Nov. 12.
,, 24,235. Crocker. Method of photography. Nov. 9.
,, 24,290. Koppmann. Process for producing coloured photographs. Nov. 9.
,, 24,341. Gittings. The art of photography. Nov. 10.
[C.S.] 808 (1904). Riebensahm and Koppmann. Process for producing coloured photographs. Nov. 16.
,, 20,954 (1904). Schmidt. Arrangement of films and filters for three-colour photography. Nov. 9.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 23,973. Mitchell. Explosives.* Nov. 5.
,, 23,986. Carter and The New Explosives Co., Ltd. Manufacture of compressed gun-cotton. Nov. 5.
,, 24,223. Hargreaves, and Curtis's and Harvey, Ltd. Blasting compounds. Nov. 9.
[C.S.] 21,481 (1903). Bowen. Explosives. Nov. 16.
,, 21,482 (1903). Bowen. Explosives. Nov. 16.
,, 28,710 (1903). Russell. Explosives for blasting or like purposes. Nov. 9.
,, 20,106 (1904). Evangelidi. Explosives. Nov. 9.
,, 21,204 (1904). Soc. de la Poudre Peigne et des Brevets J. Luciani. Manufacture of gunpowder. Nov. 16.

Printed and Published by Eyre and Spottiswoode, East Harding Street, London, E.C., for the Society of Chemical Industry.—P 670.

JOURNAL OF THE
Society of Chemical Industry.

A RECORD
FOR ALL INTERESTED IN CHEMICAL AND ALLIED MANUFACTURES.

ISSUED TWICE A MONTH.

No. 23.—Vol. XXIII. DECEMBER 15, 1904. No. 23.—Vol. XXIII.

Subscription of Members 25/- per annum;
Entrance Fee 21/-;
Election by the Council.

Price to Non-Members 36/- per annum;
To Members 25/- per Set of extra or back numbers.
Single copies (Members and Subscribers only),
1882—1901, 2/6 each; 1902 *et seq.*, 1/9 each.

The Society of Chemical Industry.

Past Presidents:

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
Sir James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., F.R.S.	1891—1892.
Sir John Evans, K.C.B., D.C.L., LL.D., Sc.D., F.R.S.	1892—1893.
E. C. C. Stanford	1893—1894.
T. E. Thorpe, C.B., LL.D., Sc.D., Ph.D., F.R.S.	1894—1895.
Thomas Tyrer	1895—1896.
Edward Schunck, Ph.D., F.R.S.	1896—1897.
Frank Clowes, D.Sc.	1897—1898.
George Beilby	1898—1899.
C. F. Chandler, D.Sc., M.D., Ph.D., LL.D.	1899—1900.
Sir Jos. W. Swan, D.Sc., M.A., F.R.S.	1900—1901.
Ivan Levinstein	1901—1903.
Sir W. Ramsay, K.C.B., D.Sc., LL.D., F.R.S.	1903—1904.

COUNCIL FOR YEAR ENDING JULY 1905.

President: Dr. Wm. H. Nichols.

Vice-Presidents:

Prof. P. Phillips Bedson.
Dr. Virgil Coblentz.
Dr. Edw. Divers, F.R.S.
Prof. W. R. E. Hodgkinson.
E. Grant Hooper.
David Howard.
Ivan Levinstein.

Official Notices.

NEW SECTION FOR NEW ENGLAND, U.S.A.

The Council has granted the application of eighty members of the Society residing in the States of Maine, New Hampshire, Vermont, Connecticut, Rhode Island, and Massachusetts, to be allowed to form a section, to be called the New England Section of the Society.

THE JOURNAL.

From the beginning of next year the Society's Journal will be printed and published by Messrs. Vacher and Sons, Great Smith Street, Westminster, S.W., to whom all communications regarding subscribers' copies and advertisements should be sent.

SUBSCRIPTIONS FOR 1905.

Members are reminded that the subscription of 25*s.* for 1905, payable on January 1st next, should be sent in good time to the Hon. Treasurer (Mr. Samuel Hall), in order to ensure continuity in the receipt of the Society's Journal. Any changes of address to appear in the new List of Members now in course of preparation should reach the General Secretary not later than January 15th, 1905.

COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Adams, M. A., l/o Ashford Road; The Kulm, Bearsted, near Maidstone.

Allen, W. W., l/o Broadway; 25, Broad Street, New York City, U.S.A.

Baty, E. J.; all communications to Nunclose, Prince's Avenue, West Kirby, Liverpool, Works Chemist.

Berolzheimer, D. D., l/o Philadelphia; 1, West 92nd Street, New York City, U.S.A.

Broadhurst, W. H., l/o 294; 290, Lafayette Avenue, Brooklyn, N.Y., U.S.A.

Burgess, W. T., l/o Holland Park; 20, Priory Road, Bedford Park, W.

Campbell, Jas. E., l/o Chandler Street; 22, Shirley Street, Worcester, Mass., U.S.A.

Darling, G. A., l/o Johannesburg; c/o Lisbon Berlyn, Ltd., Frankfort, Pilgrim's Rest, Transvaal.

Duncan, Jas.; Journals to Hotel Bristol, San Remo, Italy.

Dyck, Geo. E., l/o Chicago; c/o Morris and Co., South Street, Joseph, Mo., U.S.A.

Erskine, J. K.; all communications to c/o New Kleinfontein Co., P.O. Benoni, Transvaal.

Fitch, A. J.; Journals to 19, Grange Road, Canonbury, N.

Fotheringham, John; communications to 28, Barnwell Terrace, Govan, Glasgow (temporarily).

Garry, H. Stanley, l/o Clipstone Avenue; 66, Mapperley Road, Nottingham.

Hall, Prof. Robt. W., l/o New York; Denver, Colo., U.S.A

Hall, S. Godfrey; Journals to 19, Aberdeen Park, Highbury, N.

Harris, F. W., l/o Montrose Street: Corporation Chemical Department, 26, John Street, Glasgow.

Hurry, E. H., l/o Westbourne Grove; Goodwyns, Haslemere.

Jewell, W. M.; Journals (temp.) to c/o G. W. Wright, Norfolk, Va., U.S.A.

Jones, Arthur B.; Journals to 452, Russell Avenue, Cleveland, Ohio, U.S.A.

Leese, Jos., jun., l/o Plymouth Grove; 13, Albert Place, Longsight, Manchester.

Luck, A. Courtenay, l/o Stowmarket; Naval Arsenal, Zarate, Argentina.

Meldrum, Dr. Andrew N., l/o Mid Stocket Road; 16, Moor-oaks Road, Aberdeen.

Merry, John B.; Journals to 61, Woodfield Road, King's Heath, near Birmingham (temporarily).

O'Neill, Chas., l/o Buenos Aires; c/o The British Dyewood and Chemical Co., 33, Faulkner Street, Manchester.

Renwick, F. F., l/o Woodford Green; Hylands, Brentwood, Essex.

Royle, C. L.; Journals to 329, Upton Lane, London, E. (temporarily).

Rumbold, Wm. R., l/o Holmwood; 47, Watling Street, London, E.C.

Shorey, Dr. Edmund C., l/o Board of Health; P.O. Box 360, Honolulu, Hawaii.

Stockdale, E., l/o Birstall; c/o E. Dewhurst and Co., Ltd., Printworks, Batley, Yorks.

Voss, Walter A., l/o South Norwood; Eastwood Road, Rayleigh, Essex.

Watkins, Norman; Journals to 1701, Makiki Street, Honolulu, and (subscriptions) Box 767, Honolulu.

Wilkinson, Walter S., l/o Baltimore; P.O. Box 285, Wytheville, Va., U.S.A.

Willard, Chas. T., l/o Schenectady; c/o Singer Manufacturing Co., Elizabethport, N.J., U.S.A.

CHANGES OF ADDRESS REQUIRED.

Brach, Dr. L., l/o 223, Central Avenue, Norwich, Conn., U.S.A.

Weil, Jacob A., l/o Power Gas Corporation, Ltd., 39, Victoria Street, Westminster, S.W.

Weston, Wm., l/o H.M. Dockyard, Portsmouth.

Death.

Drown, Prof. T. M., Lehigh University, South Bethlehem, Pa., U.S.A. Nov. 16.

Annual General Meeting,

NEW YORK, 1904.

DETROIT, MONDAY, SEPT. 26TH.

While in Detroit the members were the guests of Messrs. Parke, Davis, and Co. On arrival they were received by Mr. Parker (of the City department of the firm) and Mr. F. M. Fisk (the London representative), and taken to the Russell House, where breakfast was served. They were then conveyed in trolley-cars to the factory, where they were received by Mr. E. G. Swift, general manager; Mr. J. C. Spratt, business manager; Dr. F. G. Ryan, chief of the manufacturing department, and others of the directors. The factory is situated on the river front, with plenty of space, the research laboratory being in a handsome detached building surrounded by lawns, and the biological stables separated from the works by a road. Across the river is Canada, where, within sight, the firm has another factory. Groups of ten, conducted by one of the heads of departments, were shown round the pill department—cutting, forming the mass, drying, sugar and gelatin coating, manufacture of globules; and the tablet department—compressing, triturating, and coating. Fire drill then took place in the inner courtyard on a preconcerted signal, whereon all workmen left their tasks, and proceeded to allotted posts without confusion or disorder. The visitors then proceeded through the hypodermic tablet and correspondence departments to see the manufacture of glassware (including vaccine points, serum bulbs, and hypodermic tubes), paper boxes, granular effervescent salts, lozenges, and tablet milling and granulating. Next came the drying of digestive ferments, and the binding and mailing of the firm's literature. After the crude drug and pressed herb, milling and printing departments had been inspected, the chemical department was shown, in which the preparation of digestive ferments, extracts, percolates, and soluble elastic capsules is carried on, finishing with the pharmaceutical department and power plants (electricity, compressed air). The stock, finishing, bottle-washing, and shipping departments came next, and then the party assembled on the river front to see the City fireboat throw 5000 galls. of water a minute. In the Scientific Building, of which Drs. McClintock and Houghton are directors, the departments of analysis and experimental medicine were thrown open for inspection. Behind glass partitions trained assistants were seen preparing, finishing, and filtering serums in special aseptic rooms. One of the laboratories in the Department of Experimental Medicine is devoted almost exclusively to the work of testing different antiseptics for germicidal power.

This property can be accurately determined by exposing cultures of the *Bacillus pyocyaneus*, the most resistant of vegetative forms of bacteria, to the action of certain dilutions of the disinfectant to be tested, transferring such cultures from the disinfectant to plain bouillon, in which the result, after a suitable period of incubation, is noted. In this manner a certain standard can also be established to which disinfectants must conform before being placed upon the market.

Physiological Testing of Adrenalin.—In determining the activity of solutions of adrenalin or other suprarenal extracts, the almost immediate characteristic rise in blood pressure peculiar to this drug, when injected intravenously, is taken as the index of its activity. This rise in blood pressure can be made quantitative by measuring the height to which a certain weight of mercury is raised by the action of a definite amount of adrenalin.

Standard and sample to be tested are injected alternately nto the veins of an animal, the dose of the sample being changed if necessary until the rise in blood pressure caused by each is the same. The delicacy of a physiological test s well illustrated by the effect of minute quantities of adrenalin on the blood pressure. An appreciable change n the blood pressure can be induced by a difference of 3 per cent. in the amount used, equal to 0·0000003 grm. of pure adrenalin.

The biological stables, the vaccine-propagating rooms, operating room, guinea-pig loft, and dog and rabbit cages were visited, and, in the horse-operating room, Dr. Dunckley, he firm's veterinary surgeon, injected toxin into one horse, and had another brought in to show the mode of drawing off the blood into sterilised tubes.

The party then returned to the Russell House, where uncheon was provided, at which the Mayor of Detroit (the Hon. Wm. Mayberry) made an eloquent speech. The fternoon was passed in driving in four-in-hand coaches, hrough the boulevards and suburbs of the city to Belle sle, an island park of great beauty. The day's hospitality oncluded with a dinner at the Russell House, at which were present the chief officers of the company and principal members of the staff. Prof. A. B. Prescott and Prof. Campbell, of the University of Michigan, Sir Wm. Ramsay, Prof. Erdmann, Prof. V. Coblentz, Dr. Lewkowitsch, Mr. Thos. Tyrer, and Mr. Eustace Carey spoke on behalf of he guests, and Mr. Switt and Mr. Spratt on behalf of Messrs. arke, Davis, and Co. Dr. Ryan acted as toastmaster.

NIAGARA AND BUFFALO, Tuesday, Sept. 27th.

Buffalo and Niagara Falls Reception Committee

G. P. Girdwood.
W. R. Lang.
F. J. Smale.
H. Van der Linde.

On arrival at Niagara Falls, each visitor was presented with a copy of "The Niagara Falls Electrical Handbook," published under the auspices of the American Institute of Electrical Engineers for the guidance of visitors from abroad attending the International Electrical Congress at St. Louis. It contained authoritative information concerning Niagara Falls, the numerous power developments on both sides of the river, and the various industries. After breakfast at the International Hotel, the Gorge Railway trolley cars were taken for a trip down the Niagara Gorge, past the Whirlpool Rapids on the American side, to Lewiston, thence across the bridge to the Canadian side, and back along the Gorge to Queen Victoria Park. Here lunch was provided by the Canadian Section in the new refectory.

After luncheon the two great power houses of the Niagara Falls Power Company were visited. These give a total of 100,000 horse power from water taken from the Niagara River, a mile above the falls, on the American side. All this is sold, at from 4*l.* to 5*l.* per horse power, to industries in Niagara, Buffalo, Tonawanda, and Lockport; other schemes are in progress on the Canadian side. Then the International Acheson Graphite Co.'s plant, with the highest temperature electric furnaces in existence, was visited. In the evening another trip was made down the gorge, preceded by a search-light car, which illuminated the rapids in various colours.

Wednesday, Sept. 28th.

The power-house of the Niagara Falls Hydraulic Power and Manufacturing Co.—which works a railway of 360 miles, the tramway running round the gorge, all the trolley lines in the district, all the street lighting, and the chief electrolytic plants—was visited. Some went also to the Natural Food Co.; others visited the islands above the falls, the Cave of the Winds, or viewed the falls from the steamer "Maid of the Mist."

At 11.15 the train left for Buffalo, where the visitors were received enthusiastically and entertained at the Ellicott Club. Then they went on board special fireboats in order to inspect the harbour and the new Lackawanna steel plant, the largest in the world. On their way back they landed for a while on the gigantic breakwater, which protects Buffalo from the storms which occasionally affect Lake Erie, and here saw an exhibition of fire practice. The Larkin Soap Co.'s works were also opened to the members of the Society. On their return they were received at the Buffalo Club, where many of the most prominent ladies and gentlemen in the city assembled to honour the Society.

The Society is particularly indebted to Mr. Chas. E. Acker, Chairman of the Reception Committee; to Mr. E. B. Stevens, President of the Niagara Research Laboratories; Dr. Roswell Park; Mr. Chas. W. Goodyear; Mr. H. M. Poole, President of the Ellicott Club; Mr. Pendennis White, President of the Buffalo Club; Mr. Francis D. Ward, Commissioner of Public Works; and Dr. Lee H. Smith, all of Buffalo, for the hearty reception given to the members.

BOSTON, Thursday, Sept. 29th.

Reception Committee.

Godfrey L. A. Cabot, Chairman.
Henry Howard, Secretary.
W. H. Walker, Treasurer.

F. E. Atteaux.
E. F. Billings.
A. L. Cochrane.
W. J. Webber.
Henry Wood.

Ladies' Committee.

Mrs. Charles Eliot.
Mrs. Edgar F. Billings.
Mrs. Henry Howard.
Mrs. W. H. Walker.
Mrs. W. J. Webber.

On arrival the members and ladies were conveyed to the Hotel Somerset, the headquarters. After breakfast they inspected the laboratories of the Massachusetts Institute of Technology, so long associated with the name of the late Prof. T. M. Drown. The Public Library, with its staircase embellished by the frescoes of Puvis de Chavannes; the reading room, with its frieze illustrating the "Quest of the Holy Grail," by Abbey; and the upper gallery, decorated by Sargent; and the Art Gallery, were also visited.

Thence they proceeded to Harvard University, Cambridge, Mass., where they were welcomed by President Eliot, formerly Professor of Chemistry at the Mass. Inst. of Technology, and Prof. T. W. Richards. After lunch the principal laboratories and buildings were shown. In the museum there is a remarkable collection of reproductions of flowers in glass, given in memory of Dr. C. E. Ware, and made by Messrs. Leopold and Rudolph Blaschka, of Austria. Additions are constantly being made to this collection, which is said to be entirely a labour of love on the part of the makers.

On leaving the University the members started to drive through the parks and environs of Boston to the Country Club, but were overtaken by a storm, and were reluctantly compelled to abandon the excursion.

At a smoking concert at the Hotel Somerset, in the evening, Sir Wm. Ramsay presented, on behalf of the visiting members, addresses and a small memento, in the shape of a gold match-box, to the following gentlemen, on whom had fallen the organisation and conduct of the tour:—Dr. L. Baekeland, Prof. M. T. Bogert, Prof. V. Coblentz, Dr. E. G. Love, Dr. R. W. Moore, Mr. T. J. Parker, Dr. H. Schweitzer, Mr. R. C. Woodcock, and Mr. C. B. Zabriskie. A silver cigarette case was also presented to Mr. H. C. Bates, the agent of the Pennsylvania Railroad, in recognition of his courtesy and attention.

Friday, Sept. 30th.

Parties of members visited the works of the Merrimac Chemical Co. and the Cochrane Chemical Co., both of which manufacture heavy chemicals; the New England Coke and Gas Co., with its 500 coke ovens of the Otto-Hoffman type; the Hamilton Print Works, where also all kinds of cotton goods are manufactured, bleached, and dyed; and the Douglas Shoe Co., which makes 10,000 pairs per day.

The New England Gas and Coke Co.—To Mr. Henry M. Whitney, of Boston, chiefly belongs the credit of the inception of this enterprise. From a very inferior coal, which could be very cheaply mined, it was proposed to obtain a merchantable coke containing little sulphur and a large amount of gas, for which there was an immediate sale in the neighbourhood of Boston. It was then proposed to associate this enterprise with the Massachusetts Pipe Line Co., which possessed rights of way all over the State of Massachusetts. Coke ovens, to the number of 400, were erected, agreements effected with adjoining companies, and the by-products were worked up in the immediate vicinity by subsidiary companies. After a period of considerable stress, the gas interests of Boston and the surrounding districts were brought under one management, and the experiment is now to be tried of conducting and selling coke-gas made from by-product ovens to communities at a considerable distance for fuel and light, and recovering the ammonia, tar, and other by-products.

In the afternoon the members and ladies assembled at the Point Shirley Club, at the seaside, near Boston Harbour, to partake of a clam-bake, cooked by a method which is a survival of an aboriginal custom before cooking utensils were introduced. The bake was served at 5 o'clock. Mr. F. E. Atteaux was toastmaster, and Sir Wm. Ramsay, Dr. Wm. H. Nichols, Prof. H. Walker, Mr. W. Henry Howard, and Mr. Armstrong were among the speakers. The party then broke up, some returning to New York, and others going on to Canada.

On Oct. 4th, Columbia University conferred the degree of D.Sc. on Sir Wm. Ramsay and Dr. Wm. H. Nichols. In the evening Sir Wm. Ramsay was entertained at a banquet by the Brooklyn Institute of Arts and Sciences. Prof. Irving W. Fay presided, and among those who sat at the guest table were Prof. C. F. Chandler, Dr. H. W. Wiley, Dr. F. W. Atkinson (President of the Brooklyn Polytechnic Institute), Prof. John S. McKay, Dr. Wm. H. Nichols, Mr. Fred B. Pratt, and the Rev. Dr. S. Parkes Cadman.

On Oct. 5th, Sir Wm. Ramsay and many members and ladies sailed for England by the s.s. "Baltic."

On Oct. 7th, a meeting of the New York Section of the American Chemical Society was held, preceded by a dinner at the Hotel Savoy, to which the members of the Society were invited. Dr. F. D. Dodge was in the chair, and papers were read by Messrs. Chas. Baskerville and Fritz Zerban on "Inactive Thorium," and by Mr. D. D. Jackson on the "Use of Copper Sulphate as an Algæcide in the Treatment of Water Supplies." Dr. J. Lewkowitsch also delivered an address on the "Recent Advances in the Chemistry of Fats."

Canadian Section.

Meetings held at Toronto, on Oct. 27th and Nov. 24th, 1904.

DR. F. J. SMALE IN THE CHAIR.

A discussion on "Smoke Consumers and Flue Gases" was introduced on Oct. 27th by Dr. W. B. Cohoe and Mr. Jas. Milne, after which the subject was thrown open for general discussion.

On Nov. 24th a discussion took place on "Boiler Waters and Compounds," in which Profs. Ellis and Lang, Drs. Allan and Kenrick, Messrs. Taylor, Van der Linde, Bain, Murray, and Sparrow, and the Chairman took part. The meeting was well attended.

The aim of the Committee has been to make such a selection of subjects as will be of general interest to manufacturers. Among other papers promised are: "Producers and Gas Engines," "Food Preservatives," and "Manufacture of Artificial Silk."

Newcastle Section.

Meeting held in the Chemical Lecture Theatre of the Armstrong College, Thursday, October 20th, 1904.

CHAIRMAN'S ADDRESS.

THE FUSION OF REFRACTORY MATERIALS.

BY J. T. DUNN, D.Sc.

Refractory materials have an important bearing upon many branches of chemical and metallurgical industry; and with the progress of these industries greater demands are continually being made upon such materials. Furnaces and crucibles have to resist higher temperatures and the attack of more vigorous reagents; processes are conducted for longer periods continuously, and larger bulks of material, involving larger apparatus, and consequently increased pressure on its walls, are dealt with. Hence the testing of the materials of which furnaces, crucibles, retorts, &c. are made, is becoming a matter of wider scope, and one requiring more care and attention than was formerly the case.

Many things are required of a refractory material: and the nature of these requirements naturally varies with the particular service which it has to serve. One of the most important, and the most general, is of course that it should resist a high temperature without softening or melting: and the determination of the melting points of fireclays, silica bricks, and similar substances, is consequently a matter of some importance. To this point I propose to confine myself o-night.

It is perhaps hardly necessary to say that the basis of clays, kaolinite or "claystuff," is a silicate of aluminium having approximately the composition represented by $Al_2O_3.2SiO_2, 2H_2O$; and that china clay consists of practically pure kaolinite, while other clays contain in addition mall amounts of other silicates or metallic oxides—those of ron, manganese, calcium, magnesium, and the alkalis—ogether with more or less mechanically mixed sand or other mineral fragments. It was early recognised that great ifferences in refractoriness or fusibility existed among lays; and as, on the whole, the more impure clays were ound to be the more easily fusible, the idea gained ground hat the fusibility of a clay depended entirely upon the ercentage of these foreign silicates or oxides, which were ence spoken of as "Flussmittel" or "fluxing-stuff." The elative refractoriness of a clay was thus estimated from he amount of these "fluxing-stuffs" which chemical nalysis showed to be present. Cases which contradicted his assumption, however, were not long in accumulating; nd Bischof about 1860 undertook an experimental investi- ation into the question. He heated in a wind furnace lica, alumina, kaolin, and mixtures of this with alumina d with silica in various proportions, and determined their lative fusibilities. While recognising the influence of e "fluxing-stuffs" in a clay upon its melting-point, he me to the conclusion that the determining factor was the oportion of alumina, and that the greater the percentage alumina a clay contained the more refractory would it . He endeavoured to express the relative fusibilities of ays by "coefficients," calculated from the ratios between umina and silica, and alumina and fluxing stuffs, shown the analysis.

Richters, in 1868, published a long series of very care- ly conducted experiments on the question, as a result of ich he concluded that no one factor was determinative. hile agreeing with Bischof, that of the pure aluminium icates, those high in alumina were more refractory than ose high in silica, he found that the fusibility increased, a given clay, with increase of fluxing stuff: that quan- ies of different fluxing-stuffs proportioned to their emical equivalents produced equal effects in lowering the lting point: that the effect of a mixture of different xing-stuffs was the sum of the separate effects that each nstituent of the mixture would have produced alone: d that a given percentage of fluxing-stuff produced the eater effect in lowering the melting point, the greater the portion of silica in the clay. He calculated from the alyses formulæ expressing the relative molecular propor- ns of alumina to silica, and of both to fluxing-stuff—mulæ of the type $x(Al_2O_3.ySiO_2) + RO$; such a formula es, according to Richter's results, an indication of the ibility of the clay, which is the more refractory as x is eater or as y is less.

Seger, in several of his early writings on the subject, phasised strongly—what had indeed been recognised by chof and by Richters—the importance of the mechanical l "rational" analysis of the clay. He pointed out very arly that a quantity of silica present as sand was by no ans the same thing as an equal quantity already com- ed as silicate with the alumina present, and that the nature of the sandy particles or mineral fragments intermixed with the clay stuff proper had a considerable influence on the fusibility of the clay. A clay (still more a brick, made of a mixture of the clay with small fragments of the already burnt clay, or with similar refractory materials) is not a homogeneous substance, but a mixture of substances, which not only have different melting points, but which are more or less capable when melted, by reacting on one another, to form new substances, the melting points of which are different from, and usually lower than, those of the original substances. Accordingly, when such a clay is heated, liquefaction begins at the melting point of the most fusible constituent; and if this be present in large proportion the substance will run down at this temperature to a liquid containing in suspension the solid particles of the less fusible constituents. If the latter predominate, however, they will form a solid framework which will preserve the original shape of the piece, and will hold in its interstices the liquefied portion, as a knob of sugar will hold a drop of water. But as the water will gradually dissolve sugar till saturated, and may cause the disintegration and flow of the whole lump; so the liquefied portions of the clay, kept at the same temperature, may act chemically upon the solid portions, and if in doing so they form more fusible compounds may lead to the ultimate liquefaction of the whole. The rate at which this will occur must obviously depend, not only on the chemical nature of the materials, but also the fineness of the grinding, and the more or less intimate mixture of the different constituents. It will thus be clear that two clays or bricks may glaze or vitrify on the surface at the same temperature, but that while one may gradually at that temperature, and very rapidly if the temperature be but slightly raised, liquefy completely, the other may remain practically solid till a much higher temperature is reached.

The practical determination of the melting-points of clays is a matter of considerable difficulty, on account of the high temperatures involved; and for the most part investigators have contented themselves with ascertaining the order of fusibility, and have not ventured to state definite melting-points in thermometric degrees. Bischof in his earlier experiments compared clays by determining for each the proportion of pure quartz sand with which it must be mixed in order that it should run down to a liquid at the same temperature as a standard refractory clay: the greater the amount of quartz sand needed for this the lower the melting-point of the clay. But this method assumed that the physical or mechanical support afforded by the quartz sand was not interfered with by the chemical action referred to above; and it was later abandoned by Bischof in favour of the method of comparison with normal or standard clays. He collected a series of seven standard clays, each very uniform in character, and each melting at a higher temperature than that which preceded it. Prisms of these and of the clay to be tested were heated together in a crucible in a wind-furnace till the test-piece melted; an examination of the standards, melted and unmelted, then enabled him not only to place the test between two, but as a rule to say whether it was nearer to that below or that above it in the series. Richters used a method externally similar to Bischof's earlier one, but used a temperature—that at which wrought iron melts—at which reaction between the clay and alumina, or the clay and silica, will occur. The clay to be tested was intimately mixed with varying quantities of alumina or of silica, according as preliminary experiments had shown that it was readily fusible or highly refractory; and prisms made of these mixtures were submitted to the given temperature for two hours—long enough for complete reaction to occur. The amount of alumina or of silica needed to produce a test piece, which, under this treatment became completely glazed over the surface—neither running down on the one hand nor remaining unchanged on the other—afforded a measure of the refractoriness of the clay. Seger greatly facilitated these determinations by the introduction of his "cones." These are mixtures of kaolin with quartz, alumina, felspar, and other materials, graduated in such a way as to form a series, the melting points in which rise from member to member. These are made into little narrow triangular pyramids a couple of centimetres high, and the test-piece is heated in a crucible along with three or four of these, of melting-points above and below the expected melting-point of the clay. The principle is precisely similar to that of Bischof's method with standard clays, but the "cones" possess the advantages over the standard clays of being more closely graduated, of being reproducible indefinitely, and of thus allowing comparison between the results of different experimenters at different times and in different places. The melting-points of some of the cones have been compared by Hecht with the indications of the thermo-electric pyrometer; but the temperatures given for the higher cones are probably only rough approximations.

In my own practice I have hitherto used exclusively the Seger cones (or cones made from brick-clays the melting points of which had been previously determined by Seger cones) for ascertaining the melting points of clays and bricks; but I have been able to simplify and shorten the procedure very materially by using coal-gas and oxygen in the furnace. Bischof, Richters, and Seger used the Deville furnace, an air-blast furnace fed with coke or retort carbon. The temperature attained was roughly regulated by burning off at each operation a regulated weight of fuel; but this occupies a considerable time, the test-pieces cannot be examined during the operation, and the whole must be allowed to cool considerably before the crucible can be taken out and its contents examined. I have used with great advantage Fletcher's "oxygen injector" furnace. This is a small furnace with a modified "injector" burner, which is attached, however, not to an air-bellows, but to an oxygen cylinder. It is not an "oxy-coal-gas" burner, for the oxygen, issuing from the blowpipe jet under considerable pressure, entrains with it a large quantity of air, so that the gas is burnt with enriched air, and the consumption of oxygen is very small in comparison with the effect produced. A certain amount of practice and experience are needed to obtain the best results with the burner; in my early attempts I was unable in an hour and a half, and with an enormous oxygen consumption, to melt a clay at all; but now I can readily reach a sufficient temperature in from three to five minutes, though such a rapid rise is not as a rule desirable. The body of the furnace is lined with a specially refractory clay, but it will not long stand the temperature attained, and I line my own furnace with magnesia, by simply ramming it full of calcined magnesia while the blow-pipe hole is corked, and then cutting and scraping out as much as necessary. The magnesia shrinks and cracks when heated, but by cautiously filling the cracks after each operation a lining is very soon obtained which is practically free from cracks, and which, though it is very tender and will stand no rough usage, will last for weeks or months if carefully treated, and is readily renewed if it does get destroyed. I have made many attempts to manufacture crucibles which would stand in the furnace, but hitherto have not been quite successful. I work usually with those made for the purpose by the "Laboratorium für Tonindustrie" in Berlin, and find them fairly satisfactory; but though they are the best thing I have yet been able to obtain, they soften and crack when a very refractory clay or silica brick is under treatment. I am, however, still working at this question. In an actual trial, a "cone" of the clay or brick under test is bedded in a little pure alumina in the crucible along with two or three of the Seger cones—say Nos. 27, 30, 33 for a totally unknown clay. The crucible is placed in the furnace, the lid put on, the furnace covered, and a small Téclu or good-sized Bunsen burner allowed to heat the furnace up to its limit. In a quarter of an hour the furnace is red hot, and the Bunsen burner is replaced by the burner belonging to the furnace. Coal-gas and oxygen are regulated to get the best effect, and the temperature rises rapidly. After three or four minutes the gas and oxygen are turned off, the furnace cover is lifted, the crucible lid taken off, and the contents inspected. If the test-piece is not visibly affected, the lid and furnace-cover are quickly replaced, the gas and oxygen are turned on, and after one and a half or two minutes another inspection is made. This goes on till the test-piece is seen to be melting down, when the crucible is taken out, allowed to cool, and the test-piece carefully compared with the cones. It will be found quite easy to see that it is well below, well above, or very near to cone 30, say. A repetition of the experiment is then made with a new test-piece and three consecutive cones, say 29, 30, and 31; at the end of this the position of the clay will be fixed as, say, between 30 and 31. A single determination is not enough, however; it should be repeated with the test-piece and the cones occupying different positions in the crucible, so as to eliminate errors due to unequal heating. With the arrangement I have described, however, though the outer surface of the crucible itself is hotter where the blast impinges on it than in other places, yet I have not found sensible differences (not as much as one cone difference, or say 20° C.) at different points in the crucible, save when cracks have formed and allowed entrance to the flame. Sometimes a cone or the test-piece falls against the side of the crucible and fuses into it; and sometimes the temperature rises with unexpected rapidity, and all the cones are found melted. In either of these cases a repetition of the experiment is, of course, necessary. Three or four experiments can, however, be carried out completely in the course of an hour, and when the four determinations agree, as they usually do, we are fairly certain of the result. With refractory clays, when the temperature nears the softening point of the crucible, more time is often needed, for it is then not always possible to lift the crucible lid, which is half fused to the crucible, and the crucible must be taken out, cooled, and broken before an inspection can be made; and in this case, if the experiment has not reached its end, a new beginning must be made. [A demonstration of the use of the furnace was here given.]

Naturally, many other circumstances besides its melting-point influence the suitability of a clay, a fire-brick, or a silica-brick for particular purposes. On another occasion I may have something to say in regard to some of these; but the determination of the melting-point is at least a first and an important criterion, for if the substance melts at too low a temperature any virtues it may possess in the way of mechanical strength or chemical resistivity are of no avail in high-temperature operations.

Meeting held at Armstrong College, on Thursday, November 17th, 1904.

DR. J. T. DUNN IN THE CHAIR.

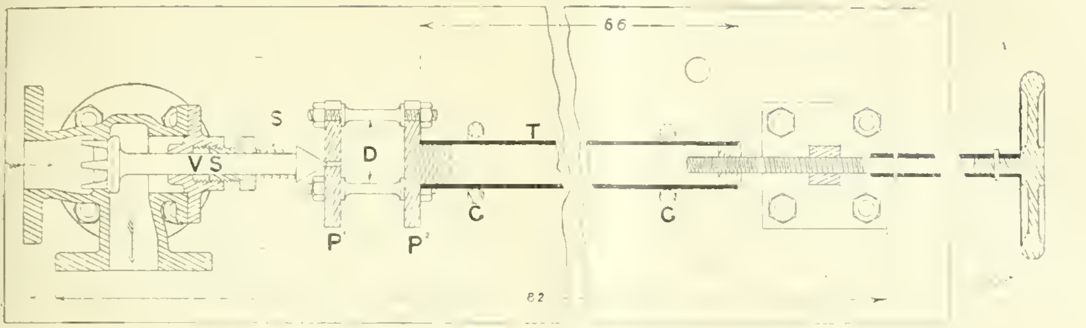
NOTES ON SOME TEMPERATURE REGULATORS.

BY WILLIAM H. SODEAU, B.Sc., F.I.C.

I. *A Steam Regulator with Expanding Tube.*—Five double-walled huts, each of about 400 cb. ft. capacity, had to be constantly maintained at different temperatures up to 60° C. by means of steam coils located beneath false floors. Each had been fitted with a commercial form of thermoregulator in which a $1\frac{1}{2}$ in. mitre valve was controlled by the expansion of a zinc tube 66 ins. in length, directly connected to the valve spindle by means of a wooden insulator. Such a tube expands rather less than 0·002 in. for 1° C. rise of temperature; hence all connections in such a device must be free from any appreciable play in order that a slight rise of temperature may occasion a reduction of the opening of the valve, and *vice versa.* The baseboards of these regulators were, however, of wood, and the bolts passing through them were continually becoming slack, whilst the wooden insulators led to similar trouble. When the author took over the charge of these huts all the regulators had failed, from these and other defects, and the heating was being controlled by means of the external stop-valves.

Three of the regulators were reconstructed (Fig. 1) so as to ensure accurate action. In each, the baseboard was replaced by a slab of slate to which the parts were attached by means of steel taper bolts, having about the same coefficient of expansion as the slate. Conduction of heat from the valve to the tube was greatly reduced by fitting the end of the valve spindle VS with a steel conical cap, the point of which rested in a hole drilled through a circular steel plate P_1. A similar plate P_2 on the end of the zinc tube T was connected to P_1 by means of three steel distance pieces D, slipped into slots in the plates, stiff paper being used to prevent metallic contact. All play was taken up by

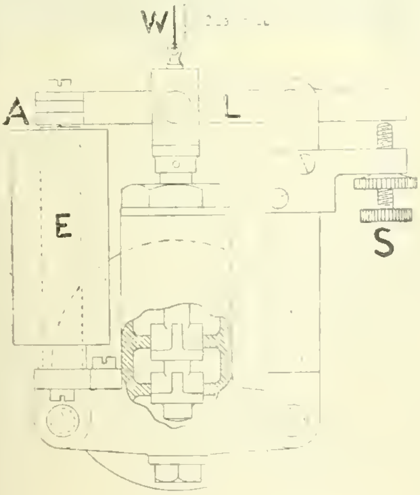
FIG. 1.



neans of a stiff spiral spring S, coiled around the external ortion of the valve spindle and tending to open the valve nore fully whenever the zinc tube contracted on account of fall of temperature. The zinc tube was supported by neans of guides G, and was prevented from rotating by a in sliding in a slot (not shown in the figure). The further nd of the tube was adjusted by means of a differential crew (16 and 12 threads), one turn of which made an lteration of $\frac{1}{48}$ in., equal to 16° C. change of temperature. By means of a piece of gas pipe, this screw was connected o a handwheel outside the hut so that the setting could be ltered without opening the door. Each regulator was onnected to a pipe conveying steam, at a pressure of about 0 lbs. to the square inch, which had been passed through a eparator in order to remove water and impurities which night tend to clog the valve.* These three regulators ran ontinuously for many months without giving any trouble. 'he temperature in each hut, as indicated by a long-stemmed hermometer having its bulb on the opposite side of the ut, was read every half hour throughout both day and ight, and rarely varied more than ± 1° C. from the intended eading. Any desired alteration of temperature could be apidly effected by turning the handwheel to the appropriate xtent as indicated above.

II. *An Electro-magnetic Steam Regulator* (Fig. 2).—'he two remaining huts (see Section I.) were fitted with ppliances constructed on a principle developed from that Scheibler's gas regulator. The lever, L, of a Dewrance in. reducing valve was extended at the end connected to e link, so that a screw, S, might be used to prevent the lve from closing beyond a certain point at which the amount of steam passing was just too little to maintain the hut at the desired temperature. To the opposite end of the lever was attached an iron cross-piece, A, forming the armature of an electro-magnet, E, fixed in the place where a dash-pot is sometimes fitted. The electro-magnet consisted of a pair of bobbins, each $3\frac{3}{8}$ ins. long by $1\frac{1}{2}$ ins. in diameter, wound with No. 22 S.W.G. double silk-covered wire. Each of the magnet poles ($\frac{5}{8}$ in. diam.) was provided with a small copper stud in the centre in order to prevent adhesion. By means of packing pieces the position of the magnet was adjusted until the amount of steam passing when the armature touched the magnet poles was markedly in excess of that required to maintain the temperature of the hut. The partial closing of the valve was brought about by means of a scale-beam and weight, which exerted a 2 lb. pull on a wire, W, *directly* connected to the valve spindle. It was found that under the actual conditions a movement of but little over $\frac{1}{64}$ in. at the valve spindle or $\frac{1}{32}$ in. at the armature was all that was required.

FIG. 2.



The electro-magnet was connected to two secondary cells in series with a relay. The relay was operated by means of a single dry-cell connected to the low temperature alarm contact of a long-stemmed creosote thermometer constructed on Sixe's principle. When the temperature fell contact was made, the relay circuit closed, and the armature pulled down to the magnet poles, the valve being thus opened more fully. On the temperature rising, contact was broken, and the valve once more closed to the minimum. The duration of the above cycle and the temperature range involved will of course depend largely upon the construction of the heating chamber and the closeness of the maximum and minimum positions of the valve. In a hut heated entirely by coils underneath a false floor the temperature range may be ± 1° C., but the cycle is of so short a duration that inside a box placed in such a hut the temperature may be regarded as constant. When a portion of the steam was blown into the air of the hut, in order to ensure saturation with moisture, the indications of the controlling thermometer rarely varied as much as 0·2° C. from the point at which the contact was sealed in. This form of regulator is more sensitive than the one described in section I., is cheaper to construct, and the thermometer bulb is the only portion which is inside the hut. The two electro-magnetic regulators ran constantly for many months without requiring much attention beyond the occasional recharging of the accumulators. It is, however, necessary to record that the creosote thermometers did not appear to be quite reliable, and, as time went on, a little gas developed in the tube, thus slightly altering the true values of the graduations. An ordinary mercurial contact thermometer may be employed instead of Sixe's form if the relay is arranged to close the circuit of the large electro-magnet when the thermometer circuit is broken, or if, using an ordinary relay, an iron disc is attached to the upper end of the valve spindle and the electro-magnet fixed immediately over this disc so that the magnet closes the valve instead of opening it.

III. *An Improved Electric Contact Thermometer.*—The ordinary thermometers with *adjustable* contacts for use with electro-magnetic thermo-regulators, alarm devices, &c., leave much to be desired. Those which are sealed up are usually

---

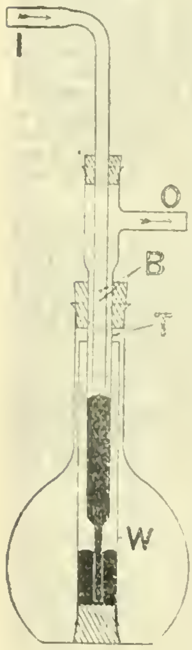
* If any clogging should occur, the obstruction may be dislodged turning the handwheel so as to permit the valve to open more ly for a few seconds.

troublesome to adjust and somewhat cumbersome, whilst fairly rapid deterioration is a decided drawback to the use of unsealed thermometers in which the mercury is protected by means of creosote. This defect of the latter can, however, be obviated by covering the mercury with purified petroleum instead of with creosote. A thermometer having one platinum wire sealed into the bulb and the other passing down the stem through a binding screw fixed just above the open top has been intermittently used during the past year, in conjunction with a Scheibler gas regulator, for controlling the temperature of a water oven. The surface of the mercury still remains bright and breaks contact sharply, whilst the petroleum ("Liquid Petroleum, B.P.," sp. gr. 0·882) has neither crept over the top nor undergone any apparent change.

It may be remarked that Scheibler's electro-magnetic gas regulator is in many respects an ideal one for accurate work, and should be widely used if placed on the market at a more moderate price than at present.

IV. *A Simple Regulator for use with Large Gas Burners* (Fig. 3).—Inside an ordinary Bohemian flask of about 16 oz. capacity is placed a tube, W, of not less than 20 mm. bore, having its lower end closed by means of a cork acting as a pad between the tube and the bottom of the flask. After completely filling the flask with methylated spirit, heated to a temperature rather higher than the regulator is likely to attain whilst in use, the neck is closed by means of an india-rubber stopper through which passes a tube, T, the lower portion of which is narrow and reaches nearly to the bottom of W, whilst the upper part is wider and provided with a side branch, O, for connection to the burner or stove. The internal diameter of the middle portion of T should be about 11 mm., *i.e.*, about 2½ to 3 mm. greater[*] than the external diameter of I (see below). A sufficient quantity[†] of mercury is next poured into T, the interior dried by means of a filter-paper, and the spirit allowed to cool to the temperature which the regulator is required to maintain. A well-fitting cork, through which passes a tube, I, of about 6 mm. bore, is inserted, and the lower end of I adjusted so as to just touch the surface of the mercury. The tube I serves as the gas inlet and has its lower end ground off obliquely. Two small holes, B, act as bye-passes, permitting the passage of sufficient gas to keep the burner or stove alight if the mercury should at any time entirely cut off the main stream. It is convenient to have two bye-pass holes of different sizes, say, 0·8 mm. and 1·2 mm. diameter respectively. Either of these can then be wholly or partially blocked with soap, or both can be left open, according to the nature of the work for which the regulator is being used. The regulator is easily made and has a high degree of sensitiveness. If the temperature increases to the extent of 1° C. the expansion of the spirit causes the mercury to rise about 5 mm. in the tube T, a height sufficient to make a very great difference in the amount of gas supplied. The preliminary adjustment is facilitated if a diminutive thermometer is suspended inside the flask in order to indicate the actual temperature of the spirit. The final adjustment for a given temperature is made by raising I about 5 mm. if the temperature is found to have settled down 1° C. below that required, or proportionately in other cases. The dimensions of the regulator may of course be varied in accordance with the size, &c., of the chamber to be heated and the accuracy required. Those given above are taken from a regulator which has proved very satisfactory in a greenhouse of about 3000 cub. ft. internal capacity and should answer well in a "constant temperature room" of moderate size or in a small drying chamber. Its capacity is about 10 to 20 times that of the ordinary Reichert regulator.

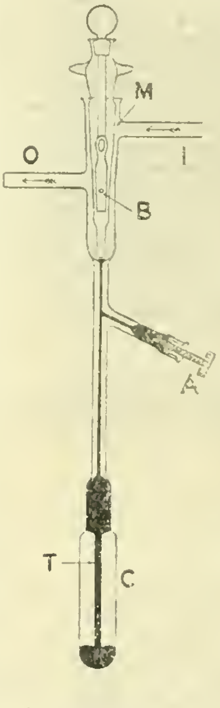
FIG. 3.



V. *A Highly Sensitive Modification of Novy's Gas Regulator.*—The ordinary forms of mercurial gas regulator give hopelessly inaccurate results if the gas pressure undergoes marked fluctuations, especially when it becomes great enough to give rise to bubbling after the end of the inlet tube has been covered. It seems a pity that such regulators should be so persistently retained for ordinary laboratory use, as their insensitiveness can be easily remedied by the employment of a larger bulb containing a liquid of high expansibility.

To work out one example in detail: Novy's gas regulator has various advantages over most of the others, but as ordinarily supplied has a bulb holding only about 1·5 c.c. of mercury. The modification shown in Fig. 4 has a cylindrical bulb C[*] of about 15 to 20 c.c. capacity, provided with an inner tube T reaching nearly to the bottom and continuous with the stem above. The bulb ordinarily contains toluene together with a little mercury, but hydrocarbons or alcohols of higher boiling point may be substituted for the toluene when desired. The bore of the lower part of the stem should be wide enough to hold 2 to 3 c.c. of mercury in order that no gas may be drawn into the bulb when the regulator is allowed to cool. The side branch containing the adjusting screw A should be inclined about 20° to 30° below the horizontal line in order that mercury may be retained in this tube after cooling, otherwise a bubble of gas may be entrapped when the regulator is again heated.

FIG. 4.



The bye-pass B, the adjustment for maximum supply M, the rigid gas inlet I, and the outlet O, remain unaltered. This modified regulator has proved very satisfactory in laboratory use. The coefficient of expansion of toluene being about five times that of mercury, and the volume of liquid having been increased about tenfold, it follows that the modification is about 50 times as sensitive to temperature changes as the original form. For certain special purposes it may be necessary to limit the external diameter of the bulb to that of the stem, but, even if the capacity of the bulb is not increased, the regulator is made nearly five times as sensitive by the substitution of toluene for mercury. The working of any regulator of this class is of course improved if a pressure regulator is attached to the supply pipe in order that there may not be a variable tendency for the gas to blow through the mercury.

---

[*] In order that the annular space between the two tubes may have a rather greater sectional area than the interior of the tube I.

[†] 10° C. fall of temperature will cause the spirit to contract to the extent of nearly 5 c.c.

[*] The old pattern regulator may readily be altered by cutting off the bulb and sealing on the lower portion of a Tollens gas regulator.

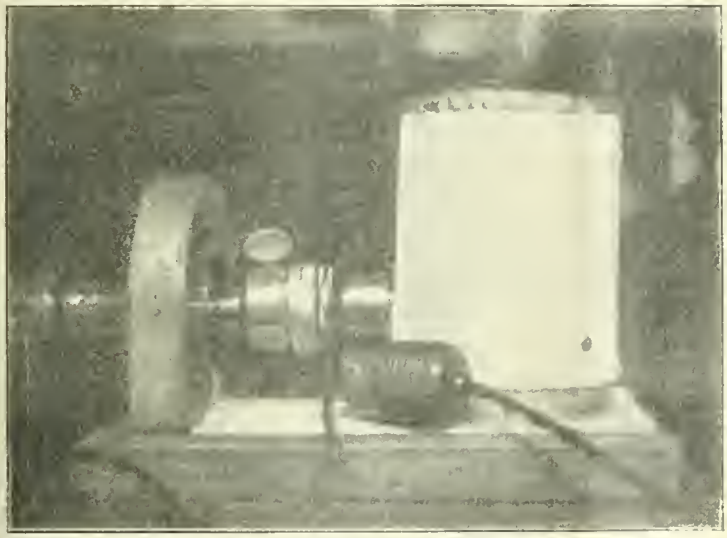
MR. J. T. WOOD IN THE CHAIR.

AN ELECTRICAL HEATER FOR LABORATORIES.

BY S. R. TROTMAN AND J. E. HACKFORD.

The apparatus is a simple contrivance consisting of a tin some 6 ins. or 8 ins. deep, and of sufficient diameter to take a lamp of 16, 32, or 50 candle power. The exterior is covered with asbestos paper. The lamp is of the ordinary type, but the greatest heat is obtained from those lamps discoloured by continual usage, and which can be obtained at a trifling cost from dealers in electric light fittings. The lamp is fixed through a hole near the bottom of the tin, as shown in the diagram. The holder, lamp, and tin are placed on a wooden base, the top surface of which is covered with asbestos beneath the tin.



The lamp is useful for saponifications, fat extractions, nd the distillation of alcohol and ethers, the source of heat eing perfectly constant, not affected by draughts, and it is npossible for inflammable liquids to be ignited.

The apparatus may be conveniently made use of as a ethod of obtaining the necessary current for the electro-tic arsenic apparatus already described in this Journal Feb. 29, 1904, pp. 177—179), and also in the Journal of e Chemical Society, 1904, Vol. 85, CV.

The wires are so arranged that when the arsenic apparatus not in use each lamp may be switched on separately, but hen the apparatus is required one main switch will turn all the lamps, whether the separate switches for the mps are on or off.

Meeting held at Leicester, on Wednesday, November 23rd, 1904.

MR. J. T. WOOD IN THE CHAIR.

THE MINERAL CONSTITUENTS OF SUMAC.

BY S. R. TROTMAN.

The mineral constituents of sumac have hardly received e attention they deserve, and it appears to be the custom tanners to raise no objection to excessive ash so long as the tannin content passes muster. This seems somewhat unwise, since much damage may be done to skins by comparatively small quantities of iron, and the presence of sand in a wheel may also be dangerous from a mechanical point of view. The published information on the subject is somewhat meagre and inconsistent, for while, on the one hand, Andreasch gives 6·6 as the ash content of genuine Italian sumac, Gordon Parker, in a recent paper, places it so low as 2 per cent. Of over 50 commercial sumacs recently analysed, in only 10 cases did the ash fall below 7 per cent., and in two of these 10 below 6 per cent.

In the best methods of sumac manipulation the dried leaf is said to be ground between stone rollers of which all the iron portions are entirely below the level of the sumac. Further, the powder is subjected to a process of ventilation and treatment with powerful electro-magnets to remove iron and magnetic oxide. This is apparently a counsel of excellence only, since 75 per cent. of the sumacs on the market contain very distinct quantities of iron removable by the magnet, in several cases rising to 0·25 per cent. These facts seem to indicate that it is quite time a rigid limit were made, and a firm stand made by those interested in the matter.

My own experiments lead me to the conclusion that the following limits are easily attainable with only moderate ventilation: ash, 6·5 per cent.; silica, 0·75 per cent.; iron, 0·15. These figures were arrived at by taking a large number of sumacs whose ash was from 7·5 per cent. to 9·5 per cent., and subjecting them to a process of winnowing, and then redetermining the ash, silica, and iron. The difference between the ash of the winnowed and unwinnowed sumac is entirely due to the removal of silica, iron, and matter insoluble in hydrochloric acid. The following is a typical example: ash before winnowing, 8·85 per cent.; after winnowing, 6·60 per cent.; silica before winnowing, 2·25; after winnowing, 0·98 per cent. I have numerous other sets of figures reiterating these points. It is to be noted that the difficulties of properly winnowing a small quantity of sumac in a laboratory are considerable, and that much better results could be obtained on the large scale. Hence the standards suggested above should be very easily obtained in bulk.

The adulteration of sumac leaf with its own stem is fairly common, and in order to see whether the high ashes one frequently finds were due to stem I have, by sifting, obtained sumacs largely composed of stems, and find that the ash is practically never above 7 per cent., however large the proportion of stem may be, thus proving that a large proportion of stems do not necessarily mean a high percentage of ash.

The percentage of combined iron in sumac seems to be very small, not more than 0·1 per cent. The metallic iron as oxide is generally extremely finely divided, and can be almost entirely removed by means of a fine sieve, or, better, by stirring with an electro-magnet. It is quite easy to separate and weigh the magnetic iron by this means, and this method has the advantage that a large quantity of sumac can be used for the test, thus increasing its accuracy. It is a rare thing to find a sample quite free from uncombined iron, and this is a common cause of stains in goods.

Discussion.

The Chairman quite agreed with the author that a standard of ash for sumac should be fixed upon. The International Association of Leather Trades' Chemists had occupied themselves so far with the determination of tannin in sumac and other materials. The reason of that was not far to seek. Tannin was the most important constituent for the tanner, and the object of the association was to get chemists to agree in the analysis of that constituent. So they had devoted their attention principally to the estimation of tannin. He thought they might fix a maximum for the ash, iron, &c., in a pure sumac. Sumac was a material which lent itself very easily to adulteration. He could remember the time when manufacturers adulterated it with sand. This, of course, was discovered very easily. Nowadays the manufacturers were much more cunning in their methods. They adulterated it with the leaves of plants which grew wild and were cheap, such as *Tamarix* and *Lentisco.* From his experience of sumac analysis no sumac was free from iron. His firm stipulated that their sumacs should contain no free iron. In testing for this he used a powerful magnet. The chief source of the iron was volcanic sand. He had examined a good many particles under the microscope and they did not appear to be fragments of ordinary metallic iron. He had always believed that the stems contained more ash than the leaves, but Mr. Trotman's figures proved this was not the case.

Mr. HAWTHORN said that if it were a question of the difference in ash being due to a mixture of some other plant it only wanted a cute adulterator to so mix different leaves as to bring the ash to the required amount.

Mr. S. F. BURFORD inquired at what temperature the ash was obtained, since the percentage of ash depended very much upon the temperature of burning.

Mr. S. R. TROTMAN said, in reply, that the sumac was incinerated in the muffle at a low temperature. He had analysed specimens of *Tamarix* and *Lentisco* which had been sent as genuine samples and had found that the ashes were a trifle under 7 per cent. They also contained magnetic iron and possibly were adulterated. The ashes of the adulterants were not sufficiently high to raise the ashes of the sumac. They might take it as a general rule that the ash of any leaf was somewhere between 5·5 and 6 per cent. Giving the maximum at 6·5 per cent. the growers would get every benefit. A good many of the iron determinations had been made before and after stirring with the magnet, and in one or two cases the amount of iron before stirring was 0·5 per cent., and after stirring 0·2 per cent.; whether the iron was metallic or magnetic, it was an adulterant if left in. He had been looking through his records for three years and he found that the ash in sumacs had greatly risen, which would indicate that less trouble was taken in the process of refinement. It would be a good thing if the International Association of Leather Trades' Chemists would take up the matter with a view to standardising the regulations.

Obituary.

THOMAS MESSENGER DROWN, M.D., LL.D.

PRESIDENT OF LEHIGH UNIVERSITY;
PRESIDENT OF THE AMERICAN INSTITUTE OF MINING ENGINEERS (1897); MEMBER OF THE SOCIETY OF CHEMICAL INDUSTRY (1888—1904), &c.

Thomas Messenger Drown was born in Philadelphia, Pa., March 19, 1842. Graduating from the Philadelphia High School in 1859, he entered the medical school of the University of Pennsylvania, and received, in 1862, the degree of M.D. For a brief period he practised as a physician, making one or two voyages as medical officer of an ocean steamship. But chemistry, studied incidentally as part of his medical course, had a strong fascination for him, and, following this call, he abandoned his practice as a physician and returned to the position of student, taking special courses in chemistry at Yale and Harvard Universities. After this he spent some years under Bunsen and Kopp at Heidelberg, and in the Royal Mining Academy of Freiberg, Saxony. Returning to the United States thus equipped, he practised for some years in Philadelphia as an analytical chemist, and in 1875 he accepted the professorship of chemistry at Lafayette College, Easton, Pa. In 1885 he assumed and held a similar position in the faculty of the Massachusetts Institute of Technology, Boston. During this period he planned and executed what has been considered his most useful and memorable achievement, *viz.*, the systematic investigation of the spring-waters and well-waters of Massachusetts, and the preparation, on the basis of the analyses made, of the famous "chloride map" of that State, from which at a glance there may be determined how much chlorine found by the analysis of water from a given locality can be considered as due to the saline breezes of the Atlantic, and how much should be regarded as indicative of organic contamination.

Dr. Drown became a member of the American Institute of Mining Engineers at its first meeting in 1871, secretary in 1873, and in 1897 he was elected President. In 1895 he left the Massachusetts Institute of Technology to accept the presidency of Lehigh University, Pa., and in the same year Columbia University, in the city of New York, conferred upon him the honorary degree of doctor of laws. The position of President of the Lehigh University he occupied for the remainder of his days.

Dr. Drown died suddenly on Nov. 17th; and a former colleague and friend writes of him: "Would there were more like him, for us to love, to admire, and to imitate!"

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3^e).

I.—PLANT, APPARATUS AND MACHINERY.

English Patents.

Discharging Corrosive Acids and other Liquids from Carboys and other Receptacles by Pneumatic Pressure; Means for ——. E. H. and C. G. Boutcher, London. Eng. Pat. 22,845, Oct. 22, 1903.

In discharging liquid from a carboy one of two methods may be adopted, both of which methods are claimed. According to the first method, a cap, through which a pipe dipping into the liquid passes, the external portion serving to deliver the liquid in any desired direction, and having an inlet tube for compressed air, is fitted air-tight to the neck of the carboy. The second method consists in placing the carboy inside a vessel, forming a chamber or casing, which can be closed air-tight, through which an air-inlet pipe and a delivery pipe dipping into the liquid in the carboy, passes. In either case, on forcing air through the air pipe, the liquid is forced through and out of the delivery pipe. In combination with the means referred to in the first method, a carboy truck, having a swinging cradle, and to which the apparatus can be attached, is also claimed. The method may also be applied to the raising of a liquid from a well or tank, by immersing the air-tight vessel referred to in the second method, in and below the level of the liquid, alternately filling the vessel or chamber with the liquid through a valved opening and expelling the contents up through a delivery pipe.—W. H. C.

Regulating Temperature; Apparatus for ——. E. Paul, Seaforth, Lancs. Eng. Pat. 23,900, Nov. 4, 1903.

A bent and flattened tube, filled with liquid, is placed in contact with the fluid, the temperature of which is to be regulated. One end of the tube is fixed, the other being free to move, and controlled by an adjustable spring. The motion of the free end, under the influence of any variation of temperature is communicated to a valve which controls the supply of steam or other heating medium.—W. H. C.

Gas and Liquid: Apparatus for Bringing —— *into Intimate Contact.* A. Schneller, Ginneken, and D. Koeleman, Noordrinde, Holland. Eng. Pat. 24,379, Nov. 10, 1903.

See Fr. Pat. 336,644 of 1903; this J., 1904, 382.—T. F. B.

Incrustation in Steam Boilers; Compound for Preventing ——. T. Byrne, G. L. Scott, and W. Wheatley, Kingston-upon-Hull. Eng. Pat. 24,651, Nov. 13, 1903.

The compound is prepared by boiling 8 cwt. of oak blocks with 500 gallons of water. To the solution obtained, 0·5 cwt. of alkali (common soda) may be added. The compound is mixed with the feed water or introduced into the boiler.—W. P. S.

Evacuating Air; Method and Apparatus for ——. A. Pfeiffer, Wetzlar, Germany. Eng. Pat. 2291, Jan. 29, 1904.

When using several pumps, the best vacuum is most quickly reached by working them arranged first in parallel and then in series. A special form of cock or valve is used to effect this change of connection. The plug has a vertical outlet, *l*, Fig. 1, communicating with the external air. In this outlet is a sliding "displacer" with a rod extension projecting downwards through the bottom of the plug, as shown. Fig. 3 is a cross section along *m m* of Fig. 2; and Fig. 4 a section on the line *n n* of Fig. 3. When the plug of the cock is rotated, the inclined plane, Fig. 4, raises the "displacer," and so allows the sealing liquid to fall, as in Fig. 2. On rotating the plug in the reverse direction, the "displacer" falls, and forces the sealing liquid into the position shown in Fig. 1. Fig. 2 shows the cock in the "parallel" position, the outlet *o* being in connection with the air, and the "displacer" raised. Fig. 1 shows the cock in the "series" position, with the outlet *o* closed, and all access of air through *l* to the surface of the plug prevented by the rise of the sealing liquid.—W. H. C.

Fig. 4.

United States Patents.

Drying Apparatus. G. D. Harris, Bayshore, N.Y., Assignor to Condensed Pure Food Co., Cohocton, N.Y. U.S. Pat. 774,321, Nov. 8, 1904.

To prevent overheating, the cells of the drying apparatus are arranged in adjacent vertical rows, separated by air spaces open to the atmosphere, and independent of the conduit for the drying-current of air.—L. F. G.

Kiln. W. N. Weir, South River, N.J. U.S. Pat. 774,544, Nov. 8, 1904.

Round a chimney are grouped a number of kilns, each comprising a main chamber with perforated bottom and "flash-wall" for the ware to be burned, and an annular chamber in the wall of the kiln, opening into a space behind the "flash-wall." Beneath the perforated bottom is a main flue, communicating by means of valved passages, with the chimney and with the annular chamber of the next kiln. The kilns are provided with main fire-boxes discharging into the space behind the "flash-wall," and with a valved "bull-hole" in the top of the kiln, opening into a closed receiver, flues connecting the various receivers. —L. F. G.

II.—FUEL, GAS, AND LIGHT.

Luminiferous Salts and Illuminating Bodies. H. Bunte. J. Gasbeleucht., 1904, **47**, 1011—1013.

The temperature of the Bunsen flame was found to be considerably higher than that at corresponding places on the Auer mantle, showing that no appreciable increase of temperature is caused by a catalytic action of the rare earths of which the mantle is composed. The similarity in form of the curves showing the distribution of temperature, and of light-emission, indicates also that the intense light of the incandescent Auer mantle is not due to catalytic action. Spectrophotometric experiments showed that as the temperature of the Bunsen flame rises, the light emitted by pure thorium oxide becomes continually bluer; with cerium oxide on a thoria skeleton, the colour of the light remains the same at all temperatures. If gradually increasing amounts of cerium oxide, up to 0·5 per cent., be added to pure thorium oxide, then, at an approximately constant temperature, the colour of the light emitted becomes bluer, whilst the illuminating power increases. With larger additions (up to 1·5 per cent.) of cerium oxide, the number of red rays increases simultaneously with a rise in the illuminating power. If still larger amounts of cerium oxide be added, the colour of the light approaches nearer and nearer that of incandescent, pure cerium oxide, whilst the illuminating power decreases. The mass of the incandescence-body has an influence on the colour of the light; with a mixture of a given composition, the light emitted is bluer, the lower the weight of the mantle. In view of these experiments, the author rejects his former view that the intense light emitted by the Auer mixture is due to catalytic action (this J., 1898, 229; 1901, 791), and concludes that the thorium oxide merely acts as a vehicle for the particles of cerium oxide, which latter are the true light-emitting agents. The cerium oxide is maintained at a high temperature in the flame owing to its distribution and to its being present in only small quantities; its illuminating action is a consequence of selective radiation. (See also this J., 1898, 1129; 1901, 791; 1902, 1012.)—A. S.

English Patents.

Coking Ovens; Impts. in ——. C. G. Redfern, London. From Poetter and Co., Dortmund, Germany. Eng. Pat. 17,661, Aug. 13, 1904.

In these coking ovens a passage runs alongside the gas-distributing passage, and communicates through openings with the vertical heating flues in which are placed the gas nozzles. The openings are closed by plugs, and by removing these latter, access can be had to the nozzles and to the air-regulating dampers.—L. F. G.

Heat from Gases produced from Solid Combustibles; Apparatus for the Recovery of ——. L. Hertzog, Arbon, Switzerland. Eng. Pat. 22,546, Oct. 19, 1903.

The furnace is surrounded by a wall of sheet metal or brick-work, and the hot furnace gases are led in a downward direction through the space thus formed. Another wall surrounds the first wall, and a fluid which it is desired to heat, is passed through this second interspace. The fluid may be gas or air, which is then conducted into the furnace. —L. F. G.

Gas Retort Beds; Inclined ——. A. J. S. B. Little, Smethwick, Staffs. Eng. Pat. 24,995, Nov. 17, 1903.

In a bench of inclined retorts, the gas-producers and the regenerative passages are arranged in the space formed by the angle between the retorts and the ground level, the producers and their charging openings being situated beneath the charging ends of the retorts. Between every pair of retort-beds there is an elevator, working in an inclined tunnel, which delivers the coke from the discharging-ends of the retorts to the charging-openings of the producers. By this arrangement the height of the retort-house, and the amount of constructional work generally, are reduced, only one staging being required for charging both the retorts and the producers.—H. B.

Retort Benches for the Manufacture of Illuminating Gas. E. Derval, Paris. Eng. Pat. 15,860, July 16, 1904. Under Internat. Conv., Sept. 5, 1903.

See Fr. Pat. 339,015 of 1903; this J., 1904, 1081.—T. F. B.

Furnaces of Gas Producers [*for Gas Retort Settings, &c.*]. J. F. Bell, Derby, and R. Masters, Bedford. Eng. Pat. 28,342, Dec. 24, 1903.

The fire-bars of the producer are inclined from the front of the furnace to the back, and are made of angle- or other trough-like section. Water drips into these bars at the front of the furnace, from a series of nozzles on a horizontal water-supply pipe, which is adapted to be swung upwards, clear of the furnace door, during clinkering operations. The water furnishes the steam required by the producer, and keeps the fire-bars cool. An additional set of horizontal, trough-like bars, may be arranged beneath the fire-bars, to increase the generation of steam, the water drip-pipes which supply these lower bars, being attached to, and adapted to be swung up with, the water supply-pipe mentioned above.—H. B.

Gas from Coal or other Material; Apparatus for the Manufacture of Crude [*Producer*] ——. H. Heenan, Manchester. Eng. Pat. 23,616, Oct. 31, 1903.

The producer consists of two superimposed chambers having a contracted passage between them; a trough-like tuyère, partly filled with water, is situated round the passage, from which a hot blast of air and steam is forced up through the fresh fuel fed into the upper chamber; a flue which leads the "green" gases from the top of the upper chamber to another trough-like tuyère, situated beneath the incandescent fuel in the lower chamber; an injector, by means of which air and steam, intermingled with the "green" gases, are forced from the tuyère up through the incandescent fuel; flues round the top of the lower chamber, for leading off the gas; a bridge for supporting the fuel; and a water-sealed ash-pan. The fuel is fed through a hopper into the upper chamber, and descends into the lower chamber as required.—H. B.

Gas [*Water-Gas*]; *Manufacture of Combustible* ——. J. Bowing, Tilbury, Essex. Eng. Pat. 28,498, Dec. 28, 1903.

Water-gas is produced, without the intervention of an air-blast period, by the treatment of comminuted fuel with superheated steam in a retort, the retort charge being heated internally by means of the superheated steam only. Steam, at a pressure somewhat above that at which it is desired to be used in the retort, is passed through a superheater, which raises it to about 700° C., and is then led into the retort through a pipe having a perforated portion which is surrounded by the fuel. The steam-blast, in passing through the mass of fuel, is reduced to a quiet flow, and a mixture of carbon monoxide and hydrogen is produced. H. B.

Producer-Gas; Manufacture of ——, *and Apparatus therefor.* J. Armstrong, London. Eng. Pat. 544, Jan. 8, 1904.

The combustion chamber of the producer is divided by means of a vertical partition into two compartments, each provided with air-blast and steam-blast pipes. While the air-blast is being supplied to the fuel in the one compartment, steam is blown simultaneously through that in the other, the gases generated being allowed to mix at the top of the partition on their way to the furnace. The air-blast and steam-blast periods in each compartment alternate in the usual way. Instead of using one divided producer, two separate producers may be worked in connection with one another. Instead of steam, furnace gases rich in carbon dioxide may be used, with or without the addition of steam, the feed being reversed from time to time from air to furnace gases and *vice versa.*—H. B.

Illuminating Gas; Manufacture and Purification of —— [*from Naphthalene*]. A. Colson, Knighton, Leicestershire. Eng. Pat. 16,766, July 29, 1904.

Coal-tar, oil-tar, blast-furnace tar, or the like is distilled, either before or after removal of carbolic acid, naphtha, &c., and the portion which distils below 270° C. is collected and redistilled so as to yield a fraction boiling between 170° and 215° C. This fraction is used as a solvent for the removal of naphthalene from the gas to be purified, the cooled gas, free from tar, being treated preferably in a washer wherein the gas is compelled to travel through the liquid in fine streams.—H. B.

Oil-Gas; Production of ——. F. G. C. Rincker, Watergraafsmeer, and L. Wolter, Amsterdam, Holland. Eng. Pat. 20,371, Sept. 21, 1904.

Fuel is brought to incandescence in a producer, the air-supply is stopped, and oil is then fed upon the top of the fuel, the gas produced being led off at the foot of the producer to a scrubber, in which it is washed with water. —H. B.

United States Patents.

Peat Fuel; Process of Manufacturing ——. C. F. Schlickeysen, Steglitz, Germany. U.S. Pat. 773,992, Nov. 1, 1904.

See Fr. Pat. 327,873 of 1902; this J., 1903, 944.—T. F. B.

Fuel; Manufacture of Artificial ——. J. J. Shedlock, Little Bentley, England. U.S. Pat. 774,705, Nov. 8, 1904.

See Fr. Pat. 340,981 of 1904; this J., 1904, 816.—T. F. B.

Coke-Oven. G. S. Ramsay, St. Marys, Pa. U.S. Pat. 773,809, Nov. 1, 1904.

The oven is provided with a central, main, bottom flue communicating at one end with the stack; vertical flues at the front and rear, communicating at their upper ends with the interior of the oven; and bottom flues connecting the vertical flues with the main bottom flue. The bottom flues at the rear of the oven are shorter than those at the front, and the flues on one side of the main flue are independent of those on the other side and also of each other, the walls forming and separating them being continuations of the outer wall of the oven and acting as supports for the floor of the oven. These bottom flues each consist of an outer radial portion, a portion in the form of a loop or approximately U-shaped, and a short inner transverse portion.—A. S.

Coke Quenching and Bleaching Apparatus. E. A. Moore, Philadelphia, Pa. U.S. Pat. 774,330, Nov. 8, 1904.

The claim is for a receptacle for the hot coke, in combination with a trench containing water, means for supplying the water to the coke, and a pipe and jet condenser for the steam generated during quenching.—L. F. G.

Gas; Apparatus for the Manufacture of ——. H. A. Bradley, Assignor to the Bradley Universal Heat, Light, and Power Co., New York. U.S. Pat. 773,781, Nov. 1, 1904.

Within the furnace are arranged three casings, forming respectively a generator, a burner for heating the latter, and a second burner for heating the first-named burner. The generator consists of three intercommunicating compartments, *viz.*, a steam chamber, which receives steam from an external boiler, a carburetting chamber into which liquid fuel is fed, and a fixing chamber (communicating with a gas-holder) within which the mixture of steam and fuel is converted into fixed gas. The two burners are similar in construction to the generator, except that the fixed gas produced by them is allowed to issue into the furnace, where it is burned, instead of being led off to the gas-holder. —H. B.

Gas-manufacturing Apparatus. C. R. Ingham, Suffern, N.Y. U.S. Pat. 774,430, Nov. 8, 1904.

A steam-superheater, consisting of several connected pipes of small diameter, filled loosely with fragments of cast-iron or the like, is arranged within a furnace which is surrounded by a wall forming a space for the passage of the products of combustion. The steam from the superheater enters a mixer under pressure, and in doing so impinges upon a supply of liquid hydrocarbon, the vapour of which it carries into the mixer. The mixer consists of an elongated chamber, closed at one end, and having at the other an inlet for the steam and hydrocarbon, and an outlet for the gas produced. The gas is led through a fixing retort consising of a number of connected pipes of small diameter, filled loosely with refractory material, and situated within the combustion chamber of a secondary furnace. The resultant illuminating gas is led off from the fixing retort.—H. B.

Charger for Gas-Producers. E. H. Carroll, Assignor to Morgan Construction Co., Worcester, Mass. U.S. Pat. 774,561, Nov. 8, 1904.

The charger consists of a stationary top-plate, a fuel reservoir, and a rotating feed-casting interposed between the two, and provided with an opening eccentric to its axis of rotation, through which the fuel drops from the reservoir on to the top-plate, over the outer edge of which it is swept by the movement of the feed-casting. On the top of the latter a water-chamber is provided to keep it cool, and a water-seal is formed at the joint between the feed-casting and the reservoir. An agitator rotates in the eccentric opening, to loosen the fuel.—H. B.

Gas-Scrubber. A. Steinbart, Carlstadt, N.J. U.S. Pat. 774,207, Nov. 8, 1904.

A vertical cylindrical vessel is provided at the top with a concentric, rotary, spraying nozzle, fed with water. The spray falls on a series of concentric rings, the upper edge of each ring rising above the edge of the adjacent inner ring, and the lower edge of each ring being toothed. The rings convert the spray from the nozzle into a vertically falling rain, which, after descending through the stream of gas, is collected and run off at the foot of the scrubber.—H. B.

French Patents.

[*Fuel*] *Briquettes; Manufacture of* ——. H. S. Gerdes. Fr. Pat. 344,225, June 23, 1904.

Anthracite or coal, in small pieces, or in the form of powder, is mixed with fresh peat, or similar moist material, to which an alkali may be added, pressed into blocks, and dried.—L. F. G.

Producer Gas; Process and Apparatus for Producing ——. P. Stiens. Fr. Pat. 344,671, July 8, 1904.

See Eng. Pat. 14,971 of 1904; this J., 1904, 977.—T. F. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

English Patent.

Petroleum and other like Hydrocarbons; Process for Saponifying ——. F. J. Lothammer, Paris, and C. Trocquenet, Colombes, France. Eng. Pat. 26,366, Dec. 2, 1903.

See Fr. Pat. 338,636 of 1903 and addition thereto; this J., 1904, 655.—T. F. B.

United States Patents.

Wood; Process of Deriving Products from ——. C. M. Dobson, New York, Assignor to The Wood Distillates and Fibre Co., Chicago. U.S. Pat. 774,135, Nov. 1, 1904.

Wood is heated by steam and external heat to a temperature sufficient to liquefy the gums and resinous matter, but not for a sufficiently long time to carbonise the fibrous portion; the heated mass is crushed by heated "mechanical means," and then macerated and heated simultaneously; the liquid portion is finally removed from the fibrous mass by pressure. —T. F. B.

Wood Distilling and Preserving Apparatus. F. S. Davis, Shirley, Assignor to J. C. Richardson, Robertsville, S.C. U.S. Pat. 774,649, Nov. 8, 1904.

Each member of a battery of horizontal cylindrical retorts is connected with a tank in which the "distilling and preserving fluid" is heated. The connections consist of a valved pipe for introducing the fluid into the retort, and another for discharging the fluid from the retort into the tank, a pump being so situated that a continuous circulation of the liquid between the tank and any one of the retorts may be maintained; thermometers are fixed in the inlet and outlet pipes near each retort. Valved vapour-outlet pipes are provided in the top of each retort, leading to a single condenser.—T. F. B.

IV.—COLOURING MATTERS AND DYESTUFFS.

1.5-*Diaminoanthraquinone; Bromination of*——. R. Scholl and H. Berblinger. Ber., 1904, **37**, 4180—4184.

2.6-*Dibromo*-1.5-*diaminoanthraquinone* is obtained both by the gradual addition of bromine to 1.5-diaminoanthraquinone suspended in cold glacial acetic acid and by direct bromination. The product is digested in bisulphite solution, washed, dried, and recrystallised from hot nitrobenzene. It forms blue, lustrous needles melting at 274° C. Experiments made to establish its orientation have shown both bromine atoms to be in ortho-position to the amino groups. 2.4.6.8-*Tetrabromo*-1.5-*diaminoanthraquinone* is prepared by brominating 1.5-diaminoanthraquinone in boiling glacial acetic acid or its disulphonic acid in water. It may also be obtained by direct bromination, as in the case of the dibromo derivative, allowing the resulting perbromide, however, to digest in water in the place of bisulphite solution. It crystallises in green lustrous needles, sparingly soluble in hot nitrobenzene, but insoluble in the usual solvents. —D. B.

Anthraquinone; Diazonium Compounds of——. F. Kačer and R. Scholl. Ber., 1904, **37**, 4185—4187.

Acid anthraquinone-1-*diazonium sulphate* was prepared from 1-aminoanthraquinone by diazotisation in presence of sulphuric acid. It forms a light yellow, crystalline powder, which is stable at the ordinary temperature, but decomposes on heating. When its sulphuric acid solution is heated gently with alcohol, anthraquinone is regenerated. *Acid anthraquinone*-1.5-*bisdiazonium sulphate* was obtained by diazotising 1.5-diaminoanthraquinone in presence of sulphuric acid. It is an orange-coloured crystalline salt, which is sparingly soluble in water and stable at the ordinary temperature, but decomposes at 172° C. Diazonium compounds prepared from 1.3- and 1.8-diaminoanthraquinones are readily soluble in water—a fact which may be utilised for obtaining from crude diaminoanthraquinone the azo dyestuffs of the 1.5-derivative in a pure form.—D. B.

Stilbene Group; The Colouring Matters of the——. *I.* A. G. Green. Chem. Soc. Trans., 1904, **85**, 1424—1431.

Two formulæ have been assigned to the stilbene dyestuffs, *viz.*, that of azoxystilbene derivatives by Bender and Schultz (Ber., 1886, 3234), and that of dinitrosostilbene derivatives by O. Fischer and Hepp (see this J., 1894, 29, and Ber., 1895, 2281). In addition to the fact that it is improbable that substances so constituted should possess dyeing properties, the following considerations show that the suggested formulæ do not correctly indicate their constitution:—Curcumine (Direct Yellow) does not give dinitrostilbenedisulphonic acid on oxidation with chromic acid (as Fischer and Hepp stated), but produces a greenish-yellow dyestuff apparently identical with Mikado Golden Yellow. In Eng. Pat. 12,922 of 1896 (this J., 1897, 531) it is shown that b condensing *p*-nitrotoluene-*o*-sulphonic acid with dehydrothiotoluidinesulphonic acid, a more soluble, yellowish dyestuff i produced, containing aldehyde groups (Curcupheníne), which is shown to be an imine of stilbene aldehyde, in the formation of which 4 mols. of *p*-nitrotoluene took part. It wa further proved that all stilbene dyestuffs contain a certain amount of aldehydic products (see Eng. Pat. 6760 of 1898; this J., 1899, 362), and that all stilbene derivatives on alkaline oxidation give rise to aldehydes (Eng. Pats. 21,825 of 1897, and 1431 and 4045 of 1898; this J., 1898, 91 and 1899, 133). By oxidising *p*-nitrotoluene-o-sulphoni acid with sodium hypochlorite, it was found possible t produce, according to the conditions, dinitrostilbenedi sulphonic acid or dinitrodibenzyldisulphonic acid (Eng Pat. 5357 of 1897; this J., 1898, 148). On heating th former with sodium hydroxide and a small quantity of som oxidisable substance, and the latter with sodium hydroxid alone, a yellow dyestuff was obtained which contained n aldehydic or alkali-sensitive product (see Eng. Pats. 21,39 and 21,553 of 1897; this J., 1898, 915). On reduction this gives rise to a series of yellow dyestuffs, and finally t diaminostilbenedisulphonic acid. In addition to these dye stuffs, the two dinitro acids form condensation product with primary amines, which appear to be mixed azo o azoxy dyestuffs, indicating a complex structure for stilben dyestuffs. *p*-Nitrotoluene and its *o*-substituted derivatives on treatment with alkali hydroxide, all give highly coloure unstable intermediate compounds, which, on further heating are transformed into analogues of Curcumine, the readines with which these intermediate compounds are formed bein found to depend on the nature of the *o*-substituent group Dinitrostilbenedisulphonic acid is not formed by direc oxidation of the *p*-nitrotoluenesulphonic acid, but is forme from the intermediate compounds mentioned above. Dinitrostilbenedisulphonic acid is also readily converted b alkaline reduction into this intermediate compound; henc it is probable that these two compounds are very similar i constitution, and that their formulæ only differ by two atom of oxygen. Some doubt, however, existed from the fac that it was never found possible to obtain a higher yiel than 65 per cent. of the dinitrostilbenedisulphonic aci (See next abstract.)—T. F. B.

Stilbene Group; The Colouring Matters of the——. *II.* A. G. Green, F. Marsden, and F. Scholefiel Chem. Soc. Trans., 1904, **85**, 1432—1438.

On heating phenyl-*p*-nitrotoluene-*o*-sulphonate with alka hydroxide, an unstable blue compound was produce which, on oxidation, gave what proved to be a mixture phenyl-*cis*- and *trans*-dinitrostilbenedisulphonates in almo theoretical yield. This mixture was separated into its com ponents, which are described. The corresponding *cis*- an *trans*-dichlorodinitrostilbenes were similarly produced i good yield from o-chloro-*p*-nitrotoluene. All these dinitr stilbene derivatives are readily reconverted into the highl coloured intermediate compounds on reduction. The fa that the above compounds are obtained in almost theoretic yield removes the doubt mentioned in the preceding abstrac whence there appears every reason to regard these inte mediate compounds as nitrosostilbene or stilbene nitrol acid derivatives, and since they are only coloured in alkali solution, they would have a quinonoid structure, *e.g.*, th crimson compound from *p*-nitrotoluene-o-sulphonic ac would have the constitution—

$$\begin{array}{l} \mathrm{CH{:}C_6H_3(SO_3Na){:}N(OH)ONa} \\ \mathrm{CH{:}C_6H_3(SO_3Na){:}N(OH)ONa} \end{array}$$

Further, the above work shows that Green and Wahl dinitrostilbenedisulphonic acid (this J., 1898, 146) really a mixture of the *cis*- and *trans*-isomerides, and it also probable that, since it is formed by oxidation of th crimson intermediate product obtained in the preparation Curcumine, this intermediate product and the stilbene dy stuffs to which it gives rise are all mixtures of the tw isomerides.—T. F. B.

Paranitraniline Red; Copper Compound of ——. W. Schaposchnikoff and V. Svientoslavski. Z. Farben- u. Textil-Ind., 1904, **3**, 422—426.

By boiling a mixture of Paranitraniline Red and copper sulphate together with ammonia in water for six hours, a deep brown product was obtained, containing 9 per cent. of copper oxide. A copper naphtholate solution was prepared according to Goldovsky's method and added to the diazo solution of paranitraniline; a compound separated out containing 3 per cent. of copper oxide. After boiling the mother-liquors for 20 hours, the precipitate contained 11 per cent. of copper oxide. When boiled with 10 per cent. hydrochloric acid it contained only 7 per cent. of copper oxide; but on extracting the unchanged oxyazo dyestuff with boiling toluol, the residue contained 11—12 per cent. of copper oxide. The formula of the copper compound is probably $Cu(O.C_{10}H_6.N:N.C_6H_4.NO_2)_2$, which requires 12·2 per cent. of copper oxide. Goldovsky's method is not suited for practical purposes, as only 3—3½ per cent. of copper oxide is taken up instead of 12·2 per cent. The best method is that of Müller, in which the ready-dyed material is passed three times through a boiling copper sulphate solution (1:1000). The brown is completely developed in two hours. The addition of a little acetic acid helps the process.—A. B. S.

Dyestuffs; Action of Low Temperatures on ——. J. Schmidlin. Comptes rend., 1904, **139**, 731—732.

Dyestuffs were exposed to the temperature of liquid air. In no case, when the dye was fixed on a textile fabric, was there any effect produced. In alcoholic solution, some dyestuffs, such as Methylene Blue and Malachite Green, were unaffected; but the rosanilines all exhibited a considerable diminution in the intensity of their colours, and there appeared a yellowish green fluorescence, the solution acquiring an appearance resembling that of Eosin. Possibly this fluorescence exists at ordinary temperatures, but is not noticeable on account of the intensity of the red or violet colour. Alcoholic solutions of Eosin cooled in liquid air also exhibit a diminution in the intensity of the colour viewed by transmitted light, whilst the fluorescence remains unchanged.—J. T. D.

English Patents.

Sulphur Colouring Matters [*Sulphide Dyestuffs*] *and Intermediate Products therefor; Manufacture of* ——. J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine. Eng. Pat. 24,930, Nov. 16, 1903.

By oxidising a mixture of equimolecular proportions of a phenol and *o*-*o*-dichloro-*p*-phenylenediamine [2.6.1.4], large quantities of stable indophenols are produced, which are readily reduced to the corresponding diphenylamine derivatives. By melting these new indophenols or diphenylamine derivatives with sulphur and sodium sulphide, dyestuffs of great colouring power are obtained. These dye cotton from sodium sulphide solutions greenish-grey to bluish-grey shades, which are rapidly converted to deep violet on exposure to air.—T. F. B.

Dyestuffs Derived from Anthracene [*Anthracene Dyestuffs*]; *Manufacture of* ——. O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst on the Maine. Eng. Pat. 26,182, Nov. 30, 1903.

According to Eng. Pat. 7387 of 1902 (see this J., 1903, 293), dyestuffs are obtained by condensing hydroxyanthraquinones with sulphonic acid salts of primary aromatic amines under pressure and at high temperatures. It is now found that hydroxy- or aminoanthraquinones can be condensed with the salts of sulphonic or carboxylic acids of primary aromatic amines, in presence of reducing agents (*e.g.*, stannous chloride), under normal pressures and at moderately low temperatures (100°—140° C.). Suitable anthraquinone derivatives are those in which the 1- and 4-positions are occupied by amino- or hydroxy- (or alkyloxy) groups, and the 5-, 6-, 7-, and 8-positions by hydrogen atoms or by hydroxy or amino groups. The resulting dyestuffs dye unmordanted wool in greenish-blue, blue, and bluish-violet shades. The dyestuffs obtained according to Eng. Pat. 23,927 of 1894 (see this J., 1895, 1041) by sulphonating the condensation products of hydroxyanthraquinones with primary aromatic amines are disclaimed. (See also U.S. Pat. 754,768 of 1904; this J., 1904, 368.)
—T. F. B.

French Patents.

Anthracene Series; Production of Dyestuffs of the ——. [*Anthracene Dyestuffs.*] Badische Anilin und Soda Fabrik. Addition, dated Sept. 17, 1903, to Fr. Pat 339,044, March 30, 1903.

See Eng. Pat. 20,151 of 1903; this J., 1904, 319.—T. F. B.

Dyestuffs Derived from Acridine Yellow; Process for Making Orange-Red ——. [*Acridine Dyestuffs.*] Farbwerke vorm. Meister, Lucius und Brüning. Fr. Pat. 339,051, Sept. 19, 1903.

See U.S. Pat. 756,540 of 1904; this J., 1904, 932.—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Aluminium; New Use for ——. Elect. Review, 1904, **45**, 70.

The U.S. Consul at Frankfort, Germany, states that in spinning machines, aluminium is being substituted for wood, especially for the spools or bobbins. The aluminium bobbins are only two-fifths as heavy as the wooden ones, and are more durable, being less sensitive to alteration of temperature and to moisture.—A. S.

Cotton; Wetting of —— *by Water and by Water Vapour.* O. Masson. Proc. Roy. Soc., 1904, **74**, 230—254.

When dried cotton-wool is immersed in water, its temperature rises for some time, and afterwards slowly falls. The same phenomenon occurs when the cotton-wool is exposed to air saturated with aqueous vapour; and in both cases the courses of the curve representing the rise and fall are similar, and are similarly affected by previous moisture and other conditions. In the latter case the effect is due to the condensation on the cotton of vapour which it absorbs, for both absorption and heat-production occur for many hours, and the amount of heat is approximately that calculated from the quantity of vapour absorbed. In the former case, though absorption cannot be directly observed, it must occur, and the air adhering to the fibre maintains the separation necessary for distillation to occur. Medical or "absorbent" cotton-wool, though it behaves like ordinary cotton-wool in saturated air, does not show the same rise of temperature in water. The water condensed on the cotton certainly does not combine chemically with it; and it is not simply condensed as a film on the surface, for the quantity is too great for the recognised maximum thickness of such films. It probably undergoes osmotic diffusion into the fibre and forms a sort of solid solution of cellulose and water, having a vapour pressure always lower than that of water. Cotton in air saturated with alcohol vapour, or gun-cotton or glass wool in air saturated with water-vapour, showed similar behaviour, though to a slighter extent, and no effect was produced when cotton was immersed in absolute alcohol or glass wool in water, so that the air-insulation is necessary to produce the effect. This thermal effect is much greater than, and probably quite different from that investigated by Parks, occurring when finely divided solids are mixed with water; but the effects long ago observed by Pouillet when finely divided solids were placed in water were probably in part at least, due to distillation.—J. T. D.

Dyeing [*Mordanting*] *Processes. VII. For* [illegible] *in which Primary Metallic Mordants are Present in Mordanted Fibres.* P. Heermann. Färber-Zeit., 1904, **15**, 325—327 and 345—347.

Raw and boiled-off silks which had been mordanted with stannic chloride, basic ferric sulphate, chromic chloride, and aluminium acetate were examined with a view to ascertaining in what form the mordant was present in the fibre. The silk was mordanted by the method previously described (this J., 1903, 623, and 1901, 57), thoroughly washed with water, and titrated directly with standardised sodium hydroxide solution; this method gives a direct determination of the amount of acid radical present in the mordanted fibre in the form of basic salt; its accuracy was checked by fusing the fibre with alkali hydroxide, and determining the amount of acid radical in the usual manner. A deduction was necessary from these results, since traces of acid remain adhering mechanically to the fibre, even after most careful washing, and this was ascertained by substituting for the mordanting a treatment with a solution of the acid of which the radical was present in the mordant, the other conditions of the process, and the analytical method, being the same as above. It was found that considerable range in the concentration of the acid solution used had no effect on the amount of acid adhering to the fibre; *e.g.*, treatment with 1, 5, and 10 per cent. solutions of hydrochloric acid resulted in the same percentage of acid being retained in each case. The analytical data were completed by a determination of the amounts of metallic oxide present in the fibre. The results were as follows: in the case of the tin mordant, the raw silk was found to contain 155 mols. of stannic oxide to each atom of chlorine, corresponding to a formula of $SnCl_4 + 619Sn(OH)_4$, and a "basicity number" (see this J., 1904, 438) 0·0019; boiled-off silk contained 143 molecules of stannic oxide to each atom of chlorine, corresponding to $SnCl_4 + 571Sn(OH)_4$ and basicity number 0·0021. With the iron mordant on raw silk, 111 mols. of ferric oxide were present to each mol. of SO_3, *i.e.*, $Fe_{222}SO_3(OH)_{664}$, basicity number 0·008; on boiled-off silk, 91 mols. Fe_2O_3 to 1 mol. of SO_3, or $Fe_{182}SO_3(OH)_{544}$, basicity number 0·0096. Chromium mordant on raw silk, 40 mols. of chromic oxide to 1 atom of chlorine, or $Cr_{80}Cl(OH)_{239}$, basicity number, 0·009; on boiled-off silk, 44 mols. of Cr_2O_3 to each atom of chlorine, or $Cr_{88}Cl(OH)_{263}$, basicity number, 0·008. Aluminium mordant; in neither raw nor boiled-off silk could any acid radicle be detected, showing that the aluminium was present as hydroxide. It would thus appear that, for all practical purposes, the mordant is not present in the fibre in the state of a basic salt, but in the form of the hydroxide.—T. F. B.

Coal-Tar Dyestuffs; Behaviour of —— towards Starch, Silicic Acid, and Silicates. W. Suida. Monatsh. Chem., 1904, **25**, 1107—1143.

Pure potato starch, free from albumin, was shaken up in the cold with solutions of various dyestuffs. After about 15 minutes the liquid was poured off and the starch washed repeatedly by decantation with cold distilled water until the water was not coloured. It was found that basic dyestuffs dye the starch strongly, whereas acid dyestuffs do not. Basic dyestuffs, which have been sulphonated, dye less strongly than the unsulphonated dyestuffs, and if highly sulphonated show little affinity for the starch. Diamine Blue B B forms an exceptional case as in distinction to all other benzidineazo dyestuffs which were tried, it dyes starch strongly. In all cases the dyed starch granules, when examined under the microscope, were found to be uniformly dyed right through. Though water does not remove the dyestuff it is removed slowly by alcohol, more quickly by dilute hydrochloric acid and by acetone. By using sufficient starch, solutions of basic dyestuffs can be completely decolorised. Starch dyed with Magenta did not lose one-third of the intensity of coloration on being extracted with alcohol in a Soxhlet apparatus for several days. The amount of dyestuff taken up by starch is very small. Thus 100 parts of potato-starch can only take up 0·00228 grm. of Magenta, or rather remove the base from the same, for all the hydrochloric acid of the Magenta is left in the bath, which, however, remains neutral, the free acid being neutralised by the mineral matter in the starch. Thus potato-starch behaves towards basic dyestuffs in an analogous manner to animal fibres and hydro- and oxycellulose and not like ordinary cellulose. It is not dyed by direct cotton dyestuffs, in which respect it differs from both animal fibres and cellulose. Dyestuffs derived from diaminostilbene form an exception in this case. Inulin is not dyed by basic dyestuffs. Attempts were then made to dye the following materials with basic dyestuffs free from ash:—Flowers of sulphur, calcium, strontium and barium sulphates, calcium, barium, magnesium, manganese, and lead carbonates, aluminium oxide (partly hydrated), aluminium phosphate, kaolin, talc, pumice powder, zinc oxide, and kieselguhr. Only the kaolin, talc, pumice, and kieselguhr were dyed. The other materials took up no colour whatever, and the same results were obtained on using boiling solutions of the dyestuffs. Only the silicates were dyed, and these were dyed very strongly. Acid dyestuffs were tried, but did not dye the silicates, with the exception of some diamine colours which dyed them slightly. A large variety of pure minerals containing silicic acid were then tried, and it was found that only those silicates containing acid hydroxyl groups were strongly dyed by basic dyestuffs (Methylene Blue and Diamond Fuchsine), silicates which were neutral or basic, or which merely contained water of crystallisation not being dyed at all, or only very slightly. Hydrated forms of silicic acid such as opal and hyalite, were also dyed, but not quartz or flint. A dark augite, jadeite, and petalite formed apparent exceptions to the rule, being dyed, although they contain no free hydroxyl groups, but these minerals readily undergo change, accompanied by hydration. All the minerals which can be dyed in this way lose the property on ignition. When they are dyed, the acid radical of the dyestuff is left in the bath, but combined with basic constituents of the original mineral so that the bath remains neutral. The dyestuff can be extracted from the dyed mineral by hydrochloric acid, alcohol or acetone, but by no means quickly or completely. Both potato-starch and kaolin can be shown to possess weakly acid properties by shaking them with weakly ammoniacal phenolphthalein or cuprammonium solution, which they decolorise. Hydrocellulose also shows this reaction, whereas calcium carbonate, strontium sulphate, zinc oxide, natrolith, and vesuvian do not. Kaolin and other acid silicates can also be dyed by means of an aqueous solution of the carbinol-base of Magenta in an analogous manner to wool, but in the former case warming is necessary, and only little free ammonia must be present. Only 20 per cent. of the dyestuff could be extracted by alcohol from kaolin dyed with Magenta. From dyed wool only 10 per cent. of the dyestuff could be extracted in the same manner. Thus in both cases by far the larger part of the colour remained fixed in the material. Further experiments with kaolin showed that so long as excess of dyestuff was present in the vat, neither temperature, or concentration had any appreciable effect on the strength of the dyeing, also that the dyestuffs used (Magenta, Paramagenta, Methylene Blue and Crystal Violet) were absorbed in molecular proportions, within the limits of experimental error. Kaolin which had been treated with warm caustic soda and then thoroughly washed, acquired by this treatment the property of taking up twice the quantity of basic dyestuff, and also of absorbing acid dyestuffs from an acid bath. Treatment with hydrochloric acid was not found to alter the behaviour of kaolin towards dyestuffs. After treatment with hydrofluoric acid it is not dyed so strongly by basic dyestuffs, but absorbs acid dyestuffs vigorously from an acid bath. During the investigation the inaccuracy and unreliability of colorimetric methods of determining the strength of dyestuff-solutions were repeatedly proved. The effect of varying amounts of hydrochloric acid in the dyeing of wool with Magenta was also tried. Up to 5 molecular proportions of hydrochloric acid per molecular proportion of Magenta caused no diminution in the intensity of the dyeings, but 9 molecules of the acid already produced considerable diminution in the intensity of the dyeing, whilst 65 molecules reduced the intensity by 50 per cent.—E. F.

Zinc Oxide Reserves under Prud'homme's Black. E. Lauber. Z. Farben- u. Textil-Ind., 1904, **3**, 417—419.

The zinc oxide is ground up with its own weight of glycerin.

Standard White.—6 kilos. of zinc oxide paste (1:1) are well mixed with 6 kilos. of glycerin and 4 kilos. of gum tragacanth (75:1000), and passed through a fine sieve.

White Resist.—250 grms. of calcined sodium carbonate are dissolved in 1 litre of water, and well mixed with 5 kilos. of standard white.

Coloured Resists.—The dyestuffs are dissolved in glycerin on the water-bath, mixed with zinc oxide and the necessary thickening agents, and passed repeatedly through the wet colour mill, and then, before printing, through a fine silk sieve. The following is an example :—"*Green Lake*": 300 grms. of Brilliant Green are dissolved in 250 c.c. of water and 1750 grms. of glycerin, and 6000 grms. of zinc oxide paste (1:1) are stirred in.

Green Printing Colour.—830 grms. of Green Lake are well mixed with 200 grms. of glycerin, 200 grms. of tragacanth (50:1000), and 800 grms. of blood albumin (750:1000); passed through the mill; and sieved.

As these printing pastes have a great tendency to stick in the engraving of the printing rollers, revolving brushes are fitted to remove the residual colour from the rollers. The resists are printed on the white cloth, and the latter is hen passed into a hot chamber to coagulate the albumin in order to prevent the running of the colour in the subsequent padding. If the cloth is dried at a low temperature, t is passed for a few minutes through the Mather-Platt. The padding with aniline liquor is best done in a two-oller padding machine, the lower roller alone dipping nto the padding bath. The printed cloth is passed between he rollers with its printed side downwards, and in order to et a thorough impregnation, is pressed against the lower oller by a smaller roller which is fixed a short distance rom the gripping place. The after-treatment of the aterial in the hot flue and chrome-bath is the same as sual.—A. B. S.

English Patents.

Iultiple-Ply Woven Fabrics; Apparatus for Treating —— with Adhesive Compound. W. R. Smith, Buffalo, U.S.A. Eng. Pat. 13,471, June 14, 1904.

Iultiple-ply woven fabrics are first heated and stretched y a passage between a series of heated rollers, each pair of hich, after the first, has a greater velocity than the receding pair. The fabrics are then passed between a air of heated rollers, by means of which they are treated ith a "filling composition," the object of the process being produce machine belting.—E.B.

leaching Textile Materials; Process for ——. O. Venter, Chemnitz, Germany. Eng. Pat. 15,395, July 9, 1904.

order to obtain more even bleaching, the fabric is posed to the action of the bleaching liquid *in vacuo*, a completely spread out condition, without longitudinal lds, *e.g.*, hung loosely over a number of rollers fixed at a ort distance from one another. Ozonised air or liquid r can be used when necessary to facilitate the bleaching. —T. F. B.

ischarge of Halogenated Indigo Colouring Matters J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 1867, Jan. 25, 1904.

e U.S. Pat. 760,817 of 1904; this J., 1904, 659.—T. F. B.

rying or Carbonising of Fibrous or other Material; Machinery for ——. J. Fielden, Rochdale, Lancs. Eng. Pat. 23,607, Oct. 31, 1903.

is machine consists of a drying chamber furnished with oving carriers for the material, and heated by a hot-air ast. The material is fed into the tube of the hot-air pply by means of a light roller, which is arranged in ides, so as to rise and fall according to the thickness of the aterial which is fed into the machine. In its lowest position is roller entirely shuts the feeding inlet and so prevents e entry of cold air, and it only rises sufficiently for the aterial to pass. A pair of squeezing rollers can also be ted so as to close the inlet, the material passing between em being thrown into the air pipe by a stripper working ide the machine. The conveyers consist of horizontal ys, which are moved to and fro by connecting rods rking with eccentrics.—A. B. S.

Sizing Yarns [on Bobbins]. F. Möller-Holtkamp. Fr. Pat. 344,471, June 30, 1904.

Yarns are wound upon bobbins, and are sized thereon by means of a composition of thinner consistency than usual, which is forced into them by centrifugal action.—E. B.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

French Patent.

Printing Paper Intermittently; Apparatus for ——. J. Grantil. Fr. Pat. 344,380, June 15, 1904.

The pattern—*e.g.*, a multi-coloured one—to be reproduced, is engraved upon the requisite number of printing rollers, of the same circumference and geared together as usual, which are arranged round the cylinder of a printing machine at such a distance from this that they come into contact with a raised portion extending around it to a length equal to the circumference of the rollers. As the paper to be printed passes through the machine, those parts of it which lie upon the raised portion of the cylinder during each revolution of this, become printed, whilst a length, corresponding with that of the unraised portion of the cylinder, remains unprinted between every two successively printed lengths.—E. B.

VII.—ACIDS, ALKALIS, AND SALTS.

Perborates; Action of Boric Acid on Alkaline Peroxides. G. F. Jaubert. Comptes rend., 1904, **139**, 796—798.

When 248 grms. of boric acid are mixed with 78 grms. of sodium peroxide and added gradually to 2 litres of cold water, the mixture dissolves at first, but later, a crystalline substance separates out, which may be filtered off and dried at a moderate temperature. This substance, when titrated with permanganate solution shows 4·17 per cent. of active oxygen, corresponding with the formula $Na_2B_4O_8 + 10H_2O$; the author terms it "perborax." It dissolves in water to the extent of 42 grms. per litre at 11° C. Its aqueous solutions have an alkaline reaction and contain free hydrogen peroxide; they are fairly stable at the ordinary temperature. When one-half of the sodium of perborax is saturated with a mineral acid, a crystalline precipitate of sodium perborate separates out; this salt has the composition corresponding to $NaBO_3 + 4H_2O$. Crystalline sodium perborate is a very stable substance and can be preserved indefinitely at the ordinary temperature. It is less soluble than perborax, but dissolves readily, with slight decomposition, in water at 50°—60° C.; vigorous evolution of oxygen takes place at 100° C. The cold aqueous solution of sodium perborate possesses all the properties of hydrogen peroxide, and the new salt affords a convenient means for the rapid preparation of that reagent. When powdered sodium perborate is added gradually to 50 per cent. sulphuric acid and the liberated boric acid is filtered off through guncotton, a very strong solution of hydrogen peroxide, at a strength of 150—200 volumes, is obtained.—J. F. B.

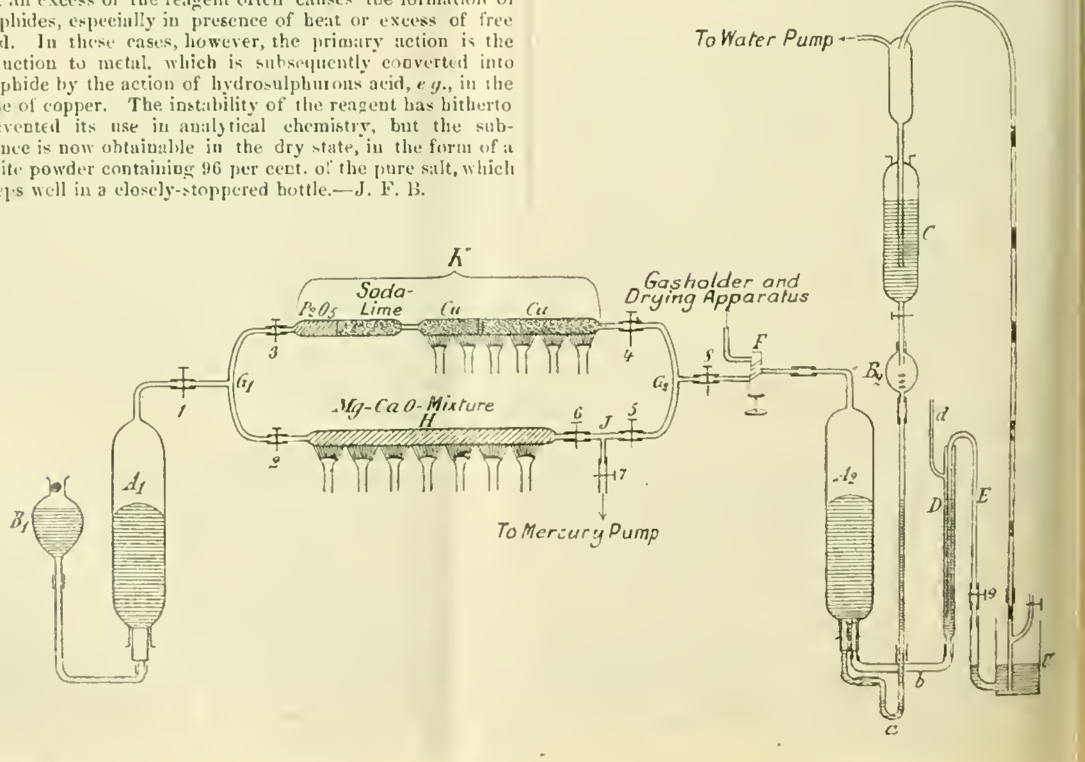
Sodium Hydrosulphite [*Hyposulphite*]; *Action of —— upon Metallic Salts. Second Communication.* O. Brunck. Annalen, 1904, **336**, 281—298. (See also this J., 1903, 710.)

The author has extended his investigations to the action of sodium hydrosulphite upon the salts of aluminium, indium, thallium, titanium, germanium, zirconium, tin, lead, arsenic, antimony, bismuth, chromium, molybdenum, tungsten, uranium, manganese, iron, nickel, cobalt, palladium, platinum, selenium, and tellurium. A survey of the general results shows that the hydrosulphite may react upon the salts of the metals in two different ways: in some cases it acts as a very powerful reducing agent, whilst in other cases it precipitates the sulphides of the metals, so far as these are capable of existing under the conditions in question. Frequently the direction of the reaction is determined by the conditions. The precipitation of sulphides takes place most readily in the case of the metals highest in the electrochemical series; these sulphides would appear to be the products of the decomposition of the corresponding hydrosulphites; their formation requires a certain time, and in many cases (*e.g.*, zinc, cadmium, and tin) the hydrosulphites or their double salts can be isolated. Towards the salts of the metals at the electropositive end of the series, sodium hydrosulphite acts primarily as a reducing agent, but an excess of the reagent often causes the formation of sulphides, especially in presence of heat or excess of free acid. In these cases, however, the primary action is the reduction to metal, which is subsequently converted into sulphide by the action of hydrosulphurous acid, *e.g.*, in the case of copper. The instability of the reagent has hitherto prevented its use in analytical chemistry, but the substance is now obtainable in the dry state, in the form of a white powder containing 96 per cent. of the pure salt, which keeps well in a closely-stoppered bottle.—J. F. B.

Nitrogen; Automatic Apparatus for the Absorption (*—— from Gaseous Mixtures.* F. Henrich. Zeit angew. Chem., 1904, **17**, 1755—1757.

The construction of the apparatus is shown in the figur In order to fill it with the gaseous mixture containin nitrogen, the vessels A_1 and A_2, are filled up to the capillar tubes with mercury, by opening the screw-clamps numbere 1 to 8, and raising the reservoirs B_1 and B_2. The thre way cock F is then put in communication with the ga holder, and the clamp 9 opened, whereby the gas flow into A_2, forcing out the mercury through the sipho E into U. Mercury is now run into B_2 from C, the thre way cock being turned till it communicates with the U-tub G_2, whilst the clamps 8, 4, 3, and 1 are opened, and 2, 5, and 7 are closed. When A_2 is about half-filled wit mercury, the clamp 9 is closed, but the mercury is allowe to run in until A_2 is filled up to the capillary tube. Tl stream of mercury from C is then cut off, the clamp 3 closed, 2, 6, and 7 are opened, and the gas in A_1 is di charged through H and J by raising B_1. When tl mercury in A_1 reaches the capillary tube, the clamps and 6 are closed, and the series of operations is repeat several times, to expel all air from the apparatus. If onl a small quantity of the gaseous material is available, A_1 filled with mercury up to the clamp 1, and A_2 up to tl three-way cock, F, and the apparatus is then evacuated b means of the mercury pump before admitting the ga When beginning the absorption of the nitrogen, A_1 and A should be about half-filled with the gaseous mixture. Tl clamps 3 and 7 are closed, 1, 2, 6, 5, 4, and 8 are opene and mercury is run fairly rapidly from C into B_2, wherel the gas is forced from A_2 through the tube H containin the heated mixture of lime and magnesium, into A_1. Whe the siphon E overflows, the gas is drawn rapidly from A back to A_2. It is then again forced from A_2 to A_1 by tl mercury flowing from C into B_2, and so on. If necessar a little air may be blown into *d*, or the rubber tubing may be pinched in order to completely expel the mercu from E each time the siphon acts. At suitable interval the clamps are so manipulated that the gas is forced pass through K in order to free it from moisture, &c.

—A. S.



Oxygen; Withdrawal of —— by Platinum. E. Goldstein. Ber. 1904, **37**, 4147—4148.

Wöhler's experiments (this J., 1903, 1246) on the oxidation of platinum, required for the most part many days or even weeks. The author has been able to show the same reaction is a much shorter time. The absorption of oxygen in vacuum tubes containing it, and the deposition of a film on the glass (no doubt platinum oxide, because different in appearance from the platinum film similarly deposited in a hydrogen tube) was long ago observed, but usually proceeds very slowly. This absorption, however, goes on very rapidly if the platinum cathode be heated almost to whiteness, either by the discharge alone, or by the discharge aided by a current from accumulators. In two or three minutes all the oxygen in a 50—100 c.c. tube thus disappears; the tube soon shows Röntgen effects, and shortly all discharge ceases. In an air tube a minute is sufficient to remove all the oxygen, and leave a residue giving the spectrum of pure nitrogen. This method can be used to remove traces of oxygen from a gas. Whether the wire oxidises and the particles of oxide are then cast off, or whether metallic particles are cast off and these fine particles are oxidised, is not yet decided. This oxidation connects itself with the author's former observation that during discharge the oxygen in vacuum tubes is converted into ozone.—J. T. D.

Lime; Apparatus for Slaking ——. B. C. White, Pittsburg, Pa. U.S. Pat. 773,834, Nov. 1, 1904.

The machine comprises two horizontal connected end compartments, and an intermediate compartment formed of two exterior and of two intermediate end walls, cast integral with each other, and having sheet-metal shells interposed between, connected at their end margins with the exterior and intermediate end walls. Rotating shafts carrying beaters extend longitudinally through the two end compartments.—E. S.

Nickel Oxide and Ammonia; Recovering —— [from Nickel-Ammonium Chloride]. H. A. Frasch, New York. U.S. Pat. 773,936, Nov. 1, 1904.

Nickel-ammonium chloride is "distilled" in presence of a dehydrating agent, such as a solution of calcium chloride saturated with sodium chloride. The resulting ammonium chloride with "the distilling fluid" from the precipitated nickel oxide is removed, treated with lime, and again distilled, the ammonia being recovered and nickel oxide precipitated. The process is repeated with fresh portions of nickel-ammonium chloride and lime, the "distilling fluid" being constantly enriched "with calcium chloride to any desired degree before finally removing it from the process." Compare U.S. Pat. 762,879, June 21, 1904; this J., 1904, 750.—E. S.

French Patent.

Alumina; Manufacture of ——. Cie. des Produits Chimiques d'Alais et de la Camargue. Fr. Pat. 339,049, Sept. 19, 1903.

See Eng. Pat. 19,924 of 1904; this J., 1904, 1088.—T. F. B.

United States Patent.

Pot-Furnace for Melting Glass. W. T. Nicholls, Wellsburg, W. Va. U.S. Pat. 774,600, Nov. 8, 1904.

The furnace consists of a long narrow combustion chamber of tunnel form with reversing regenerators connected to opposite ends. A series of similar transverse pots with closed tops are set in the furnace chamber with their ends opening through the side walls of the tunnel, each pot having a feed-in opening at one side, and a work-out opening at the opposite side, and a transverse partition with a hole in its lower part to allow glass to flow from what constitutes the melting-chamber to the work-out chamber. The furnace-chamber allows the gases to sweep from end to end over the series of pots; means are arranged whereby the glass is cooled in the work-out chamber.—A. G. L.

IX.—BUILDING MATERIALS, CLAYS, MORTARS AND CEMENTS.

Lime; Hydraulic ——. H. Seger and E. Cramer. Thonind. Z., 1904, **28**, 1535—1536.

The proportions of lime and silica in the best hydraulic limes, is such that whilst the burnt mass will set under water, there is sufficient lime to slake the whole to fine powder. The resistance of the product to water is not influenced by the quantity of alumina, but varies inversely with the amount of lime present. Undissociated silica reduces the value of the article. The assumption of Le Chatelier that the most suitable composition for hydraulic lime is 1 equivalent of silica to 4 of lime, is not confirmed by practical experience, a portion of the silica being left undissociated, and the product consequently containing an excess of lime. Iron oxide and alumina act as fluxes, and facilitate the dissociation of the silicates. The burnt lime is spread out in a thin layer, sprinkled with water, and then piled into heaps or bins for 10 days, the fine powder being sifted from the lumps. These, known as "grappiers," consist of the underburned and overburned portions, and when ground are mixed to a small extent with the hydraulic lime, to improve its water-resisting power, the rest being sold as grappier cement. The value of this latter depends on its content of calcium silicate; and too large a proportion of underburned material renders it useless. The composition of grappier cement from La Farge is: silica, 31·10; alumina, 4·43; ferric oxide, 2·15; lime, 58·83; magnesia, 1·09; alkalis; 0·94; sulphur trioxide, 0·60; carbon dioxide, 1·28 per cent. Owing to the irregular composition of these grappier cements, their use entails the adoption of special precautions.—C. S.

Refractory Materials in Electric Resistance Furnaces. F. A. J. FitzGerald. XI. A., page 1151.

English Patents.

Wood and other Fibrous and Porous Materials or Compounds; Solution for Treating [*Waterproofing*] ——. T. Gare, New Brighton, Cheshire. Eng. Pat. 23,786, Nov. 3, 1903.

Resin is first dissolved by heating with boiled linseed or castor oil, after which powdered vulcanised rubber or rubber composition is added in small quantities at a time. The mixture is then thinned, if desired, with petroleum, turpentine, &c., and applied to wood, cardboard, felt, or the like, either by immersing the articles in the solution, by forcing the solution through the material, or by simply coating the surface with the solution, in which case a hot roller may afterwards be passed over the surface. For treating wood or cardboard, equal parts of rubber and resin are mixed with 10 per cent. of boiled oil; for treating fibrous material like felt, the proportions of rubber and resin are increased by 25 per cent. In some cases, however, particularly when using a good quality of rubber, the oil may be omitted altogether. The quantity of thinning liquid used varies with the degree of porosity of the material to be treated.—A. G. L.

Refractory Material; Process of Manufacturing ——. R. Middleton, Leeds. Eng. Pat. 28,731, Dec. 31, 1903.

Portland cement is intimately mixed with 5 to 8 per cent. of starch, in the form of a concentrated solution, the mixing being preferably carried out in a steam-jacketed apparatus. The mixture is then moulded under pressure, and the resulting bricks, slabs, &c., are very carefully dried, after which they are burnt.—A. G. L.

Bricks, Tiles, Slabs, and the like; Manufacture of ——. C. H. Thompson, Stourbridge, Staffs. Eng. Pat. 28,733, Dec. 31, 1903.

Waste pieces of glass, either alone or mixed with blast-furnace slag, potsherds, pieces of earthenware or porcelain, sand, or clay, are ground and moulded by pressure, with or without preliminary damping, after which they are burnt for five hours at a temperature of 900° to 1200° C. During the burning the articles are prevented from adhering to each other by being encased in a refractory powder, *e.g.*, ground flint or, preferably, a mixture of equal parts of plaster of Paris and sand. In the case of very refractory materials, a flux, such as waste flint glass, lead borate, or felspar, may be added to the mixture to promote agglomeration. A composition giving good results is the following:—500 kilos. of opal and window glass, 250 kilos. of glazed china potsherds, $10\frac{1}{4}$ kilos. of lead borate.
—A. G. L.

Slag Wool, Silicate Cotton, or Mineral Wool; Manufacture of ——. G. A. Nelson, trading as F. McNeill and Co., London. Eng. Pat. 4275, Feb. 29, 1904.

As it is blown by the steam, air, or other pressure jet, the slag wool is deposited on a vibrating travelling band sieve or vibrating inclined riddle. By this means the different grades of the wool produced are intermingled, and the glassy particles, known as "shot," are caused to fall through the meshes of the sieve and separated.—A. G. L.

United States Patents.

Lime; Apparatus for Slaking ——. B. C. White. U.S. Pat. 773,834, Nov. 1, 1904. VII., page .

Fireproof Paint or Coating. E. R. Stowell, Portland, Ind., Assignor to A. B. Nettleton, Chicago, Ill. U.S. Pat. 774,003, Nov. 1, 1904.

The composition consists of about equal parts of finely-powdered silicon carbide and "semi-liquid" water-glass (sodium silicate), to which may be added calcium carbonate in such quantity that the product contains from 3 to 10 per cent. of this substance.—A. S.

X.—METALLURGY.

Dry Air Blast; Application of ——, *to the Manufacture of Iron.* J. Gayley. Iron and Steel Inst., Oct. 1904.

The author has effected considerable economy in the working of blast-furnaces by reducing the moisture in the air blast to a low and practically constant amount. The plant used for drying the air comprises two ammonia compressors (one in reserve), condensers, a refrigerating chamber, and a brine-tank. The compressors are of the following dimensions: high-pressure steam-cylinders, $28\frac{1}{2}$ ins. diam.; low-pressure cylinders, 56 ins. diam.; compressor cylinder, $22\frac{1}{2}$ ins. diam.; stroke, 36 ins. Each compressor has "a capacity of 225 tons ice-melting effect." The brine-tank contains 20 coils of double piping, the inner pipe of 2 ins. and the outer of 3 ins. diam., immersed in a calcium chloride brine of sp. gr. 1·21. The brine returning from the refrigerating chamber flows into the top of the tank, and is then forced by a pump through the inner pipe, wherein it is cooled below 32° F. by the ammonia flowing in the opposite direction through the annular space between the inner and outer pipes. The refrigerating chamber contains 60 vertical lines of coils, in each of which there are 75 pipes each 20 feet long, the whole representing 90,000 feet of 2-in. piping. The pipes in each vertical coil are placed in "staggered" position to insure better contact with the air. The series of coils is divided into three sections. The cooled brine from the brine-tank is fed into the coils through a 4-in. "header," and discharges into a 6-in "header," from which it passes to a stand-pipe, and thence back to the brine-tank. Air is forced into the refrigerating chamber by a blower, and in order to secure its uniform distribution, two electric fans are arranged in the space beneath the coils. The air deposits its moisture in the form of water or frost on the lower pipes and as frost on the upper pipes, and passes from the top of the chamber to the blowing engines of the blast-furnace at a temperature of 32° F., or below, and with a practically constant content of moisture. To remove the deposited frost, the supply of cold brine is cut off from several vertical lines of coil at a time, and brine which has been heated by means of steam is forced through by an auxiliary pump for a short time. In practice it is sufficient to thaw the frost off the pipes every three days. As showing the economy effected by the use of the dry air blast, it is stated that prior to its employment, in a period of 11 days, the daily production of iron in the blast furnace was 358 tons, with a consumption of 2,147 lb. of coke per ton of iron, whilst, after the introduction of the dry blast, in one period of 16 days, the production of iron was 447 tons with a consumption of 1,726 lb. of coke per ton; and, in another period of 14 days, 452 tons of iron with a consumption of 1,729 lb. of coke per ton. It was found necessary with the dry blast to reduce the speed of the blowing engine, whereby the efficiency of the latter was increased by 14 per cent. When the blowing engines were working at 96 revolutions per minute with the dried air, nearly 1 per cent. more coke was burnt and 89 tons more pig iron were produced in 24 hours than when the engines were working at 114 revolutions per minute with ordinary air. The author estimates that the saving in power consumption in the blowing-engine room would nearly or quite compensate for the requirements of the plant for drying the air. The gases from the furnace for 10 days prior to the introduction of the dry blast contained 22·3 per cent. of carbon monoxide and 13 per cent. of carbon dioxide, and had an average temperature of 538° F. When the dry blast was used, the gases contained 19·9 per cent. of carbon monoxide and 16 per cent. of carbon dioxide, and had an average temperature of 376° F. Other advantages resulting from the use of the dry blast are: the reduction of the loss of ore dust in the escaping furnace gases from 5 to 1 per cent; the possibility, with the saving in coke consumption, of the use of ores higher in phosphorus in the manufacture of Bessemer iron; the fact that owing to the absence of irregularities in the working of the furnace, the silicon can be kept low without increasing the sulphur, in the manufacture of basic iron; and the obtainment of a uniform product with respect to grade and composition. It is suggested that the application of the dry blast to the Bessemer converter and in other processes where air is used in large quantities, particularly in smelters and copper converters, in the open-hearth furnace and in cupolas, would also be advantageous. (See Eng. Pats. 11,091 of 1900 and 19,933 of 1903, and Fr Pat. 344,399 of 1904; this J., 1901, 27; 1904. 22 and 1095.)—A. S.

Cast Iron; Use of Manganese Ore as a Desulphurising Agent in the Smelting of ——. Wedemeyer. Stahl u. Eisen, 1904, **24**, 1316—1321.

Contrary to the statements of Reusch (this J., 1902, 861) and Wüst (this J., 1903, 1294), the author finds that small additions (1—1·4 per cent.) of manganese ore in the cupola furnace have little influence on the proportion of sulphur in the iron produced. Larger additions (4—4·5 per cent.) prevent the transference to the iron of the sulphur contained in the coke, but do not remove any of the sulphur contained in the pig iron used as raw material. The cost of desulphurisation by means of such large additions of manganese ore is, however, high, whilst at the same time the burning off of the silicon and iron is favoured. Moreover, the sulphur in the iron can be kept within the requisite limits by a suitable addition of limestone, a much cheaper material than manganese ore.—A. S.

Hard Steels; Microstructure of ——. W. J. Kurbatoff. Russ. phys.-chem. Ges., Oct. 1904. Chem.-Zeit., 1904, **28**, 1107.

The action of different etching materials was first tried, to ascertain which was the most delicate. Solutions of nitric and picric acids in water, alcohols, organic acids or anhydrides were used, and it was found that the etching was proportional to the ionisation. The most satisfactory reagent was a 5 per cent. solution of nitric acid of sp. gr. 1·3 in isoamyl alcohol. By means of this, differences in the structure of soft, brittle, and non-brittle steels, and lamellar nickel-steels were shown. A mixture of 1 part of a 4 per cent. solution of the same nitric acid with 1 part of methyl, ethyl, and amyl alcohol coloured the troostite and sorbite alone in 7—10 minutes. The hardness of austenite crystals varies in the groups themselves. The microstructures of steels specially rich in carbon, containing 1·9 per cent., show (1) that the texture depends on the different transformation periods of sorbite and cementite; (2) that with high temperatures, troostite with dark crystals on a bright ground results, with still higher temperatures, bright crystals on a dark ground; (3) that the texture of martensite alters in tempering; (4) that on tempering at high temperatures, troostite and cementite pass into ferrite and cementite, the latter decreasing.—F. S.

Gold Bullion; Notes on ——. A. C. Claudet. Inst. of Mining and Metall., Bull. No. 2, Nov. 10, 1904.

The author recommends that bars of bullion from the cyanide process, assaying below 800 fine, be "toughened" before being exported. For this purpose the bars are re-melted in clay crucibles holding 1000—2000 oz. of metal, and the molten bullion is stirred up after addition of sodium nitrate, the nitrate slag being removed by skimming. Successive additions of nitrate are made until the slag remains colourless. The cost does not exceed $\frac{1}{8}$—$\frac{1}{4}$*d.* per oz. of bullion. The nitrate slags may be dissolved and any gold present collected from the residues, or may be re-melted, or used in melting the cyanide precipitate in the first instance. The saving which might be effected by the mining companies is shown in the following table, in which the total fine gold in each case is taken as 500 oz.; the price of gold, 85*s.* per oz. fine: the penalty for cyanide bullion under 800 and above 700 fine, a deduction of 3 mils, and under 700 fine, a deduction of 4 mils; refining charge (in England), 2$\frac{3}{4}$*d.* per oz. of gross bullion; and melting charge, $\frac{1}{4}$*d.* per oz. of gross bullion.

"White Precipitate" formed in the Zinc Boxes of the Cyanide Works. A. Prister and B. Bay. J. Chem. Metall. and Mining Soc., S. Africa, 1904, **5**, 75—78.

The authors have made a fairly complete analysis of an average sample of the "white precipitate" formed in the "weak" and "medium" zinc boxes of the cyanide works. The results are given as follows:—Zinc potassium ferrocyanide, $K_2Zn_3[Fe(CN)_6]_2$, 10·45; zinc cyanide, 22·73; zinc hydroxide, $Zn(OH)_2$, 54·79; copper oxide, 0·40; ferric oxide, 1·00; and silica, 1·03 per cent. Traces of calcium, aluminium, cobalt, magnesium, gold, and sulphuric acid were also detected. The loss on ignition amounted to 31·32 per cent. and probably consisted of moisture, including that from the zinc hydroxide, and cyanogen from the zinc cyanide, and the zinc potassium ferrocyanide. The authors point out that it would be advantageous to pass the vapours evolved when the "white precipitate" is treated with dilute sulphuric acid in the "clean-up," through working cyanide solution, in order to absorb the hydrocyanic acid they contain.—A. S.

Silver and Cadmium; Alloys of ——. T. K. Rose. Proc. Roy. Soc., 1904, **74**, 218—230.

The properties of silver-cadmium alloys were investigated, by determining freezing-point curves, and also micrographically, with the view of ascertaining whether those richer in silver were more homogeneous than the corresponding silver-copper alloys, and consequently better adapted for making trial-plates to be used in testing the fineness of silver coin and plate. The results are summarised as follows:—1. There is evidence of the existence of the compounds $AgCd_3$, Ag_2Cd_3, $AgCd$, Ag_3Cd_2, Ag_2Cd, and Ag_4Cd. 2. Alloys containing 0—25 per cent. of silver consist of crystals of $AgCd_3$ in a matrix of cadmium. These containing 25—40 per cent. are crystals of Ag_2Cd_3 in a matrix chiefly $AgCd_3$. The alloy containing nearly 50 per cent. consists of crystals of a silver-rich substance in a matrix chiefly $AgCd_3$, which solidifies at 420° C., nearly 300° below the freezing point of the crystals. Those containing 50—60 per cent. consist, above 420° C., of mixtures of two solid solutions, one chiefly composed of $AgCd$, the other of Ag_3Cd_2, with traces of the eutectic freezing at 420° C. Those containing above 80 per cent. are mixtures of two bodies at temperatures between the liquidus and solidus portions of the curve representing the equilibrium between the solid and liquid constituents of the alloys, but these unite to form a single solution at temperatures on the solidus. 3. The alloys containing over 80 per cent. of silver do not segregate under ordinary conditions, and are practically homogeneous and uniform. They are very suitable for the manufacture of trial plates.—J. T. D.

Sulphur in Irons and Steels; New Method for the Determination of ——. H. B. Pulsifer. XXIII., page 1162.

Aluminium; New Use for ——. Elect. Review, 1904, **45**, 70. V., page 1143.

English Patents.

Steel; Manufacture of ——. J. W. Duncan, Birmingham, Eng. Pat. 20,468, Sept. 22, 1904.

A known quantity of oxygen gas is mixed with the air-blast before the latter enters the converter. For this purpose an apparatus may be used in which an air-pump for supplying the blast has an inlet valve for the air and a balance valve for the supply of oxygen contained in a valved reservoir, so that the mixture is, on the down stroke of the piston, forced past a valve into a pipe leading to a chamber whence it passes into the converter.—E. S.

Minerals; Separation of —— *from Ores and Gangue.* H. L. Sulman and H. F. Kirkpatrick-Picard, London. Eng. Pat. 20,419, Sept. 22, 1903.

A current of steam, air, or other gas, charged with a vaporised or atomised oil, is introduced, preferably into the bottom of the finely-divided pulped ore. It is stated that the minute oil globules, or the condensed vapours of volatile oils, attach themselves to the metalliferous particles in preference to the gangue, and float them up, when they may be skimmed off the surface. Or the pulp may by other means be brought into intimate contact with "oil, and with air or other gas, while the oil is in a state of fine division."—E. S.

Ores; Furnaces for Calcining or Roasting Mineral ——, *and Desulphurising the same.* T. Edwards, Ballarat, Australia. Eng. Pat. 28,464, Dec. 28, 1903.

In a long, reverberatory furnace, with a plane hearth sloped from the receiving to the discharging end, a series of rotating rabbles, disposed in two or more lines longitudinally, and geared so as to be driven in unison, have paths intersecting on the furnace hearth. There are double water passages into, through, and out of the rabbles wherein water is circulated, and covered passage-ways in the arch of the furnace through which the rabbles can be removed and replaced.—E. S.

Ore Separators and Classifiers; Improvements in certain Descriptions of ——. E. J. Swyny and S. G. Plucknett, Sydney, N.S.W. Eng. Pat. 19,140, Sept. 5, 1904.

The inlet and outlet passages of the separator are arranged over the perforated cover of a chamber into which water under pressure is introduced. The ore passes, together with water, down the inlet passage, and meets the jets of water issuing through the perforated cover of the chamber beneath, whereby the lighter particles of gangue are driven upwards through the discharge passage, and are collected on an inclined shelf, whilst the heavier metalliferous particles settle into a channel leading to discharge spouts.—E. S.

Sulphides from their Ores; Apparatus to be used in the Separation and Recovery of ——. J. H. Gillies, Melbourne, Australia. Eng. Pat. 20,159, Sept. 19, 1904.

The process used is that in which particles of sulphides in powdered sulphide ores are acted upon by an acid or saline solution that may cause gas bubbles to attach themselves to such particles, causing them to float upwards and be thus capable of separation. The apparatus consists mainly of a metal tank, in the form of an inverted truncated cone, surrounded by an outer jacket, and communicating at its base with a funnel-shaped extension, leading to an outlet pipe. The receptacle is constructed in the form of annular steps having a fall from their outer towards their inner edges, and within it are arranged a number of annular and angular glass blocks, so as to form an annular series of rings arranged one above another and held in position by metal standards, and as a whole taking the shape of a filtering funnel or inverted cone. The tank is surmounted by a hood, down the outer inclined sides of which the powdered ore is delivered and falls on to an annular baffle, whence it falls step by step downwards, the tank having been filled with the chemical liquid and heated by steam or otherwise. The sulphide particles to which gas adheres work upwards under the annular blocks until they reach annular openings which admit them into the body of the tank, where, losing the gas, they sink, and are discharged by a flow of cold liquid into a receptacle below. The dross, on the other hand, passes down between the jacket and the tank to be separately discharged. There is a ball-and-cock system to maintain the level of the liquid in the tank, and there are means for supplying cool liquid to carry off the solid products from the bottom of the apparatus without disturbing the heated liquid above.—E. S.

Metals; Annealing ——, *and Apparatus therefor.* J. S. L. Alexander and A. Shiels, both of London. Eng. Pat. 23,457, Oct. 29, 1903.

The molten annealing bath used is mainly or wholly of aluminium, the container of which is heated from a furnace by flues arranged above as well as below the bath. The temperature of the bath is maintained constant, either by attention to the heater, or by means of a thermostatic regulator inserted at about the normal level of the molten metal, and operating a lever connected to a damper in the flue. The container is made deeper at one end than at the other end, so that the pipe or tube introduced for annealing may not lie flat, but at an angle, and also that it may have a tendency to move from one side of the bath towards the other side. Means are provided for introducing articles into, and moving them through, the bath.—E. S.

Zinc [free from Lead]; Extraction of ——. C. S. Brand, Knowle, Warwick. Eng. Pat. 263, Jan. 5, 1904.

See Fr. Pat. 341,345 of 1904; this J., 1904, 827.—T. F. B.

Zinc [free from Lead]; Extraction of ——. C. S. Brand, Knowle, Warwick. Eng. Pat. 3628, Feb. 13, 1904.

See Fr. Pat. 341,346 of 1904; this J., 1904, 827.—T. F. B.

Melting Furnaces. H. J. J. Charlier, Philadelphia, U.S.A. Eng. Pat. 4384, Feb. 22, 1904.

See Fr. Pat. 340,625 of 1904; this J., 1904, 827.—T. F. B.

United States Patents.

Sheet Iron or Steel; Method of Treating ——. H. H. Goodsell, Leechburg, Pa. U.S. Pat. 774,069, Nov. 1, 1904.

See Eng. Pat. 18,746 of 1904; this J., 1904, 1034.—T. F. B

Metallurgical Process [*for Manufacture of Steel*]. M. P. Boss, San Francisco, Cal. U.S. Pat. 774,301, Nov. 8, 1904.

Finely-divided iron ore is fed upon an inclined and heated hearth, discharging into a short vertical shaft, and thence into a basin which receives the molten product. In the heated hearth the ore is subjected to the action of a flame from a hydrocarbon, which is introduced in sufficient amount to present "free" hydrocarbon gas to the reduced metal, whereby it is converted into steel. Compare U.S. Pat. 732,263 to 732,269 inclusive, of June 30, 1903; this J., 1903, 914.—E. S.

Centrifugal Separator [*for Ores*]. F. B. Pettengill, Los Angeles, Cal., Assignor to S. L. Kistler. U.S. Pat. 774.104, Nov. 1, 1904.

The separator comprises a fixed framework supporting a movable frame to which a horizontal reciprocating motion is imparted, with sudden stops; and a rotating concentrating cylinder mounted in the movable frame, the frame being provided with annular flanges surrounding the ends of the cylinder, and forming therewith annular channels. Inside the cylinder are stirring and lifting blades, which rotate independently of, and more slowly than it. The plane of revolution of the blades and cylinder is vertical. The outer edges of the lifting blades are nearer the cylinder than the inner edges, and portions of the blades extending longitudinally have a sharp edge close to the surface of the cylinder. Means are provided for feeding the ore-pulp into, and for causing a cleansing liquid to flow through, the cylinder. The concentrate is discharged through the annular channel at one end and the gangue through the corresponding channel at the other end of the separator.—A. S.

Slime; Process of Filtering ——. H. R. Cassel, New York. U.S. Pat. 774,349, Nov. 8, 1904.

The slime-pulp is introduced into a tank containing filter-cells connected to a suction-pump, and is simultaneously agitated and circulated between the cells. The slime is deposited in the form of a "thickened layer" on movable mantles arranged at the sides of the filter-cells, any non-adhering pulp being discharged through the bottom of the tank, and introduced again at the top. Water is introduced into the tank to wash out the "values" from the "thickened layer" of adherent pulp, and finally this adherent pulp is dislodged from the movable mantles by agitation, and discharged through the bottom of the tank. Compare U.S. Pat. 769,938 of Sept. 13, 1904; this J., 1904, 939.—A. S.

Nickel Oxides; Furnace for Reducing and Smelting ——. R. R. Maffett, Bayonne, N.J., Assignor to International Nickel Co., N.J. U.S. Pat. 774,591, Nov. 8, 1904.

The furnace has an open-hearth smelting chamber from which an elongated reducing chamber leads to the chimney. Charging openings are arranged lengthwise in the reducing chamber, beneath which a flue extends, having a damper at each end, and communicating with the chamber at its rear end—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A*.)—ELECTRO-CHEMISTRY.

Cadmium Cell; Report on the ——. H. S. Carhart, G. A. Hamilton, E. B. Rosa, C. H. Sharp, and B. J. Arnold. Chem. News, 1904, **90**, 225—227.

The Committee appointed by the Board of Directors of the American Institute of Electrical Engineers to inquire into the preparation of materials for, and the construction of, the cadmium or Weston cell, have issued a preliminary report. Provisional specifications are given for the preparation of mercury, cadmium sulphate solution, cadmium amalgam, mercurous sulphate and the paste, and for the construction and filling of the cell. For the cell prepared in accordance with the specifications, the name "Weston Normal Cell" is proposed. The recommendations include the purification of mercury by treatment with a nitric acid solution of mercurous nitrate (Z. Phys. Chem., **33**, 611), and subsequent re-distillation in a vacuum at least twice; the preparation of pure cadmium sulphate by re-crystallising the pure commercial salt, and selecting only the clear crystals; and the preparation of cadmium amalgam and mercurous sulphate by electrolytic methods. The H-form of cell is recommended. (See also this J., 1904, 665.)—A. S.

Aluminium Anodes; Colloidal Precipitation upon——. W. R. Mott. Electrochem. Ind., 1904, **2**, 444—447.

The loose incoherent aluminium hydroxide which is formed at an aluminium anode in most electrolytes by the passage of a current, adsorbs acid from the solution, forming a hard, dense, insoluble solid of great insulating power. The thickness of film which would bring about perfect insulation, varies with different solutions. Electrolytes containing acid radicals of high valency (citrates, phosphates, &c.) give films of great specific resistance and high dielectric strength, consequently such films are thinner, and less coulombs are required for their formation.—R. S. H.

Refractory Materials in Electric Resistance Furnaces. F. A. J. FitzGerald. Electrochem. Ind., 1904, **2**, 439—444.

The author deals chiefly with the applications of "silicocarbides," which are compounds of silicon and carbon, sometimes with oxygen, and are characterised as being amorphous and highly refractory; they can be converted into crystalline carborundum at a very high temperature. It is shown that the heat conductivity of these materials is greater than that of good firebrick, so that they are more suitable as a lining for the latter than for replacing it entirely. The electrical conductivity of the heated material is not sufficient to cause much leakage of current when it is used as a furnace lining, at any rate for such temperatures at which it is otherwise suitable. Various methods of moulding and forming articles from silico-carbides are described. Glue, dilute sodium silicate solution and tar may be used as binding agents according to the particular application in view. For articles of great mechanical strength it is preferable to frit the material together by oxidation, a temporary binding agent, such as glue, being employed; the process requires prolonged heating since the oxidation is slow. Carborundum, which is to be preferred for the higher temperatures, may be formed into articles by similar methods or by "re-crystallisation," which is effected by heating the moulded material in the electric furnace to the temperature of its formation, when the grains are found to adhere strongly. The paper concludes with a description of methods suitable for the analysis of the silicocarbides.—R. S. H.

Flours; Bleaching of ——, *by Electricity.* Balland. XVIII. A., page 1157.

United States Patents.

Electrode; Storage Battery ——, *and Process of Making Same.* E. A. Sperry, Cleveland, Ohio. U.S. Pat. 773,685, Nov. 1, 1904.

Carbonate of lead produced by precipitation electrolytically, from a solution of a lead salt, is roasted to expel carbon dioxide and leave a highly porous mixture of oxides of lead, consisting of equal parts of litharge and minium. The oxides are mixed with a soluble substance capable of combining with and hardening the lead oxides, and the mixture is applied to a grid or support. The soluble substance is dissolved out, thereby leaving relatively large feeder-pores extending through the porous active material.—R. N.

Furnace; Electric ——. C. P. Steinmetz, Schenectady, N.Y., Assignor to General Electric Co., New York. U.S. Pat. 773,824, Nov. 1, 1904.

See Eng, Pat. 15,920 of 1900; this J., 1901, 977.—T. F. B.

Kiln; Electric ——. F. E. Dickinson, Kendallville, Ind. U.S. Pat. 773,853, Nov. 1, 1904.

The body of the kiln includes a treating chamber at its interior with an adjacent heating chamber, or with a series of heating chambers or boxes at its base. An auxiliary perforated floor is spaced from the base of the kiln, so as to form return flues communicating with the bottom of each heating chamber, the auxiliary floor extending into each heating chamber. Walls or partitions extend upwards from the auxiliary floor, forming flues leading from each heating chamber, and discharging into the top of the treating chamber, each wall also separating the treating chamber from one of the heating chambers. Electrodes are arranged within each heating chamber, and produce an arc or arcs for heating the gases, so as to cause a circulation through the treating chamber and back to the heating chambers. Means are used for controlling the circulation, and for preventing the admission of air for the support of combustion, and a continuous circulation of the same air is thus maintained through the several parts. An adjustable inlet to each heating chamber provides the latter with air, and an adjustable outlet in the return flue displaces a portion of the circulating gas.—B. N.

Accumulator Plates; Proces of Electrolytically Producing Lead Peroxide Layers upon Positive ——. J. Diamant, Raab, Austria. U.S. Pat. 774,049, Nov. 1, 1904.

See Eng. Pat. 6954 of 1903; this J., 1904, 376.—T. F. B.

Electrolytic Apparatus. A. Briebaux, Brussels, Assignor to the Solway Process Co., Syracuse, N.Y. U.S. Pat. 774,230, Nov. 8, 1904.

See Eng. Pat. 7471 of 1898; this J., 1899, 376.—T. F. B.

Zinc; Process and Furnace for the Electrical Extraction of ——. A. Edelmann and N. Wallin. Fr. Pat. 344,832, July 16, 1904. Under Internat. Conv., July 23, 1903.

See Eng. Pat. 16,205 of 1904; this J., 1904, 1035.—T. F. B.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Fats; Enzymic Hydrolysis of ——. S. Fokin. Chem. Rev. Fett- u. Harz-Ind., 1904, **11**, 118—120; 139—141; 167—170; 193—195; 224—226; 244—247.

There is no difference in the enzymic action of different varieties of castor seeds, the same amount of fatty acids being liberated from almond oil by seeds from different garden varieties and from the ordinary castor plant. Nor does keeping the seed for a long time appear to have any perceptible influence on its enzymic activity. Variations in the temperature between 20° and 35° C. have also no influence on the results in the case of liquid fats, but when treating solid fats it is advisable to keep the temperature near the higher limit. Connstein, Hoyer, and Wartenberg, stated (this J., 1902, 1541) that the amount of water required to obtain the maximum of hydrolysis stood in relationship to the amount of fat, but the author concludes that the quantity of seeds is the determining factor. If too much water be added, the excess is speedily separated from the emulsion, and the amount retained by the seeds can be calculated fairly closely. Thus in four experiments in which the proportions of seeds were as 8 : 4 : 2 : 1, the amounts of water in the seeds and emulsion were as the respective square roots of these numbers arranged in similar ratio. As regards the influence of the amount of water on the yield of fatty acids, the author concludes that when the castor seeds are used in the proportion of 20 to 40 per cent. the influence of this factor is not very great, but that with smaller amounts of seeds (5 per cent.), variation in the proportion of water has much more effect, this being attributed to the readiness with which small amounts of seed separate from the emulsion. If 40 per cent. of water be used (with 5 per cent. of seed) the glycerin solution will have a concentration of about 20 per cent., whilst if the water used for washing be included, the concentration will be about 7 to 8 per cent. The glycerin requires purification from albuminoid matters, &c. The concentration of the acid (sulphuric, hydrochloric, &c.), must fall within the limits of N/20 to N 120, corresponding to the limits (of seeds employed) 5 to 40 per cent. With small amounts of acid the process is slow, whilst a concentration greater than N 10 may completely destroy the enzymic action of the seed. When the mass is properly mixed the quantity of seed used has no influence, at all events within the limits of 5 and 40 per cent. Under the proper conditions, a yield of 90 to 95 per cent. of fatty acids can be obtained within two to three days. The more thorough the mixing and the greater the amount of fat used the higher the yield of fatty acids. Solid and old (rancid) fats are not so readily hydrolysed. The hydrolysis can be started by means of carbonic acid or by the addition of free fatty acids. The nature of the oil or fat makes little difference, except in the case of those containing fatty acids of low molecular weight. The author states that the fatty acids obtained by this process are susceptible of being rapidly bleached. It is not easy to separate the aqueous glycerin solution from the residue of seeds. The author was unable to obtain the enzyme in the form of a solution. Attempts to use pancreatic juice in a technical process were unsatisfactory, the objections being the cost, the slowness of the hydrolysis, and the constant attention needed for the addition of fresh alkali. Moreover, the final products are inferior to those obtained by the castor seed process, and the glycerin can only be separated by salting out with sodium chloride and alkaline lyes, and is then much more impure than that separated from ordinary soap lyes. (See also this J., 1904, 259, 614).—C. A. M.

Copra Oil; Saponification of —— *by Cytoplasm.* E. Urbain, L. Saugon, and A. Feige. Bull. Soc. Chim., 1904, **31**, 1194—1198.

The presence of free fatty acids in copra oil appears to exert a retarding influence on the saponifying action of cytoplasm. The rate of saponification is found to vary directly with the mean molecular weight of the free fatty acids present. It was ascertained, by arresting the saponification at different times, that the saponification value of the neutral fatty oil remaining, and also the molecular weight of the fats formed was practically constant throughout the operation, whence it is concluded that the saponifying action of the cytoplasm is independent of the nature of the glyceride. This is contrary to the conclusion of Connstein, Hoyer, and Wartenberg (this J., 1902, 1542), viz., that the glycerides of the lower fatty acids were the last to be saponified, but this conclusion was based merely on the saponification of tributyrin; in this case it is pointed out that it is the butyric acid which retards saponification, and experiments are described which show that in the presence of 10 per cent. of butyric acid (on the weight of oil used) no saponification was effected in 24 hours.—T. F. B.

Borneo Tallow; Composition of ——. J. Klimont. Monatsh. f. Chem., 1904, **25**, 929—932.

Borneo tallow is the name given to the fat obtained from the fruit of different varieties of *Dipterocarpus.* The fat examined by the author was hard, of a greenish-yellow colour, and gave the following numbers:—Acid value, 15·8; saponification value, 194·6; iodine value, 30·1; and m. pt., 34·5° to 34·7° C. A solution of the fat in ether yielded a crystalline deposit (with iodine value 31·3), when cooled to 16° C. On recrystallising the fat from acetone, after removal of free fatty acids, a compound crystallising in needles was eventually obtained. This melted at 44° C. (37° C. after once melting), and had a saponification value of 188·4 and iodine value of 28·6, and an elementary composition agreeing with the formula of oleodistearin, $C_3H_5.C_{18}H_{33}O_2.(C_{18}H_{35}O_2)_2$. Further crystallisation of the substances retained in the mother liquid yielded products with relatively high saponification values (213, 218). From one of the fractions with saponification value 198, oleodipalmitin (m. pts., 33—34° C. and 28°—29° C.) was isolated. It was also concluded that glycerides of still lower fatty acids combined with unsaturated acids were present in the other fractions.

Cacao Butter.—In addition to the oleodistearin found by Fritzweiler an oleodipalmitin has been separated from this fat by the author.—C. A. M.

Cottonseed Oil; Detection of —— in Olive Oil. E. Milliau. XXIII., page 1163.

Dégras; Notes on the Analysis of ——. G. Baldracco. XXIII., page 1163.

Cholesterol; New Reaction of ——. C. Neuberg and D. Rauchwerger. XXIII., page 1162.

English Patent.

Fats or Fatty Substances or the like; Cooling Melted ——. A. E. Iveson, Gainsborough, and A. R. Wilson, Brighton. Eng. Pat. 25,868, Nov. 26, 1903.

The fat is heated until liquid or semi-liquid and subjected in a stream to the action of a blast (*e.g.*, of chilled air), which projects it in a state of fine division on to a cooling surface, such as the periphery of a rotating drum, from which it is subsequently scraped. The stream of melted fat may fall vertically and meet the blast issuing from a nozzle at right angles. Claim is also made for special apparatus for this process, which is stated to effect uniform cooling of the fat and to a large extent prevent "seeding."
—C. A. M.

United States Patents.

Halogenised Fat; Solidified ——, and Process of Making same. H. Winternitz, Halle on the Saale, Assignor to the firm of E. Merck, Darmstadt, Germany. U.S. Pat. 774,224, Nov. 8, 1904.

See Eng. Pat. 3430 of 1903; this J., 1903, 751.—T. F. B.

Liquids [Crude Glycerin]; Process of Distilling ——. W. E. Garrigues, New York. U.S. Pat. 774,171, Nov. 8, 1904.

To prevent decomposition, the liquid (glycerin, &c.) is distilled in an atmosphere of steam. For this purpose the aqueous vapours from a previous distillation may be condensed. This "sweet water" is evaporated at less than atmospheric pressure; the steam produced is superheated and injected into the crude glycerin, or the like, in the still. The superheating is effected by the vapours rising from the still, the glycerin vapours, being simultaneously condensed, giving off their heat to superheat the water vapour.
—C. A. M.

Glycerin; Recovering —— from Spent Soap Lyes. W. E. Garrigues, New York. U.S. Pat. 774,172, Nov. 8, 1904.

The liquid is neutralised with a mineral acid, and after separation of the insoluble fatty acids it is concentrated and then freed from mineral salts and volatile fatty acids, and the concentrated glycerin solution treated with an alkaline substance and distilled. Thus the soap lye may be neutralised with sulphuric acid, and aluminium sulphate added to precipitate the insoluble fatty acids. The filtrate from these is concentrated and the separated mineral salts removed, after which barium chloride is added and then sufficient sulphuric acid to liberate the volatile fatty acids combined with the alkali. These acids are partially enveloped in the barium sulphate, with which they can be separated from the liquid by filtration, whilst the remaining portion can be expelled by evaporating the liquid in a vacuum evaporator. Finally the solution is treated with sodium carbonate, and the glycerin distilled.—C. A. M.

French Patent.

Fatty, Resinous, and other Substances; Process and Apparatus for Extracting —— by means of Hot Solvents, without Pressure, and with as great Safety as in Methods of Cold Extraction. F. Genoyer. Fr. Pat. 344,919, July 18, 1904.

The material is extracted by means of a solvent heated to a temperature below its boiling point. The apparatus claimed for this purpose consists of a cylindrical extractor heated by means of a steam coil and connected by means of a pump with a lower reservoir containing the solvent. The temperature within the extractor can be maintained at the required point by the introduction of more cold solvent. After the extraction the solvent is driven into an evaporating vessel containing a steam coil, where it is evaporated at a temperature lower than its boiling point. The vapours are condensed in an adjoining vessel and the recovered solvent falls into the reservoir, whence it can be pumped again into the extractor.—C. A. M.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—PIGMENTS, PAINTS.

English Patents.

Oxide of Iron; Kilns applicable for Use in the Manufacture of ——. H. W. Hemingway, Walthamstow, Essex. Eng. Pat. 23,550, Oct. 30, 1903.

The kiln is of the type described in Eng. Pat. 4001 of 1893 (this J., 1894, 163), in which the blocks of copperas to be calcined are placed in a series of calcining pockets or chambers having removable tile covers and hinged floors, the hinges being formed as a single frame. According to the present invention, the movable floor is "hinged to a piece of stout piping," through which water is constantly circulated, the effect of which is that the destruction of such hinge by burning is prevented. The heating is conducted on the regenerative system. There are passages for supplying air and gas alternately to each of two sets of flues, the front and rear flues alternating laterally with the calcining chambers. The waste gases discharged traverse refractory material, whereby in turn the incoming air is heated before mixing with the gaseous fuel. There is special apparatus to facilitate the charging of the kiln with the blocks of copperas, and the extremities of the calcining chambers are provided with protecting curbs, having grooves into which iron covers fit, in order to diminish the wear to which the brickwork round the upper extremities of the calcining chambers is subject.—E. S.

Lakes [from Azo Dyestuffs]; Manufacture of New Colour ——. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer & Co., Elberfeld, Germany. Eng. Pat. 1389, Jan. 19, 1904.

See Fr. Pat. 339,606 of 1904; this J., 1904, 713.—T. F. B.

United States Patent.

Fireproof Paint or Coating. E. R. Stowell, Assignor to A. B. Nettleton. U.S. Pat. 774,003, Nov. 1, 1904. IX., page 1148.

French Patent.

Colours with a Base of Magnesium Carbonate (Giobertite). Mme. la Princesse Démidoff (*née* O. Lapoukhine). Fr. Pat. 339,045, Nov. 26, 1903.

The finely-powdered mineral, giobertite, can be used as the base for colours intended to resist a high temperature

on metallic surfaces, such as stoves or boilers. Oil varnish, glue, &c. are added according to the requirements.
—C. A. M.

(*B.*)—RESINS, VARNISHES.

English Patent.

Lac-Derivatives; Preparation of —— [for Lining Cans for Preserved Food]. W. S. Bucklin, Phalaux, N.J., U.S.A. Eng. Pat. 16,800, July 30, 1904.

The lac is heated in an inert medium, such as water or coal-gas, to a temperature above its melting point, so as to eliminate volatile constituents and leave a residue melting at a higher temperature and not imparting any flavour to food. A suitable method consists of heating the lac in water for 28 to 30 hours at a high pressure and temperature (320° to 352° F.). Ordinary shellac thus treated yields a tasteless product, which becomes slightly soft when heated, but is capable of resisting a very high temperature (*e.g.*, 590° to 600 F.) without charring or decomposing. Certain other lacs are converted into corresponding products in a much shorter time. For coating the interior of cans, &c. the substance is mixed in a finely-divided state with alcohol (in which it is only partially soluble) and inert colouring matters, &c. if required. The surface is painted with this preparation, which, on evaporation of the alcohol, leaves an adhesive coating of the solid material.
—C. A. M.

United States Patents.

Linoleum; Manufacture of ——. L. W. Seeser, Ragulin, Germany. U.S. Pat. 773,995, Nov. 1, 1904.

See Eng. Pat. 17,971 of 1903; this J., 1904, 906.—T. F. B.

Cement [for Securing Linoleum and the like]. F. Suter, Berlin. U.S. Pat. 774,286, Nov. 8, 1904.

The cement consists of molasses (*e.g.*, 55 kilos.), asphalt distillate (5 kilos.), rosin (25 kilos.), and alcohol (5 kilos.), with or without the addition of copal (10 kilos.).

(*C.*)—INDIA-RUBBER, &c.

Latex of Castilloa Elastica and its Coagulation. C. O. Weber. Gummi-Zeit., 1904, **19**, 101—104.

The author, in reply to de Jong and Tromp de Haas (this J., 1904, 990, 1036), maintains his view that the rubber is not contained in the latex as rubber, but in the form of a fluid oil surrounded by an albuminous covering. That the covering is albuminous and not cellulose or of a resinous nature is proved by its giving the iodine reaction, no zinc iodide reaction, and in its being insoluble in alcohol. The author first observed the fluid nature of the rubber under the microscope, and verified it by shaking out with ether. On pressing the cover-glass the albuminous sac bursts and the contents are discharged, rapidly becoming a solid mass, owing, the author considers, to a polymerisation process, which view is confirmed by Harries' well-founded polymerisation of myrcene and dimyrcene, as well as by the author's observations of the ethereal extract of the *Castilloa* latex. De Jong and Tromp also state that solidified latex of *Castilloa* rubber is soluble in ether, but the author repeats his statement that ether does not dissolve it. He has found that incompletely polymerised india-rubber forms thick jellies with ether, which he regards as emulsions, not solutions, whereas highly polymerised qualities are absolutely insoluble in that solvent, simply swelling more or less. De Jong and Tromp de Haas, on shaking out the latex or milk, with ether, obtained 9 per cent. rubber solutions, which even then were thick and could not be filtered, whilst the author obtained 43 per cent. solutions, thin and easily filtered. The author also confirms his statement that *Castilloa* latex contains no tannic acid, but a considerable quantity of albuminous matter, up to 7 per cent. These bodies appear analogous to the caseins, and gave a strong biuret reaction. De Jong and Tromp de Haas quite fail to appreciate the difference between coagulation and precipitation, as they speak of the coagulation of rubber by means of alcohol, acetone, &c., which is purely precipitation and simultaneous polymerisation. The author is convinced that the sample of rubber examined by them cannot have been a genuine sample of *Castilloa elastica*.—J. K. B.

Caoutchouc; Study of Different Kinds of ——. Examination of some Latexes in Sicily. C. Harries. Ber., 1904, **37**, 3842—3848.

The author examined freshly-collected specimens of the latex of *Ficus magnolooïdes Borci* and *Ficus elastica*.

Latex of Ficus magnol. Borci.—On extracting the latex with ether a dark-coloured, aqueous liquid was left containing a reducing sugar. The ethereal extract was separated by filtration from mucous matter, probably consisting of albuminoid bodies, and, after evaporation of the ether, formed a bright yellow syrup, which on standing partially crystallised. By repeated treatment with small quantities of ether, the syrup was separated into a crystalline, oxygenated compound, $(C_{10}H_{16}O)_3$, and a white, elastic mass, possessing all the properties of pure Para caoutchouc, except that when first isolated it was soluble in ether.

Latex of Ficus elastica.—This latex behaved in quite a similar manner to the latex of *Ficus magnol. Borci*, except that the oxygenated constituent, $(C_{10}H_{16}O)_2$, had a lower molecular weight, and was present in smaller amount. In the latex of *Ficus elastica* the oxygenated compound and the caoutchouc are present in about equal amounts, but in the latex of *Ficus magnol. Borci* the oxygenated body forms the chief constituent. The author concludes that Weber's view (see this J., 1903, 1200), that the rubber-yielding constituent of the latex is probably an aliphatic diterpene, $C_{20}H_{32}$, which is readily polymerised, has no sufficient basis. (See also this J., 1904, 990, 1036.)—A. S.

India-Rubber Articles; Analysis of ——. W. Esch and A. Chwolles. XXIII., page 1163.

English Patents.

Substitute for India-Rubber; Manufacture of an Improved ——. H. Tichsen, Berlin. Eng. Pat. 17,579, Aug. 12, 1904.

The rubber substitute is prepared by heating a solution of amber resin in castor-oil with sulphur at a high temperature (180° C.), cooling the mass, and treating it first with ozone and then with sulphur chloride in presence of a solvent, such as benzol, and of calcium carbonate.—A. S.

Cork; Process of Making a Substitute for —— [from Rubber], and the Article Produced by said Process. H. Birkbeck, London. From F. H. Brooks, Baltimore, U.S.A. Eng. Pat. 21,101, Oct. 1, 1904.

See U.S. Pat. 774,645 of 1904, following these.—T. F. B.

United States Patents.

Cork Substitutes [from India-Rubber]; Process of Making ——. F. H. Brooks, Baltimore, Md. U.S. Pat. 774,645, Nov. 8, 1904.

Rubber is dissolved in a suitable solvent, the solution mixed with sulphur and then with a "pulverised base," after which the mass is heated at a low temperature to drive off the solvent. The mixture obtained is moulded, and finally vulcanised.—A. G. L.

Rubber; Process for Reclaiming and Regenerating ——. L. T. Petersen, Assignor to J. F. McGuire, Akron, Ohio. U.S. Pat. 774,727, Nov. 8, 1904.

Vulcanised rubber is regenerated by heating it in a 10—15 per cent. solution of caustic soda to a temperature near its boiling point, a pressure of about 200 lb. per sq. in. being applied, and then heating it further with a solution of a soluble hydrocarbon or hydroxy-hydrocarbon (*e.g.*, a 1—10 per cent. solution of phenol) in a closed vessel, to a temperature of 300°—375° F., whereby the fabric is dissolved.—T. F. B.

XIV.—TANNING; LEATHER, GLUE, SIZE.

Tannins; Preparation and Elementary Composition of some Technically Important ——. T. Koerner and A. Petermann. Deutsch. Gerber-Zeit., 1904, **47**, 115—126. Chem.-Zeit., 1904, **28**, Rep. 328. (See also this J., 1904, 1115.)

The substances were extracted with hot alcohol and the iltered solutions precipitated with ether. The first two fractions obtained by fractional precipitation, were found to differ considerably in composition, the last fractions very ittle. The following results were obtained from the last fractions :—

Tannin from	Carbon.	Hydrogen.
	Per Cent.	Per Cent.
Quebracho........................	63·79	4·81
Oak wood........................	53·05	4·81
Chestnut wood....................	51·28	4·40
Mimosa bark	57·37	5·57

Thus a quebracho tannin is easily distinguishable from others by its high percentage of carbon. Other tannins which contain catechu tannin (*e.g.*, gambier and catechu) were also found to contain about 62 per cent. of carbon, but can be recognised by the fact that they contain catechin.—T. F. B.

Tanning Infusions and Extracts; Action of Saline Substances on ——. E. Nihoul. Bull. Assoc. Belg. Chim., 1904, **18**, 185—198; 220—228.

The action of saline substances on infusions of tanning materials is slight in the case of sumach; but in the case of oak and pine, sodium sulphate causes a loss of tannin, without, however, increasing the turbidity, which is always present even when the extraction has been made with distilled water. This loss may be due to a partial conversion of the tannin into substances not assimilable by he hide, or to the formation, with the salt in question, of a compound that is not retained by hide powder Possibly also the salt modifies the osmotic power of the hide, though no trace of tannin is found in the liquid after passing hrough a Procter filter. Moreover, the salt acts differently with infusions of quebracho, no loss of tannin occurring n concentrated solutions of this material. In other instances the quantity of the precipitate formed is increased at the expense of the tannin, *e.g.*, with salts of lime and magnesia, though in some cases these also behave like odium sulphate, partially converting the tannin into oluble non-tannin. The latter sometimes plays a part n the formation of turbidity. Generally speaking, the presence of saline substances in natural waters increases he loss of tannin occurring during the process of extraction. This loss is increased by prolonging the exposure, precipitates being subsequently formed in the clear liquids hat have been used for analysis. For example, after the apse of a fortnight, all the oak solutions had become urbid, except the one containing calcium chloride, which xhibited traces of mycelial vegetation. In the case of pine infusion, however, the conditions were reversed; and f the sumach solutions, only that containing magnesium icarbonate gave a deposit, the others remaining clear. On he other hand, all the solutions containing this last-named alt deepened in colour. With regard to the loss of tannin sustained during the process of extraction, it is found to be advisable, when using water charged with mineral matters, to grind the tanning materials as fine as possible, in order to diminish the loss, though this treatment increases the number of fragments of cell-substance and therefore lowers the purity of the product. The tannin extracts examined gave results similar to those furnished by the infusions, though the proportion of loss was smaller. The slight irregularities observed with the extracts may be due to differences of manufacture.—C. S.

United States Patents.

Dégras; Note on the Analysis of ——. G. Baldracco. XXIII., page 1163.

Washing and Tanning Hides or Skins; Device for ——. R. Koentzer, St. Louis, Mo. U.S. Pat. 773,873, Nov. 1, 1904.

A drum capable of being rotated is mounted upon a tanning-vat. The periphery of the drum is composed of strips arranged at intervals apart. The strips have one edge bevelled and the other straight, and each alternate strip is detachable. The fixed strips are provided with pins for suspending the hides to be tanned.—A. S.

Leather; Method of Making ——. W. Macmillan, Palmerston North, New Zealand. U.S. Pat. 774,260, Nov. 8, 1904.

See Eng. Pat. 19,661 of 1902; this J., 1903, 876.—T. F. B.

XVI.—SUGAR, STARCH, GUM, Etc.

Rowan Berries; A New Sugar from ——. G. Bertrand. Comptes rend., 1904, **139**, 802—805.

Vincent and Meunier (this J., 1899, 58) detected the presence of a substance in the mother-liquors from the crystallisation of sorbitol, which they regarded as an octite. The author has now prepared this substance, and finds it to be a hexavalent alcohol, a new isomeride of mannitol and sorbitol; he names it provisionally *sorberitol.* The mother-liquors are separated from the crystals of sorbitol, the sorbitol remaining in them is converted into sorbose by fermentation with the sorbose bacterium, the sorbose is precipitated by alcohol, and the residual syrup is treated with sulphuric acid and benzaldehyde. Sorberitol is regenerated from its benzal compound and recrystallised; it occurs in the form of anhydrous prisms, melting at 75° C. and is very deliquescent in moist air. Its rotatory power in 10 per cent. solution at 20° C. is $[\alpha]_D = -3\cdot53^\circ$. Two benzal derivatives are described: the dibenzal compound, fairly soluble in boiling alcohol and melting at 192° C., and the tribenzal compound, only sparingly soluble, and melting at about 240° C. The hexacetate of sorberitol is prepared by the action of acetic anhydride in presence of zinc chloride; it crystallises in hexagonal plates melting at 123° C., and possessing a rotatory power of $[\alpha]_D = -26\cdot66^\circ$ in 5 per cent. solution in chloroform.—J. F. B.

Reducing Sugars; Separation or Isolation of —— *by means of Aromatic Hydrazines.* G. Votoček and R. Vondráček. XXIII., page 1164.

Filters [for Sugar Solutions]. W. Kathol, Vailsburg, N. J., U.S.A. Eng. Pat. 11,854, May 24, 1904. Under Internat. Conv., July 3, 1903.

A rectangular bag of filter-cloth has a sleeve formed at one of the upper corners, the bag being otherwise completely closed. A delivery pipe is inserted into the sleeve and passes along inside the upper edge of the filter-bag to the opposite corner. The bag is caused to assume a series of vertical folds by placing a clip along the lower edge. Several of these bags are placed in a closed or open tank, the delivery pipes passing water-tight through a series of holes formed on the upper part of one side; the other end of the tube, inside the bag, resting on a ledge on the opposite side of the tank. The liquid to be filtered enters the tank by a pipe in the bottom, and the liquid passes through the filtering cloth into the bag, up the spaces formed by the folds and away by the delivery pipes to a trough on the outside of the tank, the insoluble matter remaining on the outside of the filter cloth.—W. H. C.

Gum Tragasol; Manufacture of —— from Locust Kernels. R. Gray, G. Osborn, H. B. Stocks, and H. G. White, Hooton, Cheshire. Eng. Pat. 27,186, Dec 11, 1903.

The kernels are boiled for about ten minutes in water, and, after draining off the water, are kept moist for about 24 hours. They are then passed through one or more ordinary brush decorticating machines until the shells are removed. If any colouring matter from the shells or the shells themselves are mixed with the kernels, the latter or the gum extracted from them must be treated with a soluble aluminium salt or a bichromate, in order to precipitate the colouring matter as a lake. The clear gum is then decanted off.—T. H. P.

United States Patent.

Starch, Soluble; Apparatus for Making ——. W. Browning and J. J. Barlow, Accrington. U.S. Pat. 773,783, Nov. 1, 1904.

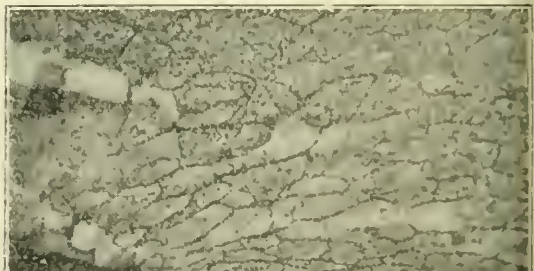
XVII.—BREWING, WINES, SPIRITS, Etc.

Malt; Presence of the Cell Wall in the Endosperm of Finished ——. A. R. Ling. Brewers' J., 1904, **40**, 741—742.

In their researches on the germination of the *gramineæ* (this J., 1890, 530), Brown and Morris explained the phenomenon of "modification" as being "co-terminous with the dissolution of the cell wall," *i.e.*, they concluded that, as germination progresses, the cell wall enclosing the starch granules of the endosperm is attacked and hydrolysed by the action of an enzyme which proceeds from the scutellum and gradually extends, throughout the whole endosperm, with the result that the "mealiness" of the latter, which is characteristic of full modification, is to be regarded as the consequence of the complete disintegration and solution of this cell wall. In 1896, Grüss (this J., 1896, 464) showed that this view is incorrect, at any rate, so far as Continental malts are concerned, and that the cell walls, although they are modified to some extent by the action of the enzyme and are made invisible except when suitably stained, are still present in the finished malt. Since the original view of Brown and Morris has remained to a large extent prevalent in this country, the author has conducted experiments in order to decide whether the longer germination which is given to English malts really does result in the complete dissolution of the cell wall in the endosperm, as suggested by those observers. For this purpose sections were cut from finished English malt corns, both in the longitudinal and transverse directions. When these sections were examined, after staining with Congo red, the cell wall was plainly discernible in all of them and was, moreover, practically continuous throughout the whole endosperm. This observation is illustrated by micro-photographs, two of which (Figs. 1 and 2) are here given.

Fig. 1.

Fig. 2.



Hence it is shown that the conclusions of Grüss are equally valid for English malts as for German malts, and it is suggested that the modification of the cell wall, which does undoubtedly take place, is confined to some less resistant constituent of this wall (*e.g.*, the araban), the products of the hydrolysis of which will probably be found as part of the carbohydrate constituents of the aqueous extract of the malt.—J. F. B.

Malt; Action of Formaldehyde on the Diastatic Power of——. Somlo and von Laszloffy. Oesterr. Chem. Zeit.; through Brewers' J., 1904, **40**, 735.

The authors steeped green malt for a short time in solutions of formaldehyde, afterwards washing out the latter and determining the diastatic power. In all cases the formaldehyde was found to have had a remarkable stimulating influence on the diastatic power of the malt, but on the other hand the addition of formaldehyde produced no increase in the diastatic powers of malt extracts. The reason for this influence is so far unexplained, but the treatment has been practised on the large scale in the distillery (see this J., 1904, 674), the malt being immersed for two hours in a 2 per cent. solution of formaldehyde. The authors consider that their observations tend to confirm the hypothesis that formaldehyde plays a part in the degradation of starch in the green plant.—J. F. B.

Saccharomycetes; A New Member of the Family of the——. H. Schiöning. Woch. f. Brau., 1904, **21**, 691—693 and 717—720. Comptes rend. trav. Lab. de Carlsberg, 1903, **6**, 103.

The author has isolated from the earth of a meadow on the St. Gothard a species of a new genus of yeast, which he has named *Saccharomycopsis capsularis.* It develops rapidly in wort in the form of ellipsoid and oval cells resembling those of *S. Pastorianus.* On the second day small surface growths of mycelial cells appear, and after about a month the film which has formed on the surface may have reached a thickness of 2 cm. In yeast-water media the mycelium readily develops asci, each ascus containing four spores. The individual spores are round in one direction and oval in profile; they possess a double membrane, a character which constitutes the chief differentiation between this new genus and that of the Saccharomyces. When viewed in profile, the spores show a fine line or seam which divides them into two unequal parts. When the spores germinate, the exosporium splits open down this seam, forming two capsules jointed together at one point, whilst the new cells grow out by budding from the open side and show an early tendency to assume the mycelial form. When the growth of yeast is treated with strong sulphuric acid, the whole of the mycelium and yeast cells dissolve, leaving behind the spores, which are resistant to the action of the acid but which show a characteristic rose-red coloration. This coloration is attributed to the presence of a cork-like constituent in the exosporium. Growths on solid substrata have a greyish-white, silky appearance; they liquefy gelatin and on some media they become red or brown in colour. This yeast ferments maltose, dextrose, levulose and *d*-galactose, but not arabinose, raffinose, milk sugar, nor cane sugar; it secretes no invertase. The optimum temperature for vegetative growth in beer wort and for sporulation is from 25° to 28° C. Sporulation does not occur above 35° C and no growth takes place above 32·5° C. In beer wort containing 13·5 per cent of total solids, this yeast produced 5·66 per cent of alcohol by volume after 27 days and 7·15 per cent. after 7 months at the ordinary temperature. The description of the new genus Saccharomycopsis is:—Budding and endosporogenous yeasts; the spore possesses two membranes and germinates by budding. The only species yet known are; *S. capsularis*, described above, and *S. guttulatus*, Robin, previously called *Cryptococcus guttulatus* or *Saccharomyces guttulatus*, first discovered by Robin in the intestine of the rabbit.—J. F. B.

Wort; Running off the —— from the Mash. Pankrath. Woch. f. Brau., 1904, **21**, 699—704.

In running off the wort from a decoction mash through the false bottom of the clearing-tun, a certain speed must not be exceeded, if the drainage is to be satisfactory, and for this reason means, such as pressure, suction, &c., intended to hasten the process have never met with success. If the wort be run off too rapidly, the flocculent matters of the grains are so compressed that portions of the bed do not part with their liquor readily. One method is worthy of further attention; it consists in agitating the mash during the whole of the running off of the main wort and disregarding the consequent turbidity of the latter, but removing this turbidity at a later stage by filtration. The author has plotted curves showing the variations of density of the main wort running from different taps. Theoretically the density should remain constant at all stages, but in reality it varies at different stages and different taps. This circumstance is attributed to the water used for rinsing various parts of the apparatus before and after the transference of the mash and to leakage of the sparging pipes; such water does not mix completely with the mash, but is localised mainly at the top and bottom. When all the main wort has drained off, the bed of grains is raked up and is then more permeable than before. The author has studied the principle of the sparging process in the laboratory, working by upward displacement. On varying the speed of the washing water it was found that a faster current of water gave a more rapid extraction but that it required a vastly greater quantity of water to complete the exhaustion. Hence the necessity of sparging slowly in order not to dilute the beer too largely. Curves were plotted showing the progress of extraction during sparging on the large scale, and the variations in the density of the liquors running from different taps according to the different areas drained by each and to variations in the permeability of the bed. These curves always descend very rapidly at first, but if the middle portion be too steep it shows that the taps are open too widely, with the result that irregularities will be encountered towards the end, when, owing to equalisations caused by the last liquors draining away, the density of the runnings will actually rise again after their collection has been stopped. So far as yield is concerned, it makes no difference whether the bed of grains be raked over once or several times, and the author shows that time is saved by not raking more than once, *i.e.*, at the beginning of the sparging; but if there are pockets of grains which are so compacted as not to yield up their wort to the sparging water, the bed may with advantage be raked up in the wet state without draining off.—J. F. B.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(*A.*)—FOODS.

Flours; Bleaching of —— by Electricity. Balland. Comptes rend., 1904, **139**, 822—823.

The author has examined a sample of flour produced by the ordinary methods, and one of the same flour bleached by treatment with electrified air. The colour of the latter was distinctly whiter, but its odour and flavour were less agreeable. The only modifications produced by bleaching capable of being detected by analysis were those of the fatty matters and the acidity. The fats, after the electrical treatment, had become slightly rancid, they were less fluid and paler in colour; the yellow oil of the wheat, which is highly aromatic in freshly ground flour, had been oxidised and partially converted into white fatty acids, soluble in absolute alcohol. The acidity of the flour had increased from 0·0147 per cent. before treatment to 0·0196 per cent. after treatment. The examination of the gluten and experiments on the bread-making properties of the flour showed that the electrical treatment had not only bleached the flour but had also "aged" it, with loss of flavour.—J. F. B.

Celery; Constituents of ——. M. Bamberger and A. Landsiedl. Monatsh. f. Chem., 1904, **25**, 1030—1034.

In addition to mannitol, the authors have found that asparagine and tyrosine are normal constituents of celery. The amount of asparagine isolated from the root stalks of different specimens of the plant was nearly the same, 62 grms. of the fresh material yielding 0·3 grm., whilst the amount of tyrosine was very small. Leucine could not be detected.—C. A. M.

English Patents.

Milk Powder; Production of Milk in the Form known as ——, applicable also to the Treatment of other Solutions containing Fatty Matter. R. R. F. Butler, Devizes, Wilts. Eng. Pat. 5946, March 10, 1904.

The milk, or any analogous solution, is first forced through fine sieves or bodies furnished with fine orifices or passages, and is then dried at a high temperature. The preliminary sifting process breaks up the fatty particles and fixes them in the liquid, so that, when the resulting powder is dissolved in water, the fat does not rise to the surface.—T. H. P.

Lac-Derivatives; Preparation of —— [for Lining Cans for Preserved Food]. W. S. Bucklin. Eng. Pat. 16,800, July 30, 1904. XIII B., page 1154.

United States Patents.

Flour; Process of Treating ——. [Bleaching, &c.] J. M. Williams, Guthrie, Okla. U.S. Pat. 769,522, Sept. 6, 1904.

The process consists in decomposing, by electrolysis, water or other liquid containing oxygen, and by means of a blast of air introduced below the level of the liquid, bringing the gaseous products formed into contact with the flour.
—W. P. S.

Vacuum Apparatus [for Milk]. M. Ekenberg, Assignor to Martin Ekenberg's Aktiebolag, Stockholm, Sweden. U.S. Pat. 774,054, Nov. 1, 1904.

See Eng. Pat. 23,770 of 1902; this J., 1903, 158.—T. F. B.

(*B.*)—SANITATION; WATER PURIFICATION.

English Patents.

Liquid Sewage or Sewage Effluent; Apparatus for Distributing —— upon Filter-Beds. H. W. Taylor, Newcastle-on-Tyne. Eng. Pat. 28,379, Dec. 24, 1903.

The distributor consists of two parallel pipes placed between two water-wheels of comparatively long length and small diameter. The pipes and water-wheels extend across the filter-bed and are mounted at each end on a wheeled carriage, the carriages running on rails laid on the walls of the filter-bed. Openings are provided in the pipes for the delivery of the sewage to the wheels. The sewage supply trough is parallel to the side of the filter and is connected by means of a siphon to a valve box in communication with the parallel pipes. The ends of the latter are alternately opened and closed at each end of the filter-bed by a lever-valve. The carriage is caused to travel backwards and forwards over the filter by the movement of the water-wheels, the axles of the latter being extended to form the axles of the carriage wheels. The end of the siphon in the supply trough is automatically opened and closed, according to the flow of sewage, by means of a valve actuated by a lever and inverted bell, or by an ordinary ball-float. A tapped chamber at the top of the siphon is provided in order to start the action of the siphon.
—W. P. S.

Sewage; Method of and Apparatus for the Bacterial Purification of ——. C. Kremer and R. Schilling, Berlin. Eng. Pat. 20,889, Sept. 28, 1904.

The apparatus consists of a vertical rotating wheel, around the circumference and on the spokes of which boxes are suspended so that they always remain in an upright position. The boxes are filled with filtering or oxidising material, such as coke, slag, &c., and are so arranged that they can be automatically removed and replaced by fresh boxes. Sewage flowing into the boxes causes the wheel to rotate, the liquid drains through from each box into the next lower one, and finally into an outlet channel. The rotation of the wheel produces a strong current of air, and the filtering material is thus subjected to aeration both while covered with sewage and during the period between the draining of the filtered liquid and the reception of a fresh charge of sewage. When the sewage is under only a small "head," a horizontal wheel, rotated by external means, is used, with the boxes of oxidising and filtering material arranged around the rim.—A. S.

United States Patent.

Waste Liquors; Device [Straining Apparatus] for the Purification of ——. H. Riensch, Charlottenburg, Germany. U.S. Pat. 773,593, Nov. 1, 1904.

See Eng. Pat. 3896 of 1902; this J., 1902, 1064.—T. F. B.

French Patents.

Furnace; Refuse Consuming and Gas Producing ——. L. Tobiansky. Fr. Pat. 344,699, April 23, 1904.

See Eng. Pat. 12,361 of 1904; this J., 1904, 878.—T. F. B.

Garbage and other Organic Waste: Apparatus for Extracting the Oil from ——. C. S. Wheelwright and J. T. Fiske, jun. Fr. Pat. 344,811, July 15, 1904.

See Eng. Pat. 14,483 of 1904; this J., 1904, 879.—T. F. B.

Oil and Fatty Matters from Garbage and similar Organic Refuse; Apparatus for Extracting ——. C. S. Wheelwright and J. T. Fiske, jun. Fr. Pat. 344,812, July 15, 1904.

See Eng. Pat. 14,482 of 1904; this J., 1904, 879.—T. F. B.

Liquids from Solid Matters; Apparatus for Extracting ——. [Treatment of Refuse.] C. S. Wheelwright and J. T. Fiske, jun. Fr. Pat. 344,910, July 15, 1904.

See Eng. Pat. 14,484 of 1904; this J., 1904, 909.—T.F.B.

Oil and Fatty Matter from Garbage and other Organic Refuse; Process and Apparatus for Extracting ——. C. S. Wheelwright and J. T. Fiske, jun. Fr. Pat. 345,046, July 15, 1904.

See Eng. Pats. 14,709 and 15,235 of 1904; this J., 1904, 879 and 909.—T. F. B.

(*C.*)—DISINFECTANTS.

Mercuric Chloride; A New Cause of the Dissociation of —— and its Influence on the Antiseptic Properties of Solutions thereof. H. Wittenet. Bull. Soc. Chim., 1904, **31**, 1033—1038.

It is found that solutions containing mercuric chloride and ammonium chloride (as used for disinfecting purposes) when made with tap water, become turbid on dilution, and a white precipitate eventually forms. On washing this with cold water, a yellowish substance was obtained, having the composition NHg_3Cl_3. The conditions necessary for the formation of this precipitate are those associated with "temporary hardness," and solutions made with distilled or even with boiled water remain quite clear when diluted. By replacing the ammonium chloride by sodium chloride, the nature of the water used has no influence on the stability of the resulting solutions. The original white precipitate, which is obtained in quantity when sodium carbonate or bicarbonate is present, appears to have the composition $NHg_3Cl_3, 3NH_4Cl$. In contact with water it dissociates into NH_4Cl and NHg_3Cl_3, the latter oxidising in contact with air and moisture.
—T. F. B.

English Patent.

Disinfecting; Improved Method of ——. A. Morgan, London. Eng. Pat. 21,053, Sept. 30, 1904.

One part of paraformaldehyde and six parts of carbon, both in a finely-powdered condition, are mixed with sufficient gum tragacanth or other suitable gum to form a stiff paste, which is pressed into blocks and dried. When required, the blocks are ignited, whereby formaldehyde vapour is gradually and uniformly disseminated.—A. S.

XIX.—PAPER, PASTEBOARD, Etc.

Wood Fibre; Chemical Investigation of ——. V. Grafe. Monatsh. f. Chem., 1904, **25**, 987—1029.

From the results of experiments described in detail, the author concludes that Wiesner's reactions for woody fibre (*viz.*, yellow coloration with aniline salts, red coloration with phloroglucinol and hydrochloric acid, and colorations given by other phenols) are due to the action of these respective substances on certain constituents of the wood fibre, the hydrochloric acid playing an accelerating part. He finds that wood fibre is not a chemical individual, but consists, in the main, of vanillin, methylfurfural, and pyrocatechol, together with coniferin which is partly combined with the cellulose in the form of an ester, partly in the resin, and partly to a small extent in the free state in the membrane. He confirms the statement of Tiemann and Haarmann and of Höhnel as to the occurrence in wood of small amounts of coniferin, to which must be attributed the blue coloration in the test with phenol, hydrochloric acid, and potassium chlorate. Vanillin can also be detected in the refuse sulphite lyes from the cellulose manufacture. The green coloration given by wood with concentrated hydrochloric acid (or better with hydrobromic acid) is in all probability due to the methylfurfural in conjunction with the coniferin. The intensity of the colorations in the different reactions must be attributed to the fine state of diffusion of these bodies by means of the resin, and to the capacity of the cellulose to retain substances that have penetrated into it, as well as to the sensitiveness of the reagents. Wood fibre has on the average a methyl value of 48. The possibility of preparing methylfurfural and pyrocatechol in a simple manner from cellulose, and the fact that there is nothing against the vanillin in the ligneous membrane having a similar origin, render Wiesner's reactions uncertain tests of lignification. The reddish-brown coloration in the so-called Maule's reaction (which consists of treating chips of wood for five minutes with 1 per cent. potassium permanganate solution, washing them in water, then placing them in dilute hydrochloric acid, until the manganese dioxide disappears, and finally exposing them to the fumes of ammonia) is also attributed by the author to the same substances that give the colorations with Wiesner's reagents.—C. A. M.

Paper Pulp; Beating of —— and Longitudinal Splitting of the Fibres. E. Kirchner. Wochenbl. f. Papierfabr., 1904, **35**, 3411—3414.

By pressing and stamping the fibres of paper half-stuff in a porcelain mortar, it was found that the property of splitting up easily and completely in a longitudinal direction is characteristic of the class of bast fibres: linen, hemp, and jute. The production of these long fine filaments or fibrillæ, which are of such great value in paper-making, is due to the radial planes of cleavage and concentric ring structure of the bast fibres; the pointed ends of the fibres do not split so easily. The characteristic knots and cross markings of the linen and hemp fibres disappear in the process of stamping; these two fibres split up in an exactly identical manner. This property accounts for the three stages of disintegration which are the foundation of modern methods of beating, *i.e.*, "free" beaten stuff, in which the bast fibres are chopped up with sharp knives; "fine" beaten stuff, consisting of chopped fibres the ends of which are subsequently split up to a greater or smaller length into tufts of fibrillæ, and "wet" beaten stuff, in which a certain proportion of the fibres are completely split up into long fibrillae, which lie in tangled masses between the still perfect fibres. Each method of beating imparts definite characters to the paper. The structure of the cotton fibre is very different from that of the bast fibres. In cotton the cell wall consists of a resistant outer layer or cuticle which cannot be split, and an inner layer which is capable of yielding fibrillæ, which, however, are not axial, but interlaced together in spiral strands or network. This structure makes the splitting of the fibre difficult and always incomplete, since the interlacing presents no longitudinal planes of cleavage. The fibrillæ only appear after prolonged stamping and are confined to the ends of the fibres or to places where the cuticle has been chipped off. They always preserve their netted form and consequently do not extend for any great length. The fibrillæ of cotton have a coarser, softer character than those of the bast fibres and their edges are less sharply defined. In the case of those fibres which have been crushed very flat without breaking the cuticle, this latter and the spiral inner layers of the cell appear to be welded together in a gelatinous, shapeless mass. The fibre of wood-cellulose presents on disintegration an appearance similar to that of the cotton fibre, but it is far less capable of withstanding energetic mechanical treatment. Its structure consists of an outer layer which does not split, and an inner layer of spirally interlaced strands, but it breaks up into short pieces, when sharply beaten, far more readily than cotton. With more gradual treatment there is a slight tendency to form fibrillæ at the ends, similar to those of cotton, but the main bulk of the fibres are entirely broken down, the outer layer appearing in the form of irregular fragments and the inner layers as a slimy, cloudy mass which shows a filamentous, tangled structure under high magnification. The resulting paper is, however, transparent and brittle, though capable of withstanding a high tensile strain.—J. F. B.

English Patents.

Wood and other Fibrous and Porous Materials or Compounds; Solutions for Treating ——. T. Gare. Eng. Pat. 23,786, Nov. 3, 1903. IX., page 1148.

Celluloid Non-inflammable; Process for Rendering ——. W. C. Parkin, A. Williams, and T. Casson, Sheffield. Eng. Pat. 28,212, Dec. 23, 1903.

See Fr. Pat. 344,501 of 1904; this J., 1904, 1111.—T. F. B.

United States Patents.

Paper [and Ink]; Safety Commercial ——. J. Rowan, Ottawa, Canada. U.S. Pat. 774,535, Nov. 8, 1904.

See Eng. Pat. 3909 of 1904; this J., 1904, 453.—T. F. B.

Cellulose; Manufacture of ——. C. Kellner, Vienna. U.S. Pat. 773,941, Nov. 1, 1904.

See Fr. Pat. 326,313 of 1902 and Addition thereto; this J., 1903, 817 and 1304.—T. F. B.

Horn-like Substance; Elastic ——, and Process of Producing same [from Acetyl Cellulose]. L. Lederer, Sulzbach, Germany. U.S. Pat. 774,677, Nov. 8, 1904.

See Addition, of Aug. 22, 1902, to Fr. Pat. 319,724 of 1902; this J., 1903, 563.—T. F. B.

Cellulose Acetate [Horn Substitute]. W. H. Walker, Newton, Mass. U.S. Pat. 774,713, Nov. 8, 1904.

Substitutes for horn, celluloid, &c., are produced by heating under pressure a stable cellulose derivative, such as cellulose acetate, with a phenol, such as thymol. Other claims relate to "a new composition of matter" containing acetyl-cellulose, thymol, and chloroform. (Compare Lederer, Addition of Aug. 22, 1902, to Fr. Pat. 319,724 of 1902; this J., 1903, 563.)—T. F. B.

Cellulose Acetate. W. H. Walker, Newton, Mass. U.S. Pat. 774,714, Nov. 8, 1904.

A cellulose ester of a fatty acid (*e.g.*, cellulose acetate) is "modified" by addition of thymol and castor oil, and the mixture is "attached to a support."—T. F. B.

French Patent.

Paper Pulp or other Fibrous Pulp; Apparatus for Beating, Triturating, and Refining ——. J. H. Annandale. Fr. Pat. 345,044, July 11, 1904. Under Internat. Conv., Nov. 28, 1903.

See Eng. Pat. 26,012 of 1903; this J., 1904, 1040.—T. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Colloidal Silver Salts. C. Paal and F. Voss. Ber., 1904, **37**, 3862—3881.

The authors describe the preparation and properties of colloidal carbonate, phosphate, sulphide, chloride, bromide, and iodide of silver. These colloidal salts were obtained by the action of the corresponding alkali salts on the adsorption compound of colloidal silver oxide (this J. 1904, 994) with sodium protalbinate or lysalbinate (this J. 1904, 996). —A. S.

Rare Earths of the Yttrium Group, near to Gadolinium. G. Urbain. Comptes rend., 1901, **139**, 736—738.

In separating fractionally the yttria earths, after the faintly rose-coloured europium oxide and the white gadolinium oxide, coloured oxides appear, each successive fraction being darker than the preceding one. The darkest fractions show with intensity the spectrum of dysprosium. Those nearer gadolinium give an absorption band at $\lambda = 488$ identical with that mapped by Lecoq de Boisbaudran in 1895, and attributed by him to an element provisionally designated $Z\delta$. By three separate methods of fractionation (nickel-earth nitrates, earth-nitrates with intercalation of bismuth nitrate, and ethylsulphates) the author has separated fractions showing only the band $\lambda = 488$. The oxides from these solutions are all brown, and contain peroxides; it has not yet been possible to decide whether these oxides are mixtures of dysprosium and the element $Z\delta$, or whether they also contain another element which shows no absorption spectrum.—J. T. D.

Alkaline Earth Tartrates; Solubility of —— in Water. H. Cantoni and Mlle. Zachovers. Bull. Soc. Chim., 1904, **31**, 1121—1124.

The solubility of the normal tartrates of strontium, calcium and barium was determined by heating the salt with water at a constant temperature for 10 hours; the amount dissolved was determined, in the case of strontium tartrate, by evaporation, and with calcium and barium tartrates, by precipitation with ammonium oxalate. The results obtained as the mean of several experiments are as follows:—

Temperature, °C.	Grms. of Salt dissolved in 100 c.c. of Water.		
	Strontium Tartrate, $C_4H_4O_6Sr + 3H_2O$.	Calcium Tartrate, $C_4H_4O_6Ca + 4H_2O$.	Barium Tartrate, $C_4H_4O_6Ba$.
2	0·12138	0·03664	0·02125
21	0·21280	0·04777	0·02905
22	..	0·04868	0·02842
39	0·31842	0·08765	0·03577
9	0·47885	0·12522	0·04398

Since barium tartrate is much less soluble than calcium tartrate, it is suggested that a barium salt might be used for decomposing the potassium tartrate in the manufacture of tartaric acid. A table of solubilities, calculated from the above figures, is given for temperatures from 0° to 60° C. inclusive, at intervals of 5°.—T. F. B.

Thioformic Acid. V. Auger. Comptes rend., 1904, **139**, 798—800.

Phosphorus pentasulphide, P_2S_5, does not react with formic acid even at the boiling temperature, but sodium metathiophosphate, $NaPS_3$, obtained by heating together equimolecular proportions of phosphorus pentasulphide and sodium sulphide, reacts readily with formic acid in the cold, with evolution of sulphuretted hydrogen. On distilling the product at 30°—40° C. *in vacuo*, and condensing the distillate at a temperature of about 20° C., crystals of unaltered formic acid are obtained, together with a very unstable liquid possessing the properties of a thio-acid, but which decomposes after a short time, depositing a white amorphous substance with evolution of sulphuretted hydrogen. Analysis indicated that this liquid contained about 35 per cent. of *thioformic acid*, H.COSH. Sodium thioformate was also obtained by Kekulé's method, by mixing phenyl formate with sodium hydrosulphide dissolved in absolute alcohol, the salt being precipitated by ether after the removal of some of the alcohol by distillation. Sodium thioformate crystallises in very deliquescent, long, white needles. Its aqueous solution gives coloured precipitates with salts of the heavy metals, which, however, are very unstable. The free acid was prepared by treating the sodium salt with formic acid in the cold, and distilling the product *in vacuo*, but a study of its properties was not possible, owing to its extreme tendency to polymerise, with loss of sulphuretted hydrogen.—J. F. B.

Papaverinium Bases. H. Decker, O. Klauser, and M. Girard. Ber., 1904, **37**, 3809—3815.

An account is given of the preparation and properties of the normal bromobutylate of papaverine, butyl-*iso*-papaverine, papaverinium chlorobutylate, the iodo-isobutylate, *p*-nitrochlorobenzylate, iodopropylate, and iodo-isopropylate of papaverine, monobromopapaverine, *N*-methylbromopapaverinium salts, *N*-methylbromo-*iso*-papaverine, bromopapaverine chlorobenzylate, and *N*-benzylbromo-*iso*-papaverine. By the oxidation of *N*-benzylbromo-*iso*-papaverine, *N*-benzyldimethoxy-*iso*-quinoline and 6-bromoveratric acid are produced. (See also this J., 1904, 336.) —A. S.

Terpenes and Essential Oils; 70th Communication; Compounds of the Thujone Series. O. Wallach. Annalen, 1904, **336**, 227—280. (Compare this J., 1902, 1244.)

The author has turned his attention to the possible existence in essential oils of more than one modification of thujone, and has isolated two physically different isomeric forms of this ketone from suitable fractions of various oils, by preparing the semicarbazones under conditions excluding the possibility of isomeric changes, and separating the semicarbazones by fractional crystallisation. α-*Thujone* is lævorotatory ($\alpha = -9$ to $-10°$); it forms two semicarbazones, one crystallising in rhombic prisms, m. pt. 186°—188° C. $[\alpha]_D = +59{\cdot}5°$, sparingly soluble in ether; the other amorphous, melting at 110° C., dextro-rotatory to about the same degree as the first, but very soluble in ether. β-*Thujone* is dextro-rotatory ($\alpha =$ about $+70°$); it forms a semicarbazone which is dimorphous, and which is obtained as hexagonal prisms, melting at 174°—175° C., which are stable at low temperatures, but which change at ordinary temperatures into rhombic prisms melting at 170°—172° C. The two isomeric thujones are partially converted, one into the other, under the action of alcoholic potash, but β-thujone is the more stable form. Both thujones are converted by alcoholic sulphuric acid into isothujone, but the α-thujone is first transformed into β-thujone. Both yield the same α-thujaketonic acid when oxidised by permanganate As regards the occurrence of these two forms of thujone in essential oils, the author has established the fact that thuja oil contains practically only α-thujone; tansy oil contains practically only β-thujone [tanacetone]; wormwood oil contains principally β-thujone together with a little α-thujone; the oils of *Artemisia barrelieri* and of sage contain mixtures of the two isomerides. The second part of the paper deals with the isoxime of thujone, the oxime of isothujone, the isoxime of thujamenthone, and the isoxime of hydroxythujamenthone.—J. F. B.

Morphine; Contribution to the Knowledge of Alkaloidal Reactions. IV. ——. C. Reichard. XXIII., page 1163.

Codeine in Opium; Determination of ——. C. E. Caspari. XXIII., page 1164.

United States Patent.

Chloral; Process of Continuously Producing and Rectifying ——. J. A. Besson, Caen, France. U.S. Pat. 774,151, Nov. 8, 1904.

Alkylaminoacetopyrocatechols; Process for Preparing ——. Farbwerke vormals Meister, Lucius und Brüning. Fr. Pat. 344,930, July 18, 1904. Under Internat. Conv., Aug. 15, 1903.

See Eng. Pat. 26,180 of 1903; this J., 1904, 1043.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

United States Patent.

Photographic Process for the Reproduction [in Relief] of Plastic Objects. C. Baese, Berlin. U.S. Pat. 771,549, Nov. 8, 1904.

See Eng. Pat. 5381 of 1902; this J., 1902, 1469.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

English Patent.

Explosives; New or Improved ——. C. J. Rusher, Cape Town, and G. W. Baudinet, Cape Colony. Eng. Pat. 7490, March 29, 1904.

To a mixture of ammonium nitrate (5 parts) and dinitrobenzene (1 part) from 0·5 per cent. to 2·5 per cent. of ammonium carbonate is added. The ammonium nitrate is heated to 90° C. and the ammonium carbonate added. The dinitrobenzene is melted, and part is impregnated with ammonia gas, the whole being mixed together hot to form the finished explosive.—G. W. McD.

United States Patents.

Chlorate Powder. W. M. Spore, Argenta, Ill. U.S. Pat. 739,356, Sept. 22, 1903.

An explosive, consisting of chlorate of potash, white of egg, and pith of cornstalks.—T. F. B.

Blasting Powder. J. Tollner, Assignor to F. G. Dokkenwandel and H. M. Grant, New York. U.S. Pat. 757,693, April 19, 1904.

The explosive consists of potassium nitrate (15 per cent.), sodium nitrate (30 per cent.), sulphur (15 per cent.), spent tan bark (20 per cent.), horse manure (20 per cent.).

—T. F. B.

XXIII.—ANALYTICAL CHEMISTRY.

INORGANIC—QUALITATIVE.

Acetates, Cyanides, and Lithium; Method for the Detection of ——. S. R. Benedict. Amer. Chem. J., 1904, **32**, 480—483.

Acetates. — The method which is capable of detecting acetates at a dilution of N/500, and is applicable in presence of all strong acids, and of all weak acids having insoluble silver salts, is based upon the facts (1) that unlike most weak acids, acetic acid has a soluble silver salt, and (2) that the acidity or degree of ionisation of acetic acid is greatly reduced by the presence of an acetate. The solution to be tested is freed from all cations, except those of the sodium group, made just alkaline with sodium carbonate, and treated with excess of silver nitrate. After filtering, the excess of silver is precipitated from the perfectly neutral solution by N/1 sodium chloride solution, and after again filtering, the liquid is saturated with hydrogen sulphide, and added to 2 c.c. of N/1 cobalt nitrate solution, which has been acidulated with two or three drops of N/1 acetic acid, and saturated with hydrogen sulphide. (A slight precipitate of cobalt sulphide may be present in the latter solution, but may be disregarded.) A copious black precipitate of cobalt sulphide forms immediately if the test solution contained an acetate.

Cyanides.—For the detection of cyanides in presence of thiocyanates and ferrocyanides, a method based upon the action of cyanides on the freshly precipitated oxides of mercury is recommended. The solution to be tested is made alkaline with sodium hydroxide, and 0·5 to 1 c.c. of N/25 mercurous nitrate solution is introduced so as to form a layer above the alkaline solution, a ring of black mercurous oxide being produced at the junction of the two liquids. The whole is then gently agitated so that the precipitate slowly mixes with the solution. If cyanide be present, a portion of the precipitate will dissolve whilst the rest will become light gray in colour, owing to the formation of metallic mercury. The test is a more delicate one than the Prussian blue reaction.

Lithium.—The solution to be tested is made alkaline with ammonia, one-tenth of its volume of N/5 disodium-hydrogen phosphate solution is added, followed by enough alcohol to produce a fairly heavy precipitate, which remains permanent on shaking. The liquid is then heated to boiling. If lithium be absent, the precipitate will completely dissolve, but if present, lithium phosphate will be precipitated upon warming, and the precipitate will not dissolve even on boiling. If the amount of lithium present be small, the solution will first become clear, and the precipitate of lithium phosphate will form on boiling.—A. S.

Strontium and Strontium Chromate; Michrochemical Detection of ——. W. Autenrieth. Ber., 1904, **37**, 3882—3887.

Strontium chromate exhibits a strong tendency to crystallise, and is thus distinguishable from barium chromate, which precipitates in the amorphous form. If to a drop of N/4 strontium nitrate solution on a microscope slide, a drop of 10 per cent. potassium chromate solution be added, the precipitate under a magnification of 120 diameters shows bundles or brushes of fine needle-like crystals, highly characteristic. If the strontium solution be N/10 or weaker, the precipitate falls only after some time, and then consists of short single or modified hexagonal prisms, requiring a magnification of about 500 to exhibit them clearly. The same crystals are obtained when ammonia in excess is carefully floated on a solution of strontium chromate in acetic acid or a mineral acid. This form seems to be unstable, and tends to pass gradually into the needle-like form. Moist strontium chromate readily dissolves in acetic acid; dried at 120° C. it is more slowly attacked, but in time dissolves completely. When, for purposes of analysis, an acid solution of strontium chromate is reduced by alcohol and precipitated by ammonia, the hydroxide, even after re-solution and precipitation, obstinately retains such quantities of strontia as to make the chromium determination quite worthless. Stock's method of precipitation by potassium iodide and iodate is quite applicable to strontium chromate. For the detection of barium, strontium, and calcium together, the author recommends separation of the thoroughly dried chlorides by alcohol, and examination of the residue for barium, precipitation of a drop of the filtrate by potassium chromate, and microscopic examination for strontium; the rest of the filtrate is converted into nitrates, and these are separated by alcohol. Separation by potassium sulphate solution is not to be recommended.

—J. T. D.

Nitrogen; Automatic Apparatus for the Absorption of ——*from Gaseous Mixtures.* F. Henrich. VII., page 1146.

INORGANIC—QUANTITATIVE.

Sulphates; Volumetric Determination of Soluble ——. M. Monhaupt. Chem.-Zeit., 1904, **28**, 1125—1126.

The method given is for the determination of sulphates in alkali and alkaline-earth salts. A weighed quantity of the substance is dissolved in water, and a solution containing known quantities of sodium carbonate and of potassium hydrate is added in excess to precipitate lime and magnesia. The solution is then made up to a known volume, and filtered. An aliquot portion of the filtrate is neutralised with hydrochloric acid, using methyl orange as indicator. The solution is then boiled to expel carbon dioxide, and a known quantity of standardised barium chloride solution added. After cooling, the solution is made up to a known volume, and a portion of the filtrate titrated with sodium carbonate solution, phenolphthalein being used as indicator. The titration can be performed accurately, if about from one-third to one-half part of 80—90 per cent. alcohol be added to the solution, and the mixture warmed. The lime and magnesia originally present may be determined by using a known excess of standardised sodium carbonate and potassium hydroxide in the first instance, and titrating a portion of the filtrate with standard acid solution, using methyl orange and phenolphthalein as indicators. From the amounts of sodium carbonate and potassium hydroxide consumed, the quantities of lime and magnesia respectively can be calculated. For instance, a mixture of 15 grms. of salt (containing 0·31 per cent. of sulphuric anhydride), 5 grms. of magnesium sulphate, and 5 grms. of crystallised magnesium chloride, was dissolved in 250 c.c. of water. 40 c.c. of the solution were then precipitated with 50 c.c. of the caustic-carbonate liquor, made up to 200 c.c., the liquid filtered, and 100 c.c. (containing 2 grms. of the mixture) of the filtrate neutralised and boiled. 20 c.c. of N/2 barium chloride solution were added, and 100 c.c. of the cooled and filtered solution then required 6·75 c.c. of N/2 sodium carbonate solution. This corresponded to 6·50 per cent. of sulphuric anhydride and a gravimetric determination gave 6·65 per cent.—L. F. G.

Sulphates and Chlorides; Use of the Chromates of Barium, and of Silver in the Determination of ——. L. W. Andrews. Amer. Chem. J., 1904, **32**, 476—480.

Sulphates. — The author recommended some years ago (this J., 1890, 328) a method for the volumetric determination of sulphates, consisting in adding a reagent prepared by dissolving barium chromate in dilute hydrochloric acid, to the sulphate solution, neutralising, filtering, and titrating the chromate in the filtrate iodometrically. It has been pointed out, however, that the solution of barium chromate in hydrochloric acid does not maintain its strength on keeping (this J., 1892, 711; 1898, 694). The author now finds that this objection is completely removed if trichloracetic acid be substituted for hydrochloric acid. Trichloracetic acid in concentrations between N/1 and N/2 is capable of maintaining permanently in solution one-sixth of its own weight of barium chromate, and the solutions do not appreciably alter on keeping, so far as the concentration of chromate is concerned.

Chlorides.—The principle of using a re-precipitable salt can also be applied to the determination of chlorides, especially to the colorimetric determination of small amounts, as for example, in water-analysis. Finely-divided silver chromate is agitated with the dilute chloride solution, the liquid is filtered or decanted, and its colour matched with that of a solution containing a known amount of potassium chromate. —A. S.

Perchlorate; Reduction [Determination] of —— in the Wet Way. B. Sjollema. Z. anorg. Chem., 1904, **42**, 127—128.

Potassium perchlorate is quantitatively reduced to chloride by boiling with ferrous hydroxide in the absence of free alkali. 0·4 grm. of potassium perchlorate was treated with a solution of 40 grms. of ferrous sulphate crystals in about 100 c.c. of water and 25 c.c. of sodium hydroxide solution (sp. gr. 1·33), and the mixture boiled for three hours; 25 c.c. of nitric acid (sp. gr. 1·32—1·33) were then added, and, after heating for some time, a further 25 c.c., after which the boiling was continued for about half an hour. While the acid solution was being boiled, the flask was provided with a device by which the vapours were washed with water, the washings running into the flask. The solution was finally made up to 500 c.c., and 250 c.c. were titrated according to Volhard's method. In seven tests the amount of perchlorate found, varied from 0·398 to 0·110 grm.—A. S.

Sodium Hydrosulphite; Action of —— upon Metallic Salts. O. Brunck. VII., page 1146.

Sulphur in Irons and Steels; New Method for the Determination of ——. H. B. Pulsifer. Chem. News, 1904, **90**, 230—231.

Two and a half grms. of the sample are moistened with water in a broad 250 c.c. beaker, and 20 c.c. of chloric acid (sp. gr. 1·12) and a very small quantity of hydrofluoric acid are added. After the action has subsided, 5 c.c. of strong hydrochloric acid are added, the beaker is covered with a watch-glass, and the contents are heated to boiling. The residue is filtered off with the aid of the filter-pump, washed two or three times with a little water, drained, and fused with sodium peroxide in a nickel crucible. The melt, after cooling, is dissolved in water and hydrochloric acid, the solution filtered and the filtrate mixed with the main solution, which has, in the meantime, been treated with 20 c.c. of strong hydrochloric acid, and evaporated until its volume is less than 10 c.c., in order to expel the hydrofluoric acid. The volume of the mixed solutions should be about 100 c.c. The sulphur is now determined in the usual manner as barium sulphate. The method is stated to give accurate results, and it is much quicker than the usual processes, the time occupied from the weighing of the sample to the precipitation of the barium sulphate being only 20 minutes.—A. S.

Tin, Commercial, and its Alloys; Analysis of ——. A. Hollard and L. Bertiaux. Bull. Soc. Chim., 1904, **31**, 1128—1131.

The following methods are recommended for the determination of impurities in tin and its alloys:—*Arsenic* is determined by the method previously described by the author (this J., 1900, 563). *Lead, bismuth, and iron.*—The tin is dissolved in a mixture of hydrochloric acid and an extremely small quantity of nitric acid; excess of ammonia is added, and sulphuretted hydrogen is passed through the solution until all the tin sulphide has dissolved. The precipitate is dissolved in hot hydrochloric acid containing bromine, the excess of which is then removed by boiling; the bismuth, lead, and copper are precipitated as sulphides and the iron determined in the solution volumetrically. The precipitate of sulphides is again dissolved in hydrochloric acid containing bromine, excess of ammonia and a small quantity of potassium cyanide are added, and the lead and bismuth are precipitated as sulphides. The washed precipitate is oxidised to sulphate, and the lead and bismuth determined electrolytically (this J., 1904, 207 and 839). *Antimony* is determined by dissolving the tin in *aqua regia*, evaporating to dryness repeatedly with hydrochloric acid to remove all nitric acid, adding a little sodium carbonate to render the residue alkaline, dissolving in sodium hydrosulphide and potassium cyanide and electrolysing. *Copper and sulphur.*—The tin (5 grms.) is attacked with nitric acid, and the resulting liquid, &c., evaporated to dryness on the water-bath. The residue is treated with water acidified with nitric acid and washed on a filter; copper is determined by electrolysing the filtrate, the residual solution being precipitated with barium chloride solution. *Alloys of lead and tin* are preferably mixed with 10 times their weight of copper, and treated with dilute nitric acid, the lead being determined in the solution by electrolytic deposition, as peroxide, after the stannic oxide precipitate has been removed.—T. F. B.

Lead, Commercial [Electrolytic Determination of Impurities in ——]. A. Hollard and L. Bertiaux. Bull. Soc. Chim., 1904, **31**, 1124—1128.

The lead is dissolved in nitric acid and deposited on a platinum anode by using a current of about 0·2 ampère. Sulphuric acid is added to the residual solution, which is then evaporated and diluted; nitric acid is added and any remaining lead is filtered off as sulphate. The *copper* is determined in this solution by electrolysis. *Nickel, zinc, and iron* are determined by the method previously described (see this J., 1904, 762). *Sulphur* is determined by evaporating the solution, freed from lead as above, to dryness with hydrochloric acid, dissolving the residue in dilute hydrochloric acid, and precipitating with barium chloride. For the determination of *arsenic*, the lead is heated with sulphuric acid, and the solution distilled with ferrous sulphate and hydrochloric acid (see this J., 1900, 563). Zinc chloride is added to the residue from this distillation, and the mixture is distilled in a current of hydrochloric acid gas, antimony chloride passing over. The distillate is neutralised with ammonia and the antimony precipitated by means of sulphuretted hydrogen. The precipitate is dissolved in a solution of sodium hydrosulphide and potassium cyanide (see this J., 1903, 512) and the *antimony* determined by electrolysis, using a current of 0·1 ampère. *Silver* is determined by precipitating a nitric acid solution of the lead by hydrochloric acid, dissolving the precipitate in potassium cyanide solution and electrolysing with a current of 0·1 ampère. The deposited metal is dissolved in nitric acid and the silver determined volumetrically by the thiocyanate method. *Bismuth and tin.*—A solution of lead in dilute nitric acid is evaporated to dryness, and the residue mixed with water and evaporated again. Ammonium nitrate solution is added and the mixture filtered; the residue on the filter, which contains the bismuth, tin, arsenic, and antimony, is dissolved in hydrochloric acid, and precipitated by sulphuretted hydrogen; the arsenious sulphide is removed from the precipitate by treatment with ammonium carbonate solution, and the antimony and tin sulphides by ammonium sulphide; the residue is now oxidised to convert sulphide into sulphate, the *bismuth* being determined electrolytically (see this J., 1904, 839). The ammonium sulphide solution, containing the tin and antimony, is precipitated by means of hydrochloric acid, the precipitate dissolved in sodium hydrosulphide and potassium cyanide, the antimony being removed as above. The tin is precipitated from the solution by hydrochloric acid, the precipitate dissolved in alkali sulphide and the solution evaporated to dryness; the residue is oxidised by means of potassium chlorate, hydrochloric acid added, and the solution filtered, ammonium oxalate being then added to the filtrate and the *tin* determined by electrolysing the hot solution, using a current of about 1 ampère.—T. F. B.

ORGANIC—QUALITATIVE.

Cotton-Seed Oil; Detection of —— in Olive Oil. E. Milliau. Comptes rend., 1904, **139**, 807—809.

The adulteration of olive oil by cotton-seed oil is generally detected by the reduction of silver nitrate on warming in alcoholic solution, or else by Halphen's reagent [mixture of amylic alcohol and carbon bisulphide containing sulphur]. Since, however, kapok oil and baobab oil [Baobab tree: *Adansonia digitata*] also show both these reactions for cotton-seed oil, and since kapok oil is now a commercial product, it was necessary to distinguish between these two oils and cotton-seed oil. The author proposes the following simple method:—The fatty acids of the oil are prepared, washed, and dried; 5 c.c. of the fused acids are mixed in a test-tube with 5 c.c. of a 1 per cent. solution of silver nitrate in absolute alcohol: the mixture is shaken, and the reaction observed. The presence of even 1 per cent. of kapok oil produces a dark brown coloration after about 20 minutes, at the ordinary temperature, baobab oil behaves in an exactly similar manner, whereas cotton-seed oil causes no reduction until the mixture is warmed.

—J. F. B.

Cholesterol; New Reaction of ——. C. Neuberg and D. Rauchwerger. Festschr. für E. Salkowski, 1904, 279—285. Chem. Centr., 1904, **2**, 1434—1435.

The tests known at present for cholesterol are given by phytosterol, coprosterol and hippocoprosterol as well as by the typical cholesterol from gall-stones. With a mixture of δ-methylfurfural (or rhamnose) and concentrated sulphuric acid, however, the typical cholesterol gives a characteristic coloration. A very small quantity of cholesterol is warmed with about 1·5 c.c. of absolute alcohol and a trace of rhamnose added. After cooling, an equal volume of concentrated sulphuric acid is introduced so as to form a layer below the solution, whereupon a raspberry-coloured ring is produced almost instantaneously at the zone of contact of the two liquids. If the layers be now mixed while the tube is cooled by a current of cold water, the mixture becomes intensely coloured, and when diluted with alcohol, gives a characteristic dark absorption band in the green to blue region of the spectrum, between the lines E and b. If the liquid becomes warm, it acquires a brownish instead of a raspberry colour, and then gives a second absorption band near the line D. Amyl or methyl alcohol, acetone or glacial acetic acid may be used in place of ethyl alcohol. With phytosterol the reaction fails, or at most, a pink coloration is produced, with occasionally an absorption band in the yellow to green portion of the spectrum. Similar reactions are given by various hydro-aromatic compounds, among them, abietic acid and retenedodecahydride, $C_{18}H_{30}$ (compare this J., 1901, 1117).—A. S.

Morphine; Contributions to the Knowledge of Alkaloid Reactions. IV. ——. C. Reichard. Chem.-Zeit., 1904, **28**, 1102—1105. (See this J., 1904, 458 and 1116.)

Morphine when added in small quantities to a solution of arsenious or arsenic acid with sulphuric acid, produces a fine purple-red coloration. The colour changes to violet after 3—5 days. The colouring matter is not extracted by ether. Atropine can be detected in the presence of morphine by the production of a fragrant odour. Strychnine with these reagents gives a dirty yellowish-green coloration; with brucine the liquid turns black on warming; cocaine produces a black precipitate. Morphine sulphate added to a concentrated solution of antimony trichloride give a deep red coloration on warming. Added to stannous chloride solution it produces no change, even on warming, till sulphuric acid is added, when a fine violet-purple coloration is produced. With atropine there is no change. When morphine is warmed with bismuth chloride solution a yellow coloration is formed. Brucine interferes with this reaction, but atropine, strychnine and cocaine do not. Morphine added to a solution of cobalt nitrate and sulphuric acid yields a dark red colour slowly changing to brownish-yellow; brucine interferes with this reaction. If cerium dioxide is triturated with sulphuric acid, morphine added, and the mixture warmed, a strong bluish-violet colour appears. It is not advisable to make use of this reaction in the presence of strychnine, or brucine, either of which gives a strong yellowish-red coloration; but it may be used in the presence of cocaine or atropine.

—F. S.

ORGANIC—QUANTITATIVE.

Dégras; Note on the Analysis of ——. G. Baldracco. Collegium, 1904, 333—335.

There are two well-known methods for determining the unsaponifiable matter:—(1) Methods by which the grease is saponified and the unsaponified matters dissolved out from the solution of the soap by extraction with ether or petroleum spirit; (2) Methods by which the unsaponifiable matter is extracted from the dry soap. The author has compared these two methods for dégras, and finds that they always yield different results. The second method of the two, is the more accurate one.—F. D. T.

India-Rubber Articles; Analysis of ——. W. Esch and A. Chwolles. Gummi-Zeit., 1904, **19**, 125—126. (This J. 1893, 467; 1894, 986—988 and 476.)

Various modifications of Henriques' and Weber's methods for the analysis of rubber goods have recently been proposed. Chéneau (this J., 1900, 780) suggests the extraction of paraffin with light petroleum spirit or chloroform, after extractions with alcoholic soda, acetone, and cold nitrobenzene. The authors have satisfied themselves that paraffin is completely extracted by acetone if the samples are properly prepared (fine enough) and extracted for a sufficiently long time. Chéneau's unsatisfactory results with acetone were doubtless due to the samples not being rolled sufficiently thin. Pontio makes his first extraction with alcohol instead of acetone. There appears to be no advantage if asphaltum be present; as both solvents dissolve a small quantity (in the case of Syrian asphaltum about 1·5 per cent.). Acetone also dissolves the unsaponifiable oils completely, but alcohol only partially. Pontio, therefore, extracts the unsaponifiable oils, together with the asphaltum, by means of a mixture of spike oil and acetone. It appears to be immaterial whether the unsaponifiable oils are extracted with the paraffin or with the asphaltum. An experiment showed that alcohol extracted five-sixths of the paraffin in a specially prepared sample (containing 21 per cent. of paraffin) in five hours, whilst acetone extracted the whole in three hours. Henriques and Weber used cold nitrobenzene for the extraction of asphaltum; Pontio uses a mixture of 60 parts of spike oil and 40 parts of acetone, boiling for six hours. The great difference between the boiling points of the two solvents and the tendency to dissolve vulcanised rubber makes this latter method impossible. Henriques, after extraction of the sample with alcoholic soda, cold ether or hot acetone, and cold nitrobenzene, ascertained the combined sulphur and mineral constituents in the insoluble residue, and calculated from the difference the amount of rubber, with the aid of factors to correct for the loss of rubber due to small quantities dissolved by the various solvents used. This correction depends, of course, upon the solvents used, and the factor $\frac{100}{97 \cdot 5}$ quoted by him as an example is not to be taken as a general factor, as assumed by some investigators. For the extraction of unsaponifiable oils from samples of rubber which could not be finely powdered or crushed, Henriques used ether, on account of its penetrative power being superior to that of acetone: however. apart from this, and in all other cases, acetone is much the better solvent.—J. K. B.

Reducing Sugars; Separation or Isolation of —— by Means of Aromatic Hydrazines. E. Votoček and R. Vondráček. Ber., 1904, **37**, 3854—3858.

In the separation of reducing sugars from mixtures it is first ascertained by preliminary tests (colour reactions, distillation with hydrochloric acid, &c.) what types of sugar are present, *i.e.*, whether they are hexoses, pentoses, methylpentoses, or mixtures of these). The content of reducing sugar in the syrup is then determined by Fehling's solution, and water added in such quantity that the proportion of sugar is about 5 per cent. This solution is then treated with an equivalent quantity of a suitable substituted hydrazine or its acetate, and the deposited hydrazone filtered off; to the mother liquor direct (*i.e.*, without setting free the sugar by means of benzaldehyde or formaldehyde) another aromatic hydrazine is then added to convert the second sugar into either a hydrazone or osazone. This operation is repeated, should a third sugar be present. The method has been applied to various mixtures of pure sugars and also to the saccharine products of hydrolysis of arabinic acid (from sugar beets), gum arabic, and coffee beans.—T. H. P.

Codeine in Opium; Determination of ——. C. E. Caspari. Pharm. Rev., **22**, 348. J. Pharm. Chim., 1904, **20**, 458—460.

Fifty grms. of opium are extracted with water, the aqueous liquid is evaporated to 250 c.c., 5 grms. of barium acetate are added, and the solution is made up to 700 c.c. with water. The meconic acid and resinous substances which are precipitated, are filtered off and washed with cold water, and the filtrate and washings are concentrated, treated with a further 5 grms. of barium acetate, diluted and filtered. These operations are repeated until barium acetate produces no further precipitate. The solution is then concentrated, a slight excess of a 10 per cent. solution of sodium carbonate is added, and the solution is filtered. The precipitate which contains the thebaine, papaverine, and narcotine is filtered off and washed with water, and the filtrate and washings are acidulated with dilute hydrochloric acid, and concentrated by evaporation. The greater part of the morphine is precipitated by adding excess of a 2 per cent. solution of ammonia, filtered off, and washed. The filtrate is acidulated, concentrated, and again treated with ammonia to precipitate the remainder of the morphine, which is filtered off and washed. The filtrate is acidulated, concentrated to 70 c.c, rendered alkaline with weak ammonia, and shaken with benzene, which dissolves the codeine, but not the narceine. In the evaporation residue of the benzene extract, the codeine is determined by titration. By this method Smyrna opium was found to contain, in two tests, 1·12 and 1·33 per cent. respectively of codeine, $C_{18}H_{21}NO_3.H_2O$.—A. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Radio-active Gas in the Hot Springs of Wiesbaden; Presence of a ——. F. Henrich. Z. angew. Chem., 1904, **17**, 1757—1760.

The author finds that the gas and water from the hot springs of Wiesbaden are distinctly radio-active. The stalactites present in the springs are also radio-active, and, unlike the water and gas, do not become inactive on keeping, although fresh stalactites are more active than those which have been removed for some time. It is possible to make the water nearly inactive by freeing it from dissolved gases by boiling.—A. S.

Carbon Dioxide; Decomposition of —— by Light. A. Bach. Ber., 1904, **37**, 3985—3986.

The author found, some years ago, that when carbon dioxide was bubbled through uranium acetate solution in bright sunlight, reduction occurred, whilst no reduction was effected by exposure of the uranium solution alone to sunlight, or by bubbling carbon dioxide through it in the dark. Euler has stated that uranium acetate solution is reduced by sunlight, either alone or when nitrogen is bubbled through it. The author, however, confirms his original observation, and attributes the difference between Euler and himself to impurity in one or the other uranium solution. —J. T. D.

Aurous Iodide; Preparation of —— by the Action of Iodine on Gold. F. Meyer. Comptes rend., 1904, **139**, 733—736.

At the ordinary temperature, iodine is without action on gold; and aurous iodide, on the other hand, does not dissociate even in a vacuum. Between 50° C. and its melting point, pure dry iodine reacts on gold, forming amorphous aurous iodide; and above the melting-point of iodine the crystallised iodide is produced. The direct reaction is always limited by the inverse one, but by using a sufficient excess of iodine a given quantity of gold can be completely converted into iodide. The iodide is best separated from the excess of iodine by careful sublimation of the latter at 30° C., as most solvents of iodine decompose the iodide. The formation of iodide takes place, in closed vessels, in presence of water; but the reaction is limited, and in the open air, where iodine can escape, water completely decomposes aurous iodide.—J. T. D.

Fluorides of Boron and Silicon; Preparation and Physical Constants of ——. H. Moissan. Comptes rend., 1904, **139**, 711—714.

The substances formed by the direct reaction of fluorine on boron and on silicon were proved to be identical respectively with boron trifluoride and silicon tetrafluoride, prepared by the usual methods. The melting and boiling-points of boron trifluoride were determined and found to be − 127° and − 101° C. respectively, under atmospheric pressure. Silicon tetrafluoride is solid at − 97° C., under atmospheric pressure, and at that temperature volatilises rapidly without liquefying. (Olszewsky had already recorded a similar behaviour at − 102° C.) Under two atmospheres pressure it melts at − 77° C. to a transparent and exceedingly mobile liquid, which boils at − 65° C. when the pressure is 181 cm. of mercury. The critical point of silicon tetrafluoride is − 1·5° C., and the critical pressure 50 atmospheres.—J. T. D.

Hydrogen Peroxide; Effect of "Poisons" on Decomposition of —— by Hæmase. G. Senter. Proc. Roy. Soc., 1904, **74**, 201—217.

Quantitative measurements have been made of the effects of various substances on the rate of decomposition of hydrogen peroxide by hæmase, an enzyme obtained from blood. The probable mechanism of the catalysis is discussed, and reasons are given for supposing that what is actually measured is "the rate of diffusion of hydrogen peroxide to the enzyme." The author prefers a chemical explanation of the action of these poisons to those already advanced. From the results obtained with acids and alkalis, as well as from the results of other observers, it is concluded that at least some enzymes are amphoteric substances, *i.e.*, substances which are neutral in aqueous solution, but can combine with either acids or alkalis to form salts.—T. H. P.

Formaldehyde; Formation of —— during the Combustion of Tobacco. A. Trillat. Comptes rend., 1904, **139**, 742—744.

Cigars, cigarettes, and tobacco in wooden and clay pipes were burnt, and the products of combustion examined for formaldehyde (compare this J., 1904, 744). Amounts varying from 0·05 to 0·12 per cent. of the weight of the

tobacco were found. The amount varies but little with the origin of the tobacco; that formed with a clay pipe is, as a rule, greater than that with a wooden pipe or from cigars or cigarettes—possibly owing to catalytic action of the hot clay surfaces. The formaldehyde seems to exist, not in the free state, but in combination with nicotine and other bases formed at the same time. The physiological effects of the aldehyde are no doubt modified on this account.
—J. T. D.

Rhodeose and Fucose; Enantiomorphism of ——. E. Votoček. Ber., 1904, **37**, 3859—3862.

The author has expressed the view (Ber., 1904, **37**, 306) that the sugar rhodeose, obtained by the hydrolysis of the glucoside convolvulin, and fucose, isolated by Tollens from plants of the *Fucus* species and also from tragacanth, are enantiomorphously related methylpentoses. Since then, Tollens has found that the melting point of fucosephenylosazone is 158°—159° C., whilst that of rhodeosephenylosazone is 176·5° C. The author now shows that the former of these melting points is incorrect, fucosephenylosazone melting at practically the same temperature as the rhodeose derivative, namely, 178°. The two phenylhydrazides of the monocarboxylic acids of rhodeose and fucose also have identical melting points. A mixture of equal amounts of the two sugars forms a true racemic compound, which is optically inactive, melts at 161°, and has a solubility in water less in the proportion of 1 : 5·4 than that of either of the components. This is the first known example of the natural occurrence of two enantiomorphously-related sugars. The view that nature only produces one member of an enantiomorphous pair of sugars is hence erroneous. The author shows that rhodeose really exists as such in convolvulin, and is not produced by the action of the baryta used for the hydrolysis.—T. H. P.

Isomeric Glucosides and Galactosides; Hydrolysis of —— *by Acids and Enzymes.* E. F. Armstrong. Proc. Roy. Soc., 1904, **74**, 188—194.

The suggestion, put forward by Bourquelot and Herissey, that the action of emulsin on milk sugar is due to the presence of small quantities of lactase, together with the emulsin proper, is improbable owing to the facts:—(1) That the curve expressing the rate at which milk sugar changes is not of the form to be expected if only a very small quantity of enzyme (lactase) were present, as then a linear expression should apply during the early stages; actually the curve is only of this form when small quantities of emulsin are used. (2) The action of emulsin on milk sugar is most retarded by dextrose and only to a slight extent by galactose, whereas the latter alone affects the action of lactase. (3) The curves for emulsin fall off very much more rapidly than those for lactase, showing that the action of the products in removing the enzyme is greater in the former case. It would seem, therefore, that emulsin is capable of acting on β-galactosides, as well as β-glucosides. With the α- and β-glucosides and the α- and β-galactosides, where the stereo-isomerism in each pair of compounds is confined to the terminal carbon atom, the β-compounds undergo hydrolysis by acids much more readily than the corresponding α-compounds. Further, on passing from a glucoside to the corresponding galactoside—involving a change in the general configuration at the fourth carbon atom affecting only the nature of the attachment of the oxygen atoms within the ring—a marked influence is exerted on the activity of the group associated with the terminal carbon atom, the galactoside being far more readily hydrolysable than the glucoside. Maltose is hydrolysed more rapidly by yeast extract than α-methylglucoside, and, in both cases, the velocity coefficient of the change diminishes as action proceeds, but to a far greater extent with maltose; the value of K for the latter is about six times as great as that for the glucoside. The hydrolysing activity of the enzyme is much greater than that of acids.—T. H. P.

Sucroclastic [*Hydrolytic*] *Actions of Acids and Enzymes; Contrast between the* ——. E. F. Armstrong and R. J. Caldwell. Proc. Roy. Soc., 1904, **74**, 195—201.

The authors have determined the effects produced on the value of the velocity constant of the hydrolysis of cane-sugar by hydrochloric acid by the addition of one or both of the products of hydrolysis or cane sugar itself. 100 c.c. of a 17·1 per cent. solution of cane-sugar, containing 0·5 grm.-molecule of hydrochloric acid were taken, and the following amounts of sugar added:—

Sugar added.	Mean Value of K.
9·0 grms. of glucose ...	12·53
9·0 „ „ levulose	12·30
9·0 „ „ invert sugar	12·42
8·55 „ „ cane sugar	12·45

It will be seen that about the same increase in the value of K (the velocity constant) is produced by equimolecular proportions of glucose and levulose, whilst the molecular effect of the biose cane sugar is about twice the molecular effect of the monose. The acceleration brought about by the addition of sugars may be attributed to a withdrawal of water by the sugar and the consequent increase in the amount of the "active system."—T. H. P.

New Books.

Oils and Fats: Their Uses and Applications. Cantor Lectures. Dr. J. Lewkowitsch, M.A., &c. William Trounce, 10, Gough Square, Fleet Street, London, E.C. 1904. Price 1*s.*

The author's four Cantor Lectures are embodied in this pamphlet, which contains 52 pages, with 28 illustrations and 18 tables. The matter is subdivided and classified as follows:—I. Extent of the Oil and Fat Industries. Sources of Supply. Raw Materials and Modern Methods of Manufacture. II. Methods of Refining. Industry of Edible Oils and Fats. III. Burning Oils. Paint Oils, Lubricating, Blown, and Boiled Oils. Linoleum Industry. Turkey-Red Oils. Hydrolysis of Fats. IV. Saponification Processes. Candle Industry. Soap Industry. Glycerin, and its Recovery from Soap Lyes. (See also this J., 1904, 1098.)

Application of Some General Reactions to Investigations in Organic Chemistry. By Dr. Lassar-Cohn, Professor of Organic Chemistry at the University of Königsberg. Translated by J. Bishop Tingle, Ph.D. First Edition. John Wiley and Sons, New York. Chapman and Hall, Ltd., London. 1904. Price 4*s.* 6*d.*

12mo volume, containing translator's and author's prefaces, and 95 pages of subject matter, also an alphabetical index. The purpose of the book is to discuss, in a systematic and generalised manner, the application of certain reactions and methods to investigations in Organic Chemistry. The divisions of the subject indicate generally the method adopted. I. Fixation of labile Hydrogen Atoms. II. Modification of Reactions. III. Improvement in the Conditions of Reaction. Overstrain of Reactions. IV. Influence of neighbouring Atoms and Atomic Complexes.

Chemisch-technische Untersuchungsmethoden. Mit Benutzung der früheren von Dr. Friedrich Böckmann bearbeiteten Auflagen, und unter Mitwirkung von E. Adam, F. Barnstein, Th. Beckert, O. Böttcher, C. Councler, K. Dieterich, K. Dümmler, A. Ebertz, C. v. Eckenbrecher, F. Fischer, F. Frank, H. Freudenberg, E. Gildemeister, R. Gnehm, O. Guttmann, E. Haselhoff, W. Herzberg, D. Holde, W. Jettel, H. Kohler, Ph. Kreiling, K. B. Lehmann, J. Lewkowitsch, C. J. Lintner, E. O. v. Lippmann, E. Marckwald, J. Messner, J. Passler, O. Pfeiffer, O. Pufahl, H. Rasch, O. Schluttig, C. Schoch, G. Schüle, L. Tietjens, K. Windisch, L. W. Winkler. Herausgegeben von Dr. Georg Lunge Professor der technischen Chemie am eidgenössischen Polytechnikum in Zürich. Zweiter Band. 5te, vollständig umgearbeitete und vermehrte Auflage. Julius Springer's Verlag, Berlin. 1905. Price M. 16; bound, M. 18.

Large 8vo volume, containing 842 pages of subject-matter, with 153 illustrations, and an appendix with eight pages of tables. The subject matter treated of in this second volume is as follows:—I. IRON (Th. Beckert) (i) Analysis of the Ores. (ii) Analysis of Iron. II. METALS OTHER THAN IRON (O. Pufahl): (i) Silver. (ii) Gold. (iii) Platinum. (iv) Mercury. (v) Copper. (vi) Lead. (vii) Bismuth. (viii) Tin. (ix) Arsenic. (x) Antimony. (xi) Zinc. (xii) Cadmium. (xiii) Nickel and Cobalt. (xiv) Manganese. (xv) Chromium. (xvi) Tungsten. (xvii) Uranium. (xviii) Molybdenum. (xix) Aluminium. (xx) Thorium. (xxi) Metallic Salts. III. ARTIFICIAL MANURES (O. Böttcher): (i) General Methods of Examining Artificial Manures. (ii) Special Methods for Examining Individual Manures. (iii) Methods for Examining Products and Raw Materials of the Manufacture of Manures in International Commerce. IV. FEEDING STUFFS (F. Barnstein). V. EXPLOSIVES (Oscar Guttmann). A. Raw Materials. B. Explosives. C. Tests of Stability and Thermal Effect. VI. DETONATORS (Wladimir Jettel): A. Raw Materials. B. Matches. VII. GAS MANUFACTURE. AMMONIA (Otto Pfeiffer). VIII. CALCIUM CARBIDE AND ACETYLENE (G. Lunge): A. Raw Materials. B. Calcium Carbide as a Trade Product. C. Acetylene. IX. COAL-TAR INDUSTRY (H. Köhler): (i) Properties and Composition of Coal-tar. (ii) Investigation of Coal-tar. (iii) Practical Process and Control. (iv) Final Products. X. INORGANIC COLOURING MATTERS (R. Gnehm): (i) Blue Colours. (ii) Yellow Colours. (iii) Green Colours. (iv) Red Colours. (v) Brown Colours. (vi) Black Colours. (vii) White Colours. (viii) Bronze Colours. (ix) Colour Lakes from Artificial Colours. (x) Ultramarine.

DIE FABRIKATION DER SODA NACH DEM AMMONIAKVERFAHREN. Von H. SCHREIB. Julius Springer's Verlag, Berlin. 1905. Price M. 9.

8vo volume, containing 312 pages of subject-matter, and a series of three tables, filled with plans of apparatus and plant relating to the Ammonia-Soda Industry. The text is classified on the following lines:—I. Introduction: Development of the Ammonia-Soda Industry. II. Burning the Lime and Recovering the Carbon Dioxide liberated. III. Preparing the Ammoniacal Solution of Common Salt. IV. Precipitation of the Sodium Bicarbonate. V. Separating the Sodium Bicarbonate from the Mother Liquors, or Filtration. VI. Decomposing the Sodium Bicarbonate into Sodium Carbonate and Carbon Dioxide, or Calcining. VII. Regenerating or Distilling the Ammonia. VIII. Treatment and Utilisation of the Spent Liquors. IX. Calculating the Power required for the Manufacture of Ammonia-Soda. X. Materials required and Costs of Preparation of the Ammonia-Soda. XI. Review of Manufacturing Method, &c.

DIE DARSTELLUNG DES ZINKS AUF ELEKTROLYTISCHEM WEGE. Von Dr. ing. EMIL GÜNTHER. Wilhelm Knapp's Verlag, Halle a. S. 1904. Price M. 10.

THIS forms one of a series of monographs on applied electricity, and takes the form of an 8vo volume, containing dedication, preface, 241 pages of subject-matter, with 59 illustrations, and an alphabetical index of names and subjects. The matter is classified as follows:—I. Properties of Zinc. Production. Uses. Occurrence. Extraction by Metallurgical Methods. Review of Extraction by Electrochemical Methods. II. Electrolysis of Aqueous Solutions. Obtaining Zinc from Mixed Ores. Obtaining Zinc Chloride. The Hoepfner Process. III. Electrolysis of fused Zinc Salts. Appendix. Calculation and Comparison of Costs.

Trade Report.

I.—GENERAL.

THE PATENT RULES, 1905.

Statutory Rules and Orders, 1904. *No.* 1652. *Dated Oct.* 20, 1904.

By virtue of the provisions of the Patents, Designs, and Trade Marks Acts, 1883 to 1902, the Board of Trade do hereby make the following rules:—

Short Title.

1. These rules may be cited as the Patents Rules, 1905.

Commencement.

2. These rules shall come into operation from and immediately after the 31st day of December, 1904.

Interpretation.

3. In the construction of these rules, any words herein used defined by the said Acts, shall have the meanings thereby assigned to them respectively.

Applications for Patents.

4. The statement of the invention claimed, with which a complete specification must end, shall be clear and succinct as well as separate and distinct from the body of the specification.

5. For Rule 9 of the Patents Rules, 1903, the following rule shall be substituted:—

When a specification comprises several distinct matters, they shall not be deemed to constitute one invention by reason only that they are all applicable to or may form parts of an existing machine, apparatus, or process.

Where a person making application for a patent has included in his specification more than one invention, the Comptroller may require or allow him to amend such application and specification and drawings or any of them so as to apply to one invention only, and the applicant may make application for a separate patent for any invention excluded by such amendment.

Every such last-mentioned application may, if the Comptroller at any time so direct, bear the date of the original application, or such date between the date of the original application and the date of the application in question, as the Comptroller may direct, and shall otherwise be proceeded with as a substantive application in the manner prescribed by the said Acts and by any rules thereunder for the time being in force.

Where the Comptroller has required or allowed any application, specification, or drawings to be amended as aforesaid, such application shall, if the Comptroller at any time so direct, bear such date, subsequent to the original date of the application and not later than the date when the amendment was made, as the Comptroller shall consider reasonably necessary to give sufficient time for the subsequent procedure relating to such application.

Procedure under Section 1 *of the Patents Act*, 1902.

6. If after the leaving of any complete specification the examiner reports that the nature of the invention is not sufficiently disclosed and defined to enable him to make the investigation prescribed by subsection 1, and the Comptroller has required amendment of the specification and drawings, or either of them, the application shall, if the Comptroller at any time so direct, bear such date, subsequent to its original date and not later than the date when the requirement is complied with, as the Comptroller may consider reasonably necessary to give sufficient time for the subsequent procedure relating to such application.

7. When the Examiner in prosecution of the investigation prescribed by subsection 1, finds that the invention claimed in the specification under examination has been wholly claimed or described in one or more specifications within the meaning of the subsection in question,

he shall, without any further prosecution of the investigation, make a provisional report to that effect to the Comptroller.

If the provisional report of the Examiner made under this Rule be not revised or altered, it shall be deemed a final report, and the application shall be dealt with as provided by subsection 6. If, however, such provisional report be reversed or altered, the investigation prescribed by subsection 1 shall be continued, and a further report shall be made to the Comptroller, and the specification shall be dealt with as provided in subsection 5 or subsection 6, as the case may require.

8. The time within which an applicant may leave his amended specification under subsection 2 shall be two months from the date of the letter informing him that the invention claimed has been wholly or in part claimed or described in any specification or specifications within the meaning of subsection 1.

In any special case the Comptroller may, if he think fit, enlarge the time prescribed by this Rule.

9. When the applicant for a patent has been informed of the result of the investigation of the examiner, made under the provisions of subsection 1, and the time allowed by Rule 8 for amendment of his specification has expired, the Comptroller, if he is not satisfied that no objection exists to the specification on the ground that the invention claimed therein has been wholly or in part claimed or described in a previous specification within the meaning of that subsection, shall inform the applicant accordingly, and appoint a time for hearing him, and shall give him ten days' notice at the least of such appointment. The applicant shall, as soon as possible, notify the Comptroller whether or not he desires to be heard. The Comptroller shall, after hearing the applicant, or without a hearing, if the applicant has not attended a hearing appointed or has notified that he does not desire to be heard, determine whether reference ought to be made in the applicant's specification to any, and, if so, what, prior specification or specifications by way of notice to the public.

10. When under subsection 6 the Comptroller determines that a reference to a prior specification ought to be made by way of notice to the public, the form of reference shall be as follows, and shall be inserted after the claims :—

Reference has been directed in pursuance of section 1, subsection 6, of the Patents Act, 1902, to the following specification of Letters Patent No. , granted to .

Where the reference is inserted as the result of a provisional report under Rule 7, a statement to that effect shall be added to the reference.

Appeal.

11. Every decision of the Comptroller under the foregoing Rules shall be subject to an appeal to the law officer.

Sealing of Patent and Payment of Fee.

12. If the applicant for a patent desires to have a patent sealed on his application, he must, on or before the last day on which a patent can lawfully be sealed, pay the prescribed sealing fee ; and if such fee be not paid, no patent shall be sealed.

The prescribed sealing fee should be paid by leaving, at the Patent Office, Form X. in the Second Schedule to these Rules, duly stamped.

Fees.

13. To the fees specified in the First Schedule to the Patents Rules, 1903, shall be added the fee specified in the First Schedule hereto.

Forms.

14. To the forms contained in the Second Schedule to the Patent Rules, 1903, shall be added the Form X. contained in the Second Schedule hereto; and in the Form C, contained in the first-mentioned Schedule the following direction shall be added in a marginal note, namely :—" In the preparation of the claim or claims, careful attention should be paid to the terms of Rule 4 of the Patents Rules, 1905. Any unnecessary multiplicity of claims or prolixity of language should be avoided."

Size, &c. of Documents.

15. For Rule 17 of the Patents Rules, 1903, the following Rule shall be substituted : —

All documents and copies of documents, except drawings, sent to or left at the Patent Office or otherwise furnished to to the Comptroller or to the Board of Trade shall be written, type-written, lithographed, or printed in the English language (unless otherwise directed) in large and legible characters with deep permanent ink upon strong white paper, and, except in the case of statutory declarations and affidavits, on one side only, of a size of approximately 13 ins. by 8 ins., leaving a margin of at least one inch and a half on the left-hand part thereof, and the signatures thereto must be written in a large and legible hand. Duplicate documents shall at any time be left, if required by the Comptroller.

At the top of the first page of a specification a space of about 2 ins. should be left blank.

Drawings accompanying Specifications.

16. For Rules 18 to 24 of the Patents Rules, 1903, the following Rules shall be substituted :—

As the drawings are printed by a photolithographic process, the character of each original drawing must be brought as nearly as possible to a uniform standard of excellence, suited to the requirements of such process, and calculated to give the best results in the interests of inventors, of the Office, and of the public. The following requirements should, therefore, be strictly observed, as non-compliance therewith will be certain to cause delay in the progress of an application for a patent.

17. Drawings, when furnished, should accompany the provisional or complete specification to which they refer, except in the case provided for by Rule 24. No drawing or sketch such as would require the preparation for the printer of a special illustration for use in the letterpress of the specification when printed should appear in the specification itself.

18. Drawings may be made by hand or lithographed, printed, &c. They must be made on pure white, hot-pressed, rolled, or calendered strong paper of smooth surface, good quality, and medium thickness without washes or colours, in such a way as to admit of being clearly reproduced on a reduced scale by photography. Mounted drawings must not be used.

19. Drawings must be on sheets which measure 13 ins. from top to bottom, and are either from 8 ins. to $8\frac{1}{4}$ ins. or from 16 ins. to $16\frac{1}{2}$ ins. wide, the narrower sheets being preferable.

If there are more figures than can be shown on one of the smaller sized sheets, two or more of these sheets should be used in preference to employing the larger size. When an exceptionally large drawing is required, it should be continued on subsequent sheets. There is no limit to the number of sheets that may be sent in, but no more sheets should be employed than are necessary, and the figures should be numbered consecutively throughout and without regard to the number of sheets. The figures should not be more numerous than is absolutely necessary. They should be separated by a sufficient space to keep them distinct.

20. Drawings must be prepared in accordance with the following requirements :—

(*a*) They must be executed with absolutely black ink.

(*b*) Each line must be firmly and evenly drawn, sharply defined, and of the same strength throughout.

(*c*) Section lines, lines for effect, and shading lines should be as few as possible, and must not be closely drawn.

(*d*) Shade lines must not contrast too much in thickness with the general lines of the drawing.

(*e*) Sections and shading should not be represented by solid black or washes.

(*f*) They should be on a scale sufficiently large to show the invention clearly, and only so much of the apparatus, machine, &c., should appear as effects this purpose. If the scale is given, it should be drawn, and not denoted by words.

Reference letters and figures, and index numerals used in conjunction therewith, must be bold, distinct, and not less than one-eighth of an inch in height. The same letters should be used in different views of the same parts. Where the reference letters are shown outside the figure, they must be connected with the parts referred to by fine lines.

21. Drawings must bear the name of the applicant (and, in the case of drawings left with a complete specification after a provisional specification, the number and year of the application) in the left-hand top corner; the number of sheets of drawings sent, and the consecutive number of each sheet, in the right-hand top corner; and the signature of the applicant or his agent in the right-hand bottom corner. Neither the title of the invention nor any descriptive matter should appear on the drawings.

22. A facsimile or "true copy" of the original drawings must be filed at the same time as the original drawings, prepared strictly in accordance with the above rules, except that it may be on tracing cloth and the reference letters and figures should be in black-lead pencil.

The words "original" or "true copy" must in each case be marked at the right-hand top corner, under the numbering of the sheet.

23. Drawings must be delivered at the Patent Office so as to be free from folds, breaks, or creases, which would render them unsuitable for reproduction by photography.

24. If an applicant desires to adopt the drawings lodged with his provisional specification as the drawings for his complete specification, he should refer to them in the complete specification as those left with the provisional specification.

Dated the 20th day of October, 1904.

G. W. Balfour,
President of the Board of Trade.

The First Schedule.

Fee Payable on Sealing of Patent.

III.—TAR PRODUCTS, PETROLEUM, Etc.

Oil Fields of India; Development of the ——.

U.S. Cons. Rep., No. 2104, Nov. 10, 1904.

During the fiscal year ended March 31, 1904, the importation of kerosene oil into India fell off nearly 10,000,000 galls. During the preceding year there was an almost identical decline, so that, compared with the fiscal year 1901–2, the reduction was nearly 20,000,000 galls., equal to 21·7 per cent. The decline in the import of Russian oil was 19·4 per cent. and of American oil 27 per cent. The rapid development of the Indian oil fields has caused this decreased import. The Indian oil is not yet of as good quality as most of the imported oil, but its cheapness secures it a market. American oil, it is said, has security for a limited market in its superior quality, but keen competition among all the common grades seems assured.

Petroleum Production; Decline in Russian ——.

Bd. of Trade J., Nov. 17, 1904.

The production of petroleum in Russia has diminished from 85 million barrels in 1901 to 75 million barrels in 1903. In 1902 Russia's share in the world's production was 43·5 per cent., and in 1903, 38·7 per cent. This decline is attributed to the lack of proper organisation, and to the frequent and disastrous fires at Baku.

VII.—ACIDS, ALKALIS, Etc.

Sodium Nitrate; Reasons for Advanced Prices of ——.

Montgomery and Co., London.

The following reasons are given for the continued advance in price of sodium nitrate :—(1) Partial failure of the sugar-beet crop on the Continent, causing a considerable rise in price of sugar. (2) Decreased shipments of nitrate from Chili during the last two months; these are not in keeping with the quantity permitted by the combination agreement, whence it is feared that the maximum quotas will not be nearly reached, which would probably result in a scarcity during the coming agricultural season.

Bauxite in the United States.

Eng. and Mining J., Nov. 10, 1904.

According to the Geological Survey, the quantity of bauxite produced in the United States last year was 48,087 long tons, an increase of 18,865 tons over the previous year. During the year the Pittsburg Reduction Company completed its mining plant at Bauxite, Ark., and a refining plant at East St. Louis. At the present time, Georgia, Alabama, and Arkansas, in the order of their outputs, furnish the total supply of bauxite in the United States. The mineral occurs in other States, notably North Carolina and South Carolina, but the deposits are not of sufficient extent or purity to be of commercial value.

Sulphur Combination; Progress of the Anglo-Sicilian ——.

Eng. and Mining J., Nov. 10, 1904.

In 1897, the first fiscal year of the sulphur combination, exports from Sicily showed an increase of over 16 per cent., resulting in a net profit of 49,350*l.*, or about 6*s.* per ton on the business done by the Anglo-Sicilian Company. Three years later, in 1900, when the high record in exports was established at 557,668 tons, the profits of the company were more than doubled. In the fiscal year ended July 31, 1904, the net profits were the largest yet, amounting to 158,430*l.* From profits earned during the eight years from 1897 to 1904 inclusive, the company paid annually a regular dividend of 6 per cent. on its 700,000*l.* preferred stock, and sometimes made an extra distribution; and in 1903 and 1904 declared a total of 100 per cent. on the 35,000*l.* common stock. At the same time there was accumulated 397,680*l.* in reserve funds, of which 144,900*l.* is held against any depreciation of stocks of sulphur, an amount equivalent to 9*s.* 10*d.* per ton on the 293,188 tons at the seaports in Sicily on July 31, 1904.

In the eight years under review the exports from Sicily to the United States aggregated 1,122,241 tons, which constituted about one third of the total exported to all countries. These imports, duty free, supplied about 36 per cent. of the consumption in America in the form of brimstone or sulphur recovered from pyrites.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

Stone Industry of the United States.

Bd. of Trade J., Nov. 24, 1904.

The figures collected by the Geological Survey put the value of the stone quarried in the United States in 1903 at 73,384,200 dols., an increase of 3,553,649 dols. over 1903, in spite of troubles in the building trades. The values of the output of the different kinds of stone are as follows:—

—	1902.	1903.
	Dollars.	Dollars.
Granite	16,076,787	15,703,793
Trap rock	2,181,157	2,732,294
Sandstone	9,437,646	9,482,802
Blue stone	1,163,525	1,779,457
Marble	5,041,182	5,362,686
Limestone for building	24,959,751	26,642,551
„ flux	5,271,252	5,123,732
Slate	5,696,051	6,256,885

Pennsylvania surpassed all other States in the product of its quarries during 1903. The value of its stone amounted to 13,913,220 dols. Second on the list is Vermont, with a value of 6,605,060 dols. New York is third, with a stone product valued at 5,742,833 dols., and Ohio is fourth, with a product worth 5,114,051 dols. The production of every other State was considerably less.

X.—METALLURGY.

Egypt; Revised Tariff Valuation for Metals and Metal Manufactures.

Bd. of Trade J., Nov. 24, 1904.

According to the *Journal Officiel* of Nov. 2, the valuation tariff for metals and manufactures of metal has been revised. Copper, in all forms except wire, is rated at an increase of 2 milliềmes* per kilo.; tin and zinc are also increased, the former 5 mill., the latter ½ mill. per kilo. Manufactures of iron and steel are valued at slightly reduced rates in some cases, others remaining stationary. Other metals and manufactures are unaffected by this revision. The rate of duty remains at 8 per cent. *ad val.*

Pig-Iron Production of Russia. First Half of 1903.

Bd. of Trade J., Nov. 24, 1904.

The following statistics of the production of pig-iron in Russia during the first six months of 1904 are taken from the *Messenger of Finance* (St. Petersburg) of the 24th October/6th November:—South Russia, 54,229,726 pouds; Ural, 21,344,248; Moscow District, 3,193,799; North Russia, 416,408; Poland, 10,943,493; Total, 90,157,674 pouds.

Comparative figures for the first six months of 1903 are not available, but the following statistics of the production of pig-iron during the past four years are published by the *Messenger*:—1900, 177,518,615 pouds; 1901, 172,778,274; 1902, 156,496,981; 1903, 149,154,927 pouds. The production for 1904 is estimated at 180,000,000 pouds. (Poud = 36 lb.)

Platinum; Reduction in the Price of ——.

Bd. of Trade J., Nov. 24, 1904.

The *Journal de St. Pétersbourg* states that, although the price of platinum is quoted at 14,500 roubles per poud, the actual price obtained for this metal by the mine owners in the Ural District is considerably less. One large proprietor sells platinum at 11,351 roubles per poud, while another has recently entered into a contract with an American firm for the sale of the whole output of the Taghilsk mines for the next ten years at rate of 10,000 roubles per poud, or about 29*l.* per lb.

XII.—FATS, FATTY OILS, Etc.

Insect White Wax; Production of —— in Szuch'uan, China.

Bd. of Trade J., Nov. 17, 1904.

The annual production of insect white wax in Szuch'uan varies with the climatic conditions. Wind and rain are destructive to the insects. During the present year the rains have been exceptionally continuous and heavy; the estimated output of the Chia-ting Prefecture is 58,125 piculs. The price of each picul is T.45, so that the total value of the Chia-ting production is T.2,250,000. Ch'êngtu is credited with an annual consumption of 1000 piculs. Other parts of Szuch'uan yield small quantities of white wax, but they are too insignificant to be of any commercial importance. The wax is mainly used in candle making and paper-glazing.

XIII. B.—RESINS, VARNISHES, Etc.

Turpentine in India.

Chem. and Druggist, Nov. 19, 1904.

The turpentine industry in India is confined to the pine forests of the Himalayas in the United Provinces (formerly called the North-West Provinces) and the Punjab. In the United Provinces the first distillery was erected in the Imperial Forest School, Dehra Dun, in 1881. The crude turpentine is collected from the Chir pine (*Pinus longifolia*) in Jaunsar and the leased forests of the Tehri-Garhwal, chiefly at Daragadh, Ninur, Obra, Sangared, and the Mantar and Sunar working circles. The trees are tapped soon after the rains are over in October, and cuts or "blazes" are made in the stem, at the base of which pots are placed to catch the exuding resin. In the lower forests of Kumaon the oleoresin begins to flow in March, and as the warm weather advances the flow increases, the greatest amount being obtained in June. One disadvantage of the factory at Dehra Dun is that it is situated more than 100 miles away from the forests, and the oleoresin has to be be brought partly by pack animals and partly by country carts. The cost of the crude resin is R. 1·1 to R. 1·11 per maund of 82·6 lb. The distillation is carried on during the greater part of the year, and five large copper stills are capable of treating 10 maunds per day. In 1900–01, 1701 maunds were distilled, in 1901–2 1628 maunds, and in 1902–3, 1602 maunds. The crude oleoresin yields from 72 to 77 per cent. of resin or colophony and from 14 to 18 per

---

* 1000 milliềmes = £E 1 = £1 0*s.* 6*d.*

cent. of turpentine oil. Until three years ago the works at Dehra Dun were running at a profit, but recently there has been a loss on account of the prices of colophony falling from Rs. 5·2 to Rs. 2·7 per maund, and the larger quantities placed on the local markets by the Forest Department in other districts. The Conservator in his report for 1902–3 reviews the financial results of the whole undertaking from the year 1888–9, when the work was started. The total receipts were Rs. 79,417; capital and working expenses, Rs. 81,033; value of buildings, apparatus, and stock in hand, Rs. 15,252, leaving a surplus of Rs. 13,636. In 1895 arrangements were made for the introduction of the turpentine industry in Naini Tal, where the proximity to the railway and the shorter distance the material would have to traverse were important considerations. In the report for 1900–1 the manufacture of turpentine and colophony was pronounced a success, the prices realised were equal to those obtained for the imported article, and no difficulty was experienced in disposing of the outturn. During the year 22,267 trees were tapped, yielding 1154 maunds of oleoresin, which is equal to about 5 lb. per tree. The output of the factory was 1625 galls. of turpentine and 817 maunds of colophony, and the profit of the year's working was Rs. 5765. The next year the manufacture was prosecuted with greater success. Improvements were made in the factory; 38,632 trees were tapped, affording 2711 maunds of oleoresin. The output was 2204 gals. of turpentine and 1084 maunds of colophony, and a substantial profit remained at the close of the year. During 1902–3, on account of the additional still and the larger demand for the products, the manufacture was more than doubled, 42,979 trees being tapped, yielding 2989 maunds of oleoresin. The profit at the end of the year was Rs. 4467. The results were considered most satisfactory, allowing, as they did, for the low market value of the colophony, which fell from Rs. 5 to Rs. 2·12. The third factory was established in 1899 in Nurpur, in the Kangra Division, Punjab. It is estimated that the possible yield of the resin in the Kangra forests within reach of the distillery is 10,000 maunds, which should produce 15,000 gals. of turpentine and 7500 maunds of colophony. Reductions on the freight for the oil and resin have been obtained, and it is hoped these concessions will enable the product to compete with the imported article as far as the seaports. The resin tapping and distillery operations have continued to be a success from the commencement, and economies have been practised in the extraction of the resin from the forests and the working of the distillery at Nurpur. The whole of the turpentine is readily disposed of, and over 3000 maunds of colophony are sold regularly to local merchants. Last year it was reported that a purchaser had been found for all the colophony made. The price obtained was considered low (Rs. 3·10 in Calcutta).

XVI.—SUGAR, STARCH, Etc.

Sugar Industry of Greece.

Foreign Office Annual Series, No. 3302.

The cultivation of the sugar beet was started in Thessaly some 12 years ago, and is making headway against the difficulties which attend the introduction of a new and difficult industry.

On a property favourably situated as regards water supply on the edge of the Thessalian plain and under the Pindus mountain range, M. Zographos sows yearly 1,500 acres of beet. The land has been gradually brought into a constantly improving state of fertility, yielding at present 8,000 kilos. per acre. To convert the beets into sugar a large factory has been established, which produces sugar of a satisfactory quality, though not quite as white as that imported from abroad. This defect, however, it is hoped to remedy by improved machinery. The sugar finds a ready sale in the country at a price slightly below that of the imported article.

The amount produced last year was about 1,250,000 kilos. (about 2,750,000 lb.), and the enterprise paid its expenses for the first time. With the constantly increasing yield of beets per acre, as the fertility of the land increases, it is hoped to realise substantial profits.

With a perhaps erroneous idea of the profits realised from the undertaking, the Government proposed at the beginning of the year 1904 to impose an excise duty of 50 lepta per oke on home-produced sugar. In deference to well-founded representations the idea appears to have been dropped, at any rate for the present.

M. Zographos sometimes employs as many as 1,500 hands. The chief difficulties to be contended with consist in the frequently-prevailing drought, an evil which extensive irrigation does not altogether remedy, and in the difficulty of disposing to advantage of the by-products, since their conversion into alcohol is prohibited in the interests of the currant and grape producers, and there is little scope for their use as food for cattle, there being few cattle to feed or fatten.

Gum Arabic from the Sudan, Egypt.

U.S. Cons. Reps., Nos. 2102, *Nov.* 8, 1904.

The gum arabic trade of the Sudan shows an enormous increase during the last few months. In July, 1904, the exports were 2,318,778 pounds, valued at 23,396*l.* Of this amount, the United States took 3,531*l.* worth. The price of gum is very low, but is now advancing, having risen to 31 cents a pound.

There were exported from Egypt 4,160,100 pounds in 1899, 6,042,050 pounds in 1900, 16,937,550 pounds in 1901, 21,791,000 pounds in 1902, and 18,939,747 pounds in 1903.

All Sudanese products are under a great disadvantage from the present high freight charges in the Nile Valley. It is believed that the new railway from Berber to the Red Sea will materially reduce this expense. The gum from Senegal is admitted duty-free into France, since Senegal is a French colony.

Gum is gathered in the forests of the Sudan and is brought to Omdurman, opposite Khartoum, and is there packed, weighed, and forwarded to Cairo, or to one of the seaports. There are at present three grades of gum recognised by the Sudan government. The first is the "kashab genuine gedaref." This pays to the government a royalty of 13*s.* 2*d.* per 99·05 pounds. The second grade, the "gezira," pays 9*s.* 3*d.*, and the third, the "talh," pays 5*s.* 2*d.* per 99·05 pounds. The first quality is soft and white in colour, and is valued in Europe at 10 to 12 per cent. more than the second grade, which is hard and reddish in colour. The gum of this second quality is packed in parcels of from 370 to 385 pounds, and is shipped in double sacks. The first grade, which is bought chiefly by chemists and druggists, is packed in wooden cases of 100 pounds each.

A very recent decree of the Sudanese government has fixed the highest duty which can be levied on gum at 20 per cent. *ad valorem*, but it has not yet arranged the sliding scale on the inferior qualities.

The trade in Egypt is chiefly in the hands of a few merchants of Cairo and Alexandria, who forward the gum to their agents in large consignments. These agents, as they sell the gum, forward the proceeds to their principals and retain a small commission of from 2 to 2½ per cent.

Beet Crop and Estimated Sugar Production of Russia.

Bd. of Trade J., Nov. 17, 1904.

According to the latest reports, the beet crop of Russia up to the 16th October amounted to 4·8 million tons, which should produce 625,000 tons of sugar. As 76 sugar refineries have not sent in their reports, and according to the yield of the beet fields per acre a further crop of 1·5 million tons is counted on, the total production of sugar in Russia for next season is estimated at about 820,000 tons.

XVII.—BREWING, WINES, SPIRITS, Etc.

Tartaric Materials: Exports of —— from Italy.

Bd. of Trade J., Nov. 24, 1904.

The following statement shows the export of tartar materials from the Italian continent during the period 1st October 1903 to 30th September 1904.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 24,641. White, Cobbold, and McNeal. Slime and sediment extractors.* Nov. 14.

„ 24,670. Imray (Meister, Lucius und Brüning). Extraction of water or other liquid from mineral, vegetable, and animal substances. Nov. 14.

„ 24,686. Lillie. Evaporating apparatus.* Nov. 14.

„ 24,785. Wilton and Wilton. Furnaces. Nov. 15.

„ 24,826. Mavor. Means for heating chambers used in the process of manufacturing linoleum, coated fabrics, and the like, and in the construction of gas furnaces. Nov. 16.

„ 24,870. Southworth. Apparatus for condensing liquids especially adapted for removing the albuminous matter from serum, &c.* Nov. 16.

„ 24,903. Capell. Washing gases and apparatus therefor. Nov. 16.

„ 24,986. Sugg. Apparatus for pressing gas. Nov. 17.

„ 25,079. Kunick. *See under* XVIII. A.

„ 25,204. Macquisten. Method of separating solid particles from each other, and apparatus therefor. Nov. 19.

„ 25,213. Mathys (Gayley). Method of treating gases. Nov. 19.

„ 25,216. Mackenzie (Lloyd). Apparatus for making solutions.* Nov. 19.

„ 25,272. Dunton. Apparatus for circulating liquids in tanks. [U.S. Appl., Nov. 25. 1903.]* Nov. 21.

„ 25,310. Rappel. Protected earthenware cocks for use with acids, lyes, and the like.* Nov. 21.

„ 25,414. Lang. *See under* VIII.

„ 25,507. Blundell. Furnaces. Nov. 23.

„ 25,601. Stavenhagen and Geiler. Process of and apparatus for manufacturing filter bodies. Nov. 24.

[C.S.] 25,589 (1903). Sewell. Evaporating apparatus. Nov. 30.

„ 967 (1904). Murphy. Apparatus for indicating the temperature of kilns or other hot-air chambers used in drying hair and like material. Nov. 23.

„ 1144 (1904). Parkes. Process and apparatus for evaporating gelatinous and the like solutions. Nov. 30.

[C.S.] 1694 (1904). Morgan Crucible Co., Ltd., and Fox. Muffles. Nov. 30.

„ 3490 (1904). Branson. Apparatus for measuring quantities of highly volatile liquids. Nov. 23.

„ 16,316 (1904). Hantke. Process and appliance for raising liquids by means of compressed air. Nov. 23.

„ 21,776 (1904). Dodge. Gas and air mixing apparatus. Nov. 23.

„ 22,469 (1904). Howl, Wood, and Wright. Forced draught furnaces and the like. Nov. 30.

II.—FUEL, GAS, AND LIGHT.

[A.] 24,694. Nusch (Mortimer-Sterling). Incandescent light mantles.* Nov. 14.

„ 24,787. Spencer. Regenerative furnaces for gas retorts, &c. Nov. 15.

„ 24,826. Mavor. *See under* I.

„ 24,975. Bennet. *See under* XXIII.

„ 24,987. Newton (Bayer and Co.). Flash light. Nov. 17.

„ 25,404. Marconnet. Process of and apparatus for producing gas from pulverisable fuel. [Fr. Appl., Dec. 8, 1903.]* Nov. 22.

„ 25,527. Koppers. Coke furnaces.* Nov. 23.

[C.S.] 25,698 (1903). Ladd. Bodies adapted for lighting purposes and rendered incandescent by heat or electricity. Nov. 23.

„ 27,496 (1903). Mond. Gas producers. Nov. 23.

„ 753 (1904). Johnson and McKean. Mantles of incandescent gas burners. Nov. 23.

„ 966 (1904). Feld. Treatment of coal gas and other gases containing ammonia and cyanogen for the extraction of ammonia and cyanogen therefrom, and the partial regeneration of the agents employed in the extraction. Nov. 30.

„ 3136 (1904). Conti and Levy. Manufacture of fuel briquettes. Nov. 30.

„ 6972 (1904). Gerard and Fiedler. Electrodes for arc lights. Nov. 23.

„ 22,092 (1904). Robson. Gas producers. Nov. 23.

„ 22,815 (1904). Boult (Cie. pour la Fabrication des Compteurs et Matérial d'Usines à Gaz). Gas purifiers. Nov. 30.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 24,840. Macknight. *See under* VII.

[C.S.] 1881 (1904). Schulze and Chem. Fabr. Ladenburg. Manufacture of *m*-cresol from crude cresol. Nov. 30.

„ 22,238 (1904). Koellner. *See under* XII.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 24,669. Abel (Act.-Ges. f. Anilinfabr.). Manufacture of 1.6- or 1.7-arylnaphthylaminesulphonic acid. Nov. 14.

„ 24,840. Macknight. *See under* VII.

„ 24,869. Newton (Bayer and Co.). Manufacture of anthraquinone derivatives. Nov. 16.

„ 25,505. Lake (Oehler). Manufacture of chloronitranisol.* Nov. 23.

„ 25,506. Lake (Oehler). Manufacture of sulphur dyes. Nov. 23.

[C.S.] 1581 (1904). Lake (Oehler). Manufacture of colouring matters. Nov. 23.

„ 3108 (1904). Johnson (Badische Anilin und Soda Fabrik). Preparation of indigo paste for direct use in the fermentation vat. Nov. 30.

„ 4998 (1904). Johnson (Badische Anilin und Soda Fabrik). Manufacture of colouring matters of the anthracene series. Nov. 30.

[C.S.] 13,941 (1904). Lake (Oehler). Manufacture of mordant dyes. Nov. 30.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 24,630. Tomlinson (Haas). Apparatus for treating materials with air or other gases for drying, bleaching, conditioning, or other purposes. Nov. 14.

„ 24,826. Mavor. *See under* I.

„ 24,995. Thomson, Shearer, and O'Brien. Process for retting flax. Nov. 17.

„ 25,165. Calico Printers' Association, Ltd., and Warr. Mordanting vegetable fibres for dyeing and printing. Nov. 19.

„ 25,166. Calico Printers' Association, Ltd., and Warr. Treating vegetable fibres to render them less inflammable. Nov. 19.

„ 25,167. Calico Printers' Association, Ltd., and Warr. Treating vegetable fibres to render them less inflammable. Nov. 19.

„ 25,208. Détré. Apparatus for subjecting textile or other materials or substances to the action of liquids under pressure for dyeing, mordanting, bleaching, washing, exhausting, extracting, or performing other operations thereon.* Nov. 19.

„ 25,252. Spears. Method of printing textile fabrics, paper, and other materials. Nov. 21.

„ 25,284. Johnson (Badische Anilin und Soda Fabrik). The discharge of dyed textile fabrics. Nov. 21.

„ 25,296. Todtenhaupt. Process for the preparation of artificial silk or hair. Nov. 21.

„ 25,702. Watson. Means for the manufacture of fibrous fireproof sheet.* Nov. 25.

„ 25,703. Scharmann. Apparatus for treating textile fabrics and other goods with liquids. [Fr. Appl., Feb. 26, 1904.]* Nov. 25.

„ 25,704. Scharmann. Apparatus for treating textile fabrics and other goods with liquids. [Fr. Appl., Feb. 26, 1904.]* Nov. 25.

„ 25,728. Howorth (Soc. Anon. Cooperativa Per La Stagionatura E. L'Assaggio Delle Sete ed Affini). Processes for dyeing or charging silks with tin compounds.* Nov. 25.

[C.S.] 25,000 (1903). Wright, Poulson, and Mackintosh. Manufacture of compounds for waterproofing textile and other fabrics, string, ropes, and the like, and apparatus therefor. Nov. 23.

„ 1466 (1904). Smith and Schute. Cylinders used in treating or cleansing wool, hair, and other fibres. Nov. 30.

„ 4626 (1904). Norton and Hellewell. Means for and method of treating or finishing pile fabrics. Nov. 30.

„ 19,007 (1904). Barbour and Montgomery. Preparing machinery for flax, hemp, and similar fibres. Nov. 30.

„ 21,397 (1904) Cadgène. Machinery used in dyeing, bleaching, or washing fabrics in the piece. Nov. 30.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

[A.] 25,252. Spears. *See under* V.

„ 25,594. Becher. Colouring, darkening, or staining wood, and means employed therein. Nov. 24.

[C.S.] 22,547 (1904). Lake (Chem. Techn. Fabrik Dr. A. R. W. Brand und Co.). *See under* IX.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 24,731. Plummer. Process to obtain magnesium oxide and hydrochloric acid. Nov. 15.

„ 24,798. Lamprey. Apparatus for the production of ozone. Nov. 15.

[A.] 24,840. Macknight. Process of treating soot to recover ammonia, pyridine, and aniline dye therefrom, and the production of a black pigment. Nov. 16.

„ 24,885. Simons. Apparatus for treating pyrites for the recovery of sulphur fumes.* Nov. 16.

„ 24,978. Wultze, and Gebr. Heyl G. m. b. H. Process for magazining and transporting carbonic acid in solid form. Nov. 17.

„ 25,010. Westdeutsche Thomasphosphatwerke Ges. m. b. H. *See under* XI.

„ 25,107. Tcherniac. Manufacture of sulphocyanide. Nov. 18.

„ 25,354. Garroway. Manufacture of sulphate of iron from waste iron and tin scrap iron. Nov. 22.

„ 25,394. Watson. Means for obtaining a dissolution of sodium silicate.* Nov. 22.

[C.S.] 27,888 (1903). Gutensohn. Compound for treating sea water to prevent incrustation and corrosion in vessels in which it is evaporated. Nov. 30.

„ 295 (1904). Blackmarr and Wilford. Method of and apparatus for converting oxygen into ozone. Nov. 30.

„ 966 (1904). Feld. *See under* II.

„ 1452 (1904). Grossmann. Manufacture of alkali nitrites. Nov. 30.

„ 3349 (1904). Bloxam (Administration der Minen von Buchsweiler). Manufacture of sodium ferrocyanide. Nov. 30.

„ 14,431 (1904). Pictet. Apparatus for the separation of nitrogen and oxygen from atmospheric air. Nov. 23.

„ 22,940 (1904). Reaney. Manufacture of hydrated lime from quicklime. Nov. 30.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 24,626. Sankey. Enamelling metallic surfaces. Nov. 14.

„ 25,414. Lang. Crucibles suitable for the manufacture of glass. [Fr. Appl., May 19, 1904.]* Nov. 22.

[C.S.] 26,363 (1903). Cunynghame. *See under* X.

„ 1933 (1904). Marzin. Ceramic printing and the like. Nov. 30.

„ 15,866 (1904). Arbogast. Method of manufacturing glassware. Nov. 30.

„ 19,067 (1904). Baudoux Glass-melting furnaces. Nov. 30.

„ 20,444 (1904). Forster. Manufacture of glass, and apparatus therefor. Nov. 23.

„ 22,065 (1904). Imray (Window Glass Machine Co.). Manufacture of sheet glass, and apparatus therefor. Nov. 23.

„ 22,655 (1904). Imray (Pressed Prism Plate Glass Co.). Manufacture of glass sheets or slabs. Nov. 23.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 24,712. Kwiatkowski. Process of making bricks, artificial stone, and similar products.* Nov. 15.

„ 24,892. Ford. Manufacture of artificial stone or sand-lime bricks. Nov. 16.

„ 24,916. Latham. Utilisation of old plaster casts and other hydrated sulphate of lime, and apparatus therefor. Nov. 16.

„ 25,128. Marga. Fireproof, acid-proof, and electrically insulating material.* Nov. 15.

„ 25,187. Von Prunk'l. Process for producing durable street pavements and railway sub-structures.* Nov. 19.

„ 25,189. Starke. *See under* XI.

„ 25,227. Hamblet. Brick kilns and the like. Nov. 21.

[A.] 25,424. Ebers. Process for manufacturing cements from hot fluid slag by the addition of lime or calcareous substances. Nov. 22.

[C.S.] 199 (1904). Mathesius. Process for manufacturing slag powder. Nov. 30.

„ 22,423 (1904). Fairweather (Nettleton). *See under* XIII.A.

„ 22,547 (1904). Lake (Chem. Techn. Fabr. Dr. A. R. W. Brand und Co.). Process for colouring natural stone. Nov. 30.

„ 22,730 (1904). Shoppee. Facing bricks. Nov. 30.

X.—METALLURGY.

[A.] 24,622. MacArthur. Removal of antimony from alloys of gold and other metals containing it. Nov. 14.

„ 24,626. Sankey. *See under* VIII.

„ 24,645. Duncan. Production of iron and steel. Nov. 14.

„ 24,781. Blackmore. Process of reducing aluminium and other metals, and making alloys thereof.* Nov. 15.

„ 24,820. Craig. Metal-melting furnaces. Nov. 16.

„ 24,823. Webb, Brettell, and Adamson. Smelting of and operating by air upon iron and other metals. Nov. 16.

„ 25,116. Moore. Apparatus for separating particles of gold, &c., from the gaugue or material with which it is associated. Nov. 18.

„ 25,270. Jackson. Solder for aluminium and other metals. Nov. 21.

„ 25,796. Drojecki. Reverberatory furnaces.* Nov. 26.

„ 25,799. Wynne. Apparatus for atomising molten blast furnace slag. Nov. 26.

[C.S.] 24,924 (1903). Neo-Métallurgie. Metallic alloy or compound. Nov. 23.

„ 25,550 (1903). Clotten. *See under* XI.

„ 26,363 (1903). Cunynghame. Furnaces or kilns for enamelling, melting, or baking metals, glass, porcelain, pottery, and the like. Nov. 30.

„ 755 (1904). Foster. Manufacture of iron in blast furnaces. Nov. 23.

„ 1323 (1904). Sharpe and Raine. Utilisation of scrap iron and steel. Nov. 30.

„ 1365 (1904). Talbot. Regenerative furnaces. Nov. 23.

„ 6945 (1904). Jacobsen. Manufacture of alloys. Nov. 23.

„ 20,242 (1904). Canivé. Welding and annealing furnace. Nov. 23.

„ 21,766 (1904). Siemens und Halske A.-G. Purification of tantalum metal. Nov. 23.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 24,689. Roselle. Electric storage batteries. [Fr. Appl., Nov. 16, 1903.]* Nov. 14.

„ 25,010. Westdeutsche Thomasphosphatwerke Ges. m. b. H. Process for producing nitric acid by aid of electricity. [Ger. Appl., Oct. 19, 1904.]* Nov. 17.

„ 25,095. Jungner. Electric accumulators.* Nov. 18.

„ 25,114. De la Croix and Joel. Electric accumulators.* Nov. 18.

„ 25,189. Starke. Composition for electrical conduits. Nov. 19.

„ 25,265. Boult (Accumulatoren und Electricitätswerke Act.-Ges., vorm. W. A. Boese and Co.). Manufacture of storage battery or accumulator electrodes. Nov. 21.

„ 25,282. Siemens und Halske Act.-Ges. Electrode for apparatus producing radiant electric energy. [German Appl., Nov. 24, 1903.]* Nov. 21.

[A.] 25,331. Hargreaves. Treating the contents of electrolytic cells. Nov. 22.

„ 25,376. Csanyi, Klupathy, and von Bárczay. Electric batteries. Nov. 22.

[C.S.] 25,550 (1903). Clotten. Process and apparatus for the electrolytic recovery of tin from materials, and for the simultaneous recovery of other metals. Nov. 30.

„ 214 (1904). Kamperdyk. Electric batteries. Nov. 23.

„ 1036 (1904). Pescatore. Accumulators. Nov. 23.

„ 20,003 (1904). Birkeland and Eyde. Process and furnace for subjecting solid materials to the action of the electric arc. Nov. 30.

„ 20,896 (1904). Bosquet. Manufacture of water jackets, casings, &c., by electrolytic means. Nov. 23.

„ 21,403 (1904). Jungner. Method for increasing the activity in electrode masses of badly conductive metallic oxides or hydrates in accumulators with invariable electrolyte. Nov. 23.

„ 21,913 (1904). Ziegenberg. Manufacture of galvanic cells. Nov. 23.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 24,713. Lewkowitsch. *See under* XVIII. A.

„ 24,913. Lucas. Detergents. Nov. 16.

„ 25,683. Harrison, Wild, and Robb. Means and process for extracting oil from cod livers and the like.' Nov. 25.

[C.S.] 18,152 (1904). Nusch (Chem. Werke, vorm. Dr. C. Zerbe). *See under* XVIII. C.

„ 22,238 (1904). Koellner. Apparatus for purifying oil and the like. Nov. 23.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, ETC.

(*A.*)—PIGMENTS, PAINTS.

[A.] 24,733. Bennett and Mastin. Manufacture of pigments. Nov. 15.

„ 24,840. Macknight. *See under* VII.

„ 24,989. Schobert. Antifouling and preservative paint.* Nov. 17.

„ 25,092. Flack (Williams). Writing ink. Nov. 18.

[C.S.] 22,423 (1904). Fairweather (Nettleton). Composition of matter for fireproof paint or coating. Nov. 30.

(*B.*)—RESINS, VARNISHES.

[A.] 24,826. Mavor. *See under* I.

(*C.*)—INDIA-RUBBER.

[A.] 24,691. Kite. Rubber vulcanising apparatus. Nov. 14.

„ 24,966. Jacobs, Jacobs, and Brockwell. India-rubber substitute. Nov. 17.

„ 24,548. Gittings. Manufacture of india-rubber substitute. Nov. 26.

[C.S.] 4200 (1904). Frost. Vulcanising apparatus. Nov. 23.

XIV.—TANNING; LEATHER, GLUE, SIZE, ETC.

[A.] 18,514A. Amend. The de-acidifying and oxidising of hides and skins. [U.S. Appl., Nov. 6, 1903.]* Nov. 26.

[C.S.] 1144 (1904). Parkes. *See under* I.

„ 22,395 (1904). De Marneffe. Process of and apparatus for tanning leather. Nov. 23.

„ 22,774 (1904). Smith. Method of preparing leather in the manufacture of the soles of boots and shoes. Nov. 30.

XV.—MANURES, ETC.

[C.S.] 25 (1904). Tivey and Andrews (Wardle). Manufacture of artificial manure from sewage and other like matter. Nov. 30.

XVI.—SUGAR, STARCH, GUM, Etc.

[C.S.] 4792 (1904). Reynaud. Manufacture of achroodextrin. Nov. 23.

„ 22,863 (1904). Moullin and Doubtfire. Brilliant glaze for use with starch. Nov. 30.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 24,944. De Kerchove and Lebbe. Fermentation and clarification of alcoholic liquids.* Nov. 17.

„ 25,744. Gates. Brewing. Nov. 26.

[C.S.] 28,184 (1903). Claussen. Manufacture of English beers or malt liquors, and the production of pure yeast cultures for use therein. Nov. 23.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 24,713. Lewkowitsch. Refining oils and fats for edible purposes. Nov. 15.

„ 25,076. Hatmaker. Dry compound of coffee and milk and process of making same. Nov. 18.

„ 25,077. Hatmaker. Drying blood and fluid extracts and preparations of animal tissue with or without the addition of other substances. Nov. 18.

„ 25,514. Breckwoldt. Process for the preservation of food or other perishable substances.* Nov. 23.

„ 25,546. Robinson and Backhouse. Apparatus for treating flour, &c., for bleaching or improving the quality thereof. Nov 24.

„ 25,624. Székely and Kovác. Process for making an easily digestible milk preparation free from germs. Nov. 24.

„ 25,660. Crocker. Food preparation. Nov. 25.

„ 25,767. Hatmaker. Dry compounds of cacao or other nuts and milk in flaky form, and process for making same. Nov. 26.

[C.S.] 20,273 (1904). Bromhead (Chem. Fabrik Helfenberg, Ltd.). *See under* XX.

Official Notices.

THE NOBEL PRIZE AND THE LAVOISIER MEDAL.

The Nobel Prize for Chemistry for the current year, vhich amounts to nearly 8000*l*., has been awarded to Sir Vm. Ramsay for his researches on the atmosphere.

The Lavoisier Gold Medal has been awarded by the French Academy of Sciences to Sir James Dewar for his esearches on the liquefaction of gases.

THE JOURNAL.

From the beginning of next year the Society's Journal vill be printed and published by Messrs. Vacher and Sons, reat Smith Street, Westminster, S.W., to whom all comunications regarding subscribers' copies and advertisements hould be sent.

SUBSCRIPTIONS FOR 1905.

Members are reminded that the subscription of 25*s*. for 905, payable on January 1st next, should be sent in good ime to the Hon. Treasurer (Mr. Samuel Hall), in order to nsure continuity in the receipt of the Society's Journal. ny changes of address to appear in the new List of lembers now in course of preparation should reach the eneral Secretary not later than January 15th, 1905.

COMMUNICATIONS.

Authors of communications read before the Society, or ny of its Local Sections, are requested to take notice that nder Rule 43 of the Bye-laws the Society has the right of riority of publication for three months of all such papers. nfringement of this Bye-law renders papers liable to be ejected by the Publication Committee, or ordered to be bstracted for the Journal, in which case no reprints can furnished to the author.

List of Members Elected

22nd DECEMBER 1904.

artsch, Chas. A., 6803, Woodland Avenue, Philadelphia, Pa., U.S.A., Chemist.

arr, Francis H., Kelvin, Church Avenue, Sidcup, Kent, Manufacturing Chemist.

lark, Arthur W., c/o J. Ellwood Lee Co., Conshohocken, Pa., U.S.A., Chemist and Bacteriologist.

lark, Dr. Friend E., Pennsylvania State College, State College, Pa., U.S.A., Chemist.

uncan, R. A., P.O. Box 509, Honolulu, Hawaii, Chemist.

vans, James Rittenhouse, 87, Fourth Street, Troy, N.Y., U.S.A., Assistant in Chemistry.

azdar, J. J., 5, Wroxham Mansions, 38, Canfield Gardens, South Hampstead, N.W., Barrister-at-Law.

ooding, E. Claude, Willow House, Washford, Taunton, Somerset, Chemical Student.

arvey, John G., Todmorden, Ont., Canada, Manufacturing Chemist.

uckley, J. F., c/o Jones Bros., Pearl and Water Streets, Brooklyn, N.Y., U.S.A., Chemical Engineer.

ckson, Ernest W., 11, Queen's Terrace, Middlesbro', Analytical Chemist.

nes, J. Shirley, c/o Giant Powder Co., Giant, Contra Costa Co., Cal., U.S.A., Chemist.

wett, Dr. H. A. D., Wansfell, Church Avenue, Sidcup, Kent, Research Chemist.

nnedy, Fred. J., 493, Lexington Avenue, New York City, U.S.A., Chemist.

Chatelier, Prof. H., 75, Rue Notre Dame des Champs, Paris, France, Professor, l'Ecole des Mines.

Lloyd, Leonard B., Broadford Tannery, Broadford, Victoria, Australia, Tanner.

Mason, Glen F., c/o H. J. Heinz Co., Pittsburg, Pa., U.S.A., Chemist.

Masson, Victor E., Pleasant Valley Wine Co., Rheims, Steuben Co., N.Y., U.S.A., Chemist and Superintendent.

Meyenberg, Dr. Alex., 9, Nelson Street, Plymouth Grove, Manchester, Works Manager.

Meyer, Prof. Dr. Richard, Technische Hochschule, Braunschweig, Germany, Professor of Chemistry.

Miller, Chas. E., 58, Chardon Street, Boston, Mass., U.S.A., Manufacturing Chemist.

Millroy, Alfred T., 53, Guilford Street, London, W.C., Laboratory Furnisher.

Mills, Dr. J. E., University of North Carolina, Chapel Hill, N.C., U.S.A., Assoc. Professor of Chemistry.

Minor, John C., jun., Saratoga Springs, N.Y., U.S.A., Manufacturer.

Napper, Sidney S., Otto-Hilgenstock Coke-Oven Co., Ltd., Tingley, near Leeds, Chemist.

Parrett, Ben. C., Washington C. H., Ohio, U.S.A., Analyst.

Pease, Fred. N., P.O. Box 437, Altoona, Pa., U.S.A., Chemist.

Phillips, Edw. W., c/o Fairmont Coal Co., Fairmont, W. Va., U.S.A., Chemist.

Scoville, Wilbur L., 50, Washington Street, Boston, Mass., U.S.A., Analytical Chemist.

Smart, Bertram J., 27, Vambery Road, Plumstead, S.E., Chemist.

Spayd, Chas. Hay, 5143, Arch Street, Philadelphia, Pa., U.S.A., Analytical Chemist.

Stiff, John T., London Portland Cement Works, Northfleet, Kent, Works Chemist.

Van Duzen, Dr. Harlan P., 232, Great Portland Street, London, W., Doctor of Medicine.

Watt, John, 17, Maple Avenue, Toronto, Ont., Canada, Glass Manufacturer.

Wiener, William, 62½, Nelson Place, Newark, N.J., U.S.A., Analytical and Consulting Chemist.

Wolf, August S., Laboratory E.L.A.S., 120, Broadway, New York City, U.S.A., Chemist.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Anderson, Dr. W. Carrick, 7, Scott Street, Garnethill, Glasgow, Consulting Chemist; communications as before.

Bott, Dr. W. Norman, l/o Sleaford; 16, St. Helen's Place, London, E.C.

Briggs, J. F., l/o Maidstone; 2, Frankfort Road, Herne Hill, S.E.

Brown, George E., l/o Arundel Street; c/o The British Journal of Photography, 24, Wellington Street, Strand, W.C.

Bryant, A. P., (communications) c/o Glucose Sugar Refining Co., West Taylor Street and the River, Chicago, and (Journals) 661, Winthrop Avenue, Chicago, Ill., U.S.A.

Chemical Trade Journal; one copy to Blackfriars Bridge, Manchester; and one copy to 265, Strand, London, W.C.

Cocking, A. T., l/o Stanford-le-Hope; Carhampton House, Four Oaks, Sutton Coldfield.

Cripps, R. A., l/o Hayward's Heath; Laboratory, D'Avigdor Road, Hove, Sussex.

Dent, Dr. Frankland, l/o Burgos; 3, Claremont Drive, Headingley, Leeds.

Dole, R. B., l/o Chicago; State Bacteriological Laboratory, Minneapolis, Minn., U.S.A.

Dreaper, W. P., l/o Braintree; 38, Sydney Road, Beckenham, Kent.

Gilchrist, P. C.; Journals to Hôtel de France, Pau, France.

Harris, Norman B.; Journals to Upper Montclair, N.J., U.S.A.

McCulloch, Jas., l/o Rose Street; 13, Clarence Drive, Hyndland Road, Glasgow.

Meade, Richard K., l/o Easton; Nazareth, Pa., U.S.A.

Meldrum, Dr. A. N., l/o Aberdeen; 16, Mooroaks Road, Sheffield.

Möckel, Alf., l/o St. Louis; retain Journals after Dec. 31st issue.

Nation, E. C., l/o Smith Street; 218, Nelson Avenue, Peekskill, N.Y., U.S.A.

Patterson, Chas. A., l/o Chester, Pa.; 59, High Street, Woodbury, N.J., U.S.A.

Pearson, Frank P., l/o North Adams; 178, Pawtucket Street, Lowell, Mass., U.S.A.

Rosenblatt, Alf.; communications to 55, East 92nd Street, New York City, U.S.A.

Rostosky, Dr. L.; all communications to Thiergartenstrasse 28, Dresden, A., Germany.

Spence, D.; Journals to Sendig Hotel, Europaeischer Hof, Dresden, A., Germany.

Tanaka, K., l/o St. Louis; Matsuba Hotel, Kudansaka, Ue, Tokyo, Japan.

Weston, T. W., l/o York; c/o Jos. Watson and Sons, Whitehall Soap Works, Leeds.

White, W. G., l/o Bay Street; Springhill, Port Glasgow.

CHANGE OF ADDRESS REQUIRED.

Riley, Fred., l/o 43, Grampian Way, Savin Hill, Boston, Mass., U.S.A.

Deaths.

Bell, Sir Lowthian, Bart., F.R.S., Rounton Grange, Northallerton. Dec. 20.

Pooley, Thos. A., Beverley, Walton-on-Thames. Dec. 8.

Rademacher, H. A., 5, Craven Street, Methuen, Mass., U.S.A. Nov. 16.

Richmond, W. H., Stalheim, Eccleston Park, Prescot, Lancs. Aug. 11.

London Section.

Meeting held at Burlington House, on Monday, December 5th, 1904.

MR. A. GORDON SALAMON IN THE CHAIR.

RASCHIG'S THEORY OF THE LEAD-CHAMBER PROCESS.

BY E. DIVERS, M.D., D.Sc., F.R.S.

These are probably the closing years of the active life of the most celebrated and important process of chemical manufacture ever invented, namely, that by which sulphur dioxide is made into sulphuric acid by the use of a little nitre. Yet it is only a few months ago that a paper, by a distinguished investigator and successful manufacturer of chemical products—Herr Dr. F. Raschig, of Ludwigshafen am Rhein—appeared in the *Zeitschrift für angewandte Chemie*, re-stating and upholding a remarkable theory of the process, which, though published seventeen years before, may still be styled a new theory, so old is the process to which it refers. This theory is now being actively discussed in the *Zeitschrift* just named, and a good abstract of it has already appeared in our own Journal. The following exposition of its nature may interest many of the members of this Society, for, simple enough in principle, it is based upon facts the knowledge of which is not widely diffused among chemists.

What is wanted, in order to understand the nature of the lead-chamber process, is to know how it happens that the presence of a little reduced nitric acid effects with extraordinary rapidity that atmospheric oxidation of sulphur dioxide, $2SO_2 + O_2 + 2H_2O = 2SO_4H_2$, which otherwise scarcely takes place at all. The pair of equations, $N_2O_4 + 2SO_2 + 2H_2O = 2NO + 2H_2SO_4$ and $2NO + O_2 = N_2O_4$, may express what happens, but tell nothing as to how it happens. From them it appears that nitric oxide and oxygen unite into nitric peroxide, but as it cannot be assumed in reading the first equation that, with equal facility and as a matter of fact, nitric peroxide decomposes into oxygen and nitric oxide, these equations fail to give the required information. Lunge's pair of equations, $2SO_2 + NO + NO_2 + O_2 + H_2O = 2ONO.SO_2.OH$, and $2ONOSO_2OH + H_2O = NO + NO_2 + 2HO.SO_2.OH$, are open to the same criticism. An advance is, indeed, made, by the recognitio of the necessity of there being some combination betwee the sulphur dioxide and one of the oxides of nitrogen. But still, it is not to be seen from Lunge's equation, in wha way the atmospheric oxygen goes to the sulphur dioxide When, in presence of air, sulphur dioxide and nitrous aci or nitric peroxide are brought together in water, they unite without oxidation to form compounds which, thoug unstable, are not oxidisable by the air. So far, therefore, i remains unexplained how the sulphur dioxide gets oxidise into sulphuric acid. According to Raschig's theory, th sulphur dioxide does *not* get oxidised by the air: ther is only a condensation or union of the sulphur dioxid with the nitrous acid. The compound hydrolyses, an thus sulphuric acid comes into existence. Then only doe aerial oxidation intervene, in order to oxidise the reduce nitrous acid.

Raschig's theory of the lead-chamber process runs, i effect, as follows:—Nitrous acid and moist sulphur dioxid combine together to form the substance, nitrososulphoni acid, $ONSO_3H$; this interacts with a second molecule o nitrous acid to form sulphuric acid and nitric oxide; an this nitric oxide, with the aid of air and water, regenerat the nitrous acid set out with. Here are the equations:—

$$(1)\ 2ONOH + 2SO_2 = 2ON.SO_2.OH;$$

$$(2)\ 2ONOH + 2ON.SO_2.OH = 4NO + 2HO.SO_2.OH$$

$$(3)\ 4NO + O_2 + 2H_2O = 4ON.OH.$$

Here, for the first time, is given a theory as to ho sulphur dioxide passes into sulphuric acid in the nitre process of its manufacture. It may be claimed for it that expresses the facts of the process, and is not merely hypothetical view of it.

The lead-chamber process has long held the position, i the exposition of chemistry, of the standard example o catalytic action. Now, a true catalytic action is one in whic there are, between the substances consumed—say, sulphu dioxide, oxygen, and water—and the substances produce from them—in this case, sulphuric acid—two other substances, whose lines of existence cut each other, so to speak at a critical point. At that point the one substance is ther facing the substances to be consumed, and equally there a that point is the other substance of the catalytic pair, facin the substances produced. Where catalytic action is goin on, the existence of both of its acting substances is almo limited to a point in time; when either attains a line o existence, the catalytic action is at an end, and the othe ubstance no longer exists. In the resent case, this state f things may perhaps be symbolised, thus :—

$$\overbrace{\mathrm{HO - NO}}\hspace{-1.3em}\underbrace{\hspace{1.3em}\mathrm{{} - SO_4H}},$$

here the brackets include nitrous acid and nitrososulphonic cid, respectively. During catalytic action, both have an xistence which is intangible, which defies direct observa- on. Only when, by changed conditions, the catalysis is isturbed, can we expect to find the one or the other. In e lead chamber itself, we find the nitrous acid (or the roducts of its break-up), when the catalysis is over, under e conditions which prevail. In his beaker glass, under ther conditions, Raschig gets evidence of the existence of itrososulphonic acid. But in the lead-chamber itself, in the egion of full activity, there should be no detectable pre- ence of this body or of nitrous acid. Admitting, with unge, that nitrososulphuric acid is one of a catalytic pair of bstances in the lead-chamber process, the same argument olds good concerning the form of existence of that sub- ance also. He may be right in believing that it is present vast quantities in the lead-chambers—return to this point ill be made later on,—but, even so, its existence may be kened to that of a twinkling star—there and not there at ery alternate moment, without any tangible presence, ntil the catalytic action proper to normal working is sturbed. It, therefore, does not really affect Raschig's eory, to deny that nitrososulphonic acid, with which may associated nitrous acid and nitric oxide, is to be found in e normally working parts of the chamber. But, before llowing up these considerations with some others of portance, the subject of the existence and nature of trososulphonic acid requires to be discussed.

Nitrososulphonic acid has not been isolated and probably ever will be. Almost as much may be said of nitrous acid. ut there is abundant evidence of the existence of the latter dilute solution, whilst its salts are common substances. he evidence of the existence of nitrososulphonic acid, and e relations of this body to certain salts, will now be briefly one into.

The earlier evidence brought forward, first by Claus and en by Raschig, of the existence of salts of nitrososulphonic id, or of its hydrate, dihydroxylaminesulphonic acid, as et indistinguishable from it, has been proved to be wrong by aga and the author. When an alkali nitrite is sulphonated the gradual addition of metasulphite, the product is not dihydroxylaminesulphonate, but hydroxylaminedisulpho- ite, $2NaNO_2 + 3Na_2S_2O_5 + H_2O = 2HON(SO_3Na)_2 + 2Na_2SO_3$. ut by a very interesting, though somewhat recondite, alytical procedure, Raschig has convinced himself that, hen the nitrite is put from the first in contact with the hole of the metasulphite, there comes into brief existence hat should be nitrososulphonate or else its hydrate, hydroxylaminesulphonate, produced thus: $NaNO_2 +$ $a_2S_2O_5 = ONSO_3Na + Na_2SO_3$.

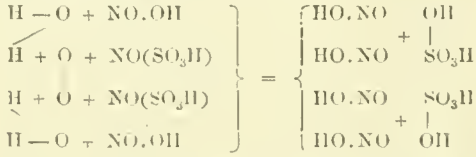
Next, experimenting with dilute titrated solutions of lphur dioxide and nitrous acid, Raschig poured sulphur oxide solution into highly dilute nitrous acid solution in rying proportions, and found that interaction was con- ned within molecular proportions, $ONOH : SO_2$. But he us got sulphuric acid and no trace of nitrososulphonic id. When, however, he poured the nitrous acid solution to the sulphur dioxide solution, kept in excess, he und that more than a molecule of sulphur dioxide was ed up, proving that hydroxylaminedisulphonic acid and trilosulphonic acid, $N(SO_3H)_3$, must have been formed. ere, it may be mentioned, that Carpenter and Linder, two ars ago (this Journal, **21**, 1400), found that sulphur oxide produced hydroxylaminedisulphonic acid with trous acid. Raschig concludes that these two experi- ents prove that dihydroxylaminesulphonic acid or its hydride, nitrososulphonic acid, is produced and then comes hydroxylaminedisulphonic acid by further sulpho- ation. The author cannot admit that that is the conclu- on which must be drawn, but he sees not the least reason r refusing to grant that, in presence of other reagents, e sulphonation may go so far only as to produce nitroso- lphonic acid.

Raschig's third point of evidence is decidedly satisfactory. On mixing the highly dilute and cooled solutions of nitrous acid and sulphur dioxide in molecular proportions, the mixed solution gives no blueing with potassium iodide and starch, thus showing the disappearance of all nitrous acid; no bleaching of iodine solution, thus showing the disappearance of all sulphur dioxide; precipitation of all sulphur as sulphate by barium chloride; and, lastly, considerable bleaching activity upon potassium permanganate. Therefore, although nitrous oxide is obtained by heating the solution, the primary interaction cannot be that expressed by $2HO.NO + 2SO_2 + H_2O = N_2O + 2SO_2(OH)_2$, since nitrous oxide has no action upon permanganate. The interaction can only have produced nitrososulphonic acid, which must have hydrolysed into nitrosyl hydride, $H.NO$, thus :—$ON.OH + SO_2 = ON.SO_2.OH$, and $ON.SO_2.OH + H_2O = ON.H + HO.SO_2.OH$. Working with stannous chloride, in place of sulphur dioxide, upon nitrous acid, much stronger solutions of this substance, nitrosyl hydride, are obtainable—solutions much too concentrated to be merely solutions of nitrous oxide. The action of stannous chloride upon nitrous acid is so definite that, were it needed, it could be used for its quantitative determination. Nitrosyl hydride stands as anhydride to dihydroxylamine, $(HO)_2NH$, and it is difficult to avoid coming to the conclusion that either nitrosyl hydride or dihydroxylamine is temporarily present in the solution in which nitrous acid has been sulphonated. But, if this is granted, it follows that either nitrososulphonic acid or dihydroxylaminesulphonic acid is produced by this sulphonation, however fleeting its existence. Raschig has obtained evidence that nitrosyl hydride is also produced by oxidising hydroxylamine.

Nitrosyl hydride interacts with nitrosyl hydroxide, that is, nitrous acid, though not readily, to form nitric oxide and water :—$ON.H + HO.NO = 2NO + H_2O$. In presence of air dissolved in the water, it proceeds quickly enough, but then nitrous acid appears in place of the nitric oxide, in accordance with the third equation. It has still to be shown that the conditions of the lead-chamber are appropriate for the occurrences formulated in Raschig's equations.

The solutions experimented upon have so far been aqueous, but the addition of sulphuric acid to them, far from being detrimental, actually determines that activity of nitrous acid upon the nitrososulphonic acid, in the presence of air, which in aqueous solutions only slowly manifests itself. When the nitrous acid is dissolved in 10/N sulphuric acid, instead of in water, sulphur dioxide and air can be blown rapidly into the solution, with complete conversion of the sulphur dioxide into sulphuric acid and no escape of nitric oxide and peroxide, although the sulphuric acid is still too weak to be a solvent of nitrososulphuric acid (nitrosyl sulphate). Indeed, the addition of enough sulphuric acid to make the solution similar to chamber acid, makes the solution such a poor solvent of nitrous acid that this then becomes gaseous to some extent. The effect of still stronger sulphuric acid, which would have generated nitrososulphuric acid, appears not to have been tried. But it has at least been shown that the lead-chamber process can be imitated in a beaker glass, in accordance with Raschig's theory and without any material production of nitrososulphuric acid.

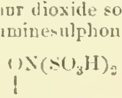
Bearing in mind the essential nature of catalytic action, it will be evident that the series of equations drawn up of represent its cycle of changes are not to be regarded as expressing interactions which proceed, independently to each other, to actual completion. Thus, in Raschig's equations, the product of the first interaction, namely, nitrososulphonic acid, is already reacting as in the second equation, before it is out of the reaction represented by the first equation. The same holds true of the active product (nitric oxide) of the second equation, which is being formed only so far as to be able to pass into the third reaction and there disappear. We have also to remember that the ordinal numbers attached to these equations, first, second, and third, serve only to mark their sequence, not to indicate a beginning and an end. The product of the reaction shown by the third equation, the nitrous acid, passes in the moment of its formation into the reaction as shown by the first equation. It was incumbent upon Raschig to give reality to the existence of the nitrososulphonic acid, or of a substance equivalent to it, but not to show that it might be isolated from the contents of the lead chambers. The same is true of his nitric oxide, but this being so well-known a substance, the above considerations seem not to have been applied to it. Raschig may be found saying that Lunge will yet have to come back to the recognition of nitric oxide as taking part in the process, and also making no attempt to meet Lunge's well-founded contention that nitric oxide is only present in the lead chamber in association with enough nitric peroxide to negative the possibility of its taking part in the process. Yet Raschig himself recognises quite well that the NO of his equations has only a catalytic existence as nitric oxide. He has done some admirable work towards establishing the existence of pernitric acid, HNO_4, and allows himself to speculate whether this substance, as well as NO, may not play a part in the process shown in equation 2. However that may be, it is in any case to be understood that nitric oxide, as we know it, has not been shown by Raschig's experiments to be a factor in the sulphuric acid process. His second equation must hardly be taken to express something which actually goes on of itself, for his experiments show that this reaction depends largely, if not wholly, for its occurrence upon the co-operation of the reaction formulated by the third equation. Equation 3 must be imagined to be subjoined to 2, something in this way:—



$$\left.\begin{array}{l} H-O+NO.OH \\ H+O+NO(SO_3H) \\ H+O+NO(SO_3H) \\ H-O+NO.OH \end{array}\right\} = \left\{\begin{array}{l} HO.NO \quad OH \\ \qquad\quad + \;| \\ HO.NO \quad SO_3H \\ HO.NO \quad SO_3H \\ \qquad\quad + \;| \\ HO.NO \quad OH \end{array}\right.$$

in which the radical, NO, is seen to be everywhere active, without once coming out into existence as nitric oxide.

Raschig's surmise that, in passing from the reaction formulated in his second equation to that expressed by his third, there may be generated pernitric acid, HNO_4, as well as NO, may puzzle those who see in the action of sulphur dioxide only that of a reducing agent upon nitrous acid. It may be well, therefore, for this and other reasons, to call attention to the fact that, in presence of the monohydrate of sulphuric acid, sulphur dioxide so acts upon nitrous acid as to generate peroxylaminesulphonic acid—



$$\begin{array}{l} ON(SO_3H)_2 \\ | \\ ON(SO_3H)_2 \end{array}$$

This substance, which gives a beautiful purple colour to the sulphuric acid, is undoubtedly a peroxide, such as pernitric acid would be, $HO.ONO_2$, with an $-O_2-$ group in it (J. Chem. Soc. 1904, **85**, 108). There is another point of interest in peroxylaminesulphonic acid in connection with the sulphuric acid process. It is the support which its production gives to Raschig's conception of the process as being dependent upon the sulphonation of nitrous acid. Can sulphazotised acids, it has in effect been asked, have anything to do with the sulphuric acid process, in which they are not to be found, at least when it is properly working? The prejudice which dictates such a question will hardly be able to withstand the evidence of such a fact as this:—Whether nitrous acid and sulphur dioxide react in presence of water or in presence of monohydrated sulphuric acid, H_2O, H_2SO_4, they produce sulphazotised substances, that is, sulphonated nitrous acid compounds. For, that being the case, can the least objection any longer be raised to the assumption that they also form such substances in presence of that more dilute sulphuric acid which is present in the lead-chambers?

What next is to be said is offered as a contribution to the theory of the lead-chamber process. The author has long been convinced that, in those regions of the chamber where the process is in active operation, where, therefore, there is dense white mist, the really gaseous part of the contents of the chamber contains no significant quantity of any oxide of nitrogen. One part of that mist consists of its liquid particles of sulphuric acid, having with it something more than one molecule and something less than two molecules of water, and holding in solution all the nitrogen oxides, one or more as the case may be. The other part of the mist is gaseous, and made up of atmospheric nitrogen and oxygen, sulphur dioxide, and vapour of water. In regions where the activity is much less, nitrogen peroxide is, indeed, among the gases, and with very little sulphur dioxide present, but this nitric peroxide is already out of the sphere of activity, and waiting to be carried off from the chambers. If it had work to do, it would not be there as gas. Whether any of the oxides of nitrogen enter the chamber from the Glover-tower in the form of mist, or whether everything is at that time gaseous, cannot, perhaps, be told, but, quickly and almost at once, the whole of the nitrogen oxides, together with water and sulphur dioxide, and probably some volatilised or mechanically carried sulphuric acid, will condense into a mist. It is difficult to conceive of another state of things, consistent with the conditions which prevail. What follows next in the process seems to be equally certain. Sulphur dioxide, oxygen, and water condense together upon the liquid particles of the mist, there uniting, under the catalytic influence of the nitrous acid present in the particles, with a rapidity limited only by the time needed for diffusion of the gases over to the particles and for dissipation of the heat caused by their condensation. But, no doubt, that rapidity of the process is seriously interfered with by the unequal distribution of the steam or water-spray through the chambers, the condensation being checked in one place because the nitrous acid loses much of its activity in consequence of the sulphuric acid of the mist-liquid being too concentrated, and in another place because, through the sulphuric acid of the mist being too much diluted, the nitrous acid escapes from the liquid particles, and, therefore, gets out of its field of greatest activity.

Perhaps, to a large extent, the language of Raschig is consistent with the assumption that he believes in the confinement of the nitrogen compounds to the liquid part of the mist, but he distinctly refers to the necessity of having more oxides of nitrogen present than can be held in solution by sulphuric acid of the dilution he takes it to have in the mist, which is surely much less than that of chamber-floor acid. Besides this, he tries to lead us back to a belief in the existence of gaseous nitrous anhydride, for short periods of time, even in presence of oxygen—a matter which would be of no interest in connection with his theory did he suppose that all his nitrous acid was in the liquid of the mist.

Unless the nitrous acid is held dissolved in the liquid of the mist in the form of nitrososulphuric acid, it is hardly possible to grant the demand of Raschig's theory for nitrous acid to be ever present in local excess of the sulphur dioxide at the seat of activity; that is, in the proportion of $2NO_2H$ to every SO_2.

Yet Raschig fails to find any place for nitrososulphuric acid in the process of sulphuric acid manufacture. If it is present at all in the chambers, it is there, he considers, injuriously, and as the result of imperfect working. According to Lunge, its presence in the chambers is certain and of prime importance. But, before proceeding further, it is desirable to say something respecting the chemical relationship of nitrososulphonic acid to nitrososulphuric acid. The propriety of what is now going to be said on this subject is unlikely to be gainsaid, but disregard of its argument leads to lamentable confusion in nomenclature. The formula of nitrososulphonic acid is $ON.SO_3H$; that for nitrososulphuric acid is $ON.O.SO_3H$. The relationship of nitrososulphonic acid to nitrososulphuric acid is, therefore, that of the almost unknown sulphurous acid, $H.SO_3H$, to sulphuric acid, $HO.SO_3H$. Nitrososulphuric acid is often named nitrosyl sulphate, but that is a practice not to be commended, because it suggests that this acid is a salt, whereas a salt it is not, nitrosyl being no basic radical. By a sulphonic derivative is meant a compound in which the radical, $-SO_3H$, plays a part analogous to that of cyanogen in a cyanide, or of chlorine in a chloride. A sulphuric compound is what is held to be a derivative, in certain ways, of sulphuric acid. When that derivation is through the substitution of a hydrogen radical by some other, it is absolutely unallowable to call the compound a sulphonic derivative, as is so frequently done in the case of nitroso-sulphuric acid. This substance is a mixed acid oxide, that is, an anhydride of two acids. It is intermediate to pyrosulphuric acid and nitrous anhydride, as thus shown :—

Pyrosulphuric Acid. Nitrososulphuric Acid. Nitrous Anhydride.

$$O < \begin{array}{l} SO_2OH \\ SO_2OH \end{array} \qquad O < \begin{array}{l} SO_2OH \\ NO \end{array} \qquad O < \begin{array}{l} NO \\ NO \end{array}$$

That sulphuric acid charged with nitrososulphuric acid will quickly absorb moist sulphur dioxide has been long known, but it was left for Raschig to discover what then happens. What does happen is expressed by his equations when, for the nitrous acid there shown, is substituted its anhydro compound with sulphuric acid. His three equations then become—

$$(1) \qquad 2H_2O + \overset{\text{Nitrososulphuric Acid.}}{2ON.O.SO_3H} + 2SO_2 =$$

$$2SO_2(OH)_2 + \overset{\text{Nitrososulphonic Acid.}}{2ON.SO_3H} \; ;$$

$$(2) \quad \overset{\text{Nitrososulphonic Acid.}}{2ON.SO_3H} + \overset{\text{Nitrososulphuric Acid.}}{2ON.O.SO_3H} = 4NO + \overset{\text{Pyrosulphuric Acid.}}{2O(SO_3H)_2} \; ;$$

$$(3) \qquad 4NO + O_2 + \overset{\text{Pyrosulphuric Acid.}}{2O(SO_3H)_2} = \overset{\text{Nitrososulphuric Acid.}}{4ON.O.SO_3H}.$$

What, then, goes on between the liquid and the gaseous parts of the mist appears to be this. The particles of the mist, consisting of strong sulphuric acid holding nitrososulphuric acid in solution, continuously absorb sulphur dioxide and oxygen, which, by the catalytic action of the nitrososulphuric acid, become sulphuric acid as fast as they are absorbed. Water is taken up in such quantity, in the normal working of the process, as serves to effect incipient hydrolysis of the nitrososulphuric acid into its constituent acids. Two molecules of sulphur dioxide and one molecule of oxygen are absorbed simultaneously, for the reason that they find between themselves, the radical of the catalyser, nitrosyl, one moment as nitrososulphuric acid and the next moment as nitrososulphonic acid. Or, leaving out all mention of the radical, nitrosyl, but remembering that the substance, nitric oxide, plays no part, the catalyser is nitrososulphonic acid and nitrososulphuric acid, alternately. Then, since a catalyser cannot be represented in an equation for a productive change, because it is neither consumed nor generated, the equation comes back to $2SO_2 + O_2 + 2OH_2 = 2SO_4H_2$, conditioned by the words "in presence of a catalyser."

The importance of the theory now advanced, that the production of sulphuric acid in the lead-chambers is due to action going on between a liquid and a gas, will be quickly evident on consideration. That state of things is the counterpart of what is actually observed to go on in Raschig's experiment in a beaker, in which sulphur dioxide and oxygen are rapidly absorbed by the nitrous acid solution, without evolution of any nitric oxide or peroxide. It renders meaningless the otherwise pertinent question raised by Lunge against Raschig's theory, why the nitric oxide does not oxidise to nitric peroxide, instead of stopping at nitrous anhydride, as required of it by Raschig. It, in this way, removes almost the sole objection that Lunge has to any theory of the process, which rests on a production of nitric oxide. But, above all, it should perhaps serve to end the rivalry between Lunge's and Raschig's theories, because it makes them to be, with some excrescences, parts of a more comprehensive theory.

There is much more in Raschig's account of his theory and of the elaborate experimental work upon which it is based, which might with advantage have been described and commented upon, but it is hoped that what has been here said will be sufficient to excite interest in the theory.

Discussion.

Prof. Tilden said that it had yet to be shown that these various substances, and the reactions expressed in these equations, were essential parts of the process, the object of which was the production of sulphuric acid. No one denied, for instance, that nitrososulphuric acid was formed to some extent in the chambers, but it did not seem to him that the production of that compound was a necessary condition of the production of sulphuric acid from the oxides of nitrogen, the oxygen of the air, sulphur dioxide and the water which were present. He was glad to hear that the author held the view that a great number of these substances expressed in the equations probably did not exist under the conditions of the chambers, because they were at a temperature in which they were to a large extent dissociated into gaseous products. He should certainly agree with him that in so far as these reactions took place, they took place on the surface of the spherules of water due to the condensation of the steam. It would be interesting if some experiments could be made at temperatures a little higher, above the boiling point of water, when there would be no condensed spherules of water at all, but where all the materials were entirely gaseous. Such a temperature was of course beyond that which prevailed generally in the vitriol chambers. He was not afraid to express the action of the peroxide of nitrogen which was present in the chambers by a very much simpler hypothesis. They had no hesitation in assuming that when nitric oxide combined with oxygen the process was very simple. He had never seen any form of complicated expression written as an equation to express this combination and he thought it would be extremely difficult to express it by anything more complicated; it might be written as $NO + O$ or $2NO + O_2$. He saw no difficulty about assuming that oxygen was capable of directly combining with nitric oxide, but he felt more difficulty in assuming that oxygen directly combined with the elements of the sulphurous acid which were present in the gases. Those who had not specially studied these substances were frequently a little confused about the oxides of nitrogen, but his belief was that there was only one coloured gaseous oxide of nitrogen and that was the peroxide, the formula of which was NO_2. His reason for the statement was this: N_2O and NO were well known colourless gases, N_2O_3 was a blue liquid which on conversion into vapour produced a yellow coloured gas. That gas consisted of a mixture of equal volumes of nitric oxide and nitrogen peroxide. It had been shown a few years ago that in all probability when these two gases were brought together there was a small amount of nitrous anhydride produced, something like 5 per cent. of the whole, as represented by Dixon's experiments; the rest was entirely dissociated. If the red gas were examined with the spectroscope the lines of the absorption spectrum were identical with those of the spectrum of peroxide of nitrogen, made in some other way. Peroxide of nitrogen obtained, for example, by heating lead nitrate was by cooling condensed first to a yellow liquid and at a lower temperature to a perfectly colourless solid. This white solid was N_2O_4 or some multiple of it. Directly it volatilised it gave the yellow gas the colour of which appeared because it was continually accumulating, the dissociation increasing as the temperature rose. On examining these bodies with the spectroscope the only one which gave the peculiar absorption spectrum was the nitrogen peroxide, NO_2, so that N_2O_3, if it existed in the gaseous state, did not give the absorption spectrum. Now in the vitriol chambers the atmosphere was generally a deep red, showing an abundance of peroxide of nitrogen. It seemed to him that in the chambers where the sulphuric acid was chiefly produced there would always be an abundance of this gas. He could not see any great difficulty in believing that just as oxygen was known to be capable of combining with nitric oxide by simple combination, so an atom of the oxygen of the nitric peroxide attached itself to the elements of the sulphurous acid here present. In nitrogen peroxide the nitrogen had an unsatisfied affinity, and it was easy to conceive of an arrangment by which the oxygen of the air united with the nitrogen of the peroxide of nitrogen, at the same moment that another atom of oxygen was detached by entering into union with the sulphur dioxide and water which together made up the molecule of the sulphuric acid. He could not see any objection to the idea that that was the essential part of the process. Of course the occasional production of hydroxylamine and other compounds could not be denied, but it seemed to him that was sufficiently explained by the fact that moderately strong sulphuric acid was present in the spherules of liquid and on the walls and floors of the chambers in the presence of sulphur dioxide and nitrogen peroxide in varying proportions. There, at any rate, were the materials for the production of some of the substances represented in these equations.

Mr. R. Forbes Carpenter said he was not prepared for the author accepting the nitrososulphonic acid as an existing body, even under the transient form described, for, in conjunction with Prof. Haga, Dr. Divers had shown that what Raschig described in earlier experiments as a salt of dihydroxylaminesulphonic acid was actually a double salt which could be produced by crystallisation of hydroxylamine disulphonate and potassium nitrite. The combination of the theories of Lunge and Raschig might be happily effected by the equations Dr. Divers had given. That not only the raw materials, but at any rate one product, of the intervention of the two named by Dr. Divers (nitrososulphonic and nitrosulphuric acids) existed through the working of the chambers was evident, as solutions of nitrososulphuric acid could be collected in the drips in the chambers as an indication of how the chamber was working. He had searched for hydroxylaminedisulphonic acid, and only on one occasion was it found as a transient body in a particular part of the chamber plant, viz., in a tower between No. 1 and No. 2 chambers, which was condensing the mist of sulphuric acid still uncondensed, and produced in No. 1; nitrososulphuric acid was there also at times, although at other times it was absent. The presence of this hydroxylaminedisulphonic acid was indicated in alkaline solution on testing with copper sulphate, a canary coloured precipitate being formed, a compound that Dr. Divers had shown them how to obtain. He had unsuccessfully looked for this acid in several other parts of the chamber. He should be glad if Dr. Divers could tell them the temperature at which Raschig's reactions took place in the solutions with which he experimented.

Dr. Veley said that he had observed that nitric acid exposed to light escaped decomposition when it almost filled the bottle, but suffered decomposition when it only partly filled the bottle. These results seemed to show that the initial decomposition of the nitric acid was a decomposition not of the liquid itself, but of the vapour proceeding from that liquid at the ordinary temperature.

Mr. F. H. English said in the first chamber the temperature was as a rule about 160° F. and in that chamber the bulk of the sulphuric acid was formed. The second chambers were generally about 120° to 130° F.; and the third chamber, where practically no action at all took place and which was filled with nitrogen peroxide, was a little above the air temperature.

Mr. Oakden said he had found that about 45 per cent. of the total acid was produced in the Glover tower where there could not possibly be these bodies present in the gaseous state. It was produced in contact with the liquid nitrososulphuric acid passing down the Glover tower, independent of the chambers altogether.

Dr. L. F. Guttmann asked the author why he had called the compound NOH, nitrosyl-hydride; he thought Angeli, its discoverer, had named it nitroxyl.

Dr. Divers, in reply, said that his theory being that no nitrous gases were present in the very active part of the chambers, because of the large quantities of sulphur dioxide there, he had only one comment to make upon Prof. Tilden's view of the activity of nitric peroxide. That was that that substance could only furnish sulphur dioxide with oxygen indirectly, that is, by the decomposition of some compound which it might form with the sulphur dioxide. Dr. Tilden's conception of the sulphuric-acid process was admittedly based on hypothetical activities, whereas Raschig's theory rested on facts experimentally determined. To illustrate that, it might be mentioned that Raschig had been led to believe that the substance, pernitric acid, was indeed formed in the reaction of nitrous acid with sulphur dioxide, but had omitted from the details of his theory the assumption of its production, because he was as yet unable to convince himself on the point, so desirous was he to have a foundation of fact for every statement. With regard to the evidence for the existence of nitrososulphuric acid in the lead-chamber, he would mention, what Raschig had pointed out, that chamber acid did not contain more nitrous acid than the same volume of water would easily hold dissolved. It could not, therefore, be assumed that that quantity of nitrous acid was proof of the presence of nitrososulphuric acid. The evidence for its presence in the lead chamber was indirect.

Dr. Veley's experience with nitric acid had its parallel in what happened to a concentrated solution of hydrochloric acid exposed to bright daylight. In a bottle practically full, that acid remained unchanged, whereas, with only a little of its solution in the bottle, chlorine was produced. Since moist hydrochloric acid gas, apart from a liquid solution of it, did not decompose (Richardson), it would seem that, so far as it applied to the case, the behaviour of either nitric or hydrochloric acid in a partly filled bottle favoured the theory put forward in the paper as to what went on in the lead-chamber.

In answer to Dr. L. F. Guttmann, "nitroxyl," used already for a radical, appeared to him to be an impossible name for a substance, and particularly inapplicable to one having the composition assigned to nitrosyl hydride.

THEORY OF THE ACTION OF METALS UPON NITRIC ACID.

BY E. DIVERS, M.D., D.Sc., F.R.S.

Introductory.

There being no explicit and connected theory of the action of metals upon nitric acid, which has general acceptance, what follows is submitted for consideration and adoption as such a theory. By theory, it may be wise to point out, is meant not some fanciful and imaginative view, based upon hypotheses, but an exposition of the real order and dependence of the facts presented in the action of the metals upon the acid. Therefore, if this theory is well founded, it should have some value in technological pursuits. It is not new, having been published in 1883 in a paper read before the Chemical Society (J. Chem. Soc., **43**, 443), in an incomplete form, and as subsidiary to the subject of the paper, which was on the production of hydroxylamine from nitric acid.

Nor is its existence unrecorded in the proceedings of this Section of the Society of Chemical Industry, it having in 1891 been subjected by Dr. Veley to adverse criticism, which was illustrated by experiments. The occasion for presenting the theory in a more developed form to the Society this evening has been given by the reading last month to the Chemical Society, of an important paper on mercurous nitrite by Prof. Rây, of the Presidency College, Calcutta.

The most convenient and most satisfactory method of treating the subject seems to be to enunciate it without prefatory remarks, and then to develop its points, and endeavour to show that they are well taken.

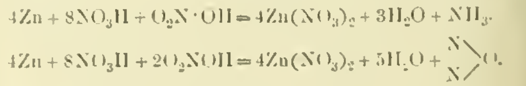
The Theory.

Silver or mercury is only active upon nitric acid in presence of nitrous acid as catalyser, and then converts it into molecular quantities of silver or mercurous nitrite and nitrate, and nothing else besides water:—

$$2Ag + 2HNO_3 = AgNO_2 + AgNO_3 + H_2O.$$

Zinc or tin acts upon nitric acid to produce zinc or stannous nitrate and, independently of each other and without intermediate products, ammonia, nitrous oxide, and nitrogen:—

$$4Zn + 8NO_3H + O_2N \cdot OH = 4Zn(NO_3)_2 + 3H_2O + NH_3.$$



$$4Zn + 8NO_3H + 2O_2NOH = 4Zn(NO_3)_2 + 5H_2O + \left.\begin{matrix} N \\ N \end{matrix}\right\rangle O.$$

$$5Zn + 10NO_3H + 2O_2NOH = 5Zn(NO_3)_2 + 6H_2O + N_2.$$

It tends also and principally to convert the nitric acid into hydroxylamine as the primary product, along with zinc or stannous nitrate. But that tendency is defeated, unless a stable acid, such as sulphuric or hydrochloride acid, be present to combine with the hydroxylamine, nitric acid itself being obviously unfitted for the purpose :—

$$6Zn + 7SO_4H_2 + 2O_2NOH =$$
$$6ZnSO_4 + 4H_2O + SO_4(NH_3OH)_2.$$

Evidence as to the Truth of the Theory.

Two Orders of Metals.—As is well known, one metal may act very differently from another upon nitric acid and also upon sulphuric acid. But, although no two act exactly alike, a division of the metals may be made into two classes, one represented by silver and mercury, and the other by tin and zinc. In the former class are included bismuth and copper, and in the latter class all other metals having strongly marked basic characters. Of the action of copper upon nitric acid it is, however, not yet possible to formulate a satisfactory and convincing theory. For, although, more than that of any other metal, the action of copper comes under the attention of chemists, there is still wanting a sufficient basis of fact to work upon. Probably, Acworth and Armstrong (J. Chem. Soc., 1877, **2**, 68) are right in attributing the production of nitrous oxide and nitrogen in this case to a secondary effect peculiar to copper. The division of metals into two classes, according to their behaviour towards nitric acid and sulphuric acid, corresponds with that into metals which cannot decompose water at all and metals which can do so in certain circumstances.

Silver and Mercury inactive upon Nitric Acid in absence of Nitrous Acid and active in its Presence.—The experiments by Russell and, above all, the quantitative experiments by Veley, have established what had already been qualitatively recognised by Millon, that the activity of silver or mercury, copper or bismuth upon nitric acid is hardly measurable, unless and until a sensible quantity of nitrous acid is present, when it is proportionate to the amount of this acid, other things being equal. In this connection, as well as in contrast with the activity of the metal, zinc or tin, it is interesting to note that silver or mercury is also inactive upon its own nitrate, that is, upon the acid radical of its own nitrate; mercury acts, it is true, upon mercuric nitrate, but only to the extent of changing it into a mercurous salt, whilst leaving it as a nitrate. Copper tends, apparently, to act similarly upon cupric nitrate.

Silver or Mercury not permanently inactive upon Nitric Acid.—Silver or mercury, notwithstanding its inactivity at first, can seldom, if ever, remain long in contact with the purest of obtainable nitric acid without action being set up; but then that is because of the dissociation which goes on, however slightly, in which the nitric acid becomes nitrous acid and oxygen, except perhaps when the acid is highly diluted. It is well known to those who have tried it, that nitric acid of moderate concentration cannot be kept free from nitrous acid, and the limit of dilution beyond which no dissociation whatever occurs is as yet unknown, if it exists.

The action of Silver or Mercury upon Nitric Acid in presence of Nitrous Acid.—When silver or mercury is converting nitric acid into molecular quantities of nitrite and nitrate, there will be present a constant quantity of nitrous acid, determined by the degree of dilution of the nitric acid and by its temperature—conditions which must be kept within limits, in order to prevent the occurrence of secondary changes. From Rây's experiments with mercury, it seems that a temperature of 35° and nitric acid of sp. gr. 1·11 at 15° are together suitable conditions for the purpose. The solution in close contact with the mercury then contains about 0·05 grm. of nitrous acid (or its equivalent of nitrite) per c.c. of solution, with from 4·5 to 5 times its equivalent of nitric acid and nitrate. That mercurous nitrite in this case, or silver nitrite in the case of silver, is freely formed, is shown by its abundant separation in the crystalline form, when the solution is of sufficient depth and is left undisturbed over the mercury or silver. That nitrate and nitrite are produced in molecular proportions is a deduction from the fact that, when the action is steadily proceeding, there is no other product than these (not counting water), and, therefore, no material change in the proportion of nitrous acid to nitric acid. It was Rây's happy thought to examine the mother-liquor during the production of mercurous nitrite under such circumstances as these, that is, when no nitric oxide is escaping from the solution. In that case there is no equation for explaining the action other than that already given, modified to suit the valency of mercury :—

$$4Hg + 4HNO_3 = Hg_2(NO_2)_2 + Hg_2(NO_3)_2 + 2H_2O.$$

Nitrous Acid, Nitric Oxide, and Nitric Peroxide as Secondary Products.—*Nitrous acid* is actually formed as a secondary product when some of the nitrite actually produced, that is, produced in the primary action, is decomposed by nitric acid. This decomposition occurs (*a*) when, as at first, there is not the requisite proportion of nitrous acid already present, and (*b*) when there is not enough water present to preserve the nitrite from the action of the nitric acid. *Nitric peroxide* appears as a secondary product when the proportion of water is so low that nitrous acid interacts with nitric acid. Lastly, *nitric oxide* results as a secondary product when the proportion of water to nitric acid is so large that the nitric acid fails to prevent the nitrous acid decomposing into this substance and nitric acid :—$3HNO_2 = HNO_3 + 2NO + H_2O$. The accordance of these assertions with well-known facts is incontrovertible

Nitrous Acid as Catalyser.—In the steady conversion of silver or mercury into nitrite and nitrate, in presence of adjusted proportions of water and nitrous acid, the nitrous acid is ever being consumed and regenerated at the same rate, thus :—

$$HNO_2 + 2Ag + HNO_3 = AgNO_2 + H_2O + AgNO_2, \text{ and}$$
$$AgNO_2 + HNO_3 = AgNO_3 + HNO_2.$$

Nitrous acid is therefore the catalyser, a substance active without being consumed, in that interaction between the metal and the nitric acid by which nitrite and nitrate are simultaneously produced in molecular proportions.

Silver or Mercurous Nitrate is a Primary Product.—It may be suggested, and, indeed, has been (Millon, Russell, Veley), that nitrate of the metal is produced only as a secondary product, that is, by the action of nitric acid upon the nitrite. That it can be and is so produced at times is, of course, the fact. But, surely, it is an unconsidered statement that, in the dissolution of silver in nitric acid containing nitrous acid, the first act is the production of nitrite only, and then that nitrate is produced from it by the action of nitric acid. This way of putting the matter involves, apparently, such inconsistencies as the following :—Nitrous acid multiplies itself in this reaction; it can only act unaided upon silver by generating nitric oxide, yet no nitric oxide is produced; nitric acid in contact with silver stands by inactive, whilst the silver and nitrous acid interact to form nitrite and nitric oxide, and only then develops activity, in order to convert this nitrite and nitric oxide, as well as some of itself, into nitrous acid again. It is true that a catalyser must be assumed to pass backwards and forwards from the state of one substance to that of another, but, then, in so doing, the catalyser neither increases nor diminishes in quantity; it is to all appearance inactive and unchanged. When silver is dissolving, the nitrate and nitrite formed are together equivalent to the nitric acid consumed, nitrous acid, the catalyser, contributing nothing to the accumulating quantity of nitrite.

What change, if any, silver or mercury would effect upon an aqueous solution of nitrous acid free from nitric acid is as yet unknown. Dr. Veley, indeed, before a meeting of this Section, performed experiments upon metals, in which he used three solutions, one of them described and shown as a solution of nitrous acid prepared from silver nitrite, another being nitric acid, and the third a mixture of nitric acid with the solution of nitrous acid, and employed words in describing them which seem to have implied that only the last was a mixture of the two acids. Also, in his memoir on the same subject, published in the *Philosophical Transactions*, and in the abstract of it in the *Proceedings* of the Royal Society, similar language was employed by him; the two solutions being there contrasted as the "water-nitrous acid" solution and the "nitric-nitrous acid" solution. Nevertheless, he did not mean to imply that the water-nitrous acid solution contained no nitric acid, for, in a paper on the chemical changes between lead and nitric acid, read before this Section of the Society, he clearly indicates the presence of nitric acid in it. But it must be said that his demonstration and description were very liable to be misunderstood, and to be taken to mean the absence of nitric acid. Since it really was present, and in good quantity too, one fails to see how these experiments and demonstrations serve to establish that nitrous acid by itself in water is very active upon copper and other metals. To show to what extent nitric acid must have been present in his solutions of nitrous acid, one of his experiments may be quoted from the *Philosophical Transactions*, in which, in half an hour, 0·0942 grm. of nitrous acid in 15 c.c. of water dissolved 0·1398 grm. of copper. It is not clear from the text whether nitric oxide escaped, but, if it did, 0·14 grm. of copper would have needed 0·414 grm. of nitrous acid, that is, more than four times as much as was present. The amount of copper dissolved proves that there must have been present, along with the 0·0942 grm. of nitrous acid, at least 0·43 grm. of nitric acid, and more than that, if all the copper was in the solution as nitrate. Dr, Veley found that, when much more nitric acid was added, the metal became much less active. The reason for this was not clear to him, nor is it so to the author; but this is a matter of secondary importance here, the point of interest in connection with the present paper being that, in any of Veley's experiments, much more nitric acid was present than the quantity equivalent to the nitrous acid in the solution. In an experiment with lead, and the only one in which the amount of nitric acid present is given, Veley found the metal very active, when the ratio of nitric acid to nitrous acid was less than that of two molecules to one (2·5:1 by weight). Could he have experimented with a still less proportion of nitric acid, doubtless he would have found molecular proportions of the two acids to be the most active mixture of all.

The Primary Products of the action of Zinc or Tin upon Nitric Acid. Nitrous Acid, or a Nitrite not a Primary Product.—When zinc acts upon nitric acid, not nitrate and nitrite or nitrous acid are the primary products, but nitrate and either hydroxylamine, or ammonia, or nitrous oxide, or nitrogen, or, rather, all these together, but independently and each associated only with the nitrate. If zinc is left in nitric acid, there is undoubtedly a production of nitrite or nitrous acid, which may at last be considerable, but only as a secondary product. Zinc acts freely upon its own nitrate in aqueous solution, the products being hydroxide and nitrite. Therefore, only in proportion as nitrate increases in quantity and, before all, nitric acid decreases in quantity, does nitrite or nitrous acid make its appearance. Just at first, only the most delicate tests can detect its presence in the solution, and for some time after, when already the true primary products have been copiously formed, its amount is still very small. All this was fully stated in the author's first paper, but Dr. Veley misconstrued the meaning of what was there said, and was at some pains to demonstrate at the meeting of this Section in 1891 (this J., **10**, 204) already referred to, that zinc acting upon nitric acid produces enough nitrous acid to respond to the metaphenylenediamine test. By this demonstration he refuted nothing that the author had said, but showed, perhaps that to say that only traces of nitrous acid are produced at first, traces sometimes doubtful to find (J. Chem. Soc., **43**, pp. 450 and 458), was a slight exaggeration, when judged by the metaphenylenediamine test. But Dr. Veley's statement, that, according to Dr. Divers' experiments, zinc does not yield an appreciable quantity of nitrous acid when it dissolves in nitric acid, is one that cannot be accounted for, since, in that paper, the author records that he even went so far as to try to estimate the amount of nitrous acid produced. Besides, it should be clear from the paper that the author's statements referred almost exclusively to the action of zinc upon nitric acid in presence of sulphuric or hydrochloric acid. Veley quotes Prof. Armstrong as stating (1883) that he finds that the primary product of the reaction of nitric acid is nitrous acid, and that this body is invariably formed when any metal is dissolved in nitric acid. He then goes on to say that his own results show that all metals dissolve in nitric acid to form nitrous acid as the primary product of the reaction. In reply to this, the author would point out that what Armstrong did state was that he had satisfied himself by experiment that N_2O_4 is produced during the dissolution of metals in nitric acid by the reaction formulated by Dr. Divers, and that, concerning the primary product of the reduction of nitric acid being nitrous acid, his statement only was that he believed there was no doubt of it, which is another thing than saying that he had found it to be the primary product. Veley's published experiments evidently do not prove that nitrous acid is the primary product of the reaction of zinc upon nitric acid, as has been already explained. It has never been denied that nitrous acid is produced, but it has been pointed out that, since it only becomes present in quantity with the using up of the nitric acid, and in the absence of another acid, the conclusion must be drawn that all along its occurrence is sufficiently accounted for by the knowledge that it is abundantly formed in the action of zinc upon zinc nitrate in the absence of much nitric acid. If the minute quantity found, at first and for some time after, represents what has escaped reduction, there seems to be no way of accounting for its greatly increasing quantity much later on, notwithstanding the presence of a superabundance of the metal. If nitrous acid be less stable than nitric acid in contact with zinc, then it should be impossible for zinc to produce it, since it could no more exist in contact with zinc than could nitric acid itself.

Hypothetical Analysis of the Action of Zinc or Tin upon Nitric Acid. "Nascent" Hydrogen.—The presentation, to oneself or to others, of the process of reduction of nitric acid to hydroxylamine, or to ammonia, or to nitrous oxide, or to nitrogen, as occurring in a succession of changes, is proper and valuable as a mental analysis of the phenomenon, but such a presentation must not be taken to be that of reality, unless the facts seem to justify and call for this assumption. In such an analysis we come, in two stages, to $N'OH$, and then see that each of several events must happen, $N'OH + 2H = H_2NOH$, or $= HN' + H_2O$; or, else, $N'OH + N'OH = N'''_2O + H_2O$. In these ways, the independent production of hydroxylamine and of nitrous oxide is accounted for. Nitrogen monohydride, $N'H$, becomes ammonia by further hydrogenisation. Nitrogen hydroxide, suffering at once both reduction and condensation, $2N'OH + 2H = N'''_2 + 2H_2O$, will in that way yield nitrogen. That is probably a correct conception of the process of reduction; nevertheless, it is only speculation. The 2H is to be understood as an abbreviation for $Zn + 2HNO_3$, what is meaninglessly called "nascent" hydrogen, made into an entity, and then endowed with activity varying in kind and degree, according to what else is substituted for the zinc.

The Production of Hydroxylamine when a Second Acid is present.—The production of hydroxylamine in the reduction of nitric acid is hardly observable, except in presence of either sulphuric or hydrochloric acid in excess, when nearly half the nitric acid may be converted into this substance. A sufficient explanation of the mode of operation of the second acid is found in its action, simply as an acid, by which, for one thing, all the nitric acid is presented as such to the zinc for reduction, instead of much of it being left as nitrate, and by which, for another thing, the hydroxylamine is rendered stable as sulphate or hydrochloride in contact with zinc and acid. It seems probable that the second acid may, by acting as such, tend also to prevent nitrogen hydroxide, which presumably would be feebly basic, from suffering condensation into nitrous oxide and water. That the second acid, along with zinc, acts as a hydrogenising agent is improbable and not borne out by observation. St. Claire Deville was also of this opinion. For example, sulphuric acid is very effective in bringing about the production of hydroxylamine, yet it is very much less acted upon by zinc than is nitric acid, and can hardly take its place, therefore, in supplying hydrogen. If it did so, then with nitric acid in excess in contact with the zinc, and in presence of sulphuric acid, no hydrogen from the latter should be set free, if it were really active, yet, as a matter of fact, hydrogen does escape. Further, since nitric acid, unaided, is reduced to nitrous oxide and ammonia, it is hard to believe that sulphuric acid can be wanted to furnish hydrogen.

Ammonia, Nitrogen, Nitrous Oxide, Nitric Oxide, and Nitric Peroxide as Secondary Products.—Since ammonia and nitrous oxide are freely produced, from the first, when zinc acts upon nitric acid, there seems to be no reason to believe them to be not primary products. But that they are also, to some extent, secondary products is certain. In the absence of much free acid, hydroxylamine salts are reduced by zinc to *Ammonia*. So is zinc nitrite. *Nitrous Oxide* may arise from the interaction of hydroxylamine with nitrous acid, provided that one of these substances is formed at a later stage and thus finds the other present, but they can hardly be supposed to be produced together, only to become nitrous oxide and water. The same is true as regards *Nitrogen* being derived from nitrous acid and ammonia. *Nitric Peroxide* and *Nitric Oxide* are undoubtedly secondary products, being derived from the decomposition of nitrous acid by nitric acid and by water respectively.

Hyponitrous Acid.—Hyponitrous acid is never found as a product of the action of zinc or tin upon nitric acid. It is only produced as a salt by the action of an alkali metal upon its nitrate, which then in definite stages becomes nitrite and hyponitrite. But in this case, hydroxylamine and nitrous oxide are produced, and, as a secondary product, ammonia. (Trans. Chem. Soc., 1899, **75**, 87.)

Discussion.

Prof. Rây said that a considerable quantity of nitrous oxide was produced when copper dissolved in nitric acid. Nitrogen and nitrous acid were also formed. In Dr. Veley's experiments on the action of nitric acid upon metals, a ball of copper had been kept rotating in the acid, so that the products of the reaction should be removed as soon as possible from the field of action at the surface of the metal. But in the usual preparation of nitric oxide by the action of copper on nitric acid, he had often noticed, when the Woulff's bottle had been left undisturbed, that the solution next the copper became of a deep green colour—a fact which seems to show that nitrite, as well as nitrate, was being produced. Copper nitrite had not yet been isolated, and probably never would be. The apparent production of copper nitrite indirectly confirmed the results obtained by the action of nitric acid on silver and mercury.

Dr. Veley said that if nitric acid had been purified by fractional distillation and finally brought over by some process analogous to the Carré still (the method adopted by Kohlrausch and Heydweiler for the purification of water), few metals were acted upon by it. Indeed, he looked forward to the time when an experimenter would obtain nitric acid of such purity, and a metal—sodium—also of such degree of purity, that, working under suitable conditions, the metal sodium would float peaceably on the nitric acid. They were brought face to face with the problem as to why did the reaction ever commence. Supposing it had begun, and supposing the conditions were such that there was formed some small quantity of nitrous acid, then the reaction would proceed rapidly and the equations represented on the board might or might not be accurate representations of the real facts. With regard to Dr. Divers' statements as to the action of zinc on nitric acid, he would like to say that he had, himself, not worked sufficiently on the subject to be able to express an opinion; all that he had desired to prove (by his demonstration on a former occasion) had been that, if the conditions were such that the zinc dissolved in the nitric acid, nitrous acid was formed. With regard to the experiments, concerning which Dr. Divers had cited certain numbers, he should explain that, of course, nitric acid was present in both the nitrous acid mixture and in what he had called the nitrous-nitric acid mixture. The object of the experiments had been to show that, instead of nitric acid facilitating the reaction between the acid liquid and the metal, it impeded it; the nitric acid present was a something in the way, and therefore he had argued, perhaps incorrectly, that the so-called nitrous acid, and not nitric acid, was the real substance which reacted with the metal. He hesitated to term certain of the equations (those in column 2, page 1184) put forward by Dr. Divers even working hypotheses.

Dr. Divers, in reply, said that he had been gratified by hearing Dr. Veley refer to nitrous acid as a substance of uncertain, shadowy existence, because in 1891 Dr. Veley had brought it against him that he had spoken of it in much the same way, in a paper published in 1885. It was important to have had it cleared up that Dr. Veley's experiments with nitrous acid and metals had established the fact that, in very dilute aqueous solutions, a mixture of nitrous acid with little more than its equivalent of nitric acid was very active upon metals, for that was quite in accordance with the view set forth in the paper as to the combined action of the acids, $NO_2H + HO.NO_2 + 2Ag = 2AgNO_2 + H_2O$. Further, that somewhat more nitric acid greatly impeded that action, although, with much more of it present, it itself became very active, with the nitrous acid as catalyser.

*LUMINESCOPE FOR COMPARING SUBSTANCES UNDER THE INFLUENCE OF RADIUM RAYS.

BY C. S. STANFORD WEBSTER, F.I.C.

The value of the method adopted in the pocket spinthariscope of Sir William Crookes, for observing the scintillating effects produced by the radium rays on sulphide of zinc, has become so generally recognised that a further extension of the method, with the object of rendering it applicable for comparing different substances, both as regards "glow" as well as scintillating power, appears desirable. It is to meet this want that the luminescope has been designed.

The instrument consists of a light circular metal box A (Fig. 1) perforated in the lid where the cylindrical piece B is attached, carrying the draw tube with the system of lenses, the latter in a similar manner to the spinthariscope, except that the pointer, with the radium salt beneath the ocular, is fixed to the inside of the lid, about the position C. The box contains a circular metal disc, shown in plan (Fig. 2) resting on leather, and having a short tube or rod fixed to the centre, which passes loosely through the bottom of the box, thus forming both the axle and the handle D. The disc is kept in place by a flange of leather, which presses on its edge, and is fixed to the lining of the box. The lid of the box is conveniently fastened by the adoption of bayonet joints. By turning the handle D, the disc is made to rotate, bringing the screens into position under the pointer as required. The disc carries four screens, one of which is temporarily fixed by means of the wire spring clips E, and can be removed at will and any other screen of a finely divided substance substituted for comparing the scintillating power, or, in the case of mounted fragments of minerals, &c., for observing the comparative glow.

Fig. 1.

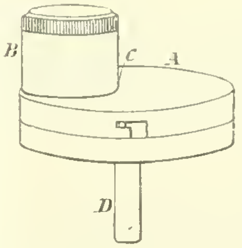


Fig. 2.

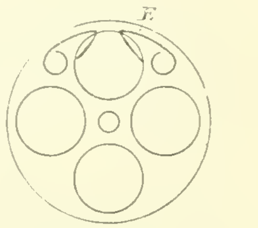

Scale = half actual size.

To obtain the best results with the instrument, the various substances should not all be placed at the same distance from the radium salt. A good plan is to give the screens a

---

* The instrument was originally styled "Fluorescope," but as there is already an instrument termed a "Fluoroscope" in existence, used for direct observations with the Röntgen rays, to prevent confusion the name Luminescope is preferred.

foundation of cork—a thick base, for instance, being used under a mounted fragment of diamond, and a thin one under the screen of sulphide of zinc. The diamond is thus brought near the pointer to obtain the maximum glow; the sulphide of zinc being farther away, the scintillations are consequently seen to the greatest advantage. It is hardly necessary to add that the draw tube must be adjusted for each observation.

I cannot conclude the description of this little instrument without acknowledging the advantage which I have had of the friendly criticism of Sir William Crookes.

METHOD FOR THE DETERMINATION OF PHOSPHORUS IN IRON ORES.

BY J. S. ROWLAND, F.I.C., AND LLEWELLYN J. DAVIES, F.C.S.

The importance of estimating the percentage of phosphorus in iron ores intended for the manufacture of steel, more especially those used in the acid process, is perhaps more necessary at present than formerly, owing to the fact that the low phosphoric ores are becoming more difficult to obtain. Works chemists generally are obliged to keep a watchful eye on all cargoes in order to prevent unsuitable ores going into the blast furnace.

The ordinary molybdate and magnesium methods are quite accurate for all purposes if carefully conducted, but they take a considerable amount of time, and for low percentages of phosphorus require a fairly large bulk of material. Oxidation has to be done with concentrated acids and these evaporated, the residue taken to dryness, and again taken up with acid, washed, &c., which all require attention.

In order to economise labour and save time, we have devised a method which has, in our hands, worked satisfactorily, and given results which agree amongst themselves, and also agree, within allowable margin of error, with those obtained by other analysts on joint samples taken from cargoes of ore.

The chief points of the method are as follows:—

(*a*) The ore is oxidised by incineration with magnesia and then boiled with dilute nitric acid. A solution is thus obtained which contains all the phosphorus, and saves the evaporation and reduction necessary in the other processes.

(*b*) The determination of the phosphorus by titration of the yellow precipitate with standard sodium hydrate and nitric acid solutions.

Method.

Mix one or two grams of the finely ground sample of the dry ore with one gram of calcined magnesia (free from phosphorus). This can be done on a piece of glazed paper. Heat the mixture in a porcelain incinerating dish (2 in. by 1 in. by ¼ in.) at a bright red heat for one hour in a muffle furnace. Allow the dish to cool and then transfer the mixture into a beaker and slowly add about 25 c.c. of 50 per cent. nitric acid and boil for 10 minutes. Allow to settle and decant the clear liquid into a Erlenmeyer flask of 12 oz. capacity, using a good filter paper; add about 25 c.c. of water to the residue in the beaker, boil for five minutes, and filter into the flask and wash till free from acid. All the phosphorus is now in solution.

Add 5 c.c. of ammonia and heat up the solution to boiling, add 50 c.c. of molybdate solution, and wrap in towel, after inserting rubber stopper (or put in shaking box), and shake for 10 minutes. Filter immediately, using a good paper and moderate suction, wash out the flask on to the filter paper five times with 1 per cent. nitric acid solution and also five times with 1/10th per cent. potassium nitrate wash (1 grm. per litre), and wash filter till free from acid. Place the filter paper and contents in the flask, add from 10 to 20 c.c. of standard sodium hydrate solution and shake a moment until the yellow precipitate is dissolved. Dilute with water to about 50 c.c., add three drops of phenolphthalein solution, and titrate with standard nitric acid solution until the pink colour disappears. The cubic centimetres of standard sodium hydrate solution used in dissolving the yellow precipitate represents the hundredths per cent. of phosphorus in the sample analysed when 1 grm. is taken for analysis.

Sodium carbonate can be used in the place of magnesia, but we have found that the latter is more convenient, owing to its infusibility.

In the above method the molybdate precipitate is treated with slight modifications according to the directions given in "A Rapid Method for Phosphorus Determination in Iron, Steel, and Ores," by James O. Handy, in the Amer. J. Analytical and Applied Chemistry, 1892.

Reagents.

Molybdate Solution (*E. F. Woods* 1898 *Formula*).—One quarter pound of molybdic acid is mixed with 300 c.c. of water in a stone jar; 175 c.c. of ammonia (0·90 sp. gr.) is stirred in and the stirring continued until all the matter is dissolved; 75 c.c. of concentrated nitric acid (1·42 sp. gr.) is added to partially neutralise the ammonia solution.

In a 2½ litre bottle is placed 500 c.c. of nitric acid (1·42 sp. gr.) and 1,200 c.c. of water. Pour the molybdate solution into the bottle and mix with a rotary motion. If the stream of molybdate flows quickly and continuously into the acid mixture no separation of molybdic acid takes place. Both solutions may be hot when mixed.

Pure Yellow Precipitate.—This can be prepared from acidified ammonia or sodium phosphate by precipitating with molybdate solution. Wash the precipitate with 1 per cent. nitric acid wash. Dry at 100° C. Keep in a glass-stoppered bottle for use.

Standard Sodium Hydrate.—7·2 grms. of sodium hydrate are dissolved in 100 c.c. of water. Saturated barium hydrate solution is stirred into the sodium hydrate solution until no further precipitation occurs. It is filtered at once and made up to 2 litres with distilled water.

Standard Nitric Acid.—10 c.c. of nitric acid (1·42 sp. gr.) is made up to 2 litres with distilled water.

Standardising Solutions.—Run the standard acid and alkali against each other, and having ascertained their relative strengths add sufficient water to the stronger to make the solutions equal in value. Next run the sodium hydrate solution against 0·100 grm. pure yellow precipitate which equals 0·00163 grm. of phosphorus. If its strength is too great (*e.g.*, if 1 c.c. equals 0·000106 grm. of phosphorus) add to the 2 litres of standard sodium hydrate 60 c.c. of water. In order to preserve the equality of the acid and alkali solutions, add to the 2 litres of standard nitric acid 60 c.c. of water and mix. The solutions will then be equal, and 1 c.c. equals 0·0001 grm. of phosphorus.

Phenolphthalein Indicator.—0·5 grm. of phenolphthalein are dissolved in 200 c.c. of 95 per cent. alcohol. Three drops are used for each titration.

DISCUSSION.

Mr. SPILLER referred to a paper he read entitled "The Estimation of Phosphorus in Iron and Steel" (J. Chem. Soc., 1866, **19**, 148), which was equally applicable to the examination of iron ores, and described how he would treat a spathic ore or clay ironstone. He never went to the length of being able to apply a volumetric process to the method as the authors had done. It was only an everyday method of getting a result which was undoubtedly accurate, and he had heard of its being used in later times.

Mr. GRANT HOOPER asked if Mr. Davies would state the object of igniting the ore with magnesia, and whether, apart from the question of the possible presence of a trace of silica, there was any reason why the molybdate precipitate should not be strictly weighed on a Gooch crucible. He further asked whether on the solution of the molybdate precipitate, with the object of removing any silica that might be present the author had any experience of the process by which the molybdate was then precipitated and weighed as lead molybdate. This process was far more rapid than the ordinary one, and he had found it very useful, though, where a large number of analyses were being made, he could understand that a titration was more rapid.

Mr. Davies, in reply, said, with regard to the condition of the phosphorus in the incinerated residue, that the magnesia in combination with oxygen from the air oxidised all the phosphorus into a form of magnesium phosphate. They had not tested in which form it was in the incinerated residue. In answer to the question of the effect of any silica in the weighing or titrating of the yellow precipitate, he would point out that the yellow precipitate was not weighed in the above process. Any silica that might be present during the process did not appear to affect the results obtained by titrating the yellow precipitate. They always filtered the molybdate solution before use. They had no practical knowledge of the lead method. By the method he had described they could get a result, allowing five minutes for weighing, in 45 minutes. Of course, they did not count the hour for burning, because once the ore was placed in the furnace it required no further attention until roasted, and other work could be done. They knew of no other process for the estimation of phosphorus that could be completed in so short a time, and they had found the results very accurate.

MR. RUSSELL W. MOORE IN THE CHAIR.

PRESENT METHODS OF TANNIN ANALYSIS AND THEIR INFLUENCE ON THE MANUFACTURE OF LEATHER.

BY JOHN R. MARDICK.

The introduction of extract tannins into American tanneries is a new feature and requires very careful mechanical attention in order to make good leather. It is our duty as chemists to exercise a scientific supervision over chemical processes in tannery practice, to manufacture extracts of good quality and to show, by careful analyses, that these extracts contain the true percentage of those tannins which actually combine with hide fibre.

The present methods of tannin analysis are all empirical. The tannins do not form a definite chemical compound with the hide matter; in fact, the absorption of tannins by hide is mostly a physical phenomenon, very closely related to osmosis. Originally, these empirical methods were devised for the benefit of the tanner; now the tanner is only a small factor in tannin analysis. Researches on tannin analysis have now so little direct bearing on the manufacture of leather that they may be said to be made altogether from the standpoint of the extract manufacturer. We know now how much tannin there is in an extract, and we leave the tanner to find out how much leather can be made from that extract.

The tannins reported on paper differ from those of the yard, because the conditions under which the tannins are analysed differ from those of the tannery. For instance, the tannin determinations in the laboratory are made in very weak solutions, containing 3 grms. of tannin to a litre, while most yard liquors are several times stronger than that amount. The result is that while reds and non-tannins go into solution under the conditions of laboratory analysis, to be subsequently taken up by the spongy hide powder and thus raise the percentage of tannins in the report, the same reds and non-tannins remain in the yard as insoluble and are thus not absorbed by the hide. Again, the temperature of a yard in normal conditions runs between 45°—75° F., while the analysis is made between 68°—100° F. Because in the analytical work the concentration of solutions, the temperature and quantity of hide powder differ from tannery conditions, so the percentage of tannins do not agree at all. In the laboratory 15 grms. of hide powder (45 grms. wet) is violently shaken with a solution containing 1 grm. solid, out of which 6 grms. is tannin. Naturally, this large quantity of hide powder absorbs not only the tannins, but also a part of non-tannins, such as gallic acid and soluble matters introduced into the extract for the purpose of preventing the precipitation of reds in the liquid extracts. All this absorbed matter is reported as tannin. Consequently, the tanners cannot make leather to correspond with the percentage of tannins found by the chemist. If methods of tannin analysis are to be empirical and made for the advancement of the leather industry, the conditions of analysis ought to correspond with actual tannery practice.

Tanning in vats involves a loss of 15 per cent. of tannin, while in modern quick tannage the loss is only 5 per cent. Why should there be such an enormous loss in tannins when the entire mechanical loss amounts to only 3—4 per cent.? A definite quantity of an extract, dissolved in a measured vat and made up to 10° bark. liquor and allowed to stand for four days, then analysed according to the American official method, without heating the liquor, but simply diluting, would not give the original percentage of tannins, but the reds and non-tannins are increased. By the official method of analysis only 5—6 grms. of solid matter is dissolved in a litre, and accordingly reds and non-tannins go into solution. In analysis much of the reds and non-tannins is absorbed by the hide powder; hence the high results. In modern quick tannage, where the extracts are heated to 100°—125° F., and then applied in a wheel to the partially-tanned skins, the loss is small, because some of the reds and non-tannins are incorporated with the hide. We cannot apply, however, this temperature to the green stock or the liquors in the vats.

There are two definitions of tannin. According to the extract manufacturer it is any vegetable principle that can be absorbed by hide powder at laboratory temperature and concentration. According to the tanner it is any bark or other astringent liquor that combines with the fibre under the normal conditions of the tannery and forms leather. Do all the tannins reported in analysis really go to make leather? Since some of the non-tannins, gallic acid and reds in these extracts are calculated as tannins, and sold as such, the tanners have always failed to secure results commensurate with the amount of extract used. For example, 100 lb. of 25 per cent. extract, which should make 60 lb. of sole leather (taking oil and moisture into consideration), in actual practice hardly makes 50 pounds, even under the most favourable conditions. This discrepancy led us to investigate the subject, and we have come to the conclusion that extracts contain from 1 per cent. to 5 per cent. less tannin than is guaranteed.

A 5° barkometer liquor was prepared from a chestnut extract, and 100 c.c. of this were treated by the maceration method with 20 grms. (containing 75 per cent. of moisture) of wet hide powder, stirred thoroughly, and large particles on the side of the glass crushed with a spatula. In 15 minutes the hide powder had absorbed all the available tannins that make leather. The clear filtrate was tested with 1 per cent. of gelatine and 10 per cent. of salt solution (this solution being accurate to 0·005 per cent). No tannin reaction could be obtained. Another 100 c.c. of the same liquor treated with 20 grms. of hide powder, shaken for 10 minutes in a milk shaker, and analysed according to the official method, gave from 0·75 per cent. to 1 per cent. more tannins than the former. Since there was no tannin in the filtrate from the maceration method the excess given by the latter method must be something else than tannins.

Again, six solutions of the same strength were macerated respectively with 20 grms. of hide powder, for $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, $1\frac{1}{2}$, and 2 hours respectively. The absorption of non-tannins in the last five cases increased successively from $\frac{1}{4}$ per cent. to 1 per cent. In the case of solid extracts the difference was from 1·5 per cent. to 3 per cent. The following were analysed by the maceration method :—

	Guaranteed.	Found.	Found.
	Per Cent.		
Total solids	..	35·00	40·21
Total soluble solids	..	33·88	38·77
Non-tannins	..	9·80	14·23
Tannins	25	24·05	24·56
Insoluble reds	..	0·50	1·43

These experiments were repeated with other extracts from different houses. Of these extracts it was found that those guaranteed as 25 per cent. tannin contained 24 per cent., while those guaranteed as 26 per cent. tannin contained not quite 25 per cent.

We think that the maceration method gives more reliable results than the shake method, but the greatest difference arises from the concentration of the solutions or amount of sample taken for analysis, as we have pointed out before. In the following results we have used three times more extract than the usual official amount, and we find that our method comes within 0·25—0·50 per cent. of actual tannery practice.

	Chestnut Extract.		Mixed Extract.	
	Modified Method.	Official Method.	Found.	Guaranteed.
Total solids	40·82	40·92	78·52	79·00
Total soluble solids	36·87	39·00	76·58	79·00
Non-tannins	14·00	15·02	15·03	10·60
Tannins	22·87	23·98	61·55	68·40
Insoluble-reds	4·65	1·92	1·94	..

	Quebracho.	
	Modified Method.	Official Method.
Total solids	47·76	47·76
Total soluble salts	39·50	43·55
Non-tannins	8·13	7·97
Tannins	31·57	35·58
Insoluble-reds	8·16	4·21

Of all methods of tannin analysis, the official method of the Association of American Official Agricultural Chemists is the simplest and most promising. Recently Parker and Payne have outlined a method by which tannin solutions are titrated with lime, forming an insoluble compound with digallic acid. Again (Zeits. angew. Chem., May 1904), Wislicenus advocated the use of alumina instead of hide powder. The accuracy of these last two methods has not yet been definitely tested, so we may turn our attention to the official method :—

Objections to the American Official Method.—(1) During shaking, the hide powder in some cases goes into solution (this depends on the strength of the solution), and non-tannins are absorbed.

(2) The quantity of material used for analysis (*i.e.*, 3 grms. of tannin for 1000 c.c.), is too little, and the hide powder too much. The result is that more gallic acid and non-tannins are absorbed by the hide powder. The tannin solution ought to contain 10 grms. of tannin per litre.

(3) There is an appreciable error in making the analysis at room temperature. The solution ought to be measured at 20° C., which corresponds to the temperature of the average tannery.

(4) In the chroming of the hide powder, 3 grms. of chrome alum for 100 grms. of hide powder is not sufficient to make it insoluble. For chroming it is better to use basic chromium, sulphate, or chloride in quantities containing 1 per cent. of chromic oxide (Cr_2O_3) per 100 grms. of hide powder.

F. Kopecky (Collegium, 1904, 211—214) says : "The absorptive power of this hide powder diminishes as it is more highly chromed, but if under chromed, the solubility is greater, especially for acid liquors."

Hide powder absorbs non-tannins under any circumstances ; but we would improve the method of manipulation so that the error from the absorption of non-tannins and gallic acid will be reduced to its lowest limit. We suggest the following improvements in the analysis of tanning materials.

Preparation of Hide Powder.—Digest 100 grms. of hide powder in 1000 c.c. of water for two hours, add 8 grms. of chrome alum, changed previously to chromium basic sulphate by boiling in 50 c.c. of water to 25 c.c. with 1 grm. of soda crystals, after 12 hours squeeze through linen and wash five times with distilled water. In the last washing add 10 c.c. of formaldehyde, and let it stand two hours before squeezing. By a press, get as much water out of it as possible, and use 25 grms. of this hide powder for analysis, and from 1—2 grms. for moisture determination.

Quantity of Material.—For the purpose of analysis the following quantities are recommended :—

Bark.	Grms.	*Extracts.*	Grms.
Hemlock	50	Chestnut wood	40
Oak bark	50	Quebracho (solid)	15
Oak wood	100	„ (liquid)	30
Quebracho wood	35	Gambier	20
Sumac	25		
Spent tan	100		
Amazona	25		

After extracting the tannin materials from the above, the solutions might be made up to 1000 c.c., and measured at 20° C.

Total Solids.—Shake the solution thoroughly, and measure out at 20° C. 50 c.c., evaporate in a weighted dish (6 ins. in diameter, 1 in. high), and dry at 102° to 103° C. for three hours.

Soluble Solids.—To 1 grm. of washed kaolin add 5 c.c. of tannin solution, stir until thoroughly mixed, then add 100 c.c. of the same solution, stir and pour on filter (S. and S. No. 590, 15 cm.). Keep the filter full, reject the first 100 c.c. of the filtrate, and evaporate the next 50 c.c. on water bath, and dry at 102° to 103° C. for three hours in the drying oven.

Non-Tannins.—To 25 grms. of hide powder, in a shake glass, add 100 c.c. of tannin solution, stir, and crush with a spatula the large particles on the side of the glass; after it has stood 10 minutes stir one half minute ; after 15 minutes further standing stir again, and throw on a double folded cheese cloth ; squeeze out as much liquid as possible, filter in same way as in soluble solids, evaporate 50 c.c. on water bath, and then dry at 102° to 103° C. for three hours.

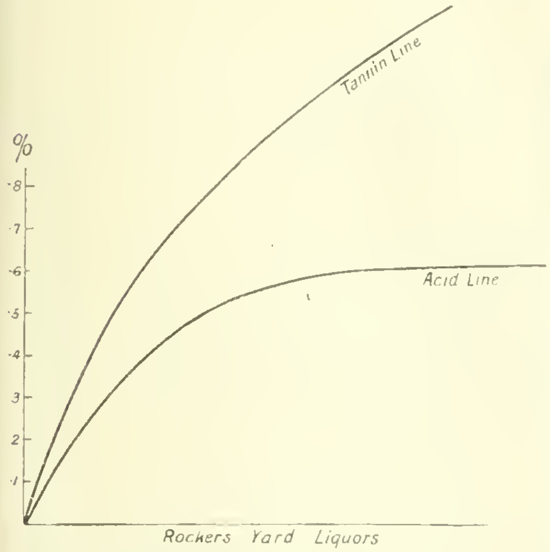
Tannins.—Soluble solids, less corrected non-tannins, give tannins.

Moisture.—100, less total solids, gives moisture.

Testing Non-Tannin Filtrate.—To 5 c.c. of clear non-tannin filtrate add 5 c.c. of 10 per cent. salt solution in a test tube ; add slowly a few drops of 1 per cent. of Nelson's gelatine solution on the side of the test tube. A slight milky cloudiness indicates the presence of tannin.

Precautions.—(*a*) In all quantitative work of tannin analysis, evaporation during filtration must be guarded against, both in the funnel and in the receiver of the filtrator. (*b*) After evaporating the solutions on water bath, the dishes which contained the tannin must be dried at from 102° to 103° C. for three hours, and must be weighed only once. (*c*) In the analysis of gambier, sumac, myrobalans, quebracho, and other sour liquors, let the tannin solution stand with the hide powder for a longer time (about 60 minutes instead of 30), with occasional stirrings.

Acidity in Tan Liquors.—In tanning, the proportion of tannins to the acids in a liquor is of paramount importance, as the success of leather manufacture depends on rightly adjusting the proportion of these two constituents. Brittle leather is obtained when the tannins are less than twice the amount of acids in the rockers and handlers, and again, when the tannins are less than three times the acids in the sapped liquors. To make this more plain, the acids and tannins rise gradually from the rockers and handlers up to the lay-away liquors, then the acids remain stationary, and the tannins increase up to 3 per cent. to 4 per cent. (See diagram.)



The best results are obtained when there is not more than from 0·5 per cent. to 0·6 per cent. acid in the rockers, while the tannins ought to be more than 1 per cent. in the rockers or handlers.

In leaching the bark, some of the extract manufacturers use alkali salts, which diminish the astringency of liquors, and sodium bisulphite, which checks the production of organic acids by fermentation when the liquors are standing in vats; consequently, they require additional acids to restore the tannins to active conditions. The alkali salts combine with the gallotannic and ellagitannic acids, and form the alkali salts of the same acids. In order to free these acids, fresh quantities of acids are required, and this additional item is a large bill of expense in tannery practice. This explains why certain extracts, which are not apparently alkaline, absorb acetic and lactic acids when added to them.

Acid Analysis.—The analysis of acids in tannin liquors is another important element for serious consideration.

The official method of determining acidity in tan liquors (rockers, handlers, &c.) by decolorising with animal charcoal, and then titrating with alkali (with phenolphthalein as indicator) is slow and faulty. Both animal charcoal and filter paper absorb acid; the decolorisation is not complete without heating the solution with a return condenser; the dark coloration produced by titration with alkali and the carbonic acid in the solution make phenolphthalein less accurate as an indicator, and this interferes with the accuracy of the determination. The following, which already is used on the Continent, and to a certain extent in this country (Deutsche Gerber-Zeitung, 1900, No. 45), is suggested as a quick and reliable method for acid determination:—

Take 25 c.c. of tannin solution and titrate with $N/10$ KOH; add alkali, $\frac{1}{2}$ c.c. at a time, and with a glass rod put a drop of the solution on blue litmus paper; observe the change of colour in the paper; in this way, repeat the testing until the solution produces no change in the shade of the paper (the litmus paper should be very sensitive and of good quality). The solution gradually assumes a dark colour as it is neutralised, and the original intensity of the acid colour produced on the litmus paper decreases correspondingly until it shows no change, and this is the end point. Or still better, the end point might be taken between the red and blue papers. In this way a determination can be made in from five to ten minutes. This method is accurate to 0·02 per cent.

MR. S. F. BURFORD IN THE CHAIR.

NOTES ON GLUE AND GLUE TESTING.

BY H. J. WATSON.

Originally it was intended that these notes should deal exclusively with the analysis of glue, but in view of the many sources from which glue is obtained, and the different methods employed in treating the raw material, it has been thought essential to the proper grouping of experimental results to classify the samples, in the first place to the sources of material, and in the second to their order of derivation. Upon the quality of glue desired depends the material and process a manufacturer will adopt.

In the first place under glues, we have skin, bone, and fish glues, and again under gelatines, skin, bone, and fish gelatines, these being subdivided according to method of treatment and order of derivation. In the first group under the subdivision, I place what I term osseine glues, being those glues which are produced by the reduction, fully or partially, of the material to a form of osseine. The term is one well known in the trade, there being in existence some factories wholly engaged in its production. From osseine thus prepared, high-class colourless glues and gelatines are manufactured. In the production of this class of glues and gelatines the preparation of the material has been carried to the highest pitch of perfection known, and the extractive period under heat has been reduced to the shortest possible, probably not more than two hours. We may assume, for all practical purposes, that this is an ideal standard. The samples, however, produced from one osseine material may represent 13 or 14 grades, all of successively lower qualities and representing in each case successive stages of extraction, each of increasing duration under heat. With regard to skin glues under this group there is a deviation in grades according to the requirements of the factory. In any case the first extractive quality will not amount to more than 25 to 30 per cent. of the total product.

In the second group I designate original glues, in that they are composed of 60 per cent. of the material contents of gelatine, and contain the total practicable extractive value of the material. Skin and bone glues come under this group.

In the third group I designate reinforced glues, and include in this class those samples which are prepared from the lower grades of the osseine glues, blended with a certain proportion of original extractive gelatine from lower classes of material.

In the fourth group I designate average glues. I place those samples which are prepared on a continuous system in which the later extraction results are passed into fresh material, and which, therefore, contains a result from a number of extractions of the same material in different stages of exhaustion.

In the fifth group I place successive glues, inclusive of these glues, which, although produced on a system similar to the third group, are reinforced from the same class of material. This grouping does not by any means exhaust the variations in these products. Under each group-heading there will be found a number of minor modifications due to special blends of materials operated upon, the particular market catered for, and also to some extent upon the individual caprice and inherited traditions of a manufacturer.

In French glues the majority may be placed under groups No. 1 (osseine) and No. 3 (reinforced). In Germany and Austria the bone glues are principally group No. 4 (average), the skin glues group No. 2 (original). The foregoing applies to the bulk, but all the groups are individually represented in each country. I would, however, emphasise the fact that there is no standard method in the manufacture of glue as in the case of, say, alkali or other well-known industrial products, and, therefore, the utter failure up to the present to set up some effective standard of valuation of glue is not difficult to understand. In my opinion this failure is due in no small measure to the absence of any attempt to apply different physical tests to samples from the different groups.

Analysis.—Practically the valuation of glue by analysis to the manufacturer is one thing and to the consumer quite another. It must be borne in mind that it is to the consumer that the ultimate decision is valuable, and chemical analysis not giving him any appreciable data of service, reliance is placed almost wholly on one or more of the many physical tests invented. I may here say that the four principal points of value to the consumer are: (1) adhesiveness; (2) strength or cohesion; (3) rate of setting; (4) carrying power or medium absorption. Adhesiveness is best shown by viscosity: strength or cohesion, by consistency jelly test; rate of setting, time taken to congeal. Of course it is impossible to generalise in this matter, as the special value to one consumer is quite a different physical property to another. As an example of what is required by a consumer, one of our customers specifies that the glue shall be submitted to the following tests:—(1) Percentage of water in original glue at 110°—115° C.; (2) percentage of ash and quality; (3) acidity (total and volatile); (4) capacity for drying; (5) percentage of foreign matters not glue; (6) viscosity, along with the physical test of smell of glue size with water absorption, &c.

The principal physical and chemical tests applied to glue were enumerated at the first meeting of this Section by Messrs. Trotman and Hackford, and will be found in the Journal for November 30th.

After numerous experiments with the various methods of glue testing, I place most reliance upon the consistency test, described by Messrs. Trotman and Hackford, and Fels' viscosity test. From personal experience I can affirm that the consistency test does not depend upon individual idiosyncracy, and that a short experience only is necessary to enable one to obtain reliable comparative results which have been found to be of great value in the manufacture of glue. The only objection to the general adoption of this test is in the selection of a standard glue which would have to be the standard of both manufacturers and consumers alike. I have found in many cases it is quite necessary, in addition to the consistency test, to know the viscosity of the glue under examination. For this test I use Fels' method with an Engler's viscometer. In the Journal 1901, page 139, Fels recommends in the application of his test that the temperature be raised from his originally prescribed one of 30° C. to 35° C., because he had met with a glue whose viscosity was 6·24, while the highest limit permissible is 4. Even at this higher temperature I have met with a number of samples which have viscosities higher than 4, one sample showing a higher viscosity than 11. It would appear therefore that a weaker solution ought to be recommended. I am aware that Rideal uses a 1 per cent. solution at 18° C., but I prefer a stronger solution.

Coming now to chemical analysis and excluding moisture, ash, acidity, and the saponification process, the only other constituent which any attempt has been made to determine is nitrogen, and by multiplying by a factor to obtain gelatin. It will perhaps be better to here explain that I prefer to adopt the recommendation of Rideal, and when speaking of the pure substance to spell it *gelatin* and the commercial article *gelatine*. It is generally accepted that the manufacture of glue or gelatine is one of hydrolysis. Collagen, the substance in osseine, which forms the principal basis of all glues and gelatines, is capable of undergoing several stages of hydrolysis, first into *gelatin*, then into *gelatoses* (analogous to albumoses), next into *gelatones* (analogous to peptones), and finally into amido acids. In the process of manufacture the whole of these reactions must take place to a more or less extent, according to duration of the process under heat. It follows, therefore, that these compounds must all be present in commercial glue or gelatine. Besides these substances there must be in the commercial product, according to the source of material and selection and treatment of same, previous to boiling, other nitrogenous bodies, as chondrin, which has gelatinising properties, mucin, albumoses, and other complex nitrogenous compounds. Messrs. Trotman and Hackford, in the paper already referred to, attempt to differentiate between the different forms of nitrogen in glue by using Bömer's method for albumoses. An attempt is made to compare the consistency jelly test with the nitrogen precipitated by zinc sulphate, and which they term albumose nitrogen. In my opinion, any attempt to place a valuation on glue by simply estimating either the total nitrogen or the nitrogen precipitated by zinc sulphate is useless. In the first place, in the total nitrogen is represented all the hydrolysed compounds of collagen and chondrigen, and other complex nitrogenous compounds. In the second place, the precipitate by zinc sulphate is of uncertain composition, because it may contain gelatin, gelatoses, and possibly chondrin; by multiplying the nitrogen found by the factor used by Allen, 5·42, we get gelatin, whether the precipitate is gelatin or gelatose. Messrs. Trotman and Hackford use the terms albumose nitrogen and peptone nitrogen. I make objection to the use of these terms to differentiate between gelatin and nitrogenous compounds not gelatin, because they are somewhat out of place when dealing with gelatin, and because the real albumose can only be a negligible quantity. If there is to be any attempt to differentiate, we ought to keep to the terms used to distinguish the different stages of hydrolysis. Albumin, albumoses, and peptones should only be used for that special group of proteids. A notable point in Messrs. Trotman and Hackford's paper is that the difference between the total nitrogen and the nitrogen precipitated by zinc sulphate can only be due to over boiling. While admitting that over boiling does to some extent destroy the gelatinising properties of glue previous to drying, the adhesive qualities are not impaired in proportional extent, if at all. The points raised by the authors already referred to are of immense interest to the manufacturer and consumer alike: to the manufacturer perhaps more so, because, if, as they state, he is losing gelatin to the extent of 1 to 15 per cent., as shown in their table, it is a serious loss which ought to be easily overcome and at the same time add to the commercial value of his glue. On account of its great importance a number of samples of commercial glue from known sources were selected and examined by the consistency jelly test, Fels' viscosity test at 35° C., total nitrogen and nitrogen by zinc sulphate. With the explanation of grouping given in the opening part of these notes and the table here set out, it will be seen that selection of material and mode of treating same before boiling are the leading factors in the differences shown between the two nitrogen tests. It will be noticed on comparing the consistency test with the viscosity test in every case they are not analogous. I mean the viscosity does not always rise and fall with the consistency. This shows the necessity for having the two methods, and is accounted for from the fact that gelatin and gelatose have not the same gelatinising properties, therefore a method which precipitates and treats both as one for calculation cannot be regarded as a method upon which reliance can be made in valuing glue or gelatine. In the table here given, Nos. 1, 2, 3, and 4, go through almost precisely the same boiling period, and the only difference is a selection of material. No. 1 is a very inferior material, and undergoes little or no treatment prior to boiling. No. 5 is a glue which undergoes the longest period of boiling, and is what is known as a medal glue. No. 6 is a celebrated Scotch grade noted for its adhesive properties, but, according to zinc sulphate test, is not greatly superior to No. 1. No. 11 certainly shows the least difference in the nitrogen tests, but has much less gelatin, according to the zinc sulphate test, than some of the much inferior grades. I have not given an osseine glue in my table, but No. 1 in Messrs. Trotman and Hackford's table is a very good example of a bone osseine glue or gelatine.

In conclusion, it appears to me to be entirely impossible, in the absence of further research and improved methods of distinguishing between hydrolysed forms of collogen, to attempt to place any valuation upon glue or gelatin by chemical methods. The action of heat is different from peptonisation by bacteria, and, although it tends to lessen gelatinising properties, it does not decrease the adhesive properties. Rideal states, after elaborate experiments, that after 12 hours' heating, all the prominent physical properties of value decline, while the chemical reactions are little altered.

Discussion.

Mr. S. R. **Trotman** said that the author's admission of the absence of a standard method of manufacture appeared to be the same thing as admitting a want of control of the different processes, while recognising that a glue might be spoilt by over boiling. These points seemed to point to the value of the method, proposed by himself and Mr. Hackford, at the last meeting of the Section, as a means of differentiating between the different forms of nitrogen and controlling the different processes. If, for instance, the zinc sulphate determination were made on the liquor as at first extracted, any decrease in this figure during the subsequent operations would undoubtedly point to peptonisation and loss of gelatine; for it was absolutely certain that the zinc sulphate figure was inversely proportional to the time of boiling. Mr. Watson's objection that the peptone figure depended upon original materials probably only pointed to the fact that these materials had undergone peptonisation previous to manufacture owing, possibly, to faulty storing. He agreed with Mr. Watson that the total nitrogen figure contained a large number of nitrogenous bodies, and that alone it was useless, but still held firmly to his opinion that, when taken in conjunction with the zinc sulphate figure, it was of considerable value from a manufacturer's point of view. Mr. Watson appeared to have somewhat misunderstood the authors when he stated that they laid much stress upon the ratio between these two figures. The terms albumose and peptone nitrogen were of course merely used as a convenient way of expressing the facts of precipitation. Since the last meeting many samples of glue had been analysed in his laboratory which appeared to him to fully confirm the opinions expressed at the last meeting. In each case where he had two glues, one of which was of good quality and the second of low grade, he had found that by mixing them in certain proportions he was practically able to control both the zinc sulphate figure and consistency at will.

Mr. H. S. **Garry** thought that they were indebted to both Mr. Watson and Messrs. Trotman and Hackford for the earnest endeavours they had made to throw some additional light on the complex nature of the problem in arriving at some standard of measurement of the value in glue samples. While there was much in both papers to which he took exception from a practical point of view, he emphasised the great necessity which existed for some method by which the value of a glue to the consumer could be readily ascertained. One great fault with most of the physical tests referred to was that they were cold tests and the consumers generally used their glue hot. The consistency test was probably the best of its kind, but to get the best comparative results more than one standard glue was necessary. The range given in Mr. Trotman's table should run from 400 downwards instead of 150 to give the necessary adjustment of values, and the standard for 250 to 400 should be of a higher gelatinising power than the standard from 100 to 250 and so on. Another great difficulty with physical tests was that the solutions used did not approximate to those actually in use by the consumer. The comparison in 5 per cent. solutions was not readily applicable to the 30 to 50 per cent. solutions in everyday use as glue. He did not attach the same value to the viscosity test as Mr. Watson. He had an opportunity some little time ago of discussing this test with Dr. Fels in Berlin, and the impression received was that it was as yet in a somewhat immature condition, and, as a comparison of value, left much to be desired. He thought that the consistency test, while giving good comparative results of the cohesion of glue, did not express the value of the adhesive qualities, and that further research would be found to negative the reliance which Mr. Trotman placed on the consistency test and, along with it, the zinc sulphate test of nitrogen as indicative of adhesive properties. It might be taken that the gelatinising power of a glue over a certain limit was obtained at the expense of its adhesive properties and *vice versâ*, and the two characteristics were neither proportional nor relative. The table given by Mr. Watson appeared to him to bear out the criticism he made at the time on Mr. Trotman's paper that the content of nitrogen and also the relative value did not depend so much on the method of manufacture as on the source from which the glue was derived. Mr Trotman assumed that the proportion which the total nitrogen content bore to the percentage shown by the zinc sulphate test was an indicator of value. This would only be correct if the value of the albumoses were the same in each case. Taking the figures given in Mr. Watson's table, he found that the value of the zinc sulphate figures varied from 27·5 per unit to 5·5 per unit, and that in the case of three of the samples, in which the percentage of albumoses was equal, the value of the albumose units was 23·9, 13·9, and 8·4 respectively per unit. This was, of course, the positive side of peptones as a reduction of value in the glue, the basis of the calculation would give, in the case of the lower grades, a minus result greater than the actual price of the product altogether. It appeared, therefore, that if Mr. Trotman's claim were carried to its logical conclusion some separation and classification of the albumoses would require to be made, and he saw no other alternative but the classification of these to source from which they were derived.

Dr. F. S. **Kipping** remarked that the figures given by Mr. Watson seemed to him to coroborate the conclusions drawn by Mr. Trotman at the last meeting.

Mr. H. J. **Watson** could hardly agree with Mr. Garry in his remarks regarding the temperature of the physical tests, for, while the consumer usually used his glue at temperatures higher than those obtained in the physical tests, the real test of adhesiveness or breaking strain was with a set or cold glue. Perhaps this would be a point in favour of the consistency test, which was a comparison of glues under set and not in the liquid state as in the viscosity test. Referring to Mr. Garry's remarks on the viscosity test, it would be quite as easy to take a standard glue as the basis of comparison, as was the case in the consistency test, as to use water as the basis. His own objection to the viscosity test was that, when dealing with a large number of samples, considerable time and attention was required, while with the consistency tests it was a comparatively simple matter to deal with 40 to 50 samples at once without much attention. In a glue factory this was a considerable advantage. Referring for a moment to the table by Messrs. Trotman and Hackford, and accepting the theory that the consistency of a glue increased 10 for a difference of 1·4 in the zinc sulphate precipitate, according to the total nitrogen gelatin, the highest possible consistency would be 171 and would be attained by No. 4 sample. Further, if one took a gelatin with an average moisture and low ash, say 15 per cent. moisture and 1 per cent. ash, and called the difference (84 per cent.) gelatin, then the highest consistency test attainable would be 231. He was aware that the units of their test might be entirely different from those in his, owing to using a different standard glue, but it would be interesting to know what was the highest consistency test they had attained by experiment and whether it had exceeded the highest possible calculated consistency test, as calculated from the zinc sulphate precipitate in their experiments.

Mr. S. R. Trotman, in reply to Mr. Watson's observation as to the standard used in the consistency test, agreed with his conclusions, and stated that he had never found a consistency number greater than 170. Of course this merely indicated that he used a different grade of gelatin as his standard from that which Mr. Watson used.

Scottish Section.

Meeting held in Glasgow, on Tuesday, October 25th, 1904.

MR. R. T. THOMSON IN THE CHAIR.

HIGH-TEMPERATURE MEASUREMENTS (WITH DEMONSTRATION OF PYROMETER).

BY THOMAS GRAY, PH.D., D.SC

Of the numerous instruments which have been devised for the measurement of high temperatures, only those which have proved of practical value and with which the writer is personally familiar will be described and discussed in this paper. As he has no practical experience of the working of the Uehling pyrometer, which is widely used in the United States, and which has also found a limited application in this country, no further reference will be made to this form of instrument.

Pyrometers based on the Expansion of Solids, Liquids, and Gases by Heat.—Numerous attempts have been made to utilise the expansion of solids, more particularly of various metals, as a means of measuring temperature, but none of these have been successful on account of the alteration of structure and consequent change of the coefficient of expansion caused by exposure to high temperatures.

The application of the expansion of liquids is limited to low-temperature work; but a comparatively recent extension of the range of the mercury thermometer is noteworthy. Certified thermometers, constructed of boro-silicate glass, graduated in single degrees up to 550° C. (1022° F.), can now be obtained from any dealer in chemical apparatus.

The expansion of gases, or, more correctly speaking, the increase of pressure at constant volume due to rise in temperature, is the principle utilised in the well-known "air" thermometer, the standard to which all the other methods are referred. The apparatus employed is fragile, and the skill and care necessary for its manipulation render it unsuitable for technical work. Attempts have been made to give the instrument a more practical form by attaching an ordinary pressure gauge to a porcelain or metal bulb by means of a capillary tube. The difficulty of obtaining a material which will withstand the pressure and at the same time be impermeable to the furnace gases at high temperatures has proved insurmountable. The Thalpotassimeter, a pyrometer of a similar type, consisting of a steel reservoir containing mercury, connected by a capillary tube to a pressure gauge, has been used to a limited extent; in this case the increase of the vapour pressure of mercury with rise in temperature is measured by the gauge, which is empirically graduated in degrees centigrade or Fahrenheit. Leakage of air at the joint, which always takes place sooner or later, renders the indications of the instrument untrustworthy.

Change of State.—The melting points of the metals, their alloys and salts have long supplied a familiar means of measuring temperature, but the difficulty of procuring a sufficient number of substances of ascertained melting point has, until recently, prevented the general application of the method. This difficulty no longer exists: Seger "cones" having melting points ranging from 590 to 1850° C., with intervals of about 20° C., are now procurable from any dealer in chemical apparatus. They consist of triangular pyramids composed of kaolin, mixed with silica, boric acid, and various metallic oxides in the necessary proportions to form a graduated series. The melting points of the various compositions have been determined by Hecht with the help of a standard thermo-couple. In applying the method, a number of cones, having a range of melting points which includes the temperature to be measured, is placed on a fireclay plate and introduced into the furnace. If the cones have been properly chosen the first members of the series will be observed to melt, whilst the last will remain unaffected. The melting point of the cone which just softens sufficiently to cause the apex of the pyramid to bend down to the base-plate is taken to be the temperature of the furnace.

The Calorimetric Method.—A cylinder or ball of metal is heated in the furnace and dropped into a measured quantity of water; from the rise of temperature of the water the temperature of the furnace is calculated. The metal used may be platinum, nickel, copper, or wrought iron. Platinum is to be preferred, as it does not oxidise when heated, and has no chemical action on water. The total heat of platinum up to 1600° C., *i.e.*, the amount of heat which 1 grm. of the metal gives out when cooled from the various temperatures down to 0° C., has been carefully determined. From a chemical point of view nickel is more suitable than iron, but the determinations of the total heat of nickel by different observers do not show a very satisfactory agreement. Iron is the least suitable metal chemically, as it oxidises, scales, and decomposes water at high temperatures; but it possesses the advantage of being always available, and the cylinder is thus easily replaced if lost. A large number of determinations have been carried out in the author's laboratory, using an iron cylinder; of these the results of two students chosen at random may be given to illustrate the degree of accuracy which may be expected:—

—	A.			B.		
	1.	2.	3.	1.	2.	3.
	C.	° C.	C.	° C.	° C.	° C.
Temp. by thermo-couple.	812	748	724	734	661	796
Temp. by calorimeter	805	740	725	745	690	790

The calorimeter vessel which was used for these experiments is constructed of thin sheet copper, and has the form of a cylinder with a flanged top; a perforated tube soldered on to the inside serves to protect the thermometer from fracture when the iron cylinder is dropped into the water. The capacity of the vessel is approximately 150 c.c., and the weight of the iron cylinder about 18 grms. The calorimeter vessel hangs supported by the flange in a wider cylinder of metal or wood, leaving an air space of about 1 in. to minimise loss of heat by radiation. The vessel is covered by a lid having a small hole through which the thermometer passes, and a larger one for the introduction of the heated metal cylinder; the rod of a stirrer also passes through the latter opening. A thermometer graduated in $\frac{1}{10}$° C. is used. A very useful table, which gives the total heat of wrought iron at various temperatures up to 1100° C., appears in Fischer's "Brennstoffe," pp. 62 and 63.

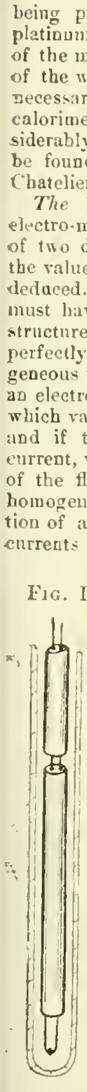
The figures given above show that the method is capable of giving results sufficiently accurate for most practical purposes. It should, however, be noted that it becomes less accurate at higher temperatures on account of the increased loss of heat in carrying the crucible containing the metal cylinder from the furnace to the calorimeter.

By using a fixed ratio between the weights of metal and water, as in the well-known Siemens' form of calorimeter, some labour in calculation is saved; but the advantage is doubtful, except in the case of platinum, as the change of weight due to oxidation and scaling necessitates frequent renewal of the metal cylinders. In the Siemens form, 1 pint (568 c.c.) of water is used, and the weights of the metal cylinders are so adjusted that their heat capacity at ordinary temperatures is exactly one-fiftieth of that of the calorimeter vessel filled with 1 pint of water. The weights used are, copper, 137; wrought iron, 112; nickel, 117; and platinum, 402·6 grms. The high temperatures are graduated on a brass scale, which slides on the thermometer, allowance being made for the increase of the specific heats of the metals with rise of temperature. In using the pyrometer, exactly 1 pint of water is poured into the vessel, and, when the temperature has become constant, the sliding scale is set so that the pointer attached to it is on a level with the top of the mercury thread of the thermometer. The heated metal cylinder is then dropped into the water, and when the maximum is reached the readings of the thermometer and on the sliding scale at the level of the top of the mercury thread are noted; the sum of these gives the temperature to which the cylinder was heated. This form of the apparatus has the advantage of being practically direct reading, but the high price of platinum almost precludes the use of such a large quantity of the metal. If copper or iron be used, frequent checking of the weights and correction for loss due to scaling are necessary. The labour of calculation, using a home-made calorimeter such as the one first described, is lessened considerably by the use of tables of total heats; these may be found in "High Temperature Measurement," by Le Chatelier and Boudouard; translated by Burgess.

The Thermo-Electric Method.—In this method the electro-motive force which is generated when the junction of two dissimilar metals is heated, is measured, and from the value of this the temperature of the heated junction is deduced. The metals which are suitable for this purpose must have a high melting point, and should not alter in structure and composition when heated; they must also be perfectly homogeneous. When a wire which is not homogeneous throughout its length is heated locally by a flame an electro-motive force is generated the value and sign of which vary according to the position at which it is heated, and if the two ends of the wire are joined, an electric current, varying in intensity and direction with the position of the flame, will flow through the wire. If the wire is homogeneous it may be heated at any part without formation of an electric current. The absence of such parasitic currents is obviously a necessity, as these will increase or diminish the intensity of the current due to the heated junction to an extent which will vary with the length of the wire heated in the furnace. The metals which most nearly fulfil the conditions referred to above are platinum and the metals of the platinum group; and the thermo-couples used practically are composed of wires of platinum opposed to an alloy of platinum either with 10 per cent. of rhodium or with 10 per cent. of iridium. The E.M.F. of the platinum—platinum-iridium couple is greater than that of the platinum-rhodium, but the latter gives more constant results, as it is less easily hardened mechanically, and is therefore to be preferred. It may be here noted that an electro-motive force results on heating the junction of a metal in the soft state with the same metal in the hardened state: any local hardening which may be caused mechanically will give rise to parasitic currents.

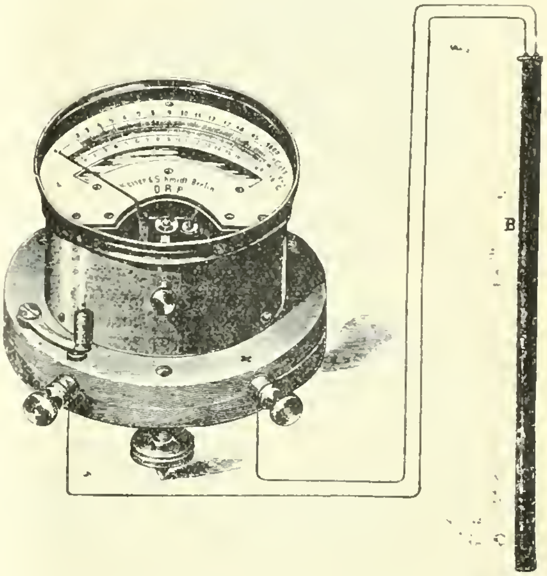
The wires of the couple are joined by fusion in the oxyhydrogen flame, insulated by threading through perforations in a porcelain rod about ¼ in. in diamater, and the free ends of the wires are connected to terminals in a wooden handle. As the composition of the wires is rapidly altered by exposure to heated furnace gases, the couple is enclosed in a porcelain tube glazed within and without, which is sometimes encased in a wider iron tube to minimise the risk of fracture. Fig. I. shows the method of insulating the wires, with the porcelain protecting tube in section

Fig. I.



The couple is used in conjunction either with a potentiometer or with a direct-reading galvanometer, the scale of which is graduated in millivolts and also in degrees centigrade or Fahrenheit up to 1600° C. The latter arrangement is the one more frequently employed, as it is more convenient and less costly. The instrument is of the D'Arsonval type; it consists of a coil of insulated wire of comparatively high resistance (100 to 200 ohms) suspended by a phosphor-bronze strip or spiral suspension between the poles of a powerful permanent magnet; a needle attached to the coil plays over the scale, and indicates the intensity of the current passing through the instrument. The galvanometer may be placed at any distance from the furnace, containing the couple, provided that the resistance of the connecting leads does not exceed 1 ohm. Fig. II. shows the instrument connected to the couple.

Fig. II.



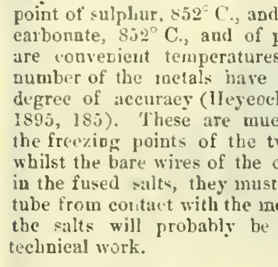
To convert this into a recording instrument the ordinary method of attaching a pen to the needle cannot be employed. Coils of high resistance must be used in the galvanometer, so that the resistance of the leads may be negligible, and the currents thus available are much too small to enable the needle to overcome the friction of the pen on the paper. It may be made to record photographically by attaching a mirror to the coil; light, passing through a slit, is reflected from the mirror and falls on a moving photographic plate or sheet of sensitised paper, thus recording the movements of the coil. The Roberts-Austen photographic recorder, an instrument of this type, has been successfully used for a number of years (see this J., 1892, 840). The record is made on a sheet of sensitised paper fixed on a drum, which revolves once in 6, 12, or 24 hours. An ingenious method of recording is employed by Messrs. Baird and Tatlock, Glasgow. The galvanometer is similar to that shown in Fig. II., but the scale of the instrument consists of a movable stirrup, which is depressed by clockwork every minute. The indicating needle, which is provided with a sharp point, plays under the scale, and when the latter descends this point is brought into contact with an inked strip of cloth, and thus marks the position of the needle on the paper below it. The paper, which has a graduation similar to that of the galvanometer scale, has also the time in hours and minutes marked along its edge, and is made to travel slowly forward by the clockwork mechanism. An examination of this paper shows the position of the galvanometer needle at intervals of one minute during the whole 24 hours, and, unless the temperature is varying very rapidly, a continuous record may be obtained by joining the various points. Another form of instrument, which traces a continuous record on a revolving drum, is made by the same firm.

Each division on the scale of the galvanometer represents about 20° C., and the temperature may be estimated to the nearest 5° C. This does sufficient justice to the method at the higher temperatures, as an accuracy greater than 5° in 1000° C. is not guaranteed. As the couple is standardised with the cold junction at 0°, the temperature of the latter should be observed: if under 30° C., a sufficient correction for practical purposes is made in the case of the platinum-rhodium couple by adding $0·5 \times t^\circ$ to the reading, where t° is the temperature, on the centigrade scale, of the junction of the leads with the wires of the couple.

If the porcelain protecting tube fractures, and the couple is exposed to the action of reducing gases at a high temperature, the wires soon become brittle, and the indications of the instrument then become untrustworthy. Vapours of the metals and substances which act chemically on platinum have a similar effect. Concerning the extent of the variation of the electro-motive force of thermo-couples, caused by exposure to the action of various chemicals, little information is available, but if the platinum has been obviously altered in composition through fracture of the porcelain tube the couple must either be replaced or re-standardised. The boiling and melting points of a number of substances have been accurately determined, and these may be utilised for standardising the couple. The boiling point of sulphur, 852° C., and the freezing points of sodium carbonate, 852° C., and of potassium sulphate, 1066° C., are convenient temperatures. The freezing points of a number of the metals have been ascertained with a high degree of accuracy (Heycock and Neville, J. Chem. Soc., 1895, 185). These are much more sharply defined than the freezing points of the two salts mentioned above; but whilst the bare wires of the couple may be placed directly in the fused salts, they must be protected by a porcelain tube from contact with the molten metals. On this account the salts will probably be found more convenient for technical work.

For the determination of the E.M.F. at the boiling point of sulphur, the apparatus used by Heycock and Neville (*loc. cit.* 197) in the standardisation of the platinum resistance thermometer is convenient. This consists of a hard glass tube about 18 ins. long by 2 ins. wide, with a bulb at the bottom, of diameter about 3 ins. To minimise loss of heat by radiation, the tube is surrounded by an asbestos cone with its base, diameter 6 ins., resting on the bulb. The space between the cone and tube is packed with asbestos wool. The level of the molten sulphur should be from 1 in. to 2 ins. above the base of the cone, to prevent superheating of the vapour. A thin-walled glass tube about ½ in. in diameter, and closed below, is supported in the wider tube, as shown in the accompanying sketch (Fig. 111.). On the bottom of this tube a a thin asbestos cone is fixed with iron wire, to prevent the liquid sulphur from condensing and collecting on the bottom of the tube. The cone is perforated at the base and sides, so that the sulphur vapour passes through and heats the tube, whilst the liquid condensed in the higher parts of the apparatus flows back over the sides of the cone. The base of the cone is shown at B. The sulphur is kept boiling by means of a large Bunsen flame protected from draughts. The insulated couple is suspended in the inner tube, and when the temperature has become stationary the position of the needle is noted.

FIG. 111.



For the freezing-point experiment the sodium carbonate or potassium sulphate is fused in a large covered platinum crucible; in the former case a gas blowpipe supplies sufficient heat, but a small blast furnace is required for potassium sulphate. When the salt is completely fused the gas is turned off, the junction of the couple is immersed in the molten salt, and the galvanometer needle is observed. The temperature falls very quickly at first, but when solidification begins the needle halts momentarily on account of the liberation of the latent heat; when solidification is complete the cooling again takes place rapidly. The position at which the needle remains stationary is noted as the value of the E.M.F. at the temperature in question.

The graph representing the relation of E.M.F. to temperature is very nearly a straight line, but it is advisable to determine more than two points experimentally, unless the range over which the couple has to be used is small. If the interval between the two points does not exceed 300° to 400° C. a line between these will represent the relation with sufficient accuracy for most technical purposes. It is scarcely necessary to add that the temperature to be measured must be within the range of the points determined, or if outside these limits it must lie close to them.

The method described above is convenient, as the necessary materials are always available, and if used with a standard couple it also serves to check the indications of the galvanometer; but it will be found more suitable in practice to have the means of fixing a larger number of points by testing the couple against a standard which is reserved for this purpose. In using this method the two couples—the standard, and the couple to be tested—are stretched out so that each forms a continuous wire, and threaded through the insulators so that the two junctions are as near together as possible. They are then placed in a porcelain tube and inserted into a furnace; the free ends (the so-called cold junctions) are gathered together and wrapped in cotton-wool, taking care that they remain insulated from one another; or, if greater accuracy is required, the cold junctions are immersed in melting ice. The free ends are connected, through a two-way switch, to the galvanometer in such a way that the standard couple is in circuit in one position of the switch and the couple to be standardised in the other. By switching in the standard couple, the temperature of the furnace is obtained with the help of the table of E.M.F.'s supplied, and the value for the other couple at this temperature is then ascertained by bringing the switch into the second position and noting the reading on the galvanometer. Any number of points within the range of the furnace can thus be readily determined, and these are subsequently plotted out on squared paper in the usual way; a convenient scale is 1 mm. = 5° C. = 0·05 millivolt. Care should be taken to close the ends of the furnace well, to prevent draughts of air, which might cool one of the couples to a greater extent than the other. For temperatures up to 1400° C. a convenient form of electric furnace, wound with platinum foil, is supplied by Heraeus, of Hanau. A resistance furnace for temperatures up to 1200° C. is cheaply constructed by winding nickel wire, 16 to 18 B.W.G., closely round a porcelain tube about 1 ft. long by 2 ins. to 3 ins. in diameter; the nickel wire is covered over with a paste of magnesia and water to prevent oxidation. When dry it is surrounded by a piece, about 3 ins. thick, of the magnesia covering which is used for insulating steam pipes. The furnace is connected with the electric mains through a suitable resistance, which admits of varying the temperature to the desired extent.

The Platinum Resistance Thermometer.—The utilisation of the increase of the resistance of a platinum spiral due to heating was first proposed and applied practically by Siemens as a means of measuring temperature. The construction of the thermometer was subsequently improved by Callander, who replaced the porcelain cylinder on which the spiral was wound by two slips of mica set at right angles to one another, so that the wires of the spiral touched the edges of the mica only, and thus reduced to a minimum any change of resistance due to the action of silica on platinum at a high temperature. The law connecting the resistance of platinum with temperature was determined by Callander and Griffiths up to 600 C., with the help of an air thermometer. The accompanying illustration (Fig. IV.) shows the construction of the platinum resistance thermometer made by the Cambridge Scientific Instrument Co. It consists of a spiral of thin platinum wire wound double round a framework composed of two strips of mica, which in section have the appearance of a cross. The free ends of the spiral are joined to stout platinum leads, which, near the top, are fixed to copper wires connected to binding screws in the wooden handle. As the resistance of the platinum wires increases with rise in temperature to an extent which varies with the length heated, a compensating arrangement is introduced. This consists of a continuous platinum wire of the same dimensions as those of the leads, which is doubled on itself and fixed so that the bend reaches the beginning of the spiral. The four wires are arranged symmetrically, and are insulated and held in position by a number of perforated mica discs, through which they pass.

Fig. V.

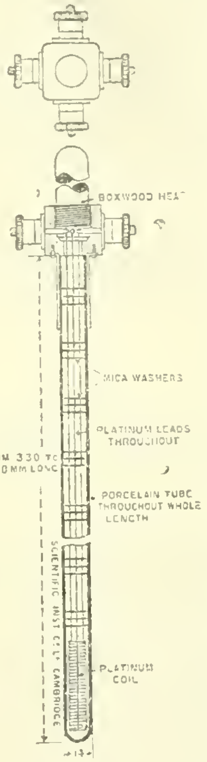


Fig. IV.

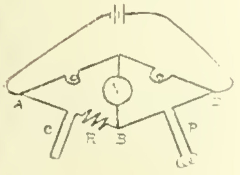
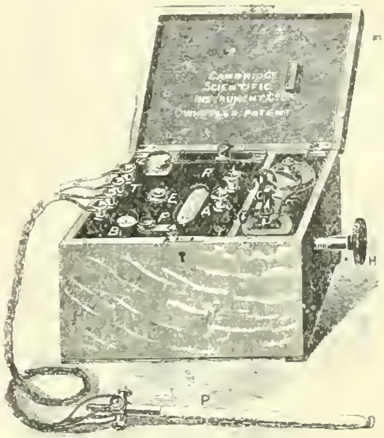


The ends of the compensator are connected with the two additional terminals shown in the illustration. The spiral and wires are enclosed in a porcelain tube, diam. ½ in., glazed outside and in. The method of measuring the increase of resistance is that of the familiar Wheatstone bridge shown in the accompanying diagram (Fig. V.). For the sake of clearness, the compensator, which lies alongside the platinum leads within the porcelain tube, is represented apart from them in the diagram. The resistance of the arm A B, which includes the compensator C and the rheostat R, is equal to that of the arm B D when the thermometer P is at 0° C., and in this condition no current passes through the galvanometer when the battery circuit is closed. This equality is disturbed when the thermometer is heated, and the increase of resistance of the spiral is measured by determining the resistance which must be added by the rheostat to re-establish equilibrium. This additional resistance represents that due to the heating of the spiral alone, as the increase of resistance of the leads is exactly compensated for by an equal increase in that of the compensating wire C. Fig. VI. illustrates the Whipple indicator, a convenient portable form of this apparatus suitable for technical work. The rheostat consists of a continuous wire, wound on the inside of a drum, provided with a contact, which slips over the wire as the drum is rotated by the handle H; the position of this contact is indicated by a pointer A outside the drum. On the outer surface of the drum, visible at A, the temperatures corresponding to the added resistances are marked in degrees centigrade or Fahrenheit up to 1400° C. In making an observation, the four binding screws T of the indicator are connected with the terminals of the thermometer by means of four insulated copper wires, as shown in the illustration, and the handle of the rheostat is turned till no movement of the galvanometer needle B is observed when the battery circuit is closed by depressing the key F. The temperature is then indicated on the drum by the pointer A. The indicator may be placed at any convenient distance from the thermometers, and by means of a suitable switchboard can be connected to any one of them. The resistance of the flexible leads has no effect on the accuracy, as that of the pair from the platinum spiral is exactly counterbalanced by the resistance of the pair connecting the compensator to the indicator. The apparatus is very sensitive, and readily indicates differences of temperature of less than 1° C. A recorder for use with the platinum resistance thermometer is made by the same firm.

Fig. VI.



Optical Pyrometers.—These instruments utilise the increase of intensity of the luminous radiations of a heated body with rise of temperature as a means of measurement. The intensity of the radiations emitted by different bodies at the same temperature varies with the nature of the heated substance; so-called "dark" bodies, of which lampblack is the best example, have a high emissive power, whilst that of highly polished metallic surfaces is small. A pyrometer based on the ascertained law which governs the relationship between the intensity of the luminous radiation and the temperature will only give correct indications in the case of substances which have the properties of a dark body, *viz.*, the power of absorbing completely the light which falls on them, and consequently of radiating light of every colour and wave-length. Iron in the incandescent state reflects very little light, and consequently approximates to the condition necessary. Polished platinum, on the other hand, reflects a large proportion of the light which falls on it, and consequently does not satisfy the necessary condition. Lampblack approximates most closely to the theoretically dark body. According to Kirchhof, however, the intensity of radiation of a closed space provided with an opening through which it may be viewed, is the same as that of a dark body, so that all closed furnaces comply with the necessary conditions.

The gradual change of colour from dull red to dazzling white which is observed when a body is heated, serves as a rough gauge of the temperature. If the substance which is being gradually heated is viewed through a spectroscope, a dark red band is first seen; this gradually broadens, and at higher temperatures the colours yellow, green, blue, and violet successively appear, forming a continuous spectrum. Simultaneously with this extension of the spectrum there is observed an increase in the intensity of each of the individual colours, and this increase may be utilised as a measure of the temperature.

The Wanner Pyrometer.—In this instrument the light emitted by the heated body, the temperature of which is being measured, is broken up by a train of prisms, and the spectrum is screened off so that only the red portion corresponding to the Fraunhofer C line is visible. The intensity of this is compared with that of the red radiation from a small 6-volt electric lamp. The pyrometer has the external appearance of a telescope about a foot long; at the end which is directed towards the furnace there are two slits, one half of which is covered by the small electric lamp. When the instrument is directed towards the furnace, the field, as viewed through the eye-piece, is seen to be composed of two semicircles; one of these is illuminated by the lamp, and the other by the light from the furnace. The two halves of the field can be adjusted to equal intensity by rotating the analyser, which forms the eye-piece of the instrument; and, from the angle through which the eye-piece has been turned to produce equality of colour, the temperature is ascertained by reference to a table.

FIG. VII.

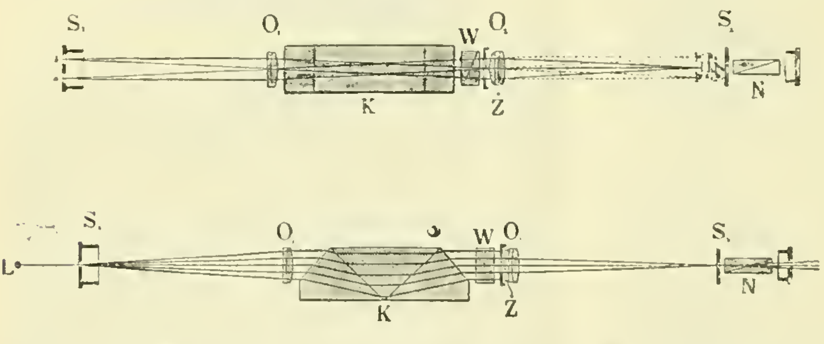


Fig. VII. shows sections through the instrument in two planes at right angles to each other. The light from the two sources *a* and *b* (lamp and furnace) passes through the slit S_1 which lies in the focus of the lens O_1; it is broken up into its constituent colours by the train of prisms K, and is subsequently polarised by the Nicol's prism W; the rays then pass through a double prism Z, and are afterwards brought to a focus by the lens O_2. Two images of *a*, due to the ordinary and extraordinary rays, and two of *b* are thus formed, but the prism Z is so constructed that the image of *a*, due to the ordinary rays, coincides, in front of the eye-piece slit S_2, with that of *b*, due to the extraordinary rays. On looking through the eye-piece the upper half of the field is seen illuminated by rays from *a*, and the lower half by those from *b*, as the sets of rays are polarised in planes at right angles to each other. Rotation of the analyser N has the effect of intensifying one half of the field and weakening the other.

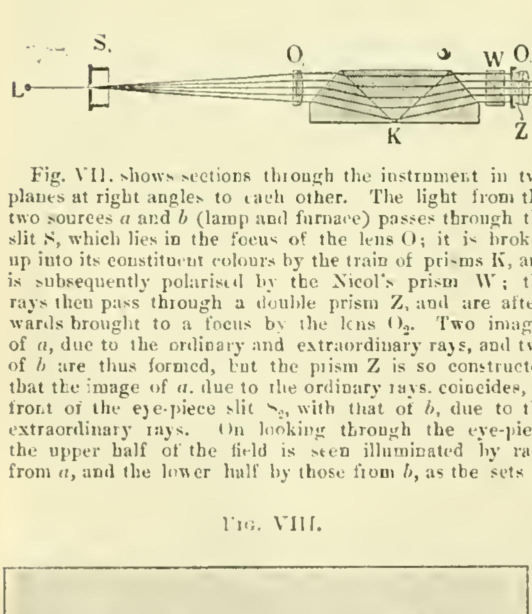
The electric lamp must be adjusted periodically by comparison with the flame of a lamp burning amyl acetate. For this purpose it is placed on the stand with the slit directed to the flame of the amyl acetate, as shown in the illustration (Fig. VIII.). The analyser is set at zero, and the resistance in circuit with the lamp is adjusted so that the upper half of the field, illuminated by the electric lamp, has the same intensity as that of the lower half, lit by the amyl acetate flame. The instrument is then ready for use. The standard is the flame of amyl acetate, but as it would be impossible to apply it practically, on account of the flickering caused by draughts of air, an electric lamp is adjusted to this standard and used in its place.

FIG. VIII.



Two forms of this instrument are made — one for measuring temperatures from 900° to 2000° C., and the other for the range 900° to 4000° C. The adjustment to equality of illumination can be easily and quickly made; the error is approximately half a degree of rotation, which corresponds in the first of these instruments to about 5° at 1300° C., and 14° at 1600° C.

Discussion of the Various Types.—For occasional observations of temperatures up to 1000° C. the calorimetric method, using an iron cylinder, will be found serviceable. The comparatively trifling cost of the apparatus is its chief recommendation. For higher temperatures a platinum cylinder may be used, but care must be taken to avoid loss of heat in transferring the cylinder from the furnace to the calorimeter. On account of this possible source of error, the writer would prefer to rely on the use of Seger cones for occasional determinations within the range 1000° to 1800° C. As a continuous means of indicating and recording temperatures up to 1600°, the thermo-electric method is the most generally useful. The fragile character of the porcelain protecting tube is a very decided drawback, as the cost of frequent renewals is high. If care be taken to avoid rapid change of temperature by warming the tube slowly before introducing it into the furnace, and by allowing it to cool gradually during the withdrawal, such a tube may last for months. If it were possible to produce quartz tubes of the necessary size at a reasonable cost, the adoption of this material would add greatly to the utility of the method. When fracture of the porcelain tube does take place, the wires of the couples are easily joined if broken, and restandardisation is a very simple operation when the necessary arrangements are available. In cases where a very long couple is used the increase of resistance due to heating may introduce an appreciable error; on this account, galvanometers with high-resistance coils should be employed.

Where a close indication of temperatures up to 1000° or possibly to 1200° C. is required, and for all low-temperature observations, such as in cold storage, the platinum resistance thermometer may be recommended. It is much more sensitive than a thermo-couple, and, when combined with the Whipple indicator, readily shows differences of less than 1° C. In situations where the porcelain protecting tube is liable to fracture, the thermo-couple will be found more satisfactory. The platinum spiral is readily affected by hot furnace gases, and if damaged is much more difficult to repair and less easily standardised; the cost of renewal is also considerably greater. For temperatures above 1600° C. some form of radiation pyrometer is necessary, and here the Wanner pyrometer will be found serviceable. Its accuracy is now certified, if desired, by the Physikalische technische Reichsanstalt, Charlottenburg. Although it does not indicate directly, the observation is easily and quickly made, and where a number of measurements of the temperatures of various furnaces have to be made, it is possible to operate more quickly than with a thermo-couple, on account of the necessity to allow the latter to heat and cool slowly, in order to prevent fracture of the porcelain tube. If the unprotected couple is used, or if a couple is kept permanently fixed in each furnace with a suitable switch to bring it into connection with the galvanometer, this advantage disappears; but the cost of upkeep of the couples and tubes, and the labour of standardising or renewing the couples, are greatly increased. The fact that the instrument itself is not heated is a strong recommendation, as the destructive action due to exposure to high temperatures is in some cases excessive with the other forms of pyrometer. The limitations to the use of the instrument referred to in the description should be noted.

Meeting held in Edinburgh, on Friday, December 6th, 1904.

DR. HUGH MARSHALL IN THE CHAIR.

THE EXAMINATION OF LINOLEUM AND THE COMPOSITION OF CORK.

BY DR. HARRY INGLE.

In the past the testing of the fabrics known as linoleum, inlaid linoleum, cork carpet, &c., for their suitability as a floor covering has been mostly based upon appearances and rule of thumb. The only exception to this rule, so far as the writer is aware, are the tests applied by the British, German, and French Governments, for the most part not published. H. Burchartz, of the Königlich Preussische Techn. Versuchsanstalt at Charlottenburg (this J., 1900, 255), gives the tests applied by the German Government. These tests will be noticed later, as well as others applied by various users.

Before proceeding to a detailed discussion of the tests it would be best to clearly define the varieties of linoleum, &c., met with in the trade. A detailed description of the linoleum manufacture, with the history of the industry, was read by W. F. Reid before the London section of our Society (this J., 1896, 75). Since then, however, the trade has developed, and many new varieties of linoleum are to be met with. These fabrics may be grouped into the following classes:—Linoleum, Plain and Printed; Inlaid Linoleum; Cork Carpet. Plain and printed linoleums, apart from the jute canvas, and backing, consist essentially of cork, pigment and a cement. The cement is obtained from linseed oil either by oxidation or polymerisation. In the oxidation processes, introduced by Walton, the inventor of linoleum, the linseed oil is converted into a semi-solid subtance by exposure to air, either by running it when charged with a drier over thin cotton (the scrim process) or by exposing it to air in the form of finely divided drops (as in Walton's later patents). This semisolid is then melted with a certain proportion of kauri gum and resin to produce the cement.

In the polymerisation process (Taylor-Parcacott patents) the oil is converted by the action of heat into an elastic rubber-like substance. This may be used as the cement or in combination with resin. The plain linoleum thus obtained from the cement, cork, and pigment, may be printed with oil colours to produce designs (printed linoleums).

Inlaid Linoleums.—In these the design permeates the body of the material. They are made by a variety of processes; for detailed information on which the patent literature in the Society's journal may be consulted. Granite linoleums also belong to this class. The composition varies from that used in plain or printed linoleum, inasmuch as it contains in place of some of the cork a varying proportion of wood-dust, and usually a larger percentage of pigment. The cement used in inlaid linoleum, so far as the writer is aware, is always made by the Walton oxidation process.

Cork Carpet.—In these the cork grains used are larger. Wood-dust is never employed, and the quantity of pigment is usually, though not always, smaller than in plain and inlaid linoleums. Both kinds of cement are used.

Having thus described the various kinds of linoleum and linoleum-like products, I will now devote some space to a discussion of the methods of examination already proposed and to the description of my own experiments.

Determination of Ash.—The ash obtained on incineration of linoleum gives a roughly approximate indication of the quantity of pigment present. This is only the case, of course, when inorganic pigments, such as oxides of iron, have been used to colour the linoleum. Organic, or partly organic pigments, such as the colour-lakes and Prussian blue, leave only their mineral ingredients behind as ash. Another source of error arises from the fact that ochres used lose their water of hydration. Compensating these errors are the facts that the cement leaves behind the driers used, and that cork itself is not absolutely free from mineral matter. Cork gives an ash content of from 1·8 to 3 per cent.

The quantity of ash given by different makes of linoleum varies very much. Inlaid linoleums usually give the most ash, although I have found some samples of German-made plain linoleum almost as high in ash content. One sample of plain green linoleum made by a German firm gave 27·4 per cent. of ash. Light-coloured linoleums usually contain more ash than those of dark colour, as more pigment has to be used to cover the colour of the cork.

Now, as to the value of a determination of the ash content in gauging the quality of a sample of linoleum, the following considerations may help us:—

(1) A large ash content indicates an increase in weight per square yard, a harder and less resilient, and consequently a more noisy, linoleum to the tread. It also shows that the linoleum is a better conductor of heat and less warm to the feet.

(2) As pigments do not possess the elasticity of cork, a linoleum containing a large amount of ash, anything above 20 per cent., is apt to be brittle. This was shown by the above-cited German sample. In the manufacture of inlaid linoleums which contain light colours this is corrected by an additional amount of cement.

(3) With regard to the wearing properties of a linoleum containing a large amount of ash, I have no reliable data, but I am inclined to think that the ash content would not have any important influence.

Attrition Test.—At the Königlich Preuss. Techn. Versuchsanstalt at Charlottenburg the linoleum is subjected to a certain number of revolutions of a loaded leaden disc of known area and fed with a given quantity of emery powder, and the weight lost per 50 sq. cm. is determined (Burchartz, *loc. cit.*).

This method is doubtless a valuable one, but the results obtained are largely dependent on the nature of the machine used, and the method, moreover, is somewhat difficult to carry out, requiring apparatus such as is not usually available in the chemical laboratory.

Bending Tests.—Burchartz (*loc. cit.*) recommends the testing of linoleum by bending it over mandrels of 23, 25, 30, &c., mm. diameter. Such tests require to be carried out with discretion. Their value obviously depends upon the use to which the linoleum is to be put. Stair cloth should of course withstand the most severe test in this respect, but for linoleum which is to be laid flat the test is of less importance, except in so far as it shows how far the linoleum is likely to suffer in the handling before it is laid and is a partial measure of certain other properties of the linoleum.

Speaking generally, the thinner qualities of these fabric will stand bending over a smaller mandrel than the thicker, but they do not on that account wear longer. Printed linoleums usually crack more easily than plain goods, and inlaid linoleum does not stand bending so well as printed linoleum, but it wears longer. Obviously the test requires caution in its application. Applied to samples of the same class of fabric it is valuable as an indication of adhesion between the grains of cork pigment and cement, but it is of little use in differentiating between the wearing qualities of two dissimilar fabrics.

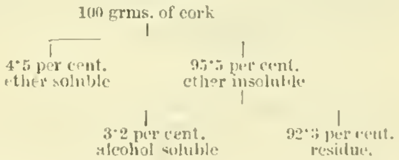
Tensile Strength.—This may or may not be a factor of importance in the valuation of linoleum for use under ordinary circumstances. As usually linoleum is not subjected to any stretching strains. I must confess I fail to see its value. However, H. Burchartz (*loc. cit.*) tests the strength of linoleum in the direction of calendering and at right angles to it, and for his results the reader is referred to the original paper.

Determination of Cork and Cement Content.—At first sight this seemed an easy problem; all that appeared necessary was to treat the linoleum with an alkali, when the oxidised oil and resin in the cement would be converted into soaps which could be removed from the cork by filtration, the acids precipitated in the filtrate and weighed. Knowing that cement contained about 80—90 per cent. of fatty and resin acids, the result of the experiment should show the cement content.

On carrying out the experiment with a linoleum of known composition it gave a result 19 per cent. too high It was thus seen that this method was unreliable. I consequently determined to examine the matter *da capo*, namely, cork itself and the chemistry of this substance.

Composition of Cork.—Very little appears to be known as to the composition of cork. Chevreul found in it a white waxy substance soluble in alcohol and ether which he called cerin or cork wax. From this Siewert isolated a substance called by him phellyl alcohol, deca-acrylic acid and another acid. The amount of ether extract is given at 1·8—2·5 per cent. of the cork. There remains a substance insoluble in ether termed by Chevreul suberine or cork proper. By the action of nitric acid (20—30 per cent.) a residue of from 3—5 per cent. of cellulose was obtained, the main mass of the cork being oxidised to a mixture of fatty acids of which suberic acid is the chief. By heating cork with sodium sulphite solution to 166° C. a residue of from 9—12 per cent. of pure cellulose was obtained. For other information on cork see Watts' Dictionary, Vol. I., page 72. I was unable to find any their information in the literature on the subject of cork.

The following experiments were carried out. Ordinary ground cork such as is used in the manufacture of linoleum was dried and extracted in a Soxhlet extractor with ether and then with alcohol:—



The ether soluble portion was crystalline and yellowish-white in colour. The alcohol soluble portion was a reddish-brown, amorphous solid.

The action of alcoholic potash on cork is of interest in this connection. 10 grams. of dried cork were treated with alcoholic potash on the water-bath for six hours in a flask provided with a reflux condenser. The contents of the flask were filtered, the residue washed with alcohol, dried, and weighed, and the alcoholic filtrate and washing kept for examination. The residue was then ignited, and the ash, consisting mainly of potassium carbonate weighed. Another 10 grms. were saponified in the same way, the precipitate washed with alcohol and then with hot water, and the two washings kept separate. The residue, consisting of cellulose and ash, was dried and weighed and the ash determined by ignition.

In the table at foot of page the two experiments are combined. Collating these results it appears that the saponification of cork produces the following:—

(*a*) Cellulose	24·4
Ash	1·8
(*b*) and (*f*) Ether-soluble acids	22·68
(*e*) Ether-soluble unsaponifiable	3·45
(*d*) Alcohol-soluble, but ether insoluble, unsaponifiable	7·4
(*c*) Ether- and water-insoluble, but alcohol-soluble acids	5·9
Alcohol- and ether-insoluble, but water-soluble acids and loss	34·37
	100·00

(*a*) consists of cellulose and lignin.

(*b*) is a dark brown sticky resinous substance of an acid character, soluble in ether and alcohol.

(*c*) is a dark-red brown amorphous brittle resinous substance of acidic character.

(*d*) is a white semi-crystalline substance of a neutral character. It is very insoluble in cold, but slightly soluble in hot alcohol, the solution of which gelatinises on cooling; m. pt. 210°—230°.

(*e*) consists of more or less white needles which are not acid in character.

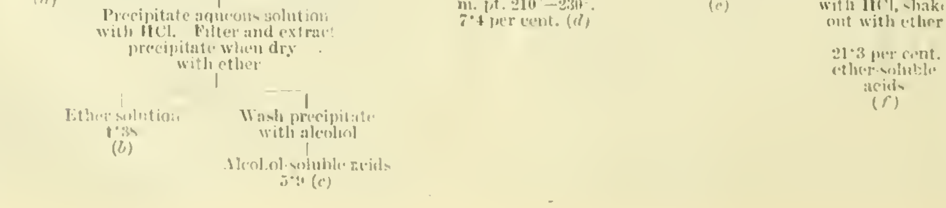
(*f*) consists of a sticky waxy substance of light brown colour and acidic character. It has an iodine value of 45 (Wijs), and would thus appear to be unsaturated. It is soluble in ether and alcohol, partly in petroleum ether.

An examination of these substances is in hand. From the above it is clear that any attempts to determine either the amount of cork or of cement in linoleum by saponification is futile, because the acids precipitated from the soaps and dissolved in ether must contain not only the oil and resin acids, but also all the ether-soluble substances derived from the saponification of the cork present, every 100 parts of which yield 25 parts of ether-soluble substance, leaving only 24·4 parts of cellulose behind.

However, cork varies very much in composition, the cellulose varies from 20 to 35 per cent., and consequently the ether-soluble portion must also vary very much.

From what has been said it is clear that it is impossible to determine the quantity of cement and cork present in a linoleum by the saponification method.

Ether Extract.—Pinette (this J., 1892, 550) considers that the linoleum giving the most ether extract is the most valuable because, he says, it contains the most oil.



Lewkowitsch (Oil, Fats, and Waxes, 2nd edition, p. 741) disputes Pinette's conclusion, because he considers that a large amount of extract shows that the linoleum cement has not been sufficiently oxidised in stoving, since linoxyn, the final product of oxidation of the cement, is insoluble in ether.

There is an element of truth in both these contentions; but again, before deciding upon the value of this constant as a criterion of the quality of the linoleum, several factors have to be taken into account.

Of what does the extract consist? The non-oxidised or non-oxidisable portion of the linseed oil and of the gum and resins used in the manufacture of the cement. It is also swelled by the ether-soluble constituents of the cork, which we have seen may reach as high as 4·5 per cent.

Now, if the linoleum be made solely from polymerised linseed oil (Taylor's cement), then we have only the non-oxidisable portions of the linseed oil and the cork extract. Samples made in this way I have found to give an extract of from 8 to 10 per cent. Sometimes the cement thus prepared is afterwards mixed with resin (the presence of which in the extract is readily recognised by the Liebermann-Storch reaction) and then the ether extract may rise to as high as 17·8 per cent.

If the linoleum be made from cement made by the oxidation process, then it contains in addition the non-oxidisable portions of the gum and resin. Consequently, linoleums thus made must always give a larger ether extract than those made with Taylor cement only. In examining such linoleums I have found extracts varying from 16·9 up to 23·3 per cent. (see table below). It is thus clear that with the same class of cement the linoleum which yields the most extract contains the most cement, but that it is not right to compare two linoleums made from different kinds of cement.

Moisture Content.—A determination of the moisture present is of importance, as it reveals the amount of surface presented by a given weight of linoleum, and hence is proportional more or less to its porosity. It is determined by drying for one hour in the water-oven. The amount is only small, varying from 1·3 to 4·3 per cent. (for details, see table below).

The importance of non-porosity of linoleum will be treated below.

Action of Water.—Burchartz cemented a glass tube on to the surface of linoleum, filled it with water, and observed if the level sank. He came to the conclusion that linoleum is practically waterproof, and did not observe any difference between different makes. This method does not recommend itself to me on account of the very limited area examined. Some foreign governments subject the linoleum to the action of salt water at 80° C. for six hours and observe the appearance of the treated material, which they stipulate should not show any blisters. It is difficult to see what bearing this has upon the everyday applications of linoleum. In my opinion such a treatment would give a premium to the poorer and more porous qualities of linoleum, for if the linoleum presented a closed and impervious surface, then the heat, by expanding the gases and air enclosed in the linoleum, would cause blisters. I think I have devised a method for the examination of the action of water upon linoleum, which gives more reliable results and which enables one to detect differences in samples of which the already discussed tests, with the exception of the moisture present test, give no indication: differences which, however, show themselves very distinctly when the linoleum is in actual use.

Water Absorption Test.—This consists in soaking pieces of linoleum in water at say 15° C. for a given period, 24—48 hours, and for a longer period, two to seven weeks. In carrying out the test the canvas back is removed, and the back of the linoleum layer rasped smooth with a file. A piece of the linoleum of about 50 sq. cm. area is dried in the water oven and weighed. The drying renders any wax which may have been used in facing the linoleum fluid, and causes it to sink into the interior of the fabric, thus opening up the pores for the freer action of the water. The linoleum is then placed in water for a given period, removed, dried between filter paper and weighed. The increase in weight gives the water absorbed, and other things being equal, this is a measure of its value.

In carrying out the tests all the samples to be examined should as far as possible be immersed together so that the results may be comparative, avoiding any disturbing influences arising from fluctuation of temperature.

Sample.	Kind of Linoleum and Cement used.	Weight per square inch in		Total thickness in	Lino thickness in	Moisture present.	Ash content.	Ether extract.	Water absorption per cent. in

It has been said that the results are a measure of the value of the linoleum. This is the case because they are an indication of its porosity. A large water absorption means a high porosity, and great porosity may indicate that the granules of the linoleum are not cohering sufficiently and consequently may be more easily removed by wear. It also shows that there is a likelihood of a free entrance of particles of dirt into the material, causing it to wear dirty. As many soaps are more or less alkaline in character a porous linoleum when washed stands a greater chance of having its binding material, oil and resin, dissolved by those alkaline fluids and thus is more likely to disintegrate.

When used in places where weight is an important factor, as on board ship, it is obvious that a porous linoleum is likely to retain more moisture than a less porous one, and hence is less suitable. In judging the linoleums by this test it is important to bear in mind that only those kinds of linoleums which belong to the same class should be compared, and not only that but the thickness should also be the same. I have found that the thicker qualities absorb less per cent. of their weight than the thinner, as they present less surface.

It would also be absurd to compare inlaid or plain goods with printed goods, because the water absorption is in this case given by the linoleum mass and is not a measure of the wearing qualities of the paint layer, which is practically waterproof. Neither would it be fair to judge the wearing qualities of cork carpet as against plain or inlaid on this test. The larger grains of cork used in cork carpet present a greater surface to the action of the water and hence more is absorbed, but the very fact that the cork grains are larger makes the fabric more resilient and therefore less likely to wear. Cork carpet as a matter of fact wears practically as long as plain or inlaid linoleum.

With these reservations the writer considers that a determination of the water absorption of two samples of linoleum belonging to the same class is one good means of determining their relative wearing properties and values.

In the table the results of the examination of samples representing the makes of eight different firms (six British, one American, and one German) are given. They were obtained from samples which the author still retains and must be considered as applying to these only, although in selecting them he has as far as possible made them representative of all the samples he has examined.

In conclusion he would urge that the result of no single test is sufficient to rely upon. Before coming to a decision as to the suitability of a sample of linoleum for any purpose the conditions under which it is to be used should be considered and the tests applied to this end.

In conclusion the author has to thank his assistant, Mr. Ernest Wake, for valuable practical help.

DISCUSSION.

Mr. S. STEWART said that when a large amount of pigment was necessarily used to get the desired colour, a greater proportion of cement would also be used, and so to a certain extent neutralise the tendency to harden the goods. In regard to the attrition test, he drew attention to the results given in this J., 1895, p. 587, by Burchartz, where, under equal conditions of experience, the following amounts of material were removed from 50 sq. cm. :—Linoleum, 1·8 c.c.; granite, 4·4 c.c.; marble, 24·3 c.c.; and oak, 7·8 c.c. These results showed the absurdity of comparing such different materials by such a test. Referring to the attempt to determine the amounts of cork and cement in linoleum samples, the problem at first also appeared to him easy, but his experience had been the same as Dr. Ingle's, and it was evident, from the results obtained that it was impossible to ascertain with any degree of accuracy, or even approximately, the relative proportions of cork and cement in linoleum by the saponification process, or by simple extraction with ether. In this connection he might supplement Dr. Ingle's results by giving the following figures obtained by treating the same sample of dried ground cork with alcoholic potash in an open basin, evaporating off the alcohol and treating with water :—

Insoluble after above treatment.	Insoluble in Ether after acidifying filtrate.	Soluble in Ether.	Soluble in Water (by diff.)	Ash.
Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
36·80	10·80	27·60	23·15	1·65
33·30	11·65	25·80	27·60	1·65
33·45	7·80	26·20	30·90	1·65

By treating the same dried cork with alcoholic potash in flask, with reflux condenser, and washing with alcohol, the following results were obtained :—

Dried Cork treated with Alcoholic Potash and washed with Alcohol.

Per cent.	Per cent.
Insoluble matter 71·92. Treated with water gave 32·52 insoluble, of which 29·92 was organic. Filtrate treated with acid and ether gave 7·82 insoluble and 1·56 soluble in ether.	Soluble matter treated with acid and ether gave 37·92 soluble in ether.

The fact that the sum of the insoluble in alcohol, 71·92, and the soluble in ether, 37·92, was 109·84, indicated that the insoluble in alcohol probably contained a considerable amount of potash. He had not separated the various products of the decomposition of cork so thoroughly as Dr. Ingle had done, as he was more concerned to discover a process for the analysis of linoleum than to undertake an investigation of the properties of such products. He agreed with Dr. Ingle as to the value of the determination of the ether extract when the class of cement used was known, as cements of different composition would give different amounts of ether extract. He had also made experiments on the absorption of water by linoleum, but found that the application of the test to the surface was no indication of the quality of the goods after the surface was removed. Removal of the canvas and paint from the back and immersion in water was better, as it was in a way the measure of the porosity of the material; but although that was the case he could not agree that it was a criterion of quality, because upon the porosity of the cork depended its resiliency, and consequently the special quality which linoleum had as a floor covering, unless fabrics of the same class were compared.

Mr. BRODIE said that he had found that, if linoleum were porous, the paint used in printing it dried dull, and the linoleum layer under the paint was brittle. He could confirm Dr. Ingle's experience in regard to the variations in the porosity of different samples.

Mr. R. T. THOMSON said that, like the previous speakers, he had experienced great difficulty in analysing linoleum, and the results recorded in the paper explained this. He asked whether polymerised oil gave the same analytical results as the oxidised oils.

Dr. L. DOBBIN asked whether there was any test for the quality of linoleum that was really reliable. He also commented upon the saponification of cork, and thought that decomposition might take place. He, too, had been unable to get any reliable results with linoleum. He did not consider the water-absorption test a measure of the wearing power as Dr. Ingle applied it; it should be applied to the surface only. Could not the cellulose content of the cork be used as a guide to the amount of cork present in a sample?

The CHAIRMAN mentioned that chloroform extracted a considerable amount of material from cork, and pointed out how unsuitable corks were to close bottles for containing such substances as alcohol, ether, and chloroform. He considered that the attrition test was probably the best test to apply, if sand or some less drastic substance than emery were used. In saponifying cork, probably the alcoholic potash decomposed the cellulose itself.

Dr. INGLE, in reply, said he agreed with the chairman with regard to the attrition test, but it was so difficult to apply, and required so costly machinery as to put it out of court. He was glad to have Mr. Stewart's confirmation of his experience with regard to the saponification of cork. Mr. Stewart's results did not altogether agree with his own, but that was doubtless due to variations in the composition of the cork examined. With regard to the difference between saponification in the open test and with a reflux condenser, he considered that suberine was probably more closely allied to the resins than to cellulose, and, as Fahrion had observed, when resin was saponified in an open vessel, different results were obtained than when the operation was carried out with a reflux condenser, the oxygen of the ir oxidising the resin at the double linkages. Cork gave, on reatment with potash, an unsaturated compound which would probably suffer similar oxidation. Hence the difference in the results. In reply to Dr. Dobbin, he was afraid that, as cork varied so much in composition, the cellulose present in a sample of linoleum was an uncertain guide. He knew of no single test that could be used to determine the value of a sample of linoleum. The water absorption test had been criticised. He did not lay too great a stress upon it, as it did not take into account the resilience of the material. It was, however, a measure of the porosity. As to the relationship between porosity and wearing power, that was an arguable matter. Dr. Dobbin considered it should only be applied to the face, but he would point out that after the facing had worn away the interior portions of the linoleum became exposed, and the test, as applied, seemed to him to give an average result for the porosity of the goods. In reply to Mr. R. T. Thomson, fabrics made from polymerised oil gave less ether extract than those made from oxidised oil cement. With regard to the action of chloroform upon cork, he had not tried it, but he did not think the results would be materially different from those obtained with alcohol and ether.

atent Specifications may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3^e^).

—PLANT, APPARATUS, AND MACHINERY.

egistering Pyrometer; New Form of ——. N. S. Kurnakow. Z. anorg. Chem., 1904, **42**, 184–202.

HE apparatus described is claimed by the author as simpler ian that of Roberts-Austen (this J., 1892, 840; 1897, 5), id the process consists in principle in measuring the temrature by means of a thermo-element connected to a irror-galvanometer, and recording the temperature by using the light reflected from the mirror-galvanometer to ll on to a silver-bromide paper fixed to the surface of a tating cylinder. The cylinder is caused to revolve by ockwork, and by means of cog-wheels of different sizes the ne occupied by a complete revolution can be varied from hour to 24 hours. The divisions on the scale are reflected om the movable mirror-galvanometer, and are read off by eans of a telescope. At one end of the cylinder of the gistering device a strip of metal is fixed, which, at the end each revolution, comes in contact with two brass springs, d thus completes an electric circuit, in which a bell is cluded. In a branch of the same circuit is an electrognetic key, which starts or stops the clockwork.—A. S.

English Patents.

Drying Apparatus; Impts. in ——. A. Van Steenkiste, Schaerbeek-Brussels, Belgium. Eng. Pat. 27,935, Dec. 19, 1903.

The arrangement of the frames in the drying chamber in an inclined position is claimed, this arrangement being effected by applying to the top and bottom of the frames, rollers travelling on guides or rails fixed to the floor and roof of the chamber. The claims also extend to cross-bars, which are arranged on the fronts or faces and backs of the frames of the drying apparatus, for holding the material to be dried, and for supporting the frames one against the other.
—W. H. C.

Separating Liquid from Solid Matter; Apparatus for —— and for partially Drying the Solid Matter. T. Houghton and the United Alkali Co., Ltd., Liverpool. Eng. Pat. 28,791, Dec. 31, 1903.

The rotating dish with filter-bottom, described in Eng. Pat. 7957 of 1903 (this J., 1904, 434), has the dish divided into compartments, which are alternately in communication with the suction device, to carry away the filtrate, and with a supply of mother liquor, water, &c., to wash the solid matter and filtering medium, this device and arrangement being the subject of the claims.—W. H. C.

Centrifugal Separators; Impts. in ——. S. C. Hauberg, Copenhagen. Eng. Pat. 2002, Jan. 26, 1904.

In a centrifugal separator, in which the bowl rests freely on the head of the revolving spindle, a pawl is arranged on the head of the spindle in such a manner that, when the spindle is revolving faster than the bowl, the pawl comes into action by centrifugal force and both are connected together. If, however, the bowl revolves faster than the spindle, the pawl ceases to act. This arrangement is claimed.—W. H. C.

Volatile Liquids; Apparatus for Measuring Quantities of Highly ——. F. W. Branson, Leeds. Eng. Pat. 3490, Feb. 12, 1904.

A graduated tube, intended to receive and measure the highly volatile liquid, is sealed at its rim to the edge of an enclosing tube, and the space between the two tubes is rendered vacuous, thus supplying a vacuum jacket, and protecting the liquid to be measured, from access of heat. A removable delivery stopper is fitted into the inner tube, and the outer tube is enlarged below so as to form a foot, so that the apparatus may be set to stand upright.—E. S.

Raising Liquids by Means of Compressed Air; Process and Appliance for ——. G. Hantke, Warsaw, Poland. Eng. Pat. 16,316, July 23, 1904.

See Fr. Pat. 345,204 of 1904, following these.—T. F. B.

Vacuum Evaporating Apparatus. T. Suzuki, Sunamura, Japan. Eng. Pat. 19,186, Sept. 6, 1904.

A series of cylindrical chambers are superposed one upon the other, and are provided with a base and top piece. Each chamber is provided with an easily removable, vertical series of horizontal heating coils, so arranged that the liquid falls between the pipes of an upper coil on to the surface of the pipes forming the coil immediately below. A distributing disc is arranged above the series of coils in each chamber, and is provided with overflow pipes and impact surfaces, so that the inflowing liquid, impinging on the latter, causes the distributor to rotate. Means are provided for feeding the apparatus with liquid, for allowing the liquid to flow from chamber to chamber, for withdrawing the same when concentrated, for connecting the apparatus to the vacuum pump, and for utilising the heat of the vapour produced in one chamber to evaporate the liquid in another. Seven claims cover the foregoing.—W. H. C.

United States Patents.

Centrifugal Machine. J. J. Berrigan, East Orange, N.J., Assignor to F. J. Arend, New York, and to J. Bernstrom, Stockholm. U.S. Pat. 774,821, Nov. 15, 1904.

The rotating drum of a centrifugal machine is provided with an outlet for the liquid separating, and with an outlet situated in its circumference for solids. The outlet for the solids is surrounded by bars projecting inwards, and the solids are swept towards it by arms carried by a rotating shaft fixed eccentrically in the drum.—L. F. G.

Centrifugal Machine. A. C. Van Kirk, Tiffin, Ohio. U.S. Pat. 775,320, Nov. 22, 1904.

A vertical conical chamber is mounted so as to rotate, and within it is a screw-blade arrangement rotating concentrically with the chamber, but at a different speed. At the bottom is a discharge opening for the solid matter, whilst the liquid is discharged from an opening in the top, near the centre. The material to be treated is led into the top of the chamber, a shield being arranged to prevent any solid matter being discharged through the liquid outlet. Means for rotating the chamber and screw, and for varying the speed and controlling the same, are provided, the whole forming the subject of the claims set forth.—W. H. C.

Discharge-regulating Device for [Centrifugal] Separators. J. J. Berrigan, East Orange, N.J., Assignor to the De Laval Separator Co., New Jersey. U.S. Pat. 775,510, Nov. 22, 1904.

Secured to and passing through the wall of the rotating bowl of the separator is a tube, inside which a liquid-discharge tube is loosely mounted, extending inside the bowl beyond the outer tube. A ring is so arranged that, when the bowl rotates, the vertical movement of the ring in one direction forces the liquid-discharge tube against the action of centrifugal force, whilst the movement of the ring in the other direction regulates and limits the extent to which the tube can be forced outwards by centrifugal force.—A. S.

Separating Non-Gaseous Material from a Mixture with Gaseous Material. A. G. McKee, Cleveland, Ohio. U.S. Pat. 774,851, Nov. 15, 1904.

The apparatus employed, consists of an upright pipe projecting into an outer pipe. The outer pipe is enlarged at its upper portion above the inner pipe, and inside the enlargement is fixed a rotating fan. The mixture to be separated enters at the top, and the non-gaseous materials fall into the annular space between the two pipes, and are removed through a shoot, whilst the gases flow through the inner pipe to a lateral exit.—L. F. G.

Drier. J. E. Turney, Louisville, Ky., Assignor to C. E. Geiger, W. E. Koop, and G. W. Fiske, of Geiger, Koop, and Fiske, Louisville. U.S. Pat. 774,859, Nov. 15, 1904

The apparatus consists of an approximately horizontal cylinder with a double or hollow wall, the annular space formed, being divided into a series of flues by longitudinal partitions. Receiving and discharge heads are fixed at the ends of the cylinder, which is suitably rotated, and the material to be dried is fed into the longitudinal flues from a conveyor, whilst a heating medium is admitted through the central portion of the cylinder.—L. F. G.

Drier. J. E. Turney, Louisville, Ky., Assignor to C. E. Geiger, W. E. Koop, and G. W. Fiske, of Geiger, Koop, and Fiske, Louisville. U.S. Pat. 774,860, Nov. 15, 1904.

The apparatus is similar to that described in the preceding patent, except that the longitudinal flues are formed by attaching a series of troughs of rectangular section to the inner wall of the rotating cylinder.—L. F. G.

Drier. T. Andrews and S. J. Loewenthal, Rockaway, N.J. U.S. Pat. 775,717, Nov. 22, 1904.

A horizontal drying cylinder is mounted concentrically within an outer cylindrical case, a space being left between them for the circulation of the heating agent. A steam turbine, fixed at one end of the inner cylinder, is driven by the steam or other heating fluid, and causes the cylinder to rotate on its axis. Means are provided for introducing and discharging the steam. The claims cover a drying cylinder thus constructed and arranged.—W. H. C.

Kier; Vomiting ——. E. D. Jefferson, Lowell, Mass. U.S. Pat. 775,450, Nov. 22, 1904.

A closed kier is claimed, adapted to contain liquor under pressure, and having a "vomiting pipe" connecting the top and bottom of the kier. The vomiting pipe, by automatic arrangement, is actuated intermittently and independently of the pressure in the kier.—W. H. C.

Vacuum Evaporating Apparatus. C. Ordway, Brooklyn, N.Y. U.S. Pat. 775,577, Nov. 22, 1904.

A vacuum pan is combined with a set of feed and settling tanks. The concentrated liquid flows from the vacuum pan to the settling tanks, and deposits the separated solid matter, which is removed, the liquid being then returned to the vacuum pan. Means are provided for controlling the feed.—W. H. C.

Heating Liquids; Method of ——. A. Waldbaur, Stuttgart, Germany. U.S. Pat. 775,788, Nov. 22, 1904.

See Eng. Pat. 15,875 of 1904; this J., 1904, 928.—T. F. B.

French Patents.

Temperature Regulators; Impts. in ——. N. E. Nash and W. E. Friedman. Fr. Pat. 345,090, Jan. 12, 1904.

A thermostat composed of two thin plates, one of porcelain and the other of nickel, is connected to a bent Bourdon tube. The latter is connected with a supply of compressed air. The Bourdon tube is provided with a valve actuated by the thermostat. When this valve is opened, some of the compressed air escapes from the Bourdon tube, which then alters its shape, and actuates a valve controlling the supply of heating fluid to the radiator or other heating apparatus.—W. H. C.

Pyrometers; Impts. in ——. H. T. Barnes and H. M. Tory. Fr. Pat. 344,718, June 6, 1904.

The apparatus consists of:—a resistance pyrometer of the usual kind, arranged in an electrical circuit in which two resistance coils are placed so as to divide the circuit into two portions; a scale formed of a wire of conducting material mounted in zigzag fashion on a suitable calibrated support; a movable conducting piece which can be brought into contact with the first wire at any position; and an arrangement for emitting sound, such as a telephone. When contact is made between the two conducting wires at a certain point on the scale, which point varies with the emperature to which the pyrometer is subjected, equilibrium s established between the two divisions of the circuit, and consequently no sound is produced in the telephone, whereas, when contact is made at any other point on the scale, ounds are produced. The scale may be calibrated to cover any desired range of temperature.—A. S.

Compound Gas Compressors. M. E. Douane. Fr. Pat. 344,686, July 8, 1904.

The compressor is designed for compressing air or rare gases, and is very compact. In the double-compression ype the cylinders are single-acting, and mounted in tandem on a vertical frame. The compressed air issuing from each cylinder is cooled by circulating in a metal coil placed in a vessel containing water, surrounding the two cylinders. n the triple-compression type, one single-acting cylinder is mounted in tandem with a double-acting cylinder, the hird compression of the gas being effected in an annular cylinder by the return stroke of the piston.—L. F. G.

Measuring Apparatus for Methyl Chloride or other Volatile Liquids. A. Rousseau. Fr. Pat. 344,929, July 12, 1904.

A cylindrical double-walled vacuum vessel, provided with a foot, is graduated in cubic centimetres. Over the top is itted a cover with a straight or curved nozzle, through which the liquid is poured out, a tight joint being made with the vacuum vessel by means of a cork ring.—L. F. G.

Heating Agglomerated Materials under Pressure; Furnace for ——. Galvanische Metall-Papier-Fabrik Act.-Ges. Fr. Pat. 344,791, July 13, 1904.

The furnace is intended for heating under pressure granular and pulverulent agglomerates, such as carbon blocks, carbon dynamo brushes, &c., up to a temperature of 1100° C. The materials are filled into the cylinders of a number of hydraulic presses arranged inside the furnace, and are pressed against the screw covers of the same. The furnace is heated by gas, which is admitted through orifices urrounded by air inlets, to two sides of each press. The products of combustion have to pass downwards before eaching the exit pipes. Means are provided for regulating he gas supply, and spy-holes for observing the temperature attained.—L. F. G.

Retort Furnace. Soc. P. de Lachomette, Williers et Cie. Fr. Pat. 345,010, July 21, 1904.

The Lachomette system of regenerative heating is modified y providing two sets of paths or flues for the waste flames, and for the secondary supply of air. Further, a portion of he secondary supply of air is made to enter the spaces between the outer rows of retorts and the walls of the furnace, whereby the retorts in these rows are heated to a higher temperature, and a more uniform distribution of heat in all parts of the furnace is attained.—A. S.

Siphoning Liquids by Means of Compressed Air. G. Hautke. Fr. Pat. 345,204, July 23, 1904.

An accumulator is interposed between the air-compressor and the vessel containing the liquid. The air in the accumulator is compressed to a high degree, and is then passed through a reducing valve, and used at a lower pressure, whereby a steady flow of liquid is maintained.—W. H. C.

Filter for all Kinds of Liquids. A. F. Capillery. Fr. Pat. 345,113, July 25, 1904.

The filter claimed consists of a number of vertically superposed filter-plates, with suitable base and top pieces. The plates are perforated and separated by filter-paper or cloth, and clamped together by a screw. The inlet and outlet pipes are cast in the border of the plates. A specially constructed core, which can be withdrawn from the casting in parts, is used to form the lateral channels communicating with the interior of the plates. The plates are made of any metal suitable for the liquid to be filtered, and the base and top pieces, which are of cast iron, are protected by a coating of the same metal.—W. H. C.

Pressure Filter, with Rapid Attachment and Concentration of Filtering Surfaces. J. Selves and U. Tocaven. Fr. Pat. 345,516, Aug. 13, 1904.

A cylindrical chamber is supported by trunnions on a suitable carriage. The filter-bags are retained within the cylinder by a special holder, which is attached to the cover-plate of the cylinder by an interrupted screw-joint, which can be rapidly put into or taken out of position. The filter-bags are tied at the lower end with a cord, thus causing them to form into several vertical pleats. They are surrounded by wire netting or open wickerwork shields in order to prevent them from expanding too far.
—W. H. C.

Filter Press (Continuous) composed of Single Elements. P. M. Privat. Fr. Pat. 339,054, Sept. 22, 1903.

The apparatus consists of several filtering elements, joined by means of tubing to several taps fixed to a distributing valve. This distributing valve is spherical, and divided into two compartments by a partition. The one compartment receives the liquid to be filtered, and the other the filtered liquid. By means of the taps the admission of liquid to each element can be controlled, and a defective element isolated.—L. F. G.

Drying Apparatus. Rheinische Webstuhl- et Appretur-Maschinenfabr., G. m. b. H. Fr. Pat. 345,303, Aug. 2, 1904.

See Eng. Pat. 17,957 of 1904; this J., 1904, 1020.—T. F. B.

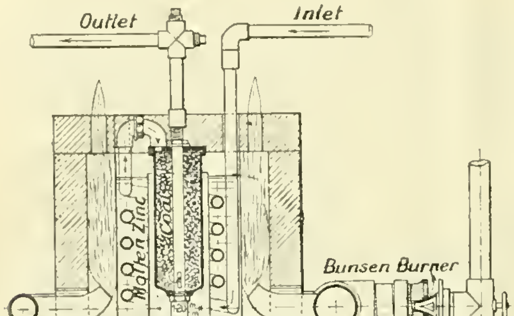
II.—FUEL, GAS, AND LIGHT.

Coal; Spontaneous Ignition of ——. A. O. Doane. Eng. News, 1904, **52**, 141; Science Abstracts, B., 1904, **7**, 940—941.

The amount of moisture present in a bituminous fuel after drying in the air, is stated to be a measure of the risk of spontaneous ignition when the fuel is stored; bituminous coals containing over 4·75 per cent. of water are dangerous. Coal bins should be of iron or steel protected by concrete, and should be roofed over; free air passages should be provided round the walls and beneath the bins to keep them cool; the depth of coal stored in them should never exceed 12 ft. The customary method of providing air passages in the body of fuel is useless, since it only tends to accelerate oxidation, and does not produce a sufficient current of air to keep the temperature down. Cracks or joints in the walls of the fuel bin increase the risk of spontaneous ignition for similar reasons.—T. F. B.

Gas; Distillation of Coal for —— by Highly-Heated [Water] Gas. E. Blass. J. Gasbeleucht., 1904, **47**, 986—987.

The destructive distillation of coal by means of a current of highly-heated water-gas has been investigated with the aid of the apparatus shown in the accompanying figure:—



The inner. iron cylinder was filled with the coal, and was surrounded by molten zinc in which was immersed the heating coil. The water-gas used, traversed first the heating coil and then the coal, and was next led through dilute sulphuric acid for the determination of the ammonia. (It was found that coal-gas suffered no loss of illuminating power when passed through the coil even at the temperature of boiling zinc (about 900° C.).) 300 grms. of coal were distilled in a current of water-gas at 672°—705° C., until the gaseous mixture produced ceased to give a luminous flame and appeared to consist of pure water-gas. The yield of ammonia was found to exceed, by 62 per cent., that obtained on carbonisation of the coal in ordinary retorts; as ammonia is completely expelled only at 900°—1000° C., the yield would have been greater had the apparatus been capable of withstanding that temperature. The quantity of water-gas required was about double that obtainable from the coke (68 per cent.) yielded by the coal. The yield of actual lighting gas was four or five times that given by ordinary distillation, and although the average illuminating power was not equal to that of ordinary coal-gas, it shows that a considerable volume of water-gas can in this way be carburetted by a relatively small quantity of coal. The gas was fully equal to ordinary gas for heating, cooking, and power uses, and for employment with the incandescence burner. A number of theoretical considerations show that the coke produced per kilo. of coal, is not sufficient to yield all the water-gas required for the distillation of the coal (compare following abstract).—H. B.

Gas; Distillation of Coal for —— by Highly-Heated [Water-] Gas. F. R. Besemfelder. J. Gasbeleucht., 1904, **47**, 1083—1084.

The author criticises the remarks of Blass (see preceding abstract), and maintains that the yield of coke is about twice as much as is required for the distillation of the coal. In the author's process, a number of water-gas producers are united to one common distillation retort, which operates uninterruptedly and feeds the incandescent coke continuously to the particular producer in action at the time, through the opening by which the hot water-gas is flowing into the distillation retort from the producer. The number of producers undergoing the air-blast is controlled automatically by the distillation retort, so that a supply of hot waste gases flows continuously round the retort, heating it from the outside. The coal and the gases pass through the retort in opposite directions. Less than half the coke produced, is sufficient for the carbonisation of the coal, and hence the proportion of water-gas contained in the illuminating gas produced is less than in the experiments of Blass, the luminosity of the flame and the calorific value of the gas being correspondingly greater.—H. B.

Naphthalene in Coal Gas; Formation of ——. A. H. White and S. Ball. XXIII., page 1240.

English Patents.

Peat; Process for Converting Raw —— into Solid Peat Fuel. C. Schlickeysen, Steglitz, Germany. Eng. Pat. 4995, Feb. 29, 1904.

The raw peat "as it is taken from the bog," is incorporated, in a mixing and kneading machine, with pulverulent, granular, or fibrous substances, such as peat dust, spent tan, road sweepings, powdered ore and the like, and is then made into blocks. The blocks are, preferably, coated on the surface with pulverulent, granular, or liquid substances, to aid the retention of which the mixture, on issuing from the kneading machine, may be first pressed through a heated mouthpiece, so as to heat the surfaces of the bars to about the boiling-point of water, before applying the coating substance.—H. B.

Gas Producers. L. Mond, London. Eng. Pat. 27,496, Dec. 15, 1903.

In a gas producer of the kind described in Eng. Pat. 12,440 of 1893 (this J., 1894, 938), the blast is supplied through a circular grate having the form of an inverted truncated cone. According to this specification, a blast-pipe passes axially up through the conical grate, the open end being covered with a hood, to prevent any fuel from entering it. The blast of air, steam, or air and steam, is delivered in two portions, one of which passes up through the blast pipe, whilst the other is led down the annular space between the two concentric casings of the producer, to enter through the conical grate.—H. B.

Gas Producers and Steam-Generators for Producing Water-Gas and Generating Steam by the Heat of such Gases; Combined Double ——. F. Neuman, Eschweiler, Germany. Eng. Pat. 21,318, Oct. 4, 1904. Under Internat. Conv., Oct. 20, 1903.

Two alternately operated producers for the generation of water-gas and producer-gas are so connected to a common tubular steam boiler, divided longitudinally by means of a partition, that the producer-gas generated in the one producer and the water-gas simultaneously generated in the other producer are made to traverse the steam boiler simultaneously, but separately from each other, for the purpose of keeping the boiler at the same temperature throughout the alternating water-gas and producer-gas periods, and maintaining a uniform production of steam.
—H. B.

Gas Producers. J. Robson, Shipley, Yorks. Eng. Pat. 22,092, Oct. 14, 1904.

The vertical fire-brick lining of the producer is recessed above the fire-grate, round the region of incandescence, and in the recess there is fitted an annular metal channel through which the supply of air and steam is made to circulate before passing up through the fire-bars. By this means the mixture of steam and air is superheated, and the adhesion of clinker to the walls at the incandescent zone is prevented by the cooling action of the current within the annular channel.—H. B.

Gas and Air Mixing Apparatus. C. C. Dodge, New York. Eng. Pat. 21,776, Oct. 10, 1904.

Inside an outer drum there are arranged, upon a common horizontal shaft, a gas-meter drum and an air-meter drum, constructed with helical compartments adapted to be immersed in water, on the usual principle. The two meter drums are driven by means of the gas pressure within the gas-meter drum, the air and gas which are delivered at the inner ends of the two drums being mixed within the outer drum and passing thence through an outlet pipe. In order to reduce the friction on the shaft-bearing, each meter drum has a central closed chamber, serving as a buoy, attached to the shaft, and the blades forming the helical compartments are attached to the periphery of this chamber. Instead of a stuffing-box at the central point where the gas inlet-pipe enters the gas-meter drum horizontally, a water sealing device is provided, consisting of a concentric sealing chamber on the end of the drum, embracing a concentric disc secured vertically on the gas inlet-pipe.—H. B.

Lighting Purposes ; Bodies Adapted for —— and Rendered Incandescent by Heat or Electricity. J. H. Ladd, Reigate, Surrey. Eng. Pat. 25,698, Nov. 24, 1903.

Flints are heated at 4000°—6000° F. (from 2204° to 3316° C.) to expel "metallic elements," ground to powder, mixed with tar and cement or the like, kneaded into a dough with water, and moulded into the desired shape. If moulded to the shape of an incandescent mantle, the latter is perforated with small holes, dried slowly, impregnated with salts of the rare earths, &c., dried, and baked at a high temperature. The dough can also be made into electric lamp filaments.—H. B.

Mantles of Incandescent Gas Burners. T. K. Johnson and W. McKean, Glasgow. Eng. Pat. 753, Jan. 12, 1904.

To strengthen and increase the lighting power of mantles, they are dipped into a solution of "sulphate of alum," and dried.—H. B.

Electrodes for Arc-Lights. F. J. Gerard and L. Fiedler, London. Eng. Pat. 6972, Mar. 22, 1904.

The electrodes contain a small proportion of lanthanum and of thorium, the ratio of the lanthanum to the thorium lying between 20 : 80 and 70 : 30. They are conveniently prepared by adding to the graphite employed, from 1 to 5 parts per 1000 of the nitrates of the earths in aqueous solution, drying, adding the usual binding ingredients, and proceeding in the ordinary way. The thorium may be replaced partly by zirconium. Two electrodes may be used together, in which the one contains the lanthanum, with or without zirconium, whilst the other contains the thorium, with or without zirconium. Cheaper forms of electrodes are made by adding, instead of rare earths, magnesium and aluminium, or their compounds, in approximately equal proportions.—H. B.

United States Patents.

[*Oil*] *Gas Generator.* F. S. Vincent, Petoskey, Mich., Assignor to R. J. Lyon, Salt Lake City. U.S. Pat. 774,802, Nov. 15, 1904.

A reservoir, containing liquid hydrocarbon, is supplied with compressed air by means of a hand-pump, and is connected to a generator consisting of an upright tubular casing, containing a sheet-metal spiral and heated by a burner placed beneath the generator. A feed-pipe for the generator is connected to the lower part of the reservoir, and is formed with a loop passing round the burner, so that the hydrocarbon is heated on its way to the generator. The feed pipe and upper part of the generator are connected to the top of the reservoir, whereby an even pressure is maintained. The gas produced in the generator is directed through a nozzle into a mixing chamber, wherein it mixes with air, and flows thence into the gas main. A branch pipe from the gas main supplies the gas required by the heating burner.—H. B.

Gas Producer. H. L. Dixon, Assignor to H. L. Dixon Co., Pittsburg. U.S. Pat. 775,265, Nov. 15, 1904.

The producer consists of a number of adjoining, water-sealed chambers, each pair of which has a common intermediate vertical wall. "Grated" air-passages are formed in the inner sides of the vertical walls of the chamber. —A. S.

Gas Generator. A. Weighlé, Töss, Assignor to Schweizerische Locomotiv- und Maschinenfabrik, Winterthur, Switzerland. U.S. Pat. 775,641, Nov. 22, 1904.

See Eng. Pat. 5798 of 1903; this J., 1904, 316.—T. F. B.

Centrifugal Gas Purifier. A. Steinbart, Carlstadt, N.J. U.S. Pat. 775,462, Nov. 22, 1904.

A rotary fan is mounted within a vertical "circular" casing; a concentric annular plate surrounds the fan a short distance from its circumference, and forms an annular chamber with the casing, from which water is injected into the path of the fan tangentially to its circumference. The casing has an outward enlargement at the centre of each side; a tapering gas-inlet tube, having its end curved spirally, being connected to one side, and a flaring outlet-pipe, likewise having its inner end curved spirally, communicating with the other side.—H. B.

Centrifugal Gas-Purifier. F. V. Mattoo, Riverton, Assignor to Camden Iron Works, Camden, N.J. U.S. Pat. 775,738, Nov. 22, 1904.

A rotary fan disc is provided on both sides with blades having recesses, the blades on one side being shorter than those on the other. The fan casing carries inwardly extending lugs, arranged in circular series, against which particles carried by the gas are projected by the action of the blades, the recesses in which register with the lugs when the fan rotates. Water is projected against the fan from one or more nozzles passing through the casing.—H. B.

French Patents.

Briquettes to resist Atmospheric Influences and to bear Transport, &c. ; Process and Apparatus for the Manufacture of Solid ——. G. Höpfner. Fr. Pat. 344,926, June 23, 1904.

The briquettes formed are said to burn without smoke, soot, or sulphurous fumes. The finely-ground fuel is intimately mixed with lime (slaked or unslaked) and the requisite quantity of water, in a long, horizontal cylinder provided with mixing blades. The mixture sets to a pasty mass, which passes into a vertical, cylindrical moulding machine, provided with an endless screw, where it is subjected to a gradually increasing pressure. The moulding machine ends below in an outlet chamber, the walls of which are kept wet by a stream of water, and below this are an automatic cutting blade and a conveyor which carries the briquettes to a drying chamber, where they are dried in an atmosphere containing carbon dioxide.—A. S.

Fuel ; Artificial ——, and Method of Making the same. P. Grayson. Fr. Pat. 345,474, Aug. 10, 1904.

Coal, in a state of fine division, is mixed with water, rosin, or pitch, plaster-of-Paris, lime or cement, and mineral oil, with or without addition of sand and sawdust. The dry materials may be mixed separately, one portion with water and another with mineral oil, and then the two mixtures incorporated; or the dry materials may be mixed with the water, and the mass incorporated with a hot mixture of the mineral oil and rosin or pitch.—A. S.

Gas Generators ; Impts. in ——. J. J. Deschamps. First Addition, dated Oct. 13, 1903, to Fr. Pat. 332,745, June 3, 1903.

See Eng. Pat. 12,221 of 1904 ; this J., 1904, 929.—T. F. B.

Gas Generators. J. J. Lafond, Fr. Pat. 339,097, Oct. 14, 1903.

An annular tuyère or trough is provided round the lower part of the combustion chamber. Hot water, supplied by a small boiler situated at the top of the generator in the path of the hot gases, enters the annular tuyère, and the steam issuing upwards therefrom, prevents the adhesion of clinker to the walls of the generator. In order to prevent the main current of gas from interfering with the cooling action of the steam at the sides, the usual supply of air and steam is admitted by a central blast-pipe at the base of the generator, and the gas produced, is led off by a central conduit (enclosing the small boiler mentioned above) depending into the generator.—H. B.

Generator for Purified Weak Gas. L. Heinen. Fr. Pat. 344,859, Jan. 26, 1904.

The generator comprises a vertical combustion-shaft, the lower part of which is slightly curved, and is provided with a fire-grate and an ash-pit having a slide for letting the ashes drop out; an observation plug at the top of the shaft; a fuel reservoir at the top and to the side of the shaft, having a helical blade for feeding the shaft with the fuel; and a water-regulating device for supplying water and air to a coiled pipe, surrounding the top of the shaft, and immersed in the hot gases produced, which furnishes a mixture of steam and air to be admitted at the foot of the shaft. The hot gases, on leaving the producer, encounter an inwardly directed spray of water, and then pass down a vertical pipe, at the foot of which the heavier solid impurities collect. The lighter particles, becoming wetted by the condensing steam, adhere to the wet surfaces of the fan through which the gases pass on their way to a coke filter and gas-holder.—H. B.

Gas Generators [using Oil and Steam]. Construction Company. Fr. Pat. 345,095, June 27, 1904.

A mixture of vaporised oil and superheated steam is converted, by heating, into a fixed gas consisting of water-gas and gaseous hydrocarbons. The apparatus used is characterised by a combination consisting of a mixing-chamber surrounding a hollow heating-chamber. The inner chamber is heated internally by means of superheated steam, and jets of heated oil and superheated steam are directed upon its surface, the mixture produced, being led off from the mixing chamber and passed through a retort wherein it is converted into fixed gas.—H. B.

Gas, Combustible, from Bituminous Fuel; Production of ——. Soc. Anon. F. Krupp A.-G. Fr. Pat. 345,016, July 22, 1904.

The main combustion chamber of the producer, which is provided with a grate and an inlet for air and steam at the bottom, is surmounted by a cylindrical charging-shaft, opening at its upper end into a covered hopper. Inlets for compressed air are provided in the charging-shaft, at the point where it opens out into the hopper. The gas off-take pipe leaves the producer at the shoulder formed by the junction of the charging shaft with the main combustion chamber, and this shoulder is provided with a series of poke-holes. The object is to maintain two zones of combustion, the one upon the fire grate, and the other at the top of the charging shaft, the latter being easily accessible for loosening the fragments of coal. The fresh coal, placed in the hopper, parts with its tarry matters in the upper zone of combustion, and is converted into coke by the time it reaches the main combustion chamber.—H. B.

Gas Producers. Soc. Menot Père et Fils et Deneuville. Fr. Pat. 345,466, Aug. 10, 1904.

An annular steam generator surrounds the fuel hopper at the top of the producer, and extends downwards some distance into the path of the hot gases. From the upper part of the steam-generator a pipe leads the steam down to the air- and steam-inlet at the base of the fuel chamber. When the water supplied to the steam-generator reaches a certain level, the excess overflows into a second pipe which delivers it into an annular box surrounding the incandescent portion of the fuel, and the steam here generated, mixes with that from the former pipe and enters the fuel chamber.—H. B.

Gases; [Automatic] Apparatus for the Analysis of ——. A. Bayer. Fr. Pat. 345,221, July 29, 1904. XXIII., page 1239.

Gases; Process for Purifying, Absorbing, and Regenerating —— *by Centrifugal Force.* E. Theisen. Fr. Pat. 345,418, Aug. 8, 1904.

See Eng. Pat. 8671 of 1903; this J., 1904, 434.—T. F. B.

Sulphur and Cyanides from Gas-Purifying Materials [Spent Oxide]; Process and Apparatus for Extracting ——. J. J. M. Bécigneul. Fr. Pat. 345,071, July 23, 1904. VII., page 1216.

Filament of High Illuminating Power for Incandescent Electric Lamps. E. L. Frenot. Fr. Pat. 344,759, July 11, 1904.

A metallic or carbon filament is coated by dipping it several times into an alcoholic solution containing the following substances: sugar candy, thorium nitrate, cerium nitrate, cobalt nitrate, aluminium nitrate, and cream of tartar, and then drying it. The alcoholic solution is then placed in a flask and boiled, the vapours, which carry over mechanically a considerable proportion of the above-named substances, being led into a vessel in which is suspended the coated filament, kept incandescent by means of an electric current. The filament is finally carbonised as usual. An alternative process is to prepare a paste of the above-named substances, extrude it into a filament, and carbonise the latter as usual.—H. B.

Filaments for Incandescent Electric Lamps; Manufacture of ——. A. de Madaillan. Fr. Pat. 345,012, July 21, 1904.

Salts or oxides of thorium, cerium, &c., are incorporated with a pasty solution of cellulose and zinc chloride; the mixture is relieved of air-bubbles by subjecting it to reduced pressure, and is then extruded into filaments, which are placed in strong alcohol for two or three hours and then dried. They are next wrapped round blocks of graphite, placed in powdered plumbago, and heated for 30 hours at 2000° C., when they are ready for use.—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM AND MINERAL WAXES.

Transformer Oils. D. Holde. Mitt. königl. Materialprüfungsamt, 1904, **22**, 147—150.

According to the author, a transformer oil, *i.e.*, one in which an electrical transformer is immersed to prevent sparks passing from one coil of wire to another, should have the following characters:—(1) It should be a pure, heavy mineral oil, having a flashing-point above 180° C. by the Pensky test or above 190° C. by the open test; (2) It should be completely free from acid, alkali, and water. (3) It should have as low a viscosity as possible, and in any case not higher than 20 by the Engler test, compared with water at 20° C. (4) It should remain liquid when cooled below 0° C.—A. S.

Paraffin; Action of Sulphuric Acid on ——. C. J. Istrati and M. Michailescon. Bull. Soc. Sciences Bucarest, 1904, **13**, 143—145. Chem. Centr., 1904, **2**, 1447—1448.

The authors find that paraffin hydrocarbons of high melting point can be treated with hot sulphuric acid without carbonisation taking place. No sulphonic acids are produced by the reaction. The constitution of the higher members of the paraffin series is discussed, and it is concluded from the results of the present and of previous work that the sulphuric acid has an oxidising action, resulting in the formation of aldehydes and of cyclic compounds.
—A. S.

Paraffin Wax; Admixture of —— *with Substances of Higher Melting Point. [Candle Making.]* E. Graefe. Chem.-Zeit., 1904, **28**, 1144—1149.

In the author's opinion the only reliable methods of determining the melting points of mixtures of paraffin wax with substances of higher melting point, are those based upon measuring the latent heat of melting at the moment of solidification, as in the methods of Finkener, of Dalican, and of Shukoff (this J., 1899, 406). In the experiments described, parallel determinations were made by Shukoff's method, by the capillary tube method, and by a method in which was determined the temperature at which solid material adhering to the bulb of the thermometer melted sufficiently to fall off. Experiments were made with soft paraffin, melting at 42 C. (Shukoff), 42·4° C. (capillary tube) and 42·5° C. (thermometer), mixed with stearine (m.p. 55·2° C.), retene, naphthalene, montan wax (this J., 1901, 1221), acidyl derivatives of aromatic bases, such as the compound, $C_6H_5.NHCOC_{17}H_{35}$, and with hard paraffin wax.

The author explains the well-known fact that the melting point of soft paraffin is really raised by the addition of hard paraffin by Ostwald's theory of solid solution. According to this, solid solutions consist of mixtures of isomorphous crystals or of mixtures of crystalline substances that crystallise in different forms, but yet form homogeneous mixed crystals of the shape of the predominant constituent, *e.g.*, naphthalene and naphthol, or salicylic and benzoic acids. In the case of hard and soft paraffin it is uncertain whether there is isomorphism or formation of mixed crystals, but it is one or the other, since it is possible to isolate different components from the homogeneous mixed crystals, and in the author's opinion the evidence of the microscope points to isomorphism.

This theory also explains why addition of montan wax causes a slight elevation (0·6° C.) in the melting point of the soft paraffin. During the distillation of the wax (this J., *loc. cit.*) slight decomposition occurs, with the formation of small amounts of paraffins which are able to crystallise in homogeneous mixed crystals with the soft paraffin.

The general conclusion arrived at is, that a substance of high melting point can only raise the melting point of paraffin when it is capable of forming with it a solid solution. Otherwise it can only depress the melting point, except in such cases where it crystallises out, when it leaves the melting point unaltered.

Solidity Tests.—The addition of substances such as montan wax confers on soft paraffin a degree of solidity which does not correspond with the melting point, and in the author's opinion a solidity test should also be applied to candles. He regards the test recommended by the (German) Commission on testing technical materials (1902) as the most suitable for the purpose. This consists in keeping the candles for a definite time fixed upright in a room at a definite temperature, and noting the amount of bending. Thus, candles prepared from the mixtures described above were kept for 10 minutes at 25° C. The real melting point (Shukoff's method) is not conclusive in itself, since the solidity of mixtures containing montan wax is greater than that of soft paraffin alone. The older optical methods of determining the melting point may still be of value for comparing different kinds of paraffin, but are useless as a criterion of the solidity of candles.—C. A. M.

Lignite Tar Distilleries; Use of Waste Liquors from —— as Manure. F. Strube. XV., page 1228.

Nitrogenous Refuse and Waste Sulphuric Acid [from Petroleum Refining]; Utilisation of ——. E. Donath. XV., page 1228.

English Patent.

Esparto, Straw, Wood, &c; Utilisation [Distillation] of Residual Matters containing Alkaline and Organic Substances from the Treatment of ——, in the Preparation of Paper-Pulp. E. H. Strange, J. H. Garle and A. A. Longsdon. Eng. Pat. 27,738, Dec. 17, 1903.

The alkaline liquors are concentrated in a multiple-effect evaporator, the uncondensable gases being collected. The concentrated matter is then removed to a retort and subjected to destructive distillation. The products, consisting of combustible gases, tars, oils and soluble organic substances are collected by means of condensers and purifiers. The alkaline residue in the stills is lixiviated and the soluble alkali is causticised.—J. F. B.

United States Patent.

Retort [for Extracting Oil from Shale]. S. L. Hague, Salt Lake City, Utah. U.S. Pat. 775,448, Nov. 22, 1904.

A horizontal cylindrical retort is set in a suitable furnace. A screw conveyor of less diameter than the retort, works in its lower portion and pushes the shale forward. Cross partitions above and partly around the conveyor, divide the retort into a number of compartments, which are connected together by suitable inlet and outlet pipes. A hopper is provided for feeding the shale into one end of the retort.—W. H. C.

French Patent.

Petroleum or Gasoline Soap, and Process for Making the same. L. A. Lebreton-Deshayes. Fr. Pat. 339,061, Sept. 24, 1903. XII., page 1226.

IV.—COLOURING MATTERS AND DYESTUFFS.

Dyestuffs; Theory of ——. J. Schmidlin. Comptes rend., 1904, **139**, 871—873.

Witt's view that certain molecular groupings, "chromophores," were the cause of colour in colouring matters, but that these chromophores were themselves weak and needed development by association with other groupings, "auxochromes," laid the foundation of the theory of dyestuffs. The nature of these two classes of groupings, however, has never been exactly defined. The author's view, based on his researches in the rosaniline series, is that a dyestuff is characterised by a molecule containing a strongly exothermic grouping (auxochrome), which determines the formation at another point in the molecule of an endothermic group (chromophor) containing aliphatic double linkings, which allow one part of the molecule to vibrate under the motive power of luminous waves of the same period. He recalls the fact that Helmholtz, to explain absorption, formulated the hypothesis that a molecule might contain central massive fixed portions, and mobile portions which would usually tend to maintain a position of equilibrium with regard to the fixed portions and to the ether, and that when absorption occurs, the energy of the wave-motion would be transformed into internal molecular energy (heat) by a species of molecular friction between the fixed and the mobile portions. That this dualism of the molecule should be independently arrived at by purely physical and also by chemical and thermochemical considerations renders it probable that the author's exothermic and endothermic groupings correspond to the fixed and the mobile portions of the molecule as imagined by Helmholtz.—J. T. D.

Aromatic Amino- and Hydroxy-Compounds; Action of Sulphites upon ——. H. T. Bucherer. J. prakt. Chem., 1904, **70**, 345—364.

A. *Technical Application of Sulphite Reactions:*—(1) *The reaction* $R.NH_2 \rightarrow R.O.SO_2Na \rightarrow R.OH$.—Certain α-naphtholsulphonic acids are prepared, some exclusively, others most advantageously, from the corresponding α-naphthylamine compounds. These may be obtained as a rule by the sulphite reaction, the exceptions being the *o*- and *m*-sulphonic acids. The following acids may be readily prepared by it:—1.4-, 1.7-, and 1.8-monosulphonic, 1.4.6 , 1.4.7-, 1.4.8-, and 1.6.8-disulphonic acids, and the 1.4.6.8-trisulphonic acid. The reaction is not available for the preparation of β-naphtholsulphonic acids. 1.8.3.6-Diaminonaphthalenedisulphonic acid being a di-*m* compound is not acted upon by sodium bisulphite. It is, therefore, an interesting fact that the corresponding dinitro compound is converted by the action of this salt into 1.8.3.6-aminonaphtholdisulphonic acid ("Acid H"), probably not, however, in the manner indicated in the patent specification (Ger. Pat. 113,944), namely, through the successive stages, dinitro→diamino→aminohydroxy, but by the direct displacement of one of the nitro groups. 1.3.5- (= 1.8.4-)-Diaminonaphthalenesulphonic acid is converted by the sulphite reaction into 1.8.5-aminonaphtholsulphonic acid, the amino group in the *p*-position relatively to the sulphonic acid group, being replaced. If, however, the diamino-compound be first condensed with acetone, and the compound thus produced be submitted to the sulphite reaction, the other amino group is attacked and 1.8.4-aminonaphtholsulphonic acid results. In the case of dihydroxynaphthalene compounds, the sulphite reaction is of value for the preparation of the 1.8.4-(= OH : OH : SO_3H) sulphonic acid. In the benzene series, monamines are scarcely acted upon. With some *m*-diamines which, like *m*-phenylenediamine, react easily, a mixture of products is obtained; with others, the reaction takes place with difficulty.

(2) *The Reaction* $R.OH \rightarrow R.O.SO_2Na$. — Those sulphurous acid esters which contain free amino groups, *e.g.*, $H_2N.R''.O.SO_2Na$, may be diazotised into, *e.g.*, $Cl.N_2.R''.O.SO_2Na$, and the compounds of the latter type may be combined with the usual dyestuff components. By treatment with alkalis, the products are hydrolysed into hydroxyazo dyestuffs. The advantages of this method of preparing the latter are (1) the sulphurous acid esters of aromatic amino compounds well withstand the process of diazotising, their molecules being protected against the action of a slight excess of nitrous acid; (2) the azo dyestuffs formed from the esters are much more soluble than those from the corresponding aminohydroxy compounds. The soluble dyestuffs may be applied to textile fibres and be transformed, *e.g.*, by oxidation, on the fibre, into difficultly soluble hydroxyazo-dyestuffs, faster to soaping and milling than the esters. Sulphurous acid esters with free auxochromous groups (OH, NH_2, &c.) may also be employed as dyestuff components, *e.g.*, in preparing isomerides of dyestuffs already known and in determining the constitution of compounds in regard to which there is doubt; thus, in Cassella's Lanacyl Blue, which is prepared by diazotising "Acid H" and combining with 1.5-aminonaphthol, the diazo residue is represented as occupying the position 6. It is more likely, in the author's opinion, that the attachment is in the position 2. It would be easy to decide the point by making use of the sulphurous ester of the aminonaphthol, with which combination can take place only in the position 2.

(3) *The Reaction* $R.OH \rightarrow R.O.SO_2Na \rightarrow R.NH_2$.—In aminating 2.1-β-naphtholsulphonic acid with ammonia according to the older method, a temperature of above 200° C. is necessary, and, along with the β-naphthylaminesulphonic acid, β-naphthylamine and β-dinaphthyl amine are formed. By the sulphite method, a much lower temperature, below the temperature of decomposition of the sulphonic acid in fact, suffices for the action. The isomeric 1.2-naphtholsulphonic acid cannot be aminated by the sulphite reaction.

B. *Extensions of the Sulphite Reactions.*—Not only primary, but also mono- and di-alkylated amines react, according to the scheme—

$$(1)\ R.N < {}^{R_1}_{R_2} + \text{Bisulphite} \rightarrow R.O.SO_2Na + \text{Alkali} \rightarrow R.OH.$$

$$(2)\ R.OH + \text{Bisulphite} \rightarrow R.O.SO_2Na + NH\,R_1R_2 \rightarrow R.N < {}^{R_1}_{R_2}.$$

R being an aromatic radicle, R_1 and R_2 alkyl groups or hydrogen atoms. The addition of mono- and di-alkylamines to hydroxy compounds by means of the sulphite reaction is, in some instances, effected with greater difficulty than is that of ammonia. Thus, in acting with methylamine upon the sulphurous ester of 1.4-naphtholsulphonic acid, it is convenient to employ a temperature of 125°—150° C., whilst with ammonia the reaction occurs at 90° C. On the other hand, the removal, by the inverse reaction, of mono- and di-alkylamines is accomplished with greater ease than is that of ammonia. The sulphite reaction may be applied to prepare alkylamines. To this end, an aromatic amine may be alkylated, decomposed by an alkali bisulphite into an alkylamine and a hydroxy compound, and the aromatic amine then regenerated by the action of ammonium sulphite upon the latter. To produce pure mono- and di-alkylamines, which in practice is always difficult, advantage may be taken of the differences in behaviour of the alkylamines, $R.NH.R_1$ and $R.N(R_1)_2$, towards sodium bisulphite at specific temperatures. A temperature can be found, for instance, at which the tertiary amine is acted upon whilst the secondary amine is unaffected, or *vice versâ*. Again, a mixture of mono- and di-alkylamines, obtained by decomposing with sodium bisulphite a mixture of secondary and tertiary amines may be brought, after conversion into sulphites, into contact with an aromatic hydroxy compound at such a temperature that only one of the two reacts. The other amine, if sufficiently volatile, may then be removed by distillation after rendering the mixture alkaline, or the alkylated amine may be precipitated, the purified aromatic alkylamine being, in either case, finally decomposed to give the pure mono- or di-alkylamine desired.—E. B.

Hydroxyazo Compounds Obtained by the Combination of Phenols with Diazo Compounds; Influence of Unsaturated Side-Chains on the Formation and Colour of ——. W. Borsche and F. Streitberger. Ber., 1904, **37**, 4116—4136.

The isomeric hydroxycinnamic acids and α-phenylhydroxycinnamic acids were investigated with regard to their behaviour towards diazo compounds. The two stereoisomeric forms of *o*-hydroxycinnamic acid, *i.e.* cumaric and cumarinic acids, each combine with one molecular proportion of diazobenzene fairly smoothly, to form *p*-hydroxyazo compounds. *m*-Hydroxycinnamic acid gives a poor yield of the *p*-hydroxyazo compound in alkaline solution, but the yield is very much improved if combination takes place in alcoholic acetic acid solution. *p*-Hydroxycinnamic acid does not react in alcoholic acetic acid solution. In alkaline solution a very unstable dyestuff is at once formed, which is possibly the compound—

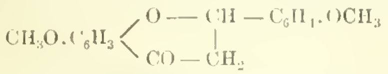
$$O : C_6H_4 : CH.C(: N.NH.C_6H_5).COOH.$$

All hydroxycinnamic acids refuse to combine with two molecular proportions of diazobenzene. On the other hand, *o*- and *m*-hydroxyphenylpropionic acids were found to be capable of combining with two molecular proportions of diazobenzene, whilst *p*-hydroxyphenylpropionic acid, of course, was only capable of combining with one. α-Phenylcumaric acid is unknown. α-Phenylcumarinic acid combines with one molecular proportion of diazobenzene and α-phenyl-*p*-hydroxycinnamic acid behaves in the same manner, in contrast to the non-phenylated compound. On the other hand, α-phenyl *m*-hydroxycinnamic acid only combines to a very slight degree, if at all, with diazobenzene. The α-phenylhydroxydihydrocinnamic acids behaved in all essentials in an analogous manner to the corresponding non-phenylated compounds, the β-hydroxyphenylpropionic acids. It appears that the influence of an α-β unsaturated side-chain on the benzene nucleus is in respect to combining power with diazo compounds, very similar to that of an azo group. Moreover, its disturbing influence is greatest when in the *m*-position to the hydroxy group, weaker in the *p*-, and weakest in the *o*-position. In order to observe the tinctorial effect of the presence of an unsaturated side-chain, the combinations with *p*-diazobenzene sulphonic acid were studied. Cumaric and cumarinic acids combined normally with this reagent, *m*-hydroxycinnamic acid only combined partially, whilst *p*-hydroxycinnamic acid yielded an unstable compound. The three hydroxyphenylpropionic acids reacted normally. It was found that the dyestuffs with unsaturated side-chain dyed wool in redder shades than the corresponding saturated compounds. Here again the influence of the unsaturated side-chain is similar to that of a second azo group. The shades produced on wool are:—Benzenesulphonic acid azocumaric acid, orange-yellow; benzenesulphonic acid azomelilotic acid, canary yellow; benzenesulphonic acid *m*-hydroxycinnamic acid, yellowish-red; benzenesulphonic acid *m*-hydroxycinnamic acid, dark yellow. Benzenesulphonic acid azo-*m*-hydroxydihydrocinnamic acid dyes in redder shades than the corresponding *o*-compound, and α-phenylbenzenesulphonic acid azomelilotic acid in redder shades than the corresponding non-phenylated compound.—E. F.

3.2′-, 3.3′-, *and* 3.4′-*Dihydroxyflavonol.* St. v. Kostanecki, A. v. Szlagier, A. Widmer, and K. Juppen. Ber., 1904, **37**, 4155—4163.

The authors have synthesised 3.2′-, 3.3′-, and 3.4′-dihydroxyflavonol, and find that these isomerides all dye mordanted wool fairly strongly, giving yellow shades on alumina- and brown shades on iron-mordant, showing that in this case the presence of hydroxyl groups in "anchi" position to one another is of no consequence as regards the mordant-dyeing properties of the dyestuff. The experiments on the dyeing properties of 2.2′-, 2.3′-, and 2.4-

dihydroxyflavonol (Kostanecki and others, this J., 1904, 712 and 367) were therefore repeated. The authors now find that the former results were erroneous, owing to the fact that 2.2′-dihydroxyflavonol is much more soluble in hot water and in alcohol than 2.3′- and 2.4′-dihydroxyflavonol. When the latter were employed in the form of fine pastes, it was found that 2·3′-dihydroxyflavonol dyed on alumina mordant almost as strongly as the 2.2′-dihydroxyflavonol, and 2.4′-hydroxyflavonol even more strongly. The presence of hydroxyl groups in "anchi"-position is, therefore, of no importance with regard to the property of dyeing on mordants. To prepare 3.2′-dihydroxyflavonol, salicylic aldehyde methyl-ether was first treated with paeonol to form 2′-hydroxy-4′-2 methoxychalkone $(CH_3O)(OH)C_6H_3.CO.CH:CH.C_6H_4.OCH_3$. This reaction is performed in presence of alcohol and sodium hydroxide. On boiling with alcohol and dilute hydrochloric acid, this is converted into 3.2′ dimethoxyflavanone—

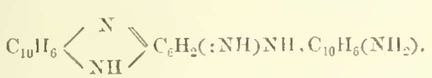


$$CH_3O.C_6H_3\left\langle\begin{array}{l}O - CH - C_6H_4.OCH_3\\ \qquad\;\; |\\ CO - CH_2\end{array}\right.$$

This is converted, by means of amyl nitrite and hydrochloric acid, into an isonitroso compound, which, on boiling with dilute sulphuric acid, forms 3.2′-dimethoxyflavonol. On boiling with strong hydriodic acid, this is converted into 3.2′-dihydroxyflavonol. 3.3′-Dihydroxyflavonol and 3.4′-dihydroxyflavonol are prepared in an analogous manner, the original salicylic aldehdye methyl-ether being replaced by *m*-methoxybenzaldehyde in the first case, and the 2′-hydroxy-4′.2-dimethoxychalkone by 2′-hydroxy-4′.4-dimethoxychalkone in the second.—E. F.

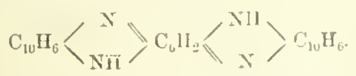
Fluorindines of the Naphthalene Series. R. Nietzki and A. Vollenbruck. Ber., 1904, **37**, 3887—3891.

1.3.4.6 - Dinitrodichlorobenzene is condensed with *o*-naphthylenediamine in presence of sodium acetate, forming aminonaphthyldinitrochloroaniline. This condenses with a further molecular proportion of *o*-naphthylenediamine, in presence of dry sodium carbonate, sodium acetate, and amyl alcohol, to form diaminodinaphthyldinitro-*m*-phenylenediamine, which, on reduction with stannous chloride, tin, and hydrochloric acid, yields diaminodinaphthyltetra-aminobenzene, $C_6H_2(NH_2)_2(NH.C_{10}H_6NH_2)_2$, in the form of a tetrahydrochloride. This substance is oxidised by air in presence of moisture or in aqueous solution, or by ferric chloride, forming aminonaphthyldiaminonaphthophenazine,



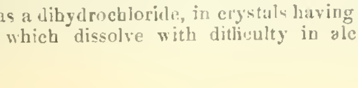
$$C_{10}H_6\left\langle\begin{array}{c}N\\ NH\end{array}\right\rangle C_6H_2(:NH)NH.C_{10}H_6(NH_2).$$

If the oxidation is carried out whilst heating, or if the abovementioned intermediate product is boiled with dilute hydrochloric acid, naphthofluorindene—



$$C_{10}H_6\left\langle\begin{array}{c}N\\ NH\end{array}\right\rangle C_6H_2\left\langle\begin{array}{c}NH\\ N\end{array}\right\rangle C_{10}H_6.$$

is formed. The hydrochloride and other salts form crystalline powders, soluble with difficulty in all solvents. The solutions are pure blue in colour. The solution of the base is red. None of the solutions are fluorescent. If the abovementioned aminonaphthyldinitrochloroaniline is condensed with o-phenylenediamine in presence of sodium carbonate, sodium acetate, and amyl alcohol, aminonaphthylaminophenyldinitro-*m*-phenylenediamine is formed. On reduction this yields aminonaphthylaminophenyltetra-aminobenzene, which readily oxidises to an intermediate product of an "azine" type of which the base is yellow and the hydrochloride, $C_{22}H_{17}N_5(HCl)_2$, brown. On oxidising the boiling, slightly acid solution of the tetra-amino substance by means of a current of air, the mixed fluorindine—



$$C_{10}H_6\left\langle\begin{array}{c}N\\ NH\end{array}\right\rangle C_6H_2\left\langle\begin{array}{c}NH\\ N\end{array}\right\rangle C_6H_4$$

s formed as a dihydrochloride, in crystals having a metallic ustre, and which dissolve with difficulty in alcohol to a blue solution. On considerable dilution the colour of the solution becomes reddish, and shows weak fluorescence. The alcoholic solution of the base is brownish-yellow and shows red fluorescence.—E. F.

Iron-Cyanogen Compounds; Blue ——. K. A. Hofmann, O. Heine, and F. Köchtlen. Annalen, 1904, **337**, 1—36.

The authors find that Soluble Prussian Blue made from potassium ferrocyanide and less than one molecular proportion of a ferric salt is identical with Turnbull's Soluble Blue made from potassium ferricyanide and less than one molecular proportion of a ferrous salt, thus confirming the results of Skraup (Annalen, 1877, **186**, 371). Both represent the ferric-potassium salt of hydroferrocyanic acid, contain water which cannot be removed without decomposition, and correspond to the formula $(FeCy_6.KH_2) - Fe(OH)_2$. Insoluble Prussian Blue, made from potassium ferrocyanide with excess of a ferric salt, or with a mixture of ferric and ferrous salts, is, if thoroughly washed in presence of air, identical with Turnbull's Insoluble Blue, made from potassium ferricyanide and excess of a ferrous salt. Precipitates obtained whilst hot, in presence of free acid, are complicated mixtures, whilst at 15° C., without excess of acid, there is always finally obtained the ferric salt of hydroferrocyanic acid, $Fe_7Cy_{18} + 10H_2O$, in which the water resists all drying agents, and is therefore probably constitutional. The residue from the preparation of hydrocyanic acid is not identical with the precipitate obtained at the ordinary temperature with potassium ferrocyanide and a ferrous salt. The latter can be oxidised, according to the proportion of the constituents, to soluble or insoluble Prussian Blue, whereas the former is only incompletely oxidised by the air, but can be completely oxidised by hydrogen peroxide to Williamson's Violet, which has the same composition as Soluble Prussian Blue, but is probably a polymer of the formula—

$$KH = (FeCy_6) < \begin{array}{c}FeOH\\ FeOH\end{array} > (FeCy_6) = KH$$

The water cannot be removed by drying. The residue from the preparation of hydrocyanic acid is the corresponding ferrous salt—

$$K_2 = (FeCy_6) < \begin{array}{c}Fe\\ Fe\end{array} > (FeCy_6) = K_2$$

Williamson's Blue is much more stable to dilute alkali than Prussian Blue. All the above-mentioned blue and violet compounds can be obtained by the reducing action of hydrogen peroxide on a mixture of potassium ferricyanide and a ferric salt From this fact and their stability towards hydrogen peroxide, it is probable that they all contain the ferrocyanogen group combined with ferric iron, and not the ferricyanogen group combined with ferrous iron. Perfectly dry hydroferrocyanic acid and ferric chloride in solution in absolute alcohol, form intensely blue precipitates, similar in appearance and behaviour to those obtained in aqueous solution, but containing hydrogen, chlorine, and the constituents of alcohol, which cannot be removed by drying in vacuum over phosphorus pentoxide. They represent the hypothetical simple ferric salts of hydroferrocyanic acid, in which the extra radical ferric atoms have united with chlorine, whilst the acid cyano-hydrogen atoms thus set free have given rise to ester formation.—E. F.

English Patent.

Sulphur Dyes [Sulphide Dyestuffs]: Manufacture of Black ——. G. W. Johnson, London. From Kalle and Co., Biebrich-on-Rhine, Germany. Eng. Pat. 26,579, Dec. 2, 1903.

See Fr. Pat. 347,278 of 1903; this J., 1904, 543.—T. F. B.

United States Patents.

Green Dyestuff [Anthracene Dyestuff]. I. Kugel, Cologne, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,367, Nov. 22, 1904.

1.4-Diamino-2.3-dibromo-anthraquinone is heated with cupric chloride in a suitable liquid. The dyestuff forms bluish-black needles, insoluble in alcohol. It is reduced by hydrosulphite and caustic soda, and the alkaline solution has the properties of a "vat," which dyes unmordanted cotton a blue shade, turning to a fast green on oxidation in the air.—A. B. S.

Blue Dyestuff [*Anthracene Dyestuff*]. M. Kugel, Cologne, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,368, Nov. 22, 1904.

1-Methylamino-2-bromo-anthraquinone is heated with cupric chloride and a suitable liquid. On reduction with hydrosulphite and caustic soda, it is converted into a hydro compound, the alkaline solution of which has the properties of a "vat," dyeing unmordanted cotton in pure blue shades. —A. B. S.

Green-blue Dyestuff [*Anthracene Dyestuff*]. M. Kugel, Cologne, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,369, Nov. 22, 1904.

1.3-Dibromo-2-aminoanthraquinone is treated with cupric chloride and a suitable liquid. The dyestuff is reduced by hydrosulphite and caustic soda, the alkaline solution obtained, having the properties of a "vat" which dyes unmordanted cotton in pure greenish-blue shades. —A. B. S.

Sulphur Dye [*Sulphide Dyestuff*]; *Dark Blue* ——. A. L. Laska, Assignor to K. Oehler, Offenbach-on-Maine, Germany. U.S. Pat. 775,570, Nov. 22, 1904.

See Eng. Pat. 12,270 of 1904; this J., 1904, 863.—T. F. B.

French Patents.

Quinonephenolimides and Quinonenaphtholimides; Manufacture and Separation of Stable ——. Farbw. vorm. Meister, Lucius und Brüning. Fr. Pat. 339,044, Sept. 17, 1903.

Quinonechlorimide, obtained by the action of bleaching powder on *p*-aminophenol in hydrochloric acid solution, is allowed to react with an equivalent quantity of phenol, *o*-cresol, *m*-cresol, or α-naphthol in presence of one molecular proportion of sodium hydroxide. From the blue liquids so obtained the phenol derivative is salted out in the form of its sodium salt, the others being precipitated in the form of their colour-acids by addition of acetic acid or sodium bicarbonate. The products are extremely stable, and may be dried without decomposition. They are easily reduced by sodium sulphide or dextrose to the corresponding dihydroxydiphenylamine derivatives.—E. F.

Sulphide Dyestuffs; Process of Making Yellow, Orange-Yellow to Orange ——. Farbwerke vorm. Meister, Lucius und Brüning. Fr. Pat. 339,096, Oct. 12, 1903.

See Eng. Pat. 21,800 of 1903; this J., 1904, 863.—T. F. B.

Sulphide Dyestuffs; Process for Manufacturing Pure Yellow, Orange-Yellow to Yellow-Orange ——. Farbwerke vorm. Meister, Lucius und Brüning. Fr. Pat. 339,103, Oct. 15, 1903.

See Eng. Pat. 21,945 of 1903; this J., 1904, 819.—T. F. B.

Para-acetamino-o-aminophenol, and Monazo Mordant Dyestuffs derived therefrom; Process for the Production of ——. L. Cassella and Co. Fr. Pat. 339,090, Oct. 9, 1903.

See Eng. Pat. 22,289 of 1903; this J., 1904, 898.—T. F. B.

Monoazo Dyestuffs; Process of Manufacturing Mordant ——. K. Oehler. Fr. Pat. 345,128, May 31, 1904.

See U.S. Pat. 767,069 of 1904; this J., 1904, 863.—T. F. B.

Monoazo Dyestuffs; Process for Manufacturing Mordant ——. K. Oehler. First Addition, dated June 13, 1904, to Fr. Pat. 345,128, May 31, 1904.

See U.S. Pat. 767,070 of 1904; this J., 1904, 863.—T. F. B.

Alizarin; Process for Manufacturing ——. Badische Anilin und Soda Fabrik. Fr. Pat. 344,680, July 8, 1904. Under Internat. Conv., Feb. 22, 1904.

Very pure alizarin, which dyes fine bluish-red shades, is produced by heating anthraquinone with very concentrated caustic alkali solution in presence of an oxidising agent. For example, 100 kilos. of anthraquinone are incorporated with a solution of 20—30 kilos. of sodium chlorate and 300 kilos. of a mixture of caustic potash and soda in 100 litres of water, and the whole heated to 200° C. in an open vessel, with agitation. The product is dissolved in water, air is blown through the solution, and the alizarin is precipitated by milk of lime. The precipitate is decomposed by hydrochloric acid, and the residue treated with dilute caustic soda solution, to separate the alizarin from the anthraquinone. The mother liquors of the process contain small quantities of benzoic acid. In place of sodium chlorate, other oxidising agents may be used, *e.g.*, sodium, barium, manganese, or lead peroxides, or mercuric oxide. —T. F. B.

Arylated 1.8-Naphthylaminesulphonic Acids; Preparation of ——. Actienges. f. Anilin-fabrikation. Fr. Pat. 344,810, July 15, 1904.

1-Naphthylamine-4.8-disulphonic acid is heated to about 180—190° C. with aniline or its homologues, with or without the addition of benzoic acid or of hydrochlorides of the same bases. The sulphonic-acid group in the 4-position is thus eliminated, the amino group of the naphthylamine sulphonic acid being simultaneously arylated. After the completion of the reaction, excess of sodium carbonate is added, the excess of aromatic base driven off by a current of steam, the solution cooled and the product precipitated by addition of acid.—E. F.

Azo Dyestuffs; Process for Preparing New Intermediate Compounds and New ——. G. Nuth, H. Hold, and H. Ruegg. Fr. Pat. 344,841, July 16, 1904.

By sulphonating α- and β-naphthylbenzidine at a temperature of 90°—100° C., slightly soluble or easily soluble sulphonic acids are obtained, according to whether ordinary (monohydrate) or fuming sulphuric acid has been used. The sulphonic acids are suitable for the preparation of azo dyestuffs. In diazotising certain of these acids, nitroso-diazonium compounds are produced, but the corresponding nitroso-azo dyestuffs can be converted into the simple azo dyestuffs by boiling with mineral acids. Dyestuffs which give yellow shades on wool are obtained by combining the tetrazo compound of the slightly soluble β-naphthylbenzidine sulphonic acid with salicylic acid; violet, by combining with β-naptholdisulphonic acid R; blue, by combining with aminonaphtholdisulphonic acid S. By combining the diazo derivative of the easily soluble β-acid with "R acid," a bluish-red dyestuff results. A large variety of shades is thus obtained by combining the four sulphonic acids with different phenols and amines. For instance, a black dyestuff results from combining the slightly soluble β-acid, on the one hand, with α-naphthlyamine, and on the other hand, with R salt.—T. F. B.

Monoazo Mordant Dyestuff [*Azo Dyestuff*] *Preparation of a New* ——. (*Case I.*) Kalle and Co. Fr. Pat. 345,083, July 25, 1904.

1-Chloro-4-acetylaminobenzene-6-sulphonic acid is nitrated with an equimolecular quantity of a nitrating agent. The product is either 1-chloro-4-acetylamino-3-nitrobenzene 6-sulphonic acid, or 1-chloro-4-acetylamino-5-nitrobenzene-6-sulphonic acid, or a mixture of the two. It is heated in a brine-bath with dilute sodium hydroxide solution, by which means the acetylamino group is replaced by a hydroxyl group. On subsequent reduction of the sodium salt of the resulting acid, by means of sodium polysulphide by preference, it is converted into a chloroaminophenolsulphonic acid. This is diazotised and combined with one molecular proportion of β-naphthol. The resulting dyestuff yields brownish-orange shades on wool from an acid bath. On subsequent chroming, these change to bluish-black, which are said to be absolutely fast to washing and fulling.—E. F.

Disazomordant Dyestuff [*Azo Dyestuff*]; *Preparation of* ——. (*Case II.*) Kalle and Co. Fr. Pat. 345,984, July 25, 1904.

Chlorobenzene is transformed by sulphonating agents into *p*-chlorobenzenesulphonic acid. This is nitrated, and the mononitro derivative heated for several hours with dilute sodium hydroxide solution to 125°—130° C. By this means the chlorine atom is replaced by a hydroxyl group. The nitro-*p*-phenolsulphonic acid is reduced without isolation, by means of zinc dust, to the corresponding amino derivative. This is precipitated by hydrochloric acid, nitrated and again reduced by means of zinc dust. A diamino-*p*-phenolsulphonic acid is thus obtained, which is tetrazotised and combined with two molecular proportions of β-naphthol. The product dyes wool directly in violet-black shades, which, on development on the fibre by chromium salts, change to bluish-black shades, which are extremely fast.—E. F.

Monoazo Mordant Dyestuffs [*Azo Dyestuffs*]; *Preparation of* —— *from α-Naphthol-o-Sulphonic Acid* (*Case III.*). Kalle and Co. Fr. Pat. 345,985, July 25, 1904.

α-Naphthol-*o*-sulphonic acid is combined with diazo compounds formed from derivatives of *o*-aminophenol. The resulting dyestuffs, when dyed on wool and subsequently chromed on the fibre, give reddish-black to greenish-black shades, which are said to be absolutely fast to washing and fulling. With diazotised *p*-chloro-*o*-aminophenol the resulting chromed dyeing is greenish-black; with the corresponding nitroaminophenol, reddish-black; with picraminic acid, brownish-black; and with *o*-nitro-*o*-aminophenol-*p*-sulphonic acid, violet black.—E. F.

Molasses, Vinasses, Saccharine Juices, and other Vegetable Extracts; Production of Colouring Matter from ——. O. Wichardt. Fr. Pat. 345,410, Aug. 9, 1904.

Molasses, &c. are introduced into solutions of metallic salts containing an excess of acid. In the majority of cases a colouring matter is precipitated in the cold, but especially on heating. In the case of salts of molybdenum and sulphuric acid, a colouring matter resembling indigo is said to be obtained.—J. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Dyeing on Mordants. M. Prud'homme. Rev. Gen. Mat. Col., 1904, **8**, 365—367.

The following general rule can be deduced from the observations of Moehlau and Steimmig, Kostanecki and Liebermann (this J., 1901, 710), on mordant dyestuffs:—When an aromatic compound contains a hydroxy group in a position adjacent to the chromophor, or to a salt-forming group (OH, COOH, SO_3H, &c.) in the *o*-position to the chromophor, this compound will be a mordant dyestuff. By comparing and contrasting the three classes of anthraquinone dyestuffs, as defined by Buntrock (this J., 1901, 983), *viz.*, those which only dye mordanted fabrics (*o*-dihydroxy compounds), those which dye unmordanted animal fibres (amino derivatives), and those which dye mordanted vegetable fibres and unmordanted or mordanted animal fibres (aminohydroxy derivatives), and also the various types of mordant azo dyestuffs, the conclusion is arrived at, that, when a dyestuff dyes unmordanted wool by reason of its containing a certain basic or acid group, it will also dye mordanted wool, if it contain a hydroxy group or an imino-sulphonic group (*e.g.*, $-NH.C_6H_4.SO_3H$) in the position farthest from (*i.e.*, para to) the basic or acid group. —T. F. B.

Formaldehyde-Hydrosulphite of Sodium. L. Baumann, G. Thesmar, and J. Frossard. Rev. Gen. Mat. Col., 1904, **8**, 353—357.

A solution of formaldehyde-hydrosulphite of sodium, obtained by dissolving sodium hydrosulphite in 40 per cent. formaldehyde, furnishes, on cooling, an abundant crop of well-defined crystals, which are found to consist, not of formaldehyde-sodium hydrosulphite, but of a mixture or compound of formaldehyde-sodium bisulphite, $NaHSO_3 + CH_2O + H_2O$, and formaldehyde-sodium bihydrosulphite, $NaHSO_2 + CH_2O + 2H_2O$; these two compounds were isolated by fractional precipitation from aqueous solution by alcohol, in which the bihydrosulphite compound is more soluble. This latter compound is not hygroscopic, is easily soluble in water, melts sharply at 63°—64° C., gives off its water of crystallisation at 120° C., and decomposes at 125° C. with evolution of formaldehyde and hydrogen sulphide. It is very easily decomposed in the cold by acids, but not so easily by alkalis as is the corresponding bisulphite compound. It is suggested that these bihydrosulphite-formaldehyde compounds should be used for reducing nitro to amino compounds. The above results would show that Bernthsen's formula for hydrosulphurous acid ($H_2S_2O_4$) is incorrect, and that Schützenberger's original one (H_2SO_2) represents its constitution, the crude "hydrosulphite" being in reality a mixture of bisulphite and bihydrosulphite, $NaHSO_3 + NaHSO_2 + H_2O$, or $Na_2S_2O_4, 2H_2O$. The formation of the formaldehyde compound is hence shown by the equation—

$$Na_2S_2O_4, 2H_2O + 2CH_2O + 2H_2O =$$
$$NaHSO_3, CH_2O, H_2O + NaHSO_2, CH_2O, 2H_2O.$$

(See also this J., 1904, 657 and 658.)—T. F. B.

Calcium Soaps; Dissolving —— *by Means of Ammonium Citrate.* Justin-Mueller. Chem.-Zeit., 1904, **28**, 1149.

The calcium carbonate precipitated from a water of about 24° of hardness can be dissolved by a solution containing 0·5 grm. of crystalline ammonium citrate per litre, whilst the calcium soap precipitated from the same water requires nearly 100 grms. of the same salt per litre for solution. The industrial application of ammonium citrate solution for dissolving calcium soaps is thus hardly possible, but there are many possible applications of this mode of solution of precipitated calcium carbonate, *e.g.*, in dyeing or printing with diamine dyestuffs. For this purpose the calcium should be precipitated from the water by means of an alkali, of which an excess is avoided, and the precipitate redissolved as described above.—C. A. M.

English Patents.

Drying, Bleaching, Carbonising, &c. of Textile Piece Goods, by Means of Air or other Gases or Vapours; Apparatus for ——. J. D. Tomlinson, Rochdale. From H. and F. Haas, Lennep, Germany. Eng. Pat. 24,666, Nov. 13, 1903.

The apparatus described in Eng. Pat. 15,108 of 1903 (this J., 1904, 659) is modified for use as a continuous machine for piece goods, by the addition of guide rollers.—A. B. S.

Calico Printing; Machine for ——. W. E. Wood, Accrington, J. C. Secombe. Lang Bridge, Ltd., Accrington. Eng. Pat. 25,891, Nov. 27, 1903.

For intermittent printing machines, in which one or more of the printing rollers have to be removed out of contact with the fabric for a definite length of time, the rollers are mounted in sliding bearings, and are pressed against the fabric by means of springs. Rams worked by hydraulic or pneumatic pressure are fitted at each side of the machine, and, when the pressure is on, they come into contact with the shaft of the printing roller and remove it out of contact with the cloth. When the pressure is released, the spring bearings force the rollers back into their printing position. The admission and release of the pressure to the rams is regulated by an arrangement of chain-gearing, which opens and closes the air- or water-valves at the arranged times. The times of contact can be altered by means of interchangeable chain wheels.—A. B. S.

Figured Fabrics; Manufacture of ——. J. Morton, Carlisle. Eng. Pat. 51, Jan. 1, 1904.

The fabrics are woven with two different materials, such as wool and cotton, they are then dyed by a process which only dyes one of the fibres, and the other fibres are either left white, or are dyed, or printed with a colour which does not affect the portions already dyed.—A. B. S.

Yarn Printing in Several Colours; Machine for ——. A. Hofmann, Gothenburg, Sweden. Eng. Pat. 21,793, Oct. 10, 1904.

The yarn-holder is fixed on a travelling carriage, which runs over the tanks containing the different colours to be printed. Each of these tanks is fitted with a printing roller, fixed on an oscillating lever, which can be brought into the position for printing by means of a Jacquard or like mechanism.—A. B. S.

Starching [Sizing] Compositions. E. M. Sharp, Padiham. Eng. Pat. 7560, March 30, 1904.

Ordinary starch is combined with gum tragasol, together with a small proportion of caustic soda, and the mixture is used for textile goods.—J. F. B.

United States Patents.

Retting Vegetable Fibres; Apparatus for ——. B. S. Summers, Chicago, Ill. U.S. Pat. 774,856, Nov. 15, 1904.

A number of digesters are connected by means of upper and lower pipes, with a chamber heated by a heating liquid, the upper pipes being situated below the level of the liquid in the heater. An additional chamber placed above the heater, and not in the circulating system, serves as replenisher, and is connected by piping with the heater and digesters. The digesting liquid is mixed with a precipitant, in an agitating chamber provided with a screw-conveyor and baffle-plates, and then passes through a filter to the heater.
—L. F. G.

Dyeing, &c.; Apparatus for ——. A. Fankhauser and A. Ryser, Baden, and F. J. B. Knibiehler, Lörrach, Assignors to Wegmann and Co., Baden, Switzerland. U.S. Pat. 775,621, Nov. 22, 1904.

See Fr. Pat. 335,696 of 1903; this J., 1904, 251.—T. F. B.

Dyeing; Apparatus for ——. J. Kershaw, Bradford. U.S. Pat. 776,069, Nov. 29, 1904.

French Patents.

Artificial Silk; Manufacture of Non inflammable and Non-explosive ——. R. Valette. Fr. Pat. 344,660, July 8, 1904.

As solvents for the nitrocellulose, mixtures of acetone and ethyl alcohol or of acetone and methyl alcohol are used, sometimes with addition of glacial acetic acid. The collodion is denitrated by means of ammonium nitrite.
—A. B. S.

Artificial Silk. H. D. Turgard. Fr. Pat. 344,845, July 16, 1904.

100 grms. of nitrated cotton are dissolved in a mixture of 2400 c.c. of 90 per cent. alcohol, 600 c.c. of glacial acetic acid, 3 grms. of albumin, and 7·5 grms. of castor oil. After well mixing, the solution is filtered and then forced through the "spinning" openings into a 1 per cent. solution of alum. The silk threads thus prepared have no tendency to stick together. The thread is finally denitrated.
—A. B. S.

Artificial Silk; Twisting and Spinning Apparatus for ——. Soc. Franc. de la Viscose. Fr. Pat. 345,274, July 30, 1904.

The cellulose solution [viscose] is fed, under pressure, through a regulating valve into the filtration chamber contained in the bracket supporting the twisting and spinning element. This latter consists of a vertical tube, rotated by a flexible connection at the top end, and supported on two sets of ball bearings carried by the tubular bracket. The viscose flowing from the filtration chamber enters the rotating tube about the middle, and descends to the spinning jet. Right- and left-handed helices are provided on the outside of the rotating hollow spindle, above and below the point where the viscose enters, to prevent any substance, either lubricant or viscose, settling between the spindle and its support. The threads are formed and twisted as they leave the rotating orifices of the jet; the latter is surrounded by a funnel-shaped appendage, which imparts a whirling motion to the coagulating liquid.
—J. F. B.

Artificial Silk; Regulating Valve for Solutions for Spinning ——. Soc. Franc. de la Viscose. Fr. Pat. 345,293, Aug. 1, 1904.

An extremely delicate valve for regulating the speed of th supply of viscose passing to the spinning tubes consists essentially of a plug-cock attached to the viscose mains, and provided with a pointer and index dial. The viscose enters the hollow plug of the cock from below, and passes out through a hole bored perpendicularly to the axis of the plug. This hole communicates with the pipe supplying the spinning jet by way of a tube passing through the plug-seating at right angles to the axis. The hole in the plug does not engage that in the seating directly, but communicates with it through a gradually shallowed groove cut in the periphery of the plug, by which arrangement the delicacy of the adjustment is enormously increased
—J. F. B.

Artificial Silk; Continuous and Automatic Apparatus for Spinning ——. Soc. Franc. de la Viscose. Fr. Pat. 345,320, Aug. 2, 1904.

The viscose is fed by way of the regulating valve, twisting element and spinning jet (see preceding abstracts) into the coagulating bath, where it is formed into a twisted compound thread. After the thread leaves the coagulating and washing baths, it is freed from adherent moisture by a rubber wiper, and passes upwards through a guide-hole, operated with a reciprocal motion by a cam-mechanism This distributes the thread uniformly on to one of a pair of winders, and at a given interval the mechanism of the cam transfers the thread to the other winder; the full one is then removed and replaced by an empty winder.—J. F. B.

Viscose; Jet for Spinning Threads from ——. Soc. Franc. de la Viscose. Fr. Pat. 345,343, Aug. 3, 1904.

The spinning jet consists of a metallic tube, into the mouth of which is fitted a removable disc or truncated cone, the sides of which are grooved parallel to the axis by very fine channels. When the disc is in position these groves constitute capillary orifices through which the viscose, previously strained, is forced. When any of the orifices become clogged, the disc or cone is removed and the grooves are easily cleaned out.—J. F. B.

Mordanting and Weighting of Textile Fibres with Zinc Chloride. C. E. Carstanjen. Fr. Pat. 344,782, July 12, 1904.

To increase the fixation of oxide of zinc on the fibre, sulphates, sulphites or thiosulphates of the alkalis, of the alkaline earths or of aluminium are added to the baths of zinc chloride.—A. B. S.

Dyeing Textile Substances in Bobbins; Process for ——. T. de Naeyer. Fr. Pat. 344,752, July 11, 1904. Under Internat. Conv., Nov. 26, 1903.

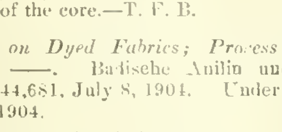
The thread is wound in bobbin form on tubes in the usual manner, and then, before dyeing, is slid on to a tube of smaller diameter than the original one, in order to reduce the tension on the inner threads, thus increasing the uniformity of the subsequent dyeings. The lengths of the tubes to which the bobbins are transferred is equal to, or slightly less than the extreme width of the bobbin, thus ensuring the bobbins being close to one another in the dye vat or other apparatus. Several bobbins, on the tubes as described above, may be held on the same core during dyeing, being kept in position by means of plates screwed on the ends of the core.—T. F. B.

Discharges on Dyed Fabrics; Process for Producing Coloured ——. Badische Anilin und Soda Fabrik. Fr. Pat. 344,681, July 8, 1904. Under Internat. Conv., June 16, 1904.

Although good white discharges are obtained by printing dyed fabrics with formaldehyde-hydrosulphite compounds, coloured discharges produced thus, are not satisfactory, since the discharge colours are imperfectly fixed. By the addition of some aromatic amino-compound to the printing mixture, fine and perfect colour discharges of considerable fastness are produced. For example, 160 grms. of tannin, 60 c.c. of water, 185 c.c. of "dilute" alcohol, and 125 c.c. of aniline are added to 1 litre of the discharge paste, containing 2 kilos. of formaldehyde-hydrosulphite compound dissolved in gum solution. A solution of 40 or 50 grms. of a basic dyestuff of the desired colour in the minimum quantity of gum water is added, and the dyed fabric is printed with the mixture, steamed, and oxidised.—T. F. B.

Lustre; Conferring —— on Materials of all kinds. H. Hall. Fr. Pat. 344,658, July 7, 1904.

The material is passed between rollers the axes of which are oblique to one another (see figure). When the rollers revolve, this arrangement causes a lateral pressure, which increases with the angle between the axes of the rollers.



—A. B. S.

Benzene used for "Dry-Cleaning" Fabrics; Process and Apparatus for Recovering ——. E. Delhotel. Fr. Pat. 344,848, July 16, 1904.

The fabrics saturated with benzene are suspended in a closed chamber or vat, at the bottom of which is a steam coil. Air is introduced through a pipe at the bottom of one side of the vat, and, being heated by the steam coil, removes the benzene from the fabrics. It is then pumped off up a tall column, down which a shower of cold water falls, thus condensing the benzene vapours. The mixture of water and benzene is separated in any convenient apparatus, and the benzene is removed. The cooled dry air is pumped again into the vat containing the fabrics, thus completing a closed circuit and avoiding loss of benzene.

—T. F. B.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

United States Patent.

Hides; Machine for Applying Colouring-Matter to ——. R. W. Churchill, West Peabody, Mass. U.S. Pat. 774,935, Nov. 15, 1904.

A movable perforated cylinder surrounds a stationary cylinder-sector, the skin to be treated, being flattened and held tightly against the cylinder by exhausting the air from the latter. A rotating and "axially-reciprocating" rubber, for applying colour, is arranged adjacent to the cylinder, and opposite to the cylinder-sector, so as to apply colour to the skin at a point where it is held against the cylinder.

—B. N.

VII.—ACIDS, ALKALIS, AND SALTS.

Chamber Process; Theory of the ——. G. Lunge. Z. angew. Chem., 1904, **17**, 1659—1663. (See also page 1178.)

Raschig gives three equations as representing the changes successively occurring in the chamber, and bases the whole process upon the behaviour of a hypothetical substance which has never been actually observed as present, while neglecting altogether another substance known to be always present in large quantity (this J., 1904, 934). He makes no reference to nitrosylsulphuric acid, $NO_2.SO_2.OH$, nor to nitrogen peroxide. Were his theory correct, both of these substances would not merely be accessory by-products, but would exercise a harmful influence from the amount of nitrogen they would abstract from the process, and a chamber would be working so much the better the less nitrogen peroxide it showed and the less "nitrous" the cloud of sulphuric acid was. This is contrary to all experience, which shows that both nitrogen peroxide and nitrosylsulphuric acid are present in large amount in a chamber in good work, and that the latter is formed wherever sulphur dioxide and water in presence of excess of oxygen react on nitric oxide, nitrogen peroxide, or mixtures of the two. Trautz in his paper (this J., 1904, 440) on the physical chemistry of the chamber process, deals chiefly with the reactions of nitrosylsulphuric acid, and though he also treats of Raschig's equations, and admits that nitrososulphonic acid may possibly occur, he has, in the author's view, not laid sufficient stress on the divergence of Raschig's experiments from the actual conditions in the chamber. Raschig has, in fact, in studying the reaction of sulphurous upon nitrous acid, left out of consideration the influence of the enormous excess of atmospheric oxygen, which must at once convert his nitrososulphonic acid, even if it have a momentary existence, into nitrosylsulphuric acid. The existence of nitrososulphonic acid in extremely dilute aqueous solution in a beaker affords no proof of its existence in the chamber cloud, in presence of excess of oxygen. His first equation, then, does not represent a reaction really occurring in the chamber. Regarding his second, he himself admits its uncertainty. The third is as inaccurate as the first: nitrogen dioxide, in presence of water and of oxygen in excess, is quickly and completely converted into nitric acid. Only when sulphuric acid of fair concentration is substituted for water, does this oxidation not proceed to nitric acid, but then the result is nitrosylsulphuric acid, equally far removed from the result in Raschig's equation.—J. T. D.

Chamber Process; Theory of the ——. F. Raschig. Z. angew. Chem. 1904, **17**, 1777—1785. (See preceding abstract; and page 1178.)

The author does admit Lunge's statement (see preceding abstract) that the presence of nitrosylsulphuric acid in the chamber is proved, and considers that the nitrous character of the chamber acid (never higher than 0·03 per cent. of N_2O_3) is due to simple solution of nitrogen trioxide in the acid, which absorbs it in its fall through the nitrous atmosphere. Even admitting, however, the existence of nitrosylsulphuric acid, its occurrence in quantity sufficient to account for its playing any important part in the working of the chamber would still be matter for grave doubt. While the author admits the necessity for an excess of nitrous gases in order that the reaction may be carried to an end, he looks on the nitrous character of the chamber acid not as the index of an unimportant by-reaction, but as a necessary evil. That this evil is only necessary for the completion of the reaction, however, is demonstrated in the fact that the earlier chambers of a set will work with excess of sulphurous acid, where there is absolutely no evidence of the production of nitrosylsulphuric acid, and where indeed there is always evidence of the production of ammonia—a circumstance only explicable on the author's theory. If Lunge postulates in such a chamber the existence of nitrosylsulphuric acid as an intermediate product, the author has much stronger grounds for assuming similarly the existence of nitrososulphonic acid. Moreover, the conditions in the chamber are arranged to secure, for technical ends, the greatest possible speed of reaction ; hence, if we are to look for any of the intermediate products in the chain of successive rapid reactions, the ultimate result of which is the same as that of the slow reaction $SO_2 + O + H_2O = H_2SO_4$, we must modify the conditions so as to retard these reactions, and thus secure for the intermediate products an existence long enough to enable us to identify them. That is why the author has modified the conditions so as to have his "chamber in a beaker," and that is why he doubts, from the very fact of its continued existence under chamber conditions (if that existence be admitted), whether nitrosylsulphuric acid is really an intermediate product in the process, and not rather the final product of a by-reaction. The author, then, holds to his first equation, $ON.OH + SO_2 = ON.SO_3H$: it is a reaction that has been shown to occur, and its occurrence under the chamber conditions may be looked on as certain, though the product so rapidly undergoes change that it may not be detected in the chamber. At least the assumption of this reaction does not, like the assumption of Lunge's reaction, $N_2O_3 + H_2O + O_2 + 2SO_2 = 2(NO_2.SO_3H)$ ascribe to sulphurous acid and nitrous acid, in company, the property which neither separately possesses, of rapidly absorbing oxygen. As to the author's second equation, $ON.SO_3H + ON.OH = 2NO + HO.SO_3H$, the uncertainty expressed by him and seized on by Lunge was not uncertainty as to whether anything of the kind could or did take place, but merely as to whether the equation $ON.SO_3H + 6ON.OH = 6NO + H_2SO_4 + HNO_4 + H_2O$, involving the formation of pernitric acid, might not really represent the reaction occurring. Either reaction involves the reduction of nitrous acid with formation of nitric oxide. The author's third reaction is traversed by Lunge, who maintains that nitric oxide with excess of oxygen forms, not nitrogen trioxide or nitrous acid, but nitrogen peroxide. Though that may be the case with excess of pure oxygen, the author's direct experiments show that with air, even in quantity containing four times or even eight times the quantity of oxygen needed to form nitrogen trioxide, the oxidation of nitric oxide goes no farther than nitrogen trioxide. Only after long standing in contact with the excess of air does the nitrogen trioxide (itself formed almost instantaneously) oxidise farther to peroxide. And further experiments in which mixtures of nitric oxide and air were shaken up with water showed that, though nitric acid was indeed formed when excess of oxygen was present, no excess was sufficient to form more than one molecule of nitric acid to each molecule of nitrous acid, so that the direct oxidation never goes farther than to form nitrogen peroxide, which with water forms nitric and nitrous acids in equimolecular proportions. The author's third equation, then, $2NO + O + H_2O = 2(ON . OH)$, must also stand as experimental fact.—J. T. D.

Sulphates ; Complex Nature of dissolved ——. A. Colson. Comptes rend., 1904, **139**, 857—859.

By comparing the depression of freezing point due to the dissolved sulphate of a divalent metal with that due to the sulphuric acid formed from it by removal of the metal, the author finds that the molecule of the dissolved salt is double that of the solid salt, and ascribes to it the formula $HSO_4.M.O.M.SO_4H$. This formula affords a possible explanation of the acid reaction of sulphates in solution.

—J. T. D.

Calcium Sulphate ; Solubility of —— *in Solutions of Nitrates.* A. Seidell and J. G. Smith. J. of Phys. Chem., 1904, **8**, 493—499, Chem. Centr., 1904, **2**, 1530—1531.

The solubility of calcium sulphate in solutions of sodium, potassium, magnesium, and calcium nitrates at 25° C. was investigated. In all cases the solubility of calcium sulphate in solutions of the nitrates was greater than in those of the corresponding chlorides (this J., 1902, 257, 549). Calcium nitrate diminishes the solubility of the sulphate. In sodium nitrate solution, the solubility of calcium sulphate rises to a maximum and then diminishes. In concentrated solutions of potassium nitrate, the amount of calcium dissolved is greater than that corresponding to the dissolved sulphuric acid, owing to the formation and separation of syngenite, $CaK_2(SO_4)_2.H_2O$ (See also this J., 1904, 865.)—A. S.

Double Chlorides of Iron and Alkali Metals ; Conditions of Formation and of Solubility of ——. F. W. Hinrichsen and E. Sachsel. Z. physik. Chem., 1904, **50**, 81—99.

Solubility determinations of mixtures of sodium and ferric chlorides, and determinations of the expansion of the solutions on heating, showed that between 0° and 60° C. no formation of a double chloride takes place. Potassium chloride and ferric chloride form a double salt, $FeCl_3.2KCl.H_2O$, at 21° C. If potassium chloride is present in excess, mixed crystals of potassium and ferric chlorides separate. The transition temperature for the formation of the double salt is between 22° and 22·5° C. Caesium chloride and ferric chloride form two double salts at 21° C., the compound $FeCl_3.3CsCl.H_2O$, when excess of caesium chloride is present, and the salt, $FeCl_3.2CsCl.H_2O$, in presence of excess of ferric chloride. The authors were unable to isolate the compound, $FeCl_3.CsCl.\frac{1}{2}H_2O$, described by P. T. Walden. The temperature of formation of the red double salt, $FeCl_3.{}_2CsCl_2.H_2O$, is 39.5°—39.8° C. A curve-diagram is given showing the solubility of caesium chloride in water at temperatures from 0° to 40° C. The saturated solution contains at 0·3° C., 61·9 per cent.; at 10° C., 63·5; at 20° C., 64·9; at 30° C., 66·3; and at 40° C., 67·4 per cent. of caesium chloride.—A. S.

Tellurium ; Action of Hydrogen Peroxide on ——. A. Gutbier and F. Resenscheck. Z. anorg. Chem., 1904, **42**, 174—176.

The authors have succeeded in preparing telluric acid from tellurium, by dissolving the metal in potassium hydroxide solution and oxidising it with hydrogen peroxide. To the red solution of potassium telluride obtained by dissolving pure tellurium in a pure 30 per cent. solution of potassium hydroxide, three times the calculated amount of a 10 per cent. solution of hydrogen peroxide was added. A vigorous reaction took place, the solution becoming colourless, and a small quantity of metallic tellurium separating. The oxidation was completed by vigorously boiling the solution for about half-an-hour, the separated tellurium was filtered off, the solution concentrated, and a large excess of concentrated nitric acid added, whereby telluric acid separated gradually in the form of a white crystalline powder.—A. S.

Sodium Vanadate Liquors ; Purification of ——. *Observations on the Industrial Separation of Metals by double Decomposition.* Herrenschmidt. Comptes rend., 1904, **139**, 862—864.

In purifying a liquor containing sodium vanadate and silicate, if an acid be added, there is no precipitation unless the liquor be concentrated ; and if it be so, vanadic acid and silica are precipitated together. By the author's plan (this J., 1904, 1094) of adding vanadic acid, the silica alone is precipitated, and the operation can be carried out in dilute solution. The principle here illustrated, of purifying the solution of a metallic salt by precipitating the impurities by means of the oxide or other compound of the metal in question, is one of wide industrial application, and may even be useful occasionally as a laboratory method.—J. T. D.

"*Flowers of Sulphur*" *and Sublimed Sulphur.* Domergue. J. Pharm. Chim., 1904, **20**, 493—499.

The form assumed by sublimed sulphur is shown to depend upon the temperature of the condensing chamber. When the process of sublimation first commences, the difference of temperature between the vapour of the sulphur and the air of the chamber is great, consequently immediate condensation takes place, and the sulphur is deposited in a spheroidal or vesicular form. As the process proceeds, and the temperature rises, condensation takes place more slowly, and crystalline particles as well as spheroidal sulphur are deposited. Ultimately with further increase of temperature the sublimed sulphur at first formed, is melted, and, on cooling, forms friable blocks or masses which are wholly crystalline in structure. Since the commercial value of sublimed sulphur depends upon the proportion of the spheroidal form it contains, which is the allotropic condition insoluble in carbon bisulphide, it is suggested that that solvent should be employed for determining the value, and that the term "flowers of sulphur" should be reserved for the product which shows not less than 33 per cent. of the insoluble variety at the time of production, and that the value of commercial samples be based upon this standard. Thus a sample containing 30 per cent. of insoluble sulphur should be described for trade purpose as containing 90 per cent. of "flowers of sulphur." The term "sublimed sulphur" should be applied to the whole product of sublimation without regard to its physical condition.

Potassium Ferrocyanide; Influence of Anode on Electrolytic Oxidation of ——. A. Brochet and J. Petit. XI. A., page 1222.

Iron Cyanogen Compounds; Blue ——. K. A. Hofmann, O. Heine, and F. Höchtlen. IV., page 1209.

Phosphates; Colorimetric Determination of ——. O. Schreiner and B. E. Brown. XXIII., page 1240.

English Patents.

Oxygen; Preparation of ——. G. F. Jaubert, Paris. Eng. Pat. 26,148, Nov. 30, 1903. Under Internat. Conv., July 3, 1903.

See Addition, of July 3, 1903, to Fr. Pat. 325,627 of 1902; this J., 1903, 1348.—T. F. B.

Nitrogen and Oxygen from Atmospheric Air; Apparatus for the Separation of ——. R. P. Pictet, Steglitz, Germany. Eng. Pat. 14,431, June 27, 1904. Under Internat. Conv., June 27, 1903

See Addition, of June 27, 1903, to Fr. Pat. 322,600 of 1902; this J., 1904, 371.—T. F. B.

United States Patents.

Barium Hydrate; Manufacture of ——. F. Jahn, Assignor to Harrison Bros. and Co. U.S. Pat. 775,752, Nov. 22, 1904. XI. A., page 1223.

Bisulphite Liquor; Apparatus for Preparing ——. P. Drewsen and J. Parent, Assignors to Drewsen-Parent Construction Co., Shawano, Wis. U.S. Pat. 774,869, Nov. 15, 1904.

An elongated closed tank with a substantially flat bottom has its liquid supply at one end, and gas supply and discharge port at the opposite end. There are agitators, each consisting of a shaft provided with blades in and across the tank, and each having a dam in the tank's bottom behind it. There are also removable pipe sections having return bends suspended in the tank, from a bar resting on its edges, and adapted to carry "temperature controlling water" through them.—E. S.

French Patents.

Hydrochloric Acid and Sulphuric Acid; Process for the Production and Simultaneous Separation of ——. Consortium für Elektrochem. Ind. Second Addition, dated June 27, 1904, to Fr. Pat. 335,496 of Aug. 24, 1903. (See this J., 1904, 252 and 606.)

For "acide sulfurique aqueux" in the second sentence of the second paragraph of the specification of the main patent, read "acide muriatique aqueux."—E. S.

Products having great Affinity for Water [Sulphuric Anhydride, &c.]; Process for the Condensation of ——. A. H. Perret. Fr. Pat. 314,964, July 19, 1904.

The products, such as sulphuric and phosphoric anhydrides, are distilled in a retort communicating with receivers, not sealed, but surrounded by materials not readily conducting heat and into which receptacles air, cooled and dried, is passed as it issues from a chamber in which a strong solution of calcium chloride, for instance, is continuously showered down.—E. S.

Arsenious Acid; Apparatus for the Extraction of —— from Ores. E. Biguet. Fr. Pat. 345,063, July 23, 1904.

The apparatus includes a series of muffles, in which the arsenical ore is so heated as to sublime the arsenic, which passes into a chamber to which air is admitted, arsenious anhydride being formed and deposited. Air is aspirated through the entire apparatus in such manner as to lead the vapours through a series of large condensing chambers, and then through complementary chambers of special construction. Lastly, the vapours are led up a coke tower, sprayed at the top with water. The sulphurous acid thus collected, is treated with limestone.—E. S.

Carbonic Acid: Obtaining —— from Solutions of Bicarbonate. Chem. Techn. Fabr. Dr. A. R. Brand and Co. Fr. Pat. 344,744, July 9, 1904.

The alkali bicarbonate solution, mixed, if necessary, with soap or grease, to make a lather, is fed continuously through a tubular apparatus, heated by gases from a furnace passing through a central horizontal pipe. The froth produced passes to a cooler, where it is cooled by the incoming liquid; the froth subsides, the liberated carbon dioxide being collected and the residual solution of monocarbonate used for absorbing carbon dioxide from gases of combustion.

—E. S.

Carbonic Acid; Process for the Storage and Transport of —— in a Solid State and at a Low Temperature. Gebr. Heyl and Co., and A. Wultze. Fr. Pat. 314,957, July 19, 1904.

As the carbon dioxide is stored in the solid state, the recipients need not be of great resisting power. The recipient shown in Fig. 1 is provided with a double enveloping an empty space b, for reception of a refrigerating mixture, such as a mixture of carbon dioxide and ether; the outer layer c is of some non-heat-conducting material. The continual evaporation of the cooling liquid maintains the carbon dioxide within the receptacle in the solid state. g and g^1 are safety valves. A small apparatus for aspiration and compression is set within the space b, the piston to which is actuated from e outside the apparatus, as shown. The vapours arising from the volatile mixture are aspirated at l, through the tube k, and are compressed and liquefied by means of the tuyères m in the evaporating chamber, the process continuing as long as the motive force is applied. A force-pump, o, n, serves to remove the solid dioxide, which may be conveyed into the steel cylinder shown in Fig. 2, fitted with double envelope, &c. like that represented in Fig. 1. Such cylinders are provided with means for charging and discharging similar to those in ordinary use for storing and conveying liquid carbon dioxide. E. S.

Fig. 1.

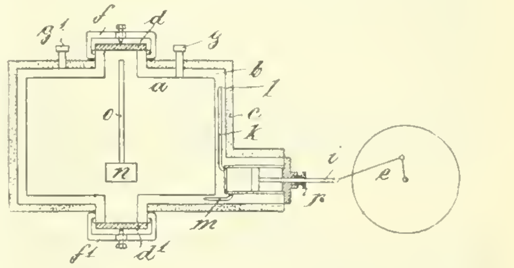

Fig. 2.

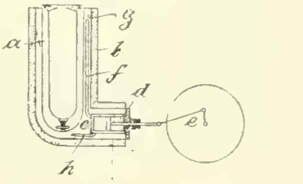

Ammonia; Manufacture of ——. H. C. Woltereck. Fr. Pat. 345,399, Aug. 6, 1904.

A mixture of air and steam is caused to act upon peat heated in a retort at a temperature not higher than 550° C., and, preferably, at about 400° C. Other suitable carbonaceous substances, such as coke, lignite, &c., may be substituted for peat in the process. The distilled products may contain, besides ammonia, tar, hydrocarbons, acetic acid, &c. Compare Eng. Pat. 2461 of 1902 and Fr. Pat. 332,591 of 1903; this J., 1903, 695 and 1243.—E. S.

Sulphur and Cyanides from Gas-purifying Materials [*Spent Oxide*]; *Process and Apparatus for Extracting* ——. J. J. M. Béeigneul. Fr. Pat. 345,071, July 23, 1904.

The spent oxide, placed in a closed vessel, is extracted by means of "hot benzene, particularly toluene heated to 100—110° C.;" the hot solution of sulphur is passed through a filter of animal charcoal, to remove the dissolved tarry matters, and is then cooled, to cause the precipitation of the sulphur; and after filtration the toluene is again used for extracting a fresh quantity of spent oxide. The apparatus used is connected together in such a manner as to prevent loss of solvent at any point; the extraction vessel and filters are fitted with steam jackets, so that any solvent present may be distilled off and recovered before the vessel is opened for renewing the contents. The extracted oxide is heated with lime in a closed vessel, in order to obtain the cyanide directly as ferrocyanide of calcium.—H. B.

Air and Gaseous Mixtures; Separating —— into their Elements. Soc. l'Air Liquide (Soc. Anon. pour l'Etude et l'Exploit. des Procédés G. Claude et R. J. Lévy). First Addition, dated July 29, 1904, to Fr. Pat. 338,812, of June 3, 1903.

Certain corrections are made to the drawing given in the main patent (see this J., 1904, 823) in reference to the overflow tube.—E. S.

VIII.—GLASS, POTTERY, ENAMELS.

Devitrification. W. Guertler. Z. anorg. Chem., 1904, **40**, 268—279.

Certain substances can be obtained in the form of "glasses" by rapid cooling far below the melting point, from the molten state. The time-temperature curves, plotted from the results obtained by slowly heating these glasses in the electric furnace, show a sudden upward bend, almost parallel to the temperature axis, indicating the point of devitrification, *i.e.*, when conversion of the unstable non-crystalline vitreous form into the crystalline form occurs, with evolution of heat. This change is a non-reversible "explosive" action. The following devitrification temperatures were determined:—Sodium silicate, 550° ± 20° C.; cobalt borate, 640° ± 20°; copper borate, 675° ± 15°; manganese borate, 670° ± 20° C.—T. F. B.

Plastic Clay; Is the Shrinkage and Porosity of —— in Firing, of a Mechanical or Chemical Nature? E. Berdel. Sprechsaal, 1904, **37**, 1755—1757; 1792—1795.

From experiments made with Halle clay and Zettlitz kaolin, it appears that the felspar solidifying from the fused mass is of lower specific gravity (by nearly 0·2 per cent.) than the natural product, the change beginning first at a temperature between Seger cones 1 and 2, and decreasing up to the fusing point. The specific gravity of quartz gradually and continually diminishes on heating. The shrinkage and porosity of Zettlitz kaolin undergo modification at about the same temperature as felspar. The effect of felspar on closeness of texture can be detected at Seger cone 1, and justifies the addition of this substance, even to stoneware bodies fired at a low temperature. Its action at low heats undergoes a change coinciding with the change in specific gravity. The influence of felspar varies directly with the fineness of division, so that when very finely ground spar is added in quantity to Zettlitz kaolin the latter is rendered very close in texture, at about Seger cone 2. At low firing heats the expansion of quartz diminishes the shrinkage and close texture of the clay substance, but the action is less pronounced at the "turning point" (Seger cone —2) already mentioned, whilst at higher temperatures the porosity and dimensions of the ware increase. The maximum porosity is attained when quartz and clay substance are in equal proportions, and diminishes with further additions of quartz, which, however, acts less effectually in proportion as it is more finely ground. Halle clay is less influenced by heat than the earthy Zettlitz kaolin, but the influence increases as the sand is removed by levigation. A specific feature of plastic clays is the increased closeness of texture at Seger cones 09 and 1. Halle clay contains considerable quantities of silicate fluxes, which must be classed as "clay substance." The addition of quartz counteracts the influence of firing, the reverse being the case with felspar. A small amount of quartz neutralises the aforesaid decrease in porosity, small amounts of felspar having an entirely opposite effect. This behaviour indicates that the increased closeness in Halle clay is due to finely divided fluxes. The finest non-plastic particles of this clay are particularly rich in these fluxes, and when mixed with Zettlitz kaolin impart to the latter qualities similar to those of Halle clay, thus indicating the important part they play in the last named. From these particulars it is concluded that the behaviour of plastic clays on firing is in part due to the chemical action of the contained fluxes. No difference in principle, however, can be found in the action of fire on plastic and non-plastic clays.—C. S.

United States Patents.

Glass; Apparatus for Manufacturing ——. A. R. Wilson and L. M. Dull, Assignors to A. R. Gordon, F. N. Dull, and W. E. Dittenhaver, all of Toledo, Ohio. U.S. Pat. 775,740, Nov. 22, 1904.

A reservoir extends through a side wall of the tank for the glass, the reservoir being provided with an inlet communicating with the interior of the tank, and with a discharge conduit leading from its lower portion. Means connected with the exposed portion of the reservoir are provided for supplying air under pressure to the interior, so as to operate a check-valve situated within the reservoir and controlling the inlet. A heating chamber, within which is placed a burner, surrounds a portion of the reservoir. The top of this chamber constitutes a mould-receiving platform.
—A. G. L.

Granite [*Glass*]; *Manufacture of Artificial* ——. L. A. Garchey, Paris. U.S. Pat. 776,160, Nov. 29, 1904.

See Fr. Pat. 325,175 of 1902; this J., 1903, 697.—T. F. B.

French Patents.

Gas Furnace for Glass Works; A Highly Regenerative Circular ——. C. Deselles. Fr. Pat. 344,894, July 4, 1904.

The furnace described is for pots, and is heated by a gas-generator. A direct regeneration of the heat produced by the combustion of the gas and air in the arch of the furnace is effected by introducing and circulating air, from without, through chambers or inlets arranged in the whole mass of masonry, which is heated by the process of combustion. The air inlets, and flues for the escape of the products of combustion, are arranged in the pillars forming the openings for the mouths of the pots, and in the pillars of the arches of the furnace.—W. C. H.

Gas Furnace for Glass Works; A Circular Highly Regenerative ——. C. Deselle. First Addition, of July 26, 1904, to Fr. Pat. 344,894, of July 4, 1904.

This addition to the principal patent refers, first, to the arrangement, in the central column of the pot furnace of the air- and gas-channels so that these may be coupled two and two. To allow for the contracted width of the single channel formed by the union of an air- and a gas-channel, an increasing depth is given to the channel towards the centre of the column. In order to catch glass from broken pots, one or more receptacles are arranged outside the furnace, in such a way that the glass can flow from the "siege" down a channel into the receptacle, the bottom of the channel being luted with a vertical tile, to prevent escape of gas from the furnace, which tile is pushed off, when necessary, by the weight of glass behind it. The claims also include details of the arrangement of air- and gas channels in the walls and arch of tank furnaces, in order to attain in them the high degree of recuperation aimed at in the pot furnaces already described.—W. C. H.

Glass; Process and Furnace for the Continuous Manufacture of Finer Kinds of ——, such as Crystal, &c. S. O. Richardson, jun. Fr. Pat. 345,256, April 7, 1904.

See U.S. Pats. 756,409 and 766,771 of 1904; this J., 1904, 489 and 866.—T. F. B.

Glassware; Process for Making ——. J. L., C. V., F. J., F. L., and P. R. Arbogast. Fr. Pat. 345,097, July 16, 1904. Under Internat. Conv., July 16, 1903.

See U.S. Pat. 756,558 of 1904; this J., 1904, 490.—T. F. B.

Continuous Kilns; Arrangement to obviate the Use of Stoves, hitherto employed for the Drying of Ceramic Articles about to be Burnt in ——. Soc. Perrusson fils et Desfontaines. Fr. Pat. 345,318, Aug. 2, 1904.

The heat of the products of combustion in the hotter chambers of a continuous kiln is used for drying articles which are placed in the cooler chambers ready to be burned. The hot gases are conveyed by a system of pipes from a hood, luted with sand on to the roof of a hot chamber, to down-pipes leading into a chamber filled with articles to be dried. When necessary, the heat of the gases can be reduced by the admixture of cold air, admitted to the pipes through a valve.—W. C. H.

IX.—BUILDING MATERIALS, CLAYS, MORTARS AND CEMENTS.

English Patents.

Building and Decorating Materials. A. Silbiger, London. Eng. Pat. 24,618, Nov. 12, 1903.

From 90 to 75 per cent. of Portland, Roman, or other hydraulic cement is mixed with 10 to 25 per cent. of asbestos, kieselguhr, or vegetable fibre in a humid state, and the mixture moulded by a pressure of about 1 ton per sq. in. into slabs of the required size. A mixture of 80 per cent. of cement and 20 of asbestos, &c. has been found to give good results; but part of the cement may in some cases be replaced by lime. Wire netting, perforated zinc, &c. may be laid between two thicknesses of the material whilst still in the humid state; or a sheet or board of asbestos, cardboard, &c. may be glued to the finished slabs. The slabs may also be secured to wooden or other frames, or they may be mounted directly on the bricks, if it is desired to cover walls.—A. G. L.

Masonry or Brickwork of Furnaces, Ovens, Pipes, Retorts, and the like; Manufacture of a New Pulverulent Product for Coating and Joining ——. L. E. Muller, Paris. Eng. Pat. 15,057, July 5, 1904. Under Internat. Conv., July 8, 1903.

See Fr. Pat. 338,914 of 1903; this J., 1904, 985.—T. F. B.

United States Patents.

Non-conducting Coverings, Blocks, and Slabs; Manufacture of ——. H. C. Michell, London. U.S. Pats. 774,946 and 774,947, Nov. 15, 1904.

See Eng. Pats. 21,386 and 21,387 of 1902; this J., 1904, 188.

Brick or Stone, Artificial; Process of Making ——. L. F. Kwiatowski, New York. U.S. Pat. 775,222, Nov. 15, 1904.

The bricks, &c. are made from lime and sand by simultaneously incorporating and powdering the whole of the unslaked lime and part of the sand in its natural moist condition, and then adding the remainder of the sand, together with sufficient water to complete the hydration of the lime. The mixture obtained is moulded and subjected to the action of steam under pressure impregnated with salts. —A. G. L.

Building Blocks; Method of Manufacturing —— from Materials including Hydraulic Cement. H. Warden, Fredericksburg, Va. U.S. Pat. 775,588, Nov. 22, 1904.

In order to hydrate the cement in the building blocks without washing out the soluble constituents of the blocks, the latter are placed in intimate contact with (*i.e.*, upon) a substance having the capacity of absorbing water by capillary attraction, and so that the lower portion of the substance is immersed in water of a constant depth. The portion of the substance connecting the part immersed and that in contact with the blocks is arranged so that the flow of water through it will be induced solely by capillarity, and not by gravity, whereby an excessive supply of water to the blocks is avoided.—A. G. L.

Roofing or Flooring; Flexible ——. L. C. Rugen, Boundbrook, N.J., and H. Abraham, N.Y., Assignors to The Standard Paint Co., Boundbrook, N.J. U.S. Pat. 775,635, Nov. 22, 1904.

"A suitable flexible fabric" is impregnated with a heated hydrocarbon mixture to produce a foundation. In the presence of heat and pressure a coloured facing, consisting of a pigment and a carrier or flux containing a resinous body and a fatty body, is then applied to the foundation in a plastic condition, so as to cause the facing and foundation to interlock.—A. G. L.

Weatherproof Covering. L. C. Rugen, Boundbrook, N.J., and H. Abraham, N.Y., Assignors to The Standard Paint Co., Boundbrook, N.J. U.S. Pat. 775,636, Nov. 22, 1904.

To a suitable foundation is applied a permanent facing containing a pitch or bitumen of a brownish colour when examined in a thin layer, and also containing a pigment adapted to become plainly visible, or to be developed by atmospheric influences; to this permanent facing is then applied a temporary facing of about the same colour as the final colour of the permanent facing, the temporary facing being adapted to be removed by exposure to the atmosphere.—A. G. L.

Brick; Refractory ——. W. F. B. Berger, Assignor to The American Bauxite Co., both of Little Rock, Ark. U.S. Pat. 775,887, Nov. 22, 1904.

The brick is made of calcined American bauxite and about 20 per cent. of fire-clay, which acts as a binder. —A. G. L.

Compositions [Plasters] from Calcined Gypsum; Manufacture of ——. L. Mack, Stuttgart, Germany. U.S. Pat. 776,076, Nov. 29, 1904.

See Eng. Pat. 12,584 of 1903; this J., 1903, 952.—T. F. B.

Building Material; Artificial ——. A. Seigle, Lyon-Monplaisir, France. U.S. Pat. 776,430, Nov. 29, 1904.

See Addition, of June 4, 1903, to Fr. Pat. 323,666 of 1902; this J., 1903, 1294.—T. F. B.

Cement; Method of Making White ——. E. Gogler, Podgorze, Austria. U.S. Pat. 794,840, Nov. 15, 1904.

See Eng. Pat. 388 of 1904; this J., 1904, 443.—T. F. B.

Cement Kiln; Rotary ——. T. A. Edison, Llewellyn Park, N.J. U.S. Pat. 775,600, Nov. 22, 1904.

See Eng. Pat. 4735 of 1902; this J., 1903, 367.—T. F. B.

Cement; Method of Burning ——. M. Williams, London. U.S. Pat. 775,693, Nov. 22, 1904.

See Eng. Pat. 10,853 of 1902; this J., 1903, 629.—T. F. B.

French Patents.

Stone, Artificial; Manufacture of a Plastic Material for Making ——. R. Heusch. First Addition, of July 15, 1904, to Fr. Pat. 341,660, of Mar. 25, 1904.

500 grms. of powdered slag or slate are mixed with 150 grms. of magnesite and 100 grms. of pure sand; and to

the mixture 100 c.c. of 96 per cent. sulphuric acid and 140 c.c. of magnesium chloride solution at 30° B. are added, with constant stirring. The mass is then placed in moulds and allowed to harden. A more even product is obtained by mixing 600 grms. of slag or slate powder with 150 grms. of magnesite and adding 180 c.c. of magnesium chloride solution at 30° B.—A. G. L.

Imitations of Marble in Plaster and Cement; Process for the Manufacture of ——. R. Hülsberg. Fr. Pat. 341,912. July 18, 1904.

Imitation marble articles made of plaster or cement, when withdrawn from the mould, are subjected for about 24 hours to the action of an alkaline solution, such as a "trebly concentrated solution of ammonia" (sp. gr. 0·910), and are washed with water immersed for about 24 hours in a solution of magnesium sulphate and sodium phosphate, then dried and, if necessary, impregnated with paraffin.—W. C. H.

Works of Art [*Imitation Marble*] *and the like; Process for Manufacturing* ——. H. J. P. Dumas. Fr. Pat. 345,337, Aug. 3, 1904.

See Eng. Pat. 26,568 of 1903; this J., 1904, 1029.—T. F. B.

Pavements free from Dust; Process for rendering ——. Chem. Werke Mügeln b. Dresden, G. m. b. H. Fr. Pat. 345,067, July 23, 1904.

To prevent the formation of dust, the materials used for the construction of the pavement are moistened and impregnated with lye, preferably that obtained in the manufacture of cellulose. The materials may be moistened and impregnated before, during, or after the laying of the pavement. The resinous substances contained in the lye are said to act as an adhesive between the dust and the materials.—W. C. H.

Plaster; Method of Revivifying Old ——. E. Paupy. Fr. Pat. 345,544, Aug. 12, 1904.

Old plaster, without previous grinding, is stacked up in furnaces similar to those used for burning new plaster, with the larger pieces at the bottom, and the smaller above, and burned until dehydrated. The combustible is placed either in temporary flues built up of lumps of the old plaster, or on the ground (or on bars) under a grating which supports the plaster to be burned.—W. C. H.

Sand and Cement; Setting of Mixtures of ——. B. Chan. Fr. Pat. 345,122, July 26, 1904.

According to this invention, ordinary water used for the setting of mixtures of sand and cement is replaced by lime-water, which is said to react chemically with the silica of the sand and cement, and thus improve the setting of the mortar.—W. C. H.

Cement; Rotary Furnaces for the Manufacture of ——. F. L. Smidth et Cie. Fr. Pat. 345,419, Aug. 8, 1904.

In rotary cement kilns, in the upper part, in which the raw material introduced undergoes drying and preliminary heating by the action of the sensible heat of the products of combustion, partitions are arranged, radially or otherwise, to turn over the material and increase the surface of contact between it and the products of combustion. The partitions may be corrugated &c., to increase the surface.—W. C. H.

X.—METALLURGY.

Blast-Furnace Charging Apparatus: Special Forms of ——. T. F. Witherbee. Amer. Inst. Mining Eng., Sept. 1904.

A description is given of some special forms of charging apparatus for blast-furnaces, the more efficient of which consist in principle of a double bell combined with a hopper. The author suggests, that by means of such devices, the charge could be introduced nearer the centre of the furnace, and that by having a more resistant column of material there to blow against, better results might be obtained, since the tuyère-area could be reduced, and thus the "wandering" of the blast minimised.—A. S.

Dry Air Blast; Influence of —— *on the Working of the Blast-Furnace.* A. Lodin. Comptes rend., 1904, **139**, 922—925.

The work of Gayley (this J., 1904, 1148) is in contradiction to the views hitherto held as to the importance of the moisture in the blast; but the striking results he has obtained are probably due to the special circumstances under which he worked. The total "heat-bills" for the two cases quoted by him show a difference due to the heat of decomposition of the moisture representing 2·8 per cent. of the total heat evolved, and it is not obvious how the saving of this should effect an economy of 19·8 per cent. in the coke used. This heat, however, is absorbed in the immediate neighbourhood of the tuyères, where a very high temperature is necessary, and where the only portion of the heat available is that given out between the temperature of the burning fuel and that of the burning slag or pig; this difference is never very considerable, because the carbon is here burnt only to monoxide. Hence small subtractions or additions of heat here will have a very important influence on the coke consumption. In the Isabella furnaces, with which Gayley worked, this influence is exaggerated by the low temperature of the blast, and the rise of 100° C. in the blast-temperature resulting from the drying, is largely responsible for the improved results. Had the blast been heated to 500° C., instead of being dried, probably the same improvement would have resulted. In Europe, where the blast is heated to 700°—800° C., the effect produced by previous drying will almost certainly be much less than that obtained by Gayley.—J. T. D.

Dry Air Blast; Employment of ——, *in Blast Furnaces.* H. Le Chatelier, Comptes rend., 1904, **139**, 925—927.

The economy in fuel—20 per cent.—stated by Gayley (this J., 1904, 1148) to result from the removal of the moisture from the air of the blast is four times as great as the amount due to the saving of heat which, with moist air, is spent in dissociating the water vapour and reacting with it on the coke; so that if the economy be real, its cause must be other than that to which Gayley attributes it. It is to be borne in mind that the consumption of fuel varies greatly with the temperature at which the furnace is worked; and if the dry blast, for example, gives a pig containing less sulphur than the moist blast at the same temperature, it will be possible with the dry blast to work at a lower temperature than with the moist, thus saving fuel, and yet produce an equally pure pig. If this be the true cause of economy, then it does not follow that the same economy will result, as the author concludes, from the use of dry air in other operations, such as the Bessemer process. It seems highly probable that the use of dry air will produce a less sulphurous pig; for the sulphur exists chiefly in the coke, and with dry air will burn to sulphur dioxide, which will be oxidised and absorbed by the lime in the flux and will go into the slag, never reaching the spongy iron in the layers above, whilst in presence of hydrogen derived from the moisture, phenomena of equilibrium will be produced, and the gases will contain a certain proportion of hydrogen sulphide, which will in part at least reach and be absorbed by the spongy reduced iron. The author has found that calcium sulphide, heated to 600° C. in a stream of dry carbon monoxide, gives off no gas that will blacken a strip of heated silver or a solution of silver nitrate; but when the carbon monoxide is mixed with water vapour or hydrogen, both the metal and the solution are rapidly blackened.—J. T. D.

Cast Iron; Manganese Ore as a Desulphurising Agent in the Smelting of ——. Wedemeyer. Stahl u. Eisen, 1904, **24**, 1377—1380.

Trials in reverberatory and crucible furnaces gave results confirming those obtained in the cupola (see this J., 1904, 1149), and show that the use of expensive manganese ore as a desulphurising agent for cast iron is irrational.

—A. S.

Rusting of Iron; Stimulating and Paralysing Effects of certain Substances on the ——. L. Lindet, Comptes rend., 1904, **139**, 859—862.

Certain metals, especially copper, when placed in water kept constantly aerated, in presence of iron, accelerate greatly the process of rusting; whilst others, such as tin, lead, zinc, manganese, aluminium, and magnesium, retard it. These effects are not due to the metal, but to minute quantities of oxide or hydroxide in solution; for water which has been for some time in contact with the metal, produces the same effect as that which contains it. Ferric oxide itself exerts an accelerating influence on rusting. Prominent among those which exert a paralysing influence is arsenious oxide; in presence of this oxide, the rusting is either stopped or greatly retarded. In the latter case, ferric arsenite is formed in a colloidal state. Arsenic pentoxide and orpiment, if present to the extent of 1 per cent., also act as retarders. Most dissolved salts, in consequence of their electrolytic dissociation, greatly increase the rapidity of rusting. Organic substances vary greatly in their action; sugar, phenol and resorcinol accelerate it, whilst alcohol, methyl salicylate, &c., retard it. The tinned or galvanised cans in which denatured alcohol is delivered often rust badly; this forms an obstacle to the use of such spirit for motor cars. Denatured alcohol is almost always made from the first runnings of the distillation, and hence contains aldehyde, ethyl acetate, and traces of acetic acid. To it is added impure methyl alcohol, containing acetone and methyl acetate, together with (if it is to be used for motor cars) an equal volume of light coal-tar spirit. This last is the substance which is most active in causing rusting. The aldehyde and esters do not provoke oxidation, but they attack the zinc or the tin, and then the iron; and the metallic acetates formed then start the oxidation. Arsenic compounds suggest themselves as a remedy for this; alcohol dissolves only traces of arsenic itself, it dissolves much more considerable quantities of its oxidised compounds.

—J. T. D.

Cyanide Practice at the Maitland Properties, South Dakota. J. Gross. Amer. Inst. Mining Eng., Sept., 1904.

The ores worked are the so-called "Potsdam silicious ores," containing pyrrhotite and iron pyrites in about equal proportions, together with arsenic, copper, and traces of antimony and tellurium; also, considerable quantities of bismuth have been found in the zinc-box precipitates. Only the oxidised ores are subjected to cyanide treatment. The ore is crushed in a solution containing 1·2—1·3 lb. of potassium cyanide and 0·8 to 1 lb. of caustic soda per ton. For every ton of ore fed to the stamp-battery, 4—5 tons of cyanide solution are used. The crushed product obtained contains about 60 per cent. of sand and 40 per cent. of slime, and is passed to the cone classifiers, consisting of two upper conical vessels, the discharges from which unite and pass into a lower conical vessel, where they meet an upward current of cyanide solution. The aim is to make a clean sand rather than a clean slime. The sand discharged from the bottom of the lower cone is leached with a solution containing 1·5—1·6 lb. of potassium cyanide and 1·0—1·2 lb. of caustic soda per ton. The slime overflowing from the cones is treated by a system of combined agitation and decantation. The extraction averaged 62·22 per cent. of the gold, and 26·1 per cent. of the silver in the first half of 1903, and 75·52 per cent. of the gold and 44·3 per cent. of the silver in the second half. These figures, though low, exceed those yielded by test extractions by from 5—10 per cent. Of the total extraction, 47·9 per cent. is obtained in the battery, 27 per cent. from the sand-leaching, and 25·1 per cent. from the slime treatment.—A. S.

Crushing in Cyanide Solution, as practised in the Black Hills, South Dakota. C. H. Fulton, Amer. Inst. Mining Eng., Sept. 1904. (See preceding abstract.)

The most economical extraction is obtained if the ore is crushed so that most of it is between 30-mesh (0·0195 inch) and 60-mesh (0·0075 inch) size. The separation of the sand from the slime is effected in the outer sheet-iron cones of an ordinary hydraulic classifier, from which the inner cones have been removed. The high content of lime (added during the crushing of the ore in the cyanide solution) in the pulp is a source of trouble, both by its coagulating effect on the slime, causing the latter to settle with the sand, and by giving rise to the formation of an excessive quantity of froth or foam. In charging the sand-vats, the system of "dry-filling" is adopted, the pulp being fed into the empty vat, and the solution continually drained off until the vat is full of sand. The advantages of this method are that—(1) The slime in the pulp is uniformly distributed with the sand, whereby the percolation of the solution through the charge is favoured. (2) During the filling a large quantity of solution passes through the sand, thus increasing the extraction. Two methods of slime treatment are in use. In the first the treatment is completed in the vat into which the pulp is first charged, the agitation being effected by means of compressed air. In the second method, the slime is repeatedly transferred from one vat to another (generally 3 or 4 times), and the charge is agitated by means of centrifugal pumps.—A. S.

Platinum; Volatilisation of ——. G. A. Hulett and H. W. Berger. J. Amer. Chem. Soc., 1904, **26**, 1512—1515.

Platinum begins to volatilise in air at about 800° C., and the action increases markedly as the temperature rises. In a vacuum or an atmosphere free from oxygen, there is no volatilisation. The phenomenon is consequently due to the presence of oxygen, and it seems probable that there exist volatile compounds of the platinum metals which are stable at high temperatures, but decompose at lower temperatures, and such compounds would probably be endothermic. The existence of a volatile oxide of platinum which decomposes at 800° C. and below, but is stable above that temperature, would account for all the observed facts. The "sprouting" of molten platinum when cooling may be due to the decomposition of such a compound.—T. H. P.

Copper, Tin, and Oxygen. E. Heyn and O. Bauer. Mitt. königl. Materialprüfungsamt, 1904, **22**, 137—147.

A previous investigation dealt with the relations between copper and oxygen (this J., 1901, 723, 956). In the present series of experiments, the authors investigated the action of oxygen or compounds containing oxygen on fused copper-tin alloys, and the changes produced thereby during and after solidification. The results have a bearing on the technical question of the alteration of bronzes when these are fused with access of air. It was found that any oxygen contained in copper-tin alloys is in the form of crystals of stannic oxide, which are insoluble in the fused alloy (and also in fused tin). The crystals are frequently stunted, forming pellicles, which are always found in that constituent of the alloy which solidifies last, *i.e.*, that which is rich in tin. The presence of stannic oxide causes a thickening of the fused alloy. If cuprous oxide be used in preparing the alloys, this reacts with the tin at the melting temperature, forming copper and stannic oxide. Phosphorus is an effective de-oxidising agent for copper-tin alloys containing stannic oxide. If copper tin alloys be fused with access of air, there are formed at first an upper layer of an alloy of copper and cuprous oxide, and a lower layer of a copper-tin alloy, both containing crystals or pellicles of stannic oxide. If the heating be continued for a sufficiently long period, the lower layer entirely disappears, the whole of the tin being converted into stannic oxide. The authors also state that the grey and yellow patches frequently observed on a fracture of a commercial tin bronze are not due to segregation (liquation), but to the formation of large grains owing to slow cooling. The different coloured patches of metal contain the same percentage of tin, and with more rapid cooling they become smaller, and so intimately mixed, that the fracture exhibits a uniform "mixed-colour."—A. S.

Stannic Oxide in Copper-Tin Alloys; Electrolytic Separation and Determination of ——. E. Heyn. XXIII., page 1239.

Arsenical Poisoning; Danger of ——, to Workmen engaged in Autogenous Soldering. G. Lunge. Chem.-Zeit., 1904, **28**, 1169—1170.

THE author has already drawn attention to the danger arising from arsenical hydrogen to workers with autogenous soldering apparatus, especially in close workshops or in the inside of small vessels. He now gives some figures communicated by Major Nathan, of the Government Powder Works at Waltham Abbey, contained in a report (not yet printed) by Mr. Robertson, the chemist there. Tested by the Marsh-Berzelius process, samples of zinc from Ash and Lacey showed from 0·00008 to 0·00015 per cent. of arsenic (0·0074 to 0·0140 grains of arsenious oxide per lb.); one marked G. v. Giesches Erben, 0·0008 per cent. (0·074 grains per lb.); one of Brunner, Mond & Co.'s electrolytic zinc 0·00008 per cent. (0·0074 grains per lb.). Hence, a maximum limit of 0·0005 per cent. of arsenic (0·047 grain of arsenious oxide per lb.) may fairly be demanded of dealers. Three samples of sulphuric acid yielded:—*a*, Denitrated, not concentrated, acid, 0·00022 per cent. (0·02 grain per lb.); *b*, Concentrated acid from the Kessler evaporator, the same amount; *c*, Chapman and Messel's acid, half the amount. Taking 0·0005 per cent. in the zinc, and 0·00022 per cent. in the acid, a week's work in the soldering shop at Edmondsey would produce 180 c.c. of arsine, forming 0·845 grm. of arsenic trioxide, or 0·141 grm. per day. The danger of direct poisoning by this amount of arsenic trioxide is small; but it is not to be disregarded, nor is that due to accumulations of arsenical dust. Arsine itself is, of course, much more poisonous than the product of its combustion, and the escape of the gas by faulty tubing or connections, or leaks in the apparatus, should be carefully guarded against. Copper sulphate solution, with which the author recommended that the gas should be washed to remove the arsenic, has not been found effectual by Robertson, who recommends for the purpose 5 per cent. permanganate solution, or chromic acid in sulphuric acid solution. The author suggests the use of electrolytic hydrogen, which prepared from alkaline solutions is probably free from arsenic, and could be sold, compressed in cylinders, at little more cost than that made from acid and zinc.—J. T. D.

ENGLISH PATENTS.

Iron; Manufacture of ——, in the Blast Furnace. W. J. Foster, Walsall. Eng. Pat. 755, Jan. 12, 1904.

THE present invention is an enlargement of Eng. Pat. 4147, of 1901 (this J., 1902, 349), according to which highly-heated solid carbon and fluxes were injected into the furnace by and with the hot blast through the tuyères. Under the present extension, metal pieces, such as "swarf" (iron or steel turnings, or shavings), or metallic iron of any form, with or without solid carbon and fluxes, and previously heated to a temperature at least as high as that of the hot blast, are injected with the blast into the furnace, as described in the cited patent.—E. S.

Regenerative Furnaces [for Steel Manufacture]: Impts. in ——. B. Talbot, Leeds. Eng. Pat. 1365, Jan. 19, 1904.

IN regenerative gas furnaces, and especially in such as are used in the manufacture of steel, in order to cool the masses of brickwork at the two ends of the furnace, through which the uptakes bring the gas and air from the regenerators into the furnace, a chamber is built into such brickwork, preferably semi-circular in cross section, having its bottom open, or partly open to the air on the side facing the furnace, whilst the top is closed, and provided with air-channels passing completely through the brickwork to allow of air circulation.—E. S.

Steel; Manufacture of ——, and Treatment of Copper Nickel, and like Mattes. Cie. du Réacteur Métallurgique, Paris. Eng. Pat. 14,985, July 4, 1904. Under Internat. Conv., Aug. 6, 1903.

SEE Fr. Pat. 334,151 of 1903; this J., 1904, 66.—T. F. B.

Zinc; Extraction and Purification of ——. A. V. Cunnington, Winnington, Cheshire. Eng. Pat. 4706, Feb. 25, 1904.

THE preferably roasted, and finely-divided zinc ore, is stirred in a strong solution of zinc chloride, and the basic zinc salts formed are converted into the chloride by the addition of hydrochloric acid, introduced below the surface of the liquid. The process may be made continuous by making successive additions of ore and of acid, and withdrawing the exhausted portion of the ore. To free the liquor from arsenic, either freshly-precipitated ferric hydroxide is stirred into the neutral or slightly alkaline liquid, or, to the slightly acid liquor containing ferric iron in solution, zinc oxide, lime, or the like is added to precipitate ferric hydroxide, which carries the arsenic down with it, and the precipitate is removed. The arsenic-free liquor may be treated electrolytically or otherwise, to recover the zinc and other metals present.—E. S.

Alloy. Soc. Anon. La Néo-Métallurgie, Paris. Eng. Pat. 23,361, Nov. 3, 1903. Under Internat. Conv., Nov. 6, 1902.

Alloy or Compound; Metallic ——. Soc. Anon. La Néo-Métallurgie, Paris. Eng. Pat. 24,924, Nov. 16, 1903. Under Internat. Conv., April 17, 1903.

SEE Fr. Pat. 331,276 of 1903; this J., 1903, 1136.—T. F. B.

Alloys; Manufacture of ——. A. Jacobsen, Hamburg, Germany. Eng. Pat. 6945, March 22, 1904.

SEE Fr. Pat. 342,054 of 1904; this J., 1904, 903.—T. F. B.

Metals and Alloys; Hardening of ——. S. Cowper-Coles and Co., Ltd., and S. O. Cowper-Coles, London. Eng. Pat. 27,172, Dec. 11, 1903.

ALUMINIUM, or an alloy of aluminium, is covered with zinc dust (containing some zinc oxide) within a receptacle, which is closed, and heated to a temperature below the melting point of zinc, say to about 400° F., for a suitable period. It is stated that the articles on removal will be found to be "coated with zinc," which penetrates to a certain depth, forming a very hard skin. The process is also applicable to articles made of copper or alloys of copper.—E. S.

Puddling Furnace: Mechanical ——. W. B. Burrow, Norfolk, Va. U.S. Pat. 775,026, Nov. 15, 1904.

THE furnace is of the stationary reverberatory type, having a hearth or metal bed supported by machinery, with means for imparting to it combined rocking and horizontal movements. There is a concave lining within and around the hearth, and refractory linings project on either side over the concave lining and the bed, whereby the flames are deflected downwards upon the hearth. The inclined planes or wedge-shaped run-ways for the bed have a water-cooled track. A fireplace at each end of the furnace supplies the hearth with the products of combustion, and a pendant angular roof has its lowest point immediately above the hearth at the centre of the furnace, and from which flues pass for exit of waste gases. A stationary, detachable toothed rabble extends into and across the hearth in the direction of its width, for stirring and raking the metal as the hearth oscillates. The furnace is specially adapted for the manufacture of wrought or malleable iron. (Compare U.S. Pat. 755,215 of 1904, this J., 1904, 444.)—E. S.

Gold and Oxide of Iron; Process of Recovering —— from Sand. T. J. Lovett, Chicago. U.S. Pat. 775,043, Nov. 15, 1904.

Sand containing magnetic iron oxide with gold is mixed with water and treated magnetically, to concentrate the iron oxide with the gold which it carries, which concentrate, together with that obtained from the tailings of the first process, is subjected to the action of a suitable chemical solution "capable of dissolving the gold without material injury to the iron." The undissolved iron oxide is left in an available condition, and the gold contained in the solution is recovered.—E. S.

Gold-saving Apparatus. L. Sachse, Oroville, Cal. U.S. Pat. 774,786, Nov. 15, 1904.

This is a float-gold saving apparatus, in which a tank is separated by an intermediate floor into an upper and lower compartment, communicating through an opening in the floor. A trough is formed within the upper compartment into which the body of silica-carrying water flows. Wells are formed between the outer walls of the trough and of the compartment. There are adjustable means vertically over the opening in the floor, whereby the inflowing liquid is intercepted, and the precipitates from it are directed through the opening into the lower compartment, and in the path of the flow it is arranged to project water into the inflowing current of gold-carrying water, in opposition to the downward current from the feed sluice. The general arrangements are such that a body of the water carrying black sand is held for a time approximately still, an eddy being caused when desired by a suitably placed water-pipe; there are also adjustable deflectors whereby the flow is deflected as desired.—E. S.

Metals; Extracting [Cyanide Process] —— from their Ores. F. H. Long, Chicago, Ill. U.S. Pat. 775,405, Nov. 22, 1904.

The mixed ore and cyanide solution are contained in a closed vessel having a funnel-shaped bottom terminating in a pipe so connected, branched and valved, that when the mixture is caused to flow into the pipe by pressure of an air-blast, it may be caused to return to the reservoir by a branch leading to the top of the latter, or may be otherwise diverted. In any case the effect is to pass the charge "through a contracted channel" with the air-blast, so as to revivify the cyanide and "clear" the ore.—E. S.

Precious Metal from Ores; Process of Extracting ——. J. J. Berrigan, East Orange, N.J., Assignor to F. J. Arend, New York, and J. Bernstrom, Stockholm. U.S. Pat. 775,509, Nov. 22, 1904.

The process is continuous, and consists in causing the comminuted ore to meet a stream of an aqueous solvent of the precious metal, whereby an aerated mixture of ore and solution is produced. This mixture is then centrifugally agitated and projected through successive quantities of solvent contained in a number of vessels arranged at different levels and communicating with one another, the mixture descending by gravity from one vessel to the next lower one. The enriched solution is finally separated centrifugally from the ore. (See the two following abstracts.)—A. S.

Precious Metal from Ores; Apparatus for Extracting ——. J. J. Berrigan, East Orange, N.J., Assignor to F. J. Arend, New York, and J. Bernstrom, Stockholm. U.S. Pat. 775,414, Nov. 22, 1904.

The comminuted ore and an aqueous solvent of the precious metal are fed into a horizontal mixing vessel through separate inlets at the top. A conveyor is arranged inside the vessel to move the ore towards the outlet, which is at the bottom, below the inlet for the solvent. The mixed ore and solvent pass by gravity to the highest of a number of centrifugal agitators, arranged at different levels, each of which consists of a vessel rotating on an eccentric axis, and having an outlet in its circumferential wall, and means for discharging the ore and solution through the outlet. From the lowest agitator the pulp passes to a centrifugal separator, in which the enriched solution is separated from the ore. (See following abstract.)—A. S.

Centrifugal Separator. J. J. Berrigan, East Orange, N.J., Assignor to F. J. Arend, New York, and J. Bernstrom, Stockholm. U.S. Pat. 775,415, Nov. 22, 1904.

The separator consists of a frusto conical vessel supported eccentrically within a horizontal rotary cylinder mounted on axial trunnions, the larger end of the separator and one end of the cylinder being in one piece. One of the trunnions is hollow, and the mixture of solid and liquid materials is fed continuously through it into the large end of the separator. Inside the separator is a spiral conveyor for moving the solid material from the inlet to the outlet, the latter being at the small end of the separator. By means of suitable gearing the conveyor is rotated at a speed different from that of the separator. The liquid is discharged through an outlet in the large end of the separator between its circumferential wall and the axis of rotation, the outlet extending through the hollow trunnion.—A. S.

Metals: Apparatus for Treating Finely-divided Material for the Recovery of ——. D. C. Boley, Deadwood. U.S. Pat. 774,736, Nov. 15, 1904.

The apparatus belongs to the type in which ores are treated with a solution, and are washed by upward filtration. There are two elevated supply tanks, one for the solvent liquid and one for water, and there is a compressed air or gas supply, all connected by valved pipes to the bottom of the filtering tank, so that solution, water, or compressed air may be admitted, separately or otherwise, with a float-regulator valve operating for cutting off or turning on the liquid supply. A lining of textile fabric is secured to the upper surface of a perforated (double) tank bottom, by folds of the fabric inserted as grooves, the folds being filled "with the packing material as a rope, and held to the tank bottom by battens overlying the groove, but placed beneath the textile fabric," the edges of the latter being secured to the sides of the tank.—E. S.

Ores; Process of Reducing ——. H. F. Brown, Oakland, Cal. U.S. Pat. 774,930, Nov. 15, 1904.

The powdered ore is passed through highly heated vertical tubular apparatus, in which the air is not whirled, and is then continuously passed in its hot state through a whirling heated atmosphere moving in the same direction as the descending body of ore.—E. S.

Ore-roasting Furnace. A. P. O'Brien, Richmond, Va. U.S. Pat. 775,147, Nov. 15, 1904.

The furnace is of the vertical type with a number of superposed hearths fed from above, and a central hollow vertical rotating shaft divided into as many vertical compartments as there are hearths. A hollow arm carrying rabbles extends into the shaft at each compartment, through its walls. The rabble arms have internal passages for leading air from one compartment in the shaft to the adjoining one. The disc secured to the shaft, whereby it is rotated by means of suitable gearing, is thin and somewhat flexible, that it may accommodate itself to the expansion or contraction of the shaft by changes of temperature. The blades of the rabbles are progressively set at different angles from one end of the arm to the other whereby the action of the blades on the ore is varied. There is a gas collector at the top of the furnace, including a segmental casing in connection with a series of pipes leading to it from different parts, an elongated slot being formed in the casing for reaching every portion of the gas collector. Provision is made for the passage of water through the shaft and rabble arms.—E. S.

Zinc; Apparatus for the Extraction of ——. C. S. Brand, Knowle, England. U.S. Pats. 775,359 and 775,360, Nov. 22, 1904.

See Fr. Pats. 341,345 and 341,346 of 1904; this J., 1904, 827.—T. F. B.

Copper or like Metals; Process of Separating —— *from their Ores.* P. Weiller, Vienna, and A. Weiller, Trieste, Austria. U.S. Pat. 775,548, Nov. 22, 1904.

See Addition, of April 7, 1904, to Fr. Pat. 336,989 of 1903; this J., 1904, 903.—T. F. B.

Metals; Process of Separating —— *from Sulphide Ores.* C. V. Potter, Balaclava, Vic. U.S. Pat. 776,145, Nov. 29, 1904.

See Eng. Pat. 1146 of 1902; this J., 1902, 410.—T. F. B.

French Patents.

Steel; Process for Incorporating Crystalline or Amorphous Silicon Carbide with ——. W. Kaufmann and A. Bouvier. Fr. Pat. 344,906, July 13, 1904.

The silicon carbide is introduced in equal quantities, at regular intervals, into the molten metal as it runs into the ladle or mould, the carbide being introduced at a point close to where the stream of metal enters the ladle, so as to obtain a homogeneous product. The molten metal should be as hot as possible, and should contain no slag, otherwise the carbide will be decomposed. The following proportions of carbide are used: for steel for tyres, 0·11 to 0·12 per cent.; for moulded steel, 0·37 to 0·39 per cent.; for mild basic steel (resistance, 46—50 kilos.), 0·075 to 0·08 per cent.—T. F. B.

Metals and Oxides; Means for Recovering —— *from Solutions containing them.* A. Gutensohn. Fr. Pat. 344,630, July 6, 1904.

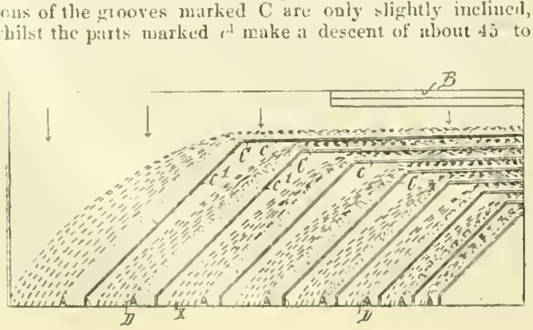
Metals, or their oxides, are recovered from their acid solutions by treatment with a precipitant prepared by heating together melted rosin and slaked lime, and then adding a solution of sodium carbonate and caustic soda. The precipitant is brought into contact with the, preferably hot, solution to be precipitated, and more alkali is subsequently added. The oxide or metal is carried down in combination with the rosin. The resulting compound is collected and distilled in order to recover the rosin, the metal being obtained as such or in the form of its oxide.—E. S.

Melting Furnace. Osnabrücker Maschinenfabrik, R. Lindemann. Fr. Pat. 344,935, July 18, 1904.

The furnace is formed with double walls, within which is a serpentine channel for the heating of the air to be admitted to the grate.—E. S.

Ores; Concentrators for ——. J. F. C. Abelspies. Fr. Pat. 345,198, July 20, 1904.

The table represented in plan in the drawing is slightly inclined, so that the mud or pulp flowing upon it from the reservoir B is received by the groove C, and overflows to the next, and so on, whilst the stream of washing water drives the ore downwards, and, aided by a see-saw motion continuously imparted to the table, forms whirls on the way. The flow is also towards the edge of the table. The portions of the grooves marked C are only slightly inclined, whilst the parts marked c^1 make a descent of about 45° to the horizontal. At the lower edge of the table, the currents from the several grooves are kept apart by the guides D, the waste and the concentrate being directed into separate channels. The grooves are successively farther apart from the lowest to the highest part of the table.—E. S.



XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(A.)—ELECTRO-CHEMISTRY.

Electrolysis with Alternating Current. A. Brochet and J. Petit. Z. Elektrochem., 1904, **10**, 909—912.

The solubility of platinum under the action of alternating currents is ascribed to secondary chemical reaction between the finely divided metal thrown off from the cathode and the cyanide solution. Iron is dissolved under the influence of alternating current, but shows an anomalous behaviour. Increase of current density favours the reactions up to a limit when the solubility reaches its maximum value. Although higher frequency of the current generally decreases the chemical effect, this is not always the case. —R. S. H.

Barium Platinocyanide; Preparation of ——. A. Brochet and J. Petit. Z. Elektrochem., 1904, **10**, 922—924.

The authors find that the usual somewhat tedious chemical preparation of this salt can be greatly simplified by making use of the fact that platinum is soluble in barium cyanide under the influence of alternating current. With a current of 0·4 ampère per sq. cm., a P.D. of 5 volts, and an electrolyte containing 270 grms. barium cyanide per litre, they obtained a satisfactory product. About 8·0 K.W. hours are required per kilo. of the double salt. The product which is obtained by crystallisation does not at first possess the fluorescence necessary for its use for X-ray screens; but by recrystallisation from a solution containing cyanide, *e.g.*, barium cyanide, the small fluorescent crystals are readily obtained. (See also this J., 1904, 548.)—R. S. H.

Potassium Ferrocyanide; Influence of Anode on Electrolytic Oxidation of ——. A. Brochet and J. Petit. Comptes rend., 1904, **139**, 855—857.

In the electrolysis of potassium ferrocyanide there may appear at the anode not only potassium ferricyanide, but also hydroferrocyanic acid, the production of the latter involving escape of free oxygen, which is thus lost as far as the production of ferricyanide is concerned. If the ferrocyanogen ions can attack the anode, the metallic ferrocyanide is formed, and if this be insoluble, it forms a resisting coating and lessens the current or raises the potential difference in the cell. The authors have employed anodes of various materials, and divide them into five groups:—1. Those not forming metallic ferrocyanide (platinum, carbon); 2. Those slightly attacked, and giving fair yields (iron, cobalt, nickel); 3. Slightly attacked, but poor yields (lead, antimonial lead, tin); 4. Strongly attacked, but variable yields (copper, zinc, cadmium, mercury); 5. Those behaving as soluble anodes (magnesium, aluminium, silver). The yields vary from 75 per cent. of the theoretical (platinum), or 50 per cent. (iron), to none; and the physical condition of the anode is important, platinised platinum only yielding 45 per cent., for instance, against 75 per cent. for the polished metal. —J. T. D.

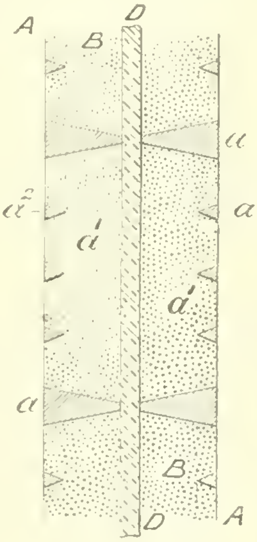
English Patents.

Batteries; Electric ——. P. J. Kamperdyk, New York. Eng. Pat. 214, Jan. 4, 1904.

Each cell has a central porous vessel of carbon, open at its upper and lower ends, and two similar lateral porous vessels, one side wall of each of the latter being formed by the corresponding wall of the outer receptacle. The porous vessels may be provided internally with a supporting metallic frame of wire. The bottoms of the vessels are closed by being embedded in a layer of suitable material on the base of the outer cell, and the porous vessels thus form the positive compartments, the positive electrodes consisting of carbon rods or balls in contact with non-oxidisable metal, or conductors coated with such a metal, or the balls may be threaded on the conductors. The negative electrodes of zinc may have an internal supporting framework of non-oxidisable metal, or wire covered with such a metal. Pipes are also embedded in the material closing the bottoms of the porous vessels, so as to make connection between the positive or between the negative compartments. A number of cells are in communication with feed reservoirs in such a way that the exciting and depolarising liquids may be fed into the cells, or withdrawn through waste pipes. For this purpose there is a system of communication between the cell compartments and the reservoirs, the system comprising two conduits, which may be rotated, and each is provided with three apertures, the latter being adapted so that two of them simultaneously coincide with ducts in connecting boxes. Tubes lead from the boxes to the cell compartments. Three-way cocks are inserted in the conduits, so that in one position of the latter the liquids are delivered from the reservoirs into the cell compartments, and in the second position the liquids are withdrawn through the waste pipes.—B. N.

Accumulators or Secondary Batteries. T. Peseatore. Manchester. Eng. Pat. 1036, Jan. 15, 1904.



Two plates, A, made of hard lead, are placed back to back, the space a^1 between the ribs a being filled with a composition B, composed of a mixture of active spongy material and an inert powder, he material being held in position by means of a network of cross ribs a^2. If necessary, a lead plate D may be placed between the plates A so as to increase he surface contact, and he plates are then bolted ogether. The material is maintained constantly in compression, and is prevented from expanding or welling, thus avoiding loss of conductivity from disintegration and separation of he particles of the material. —B. N.

Activity in Electrode Masses of Badly Conductive Metallic Oxides or Hydrates; A Method for Increasing the ——, in Accumulators with Invariable Electrolyte. E. W. Jungner, Norrköping, Sweden. Eng. Pat. 21,403, Oct. 5, 1904, under Internat. Conv., Oct. 31, 1903.

The method claimed consists in intimately mixing powdered lectrode masses of badly conducting oxides or hydrates hydroxides] with well pulverised "chemically pure black ead," and then mixing with pure crystalline graphite in the orm of flakes or scales, in order to increase the conductivity f the masses.—B. N.

Cells; Galvanic ——. R. Ziegenberg, Berlin. Eng. Pat. 21,913, Oct. 11, 1904.

Plates of peroxide of lead are first dried in a moderately eated atmosphere, and finally in a suitable vacuum apparatus. While the vessel is still exhausted, concentrated lphuric acid is admitted from below so as to cover the ates, and air is then allowed to enter from above in order drive the acid into the pores of the peroxide. The plates, charged with acid, are then placed in a suitable vessel with zinc plates, and water is added to form a galvanic cell. —B. N.

United States Patents.

Electrical Energy; Converting the Energy of Fuel into ——. H. Jone, Chicago, Ill. U.S. Pat. 775,472, Nov. 22, 1904.

A galvanic cell is constructed with a positive pole of metal, a negative pole consisting of a porous carbon vessel, which contains a metallic oxide as depolariser, and an alkali as electrolyte. The cell is maintained at an elevated temperature by means of the waste heat produced at other stages of the process; and electrical energy is generated by oxidation of the metal, the depolariser being simultaneously deoxidised. The oxidation product of the metal is then reduced to metal by introducing into the cell hot fuel gases from carbonaceous materials, or a reducing gas obtained from the fuel gases. Tin is mentioned as a suitable metal. and also those metals which generate hydrogen with alkali, which are capable of "acting as an acid towards alkali;" which form oxides that yield chiefly carbon dioxide in addition to metal when reduced by carbon, and which form lower and higher oxides. In the last-mentioned case, the oxidation is carried only to the formation of the lower oxide.—A. S.

Storage Battery Plates; Protective Coating or Covering for ——. A. Meygret, Paris. U.S. Pats. 776,192 and 776,480, Nov. 29, 1904.

See Eng. Pat. 1673 of 1903; this J., 1904, 119. The plates may also be coated with a mixture of cellulose tetracetate and tetrabutyrate, or with the latter alone.—T. F. B.

Furnace; Electric ——. R. Raddatz, Milwaukee, Wis. Assignor to Allis-Chalmers Co., N.J. U.S. Pat., 775,282, Nov. 15, 1904.

A travelling bed, adapted to support and carry forward the substance to be treated, is provided with a feeding device for delivering the material to the bed, and electrodes, with their ends brought within "arcing" distance, are arranged in proximity to the point at which the material is delivered. The negative electrode is relatively nearer, and the positive electrode farther from the feeding-inlet. Suitable mechanism imparts motion to the bed and feeding devices, and means are provided for varying the relative movements of these, in order that the feed and delivery may be accurately proportioned to the rate at which the material is reduced. The material is fed over an incline, and a hood extends from the bed over the proximate ends of the electrodes and upward over the inclined feed surfaces, whereby the waste heat from the arc and from the fused material is caused to act upon the incoming material. —B. N.

Electric Furnace. A. C. Higgins, Worcester, Mass. U.S. Pat. 775,654, Nov. 22, 1904.

The furnace consists of a base upon which is supported a removable, conical, unlined shell, forming the side walls of the furnace. Means are provided for lifting the shell, the furnace-charge being left entirely supported on the base. A stream of water is supplied at the top of the shell, and flows down the outer surface of the latter into a trough formed in the base, the cooling effect of the water causing the fused material within the furnace to form a lining on the inside of the shell.—A. S.

Gases; Apparatus for Electrically Treating ——. K. Birkeland, Christiania. U.S. Pat. 775,123, Nov. 15, 1904.

See Fr. Pat. 335,692 of 1903; this J., 1904, [illegible] —T. F. B.

Barium Hydrate; [Electrolytic] Manufacture of ——. F. Jahn, Ridley Park, Assignor to Harrison Bros. & Co. Philadelphia, Pa. U.S. Pat. 775,752, Nov. 22, 1904.

Barium sulphide solution is electrolysed "between electrodes of which the anode is larger than the cathode, with interposition of a porous partition, whereby some of the barium hydroxide is formed in the cathode compartment while the remainder and greater part is formed along with polysulphides in the solution in the anode compartment." The barium hydroxide is then recovered from the solution in the latter compartment.—E. S.

Electrolytic Winning of Metals from Ores with Insoluble Anodes. St. Laszczynski. Elektrochem.-Zeit., 1904, **11**, 54—56.

In order to do away with the necessity of an ordinary diaphragm and at the same time overcome the difficulties due to oxidation at the anode, the author recommends a special cell for such electrolytic work. The essential peculiarity lies in closely surrounding the anode with a thick texture which hinders the diffusion of the ferrous and other oxidisable salts to the anode.—R. S. H.

Lead-Tin Alloys; Separation of Tin from Lead in ——. L. Peetz. Metallurgie, 1904, **1**, 281—297, and 336—345. Science Abstr., A. 1904, **7**, 931.

Attempts were made to remove the lead from lead-tin lloys by means of molten stannous chloride, or its double salts with alkali chlorides Stannous chloride and its louble salts are completely decomposed by lead, the rate of lecomposition increasing with rise of temperature, but the lecomposition is not complete in the case of lead-tin alloys, a state of equilibrium being reached. The losses of tin by volatilisation render the process useless practically. Tin an be separated from tin-lead alloys electrolytically by means of lead oxide in alkaline solution, alkali stannate being formed; the separation is possible in three days, using a temperature of 35° C. The alloy is best used in plates 1 mm. thick, in which case no loss of tin occurs.
—T. F. B.

English Patent.

Water-jackets, Casings and the like; Manufacture of —— by Electrolytic means. A. F. Bosquet, Paris. Eng. Pat. 20,896, Sept. 28, 1904.

HIS invention relates to the manufacture of jackets, asings, &c., for the cylinders of explosion motors. The ylinder is provided with grooves for the reception of the acket edges, the grooves being produced during the casting f the cylinder and afterwards treated with a sand jet. The acket is formed of copper deposited from an ordinary lectrolytic bath, after a preliminary coating from a bath of opper cyanide, the metal being deposited in the grooves nd on a material, cast on the cylinder, which is fusible at a omparatively low temperature. The cylinder is afterwards laced in hot water or steam to melt the fusible metal, and hus leave a cavity for the circulation of water.—B. N.

antalum Metal; Purification of ——. Siemens und Halske Akt., Berlin. Eng. Pat. 21,766, Oct. 10, 1904. Under Internat. Conv., Oct. 15, 1903.

MPURE metallic tantalum powder is compressed into a r or mass, which is heated electrically in a crucible of agnesia or thoria, lined with tantalum metal, a bar of he same being used as cathode. The apparatus is enclosed n a glass chamber in which a vacuum is maintained.
—E. S.

United States Patents.

old; Extracting —— from Ores [Cyanide Process]. H. R. Cassel, London. U.S. Pat. 775,597, Nov. 22, 1904.

HE powdered ore is agitated with a solution containing a anide and a haloid salt (a bromide or chloride of a itable base) and the gold present is gradually and connuously transformed into a soluble cyanide by passage of n electric current at a stated high density. From the lution separated from the ore, the gold is precipitated d the haloid salt recovered, and to the residual solution a anide is added to fit it for re-use. Compare U.S. Pats. 2,708 and 732,709 of 1903; and 769,938 and 774,349 of 04; this J., 1903, 915, and 1904, 939, 1151.—E. S.

Electrically Treating Materials; Method of ——. W. S. Franklin. Assignor to F. Conlin, both of Bethlehem, Pa. U.S. Pat. 775,031, Nov. 15, 1904.

The electric current is passed between electrodes, arranged within a chamber, and through molten slag which partially fills the chamber. The distance between the electrodes is caused to vary continuously so that an arc is formed at intervals between the upper electrode and the slag. The material is fed into the top of the chamber, first passing through the arc and then through the slag.—B. N.

Aluminium or other Metals; Process of Reducing ——. H. S. Blackmore, Mount Vernon, N.Y. U.S. Pat. 775,060, Nov. 15, 1904.

An oxygen compound or oxide of a metal, or metals, such as lithium and calcium, is maintained in a state of fusion, and an oxygen compound or oxide of a metal, such as aluminium, and having a less affinity for oxygen, is added to the fused mass. On passing an electric current, the metal with the lesser affinity for oxygen is liberated, an anode being used which will combine with the disengaged oxygen. The bath is replenished from time to time with the oxygen compound of the metal which is being liberated. The fusion of the mass may be maintained by an alternating current which does not yield metal, and by the simultaneous action of a direct current, the metal may be liberated at a temperature below the normal melting point of the oxide of the metal.—B. N.

French Patents.

Electric Furnace. P. Girod. Addition, dated July 4, 1904, to Fr. Pat. 329,822 of Feb. 28, 1903 (this J., 1903, 1054).

The modification claimed in the present addition has for its object the circulation of the current through the largest possible portion of the available space of the furnace, and consists in separating the heating resistance into a number of circuits, arranged in any desired manner.—A. S.

Electric Furnace intended for the Transformation of Cast Iron into Steel. G. H. Gin. First Addition, dated Aug. 3, 1904, to Fr. Pat. 342,101 of March 30, 1904 (this J., 1904, 904).

The main patent, relating to the refining of molten iron by running it into a gutter repeatedly curved upon itself, constituting the resistance in an electric circuit, is now supplemented in certain respects. The electrothermic heating of the metals and alloys is kept separate from the purifying reactions, in effecting the former mainly whilst the metal is in channels of small section, and the latter, whilst it is in basins successively reunited by the passing of the current along the heated channels. Thus, the current in traversing the metal flowing in narrow sections heats it more highly than the metal which is traversing broad sections, or in re-united sections, such as may be made by merging some of the intervening section walls.

The narrow heating channels for the flow of the metal, are caused to start immediately from the steel masses which serve as poles to the current. These masses are cooled by a "peripheral" current of water. The bases of these blocks are guarded by cylindrical envelopes of bronze or of copper containing phosphorus, cooled by interior water circulation, to ensure electrical contact with the conductors, and reduce to a minimum the self-induction of the current.—E. S.

Zinc; Process for extracting —— Electrolytically from Sulphate Solutions. Siemens und Halske Akt.-Ges. Fr. Pat. 345,154, July 27, 1904. Under Internat. Conv., Nov. 20, 1903.

See Eng. Pat. 16,396 of 1904; this J., 1904, 1098.
—T. F. B.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Paraffin Wax; Admixture of —— with Substances of Higher Melting Point. [*Candle Making.*] E. Graefe. III., page 1206.

English Patents.

Waste Oil Filter. S. H. H. Barratt and the United Asbestos Co., Ltd., London. Eng. Pat., 21,452, Oct. 6, 1904.

This apparatus consists of a vessel divided into two or more compartments by means of vertical or nearly vertical partitions. A filtering medium of woven fabric, asbestos, &c., is stretched, across a grid placed over a hollow frame, in the partition, whilst a porous filtering mass within the frame is kept in position by means of a second grid (which may also be covered with a woven fabric), the pressure of which can be regulated by means of a screw or other device. The waste oil introduced through a strainer into one compartment, passes horizontally through the filtering media into the other compartment or compartments, so that there is but little accumulation of impurities on the filter.
—C. A. M.

Oil and the like; Apparatus for Purifying——. C. A. Koellner, Neumühlen, Germany. Eng. Pat. 22,238, Oct. 15, 1904.

This apparatus, intended for the filtration of viscous oil, engine grease, etc., consists of two superposed chambers each of which contains filtering sheets kept apart by means of bars, frames, etc., and kept in position by means of a screw or other device. The oil enters at the bottom of the upper chamber, rises through the filter, and is then conducted to the top of the lower chamber through the filter, in which it passes downwards. The passage connecting the two chambers may be provided with a cover and observation window, and may end in a shoot to conduct the oil towards the middle of the top of the lower filter.—C. A. M.

Soap Preparations for use in Preventing Poisoning by Compounds of Lead, Copper, Arsenic, Mercury and other Metals; Process for making——. F Nusch, London. From Chem. Werke G. m. b. H., vorm. C. Zerbe, Freiburg in Baden. Eng. Pat. 18,152, Aug. 22. 1904.

The ready decomposition on contact with air of soaps containing "sulphuretted alkali and hydrothionic acid," is prevented by coating the preparation with paraffin, soluble glass (alkali silicate), or the like, whilst the stability of the soap is increased by the addition to its ingredients of a substance such as vaseline, to counteract the influence of the air. (Compare Fr. Pat. 341,159 of 1904; this J., 1904, 829.)—C. A. M.

French Patents.

Petroleum or Gasoline Soap, and Process for Manufacturing the same. L. A. Lebreton-Deshayes. Fr. Pat. 339,061, Sept. 29, 1903.

Thirty-two kilos. of petroleum or gasoline, previously agitated with 16 kilos. of caustic soda lye, are stirred into 20 kilos. of melted animal or vegetable fat, and then 24 kilos. of caustic soda lye are added, with stirring. The soap is run into a suitable mould, which is transferred to a room heated to about 30° C. for about 24 hours, to complete the saponification.—T. F. B.

Soap; Manufacture of Neutral——, *Keeping its Neutrality during Hydrolysis.* P. Horn. Fr. Pat. 345,185, Aug. 11, 1904.

Products of the artificial digestion of albuminoids with acids or alkalis ("albuminoses") are introduced into the soap, with the object of combining with free alkali already present or liberated during the hydrolysis of the soap by water.—C. A. M.

Soap Preparation for use as Protection against Lead Poisoning; Process for making a——. Chem. Werke Ges. m. b. H., vorm. Dr. C. Zerbe. First Addition, dated Aug. 13, 1904, to Fr. Pat. 341,159, Feb. 25, 1904.

See Eng. Pat. 18,152 of 1904; preceding these.—T. F. B.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—PIGMENTS, PAINTS.

United States Patents.

Paint Composition. W. A. Hall, Bellows Falls, Vermont. U.S. Pat. 775,919, Nov. 29, 1904.

See Eng. Pat. 26,903 of 1903; this J., 1904, 328. T. F. B.

Oil Colour. M. Hérisson. Addition, dated July 28, 1904, to Fr. Pat. 337,440, Dec. 5, 1903. (See this J., 1904, 495.)

The oil colour claimed in the main patent (*loc. cit.*) can be advantageously used in place of red lead, for a first coating on iron. The pigment is improved by decreasing the amount of barium chloride, and increasing that of zinc white, and it should be coloured by adding a little red ochre.
—M. J. S.

(*B.*)—RESINS, VARNISHES.

United States Patents.

Citrus Fruits; Process of Extracting Oleo-resin from the Peel of——. E. J. Sheenan, Assignor to San Gabriel Valley Essential Oil Co. U.S. Pat. 775,502, Nov. 22, 1904. XX., page 1237.

Citrus Fruits; Oleo-resinous Product from——. E. J. Sheenan, Assignor to San Gabriel Valley Essential Oil Co. U.S. Pat. 775,546, Nov. 22, 1904. XX., page 1237.

French Patents.

Amber; Process for Utilising Waste Yellow——. H. Thiemann. Fr. Pat. 345,196, July 15, 1904.

Amber powder, turnings, and other waste are treated with chloroform, so as to obtain the soft α- and β-resins free from impurities. The addition of these resins to copal or amber of low quality produces a mixture suitable for the manfacture of ambroïde. Addition of a small quanity of succinic acid causes a cloudiness, by which the resemblance of the product to natural yellow amber is enhanced.—M. J. S.

(*C.*)—INDIA-RUBBER, &c.

Latex of Castilloa Elastica. A. W. K. de Jong. Ber., 1904, **37**, 4398—4399.

The substance which retards the coagulation of the latex of *Castilloa elastica* (this J., 1904, 990) has been found to be of an albuminoid character. It is precipitated by alcohol and acetone, but not by acetic acid, and its action is probably due to the adherence of the precipitate to the particles of caoutchouc, thus reducing the cohesive power of the latter. The author has also succeeded in detecting in the latex the presence of a tannic acid (calcium salt, $C_{31}H_{58}O_{20}Ca$), an acid, $(C_{17}H_{30}O_{10})_x$, potassium chloride, a sugar (m. pt. of osazone, about 200° C.), and a compound the neutral solution of which is coloured green.—A. S.

French Patents.

[Rubber] Latex; Process and Apparatus for the Treatment of——. P. F. E. Christiaens. Fr. Pat. 345,020, July 22, 1904.

The latex is mixed with water and passed first through gauze tissue of fairly wide mesh to remove leaves, dirt, &c.; and then through one or two stretched cloths previously coated or sprinkled with a coagulating agent. The apparatus consists of three frames fitted one within the other, between the ends of which the cloths are stretched. The outer and inner frames are without bottoms, but the middle one has an openwork bottom of laths or bamboo.—A. S.

Vulcanised Rubber Waste; Regenerating——. A. Kittel. Fr. Pat. 344,734, July 9, 1904.

The rubber waste is cut up into small pieces and incorporated with a dry powdered alkali capable of uniting with the sulphur. The mixture is pressed, heated for 2—3 hours at 220°—280° C., and then treated in the usual manner. In the case of waste containing a large proportion of loading material, powdered rosin may be added with the alkali. —A. S.

XIV.—TANNING; LEATHER, GLUE, SIZE.

Tannin Extracts; Note on the Behaviour of Sulphites in ——. R. Lepetit and C. C. Satta. Collegium, 1904, 311—313, 317—324.

The results of a series of experiments on tannin extracts containing sulphites, lead the authors to confirm Parker and Gansser's view (this J., 1901, 1085), that such extracts have no injurious action on leather. It was found that in an extract of quebracho treated with bisulphite, a fairly large proportion of sulphate was always formed by oxidation, but only very little free sulphuric acid.—F. D. T.

Tannin Matters; Note on the Analysis of ——. R. Lepetit. Collegium, 1904, 305—311.

The author criticises the present official method of analysis, in that it does not take sufficient account of the values of "non tannins," and takes no account of "insolubles," notwithstanding the fact that the latter include the phlobaphenes which enter largely into the composition of leather. The figures of analysis would be more exact if, instead of bringing the result to a hundred by obtaining one of the percentages by subtraction, the various determinations were all made direct.

A comparison of analyses of similar extracts made by several chemists last year showed considerable differences, although the same hide powder was used. The variations were evidently due not only to differences of manipulation, but also to the fact that insufficient care was taken when the samples were drawn. The author recently drew samples with great care from about two kilos of liquid extract, and also from dry extracts, which latter he pounded up finely and then passed through two sieves. Comparative analyses by several members of the I.A.L.T.C. showed then considerably less variation than in the case above cited. The author does not think it advisable to adopt, without restriction, the rule that all tannin solutions must be filtered before analysis, as many tanners rightly demand that there should be a certain quantity of insoluble matter present. In view of the increasing importance of extracts known as "soluble in the cold," the author proposes that the Congress should settle what the maximum amount of insoluble matter in these extracts should be.—F. D. T.

Gelatin; Setting and Swelling of ——. P. v. Schroeder. Z. Phys. Chem., 1903, **45**, 75—117. Science Abstr. A., 1904, **7**, 914.

By heating a solution of gelatin at 100° C., its viscosity, measured at 25° C., gradually decreases to a constant minimum; this change is attributed to hydrolysis, and is accelerated by both hydrogen and hydroxyl ions (*i.e.*, by addition both of acid and alkali), the final viscosities thus reached being lower than that obtained with a pure gelatin solution. The sulphates and chlorides of potassium, sodium, and ammonium, sodium nitrate, and the chlorides and sulphates of lithium and magnesium all increase the viscosity of gelatin solutions, the greatest increase being produced by magnesium salts. The vapour pressure of gelatin, after soaking in water, is found to be greater than that of water at the same temperature.—T. F. B.

Colloids [Gelatin, &c.]; Solution and Swelling of ——. K. Spiro. Beitr. Chem. Physiol. Path., 1904, **5**, 276—296. Science Abstr., 1904, A, **7**, 922—923.

The swelling of gelatin is considerably accelerated by hydrogen and hydroxyl ions (see von Schroeder, preceding abstract), and also by colloidal ferric hydroxide, even in presence of a substance such as dextrose. With a 3 per cent. solution of dextrose, the maximum swelling of gelatin is produced; with a 25 per cent. solution, no water is absorbed, whilst with more concentrated solutions, the gelatin loses water and shrinks. Other substances, such as plates of agar, are not affected in the same way as gelatin. In a colloidal ferric hydroxide solution, obtained by prolonged dialysis (which contains an appreciable amount of chlorine), part of the substance is undoubtedly present in true solution, but the greater part is merely in suspension. Gelatin is affected less by dialysed than by "commercial" solutions of colloidal ferric hydroxide. The formation of a colloidal solution appears to require the presence of a small amount of an electrolyte.—T. F. B.

Nitrogenous Refuse [Leather Waste, &c.] and Waste Sulphuric Acid; Simultaneous Utilisation of ——. E. Donath. XV., page 1228.

English Patent.

Tanning Leather; Process of and Apparatus for ——. H. de Marneffe, Liège, Belgium. Eng. Pat. 22,395, Oct. 18, 1904.

See Fr. Pat. 339,428 of 1904; this J., 1904, 720.—T. F. B.

United States Patents.

Hides; Machine for Applying Colouring Matter to ——. R. W. Churchill. U.S. Pat. 774,935, Nov. 15, 1904. VI., page 1213.

Leather; Process of Treating [Waterproofing] ——. P. Magnus, Collingwood, Victoria. U.S. Pat. 775,839, Nov. 22, 1904.

See Fr. Pat. 331,239 of 1903; this J., 1903, 1140.—T. F. B.

French Patents.

Tannin Extracts; Process for the Clarifying of ——. Soc. des Extraits de Chêne en Russe. Fr. Pat. 339,064. Sept. 25, 1903.

The tannin liquors are treated with finely-pulverised neutral bodies such as sand, clay, kaolin or barium sulphate. The latter carry down insoluble matters in suspension, thereby rendering the extracts clear.—F. D. T.

Skins; Process for the Tanning of ——. E. L. Alilaire. Fr. Pat. 345,002, July 21, 1904.

The skins are tanned with liquors extracted from peat. It is claimed that skins so treated are especially supple and strong.—F. D. T.

Leather; Artificial ——, *and Method of Making the same.* J. B. Granjon and J. F. J. Berchet. Addition, dated Aug. 5, 1904, to Fr. Pat. 343,704, June 4, 1904 (this J., 1904, 1036).

The artificial leather prepared according to the process described in the main patent, is coated (before the tar is quite dry) on one or both sides with a sheet of paper, cardboard, textile fabric, or metal.—A. S.

Size Glue; Manufacture of a Special ——. C. Vierue and F. Kowachiche. Fr. Pat. 339,098, Oct. 14, 1903.

From 1—20 per cent. of zinc oxide is added to the hot solution of glue, and after well agitating, the liquor is passed through a sieve and cooled in moulds. It is claimed that the resulting glue, which is white and opaque, has a tensile breaking strength 20 per cent. greater than that of ordinary glue, whilst size prepared from it has a resistance to moisture, 30 per cent greater than ordinary glue size.—A. S.

XV.—MANURES, Etc.

Calcium Phosphates; Action of Water on the ——. F. K. Cameron and A. Seidell. J. Amer. Chem. Soc., 1904, **26**, 1454—1463.

Both tricalcium phosphate and monocalcium phosphate are considerably hydrolysed and decomposed by the action of water. In both cases, the amount of decomposition and the concentration of the resulting solution at the temperature employed in the authors' experiments (25° C.), is dependent on the ratio between the amounts of solid phosphate and water. Dicalcium phosphate, however, is only slightly decomposed by water and appears to dissolve mainly as such, so that it is the only phosphate of calcium stable in water under ordinary conditions.

The presence of calcium sulphate slightly increases the phosphoric acid dissolved from tricalcium phosphate, produces probably a slight increase with the monocalcium salt, but a marked decrease with dicalcium phosphate; calcium carbonate diminishes the phosphoric acid dissolved from all three phosphates. Carbon dioxide increases the phosphoric acid dissolved from tri- or di-calcium phosphate, but is without apparent effect on the action of water on the monocalcium salt.—T. H. P.

Lignite-tar Distilleries; Use of Waste Liquors from —— as Manure. F. Strube. Z. angew. Chem., 1904, **17**, 1787.

In spite of repeated trials, no method of treatment for these waste liquors has yet been found which will render them inoffensive at a practicable cost; usually they are diluted by being run into neighbouring streams. The author has, however, successfully applied them for manurial purposes. Two portions of land were treated similarly in all respects save that one was regularly sprinkled, by means of spray-diffusers, with these waste liquors, and the other not. The yield of oats on the sprinkled portion was represented by the figures 44·5 grain, 79·0 straw, 11·0 chaff, while the corresponding figures for the other portion were 38·0, 61·5, 8·0; the grain from the sprinkled portion contained 2·13 per cent. of nitrogen, that from the other 1·67 per cent., so that the total yields of nitrogen from the two portions were very nearly in the ratio of 3 to 2. -J. T. D.

Nitrogenous Refuse [Leather Waste, &c.] and Waste Sulphuric Acid [from Petroleum Refining]; Simultaneous Utilisation of ——. E. Donath. Chem.-Zeit., 1904, **28**, 1153—1154.

When nitrogenous substances such as leather, wool, hair, horn, &c., are heated at about 300° C. with 30—50 per cent. of sulphuric acid and afterwards extracted with water, considerable amounts of ammonium sulphate are obtained, whilst the carbonised residues, according to the nature of the substance employed, may be utilised as a decolorising agent, or, if unsuitable for this purpose, may be utilised for the production of potassium ferrocyanide. For the first operation it is proposed to employ waste sulphuric acid from the purification of petroleum. In an experiment in which leather meal (220 grms.) was treated with sulphuric acid, 3·36 grms. of ammonia were obtained; and of the total nitrogen only 2·5 per cent. was lost. In another experiment, however, the loss was much greater. The carbonised residues contained from 4 to 10 per cent. of nitrogen.—N. H. J. M.

English Patent.

Fertiliser or Manure; Manufacture of ——. H. Myers, Burton-on-Trent. Eng. Pat. 494, Jan. 8, 1904.

Claim is made for a mixture consisting of pressed brewers' yeast (20 to 30 parts), oak sawdust (15 to 20 parts), powdered lime (25 parts), bone dust (10 to 20 parts), basic slag (10 parts), and sodium sulphate (10 parts). After blending, the mixture is passed through a revolving cylindrical wire riddle.—C. A. M.

XVI.—SUGAR, STARCH, GUM, Etc.

[Sugar]; Carbonating and Systematic Washing of Filter-press Scums. A. Aulard. Bull. Assoc. Chim. Sucr. et Dist., 1904, **22**, 299—312.

In order to secure perfect washing of filter-press scums, the juice must have been well treated with lime, and the first carbonating carried out at about 70° C. The pressure at the filter-presses should not exceed two atmospheres. The water used, is the ammoniacal water from the third and fourth bodies of the multiple effect, cooled to 45°—50° C. It should be put into the press at from 1 to 1·5 atmospheres pressure. When the presses are not arranged for absolute displacement of the juice as in those of the Fives-Lille Co., and there is consequent mixing of water and juice, it is of advantage to return part to serve as water of displacement for the succeeding operation. For liming, sufficient water only should be used to bring the slaked lime to from 32° to 34° B. There is no reason against the use of a dense milk of lime when the mixing of the diffusion juice in the cold with lime lasts at least an hour.—L. J. de W.

Sugar Solutions; Boiling Points of Pure and Impure ——. H. Claassen. Zeits. Ver. Deutsch. Zuckerind., 1904, **54**. 1159. (See this J., 1904, 1105.)

—L. J. de W.

Sugar in Solutions of Tannin; Presence of ——. H. Nové. Bull. Assoc. Chim. Sucr. et Dist., 1904, **22**, 325—326.

The author finds that alcoholic solutions of tannin, frequently used along with lead acetate to clarify and decolorise sugar solutions for polariscope readings, especially after being kept some time, may contain dextrose and consequently affect the accuracy of the results. The natural glucosides present in some tannins are decomposed into dextrose and gallic acid. The use of concentrated solutions of tannin is therefore condemned.—L. J. de W.

Starch-Glucose Syrups prepared by Hydrochloric Acid; Suitability of —— for Confectionery. E. Preuss. Z. Spiritusind., 1904, **27**, 478.

Glucose which has been prepared with hydrochloric acid, as the American confectioners' glucose is, must never be neutralised with chalk, but always with sodium carbonate. The author has ascertained experimentally that the resulting sodium chloride is without any inverting action upon the cane sugar in the process of boiling confectionery. The proper use of sodium carbonate also decomposes any calcium chloride which may be produced by the action of the acid upon the ash of the starch; well neutralised syrups never contain calcium chloride. Further, the author shows that it is not necessary to use higher temperatures when converting with hydrochloric acid, than when sulphuric acid is employed. In practical work a temperature of 120°—130° C. or a pressure of one atmosphere is never exceeded, on account of the danger of reversion. Syrups properly prepared with hydrochloric acid are no less suitable for confectionery than those made with sulphuric acid, and any defects observed are really attributable to the presence of abnormal products due to conversion at excessively high temperatures or to incorrect neutralisation, filtration, or decolorisation.—J. F. B.

Aldoses; Separation of —— by Secondary Hydrazines. R. Ofner. Ber., 1904, **37**, 4399—4402. (See also this J., 1904, 993.)

The author has succeeded in preparing in acetic acid solution the methylphenylhydrazones of dextrose and xylose, and the benzylphenylhydrazone of xylose, although hitherto it has only been possible to produce these derivatives from neutral solutions. The following is the method adopted for the preparation of the methylphenylhydrazone of dextrose. Two grms. of dextrose are well mixed with 5 c.c. of 50 per cent. acetic acid, 1·8 grms. of methylphenylhydrazine are added, and the mixture is allowed to stand at the ordinary temperature in a closed flask with occasional shaking. The whole of the sugar gradually passes into solution, and from the deep red liquid, the hydrazone separates after about two hours in the form of colourless needles. After a further hour, the crystalline mass is repeatedly digested with ether, pressed on an earthenware plate and re-crystallised from alcohol. The yield of pure hydrazone is 50 per cent of the theoretical amount.—A. S.

Achroo-Dextrin; Manufacture of —— [from Peat]. G. Reynaud, Paris. Eng. Pat. 4792, Feb. 26, 1904.

See U.S. Pat. 761,542 of 1904; this J., 1904, 721.—T. F. B.

French Patents.

Beet Sugar; Process for Manufacturing ——. M. Roeseler, A. Schaer, and H. W. Hinze. Fr. Pat. 345,299, Aug. 1, 1904.

See U.S. Pat. 770,700 of 1904; this J., 1904, 994.—T. F. B.

Sugar or Diffusion Juices; Purification of Crude ——. Vve. H. Breyer (*née* Mitterbacher) and A. J. von Wehrstedt. Fr. Pat. 345,463, Aug. 8, 1904.

An intimate mixture, consisting of two parts of calcium hydroxide with one part of powdered brick, is added to the crude sugar juice at a temperature of 80° C. in the proportion of 2·5 to 3·0 per cent. on the weight of the beetroots. The mixture is agitated mechanically, whilst it is saturated with carbon dioxide.—J. F. B.

Sugar; Rapid and Economical Process of Refining ——. J. B. L. Aurientis and R. Fontenilles Fr. Pat. 345,261, July 26, 1904.

Sugar of the quality known as No. 3 or "extra," is melted with water in such proportions and at such a temperature that the syrup, after cooling to about 30° C., contains at least 60 per cent. of refined crystals produced by suitable "malaxage." The syrup drained off from this mass is utilised for melting a second batch of sugar, with the addition of the necessary quantity of water. When the drained syrups become too highly coloured, they are decolourised and returned for re-melting. Any concentration of the syrups is avoided. The crystallised refined mass is drained in the centrifugal machines, mixed with hot, saturated, "clairce" syrup, and moulded in any suitable manner. The refuse from the moulded sugar is remelted.—J. F. B.

Viscous Materials [Molasses]: Apparatus for Drawing off ——, the Draw-off Cock being Automatically regulated by a Float. B. Gäde. Fr. Pat. 344,724, June 21, 1904.

The viscous material is drawn off from a tun into a vessel, and as this fills, it raises a float connected by means of a lever to a weight. When the vessel is full, the weight is released and closes the draw-off cock.—L. F. G.

Molasses, Vinasses, Saccharine Juices, and other Vegetable Extracts; Production of Dyestuffs from ——. O. Wichardt. Fr. Pat. 345,440, Aug. 9, 1904. IV., page 1211.

Betaïne or its Salts from Molasses; Process for Extracting ——. C. Stiepel. Fr. Pat. 344,954, July 19, 1904.

Concentrated molasses is intimately mixed with twice its volume of 95 per cent. alcohol. The mixture is allowed to settle, and the alcoholic layer is decanted off, filtered, and decolorised by animal charcoal. It is then concentrated to a syrupy consistency, treated with strong hydrochloric acid, and cooled; the crystals of betaine hydrochloride which separate out, are subsequently purified by recrystallisation from alcohol.—J. F. B.

Starch [Amyloid]; Manufacture of —— from Cellulose, Wood, &c. A. Börner. Fr. Pat. 345,370, Aug. 4, 1904.

Sawdust or other waste vegetable material is digested for 18—60 hours with a suitable acid or alkaline solution. The most suitable solvent consists of a 1—2 per cent. solution of caustic soda, with which the sawdust is systematically extracted in a diffusion battery at a temperature of about 24° C. The extract is freed from resins, &c. by acidulation, and the "starch" is precipitated from the clarified solution by saturating the latter with common salt. The separated "starch" may then be saccharified by acid, and converted into alcohol by fermentation and distillation.—J. F. B.

XVII.—BREWING, WINES, SPIRITS, Etc.

Culture Yeasts; Researches on —— in the Moist and Pressed Condition. W. Henneberg. Woch. f. Brau., 1904, **21**, 625—629, 654—660, 668—675, 683—686, 711—716, 731—740, 747—751, 759—763.

Conclusions are summarised setting forth the results of a long series of investigations on the behaviour and longevity of quiescent yeast cells and the influence of foreign organisms on yeast, including a study of spontaneous infection, decomposition, and putrefaction of preserved yeast. The experiments were carried out (1) with absolutely pure cultures, and (2) with pressed industrial yeast. A comparison of these two series showed that, in the bulk, the pure cultivated yeast lived for a shorter time than the industrial cultures, but that frequently a few cells of the pure cultures survived after the whole of those of the industrial cultures were dead. Variations in the relative longevity of the two kinds of cultures were observed, according to the temperature of storage and the race and type of the yeast. In pure cultures the bottom yeasts lived longer than the top yeasts, but in industrial cultures the reverse was the case; the two types of yeast are, however, not really comparable. In pure cultures there was frequently a slight reproduction, but scarcely any in the industrial cultures. In pure cultures of Races II. and XII. the presence of excess of moisture was very injurious, but in industrial cultures much less so. Exclusion of air by means of a layer of paraffin was found to be unfavourable in pure cultures of Race XII., but favourable in industrial cultures. Industrial cultures of Race XII. often contained spores, whereas the pure cultures of this variety were always devoid of them. Infection by *Oidium lactis* is very destructive in pure cultures, but in industrial cultures of the distillery yeasts, this fungus forms a protective film with distinctly favourable effects. Sulphuretted hydrogen (due to infection) was produced only in the industrial cultures; the latter also were proof against putrefactive bacteria and hay bacilli. Generally, it may be said that the life of moist yeast cells in the quiescent state is comparatively short, especially at high temperatures. The life of the cell is cut short by the accumulation in the restricted space of the pressed mass, of poisonous products of metabolism, or by foreign organisms. In order to obtain a culture which will remain alive for a considerable time, it is necessary to select a suitable race of yeast and to cultivate it under conditions which will induce a vigorous growth, as free as possible from infecting organisms.—J. F. B.

Denaturing Sugar for Use in the Brewery; Directions for ——. Z. Ver. Deutsch. Zucker Ind., 1904, **54**, [Gen. Part], 408. (See this J., 1904, 1053.)

In accordance with the law of July 5, allowing the use of duty-free sugar for brewing purposes in France, the following two methods of denaturing the sugar were sanctioned on October 1:—(1) A mixture is made in the following order of 1000 kilos. of drinking water, 2 kilos. of syrupy, purified commercial phosphoric acid of sp. gr. 1·45, 1000 kilos. of sugar or syrup, and 20 kilos. of hops. The mixture is brought to the boil. After boiling for 15 minutes, the density of the boiling liquid is taken with a hydrometer, and boiling continued until it has reached 1·26. The syrup poured off, must have a density of 1·32. (2) A mixture is made in the following order, 1000 kilos. of drinking water, 4 kilos. of crystallised tartaric acid, 1000 kilos. of sugar or syrup, and 20 kilos. of hops. The rest of the procedure is as under (1).—L. J. de W.

[*Brewing.*] *Action of Disinfectants on Beer Incrustation.* V. Törnell and E. Morell. Z. ges. Brauw., 1904, **27**, 841—846.

Experiments were made on the incrustation found in the main leading from the hop-back to the cooler. The substance which contained 9·4 per cent. of moisture and was soluble to the extent of 14½ per cent. in water, was crushed and exposed to the action of the reagents (20 c.c. per 0·4 grm. of substance) for an hour, then stirred and left for a similar period, the insoluble residue being finally collected on a tared filter, washed with 300 c.c. of water and dried at 100° C. "*Antiformin*" (in which the active substance is hypochlorous acid, and which contains 5·2 per cent. of sodium hydroxide) dissolved 97 per cent. of the incrustation with brisk effervescence, the chlorine decolorising the solution. On the other hand, a 5 per cent. solution of *caustic soda*, dissolved only 23 per cent., so that the more vigorous action of the first-named reagent must be ascribed to the active chlorine, though in the case of *sodium hypochlorite* and *bleaching powder*, this activity was less pronounced (64·4 per cent. and 39·7 per cent. respectively). *Sodium* and *potassium carbonates* act more by loosening the incrustation than as solvents, only 20 per cent. being dissolved by solutions of 2½—10 per cent. strength. *Potassium bisulphite* increases the insolubility of the incrustation in water by nearly 2 per cent., and also hardens the crust—a behaviour explaining the known fact that vats treated with this reagent incrust sooner and more firmly than otherwise. The same result, but in still higher degree, is furnished by "*montanin*," which actually increases the insolubility by 25 per cent., and is therefore entirely unsuitable as an anti-incrustant. *Ammonium bifluoride* (0·5—1 per cent. solution) dissolves only about 1 per cent. more than water. It is therefore concluded that oxidising agents alone, do not exert any powerful solvent action on the incrustation.—C. S.

Distillery Yeast Mash; Heating the —— to 75°—81° C. after Acidification. Schirmann. Z. Spiritusind., 1904, **27**, 478—479.

The heating of the preliminary yeast mash to a temperature of 75—81° C., after acidification by lactic acid bacteria and before sowing the yeast, is always recommended as a safeguard for destroying any undesirable bacteria which may have developed along with the lactic bacteria. The author, however, questions the utility of this partial sterilisation, because its good effects may be outweighed by its ill effect on the nutrition of the yeast. He contends that if the lactic fermentation has taken place under favourable conditions of purity, the heating is unnecessary, and that it is quite likely, by its action upon the albuminoids and enzyme-constituents of the mash, to modify the composition of the liquid in a direction unfavourable to the yeast. He claims that it is possible to judge whether an acidified yeast mash is in such a condition as to require heating for sterilisation purposes, or whether this heating may be omitted with advantage to the yeast. Henneberg, commenting on the above, points out that there are some kinds of "wild" lactic bacteria which develop well under the same conditions as the "cultivated" species, and that these are capable, in sufficient quantities, of exerting a disastrous effect upon the yield of spirit. It is very doubtful whether it is possible in practice to distinguish the presence to a dangerous extent of these harmful bacteria, and the pasteurisation of the mash must be regarded as a necessary safeguard.—J. F. B.

Distillery Fermentation Tuns; Attemperators for ——. G. Heinzelmann. Z. Spiritusind., 1904, **27**, 477.

Attemperators are of two kinds, the stationary and the movable. The copper pipes of the stationary coils should be flattened or oval in section, since their sole function is to cool the mash. The pipes of the moving coils should on the other hand be round in section, since flattened pipes in their spiral path cut through the mash without making a sufficient path for the escape of the carbon dioxide, which is the chief object of their motion. The speed of rotation should be 18 to 20 revolutions per minute, and the up and down stroke should be about 3 ft. in length. The coils should never be so adjusted that they break through the surface of the mash as they rise, as thereby a loss of alcohol would occur. The attemperators must be kept perfectly clean, and there should be no projections or corners to which particles of stale mash may adhere and so cause infection; any leakage of water from the inside of the coils may also introduce infecting bacteria. Mere spraying is not sufficient to remove the slimy deposit of yeast which collects on the coils; these should be scrubbed as frequently as possible with milk of lime.—J. F. B.

Rum distilled in British Guiana; Proportion of Esters normally Present in ——. J. B. Harrison. British Guiana Official Gazette, Oct. 19, 1904.

From the results of analysis of a number of "estate" rums and of "bush" rums (the products of illicit distilleries), it is concluded that rum as at present manufactured in British Guiana is subject to a wide range of variation in its contents of esters (calculated as ethyl acetate), the numbers obtained varying from 12 to 80 parts for estate rums and for bush rums from 24 to 115 parts per 100,000 of alcohol by volume. The mean contents of esters in the rum exported from the colony during the past three years have varied from 64·7 to 104 parts, the mean for the total export being 83·5 parts. Rum distilled by means of continuous and of Coffey stills contains a mean of 41·9 parts of esters with 18·4 parts of acids; that from vat stills, 69·9 parts of esters with 33·1 parts of acids. The results here given offer no support to the theory that rum can be judged as to its freedom from admixture with silent spirit by the amount of esters present.—T. H. P.

Trehalase; Presence of —— in Mushrooms.
E. Bourquelot and H. Hérissey. XXIV., page 1243.

Rusting of Iron [by Denatured Spirit]; Stimulating and Paralysing Effects of certain Substances on ——. L. Lindet. X., page 1219.

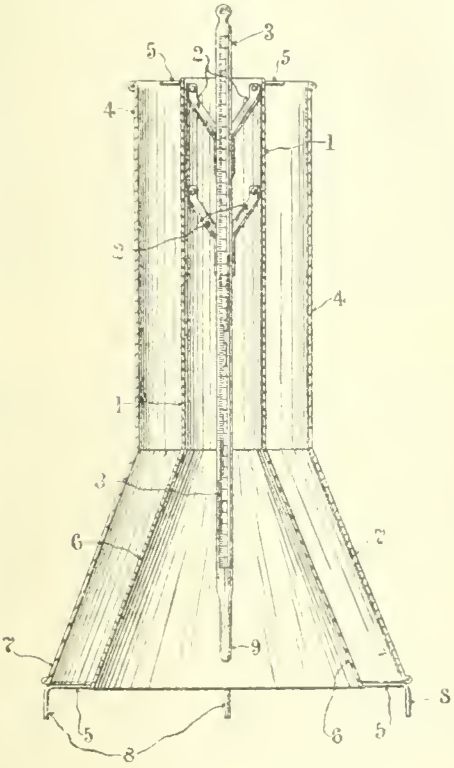
English Patents.

English Beers or Malt Liquors; Manufacture of ——, and Production of Pure Yeast Cultures for use therein. N. H. Claussen, Copenhagen. Eng. Pat. 28,184, Dec. 22, 1903.

Claim is made for the employment in the manufacture of English beers, such as ale, stout, and porter, of cultures of a new species of micro-organisms, which are termed brettanomyces and which do not form endospores, in order to produce the flavour and condition peculiar to such beers. The brettanomyces may be added after the primary fermentation or after pasteurisation, or may be mixed with the pitching yeast.—T. H. P.

Temperature of Kilns or other Hot-Air Chambers used in Drying Grain and like Materials; Apparatus for Indicating the ——. A. J. Murphy, Leeds. Eng. Pat. 967, Jan. 14, 1904.

This apparatus consists of a casing 1, provided with inturned spring clips 2, for holding a thermometer 3 centrally within the casing, 4 being an external shield or jacket which is held concentrically outside the casing 1 by distance pieces, 5. The bases of the casing 1 and shield 4 are opened out into trumpet bases 6 and 7, and feet 8, are provided, which are placed in perforations in the floor of the kiln. When the apparatus is placed on the floor of the kiln, the gases are free to ascend and pass in close contact with the bulb 9, of the thermometer, without being altered in temperature by contact with the walls of the apparatus in contact with the grain.—T. H. P.



Fertilizer or Manure [from Brewers' Yeast]; Manufacture of ——. H. Myers. Eng. Pat. 494, Jan. 8, 1904. XV., page 1228.

United States Patents.

Malt Kiln. C. E. Glafke, San Francisco. U.S. Pat. 774,915, Nov. 15, 1904.

A kiln-furnace provided with grate-bars for burning coke, is combined with a supplemental horizontal flue, U-shaped in vertical cross-section, opening into the furnace. A jacket surrounds the top and sides of the horizontal flue at such a distance that an air chamber is thus formed, which opens into the furnace; there is also an air chamber below the floor of the horizontal flue. Liquid fuel is supplied at the end of the horizontal flue furthest removed from the furnace.
—J. F. B.

Brewing; Art of ——. J. Schneible, Weehawken, N.J. U.S. Pat. 775,730, Nov. 22, 1904.

See Eng. Pat. 14,028 of 1904; this J., 1904, 996.—T. F. B.

French Patents.

Phlegms, Wines, and Alcoholic Liquors generally; Continuous Rectification of ——. A. Baudry. Fr. Pat. 339,079, Oct. 2, 1903. (See also this J., 1904, 1107.)

Two distillation columns are provided, the first serving for the separation of the volatile impurities, gases, &c., from the phlegms or wine as far as possible, and the second serving for the separation of volatile impurities from the liquor returned from the rectifying column. The second distillation column may be heated by the latent heat of the alcoholic vapours of the separating column. The volatile impurities from the two distillation columns concentrate themselves on certain plates of a "double" column, leaving a distinct "neutral zone" practically free from impurities. The alcoholic liquid from the "neutral zone" is divided into two parts, one descending into the lower portion of the double column and concentrating the fusel oil products on certain plates, whilst the other is mixed with the phlegms or wine in the first distillation column.—J. F. B.

Spirits; Manufacture of Naturally Perfumed and Aromatic ——. H. Pape and G. Defourneaux. Fr. Pat. 339,085, Oct. 6, 1903.

A selected species of yeast, isolated from sugar canes and cultivated in the pure state, and rendered more active by special treatment, is utilised for the production of fine rum from sugar-cane molasses. The same yeast can be utilised for the fermentation of mashes prepared from beetroot products or saccharified grains, with the addition, if desired, of vinasses derived from sugar-cane products. The fermented mashes are distilled in rectifying columns, and the various distillates are selected or blended.—J. F. B.

Alcoholic Vapours; Recovery of —— from other Volatile Products. J. Jean et Cie and G. Raverat. Fr. Pat. 345,138, July 25, 1904.

The alcoholic vapours, mixed with air or other gases, are passed through columns containing concentrated sulphuric acid. The acid absorbs the alcohol, which is subsequently recovered by diluting with water.—J. F. B.

Wines, Musts, Ciders, &c.; Apparatus for Determining the Dry Extract and the Alcohol in ——. A. B. Darbois. Fr. Pat. 345,455, July 28, 1904. XXIII., page 1239.

Marcs and Grapes [Alcohol and Cream of Tartar]; Process and Apparatus for Treatment of ——. Egrot, Grangé et Cie. Fr. Pat. 344,737, July 9, 1904.

The fermented marcs are charged into a battery of closed diffusion vessels elongated in form and of small diameter, and capable of withstanding a high pressure. The marcs are extracted in these vessels, first by cold or warm water under pressure, and subsequently by hot water heated under pressure to a temperature above 100° C. The cold water extracts the alcohol, whilst the hot water dissolves the cream of tartar. The same apparatus may be used for extracting the must from the vintage before fermentation, or for the extraction of the wine from the fermented lees.—J. F. B.

Marcs of Wine or Fermented Products: Recovery of Alcohol from ——. G. Ciapetti. Fr. Pat. 314,880, June 18, 1904.

Referring to a previous patent (this J., 1903, 1099), the batteries in which the marcs are treated with sulphurous acid and hydrosulphurous acid for the extraction of cream of tartar, are connected with a distilling and rectifying apparatus in which the alcoholic vapours, expelled from the marcs before their extraction, are separated into refined spirits and common spirits, both, at a high concentration. (See also this J., 1904, 1039.)—J. F. B.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(*A.*)—FOODS.

Flour; Bleaching of ——. E. Fleurent. Comptes rend., 1904, **139**, 945—946.

Three processes are in use for bleaching flour, depending on the use respectively of ozonised air, of air charged with chemically prepared nitrogen peroxide, and of air charged with nitrogen oxides obtained by the spark discharge through it. If these processes merely changed the colour of the flour they would not be worth using; but experiment has shown, it is stated, that by their influence on the transformations of the fatty matters, on the acidity, on the diastatic power, and on harmful micro-organisms, they allow an increased amount of superior flour to be extracted, and improve its keeping qualities.—J. T. D.

Cows' Milk; Nutritive Value of —— *Sterilised at* 108° *C.* G. Variot. Comptes rend., 1904, **139**, 1002—1003.

During the last twelve years about 400,000 litres of cows' milk, sterilised at 108° C. in hermetically sealed bottles, have been sent out in France. The results show that such milk maintains the whole of its nutritive value, whilst its assimilability is not appreciably changed.—T. H. P.

Straw Pulp and Cattle Fodder. Lehmann. XIX., page 1233.

English Patent.

Milk Powder; Manufacture of ——. G. H. Rayner, London. From J. Maemecke, Berlin. Eng. Pat. 6720, March 19, 1904.

Milk is first pasteurised, then filtered, and rendered homogeneous. During this time the quantity of calcium separated as an insoluble compound is determined, and a corresponding amount of a calcium compound (calcium combined with a higher alcohol, or sugar) is added to the milk, which is evaporated under reduced pressure to about one-fifth of its volume. The thick liquid obtained, is then completely dried in layers of about 5 mm. thickness in flat-bottomed pans. The dry product is powdered. The latter is soluble, and it is claimed that it does not become rancid on keeping.—W. P. S.

United States Patent.

Preserving and Disinfecting; Method of ——. A. Müller Jacobs, Brooklyn. U.S. Pat. 775,066, Nov. 15, 1904.

Decomposable matter is preserved and disinfected by subjecting it to the action of zirconium compounds (which possess radio-active functions) by immersing the matter in a suitable solution of the salts of zirconium.—J. F. B.

French Patents.

Gluten; Process and Apparatus for Drying and Bleaching ——. L. A. Morel. Fr. Pat. 344,631, July 6, 1904.

The gluten, in the form of cakes, is placed upon electrically heated plates under the receiver of an air-pump. Pasty gluten is filled into tubes which stand on the plates. The temperature of the latter is controlled by means of a special thermostat. Absorbing materials contained in vessels surrounded by cold water are placed under the receiver and a stirring apparatus for the absorbent is actuated by connections with the handle of the air pump.—W. P. S.

Foods—Flour, Milk, &c; Process and Apparatus for Producing a Bleaching, Improving or Sterilising Agent for ——. The Ozonised Oxygen Co., Ltd. Fr. Pat. 344,914, July 18, 1904. XI. A, page 1224.

Lac Derivative [*Lining Preserved Food Tins*], *and Process for Manufacturing the same.* W. S. Bucklin. Fr. Pat. 345,174, July 28, 1904.

Arsenical Poisoning; Danger of —— *to Workmen Engaged in Autogenous Soldering.* G. Lunge. X., page 1220.

Calcium Soaps; Dissolving —— *by Means of Ammonium Citrate.* Justin Mueller. V., page 1211.

English Patents.

Sterilising Liquids, particularly Water; Process for ——. R. Cambier, A. Tixier, and C. E. Adnet, Paris. Eng. Pat. 28,586, Dec. 29, 1903.

See Fr. Pat. 337,630 of 1903; this J., 1904, 500.—T. F. B.

Water Purifying Apparatus. P. Schou, Copenhagen. Eng. Pat. 21,777, Oct. 10, 1904.

The water enters a conical vessel from pipes attached to a central rotating pipe, the rotation being caused by the pressure of water issuing from the pipes. The central rotating column extends upwards into a chamber placed above the conical vessel. This second chamber contains the chemicals to be added to the water, and stirrers attached to the central column serve to keep these well mixed. A cam is placed on the shaft, and, as it rotates, it opens and closes a spring valve in a pipe leading from the chemical chamber to the water tank. The distance which the valve opens is partially regulated by an adjustable disc on the valve-rod, and also by a piston on the main shaft, which rises with an increase of the pressure of the water supply and causes a wider part of the cam to operate on the valve rod.—W. P. S.

United States Patents.

Garbage or Offal; Apparatus for Cooking ——, *and Removing the Oil or Grease therefrom.* C. S. Wheelwright, Bristol, R.I. U.S. Pat. 774,804, Nov. 15, 1904.

See Eng. Pat. 14,482 of 1904; this J., 1904, 879.—T. F. B.

Garbage, &c.; Process of Cooking ——, *and Removing the Oil, &c., therefrom.* C. S. Wheelwright, Bristol, R.I. U.S. Pat. 774,805, Nov. 15, 1904.

Garbage or Offal; Apparatus for Cooking ——, *and Removing the Oil therefrom.* C. S. Wheelwright, Bristol, R.I. U.S. Pat. 774,806, Nov. 15. 1904.

See Eng. Pat. 14,483 of 1904; this J., 1904, 879.—T. F. B.

Garbage &c.; Process of Cooking ——, *and Removing the Oil, &c., therefrom.* C. S. Wheelwright, Bristol, R.I. U.S. Pat. 774,807, Nov. 15, 1904.

See Eng. Pat. 15,235 of 1904; this J., 1904, 909.—T. F. B.

Garbage or Offal; Apparatus for Removing Oil or Grease from ——. C. S. Wheelwright, Bristol, R.I. U.S. Pat. 774,808, Nov. 15, 1904.

See Eng. Pat. 14,483 of 1904; this J., 1904, 879.—T. F. B.

Water, Purifying Apparatus ——. J. C. W. Greth, Assignor to W. B. Scaife and Sons Co., Pittsburg, Pa., U.S. Pat. 775,901, Nov. 22, 1904.

A lime-saturating and lime-treatment tank, a "soda"-treatment tank, an upward flow settling tank and a filter are contained in a single outer tank. The water to be treated, passes through the system in the above order. Means are provided for controlling the supply of water and chemicals automatically, and for causing an inverse vertical flow in the lime and "soda" tanks.—W. H. C.

French Patent.

Liquids [*Water*]; *Process of Sterlising* ——. L. Freyssinge and R. Roche. Fr. Pat. 345,148, July 26, 1904.

The process consists in adding to the liquid, especially water, compounds capable of generating a small quantity of hydrogen peroxide (about 50 mgrms. per litre of water), and then separating the water by decantation or filtration from the residual reaction products. The compounds added, must be of such a nature that the residual products are insoluble and perfectly innocuous.—A. S.

(C.)—DISINFECTANTS.

Bactericidal and Antiseptic Action of Eucalyptus Oil and its Constituents. C. Hall. Schimmel's Report, Oct. 1904, 37—39.

Eucalyptol [cineol] is the least active in bactericidal power of all the constituents of eucalyptus oils. Aromadendral, piperitone and phellandrene are the most active bodies. *B. coli communis* is only destroyed after eight hours' exposure to the action of cineol; the same effect is obtained under similar conditions, in 10 minutes with aromadendral, in 40 minutes with piperitone, and in 90 minutes with phellandrene. Dextro- and lævo-pinene and aromadendrene are somewhat less powerful as antiseptics than phellandrene, but are more active than cineol. Eudesmol has a powerful bactericidal action, and also increases the activity of cineol and piperitone. When eucalyptus oil contains ozone, due to the oxidation of the terpenes, the antiseptic power of the contained cineol is enormously increased. Such oils destroy the vitality of *B. coli communis* in 15 minutes, and the activity of the cineol is then only exceeded by that of aromadendral. For this reason only ozonised eucalyptus oils should be employed as the source of cineol intended for medicinal use. It is stated that the ozone is not removed from cineol by the process of extraction by freezing and rectification.—J. O. B.

French Patent.

Phenol and Formaldehyde; Process for Preparing a Condensation Product of —— [Disinfectant]. A. Stephan. Fr. Pat. 345,398, Aug. 6, 1904.

200 grms. of phenol are heated with 400 grms. of a 40 per cent. solution of formaldehyde, in presence of alkali, to about 100° C., using a pressure of $1\frac{1}{2}$ to 2 atmospheres. The resulting liquid is heated on a water-bath under reflux condenser till the odour of phenol has disappeared, and precipitation is then effected by the addition of acid. The precipitate is filtered off and dried, and is suitable for use as a disinfectant. (See also Lingner, this J., 1903, 1014; and Raetz, this J., 1904, 500.)—T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

Straw Pulp [for Paper-Making] and Cattle Fodder. Lehmann. Papier-Zeit., 1904, **29**, 3562.

A proposal is made for increasing the fodder value of cereal straw by combining the manufacture of straw pulp for paper mills with that of "soda-straw" for cattle fodder. It is suggested that the manufacture might be undertaken by the beet-sugar factories during the season when sugar manufacture is at a standstill. The straw is boiled in spherical boilers of at least 10 cubic metres capacity; in one operation straw cellulose for papermaking is prepared by boiling the straw with caustic soda and separating the fibre in the form of "half-stuff." In the next operation the alkaline liquors, drained off from the pulp and containing at least half of the nutrient matters of the straw, are utilised for boiling a second batch of straw which is to be used as cattle fodder.—J. F. B.

English Patent.

Esparto Grass, Straw, Wood, and the like, Utilisation [Distillation] of Residual Matters containing Alkaline and Organic Substances, such as the Residual Matters resulting from the Treatment of ——, in the Preparation of Paper Pulp. E. H. Strange, J. H. Gaele, and A. A. Longsdon. Eng. Pat. 27,732, Dec. 17, 1903. III., page 1207.

United States Patents.

Fibre for Paper-Making: Apparatus for Preparing ——. F. H. Cloudman, Rumford Falls, Me. U.S. Pat. 775,027, Nov. 15, 1904.

A condenser is arranged above, and connected with the upper part of a digester, and an air separating and gas-absorbing arrangement is placed between the condenser and the lower part of the digester. After leaving the condenser, the condensed liquid and absorbed gas return to the digester by the action of gravity through the air-separating means, the latter being provided with an outlet for the discharge of the air.—B. N.

Fibre for Paper-Making; Apparatus for Preparing ——. F. H. Cloudman, Westbrook, Me. U.S. Pat. 775,028, Nov. 15, 1904.

A digester is connected by means of a pipe, provided with a valve, with a gas absorber placed at a higher level. Above the gas absorber, and connected with it, is a condenser provided at the top with an air-relief pipe; the liquid and gas return by the action of gravity through a pipe connecting the lower parts of the absorber and digester, the pipe being provided with a check-valve.—B. N.

Paper Pulp. J. Ferrand, Asnières, France. U.S. Pat. 774,982, Nov. 15, 1904.

See Fr. Pat. 327,046 of 1902; this J., 1903, 879.—T. F. B.

Paper Pulp; Production of ——. J. Kitsee, Philadelphia. U.S. Pat. 775,829, Nov. 22, 1904.

Crude wood or other fibre is immersed in a saline solution containing an alkali base, *e.g.*, sodium chloride. The fibre and solution are placed in the negative compartment of an electrolytic apparatus, and the mixture is subjected to the action of an electric current which produces sufficient caustic alkali to dissolve the non-cellulose matters of the wood.—J. F. B.

Wood-Pulp Mill Effluents; Process of Neutralising ——. C. W. Doughty, Augusta, Ga. U.S. Pat. 775,525, Nov. 22, 1904.

The waste sulphite liquors are passed through a tank fitted with partitions, to give an up-and-down motion, and with agitators. The liquors are there treated with calcium carbonate introduced as a continuous current; after suitable agitation the heavy matters are removed by settling, and the decanted liquid is treated with ammonia.—J. F. B.

Paper-Making Apparatus. R. Binns, South Windham, Conn. U.S. Pat. 775,511, Nov. 22, 1904.

A cylinder with a "screened" periphery and closed ends is supported entirely upon a hollow shaft within a tank. Outlet passages are provided, through which the water inside the cylinder passes into the hollow shaft. At one end of the hollow shaft is a tilting discharge outlet, the size of which may be altered, and by means of which the level of water inside the cylinder may be varied relatively to that of the water in the tank surrounding the cylinder.—A. S.

Filter [for Waste from Paper and Cellulose Factories]. O. Mehnert and P. Pape, Assignors to Maschinenfabrik Akt.-Ges., vorm. Wagner and Co., Kothen, Germany. U.S. Pat. 775,475, Nov. 22, 1904.

See Eng. Pat. 8061 of 1903; this J., 1904, 557.—T. F. B.

French Patents.

Paper from Maize Stalks, Sugar Cane, and Similar Pithy Stems; Manufacture of ——. V. Dreesen. Fr. Pat. 344,692, July 9, 1904.

The stems are split and chopped into suitable pieces, which are then boiled with caustic soda under pressure. The boiled material is then washed and broken in a "potcher" of special construction, provided with washing surfaces which allow the pith cells to pass through their meshes along with the washing water, leaving the true fibres of the stems in the engine. The good fibres are converted into paper pulp, whilst the washing waters containing the pith cells are collected in large tanks in which the cellular matter is separated by sedimentation—J. F. B.

Pavements free from Dust; Process for Rendering ——. Chem. Werke Mügeln, b. Dresden, G. m. b. H. Fr. Pat. 345,067, July 23, 1904. IX., page 1218.

Celluloid Substitute [*Casein Basis*]; *Transparent and Non-inflammable*——. H. M. Provenx. Fr. Pat. 339,081, Oct. 5, 1903.

"Caselith" may be prepared in two ways—(1) Casein, nitrocellulose, and camphor are mixed with 1 part of glycerin, and a boric acid solution, consisting of 1 part of alcohol, heated to 120° C. and containing 50 per cent. of boric acid; (2) the same mixture with the omission of the nitrocellulose and camphor. The proportion of glycerin may be varied according to the degree of plasticity desired. When nitrocellulose and camphor are employed, these constituents are added immediately before rolling. The milled products are finally hardened by immersion in a bath of formaldehyde.—J. F. B.

Artificial Silk; Twisting and Spinning Apparatus for ——. Soc. Franç. de la Viscose. Fr. Pat. 245,274, July 30, 1904. V., page 1212.

Artificial Silk; Regulating Valve for Solutions for Spinning ——. Soc. Franç. de la Viscose. Fr. Pat. 345,293, Aug. 1, 1904. V., page 1212.

Artificial Silk; Continuous and Automatic Apparatus for Spinning ——. Soc. Franç. de la Viscose. Fr. Pat. 345,320, Aug. 2, 1901. V., page 1212.

Viscose; Jet for Spinning Threads from ——. Soc. Franç. de la Viscose. Fr. Pat. 345,342, Aug. 3, 1904. V., page 1212.

Celluloid Objects and Similar Substances; Process for Imparting a Lustre to ——. W. Homberger. Fr. Pat. 345,405, Aug. 6, 1904.

See Eng. Pat. 17,232 of 1904; this J., 1904, 997.—T. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Adrenaline (Suprarenine). E. Friedmann. Beitr. chem. Physiol. u. Pathol. **6**, 92—93, Chem. Centr., 1904, **2**, 1512.

The optically active tribenzenesulpho-adrenaline can be oxidised to a compound containing the same number of carbon atoms as adrenaline, but which is optically inactive, and is of a ketonic character. The author has identified this compound as methylaminoacetopyrocatechol, and names it *adrenalone.* On further oxidation it yields a substituted acid amide, $C_6H_3(OH)_2 . CO.CO.NH(CH_3)$, *peradrenalone.* It is concluded that adrenaline has the constitution:

$$(OH)C\left\langle\begin{matrix}C(OH){:}CH\\ CH\ .\ CH\end{matrix}\right\rangle C.CH(OH).CH_2.NH(CH_3).$$

—A. S.

Ephedrines, Synthetic ——. E. Fourneau. J. Pharm. Chim., 1904, **20**, 481—492.

In addition to ephedrine $C_{10}H_{15}NO$, m. pt. 30° C., isolated by Nagai from *Ephedra vulgaris*, pseudoephedrine $C_{10}H_{15}NO$ m. pt. 114—115° C., discovered by Ladenburg and by Miller in the same plant; and isoephedrine, obtained by Nagai by heating ephedrine with hydrochloric acid, which was subsequently shown by Schmidt to be identical with pseudoephedrine, the following synthetic amino-alcohols, isomerides and homologues of ephedrine, are described.

Methylaminodimethylphenylcarbinol, $(C_6H_5)(CH_3)C[CH_2.NH(CH_3)]OH$, obtained by heating methoethenylphenyl chlorhydrin or iodhydrin with monomethylamine, under pressure at 130° C. After separating the crystals of methylamine hydrochloride, the mother liquor is concentrated, treated with 20 per cent. hydrochloric acid, and shaken out with benzene to remove neutral bodies and uncombined chlorhydrin; the base is next liberated by sodium carbonate and shaken out with ether. The ethereal residue is then fractionally distilled *in vacuo.* Methylaminodimethylphenyl-carbinol is thus obtained as a syrupy noncrystalline base, b. pt. 137° C. under 33 mm. pressure. It affords crystalline salts; hydrochloride, m. pt. 153° C.; aurichloride, m. pt. 148° C.; oxalate, m. pt., 158° C.; the dibenzoyl derivative melts at 122° C.

Dimethylaminodimethylphenylcarbinol, $(C_6H_5)(CH_3)C[CH_2.N(CH_3)_2]OH$, also a liquid: b. pt. 135° C. under 22 mm. The hydrochloride melts at 160°, the iodomethylate at 157° C.

Methylaminophenylethylcarbinol, $(C_6H_5).CH(OH).CH(CH_3).NHCH_3$, is obtained by treating phenylpropylene with iodine and mercuric oxide in the presence of aqueous ether; by this means an impure iodhydrin is obtained in which the iodine is attached to the carbon of the ethylene chain furthest removed from the benzene nucleus. This crude iodhydrin is allowed to stand in contact for some days with an alcoholic solution of monomethylamine, at normal temperature. The base formed is isolated by fractional distillation *in vacuo.* It boils at 155°—156° C. under 31 mm.; it is a syrupy liquid which separates in large prisms from solution in light petroleum spirit; m. pt., 60° C.; the hydrochloride melts at 178° C., the dibenzoyl derivative at 92° C.

Dimethylaminophenylethylcarbinol, $(C_6H_5)C\ CH(CH_3).N(CH_3)_2]HOH$, like the preceding base, is an oily liquid crystallising from light petroleum spirit: m. pt., 47° C.; b. pt., 151°—152° C. under 31 mm. The hydrochloride melts at 180° C., the picrate at 80° C., the dibenzoyl derivative at 108° C. The last-named is said to have an intense anæsthetic action.

Methylaminomethylbenzylcarbinol, $(C_6H_5.CH_2)C[CH_2.NH(CH_3)]HOH$, is obtained from the iodhydrin resulting from the action of nascent hypoiodous acid on phenylallylene. It boils at 148° C. under 22 mm. and at 169° under 40 mm. It is very syrupy, remains amorphous at low temperatures, and gives crystalline salts with difficulty. The iodomethylate, precipitated from alcoholic solution by means of ether, and crystallized from acetic ester and ether, melts at 148° C. The dibenzoyl derivative melts at 42°—43° C.

Dimethylaminomethylbenzylcarbinol, $(C_6H_5.CH_2)C[CH_2.N(CH_3)_2]HOH$, is obtained by substituting dimethylamine for monomethylamine in the preceding experiment. The base boils at 143° C. under 22 mm. The hydrochloride is syrupy; aurichloride, m. pt., 122° C.; the monobenzoyl derivative is liquid; its hydrochloride, which is said to have a powerful anæsthetic action, melts at 165° C.

Primary methylaminomethylbenzylcarbinol, $C_6H_5.CH(CH_2OH)[CH_2.NH(CH_3)]$, is obtained from the chlorhydrin, $(C_6H_5)CH(CH_2Cl)(CH_2OH)$, which is produced by the action of epichlorhydrin on phenylmagnesium bromide. It boils at 145° C. under 22 mm. It is heated at 130° C. under pressure, with benzene solution of methylamine. The base thus obtained boils at 145° C. under 24 mm. It is a reducing agent; all its salts are oily.

Dimethylaminomethylbenzylcarbinol.—The base obtained with dimethylamine boils at 136° C. under 24 mm. Its hydrochloride is obtained crystalline by precipitating the solution in acetone with anhydrous ether; m. pt. about 288° C. The aurichloride melts at 126°—127° C., the iodomethylate at 148° C. The hydrochloride of the dibenzoyl derivative forms fine crystals; m. pt., 141° C.—J. O. B.

Skimmianine, an Alkaloid from Skimmia japonica Thunb. J. Honda. Arch. exp. Pathol. u. Pharmak, 1904, **52**, 83—94. Chem. Centr., 1904, **2**, 1511—1512.

The alkaloid *skimmianine,* $C_{32}H_{29}N_3O_9$, is present in all parts of the *Skimmia japonica Thunb.*, but most abundantly in the leaves. It was isolated by extracting the air-dried leaves with 96 per cent. alcohol at the ordinary temperature. The alcohol was distilled off from the extract, the green residue shaken with warm water, and filtered. The brown filtrate was shaken with chloroform, and after removal of the chloroform, the base was crystallised from alcohol and obtained in the form of yellowish prisms melting at 175·5° C. The free alkaloid is almost tasteless, but its salts are intensely bitter. The base is easily soluble in chloroform and alcohol, moderately soluble in methyl alcohol, slightly soluble in ether, amyl alcohol, and carbon bisulphide, insoluble in water and light petroleum spirit. Dilute mineral acids dissolve skimmianine only when added in excess; the salts crystallise in needles when the solutions are evaporated. The alkaloid gives voluminous precipitates with the ordinary reagents, such as potassium-mercuric iodide, iodine dissolved in potassium iodide, picric, tannic, and phosphotungstic acids. With Fröhde's reagent it gives a green colour, which changes to blue, and with a solution of potassium permanganate in concentrated sulphuric acid a violet coloration, which changes to yellowish-brown.—A. S.

Essential Oil of Basil. P. van Romburgh and C. J. Enklaar. Report of Konink. Acadm. van Wetenschappen ti Amsterdam, 1904; Schimmel's Report, Oct. 1904, 14.

The essential oil of *Ocimum basilicum* contains a new terpene, ocimene $C_{10}H_{16}$, closely resembling myrcene; like that terpene, it readily absorbs oxygen, being converted into a colourless viscid substance. Ocimene differs from myrcene, however, in physical characters, and on reduction with sodium in alcohol, yields a dihydro-ocimene, which gives a crystalline bromine addition compound differing in sp. gr. from that obtained by Semmler from dihydromyrcene. Incidentally it is noted that basil oil finds useful application for blending with mignonette bouquets.

—J. O. B.

Citronella Oil; Reliability of Bamber's Test for the Presence of Impurity in ——. Schimmel's Report, Oct. 1904, 21.

A sample of citronella oil, considered to be quite pure, which contained 60 per cent. of total geraniol, and gave a turbid solution which separated no oily drops on cooling, by the "improved Schimmel's test" (this J., 1904, 686) was found when examined by Bamber's method (this J., 1904, 77) to give results indicating the presence of 5 per cent. of impurity. Doubt is therefore expressed as to the reliability for quantitative determinations of Bamber's method, which it is proposed to make the official test for controlling the quality of citronella oil (see Trade Report, p. 1247).

—J. O. B.

Essential Oil of Cypress. Schimmel's Report, Oct. 1904, 23—26.

Furfural, *d*-pinene, *d*-camphene, *d*-sylvestrene, cymene; a ketone possibly sabinol; a terpene alcohol (?); *d* terpineol, as ester, probably acetate; valeric acid, *l*-cadinene, a sesquiterpene alcohol; cypress camphor, identical with the sesquiterpene alcohol of cedar oil; and a body with the odour of gum labdanum, are recorded as constituents of cypress oil.—J. O. B.

Essential Oil of Fennel [and Anethol]; Cause of the Increase of Density of ——. Schimmel's Report, Oct. 1904, 42.

The observed increase in the sp. gr. of fennel oil on keeping under certain conditions is due, in part, to the oxidation of anethol into anisic aldehyde and anisic acid, and, in part, to the polymerisation of the anethol. Fennel oil [and anethol] should therefore be stored in vessels from which light and air are excluded. A specimen of anethol which originally had the following characters: sp. gr. at 25° C., 0·9846; $\alpha^{25°}_{D} = \pm 0°$; $n^{25}_{D} = 1·56079$; solidifying point + 21·3° C.; solubility in 90 per cent. alcohol 1:2, after being kept for two years exposed to air and light, acquired the sp. gr. at 25° C. of 1·1245; α_D, $= \pm 0°$; $n^{25}_{D} = 1·54906$; not solidifying at − 20° C.; solubility in 70 per cent. alcohol, 1:1·5. Not only was the sp. gr. greatly increased, but the oil had become much more soluble; it was less mobile than normal anethol, and the taste had entirely changed, becoming disagreeable. It contained some anisic aldehyde but only traces of anisic acid. The greater part of the original anethol had become polymerised.

—J. O. B.

Essential Oil of Ginger-Grass; Constituents of ——. Schimmel's Report, Oct. 1904, 44—48.

Dextro-limonene and dipentene have been isolated from ginger-grass oil, also an aldehyde $C_{10}H_{16}O$, isomeric with citral, having an odour resembling that of œnanthic aldehyde and of citronellal, b. pt. at 5 mm. 76°—78° C., at 754 mm. 221° 224° C., sp. gr. at 15° C. 0·9551 optically inactive; this aldehyde only occurs to the extent of 0·2 per cent. in the original oil. The alcohol $C_{10}H_{18}O$, resulting from its reduction, was a thick oil, b. pt. at 4 mm. 89°—91° C.; at 755 mm. 236°—238° C.; sp. gr. at 15° C. 0·9419, optically inactive; m. pt. of phenylurethane, 100°—101° C. On exposure to air the aldehyde readily oxidises, forming a crystalline acid, $C_{10}H_{16}O_2$, m. pt. 106°—107° C. It is identical with the acid obtained by saponifying the esters of the oil. In addition to the above, an alcohol, $C_{10}H_{16}O$ is found to accompany the geraniol present.—J. O. B.

Essential Oil of Juniper; Russian, Dextrorotatory ——. Schimmel's Report, Oct. 1904, 50.

Two specimens of Russian juniper oil have been met with, which were normal in all physical characters except optical rotation, the α^D being + 7° and + 8° instead of showing the usual lævogyrate rotation. The aroma of the oils was good, and the solubility normal.—J. O. B.

Lemon-Grass [Essential] Oil from the Cameroons. Schimmel's Report, Oct. 1904, 52.

A specimen of *Andropogon* grass oil, distilled from plants cultivated in the Botanical Gardens at Victoria, Cameroons, which were believed to be authentic citronella grass, has been found to have all the characters of lemon-grass oil, sp. gr. 0·8929; $\alpha_D = - 0° 8'$; citral content 84 per cent.; imperfectly soluble in 70, 80, 90 per cent., and absolute alcohol. In its insolubility in alcohol the oil resembles West Indian lemon grass oil. Great confusion exists in the botanical nomenclature of the species *Andropogon*; in addition to this, it is possible that conditions of climate, soil, and culture, profoundly modify the character of the oil of the same species grown in different localities. West Indian grass oil, supposed to be derived from *Andropogon schoenanthus*, which should yield palmarosa oil, gave a product more nearly approaching lemon-grass oil. In another instance, the same plant has been found, in one locality, to yield an oil rich in geraniol; in another, a distillate in which citral was the predominant constituent. A further difficulty lies in the fact that distinct species of the genus *Andropogon* are susceptible of great variation, this being especially the case with *Andropogon schoenanthus*. Another source of error is the vernacular names given to the oils. Thus in Java, lemon-grass oil is known as "sireh," but the same name is applied to the oil of *Tetranthera citrata*, belonging to a different natural order, but closely resembling lemon-grass oil in odour.—J. O. B.

Essential Oil of Limes. Schimmel's Report, Oct. 1894, 54.

Two specimens of Dominica lime oil from Barbados have been examined.

Hand-pressed Lime Oil.—Sp. gr. at 15° C., 0·9008; α_D − + 36° 17′; α_D of first 10 per cent. on fractionating = + 39° 30′; acid value 6·05; ester value 29·55; residue on evaporation 17·8 per cent.; solubility in 90 per cent. alcohol somewhat over 1:4, with slight turbidity due to a paraffin. The dilute alcoholic solution shows a blue fluorescence, probably due to the presence of methyl anthranilate. The oil is yellow, and has a pleasant lemon-like aroma.

Distilled Lime Oil.—The oil was bright yellow in colour, and had an unpleasant empyreumatic odour: sp. gr. 0·8656; α_D = + 46° 36′; α_D of first 10 per cent. on fractionating = + 53° 8′; acid value 1·8; ester value 4·05; residue on evaporation 3·16 per cent.; solubility in 90 per cent. alcohol, about 1 in 5, with slight cloudiness.—J. O. B.

Essential Oil of Nutmeg. Sp. Gr. of —— in the British Pharmacopaia. Schimmel's Report, Oct. 1904, 66.

THE limits of sp. gr. 0·870 to 0·910 at 15·5° C. officially required by the Pharmacopœia are considered to be too low, and instead of ensuring the supply of oil distilled from rich nutmegs, have an opposite tendency. The normal range of sp. gr. is from 0·870 to 0·920; oil distilled from specially fine nutmegs attaining the sp. gr. 0·922.—J. O. B.

Essential Oil of Opopanax. Schimmel's Report, Oct. 1904, 67.

STEAM distillation of the so-called opopanax gum, derived from a *Balsamodendron*, probably *B. kafal*, yields the fragrant oil used in perfumery. A recently prepared specimen had the sp. gr. 0·895, $\alpha_D = -12° 55'$, saponification value 14·5, which was increased on acetylating. The bulk of the oil distilled under 3 mm. pressure at 45°—130° C. From the residue a small quantity of a sesquiterpene alcohol was separated; b. pt. *in vacuo* 135°—137° C. This had the characteristic odour of the oil. The portion which distilled *in vacuo* consisted chiefly of a sesquiterpene, boiling at ordinary pressure at 260°—270° C. It gave a crystalline hydrochloride, m. pt. 80° C.—J. O. B.

Essential Oil of Phellandrium Aquaticum [*Water Fennel*]; *New Constituents of ——.* Schimmel's Report, Oct. 1904, 88—92.

A NEW aldehyde, phellandral, $C_{10}H_{16}O$, isomeric with citral, has been isolated from the essential oil of *Phellandrium aquaticum*, after removing phellandrene. Phellandral has the following characters:—B. pt., 89° C. under 5 mm. pressure; sp. gr. at 15° C., 0·9445; $\alpha_D = -36° 30'$; the semicarbazone, sparingly soluble in alcohol, has the m. pt. 204° C.; the oxime, in large brilliant tablets, melts at 87°—88° C.; the phenylhydrazone, which readily resinifies, melts at 122°—123° C. On exposure to the air, phellandral oxidises, forming a crystalline acid, having the formula $C_{10}H_{16}O_2$. When oxidised with permanganate, a dibasic acid, $C_9H_{16}O_4$, soluble in water and crystallising in needles, is obtained. In the non-aldehydic portion of the oil a new alcohol, androl, $C_{10}H_{20}O$, was isolated by fractionating the lower boiling portions of the oil. This had the b. pt. 197°—188° C.; sp. gr. 0·858; $\alpha_D = -7° 10'$; $n_D^{15°} = 1·44991$. It had, in a high degree, the characteristic odour of the oil, and is probably the chief odorous principle. Another alcohol, with a rose-like odour, was isolated from the fractions boiling above 230° C. by means of phthalic anhydride, but the amount was too small for identification.—J. O. B.

Essential Oil of Cinnamomum Loureirii; Nekkei Oil. Schimmel's Report, Oct. 1904, 96.

THE essential oil of the leaves and young shoots of the Japanese cinnamon, *Cinnamomum loureirii*, distilled in Japan, is bright yellow in colour, and has a pleasant odour resembling that of citral and Ceylon cinnamon oil. The yield is 0·2 per cent. It has the following characters:—Sp. gr. at 15° C. 0·9005; $\alpha_D = -8° 45'$, acid value, 3·01; ester value, 18·6; solubility in 70 per cent. alcohol 1 : 2 to 2·5 and more, with opalescence; 1 : 1 with 80 per cent. alcohol. It contains 27 per cent. of aldehydes, chiefly citral; the non-aldehydic constituents contain cineol and linalool, the latter constituting about 40 per cent. of the original oil.—J. O. B.

Essential Oil of Tanacetum Boreale. Schimmel's Report. Oct. 1901, 97.

THE half-dried herb yielded 0·12 per cent. of a yellowish oil with a powerful thujone odour; sp. gr. at 15° C. 0·9218; $\alpha_D = +48° 25'$; soluble with turbidity in about 8 volumes of 70 per cent. alcohol, and separating paraffin.—J. O. B.

Thuja Articulata; Essential Oil of the Wood of ——. E. Grimal. Comptes rend., 1904, **139**, 928-928.

THE wood of this Algerian tree (which furnishes Sandarac resin) when submitted to distillation with steam, yields about 2 per cent. of a dark reddish-brown essential oil, which smells of phenols. It contains carvacrol, thymoquinol, and thymoquinone.—J. T. D.

Essential Oil in Annuals; Formation and Distribution of ——. E. Charabot and G. Laloue. Comptes rend., 1904, **139**, 928-929.

BEFORE the period of flowering, the essential oil is formed in the green parts of the plants. As the development of the flowers proceeds, the quantity of essential oil in the whole portion of the plant borne by each stalk, increases; but that in the green parts shows a diminution, whilst that in the flowers shows a great increase. The essence thus appears to be transported from the leaves to the flowers, along with the carbohydrates which are destined for the nutrition of the flowers and fruit. After fruiting, when the reserve storage of carbohydrates is accomplished, and the transport of nutritive substances to the flower ceases, the essential oil seems to return to the leaves; for these show an increase, whilst the amount in the flowers, and the total amount in the plant, have decreased. The essential oil thus seems not to be independent of the mechanism which provides for the accumulation of reserve nutriment in the fruit. Comparing different organs of the plant, the leaves and flowers are found to be richest in essential oil; the stalks contain but little, and the roots none.—J. T. D.

Lupeol from the Bark of Roucheria Griffithiana, Planch. J. Sack and B. Tollens. Ber., 1904, **37**, 4105-4109.

THE authors have studied the above bark which is employed by the natives of Malacca for mixing with their arrow-poison. They have obtained from it dextrose and a crystalline substance belonging to the cholesterol group, which is identical with the *lupeol* previously observed in lupin-pods and in certain species of gutta-percha. The lupeol was extracted from the bark by means of alcohol and was prepared, after repeated purification, in the form of fine colourless needles, melting at 210° C. It is insoluble in water and aqueous acids and alkalis, but soluble in most organic media. Lupeol has the formula $C_{26}H_{42}O$ and a rotatory power, in 6·5 per cent solution in chloroform, of $[\alpha]_D = 27·3°$. When treated with acetic anhydride and strong sulphuric acid, its chloroform solution yields a violet coloration after half an hour. Lupeol combines with 2 atoms of bromine by addition; the dibromide melts at 154° C., the benzoate at 262° C., and the phenylcarbamate at 226° C.—J. F. B.

ENGLISH PATENTS.

Amino-Alcohols and their Derivatives [*for Perfumery*]; *Preparation of ——.* E. F. A. Fourneau, Paris. Eng. Pat. 24,631, Nov. 12, 1903.

SEE Fr. Pat. 338,889 of 1903: this J., 1904, 910.—T. F. B.

Pyrocatechnicmonoalkylethers and especially of Guaiacol and Guaethol with Protein Substances; Process for the Production of Compounds of ——. H. C. Fehrlin, Schaffhausen, Switzerland. Eng. Pat. 449, Jan. 7, 1904.

COMPOUNDS of "pyrocatechuic monoalkyl ethers" with protein substances (*e.g.*, albumin) are prepared either by mixing together aqueous solutions of the substances, with or without heating, until the mixture coagulates, or by adding an aqueous solution of the proteid to an alkaline solution of the "pyrocatechuic ether" and precipitating the solution with dilute acid. The product is filtered, washed, dried, heated to 115°—120° C., washed with some indifferent solvent (*e.g.*, toluene), and finally dried. For example, 650 grms. of guaiacol or guaethol, dissolved in alcohol, are added, with constant stirring, to a solution of 1 kilo. of egg albumin in 10 litres of water; or a mixture of 1 kilo. of casein, 150 grms. of guaiacol, and 2 kilos. of alcohol is heated for several hours on the water-bath. The compounds thus produced, are insoluble in water, alcohol, and acids, but are decomposed by alkalis; they are also completely insoluble in the gastric juice, and are said to possess therapeutic value.—T. F. B.

UNITED STATES PATENTS.

Ionone; Process of making Homologues of ——. R. Schmidt, Assignor to Haarmann and Reimer, Chem. Fab zu Holzminden G. m. b. H., Germany. U.S. Pat. 775,251, Nov. 15, 1904.

Cyclic homologues of ionone are prepared by treating aliphatic homo-ionones with dilute acid, and treating the "α-cyclic" homo-ionones thus formed with a concentrated acid at a temperature not above 40° C.; the cyclic homo-ionones may also be prepared by treating the aliphatic ketones directly with concentrated acid below 40° C. Different isomers of the ionone derivative are obtained according to the nature of the concentrated acid employed. See also Ger. Pats. 116,637, 122,466, and 134,672, and U.S. Pat. 762,765; this J., 1901, 151 and 1018; 1902, 1348; and 1904, 798.—T. F. B.

Citrus Fruits; Process of Extracting Oleo-Resin from the Peel of ——. E. J. Sheenan, Assignor to San Gabriel Valley Essential Oil Co., Pasadena, Cal. U.S. Pat. 775,502, Nov. 22, 1901.

The peel of citrus fruits is coarsely ground, wrapped in filter cloth, and the water removed by pressing between plates. The mass is finely pulverised, extracted with a suitable volatile solvent (ether, chloroform, or carbon bisulphide), the extract evaporated, and the oleo-resin dried in a current of hot air.—T. F. B.

Citrus Fruits; Oleo-resinous Product from ——. E. J. Sheenan, Utica, N.Y., Assignor to San Gabriel Valley Essential Oil Co., Pasadena, Cal. U.S. Pat. 775,546, Nov. 22, 1904.

Claim is made for the oleo-resinous product extracted from the peel of citrus fruits by the method described in U.S. Pat. 775,502 (see preceding abstract). This consists, in addition to the essential oil of the fruit, of a series of flavouring resins composed of acid and neutral resins in about equal proportions and together constituting from 6—10 per cent. of the total product. Its specific gravity is slightly higher and its optical rotation slightly lower than those of the commercial essential oils. The neutral resins are not volatile in steam, but are deposited from hot alcohol in the form of crystals of m. pt. 120°—130° C. The acid resins are insoluble in alcohol, but soluble in alcoholic sodium hydroxide solution. These resins are all completely soluble in ether, chloroform, or carbon bisulphide.—T. F. B.

Dialkylbarbituric Acid; Process for Preparing ——. M. Engelmann, Elberfeld, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,809, Nov. 22, 1904.

The process is similar to that described in Eng. Pat. 22,967 of 1903 (this J., 1904, 76) with the exception that the thiocarbonyl group of the dialkyl-di-imino-thiopyrimidine is first oxidised to a carbonyl group, the two imino groups being subsequently eliminated.—T. F. B.

Dialkylbarbituric Acid: Process of Preparing ——. M. Engelmann, Elberfeld, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,810, Nov. 22, 1904.

See Eng. Pat. 22,967 of 1903; this J., 1904, 76.—T. F. B.

Phenol Compound. C. Gentsch, Vohwinkel, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 775,814, Nov. 22, 1904.

The addition compounds, formed by uniting 1 mol. of an alkali salt of a phenol with several molecules of a free phenol, are claimed. Special claim is made for that derived from 1 mol. of the potassium salt of *m*-cresol and 3 mols. of *m*-cresol, which is a crystalline solid having an alkaline reaction; it melts at 88° C., above which temperature *m*-cresol is split off.—T. F. B.

Alcohols and Aldehydes; Process of Making ——. H. S. Blackmore, Assignor to R. C. Mitchell, Mount Vernon, N.Y. U.S. Pat. 774,824, Nov. 15, 1904.

A mixture of an alcohol and aldehyde is produced by passing the corresponding hydrocarbon over a mass of a suitable metallic oxide (*e.g.*, ferric oxide) heated to a temperature sufficient to oxidise the hydrocarbon, but insufficient to decompose the desired products. Thus, a mixture of methyl alcohol and formaldehyde is obtained by passing a current of methane under pressure over heated ferric oxide. When the process is complete, the reduced iron is reoxidised by heating it and passing a current of air over it.
—T. F. B.

FRENCH PATENTS.

Aldehydes; General Process of Preparing ——. L. Bouveault. Fr. Pat. 339,121, Oct. 26, 1903.

Aldehydes are produced by decomposing with water the product of the reaction of di-substituted aminoformaldehydes on alkyl-, aryl-, or hydroaryl magnesium halides. The stages of the process are represented by the equations—

$$R.Mg.X. + H.CO.NR'R'' = R.CH(O.Mg.X)NR'R.''$$

$$2.R.CH(OMg.X)NR'R'' + H_2O =$$
$$2R.CHO + MgO + MgX_2 + 2NHR'R''$$

where R, R', and R'' represent alkyl-, aryl-, or hydroaryl radicles and X a halogen atom.—T. F. B.

Alkylaminoacetopyrocatechols; Process for Preparing ——. Farbwerke vorm. Meister, Lucius und Brüning. First addition, dated July 18, 1904, to Fr. Pat. 344,930, July 18, 1904. Under Internat. Conv., Sept. 26, 1903.

See Eng. Pat. 26,430 of 1903; this J., 1904, 1043.—T. F. B.

Dialkylbarbituric Acids from Dialkylaminomalonic Esters

$$\begin{matrix}X\\Y\end{matrix}>C<\begin{matrix}CONH_2\\COOR\end{matrix};$$

Process for Producing ——. Maison E. Merck. Fr. Pat. 344,980, July 20, 1901. Under Internat. Conv., March 16, 1904.

Dialkylbarbituric acids, as well as dialkylbarbituric esters and dialkylmalonic acid amides, are produced by the action of urea, thiourea or guanidine on dialkylaminomalonic esters, of the formula $(X)(Y)C(CONH_2)COOR$, in presence of suitable condensing agents. Diethylbarbituric acid is produced by heating diethylaminomalonic acid with urea and sodium ethylate. Diethylmalonylguanidine is produced similarly from guanidine hydrochloride and diethylaminomalonic ester.—T. F. B.

C.C.-Dialkylbarbituric Acids; Process for the Production of ——. E. Merck. Fr. Pat. 345,196, July 20, 1904. Under Internat. Conv., Oct. 20, 1903.

Dialkylmalonylguanidines, $R_2C:(CO.NH)_2:C:NH$, are converted into dialkylbarbituric acids by heating (*e.g.* in a sealed tube at 120° C., for an hour), with reagents which will split off the imino group, such as dilute hydrochloric or sulphuric acid (1 : 3). Compare Fr. Pat. 343,673 of 1904; this J., 1904, 1043.—T. F. B.

Barbituric Acids; Process for Converting Di-imino or Tri-iminobarbituric Acids (Di-iminomalonylguanidines) into ——. E. Merck. Fr. Pat. 345,497, July 20, 1904. Under Internat. Conv., Feb. 10, 1904.

Di-imino and tri-iminobarbituric acids, obtained by condensing malonyl-nitrile or its alkyl derivatives with urea or guanidine, are converted into barbituric acids by heating with mineral acids. (Compare preceding abstract.)
—T. F. B.

Bromodialkylacetamides : Process for Preparing ——. Kalle et Cie. Fr. Pat. 345,231, July 29, 1904. Under Internat. Conv., Dec. 9, 1903.

Bromodialkylacetamides of the constitution R.R′.CBr.CONH$_2$, are obtained from the corresponding dialkylacetic acid by converting the latter, by the action of phosphorus chloride or phosphorus and bromine into dialkylacetyl chloride or bromide, brominating with one mol. of bromine, and converting the resulting bromodialkylacetyl chloride or bromide into bromodialkyl acetamide by treating with ammonia or ammonium carbonate in ethereal solution. The diethyl, ethylpropyl, and dipropyl compounds are described.—T. F. B.

Picric Acid ; Process for Preparing —— in the Cold. O. Wichardt. Fr. Pat. 345,441, Aug. 9, 1904.

Picric acid may be prepared without the aid of heat, by adding 20 parts of phenol, with constant stirring, to a mixture of 100 parts of nitric acid (sp. gr., 1·4) and 30 parts of alcohol. The crystalline mass thus produced is dissolved in hot water, and the crude picric acid, which separates on cooling, is purified in the usual way. The yields are stated to average 95 per cent of the phenol used.
—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Development with an Acid Developer. Maes. Brit. J. Phot., 1904. **51,** 1031—1032.

Balagny (Fr. Pat. 338,650 of 1903 ; this J., 1904, 680) has shown that amidol can be used successfully in acid solution for developing plates and papers : the author finds that other developers, notably pyrogallol, ortol, and adurol, give equally good results in acid solutions. The time necessary for development is greater than when alkaline solutions are employed, but there is less tendency to fog and halation, and better gradation is obtainable.—T. F. B.

Photographs prepared by Lippmann's Process ; The Dark Stripes [Zenker's Stripes] which appear on Spectra Covering ——. L. Pfaundler. Ann. der Physik, 1904 [3], **15,** 371—384. Chem. Centr., 1904, **2,** 1146. (See this J., 1891, 483 ; 1893, 464 ; 1895, 65 ; 1896, 400 ; 1900, 273.)

The chief result of the author's work, which is mainly mathematical, is that if two light waves of unequal wavelengths penetrate the silver bromide film, the two systems of silver separations are optically influenced. The appearance of the dark stripes predicted by Zenker shows that in the Lippmann process, quite a number of colour-pairs do not unite to a correct colour-mixture, but are neutralised to black.—A. S.

French Patents.

Colouring Silver [Photographic] Pictures ; Process for ——. O. Gros. Fr Pat. 345,033, May 31, 1904. Under Internat. Conv., April 9, 1904.

"Silver prints" are first converted into "manganic prints," (see Fr. Pat. 343,583 of 1904 ; this J., 1904, 1044) and then coloured by means of suitable dyestuffs or solutions. For example, a silver bromide print is decolorised in the following solution : 10 per cent. potassium bromide solution, 3 c.c. ; 10 per cent. citric acid solution, 2 c.c. ; and 3 c.c. of a solution obtained by mixing 6 grms. of sodium tartrate, 1 grm. of crystallised manganous sulphate, 5 grms. of N/1 sodium carbonate solution, and 5 grms. of a 4 per cent. potassium permanganate solution. To this solution is added 100 c.c. of a 0·4 per cent. solution of potassium ferricyanide. The decolorised print is washed and introduced into a solution composed of 90 c.c. of 2 per cent. potassium ferricyanide solution, and 10 c.c. of sodium carbonate solution. The brown "manganic" print thus obtained can be coloured by any known process, *e.g.*, by means of aniline hydrochloride. By this process it is stated that a much greater variety of tones may be obtained than by working directly on the ordinary silver print.
—T. F. B.

Photographic Paper ; Sensitive Coating for ——, and Process for Manufacturing same. G. Hauser. Fr. Pat. 345,206, July 25, 1904.

Certain insoluble zinc salts, particularly the oxide, possess the property of accelerating considerably the reduction of soluble silver salts by daylight. The emulsion may be prepared by immersing the paper or other support, previously coated with gelatin with which zinc oxide has been incorporated, in a solution of silver nitrate or citrate. Prints of a pleasing black tone are said to be obtained on such a paper. They require no further toning, and are finished by simply fixing in sodium thiosulphate solution, which in no way alters the tone. Under-exposed prints may be developed in the usual way, thus permitting the working of these papers by artificial light.—T. F. B.

Photographic Films ; Self-Detaching ——. M. Bry et Cie. Fr. Pat. 345,535, Aug. 12, 1904.

The self-detaching films at present in use, consisting of a gelatin film attached to a paper support by means of wax, rubber, glucose, &c., possess the disadvantage of frequently becoming detached during the manipulations, and also of being easily distorted and of curling up, even when dry. These defects are found to be remedied by backing a gelatin film (0·8—1·0 mm. thick) with a film of collodion, applying the sensitive emulsion to the gelatin, and fastening the temporary paper support to the collodion side by means of an albuminoid adhesive, soluble in water. Such a film is stated to retain its shape during the operations, and to be easily detached when finished.—T. F. B.

Pigment [Photographic] Pictures on Transparent Supports : Process for Producing Detachable ——. H. Schmidt. Fr. Pat. 345,594, Aug. 13, 1904.

See Eng. Pat. 17,610 of 1904 ; this J., 1904, 998.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

English Patents.

Explosives [Perchlorate]. F. E. W. Bowen, London. Eng. Pat. 21,481, Oct. 6, 1903.

The composition of these explosives is as follows :—Shell powder : ammonium perchlorate (75 per cent.), aluminium (12 per cent.), and paraffin (13 per cent.). Blasting powder : ammonium perchlorate (72 per cent.), aluminium (11 per cent.), and nitronaphthalene (17 per cent.).
—G. W. McD.

Explosives. F. E. W. Bowen, London. Eng. Pat. 21,482, Oct. 6, 1903.

Nitrocellulose (66—75 parts) is dissolved in acetone or ether alcohol and finely powdered ammonium perchlorate (25—33 parts) incorporated with it. The mixture can then be rolled or pressed as usual.—G. W. McD.

Explosives for Blasting or like Purposes. J. Russell, Hamilton, Scotland. Eng. Pat. 28,710, Dec. 31, 1903.

Mono-, di-, or trinitrotoluene (2—10 cent.) is added to nitroglycerin blasting explosives to prevent them from freezing at low temperatures.—G. W. McD.

Explosives; Impts. in ——. N. Evangelidi, Charcow. Russia. Eng. Pat. 20.106, Sept. 17, 1904.

The explosive consists of potassium chlorate (78 parts), yellow prussiate of potash (37·5 parts), wood charcoal (6 parts), and glycerin (6·5 parts). The addition of glycerin is said to give safety and to allow of the intimate mixing of the ingredients. For a granulated powder one-half of the charcoal is replaced by tannin.—G. W. McD.

Gunpowder; Manufacture of ——. Soc. de la Poudre Peigne et des Brevets. J. Luciani, Geneva, Switzerland. Eng. Pat. 21,204, Oct. 3, 1904. Under Internat. Conv., Feb. 17, 1904.

The charge of powder for ordnance or small fire-arms consists of a sheet of explosive of suitable thickness coiled on itself and provided, either over the whole of its surface, or only a part, with cuts or notches of straight, waved or other shape, which extend wholly or partly through the thickness of the sheet. The object of the invention is to produce a sheet containing a certain number of points at which combustion may commence and from which it may spread in a regular and uniform manner.—G. W. McD.

United States Patent.

Pyrotechnical Compound. K. Hufnagel, Germany, Assignor to E. H. Wagner, New York. U.S. Pat. 775,822, Nov. 22, 1904.

The compound consists of a mixture of white and red phosphorus, potassium chlorate, red clay, and gum arabic. —A. S.

French Patent.

Picric Acid: Process for Preparing —— in the Cold. O. Wickardt. Fr. Pat. 345,411, Aug. 9, 1904. XX., page 1238.

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

Continuous Extraction of Solutions with Chloroform; Apparatus for ——. E. Baum. Chem.-Zeit., 1904. **28**, 1172.

The apparatus is easily understood from the drawing. Some chloroform is first placed in the inner vessel, followed by the solution to be extracted. Connection is then made to the vessel below containing the chloroform, and to the reflux condenser above, the end of which is so arranged, as seen in the figure, that the drops of condensed chloroform fall through the solution to be extracted.—J. T. D.

French Patents.

Gases; Apparatus [Automatic] for Analysis of ——. A. Bayer. Fr. Pat. 345,221, July 29, 1904.

The apparatus is designed for determining and registering graphically the composition of a gaseous mixture, *e.g.*, boiler-furnace gases. It comprises two or more gas meters, communicating with one another, but having interposed between them vessels containing liquid or solid absorbents and tubular cooling devices. The rate of flow of the gas is thus measured before and after the removal of the component to be determined, the gas being brought to the same temperature in each case before passing through the meter. The dials of the meters are connected to a differential registering mechanism, by means of which the rates of flow are traced with a stylus upon a diagram carried by a drum. The gas to be analysed is drawn through the apparatus by means of a water-pump.—H. B.

Wines, Musts, Ciders, &c.; Apparatus for Determining the Dry Extract and the Alcohol in ——. A. B. Darbois. Fr. Pat. 345,455, July 28, 1904.

The apparatus consists of an ebullition alcoholometer and a densimeter with immersion tube in a portable case. The ebullition apparatus is heated by a spirit lamp, the flame of which impinges on a metal bulb through which the wine is caused to circulate, whereby rapid heating is ensured. The upper part of the ebullition cylinder is connected with a condenser. The densimeter floats in a cylinder which fits on the same stand as the alcoholometer: it is provided with an index fixed on the top of the cylinder which can be read at a point above the liquid. The stem of the float is graduated in two scales, one showing the dry extract and the other the amount of alcohol obtainable from any fermentable must.—J. F. B.

INORGANIC—QUANTITATIVE.

Iron; Separation of —— from Nickel and Cobalt by Formic Acid. L. H. Borgström. Bull. Comm. Geol. de Finlande, 1903, **14**, 73; Chem.-Zeit., 1904, **28**, Rep. 353.

The difficulties in the way of the ordinary methods of separation are obviated by using ammonium formate as the precipitant of the iron, the latter alone being thrown down from a neutral solution. A second precipitation suffices to entirely free the iron from nickel and cobalt. The precipitates are easily filtered, but the decomposition, filtration, and washing must be effected in the warm.—C. S.

Copper; Electrolytic Determination of ——. A. Kufferath. Z. angew. Chem., 1904, **17**, 1785—1786.

For technical purposes, where the highest degree of accuracy is not required, copper can be determined electrolytically with great rapidity if formaldehyde (in the shape of commercial formalin) be added to the solution. The deposition of nickel, cobalt, and iron is hindered or entirely prevented by the presence of formaldehyde. The solution for electrolysis, about 130 c.c., is placed in a platinum basin of about 9 cm. diameter and 4.5 cm. depth, the inner surface of which has been slightly matted by careful rubbing with finely-powdered glass. To the solution are added 1·5—2·0 c.c. of formalin, the temperature raised to and kept at 60°—65° C., and a current of 2·5—3·0 ampères at 2 volts passed till a sample shows no copper reaction. Without interrupting the current, the deposit is washed clean with water, then twice with 95 per cent. alcohol and lastly with ether; it is then dried *in vacuo* over sulphuric acid. The whole analysis takes 2—2½ hours. The anode is a flat platinum spiral kept as deep as possible in the solution, and passes through an inverted funnel which just touches the liquid: all loss of spray is thus avoided. Results with pure copper sulphate solution were accurate; with mixtures in approximately equal proportions of copper and nickel, copper and cobalt, copper and iron sulphates, 99·71 to 99·92 per cent. of the actual copper was yielded. Ammonium nitrate, chlorides, or free nitric acid, prevent concordant results from being obtained; very small amounts of the last-named, however, may be present without interfering seriously with the process.—J. T. D.

Stannic Oxide in Copper Tin Alloys; Electrolytic Separation and Determination of ——. E. Heyn and O. Bauer. Mitt. königl. Materialprüfungsamt, 1904, **22**, 144—145. (See page 1219.)

The alloy in the form of turnings is placed on the bottom of a platinum dish and serves as anode, the cathode is of platinum gauze, and the electrolyte sulphuric acid of sp. gr. 1·18. A current strength of 0·5—0·7 ampère is employed. The metallic constituents of the alloy dissolve rapidly, whilst stannic oxide separates at the anode. The copper deposited on the cathode must be frequently removed, to prevent it falling to the bottom and to avoid short-circuiting. Towards the end of the electrolysis the solution of the alloy proceeds very slowly, the separated stannic oxide preventing good electrical contact with the anode. The dish should now be continuously shaken, in order to expose fresh surfaces of the alloy. The residual stannic oxide is washed with sulphuric acid, treated for a short time with nitric acid, dried, and ignited. It contains a trace of copper, a sample analysed giving the following results:—Stannic oxide, 99·16; copper, 0·99 per cent. —A. S.

Phosphates; Colorimetric Determination of ——. O. Schreiner and B. E. Brown. J. Amer. Chem. Soc., 1904, **26**, 1463—1468. (See also this J., 1904, 911.)

BESIDES the solutions (1), (2), (3), and (4), given in the paper of Schreiner and Ferris on the determination of magnesium, the following are required: (6) 1 part of strong ammonia solution (sp. gr. 0·9) free from silica, and 9 parts of water; silica may be removed by distillation; (7) saturated ammonium oxalate solution; (8) magnesia reagent, prepared by dissolving 13 grms. of magnesium chloride, $MgCl_2, 6H_2O$, and 20 grms. of ammonium chloride in about 900 c.c. of water, adding 50 c.c. of strong ammonia solution (sp. gr. 0·9) and diluting to a litre; 1 c.c. of this solution will precipitate 0·0035 grm. of phosphoric anhydride. To a convenient quantity of the liquid, usually 50 c.c., 1 drop of ammonia solution and two or three drops of saturated ammonium oxalate solution are added and the liquid evaporated to dryness on a water-bath. 1 c.c. of the magnesia reagent (7) is well mixed with the cooled residue, and the whole allowed to stand about two hours. The precipitated magnesium ammonium phosphate is then washed on a filter free from silica several times with the ammonia solution (6) until the filtrate measures approximately 50 c.c. The precipitate is then washed with about 5 c.c. of cold water, dissolved on the filter in about 5 c.c. of nitric acid (2) and the filter is washed with hot water until about 45 c.c. of filtrate are obtained. 4 c.c. of ammonium molybdate solution (1) are added to the cooled liquid and, after 20 minutes, the solution is compared with the standard colorimetric phosphate solution (4). This method gives good results with quantities of phosphates as small as 1 part of phosphoric anhydride per million of solution, and it is not influenced by the presence of other salts, including silicates. —T. H. P.

ORGANIC—QUALITATIVE.

Sugars; Reaction of Aldehydic ——. A. Berg. Bull. Soc. Chim., 1904, **31**, 1216—1217.

THIS method is based on the fact that the aldoses are oxidised by bromine in presence of water, the aldehydic group being converted into a carboxylic group. These alcohol acids all give a deep yellow coloration with an acidified solution of ferric chloride. Under similar conditions, ketoses are not converted into carboxylic acids, and the resulting solutions give no coloration with ferric chloride. 0·02—0·03 grm. of the sugar is heated with 10 c.c. of saturated bromine water to 60°—70° C. for 10 minutes, and the excess of bromine removed by boiling. On adding to this solution 10 c.c. of a solution made by the addition of 4 drops of ferric chloride solution (sp. gr. 1·44) and 2 drops of concentrated hydrochloric acid to 100 c.c. of water, the yellow coloration is produced if an aldehydic sugar has been used. This method gives a simple means for establishing the purity of the ketoses. In testing the poly-oses, it is necessary to use freshly prepared bromine water, since hydrobromic acid would tend to cause inversion of the sugar.—T. F. B.

Starch-containing Materials; Method of Distinguishing between Different —— *by Means of Iodine Vapour.* A. Dubosc. Chem.-Zeit., 1904, **28**, 1149.

THIS method, first described by Bleicher, consists in placing the substance on a glass plate, on which is also placed a watch glass containing a little iodine, and covering the whole with a bell-jar. After 24 hours, marked differences can be observed in the colorations of different substances. Thus, maize starch turns blackish-violet, wheat starch bluish-grey, sago starch brownish-grey, and potato-starch yellowish-grey, the yellow shade increasing with the proportion of foreign matters present.—C. A. M.

Essential Oil of Bitter Almonds; Manipulation of the Test for Chlorine in ——. Schimmel's Report, Oct. 1904, 7—8.

A PIECE of filter paper about 2 × 2½ ins. is folded into a spill, saturated with the oil, placed in a small porcelain dish, ignited, and covered over while burning with a capacious beaker, the inside of which has been previously moistened with distilled water. This beaker is allowed to remain for a minute after the flame has burnt out; it is then rinsed with 10 c.c. of distilled water, and the rinsings tested for chlorine in the usual manner, with silver nitrate. Precaution should be taken to ensure that any reaction obtained is not due to hydrocyanic acid.—J. O. B.

ORGANIC—QUANTITATIVE.

Nitrogen in Organic Compounds; Determination of ——. H. C. Sherman and M. J. Falk. J. Amer. Chem. Soc., 1904, **26**, 1469—1474.

DYER'S modification (this J., 1895, 604) of the Gunning-Kjeldahl method of nitrogen determination, in which the substance is heated with sulphuric acid and mercury until frothing subsides, after which 10 grms. of potassium sulphate are added, and the solution boiled until colourless, combines all the advantages of the other modifications of this method. It is, however, not sufficient in all cases to boil the liquid until it becomes colourless. With very resistant substances, such as alkaloids, coal, &c., the boiling with sulphuric acid, mercury, and potassium sulphate should be continued for at least two hours after the solution becomes colourless, and for not less than three hours in all. No advantage is found in the use of copper in addition to the reagents mentioned, but with the coals tested, slightly higher results were obtained by the careful use of permanganate at the end of three hours' boiling. With all samples in which the nitrogen exists essentially as proteids or albuminoids and related compounds, including the so-called "nitrogenous extractives," and other amides and amino-compounds, it is only necessary to use mercury and potassium sulphate and to boil for at least one hour from the time the potassium sulphate is added.—T. H. P.

Ammonia and Amines; Determination of ——. J. Effront. Ber., 1904, **37**, 4290—4295.

WHILE the measurement of the nitrogen evolved by the reaction of hypochlorites upon ammonia and amino-compounds does not afford a generally applicable and accurate method for the determination of these substances, much better results are obtained by measurement of the available chlorine destroyed in the reaction. Amino-, imino-, and nitrile bases, amides and amino-acids can be thus determined, but ammonium-bases are without action on hypochlorites. To carry out the process, 20 c.c. of a solution of bleaching-powder (1·5—2 per cent. of available chlorine) are placed in a 50 c.c. flask, 20 c.c. of *N*/sodium carbonate solution are added, and 1—5 c.c. of a 1 per cent. solution of the substance under examination; the flask is filled up with distilled water, corked, and allowed to stand in the dark for 12—15 hours. The liquid is then rinsed into a beaker, arsenious oxide solution exactly equivalent to the original bleaching powder solution used, is added, then 20 c.c. of N-sulphuric acid, followed by 10 c.c. of saturated solution of sodium bicarbonate; the excess of arsenious oxide is now titrated by means of iodine solution. The method is available for the determination of ammonia in waters. (See this J., 1904, 912.)—J. T. D.

Naphthalene in Coal Gas and Tar; Determination of ——. A. H. White and S. Ball. J. Gas Lighting, 1904, **88**, 262—263, 323—326.

THE authors determined the amount of naphthalene in the gas as it leaves the retort, and followed step by step the progress of its elimination in the subsequent manufacturing plant. For the determination of naphthalene in the purified gas, Küster's method (Ber., 1894, **27**, 1101), as modified by Colman and Smith (this J., 1900, 128), was found to give good results. To determine naphthalene in tar, the following method was finally adopted:—About 1 grm. of tar is weighed into an Erlenmeyer flask of 50 c.c. capacity, closed by a doubly bored stopper containing two tubes, one of which forms an air inlet, whilst the other is attached to a U-tube, the first two thirds of which is filled with fragments of quicklime, and the remainder with glass-wool and phosphorus pentoxide. The flask and drying-tube are placed in an air-bath heated to 70°—80° C., the outlet of the latter being coupled by a short connection to a second U-tube outside the air-bath and immersed in ice-cold water. A current of air is drawn through the apparatus at the rate of 2 litres per hour, the naphthalene being volatilised and retained in the cold U-tube. The operation is continued until the latter no longer gains in weight, and the final increase of weight is taken as the quantity of the naphthalene in the tar; although the naphthalene formed is not quite pure, the results are sufficiently accurate for the purpose in view. To determine the amount of naphthalene in the crude gas, in which it is present partly in solution in the suspended tar, and partly in the form of vapour, a half-inch glass tube packed with glass wool is inserted some six inches into the gas main at the point where the test is to be made, the filtering material being thus kept at the same temperature as the gas. One cubic foot is aspirated through the filter, and thence, through as short a connection as possible, into a bottle containing picric acid solution, which retains the naphthalene present as vapour. The naphthalene in the tar filter is estimated in the manner above described, and the picric acid solution is washed into a 50 c.c. Erlenmeyer flask, solid caustic soda added to neutralise the acid, and the naphthalene volatilised and determined as before. The combined result gives a sufficiently accurate representation of the total quantity of naphthalene, both in the suspended tar and as vapour in the crude gas, but does not permit of the estimation of the proportions present in each state, inasmuch as the tar filter, although maintained at the same temperature as the gas, largely absorbs the naphthalene vapour before it reaches the picric acid. It has frequently been stated that the vapour pressure of naphthalene is affected by the presence of moisture, ammonia, and acetylene in the gas, but the authors find, on experimental investigation of this point, that these gases exert no such influence. Experiments made with benzene vapour seemed to indicate that this hydrocarbon increased the vapour pressure of naphthalene, but the authors do not regard the results as conclusive.

—H. G. C.

Beetroots; Direct Determination of Sugar in ——. Non-influence of Air on the Results. H. and L. Pellet. Bull. Assoc. Chim. Sucr. et Dist., 1904, **22**, 312—317.

In reply to Loga, who found that in the hot aqueous digestion method of Pellet it was necessary for accuracy to remove the air by subjecting the liquids examined to a vacuum for 30 to 40 minutes, the author attributes his failures to improperly formed pulp. The coarse pulp obtained with rasps having saw teeth give very little emulsion, and the froth is readily removed with a little ether or alcohol. The Keil disc should not revolve at a greater rate than 250 turns per minute, and the normal weight of pulp should be made to 200 c.c. and read in a 400 mm. tube. There is then no difficulty in removing the air.—L. J. de W.

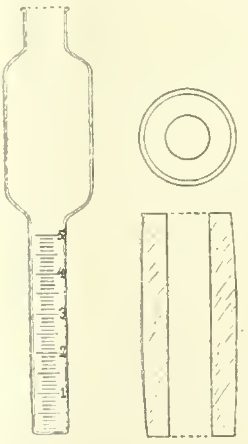
Beetroot Juice; Determination of the Purity of ——. H. Schulz. Z. Ver. Deutsch. Zucker Ind., 1904, **54** [Techn. Part], 1248—1250.

Recent researches have shown that the usual method of determining the quotient of purity of raw beetroot juice is very unsatisfactory. In the first place it is desirable to be able to prepare readily in the laboratory a juice which shall represent in composition the factory juice in its various conditions, for it is of far greater importance to know the purity of such juice than that of raw juice which, as is well known, is purified in very different degrees during separation, owing to the varying precipitability of its non-sugars.

The author treated the normal weight of fine rasped pulp in a 200 c.c. flask, half filled with water, with 2 or 3 c.c. of a 1:10 milk of lime, and heated on the water bath to 85°—90° C. In two minutes the separation was complete. Precipitation of the excess of lime by the ordinary reagents was found to be unsatisfactory. "Active" magnesium carbonate (magnesium bicarbonate) precipitates the lime quantitatively, but the reagent quickly loses its power, when a mixture of magnesium hydroxide and carbonate remains in solution. The active reagent is prepared by completely saturating magnesium hydroxide held in suspension in water with carbon dioxide. The filtrate is cooled at the temperature of melting ice and the magnesium salt crystallised out. It may also be prepared by gradual evaporation at 20° C., but the yield is less and the product not so active.—L. J. de W.

Maple-Syrup and Maple Sugar; Composition, Analysis, and Adulteration of ——. J. Hortvet. J. Amer. Chem. Soc., 1904, **26**, 1523—1545.

The author describes the methods he has employed in the analysis of a number of samples of maple-syrup and maple-sugar, both pure and adulterated. One of the determinations which gives a clue to the purity or otherwise of the product is that of the volume of the precipitate formed with lead sub-acetate; the method of measuring this is as follows: Into the tube shown in the figure, which has a total length of 15·2 cm., a diameter at the wide part of 3·0 cm., and at the stem of 2·0 cm., are placed 5 c.c. of the syrup or 5 grms. of the sugar and 10 c.c. of water. After complete solution, 0·5 c.c. (10 drops) of alumina-cream and 1·5 c.c. of lead sub-acetate solution are added, and the tube well shaken. The tube is then allowed to stand for from 45 to 60 minutes, with occasional twisting to facilitate the settling of the precipitate. It is then fitted into the holder, which is 7·7 cm. long, 3·2—3·5 cm. in diameter, and has a central aperture 1·3 cm. in diameter, and placed in a centrifugal machine and run for six minutes; any material adherent to the wider portion is then loosened with a piece of wire and the centrifugalising continued for a further period of six minutes at the same speed as before. The volume occupied by the precipitate is then noted, reading to 0·01 c.c. as nearly as possible. A similar blank experiment is made with water, alumina-cream, and lead sub-acetate, the volume of the precipitate obtained being subtracted from those given by the sugars.



The analytical results obtained with sugars and syrups of known purity are summarised in the following table:—

	Syrups.			Sugars.		
	Maximum.	Minimum.	Mean.	Maximum.	Minimum.	Mean.
Volume of lead sub-acetate precipitate in c.c.	2·89	1·38	1·87	3·37	1·31	1·99
Ash, per cent.	1·53	0·76	1·02	1·45	0·72	0·99
Phenolphthalein alkalinity	0·62	0·30	0·40	0·57	0·25	0·41
Total alkalinity	2·18	1·09	1·69	2·39	1·12	1·69

These numbers all refer to the amount of dry matter present in the samples.—T. H. P.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Helium: Presence of —— in Radio-Active Gaseous Mixtures evolved from Thermal Springs. C. Moureu. Comptes rend., 1904, **139**, 852—855.

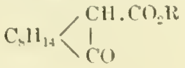
In view of the production of helium from the radium emanation, discovered by Ramsay and Soddy, and since observed by other investigators, it seemed desirable to ascertain whether this element accompanied the radioactive constituents of the gases from mineral springs. Curie and Laborde have already recognised it in three instances, and the author has found the helium line in the spectrum of the gases from 12 other springs which he has examined. In nearly all of them the helium line ($\lambda = 587 \cdot 6$) was at least as brilliant as the strongest argon lines in the same spectrum. The amounts of helium present vary greatly, that in the strongest springs being estimated at 50 times that in the weakest.—J. T. D.

Colloidal State: The ——. G. E. Malfitano. Comptes rend., 1904, **139**, 920—922.

The author considers that matter in the colloidal state consists of an electrolyte dissociated into ions, with insoluble molecules grouped around these ions.—J. T. D.

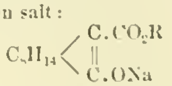
Salt Formation in Solutions, especially of Tautomerisable Compounds (Pseudo Acids, Pseudo Bases). J. W. Brühl and H. Schröder. Z. physik. Chem., 1904, **50**, 1—42.

The authors have determined by physico chemical methods the chemical constitution of esters and ester-salts of the type of aceto-acetic ester and sodium aceto-acetic ester. The experiments were carried out with the methyl, ethyl-, and amyl esters of camphocarboxylic acid, these compounds being converted into their sodium salts by treatment with the corresponding sodium alcoholates. Three spectro-chemical methods were employed, each giving results controlling and confirming those obtained by the other two. Details are given showing how it can be ascertained by determinations of the refraction and dispersion of the different components and of the mixtures (or solutions of the ester salts):—(1) Whether, in the process of salt formation, the optical properties of the acid radical alter, and, consequently, whether a chemical transformation (enolisation, ketonisation) takes place; (2) whether the optical properties of the basic radical (metal or ammonium) alter; or (3) whether the difference between the optical functions of the salt and of the acid (or base) is a constant, as in the case when the salt formation takes place without chemical transformation, or is smaller or greater than this constant. These methods are applicable to all compounds capable of undergoing tautomerisation (pseudo acids, pseudo bases, and amphoteric compounds). In the case of camphocarboxylic acid esters (which behave as weak acids), it was found that in methyl, ethyl, and amyl alcoholic solutions the formation of ester salts is always associated with a transformation of the ketonic ester:



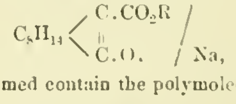
$$C_8H_{14}\left\langle\begin{array}{l}CH.CO_2R\\ |\\ CO\end{array}\right.$$

into the enolic oxygen salt:



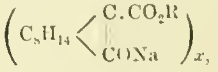
$$C_8H_{14}\left\langle\begin{array}{l}C.CO_2R\\ \|\\ C.ONa\end{array}\right.$$

In dilute methyl- and ethyl-alcoholic solutions of the ester salts, the optical function (atomic refraction) of the sodium is practically the same, but is quite different from (about 20 per cent. smaller) than that of the metal in amyl alcoholic solutions of equal dilution. The optical function of the sodium is greater in concentrated than in dilute solutions, and is then the same for all three solvents. These differences are due to the facts that in dilute methyl- and ethyl-alcoholic solutions, the ester salts are ionised, whereas in concentrated methyl- and ethyl alcohols, and in amyl alcoholic solutions, they are not. Determinations of the osmotic pressure and electric conductivity of the solutions confirmed this view. It was found, in fact, that the sodium salt of camphocarboxylic acid methyl ester is almost completely ionised in dilute methyl alcoholic solution. Solutions of sodium alcoholates in the corresponding alcohols also exhibited a similar behaviour, and it is concluded that the degree of ionisation corresponds to the optical function of the sodium. The optical function can thus be used as an exact expression and measure of the condition of ionisation. Determinations of the optical function of sodium in dilute (ionised) and in concentrated (non-ionised) aqueous solutions of sodium hydroxide showed that this is about 12—15 per cent. smaller in the case of the sodium ion than in that of the non-ionised metal. It would, therefore, be possible to determine spectrochemically the degree of ionisation of a dissolved compound. The difference in behaviour of solutions of sodium salts of camphocarboxylic acid esters in methyl- or ethyl-alcohol on the one hand, and in benzene or ether on the other hand, is due to the fact that the first-named solutions contain the monomolecular and ionised salt—



$$C_8H_{14}\left\langle\begin{array}{l}C.CO_2R\\ \|\\ C.O.\end{array}\right. \Big/ \; / \; Na,$$

whilst the last-named contain the polymolecular salt—



$$\left(C_8H_{14}\left\langle\begin{array}{l}C.CO_2R\\ \|\\ CONa\end{array}\right.\right)_x,$$

x being equal to from 3 to 4.—A. S.

Osmosis, Solubility, and Narcosis: Theories of ——. I. Traube. Phil. Mag., 1904, **8**, 704—715.

As the result of experiments on a large number of substances, it is found that the greater the osmotic velocity of a substance soluble in water, the more that substance reduces the capillary constant of water. Substances that cannot penetrate membranes increase that constant. It has also been shown that, in every substance examined by Overton and the author, osmotic and capillary phenomena correspond. Whence it is deduced that the difference of surface tensions determines the direction and velocity of osmosis, in fact it is the motive force in osmotic pressure. From this conclusion it would appear that the generally accepted theory of diffusion is incorrect, and that in reality it is the pure solvent which, by virtue of its low surface tension, migrates into the salt solution. Further, if two mutually soluble liquids, or a solid and a solvent be brought into contact, the "solution tension" will depend chiefly on the difference between the surface tensions. This explains why a much greater quantity of ethyl or amyl alcohol dissolves in water than of water in ethyl or amyl alcohol, and why a coarse and a fine powder behave differently towards solvents (Hulet, Z. Phys. Chem., 1901, 385). Also the surface tension of a solution will never fall below that of the dissolving substance, for, with increasing concentration of the solution, a point will finally be reached when the surface tensions of solution and dissolving substance are equal; at this point the solution will be saturated. This theory is verified by several experiments, *e.g.*, with solutions of ethyl and amyl alcohol in water. It has also been experimentally established that equal equivalents of substances belonging to homologous series (*e.g.*, alcohols, fatty acids, esters), which exercise a strong influence on capillarity, lower the capillary height of water in the proportion $1 : 3 : 3^2 : \ldots$ The solution tensions of these substances would therefore show a similarly proportional increase with increasing molecular weight. It is then deduced that distribution coefficients and solution tensions —hence also surface tensions and osmotic velocity—are proportional magnitudes of the first approximation; this is also independently established from experimental data. Overton and H. Meyer have found that efficacious narcotics, anæsthetics, and antipyretics all penetrate thin membranes rapidly; but since a near relation exists between osmotic velocity and surface tension, it was to be expected that surface tension and narcotic power would run parallel. This is actually the case, even in substances differing materially in constitution. In narcotics belonging to homologous series the analogy is complete, since it is found that the narcotic action of homologous substances increases with increasing molecular weight in the ratio $1 : 3 : 3^2$. . . . Since narcotics exercise their chief action in cells containing much lipoid substance, it follows that, after penetration into the cell, not only will some narcotic be dissolved in the lipoid substance, but some of the lipoid will dissolve in the narcotic, which is probably the cause of the disagreeable secondary effects exerted more or less by all narcotics. If this be the case, there would seem little probability of ever finding a perfectly innocuous narcotic.—T. F. B.

Aromatic Ketones; Hydrogenation of —— by Reduced Nickel. New Synthesis of Aromatic Hydrocarbons. G. Darzens. Comptes rend., 1904, **139**, 868—870.

When aromatic ketones are hydrogenated at 190°—195 C. with the catalytic aid of nickel reduced from nickelous oxide at (not below) 300° C., the reaction $C_6H_5.CO.R + 2H_2 = C_6H_5.CH_2.R + H_2O$ occurs sharply. In this way acetophenone yields (95 per cent.) pure ethylbenzene; *p*-cresyl ketone gives with ease a similar yield of *p*-methylethylbenzene; and *p*-butylacetophenone (easily prepared by treating tertiary butylbenzene with acetyl chloride and aluminium chloride) gives *p*-tertiary butylethylbenzene, a new hydrocarbon, faintly smelling of carrots, b. pt. 209°—213° C. The same method applied to benzene-substituted fatty ketones is equally fertile, benzoylacetone, for example, yielding normal butylbenzene. While Friedel and Crafts' reaction yields chiefly *m*-derivatives, this method is most applicable to *p*-derivatives. The author finds that the temperature at which the nickel is reduced not only affects the energy of the reaction, but in some cases also its nature; thus nickel reduced at a much lower temperature than 300° C. yields from the ketone not the aromatic hydrocarbon, but its hexahydro derivative.—J. T. D.

Trehalase; Presence of —— in Mushrooms. E. Bourquelot and H. Hérissey. Comptes rend., 1904, **139**, 874—876.

In most species of mushrooms trehalase exists. The period of its presence and that of its disappearance seem to be in relation respectively with that during which trehalose is utilised by the plant, and that during which it is being stored as a reserve substance.—J. T. D.

Tyrosine in Elder Berries; Occurrence of ——. J. Sack and B. Tollens. Ber., 1904, **37**, 4115.

Fresh elder berries were boiled with water, and the extracted juice was clarified by means of lead acetate. The filtrate was then freed from lead, and concentrated. After cooling, crystals separated out, and were fully identified as those of *tyrosine*.—J. F. B.

Technical Chemistry; The Relations of —— to the other Sciences. Address by Prof. C. E. Munroe, of the George Washington University, before the Int. Congress of Arts and Sciences, St. Louis, Sept. 23, 1904. Applied Chemistry Section.

Numerous instances are detailed in this paper of the bearings which technical chemistry has upon other sciences and on the arts, and also of the many ways in which it depends upon other sciences for its progress. Thus, physical processes form an important part of most chemical manufactures; further, technical chemists utilise many physical methods in their analytical work—*e.g.*, spectrum analysis, photometry, polarimetry, &c. It is shown how necessary are research laboratories, both for introducing and examining new products and processes, and for devising and improving analytical methods. The bearing of atomic weight determinations on the purely commercial side of technical chemistry is pointed out. In many instances technical chemistry has benefited greatly by the practical application of theories, such as those of dissociation, mass action, and osmotic pressure. In the course of the paper the following statistics are given of the growth of chemical industry in the United States from 1890—1900:—

Year.	Number of Establishments.	Number of Employés.	Total Wages.	Cost of Materials used.	Value of Products.
			Dols.	Dols.	Dols.
1890	58,195	710,485	311,369,495	2,177,443,777	3,165,768,188
1900	84,172	1,038,543	469,848,022	3,392,211,974	4,962,715,787

The United States is the only country which takes a census of manufactures, so no comparisons could be obtained.—T. F. B.

Technical Chemistry; Some Present Problems in ——. Address by Prof. W. H. Walker, of the Mass. Inst. of Technology, before The Internat. Congress of Arts and Sciences, St. Louis, Sept. 1904.

In the author's opinion the point upon which most stress should be laid is that there is no dividing line between pure science and the utilitarian side of chemistry. The explanation of Germany's success in solving the problems confronting chemical industries rests mainly on the fact that in that country it is recognised that the questions have first to be regarded as problems in pure chemistry, to be studied by men fully trained in pure science. If these men are also chemical engineers, then obviously the ultimate solution of the technical problem is hastened, but in the first place the main desideratum is that the men have been trained in the spirit and methods of scientific research. The author reviews some of the important problems in technical chemistry: (1) The production of fertilisers in the United States has increased from 1,900,000 tons to 2,900,000 tons in the past 10 years. It is estimated that the total value of the potash, phosphoric acid, and nitrogen consumed by agricultural products in one year amounts to 3,200,000,000 dols. Of these three ingredients of fertilisers, the supply of phosphoric acid in the form of native phosphate deposits, and of slags from metallurgical processes, seems practically inexhaustible. The supply of potash, on the other hand, will not be on a perfectly satisfactory basis until sources independent of the Stassfurt deposits are discovered. In this direction Clark's method of converting the potassium of felspar into potassium chloride by fusing the mineral with ammonium chloride is of interest; and if the reaction could be applied to orthoclase, and the ammonia recovered economically, an important new source of potash would be available. Most importance, however, attaches to the supply of available nitrogen, and, after a survey of the progress made, the author predicts that it will not be a great while before the synthetic preparation of cyanides, ammonia, and nitric acid from atmospheric nitrogen will be on a commercial basis. At the present time the fixation of atmospheric nitrogen as nitrate through the agency of bacteria rather than by an electrical process appears to be more promising; in fact, cultures for the artificial inoculation of the soil may now be obtained in considerable quantity, and field experiments have shown that with their aid, good crops may be grown upon what would otherwise be almost sterile soil. Another problem connected with technical chemistry, and which is rendered more acute by the possible use of cellulose as a raw material for the production of foodstuffs, is (2) the conservation of forests. The solution of the problem will consist in the substitution of other raw materials in chemical industries where wood is now used for the purpose. As raw materials for the production of cellulose, there are the waste straw of flax-, wheat-, oat- and other crops, cornstalks, and bagasse from sugar manufacture. (3) In countries where the tax on fermented mash is not high, there would seem to be an opening for a process for the manufacture from alcohol of acetic acid in a more concentrated form than can be produced with the aid of *Mycoderma aceti*, the crude molasses which is wasted in large quantities in semi-tropical countries being used as raw material for the production of the alcohol. Formic acid, also, which can be synthesised from carbon and water, might be substituted for acetic acid for many purposes. Other problems calling for solution are:—(4) methods of tanning with materials other than vegetable tannins; (5) the synthesis of india-rubber, or substances with similar properties; the utilisation of trade wastes, such as (6) soda and sulphite cellulose lyes, *e.g.*, as foodstuffs for cattle, &c.; (7) waste yeast; (8) arsenic sulphide from the purification of crude acids; (9) grease from wool washing, city garbage, &c.; (10) the hygienic preservation of food; (11) the fireproofing and preservation of wood; and (12) the prevention of the corrosion of structural iron and steel. The author also discusses the applications of electrical energy and of catalysis or contact action, forces the usefulness of which technical chemists are only beginning to appreciate.—A. S.

New Books.

CHEMIKER-KALENDER, 1905. Ein Hülfsbuch für Chemiker, Physiker, Mineralogen, Industrielle, Pharmazeuten, Hüttenmänner u.s.w. Von Dr. RUDOLF BIEDERMANN. Sechsundzwanzigster Jahrgang. In zwei Theilen. *Erster Theil.* Julius Springer's Verlag, Monbijouplatz 3, Berlin. 1905. Price 4*s.*

ARRANGED as a pocket book and containing almanack for 1905, with also a table of the more frequently used atomic weights and their multiples. In the Thermochemical Tables those numbers are repeated which Berthelot used. Dr. H. Bernthsen and Dr. P. Julius have contributed material improvements in the chapter on Colour Chemistry. The Tables on the Naphthalene derivatives and the Coal-Tar Colours have been thoroughly revised, and Dr. L. Spiegel has revised the Alkaloid Tables. There is a Chronological Table of the principal events in the History of Physical Sciences. A Note-book Calendar with blank pages is further arranged for the different days of the year, in which observations, facts, &c., may be recorded. Then follows tabulated matter, useful in the Laboratory: of Specific Gravities, of Gases and Liquids, Salts, Alcohols, Tables of Solubility and Properties of Chemical Substances, Analysis, Volumetric Analysis, Gas Analysis, and Spectrum Analysis. The subject-matter, exclusive of the Calendar and the blank pages for Notes, fills 362 pages.

Zweiter Theil.—This supplementary work is of similar size to the pocket-book, but is unbound, and is more directly of Technological interest. It contains Tables relating to I. Physics and Physical Chemistry, II. Mineralogy, and III. Technical Chemical Analysis and Investigations. But, besides the tabulated matter, there are concise descriptive paragraphs of introductory character, with descriptions of Analytical Methods. The subdivisions under III. are as follows:—1. Water. 2. Assaying. 3. Fuels. 4. Sulphuric Acid. 5. Alkali. 6. Bleaching Powder. 7. Saltpetre and Explosives. 8. Ceramics. 9. Glass. 10. Mortar and Cement. 11. Illuminants. 12. Starch and Sugar. 13. Fermentation Industry. 14. Fats and Oils. 15. Tanning. 16. Textile Fibres and Paper. 17. Photography. 18. Dyeing. 19. Physiological Chemical Analysis. Appendix with various Recipes, &c. The subject-matter fills 511 pages.

THE CENTURY IN PHOSPHATES AND FERTILIZERS. A Sketch of the South Carolina Phosphate Industry. By PHILIP E. CHAZAL. Lucas-Richardson Lithograph and Printing Co., 130, East Bay Street, Charleston, S.C. 1904.

8vo pamphlet containing 71 pages of subject-matter.

NOTES ON ASSAYING AND METALLURGICAL LABORATORY EXPERIMENTS. By RICHARD W. LODGE, Assistant Professor of Mining and Metallurgy, Massachusetts Institute of Technology. First Edition. John Wiley and Sons, New York. U.S.A. Messrs. Chapman and Hall, Ltd., London. 1904. Price 12*s.* 6*d.*

8vo volume containing 279 pages of subject-matter, with 47 illustrations, and the alphabetical index. The subjects treated of are as follows:—I. Apparatus, Reagents, and Materials. II. Sampling. III. Assay of Ores for Silver. IV. For Gold. V. For Lead. VI. Bullion. VII. Assay of Ores for Copper and Tin. VIII. Platinum and the Platinum Group. IX. Metallurgical Laboratory Experiments and Notes. These notes, it is stated, are chiefly those used by the third-year and partly those used by the fourth-year Students in Assaying, in the Metallurgical Laboratory of the Massachusetts Institute of Technology.

Trade Report.

I.—GENERAL.

GERMAN CHEMICAL INDUSTRY; PROFITS IN THE ——.

Eng. and Mining J., Dec. 1, 1904.

In the fiscal year 1903-4, comparatively few companies have shown increased profits, in fact, the more important among them have, by reason of keen competition, realized smaller earnings. Still, shareholders' dividends have been from 5 to 10 per cent. for the 12 months. The net profits of the Hönningen Chemical Company in 1903-4, amounted to 22,171*l.*, permitting the payment of a 10 per cent. dividend. The Stassfurt Company, with a share capital of 150,000*l.*, showed net profits of 15,439*l.*, and a dividend of 8 per cent., while the United Company, of Leopoldshall, from net profits of 15,602*l.*, declared 5 per cent. on its preferred stock, and 2 per cent. on the common. Although it gained 314*l.* in net profits to 10,705*l.*, the Byk Chemical Works, of Berlin, paid a dividend of 6 per cent., against 7 per cent. a year ago. The Wilhelmsburg Chemical Company, of Hamburg, cut its dividend rate from 8 to 6 per cent.; the Paul Gulden Colour and Tar Products Company, of Leipzig, from 6·5 to 5·5 per cent., while the North German Chemical Company, of Harburg, paid only 6 per cent. on the preferred, nothing on the common, and the Union Company, of Stettin, increased its rate from 8 to 9 per cent. The Dusseldorf Color Works, reports net profits of 1,400*l.*, as against a heavy loss in 1902-3. A forecast for the year 1904-5 suggests that the increased activity and better prices ruling will result in a substantial improvement.

JAPANESE CHEMICAL INDUSTRY.

Chem. and Druggist, Dec. 10, 1904.

Although chemical industry is in a flourishing condition in Japan, no prospects are offered to European chemists, in consequence of the number of Japanese who have studied in Europe, or at the high schools in Tokio or Kioto. There are at present 840 factories in Japan employing chemists. Two of these undertakings employ over 500 workmen, 86 over 100, 207 over 50, and 348 have 30 men employed. Altogether there are 38,591 men and women at work in various chemical works. The Japanese Government contributes largely towards promoting this branch of industry, and last year there were 79 Government laboratories, whose duty it is to ascertain and impart the methods of utilising the numerous varieties of seaweed and other fishery products, which are so plentiful in Japanese waters.

II.—FUEL, GAS, AND LIGHT.

COAL BRIQUETTES IN INDIA.

Eng. and Mining J., Dec. 1, 1904.

During the year 1902, 13,400 tons of patent fuel were made in India. Khost (Baluchistan) produced nearly 7,000 tons, and Dandot (Punjab) over 6,000 tons. During the official year 1903-1904, 14,513 tons were manufactured at Khost with an outlay of 190,000 Rs. The fuel is used on the railways. There is a small plant also at Giridih (Bengal), but since the installation of modern coke-ovens it has been little used.

RUSSIA; COAL INDUSTRY OF ——.

Bd. of Trade J., Dec. 1, 1904.

The coal production of Russia for the past three years is shown in the subjoined table.—

——	1901.	1902.	1903.
	Thousands of Pouds.	Thousands of Pouds.	Thousands of Pouds.
South Russia	694,420	642,140	728,090
Poland	258,915	263,320	295,160
Ural.........	30,255	33,202	30,080
Moscow district.......	16,007	12,814	13,919
Caucasus	3,342	2,036	2,210
Total { 1,000 of pouds	1,002,939	953,512	1,069,450
Total { Tons........	27,859,000	26,486,000	29,707,000

The destination of the coal produced in the Donetz basin during the past two years was as follows :—

——	1902.	1903.
	Thousands of Pouds.	Thousands of Pouds.
Railways	141,287	166,937
Salt mines............................	3,600	5,167
Shipping	11,262	11,596
Gas works............................	2,770	1,282
Sugar refineries	38,154	41,924
Foundries*............................	110,358	119,787
Manufactories of machinery	19,122	22,058
Other manufactories	25,188	33,531
Towns of Kharkov, Ekaterinoslaw, Rostov, and Taganrog	15,726	13,329
Exported through Taganrog	31,607	57,462
Other consumers	52,729	61,878

During 1903, the Russian railways consumed 166,937,000 pouds of coal from the Donetz basin, 44,218,449 pouds from Poland, 6,500,000 pouds from the Moscow district, and 34,000,000 pouds of imported coal.

The distribution during the past two years of the coal produced in Poland, which is not suitable for gasworks, is shown below :—

——	1902.	1903.
	Thousands of Pouds.	Thousands of Pouds.
Railways	34,781	43,218
Foundries.	29,628	34,103
Denaturating works...................	18,227	17,779
Sugar refineries......................	24,924	16,752
Other manufactories..................	76,314	92,840
Domestic consumption.......	50,683	54,854

Poud = 36 lbs.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM; CALIFORNIA ——.

P. W. Prutzmann. J. of Elect., 1904, 306—317. *Science Abstracts, B.*, 1904, 7, 939—940.

Out of twenty-seven counties in California, only seven are producing oil profitably, the remainder having either yielded nothing, or only very small quantities of oil. In the seven producing counties, there are 14 centres of production, and on Dec. 31, 1903, the state of the industry was as follows :—Producing wells, 2998 ; abandoned wells, 1271 ; wells drilling, 159 ; uncertain, 322 ; total, 4750. Oil lighter than 20° B. is suitable for refining, the remainder being utilised for fuel purposes, or in the manufacture of asphalt. The total production of oil according to this classification is as follows :—Refining, 3,540,000 barrels ; fuel, 21,070,000 barrels ; thus averaging 27·7 barrels per well. The author devotes the remainder of the paper to describing the methods of refining employed, and the characteristic properties of Californian petroleum.—T. F. B.

VII.—ACIDS, ALKALIS, Etc.

ROCK PHOSPHATE ; NEW SOURCE OF ——.

Bd. of Trade J., Dec. 1904.

A large deposit of rock phosphate, testing 63 to 68 per cent. of tribasic calcium phosphate, has been discovered about 35 kilometres from the deposit at Metlaoui. In 1906 when this new mine—"Redeyef"—will be connected with the Sfax-Metlaoui railroad, the export of this new phosphate will be commenced.

VIII.—GLASS, POTTERY, AND ENAMELS.

GARNET ; A NEW SOURCE OF ——.

Eng. and Mining J., Dec. 1, 1904.

The use of garnet as an abrasive is firmly established in certain manufacturing industries, and there is little doubt that this material will continue to find favour, notwithstanding the great expansion in the utilisation of other abrasives, particularly corundum and carborundum. In the United States the production of garnet now amounts to over 4,000 tons yearly, and the value of the yearly product approximates 150,000 dols. The principal supplies hitherto have been derived from the Adirondack region of New York, smaller quantities being obtained from Pennsylvania, Connecticut, and North Carolina. With the opening of some new quarries in the last-named State a larger output may be expected in the future from that section of the country. The properties are situated near Marshall, in Madison county. The garnet is of the almandine variety, and occurs in a band of chloritic schists, about 20 ft. wide, that can be traced on the outcrop for nearly a mile. The crystals are of large size, averaging 2 in. in diameter, and often exceeding this limit. While somewhat altered to chlorite near the surface, the garnet in the deeper workings is perfectly fresh, and breaks into clean, sharp particles, so that a very pure abrasive material can be obtained. Its hardness, according to the usual scale, is about 7·5.

The property is well situated for railroad transportation, being on the main line of the Southern Railway running from Salisbury, N.C., to Chattanooga, Tenn. Active quarrying was begun in January of the present year, since which time a large quantity of garnet has been taken out and shipped to market.

IX.—BUILDING MATERIALS, Etc.

CEMENT PRODUCTION OF THE UNITED STATES.

Bd. of Trade J., Dec. 8, 1904.

A report issued by the Department of the Interior, at Washington, states that the total production of hydraulic cement in 1903 was 29,899,140 barrels, valued at 31,931,341 dols., as compared with 25,753,504 barrels, valued at 25,366,380 dols., produced in 1902. Of the total production in 1903, 22,342,973 barrels, having a value of 27,713,319 dols., were Portland cement. The production of natural-rock cement was 7,030,271 barrels, valued at 3,675,520 dols. The production of Pozzuolana or slag cement was 525,896 barrels, valued at 542,502 dols.

The increased production of Portland cement in 1903 resulted in a glutted market, which made the artificial product so low in price in the eastern part of the country as to seriously interfere with the production of natural-rock cement. Many of the plants whose output is exclusively the natural cement were for this reason shut down during a large part of the year.

X.—METALLURGY.

MINERAL PRODUCTION OF NEW ZEALAND IN 1903.

Bd. of Trade J., Dec. 8, 1904.

The annual report of the Minister for Mines contains the following particulars of the quantities and values of the chief mineral products exported from and coal used in New Zealand during the years 1902 and 1903:—

	1902.		1903.	
	Quantity.	Value.	Quantity.	Value.
	Ozs.	£	Ozs.	£
Gold	508,045	1,951,433	583,314	2,037,831
Silver	674,196	71,975	911,914	91,497
	Tons.		Tons.	
Copper ore	..	..	6	123
Manganese ore	..	..	70	210
Chrome ore	175	525	..	..
Mixed minerals	415	4,422	625	7,014
Hæmatite	17	116	..	1
Coal exported	188,677	154,747	152,332	128,927
Coal used in New Zealand	1,174,025	587,012	1,267,861	633,931
Kauri gum	7,430	450,223	9,357	631,102
Shale (treated in New Zealand)	2,338	1,169	36	18
Total value	..	3,221,622	..	3,530,654

IRON AND STEEL IN RUSSIA.

Eng. and Mining J., Dec. 1, 1904.

Official figures recently published show that the production of pig iron in Russia in 1903 was 2,453,953 tons, a decrease of 106,191 tons from the previous year. The output by districts was as follows:—North Russia, 22,462 tons; Moscow, 95,591; South Russia, 1,366,437; Poland, 308,914; Ural, 660,546 tons. In Poland there was an increase of 26,612 tons over 1902; all the other districts showed decreases, the most important being in the Ural, where it was 69,797 tons. The production of iron castings, or foundry work, was 209,000 tons, an increase of 19,000 tons. The wrought, or puddled, iron reported, in finished forms, was 194,000 tons, a decrease of 83,000 tons. In steel production, however, there was an increase of 315,000 tons, or 15 per cent., the total being 4,325,510 tons.

—	1902.	1903.
Pig iron produced	2,560,000	2,454,000
Imported as pig	18,000	13,000
Imported in finished forms	327,000	336,000
Total consumption	2,905,000	2,803,000

The proportion of steel made by the various methods was: Bessemer, or converter, 24·3; open-hearth, 75·6; crucible, 0·1 per cent.

The approximate consumption of iron is given in the foregoing table, finished material and machinery being reduced to terms of equivalent pig-iron.

The consumption of iron per head in Russia is much less than that of any other European country. There is practically no iron nor steel exported from the country.

XIII. C.—INDIA-RUBBER, Etc.

RUBBER PRODUCTION OF PARÁ, 1899-1904.

Bd. of Trade J., Dec. 1, 1904.

The following particulars of the rubber production of Pará for the year, July 1903 to June 1904, as compared with the four previous years, are taken from the *Brazilian Review* of 25th October:—

Crop Years.	Quantity.	Value.
	Met. Tons.	£
1899—1900	9,957	2,862,400
1900—1901	9,247	2,647,185
1901—1902	10,333	2,799,720
1902—1903	11,327	3,059,000
1903—1904	11,362	2,807,641

Of the exports through Iquitos, Manaos, and Pará, during the year 1903-04, 12,160 metric tons of rubber and 3,338 metric tons of caucho were sent to Europe, and 13,873 metric tons of rubber and 1,210 tons of caucho to the United States of America.

XVI.—SUGAR, STARCH, Etc.

BEET-SUGAR PRODUCTION OF EUROPE FOR THE 1904-5 SEASON.

U.S. Cons. Rep., No. 2119, *Nov.* 29, 1904.

The *Wochenschrift des Centralvereines für Rüben-Zucker-Industrie* gives the following results of the latest inquiry made by the Internationale Vereinigung für Zuckerstatistik regarding the probable sugar output for the current sugar season of 1904-5. These are preliminary estimates, subject to correction when the results of the second inquiry become known, which inquiry is undertaken later in the season:—

Country.	Factories in Operation.		Beets.		Sugar (in terms of Raw).	
	1903-4.	1904-5.	1903-4.	1904-5.	1903-4.	1904-5.
			Met. Tons.	Met. Tons.	Met. Tons.	Met. Tons.
Austria-Hungary	215	206	7,775,500	6,165,000	1,158,800	914,800
Germany	384	375	12,706,500	9,933,000	1,929,400	1,518,000
France	296	275	6,441,500	4,686,000	794,400	614,300
Belgium	100	90	1,550,000	1,267,000	202,800	179,100
Holland	29	26	880,000	908,000	123,500	133,900
Russia	275	276	7,705,300	6,580,000	1,160,700	945,400
Sweden	17	18	748,400	591,000	107,200	88,200
Denmark	7	7	380,000	340,000	48,000	48,000
Italy	32	32	1,000,000	700,000	135,000	80,000
Total	1,355	1,305	39,187,200	31,170,000	5,659,800	4,521,700

The authoritative publication from which the above data are taken calculates the quantities available for export from the beet-sugar countries during the current sugar year (1904-5) as shown in next column.

In the year 1903-4 Great Britain alone took 1,400,000 tons of sugar (in terms of raw), and the sugar stocks of the world are now over 400,000 tons less than a year ago, hence there is some reason to anticipate a scarcity of supply in the European sugar markets during the current sugar season. These facts have already resulted in higher prices. But an increase of price is bound to benefit cane sugar as well, and thus strengthen the competition on the part of the tropical product by causing its entrance into markets which until lately were held securely and exclusively by European beet sugar.

Country.	Production.	Consumption.	Available for Export.
	Met. Tons.	Met. Tons.	Met. Tons.
Austria-Hungary	915,000	450,000	465,000
Germany	1,518,000	930,000	588,000
France	614,000	580,000	34,000
Belgium	179,000	80,000	99,000
Holland	134,000	80,000	54,000
Total	3,360,000	2,120,000	1,240,000

XVII.—BREWING, WINES, SPIRITS, Etc.

Alcohol in France; Production, Imports, and Exports of —— in the Season 1903–4.

Z. Spiritusind., 1904, **27**, 471.

The total production of alcohol in France in the season 1903–4 has been very much higher than in the previous year, as is shown by the following figures for the last five years:—1899–1900, 2,641,505 hl.; 1900–1, 2,799,543 hl.; 1901–2, 2,026,212 hl.; 1902–3, 1,729,652 hl.; 1903–4, 2,200,725 hl. The whole of the increased production is from industrial distilleries, that of the private distilleries showing a decrease from 77,748 hl. to 37,437 hl.

The following statistics show the sources from which the industrial distilleries produced their alcohol in 1903–4, the figures in brackets being those for 1902–3: Wine, 36,663 hl. (27,342 hl.); marcs, 34,220 hl. (18,730 hl.); grain, 368,562 hl. (322,007 hl.); beetroots, 1,084,163 hl. (499,965 hl.); molasses, 639,527 hl. (773,625 hl.); other materials, 153 hl. (235 hl.).

Imports in 1903–4 amounted to 122,911 hl., and exports to 287,699 hl., while home consumption was 2,172,550 hl., and the stock at the end of the official year, 538,947 hl. The figures for the previous year were 87,715 hl., 279,091 hl., 1,774,341 hl., and 685,530 hl. respectively.—J. F. B.

Spirit-Industry; German ——.

Chemist and Druggist, *Dec.* 3, 1904.

The German Chambers of Commerce of Nordhausen and Hanau, whose districts are especially interested in the spirit-industry, have appealed to the Federal Council requesting that regulations may be issued permitting the distillation of spirit from maize, in order to prevent the threatened scarcity and further increase in the prices of spirit and potatoes. In urging this petition the Chambers state that even though the spirit-production since October 1, 1903, is normal, the stocks of spirit on October 1, 1904, were lower by 40,000 hectolitres than the stocks at the same period of 1903. The petition also states that as the position is at present, it will require the best efforts of all distilleries to produce sufficient spirit for the demand in 1904–5. This will only be possible by exercising the greatest economy with potatoes. They are convinced that difficult times are ahead, and that a period of scarcity may be expected in the spring. In order to realise the consequences of this development, it is only necessary to point out the increase in price of methylated spirit, which has advanced by 10 M. per hectolitre since last year. The use of spirit for lighting, heating, and technical purposes, which for several years has increased in consumption by 100,000 hectolitres per annum, will also be greatly hampered, says the petition. As regards consumption for drinking purposes, this takes up almost two-thirds of the entire yearly production of those who are engaged in the brandy trade. The larger and richer distilleries will probably be able to weather the periods of unfavourable prices, but the smaller works will be placed in a most difficult position if the prices of brandy advance further. At present they are higher than they have ever been.

The present Secretary of the Treasury, Count Posadowsky, issued regulations in 1902 which were entirely in accordance with the wishes of the Spirit Ring. In these regulations it is not the taxation but the regulation of the production which requires remedying. When the last regulations in 1902 were issued, the spirit industry suffered from over-production, and naturally the Spirit Ring fitted the law to the immediate position. The Spirit Ring was founded in 1899. The production, which 10 years previously amounted to an average of 306·9 million litres, rose to 382·3 million litres in 1898–99, to 365·5 million in 1899–1900, to 406 millions in 1900–1, and 424·4 millions in 1901–2. On the basis of these regulations, the Spirit Ring ordained an artificial control of the production, and this has eventually brought about the present scarcity.

The *Berliner Tageblatt* reports that movements are on foot to amalgamate the Bank für Spirit- und Produktenhandel, Berlin, and the Posen Spirit Co., who own works in Posen and Magdeburg. It is intended to bring about greater economies in the management of the business. The contracts of the Centrale with the spirit manufacturers and the agricultural distillers expire in 1908, and the Spirit Ring evidently hopes, by means of closer union, to be able to oppose more effectually any immoderate demands on the part of the distillers. The two companies in question have already stood in close relations with each other, and the director of the Centrale, Mr. Stern, and the rentier, Mr. Gutman, belong to the directorate of both companies.

Spirit Market; Position of the German —— at the End of October 1904.

Z. Spiritusind., 1904, **27**, 470.

The production of spirits in October was considerably greater than in the corresponding month of 1903 and 1902, but there is likely to be a shortness in the supply later on, There has been a marked falling off of the consumption in all branches. The decrease in duty-paid spirit for drinking is partly accounted for by the clearing of excessive supplies in September. The total issue of duty-free spirits shows a slight decrease as compared with October 1903. The decrease in the consumption of spirit for industrial purposes is due to the rise in the price of alcohol; these conditions are likely to continue for the present and to be attended by a decreased production. The whole of the decrease in the consumption of industrial spirits is due to fully denatured spirits. In the consumption of pure and partially denatured spirits, issued free of duty for industrial purposes, there has been a slight rise as compared with October 1903. The export of spirit in October this year has been merely nominal, and is likely to remain so: this trade has for the last few years been conducted at a loss. The position of the market at the end of October 1904 is shown in the following statement:—Stock at end of September, 260,668 hl.; production in October, 217,955 hl.; total available supply, 478,623 hl.; Consumption: for drinking, 180,938 hl.; duty-free industrial spirit, denatured, 64,480 hl.; pure or partially denatured, 36,542 hl.; exported, 223 hl.; total, 282,183 hl.—J. F. B.

XX.—FINE CHEMICALS, Etc.

Camphor Monopoly; The Japanese ——.

Schimmel's Report, *Oct.* 1904, 15.

The restrictions imposed on the camphor industry by the regulations of the Japanese Government monopoly, have induced experiments on the cultivation of *Cinnamomum camphora* in German colonies. Camphor trees are best grown from seed, which is gathered in the autumn and stored during the winter in sand. Before sowing in the spring, the dry seed is soaked in water for 24 to 48 hours, then sown $\frac{1}{2}$ to $\frac{3}{4}$ inch deep; the seedlings are transplanted when from 10 to 16 inches high. If the camphor is to be obtained from the leaves, the plants are arranged in hedges; but if distillation of the wood is to be performed, a space of 15 to 16 feet between each tree is allowed. The tree may also be propagated by layers or from cuttings. Experiments in this direction are being conducted at the German Biologico-agricultural Institute at Amanti, and also with the cultivation of *Dryobalanops aromatica*, which yields Borneo camphor.—J. O. B.

Essential Oil of Cedar Wood.

Schimmel's Report, *Oct.* 1904, 18.

As lead pencils are now made from Florida cedar wood which is imported ready sawn, and not in logs as formerly, waste sawdust and turnings are becoming scarcer, causing an increase in the price of cedar-wood oil. In view of the growing demand, it may be necessary to import the wood in logs for the purpose of distillation, in which case a still further increase in price will follow.—J. O. B.

Citronella Oil.

Schimmel's Report, *Oct.* 1904, 19.

Export.—After showing a decline of more than 200,000 lb. in 1903, compared with 1902, the shipments of citronella oil from Ceylon again show an increase, 710,071 lb. being recorded as shipped to the end of July 1904 against 569,875 lb. for the corresponding period last year. The United States is the largest consumer, taking, this year, 325,419 lb.; 300,847 lb. have been shipped to the United Kingdom, and 37,459 lb. to Germany; France has only taken, direct, 235 lb. The above figures do not represent the consumption of the oil in the countries named since a large bulk is re-shipped to the Continent *via* London.

Control of Quality.—It is proposed to subject citronella oil for export to official supervision; oil which is found by Bamber's test (this J., 1904, 77) to contain not more than 1 per cent. of admixture being marked with the Government brand "Pure Oil," and sealed with a red official seal. Oils which contain admixture up to 10 per cent., by the same test, are to be marked "90 per cent. purity," and sealed with green seals. The export of all oils containing more than 10 per cent. of admixture is forbidden. Stations for examining the oil under this system are to be established at Galle and Colombo.—J. O. B.

Bergamot Oil.

Schimmel's Report, Oct. 1904, 27.

Higher prices may be expected to rule for Bergamot oil. The product of harvest, provided the fruits yield the normal amount of oil, is not expected to exceed 40,000 or 50,000 kilos., compared with 100,000 kilos. of the previous harvest. The bergamot orange trees were much affected by the hot dry weather which occurred at the end of the flowering, and prevented the proper setting of the fruit, causing enormous quantities of immature fruits to fall from the trees.—J. O. B.

Lemon Oil Market.

Schimmel's Report, Oct. 1904, 28.

Great fluctuations have taken place in the price of lemon oil. After reaching, in March last, the lowest figure recorded, 4 marks per kilo., a sharp upward movement to 5·25 marks, caused by large American purchases, took place in May. This was followed by a decline to 4·5 marks per kilo., at which price the oil has remained, until the reduction of stock to 25,000 kilos. caused a slight upward tendency. This small stock will probably be exhausted by the time the product of the new crop arrives on the market.

No exact estimates of the amount of the new crop are yet possible; it is expected that the total yield of oil will be about one-fifth below that of last year.—J. O. B.

Essential Oil of Geranium.

Schimmel's Report, Oct. 1904, 43.

In Algeria, the cultivation of geranium has been considerably increased, with the result that large quantities of oil have been put on the market, causing a fall in prices to 5 francs a kilo. The product of the recent harvest is of exceptionally good quality.

In Réunion, although great damage was done to the geranium plantations early in the year by a cyclone, after a temporary rise immediately following this disaster, prices have fallen to a lower figure than before, since the new plantations, requiring only four months to produce material for distillation, were in a position to supply oil in a relatively short period. Large stocks of oil had also accumulated which also tended to depress the market rate. The present stock at Marseilles is estimated at about 4,000 kilos. No change in price is anticipated.—J. O. B.

Lavender Oil.

Schimmel's Report, Oct. 1904, 50.

The dry weather of the past summer has had a general adverse effect on the French lavender crop, rendering the harvest yield only about one fourth of the normal quantity. No stocks appear to be held in France, so that very high prices will probably rule.—J. O. B.

Neroli Oil Industry; French ——.

Schimmel's Report, Oct. 1904, 60.

Although the blossom harvest in the Alpes Maritimes has been normal, with an estimated amount of 1,800,000 kilos., and the oil yield from these was favourable, a tendency to increased price is evident. This is due to dispute between the growers and the distillers. The former, driven by the unremunerative prices offered for the blossoms, have formed a syndicate for controlling the price, which is fixed at 65 francs per 100 kilos. If this be not conceded they intend to commence distilling themselves. It is stated that the growers' syndicate have actually distilled about 300 kilos. of oil this year, and have destroyed 40,000 kilos. of blooms, which they could not deal with owing to lack of distilling plant. Arrangements are in progress which will enable the growers to distil the whole of next year's blossom crop should the distillers refuse to accept their terms.—J. O. B.

Peppermint Oil Industry; American ——.

Schimmel's Report, Oct. 1904, 70.

Michigan and Indiana.—The severe winter of last year destroyed a large proportion of the plants, and rendered new roots for planting difficult to obtain. The total yield of oil from this district is estimated this year at between 137,000 to 140,000 lb.

Wayne County.—There are indications that the cultivation of peppermint on marshy land, which has been to a great extent abandoned during the past six years on account of the low market price of the oil, is being actively resumed. Black mint is the only plant cultivated, which under proper cultivation yields from 30 to 50 lb. of oil per acre. Much of the mint planted this year has not been distilled, but has been reserved for still further extending the crop for next season. The yield of black mint oil for 1904 is estimated at about 14,000 lb.—J. O. B.

Peppermint Oil Industry; English ——.

Schimmel's Report, Oct. 1904, 74.

The yield of oil from this year's crop is the lowest recorded for 20 years, not amounting to more than half the average product. The bulk of the distillation has already been sold at prices 20 per cent. higher than those obtained in 1903. A further advance in price is therefore inevitable. The quality of the oil produced this year is good.—J. O. B.

Peppermint Oil Industry; Japanese ——.

Schimmel's Report, Oct. 1904, 75.

The high prices obtained last year have led to an important extension of the cultivation of peppermint in Japan, the product of the first crop in one district alone being estimated at about 200,000 kilos. A later crop from another district is anticipated to yield 72,000 kilos.; the total production of the whole of Japan will probably not fall below 300,000 kilos. In consequence of this large production, a heavy fall in prices has occurred both in menthol and in de-mentholised oil; the former declining from 18*s.* to 9*s.*, and the latter from 5*s.* 9*d.* to 4*s.* In view of the upward tendency of the American peppermint-oil market, a further decline is not anticipated.—J. O. B.

Peppermint Oil in Saxony.

Schimmel's Report, Oct. 1904, 76.

Despite the exceptional drought of the past summer the crop of peppermint oil in the neighbourhood of Miltitz has been good, yielding a high-grade oil. The dry weather, however, prevented the growth of a second crop.—J. O. B.

Rose Oil [Otto of Rose]; Turkish ——.

Schimmel's Report, Oct. 1904, 77.

The rose harvest this year has been favourable, and has given a yield of about 5000 kilos. of rose oil. This is not quite equal to the product of the 1903 harvest, when 6200 kilos. were obtained, but is in excess of an average yield. Up to the present about 2200 kilos. have changed hands, at prices near 500 marks, below which the so-called first quality oil has not yet fallen. The total export of otto of rose from April 1st, 1903, to April 1st, 1904, amounted to 6002 kilos., against 3624 kilos. for the same period in 1902—1903. Of this amount, France took 1834 kilos.;

America, 1403 kilos.; Germany, 1039 kilos.; and the United Kingdom, 913 kilos. An increase of price in rose oil is not expected.—J. O. B.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 24,832. Eldred. Heating process and reverberatory furnace. Nov. 28.

,, 24,836. Bruns. Process of and apparatus for making extracts, washing precipitates, purifying liquids, and like processes. Nov. 28.

,, 24,858. De Bavay. *See under* X.

,, 24,879. Wilton. *See under* III.

,, 25,892. Hesketh. Apparatus for depriving air of moisture previous to supplying it to blast furnaces, converters, &c. Nov. 28.

,, 25,966. Davis. Apparatus for heating or vaporising water or other fluid. Nov. 29.

,, 26,102. Lloyd and Sutcliffe. Drying appliance for hydro-extractors. Nov. 30.

,, 26,255. Neumann and Stade. Vacuum pans. Dec. 2.

,, 26,270. Richards. Hot air driers. [U.S. Appl., June 20, 1904.]* Dec. 2.

,, 26,578. Barham. Apparatus for cooling or heating liquids. Dec. 6.

,, 26,602. Johnson (Badische Anilin und Soda Fabr.). *See under* XI.

,, 26,623. Mélotte. Centrifugal liquid separators. Dec. 7.

,, 26,669. Hudson and Crooke. *See under* X.

,, 26,670. Hudson and Crooke. *See under* X.

,, 26,978. E. Allen and Co., Ltd., Leach and Leach. Apparatus and appliances for drying slurry in the manufacture of cement, paints, colours, and the like. Dec. 10.

[C.S.] 26,778 (1903). Blount and Middleton. Kilns or furnaces, especially applicable to kilns for burning lime, cement, &c. Dec. 7.

,, 26,822 (1903). Bolton. Apparatus for superheating steam. Dec. 14.

,, 28,087 (1903). Oxford and Buxton. Means of drying semi-liquids. Dec. 14.

,, 28,594 (1903). Lake (Trump). Process of drying and otherwise treating materials by air or other currents. Dec. 14.

,, 28,595 (1903). Lake (Trump). Apparatus for drying and otherwise treating materials by air or other currents. Dec. 14.

,, 28,617 (1903). Harvey. *See under* XVI.

[C.S.] 26,570 (1903). Winter. Process for manufacturing plated wire. Dec. 7.

,, 27,298 (1903). Dawes. Magnetic separators for ores, &c. Dec. 14.

,, 28,590 (1903). Cowper-Coles and Co., Ltd., and Cowper-Coles. Coating metals with copper. Dec. 7.

,, 3087 (1904). Johnson. *See under* XI.

,, 20,160 (1904). Gillies. Apparatus for recovering zinc and other sulphides from their ores by the wet or chemical process. Dec. 7.

,, 23,331 (1904). De Dion and Bouton. Manufacture of case-hardened articles of chrome-nickel steel. Dec. 14.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 25,829. Wohle and Hart. *See under* IX.

,, 25,839. Thorp. Electrolysing apparatus. Nov. 28.

[A.] 25,902. Ekstromer Accumulator Co., Ltd., and Oppermann. Secondary batteries. Nov. 28.

,, 26,557. Boult (Ashcroft). Process and apparatus for producing metals of the alkali group by electrolysis. Dec. 6.

,, 26,602. Johnson (Badische Anilin und Soda Fabrik). Production of reactions in gases by means of electric arcs. Dec. 6.

,, 26,786. Hardingham (Felten und Guilleaume Carlswerk Act.-Ges.). Means for rendering the insulation of electric conductors fireproof. Dec. 8.

,, 26,849. Bailey. Apparatus for electro-deposition of metals. Dec. 9.

,, 26,948. Mills (Edison). Storage batteries.* Dec. 10.

,, 26,949. Mills (Edison). Continuous apparatus for nickel plating. Dec. 10.

[C.S.] 27,249 (1903). Garuti and Pompili. Apparatus for collecting, separating, drying, or similarly treating oxygen and hydrogen generated by electrolysis of water. Dec. 7.

,, 456 (1904). Leetham and Bousfield. Manufacture of chlorine by electrolysing sodium chloride solution, and apparatus therefor. Dec. 14.

,, 3087 (1904). Johnson. Apparatus for amalgamating and coating metals or alloys with metals or alloys by aid of electricity. Dec. 14.

,, 18,403 (1904). Townsend. Electrolytic process and apparatus therefor. Dec. 14.

,, 21,402 (1904). Jungner. Electrodes for electric accumulators with variable electrolyte. Dec. 14.

,, 23,622 (1904). Möllmann. Galvanic batteries. Dec. 7.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 26,192. Salasco and Rovere. *See under* III.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

[A.] 25,830. Wohle and Hart. Compound for use, in combination with pigments, for the preparation of paints. Nov. 28.

,, 28,937. Hickman. Composition to be used as a coating for metallic surfaces for the prevention of corrosion. Nov. 29.

,, 26,263. Samples. Oil paints. Dec. 2.

,, 26,457. Newton (Bayer and Co.). Production of new colour lakes. Dec. 5.

,, 26,643. Macknight. *See under* VII.

,, 26,908. Johnson (Badische Anilin und Soda Fabrik). *See under* IV.

,, 26,909. Johnson (Badische Anilin und Soda Fabrik). *See under* IV.

,, 26,978. E. Allen and Co., Ltd., Leach and Leach. *See under* I.

[C.S.] 2376 (1904). Hérisson. Manufacture of paints or pigments. Dec. 7.

,, 2469 (1904). Johnson (Badische Anilin und Soda Fabrik). *See under* IV.

XIV.—TANNING; LEATHER, GLUE, SIZE, Etc.

[A.] 25,916. Head. Process of preserving skins. Nov. 29.

,, 25,984. The Sunbury Leather Co., Ltd., and Miller. Manufacture of leather. Nov. 29.

,, 26,778. Payne. Improvements in tanning, and in the treatment of waste tanning materials and liquids. Dec. 8.

[C.S.] 26,049 (1903). Dolat. Process for the preparation of skins. Dec. 7.

,, 2167 (1904). Castle. *See under* V.

,, 22,952 (1904). Wetter (Thüringer Gelatine-Fabrik, E. Jetter und Krause). Gelatine or gelatinous foodstuffs. Dec. 7.

[C.S.] 23,016 (1904). Dougherty. Machines for mechanically seasoning, oiling, or otherwise treating skins. Dec. 14.

XVI.—SUGAR, STARCH, GUM, Etc.

[C.S.] 27,666 (1903). Harvey (Naudet and Hinton). Treatment of sugar cane, beetroot, and the like. Dec. 7.

,, 28,617 (1903). Harvey. Evaporators for the treatment and concentration of cane juice, beet juice, and other juices and liquids. Dec. 7.

,, 28,711 (1903). Harvey. Evaporators for concentrating sugar cane, beet, and like juices or liquids. Dec. 7.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 26,698. Board and Board. The process of fermentation. Dec. 7.

,, 26,751. Hart. Method of and apparatus for use in the fining of beer and other like liquors.* Dec. 8.

[C.S.] 2398 (1904). Ward. Device for agitating and aerating wort. Dec. 7.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 26,623. Mélotte. *See under* I.

,, 26,654. Mitchell. Process for the production of proteid. Dec. 7.

,, 26,905. Weitzmann. Process for refining and purifying coffee. [Appl. in Denmark, Sept. 27, 1904.]* Dec. 9.

[C.S.] 26,495 (1903). Nesfield. Sterilisation of water and other liquids and of alimentary substances to render same potable or edible. Dec. 7.

,, 20,885 (1904). Combret. Alimentary products constituting a phosphated vinegar. Dec. 7.

,, 22,030 (1904). Posternak. Process for the production of soluble earthy alkaline and metallic salts of the organic phosphorus compound contained in vegetable foodstuffs. Dec. 7.

,, 22,952 (1904). Wetter (Thüringer Gelatine-Fabrik). *See under* XIV.

,, 23,177 (1904). Müller. Food preparations. Dec. 7.

(*B.*)—Sanitation; Water Purification.

[C.S.] 5467 (1904). Wehner. Apparatus for purifying water. Dec. 14.

(*C.*)—Disinfectants.

[C.S.] 4540 (1904). Kitching and Shirley. Disinfectants. Dec. 7.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 26,434. Woods and Morgan. Manufacture of celluloid compounds. Dec. 5.

[C.S.] 1857 (1904). Hawke. *See under* XXI.

,, 2357 (1904). Howorth (Soc. Franç. de la Viscose). Apparatus for treating viscose. Dec. 7.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 26,383. Loebell. Process for purifying crude viscine obtained from plants of the ilex class.* Dec. 3.

,, 26,649. Livingstone (Stein). Compound for use in medicine, and process of manufacturing the same. Dec. 7.

,, 26,713. Oberlander and The Alliance Chemical Co., Ltd. Manufacture of saccharine. Dec. 8.

,, 26,779. Zimmermann (Chem. Fabr. auf Actien, vorm. E. Schering). Manufacture of camphor. Dec. 8.

[C.S.] 22,030 (1904). Posternak. *See under* XVIII. A.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 25,897. Harris, Gillard, and Molyneux. Coating or preparation of paper or other material for photographic purposes. Nov. 28.

,, 26,066. Kelly and Bentham. Self-developing dry plate. Nov. 30.

,, 26,247. Morgan. Manufacture of sensitive photographic self-toning printing-out paper.* Dec. 2.

,, 26,456. Newton (Bayer and Co.). The pigment process, and new copying materials for use therein. Dec. 5.

,, 26,573. Clarke. Colour photography. Dec. 6.

[C.S.] 1857 (1904). Hawke. Manufacture of sensitised copying papers. Dec. 7.

,, 2693 (1904). Hewitt and Miles. Photographic printing. Dec. 14.

,, 3794 (1904). Abel (Act.-Ges. für Anilinfabr.). Manufacture of flash-lights for photography. Dec. 7.

,, 22,988 (1904). Soc. Anon. des Plaques et Papiers Photographiques A. Lumière et ses Fils. Sensitised plates for a process of colour photography. Dec. 14.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 26,146. Curtis's and Harvey, Ltd., and Hargreaves. Explosive compounds. Dec. 1.

,, 26,974. Luck. Manufacture of explosives. Dec. 10.

,, 27,005. Wetter (Westfälisch-Anhaltische Sprengstoff-Act.-Ges.). Priming or detonating compositions suitable for percussion caps. Dec. 10.

XXIII.—GENERAL ANALYTICAL CHEMISTRY.

[C.S.] 28,262 (1903). Schlatter and Deutsch. Method of and apparatus for ascertaining the quantity of carbonic acid in furnace gases. Dec. 7.

Printed and Published by Eyre and Spottiswoode, East Harding Street, London, E.C., for the Society of Chemical Industry.—P 856.

LIST OF COUNCIL AND OFFICERS.

President.

Sir Wm. Ramsay, K.C.B., D.Sc., LL.D., F.R.S., 19, Chester Terrace, London, N.W.

Vice-Presidents.

Prof. P. Phillips Bedson, Durham College of Science, Newcastle-on-Tyne.

Prof. Marston T. Bogert, Columbia University, New York City, U.S.A.

Eustace Carey, 26, Alexandra Drive, Sefton Park, Liverpool.

Dr. John Clark, 138, Bath Street, Glasgow.

E. Grant Hooper, 16, Royal Avenue, Sloane Square, London, S.W.

Ivan Levinstein, Hawkesmoor, Fallowfield, Manchester.

Dr. R. Messel, 147, Victoria Street, London, S.W.

Wm. H. Nichols, 25, Broad Street, New York City, U.S.A.

Dr. F. B. Power, 6, King Street, Snow Hill, London, E.C.

Prof. H. R. Procter, Rowangarth, Ben Rhydding, *viâ* Leeds.

Dr. Jos. W. Swan, F.R.S., 58, Holland Park, London, W.

Thomas Tyrer, Stirling Chemical Works, Stratford, E.

Ordinary Members of Council.

Dr. Edw. Divers, F.R.S., 3, Canning Place, Palace Gate, London, W.

Dr. J. Grossmann, Northern Assurance Buildings, Albert Square, Manchester.

Henry Hemingway, Marsh Gate Lane, Stratford, E.

Prof., W. R. E. Hodgkinson, Royal Ordnance College, Woolwich, S.E.

David Howard, Devon House, Buckhurst Hill, Essex.

Dr. J. Lewkowitsch, 71, Priory Road, London, N.W.

N. H. Martin, Northumberland Road, Newcastle-on-Tyne.

Max Muspratt, 2, Mannering Road, Sefton Park, Liverpool.

B. E. R. Newlands, 2, St. Dunstan's Hill, London, E.C.

Prof. W. J. Pope, F.R.S., Municipal School of Technology, Manchester.

Frank Scudder, Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester.

Dr. W. S. Squire, Clarendon House, St. John's Wood Park, London, N.W.

Chairmen and Secretaries of Sections (Ex-officio Members of Council).

Canadian :
Chairman... Prof. W. R. Lang, The University, Toronto, Canada.
Secretary ... Alf. Burton, 42, Front Street West, Toronto, Canada.

Liverpool :
Chairman... F. H. Tate, 9, Hackins Hey, Liverpool.
Secretary ... W. Roscoe Hardwick, 13, Batavia Buildings, Hackins Hey, Liverpool.

London :
Chairman... Walter F. Reid, Fieldside, Addlestone, Surrey.
Secretary .. Julian L. Baker, 7, Addison Road, Bedford Park, London, W.

Manchester :
Chairman ... J. Carter Bell, Bank House, Higher Broughton, Manchester.
Secretary ... Julius Hubner, 24, Delaunay's Road, Crumpsall, Manchester.

Newcastle :
Chairman... Dr. J. T. Dunn, 75, The Side, Newcastle-on-Tyne.
Secretary ... F. C. Garrett, Durham College of Science, Newcastle-on-Tyne.

New York :
Chairman... Dr. V. Coblentz, College of Pharmacy, 115, West 68th Street, New York City, U.S.A.
Secretary .. Dr. H. Schweitzer, 40, Stone Street, New York City, U.S.A.

Nottingham :
Chairman... J. T. Wood, 62, Park Road, Nottingham.
Secretary ... S. R. Trotman, King's Walk Chambers, Parliament Street, Nottingham.

Scotland :
Chairman... T. L. Patterson, Maybank, Finnart Street, Greenock, N.B.
Secretary ... Dr. Thos. Gray, c/o Gourlay and Deas, 180, Hope Street, Glasgow.

Sydney, N.S.W. :
Chairman... Prof. A. Liversidge, F.R.S., The University, Sydney.
Secretary ... T. U. Walton, Colonial Sugar Refining Co., O'Connell Street, Sydney.

Yorkshire :
Chairman... Jas. E. Bedford, Messrs. Wood and Bedford, Kirkstall Road, Leeds.
Secretary ... Thos. Fairley, 17, East Parade, Leeds.

Honorary Treasurer.

Samuel Hall, East London Soap Works, Bow, E.

Honorary Foreign Secretary.

Dr. Ludwig Mond, F.R.S., 20, Avenue Road, Regent's Park, London, N.W.

General Secretary.

Chas. G. Cresswell, Palace Chambers, Westminster, S.W
(Telegraphic address :—59, Palatable, London.)

Editor.

Watson Smith, 34, Upper Park Road, Haverstock Hill, London, N.W.

LIST OF MEMBERS.

Total Membership on February 29th, 1904 = 3996.

A

1897. Ablett, A. W., P.O. Box 91, Germiston, near Johannesburg, Transvaal, S. Africa, Cyanide Works Manager.
1903. Abraham, Herbert, 13, West 89th Street, New York City, U.S.A., Chemist.
1902. Acker, Chas. E., Acker Process Co., Niagara Falls, N.Y., U.S.A., Manufacturer.
1903. Ackermann, Franz W., 86, Pierrepont Street, Brooklyn, N.Y., U.S.A., Chemist.
1900. Ackroyd, Wm., Borough Laboratory, and (communications) Crossley Street, Halifax, Yorks, Analytical Chemist.
1903. Acton, J. Rowland, Wicklewood, Maze Road, Kew, S.W., Civil Servant.
1892. Adams, Arthur, Kelvin House, Edgbaston Road, Smethwick, near Birmingham, Science Lecturer.
1884. Adams, M. A., Ashford Road, Maidstone, Kent, Public Analyst.
1902. Adams, O. Gore, School of Mines, Thames, Auckland, New Zealand, Director.
1897. Adams, Thos. H., 107, Crewe Street, Derby, Analyst.
1895. Adamson, G. P., 233, Reeder Street, Easton, Pa., U.S.A., Manufacturing Chemist.
1891. Adcock, S. R., St. Helen's Smelting Co., Atlas Court, St. Helen's, Lancashire, Analytical Chemist.
1901. Addison, Leonard, c/o Messrs. Burt, Boulton, and Haywood, Selzaete, Belgium, Chemist.
1901. Addison, Dr. Wm. L. T., Wm. Davies Co., Ltd., Front Street East, and (Journals) 513, Markham Street, Toronto, Canada, Chemist.
1898. Adgate, M., c/o General Chemical Co., Syracuse, N.Y., U.S.A., Chemist.
1898. Adiassewich, Alex. V., 6, Camden Gardens, Shepherd's Bush, London, W., Oil Engineer.
1896. Adler, Dr. Leon N., Adler Colour and Chemical Works, 100, William Street, New York City, U.S.A., Manufacturing Chemist.
1888. Adriance, Dr. John S., 105, East 39th Street, New York City, U.S.A., Analytical Chemist.
1899. Adrot, Léon, 38, Rue de la Station, Jette St. Pierre, Belgium, Chemist.
O.M. Affleck, Dr. J., Highfield, Woodend Park, Grassendale, near Liverpool, Alkali Inspector.
1903. Aicher, Chas. P., Camp Bird Mills, Ouray, Colo., U.S.A., Mill Manager.
O.M. Aitken, Dr. A. P., 38, Garscube Terrace; and (Journals) 8, Clyde Street, Edinburgh, Consulting Chemist.
1886. Aitken, J. B., Gerard's Fold Chemical Works, Widnes, Chemical Manufacturer.
1884. Akitt, Thos., Birksgate, Kircaldy, N.B., and (Journals) Skelmorlie, Ayrshire, Chemist.
1883. Albright, G. S., Bromesberrow Place, Ledbury, Chemical Manufacturer.
O.M. Albright, W. A., Mariemont, Edgbaston, Birmingham, Chemical Manufacturer.
1891. Alcock, Jno. W., Central Brewery, Mott Street, Birmingham, Maltster and Brewer.
1902. Alden, Frederick, 311, 17th Street, Milwaukee, Wis., U.S.A., Chemist.
1898. Alden, John, Chemical Laboratory, Pacific Mills, Lawrence, Mass., U.S.A., Chemist.
1901. Aldous, Hugh G., 21, Brechin Place, South Kensington, S.W., Brewery Director.
1900. Aldrich, Roger C., c/o F. H. Kalbfleisch Co., White and Hoerum Streets, Brooklyn, N.Y., U.S.A., Mechanical Engineer.
1890. Aldrick, Edwin John, 53, Alpha Road, West Ferry Road, Millwall, E., Chemical Works Clerk.
1899. Alexander, D. Basil W., Denver Testing Laboratory, P.O. Box 1341, Denver, Colo., U.S.A., Chemist.
1900. Alexander, Jerome, c/o National Gum and Mica Co., 502—510, West 45th Street, New York City, U.S.A., Chemist.
1883. Alexander, W. T., Crumnock, Eccles, Manchester, Drysalter.
1901. Allan, Dr. F. B., Chemical Laboratory, University of Toronto, Canada, Lecturer on Chemistry.
1891. Allan, F. H. Tielke, Portobello House, Wakefield, Analytical Chemist.
1898. Allan, John, 55, Northern Grove, West Didsbury, near Manchester, Chemist.
1902. Allbright, Wm. B., 5139, Lexington Avenue, Chicago, Ill., U.S.A., Chemical Engineer.
O.M. Alldred, C. H., 8, St. Margaret's Road, Plumstead Common, Kent, Analytical Chemist.
1898. Alleman, Dr. Gellert, Swarthmore College, Swarthmore, Pa., U.S.A., Professor of Chemistry.
O.M. Allen, A. H., Broomfield Road, Sheffield, Consulting Chemist.
1903. Allen, Chas. A., 188, Harwood Street, Darwen, Lancs, Chemist.
1902. Allen, Chas. D., jun., 475, 4th Street, Brooklyn, N.Y., U.S.A., Chemist.
1891. Allen, E. W., Lea Mount, Glossop, Paperstainers' Manager.
O.M. Allen, J., 164, Upper North Street, Poplar, E., Manufacturing Chemist.
1901. Allen, R. F., 5016, Baltimore Avenue, Philadelphia, Pa., U.S.A., Chemist.
1889. Allen, R. L., Crewe Road, Sandbach, Cheshire, Analytical Chemist.
1904. Allen, Thos. E., c/o American Aristotype Co., Jamestown, N.Y., U.S.A., Chemist.
1886. Allen, Walter S., 34, South Sixth Street, New Bedford, Mass., U.S.A., Chemist.
1892. Allen, Walter W., Room 1709, 170, Broadway, New York City, U.S.A., Metallurgical Manager.
1900. Allen, Wilfrid T., c/o Hugh Wallace and Co., Ltd., 5, Fenchurch Street, London, E.C., Director.
1884. Allen, Wm., Evenley Hall, Brackley, North Hants.
1893. Allerton, Rt. Hon. Lord, F.R.S. (Journals), Allerton Hall, near Leeds; and c/o W. L. Jackson and Sons, Ltd., Buslingthorpe, Leeds, Tanner.
O.M. Allhusen, A., Gateshead-on-Tyne, Chemical Manufacturer.
1886. Allibon, G. H., 35, Eglantine Avenue, Belfast, Ireland, Chemical Works Manager.
1900. Allingham, Jno., 76, Gayville Road, Wandsworth Common, London, S.W., Assayer.
1887. Alliott, J. B., Messrs. Manlove, Alliott, and Co., Ltd., Nottingham, Mechanical Engineer.

1900. Allison, Thos. McGregor, Sargent Street, Bedminster, Bristol, Tanner.

1895. Allison, Wm. O., 100, William Street, New York City, U.S.A., Publisher of "Oil Paint and Drug Reporter."

1889. Alpiar, Agop, Smyrna, Asia Minor, Morphia Manufacturer.

1899. Alsop, Wm. K., 30, Ferry Street, New York City, U.S.A., Chemist.

1901. Alston, Robt. A., New Rietfontein Estates Gold Mines, Ltd., P.O. Knights, Rietfontein, Transvaal, Mining Engineer.

1904. Alton, W. Lester, "Dangarvan," Putney Heath, S.W., Chemist.

1898. Ambler, Chas. Taaffe, Dharhara Station, E.I. Ry., Bengal, India, Mine Owner and Contractor.

1897. Amend, Otto P., 205—211, Third Avenue, New York City, U.S.A., Chemist.

1900. Anderson, Jas. W., 1, Preston Villas, Halling, near Rochester, Kent, Analytical Chemist.

1889. Anderson, Robt. T. R., 80, Seedhill Road, Paisley, Technical Chemist.

1894. Anderson, Dr. W. Carrick, 2, Florentine Gardens, Hillhead, Glasgow, University Lecturer.

1895. Anderson, Wm., 19—21, Blackfriars Street, Edinburgh, Drysalter.

O.M. Anderton, G. H., Howendyke, Howden, Yorks, Chemical Manufacturer.

1896. Andreoli, Gabriel, P.O. Box 3725, Johannesburg, Transvaal Colony, South Africa, Electro-chemist.

1889. Andrews, C. W., c/o The John Crerar Library, Wabash Avenue and Washington Street, Chicago, Ill., U.S.A., Librarian.

1904. Andrews, Geo. D., 7, Old Ford Road, London, N.E., Chemist.

1903. Andrews, Wm. H., c/o Pratt and Lambert, Buffalo, N.Y., U.S.A., Manager (Varnish Works).

1903. Anfilogoff, N. A., c/o The Roumanian Oil Trust, Ltd., Thames Haven, Stanford-le-Hope, Essex, Chemist.

O.M. Angell, J., 6, Beaconsfield, Derby Road, Withington, Manchester, Chemical Lecturer.

1892. Annandale, C. J. R., The Briary, Shotley Bridge, Co. Durham, Paper Maker.

1883. Annandale, Jas. H., Polton Paper Works, Midlothian, N.B., Paper Maker.

1897. Annis, Dr. E. G., Public Health Dept., Town Hall, Greenwich, S.E., Medical Officer of Health.

1887. Annison, R. H., 16, Water Lane, Tower Street, London, E.C., Master Lighterman.

1894. Ansbacher, L. A., P.O. Box 1934, New York City, U.S.A., Colour Manufacturer.

1903. Anspach, Dr. R., Markt 2, Siegburg, bei Köln, Germany, Chemist.

1902. Anthony, John, 82, Bay Street, Toronto, Canada.

1899. Appleby, C. W., Farnworth, near Widnes, Lancashire, Pith and Size Manufacturer.

1895. Appleby, Prof. W. R., 911, 5th Street, S.E., Minneapolis, Minn., U.S.A., Professor of Mining and Metallurgy.

1894. Appleton, H. A., c/o Vinolia Co., Ltd., Carpenter's Road, Stratford, E., Analytical Chemist.

1897. Appleton, Jno. Howard, 209, Angell Street, Providence, R.I., U.S.A., Professor of Chemistry.

1900. Appleyard, Geo. H., c/o British Oil and Cake Mills, Ltd., 151, Cleveland Street, Hull, Chemist.

1903. Arbogast, Ralph, c/o Edison Storage Battery Co., Silver Lake, N.J., U.S.A., Chemist.

1901. Archbold, Dr. Geo., P.O. Box 283, Prescott, Ont., Canada, Consulting Chemist and Manager.

O.M. Archbutt, Leonard, The Yews, Madeley Street, Derby, Analytical Chemist.

1899. Archdale, T. Henry, 77, Queen's Road, Blackburn, Manager of Tar and Ammonia Works.

1904. Archdale, Wm., 21, Oldham Road, Miles Platting, Manchester, Manager of Chemical Works.

1901. Ardagh, Edw. G. R., 28, Leopold Street, Parkdale, Toronto, Canada, Chemist.

1900. Ardern, Edw., 2, Atkinson Road, Urmston, near Manchester, Chemist.

1901. Argall, Philip, 728–732, Majestic Buildings, Denver, Colo., U.S.A., Manager (Gold Extraction Works).

1903. Armstrong, E. D., c/o Empire and American Glycerin Co., Hartford City, Ind., U.S.A., Chemist.

1902. Armstrong, Edward E., Pennsylvania Salt Manufacturing Co., Natrona, Pa., U.S.A., Manufacturing Chemist.

1899. Armstrong, Richard, Saul Street Soap Works, Preston, Lancashire, Soap Manufacturer.

1901. Arnold, G. Edmund, 6, Kingsfield Terrace, Faversham, Kent, Manager (Cotton Powder Co., Ltd.).

1899. Arnott, G. W. Campbell, 188, King Street East, Toronto, Canada, Chemical Agent.

1903. Arnott, J. S., Cifnentes, No. 5, Gijon, Spain, Chemist and Metallurgist.

1901. Arundel, Arthur S. D., Penn Street Works, Hoxton, N., Paper Box Manufacturer.

1901. Asano, K. 25, Kitachonyachō, Kyobashi, Tokyo, Japan, Mining Chemist.

1903. Ashley, Frank R., Western Chemical Manufacturing Co., Denver, Colo., U.S.A., Manufacturing Chemist.

1900 Ashley, Harrison Everett, 1089, Acushnet Avenue, New Bedford, Mass., U.S.A., Metallurgical Chemist.

1900. Ashton, Jas., Rhodes Farm, Whitefield, Manchester, Chemist and Manager.

1890. Ashton-Bost, W. D. *See* Bost, W. D. Ashton.

1885. Ashwell, H., 117, Waterloo Crescent, The Forest, Nottingham, Bleacher and Dyer.

1885. Ashwell, J. H., 117, Waterloo Crescent, The Forest, Nottingham, Bleacher and Dyer.

1894. Ashworth, Arthur, Fernhill Chemical Works, Bury, Lancs., Chemical Manufacturer.

1903. Ashworth, Jno. B., The Creamery, Broad Green, Liverpool, Manager.

1898. Aspinall, Thos., 42, Gilnow Road, Bolton, Analytical and Manufacturing Chemist.

1897. Aspinwall, Capt. H. C., Haskell, N.J., U.S.A., Explosives Manufacturer.

1900. Aston, Bernard C., Agricultural Department, Wellington, New Zealand, Chemist.

1891. Atkins, C. E., Teigngrace, Byculla Park, Enfield, N., Chronometer Maker.

1885. Atkinson, A. J., 41, Stewart Street, Cardiff, Analytical Chemist.

1902. Atkinson, Edwin B., Furze Glen, Lambert Road, Great Grimsby, Lecturer in Chemistry.

1900. Atkinson, Jno. W., Betteravia, Cal., U.S.A., Chemist.

O.M. Attfield, Dr. J., F.R.S., Ashlands, Watford, Herts.

1900. Atwood, Frank W., 216, Milk Street, Boston, Mass., U.S.A., Chemist.

1895. Auchterlonie, Wm., jun., c/o Clark Thread Co., Newark, N.J., U.S.A., Dyeworks Manager.

1901. Auden, Dr. H. A., c/o United Alkali Co., Ltd., Central Laboratory, Widnes, Chemist.

1897. Auger, Chas. L., 425, Park Avenue, Paterson, N.J., U.S.A., Silk Dyer.

1887. Austen, Prof. Peter T., 218, St. John's Place, Brooklyn, N.Y., U.S.A., Professor of Chemistry.

1901. Austin, Herbert, c/o George Scott and Son, Ltd., 67, Lord Street, Liverpool, Engineer.

1902. Austin, J. H., Allscott, Wellington, Shropshire, Analytical Chemist.

1901. Auty, Albert M., c/o John Smith and Sons, Field Head Mills, Bradford, Chemist.

1902. Avery, D., 23, Belmont Avenue, Kew, Melbourne, Vic., Australia, Teacher of Chemistry.

1901. Ayer, Harold O., 503, Whitaker Street, Savannah, Ga., U.S.A., Chemist.

1890. Aykroyd, H. E., Oakwood Dye Works, Bradford, Yorks, Dyer.

1899. Aylsworth, Jonas W., 223, M'lland Avenue, East Orange, N.J., U.S.A., Chemist.

1903. Ayres, W. J., P.O. Box 187, Pernambuco, Brazil, Sugar Expert.

B

1895. Bacon, Nathaniel T., Peace Dale, Rhode Island, U.S.A., Chemical Engineer.
1903. Bacon, R. A., 31, West 17th Street, New York City, U.S.A., Manufacturing Chemist.
1897. Bacon, Wm., 4, New Court, Lincoln's Inn, W.C., Chemist.
1897. Badock, Stanley H., 41, Downleaze Road, Stoke Bishop, near Bristol, Smelter.
1898. Baekeland, Dr. Leo, Snug Rock, North Broadway, Yonkers, N.Y., U.S.A., Manufacturing Chemist.
1902. Baer, Dr. Samuel H., 158, Chambers Street, New York City, U.S.A., Consulting Chemist.
1903. Bailey, Prof. E. H. S., The Library, Kansas State University, Lawrence, Kas., U.S.A., Professor of Chemistry.
1885. Bailey, Edwin M., The Elms, East Calder, N.B., Technical Chemist.
1883. Bailey, Dr. G. H., Marple Cottage, Marple, Cheshire, Chemical Lecturer.
1903. Bailey, Harold J., c/o Great Western Colliery Co., Pontypridd, S. Wales, Chemist.
1898. Bailey, Henry, 18, Lavender Sweep, Lavender Hill, S.W., Analytical Chemist.
1888. Bailey, Dr. T. Lewis, Gas Street, Runcorn, Chemist.
1888. Bailey, Sir W. H., Albion Works, Salford, Manchester, Chemical Engineer.
1888. Bailey, Walter P., Fabrica de Productos Amoniacales, 2A, Aguada, Cadiz, Spain, Manufacturing Chemist.
1902. Bain, Jas. Watson, 90, Charles Street, Toronto, Ont., Canada, Chemist.
1890. Baird, H. Harper, 14, Cross Street, Hatton Garden, London, E.C., Laboratory Furnisher.
1902. Baird, Dr. Julian W., Massachusetts College of Pharmacy, Boston, Mass., U.S.A., Professor of Chemistry.
1891. Baird, Wm., c/o Lewis Berger and Sons, Ld., Homerton, N.E., Technical Chemist.
1895. Baird, W. Raymond, 271, Broadway, New York City, U.S.A., Patent Lawyer.
1890. Bairstow, John, Burley, Queen's Park, Chester, Chemical Works Manager.
1903. Baker, Arthur, 93, Blackburn Road, Darwen, Lancs., Chemist.
1902. Baker, Chas. F., Technical College, Sunderland, Lecturer in Chemistry.
1901. Baker, F. Guy Stirling, Marryatt's Lodge, The Forest, Snaresbrook, Essex, Student.
1883. Baker, Harry, Epworth House, Moughland Lane, Runcorn, Analytical Chemist.
1899. Baker, H. Fenimore, c/o Thomsen Chemical Co., Baltimore, Md., U.S.A., President.
1892. Baker, Julian L., 7, Addison Road, Bedford Park, W., Sugar Chemist.
1886. Baker, Theodore, c/o G. Henry, Pompton Lakes, N.J., U.S.A., Analytical Chemist.
1898. Baldwin, Abram T., Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Manufacturer.
1903. Baldwin, F. H., Bergenport Chemical Works, Bayonne, N.J., U.S.A., Superintendent.
1903. Baldwin, Dr. H. B., 9–11, Franklin Street, Newark, N.J., U.S.A., Chemist (Dept. of Public Health).
1901. Ball, Edward, c/o B. Young and Co., Spa Road, Bermondsey, S.E., Glue and Size Manufacturer.
1903. Ball, S. F., Hull Avenue and 209th Street, Bronx Borough, New York City, U.S.A., Analytical Chemist.
1389. Ballantyne, H., 75, Chancery Lane, London, W.C., Analytical Chemist.
1903. Ballantyne, W. H., 111, Hatton Garden, London, E.C., Patent Agent's Assistant.
1892. Ballard, Ernest, Colwall, Great Malvern, Malt Vinegar Brewer.
O.M. Ballard, E. G., Greenfield Cottage, Hoole Road, Chester, Alkali Works Inspector.
1891. Ballinger, Jno., Free Library, Cardiff, Librarian.
1903. Baltzly, E. B., c/o Semet Solvay Co., Syracuse, N.Y., U.S.A., Chemist and Superintendent.
1890. Baly, E. C. C., University College, Gower Street, London, W.C., Analytical Chemist.
O.M. Bamber, H. K., 9, Victoria Street, London, S.W., Consulting Chemist.
1894. Bamber, H. K. G., Ingress House, Greenhithe, Kent, Cement Works Chemist and Manager.
1898. Bamford, Harry, 70, Duckworth Terrace, Bradford, Yorks, Dyer.
O.M. Banister, H. C., Elmhurst, Blundellsands, near Liverpool, Chemical Works Manager.
1890. Banks, Jno. H., c/o Ricketts and Banks, 104, John Street, New York City, U.S.A., Mining Engineer.
1895. Bannan, John F., 59, Court Street, North Andover, Mass., U.S.A., Chemist (Woollen Mill).
1385. Banner, Samuel, 4, Ivanhoe Road, Liverpool, Petroleum Merchant.
O.M. Bannister, R., 59, Tregunter Road, South Kensington, S.W., Analytical Chemist.
O.M. Bannister, W., Victoria Lodge, Cork, Ireland, Manufacturing Chemist.
1901. Barber, René R., Georgetown, Ont., Canada, Analytical Chemist.
1892. Barden, Alf., Far Bank, Shelley, near Huddersfield, Glue and Size Maker.
1886. Bardsley, Robt., Messrs. Jewsbury and Brown, Ardwick Green, Manchester, Mineral Water Manufacturer.
1895. Bardwell, Fred. L., Massachusetts Institute of Technology, Boston, Mass., U.S.A., Assistant Professor of Chemistry.
1903. Baringer, Fred. J., Eagle White Lead Works, 1020, Broadway, Cincinnati, Ohio, U.S.A., Chemist.
1902. Barker, Hugh S., 32, Cumberland Avenue, Sefton Park, Liverpool, Laboratory Furnisher.
1895. Barlow, Clinton W., 103—105, Greene Street, New York City, U.S.A., Merchant.
1901. Barlow, John J., 177, Manchester Road, Accrington, Calico Printer's Chemist.
1899. Barlow, Wm., 311, Market Street, Droylsden, near Manchester, Analytical Chemist.
1891. Barnes, Edward A., Dynamite Works, Modderfontein, Transvaal, Technical Chemist.
1901. Barnes, Fred., 46, Park Road, Sittingbourne, Kent, Paper Mill Chemist.
1884. Barnes, H. J., Phœnix Chemical Works, Hackney Wick, E., Manufacturing Chemist.
O.M. Barnes, Jos., Green Vale, Westhoughton, near Bolton, Lancashire, Analytical Chemist.
1881. Barnes, Jonathan, 301, Great Clowes Street, Manchester, Analytical Chemist.
1902. Barnett, Marcus S., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Sugar Works Chemist.
1897. Barnett, Robt. E., 9, Virginia Road, Leeds, Headmaster (Leeds Technical School).
1898. Barnicott, Jas. A., Messrs. May and Baker, Ltd., Garden Wharf, Church Road, Battersea, S.W., Chemical Manufacturer.
1901. Baron, Wm. Briscoe, Manchester Steam Users' Association, 9, Mount Street, Manchester, Chemist.
1901. Barr, Geo., Manchester Mills, Manchester, N.H., U.S.A., Calico Printer.
O.M. Barr, J., Dinting Vale, Dinting, near Manchester, Chemical Manager.
1890. Barraclough, Wm. H., Mortomley, near Sheffield, Analytical Chemist.
1900. Barralet, Edgar S., 4, Kenyon Mansions, Queen's Club Gardens, W. Kensington, W. Chemist.
1896. Barratt, J. Treeby, Bronheulog, Mostyn, North Wales, Chemist and Manager.
1903. Barreto, Ignacio de Barros, Engenho do Meis Vergea, Pernambuco, Brazil, Manager (Sugar Factory).
1890. Barrett, Arthur A., 5, Strada del Pozzo Leone, Messina, Sicily, Manufacturer of Essential Oils.
1890. Barrie, D. McLaurin, Analytical Chemist.
1900. Barrow, Jos., 13, The Grove, Bebington, Cheshire, Chemist.
1893. Barton, G. E., c/o Whitall, Tatum, and Co., Flint Glass Works, Millville, N.J., U.S.A., Technical Chemist.

1900. Barton, L. Edward, 283—285, Broadway, Albany, N.Y., U.S.A., Chemist.
1903. Bartripp, Geo. F., 51, Pulteney Road, South Woodford, Essex, Analytical Chemist.
1895. Baskerville, Dr. Chas., University of North Carolina, Chapel Hill, N.C., U.S.A., Professor of Chemistry.
1884. Bassett, H., 26, Belitha Villas, Barnsbury, N.
1899. Bassett, Wm. H., Torrington, Conn., U.S.A., Chemist.
1890. Bate, William, c/o National Explosives Co., Ltd., Hayle, Cornwall, Technical Chemist.
1903. Bateman, A. H., 34, Bridge Avenue, Hammersmith, W., Chemist.
1903. Bates, C. O., Coe College, Cedar Rapids, Iowa, U.S.A., Teacher of Chemistry.
1884. Bateson, Percy, Cuckoo Lane, Gateacre, near Liverpool, Technical Chemist.
1903. Battle, A. E., The B. S. A. Asphalt Manufacturing Co., Ltd., Woodstock, Capetown, S. Africa, Works Manager.
1885. Batty, R. B., Wharncliffe, Erdington, near Birmingham, Nickel Works Manager.
1903. Baty, E. J., 76, Prenton Road East, Birkenhead, Chemical Student.
1903. Bauer, Geo. W., 632, Sacramento Street, San Francisco, Cal., U.S.A., Vice-President and Chemist (Hop and Malt Co).
1900. Baur, Jacob, 67, Wells Street, Chicago, Ill., U.S.A., Liquid Carbonic Acid Manufacturer.
1898. Baxter, John G., c/o Mrs. Kitchell, Cemetery Lodge, Heckmondwike, Yorks, Chemist.
O.M. Baxter, W. H., Nuthurst, Streatham, S.W., Brewery Director.
1899. Bayly, Francis W., Royal Mint, Sydney, N.S.W., Australia, Assayer.
O.M. Baynes, J., Royal Chambers, Scale Lane, Hull, County and Borough Analyst.
1897. Beadle, Alec A., Greenheys, Granville Road, High Barnet, Herts., Electro-Chemist.
1886. Beadle, Clayton, Melrose, Hatherley Crescent, Sidcup, Kent, Consulting Chemist.
1890. Bealey, Adam C., c/o A. C. Bealey and Sons, Radcliffe, Lancashire, Bleacher and Alkali Manufacturer.
O.M. Beanes, E., Moatlands, Paddock Wood, Kent, Manufacturing Chemist.
1883. Beaven, E. S., 5, Boreham Terrace, Warminster, Wilts, Maltster.
1897. Beaver, Chas. J., Stanmore, Cecil Road, Hale, Cheshire, Chemist.
1895. Bechi, G. de, c/o Messrs. W. Blythe and Co., Church, Lancs., Chemical Engineer.
1898. Beck, Herbert H., 105, South Queen Street, Lancaster, Pa., U.S.A., Chemist.
O.M. Beckett, G. H., Glendye Cottage, Stevenston, Ayrshire, Analytical Chemist.
1898. Beckett, Jos. H., 20, Albert Road, Parkgate, near Rotherham, Analytical Chemist.
1903. Beckwith, Edw. Pierrepont, Garrison on the Hudson, N.Y., U.S.A., Chemist.
1899. Bedford, Alf. C., 26, Broadway, New York City, U.S.A., Chemical Merchant.
1891. Bedford, Chas. S., Rocela, Weetwood, Headingley, Leeds, Manufacturing Chemist.
1891. Bedford, Jas. E., Messrs. Wood and Bedford, Airedale Chemical Works, Leeds, Manufacturing Chemist.
O.M. Bedson, Prof. P. Phillips, Durham College of Science, Newcastle-on-Tyne, Professor of Chemistry.
1901. Beebe, Murray C., Nernst Lamp Co., Pittsburg, Pa., U.S.A., Engineer.
1901. Beevers, Clifford J., c/o Brotherton and Co., Holmes Street, Dewsbury Road, Leeds, Analyst.
1899. Behr, Dr. Arno, Pasadena, Cal., U.S.A., Chemist.
1903. Behrend, F., 54, Front Street, New York City, U.S.A., Importer of Chemical Stoneware.
1902. Behrend, Dr. Otto F., Hammermill Paper Co., Erie, Pa., U.S.A., Vice-President.
O.M. Beilby, G., 11, University Gardens, Glasgow, Chemical Engineer.
1902. Bek, Lars P., Colonial Sugar Refining Co., Ltd., Pyrmont Refinery, Sydney, N.S.W., Australia, Analytical Chemist.
1884. Bell, C. Lowthian, Free Library, Middlesbrough-on-Tees, Soda and Iron Manufacturer.
1902. Bell, Edwin L., Vidal Dyes Syndicate, Ltd., West Ferry Road, Millwall, E., Manager.
1900. Bell, Hugh P., 30, Egerton Crescent, London, S.W., Chemist.
O.M. Bell, J. Carter, Bank House, The Cliff, Higher Broughton, Manchester, Public Analyst.
1886. Bell, J. Ferguson, Derby Gas Light and Coke Co., Derby, Gas Engineer.
O.M. Bell, Sir Lowthian, Bart., F.R.S., (Journals) Rounton Grange, Northallerton ; and (subs.) c/o Bell Bros., Middlesbrough, Iron and Chemical Manufacturer.
1903. Bell, P. Carter, Milburn, N.J., U.S.A., Chemical Manufacturer.
1884. Bell, T. Hugh, Middlesbrough-on-Tees, Soda and Iron Manufacturer.
1902. Bement, Alburto, 218, La Salle Street, Chicago, Ill., U.S.A., Chemical Engineer.
O.M. Bendix, D., The British Alizarin Co., Limited, Silvertown, Victoria Docks, E. ; Journals to 371, Romford Road, Forest Gate, E., Managing Chemist.
1898. Bendixen, Julius C.,
Leather Manufacturer.
1897. Benfey, Dr. Hans, 2, Sunnyside Terrace, Clayton, Manchester, Manufacturing Chemist.
1903. Benham, Keith, Deans Hill, Stafford, Analytical and Consulting Chemist.
1902. Benjamin, Albert, c/o Thos. Hardcastle and Sons, Ltd., Firwood Works, Bolton, Colorist and Dyer.
O.M. Benjamin, Dr. M., Smithsonian Institution, Washington, D.C., U.S.A., Consulting Chemist, A.M.
1904. Benn, R. H. D., 16, Springfield Avenue, Westmount, Montreal, Canada, Analytical Chemist.
1899. Bennett, Alex. H., Chemical Laboratory, 39, Lime Street, E.C., Works Chemist.
1901. Bennett, Arnold, c/o Saml. Osborn and Co., Clyde Steelworks, Sheffield, Chemist.
1884. Bennett, Thos., Birch Vale, near Stockport, Calico Printer.
1902. Bennie, P. McN., P.O. Box 118, Niagara Falls, N.Y., U.S.A., Foreign Representative.
1901. Bentley, Wm. H., 6, Woodbine Terrace, Irlam, near Manchester, Technical Chemist.
1890. Bentz, Ernest, 107, Shaw Lane, Dinting, near Manchester, Lecturer on Dyeing.
1897. Berg, Julius, Elsässischer Petroleum Geselischaft, Waburg, Elsass, Germany, Oil Refinery Manager.
1884. Beringer, J. J., Basset Road, Camborne, Cornwall, Metallurgist.
1893. Berk, Fred. W., 1, Fenchurch Avenue, London, E.C., Chemical Manufacturer.
1903. Berkeley, Dr. Wm. N., Box 466, San Juan, Puerto Rico, U.S. West Indies, Chemist.
1900. Bermingham, Jno., jun., c/o California Powder Works, Pinole, Contra Costa Co., Cal., U.S.A., Powder Works Superintendent.
1889. Bernard, Jas., jun., Casal das Rolas, Olivaes, near Lisbon, Chemical Works Manager.
O.M. Bernays, J., 96, Newgate Street, London, E.C., Civil Engineer.
1900. Berolzheimer, D. D., 317, South 18th Street, Philadelphia, Pa., U.S.A., Chemist.
1897. Berry, Albert E., 62, Claremont Road, Forest Gate Essex, Works Manager.
1883. Berry, E. E., Bordighera, Italy, Technical Chemist.
1889. Berry, G. F., Atlas Chemical Works, West Ferry Road, Millwall, E., Chemical Works Manager.
1903. Berry, W. G., 329, West 83rd Street, Manhattan Borough, New York City, U.S.A., Chemist.
1898. Berwick, D. C., 62, Trinity Road, West Bromwich, and (Journals) c/o Chance Bros. & Co., Ltd., Glass Works, near Birmingham, Electro-Metallurgist.
1886. Best, Dr. T. T., Hardshaw Brook Chemical Works, St. Helens, Lancashire, Technical Chemist.

1901. Betts, Anson G., Troy, N.Y., U.S.A., Chemist.

O.M. Bevan, E. J., 4, New Court, Lincoln's Inn, London, W.C., Public Analyst and Consulting Chemist.

1900. Bevan, Jno. W., Risedale, St. James' Crescent, Swansea, Manager of Metallurgical Works.

O.M. Beveridge, Jas., "The Gables," Alderley Edge, Cheshire; and (Journals) c/o The Cushing Sulphite Fibre Co., Ltd., St. John, N.B., Canada, Pulp and Paper Manufacturer.

1900. Bevington, Col. S. B., 42, St. Thomas Street, Southwark, S.E., Leather Dresser.

1893. Bhaduri, Prof. K., Canning College, Lucknow, India, Professor of Chemistry.

1898. Bhattacharyya, Haripada, Foundry and Shell Factory, Cossipore, Calcutta, India, Chemist.

1896. Bibby, John, c/o J. Bibby & Sons, Formby Street, Liverpool, Student.

O.M. Bickerdike, W. E., Bryer's Croft, Wilpshire, near Blackburn, Manufacturing Chemist.

1895. Bicknell, G. Arthur, 839, East Madison Avenue, Cleveland, Ohio, U.S.A., Analytical Chemist.

1901. Bielecki, Dr. Jan, "Chemik Polski," 118, Marszalskowska Street, Warsaw, Russian Poland, Chemist.

1903. Bierwirth, L. W., Dover, N.J., U.S.A., Civil Engineer (Laflin and Rand Powder Co.)

1884. Biggart, J. Wm., 29, Cathcart Street, Greenock, N.B., Analytical Chemist.

1891. Biggart, Wm. L., Woodbine, Bridge of Weir, N.B., Public Analyst.

O.M. Biggs, B., 110, Cannon Street, London, E.C., Chemical Merchant.

O.M. Billing, H. S., 11, Devon Terrace, Ford Park, Plymouth, Analytical and Managing Chemist.

1896. Billings. Edgar F., 64, Federal Street, Boston, Mass., U.S.A., Manufacturing Chemist.

1896. Billington, Chas., jun.. Studleigh, Longport, Staffordshire, Metallurgist.

1898. Binney, Harold, Washington Life Building, 141, Broadway, New York City, U.S.A., Patent Lawyer.

1902. Binning, Stevenson, 101, Shooter's Hill Road, Blackheath, S.E., Technical Chemist.

1903. Binns, John H., Thornfield, Mystic Pond, Methuen, Mass., U.S.A., Dyer and Finisher.

1896. Bird, Arthur W., 10, Norfolk Square, London, W., Works Engineer.

1896. Bird, Jno. B., Minver House, 61, Bateman Street, Cambridge, Manure Manufacturer.

1903. Bird, Thos., 59A, Brook Street, Grosvenor Square, London, W., Surgeon.

1902. Bird, W. Robt., 217, Newport Road, Cardiff, Oil Merchant.

1895. Bird, Wm. R., (communications) 125, Goddard Avenue; (Journals) Laboratory, G.W.R. Works, Swindon, Wilts, Analytical Chemist.

1885. Birley, R. K., c/o Chas. Macintosh and Co., Ltd., Cambridge Street, Manchester, India-rubber Manufacturer.

1895. Bischoff, Dr. Ernst, 87-89, Park Place, New York City, U.S.A., Chemist.

1883. Bishop, A. Conway, Three Mills Lane, Bromley-by-Bow, E., Manufacturing Chemist.

1884. Bishop, Fred, c/o Burmah Oil Co., Rangoon, Burmah, Technical Chemist.

O.M. Bishop, G. A., 38, Sherbrooke Avenue, Maxwell Park, Glasgow, Mining Engineer.

1903. Bishop, Howard B., 609, Greene Avenue, Brooklyn, N.Y., U.S.A., Chemist.

1903. Bishop, J. T. F., Chemical Club, Manchester, Secretary.

1902. Black, Walter G., 9, Routh Road, Wandsworth Common, S.W., Chemist.

1894. Blackmore, H. S., 206, South Ninth Avenue, Mount Vernon, N.Y., U.S.A., Chemist (Pure Aluminium and Chemical Company).

1899. Blackwell, G. G., 44-47, The Albany, Liverpool, Mineral and Metal Merchant.

1896. Blagden, Victor, 50-51, Lime Street, London, E.C., Chemical Merchant.

1883. Blagden, W. G., 4, Fenchurch Avenue, London, E.C., Chemical Merchant.

1897. Blair, Andrew A., 406, Locust Street, Philadelphia, Pa., U.S.A., Analytical Chemist.

1884. Blake, Jas., Thames Sugar Refinery, Silvertown, London, E., Sugar Refinery Manager.

1902. Blakemore, Geo. H., Great Cobar Copper Mine, Cobar, N.S.W., Australia, Metallurgist.

1890. Blakey, A. J., Dudbridge Mills, Stroud, Gloucestershire, Dyer.

1891. Blass, Edw., Essen (Ruhr), Germany, Civil Engineer.

1893. Blears, John, c/o Langworthy Bros. and Co., Lim., Greengate Mills, Salford, Dyer and Calico Printer.

O.M. Bles, A. J. S., 32, Chorlton Street, Manchester, Chemical Merchant.

1889. Bloede, Victor G., Station D., Baltimore, Md., U.S.A., Manufacturing Chemist.

1891. Bloomer, Fred. J., Penpont, Clydach, R.S.O., Glamorgan, Technical Chemist and Nickel Works Manager.

1886. Blount, Bertram, Chemical Laboratory, 76 and 78, York Street, Westminster, S.W., Analytical Chemist.

1588. Bloxam, A. G., Birkbeck Bank Chambers, Chancery Lane, W.C., Analytical Chemist.

1890. Bloxam, W. Popplewell, c/o Indigo Improvements Syndicate, Dalsingh Serai, Tirhoot, Bengal, India, Research Chemist.

1902. Bluman, Nicholas J., 10, Amersham Road, New Cross, S.E., Student of Chemistry.

1903. Blumenthal, Lionel, 25, Lever Street, Piccadilly, Manchester, Chemist.

1886. Blundstone, E. R., 14, Great Smith Street, Westminster, S.W., and (Journals) Heathfield, Park Road, Hampton Hill, Middlesex, Consulting and Analytical Chemist.

O.M. Boake, A., Warton Road, Stratford, E., Manufacturing Chemist.

1888. Boake, Edmund J., Aberffraw, Nursery Road, Loughton, Essex, Manufacturing Chemist.

1885. Board, J. T., Distillery, Cheese Lane, Bristol, and (Journals) Roseneath, Willsbridge, near Bristol, Distiller.

1899. Boehm, Fred., 16, Jewry Street, London, E.C., Chemical Agent and Merchant.

1898. Bogert, Prof. Marston T., Department of Organic Chemistry, Columbia University, New York City, U.S.A., Instructor in Organic Chemistry.

1903. Boissevain, Chas. E. H., 92, van Eeghenstraat, Amsterdam, Holland, Chemical Manufacturer.

1903. Bolam, Dr. H. W., Leith Technical College, Leith, N.B., Lecturer on Chemistry.

1901. Bolton, E. Richards, 54, Digby Mansions, Hammersmith, W., Manufacturing Chemist.

1892. Bookman, Dr. S., 9, East 62nd Street, New York City, U.S.A., Chemist.

1888. Boor, Leonard G., 39, Mincing Lane, London, E.C., Chemical Merchant.

1896. Boot, John C., Klatten, Java, Netherlands Indies, Chemist.

1904. Booth, N. Parr, Analytical Laboratory, Cadbury Bros., Ltd., Bournville, near Birmingham, Analytical Chemist.

1894. Booth, Robt., 110, Cannon Street, London, E.C., Engineer.

1891. Boothby, Chas., 31, Dryburgh Road, Putney, London, S.W., Analytical Chemist.

1903. Boral, Robin, Rhodes Mount, Rhodes, near Manchester, Works Manager.

1897. Borland, C. R., P.O. Box 24, Concord Junction, Mass., U.S.A., Smokeless Powder Manufacturer.

O.M. Borland, W. D., Beacon Lodge, Bean, *viâ* Dartford, Kent, Explosives Chemist.

1903. B roschek, Dr. L., 149, East 56th Street, New York City, U.S.A., Chemist.

1903. Bossi, Dr. Arnold, L., c/o Arnold Print Works, North Adams, Mass., U.S.A., Chemist.

1890. Bost, W. D. Ashton, Cartvale Chemical Works, Paisley, N.B., Chemical Manufacturer.

O.M. Bothamley, C. H., Hurst Knoll, Weston-super-Mare, Somerset, County Director of Technical Instruction.

1890. Bott, Dr. W. Norman, The Vicarage, Sleaford, Lincolnshire, Science Lecturer.

1884. Böttinger, Dr. H. T., Elberfeld, Germany; and (subs.) c/o The Bayer Co., Ltd., 19, St. Dunstan's Hill, E.C., Colour Manufacturer.

O.M. Bottle, Alex., 4, Godwyne Road, Dover, Pharmaceutical Chemist.

1901. Bottomley, Dr. J. Frank, 21, Wentworth Place, Newcastle-on-Tyne, Consulting Chemist.

O.M. Boulton, H. E., 64, Cannon Street, London, E.C., Chemical Manufacturer.

1890. Boulton, James, Crayford Mills, Stratford, E., Manufacturing Chemist.

O.M. Boulton, S. B., 64, Cannon Street, London, E.C., Chemical Manufacturer.

1883. Boulton, T. S., 14, Freegrove Road, Caledonian Road, N., Manager.

1900. Bourcoud, Augustin E., Comp. General de Productos Quimicos del Aboño, Gijón, Spain, Civil Engineer.

1884. Bow, R. H., 7, South Gray Street, Edinburgh, Civil Engineer.

1904. Bowden, Thos., 201, Heights Lane, Rochdale, Dyer and Chemist.

1885. Bowen, S. B., Brickfield Chemical Works, Llanelly, South Wales, Chemical Manufacturer.

1899. Bowen, Wm., 43, Woodend Road, Erdington, Birmingham, Chemist.

1888. Bower, Frank, Truman's Brewery, Spitalfields, E., Analytical Chemist.

1897. Bower, Wm. H., 29th Street and Gray's Ferry Road, Philadelphia, Pa., U.S.A., Chemical Manufacturer.

1892. Bowes, Harry, 53, Moss Bank, Higher Crumpsall, Manchester, Analytical Chemist.

1903. Bowey, John, jun., Box 227, Coraopolis, Pa., U.S.A., Chemist.

1889. Bowing, Jno., Fuel Works, Tilbury, Essex, Consulting Chemist.

1883. Bowley, Jos. John, Wellington Works, Battersea Bridge, London, S.W., Chemical Manufacturer.

1899. Bowley, J. Plunkett, 1, Wellington Road, Battersea, S.W., Varnish Manufacturer.

1883. Bowman, Dr. F. H., Spinningfield, Deansgate, Manchester, Chemical Manufacturer.

1894. Bowman, Jas. H., Canada Chemical Manufacturing Co., London, Ont., Canada, Professor of Chemistry.

1884. Bowman, R., Cynwyd, near Corwen, N. Wales, Chemical Manufacturer.

1896. Bowman, Walker, 39, Cortlandt Street, New York City, U.S.A., Chemist.

1899. Bowtell, Norman E., Hazeldene, Heath Road, Runcorn, Cheshire, Works Chemist.

1893. Boyce, Frank, c/o Goodall, Backhouse, and Co., White Horse Street, Leeds, Technical Chemist.

1884. Boyd, Pythagoras, 17, Union Street, North Adams, Mass., U.S.A., Print Works Superintendent.

O.M. Boyd, W., P.O. Box 1829, Johannesburg, South Africa, Technical Chemist.

1899. Boyes, Herb. J., Rio de Janeiro Flour Mills, Ltd., Caixa do Correio 574, São Paulo, Brazil, Chemist.

1902. Brach, Dr. Ludwig K., c/o U.S. Finishing Co., Norwich, Conn., U.S.A., Chemist and Colourist.

1885. Bradburn, J. A., Dade City, Fla., U.S.A., Chemical Engineer.

1883. Bradbury, A., Queen Buildings, 11, Dale Street, Liverpool, Chemical Broker.

1902. Bradbury, S., Thornham New Road, Castleton, Manchester, Chemist.

1898. Bradford, Ernest, Ohio State University, Columbus, Ohio, U.S.A., Metallurgical Chemist.

1895. Bradford, Henry, c/o W. H. Gorringe, Southampton House, Southwick, near Brighton, Analytical Chemist.

1904. Brading, R. W., Casella, Sandal Road, New Malden, Surrey, Builder.

1894. Bradley, Edw. F., The Star Brush Co., Ltd., Eden Grove, Holloway, N., Engineer.

1896. Bragg, Everett B., 1745, Chicago Avenue, Evanston, Ill., U.S.A., Manufacturing Chemist.

1891. Braithwaite, Isaac, Kendal, Westmoreland, Drysalter.

1897. Braithwaite, Jno. O., Hilika, Warren Road, Chingford, Essex, Pharmaceutical Research Chemist.

1901. Braman, Winfred W., State College, Pennsylvania, U.S.A., Assistant Instructor.

1903. Brame, J. S. S., 5, Coleraine Road, Blackheath, S.E., Demonstrator in Chemistry.

O.M. Bramham, W., 86, Bow Road, London, E., and (communications) 115, Broadhurst Gardens, West Hampstead, London, N.W., Chemical Engineer.

O.M. Bramwell, Major E., Chemical Works, St. Helens, Lancashire, Chemical Manufacturer.

O.M. Bramwell, G. H., Cowley Hill, St. Helens, Lancashire, Alkali Manufacturer.

1902. Branegan, Jas. Aug., 4,523, North Uber Street, Philadelphia, Pa., U.S.A., Chemical Salesman.

O.M. Branson, F. W., Wynneholme, Far Headingley, Leeds, Pharmaceutical Chemist.

1903. Brassard, Fred. à. c/o Messrs. Bever and Wolf, 46, Vicar Lane, Bradford, Yorks, Aniline Colour Importers.

1901. Brearley, Harry, Salamander Stahlwerke, Jaegel, Riga, Russia, Analytical Chemist.

1888. Breffitt, Wm., Glasshoughton, Castleford, Yorks, Glass Manufacturer.

1888. Bressey, Edw., 209, Romford Road, Stratford, E., Gold and Silver Refiner.

1901. Brewer, Dr. C. E., Wake Forest, N.C., U.S.A., Professor of Chemistry.

1903. Brewer, Leonard A., Prior Well Brewery, Worksop, Notts, Brewer and Chemist.

1900. Brewis, E. Theodore, 7, Cowper Street, Finsbury, E.C., Chemist.

1894. Breyer, Theodor, c/o Warner Sugar Refining Co., Waukegan, Ill., U.S.A., Chemist (American Glucose Co.).

1885. Briant, L., 24, Holborn Viaduct, London, E.C., Analytical Chemist.

1890. Brierley, J. T., Highfield, Golden Hill, Leyland, near Preston, Lancs., Analytical Chemist.

1894. Briggs, J. Burnett, Vauxhall Soap Works, 6, Blackstock Street, Liverpool, Soap Manufacturer.

1893. Briggs, J. F., 12, Salisbury Road, Maidstone, Sugar Works Chemist.

1885. Briggs, T. Lynton, 188, Central Avenue, Flushing, Long Island, N.Y., U.S.A., Technical Chemist.

1886. Briggs, Wm., 13, Panmure Street, Dundee, Manufacturing Chemist.

1890. Brindley, G. F., c/o Niagara Electro-Chemical Co., Niagara Falls, N.Y., U.S.A., Chemical Engineer.

1886. Bristow, G. W., 10, Philpot Lane, London, E.C., Chemical Manager.

1887. Broadbent, H., c/o Goodall, Backhouse, & Co., Sovereign Street, Leeds, Chemist.

1896. Broadhurst, W. Homer, 294, Lafayette Avenue, Brooklyn, N.Y., U.S.A., Chemist.

1889. Brock, Arthur, Firework Factory, Sutton, Surrey, Firework Manufacturer.

O.M. Brock, J., Gwern-Tyno, Colwyn Bay, North Wales, Chairman of United Alkali Co., Ld.

1896. Brooke, C. B., jun., Colne House, Brantham, near Manningtree, Xylonite Manufacturer

1900. Brooke, Jno. R., 36–37, Mincing Lane, London, E.C., Chemist.

1884. Brookes, E. A., c/o The Chilian Mills Co., Ltd., Chiguayante, Concepcion, Chile, Analytical Chemist.

1895. Brookman, Fred. W., 6, West Street, Rochdale Manure Works Manager.

1903. Brooks, H. Kibbe, c/o Casein Co. of America, Bellows Falls, Vermont, U.S.A., Chemist.

1893. Broome, F. S. J., Leaholme, Holloway, near Matlock Bath, Derbyshire, Assayer.

1901. Broome, Jos., 40, East 39th Street, Bayonne, N.J., U.S.A., Chemical Engineer.

O.M. Brotherton, E. A., M.P., Commercial Buildings, Leeds, Ammonia Distiller.
1884. Brown, Prof. A. Crum, F.R.S., 8, Belgrave Crescent, Edinburgh, Professor of Chemistry.
1902. Brown, A. H., c/o Daly Reduction Co., Hedley, B.C., Canada, Metallurgist.
1891. Brown, Cæsar R., 23, Gower Road, Forest Gate, E., Works Foreman.
O.M. Brown, D., 93, Abbey Hill, Edinburgh, Chemical Manufacturer.
O.M. Brown, D., Donaghmore, Tyrone, Ireland, Soap Manufacturer.
1890. Brown, Edw. Hilton, c/o W. Ropes and Co., St. Petersburg, Russia, Analytical Chemist.
1903. Brown, Frank C., P.O. Box 211, Framingham, Mass., U.S.A., Foreman.
1894. Brown, Geo. E., c/o The Photogram, Ltd., Effingham House, Arundel Street, Strand, London, W.C., Chemist.
O.M. Brown, Henry, Benskin's Brewery, Watford, Herts, Brewing Chemist.
1899. Brown, Dr. Henry C., The Chemical Works, King's Lynn, Chemical Manufacturer.
O.M. Brown, Dr. Horace T., F.R.S., 52, Nevern Square, Kensington, S.W., Brewing Chemist.
O.M. Brown, Dr. J. Campbell, 8, Abercromby Square, Liverpool, Professor of Chemistry.
1891. Brown, J. Henry, Minas d'Aljustrel Alemtejo, Portugal, Technical Chemist.
1901. Brown, Jos., Ashleigh House, Savile Town, Dewsbury, Manufacturing Chemist.
1892. Brown, Reginald B., 11, Circular Road, Withington, Manchester, Technical Chemist.
1889. Brown, Robt., The Firs, Hartford, Northwich, Engineer.
1901. Brown, Samuel B., Loveclough, Rawtenstall, Lancashire, Calico Printer's Manager.
O.M. Brown, T., Skopelos, Hunstanton, Chemical Manufacturer.
O.M. Brown, Walter, c/o Jas. H. Dennis and Co., Ltd., Widnes, Technical Chemist.
1900. Brown, Walter B., Victor Chemical Works, Chicago Heights, Ill., U.S.A., Chemist.
1897. Brown, Wm., 293, Great Clowes Street, Higher Broughton, Manchester, Engineer.
1901. Browne, Dr. Arthur L., 13-15, North Street, Baltimore, Md., U.S.A., Analytical Chemist.
1903. Browne, Dr. Chas. A., jun., Audubon Park, New Orleans, La., U.S.A., Sugar Chemist.
O.M. Browning, W., Broad Oak, Accrington, Calico Printer.
1901. Brownlie, David, 11, Langford Road, Heaton Chapel, near Manchester, Chemist.
1902. Brownrigg, Marcus P., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1902. Brownsdon, Dr. H. W., King's Norton Metal Co., Ltd., Abbey Wood, Kent, Works Chemist.
1902. Bruce, Alex., Laboratory, Hyde Park Corner, Colombo, Ceylon, Chemist.
1890. Bruce, Jas., Vauxhall Distillery, Liverpool, Distiller.
1900. Bruce, Wm. T., c/o Hugh Wallace and Co., Ltd., 5, Fenchurch Street, London, E.C., Director.
1892. Bruckmann, G. T., 192, 18th Street, Brooklyn, N.Y., U.S.A. Chemical Engineer.
O.M. Brunner, H., Holly Mount, Tarbock Road, Huyton, near Liverpool, Chemical Manufacturer.
1894. Brunner, H. Bertram, Winnington Park, Northwich, Chemist and Electrician.
1887. Brunner, J. F. L., 23, Wetherby Gardens, London, S.W., Chemical Manufacturer.
O.M. Brunner, Sir J. T., Bart., M.P., Druid's Cross, Wavertree, Liverpool, Chemical Manufacturer.
1902. Brunner, Roscoe, c/o Messrs. Brunner, Mond, and Co., Ltd., Northwich, Alkali Manufacturer.
1894. Brunton, J. Dixon, Wire Mill, Musselburgh, N.B., Wire Manufacturer.
1903. Bryant, V. Seymour, The Bank, Camborne, Cornwall, Analytical Chemist.
1890. Bryce, John Annan, Messrs. Wallace Bros., 8, Austin Friars, London, E.C., Merchant.
1894. Bryce, Thos., Tharsis Mines, Huelva, Spain, Chemist.
1897. Bryson, Jas., Pumpherston Oil Works, Midcalder, N.B., Oil Works Manager.
1892. Buchanan, D. G., Mount Vernon House, Glasgow, Analyst.
1902. Buchanan, Duncan G., 500, Church Street, Toronto, Ont., Canada, Chemist.
1901. Buchanan, E. F., 712, Payne Avenue, Akron, Ohio, U.S.A., Chemist.
1888. Buchanan, Jas., jun., Caledonia Foundry, Brasenose Road, Liverpool, Engineer.
1897. Bucher, Prof. John E., Brown University, Providence, R.I., U.S.A., Assistant Professor.
1897. Buck, Chas. A., 521, Locust Street, South Bethlehem, Pa., U.S.A., Chief Chemist (Bethlehem Iron Co.).
1897. Bucknill, Jno. A., P.O. Box 52, Government Patent Office, Pretoria, Transvaal, Comptroller General of Patents.
O.M. Budden, E. R., 13, Heath Mansions, Hampstead, N.W., Consulting Chemist.
1900. Bull, Dr. Benjamin S., 104, Humber Road, Blackheath, S.E., Technical Chemist.
1902. Bull, Irving C., P.O. Box, 294, Middletown, N.Y. U.S.A., Chemist.
1892. Bull, Johannes C., Athelstone, Havelock Street, Helensburgh, N.B., Chemical Engineer.
O.M. Bullock, J. L., 3, Hanover Street, Hanover Square, London, W., Manufacturing Chemist.
1899. Bult, Herbert J., 18, Billiter Street, London, E.C., Chemist.
O.M. Bumby, H., Coltness Ironworks, Newmains, N.B., Ironworks Manager.
O.M. Bunker, H. E., 19, Napier Street, Toronto, Ont., Canada, Technical Chemist.
1901. Bunting, Henry H., c/o Peruvian Corporation, Ltd., Lima, Peru, Analyst.
1894. Bunting, W. Lightfoot, Forest Bank, Crawshawbooth, near Manchester, Calico Printer.
1893. Burbridge, Jas., India-rubber Mills, Tottenham, N., India-rubber Manufacturer.
1886. Burdekin, G., jun., Park Villa, Prescot Road, St. Helens, Chemical Works Manager.
1896. Burford, Samuel F., The Firs, Kirby Muxloe, near Leicester, Analytical Chemist.
1898. Burge, Chas. H., Government Laboratory, Clement's Inn Passage, Strand, W.C., Analyst.
1889. Bürger, Dr. J., 1, Birch Avenue, Talbot Road, Old Trafford, Manchester, Technical Chemist.
1901. Burgess, Prof. C. F., University of Wisconsin, Madison, Wis., U.S.A., Electro-chemical Engineer.
1889. Burgess, Geo., Hale Road, Ditton, Widnes, Chemist.
1889. Burgess, Wm. T., 46, Portland Road, Holland Park, London, W., Analytical Chemist.
O.M. Burghardt, Dr. C. A., Butcombe, Blagdon, Bristol, Consulting Chemist.
1902. Burk, W. E., Male High School, Louisville, Ky., U.S.A., Chemist and Teacher.
1902. Burkard, Dr. Ernst, The Heyden Chemical Works, Garfield, N.J., U.S.A., Chemist.
1899. Burkhardt, Dr. G., c/o Soc. Romana de Produse Chimiche, Valea Calugareasca, Roumania, Chemist.
1897. Burland, Lt.-Col. Jeffrey H., 824, Sherbrooke Street, Montreal, Canada, Paper and Card Manufacturer.
1896. Burland, Richard O., Bishopgate, Wigan, Manufacturing Chemist.
1900. Burleigh, Wm. F., c/o Murphy Varnish Co., Newark, N.J., U.S.A., Technical Chemist.
1897. Burls, Frank B., 4, Dyers Hall Road, Leytonstone, Essex, Chemist.
1898. Burls, Herbert T., (Journals) c/o Royal Societies Club, St. James Street, S.W., and (communications) Foulis Terrace, Onslow Gardens, S.W., Mechanical Engineer.
1901. Burnand, Sydney, Manbré Saccharine Co., Ltd., Hammersmith, W., Manager.
O.M. Burnard, R., Plymouth Chemical Works, Plymouth, Chemical Manufacturer.

1891. Burnet, Henry K., North Brook Vitriol Works, Bradford, Yorks., Vitriol Maker.

1897. Burnet, Jno. Jas., 18, University Avenue, Glasgow, Architect.

1893. Burnham, J. C., Cordite Factory, Wellington, Nilgiri Hills, India, Analytical Chemist.

1900. Burnside, Chas. F., c/o International Smokeless Powder Co., Parlin, N.J., U.S.A., Chemist.

1890. Burn-Murdoch, J. V., Neuck, Larbert, N.B., Assayer.

1900. Burr, Edmund C., 1722, Vallejo Street, San Francisco, Cal., U.S.A., Manufacturer.

1903 Burr, Edwin H., 18, Cedar Street, New York City. U.S.A., Importer of Essential Oils.

1900. Burr, E. Willard, Alvarado, Alameda Co., Cal., U.S.A., Sugar Manufacturer.

O.M. Burrell, B. A., 5, Mount Preston, Leeds, Analytical Chemist.

1892. Burrough, Horace, jun., 509, West Lombard Street, Baltimore, Md., U.S.A., Technical Chemist.

1888. Burrows, Edw., Home Villa, Low Fell, Gateshead-on-Tyne, Alkali Works Manager.

1901. Burton, Alf., c/o Merchants' Dyeing and Finishing Co., Ltd., 42, Front Street West, Toronto, Canada, Dyer and Finisher.

1903. Burton, Jno., 2, Green Street, Bethnal Green, E., Dye and Chemical Manufacturer.

1889. Burton, Wm., The Hollies, Clifton Junction, near Manchester, Potter's Chemist.

1897. Burwell, A. W., Kyle Street, Lakewood, *via* Cleveland, Ohio, U.S.A., Consulting Chemist.

1885. Bury, J. H., Church Chemical Works, near Accrington, Chemical Manufacturer.

1897. Bush, J. M., c/o W. J. Bush and Co., Ltd., Ash Grove, Hackney, E., Manufacturing Chemist.

1897. Butler, David B., 41, Old Queen Street, Westminster, S.W., Cement Expert.

1903. Butler, Fredk., Ash Lane, Hough Green, near Widnes, Manager (Ditton Copper Works).

1890. Butler, Paul, Lowell, Mass., U.S.A., Ammunition Manufacturer.

1885. Butler, Samuel, The Cedars, Compton, Wolverhampton, Brewer.

1886. Butler, W. W., Southfield, Norfolk Road, Edgbaston, Birmingham, Brewer.

1903. Buttenshaw, E. L., 31, Edge Lane, Chorlton-cum-Hardy, Manchester, Analytical Chemist.

O.M. Butterfield, J. C., 79, Endlesham Road, Balham, S.W., Analytical Chemist.

1892. Butterfield, W. J. A., Overdale, Bletchingley, Surrey, Analytical Chemist.

1897. Butters, Charles, 28-31, Bishopsgate Street Within, London, E.C., and (Journals) 220, Crocker Building, San Francisco, Cal., U.S.A., Metallurgist.

1900. Butterworth, Elwell R., c/o Reversible Collar Co., 111, Putnam Avenue, Cambridge, Mass., U.S.A., Chemist.

1902. Butterworth, F. J., P.O. Box 54, Newark, N.J., U.S.A., Chemist.

1892. Buttfield, Horace V., 13, Wellington Road, Bush Hill Park, Enfield, N., Chemical Demonstrator.

O.M. Byard, A. G., c/o Burt, Boulton, and Heywood, Apartado 8, Bilbao, Spain, Technical Chemist.

1899. Byrnes, Eugene A., 918, F. Street, N.W., Washington, D.C., U.S.A., Examiner in Electro-Chemistry.

1893. Byrom, T. H., Laboratory, Wigan Coal and Iron Co., Wigan, Analytical Chemist.

1887. Bythway, M., 44, Lloyd Street, Albert Street, Manchester, Drysalter.

C

1884. Cabot, Godfrey L., 82, Water Street, Boston, Mass., U.S.A., Chemist.

1889. Cadett, Jas., Ashtead, Surrey, Photographic Dry Plate Maker.

1902. Cady, Walter B., c/o Wabash Portland Cement Co., Stroh Ind., U.S.A., Chemist.

1901. Cady, Wm. H., 13, North Water Street, Philadelphia, Pa., U.S.A., Colour Chemist.

1891. Caines, G. S. A., 7, Rochester Terrace, Camden Road, London, N.W., Analytical Chemist.

1900. Cairns, Adam, Thistle Rubber Mills, Commerce Street, Glasgow, Manager.

1896. Cairns, F. Irvan, Anaconda, Mont., U.S.A., Metallurgist.

1897. Cairns, Wm., 5, Carlton Place, Glasgow, Plumber.

1891. Caldecott, W. Arthur, Box 67, Johannesburg, Transvaal, South Africa, Metallurgist.

1897. Calder, W. A. S., The Hollies, South Road, Smethwick, Chemical Manufacturer.

1888. Caldwell, Wm., Murray Street, Paisley, N.B., Drysalter.

1891. Calkin, Wm. S., Spring Forge, Pa., U.S.A., Paper Pulp Works Chemist.

1902. Calm, Chas. E., 190, Michigan Street, Chicago, Ill., U.S.A., Manufacturing Chemist.

1901. Calvert, Jos. E., 293, Butler Street, Etna, Allegheny Co., Pa., U.S.A. Analytical Chemist.

1899. Calvert, Sidney, State University, Columbia, Mo., U.S.A., Professor of Chemistry.

1895. Cambier, Jacob, 910, Spruce Street, Pueblo, Colo., U.S.A., Chemist.

1894. Cameron, Alex., Kronthal im Taunus, Germany, Chemical Engineer.

1891. Cameron, Jas., 70, Old Chester Road, Woodhey, near Birkenhead, Chemist.

1888. Cameron, Peter, Bath Bridge Colour Works, Bristol, Colour Works Manager.

O.M. Cammack, J., 51, Denton's Green Lane, St. Helens, Technical Chemist.

1886. Campbell, Andrew, c/o Burmah Oil Co., Ltd., Dunneedaw, Rangoon, Burmah, Analytical Chemist.

O.M. Campbell, Archibald, Berry Lodge, Rugeley, Staffordshire, Technical Chemist.

1902. Campbell, Ashley, Colonial Sugar Refining Co., Ltd., Pyrmont Refinery, Sydney, N.S.W., Australia, Analytical Chemist.

1899. Campbell, Jas. Eunyce, Hotel Stanwix, Chandler Street, Worcester, Mass., U.S.A., Chemical Engineer.

1886. Campbell, John, 75, Hudson Street, New York City U.S.A., Dye Manufacturer.

1901. Campbell, Kenneth F., M.Inst.C.E., 1, Peel Street, Huddersfield, Civil Engineer.

1897. Canfield, F. D., jun., c/o Cuban Sugar Refining Co., Cardenas, Cuba, Sugar Refiner.

1893. Cannon, J. C., 12, Western Road, Shoreham, Sussex, Analyst.

O.M. Cannon, M., 25, Stormont Road, Clapham Common, S.W., Vinegar Works Manager.

1891. Canziani, Enrico, 3, Palace Green, Kensington, W., Civil Engineer.

1891. Carden, Albert J., Dunster House, 12, Mark Lane, E.C., Distiller.

1893. Carey, Arthur, 1, Grassendale Road, Cressington, near Liverpool, Chemist.

O.M. Carey, Eustace, 20, Alexandra Drive, Sefton Park, Liverpool, Chemical Manufacturer.

O.M. Carlile, T., 23, West Nile Street, Glasgow, Chemical Manufacturer.

1895. Carlsson, Hugo, c/o Dominion Iron and Steel Co., Sydney, C.B., Canada, Analytical Chemist.

1893. Carmichael, Dr. H., 176, Federal Street, Boston, Mass., U.S.A., Analytical Chemist.

1896. Carmichael, Herbert, Bureau of Mines, Victoria, British Columbia, Public Analyst and Assayer.

1884. Carmody, Prof. Patrick, Government Laboratory, Port of Spain, Trinidad, Analytical Chemist.

1903. Carneiro da Cunha, J. M., Comp. Agricola & Mercantil, Rua do Apollo 28, Pernambuco, Brazil, Manager.

1897. Carnell, Wm. C., c/o Tacony Chemical Works, Bridesbury, Philadelphia, Pa., U.S.A., Chemist.

O.M. Caro, Dr. H., Mannheim, Germany, Technical Chemist.

1893. Carpenter, C. C., South Metropolitan Gas Co., 709A, Old Kent Road, London, S.E., Civil Engineer.
1900. Carpenter, Frank B., Crenshaw Building, Richmond, Va., U.S.A., Chemist.
1900. Carpenter, Harry B., c/o Lister's Agricultural Chemical Works, Newark, N.J., U.S.A.
1903. Carpenter, H. C. Harold, The National Physical Laboratory, Bushy House, Teddington, Middlesex, Chemist and Metallurgist.
O.M. Carpenter, R. Forbes, Prestwich, Greencroft Gardens, West Hampstead, N.W., Chief Inspector under the Alkali, &c. Works Acts.
1885. Carruthers, J. G., Burnbrae House, Milngavie, N.B., Dyeworks Manager.
1903. Carson, Archd., The Cedars, Cranford, Middlesex, Colour Manufacturer.
1901. Carson, Geo. C., c/o Fred. Hurst, Redding, Shasta Co., Cal., U.S.A., Mining Engineer.
O.M. Carteighe, M., 180, New Bond Street, London, W., Pharmaceutical Chemist.
1902. Carter, Jno. P., 626, South 24th Street, Philadelphia, Pa., U.S.A., Analytical Chemist.
1895. Carter, Stewart F., Windsor Printworks, North Adams, Mass., U.S.A., Technical Chemist.
1903. Carter, Thomas, 322, Scarr Hill, Bradford, Yorks, Works Chemist.
1886. Carter, W. Chas., Hotel Alfonse, Sydney, Cape Breton, Nova Scotia, Canada, Analytical Chemist.
1889. Carulla, F. J. R., 84, Rose Hill Street, Derby, Chemical Manufacturer.
1903. Caspari, Dr. W. A., 5, Park Lane, Teddington, Chemist and Physicist.
1902. Catchpole, Albert A., Ravensdeane, Grove Park, Lee, Kent, Works Chemist.
1895. Catlin, Chas. A., 133, Hope Street, Providence, R.I., U.S.A., Chemist (Rumford Chemical Works).
1896. Caven, Robt. M., University College, Nottingham, Lecturer in Chemistry.
O.M. Cawley, G., 25, Victoria Street, Westminster, S.W., Chemical Engineer.
O.M. Cawley, J., 278, Passaic Street, Newark, N.J., U.S.A., Analytical Chemist.
1897. Cawley, Thos. A., British Gelatin Works, New Bedford Road, Luton, Beds., Gelatin Manufacturer.
1900. Cayvan, Llewellyn L., 817, Pennsylvania Avenue, Kansas City, Mo., U.S.A., Chemist.
1902. Cerasoli, Alburto, 29, West Kensington Mansions, London, W., Engineer.
1891. Chadwick, Walter M., 24, West 3rd Street, Bayonne, N.J., U.S.A., Chemical Works Manager.
1897. Challen, Matthew B., School of Mines, Daylesford, Victoria, Australia, Assayer.
O.M. Chaloner, G., 30, Weston Park, Crouch End, N., Chemical Lecturer.
1894. Chaloner, G. W., 26, Eagle Wharf Road, Hoxton, N., Chemical Manager.
1901. Chamberlain, G. E., 5169, Delmar Building, St. Louis, Mo., U.S.A., Chemist.
1902. Champion, Edmund C., c/o Iola Portland Cement Co., Iola, Kas., U.S.A., Chemist.
O.M. Chance, A. M., Chemical Works, Oldbury, near Birmingham, Chemical Manufacturer.
O.M. Chandler, Dr. C. F., Columbia University, West 116th Street, New York City, U.S.A., Professor of Chemistry.
1900. Chandler, Prof. W. H., Lehigh University, South Bethlehem, Pa., U.S.A., Professor of Chemistry.
1893. Chaplin, Dr. Edw. M., Public Analyst's Laboratory, Wakefield, Yorks, Analytical Chemist.
1890. Chapman, Alf. C., 8, Duke Street, Aldgate, E.C., Analytical Chemist.
1903. Chapman, Geo. W., Swift Fertilizer Works, 913, Prudential Building, Atlanta, Ga., U.S.A., Superintendent.
O.M. Chapman, S., 36, Mark Lane, E.C., Chemical Manufacturer.
1894. Charlier, A. C. J., 54, Hornsey Rise, Crouch End, N., General Manager and Chemist.
1902. Charlton, Thos., 2926, Webster Street, San Francisco, Cal., U.S.A., Manufacturing Chemist.
1900. Chase, March F., c/o New Jersey Zinc Co., Palmerton, Pa., U.S.A., Chemist.
1889. Chase, R. L., Arnold Printworks, North Adams, Mass., U.S.A., Printworks Chemist.
1894. Chatard, Dr. T. M., 1716, Rhode Island Avenue, Washington, D.C., U.S.A., Chemical Engineer.
1900. Chattaway, Wm., Apothecaries' Hall, London, E.C., Consulting Chemist.
1898. Chattock, Herbert E., 23, Apsley Road, Clifton, Bristol, Oilcake Manufacturer.
1901. Cheetham, Howard, 18, St. Ann Street, Manchester, Chartered Patent Agent.
1894. Cheney, J. P., c/o Cheney Bros., South Manchester, Conn., U.S.A., Silk Manufacturer's Chemist.
1885. Cheyne, A. M., c/o Messrs. Burgoyne, 16, Coleman St., E.C., Analytical Chemist.
1902. Chilwell, John, Oakeswell, Wednesbury, Analyst.
1893. Cholerton, A. F., 40½, Belgrave Gate, Leicester, Manufacturing Chemist.
1890. Chorley, Jno. C., Lodge Lane, Bewsey, Warrington, Analytical Chemist.
O.M. Christie, J., Levenfield, Alexandria, N.B., Dyer and Printer.
1903. Christie, John, c/o The British Explosives Syndicate, Ltd., Pitsea, Essex, Analytical Chemist.
1898. Christison, Geo., Cremona, Cambridge Drive, Glasgow, Engineer.
1883. Christy, Thos., The Manor House, Wallington, Surrey; and 4, 10, and 12, Old Swan Lane, London, E.C., Chemical Botanist.
O.M. Chrystal, W. J., Shawfield Works Rutherglen, near Glasgow, Chemical Manufacturer.
O.M. Church, Professor A. H., F.R.S., Shelsley, Kew, Surrey, Professor of Chemistry in the Royal Academy.
1890. Church, Elihu D., jun., 63, Wall Street, New York City, U.S.A., Soda Manufacturer.
1904. Cirkel, Fritz, 80, Stanley Street, Montreal, P.Q., Canada, Mining Engineer.
1896. Claflin, Alan, Littleton, Mass., U.S.A., Manufacturing Chemist.
1900. Clamer, Guilliam H., 46, Richmond Street, Philadelphia, Pa., U.S.A., Chemist.
1885. Clanahan, H. C., 79, Mosley Street, Manchester, Chemical Merchant.
1901. Clapham, Henry E., Laurel Bank, Wilsden, near Bradford, Yorks., Technical Chemist.
1891. Clapp, Ralph R., c/o Standard Ammonia Co., Ltd., Iceland Wharf, Old Ford, E., Ammonia Works Manager.
1889. Clapperton, J., jun., 36, Ashton Gardens, Hillhead, Glasgow, Analytical Chemist.
1903. Clare, Henry, 107, Newgate Street, Morpeth, Northumberland, Schoolmaster.
1903. Clark, Augustus, Fundicio do Bowman, Caixa 57, Recife, Pernambuco, Brazil, Mechanical Engineer.
1896. Clark, Donald, Bairnsdale, Victoria, Australia, Director of School of Mines.
1903. Clark, Edmund, Board of Health, 6th Avenue, and 55th Street, New York City, U.S.A., Chemist.
1901. Clark, Herbert Noel, West Ham Gasworks, Stratford, E., Gas Engineer.
O.M. Clark, Dr. J., 138, Bath Street, Glasgow, Analytical Chemist.
1900. Clark, Jno., Broadway Works, Millwall Dock, London, E., Manufacturing Chemist.
1902. Clark, Robt. M., Rockbank, Partickhill, Glasgow, Chemist.
1903. Clark, Dr. W. Inglis, 104, South Canongate, Edinburgh, Manufacturing Chemist.
1902. Clark, Wm. Linus, Champion Coated Paper Co., Hamilton, Ohio, U.S.A., Chemist.
1891. Clarke, Goddard, South Lodge, Champion Hill, S.E., Drysalter.
1898. Clarke, J. F. Wyllie, Messrs. J. and R. Tennent, Wellpark Brewery, Glasgow, Managing Director.

1903. Clarke, Robt. W., c/o Clinical Research Association, Ltd., 1, Southwark Street, London, S.E., Analyst.

1897. Clarke, Wm. B., Edison-Swan Electric Works, Ponders End, N., Electro-Chemist.

O.M. Claudet, A. C., 6, Coleman Street, E.C.; and (Journals) 9, Daleham Gardens, Hampstead, N.W., Metallurgist.

O.M. Claudet, F. G., 181, Willesden Lane, N.W., Assayer and Metallurgist.

1889. Claus, Wm. H., c/o Claus and Ree, Clayton, Manchester, Manufacturing Chemist.

O.M. Clayton, E. G., Chemical Laboratory, 32, Holborn Viaduct, London, E.C., Consulting Chemist.

1895. Clayton, Dr. G. C., Maldon Lodge, Wavertree, Liverpool.

1899. Clayton, Harold, 51, Smallbrook Lane, Westleigh, Lancashire, Colourist and Chemist.

1891. Clayton, J. W., c/o Clayton and Jowett, Ltd., Concert Street, Liverpool, Essence Distiller.

1894. Clayton, Robt. H., 12, Park Avenue, Southport, and (Journals) 37, George Street, Cheetham Hill, Manchester, Chemist.

1893. Clemes, J. H., The Bracken, Newquay, Cornwall.

1886. Cleminshaw, E., Alkali Works, Oldbury, near Birmingham, Technical Chemist.

1883. Clemons, G. H., Cudbear Street, Hunslet Road, Leeds, Dyeware Manufacturer.

1884. Clerk, Dugald, 18, Southampton Buildings, Chancery Lane, W.C., Engineer.

1899. Cleveland, D. B., 116, Olive Street, Cleveland, Ohio, U.S.A., Chemist.

1884. Cliff, Stephen, Wortley, near Leeds, Firebrick Maker.

1900. Clifford, Wm., Glenhurst, Sewage Outfall Works, Wolverhampton, Sewage Works Manager.

O.M. Cloud, T. C., 4, Lloyd's Avenue, Fenchurch Street, E.C., Metallurgist and Manager.

O.M. Clowes, Prof. F., 40, Craven Street, Charing Cross, W.C.; and The Grange, College Road, Dulwich, S.E., Chief Chemist (L.C.C.).

1891. Clutton, J. H., Elliott's Metal Co., Ltd., Burry Port, R.S.O., Carmarthenshire, Assayer.

1900. Clymer, Wm. R., c/o National Carbon Co., Cleveland, Ohio, U.S.A., Chemist.

1899. Coates, Chas. E., jun., Louisiana State University, Baton Rouge, La., U.S.A., Professor of Chemistry.

1888. Coats, Jno. T., 105, Broughton Street, Edinburgh, Manufacturing Chemist.

1893. Cebb, Jno. W., Farnley Ironworks, near Leeds, Technical Assistant to Managing Director.

1904. Coblentz, Lambert, 122, Broderick Street, San Francisco, Cal., U.S.A., Chemist.

1894. Coblentz, Dr. Virgil, College of Pharmacy, 115, West 68th Street, New York City, U.S.A., Chemical Lecturer.

1899. Cochran, Alfred, 559, Madison Street, Brooklyn, N.Y., U.S.A., Chemist.

1904. Cochran, C. B., 514, South High Street, West Chester, Pa., U.S.A., Teacher of Chemistry.

1898. Cochrane, A. Lynde, 55, Kilby Street, Boston, Mass., U.S.A., Clerk (Cochrane Chemical Co.).

1895. Cochrane, Jno., Watford Bridge, New Mills, viâ Stockport, Calico Printer.

1901. Cockburo, John A., Ardeer, Stevenston, Ayrshire, Analytical Chemist.

1902. Cocking, Allan T., The Grove, Stanford-le-Hope, Essex, Ammunition Manufacturer.

1903. Cofman-Nicoresti, J., 41, Hart Street, Bloomsbury, W.C., Chemist.

1903. Coggesball, Dr. G. W., Chestnut Street, Dedham, Mass., U.S.A., Chemical Manufacturer.

1887. Coghill, P. de G., Borax Works, Old Swan, Liverpool, Technical Chemist.

1884. Cogswell, W. B., Syracuse, N.Y., U.S.A., Chemical Engineer.

1899. Cohen, Dr. Hermann, c/o S. Mandle, 3943, West Pine Boulevard, St. Louis, Mo., U.S.A., Organic Chemist.

O.M. Cohen, Dr. J., Yorkshire College, and (Journals) 13, Cardigan Road, Leeds, Analytical Chemist.

1900. Cohen, R. Waley, 11, Hyde Park Terrace, London, W., Chemist.

1897. Cohn, Alfred J., c/o Merck and Co., 13–19, University Place, New York City, U.S.A., Chemist.

1901. Cohn, Sigmund, 13, Dutch Street, New York City, U.S.A., Metallurgical Chemist.

1903. Colbert, W., British S.A. Dynamite Factory, Modderfontein, Transvaal, Analytical Chemist.

1891. Colby, Albert L., c/o International Nickel Co., 43, Exchange Place, New York City, U.S.A., Metallurgical Engineer.

1899. Colby, E. A., Baker Platinum Works, Newark, N.J., U.S.A., Metallurgical Chemist.

O.M. Colby, W. H., Carreg-wen, Aberystwith, Wales.

1893. Colefax, Dr. Arthur, 85, Onslow, London, S.W., Barrister-at-Law.

1893. Coleman, W. H., 299, North Road, Clayton, Manchester, Tar Works Chemist.

O.M. Collens, E., Vinegar Works, Stourport, Worcestershire, Vinegar Works Manager.

1887. Collett, J. M., Hillfield, Gloucester, Chemical Manufacturer.

1901. Colley, Bernard T., c/o American Smelting and Refining Co., Aguas Calientes, Mexico, Assayer.

1902. Colley, Hyltou H., c/o Dr. Bedford, Ponsonby, Auckland, New Zealand, Chemist.

1903. Collier, Pierre, Companhia Industrial Pernambucana, Pernambuco, Brazil, Civil Engineer.

1893. Collin, Dr. C. A., Ferguslie Threadworks, Paisley, N.B., Textile Chemist.

1898. Collingridge, Frank, 4, Wyndham Road, Edgbaston, Birmingham, Chemist.

1883. Collins, J. H., 702, Salisbury House, Finsbury Circus, London, E.C., Technical Chemist.

1899. Collins, S. Hoare, Durham College of Science, Newcastle-on-Tyne, Agricultural Chemist.

1888. Collins, W. Hepworth,
Analytical Chemist.

1899. Collis, Walter T., Swinford House, Stourbridge, Worcestershire, Chemist.

1891. Colman, Dr. H. G., Elmside, Worcester Park, Surrey, Analytical Chemist.

1892. Colquhoun, Lewis, c/o South African Explosives Co., Modderfontein, Transvaal, Analytical Chemist.

1894. Colquhoun, W., Plas Penyddol, Bersham, near Wrexham, North Wales, Engineer.

1901. Colwell, J. Kear, Finsbury Town Hall, Rosebery Avenue, E.C., Analytical and Consulting Chemist.

1900. Comey, Arthur M., 12, Pearl Street, Boston, Mass., U.S.A., Technical Chemist.

1899. Conant, Francis M., c/o Sanderson and Porter, Mishawaka, Ind., U.S.A., Chemical Engineer.

1901. Connah, Jas., Normanhurst, Park Road, Sidcup, Kent, Government Analyst.

1902. Conner, Robt. S., c/o Newaygo Portland Cement Co., Newaygo, Mich., U.S.A., Chemist.

1883. Connor, C. C., 4, Queen's Elms, Belfast, Ireland, Chemist.

1891. Conradson, Pontus H., Galena Oilworks, Franklin, Pa., U.S.A., Analytical Chemist.

1889. Conroy, Dr. Jas. T., 13, Heward Drive, Grassendale, Liverpool, Chemist.

1887. Constable, W. H., Australian Alum Works, Runcorn; (communications) 19, Stocks Lane, Chester, Analytical Chemist.

1902. Converse, W. A., Rooms 27–34, Rialto Building, Chicago, Ill., U.S.A., Chemist.

1891. Coode, J. Charles, 19, Freeland Road, Ealing, W., Civil Engineer.

1902. Cook, Arthur Jas., 167, Richmond Road, Hackney, N.E., Chemist (Cement Works).

O.M. Cook, H. J., The Firs, Woodford Green, Essex, Soap Manufacturer.

1903. Cook, Jas. W., London and Provincial Dye Works, Hackney Wick, N.E., Dyer.

1888. Cook, Jno. J., Atlas Foundry, St. Helens, Lancashire, Ironfounder.

1899. Cook, R. Anderson, New Brunswick, N.J., U.S.A., Chemist.

1898. Cook, Thos. Alex., East London Soap Works, Bow, E., Soapmaker.
1899. Cook, Walter G., 9, Hendon Lane, Finchley, N., Analytical Chemist.
1894. Cook, Wm. Martyn, Cecilhurst, Uplands Park, Enfield, N., Analytical Chemist.
1891. Cooke, Arthur W., c/o Brotherton and Co., Holmes Street, Dewsbury Road, Leeds, Analytical Chemist.
1901. Cooper, T. S., Beckfoot, Manchester, S.E., Calico Printing Chemist.
1891. Cooper, Walter J., (communications) c/o South Wales Cement Co., Penarth, Cardiff; and (Journals) The Elms, Lower Penarth, South Wales, Cement Works Manager.
1897. Cooper, Wm. R., 113, Tulse Hill, S.W., Electrical Engineer.
1890. Corcoran, Bryan, 31, Mark Lane, London, E.C., Chemical Engineer.
1887. Cordner-James, J. H., Finsbury House, Blomfield Street, London, E.C., Mining Engineer.
1899. Cornelison, Dr. Robt. W., Bloomfield, N.J., U.S.A., Consulting Chemist.
1887. Cornett, Jas. P., Ford Paper Works, Hylton, near Sunderland, Paper Maker.
1903. Corrêa de Brito, Dr. L., Rua do Commercio, 6, Recife, Pernambuco, Brazil, Civil Engineer.
1889. Corrie, David, c/o Nobel's Explosives Co., Ltd., Polmont Station, N.B., Technical Chemist.
1902. Corse, Wm. Malcom, 1283, Third Avenue, Detroit, Mich., U.S.A., Chemist.
1903. Cortright, R. M., 20, South Centre Street, Bethlehem, Pa., U.S.A., Assistant Chemist.
1894. Coste, J. H., 40, Craven Street, W.C.; and (Journals) 206, Amhurst Road, Hackney, E., Analytical Chemist.
1901. Costobadio, H. A., Overdale, Mottram-in-Longdendale, near Manchester, Calico Printer.
1891. Cotton, W. F., Hollywood Roebuck, Co. Dublin, Gas Works Manager.
1898. Coupe-Annable, H. W., c/o Tungsten and Rare Metals Co., Queen's Road, Battersea, S.W., Chemist.
1894. Court, Heywood, 67, Surrey Street, Sheffield, Analytical Chemist.
1898. Courtney, Samuel, 37, The Mount, Belfast, Ireland, Manager.
1894. Cousins, W. J., 17, Temple Chambers, Temple Avenue, E.C., Consulting Chemist and Director.
1903. Cowan, Wallace, c/o The Stirling Boiler Co., Ltd., Motherwell, N.B., Analytical Chemist.
1893. Cowan, W. J., 12, Park Avenue, Wood Green, N., Fine Colour Manufacturer.
1894. Coward, Percy, Sewage Disposal Works, Deighton, Huddersfield, Chemist.
1897. Cowburn, Arthur W., 29, Princess Street, Manchester, Chemical Merchant and Analytical Chemist.
1894. Cowburn, W. H., 29, Princess Street, Manchester, Chemical Merchant.
1891. Cownley, A. J., 225, Barry Road, Dulwich, S.E., Analytical Chemist.
1891. Cowper-Coles, Sherard Osborn, Grosvenor Mansions, Victoria Street, Westminster, S.W., Metallurgical Engineer.
1902. Coyle, Benj. C., City Laboratory, 17, Castle Street, Dublin, Analytical Chemist.
1884. Craig, Geo., Chemical Laboratory, 95, Bath Street, Glasgow, Technical Chemist.
1895. Craig, Thos. J., c/o Messrs. Peter Spence and Sons, Manchester Alum Works, Manchester, Chemist.
1903. Craine, Chas. R., 42, Pooley Place, Buffalo, N.Y., U.S.A., Chemist.
1886. Crake, Wm., 394, Staniforth Road, Sheffield, Analytical Chemist.
1904. Cramer, A., jun., Cramer and King Co., Paterson, N.J., U.S.A., Chemist.
1901. Crane, Fred. D., 28, Hillside Avenue, Montclair, N.J., U.S.A., Consulting Chemist.
1902. Crane, Jasper E., Technology Chambers, Irvington Street, Boston, Mass., U.S.A., Chemist.
1898. Cranfield, Wm., Higher Grade Board School, Halifax, Yorks, Teacher of Chemistry.
1903. Cranmer, Ridgeway, 170, 88th Street, Bay Ridge, Brooklyn, N.Y., U.S.A., Chemist.
1902. Craven, Alfd. B., 91, Fielding Terrace, Armley, Leeds, Analytical Chemist.
1889. Craven, Chas. E., Oak Villa, Bramley, near Leeds, Dyer.
1899. Craven, Jas., The Netherlands, Broughton Park, Manchester, Chemist.
1891. Craven, Jno., jun., c/o Dominion Tar and Chemical Co., Ltd., Sydney, Nova Scotia, Chemist.
1885. Craw, John, 15, Cadogan Street, Glasgow, Drysalter.
O.M. Crawford, D., Langdale's Chemical Manure Co., Lim., St. Laurence, Newcastle-on-Tyne, Manager.
1884. Crawford, D., 12, Abbey Grove, Eccles, Manchester, Dyer and Printer.
1890. Crawshaw, E., 25, Tollington Park, London, N., Dye Merchant.
1900. Crayen, Dr. Gustav, 146, West 23rd Street, New York City, U.S.A.
1895. Cremer, John H., 24, Superior Street, Cleveland, Ohio, U.S.A., Chemist and Metallurgist.
O.M. Cresswell, C. G., Ermyngarth, Ashtead, Surrey; and 9, Bridge Street, Westminster, S.W., Chemist.
1901. Cribb, Cecil, 136, Shaftesbury Avenue, London, W., Analytical and Consulting Chemist.
1890. Criper, Wm. R., Cossipore Chemical Works, Cossipore, Calcutta, India, Manufacturing Chemist.
1902. Cripps, R. A., The Laboratory, Hayward's Heath, Sussex, Analyst.
1902. Croasdale, Dr. Stuart, 1574, York Street, Denver, Col., U.S.A., Mining Engineer and Metallurgist.
1898. Crompton, Benj. F., Haigh Dyeworks, near Wigan, Lancs., Dyer.
1885. Crompton, Percy R., Elton Paper Mills, near Bury, Lancashire, Paper Maker.
1901. Cronquist, G. W., Klagstorps Aktiebolag, Klagshamn, Sweden, Technical Chemist.
1889. Cronquist, Prof. A., Werner, 4, Kammakasegatan, Stockholm, Sweden, Consulting Chemist.
O.M. Crookes, Sir Wm., F.R.S., 7, Kensington Park Gardens, Notting Hill, W., Analytical Chemist.
1896. Crosby, Thos., Llanelly Steelworks, Llanelly, South Wales, Metallurgist.
O.M. Crosfield, A. L., 46, Bidston Road, Oxton, Birkenhead, Analytical Chemist and Assayer.
1896. Crosfield, Capt. G. R., Volunteer Quarters, Sankey Street, Warrington, Soap Manufacturer.
1884. Cross, C. F., 4, New Court, Lincoln's Inn, London, W.C., Analytical Chemist.
1900. Crosskey, Alex., N., c/o Dr. Crosskey, Lewes, Sussex, Chemist.
1894. Crossley, Dr. Arthur W., Chemical Laboratory, St. Thomas' Hospital, London, S.E., Organic Chemist.
1900. Crossley, Frank, Duchy Bank, Seedley Road, Pendleton, Manchester, Analytical Chemist.
1902. Crossley-Holland, F. W., 68, Parade, Leamington, Chemist and Druggist.
1892. Crossman, Tom, Albion Brewery, Coldhurst Street, Oldham, Brewing Chemist.
1884. Crow, Dr. J. K., 2, Ulundi Road, Blackheath, S.E., Technical Chemist.
1894. Crow, Henry W., 94, Romford Road, Stratford, E., Tar Distiller.
1902. Crowell, Henry H., Delewanna, N.J., U.S.A., Dyer.
1893. Crowther, Edw., Woodland Dyeworks, Headingley, Leeds, Dyer.
1883. Crowther, Horace W., The Beeches, West Bromwich, Technical Chemist.
1899. Crowther, J., South Australian School of Mines, Adelaide, Metallurgist.
1884. Crowther, W. M., Field House, Gomersal, near Leeds, Manufacturing Chemist.
1884. Crumbie, W. D., 146, Washington Street, East Orange, N.J., U.S.A., Analytical Chemist.
1902. Crush, E. H., 3, Westcombe Park Road, Blackheath, S.E., Technical Chemist.

1903. Cullen, W. H., The Castner-Kellner Alkali Co., Ltd., Weston Point, near Runcorn, Cheshire, Engineer.
1892. Cullen, Wm., Dynamite Factory, Modderfontein, Transvaal, Chemist.
1897. Culmann, Dr. Julius, 525, Norwood Avenue, Buffalo, N.Y., U.S.A., Chemist and Colourist.
1904. Culmer, Harry H., 6200, Madison Avenue, Chicago, Ill., U.S.A., Chemist and Tar Distiller.
1883. Cuming, James, jun., Chemical Works, Yarraville, Melbourne, Australia, Manure Manufacturer.
1897. Cunliffe, Albert J., Kern Mill Printworks, Whittle-le-Woods, Lancashire, Calico Printer.
1893. Cunningham, Edw., Mission Ridge, Sta. Barbara, Cal., U.S.A., Chemical Engineer.
O.M. Curphey, W. S., Borva, Lenzie, N.B., Alkali Works Inspector.
1902. Currier, Edw. Eug., 15, Ferry Street, Everitt, Mass., U.S.A., Chemist.
1898. Curtis, Marvin, 123, California Street, San Francisco, Cal., U.S.A., Wine Chemist.
1903. Cushing, Robt. P., Lock Haven, Pa., U.S.A., Chemist.
1902. Cuthbush, Chas. G., 149, Westcombe Hill, Blackheath, London, S.E., Electrical Engineer.
1884. Cuthbertson, Sir J. N., 29, Bath Street, Glasgow, Chemical Broker.
1899. Cutler, Fred. F., 183, Essex Street, Boston, Mass., U.S.A., Publisher.
1904. Cutts, Henry E., 55, Fulton Street, New York City, U.S.A., Technical Chemist.

D

O.M. Dacie, J. C., Soap Works, Putney, London, S.W., Soap Manufacturer.
1897. Dains, Herbert H., 27, Inderwick Road, Stroud Green, N., Analytical Chemist.
1897. Dakin, Henry D., Jenner Institute of Preventive Medicine, Chelsea, S.W., Assistant Analyst.
1904. Dale, G., Waverley Terrace, Hood Lane, Warrington, Technical Chemist.
1887. Dale, Jas., c/o Jas. H. Dale, 1, Dorothy Villas, Cavendish Road, West Croydon, Coppersmith.
1897. Dancer, Wm., Millgate Hall, Newbridge Lane, Stockport, Analytical Chemist.
1884. Daniell, Louis C., (Journals) Royal Standard Brewery, Tamworth, New South Wales; and (subs.) c/o W. T. Allen & Co., 132, Queen Victoria Street, London, E.C., Brewer.
1903. Dannenbaum, Dr. H., 3346, Frankland Avenue, Philadelphia, Pa., U.S.A., Secretary and Treasurer (National Ammonia Co.).
1902. Danziger, Jos. L., Columbia University, New York City, U.S.A., Analytical Chemist.
1885. Darby, Jno. H., Brymbo Hall, near Wrexham, Ironmaster.
1894. Darling, G. A., Robinson G. M. Co., Box 1,024, Johannesburg, S.A., Metallurgical Chemist.
O.M. Darling, W. H., 126, Oxford Street, Manchester, Analytical Chemist.
1887. Davenport, Dr. B. F., 161, Tremont Street, Boston, Mass., U.S.A., Consulting, Sanitary, and Toxicological Chemist.
1900. Davidson, Alex., jun., 2, Hamilton Park Terrace, Hillhead, Glasgow, Analytical Chemist.
1899. Davidson, Charles, 37, Heriot Street, Pollokshields, Glasgow, Analytical Chemist.
1901. Davidson, G. M., Chicago & N. W. Railroad Shops, P.O. Station E., Chicago, Ill., U.S.A., Chemist.
1883. Davidson, J. E., 40, Percy Gardens, Tynemouth, Chemical Manufacturer.
1891. Davidson, Richard, 44, High Street, Dundee, Oil Merchant's Clerk.
O.M. Davidson, R. Holden, c/o United Alkali Co., Ltd., Ammonia Soda Works, Fleetwood, Works Manager.
1904. Davidson, Robert, c/o Dalgety & Co., Ltd., 15, Bent Street, Sydney, N.S.W., Australia.
1897. Davies, Charles T., 207, Windsor Street, Reading, Pa., U.S.A., Chemist.
1889. Davies, G. W., 8, Spring Hill, Stockport, Chemical Lecturer.
1898. Davies, Herbert E., The Laboratory, 28, Chapel Street, Liverpool, Analytical Chemist.
1898. Davies, Leyshon, 1, North Claremont Gardens, Glasgow, Gunpowder Mills Manager.
1896. Davies, Llewellyn J., Bute Chambers, Bute Road, Cardiff, Analytical and Consulting Chemist.
1886. Davies, M. Lloyd, North American Chemical Co., Bay City, Mich., U.S.A., Alkali Works Manager.
1897. Davies, Saml. H., c/o H. S. Rowntree and Co., Cocoa Works, York, Research Chemist.
1903. Davies, Thomas, 56, Wellesley Street, Toronto, Ont., Canada, Manufacturer.
1902. Davies, Wm. Rhys, 60, Northampton Terrace, Bradford, Yorks, Analytical Chemist.
1900. Davis, Arthur C., 2, Downing Grove, Cambridge, Cement Maker.
O.M. Davis, A. R., Havelock Villa, Wellington Road North, Stockport, Analytical Chemist.
1901. Davis, Bernard F., c/o Borneo Co., Boedok, Sambas, Borneo, Metallurgical Engineer.
1902. Davis, Charles B., c/o Dr. Francis Wyatt, 39, South William Street, New York City, U.S.A., Technical Chemist.
1902. Davis, Emerson, 515, Cass Avenue, Detroit, Mich., U.S.A., Chemist.
1893. Davis, Fred., 51, Imperial Buildings, Ludgate Circus, London, E.C., Analytical and Consulting Chemist.
O.M. Davis, George E., Sandilands, Knutsford, Cheshire, Chemical Engineer.
O.M. Davis, H. W., Government Laboratory, Clement's Inn Passage, Strand, W.C., Analytical Chemist.
1903. Davis, Leon K., Room 510, 31, Milk Street, Boston, Mass., U.S.A., Chemical Engineer.
O.M. Davis, T. Sebastian, 199, South Lambeth Road, London, S.E., Vinegar Works Chemist.
1897. Davis, Wm. A., 8, Quenington Mansions, Rostrevor Road, Fulham, S.W., Chemist.
1900. Daw, Fred W., Eureka Place, Ebbw Vale, Mon., Metallurgical Chemist.
1903. Dawes, Arthur W., 3, Madison Place, Albany, N.Y., U.S.A., Chemist.
O.M. Dawson, C. A., 40, Russell Road, Sefton Park, Liverpool, Technical Chemist.
1886. Dawson, W. Haywood, British Alizarin Co., Limited, Silvertown, Victoria Dock, E.; and (Journals) 187, Eglinton Road, Woolwich, S.E., Technical Chemist.
1901. Day, Dr. David T., U.S. Geological Survey, Washington, D.C., U.S.A., Geologist.
O.M. Deacon, H. W., 8, Ullet Road, Liverpool, Alkali Manufacturer.
O.M. Deakin, H. T., Dewhurst House, Egerton, near Bolton, Dyer.
1903. Dean, Harry, 23, Spinkfield Road, Birkby, Huddersfield, Chemist.
1899. Deane, Leopold M., Davington House, Faversham, Kent, Chemist (Cotton Powder Co., Ltd.)
1892. Deaville, B., Beech Avenue, Nottingham, Manufacturing Chemist.
1903. De Blois, W. H., c/o Gen. Chemical Co., Camden, N.J., U.S.A., Chemist.
1899. De Castro, J. Paul, Laboratory, Effingham House, Arundel Street, Strand, W.C., Consulting Chemist and Assayer.
1902. De Cew, J. A., c/o Canada Paper Mills, Windsor Mills, Quebec, Canada, Chemist.
1893. De Clerck, Maurice, Heule-lez-Courtrai, Belgium.
1884. Deering, W. H., Chemical Department, Royal Arsenal, Woolwich, S.E., Analytical Chemist.
1900. Deerr, Noel, Mauritius Estates and Assets Co., Ltd., Mauritius, Analytical Chemist.
1902. Deghuée, Dr. Jos. A., 247, Harrison Street, Brooklyn, N.Y., U.S.A., Chemist.

1901. De Jonge, Cornelius, 36, Doughty Street, Brooklyn, N.Y., U.S.A., Pharmaceutical Chemist.

1893. Delahaye, Philibert, 105, Rue St. Lazare, Paris (IX.), Gas Engineer.

1899. Delano, Warren, jun., 1, Broadway, New York City, U.S.A., Mine Operator.

1901. Delany, Chas., c/o Elliott Bros., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Chemist.

1896. De Lessing, Dr. G. C., 945, Park Avenue, New York City, U.S.A., Manufacturing Chemist.

1888. Dempsey, Geo. C., 165, Market Street, Lowell, Mass., U.S.A., Chemist.

1903. Dempsey, Jno. C., 29, North Front Street, Philadelphia, Pa., U.S.A., Aniline Merchant.

1899. Denham, Wm. S., 2, Kelvinside Terrace North, Glasgow, Chemist.

1891. Denison, Joseph R., 18, Duckworth Lane, Bradford, Analytical Chemist.

1897. Dennis, John, Ellonville, Dalkeith, N.B., Contractor.

1898. Dent, Dr. Frankland, Calle San Juan, 63, principal, Burgos, Spain, Consulting Chemist.

1901. Devas, Dr. Ernest W., 74, Woodland Terrace, Old Charlton, Kent, Technical Chemist.

1890. De Velling, F. W., Higher Grade Board School, The Boulevard, Hull, Head Master and Science Lecturer.

1898. Dewar, Alex. H., c/o The Linoleum Manufacturing Co., Staines, Middlesex, Chemist.

O.M. Dewar, Prof. J., F.R.S., Royal Institution, Albemarle Street, W. (Journals); and 1, Scroope Terrace, Cambridge, Professor of Chemistry and Physics.

1894. Dewar, Jno. A., M.P., Murrayshall, Scone, Perthshire, N.B., Distiller.

1889. Dewey, Fred. P., Lanier Heights, Washington, D.C., U.S.A., Metallurgist.

1899. Dewez, Eugène, jun., Herve, Belgium, Tanner.

1891. De Wilde, Prof. P., Soc. Anon. de Prod. Chim. et d'Exploitations Minierès, Bône, Algeria, Professor of Chemistry.

1886. Dey, Preo Lall, 4, Beadon Street, Calcutta, Manufacturing Chemist.

1903. Diamond, Wm., c/o Simon-Carves, Ltd., Barrow Collieries, near Barnsley, Yorks, Works Manager.

O.M. Dibdin, W. J., Edinburgh Mansions, Howick Place, S.W.; and (Journals) Mayfield, Grange Road, Sutton, Surrey; Analytical Chemist.

1897. Dick, Jno., c/o Jno. Dick, Ltd., 77, York Street, Toronto, Ont., Canada, Manufacturer.

1902. Dick, Jno., Wharf Road, Cubitt Town, London, E., Manager and Chemist.

1904. Dick, W. D., 46, Primrose Hill Road, South Hampstead, N.W., Analytical Chemist.

1898. Dickenson, Frank, 26, O'Connell Avenue, Berkeley Road, Dublin.

1896. Dickenson, F. M., c/o Broken Hill Proprietary Co., 3, Great Winchester Street, E.C., Secretary.

1902. Dickerman, Judson C., 10, Minot Street, Woburn, Mass., U.S.A., Chemical Engineer.

1893. Dickerson, E. N., 141, Broadway, New York City, U.S.A., Lawyer.

O.M. Dickinson, A. J., Neptune Tar and Chemical Works, Deptford, S.E.; and (Journals) 57, Lewisham High Road, S.E., Tar Distiller.

1887. Dickson, Jno., Easter Fluchter, Baldernock, near Glasgow.

1898. Dickson, Samuel, 2, Broadway, Westminster, S.W., Analytical Chemist.

1899. Dieckmann, Dr. Otto, 1182, Harrison Avenue, Cincinnati, Ohio, U.S.A., Chemist.

1901. Diehl, Oscar C., c/o Saginaw Salt Co., St. Charles, Mich., U.S.A., Chemist.

1894. Diestel, Wm., 77, William Street, New York City, U.S.A., Dyestuff Importer.

1898. Dillon, Wm., 28, Oakwood Avenue, Roundhay, Leeds, Oil, Colour, and Varnish Manufacturer.

O.M. Divers, Dr. E., F.R.S., 3, Canning Place, Palace Gate, London, W., Professor of Chemistry.

1903. Divine, Robt. E., Hamburg, Erie Co., N.Y., U.S.A., Chemist.

1899. Dixon, Fred. W., Longfellow House, Wellesley Hills, Mass., U.S.A., Dyer.

1888. Dixon, Prof. Harold B., F.R.S., Owens College, Manchester, Professor of Chemistry.

1885. Dixon, Jos., Spring Grove, near Sheffield, Paper Maker.

1884. Dixon, Wm., 102, Spring Street, Bury, Lancashire, Science Master.

1902. Dixon, Wm. A., 97, Pitt Street, Sydney, N.S.W., Australia, Public Analyst and Assayer.

1892. Dobb, Thos., 54, Riverdale Road, Sheffield, Pharmaceutical Chemist.

O.M. Dobbie, Dr. J. J., Museum of Science and Art, Chambers Street, Edinburgh, Director.

1901. Dobbie, Jas., Laurel Bank, Broomfield Road, Ayr, N.B., Tanner.

O.M. Dobbin, Dr. L., Chemical Laboratory, University, Edinburgh, Professor of Chemistry.

1890. Dodd, A. J., River View, Belvedere, Kent, Oil Refiner.

1902. Dodd, T. H., 6, Granville Park, Blackheath, S.E., Chemist (Royal Arsenal).

1889. Dodd, W. Ralph, Trederwen, Village Road, Enfield, Middlesex, Chemical Works Manager.

1901. Dodds, Roger, 4, Marlborough Terrace, Scotland Gate, R.S.O., Morpeth, Technical Chemist.

1900. Dodge, Dr. Francis D., c/o Dodge and Olcott, 137, Water Street, Brooklyn, N.Y., U.S.A., Chemist.

1897. Doerflinger, Wm. F., Acker Process Co., Niagara Falls, N.Y., U.S.A., Research Chemist.

1897. Dohme, Dr. Alf. R. L., Messrs. Sharp and Dohme, Baltimore, Md., U.S.A., Manufacturing Chemist.

1885. Doidge, H., 145, Church Street, Pietermaritzburg, Natal.

1903. Dole, Richard B., U.S. Geological Survey, 618, Boylston Building, Chicago, Ill., U.S.A., Chemist.

1897. Dolge, Carl B., Westport, Conn., U.S.A., Manufacturer of Instruments and Antiseptics.

1884. Donald, Jas., 96, Anerley Park, Anerley, S.E., Manufacturing Chemist.

1903. Donald, Dr. Jas. T., 112, St. François Xavier Street, Montreal, Canada, Analytical and Consulting Chemist.

O.M. Donald, W., Saltcoats, N.B., Analytical Chemist.

1900. Donald, Wm., Ridgefield Park, Bergen Co., N.J., U.S.A., Assayer and Chemist.

1902. Donaldson, Thos., c/o British South African Explosives Co., Ltd., Modderfontein, Transvaal, Chemist.

1901. Donnelly, Francis, 335, Hyde Road, Ardwick, Manchester, Manager (Varnish Co.).

1886. Doolittle, Orrin S., 445, Oley Street, Reading, Pa., U.S.A., Chemist, Philadelphia and Reading Railroad.

1890. Dore, Jas., Copper Works, High Street, Bromley-by-Bow, E., Distiller's Engineer.

1896. Doremas, Dr. Chas. A., 59, West 51st Street, New York City, U.S.A., Professor of Chemistry.

O.M. Dott, D. B., Abbey Hill Chemical Works, Edinburgh, Analytical Chemist.

1883. Dougall, Archibald, Gasworks, Kidderminster, Gas Engineer.

1897. Douglas, Geo., Heather Bank, Bingley, Yorks, Dyer.

1894. Douglas, Loudon M., Baltic Wharf, Putney, S.W., Chemical Manufacturer.

1884. Douglas, William, Diamond Plantation, Demerara, British Guiana, Chemical Engineer.

1900. Doulton, H. Lewis, Lambeth Pottery, London, S.E., Potter.

1902. Doveton, Godfrey D., 319, Majestic Building, Denver, Colo., U.S.A., Metallurgist.

1900. Dow, Allan W., 2016, Hillyer Place, Washington, D.C., U.S.A., Chemist (District Engineer's Dept.).

1898. Dow, Herbert H., Midland, Mich., U.S.A., Manufacturing Chemist.

1885. Dowson, J. Emerson, 39, Victoria Street, Westminster, S.W., Civil Engineer.

1902. Dowzard, Edwin, The Haven, Barton Heys Road, Formby, Lancashire, Analyst.

1901. Doxrūd, Christian, Christiania, Norway, Professor of Chemical Technology.

1902. Drake, Bryant S., Peyton Chemical Co., Martinez, Cal., U.S.A., Chemist.

1885. Drake, Chas. A., Three Mills Distillery, Bromley-by-Bow, E., Brewer.

1886. Dreaper, W. P., c/o Courtauld and Co., Ltd., Bocking, near Braintree, Essex, Technical Chemist.

1901. Dreghorn, David, Greenwood, Pollokshields, Glasgow, Soap Maker.

O.M. Drew, D., Lower House Printworks, near Burnley, Calico Printer.

1896. Drewsen, Dr. Viggo B., 5, Beekman Street, New York City, U.S.A., Wood Pulp and Paper Expert.

O.M. Dreyfus, Dr. C., Clayton Aniline Co., Ltd., Clayton, Manchester, Dye Manufacturer.

1904. Dreyfus, Dr. L. A., c/o The Muralo Co., New Brighton, S.I., N.Y., U.S.A., Chemist.

1893. Dreyfus, S., Clayton Aniline Co., Ltd., Clayton, Manchester, Chemist.

1899. Dreyfus, Dr. Wm., 162, East 95th Street, New York City, U.S.A., Chemist.

O.M. Driffield, V. C., Appleton, Widnes, Chemical Engineer.

1899. Drobegg, G., 81, Maiden Lane, New York City, U.S.A., Superintending Chemist.

1887. Drown, Prof. T. M., The Lehigh University, South Bethlehem, Pa., U.S.A., Professor of Analytical Chemistry.

1889. Drummond, Hon. G. A., Montreal, Canada.

1898. Drummond, Dr. Isaac W., 436, West 22nd Street, New York City, U.S.A., Chemist.

1904. Dubois, Norman A., 405, Euclid Avenue, Syracuse, N.Y., U.S.A., Instructor in Chemistry.

1903. Dubuque, Edwin D., 32, Eagle Street, Albany, N.Y., U.S.A., Chemist.

1899. Ducas, B. P., 151, Front Street, New YorkCity, U.S.A., Chemical and Dyestuff Importer.

1897. Duckham, Alex., Phœnix Wharf, West Ferry Road, Millwall, E., Works Chemist.

1902. Duckworth, Wm. H., Moorfield, Sylvan Avenue, Sale, Cheshire, Manufacturing Chemist.

1899. Dudderidge, Frank R., 55, Northumberland Street, Newcastle-on-Tyne, Teacher of Chemistry.

1890. Dudley, Dr. C. B., 1219, 12th Avenue, Altoona, Pa., U.S.A., Analytical Chemist.

1887. Dudley, Prof. W. L., Vanderbilt University, Nashville,Tenn., U.S.A., Professor of Chemistry.

1899. Duff, Wm. S., Woodland View, Cleveland Road, South Woodford, Essex, Manufacturing Chemist.

1901. Dufty, Lawrence, 23, Broomhall Place, Sheffield, Analytical Chemist.

O.M. Duggan, T. R., 17, Foyle Road, Blackheath, S.E., Analytical Chemist.

1898. Duguid, Jas., 10, Godliman Street, London, E.C., Journalist.

1858. Duisberg, Dr. Carl, The Bayer Co., Ltd., (Journals) Elberfeld, Germany, (subscriptions) 19, St. Dunstan's Hill, E.C., Chemist.

1888. Dukes, T. William, Box 10, Vryheid, South Africa, Merchant.

1889. Duncan, Arthur W., 1, Trafalgar Road, Higher Bentcliffe, Pendleton, Manchester, Analytical Chemist.

O.M. Duncan, Jas., 52, Shakespeare Street, Hove, Sussex, Sugar Refiner.

1904. Duncan, Wm. Wheeler, 406, Massachussetts Avenue, Boston, Mass., U.S.A., Chemist.

1898. Dunham, Edw. K., 338, East 26th Street, New York City, U.S.A., Professor of Bacteriology and Hygiene.

1901. Dunham, Henry V., c/o Casein Co., 22, Rue du 4 Septembre, Paris, Chemist.

1889. Dunlop, Robt., Shettleston Oil and Chemical Works, Shettleston, Glasgow, Oil Works Manager.

1892. Dunn, Fred., 193, Collins Street, Melbourne, Victoria, Analytical Chemist.

O.M. Dunn, J., Northern Assurance Buildings, Albert Square, Manchester, Chemical Manufacturer.

O.M. Dunn, Dr. J. T., 75, The Side, Newcastle-on-Tyne, Consulting Chemist.

O.M. Dunn, P., Northern Assurance Buildings, Albert Square, Manchester, Chemical Merchant.

1901. Dunn, Wm. R., 157, South 6th Street, Easton, Pa., U.S.A., Cement Works Manager.

1902. Dunning, D. M., junr., Auburn, N.Y., U.S.A., Gas Engineer.

1901. Dunsford, Geo., Laboratory, Wigan Coal and Iron Co., Ltd., Wigan, Analytical Chemist.

O.M. Dupré, Dr. A., F.R.S., Edinburgh Mansions, Howick Place, S.W., Consulting Chemist.

1897. Durant, H. T., P.O. Box 603, Buluwayo, Matabeleland, South Africa, Metallurgist.

1897. Durkee, Frank W., Tuft's College, Mass., U.S.A., Assistant Professor of Chemistry.

1899. Duryea, Chester B., 80, Madison Avenue, New York City, U.S.A., Starch Manufacturer.

1891. Duttson, W. H., Southwood, Silverdale, Sydenham, S.E., Merchant.

1891. Dvorkovitch, Dr. P., 26, Bevis Marks, London, E.C., Technical Chemist.

1903. Dyck, George E., The National Provisioners' Laboratory, 78—80, Broad Street, New York City, U.S.A., Analytical Chemist.

O.M. Dyer, Dr. B., 17, Great Tower Street, London, E.C., Analytical and Consulting Chemist.

O.M. Dyson, C. E., Flint, North Wales.

1902. Dyson, George W., 89, Cowlishaw Road, Sheffield, Analyst.

1892. Dyson, Septimus, 8, Belmont Avenue, Harrogate, Manufacturing Chemist.

E

1839. Earnshaw, Edward H., 22nd and Filbert Streets, Philadelphia, Pa., U.S.A., Chemist (Gas Improvement Co.).

1902. Earp, Dr. Francis S., 72, Addis Street, Kalgoorlie, W. Australia, Metallurgical Chemist.

O.M. Earp, W. R., Preston Brook, Warrington, Chemical Manufacturer.

1902. Easterbrooks, Frank D., Raritan Copper Works, Perth Amboy, N.J., U.S.A., Chemist.

1884. Eastick, C. E., 7, King Edward Street, Whitechapel, E., Sugar Works Manager.

O.M. Eastick, J. J., Millaquin Refinery, Bundaberg. Queensland, Sugar Works Manager.

1898. Eastick, S. Philip, 25, Woodville Road, Ealing, W., Chemical Engineer.

1890. Eastlake, A. W., Caenwood House, Grove Road, Clapham Park, S.W., Petroleum Works Manager.

1891. Eastwick, Jos. H., 2216, North 51st Street, Philadelphia, Pa., U.S.A., Chemist.

1885. Eastwood, Edw., c/o Lever Brothers, Ltd., Port Sunlight, Birkenhead, Soapmaker.

1902. Eastwood, Robert F., 128, Derby Road, Widnes, Chemist.

1903. Eaton, Edward N., 1628—315, Dearborn Street, Chicago, Ill., U.S.A., Chemist.

1898. Eavenson, Alban, 2013 Vine Street, Philadelphia, Pa., U.S.A., Soap Works Chemist.

1902. Eckel, Edwin Clarence, U.S. Geological Survey, Washington, D.C., U.S.A., Geologist.

1892. Eddy, Harrison P., Sewage Purification Works, Worcester, Mass., U.S.A., Superintendent.

1901. Eddy, W. Clifton, Box 21, Rocky Ford, Colo., U.S.A., Superintendent.

1894. Ede, Henry E., c/o Copaquire Copper Sulphate Co., Ltd., (Journals) Iquique, Chile; (subscriptions) 101, Leadenhall Street, London, E.C., Analytical Chemist.

1885. Edge, Anthony, 79, Milton Street, Readville, Mass., U.S.A., Chemist.

1900. Edgerley, Daniel W., Chilton Manufacturing Co., College Point, Long Island, N.Y., U.S.A., Chemist.

1902. Edison, Thos. Alva, Edison Laboratory, Orange, N.J., U.S.A., Inventor and Manufacturer.

1903. Edkins, Geo. J., 41, Parkholme Road, Hackney, N.E., Oil Refiner.

1902. Edwards, H. Seaton, 19, Park Road, Port Sunlight, Cheshire, Analyst.

1903. Edwards, R. S., Rockland Rockport Lime Co., Rockland, Me., U.S.A., Chemist.

1885. Ehrenfeld, Prof. Chas. H., York Collegiate Institute, York, Pa., U.S.A., Professor of Chemistry.

1896. Ehrhardt, Ernest F., Badische Anilin und Soda Fabrik, Ludwigshafen a/Rhein, Germany, Research Chemist.

1895. Ekenberg, Dr. M., Stockholm, Sweden, Technical Chemist.

O.M. Ekman, C. D., Overcliffe, Gravesend, Kent, Technical Chemist.

1885. Elborough, T., 59, Mark Lane, London, E.C., Manure Manufacturer.

1901. Elkan, Leo A., 594, Dearborne Avenue, Chicago, Ill., U.S.A., Tanner.

1901. Elkins, Arthur W., 520, Park Avenue, East Orange, N.J., U.S.A., Civil Engineer.

1892. Elliot, John, Free Library, Wolverhampton, Librarian.

1884. Elliott, Dr. A. H., Consolidated Gas Co., 4, Irving Place, New York City, U.S.A., Analytical Chemist.

1896. Elliott, Dr. J. F., c/o Grimwade and Co., 6, Trinity Square, E.C.; and (Journals), O'Connell Street, Sydney, N.S.W., Manufacturing Chemist.

1902. Elliott, Victor G., Chemical Works, Rozelle, Sydney, N.S.W., Australia, Manufacturing Chemist.

1903. Ellis, A. W., 10, Endymion Road, Brixton Hill, S.W., Analytical Chemist.

1903. Ellis, Chas. E., Iowa State College, Ames, Iowa, U.S.A., Agricultural Chemist.

1885. Ellis, C. J., Almorah Villa, Milngavie, near Glasgow, Technical Chemist.

1893. Ellis, E. Victor, 21, Castle Street, Edinburgh, Analytical Chemist.

1902. Ellis, Frederick R., 15, Shadwell Road, Bishopston, Bristol, Chemist and Druggist.

1894. Ellis, G. Beloe, 70, Chancery Lane, W.C., Patent Agent.

O.M. Ellis, H., 112, Regent Road, Leicester, Chemical Merchant.

1891. Ellis, Prof. W. Hodgson, School of Practical Science, Toronto, Ont., Canada, Professor of Applied Chemistry.

1891. Ellison, Henry, Northfield, Cleckheaton, Yorks, Manufacturing Chemist.

1901. Ellms, Jos. W., Laboratory, East Court and Martin Street, Cincinnati, Ohio, U.S.A., Chemist.

O.M. Elmore, A. S., 4, Broad Street Place, London, E.C., Electro-Metallurgist.

1885. Elworthy, H. S., 239, Dashwood House, New Broad Street, London, E.C., Sugar Works Chemist.

1901. Emerson, Dr. W. H., Georgia School of Technology, Atlanta, Ga., U.S.A., Professor of Chemistry.

1902. Emery, Arthur L., 83—85, New Montgomery Street, San Francisco, Cal., U.S.A., Chemical Engineer.

1899. Emery, E. G., c/o Franklin H. Kalbfleisch Co., 31—35, Burling Slip, New York City, U.S.A., Chemist.

O.M. Endemann, Dr. H., 23, William Street, New York City, U.S.A., Analytical Chemist.

1897. Enequist, Erik W., North 8th and Roebling Streets, Brooklyn, N.Y., U.S.A., Chemist.

1894. Enequist, John, 556, Greene Avenue, Brooklyn, N.Y., U.S.A., Chemical Engineer.

1899. Engledue, Col. W. J.,
Colonel (late) Royal Engineers.

1895. English, Frank H., 217, Strone Road, Manor Park, E., Analytical Chemist.

1899. Enright, Bernard, 330, East 4th Street, South Bethlehem, Pa., U.S.A., Analytical Chemist.

1902. Erhart, Wm. H., 11, Bartlett Street, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.

1888. Erkine, J. K., (Journals) New Kleinfontein Co., Benoni, Transvaal, and (subscriptions) 102, Palmerston Crescent, Palmer's Green, London, N., Analytical Chemist.

1886. Ermen, F., jun., Nassau Mills, Patricroft, Manchester, Dyer and Bleacher.

1897. Escher, Paul, c/o Swift & Co., National Stockyards, St. Clair Co., Ill., U.S.A., Chemist.

1884. Esilman, A., 25, Roe Lane, Southport, Lancashire, Analytical Chemist.

O.M. Estcourt, C., Seymour House, 5, Seymour Grove, Old Trafford, Manchester, Consulting Chemist.

1903. Euler, C. G., 18—20, Platt Street, New York City, U.S.A., Agent for Essential Oils.

1883. Evans, Enoch, 660, Coventry Road Birmingham, Accountant.

1898. Evans, Ernest D., The Western Tanning Co., Bedminster, Bristol, Tanner.

1903. Evans, F. Sparke, Avonside Tannery, Bristol, Tanner.

1883. Evans, Sir John, K.C.B., F.R.S., Nash Mills, Hemel Hempstead, Herts, Paper Maker.

1889. Evans, R. E., 3, Glencoe, Stratford-on-Avon, Brewing Chemist.

1896. Evans, Dr. Thos., University of Cincinnati, Ohio, U.S.A., Instructor in Technical Chemistry.

1903. Evans, Wm. J., 91, Fulton Street, New York City, U.S.A., Manufacturing Chemist.

1898. Evans, Wm. Perceval, Canterbury College, Christchurch, New Zealand, Professor of Chemistry.

O.M. Evershed, F., Atlas Works, Hackney Wick, N.E., Colour Chemist.

1903. Evershed, John, Union Oil Mills, Copenhagen Place, Limehouse, E., Chemist.

1894. Ewan, Dr. Thos., 30, Lansdowne Crescent, Kelvinbridge, Glasgow, Chemist (Aluminium Co.).

1903. Eweli, E. E., German Kali Works, 22½ S. Broad Street, Atlanta, Ga., U.S.A., Chemical Works Manager.

1892. Exley, Arthur, Braemore, Vesper Road, Kirkstall, Leeds, Tanner.

F

1898. Fadé, Louis, c/o Dr. F. Stockhausen, Deutsche Gold und Silber Scheide-Anstalt, Frankfort a/M., Germany, Chemist and Director.

O.M. Fahlberg, Dr. C., Saccharin Fabrik, Salbke-Westerhüsen a/Elbe, Germany, Manufacturing Chemist.

1902. Fahrig, Dr. Ernst, 3615, Locust Street, Philadelphia, Pa., U.S.A., Chief of Laboratories (Commercial Museum).

1902. Faill, Jas., 51, Partickhill Road, Glasgow, Technical Chemist.

1902. Fairchild, Benj. T., 76, Laight Street, New York City, U.S.A., Manufacturing Chemist.

1903. Fairhall, E. J., (Journals) c/o A. Boake, Roberts, and Co., Stratford, E., and (Subscriptions) 29, Winsham Grove, Clapham Common, S.W., Analytical Chemist.

O.M. Fairley, T., 17, East Parade, and (Communications) 8, Newton Grove, Leeds, Analytical Chemist.

O.M. Fairlie, H. C., Camelon Chemical Works, Falkirk, N.B., Chemical Manufacturer.

1901. Fairlie, Jas., Camelon Chemical Works, Falkirk, N.B., Manufacturing Chemist.

1894. Fairweather, Wallace, 65—66, Chancery Lane, W.C., Patent Agent.

1902. Fairweather, Wallace C., 62, St. Vincent Street, Glasgow, Engineer.

1898. Falding, F. J., 52, Broadway, New York City, U.S.A., Chemical Engineer.

1891. Fallon, J. H. M., 61, Birdhurst Rise, South Croydon, Fertiliser Expert.

1897. Farmer, John E., Beddington Farm, Beddington Lane, near Croydon, Assistant Manager (Sewage Works).

O.M. Farrant, N., c/o J. Nicholson and Sons, Chemical Works, Hunslet, Leeds, Analytical and Metallurgical Chemist.
1897. Farrell, Frank J., 24, Primrose Mansions, Prince of Wales Road, S.W., Analytical Chemist.
O.M. Farries, T., 12, Coleman Street, London, E.C., Manufacturing Chemist.
O.M. Farrington, T., 5, Summerhill Terrace, Cork, Ireland, Chemical Engineer.
1902. Fasnacht, E. A., The Hollies, Clayton Bridge, Manchester, Technical Chemist.
O.M. Faulkner, F., The Laboratory, 65, Bath Row, Birmingham, Consulting Brewer's Chemist.
1891. Faweett, Jas. H., Lanzi, Campiglia Marittima, Toscana, Italy, Metallurgist.
1884. Fawsitt, C. A., Atlas Chemical Works, East Nelson Street, Glasgow, Chemical Manufacturer.
1903. Fawsitt, Dr. Chas. E., Chemical Department, The University, Edinburgh, Assistant in Chemistry.
1903. Faxon, W. A., 101, Main Street, Buffalo, N.Y., U.S.A., Chemist.
1903. Feilmann, Dr. M. E., c/o Messrs. Brooke, Simpson, and Spiller, Ltd., Hackney Wick, N.E., Chemist.
1892. Feld, Walther, Hönningen a/Rhein, Germany, Chemical Works Director.
1897. Felix, Dr. Lorenz, 53, Rue Petit, St. Denis s/Seine, France, Technical Chemist.
1899. Ferguson, Geo., Gleniffer Soap Works, Paisley, N.B., Soap Manufacturer.
1900. Ferguson, Geo. A., College of Pharmacy, 115, West 68th Street, New York City, U.S.A., Professor of Analytical Chemistry.
1896. Ferguson, J. Hart, Loch Katrine Distillery, Camlachie, Glasgow, Distillery Manager.
O.M. Ferguson, Prof. J., The University, Glasgow, Professor of Chemistry.
1902. Fergusson, Donald M., c/o Acadia Sugar Refining Co., Halifax, N.S., Canada, Analytical Chemist.
1883. Fergusson, H., Prince Regent's Wharf, Victoria Docks, E., Technical Chemist.
1901. Ferrell, Jos. L., 2220, Race Street, Philadelphia, Pa., U.S.A., Mechanical Engineer.
1901. Ferris, Wm. S., c/o Miami Mining Co., Concord, N.C., U.S.A., Chemist.
1893. Fiebing, John H., 644, 28th Street, Milwaukee, Wis., U.S.A., Leather Trade Chemist.
1885. Field, E. W., Clond House, Sandiacre, near Nottingham, Brewer.
1887. Field, S. S., 3, Glenluce Road, Blackheath, S.E., Manufacturing Chemist.
1891. Field, Wm. Eddington, 65, Sutherland Road, Armadale, Melbourne, Victoria, Analytical Chemist.
1884. Filcock, P., Cumberland House, Cumberland Street, Macclesfield, Analytical Chemist.
1900. Fillis, Frank, 43, Romilly Road, Barry, Glam., Cement Works Chemist.
1902. Finch, Chas. Allt., 130, King Street, Sydney, N.S.W., Australia, Analytical and Pharmaceutical Chemist.
1904. Finch, Martin L., Vitriol and Chemical Works, Cattedown, Plymouth, Chairman of Directors of Jas. Gibbs and Finch, Ltd.
1899. Fingland, Jno. J., Minas de Aznalcollar, Prov. de Sevilla, Spain, Analytical Chemist.
1899. Finley, Norval H., 6638, Deary Street, Sta. A., Pittsburg, Pa., U.S.A., Chemist.
1904. Finn, Cornelius P., Farnley Iron Works, Farnley, Leeds, Technical Chemist.
1903. Fischer, Dr. Carl, 213—215, Water Street, New York City, U.S.A., Chemist.
1903. Fish, Chas. C. R., 10, Park Square, Boston, Mass., U.S.A., Chemist.
1902. Fisher, Fred., Marlborough, Mich., U.S.A., Chemist.
1900. Fisher, Henry, 57, East 83rd Street, New York City, U.S.A., Teacher of Chemistry.
1902. Fisher, Pearson, c/o Messrs. Manlove, Alliott, and Co., Ltd., Bloomsgrove Works, Nottingham, Mechanical Engineer.
1901. Fisher, Wm. Elbertson, 67, Argyle Street, Toronto, Canada, Master Dyer.
O.M. Fisher, W. W., 5, St. Margaret's Road, Oxford, Chemical Lecturer.
1895. Fison, Jno., Messrs. Jas. Fison and Sons, Thetford, Norfolk, Chemical Manufacturer.
1904. Fitch, A. J., Grange Road, Canonbury, N., Brewers' Chemist.
O.M. Fitzbrown, G., Ditton Copper Works, Widnes, Metallurgist.
1897. Fitzgerald, Francis A. J., P.O. Box 118, Niagara Falls, N.Y., U.S.A., Chemical Engineer.
1902. FitzGibbon, Thos., 14A, Kenyon Street, Fulham, S.W., Analytical Chemist.
1900. Fitz-Randolph, R. B., State Laboratory of Hygiene, Trenton, N.J., U.S.A., Bacteriologist and Chemist.
1896. Flammer, E., Heilbronn a/N., Germany, Manufacturing Chemist.
1892. Flanagan, Chas. A., 54, Gorse Street, Stretford, Manchester, Manufacturing Chemist.
1901. Flavelle, Jos. W., c/o Wm. Davies Co., Toronto, Canada, Merchant.
1892. Fleming, J. Arnold, Britannia Pottery, 136, Glebe Street, Glasgow, Potter.
1903. Fleming, Jno. A., Vulcan Copper Works, 465, East Front Street, Cincinnati, Ohio, U.S.A., Civil Engineer.
O.M. Fletcher, A. E., Coombe Lea, Dorking, Surrey, Ex-Chief Inspector Alkali, &c. Works.
1893. Fletcher, E. Morley, 3, Woodhouse Cliff, Leeds, Alkali Works Inspector.
O.M. Fletcher, F. W., Beauchamp Lodge, Enfield, Manufacturing Chemist.
1891. Fletcher, R. Jaques, North Geelong, Victoria, Manufacturing Chemist.
1904. Fleurent, Dr. E., 5, Villa du Chateau, Bois Colombes (Seine), France, Professor of Chemistry.
1892. Flintoff, R. J., Daisy Villa, Todmorden Road, Littleboro', Lancs., Chemist.
1899. Focht, Louis, 105, E. Hanover Street, Trenton, N.J., U.S.A., Civil Engineer.
1890. Foden, Alfred, 19, Lancaster Avenue, Sefton Park, Liverpool, Metallurgical Chemist.
1900. Foersterling, Dr. H., c/o The Roessler and Hasslacher Chemical Co., Perth Amboy, N.J., U.S.A., Chemist.
1900. Fogetti, Lucien, Chemist.
1895. Fogg, Chas. A., Graythorne, Albert Road, Bolton-le-Moors, Lecturer in Chemistry.
1901. Folsom, Herbert A., 254, Knight Street, Providence, R.I., U.S.A., Textile Chemist.
1900. Forbes, Eli, Lancaster Mills, Clinton, Mass., U.S.A., Chemist.
1895. Forbes, Paul R., 37, Avenue de l'Alma, Paris, Chemist and Assayer.
1893. Ford, J. B., jun., Michigan Alkali Co., Wyandotte, Mich., U.S.A., Secretary and Treasurer.
1889. Ford, Jno. S., Abbey Brewery, Edinburgh, Analyst.
1899. Forel, Geo., 18, Rue Hohenlohe, Strasburg, Alsace, Chemist.
1885. Formoy, J. Arthur, Chestham, Grange Road, Sutton, Surrey, Oil Expert.
1898. Forrest, J. Kerr, 97, Jeffcott Street, Melbourne, Victoria, Australia, Manufacturing Chemist.
1890. Forrester, A. M., c/o Laidlaw, Mackill, and Co., 3400—3500, Williamsburg Avenue, Richmond, Va., U.S.A., Analytical Chemist.
1902. Forstall, Alf. E., 58, William Street, New York City, U.S.A., Consulting Gas Engineer.
1899. Forster, Dr. Martin O., Royal College of Science, South Kensington, S.W., Demonstrator of Chemistry
1901. Forster, Miss E. L. B., King's College, Strand, London, W.C., Analyst.
1884. Forster, Ralph C., c/o Messrs. Bessler, Waechter, & Co., 18 and 19, Fenchurch Street, E.C., Chemical Merchant.
1884. Forth, Henry, Meadowcroft, Marple, near Stockport, Drysalter.
1895. Foster, Jas., 42, Herriet Street, Pollokshields, Glasgow, Engineer.

O.M. Foster, R. Le Neve, Harrytown Hall, Bredbury, near Stockport, Manufacturing Chemist.

1888. Foster, Wm., St. Martin's Terrace, Newton Park, Leeds, Manufacturing Chemist.

1903. Fotheringham, John, Nansori Mill, Rewa River, Fiji, Chemist.

1891. Fowler, Gilbert J., Broad Oak, Urmston, near Manchester, Superintendent and Chemist (Manchester Corporation Sewage Works).

1898. Fowler, Theo. V., P.O. Box 168, Buffalo, N.Y., U.S.A., Chemical Works Manager.

1886. Fox, A. Stanley, 23, South Road, Faversham, Kent, Chemist (Cotton Powder Co., Ltd.).

1898. Fox, Jno., 76, Butler Street, Oldham Road, Manchester, Analyst.

1888. Fox, J. Wesley, 7, Bushell Street, Wapping, E., Salt Merchant.

O.M. Fox, T., jun., Tonedale, Wellington, Somerset, Wool Manufacturer.

1901. France, G. Herbert, Woodroyd Dyeworks, Low Moor, Bradford, Yorks., Dyer.

1899. Franchot, Stanislaus P., c/o National Electrolytic Co., Niagara Falls, N.Y., U.S.A., Manufacturing Chemist.

1885. Francis, Edwd., Park Ravine, Nottingham, Chemical Lecturer.

O.M. Francis, E. G., 29, Matheson Road, West Kensington, W., Glucose Works Manager.

O.M. Francis, G. B., 38, Southwark Street, London, S.E., Wholesale Druggist.

O.M. Francis, W. H., Cleveland, Thornton Road, Clapham Park, S.W., Wholsale Druggist.

1894. Franck, Jerome W., 29, Broadway, New York City, U.S.A., Chemist.

1903. Francksen, Dr. Aug., 4803, Garden Street, Bridesburg, Philadelphia, Pa., U.S.A., Chemist.

1886. Frankenburg, Isidor, Greengate Rubber Works, Salford, Manchester, India-rubber Manufacturer.

1895. Frankforter, Dr. G. B., University of Minnesota, Minneapolis, Minn., U.S.A., Professor of Chemistry.

O.M. Frankland, Prof. P. F., F.R.S., The University, Birmingham, Professor of Chemistry.

O.M. Frankland, H., Streonshalh, The Crescent, Linthorpe, Middlesbro', Analytical Chemist.

1902. Franklin, Chas. R., Gibbstown, Gloucester Co., N.J., U.S.A., Analytical Chemist.

1901, Frasch, Hans A., c/o F. T. Falding, 52, Broadway, New York City, U.S.A., Manager.

1900. Frasch, Herman, 681, Euclid Avenue, Cleveland, Ohio, U.S.A., Oil Refiner.

1891. Fraser, Leslie McG., 98, Commercial Road East, London, E., Chemical Engineer.

1902. Fraser, R. A., The Serpentine S., Blundellsands, near Liverpool, Fellmonger.

1886. Fraser, W. J., 121, Adelaide Road, London, N.W., Mechanical Engineer.

1902. Frederick, Geo. E., jun., P.O. Box 762, New York City, U.S.A., Chemical Merchant.

1903. Free, R. E., The Elms, Mistley, Essex, Maltster.

1885. Freear, H. M., Hardwick Road, Woburn Sands, Beds., Analytical Chemist.

1903. Freeman, L. E., Room 503, 26, Broadway, New York City, U.S.A., Technical Chemist.

1899. French, Alf., St. Bartholomew's Hospital, Rochester, Kent, Dispenser.

1900. French, Thos., 1, Kelvinside Terrace West, Glasgow, Chemist.

1898. French, Wm., Storey Institute, Lancaster, Science Teacher.

1902. Frenzel, Arthur B., 1.540 Sherman Avenue, Denver, Colo., U.S.A., Consulting Engineer.

1903. Frerichs, F. W., c/o Merck and Co, St. Louis, Mo., U.S.A., Manufacturing Chemist.

1888. Frew, Dr. Wm., King James' Place, Perth, N.B., Brewing Chemist.

1903. Frew John, Dunrod Cottage, Hamilton, N.B., Chemist.

1886. Fries, Dr. Harold H., 92, Reade Street, New York City, U.S.A., Chemical Manufacturer.

1902. Fries, Jno. W., Winston, Salem, N.C., U.S.A., Cotton Manufacturer.

O.M. Friswell, R. J., (communications) Bound Reed, Higham, Kent; (Journals) 43–45, Gt. Tower Street, E.C., Consulting Chemist.

1901. Fritchle, Oliver P., c/o Boston and Colorado Smelting Co., Argo, Colo., U.S.A., Metallurgical Chemist.

1898. Frith, J. Mason, Linden Lodge, Runcorn, Cheshire, Lime Burner.

1899. Fritzsche, Karl, c/o Schimmel and Co., Miltitz, near Leipzig, Germany, Manufacturer of Essential Oils.

1890. Frost, Dr. Howard V., 3958, Drexel Boulevard, Chicago, Ill., U.S.A., Professor of Chemistry.

1884. Frost, Joe, Storths Mill, Moldgreen, Huddersfield, Manufacturing Chemist.

O.M. Fryer, Dr. A. C., 13, Eaton Crescent, Clifton, Bristol, Alkali Works Inspector.

1903. Fudge, T., 397, Avenue E., Bayonne, N.J., U.S.A., Chemist.

1894. Fuerst, Dr. Alex. F.,

Chemist.

1889. Fuerst, Jos. F., 17, Philpot Lane, London, E.C., Chemical and Oil Merchant.

1895. Fuerst, W. F., 2, Stone Street, New York City, U.S.A., Chemical Merchant.

1894. Fuller, Chas. J. P., L. and Y. Railway Works, Horwich, near Bolton, Analytical Chemist.

1902. Fuller, Henry C., 83, North Washington Street, Boston, Mass., U.S.A., Analytical Chemist.

1899. Fuller, Robt. F., Neston Park, Corsham, Wilts, Rubber Manufacturer.

1899. Fuller, W. M., c/o Morris and Griffin, Ltd., Maindee, Newport, Mon., Chemical Manufacturer.

O.M. Fuller, Wm., 8, Orchard Road, Blackheath, S.E., Chemist.

1898. Fulmer, Elton, Pullman, Wash., U.S.A., Professor of Chemistry.

1896. Fulton-Smith, J., 20, Bold Street, Warrington, Brewer.

1885. Fyfe, Jno., 7, West George Street, Glasgow, Oil Works Director.

G

1898. Gabain, Chas. E., Messrs. Gabain Frères, Havre, France, Manufacturer of Edible Fats.

O.M. Gabbett, E. R., 64, Vanbrugh Road, Blackheath, S.E., Chemical Engineer.

1890. Gajjar, T. K., Techno-chemical Laboratory, Girgaum, Bombay, India, Consulting Chemist.

1884. Gall, Henry, 5, Rue Albert Joly, Versailles (S. et O.), France, Technical Chemist.

1897. Galletly, J. C., 101, Armadale Street, Dennistoun, Glasgow, Assistant to Professor of Metallurgy.

1901. Gallivan, Frank B., 56, Prospect Place, Brooklyn, N.Y., U.S.A., Chemist.

1903, Gallum, Albert F., Milwaukee, Wis., U.S.A., Tanner.

1901. Gallup, W. Arthur, Arnold Printworks, North Adams, Mass., U.S.A., Printer.

1901. Galpin, Harry T., 55, West 57th Street, New York City, U.S.A., Chemist.

1891. Galt, Hugh Allen, Columbia Chemical Co., Barberton, Ohio, U.S.A., Works Manager.

O.M. Gamble, Sir David, Bart., Windlehurst, St. Helens, Chemical Manufacturer.

1887. Gamble, Jas. N., The Laboratory, Procter and Gamble Co., Ivorydale, Ohio, U.S.A., Soap Manufacturer and Oil Refiner.

O.M. Gamble, J. C., Haresfinch, St. Helens, Chemical Manufacturer.

1902. Gamer, A. C. C., P.O. Box 70, Bellingham, Wash. U.S.A., Chemist.

1894. Gane, Eustace H., 95, Fulton Street, New York City U.S.A., Pharmaceutical Chemist.

1888. Gans, Adolf, Farbenfabrik von L. Cassella & Co., Frankfort o/Main, Germany, Dye Works Manager.

1901. Gansser, Dr. A., c o Messrs. Lepetit, Dollfus and Gansser, Garessio-Ponte (Provincia di Cuneo), Italy, Chemical Engineer.
1896. Gardair, Aimé, 51, Rue St. Ferréol, Marseilles, France, Director of Chemical Co.
1893. Gardiner, H. J., 90, Cannon Street, London, E.C., Chemical Manufacturer.
1891. Gardner, Walter M., Municipal Technical College, Bradford, Director of Chemistry and Dyeing Department.
1897. Garfield, Jos., Thackley, Bradford, Yorks, Civil Engineer.
1888. Garibaldi, Joachim A., 21, Church Place, Gibraltar, Analytical Chemist.
1890. Garrett, F. C., Durham College, of Science, Newcastle-on-Tyne, Teacher of Science.
1901. Garroway, Jno., 58, Buchanan Street, Glasgow, Manufacturing Chemist.
1899. Garroway, Wm., 694, Duke Street, Glasgow, Chemical Manufacturer.
1898. Garry, H. Stanley, 9, Clipstone Avenue, Nottingham, Manure Works Manager.
O.M. Garton, R. (Hill, Garton, & Co.), Southampton Wharf, Battersea, S.W., Glucose Manufacturer.
1893. Garton, Rd. S., Woodycrest Avenue, Highbridge, New York City, U.S.A., Chemist.
1886. Gascoyne, Dr. W. J., 36, South Holliday Street, Baltimore, Md., U.S.A., Analytical Chemist.
O.M. Gaskell, Holbrook, Woolton Wood, Woolton, near Liverpool, Alkali Manufacturer.
O.M. Gaskell, Holbrook, jun., Erindale, Frodsham, Cheshire, Alkali Manufacturer.
1902. Gaskell, Holbrook (III.), Erindale, Frodsham, Cheshire, Engineer.
1901. Gass, Jas. Kelly, 113, Vanhook Street, Camden, N.J., U.S.A., Dyer.
1897. Gaster, Leon, 32, Victoria Street, Westminster, S.W., Electrical Engineer.
1895. Gate, Tom Erskine, (Journals) c/o Calder and Mersey Extract Co., Ltd.; and (subscriptions) Calder House, Dewsbury, Yorks, Manufacturing Chemist.
O.M. Gatheral, Geo., 174, Soho Hill, Handsworth, Birmingham.
1903. Gaylord, Wallace K., Throop Polytechnic Institute, Pasadena, Cal., U.S.A., Professor of Chemistry.
1891. Gesler, Dr. Jos. F., New York Mercantile Exchange Building, 6, Harrison Street, New York City, U.S.A., Consulting Chemist.
1901. Gemmell, G. H., 4, Lindsay Place, George IV. Bridge, Edinburgh, Analytical Chemist.
1901. Gent, Percy W., 792½, Ridge Street, Forest Hill, Newark, N.J., U.S.A., Chemist.
1897. Gent, Wm. T., Springfield, Misterton, near Gainsboro', Metallurgical Chemist.
1896. Genth, Fred. A., jun., 222, Walnut Street, Philadelphia, Pa., U.S.A., Chemist.
1902. George, Wm. K., 80, Glen Road, Toronto, Ont., Canada, Manufacturer.
1894. Georgi, Carl, 77, John Street, New York City, U.S.A., Aniline Colour Importer.
1903. Georgii, Max, 606, F Street, N.W., Washington, D.C., U.S.A., Patent Attorney.
O.M. Gerland, Dr. B. W., 105, Plantation Street, Accrington, Consulting Chemist.
1903. Ghose, Anukul, 42, Shambazar Street, Calcutta, India, Analyst.
1891. Gibb, Thos., Mount Perry, Queensland. Metallurgist.
1903. Gibbings, Wm., 11, Howard Drive, Grassendale, Liverpool, Works Manager.
O.M. Gibbins, H. B., 177, Redland Road, Bristol.
1902. Gibbon, Edw., Ynys House, Clydach, R.S.O., Glam., Works Chemist.
1883. Gibbs, D. Cecil, Soap Manufacturer.
O.M. Gibbs, Wm. P., Fabriken, Hjerpen, Jemtland, Sweden, Analytical Chemist.
1893. Gibbs, W. T., Buckingham, Prov. Quebec, Canada, Manufacturing Chemist.
O.M. Gibson, Dr. J., 20, George Square, Edinburgh, Chemical Lecturer.
O.M. Gibson, J. M., c/o Buckley Brick and Tile Co., Buckley, *viâ* Chester, Brick and Tile Manufacturer.
1899. Gifford, Wm. E., 408, New Jersey Railroad Avenue, Newark, N.J., U.S.A., Chemist.
1892. Gilbard, T. Francis H., 245, Dalston Lane, Hackney, N.E., Analytical Chemist.
1903. Gilby, Joseph W., Berners Street, Peterson Road, Wakefield, Works Chemist.
O.M. Gilchrist, P. C., F.R.S., Metallurgist.
1884. Gilchrist, Peter S., Charlotte, N.C., U.S.A., Chemical Engineer.
1900. Gildersleeve, W. H., Middleboro', Ky., U.S.A., Chemist.
O.M. Giles, W. B., The Grange, Leyton, Essex, Chemical Manufacturer.
1886. Gill, Dr. Aug. H., Massachusetts Institute of Technology, Boston, Mass., U.S.A., Assistant Professor of Gas Analysis.
1900. Gill, J. Arthur, 10, Manor Road, Rusthall, Tunbridge Wells, Analyst.
1901. Gill, Wm. S., 40, St. Paul Street, Aberdeen, Colour and Varnish Manufacturer.
1903. Gillean, R. Hampson, c/o General Chemical Co., Bayonne, N.J., U.S.A., Chemist.
1901. Gilles, Wm. S., Bradford Street, Bocking, near Braintree, Essex, Technical Chemist.
1903. Gillett, Wm. Lowry, Hotel San Remo, Central Park West, and 75th Street, New York City, U.S.A., Chemical Engineer.
1888. Gillman, Gustave, A M.I.C.E. Ferrocarril de Murcia, á Granada, Aguilas, Prov. de Murcia, Spain, Civil Engineer.
1892. Gilmour, J. D., 190, Butterfiggins Road, Glasgow, Chemist.
1891. Gimingham, Edw. A., 1, Cranbourne Mansions, Cranbourne Street, W.C., Electrician.
1900. Ginder, Wm. H., c/o American Sheet Steel Co., Vandergrift, Pa., U.S.A., Analytical Chemist.
1896. Girdwood, Dr. G. P., 111, University Street, Montreal, Canada, Professor of Chemistry.
1903. Gladding, Thos. S., 55, Fulton Street, New York City, U.S.A., Analytical Chemist.
1886. Glaeser, F. A., Carpenter's Road, Stratford, E., Varnish Manufacturer.
1889. Glaser, Chas., 21, South Gay Street, Baltimore, Md., U.S.A., Analytical and Consulting Chemist.
1889. Glatz, Jos., 485—493, Kent Avenue, Brooklyn, N.Y., U.S.A., Chemical Manufacturer.
1901. Glegg, Robt., 29, Kimberley Street, Liverpool, Analytical Chemist.
1894. Glen, Chas., Glengowan Printworks, Caldercruix, N.B., Calico Printer.
1890. Glen, J., jun., Glengowan Printworks, Caldercruix, N.B., Calico Printer.
1900. Glendenning, Arthur, 31, Bright Street, Middlesbrough, Analytical Chemist.
1884. Glendinning, H., Winnington Park, Northwich, Cheshire, Technical Chemist.
1904. Glendinning, T. A., 31, Garthland Drive, Dennistoun, Glasgow, Brewery Chemist.
1895. Glenn, Wm., Baltimore Chrome Works, 1348, Block Street, Baltimore, Md., U.S.A., Chrome Manufacturer.
1888. Gloag, Robt. F., Grove Hill, Middlesbrough, Secretary.
O.M. Glover, G. T., 24, Craven Hill Gardens, Lancaster Gate, W., Chemical Works Manager.
1896. Glover, H., East Falls, Schuylkill, Philadelphia, Pa., U.S.A., Chemical Works Superintendent.
O.M. Glover, W., Rio Tinto Mines, Huelva, Spain, Technical Chemist.
1903. Goetschius, Howard B., Little Ferry, N.J., U.S.A., Chemist.
1896. Goetz, Isidore, 2, Kelfield Gardens, North Kensington, W., Mine Manager.
1898. Golding, Jno., Midland Agricultural and Dairy Institute, Kingston, and (Journals) Ashby Road, Kegworth, Derby, Agricultural Chemist.

O.M. Goldschmidt, Dr. S. A., 43—51, Sedgwick Street, Brooklyn, N.Y., U.S.A., Chemical Manufacturer.
1897. Goldschmiedt, Dr. Guido, Laboratory, II. Salmgasse 1, Prag, Austria, Professor in Imperial German University.
1895. Goldsmith, Byron B., 19, East 74th Street, New York City, U.S.A., Vice-President (American Lead Pencil Co.).
1899. Goldsmith, Jno. N., British Xylonite Co., Ltd., Manningtree, Essex, Chemist.
1900. Goodchild, Wm. H., Elmwood Lodge, Long Lane, Finchley, London, N., Chemical Student.
1898. Goode, J. Archibald, 16, Crampton Street, London, S.E., Analytical Chemist.
1899. Goodhue, Francis A., 32, India Street, Boston, Mass., U.S.A., Aniline Colour Importer.
1898. Goodrich, Chas. G., Akron, Ohio, U.S.A., Rubber Manufacturer.
1884. Goodwin, C. C., The White House, St. John's Road, Bowdon, Cheshire, Soapmaker.
1894. Goodwin, Dr. W. L., The School of Mining, Kingston, Canada, Professor of Chemistry.
O.M. Goppelsroeder, Dr. F., Leimenstrasse 51, Basel, Switzerland, Professor of Chemistry.
1901. Gordon, A. T., c/o Oliver Iron Mining Co., Mount Iron, Minn., U.S.A., Chemist.
1898. Gordon, Colin, Storer's Wharf, Cubitt Town, E., and (Journals) Lynwood, Vanbrugh Hill, Blackheath, S.E., Chemical Engineer.
1884. Gordon, J. G., Queen Anne's Mansions, Westminster, S.W., Steel Manufacturer.
1883. Gore, Dr. G., F.R.S., 20, Easy Row, Birmingham Metallurgist.
1901. Gornall, Frank H., 256, Park Road, Crouch End, N., Chemist.
1891. Gorvin, Jno. C., English Crown Spelter Co., Ltd., Swansea, Works Manager.
O.M. Gossage, F. H., Camp Hill, Woolton, Liverpool, Alkali Manufacturer.
1897. Gossage, W. Winwood, Widnes, Lancashire, Soap Manufacturer.
1904. Gotthelf, August H., Hastings-on-Hudson, N.Y., U.S.A., Chemist.
1890. Goulding, Wm. Joshua, 25, Eden Quay, Dublin, Manure Manufacturer.
1903. Govers, F. X., 250, Main Street, Owego, Tioga Co., N.Y., U.S.A., Manager and Chemist.
O.M. Gow, R. J., Ivy Lea, Hough Green, near Widnes, Metallurgical Chemist.
O.M. Gowland, W., 13, Russell Road, Kensington, W., Assayer and Metallurgist.
1886. Goyder, G. A., 12, Pirie Street, Adelaide, South Australia, Chemist.
1890. Grabfield, Dr. J. P., 4712, Greenwood Avenue, Chicago, Ill., U.S.A., Chemist.
1900. Grabill, Clarence A., Val Verde, Yavapai Co., Arizona, U.S.A., Chemist.
1883. Graesser, R., Cefn, near Ruabon, North Wales; and Argoed Hall, Llangollen, North Wales, Manufacturing Chemist.
O.M. Graham, Prof. C., The Reculvers, Hastings, Consulting Chemist.
O.M. Graham, C. C., Highmoor, Bemhydding Road, Ilkley, Yorks, Technical Chemist.
1883. Grandage, H., c/o Flax Pilp, Ltd., 25, Billiter Street, London, E.C., Dyer.
1897. Granger, Dr. J. Darnell, 43, Myrtle Road, Acton, W., Analytical Chemist.
1900. Granja, Rafael, Kingston, N.Y., U.S.A., Chemist.
1903. Grant, Henry C., c/o Grasselli Chemical Co., 63, Wall Street, New York City, U.S.A., Manager.
1896. Graves, Geo. H., c/o General Chemical Co., Bridgeport, Conn., U.S.A., Manufacturing Chemist.
1896. Graves, Walter G., 364, Harkness Avenue, Cleveland, Ohio, U.S.A., Chemist.
1895. Gray, Elisha B., c/o United Oil and Refining Co., Beaumont, Texas, U.S.A., Oil Inspector and Chemist.
1903. Gray, G. Oscar, Iron Gate, Va., U.S.A., Chemist.
1884. Gray, G. Watson, 8, Inner Temple, Dale Street, Liverpool, Consulting Chemist and Assayer.
1902. Gray, J. Campbell, Glengoyt, Strines, near Stockport, Printworks Chemist.
1904. Gray, Jas., Box 5, Fordsburg, Johannesburg, Transvaal, Chemist.
1886. Gray, Jno., 13, Queen's Road, Rock Ferry, near Birkenhead, Oil Works Chemist.
1903. Gray, Jno. Lathrop, c/o Tide Water Oil Co., East 22nd Street, Bayonne, N.J., U.S.A., Assistant Superintendent (Paraffin Works).
1902. Gray, John, Port Credit, Ont., Canada, Starch Manufacturer.
1896. Gray, Dr. Thos., 204, George Street, Glasgow, Lecturer in Chemistry.
1903. Gray, Wm. S., 76, William Street, New York City, U.S.A., Chemical Merchant.
1901. Greaves, Albert E., c/o P. Spence and Sons, Ltd., Goole Alum Works, Goole, Yorks, Works Chemist.
1891. Greaves, I. A. R., Morton, Gainsborough, Brewer.
1894. Greaves, Wm., Powell Duffryn Steam Coal Co., Aberaman, Aberdare, South Wales, Chemical Engineer and Chemist.
1894. Greeff, R. W., 20, Eastcheap, London, E.C., Chemical Agent.
1890. Green, Alfred H., Oaklands, Lowton, Newton-le-Willows, Lancashire, Manufacturing Chemist.
O.M. Green, Prof. Arthur G., 2, Dartmouth Road, Brondesbury, N.W., and Clothworkers' Department, The Yorkshire College, Leeds, Professor of Dyeing.
1903. Green, G. F. Dudbridge, 75, Gracechurch Street, E.C., Manufacturing Chemist.
O.M. Green, H., Hayle Mill, Maidstone, Paper Manufacturer.
1888. Green, Jno. Edw., Broadlea, Urmston, near Manchester, Soap Works Manager.
1836. Green, Jno. Wilberforce, 55, The Avenue, Kew Gardens, S.W., Technical Chemist.
O.M. Green, L., Lower Tovil, Maidstone, Paper Manufacturer.
O.M. Greenaway, A. J., The Orchard, Chertsey, Surrey, Sub-Editor of Chemical Society's Journal.
1884. Greenhalgh, Jas. Herbert, Whitebirk, Green Mount, near Bury, Lancs., Assistant Manager of Printworks.
O.M. Greenway, T. J., Chillagoe, North Queensland, Australia, Metallurgist.
1902. Greenwood, Conrad Varley, Green Hill, Colne, Lancs., Cotton Mill Manager.
O.M. Greenwood, Helmes, Regent House, Hartmann Street, Accrington, Lancashire, Technical Chemist.
1897. Gref, Anthony, 40, Stone Street, New York City U.S.A., Patent Lawyer.
1904. Gresty, Jas. E., 135, Oxford Street, Manchester, Chemical Engineer.
O.M. Greville, H. L., 51, Hafton Road, Catford, S.E., Gas Examiner.
1900. Griffin, Dr. Jno. J., Catholic University of America, Washington, D.C., U.S.A., Professor of Chemistry.
1890. Griffin, John R., 20—26, Sardinia Street, Lincoln's Inn Fields, W.C., Chemical Apparatus Maker.
1886. Griffin, Martin L., Mechanicville, Saratoga Co., N.Y., U.S.A., Analytical Chemist (and Consulting) (Fibre, Paper, Clays).
O.M. Griffith, R. W. S., Eyeworth Lodge, Lyndhurst, Hants, Gunpowder Manufacturer.
1902. Griffiths, Manfred E., Fernside, Childer Road, Stowmarket, Explosives Chemist.
1894. Griffiths, Thos., The Cedars, Clapham Common, S.W., Manufacturing Chemist.
1902. Grimwade, Wilfrid R.; (Journals) 342, Flinders Lane, Melbourne, Vic., Australia; (subscriptions) c/o Grimwade, Ridley, and Co., 6, Trinity Square, London, E.C., Manufacturing Chemist.
O.M. Grimwood, R., 41, Lady Margaret Road, London, N.W., Analytical Chemist.
1900. Grimwood, Robt. G., 17, Dagmar Road, Stroud Green, N., Analytical Chemist.

O.M. Grindley, J., Upper North Street, Poplar, London, E., Tar Distiller.

1888. Gripper, Harold, Great Central Railway, Gorton, Manchester, Analytical Chemist.

1903. Griswold, Geo. G., Globe Plant, A. S. and R. Co., Denver, Colo., U.S.A., Assistant Superintendent.

1897. Gronemeyer, Herman H., 315, Amesbury Avenue, Cleveland, Ohio, U.S.A., Chemical Superintendent.

1900. Gross, Abraham, 341, Oakland Avenue, Pittsburg, Pa., U.S.A., Technical Chemist.

O.M. Grossmann, Dr. J., Northern Assurance Buildings, Albert Square, Manchester, Consulting Chemist and Chemical Engineer.

1896. Grosvenor, Wm. M., jun., c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Electro-Chemist.

O.M. Groves, C. E., F.R.S., 352, Kennington Road, London, S.E., Chemist (Thames Conservancy).

1903. Grundy, F. Barnes, Victoria Mills, Bredbury, near Stockport, Technical Chemist.

1899. Gudemann, Dr. Edw., 4319, Vincennes Avenue, Chicago, Ill., U.S.A., Chemist.

1902. Guenther, Felix, jun., c/o Crescent Portland Cement Co., Wampum, Pa., U.S.A., Chemist.

1898. Guess, Harry A., Silver Lake Mines, Silverton, Colo., U.S.A., Chemist.

1899. Guest, Edw. Graham, 5, Churchhill, Edinburgh, Cereals Chemist.

1903. Guest, Hon. Lionel G., 205, St. James Street, Montreal, Quebec, Canada, Engineer.

1899. Guild, Frank N., University of Arizona, Tucson, Arizona, U.S.A., Professor of Chemistry.

1900. Guitermann, Edw. W., Passaic Printworks, Passaic, N.J., U.S.A., Chemist.

1894. Gulliver, Geo. W., c/o Burt, Boulton, and Haywood, Selzaete, Belgium, Chemist.

1903. Gunn, Gilbert, 80, Prettywood, Bury, Lancs., Paper Mill Chemist.

1883. Gunn, W. L., Broad Plain Soap Works, Bristol, Analytical Chemist.

1900. Günther, Chas. E., Liebig's Extract of Meat Co., Ltd., 4, Lloyd's Avenue, London, E.C., Merchant.

1902. Günther, Wm. J. W., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Inspector.

1894. Gurney, J. Clare, Fabrica Roma, La Union, Prov. de Murcia, Spain, Analytical Chemist.

1899. Gutcher, Wm., Singapore Oil Mills, Singapore, S.S., Superintendent Engineer.

1903. Guthrie, Alan, c/o Cooper, Allen, and Co., Cawnpore, India, Leather Trades Chemist.

1903. Guthrie, Alex, The Cottage, Bocking, Braintree, Essex, Manager.

1892. Guthrie, John, Trentham Street, Dewsbury Road, Leeds, Chemical Works Manager.

1901. Guthrie, John M., 199, Ferry Road, Leith, N.B., Analytical Chemist.

1903. Guttmann, Dr. Leo F., 18, Aberdare Gardens, West Hampstead, N.W., Research Chemist.

1892. Guttmann, Oscar, 12, Mark Lane, London, E.C., Consulting Chemical Engineer, M. Inst. C. E.

H

1902. Haas, Herbert, c/o Great Western Gold Co., Redding, Cal., U.S.A., Chemist and Metallurgist.

O.M. Habirshaw, W. M., Glenwood Works, Yonkers, N.Y., U.S.A., Chemical Engineer.

1883. Hacking, W. H., The Grange, Clayton-le-Moors, near Accrington.

1900. Haddock, Arthur G., c/o Castner-Kellner Alkali Co., Ltd., Weston Point, Runcorn, Cheshire, Technical Chemist.

1898. Haddow, Geo., Parkview, Redding, Polmont Station, N.B., Chemist.

1887. Hadfield, R. A., Newhall Road, Attercliffe, Sheffield, Steel Founder.

1884. Hadkinson, F., Pamphila Oil and Soap Works, Mitylene, Mediterranean, Oil Refiner and Soap Manufacturer.

O.M. Hadkinson, R., Smyrna, Asia Minor, Oil Refiner.

1904. Hadley, Geo., 58, Halesowen Street, Blackheath, Staffs., Spelter Works Manager.

1902. Haff, Max M., 77, Gloucester Street, Ottawa, Canada, Chemist.

1887. Haig, Robert, Mechanical Retorts Co., Limited, Murray Street, Paisley, N.B., Chemical Engineer.

1896. Haigh, De Lagnel, 33, Norwood Avenue, Summitt, N.J., U.S.A., Chemist.

1898. Haigh, Fred., 141, Autumn Street, Passaic, N.J., U.S.A., Chemist (Flax Spinning Co.).

1898. Haigh, Percy, c/o Messrs. Bird Bros, Duxford, Cambridge, Analytical Chemist.

1888. Hailes, A. J. de, 15, Red Lion Square, W.C., Analytical Chemist.

1889. Haines, Reuben, Haines Street, near Chew Street, Germantown, Philadelphia, Pa., U.S.A., Analytical Chemist.

O.M. Hake, C. N., 423, Flinders Lane, Melbourne, Victoria, Inspector of Explosives.

1903. Halbert, Thos., c/o British South African Explosives Co., Modderfontein, Transvaal, Analytical Chemist.

1903. Hale, Dr. Frank E., Mount Prospect Laboratory, Flatbush Avenue and Eastern Parkway, Brooklyn, N.Y., U.S.A., Chemist.

1888. Hale, Edw. P., c/o Wakefield & Co., Gatebeck Kendal, and (communications) Endmoor, near Kendal, Analytical Chemist.

1887. Hall, Allan T., c/o Sissons Bros. & Co., Ltd., Hull, Oil Refiner and Varnish Manufacturer.

1886. Hall, Archibald D., 7, Fenchurch Avenue, London, E.C., Analytical Chemist.

1898. Hall, Clarence A., 517, North American Building, Philadelphia, Pa., U.S.A., Chemist.

O.M. Hall, Edgar, Silver Spur, Stanthorpe, Queensland, Australia, Technical Chemist.

1902. Hall, Geo., c/o A. A. Vantine and Co., Broadway and 18th Street, New York City, U.S.A., Chemist.

1902. Hall, Henry, c/o Booth and Co., Irk Vale Works, Middleton, Lancashire, Dyer and Finisher.

1893. Hall, Jas. W., Bombay, Baroda, and Central India Railway, Sabarmati, near Ahmedabad, India, Linseed Oil Mills Manager.

1885. Hall, Jno. A., Victoria Chemical Works, Victoria, British Columbia, Analytical Chemist.

1900. Hall, Jcs. J., 414, Fifth Avenue, Cedar Rapids, Iowa, U.S.A., Chemist.

1900. Hall, Prof. Robt. W., Havemeyer Laboratory, University Heights, New York City, U.S.A., Professor of Analytical Chemistry.

O.M. Hall, S., East London Soap Works, Bow, London, E. Soap Manufacturer.

1896. Hall, S. G., East London Soap Works, Bow E., Soap Maker.

1898. Hall, Wm. F., c/o Wanderer G. M. Co., Selukwe, Rhodesia, Cyanide Manager.

1886. Haller, Geo., Sussex House, 52, Leadenhall Street, London, E.C., Chemical Merchant.

1893. Haller, H. Left, 26, Scale Lane, Hull, Analytical Chemist.

1895. Halliwell, Edw., c/o Ribble Joint Committee, 16, Walton's Parade, Preston, Chief Inspector.

1901. Hallock, Dr. Albert P., 440, First Avenue, New York City, U.S.A., Chemist.

1892. Hamaguchi, K., Hiro Mura, Arito Gori, Wakayama Ken, Japan, Soy Manufacturer.

1897. Hambly, Fred. J., Buckingham, Quebec, Canada, Chemist.

1901. Hambuechen, Carl, 113, West Gorham Street, Madison, Wis., U.S.A., Electro-Chemist.

1887. Hamilton, Jas. C., Arncliffe, Arnside, viâ Carnforth, Chemical Works Manager.

1885. Hamilton, Oswald, Lancaster Cottage, Old Stratford, near Stony Stratford, Chemical Engineer.

1884. Hamilton, Robert, Glengarnock Chemical Co., Ltd., Glengarnock, N.B., Works Manager.

1892. Hamilton, Robt., 62, Tempest Road, Beeston Hill, Leeds, Analytical Chemist.

O.M. Hammill, M. J., The Gables, St. Helens, Alkali Manufacturer.

1898. Hammersley, W. Stanley, Longjumeau, S. et O., France, Tanner.

1892. Hammond, Geo. W., Yarmouthville, Maine, U.S.A., Paper Co.'s Agent.

1904. Hammond, H. S., Government Laboratory, Kingston, Jamaica, Analyst.

O.M. Hammond, J., Gas Works, Eastbourne, Sussex, Gas Manager.

1902. Hampson, B. A., "Hampson's Buildings," Smith Street, Durban, Natal, S. Africa, Assayer and Geologist.

1900. Hampton, F. T., Hill City, Tenn., U.S.A., Civil Engineer.

1900. Hancock, Walter C., 10, Upper Chadwell Street, Myddelton Square, London, E.C., Analytical Chemist.

1896. Hand, Daniel, 30, Mount Pleasant Avenue, Newark, N.J., U.S.A., Chemist.

1889. Handy, Jas. O., 325, Water Street, Pittsburg, Pa., U.S.A., Chemist.

1888. Hanks, Abbot A., 531, California Street, San Francisco, Cal., U.S.A., Assayer.

1901. Hanna, Charles E., 316, St. James' Street, Montreal, Canada, Secretary.

1899. Hanna, Dillinger C., 4262, Parkside Avenue, Philadelphia, Pa., U.S.A., Chemist and Superintendent.

O.M. Hanson, A. M., Abbey Printworks, Whalley, Blackburn, Print Works Chemist.

1901. Hardcastle, G. Fred., 9, Newtown Street, Leicester, Teacher of Science and Technology.

1894. Harden, Dr. Arthur, c/o British Institute of Preventive Medicine, Grosvenor Road, London, S.W., and (communications) 2, Marlborough Road, Richmond, S.W., Lecturer in Chemistry.

1900. Hardwick, W. Roscoe, 13, Batavia Buildings, Hackins Hey, Liverpool, Chemist.

1902. Hardy, G. B., Belmont Gold Mine, Cordova, Ont., Canada, Metallurgist.

1897. Harger, Dr. Jno., 11, Ivy Mount, Sutton-on-Hull, Chemist.

1896. Hargreaves, Jas., Farnworth, Widnes, Lancashire, Chemical Engineer.

O.M. Hargreaves, Jno., Widnes, Alkali Manufacturer.

O.M. Harland, R. H., Plough Court, 37, Lombard Street, London, E.C., Consulting Chemist.

1904. Harley, B., 12, Russell St., Falkirk, N.B., Analytical Chemist.

1893. Harlock, E. B., Newton Farm, Middlewich, Chemical Manufacturer.

1898. Harman, Edw. A., Gas Works, Huddersfield, Gas Engineer, M. Inst. C. E.

1903. Harrington, E. M., Aetna, Lake Co., Ind., U.S.A., Explosives Manufacturer.

O.M. Harrington, W. B., Leeview, Montenotte, Cork, Chemical Manufacturer.

1893. Harris, Arthur, 22, Marsh Gate Lane, Stratford, E., Soap Maker.

1885. Harris, Booth, jun., Beeleigh, Victoria Road Buckhurst Hill Essex, Soap Maker.

O.M. Harris, D., 16, Merchiston Avenue, Edinburgh, Chemical Manufacturer.

1897. Harris, Fred. W., Sanitary Chambers, Chemical Department, Glasgow, Public Analyst.

1900. Harris, Dr. Harry B., 212, Jones Street W., Savannah, Ga., U.S.A., Chemist.

1900. Harris, L. A., Wyoming, Wood Vale, Lordship Lane, London, S.E., Chemist.

1896. Harris, Wm. T. A., Ideal Soapery, East Street, Brempton, Adelaide, South Australia, Soap Maker.

O.M. Harrison, A., Thames Sugar Refinery, Silvertown, London, E., Sugar Works Chemist.

O.M. Harrison, G. D., Netham Chemical Works, Bristol, Chemical Manufacturer.

1883. Harrison, G. H., Hagley, near Stourbridge, Firebrick Maker.

1884. Harrison, G. King, Hagley, near Stourbridge, Fireclay Mine Owner.

1892. Harrison, Prof. John B., C.M.G., Government Laboratory, Georgetown, Demerara, B.G., Government Analyst.

1898. Harrison, Wm. H., 29, Avenue Crescent, Harehills Lane, Leeds, Analytical Chemist.

1896. Hart, Bertram, c/o Tennants and Co., Clayton, Manchester, Analyst.

1886. Hart, Bertram H., The Elms, Old Charlton, S.E., Analytical Chemist.

O.M. Hart, Dr. E., Gayley Hall, Lafayette College, Easton, Pa., U.S.A., Professor of Chemistry.

1890. Hart, H. W., 13, Lynwood Villas, Darwen, Lancashire, Analytical Chemist.

1897. Hart, Wm. Beamont, Manchester Laboratory, 8, Exchange Street, Manchester, Consulting Chemist.

1886. Hartley, Arthur, The Brewery, Emsworth, Hants, Brewer.

1883. Hartley, Joseph, 102, Kirkmanshulme Lane, Longsight, Manchester, Technical Chemist.

1889. Hartley, R. Kent, Springwood House, Middleton Junction, near Manchester, Chemical Works Manager.

O.M. Hartley, Prof. W. N., D.Sc., F.R.S., Royal College of Science, Dublin, Professor of Chemistry.

1897. Hartmann, Ernest E., Waialua, Oahu, Hawaii, Chemist.

1891. Hartog, Philip J., 22, Brondesbury Villas, London, N.W., Analytical Chemist.

1892. Hartridge, Jas. Hills, Holmwood, Hendon, Manufacturing Chemist.

1901. Hartwell, S. Warren, 215, North 2nd Street, Easton, Pa., U.S.A., Chemist.

1901. Hartzell, Harry S., 126, North 4th Street, Allentown, Pa., U.S.A., Chemist.

1899. Harvey, Chas., 38, Shakespeare Crescent, Manor Park, E., Manufacturing Chemist.

1892. Harvey, E. Feild, Omrac, St. John's, Newfoundland, Chemist.

1885. Harvey, Ernest W., Stoneleigh, Grove Road, Clapham Park, S.W., A.R.S.M. Engineer.

1888. Harvey, H. C., Raglan House, Brooklands, near Manchester, Chemist.

1891. Harvey, Sidney, South-Eastern Laboratory, Canterbury, Analytical Chemist.

1899. Harvey, Thos. F., 84, Henry Road, West Bridgford, Nottingham, Analyst (Drug Co.).

1883. Harvey, T. H., Cattedown, Plymouth, Chemical Manufacturer.

1903. Hasenclever, Max, Chemische Fabrik Rhenania, Aachen, Prussia, Chemical Manufacturer.

1900. Haslwanter, Chas., 908, Willoughby Avenue, Brooklyn, N.Y., U.S.A., Analytical Chemist.

1897. Hasslacher, Jacob, P. O. Box 1999, New York, U.S.A., President of Roessler-Hasslacher Chemical Co.

1903. Hasting, J. J., c/o Benjamin Moore and Co., 244–259, Water Street, Brooklyn, N.Y., U.S.A., Chemist.

1894. Hatfield, Jno. A., c/o J. Lysaght, Ltd., Orb Ironworks, Newport, Mon., Analytical Chemist.

1903. Hatschek, Emil, c/o The Niles-Bement-Pond Co., 138, Liberty Street, New York City, U.S.A., Engineer.

1887. Hatton, Wm. P., c/o W. R. Hatton & Sons, Wormwood Scrubs, W., Starch Works Manager.

1899. Haus, Simon V., c/o Eastman Kodak Co., Rochester, N.Y., U.S.A., Photographic Chemist.

1900. Havens, Dr. F. S., c/o Franklin H. Kalbfleisch Co., 35, Burling Slip, New York City, U.S.A., Silk Conditioner.

1899. Hawdon, H. S., Harton Road, Westoe, South Shields, Manager.

1895. Hawker, E. W., Adelaide Club, Adelaide, South Australia, Metallurgist.

1902. Hawkins, Clement C., c/o The Chatfield Mfg. Co., Carthage, Ohio, U.S.A., Chemist.

1897. Hawkins, Ernest M., Lime Tree Farm House, Stone Street, Petham, Canterbury, Chemist.

O.M. Hawkins, H., Concord Junction, Mass., U.S.A., Explosive Works Manager.
1893. Hawkins, J. Dawson, c/o Colo. Phila. Reduction Co., Colorado City, Col., U.S.A., Smelting Works Manager.
1887. Hawliczek, Josef, 77A, Lord Street, Liverpool, Consulting Chemical Expert.
1899. Haworth, Dr. Edw., Sunnyside, Norman Road, Runcorn, Cheshire, Chemist.
1903. Haworth, Herbert, Crown Works, Appley Bridge, near Wigan, Director (Grove Chemical Co.).
1904. Hawthorn, J. H., Municipal Technical School, Leicester, Head Master.
1895. Hay, Alex. B., Kelvindock Chemical Works, Maryhill, Glasgow, Manufacturing Chemist.
1898. Haycraft, Jos. H., St. Peter's, Adelaide, South Australia, Metallurgical Chemist.
1894. Haynes, David O., 8, Spruce Street, New York City, U.S.A., Proprietor of "Pharmaceutical Era."
1902. Hays, B. F., c/o Fraser Tablet Co., 454474, 18th Street, Brooklyn, N.Y., U.S.A., Chemist.
1902. Hazard, Dr. Elmer C., Shrewsbury, N.J., U.S.A., Chemist.
1903. Hazen, Chas. R., Collingwood, Ohio, U.S.A., Chemist.
1894. Heal, Carlton, Duston, near Northampton; (Journals) c/o Northampton Tanning Co., St. James' End, Northampton, Chemical Student.
1903. Heald, Henry I., Cliffe House, Kilnhurst, near Rotherham, Yorks., Manager of Earthenware Factory.
1899. Healey, Alfred E., Willesden Paper and Canvas Works, Willesden Junction, N.W., Managing Director.
1890. Heape, Chas., 19, George Street, Manchester, Calico Printer.
1898. Heasman, Walter, Castle Brewery, Bridgnorth, Salop, Brewer.
O.M. Heath, R. C., Myton Grange, near Warwick, Chemical Manufacturer.
1897. Heaton, John, 3, Belle Vue Park, Sunderland, Brewer and Chemist.
1895. Hebden, Jno. C., 64, Exchange Place, Providence, R.I., U.S.A., Works Manager and Chemist.
1895. Hecker, Paul, 102, Fenchurch Street, London, E.C., Chemical Merchant.
1900. Heckman, J. Conrad, (Journals) c/o Larkin Soap Manufacturing Co., Seneca Street, Buffalo, N.Y., U.S.A., Chemist.
1889. Heckmann, C., 9, Görlitzerufer, Berlin, S.O., Germany, Chemical Apparatus Maker.
1885. Hedley, Armorer, Durrant House, Bournemouth, Hants, Soap Manufacturer.
1895. Hedley, Geo. H., Hedge Mill, Loudwater, Bucks, Chemical Manufacturer.
1902. Heebner, Prof. Chas. F., Ontario College of Pharmacy, Toronto, Canada, Professor of Pharmaceutical Chemistry.
1903. Hegeman, John W., 102, Barbey Street, Brooklyn, N.Y., U.S.A., Chemist.
O.M. Hehner, Otto, 11, Billiter Square, London, E.C., Analytical and Consulting Chemist.
1902. Heidenhain, Dr. Henry, 108, Gitschinerstrasse, Berlin, S.W., Chemist.
1902. Heike, Rudolph E., American Sugar Refining Co., P.O. Box L., Jersey City, N.J., U.S.A., Chemist.
1898. Heileman, W. H., (communications) U.S. Department of Agriculture, Bureau of Soils, Washington, D.C.; and (Journals) Elwell, Iowa, U.S.A., Expert Field Assistant.
1887. Hellier, E. A., Avonside Varnish Works, Bristol, Varnish Manufacturer.
1885. Hellon, Dr. R., 40, New Lowther Street, Whitehaven, Analytical and Consulting Chemist.
O.M. Helm, H. J., Simonstone, Hammelton Road, Bromley, Kent, Government Analyst.
1903. Helps, D. H., c/o Reading Gas Co., King's Road Works, Reading, Engineer and Manager.
1898. Hemingway, Frank C. R., 133, Front Street, New York City, U.S.A.
1883. Hemingway, H., (Journals) Baglan Lodge, Briton Ferry, S. Wales, and (communications) Marsh Gate Lane, Stratford, E., Chemical Manufacturer.
1884. Hempleman, F. S., Wennington House, Wennington, Romford, Essex, Manure Manufacturer.
1903. Hemstreet, George P., Hastings-on-Hudson, N.Y., U.S.A., Mechanical Engineer.
1888. Henderson, Prof. G. G., The Technical College, George Street, Glasgow, Professor of Chemistry.
1902. Henderson, Jas. A. Russell, 33, Blythswood Drive, Glasgow, Technical Chemist.
1900. Henderson, J. Brownlie, Government Analyst's Office, Brisbane, Queensland, Government Analyst.
1902. Henderson, J. C. A., 4, Sun Court, Cornhill, London, E.C., Gentleman.
1894. Henderson, Jos., Thornaby Ironworks, Thornaby-on-Tees, Metallurgical Chemist.
1894. Henderson, Norman M., Broxburn Lodge, Broxburn, N.B., Oil Works Manager.
O.M. Henderson, W. F., Moorfield, Claremont Gardens, Newcastle-on-Tyne.
1893. Hendrick, Jas., Marischal College, Aberdeen, Lecturer on Agricultural Chemistry.
1889. Hennin, Alphonse, Portoferraio, Elba, Italy, Metallurgical Chemist.
1904. Henshaw, Percy B., 3, Dobbin Hill, Endcliffe, Sheffield, Steel Chemist.
1894. Henshaw, Sam., Glenthorne, Wolstanton, Stoke-on-Trent, Chemical Works Manager.
1894. Hepburn, J. G., Priory Works, Dartford, Kent, Leather Manufacturer.
1894. Heriot, T. H. P., 23, Wolseley Road, Crouch End, N., Analytical Chemist.
O.M. Herman, W. D., Holm Lea, Rainhill, Lancashire, Glass Works Chemist.
O.M. Heron, J., 110, Fenchurch Street, London, E.C., Brewing Chemist.
1903. Herreshoff, J. B. F., 40, West 59th Street, New York City, U.S.A., Chemical Engineer.
1899. Herrick, Rufus F., 16, Herrick Street, Winchester, Mass., U.S.A., Chemist.
1887. Herriot, Wm. Scott, 19, Kier Street, Pollokshields, Glasgow, Chief Engineer.
O.M. Herrmann, R. W., 59, Mark Lane, London, E.C., Chemical Merchant.
1891. Hersam, Ernest A., University of California, Berkeley, Cal., U.S.A., Assistant Professor of Metallurgy.
O.M. Herschel, Prof. A. S., F.R.S., Observatory House, Slough, Bucks, Hon. Professor of Experimental Physics.
1898. Hersey, Milton L., 146, St. James' Street, Montreal, Canada, Consulting Chemist.
1901. Hershey, Aldus N., c/o Sharp and Dohme, Baltimore, Md., U.S.A., Chemist.
1903. Herstein, Dr. Bernard, 118, Humphry Avenue, Bayonne, N.J., U.S.A., Technical Chemist.
1898. Heslop, Oliver, 55, Sandown Lane, Wavertree, Liverpool, Analytical Chemist.
1885. Hess, Dr. Adolph, Kirkstall Road, Leeds, Chemical Manufacturer.
1891. Hetherington, Dr. Albert E., Ammonia Soda Works, Fleetwood, Lancashire, Analytical Chemist.
1894. Hewitt, A. H., The Green Island Cement Co., Lim., Hong Kong, China, Engineer.
O.M. Hewitt, Dr. D. B., Oakleigh, Northwich, Cheshire, Alkali Manufacturer.
1899. Hewitt, Edw. R., 13, Burling Slip, New York City, U.S.A., Glue Manufacturer.
1903. Hewitt, H. R., 329, Bradford Road, Manchester, Chemical Works Manager.
1896. Hewitt, Dr. J. Theo., 8, Montpelier Road, East Twickenham, Lecturer.
1890. Hewlett, John C., 40—42, Charlotte Street, Great Eastern Street, London, E.C., Manufacturing Chemist.
1893. H y, Harry, 2, Ash Terrace, Savile Town, Dewsbury, Dyer.

1894. Heyl-Dia, G. Edw., 236, Great Clowes Street, Higher Broughton, Manchester, Chemical and Electrical Engineer.

1901. Heys, Thos., 114, Bay Street, Toronto, Canada, Consulting Chemist.

1884. Heys, W. E., Llanberis, Bushey Hall Road, Watford, Consulting Engineer.

1883. Heywood, J. H., 231, Drake Street, Rochdale, Technical Chemist.

O.M. Heywood, J. S., 7, Caledonian Road, King's Cross, London, N., Chemical Manufacturer.

1897. Hibbard, Paul L., 2657, North 42nd Court, Chicago, Ill., U.S.A., Starch Chemist.

1901. Hiby, Dr. Walter, 4, Southampton Row, London, W.C., Chemical Engineer.

1897. Hicks, Edwin F., 94, Hamilton Place, New York City, U.S.A., Analytical Chemist.

1893. Hicks, Jas. A., c/o Dr. B. Redwood, 4, Bishopsgate Street Within, London, E.C., Analytical Chemist.

O.M. Higgin, W. H., Hollywood, Lostock, near Bolton-le-Moors, Chemical Manufacturer.

1901. Higginbottom, Alf., Quarry Bank, New Mills, near Stockport, Colourist.

1886. Higgins, C. L., Muspratt's Works, Widnes; and (Journals) 79, Bedford Street South, Liverpool, Manufacturing Chemist.

1901. Highley, Arnold, 20, Spotland Road, Rochdale, Chemist.

1903. Hill, Chas. Alex., 64, Park Street, Southwark, S.E., Wholesale Druggist.

1897. Hill, George, Barton-on-Humber, Chemical Works Manager.

1897. Hill, Dr. Herbert M., University of Buffalo, N.Y., U.S.A., Professor of Chemistry and Toxicology.

O.M. Hill, J. K., 13, Osborne Place, Copland Road, Govan, near Glasgow, Manufacturing Chemist.

1892. Hill, Sydney, c/o Blundell Spence and Co., Ltd., Hull, Analytical Chemist.

1903. Hill, W. Basil, James Street Leather Works, York, Tanner.

1902. Hill, Wm. G. H., jun., American Rubber Co., East Cambridge, Mass., U.S.A., Chemist.

1898. Hill-Jones, Thos., 30, Bisham Gardens, Highgate, N., Manufacturing Chemist.

O.M. Hills, C. H., Anglesea Copper Works, Low Walker, Newcastle-on-Tyne, Copper Smelter.

1894. Hills, Harold F., Commercial Gas Works, Stepney, London, E., Analytical Chemist.

1898. Hills, Thos. Herbert, Chemical Works, Deptford, S.E., Chemical Manufacturer.

O.M. Hills, W., 225, Oxford Street, London, W., Pharmaceutical Chemist.

1893. Hilton, Edgar G., 17, Howard Drive, Grassendale, Liverpool, Varnish and Paint Manufacturer.

1899. Hinchley, J. W., Royal Mint, Bangkok, Siam, Chemical Engineer.

O.M. Hindle, J. H., 8, Cobham Street, Accrington, Dyeworks Manager.

1883. Hinds, James, 127, Gosford Street, Coventry, Pharmaceutical Chemist.

1899. Hinks, Percy J., Tavern Street, Stowmarket, Chemist.

1891. Hinman, Bertram C., 23, Trewsbury Road, Sydenham, S.E., Metallurgical Chemist.

1892. Hinshelwood, Thos., Glasgow Oil and Paint Works, Glenpark Street, Glasgow, Oil Refiner.

1900. Hirsh, Jos. E., 1245, 85th Street, Brooklyn, N.Y., U.S.A., Chemist.

19 3. Hirshfield, E., 14, Lancaster Street, Albany, N.Y., U.S.A., Chemist.

1895. Hirst, H. Reginald, Croft House, Batley, Yorks, Works Chemist.

1886. Hislop, Geo. R., (Journals) Gas Works, (communications) Greenhill House, Underwood Road, Paisley, N.B., Gas Enginner and Manager.

1900. Hobbs, Alex. F., Merrimack Manufacturing Co., Lowell, Mass., U.S.A., Printworks Superintendent.

1900. Hobbs, Dr. Perry L., Western Reserve Medical College, Cleveland, Ohio, U.S.A., Professor of Chemistry.

1894. Hodge, Andrew, 28, Grosvenor Road, Heaton Moor, near Stockport, Printworks Chemist.

1890. Hodges, Harry B., Long Island Railroad Co., Long Island City, N.Y., U.S.A., Chemical Engineer.

1902. Hodgkins, David H., 19, East Park Street, Newark, N.J., U.S.A., Manufacturing Chemist.

O.M. Hodgkinson, Dr. W. R., (Journals) 18, Glenluce Road, Blackheath, S.E.; and Royal Artillery College, Woolwich, S.E., Professor of Chemistry.

O.M. Hodgson, Chris., 33, Oakdale Road, Nether Edge, Sheffield, Metallurgical Chemist.

1897. Hodgson, Matthew, Ardmore, Wicklow, Ireland, Technical Chemist.

1890. Hodgson, Wm., 66, Deansgate, Manchester, Oil and Colour Broker.

1903. Hoffmann, W. F., 23, Division Place, Newark, N.J., U.S.A., Chemical Merchant.

1886. Hogben, W., c/o Viscoloid Co., Leominster, Mass., U.S.A., Chemist and Superintendent.

O.M. Hogg, T. W., (Journals) c/o John Spencer and Sons, Newburn Steelworks, Newcastle-on-Tyne; and (communications) Castlenock, Ryton-on-Tyne, Metallurgical Chemist.

1903. Holde, Prof. Dr. D., Geisbergstrasse 30, Berlin, W., Germany, Principal (Kgl. Versuchsanstalt).

1899. Holden, Archie Neill, c/o Hardman and Holden, Ltd., Miles Platting, Manchester, Chemist.

1903. Holden, G. E., 21, Durnford Street, Middleton, near Manchester, Works Chemist.

1887. Holden, G. H., Manchester Oxide Co., Ltd., Canal Street, Miles Platting, Manchester, Chemist.

1904. Holden, Norman N., c/o Messrs. Hardman and Holden, Miles Platting, Manchester, Manufacturing Chemist.

1902. Holdsworth, Ernest T., Westholme, Great Horton, Bradford, Dyer.

1904. Holgate, Arthur, Rigby Street Mills, Liverpool, Corn Miller.

1885. Holgate, T. E., 173, Hollins Grove, Darwen, Lancashire, Metallurgist.

1884. Holgate, Thos., 5, Victoria Street, Westminster, S.W., Gas Engineer.

O.M. Holland, Philip, 22, Taviton Street, Gordon Square, London, W.C., Analytical Chemist.

1892. Holland, Philip H., 958, Sherbrooke Street, Montreal, Canada, Merchant.

1901. Hollick, Herbert, c/o General Chemical Co., Camden, N.J., U.S.A., Works Manager.

1902. Holliday, Lionel B., Lunnclough Hall, Huddersfield, Chemical Manufacturer.

1896. Hollings, J. Spencer, Brymbo, North Wales, Works Manager.

1903. Hollinshead, Peter, New Field House, Wimboldsley, near Middlewich, Cheshire, Chemist.

1900. Hollinshead, W. H., Vanderbilt University, Nashville, Tenn., U.S.A., Teacher of Chemistry.

1890. Holloway, G. T., 57 and 58, Chancery Lane, W.C., Analytical and Consulting Chemist.

1900. Hollway, Jno., 6, Highbury Grange, London, N., Mine Owner.

1883. Holmes, Ellwood, Wyncote, Jesmond Park East, Newcastle-on-Tyne, Colour Manufacturer.

O.M. Holmes, F. G., 31, St. George's Road, Waterloo, Liverpool, Technical Chemist.

1900. Holthouse, Harold B., 12, Melton Grove, West Bridgford, Nottingham, Chemist.

1902. Holton, Alf. L., 385, Bradford Road, Manchester, Chemist.

1892. Holton, E. C., Sherwin-Williams Co., 100, Canal Street, Cleveland, Ohio, U.S.A., Chemist.

1893. Holzapfel, Max., Maritime Buildings, Quayside, Newcastle-on-Tyne, Manufacturer.

1893. Homfray, D., 6, Dartmouth Row, Greenwich, S.E. Analytical Chemist.

O.M. Hooper, E. Grant, Government Laboratory, Clement's Inn Passage, Strand, W.C.; and (Journals) 16, Royal Avenue, Sloane Square, S.W., Analytical Chemist.

1889. Hooper, Ernest F., Wear Fuel Works, Hendon Dock, Sunderland, Technical Chemist.

1888. Hope, Jas., Dean House, Lenzie, N.B., Nickel Works Manager.

1904. Hopewell, Fredk., 86, Youville Square, Montreal, Canada, Manager.

1892. Hopkins, Erastus, Lake Helen, Fla., U.S.A., Consulting Chemist.

1893. Hopkins, Gerald V., Nicholaston House, Penmaen, near Swansea; and (Journals) Silico, Rossland, Canada, Metallurgist.

1894. Hopkins, Herbert W., (Journals) c/o Waihi G. M. Co., Waihi, Paeroa, N.Z.; and 13, Harrington Gardens, South Kensington, S.W., Metallurgist.

1891. Hopkinson, John, Marion Street, Lister Hills, Bradford, Yorks, Lubricant Manufacturer.

1898. Hopwood, Wm. H., Bella Vista, Strines, near Stockport, Printworks Chemist.

1895. Horne, Dr. W. D., Yonkers, N.Y., U.S.A., Consulting Chemist.

1904. Hornsey, J.W., 914, New England Building, Cleveland, Ohio, U.S.A., Chemical Engineer.

1900. Horsfall, Jno., 4, Grange Avenue, Rawtenstall, Manchester, Analytical and Consulting Chemist.

1902. Horsfall, L. H., c/o Binny and Co., Madras, India, Chemist.

1901. Horton, Edw., jun., 8, Orford Street, Chelsea, S.W., Student.

1889. Horton, William, 12, Princes Road, Liverpool, Analytical Chemist.

1902. Hosford, Roger F., 125, Milk Street, Boston, Mass., U.S.A., Chemical Engineer.

1890. Huskins, A. Percy, Gordonville House, Rosetta Park, Belfast, Ireland, Analytical Chemist.

1899. Hoskins, Wm., Room 55, 81, South Clark Street, Chicago, Ills., U.S.A., Chemist.

1899. Houlder, Bertram E., 11, Portland Road, Southall, Middlesex, Chemist.

1892. Houston, John, 26, Princess Street, Manchester, Drysalter.

1888. Houston, Robt. S., Hawkhead Road, Paisley, N.B., Analytical Chemist.

1891. Hovenden, Fred., Glenlea, Thurlow Park Road, West Dulwich, S.E.

O.M. Howard, A. G., Burnt House, Chigwell, Essex, Chemical Manufacturer.

1901. Howard, Bernard F., Devon House, Buckhurst Hill, and (Journals) Lavender Mount Works, Ilford, Essex, Chemical Student.

O.M. Howard, D., Devon House, Buckhurst Hill, Essex, Chemical Manufacturer.

1887. Howard, D. Lloyd, City Mills, Stratford, E., Chemical Manufacturer.

1903. Howard, Fred. A., 254, Montello Street, Brockton, Mass., U.S.A., Chemist.

1898. Howard, Henry, 175, Mountfort Street, Brookline, Mass., U.S.A., Chemical Engineer.

1902. Howard, Nelson A., c/o General Chemical Co., Hegewisch, Ill., U.S.A., Chemist.

1904. Howard, T., Hibernia House, Hibernia Road, Hounslow, Chemist.

O.M. Howard, W. D., City Mills, Stratford, London, E., Chemical Manufacturer.

1903. Howe, Jas. Lewis, Washington and Lee University, Lexington, Va., U.S.A., Professor of Chemistry.

1904. Howell, Walter L., c/o Appraiser's Office, Custom House, New Orleans, La., U.S.A., Chemist.

1899. Howles, Fred., c/o McDougall Bros., Millwall Docks, London, E., Chemist.

1889. Howorth, F. Wise, c/o Lloyd Wise, 46, Lincoln's Inn Fields, W.C., Technical Chemist and Chartered Patent Agent.

1896. Hoyte, Percy S., Gas Works, Coxside, Plymouth, Gas Engineer.

1900. Hübner, Julius, 24, Delaunay's Road, Crumpsall, Manchester, Director of Dyeing and Papermaking Departments (Municipal School of Technology).

1898. Hudson, Albert W., 312, Colorado Building, 16th and California Streets, Denver, Colo., U.S.A., Assayer.

1902. Hudson, C. Edward, c/o E. G. Jepson and Co., Albion Walk Chambers, Leeds, Drysalter.

1899. Hudson, Dr. Edw. J., c/o Pioneer Iron Co., Marquette, Mich., U.S.A., Chemist.

O.M. Hughes, J., 79, Mark Lane, London, E.C., Agricultural Chemist.

1898. Hughes, Raymond M., Oxford, Butler Co., Ohio, U.S.A., Professor of Chemistry and Physics.

1903. Hullegard, H., c/o Orford Copper Co., New Brighton, N.Y., U.S.A., Chemical Engineer.

1900. Hulley, Geo. D., c/o J. Eavenson and Sons, 20th and Wood Streets, Philadelphia, Pa., U.S.A., Soapworks Chemist.

1893. Humfrey, Chas., Hilderstone, Hartford, Cheshire, Alkali Works Manager.

1896. Humphrey, H. A., 38, Victoria Street, Westminster, S.W., Consulting Engineer.

1901. Humphrey, Henry C., c/o New York Glucose Co., Edgewater, N.J., U.S.A., Chemist.

1903. Humphrey, John, 17, Bloomsbury Square, London, W.C., Editor ("British and Colonial Druggist").

1902. Humphrey, Rich. L., 1001, Harrison Building, Philadelphia, Pa., U.S.A., Civil Engineer.

1903. Humphreys, A. C., 31, Nassau Street, New York City, U.S.A., Engineer.

1901. Humphreys, Otho F., Patton Paint Co., Milwaukee, Wis., U.S.A., Paint Manufacturer.

O.M. Humphrys, N. H., Gasworks, Salisbury, Wilts, Gas Engineer.

1895. Hunicke, Dr. H. Aug., 3532, Victor Street, St. Louis, Mo., U.S.A., Prof. of Applied Chemistry.

1900. Hunt, Arthur V., 76, Cromwell Street, Stretford, Lancashire, Analytical Chemist.

O.M. Hunt, Bertram, Tres Amigos Mine, Puntarenas, Costa Rica (*viâ* New Orleans and Port Limon), Technical Chemist.

O.M. Hunt, Chas., 15, Victoria Street, Westminster, London, S.W., Gas Engineer.

O.M. Hunt, E., Myvod House, Wood Green, Wednesbury, Staffs., Chemical Manufacturer.

1883. Hunt, J. S., Appleton, Widnes.

1903. Hunt, P. C. Holmes, Metropolitan Gas Co., Flinders Street, Melbourne, Vic., Australia, Gas Engineer.

O.M. Hunt, W., Hampton House, Wood Green, Wednesbury, Staffordshire, Chemical Manufacturer.

1897. Hunter, Prof. A. G. Kidston, (subs.) c/o John Hunter, 18, Great Clyde Street, Glasgow; and (Journals) P.O. Box 164, Dunedin, N.Z., Prof. of Chemistry.

1903. Hunter, H. B., Dennery Factory, St. Lucia, West Indies, Sugar Works Manager.

1902. Hunter, Hy. Blount, Hunter Chemical Co., Norfolk, Va., U.S.A., Industrial Chemist.

1893. Hunter, Prof. Matthew, Rangoon College, Rangoon, Burmah, Prof. of Chemistry.

1892. Hunter, Sidney H., 202, Bow Road, E., Mechanical Engineer.

O.M. Huntington, Prof. A. K., King's College, Strand, London, W.C., Professor of Metallurgy.

1902. Huntly, Geo. N., 96, Gower Street, London, W.C., Analytical and Consulting Chemist.

1902. Huntoon, Louis D., Paterson, N.J., U.S.A., Mining Engineer.

1904. Huntzinger, Alfred, 3, Egerton Road, Chorlton-cum-Hardy, near Manchester, Chemist and Colourist.

1900. Hurd, Geo. E., 72, Michigan Avenue, Chicago, Ill., U.S.A., Food Products Manufacturer.

1903. Hurlburt, Allen S., c/o Thomsen Chemical Co., Baltimore, Md., U.S.A., Chemist.

1894. Hurry, E. H., 122-1, Broadway, New York City, U.S.A., Mechanical Engineer.

1884. Hurst, G. H., 22, Blackfriars Street, Salford, Manchester, Analytical Chemist.

1901. Hurty, Jno. N., Cor. Penn and Ohio Streets, Indianapolis, Ind., U.S.A., Analytical Chemist.

O.M. Huskisson, P. L., 77, Swinton Street, London, W.C., Chemical Manufacturer.

O.M. Huson, C. W., 18, Batavia Buildings, Hackins Hey, Liverpool, Analytical Chemist.

1894. Hutcheson, Jno. F., 22, St. Enoch Square, Glasgow, Chemical Manufacturer.

O.M. Hutchinson, C. C., 3, Harcourt Buildings, Temple, E.C., Barrister-at-Law and Chemical Engineer.

1900. Hutchinson, Edw. G., Gas Offices, Pontefract Road, Barnsley, Yorks, Assistant at Gasworks.

O.M. Hutchinson, T. J., Aden House, Manchester Road, Bury, Analytical and Consulting Chemist.

1901. Hutton, Robt. S., Owens College, Manchester, Lecturer on Electro-Chemistry.

O.M. Huxley, Jas. H., c/o Vickers, Son, and Maxim, Ltd., River Don Works, Sheffield, Metallurgical Chemist.

1897. Hyams, Geoffrey M., P.O. Box 5104, and 312, Sears Building, Boston, Mass., U.S.A., Mines Manager.

1902. Hyde, Austin T., Box 365, Rumford Falls, Maine, U.S.A., Chemical Engineer.

1897. Hyde, B. T. Babbitt, c/o B. T. Babbitt, 82, Washington Street, New York City, U.S.A., Soap Manufacturer.

1899. Hyde, Fred. S., 215, Schermerhorn Street, Brooklyn, N.Y., U.S.A., Research Chemist.

1897. Hyde, Henry St. John, 210, East 18th Street, New York City, U.S.A.

1899. Hyde, Wm. Grantley, 26, Winsham Street, Clapham Common, S.W., Assayer.

1901. Hyman, Leonard W., 342, South Pearl Street, Albany, N.Y., U.S.A., Analytical Chemist.

1896. Hyndman, H. H. Francis, 27, Pembroke Square, Kensington, W., Analytical and Consulting Chemist.

I

1898. Ibbotson, E. C., 3, Ashgate Road, Sheffield, Metallurgist.

1900. Ichioka, Dr. Tajiro. 19, Maruyama Shinmachi, Hongo, Tokio, Japan, Chemist (Imperial Japanese Navy).

1885. Idris, T. H. W., 110, Pratt Street, Camden Town, N.W., Mineral Water Manufacturer.

1902. Ibart, John P., 427, West 38th Street, New York City, U.S.A., Technical Chemist.

1900. Imrie, John, 415, Shields Road, Pollokshields, Glasgow, Analytical Chemist.

1900. Ingalls, Walter R., 229, Ocean Street, Lynn, Mass., U.S.A., Mining Engineer and Metallurgist.

1889. Ingle, Dr. Harry, 15, John Street, Kirkcaldy, Fifeshire, Organic Chemist.

1891. Ingle, Herbert, c/o Dept. of Agriculture, Government Buildings, Pretoria, Transvaal, Govt. Agricultural Chemist.

1884. Inglis, R. A., Culrain, Bothwell, N.B., Analytical Chemist.

1904. Irlam, H. A., 31, East Street, Faversham, Kent, Chemist.

1884. Irving, J. M., 17A, Dickinson Street, Cooper Street, Manchester, Chemical Merchant.

O.M. Irwin, W., Inglehurst, Stand, near Manchester, Analytical Chemist.

1893. Isaac, J. F. V., Research Chemist.

1888. Isaac, T W. Player, Barton Court, Abingdon, Chairman of Waterworks Co.

1896. Isaacs, Louis A., 110, Greencroft Gardens, West Hampstead, N.W.; (Journals), c/o Yeatman and Co., Ltd., Denmark Street, E., Manufacturer.

1901. Isakovics, Alois von, Monticello, N.Y., U.S.A., Manufacturing Chemist.

O.M. Isler, Otto, 35–37, Dickinson Street, Manchester, Chemical Merchant.

1900. Ittner, Dr. Martin H., c/o Colgate and Co., Jersey City, N.J., U.S.A., Soap and Essential Oil Chemist.

J

1890. Jackman, E. J., 60, Belgrave Road, Ilford, Essex, Technical Chemist.

1898. Jackson, Alf. Greville, George Street, Brisbane, Queensland, Electro-Chemical Engineer.

1901. Jackson, Daniel D., Mount Prospect Laboratory, Flatbush Avenue and Eastern Parkway, Brooklyn, N.Y., U.S.A., Chemist.

1903. Jackson, D. H., 47, Mecklenburgh Square, London, W.C., Chemist.

O.M. Jackson, Edward, Clovelly, Grove Avenue, Moseley, Birmingham, Alkali Works Inspector.

1891. Jackson, F., Smedley Bridge Works, Cheetham, near Manchester, Chemical Apparatus Maker.

1883. Jackson, Frederick, 14, Cross Street, Manchester, Laboratory Furnisher.

1901. Jackson, Henry A., 1101, Washington Street, Wilmington, Del., and Columbia University, New York City, U.S.A., Chemist.

1886. Jackson, John, 98, Dobbie's Loan, Glasgow, Lubricant Manufacturer.

1901. Jackson, Percy G., Chemical Laboratory, Locomotive Department, Midland Railway, Derby, Chemist.

O.M. Jackson, R. V., c/o Scotch and Irish Oxygen Co., Polmadie, Glasgow, Technical Chemist.

1890. Jackson, Saml., c/o Binny and Co., Madras, India, Analytical Chemist.

1902. Jackson, Samuel, Wm. Metcalf, Ltd., Church, near Accrington, Director (Tar Distillery).

1898. Jackson, Thos., Clayton Chemical Works, Clayton, Manchester, Chemical Manufacturer.

1900. Jackson, Victor G., 167, Grove Lane, Denmark Hill, S.E., Chemist.

1901. Jackson, W. B., Glengowan Printworks, Caldercruix, N.B., Chemist.

1903. Jackson, Wm. D. N., 78, North Road, Wallsend-on-Tyne, Analytical Chemist.

1900. Jackson, Dr. W. Hatchett, Radcliffe Library, University Museum, Oxford, Librarian and Science Tutor (Keble College).

1903. Jackson, W. H., 50 & 52, North Front Street, Philadelphia, Pa., U.S.A., Chemist and Importer.

1893. Jackson, Rt. Hon. W. L., F.R.S. See Allerton, Rt. Hon. Lord.

1899. Jackson, W. Morton, c/o Manchester Oxygen Co., Ltd., Great Marlborough Street, Manchester, Manager.

O.M. Jackson, W. P., Saxilby, near Lincoln, Chemical Works, Manager.

1901. Jacobs, Charles B., 44, Broad Stecet, New York City, U.S.A., Chemist.

1901. Jacobsen, Rudolph C., 154, Lake Street, Chicago, Ill., U.S.A., Editor "Hide and Leather."

1900. Jacoby, Areli H., c/o New York and Boston Dyewood Co., 156, William Street, New York City, U.S.A., Chemist.

1897. Jacqué, Maurice, "La Cantabrica," Galdacano, cerca Bilbao, Spain, Chemical Engineer.

1901. Jadhava, Khasberao B., Baroda, Bombay Presidency, India, Collector and District Magistrate.

1900. Jäger, B. M., c/o Geo. Jäger and Sons, 77, Burlington Street, Liverpool, Chemist, Sugar Refinery.

1886. Jago, Wm., Godrevy House, Wilbury Avenue, Hove, Sussex, Chemical Engineer.

1889. James, Alf., 56, New Broad Street, London, E.C., Mining Engineer.

1883. James, E. T., British Alizarin Co., Ltd., Silvertown, Victoria Docks, E., Secretary.

1885. James, Dr. J. Wm., Aylmer House, Weston-super-Mare; and (Journals) 29, Redcliff Street, Bristol, Chemical Lecturer.

1893. James, Lawrence S., 32, Hawley Street, Boston, Mass., U.S.A., Gas Inspector.

1902. Jameson, Lewis, 83, Queen Victoria Street, London, E.C., Consulting Chemist.

1903. Janes, Frank W., Wolseley Street, Surrey Hills, Vic., Australia, Assayer.

1890. Jantzen, Paul, 133, Fenchurch Street, London, E.C., Chemical Merchant.

O.M. Japp, Dr. F. R., F.R.S., The University, Aberdeen, Professor of Chemistry.

1890. Jarmain, Geo. S., Hazeldene, Edgerton, Huddersfield, Wool Extractor.

O.M. Jarmay, G., Hartford Lodge, Hartford, Cheshire, Alkali Manufacturer.

1884. Jarves, Deming, Michigan Carbon Works, Detroit, Mich., U.S.A., Manufacturing Chemist.

1900. Jarvie, Jas., Monkland House, Kirkintilloch, N.B., Chemist.

O.M. Jayne, Dr. H. W., 931, North Broad Street, Philadelphia, Pa., U.S.A., Manufacturing Chemist.

O.M. Jekyll, J., Castle Moat House, Lincoln, Chemical Manufacturer.

1892. Jenkin, W. A., 5, Bella Vista, Minas de Rio Tinto, Provincia de Huelva, Spain, Metallurgical Chemist.

1894. Jenkins, John H. B., Laboratory, G.E.R. Works, Stratford, E., Analytical Chemist.

1894. Jenks, Robt. L., 89, Bartholomew Close, London, E.C., Chemist.

O.M. Jenner, E., 209, Markhouse Road, Walthamstow, Essex, Chemical Manufacturer.

1903. Jennings, Henry, 42, Marlowes, Hemel Hempstead, Herts, Analyst.

1899. Jennings, Thos., Brookfield, Cork, Ireland, Chemical Manufacturer.

1899. Jerdan, Dr. David S., c/o J. and G. Cox, Ltd., Gorgie Mills, Edinburgh, Chemist (Gelatin Works).

1899. Jessop, Louis V., 8, Rockmead Road, Victoria Park, N.E., Chemist.

1896. Job, Robt., 109, Windsor Street, Reading, Pa., U.S.A., Analytical Chemist.

1886. Johnson, A. E., Claremont, Lyndhurst Road, Wolverhampton, Analytical Chemist.

1900. Johnson, Albert C., 320, East 25th Street, Baltimore, Md., U.S.A., Chemical Engineer.

1902. Johnson, Chas. M., 701, Orchard Street, Avalon, Allegheny Co., Pa., U.S.A., Chemist.

1891. Johnson, Edmond E., Corsden, Harold Wood, Essex, Chemical Engineer.

1900. Johnson, Edw., c/o Pereira, Carneiro, & Co., Rua do Commercio, No. 6, Pernambuco, Brazil, Sugar Works Manager.

1902. Johnson, Emil F., 96–98, Maiden Lane, New York City, U.S.A., Consulting Chemist.

1900. Johnson, F. Carter, National Acid Co., 714, Union Street, New Orleans, La., U.S.A., Chemical Engineer.

1904. Johnson, F. M. G., 286, Peel Street, Montreal, Canada, Chemist.

1903. Johnson, Horace, Waialua, Oahu, Hawaii, U.S.A., Chemist.

O.M. Johnson, J. E., 40, Idmiston Road, Stratford, London, E., Manufacturing Chemist.

1884. Johnson, J. Grove, 23, Cross Street, Finsbury, London, E.C., Assayer.

1895. Johnson, Jesse F., 58, Metcalfe Street, Montreal, Canada, Chemical Engineer.

1900. Johnson, Jno. E., c/o John Johnson and Co., 95–97, Liberty Street, New York City, U.S.A., Chemical Engineer.

1900. Johnson, Jno. W. H., (communications) York House, Thornhill, Dewsbury, (Journals) West Riding Rivers Board, Wakefield, Yorks, Analytical Chemist.

O.M. Johnson, S. H., Warren Hill House, Loughton, Essex, Chemical Engineer.

O.M. Johnson, T. A., Field House, Winnington Park, Northwich, Cheshire.

1903. Johnson, Thos., Caixa 149, Pernambuco, Brazil, Manager.

1895. Johnston, Alex. R., 18, Percy Street, Ibrox, Glasgow, Analytical Chemist.

1894. Johnston, G. Lawson. *See* Lawson-Johnston, G.

1889. Johnston, Thos., Nobel's Explosives Co., Ltd., 195, West George Street, Glasgow, Manager.

1904. Johnston, Thos. J., 4, Garriock Drive, Kelvinside North, Glasgow, Chemist.

1890. Johnston, Wm. A., The S. S. White Dental Manufacturing Co., Prince's Bay, Staten Island, N.Y., U.S.A., Dental Enamel Manufacturer.

1894. Johnston, Wm. E. Lawson. *See* Lawson-Johnston, W. E.

O.M. Johnston, Wm. G., Anchor Chemical Works, 1005, Garngad Road, Glasgow, Technical Chemist.

O.M. Johnstone, Jas., Shawfield Works, Rutherglen, Glasgow, Technical Chemist.

1903. Johnstone, S. J., 15, Springfield Road, New Southgate, N., Research Chemist.

O.M. Johnstone, W. G., The Brewery, Newark-on-Trent, Chemist.

1902. Jollyman, Walter H., Government Laboratory, P.O. Box 1080, Johannesburg, Transvaal.

1903. Jones, Alfred O., c/o Carr and Co., Caldewgate, Carlisle, Works Chemist.

1897. Jones, Chas. H., El Cobre Mines, Santiago de Cuba, Cuba, Technical Chemist.

1902. Jones, David R., Standard Chemical Co., Deseronto, Ont., Canada, Chemical Engineer.

1902. Jones, E. Strangways, Sulphide Corporation, Ltd., Cockle Creek, N.S.W., Australia, Metallurgical Chemist.

O.M. Jones, E. W. T., 10, Victoria Street, Wolverhampton, Analytical Chemist.

1897. Jones, Fred. W., 96, Downs Park Road, Clapton, N.E., Explosives Works Manager and Chemist.

1896. Jones, G. Cecil, Wisteria Cottage, Manningtree, Essex, Works Chemist.

1903. Jones, G. Robert, Gas Works, Caixa 147, Pernambuco, Brazil, Gas Engineer.

1898. Jones, Henry, Broughton Bridge Mills, Salford, Dyer and Finisher.

O.M. Jones, H. Chapman, Royal College of Science, South Kensington, S.W., Senior Demonstrator in Chemistry.

1893. Jones, Herbert. *See* Sefton-Jones, H.

1901. Jones, Herbert J., c/o The Scottish Acid and Alkali Co., Ltd., Kilwinning, N.B., Chemist.

1899. Jones, Llewellyn J. W., Tacoma Smelting Co., Tacoma, Wash., U.S.A., Metallurgist.

1898. Jones, Martin L., c/o Ooregum G. M. Co., Oorgaum, Mysore State, India, Metallurgical Chemist.

1894. Jones, M. W., Greystonedale, Kensington Hill, Bristol, Manager (Oil and Colour Works).

1887. Jones, T. Tolley, 356, Little Collins Street, Melbourne, Victoria, Explosives Manufacturer.

1903. Jones, Wm. App, c/o Boston Artificial Leather Co., 12, E. 18th Street, New York City, U.S.A., Chemist.

1903. Jones, Wm. James, jun., Purdue University, La Fayette, Ind., U.S.A., Chemist.

O.M. Jones, W. Norris, Lancashire Metal Works, Widnes, Technical Chemist.

1902. Jonker Czn., Hendrik, Hotel zum Weiszen Ross, Worth a S, Germany, Chemical Engineer.

1899. Joplin, Geo. C., 12, Harrington Street, Sydney, N.S.W., Australia, Analyst.

1904. Jordan, Stanley, 100, William Street, New York City, U.S.A., Importer of Chemicals.

1897. Jorissen, Dr. Wm. P., Koninklijk Inst. v. d. Marine, Willemsoord, Holland, Editor.

1900. Josephson, Edgar, 131, Amity Street, Brooklyn, N.Y., U.S.A.

1891. Joslin, Omar T., 3223, Spring Grove Avenue, Cincinnati, Ohio, U.S.A., Chemical Engineer.

1887. Joüet, Dr. C. H., Roselle, Union Co., N.J., U.S.A., Technical Chemist.

1889. Journand, Louis, 21, Grand Rue, Bourg-de-Péage, Drôme, France, Technical Chemist.

1888. Joy, Douglas G., The Rookery, Stevenage, Herts, Oil Refiner.

1903. Joyce, Clarence M., c/o Arlington Co., Arlington, N.J., U.S.A., Chemist.

1887. Jürgensen, Dr. Rolof, Karlsgasse 5, Prag-Zizkov, Austria, Chemist.

1900. Just, Jno. A., Jefferson Avenue and Delano Street, Pulaski, Oswego Co., N.Y., U.S.A., Chemist.

O.M. Justice, P. M., 55–56, Chancery Lane, London, W.C., Patent Agent.

K

1898. Kahn, Julius, 100, West 80th Street, New York City, U.S A., Manufacturer of Rubber Goods.

1896. Kalbfleisch, Franklin H., 33–35, Burling Slip, New York City, U.S.A., Chemical Manufacturer.

1884. Kalle, Dr. Wm., Biebrich-am-Rhein, Germany, Colour Manufacturer.

1899. Karas, Jno., c/o Buffalo Shirt Co., 565-577, Washington Street, Buffalo, N.Y., U.S.A., Laundryman.

1901. Kasson, Henry R , 1209, Stock Exchange Building, Chicago, Ill., U.S.A., Asphalt Chemist.

1903. Katz, Dr. B. Alexander, Patentbureau Richard Lüders, Görlitz, Schlesien, Germany, Patent Agent.

1901. Kauder, Dr. E., c/o Merck and Co., Rahway, N.J., U.S A., Chemist.

1903. Kauffman, Milton H., American Smelting and Refining Co., Durango, Colo., U.S.A., Chemist.

1892. Kaufmann, Dr. Herbert M., c/o Mutual Chemical Co., Jersey City, N.J., U.S.A., Chemist.

1904. Kawai, I., 54, Shidamachi Shirokane, Shiba, Tokyo, Japan, Chemist.

1885. Kawakita, Michitada, Imperial Engineering College, Tokio, Japan, Analytical Chemist.

O.M. Kay, Wm. E., Marple Lodge, Marple, Cheshire, Printworks Chemist.

1897. Kearns, Jno. S., Baxenden House, near Accrington, Chemist and Dyer.

1894. Kebler, Lyman F., Department of Agriculture, Bureau of Chemistry, Washington, D.C., U.S.A., Chief of Drug Laboratory.

1886. Keiser, Prof. E. H., Washington University, St. Louis Mo., U.S.A., Professor of Chemistry.

1900. Kelf, Henry C.,
Sugar Chemist.

1900. Kellner, Dr. Carl, (Journals) Laby., Borschkegasse No. 8, Vienna, IX 2; and (Subscriptions) Hohe Warte No. 29, Vienna XIX., Austria, Paper Chemist.

885. Kellner, Dr. Wm., 135, Victoria Road, Old Charlton, S.E., Chemist to War Department.

901. Kelsey, Jas. W., c/o Pharmacie Swann, 12, Rue Castiglione, Paris, France, Chemist and Metallurgist.

1889. Kempson, John F., Pye Bridge Chemical Works, near Alfreton, Derbyshire, Chemical Manufacturer.

1901. Kennedy, Alex., Kenmill House, Bothwell, N.B., Rosin Distiller.

1903. Kennedy, Hugh Watson, 626, South 19th Street, Philadelphia, Pa., U.S.A., Chemist.

1891. Kenrick, Prof. Edgar B., 282, Assiniboine Avenue, Winnipeg, Manitoba, Canada, Prof. of Chemistry.

1901. Kenrick, Dr. Frank B., 209, John Street, Toronto, Canada, Lecturer on Chemistry.

1888. Kent, Wm. J., "Parterre," Sandown, I. of W., Assayer and Chemical Engineer.

1903. Kenyon, Percy S., 15, Rook Street, Manchester, Drysalter.

1889. Kenyon, Thos., The Shrubbery, Hilton Park, Prestwich, near Manchester, Manufacturing Chemist.

1900. Keppelmann, Alf. J., P.O. Box 1549, Philadelphia, Pa., U.S.A., Chemical Merchant.

1888. Ker, Alan D., Millburn Chemical Works, Garngad Hill, Glasgow, Chemical Manufacturer.

1899. Kern, Walter P., 282, Lafayette Avenue, and (Journals) c/o General Chemical Co., Dundee Works, Passaic, N.J., U.S.A., Chemist.

1894. Kerr, Jas., Surgeons Hall, Edinburgh, Lecturer on Chemistry.

1890. Kerr, Saml. T., 516, North Delaware Avenue, Philadelphia, Pa., U.S.A., Salt Manufacturer.

1897. Kerr, Wm. M., c/o General Chemical Co., 608, Philadelphia Bourse, Philadelphia, Pa., U.S.A., Manufacturing Chemist.

1896. Kershaw, Jno. B. C., Faraday House, 8, Charing Cross Road, London. W.C., Analytical Chemist.

1902. Kessler, Henry W., Brandt, Susquehanna Co., Pa., U.S.A., Manufacturing Chemist.

1903. Kessler, R., jun., Brandt, Susquehanna Co , Pa , U.S.A., Chemical Manager.

1893. Kestner, Paul, 5, Rue de Toul, Lille, France, Chemist.

1898. Keswick, Wm., M.P., 3, Lombard Street, London, E.C., Merchant.

1900. Kewley, Jas., Arbory Road, Castletown, Isle of Man, Technical Chemist.

1890. Keys, W. H., Lyndon House, West Bromwich, Oil and Chemical Manufacturer.

1892. Kibble, W. Oakes, G.P.O., Denver, Colo., U.S.A., Chemical Engineer.

1896. Kier, Thos., Thornliebank, Glasgow, Chemist.

1900. Kilgore, Benj. W., Raleigh, N. Carolina, U.S.A., Chemist.

1901. Kilmer, Fred. B., New Brunswick, N.J., U.S.A., Chemical Manufacturer.

O.M. Kinch, E., Royal Agricultural College, Cirencester, Professor of Chemistry.

O.M. King, A. J., (Journals) Ingersley Vale, and (communications) Rock Bank, Bollington, near Macclesfield, Bleacher and Finisher.

1884. King, C. M., Campsie Alum Works, Lennoxtown, N.B., Alum Manufacturer.

O.M. King, J. Falconer, 20, Chambers Street, Edinburgh, Consulting Chemist.

1897. King, Joshua, Clarewood, Camberley, Surrey, Indian Civil Service (retired).

1887. King, Robt., 115, Wellington Street, Glasgow, Chemical Manufacturer.

1895. King, Sidney J., 49, Arundel Square, Barnsbury, N., Colour and Dyestuff Traveller.

O.M. King, Walter R., (Journals) Avalon, Trinity Avenue, Southend-on-Sea; and (Subscriptions) 16, Mincing Lane, E.C., Chemical Manufacturer.

1903. King, William, c/o Natal Estates, Ltd., South Coast Junction, Natal, S. Africa, Analytical Chemist.

1899. King, Wm. R., Box 695, Summit, N.J., U.S.A., Mechanical Engineer.

1896. Kingdon, G. Holman, 27, Grappenhall Road, Stockton Heath, Warrington, Technical Chemist.

1883. Kingsford, T. P., Oswego, N.Y., U.S.A., Starch Manufacturer.

O.M. Kingzett, C. T., Elmstead Knoll, Chislehurst, Kent, Technical Chemist.

1892. Kinnicutt, Professor L. P., 77, Elm Street, Worcester. Mass., U.S A., Professor of Chemistry (Worcester Polytechnic Institute).

1897. Kipping, Dr. F. Stanley, F.R.S., University College, Nottingham, Prof. of Chemistry.

1898. Kirkland, Archd., 78, High Street, Irvine, N.B., Baker.

1897. Kirkland, Robt., Grand Junction Glue and Chemical Co., Ltd., Market Harborough, Chemist.

1900. Kirkpatrick, Stafford F., 96, Barrie Street, Kingston, Ont., Canada, Assayer.

1887. Kitamura, Y. (Journals), c/o R. Fujihanaya, Yokoyamacho Sanchome, Tokyo, Japan, Agricultural Chemist.

1902. Kitchen, Wm. J., Port Melbourne North, Vic., Australia, Soap and Candle Manufacturer.

1891. Kitson, Sir James, Bart., M.P., Gledhow Hall; and (Journals) Monkbridge Iron and Steel Co., Ltd., Leeds, Iron and Steel Manufacturer.

1883. Kitto, B., 26, Lancaster Road, Finsbury Park, London, N., Analytical Chemist.

1900. Kittredge, H. G., 42, Linden Avenue, Dayton, Ohio, U.S.A., Chemist.

1900. Kleber, Dr. Clemens, Union Avenue, Clifton, N.J., U.S.A., Director (Fritzche Bros.' Laboratory).

1888. Kleemann, Dr. S., Farben Fabrik, Forchheim, Bavaria, Analytical Chemist.

1898. Klein, Otto H., Room 110, Stewart Building, 280, Broadway, New York City, U.S.A., Consulting Engineer.

1903. Kline, Clarence M., c/o Smith, Cline, and French Co., Canal and Poplar Streets, Philadelphia, Pa, U.S.A., Wholesale Druggist.

1889. Klipstein, A., 122, Pearl Street, New York City, U.S.A., Chemical Manufacturer.

1902. Klipstein, Ernest C., 116, Prospect Street, East Orange, N.J., U.S.A., Chemical Manufacturer.

1891. Knaggs, Alfred B., Bradley Lane, Huddersfield, Technical Chemist in Dyeworks.

1900. Knapp, Rudolf E., 208, Observatory Street, Ann Arbor, Mich., U.S.A., Chemist.

1892. Knecht, Dr. E., Municipal School of Technology, Manchester: and (Journals) 5, Station Road, Crumpsall, Manchester, Professor of Tinctorial Chemistry.

1887. Knight, A. H., 2, Gerald Road, Oxton, Cheshire, Assayer.

1903 Knight, Harley F., 64, Amhurst Park, Stamford Hill, N., Analyst.

1384. Knight, Henry, Stanley House, 73, Anfield Road, Liverpool, Colour and Varnish Manufacturer.

O.M. Knight, J. B., Silvertown Soapworks, Silvertown, London, E., Soap Manufacturer.

1887. Knights, J. West, Public Laboratory, Tenison Road, Cambridge, Analytical Chemist.

1885. Knipler, F., c/o R. Harper and Co., Port Melbourne, Victoria, Starch Manufacturer.

1883. Knowles, Joshua, Stormer Hill, Tottington, near Bury, Calico Printer.

1886. Knox, E. W., Colonial Sugar Refining Co., Sydney, N.S.W.; and c/o Parbury Henty & Co., 20, Eastcheap, London, E.C., Sugar Manufacturer and Refiner.

1902. Knudsen, Hans, 29A, Gillingham Street, London, S.W., Inventor.

1904. Koch, J. A., Bluff and Pride Streets, Pittsburg, Pa., U.S.A., Chemist.

1903. Koch, Walter E., c/o Lustre Mining Co., Sta. Maria del Oro, *via* Parral, Ese Durango, Mexico, Metallurgical and Mining Engineer.

1904. Koebig, Dr. J., 828, East 3rd Street, Los Angeles, Cal., U.S.A., Chemical Engineer.

1895. Koechl, Victor, P.O. Box 159, New York City; (Journals) 47, Montgomery Place, Brooklyn, N.Y., U.S.A., Dye Merchant.

1901. Koehler, Dr. H., c/o Roessler and Hasslacher Chemical Co., Perth Amboy, N.J., U.S.A., Manager.

1884. Kohn, Dr. Charles A., M.Sc., Sir John Cass' Technical Institute, Jewry Street, Aldgate, E.C., Principal.

1902. Kohnstamm, Lothair S., 87, Park Place, New York City, U.S.A., Chemist.

1884. Kolb, J., Soc. Anon. des Manuf. de Produits Chimiques, Lille, France, Chemical Manufacturer.

1902. Kottmann, Dr. Gustav, Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.

O.M. Kraftmeier, E., 54, Parliament Street, Westminster, S.W., Explosives Manufacturer.

1894. Krause, Dr. Albert H., 32, Wellington Avenue, Cleveland, Ohio, U.S.A., Chemist (Grasselli Chemical Co.).

O.M. Krause, Prof. Dr. G., "Chemiker-Zeitung," Cöthen, Germany, Editor.

O.M. Krause, O. H., c/o American Sugar Refining Co., Jersey City, N.J., U.S.A., Chemical Engineer.

1898. Krebs, H. J., Wilmington, Del., U.S.A., Manufacturing Chemist.

1903. Kremer, Frank N., 646, Broadway, Milwaukee, Wis., U.S.A., Chemist.

1900. Kremers, Dr. Edw., Madison, Wis., U.S.A., Professor (University of Wisconsin).

O.M. Kühl, W. H., 73, Jägerstrasse, Berlin, Germany, Bookseller.

1900. Kunheim, Dr. Erich, 32, Dorotheenstrasse, Berlin, N.W., Germany, Chemist.

1885. Kupferberg, Dr. H., 19, Schulstrasse, Mainz, Germany, Technical Chemist.

1896. Kuttroff, Adolf, 128, Duane Street, New York City, U.S.A., Chemical Merchant.

1900. Kuttroff, Fred., 128, Duane Street, New York City, U.S.A., Merchant.

1904. Kyle, J., Canada Paint Co., Ltd., 572, William Street, Montreal, Canada, Analytical Chemist.

O.M. Kynaston, J. W., 3, Oak Terrace, Beech Street, Liverpool, Chemical Engineer.

L

1897. Lahonde, Dr. Leon, 172, South Main Street, Albion, Orleans Co., N.Y., U.S.A., Consulting Chemical Engineer.

1890. Lacey, E. C., 10, Clarence Road, Croydon, Manufacturing Chemist.

O.M. Lacey, T. S., Gas Works, York Road, King's Cross, London, N.W., Gas Engineer.

1899. Lachman, Albert, California Wine Association, San Francisco, Cal., U.S.A., Wine Merchant.

1903. Lachman, Dr. Arthur, 131, Second Street, San Francisco, Cal., U.S.A., Chemical Engineer.

1888. Lagerwall, Dr. Ivar, Sunthorpe, Wallington, Surrey, Petroleum Manufacturer.

O.M. Laidler, C. P., 20, Noble Terrace, Gateshead-on-Tyne, Analytical Chemist.

1902. Laist, Fredk., Chemical Department, University of Utah, Salt Lake City, Utah, U.S.A., Chemist.

O.M. Lake, G., jun., 83, Primrose Lane, Glossop, Derbyshire, Analytical Chemist.

1900. Lamar, Wm. R., c/o Mallinckrodt Chemical Works, St. Louis, Mo., U.S.A., Chemist.

1898. Lamb, Morris Chas., 151, Westcombe Hill, Blackheath, S.E., Chemist.

1900. Lambert, Walter S., Morriston Place, Clydach, R.S.O., Glamorgan, Analyst.

1899. Lamborn, Leebert Lloyd, 134, Willoughby Avenue, Brooklyn, N.Y., U.S.A., Factory Superintendent.

1895. Lancaster, Jno. C., 260, Alfreton Road, Nottingham, Engineering Works Manager.

1904. Lancey, Darragh de, Great Barrington, Mass., U.S.A. Secretary and Assistant General Manager of Stanley Instrument Co.

1900. Lander, Geo. D., Royal Veterinary College, Camden Town, N.W., Lecturer.

1895. Landin, John, 40, Drottninggatan, Stockholm, Sweden, Public Analyst.

1903. Lane, Nathaniel J., U.S. Laboratory, 641, Washington Street, Manhattan Borough, New York City, U.S.A., Analytical Chemist.

1890. Lang, Jas. G., Dominion Hotel, Victoria, B.C., Canada, Analytical Chemist.

1893. Lang, Dr. Wm. R., University of Toronto, Canada, Professor of Chemistry.

O.M. Langdon, Dr. M. J., 16, Harriet Street, Stretford, Manchester, Analytical Chemist.

1890. Lange, Dr. Martin, 28, Hermitage Road, Crumpsall, Manchester, Analytical Chemist.

1892. Langer, Dr. Carl, Ynyspenllwch, Clydach, R.S.O., Glamorganshire, Analytical Chemist.

1897. Langmuir, Arthur C., c/o Marx and Rawolle, 9, Van Brunt Street, Brooklyn, N.Y., U.S.A., Analytical Chemist.

1902. Langmuir, F. Leighton, Beau Séjour, Freiburg i/B, Germany, Chemist.

1898. Langstaff, Wm., c/o Grasselli Chemical Co., Tremley, N.J., U.S.A., Chemist.

1900. Lant, Herbert, "Ivy Bank," Wath-on-Dearne, near Rotherham, Yorks., Chemist and Manager.

1903. Larter, Alfred T., The Basingstoke Ironworks, Basingstoke, Hants, Chemist.

1884. Latham, Baldwin, Parliament Mansions, Victoria Street, Westminster, S.W., Civil Engineer.

1889. Latham, J. J., Mill House, Bold, Widnes, Chemical Works Manager.

O.M. Lawrence, Jas., Box 707, Joplin, Mo., U.S.A., Explosives Manufacturer.

O.M. Laws J. P., 2, Aigburth Vale, Liverpool, S., Analytical Chemist.

1885. Lawson, Arthur J., Marsh Soapworks, Bristol, Soap Manufacturer.

1900. Lawson, Wm., c/o Utah Sugar Co., Salt Lake City, Utah, U.S.A., Chemist.

1894. Lawson Johnston, G., c/o Bovril, Ltd., 152, Old Street, London, E.C., Vice-Chairman.

1894. Lawson-Johnston, W. E., c/o Bovril, Ltd., 152, Old Street, London, E.C., Director.

1893. Lawton, Thos., Calthorpe House, Aldridge Road, Perry Barr, Birmingham, Chemical Works Manager.

1890. Laycock, Dr. W. F., 46, Boar Lane, Leeds, Analytical Chemist.

1902. Lazell, Ellis Warren, 1619, Filbert Street, Philadelphia, Pa., U.S.A., Chemist.

1898. Lean, Geo., 15, Park Terrace, Glasgow, Chemist.

1897. Leathart, Thos. H., Lead Works, Newcastle-on-Tyne, Lead Manufacturer.

O.M. Leather, Dr. J. Walter, Dehra Dun, United Provinces, India, Government Agricultural Chemist.

1893. Le Boutillier, Clement, c/o Taylor Iron and Steel Co., High Bridge, N.J., U.S.A., Chemist.

1896. Lecomber, W. G., Beech House, Ashton Grove, Ashton-on-Mersey, Cheshire, Engineer.

1896. Lederle, Dr. E. J., Health Department, New York City, U.S.A., Chief Chemist.

1892. Ledoff, Prof. A., Technological Institute, Kharkoff, Russia, Professor of Chemistry.

1895. Ledoux, Dr. Albert R., 99, John Street, New York City, U.S.A., Chemist.

1903. Ledoux, Aug. D., 68, Beaver Street, New York City, U.S.A., Importer of Pyrites.

1901. Lee, FitzHugh, c/o Grasselli Chemical Co., Cleveland, Ohio, U.S.A., Superintendent.

1898. Lee, Jno. L., Woodfield, Lytham, Lancashire, Dyer and Bleacher.

1885. Lee, S. Wright, 6–10, Whitechapel, Liverpool, Wholesale Druggist.

1899. Lee, Waldemar, 4620, Wayne Street, Philadelphia, Pa., U.S.A., Chemist.

1886. Leeds, F. H., 26, East Bank, Stamford Hill, N., Analytical Chemist.

1903. Leerburger, Henry, 54, Beekman Street, New York City, U.S.A., Essential Oil Merchant.

1889. Leese, Joseph, 3, Lord Street West, Southport.

1903. Leese, Jos., jun., 392, Dickenson Road, Longsight, Manchester, Analytical and Technical Chemist.

1901. Lefebvre, Georges, Compagnie du Phospho-Guano, 60, Rue de Bondy, Paris, Director.

1901. Leffler, Rudolf L., c/o Thos. Firth and Sons, Ltd., Norfolk Works, Sheffield, Metallurgical Chemist.

1901. Leibfried, Jno. E., Bethlehem, Pa., U.S.A., Analytical Chemist.

1888. Leigh, Cecil, Birmingham Metal and Munition Co., Adderley Park Rolling Mills, Birmingham, Technical Chemist.

1902. Leighton, A. E., Aruvankad, Nilgiris, India, Analytical Chemist.

1894. Leitch, Jno. W., Milnsbridge Chemical Works, near Huddersfield, Aniline Dye Manufacturer.

1898. Leman, Wm. T., c/o Lake Carriers Oil Co., Coraopolis, Pa., U.S.A., Oilworks Manager.

1901. Lengfeld, Dr. Felix, 202, Stockton Street, San Francisco, Cal., U.S.A., Manufacturing Chemist.

1883. Lennard, F., 70, Gracechurch Street, E.C.; and (Journals) 29, Adelaide Crescent, Hove, Sussex, Chemical Manufacturer.

1884. Leonard, Wm. J., Hope Chemical Works, Hackney Wick, E., Naphtha Distiller.

1903. Lepsius, Prof. Dr. B., Griesheim a/M., Germany, Director (Chem. Fabr. Griesheim Elektron).

1888. Lequin, E., Directeur Général des Usines de Produits Chimiques de la Société de St. Gobain, 1, Place des Saussaies, Paris (VIII^e.).

1894. Leslie, Hugh M., Marikuppam, Mysore State, South India, Chemical Engineer.

1899. Lesser, Wm., P.O. Box 162, Albany, N.Y., U.S.A., Manufacturing Chemist.

1901. Lessing, Dr. Rudolf, c/o The Gas Light and Coke Co., Tar and Liquor Works, Beckton, and (Journals) 98, Milton Avenue, East Ham, E., Chemist.

1900. Lessner, Chas. B., San Finx Tin Mines, Ltd., Carrill, Spain, Metallurgical Chemist.

1896. Lester, Isaac E., 57, Westminster Road, Handsworth, Birmingham, Steelworks Manager.

1892. Lester, J. H., Royal Exchange, Manchester, Analytical Chemist.

1899. Le Sueur, Dr. Henry R., Chemical Laboratory, St. Thomas' Hospital, London, S.E., Demonstrator.

1894. Lett, Stephen J., 149, Lupus Street, London, S.W., Chemical Engineer.

1898. Leuthardt, Peter, 33, Rydal Gardens, Streatham, London, S.W., Chemical Manufacturer.

1891. Lever, Wm. H., Thornton House, Thornton Hough, Cheshire, Soap Manufacturer.

1901. Levett, Walter, Fairview, St. Margaret's Avenue; and (Journals) Mines Safety Explosives Co., Stanford-le-Hope, Essex, Factory Manager.

1903. Levi, Louis E., c/o Pfister and Vogel Leather Co., Milwaukee, Wis., U.S.A., Chemist.

1900. Levine, Edmund J., c/o The Fiberloid Co., 7, Waverley Place, New York City, U.S.A., Chemist.

1901. Levinstein, Dr. Herbert, (Journals) Hawkesmoor, Fallowfield, and (communications) 21, Minshull Street, Manchester, Chemist.

O.M. Levinstein, Ivan, (Journals) Hawkesmoor, Fallowfield, and (communications) 21, Minshull Street, Manchester, Colour Manufacturer.

1903. Levy, Arthur G., 219, Elgin Avenue, Maida Vale, W., Chemist.

1901. Levy, Dr. Albert, The Mond Nickel Co., Ltd., Clydach, R.S.O., Glamorgan, Works Chemist.

1887. Lewes, Prof. Vivian B., Royal Naval College, Greenwich, S.E. Professor of Chemistry.

1898. Lewin, H. James, Royal Victoria Yard, Deptford, S.E., Analytical Chemist.

1889. Lewis, A. E., 56, Thomas Lane, Knotty Ash, Liverpool, Analytical Chemist.

1896. Lewis, Daniel C., c/o Millville Manufacturing Co., Millville, N.J., U.S.A., Dye and Bleach Works Chemist.

1900. Lewis, Ernest A., 310, Dudley Road, Birmingham, Chemist and Metallurgist.

1904. Lewis, E. W., 97, Belgrave Road, Ilford, E., Chemist.

1902. Lewis, Fredk. H., Fordwick, Va., U.S.A., Manager (Virginia Portland Cement Co.).

1903. Lewis, Fred. J., c/o Moss Chemical Co., 15, Carlaw Avenue, Toronto, Ont., Canada, Manufacturing Chemist.

1900. Lewis, John, 10, Windsor Road, Denmark Hill, S.E., Cashier (Paint Works).

1900. Lewis, Saml. J., 122, Newington Causeway, London, S.E., Pharmaceutical Chemist.

1889. Lewkowitsch, Dr. Julius, 71, Priory Road, West Hampstead, N.W., Consulting Chemist.

1901. Lichtenstein, Alf. S., Arnold Printworks, North Adams, Mass., U.S.A., Chemist.

O.M. Lichtenstein, Theodore, Chemical Works, Silvertown, E., Manufacturing Chemist.

1892. Liddle, G. A., 469, Walmersley Road, Bury, Lancs., Chemist, Dyewood Extract Works.

1885. Liddle, W. T., 14, Willows Avenue, Ansdell, Lytham, Lancs., Manager, Dyewood Extract Works.

O.M. Liebmann, Dr. A., 10, Marsden Street, Manchester, Analytical Chemist.

1899. Liedbeck, P. F. Alarik, 43, Strandwagen, Stockholm, Sweden, Chemical Engineer.

O.M. Lightfoot, T. E., 88, Arden Terrace, Accrington, Calico Printer's Chemist.

1898. Lilly, Josiah K., c/o Eli Lilly and Co., Indianapolis, Ind., U.S.A., Manufacturing Pharmacist.

1885. Lilly, Oliver M., The Croft, Spondon, Derby, Colour Manufacturer.

1903. Lindmueller, C., c/o The Ohio Farmers' Fertilizer Co., 882, Prospect Street, Cleveland, Ohio, U.S.A., Chemist.

1897. Lindsay, Robt., Rosshead, Alexandria, N.B., Chemist.

1901. Lindsay, Robt. D., P.O. Box 4654, Johannesburg, Transvaal, Chemist.

1890. Ling, Arthur R., Laboratory, 74, Great Tower Street, E.C., and (Journals) Hazeldene, Kingston Road, New Malden, Analytical and Consulting Chemist.

1904. Link, J., 92, Harrow Road, Leytonstone, N.E., Chemical Manufacturer.

1901. Lippincott, Warren B., c/o American Smelting and Refining Co., Argentine, Kansas, U.S.A., Chemist.

1896. Lishman, Geo. P., Bunker Hill, Fence Houses, Co. Durham, Colliery Chemist.

1896. Littell, R. Ballantine, 50, South Walnut Street, East Orange, N.J., U.S.A., Chemist.

1901. Little, C. A., Elyria, Ohio, U.S.A., Analytical Chemist.

1889. Little, Wm. G., Blendon Grove, Bexley, Kent, Chemical Manufacturer.

O.M. Littlejohn, Jas., c/o African Banking Corporation, Johannesburg, Transvaal, Analytical Chemist.

1902. Littlewood, Dr. Jas. B., U.S. Patent Office, Washington, D.C., U.S.A., Chemical Examiner.

1904. Livermore, W. D., Washington Mill, Lawrence, Mass., U.S.A., Chemist.

1886. Liversedge, A. J., Clock House, Arundel Street, Strand, W.C., Mechanical Engineer.

O.M. Liversidge, Prof. A., F.R.S., Professor of Chemistry.

1883. Livingston, W. J., London County Council, Spring Gardens, London, S.W., Analytical Chemist.

1903. Llewellyn, Ivor P., c/o Peter Spence and Sons, Ltd., Manchester Alum Works, Manchester, Chemist.

1899. Lloyd, Charles, (subscriptions) c/o Lake View Consols, Ltd., Salisbury House, London Wall, London, E.C.; and (Journals) c/o Manager, Lake View Consols, Ltd., Boulder, Western Australia, Secretary.

1900. Lloyd, Fred. J., Muscovy House, Trinity Square, London, E.C., Analyst.

1900. Lloyd, Thos. H., c/o Quibell Bros., Newark, Analyst.

1901. Lober, Jno. B., Vulcanite Portland Cement Co., 1230, Land Title Building, Philadelphia, Pa., U.S.A., Cement Manufacturer.

1899. Loder, Francis H., 9, St. John's Park, Blackheath, S.E., Director.

1888. Lodge, Edw., 25, Seale Hill, Cowcliffe, Huddersfield, Teacher of Wool Dyeing.

1900. Loeb, Dr. Morris, New York University, University Heights, New York City, U.S.A., Professor of Chemistry.

1891. Loewenthal, Dr. R., Uhlandstrasse, 39, Frankfurt a/M., Germany, Textile Chemist and Lecturer on Dyeing.

1899. Logan, John, Offendene, Oakfield Drive, Ashton-on-Mersey, Indigo-Blue Dyer.

O.M. Lomas, T., 5, Esmond Gardens, Bedford Park, W., Chemical Manufacturer.

1888. Lombard, Emile, 12, Rue Breteuil, Marseilles, France, Director of Pyrites Co.

1901. Long, Eugene J., c/o E. O'Callaghan and Son, City Tannery, Limerick, Ireland, Tanner.

1902. Longden, Alf. Hy., Stanton-by-Dale, Nottingham, Analytical Chemist.

1898. Longstaff, Jas. P., Chemical Department, The University, Edinburgh, Assistant.

1901. Loomis, Dr. H., 58, West 40th Street, New York City, U.S.A.

1902. Loomis, Henry M., Box 166, Niagara Falls, N.Y., U.S.A., Chemist.

1890. Lord, F. J., 4, Winmarleigh Street, Warrington, Analytical Chemist.

1896. Lord, Jno. Lloyd, 23, Park View, Elton, Bury, Lancs., Chemist and Manager.

1897. Lord, N. W., 338, West 8th Avenue, Columbus, Ohio, U.S.A., Professor of Metallurgy.

O.M. Lorenz, H., 7 and 8, Idol Lane, London, E.C., Chemical Merchant.

O.M. Lorimer, J., Britannia Row, Islington, N., Manufacturing Chemist.

O.M. Lorrain, J. G., Norfolk House, Norfolk Street, Strand, London, W.C., Civil Engineer.

O.M. Lott, F. E., The Laboratory, Bridge Chambers, Burton-on-Trent, Consulting Brewing Chemist.

O.M. Louis, D. A., 77, Shirland Gardens, London, W., Metallurgist and Mining Engineer.

1891. Louis, Prof. Henry, Durham College of Science, Newcastle-on-Tyne, Professor of Mining.

O.M. Love, Dr. E. G., 80, East 55th Street, New York City, U.S.A., Analytical Chemist.

1899. Love, Wm., 28, Royal Exchange Square, Glasgow, Managing Director (Broxburn Oil Co., Ltd.).

1895. Lovejoy, Frank W., Kodak Park, Rochester, N.Y., U.S.A., Chemical Engineer.

1904. Loveland, Jas. W., 8, Kenwood Street, West Somerville, Mass., U.S.A., Superintendent of Soap Works.

O.M. Lovibond, J. W., Lake House, Salisbury, Tintometer Manufacturer.

O.M. Lovibond, T. W., West Jesmond House, Newcastle-on-Tyne, Brewer.

1897. Low, Albert H., P.O. Drawer 1537, Denver, Colo., U.S.A., Metallurgical Chemist.

1900. Low, Prof. Wilson H., Cudahy Packing Co., South Omaha, Neb., U.S.A., Chemist.

1887. Lowe, Clement W., Cornbrook, Legh Road, Knutsford, Cheshire, Manufacturing Chemist.

O.M. Lowe, W. F., 9, Hough Green, Chester, Analytical Chemist.

1885. Lowson, J. G. F., Hollycot, Lasswade, N.B., Paper Maker.

1895. Lucas, Alf., Survey Department, Public Works Ministry, Cairo, Egypt, Analyst.

1892 Lucas, Bernard R., 3, Dyar Terrace, Winnington, Northwich, Alkali Works Manager.

O.M. Lucas, R., Alwinenstrasse 11, Wiesbaden, Germany, Technical Chemist.

O.M. Luck, Alf., Luck's Explosives, Ltd., Stowmarket, Suffolk, Explosives Chemist.

1900. Lummus, Walter E., 62, Newhall Street, Lynn, Mass., U.S.A., Manager (Commonwealth Manufacturing Co.).

1903. Lumsden, Alex. A., Forth Chemical Works, Bo'ness, N.B., Technical Chemist.

1888. Lund, Jas., 142, Hawthorne Street, Malden, Mass., U.S.A., Ammonia Works Manager.

1888. Lundholm, Carl O., Journals to Nobel's Explosives Co., Ltd., Ardeer Factory, Stevenston, Ayrshire, Explosives Works Manager.

1898. Lundteigen, Andreas, Union City, Mich., U.S.A., Chemist.

O.M. Lunge, Prof. Dr. G., Steinwiesstrasse 40, Zürich, V., Switzerland, Professor of Chemistry.

1894. Lungwitz, Theo., c/o Chas. Pfizer and Co., 81, Maiden Lane, New York City, U.S.A., Superintending Chemist.

1885 Lupton, Sydney A., 102, Park Street, Grosvenor Square, London, W.

1890. Luthy, Edmund O., 2419, Ohio Avenue, Cincinnati Ohio, U.S.A., Distiller.

1884. Lüthy, Otto, Maywood, N.J., U.S.A., Analytical Chemist.

1895. Luxmoore, Dr. Chas. M., University College, Reading, Lecturer on Chemistry.

1899. Luxton, Thos., 28, Albany Street, Hull, Teacher of Chemistry.

1903. Lye, Ernest B., Leagrave Hall, near Luton, Beds., Straw Plait Dyer and Bleacher.

1885. Lye, W. T., Leagrave Hall, near Luton, Beds, Straw Dyer.

1884. Lyle, James, Ardenco, Plaistow Wharf, Victoria Docks, E., Sugar Refiner.

1885. Lyle, Jno., 21, Mincing Lane, London, E.C., Sugar Refiner.

1902. Lyle, Robert F., Berry Yards Sugar Refinery, Greenock, N.B., Analytical Chemist.

1889. Lymn, Arthur H., 125, Alexandra Road, Wimbledon, Chemical Works Manager.

1899. Lynn, R. Rankine, 7, Highburgh Terrace, Dowanhill, Glasgow, Chemical Engineer.

1899. Lynn, Vaughan G., , Merchant.

1898. Lynne, Miss Mary S., 421, Wood Street, Pittsburg, Pa., U.S.A., Chemist.

1902. Lyon, Edwd. H., 520, West 27th Street, New York City, U.S.A., Manufacturing Chemist.

O.M. Lyon, J. G., The Aire Tar Works, Knottingley, Yorks, Tar Distiller.

O.M. Lyte, F. Maxwell, 60, Finborough Road, Radcliffe Square, London, S.W., Chemical Manufacturer.

O.M. Lytle, A. M., North of Ireland Chemical Co., Ltd., 31, Victoria Street, Belfast, Ireland, Chemical Manufacturer.

M

1898. Maass, Frank, P.O. Box 507, Paterson, N.J., U.S.A., Silk Dyer.

1887. Mabery, Prof. Chas. F., Case School of Applied Science, Cleveland, Ohio, U.S.A., Professor of Chemistry.

1894. Mabey, Fred O., 196, Amhurst Road, Hackney, N.E., Wine Merchant.

1891. Macadam, Herbert E., Milton House, Selsdon Road, Wanstead, E., Manure Works Manager.

1894. Macadam, Stevenson, 55, York Place, Edinburgh, Analytical Chemist.

1894. McAlley, Robt., Bankside, Falkirk, N.B., Paint Works Manager.

1891. Macallan, J., 3, Rutland Terrace, Clontarf, Dublin, Analytical Chemist.

1892. Macara, Thos., jun., c/o Jas. Robertson and Sons, Thrushgrove Works, Paisley, N.B., Chemist.

1889. McArthur, Jno., 196, Trinity Road, Wandsworth Common, S.W., Chemist.

1887. McArthur, J. B., Price's Patent Candle Co., Limited, Bromborough Pool, near Birkenhead, Oil Works Chemist.

1886. Macarthur, J. G., 98, Dobbie's Loan, Glasgow, Lubricant Manufacturer.

O.M. McArthur, J. S., 45, Renfield Street, Glasgow, Consulting Chemist and Metallurgist.

1901. MacArthur, Jno. S., 15, St. John's Road, Pollokshields, Glasgow, Paint and Varnish Manufacturer.

1892. McArthur, Thos., 7, Temple, Dale Street, Liverpool, Drysalter and Dyewood Extractor.

1901. McCaffery, Richard S., San Pedro, New Mexico, U.S.A., Mining Engineer and Metallurgist.

1898. MacCallum, D. A., 389, Central Chambers, 93, Hope Street, Glasgow, Chemist.

O.M. McCallum, J. M., Southdene, Paisley, N.B., Soap Manufacturer.

1903. McCandless, Jno. M., State Laboratory, Atlanta, Ga., U.S.A., Analytical Chemist.

1894. McCann, Owen, c/o J. Gilton and Co., Oriel Street, Vauxhall Road, Liverpool, Printing Ink Manufacturer.

1893. McCombie, C., 19, St. Dunstan's Hill, London, E.C., Drug and Chemical Merchant.

1903. McCourt, Cyril D., 52, Victoria Road, Clapham, S.W., Research Chemist (Morgan Crucible Co.).

O.M. McCowan, W., Neilston, N.B.

1897. McCrae, Dr. John, jun., 7, Kirklee Gardens, Kelvinside, Glasgow, Chemical Demonstrator.

1898. McCreath, Wm. D., c/o Quantock Vale Cider Works, North Petherton, Bridgewater, Cider Manufacturer

1884. McCulloch, J., Oakleigh, Rose Street, Garnet Hill, Glasgow, Chemical Works Manager.

1900. McCulloch, John, Glencoe, Lostock Gralam, Cheshire, Chemical Engineer.

1903. McCully, R. E. J., 251, Maidstone Road, Rochester, Kent, Analytical Chemist.

O.M. McDaniel, J. J., Woodlands, Bandon, Ireland, Distiller.

O.M. Macdonald, A., 72, Great Clyde Street, Glasgow.

1897. MacDonald, G. W., c/o Curtis's and Harvey, Ltd., Dartford, Kent, Explosives Chemist.

O.M. Macdonald, J. W., c/o Messrs. H. Tate and Sons, Thames Sugar Refinery, Silvertown, E., and Cleveland, The Glebe, Blackheath, S.E., Analytical Chemist.

1902. Macdonald, Peter, jun., Mazapil Copper Co., Ltd., Concepcion del Oro, Zacatecas, Mexico, Analytical Chemist.

1899. MacDonald, S. Fremont, c/o Ashtabula Hide and Leather Co., Ashtabula, Ohio, U.S.A., Tanner.

O.M. McDonald, T. M., Walilabo Estate, St. Vincent, West Indies, Sugar Chemist.

1899. McDougall, Hugh, Mount Pleasant, Uddingston, N.B.; (Journals to) Johnson's Cement Works, Gateshead-on-Tyne, Chemical Engineer.

1895. McDougall, Isaac, jun., The Orchard, Hale, near Manchester, Student.

1895. McDougall, Isaac S., The Orchard, Hale, near Manchester, Manufacturing Chemist.

1890. McDougall, J. T., Dunolly, Morden Road, Blackheath, S.E., Manufacturing Chemist.

1889. MacEwan, Peter, 64, Southwood Lane, Highgate, N., Editor of "Chemist and Druggist."

1891. McEwen, Atholl F., 1, Northbrook Road, Lee, S.E., Analytical Chemist and Assayer.

1901. McEwen, Duncan C., c/o British and Korean Corporation, Ltd., Gwendoline, Korea, Metallurgical Chemist.

1902. McFarland, Alan R., c/o Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Works Manager.

O.M. Macfarlane, R. F., Tharsis Copper Works, East Moors, Cardiff, Technical Chemist.

1884. Macfarlane, Thos., 317, Queen Street, Ottawa, Canada, Analyst to Dominion of Canada.

1901. McFarlane, Walter, Sunnyside, Mansewood, Pollockshaws, Glasgow, Printworks Manager.

1890. McFarlane, W. W., 522, West 9th Street, Chester, Pa., U.S.A., Dyeworks Manager.

1893. McGhie, T. Burns, c/o Quirk, Barton, and Co., Normandy Wharf, Rotherhithe, S.E., Analytical Chemist and Assayer.

1891. McGill, Dr. J. T., Vanderbilt University, Nashville, Tenn., U.S.A., Adjunct Professor of Chemistry.

1899. MacGillivray, Wm. A., c/o Swansea Safety Fuse Co., Pipe House Wharf, Swansea, Analytical Chemist.

1887. McGlashan, John, Cawnpore Sugar Works, Cawnpore, India, Technical Chemist.

1902. McGovney, Chas. S., Experiment Station, West La Fayette, Ind., U.S.A., Chemist.

1884. McGowan, John, Ash House, Talke, near Stoke-upon-Trent, Colliery Manager.

1896. McIlhiney, Dr. Parker C., 145, East 23rd Street, New York City, U.S.A., Chemist.

1894. McIlwaine, Alf. W., Stoneferry, Hull, Oil Manufacturer.

O.M. MacIndoe, G. D., Ettrick Street, Invercargill, New Zealand, Chemical Works Manager.

1903. Macintire, Benj. Gould, P.O. Box 365, Rumford Falls, Maine, U.S.A., Chemist.

1901. Macintosh, John, Minnie Bank, Cromwell Street, Dunoon, N.B., Analytical Chemist.

1888. MacKean, Wm., Welsbach Incandescent Gas Light Co., Ltd., Broomhill Road, Wandsworth, S.W., Technical Chemist.

O.M. McKechnie, D., Grange Mount, Cowley Hill, St. Helens, Lancashire, Copper Extractor.

O.M. McKechnie, D. M., Metal Works, Widnes, Lancashire, Copper Extractor.

1904. McKechnie, R. D. c/o The British Explosives Syndicate, Ltd., Pitsea, Essex, Chemist.

1887. McKellar, W. G., c/o United Alkali Co., Ld., Eglinton Works, Irvine, N.B., Technical Chemist.

1895. McKenna, Dr. Chas. F., 221, Pearl Street, New York City, U.S.A., Chemist.

1903. McKenny, Chas., Bayview House, Drogheda, Ireland, Chemical Engineer and Manure Manufacturer.

1899. Mackensie, Alex. H., 12, Hale Street, North Adams, Mass., U.S.A., Colour Mixer.

1900. Mackenzie, J. Kenneth, 1120, Rookery Building, Chicago, Ill., U.S.A., Mining Engineer.

1884. Mackenzie, Dr. W. Cossar, Tewfikieh College of Agriculture, Ghizeh, Egypt, Analytical Chemist.

1893. McKerrow, C. A., Eversley, Wilmslow, Cheshire, Analytical and Consulting Chemist.

1893. McKesson, John, 91, Fulton Street, New York City, U.S.A., Manufacturing Chemist.

1891. Mackey, W. McD., Victoria Chambers, Leeds, Analytical Chemist.

1900. McKillop, George F., Broxburn Oilworks, Broxburn, N.B., Works Chemist.

1890. McKillop, Jno., 99, Brook Green, London, W., Metallurgist.

1902. McKim, Wm., 25, Fairview Street, Yonkers, N.Y., U.S.A., Colour Maker.

1884. McKinlay, R. W., Ameliaville, Aytoun Road, Pollokshields, N.B., Metal Merchant.

1904. Mackintosh, Jno. C., Canada Iron Furnace Co., Midland, Ont., Canada, Chemist.

1898. McLaurin, Robt., 414, Sauchiehall Street, Glasgow, Chemist.

1888. MacLean, Alex. S., 31, Bank Street, Greenock, N.B., Soap Refiner.

O.M. McLellan, J. Y., Beech Cottage, Boothferry Road, Goole, Chemical Manufacturer.

1892. McLeod, Jas., Westhill, Cardross Road, Dumbarton, N.B., Analytical Chemist and Gas Examiner.

1903. MacMahon, F. W., 8, Viederwald Road, Sydenham, S.E., Chemist (Oxychlorides, Ltd.).

1896. McMaster, Daniel, c/o Oxford Paper Co., Rumford Falls, Maine, Paper Mill Manager.

1894. Macmillan, Arch., 12, Hastings Street, Sunderland.

1903. McMullan, Charles, 20, Corn Market, Belfast, Ireland, Chemist.

1889. McMurtrie, J. M., 21, Princes Street, Pollokshields, Glasgow, Brass Founder.

1900. McMurtrie, Dr. Wm. T., 144, West 49th Street, New York City, U.S.A., Chemist.

1895. McMurtry, G. C., Wallaroo Smelting Works, Wallaroo, South Australia, Manager.

1884. Macnab, C., Lillyburn, Milton of Campsie, N.B., Calico Printer.

O.M. Macnab, W., Edinburgh Lodge, Howick Place, Victoria Street, S.W., Analytical Chemist.

1892. McVie, Jas. P., Ravenscraig, Canning Street, Hebburn-on-Tyne, Analytical Chemist.

1894. McVitie, Robt., 25, Nicoll Road, Harlesden, N.W., Biscuit Manufacturer.

1901. Maertens, Emile, P.O. Box 1002, Providence, R.I., U.S.A., Engineer.

1895. Magnus, Isidor, 52, Leadenhall Street, London, E.C., Chemical Merchant.

1901. Magruder, Egbert W., Department of Agriculture, Richmond, Va., U.S.A., Chemist.

1885. Mahon, R. W., N.Y. Central and Hudson River Railroad, West Albany, N.Y., U.S.A., Analytical Chemist.

1898. Main, Wm., 299, Jefferson Avenue, Brooklyn, N.Y., U.S.A., Chemical Expert.

O.M. Major, J. Lewis, Sculcoates, Hull, Tar Distiller and Chemical Manufacturer.

1886. Mallinckrodt, Edw., Mallinckrodt Chemical Works, St. Louis, Mo., U.S.A., Manufacturing Chemist.

1897. Mallory, J. Halsey, Drawer 69, Columbia, S.C., U.S.A., Assistant Chemist (The American Cotton Oil Co.).

1896. Mann, E. A., Government Laboratory, Perth, Western Australia, Government Analyst.

1893. Mann, Harold H., Indian Tea Association, Royal Exchange Buildings, Calcutta, India, Research Chemist.

1899. Mann, Jas. S., 97, Greengate Street, Plaistow, Essex, Analyst.

1891. Mann, John C., c/o Major and Co., Ltd., Sculcoates, Hull, Chemist.

1903. Mannhardt, Hans, 1641, Melrose Street, Chicago, Ill., U.S.A., Analytical Chemist.

O.M. Mannington, H. T., Marshlea, Beaconsfield Road, Farnworth, Widnes.

1892. Mansbridge, Wm., 27, Elmbank Road, Sefton Park, Liverpool, Chemist.

1893. Marchlewski, Dr. L., Strzelecka, 9, Krakow, Austria.

1903. Mardick, Jno. R., c/o Wm. F. Moser and Co., Du Bois, Pa., U.S.A., Chemical Engineer.

1904. Maréchal, H., Eugene Maréchal et fils, Vénissier (Rhone), France, Oilcloth Manufacturer.

1883. Markel, Dr. K., Lodge Lane, Bewsey, Warrington, Technical Chemist.

1886. Markham, A. D., 71, Queen Street, Hull, Pharmaceutical Chemist.

1902. Marriott, F. Grant, 14, Selby Street, Toronto, Canada, Chemical Student.

1901. Marsden, Dr. Fred, Dyeing Department, Yorkshire College, Leeds, Chemist.

O.M. Marsh, J. T., Ammonia Soda Works, Fleetwood, Lancashire, Chemist.

1883. Marsh, W., Union Alkali Co., Soho Works, Manchester, Chemical Manufacturer.

1895. Marshall, Arthur, Hope Cottage, Church Hill, Loughton, Essex, Explosives Chemist.

1891. Marshall, Dr. Hugh, 12, Lonsdale Terrace, Edinburgh, Professor of Chemistry.

1895. Marshall, Frank G., 4, Woodhouse Terrace, Bewick Road, Gateshead, Technical Chemist.

1901. Marshall, Jos. W., Boulevard Higher Grade School, Hull, Science Lecturer.

1896. Marshall, Percy S., Union Laboratory, Half Moon Street, Huddersfield, Assistant Chemist.

1883. Marshall, Wm., Carisbrook, Queen's Road, Cheadle Hulme, Cheshire, Dyer.

1884. Marshall, Wm., Barkley, Teddington, Middlesex, Analytical Chemist.

1894. Martin, Alex. M., Douglas Villa, Dunbeth Road, Coatbridge, N.B., Analytical Chemist.

1895. Martin, Chas. H., 14, Aldred Street, Crescent, Salford, Oil and Soap Works Assistant Manager.

1885. Martin, H., 67, High Street, Wellington, Somerset, Manure Works Manager.

O.M. Martin, N. H., Ravenswood, Low Fell, Gateshead-on-Tyne, Manufacturing Chemist.

1899. Martin, Wm E., c/o Kynoch Ltd., Arklow, Co. Wicklow, Ireland, Chemist.

O.M. Martin, W. H., 183B, King's Road, Chelsea, London, S.W., Analytical Chemist.

1887. Martineau, Sydney, Northwood, Rydal Road, Streatham, S.W., Sugar Chemist.

1894. Martyn, T. Graham, 11, Stratton Terrace, Truro, Cornwall, Metallurgist.

1902. Marx, Joseph S., California Powder Works, Pinole, Cal., U.S.A., Chemist.

1887. Mason, J. Francis, Eynsham Hall, Witney, Oxon.

1892. Mason, Thos., Beech Avenue, Nottingham, Manufacturing Chemist.

1903. Massey, Joseph B., 60, Colne Road, Burnley, Chief Sanitary Inspector.

O.M. Masson, Prof. D. Orme, University of Melbourne, Victoria, Australia, Professor of Chemistry.

1889. Master, Ardesheer B., 679, Tardeo, Bombay, India, Chemical Manufacturer.

1901. Master, Chaturbhai G., Khodi-Ambli, Ahmedabad, India, Size and Chemical Manufacturer.

1902. Masujima, Bunjiro, 19, Honjoku Midoricho Sanchome, Tokyo, Japan, Prof. of Applied Chemistry.

1903. Masure, Gaston, 7, Rue de Constantine, Rouen, France, Chemist.

1902. Masury, Fred. L. M., Sharon, Pa., U.S.A., Explosives Manufacturer.

O.M. Mather, J., Blaydon Chemical Works, Blaydon-on-Tyne, Manager.

1900. Mather, Wm., c/o British Aluminium Co., Ltd., Larne Harbour, co. Antrim, Ireland, Chemist.

1890. Matheson, W. J., 182–184, Front Street, New York City, U.S.A., Chemical Merchant.

1901. Mathew, W. E. B. de Vere, Shanklin, Lucien Road, Upper Tooting, S.W., Analytical Chemist.

1900. Mathews, Dr. Jno. A., c/o Crucible Steel Co. of America, Syracuse, N.Y., U.S.A., Chemist.

1898. Mathewson, E. P., Anaconda, Mont., U.S.A., Metallurgist.

1888. Mátos, Louis J., 105, North 19th Street, East Orange, N.J., U.S.A., Chemist.

1896. Matsui, G., c/o Japan Sugar Refinery Co., Onagigawa, Tokio, Japan, Chemical Engineer.

1899. Matthews, Dr. J. Merritt, 425, South Broad Street, Philadelphia, Pa., U.S.A., Professor of Chemistry and Dyeing (Philadelphia Textile School).

1889. Mawdsley, W. H., c/o Gold Mining Co., Ltd., Mount Morgan, Queensland, Chemist.

1903. Maxim, Hudson, 891, Sterling Place, Brooklyn, N.Y., U.S.A., Chemist and Mechanical Engineer.

1894. Maxwell, Jno., Solway Chemical Works, Silloth, and (communications) English Street, Carlisle. Cumberland, Chemical Manure Manufacturer.

1903. Maxwell, Orin P., Piedmont, Mineral Co., West Va., U.S.A., Chemist.

1897. May, George H., c/o Fabrikoid Co., Newburgh, N.Y., U.S.A., Assistant Chemist

1901. May, Dr. Sidney, 313, East 112th Street, New York City, U.S.A., Lecture Assistant.

1884. Mayenfeld, Dr. E. von Salis. See under "Salis."

1903. Mayer, Andrew, jun., c/o Carnegie Steel Co., Edgar Thompson Works, Braddock, Pa., U.S.A., Chemist.

1896 Mayfield, A. S., 14, Beresford Avenue, Hull, Analyst.

1892. Mayfield, H. B., Normanhurst, Mundy Street, Heanor, near Nottingham, Dyer.

1901. Mayfield, Thos., Fair View House, Heanor, near Nottingham, Hosiery Manufacturer.

1885. Mayhew, E. W. A., High Street, Freemantle, Western Australia, Manufacturing Chemist.

1900. Maywald, F. J., 1028, 72nd Street, Brooklyn, N.Y., U.S.A., Technical Chemist.

1892. Meacham, Chas. S., c/o Ohlsson's Cape Breweries, Ltd., Cape Town, South Africa, Brewer.

1902. Meade, Richd. K., 12, Chestnut Terrace, Easton, Pa., U.S.A., Chemist.

1903. Mears, James, 77, Arden Road, Handsworth, Birmingham, Analytical Chemist.

1898. Meeds, Alonzo D., 103, Boston Block, Minneapolis, Minn., U.S.A., Analytical Chemist.

1896. Meggitt, Loxley, Wheatsheaf Works, Alexandrina, Sydney, N.S.W., Australia, Analytical Chemist.

1901. Meier, Dr. Franz, Basle Chemical Works, Basle, Switzerland, Chemist.

1888. Meikle, Jno., 8, Melrose Street, Great Western Road, Glasgow, Journalist.

1902. Melcher, Arthur C., 58, Bowen Street, Newton Centre, Mass., U.S.A., Chemist.

O.M. Meldola, Prof. R., F.R.S., 6, Brunswick Square, London, W.C., Professor of Chemistry.

1901. Meldrum, And. N., 92, Bonnymuir Place, Aberdeen, Lecturer on Chemistry.

1891. Meldrum, Jas. Jones, Timperley, Cheshire, Manufacturing Engineer.

1891, Mellen, E. D., 1590, Massachusetts Avenue, Cambridge, Mass., U.S.A., Treasurer (Curtis, Davis, and Co.)

O.M. Mellon, W. W., 9, Glenart Avenue, Blackrock, Co. Dublin, Ireland, Manufacturing Chemist.

1902. Mellor, Percy H., Burton Road, Woodville, near Burton-on-Trent, Pottery Manager.

O.M. Mellor, S., Magnesium Metal Co., Patricroft, Manchester, Metal Refiner.

1884. Melville, D., P.O. Box No. 1, Woodmere, Wayne Co., Mich., U.S.A., Chemical Works Manager.

1900. Mende, Alex. P., 120, Liberty Street, New York City, U.S.A., Manufacturing Chemist.

1893. Mensching, Dr. C., 3, Geismar-Chaussée, Göttingen, Germany, Chemist.

O.M. Menzies, R. C., Inveresk Mills, Musselburgh, N.B., Paper Maker.

1892. Mercer, C. A., 22, Streathbourne Road, Upper Tooting, S.W., Chemical Apparatus Maker.

1886. Mercer, J. B., 330, Lower Broughton Road, Manchester.

O.M. Mercer, F. M., 34, Camomile Street, London, E.C., Manufacturing Chemist.

1890. Merck, E., Darmstadt, Germany, Maunfacturing Chemist.

1887. Merrell, Geo., Lock Box 786, Cincinnati, Ohio, U.S.A., Manufacturing Chemist.

1903. Merrill, Mrs. Frances B., Merrill Process Co., Jones Point, N.Y., U.S.A., President.

1899. Merrill, Frank H., Los Angeles Soap Co., Los Angeles, Cal., U.S.A., Factory Superintendent

1903. Merrill, Herbert C., 38, Main Street, Peabody, Mass., U.S.A., Chemical Engineer (Leather Factory).

1902. Merritt, Wm. G., 643, Second Avenue, Detroit, Mich., U.S.A., Chemist.

1904. Merry, Jno. B., Ashfield, Ash Lane, Hough Green, near Widnes, Works Chemist.

1903. Mersan, Ferdinand de, 17, Cecil Street, Gainsborough, Lincolnshire, Chemist.

1903. Mersereau, G., Susquehanna Dyeworks, Williamsport, Pa., U.S.A., Chemist.

1901. Merson, Geo. F., 24, Newgate Street, Newcastle-on-Tyne, Manufacturing Pharmaceutical Chemist.

1897. Meslans, Prof. M., 59, Quai de la Baronnie, Ablon (Seine et Oise) France, Professor of Chemistry.

O.M. Messel, Dr. R., 147, Victoria Street, London, S.W., Chemical Manufacturer.

1899. Metcalf, Howard F., Farr Alpaca Co., Holyoke, Mass., U.S.A.

1886. Metcalf, Jno., Moorfield, Altham, near Accrington, Tar Distiller.

1898. Metz, Herman A., P.O. Box 2178, New York City, U.S.A. (Victor Koechl and Co., Dyestuffs and Chemicals).

1900. Mewborne, Robt. G., c/o Kentucky Tobacco Product Co., Louisville, Ky., U.S.A., Chemist.

1902. Meyer, August R., Room 402, New England Building, Kansas City, Mo., U.S.A., Metallurgist.

1898. Meyer, Dr. Franz, 68, Broad Street, New York City, U.S.A., Metallurgical and Chemical Engineer.

1902. Meyer, Dr. Fredk. L., 2028, Park Avenue, Philadelphia, Pa., U.S.A., Chemist.

1900. Meyer, Karl, Osterbrogade, 60, Kopenhagen, O., Denmark, Chemist.

1902. Meyrick, L. J., 137, City Road, Birmingham, Assistant Analyst.

1903. Miall, Dr. Stephen, 6, Stone Buildings, Lincoln's Inn, London, W.C., Solicitor.

1896. Miles, G. Wellington, 29, Central Street, Boston, Mass., U.S.A., Analytical Chemist.

1889. Milestone, W. C., 7, Heathfield Road, Wandsworth Common, S.W., Chemical Works Manager.

1899. Millar, Jas. H., P.O. Box 2070, Johannesburg, Transvaal, Laboratory Manager.

1897. Millard, Edgar J., 40–42, Charlotte Street, London, E.C., Chemist and Manager.

1903. Millen, J. Dunlop, Mount Bischoff Smelting Works, Launceston, Tasmania, Analyst and Assayer.

1883. Miller, Dr. A. K., Kilvert's Buildings, Withy Grove, Manchester, Analytical Chemist.

1884. Miller, A. Russell, Hill Park, Bothwell, N.B., Printworks, Chemist.

O.M. Miller, E. V., Sugar Works, Chelsea, Auckland, New Zealand, Sugar Works Chemist.

1889. Miller, Geo., 54, Ramilies Road, Sefton Park, Liverpool, Technical Chemist.

1897. Miller, Dr. Edmund H., School of Mines, Columbia University, New York, U.S.A., Chemist.

1900. Miller, Hampton K., Lake City, Fla., U.S.A., Chemist (Florida A. & M. College).

1893. Miller, Dr. Harry E., 1015, Chestnut Street, Oakland, Cal., U.S.A., Chemist.

1902. Miller, H. Harold, Consumers' Gas Co., 269, Front Street, E., Toronto, Canada, Chemist.

1883. Miller, Dr. H. von, III. Beatrixgasse 32, Wien, Austria, Chemical Manufacturer.

1894. Miller, Dr. John A., 40–45, Lewis Block, Buffalo, N.Y., U.S.A., Consulting Chemist, State Analyst.

1897. Miller, Jas., Minas de São Bento, Santa Barbara de Matto Dentro, Minas Geraes, Brazil, Metallurgical Chemist.

1894. Miller, J. Carlile, 89, Rumford Street, Bridgeton, Glasgow, Manufacturing Chemist.

1888. Miller, J. Hopkins, 5, Catherine Street, Parliamentary Road, Glasgow, Dyeworks Chemist.

1889. Miller, Jno. Poynter, Sandilands Chemical Works, Aberdeen, Technical Chemist.

1884. Miller, Dr. N. H. J., Harpenden, near St. Albans, Agricultural Chemist.

1899. Miller, P. Schuyler, Mount Prospect Laboratory, Flatbush Avenue, Brooklyn, N.Y., U.S.A., Chemist.

1898. Miller, Rudolf E. W., 8, Stanley Villas, Greenway Road, Runcorn, Chemist.

1901. Miller, Stuart B., 701, South 20th Street, Birmingham, Ala., U.S.A., Chemical Engineer.

1884. Miller, T. Paterson, The Cairns, Cambuslang, near Glasgow, Dyer and Printer.

1901. Miller, W. Lash, 50, St. Alban Street, Toronto, Canada, Associate Professor of Physical Chemistry.

1884. Miller, W. M., Caledonia Estate, Prov. Wellesley, Penang, S.S., Sugar Chemist.

1902. Milligan, R. E., New York Continental Jewell Filtration Co., 15, Broad Street, New York City, U.S.A., Chemical Engineer.

1903. Millington, Abraham, c/o J. Parry, E.V. Wharf, The Docks, Newport, Mon., Metallurgical Chemist.

O.M. Mills, Prof. E. J., F.R.S., 11, Greenhill Road, Harrow, Professor of Chemistry.

1903. Milnes, Cresswell, Arlesey, near Hitchin, Herts., Chemist.

1887. Milnes, Edmund, Seedfield, Bury, Lancashire, Dyeing Extract Maker.

1902. Milnes, Ernest E., c/o Joseph Smithson, Ltd., India Buildings, Halifax, Yorks, Chemist.

1901. Milroy, Andrew, House Hill Muir, Nitshill, N.B., Manager.

1895. Miner, Harlan S., c/o Welsbach Light Co., Gloucester City, N.J., U.S.A., Technical Chemist.

1889. Miniati, T., Penketh, near Warrington, Chemist.

1895. Mitchell, Chas. A., c/o Beaufoy and Co., South Lambeth Road, S.W., Analyst.

1901. Mitchell, Frank H., Orono, Penobscot Co., Maine, U.S.A., Tutor in Chemistry.

1898. Mitchell, G. D. H., c/o S. S. White Dental Manufacturing Co., Prince's Bay, Staten Island, N.Y., U.S.A., Chemist.

1902. Mitchell, John, c/o W. Mitchell and Sons, Ayr, N.B., Provision Curer.

1883. Mitchell, J. W., Plantation House, Clough Fold, near Manchester, Waste Bleacher.

1904. Mitsugi, R., Naoki Match Manufactory, Aratamachi, Kobe, Japan, Chemist.

O.M. Mitting, E. K., 43, Highfield South, Rock Ferry, Cheshire, Technical Chemist.

1900. Mixner, Albert F., c/o Homeward Bound G. M. Co., Yalwal, viâ Nowra, N.S.W., Australia, Metallurgist.

1895. Moale, Dr. Philip R., c/o Asheville Printing Co., 3, West Court Square, Asheville, N.C., U.S.A., Analytical Chemist.

1902. Möckel, Heinrich A., c/o D. M. Base and Co., Roaring Springs, Pa., U.S.A., Chemist and Engineer.

1903. Möhlau, Prof. Dr. Richard, Semperstrasse 4, Dresden, A., Germany, Professor of Colour Chemistry.

O.M. Mohr, Dr. B., 69A, Parliament Hill, Hampstead, N.W., Consulting Chemist and Metallurgist.

1894. Mole, Herbert B., The Croft, Shepton Mallet, Somerset, Brewer.

1902. Molesworth, F. H., 46, West Street, North Sydney, N.S.W., Australia, Analytical Chemist.

1903. Mommers, Richard, c/o Illinois Sugar Refining Co., Pekin, Ill., U.S.A., Chemical Engineer.

O.M. Mond, Dr., L., F.R.S., 20, Avenue Road, Regent's Park, N.W.; and 64, Via Sistina, Rome, Alkali Manufacturer.

1891. Mond, Robt. L., Winnington Hall, Northwich, Chemist.

1890. Moodie, Wm. E., Alexandria Works, Alexandria, N.B., Analytical Chemist.

1901. Moody, Chas. J., Lake View Consols Mine, Boulder, West Australia, Analyst and Assayer.

1898. Moody, Dr. Herbert R., Hobart College, Geneva, N.Y., U.S.A., Science Instructor.

1884. Mook, Chas., 2, Kapellenstrasse, Eisenach, Germany, Alkali Works Director.

1903. Mooney, F. M., 118, Pembroke Road, Dublin, Chemical Manure Manufacturer.

1903. Mooney, Geo. A., 2716, St. Catherine Street, Montreal, Canada, Chemical Merchant.

1902. Mooney, Luke, 36, West 52nd Street, Bayonne, N.J., U.S.A.

1887. Moore, Chas. C., Harley Buildings, 11, Old Hall Street, Liverpool, Chemist.

1901. Moore, Chas. W., 33, Demesne Road, Whalley Range, Manchester, Chemical Student.

1902. Moore, Fred., Victoria Chemical Co., Ltd., Victoria, B.C., Canada, Manufacturing Chemist.

1892. Moore, Dr. Geo. D., 201, Salisbury Street, Worcester, Mass., U.S.A., Professor of Chemistry.

1904. Moore, Gerrit J., jun., c/o National Brewers' Academy, 39, South William Street, New York City, U.S.A., Analytical Chemist.

1902. Moore, Jas. H., Saltville, Va., U.S.A., Chemist.

1899. Moore, Quintin, jun., Dalmarnock Chemical Works, 89, Rumford Street, Glasgow, Works Manager.

1899. Moore, Dr. Russell, W., 47, Linden Place, Orange, N.J., U.S.A., Chemist (U.S. Appraiser's Office).

1885. Moore, R. T., 142, St. Vincent Street, Glasgow Mining Engineer.

1890. Moore, Thos., Laboratoire du Service Local, Noumea, New Caledonia, Analytical Chemist.

1903. Moorhouse, J. B., Cecil Mount, Park Avenue, Bradford, Yorks., Dyer.

1903. Moran, Geo. A., 333, Haverhill Street, Lawrence, Mass., U.S.A., Chemist.

1890. Mordle, F. Dare, Guilderoy, Matlock Bath, Derbyshire, Starch Manufacturer.

1902. More, Andrew, Government Laboratory, Clement's Inn Passage, Strand, W.C., Government Analyst.

1901. Morgan, Dr. Gilbert T., Royal College of Science, South Kensington, S.W., Demonstrator of Chemistry.

1890. Morgan, J. Jas., 9, Upper Kent Road, Victoria Park, Manchester, Assayer.

1898. Morgan, Thos. M., Longue Pointe, near Montreal, Canada, Manufacturer.

1885. Morgans, Thos., 60, Queen Square, Bristol, Civil Engineer.

1901. Moriarty, John J., 5, D'Arcy Street, Toronto, Canada, Assistant Chemist.

1902. Morison, Jas., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.

1897. Morison, Samuel L., 15, Broad Street, New York City, U.S.A., Water Engineer.

O.M. Moritz, Dr. E. R., 45, Great Tower Street, London, E.C., Brewing Chemist.

1885. Morley, Dr. H. Forster, 5, Lyndhurst Road, Hampstead, N.W., Professor of Chemistry.

1903. Morningstar, Jos., 48, Park Place, New York City, U.S.A., Merchant.

1902. Morrell, Dr. R. S., Gonville and Cains College, Cambridge, Lecturer.

1884. Morrice, Jas. A., 1, Prince's Terrace, Dowanhill, Glasgow, Starch and Gum Manufacturer.

1898. Morris, Edgar F., Grey House, Barrington Road, Altrincham, Cheshire, Research Chemist.

1897. Morris, Harry, Avenue House, Doncaster, Chemical Merchant.

1890. Morris, Herbert N., Gorton Brook Chemical Works, Manchester, Technical Chemist.

O.M. Morris, J. Haydn, 9, Rathbone Road, Wavertree, Liverpool, Technical Chemist.

1902. Morrison, Jos., Wellfield, Farnworth, Widnes, Manager.

1901. Morse, Willard S., Apartado A., Aguascalientes, Mexico, Assistant Manager.

O.M. Morson, T., 31, Southampton Row, London, W.C., Manufacturing Chemist.
1904. Morson, Thos. D., c/o T. Morson and Son, Summerfield Works, Ponders End, N., Chemist.
1889. Morton, Jas., Dalquhurn Works, Renton, N.B., Dyeworks Manager.
1897. Morton, Jno.. North Road, St. Helens, Lancashire, Analytical Chemist.
1902. Mosbaugh, Francis R., c/o Huntsville and Bracebridge Tanning Co., Huntsville, Ont., Canada, Chemist.
1888. Mosenthal, Henry de, 220, Winchester House, Old Broad Street, E.C., Explosives Company Manager.
1903. Moses, Herhert B., c/o National Battery Co., Buffalo, N.Y., U.S.A., Electro-chemist.
1903. Mosher, Walter R., 1274, West Avenue, Buffalo, N.Y., U.S.A., Chemist.
1894. Moszczenski, J. von, Tartar Chemical Co., Ninth Street and Gowanus Avenue, Brooklyn, N.Y., U.S.A., Consulting Chemist.
1897. Motion, Jno., c/o Valvoline Oil Co., Edgewater, N.J., U.S.A., Oil Refinery Chemist.
1887. Moul, Frank, Aldersgate Chemical Works, Southall, Technical Chemist.
1901. Moule, Jno. W., Sulphide Corporation, Ltd., Cockle Creek, N.S.W., Metallurgical Chemist.
1884. Moult, J., Underhill, Low Fell, Gateshead-on-Tyne, Secretary.
1898. Moulton, Prof. Chas. W., Vassar College, Poughkeepsie, N.Y., U.S.A., Professor of Chemistry.
1892. Mount, Edw., Oaklands, Aughton, near Ormskirk, Assistant Secretary (United Alkali Company).
O.M. Muir, J. P., 233, Camden Road, London, N., Chemist.
1890. Muir, Jas. Stanley, 8, Westminster Gardens, Glasgow, W., Chemist.
1896. Muir, Wm., 97, Church Street, Edmonton, Middlesex, Merchant.
1894. Muir-Smith, W., c/o A. B. Fleming & Co., Ltd., Caroline Park, Edinburgh, Oil Works Manager.
O.M. Müller, Dr. H., F.R.S., 13, Park Square East, Regent's Park, London, N.W., Research Chemist.
1896. Mundy, Lionel, 27, Merton Road, Kensington, W., Importer of Unfermented Wines.
1887. Munroe, Prof. Chas. E., Columbian University, Washington, D.C., U.S.A., Professor of Chemistry and Dean.
1900. Munsell, Dr. Chas. E., c/o Devor and Raynolds Co., 110, Horatio Street, New York City, U.S.A., Colour Chemist.
1903. Munsterman, Carl A., 216, South Utica Street, Waukegan, Ill, U.S.A., Chemist.
1900. Munton, Fred. T., Beaconsfield, Western Road, Runcorn, Cheshire, A.R.S.M., Analytical Chemist.
1897. Murch, D. Wilshin, 6, Victoria Road, Wednesbury, Staffs., Chemist.
1886. Murdoch, R. H. M., Shore Road, Stevenston, Ayrshire, Explosives Chemist.
1899. Murphy, Albert J., The Laboratory, 11, Lyddon Terrace, Leeds, Brewer's Chemist.
1901. Murray, Benjamin L., c/o Merck and Co., University Place, New York City, U.S.A., Chemist.
1903. Murray, Chas. B., c/o St. Louis Plate Glass Co., Valley Park, Mo., U.S.A., Chemist.
1899. Murray, Jas. J., Iron King Mines, Val Verde, Arizona, U.S.A., Mining Engineer.
1901. Murray, Jas. P., Toronto Carpet Manufacturing Co., Ltd., King Street and Fraser Avenue, Toronto, Canadu, Carpet Manufacturer.
1896. Murray, Dr. Thus. S., 1, Nelson Street, Dundee, Professor of Chemistry.
1898. Murray, Rd., Laurel Bank, Potternewton Lane, Chapel Allerton, Leeds, Analyst.
O.M. Muspratt, E. K., Seaforth Hall, near Liverpoo, Alkali Manufacturer.
1894. Muspratt, Max, 2, Mannering Road, Sefton Park, Liverpool, Technical Chemist.
O.M. Muspratt, S. K., 9, Church Street, Flint, North Wales, Alkali Manufacturer.
O.M. Muter, Dr. Jno., Winchester House, Horley, Surrey, Chemical Lecturer.
1895. Muurling, T. J. R., P.O. Box 2660, New York City, U.S.A., Dyestuff Importer.
1903. Myers, Edgar C., (Journals) New Franklin, Mo., and 1107, Paquin Street, Columbia, Mo., U.S.A., Agricultural Chemist.
1897. Myers, Dr. Henry C., University of California, Berkeley, Cal., U.S.A., Prof of Chemistry.
1891. Myers, Wm. S., Nitrate of Soda Propaganda, 12, John Street, New York City, U.S.A., Director.

N

902. Naef, Dr. Ernest E., 26, Stanley Road, Whalley Range, Manchester.
1884. Naef, Dr. P., U.S.A., Technical Chemist.
1903. Naef, Jno. J., 416, Eleventh Avenue, Paterson, N.J., U.S.A., Chemist.
1903. Nagel, Dr. Oscar, 90, Wall Street, New York City, U.S.A., Chemist.
1903. Nagel, Oskar H. L., Glenbrook, Conn., U.S.A., Superintendent (Chemical Works).
1897. Nairn, Michael, Ben Dhu, Kirkcaldy, N.B., Linoleum Manufacturer.
1901. Nakagawa, Sōsuke, Hokkaidō Cement Co., Kamüso, near Hakodate, Japan, Chief Engineer.
1903. Nakayama, Takakichi, c/o Fuji Paper Co., Sanjikkenbori, Tokyo, Japan, Chemist.
1901. Nanabhai, Krishnalal, 8–10, Nepean Sea Road, Malabar Hill, Bombay, India, Technological Chemist.
1893. Napier, Jno. W., Gas Works, Alloa, N.B., Manager and Chemist.
1903. Nash, A. Douglas, 221, Broadway, Flushing, N.Y., U.S.A., Glass Manufacturer.
1897. Nash, Leonard M., 281, Seven Sisters Road, Finsbury Park, N., Works Chemist.
1900. Nathan, Major Fred. L., R.A., Royal Gunpowder Factory, Waltham Abbey, Essex, Superintendent,
1898. Nation, Edmund C., 237, Smith Street, Peekskill. N.Y., U.S.A., Manager (Highlands Chemical Co.).
1892. Naylor, Wm., 3, Garstang Road, Fulwood, Preston, Lancs., Chemist.
O.M. Naylor, W. A. H., 38, Southwark Street, London, S.E., Manufacturing Chemist.
1901. Neale, Percy R., c/o Messrs. Morris and Co., Doncaster, Yorks, Chemical Manufacturer.
1899. Neate, Percy J., " Belsize," Watts Avenue, Rochester, Kent, Director of Cement Co.
1902. Neave, Geo. B., Technical College, 204, George Street, Glasgow, Assistant to Professor of Chemistry.
1898. Neil, Jas. Millar, 176, Roxborough Street East, Rosedale, Toronto, Canada, Technical Chemist.
1890. Neill, Geo. D., Drumslea, Greenock, N.B., Sugar Refiner.
1898. Neilson, Alex. McG., c/o Arthur May and Co., Durban, Natal, Analytical Chemist.
1889. Neilson, Thos., Metallurgical Chemist.
1902. Neish, Arthur C., Columbia University, New York City, U.S.A., Chemist.
1893. Nelson, Arthur J., 381, Edge Lane, Droylsden, Manchester, Chemist.
1898. Nelson, Elnathan K., c/o Nelson Morris and Co., Chicago, Ill., U.S.A., Chemist.
1897. Nelson, Walter, Emscote Mills, Warwick, Gelatin Manufacturer.
1903. Nemian, Howard S., 122, Hudson Street, New York City, U.S.A., Manufacturing Chemist.
902. Nesbitt, Dr. Beattie, 71, Grosvenor Street, Toronto, Canada, Physician.
1901. Neufville, Dr. Rudolf de, c/o Metallurgische Gesellschaft, Frankfort a/M., Germany.
1902. Neumann, Dr. Edgar, 60, Chancery Lane, London, W.C.

1903. Neumann, Dr. Max, Hohenstaufenstr. 32, Berlin, W. 30, Germany.
1903. Nevin, Jas. Victor, Bristol Dispensary, Bedminster, Bristol, Pharmacist.
O.M. Newall, F. S., Washington, co. Durham, Chemical Manufacturer.
1889. Newberry, Spencer B., Sandusky Portland Cement Co., Sandusky, Ohio, U.S.A., Cement Works Manager.
1896. Newcomen, Thos., Chemical Works, Lydbrook, near Ross; Wood Distiller.
O.M. Newlands, B. E. R., 2, St. Dunstan's Hill, London, E.C., Analytical and Consulting Chemist.
O.M. Newlands, W. P. R., 232, Amesbury Avenue, Streatham Hill, S.W., Sugar Chemist.
1884. Newton, Jno., Park Green, Macclesfield, Silk Dyer.
O.M. Newton, Jno., Manor Works, Rotherhithe New Road, London, S.E., Manure Manufacturer.
1900. Newton, Dr. Wm., 39, Mincing Lane, London, E.C., Chemist.
1901. Nibelius, Axel W. T., American Forcite Powder Manufacturing Co., Landing, N.J., Chemist.
1904. Nichols, C. W., 406, Clinton Avenue, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.
1884. Nichols, J. A., Stanley Mount, New Mills, near Stockport, Teacher of Science.
1888. Nichols, W. H., The Nichols Chemical Co., 25, Broad Street, New York City, U.S.A., Manufacturing Chemist.
1897. Nicholson, Harry, Tyn-y-vardd, Llaneltyd, Dolgelly, North Wales, Assayer.
1904. Nicholson, Wilfred E., Hunslet Chemical Works Leeds, Chemical Manufacturer.
1897. Nicholson, Wm. J., Ardeer, Stevenston, Ayrshire, N.B., Chemist.
1897. Nickel, Herman, c/o The N. K. Fairbank Co., 3rd and Convent Streets, St. Louis, Mo., U.S.A., Chemist.
1888. Nickolls, John B., The Laboratory, Grange, Guernsey, Analytical Chemist.
O.M. Nicol, Dr. W. W. J., 15, Blacket Place, Edinburgh, Chemical Lecturer.
1903. Nicoll, Frank, 221, Walmersley Road, Bury, Lancs., Chemist.
1900. Nield, J. H., c/o General Chemical Co., Bayonne Works, Bayonne, N.J., U.S.A., Superintendent.
1898. Nightscales, Geo., 13, Spring Street, Hull. Oil Merchant.
1899. Nihoul, Dr. Edw., Waremme, Belgium, Director of the Liège Tannery School.
O.M. Nimmo, Jas., Penshurst, 8, Lawrence Road, South Norwood, S.E., Analytical Chemist.
1885. Nishigawa, T., Ryuso Kaisha, Osaka, Japan, Director of Sulphuric Acid and Soda Works.
1898. Nishikawa, T., c/o Nippon, Seimikaisha, Onoda, Nagato, Japan, Chemist.
O.M. Nolting, Dr. E., Ecole de Chimie, Mulhouse, Alsace, Germany, Professor of Chemistry.
O.M. Norman, F. J., Lyndhurst, Higher Runcorn, Cheshire, Chemical Manufacturer.
1900. Norman, Geo. M., 929, University Avenue, Madison, Wis., U.S.A., Chemist.
1892. Norman, J. T., 23. Leadenhall Street, E.C., Consulting Chemist.
1898. Norris, Albert P., 760, Massachusetts Avenue, Cambridgeport, Mass., U.S.A., Assistant Chemist.
1904. Norris, Cassius W., 612, Commerce Street, Milwaukee, Wis., U.S.A., Tannery Chemist.
1899. Norris, Geo. L., Standard Steel Works, Burnham, Mifflin Co., Pa., U.S.A., Chemist.
1893. Norris, Wm. M., Princeton, N.J., U.S.A., Leather Chemist.
1902. North, Barker, Glenholme, Glenholme Road, Manningham, Bradford, Lecturer in Chemistry.
1890. North, E. Gordon N., Jubiles, Alpujarra, Prov. de Granada, Spain, Technical Chemist.
1903. North, Henry A., 649, Green Avenue, Brooklyn, N.Y., U.S.A., Chemist.
O.M. Northing, J., The Murrough, Wicklow, Ireland, Technical Chemist.
O.M. Norton, Dr. S. A., 363, East Town Street, Columbus, Ohio, U.S.A., Professor of Chemistry (Ohio State University).
1887. Norton, Dr. T. H., U.S. Consulate, Mezereh, Mamouret-ul-Aziz, Turkey-in-Asia, open Mail, *viâ* Constantinople, Ph.D., Sc.D., U.S. Consul.
1901. Novarine, John L., 79, Main Street, Brooklyn, N.Y., U.S.A., Chemist.
1899. Noyes, Henry, (Subscriptions) c/o J. C. Lanyon and Sons, Gresham House, Old Broad Street, London, E.C.; and (Journals), 17, Queen Street, Melbourne, Vic., Australia, Engineer.
1901. Noyes, Dr. Wm. A., Johns Hopkins Univ., and 1505, Bolton Street, Baltimore, Md., U.S.A., Editor (J. Amer. Chem. Society).

O

1894. Oakes, Geo. A., Bloomfield, N.J., U.S.A., Woollen Mill Owner.
1884. O'Beirne, W. G., British Chemical Works, Clydebank, Glasgow, Manufacturing Chemist.
1904. Oberländer, Dr. Otto, 62, Delaunay's Road, Crumpsall, Manchester, Technical Chemist.
1900. O'Brien, Frederick, 9, Elvaston Road, Victoria Park, Bedminster, Bristol, Analytical Chemist.
1900. O'Byrne, Leo C., 996, Washington Boulevard, Chicago, Ill., U.S.A., Chemist.
1902. Oekel, Reinhold, 9, Walton New Road, Warrington, Technical Chemist.
1901. O'Connor, Chas. P., 149, Clinton Street, Brooklyn, N.Y., U.S.A., Analytical Chemist.
1887. Oddie, Jas., School of Mines, Ballarat, Australia, Chemical Lecturer.
1888. Oddy, Robert W., 60, Waterhouse, Toad Lane, Rochdale, Chemist.
1901. Odling, Francis J., Box 314, G.P.O., Melbourne, Vic., Australia, Mining Engineer.
1884. Oehler, K., Offenbach-am-Main, Germany, Colour Manufacturer.
1888. Ogata, Saburo, Zohei Shikyoku, Okurasho, Tokyo, Japan, Assayer.
1901. Ogden, Richard L., 314, North Main Street, Bethlehem, Pa., U.S.A., Chemist (U.S. Navy).
1896. Ogilvy, D. J., Gest Street; and C. H. and O. R. R., Cincinnati, Ohio, U.S.A., Manufacturing Chemist.
1902. Oglesby, Wm. R., Wabash Portland Cement Co., Stroh, La Grange Co., Ind., U.S.A., Chemist.
1901. Ogston, Alex. G., Ardoe, near Aberdeen, N.B., Soap Manufacturer.
1903. Ohlenschlager, J. G., jun., 2, Fowkes Buildings, Great Tower Street, London, E.C., Chemical Merchant.
1898. Olden, Chas., Hunstanton, Norfolk, Metallurgical Engineer.
1903. Oldham, E. W., St. Louis Portland Cement Co., St. Louis, Mo., U.S.A., Chemist.
1884. Oliver, F., 31, Horsley Hill Road, Westoe, South Shields, Analytical Chemist.
1902. Oliver, Frank M., 755, North 38th Street, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
1888. Oliver, Wm. Letts, 101, Vernon Street, Oakland, Cal., U.S.A., Mining Engineer.
1901. Olivier, Dr. Louis, 22, Rue du Général-Foy, Paris, 8^{e}, Directeur (Revue Générale des Sciences).
O.M. Ollerenshaw, S., 96, Davyhulme Lane, Urmston, Manchester, Technical Chemist.
1903. O'Loughlin, C. C., Northern Aluminium Co., Shawenegan Falls, Quebec, Canada, Analyst.
1899. Olsson, Gustav, c/o Hecla Compressed Gas Co., West 3rd Street, Chelsea, Mass., U.S.A., Manufacturing Chemist.
1902. O'Neill, Chas., c/o Messrs. Wilson and Carlisle. Calle Maipu, Buenos Ayres, Argentina, Chemist and Colourist
O.M. O'Neill, E. H., Johnson's Saccharum Co., Limited, Stratford, London, E., Managing Director.

1898. Ormerod, Ernest, Chem. Laboratorium, Polytechnikum, Zurich, Switzerland, Chemical Student.

1894. Ormerod, John, Globe Leather Works, Castleton, Manchester, Tanner and Currier.

O.M. Orr, A., 35A, Bligh Street, Sydney, New South Wales, Analytical Chemist.

O.M. Orr, J. B., Chestnut Lodge, Widnes, Lancashire, Chemical Manufacturer.

1884. Orr, Robert; c/o Jas. Miller, Son, and Co., 79, West Nile Street, Glasgow; and (Journals), Kinnaird, Larbert, N.B., Manufacturing Chemist.

1899. Orr, Thos. W., Esperanza Nitrate Co., Taltal, Chile, Chemist.

1890. Orsman, Wm. Jas., Chemical Laboratory, Gathurst, near Wigan, Explosives Chemist.

1897. Osborne, Thos. B., P.O. Box 485, New Haven, Conn., U.S.A., Chemist.

1900. Osbourne, Jno. P., 572, Alexandra Parade, Dennistoun, Glasgow, Analytical Chemist.

1896. Osmond, Jno. H., c/o Smith, Bell, & Co., Manila, Sugar Works and Technical Chemist.

1900. O'Shaughnessy, Francis R., Home Farm, Tyburn, Birmingham, Chemist.

1885. O'Shea, L. T., University College, Sheffield, Chemical Lecturer.

O.M. O'Sullivan, C., F.R.S., 140, High Street, Burton-on-Trent, Brewer and Chemist.

1883. O'Sullivan, J., High Bank, Burton-on-Trent, Brewing Chemist.

1898. Oushkoff, John P., c/o P. K. Oushkoff & Co., Moscow, Russia, Chemical Manufacturer.

1903. Outwater, Raymond, 1312, B. Street S.W., Washington, D.C., U.S.A., Chemist.

1887. Overtoun, Lord, 7, West George Street, Glasgow, Chemical Manufacturer.

1904. Owen, Halsall, Newholme, Latchford, Warrington, Engineer.

1891. Owens, Caradoc, 88, Great Clowes Street, Lower Broughton, Manchester, Dyer's Manager.

1903. Ozias, Ramon E., 732, Clinton Avenue, Newark, N.J., U.S.A., Assayer.

P

1904. Packard, C. T., Millbank, Bramford, near Ipswich, Manager of Chemical Works.

O.M. Packard, E., jun., Bramford, near Ipswich, Manure Manufacturer.

1899. Paessler, Dr. Joh., Vorstand der Deutschen Versuchsanstalt für Lederindustrie, Freiberg in Sachsen, Germany, Chemist.

O.M. Page, F. J. M., 54, Sutherland Street, Pimlico, S.W., Chemical Lecturer.

1901. Page, Ralph H., Chemist (Solvay Co.).

1886. Pagès, Albert, 34, Boulevard Henri IV., Paris, Technical Chemist.

1892. Paine, Augustus G., 60, Times Building, and (Journals) 41, Park Row, New York City, U.S.A., President of Paper Making Co.

O.M. Paine, S., Devisdale, Bowdon, and (Journals) Otter Works, Manchester, Pharmaceutical Chemist.

1902. Pakes, Dr. Walter C. C., Box 1080, Johannesburg, Transvaal, S. Africa, Analyst and Bacteriologist.

1903. Palmenburg, O. W., 107, West 70th Street, New York City, U.S.A., Chemist.

1887. Palmer, T. Chalkley, Box 19, Chester, Pa., U.S.A., Manufacturing Chemist.

1887. Palmer, Thos. C., Beechwood, Moss Lane, Pinner, Engineer.

1902. Paquin, Felix, Memphis, Tenn., U.S.A., Chemist.

O.M. Park, J., Millburn Chemical Works, Garngad Hill, Glasgow, Chemical Manager.

1888. Parker, Chas. E., Vine House, Penketh, Warrington, Tanner.

1894. Parker, Chas. E., 164, New Street, New Brunswick, N.J., U.S.A., Chemist.

1898. Parker, Charles H., Craigside, Clark Street, Wolverhampton, Chemist.

1891. Parker, Edw., Laburnum House, Rushford Park, Levenshulme, Manchester, Analytical Chemist.

1904. Parker, G. H., c/o Messrs. Haddock, Parker, and Co., 14, Chapel Street, Liverpool, Chemical Broker.

1894. Parker, Dr. J. Gordon, Herold's Institute, Drummond Road, Bermondsey, S.E., Head of Tanning School.

1897. Parker, Matthew A., 13, Hamilton Crescent, Partick, Glasgow, Assistant to Professor of Chemistry.

1901. Parker, Richard H., N.Y. Testing Laboratory, Long Island City, N.Y., U.S.A., Analytical Chemist.

O.M. Parker, Thos., Manor House, Tettenhall, Wolverhampton, Electrical Engineer.

1891. Parker, Thos. J., Bayonne, N.J., U.S.A., Chemical Works Manager.

1903. Parker, Wm. B., t, Manor Road, Park Estate, Rugby, Chief Chemist (British Thomson-Houston Co., Ltd.).

1901. Parker, Dr. Wm. Huntington, 177, State Street, Boston, Mass., U.S.A., Chemist in Charge (U.S. Appraiser).

1898. Parker, W. W., Whitehouse Street Tannery, Bristol, Tanner.

1901. Parkes, Albert E., 43, Whitehorse Street, Stepney, E., Analytical Chemist.

1898. Parrish, Saml., 80, Grange Avenue, Chapeltown Road, Leeds, Teacher of Chemistry.

1896. Parry, John, Ebbw Vale Wharf, Newport, Mon., Analytical Chemist.

1901. Pass, James, Onondaga Pottery Co., Syracuse, N.Y., U.S.A., Pottery Manufacturer.

1902. Patch, Prof. Jas. A., Syrian Protestant College, Beirût, Syria, Prof. of Chemistry.

1902. Patchett, Isaac, 11, Field Hill, Batley, Yorks, Science Master.

1897. Patchett, Jas., Oakworth, Hadley, Wellington, Salop, Ironmaster.

1901. Paterson, David, Leabank, Rosslyn, Midlothian, Colour Chemist.

1884. Paterson, John, Belle Isle Place, Workington, Cumberland, Mechanical Engineer.

1887. Paton, J. M. C., Messrs. Manlove, Alliott & Co., Ltd., Nottingham, Mechanical Engineer.

1886. Paton, W. Grant, 18, Bertram Road, Liverpool, Alkali Works Manager.

1901. Patterson, Chas. A., c/o Repauno Chemical Co., Chester, Pa., U.S.A., Analytical Chemist.

1903. Patterson, E. V., University Club, Baltimore, Md., U.S.A., Textile Colourist.

O.M. Patterson, Geo., c/o The Manbré Saccharine Co., Ltd., Fulham Palace Road, Hammersmith, W., Technical Chemist.

1893. Patterson, Harry J., College Park, Prince George's Co., Md., U.S.A., Agricultural Chemist.

O.M. Patterson, T. L., Maybank, Finnart Street, Greenock, N.B., Sugar Works Manager.

1902. Patterson, Wm. Hamilton, Fernlea, Danes Road, Rusholme, Manchester, Student.

1881. Pattinson, Dr. H. Salvin, 75 Side, Newcastle-on-Tyne, Analytical Chemist.

O.M. Pattinson, J., 75, The Side, Newcastle-on-Tyne, Consulting Chemist.

O.M. Pattison, Jas., Drimnamona, Kilmalcolm, N.B., Chemical Merchant.

1889. Pattison, Percy J., 5, Kingsley Road, Forest Gate, E., Technical Chemist.

1900. Paul, Dr. L. Gordon, Market Hall Chambers, Huddersfield, Consulting Chemist.

1891. Paul, Jas. H., 19, Glenluce Road, Blackheath, S.E., Analytical Chemist.

1902. Pauli, Dr. Hermann, Rusterstrasse 15, Frankfurt a/M., Germany, Chemist.

1902. Pay, Walter Herbert, Government Laboratory, Durban, Natal, S. Africa, Chemist and Assayer.

O.M. Payne, J. B., 15, Mosley Street, Newcastle-on-Tyne, Manufacturing Chemist.

1898. Pearce, Edw. D., Messrs. T. P. Shepard and Co., P.O. Box 1336, Providence, R.I., U.S.A., Manufacturing Chemist.
1894. Pearce, Jas. Stanley, Clements, Snaresbrook, Essex, Chemical Manufacturer.
1897. Pearce, Richard, Argo, Col., U.S.A., Smelting Works Manager.
1903. Pearce, Sidney H., P.O. Box 149, Johannesburg, Transvaal, South Africa, Metallurgist.
1883. Pearce, W., Chemical Works, Bow Common, London, E., Chemical Manufacturer.
1903. Pearcy, A. C., 40, St. Kilda's Road, Stoke Newington, N., Director, Explosives Co.
1903. Pears, Thos., The Laboratory, Soap Works, Isleworth, Soap Manufacturer.
1893. Pearson, Frank P., Arnold Printworks, North Adams, Mass., U.S.A., Printworks Manager.
1894. Pearson, Wm. H., 6, Fenchurch Buildings, London, E.C., Analytical Chemist.
O.M. Pechiney, A. R., Salindres, Gard, France, Chemical Engineer.
1898. Peck, Dr. Ernest L., Claremont, Merrilocks Road Blundellsands, near Liverpool, Analytical Chemist.
1898. Peckham, Stephen F., Room 104, 280, Broadway, New York City, U.S.A., Chemist.
1894. Peden, Jno., 30, Ardgowan Street West, Greenock, N.B., Analytical Chemist.
O.M. Pedler, Prof. A., C.I.E., F.R.S., Writer's Buildings, Calcutta, India, Director of Public Instruction.
1886 Pedler, J. R., 47, Tregunter Road, South Kensington, S.W., Clerk.
1903. Peffer, Harry C., c/o Pittsburgh Reduction Co., East St. Louis, Ill., U.S.A., Manufacturing Chemist.
1899. Pell, A., 7, Elphinstone Circle, Bombay, India, Chemist.
1897. Pellew, Chas. E., Columbia University, New York City, U.S.A., Adjunct Professor of Chemistry.
1896. Penney, Mulgrave D., 11, High Street, Hull, Analytical Chemist.
1903. Pennington, R. W. R., "Carbonic," Mazagon, Bombay, India, General Manager and Engineer (Sirdar's Carbonic Acid Co., Ltd.).
1890. Pennock, J. D., c/o Solvay Process Co., Syracuse, N.Y., U.S.A., Technical Chemist.
1885. Pentecost, S. J., Nottingham Road, New Basford, and (Journals), Sherwood Hill Works, Sherwood Rise, Nottingham, Lace Dresser.
1887. Pentermann, H. T., 37, Clifton Crescent, Peckham, S.E., Brewing Chemist.
1892. Peploe, D. H. T., Underriver House, Sevenoaks, Kent.
1899. Peppel, S. Vernon, 431, Main Street, Louisville, Ky., U.S.A., Chemist.
1885. Perkin, A. G., F.R.S., 8, Montpelier Terrace, Hyde Park, Leeds, Technical Chemist.
1898. Perkin, Dr. F. Mollwo, Borough Polytechnic Institute, Borough Road, S.E., Head of Chemical Department.
O.M. Perkin, Dr. W. H., F.R.S., The Chestnuts, Sudbury, Harrow, Research Chemist.
1887. Perkin, Dr. W. H., jun., F.R.S., Fairview, Wilbraham Road, Fallowfield, Manchester, Professor of Chemistry.
1903. Perkins, Frank G., Lake Mary, Florida, U.S.A., Starch Manufacturer.
1893. Perkins, T. S., 155, Bushkill Street, Easton, Pa., U.S.A., Chemist.
1899. Perks, Walter G., (Journals) Glanafon, and (communications) c/o National Explosives Co., Ltd., Hayle, Cornwall, Manufacturer.
1904. Perrott, Bert, County School, Neath, Glamorgan Demonstrator in Chemistry.
1901. Perry, Chas. M., 4, Catalpa Road, Providence, R.I., U.S.A., Bleach and Dyeworks Chemist.
1887. Perry, D., Norwood, Lenzie, N.B., Manufacturing Chemist.
1895. Perry, Jos. H., 276, Highland Street, Worcester, Mass., U.S.A., Teacher of Chemistry.
1903. Perry, M. J. T., Australian Drug Co., O'Connell Street, Sydney, N.S.W., Australia, Manufacturing Chemist.
1903. Perry, Robt. Swain, c/o Harrison Bros. and Co., Inc., 35th Street and Gray Ferrry Road, and (Journals) Station D., Philadelphia, Pa., U.S.A., President.
1901. Persons, Ashton C., 315, Prospect Street, Willimantic, Conn., U.S.A., Chemist.
1897. Peter, Dr. A. H., c/o Zinsser and Co., Hastings-on-Hudson, N.Y., U.S.A., Chemist.
1893. Pethybridge, Walter, 3, Rhodesia Road, Clapham Rise, S.W., Chemist and Assayer.
1903. Petrie, Jas. M., The University, Sydney, N.S.W., Australia, Chemist.
1902. Petsche, B. W., 25, Fairview Street, Yonkers, N.Y., U.S.A., Chemist.
1883. Pettigrew, J., 6, St. Helen's Place, Bishopsgate, E.C., Technical Chemist.
1892. Pettigrew, Robt., c/o Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester, Electrochemist.
1902. Pettitt, Alf., 691, Fulton Street, Brooklyn, N.Y., U.S.A., Chemist.
O.M. Peyton, E. P., Chemical Works, Lister Street, Birmingham, Chemical Manufacturer.
1900. Peyton, Wm. C., c/o Peyton Chemical Co., Room 30, 4th Floor, Mills Building, San Francisco, Cal., U.S.A., Chemist.
1888. Philip, Arnold, Chemical Laboratory, H.M. Dockyard, Portsmouth, Electro-Metallurgist and Electrical Engineer.
1903. Philipp, Herbert, 92, Gordon Street, Perth Amboy, N.J. U.S.A., Chemist and Electrochemical Engineer.
1886. Phillips, A. G., 11, Essex Villas, Phillimore Gardens, Kensington, W., Barrister-at-Law.
1891. Phillips, G. Brinton, (Journals) 622, Race Street; (communications) 2007, De Lancey Place, Philadelphia, Pa., U.S.A., Manufacturing Chemist.
O.M. Phillips, Harcourt, 9, Crawford Avenue, Bolton, Analytical Chemist.
1895. Phillips, S. Chas., 47, Cannon Street, London, E.C., Chemical Engineer.
1904. Phillips, V. C., Haselmere, Morris Avenue, Manor Park, E., Chemist.
1898. Phillips, Wm. H., 100, Milton Avenue, East Ham, E., Soapmakers' Assistant.
1883. Phipson, Dr. T. L., Casa Mia, Putney, S.W., Analytical and Consulting Chemist.
1894. Picard, Hugh F. K., 44, London Wall, London, E.C., Metallurgist.
O.M. Pick, Dr. S., Direction der Soda Fabrik, Szczakowa, Galizien, Austria, Chemical Engineer and Manager.
1902. Pickard, R. H., Merlin Road, Blackburn, Teacher and Analyst.
1897. Pickert, Leo. W., American Sugar Refining Co., Granite Street, South Boston, Mass., U.S.A., Chemist.
1904. Pickup, Edgar H., 348, Great Clowes Street, Higher Broughton, Manchester, Calico Printer.
1899. Pidduck, E. W., University College of Wales, Aberystwith, Wales, Assistant Chemist.
1901. Pierce, Ira L., Woodbury, Gloucester Co., N.J., U.S.A., Chemist (Repauno Chemical Co.).
1897. Pilhashy, Benj. M., 1325, Lincoln Avenue, Walnut Hills, Cincinnati, Ohio, U.S.A., Chemist (Pure Culture Yeast Co.).
1888. Pilkingten, G., Laboratory, Victoria Buildings, Silver Street, Bury, Lancashire, Analytical Chemist.
1893. Pilley, Thos. W., 33, Grove Hill Road, Denmark Hill, S.E., Analytical Chemist.
1894. Pilling, John E., Agnew Villas, 78, Whitegate Drive, Blackpool, Chemist.
1883. Pipe, Jas., Messrs. Wm. Henderson & Co., Irvine, N.B., Chemical Manufacturer.
1896. Piper, Walter E., Boston Rubber Shoe Co., Malden, Mass., U.S.A., Chemist.
1899. Pirie, Alex. G., Messrs. Alex. Pirie and Sons, Ltd., Stoneywood Works, Bucksburn, Aberdeenshire, Paper Manufacturer.
1900. Pitman, Jno. R., c/o Laflin and Rand Powder Co., Haskell, N.J., U.S.A., Chemist.

O.M. Pitt, T., 16, Coleman Street, London, E.C., Manufacturing Chemist.
1902. Pittard, Jno., 30, Mansfield Road, Ilford, Essex, Chemical Manufacturer.
1884. Pittuck, F. W., 15, Stratford Grove, Heaton, Newcastle-on-Tyne, Technical Chemist.
1899. Pizey, Jas. H., 22, Duke's Avenue, Muswell Hill, N., Chemist.
1894. Platten, Frank, c/o Elliot's Metal Co., Limited, Selly Oak Works, near Birmingham, Metallurgical Chemist.
1890. Platts, Jno. C., Heaton Moor Lodge, Heaton Chapel, near Stockport, Metallurgical Chemist.
1896. Plaut, Albert, 128, William Street, New York City, U.S.A., Wholesale Druggist.
1888. Playfair, David J., 7, Victoria Crescent, Dowanhill, Glasgow, Manufacturing Chemist.
1891. Pocklington, Hy., 41, Virginia Road, Leeds, Assurance Co.'s Local Manager.
1901. Pollard, Wm., Museum, Jermyn Street, London, S.W., Chemist (H.M. Geological Survey).
1902. Pollitt, Jas. C. T., c/o Kynoch, Ltd., Witton, near Birmingham, Managing Chemist.
1893. Pollitt, R. B., De Beers Explosives Works, Somerset West, C.C., South Africa, Civil Engineer.
1883. Pollock, A., Kirkland, Bonhill, Dumbartonshire, Dyeworks Manager.
1890. Pomeroy, Dr. Chas. T., 55, Broad Street, Newark, N.J., U.S.A., Ink Manufacturer.
1896. Pond, Prof. G. G., State College, Centre Co., Pa., U.S.A., Professor of Chemistry.
O.M. Pond, J. A., 99, Queen Street, Auckland, New Zealand, Analytical Chemist.
1900. Pont, Francis G. du, Montchanin, Del., U.S.A., Manufacturer.
1895. Pont, Pierre S. du, Wilmington, Del., U.S.A., Explosives Manufacturer.
1896. Poole, Herman, 157, West 106th Street, New York City, U.S.A., Manufacturing Chemist.
O.M. Pooley, T. A., Beverley, Hersham Road, Walton-on-Thames, Analytical Chemist.
1892. Pope, Frank, c/o The Dunwoody Bros. Soap Co., Denver, Col., U.S.A., Chemist.
O.M. Pope, S., 35, Victoria Road, Runcorn, Chemical Works Manager.
1899. Pope, Thos. H., The University, Birmingham, Chemist.
1900. Pope, Prof. W. J., F.R.S., Municipal School of Technology; and (Journals), 16, Hope Street, Higher Broughton, Manchester, Professor of Chemistry.
1900. Popplewell, Jos. M., c/o Brotherton and Co., Holmes Street, Dewsbury Road, Leeds, Chemist.
1899. Porter, A. Felix, Haskell, N.J., U.S.A., Explosives Chemist.
1896. Porter, Herbert, 80, Lancaster Avenue, Fennel Street, Manchester, Alkali Inspector.
1902. Porter, J. Edw., P.O. Box 785, and 205, W. Genesee Street, Syracuse, N.Y., U.S.A., Chemist.
1901. Porter, Jno. L., New Orleans Sewerage Board, 602, Carondelet Street, New Orleans, La., U.S.A., Chemist.
1899. Potter, Chas. A., 198, Waterman Street, Providence, R.I., U.S.A., Chemist.
1884. Potter, Chas. E., Love Lane Sugar Refinery, Liverpool, Sugar Works Chemist.
1888. Potter, Chas. J., Heaton Hall, Newcastle-on-Tyne, Cement Manufacturer.
O.M. Potter, E. P., Salwick Hall, near Preston, Alkali Manufacturer.
1899. Potter, Rowland S., 97, Belgrave Road, Ilford, Essex, Chemist.
1902. Potts, Cuthbert, Hawkesbury Agricultural College, Richmond, N.S.W., Lecturer in Chemistry.
1900. Potts, Geo., E., Dover, N.J., U.S.A., Explosives Manufacturer.
1902. Potts, Henry Wm., Hawkesbury Agricultural College, Richmond, N.S.W., Chemist and Principal.
1892. Potts, Joseph T., Price's Patent Candle Co., Bromboro' Pool, near Birkenhead, Chemist.
1900. Pough, Frank H., c/o T. and S. C. White Co., 28, Burling Slip, New York City, U.S.A., Manager.
1889. Powell, A. Ernest, Craigowan, Clarendon Road Whalley Range, Manchester, Oil Merchant.
1900. Powell, Harry J., 506, Lordship Lane, S.E., Glass Manufacturer.
1884. Powell, L. S., St. John's Cottage, Hildenborough, Tonbridge, Electrician.
1897. Power, Dr. Fred. B., Wellcome Research Laboratories, 6, King Street, Snow Hill, London, E.C., Director.
1902. Powney, Wm. E. F., 9, Lancaster Road, Stroud Green, N., Analytical Chemist.
1900. Pratt, N. P., Laboratory, Atlanta, Ga., U.S.A., Manufacturing Chemist.
1889. Pratt, Walter E., 17, East Road, Lancaster, Analytical Chemist.
1897. Prentice, Dr. Bertram, Royal Technical Institute Salford, Lecturer on Chemistry.
1902. Prentice, Dr. David, 30, Whitefield Road, Stockton Heath, Warrington, Chemist.
1903. Prentice, Jas., Cossipore Sugar Works, Calcutta, India, Chemist.
1888. Prescott, Dr. Albert B., Ann Arbor, Mich., U.S.A.
1900. Prescott, Saml. C., Mass. Inst. of Technology, Boston, Mass., U.S.A., Instructor in Bacteriology.
1891. Preston, Alf., 29, Southfields, Manchester Road, Bury, Lancs., Chemist.
1883. Preston, R., Grasmere, Whitefield, near Manchester, Manufacturing Chemist.
O.M. Price, A. F., 524, Sacramento Street, San Francisco, Cal., U.S.A., Analytical Chemist.
1904. Prichard, Norman B., Capelton, Quebec, Canada, Chemical Engineer.
1902. Pringsheim, Dr. H. H., Boylston Hall, Harvard University, Cambridge, Mass., U.S.A., Chemist.
1899. Prinsen-Geerligs, H. C., Tegal, Java, Netherlands Indies, Director of Sugar Cane Experimental Station.
1893. Pritchard, Edgar J., North Hill, Swansea, Works Manager.
1903. Pritchard, Philip M., Chief Engineer's Office, United Alkali Co., Widnes, Engineer.
1896. Prochazka, Dr. Geo. A., 138, West 13th Street, New York City, U.S.A., Colour Manufacturer.
1897. Prochazka, John, 15, East 12th Street, New York City, U.S.A., Coal-Tar Colour Chemist.
O.M. Procter, Prof. H. R., Yorkshire College, Leeds; and (Journals) Rowangarth, Ben Rhydding, near Leeds, Yorks, Lecturer on Tanning.
1884. Procter, J. W., Skeldergate Bridge, York, Manure Manufacturer.
1890. Proctor, Miss Anne J., Free Library, Widnes, Librarian.
O.M. Proctor, C., 99, Underhill Road, East Dulwich, S.E., Analytical Chemist.
O.M. Proctor, W. W., 33, The Side, Newcastle-on-Tyne Assayer and Analytical Chemist.
1901. Propach, C., 189, East Kinzie Street, Chicago, Ill., U.S.A., Colour Merchant.
1894. Proude, Jas., 30, Cromwell Terrace, Halifax, Yorks, Soap Works Chemist and Manager.
1899. Pullar, Edmund, Keirfield, Bridge of Allan, N.B., Manufacturer.
1894. Pullar, Herbert S., Pullar's Dyeworks, Perth, N.B., Dyer.
O.M. Pullar, Sir Robert; Journals to Jas. Craigie, Sandeman Public Library, Perth, N.B., Dyer.
O.M. Pullar, R. D., Pullar's Dyeworks, Perth, N.B., Dyer.
1903. Pullin, Sydney R., 10, Newton Grove, Chapeltown Road, Leeds, Chemist.
1902. Puntan, H. H. C., 10, London Chambers, Durban, Natal, Public Analyst.
1894. Purdie, Dr. Thos., F.R.S., 14, South Street, St. Andrews, N.B., Professor of Chemistry.

Q

1903. Queeny, Jno. F., Monsanto Chemical Works, 1806—1818, South 2nd Street, St. Louis, Mo., U.S.A., Chemical Manufacturer.

1903. Queneau, Augustin L., c/o New Jersey Zinc Co., South Bethlehem, Pa., U.S.A., Mining Engineer.

1887. Quibell, Oliver, Shalem Lodge, Newark-on-Trent, Manure Manufacturer.

1902. Quinan, Kenneth B., c/o De Beers Explosives Works, Somerset West, Cape Colony, South Africa, Chemist.

1897. Quinan, Wm. R., (Journals) General Manager, De Beers Explosives Works, Cape Town, South Africa; and (subscriptions) c/o De Beers Consolidated Mines, 15, St. Swithin's Lane, E.C., Superintendent (Powder Works).

1897. Quirk, Jno. S., Lead Smelting Works, St. Helens, Lancs., Manager.

R

1898. Radcliffe, Lionel G., 6, Alma Terrace, Old Trafford, Manchester, Chemist.

1904. Rademacher, Dr. Ferdinand, Prag Carolinenthal, Austria, Chemical Manufacturer.

1884. Rademacher, H. A., Arlington Mills, Lawrence, Mass., U.S.A., Chemical Expert.

1900. Radley, Ernest G., 49, Ernest Street, West Norwood, S.E.

1897. Rae, Roderic H., Claremont, Turner's Hill, Cheshunt, Herts, Engineer (Edison-Swan Electric Works).

1895. Raegener, Louis C., 141, Broadway, New York City, U.S.A., Lawyer.

1901. Ralston, Wm., Government Chem. Laboratory, Lagos, West Africa, Government Chemist.

1902. Ramsay, A. Alexander, Laboratory, Department of Agriculture, 136, George Street, Sydney, N.S.W., Assistant Chemist.

O.M. Ramsay, Sir William, K.C.B., D.Sc., LL.D., F.R.S., University College, Gower Street, London, W.C.; Journals to 19, Chester Terrace, N.W., Professor of Chemistry.

1888. Ramsay, W., c/o Laird Bros., Ironworks, Birkenhead, Chemist and Assayer.

1898. Ramsden, Andrew, Deccan Sugar Co., Ltd., Samalkot, Godaveri District, India, Manager.

1901. Ransom, Francis, The Chilterns, Hitchin, Herts, Manufacturing Pharmaceutical Chemist.

1898. Raschen, Dr. Julius, The Highlands, Runcorn, Cheshire, Consulting Chemist (United Alkali Co.).

1893. Ratcliff, Frank D., The Cottage, Green Hill, Bromsgrove, Worcestershire, Vinegar Brewer.

1904. Ratcliffe, C. F., Tar Works, Pontefract Road, Leeds, Tar Distiller.

1898. Ratcliffe, Walter, 21, Mawdsley Street, Bolton, Analytical Chemist.

1895. Rau, Dr. H. M., 130–132, Pearl Street, New York City, U.S.A., Chemist.

1901. Rauter, Dr. G., Cauerstrasse 2, Charlottenburg 1, bei Berlin, Germany, Engineering Chemist.

1901. Rawlins, Herbert J. L., The Cottage, Rainhill, Lancashire, Managing Director.

1903. Rawolle, Frederick C., c/o Marx and Rawolle, 100, William Street, New York City, U.S.A., Chemist.

O.M. Rawson, Chris., 44, St. Augustine Road, Bedford, Anal. and Cons. Chemist.

1883. Rawson, Dr. S. G., Technical Schools, Huddersfield, Analytical Chemist.

1904. Ray, Wm., 65, Wellington Road, Fallowfield, Manchester, Colourist.

1895. Read, E. J., St. Ives, The Avenue, Gravesend, Kent, Analyst.

1890. Reade, Thos., Sebright House, Tettenhall Wood, Wolverhampton, Manufacturing Chemist.

1903. Reading, Richard W., Knight's Deep, Ltd., P.O. Box 143, Germiston, Transvaal, S. Africa, Assayer and Mechanical Engineer.

O.M. Readman, Dr. J. B., Mynde Park, Hereford, Analytical and Consulting Chemist.

1902. Redfern, C. G., 4, South Street, Finsbury, London E.C., Patent Agent.

1890. Redgate, J. G., Traffic Street, Nottingham, Aërated Water Manufacturer.

1901. Redpath, Leon W., International Smokeless Powder and Dynamite Co., Parlin, N.Y., U.S.A., Chemist.

O.M. Redwood, Dr. Boverton, 4, Bishopsgate Street Within, London, E.C., Petroleum Expert.

1884. Redwood, I. I., Bantry House, Picardy Hill, Belvedere, Kent, Technical Chemist.

1887. Redwood, Robt., 4, Bishopsgate Street Within, London, E.C., Secretary.

1891. Redwood, T. Horne, Olveston, Sedlescombe Road, St. Leonard's-on-Sea, Analytical Chemist.

1886. Rée, Dr. A., 15, Mauldeth Road, Withington, Manchester, Aniline Dye Manufacturer.

1884. Reed, Albert E., The Grange, Leigham Court Road, Streatham, S.W., Paper Works Chemist.

1902. Reed, Herbert C., c/o Stamford Manufacturing Co., Stamford, Conn., U.S.A., Chemist.

1895. Reed, Dr. J. Hastings, Hambledon Mill, *viâ* Cairns, North Queensland, Sugar Manufacturer.

1893. Reekie, J. A., Blackford House, Whitefield, near Manchester, Calico Printer's Colour Mixer.

1883. Reeks, T. H., 106, Queen Victoria Street, London, E.C., Analytical and Consulting Chemist.

1901. Rees, Harald B., c/o Harris-Rees Tanning Co., Sylva, N.C., U.S.A., Tanner and Currier.

1897. Rees, W. H., Big Pine, Inyo Co., Cal., U.S.A., Chemist.

1900. Reese, Dr. Chas. L., c/o Repauno Chemical Co., Chester, Pa., U.S.A., Chemist.

1897. Reid, Andrew, 133, Minard Road, Crossmyloof, Glasgow, Chemist.

1896. Reid, Robt., Oil Mills, Horbury Bridge, near Wakefield, Chemical Student.

1895. Reid, T. Anderson, c/o Johnsen, Jörgensen, and Wettre, 38, Victoria Buildings, Manchester, Works Manager.

O.M. Reid, Walter F., Fieldside, Addlestone, Surrey, Technical Chemist.

1893. Reid, Wm., jun., Bombay Dyeworks, Dadur, Bombay, India, Dyer.

1898. Reitmeyer, Robt. E. D., 1 & 2, Rangoon Street London, E.C., Chemical Merchant.

1901. Remington, J. Percy, jun., U.S.A., Chemist.

1900. Remington, J. Stewart, Aynsome, Grange-over-San R.S.O., Lancs., Consulting Chemist.

1903. Remsen, President Ira, Johns Hopkins University, Baltimore, Md., U.S.A., President.

1884. Renaut, F. W., 17, Emanuel Avenue, Friar's Park, Acton, W., Secretary.

O.M. Rennie, Dr. E. H., University of Adelaide, South Australia, Professor of Chemistry.

O.M. Reunoldson, W. L., c/o United Alkali Co., Ltd., Hebburn-on-Tyne, Manager.

1901. Renwick, Frank F., Glengall, Woodford Green, Essex, Chemist (Photographic Works).

1894. Rettie, Theodore, 16, Great King Street, Edinburgh. Metallurgical Chemist.

1895. Reubens, Chas. M., c/o Brady Brass Co., 202, Tenth Street, Jersey City, N.J., U.S.A., Chemist.

1902. Reuterdahl, Arvid, 194, Calla Street, Providence, R.I., U.S.A., Consulting Electrical Chemist.

O.M. Reynolds, Dr. J. Emerson, F.R.S., 29, Campden Hill Court, Kensington, W., Professor of Chemistry.

O.M. Rhodes, E., c/o Thos. Vickers & Sons, Widnes, Technical Chemist.

1892. Rhodes, Jos., Church Bridge House, Accrington Print Works Chemist.

1902. Rhodin, B.E.F., Sault Ste. Marie, Ont., Canada, Chemical Engineer.

1895. Ricarde-Seaver, Major F. J., 16, Grafton Street, Bond Street, W., Metallurgist.

1901. Richard, Geo. A., Mount Morgan Mine, Queensland, Australia, Metallurgical Engineer.

1889. Richards, Edgar, 341, West 88th Street, New York City, U.S.A., Analytical Chemist.

1888. Richardson, Clifford, New York Testing Laboratory, Long Island City, N.Y., U.S.A., Chemical Engineer.

1888. Richardson, D. B., Aucheneck, Killearn Station, N.B., Chemical Merchant.

1903. Richardson, F. J., Chemical Works, Ringsend Docks, Dublin, Ireland, Chemical Manure Manufacturer.

1884. Richardson, F. W., Oak Lea, Menston, Yorkshire, Analytical Chemist.

1892. Richardson, G. E., Branch House, Batley, Yorks Manufacturing Chemist.

1900. Richardson, Jno. H., c/o H. D. Pochin and Co., Ltd., Salford, Manchester, Manager.

1889. Richardson, S. M., 415, Main Street, Bonhill, N.B. Analytical Chemist.

1891. Richardson, Walter W., 1, Montpellier Terrace, Cliff Road, Leeds, Manufacturing Chemist.

1903. Richardson, Wm., 2, Oakfield Terrace, Headingley, Leeds, Drysalter.

1894. Richardson, Wm. H., Newsky Thread Mills, Malaja Bolotnaja, St. Petersburg, Russia, Textile Chemist.

1886. Richmond, H. D., Fair Holm, Grimwood Road, Twickenham, Chief Chemist (Aylesbury Dairy Co.).

1898. Richmond, Jno. R., Stalheim, Eccleston Park, Prescot, Lancs., Alkali Works Manager.

1901. Richmond, Sylvester O., c/o A. H. Allen, 67, Surrey Street, Sheffield, Analytical Chemist.

1884. Richmond, W. H., Stalheim, Eccleston Park, Prescot, Alkali Manufacturer.

1886. Riddell, R., 87, Horninglow Street, Burton-on-Trent, Brewer.

1894. Ridding, Howard C., School of Mines, Redruth, Cornwall, Principal.

1884. Rideal, Dr. Samuel, Chemical Laboratory, 28, Victoria Street, Westminster, S.W., Analytical and Consulting Chemist.

O.M. Ridsdale, C. H., Ferndale, Linthorpe, Middlesbrough, Yorks, Analytical Chemist.

1899. Riederer, Emil J., Forcite Powder Co., Landing, P.O., N.J., U.S.A., Chemist.

1902. Riederer, Dr. Herman S., Newton, Sussex Co., N.J., U.S.A., Chemist.

1892. Riker, Jno. J., 45, Cedar Street, New York City, U.S.A., Merchant.

O.M. Riley, E., 2, City Road, Finsbury Square, London, E.C., Metallurgical Chemist.

1902. Riley, Fred., 43, Grampian Way, Savin Hill, Boston, Mass., U.S.A., Traveller.

O.M. Riley, J. E., Arden Hall, near Accrington, Chemical Manufacturer.

1884. Riley, Jno., Mayfield, Thornliebank, near Glasgow, Print Works Manager.

1893. Riley Wm., Castleton, Manchester, Chemical Manufacturer.

1904. Riley, W. A., Brunswick Lodge, Newmarket Road, Norwich, Brewer.

1899. Rink, Arnold, 9, Butler Street, Milton Street, London, E.C., Tannin Extract Manufacturer.

1889. Rintoul, Wm., Royal Gunpowder Factory, Waltham Abbey, Essex, Explosives Chemist.

1901. Ripley, Philip F., c/o American Woollen Co., Maynard, Mass., U.S.A., Chemist.

1900. Rising, Willard B., Berkeley, Cal., U.S.A., Professor of Chemistry.

1885. Ritson, T. N., 1, West Cliff Villas, West Cliff Road, Ramsgate, Gas Engineer.

1899. Rivington, W. John, 24, Mark Lane, London, E.C., Newspaper Proprietor.

O.M. Rix, W. P., Ashfield Cottage, Liverpool Road, Newcastle, Staffordshire, Potter.

1890. Roberts, C. F., Linfitts, Delph, viâ Oldham, Chemical Merchant.

O.M. Roberts, F. G. Adair, Oak Hill Lodge, Frognal, N.W., Chemical Manufacturer.

1901. Roberts, H. E. U. (Journals), 11, Albion Terrace, Faversham, Kent; and 9, St. James' Street, Bath, (Cotton Powder Co., Ltd.), Chemist.

1885. Roberts, R. Wightwick, 22, Calle Arturo Prat, Valparaiso, Chili, Analytical and Consulting Chemist.

1900. Roberts, Wm. Brittain, Wilderspool House, Warrington, Brewer and Analyst.

1902. Roberts, Wm. H., 1, Newborough Avenue, Sefton Park, Liverpool, S., Analytical Chemist.

1902. Robertshaw, Chas. D., c/o Chas. Price and Co., Oilworks, Belvedere, Kent, Analytical Chemist.

1894. Robertson, Alex., Argyle Chemical Works, Oban, N.B., Manufacturing Chemist.

1891. Robertson, Alex. A., 12, Bennison Drive, Grassendale, Liverpool, Technical Chemist.

1897. Robertson, Andrew J., 17, South 12th Street, Richmond, Va., U.S.A., Analytical Chemist.

1903. Robertson, Fred., 128, Wellington Street, Glasgow, Analytical Chemist.

1900. Robertson, Jas., 103, Whifflet Street, Coatbridge, N.B., Analytical Chemist.

1891. Robertson, Dr. Robt., (communications) 9, Sewardstone Road; (Journals) Royal Gunpowder Factory, Waltham Abbey, Essex, Analytical Chemist.

1901. Robertson, Robert, California Powder Works, Santa Cruz, Cal., U.S.A., Superintendent.

1903. Robertson, W. Crum, 15, Commerce Street, Glasgow, Oil Merchant and Importer.

1895. Robins, Walter, Wanstead Cottage, New Wanstead, Essex, Chemist.

1897. Robinson, Clarence J., Westerleigh, West New Brighton, N.Y., U.S.A., Chemist.

1900. Robinson, Edw. B., Victoria Oil Works, Nitshill, near Glasgow, Oil Distiller.

1902. Robinson, Hy. Fishwick, Culcheth Chemical Works, Newton Heath, Manchester, Manufacturing Chemist.

O.M. Robinson, H. H., 75, Finborough Road, West Brompton, S.W., Analytical Chemist.

O.M. Robinson, Jno., 8, Kaludah Terrace, Albert Road, Widnes, Chemical Engineer.

O.M. Robinson, Jos., Farnworth, Widnes, Chemical Manufacturer.

1387. Robinson, Thomas, (Journals) 401, West Street, Glasgow; and (communications), The Villa, Nitshill, N.B., Chemical Works Manager.

1902. Robitschek, Carl, 200, Worth Street, New York City, U.S.A., Scientific Brewer.

1894. Robson, Jas., 204, George Street, Glasgow, Chemist.

1903. Robson, Tom, Caixa 149, Pernambuco, Brazil, Engineer.

1894. Rodda, Edw. D., 6, Gold Street, Roath, Cardiff, Engineer.

1884. Rodger, Edw., 1, Clairmont Gardens, Glasgow, W.

1904. Roeber, Dr. E. F., 114, Liberty Street, New York City, U.S.A., Editor of "Electrochemical Industry."

1903. Roelofsen, Dr. J. A., c/o Coal Distillation Co., Middlesborough, Yorks., Works Manager.

1900. Rogers, Geo. J., Wallaroo Smelting Works, South Australia, Chemist.

1890. Rogers, Harry, 5, Stoke Newington Common, London, N.

1899. Rogers, John, Ardeer Factory, Stevenston, Ayrshire, N.B., Chemist.

1901. Rogerson, John W., 5, Ashley Gardens, London, S.W.., Maltster.

1898. Roller, H. C., 139, Henry Street, Brooklyn, N.Y., U.S.A., Superintendent.

1899. Rollin, Chas., Bylton, East Jarrow-on-Tyne, Chemical Manufacturer.

O.M. Rollin, J. C., 1, St. Nicholas Buildings, Newcastle-on-Tyne, Chemical Manufacturer.

1898. Roode, Rudolf de, International Paper Co., Glens Falls, N.Y., U.S.A., Chemist and Superintendent.

O.M. Roscoe, Sir Henry, F.R.S., 10, Bramham Gardens, South Kensington, S.W., Consulting Chemist.

1901. Roscow, Jas., 471, Park Avenue, Paterson, N.J., U.S.A., Colourist and Chemist.

1893. Roscow, Jno. F., c/o United States Finishing Co., Norwich, Conn., U.S.A., Print Works Chemist.

1899. Roscow, Wm., 24, Prince Street, Pawtucket, R.I., U.S.A., Analytical Chemist.

1904 Rose, Jno., 121, Lovely Lane, Warrington, Technical Chemist.

1901 Rose, Jno. Leonard, Porton Brook Chemical Works, Manchester, S.E., Chemist.

1902. Rosebrugh, Prof. T. R., 666, Spadina Avenue, Toronto, Canada, Professor of Electrical Engineering.

1897. Rosengarten, Dr. Geo. D., 1700, Fitzwater Street, Station D, Philadelphia, Pa., U.S.A., Manufacturing Chemist.

1896. Rosenheim, Dr. Otto, 68, Belsize Park Gardens, Hampstead, N.W., Analytical and Research Chemist.

1887. Ross, Alex. J. J., Tayavalla, Falkirk, N.B., Chemical Manufacturer.

1893. Ross, Arthur, 1, Glengall Road, Old Kent Road, London, S.E., Analytical Chemist.

1901. Ross, Herbert W., 1070, 16th Street, Oakland, Cal., U.S.A., Chemist.

1887. Ross, Jas. G., (Journals) 5–9. Sunbury Place, Belford Road; and (subscriptions) 47, Comely Bank Place, Edinburgh, Analytical Chemist.

1900. Ross, Raymond, Public Analyst's Office, Burnley, Lancashire, Analytical Chemist.

1888. Rothwell, C. F. Seymour, Film and Paper Factory, Mobberley, Cheshire, Chemist.

O.M. Rottenburg, Paul, Messrs, Leisler, Bock & Co., 105, West George Street, Glasgow, Chemical Merchant.

1896. Round, Wm., Albion Street, Birmingham, Analytical Chemist.

1899. Rouse, H. W., 62, Russell Road, Custom House, E., Foreman (Sulphuric Acid Works).

1903. Rouse, Wm., 63, John Street, Alexandria, Dumbartonshire, Chemist.

O.M. Rowland, W. L., 4800, Chester Avenue, Philadelphia, Pa., U.S.A., Chemist.

1904. Rowley, Ernest W., Chemical Laboratory, Locomotive Department, North Eastern Railway, Gateshead-on-Tyne, Analytical Chemist.

1901. Rowley, Walter Eugene, c/o Schoellkopf, Hartford, and Hanna Co., 100, William Street, New York City, U.S.A.

1904. Rowling, S. R., 1, Beechwood, Kendal, Westmoreland, Analyst.

1899. Roy, Benjamin, Ailsa Lodge, 17, Whitelow Road, Chorlton-cum-Hardy, Manchester, Chemist.

1896. Royal-Dawson, H., (Journals) 22, Lyndhurst Gardens, Creffield Road, Ealing, W., Brewer's Chemist.

1898. Royle, Chas. L., c/o East India Distilleries and Sugar Factories, Ltd., Nellikuppam, S. Arcot, Madras, India, Sugar Chemist.

1898. Royle, Thos. H., Bareilly, United Provinces, India, Chemist.

O.M. Royle, T., 329, Upton Lane, Forest Gate, Essex, Chemical Engineer.

O.M. Royse, S. W., St. Andrew's Chambers, 20, Albert Square, Manchester, Chemical Engineer.

1902. Rücker, Dr. Hermann von, 13, Post Strasse, Hof, Bavaria, Germany, Chemist.

1896. Ruddock, Fred. G., Egypt Street Chambers, Warrington, Analytical Chemist.

1895. Rudge, Alfred, Sutton Alkali Works, St. Helens, Analytical Chemist.

1884. Ruffle, Jno., Musley, Ware, Herts., Consulting Chemist and Electrician.

1898. Ruhl, Louis, c/o Roessler and Hasslacher Chemical Co., P.O. Box 1999, 100, William Street, New York City, U.S.A., Chemical Merchant.

1902. Ruhoff, O. E., c/o Mineral Point Zinc Co., Mineral Point, Wis., U.S.A., Chemist.

O.M. Rumble, C., Belmont Works, Battersea, London, S.W., Candle Works Chemist.

1899. Rumbold, Wm. R., Mill House, Holmwood, Surrey, Electro-Metallurgist.

1895. Rump, Ernst, The Leeds Phosphate Works, Hunslet, Leeds, Manager.

1903. Runting, D. A., 60, Market Street, Melbourne, Vic., Australia, Assayer.

1903. Runyan, Elmer G., Hutchins Building, Washington, D.C., U.S.A., Chemist and Gas Inspector.

1899. Rushby, Wm., 22, Surrey Street, Batley, Yorks, Analyst.

1901. Rushton, Benjamin, Waterloo, Whalley Road Accrington, Analytical Chemist.

1887. Russell, D., Cadham, Markinch, Fife, N.B., Paper Maker.

1884. Russell, Jno., Anchor Brewery, Britten Street, Chelsea, London, S.W., Brewer.

1903. Russell, T. A., Walmer Road, and (Journals) Queen's Hotel, Toronto, Ont., Canada, Manufacturer (Bicycles and Automobiles).

O.M. Russell, Dr. W. J., F.R.S., 34, Upper Hamilton Terrace, London, N.W., Professor of Chemistry.

1901. Rust, Robt. R., c/o Mineral Point Zinc Co., North Chicago, Ill., U.S.A., Chemist.

1884. Ryland, Howard P., Agricultural Chemist.

S

1895. Saalfeld, Adolphe, 2, South King Street, Manchester, Chemical Merchant.

1895. Saarbach, Dr. L., 114, Pearl Street, New York City, U.S.A., Consulting Chemist.

1883. Sadler, A. E., Sand Hall, Ulverston, Lancashire, Manufacturing Chemist.

O.M. Sadler, Dr. S. A., M.P., Middlesbrough-on-Tees, Colour Manufacturer.

1884. Sadtler, Dr. S. P., 145, North 10th Street, Philadelphia, Pa., U.S.A., Consulting Chemist.

1896. Sadtler, Dr. S. S., N.E. corner of 10th and Chestnut Streets, Germantown, Pa., U.S.A., Chemist (U.S. Customs).

1897. Sage, C. Edward, 2, Charterhouse Street, London, E.C., Consulting Chemist.

1902. Sahm, Louis N., 22, Cliff Street, New York City, U.S.A., Chemist.

1897. St. John, Harry, Queen Street Brewery, Sunderland, Brewer and Analyst.

1884. Salamon, A. G., 1, Fenchurch Avenue, London, E.C., Consulting Chemist.

1885. Salamon, Jno., Rainham, S.O., Essex, Manufacturing Chemist.

1884. Salis-Mayenfeld, Dr. E. von., P.O. Box 165, Albany, N.Y., U.S.A., Technical Chemist.

1902. Salter, M. J., 65, Park Road, Crouch End, London, N., Analytical Chemist.

O.M. Samuel, W. Cobden, 66, Croxted Road, West Dulwich, S.E., Analytical Chemist.

O.M. Samuelson, Rt. Hon. Sir Bernhard, Bart., F.R.S., 56, Prince's Gate, London, S.W., Ironmaster.

1896. Samuelson, Francis A. E., Sir B. Samuelson and Co., Ltd., Middlesbrough, Ironmaster.

1895. Samuelson, Godfrey B., c/o Messrs. W. T. Glover and Co., Salford, Electrical Manufacturer.

1901. Sanders, C. Newell, Roanoke, Va., U.S.A., Railway Chemist.

1902. Sanders, Warren W., c/o Jarecki Chemical Co., Station P., Cincinnati, Ohio, U.S.A., Chemist.

1895. Sanderson, John, c/o B. S. Cohen, Ltd., 15, Clerkenwell Close, London, E.C., Chemist.

1898. Sanderson, T. C., Richmond Avenue, Port Richmond, Staten Island, N.Y., U.S.A., Chemical Engineer.

1884. Sandon, R., 42, Lewisham Road, Dartmouth Park, N.W., Examiner at Patent Office.

O.M. Sanford, P. Gerald, 25, Canterbury Road, West Croydon, Public Analyst and Consulting Chemist.

1890. Saniter, E. H., 51, Grange Road West, Middlesbrough, Analytical Chemist.

1901. Sargent, Dr. Geo. W., Carpenter Steel Co., Reading, Pa., U.S.A., Chemist and Metallurgist.

1903. Saunders, Lewis E., Niagara Research Laboratories, Niagara Falls, N.Y., U.S.A., Electro-Chemical Engineer.

1896. Saunders, Walter M., 20, Dewey Street, Olneyville, R.I., U.S.A., Analytical Chemist.

1895. Savage, Arthur E., Charles Street, Elsternwick, Victoria, Australia, Metallurgist.

1903. Savage, George M., c/o C. G. Euler, Platt and Gold Street, New York City, U.S.A., Chemist.

1895. Sawers, Wm. D., 1, Athole Gardens Place, Glasgow, Chemist.

1903. Sawin, Luther R., Mount Prospect Laboratory, Flatbush Avenue and Eastern Parkway, Brooklyn, N.Y., U.S.A., Bacteriologist.

1901. Sawyer, Harris E., 27, Bellevue Street, Dorchester, Mass., U.S.A., Chemist and Bacteriologist.

1903. Saxby, Fred. W., c/o P. Haulgrave and Co., 25, Hill Street, Liverpool, Tar Distiller.

1898. Saxe, Sigmond, 107, Manhattan Avenue, New York City, U.S.A., Manufacturing Chemist.

1895. Sayer, Harry, 82, Victoria Street, London, S.W., Metallurgical Chemist.

1894. Sayers, Jos. J., Mayville, Stevenston, Ayrshire, Explosives Chemist.

1895. Scales, F. Shillington, "Jersey," St. Barnabas Road, Cambridge.

1899. Schaak, Dr. Milton F., 108, Penn Street, Brooklyn, N.Y., U.S.A., Chemist.

O.M. Schack-Sommer, Dr. G., 48, Marlborough Mansions, Victoria Street, S.W., Sugar Refiner.

1899. Schaefer, Dr. L., Maywood, N.J., U.S.A., Manufacturing Chemist.

1898. Schaffer, Herbert A., 321, Spring Garden Street, Easton, Pa., U.S.A., Chemist (Portland Cement).

1903. Schanche, Herman G., 3401, Gray's Ferry Road, Philadelphia, Pa., U.S.A., Chemist.

1903. Scheidel, Dr. Aug., Union Club, Sydney, N.S.W., Australia, Managing Director.

1886. Schellhaas, Henry Alf., Thornhill, Beach Road, Hartford, Northwich, Mechanical Engineer.

1894. Schidrowitz, Dr. P., 57, Chancery Lane, W.C., Research Chemist.

1895. Schieffelin, Dr. W. Jay, 841, Southern Boulevard, New York City, U.S.A., Manufacturing Chemist.

1901. Schieren, G. Arthur, Dixie Tannery, Bristol, Tenn., U.S.A., Mechanical Engineer and Tanner.

1902. Schjölberg, T. E., Taltal, Chile, S. America, Chemist.

1902. Schlegel, Jno. Wm., 602, East 5th Street, New York City, U.S.A., Chemist.

1893. Schleicher, Francis J., 38, West Tenth Street, Long Island City, N.Y., U.S.A., Technical Chemist.

1902. Schlesinger, Basil E., 92, Mount Vernon Street, Boston, Mass., U.S.A., Chemist.

1901. Schlichting, Emil, 61, Hicks Street, Brooklyn, N.Y., U.S.A., Chemist.

1902. Schloss, Joseph A., Apartado, 65, Monterey, Mexico, Analytical Chemist.

1901. Schneider, Edw. J., c/o Union Carbide Co., Sault Ste. Marie, Mich., U.S.A., Chemist.

1899. Schniewind, Dr. F., c/o United Coke and Gas Co., 17, Battery Place, New York City, U.S.A., Chemist.

1897. Schoder, Dr. Robt., c/o Deutsche Gasglühlicht Act.-Ges., 13, Alte Jakobstrasse, Berlin, Chemist.

1902. Schofield, Jas. A., The University, Sydney, N.S.W., Australia, Lecturer in Chemistry.

O.M. Scholefield, H. E., Edge Hill Chemical Works, Liverpool, Chemical Manufacturer.

1898. Scholes, Geo. R., Liebig's Extract of Meat Co., Ltd., 21, Longue Rue des Claires, Antwerp, Belgium, Analytical Chemist.

1902. Schoonmaker, H., c/o R. A. Perez, 120, North Main Street, Los Angeles, Cal., U.S.A., Metallurgical Chemist.

1895. Schroeder, E. August, c/o Church and Co., 36, Ash Street, Brooklyn, N.Y., U.S.A., Chemist.

1901. Schultze, Wm., 194, Academy Street, Jersey City Heights, N.J., U.S.A., Chemist.

1902. Schulze, Emil A., 15, Stanthorpe Road, Streatham, S.W., Incandescent Mantle Manufacturer.

1893. Schüpphaus, Dr. R. C., 171, Broadway, New York City, U.S.A., Consulting Chemist.

1893. Schwab, Dr. L. C., Sedanstrasse 53, Bernburg, Anhalt, Technical Chemist.

1901. Schwartz, David, c/o Southern Cotton Oil Co., Gretna La., U.S.A., Chemist.

1902. Schwarz, Gustav A. (Grasselli Chemical Co.), 63, Wall Street, New York City, U.S.A., Manager.

1900. Schwarz, Dr. Henry P., c/o Western Sugar Refining Co., Potrero, San Francisco, Cal., U.S.A., Chemist.

1889. Schweich, Emil, 20, Hyde Park Square, London, W., Technical Chemist.

1903. Schweickert, Karl, c/o Egyptian Lacquer Manufacturing Co. and (Journals), 6, Oliver Street, Rahway, N.J., U.S.A., Chemist.

1894. Schweitzer, Dr. H., 40, Stone Street, New York City, U.S.A., Analytical Chemist.

1891. Scott, Andrew, Royal Gunpowder Factory, Waltham Abbey, Essex, Analytical Chemist.

1889. Scott, Ernest G., 2, Talbot Court, Gracechurch Street, London, E.C., Soap Works Chemist.

1898. Scott, Jas., Cawnpore Woollen Mills, Cawnpore, India, Chemist.

1894. Scott, Jno. Gillespie, Annislea, Northfield, Liberton, near Edinburgh, Analytical Chemist.

1901. Scott, Leonard C., c/o Kennicott Water Softener Co., 29, Great St. Helens, London, E.C., Chemist.

1894. Scott-Smith, G. E., 67, Surrey Street, Sheffield, Analytical Chemist.

1902. Scott, Walter, 83, Albert Road, Levenshulme, Manchester, Chemist.

1889. Scovell, M. A., Lexington, Kentucky, U.S.A., Agricultural Chemist.

1887. Scrutton, Willis J. C., 18, Billiter Street, London, E.C., Analytical Chemist.

1896. Scrymgeour, Wm., Whistlebrae, Lamington Heights, Kalgoorlie, West Australia, Chemist.

O.M. Scudder, F., Mersey and Irwell Joint Committee, 44, Mosley Street, Manchester, Analytical Chemist.

1895. Seabrooke, H. Cecil, Black Ash, Grays, Essex, Research Chemist.

1900. Searby, Fred. M., West Berkeley, Cal., U.S.A., Oilworks Superintendent.

1889. Searl, Albert, Montreux, Victoria Road, Sidcup, Kent, Technical Chemist.

1898. Searle, Alf. B., 280, Western Bank, Sheffield, Analytical Chemist.

1896. Sedding, G. H. P., c/o Florida Syndicate, Jacksonville, Florida, U.S.A., Chemist.

1901. Sederholm, Erik, 28, Jakopsgatan, Stockholm, Sweden, Chemist (Royal Navy Board).

1901. Seeler, Dr. F., c/o Merck and Co., Rahway, N.J., U.S.A., Manufacturing Chemist.

1893. Sefton-Jones, Herbert, c/o W. P. Thompson and Co., 322, High Holborn, W.C., Analytical Chemist.

1902. Segaert, Edw., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.

1899. Seher, A., c/o Maas and Waldstein, Riverside Avenue, Newark, N.J., U.S.A., Chemist.

1896. Seldner, Rudolph L., 1395, Dean Street, Brooklyn, N.Y., U.S.A., Instructor in Chemistry.

1904. Seligman, Richard, Messrs. J. and W. Seligman, Mills Buildings, New York City, U.S.A., Chemist.

1884. Semet, Louis, 217, Chaussée de Vleurgat, Brussels, Alkali Manufacturer.

1898. Sen (Gupta), Nagendra Nath, 18, Lower Chitpur Road, Calcutta, India, Physician and Chemist.

1895. Senger, Robt., 37, Warren Street, New York City, U.S.A., Manufacturing Chemist.

1899. Senior, Francis L., Lock 28, Sanford, Maine, U.S.A., Mill Chemist.

O.M. Sevin, C., 68, Central Hill, Upper Norwood, S.E., and (Journals) c/o Dollman & Pritchard, 9 and 10, King Street, Cheapside, E.C., Chemical Engineer and Oil Refiner.

1900. Seward, Geo. O., Holcomb Rock, Va., U.S.A., Chemist.
1896. Seyler, Clarence A., Technical Institute, Nelson Terrace, Swansea, Chemist and Assayer.
1889. Seymour-Jones, A., Pendower, Wrexham, Leather Manufacturer.
1903. Shacklady, T. G., Addiscombe Villas, Cliffe-at-Hoo, Rochester, Technical Chemist.
1892. Shanks, Arch., Bridgend Mills, Dalry, Ayrshire, N.B., Chemist.
1883. Sharp, James, Shirley Manor, Wyke, near Bradford, Yorks, Dyer.
1891. Sharpe, Granville H., 11 & 12, Great Tower Street, London, E.C., Analytical Chemist.
1884. Sharples, Stephen P., 26, Broad Street, Boston Mass., U.S.A., Analytical Chemist.
1896. Sharpley, Wm. P., c/o Jno. Fleming, P O. Box 1878, Johannesburg, S. Africa, Analytical Chemist.
1900. Sharwood, Wm. J., 2119, Durant Avenue, Berkeley, Cal., U.S.A., Metallurgical Chemist.
1900. Shattuck, A. F., The Solvay Process Co., Detroit, Mich., U.S.A., Chemist.
1885. Shaw, F. W., Temple House, Heapey, near Chorley, Lancashire, Analytical Chemist.
1883. Shaw, Geo., 35, Temple Row, Birmingham, Patent Agent.
1890. Shaw, H. Dixon, Bond Street, Dewsbury, Yorks, Analytical and Consulting Chemist.
1902. Shaw, Wm. R., Oak Lea, Carlton Road, Godley, near Hyde, Cheshire, Chemist (Tennants and Co.).
O.M. Shearer, A., 43 Derby Road, Burton-on-Trent, Technical Chemist.
1903. Sheldon, Dr. N. L., Cordite Factory, Arwankad, Nilgiri Hills, India, Works Manager.
1903. Shenk, F. D., 138, Monroe Avenue, Detroit, Mich., U.S.A., Chemist.
O.M. Shenstone, W. A., F.R.S., Tuffleigh, St. Vincent Rocks, Clifton, Bristol, Chemical Lecturer.
1892. Shenton, Jas. P., 37, Torbay Road, Chorlton-cum-Hardy, near Manchester, Analytical Chemist.
1902. Shepard, Chas. H., Chemical Laboratory, Union Iron Works, San Francisco, Cal., U.S.A., Chemist.
1889. Shepard, Dr. Chas. U. (communications) P.O. Box 42, Summerville, S.C., and (Journals) 56, Broad Street, Charlston, S.C., U.S.A.
1904. Shepherd, A. B., c/o British Oil and Cake Mills, Ltd., 151, Cleveland Street, Hull.
1900. Shepherd, E. Sanger, 5-7, Gray's Inn Passage, Holborn, W.C., Scientific Instrument Maker.
1893. Shepherd, H. H. B., Northcote, Mount Pleasant Lane, Upper Clapton, N.E., Chemist.
1898. Shepherd, Reginald des F., c/o Calico Printers' Association, 56, Mosley Street, Manchester, Printworks Chemist.
1895. Sherman, G. W., Akron, Ohio, U.S.A., General Manager.
1899. Shero, John E., c/o Pittsburg Reduction Co., Niagara Falls, N.Y., U.S.A., Chemist.
1893. Shields, Dr. John, Minas de Rio Tinto, Prov. de Huelva, Spain, Chemist.
1899. Shillitoe, Frank, 35, Pontefract Road, Castleford, Yorks, Chemist.
1896. Shimomura, K., c/o Osaka Seimi Works Co., Kawagishicho, Nishiku, Osaka, Japan, Chemist.
1886. Shimosé, Masachika, Shimosé Powder Works, Takinogawa, near Oji, Tokyo, Japan, Chemical Engineer.
1902. Shimotome, Henyi, Higher Technical School, Asakusa, Tokyo, Japan, Professor of Chemistry.
1888. Shishkoff, Sergius A., Mojga, Elabouga, Govt. of Viatka, Russia, Manufacturer Glass Works.
1899. Sholes, Chas. E., c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Chemical Salesman.
1900. Shonk, Albert, 6, York Road, West Hendon, Analytical Chemist.
1899. Shores, Dr. Jeff. H., Derby Road, Farnworth, Widnes, Chemist.
1897. Shorey, Dr. Edmund C., Office of Board of Health, Honolulu, H.I., Chemist.
1904. Short, Andrew, Choppington, Morpeth, Works Chemist.
1903. Shorter, A. E., 64, Garden Reach, Calcutta, India, Soap and Candle Manufacturer.
1902. Shoubridge, Sydney Y., M.I.C.E., Gasworks, Lower Sydenham, S.E., Gas Engineer.
1901. Shukoff, Dr. Alexis A., Borowaja, No. 86, St. Petersburg, Russia, Technical Chemist.
1899. Shuler, Darius P., Mine La Motte, Mo., U.S.A., Chemist.
1890. Shutt, Frank T., Central Experimental Farm, Ottawa, Canada, Agricultural Chemist.
1901. Siau, Raymond L., Springfield Brewery, Wolverhampton, Carbohydrate Research Chemist.
1902. Sibley, Samuel E., 3, Rutland Road, Ilford, Essex, Technical Chemist.
1902. Siebold, Alfred, Eglinton Dyewood Mills, Alloa, N.B., Technical Chemist.
1901. Silberrad, Dr. Oswald, Hill Top, Shooter's Hill, Kent, Research Chemist.
1903. Silva, Alfredo, Rua do Commercio, No. 4, Recife, Pernambuco, Brazil, Cotton Mill Manager.
1892. Silvester, Harry, 78, Holyhead Road, Handsworth, Birmingham, Analytical and Consulting Chemist.
1901. Sim, Wilfrid A., c/o Wm. Sim and Son, 40, Jane Street, Leith, N.B., Colour Manufacturer.
1903. Simmons, Wm. H., Oakleigh, Stoke Newington Common, N., Analytical Chemist.
1898. Simon, Dr. A., 55-56, Bishopsgate Street, E.C., Chemical Engineer.
1890. Simonds, Dr. F. M., 159, Front Street, New York City, U.S.A., Mining Engineer and Assayer.
1902. Simonson, Wm., 126, West 9th Street, Cincinnati, Ohio, U.S.A., Chemist.
1897. Simpson, E. S., Geological Survey Laboratory, Museum Street, Perth, West Australia, Assayer.
O.M. Simpson, W. S., 17, Lakeside Road, Palmers Green, N., Analytical Chemist.
1900. Sims, W. Edgar, Portinscale Lodge, Higher Crumpsall, Manchester, Technical Chemist.
1894. Sinclair, Dr. W., 60, Stirling Road, Trinity, Edinburgh, Chemist.
1890. Sindall, R. W., 201, Wellmeadow Road, Catford, S.E., Paper Mills Chemist.
1889. Singer, Ignatius, Horsforth, near Leeds, Manufacturing Chemist.
1899. Singmaster, J. Arthur, c/o New Jersey Zinc Co. of Penna., Palmerton, Pa., U.S.A., Chemist.
1901. Sinnatt, Frank S., Glenside, Church Lane, Moston, Manchester, Demonstrator of Chemistry.
O.M. Sisson, G., jun., c/o Washington Chemical Co., Ltd., Washington Station, R.S.O., Co. Durham, Works Manager.
1885. Skaife, Wilfred T., 630, Sherbrooke Street, Montreal, Canada, Sugar Chemist.
1894. Skelton, John R., c/o Norwich Crape Co., Ltd., St. Augustine's, Norwich, Technical Chemist.
1897. Skertchley, W. P., Laboratory, 11, Billiter Square, E.C., Analytical Chemist.
1904. Skerten, Wm. B., 25, Broad Street, New York City, U.S.A., Chemical Accountant.
1891. Skilton, C. F. E., Brewery House, Staines, Brewer.
1901. Skinner, Hervey J., c/o Little and Walker, 7, Exchange Place, Boston, Mass., U.S.A., Chemist.
1904. Skirrow, Dr. F. W., c/o The Manchester Oxide Co., Canal Street, Miles Platting, Manchester, Research Chemist.
1903. Skoglund, Jean V., 142, West 117th Street, New York City, U.S.A., Chemist.
1896. Skurray, Thos., United Breweries, Abingdon, Berks, Brewer.
1897. Skvortzoff, Basil N., Chemical Technologist.
O.M. Slade, H. E., India Rubber Works, Streatham Common, London, S.W., Rubber Works Manager.
1887. Slatter, Geo. W., Carlton Terrace, Nab Wood, Shipley, Yorkshire, Analytical Chemist.
1895. Slocum, Dr. Frank L., 401, South Linden Avenue, E.E. Pittsburg, Pa., U.S.A., Chemist.

1899. Slosson, Edwin E., University of Wyoming, Laramie, Wyoming, U.S.A., Professor of Chemistry.
1883. Smail, J. I., Warren Wood, Hayes Common, Beckenham, Kent. Chemical Manufacturer.
1901. Smale, Dr. F. J., c/o Wm. Davies Co., Toronto Canada, Chemist.
1898. Small, Fritz H., c/o Graton and Knight Manufacturing Co., Worcester, Mass., U.S.A., Chemist.
O.M. Smetham, A., 16, Brunswick Street, Liverpool, Analytical Chemist.
1884. Smiles, Jas., 173, Bruntsfield Place, and (Journals) Blandfield Chemical Works, Lower Broughton Road, Edinburgh, Manufacturing Chemist.
1904. Smith, Albert E., c/o Mount Hope Finishing Co., North Dighton, Mass., U.S.A., Superintendent.
1886. Smith, Alfred, Excelsior Chemical Works, Clayton. Manchester, Manufacturing Chemist.
1898. Smith, Alf. B., Whiteley House, Glossop, Derbyshire, Bleacher and Dyer's Manager.
1897 Smith, Allan, c/o Kellner-Partington Paper Pulp Co., Hallein, bei Salzburg, Austria, Paper Mills Chemist.
1898. Smith, Andrew B., P.O. Box 90, Queenstown, C.C., S. Africa, Chemist.
1896. Smith, Andrew T., c/o Castner-Kellner Alkali Co., Ltd., 43, Castle Street, Liverpool, General Manager.
1893. Smith, Edgar B., Prince Regent's Wharf, Silvertown, E., Chemist.
1895. Smith, Dr. E. Ellsworth, 26, East 29th Street, New York City, U.S.A., Consulting Physiological Chemist.
O.M. Smith, Edgar F., c/o E. M. Robson, Trelawny, Fairfax Road, Bedford Park, W., Analytical Chemist.
1892. Smith, Ernest A., The Assay Office, Leopold Street, Sheffield, Assayer.
1900. Smith, E. Sell, 219, East Market Street, Warren, Ohio, U.S.A., Manufacturing Chemist.
1898. Smith, E. Shrapnell, Cecil Chambers, East Strand, London, W.C., Chemical Engineer.
1903. Smith, Ewing, 19, Queen Street, Perth, N.B., Analytical Chemist.
1903. Smith, F. M., 100, William Street, New York City, U.S.A., President (Pacific Coast Borax Co.).
1891. Smith, Francis P., 20–21, Queenhithe, Upper Thames Street, London, E.C., Chemist.
1902. Smith, Frank Gurney, 7, Luxemburg Gardens, Brook Green, W., Chemical Student.
O.M. Smith, G., Rosehall Terrace, Falkirk, N.B., Explosive Works Manager.
1897. Smith, Sir Geo. J., Messrs. Bickford, Smith, & Co., Ltd., Tuckingmill, Cornwall, Fuse Manufacturer.
1890. Smith, Harry, 74, Holly Avenue, Jesmond, Newcastle-on-Tyne, Colour Works Manager.
1890. Smith, Harry E., L.S. & M.S. Railway, Collinwood, Ohio, U.S.A., Analytical Chemist.
1904. Smith, Henry, 83, Brownlow Road, Horwich, Bolton-le-Moors, Lancs., Analytical Chemist.
1900. Smith, H. Ewing, 22, City Road, London, E.C., Manufacturing Chemist.
1902. Smith, Hy. Geo., Technological Museum, Harris Street, Ultimo, Sydney, N.S.W., Australia, Assistant Curator and Chemist.
1901. Smith, H. Procter, "Gorphwysfa," Shotton, Flintshire, Metallurgical Chemist.
O.M. Smith, H. R., 1, Aubert Park, Highbury, London, N., Analytical Chemist.
1901. Smith, H. Sutcliffe, Edward Ripley and Son, Ltd., Bowling Dyeworks, Bradford, Managing Director.
1890. Smith, H. Wood, c/o John Batt and Co., Ltd., 39, Old Broad Street, London, E.C., Chemist.
1897. Smith, James, 30, Milner Road, Aigburth, Liverpool, Analytical Chemist.
1903. Smith, James, South Bank, Frodsham, Cheshire, Metallurgist.
1893. Smith, Jas. F., 15, Second Avenue, Halifax, Yorks, Analytical Chemist.
O.M. Smith, J., Ash Grove House, Radcliffe, Manchester.
1901. Smith, J. Cruickshank, 28, Westmoreland Road, Westbourne Park, London, W., Technical Chemist.
O.M. Smith, Dr. J. H., Wollishofen, Zürich, Switzerland, Chemical Manufacturer.
1884. Smith, J. Johnstone, Lockwood Brewery, Huddersfield, Brewing Chemist.
1902. Smith, Jno., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia.
1898. Smith, John. Hartley Street Dyeworks, Dewsbury, Yorks, Dyer.
O.M. Smith, Jno. W., 7, Brookfield Street, Roslindale, Boston, Mass., U.S.A., Analytical Chemist.
1896. Smith, Joseph Kent, 32, Hough Green, Chester, Metallurgical Chemist.
1888. Smith, J. Tertius, Richmond House, Plaistow, Essex, Technical Chemist.
1890. Smith, J. Wm., Solvay Process Co., Syracuse, N.Y., U.S.A., Alkali Works Manager.
1898. Smith, R. F. Wood, Laboratory, 89, Bartholomew Close, E.C., Consulting Chemist.
1890. Smith, Dr. R. Greig, Linnean Society's House, Elizabeth Bay, Sydney, N.S.W., Bacteriologist and Chemist.
1890. Smith, R. Watson, c/o New Transvaal Chemical Co., Ltd., Knights Dam (Half Weg), Johannesburg, S. Africa, Chemical Works Manager.
1900. Smith, T. Connell, Blandfield Chemical Works, Edinburgh, Manufacturing Chemist.
1897. Smith, Theophilus R., c/o Brotherton & Co., Haigh Park Chemical Works, Stourton, near Leeds, Chemist.
1896. Smith, Walter E., 158, Doyle Avenue, Providence, R.I., U.S.A., Instructor in Chemistry.
1903. Smith, Dr. Warren R., Lewis Institute, Chicago, Ill., U.S.A., Teacher.
O.M. Smith, Watson, 34, Upper Park Road, Haverstock Hill, N.W., Editor of Society's Journal.
O.M. Smith, Wilfred, 182, West Street, Glasgow, Chemical Manufacturer.
1896. Smith, Dr. W. Stanley, Bryntirion, Bersham, near Wrexham, North Wales, Brewer.
O.M. Smithells, Prof. A., F.R.S., Yorkshire College, Leeds, Professor of Chemistry.
1902. Smither, F. W., 310½, Union Street, Nashville, Tenn., U.S.A., Analytical Chemist.
O.M. Smithers, F. O., Dashwood House, 9, New Broad Street, London, E.C., Chemical Agent.
1902. Smoot, Albert M., 1263, Waverly Place, Elizabeth N.J., U.S.A., Analytical Chemist.
1902. Smyth, Dr. Morland, c/o Mander Bros., John Street, Wolverhampton, Chemist.
1902. Smythe, Jno. A., Durham College of Science, Newcastle-on-Tyne, Demonstrator in Chemistry.
1902. Smythe, Dr. J. S., (communications) Rantallard, Lance Lane, Wavertree. Liverpool, and (Journals) c/o W. Meadowcroft and Son, Ltd., Regent Street, Blackburn, Analytical Chemist.
1888. Snape, Dr. H. Lloyd, Balholm, Lathom Road, Southport, Director of Education for Lancashire.
1896. Snowdon, Jno., jun., Messrs. Snowdon, Sons, & Co., Millwall, E., Chemical and Oil Manufacturer.
1902. Snyder, Prof. Harry, 2090, Commonwealth Avenue, St. Anthony Park, Minn., U.S.A., Professor of Agricultural Chemistry.
1900. Sodeau, Wm. H., 114, Park Road, Newcastle-on-Tyne, Chemist.
1903. Sohlman, Ragnar, Bofors, Sweden, Manager (A. B. Bofors' Nobelkrut).
1894. Sohn, Chas. E., 2, Harpur Street, Bedford Row, London, W.C., Analyst.
1895. Solvay, Armand, 25, Rue Prince Albert, Brussels, Gérant de la Société Solvay et Cie.
1884. Solvay, Ernest, 43, Rue des Champs Elysées, Brussels, Alkali Manufacturer.
1903. Somermeier, Edw. E., 1590, Neil Avenue, Columbus, Ohio, U.S.A., Chemist.

1897. Somerset, H. St. John, jun., Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Assayer.

1884. Sommer, Adolf, corner 1st and Binney Streets, East Cambridge, Boston, Mass., U.S.A., Pharmaceutical Chemist.

1894. Sonstadt, Edw., Church Fields, Cheshunt, Herts, Chemical Technologist.

1896. Sorel, Ernest, 119, Rue Notre-Dame-des-Champs, Paris, VI., Engineer.

1896. Souther, H., 440, Capitol Avenue, Hartford, Conn., U.S.A., Chemical and Metallurgical Engineer.

1892. Southern, Thos., Jr., Wheathill Chemical Works, St. Simon Street, Salford, Manufacturing Chemist.

1883. Soward, A. W., 28, Therapia Road, Honor Oak, S.E., Principal Clerk (Legacy Duty Office).

1890. Sowerby, Thos. H., Canal Soap Works, Verney Road, Rotherhithe New Road, S.E., Soap Manufacturer.

O.M. Sowerby, W. M., c/o United Alkali Co., Ltd., Allhusen Works, Gateshead-on-Tyne, Lancashire, Alkali Works Manager.

1887. Spackman, Chas., Rosehaugh, Clitheroe, Lancashire, Portland Cement Manufacturer.

1901. Sparrow, J. Marcellus, c/o Imperial Varnish and Colour Co., Ltd., 6–22, Morse Street, Toronto, Canada, Varnish and Colour Manufacturer.

1883. Spence, D., Pension Todd, Luttichau Strasse 14, Dresden, Germany, Alum Manufacturer.

O.M. Spence, F., Alum Works, Manchester, Alum Manufacturer.

1900. Spence, Howard, (Journals) Audley, Broad Road, Sale, Cheshire, and c/o Peter Spence and Sons, Ltd., Alum Works, Manchester, Chemical Manufacturer.

1901. Spence, Jno. Davidson (Journals) 2, Hawkhill Place, Dundee; and (Communications) 39, Mincing Lane, London, E.C., Consulting Chemist.

1894. Spence, J. Napier, 69, Frithville Gardens, Shepherd's Bush, W., Teacher of Chemistry.

1883. Spence, Jno. W., Tiviot Colour Works, Manchester Road, Stockport, Drysalter.

1903. Spencer, Arthur G., Truro, Nova Scotia, Canada, Chemist.

1900. Spencer, Harold R.S., Spring Side, Sharples, Bolton, Lancs., Paper Maker.

1884. Spencer, Jno., Globe Tube Works, Wednesbury, Tube Manufacturer.

O.M. Spencer, J. W., Newbiggin House, Kenton, Newcastle-on-Tyne, Steel Manufacturer.

1901. Spencer, Robt., jun., c/o E. Ripley and Son, Ltd. Bowling Dyeworks, Bradford.

1902. Sperry, Elmer A., 855, Case Avenue, Cleveland, Ohio, U.S.A., Electrical Engineer.

1897. Sperry, Erwin S., P.O. Box 656, Bridgeport, Conn., U.S.A., Metallurgist.

1884. Spiegel, Dr. Adolf, Messel, bei Darmstadt, Germany, Analytical Chemist.

1899. Spieler, Aug. J., 543, Gifford Street, Syracuse, N.Y., U.S.A., Stearic Acid Works Superintendent.

1903. Spielmann, P. E., 21, Cadogan Gardens, London, S.W., Chemical Student.

1889. Spies, Adolph, 102, Fenchurch Street, London, E.C., Chemical Merchant.

1889. Spies, Hermann, 102, Fenchurch Street, London, E.C., Chemical Merchant.

1885. Spiller, A., Edison-Swan Electric Co., South Benwell Works, Newcastle-on-Tyne, Electrician.

O.M. Spiller, J., 2, St. Mary's Road, Canonbury, London, N., Consulting Chemist.

1896. Spoor, J. L., Madras Cement Works, Madras, India; and (Journals), Rede Court, Rochester, Kent, Portland Cement Manufacturer.

O.M. Sprengel, Hermann Johann Philipp, Ph.D. (Heidelb.), F.R.S., Royal Prussian Professor (titular); Journals to Prof. Sprengel, F.R.S., Savile Club, 107, Piccadilly, London, W., Chemist.

1900. Spurge, Edw. C., Société Française de l'Industrie Chimique, 7, Quai de Seine, Courbevoie, near Paris, Chemist.

1901. Spurlin, Oscar L., c/o Georgia Cotton Oil Co., 919, Austell Building, Atlanta, Ga., U.S.A., Chemist.

O.M. Squire, P. W., 413, Oxford Street, London, W., Pharmaceutical Chemist.

O.M. Squire, Dr. W. S., Clarendon House, St. John's Wood Park, N.W., Chemical Engineer.

1896. Stafford, Chas. H., (Journals) c/o The Birkacre Printing Co., and Hollyfield, Weldbank, Chorley, Colourist.

O.M. Stahl, Dr. K. F., 57th Street and A. V. Ry., Pittsburg, Pa., U.S.A., Chemical Works Manager.

1903. Stainton, Dr. W. J., 29, Narcessus Road, West Hampstead, N.W., Colour Chemist.

1904. Standfast, Jno. T., c/o Messrs. Burt, Boulton, and Haywood, Ltd., Selzaete, Belgium, Chemist.

1884. Stanning, John, Broadfield, Leyland, near Preston Bleacher.

1888. Stantial, Frank G., c/o Cochrane Chemical Co., Everett, Mass., U.S.A., Technical Chemist.

1885. Staples, H. J., The Old Hall, Spondon, Derby, Colour Manufacturer.

O.M. Stark, J. F., Rosedale, Bromborough, Cheshire, Works Superintendent.

1896. Statham, Noel, Compañia General de Productos Quimicos del Aboño, Gijón, Spain, Engineer.

1895. Stead, J. Christopher, 1, Finsbury Circus, London E.C., Technical Chemist.

O.M. Stead, J. E., 11, Queen's Terrace, Middlesbrough-on-Tees, Analytical Chemist.

1898. Stearns, Theron C., 44, Montgomery Street, Jersey City, N.J., U.S A., Consulting Chemist.

O.M. Stebbins, Dr. J. H., 80, Madison Avenue, New York City, U.S.A., Analytical Chemist.

O.M. Steedman, R. H., Whinfield, Prestwick, Ayrshire, N.B., Chemical Manufacturer.

1896. Steel, Fred. W., c/o Cuming, Smith, and Co., Yarraville, Melbourne, Vic., Analytical Chemist.

1900. Steel, Jno. S., Adelaide Chemical Works, New Thebarton, Adelaide, South Australia, Chemist.

1884. Steel, R. Elliott, 38, East Park Parade, Northampton, Headmaster.

O.M. Steel, Thos., Colonial Sugar Refinery, O'Connell Street, Sydney, N.S.W., Australia, Sugar Chemist.

1897. Stein, Sigmund, 214, Upper Parliament Street, Liverpool, Sugar Refinery Manager.

1897. Steinhart, Dr. Oscar J., 4, Palace Street Mansions, Buckingham Gate, S.W., Manufacturing Chemist.

1901. Steinmetz, Chas. P., Research Laboratory, General Electric Co., Schenectady, N.Y., U.S.A., Electrician.

1903. Stell, S. F., 25, Henry Street, Keighley, Yorks., Teacher of Chemistry.

1887. Stenhouse, T., Townhead, Rochdale, Analytical Chemist.

1903. Stephan, Geo. B., c/o Larkin Soap Co., Buffalo, N.Y., U.S.A., Perfumer.

1904. Stephen, A. E., 33, Victoria Street, Ashfield, Sydney, N.S.W., Australia, Analytical Chemist.

1884. Stephens, H. Chas., M.P., Avenue House, Finchley, N., Ink Manufacturer.

1892. Stephens, M. E., 4, Carlton Gardens, London, S.W.; and (Journals) 57–60, Aldersgate Street, London, E.C., Ink Manufacturer.

1889. Stern, Arthur L., Southbank, Stapenhill Road, Burton-on-Trent, Brewing Chemist.

O.M. Steuart, D. R., Osborne Cottage, Broxburn, West Lothian, N.B., Oilworks Chemist.

1903. Steven, A. B., The Yorkshire College, Leeds, Lecturer on Dyeing.

1899. Stevenot, G. A., c/o Schoellkopf, Hartford, and Hanna Co., 100, William Street, New York City, U.S.A., Chemist.

1898. Stevens, Arthur F., 61, Balfour Road, Highbury New Park, N., Paper Examiner.

1904. Stevens, Edgar B., 688, 7th Street, Buffalo, N.Y., U.S.A., Treasurer and Chemist.

1902. Stevens, Hy. P., The Firs, Ash, Surrey, Demonstrator in Chemistry.

1894. Stevens, Jno. H., 295, Ferry Street, Newark, N.J., U.S.A., Manufacturing Chemist.

1902. Stevens, M. White, H.M. Patent Office, Chancery Lane, London, W.C., Chemist.
1903. Stevens, T. R. B., 39, High Street, Battersea, S.W., Metallurgical Chemist.
1884. Stevens, Wm., The Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, E.C., Secretary.
1899. Stevenson, Arnold, 4, Porchester Gardens, London, W., Chemist.
O.M. Stevenson, Dr. T., Guy's Hospital, London, S.E., Chemical Lecturer.
O.M. Stevenson, W., Standard Works, 95A, Southwark Street, London, S.E., Chemical Manufacturer.
1901. Stewart, David B. D., Aberdeen Comb Works, Hutcheon Street, Aberdeen, Managing Director.
1903. Stewart, Jas., 3, Ludgate Circus Buildings, London, E.C., Editor ("Gas World").
1890. Stewart, Robt., 14, Grosvenor Road, Ilford, Essex, Chemical Works Manager.
1896. Stewart, R. Patrick, 59, Wellwood Terrace, Kerr Street, Kirkintilloch, N.B., Analytical Chemist.
O.M. Stewart, S., c/o Michael Nairn and Co., Ltd., Linoleum Works, Kirkcaldy, N.B., Technical Chemist.
1899. Stewart, Saml., 16, Great George Street, Westminster, S.W., and (Journals) Parkhurst Park Road, Wallington, Surrey, Managing Director (Explosives Co.).
1904. Stieglitz, Julius, University of Chicago, Chicago, Ill., U.S.A., Associate Professor of Chemistry.
1901. Stifel, Walter H., 1319, Locust Street, Allegheny, Pa., U.S.A., Tanner.
1903. Stillwell, Albert G., 55, Fulton Street, New York City, U.S.A. Chemist.
1903. Stingelin, Dr. Fritz, Union Knitting Mill, Schuylkill Haven, Pa., U.S.A., Chemist.
1886. Stirk, Jos.,Ferncliffe, Elm Bank, Nottingham, Brewer's Engineer.
1893. Stock, F. W. Keating, County Analyst's Office, Darlington, Analytical and Consulting Chemist.
1900. Stockdale, Edgar, Printworks, Birstall, Yorks, Colour Mixer.
1888. Stockdale, Wm., Irwell Printworks, Stacksteads, near Manchester, Calico Printer.
1887. Stocks, H. B., Lynwood, Neston, Cheshire, Analytical Chemist.
1903. Stoddard, Jesse D., c/o Operating Board, American Radiator Co., Lake and Dearborn Streets, Chicago, Ill., U.S.A.
1885. Stoddart, F. Wallis, Western Counties Laboratory, College Green, Bristol, Analytical Chemist.
1899. Stoddart, Reginald T., Corporation Tar Works, Charlestown Road, Halifax, Yorks., Manager.
O.M. Stoer, J., 6, Hanover Quay, Dublin.
1903. Stofer, Richard C., 28, Hayes Street, Norwich, N.Y., U.S.A., Pharmaceutical Chemist.
O.M. Stoker, G. N., 9, Lessar Avenue, Clapham Common, S.W., Analytical Chemist.
1899. Stokes, Alf. W., Laboratory, Vestry Hall, Paddington Green, W., Public Analyst.
1898. Stokes, Dr. Henry N., Bureau of Standards, Washington, D.C., U.S.A., Chemist.
1892. Stone, Frank, Laboratory, 193, Collins Street, Melbourne, Victoria, Analytical Chemist and Assayer.
1900. Stone, Geo. C., c/o New Jersey Zinc Co., 71, Broadway, New York City, U.S.A., Engineer.
1899. Stone, I. F., 100, William Street, New York City, U.S.A., Chemical Merchant.
1888. Stone, Thos. W., Chemical Works, St. George, Bristol, Chemical Manufacturer.
1902. Storar, John, (Journals) Coniston Lodge, Hornsea; and (communications) c/o Messrs. Reckitt and Sons, Hull, Chemical Engineer.
O.M. Storey, I. H., Haverbreaks, Lancaster, Chemical Manufacturer.
1903. Stormer, Edward J., J. J. Case Plow Works, Racine, Wis., U.S.A., Analytical Chemist.
1902. Storr, Bertram V., 27, Belgrave Road, Ilford, Essex, Chemist.
1888. Stowe, W. T., 11, Camphill Avenue, Langside, Glasgow, Analytical Chemist.
1883. Strangman, J. Pim, 9, Clydesdale Road, Notting Hill, W., Bleacher.
1903. Strayer, D. W., 112, Newman Avenue, Bayonne, N.J., U.S.A., Chemist.
1903. Strickler, Emerson H., c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Chemist.
1887. Strong, Colin R., 13, St. Ann Street, Manchester, Oil Merchant.
O.M. Stuart, C. E., 29, Mosley Street, Newcastle-on-Tyne, Chemical Apparatus Dealer.
1896. Stuart, Harry T. R., Know Mill House, Entwistle, near Bolton, Printworks Sub-Manager.
O.M. Stuart, T. W., 7, Livingston Drive, Sefton Park, Liverpool, Alkali Works Manager.
1901. Stuart, Dr. W. Theophilus, 197, Spadina Avenue, Toronto, Canada, Physician and Professor of Chemistry.
1896. Stubbs, Augustus J., 50, Calle de Ferraz, Madrid, Spain.
O.M. Studer, Dr. A., Postgebäude, Olten, Switzerland, Consulting Chemist.
1890. Studer, Simon J., Helvetia, Stockton Heath, near Warrington, Technical Chemist.
1903. Sturrock, Capt. G. C., R.A., Indian Cordite Factory, Aruvinkad, Nilgirio, India, Assistant Superintendent.
1898. Styles, R. Curling, Knockhall, Greenhithe, Kent, Analytical Chemist.
1896. Suckert, Dr. J. J., 253, Broadway, New York City, U.S.A., Manufacturing Chemist.
1895. Sudborough, Dr. J. J., University College of Wales, Aberystwith, Lecturer in Chemistry.
1889. Sulman, H. L., 41, London Wall, London, E.C., Chemist and Metallurgist.
1895. Summers, Bertrand S., 430, The Rookery, Chicago, Ill., U.S.A., Electro-Chemist.
1890. Sumner, Harold, Worthington, near Wigan, Dyer and Bleacher.
1896. Sunderland, A., 84, Hainworth Wood Road, Ingrow, Keighley, Teacher of Chemistry.
1899. Sundström, Carl, c/o Solvay Process Co., Detroit, Mich., U.S.A., Chemist.
1895. Sundström, Karl J., Sibley, Mich., U.S.A., Manufacturing Chemist.
1884. Sutherland, D. A., 13, Victoria Street, Westminster, S.W., Consulting Technical Chemist and Assayer.
1894. Sutherland, Geo., Croft Cottage, Bonhill, N.B., Chemist.
1887. Sutherland, Jas., c/o British Aluminium Co., Ltd., Larne Harbour, Co. Antrim, Ireland, Chemist.
O.M. Sutherland, R. M., Lime Wharf Chemical Works, Falkirk; and Solsgirth, Dollar, N.B., Chemical Manufacturer.
1899. Sutherst, Dr. Walter F., Brimsdown Lead Co., Ponders End, N., Chemist.
1901. Sutro, H. H., 126, Liberty Street, New York City, U.S.A., Chemist.
O.M. Sutton, Francis, Norfolk County Laboratory, Redwell Street, Norwich, Analytical Chemist.
1886. Sutton, F. Napier, 6, Grosvenor Gardens, Willesden Green, N.W., Alkali Works Inspector.
1900. Sutton, W. Lincolne, Hillcroft, Eaton, Norwich, Public Analyst.
O.M. Swan, J. Cameron, 4, Nicholas Buildings, Newcastle-on-Tyne, Manufacturing Chemist.
O.M. Swan, Dr. Jos. W., F.R.S., 58, Holland Park, London, W., Chemist and Electrician.
1898. Swanson, Jas. F., (Journals) 5, Edmiston Terrace, Copeland Road, Govan, N.B.; (subs.) c/o Mr. R. Glover, 13, Belville Street, Greenock, N.B., Technical Chemist.
1884. Swinburne, Geo., (Journals), 99, Queen Street, Melbourne, Australia; (subs.) c/o Jno. Coates and Co., Suffolk House, Laurence Pountney Hill, E.C., Gas Engineer.

1901. Swinton, Ralph S., c/o W. J. Bush, Incorporated, Linden, N.J., U.S.A., Analytical Chemist.

1903. Sykes, Walter F., 85, Water Street, New York City, U.S.A., Chemical Merchant.

1902. Sylow, Paul L. P. G., Korsör, Alexandra Street, Drummoyne, Sydney, N.S.W., Australia, Analytical Chemist.

O.M. Syme, W. B., Elm Cottage, Addiewell, West Calder, N.B., Oil Works Chemist.

1903. Symmes, Whitman, 630, Harrison Street, San Francisco, Cal., U.S.A., Chemical Engineer.

T

1895. Taber, G. H., 814, Frick Building, Pittsburg, Pa., U.S.A., General Manager (Gulf Refinery Co.).

1896. Takagi, T., Kyoikuhin Seizo Kaisha, Asakusa, Sebickihen Cho, Tokyo, Japan, Chemical Engineer.

O.M. Takamatsu, T., Tokyo University, Japan, Analytical Chemist.

O.M. Takamine, Dr. J., 613, West 142nd Street, New York City, U.S.A., Engineer.

1890. Takayama, Jintaro, Nando Machi, 26, Ushigome, Tokio, Japan, Director (Imperial Industrial Experiment Station).

1901. Talati, K. E., Tirvetteyoor, near Madras (Chingulput), India, Leather Dresser.

1903. Talbott, Dr. B. E., Chaneyville, Md., U.S.A., Manufacturing Chemist.

1902. Talley, Thos. Washington, c/o Tuskegee Institute, Tuskegee, Ala., U.S.A., Chemist.

1898. Tanaka, Keishin, Matsuba Hotel, Kudansaka, Uye, Tokio, Japan, Chemist.

1900. Tankard, Arnold R., 67, Surrey Street, Sheffield, Analytical Chemist.

O.M. Tate, F. H., 9, Hackins Hey, Liverpool, Analytical and Technical Chemist.

1902. Tate, Francis G. H., Inglewood, Beckwith Road, Dulwich, S.E., Assistant Analyst (H.M. Customs).

O.M. Tatlock, J., 45, Renfrew Street, Glasgow, Laboratory Furnisher.

O.M. Tatlock, R. R., 156, Bath Street, Glasgow, Consulting Chemist.

1902. Tatters, Hugh Lee, 17, Waterloo Road, Runcorn, Cheshire, Analytical Chemist.

1892. Tatton, Reginald A., Mersey and Irwell Joint Commission, 44, Mosley Street, Manchester, Civil Engineer.

O.M. Taubman, R., 12, Eton Road, Haverstock Hill, N.W., Analytical Chemist.

1901. Taussig, Emil, 26, East 59th Street, New York City, U.S.A., President (West Disinfecting Co.).

1898. Taverner, W., Ashland, Oregon, U.S.A., Analytical Chemist.

1901. Tayler, Jno. Bernard, 2, Alma Terrace, Wavertree, Liverpool, Works Chemist.

1903. Taylor, Alvin M., c/o General Chemical Co., Hudson River Works, Hudson Heights, N.J., U.S.A., Chemist.

1902. Taylor, Arthur P., 460, Jarvis Street, Toronto, Ont., Canada, Manufacturer.

1898. Taylor, B. Franklin, Gainesville Cotton Oil Co., Gainesville, Ga., U.S.A., Manufacturing Chemist.

1902. Taylor, Edward R., Penn Yan, N.Y., U.S.A., Manufacturing Chemist.

1902. Taylor, Francis O., c/o Parke, Davis, and Co., Detroit, Mich., U.S.A., Analytical Chemist.

1886. Taylor, G. Crosland, Ravenscar, Helsby, near Warrington, Electrical Engineer.

1894. Taylor, G. Midgley, 27, Great George Street, Westminster, S.W., Analytical Chemist.

1893. Taylor, G. W., Dinting Vale Printworks, Dinting, near Manchester, Printworks Chemist.

O.M. Taylor, H. E., 702, Alexandra Parade, Dennistoun Glasgow, Lead Works Manager.

1883. Taylor, Jas., Department of Mines, Sydney, N.S.W., Australia, Government Metallurgist.

1888. Taylor, Jas. Davis, 9, Mincing Lane, London, E.C., Chemical Merchant.

1898. Taylor, Jas. M., 59, Kenmare Road, Sefton Park, Liverpool, Analytical Chemist.

1901. Taylor, John, Crawford Municipal Technical School, Cork, Ireland, Science Master.

1901. Taylor, Jno., 3, Rossett Road, Great Crosby, near Liverpool, Works Chemist.

1888. Taylor, J. Scott, c/o Winsor and Newton, Ltd., 38, Rathbone Place, London, W., Technical Chemist.

1896. Taylor, Martin, "The Clough," Buckhurst Hill, Essex, Chemical Works Manager.

1901. Taylor, M. J., 77, Front Street, E., Toronto, Canada, Soap Manufacturer.

1898. Taylor, Newman, Chinchpooghley Road, Parel, Bombay, India, Resident Engineer.

1901. Taylor, Sidney H., 2, Warwick Road, Weston, Bath, Works Chemist.

1902. Taylor, Thos., 12, Ancaster Drive, Great Western Road, Glasgow, Chemical Manufacturer.

1902. Taylor, Tom., jun., c/o Durant, Taylor and Co., 68, Major Street, Manchester, Chemical Merchant.

1898. Taylor, Walter, 20, Canning Street, Bury, Lancs., Technical Chemist.

1903. Tazaki, T. M., 15, Kamiyoshicho, Asakusaku, Tokyo, Japan, Technical Chemist.

1887. Teanby, G. W. A., Elvin Lodge, East Dereham, Norfolk, Analytical Chemist.

1899. Teas, Wm. Holmes, Ridegway, Pa., U.S.A., Chemist.

O.M. Teed, Dr. F. L., Chem. Laby., 9, Mincing Lane, London, E.C., Analytical Chemist.

O.M. Tennant, Sir Chas., Bart., 40, Grosvenor Square, W.; Glen, Peeblesshire, N.B., and Journals to St. Rollox, Glasgow, Alkali Manufacturer.

1884. Tennant, Jas., Alex. Fergusson and Co., Ltd., 38, McAlpine Street, Glasgow, Lead and Colour Manufacturer.

1896. Tennille, Geo. F., c/o Southern Cotton Oil Co., Savannah, Ga., U.S.A., Chemist.

1888. Terry, Albert, Verulam, Mount Albert Road, Balwyn, near Melbourne, Victoria, Brewer.

1884. Terry, Hubert L., 3, Herbert Street, Moss Side, Manchester, Technical Chemist.

O.M. Tervet, R., 54, Penshurst Road, South Hackney, E., Oil Works Manager.

1902. Test, Wm. H., 716, Brown Street, Lafayette, Ind., U.S.A., Assistant Professor of Chemistry.

1893. Tetley, C. F., Messrs. Jos. Tetley and Son, The Brewery, Leeds, Brewer.

1897. Tetlow, Wm. E., Ash Cottage, Ashfield, Dunblane, N.B., Chemist.

1903. Thatcher, Ed. J., Firfield House, Knowle, near Bristol, Merchant and Manufacturer.

1903. Thayer, Harry M., c/o The Procter and Gamble Co., Ivorydale, Ohio, U.S.A., Chemist.

1901. Thiry, Jos., Incheape, Southill Road, Chislehurst, Kent, Manager (Coke Oven Co.).

O.M. Thomas, Chas., J.P., D.L., Pitch and Pay, Stoke Bishop, near Bristol, Soap Manufacturer; Deputy Chairman, Midland Railway.

1894. Thomas, H. Russell, Broad Plain Soap Works, Bristol, Soap Manufacturer.

1902. Thomas, Jas. E., Box 192, Germiston, Transvaal, South Africa, Cyanide Manager.

O.M. Thomas, J. W., Overdale, Shortlands, Kent, Analytical Chemist.

1902. Thomas, Nehemiah M., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia.

1901. Thomas, Octavius, Gas and Water Offices, Pentre, Glamorganshire, Gas and Water Engineer.

1888. Thomas, S. Percy, 2, Landrock Road, Hornsey, N., Technical Chemist.

1898. Thomas, Wm. Harrison, jun., Passaic Print Works, Passaic, N.J., U.S.A., Printworks Chemist.

1885. Thompson, Prof. Claude M., 38, Park Place, Cardiff, Professor of Chemistry.

1898. Thompson, Edw. C., 40, Glenluce Road, Westcombe Park, S.E., Manufacturing Chemist.

1893. Thompson, G. Rudd, 69, Dock Street, Newport, Mon., Analytical and Consulting Chemist.

1895. Thompson, Gustave W., 129, York Street, Brooklyn, N.Y., U.S.A., Chemist.

1903. Thompson, Jno. Fairfield, Department of Metallurgy, Columbia University, New York City, U.S.A.

1903. Thompson, Jno. T., Corporation Sewage Works, Knostrop, Leeds, Analyst.

1885. Thompson, W., Sankey Hill, Earlestown, Lancashire, Sugar Refiner.

1884. Thompson, W. G., Colour Manufacturer.

O.M. Thompson, W. P., Patent Office, 6, Lord Street, Liverpool, Patent Agent.

1896. Thomsen, Alonzo L., Maryland Club, 1, East Eager Street, Baltimore, Md., U.S.A., Manufacturing Chemist.

1902. Thomson, Allen B., c/o Spencer, Chapman, and Messel, Ltd., Silvertown, E., Chemical Engineer.

1881. Thomson, G. Carruthers, 53, Bedford Road, Rock Ferry, Birkenhead, Engineer.

1903. Thomson, G. M., 129, Moray Place West, Dunedin, New Zealand, Analyst.

1891. Thomson, Jas. M., Royal Gunpowder Factory, Waltham Abbey, Essex, Manager (Cordite Branch).

1901. Thomson, J. M., New Hermand Oil Co., Ltd., Breich Works, West Calder, N.B., Manager.

1894. Thomson, John, Overlee, Alexandria, N.B., Printworks Manager.

1884. Thomson, Robt. T., 156, Bath Street, Glasgow, Analytical Chemist.

1899. Thomson, Thos., (Journals) Waterproofing Co., Barrhead; and Westlea, Barrhead, near Glasgow, Manufacturer.

O.M. Thomson, W., Royal Institution Laboratory, Manchester, Analytical and Consulting Chemist.

1890. Thomson, Wm. Thos., Royal Gunpowder Factory, Waltham Abbey, Essex, Explosives Chemist.

1902. Thorburn, Jas., Reid's Villas, Stevenston, Ayrshire, N.B., Analytical Chemist.

1900. Thorman, J. Stanley, West Ham Gasworks, Stratford, E., Chemist.

O.M. Thorne, Dr. L. T., 2, Denbigh Gardens, Richmond-on-Thames; and (Journals) Southampton Wharf, Battersea, S.W., Technical Chemist.

O.M. Thorneycroft, Wallace, East Plean House, Bannockburn, N.B., Technical Chemist.

1891. Thornton, Chris., 16, Hillside Avenue, Providence, R.I., U.S.A., Printworks Manager.

1891. Thornton, David H., Brookfoot Dyeworks, Brighouse, Yorks, Dyer.

1887. Thornton, H., Redbourn, Ashford, Middlesex, Analytical Chemist.

1899. Thornton, Wm., (Journals) c/o Isaac Brandon & Bros., Panama, Central America; and (subsn.) c/o Thos. Thornton, Hermand, West Calder, N.B., Chemist.

1895 Thorp, Dr. Frank H., Mass. Inst. of Technology, Boston, Mass., U.S.A., Assistant Professor of Industrial Chemistry.

O.M. Thorpe, Dr. T. E., C.B., F.R.S., Government Laboratory, Clement's Inn Passage, Strand, W.C.; and (Journals) 61, Ladbroke Grove, Notting Hill, W., Chief Chemist (Customs and Inland Revenue).

1902. Thurlow, Nathaniel, 226, East Frederick Street, Lancaster, Pa., U.S.A., Chemist.

1898. Thurnauer, Dr. Gustav, c/o Aurora Metal Co., Aurora, Ill., U.S.A., Chemist.

1904. Thurston, Azor, Grand Rapids, Ohio, U.S.A., Chemist

1904. Tickle, Thos., Laboratory, 83, Queen Street, Exeter, Analyst.

1903. Tighe, Arthur, 20, Marlborough Place, St. John's Wood, London, N.W., Chemical Student.

1901. Tilden, Philip S., c/o Franklin H. Kalbfleisch Co., 35, Burling Slip, New York City, U.S.A., Manufacturing Chemist.

O.M. Tilden, Prof. W. A., F.R.S., The Oaks, Murray Road, Northwood, Middlesex, Professor of Chemistry.

1900. Tilley, Jas. W., Melrose, Raleigh Gardens, Brixton Hill, London, S.W., Research Chemist.

1901. Timmans, W. G., 108, Peel Street, Derby, Chemical Works Manager.

1886. Timmins, A., Argyll Lodge, Higher Runcorn, Civil Engineer.

O.M. Timmis, T. Sutton, Widnes, Chemical Manufacturer.

1894. Tipler, Fred. C., 48, Brooklyn Street, Crewe, Analytical Chemist.

1890. Tobey, C. H., Collingwood, Ontario, Canada, Tannery Chemist.

1894. Toch, Maximilian, 52, 9th Street, Long Island City, N.Y., U.S.A., Chemist.

1893. Tocher, Jas. F., 5, Chapel Street, Peterhead, N.B., Pharmaceutical Chemist.

1886. Todd, A. M., 204, North Rose Street, Kalamazoo, Mich., U.S.A., Manufacturing Chemist.

1899. Tompkins, Vreeland, 533, Communipaw Avenue, Jersey City, N.J., U.S.A., Analytical Chemist.

O.M. Toms, F. Woodland, States Analyst's Office, St. Heliers, Jersey, Analytical Chemist.

1902. Tone, Frank Jerome, c/o The Carborundum Co., Niagara Falls, N.Y., U.S.A., Manager.

1899. Tone, Jay E., 1427, Woodland Avenue, Des Moines Iowa, U.S.A.

1902. Torrey, Charles A., jun., 17, Park Vale, Brookline, Mass., U.S.A., Chemist.

O.M. Towers, J. W., Brantwood, Allerton, near Liverpool, Analytical Chemist.

1903. Townsend, C. Eyre-Coote, 36, Glenluce Road, Blackheath, S.E., Commission Agent.

1893. Townsend, Chas. F., 1, Morgan Road, Bromley, Kent, Chemist.

1892. Townsend, Chas. W., 19, Crawford Street, Port Dundas, Glasgow, Chemical Manufacturer.

1892. Townsend, Oliver C., 1, Horton Crescent, Rugby, Chemical Manufacturer.

1897. Towse, Walter, c/o Messrs. E. and J. Richardson, Elswick Leather Works, Newcastle-on-Tyne, Technical Chemist.

1899. Trantom, Dr. Wm., 10, Field Road, New Brighton, Cheshire, Chemist.

1894. Traphagen, Dr. Frank W., Colorado School of Mines, Golden, Colo., U.S.A., Professor of Metallurgy and Assaying.

1900. Traquair, Jno., Glenfield Starch Works, Paisley, N.B., Analytical Chemist.

1904. Trantwein, Alfred P., Carbondale, Pa., U.S.A., President (Carbondale Chemical Co.).

1893. Travers, Dr. Morris W., University College, Bristol, Chemist.

1889 Trechmann, A. O., Halling Lime and Cement Works, near Rochester, Kent, Cement Works Chemist.

1885. Trechmann, Dr. C. O., Warren Cement Works, Hartlepool, Cement Manufacturer.

1895. Treharne, F. Gwilym, Wranghrook, Llanishen, near Cardiff, Analytical Chemist.

1885. Trewby, Herbert, 62, St. John Street, London, E.C., Analytical Chemist.

1883. Tribe, P. C. M., Rothesay, Datchet, Windsor, Secretary.

1901. Trigger, Oliver, Chem. Dept., Royal Arsenal, Woolwich, S.E., Analytical Chemist.

1898. Tripp, Dr. E. Howard, (Journals) Municipal Technical College; and 46, Terrace Road, Swansea, Science Master.

O.M. Trobridge, A., c/o Trobridge and Co., Ltd., South Shore Road, Gateshead-on-Tyne, Technical Chemist.

1897. Trotman, Saml. R., King's Walk Chambers, Parliament Street, Nottingham, City Analyst.

1900. True, Percival E., Bowker Chemical Co., Elizabeth, N.J., U.S.A., Chemical Engineer.

1887. Tsukiyama, S., Nippon Seito Kaisha, Osaka, Japan, Paper Mills Chemist.

1894. Tucker, Alex. E., Norwich Union Chambers, Congreve Street, Birmingham, Metallurgist and Chemist.

1897. Tucker, Samuel A., Columbia University, New York City, U.S.A., Tutor in Industrial Chemistry.

1886. Tuer, Arthur H., Thornhill, near Wigan, Analytical Chemist.

1903. Tufts, C. G., c/o Semet-Solvay Co., Syracuse, N.Y., U.S.A., Chemical Engineer.

1901. Tulloch, Wm. F., 7, West George Street, Glasgow, Merchant.

1899. Turnbull, Dr. Andrew, Manchester and Liverpool District Tanners' Federation, 3, Lord Street, Liverpool, Consulting Chemist.

1888. Turnbull, G. W., 2, Haws Hill, Carnforth, Lancashire, Metallurgical Chemist.

1884. Turnbull, W. S., 37, West George Street, Glasgow, Chemical Manufacturer.

1902. Turner, Basil, 5, Moore Street, Sydney, N.S.W., Australia, Metallurgist.

1902. Turner, Jos., c/o Read, Holliday, and Sons, Ltd., Huddersfield, Chemist.

1904. Turner, Owen, Park Tower, Ipswich, Tanner and Currier.

1897. Turney, Fred. N., 76, Rue Wilson, Brussels, Belgium, Leather Dresser.

1887. Turney, Sir J., Springfield, Alexandra Park, Nottingham, Tanner.

1891. Turri, Geo. G., Salisbury Building, cor. of Queen and Bourke Streets, Melbourne, Vic., Australia, Patent Agent.

1903. Tutton, Henry Ralph, 19, St. James' Parade, Bath; and (Journals) c/o Burham Cement Works, Aylesford, Kent, Chemist.

1890. Tweedy, Jas., 306A, Burdett Road, Limehouse, E., Metallurgical Chemist.

1891. Twitchell, E., Wyoming, Ohio, U.S.A., Candle Works Manager.

1897. Twynam, H., c/o Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Mining Engineer.

O.M. Twynam, T., Hawthorne House, Slaid Hill, Moortown, Leeds, Metallurgist.

1901. Tyler, Chas. R., 424, West 57th Street, New York City, U.S.A., Analytical Chemist.

O.M. Typke, P. G. W., Lawn House, New Malden, Surrey, Chemical Manufacturer.

1893. Tyrer, Chas. T., Stirling Chemical Works, Stratford, E., Manufacturing Chemist.

O.M. Tyrer, T., Stirling Chemical Works, Stratford, E., Chemical Manufacturer.

1899. Tysoe, Jos., South Metropolitan Gas Co., East Greenwich, S.E., M. Inst. C.E., Gas Engineer.

U

1894. Uhlig, E. C., 48, Barclay Street, New York City, U.S.A., Glass Works Chemist.

1900. Uhlig, W. C., c/o Hygeia Distilled Water Co., 349, West 12th Street, New York City, U.S.A., Chemist.

1897. Ullman, Jas. A., c/o Sigmund Ullman Co., 146th Street, and Park Avenue, New York City, U.S.A., Printing Ink Manufacturer.

1900. Ulmer, Geo. F., c/o Arbuckle Bros., Sugar Refinery, Foot of Pearl Street, Brooklyn, N.Y., U.S.A., Chemist.

O.M. Umney, C., (Journals) 81, Lawrie Park Road, Sydenham, and (communications) 50, Southwark Street, London, S.E., Manufacturing Chemist.

1889. Underhill, Thos. J., 73, Pepy's Road, New Cross, S.E., Inspector of Stores.

1885. Underwood, G. R., 4, Emerson Street, Peabody, Mass., U.S.A., Glue Works Chemist.

1898. Unglaub, Oscar, Ban Hill House, Bolton Road, Pendleton, Manchester, Soap Manufacturer.

1883. Usmar, J. H., 22, Billiter Street, London, E.C., Chemical Merchant.

1904. Uyeda, Toyokitsu, Takasago, Harima, Japan, Chemist.

V

1896. Van der Linde, Harold, 47, Front Street West, and (Journals) 101, Tyndall Avenue, Toronto, Canada, Chemist (India-rubber and Gutta-percha Manufacturing Co.).

1895. Vanderpoel, Dr. Frank, 153, Center Street, Orange, N.J., U.S.A., Chemist.

1902. Van der Sleen, Nicolaas, Gedempte Oude Gracht, 47, Haarlem, Holland, Consulting Chemist and Bacteriologist.

1903. Van Dyck, Edwin M., Bureau of Engraving and Printing, Washington, D.C., U.S.A., Chemist and Ink Maker.

1897. Van Gelder, Arthur P., c/o Climax Powder Manufacturing Co., Emporium, Pa., U.S.A., Superintendent.

1903. Van Gilder, H. P., 234, Bushkill Street, Easton, Pa., U.S.A., Analytical Chemist.

1891. Van Gundy, Chas. P., Laboratory, B. & O. R. R., Baltimore, Md., U.S.A., Metallurgical Chemist.

1896. Van Ingen, Dudley A., New Jersey Zinc Co., Newark, N.J., U.S.A., Chemist.

1896. Van Laer, Norbert, Truman's Brewery, Burton-on-Trent, Brewer and Chemist.

1897. Van Marken, J. C., 150, Queen Victoria Street, E.C., Chemical Engineer.

1902. Vanwinckel, W. H., c/o Lyman Bros. and Co., Ltd., 71, Front Street East, Toronto, Canada, Chemist.

1902. Van Zwaluwenburg, Jas. G., 607, East Ruby Avenue, Argentine, Kansas, U.S.A., Analytical Chemist.

1888. Vargas-Vergara, J. M., Apartado No. 237, Bogota, Republic of Colombia, S. America, Metallurgical Chemist.

O.M. Vasey, T. E., 6, South Parade, Leeds; (Journals) P.O. Box 1149, Montreal, Canada, Chemical Engineer.

1894. Veitch, Geo., Chemical Works, Crieff, N.B., Manufacturing Chemist.

1898. Verity, Ben, Magog, Prov. Quebec, Canada, Printworks Chemist.

1897. Verity, Victor, 83, Lexington Street, East Boston, Mass., U.S.A., Chemical Works Foreman.

O.M. Vickers, Wm., c/o Thos. Vickers and Sons, Miles Platting, Manchester, Chemical Manufacturer.

1895. Vigelius, Carl, 175, Pearl Street, New York City, U.S.A., Shellac Bleacher.

1896. Vincent, Jos. A., Rooms 207–8, 421, Chestnut Street, Philadelphia, Pa., U.S.A., Mechanical Engineer.

1897. Vlies, Leonard E., Fernroyd, Wellington Road, Whalley Range, Manchester.

O.M. Voelcker, E. W., 22, Tudor Street, London, E.C., Agricultural Chemist.

1887. Voelcker, Dr. J. A., 20, Upper Phillimore Gardens, Kensington, W., Agricultural Chemist.

1901. Vogel, G. C., 583, Cass Street, Milwaukee, Wis., U.S.A., Tanner.

1897. Vogel, Julius L., 91, Blackfriars Road, S.E., Engineer.

1899. Vogeler, Gustav, 17, Philpot Lane, London, E.C., Merchant.

1900. Volney, Dr. Carl W., Keyport, N.J., U.S.A., Chemist (Smokeless Powder Co.).

1897. Voorhees, Louis A., Box 55, New Brunswick, N.J., U.S.A., Agricultural Chemist.

1899. Voorhees, Samuel S., c/o Supt. Architect, Treasury, Washington, D.C., U.S.A., Chemist.

1902. Vorisek, Dr. Anton, College of Pharmacy, 115—119, West 68th Street, New York City, U.S.A., Instructor.

1888. Vörster, Fritz, Cöln-Marienburg, Germany, Manufacturing Chemist.

1885. Voss, Hermann, 19, Beckenham Road, Beckenham, Kent, Manure Works Manager.

1899. Voss, Walter A., Melrose, Whitworth Road, South Norwood, S.E., Manufacturing Chemist.

1899. Vreeland, Cornelius D., Upper Montclair, N.J., U.S.A., Manufacturing Chemist.

W

1896. Wachtel, Gregory, 6, Manejny Pereulok, St. Petersburg, Russia, Chemical Engineer.
1895. Waddington, Thos. W., 74, Blackburn Road, Padiham, Lancashire, River Inspector.
1902. Wade, Frank, 10, Shirley Road, Southsea, Analytical Chemist.
1890. Wade, Jas. L., 28, West Kensington Gardens, London, W., Chemical Manufacturer.
1889. Wadman, W. E., 102, Lord Avenue, Bayonne, N.J., U.S.A., Manufacturing Chemist.
1897. Wagner, Dr Theodore B., 1444, Wilson Avenue, Chicago, Ill., U.S.A , Chemist.
1893. Wagner, W. G., Glyndhurst, Ealing Common, W., Manufacturing Chemist.
1903. Wainwright, J , 15, Bolton Road, Port Sunlight, near Birkenhead, Soap Works Manager.
1884. Wainwright, Dr. J. H., 159, Front Street, New York City, U.S.A., Analytical Chemist.
1895. Wainwright, Wm., c/o Spooner and Bailey, Chemical Manure Works, Eling, near Southampton, Chemist.
1901. Waite, C. Nelson, c/o General Artificial Silk Co., 32, South Broad Street, Philadelphia, Pa., U.S.A., Chemist.
1899. Wakefield, Wm. C., c/o Savile Town Chemical Co., Ltd., Savile Town, Dewsbury, Chemist.
1894. Waldman, Louis J., P. O. Box 162, Albany, N.Y., U.S.A., Aniline Dye Manufacturer.
1895. Waldstein, Dr. Martin E., 107, Murray Street, New York City, U.S.A , Manufacturing Chemist.
1887. Walker, Archibald, 8, Crown Terrace, Glasgow, Distiller.
1900. Walker, David C., Gibbonsville, Idaho, U.S.A., Analytical Chemist.
1897. Walker, H. V., 38, Clinton Street, Brooklyn, N.Y., U.S.A., Chemist.
1894. Walker, Dr. Jas., University College, Dundee, Professor of Chemistry.
1902. Walker, Jas., Knowle House, Mirfield, Yorks, Woollen Manufacturer.
1897. Walker, Jas. W., Fernlea, Irvine, N.B., Chemical Manufacturer.
1902. Walker, Jno. H., Gourepore Works, Naihati, E.B.S.R., Bengal, India, Chemist.
1884. Walker, S. R., 19, Wolsey Street, Radcliffe, Manchester, Foreman Dyer.
1895. Walker, W. Sloane, c/o Walker, Ltd., Litherland, near Liverpool, Tanner.
1900. Walker, Dr. Wm. H., Massachusetts Inst. of Technology, Boston, Mass., U.S.A., Chemical Expert.
1897. Wallace, Edwin C., P.O. Box 42, Cambridgeport, Mass., U.S.A., Chemist.
1897. Wallace, Robt. A., Dorset Hall, Merton, Surrey, Chemical Manufacturer.
1883. Wallace, Robert, 20, Murrayfield Avenue, Edinburgh, Distiller.
O.M. Waller, Dr Elwyn, 7, Franklin Place, Morristown, N.J., U.S.A., Professor of Chemistry.
1899. Wallerstein, Dr. Max, 105, East 91st Street, New York City, U.S.A., Chemist.
1886. Walsb, F. T., 195, Nesmith Street, Lowell, Mass., U.S.A., Colour Printer.
1901. Walsh, Lionel O. P., c/o Burt, Boulton, and Haywood Ltd., Prince Regent's Wharf, Silvertown, E., Chemist.
1903. Walsh, Peter H., P.O. Box 469, Magog, Quebec, Canada, Analytical Chemist.
1904. Walther, Wm., Holzapfel's Compositions Co., Ltd., Heworth Shore, Felling-on-Tyne, Chemist and Works Manager.
1902. Walton, Thos. U., Colonial Sugar Refining Co., Ltd., O'Connell Street, Sydney, N.S.W., Australia, Analytical Chemist.
1895. Want, W. Philip, 44, Bishopsgate Street Without, London, E.C., Pharmacist and Editor.
1901. Warburton, Frank, 5, Rosebery Gardens, Muswell Hill, N., Manager.
1896. Warhurton, Thos., 12, Seymour Road South, Clayton, Manchester, Chemist.
1903. Ward, Dudley R., 251, Peckham Rye, London, S.E., Analytical Chemist.
O.M. Ward, Geo., Messrs. Hirst, Brooke, and Hirst, Millgarth Mills, Leeds, Chemical Works Manager.
1891. Ward, G. J., The Cottage, Hallam Fields, near Nottingham, Civil Engineer.
1884. Ward, Howard Chas., Yeatton, Hordle, Lymington, Hants, Deputy Chairman of Gas Co.
1898. Ward, John, Barnstone Blue Lias Lime Co., Ltd., Barnstone, Notts, Manager.
1899. Ward, Wm. J., c/o Olive and Partington, Broughton Bridge Paper Mills, Manchester, Chemist.
O.M. Wardale, J. D., Redheugh Engine Works, Gateshead-on-Tyne, Engineer.
1892. Warden, Jno. B., P.O. Box 701, Deadwood, S. Dakota, U.S.A., Analytical Chemist.
1897. Wardle, Sir Thos., 54, St. Edward Street, Leek, Staffordshire, Silk Dyer.
1902. Waring, W. Geo., Webb City, Mo , U.S.A , Metallurgical Chemist.
1885. Warington, Robt., F.R.S., Harpenden, Herts, Agricultural Chemist.
1899. Warnes, Arthur R., c/o T. L. Willson, 117, Boyson Road, Walworth, S.E., Soapworks Chemist.
1890. Warren, Fiske, 161, Devonshire Street, Boston, Mass., U.S.A., Paper Manufacturer.
1902. Warren, H. D., The Gutta Percha and Rubber Manufacturing Co., Ltd., 45—49, West Front Street, Toronto, Canada, President.
1890. Warren, Jno. Davis, 7, Essex Road, Acten, W., Manufacturing Chemist.
1901. Warren, Jno. E., Eagle Chemical Works, Barchester Street, Poplar, E., Tar Distiller.
1885. Warren, T. T. P. Bruce, Tamworth Villa, Earlham Grove, Forest Gate, Essex, Analytical Chemist.
1885. Waterfall, W. B., c/o Avon Manure Co., Bristol; and (Journals) Thirlmere, Clavering Road, Redland, Bristol, Manure Manufacturer.
1890. Waterhouse, Major-General Jas., Oak Lodge, Court Road, Eltham, Kent, Assistant Surveyor-General of India (retired).
1891. Waterhouse, Robt., 7, Lyme Grove, Altrincham, Cheshire, Analytical and Agricultural Chemist.
1902. Watkins, E. J., (communications) 81, Montpelier Road; (Journals) c/o Mellin's Food, Ltd., Stafford Street, Peckham, S.E., Works Chemist.
1900. Watkins, Norman, Box 767, Honolulu, Hawaiian Islands, Chemist.
1898. Watkins, Willard H., c/o Schoellkopf, Hartford, and Hanna Co., 163, Oliver Street, Boston, Mass., U.S.A., Colourist.
1894. Watmough, Benj., 1, Ryeburn, Stanley Road, and (Journals) c/o Messrs. Brotherton and Co., Ammonia Works, Calder Vale, Wakefield, Analytical Chemist.
1894. Watson, Alex. Forbes, St. James's Gate Brewery, Laboratory, Watling Street, Dublin, Chemist.
1884. Watson, Chas., Dawsholm Chemical Works, Maryhill, Glasgow, Manufacturing Chemist.
1894. Watson, Chas. Ernest, c/o Peter Spence and Sons, Manchester Alum Works, Manchester, Chemical Assistant.
1890. Watson, Eric E., (Journals) The Queensland Smelting Co., Aldershot, Maryborough, Queensland, Australia; (subs.) c/o S. Watson, Queen Insce. Buildings, Dale Street, Liverpool, Metallurgical Chemist.
1895. Watson, H. Ard, Ashwood, North Hill Road, Headingly, Leeds, Tar Distiller.
1901. Watson, Herbert J., Glenarm Villas, Cavendish Street, Mansfield, Notts., Chemist.
1903. Watson, H. M., 22, Coleraine Road, Blackheath, S.E., Paint Manufacturer.

1903. Watson, H. W., 111, Brudenell Road, Hyde Park, Leeds, Analytical Chemist.
1894. Watson, Jas., 60, West Park Terrace, South Shields, Alkali Works Manager.
O.M. Watson, Jno., c/o City and Suburban Gold Mining Co., Box 1026, Johannesburg, Transvaal, South Africa, Technical Chemist.
O.M. Watson, Jno. C., Schluesselberg, near St. Petersburgh, Russia, Technical Chemist.
1891. Watson, Jno., 56, Cantwell Road, Woolwich Common, S.E., Analytical Chemist.
O.M. Watt, A., c/o Macfie & Sons, 34, Moorfields, Liverpool. Sugar Works Chemist.
1901. Watt, Francis L., 111, Lauderdale Mansions, Lauderdale Road, Maida Vale, W., Student.
1900. Watts, Chas. J., 40, City Road, London, E.C., Manufacturer.
1893. Watts, Jno. Isaac, Fairleigh, Hartford, Cheshire, Alkali Works Manager.
1903. Wayland, Wm. A., 12, Albert Road, Brockley, S.E., Manufacturing Chemist.
1900. Webb, Jno. F., 20, Louvaine Road, St. John's Hill, Battersea, S.W., Mining and Electrical Engineer.
1901. Webb, Wm. J., 90, Ash Street, Yonkers, N.Y., U.S.A., Superintendent of Printing Department.
1891. Weber, C. Otto, Heathfield, Middleton Road, Crumpsall, Manchester, Analytical Chemist.
1884. Webster, C. S. Stanford, Malvern House, Redland, Bristol, Professor of Chemistry.
1901. Webster, Geo J., Standard Chemical Co., Ltd., Gooderham Building, Toronto, Canada, Secretary.
1902. Webster, Jno., Chemical Laboratory, Guy's Hospital, S.E., Analyst.
1897. Wedge, Utley, Pennsylvania Salt Manufacturing Co., Philadelphia, Pa., U.S.A., Chemist.
1902. Weed, Hy. T., 408, Third Street, Brooklyn, N.Y., U.S.A., Teacher of Chemistry.
1893. Weeks, H. B., 2, Infield Park Road, Barrow-in-Furness, Analytical Chemist.
1895. Weems, Dr. J. B., Iowa Agricultural College, Ames, Iowa, U.S.A., Agricultural Chemist.
1898. Weeple, Lawrence, Pinchin's Wharf, Stratford, E., Colour Works Chemist.
1903. Weinberg, J., Rosa, United Provinces, India, Chemist.
1902. Weiskopf, Erich, Dynamite Factory, Modderfontein, Transvaal, South Africa, Chemist.
1902. Weiss, Georg A., Chemische Fabrik, Ahlden a/Aller, Hannover, Germany, Chemical Manufacturer.
1898. Weissmüller, Rudolf E. *See* Miller, R. E. W.
1899. Weldon, Leonard E., Lime Villas, Egypt Road, Nottingham, Dyer.
1903. Wellcome, Henry S., Snow Hill Buildings, London, E.C., Manufacturing Chemist.
1891. Wells, Jas. Gray, Trent House, Branston, Burton-on-Trent, Brewing Chemist.
1894. Wells, Pierson L., 86, Joralemon Street, Brooklyn, N.Y., U.S.A., Patent Lawyer and Engineer.
1885. Welsh, Jas., Horrocks Lane Dyeworks, Red Bank, Manchester, Printworks Manager.
1890. Welsh, Thos. L., 3, Prince's Gardens, Dowanhill, Glasgow, Analytical Chemist.
O.M. Welsh, W., Holt Town, Manchester.
1897. Wense, Dr. W., Chem. Fabr. Griesheim-Elektron, Griesheim a/Main, Germany, Manager.
1890. Werner, Emil A., 5, Church Avenue, Rathmines, Dublin, Chemical Demonstrator.
1903. Wesener, Dr. John A., 103, State Street, Chicago, Ill., U.S.A., Consulting Chemist.
1884. Wessel, Carl, (communications) Geheimer Commerzienrath, C. Wessel, Bernburg; and (Journals) Deutsche Solvay-Werke, Act. Ges., Bernburg, Anhalt, Germany, Alkali Manufacturer.
1889. Wesson, D., P.O. Box 458, Savannah, Ga., U.S.A., Technical Chemist and Cotton-Oil Expert.
1903. West, Leonard, 203, Uttoxeter New Road, Derby, Manufacturing Chemist.
1900. Westenfelder, B. D., c/o American Oak Leather Co., Cincinnati, Ohio, U.S.A., Chemist.
1885. Westmoreland, J. W., 3, Love Lane, Eastcheap, E.C., Metallurgical Chemist.
1898. Weston, David B., Box 503, Sharon, Mass., U.S.A., Chemist.
1894. Weston, Robt. S., 14, Beacon Street, Boston, Mass., U.S.A., Chemist and Bacteriologist.
1885. Weston, Wm., H.M. Dockyard, Portsmouth, Analytical Chemist.
1902. Wethered, Wm. P., Redcourt, Carnatic Road, Mossley Hill, Liverpool, Manager.
1890. Wetter, Jasper, 37–39, Essex Street, Strand, W.C., Patent Agent.
1883. Wetzel, H. A., Box 488, Detroit, Michigan, U.S.A., Manufacturing Chemist.
O.M. Whalley, L. J. de, 172, Erlanger Road, New Cross, S.E., Sugar Chemist.
1904. Whatmough, Dr. Wm. H., Woodleigh, Cheadle, Cheshire, Chemist.
1898. Wheeler, Edw. J., 79, Chapel Street, Albany, N.Y., U.S.A., Analytical Chemist.
1903. Wheeler, Ernest, 335, Park Road, Oldham, Lancashire, Analytical Chemist (Platt Bros. and Co.).
1895. Wheelwright, Dr. E. W., Greenholme, Westfield Road, Acock's Green, near Birmingham.
1898. Whichelo, Matthew A., 9, Eversfield Road, Eastbourne, Aërated Water Manufacturer.
O.M Whiffen, T., Lombard Road, Battersea, London, S.W., Manufacturing Chemist.
O.M. Whiffen, Thos. J., Harefield, Southfields, S.W., Manufacturing Chemist.
O.M. Whiffen, W. G., Lombard Road, Battersea, London, S.W., Manufacturing Chemist.
1902. Whipple, G. C., Mount Prospect Laboratory, Flatbush Avenue, and Eastern Parkway, Brooklyn, N.Y., U.S.A., Chemist.
1893. Whitaker, Alf., Newlaithes Grange, Horsforth, Leeds, Dyer.
1899. Whitaker, Milton C., c/o Welsbach Light Co., Gloucester City, N.J., U.S.A., Chemist.
1895. Whitaker, Thos., Newlay Hall, near Leeds, Dyer.
O.M. Whitaker, Thorp, (Journals) Bradford Dyers' Association, Ltd.; and 35, Pemberton Drive, Bradford, Yorks, Dyer's Chemist.
O.M. White, A. Dowler, 65, Cedar Gardens, Deodar Road, Putney, London, S.W., Chemical Manufacturer.
1898. White, Alf. H., 1003, East University Avenue, Ann Arbor, Mich., U.S.A., Instructor in Chemical Technology.
1893. White, Arthur F., 30, Cornwall Terrace, Manningham, Bradford, Yorks, Manufacturing Druggist.
1902. White, Geo. Arthur, P.O. Box 70, Vandergrift, Pa., U.S.A., Chemist.
1901. White, H. Graham, 24, Bidston Road, Oxton, Birkenhead, Works Chemist.
1889. White, Henry, 245, Western Road, Crookes, Sheffield, Manufacturing Chemist.
1887. White, J. Campbell. *See* Overtoun, Lord.
1898. White, Jno., County Offices, St. Mary's Gate, Derby, Public Analyst to County of Derby.
O.M. White, Paul T., Horton Field House, West Drayton, Chemical Manufacturer.
1903. White, Ralph, 35, The Cedars, Middlewich Road, Northwich, Engineer.
1894. White, W. Gilchrist, 86, Bay Street, Port Glasgow, N.B., Calico Printer's Chemist.
1892. Whitehead, J., 8, West Street, Rochdale, Dyer.
1903. Whitehouse, P. L., 10, Victoria Street, West Bromwich, Staffordshire, Oil Chemist.
1885. Whiteley, R. Lloyd, 5, Bagnall Street, West Bromwich, Staffordshire, Chemical Lecturer.
1892. Whiteside, Jno. L., 376, St. Helen's Road, Bolton-le-Moors, Chemical Lecturer.
1885. Whittaker, C. J., West Bank, Lytham, Lancashire, Chemical Engineer.
1901. Whitton, Jas. T., c/o Nobel's Explosives Co., Ltd., Ardeer, Stevenston, N.B., Chemist.
1884. Whowell, F., Carr Bank, Tottington, Bury, Lancashire, Bleacher.

1899. Wiarda, Jno. C., 259—273, Green Street, Brooklyn, N.Y., U.S.A., Manufacturing Chemist.
1897. Wiborg, F. B., The Ault and Wiborg Co., Cincinnati, Ohio, U.S.A., Manufacturer.
1890. Wickens, B. Foster, 31, Bermondsey Wall, London, S.E., Managing Director (Wickens, Pease & Co., Ltd.).
1887. Wielandt, Dr. Wm., Maltkestrasse, 8^1, Magdeburg, Germany, Chemist.
1904. Wieler, Eric E., 4, Palatine Road, Withington, Manchester, Chemical Merchant.
1900. Wiener, Aug. F., c/o Vanadium Alloys (1901), Ltd., 31, Lombard Street, London, E.C., General Manager.
1904. Wigg, Chas. E., Rockshaw, Merstham, Surrey, Electrical Engineer.
1883. Wiggin, W. W., Wiggin Street, Birmingham Heath, Birmingham, Nickel Refiner.
1897. Wigglesworth, Henry, 25, Broad Street, New York City, U.S.A., Manufacturing Chemist.
O.M. Wightman, C., 1, Fenchurch Avenue, London, E.C., Chemical Merchant.
1899. Wild, Roland C., The Grange, New Eltham, Kent, Analytical Chemist.
1893. Wilder, F. L., Morro Velho, Villa Nova de Lima, Estado de Minas Geraes, Brazil, Assayer.
1902. Wilder, Salmon W., jun., Merrimac Chemical Co., 77, Broad Street, Boston, Mass., U.S.A., Treasurer.
1899. Wildman, Arthur J., 17, Streatfield Avenue, East Ham, E., Chemist.
1902. Wiley, Harvey W., Bureau of Chemistry, Department of Agriculture, Washington, D.C., U.S.A., Chief.
1903. Wilkie, Jno. M., 83, Henry Road, West Bridgford, Nottingham, Analytical Chemist.
1885. Wilkin, Sir Walter, K.C.M.G., Appold Street, Finsbury, E.C., Yeast Manufacturer.
1901. Wilkins, Albert D., P.O. Box 34, Elizabeth, Pa., U.S.A., Chemist.
1895. Wilkins, Charles, 40, Church Lane, Hornsey, N., Manufacturing Perfumer.
1899. Wilkins, H. A. J., c/o New Jersey Zinc Co., 71, Broadway, New York City, U.S.A., Mining Engineer.
1900. Wilkins, W. G., (Journals) c/o Derby Chemical Colour Co., 17, Bridge Street; and 59, Uttoxeter Road, Derby, Colour Manufacturer.
1886. Wilkinson, J. B., Tong Street, Dudley Hill, Bradford, Yorks, Chemical Manufacturer.
1898. Wilkinson, Walter S., P.O. Box 835, Baltimore, Md., U.S.A., Asphalt Block Manufacturer.
1884. Will, W. Watson, 1, St. Agnes Place, Kennington Park; and (Journals) 162, Kennington Park Road, S.E., Professor of Organic Chemistry.
1903. Willard, C. T., 41, State Street, Schenectady, N.Y., U.S.A., Chemist.
1893. Willcox, Benjamin, 47, Lincoln's Inn Fields, London, W.C., Patent Agent.
1898. Willcox, Frank A., 18, Holmlands Park, Sunderland, Explosives Chemist.
1900. Willenz, Dr. Michel, Rue Haringrode, 4, Antwerp, Belgium, Leather Trades Chemist.
1903. Williams, Chas. Ed., Thornhayes, Sleaford, Seed Crusher.
1895. Williams, David T., 9, Calvert Terrace, Swansea, Chemist.
1903. Williams, Harvey L., P.O. Box 410, Bristol, Tenn., U.S.A., Manufacturer of Barium Salts.
1891. Williams, Henry J., 161, Tremont Street, Boston, Mass., U.S.A., Chemical Engineer.
1896. Williams, Jno. Taylor, 2, Queen Street, Wellington, Salop, Brewer.
1904. Williams, Jno. T., Glenbrook Avenue, Stamford, Conn., U.S.A.
1904. Williams, Naboth, 28, Rolleston Street, Warrington, Technical Chemist.
1902. Williams, Percy, British Uralite Co., Ltd., Higham,, near Rochester, Kent, Chemist.
1885. Williams, Rowland, Hale Cote, Haverbreaks, Lancaster, Analytical Chemist.
1900. Williams, Saml. H., Glastonbury, Conn., U.S.A., Soap Manufacturer.
1903. Williams, S. M., 269, Springdale Avenue, East Orange, N.J.. U.S.A., Chemist.
1885. Williams, T. Howell. *See* Idris, T. H. W.
1884. Williams, Prof. W. Carleton, Firth College, and 23, Broomgrove Road, Sheffield, Professor of Chemistry.
1902. Williams, Walter Scott, Arnold Printworks, North Adams, Mass., U.S.A., Chemical Engineer.
1887. Williams, W. Collingwood, 68. Grove Street. Liverpool, Analytical Chemist.
O.M. Williams, W. J., 5004, Franklin Street, Frankford, Philadelphia, Pa., U.S.A., Analytical Chemist.
1899. Williamson, G. N., 14, Dey Street, New York City, U.S.A., Manufacturing Chemist.
1894. Williamson, J. Alex., 14, Milton Avenue, Highgate, N., Analytical Chemist.
O.M. Williamson, Robt., Low Walker, Newcastle-on-Tyne, Technical Chemist.
1903. Wills, J. L., 133, Midwood Street, Brooklyn, N.Y., U.S.A., Technical Chemist.
1895. Willson, Thos. L., St. Catherine's, Ont., Canada, Electrical Engineer.
1891. Wilson, A. Poole, 16, Nora Terrace, Glasnevin, Dublin, Ireland, Analytical Chemist.
1890. Wilson, Alf., c/o Messrs. J. and E. Sturge, 18, Wheeley's Lane, Birmingham, Manufacturing Chemist.
1884. Wilson, Anthony W., 20, Westcott Street, Hull, Colour Works Manager.
1888. Wilson, Cecil H., c/o Sheffield Smelting Co., Ltd., Sheffield, Metallurgical Chemist.
O.M. Wilson, C. J., 14, Old Queen Street, Westminster, S.W.
1888. Wilson, David, jun., Carbeth, Killearn, by Glasgow.
1885. Wilson, Frank, 7, Bedford Square, London, W.C., Brewer.
1903. Wilson, Geo. C., Mysore Gold Mines, Marikuppam, Mysore State, India, Chemist.
O.M. Wilson, G. E., The Chemical Works, Oldbury, near Birmingham, Chemical Manufacturer.
1902. Wilson, Geo. W., 18. Dinting Vale, Dinting, near Manchester, Works Chemist.
1899. Wilson, Gordon (Jnls.), c/o Lavenga Herms., Mineral Animas, Pueblo Nuevo, Durango, Mexico; and (subscriptions) Benallan, Kirkintilloch, N.B., Chemist and Assayer.
1886. Wilson, Jno., Tyneside, Hagley Road, Birmingham, Technical Chemist.
1896. Wilson, Jno., The Vines, Oxford Road, Runcorn, Chemical Engineer.
1902. Wilson, Jno. B., Mount Morgan Gold Mining Co., Mount Morgan, Queensland, Australia, Mining Engineer.
O.M. Wilson, J. H., 6, Fenchurch Buildings, E.C., Chemical Manufacturer.
1902. Wilson, Leonard P., Stocksfield, Church Road North, Hanwell, W., Technical Chemist.
O.M. Wilson, R. H., Egglescliffe, R.S.O., Co. Durham, Chemical Manufacturer.
1900. Wilson. Walter A., Ardeer, Stevenston, Ayrshire, N.B.
1885. Wilson, Dr. W. H., Presidency College, Madras, India, Lecturer on Physics.
1890. Wilson, W. W., The Grange, Carbrook, near Stalybridge, Analytical Chemist.
1884. Wilton, Thos., Winsor House, Beckton, E., Tar Works Manager.
1901. Wing, Herbert H., Monticello, N.Y., U.S.A., Chemical Engineer.
1892. Wing, J. D., 22, William St., New York City, U.S.A., Merchant.
1893. Wingate, Hamilton M., 24, Wynell Road, Forest Hill, S.E., Technical Chemist and Metallurgist.
1892. Wingfield, T. R., 5, Bromwich Street, Bolton, Brewer.
O.M. Wingham, A., Livermead House, Torquay, Metallurgical Chemist.
O.M. Winser, P. J., Moor House, Biddulph Moor, Congleton, Cheshire, Soap Works Manager.

O.M. Winsloe, H., c/o Tennants & Co., Clayton, Manchester, Manufacturing Chemist.

1892. Winstanley, Hy., Mayfield, Sutton Road, Heaton Norris, near Stockport, Technical Chemist.

1886. Winstone, E. H., Members' Mansions, 36, Victoria Street, London, S.W., Ink and Paint Manufacturer.

1892. Wirtz, Dr. Quirin, 28, Great Ormond Street, W.C., Consulting Chemist.

1900. Wishart, Harlan L., c/o Lake Superior Powder Co., Marquette, Mich., U.S.A., Chemist.

1889. Wishart, Jno., 39, St. Vincent Place, Glasgow, General Manager (Oakbank Oil Co., Lim.).

1902. Withers, Prof. W. A., State A. and M College, West Raleigh, N.C., U.S.A., Professor of Chemistry.

1899. Withinshaw, John G., Penketh, near Warrington, Tanner.

O.M. Witt, Dr. Otto N., Siegmundshof, 21, Berlin, N.W., Professor of Chemistry.

1892. Witthaus, Dr. R. A., Cornell Medical College, First Avenue and 28th Street, New York City, U.S.A., Professor of Chemistry.

1903. Wolf, Jacques, c o Jacques Wolf and Co., Passaic, N.J., U.S.A., Manufacturing Chemist.

1894. Woltereck, Dr. H. C., 3, Edinburgh Mansions, Howick Place, Victoria Street, S.W., Consulting Chemist.

1903. Wolton, Wm. R., c/o Joseph Fison and Co., Ltd., Ipswich, Manager.

1890. Wood, Ebenezer. Stephenson Street, Canning Town, E., Manufacturing Chemist.

1900. Wood, Frank, Hazelhurst, Doncaster Road, Barnsley, Yorks, Assistant Manager (Glass Works).

1901. Wood, Frank S., 25, Suffolk Street, Newland, Hull, Cement Works Chemist.

1887. Wood, Jos. T., 62, Park Road, Nottingham, Tanner.

1886. Wood, Wm. 20, Rue Général van Merlen, Antwerp, Belgium, Bleacher and Dyer.

O.M. Woodcock, R. C., American and Continental Sanitas Co., 636–642, West 55th Street, New York City, U.S.A., Technical Chemist.

1888. Woodham, Kingston G., 5, Lethbridge Road, Southport; and (Journals) c/o Price's Patent Candle Co., Ltd., 3, Cross Street, Manchester, Oilworks Manager.

1902. Woodhead Chas. E., 40, Westwood Street, Moss Side, Manchester, Chemist.

1881. Woodhead, Jas., Inglewood, Slaithwaite, near Huddersfield, Tar Distiller.

1890. Woodman, Dr. Durand, 127, Pearl Street, New York City, U.S.A., Analytical Chemist.

1900. Woodrow, John, 12, Park Road, Hull, Chemist.

1902. Woodside, F. Frank, Chesco Chemical Co., Uwchland, Pa., U.S.A., General Manager.

1896. Woodward. Jas., 31, Coventry Road, Ilford, Essex, Government Analyst.

1904. Woolcott, Geo. H., 26, Birdhurst Road, Croydon, Brewer's Chemist.

1896 Woolf, Julian, 51, Buckland Crescent, South Hampstead, N.W., Manufacturer.

1889. Woolf, Mortimer, Yeatman and Co., Denmark Street, E.; and (Journals) Mayfield, Mortimer Road, St. John's Wood, N.W., Vinegar Brewer.

O.M. Woolley, G. S., Victoria Bridge, Manchester, Pharmaceutical Chemist.

1891. Woolworth, J. G., 11, Halsey Street, Providence, R.I., U.S.A., Consulting Chemist.

1901. Worden, Edw. C., c/o Clark Thread Co., Newark, N.J., U.S.A., Analytical Chemist.

1888. Worms, Emil, Elabouga, Govt. of Viatka, Russia, Technical Chemist.

O.M. Worrall, H., Crimsworth, Whalley Range, Manchester, Dyer.

1903. Worstall, Robt. A., c/o Chicago Varnish Co., Chicago, Ill., U.S.A., Chemist.

1895. Worth, F. G., The Acetylene Illuminating Co., 3, Victoria Street, London, S.W., Managing Director.

1900. Worthington, Arthur, Starrcliffe Terrace, Great Lever, Bolton, Chemist and Sub-Manager.

1894. Wotherspoon, Peter, 135, Bede Burn Road, Jarrow-on-Tyne, Chemist.

1896. Wrampelmeier, T. J., E. I. du Pont de Nemours Powder Co., 39, Victoria Street, Westminster, S.W., Chemist and Representative.

O.M. Wray, O. J. P., Haslemere, Coleraine Road, Blackheath, S.E., Technical Chemist.

1901. Wren, E. Cecil, Glencoe, Egglescliffe, R.S.O., Co Durham, Vinegar Brewer.

1895. Wright, Arthur C., c o Turner, Morrison and Co., 6, Lyons Range, Calcutta, India, Chemist.

1901. Wright, Harold E., c o Sir B. Samuelson and Co., Ltd , Middlesbrough, Chemist.

1885. Wright, Jos., 19, Arboretum Street, Nottingham, Lace Dresser.

O.M. Wright, L. T., The Mountain Copper Co., Keswick, Cal., U.S.A.

1894. Wright, Sidney B.,
,Chemist.

1900. Wright, Walter J., 11, Albion Terrace, Faversham, Kent, Chemist (Cotton Powder Co.).

1890. Wülfing, Dr. Charles, Hönningen a/Rhein, Germany, Technical Chemist.

1890. Wyatt, Dr. Francis, 39, South William Street and 29, Stone Street, New York City, U.S.A., Consulting Chemist.

O.M. Wyld, Jno., The Avenue, Lidgett Park, Roundhay, Leeds, Chemical Works Manager.

Y

1900. Yamaoka, S., 10, Nishikatamachi, Hongo, Tokio, Japan, Chief Engineer.

1901. Yardley, Frank, c/o Henry Jutson and Sons, Liverpool Street, Birmingham, Chemical Manufacturer.

1899. Yates, Arthur, Lebong Donok, Bencoelen, Sumatra, Netherlands Indies, Metallurgist.

O.M. Yates, F., 64, Park Street, Southwark, London, S.E., Chemical Manufacturer.

1897. Yates, Wm. H., 11, Lansdowne Road, Southport, Lancashire, Technical Chemist.

1898. Yetton, Thos., Fen Villa, Queen's Road, Loughton, Essex, Distiller's Chemist.
