In this process the dried beet or other material, preferably in a coarsely powdered condition, is treated in an extraction apparatus with alcohol of suitable strength, and at as high a temperature as possible without boiling the alcohol. When the latter is sufficiently saturated with sugar, it is removed from the residue and cooled to a low temperature to separate the sugar. The alcohol is then again used for extracting the residual matter, after which it is cooled dow as before. This process is repeated until all the sugar i removed from the material. The sugar thus obtained, either in crystals or as a syrup, is then refined.—T. H. P.

XVII.—BREWING, WINES, SPIRITS, Etc.

Beer; Condition, Viscosity, and "Head" Retention in ——. O. Mohr. Woch. f. Brau., 1904, **21**, 363—368.

Referring to Prior's hypothesis that the retention o carbon dioxide in beer is partly attributable to combinatio with primary phosphates, the author points out that th mean content of phosphoric acid in beer is only 0·07 pe cent. so that not more than 0·03 per cent. of carbon dioxid can enter into such a combination. Equally untenable i his opinion are the assumptions, based on no experimenta evidence whatever, of the formation of an ester by the unio of the carbon dioxide and the alcohol present. The formation of carbonic acid (H_2CO_3) in aqueous solution has lon been recognised. The combination of carbon dioxide wit the proteids of beer, as suggested by Hanke, is equall unsupported by experimental evidence, the gas bein merely held in suspension to an extent determined by th viscosity of the liquid. In examining the influence of th various constituents of beer on the viscosity, he uses th Ostwald viscosimeter, and finds that, with water = 100, on per cent. of absolute alcohol = 104—105, whilst 10 pe cent. = 156—157. The method is simpler than gravit determinations, and can be performed with about 5 c.c. o liquid. By the same method a 1·25 per cent. solution o dextrin gives the viscosity 109—110, and a 5 per cen solution = 142—147·9. Maltose has a far smalle influence on the viscosity, that of a 1·25 per cent. solutio being only 103, and a 5 per cent. solution = 112·5. Glycer gives almost identical results as maltose, whilst the miner salts have a still smaller influence, potassium chlorid even reducing the viscosity below that of water alone (th 7·46 per cent. solution = 93·3). Finally, the influence the proteids diminishes in proportion to the degree of degradation, casein (1 per cent. solution) giving 119·8, pepton 104·2, and asparagine 100·9. Ullik's assumption that th viscosity of beer is affected by (undetermined) substance present in very small amount, seems to be justified, sinc the calculations based on the viscosity of the alcohol an extract present (the latter being calculated as dextrin), giv results below those of the actual determination of the bee Nevertheless, the alcohol, and above all the extract, for the chief factors in governing the viscosity, and, therefor to ensure head retention, it is important to aim at lo attenuation, especially when working with worts of low initi gravity.—C. S.

Beer; Influencing the Retention of "Head" in ——. A. Bau. Woch. f. Brau., 1904, **21**, 382—383.

In addition to the positive causes of "head" retention, *i.e* viscous substances and infinitely minute colloid particle there must be taken into account a negative factor, namel the absence of substances tending to reduce the surfa tension of the beer. Among these head-destroying substances, the chief place is occupied by amyl alcohol an secondary octyl alcohol formed during fermentation, th addition of a drop of which to beer with good "head will cause the latter to dissipate immediately with bris effervescence. Next come the corresponding aldehyd and acids, whereas, contrary to the usual opinion, fa have little influence. It is well known that acetic ac lactic acid, succinic acid, and glycerol are among th by-products of fermentation in beer; but whether th various alcohols, aldehydes, and acids found in spirit an wines are also formed in beer has still to be determinined
—C. S.

Fermenting Liquids; Importance of Determining th Degree of Infection in —— immediately after Samplin P. Lindner. Woch. f. Brau., 1904, **21**, 368—369.

In sending samples of wort or beer through the post f biological examination, the relative character of the organis

y undergo alteration, and, therefore, cease to accurately
resent the original conditions. On this account the
hor recommends brewers to make droplet cultures
hollowed object glasses, since this method will give
cise indications in 15 to 20 hours, and will afford valuable
ormation as to the keeping qualities of a batch of bottled
r, for example.—C. S.

ltose Action ; The Constancy of —— and the Influence
f the Products of Reaction. C. Philoche. Comptes
end., 1904, **138**, 1634—1636.

e author brings forward fresh proofs of the constancy of
action of maltase, which retains its initial activity for
hours, in presence of the products of the transformation.
retardation produced in the action of maltase by the
ition of dextrose is much less than that exerted by
ert sugar on invertase.—T. H. P.

r ; Notes on Claussen's Paper on Sarcina Sickness
—. H. Will and R. Braun. Z. ges. Brauw.,
904, **27**, 462—463. (See this J., 1904, 332.)

the authors' experience a 5 per cent. solution of
nonium fluoride suffices to thoroughly disinfect brewery
nsils. For hose pipes the 0·5 per cent. solution re-
mended by Claussen for the detection of *pediococci*
uld be allowed to act for at least 12, and preferably
24 hours. The antiseptic should not, however, be used
many times or too long, for though it will continue
acious for three to four weeks, it afterwards allows
næ to develop. Contrary to Claussen's experience
have found that sarcina beer, after treatment for half
hour with an equal volume of a 1 per cent. solution
mmonium fluoride, was not freed from infection, develop-
nt taking place in ammoniacal yeast water. Very
k potassium fluoride (0·003—0·007 per cent.) greatly
urs the growth of sarcina, whilst retarding that of
ts and rod bacteria. They cannot agree that ammo-
al yeast water is entirely unsuitable for the detection
sarcina in brewery practice, having often found it
ble for this purpose, though care is necessary in adding
ammonia.—C. S.

rt and Beer Pipes ; Causes and Prevention of
nfection in ——. G. Luff. Z. ges. Brauw., 1904,
7, 453—456, 484—487.

RE is practically no difference in efficiency between the
ous disinfectants used for cleansing metal- and hose-
s, when diluted to the necessary working strength ; con-
ently selection must depend on the cost, possibility of
over again, and action on the pipes, utensils, &c.
nfectants containing hypochlorous acid cannot be used
e. Soda intended for use again must be kept in a
d vessel, whereas the hydrofluosilicic acid preparation
ntanin" can be stored in wooden utensils. Four per
. solutions of this efficient antiseptic have no action
he metallic fittings, varnish, or materials of brewing
sils or pipes. Since the action of disinfectants is in
ase more than temporary, the pipes to be cleansed
ld be treated at least once a week (more often in
ner) for two hours with a 4 per cent. solution of
ntanin," or with some other preparation of suitable
gth.—C. S.

ithin ; Presence of —— in Wine. A. Rosenstiehl.
Monit. Scient., 1904, **18**, 485—487.

RICH and Ortlieb (this J., 1904, 333) found 0·35 grm.
cithin per litre in a Greek wine from Thera : about as
as is contained in milk. In criticising their conclusions,
uthor points out that the lecithin is derived rather
the juice than from the pulp, and that it is not
ciably destroyed by his process of heating the must
fermentation.—W. A. C.

sing Ferment [Anaeroxydase] ; Action of an In-
ct —— on Vanillin and Morphine. E. Bourquelot

English Patent.

Filtering Liquids [Wines, Beers, &c.] ; Process and Apparatus for ——. S. H. Johnson and S. H. Johnson and Co., Ltd., Stratford. Eng. Pat. 10,753, May 10, 1904.

A vertical filter-press has the plates arranged around a central tie rod, and has a base plate attached to one end. In the latter are suitable openings for feeding and discharging the liquid. An air- and water-tight cover encloses the press, and is attached to the base plate. A strainer is provided to keep back larger particles of solid matter. The process applied to "fermented beverages and the like" is claimed as well as the apparatus.—W. H. C.

XVIII.—FOODS ; SANITATION ; WATER PURIFICATION, & DISINFECTANTS.

(*A*.)—FOODS.

Butter and Margarine ; Browning and Frothing of —— on Heating. G. Fendler. Chem. Rev. Fett- u. Harz-Ind., 1904, **11**, 122—124.

From the results of experiments (described in detail) the author concludes that the frothing of butter when heated is not due to the presence of soap. Margarine can be made to froth and become brown, like butter, by the addition of 0·2 per cent. of egg yolk or 0·2 per cent. of lecithin. The presence of traces of sugar, such as is introduced with the milk in milk margarine, is also a necessary factor for the browning.—C. A. M.

French Patents.

Milk Powder ; Process for Obtaining ——.
J. R. Hatmaker. Fr. Pat. 339,943, Jan. 27, 1904.

Before evaporating, the acidity of the milk is reduced to "3 degrees" by the addition of a suitable alkali. A preliminary titration is made on a small quantity of the milk in order to ascertain the amount of alkali (*e.g.*, sodium bicarbonate) to be added to the bulk thereof. "Degrees" of acidity is an expression referring to the number of c.c. of N/10 sodium hydroxide solution required per 100 grms. of milk.—W. P. S.

Milk and Lecithin Food Products ; Preparation of ——.
A. Fournier. Fr. Pat. 340,047, Jan. 30, 1904.

The claims are for mixtures of milk, cheese, butter, condensed milk or the like, and lecithin. The latter is added in the form of a concentrated alcoholic or ethereal solution. After thorough incorporation, the alcohol or ether is removed by evaporation, and the mixture sterilised. The lecithin solution and the milk may be separately sterilised before mixing.—W. P. S.

Milk; Process and Apparatus for Producing Purified ——, and Cream and Butter freed from all Objectionable Germs. G. Daseking and H. Paradies. Fr. Pat. 340,145, Feb. 3, 1904.

See Eng. Pat. 12,045 of 1903; this J., 1904, 381.—T. F. B.

Coffee; Process of making an Extract of ——. A. Farago and S. Bartha. Fr. Pat. 340,404, Feb. 12, 1904.

See Eng. Pat. 3465 of 1904; this J., 1904, 452.—T. F. B.

(*B.*)—SANITATION; WATER PURIFICATION.

Formaldehyde; Atmospheric ——. H. Henriet. Comptes rend., 1904, **139**, 67—68.

The author's determination of the amount of formaldehyde in the air (this J., 1904, 687) from the amount of carbonic acid formed when the air was passed over heated mercuric oxide, led to the figures 2 to 6 grms. per 100 cubic meters of air. Air containing such a proportion, however, would be quite irrespirable; hence the carbon dioxide formed cannot have proceeded from free formaldehyde, but was possibly derived in part from some compound of formaldehyde. Water through which air has been passed in large quantity gives the reaction of formaldehyde; but if the same water be previously treated with sulphuric or acetic acid, formaldehyde is indicated in much larger amount, which shows that some compound of formaldehyde does exist in the air. Delépine has shown that formaldehyde heated with water yields formic acid, carbon dioxide, and methyl alcohol; and as the author has found formic acid and extra carbon dioxide in the atmosphere at times of fog, he suggests that Delépine's reaction may occur in the atmosphere, and that the methyl alcohol and formaldehyde may react to form methylal, from which formaldehyde can be regenerated by the action of acids.—J. T. D.

Formaldehyde; Presence of —— in the Products of Combustion of Fuels. A. Trillat. II., page 744.

United States Patent.

Treating Sewage; [Electrolytic] Apparatus for ——. W. J. Schweitzer, Whiteplains, N.Y. U.S. Pat. 763,026, June 21, 1904.

An electrolysis chamber is used in conjunction with settling tanks for the treatment of sewage which is caused to flow through the system. The grease is subsequently removed, the sediment allowed to settle, and the purified water run off through a filter.—R. S. H.

(*C.*)—DISINFECTANTS.

United States Patent.

Insecticide Compounds. O. D. Goodell, Baltimore. U.S. Pat. 763,481, June 28, 1904.

The following substances mixed together compose this insecticide:—Barium sulphide (the chief constituent), barium silicate, potassium silicate, potassium oxide, and barium oxide, together with iron sulphide, silex, and carbon, if desired.—R. L. J.

XIX.—PAPER, PASTEBOARD, Etc.

United States Patent.

Viscose: Process of Purifying ——. C. F. Cross, London, Assignor to D. C. Spruance, Philadelphia. U.S. Pat. 763,266, June 21, 1904.

See Eng. Pat. 21,030 of 1903; this J., 1903, 1363.—T. F. B.

French Patent.

Celluloid; Artificial ——. J. Schmerber. Fr. Pat. 340,266, Feb. 8, 1904.

Methylacetanilide is claimed as a partial or complete substitute for camphor in the manufacture of celluloid. 40 parts of the two substances mixed or 30—35 parts of methylacetanilide only, dissolved in the usual proportion of alcohol are equal in effect to 50 parts of camphor per 100 of nitro-cellulose.—R. L. J.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Borax; Relation of —— to Carbonic Acid [Minera Spring Water]. L. Grunhut. Z. phys. Chem., 190 **48**, 569—576.

In aqueous solution, borax dissociates completely int sodium metaborate and free boric acid. This view, firs enunciated by Schweizer in 1856, is confirmed by th results of modern research, especially by Shelton's recen determinations of the change of electric conductivity of solution of borax as sodium hydroxide is slowly added to i If carbon dioxide be led into an aqueous solution of borax however, the sodium metaborate is decomposed, a corresponding amount of free boric acid is formed, and the whol of the sodium is converted into bicarbonate. If, in presenc of carbon dioxide, a large excess of boric acid be added, certain, though very slight, formation of sodium metaborat occurs, as shown by the slight decrease in electric condu tivity. From this it would seem that the small amount boric acid which occurs in the waters of some miner springs must exist, at least in the presence of free carbo dioxide, as free acid, H_3BO_3.—J. T. D.

Basic Mercury Salts. A. J. Cox. Z. anorg. Chem., 1904, **40**, 146—181.

The authors have applied the phase rule to the examinatio of the hydrolysis of mercury salts and find that mercur chromate, mercuric and mercurous nitrates, and mercur and mercurous sulphates are converted first into basic sal and then into the oxide; mercuric fluoride is convert directly into the oxide.

Mercuric Chromate.—Only one basic salt exists, dark red powder of the composition, $3HgO.CrO_3$, and th is not stable when the acid-concentration of the solution less than 0·00026 N at 50° C. The other so-called bas mercuric chromates are merely mixtures either of t normal and basic salts or of the basic salt and mercur oxide. The normal chromate is stable only when the aci concentration of the solution is as high as 1·41 N 50° C.).

Mercuric Nitrate.—One basic salt, a heavy white powd of the composition, $3HgO.N_2O_5$, exists. The minimu acid-concentration at which the normal and basic sal respectively, are stable at 25° C. are 18·72 N and 0·159

Mercuric Sulphate.—The basic salt has the compositio $3HgO.SO_3$, and forms a heavy, bright lemon-yell powder, much less soluble than the normal salt. T minimum acid-concentrations at which the compounds a stable at 25° C. are: normal salt, 6·87 N; basic sa 0·0013 N.

Mercuric Fluoride.—This salt is converted directly i mercuric oxide by the action of water, no basic salt bei formed. It is stable when the acid-concentration of t solution is 1·14 N at 25° C.

Mercurous Nitrate.—Two basic salts were isolated, on white powder having the composition, $5Hg_2O.3N_2$ $2H_2O$, and the other a yellowish-green powder, proba $3Hg_2O.N_2O_5.2H_2O$. It is probable that other basic sa also exist. The minimum acid-concentrations at which t compounds are stable at 25° C. are: normal salt, 2·95 basic salt, $5Hg_2O.3N_2O_5.2H_2O$, about 0·293 N; basic s $3Hg_2O.N_2O_5.2H_2O$, 0·0017 N.

Mercurous Sulphate.—Only one basic salt, $2Hg_2O.S$ H_2O exists, and this is stable when the acid-concentrat of the solution is 0·00056 N at 25° C. The normal salt stable when the acid-concentration is 0·0042 N at 25° C. —A. S

Potassium Iodide; Decomposition of ——, by Fats. Heffter. Schweiz. Woch. Chem. Pharm., 1904, **42**, 3 Chem.-Zeit., 1904, **28**, Rep. 188.

Potassium iodide ointment, prepared with lard and wat becomes coloured sooner or later, small quantities of iod being liberated. The substance causing this decomposit is found to be the hydrogen peroxide contained in water made use of; the action is accelerated in prese trace of free fatty acids. The fats are said to be "auto-:idisable substances," which take up oxygen from the :, yielding peroxide compounds, the latter then oxidising e water to hydrogen peroxide.—T. H. P.

Iorphine Reaction ; New ——. C. Reichard. XXIII., page 763.

\ux Vomica ; Extract of ——. K. Papl. Apoth.-Zeit., 1904, **19**, 325 ; Pharm. J., 1904, **73**, 10.

XPERIMENTS to determine the best conditions for the eparation of extract of nux vomica led to the following sults, the most satisfactory extract being that obtained by rcolating with dilute alcohol at between 20° and 30° C.

Extraction with 70 per cent. Alcohol.

Temperature.	Yield of Extract.	No. of c.c. of N/100 Acid required by Alkaloids in 0·66 grm. of Extract.
° C.	Per Cent.	
0	8·368	30·7
10	8·404	30·5
15	8·612	30·9
20	8·766	32·6
25	8·766	32·7
30	8·954	31·4
40	8·666	29·9
50	8·602	30·4
60	8·078	29·8

Extraction at 25°—30° C.

trength of Alcohol.	Yield of Extract.	No. of c.c. of N/100 Acid required by Alkaloids in 1 grm. of Extract.
Per Cent.	Per Cent.	
40	9·358	38·6
50	9·286	44·4
60	9·668	47·5
70	8·864	..
80	8·162	46·7
90	6·398	42·3
99	5·474	35·6

The extracts obtained with 40 and 50 per cent. alcohol ere friable ; in the others the proportion of fat increased ith the strength of the alcohol used. Previous removal of e fat by means of petroleum spirit did not give satis-ctory results, the yield and strength of the extract both ing diminished.—A. S.

'anillin and Morphine ; Action of an indirect Oxidising Ferment [Anaeroxydase] on ——. E. Bourquelot and L. Marchadier. XXIV., page 766.

'anilla containing Heliotropin. Göller. Pharm. Centralh., 1904, 192. Chem. and Druggist, 1904, **65**, 13.

HE author finds that the vanillon or pompona (the fruit of *anilla pompona*), and the fruit of *V. planifolia* contain liotropin as well as vanillin. These varieties of vanilla nnot be used as spices, but are employed to a considerable tent in perfumery.—A. S.

hodinol, the Characteristic Alcohol of Oil of Roses ; Complete Synthesis of ——. L. Bouveault and Gourmand. Comptes rend., 1904, **138**, 1699—1701.

OUVEAULT and Barbier (this J., 1896, 373) first identified odinol, and showed it to be characteristic of the oils rose and of *Pelargonium odoratissimum.* Tiemann and hmidt suggested that it was an optical isomeride of tronellol, but Bouveault showed that the isomerism must chemical, and no doubt due to a difference in the sition of the double linkings, rhodinol being—

$$(CH_3)_2C:CH.CH_2.CH_2.CH(CH_3).CH_2.CH_2OH ;$$

hilst citronellol is—

$$CH_2:C(CH_3).CH_2.CH_2.CH_2.CH(CH_3).CH_2.CH_2OH.$$

The authors have now, by treating ethyl geraniate with sodium, according to Bouveault and Blanc's method of converting esters into alcohols (this J., 1903, 888), obtained from it rhodinol ; and as the constitution of ethyl geraniate has been established by complete synthesis to be—

$$(CH_3)_2 : C : CH.CH_2.CH_2.C(CH_3) : CH.CO_2.C_2H_5,$$

the constitution of rhodinol must be that above given. Similar treatment of ethyl rhodinate, prepared from synthetic geranic acid by Tiemann's method, gave racemic rhodinol, agreeing with rhodinol from oils of rose or of pelargonium in all its characters save optical rotation. The natural and the synthetic rhodinol yield identical pyruvates, colourless oily substances of peculiar odour, boiling at 143° C. at 10 mm., and giving identical crystallised semicarbazones when treated with semicarbazide.—J. T. D.

Robinin ; Study of the Glucoside ——. N. Waliaschko. J. russ. phys.-chem. Ges., 1904, **36**, 421—438 ; Chem. Centr., 1904, **1**, 1609—1610.

THE robinin was prepared by boiling fresh acacia blossoms with water, or extracting the dried flowers with ether. It has the composition, $C_{33}H_{40}O_{19}.7\frac{1}{2}H_2O$; 7 mols. of water are easily split off, but the last $\frac{1}{2}$ mol. is evolved only at 110° C. On hydrolysis with mineral acids it yields almost quantitatively a yellow dyestuff, *robigenin*, $C_{15}H_{10}O_6.H_2O$, 2 mols. of rhamnose, and 1 mol. of galactose. Robigenin loses its water of crystallisation at 130° C. and melts at 270° C. ; it belongs to the flavone group of dyestuffs. —A. S.

Phenocoll ; Detection of —— *in cases of Poisoning.* A. Archetti. XXIII., page 763.

Carbon ; Determination of ——, *by Sodium Peroxide and Barium Chloride in Explosive Compounds and Organic Bodies burning with difficulty* [*Alkaloids, &c.*]. F. von Konek. XXIII., page 763.

Chloroform ; Influence of Moist Alcohol and Ethyl Chloride on the Boiling Point of ——. J. Wade and H. Finnemore. Chem Soc. Proc., 1904, **20**, 163.

CHLOROFORM, when made from alcohol, contains a small quantity of ethyl chloride, the absence of which from chloroform made from acetone detracts from its efficiency as an anæsthetic. The ethyl chloride depresses the boiling point of the chloroform ; it was partially isolated by fractionation through a Young's evaporator column, and was identified by conversion into silver propionate. Incidentally, the authors have isolated binary mixtures of chloroform and alcohol, and chloroform and water, and a ternary mixture of chloroform, alcohol, and water, all of minimum boiling point. The first binary mixture boils at 59·4° 760 mm., has a sp. gr. 1·1125 at 15°/15°, and contains 7 per cent. of alcohol. The second binary mixture boils at 56·1°/mm., and contains about 1 per cent. of water. The ternary mixture boils at 55·5° 760 mm., and contains 4 per cent. of alcohol and about 3·5 per cent. of water. The water in both these mixtures separates at once from the distillate.

Electrically Extracting Essential Oil ; Process and Apparatus for ——. G. D. Barton, Assignor to Boston Leather Process Co. U.S. Pats. 763,151 and 763,152, June 21, 1904. XI. A., page 754.

FRENCH PATENT.

Meta-cresol ; Process for Producing —— *from Crude Cresol.* Chem. Fabr. Ladenburg, G. m. b. H. Fr. Pat. 339,880, Jan. 25, 1904.

THE process is based on the fact that the normal calcium salt of *m*-cresol is much less soluble in water or cresol than is the corresponding salt of *p*-cresol. Crude cresol may be saturated with calcium hydroxide, the mass which separates filtered off, and decomposed with acids, relatively pure *m*-cresol being obtained ; if less calcium hydroxide be used (*e.g.*, an amount equal to that of the cresol employed) the resulting crystalline mass is freed from the mother liquor by washing with benzene, and is finally decomposed by means of acid.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

Carbon; Determination of —— by Sodium Peroxide and Barium Chloride in Explosive Compounds and Organic Bodies burning with difficulty. F. von Konek. XXIII., page 763.

United States Patents.

Explosive Compound. C. M. Hall, Niagara Falls, U.S.A. U.S. Pat. 763,666, June 28, 1904.

The explosive consists of silicon in an oxidisable condition and an oxidising agent.—G. W. McD.

Explosive Compound. C. M. Hall, Niagara Falls, U.S.A. U.S. Pat. 763,665, June 28, 1904.

The explosive consists of a finely powdered brittle alloy containing aluminium, iron, and silicon mixed with ammonium nitrate.—G. W. McD.

Explosive. W. Kirssanoff, Russia, Assignor to Société en Actions "Promethée." Directeur Metchislaw Fiedler, Moscow, Russia. U.S. Pat. 763,675, June 28, 1904.

The explosive consists of potassium chlorate (70 per cent.), potassium permanganate (20 per cent.), turpentine (9 per cent.), and carbolic acid (1 per cent.).—G. W. McD.

XXIII.—ANALYTICAL CHEMISTRY.

INORGANIC—QUALITATIVE.

Alkali Fluorides; Detection of —— in Foods. J. Froidevaux. J. Pharm. Chim., 1904, **20** 11.

About 30 grms. of the finely chopped material are cautiously incinerated in a platinum capsule with 1 or 2 c.c. of 50 per cent. sodium carbonate solution, until all the organic matter has been destroyed. The residue is powdered, boiled with 5 or 6 c.c. of distilled water for a few minutes in the same capsule and filtered; the filtrate is treated with excess of pure hydrochloric acid and a few drops of helianthin. Saturated solution of ammonium acetate is then poured into the mixture until the appearance of a yellow colour. One or 2 c.c. of calcium chloride are added; in the presence of fluorides a turbidity, or a precipitate will be formed. Under these conditions the free hydrochloric acid is completely saturated while acetic acid is liberated, which prevents the ultimate precipitation of the phosphates by the calcium chloride, and favours the precipitation of calcium fluoride.

The nature of the precipitate may be verified by heating the cloudy liquid, collecting, washing, and drying the precipitate and introducing it with sand and sulphuric acid into Sanglé Ferrière's apparatus. The reaction is sufficiently delicate to detect an admixture 0·05 per cent. of an alkali fluoride with meat or meat products.—J. O. B.

INORGANIC—QUANTITATIVE.

Sulphuric Acid; Determination of ——, especially in presence of Iron. G. Lunge. Zeits. angew. Chem., 1904, **17**, 949—953.

Silberberger (this J., 1903, 1149, and 1904, 358) has contended, in favour of his method of precipitation by means of alcoholic solution of strontium chloride, that the author's method of determining sulphur in pyrites does not give accurate results, inasmuch as:—(1) in precipitating the ferric hydroxide, basic ferric sulphates are formed, from which the sulphuric acid cannot be washed out; (2) the barium sulphate precipitate contains barium chloride; (3) the filtrate contains barium sulphate, which is not absolutely insoluble in water or in the salt solutions concerned. The author claims that almost universal experience is against statement (1), and quotes the work of 22 of his students, new to the method, and working solely from printed directions, 12 of whom succeeded completely in washing out the sulphur, while only three had serious errors (0·15 to 0·27 per cent.) from this cause. Experiments were instituted to test Silberberger's method on potassium sulphate and on pyrites (the author holds that Silberberger should not have used sulphuric acid without neutralising, for his test determinations, and that his determination of its strength by alkalimetric titration of 10 c.c. measured by a pipette is not exact enough). In the experiments with potassium sulphate the filtrations were exceedingly tedious, requiring several hours, and the filtrates were never quite clear, though the error from this cause was only 0·02—0·03 per cent. The strontium sulphate was free from chloride, and the concentrated filtrate gave no further indication of strontium sulphate. Similar experiments in presence of ferric chloride showed the same peculiarities in the filtration, and the wet precipitate was always buff-coloured, while many hours of ignition (during which it gained weight) were necessary to bring it to constant weight. The ignited precipitates varied in colour, but all contained 0·23—0·35 per cent. of their weight of Fe_2O_3. Parallel experiments by Lunge's method, exactly as described in the "Alkali-maker's Pocket Book," gave, it is stated, rapid filtrations, clear filtrates, and precipitates constant after the first ignition, the whole operation requiring one-third to one-fourth of the time required for Silberberger's method. The results were 50·01, 49·63, 49·57 per cent., and the precipitates contained 0·43, 0·27, 0·42 per cent. of their weight of Fe_2O_3. The results by Lunge's method were 49·82, 49·87 per cent., with corrections under head 1, of 0·0; under head 2, of − 0·01, − 0·04; under head 3, of + 0·06, + 0·07 per cent.

The author's conclusions are that his method gives results of satisfactory accuracy without any correction, and that the known errors are very small and in opposite directions, while no error should arise from the retention of sulphur by the ferric hydroxide; but that Silberberger's method, said to be very troublesome, and costly from the amount of alcohol needed, though it gives satisfactory results when iron is absent, cannot be used for pyrites, as the results may differ by 0·5 per cent., from the retention of iron by the precipitate and the difficulty of attaining constant weight on ignition.—J. T. D.

Palladium; Separation of —— from other Metals, by means of Hydrazine. P. Jannasch and L. Rostosky. Ber., 1904, **37**, 2441—2461.

Group 1. From Aluminium, Chromium, Uranium, Molybdenum, and Tungsten.—To the mixture, containing just enough hydrochloric acid to preserve a clear solution (and, in the case of tungsten, 2 grms. of tartaric acid), diluted to 300 c.c., and heated to boiling, add 30 c.c., also boiling, of a solution of hydrazine sulphate saturated in the cold. Heat on the water-bath for a few minutes till the precipitate collects together, filter through asbestos in a hard glass tube, wash dry at 110°—120° C., reduce any palladious oxide by ignition in hydrogen, and weigh. In the filtrate, aluminium, chromium, or uranium, is determined by precipitation with ammonia, molybdenum by addition of ammonia and ammonium sulphide followed by hydrochloric acid, and conversion of the sulphide into trioxide by heating in air or oxygen, tungsten by adding to the filtrate 20 c.c. of concentrated hydrochloric acid, evaporating to small bulk, diluting, filtering off the separated tungstic acid and washing with water containing hydrochloric acid, evaporating the filtrate to dryness, completely charring the tartaric acid, extracting thoroughly with ammonia, precipitating the ammoniacal solution with quinoline, and igniting this and the former precipitate of tungstic acid together. In none of these cases does the excess of hydrazine salt interfere.

Group 2. From the Alkaline Earth Metals.—The process is similar to the above, except that (unless for dilute solutions of calcium) hydrazine hydrochloride must be used. The excess of hydrazine salt exerts no influence on the determination of barium or strontium as sulphate, or of calcium as oxalate.

Group 3. From Manganese, Nickel, Cobalt, Cadmium, and Copper (also Zinc and Iron, see this J., 1904, 729).—These netals form difficultly soluble metal hydrazine sulphates, vhich it was thought would interfere with the process by recipitating with the palladium ; but the separation from nanganese or cadmium is effected exactly as above, and rom nickel or cobalt by dilution to 400 c.c., before precipiation, instead of 300. Manganese is precipitated in the ltrate by hydrogen peroxide, nickel or cobalt by sodium ydroxide and hydrogen peroxide, cadmium by hydrogen ulphide. In no case does the excess of hydrazine salt nterfere. In the case of copper, though this metal alone s not precipitated by hydrazine salts, yet it always came own with the precipitated palladium, reduced, no doubt, y the catalytically formed hydrogen. The authors hope effect a separation by working in the cold, but have not et perfected the method.

Group 4. From Antimony, Arsenic, and Tin.—In the case f antimony, 6 grms. of citric acid are added to the solution, hich is diluted to 150 c.c., and precipitated as usual ; the eating on the water-bath, after precipitation is limited to ve minutes, and the filtrate returned if necessary upon the lter till clear. The antimony is precipitated and weighed s sulphide. Arsenic must be converted from the arsenious the arsenic condition, then the precipitation with hydrazine, an be carried out as in the case of aluminium. The arsenic an be determined in the concentrated filtrate as magnesium mmonium arsenate, without removing the excess of ydrazine. In the case of tin, the solution is evaporated to ryness, taken up with 10 c.c. of concentrated hydrochloric cid, diluted to 140 c.c., and precipitated hot with a solution f 1 grm. of hydrazine hydrochloride in 20 c.c. of water. recipitation does not occur for some minutes, and the recipitate can only be filtered after 1—2 hours on the ater-bath, even then requiring several passages through e same filter before the filtrate is clear. This precipitate practically pure metallic palladium. The tin is precipiated as sulphide.

Group 5. From Mercury, Lead, Bismuth, Silver, Platium, and Gold. – In none of these cases could a separation effected.—J. T. D.

alladium ; Determination of —— and its Separation from other Metals by means of Acetylene. H. Erdmann and O. Makowka. Ber., 1904, **37**, [11], 2694—2697.

he authors publish a preliminary note, pointing out that e separation by means of hydrazine proposed by Jannasch, eltges, and Rostosky (this J., 1904, 729, and preceding ostract) is not suitable for palladium. To separate alladium and copper, the present authors proceed as llows :—The palladium is precipitated from hydrochloric cid solution (about 1 c.c. of hydrochloric acid of sp. gr. ·05 to 30—60 c c. of solution) by passing in acetylene for minutes. The light brown precipitate is filtered, washed, ut whilst still moist into a porcelain crucible, and ignited ter the addition of a little ammonium nitrate. After eating for a few minutes in a current of hydrogen it is eighed. To the filtrate, ammonia, and 1 c.c. of a 10 per nt. solution of hydroxylamine chloride are added, and etylene passed for five minutes. The precipitate is tered off, washed, and ignited after evaporation with lute nitric acid. The palladium thus separated is free om copper, and the copper is free from palladium.
—L. F. G.

rsenic ; The Electrolytic Determination of Minute Quantities of ——. H. J. S. Sand and J. E. Hackford. Chem. Soc. Proc., 1904, **20**, 123.

high supertension of the cathode is requisite for the duction of arsenic acid to metallic arsenic, the reaction ing most readily effected in the presence of metals having is property, such as lead or zinc, and probably also ercury. The production of arsenic trihydride from senites is accomplished more readily by platinum cathodes an by those of copper, which have a much higher pertension. The authors recommend the use of lead ectrodes for the determination of minute quantities of senic, as their application causes a simplification of evious methods. Errors which may arise in the electrolytic methods owing to the presence of foreign metals can be rectified by the addition of lead acetate or zinc sulphate to the electrolyte except when the foreign metal is mercury. When lead and zinc cathodes are used, the smallest amount of arsenic which can be detected in alkaline solutions of arsenates and arsenites is about 30 times as great as in acid solution, but cathodes of platinum (which has a low supertension) are quite unsuitable.

Potassium Permanganate ; Standardisation of —— by the Electrolytic and Iodine Methods. F. Dupré. Zeits. angew. Chem., 1904, **17**, 815—817.

Potassium permanganate solutions which had been kept for at least a month, that is, until they no longer changed in strength, were examined by (*a*) Treadwell's electrolytic method (Z. anal. Chem., **2**, 68) and (*b*) Volhard's iodine method (Annalen, **198**, 333 and 318 ; Z. anal. Chem., **20**, 274). Results are given showing that the electrolytic method is quite trustworthy.—R. L. J.

Calcines ; Analysis of ——. J. P. Walker. Eng. and Mining J., 1904, **77**, 922.

For the analysis of the calcines, obtained by roasting in the McDougal furnace, fine concentrates having a composition corresponding to the formula $Cu_2S.6FeS_2$, the following determinations were made, the figures being those obtained in an actual analysis :—Total copper, 12·0 ; copper soluble in 20 per cent. sulphuric acid, 6·8 ; silica, 23·6 ; total iron, 35·0 ; iron present as ferrous oxide, 15·0 ; alumina, 7·6 ; total sulphur, 9·7 ; sulphur soluble in water, 0·4 per cent. Copper oxide was proved to be absent, therefore the copper soluble in sulphuric acid is taken to be that present as cuprous oxide. The ferrous oxide was determined by boiling 4·5 grms. of the sample for 15 minutes with 0·2 per cent. sulphuric acid in a flask fitted with a valve, filtering and titrating with permanganate, a correction being made for the ferrous iron produced by the action of the cuprous oxide, according to the equation : $Cu_2O + Fe_2(SO_4)_3 + H_2SO_4 = 2CuSO_4 + 2FeSO_4 + H_2O$. The actual composition of the sample under notice was then deduced as follows :—Silica, 23·6 ; alumina, 7·6 ; sulphur trioxide (from sulphur soluble in water), 1·0 ; cuprous oxide (from copper soluble in 20 per cent. sulphuric acid), 7·7 ; cuprous sulphide (from total copper less that in the form of cuprous oxide), 6·5 ; ferrous oxide, 20·6 ; pyrites, FeS_2 (from total sulphur less that present as cuprous sulphide and sulphur trioxide), 15·0 ; ferric oxide (from total iron less that present as ferrous oxide and pyrites), 17·0 ; total, 99·0 per cent.—A. S.

Sulphur in Golden Antimony Sulphide used for Rubber Manufacture ; Determination of ——. W. Esch and F. Balla. Chem.-Zeit., 1904, **28**, 595—596.

Two portions of golden antimony sulphide, weighing exactly 10 grms., were extracted in a Soxhlet apparatus, one with carbon bisulphide, the other with acetone. On evaporating the solvent and weighing the sulphur, 1·04 grms. and 1·05 grms. of extracted sulphur were found, corresponding to 10·4 and 10·5 per cent. The acetone extract was found to contain some golden antimony sulphide which had passed through the filter paper. On attempting similarly to determine the loss in weight of two samples on extracting with carbon bisulphide and acetone, drying and weighing the residue, the dried antimony sulphide was found to retain acetone. C. O. Weber has stated that antimony pentasulphide is decomposed into sulphur and antimony trisulphide on boiling with carbon bisulphide. This was shown to be erroneous by adding a weighed quantity of sulphur to antimony sulphide that had been extracted for one hour with carbon bisulphide, and extracting for four hours with carbon bisulphide. A quantity of sulphur exactly equal to that added was extricated. The carbon bisulphide used had been twice distilled over lead oxide, lead dust, and mercury. Ordinary impure carbon bisulphide slightly decomposes golden antimony sulphide, causing a loss of about 0·27 per cent. Benzene is not so suitable a solvent as carbon bisulphide.—L. F. G.

Nickel from Zinc; Electrolytic Separation of ——. Hollard and Bertiaux. Comptes rend., 1904, **138**, 1605.

The authors have already shown that the electrolytic separation of these two metals, impracticable by the ordinary methods because of the similar values of their polarisation-tensions, becomes possible by the employment of a soluble anode or by the addition of a reducing substance to the bath. They now find that zinc ammonium nitrite is a complex salt, does not yield zinc ions in solution, and hence is not an electrolyte; and they accordingly separate zinc from nickel as follows:—To the solution of the sulphates add successively 5 grms. of magnesium sulphate, 25 c.c. of ammonia (sp. gr., 0·924), dilute sulphuric acid to acidity, 12·5 grms. of ammonium nitrate, and 25 c.c. of saturated solution of sulphur dioxide. Boil till all sulphur dioxide is expelled, dilute with water, add 25 c.c. of the ammonia solution, make up to 300 c.c., and electrolyse at 85° C. with a current of 1 ampère. The results of analyses quoted are accurate.—J. T. D.

Molybdenum in Steel and Steel-making Alloys; Determination of ——. F. Van Dyke Cruser and E. H. Miller. J. Amer. Chem. Soc., 1904, **26**, 675—695.

The authors find that in the separation of molybdenum from iron by precipitating the latter as hydroxide, sodium hydroxide is more efficient than ammonia, but with both reagents the results are too high, owing to the formation of a ferric molybdate, which is slightly soluble in excess of alkali. Moreover, vanadium, uranium, and tungsten, if present, are not separated from molybdenum by this method. Molybdenum can be completely precipitated in presence of iron from an acid solution by hydrogen sulphide under pressure. The precipitate carries down mechanically a little iron, which must subsequently be removed by means of ammonia. Any chromium, vanadium, and uranium present remain in solution, and tungsten also, if 3—4 grms. of tartaric acid be added. It is pointed out that, contrary to what is stated in most text-books, tungsten trioxide is quite soluble in acids. The following method of working is recommended:—

Molybdenum Steel.—About 1 grm. of drillings is dissolved in 80 c.c. of "silicon mixture" (500 c.c. of concentrated nitric acid, 150 c.c. of concentrated sulphuric acid, and 1,500 c.c. of water), the mixture evaporated till fumes of sulphur trioxide appear, cooled, and the salts dissolved by adding 50 c.c. of hot water, and boiling. The solution is introduced into a pressure-bottle, 6 c.c. of concentrated sulphuric acid added, the whole diluted to about 200 c.c., and a very rapid stream of hydrogen sulphide passed through. The bottle is then closed, heated on the water-bath for 1—2 hours, allowed to cool, the contents filtered through a Gooch crucible with the aid of the pump, and the precipitate washed with dilute (1:50) sulphuric acid saturated with hydrogen sulphide. The asbestos and precipitate are removed from the crucible, treated with 10 c.c. of concentrated hydrochloric acid, 5 c.c. of concentrated nitric acid, and 10 c.c. of concentrated sulphuric acid, and the mixture evaporated till copious fumes of sulphur trioxide are evolved, air being meanwhile blown through the solution. The solution is then allowed to cool, 50 c.c. of water and excess of ammonia are added, and the asbestos and any precipitated ferric hydroxide are filtered off and washed with hot water. The filtrate is acidified, passed through a "reductor" containing unamalgamated zinc, and the molybdenum determined by titration with potassium permanganate solution, the conditions prescribed by Miller and Frank (this J., 1903, 1149) being observed. When tungsten is present it separates, partially, as tungsten oxide, when the acid solution first obtained is evaporated. It may be recognised by dissolving the deposit in ammonia, making strongly acid with hydrochloric acid, and adding a saturated hydrochloric acid solution of stannous chloride, followed by ammonium thiocyanate. A deep green colour indicates the presence of tungsten. If tungsten be present, the acid solution, after being evaporated as before, is cooled, treated with 50 c.c. of water and 5 grms. of tartaric acid, heated to boiling, and filtered into the pressure-bottle. The residue is washed with hot water, then again treated with the "silico mixture" and tartaric acid as before, the solution filtere into the pressure-bottle, and the method described abov followed.

Ferromolybdenum.—4—5 grms. are dissolved in 180–200 c.c. of "silicon mixture," the solution allowed to coo diluted to 1 litre, and 50 or 100 c.c. treated as in the case o molybdenum steel.

Molybdenum Metal.—2—3 grms. are dissolved in "silico mixture," concentrated hydrochloric acid added, the mixtur heated for some time, diluted with water, and filtered into litre flask. The filter is burnt, moistened with nitric acid i a platinum crucible, using as low a heat as possible, and th residue fused with potassium pyrosulphate. The melt i dissolved in hot water, the solution added to that in the litr flask, the whole made up to the mark, and 50 c.c treated a in the case of molybdenum steel.—A. S.

Soil Acidity; Comparison of Methods for the Determina tion of ——. F. P. Veitch. J. Amer. Chem. Soc., 1904 **26**, 637—661.

The two methods examined were the sodium chlorid method of Hopkins, Pettit, and Knox, and the author' lime-water method. The first method consists in shakin 100 grms. of soil with 250 c.c. of 5 per cent. sodium chlorid solution for three hours, filtering and titrating 125 c.c. o the boiled filtrate with standard alkali solution, usin phenolphthaleïn as indicator. The amount of alkali use multiplied by 4, is that required to neutralise 100 grms. o the soil. In the second method, three equal portions of th soil (each containing as many grms. as the standard lim water contains mgrms. per c.c.) are mixed with 50 c.c. o distilled water and varying amounts of standard lime wate and evaporated to dryness at 100° C. The residues ar allowed to stand for 12 hours with 100 c.c. of water, an 50 c.c. of each solution is evaporated down, after addition o a few drops of phenolphthaleïn, to a volume of 5 c.c., or unt a pink colour is produced. This process is repeated o fresh portions of soil, the differences in the amounts of lim water used being gradually diminished until the leas quantity of lime water which gives a pink colouration i found; this quantity is taken as the acidity equivalent o the soil. It is found that, as the soils tested contain mor organic matter, so the results obtained by the two method become more divergent, the former method showing th lower acidity. Soils containing little organic matter ma give higher acidity values by the former method, but it i concluded that this method will not generally indicate th necessity for sufficient lime dressing, hence, the secon method is more desirable as giving a true indication o the amount of lime required to render the soil slightl alkaline.—T. F. B.

Arsenic; Separation of —— *by Distillation in Hydroge Chloride.* G. T. Morgan. Chem. Soc. Proc., 1904, **20** 167.

A modification of Piloty and Stock's apparatus (Ber. 1897, **30**, 1649) was described in which the mixed sulphide of arsenic and antimony were distilled in a current o hydrogen chloride, so that the vapours did not come int contact with organic matter until after passing through cooled aqueous solution of hydrogen sulphide. In dealin with a mixture containing arsenic in the two states of oxidation, the distillation was first carried out in hydroge chloride, when the arsenious sulphide precipitated in th receiver represented the tervalent arsenic. On repeatin the distillation of the residual liquid in a current o hydrogen chloride mixed with hydrogen sulphide a secon precipitation of arsenious sulphide was obtained, this bein derived from the arsenic originally present in the quin quivalent condition.

Carbon; Determination of —— *by Oxidation with Chromi Acid.* G. T. Morgan. Chem. Soc. Proc., 1904, **20** 167.

Phosphoric acid was substituted for sulphuric or hydrochloric acid in the gravimetric estimation of carbon dioxide in native carbonates, and when these substances containe nic matter, chromic acid was subsequently added to contents of the distilling flask and the operation ated, the second increase in weight of the tared absorp- tube being due to the oxidation of the organic carbon. mixture of chromic and phosphoric acids was also used timating the total carbon in cast iron and ferroman- se, the employment of a non-volatile acid instead of uric acid obviating the risk of carrying over acid s into the weighed absorption tube.

ORGANIC—QUALITATIVE.

phene Reaction with Nitroso-sulphuric Acid. C. bermann and B. Pleus. Ber., 1904, **37**, 2461—2464.

ALBE found that certain benzenes from coke-ovens, n showed thiophene with the isatin reaction, did not any indication of it with Liebermann's reagent, and ned that this was caused by the presence of some rto unknown substance which affected the reaction. authors have carefully examined these benzenes, and that the explanation lies in the fact that they contain little thiophene, and that the isatin reaction is much delicate than that with nitrososulphuric acid. They find, contrary to the statement of Bauer, that the henin reaction is given by pure sulphuric acid, free nitrous or nitric compounds.—J. T. D.

se Oleines [Wool Oils]; Detection of Mineral Oil in stilled ——. A. H. Gill and S. N. Mason. J. Amer. em. Soc., 1904, **26**, 665–671.

authors sought to find methods of detecting adultera- of distilled grease oleines with cheaper mineral oils. find: (1) the bromine values, especially the bromine- ion values (this J., 1900, 176) of the hydrocarbons pure oleines, are much higher than those of mineral (2) the grease oleine hydrocarbons give a rotation of ·18° in the Laurent polariscope, whilst minerals oils nactive or give only a slight rotation (1°—2°); (3) the es of refraction of mineral oils are lower than those of istilled grease hydrocarbons. The following were some e results obtained :—

ohols; Purification and Identification of ——. . Bouveault. Comptes rend., 1904, **138**, 984—985.

dentification of liquids is always difficult and uncer- a mixture of isomers may be confounded with a te substance. This difficulty is felt in a high degree lcohols, most of which are liquid, and only separable one another by methods of fractionation. The various ds proposed for converting alcohols into other com- ts for identification are of very limited application: ne author now extends the limits by making use of yruvic esters. These, if primary or secondary, can ntly be prepared by simply heating together the l and pyruvic acid for some time, and then distilling; h some unsaturated alcohols (geraniol for example) composed by this process. Tertiary alcohols seem be decomposed by pyruvic acid, and yield alkylene carbons (a useful method of preparing the latter). The pyruvates all react energetically with semi-carbazide, and the semi-carbazones produced are stable well crystallised substances, each with its characteristic constants. By their means the alcohols can be identified (and, if necessary, purified). Treatment with alcoholic potassium hydroxide regenerates the alcohol.—J. T. D.

Morphine Reaction; New ——. C. Reichard. Pharm.-Zeit., 1904, **49**, 523. Chem.-Zeit., 1904, **28**, Rep. 195.

If to a mixture of formaldoxime sulphate and sulphuric acid, a trace of morphine or a morphine salt be added, an intense bluish violet colour is produced on warming. Atropine also gives a reaction with formaldoxime and sulphuric acid, a dark brown colour being produced, which however is destroyed on the addition of a few drops of water. A greater quantity of water is required to destroy the colour produced with morphine.—A. S.

Phenocoll; Detection of —— in Cases of Poisoning. A. Archetti. Chem.-Zeit., 1904, **28**, 597—598.

Phenocoll or aminoaceto-*p*-phenetidine—

$$C_2H_5O.C_6H_4.NH.(COCH_2.NH_2)$$

is a white powder of m. pt. 105·5° C., soluble in alcohol, soluble with difficulty in water, benzene, and chloroform. The aqueous solution gives a reddish-yellow precipitate with bromine water. It is soluble in concentrated sulphuric acid on warming, on adding potassium chromate a brown coloration, changing to green, is produced. On evaporating a little phenocoll with a few drops of caustic potash solution, neutralising with hydrochloric acid, and adding ferric chloride, a deep violet colour is produced. The reaction takes place in accordance with the following equation—

$$C_2H_5O.C_6H_4.NH(CO.CH_2NH_2) + KOH + H_2O = HO.C_6H_4.NH_2 + NH_2.CH_2.COOK + C_2H_5OH.$$

On shaking an aqueous solution of phenocoll hydrochloride with ether, no phenocoll can be extracted. On adding caustic alkali, it readily passes into the ethereal extract. In the body, phenocoll is decomposed into *p*-aminophenol and glycin, in accordance with the above equation.—L. F. G.

Lard; Crystals obtained in the Belfield Test for ——. H. Kreis and A. Hafner. XII., page 755.

ORGANIC—QUANTITATIVE.

Carbon; Determination of —— by Sodium Peroxide and Barium Chloride in Explosive Compounds and Organic Bodies burning with difficulty [Alkaloids, &c.]. F. von Konek. Zeits. angew. Chem., 1904, **17**, 888—891.

A solution of crystallised barium chloride (101·67 grms. per litre) is made use of, each c.c. being equivalent to 0·005 grm. of carbon in the form of barium carbonate. 0·5 grm. of the finely divided substance (in case of bodies not easily combustible 0·25 grm.) is intimately mixed with a weighed quantity of sodium peroxide (10—12 grms.) in a crucible and ignited. The mass when cool is dissolved and made up to 500 c.c. with water free from carbon dioxide. 100 c.c. or 200 c.c. of this solution (equivalent to 0.10 grm. of the organic body) are transferred to a 250 c.c. flask, and 20—25 c.c. of the barium chloride solution added and well agitated. The precipitated barium carbonate is filtered off through a dry filter and in 100 c.c. of the filtrate, the excess of barium chloride is estimated as sulphate, the difference being the barium chloride required to precipitate the carbonate formed during the reaction. The absence of sodium carbonate in the peroxide should be determined by a blank experiment. Alkaloids and picric acid were analysed as above with satisfactory results.—G. W. McD.

Phosphorus and Nitrogen; Determination of —— in Organic Bodies by means of Sodium Peroxide. F. von Konek. Zeits. angew. Chem., 1904, **17**, 886—888.

The material is ground in an agate mortar sifted through the finest gauze, and 0·5 grm. mixed with 10—15 grms. of sodium peroxide in a nickel crucible. The latter is placed in water in a basin and ignited in the usual manner. The melt is then dissolved out, filtered, acidified with hydrochloric acid, heated to drive off carbon dioxide, rendered alkaline with ammonia and precipitated with magnesia mixture. For the determination of nitrogen the same procedure is followed, but the aqueous extract containing the sodium nitrate is reduced in Devarda's apparatus by an aluminium-copper couple and estimated as usual.

—G. W. McD.

Briquettes; Determination of Proportion of Binding Material in ——. E. J. Constam and R. Rougeot. Zeits. angew. Chem., 1904, **17**, 845—848.

Samples of various pitches used in briquette manufacture were examined with the results enumerated in the following table.

Samples.	Softening Point.	Melting Point.	Coke.	Ash.	Soluble in Carbon Bisulphide.
	° C.	° C.	Per Cent.	Per Cent.	Per Cent.
German (23) ..	37—62·5	44—69	25—50	0·04—2·5	60—91
English (6) ...	43—55	52—61	40—50	0·12—0·8	66—79
Dutch (3)	45—52	52—59	50—53	0·15—0·19	63—64
Swiss (1)	53	61	35	0·27	67·8

For the determination of the carbon bisulphide extract, 1—2 grms. of the finely-divided pitch are mixed with about 10 times the amount of ignited sand and extracted for 72 hours in a Soxhlet apparatus, the extract being finally dried *in vacuo* for 4—5 days over phosphorus pentoxide. The plastic condition and the binding power of a pitch are in proportion to its solubility in carbon bisulphide. The carbon bisulphide extract of all the samples of pitch examined gave a mean of 76·3 per cent. and as in general about 7 per cent. of pitch is used in briquette manufacture the authors select 5·34 per cent. carbon bisulphide extract from a briquette as showing sufficiency of binding material, a conclusion confirmed by transport and compression tests. For the estimation of the carbon bisulphide extract from a briquette 10 grms. of the finely-divided material are extracted under similar conditions as described above except that no sand is required.—G. W. McD.

Gases containing Hydrogen; Fractional Combustion of —— by means of Heated Palladium Wire. F. Richardt. J. f. Gasbeleucht., 1904, **47**, 566—570 and 590—595.

The author has studied the behaviour of hydrogen, methane, ethane, and ethylene respectively, when mixed with air and passed over palladium wire. At temperatures up to 450° C., methane is found not to be attacked; above that temperature, even below a visible red heat, an appreciable proportion of the gas undergoes combustion, if it remains long enough in contact with the palladium; but if the current is led quickly over the palladium, practically none of the methane is burned even at 600°—650°. The delay in ignition thus indicated, finds its explanation in the observation of Mallard and Le Chatelier that explosive mixtures of methane and oxygen, when raised to the ignition temperature, do not explode at once, the retardation in the ignition amounting, at 600°—700° C., to about 10 seconds, but diminishing with rise of temperature, until at 1000° it is imperceptible. Any hydrogen present with the methane is burned completely at 450° C., even if the contact with the palladium wire be short. The presence of hydrogen does not affect the combustion of the methane, excepting that the retardation in the ignition disappears, on account of the rise of temperature caused by the combustion of the hydrogen. Ethane behaves on the whole in the same way as methane: these two gases cannot be separated by practical combustion. Ethylene begins to burn even at 300°, but cannot be fractionated from methane or ethane, as the ignition temperature of these two gases would be overstepped. In the determination of hydrogen by Bunte's method (which consists in passing the gas, mixed with air, through a heated capillary tube containing palladium wire, and noting the contraction in the volume of tl gas), the temperature has to be carefully regulated. I as is commonly recommended, the palladium is heat just to visible redness, a sensible amount of the methai is burned. If, however, the tube is heated just until tl alkali of the glass colours the Bunsen flame, and the g is led quickly through the tube, no methane is burne whilst the hydrogen disappears completely. One passa of the gas is sufficient; but it may safely be led ov again if desired, at even a higher temperature, since the absence of hydrogen the retardation in the igniti protects the methane from attack.—H. B.

Cocoanut Oil in Butter; Determination of ——. . Müntz and H. Coudon. Monit. Scient., 1904, 1 530—541.

The method proposed consists in determining the amou of insoluble volatile fatty acids yielded by the sample ai also the ratio which these bear to the soluble volatile fat acids. 10 grms. of the filtered fat are saponified in a fla by adding 5 c.c. of warm concentrated potassium hydroxi solution. The latter is of such strength that it forms saturated solution at 20° C. (about 120 grms. of potassiu hydroxide to 100 c.c. of water). The mixture of fat ai alkali is well mixed and kept at a temperature of 80° for 20 minutes, after which 200 c.c. of water are added ai the soap completely dissolved by shaking the contents of tl flask. Thirty c.c. of phosphoric acid solution (sp. gr. 1·1 are then introduced and the mixture freed from carb dioxide by subjecting it to a reduced pressure at a lo temperature. The flask is now connected to a condens by means of a spiral fractionating tube, the total leng of the latter being 1 metre, and the distillation proceed with. A few pieces of pumice or pipe-clay must be add to prevent bumping. Two hundred c.c. of distillate a collected and the distillation should take about an hour ai a half. The distillate is allowed to stand overnight, ai is then passed through a moistened filter, the receiver bei rinsed out with 5 c.c. of water. One hundred c.c. standardised lime-water are then added directly to tl filtrate and the neutralisation completed by running further quantities of the lime-water from a burette, usi phenolphthalein as indicator. The volume of lime-wat used is then calculated into butyric acid.

The insoluble volatile fatty acids obtained by the di tillation are dissolved from the condenser, receiver, ai filter with alcohol, and the solution titrated with tl standardised lime-water, the volume of the latter used bei calculated into butyric acid.

Pure butters when examined according to the abo method, yielded from 4·79 to 6·01 per cent. of solub volatile fatty acids (as butyric) and from 0·50 to 0·87 p cent. of insoluble volatile acids, whilst various samples cocoanut oil gave from 1·15 to 1·27 per cent. of solub volatile acids and 3·01 to 3·63 per cent. of the insolub volatile acids. The authors also calculate the ratio soluble to insoluble acids according to the formula—

$$\frac{\text{insoluble volatile acids}}{\text{soluble volatile acids}} \times 100$$

This gives a value varying from 9·1 to 15·6 in the ca of butter, whilst for cocoanut oil it lies between 250·3 ai 282·3. A sample of margarine yielded 0·04 per cent. soluble volatile acids and 0·16 per cent. of insoluble volati acids. (See also this J., 1904, 387.)—W. P. S.

Crude Rubber; Examination of ——. G. Fendler. Be d. d. Pharm. Ges., 1904, **14**, 208; Pharm. J., 190 **73**, 10.

The rubber cut into fine shreds is dried in a desiccator ov sulphuric acid. Two grms. of the dried rubber are di solved in petroleum spirit (in about 24 hours), the solutio made up to 100 c.c., and, after a short time, filtered throug a tared filter consisting of a tube containing a layer glass wool 1—2 cm. high. Fifty c.c. of the filtrate ai collected, and the residue is washed, dried, and weighe The 50 c.c. of filtrate are shaken with 70 c.c. of absolu alcohol, the precipitated caoutchouc washed by kneadin with a small amount of alcohol, dried, and weighe e solutions and washings are evaporated and the residual in weighed. The following results have been obtained this method.

ia Rubber ; Weber's Method for the direct Determination of ——. Paul Alexander. Gummi-Zeit., 1904, **18**, 89—791. See Weber, this J., 1903, 1211.

e author found it necessary to deviate from Weber's ructions a little in order to get satisfactory results. e to two grms. of the sample previously extracted with tone and alcoholic caustic soda, are placed in the decomtion flask with only just sufficient alcohol-free chloron to cover the bottom of the gas-inlet tube. Nitrogen oxide from 50 grms. of lead nitrate is then passed ugh in a rapid stream. After standing some hours, the roform is removed by immersing the flask in lukewarm er whilst drawing a current of dry air through the flask. he dry reaction product is dissolved in acetone and the tion filtered. The solution is then evaporated to a ll volume (not more than 20 c.c.), and poured into c.c. of 10 per cent. ammonium chloride solution and wed to stand over night in order to allow oily products to solidify. The further treatment is precisely rding to Weber's method. Benzene cannot be substil for chloroform as the tendency is much greater for addition product to settle in an oily condition. The or found it essential to use twice as much lead nitrate commended by Weber, also that it is important to keep olume of the acetone solution as low as possible before pouring into the ammonium chloride solution, otherwise difficulty is encountered in obtaining a solid product.

—J. K. B.

Tannin ; Determination of —— *without Hide Powder.* H. Wislicenus. Z. angew. Chem., 1904, **17**, 801—810.

The author describes the physical properties and chemical behaviour towards tanning agents, of a highly porous aluminium oxide and hydroxide, which show by their attraction for the tanning agents a certain analogy to the action of raw hide, and the use of these materials is thus suggested in the analysis of tan stuffs. The metallic compounds resulting from the use of the two substances are called tannal or tannalith.

Preparation.—Aluminium powder (100 grms.) is shaken in a capacious beaker with a 5 per cent. solution of caustic soda, the liquor being decanted off in a short time, fresh caustic soda added, and drained off, and the residue well washed by decantation. To the last washing water a small quantity of mercuric chloride is added, the white powdery hydroxide is drained and dried with alcohol and ether. The mass is then passed through a fine sieve (0·5 mm. mesh) to remove oxide and metal if any, which can be afterwards worked up as before. Alternatively, the aluminium may be at once treated with ethereal solution of mercuric chloride, then, with the calculated amount of water, and dried with alcohol and ether. The oxide is produced by heating the hydroxide in a flat porcelain dish.

Mode of Using.—2·5—3 grms. of the hydroxide or 2—2·5 grms. of the oxide are gradually added to 100 c.c. of the liquor to be analysed, well shaken, and left to stand for a few hours. The clear liquor may be tested with an iron salt to ascertain that absorption is complete. Fifty c.c. of the clear liquor are drawn off and evaporated to determine non tannins and by subtraction from the contents of 50 c.c. of original liquor the tannins are calculated. Further, if a known weight of oxide be employed, the tannalith may be dried and weighed and the increase in weight noted ; or the tannalith may be ignited and the loss observed, as checks on the estimation of tannin by difference.

Some of the analytical results compared with hide-powder determinations are shown in the following table, the quantities being grms. per 100 c.c.

Liquor.		Hide Powder.		Aluminium Hydroxide.		Aluminium Oxide.		Original Total Soluble.

	Non-tannin	0·1000	..	..	..	0·1042	..	..

e advantages claimed for the method are the certain simple preparation of the material and its regular y, its complete absorptive power, small quantity sary, capability of being washed free from nonis and of being weighed, its similarity in action le-powder, and, in addition, the fact that no special atus is required.—R. L. J.

zing Sugars ; Potassium Bromide as Indicator in the termination of —— *with Fehling's Solution.* P. Berti. l. Assoc. Chim. Sucr. et Dist., 1904, **21**, 1234—1236.

o small crystals of potassium bromide be placed on a lain plate, and, whilst moistening one with a drop of the other be moistened with a drop of a solution oper sulphate of 0·005 per cent. strength, and then h crystal be touched with a drop of concentrated sulphuric acid, the first will be observed to turn y, due to the formation of free bromine, whilst the second acquires a violet tint, due to the formation of anhydrous copper bromide. Potassium bromide may thus be used to indicate the final limit of the reaction with Fehling's solution applied, *e.g.*, in determining the reducing sugars in molasses. A drop of solution is placed on two superposed pieces of filter paper resting on a porcelain plate. A crystal of potassium bromide is then placed on the moistened spot on the plate and a drop of sulphuric acid added. The violet coloration ensues as long as copper is present. The results are within the limits of commercial work.—L. J. de W.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Zinc Blende ; Luminescent ——. A. S. Eakle and W. J. Sharwood. Eng. and Mining J., 1904, **77**, 1000.

The authors report on the occurrence of luminescent zinc blende in Mariposa county, California, Eureka county,

Nevada, and also in Colorado, Arizona, and Montana. The Mariposa ore has either a flaky or schistose structure, and ranges in colour from a light to a dark grey. It consists mainly of a granular mixture of white barite (barium sulphate) and brown sphalerite (zinc blende), the latter being the luminescent constituent. The ore also contains tetrahedrite and galena, and about 17 dols. of gold and 4 oz. of silver per ton. When the ore is scratched with a knife-blade (or even with the finger-nail), a bright line of light follows the point of the blade. The appearance is that of a series of momentary sparks, which are plainly perceptible in daylight. The ore is not radio active.
—A. S.

Vanillin and Morphine; Action of an indirect Oxidising Ferment [Anaeroxydase] on ——. E. Bourquelot and L. Marchadier. J. Pharm. Chim., 1904, **20**, 5—10.

It is found that the indirect oxidising ferments [anaeroxydases], such as are found in an infusion of oatmeal, react on vanillin and morphine, in the presence of hydrogen peroxide, precisely like the direct oxidising ferments or oxydases, forming dehydrodivanillin in the first case, and oxymorphine in the second. The action is quite independent of any decomposition of the hydrogen peroxide; if manganese dioxide be employed as the decomposing agent, the oxidisable body undergoes no modification, which demonstrates that the so-called "nascent" oxygen plays no part in the reaction. It appears that the oxygen given off under the action of anaeroxydases, is, at any rate partially, in a different molecular state at the time of its generation, to that formed by the action of manganese dioxide.

Oxydases and anaeroxydases have several properties in common which show that their functions are closely related. Thus the presence of a relatively high percentage of alcohol, even up to 50 per cent., does not hinder the action of either. Traces of hydrocyanic acid are sufficient to arrest their activity, and both ferments are much more resistant to heat than hydrolysing ferments. Bourquelot has advanced the theory that true oxidising ferments may be a special form of ozonides (in fact, peroxides), which, after having parted with their available oxygen to oxidisable bodies, absorb it again from the air and thus act as carriers of oxygen. For the continuous decomposition of the regenerated ozonide, the intervention of an anaeroxydase is necessary. A direct oxydase would therefore appear to be a mixture of such an ozonide and an anaeroxydase. The fact that direct oxydases almost invariably act on hydrogen peroxide is thus explained. This hypothesis has recently been advanced, although somewhat differently, by Chodat and Bach [*Biochem. Centralblatt*, 1903, **1**, 417]. See following abstracts. According to them, there are three classes of oxidising bodies, oxygenases (albuminoids which fix molecular oxygen forming peroxides); peroxydases, (indirect oxydases); and catalases (bodies which decompose hydrogen peroxide without themselves forming oxidation products). They therefore apply the term peroxydases, originated by Linossier, to the anaeroxydases, on the ground that the denomination is more in conformity with the nomenclature generally accepted for the soluble ferments.

The word peroxydase would indicate a ferment acting on peroxides and oxidising them, which is absurd, since it reduces them; while oxygenase would mean a body acting on oxygen and oxidising it. Anticipating this anomaly, Bourquelot has chosen, almost a year prior to Linossier, the terms "direct oxidising" and "indirect oxidising" ferments for these two groups, names which are self explanatory. As to the "catalases," since these are not agents of oxidation, they have no place in the category of the oxydases.—J. O. B.

IX. Peroxydase Reaction; Velocity of the ——*; Function of Peroxides in the Chemistry of Living Cells.* A. Bach and R. Chodat. Ber., 1904, **37**, 2434—2440. (See also this J., 1902, 1561; 1903, 384, 887; 1904, 210, 505.)

The authors show that the velocity of the action of peroxydase follows the law of mass action, in so far as the reaction is not disturbed by the products formed. Peroxydase must be regarded as an enzyme, and differs in onl one way from other enzymes: it becomes rapidly and com pletely used up in carrying out oxidation in presence c hydrogen peroxide, whilst other enzymes are more or les completely regenerated during their action, and are henc able to act on a relatively large quantity of material. Thi regeneration is, however, not a characteristic property c the enzymes, which are all more or less limited in the action.—T. H. P.

Oxido-reducing Enzyme; Existence and Conditions c Action of an —— *in Plants.* J. E. Abelous. Compte rend., 1904, **138**, 1619—1620.

The juice of the potato contains an enzyme which, lik one present in the animal organism, energetically reduce nitrates, but which is incapable of oxidising salicylic alde hyde, except in presence of an oxidising agent, such a potassium chlorate; the latter then undergoes partial re duction. This difference in mode of action between th oxido-reducing enzyme of the animal organism and that c the vegetable organism, is due to the oxydases present in th latter, which oxidise the substance reduced by the form enzyme. When the plant cells are not ruptured and whe air is excluded, so as to prevent the action of the oxydase potato juice is able to oxidise salicylic aldehyde.—T. H. P

Oxalates; Decomposition of —— *by Heat.* Alex. Sco Chem. Soc. Proc., 1904, **20**, 156.

In spite of the simple formulæ given to the oxalates, the decomposition by heat is by no means as simple as usual stated. Ordinary precipitated calcium oxalate turns gr on ignition, and this change, which is due to the separati of small quantities of carbon, occurs even with the pur calcium oxalate. This salt gives very little carbon dioxi and carbon, but always a little of each, decomposing pra tically in accordance with the equation usually give $CaC_2O_4 = CaCO_3 + CO$. Sodium and barium oxala decompose in accordance with the following equations: $7Na_2C_2O_4 = 7Na_2CO_3 + 3CO + 2CO_2 + 2C$; $8BaC_2O_4$ $8BaCO_3 + 6CO + CO_2 + C$. Magnesium oxalate giv exactly equal volumes of carbon dioxide and monoxide a no carbon, $MgC_2O_4 = MgO + CO + CO_2$, but almost all t other oxalates tested gave notable quantities of carb dioxide and carbon.

Butea Frondosa; Colouring Matter of the Flowers of —— A. G. Perkin. Chem. Soc. Proc., 1904, **20**, 169.

In a former communication (J. J. Hummel and A. Perkin, this J., 1903, 693), it was considered probable tl butein from *Butea frondosa* exists in a colourless, as well in a yellow form. These modifications are, howev distinct substances. The colourless compound now term butin, $C_{15}H_{12}O_5$, crystallising from alcohol in colourle needles and from dilute alcohol in pale yellow needles w $\frac{1}{2}H_2O$, melts at 224°—226°, whilst butein, $C_{15}H_{12}O_5$, orang yellow needles (m. pt. 213 —215°), crystallises from dil alcohol with $1H_2O$. It is obtained in small quant together with butin from the plant, and can be prepar from butin by the action of hot dilute caustic alkali alcoholic potassium acetate. On fusion with alkali, but gives the same decomposition products as butin, and methylation the same two trimethyl ethers, (*a*) m. 156 —158 , and (*b*) m. pt. 119°—121°. When digested w boiling dilute alcoholic sulphuric acid, butein is partia reconverted into butin, and by digesting the trimeth compound (m. pt. 119 —121°), which is really butin met ether, with alcoholic potash and water it passes into butein methyl ether (*a*) (m. pt. 156°—158). Again digesting butein methyl ether with alcoholic sulphuric a butin methyl ether is obtained. Butein has the constitut of a tetrahydroxybenzylideneacetophenone (chalkon whilst butin is shown to have that of the correspond flavanone compound (this J., 1904, 367).

Calculations used in Cane-Sugar Factories. A Practical System of Chemical Control for Louisiana Sugar Houses and other Cane-producing Countries. By Irving H. Morse, B.S. First Edition. John Wiley and Sons, New York. 1904. Chapman and Hall, Ltd., London. Price 6*s*. 6*d*.

Small 8vo volume, containing preface and 75 pages of ubject-matter, principally tables. The subjects treated of re mainly as follows:—I. Analysis of Products, with Tables. II. Extraction, Saturation, Inversion, &c.; III. Laboratory Records. IV. Tables. Solids, and Purity corresponding to each degree. Polarisation of Commercial ugar, &c. V. Factors used in Calculating Available Sugar. Factors for Refinery Products. Beet-Sugar Factories and Factories Manufacturing 96° Sugar or "YC" Sugar. VI. The most Profitable Sugar to Manufacture, &c. VII. The Available Sugar in a Ton of Cane. Yellow clarified," Second and Third. "96 Test," Second and Third. "Rendimiento" or Sugar Extraction or Cuban Factories.

Die Elektrochemische Industrie Deutschlands. Von P. Ferchland, Ph.D. Wilhelm Knapp's Verlag, Halle-a.-S. 1904. Price M. 2·50.

vo volume, containing 64 pages of subject-matter, with our illustrations, and an alphabetical index. The subjects reated of are:—I. Origin, Aims and Limits of Electro-Chemical Industry in Germany. II. Production of Power or Electrochemical purposes in Germany. III. Alkali nd Chlorine (Bromine). IV. Electric Bleaching. V. Hydrogen, Oxygen, and Ozone. VI. Calcium Carbide and Phosphorus. VII. Sodium, Magnesium, and Aluminium. VIII. Zinc. IX. Copper, Nickel. X. Noble Metals. XI. Other Inorganic Chemical Processes. XII. Organic Electro-Chemistry. XIII. Power required for Substances prepared lectrolytically.

Die Elektrochemische Reduktion der Nitroderivative organischer Verbindungen in experimentaller und theoretischer Beziehung. Von Joh. Möller. Wilhelm Knapp's Verlag, Halle-a.-S. 1904. Price M. 4.

vo volume, containing 113 pages of subject-matter and he alphabetical index of subjects and authors. This work devoted to a description of all the experimental and heoretical results so far obtained in the reduction of the itro-derivatives of organic compounds.

he Occurrence of Aluminium in Vegetable Products, Animal Products, and Natural Waters. By C. F. Langworthy, Ph.D., and Peter T. Austen, Ph.D. First Edition. John Wiley and Sons, New York. 1904. Price 8*s*. 6*d*. net. Chapman and Hall, London.

vo volume, containing 132 pages of subject-matter and he alphabetical index. The subject treated of is classified s follows:—I. Aluminium in Vegetable Products. II. In nimal Products. III. In Natural Waters. IV. In Miscellaneous Materials. The work takes the form of a assified and complete bibliography of the subject.

nalytical Chemistry. By F. P. Treadwell, Ph.D., Professor of Analytical Chemistry in the Zürich Polytechnikum. Translated from the Second German Edition by William T. Hall, S.B. Volume II.—Quantitative Analysis. John Wiley and Sons, New York. 1904. Price 17*s*. net. Chapman and Hall, Ltd.

vo volume, containing prefaces, 645 pages of subject-atter, with 96 illustrations, and including numerous tables, d a set of logarithmic tables, followed by the alphabetical dex. After the introduction with the usual descriptions f general methods of procedure, and of apparatus used, the ork is divided into Parts I., II., and III., devoted as llows:—I. The Gravimetric Determination of the Metals d of the Metalloids. Part II. Volumetric Analysis—(A) Oxidation and Reduction Methods; (B) Precipitation ethods. Part III. Gas Analysis.

A Systematic Handbook of Volumetric Analysis, or the Quantitative Estimation of Chemical Substances by Measure, applied to Liquids, Solids, and Gases. Adapted to the Requirements of Pure Chemical Research, Pathological Chemistry, Pharmacy, Metallurgy, Manufacturing Chemistry, Photography, &c., and for the Valuation of Substances used in Commerce, Agriculture, and the Arts. By Francis Sutton, F.I.C. Ninth Edition, revised and enlarged. J. and A. Churchill, 7, Great Marlborough Street, London. 1904. Price 20*s*. net.

This volume, 8vo size, contains 607 pages of subject-matter, with 121 illustrations, and the alphabetical index. It is subdivided as follows:—Part I. Devoted to General Principles, gives Descriptions of the Chemical Balance, and General Apparatus and Methods. II. Alkalimetry. III. Analysis by Oxidation or Reduction. IV. Analysis by Precipitation. V. Application of Foregoing Principles of Analysis to Special Substances. VI. Special Applications of the Volumetric System to the Analysis of Urine, Potable Waters, Sewage, &c. VII. Volumetric Analysis of Gases and Construction of Apparatus.

Report on Air Tests in Humid Cotton Weaving Sheds. By Frank Scudder, F.I.C. [Home Office.] Eyre and Spottiswoode, East Harding Street, Fleet Street, London, E.C.; 32, Abingdon Street, Westminster, S.W.; Oliver and Boyd, Edinburgh; and E. Ponsonby, 116, Grafton Street, Dublin. 1904. Price 3*d*.

This report refers to the question of ventilation of humid cotton cloth factories, in pursuance of an inquiry into the Cotton Cloth Factories Act, 1889, commenced in 1896, when the Secretary of State appointed a Departmental Committee of which Sir Henry Roscoe, F.R.S., was chairman. On Feb. 2, 1898, it was ordered that ventilation should be such that the carbon dioxide in the air of such factories should not exceed nine volumes per 10,000 of air. The report states that "in the great majority of cases the proportion of carbon dioxide was far below" the limited quantity mentioned. The method of determination and apparatus employed Mr. Scudder describes. The method used was that of Pettenkofer with baryta water and oxalic acid.

Trade Report.

I.—GENERAL.

International Exhibition, Saint Louis, 1904. Dept. C., Liberal Arts. Catalogue of British Exhibits, Classified under Group 23. Chemical and Pharmaceutical Arts. Issued by the Royal Commission. William Clowes and Sons, Ltd., Duke Street, Stamford Street, S.E., and Great Windmill Street, W., London. 1904. Price 1*s*. net.

Sub-Committee for Group 23 (Chemical and Pharmaceutical Arts), Dr. Boverton Redwood, F.R.S.E., *Chairman*, A. Gordon Salamon, Esq., Thomas Tyrer, Esq., Charles Wightman, Esq., Edmund H. Lloyd, *Secretary*.

This catalogue of the British exhibits in Group 23 contains an introductory note of nine pages, a plan of the exhibits, a list of the exhibitors arranged in alphabetical order, with references to the plan and to the pages in the catalogue, a series of descriptive accounts of some of the principal branches of the industry represented by the exhibits (pages 11—137), and a detailed list of exhibitors and exhibits (pages 138—180).

In the introductory note it is stated that arrangements were made with Mr. G. R. Dunell to obtain information by means of interviews with leading exhibitors and technologists in Great Britain, and that the particulars so furnished have, with the assistance of Mr. Walter F. Reid, Chairman of the London Section of the Society of Chemical Industry, been embodied in the descriptive accounts already mentioned.

Exhibits of Special Scientific Interest.

Low Temperature Research Exhibit.—Complete plant in operation, as employed by Prof. Sir James Dewar, F.R.S., at the Royal Institution, London, in producing liquid and solid hydrogen. (Constructed for the Royal Commission by Messrs. Lennox, Benton, and Reynolds, Ltd.) *Scientific Lectures and Demonstrations* in connection with this exhibit will be given by Mr. J. E. Petavel.

Wellcome Chemical Research Laboratories; Wellcome Physiological Research Laboratories.—Specimens of essential oils, substances isolated from chaulmugra seeds, chaulmugric acid derivatives, alkaloids, extracts, morphine derivatives, phenylic salts of dibasic acids, and certain inorganic salts, &c.

Baly, E. C. C.—Photographs of spectra.

Collie, Prof. J. Norman, Ph.D., F.R.S.—Specimens of dimethylpyrone, and some derivatives, also of oxonium compounds.

Glasgow and West of Scotland Technical College (Prof. G. G. Henderson, M.A., D.Sc.).—Specimens illustrative of research work.

Hartley, Prof. W. N., F.R.S., Royal College of Science for Ireland, Dublin.—Photographs and substances recently prepared for research purposes.

Lister Institute of Preventive Medicine (Dr. Allan Macfadyen and Mr. Sydney Rowland).—Diagrammatic section and photographs of the disintegrator used in investigations on intracellular toxines.

Lovibond, Joseph W.—"Tintometer" and sets of equivalent colour standards, &c.

Newlands, B. E. R.—Collection of 11 ancient bronze or bell metal mortars. Photographs, by Miss M. A. Newlands, of old prints.

The Owens College (Prof. H. B. Dixon, M.A., F.R.S.).—Exhibits illustrating the discoveries of Sir H. E. Roscoe, F.R.S., and the late Prof. C. Schorlemmer, F.R.S.; the late Dr. E. Schunck, F.R.S.; the late R. S. Dale and Prof. C. Schorlemmer; the late Sir Edw. Frankland, F.R.S.; and Prof. H. B. Dixon, F.R.S.

Ramsay, Prof. Sir Wm., F.R.S.—Vacuum tubes containing helium, neon, argon, krypton, and xenon (Ramsay and Travers).

Reynolds, Prof. J. Emerson, F.R.S.—Specimens illustrative of research work at Trinity College, Dublin.

Royal College of Science, London (Prof. W. A. Tilden, F.R.S.).—Specimens illustrative of research work by staff and students.

Society of Apothecaries of London (Wm. Chattaway).—Antiquities relating to pharmacy.

Travers, Prof. Morris W., F.R.S.—Diagram of hydrogen liquefier.

The names of the firms who take part in the British Exhibit are given below under the respective branches of Chemical Industry and Pharmacy:—

Alkali Industry:

- *Alkali.*—Brunner, Mond and Co., Ltd.; Castner-Kellner Alkali Co., Ltd.; Chance and Hunt, Ltd.; J. Crosfield and Sons, Ltd.; United Alkali Co., Ltd.

Franco-German Tariff and Trade Relations.

U.S. Cons. Reps., No. 1984, *June* 21, 1904.

A committee appointed by the Parliament of France investigate the tariff and trade relations of France wi some of the great nations of the world as affected by t new arrangements entered into or to be negotiated since t end of the treaties which expired December 31, 1903, h just made a voluminous report, of which the following is extract:—

The report of the commission begins by a short review the industrial and agricultural condition of Germany. Th lowing are the figures of production for the past three ars :—

Description.	1899—1900.	1900 · 1901.	1901-2.
	Tons.	Tons.	Tons,
neat............	3,847,447	3,841,465	2,498,851
e..............	8,675,792	8,550,659	8,162,660
rley...........	2,988,876	3,002,182	3,221,102
ts.............	6,882,687	7,031,930	7,050,153
tatoes.........	38,486,202	40,585,317	48,687,261
y..............	25,909,781	23,767,700	22,370,047

The large crop of potatoes was stimulated by the growth the output of alcohol, which, in Germany, is generally rived from potatoes. The exports of alcohol from rmany are constantly increasing, and the consumption alcohol for varnish, chemical products, lighting, heat, and wer is very great.

The beet crop alone has increased in France during the t 10 years. It passed from 479,500 acres to 837,500 es, an increase due to the sugar laws of 1884 and 1897 ablishing the export bounty. As those laws are repealed day this acreage is likely to diminish. It will be very ficult to find a compensation in the increase in the sumption of alcohol in industry.

The commission here enters upon an elaborate review of mineral wealth of Germany, comparing the output of n, potassium, zinc, lead, salt, lignites, copper, and coal the past six years. The concluding sentence is that growth in the mining industry in Germany can only be npared to that of the United States.

Following this is a tabulated statement of the iron and el industry of the United States, Great Britain, Germany, ince, Russia, and Spain, in the order given, the consion again being that the progress of Germany in that ustry is only comparable with the United States.

he report states that Germany wages a very sharp npetition against French chemical products—above all, e products for the laboratory. In that branch the Gerns have almost monopolised the commerce of the world, nks to the exceedingly well-equipped mills and to their vity. They have also succeeded in materially reducing first cost of production. In Germany, 1,950,000 cb m. ,816,200 cb. ft.) of wood were turned into paper in 1897. many consumes annually 750,000 tons of paper and ls. This immense consumption is due to the activity of ting and lithography in that country.

he report enters into a careful examination of the mercial conditions existing between France and Germany, ng the text of the treaties, and then gives the new oms laws of Germany, from which the following are n :—

ubricating oils are charged a duty of 12·50 francs 12 dols.) per 100 kilos. (220 lb.) by the new German f. Stearin, which was formerly free of duty, is now able at 12.50 francs (2.412 dols.) per 100 kilos. ; candles 28.15 francs (5.433 dols.) per 100 kilos. The duty on same articles coming into France are but 8 and 16 francs 44 dols. and 3.088 dols) respectively. Soaps are ged with a duty of from 6.75 to 12.50 francs (1.302 to 2.412 dols.). France formerly exported 1,500,000 s' (289,500 dols.) worth of soap and perfumery into aany. It is thought that this business will be lost r the new tariff.

rmany's exports of aniline and similar products ased from 52,000,000 marks (12,376,000 dols.) in to 81,345,000 marks (19,360,110 dols.) in 1901.

ance imported chemical products from Germany in representing a value of 22,700,000 francs (4,381,100); in 1901, a value of 21,501,000 francs (4,149,693); and in 1902, a value of 21,618,000 francs (4,172,274).

the new German tariff sulphuric, nitric, hydrochloric, , and other acids are free of duty ; but oxalic acid is cted by a duty per 100 kilos. of 10 francs (1.93 dols.) ; acid, 15 francs (2.895 dols.) ; and tartaric acid, ncs (1.93 dols.).

following the example of France, Germany has found essary to protect soda salts by a high duty ; caustic soda, 4.37 francs (84.3 cents) ; sodium carbonate, 1.87 francs (35 cents). The duty on alum and aluminium sulphate is 3.75 francs (72.3 cents).

Aniline colours are exempt, which is very natural, as Germany possesses all the markets.

Varnish, lacquers, and mastics are placed at greatly increased duties—37.50 francs (7.237 dols.) for alcohol varnish.

In short, for secondary chemical products a heavy protective duty has been imposed—6.75 francs (1.286 dols.) ; for gelatin in leaves, 37.50 francs (7.237 dols.). Casein has a protection of 12.50 francs (2.412 dols.), while as paste it has no duty at the French frontier.

Drawbacks in the United States of America.

Foreign Office Annual Series, No. 3185, *June* 1904.

Although the United States tariff is strongly protective, a drawback of 99 per cent. of the duties paid on imported articles is allowed when they are used in the manufacture of other articles in the United States which are subsequently exported. This applies to the tin plate trade. Large quantities of British tin plates are imported, and on being made up in America into cases, are filled with American oils, canned goods, &c., and on exportation 99 per cent. of the duty paid is refunded as a drawback. This drawback affects a large number of articles other than tin plates. The law will be found in the Act of July 24, 1897, which has been recently published in the Parliamentary Paper, Commercial No. 2 (1904).

Chemical Exports from Germany.

Foreign Office Annual Series, No. 3196, *June* 1904.

A large firm manufacturing fine chemicals reports that, though demand was active in 1903, prices were almost unremunerative by reason of fresh competition at home and abroad. Foreign countries are endeavouring ever more vigorously to emancipate themselves altogether from German products, and with much success. The United States, especially under protection of its tariff, is rapidly and successfully developing the manufacture of fine chemicals, so that the export from Germany to America can now be effected only with great difficulty. The firm adds that exports to Canada have been made impossible by the differential duty in favour of the United Kingdom.

III.—TAR PRODUCTS, PETROLEUM, Etc.

Petroleum in California in 1903.

Foreign Office Annual Series, No. 3185, *June* 1904.

The output of oil in California amounted to 20,000,000 barrels* in 1903, as against 13,000,000 barrels in 1902. Deducting that which will be either refined or exported, the balance available for steam purposes will be large enough to disturb the coal market. The price of oil has decreased during the past year, and the railway companies have bought up large oil properties. The older wells—especially in South California—are giving out, and the greatest caution as to oil properties offered for sale should be exercised. The Standard Oil Co. purchased 9,000,000 barrels from the Peerless Oil Co., at 20 c. a barrel at the wells, and engage to purchase 5,000 barrels daily for five years as from Jan. 1, 1903. This is held to prove that the Standard Oil Co. are convinced that the attempts to refine crude Californian oils have succeeded. In fact, they are being refined locally with very good results, but are not of a high grade, and are mixed with fine Eastern oil. The use of oil fuel is extending in every direction.

Petroleum Production of Russia.

Bd. of Trade J., July 7, 1904.

The production of naphtha wells in the peninsula of Apcheron in 1903 was 595,000,000 pouds,* as compared with 637,000,000 pouds in 1902, and 675,000,000 pouds in 1901. The decrease in 1903 is due to the fact that, owing

---

* 1 barrel = 33·5 galls. ; 1 poud = 36·112 lb.

to the low market price of petroleum, several of the more important wells were not worked during the earlier part of the year; there was also a diminution in the output of some of the other wells. Moreover, work was severely hampered by labour disputes during the month of July. Some of the wells are giving signs of exhaustion, but on the other hand, new sources of production have been discovered in the district of Bibi-Eibat.

In 1903, 80,000,000 pouds of naphtha were exported from Batoum, showing an increase of 8 per cent. on 1902. Of this, 61,000,000 pouds were petroleum properly so-called. 27,000,000 pouds were sent to the East, the remainder to Europe.

IV.—COLOURING MATTERS AND DYESTUFFS.

Dyestuffs: U.S. Customs Decisions.

June 1904.

Pyrol Black R.O., Sulphur Black T.G., and Sulphaniline Black were decided to be dutiable at 30 per cent. *ad val.* as "coal tar dyes," under par. 15 of the tariff.
—R. W. M.

X.—METALLURGY.

Zinc Ore Exports from Carthagena, Spain.

Foreign Office Annual Series, No. 3188, *June* 1904.

In his report for 1903, the British Vice-Consul at Carthagena gives the following figures showing the shipments of zinc ore from that port to the countries named during the past year:—

	Tons.
United Kingdom	4,150
Belgium	82,050
Germany	1,050
France	1,000
Total	88,250

The above total shows an increase of 22,580 tons over the preceding year. The United Kingdom has taken more by 893 tons, Belgium by 21,427 tons, Germany by 900 tons, and France by the full shipment of 1,000 tons. Of the above quantity 7,900 tons were calamine, the remainder being blende, usually found in the mines which are worked for lead, and, not unfrequently, the lead ore gives out and "degenerates," as the miners say, into blende.

Iron Industry of the Transvaal.

Bd. of Trade J., July 7, 1904.

The *Rhodesia Herald* states that the first blast-furnace in South Africa has recently been erected near Pretoria, on the line of the railway; it is situated in the centre of iron deposits and close to coal supplies. The furnace, which will have a weekly capacity of 500 tons of pig-iron, is to be followed by rolling-mills and a steel-converting plant. In addition to iron ore and coal, there is plenty of limestone in the neighbourhood. The ore is of the hematite and magnetite variety, and runs 58 to 62 per cent. of metallic iron. A survey above ground and cross-cutting indicate that there are some 62,000,000 tons of iron in sight. There is also manganese ore in Africa.

Mineral Output of Western Australia.

Government Gazette of Western Australia, April 8, 1904.

	1902.		1903.	
	Quantity.	Value.	Quantity.	Value.
	Tons.	£	Tons.	£
Black tin	620	39,788	817	55,890
Copper ore	2,262	8,090	20,526	56,541
Ironstone	4,800	2,040	220	81
Coal	140,884	856,188	133,427	69,128
Limestone	5,080	1,340	1,280	178

Arsenic in Spain.

Chem. and Druggist, July 2, 1904.

A company has been formed to develop deposits arsenical pyrites situated in the province of Orense, Spa The ore carries some gold and from 25 to 40 per cent arsenious acid. It is proposed to treat the pyrites cyanidation for the recovery of the gold, and the resid will then be used for the production of arsenic. A numl of concessions have been granted recently in the sa locality for similar undertakings.

XII.—FATS, FATTY OILS, Etc.

Castor Oil Production in New Zealand.

Queensland Agric. J. Pharm. J., July 9, 1904.

The castor oil plant (*Ricinus communis*) is a native of warm countries. It is very hardy and will thrive on alm any soil and in any situation, attaining a great height one season after sowing the seed. The plant prefers soils. The seed should be sown in rows, 6 ft. apart 4 ft. in the rows. Before sowing, the seed should be stee in hot water for 24 hours. After the plants are ab ground, the cultivation is the same as for corn, cotton, tobacco.

When the seed-pods are ripe, they suddenly burst o and scatter the seeds in all directions. Special arran ments must, therefore, be made for harvesting th When the pods are seen to be turning brown, the spi which bear them are cut off and taken to a clean-sw piece of hard ground which may be enclosed with galvani iron. Here they remain, being turned occasionally until pods have emptied themselves. The husks are then moved by winnowing, and the beans swept up and bagg They must on no account be allowed to get wet. T work is so light that it can be done by young children.

The yield of beans varies between 20 and 30 bushels acre. The oil is extracted by means of a hydraulic screw, or a lever press. What is known as "cold-dra castor oil" is that obtained by mere pressure. The f thing to do is to remove the external hull. This is effec by passing the beans through two revolving rollers, se such a way as merely to crack the hull, which is then rid of by winnowing. The decorticated seeds are then into coarse hempen bags about 2 ft. in diameter. Betw each layer of bags there is placed a steel plate, and at 20 or 30 bags, each holding about 40 lb. of seeds, are pla on top of each other in the press. The pressure must applied gradually, and the oil running from the first p is the best. As the pressure is increased up to the power of the press a second quality is produced. The p after this is taken out, mixed with hot water, and ag pressed to obtain the third quality. Another method is place the beans in a stone roller mill. This consists of large round stones connected by a spindle, which revolved by horse-power in a hollow round stone, in wh the beans are placed. These stone mills hold about 2 c and this quantity is crushed every half-hour. The o poured into filtering bags, and the pure oil runs from shelves on which the bags are placed through tubes vessels placed to receive it. The average yield of o 40 per cent.

Finishing Soap: U.S. Customs Decision.

June 16 *and* 18, 1904.

Several varieties of soap known as finishing soap, sisting in one case of beef tallow and alkali, assessed duty as "alizarin assistant not made from castor oil," a per cent. *ad val.* under par. 32 of the tariff; in ano case assessed for duty as "alizarin assistant containing than 50 per cent. of castor oil," at 15 cents per gallon; in a third case, consisting of resin and alkali, assessed duty at the same rate—none of the above having sulphonated—were decided to be dutiable at 20 per c *ad val.* under par. 72 of the tariff, as "soaps not speci provided for."—R. W. M.

SOAP STOCK: U.S. CUSTOMS DECISION.

June 21, 1904.

A mixture of oils consisting of castor oil, 77·50 per cent.; live oil, 12·72 per cent.; and oleic acid, 9·78 per cent., nd intended for use in manufacturing, was held to be utiable according to the component material of chief value nder section 7 and par. 33 as "castor oil" at 35 cents per allon. Although the article was suitable for use in soap aking, its common and exclusive use for this purpose was ot shown with sufficient conclusiveness to entitle it to free ntry under par. 568 as "soap stock." The Board also held hat oleic acid is not a distilled, essential, expressed, or endered oil; hence the above mixture is not covered by ar. 3, which provides for combinations of the foregoing

—R. W. M.

XIII. A.—PIGMENTS, PAINTS, Etc.

OCHRE SHIPMENTS FROM CARTHAGENA.

Foreign Office Annual Series, No. 3188, *June* 1904.

As regards ochre, the Vice-Consul states that only 343 ns were shipped, all to the United Kingdom. Buyers are fficult to please, good ochre is difficult to get, and profits e not good enough to animate shippers in making special forts to increase quantities.

MARKING INK; MANUFACTURE OF —— IN MEXICO.

Bd. of Trade J., July 14, 1904.

According to a despatch from the Italian Minister at exico, reproduced in the *Bolletino Ufficiale del Ministero Agricoltura*, a large quantity of marking ink of the best ality is now being manufactured at Jalapa, in the state of ra Cruz. This ink is extracted from the pulp of the *cleloahnitl* tree. During the month of April, about 2,300 es were exported to Germany.

The tree from which the ink is manufactured is found in eat abundance throughout the districts of Jalapa, Vinios, xpoco, and Huaxtlau; it is therefore confidently expected it the new industry will be greatly developed.

XIII. B.—RESINS, VARNISHES, Etc.

RUBY VARNISH: U.S. CUSTOMS DECISION.

June 10, 1904.

A varnish tinted red for photographic purposes was held be properly assessed for duty as "varnish" at 35 per t. *ad val.* under par. 53 of the Tariff Act, and not to be iable either at 25 per cent. *ad val.* as a chemical comınd under par. 3, or at 20 per cent. *ad val.* under section ıs a "manufactured article unenumerated." The Board ther held that the assessment of duty at 1·35 dols. gallon and 35 per cent. *ad val.*, as "spirit varnish," was oneous, as the article contains no ethyl alcohol.

—R. W. M.

XIII. C.—INDIA-RUBBER, Etc.

NDIA-RUBBER CULTIVATION IN GERMAN COLONIES.

Foreign Office Annual Series, No. 3186 *June* 1904.

Much attention has been given of late in Germany to the essity of improving the existing condition of india-rubber ivation in German African colonies, where the same has developed as it was hoped, and in some of the colonies production has in fact been diminishing. Those proug most india-rubber at present are Cameroon and East ca, but the exportation of both together did not exceed ,000*l.* in value in 1902.

XVI.—SUGAR, STARCH, Etc.

CHOOL IN CONNECTION WITH THE SUGAR, STARCH, AND ALCOHOL INDUSTRIES IN ITALY.

Bd. of Trade J., July 7, 1904.

Consul-General at Florence reports that, in ust next, a school will be opened, attached to the University of Ferrara, in connection with the sugar, starch, and alcohol industries.

The teaching will include Technical Chemistry, Technical Mechanics, Seed Selection and Technical Agriculture, Zymotechnics, Legal Matters and Accounts, and Chemical and Industrial Analyses.

GUMS IN ABYSSINIA.

Bd. of Trade J., June 30, 1904.

Abyssinian gums in general are white and highly esteemed. They are abundant and receive but little commercial attention. The best regions are those of from 4,900 to 5,900 ft. altitude, although in the lower plains there is quite sufficient to invite exploitation. All these gums are exported by way of Aden, and are probably never recognised at the ports of arrival as of Abyssinian origin. The export at present amounts to about 1,930*l.* annually. This export could be easily augmented to five times the present amount.

XVII.—BREWING, WINES, SPIRITS, Etc.

INTERNATIONAL SPIRIT INDUSTRY EXHIBITION, VIENNA.

Chem.-Zeit., 1904, **28**, 477—478.

Cooking Apparatus.—The experiments made with various types of cooking apparatus fed with spirit show that whilst the older forms required 13 minutes to boil 1 litre of water and consumed 38 grms. of spirit, the newer types do the same in nine minutes with 32 grms. and the regulator stoves in eight minutes with 27 grms. The quantity of spirit consumed per hour in the three kinds is 175, 210, and 200 grms. respectively.

Lamps. — The exhibits comprise incandescence spirit lamps up to 1,000 Hefner candle-power. Tests of some of them, under the auspices of the Ministry of Commerce, gave the following results, 90 per cent. spirit being used:—

Lamp.	Candle Power.	Time Needed for Heating Burner.	Consumption per 10-Candle Hour.
		Min.	Grms.
Incandescence lamp with by-pass flame	42·5	1·5	24
Incandescence lamp with heat conductor	34·0	2·0	29
Street spirit lamp	70·0	9·5	12
Petroleum lamp with 16-line circular burner	9·5	..	43

Motors and Automobiles.—The exhibits are considered to demonstrate the suitability of spirit for power purposes, and the competition with petrol resolves itself into the question of relative cost. The fixed motors are fed with unmixed motor spirit, carburetted spirit being used for automobiles.

Denaturing.—A portion of the spirit was denatured with a preparation prescribed by the Royal Austrian Agricultural Experimental Station [composition not given], the remainder being mixed to furnish motor spirit.—C. S.

METHYLATION: RECTIFYING AND COMPOUNDING.

Pharm. J., July 9, 1904.

In the House of Commons, on July 5, the Chancellor of the Exchequer said that the total quantity of spirits distilled in England during the year ended March 31, 1904, was 11,694,831 proof gallons. The quantity of home-made spirits used for methylation during the same period was 4,398,002 proof gallons. He had no means of knowing the quantities used for rectifying and compounding. 33,300 proof gallons of British spirits were despatched to Customs warehouses at Leith from English distilleries during the 12 months ended June 30, 1904. The materials commonly used in the distillation of English spirit were malt, unmalted grain, molasses, sugar, glucose, and rice.

Tax-free Spirit.

Times, July 21, 1904.

In committee on the Finance Bill, on July 20, Mr. Scott-Montagu moved a new clause providing that alcohol which had been suitably denatured and rendered unpotable and was required for motive power, lighting, heating, and manufacturing purposes should be sold without payment of any duty or tax, and that absolute alcohol should also be exempt from duty when employed in manufacturing operations where it could be proved to the Commissioners that denaturing agents would prevent its use. He also asked that a committee should be appointed to investigate the subject.

The Chancellor of the Exchequer said that he could not accept the clause as it stood on the paper, but he would accept the suggestion to have a committee appointed to look into the matter. He was aware that a great deal of importance was attached to the question, and he agreed that the public should have an opportunity of explaining what it was they wanted as well as an opportunity of learning the facilities which the law provided. He could not undertake to deal with a point of legislation in the Finance Bill.

Mr. Bryce asked whether alcohol for motive power would be the only question inquired into by the committee, or whether the inquiry would be extended to the exemption of alcohol for use in various trades.

The Chancellor of the Exchequer: I intended the committee to cover both subjects.

Mr. Gibson Bowles warned the right hon. gentleman against agreeing too readily to these exemptions of alcohol. Exemption of one man meant an increased burden on another. The committee might disclose grievances, of course, but the right hon. gentleman should not be led away to propose in his next Budget anything in the interest of the motor industries or any other industries. He did not agree with the proposal that spirits which were not drunk should be exempt any more than spirits that were drunk.

The clause was withdrawn.

Spirit in Poland.

Chem. and Druggist, July 16, 1904.

The failure of the potato crop in Poland last year proved disastrous for the spirit distilleries, and large quantities of maize had to be imported from Bessarabia and the Caucasus to replace potatoes. The prices paid by the monopoly for spirit in 1903 were from 55 to 71 copecks per vedro (average 6*d*. per gallon), which was higher than usual. According to the law of 1903, permission was granted for the use of denatured spirit free of Excise for industrial and technical purposes; but little advantage was taken of it on account of the shortness of spirit and the low price paid by the monopoly (4*d*. per gallon) for spirit to be denatured, which did not encourage distillers to sell spirit to the monopoly for that purpose. Denatured spirit was sold by the monopoly only at Warsaw at 6*d*. per gallon. The consumption of denatured spirit was small, as special permission to use it has to be obtained from the Ministry in each case, even for a single lamp. According to the Law of June 12, 1900, which was in force till the end of 1903, Poland was allowed to produce 22,500,000 galls. of spirit a year; but a new law, which came into force in January 1904, does not now in any way restrict the production of spirit in Poland. The annual requirements of the monopoly have been fixed by the Ministry at 18,191,355 galls. for the period 1903–7, the monopoly taking this quantity at a fixed rate.

Spirituous Tinctures in Cape Colony.

Pharm. J., June 18, 1904.

On and after July 1, 1904, a duty of 15*s*. per proof gallon will be levied on spirituous tincture imported into Cape Colony. Tinctures made in the Colony will only pay a duty of 6*s*. The duty affects British manufacturers very seriously, and the matter is under consideration by the London Chamber of Commerce.

XVIII. B.—SANITATION.

Nitrous Fumes and Arseniuretted Hydrogen.

Chem. Tr. J., July 9, 1904.

The annual report of the Prussian factory inspect gives particulars concerning the 1,293 chemical factor which were visited, special attention being paid to accide and dangers incidental to chemical manufactures. Meati is made of several cases of poisoning by nitrous fume in some instances the workmen appeared to recover fr the effects, but were subsequently seized with internal pa and died. Arseniuretted hydrogen was the cause of t deaths in another instance. The particularly deadly natu of this gas is not sufficiently realised. It is very liable be present in hydrogen generated from zinc or iron, a may be formed from arsenic contained either in the a or the metal. Very minute quantities are sufficient to kil man. Wherever hydrogen is used, either for lead burni or for reducing purposes, or for filling balloons, this dang should not be lost sight of. Several explosions took pl in explosive factories during 1903.

Chloroform as a Remedy for the Injurious Effec of Inhaling Nitrous Fumes.

Chem. Ind., 1904, **27**, 379.

Chloroform has been found an excellent remedy for ill effects of "gassing" with nitrous fumes. In ma cases, after apparent entire recovery, workpeople and oth are seized with cramps or spasms and die. The direct of the Rheinisch-Westfälischen Explosives Compan Troisdorf, have issued an instruction in their works t any person who has inhaled nitrous fumes must h administered to him every 10 minutes a glass of water i which 3 to 5 drops of chloroform have been added from dropping-tube until recovery. The largest quantity chloroform that may be thus administered per day 1·5 grm.; 3 drops of chloroform are considered as weighi 0·045 grm., and 5 drops 0·078 grm. This prescription to be strictly observed, and the amounts by no me exceeded. Chloroform being somewhat unstable wh exposed to light, it must be kept in bottles of colou glass.

XX.—FINE CHEMICALS, Etc.

Cascara Sagrada, or Chittim Bark, in Oregon

Foreign Office Annual Series, No. 3207, *July* 1904.

The bark of the cascara sagrada, or chittim tree, has recent years assumed a growing importance as an article commerce, and appears to be produced principally in t district. The article is being largely used in medicine, during the past year about 500 tons were shipped to United Kingdom and Continent. The production stimulated by high prices to such an extent that there danger of all the trees being destroyed. In May average price paid was 2*d*. per lb., but under demand reached 6*d*. in August, and as much as 10*d*. was paid September. The peeling season is from May to Aug. The tree grows in wet ground, is of rapid growth, but rar attains a size over 1 ft. in diameter. One was repor last year as 2 ft. 3 ins., but the sizes preferred for peel are from 4 ins. and upwards. In peeling, the tree is girdled about 5 ft. from the ground and the bark remo down to the base. It is then cut down, and the b removed from the rest of the trunk and larger branch The bark is then dried in the sun for four or five d chopped up, and packed in sacks for shipment. production last year was about 1,000 tons. From pre appearances there will be an over-production in 1904, not more than 2*d*. is offered for the dried bark.

"Oil of Lemon" Extraction in California.

Foreign Office Annual Series, No. 3185, *June* 1904.

California lemon growers are most anxious to obtai machine for extracting "oil of lemon," the present pro being unsatisfactory.

Acetin: U.S. Customs Decision.

June 17, 1904.

Merchandise invoiced as "Essigsäure," which on analysis as shown to contain 75 per cent. of mixed acetins, was eld to be dutiable at 25 per cent. *ad val.* as a "chemical ompound" under par. 3 of the tariff, and not as "acetic id" under par. 1.—R. W. M.

Amyl Acetate: U.S. Customs Decision.

June 16, 1904.

Chemically pure amyl acetate was decided to be dutiable 2 dols. per lb. as a "fruit ether" under par. 21 of the Tariff ct.—R. W. M.

Ichthyol: U.S. Customs Decision.

June 10, 1904.

Ichthyol ammonium sulphonate, generally known in armacy as ichthyol, was held by the Board to be free of ty as "ichthyol" provided for in par. 626. Duty had been sessed at 25 per cent. *ad val.*, under par. 3, as a "chemical mpound," or under par. 68 as a "medicinal preparation," the ground that the ichthyol provided for in par. 626, hich covers various oils, was the oil of ichthyol, and not e sulphonated ammonium salt (see J., 1903, 833). The ard held that the term "ichthyol," as used in the law, vers the sulphonated ammonium salt, and overruled the sessment of duty.—R. W. M.

Patent List.

.B.—In these lists, [A.] means "Application for Patent," and S.] "Complete Specification Accepted."

here a Complete Specification accompanies an Application, an erisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of plete Specifications Accepted, those of the Official Journals hich acceptances of the Complete Specifications are advertised. omplete Specifications thus advertised as accepted are open to pection at the Patent Office immediately, and to opposition hin two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

A.] 15,010. Reavell. Cooling towers for reducing temperature of condensing water and other liquids. July 5.

,, 15,129. Burdh. Cooling, heating, and similar apparatus. July 6.

,, 15,775. Martin. Filtering apparatus for the extraction of liquid from finely crushed minerals or the like. July 15.

,, 15,776. Ogle and the Cyanide Vacuum Filter Co. Apparatus for the separation of liquids from solids, particularly applicable to the extraction of metals from their ores. July 15.

,, 15,780. Withers (Bruyère). Distillation apparatus. July 15.

S.] 16,419 (1903). Junkers. Apparatus for heating liquids. July 20.

, 16,472 (1903). Leetham. Apparatus for treating finely divided materials, such as flour, with a gaseous agent. July 13.

, 22,094 (1903). Thompson (Blaisdell). Apparatus for discharging or filling vats and like receptacles. July 20.

[C.S.] 22,095 (1903). Thompson (Blaisdell). Distributing apparatus especially applicable for filling vats or the like. July 20.

,, 13,186 (1904). Neel. Desiccation of liquids. July 20.

II.—FUEL, GAS, AND LIGHT.

[A.] 14,947. Bayles. Fuel. [U.S. Appl., July 2, 1903.]* July 4.

,, 14,952. Baer and Co. Catalytic gas igniters. [Fr. Appl., July 18, 1903.]* July 4.

,, 14,971. Steins. Process and apparatus for the manufacture of generator gas.* July 4.

,, 15,088. Dixon. Gas washing, cooling, and heating towers. July 6.

,, 15,089. Dixon. Gas producers. July 6.

,, 15,269. Kermode. Burners for liquid fuel. July 8.

,, 15,270. Kermode. Apparatus for burning liquid fuel. July 8.

,, 15,271. Kermode. Apparatus for burning liquid fuel. July 8.

,, 15,800. Robins. *See under* XVIII. B.

,, 15,810. Robt. Dempster and Sons, and Radcliffe. Calciners and destructors. July 16.

,, 15,821. Mason. Apparatus for manufacturing producer- and water-gas. July 16.

,, 15,846. Spencer. Gas regenerative furnaces. July 16.

,, 15,862. Wilson. Furnaces for burning coal dust or like pulverulent fuel. July 16.

[C.S.] 23,659 (1903). Thompson (Best). Furnaces for burning liquid hydrocarbons. July 20.

,, 23,660 (1903). Thompson (Best). Apparatus for burning liquid hydrocarbons in furnaces and fire boxes. July 20.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[C.S.] 23,659 (1903). Thompson (Best). *See under* II.

,, 23,660 (1903). Thompson (Best). *See under* II.

,, 7481 (1904). Kuess. Process for solidifying petroleum and other mineral oils for their application as fuel and for lighting purposes. July 13. (Date applied for, Nov. 6, 1903.)

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 14,970. Imray (Meister, Lucius und Brüning). Manufacture of new dyestuffs of the anthracene series. July 4.

,, 14,972. Imray (Meister, Lucius und Brüning). Manufacture of yellow mordant dyestuffs. July 4.

,, 15,025. Shillito (J. R. Geigy). Manufacture or production of ortho-oxy-azo colouring matters. July 5.

,, 15,223. Imray (Basle Chem. Works). Manufacture of indoxyl, its homologues, and their derivatives. July 7.

,, 15,418. Shillito (J. R. Geigy). Manufacture of α-nitro-1-diazo-2-oxynaphthalene-sulphonic acid, or sulphonic acid of the nitro-naphthalene-1.2-diazoxide. July 11.

[A.] 15,624. Abel (Act.-Ges. f. Anilin-fabrikation). Manufacture of 1.8-arylnaphthylaminesulphonic acids. July 13.

[C.S.] 18,246 (1903). Newton (F. Bayer and Co.). Manufacture and production of pyrimidine derivatives. July 20.

„ 18,924 (1903). Read Holliday and Sons, Ltd., Turner, Dean, and Turner. Production or manufacture of colouring matters. July 13.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 15,080. Mather. Kiers for treating textile fabrics and the like. July 6.

„ 15,276. Sello. Method of producing dust-free consistent surgical dressing material.* July 8.

„ 15,297. Drewsen. Process of manufacturing products from cornstalks, sugar cane, and analogous pithy stalks.* July 8.

„ 15,331. Roberts and Crossley. Method and means employed for carbonising fibres. July 9.

„ 15,395. Venter. Process for bleaching textile fabrics.* July 9.

„ 15,615. Payne and Masterson. System of spirit dyeing. July 13.

„ 15,721. Ward and Kenworthy. Apparatus for dyeing, bleaching, and otherwise treating yarn, warp, and fibrous materials with liquid. July 15.

„ 15,729. Roberts and Crossley. Method of and means for removing vegetable impurities from woollen rags, wool, and other animal fibres. July 15.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

[A.] 15,424. Armitage, Jowett, and Sowry. Method of and apparatus for varnishing or otherwise coating paper or other materials. July 11.

[C.S.] 9487 (1904). Boult (Fabr. F. Schwartz and Co.). Wall paper. July 20.

„ 10,798 (1904). Tittel. Process and apparatus for the production of paper coated on one side with coloured material. July 20.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 14,966. Schilling and Kremer. *See under* XVIII. B.

„ 15,138. Gutensohn. *See under* X.

[C.S.] 15,212 (1903). Hiebling. Manufacture of soda and caustic potash, chlorine, and hydrochloric acid by electrolysis of aqueous solutions. July 20.

„ 19,267 (1903). Bergmann. Method of producing di-calcium phosphate. July 13.

„ 12,797 (1904). Leduc and Griffiths. *See under* X.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 15,662. Neuss. Method of producing different colours on pearl heads of solid glass-headed pins. July 14.

„ 15,866. Arbogast. Method of manufacturing glassware. [U.S. Appl., July 16, 1903.]* July 16.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 15,057. Muller. Manufacture of new pulverulen product for coating masonry or brickwork c furnaces, retorts, and the like. [Fr. Appl July 8, 1903.]* July 5.

„ 15,142. Muller. Process for the manufacture bricks and products with a facing of carborundu or other material. [Fr. Appl., July 13, 1903.] July 6.

„ 15,176. Steenbock. Manufacture of vitreo cement.* July 7.

„ 15,181. Steenbock. Manufacture of materi designed for the production of cement.* July

„ 15,549. Broadbent. Burning of pipes, chimn pots, and other like earthenware goods in kil or ovens. July 12.

„ 15,795. Rieter-Bodmer. Manufacture of artifici stone pipes, tiles, plates, vessels, and the lik and apparatus therefor. July 15.

[C.S.] 218 (1904). Forell. Process for manufacturi cement from slag. July 13.

„ 8859 (1904). Windholz. Process of making grinding, polishing, or smoothing substance, one refractory to heat. July 13.

„ 12,518 (1904). Watson Material or compositi to be used for damp courses, for covering roo surface of bridges, and the like, for insulatiou electrical conductors, and other purposes of a li kind. July 13.

X.—METALLURGY.

[A.] 14,980. Lébédeff. Process for smelting sulphurat copper ores and the simultaneous concentrati of the matte. July 4.

„ 14,985. Cie. du Réacteur Métallurgique. Manuf ture of steel, and treatment of copper, nick and like matts. [Fr. Appl., Aug. 6, 1903. July 4.

„ 15,138. Gutensohn. Recovering desired metal a oxides from acid solutions containing the sa July 6.

„ 15,141. Sir W. G. Armstrong, Whitworth, & Ltd., and Ferry. Manufacture of steel and ot forgings. July 6.

„ 15,220. Hadfield. Manufacture or treatment armour plates and other articles of steel. July

„ 15,347. Griesbach. Apparatus for utilising wa tin plate, scrap, and the like. July 9.

„ 15,577. Nicholas. Recovery of metals from o &c. July 13.

„ 15,592. Phillips and Pickering. Cyanide proc of gold extraction. July 13.

„ 15,727. Twynam. Recovery of zinc from z cuttings and galvanised waste. July 15.

„ 15,776. Ogle and the Cyanide Vacuum Filter *See under* I.

„ 15,792. Wrinkle and Wrinkle. Smelting furnac July 15.

[C.S.] 12,797 (1904). Leduc and Griffiths. Process the enriching of calcareous ores. July 13.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 15,294. Betts. Process of electro-depositing antimony. July 8.

„ 15,298. Betts. Process for treating metal mixtures produced as a by-product in electrolytic metal-refining operations. July 8.

„ 15,308. Betts. Process of making lead dithionate.* July 8.

C.S.] 15,212 (1903). Hiebling. *See under* VII.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

A.] 15,235. Wheelwright and Fiske. Process of cooking garbage and offal, and removing the oil or melted grease therefrom.* July 7.

.S.] 19,163 (1903). Defavrie. Composition for the manufacture of phonographic cylinders and for other purposes. July 13.

„ 2081 (1904). Töllner. Process for manufacture of substitute for cod-liver oil. July 13.

„ 10,536 (1904). Haase. Candles. July 13.

„ 13,171 (1904). Hunter. *See under* XX.

I.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

.] 15,725. Adam. Carbon recovery plant for the manufacture of lamp-black and such like. July 15.

„ 15,754. Dunnett. Preparation for preventing incrustation of and preserving the hulls of sea-going ships. July 15.

(*B.*)—Resins, Varnishes.

S.] 12,647 (1904). Krämer. *See under* XVII.

, 12,663 (1904). Melville, Rees, and Rees. Substitute for oilcloth or linoleum. July 20.

(*C.*)—India-Rubber.

.] 15,436. Kittel. Process for regenerating vulcanised rubber waste.* July 11.

IV.—TANNING, LEATHER, GLUE, SIZE, Etc.

.] 15,449. Bossuet. Substitute for whalebone. [Fr. Appl., Dec. 16, 1903.]* July 11.

15,629. Piesbergen. Artificial leather substitute and its method of manufacture.* July 13.

S.] 11,249 (1904). Amidon. Apparatus for treating hides, skins, and sides of leather. July 13.

XV.—MANURES, Etc.

] 15,709. Boutan. Manufacture of manures. [Fr. Appl., Aug. 13, 1903.] July 14.

XVII.—BREWING, WINES, SPIRITS, Etc.

] 15,370. Boult (Pabst Brewing Co.). Pasteurising apparatus.* July 9.

[A.] 15,615. Payne and Masterson. *See under* V.

„ 15,780. Withers (Bruyère). *See under* I.

[C.S.] 23,327 (1903). Blaxter, Blaxter, and Chaloner. Apparatus for the production of non-deposit beer and the like, and for clarifying liquids and carbonating the same. July 13.

„ 12,647 (1904). Krämer. Apparatus for varnishing, pitching, or similarly treating casks, vats, or the like. July 13

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 15,020. Eichmann. Processes of preserving milk and cream. July 5.

„ 15,135. Priest. Manufacture of custard powder. July 6.

„ 15,370. Boult (Pabst Brewing Co.). *See under* XVII.

„ 15,440. Imray (Maragliano). Manufacture of meat powder or meal, and process therefor. July 11.

„ 15,505. Petersson. Method of and apparatus for sterilising milk, cream, &c. July 12.

„ 15,605. Harris. Refrigerating and preserving meats, butter, milk, and other matter subject to decay. July 13.

[C.S.] 15,319 (1903). Sandison. Treatment of fish, fish refuse, and the like. July 20.

„ 16,472 (1903). Leetham. *See under* I.

„ 18,428 (1903). Boult (Rücker and Pickée). Preservatives and the method of applying them to foodstuffs and the like. July 13.

„ 19,760 (1903). Cleghorn. Process of preserving meat, fowl, fish, &c. July 20.

„ 10,758 (1904). Dunne. Means for preserving food, &c. July 20.

(*B.*)—Sanitation; Water Purification.

[A.] 14,929. Adams. Sewage filters. July 4.

„ 14,966. Schilling and Kremer. Process for extraction of ammonia from sewage waters and the like.* July 4.

„ 15,235. Wheelwright and Fiske. *See under* XII.

„ 15,276. Sello. *See under* V.

„ 15,800. Robins. Method and means for treating smoke, steam, sewer gas, impure air, and other fumes for the prevention or mitigation of a nuisance. July 15.

„ 15,829. Middleton. Filter and contact beds for the bacterial treatment of sewage. July 16.

[C.S.] 8865 (1904). Bamberger, Böck, and Wanz. Process of and apparatus for regenerating breathed-out air for respiration purposes. July 20.

„ 12,232 (1904). McLean and Patterson. Treatment of sewage. July 13.

(*C.*)—Disinfectants.

[C.S.] 8415 (1904). Lake (F. Stearns and Co.). Antiseptic compounds, and processes for manufacturing them. July 13.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 15,435. Gardner (Weiler-ter-Meer). Process for producing substances resembling celluloid. July 11.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 14,955. Gärtner. Polychlorals, and manufacture of same. July 4.

,, 15,784. Boult (F. Fritzsche and Co.). Manufacture of protocatechuic aldehyde.* July 15.

[C.S.] 13,171 (1904). Hunter. Machine for extracting oil from the rind of limes and other citrus fruits. July 20.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 15,053. Cocking and Kynoch, Ltd. Smokele powders and their manufacture. July 5.

[C.S.] 19,438 (1903). Lundholm. Explosives. July 20

,, 20,216 (1903). Bielefeldt. Explosives or blastin compositions. July 20.

XXIII.—GENERAL ANALYTICAL CHEMISTRY.

[A.] 15 706. Thompson (Ver. Maschinenfabrik Augsbu und Maschinenbaugesellschaft Nürnberg A.-G Method for the continuous determination of t hydrogen contents of gaseous mixtures, a apparatus therefor.* July 14.

Notices.

ANNUAL GENERAL MEETING, NEW YORK, 1904.

The Annual General Meeting will be held in New York City on Thursday, Sept. 8th, and following days. Members who propose to attend the meeting are requested to inform the General Secretary, as soon as possible, by what steamer they will travel. The principal boats will be met on arrival at New York by a representative of the Reception Committee, who will escort the guests to the Hotel Seville, Madison Avenue and 29th Street, which will be the Society's Headquarters in New York. A similar system will be observed at all the other cities visited by the special train. A revised programme appeared in the March 31st issue.

In accordance with the provisions of Rule 18 of the Bye-laws, notice is hereby given that those members whose names are printed in *italics* in the list of Council will retire from their respective offices at the forthcoming Annual Meeting.

Mr. Wm. H. Nichols has been nominated to the office of President under Rule 8: Dr. Edw. Divers, Prof. W. R. Eaton Hodgkinson, Mr. Max Muspratt, and Mr. T. J. Parker have been nominated Vice-Presidents under Rule 8; and Sir Wm. Ramsay has been nominated a Vice-President under Rule 11.

Mr. Oscar Guttmann, Prof. W. R. Lang, Dr. Boverton Redwood, and Mr. Walter F. Reid, have been nominated under Rule 18 to fill four vacancies among the Ordinary Members of Council. No ballot will be required.

The Hon. Treasurer and Hon. Foreign Secretary have been nominated for re-election to their respective offices.

COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Akitt, T.; Journals to Mijnbouw Maatschappij Katahoen, Lebong Soelit, Benkoelen, Sumatra; subscriptions as before.

Anderson, Jas. W., l/o Preston Villas; The Paddock, Halling, near Rochester, Kent.

Baskerville, Dr. Chas., l/o Chapel Hill; College of the City of New York, New York, U.S.A.

Burrell, B. A., l/o Mount Preston; 8, Springfield Mount, Leeds.

Cannon, J. C., l/o Western Road; Danehurst, Gordon Road, Shoreham, Sussex.

Deerr, Noel, l/o Mauritius; Blairmont, Berbice, Briti Guiana.

Flavelle, Jos. W., l/o Front Street East; Toronto Technic School, College Street, Toronto, Canada.

Forth, H.; Journals (temporarily) to 32, Queen Stre Manchester.

Hambuechen, Carl, l/o Madison; c/o Pittsburg Reducti Co., East St. Louis, Ill., U.S.A.

Hurry, E. H., l/o New York; 7, St. Stephen's Mansion Monmouth Road, Westbourne Grove, W.

James, Alfred, l/o New Broad Street; 2, Broad Str Place, London, E.C.

Johnson, Jno., late "Jno. E.," and of Liberty Street; c John Johnson Co., Franklin Square, New York Cit U.S.A.

Joplin, G. C., l/o Harrington Street; Brierbank, Alb Road, Strathfield, Sydney, N.S.W.

Korte, Dr. Reinold F., l/o Clydach; retain Journals.

Liebmann, Dr. Ad., l/o Marsden Street; 16, Darby Aven West Didsbury, Manchester.

Moore, Chas. C., l/o Old Hall Street; 33, Clarendon Ro Garston, Liverpool.

Nield, J. H., l/o Bayonne; c/o General Chemical Co., P Box 8, Hudson Heights, N.J., U.S.A.

Ward, Wm. T.; Journals to 59, Princess Road, Urmst Manchester.

Watkins, Willard H., l/o Oliver Street; c/o Schoellk Hartford and Hanna Co., 36, Purchase Street, Bost Mass., U.S.A., Chemist.

London Section.

Meeting held on June 6th, 1904.

ERRATA.

THE LOSS OF NITRE IN THE CHAMBER PROCESS.

BY J. K. H. INGLIS.

(This J., June 30th, 1904, 643—645.)

Discussion.

On p. 645, col. 1, for author's reply, read as follows:

Mr. Inglis, in reply, said that the amount of nitrous g found in the bulbs corresponded to 50 per cent. of the loss of nitre. But if pure nitric oxide were condensed bulb at the temperature of liquid air, and the bulb evacuated by means of a mercury pump, it was found the nitric oxide had an appreciable vapour pressure at temperature, therefore the whole of the nitric oxide in flue gases could not be condensed, and some of it woul lost. Hence the total amount accounted for was at greater than 50 per cent. of the whole loss. It was possible to state whether the main loss was as nitric or nitrogen peroxide, for the latter seemed to interact sulphur dioxide in the bulb, and nitric oxide would be product of this reaction.

ATENT SPECIFICATIONS may be obtained by post by remitting as follows:—

English.—8*d*. each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s*. each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3e).

—PLANT, APPARATUS, AND MACHINERY.

English Patents.

sks, Boxes, and other Receptacles; Impermeable Coatings or Linings for ——. J. Wetter, London. From the firm of Hugo Blank, Berlin Eng. Pat. 16,490, July 27, 1903.

E cask, &c. is coated with a solution of casein, albuse, or glue or gelatin products in water, ammonia, or er suitable solvent, and the layer, after drying, treated h formaldehyde. Or, formaldehyde may be mixed with coating solution before use.—C. A. M.

istillation Apparatus. A. Gerhardt, Kassel, Germany. Eng. Pat. 18,869, Sept. 1, 1903.

Fr. Pat. 335,034 of 1903; this J., 1904, 111.—T. F. B.

United States Patents.

Drying Materials; Method of ——. L. Gathmann, Washington. U.S. Pat. 763,387, June 28, 1904.

t is caused to pass downwards through the chamber taining the material to be dried, and is there heated so o cause it to take up the vapour to be expelled. The urated air is then passed to a lower level, where it is 'ed, and the vapour condensed. The same air is then o passed through the drying space, being used conously.—W. H. C.

rying Substances; Method of ——. L. Gathmann, Washington. U.S. Pat. 763,388, June 28, 1904.

process is similar to that of the foregoing U.S. Pat. 387, with the exception that the condensation takes e in a separate vessel, connected by pipes to the ng chamber.—W. H. C.

ing Kiln. J. F. Haurahan, Ottawa. U.S. Pat. 764,583, July 12, 1904.

Eng. Pat. 4602 of 1904; this J., 1904, 537.—T. F. B.

porating Apparatus; Piled Vacuum ——. T. Suzuki, Sunamura, Japan. U.S. Pat. 764,393, July 5, 1904.

Eng. Pat. 3165 of 1904; this J., 1904, 483.—T. F. B.

Aerating Liquids; Apparatus for ——. F. G. Hampson, London. U.S. Pat. 764,461, July 5, 1904.

See Eng. Pats. 11,612 and 16,353 of 1901; this J., 1902, 984 and 1191.—T. F. B.

French Patents.

Filtering Liquids; Process for ——. G. Stade, Germany. Fr. Pat. 340,322, Feb. 10, 1904.

The flow of the liquid on to the filtering medium (which is preferably sand) is so arranged that the stream of liquid is broken up, and does not disturb the surface of the sand. —W. H. C.

Vacuum; Apparatus for Supplying a —— *by the Circulation of a Liquid.* C. W. Stanton. Fr. Pat. 310,885, March 2, 1904. Under Internat. Conv., Dec. 17, 1903.

See Eng. Pat. 5791 of 1904; this J., 1904, 538.—T F. B.

II.—FUEL, GAS, AND LIGHT.

Coal Analysis; A Frequent Cause of Error in ——. J. Alix and Bay. XXIII., page 800.

Spirit; Production of Cheap —— *for Technical Purposes.* Delbrück. XVII., page 796.

English Patents.

Tar [*for Briquettes, &c.*]; *Method of Solidifying* ——. S. G. Coulson. Eng. Pat. 2102, Jan. 28, 1904. III., page 780.

Gas Producers; Regulation of [*Suction*] ——. W. J. Crossley and T. Rigby, Manchester. Eng. Pat. 13,763, June 20, 1903.

The patentees state that the difficulty experienced in making good gas, in a suction producer which is subject to a varying demand for gas, may be largely overcome if the proportion of steam to air is reduced while the demand is low, and raised to the maximum at full load. The cooling of the fire by an excess of steam is thus avoided. To effect the required automatic regulation of the proportions, one part of the air supply to the producer (the primary supply) is led directly to the fire-grate through an inlet of such an area as to be always working practically at its fullest, even at low loads. The secondary air supply is passed through a chamber in which it mixes with steam, and thence to the fire-grate, where it mixes with the primary air supply. Any variations in the suction applied to the producer affect mainly the secondary supply, as the primary is almost constant, and hence an increase in the rate of suction causes a corresponding increase in the ratio of steam to air (see following abstract).—H. B.

Gas Producers [Suction]. W. J. Crossley and T. Rigby, Manchester. Eng. Pat. 13,764, June 20, 1903.

To prevent the adhesion of clinker to the refractory lining of the producer (which is of the up-draught type), the fire-grate is fixed in the centre of an air-tight bottom plate, a few inches below the foot of the refractory lining. Annular box-castings are arranged concentrically in the space between the foot of the lining and the bottom plate, and act as superheaters for the air and steam passing through on their way to the under side of the fire-grate. A steam-generating device is provided on the top of the producer, surrounding the fuel hopper and depending into the combustion chamber. The secondary air supply is drawn through this chamber, and passes, mixed with steam, down to the superheaters mentioned above. The primary air supply enters directly below the fire-grate. The action of the primary and secondary air supplies is that described in the preceding abstract.—H. B.

Gas Producers [for Bituminous Fuel]. J. Fielding, Gloucester. Eng. Pat. 15,966, July 26, 1903.

The producer, which carries a feed hopper above and rests upon a water-sealed foundation as usual, is provided a little above its middle height with an annular conical grate, through which the air (or air and steam) supply enters in a substantially horizontal direction, suitable ducts being arranged near the base of the producer for leading off the gas generated. By this arrangement the air, or air and steam, is brought into the combustion chamber below the level of the raw fuel, directly into the incandescent zone, and is then deflected downwards so as to pass through the whole body of incandescent fuel.—H. B.

Gas; Method of and Apparatus for the Manufacture of ——. G. Westinghouse, London. From A. M. Gow, Edgewood Park, Pa., U.S.A. Eng. Pat. 17,215, Aug. 7, 1903.

See U.S. Pats. 742,411 and 742,412 of 1903; this J., 1903, 1287.—T. F. B.

Water-Gas, Producer-Gas, and the like; Process and Apparatus for the Production of ——. P. Schmidt, Hanover. Eng. Pat. 24,935, Nov. 16, 1903.

See Fr. Pat. 338,626 of 1903; this J., 1904, 653.—T. F. B.

Alkaline Prussiates; Manufacture of ——. G. E. Davis. Eng. Pat. 20,069, Sept. 17, 1903. VII., page 787.

United States Patents.

Gas-Producer. P. J. Buckley, Waukesha. U.S. Pat. 763,460, June 28, 1904.

Air circulates through chambers in the walls of the producer and is then led through a closed feeding-hopper, containing the raw fuel, after which it is passed into the combustion chamber of the producer. The discharge valve of the hopper is carried by the air-inlet pipe, which extends vertically down the centre of the hopper and is connected at its upper end to branch pipes entering telescopically the pipes which lead the hot air from the chambers in the walls of the producer.—H. B.

Gas; Process of Making ——. D. Turk, Riesa, Germany, Assignor to F. J. Maly, Aussig, Austria-Hungary. U.S. Pat. 764,320, July 5, 1904.

See Eng. Pat. 23,662 of 1900; this J., 1901, 1197.—T. F. B.

Carbon [Graphite]; Separating —— from Pulveris Carbonaceous Materials. J. D. Darling, Philadelphi U.S. Pat. 763,859, June 28, 1904.

Powdered carbonaceous material, such as graphitic or mixed with oil, is mechanically agitated under a body water divided horizontally by an obstruction (on which th mixture rests) impervious to the commingled oil an carbon, but pervious to the water and gangue. A flow water enters above the obstruction, below which it has i outflow, thus maintaining a downward current of wat through the "foraminate partition."—E. S.

French Patents.

Fuel; Artificial or Compound ——. International Fuel Co. Fr. Pat. 340,779, Feb. 19, 1904.

See Eng. Pat. 3781 of 1904; this J., 1904, 601.—T. F. B.

Furnace for Burning Tan and similar Fuel. D. M. Myer Fr. Pat. 340,849, March 1, 1904. Under Internat Conv., March 2, 1903.

See Eng. Pat. 5015 of 1904; this J., 1904, 653.—T. F. B.

Coke; Apparatus for Electrically Separating —— fro Cinders, &c. H. Lelarge. Fr. Pat. 340,898, March 1904.

See Eng. Pat. 5799 of 1904; this J., 1904, 653.—T. F. B

[Acetylene] Gas Generator with Warm Chamber. F. Fescourt and C. Maurin. Fr. Pat. 340,227, Feb. 6, 190

The generator, in which gas is produced by the action water on carbide of calcium or the like, is characterised the arrangement, above the bell in which the gas liberated, of a "warm chamber" through which the gas led before leaving the apparatus, "in order to be dried the heat developed by the decomposition of the substanc producing the gas."—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM AND MINERAL WAXES.

English Patents.

Distillation of Organic Substances; Dry ——. H. Aminoff, Domnarfvet, Sweden. Eng. Pat. 17,9 Aug. 19, 1903.

See U.S. Pat. 748,457 of 1903; this J., 1904, 113.—T. F.

Tar [for Briquettes, &c.]: Method of Solidifying — S. G. Coulson, Sheffield. Eng. Pat. 2102, Jan. 28, 1904

Tar is mixed, at 140° to 150° F., with one-tenth to or eighth of its weight of concentrated sulphuric acid, t addition of acid being performed so that the temperatu does not rise above 250° F. The mixture is then allow to cool in suitable moulds, when it is intended for use a binding material for fuel, road-making materials, &c. —T. F. B.

United States Patent.

Wood; Process of Destructive Distillation of ——. G Gilmer, New Orleans, Assignor to Illinois Investme Co., West Virginia. U.S. Pat. 762,303, June 14, 190

Wood is distilled in a retort slightly inclined to the ho zontal, by applying heat to the upper portion only of the bo of wood, the application of heat being so controlled a cause the heated zone to pass gradually downwards throu the wood. The vapours evolved are drawn off from t bottom of the lower end of the retort in several fraction —T. F. B

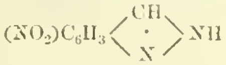
IV.—COLOURING MATTERS AND DYESTUFFS.

Trialkylated Amidines ; Preparation of ——. J. v. Braun. Ber., 1904, **37**, 2678—2685.

THE author has investigated the action of phosphorus pentachloride on dialkylated acid amides of the benzene and naphthalene series, and finds that in a suitable organic olvent, such as chloroform, these substances react smoothly nd readily to form aminochlorides, according to the equa- ion $R_1.CO.NR_2 + PCl_5 = R_1.CCl_2.NR_2 + POCl_3$. The roducts are extremely stable in absence of air. With water hey re-form the original acid amides with violent evolution f hydrochloric acid. By precipitating the aminochlorides rom chloroform solution with light petroleum spirit, ashing out the phosphorus oxychloride with more petro- eum spirit, and then acting on them with primary amines n chloroform solution, amidines are readily and rapidly ormed. In this way it is possible to form amidines ontaining groups which could not hitherto be introduced nto the molecule.—E. F.

ndazoles from Nitrated Orthomethylated Amines ; Forma- tion of ——. E. Noelting. Ber., 1904, **37**, 2556—2597.

HEN a diazotised nitro-derivative of *o*-toluidine is decom- osed by boiling its solutions or by letting its neutral aqueous olution or solution in acetic acid stand, the two main roducts of the reaction are the corresponding phenol and dazole. Thus the diazo compound from *o*-nitro-*o*-toluidine, $_5H_3(CH_3)(NH_2)(NO_2)$[1.2.3], yields *o*-nitro-*o*-cresol, and nitro-indazole—



$$(NO_2)C_6H_3\left\langle\begin{matrix}CH\\ \cdot\\ N\end{matrix}\right\rangle NH$$

he proportions of these two substances which are formed ry greatly, both with the constitution of the original azo compound and with the conditions under which the action takes place, it being often possible to obtain the e or the other product quantitatively. The author has stematically investigated the proportions of cresol and dazole formed from the diazo compounds of 22 mono- d dinitrated *o*-toluidines and homologues on boiling th mineral acids, with dilute acetic acid, and in neutral ueous solution, and also on standing in glacial acetic d solution at the ordinary temperature, and has tabulated e results. The following general conclusions were rived at :—

(a) *o-Nitramines.* — On boiling with mineral acids, 80— 0 per cent. of indazole is formed. An additional methyl oup in *o*-position to the methyl group which takes part the ring-formation exerts a favourable, a methyl group *p*-position to the amino group an unfavourable effect. heating with dilute acetic acid, or letting stand with cial acetic acid, the yields of indazole are, in general, aller.

(b) *m-Nitramines.* — On warming the diazo solutions th dilute mineral acids, cresols are mainly formed, ethylated derivatives yielding cresols only. Theoretical lds of cresol are formed in all cases by dropping the zo liquid into boiling dilute mineral acid. On boiling th glacial acetic acid, about 80 per cent. of indazole is med. Even *p*-methylated derivatives give similar yields indazole on adding the cold solution of the diazo com- und in glacial acetic acid to boiling glacial acetic acid. acial acetic acid solutions of the diazo compounds give nost quantitative yields of indazole on standing. Methylated derivatives yield large amounts of by-products en treated in this way.

(c) *p-Nitramines.*—These yield phenols quantitatively boiling the diazo solutions with mineral acid. Indazoles obtained in yields of 80 per cent. on letting the glacial tic acid solutions stand in the cold.

(d) *Dinitramines.*—Satisfactory yields of indazole are tained on boiling mineral acid solutions of the diazo npounds, 80 per cent. yields on dropping them into dilute boiling sulphuric acid. *p*-Methyl groups exert a very unfavourable effect on the indazole formation. The diazo solutions are very unstable even in the cold, forming reddish-brown by-products.

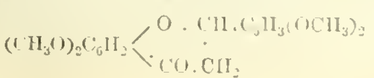
In general, by-products are formed in this reaction, especially in the case of the *p*-methylated compounds and on boiling in acetic acid solution. These consist of nitro derivatives of toluene-azo-indazoles and of oxyazo compounds, together with nitrogenous substances of unknown constitution which are very insoluble. Nitro-indazoles are white to yellow substances which can be sublimed, and are either non-volatile or scarcely volatile in a current of steam. They are usually easily soluble in alcohol, in glacial acetic acid, and in acetone. They have weakly basic and rather more strongly marked acid properties. The imino hydrogen can be replaced by alkyl and by acidyl groups. Nitro-indazoles do not react with diazo compounds. They can be readily reduced in acid solution to amino-indazoles which are strong bases, which condense with dimethyl-*p*-aminobenzaldehyde to form strong yellow dyestuffs and can be readily diazotised in acid solution. The diazo compounds react with amines and phenols to form dyestuffs which have a weak affinity for unmordanted cotton. Amino-indazoles also react with diazo compounds to form dyestuffs which show a weak affinity for unmordanted cotton.—E. F.

Diphenyl- and Triphenylmethane Dyestuffs ; Basic ——*II.* J. v. Braun. *p-Diaminodiphenylmethane ; Derivatives of* ——. J. v. Braun and E. Kayser. Ber., 1904, **37**, 2670—2678. (See also this J., 1904, 318.)

NEITHER auramine base nor Michler's ketone could be smoothly converted into the corresponding cyanomethylated compounds by means of cyanogen bromide. On the other hand, the authors were able to obtain *p*-dicyanodimethyldiaminodiphenylmethane, $[(CH_3)(CN).N.C_6H_4]_2:CH_2$, in good yields by the action of cyanogen bromide on *p*-tetramethyldiaminodiphenylmethane. The product, a white crystalline substance, can be easily oxidised to the corresponding ketone, $[(CH_3)(CN).N.C_6H_4]_2:CO$, but the preparation of the corresponding auramine, $[CH_3(CN).N.C_6H_4]_2:NH$, in a pure state, which was the ultimate object of the authors, was found to be extremely difficult. *s*-Dimethyldicyanodiaminobenzophenone reacts readily with hydroxylamine to form the corresponding oxime, but does not react with tertiary aromatic bases in presence of phosphorus oxychloride, nor was it found possible to form dimethyldicyanodiaminotriphenyl carbinol from it by Grignard's reaction with magnesium bromobenzene. By the action of mineral acids dicyanodimethyldiaminodiphenylmethane is converted into *s*-dimethyldiaminodiphenylmethane, $[CH_3.NH.C_6H_4]_2:CH_2$, a substance already described in Ger. Pat. 68,011, according to which it is formed by the action of formaldehyde on methylaniline. With benzylbromide it forms *s*-dimethyldibenzyldiaminodiphenylmethane, the solutions of which in organic solvents and in aqueous acids are pale blue in colour. This latter is a well-defined crystalline substance, very different in properties to the product described under the same name in Ger. Pat. 68,665. On treatment with mineral acids *s*-dimethyldicyanodiaminobenzophenone can be converted into *s*-dimethyldiaminobenzophenone, $[CH_3.NH.C_6H_4]_2CO$. The solutions of this substance in organic solvents and in aqueous acids have an intense yellow colour. With cyanogen bromide the original dicyano compound is re-formed. The substance also forms a pale yellow nitroso compound, $[(CH_3)(NO)N.C_6H_4]_2:CO$ and a colourless, crystalline dibenzoyl compound $[(C_6H_5CO)(CH_3)N.C_6H_4]_2:CO$ which does not agree in properties with the product obtained by Nathanson and Müller by the action of benzoyl chloride on Michler's ketone (this J., 1889, 978).—E. F.

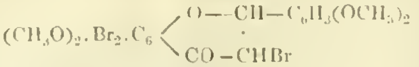
Luteolin ; A Second Synthesis of ——. S. Fainberg and St. v. Kostanecki. Ber., 1904, **37**, 2625—2627.

1.3.3′.4′-TETRAMETHOXYFLAVANONE—



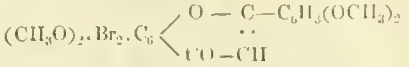
$$(CH_3O)_2C_6H_2\left\langle\begin{matrix}O\ .\ CH.C_6H_3(OCH_3)_2\\ \cdot\\ CO.CH_2\end{matrix}\right.$$

is converted by the action of bromine into 2.4.α-tribromotetramethoxyflavanone—



$$(CH_3O)_2.Br_2.C_6\left\langle\begin{matrix} O-CH-C_6H_3(OCH_3)_2 \\ \cdot \\ CO-CHBr \end{matrix}\right.$$

On treatment with alcoholic potassium hydroxide this forms 2.4-dibromo-1.3.3′.4′-tetramethoxyflavone—



$$(CH_3O)_2.Br_2.C_6\left\langle\begin{matrix} O-C-C_6H_3(OCH_3)_2 \\ \cdot\cdot \\ CO-CH \end{matrix}\right.$$

which on saponification and simultaneous elimination of bromine, by boiling with hydriodic acid, yields luteolin, which is 1.3.3′.4′-tetrahydroxyflavone—

$$C_6H_2(OH)_2\left\langle\begin{matrix} O-C-C_6H_3(OH)_2 \\ \cdot\cdot \\ CO-CH \end{matrix}\right.$$

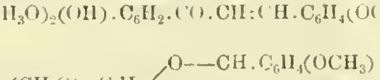
—E. F.

3.4.2′-*Trihydroxyflavonol.* S. S. Cohen and St. v. Kostanecki. Ber., 1904, 37, 2627—2631.

By the action of gallacetophenonedimethyl ether on salicylaldehydemethyl ether, 2′-hydroxy-3′.4′.2-trimethoxychalkone is formed, either alone or mixed with 3.4.2′-trimethoxyflavanone, according to the equations—

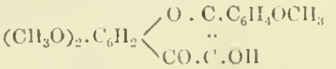
$$C_6H_2(OCH_3)_2(OH)(COCH_3)[1.2.3.4] + C_6H_4(OCH_3)(CHO) = (CH_3O)_2(OH).C_6H_2.CO.CH:CH.C_6H_4(OCH_3) + H_2O$$

or—



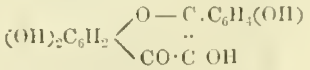
$$(CH_3O)_2.C_6H_2\left\langle\begin{matrix} O-CH.C_6H_4(OCH_3) \\ \cdot \\ CO.CH_2 \end{matrix}\right. + H_2O$$

The first of these products, the chalkone, is converted into the second by boiling with dilute mineral acids. 3.4.2′-Trimethoxyflavanone is converted by amyl nitrite and hydrochloric acid into the isonitroso compound, which on boiling with a mixture of acetic and dilute sulphuric acids, is converted into 3.4.2′-trimethoxyflavonol—



$$(CH_3O)_2.C_6H_2\left\langle\begin{matrix} O.C.C_6H_4OCH_3 \\ \cdot\cdot \\ CO.C.OH \end{matrix}\right.$$

The latter is demethylated by boiling with hydriodic acid, forming 3.4.2′-trihydroxyflavonol—



$$(OH)_2C_6H_2\left\langle\begin{matrix} O-C.C_6H_4(OH) \\ \cdot\cdot \\ CO\cdot C\ OH \end{matrix}\right.$$

This compound dyes in intense orange-yellow shades on alumina, and brown to black on iron mordant. Almost exactly the same dyeings are obtained with 3.4.3′-trihydroxyflavonol, described in the next abstract.—E. F.

3.4.3′-*Trihydroxyflavonol.* St. v. Kostanecki and O. Schleifenbaum. Ber., 1904, 37, 2631—2633.

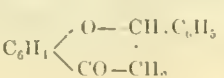
2′-Hydroxy-3′.4′.3-trimethoxychalkone—

$$(CH_3O)_2(OH).C_6H_2.CO.CH:CH.C_6H_4(OCH_3)$$

was obtained by the action of gallacetophenonedimethyl ether on *m*-methoxybenzaldehyde. This was converted, by the methods described in the last abstract, successively into the corresponding flavanone, an isonitroso derivative of the same, 3.4.3′-trimethoxyflavonol, and finally into 3.4.3′-trihydroxyflavanol, which closely resembles the corresponding 3.4.2′ compound in properties.—E. F.

Flavanone and Flavone: Synthesis of ——. St. v. Kostanecki and W. Szabrański. Ber., 1904, 37, 2634—2635.

o-Methoxyacetophenone was demethylated by heating with hydrochloric acid, forming *o*-hydroxyacetophenone. This yields 2′-hydroxychalkone with benzaldehyde according to the equation $C_6H_4(OH)(COCH_3) + C_6H_5.CHO = C_6H_4(OH).CO.CH:CH.C_6H_5 + H_2O$. On boiling with dilute hydrochloric acid in alcoholic solution this forms flavanone—



$$C_6H_4\left\langle\begin{matrix} O-CH.C_6H_5 \\ \cdot \\ CO-CH_2 \end{matrix}\right.$$

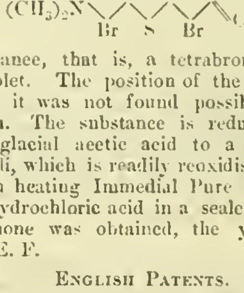
a substance of pleasant, faintly aromatic odour, crystalli ing in colourless needles, and soluble in concentrat sulphuric acid to a pale yellow, and in alcoholic sodiu hydroxide to an orange-yellow solution With bromine yields α-bromoflavanone, which is converted by alcohol potassium hydroxide solution into pure flavone—

$$C_6H_4\left\langle\begin{matrix} O.C.C_6H_5 \\ \cdot\cdot \\ CO.CH \end{matrix}\right.$$

—E. F.

Immedial Pure Blue. R. Gnehm and F. Kaufler. Ber., 1904, 37, 2617—2623.

Immedial Pure Blue, obtained by melting *p*-dimethylamin *p*-hydroxydiphenylamine with sulphur and sodium sulphi according to Ger. Pat. 134,947, was purified by means the hydrochloride of the leuco compound, which w isolated, oxidised in alkaline aqueous suspension in current of air, and finally freed from unchanged dipheny amine derivative and from Methylene Violet by washi with dilute acid. The purified dyestuff was heated wi potassium bromate and aqueous hydrobromic acid in sealed glass tube to 115°—125° C. From the products this reaction, nitrobenzene extracts 30—50 per cent. of finely crystalline reddish-violet product, which is ve insoluble in most other ordinary solvents. The analys and molecular weight determination agree with the empiric formula $C_{14}H_8ON_2SBr_4$. A determination of the meth groups attached to nitrogen agreed with the presence of dimethylamino group. The substance does not chan colour on boiling with acetic anhydride, and is insolul in alkali, and therefore does not appear to contain fr amino- or hydroxy groups, and one must assume that t sulphur takes part in the ring-formation. These co siderations lead the author to the formula—



for this substance, that is, a tetrabromo derivative Methylene Violet. The position of the bromine atoms uncertain, and it was not found possible to complet eliminate them. The substance is reduced by stann chloride and glacial acetic acid to a leuco compou soluble in alkali, which is readily reoxidised to the origi substance. On heating Immedial Pure Blue with sodi chlorate and hydrochloric acid in a sealed tube to 130° tetrachloroquinone was obtained, the yield being ab 20 per cent.—E. F.

English Patents.

Azo Dyestuffs; Manufacture of [Black] ——. G. Ellis, London. From Chem. Fab. vorm. Sandoz, Ba Eng. Pat. 14,768, July 2, 1903.

Black azo dyestuffs, suitable for use in wool dyeing, obtained by combining in alkaline solution diazotised am and aminoazo compounds of the benzene and naphthal series and their sulphonic acids with 1.8-aminonaphth 3.6-disulphonic acid, diazotising the resulting compou and combining with amino and hydroxy derivatives naphthalene and their sulphonic acids. For examp 2.6.8-naphthylaminedisulphonic acid is diazotised coupled with α-naphthylamine, the product is diazoti and combined with 1.8-aminonaphthol-3.6-disulpho acid, and the compound thus formed is in turn diazoti and combined with α-naphthylamine. The dyestuff fir obtained dyes wool in blue-black shades, which are tur to deep black by subsequent treatment with potassi bichromate.—E. B.

Acetdiamidophenolsulpho Acid [Azo Dyestuffs]; N ——, and Colouring Matters therefrom. R. B. Ransfo Upper Norwood. From L. Cassella and Co., Frankf on-Maine. Eng. Pat. 17,792, Aug. 17, 1903.

Nitroaminophenolsulphonic acid (OH : NO_2 : NH_2 : S 1:2:6:4) is acetylated and reduced. The ace diaminophenolsulphonic acid thus obtained gives, w diazotised and combined with phenols and amines, yestuffs of great technical value. Those produced from a umber of naphthol- and aminonaphtholsulphonic acids, pplied in an acid bath and after-treated on the fibre with otassium bichromate, dye wool in shades ranging from iolet to black; thus, for example, the dyestuff prepared om 1.8.4-aminonaphtholsulphonic acid dyes wool a violet, hich changes to a blue-black colour on chroming, the yeing produced being, it is stated, exceedingly level and ist to washing, milling, and light. (Compare this J., 1904, .)—E. B.

United States Patent.

itramines [Nitro Compound]; Process of Reacting on —— with Formaldehyde and a Product thereof. B. Homolka and J. Erber. Assignors to Farbwerke vorm. Meister, Lucius und Brüning, Höchst a/M. U.S. Pat. 763,756, June 28, 1904.

ALTS of primary aromatic nitramines are acted upon in queous solution by formaldehyde. The compound thus oduced from *p*-nitro-*o*-toluidine ($CH_3:NH_2:NO_2=1:2:4$), m. pt. 107° C., is a yellow crystalline substance, melting 230° C., insoluble in water, almost insoluble in most the usual organic solvents, but soluble in hot, glacial etic acid.—E. B.

French Patents.

Anthracene Dyestuffs. Cie. Paris. Coul. d'Aniline. Fr. Pat. 338,756, April 16, 1903.

IE halogen derivatives of 1.5- and 1.8-aminoanthra-inonesulphonic acids (see Fr. Pat. 334,576; this J., 04, 57) are condensed with primary aromatic amines, e resulting products being sulphonated. A dyestuff which es unmordanted wool in pure blue shades is thus obtained brominating the 1.8-isomeride, condensing with *p*-luidine, and sulphonating. (See U.S. Pats. 748, 375, 4, and 768; this J., 1904, 113 and 368.)—E. B.

lphide Dyestuffs derived from the Indophenol, $HO.C_6H_4.N:C_6H_4:O$, and its Homologues; Blue ——. Act.-Ges. f. Anilinfabr. Fr. Pat. 338,761, April 18, 1903.

Fr. Pat. 303,524, reference is made to a dyestuff which formed by the action of sodium sulphide (4 parts) and phur (1 part) upon the "simplest" indophenol, of formula $HO.C_6H_4.N:C_6H_4:O$, and which is therein cribed as being of no value. Later (Fr. Pat. 315,669; s J., 1902, 543), it was discovered that, in the case the sulphide dyestuffs derived from the indophenols erally, better yields are obtained when the proportion sulphur employed in the reaction (in aqueous solution 100° C.) is increased so as to be sufficient for the possible mation with the sodium sulphide of sodium pentasulphide. s now found that not the yield only, but the nature of product also is influenced by such increase, which is ecially noticeable with the indophenol of the formula en above and its homologues. A valuable dyestuff is, example, produced by heating together in aqueous tion at 110°—115° C. for 24 hours a mixture of the ium compound of the "simplest" indophenol (30 kilos.) n sulphur (80 kilos.) and crystallised sodium sulphide 0 kilos.). The product dyes from a sodium sulphide h unmordanted cotton in deep greenish-blue shades, ch are converted by oxidising agents into indigo-blue des of great fastness.—E. B.

sazo Dyestuffs [Azo Dyestuffs]. Badische Anilin und Soda Fabrik. Fr. Pat. 338,782, May 4, 1903.

-DIHYDROXYNAPHTHALENE is coupled with two molecular portions of the same diazo-salt or of dissimilar diazo s The products dye wool in shades ranging from red lue. The dyestuff prepared from two molecular propor- s of *o*-diazophenolsulphonic acid dyes a violet shade, h becomes black on chroming.—E. B.

nothioalphyl Derivatives and Azo Sulphide Dyestuffs rived therefrom; Production of New ——. [Azo Dyestuffs.] Soc. pour l'Ind. Chim. à Bâle. First Addition, ated Jan. 19, 1904, to Fr. Pat. 337,329, Nov. 5, 1903.

EN the dinitrothioalphyl compounds mentioned in the cipal patent (this J., 1904, 486) are completely reduced, diamino compounds are produced, which, on being diazotised and combined with amines or phenols, &c., or coupled with diazo compounds, give rise to new dyestuffs which possess the property of dyeing unmordanted cotton. A series of mononitrothioalphyl compounds has also been prepared by substituting the corresponding mononitro compounds for the dinitro intermediate compounds previously named (*loc. cit.*). New dyestuffs result when the mono-amino compounds derived from these are diazotised and coupled with amines and phenols, &c., or are themselves coupled with diazo compounds. In place of the aminothio-alphyl compounds, amino-alphyldisulphides and the corresponding xanthates can also be employed.—E. B.

Azo Dyestuffs; Electrolytic Method for Preparing ——. C. F. Boehringer und Soehne. Fr. Pat. 340,447, Feb. 15, 1904.

SEE U.S. Pat. 761,310 of 1904: this J., 1904, 712.—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Natural and Artificial Silks; Differentiation of ——. A. Herzog. Z. Farben- u. Textil-Chem., 1904, **3**, 259—260.

IF an artificial silk fibre be dyed, and then, after suitable mounting, be examined under a microscope fitted with a Nicol's prism, it shows dichroïc effects when moved into different positions with regard to the plane of vibration of the light passing through the Nicol. In the case of natural silks there is either no dichroïc effect or else it is quite inappreciable. It is of interest to note that these optical effects persist through all the changes from cellulose to artificial silk.—A. B. S.

Weighted Silk; Action of Hydrofluosilicic Acid on ——. R. Gnehm. Z. Farben- u. Textil-Chem., 1904, **3**, 258—259.

THE extraction of a sample of black weighted silk with hydrofluosilicic acid gave results which varied enormously according to the conditions of treatment. Such small changes as, *e.g.*, drying the silk between two acid treatments, had quite an important influence on the results. The usual weighting material (tin-phosphate-silicate) appears to be acted on quite differently from one containing alum. The amount of the weighting material extracted by the acid varied, in the different experiments, from 20 to 65 per cent. (see also this J., 1903, 969).—A. B. S.

Cotton from North-Eastern Rhodesia and British Central Africa. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 90 and 87).

FOUR samples of cotton grown near Mirongo Station, in the Senga country, have been examined. (1) *Mironjo-Senga:* A cotton of creamy colour, with a faint reddish tinge, having a soft, silky staple, 1·2—1·4 ins. long. Value, 7⅝*d.*—8*d.* per lb. (2) *Katumbi-Senga:* Cotton of good creamy colour, with weak and irregular staple, 1·3—1·5 ins. long. Value, 7⅜*d.*—7½*d.* per lb. (3) *Mironjo-Egyptian:* Soft, silky cotton of pale reddish-brown colour, with a rather irregular staple, 1·3—1·5 ins. long. Value, 8½*d.* per lb. (4) *Katumbi-Egyptian:* Cotton similar to (3), but rather paler in colour. The staple was "neppy," less silky than that of (3), and had a length of 1·3—1·5 ins. Value, 8¼*d.* per lb.

Two samples from British Central Africa were also examined, one from Zomba and the other from North-Eastern Rhodesia. The Zomba specimen was somewhat harsh and of a yellowish colour, with occasional buff-coloured stains where the cotton was "perished"; it contained fragments of broken seeds together with a few whole seeds, and had a staple 24—32 mm. in length. The cotton, free from seeds, and properly cleaned, would be worth about 5*d.* per lb. on the spot. The Rhodesian specimen consisted of wild cotton, which had not been ginned; it was fairly silky, of white to yellowish colour, with occasional buff-coloured stains, and had a staple of 23—33 mm. If properly prepared, it would be worth 4½*d.* per lb. on the spot. The seed freed from cotton would be worth about 4*l.* 5*s.* per ton.—A. S.

Cotton (Gossypium Barbadense) from South Australia. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 89.

The sample, which had been gathered from plants several years old, the cultivation of which had been neglected, had a length of staple of 1·2—1·5 ins. The cotton was silky, but irregular, and inferior to American "Sea Island" cotton. It is estimated as worth about 7½*d.* per lb.—A. S.

Hemp, Sisal (Agave Rigida, var. Sisalana), from South Australia. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 88.

The specimen examined consisted of white, fairly strong fibre, with a staple of average length, 40 ins. It is valued at 35*l.*—38*l.* per ton on the London market. The results of the chemical examination of the sample, together with those obtained with specimens of Sisal hemp from other British Colonies, are given in the following table :—

Source of Fibre.	Moisture.	Ash.	Cellulose.
	Per Cent.	Per Cent.	Per Cent.
South Australia............	8·8	0·7	79·1
Bahamas	12·8	4·4	75·9
Trinidad....................	11·6	1·0	77·2
New South Wales	9·8	1·6	77·7
India (Saharanpur).........	9·1	0·8	82·4

—A. S.

Fibre of Furcræa Gigantea from British Central Africa. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 84.

Furcræa gigantea, the plant from which Mauritius hemp is derived, has been found to grow well in British Central Africa. The specimen of the fibre examined was fairly white in colour, and had a staple about 40 ins. in length. In the following table the results of the chemical examination of the fibre are given, together with those obtained with specimens of the same fibre from S. India, Grenada, and Victoria :—

——	B.C.A. Specimen.	S. Indian Specimen.	Grenada Specimen.	Victoria Specimen.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Moisture	8·7	9·8	10·2	11·6
Ash	1·4	..	2·4	2·8
Loss on (*a*) hydrolysis..............	10·0	12·4	14·9	13·0
Loss on (*b*) hydrolysis	14·5	14·5	22·0	23·5
Loss on acid purification	1·7	1·7	3·8	5·6
Loss on mercerisation..............	8·7	11·4	16·0	16·2
Gain on nitration ...	38·1	40·7	34·0	34·0
Cellulose............	75·8	77·7	77·8	72·2
Length of ultimate fibre in mm.	2—5 (aver. 3·5)	2—5	1—5	1—3

The specimen examined closely resembles that from Southern India, and is distinctly superior to those from Grenada and Victoria. It is estimated as worth from 26*l.* to 30*l.* per ton.—A. S.

Hemp, Mauritius (Furcræa Gigantea), from South Australia. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 89.

The specimen consisted of a very long fibre (staple, 5 ft.), but of poor colour, roughly prepared and weak. It is said to be worth 28*l.* to 30*l.* per ton. It contained 8· per cent. of moisture, 1·4 per cent. of ash, and 74·5 per cent. of cellulose.—A. S.

Hemp, Bowstring (Sansevieria Zeylanica), from South Australia. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 88—89.

The sample consisted of a soft, fine fibre, somewhat deficient in strength, and with an average length of 38 ins. It is estimated as worth from 33*l.* to 35*l.* per ton. analysis, the sample gave the following results, the fig obtained with specimens of the fibre from other sour being also given for the purpose of comparison :—

Source of Fibre.	Moisture.	Ash.	Cellul
	Per Cent.	Per Cent.	Per Ce
South Australia............	8·1	0·4	80·9

VII.—ACIDS, ALKALIS, AND SALTS.

Alkali, &c. Works; Fortieth Annual Report on —— the Chief Inspector. Feb. 17, 1904.

The Alkali, &c. Works Bill of 1903, to amend and solidate previous Acts, was read a first time in the ses of 1903. It was proposed in this Bill to include, thoug a very limited manner, certain smelting or metallurg works within its scope; but in the Bill of 1904, rece introduced, the clauses relating to these have been w drawn, as, if included, it became evident that opposi causing delay would be made. But amendments of cer clauses of the 1903 measure are included, which have agreed upon with the trades affected.

Alkali and wet copper works, these being the lon under inspection, have given "little ground for complai in the past year. Complaints of damage done conti to be received from Widnes in 1903, but in this dis there are metallurgical works not within the jurisdictio the Alkali Acts, with which works the responsibility n be shared.

In alkali waste works, attention continues to be direc to the acid discharges from the chimneys to which, "a combustion to sulphurous acid in special coal-fired furna the residual mixture of fine sulphur, sulphuretted hydro and sulphurous acid is draughted." The chief inspecto first suggested the use of a spray of alkaline magma (bonated spent waste) thrown up to meet the residual ga but such waste proved to be too crystalline to be a g absorber, and to be apt to clog the passages. An exp mental plant was set up by Mr. Murphey, co-opera with Dr. Affleck, in which a constant flow of milk of wa rendered alkaline either by (1) milk of lime; or (2) carbonated spent waste (discharged from the Cha rbonators), ran down two boiler fire-flues set up on end, tandem, in which sloping shelves were fixed, extending half the diameter of the flue. In order to interpret tionally the results obtained, Mr. Linder undertook a boratory investigation "to determine the conditions most vourable for the complete absorption of hydrogen sulphide nd sulphur dioxide by 'waste' slurry, either alone or in onjunction with added lime." The questions to be answered ere: (1) Nature of the interaction of hydrogen sulphide nd sulphur dioxide in presence of varying amounts of alcium hydroxide. (2) Nature of the interaction of hydro- en sulphide and sulphur dioxide in presence of tank waste spended in water. In respect to (1), calcium sulphide ave no reaction with calcium sulphite in presence f excess of lime. Calcium hydrosulphide and calcium isulphite yielded mainly calcium thiosulphate. Calcium lphide and hydrosulphide with calcium bisulphite, in resence of free sulphurous acid, gave calcium thio- lphate, free sulphur, and sulphur in other forms, but the eacting proportions are always S as H_2S : S as SO_2 : : 44 : 56. t appears, therefore, that if loss of sulphur as thiosulphate r free sulphur is to be avoided, the presence of free lphurous acid or bisulphite should be excluded. In spect to (2), the action of hydrogen sulphide and sulphur ioxide upon "waste slurry" at 60° F., the experiments hich were made with (*a*) hydrogen sulphide alone; (*b*) lphur dioxide alone; and (*c*) hydrogen sulphide and lphur dioxide together, lead to the following conclu- ions:—"(*a*) The free base in solution as hydrate or arbonate reacts with the added hydrogen sulphide and lphur dioxide to form soluble hydrosulphide or insoluble lphite respectively. (*b*) The sulphurous acid reacts with in- luble calcium sulphide—(i.) Local, $2H_2SO_3 + CaS = H_2S +$ a$(SO_3H)_2$; (ii.) General, $H_2SO_3 + CaS = H_2S + CaSO_3$.) The sulphuretted hydrogen added, and that liberated by eactions (*b*) reacts with insoluble calcium sulphide, $H_2S +$ aS $= Ca(SH)_2$. (*d*) Calcium bisulphite and calcium hydro- lphide react locally to form thiosulphate, $2Ca(SO_3H)_2 +$ a$(SH)_2 = 3CaS_2O_3 + 3H_2O$. Applying these equations calculate the theoretical yield of hydrosulphide, figures e obtained which agree well with experiment." Details the results obtained are given in two tables.

At wet copper works, more difficulty is experienced than alkali works generally, in keeping the hydrochloric id gas evolved within due limits, partly because it has t proved convenient to construct the furnaces on the us-pressure principle, as usually the case. Dr. Affleck ports that by a plan of burning a certain proportion "pyrites smalls" in a special furnace apart, at certain tervals, and mingling the gases with those derived om the other furnaces, in which the mixture of burnt pper ore with salt is calcined, all excess of chlorine in these ses is reduced, obviating the difficulty in absorption which herwise arises. It is stated that at a factory in which one imney draws from 20 or more furnaces, the adoption this method has rendered air dilution, as formerly actised, unnecessary, in order to keep within the require- nts of the Act.

The works in which sulphuric acid is made by the amber process have given no grounds for complaint in spect to escape of acid gases in the past year. Of the ntact process, two examples, on different systems, are now erating in England, and a factory also exists in Scotland. ese English works have been the occasion of some uble, due to defects of design and construction. The ef inspector recommends, for the reduction of the escape acid, when its recovery is not desired, a limestone er, fed with water, such as has been successfully em- yed in the Venetian red manufacture. In respect to the tch factory (using the contact process), the chief inspector rets that not much progress has been made in reducing escape of acid gases; but trials are being made of a design, from which better results are expected. The tom inlet to vitriol chambers, of which Mr. Porter showed lass model before the Society of Chemical Industry at nchester, in April 1903, (this J., 1903, 477), has been pted at several works, and an experimental trial of the hod at one works has shown a yield of acid in the ire plant "7·0 per cent. higher with the bottom inlet he chamber, than with the old flues, and there was also found to be a saving of nitre just on 1·0 per cent." Other advantages accruing from the adoption of the method are also mentioned.

Many firms have to purify their sulphuric acid from arsenic by means of hydrogen sulphide, and at present the sulphide mud is consigned to the nearest tip; but it is hoped that some method of utilising it may be found. An analysis by Mr. Fryer shows that the mud contains, besides its main constituents (arsenious sulphide and free sulphur), sulphuric acid and water, appreciable proportions of antimonious, lead, bismuth, and copper sulphides, besides calcium and ferrous sulphates.

In the concentration and rectification of sulphuric acid, "the overheat pan has not yet been replaced" by a method "yielding more satisfactory results in lessened escape of acid gases." The Kessler system has received further extension, though not unattended by complaints on the starting of new plant; but improved results are expected. The advantages arising from the exclusion, as far as possible, of air and permanent gases from the vapour to be condensed, previously pointed out by the chief inspector, are increasingly recognised. The best results are obtained where platinum stills with platinum covers are used, next to which in efficiency comes the Faure-Kessler combined platinum and lead apparatus. In making acidimetric estimations, the chief inspector emphasises the precautions necessary to be observed. In using phenolphthalein and methyl orange as indicators, it is to be noted that the former gives an erroneous result unless it is titrated at a boiling heat, owing to the action of carbonic acid; and it is pointed out that 1 cb. ft. of air at 60° F. contains carbon dioxide equivalent to 0·59 grain of sulphuric anhydride. When an alkaline absorbent of residual acid gases is used, the conditions are favourable for retention of the carbon dioxide. In exits of chambers using pyrites, or the gases of sulphate of ammonia saturators, or spent oxide from gas works, as the source of sulphur, the proportion of carbon dioxide is increased for reasons that are explained. The chief inspector writes, "as regards the critical comparison of various absorbents, it is absolutely essential that concurrent aspirations should be made, if it is desired to draw any conclusion with certainty as to the efficiency of any particular absorbent. Conditions vary, from time to time, with such rapidity in the chamber process that only in this way is it possible to proceed to obtain results of permanent value." The manufacture of chemical manures has been conducted in increased volume in the past year. Dr. Affleck's method of testing the acid gases escaping from the final exit flues in the manufactures described in the preceding report (see this J., 1903, 863) has been adopted generally, accuracy being thereby secured. The following table shows the amount of manure materials, in tons, imported during the years indicated:—

—	1903.	1902.	1901.
Guano	28,000	9,000	13,000
Mineral phosphates	392,714	365,000	354,910
Nitrate of soda	115,000	105,000	107,600

The exports of sulphate of ammonia were 162,300 tons in 1903, as compared with a home consumption of 71,700, inclusive, for all purposes. For 1902, the corresponding figures were 162,750 tons and 63,750 tons respectively. Mond producer-gas plants, fitted for the recovery of ammonia, have been introduced for the first time in Scotland, and in 1904 a further increase in them is looked for, as well as further extension of coke-oven plants with recovery of residuals. The tendency for gasworks to work up their own residual products is on the increase. The chief inspector directs attention to certain sources of loss of ammonia in the saturators, one of which is the construction of saturators with too steep an angle in the bottom from back to front, so that after the sulphate formed has been fished out, the ammonia-distributing pipe tends to become unsealed; losses also occur through gradual enlargement of the holes in the pipe.

Amount of Sulphate of Ammonia produced in the United Kingdom.

——	1903.	1902.	1901.
Gas works	149,489	150,055	142,703
Iron works	19,119	18,801	16,353
Shale works	37,353	36,931	40,011
Coke-oven works	17,438	15,352	12,255
Producer-gas and carbonising works (bone and coal)	10,265	8,177	5,891
Total	233,664	229,316	217,213

Mr. Linder, at the request of the Chief Inspector, gives "Analyses of Ammoniacal Liquors from various Sources, and Review of the Methods employed in Determining the various Sulphur Compounds," in which he details the methods adopted for the determination of ammonia, free and fixed; carbonic acid; chloride; sulphur, under (*a*) as sulphate; (*b*) as thiocyanate (sulphocyanide); (*c*) as sulphide, sulphite, and thiosulphate; (*d*) total sulphur; (*e*) sulphur as polysulphide. Under the heading "Estimation of Sulphate in Ammoniacal Liquors," three methods are described, consisting in: (1) differentiation of sulphite and thiosulphate by oxidation with a current of air; (2) precipitation of the sulphite by baryta water; (3) polysulphide method, for which the results are given in tabular form. Other headings are: Estimation of Total Sulphur in Ammoniacal Liquors; Distribution of Sulphur in Ammoniacal Liquors; and Estimation of Cyanide in Ammoniacal Liquors.

The total output of rock salt, white salt, and salt contained in brine used for making alkali by the ammonia-soda process, was, in 1902, 1,893,881 tons, the output for the preceding year having been 1,783,056 tons. Most of the increase was due to the works in Cheshire and Stafford. In cement works, there is continued extension of methods depending on the continuous feed of materials and discharge of calcined cement by the use of rotary cylindrical kilns. Difficulties in reference to the occurrence of black smoke have not been wholly overcome. All the works of the Associated Portland Cement Manufacturers, 1900, Ltd., have been provided with cylinders of compressed oxygen, with mouthpieces, for use in cases of poisoning by kiln gases. It has been suggested to other owners and managers of cement works to adopt similar precautions. The production of arsenic has fallen from 3,361 tons in 1901 to 2,131 tons in 1902. No fault is found with the works. A new Venetian red work has been established in South Wales.

In respect to the conduct of tar works, the Home Office has issued draft rules calling attention to the risks to workmen who are engaged in carrying on the various operations of the process, in harmony with the chief inspector's previous warnings, as to isolation of stills during the process of chipping out and cleaning. In "Studies on the Claus Kiln Reaction," the substance of much of the paper by the chief inspector and Mr. Linder, published in this Journal for March, 1903, 457—465, is reproduced, with the results of experiments made since that date. The examples given in the 39th Report of the theoretical maximum heat of reaction were confined to the Scotch works, but have now been extended to the English works. According to the hypothesis examined, the maximum arrived at lies between 946° and 1033° F. There is evidence that at the top of the Claus kiln, owing to the intensity of chemical reaction in this space, temperature is very high, causing much injury to the wrought-iron top. It is anticipated that Dr. Affleck will continue experiments at an experimental Claus kiln to further elucidate this point. The chief inspector gives, in an appendix to the above-mentioned "Studies," detailed calculations showing that the governing factor for conditions for the reversing action, $3S + 2H_2O = 2H_2S + SO_2$ (the other reaction being $H_2S + O = H_2O + S$), is the large amount of heat required to vaporise the sulphur.

The Claus kiln reaction studies are grouped under the following heads:—(A.) The Heat reactions, theoretically considered, of different Gaseous Mixtures, with tabular matter. (B.) Experiments with Manganese Oxides as Contact Material in place of Ferric Oxide, in respect to which it is stated that "while, in the Claus kiln, ferric oxide is converted into iron bisulphide, manganite of manganese and manganite of calcium are converted into manganous and calcium sulphates. The stage of manganese sulphide appears to be of very temporary duration; no trace of this could be found. The manganous sulphate is in the form of monohydrate." (C.) Determination of the "Efficiency" of the Claus Kiln and Chambers, with remarks upon the measurement of gaseous volumes, and methods applicable to exit gases. Under this heading, several tables of results are given, partly derived from experiments (by Mr. Linder) with the Leicester Corporation, and South Metropolitan Gas Company's Claus plant, supplemented by tests from other works. (D.) Ammonia in Recovered Sulphur from Claus kilns attached to Gas Liquor Processes. Under this heading the results of experiments on the reaction of steam upon hydrocyanic acid at from 500°—600° C. are given. (E.) Appendix, giving thermal calculations and discussions with numerous experiments, and calculations relating to the air supply in treating saturator gases; and on the volume of reacting mixture entering, to that of the exit gases. Mr. Sutton (Eastern and South Eastern Counties District) writes: "The presence of considerable quantities of ammonia salts in the recovered sulphur from the Claus process ha frequently been observed. These were generally attributed to ammonia having passed by the saturators; but during a recent investigation of the working efficiency of certai contact material used in a Claus kiln and the reaction taking place therein, it was found that cyanogen compound passing forward to the kiln with the saturator gases were converted into ammonia compounds. This interesting reaction is receiving further investigation." Combustion o foul saturator gases in a special furnace, with subsequen neutralisation of the resulting sulphurous acid, has received further extension in several works; whereas their passage to the hydraulic or crude gas main of coal-carbonising plant is less adopted. The practice of passing such gase to the retort or boiler fire flues is still in use, but is considered to be legitimate only at the smallest works.

A curious statement is made respecting the heaps of alkal waste about the Netham Chemical Works, at Bristol. Of these, for years no blade of grass or weed grew; but now the narrow-leaved wall mustard (*Diplotaxis tenuifolia*) i "fast spreading its verdure over these arid heaps of chemica refuse." The plant occurs in the south, south-west, an east of England, but in other parts is rare or absent. I bears pale yellow flowers with an almond-like fragranc It is suggested that, on æsthetic grounds, it might b worth while to encourage the growth of this plant on othe such unsightly heaps besides those of Bristol. There wa one prosecution in the year covered by the Report, f infractions of the provisions of the Act of 1881 in th manufacture of chemical manure. The Report contai 183 pages, of which 13 pages are devoted to Scotland.

—E. S.

Electrolysis of Alkali Chlorides by the "Bell Process"
G. Adolph. Z. Elektrochem., 1904, **9**, 449—450.

The author claims priority for the experimental found tions of a theoretical explanation of the continuous functio of this process, as recently dealt with by O. Steiner (th J., 1904, 545); he considers that the experiments of t latter confirm, rather than contradict, his previous work.

—R. S. H.

Potassium Metabisulphite and Sodium Bisulphite; Alter tion of —— when Exposed to Air. A. and L. Lumi and A. Seyewetz. XXI., page 799.

Cyanogen and Cyanides: Slow Oxidation of —— by Fr Oxygen. Berthelot. Comptes rend., 1904, **139**, 169 177.

Alkali cyanides, cyanogen, and hydrocyanic acid, aqueous and alcoholic solutions, all absorb free oxyg slowly; the absorption is accelerated by sunlight and al by rise in temperature. The absorption is most marked the case of potassium cyanide, and most feeble with hyd cyanic acid. When the absorption is carried out ov ercury, small quantities of the metal are dissolved; when e oxidation of potassium cyanide was performed in coholic solution, over mercury, and in presence of otassium hydroxide, no solution of the mercury was found occur.—T. F. B.

English Patents.

itrous Anhydride and Nitrites; Manufacture of ——. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer & Co., Elberfeld, Germany. Eng. Pat. 18,591, Aug. 28, 1903.

E Fr. Pat. 335,229 of 1903; this J., 1904, 186.—T. F. B.

icalcium Phosphate; Method of Producing ——. E. Bergmann, Ohlau, Germany. Eng. Pat. 19,267, Sept. 7, 1903.

E Fr. Pat. 335,798 of 1903; this J., 1904, 253.—T. F. B.

lkaline Prussiates; Manufacture of ——. G. E. Davis, Knutsford, Cheshire. Eng. Pat. 20,069, Sept. 17, 1903.

the process for the manufacture of alkali prussiates from al gas scrubbings described in Eng. Pat. 26,566 of 1902 his J., 1903, 1243), it is found to be necessary to use an xcess of sodium carbonate over that needed to form sodium russiate and to displace ammonia in the mixture of liquids d solids coming from the scrubber, and this excess ecomes concentrated in the mother liquor remaining after e crystallisation. The present invention consists in adding me to the mother liquor, and using the caustic filtered lution for introduction to the still for the conversion of e sodium-ferrous-ferrocyanide into sodium prussiate, as escribed in the cited patent.—E. S.

ypsum; Manufacture of Crystalline ——, applicable for Filling Purposes. W. Brothers, Prestwich, Lancashire. Eng. Pat. 26,007, Nov. 28, 1903.

E Fr. Pat. 333,858 of 1903; this J., 1904, 20.—T. F. B.

itrogen and Oxygen; Apparatus for the Separation of —— from Atmospheric Air. J. Price, London. Eng. Pat. 14,213, June 27, 1903.

HE process consists in the known process for the use of rium oxide or the like; but in such manner as to be ntinuously carried out. The apparatus includes the mbination with a suitably heated retort, of means for ceiving air and for discharging separated gases; of a rtition carried by a spindle mounted on bearings in the tort, capable of being turned in either direction to tablish or cut off communication between the oxygen d nitrogen chambers defined by the partition; and trays contain the absorbing material, arranged in connection th the spindle, and to be moved out of one chamber into e other simultaneously with the movement of the partition. another form of apparatus, also giving a continuous ocess of separation, means are provided for moving the eptacles containing the absorbing medium from one amber to another, to effect peroxidation and deoxidation. —E. S.

United States Patents.

trous Anhydride and Nitrites; Process of Making. H. von Kéler, Leverkusen, Germany, Assignor to Farbenfabriken of Elberfeld Co., New York. U.S. Pat. 763,491, June 28, 1904.

MIXTURE of ammonia with air or oxygen in excess is ssed over an oxide of a heavy metal (iron oxide for tance), or over a mixture of such oxides, kept at a mperature between 650° and 750° C. to obtain nitrous ydride. When it is desired to form a nitrite, the effluent es, containing "nitrous anhydride," are brought into tact with an alkali hydroxide or carbonate.—E. S.

drocyanic Acid; Process of Making ——. W. Feld, Hönningen-on-the-Rhine, Germany. U.S. Pat. 764,443, uly 5, 1904.

s addition, of Aug. 30, 1902, to Fr. Pat. 315,837 of 01; this J., 1903, 571.—T. F. B.

Ammonium, Nitrate of; Process of Producing ——. E. Naumann, Cologne, Germany. U.S. Pat. 764,251, July 5, 1904.

See Fr. Pat. 339,733 of 1904; this J., 1904, 714.—T. F. B.

Copper Sulphate; Process of Making ——. G. Gin, Paris. U.S. Pat. 765,000, July 12, 1904.

Acid of Proof Composition. F. A. Pank. U.S. Pat. 763,421, 1904. IX., page 788.

French Patents.

Phosphoric Acid; Producing ——, by Means of Aluminum Phosphate and other Substances. Brandon Frères. Fr. Pat. 340,272, Feb. 9, 1904.

Aluminium phosphate (especially the natural phosphate), which may be mixed with coal dust, is heated in a suitable retort, connected to condensing apparatus and an exhausting pump, to a temperature not exceeding 800° C. It is stated that on maintaining a vacuum (say from 6 to 50 mm. of mercury) in the retort by use of the pump, the heated phosphate gives off fumes which condense in water, mainly to metaphosphoric acid, mixed with small proportions of orthophosphoric, hypophosphoric, and hypophosphorous acids. The vapours not absorbed by water are passed through alkaline solutions.—E. S.

Oxygen; Simplified Preparation of ——. G. F. Jaubert. Fr. Pat. 340,388, Feb. 12, 1904.

The process is one of preparing oxygen by the action of water on alkali peroxides, &c. The peroxides are contained in hermetically soldered tin boxes, preferably in packets or pieces separated from one another by suitable bands or metal strips. A box thus charged is provided with an opening in its upper side, closed by a screw stopper, and another, but perforated stopper, is provided, adjusted to the same thread, having a rubber tube attached, connecting it to a reservoir. A pin hole is made in the under side of the box, which, fitted to the discharge tube, is completely immersed in water. As the water slowly enters, oxygen is formed and is collected. Compare Fr. Pat. 325,627 of 1902, and Add. to the same, this J. 1903, 743 and 1348, and Fr. Pat. 336,062 of 1903; this J., 1904, 323. —E. S.

VIII.—GLASS, POTTERY, ENAMELS.

Ceramic Body; New ——. M. Buchner. Z. angew. Chem., 1904, **17**, 985—988.

It is found that the artificial corundum, obtained as a by-product of the Goldschmidt aluminothermal process (this J., 1898, 1151), is capable of imparting to kaolin, clay, and other ceramic bodies (for stoneware in particular), the property of resisting extreme fluctuations of temperature, owing to the fact that it almost entirely eliminates the element of contraction in these bodies. Sherds containing corundum as an ingredient may be heated to whiteness in the oxyhydrogen blowpipe flame and immediately plunged into water without fracture. They also possess a high tensile strength (*e.g.*, 61·2 kilos. per sq. cm.), with a total extensibility of 0·0149 (permanent 0·0019, elastic 0·012) per cent. With ordinary stoneware of corresponding quality, these values are about 44 kilos., and 0·0097 (permanent 0·0002, elastic 0·0095) per cent. respectively. The crushing strength of the corundum ware is 1725 to 2685 kilos. per sq. cm., as compared with 800—1300 kilos. in the case of ordinary stoneware. The ware is acid-proof, and can be made up in the form of porous diaphragms for electrolytic purposes; whilst the absence of shrinkage is considered to specially fit it for these uses.—C. S.

French Patent.

Glass; Process for Working ——. H. J. Hays. Fr. Pat. 340,920, March 3, 1904.

See Eng. Pat. 4501 of 1904; this J., 1904, 546.—T. F. B.

X.—METALLURGY.

Metals; Hard and Soft States in ——. G. T. Beilby. Electro-Chem. and Metall., 1904, **3**, 806—819.

The author brings forward a new theory of the hardening of metals by plastic flow based on the results of a study of the microstructure of metal and other surfaces (this J., 1903, 1107,* 1108), and, in particular, the discovery of surface flow during the polishing of crystalline solids (this J., 1901, 922; 1903, 1166). According to the theory metals occur ordinarily in two distinct phases: the hardened or amorphous (A), and the annealed or crystalline (C) phase. The A phase is transformed into the C phase by the agency of heat, the C phase is transformed into the A phase by mechanically produced flow. In the transformations $A \rightleftarrows C$ there are two intermediate mobile phases, M and M′, so that the transformations may be written $A \rightarrow M' \rightarrow C$ and $C \rightarrow M \rightarrow A$. Evidence in favour of the theory is furnished by:—(1) The distinct mechanical properties of the two phases A and C. (2) The microstructure of these and the indications which it supplies of the existence of the mobile phases M′ and M. (3) The optical properties, (4) the electrical properties, and (5) th thermochemical properties of the phases A and C.

Mechanical Properties—When silver is rolled, hammered or wire-drawn, its hardness and tenacity are raised to very high point. For instance, the tensile strength of sol silver may, in this way, be raised from under 10 tons t over 20 tons per square inch. A strip of silver made quit hard and springy by hammering will, after heating t 260° C., become so soft that it may be pressed perfectl flat on a smooth surface by the slightest pressure from th finger.

Microstructure.—Annealed silver, if in a sufficientl massive form, always shows a crystalline microstructur consisting of skeletons or grains built up of lamellæ similarly oriented units. The microstructure of hardene silver is vitreous-looking on the surface, and finely granul immediately below the surface. By careful treatment wit a solvent, the glassy surface and the granular portio immediately below can be completely removed, disclosir the crystalline grains or skeletons of the C phase mo or less deformed or broken up. The vitreous layer wi granules thickly distributed throughout its mass, alwa appears at surfaces of flow, the granules probably bei produced by the breaking down of the lamellæ and th setting free of the units of which they are built up. Th persistence of the units of the C phase in the granules m be due to their being encased in an envelope of the hardene A phase.

Optical Properties.—Hardened silver, even in i moderately attenuated forms, such as beaten leaves an deposited films, is highly reflecting and only slight translucent. By heating to 250°—300° C., the leaf or fil becomes transparent and loses much of its reflecti quality, but opacity and reflecting power are restored "flowing" or burnishing the annealed leaf or film.

Electrical Properties.—Silver wire in the annealed sta has an electrical conductivity 8—10 times higher than th of the same wire in the hardened state. A thermo-juncti consisting of a hardened and an annealed silver wire h an E.M.F. of 0·17 micro-volt for 1° C. of difference betwe the hot and cold junctions. At 260° C. the E.M.F. fa to zero, as the hardened wire then passes into the s condition. Copper, iron, platinum, and magnesium show a measurable E.M.F. between the two states.

Thermochemical Properties.—In etching polished hardened silver, the solvent acts first on the harden phase, leaving the crystalline phase exposed, whereas the hardened metal were merely a slightly compacted fo of the annealed, the latter more open form would be mo readily attacked and dissolved.

The author discusses the application of his theory to t deformation of the crystalline structure of metals by ov strain as observed by Ewing and Rosenhain (this J., 18 834; 1900, 1115), the increase in the tensile strength a metal produced by drawing it through a die, the hardeni of iron by thermal treatment and the mechanical action gases in this respect (see this J., 1901, 1212), and t breaking down of the tenacity and elasticity of met under frequent repetitions or reversals of stress. The gr inferiority of a wire which has been hardened by stretchi as regards tenacity to one which has been harden by drawing through a die, is due to a difference in t structural disposition of the two phases in the harden metal. In the stretched wire the surface layer duri stretching must be alternately made and broken ma times, and is finally left rough and open. In drawi on the other hand, the flow of the surface as the wir leaving the die, ensures that it is strong and unbroken.

Spathic Iron Ore; Calcination of ——. C. Lacoisne. Bull. Soc. d'Encourag., 1904, **106**, 360.

The spathic ores of Western Hungary and Austrian Sile contain 35 per cent. of iron or less, and are usually calcu so as to lessen the cost of transport. The furnaces, li with ordinary brick and cased in sheet iron, hold ab 60 tons, and calcine about 15 tons per 24 hours. Altern layers of ore (3½ tons) and coke (210 kilos.) are charg and a tube of 25 mm. diameter passes down the centr the furnace, through lateral holes in which fine jets of wa ler pressure are injected horizontally into the furnace. e reaction of this upon the hot coke, and the subsequent nbustion of the hydrogen and carbon monoxide pro- ed, favour the calcination, so that a saving of half fuel (from 12 to 6 per cent.) formerly used has been ected.—J. T. D.

Tool-Steels ; Rapid ——. H. le Chatelier. Bull. Soc. d'Encourag., 1904, **106**, 334—347.

E author gives the following analyses of rapid tool els :—

o.	Carbon.	Silicon.	Manganese.	Tungsten.	Chromium.
1	0·71	0·20	0·30	12·0	3·0
2	0·43	0·22	0·17	15·5	4·5
3	0·45	0·16	0·02	13·0	1·6
4	0·45	0·60	0·18	9·5	2·05
5	0·60	0·40	0·30	13·5	8·0
6	0·20	0·25	0·18	7·0	2·1
7	0·65	0·60	0·12	0·4	3·6

e may take the average or typical composition to be :— rbon 0·5, silicon 0·2, manganese 0·2, tungsten 12, romium 3·0, molybdenum 1, iron 83 ; but very probably s will be modified in the future, and may revert to the gher carbon and lower tungsten and chromium of the ginal rapid steels. The points of chief importance in nsidering the progress made or to be made in rapid steels e as follows :—1. *Net price:* This is high, say 6 frs. r kilo., due to the high prices of vanadium (110), molyb- num (17), and tungsten (7 frs. per kilo.). 2. *Hardness:* is seems to decrease with the carbon, for these steels n be scratched more easily than high carbon tool steels. *Fragility:* Rapid steels are more brittle than carbon steels ; to minimise the inconvenience of this, tools have been made of ordinary steel, with a piece of rapid steel welded on by the oxyacetylene flame to form the cutting edge. Probably careful determinations of the temperature of heating and of the cooling bath would enable a less brittle rapid steel to be produced. An over-heated carbon steel segregates and becomes heterogeneous, and no doubt a rapid steel does the same ; and this heterogeneity probably causes brittleness. 4. *Resistance to Tempering:* The temperature of softening is above 500—600° C., but an hour at 700° C. softens the hardest steel completely. The higher this temperature can be kept the better ; for though the average temperature of the tool at work may not reach 500° C., yet the outer portions may be at a much higher temperature. It is to be remembered that the temperature of recalescence is about 700° C., so that as the softening temperature approaches 700° C. there comes a point where softening is impossible. The tempering temperature depends both on the composition of the steel and the initial temperature of heating. A bar with its lower end dipping into water, and heated to fusion at its upper end, then plunged into a zinc-aluminium alloy at 550° C., showed four zones (illustrated in the paper by micro-photographs) indicating, at the bottom, the soft steel unaltered ; above, slight softening of the hardened metal on remaining in the bath ; above this, perfect temper, homogeneity, with no sign of softening, and at the top hard and brittle steel, heterogeneous in structure. 5. *Cracks:* These form one of the troubles of tempering. They arise from sudden changes of volume, and the liability to them is greatest with high carbon and with a low percentage of tungsten. They have two distinct causes :—*a.* The state of the metal which is stable at a high temperature is not preserved during the sudden cooling, for the non-magnetic metal becomes magnetic. This change is accompanied by change of volume, producing cracks ; and this effect is the greater, the colder and more brittle the metal is when the change occurs. For this reason the use of metallic baths is advantageous, provided the temperature is not high enough to allow any softening to take place. It is probably to avoid cracks, too, that the carbon has been gradually lessened and the tungsen increased in rapid steels. *b.* Rapid steels as distinguished from steels in general exhibit another cause of cracks, the same which produces them in glass. A drop of water on the hot steel, for instance, will cause them, hence the recommendation that tools of rapid steel should be sharpened either dry or in a liberal stream of water. In an appendix the author gives the following diagrams showing the points of transformation of the seven steels, the analyses of which are given above, determined by Roberts - Austen's method, using the modified apparatus of M. Saladin, and adds for comparison a similar curve obtained from an ordinary steel with 0·9 per cent. of carbon (see first figure in preceding group). The ordinates measure temperatures, the abscissæ differences of temperature between a piece of nickel and the steel under experiment.—J. T. D.

Rapid Steels ; Contribution to the Theory of ——. F. Osmond. Bull. Soc. d'Encourag., 1904, **106**, 348—352.

The specific characters of rapid steels are as follows :—1. The critical points are lowered during the cooling, when the temperature of the previous heating is raised ; and if that temperature is above a certain minimum and the metal is cooled through a sufficient range, it remains self-hardened. 2. Rise of the temperature of heating may cause coalescence of the points Ar 3. 2, and Ar 1, or separation of the multiple point Ar 3. 2. 1. 3. Prolonged heating at a low temperature is equivalent, as far as the position and form of the critical points are concerned, to a shorter heating at a higher temperature. 4. The hardness acquired is more stable during tempering than in the case of carbon steels. The explanation of these characters is found in the following considerations:—1. Suppose a hypereutectoid carbon steel, heated to the point Ac 3. 2. 1, and suppose the homogeneous redistribution of the carbon above the critical point to be instantaneous. The α-iron changes to γ-iron, the carbide of the perlite dissolves and the perlite becomes austenite. If now cooled, the independent cementite plays no part, the content of active carbon is that of the eutectoid—constant and the final state depends on the rate of cooling. Besides the independent cementite, we have, if this rate be infinitely slow, ferrite in grains and extra-granular cementite; complete physico-chemical and structural equilibrium. If ordinary, perlite; physico-chemical equilibrium complete, structural incomplete. If accelerated, sorbite; less complete physico-chemical equilibrium, structural quite incomplete. If rapid, troostite, and if very rapid, martensite; the physico chemical equilibrium more incomplete at each stage. If the heating be continued above Ac 3.2.1, the independent cementite gradually dissolves, and the dissolved carbon increases till a temperature is reached depending on the total carbon: and if the subsequent cooling be rapid enough to impede the segregation of the independent cementite, the final state will depend on the amount of carbon originally dissolved, and as the rapidity of cooling increases we shall have successively—troostite and cementite; martensite and cementite; martensite and austenite. In the austenite, transformation has not begun, and the iron is in the γ-state. 2. Suppose a rapid steel similarly treated. The effect of the chromium and tungsten is to impede the segregation of the cementite, so that, as a first approximation, and within limits, we can neglect the variations in the rate of cooling. Thus, even during slow cooling, the transformation points are lowered further, the greater is the excess of carbon-content at the beginning over that of the eutectoid; and the carbon-content itself depends, directly on the temperature of heating, and indirectly on the chemical composition. By varying the temperature of heating, and thus the content of dissolved carbon, then, we can have as final state, any one of the series, perlite, sorbite, troostite, martensite, austenite, or mixtures of them among themselves and with the cementite in excess. 3. In rapid steels, the hypothesis of the immediate redistribution of the carbon above the critical point does not represent the facts. Its solution is slow, as is the segregation on cooling: they are two sides of one character. Moreover, the cementite is often spherolitic, in separated nuclei, which further retards the solution of the carbon. Thus, unless the heating be very prolonged or the temperature very high, the carbon distribution is not homogeneous, but there are maxima around the cementite nuclei and minima between them. On cooling, each portion behaves independently, and hence a doubling of the recalescence, and a heterogeneous final product, containing always at least two constituents. Usually, recalescence will be single if the temperature has been just above Ac 3.2.1 (for the independent cementite has hardly begun to diffuse) or if it has been very much higher (for the redistributed carbon is homogeneous), and it will be double for intermediate temperatures. 4. If the temperature be raised above the highest temperature spoken of in 3, recalescence may again be double; for partial fusion may separate the metal into two constituents of different carbon-content, which remain distinct during cooling. 5. Chromium, tungsten, &c., lower the eutectoid carbon-content, so that rapid steels are usually hypereutectoid. In the contrary case (or with the hypereutectoid if the cementite be spherolitic) there may be on cooling a point Ar 3.2, independent of Ar. 1. 6. The elevation of the temperature of softening in rapid steels is not yet definitely explained: it seems to be another result of the difficulty of segregation of the carbide. Possibly the austenite is transformed into martensite, and thus we get hardening instead of the softening that occurs in carbon steels. 7. There is n separate theory of rapid steels; the general theory o carbon steels is applicable, if we bear in mind that th solution of carbon during heating and segregation durin cooling are rendered difficult by the presence of chromiur and tungsten, so that we get, without hardening, all th series of effects which characterise hardening in carbo steels.—J. T. D.

Electrical Resistance of Hardened Carbon Steels; Effe of Reheating on ——. Grenet. Bull. Soc. d'Encourag 1904, **106**, 353—357.

Bars of steel (carbon 1·29, manganese 0·07, silicon 0·1 phosphorus 0·006, sulphur, traces) of different sizes an shapes were hardened by heating to varied temperature and then cooling in dilute sulphuric acid. Their electric resistance was determined in this state, and after r heating to varied temperatures for 10 minutes. Moderatel energetic hardening exerts no influence on the electri resistance (nor, as Charpy has shown, on the dilatation of steels, though it acts energetically on their mechanic properties. Reheating, up to 700° C., acts continuously o the mechanical properties of these steels. Very energet hardening acts on the electric resistance and on th dilatation of these steels, but reheating to 400° C. destroy this effect completely, while it continues to act more an more strongly up to 700° C. on their mechanical propertie Thus, increase of mechanical resistivity and of electric resistivity, though produced by the same means, do n seem to be due to the same modification of the steel. Col hammering acts on the mechanical properties of stee similarly to moderate hardening, but it has no effect on th electric resistance.—J. T. D.

Nickel Steels; Effect of Heat Treatment on ——. Grene Bull. Soc. d'Encourg., 1901, **106**, 358—359.

Two samples were examined, containing carbon 0·3. manganese 0·36 and 0·34, nickel 26·9 and 29·0 per cen respectively, and traces of silicon, phosphorus, and sulphu Their temperatures of dilatometric transformation were, heating 510°—540° and 495°—535° C. respectively, and, cooling below 0° C. Forged and reheated at 925° C., bot samples showed the ordinary microscopic characters of no transformed metal. Forged, reheated at 925° C., cooled 80° C., and reheated at 550° C., they showed that, after th cooling, part of the metal had been transformed: they we now magnetic; but after reheating they again became no magnetic, though their microscopic aspect was the san as that of the cooled specimens. Possibly the coolin separates the elements, not of a eutectic, but of a supe saturated solution, and when the transformation-temperatu is passed on reheating, only a small proportion of the elements recombine. On heating to 800° the metal recove the aspect it had before transformation. The steels, heat to 550° C., after having undergone transformation wi change of volume at a low temperature, exhibit an increa of tensile strength at the elastic limit, an increase maximum tensile strength, and a diminution of elongatio as compared with the metals before cooling and reheatin J. T. D.

Iron and Steel; New Process for the Protection of — from Corrosion. S. Cowper-Coles. Electro-Chem. a Metall., 1904, **3**, 828—836.

The iron or steel freed from scale or oxide is placed in closed air-tight iron receptacle coated on the inside wi plumbago and charged with zinc dust. The whole is th heated to 500°—600° F. for a few hours, and allowed cool. In order to avoid the formation of too much zi oxide, the air is exhausted from the receptacle before th heating, or about 3 per cent. of carbon in a very fine sta of division is added to the zinc dust. The thickness of th coating depends on the temperature and the duration heating. The process ("Sherardising") can also be applie to the coating of iron with copper, aluminium and antimon and of aluminium and copper with zinc. Copper and alloys when subjected to the process are case-hardened, a can indeed be rendered so hard on the surface as to tu the edge of a steel tool. Various advantages are claime for the process over the ordinary method of hot galvanisin —A. S.

Platinum in Wollastonite, found in Sumatra. L. Hundeshagen. Inst. Min. & Met., July 21, 1904.

ıe author describes a deposit of wollastonite associated th garnet (*grossularite*), bornite, gold, and platinum ıich occurs in old schists near the Singeuggoe River, ıich have been penetrated by granite and subsequently erlaid by augite-diorite and by volcanic rocks. He nsiders that the present ore-deposit was originally "a yer or big lens" of limestone included within the schists, d that the alteration into wollastonite and garnet has en effected by the intrusion of "apophyses of granite," e introduction of copper, gold, platinum, &c., having been bsequently effected by hot springs. The absence of rpentine and of magnesian compounds generally is reırked upon by the author. A sample of slightly composed wollastonite gave 6 grms. of platinum with grms. of gold and 2 grms. of silver per 1,000 kilos. ains of gold and platinum are found in the river sands low the ore-deposit.—J. H. C.

Platinum and its Deterioration; Some Notes on ——. W. Campbell. Electrochem. Ind., 1904, **2**, 259—261.

ıe chief causes of the deterioration of platinum seem to its volatility at high temperatures and the fact that ating above 1,000° C. for any length of time causes ttleness. This brittleness may be due to crystallisation, the formation of compounds, or to the absorption and olution of gases. The author considers the matter parularly as it affects the use of this metal in resistance ermometers and thermo-couples. The greatest alteration caused by heating in a reducing atmosphere in presence siliceous material.—R. S. H.

Lead and Tin; Behaviour of Alloys of —— towards cids. O. Sackur. Z. Elektrochem, 1904, **10**, 522—529.

determining the equilibrium established when lead-tin oys are acted on by acidified solutions of lead salts and tin salts, it is shown (1) that, above 10 per cent., lead present in the free state, and below 10 per cent. in solid lution; (2) that tin forms solid solutions up to 3 per nt.; and (3) that no chemical compound is formed by metals. Further, a series of alloys was exposed to the vcat action of dilute acetic acid of various strengths, itated by a constant supply of air. The lead is directly solved, whilst the tin goes into solution secondarily precipitating an equivalent quantity of lead from the viously formed salt; a coating of pure lead is thus left the alloy, and from this point onward the sum of lead l tin dissolved is approximately independent of the comsition of the alloy. The greater the air supply the more tal goes into solution, but only when the alloy contains ove 30 per cent. of lead. Lactic acid dissolves comparaly more tin than acetic acid of the same strength.
—W. A. C.

tal Substitution. A. J. J. Vandevelde and C. E. Vasteels. Bull. Acad. roy. Belg., 1904, 331—360. Chem. Centr., 1904, **1**, 1629.

e influence of temperature and concentration on the rate ubstitution of copper in aqueous alcoholic sulphate solu- by zinc was determined. The experiments were made emperatures of 24°—25°, 17°—18°, and 7°—8° C., with eous alcoholic solutions containing equal amounts of per sulphate but varying proportions of water and alcohol. general, increase of temperature caused an increase in rate of substitution. The initial velocity of reaction is atest in pure aqueous solutions, and, in aqueous alcoholic itions, decreases as the proportion of alcohol increases. er some hours, the maximum rate of substitution occurs aqueous solutions at low temperatures, but in aqueous holic solutions, containing increasing proportions of hol, at higher temperatures. The reaction is a double , being chiefly a simple substitution, with separation of per, in the first stage, and formation of an insoluble c zinc sulphate in the second. Low temperature and hol retard the metal substitution, but favour the formn of basic salts. The precipitate which separates is mixture of metallic copper with the basic sulphates $ZnO.ZnSO_4$ and $2ZnO.ZnSO_4$. Metallic zinc does not cause separation of basic sulphate from a solution of pure zinc sulphate. (See also this J., 1903, 368, 626.)—A. S.

Blast-Furnace Charges; A Graphic Method for the Computation of ——. C. O. Bannister. Inst. Min. and Met., July 21, 1904.

The method proposed by the author is somewhat similar to that devised by H. C. Jenkins (J. Iron and Steel Inst., 1891, 151), but it merely requires a sheet of squared paper, no slide-rule being necessary. The author gives a diagram in illustration of his method. (See also this J., 1892, 821.)
—J. H. C.

Sulphur in Iron; Rapid Method for the Determination of Total —— by Evolution. S. S. Knight. XXIII., page 800.

English Patents.

Iron Sand, whether Natural, or Prepared by Reducing Iron Ore or Iron Wastes; Converting —— into Briquettes. T. Rouse and H. Cohn, London. Eng. Pat. 17,445, Aug. 11, 1903.

Iron sand concentrates, powdered iron ore, blue-billy, or the like, are agglomerated into blocks by means of a solution of water-glass, and the blocks are hardened in a chamber through which hot air and steam are passed, so that the atmosphere of the chamber may be kept hot and moist without condensation of water. Compare Eng. Pat. 21,880 of 1902, and 15,188 of 1903; this J., 1903, 1090, and 1904, 664.—E. S.

Sulphide Ores or Compounds: Treating —— preparatory to Smelting. T. Huntington and F. Heberlein, London. Eng. Pat. 13,454, June 16, 1903.

The sulphide ores are roasted in a suitable furnace "until the proportion of sulphur is reduced to a suitable degree," and are then quickly cooled by the aid of water. The cooled ore is then placed upon a layer of hot ore or fuel in a receptacle through which a current of air is passed, whereby the oxidation is completed, and the mass is fitted for transference to a blast furnace for reduction of the metal. Compare Eng. Pats. 8064 of 1896, and 3795 of 1897; this J., 1897, 543 and 683.—E. S.

Ores [Zinc Sulphide or Complex]; Treatment of ——. C. Cory, Swansea. Eng. Pat. 14,013, June 23, 1903.

Zinc sulphide ores are mixed with coal and with a small proportion of sago (say from ½ to 2 per cent. of the mixture), and the powdered mixture is subjected to the action of live steam, hot enough to rupture the starch cells of the sago. The plastic mass is then made into briquettes, which are heated in retorts lined with carborundum, to obtain zinc by distillation. The briquetting with the aid of sago, used as described, of sulphide and complex ores generally, is also claimed.—E. S.

United States Patents.

Sulphides from Ores; Apparatus for Use in certain Processes for Extracting ——. G. D Delprat, Assignor to Broken Hill Proprietary Co., both of Australia. U.S. Pat. 763,662, June 28, 1904.

The invention relates to apparatus for use in the process of floating concentrates from ores to the surface of a body of liquid. A pan having an inclined bottom is provided with an adjustable distributing plate at its upper end, having its lower edge close to the bottom of the pan. There is a discharge for the concentrates at the upper part of the pan, over a sump at the lower end of the inclined bottom; a vertical baffle-plate extends from the beginning of the discharge to near the lower edge of the bottom, separating the sump from the pan, and maintaining a submerged entrance to the sump for the tailings from the pan. Means for feeding ore and acid solution, and for heating the pan, are provided. See also Eng. Pat. 27,132 of 1903; this J., 1904, 610.—E. S.

Smelting and Reducing Metals; Process of ——. C. Diesler, Coblentz, Germany. U.S. Pat. 764,041, July 5, 1904.

See Eng. Pat. 920 of 1901; this J., 1902, 261.—T. F. B.

Ore Separator: Magnetic ——. F. J. King, Croydon, Surrey. U.S. Pat. 765,013, July 12, 1904.

See Eng. Pat. 5209 of 1902; this J., 1902, 1399.—T. F. B.

French Patent.

Ores; Treatment of ——. [*Vacuum Filter for Solutions of Metals.*] The Rapid Cyanide Treatment, Limited. Fr. Pat. 340,238. Feb. 6, 1904.

The crushed ores are placed, with the dissolving solution, in a closed rotating, horizontal cylinder, with filtering material arranged within its sides and ends upon a grill of wooden supports, in such manner that the vacuous spaces communicate with a cased aperture centrally placed at one end of the cylinder, from which the filtered liquid flows down a vertical pipe connected to a pump, by means of which a partial vacuum is formed on the discharge side of the filtering material. The solvent solution is supplied to the cylinder through a pipe in connection with a forcing pump and an ozonising apparatus, so that air or ozonised air may be introduced. By means of the pump, pressure, say not exceeding 1 kilo. per sq. cm., may be put upon the contents of the cylinder on the supply side of the filtering material. After the solvent solution and washings have been forced through the filtering material, leaving the layers of pulp practically dry, the revolution of the cylinder is suspended, so that the dried pulp may fall by gravity on the simultaneous cessation of the out-draught and establishment of equilibrium between the opposite sides of the filtering material. The cylinder has removable doors on its sides for charging and discharging.—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

Aluminium Anodes; Dimensions of Films on ——. W. R. Mott. Electrochem. Ind., 1904, **2**, 268—271.

In studying the formation of anode films on aluminium electrodes in phosphate solutions, the author finds that the thickness of the film is approximately a linear function of the voltage. Various methods were used for measuring the thickness. From the gain in weight of the anode, as also from the coulombs required for the formation, the calculation can be made. By the interference colours of the film an accurate and easy method of measurement is available, whilst by actually separating the film from the metal the thickness can be directly measured. The approximate thickness with different voltage is given as:—1 volt, 0·000001 cm.; 20, 0·00002; 80, 0·00008; and 320 volts, 0·0003 cm.—R. S. H.

Hydrosulphites [Hyposulphites] of Sodium and Calcium; Electrolytic Preparation of ——. A. R. Frank. Elektrochem., 1904, **9**, 450—452.

The author describes his work on this subject, and in particular replies to the criticism of Elbs and Becker (this J., 1901, 611). The statement that a saturated solution of calcium bisulphite contains only 9·3 grms. per litre, is said to be quite incorrect; solutions containing up to 90 grms. are in everyday use, and with such concentrated solutions the solid calcium hydrosulphite can be electrolytically prepared with a good yield.—R. S. H.

English Patents.

Ozonising Air and other Gases; Apparatus for ——. R. F. Wood-Smith, London. Eng. Pat. 17,885, Aug. 18, 1903.

The invention relates to improvements in ozonising apparatus of the Andreoli type. A plate of sheet metal, such as aluminium, is provided on one or both of its face with a number of projecting points, formed by stampin holes alternately from opposite sides of the plate. Spacin pieces separate the points from two dielectric plates o *micanite*, arranged one on each side of the aluminium plat and metal plates are fixed against the outer surfaces of th *micanite*.—B. N.

(*B.*)—ELECTRO-METALLURGY.

Refining Gold Alloys; Electrolytic Process of ——. E. Wohlwill. Electrochem. Ind., 1904, **2**, 261—264.

The author extends his previous article (this J., 1901, 717 by considering the factors which limit the more gener application of the electrolytic process. On account of th low temperature and current density employed, the Phila delphia results do not give satisfactory data. If th temperature be raised from 50°—55° C. to 65°—70° C gold containing up to 15 per cent. of silver can be dealt wit advantageously by this method. Moreover, the intere charges are considerably reduced, since it is possible t recover from 80 to 82 per cent. of the anode gold in 2 hours, when the current density is increased to the prop extent.—R. S. H.

Electrolysis with well-stirred Electrolytes. H. Sand. Z. Elektrochem., 1904, **9**, 452—454.

Referring to the recent publication of Amberg (this J 1904, 667), the author draws attention to his work on th electrolysis of an acid solution of copper sulphate (this J 1901, 725). From this it appears that the current densit is only limited by the rapidity of rotation of the electrode, an that consequently the condition of the metal deposit is n directly dependent on the current density. The effect stirring is to diminish the alterations of concentration in th immediate neighbourhood of the cathode, which alone a capable of exerting a very great influence on the nature the deposit.—R. S. H.

English Patent.

Metallic Compounds; Reducing of ——, *and Fusing Metals, in particular of Nickel and Iron, in the Electr Furnace.* C. D. Abel, London. From Siemens an Halske Akt.-Ges., Berlin. Eng. Pat. 19,366, Sept. 1903.

In the reduction of metallic compounds (particularly o nickel protoxide) and in the fusing of metals, such as nick and iron, in the electric furnace, the lower carbon electrod is covered, before the process begins, with a layer of sla such as of magnesia, with an addition of fluorspar, co ducting to electricity, and such as may remain "in a toug or solidified form at the reducing or smelting temperature," —E. S.

United States Patent.

Vanadium and its Alloys: Process of Manufactur ——. G. Gin, Paris. U.S. Pat. 765,001, July 1 1904.

See Fr. Pat. 340,413 of 1904; following these.—T. F. B.

French Patent.

Vanadium and its Alloys; [Electrolytic] Manufacture of ——. G. Gin. Fr. Pat. 340,413, Feb. 13, 1904.

The process consists in electrolysing a bath of fuse calcium fluoride, in which the cathode is a block of stee and the anode is an agglomerated mixture of carbon with vanadium oxide. The bath is fed with a certain quantit of fluoride of iron or of other metal, an alloy of whic with vanadium it is desired to obtain. The decompositio of such a fluoride assists the process, and supplies th fluorine which continuously regenerates the electrolyte the expense of the anode, and plays the part of the mediu of transmission of the vanadium from the anode to th cathode. (See this J., 1903, 1248).—E. S.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

en Oil; Nature and Commercial Uses of ——. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 117—120.

Ben" or "Behen" oil is obtained from the seeds of *oringa pterygosperma* and *M. aptera*. A sample of pods d seeds of *M. pterygosperma* from Northern Nigeria elded, on extraction with ether, 38 per cent. of a pale llow, almost odourless oil, having a bland, agreeable te. By filtration at 17°—18° C. the oil was separated o a liquid and a solid portion, which gave the following ults on analysis:—

—	Liquid Portion.	Solid Portion.
ecific gravity at 15° C.	0·914	...
d value	15·3	...
e fatty acids (as oleic cid) Per cent.	7·7	...
onification value	189·2	194·4
ine value	70·7	68·3

other sample of ben oil, from Jamaica, was separated filtration at 17° C. into 60 per cent. of a pale yellow and 40 per cent. of a nearly white, solid fat. On lysis the following results were obtained:—

—	Liquid Portion.	Solid Portion.
ific gravity	0·9124 at 15° C.	*0·8650 at 100° C.
l value	8·7	7·2
e fatty acids (as oleic id) Per cent.	4·4	3·6
onification value	196·3	193·6
ne value	70·1	65·2

* Compared with water at 15° C.

en oil could be produced at a sufficiently cheap rate, ould be likely to find a market as an edible oil, whilst liquid portion might be of use as a lubricant for fine hinery. (See also Lewkowitsch, this J., 1904, 25).
—A. S.

English Patents.

; Appliance [and Process] for Use in Refining ——. Macalpine, London. Eng. Pat. 15,457, July 13, 1904.

upright cylindrical vessel, the bottom of which is al in shape, and provided with a draw-off cock and rated false bottom, is partially filled with granular rial, such as coke, &c. Pipes for introducing com- ed air, and the solution with which the oil is to be ed, enter the vessel below the false bottom, on which ranular material rests. The refining reagent is run the vessel and allowed to saturate the granular rial, the excess being run off. The crude oil is then luced, and agitated with the granular material by ing compressed air through the mass.—T. F. B.

or Wax-like Substances from Hydrous Materials; traction of ——. T. A. Hearson, London; F. Frank l M. Ziegler, Berlin. Eng. Pat. 4867, Feb. 27, 1904.

aw material is extracted without preliminary drying neans of vapours of benzene, carbon bisulphide, ne, alcohol, chloroform, or carbon tetrachloride, and ixed solvent and water vapours are subsequently con- d in a receiver, where separation takes place through ation.—C. A. M.

cants; Production of ——. W. P. Thompson, ndon and Liverpool. From Ges. z. Verwerthung der eg'schen Wasserlöslichen Mineralöle u. Kohlenwas- stoffe, G. m. b. H., Berlin. Eng. Pat. 13,473, June 16, 3.

ral oils soluble in water (this J., 1904, 655) are ed by ozone or compressed air at 70°—105° C., and mixed with a small proportion of ceresin or paraffin (previously treated with 1—2 per cent. of alkali solution) and also with water, soap solution, or gelatin solution according to requirements.—C. A. M.

French Patent.

Soap containing Alcohol. A. Wolff. Fr. Pat. 340,247, Feb. 8, 1904.

The claim is for a soap containing, *e.g.*, 15 parts of anhydrous cocoanut oil soap, 5 parts of water, and 80 parts of alcohol, with or without the addition of perfumes or disinfectants.—C. A. M.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*B.*)—RESINS, VARNISHES.

Kauri Resin; Supposed —— *from Queensland.* Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 91—92.

The sample consisted of a single rounded block, weighing about 3 lb., composed of a bright yellow transparent resin with a number of dark streaks and opaque patches scattered throughout its mass. The resin had a pleasant aromatic odour, was completely soluble in alcohol and ether, slightly soluble in benzene, and very slightly so in chloroform. Sp. gr., 1·0543; acid value, 136·6; ash, 0·13 per cent. The essential constituents of the resin are the same as those of the resin of *Callitris verrucosa*, *viz.*, pimaric and callitrolic acids (see this J., 1901, 1222), and it may therefore be regarded as a sandarac derived from a species of *Callitris*. Commercial sandaracs occur in characteristic, elongated, light yellow tears, the most valuable variety (60*s.*—70*s.* per cwt.) being African sandarac obtained from *Callitris quadrivalvis*. The Queensland resin, owing to its unusual form, would probably be worth only 25*s.* to 30*s.* per cwt., instead of the 35*s.* per cwt. obtained for the ordinary tear form of Australian sandarac.—A. S.

Tacamahac Resin, Commercial; Constitution of ——. A. Tschirch and O. Saal. XX., page 798.

(*C.*)—INDIA-RUBBER, &c.

Rubber from British Central Africa. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 83.

A sample of rubber as collected and offered for sale by the natives of British Central Africa, and stated to be obtained from the vines of the indigenous Landolphias, was examined. The rubber was not sticky and exhibited good elasticity and tenacity. It gave the following results on analysis:—Moisture, 1·3—1·5; caoutchouc, 87·5—89·7; resin, 4·7—4·8; dirt, 4·2—6·3; ash (included in dirt), 0·6—0·8 per cent. The sample may be regarded as good, clean ball rubber. It was valued at 3*s.* 2*d.*—3*s.* 3*d.* per lb. on the London market.—A. S.

"Mpai" Rubber from Amatongaland, Natal. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 94—95.

The specimen rubber was obtained from the "Mpai" or "Mfubu" tree, probably a species of Ficus. It consisted of a light-brown, flat, elongated cake. The material had a somewhat fibrous structure, resembling that of gutta-percha; it exhibited very little elasticity, but considerable tenacity. In warm water it softened a little without becoming sticky and could then be readily drawn out. The specimen contained:—Moisture, 28·4; resin, 49·9; caoutchouc, 19·6; dirt, 2·1; ash (included in dirt), 0·79 per cent. It is worth about 10½*d.* or 11*d.* per lb.—A. S.

Rubber of Landolphia Kirkii from Amatongaland, Natal. Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, **2**, 95—96.

Two capsules of rubber from the "Ibuugu" vine, *Landolphia Kirkii*, have been examined. The rubber was light pinkish-brown externally, but deep reddish-brown within; it was not sticky, and exhibited very good elasticity and tenacity. On chemical examination the samples furnished the following results:—

—	Sample A.	Sample B.
	Per Cent.	Per Cent.
Moisture	7·7	9·1
Caoutchouc	80·1	75·7
Resin	6·9	10·3
Dirt	5·3	4·9
Ash (included in dirt	0·31	0·37

The rubber thus appears to be of good quality and would be worth about 4*s.* per lb. in the London market as compared with 4*s.* 8*d.* per lb. for fine Para rubber.—A. S.

Caoutchouc Molecule; Decomposition of the —— with Formation of a Cyclic Hydrocarbon. R. Ditmar. Monatsh. f. Chem., 1904, **25**, 464—474.

The author has examined further the amorphous yellow product obtained by the action of concentrated nitric acid on crude Para caoutchouc (see this J., 1902, 626, 1404). 50 grms. of crude Para rubber in very small pieces were exhausted with acetone for the removal of resin, fat, and oils, and the residue was extracted successively with 4·4 per cent. caustic potash solution and distilled water, and dried *in vacuo* over sulphuric acid, till of constant weight. The caoutchouc so obtained is soluble in the usual solvents and also in melted paraffin, hot benzaldehyde, and quinoline. The crude rubber also is soluble in the two latter solvents. From a warm quinoline solution the caoutchouc separates on cooling, and also on treatment with ether, in the form of elastic structureless pellicles, which can be kneaded together and remain plastic for a long time. The best results on nitration were obtained with red fuming nitric acid. The nitro product is soluble in glacial acetic acid, acetone, and quinoline, but is reprecipitated from solution by ether. The alkali salts of the product are soluble in water. From the results of reduction, acetylating, and other experiments, the author concludes that the nitro product is the 5.6-dinitro-2.3-dihydro- or 3.6-dinitro-2.5-dihydrocumic acid, $C_3H_7.C_6H_4(NO_2)_2.COOH$.—A. S.

Caoutchouc and its Distillation Products; Chemistry of ——. R. Ditmar. Ber., 1904, **37**, 2430—2434.

The author considers that the product obtained by Wallach (Annalen, **238**, 87) by the action of fuming nitric acid on the sesquiterpene, $C_{15}H_{24}$, isolated from cubeb, patchouli, galban, cade, and sabine oils, is identical with the dinitro compound (5.6-dinitro-2.3-dihydro- or 3.6-dinitro-2.5-dihydrocumic acid) formed by the action of nitric acid on rubber (this J., 1902, 626; Ber., 1902, **35**, 1948, 3265; also preceding abstract). From the behaviour to nitric acid of the products of the destructive distillation of caoutchouc, the author concludes that this nitric acid reaction is a general one for sesqui-, di-, and polyterpenes. 0·5 kilo. of crude Para rubber was destructively distilled, and the crude oil obtained, the so-called "cautchoucine" fractionated, the following portions being collected:—(1) 35°—70° C., isoprene fraction, colourless, very mobile liquid; (2) 70°—150° C., slightly yellowish, mobile liquid; (3) 150°—200° C., dipentene fraction, brownish, mobile liquid; (4) 200°—300° C., hevene fraction, dark brown, mobile liquid; and (5) above 300° C., di- and polyterpene fraction, very dark brown, oily liquid. It was found on treating the fractions with nitric acid, that the course of reaction was different with the concentrated and with the fuming acid, but the final products were the same with both reagents. Fractions (1) to (4) gave resins; fraction (5) gave a solution which when poured into water yielded a large amount of the dinitro compound. From the resins yielded by (3) and (4), 0·1 and 0·8 grm., respectively, of the dinitro compound were isolated.

—A. S.

XIV.—TANNING; LEATHER, GLUE, SIZE.

(Divi-Divi) Pods of Cæsalpinia Coriaria from Indi Bull. Imp. Inst. (Suppl. to Board of Trade J.), 190 2, 92—93.

The sample (No. 18,545) consisted principally of husl
with a few small unbroken fruits containing one or tv
minute black seeds. It resembled in appearance the div
divi of commerce. In the following table are given tl
results of the chemical examination of the present sampl
two samples of Indian divi-divi previously examined, and
specimen received from Queensland in 1898:—

—	Indian Samples.			Queensla Sampl
	No. 18,545. Per Cent.	No. 8026. Per Cent.	No. 8028. Per Cent.	Per Ce
Tannin (calculated on material dried at 105° C.)	15·4	19·7	32·8	51·4
Total soluble matter	68·5	65·9	46·0	68·3
Moisture	13·3	12·8	13·1	15·9
Ash (calcium carbonate, with a little ferric oxide and silica).	2·6	3·1	3·3	2·2

The present specimen is thus of much better quality th
either of the previous Indian samples, and would probal
sell readily at 8*l.* 10*s.* to 11*l.* per ton.—A. S.

Bleaching of Leather. B. Kohnstein. Der Gerber, 19 30, 189—190.

Methods for bleaching leather may be divided into (
natural and (*b*) chemical processes. The former compi
the action of direct sunlight, only applicable to oil-leathe
and freezing, which gives a very soft leather. When
organic acids are used, it is advisable to dry out and tl
bleach, as such acids, if allowed to penetrate right thro
the hides, are difficult to remove by washing. Oxalic ac
sulphuric acid, and sulphurous acid vapour are used, a
lead acetate solution (9 kilos. in 320 litres of water), witl
subsequent bath of sulphuric acid (3½ kilos. in 320 litre
water). Potassium permanganate with sulphuric acid, a
hydrogen peroxide, have proved too costly; but the use
barium or sodium peroxide is established in America. T
last is employed as follows:—1 kilo. of sulphuric a
(66° B.) is poured into 400 litres of cold water, 1·75 ki.
of sodium peroxide are gradually added, and fin
ammonia until the liquor is faintly alkaline to litn
A bleaching effect is secured by mixing white or blu
white solid materials, such as talc, china-clay, or "baryte
with the fat-liquor.—R. L. J.

[Spueing] on Upper Leather: Formation of White Pat ——. W. Eitner. Der Gerber, 1904, **30**, 173—174

Museum specimens of chrome-leather containing 5 per ce
of grease (soap and moëllon and neatsfoot oil), which
been left in contact with vegetable-tanned leather (hors
containing 17 per cent. of grease, showed clearly-defi
white patches at the points of contact. These proved to
stearin crystals, which had penetrated right through
chrome-leather, and showed on both sides. No evide
could be obtained as to whether these had passed from
one leather to the other in a state of solution, *i.e.*, dissol
in the more fluid components of the grease used on
vegetable-tanned leather, or whether they had pa
directly through the membrane represented by the chro
leather as crystalloid substances are known to do.
author cites the appearance of magnesium sulphate on
surface of boots, arising from the loading material in
canvas linings, and considers, as a practical result,
stearine should be avoided in the fat-liquoring of chro
leather and the greasing of lightly tanned calf, whilst its
is indicated for heavily tanned or hot-stuffed chrome go

—R. L.

VII.—BREWING, WINES, SPIRITS, Etc.

uminoïd - Content of Barley : Simple Method for easuring the ——, by Pappenheim's Triacid Solution. Lindner. Woch. f. Brau., 1904, 21, 397—398.

PENHEIM'S triacid solution (see U. Pepper, Woch. f. ., 1903, 20, [29]), which in the form of the base ins the colouring matter of Unna's Methylene Blue Eosine, has been suggested as a means of obtaining some of the proportion of albuminoids present in barley and od preparations. The author has examined, by means is dyestuff, three specimens of barley containing 8, , and 16·1 per cent. of albuminoids, determined by lahl's method. It was found that the principal seat of lbuminoids, which are coloured red by the above dyelies in the layers of cells situate immediately below the one layers and especially in the neighbourhood of the al furrow. Although there is a considerable difference pearance between the cross sections of the barley conig 8 per cent. and of that containing 16·1 per cent. of inoids, yet no conclusion can be drawn therefrom rning the whole corn. The author therefore adopted rocedure made use of by Weissbein in the examinaf food preparations ; 0·2 grm. of the finely-powdered was placed in a small tube, together with 10 c.c. ter and 6 drops of the dyestuff solution. The tube vell shaken up several times, and at the end of five es was centrifugalised in a hand machine. In two es the meal was found to be collected at the pointed f the tube, and the coloured liquid was poured off. nove excess of the dyestuff, the meal was stirred up c.c. of water, the volume of which was then made up ut 10 c.c. ; this liquid was then separated by centrifug. The appearance of the residue varies considerably, barleys poorest in albuminoids appearing blue to green, the others being sprinkled with red. In order to compare different barleys better, the residual meal was stirred up with 1 c.c. of water and quickly poured out on to a stiff card and spread out so as just to cover a circle " 10 cm." in diameter, any liquid being then removed by means of filter paper. When dry the various preparations may be compared with one another and with a permanent preparation. Working thus it is easy to analyse four barleys in this way in 20 minutes, and so discover whether they are rich or poor in albuminoids.—T. H. P.

Malt with Short Acrospire and the Beer yielded by it. R. Holzhauser. Woch. f. Brau., 1904, 21, 403—404.

In the preparation of malt with short acrospire growth, which the author recommends for beers of the Pilsener type, it is important not to steep for too great a period. Using the aëration method of steeping, a total of 26 hours under water and 26 hours dry is sufficient. The author gives the details of his method of flooring, by which he obtains an acrospire of $\frac{1}{2}$ to $\frac{2}{3}$ of the length of the corn and with moderately short, stout rootlets. No heating takes place during the flooring, the highest temperature attained being 61°—63° F. Low temperatures are so easily maintained that it is possible to steep 6—10 per cent. more barley for the same floor area than when the old method is used. The green malt is thoroughly dried on the upper floor of the kiln, and is then dried off at an average temperature of 194° F., which is maintained for $3\frac{1}{2}$ hours. The malt prepared in this way is mealy, has a somewhat aromatic flavour, and seldom contains steely-ended corns. The yield of malt is very high, often reaching 80 per cent., and the colour of the laboratory wort corresponds with 0·25 c.c. of N/10 iodine solution. The mashing method used by the author is a rapid process, the temperatures being 149°, 158°, and 167° F. Saccharification takes place quickly and both the first and second worts are perfectly clear. The average extract obtained is 72·5—73 per cent. calculated by Windisch's tables. The first half-dozen brews carried out by this method deposited large quantities of albuminoid matter on fermentation and the beers cleared slowly, although perfectly, in the lager cellar ; with subsequent worts, however, a normal behaviour was obtained. The course of the primary and after fermentations shows that the wort yielded by malt with short acrospire growth contains considerably more malto-dextrins and dextrin than wort prepared by the same mashing process from malt with greater acrospire development. The final beer is pure yellow in colour, has a full malty flavour and a pleasant bitter taste, and retains its head extremely well. During a severe winter it showed no inclination to become turbid, and can be kept for five weeks without forming any deposit.
—T. H. P.

Pale, High-Dried Malt : Preparation of ——. F. Soding. Woch. f. Brau., 1904, 21, 438—439.

In the kilning of pale malt at high temperatures, it is important that the malt should be well dried on the upper floor of the kiln before it is passed down to the lower floor. The temperature must be kept down until the combes can be readily rubbed off between the hands. Any cooling of the malt on the upper hearth, such as may take place in wet weather, must be avoided, as it is always accompanied by increase in the colour. The author therefore passes the air through a layer of dry malt combes spread on a small wire floor, all moisture being in this way removed from the air. High-dried pale malt must not be stored warm, as it speedily deteriorates ; it is therefore advisable to spread it out immediately after unloading, the small amount of moisture absorbed having no prejudicial effect on the wort. Beer prepared from malt kilned in this way has a full taste and pleasant aroma not met with in ordinary pale beers.—T. H. P.

Yeast ; Use of —— instead of Kräusen. G. Henne. Woch. f. Brau., 1904, 21, 427.

The advantages of adding yeast to beer after the primary fermentation instead of "kräusening" are greater brilliancy,

better keeping quality, and retention of head, and the absence of any raw unripe taste. The addition of the yeast, the great disadvantage of which is the time taken up, especially in large breweries, is carried out as follows: About a bucketful of beer is taken from the cask, mixed intimately with healthy, thick, pasty yeast, and returned to the cask through a funnel. As vigorous frothing takes place, it is necessary to wait a little while in order to fill the cask completely, and when this is done the cask is tightly bunged again. About 2 litres of the pasty yeats should be taken to 20 hectolitres of beer (*i.e.*, 0·1 per cent. by vol.). Mixing the yeast with boiled and cooled water before adding to the beer is not recommended, as the cooling of the water occupies considerable time. In the case of a beer which had become turbid and had assumed a very unpleasant flavour and smell, the author added about 4 litres of extremely vigorous pasty yeast to each cask. After being kept tightly bunged for 12—14 days, the beer became "water-white" and regained its normal pleasant flavour. This result is brought about by the agglomeration of the bacteria by the glutinous cell membrane of the yeast.
—T. H. P.

Bacterial Infection in the Brewery: Detecting ——. Falk, Hausmann, and Luff. Z. ges. Brauw., 1904, **27**, 524—528.

In the detection of bacterial infection in wort, beer, &c., by the pure yeast fermentation method first recommended by Prior, it is found that the yeast sediment deposited after 9—10 days rarely exhibits traces of bacteria, these (especially sarcina and lactic bacilli) not developing until the samples have been forced at 25° C. for 8—10 days in small sterilised flasks. Sporagenic yeasts, however, may be detected in the original sediments. Two cases of infected breweries have been successfully dealt with by this method.
—C. S.

Beer; Action of —— *on Metals.* H. Seyffert. Woch. f. Brau., 1904, **21**, 398—400.

Cold brewery wort, left for some time in contact with sheet-iron, dissolves some of the latter, which can be readily detected in the liquid. When such wort is fermented, a considerable proportion or, in some cases, all of the iron is removed and passes into the yeast. The presence of iron in the beer injures the head-retaining properties. Also, beer in which iron, copper, or tin is immersed, becomes turbid, the action being especially rapid with the first two metals; with lead, no turbidity is obtained. With practice, the author's palate became very sensitive to iron in beer, so that he was able to detect quantities of this metal too small to be recognised by direct chemical tests. These small proportions of iron give to the beer a certain dryness and thinness of taste. The author's experiments show that beer should never be allowed to come into contact with an iron surface, and that contact with bright copper or brass should be as limited as possible. Tinned iron, which is so frequently used in beer filters, racking apparatus, &c., is especially dangerous, and should never be employed. Only well-tinned copper and brass are allowable, and these must be previously treated for some time (at least 24 hours) with beer residues, so that the white surface of the tin becomes slightly yellowish. Such apparatus should never be vigorously brushed or treated with alkalis, otherwise the thin protective coating may be removed. In general, thorough washing, first with cold, and then with hot water is sufficient. But when the wire gauze of the filter becomes stopped up, and it is necessary to clean it thoroughly with brushes and alkali or acid, it should be subsequently soaked in beer residues before being used again. The whole of the tin present in the beer may be readily precipitated in the following manner: 1 litre or more of the beer is rendered faintly alkaline with sodium carbonate, and heated to 60° C., by which means a flocculent precipitate, which readily settles, is formed. The clear supernatant beer is siphoned off and the residue filtered, dried, and ignited, the ash thus obtained being tested for tin. It is probable that the precipitate formed consists of a compound containing tin, phosphoric acid, and protein.—T. H. P.

Spirit; Production of Cheap —— *for Technical Purpose* M. Delbrück. Z. Spiritusind., 1904, **27**, 301.

Although 1 litre of petroleum furnishes 10,000 units c heat on combustion against 6,000 units yielded by 1 litr of alcohol, it is still possible for the latter to compete wit the former for incandescent lighting purposes, provide that the price of alcohol is to that of petroleum in the pr portion of 3 : 2. In countries where petroleum is des this ratio is more nearly reached than in Germany, but, the same time, the fiscal regulations of the latter countr are of great assistance. With regard to the manufactu of cheap spirit, a decrease in the cost of production considered likely by the author. Cheaper raw material the use of the beetroot and its by-products, and th cultivation of new varieties of potatoes, will diminish th price of the alcohol, as will also the protection of the ra materials from decomposition, caused by enzymes and th like. It will be found cheaper to dry potatoes instead storing them in their natural state, the cost of drying w more than compensating for the loss which occurs on lon keeping. The introduction of the "amylo" process fro Japan has considerably cheapened the production alcohol. This process gives practically a theoretical yie of alcohol combined with a great saving of malt, the latt being only used in sufficient quantity to liquefy the mas Saccharification is brought about by inoculating the mas with the fungus *Amylomyces Rouxii.* The production, b patent apparatus, of alcohol of high percentage direct fro the mash is of great importance. This strong alcohol less contaminated by storage in wooden barrels than weaker spirit, and is consequently preferable for technic uses.—W. P. S.

uit Juices ; Use of Preservatives in ——. G. Heinzelmann. Z. Spiritusind., 1904, **27**, 299.

IE use of salicylic acid for preserving fruit juices has actically ceased in Germany, as the result of regulations sed on the medical opinion that this acid is injurious to alth, even in the small quantities employed for preserving rposes. Hydrofluoric acid having recently been detected fruit juices, the author points out that there is a preservae on the market bearing the name "Frut," which nsists of an aqueous solution of hydrofluoric acid. This sold in special prepared flasks, and a powder is also ppiied at the same time, consisting of calcium carbonate. ie latter is to be added to the fruit juices before they are ought into use, in order to precipitate the hydrofluoric acid calcium fluoride. As it is quite likely that in some cases sufficient calcium carbonate may be added, leaving excess hydrofluoric acid in the juice, the use of this preservative very objectionable. The most suitable preservative is cohol, provided that a declaration of its presence be made. —W. P. S.

X.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

ine Glycerophosphates. P. Carré. Bull. Soc. Chim., 1904, **31**, 803—805.

c quinine glycerophosphate is obtained by mixing 1 mol. of lycerophosphoric acid (this J., 1904, 35 and 1128) 2 mols. of the base, in alcoholic solution ; if absolute alcohol be the solvent the resulting salt is anhydrous ; if 80 per cent. alcohol be used it contains 4 mols. of water of crystallisation. In either case it is precipitated from the alcoholic solution with ether. Dried at normal temperatures the hydrated salt has the formula—

$$CH_2OH.CHOH.CH_2.O.PO(O.C_{20}H_{24}N_2O_2)_2 + 4H_2O.$$

It is readily rendered anhydrous at 100° C., and then has the m. pt. 148·5° C. The hydrated salt begins to melt at 147° C.

Neutral quinine glycerophosphate is prepared as above, but with 1 mol. of acid and of base. It also forms anhydrous or hydrated crystals, according to the solvent used. The hydrated salt has the formula—

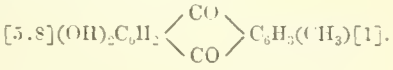
$$CH_2OH.CHOH.CH_2.O.PO(OH)_2C_{20}H_{24}N_2O_2 + 2H_2O.$$

It becomes anhydrous at 100° C., and melts at 151°—152° C. Both salts occur in fine acicular crystals. The basic salt is soluble in alcohol, insoluble in ether, sparingly soluble in water ; in the hydrated state it is insoluble in acetone, but it becomes soluble therein when anhydrous. The neutral salt is more soluble in alcohol and in water than the above ; in other respects its behaviour to solvents is the same. Since the hydrated salts are insoluble in acetone, they may be obtained in fine crystals by adding that body to the alcoholic solutions.—J. O. B.

Chrysophanic Acid and Emodin ; Constitution of ——. H. A. D. Jowett and C. E. Potter. Chem. Soc. Trans., 1903, **83**, 1327—1334.

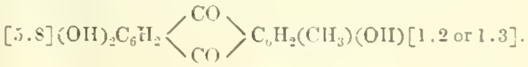
CHRYSOPHANIC acid and emodin are known to be respectively the di- and tri-hydroxy derivatives of a methylanthraquinone, but the position of the substituting groups has not yet been satisfactorily determined. Attempts to synthesise the compounds failed, but the results obtained enable the authors to propose, with a considerable degree of certainty, the following formulæ for them :—

Chrysophanic acid,



$$[5.8](OH)_2C_6H_2\left\langle\begin{matrix}CO\\CO\end{matrix}\right\rangle C_6H_3(CH_3)[1].$$

Emodin—



$$[5.8](OH)_2C_6H_2\left\langle\begin{matrix}CO\\CO\end{matrix}\right\rangle C_6H_2(CH_3)(OH)[1.2 \text{ or } 1.3].$$

—A. S.

Quercitol ; A Lævo-rotatory Modification of ——. F. B. Power and F. Tutin. Chem. Soc. Trans., 1904, **85**, 624—629.

BY extraction with alcohol, the authors isolated from the leaves of *Gymnema sylvestre* (Br.), a colourless crystalline compound, $C_6H_7(OH)_5.H_2O$, m. pt. 174° C. ; $[\alpha]_D = -73·9°$. The compound is thus a hydrated lævo-rotatory quercitol. It loses its water of crystallisation at 110° C. Like *d*-quercitol it yields malonic acid on oxidation with permanganate, and a diketotrihydroxyhexahydrobenzene when oxidised with sodium hypobromite.—A. S.

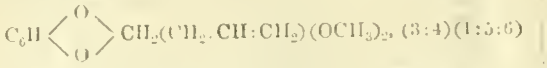
Oil of Turpentine ; Action of Salicylic Acid on ——. E. Tardy. J. Pharm. Chim., 1904, **20**, [2], 57—58.

HAVING set aside for some years the viscous liquid esters obtained by the action of salicylic acid on oil of turpentine and subsequent fractionation, it was recently found that these had crystallised to a fine crop of bornyl salicylate, m. pt. 44°—45° C., $\alpha_D - 34° 20'$. The oily liquid originally obtained was therefore mainly bornyl salicylate, prevented from rapid crystallisation by the presence of adherent impurities. Attention was directed to these abandoned experiments by the recent publication of a patent for the preparation of borneol, isoborneol, and camphor from oil of turpentine by the action of salicylic acid, and the subsequent saponification of the esters thus formed.—J. O. B.

Dill- and Parsley-Apiols ; Constitution of ——. H. Thoms. Archiv der Pharm., 1904, **242**, [5], 344—347.

THE behaviour of the ethylated phenol in the case of dill-apiol shows that the ethoxy group must be in the para-position ; while in the formation of a quinone from the ethylated product an ethyl and a methyl group are split off.

The two methoxyl groups are therefore present in juxtaposition, and dill-apiol is a (1) allyl- (5.6) dimethoxy-(3.4) methylenedioxybenzene—



$C_6H\langle O_2 \rangle CH_2(CH_2.CH:CH_2)(OCH_3)_2$, (3:4)(1:5:6)

Parsley apiol, on the other hand, has been shown by the author to be (1) allyl (2.5) dimethoxy (3.4) methylene dioxybenzene (this J., 1903, **22**, 1255).—J. O. B.

Matico Leaves; [*Essential*] *Oil of* ——. H. Thoms. Archiv der Pharm., 1904, **242**, 328—344.

The oil employed had the sp. gr. 1·1343. Fractionated in an atmosphere of carbon dioxide, it gave 1·9 per cent. at 270° C.; 17·1 per cent. at 270°—282° C.; 46·0 per cent. at 282°—286° C.; 20·1 per cent. at 286°—288° C.; and 11·9 per cent. of resinoid residue. These fractions were refractionated under reduced pressure, and the following constituents isolated. A hydrocarbon boiling at 121°—130° C. under 13 mm. pressure, solidifying at −18° C. A trace of an unidentified phenol ester, which gives a bromo derivative, m. pt. 123°—124° C. A considerable amount of dill-apiol; a small quantity of parsley-apiol. No matico camphor or asarone, such as was found in commercial matico oil 20 years ago, could be isolated. Nor could the matico ether, $C_{11}H_{18}O_4$, of Fromm and Emster be isolated as a distinct body. This supposed constituent was probably a mixture of the two apiols. Similarly, the so-called maticoic acid obtained by those authors by oxidation with permanganate, is a mixture of dill-apiolic acid, m. pt. 151° C., and parsley-apiolic acid, m. pt. 175° C. No proof of the splitting off of carbon and oxygen atoms, by means of bromine, as stated by Fromm and Emster, could be established. Doubtless these investigators were dealing with a mixture of bromo-bodies containing tribromo-apiol, which, however, they failed to isolate. The author finds that the bromo derivatives of the lower boiling fractions of matico oil have relatively higher melting points, contain more bromine, and possess a lower methoxyl content. The richer in apiol the fractions, the lower are the melting points of its bromo derivatives. The ratio of methoxyl contained in them is in inverse proportion to the amount of bromine.
—J. O. B.

Tacamahac Resin, Commercial; *Constitution of* ——. A. Tschirch and O. Saal. Archiv der Pharm., 1904, **242**, [5], 395—400.

The resin [a fragrant oleo-resin of undetermined botanical source, allied in properties to elemi] was insoluble in water, soluble in most organic solvents, including light petroleum spirit and carbon bisulphide. Its alcoholic solution has an acid reaction. The resin, purified from foreign matter by solution in ether, melts at 85°—87° C. It contains 3 per cent. of gum; 0·5 per cent. of tacamahinic acid, $C_{43}H_{77}O_2$, amorphous, melting at 95° C., removed by shaking out the ethereal solution with 1 per cent. ammonium carbonate solution; 0·5 per cent of tacamaholic acid, $C_{15}H_{25}O_2$, m. pt. 104°—106° C., removed by dilute sodium carbonate solution; 3 per cent. of essential oil with a camphoraceous and turpentine odour, the greater part distilling between 170° and 175° C., the rest between 175° and 210° C.; 50 per cent. of α-takoresene and 30 per cent. of β-takoresene: the former, $C_{21}H_{35}O$, insoluble in alcohol, sp. gr. 0·892, m. pt. 93°—95° C.; the latter, $C_{15}H_{25}O$, soluble in that solvent; m. pt. about 82° C.; with traces of bitter principle and 10 per cent. of foreign impurities.—J. O. B.

Digitalin; *Detection of* ——. C. Binz.
XXIII., page 800.

English Patents.

Pharmaceutical Compound [*Trichlorisopropyl Alcohol*]; *Manufacture of* ——. H. E. Newton. From the Farbenfabriken vorm. F. Bayer and Co., Elberfeld. Eng. Pat. 18,245, Aug. 24, 1903.

Methyl bromide or other halogen methyl compound is mixed with dry alcohol-free ether and allowed to act upon magnesium filings. Dry chloral in dry alcohol-free ether is added, when a halogen magnesium compound of trichlor isopropyl alcohol is formed, $CCl_3.CH(OMg.halogen).C$l When this latter is decomposed by ice-water, trichloroisopropyl alcohol is liberated, melting at 48°—49° C. aft recrystallisation.—F. S.

Alcohols and Alcohol Derivatives applicable as or in t Manufacture of Perfumes, Flavourings, or the like, a of Primary Alcohols generally; *Manufacture of* —. L. Bouveault and G. Blanc, Paris. Eng. Pat. 14,7 July 2, 1903.

The preparation of the following new alcohols is claimed Methyl-3-nonanol-1; dimethyl-3:7-octene-6-ol-1; unde lene-10-ol-1; oleic alcohol; hexahydrobenzyl alcoh campholene alcohol; campholic alcohol; paramethox phenyl-2-ethanol; 2:2-dimethylbutanediol-1:4; 2:2 methylpentanediol-1.5; 2-methylhexanediol-1:6; octa diol-1:8; decanediol-1:10. Also derivatives of the n alcohols, *viz.*, butyrate, valerate of nonyl and of dodec oxide, acetate, and butyrate of campholene alcohol; bu rate and valerate of phenylethyl; formate, acetate, butyra and valerate of phenylpropyl; acetate of paramethoxyphen ethyl; oxide of methyloctyl. These alcohols are manuf tured by reducing the corresponding acid ester with sodi in absolute alcohol. The alcohol and ester must be f from all traces of moisture to secure the best yield.—F. S

Oxybenzaldehydes and Oxybenzoic Acids; *Manufact of* ——, *and Intermediate Products of the said Ma facture*. J. Y. Johnson, London. From The Badis Anilin und Soda Fabrik, Ludwigshafen-on-Rhine. E Pat. 17,347, Aug. 10, 1903.

Aromatic sulphonic acid esters of cresols, obtained by action of an aromatic sulphonic chloride on a dilute alka solution of a cresol, are oxidised to the correspondi sulphonic esters of hydroxybenzaldehyde and hydro benzoic acid by means of manganese dioxide and sulph acid. 500 parts of the benzenesulphonic acid ester o-cresol are mixed, at 100° C., with 300 parts of mangan dioxide and 800 parts of 70—80 per cent. sulphuric ac the mixture is agitated for four or five hours at the s temperature, and diluted with about 900 parts of water allowed to stand in a warm place. The oily product wh separates is mixed with cold, dilute caustic soda solut filtered, and acidified, when the benzene sulphonic acid e of salicylic acid separates. "The reaction product rem ing undissolved" is mixed with bisulphite solution, and aldehyde-bisulphite compound decomposed by means alkali, the benzenesulphonic ester of salicylic aldeh being obtained. These esters are easily saponified to corresponding hydroxy acids and hydroxy aldehydes.
—T. F. B

Pinene Hydrochloride; *Purification of* ——. F. Lie (Chem. Fabr. Uerdingen, Lienau, and Co.) and Naschold, Uerdingen-on-Rhine, Germany. Eng. I 14,189, June 25, 1903.

See Fr. Pat. 328,009 of 1902 and addition thereto; J., 1903, 1101, and 1904, 336.—T. F. B.

United States Patents.

Isoionone; *Homologues of* ——, *and Process of Ma same*. R. Schmidt, Assignor to Haarmann and Rei Chem. Fabr. zu Holzminden, G. m. b. H., Holzmin Germany. U.S. Pat. 762,765, June 14, 1904.

Isomers of cyclic homoionones are obtained by treatin mixture of cyclocitral (or its isomers) and "homolog ketones" with condensing agents; the resulting compou possess the odour of violets and orris (See Ger. Pat. 116, of 1898; this J., 1901, 150).—T. F. B.

Saponin, and Process of Making same. R. Kob Rostock, Assignor to Firm of E. Merck, Darmst. U.S. Pat. 763,003, June 21, 1904.

Guaiacum extract containing saponin is treated with l acetate, thereby precipitating the lead salt of the saponin; the neutral saponin is precipitated as its lead r treating the filtrate with lead subacetate; neutral ponin is obtained from its lead salt, by treatment with lphuretted hydrogen, in the form of a powder soluble alcohol, but insoluble in ether, and precipitated from its queous or alcoholic solution on addition of ammonium lphate.—T. F. B.

Extracts; Process of Increasing the Solubility of ——. J. Maggi, Paris. U.S. Pat. 764,483, July 5, 1904.

ee Fr. Pat. 330,691 of 1903: this J., 1903, 1078.—T. F. B.

French Patent.

lucinium Hydroxide; Process for Obtaining Pure ——. G. van Oordt. Fr. Pat. 340,027, Jan. 29, 1904.

r digesting a mixture of the hydroxides of glucinium, uminium, and iron, with water, dilute ammonia, &c., or ith insufficient alkali hydroxide solution to dissolve the droxides, the glucinium hydroxide is rendered very soluble in acids and dilute alkalis; if the iron be then moved by means of acid, and the alumina by long ating with just sufficient alkali hydroxide, fairly pure ucinium hydroxide is obtained; this can be further eed from traces of iron and aluminium hydroxides by ssolving in acetic acid, evaporating the solution to dryness, eating with glacial acetic acid, again evaporating to yness, and extracting the iron and aluminium acetates by eans of water, and then extracting the pure glucinium etate by means of chloroform.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

lver; Influence of the Character of Developers on the Size of Grain of Reduced ——. A. and L. Lumière and A. Seyewetz. Brit. J. Phot., 1904, **51**, 630—631.

e size of the grain of reduced silver, as produced by the rious developers in common use, is practically invariable, l temperature (between 5° and 35° C.) and concentration the developer would appear to be without influence also; y protracted development tends to cause a diminution the size of the grain, whilst excess of alkali or alkali omide produces a very slight enlargement of the grain. ehle developers, such as *p*-phenylenediamine or *o*-amino-enol, when used with sodium sulphite, produce a deposit nilar to that obtained with collodion emulsions, and of a ch finer grain than that given by the other developers; addition of alkali carbonate, however, the size of the in increases until the "normal" composition of developer eached, when the size and appearance of the grain are nost identical with those produced by other developers. —T. F. B.

tassium Metabisulphite and Sodium Bisulphite; Alteraion of —— *when exposed to Air.* A. and L. Lumière nd A. Seyewetz. Brit. J. Phot., 1904, **51**, 645—646.

lid potassium metabisulphite is not appreciably altered exposure to air, even at a temperature of 100° C. In tion, gradual oxidation occurs, the rate of decompoon being greater the more dilute the solution; the tions are much more stable than those of sodium phite of the same strength (see this J., 1904, 488), a 1 per t. solution of the latter being totally oxidised after one k, whilst a 1 per cent. solution of potassium metalphite is only oxidised to the extent of about 22 per t. after three weeks; in the more concentrated solutions difference is less marked, though very apparent. stallised sodium bisulphite deteriorates rather rapidly exposure to air, the decomposition being more rapid in ist air. In solution, the salt behaves very similarly potassium metabisulphite. On the whole, however, ydrous or normal sodium sulphite seems most suitable photographic use, since the use of metabisulphite essitates the addition of measured quantities of alkali at time of development.—T. F. B.

English Patent.

Pictures or the like by Aid of Catalysis; Reproduction of ——. A. G. Bloxam, London. From the Neue Photographische Gesellschaft, Berlin. Eng. Pat. 18,370, Aug. 25, 1903.

The present invention consists in substituting a stable catalyst for the silver in negatives. For this purpose the negative is treated with either (1) a solution of manganic hydroxide in tartaric acid, afterwards rendered alkaline with sodium hydroxide; (2) a solution of potassium permanganate mixed with an excess of sodium tartrate; (3) a solution of potassium permanganate and tartaric acid rendered alkaline with sodium hydroxide; or (4) a saturated solution of sodium tartrate in which is dissolved a mixture of potassium permanganate and manganous sulphate. The negative or picture is then washed for a short time and brought into a solution of potassium ferricyanide and sodium hydroxide. The negative thus obtained is well suited for catalytic multiplication by means of hydrogen peroxide. After long use its activity may be restored by means of ammonia vapour.—W. P. S.

French Patent.

Photographic Papers; Process for the Preparation of ——. I. Hoffsümmer. Addition, dated Feb. 3, 1904, to Fr. Pat. 336,873, Nov. 21, 1903.

See Eng. Pat. 3855 of 1904; this J., 1904, 622.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

English Patent.

Explosives. H. H. Lake, London. From Dynamit-Act.-Ges., vorm. A. Nobel and Co., Hamburg. Eng. Pat. 14,825, July 3, 1903.

See Fr. Pat. 333,443 of 1903; this J., 1903, 1367.—T. F. B.

United States Patent.

Nitrating Fibrous Matter; Process of ——. J. Selwig, Brunswick. U.S. Pat. 764,776, July 12, 1904.

See Fr. Pat. 327,802 of 1902; this J., 1903, 963.—T. F. B.

XXIII.—ANALYTICAL CHEMISTRY.

INORGANIC—QUANTITATIVE.

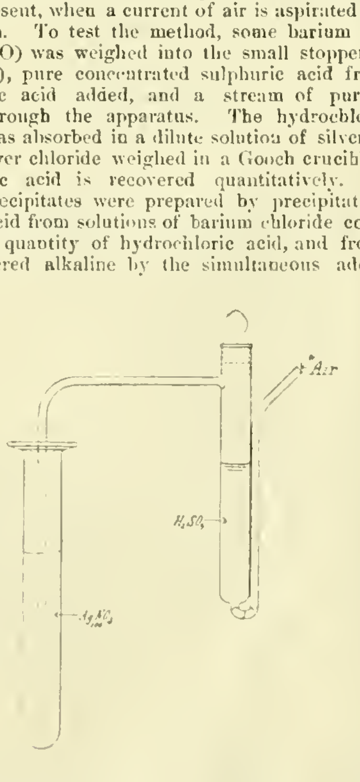
Arsenic; Electrolytic Methods for the Detection and Determination of Minute Quantities of —— *in Beer, Malt, Foodstuffs, &c.* W. Thomson. Memoirs and Proc. Manchester Lit. and Phil. Soc., 1904, **48**, Part III.

The apparatus designed by the committee appointed by the Commissioners of Inland Revenue for the electrolytic detection and determination of arsenic does not, in the author's hands, produce a mirror when less than $\frac{1}{300}$ grain of arsenic per gallon is present, using 50 c.c. of the solution. With a cathode composed of granulated zinc, connected with the battery by a platinum wire, much better results were obtained, but, when working with 0·001 gr. per gall. the mirror produced was not so intense as that obtained with the Marsh-Berzelius method. The form of apparatus ultimately adopted, and which gave mirrors of equal intensity to those obtained with the Marsh-Berzelius apparatus, consists of a porous pot, 3 ins. high by $1\frac{1}{2}$ in. diameter, surrounded, as in the "Committee's" apparatus, by a band of platinum foil, which serves as anode. A glass stopper is ground into the top of the porous pot, and is provided with two openings; through one of these, the narrowed end of a zinc rod projects, and is connected with the negative pole of the battery; the other opening serves both for introducing the liquid to be tested and as an exit for the hydrogen. The whole apparatus is placed in a glass beaker, about $\frac{1}{5}$ in. more in diameter than the external diameter of the porous pot, thus necessitating the use of only a small amount of sulphuric acid. In other respects, the apparatus is similar to that devised by the "Committee."

It is found that a current of 3 ampères is preferable to one of 5 ampères, as the mirrors obtained with the former are less spread out over the tube, and therefore easier to compare. Experiments showed that all the arsenic was collected in the form of a mirror 40 minutes after the introduction of the liquid, and that, with this form of apparatus, arsenic as well as arsenious compounds were completely reduced without addition of metabisulphite. A series of experiments showed that the addition of amyl alcohol to prevent frothing (as recommended by the Committee) resulted in the formation of smaller deposits of arsenic than when no amyl alcohol was used; in fact, an experiment with as much arsenic as is permissible in beer (50 c.c. of a solution containing $\frac{1}{200}$ gr. of arsenious oxide per gallon) no mirror was produced when amyl alcohol was added. Glucose was also found to have a marked influence in preventing the formation of mirrors. It is concluded that, in using 25 c.c. of beer, as recommended, and destroying organic matter, a very faint mirror is produced from beer containing 0·01 gr. per gallon, but when beer is used direct with amyl alcohol, no mirror is produced, and therefore the direct method fails to detect an amount of arsenic considerably greater than that which the committee regard as sufficient to condemn the sample.
—T. F. B.

Barium Sulphate; Chlorine in precipitated ——. G. A. Hulett and L. H. Duschalk. Z. anorg. Chem., 1904, **40**, [2], 196—217.

The "occlusion" of barium chloride by precipitated barium sulphate, and its non-removal by calcining, extracting with acids, and washing with water, has so far been quantitatively investigated only by Richards and Parker (Amer. Acad. Sci., **31**, (1896), 67), the determination of the amount of chlorine present being very difficult. The authors make use of the fact that barium sulphate is completely soluble in concentrated sulphuric acid, and loses any chlorine present, when a current of air is aspirated through the solution. To test the method, some barium chloride ($BaCl_2.2H_2O$) was weighed into the small stoppered tube (see figure), pure concentrated sulphuric acid free from hydrochloric acid added, and a stream of purified air bubbled through the apparatus. The hydrochloric acid liberated was absorbed in a dilute solution of silver nitrate, and the silver chloride weighed in a Gooch crucible. The hydrochloric acid is recovered quantitatively. Barium sulphate precipitates were prepared by precipitation with sulphuric acid from solutions of barium chloride containing a constant quantity of hydrochloric acid, and from solutions rendered alkaline by the simultaneous addition of barium hydroxide solution. The chlorine present in the precipitates was determined, and found to be 0·27—0·64 per cent. in the case of the hydrochloric acid solution, and 0·158 per cent. in the case of the alkaline solution, 0·096 per cent. of this latter being volatile. Barium sulphate precipitated from barium hydroxide solution with sulphuric



acid does not "occlude" chlorine after shaking for 20 d
with a solution of barium chloride. On heating preci
tated barium sulphate between 300° and 650° C. it lo
water and volatile chlorine. Between 650° and 900° C.
residue consists of barium sulphate and barium chlori
On further heating between 900° and 1100° C. it again lo
in weight, and the residue shows an alkaline reaction.
the determinations were carried out in platinum or J
glass vessels, the barium sulphate in the wash waters
recovered, and all weighings reduced to vacuum.
authors consider the "occlusion" of chlorine in the p
cipitates to be due to the presence of HSO_4' and $BaCl^{\cdot}$ i
in the solution, causing the precipitation of BaCl.HS
They confirmed this by precipitating barium platinocyani
$BaPt(CN)_4$, solution with magnesium sulphate soluti
when the theoretical quantity of barium sulphate
obtained. They recommend the calcining of barium s
phate precipitates at 700° C. and subsequent determinat
of the barium chloride present.—L. F. G.

Sulphur in Iron; Rapid Method for the Determination
Total —— *by Evolution*. S. S. Knight. Amer. Che
J., 1904, **32**, 84—85.

Two grms. of the sample of iron, mixed with 1 grm.
pure iron-dust, are placed in a porcelain crucible
covered with a layer of 1 grm. of iron dust. The wh
is covered with a disc of filter paper, the crucible lid
put in place, and the contents roasted strongly for
minutes by means of a blow-pipe flame. When nea
cool, the mass is decomposed by hydrochloric acid, and
evolved gases passed through a standard solution of c
mium chloride, which is subsequently titrated with stand
iodine solution. The results obtained by this meth
(which occupies less than half an hour) agree closely w
those obtained by slower methods, which have been pro
to be accurate.—T. F. B.

ORGANIC—QUALITATIVE.

Digitalin; Detection of ——. C. Binz. Arch. inter
de Pharmacod., 1904, **12**, 337. Biochem. Centra
1904, **2**, 701.

Grandeau's test (purple coloration with concentr
sulphuric acid and bromine water) did not give the cha
teristic coloration with Merck's "crystalline digitalin"
"crystalline digitoxin," whereas, on the other hand,
similar colorations were obtained with helleborein, stro
anthin, convallamarin, erythroplein, euonymin, cyclar
delphinin, saponine, silicin, amygdalin, benzaldehy
peronin, turpentine oil, terpene hydrate, abietic acid (c
talline), camphor, menthol, cubebin, solanine, bru
cytisine, veratrine, and agaricine. In the case of Tra
reaction (reduction of phosphomolybdic acid on heat
with the formation of a green coloration turning blu
the addition of ammonia) positive results were obta
with all the digitalin preparations tried, although in s
cases only after prolonged heating, whilst digitoxin
alcoholic solution only reacted after vigorous heating
long-continued cooling. The coloration was also obta
with helleborein, strophanthin, scillitoxin, convallama
cyclamin, delphinin, saponin, ricin, morphine, hero
peronin, strychnine, brucine, aniline, and phenacetin.
author concludes that if both tests give negative res
the absence of digitalin is certain, but that if the cha
teristic colorations be obtained, the absence of the o
substances named must be assured.—C. A. M.

ORGANIC—QUANTITATIVE.

Coal Analysis; A Frequent Cause of Error in ——
J. Alix and J. Bay. Comptes rend., 1904, **139**, 215—2

Coal nearly always contains considerable amounts
calcium carbonate, six samples tested showing a mean
4·99 per cent., corresponding to 2·06 per cent. of car
dioxide. When the coal is incinerated to determine
carbon content, a correction must therefore be made for
carbon dioxide arising from calcium carbonate, as oth
wise the carbon content would not give accurate indica
of the fuel value of the coal.—T. F. B.

Margarine; Characteristic Values of ——. E. Russell, and V. H. Kirkham. Analyst, 1904, **29**, 206—208.

Thirteen samples of commercial margarine examined by the authors gave the following results:—Valenta test (° C.) 62 to 96; Reichert value (7 samples), 0·5 to 5; water (6 samples), 9·9 to 18·7 per cent.; butyro-refractometer reading (10 samples), + 2·7 to + 9·4; oleo-refractometer reading (9 samples), − 4 to − 22; and iodine value, (4 samples), 48·5 to 79·8. They conclude from their results: (1) That Valenta figures above 89° C. are obtained when not more than traces of butter-fat or cotton-seed oil are present, butter-fat causing the greater depression. (2) That the presence of butter-fat reduces the butyro-refractometer and oleo-refractometer readings, whilst vegetable oil increases them. (3) That similar conclusions can be drawn from the iodine value. In the authors' opinion the amount of water and vegetable oil in margarine should be legally fixed.—C. A. M.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Radium; Origin of ——. H. N. McCoy. Ber., 1904, **37**, 2641—2656.

Radio-active substances are usually divided into those exhibiting permanent and those exhibiting temporary activity. The loss of activity is usually ascribed to change of chemical constitution. Sometimes two or more stages are passed through (the radium-emanation giving rise to the *x*-emanation, for example), but ultimately an inactive substance results. The permanence of the activity of the three so-called permanently active substances, uranium, thorium, and radium, is perhaps open to doubt. For, on the one hand, quantitative measurements of radio-activity are not very exact, and, such as they are, have only been made during a very few years; and, on the other, indications, if not proofs, of the slow decline of "permanent" activity are given by (1) the fact that at least the α- and β-radiations are material; (2) the proof, given by Rutherford and Soddy, that uranium-*x* (of temporary activity) is not an accidental impurity in uranium, but is generated from it, and that its rate of loss of activity indicates a "monomolecular reaction," *i.e.*, is proportional to its quantity; so that, though its mass is so small compared with that of the generating uranium that the latter may be considered as practically constant, yet it is undergoing loss in producing uranium-*x*, and that loss must become evident in time. The same is shown by the proof of Ramsay and Soddy that the ultimate transformation product of the radium-emanation is helium. (3) The almost certainty that radio-activity is not the result of external stimulation. As to the rate of loss of "permanent" radio-activity, Rutherford has estimated that in the case of radium the loss may be 1 1,000th of the total mass in a year, and in that of thorium about 1/1,000,000th as large. If that be so, many ages would be required for the final disappearance of radium from the earth, if it once existed in considerable quantity; while its present existence may be due to its being constantly formed from some much more slowly transforming substance to which radium would bear the same relation that uranium-*x* does o uranium. In theory, if a series of substances were transformable successively into one another—A→B→C→ ……N, he rate of transformation being in each case proportional to the mass of the transforming substance, then f the mass of A be supposed constant, B will be formed at a steady rate, but will decompose at a rate increasing with its quantity, till that rate rises to the rate of its formation; then its mass will be constant. The same will occur with C; and ultimately, if equilibrium is eached, the masses of B, C, &c. will be $\frac{k_a}{k_b}$ A, $\frac{k_a}{k_c}$ A, &c., where $k_a k_b$, &c. represent the amounts of A, B, &c., ransformed from unit mass in unit time. The amount of B, for instance, formed after any time t from the beginning, $\frac{k_a}{k_b}$ A $(1 - \epsilon^{-k_b t})$; an expression exactly similar to hat deduced by Rutherford and Soddy for the radioctivity produced by the formation of ThX in a thorium reparation. This last expression enables the time required for the production of any given fraction of the maximum or equilibrium-production of the substance concerned, to be deduced; thus for 99 per cent. and 99·9 per cent. of the maximum, the times required are $\frac{4\cdot6}{k}$ and $\frac{6\cdot9}{k}$. These times are inversely as the rates (k) of transformation; and a maximum will be practically reached in a very short time in any case in which the transformation-rate of the product is very great compared with that of the mother-substance. Applying this to radium, from the figure above given, we get t (for 99 per cent. of the maximum) = 4,600 years; so that any radium-containing mineral over 5,000 years old probably now contains practically its maximum amount of radium (on the assumption that k for the mother-substance is so small compared with k for radium that the mass of the former may be considered constant). The frequent association of radium with uranium-minerals, coupled with the fact that uranium is radio-active, and is probably transforming, though very slowly as compared with radium, suggest that uranium is possibly the mother-substance of radium. If this be so, all uranium minerals should contain radium, in amount proportional to their uranium-content. The author has examined 12 very different uranium minerals, and finds this to be very nearly the case, the figures representing the quotient of radio-activity by percentage of uranium varying from 18·9 to 24·7, with an average of 22·1. Pure uranium compounds gave a corresponding average figure (with greater variations, due no doubt to difficulties of purification) of 3·86; so that the old minerals, containing besides uranium their maximum amounts of its transformation products, are 5·7 times as active as the new uranium preparations. Apparently then, we have the series U → UX → Ra → RaEm → EmX → He, with possibly other end- or intermediate members. The transformation-rates of UX, RaEm, and EmX are vastly greater than that of radium; hence the amounts of these bodies present in the minerals are much smaller than that of radium. The activity of radium may be taken at 1½ million times that of uranium; and since the activity of radium in uranium minerals is (5·7 − 1 =) 4·7 times that of the uranium present, there should be about 1 part of radium to 300,000 of uranium in these minerals—a result agreeing well with those of experiment.—J. T. D.

Minerals; Examination of different —— *with respect to Radio-activity, by the Photographic Method.* F. Kolbeck and P. Uhlich. Centr.-Bl. f. Min. u. Geol., 1904, 206—208. Chem. Centr., 1904, **1**, 1632.

The authors find that the uranium pitchblende from the Vereinigt-Feld mine at Johanngeorgenstadt is more active than the Joachimstal ore. Other strongly active ores are uranotite and carnotite from Neustädtel - Schneeberg, orangite from Brevig, Norway, and monazite from Moss, Norway.—A. S.

Metals; Action of Radium on ——. N. Orloff. J. russ. phys.-chem. Ges., **36**, 41—45. Chem. Centr., 1904, **1**, 1639.

An aluminium plate, 0·1 mm. thick, which had been covered for some months with a small receptacle containing "0·03 grm." of radium bromide, was found to have numerous small globules of apparently fused metal on its under side. These protuberances were radio-active, and their activity was not diminished by seven months' exposure to the air, by washing the plate with alcohol, ether, or boiling water, nor by heating in a thermostat to 320° C.
—A. S.

Acid Sulphates; Decomposition of some —— *in Consequence of Mechanical Deformation.* W. Spring. Bull. Acad. roy. Belg, 1904, 290—309. Chem. Centr., 1904, **1**, 1630—1631.

A number of acid sulphates, both in the anhydrous condition and containing water of crystallisaton, were subjected to the action of strong pressure, with deformation, in a steel cylinder having a small hole in the bottom. Lithium hydrogen sulphate (lithium anhydrosulphate) was separated in this way into a constituent richer in acid (approximating to the composition, $9LiHSO_4.2H_2SO_4$) which flowed through the opening, and a residual portion nearly of the composition of the normal sulphate. With the salt $LiHSO_4.H_2O$, water also was separated. No distinct action was observed with sodium hydrogen sulphate (sodium anhydrosulphate) but with the various hydrates of this salt, especially at a somewhat higher temperature, large quantities of the water of crystallisation and a considerable amount of sulphuric acid were separated; at lower temperatures the water separated first. The acid sulphates of potassium, rubidium, and cæsium remained practically unaffected by the action of pressure. In a further series of experiments, mixtures of sodium hydrogen sulphate (anhydrosulphate) with various basic oxides (PbO, CuO, HgO, Ag_2O) were subjected to strong pressure. In completely closed cylinders no reaction took place, but when the pressure was accompanied by mechanical deformation, *i.e.*, when there was a small hole in the bottom of the cylinder, chemical reaction ensued until the acid contained in the acid salt was completely neutralised. A similar action is brought about by merely rubbing the two compounds together; *e.g.*, copper oxide forms a white compound, $CuSO_4.Na_2SO_4.H_2O$. (See also this J., 1904, 374.)—A. S.

Nitrogen; Solubility of —— in Liquid Oxygen.

E. Erdmann and F. Bedford. Ber., 1904, **37**, 2545—2550.

A REPLY to Stock (this J., 1904, 489). The authors' paper (*ib.* 441) described purely experimental work. No detailed description of the preparation of liquid oxygen was available, and experimenters had lamented the difficulty of obtaining it in quantity sufficient to work with; hence the publication of their method. The solubility of nitrogen in liquid oxygen below its boiling point was experimentally established by the authors. Oxygen boiling in a vessel open to the air does not absorb nitrogen, but if a stream of nitrogen or air be passed through the boiling oxygen, nitrogen is absorbed by the oxygen. As the result of experiments, the authors admit the probability of Stock's view, that by the passage of the current of nitrogen the temperature of the boiling oxygen is reduced below the boiling point, so that the absorption of nitrogen really occurs slightly below that point.—J. T. D.

Sugars; Action of Benzylphenylhydrazine on ——.

R. Ofner. Ber., 1904, **37**, 2623—2625.

THE statement of Neuberg to the effect that only ketoses yield osazones with secondary hydrazines has been refuted by Goldschmiedt, who found that with benzylphenylhydrazine, dextrose yields the same osazone as levulose. The author shows that neither dextrose nor levulose reacts with pure benzylphenylhydrazine, and that the compound obtained by Neuberg and by Goldschmiedt is phenylbenzylphenyldextrosazone, $C_{25}H_{28}O_4N_4$, the formation of which is due to the presence of phenylhydrazine in commercial benzylphenylhydrazine. This compound may also be prepared by the action of pure benzylphenylhydrazine on phenyldextrosazone.—T. H. P.

Enzymes that decompose Amides; Occurrence of —— in Mould-Fungi.

K. Shibata. Hofmeisters Beitr., 1904, **5**, 385. Biochem. Centralbl., 1904, **2**, 651.

THE mycelia of *Aspergillus niger* were pressed and triturated, or treated with acetone as in the method of Albert and Buchner, and then brought in contact with the amides under examination. The following amides were decomposed:—Urea, biuret (slightly), acetamide, oxamide, and asparagine (very slightly), whilst small amounts of ammonia were liberated from the amino acids, alanine and tyrosine. Hippuric acid was decomposed with the formation of glycocoll. The following were not attacked:—Urethane, guanidine, allantoin, uric acid, and benzamide. The author suggests the name *amidases* for this class of enzymes. —C. A. M.

IX. *Peroxydase Reaction; Velocity of the ——. Peroxides; Function of —— in the Chemistry of Living Cells.*

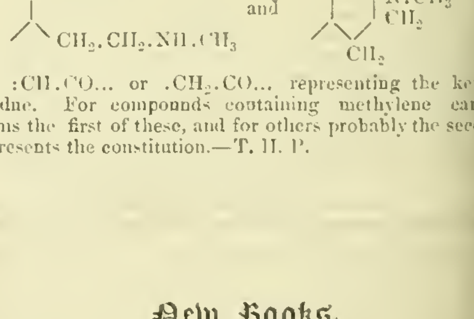
A. Bach and R. Chodat. Ber., 1904, 2431—2440. (See also this J., 1904, 766.)

FOR determining the velocity of this reaction, the authors made use of the oxidation of hydriodic acid by peroxydase and hydrogen peroxide, the course of the reaction being ascertained by titration with thiosulphate solution. The results show that the peroxydase, in rendering active the hydrogen peroxide during the oxidation, is used up, as was found to be the case in the oxidation of pyrogallol (this J., 1904, 505). In the present experiments the peroxydase exhibited a much greater activity than it did in the pyrogallol reaction. The velocity of the peroxydase reaction was found to follow the law of mass, in so far as it was not inhibited by the secondary products formed. The authors consider that peroxydase is a ferment. It differs from other ferments in being completely and quickly used up during the process of rendering hydrogen peroxide active, but, on the other hand, its origin, preparation, and genera properties are similar to those of other ferments. Its mass-reaction, when not interfered with, is also common to rennet-ferment, invertase, and catalase.—W. P. S.

Coartnine and Hydrastinine; Condensation of —— wit Ketones.

C. Liebermann and A. Glawe. Ber., 1904, **37** 2738—2744. Compare this J., 1904, 202.

COTARNINE and hydrastinine form condensation product not only with ketones and with most compounds containin methylene carbons between carbonyl groups, but also with many other compounds, such as quinol (hydroquinone) phloroglucinol, and pyrogallol. Descriptions are given o the condensed products formed with ethyl phenylacetate ethyl malonate, cumarone, and resorcinol, and of some o the derivatives of these products. Attempts were made, bu without success, to combine the two bases with meconin and so obtain narcotine and hydrastine. Many of thes condensation products, for example, those formed fro ethyl malonate, decompose so readily into their component that these latter are obtained in even the simplest changes With others, however, it is necessary to employ such vigorous agents as boiling mineral acids in order to de compose them, but in all cases the decomposition yields th components from which they were obtained. Some of thes products are more readily obtained when piperidine is used a condensing agent in place of sodium carbonate. There ar two possible constitutions for these compounds, namely:—



the :CH.CO... or .CH_2.CO... representing the keton residue. For compounds containing methylene carba atoms the first of these, and for others probably the second represents the constitution.—T. H. P.

New Books.

CHEMICAL TECHNOLOGY AND ANALYSIS OF OILS, FAT AND WAXES. By Dr. J. LEWKOWITSCH, M.A., F.I.C Third Edition, entirely rewritten and enlarged. In tw volumes. Macmillan and Co., Ltd., London 190 Price 36s. net. The Macmillan Company, New York.

Two 8vo volumes, Vol. I. containing 427 pages of subject matter, numerous tables, and 53 illustrations; and Vol. II 709 pages of subject-matter, tables, and 35 illustration Total pages of matter are therefore 1136, with 88 illustration The alphabetical index follows at the close of Vol. II.

The leading subjects treated of in Vol. I. are th following:—I. Classification of Oils, Fats, and Waxes, wit their Physical and Chemical Properties. II. Saponificatio of Fats and Waxes. III. Constituents of Fats and Waxe IV. Preparation of the Fatty Matter for Examinatio Preliminary Tests. V. and VI. Physical and Chemica Methods of Examining Oils, Fats, and Waxes. VII. The Qualitative Examination. VIII. Examination of the Mixe Fatty Acids. IX. Examination of Unsaponifiable Matte

X. Detection and Quantitative Determination of Rosin. XI. Application of Foregoing Methods to the Systematic Examination of Oils, Fats, and Waxes. XII. Examination by strictly Scientific Methods.

The leading subjects treated of in Vol. II. are as follows:—XIII. Commercial Preparation of Oils, Fats, and Waxes. XIV. Description of the Natural Oils, Fats, and Waxes; also Methods of Preparing and Examining them and Detecting Adulterations. A. OILS AND FATS. GLYCERIDES. I. Oils or Liquid Fats. II. Solid Fats. B. WAXES. I. Liquid Waxes. II. Solid Waxes. XV. Technology of Oils, Fats, and Waxes; Technical and Commercial Examination of the Products of the Oil and Fat Industries. A. Industries having for their Object the Refining of Oils and Fats. B. Industries wherein Glycerides undergo chemical change, but are not saponified. C. Industries based on the Saponification of Oils and Fats. I. Candle Industry. II. Soap Manufacture. III. Glycerin Manufacture. XVI. Technology of Waste Fats. 1. Greases. 2. Cotton-seed Foots. 3. Fuller's Grease. 4. Black (recovered) Oil. 5. Wool Grease. 6. Sod Oil, Dégras. 7. Stuffing Greases. 8. Garbage Fats, Sewage Fats.

CHEMISCH-TECHNISCHE UNTERSUCHUNGSMETHODEN. Mit Benutzung der früheren von Dr. Friedrich Bockmann bearbeiteten Auflagen, und unter Mitwirkung von E. Adam, F. Barnstein, Th. Beckert, O. Böttcher, C. Councler, K. Dieterich, K. Dümmler, E. Ebertz, C. von Eckenbrecher, F. Fischer, F. Frank, H. Freudenberg, E. Gildemeister, R. Gnehm, O. Guttmann, E. Haselhoff, W. Herzberg, D. Holde, W. Jettel, H. Köhler, Ph. Kreiling, K. B. Lehmann, J. Lewkowitsch, C. J. Lintner, E. O. v. Lippmann, E. Marckwald, J. Messner, J. Pässler, O. Pfeiffer, O. Pufahl, H. Rasch, O. Schluttig, C. Schoch, G. Schüle, L. Tietjens, K. Windisch, L. W. Winkler. Herausgegeben von Dr. GEORG LUNGE. Erster Band. Fünfte vollständig umgearbeitete und vermehrte Auflage. Julius Springer's Verlag, Berlin. 1904. Price M. 20.

LARGE 8vo volume, containing 953 pages of subject-matter, with 180 illustrations, and an Appendix with 49 pages of ables. The subject-matter treated of in this first volume s as follows: —I. GENERAL PORTION (G. Lunge). General Operations: (i) Sampling; (ii) Laboratory Work. SPECIAL SECTION. Technical. GAS ANALYSIS (Ferd. Fischer). FUEL DETERMINATIONS (F. Fischer). MANU-ACTURE OF SULPHUROUS ACID, NITRIC ACID, AND SULPHURIC ACID. SALTCAKE AND HYDROCHLORIC ACID MANUFACTURE, AND SODA MANUFACTURE. CHLORINE NDUSTRY (G. Lunge). POTASH SALTS (L. Tietjens). YANOGEN COMPOUNDS (H. Freudenberg). INVESTIGATION F EARTHENWARES (K. Dümmler). ALUMINA PREPARA-IONS (G. Lunge). GLASS (E. Adam). MORTAR INDUSTRY Carl Schoch). WATER (L. W. Winkler). TESTING VATER FOR BOILER FEEDING, &c. (G. Lunge). SEWAGE ND EFFLUENTS (E. Haselhoff). SOILS (E. Haselhoff). HE ATMOSPHERE (K. B. Lehmann).

INERAL RESOURCES OF THE UNITED STATES. (Department of the Interior. United States Geological Survey. Chas. D. Walcott, Director.) Calendar year 1902. DAVID T. DAY, Chief of Division of Mining and Mineral Resources. Washington, U.S.A., Government Printing Office. 1904.

vo volume containing "Letter of Transmittal," Introducon, and 1,016 pages of subject-matter with six illustrations, nd the alphabetical index of subjects. The following are e items on which geographical and industrial details are iven:—I. Iron Ores: (i) Statistics of the American Iron rade for 1902; (ii) General Statistics of Iron and Steel, on Ore, and Coal, to the year 1901 inclusive, for five ading Iron and Steel Producing Countries. II. Gold and ilver. III. Manganese Ores. IV. Copper. V. Lead. I. Zinc. VII. Aluminium and Bauxite. VIII. Platinum. X. Mercury. X. Lithium. XI. Nickel and Cobalt. II. Antimony. XIII. Arsenic. XIV. Bismuth. XV. ungsten; Molybdenum; Uranium; Vanadium. XVI. oal. XVII. Coke. XVIII. Gas, Coke, Tar, and mmonia at Gas Works, and in Retort Coke Ovens. XIX. Petroleum. XX. Natural Gas. XXI. Asphaltum and Bituminous Rock. XXII. Stone. XXIII. Clay-working Industries. XXIV. Cement. XXV. Precious Stones. XXVI. Talc and Soapstone. XXVII. Abrasive Materials. XXVIII. Borax. XXIX. Bromine. XXX. Fluorspar and Cryolite. XXXI. Gypsum. XXXII. Phosphate Rock. XXXIII. Salt. XXXIV. Sulphur and Pyrites. XXXV. Barytes. XXXVI. Mineral Paints. XXXVII. Asbestos. XXXVIII. Chromite. XXXIX. Flint and Felspar. XL. Graphite. XLI. Magnesite. XLII. Mica. XLIII. Mineral Waters. XLIV. Monazite. XLV. Glass Sand.

SPECIAL TECHNICAL SCHOOLS FOR THE CERAMIC INDUSTRIES IN GERMANY. Foreign Office Miscellaneous Series, No. 615. Eyre and Spottiswoode. Price 1½d.

A REPORT on the aims, organisations and plans of instruction in the technical schools for the ceramic industries at Höhr, Bunzlau, and Landshut, and the technical school for brick-making industries at Lauban.

IRON AND STEEL, 1903. STATISTICAL TABLES. 244. Eyre and Spottiswoode. Price 3d.

THIS memorandum, which has been drawn up in the Commercial, Labour, and Statistical Department of the Board of Trade, deals with the production and consumption, during the 13 years 1890 to 1902 (and where possible to 1903), of iron ore and pig iron, and the production of steel in the United Kingdom, and in the principal foreign producing countries, *viz.*, Russia, Sweden, Germany (including Luxemburg), Belgium, France, Spain, Italy, Austro-Hungary, and the United States of America.

Trade Report.

I.—GENERAL.

CANADIAN TARIFF CHANGES.

Bd. of Trade J., July 21, 1904.

A Customs Memorandum (No. 1,287 B), issued by the Canadian Commissioner of Customs on 28th June 1904, gives the details of the Tariff Resolutions proposed by the Canadian Minister of Finance in Committee of Ways and Means on 7th June 1904, as amended on 28th June 1904.

The following are some of the amendments effected thereby:—

New Rates of Duty.

Paraffin-wax candles, 25 per cent. *ad valorem.*

Paraffin wax, 25 per cent. *ad valorem.*

Illuminating oils, composed wholly or in part of the products of petroleum, coal, shale, or lignite, costing more than 30 c. per gall., 20 per cent. *ad valorem.*

Lubricating oils, composed wholly or in part of petroleum, costing less than 25 c. per gall., 2½ c. per gall.

Crude petroleum, gas oils (other than benzine and gasoline) above 0·775 but below 0·8235 sp. gr. at 60 temperature, 1½ c. per gall.

Oils, coal and kerosene distilled, purified or refined, naphtha and petroleum, and products of petroleum n.e.s., 2½ c. per gall.

Lubricating oils n.e.s., and axle-grease, 20 per cent. *ad valorem.*

Vaseline, and all similar preparations of petroleum for toilet, medicinal, or other purposes, 25 per cent. *ad valorem.*

Duty Free.

The following articles now dutiable to be transferred to the free list:—

Whale-oil soap.

Plain basic photographic paper, baryta coated, for albuminising or sensitising.

Hydrofluosilicic acid.

Glass cut to size for the manufacture of dry plates for photographic purposes, when imported by the manufacturers of such dry plates for use exclusively in the manufacture thereof in their own factories.

Ferment-cultures to be used in butter-making.

Quassia juice.

Crude petroleum, fuel and gas oils, 0·8233 sp. gr. or less, at 60° temperature.

Philosophical and scientific apparatus, utensils, instruments, and preparations, including boxes and bottles containing the same, of a class or kind not manufactured in Canada, when especially imported in good faith for the use and by order of any society or institution incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use or by order of any college, academy, school, or seminary of learning in Canada, and not for sale, subject to such regulations as the Minister of Customs shall prescribe.

GERMANY; TRADE OF —— IN 1903.

Foreign Office Annual Series, No. 3221.

The following tables show the value of some of the imports and exports of Germany for the year 1903, as compared with those of the year 1902. The figures for 1903 are calculated according to the prices fixed for 1902:—

Articles.	Value in 1,000 Marks (50*l*.).			
	Imports.		Exports.	
	1902.	1903.	1902.	1903.
Lead and leaden goods..	9,085	12,200	14,216	16,968
Drugs and dyes.........	263,392	267,407	380,629	100,149
Iron and iron goods.....	51,828	57,221	603,375	658,253
Ores, fine metals, asbestos, &c.	355,661	522,897	206,266	192,849
Glass and glassware	8,699	9,316	48,005	52,008
Hides	258,955	292,282	137,402	122,473
Caoutchouc, guttapercha, and goods thereof.....	73,263	76,252	50,000	52,815
Copper and copper goods	109,011	120,628	120,236	142,408
Leather and leather goods................	64,378	66,512	153,368	164,849
Candles.................	194	187	809	864
Oils, not otherwise mentioned, and fats.......	261,102	258,288	47,189	50,122
Paper and cardboard goods	15,207	18,447	109,322	129,431
Petroleum	93,109	101,232	1,459	1,885
Soap and perfumery	2,706	2,725	17,054	20,363
Stones and earthenware.	45,154	44,724	38,054	39,719
Coal, brown coal, coke, and peat	163,231	169,385	267,576	295,887
Tar, pitch, resin, and asphaltum	31,834	36,301	10,264	11,601
Clay goods..............	7,098	7,646	77,868	85,252
Oilcloth	863	876	2,655	3,037
Zinc and zinc goods.....	9,870	9,859	39,650	38,292
Tin and tinware	34,052	34,578	13,732	14,166

In the chemical industry, 1903 has witnessed an increased production, but the financial yield of the chemical works is decreasing, which is proved by the fact that the dividends of those among them which are share companies are following a downward tendency.

The importance of the German chemical industry is best characterised by the figures of its foreign trade; the import and export of its raw materials and the export of its produce have during the last 10 years risen by about 20 per cent., while the import of manufactured chemical articles has remained practically stationary:—

Raw Materials.

Year.	Imports.		Exports.	
	Quantity in 1,000 Tons.	Value in 1,000,000 Marks.	Quantity in 1,000 Tons.	Value in 1,000,000 Marks.
1902	1,998	212	765	44
1901	1,940	221	863	45
1900	1,928	218	727	45
1893	1,148	164	355	34

Manufactured Articles.

Year.	Imports.		Exports.	
	Quantity in 1,000 Tons.	Value in 1,000,000 Marks.	Quantity in 1,000 Tons.	Value in 1,000,000 Marks.
1902	318	111	810	386
1901	349	111	789	363
1900	322	113	750	352
1893	233	109	506	265

The number of establishments increased in 1902 fro 7,352 to 7,539; the number of adult workmen has rise from 156,488 to 160,841, *i.e.*, an increase of 2·78 per cent the sum of the wages earned has risen from 159,930,488 t 164,207,621 marks; the average annual wage amounted t 1,009 marks 67 pf., against 1,011 marks 10 pf. in the pr ceding year, so that after an uninterrupted rise durin many years the average wage in the chemical industr shows for the first time a decrease.

AUSTRIA HUNGARY; CHEMICAL TRADE OF ——.

Foreign Office Annual Series, No. 3199.

Chemical products to the value of 1,247,547*l*. were in ported during 1903, this being 141,057*l*. more than in 190 while "chemical auxiliaries" were exported to the value 569,393*l*., an increase of 83,814*l*. "Chemical products stand at 1,039,308*l*., an increase of 178,782*l*. In export dyeing and tanning materials total 703,306*l*., india-rubbe goods 461,186*l*., and glass and glassware 2,152,962*l*. Th following are imports from and exports to the Unite Kingdom:—

Imports.

Articles.	Quantity.	Value.
	Cwt.	£
Oils..................................	36,425	45,795
Medicine and perfumery..............	1,119	10,734
Dyeing and tanning materials.........	10,859	14,392
Gums and resins......................	16,614	20,994
Mineral oil..........................	1,875	635
Glass and glassware..................	1,118	6,798
Chemical substances..................	69,834	49,128
,, products..................	14,211	57,785
Soap and candles	1,923	2,699

Exports.

Articles.	Quantity.	Value.
	Cwt.	£
Oils.................................	53	99
Mineral water	37,924	28,011
Medicine and perfumery..............	61	686
Dyeing and tanning materials........	291,085	141,627
Gums and resins......................	9,964	1,889
Mineral oil..........................	39,985	9,450
India-rubber and india-rubber goods.	13,180	39,335
Chemical substances.................	27,896	34,076
,, products..................	90,782	131,677
Soap and candles	931	1,377

The following table shows what Austria-Hungary imorted from British India :—

Articles.	Quantity.	Value.
	Cwt.	£
ape-seed	37.768	16,737
astor oil	35,391	20,912
il seed	521,364	308,072
inseed	254,213	144,849
alm kernels	152,224	89,918
undries (seeds)	1.103	846
ils	1,713	2,109
ledicine and perfumery	146	2.003
yeing and tanning materials	88,237	77.969
ums and resins	15,056	57,747
ndia-rubber	509	8,866
hemical products	69	414

The exports to India included chemicals valued at about ,000*l*. From the West Indies 200*l*. worth of perfumery as imported in 1903 ; Cape Colony took 1,264*l*. worth of iemical products, and Ceylon 1,133*l*. worth of medicines id perfumery.

X.—*METALLURGY.*

Murchison Goldfield, Western Australia.

Bull. Imp. Inst. (*Suppl. to Board of Trade J.*), 1904, 2, 114.

The Murchison goldfield embraces the districts of Lennonlle, Mount Magnet, and Boogardie. The auriferous posits are of two types, white quartz reefs and laminated iartz and jasper veins, the whole being enclosed in a belt altered rocks containing diorite, diabase pyroxenite, and ists, termed greenstone. The principal mines of the ount Magnet district are seven in number, those of the oogardie, 12, and Lennonville, 13. The total amount of e worked from 1891 to 1902 was 191,820 tons, yielding 1,518 oz. of gold, or an average of 0·99 oz. per ton.

—A. S.

Ferro Alloys : U.S. Customs Decision.

Ferrochrome, ferrotungsten, ferromolybdenum, and rovanadium, made in the same manner as ferromangase, and used for the same purpose—to harden and ighen steel—were decided by the United States Circuit urt to be dutiable at 4 dols. per ton, by similitude to romanganese, under paragraph 122 of the present tariff. ie contention of the Government that they were dutiable 20 per cent. *ad valorem* under paragraph 183, as "metal wrought," was overruled. (Compare this J., 1903, 72).—R. W. M.

German Silver : U.S. Customs Decision.

July 14, 1904.

German silver in bars and sheets was held to be dutiable 45 per cent. *ad valorem* under paragraph 193 of the esent tariff as a "manufacture of metal." Paragraph 4 provides for "German silver unmanufactured" at per cent. *ad valorem*. The Board held that its proions cover only German silver in pigs or ingots, and not any other form.—R. W. M.

XII.—*FATS, FATTY OILS, Etc.*

Oil and Soap Trade of Marseilles in 1903.

Foreign Office Annual Series, No. 3230.

The Marseilles oil and oil-seed trade for the year 1903 s exceptionally good and the different companies and vate mills realised handsome profits, having been favoured a good market for oils in the early part of the year, ich enabled crushers to make large sales for forward monthly deliveries at full values ; and, as there were record crops of sesame seed and earthnuts in India and on the west coast of Africa, prices of raw materials declined steadily and thus crushers covered their requirements at very profitable rates. For the 12 months the total imports of all oil seeds, earthnuts, and copra amounted to 485,544 tons, as against 422,880 tons for 1902, and 333,474 tons, the average of the five years 1898—1902. The leading figures in these imports for 1903 comprised 122,431 tons of gingelly seed from East India, as against the average of 66,789 tons ; 86,291 tons of decorticated earthnut from India ; 92,784 tons of undecorticated earthnut from the west coast of Africa ; 27,631 tons of castor seed from East India (as against the average of 24,671 tons) ; and 106,678 tons of copra from all parts (as against the average of 86,185 tons). All these imports, with the exception of a few thousand tons of copra transhipped to Spain, have been crushed in Marseilles. By reason of the large increase in imports of oil seeds, the local mills have produced sufficient oils for edible and technical requirements ; and imports of manufactured oils from other sources have continued on a very reduced scale, being chiefly confined to some edible cottonseed oil chiefly from the United States, for mixing purposes. These imports of cottonseed oil have amounted to 13,811 tons, as against 27,216 tons for 1902 and 45,988 tons for the five years average from 1898—1902. Two kinds of unrefined glycerin are produced at Marseilles, the one extracted before soap boiling and the other extracted from the soap lyes after the soap is made. The latter contains 80 per cent. of anhydrous glycerin, 10 to 10½ per cent. of salts, traces of sulphides, and small quantities (¼ or even ½ per cent.) of thiosulphates. The former is sold at 15 c. the litre, with a density of 1·240 and a maximum of ½ per cent. of ash. The total production at Marseilles amounts to from 8,000 to 9,000 tons annually. There is a glycerin distillery at Marseilles which treats some 2,000 tons annually and turns out a white glycerin, doubly distilled, for current sale, as well as glycerin for the manufacture of dynamite. The rest of the output is exported in a raw condition to the United Kingdom, to Germany, and, especially, to the United States. Before the Transvaal war, Germany bought large quantities of glycerin for the manufacture of dynamite. Now, however, the business appears to have changed hands and to be done through the United Kingdom. The consumption of glycerin increases yearly, while the output has reached its maximum, which can only be increased by the development of the soap manufacture ; the demand, therefore, will probably shortly exceed the supply. For some years past prices have ruled at about 100 fr. the ton in bulk for saponification glycerin, and 80 frs. for glycerin from the soap lyes. These prices are kept up fairly easily during the dull months, but are bound to go considerably higher when there is a big demand. All the linseed and practically all the sesame and poppy cakes are consumed for feeding cattle in France, or, in the case of black gingelly, for manuring. The earthnuts, which are brought to Marseilles undecorticated, are shelled there, and the shells ground into a whitish powder, which is used for cattle feeding, and is exported mainly to Hamburg and Stettin, where it is mixed with molasses and forms a good, brittle feed cake. Some goes to London, Liverpool, and Glasgow. The sales of soap effected have been much the same as those of 1902, and as the oils required have gone down in price, so has the price of soap. Thus no larger profits seem to have accrued to the boilers. As enormous stocks of the necessary oils are in hand, and there is no fear of their being exhausted, a good all-round year of business is expected. Exportation to the Far East and to Canada has slightly fallen. An increasing trade with Canada has been fully expected, but these expectations have not been realised. The old-fashioned mottled soap for which Marseilles was famous is gradually dying out, being replaced by the more convenient and harder white soap, mostly made with 20 to 25 per cent. of copra oil, and 35 to 40 per cent. of either earthnut oil or sesame oil, or cottonseed oil, as the price of the latter three vary. Earthnut oil and sesame, cottonseed oils, tallow and other compounds are now hardly used. The finest soaps made here, known as olive-oil soaps, are composed of varying mixtures of earthnut and olive oil, probably never pure olive oil alone. When a pure olive-oil soap is absolutely required, a special vat is made up at about twice the price of ordinary soap.

Beeswax from British Central Africa.

Bull. Imp. Inst. (Suppl. to Board of Trade J.), 1904, 2, 85—86.

A sample of the clarified beeswax was submitted to brokers, who reported that consignments of similar quality would meet with a ready sale in the London market, at prices ranging from 6*l.* 17*s.* 6*d.* to 7*l.* per cwt. They recommend that the wax be shipped in blocks of 90—100 lb. each, cased in "gunny." Beeswax is already exported from British Central Africa, but it is stated that much larger quantities could be readily produced.—A. S.

XIII. A.—PIGMENTS, PAINTS, Etc.

Green Earth: U.S. Customs Decision.

July 7, 1904.

Green earth was assessed for duty at 30 per cent. *ad valorem* as a "color," under paragraph 58 of the present tariff. An analysis of the sample showed it to be coarsely ground celadonite,—a talc-like mineral. The Board of General Appraisers accordingly held it to be dutiable at 2 dols. per ton as a "wrought earth," under paragraph 93. —R. W. M.

XIV.—TANNING; LEATHER; GLUE, Etc.

Tannin; Export Trade of —— in India.

Bd. of Trade J., July 28, 1904.

According to *Capital* (Calcutta), a recent official report mentions that investigations made in the Madras Presidency have resulted in testifying that the forests and waste lands of the Presidency possess a very large number of trees and shrubs which are capable of yielding tannin in sufficient quantities to be of practical importance. In the Northern Circle of the forest department, there are believed to be 70 different kinds of tannin-yielding shrubs and trees. That the supply is large throughout is evidenced by the fact that the Provincial Forest Department derives a revenue of over a lakh of rupees from the sale of the right of collecting tannin-yielding materials. So far the only tannin materials exported from Southern India are myrabolams from Cocanada and the Vizagapatam coast ports, the exports varying from 6,000 to 7,000 tons per annum, of the value of about three lakhs of rupees. That there is no important export trade in Indian tannin is, according to the report, believed to be principally due to the fact that no serious and continuous efforts have ever been made to introduce Indian tannin material to the European markets.

XVI.—SUGAR, STARCH, Etc.

Sugar: Polariscopic Testing of ——.
U.S. Customs Decision.

June 1, 1904.

The United States Circuit Court of Appeals rendered a decision on testing sugar by the polariscope, upholding the action of the Secretary of the Treasury in instituting a system of corrections for temperature not in general use among chemists. This decision reversed that of the lower court, in which it was held that "testing by the polariscope" had a well established trade meaning at the time of the passage of the Act of 1897. The higher court holds that as long as the Secretary acts in good faith and prescribes no regulations tending to make the prescribed test less accurate than it was at the time of the passage of the act, the courts should not interfere with the administrative details confided to him. This decision affirms the correctness and authority of the system of corrections established mainly by H. W. Wiley. (See this J., 1903, 721.)—R. W. M.

XVII.—BREWING, WINES, SPIRITS, Etc.

Saké: U.S. Customs Decision.

May 25, 1904.

The United States Circuit Court held that saké, a beverage made from rice by processes similar to those employed in making beer, does not possess sufficient similarity to either wine or beer to be dutiable as either. The Court held it to be subject to a duty of 20 per cent. *ad valorem* under section 6 of the present tariff as a "manufactured article unenumerated," and reversed the decision of the Board of General Appraisers, holding it to be dutiable by similitude as a "still wine" under paragraph 296. —R. W. M.

XX.—FINE CHEMICALS, Etc.

Saccharin; Importation of —— into Greece Prohibited.

Bd. of Trade J., July 21, 1904.

By a law of the 28th April/11th May last, the importation into Greece or the employment in that country of saccharin or other artificial sweetening substances possessing a higher sweetening power than cane sugar, without its nutritive qualities, is prohibited except for pharmaceutical purposes.

A subsequent decree specifies "dulcine" "sucrase" and "sucramine" or "*sucre de Lyon*," as being the sweetening substances other than saccharin, the importation of which is prohibited under the law. It provides, however, that the prohibited substances may be imported by chemists or pharmacists exceptionally, on special permission of the Minister of Finance, but only through Custom Houses of the 1st or 2nd class, and in quantities not exceeding 50 dramia (3,000 grains) a year. This applies equally in the case of saccharin, &c., desired to be introduced by Parcel Post. Importations of saccharin, &c., as "samples without value" are not permitted.

Gardenia; Oil of ——. U.S. Customs Decision.

July 1, 1904.

Oil of gardenia, assessed for duty as "alcoholic perfumery" at 60 c. per lb. and 45 per cent. *ad valorem*, under paragraph 2 of the present tariff, was decided to be dutiable at 25 per cent. *ad valorem*, under paragraph 3 as a "chemical compound." (Compare this J., 1904, 345.)—R. W. M.

Rose; Artificial Oil of ——.
U.S. Customs Decision.

June 29, 1904.

Synthetic oil of rose, made to resemble the natural oil as closely as possible, and showing substantially the properties of the natural oil, was decided to be free of duty as "otto of roses" under paragraph 626 of the present tariff. Assessment of duty at 25 per cent. *ad valorem* as a "chemical compound" under paragraph 3 was overruled. —R. W. M.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 15,923. Rhodes. Valves for controlling acids and other chemical fluids and vapours. July 18.

,, 16,024. Leyer. Driers.* July 19.

,, 16,045. Walton. Coal and ore washing machinery. July 20.

,, 16,261. Brit. Thomson Houston Co. (Gen. Electric Co.). Apparatus for electrically heating liquids. July 22.

,, 16,316. Hantke. Process and appliance for raising liquids by means of compressed air.* July 23.

,, 16,354. Shields. Means for removing dust from gases.* July 23.

,, 16,427. Browne and McKinlay. Apparatus for subjecting gases or vapours to the action of liquids or vapours therefrom, especially applicable to scrubbing or enriching illuminating or other gases, or for recovery purposes. July 25.

,, 16,588. Matcham. Combined rotary kilns and driers. [U.S. Appl., Jan. 11, 1904.]* July 27.

,, 16,618. Robinson. Furnaces. July 28.

,, 16,652. Challis. Filters, filtering media, &c. July 28.

,, 16,826. Roche. Filtering apparatus. July 30.

[C.S.] 18,346 (1903). Michael and Roberts. Grinding machines. Aug. 4.

,, 19,320 (1903). Macfarlane and Macfarlane. Centrifugal machines. July 27.

,, 20,163 (1903). Bloxam (Dillon). Treatment of liquids with ozonised air or other gaseous ozone mixtures. July 27.

,, 1013 (1904). Kauffmann. Working and construction of furnaces for roasting ores and like materials. July 27.

,, 3003 (1904). Stade. Process and devices for filtering liquids. Aug. 4.

,, 12,164 (1904). Dahl. Centrifugal separators. Aug. 4.

,, 14,484 (1904). Wheelwright and Fiske. Apparatus for removing liquids from solids, applicable for the treatment of garbage and other purposes. Aug. 4.

II.—FUEL, GAS, AND LIGHT.

[A.] 15,908. Reichwald (F. Krupp, Act.-Ges.). Process of and apparatus for producing combustible gases from bituminous fuels. July 18.

,, 15,937. Boaler. Incandescent mantles. July 18.

,, 16,008. Koppers. Coke ovens.* July 19.

[A.] 16,067. Grice. Gas producers.* July 20.

,, 16,069. Smith. Manufacture of producer gas, applicable both to pressure and suction plants. July 20.

,, 16,113. Calvert and Snape. Method of treating incandescent lamp filaments to increase their density and also the density of the carbon deposited on them during the flashing process. July 20.

,, 16,288. Akt.-Ges. f. Selas Beleucht. Apparatus for the production of mixtures of gas and air. [German Appl., Oct. 21, 1903.]* July 22.

,, 16,425. Electric Equipment and Securities, Ltd., and Ruzicka. Manufacture of electric incandescence bodies. July 25.

,, 16,427. Browne and McKinlay. *See under* I.

,, 16,593. Hemingway and Booth. Apparatus for washing and purifying gas. July 27.

,, 16,658. Bateman. Mantles for incandescent gas lighting. July 28.

,, 16,763. Boutillier. Apparatus for producing poor gas free from tarry matters. [Fr. Appl., Aug. 25, 1903.]* July 29.

,, 16,765. Kirkham, Hullett, and Chandler, Ltd., and Hersey. Apparatus for washing or scrubbing gas. July 29.

,, 16,756. Colson. Manufacture and purification of illuminating gas. July 29.

[C.S.] 17,788 (1903). Lake (Selas Ges.). Apparatus for the production of mixtures of gas and air. Aug. 4.

,, 20,678 (1903). Cerasoli. Gas producers. July 27.

,, 21,964 (1903). Derval. Inclined gas retorts. Aug. 4.

,, 2547 (1904). Capitaine. Suction gas producers. Aug. 4.

,, 8993 (1904). Poetter. Gas-producing plant for heating retort furnaces. Aug. 4.

,, 12,361 (1904). Tobiansky. Refuse-consuming and gas-producing furnaces. Aug. 4.

,, 14,383 (1904). Poetter. Gas producers. Aug. 4.

,, 14,465 (1904). Klein. Gas-purifying plant. Aug. 4.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 16,543. Hanmer. Apparatus for treating peat, turf, wood, &c., to obtain valuable products therefrom. July 27.

,, 16,756. Lyndall and Costley-White. Process for rendering benzene or the like non-inflammable. July 29.

[C.S.] 24,801 (1903). Tabourin, Girard, and Portevin. Manufacture of solid and fluid mineral lubricants. July 27.

,, 12,122 (1904). Weyl. Distillation of coal tar. Aug. 4.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 15,920. Ransford (Cassella and Co.). Manufacture of sulphide colours. July 18.

[A.] 15,935. Abel (Act.-Ges. f. Anilinfabr.). Manufacture of indophenols. July 18.

,, 15,982. Shillito (Aniline Colour and Extract Works, formerly J. R. Geigy). Manufacture of nitro-*o*-oxyazo colouring matters. July 19.

,, 16,119. Johnson (Kalle and Co.). Manufacture of new dyes. July 20.

,, 16,120. Johnson (Kalle and Co.). Manufacture of new dyes. July 20.

,, 16,121. Johnson (Kalle and Co.). Manufacture of new dyes. July 20.

,, 16,268. Abel (Act.-Ges. f. Anilinfabr.). Manufacture of sulphur dyes and of materials for their production. July 22.

,, 16,269. Imray (Meister, Lucius und Brüning). Manufacture of violet sulphurised dyestuffs. July 22.

,, 16,538. Johnson (Badische Anilin und Soda Fabrik). Manufacture of violet blue colouring matters of the anthracene series and intermediate products of the said manufacture. July 26.

,, 16,566. Shillito (Aniline Colour and Extract Works, formerly J. R. Geigy). Manufacture of *o*-oxyazo colouring matters from 2-diazo-1-naphthol sulphonic acids. July 27.

[C.S.] 21,800 (1903). Imray (Meister, Lucius und Brüning). Manufacture of yellow, orange-yellow to orange sulphurised dyestuffs. Aug. 4.

,, 21,945 (1903). Imray (Meister, Lucius und Brüning). Manufacture of clear yellow, orange-yellow to yellow-orange sulphurised dyestuffs. July 27.

,, 12,270 (1904). Lake (Oehler). Sulphur dyes. Aug. 4.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 15,906. Hadden. Printed fabrics. July 18.

,, 15,943. Johnson (Badische Anilin und Soda Fabrik). Production of coloured discharges on dyed materials. July 18.

,, 15,944. Johnson (Badische Anilin und Soda Fabrik). The discharging of dyed textile fabrics. July 18.

,, 15,978. Bauersachs and Brückner. Processes of dyeing cops.* July 19.

,, 16,105. Möller-Holtkamp. Dressing or sizing yarns. July 20.

,, 16,185. Bartelt. *See under* VII.

,, 16,313. Boult (Poisson). Method of retting and washing vegetable textile fibres. July 23.

,, 16,351. Soc. Anon. des Rizières Françaises. Treatment of rice flour with a view to its substitution for various starches used in sizing and finishing. [Fr. Appl., Aug. 1, 1903.]* July 23.

,, 16,503. Wild. The dyeing of textile fibres or fabrics. July 26.

,, 16 594. Hulse and Co., Ltd., and Shaw. The production of printed fabric, such as calico. July 27.

[C.S.] 19,002 (1903). Armengol. Thread, and process of manufacturing the same. July 27.

,, 20,476 (1903). Mascelli. Apparatus for dyeing and similar purposes. July 27.

[C.S.] 20,925 (1903). Thompson (Wegmann and Co.). Method of dyeing cotton and the like, and apparatus therefor. Aug. 4.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 16,185. Bartelt. Apparatus for preparing bleaching liquor. July 21.

,, 16,353. Shields. Treatment of the gases issuing from pyrites burners.* July 23.

,, 16,504. Woltereck. Production of ammonia. July 26.

,, 16,672. Smith. Manufacture of monoxide of lead. July 28.

[C.S.] 5101 (1904). Bloxam (Gibbs). Manufacture of salts of oxyacids of chlorine and salts of chromic acid. July 27.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 16,279. Nolan. Process of and apparatus for fire-polishing glass. July 22.

[C.S.] 16,847 (1903). Martin. Means of decorating pottery, porcelain, glass, paper, or other medium. July 27.

,, 12,201 (1904). Fidler. *See under* IX.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 15,979. Schmidtgen and König. Process for manufacturing an isolating material. July 19.

,, 16,002. Mills. Bricks. July 19.

,, 16,029. Gesner. Incorrodible material and the method of its production. July 19.

[C.S.] 20,421 (1903). Howett. Manufacture of artificial stone. July 27.

,, 22,769 (1903). Perpignani and Candlot. Kilns for burning cement, lime, &c. Aug. 4.

,, 9914 (1904). Ducastel. Agglutinant or cement, and method of manufacturing the same. July 27.

,, 12,201 (1904). Fidler. Continuous kilns for burning blue and salt-glazed and vitrified bricks, tiles, and terra-cotta, &c. Aug. 4.

,, 14,374 (1904). Henry. Continuous kilns for burning fireproofing, tile, and other clay products. Aug. 4.

X.—METALLURGY.

[A.] 15,964. Slater. Method for the extraction and reduction of precious metals from ores, earths, sands, and tailings. July 19.

,, 16,028. Johnson (Meya). Manufacture of steel. July 19.

,, 16,112. Ogle and Woolford. Furnaces for the treatment of refractory ores. July 20.

,, 16,205. Edelmann and Wallin. *See under* XI.

,, 16,267. Gauntlett. *See under* XI.

,, 16,276. Kaufmann and Bouvier. Manufacture of steel. July 22.

,, 16,396. Abel (Siemens und Halske Act.-Ges.). *See under* XI.

,, 16,412. Lake (Cyanid-Ges.). Treatment of iron and steel for the hardening or case-hardening of the same. July 25.

[A] 16,419. Engels. Process for treating steel and armour plates. [Fr. Appl., March 21, 1904.]* July 25.

„ 16,448. Harmet. Process for refining cast iron, and apparatus therefor. [Fr. Appl., Aug. 28, 1903.]* July 25.

„ 16,449. Fink and Huguenot. Process and apparatus for granulating or pulverising certain fusible metals and alloys. [Fr. Appl., Jan. 7, 1904.]* July 25.

„ 16,491. Swinburne. Treatment of sulphide ores. July 26.

„ 16,492. Swinburne. Treatment of antimony, arsenic, bismuth, and gold ores. July 26.

„ 16,517. Broadbent and Herdman. The galvanisation of metal and the manufacture of metallic alloys. July 26.

„ 16,754. Tyars. Apparatus for treating and amalgamating metals. July 29.

[C.S.] 1013 (1904). Kauffmann. *See under* I.

„ 1941 (1904). Wilkins. Cement for iron and steel castings and the like. Aug. 4.

„ 4975 (1904). Moore and Heskett. Process of and apparatus for treating ferruginous ore for the manufacture of iron and steel therefrom. Aug. 4.

„ 12,976 (1904). Cutler. Furnace for calcining quicksilver ores. July 27.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 15,952. Berg. Electrode for electrical accumulators. [Appl. in Sweden, July 18, 1903.]* July 18.

„ 16,205. Edelmann and Wallin. Electric furnaces and the extraction of zinc by means of the same. July 21.

„ 16,267. Gauntlett. Deposition of zinc and other metals by means of electricity. July 22.

„ 16,396. Abel (Siemens und Halske Act.-Ges.). Method of producing zinc from sulphate solutions by electrolysis.* July 25.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[C.S.] 16,825 (1903). Westaway. Method of and apparatus for granulating and solidifying fat or the like. Aug. 4.

„ 13,451 (1904). Zimmermann and Stöhr. Floating soap, and process for the manufacture of the same. Aug. 4.

The following take office in Sept. next:—*Chairman:* H. Procter. *Committee:* W. Ackroyd, J. E. Bedford, F. Branso B. A. Burrell, and A. Smithells.

N.B.—The names in *italics* are those of members of Committee who retire from their respective offices at the end of the current session

Notices.

ANNUAL GENERAL MEETING, NEW YORK, 1904.

The Annual General Meeting will be held in New York City on Thursday, Sept. 8th, and following days. Members who propose to attend the meeting are requested to inform he General Secretary, as soon as possible, by what steamer hey will travel. The principal boats will be met on arrival t New York by a representative of the Reception Committee, who will escort the guests to the Hotel Seville, Madison Avenue and 29th Street, which will be the ociety's Headquarters in New York. A similar system will be observed at all the other cities visited by the special rain. A revised programme appeared in the July 30th issue.

In accordance with the provisions of Rule 18 of the Bye-laws, notice is hereby given that those members whose ames are printed in *italics* in the list of Council will retire rom their respective offices at the forthcoming Annual Meeting.

Mr. Wm. H. Nichols has been nominated to the office of President under Rule 8; Dr. Edw. Divers, Prof. W. R. Eaton Hodgkinson, Mr. Max Muspratt, and Mr. T. J. Parker have been nominated Vice-Presidents under Rule 8; and Sir Wm. Ramsay has been nominated a Vice-President under Rule 11.

Mr. Oscar Guttmann, Prof. W. R. Lang, Dr. Boverton Redwood, and Mr. Walter F. Reid, have been nominated under Rule 18 to fill four vacancies among the Ordinary Members of Council. No ballot will be required.

The Hon. Treasurer and Hon. Foreign Secretary have een nominated for re-election to their respective offices.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary r permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending ubscriptions, the use of the form attached to the application elps in the verification of addresses, on which the safe elivery of the Journal depends.

shley, Harrison E., l/o New Bedford; 189, St. George Street, East Liverpool, Ohio, U.S.A.

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3e).

I.—PLANT, APPARATUS AND MACHINERY.

English Patents.

Discharging or Filling Vats and like Receptacles; Apparatus for ——. W. P. Thompson, London. From H. W. Blaisdell, Los Angeles, Cal., U.S.A. Eng. Pat. 22,094, Oct. 13, 1903.

On a suitable support is arranged a central column, carrying rotating arms at its base. From the arms depend cup-shaped discs or plates for feeding the material to the centre of the vat. In the central column is an elevator for lifting the material and discharging it into a shoot. The whole apparatus can be raised or lowered, can be modified so as to be used for charging as well as discharging, and can be moved over a series of vats.—W. H. C.

Distributing Apparatus especially applicable for use in Filling Vats or the like. W. P. Thompson, London. From H. W. Blaisdell, Los Angeles, Cal., U.S.A. Eng. Pat. 22,095, Oct. 13, 1903.

A distributor consisting of curved spiral blades is mounted on a vertical shaft passing through a hopper arranged over a vat. Means are provided for rotating the shaft, thereby causing the material fed into the hopper to be evenly distributed. The distributor can be raised or lowered by suitable means, and a guard ring is provided to prevent the material from being thrown over the edge of the vat. The apparatus may be fixed, or movable over a series of vats. —W. H. C.

Centrifugal Extraction Apparatus. R. W. Strehlenert, Neu Babelsberg, Germany. Eng. Pat. 26,471, Dec. 3, 1903.

The apparatus consists of a centrifugal basket provided at its outer wall with a number of holes, and furnished at its centre with a truncated cone. Inside this conical aperture is placed a conical flange forming part of the casing surrounding the centrifugal basket, and through this passes the rotating shaft carrying the basket. Upon the casing rest two covers, one being fitted tightly to the edge of the casing by an indiarubber ring, whilst the other is suspended below, an annular space being thus formed between the two covers. The centrifugal force causes the extracting liquid to rise at the edge of the casing and to overflow into the annular space above, where the friction of the walls destroys the centrifugal velocity and allows the liquid to flow back into the basket through a central opening provided in the covers.—L. F. G.

Varnishing, Pitching, or similarly Treating Casks, Vats, or the like; Apparatus for ——. M. D. Krämer, Laeken-Brussels. Eng. Pat. 12,647, June 3, 1904.

The improvements which relate to the apparatus described in Eng. Pat. 25,362 of 1902, consist in placing a shallow bath over the pitch-melter. In this bath are several radially disposed rollers to facilitate the manipulation of the cask, whilst the bath itself serves to collect and return to the melter any excess of pitch, &c. The injector pipe can be raised or lowered by a lever.—W. H. C.

Desiccation [Evaporation] of Liquids. W. D. Neel, Chicago. Eng. Pat. 13,186, June 10, 1904.

To obtain the solid constituents of a liquid in the form of a powder, the liquid is sprayed into a closed chamber where the spray is subjected to the action of a "heated innocuous gas," such, *e.g.*, as air. The liquid is carried off in a state of vapour, and the solid falls to the bottom as a powder. The sides and top of the chamber are formed of pervious material, and the chamber itself is enclosed in an outer casing. The pressure in the space between the two is reduced by suitable means so that the vapour-laden gas passes outwards through the pervious material. Means are provided for spraying the liquid, for continuously removing the powder, and for introducing and exhausting the heated gas.—W. H. C.

United States Patents.

Funnel. W. E. Burgess, Aberbeeg, England. U.S. Pat. 764,422, July 5, 1904.

The combination is claimed, with a funnel for filling vessels with liquid, of a siphon of which one limb is adapted to dip into the vessel to be filled, and an upright transparent pipe, which connects the lower end of the other limb of the siphon with the exit-opening of the funnel.—W. H. C.

Dryer. J. D. Bourdeau, Assignor to Bourdeau Food Co. Battlecreek, Mich., U.S.A. U.S. Pat. 764,552, July 12 1904.

A series of vertically superposed, horizontal, paralle conduits, with perforated bottoms, have conveyor worm working in opposite directions in alternate conduits. The are connected at alternate ends, the material to be drie is fed into the top conduit and passes through each i succession to the outlet at the bottom. Means are provide for working the conveyors and for withdrawing the air fron each conduit.—W. H. C.

Muffle. J. C. Fox, Assignor to the Morgan Crucible Co., Ltd., London. U.S. Pat. 765,728, July 26, 1904.

The muffle consists of a horizontal chamber, with a movabl front wall, and its further end is provided with a discharg aperture for gases. Air passages extend longitudinally alon the sides within the muffle, which has air-inlet apertur at intervals throughout its length, to supply oxygen un formly to the contents. The apertures to the air passage are designed to receive plugs for controlling the admissio of air.—E. S.

French Patents.

Drying Machines [Centrifugal] with Several Chamber G. ter Meer. Fr. Pat. 341,131, Jan. 26, 1904.

See Eng. Pat. 1505 of 1904; this J., 1904, 537.—T. F. B.

Evaporating in Vacuo: Columns for ——. T. Suzuki. Fr. Pat. 341,356, Feb. 9, 1904.

See Eng. Pat. 3165 of 1904; this J., 1904, 483—T. F. B

Filter-Presses. P. Meura. Fr. Pat. 340,503, Feb. 13, 1904.

HE supply-channel is placed at the side of each plate, lightly above the top. The connecting passage, to the nterior of the chamber, has the same sectional area as the upply channel, in order to obviate any obstruction. —W. H. C.

Filter-Press. Soc. Française de la Viscose. Fr. Pat. 340,871, March 1, 1904.

HE filter-press, which is for vacuum filtration, has the oints between the plates made by rubber rings let into grooves. The supply, delivery and washing channels are ituated at the corners of the plates.—W. H. C.

Refining or Purifying Apparatus. C. W. Stanton. Fr. Pat. 340,620, Feb. 22, 1904.

SEE Eng. Pat. 5791 of March 9, 1904; this J., 1904, 538. —W. H. C.

Measuring Apparatus for Granulated or Powdered Materials. J. W. Pope, U.S.A. Fr. Pat. 340,638, Feb. 22, 1904.

Two discs are mounted on an axis in such a manner that he vertical distance between them can be regulated by a screw. The upper disc can be rotated and has several apertures, whilst the lower one is fixed and has but one opening connected with a delivery spout. Between the discs are a number of telescopic tubes forming measures and fitting into the holes in the upper disc. Above the upper disc is a feed-tube, connected with a hopper, containing the material to be measured. As the upper disc is rotated, the measuring tubes are first brought under the feed and filled, and then later, opposite the discharge, and emptied.—W. H. C.

Distilling; Apparatus for ——. O. Perrier. Fr. Pat. 340,700, Feb. 25, 1904.

IMPROVED analysers and temperature and pressure regulators are applied to continuous or discontinuous distillation columns.—W. H. C.

Muffles. The Morgan Crucible Co., Ltd. Fr. Pat. 341,045, March 8, 1904.

SEE U.S. Pat. 765,728 of 1904; preceding these.—T. F. B.

Separating Apparatus; Centrifugal ——. E. Seger. Fr. Pat. 341,083, March 9, 1904.

SEE Eng. Pat. 458 of 1904; this J., 1904, 363.—T. F. B.

II.—FUEL, GAS, AND LIGHT.

Sulphur; Forms in which —— occurs in Coal, their Calorific Values and their Effects upon the Accuracy of the Heating Powers, calculated by Dulong's Formula. E. E. Somermeier. J. Amer. Chem. Soc., 1904, **26**, 764—780. (See this J., 1904, 601.)

CONTINUING his experiments, the author finds that when the sulphur is present in the form of ferrous sulphate, the results given by Dulong's formula will be 10 cals. too low for each 1 per cent. present in that form. In the case of sulphur as pyrites, the results based on uncorrected ultimate analyses are about 9·6 cals. too high for each 1 per cent. of sulphur in that form, whilst if corrections be made for the amount of oxygen in the ash, the calculated results will be 6·6 cals. too low. When the sulphur is present in organic combination, the results given by the formula are probably 4·5 cals. too low for each 1 per cent. of such sulphur. From the average results obtained with five samples of coal, the general conclusion arrived at is that very satisfactory results for total sulphur are given by Dulong's formula (unmodified) applied to the figures of an uncorrected ultimate analysis. The formula gives lower results than those obtained by the use of Mahler's calorimeter, especially in the case of samples highest in moisture and oxygen, *e.g.*, Waterloo coal. By substituting Berthelot's value for amorphous carbon (8140) the formula gave results in close agreement with the calorimetric determinations, except in the case of the Waterloo coal, the average results with which were still 1 per cent. too low. The values obtained with this modified formula applied to certain samples of Ohio coals, agreed closely with values actually determined.—C. A. M.

ENGLISH PATENTS.

Fuel [Briquettes]; Artificial ——. C. Cory, Swansea. Eng. Pat. 14,014, June 23, 1903.

BRIQUETTES of the kind described in Eng. Pat. 4830 of 1901 (this J., 1902, 459) are rendered more waterproof by adding a small quantity (about 4 per cent.) of pitch or other similar hydrocarbon to the mixture of pulverised fuel and agglutinant material, before forming it into briquettes.—H. B.

Solidifying Petroleum and other Mineral Oils for their Application as Fuel and for Lighting Purposes; Process for ——. V. J. Kuess. Eng. Pat. 7481, March 29, 1904. III., page 817.

Peat [Briquettes]; Treatment of ——. A. McLean, London, and W. Paterson, Dumfries. Eng. Pat. 12,231, May 30, 1904.

UNSLAKED lime, in amount about 5 per cent. of the quantity of peat treated, is sifted over the latter, and the mass thoroughly mixed. After drying on a "hearth," the mass is formed into briquettes under a pressure of about 2 tons per square inch.—L. F. G.

Sewage [Sludge]; Treatment of —— [Fuel Briquettes]. A. McLean and W. Paterson. Eng. Pat. 12,232, May 30, 1904. XVIII. B., page 833.

Furnaces for Burning Liquid Hydrocarbons. W. P. Thompson. From W. N. Best, Los Angeles, Cal., U.S.A. Eng. Pat. 23,659, Oct. 31, 1903.

THE furnace is built of specially constructed fire-bricks, and comprises a fire-box open below, and situated above an air chest from which air is supplied to the furnace at suitable points, an arch of fire-brick slanting upwards and furnished with a refractory shield against which the atomised fuel is blown, a passage in the arch to pre-heat the air supplied to the furnace and prevent burning of the arch material, and means for controlling the air supply. —L. F. G.

Furnaces and Fire Boxes for burning Liquid Hydrocarbons. W. P. Thompson. From W. N. Best, Los Angeles, Cal., U.S.A. Eng. Pat. 23,660, Oct. 31, 1903.

THE invention relates to an improved form of burner having an oil outlet, and a steam or air nozzle arranged behind in such a way as to discharge across the oil outlet. The nozzle is reduced in area at the middle, and "flares" outwardly at the sides, so that the oil is carried by the steam or air in a fan-shaped blaze that completely fills the furnace. A plate is arranged over the outlet to regulate the supply of fuel. —L. F. G.

Vaporising and Burning Oils; Apparatus for ——. F. Dumontier, C. Chartier (*née* Paysant), L. H. Ninin, and M. Vénitien (*née* Leroy), Paris. Eng. Pat. 8596, April 14, 1904.

THE apparatus, designed for use with heavy oils, and of which two forms are described, consists of one or more vertical vaporising chambers heated by the flame of the burner itself; a collecting chamber at the top, leading the vapours to the burner; and recesses formed in the vaporising chambers for collecting any deposits which may be produced; all portions of the apparatus being so arranged as to be easily taken to pieces for purposes of cleaning.—H. B.

Oxy-hydrogen Combustion Apparatus. The International Oxy-generator Syndicate, Ltd., and A. Rosenberg, London. Eng. Pat. 14,663, July 1, 1903.

A HEAVY hydrocarbon is forced from a reservoir through a tube containing a wick, or through capillary tubes, into a volatilising chamber packed with asbestos or wire gauze, and heated by a burner. The vapour passes into a mixing chamber, provided with suitable baffle plates, where it is mixed with oxygen under pressure, and then issues to the burner jet. A by-pass from the oxygen supply-pipe leads to the reservoir, supplying the pressure requisite for forcing out the hydrocarbon, the rate of supply being therefore always proportional to the pressure of the oxygen, and to the consumption. The pressure in the reservoir may be augmented by heating.—L. F. G.

Siemens Regenerative Furnaces; Impts. in ——. A. Kurzwernhart, Zuckmantel, Austria. Eng. Pat. 8311, April 11, 1904.

The combustible gas remaining in the regenerative chamber of the Siemens furnace is forced, before the reversal of the gas and air current, into the furnace by means of waste gases drawn, for example, from the flue of the furnace itself. Suitable valves are provided for simultaneously shutting off the supply of producer gas, and admitting the supply of waste gases which is to drive the former into the furnace. The waste gases may be drawn from the flue and driven through the regenerative chamber by means of a fan, steam injector, or the like. Alternatively, the waste gases may be driven through the chamber by means of a current of air introduced at a suitable point behind them; in this case the air is introduced into a branch of the furnace flue, which is normally filled with waste gases, the branch being placed in communication with the gas-supply pipe at the time of reversal.—H. B.

Gas Producers [*for Moistor Bituminous Fuels*]. A. Cerasoli, London. Eng. Pat. 20,678, Sept. 25, 1903.

The upper region of the producer is divided into three compartments by two partitions depending from the top to different depths. Two of the compartments have feeding hoppers at the top, the gas-outlet pipe being arranged on the top of the third. An inclined grate, to which the blast of air, or air and steam, is supplied, is placed at the foot of the producer at the side opposite to that of the gas-outlet compartment; hence the main volume of gas produced in the zone of combustion is led off directly by this compartment. By means of a steam injector directed through an opening in the upper part of the partition between the other two compartments, part of the hot gas from the combustion zone is drawn up through the one column of raw fuel and driven down through the other; hence the moisture or tarry matter contained in the fuel (peat, soft slack, &c.) is distilled off and driven through the incandescent zone before reaching the outlet.—H. B.

Sealing Metal into Glass or other Vitreous Material [*Wires for Incandescent Lamps, &c*]; *Methods of* ——. E. A. Carolan, London. From The General Electric Co., of Schenectady, New York, U.S.A. Eng. Pat. 18,255, Aug. 24, 1903.

The metal is surrounded with a glass envelope, and heated electrically, and any gases driven off by the heating are removed from the envelope by a pump. While still hot, the glass is fused round the metal.—W. C. H.

Incandescent Mantles [*Wood Cellulose*]. Evered and Co., Ltd., Smethwick. From C. Weiblen, Metzingen, Germany. Eng. Pat. 22,451, Oct. 17, 1903.

"Wood cellulose, prepared in the ordinary way, is made suitable for weaving or knitting by drawing the threads or filaments of the same through preferably a fatty, saponaceous, watery liquid, such as soapy pulp containing fat and water." The prepared threads are woven into mantle fabrics, cleansed in an acid bath, washed with distilled water, and then impregnated as usual with salts of suitable earths. Fabrics of wood cellulose are stated to have a greater absorbing power than those of cotton.—H. B.

United States Patents.

Superheater for Gas Producers. A. B. Duff, Pittsburg. U.S. Pat. 764,137, July 5, 1904.

The superheater comprises a cylindrical casing; upper and lower tube-plates; two up-comer tubes and two down-comer tubes extending between the tube-plates; a dust-box at the foot of each set of tubes; and an inlet and an outlet on the casing to cause the air, or air and steam, required for the producer to circulate round the tubes; the cross-sectional area of the tubes being much greater than that of the gas-supply pipe from the producer, so as to reduce the speed of the gas and permit the deposition of dust.—H. B.

Combustible Gas from Petroleum-Oil or other Hydrocarbon Fluids; Apparatus for Producing ——. C. A. Kuenzel, Brooklyn, N.Y. U.S. Pat. 764,601, July 12, 1904.

A combustion-chamber, steam-chamber, and hydrocarbon-chamber are so combined that the heated air and hydrocarbon vapour are passed through a mixing vessel, having a perforated diaphragm, to the combustion-chamber. —W. H. C.

Gas Washer. O. N. Guldlin, Fort Wayne, Ind. U.S. Pat. 763,049, July 5, 1904.

The gas ascends through small perforations in a horizontal plate on to which the washing liquid is supplied from above. Adjacent to the perforations are small projecting plates which deflect the ascending streams of gas along the direction of the plate and accelerate the flow of the liquid on the plate.—T. F. B.

Smelting Compounds and Producing Carbides [*Electrically*]. W. S. Horry, Assignor to Union Carbide Co. U.S. Pat. 765,838, July 26, 1904. XI. A., page 828.

Fuel, Artificial; Process for the Manufacture of ——. J. J. Shedlock. Fr. Pat. 340,981, March 5, 1904.

The mixture of coal dust and tar, for example, is made in a suitable closed vessel, from which the air is expelled by superheated steam or gas. The gaseous current volatilises the resinous matter and renders the material adhesive, whilst any volatile bodies are carried into a condenser and recovered.—W. H. C.

French Patents.

Coal Mine; Artificial ——. R. J. P. Cottamin. Fr. Pat. 311,333, March 15, 1904.

Vegetable and mineral matters such as grasses, leaves, chalk, &c., are treated in closed tanks or pits with sewage, in order to obtain, by the action of bacteria, artificial coal, phosphates, sulphates, and ammonia.—W. H. C.

Liquid Air; Manufacture of —— [*Water-Gas, &c.*]. Soc. L'Air Liquide (Soc. An. p. l'Etude et l'Exploitatio des Proc. G. Claude). Fourth Addition, of Feb. 8, 1904, to Fr. Pat. 296,211, Jan. 16, 1900.

The apparatus and processes described in Fr. Pat. 296,211, Jan. 16, 1900, and in the Additions thereto of Oct. 1900, and of June 1902, for the manufacture of liquid air, are now claimed as applicable, including the expansion of the compressed gases at low temperature, to water-gas, to low-grade gas, and the like. Compare Eng. Pats. 12,905 of 1900, and 27,658 of 1902; this J., 1901, 1018, and 1903. 1339.—E. S.

[*Mineralised*] *Electrodes for Arc Lamps.* A. Blonde. Third Addition, dated Feb. 1. 1904, to Fr. Pat. 23,81 of Aug. 18, 1902 (this J., 1903, 487).

Electrodes of the kind described in the main patent having an external coating of pure carbon, are provided with a second sheath of carbon, baked beforehand at very high temperature; the inner layer of carbon, which is attached directly to the mineralised core, serving to ensure a good electrical contact between the core and the outer highly baked layer.—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

Petroleum and its Distillation Products; Optical Examination of ——. M. Rakusin. J. russ. phys.-chem. Ges. 1904, **36**, 554—559. Chem. Centr., 1904, **2**, 270.

The colourless and also the yellow distillation products o petroleum, from benzine (petroleum spirit) up to spindl oil, showed a dextro-rotation of 0·2°—2·3° (saccharimeter degrees). Of the oils examined, yellow spindle oil from Baku showed the greatest rotation. Benzine and kerosene from Grosny petroleum, yellow American spindle oil ("Viscolite"), and solutions of Baku petroleum in benzine and benzene also showed a dextro-rotation.—A. S.

Methyl Alcohol; Determination of —— in Products of Wood Distillation. M. J. Stritar and H. Zeidler. XXIII., page 841.

ENGLISH PATENTS.

Lubricants; Manufacture of Solid and Fluid Mineral ——. P. J. Tabourin, Paris, J. Girard, Saone et Loire, and L. Portevin, Paris. Eng. Pat. 24,801, Nov. 14, 1903. Under Internat. Conv., Nov. 15, 1902.

See Fr. Pat. 326,348 of 1902; this J., 1903, 791.—T. F. B.

Solidifying Petroleum and other Mineral Oils for their Application as Fuel and for Lighting Purposes; Process for ——. V. J. Kuess, Tunis. Eng. Pat. 7481, March 29, 1904. Under Internat. Conv., Nov. 6, 1903.

Ten kilos. of rosin, "or any other hydrocarbon of the turpentine series," is dissolved in 100 litres of petroleum, and 10 kilos. of melted animal fat is stirred in. A solution of 3 kilos. of caustic soda in 3 litres of water is then stirred in, and, after two hours, a litre of hydrochloric acid is added. After about four hours a further 2 kilos. of caustic soda, dissolved in 2 litres of water, is added, and the mixture, after standing two or three days, is heated "on a slow fire," under slight pressure, for about three hours, and poured into moulds. The resulting solid blocks are suitable for lighting, heating, and other purposes. (Compare Fr. Pat. 337,714, this J., 1904, 488.)—T. F. B.

UNITED STATES PATENTS.

Desulphurising Oils or Distillates; Process of ——. O. P. Amend, New York. U.S. Pat. 764,099, July 5, 1904.

Oils or distillates are treated with alkali in excess of the amount required to neutralise the acids present, and are then agitated with copper sulphate, thus precipitating copper sulphides. The product is now oxidised, *e.g.*, by addition of "ferrous hydrate" and injection of steam, to convert the copper compounds to sulphate, which is removed, and the oil is allowed to settle.—T. F. B.

Combustible Gas from Petroleum-Oil or other Hydrocarbon Fluids; Apparatus for Producing ——. C. A. Kuenzel. U.S. Pat. 764,601, July 12, 1904. II., page 816.

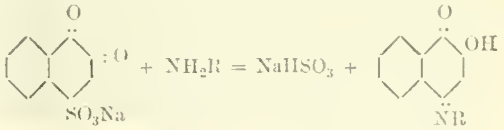
IV.—COLOURING MATTERS AND DYESTUFFS.

Ethylbenzylaniline. G. Schultz, O. Rohde, and E. Bosch. Annalen, 1904, **334**, 235—264.

p-Nitrosoethylbenzylaniline was obtained by adding hydrochloric acid and sodium nitrite to the alcoholic solution of ethylbenzylaniline. The product was extracted with ether after liberation by addition of sodium carbonate. The ethereal extract is green. A subsequent ethereal extract was dark red, but no definite substance could be isolated from it. The yield was about 70 per cent. of the theoretical amount and benzaldehyde was always formed as a by-product. *p*-Nitrosoethylbenzylaniline forms steel-blue plates and is quite analogous in its reactions to *p*-nitrosodimethylaniline. Thus it condenses with β-naphthol to form an oxazine dyestuff which is of a purer blue shade than its analogue, Meldola's Blue. A hydrochloride of *p*-nitrosoethylbenzylaniline was prepared, but is decomposed by water. On nitration of ethylbenzylaniline by adding nitro-sulphuric acid to its solution in strong sulphuric acid in the cold, the authors obtained mainly *m*-nitrobenzylethylaniline, together with a little *p*-nitrobenzylethylaniline. This does not agree with the results of Gnehm and Schentz (J. pr. Chem., 1901, **63**, 426), who state that they obtained *p*-nitroethylbenzylaniline. The *m*-compound forms reddish-brown prisms, and the *p*-compound yellow rhombs. *o*-Nitrobenzylethylaniline was obtained synthetically from *o*-nitrobenzylchloride and ethylaniline. All these nitrobenzylethylanilines form white hydrochlorides, decomposed by water. *o*-Nitro-ethylbenzylaniline was obtained as a reddish-brown oil, which refused to crystallise, by the action of *o*-nitrobromobenzene on ethylbenzylaniline. It is more basic in properties than *o*-nitrobenzylethylaniline. The authors also attempted to oxidise *p*-nitroso-ethylbenzylaniline to the *p*-nitro compound. A large number of oxidising agents were employed, but a crystalline product could only be obtained by oxidation with dilute nitric acid, and in this case a dinitro product was obtained. The same product was obtained by the action of fuming nitric acid on ethylbenzylaniline dissolved in a little glacial acetic acid. It shows no basic properties. *p*-Nitro-ethylbenzylaniline was obtained by nitrating ethylbenzylaniline, dissolved in 30 times its weight of glacial acetic acid, with the calculated amount of fuming nitric acid. The product was isolated with some difficulty. After reduction to the corresponding amino compound it gives the Methylene Blue reaction, which proves the *p*-position of the nitro group. It shows no basic properties. The authors find that the method of preparing aminobenzylethylanilines by adding nitrobenzyl chlorides to aniline, and at once reducing with iron and hydrochloric acid, described in Ger. Pat. 56,908, does not lead to the required result, aniline and toluidine being formed by decomposition of the molecule. Other reducing agents led to the same result. The amino compounds cannot be obtained by reduction of the formed nitro compounds for similar reasons. *p*-Amino-ethylbenzylaniline was obtained from *p*-nitroso-ethylbenzylaniline by reduction with zinc dust and dilute sulphuric acid. This base gives the Methylene Blue reaction. It is oxidised by the air. It also yields well-defined benzoyl and acetyl derivatives. After diazotisation it couples with β-naphthol to form an azo dyestuff which, after crystallisation, forms black crystals with a green lustre, which are red by transmitted light.—E. F.

Naphthoquinonesulphonic Acid; Applications of ——. P. Ehrlich and C. A. Herter. Z. physiol. Chem., 1904, **41**, 379—392. Chem. Centr., 1904, **2**, 112—114.

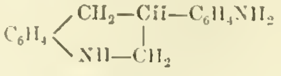
Witt's 1.2-naphthoquinone-4-sulphonic acid combines with all aromatic mono- and diamines, the dyestuffs produced being mostly orange when a monamine is used; a dimethylamino group in the para-position causes a change of colour from orange to violet. The acid also forms dyestuffs with so-called acid methylene compounds, resorcinol, phloroglucinol, secondary amines (piperidine, diamylamine, methylaniline), and also with bodies such as peptone, tyrosine, and uric acid. The reaction with amines proceeds according to the equation—



The condensation products are insoluble in water; by the introduction of an acid (COOH, SO_3H) group, they become soluble in alkali, and by the introduction of amino groups, soluble in acids. Among the "acid methylene" compounds from which dyestuffs were prepared were nitromethane, nitrotoluene, acetylacetone, benzoylacetone, aceto acetic ester, benzoyl acetic ester, desoxybenzoïn, cyanacetamide, phenylpyrazolone and rhodanic acid.—A. S.

Dyestuffs; New [Azo and other] ——. L. Paul. Chem.-Zeit., 1904, **28**, 702—704.

When amines are heated at about 220° C. with glycerin which has previously been freed from water by heating at 230°—240° C., compounds are formed belonging to three classes:—(1) L-bases, soluble in hydrochloric acid and diazotisable; (2) S-bases, soluble in hydrochloric acid and not diazotisable; and (3) Rx-compounds, apparently feeble dyestuffs, which are neither soluble in hydrochloric acid nor diazotisable. The L-base (A L-base, prepared from aniline) of the probable formula—



forms a greyish powder. On being diazotised and combined with salt-R, it yields a Ponceau which dyes wool similarly to the ordinary azo-Ponceaux; with resorcinol, it gives a yellow azo compound. This base is also formed from phenylhydrazine hydrochloride and glycerin. The L-base from benzidine (B L-base) dissolves readily in ether and 50 per cent. alcohol. Treated with nitrous acid, it gives a tetrazo compound which combines with phenols, &c., the compounds formed being more soluble and yellower in shade than the corresponding benzidine compounds. Bases were similarly obtained from sulphanilic acid, a-naphthylamine, *p*-aminoacetanilide, *p*-nitraniline and other amines. The products obtained by the L reaction from *p*-nitraniline, a-naphthylamine, dimethylaniline, *m*- and *p*-phenylenediamine, and other bases are for the most part more soluble than the bases from which they are derived. It would thus appear possible that the reaction may be of general utility in obtaining derivatives of greater solubility from sparingly soluble amines. In the case of *m*-phenylenediamine, the glycerin appears to take no part in the reaction, but to act solely as a solvent. On heating proportions of glycerin (30 c.c.) and of the hydrochloride salt (3·6 grms.) similar to those found most suitable for the preparation of the AL- and BL-bases, no diazotisable base is obtained. With a much larger proportion of the salt (25 grms. and 50 c.c. of glycerin) a different reaction takes place. Hydrochloric acid and ammonia are evolved and a diazotisable base is formed which dissolves readily in acetic acid, and from this solution dyes cotton mordanted with tannic acid in brown shades, which are very fast to light. On sulphonation, the base yields two sulphonic acids. When resorcinol (25 grm.) is heated with a small proportion of zinc chloride (5 grms.), two dyestuffs are obtained. That which is chiefly produced (yield—60 per cent.), when precipitated from its alkaline solution by sodium bisulphate, dyes silk a salmon-pink colour. It yields two sulphonic acids, which differ greatly in solubility, the more soluble dyeing wool in orange-red shades. With a larger proportion of zinc chloride (25 grms.) the dyestuff which with less of this reagent is formed in smaller amount (yield, 1½ per cent.), is chiefly produced. It dyes wool and silk in yellowish-brown colours and has greater dyeing power than the other dyestuff. The bromo derivatives of both compounds are bluish-red dyestuffs; their sulphonic acids dye wool in bright scarlet shades. A mixed dyestuff is obtained by adding *m*-phenylenediamine hydrochloride (7 grms.) to resorcinol (14 grms.) heated to a little below its boiling point. It dissolves in alkalis, and from a bath prepared by precipitating it in a fine state of division by the addition of an acid salt to its alkaline solution, it dyes wool and cotton in orange shades. It yields two sulphonic acids. Dimethyl-*m*-phenylenediamine hydrochloride gives with resorcinol a dyestuff of bluish shade soluble with difficulty.—E. B.

Galloflavin and Resoflavin. J. Herzig and R. Tscherne.

Monatsh. f. Chem., 1904, **25**, 603—610.

GALLOFLAVIN was first prepared by Bohn, and Bohn and Graebe, after investigating it, proposed $C_{13}H_6O_9$ as its most probable formula. The authors have re-examined the pure compound and its acetyl and methyl derivatives, and find that the analytical results correspond best with the formula $C_{15}H_8O_{10}$ or $C_{15}H_3O_5(OH)_5$. The methyl derivative was prepared by treating galloflavin with excess of diazomethane in ethereal suspension. An interesting point is that whilst acetylgalloflavin (m. pt. 232°—234° C.) can be obtained in almost white crystals, the crystals of methylgalloflavin (m. pt. 235°—237° C.) have a distinct yellow tinge. Resoflavin, obtained by the oxidation of *s*-dihydroxybenzoic acid has similar properties to galloflavin. Its acetyl derivative (m. pt. 274°—277° C.) is white, and its methyl derivative (m. pt. 282°—283° C.) distinctly yellow. The high melting points of the acetyl and methyl derivatives of the two compounds point to high molecular weights, and the authors consider it not improbable that the molecule of galloflavin is larger than $C_{15}H_8C_{10}$; the analytical figures would answer just as well for a multiple of $C_3H_2O_2$.—A. S.

Gallobromine, a Dyestuff Derived from Dibromogallic Acid.

P. Sisley. Rev. Gén. Mat. Col., 1904, **8**, 225—227.

DIBROMOGALLIC acid (50 parts) is dissolved in alcohol (300 parts), formaldehyde (30 parts of 40 per cent. aqueous solution) added, and sulphuric acid (300 parts of 98 per cent. strength) gradually run in, the solution being constantly agitated. After the mass has been left at rest for 12 hours, it is poured into water, the precipitate being collected, washed, and dried. The yield amounts to about 50 per cent. of the dibromogallic acid taken. The crude dyestuff obtained was purified by dissolving it in a solution of sodium carbonate. After purification it was finally obtained in the form of a dark brown powder. It is almost insoluble in water, soluble with a reddish-purple colour in alcohol, acetic acid, &c., with a bluish purple colour in dilute alkali solutions. It dyes metallic oxide mordants in shades closely resembling those of the corresponding logwood combinations. The dyeings are faster to soaping than those of logwood, but not fast to light. Gallobromine can also be prepared by brominating trihydroxyfluorone dicarboxylic acid (see Möhlau, this J., 1898, 571), and its formula must therefore be—

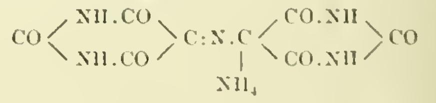
$$\begin{array}{l} CBr.C(COOH) : C\,.\,CH : C.C(COOH) : CBr \\ \ddot{C}(OH).C(OH) : \dot{C} - O - \dot{C} - C(OH) - \dot{C} : O \end{array}$$

The reddish dyestuff which is formed along with "gallobromine" from dibromogallic acid, is probably dibromotrihydroxyfluorone.—E. B.

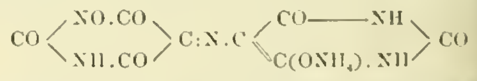
Purpuric Acid and Murexide; Constitution of ——.

R. Möhlau. Ber. 1904, **37**, 2686—2691.

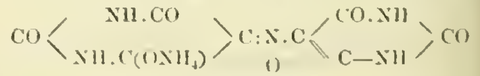
FROM the results of his investigations, on similar lines to those of Piloty and Finckh (this J., 1904, 656), and from theoretical considerations, the author concludes that the formula of murexide is probably—



or—



the first being a pseudo form of the other. He therefore comes to the same essential conclusions as Piloty and Finckh (*loc. cit.*) and as Slimmer and Stieglitz (this J., 1904, 656). He considers an alternative formula—



proposed by Piloty to be unlikely in view of the instability of murexide.—E. F.

English Patents.

Tetrazophenol Sulphonic Acid; Manufacture of a ——

O. Imray. From Farb. vorm. Meister, Lucius un Brüning. Hoechst-on-Maine, Germany. Eng. Pat 18,283, Aug. 24, 1903.

IF the disulphonic acid obtained by sulphonating *m*-phenylenediamine is diazotised in the usual manner, a mixture o a diazo-compound and of a Vesuvine dyestuff is formed If the dyestuff formation is avoided as much as possibl which can be done by using considerably more than th theoretical quantity of nitrite, and ensuring the continuou presence of at least one molecule of nitrous acid in excess a good yield of tetrazophenolsulphonic acid is obtained one sulphonic acid group being replaced by a hydroxy group. The operation is carried out by running th solution of diamino-acid and nitrite into mineral acid, o by rapidly mixing the mineral acid with the solution o diamino-acid and nitrite, or by rapidly mixing nitrit solution with that of the diamino-acid and mineral aci ius a solution of 1 mol. of the sodium salt of the diamino- ulphonic acid and 2·4 mols. of nitrite may be run at the dinary temperature below the surface of excess of dilute drochloric acid. The tetrazophenolsulphonic acid separates rtly as yellow crystals.—E. F.

lphurised Dyestuffs [Sulphide Dyestuffs]; Manufacture of Clear Yellow, Orange Yellow to Yellow Orange ——. O. Imray. From Farb. vorm. Meister, Lucius und Brüning, Höchst-on-Maine, Germany. Eng. Pat. 21,945, Oct. 12, 1903.

HE dyestuffs are obtained by heating to a high temperature toluylenediamine, or the products obtained by the action carbon bisulphide on *m*-toluylenediamine, or the products tained by heating the last-mentioned products, with sul- ur and an aromatic base, such as benzidine, or with lphur and formanilide. To make the products technically eful, they are then heated with sodium sulphide and dried *vacuo* Thus, for instance, equal molecules of *m*-toluylene- amine and formanilide are introduced into 28 atomic pro- rtions of molten sulphur, preferably at about 110°—130° C. ie temperature is gradually raised to 210°—220° C. The estuff changes from yellow to orange yellow. When ld, the melt is pulverised and introduced at about 80° C. o $2\frac{1}{2}$ times its weight of sodium sulphide, heated to 5° C., and dried.—E. F.

louring Matters [Sulphide Dyestuffs]; Production of ——. Read Holliday and Sons, Ltd., J. Turner, H. Dean, and J. Turner, Huddersfield. Eng. Pat. 18,924, Sept. 2, 1903.

IE yellow nitro dyestuff prepared, according to Eng. Pat. ,078 of 1902 (see this J., 1903, 1081) by nitrating itrodiphenylaminesulphonic acid, is heated alone, or th an equal weight of *m*-dinitro-*p*-hydroxydiphenylamine, th sulphur and sodium sulphide. The resulting dye- iffs dye vegetable fibres greenish-black or black from a th containing sodium sulphide.—T. F. B.

alogenised Nitro Compounds. H. H. Lake. From K. Oehler, Offenbach-on-Maine, Germany. Eng. Pat. 10,678, May 9, 1904.

2.4-Dichloronitrobenzene is obtained by the action of lorine on molten *p*-chloronitrobenzene in presence of a itable carrier such as anhydrous ferric chloride, iron, timony pentachloride, iodine or phosphorus pentachloride. ie most advantageous temperature for the reaction is 5° C. When phosphorus pentachloride is used it is lvantageous to raise the temperature to 150° C. When e mass has increased in weight by the theoretical amount, is poured into water and washed with water at 50° C. he product is thus obtained in theoretical quantity and fficiently pure for technical use. It can be distilled thout decomposition at 750 mm. pressure and 256—260° C. --E. F.

UNITED STATES PATENTS.

lphur Dye [Sulphide Dyestuff]; Black ——, and Process of Making same. R. Lauch, Uerdingen, Germany. U.S. Pat. 764,733, July 12, 1904.

SOLUTION of *p*-aminodinitrodiphenylamine in certain lvents is heated with sulphur and an alkali sulphide to out 180° C. The product is black, rather hygroscopic, d soluble in cold sodium sulphide solution with greenish lour, becoming blue with further sodium sulphide. This lution becomes bluish-black on oxidation in the air and elds a black precipitate with mineral or acetic acid. The estuff yields on unmordanted cotton from an alkali phide bath deep black shades without further oxidation, narkably fast and improved by further treatment with tallic salts such as bichromates and copper sulphate, racterised by fastness to acid, alkali and light.—E. F.

lphur Dye [Sulphide Dyestuff]; Direct Cotton ——, nd Process for Making same. R. Lauch, Uerdingen, ermany. U.S. Pat. 764,734, July 12, 1904.

Aminodinitrodiphenylamine is boiled with sulphur and phides in presence of certain diluting agents. The duct is a violet-black powder, dissolving in sodium sulphide solution to a violet liquid, and dyeing unmordanted cotton directly from a sodium sulphide bath. The dyeings are improved by further treatment with metallic salts. —E. F.

Sulphur Dyes; Process of Making Stable ——. R. Lauch, Uerdingen, Germany. U.S. Pat. 764,735, July 12, 1904.

THE dyestuffs obtained by the action of sulphur and alkali sulphide on *p*-aminodinitrodiphenylamine are rendered stable by exposing them in a powdered state to the action of air.—E. F.

Azo-Colour [Azo-Dyestuffs]; Red ——. P. Julius and C. Winter, Assignors to Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. U.S. Pat. 765,079, July 12, 1904.

o-Chloro-*p*-toluidine is diazotised and coupled with 2-naphthol-3.6-disulphonic acid. The sodium salt of the dyestuff is brilliantly red and soluble with difficulty in cold, but easily in hot water. The barium lake of the dyestuff is brilliant red in colour and practically insoluble in water. —E. F.

Azo-Colour [Azo-Dyestuff]; Yellow-Red ——. P. Julius and F. Osthelder, Assignors to Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. U.S. Pat. 765,080, July 12, 1904.

o-Chloro-*p*-toluidine is diazotised and coupled with β-naphthol. The product is a yellowish-red dyestuff yielding a yellowish-red lake when mixed with a substratum. —E. F.

Cyanmethylanthranilic Acid; Omega ——. O. J. Graul, Assignor to the Badische Anilin und Soda Fabrik, Ludwigshafen-onRhine, Germany. U.S. Pat. 765,576, July 19, 1904.

SEE Eng. Pat. 14,676 of 1903; this J., 1904, 604.—E. B.

Acetyldiaminophenolcarbonic Acid and Azo-Dyestuffs derived therefrom; Preparation of ——. Soc. L. Cassella et Cie. Fr. Pat. 338,844, June 5, 1903.

p-AMINOSALICYLIC acid is acetylated in the usual manner, nitrated in strong sulphuric acid solution at 5°—10° C.

with strong nitric acid, and the nitro-acetylaminophenolcarbonic acid so obtained is reduced, preferably with iron and acetic acid. The 1-hydroxy-2-amino-4-acetylaminobenzene-6-carboxylic acid so obtained is isolated in the usual manner. It is soluble with difficulty in water, the salts being easily soluble. With nitrous acid it forms a golden-yellow diazo compound, very insoluble in water, and combining with naphthols, dihydroxynaphthalenes, aminonaphthols, and their sulphonic acids to form mordant azo dyestuffs which are much bluer in shade, more even, and faster to light than those derived from 1-hydroxy-6-aminobenzene-2-carboxylic acid. Thus, with β-naphthol, a dyestuff is obtained dyeing wool from an acid-bath in Bordeaux red shades turning to violet when treated with bichromate. With aminonaphtholsulphonic acid H a product is obtained dyeing unmordanted wool in violet shades, which become bright blue on treatment with bichromate.
—E. F.

Acid Cyanides [*ω-Cyanomethylaniline Derivatives*]; *Production of* ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,818, Dec. 5, 1903. Under Internat. Conv., Oct. 24, 1903.

Schiff's bases, produced by condensing an aromatic amine with an aldehyde, are converted into the corresponding nitriles of the general formula R.NH.CH(R′)CN on treatment with hydrocyanic acid. ω-Cyanomethylaniline is produced by stirring 110 grms. of anhydroformaldehyde-aniline into a solution of 70 kilos. of potassium cyanide in 200 litres of water and 300 kilos. of ice, to which the theoretical quantity of acid has been added; the mixture is heated at 100° C. for two hours in an autoclave, and the product filtered off. (See also Eng. Pat. 14,676 of 1903; this J., 1904, 604.)—T. F. B.

Orthohydroxy Azo Dyestuffs susceptible to Chroming on the Fibre; Production of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,819, Dec. 17, 1903. Under Internat. Conv., Nov. 27, 1903.

α-Naphthylamine di- or tri-sulphonic acids, which have one sulphonic group in the *o*-position to the amino group, are diazotised, and the diazo compounds allowed to stand in neutral solution, or with dilute acid, or with alkali acetates or carbonates; the *o*-hydroxydiazonium compounds thus produced, when coupled with β-naphthol, give dyestuffs which dye wool violet-red to red-brown shades, converted to deep blue or bluish-black on chroming.—T. F. B.

Dyestuffs of the Anthracene Series [*Indanthrene Dyestuffs*]; *Production of Grey* ——. Badische Anilin und Soda Fabrik. Fr. Pat. 341,126, Jan. 12, 1904.

1.5-, 1.8-, 1.3-, 2.6-, or 2.7-Diamino-anthraquinone is fused with potassium hydroxide at 180°—200° C. The sulphonic acids of these diamines may also be used. The melt is boiled with water, and the insoluble dyestuff separated by filtration. The products form reddish-grey to olive-grey pastes, and, when dry, black powders, almost insoluble in ordinary solvents. Their properties resemble those of Indanthrene and Flavanthrene. They dye the vegetable fibres from a reduction vat containing alkali hydroxide in bluish-grey to reddish-grey shades, and can also be used for printing. The dye-liquor is brown in colour. The dyeings are remarkably stable. The dyestuffs from the 1.5- and 1.8-diamines give reddish, those from the 1.3-, 2.6-, and 2.7-diamines give greenish shades.
—E. F.

Anthraquinone Derivatives [*Anthracene Dyestuffs*]; *New Process for the Production of* ——. Soc. Anon. Prod. F. Bayer et Cie. Fr. Pat. 340,517, Feb. 17, 1904.

1.4-Aminohydroxyanthraquinone, 1.4-alkylaminohydroxyanthraquinones, and sulphonic acids of these compounds are obtained by heating α-aminoanthraquinone, α-alkylaminoanthraquinone, and their sulphonic acids with fuming, 100 per cent. or ordinary concentrated sulphuric acid, with or without addition of boric acid. The products either serve for the production of, or are themselves, dyestuffs of technical value. The product obtained from α-methylaminoanthraquinone with 20 per cent. fuming sulphuric acid and boric acid at 150°—160° C., which is probably 1-methylamino-4-hydroxyanthraquinone-2 sulphonic acid, dyes unmordanted wool in violet and chrom mordanted wool in blue shades. 1-Methylamino-4-hydrox anthraquinone-5-sulphonic acid, from 1-methylaminoanthr quinone-5-sulphonic acid, has similar dyeing properties.
—E. F.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Dyeing [*Mordanting*] *Process. VI. Theories of t Mordanting Process.* P. Heermann. Färber-Zei 1904, **15**, 165—170, 183—188, 197—200, 214—219.

Five theories which have been suggested to explain t mordanting process are discussed with respect to the f lowing practical matters of experience: (1) the nature the fibre has a great influence on the result; (2) t mordant cannot be rubbed off the fibre, or boiled out of i (3) the duration of treatment and the temperature, conce tration, and basicity of the mordant bath have very gre influence on the ultimate result (see this J., 1903, 361 a 623, and 1904, 57 and 439); (4) the efficiency of a morda is not proportional to its ionisation; (5) the temperature the mordant bath rises during the process; (6) chemical indifferent compounds (fibre and mordant) take part the process; (7) the fibre is not altered structurally chemically by the process, and can be obtained in original form by dissolving out the mordant base: (8) t basicity of the mordant (see this J., 1904, 439) remai constant during the process; (9) the mordant base (on t fibre) is capable of further combination and reaction: (1 the ratio between the weights of mordant and fibre influen the result of the operation. The "impregnation" theory contradicted by facts (1), (2), (3), (4), (5), and (10), a is quite untenable; the "solution" theory does not agr with facts (3) and (8) and possibly (6) and (9); t "organo-metallic" theory (assuming the formation of co pounds of the fibre and the mordant base) is not compati with facts (3), (6), (7), (8), and (9); the "catalyti theory (assuming that the fibre acts as a catalytic age decomposing the mordant, and precipitating a basic salt the fibre) and the "ionic" theory (that the affinity a fibre for a mordant depends on the ionisation of mordant, and on the difference between the elect affinities of the mordant ion and of the fibre) are b proposed by the author as agreeing with all the obser facts; the latter is preferred, as, although the former d not appear to have any flaw, the explanation of the vari facts seem in some cases less simple than in the case of "ionic" theory.—T. F. B.

English Patents.

Dyeing; Apparatus for —— and for similar Purpo L. Mascelli, Milan. Eng. Pat. 20,476, Sept. 23, 1903.

FRENCH PATENTS.

iscose; Automatic Machine for Fixing Filaments of ——. Soc. Franç. de la Viscose. Fr. Pat. 340,812, Feb. 27, 1904.

HE skeins of viscose threads are supported on a pair of llers, mounted in a vertical plane, in a vat. An acid rinkler is supported over the upper roller, which is fixed in sition. The lower roller can be raised or lowered by eans of a pump, to permit the skeins being put in position removed. Each of the rollers can be rotated by belts om the same shaft, which is fitted with an arrangement of ms, whereby each roller may be caused to perform a rtion of a revolution alternately, thus constantly altering e position of the skeins on the rollers and ensuring regular fixation."—T. F. B.

yeing and Bleaching of Textile Materials; Apparatus for ——. F. Scharmann. Fr. Pat. 340,736, Feb. 26, 1904.

HE machine consists of a closed vertical, cylindrical vessel which are placed two concentric, perforated cylinders, tween which is packed the material to be treated. The ace contained by the inner perforated cylinder is concted to a circulating pump, and by a suitable arrangement partitions and valves the liquid is made to pass in various rections through the material contained between the two rforated cylinders.—A. B. S.

yeing and Bleaching; Apparatus for ——. F. Scharmann. Fr. Pat. 340,792, Feb. 26, 1904.

the centre of the dye vessel a compartment is formed by ans of a number of superimposed segments. A man nds in this compartment and packs the material to be ated, in the surrounding portion of the dye vessel, on a rforated false bottom. As the depth of the material reases, extra sections are placed on the central compartnt until the vessel is full, when the material is covered th a perforated cover. By means of a circulating pump ich is connected with the central and outer parts of the sel, the dye or bleaching liquor is forced up through the terial, passes through the perforated top plate and overws into the central compartment, and then back into the mp. The liquids can be heated with steam-coils placed der the false bottom of the outer vessel.—A. B. S.

inting with Indigo by means of Hydrosulphites; Process for ——. Cie. Paris. Coul. d'Aniline. Fr. Pat. 338,831, May 30, 1903.

Eng. Pat. 13,116 of 1903; this J., 1904, 544.—T. F. B.

UNITED STATES PATENT.

Dyeing Skins; Apparatus for ——. P. Bruffaers, Schaerbeek, Belgium, Assignor to H. M. Peyser, Boston, U.S.A. U.S. Pat. 765,375, July 19, 1904.

SEE Fr. Pat. 336,992 of 1903; this J., 1904, 440.—T. F. B.

FRENCH PATENT.

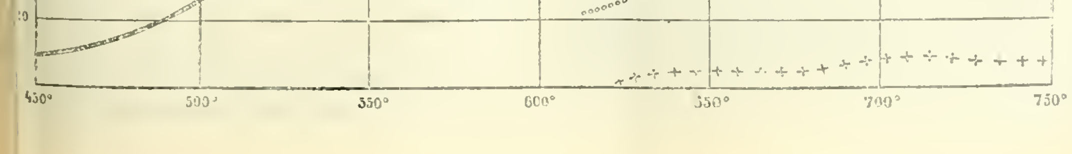
Pearly Effects on Paper, Card, &c.; Process for Obtaining ——. P. Dejey. Fr. Pat. 338,820, May 26, 1903.

PEARL-LIKE effects are produced on paper, &c., by coating it with a hot composition of lead acetate (80 parts), gelatin (5 parts) and glycerin (1 part), and allowing the acetate to crystallise in a strong current of air, or in any other manner which will produce wavy lines or designs on the surface. —T. F. B.

VII.—ACIDS, ALKALIS, AND SALTS.

Sulphur Trioxide; Catalytic Production of ——. G. Lunge and K. Reinhardt. Z. angew. Chem., 1904, **17**, 1041—1051.

THE authors have extended the work of Lunge and Pollitt (this J., 1903, 79), using, however, an electric resistance furnace to heat the tube containing the contact substance, by which means accurate regulation of the temperature, and thus determination of the influence of varying temperatures, is made possible. Lunge and Pollitt's method of passing a stream of mixed sulphur dioxide and air over the heated contact substance, and determining the composition of the mixture before and after contact, was retained; for though it has disadvantages, yet it imitates the conditions of the process as carried out on the industrial scale. The temperature was determined by a Le Chatelier thermo-electric pyrometer, and was found to be very nearly constant for the same strength of current. The results of the several series of observations are as follow:—1. With pure ferric oxide (Aguas Teñidas burnt pyrites), catalytic action begins, under favourable conditions, at about 400° C., and reaches its maximum at 625° C., at which temperature about 70 per cent. of the total sulphur dioxide is converted. 2. Drying the gases by phosphorus pentoxide instead of by ordinary concentrated sulphuric acid is practically without influence on the action. 3. When the burnt pyrites was impregnated with arsenic trioxide, the results in the most favourable case were practically the same as those with ferric oxide alone; they agreed with Lunge and Pollitt's results for ferric oxide containing arsenic, but were higher than those experimenters obtained with ferric oxide alone. 4. Pure ferric arsenate prepared in the wet way gave the same maximum conversion (70 per cent.) at the same temperature (625° C.) as ferric oxide, but ferric arsenite



acted much less favourably (it is doubtful whether the substance prepared and used as ferric arsenite is really a definite compound). 5. Pure arsenic pentoxide also acts as a strong catalyst, giving about 55 per cent. of conversion as a maximum at a temperature of 680° C. 6. The addition to ferric oxide of small quantities of cupric oxide or sulphate is without influence, but larger quantities act prejudicially, and the effect of cupric oxide alone is still less (48—50 per cent. conversion at 680°—740° C.). 7. Jena glass and glazed or unglazed porcelain are almost without action; their catalytic effect is just perceptible at 700° C. Silica, on the other hand, whether as rock crystal or as amorphous quartz, has a very perceptible action (about 10 per cent. conversion at 700° C.). The accompanying diagram, in which the abscissæ are temperatures and the ordinates percentages of conversion, summarises the results.

—J. T. D.

Chromates of Zinc and Cadmium. M. Gröger. Monatsh. f. Chem., 1904, **25**, 520—536.

The author has examined the action of potassium, sodium, and ammonium chromates on solutions of zinc and cadmium salts, in a manner similar to that in which he previously (Sitzungsber. d. k. k. Akad. d. Wiss., Wien, 1903, **112**, II*b*, 263) examined their action on copper salts. The results of the investigation may be summarised as follows:—When different alkali chromates are allowed to act upon solutions of the chlorides of copper, zinc, and cadmium, sodium chromate precipitates a basic chromate of the heavy metal, whilst potassium and ammonium chromates give precipitates of double chromates. Except in the case of the cadmium double chromates, the composition of the precipitate varies according to whether an excess of the salt of the heavy metal or of alkali chromate be used. The precipitates obtained with excess of the alkali chromate generally have a composition varying with the concentration of the reacting solutions; they are probably not definite compounds, but mixtures containing varying proportions of the more stable double chromates produced when excess of the salt of the heavy metal is used. An exception occurs however in the case of zinc chloride and ammonium chromate, the compound obtained with excess of the chromate being more permanent than that precipitated when excess of zinc chloride is present. The double chromates are all decomposed by water, the final products in the case of the zinc and copper compounds being $ZnCrO_4.3Zn(OH)_2$ and $CuCrO_4.2Cu(OH)_2$ respectively. Some of the compounds produced were as follows:—From zinc chloride (excess) and potassium chromate, $4ZnO.K_2O.4CrO_3.3H_2O$; zinc chloride and sodium chromate, $4ZnO.CrO_3.3H_2O$; zinc chloride and ammonium chromate (excess), $2ZnO.(NH_4)_2O.2CrO_3.H_2O$; cadmium chloride and potassium chromate, $4CdO.K_2O.4CrO_3.3H_2O$; cadmium chloride and ammonium chromate, $4CdO.(NH_4)_2O.4CrO_3.3H_2O$; cupric chloride (excess) and potassium chromate, $4CuO.K_2O.4CrO_3.3H_2O$.—A. S.

Dissolved Substances; Alteration of the Concentration of and Crystallisation of —— by Centrifugalising. R. P. Van Calcar and C. A. Lobry de Bruyn. Rec. trav. chim. Pays-Bas, 1904, **23**, 218—223. Chem. Centr., 1904, **2**, 5.

The experiments were made with solutions of potassium thiocyanate, ferrocyanide and iodide, saccharose and Glauber's salt. After centrifugalising, samples were taken at four different points from the periphery inwards. In all cases, an enrichment of the peripheral portion in dissolved substance was observed. For example a 0·2-N potassium iodide solution was centrifugalised for three hours in an apparatus working at 2400 revolutions per minute. The four samples then gave the following results:—(1) from inner portion ...; (2) 0·1-N; (3) 0·32-N; (4) from outer portion, 0·25-N. A crystallisation of the dissolved substance under the action of centrifugal force was observed with a solution of Glauber's salt containing 8·78 per cent. of sodium sulphate. After centrifugalising for five hours, a large quantity of crystals of $Na_2SO_4.10H_2O$ was filtered off, whilst the residual solution contained only 5·54 per cent. of sodium sulphate.—A. S.

Ozone; Formation of —— at High Temperatures. J. Clement. Ann. der Physik, 1904, **14**, 334—353. Che Centr., 1904, **2**, 79—80.

If oxygen be led rapidly over a Nernst's incandescent bo at about 2,200 C., and then passed into potassium iodi solution, iodine is separated so long as the apparat contains nitrogen, the separation being effected by t nitric oxide formed. No formation of ozone occurs, sir if nitrogen be not present in the apparatus no iodine separated. Also with an incandescent body cut into piec so that it acted both as an incandescent and an arc lam and which had a temperature of about 3,000° C., formation of ozone could be observed. Ozone was deco posed completely by passing through a hollow incandesce body. In the author's opinion, earlier workers who clai to have observed the formation of ozone at high tempe tures, have been misled by the production of nitric oxi By means of a simple de-ozoniser, the author shows t the decomposition of ozone at high temperatures (abo 127° C.) is a bimolecular reaction. The alteration of coefficients of velocity with the temperature may represented by the equation: $l\,n\,k = -\frac{5700}{T} + 14{,}9$ It follows, from this equation, that ozone decompo practically instantaneously at 1,000° C., the proportion ozone diminishing from 1 to 0·001 per cent. in 0·00 second.—A. S.

Sodium Chloride; Electrolysis of —— with Iron Mercu Cathodes. W. Kettembeil and C. F. Carrier. XI. page 827.

English Patent.

ctive Oxygen; Salts of Acids containing easily liberated ——, Preparation of. G. F. Jaubert. First Addition, dated Feb. 12, 1904, to Fr. Pat. 336,062 of 1903 (this J., 1904, 323).

ccording to the principal patent, salts having the pro-
erties named in the title are obtained by reacting on a
eroxide by boric or other acid. In the present modified
ocess, the proportion of active oxygen in the salts obtained
increased by causing two acids (such as boric and
lphuric acids) to react on a peroxide. For example: to
mixture of 525 grms. of sulphuric acid with 10 litres of
ater, 1,240 grms. of boric acid and 780 grms. of sodium
roxide are slowly added. The crystals formed after
me hours contain the active oxygen, which may be easily
erated as above described.—E. S.

Phosphates; Purification of ——. L. Reymond. Fr. Pat. 340,726, Feb. 27, 1904.

osphates, whether calcic or other, are roasted to destroy
ganic colouring matters, as well as to render insoluble
e iron, alumina and silica that may be present; or, if it
desired only to render innocuous the organic matters,
e phosphates may be exposed to the action of super-
ated steam, or be acted upon by a hot or cold concentrated
id.—E. S.

yrites; Mechanical Furnaces having superposed Hearths for Roasting ——. A. L. Stinville. Fr. Pat. 340,940, March 3, 1904.

order to better obtain control of the temperature in
rnaces such as indicated in the title, a portion of the
sing is constructed with a series of vertical passages
ening to the air above and below, such passages being
parated from the interior heated spaces, and otherwise
ed, with conducting metal plates. A current of air
sses continually through these passages, or a fluid, as
ter, may be caused to traverse them, in either case
bject to adjustment. Canals may also be made in the
arths for passage of a fluid or of air.—E. S.

Lead Salts; Preparation of ——. W. Mills. Fr. Pat. 341,241, March 14, 1904.

See U.S. Pat. 754,668 of 1904; this J., 1904, 371.—T. F. B.

Air and Gaseous Mixtures; Separating —— into their Elements. Soc. l'Air Liquide (Soc. Anon. pour l'Etude et l'Exploit. des procédés G. Claude et R. J. Lévy). Fr. Pat. 338,842, June 3, 1903.

The process for the production of oxygen by means of liquid air or of mixtures of liquid oxygen and nitrogen, consists in bringing these liquids methodically into contact with gaseous oxygen, whereby they become successively enriched in oxygen in substitution for nitrogen, such residual liquid oxygen being finally evaporated in liquefying a corresponding quantity of air. Such an enriching of the liquid mixture may be preceded by application of a gaseous mixture less rich in oxygen. The apparatus consists of a column having a series of superposed platforms, perforated, or with capped openings; a vaporiser in the lower part of the column with an arrangement of tubes whereby the liquid is conveyed from the bottom of the vaporiser, for distribution, to the top of the column, and a portion of the gas formed in the vaporiser passes into the column. Arrangements may be made for the delivery of gas less rich in oxygen into the middle portion of the vertical column. The process and apparatus are claimed as applicable to other gaseous mixtures than of oxygen and nitrogen.
—E. S.

VIII.—GLASS, POTTERY, ENAMELS.

English Patent.

Glass Sheets or Plates; Impts. in, and Apparatus for, the Manufacture of ——. E. Foureault, Lodelinsart, Belgium. Eng. Pat. 28,790, Dec. 31, 1903.

Continuous sheets of glass are drawn between pairs of asbestos rolls, which permit the sheet being drawn without deterioration, the rolls being composed of superposed asbestos washers, compressed between metal discs, and driven by toothed gearing. Above the rolls is placed a chimney, or casing, for cooling and annealing the sheet; the casing, lined with a non-conducting material, supports the shafts of the rolls, and is provided with gas-jets to re-heat the sheets, and at the top cold air is blown in to accelerate the cooling. Passages for the circulation of water or oil are provided above the drawing slot to cool the glass to the proper consistency for drawing into sheets; also means for throwing jets of cold air on to the sheet to solidify it—and when necessary to cool it more in the middle than at the edges—and gas-jets to re-heat it if necessary. Rails with divergent grooves, or rolls with helical grooves, give a slight stretch to the sheet in a horizontal direction as it leaves the drawing slot. Means are also provided for introducing metal wires into the edges of sheets to avoid contraction as it leaves the drawing slot. The claims also include a portable modification of the apparatus.—W. C. H.

United States Patents.

Glass-melting Furnace. W. T. Nicholls, Wellsburg, W. Va. U.S. Pat. 764,306, July 5, 1904.

A series of inclined retorts, one above another, each capable of removal without disturbing the others, is arranged in a furnace chamber, through which flame and gases pass. The retorts have feed openings at one end, and at the other discharge openings, containing partitions, by which molten glass is delivered into a working chamber, connected to the side of the furnace chamber.—W. C. H.

Glass; Manufacture of ——. S. O. Richardson, jun., Toledo, Ohio. U.S. Pat. 764,501, July 5, 1904.

Fresh material is continuously added to a body of molten glass, confined "in the presence of a reducing temperature," whereby a portion of the molten glass is caused to overflow into a casting zone, which is maintained at a temperature sufficiently high to allow the glass to be cast into definite form by the heat radiated from the reducing zone.—W. C. H.

Ceramic Articles; Process of Manufacturing Reinforced ——. J. Dansette, Paris. U.S. Pat. 765,358, July 19, 1904.

See Eng. Pat. 13,046 of 1903; this J., 1904, 660.—T. F. B.

French Patents.

Ceramic, Porcelain, Enamelled Objects; Production of Coloured Images on ——. E. Zerr. Fr. Pat. 340,628, Feb. 22, 1904.

Coloured images are produced on porcelain, enamel, faience, &c., by making three negatives of the original in yellow, red, and blue, and from these three engravings, and by means of these three proofs in oil colours on a sheet; the coloured image is transferred to the object to be ornamented, dusted with coloured powders, and burnt after each transference, or only after applying the powder for all three colours.—W. C. H.

Porcelain or Faïence capable of Flowing; Preparation of Paste for ——. E. Weber. Fr. Pat. 340,664, Feb. 23, 1904.

Ceramic paste, that will flow, is made by means of plastic clays with the addition of carbonate of soda, soda-lye, ammonia, potash, soluble glass, molasses, soap, &c. The paste is thinned by the addition, besides refractory clay of fine grain, of clays of grain up to 10 mm., for which may be substituted, wholly or in part, quartz, graphite, emery, corundum, &c.—W. C. H.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

Decayed Stone-work in the Chapter House, Westminster Abbey; Treatment of ——. Copy of Memoranda by A. H. Church. Furnished to the First Commissioner of H.M.'s Works, &c., May 28, 1901.

The stone affected belongs to an inferior sandstone of one of the lower beds of the Upper Greensand, and consists chiefly of silicious sands with some mica, &c., cemented by from 7 to 15 per cent. of calcium carbonate, and is very subject to injury from exposure to the London atmosphere, whereby in some cases the transformation of the carbonate into gypsum is practically complete. The decay arising from such exposure has occasionally penetrated to a depth of two or more inches, and in many portions, a crust of some thickness peels off on touching with the finger or with a sable brush. Whereas the reaction to test-paper of the watery extract of the unaltered stone is neutral, that of the decayed stone is strongly acid, and contains much soluble salts, due to the action of hydrochloric acid, the ratio of which to sulphuric acid as an attacking agent, comes out only as 1 : 27. Ammonia is sometimes found in the decayed stone. The remedy applied, consisted in repeated treatment of the stone with a saturated aqueous solution of barium hydroxide, by means of a White's pneumatic diffuser, after cleansing the surface from dust by an air jet, applied for instance by a Fletcher foot-blower. The liquid penetrated the decayed stone for the depth of several inches, but did not, until after several successive applications, form an impervious crust on the surface. The hardening proceeded from within outwards, and after, upon an average, about nine successive treatments, the stone became, not only reconstructed, but even harder than when in its original condition. The chemistry of the process consists in the conversion of the gypsum in the decayed stone into barium sulphate, with the simultaneous production of calcium hydroxide, which, gradually absorbing carbon dioxide, reconstitutes calcium carbonate. A slight white film of barium carbonate appears upon the face of the renovated stone, which may be brushed off, or dusted over with raw umber, and allowed to remain as a protective surface.

In a subsequent Report dated Nov. 18, 1903, in continuation of the preceding Report, the author describes the success that had followed the application of the process to the bays of the Chapter House; success was also attained by like treatment of decayed Purbeck marble. Reference is made to a patent (Eng. Pat. 220 of 1862) for the use of baryta water alternately with a solution of free silicic acid in water, a process which proved efficacious in protecting new stonework, but did not answer well with decayed stonework, owing to the silicic acid clogging the pores of the surface, and so obstructing the baryta solution from penetrating.—E. S.

Cement Roofing Tiles; Testing ——. Thonind. Zeit., 1904, **28**, 999—1000.

A number of cement roofing tiles supplied by members of the German Cement Ware Association were tested for weight, strength, and porosity. The mean results of 34 samples were as follows:—weight dry, 2·716 kilos.; after 24 hours under water, 2·902 kilos.; breaking strain, 46·7 kilos.; absorption of water, 6·85 per cent. Seven specimens allowed water to penetrate right through.—C. S.

Carbon Dioxide; Determination of —— *in Crude Cement Powder.* G. Sander. XXIII., page 838.

English Patents.

Emery and like Substances from Slag; Process for Obtaining a Substitute for ——. L. Wirtz, London. Eng. Pat. 14,366, June 27, 1903.

Emery, or like substances, and cleaning powders, are obtained by soaking slag in hydrochloric acid or a chloride, and evaporating the resulting liquid, with or without the addition of sodium chloride or other sodium compounds, until it attains a thick consistency. The precipitate formed on cooling is calcined, and washed to remove the heavier crystals of emery from the residue, which is dried and ground.—W. C. H.

Grinding, Polishing, or Smoothing Substance, or a Substance Refractory to Heat; [Electric] Process of Making ——. J. Windholz, Paris. Eng. Pat. 8859 April 18, 1904.

The substance described consists of an intimate mixture of carbide of boron, and corundum. The carbide of boron is obtained by melting a mixture of one or more boron compounds and alumina, glucina, and coal in a bath in an electric furnace, the bath consisting of silicate or quartz, iron ore, borate of calcium, and common salt.—W. C. H.

Fireproof Stone or Stoneware and Mortar; Manufacture of ——. H. Spatz, Düsseldorf, Germany. Eng. Pat 7736, March 31, 1904.

Finely divided quartz or other suitable silicious materia is combined with a calcareous binding medium, adapted t form silicate of lime, the medium consisting of caustic lim and waste liquor obtained from the manufacture of wood cellulose. This medium may also be used as a fireproof lime-mortar. Fireproof stones may also be produced by moulding and pressing a mixture of wood-cellulose lye and finely divided magnesite, or other highly basic mineral. —W. C. H.

Slabs or Sheets Imitating Marble; Manufacture of —— O. Devillers, Jumet, Belgium. Eng. Pat. 10,040, May 2 1904.

Fragments of burst glass bubbles, blown from refined glas of various colours, are spread on glass plates, and sprinkle with powdered or liquid enamel, with or without th addition of sand, and the whole fired at a temperature o about 800° C., and afterwards gradually cooled.—W. C. H.

Wall Paper [Rendering Adhesive]. A. J. Boult, London From the Fabrik Gebrauchsfertiger Holz- u. Marmor Imitationen. Fr. Schwartz & Co., Berlin. Eng. Pat 9487, April 25, 1904.

The invention relates especially to papers on which ar printed coloured representations of wood or marble graining or the like, and to the method of attaching the same t walls or other surfaces. The back of the paper is coate with a mixture of dextrin and a substance capable of forming with sodium silicate an insoluble double silicate, *e.g.* an alkaline earth, metallic oxide, &c. The surface t ich the paper is to be applied is first oiled or varnished, d is then coated with "water-glass." The paper is then ached while the "water-glass" is still moist.—E. B.

ment for use in repairing Retorts, and for like purposes; Manufacture of ——. J. E. Williams, Manchester. Eng. Pat. 18,064, August 21, 1903.

FIREPROOF cement composed of the following ingredients approximately the proportions mentioned:—25 per cent. magnesite, and 75 per cent. of a mixture of 200 cwt. of ina clay, 100 cwt. of barytes, 40 gallons of silicate of a (100° Twaddell), 24 gallons of water, and 28 lb. of ax.—W. C. H.

United States Patents.

gnesia-Cement Composition. H. Mielck, New York, Assignor to J. L. Sackman, Brooklyn, N.Y. U.S. Pat. 64,250, July 5, 1904.

COMPOSITION for use as artificial stone composed of a xture, in which reaction has taken place, of 100 parts of nt magnesia, 35 parts of magnesium chloride, 5 parts of ked lime, 5 parts of the residue from ammonia-soda nufacture, 25 parts of clay, and 1,000 to 1,200 parts of d.—W. C. H.

nent or Cementitious Material; Making Products of ——. W. E. Jaques, Grand Rapids, Mich. U.S. Pat. 64,361, July 5, 1904.

cement or artificial stone is made by mixing sand, the like, with a cementing substance in the dry state, lding the mixture, and subjecting it to pressure, at the e time introducing and impregnating the mass with sture and finally compacting the moistened mass by ernal pressure.—W. C. H.

French Patents.

tective and Insulating Coating for Wood and Metals. . L. Béthisy and Soc. Myrthil Rose et Cie. Fr. Pat. 40,622, Feb. 22, 1904.

coating consists of nitro-cellulose, and a solution alcium chloride, dissolved in amyl acetate, together ether, and alcohol, and a powder such as alum, fibrous asbestos, or mica. To render the coating it, vaseline oil and oil of aspic may be added. The ing is applied in the liquid state to wood and metals, is said to make the surface resistant to moisture, flame, osion, and to the electric current.—W. C. H.

ing [from Asphalt]; Process for Making an Arti- ial ——. Soc. des Usines Westdeuts. Thomas-phosphat. r. Pat. 341,272, March 3, 1904. Under Internat. Conv., eb. 3, 1904.

Eng. Pat. 7343 of 1904; this J., 1904, 750.—T. F. B.

ous Bodies [Refractory]; Production of ——. Cie. ançaise de l'Acétylène Dissous. Fr. Pat. 341,329, arch 14, 1904.

rder to prepare porous bodies capable of resisting high eratures, the main constituent, such as magnesia, a, baryta, chalk, &c., is mixed with carbon, and an oxidising substance, such as nitrate or chlorate e main constituent metal, and the mixture is strongly ed. The carbon is thus burnt away, not only by the n of external air, but also by that of oxygen internally ed, so that a body porous throughout is produced. saline nitrate or chlorate, such as sodium or potassium te or chlorate for instance, is used, the soluble car- te remaining after the furnacing, may be washed out e product by water.—E. S.

and Cement Furnaces; Impts. in ——, to Increase Draught, and Carry Off the Fumes from the rnace Mouth. Cie. des Fours à Chaux de la Gare Beffes (Cher). Fr. Pat. 340,461, Feb. 15, 1904.

ncrease the draught of lime and other furnaces, an ted truncated cone of metal is arranged at the bottom of the chamber and perforated with orifices to allow external air to enter the chamber and become heated. In the upper part of the furnace, a little below the top, is arranged a circular channel, which communicates through openings with the interior of the combustion chamber, to draw off fumes and gases from the chamber and convey them to the chimney.—W. C. H.

Cement; Manufacture of ——. K. Müller. Fr. Pat. 340,479, Feb. 16, 1904.

CEMENT is made by mixing sulphate of lime with barium chloride, with the addition of a base, suitable for the formation of oxychloride, such as the oxide of calcium, magnesium, or lead.—W. C. H.

Cement and Similar Substances; Process for Preparing and Burning ——. Levie Frères. Fr. Pat. 341,211, March 12, 1904. Under Internat. Conv., March 30, 1903.

SEE Eng. Pat. 7028 of 1904; this J., 1904, 607.—T. F. B.

X.—METALLURGY.

Monell [Steel] Process. Leo. Oesterr.-Z. Berg.- u. Hüttenw., 1904, **52**, 355. Chem.-Zeit., 1904, **28**, Rep. 215.

THIS process is a modification of the Martin process. A charge consisting of 3 tons of limestone, and 1—1·2 tons of iron ore is placed on the magnesite hearth, and after $1\frac{1}{2}$ hours, when the ore is nearly fused, 40 tons of molten pig-iron direct from the blast furnace are added. A vigorous reaction takes place, phosphorus, silicon, and manganese going rapidly into the slag, which after about two hours is almost completely run off through an outlet at the back of the furnace. The steel now has the following composition (A):—

—	Pig Iron.	Ore.	Steel (A).	Steel (B).
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Carbon	3·90	..	2·0—2·5	0·25—0·30
Silicon	0·5—0·9	3·0	trace	..
Manganese	0·8—0·9	0·1	0·1—0·15	0·38—0.40
Phosphorus	0·5—0·8	0·1	0·04	0·015—0·016
Sulphur	0·04—0·07	..	0·04	0·024
Iron	..	64·0	..	..

140—180 kilos. of ore are then added, and the bath of metal, almost entirely free from slag, is heated further until the desired degree of decarburisation is attained (see col. B in table). The slag contains silicic acid, 20; iron, 20—25; phosphoric acid, 3—5; lime, 20—25.—A. S.

Steel Rails; Effects of Annealing on ——. T. Andrews and C. R. Andrews. Proc. Inst. Civil Eng., 1904, **156**, [2].

FOLLOWING a suggestion made in 1900 by W. C. Roberts-Austen and T. E. Thorpe, the authors have determined the effect of annealing finished steel rails at temperatures of 770°, 850°, and 940° C. The results indicate that no great practical advantage would accrue from the general annealing of finished steel rails, although in some special cases it might be useful. If careful attention be paid to the physical composition of the finished rails, and to their thermal treatment during manipulation, good rails can be obtained from both acid-Bessemer and acid-Siemens steel, provided that the chemical composition be kept within the following limits or near thereto: combined carbon, 0·390—0·411; manganese, 0·697—0·775; silicon, 0·058—0·065; sulphur, 0·066—0·076; and phosphorus, 0·063—0·066 per cent. The detailed results obtained are set out in a series of tables, and four micro-photographs are given showing the difference in structure before and after annealing.—A. S.

Gold and Silver Extraction; Refining of the Precipitates Obtained by Means of Zinc in the Cyanide Process of ——. G. H. Clevenger. Trans. Amer. Inst. Min. Eng., Oct. 1903.

THE author considers that the best method of refining the gold-silver-zinc precipitates from cyanide solutions is by smelting with lead after distilling off the zinc. He prefers this to the ordinary acid treatment, since most of the zinc is thus at once recovered in a form available for re-use as a precipitant. The process recommended is to mix the dried precipitate with granulated lead (one to three times the weight of the dried precipitate) and charcoal (about one-tenth the weight of the lead). The mixture is placed in a graphite retort, which is heated by means of a gas furnace. The greater part of any mercury that may be present is driven off while the temperature is still very low, and may be readily collected. On further heating, zinc begins to distil off at about 700° F., and practically all is driven off in four or five hours, the temperature being finally raised to 1300° F. Very little gold or silver is thus volatilised, and that little remains with the zinc, which is used for subsequent cyanide precipitation. When the metallic vapours are received in a well-cooled condenser most of the zinc condenses as dust, especially while carbon monoxide is being evolved. The material in the retort at the end of the distillation is in appearance the same as at the start; but upon closer examination there will be found small shots of bullion all through it, and, usually, one or two larger masses. This residue can be poured from the retort like so much sand. It should be mixed with four or five parts of litharge and melted down on a test, a little iron filings and silica being added when necessary. After thorough fusion the slag is skimmed off and the lead cupelled, the resulting litharge being used for the next operation. The bullion after re-melting is cast into bars which are ready for parting.—J. H. C.

Aluminium Wire for Electrical Transmission; Application of ——. F. Krull. Z. angew. Chem., 1904, **17**, 1058—1060.

The author gives a list of nine large power transmission lines in the United States, Canada, and Italy, which have used, and still use, aluminium instead of copper wire. Aluminium wire installations are not yet to be found in Germany and England, except in the case of factories where aluminium is made. Reference is made to the work of J. B. C. Kershaw, according to which the corrosion of exposed aluminium wires at St. Helens and Waterloo (Liverpool) is considerable, and sufficient to make the use of aluminium unsuitable for transmission purposes in those districts.—R. S. H.

Aluminium-Tin Alloys. E. S. Shepherd. J. of Phys. Chem., 1904, **8**, 233-247. Chem. Centr., 1904, **2**, 181.

The author first discusses the work of Guillet (this J., 1902, 121) and of Anderson and Lean (this J., 1903, 1245), and then gives the results of his own experiments, which consisted in determining the cooling curves and densities of various mixtures of aluminium and tin. The cooling curves and examination of the microstructure gave no indication of either of the alloys, AlSn and Al_4Sn. Also, no proof could be discovered of the existence of two layers in the mixtures, but the presence of a solid solution (containing about 20 per cent. of tin) was ascertained. The densities of the products were as follows:—

Percentage of Aluminium.	Density.	Percentage of Aluminium.	Density.
100	2·680	50	3·829
95	2·760	40	4·199
90	2·845	30	4·671
80	3·001	20	5·306
70	3·241	10	6·176
60	3·489	5	6·679

Ore-Roasting Furnace. G. H. Shellaberger, Dekalb,
Assignor to Apex Manufacturing Company, Kansas
Mo. U.S. Pat. 765,997, July 26, 1904.

The furnace is of the long horizontal revolving type,
has a central primary ore chamber, with passages
municating between it and numerous separate return
chambers, with interspaced longitudinal heat passages.
annular "air-trunk" surrounds and encloses the pri
ore chamber. A heat-generating furnace, through
combustion chamber of which the body of the ore fu
extends, and beyond which the receiving end of the fu
body projects, communicates with the several return
chambers. Means are provided for feeding ore into
receiving end of the primary ore chamber, and into
contiguous end of the annular air-trunk. The ore cham
are sealed against the admission of products of combus
A fume chamber and hopper communicate with the
charge ends of the return ore chambers. A series of va
air-pipes lead from the annular air-trunk into each of
return ore chambers. There is a closed receptacle
introducing a granular refining agent, mounted upon
exterior of the revolving furnace body, having an o
pipe communicating with the interior of the roa
chamber, controlled by a valve, with which a weighted
is connected, whereby the valve is caused to rotate upo
own axis as the furnace revolves, and alternately opens
closes by gravity.—E. S.

e-Roasting Furnace. G. H. Shellaberger, Dekalb, Ill., Assignor to Apex Manufacturing Company, Kansas City, Mo. U.S. Pat. 765,998, July 26, 1904.

E furnace, as to its general features, belongs to the type that described in the preceding abstract. A number of ly sections are joined end to end to form an extended izontal revolving furnace. There is a central "air-nk" with a number of concentric air-chambers, a responding series of interspaced heat flues, and radial flues affording communication between the air-trunk l ore chambers at intervals throughout the length of the nace. The radial air-flues are controlled by hollow ton valves operated by rods. Means for feeding and charging the ore are described.—E. S.

loy, and Method of its Manufacture. R. B. Wheatley, London. U.S. Pat. 766,085, July 26, 1904.

about 160 parts of molten zinc, 8 parts of strontium phate are added; second, to about 640 parts of copper l 240 parts of molten zinc, 8 parts of an alloy of 6 parts copper to 2 parts of manganese, 4 parts of an alloy of art of iron to 3 parts of tungsten, 3 parts of aluminium l 4 parts of tin are added; third, the product of the first ing is added to that of the second mixing while the er is in the molten state. An alloy is also claimed sisting of about 98·5 parts of an alloy of 60 parts of per with 40 parts of zinc, to which is added about parts in all of stated proportions of iron, tungsten, minium, tin, and strontium.—E. elting Furnace. H. J. J. Charlier. Fr. Pat. 340,625, Feb. 22, 1904.

furnace is mounted on trunnions to be capable of ing on its longitudinal axis; it has an axial opening at end to admit a combined gas and air jet, and an ing on the top, near the end receiving the flame, for rtion of a removable charging hopper. Thus, the lucts of combustion pervade the interior of the furnace, coursing back from the closed end, find exit through charging hopper. The same opening that admits the per, on removal of the latter, serves, after tilting the ace, as the discharging opening for the molten contents. —E. S.

zing Composition and its Application. J. C. Bassett, . E. Parker, and H. F. Strout. Fr. Pat. 340,180, arch 8, 1904.

U.S. Pat. 756,079 of 1904; this J., 1904, 444.—T. F. B.

Zinc; Extraction of —— [Free from Lead]. C. S. Brand. Fr. Pat. 341,345, March 15, 1904.

IN the distillation of zinc in the usual retorts, a mass of refractory bodies, such as fragments of earthen crucibles, is placed within the tubulures of condensation at the ends adapted to the retort, or within the retorts themselves near their outlets, in order to arrest by filtration the lead accompanying the zinc-vapour.—E. S.

Zinc; Extraction of —— [Free from Lead]. C. S. Brand. Fr. Pat. 341,346, March 15, 1904.

IN order to remove lead from the vapour of zinc in the ordinary process of distillation, the tubulure to the retort is formed with a closed perforated end, from the bottom of which the under side rises upwards at an acute angle so as to approach the level top of the tubulure, forming a bridge, beyond which the lower side is curved downwards, to form a basin wherein the distilled zinc collects. The lead present in the vapours is arrested by the pocket formed by the bridge and end of the tubulure, as described, and, condensing there, flows back through an orifice in the end into the retort. Compare the preceding abstract.—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

Sodium Chloride; Electrolysis of —— with Iron-Mercury Cathodes. W. Kettembeil and C. F. Carrier. Z. Elektrochem., 1904, **10**, 561—566.

THE authors have examined a recently patented process (Gurwitsch, Ger. Pat. 145,749 of 1902), in which the cathode consists in a slanting plate of corrugated iron on which is dropped mercury, which then covers the whole plate. These cathodes are useless when they begin to rust, and must be constantly kept under current. The best possible yield of alkali is obtained at a current density of not less than 0·38 ampère per sq. cm., with a somewhat rapid flow of mercury, the anode being separated by a porous septum; the current efficiency is then about 85 per cent. The losses are attributed mainly to eddies set up by the mercury, whereby chlorine is continually brought into contact with the amalgam. Nickel presents no advantages as a cathode material. One of the authors (Carrier) subsequently shows that a good yield, without using a diaphragm, can only be obtained if the surface of the mercury be kept either in a condition of slow and even motion or in one of entire rest. —W. A. C.

Gases [Batteries]; Method of Separating Mechanically-entrained Globules from ——. T. A. Edison, Llewellyn Park, N.J., Assignor to Edison Storage Battery Co., Orange, N.J. U.S. Pat. 764,183, July 5, 1904.

THE mechanically-entrained globules are separated from the gases generated in a storage battery, and the gases are rendered non-explosive, by forming a liquid film in the path of the escaping gases. The escape of the gases is prevented until a sufficient pressure is attained, and, by suddenly releasing the pressure, the gases and entrained globules are projected against the film with sufficient velocity to overcome the surface tension of the film, whereby the entrained globules coalesce with the film. Simultaneously with the escape of the gases, the surplus quantity of the film not retained by capillarity is returned to the solution. The gases escape through a contracted vent and are spread, diffused and attenuated, the attenuated gases finally passing through a cooling medium.—B. N.

Electrical Energy; Method of Converting the Energy of Fuel into ——. H. Jone, Chicago. U.S. Pat. 764,595, July 12, 1904.

A METAL, such as tin, which is capable of forming a higher and lower oxide, is used as the positive plate in a solution of an alkali as the electrolyte, the negative plate consisting of a porous carbon vessel, the latter serving also as a container for a metallic oxide acting as a depolariser. The metal is oxidised, and the tin remains in solution in the alkali, and is afterwards precipitated as barium stannite by addition of barium hydroxide. The barium stannite is reduced to metallic tin by means of carbonaceous fuel, and the waste gases from the furnace are used to heat the galvanic cell.—B. N.

Smelting Compounds and Producing Carbides [*Electrical*]. W. S. Horry, Assignor to Union Carbide Co., Niagara Falls, N.Y. U.S. Pat. 765,838, July 26, 1904.

ELECTROLYSABLE compounds, with or without mixture with a reducing agent, are smelted by subjection to an alternating electric current, having a frequency of more than 133 periods per second. Calcium carbide is produced by heating in like manner, and under the same conditions as to frequency of alternations of the current, a mixture of a calcium compound with carbon. In any case the frequency of the alternations of the current should be such as to "substantially eliminate losses due to electrolytic decomposition," the energy of the current being thus made available as heat.—E. S.

Sodium: Electrolytic Production of —— from Mixtures of Sodium Hydroxide and Carbonate. C. F. Carrier. Z. Elektrochem., 1904, **10**, 568—572.

IN discussing Becker's process (Ger. Pat. 104,955) the author points out that the addition of carbonate to the fused electrolyte can be of little use unless the carbonate itself is directly split up with evolution of carbon dioxide. Experiments were made with mixtures of caustic soda and sodium carbonate containing up to 66 per cent. of the latter, at temperatures of 230° to 630° C. and current-densities rising to 2 ampères per sq. cm. In no case was an evolution of carbon dioxide detected. It is concluded that Becker's process is no advance upon Castner's, in which fused caustic soda alone is electrolysed.—W. A. C.

UNITED STATES PATENT.

Nickel-Plating; Process of ——. J. W. Aylswo Assignor to Edison Storage Battery Co., Orange, U.S. Pat. 765,371, July 19, 1904.

THE strip-like article, or a connected series of sepa articles, is passed continuously through a heating cham in which the articles are heated, and surrounded b reducing atmosphere in order to deoxidise them. They then passed continuously through a plating bath, wash and finally subjected to a welding temperature, produ electrically, and cooled while surrounded by a non-oxidi atmosphere.—B. N.

FRENCH PATENTS.

Furnace; Electric ——. E. F. Côte and P. R. Pier Fr. Pat. 340,632, Feb. 22, 1904.

VOLATILE metals, such as zinc, are extracted from ores by displacing the metal with a second, such as i The mineral and reacting metal are melted separately in crucibles by electric arcs, and the melted substances flow into a closed chamber, in which they are mixed maintained in a fluid state, during the reaction, by the J effect.—B. N.

Heating of Carbon [Electrically]; Process of — Applicable in Chemical and Other Analogous Proce Soc. Anon. L'Ind. Verrière et ses Dérivés. Fr. 340,846, March 1, 1904.

THE carbon is heated by the resistance which it offe the passage of an electric current. Forms of apparatu described in which the method is applied to the manu ture of carbon bisulphide and the cementation of iron. —B.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Bees-wax of British India. D. Hooper. Indian Ag Ledger, 1904, 73—110.

AFTER describing the species of bees found in India centres of the wax and honey trade are discussed, the met of preparing the wax and its local uses are referre and finally the character and chemical composition o various kinds of bees-wax are given. Indian bees-w derived from three species of bees, *Apis dorsata*, *A. in* and *A. florea*, but chiefly from *A. dorsata*. In the fo ing table the chemical and physical characteristics of waxes are shown :—

Origin.	—	Melting Point.	Acid Value.	Saponification Value.	H lo Va
		° C.			
Apis dorsata, 23 samples	Average	63·1	7·0	96·2	[illegible]
	Maximum	67·0	10·2	105·0	[illegible]
	Minimum	60·0	1·4	75·6	[illegible]
Apis indica, 7 samples	Average	63·25	6·8	96·2	7
	Maximum	64·0	8·8	102·5	9
	Minimum	62·0	5·0	90·0	5
Apis florea, 5 samples	Average	64·2	7·5	103·2	[illegible]
	Maximum	68·0	8·9	138·5	11
	Minimum	63·0	6·1	88·5	[illegible]

It will be seen that, whilst the waxes are almost ide in composition, they differ considerably from Euro waxes. The acid value is much lower, and the usual of cerotic acid to myricin is consequently altered.

Another source of wax in India is from the Dan bees, *Melipona (Trigona) spp.*, a species also occurri South America. This wax has an average melting of 70·5° C., acid value 20·8, saponification value 110·4 iodine value (Hübl) 42·2.—W. P. S.

for Use by Lead Workers; Manufacture of ——. m. Werke G. m. b. H. vorm. C. Zerbe. Fr. Pat. ,159, Feb. 25, 1904.

UTION of soap is mixed at a temperature of 30° C.
powdered alkali sulphides, and allowed to cool.
ered marble may be added to form a more solid soap.
, the sulphides convert any lead on the hands into
ble lead sulphide. The soap will also prevent similar
ing by copper or mercury.—W. P. S.

III.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(A.)—PIGMENTS, PAINTS.

White and White Lead; Relative Covering Power ——. E. Lenobie. Bull. Soc. d'Encouragement, , **106**, 513—537.

xpression "covering power," as applied to a pigment,
en understood in two different senses, viz., power of
ion over a larger or smaller area, and power of concealing the subjacent surface. The author considers the latter to be the true meaning of the expression, since the former can obviously be varied for the same pigment by altering the proportion of vehicle with which it is mixed. Covering power is therefore directly related to opacity. As the result of numerous comparisons it is found that when white lead (Dutch) and zinc white (Vieille Montagne) are mixed with equal proportions of vehicle (oil and turpentine), 7 parts by weight of white lead are required to give the same degree of opacity as 5 parts of zinc white, or 7 volumes of white lead as 6 volumes of zinc white. Therefore, whether equal weights or equal volumes are regarded, zinc white has the greater covering power. In practice, however, zinc white requires a much larger proportion of vehicle than white lead. As a consequence, it results that when coats of equal thickness of the two paints are laid on (containing those proportions of vehicle which render them applicable with equal facility), it is necessary to apply four coats of the zinc white paint to obtain the same opacity as that produced by three coats of white lead.

—M. J. S.

UNITED STATES PATENTS.

White Lead; Treating the Residue resulting from Manufacture of ——. J. W. Bailey, F. T. Bailey, and M. Bailey, New York, Assignors to the United Lead Co., New Jersey, U.S.A. U.S. Pat. 766,133, July 26, 1904.

THE waste products from the corroding process, consisting of lead carbonate, lead oxide, and metallic lead, are fed into a revolving drum arranged obliquely. The lower part of the drum contains acetic acid, the upper part air or a corroding gas. The mixture is therefore alternately submerged in the acid and exposed to the air, whilst the attrition of the metallic particles constantly presents new surfaces to the action. With a suitable strength of acetic acid, the metallic lead and lead oxide are converted into lead acetate, which remains in solution, whilst the lead carbonate is automatically discharged from the drum.—M. J. S.

Paints and Paint Vehicles; Production of ——. E. H. Strange and E. Graham, London. U.S. Pat. 766,740, Aug. 2, 1904.

SEE Eng. Pat. 8335 of 1903; this J., 1904, 448.—T. F. B.

(B.)—RESINS, VARNISHES.

ENGLISH PATENT.

Oilcloth or Linoleum; Substitute for ——. W. Melville, W. V. Rees, and P. L. Rees, Manchester. Eng. Pat. 12,663, June 4, 1904.

SHEETS of fibrous paper pulp are hardened and rendered non-absorbent by treatment with oil and size, to which lime or "soda" has been added. When dry the material is coated with oils and staining colours, again dried, and finally printed with the desired pattern.—T. F. B.

UNITED STATES PATENTS.

Distilling Crude [Turpentine] Oils; Apparatus for ——. J. C. Mallonee, Charlotte, W.C., Assignor to J. J. Mallonee, Crichton, Ala. U.S. Pat. 764,138, July 5, 1904.

THE apparatus is designed for distilling turpentine from crude turpentine oils, and consists of a still provided with a vertical vapour outlet of sufficient length to permit the heavier oils to flow back to the still, the lighter vapours passing through a condenser to the separator. A pipe fixed in the bottom of the still carries the residue to a second still, which is also connected with a condenser and separator, whence the distillate passes to a third still. The residues from the second and third stills are run together into a fourth still, where they are fractionated.—T. F. B.

Resinous Matter; Process of Extracting —— from Long-leaf or Pitch Pine. W. B. D. Penniman, Baltimore, Md. U.S. Pat. 764,863, July 12, 1904.

THE wood is steeped in hot liquid in a suitable vessel, the atmospheric pressure is then reduced above the liquid and the exuded resinous matter is later decanted from the surface of the liquors.—R. L. J.

French Patent.

Varnish; Process of Making Quick-drying ——. T. Abelmann. Fr. Pat. 338,807, May 18, 1903.

A resin, such as colophony, is melted and incorporated with an equal weight of a mixture of four parts of heavy mineral oil (sp. gr., 0·820—0·890) and one part of petroleum naphtha (benzine lourde) (sp. gr. 0·730—0·740), or with the intermediate petroleum fraction known as solar oil. This product is then oxidised by atmospheric air, diluted to an appropriate fluidity with oil of turpentine, and treated with 1·5—3 per cent. of a siccative.—M. J. S.

(*C.*)—INDIA-RUBBER, &c.

Venezuelan Rubber-Latexes. Marckwald and Fr. Frank. Gummi-Zeit., 1904, **18**, 850—851.

Three latexes, one unnamed, of Venezuelan origin were found to have the following composition and characters:—

——	1. "Leche de Marima."	2. "Leche de Pendare."	3. Unnamed.
	Per Cent.	Per Cent.	Per Cent.
Rubber substance.....	0·65	2·26	20·56
Resins..............	19·38	17·62	73·52
Albuminous matter ...	1·36	0·29	..
Impurities...........	1·60	4·80	1·85
Ash..................	0·75	0·01	0·62
Water removed at 100° C...............	76·25	74·74	3·45
Appearance of latex...	Reddish-white acid fluid, preserved by formalin.	Yellowish acid fluid, somewhat coagulated.	Cheesy appearance.
Nature of rubber......	Very inferior; no α-caoutchouc present.	Poor; 13·11 per cent. of α-caoutchouc present.	Good; 66·42 per cent. of α-caoutchouc present.
Nature of resin	5 per cent. soluble in acetone with m. pt. 62·5°.	18 per cent. of m. pt. 64° C.; 82 per cent. of high m. pt.	Similar to Pontianac resin.

The impurities of No. 2 consisted almost entirely of sugar and the ash of 1 and 2 was chiefly lime and magnesium salts.—R. L. J.

Para Rubber; Decomposition of —— *by Ozone.* C. Harries. Ber., 1904, **37**, 2708—2711.

Para rubber, in chloroform solution, whilst only polymerised by the action of permanganate, forms an ozonide under the action of ozone. When warmed with water this decomposes into keto- and di-aldehydes and hydrogen peroxide, which last oxidises the aldehydes to the corresponding acids. The ozonide, readily purified by solution in ethyl acetate and precipitation with light petroleum spirit, is a vitreous mass, explodes like other ozonides, when heated on platinum, and has the composition $(C_{10}H_{16}O_6)x$. Molecular weight determinations made it uncertain whether the value of x should be 2 or 3. On digestion with water for a short time, the solution when tested indicated the presence of levulinic and succinic aldehydes. After complete digestion, the main product was identified as levulinic acid. A smaller product gave reactions characteristic of succinic acid but could not be identified with the known acid. These results indicate the presence of the complex $\begin{matrix}C\\C\end{matrix}>C:CH.CH_2.CH_2.C(CH_3):CH.C$ in the original $C_{10}H_{16}$ molecule. Oxalic acid was not found and is probably only a secondary oxidation product of rubber. Like other ozonides the caoutchouc ozonide is much more highly active to a sensitised plate than ozone itself.—R. L. J.

United States Patent.

Raw Rubber; Apparatus for Treating ——. J. R. C. Danin, Para, Brazil. U.S. Pat. 765,167, July 19, 1904.

A hollow drying-drum with open ends is fitted with a flattened, "flaring," nozzle inside, which delivers the products of combustion received by means of a tube fr an outside combustion funnel, close up to the wall of drum.—J. K. B.

French Patents.

Vulcaniser; Improved ——. Soc. F. Clouth, Rheinis Gummi-Waarenfabrik. Fr. Pat. 340,670, Feb. 23, 190

Mechanical details are given of an improved vulcani with (*a*) means for applying mechanical pressure thro the top upon the enclosed moulds or forms; and (*b* laterally disposed cover or lid secured by screws, tl features being in combination.—R. L. J.

Rubber Substitutes; Manufacture of Substances for as ——. The Velvril Co., Ltd. Fr. Pat. 341, March 17, 1904.

See Eng. Pat. 13,306 of 1903; this J., 1904, 670.—T. F

XIV.—TANNING; LEATHER, GLUE, SIZ

Chromed Hide-Powder Question. F. Kopecky. Collegium, 1904, 211—214, 217—222.

The results obtained by the author show that a satisfac chromed hide-powder may be made from the inferior p of a hide (belly) which are unsuitable for the ma facture of ordinary hide-powder. As compared with ordinary powder, *e.g.*, Freiberg, the absorptive powe less per grm. but is regular, whilst the powder can packed closer, so that the usual filter bell is large eno for all purposes. The quantity required for anal may be packed dry or wholly or in part moistened the liquor under analysis without affecting the result. absorptive power increases as the powder is more fi ground, though for stirring and shaking methods of anal a somewhat coarse powder used in larger quantities 10 grms. per 100 c.c. of liquor (0·35—0·45 per cent. tan is desirable. The absorptive power of this powder dimini as it is more highly chromed, but if underchromed solubility is greater, and especially for the analysis of liquors, which really has caused the demand for alternative powder, it must be sufficiently chrome prevent swelling. Chrome alum crystals (10 per ce and crystallised sodium carbonate (3·5 per cent.) gi suitable chroming liquor. A basic liquor made bichromate by reducing with glucose is less satisfac As regards neutralisation, this must not be carried far; if too highly neutralised the powder becomes absorptive and at the same time the hide substanc again rendered soluble. In the analysis of oak extract this powder, tanned as indicated, neutralised wi 3 per cent. solution of borax, washed, dried, ground. washed, and again ground and dried, gave results cl agreeing with Freiberg hide-powder in the hands of diffe workers. Its behaviour with other materials, especially liquors, will be described later.—R. L. J.

United States Patent.

Waterproof Dressing and Preservative for Lea A. Aagaard, Everett, Wash. U.S. Pat. 764,971, 12, 1904.

Dogfish oil (5—14 parts), pine or pine-root tar (parts), turpentine, and a suitable solvent (one or mor these constituents being omitted as desired) are m together to form a leather-dressing.—R. L. J.

French Patents.

Tannin Extract Soluble in the Cold; Process for maki Colourless ——. G. Klenk. Addition, dated Mar 1904, to Fr. Pat. 316,570, Dec. 5, 1901.

Glacé Leather [from Intestines]. B. Trenckman Fr. Pat. 340,486, Feb. 16, 1904.

The outer walls of intestines, particularly the cæcum o gut of the ox, at present turned into gold-beater's skin cleaned, very lightly tanned with chrome, alum, or veget tannins, and then stuffed with egg-yolk, flour, &c. Tw re prepared membranes are superimposed on one another, ually grain to grain, so that on drying they form a solid nogeneous sheet without the aid of any adhesive. This ather" is then degreased by the use of benzine The liminary tanning may be omitted or applied after the fting process.—R. L. J.

tering Material [Hide Powder] for Fats and Oils. G. Gautier. Fr. Pat. 341,167, March 3, 1904. XII., page 829.

XV.—MANURES, Etc.

e; Influence of Varying Ratios of Lime to Magnesia n the Growth of ——. K. Aso. Bull. Coll. Agric., Tokyo, **6**, 97—102. Chem. Centr., 1904, **2**, 255–256.

GETATION experiments, in which varying amounts of ium carbonate and magnesium carbonate were added to oil containing lime and magnesia in the ratio 1 : 1, showed t the most suitable "lime factor" for rice is, as in the e of other species of *Gramineæ*, between 1 and 2. The ld of rice varies to a considerable extent with varying os of lime to magnesia, an excess of lime over the proper portion being more injurious than an excess of magnesia. —A. S.

e Culture; Practical Application of Manganese Chloride in ——. K. Aso. Bull. Coll. Agric., Tokyo, , 131—133. Chem. Centr., 1904, **2**, 256.

application of manganese chloride, a by-product in the nufacture of bleaching-powder, corresponding to 25 kilos. manganese protosesquioxide, Mn_3O_4, per hectare, re- ed in a yield of rice (grains) one-third greater than that ained without manganese chloride. The yield of straw increased to an even greater extent.—A. S.

English Patent.

h, Fish Refuse, and the like; Treatment of ——. V. M. Sandison, Ayton, Berwick. Eng. Pat. 15,319, uly 10, 1903.

E fish or fish refuse is reduced to a semi-fluid consistency boiling and diluting with water. The mixture, while l hot, with or without the addition of chemicals, is anted to remove the more liquid portion, the liquid and re solid portions being then independently subjected to trifugal action in machines of the non-perforated drum e. The liquid albuminoid portion obtained is subse- ntly subjected to further heating or treatment by micals, and again passed through the centrifugal machine separate the fish-oil. The solids are dried to form a nure or "guano."—W. P. S.

French Patent.

Manure, and Process for its Manufacture. J. Hammerschlag. Fr. Pat. 340,449, Feb. 15, 1904.

KALI or other silicates or silicic acid are added to an aline solution or magma of humous substances. The er are preferably prepared by treating decomposed mal or vegetable bodies with caustic or carbonated alis or with ammonia. Such a "silico-humic" prepara- n may be used as a manure, in some cases, with the tial or entire substitution of phosphates (powdered es, Thomas slag, or the like) for the silicates; or the mic solutions may be treated with alkaline phosphates. example is given of a manure made up by adding a xture of turf, bog earth, lignite, or the like, in small ces, to an alkaline solution; silicates or phosphates are n added, and the mass is set to ferment in heaps. —E. S.

XVI.—SUGAR, STARCH, GUM, Etc.

ess-diffusion [Beet Sugar]; Continuous ——. Hyroš nd Rak. Oesterr. Z. Zuckerind, 1904, **33**, 360. Chem.-Zeit., 1904, **28**, Rep. 212—213.

E authors have tested their process of combined diffu- n and pressing (Fr. Pat. 318,451 of 1902; this J., 1902, 1462) on the large scale, with a plant consisting of seven vessels, capable of treating 3600 kilos. of beetroots in 24 hours. It is stated that within 40 minutes a juice is obtained of the same concentration as ordinary beet juice, but of higher purity, together with 30 per cent. of "chips," containing 22 per cent. of dry substance with only one per cent. of sugar.—A. S.

Gum Acacia; Detection of —— *in Powdered Tragacanth.* E. Paget. XXIII., page 840.

XVII.—BREWING, WINES, SPIRITS, Etc.

Yeast; Note on Top-fermentation ——. J. J. van Hest. Z. ges. Brauw., 1904, **27**, 540—542.

In connection with the question whether the cells of top-fermentation yeast exercise their chief vital functions in a periodic manner, samples of wort were pitched with different quantities of yeast, the progress of attenuation and extent of yeast reproduction being noted at regular intervals. With the smallest amount of yeast (4 c.c. per hectolitre) attenuation commenced between the second and third days, the extract consumed being for the most part utilised by the newly-formed cells, the bulk of which were produced during the same period. After the fourth day the yeast entered into the stage of physiological activity (production of zymase), the attenuation increasing up to the sixth day, to thereafter recede, owing to the exhaustion of fermentable sugar. In this case, therefore, the periodic action was clearly observed, the biological activity predominating during the first three days and the physiological action during the last three. In proportion as the amount of pitching yeast was increased, the difference became less marked, the attenuation commencing earlier owing to the presence of a larger number of cells sufficiently mature to discharge their physiological functions at the outset. These results are considered to harmonise with those obtained by the author in connection with the absorption of nitrogen and formation of alcohol during fermentation (this J., 1904, 73).—C. S.

Yeast; Note on the Longevity of Culture ——. H. Wichmann. Allgem. Z. f. Bierbrau., 1904, **32**, 322.

Confirming Henneberg's observation that yeast cells on the surface of the culture vessel live longer than those at the bottom (this J., 1904, 672), the author finds that greater longevity is exhibited by cells in the ring of yeast adhering to the walls of the flask when cultures are made in wort, than by the cells of sedimental yeast. Since no aerospores could be detected in the ring cells, the greater longevity of the latter seems due to the presence of a more favourable environment in that situation. For re-inoculation the author finds that the ring cells give more vigorous growth, and he therefore shakes the flask, to ensure proper admixture of the ring and sedimental cells, before making the transfer to the new medium. It is regarded as a sign of weakly or dead cells when the sedimental yeast diffuses too readily on shaking.—C. S.

Amylase. [Influence of Various Substances on the Diastatic Power of Malt.] J. Effront. Monit. Scient., 1904, **18**, 561—565.

Ford has concluded from his experiments (this J., 1904, 414) that asparagine does not augment diastatic action unless there has been previous restriction, due to alkalinity of the starch or to some other cause. As this conclusion is in opposition to previously published statements of the author (this J., 1893, 368, 851; 1896, 127), the latter has repeated his experiments, the results of which confirm his first statement. The influence of other amino bodies was also tried. Aspartic acid had practically the same effect as asparagine, *viz.*, 9 to 10 times more maltose formed. Glycocoll, sarcosine, leucine, hippuric acid, creatine, &c., also favoured the diastatic action. Succinamide was found to retard the action. The action of the amides is independent of the temperature and degree of alkalinity of the starch paste.—W. P. S.

Sulphurous Acid in Wine. W. Kerp. Arbb. Kais. Gesund.-Amt. **21**, 141—225; 372—376. Chem. Centr., 1904, **2**, 56—59.

The author deals with the amount, condition, and action of sulphurous acid in wine. A review is given of the statements in literature with respect to the amount of sulphurous acid in wine, from which it appears that of 1,071 samples, 460, or 42·95 per cent., contained up to 50 mgrms. of sulphur dioxide per litre; 366, or 34·18 per cent., contained from 51 to 100 mgrms.; 150, or 14·00 per cent., contained from 101 to 150 mgrms.; 63, or 5·88 per cent., contained from 151 to 200 mgrms.; and 32, or 2·99 per cent., contained more than 200 mgrms. of sulphur dioxide per litre. With regard to free sulphurous acid, of 475 wines, about 75 per cent. contained from 1 to 10 mgrms. and a further 5 per cent. from 11 to 20 mgrms. per litre. The sulphurous acid addition compounds of aldehydes undergo hydrolytic dissociation in aqueous solution to a degree depending upon the nature of the aldehyde, the temperature, and the concentration of the solution. The dissociated sulphurous acid can be titrated directly with iodine solution and is reckoned as free sulphurous acid on analysis. Acetaldehyde-sulphurous acid is dissociated to only a small extent, but dextrose- and levulose-sulphurous acid are dissociated to a much greater degree. In sulphited musts and in strongly sulphited sweet wines, dextrose- and levulose-sulphurous acid are present, but in moderately sulphited, completely fermented wines, the sulphurous acid is combined with acetaldehyde. The pharmacological action of aldehyde-sulphurous acid compounds is due to the dissociated sulphurous acid, and its intensity can therefore be measured by the iodine-absorption of the aqueous solution of the compounds.—A. S.

Enzymes; Study of the Instability of ——. K. Aso. XXIV., page 842.

English Patents.

Non-deposit Beer; Apparatus for the Production of ——, *and for Clarifying Liquids and Carbonating the same.* A. P. Blaxter, A. P. Blaxter, jun., and G. W. Chaloner, trading as Barnett and Foster, all of London. Eng. Pat. 23,327, Oct. 28, 1903.

Instead of employing a vessel with internal stirring arrangements, the patentees use apparatus for chilling or carbonating liquids, so constructed as to be rotated as a whole. The vessel is cylindrical in shape, is provided with runners which rest upon grooved rollers, and is fitted with internal trough-like blades, which, as the vessel rotates, raise up some of the liquid and spill it back again into the bulk. The various connections in and out of the vessel are made by way of the trunnions.—W. P. S.

Varnishing, Pitching, or similarly treating Casks, Vats, or the like; Apparatus for ——. M. D. Krämer. Eng. Pat. 12,647, June 3, 1904. I., page 814.

United States Patents.

Fermentation of Bottom-fermented Beer under Pressure; Process of carrying through the ——. V. Lapp, Leipzig, Germany. U.S. Pat. 766,271, Aug. 2, 1904.

See Fr. Pat. 320,264 of 1902; this J., 1903, 157.—T. F. B.

Fermentation-Gas [Carbon Dioxide]; Apparatus for Treating ——. J. F. Wittemann, Brooklyn, Assignor to The Wittemann Co., New York. U.S. Pat. 766,481, Aug. 2, 1904.

See Eng. Pat. 64 of 1900; this J., 1900, 459.—T. F. B.

Storage Vessels [for Beer]; Process of Treating ——. V. Lapp, Leipzig, Germany. U.S. Pat. 766,506, Aug. 2, 1904.

See Eng. Pat. 3682 of 1904; this J., 1904, 556.—T. F. B.

French Patent.

Spirit; Process for Maturing ——. L. Wittenberg and H. Kaufmann. Fr. Pat. 340,861, March 1, 1904.

In order to colour and to remove unpleasant taste from freshly distilled spirit (brandy and the like), the latter is treated with finely divided cork, or passed through a fil containing the same.—W. P. S.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(*A.*)—FOODS.

Texas Cottonseed Meal; Composition of ——. H. Harrington and G. S. Fraps. Texas Agric. Exp. St Bull., **70**, 3—15. Chem. Centr., 1904, **2**, 245—246.

Of 46 samples of Texas cottonseed meal from 31 differ districts, 14 contained over 7·9 per cent. of nitrog 19 from 7·5 to 7·9 per cent., and 13 from 7 to 7·5 cent. Of 151 samples from other States, only 8 contain more than 7·5 per cent. and none more than 7·9 per ce of nitrogen. The average composition of American cotto seed meal obtained from 400 samples was:—Water, 8·5 ash, 7·2; proteïn, 43·26; crude fibre, 5·44; non-nit genous extractive matter, 22·31; fat, 13·45 per cent. T samples of Texas meal richest in nitrogen came from western portion of the State, and those poorest in nitrog from the eastern portion. It is probable that the differen is connected with the varying moistness of the soil, as t western portion of Texas has the smallest rainfall. T cottonseed husks had the composition:—water, 11·36; a 2·73; proteïn, 4·18; crude fibre, 45·32; non-nitrogen extractive matter, 34·19; fat, 2·22 per cent. Th contained 0·69 per cent. of nitrogen, 0·25 per cent. phosphoric anhydride, and 1·02 per cent. of potassi oxide.—A. S.

Lard from Hogs fed on Cottonseed Meal; Reaction of — with Halphen's Reagent. E. Fulmer. J. Amer. Che Soc., 1904, **26**, 837—851.

Experiments were made with 23 animals which were with varying quantities of cottonseed meal during a peri of 84 days, the minimum amount eaten by one individ being 7·7 lb. and the maximum 154 lb. Lard render from samples of fat from each animal gave distinct a in some instances, strong colorations with Halphe reagent, the intensity of coloration expressed in equivale of cottonseed oil ranging from 0·4 to 15 per cent. general, lard from kidney fat gave the greatest degree coloration, and lard from intestinal fat the least. T substance producing the coloration is transmitted to parts of the animal, though in unequal amounts. On deposited in the fat of the animal the colour-produci substance is very persistent. Thus, an animal killed thr months after it had received its last portion of cottonse meal yielded lard giving a coloration equivalent to 4 cent. of cottonseed oil, and lard from another killed fi months after the last portion gave a coloration equival to 3 per cent. of oil. (See also this J., 1903, 113.) —C. A. M.

English Patents.

Treating Finely Dicided Materials such as Flour with Gaseous Agent; Apparatus for ——. S. Leetham, Yo Eng. Pat. 16,472, July 27, 1903.

The apparatus is intended for effecting the conditionin sterilising, &c., of flour, meal, bran, and the like. T flour is fed into one end of a horizontal box or troug the bottom of which is provided with transverse ribs its upper surface, and which is capable of a horizont reciprocating motion. The top of the box is provided wi partitions projecting downwards, and is capable of vertical reciprocating motion. Specially constructed g inlets are provided, and when the apparatus is in use, t flour is carried forward, stirred up, and thoroughly expos to the action of the gas.—W. H. C.

Preservative for Foodstuffs, Articles of use, and t like. A. J. Boult, London. From K. Rücker a D. J. Pickée, both of Gorinchem, Holland. En Pat. 18,428, Aug. 26, 1903.

The articles of food, or boxes for containing the same, a dipped in the preservative claimed, which consists of linse l, 60 per cent.; colophony soap, 20 per cent.; and shellac,) per cent. Glycerin and wax may also be added to nder the skin formed on the articles sufficiently flexible. he preservative is melted by heating before dipping the rticles in it.—W. P. S.

'asein; Process for the Preparation of a Clear Solution of ——. A. P. Horn, Hamburg. Eng. Pat. 20,063, Sept. 17, 1903.

ee Fr. Pat. 335,799 of 1903; this J., 1904, 265.—T. F. B.

United States Patent.

French Patent.

ood Product from Sweet Cassava; Production of a ——. H. W. van Dalfsen. Fr. Pat. 340,845, March 1, 1904.

he root is reduced to a pulp by boiling in a closed vessel by roasting, and is then rolled into sheets, the latter eing finally dried or baked and ground. If desired, rmicelli may be added to the pulp.—W. P. S.

(B.)—SANITATION; WATER PURIFICATION.

English Patents.

iquids [Sewage]; Biological Purification of ——; *with Continuous Operation and Plant used in connection therewith.* C. Peters, Borsfleth, Germany. Eng. Pat. 16,494, July 27, 1903.

he liquid is fed on to a series of basins by suitable means, e said basins consisting of an upper layer of fine slag and lower layer of coarser slag. These basins are placed on bed of coarse slag, bricks, or coke, either sunk in the ound or raised above it. The basins are surrounded by orders sloping upwards, and between the basins the coarse derstructure is exposed to the air. Suitable channels are aced below the understructure to drain off the effluent d also to supply air to the bed.—W. P. S.

anks; Settling or Precipitating ——. A. Fidler, Northampton. Eng. Pat. 18,570, Aug. 28, 1903.

he tank circular in shape and similar to that described Eng. Pat. 19,249, 1897 (this J., 1898, 787), is provided ith a blade or spiral moving concentrically, which carries e sludge into a sump placed at the bottom of the tank. hen the sump is full of sludge a valve on the discharge pe is opened and the sludge forced out by the head of uid in the tank. A horizontal plate fixed just above the mp, and of slightly larger diameter than the latter, revents any sudden rush of liquid into the sump and nsequent disturbance of and mixture with the sludge. —W. P. S.

ewage, Bacterial or Septic Tank; Treatment of ——. V. Bordigoni, Paris. Eng. Pat. 11,900, May 25, 1904.

he septic tank described is preferably made of concrete d is covered so as to be air-tight. It is divided into four mpartments. In the first the sewage is received through pipe. A partition reaching from the top of the tank to arly the bottom separates the first compartment from the econd. As the sewage flows from the first to the second mpartment it passes between baffle plates placed at the ttom of the latter. A syphon-tube establishes communiation between the second and third divisions. The fourth mpartment is separated from the third by a partition, rforated at its base and reaching nearly to the top of the nk. This last compartment contains filtering materials d is provided with a discharge pipe for the purified fluent. The latter two compartments are only one-half e size of the first two.—W. P. S.

ewage [Sludge]; Treatment of —— *[Fuel Briquettes].* A. McLean, London, and W. Paterson, Dumfries. Eng. Pat. 12,232, May 30, 1904.

he sludge obtained from a settling tank is partially dried placing it in a vessel having a filtering cloth for its bottom, and producing a reduced pressure below this vessel. The partially dried sludge is then mixed with from 5 to 10 per cent. of powdered unslaked lime, and completely dried on a "hearth." The dry residue may now be mixed with about 5 per cent. of coal tar or the like, and pressed into briquettes for use as fuel.—W. P. S.

Air for Respiration Purposes; Process and Apparatus for Regenerating Breathed Out ——. M. Bamberger, F. Bock, and F. Wanz, all of Vienna. Eng. Pat. 8865, April 14, 1904.

The apparatus described is intended for use with a mask. It has the shape of a cylinder, and is divided into two chambers by means of asbestos partitions. A tube filled with water is placed down the centre of the apparatus. When required for use, a tube at the top is connected to the mask and a piston rod pressed down, thereby puncturing lead partitions in the apparatus, and allowing the water in the tube to flow into the lower chamber, which contains sodium peroxide or potassium tetroxide. The oxygen evolved is collected in a gas bag at the lower part of the apparatus. The breathed-out air enters the upper chamber, which is also filled with the alkali peroxide, through a filter. The moisture and carbon dioxide are thus removed, and the air, after being mixed with a quantity of the oxygen in the gas bag, is drawn back into the mask.—W. P. S.

Water Purifying Apparatus. A. Woodall, Manchester. Eng. Pat. 19,916, Sept. 16, 1903.

In order to remove the suspended impurities from the waste water of mills, bleach works, &c., especially matters of a fibrous nature, the water is passed through a perforated trough arranged in a trench. A series of brushes are arranged in, and parallel with, the axis of the trough, and are rotated so as to "sweep" the suspended matters out of the water on to a perforated plate at one side of the trough. —W. H. C.

Liquids [Water], Treatment of ——, *with Ozonised Air or other Gaseous Ozone Mixtures.* A. G. Bloxam, London. From E. Dillan, Berlin. Eng. Pat. 20,163, Sept. 18, 1903.

In the process of sterilising water by means of ozonised air, described in Eng. Pat. 9183 of 1901, the ozonised air was found to become vitiated owing to gaseous impurities present in the water. To overcome this difficulty, the water to be sterilised is caused to fall, in the form of spray, first through a vessel placed above the steriliser proper. A current of air blown across the falling spray removes the impurities.—W. H. C.

United States Patents.

Organically Contaminated Liquids [Sewage]; Apparatus for Testing ——. W. D. Scott-Moncrieff. U.S. Pat. 765,794, July 26, 1904. XXIII., page 837.

Water; Method of Purifying ——. W. M. Jewell, Winnetka, and W. J. McGee, Oak Park, Ill., Assignors to themselves and to O. H. Jewell, Chicago. U.S. Pat. 766,146, July 26, 1904.

Barium carbonate and a "soluble reagent" are added to the water and the mixture electrolysed.—W. P. S.

French Patents.

Soap for use by Lead Workers; Manufacture of a ——. Chem. Werke G. m. b. H. vorm. C. Zerbe. Fr. Pat. 341,159, Feb. 25, 1904. XII., page 829.

Sewage and other Refuse; Treatment of ——. J. L. F. Garrigou. Fr. Pat. 340,740, Feb. 26, 1904.

The liquid and solid portions of the sewage are separated either by filtration or allowing them to settle. The liquid portion is heated with slaked lime in a retort, whilst the solids are mixed with felspar and heated in a second retort. The products of distillation are collected in suitable absorbing chambers attached to each retort. The whole plant is enclosed in a dome-shaped building, from which the air is continuously drawn and passed through absorbing vessels, in order to collect volatile gases evolved during the filtration, &c.—W. P. S.

Coal Mines: Artificial ——. R. J. P. Cottangin. Fr. Pat. 341,333, March 15, 1904. II., page 816.

Pressure Filters, for Water and other Liquids. C. E. Chamberland. Fr. Pat. 340,587, Feb. 20, 1904.

The inner cylindrical filtering bodies have each an enlargement at the top, the shoulder of which fits upon the top of an outer vessel enclosing the filter, and thus completing the whole apparatus. The joint is rendered tight by means of a clamp and some kind of suitable packing material. The water to be filtered enters at the bottom of the outer vessel by a perforated cross tube, whilst the filtered water leaves by a similar tube in the enlargement at the top of the filter body or cylinder. Such filters can be used singly, or may be grouped together to form a battery.—W. H. C.

(*C.*)—DISINFECTANTS.

English Patent.

Antiseptic Compounds and Process for Manufacturing the same. H. H. Lake, London. From F. Stearns and Co., Detroit, U.S.A. Eng. Pat. 8415, April 12, 1904.

On treating intermolecular anhydrides of dibasic acids with hydrogen peroxide, peroxide acids having antiseptic properties are obtained. Five parts of succinic anhydride are agitated for about half an hour with 13 parts of 7 per cent. hydrogen peroxide. The precipitate consists of the succinic peroxide acid, probably $HO.CO(CH_2)_2CO.O.O.CO(CH_2)_2COOH$. It is a soluble, crystalline substance, melting at 128° C. with evolution of gas, contains 6·8 per cent of active oxygen, and is non-toxic. On long standing with water, the substance is hydrolysed to succinic acid and succinic mono-per acid, $HO.CO(CH_2)_2CO.O.OH$. —T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

Kaolin [for Paper-making]; Amount of Water in ——. Papier-Zeit, 1904, **29**, 2285.

Attention is drawn to the widely varying amounts of water in the various clays used by paper-makers for "filling" purposes. For instance, Bohemian clays contain from 3 to 6 per cent. of water, whilst in English clays, the quantity varies from 10 to 20 per cent. Some limit is considered necessary to prevent waste as regards price and freight.—W. P. S.

English Patents.

Oilcloth or Linoleum; Article of Manufacture for use as a Substitute for —— *[from Paper Pulp].* W. Melville and W. V. Rees. Eng. Pat. 12,663, June 4, 1903. XIII. B., page 829.

Paper Coated on one Side with Coloured Material, Process and Apparatus for Producing ——. C. Tittel, Josefsthal, Austria. Eng. Pat. 10,798, May 10, 1904.

Colouring materials are allowed to flow in a regulated horizontal stream upon a wet layer of paper as this is formed on the wire frame of a paper-making machine, being united with the paper by the operations of couching, pressing, and drying. The special apparatus employed to this end consists of a tipping trough, extending across the layer of paper, rendered adjustable by means of screw gear at its front, and communicating with a sluice-box fitted with a vertically adjustable gate, in combination with an apron, a squeezing roller, and a perforated pipe lying horizontally along the back of the trough, and connected with a vertical pipe, provided with a cock and an indicator, for the supply of the colouring materials from a mixing tank to the trough. The colouring materials flow through the sluice upon the apron, from which they are uniformly distributed on to the squeezing roller, which applies them to the layer of paper travelling along underneath.—E. B.

Solutions of Cellulose in the Manufacture of Filaments; Apparatus for Pumping and Controlling the Passag of Liquids or Semi-liquids, and more especially of ——. C. H Stearn, London, and C. F. Topham, Kew. Eng. Pat. 16,605, July 28, 1903.

The cellulose solution is kept under sufficient pressure to raise the inlet valve and pass into the body of the pump, but the delivery valve is held in position by a spring sufficiently strong to resist this pressure. By throwing the plunger of the pump into motion, however, sufficient pressure is obtained to open the delivery valve. Hence n air bubbles can get into the solution on suction and th pump can be used to regulate the thickness of the filament by altering the speed. In order to give an even flow o solution from the pump, an air chamber is in communicatio with the passage leading from the delivery valve to th outlet.—G. W. McD.

Phonographic Cylinders, &c.; [Celluloid-Stearin] Com position for the Manufacture of ——. A. Defavri Paris. Eng. Pat. 19,163, Sept. 5, 1903.

Celluloid containing a certain proportion of stearic ac in addition to the usual ingredients.—C. A. M.

Incandescent Mantles [Wood Cellulose]. Evered & Co Ltd. From C. Weiblen. Eng. Pat. 22,451, Oct. 17, 1903 II., page 816.

United States Patent.

Drying Machine [for Paper]. S. A. Cohen, New York U.S. Pat. 764,561, July 12, 1904.

The paper to be dried passes over a set of feed rollers wit tapes, in a straight path, and is subjected to an air blas issuing from a perforated plate. The paper then passe over a semicircular set of rollers to a second straight se where it is again subjected to an air blast. Means ar provided for preventing anything coming into contact wit the paper except the air.—W. H. C.

French Patents.

Viscose; Treatment of ——. Soc. Franç. de la Viscose. Fr. Pat. 340,563, Feb. 19, 1904.

Viscose, which has been gelatinised and cooled, is treate in a rotating drum, with a solution of sea salt, with without sodium bicarbonate. For example, for 100 kilo of viscose containing 10 per cent. of cellulose, may be use a solution of 10 kilos. of sea salt and 10 kilos. of sodiu bicarbonate in 100 litres of water. The mother liquor then run off, and the viscose again treated with a 50 p cent. solution of sodium chloride. The effect of th treatment is the removal of alkali sulphides and pol sulphides.—T. F. B.

Viscose; Apparatus for Extracting the Air and Fr Carbon Bisulphide contained in ——. Soc. Franç. de Viscose. Fr. Pat. 340,690, Feb. 24, 1904.

An air-tight conical vessel is provided with a rotati conical plate, on which the viscose is fed through a pipe the top of the vessel. Projections are fixed on to t lower part of the conical plate, to throw the viscose on the sides of the vessel, which is evacuated during t operation; this treatment removes all air and dissolv carbon bisulphide from the viscose, which finally falls in a trough at the bottom of the vessel, and is run off throug a side tube.—T. F. B.

Viscose; Automatic Machine for Fixing Filaments ——. Soc. Franc. de la Viscose. Fr. Pat. 340,81 Feb. 27, 1904. V., page 821.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Cerium Compounds: Study of some ——. J. Sterl Ann. Chim. Phys., 1904, **2**, 193—232. Chem. Cent 1904, **2**, 84—85. (See this J., 1901, 927.)

Preparation and Purification of Cerium Oxide.—For t separation and the detection of iron in presence of exce f cerium, the following rapid method is useful. It is ased upon the fact that a solution of a cerous salt is not mediately precipitated by a small excess of ammonia. he solution containing the cerium in the cerous condition : treated with ammonia till all the cerium is precipitated, nd the liquid has a strongly alkaline reaction; glacial cetic acid is then added till the precipitate is just redisolved, leaving the liquid still alkaline, and the solution is aturated with hydrogen sulphide. The precipitate is ltered off, the solution acidified with acetic acid, and the ydrogen sulphide expelled. For the separation of larger uantities of iron from a smaller quantity of cerium, the ethod proposed by Rose for the separation of zirconium nd iron appears to be the most useful one. The solution treated with tartaric acid, made alkaline with ammonia, nd the iron precipitated by hydrogen sulphide.

Ceric Oxide.—Ceric oxide prepared by ignition of the xalate, formate, succinate, acetate, or sulphate, or of the ydrated oxide, may have a faint lemon yellow colour, due the formation of higher oxides, even when foreign earths e absent. Hydrated ceric oxide, CeO_2H_2O, is obtained treating a solution of cerous nitrate with a cold solution sodium peroxide. The voluminous precipitate becomes enser and acquires a lemon-yellow colour on boiling. rystalline ceric oxide is pure white, but becomes somewhat ddish-brown if it comes in contact with the air.

Cerium Sulphide.—By the action of hydrogen sulphide n ceric oxide, hydrated ceric oxide, cerous sulphate or rous carbonate at a bright red heat, cerous sulphide, e_2S_3, is produced. It is a purple-red microcrystalline owder, which, when heated in air, loses sulphur, and is nverted into a mixture of ceric oxide and cerous sulphate. is decomposed by cold dilute acids, but is practically nacted upon by cold or boiling water, ammonium sulphide nd alkali polysulphides. If white ceric oxide be heated utiously for 1 hour in a current of moist hydrogen lphide, a golden-yellow oxysulphide is formed, having pproximately the composition Ce_2O_2S, which, when exposed the air, changes slowly into a more stable, grass-green xysulphide. According to the author the golden-yellow ystalline sulphide described by Mosander does not exist.

—A. S.

Stovaïne: a new Local Anæsthetic. E. Fourneau. J. Pharm. Chim., 1904, **20**, 108—109.

HE hydrochloride of the benzoyl ether of dimethylaminoentanol $(CH_3)(C_2H_5)[CH_2.N(CH_3)_2.HCl]C.O.COC_6H_5$, hich has been introduced into medicine under the name f stovaine, possesses anæsthetic properties comparable with ith those of cocaine. It is obtained by acting on dimethylninoketone with ethylmagnesium bromide; ethyldimethylninopropanol or dimethylaminopentanol is thus obtained, hich, when treated with benzoyl chloride, gives stovaïne. occurs in small brilliant lamellæ, m. pt., 175° C. It is ery soluble in water, alcohol, and acetic ester, sparingly luble in acetone.—J. O. B.

opulin [Benzoylsalicin]; Simple Method of preparing ——. L. Doblin and A. D. White. Brit. Pharm. Conf., Aug. 1904; Pharm. J., 1904, **73**, 233.

OPULIN may be satisfactorily obtained by benzoylating licin by Schotten-Baumann's reaction. A solution of 0 grms. of salicin in a litre of water, was rendered alkaline ith potassium hydroxide, and 10 grms. of benzoyl chloride lded very slowly with constant agitation; more alkali ing added from time to time, to avoid the formation of uch free acid. The populin formed separated at once, rming a bulky white precipitate, which was collected, ied, powdered, and extracted with ether. On recrystal-ing the residue insoluble in ether from boiling water, then om hot alcohol, pure populin, m. pt., 180° C., was obtained.

—J. O. B

ux Vomica Seeds; Distribution of Fats and Strychnine in ——. H. W. and S. C. Gadd. Brit. Pharm. Conf., Aug. 1904; Pharm. J., 1904, **73**, 246.

HE hairs covering the seeds of *Strychnos nux vomica* are und to contain much more fat, and relatively less rychnine than the embryo of the seeds, and this fat is ore readily removed by 70 per cent. alcohol from the hairs than from the other parts. Consequently decorticated seeds are recommended for the preparation of galenical products of nux vomica.—J. O. B.

Amorpha Fruticosa; Constituents of the Essential Oil of ——. V. Pavesi. Estr. aus Rendiconti del R. Ist. Lomb. di sc. e lett., **37**, 487—494. Chem. Centr., 1904, **2**, 224. (See this J., 1904, 558.)

THE portion of the oil boiling below 250° C. contains a terpene boiling at 80°—120° C. under 30 mm. and 150°—220° C. under 750 mm. pressure; sp. gr. at 15° C., 0·8717; refractive index, 1·4811 at 15·5° C. The portion boiling between 250° and 270 C. contains cadinene and another terpene, for which the author proposes the name *amorphene*, $C_{15}H_{24}$, sp. gr. at 15° C., 0·916; refractive index at 15° C., 1·50652. Amorphene differs from cadinene in that its hydrochloride is liquid.—A. S.

Burdock Root; Essential Oil of ——. Haensel's Report, July 1904; through Apoth. Zeit., 1904, **19**, 557.

BURDOCK root yielded 0·176 per cent. of a brownish-yellow oil having an acid reaction; sp. gr. at 25° C., 0·9695; $[\alpha]_D = +1·24°$ at 30° C.; acid value, 13·5; saponification value, 236·6; readily soluble in 80 per cent. alcohol. The oil contains palmitic acid.—J. O. B.

Conium Maculatum; Essential Oil of ——. Haensel's Report, July 1904; through Apoth. Zeit., 1904, **19**, 557.

Essential Oil of Conium Herb.—The herb free from flowers gave 0·0765 to 0·078 per cent. of a dark brown, unpleasant smelling, acid essential oil which deposited stearoptene at low temperatures. It had the sp. gr. 0·9502 at 15° C.; acid value about 60; saponification value about 70. On rectification by steam distillation only 25·15 per cent. of the original oil distilled over, the dark-coloured residue solidifying on cooling. The rectified oil was brownish, acid in reaction and had an odour almost similar to that of the crude product. It had the sp. gr. 0·9310 at 20° C.; $[\alpha]_D = -12·4°$ at 20° C.; saponification value 36. It was readily soluble in 90 per cent. alcohol and in about 80 parts of 80 per cent. alcohol. Palmitic acid was isolated from the residue.

Essential Oil of Conium Fruits.—The fruits yielded 0·0179 per cent. of essential oil of a brownish-black colour, with a repulsive odour and taste, neutral in reaction; saponification value, 34; sp. gr., 0·8949 at 15° C. On rectifying 51 per cent. of a greenish-yellow oil was obtained having the sp. gr. 0·8313 at 15° C.; $[\alpha]_D = -2·16°$ readily soluble in 96 per cent. alcohol, sparingly dissolved by 80 per cent. alcohol.—J. O. B.

Odorous Principles; Mechanism of the Circulation of —— *in the Plant.* E. Charabot and G. Lalone. Bull. Soc. Chim., 1904, **31**, 884—896.

FROM experiments performed with the bitter orange *Citrus bigaradia* in various stages of growth, it is concluded that the chemical changes undergone by the terpene compounds of the portion of the essential oil contained in the stem of the tree renders it less soluble in water than the corresponding essential oil of the leaves. This difference, slight at first, increases as vegetation advances. The osmotic pressure in the stem tends to diminish, whilst a certain amount of the more soluble constituents, following the laws of diffusion, are transferred from the leaves to the stem. On arrival there, they throw out of solution, if the stem sap be nearly saturated, the least soluble of the dissolved odorous bodies. A transference is, therefore, constantly in progress from the leaf to the stem, or from the point where the odorous substances are most actively formed to where they become, relatively, less soluble. The oil of the leaves is found to be distinctly less rich in esters than that of the stem. In young leaves the total esters amounted to 30·8 per cent. of the oil, calculated as linalyl acetate, against 39·0 per cent. in the young twigs; mature leaves gave 31·1 per cent.; and mature twigs 62·0 per cent. The free alcohols in young leaves amounted to 31·3 per cent., in young twigs to 28·4 per cent., in old leaves to 30·0 per cent., whilst old twigs contained but 3·2 per cent.—J. O. B.

Thorium from Cerium, Lanthanum, and Didymium; Separation of —— by Metanitrobenzoic Acid. A. C. Neish. XXIII., page 839.

Methyl Alcohol in Commercial Formaldehyde; Determination of ——. M. J. Stritar. XXIII., page 841.

Pyrimidine Derivatives [Alkyl Barbituric Acids]; Manufacture of ——. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld. Eng. Pat. 18,246, Aug. 24, 1903.

See U.S. Pat. 744,732 of 1903; this J., 1904, 35.—T. F. B.

Cod-liver Oil; Manufacture of a Substitute for ——. K. F. Töllner, Bremen, Germany. Eng. Pat. 2081, Jan. 27, 1904.

Algaceous plants rich in iodine are dried and extracted with a suitable fatty oil (*e.g.*, sesamé oil) or mixture of fatty oils and the oily extract filtered; or, the dried seaweed may be roasted and pulverised before the extraction, and alcohol used as a solvent in addition to the fatty oil.
—C. A. M.

Oil from the Rind of Limes and other Citrus Fruits; Machine for Extracting ——, R. G. Hunter, Whitely Bay, Northumberland. Eng. Pat. 13,171, June 10, 1904.

The limes pass down a shoot to a partitioned hopper, being admitted to the latter by alternately operated feeders, and then through feed tubes to an extracting device consisting of plates provided with points on their surfaces and capable of moving horizontally and vertically in opposite directions at different speeds. The rinds are thus punctured and the extracted oil flows off by suitable channels. The fruit then passes out of the machine into a lateral receptacle.
—W. P. S.

Heating of Carbon [Electrically]; Process of ——, applicable in Chemical and other Analogous Process [Manufacture of Carbon Bisulphide]. Soc. Anon. Prod. l'Ind. Verrière et ses Dérivés. Fr. Pat. 340,846, March 1, 1904. XI. B., page 828.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Emulsions [Photographic]; Pyridine as a Ripening Agent for ——. O. N. Witt. Phot. Mitt., 1904, **41**, 235—236.

Pyridine may be advantageously used to accelerate the "ripening" of emulsions; the process can be prolonged for a considerable time at 100° C., without fear of the emulsions being liable to fog, and there is no great tendency to form coarse-grained emulsions. The process may be carried out by sensitising the emulsion, not with silver nitrate, but with the double salt of pyridine and silver nitrate, $AgNO_3(C_5H_5N)_2$; the unripened emulsion gives very "slow" plates, which produce negatives of good contrast, whilst on heating the emulsion, it becomes highly sensitive, without losing the power of giving clear negatives.
—T. F. B.

English Patent.

Photographic Paper. A. Zimmermann, London. From Chem. Fabr. auf Actien, vorm. E. Schering, Berlin. Eng. Pat. 20,325, Sept. 21, 1903.

Explosives. C. O. Lundholm (Nobel's Explosives Co., Ltd.), Stevenston, Scotland. Eng. Pat. 19,438, Sept. 9, 1903.

By the addition of nitro-glycerin to ammonium nitrate explosives, products are obtained which can easily be exploded with a No. 6 detonator. A suitable composition for blasting consists of ammonium nitrate, 80 parts; nitroglycerin, 10 parts; wood-meal, 10 parts. Such explosives are hygroscopic, and must be enclosed in waterproof wrappers.—T. F. B.

Explosives or Blasting Compositions. M. Bielefeldt, Berlin. Eng. Pat. 20,216, Sept. 19, 1903.

See Fr. Pat. 335,801 of 1903; this J., 1904, 269.—T. F. B.

Explosives; Impts. in ——. C. H. Curtis, C. L. W. Smith, D. J. Metcalfe, and A. C. Pearcy, London, and A. F. Hargreaves, Roslin. Eng. Pat. 20,965, Sept. 30, 1903.

A safety non-detonating explosive which yields when exploded a large proportion of carbon monoxide together with non-inflammable gases, in such proportion as to protect the carbon monoxide from the oxygen of the atmosphere until its temperature has fallen within the safety limit. The explosive consists of two separate mixtures—(A) Saltpetre (75 per cent.), charcoal (22·5 per cent.), and sulphur (2·5 per cent.). (B) Paraffin wax (23 per cent.), and rice or maize starch (77 per cent.) which are blended together in the proportion of (A) (85—87·5 per cent.) to (B) (15—12·5 per cent). Mixture (B) is prepared as follows :—Paraffin wax is melted and granulated starch added until the entire charge of molten wax is absorbed, thus rendering the starch granules harder, more coherent, and less susceptible to atmospheric influences. The two mixtures are then blended and pressed into a compact pellet.—G. W. McD.

Fuses; Means for Igniting ——. W. Reine, Quartz Mountain, U.S.A. Eng. Pat. 12,238, May 30, 1904.

A device especially suitable for damp mines, in which a cap of conical shape (the apex being filled with sodium) is attached to the fuse end. On breaking the cap the sodium is ignited by the moisture in the atmosphere.—G. W. McD.

United States Patents.

Powders; Apparatus for Measuring the Duration of Combustion of ——. A. Ciolfi. U.S. Pat. 764,350, July 5, 1904. XXIII., next col.

"*Smokeless" Gunpowder, and Method of Making same.* W. H. Simpson, Peoria, Ill. U.S. Pat. 765,999, July 26, 1904.

A mixture is made of potassium chlorate, 37 parts, and potassium ferrocyanide, 25 parts, with sufficient water to make a dough-like mass, to which are added a saturated ethereal solution of eight parts of flowers of sulphur, and 30 parts of tannic acid dissolved in "Columbian spirits." The mixture is granulated and dried.—E. S.

French Patents.

Guncotton; Method and Apparatus for Compressing Blocks of ——. G. W. Bell. Fr. Pat. 340,473, Feb. 16, 1904.

The press block is mounted horizontally and is made in two parts, the upper being hinged to facilitate the introduction of the mould. The plungers work from opposite ends, and have a longitudinal motion independent of each other. It is claimed that a greater uniformity of density is thus obtained, and the pressure required is less than that usually necessary.—G. W. McD.

Nitrocellulose, Nitrohydrocellulose and Nitro-oxycellulose; Process for Manufacture of ——. Patronenfabrik, Saxonia. Fr. Pat. 340,527, Feb. 18, 1904.

See Eng. Pat. 5126, 1904; this J., 1904, 560.—G. W. McD.

Chlorate and Nitrate Explosives. E. Louis. Fr. Pat. 340,913, March 2, 1904.

The following are given as examples of these explosives. Potassium chlorate (75—94 per cent.), potassium nitrate (0—15 per cent.), lard (0—10 per cent.), beef fat (0—14 per cent.), and mutton fat (0—18 per cent.), and also potassium chlorate (60—80 per cent.), potassium nitrate (0—20 per cent.), mononitronaphthalene (0—15 per cent.), mononitrobenzene (0—5 per cent.), dinitrobenzene (0—16 per cent.), rosin (0—15 per cent.), and lard (3—10 per cent.). The finely powdered dry chlorate and nitrate are ncorporated with the melted fats and nitrohydrocarbons and the mass, after cooling, is broken up into grains of he desired size.—G. W. Mc.D.

Explosive Mixture of Great Shattering Power. X. Ceipek. Fr. Pat. 341,021, March 1, 1904.

Small quantities of potassium nitrate and of picric acid are added to a mixture of ammonium nitrate and aniline nitrate in order to improve its keeping properties.—W. H. C.

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

United States Patents.

Organically Contaminated Liquids [Sewage]; Apparatus for Testing ——. W. D. Scott-Moncrieff, London. U.S. Pat. 765,794, July 26, 1904.

See Eng. Pat. 18,061 of 1899; this J., 1900, 1032.—W. P. S.

Powders; Apparatus for Measuring the Duration of Combustion of ——. A. Ciolfi, Cleveland, U.S.A. U.S. Pat. 764,350, July 5, 1904.

A timing apparatus (consisting of a rotating drum on which a record is traced by means of a vibrating fork) is set in motion simultaneously with the electrical ignition of the powder, and similarly thrown out on completion of combustion.—G. W. McD.

French Patent.

Cupels; Manufacture of ——. The Morgan Crucible Co., Ltd. Fr. Pat. 341,015, March 7, 1904.

See Eng. Pat. 1695 of 1904; this J., 1904, 623.—T. F. B.

INORGANIC—QUALITATIVE.

Gold; Microchemical Detection of —— by means of Colloidal Coloration of Silk Fibre. J. Donau. Monatsh. f. Chem., 1904, **25**, 545–554.

The fact that various fibres become coloured purple when they are immersed in a gold solution has been long known. The author has determined the best conditions under which the phenomenon may be applied to the microchemical detection of gold. The best results are obtained by use of a silk fibre, which has been previously treated with stannous chloride and pyrogallol, a red coloration being produced with the gold solution. The fibre is perferably one which has been prepared from raw silk by from 2 to 4 hours treatment with about 10 per cent. caustic potash or soda solution followed by thorough washing with water. The fibre is then immersed for a considerable time in a stannous chloride solution containing a little pyrogallol, and then washed a few times with water and dried between filter-paper before being immersed in the solution of gold hydrogen chloride. The reaction is carried out in a way exactly similar to that used by Emich with litmus-silk (this J., 1901, 1142; 1902, 498); it is much more sensitive than the ordinary microchemical test for gold, and is especially useful for the detection of small quantities of gold in presence of large amounts of other substances. For this purpose the solution containing the gold, but no free chlorine, is treated with lead parings and slowly evaporated almost to dryness. The residue is treated with water, washed by decantation, and dissolved in *aqua regia*. The small amount of dissolved lead is precipitated by dilute sulphuric acid, the solution evaporated first on the water-bath and later on the sand-bath, till sulphuric acid is expelled, the residue taken up with water and tested for gold as described above. The reaction is not affected by the presence of magnesium, alkaline-earths, aluminium, chromium, zinc, manganese, nickel, cobalt, mercuric, lead, bismuth, and copper salts. It is prevented by bases, concentrated mineral acids, arsenious, arsenic and silicic acids, tartar emetic and antimoniates. Silver salts alone colour the silk fibre yellow, but this is covered by the red gold coloration and is also destroyed by treatment with nitric acid. Platinum salts in small proportions have no influence, but when present in excess colour the fibre black.—A. S.

Cerium Compounds; Study of some —— [Detection of Iron in Presence of Cerium]. J. Sterba. XX., page 834.

INORGANIC—QUANTITATIVE.

Volumetric Analysis; Standard Substances for ——, and Iodometry. F. Raschig. Z. angew. Chem., 1904, **17**, 577—585. (See Higgins, this J., 1900, 958.)

The author prefers hydrochloric acid, prepared by dissolving a known weight of the gas in water, to either oxalic acid or sodium carbonate as a standardising substance. The method of preparation is as follows:—Place 90 c.c. of water in a 100 c.c. flask, provided with a bent capillary tube hanging over the neck and reaching close to the bottom. Weigh accurately: then place on one pan of a balance turning with a centigram, attach a 30 cm. length of narrow indiarubber tubing (cycle-tyre valve tubing) to the capillary and to a Kipp apparatus delivering hydrochloric acid gas, from the action on ammonium chloride of strong sulphuric acid; counterpoise the flask and contents; place 3·7 grms. weight on the other scale, and then admit hydrochloric acid gas till equilibrium is re-established. If the Kipp and its sulphuric acid wash-bottle had the air expelled before connecting, absorption takes place with practically no bubbling and no evaporation. Disconnect, cool the flask, and weigh flask and capillary accurately; this gives the exact weight of gas absorbed. Rinse the capillary into the flask, and make up to the calculated volume for N/1 acid (adding the quantity of water over 100 c.c. from a graduated pipette, or making use of a flask graduated on the neck between 100 and 110 c.c.). The acid so obtained is accurately normal, and its preparation requires no excessive skill in manipulation. By its help N/1 sodium hydroxide solution is standardised, and from this sulphuric acid and other acids.

A similar solution of sulphurous acid, made by passing sulphur dioxide from a siphon into water, serves to standardise iodine. This, however, must not be made stronger than N/20, or it loses sulphur dioxide readily, and even the N/20 solution requires some care and skill in its preparation. It loses no gas in half-an-hour or more, and can be measured and transferred by a pipette, but cannot be poured from one vessel to another without loss of at least 2 per cent. of its sulphur dioxide. To standardise iodine, place 25 c.c. of the nominally N/10 solution in a conical flask, plunge the point of a 50 c.c. pipette containing the sulphur dioxide solution, to the bottom, and let the contents slowly out, keeping the liquid in constant rotation. If exact, the yellow tint of the iodine just disappears with the last drop of the sulphurous acid. If not quite exact, a few drops of the N/10 thiosulphate or iodine solution, as the case may be, are added to the point of disappearance or re-appearance of the yellow tint, the solution is corrected accordingly, and re-standardised. With practice, there is no need to use starch as an indicator. If then, the colourless liquid from the iodine standardisation be titrated with N/10 sodium hydroxide it should require exactly 50 c.c., and we can thus check the iodine, standardised from the sulphurous acid solution, against the sodium hydroxide, standardised from the hydrochloric acid, and establish the correspondence of all these solutions. From the iodine, permanganate can now be standardised:—Exactly decolorise 25 c.c. of N/10 iodine by means of 50 c.c. of N/20 sulphurous acid. Add 25 c.c. of N/10 permanganate, and decolorise again:—Exactly 50 c.c. should be needed. Whilst, however, the author hopes his hydrochloric acid standardising may come into general use, he feels this is not likely to be the case with the sulphurous acid standard; the weighing of flask and contents (about 250 grms.), in order to get the exact weight of 0·32 grm. of sulphur dioxide, being undoubtedly a weak point.

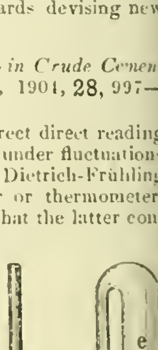
The direct titration of sulphurous acid by sodium hydroxide is not very satisfactory. If phenolphthaleïn be used, a pink colour is struck when about 95 per cent. of the required soda has been added; though when neutralisation is complete, the sudden deepening of the red colour with the last drop is fairly conspicuous. If Methyl Orange be used, though the change from sulphurous acid to bisulphite is sharp, yet the titration is inexact, and more soda solution is required than corresponds to the sulphurous acid. This is due to oxidation; the bisulphate formed is acid to Methyl Orange, though the corresponding bisulphite would have been neutral. The author finds that sulphurous acid itself is very unsensitive to oxygen, but that at the moment of being converted into or being liberated from a sulphite it rapidly absorbs oxygen. This explains the fact that if, instead of treating sulphur dioxide solution with iodine and then titrating with sodium hydroxide, 20 c.c. of N/10 sulphur dioxide be very slowly introduced under 20 c.c. of N/10 sodium hydroxide and then iodine be added, only 17 c.c. instead of 20 c.c. will be needed. That this is not due to loss by escape of gas is shown by the fact that the liquid now requires 17 c.c. of sodium hydroxide solution for neutralisation, a total of 20 + 17 = 37 c.c., instead of 2 × 17 = 34 c.c. To this character, too, and partly to escape of gas, is due the fact that in titrating sulphurous acid with iodine, too low results are always obtained if the iodine be added to the sulphurous acid—neither Bunsen's explanation of this, nor that of Volhard, involving the separation of sulphur, being satisfactory.—J. T. D.

Indicators; Mixed ——. M. Scholtz. Z. Elektrochem., 1904, **10**, 519—553.

When an acid is titrated with alkali in presence of two indicators, that indicator will be first affected, which is the stronger acid; in titrating with acid the converse holds good. Transition tints are thus produced just before neutralisation, and by this method the comparative strengths of numerous indicators, taken in pairs, have been ascertained. It is suggested that the results may help towards devising new volumetric methods.—W. A. C.

Carbon Dioxide; Determination of —— *in Crude Cement Powder.* G. Sander. Thonind. Zeit., 1904, **28**, 997—998.

The apparatus is designed to give a correct direct reading of the alterations in the volume of gas under fluctuations of temperature and pressure, so that the Dietrich-Frühling apparatus can be used without barometer or thermometer. The measuring tube *a* is widened at *e* so that the latter contains, up to the zero-mark *o*, exactly 100 c.c. (at 0° C. and 760 mm.). The tube *a* is graduated in one-fifths of 1 c.c. (total 30 c.c.), and is filled to the zero mark with mercury, balanced by the tube *b*. To set the apparatus, mercury is poured into the tube *a*, which is closed by the thumb and turned over to allow the mercury to escape until the surface coincides with the mark corresponding to the volume occupied by 100 c.c. of air at the prevailing temperature and pressure. The mercury is poured into a basin, and the air in *e* is moistened by introducing a drop of water which is then vaporised by heat, the open end of *a* being closed by the mercury tube *b*. When the air is re-cooled, the measured mercury is returned to *e*, and *c* is re-closed by the rubber tube attached to *b*, whereupon the apparatus is tilted to allow the mercury to run from *e* into *a*, leaving the standard volume of air in *e*. Assuming that 200 c.c. of carbon dioxide are furnished by 0·89388 grm. of calcium carbonate, then if the crude cement powder is to give 75 per cent. of carbonate (*i.e.*, 150 c.c. of carbon dioxide), the volume of air recorded in the apparatus must be multiplied by 1·5, and from the result can be calculated the weight of calcium carbonate corresponding t the volume of gas formed in the Dietrich-Frühling test. The author has compiled a table of these weights at temperature between 0° and 30° C.



In a modification of the apparatus the part *e* is turne upright, to form a direct continuation of the tube *a*, in orde to facilitate the primary adjustment, the open end of being dipped into a trough of mercury, and the rubbe tubing attached whilst *a* is in this position.—C. S.

Lead Assay; Commercial Wet ——. H. A. Guess. Trans. Amer. Inst. Min. Eng., 1904.

The following methods are convenient for all lead deter minations, but especially suitable for the assay of poor ore containing about 0·5 per cent. 1 The ore is dissolved i nitric acid and evaporated with sulphuric acid, water adde the whole heated to dissolve soluble sulphates, the solution filtered, and the residue well washed. Filter and residue are now returned to the original flask, and digested with slightly acid ammonium acetate solution till all lead sulphate is dissolved. The liquid is diluted with water, and potassium chromate solution (9·396 grms. per litre) added in known quantity and slight excess. The solution is filtered and the residue washed free from chromate; the filtrate is acidified with 25 c.c. of hydrochloric acid (sp. gr. 1·1), a crystal of potassium iodide added, and the liberated iodine determined by titration with sodium thiosulphate solution (36 grms. of the pure crystallised salt to the litre. Half-strength, however, usually preferred) and starch. The liberated iodine affords a measure of the unused chromate, and hence of that used in precipitating the lead. The chromate solution and the stronger thiosulphate solution are equivalent per c.c. to 0·01 grm. of lead. The only substance which interferes with this process is antimony, which tends to prevent solution of the lead sulphate. If antimony be present, slightly ammoniacal ammonium acetate solution is used for the digestion, and is acidified after solution is complete, before diluting and precipitating with chromate. With much lead, the quantities of ammonium acetate solution and of water are not of moment; but with 1 per cent. or less, the strong ammonium acetate solution should not exceed 10 c.c., nor should the bulk after dilution exceed 50 c.c. A large excess of chromate hastens the completion of precipitation of these small quantities, but makes the subsequent washing tedious, and gives an objectionably large amount of chromate to titrate. Unless antimony be present, instead of back-titration, hot dilute hydrochloric acid may be poured, first into the precipitation-flask to dissolve any lead chromate contained in it, then through the filter (the funnel being placed in the neck of a clean flask) till all the lead chromate is dissolved; flask and filter are well washed with warm water, and the solution of lead chromate is titrated with iodide and thiosulphate. 2. This method is especially adapted for heavy lime-ores, in the case of which the previous method would be found tedious, on account of the large bulks of calcium sulphate to be washed:—To 1—5 grms. (according to richness) of the ore, in a 250 c.c. flask, add 3—5 c.c. of strong nitric acid and 15 c.c. of strong hydrochloric acid: heat till all is dissolved and the excess of acid has been reduced to about 8 c.c. Then add dilute ammonia till in slight excess, and afterwards excess of 80 per cent. acetic acid slowly, with vigorous shaking, and finally 5 c.c. of strong ammonium acetate solution. If antimony and gelatinous silica be absent, and the undissolved siliceous residue be slight, add excess of 10 per cent. potassium chromate solution to the hot undiluted liquid, shake, allow to settle for five minutes, filter, and wash free from soluble chromates. Place funnel in neck of original flask, dissolve lead chromate with hot hydrochloric acid, wash with water containing 0·5 per cent. of acetic acid and titrate the solution with iodide and thiosulphate solution as before. By using not too much iodide (0·5—2·0 grms.), and having say 50 c.c. of 1·1 hydrochloric acid in 200 c.c. of warm liquid, there is hardly any tendency for lead iodide to separate and obscure the reaction. This "short-cut" method gives good results in presence of most other metals; but interference may be caused by barium, if present as carbonate, for barium chromate is insoluble; the addition of 1—2 c.c. of 10 per cent. ammonium sulphate remedies this. Interference also occurs with bismuth, antimony, and silver, and then the first method should be used. Either of these methods is much to be preferred, in the case of poor ores, to the molybdate method (this J., 1893, 376), which is so generally used; for the end reaction in the molybdate method is not sharp, and may involve an error of 0·3—0·5 c.c. (= 3—5 mgrms. of lead), which, though permissible in a rich ore, may be as much as the total quantity of lead in a poor ore.—J. T. D.

Bismuth; Electrolytic Determination of ——. A. Hollard and L. Bertiaux. Comptes rend., 1904, **139**, 366—367.

Separation from Copper.—To the solution of the sulphates containing not too great an excess of sulphuric acid, and heated to boiling, phosphoric acid is added in excess, and the solution allowed to stand overnight, to complete the precipitation of the bismuth. The precipitate is filtered, washed with dilute phosphoric acid (1 vol. of acid of sp. gr. 1·711 diluted to 20 vols.) and finally, to remove the copper more readily, with a mixture of potassium cyanide and ammonium sulph-hydrate, 100 c.c. of which contain 5 grms. of cyanide and 5 c.c. of the sulph-hydrate obtained by saturating 10 per cent. ammonia with hydrogen sulphide. The bismuth phosphate is now dissolved in nitric acid diluted with an equal volume of water, and evaporated with 12 c.c. of sulphuric acid till thick white fumes are given off. The solution, which now contains the bismuth as pyrophosphate, is diluted to 300 c.c., and the liquid electrolysed with a current of 0·1 ampere, for 24 hours. The deposited bismuth should be free from copper, but should it contain any, the copper can be estimated colorimetrically, and its amount deducted.

Separation from Lead.—The solution of the nitrates is evaporated with 12 c.c. of sulphuric acid, together with the quantity equivalent (approximately) to the contained metals, till thick white fumes appear. Allow to cool, dilute with water to 300 c.c., add 35 c.c. of absolute alcohol and electrolyse with a current of 0·1 ampère for 48 hours. Very small amounts of bismuth can in this way be accurately separated from large amounts of lead; the deposited bismuth is absolutely free from lead.—J. T. D.

Manganese; Electrolytic Determination of ——. J. Köster. Z. Elektrochem., 1904, **10**, [31], 553—554.

It has been hitherto found impossible to deposit manganese peroxide coherently under a rotating cathode. The author succeeds by adding 10 grms. of ammonium acetate and 10 c.c. of 96 per cent. alcohol to the electrolyte (which must be free from chlorides) and using a roughened dish of platinum-iridium. The temperature must be kept at 75°—85° C. A current density of 4 ampères per sq. dcm. may be applied.—W. A. C.

Thorium from Cerium, Lanthanum and Didymium; Separation of —— by Metanitrobenzoic Acid. A. C. Neish. J. Amer. Chem. Soc., 1904, **26**, 780—793.

The method is based on the fact that metanitrobenzoic acid precipitates thorium from a neutral solution of the nitrate as $Th(C_6H_4NO_2CO_2)_4$. Thus, on treating 25 c.c. of a solution containing an amount of thorium equivalent to 0·1128 grm. of thorium oxide, with about 150 c.c. of a 0·35 to 0·4 per cent. solution of the acid at 80° C., and keeping the beaker at 60° to 80° C. for 15 minutes, a bulky precipitate is deposited which, after being washed with a 5 per cent. solution of the precipitating acid and ignited in a platinum crucible, leaves the quantitative amount of thorium oxide. For the ignition the filter paper should be placed whilst still moist in the uncovered crucible, and heated first in the Bunsen flame, and then for 15 minutes in the blast flame. For the complete separation of thorium from cerium, &c., reprecipitation is necessary. For this purpose the precipitate is dissolved off the paper by means of hot dilute nitric acid (1 : 5), the paper well washed with hot water, and the solution diluted to about 150 c.c. and treated with 25 c.c. of the *m*-nitrobenzoic acid solution. Sufficient Methyl Orange to give a decided red tint to the liquid is now added, and dilute ammonia solution (1 : 10) run in until the colour changes to pink, the liquid being thoroughly stirred after each addition. Care must be taken not to continue the neutralisation until the liquid becomes yellow, or the other earths will be reprecipitated. To insure complete precipitation of the thorium compound an additional 50 c.c. of the reagent are now added, the beaker heated on the water-bath as before, the precipitate collected, washed, dissolved in dilute nitric acid, and once more precipitated, before final ignition. *m*-Nitrobenzoic acid gives no precipitate with glucinum, gadolinium, yttrium, titanium, and samarium; zirconium gives a white opalescence and precipitate which increases on heating; whilst erbium gives a white curdy precipitate. Mercurous and mercuric nitrate give heavy curd-like precipitates which dissolve on heating.

Analysis of Monazite Sand.—2 grms. of the sand in a fine state of division are mixed with 10 to 15 c.c. of concentrated sulphuric acid in a porcelain crucible which is gradually heated on a plate until the excess of acid has evaporated. More acid is then added, the contents stirred, and digestion continued for three hours, after which time the phosphates are converted into sulphates. The crucible is now cooled in ice water and the mass introduced drop by drop into 600 c.c. of water also cooled to 0° C., the crucible itself being finally placed in the beaker and left over night. The solution is heated to boiling, and treated with a boiling solution of oxalic acid (saturated in the cold), which is added in large excess with constant stirring. The white crystalline precipitate that separates on cooling, consisting of thorium, cerium, lanthanum, and didymium oxalates, is collected and washed with a dilute solution of oxalic acid, after it has stood for several hours. The filter paper containing the precipitate is returned to the same beaker and boiled with 10 to 15 grms. of potassium hydroxide and 25 to 50 c.c. of water, and the resulting hydroxides filtered off from the liquid which has previously been diluted to about 300 c.c. The precipitate is washed free from alkali and dissolved in hot dilute nitric acid (1 : 5), the solution evaporated to dryness on the water-bath, and the residue moistened with water and evaporated until free from all traces of free nitric acid. The nitrates are dissolved in 500 to 600 c.c. of water, 150 to 250 c.c. of the solution of *m*-nitrobenzoic acid slowly introduced with constant stirring, and the liquid heated at 60° to 80° C., and filtered from the precipitate, which is dissolved in dilute nitric acid, reprecipitated, and ignited whilst moist as described above. A pure white thorium oxide is more readily obtained by neutralising the solution of the thorium *m*-nitrobenzoate with potassium hydroxide instead of with ammonia, a slight excess of the reagent converting the flocculent *m*-nitrobenzoate first reprecipitated into the more compact hydroxide.—C. A. M.

ORGANIC—QUALITATIVE.

Beeswax; Detection of Artificial Colouring Matter in ——. P. Lemaire. Bull. Soc. Pharm. de Bordeaux, 1904, **44**, 182—182.

A SMALL fragment of the wax is dissolved in chloroform, and two or three drops of hydrochloric acid are added to the solution. The production of a rose-red colour indicates artificial colouring matter. Another portion is saponified by boiling with caustic soda solution, then treated hot with excess of hydrochloric acid. If a fugitive rose-red colour be obtained, which turns green on adding excess of ammonia, the wax is artificially coloured. Another piece of the wax is melted in a capsule with saturated boric acid solution; on evaporating to dryness the residue acquires a reddish colour with wax containing added colouring matter.

—J. O. B.

Gum Acacia; Detection of —— *in Powdered Tragacanth.* E. Payet. Rep. Pharm., 1904, **16**, 301.

TRAGACANTH does not, like acacia, contain an oxydase capable of giving a brown colour with guaiacol in the presence of hydrogen peroxide. This reaction, therefore, enables the fraudulent admixture of gum acacia to be detected in powdered gum tragacanth. A 5 per cent. solution of the suspected gum is prepared with cold water; to this is added an equal volume of 1 per cent. aqueous solution of guaiacol, and one drop of hydrogen peroxide; on agitating the mixture and allowing it to stand, a brown colour is rapidly developed if gum acacia be present, whilst, if the tragacanth be pure, the mucilage remains perfectly colourless.—J. O. B.

Glycerides; Solutions of —— *in Acetic Acid* [*Distinction between Butter and Margarine*]. L. Hoton. Bull. Soc. Chim. Belg., 1904, **18**, 147—165.

WHEN a solution of acetic acid in a fat is chilled, there is a separation into two layers, the upper of which may be regarded as fat + acid and the lower as acid + fat. In the case of butter, the glycerides dissolved first, are those with low critical temperatures of solution, low melting points, and low refractive indices. In the case of other fats and oils, however, those portions with high refractive indices are the first to pass into solution. On these facts the following analytical method is based :—5 grms. of the melted filtered butter-fat are mixed with 10 c.c. of acetic acid (sp. gr. 1·057) in a tube (16 mm. in diameter, graduated in mm.), which is heated to 60° C., with occasional agitation, in the water-bath. The contents are then cooled to 40° C., and the height of the upper layer measured. As soon as the temperature falls to 35° C., the lower layer is decanted into a weighed flat dish, and evaporated at about 70° C. until constant in weight (= Extract A). The portion left in the tube is mixed with a fresh 10 c.c. of acetic acid, and treated in the same way as the original fat, yielding Extract B and a residue C, which is also dried and weighed. The critical temperature of solution, Valenta test, and refractive index of each of the three fractions is then determined, and conclusions drawn from the ratio in which they stand to one another.

The following table shows representative results given by pure butter and different raw materials of margarine :—

Fraction.	Butter.			Oleomargarine.			Neutral Lard.		
	Centigrms.	Critical Temp. of Solution.	Valenta Figures.	Centigrms.	Critical Temp. of Solution.	Refraction at 40° C.	Centigrms.	Critical Temp. of Solution.	Refraction at 40° C.
		° C.	° C.		° C.			° C.	
A..........................	109	48	39	30	72	49·8	31	63	50·5
B..........................	182	49	43	48	74	49·5	50	67	49·7
C..........................	193	57	55	423	80	49·0	420	78	49·3

Fraction.	Crude Cottonseed Oil.			Arachis Oil.			Sesamé Oil.		
	Centigrms.	Critical Temp. of Solution.	Refraction at 40° C.	Centigrms.	Critical Temp. of Solution.	Refraction at 40° C.	Centigrms.	Critical Temp. of Solution.	Refraction at 40° C.
		° C.			° C.			° C.	
A..........................	65	52	63·0	42	57	59·0	55	60	62·7
B..........................	70	54	63·2	68	67	58·8	65	67	59·3
C..........................	360	70	59·2	395	78	56·0	370	77	57·0

The solubility of butter-fat in acetic acid is independent of the proportion of volatile acids present. In the author's opinion the most important factor is the difference between the critical temperatures of solution of the fractions C and A. Thus 11 samples of pure butter-fat gave on the average 11·5 for values of C—A, whilst butter-fats containing 10 to 20 per cent. of margarine gave an average of 15·5. In like manner the mean difference between the Valenta numbers of C and A was 22 for the pure butter-fats and 27 for the adulterated butter-fats. On the other hand, certain pure butter fats gave figures for the critical temperatures of C—A as high as those containing 10 to 15 per cent. of margarine, so that the method by itself does not furnish proof of adulteration. The author considers, however, it may be of great service in the case of butter-fats having a Reichert-Meissl value of 23 to 27, and when such samples give a value of less than 11 for the critical temperatures C—A, they may be regarded as pure. There is a concentration of margarine in the fractions, the quantities of a mixture dissolved by acetic acid not being proportional to the coefficients of solubility of butter and other fats in that mixture.—C. A. M.

ORGANIC—QUANTITATIVE.

Incineration of Organic Matter facilitated by the use of Pumice Stone ——. Duyk. Ann. Chim. anal. appl., 1904, **9**, 252—254.

Coarsely powdered, recently calcined pumice stone, mixed n equal weight with the solid or extractive to be incinerated, s recommended to facilitate the burning off of organic matter. By its aid a perfect ash is readily obtained with the most refractory nitrogenous substances, such as albumin, wool, or yeast, which are notoriously difficult to incinerate completely by ordinary methods.—J. O. B.

Methyl Alcohol; Determination of —— in the Products of the Distillation of Wood. M. J. Stritar and H. Zeidler. Z. anal. Chem., 1904, **43**, 387—400.

The authors employ the iodine method for this purpose and use an apparatus similar to that described by Zeisel and Fanto for the determination of glycerin (this J., 1902, 992). The reaction between the methyl alcohol and the hydriodic acid (sp. gr. 1·70) is allowed to take place lirectly in the apparatus, and not in a closed tube.

Crude Wood Spirit.—5 c.c. are measured out in a pipette (the weight of the volume delivered being previously scertained) and diluted to 500 c.c. This solution is used or the determination.

Crude Dilute Wood Spirit.—10 c.c. are diluted with bout 40 c.c. of water and shaken with 0·5 grm. of animal charcoal for 15 minutes. The mixture is then filtered and he filter washed with water until the filtrate measures 00 c.c.

Crude Wood Acid.—50 c.c. are neutralised with sodium arbonate, diluted to 250 c.c. and filtered. 100 c.c. of the ark coloured filtrate are then rendered alkaline with odium hydroxide and distilled. 50 c.c. of distillate are ollected, treated with animal charcoal, and the etermination proceeded with.

With regard to the influence of other substances in these istillation products, only allyl alcohol and esters greatly nterfere with the results. The first is separately determined by the bromine method and allowed for, whilst the uantity of esters in the sample is obtained from a etermination of the ester value.—W. P. S.

Iethyl Alcohol in Commercial Formaldehyde; Determination of ——. M. J. Stritar. Zeits. anal. Chem., 1904, **43**, 401—402.

ive c.c. of the formaldehyde solution are diluted with 00 c.c. of water, an excess of ammonia added, and the nixture distilled. Fifty c.c. of distillate are collected, made ightly acid with acetic acid and diluted to 100 c.c. The ethyl alcohol is then determined by the iodide (Zeisel) nethod as modified by the author. The small quantities of ormaldehyde found in the distillate, do not affect the result. —W. P. S.

nsaponifiable Matter in Oils and Fats [*Determination of* ——]. J. Huwart. Les Corps gras ind., 1904, **30**, 194—195, 210—211, 228—229, 242—243, 258—259, 274—275, 290—291, 306—307, 322—323. Chem. Centr., 1904, **2**, 158—159.

ccording to the author the usual methods for the determination of the unsaponifiable matter in oils and fats are inaccurate. The following method is recommended:— grms. of the oil or fat are boiled for at least ½ hour with c.c. of a 20 per cent. alcoholic caustic potash solution under a reflux condenser, and N/1 hydrochloric acid is then added until the liquid is nearly neutral. The liquid soap whilst still warm is transferred to a separating funnel, the flask being rinsed several times with 35 c.c. of warm water; 15 c.c. of glycerin of sp. gr. 1·26, are added, and the whole well shaken, and extracted with 50 c.c. of ether. The aqueous layer is separated, and again extracted with ether. The combined extracts are distilled to a small bulk, and the residue treated with 1 drop of phenolphthaleïn solution and a few drops of a 3 per cent. alcoholic caustic potash solution, and a few grms. of finely-broken glass added. The remainder of the ether is then distilled off, the residue dried for 2—2½ hours at 95°—100° C., and then treated with 45—50 c.c. of anhydrous ether or light petroleum spirit (b. pt., below 80° C.). After 12 hours, the solution is filtered, the residue washed several times with ether, the filtrate and washings are evaporated very slowly, and the residue is dried for 1½—2½ hours at 100° C. The author obtained the following results with this method:—Oil from *Lotta molva*, 1·02—1·07; oil from *Merlangus virens*, 0·88—0·09; oil from *Clupea sprattus*, 1·362; oil from *Lamina cornubica*, 1·51—1·66; olive oil, 0·7—0·8; pure butter fat, 0·33—0·44; and margarine fat, 0·65 per cent. The unsaponifiable matter consisted for the most part (75—85 per cent.) of cholesterol, which was determined by converting it into its acetic ester, and determining the combined acetic acid in the latter.—A. S.

Halogen Absorption of Oils; Comparison of the Hübl, Wijs, Hanus, and McIlhiney Methods of Determining the ——. L. M. Tolman. J. Amer. Chem. Soc., 1904, **26**, 826—837. (See also Archbutt and Harvey, this J., 1902, 1437—1439.)

The author's experiments have led him to the conclusion that the results obtained by the methods of Wijs and Hanus are more reliable than the Hübl values. The solution of Hanus is readily prepared, and gives results agreeing more closely with current figures, but for rapid absorption an excess of 60 to 70 per cent. is required. In the case of Wijs' solution an excess of 35 per cent. is sufficient, but the results are higher. With either method 80 minutes is a sufficient time for complete absorption, though Wijs' method is about three times as rapid. The solution of Hanus is less affected by light than the other solutions. Acetic acid is a more suitable solvent for the active agent than carbon tetrachloride, which gives unsatisfactory results in ordinary work. If, however, the amount of substitution is to be determined, a solution of iodine chloride in carbon tetrachloride is the best reagent. For instance, in the case of rosin oil the following iodine values were obtained after 30 minutes:—

——	Total.	Addition.	Substitution.
Iodine chloride in carbon tetrachloride	257·0	5·46	125·7
Iodine bromide in carbon tetrachloride	190·8	24·50	83·8
Bromine	257·0	5·46	125·7

—C. A. M.

Glycerol; Notes on the Determination of ——. [*Bichromate Method.*] Taurel. Monit. Scient., 1904, **18**, 574—577.

Several details are mentioned, the observance of which is considered to be necessary in order to obtain correct results by this method. In the first place, the glycerin should be carefully neutralised before precipitating the impurities with lead solution. The latter should consist of a solution of di-basic lead acetate or a mixture of sesqui-basic and di-basic lead acetate. Any excess of the latter added, must be removed before adding the chromic acid solution. It is preferable to carry out the oxidation in a flask attached to a reflux condenser.—W. P. S.

Chromed Hide-Powder Question. F. Kopecky.
XIV., page 830.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Diamond; Action of Radium Emanations on ——. Sir W. Crookes. Proc. Roy. Soc., 1904, **74**, 47—49.

It has previously been shown that when diamonds are exposed to the impact of radiant matter in a high vacuum, they exhibit phosphorescence of different hues, and assume a dark colour, owing to the formation of a coating of graphite. The author selected two Bingara diamonds, A and B, weighing respectively 0·960 and 1·020 grains; and of the same very pale yellow "off colour." B was kept first for a fortnight, and then for a further six weeks, close to a quartz tube containing about 15 mgrms. of pure radium bromide sealed *in vacuo*; it phosphoresced brightly and continued to glow the whole time of the experiment. At the end, no appreciable difference in colour between the two diamonds could be detected. B was then kept for 78 days in direct contact with radium bromide, at the end of which period, it was distinctly darker than A and had a bluish-green tint. After removing the graphite from B by treatment with nitric acid and potassium chlorate, the two diamonds were equally bright and transparent, but B had a pale bluish-green colour. This alteration of colour may be of commercial importance. It was found that the diamond B was strongly radio-active after it had been removed from the radium bromide for 35 days, during 10 of which it was being heated in the mixture of nitric acid and potassium chlorate, to remove its outer skin of graphite.—A. S.

Photochemical Reactions in a Homogeneous System; Reversible ——. I. Anthracene and Di-Anthracene. R. Luther and F. Weigert. Sitzungsber. Kgl. pr. Acad. Wiss., Berlin, 1904, 828—839. Chem. Centr., 1904, **2**, 117.

Under the influence of sunlight, anthracene in solution, as observed by Fritzsche, and also, according to the authors, in the solid condition and as vapour, changes into dianthracene which, in the dark, is again converted into anthracene. The transformation is especially rapid under the action of light from a mercury vapour electric lamp. The conversion of dianthracene into anthracene in the dark, is complete; but, in the case of the reverse reaction in the light, a condition of equilibrium is finally attained, the proportions of the two compounds depending upon various factors, such as the nature of the solvent and of the source of light, the intensity of the light, the surface illuminated, the volume of the solution, &c. The reactive power of anthracene is considerably increased under the influence of light, *e.g.*, when exposed to light, anthracene is oxidised by the air with the production of a yellow coloration.—A. S.

Diphenylcarbonic Ester; Action of a Trace of some Salts and of Caustic Alkali on ——. R. Fosse. Comptes rend., 1904, **139**, 141—143.

The author has previously shown that diphenyl carbonate, when heated with a small quantity of dry sodium carbonate, decomposes with formation of carbon dioxide, phenol, and phenyl-*o*-phenoxybenzoate, in accordance with the equation: $2(C_6H_5)_2CO_3 = CO_2 + C_6H_5OH + C_6H_4(CO_2C_6H_5)(OC_6H_5)$. He now finds that small quantities of trisodium phosphate, disodium arsenate, sodium bi- and tetraborate, di- and monosodium salicylate, sodium ethylate, sodium hydroxide, and potassium hydroxide are also capable of causing this decomposition.—A. S.

Enzymes; Study of the Instability of ——. K. Aso. Bull. Coll. Agric., Tokyo, **6**, 57—75. Chem. Centr., 1904, **2**, 79.

In order to elucidate the nature of the labile groups present in enzymes, the author studied the action of cyanogen, nitrous and nitric acids, hydrazine, methylhydrazine, and hydroxylamine on different enzymes. It was found that: (1) The activity of enzymes is not destroyed in very dilute solutions by small quantities of cyanogen; this is a further essential difference in the behaviour of living protoplasm and that of enzymes. (2) Very dilute nitrous acid has a greater destructive action on the activity of enzymes than nitric acid of the same concentration. (3) Hydrazine, methylhydrazine, and hydroxylamine in dilute neutral solutions destroy the activity of enzymes. The behaviour of the enzymes can be best explained if the active groups are aldehyde or ketone groups. (See also this J., 1904, 687.)—A. S.

New Books.

Das Photographieren mit Films. "Photographische Bibliothek," Bd. II. Dr. E. Holm. Gustav Schmidt' Verlag, Berlin, W., 10. 1904. Price M. 1.20.

8vo volume, containing 64 pages of subject-matter and table of contents. The pages are illustrated with 51 engravings, and the subject is treated under the followin heads:—A. Functions and Varieties of Films. Ordinar and Orthochromatic Films, and Films for Tricolour Photography. Celluloid, Paper, and Gelatin Films. B. Advantages and Drawbacks in Films as opposed to Glass Plates I. Advantages of Films. II. Disadvantages. C. Preparation of Films. (i.) Mechanical Preparation, &c. (ii.) Exposure. (iii.) Development. (iv.) Further Treatment o Films. (v.) Different kinds of Film-Cameras, &c.

Electro-Chemistry. Part I. General Theory. By R. A Lehfeldt, D.Sc., Professor of Physics at the East Londo Technical College. Including a chapter on the Relatio of Chemical Constitution to Conductivity. By T. S Moore, B.A., B.Sc., Lecturer in the University o Birmingham. Longmans, Green, and Co., 30, Paternoste Row, London, E.C.; also New York and Bombay. 1904 Price 5*s*.

8vo volume, containing 260 pages of subject-matter, wit 55 illustrations. Pages 255—260 are devoted to table pages 261—268 to alphabetical indexes of names of author &c., and subjects. The subject-matter is treated under th following arrangement:—I. (R. A. Lehfeldt) Mechanis of Conduction in Electrolytes. II. (T. S. Moore) Relatio of Chemical Constitution to Conductivity. III. (R. A Lehfeldt) Theory of Chemico-Electromotive Force.

Trade Report.

I.—GENERAL.

National Bureau of Standards, U.S.A.: Annua Report of the Director of the —— for the Fiscal Year ended June 30, 1903.

Government Printing Office, Washington, U.S.A.

The Office of Standard Weights and Measures of th Treasury Department was, on July 1, 1901, in pursuanc of an Act of Congress approved March 3, 1901, supe seded by the Bureau of Standards. On July 1, 1903, Department of Commerce and Labour was establishe to which the Bureau was transferred. The functio of the Bureau of Standards are as follows:—The custod of the standards; the comparison of the standards used scientific investigations, engineering, manufacturing, com merce, and educational institutions, with the standar adopted or recognised by the Government; the constructio when necessary, of standards, their multiples, and su divisions; the testing and calibration of standard measuri apparatus; the solution of problems which arise in conne tion with standards; the determination of physical constan and properties of materials. The Bureau will also furni such information concerning standards, methods of measur ment, physical constants, and the properties of materia as may be at its disposal. For all comparisons, calibration tests, or investigations, except those performed for t Government of the United States or State Government reasonable fees will be charged.

In the Annual Report of the Director, detailed descriptions of the various departments of the Bureau and of their equipment are given. The number and value of the tests completed during the fiscal year ended June 30, 1903, are given in the following table :—

Nature of Test.	For Government.		For Public.		Total.	
	No.	Value.	No.	Value.	No.	Value.

Accompanying the report are seven Bureau circulars dealing with : (1) Verification of Standards and Measuring Instruments ; (2) Verification of Metal Tapes ; (3) Verification of Standards of Mass ; (4) Verification of Standards of Capacity ; (5) Testing of Clinical Thermometers ; (6) Verification of Electrical Standards and Measuring Instruments ; (7) Pyrometer Testing and Heat Measurements.

—A. S.

FEDERATED MALAY STATES ; EXPORTS OF THE —— IN 1903.

Bd. of Trade J., Aug. 4, 1904.

Tin and tin ore contributed 71½ million dols. to the exports, an increase of 14½ per cent. in value and of 7 per cent. in quantity of tin, and over 10½ per cent. in that of tin in ore. Pahang sent out an increase of 2,000 piculs of tin (25,275 against 23,114 piculs). Gold bullion from Pahang fell to 12,441 oz., representing a value of 565,366 dols., a decrease of 7,113 oz. and of 170,000 dols., but the export from Negri Sembilan rose from 199 oz. in 1902 to 2,370 oz. in 1903, and in value from 7,000 dols. to 98,000 dols. Sugar, almost entirely from Perak, amounted to 391,595 piculs, valued at 1,807,679 dols., a decrease in quantity but an increase in value, as compared with the figures for the previous year, which were 421,880 piculs and 1,705,504 dols.

Rubber was exported from Negri Sembilan to the value of 250 dols. in 1902 and 3,713 dols. in 1903. Gambier exports reached 386,675 dols., a decrease of some 25,000 dols in value and of 3,000 piculs in quantity ; the decrease occurred in Negri Sembilan. Jungle guttas of all kinds rose in value from 41,000 dols. to 68,000 dols., and in quantity from 531 to 625 piculs, Pahang alone contributing to the extent of 53,000 dols., an advance of 19,000 dols., and Selangor having a trade of 13,000 dols. compared with less than 1,000 dols. in 1902.

LYONS (FRANCE) ; CHEMICAL INDUSTRY IN ——.

Foreign Office Annual Series, No. 3243.

The following table shows the consumption of pyrites in Lyons in 1901-3 :—

——	1901.	1902.	1903.
	Tons.	Tons.	Tons.
Production of mines of St. Bel	307,000	315,000	320,000
Export	53,000	64,000	117,000
	254,000	251,000	203,000
Import of pyrites	205,000	171,000	205,000
Consumption	459,000	422,000	408,000

The consumption of pyrites, and consequently the production of sulphuric acid, has decreased slightly. The manufacture of "concentrated" sulphuric acid, begun in 1902 at Lyons by the Volta company, continued in 1903.

The glue and gelatin trade suffered from over-production. The general industrial crisis throughout France prevented the French industry from absorbing the surplus production, nor has production lagged behind in other countries ; the import into France also increased from 1,992 tons in 1902 to 2,428 tons in 1903. The increase in export from 7,794 tons in 1902 to 7,948 tons in 1903 did not suffice to relieve the congestion of the market, and a considerable fall in prices resulted. The activity of the bone manure industry, on the other hand, keeping up the price of raw material, placed the glue and gelatin industries in an abnormal position. This brought about an appeal from the manufacturers for a higher protective tariff, which was granted, it being fixed at 11 fr. per 100 kilos. general tariff, and 7 fr. 50 c. per 100 kilos. minimum tariff.

Reduction in the output of phosphorus was general in 1903. The consumption is stationary and the activity of the factories is dependent on the export demand. The export of white phosphorus fell from 89½ tons in 1902 to 61½ tons in 1903, whilst red phosphorus increased from 48¾ to 65½ tons for the same period.

The consumption of stearine and soap was as follows :— 1884, 30,500 tons ; 1900, 28,000 ; 1901, 25,750 ; 1902, 25,400 ; 1903, 24,600. The export is maintained, but does not counterbalance the decrease of consumption in France itself. The export of candles during the last three years was as follows :—1901, 4,402 tons ; 1902, 4,348 ; 1903, 4,381. Small factories are gradually disappearing.

There are two manufactories at Lyons for turning out rubber goods. The factory at Lacollonge has produced a new article—hardened imitation rubber—at a cost far below ordinary hardened rubber. A curious economic phenomenon has taken place of late years in the French rubber industry. Bordeaux has recently taken the place of Antwerp as the rubber market for France. The figures showing the imports into Bordeaux are as follows :—1898, 89 tons ; 1899, 175 ; 1900, 239 ; 1901, 235 ; 1902, 678 ; 1903, 1,113. The consumption of indiarubber both at Clermont-Ferrand and at Lyons for electrical machines, and for tyres for automobiles and bicycles, has brought these cities to form new commercial connections.

MADAGASCAR ; TRADE OF —— IN 1903.

Bd. of Trade J., Aug. 4, 1904.

Below are given the values of certain articles exported from Madagascar in 1903. The figures in brackets are those for 1902 :—Gold, 5,856,778 fr. (4,123,612 fr.) ; rubber, 2,581,439 fr. (545,630 fr.) ; hides, 1,214,686 fr. (734,890 fr.); wax, 556,018 fr. (789,519 fr.).

VII.—ACIDS, ALKALIS, Etc.

SULPHUR TRADE OF SICILY.

Bd. of Trade J., Aug. 4, 1904.

The exports of sulphur from Sicily during the 12 months ended June 30, 1904, amounted to 505,629 tons, as compared with 484,850 tons in the similar period of 1902–3.

The stock of sulphur remaining in Sicily at the end of June last was 278,025 tons, as compared with 287,878 tons and 276,589 tons respectively on the same date in 1903 and 1902.

X.—METALLURGY.

NEW SOUTH WALES ; MINERAL PRODUCTION OF ——

Bd. of Trade J., Aug. 4, 1904.

According to the annual report of the Department of Mines, New South Wales, the value of the mineral production of the State for the year 1903 was 6,059,486*l.*, this being a net increase of 421,341*l.* over that of the previous year (see this J., 1903, 767). All the principal minerals show satisfactory increases in value.

The production of gold from ores, &c. mined in the State during 1903 was 295,778 oz. crude (equal to 254,260 oz. fine), valued at 1,080,029*l*., as compared with 190,316 oz. crude (equal to 161,255 oz. fine), valued at 684,970*l*., for the preceding year. A statement of the yield obtained by dredges during the past four years shows an increase from 8,882 oz. in 1900 to 27,238 oz. in 1903. The chief centre of the gold dredging operations is in the Araluen division. There were fourteen plants at work there at the close of the year, and they contributed 53 per cent. of the value of the yield obtained by this branch of of the industry.

The total quantity of coal produced in New South Wales to the end of 1903 is estimated at 109,741,916 tons, valued at 44,021,103*l*. The production for 1903 was 6,354,846 tons, valued at 2,319,660*l*., as compared with 5,942,011 tons, valued at 2,206,598*l*. for the previous year.

The total production of kerosene shale for 1903 was 34,776 tons, valued at 28,617*l*., this being a decrease of 28,104 tons, and 31,100*l*. in value, on that of the previous year.

The estimated net value of silver, silver-lead, concentrates, ores, &c. for 1903 was 1,501,403*l*., and with lead and zinc added, the total value was 1,626,576*l*., or an increase of 128,114*l*. in the value of the output as compared with the previous year.

From ores raised in the State during the year, the value of the copper produced was 431,186*l*., as compared with 308,923*l*. for the previous year. The quantity of tin ore obtained by the dredges during the year amounted to 244 tons, valued at 20,100*l*.

At the close of the year there were six plants equipped primarily for saving tin at work, while three dredges were saving tin as well as gold. Several additional plants were on the point of starting operations, and others were in the course of construction. The output of tin ore during the year 1904 is therefore likely to be largely augmented from this source.

Manganese Ore Industry of Russia.

Foreign Office Annual Series, No. 3206.

The following figures show the quantities of manganese ore exported from Batoum during the year 1903 to the countries named :—Russia, 53,420 tons ; Netherlands, 50,900 tons ; Belgium, 5,125 tons ; total, 109,445 tons.

The stock of manganese ore at Tchiatouri at the end of 1903 was over 323,000 tons, mostly of good quality, and the market prices varied from 6 to 7 kopeks per poud (1½*d*. to 2*d*. per 36 English lb.), less an allowance of 15 to 20 per cent. on the weight for waste. Steamers are loaded almost entirely at Poti from waggons coming direct from Tchiatouri.

Minerals in Barcelona (Spain).

Foreign Office Annual Series, No. 3237.

Further progress has been made in the working of the arsenic and galena mines, from which, during the year, 6,982 tons of arsenical pyrites were sent to the smelting works at Badalona, producing 2,350 tons of white arsenic which, with the exception of 43 tons, was exported at a very profitable price.

The past year has seen the first shipment of iron ore from a mine in Catalonia, a British firm having shipped at Culera (a small port near Port Bou) 2,200 tons of iron ore, proceeding from the mines of Celra, in the province of Gerona, for Newport, Mon.

XII.—FATS, FATTY OILS, Etc.

Olive Oil ; Production of —— in Spain.

Monit. Offic. du Commerce. Bd. of Trade J., Aug. 4, 1904.

In 1903, the area of land devoted to the cultivation of olives amounted to 1,333,303 hectares,* an increase of 173,042 hectares over the average for the last 10 years. The production, however, shows a decrease, being 1,975,803 quintals, as compared with an average of 2,195,743 quintals during the last 10 years.

A large portion of the oil produced is consumed in Spain ; the remainder is sent to France, chiefly to Nice, Aix, and Salon, where it is refined and mixed with oil produced in Provence, consumed in France, or exported to other countries.

XIII. A.—PIGMENTS, PAINTS, Etc.

Sienna ; Burnt Italian —— : U.S. Customs Decision.

July 18, 1904.

Burnt sienna earth, showing on analysis water 9·80 per cent., iron oxide 82·75, and alumina, silica, and sulphates 7·45 per cent., was assessed for duty at 30 per cent. *ad valorem*, as a "colour," under paragraph 58 of the present tariff. The Board of General Appraisers overruled this action, and sustained the claim of the importer that it was properly dutiable at ⅜ cent per lb., under paragraph 49, as "sienna, washed, powdered, or pulverised," on the ground that the evidence showed it to be sienna, and that there was no recognised dividing line between sienna earth and iron oxide.—R. W. M.

XIII. B.—RESINS, VARNISHES, Etc.

Wood Turpentine ; Manufacture of —— in Savannah, U.S.A.

Foreign Office Annual Series, No. 3240, *Aug.* 1904.

"Wood turpentine," that is, a somewhat inferior quality of spirit of turpentine, is now being manufactured in the Southern States from pine knots, roots, &c., which sources of supply have hitherto been allowed to go to waste in abandoned pine lands. The new industry, as yet, is only in the experimental stage, but it is being watched with interest by naval store dealers, who hope that an article produced in this way may be useful in the industrial arts, where cheaper grades are utilisable, and where it is not necessary to use the high standard qualities of spirits of turpentine which so far can only be obtained by distilling the pure gum of the pine tree.

XIII. C.—INDIA-RUBBER, Etc.

Crude Gutta-Percha Trade ; Control of —— by the Chinese.

India-Rubber J., 1904, **28**, 127—128.

In a pamphlet recently issued by the Philippine Department of the Interior, P. L. Sherman states that the entire crude gutta-percha trade is practically controlled by the Chinese in Singapore, the secrets of boiling, working over, mixing, adulterating, and colouring being closely guarded. Philippine gutta-percha is collected by natives, who receive from the middleman about 10 Mexican dols. per picul of 162½ lb. The middleman carries the material to the coast and sells it to the Chinese exporter at the rate of 40—80 dols. per picul of 137½ lb. The forestry dues (5—7 Mexican dols.) are paid by the exporter, who sends the gutta-percha to Sandakan (North Borneo) or Singapore, where it is sold for 100—150 Mexican dols. per picul of 133½ lb., as North Borneo gutta-percha. It is stated that the Chinese in preparing the crude material for the European market are guided by smell, colour, toughness, and the softening and hardening test in hot and then cold water. So long as the collecting of the gutta-percha is in the hands of wild natives, and the manipulating and sale are controlled by the Chinese, there is no hope of the gutta-percha trade being placed on a fair basis.—A. S.

Rubber Production of the Congo Free State.

Bd. of Trade J., Aug. 4, 1904.

The total value of the rubber exported from Congo during 1903 is estimated at 1,893,754*l*.

---

* Hectare = 2·47 acres. Quintal = 220½ lb.

XIV.—TANNING; LEATHER; GLUE, Etc.

QUEBRACHO IN PARAGUAY.

Foreign Office Annual Series, No. 3241.

The quebracho extract business of Paraguay has greatly increased of late years, the value of the export having risen from 5,056*l.* in 1900 to 18,779*l.* in 1901, 44,032*l.* in 1902, and 60,125*l.* in 1903.

CHESTNUT WOOD EXTRACT; EXPORTS OF —— FROM BASTIA (FRANCE).

Foreign Office Annual Series, No. 3246.

In 1902 the total export of extract of chestnut wood for anning to the principal markets outside France were ,000 tons, Hamburg taking more than half; but Liverpool vas the largest buyer in 1903, when the shipments were:—

——	Barrels.	Tons.
iverpool	15,200	4,100
lamburg	14,500	3,900
ntwerp	5,600	1,500
ondon	2,600	700
Total	37,900	10,200

XVI.—SUGAR, STARCH, Etc.

SIZING STARCH: U.S. CUSTOMS DECISION.

July 28, 1904.

A mixture of tapioca and potato starches was decided to e dutiable at 1½ c. per lb., under paragraph 285 of the resent tariff, notwithstanding that tapioca by itself is free f duty. The claim of the importer that it was dutiable at 0 per cent. *ad valorem* under section 6 as a "manufactured rticle unenumerated" was overruled.—R. W. M.

XVII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOL; OCTROI TAX ON ——. U.S. CUSTOMS DECISION.

The Treasury Department has directed an appeal to the ircuit Court of Appeals from the decision of the United ates Circuit Court on the above (see this J., 1904, 734). util this question is finally settled by the Circuit Court of ppeals, the decision of the lower court will not be followed the United States Customs.—R. W. M.

XX.—FINE CHEMICALS, Etc.

PETIT-GRAIN OIL; EXPORTS OF —— FROM PARAGUAY.

Foreign Office Annual Series, No. 3241.

The value of the export of oil of petit-grain from Paraguay ring the last few years was as follows:—1898, 1,920*l.*; 99, 2,442*l.*; 1900, 3,818*l.*; 1901, 5,350*l.*; 1902, 5,831*l.*; 03, 7,183*l.*

GLYCERIN TANNATE: U.S. CUSTOMS DECISION.

July 22, 1904.

A compound of glycerin and tannin made by a patented ocess, was assessed for duty at 50 c. per lb. as "tannic id" under paragraph 1 of the present tariff. The Board General Appraisers overruled this action, and sustained e claim of the importer that it was dutiable at 25 per cent. *valorem* under paragraph 3 as a "chemical compound."
—R. W. M.

COUMARIN: U.S. CUSTOMS DECISION.

July 18, 1904.

Synthetic coumarin, produced from coal tar, was decided be dutiable at 20 per cent. *ad valorem*, under paragraph of the present tariff as a "preparation of coal tar, not a colour or dye, and not medicinal." The assessment of duty at 25 per cent. *ad valorem*, as a "chemical compound," under paragraph 3, was overruled.—R. W. M.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted; those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

[C.S.] 21,609 (1903). Creswick and Shaw. Electrodeposition of metals upon aluminium. Aug. 17.

„ 9468 (1904). Neuburger and Minet. Method and apparatus for heating the charge of electric furnaces. Aug. 10.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 17,218. Armstrong and Armstrong. Manufacture of soap and detergent compounds. Aug. 6.

[C.S.] 14,216 (1904). Brown (Warden). Apparatus for filtering and washing oils. Aug. 17.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

[C.S.] 22,806 (1903). Newton (Bayer and Co.). Manufacture of colour lakes. Aug. 17.

(*B.*)—Resins, Varnishes.

[A.] 17,222. Walton. Manufacture of floorcloth, wall coverings, &c. Aug. 6.

(*C.*)—India-Rubber.

[A.] 17,313. Price. Process for devulcanising and regenerating rubber waste. [U.S. Appl., May 26, 1904.]* Aug. 8.

„ 17,579. Tiehsen. Manufacture of a substitute for indiarubber.* Aug. 12.

[C.S.] 17,156 (1903). Frankenburg, Ltd., Frankenburg and Betteridge. Rubber solutions or compounds. Aug. 17.

XIV.—TANNING, LEATHER, GLUE, SIZE, Etc.

[A.] 16,888. Hannemann. Non-desiccating depilatories.* Aug. 2.

[C.S.] 9932 (1904). Oakes. *See under* IV.

XVI.—SUGAR, STARCH, GUM, Etc.

[C.S.] 16,750 (1903). Harrison (F. Hlavati and Co.). Manufacture of sugar. Aug. 10.

„ 23,703 (1903). Bate. Drying starch from rice or other amylaceous products. Aug. 17.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 16,992. Baker and Ling. The sulphuring of hops, malts, and other materials, with special reference to the avoidance of contamination with arsenic, and apparatus therefor. Aug. 3.

„ 17,438. Hunt. Manufacture and maturing of spirit. Aug. 10.

„ 17,651. Linzel and Bischoff. Production from fermented fluid of a drink free from alcohol, by means of a vacuum. Aug. 13.

[C.S.] 19,472 (1903). Henry. Apparatus for assisting the aerating of grain for malting, distilling, &c., during the steeping process. Aug. 10.

„ 11,752 (1904). McKenna (Holst and Fleischer). Malting and drying drums. Aug. 10.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*B.*)—Sanitation; Water Purification.

[A.] 16,931. Dorling. The sterilisation of water.* Aug. 2.

„ 16,934. Lake (Jewell). The purification of water. Aug. 2.

„ 17,307. Walter. Water purifying apparatus. [Ger. Appl., Sept. 21, 1903.]* Aug. 8.

[C.S.] 17,661 (1903). Boult (Vasseux). Treatment of wash and other waste waters or residues. Aug. 17.

„ 20,021 (1903). Turner. Treatment of trade effluents. Aug. 17.

„ 14,709 (1904). Wheelwright and Fiske. Apparatus for removing oil and grease from garbage or offal. Aug. 10.

„ 15,235 (1904). Wheelwright and Fiske. Process of cooking garbage or offal and removing the oil or melted grease therefrom. Aug. 17.

(*C.*)—Disinfectants.

[A.] 17,320. Stephan. Disinfectant. Aug. 8.

„ 17,607. Endemann. Antiseptic compositions and process of producing the same.* Aug. 12.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 17,232. Homberger. Method of imparting lustre to objects made of celluloid and the like. Aug. 6.

[C.S.] 19,541 (1903). Harrison (Vellumoid Paper Co.). Manufacture of waterproof paper and the like. Aug. 10.

[C.S.] 14,447 (1901). Hennessen and Spix. Process of manufacturing figured glazed paper. Aug. 17.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 16,996. Merck. Manufacture of new cyan derivatives of pyrimidine. [Ger. Appl., Sept. 15, 1903.]* Aug. 3.

,, 17,003. Newton (Bayer and Co.). Manufacture of pyrimidine derivatives. Aug. 3.

[C.S.] 24,723 (1903). Imray (Meister, Lucius und Brüning). Manufacture of compounds of the active substance of suprarenal glands. Aug. 17.

,, 25,546 (1903). Verley. Manufacture of protocatechuic aldehyde and its derivatives. Aug. 17.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 17,009. Lake (Jacobson). Photographic reproductions.* Aug. 3.

,, 17,036. Lake (Jacobson). Photographic reproductions.* Aug. 3.

,, 17,192. Strasser. Photographic process. Aug. 5.

,, 17,610. Schmidt. Pigment photographic processes.* Aug. 12.

XXII.—EXPLOSIVES, MATCHES, Etc.

[C.S.] 17,414 (1903). Bell. Pressing of gun-cotton blocks, and apparatus therefor. Aug. 10.

,, 14,625 (1904). Hill. Matches. Aug. 10.

Printed and Published by Eyre and Spottiswoode, East Harding Street, London, E.C., for the Society of Chemical Industry.—P 10403.

JOURNAL OF THE
Society of Chemical Industry.
A RECORD
FOR ALL INTERESTED IN CHEMICAL AND ALLIED MANUFACTURES.
ISSUED TWICE A MONTH.
No. 17.—Vol. XXIII. SEPTEMBER 15, 1904. No. 17.—Vol. XXIII.

Subscription of Members 25/- per annum;
Entrance Fee 21/-;
Election by the Council.

Price to Non-Members 36/- per annum;
To Members 25/- per Set of extra or back numbers.
Single copies (Members and Subscribers only),
1882—1901, 2/6 each; 1902 *et seq.*, 1/9 each.

The Society of Chemical Industry.

Past Presidents:

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., F.R.S.	1891—1892.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Anspach, Dr. R., l/o Vestra Hamngatan; Kristinelundsgatan 5, Göteborg, Sweden.

Ardern, Edw., l/o Atkinson Road; 4, Westbourne Road, Urmston, Manchester.

Beckett, Jos. H., l/o Albert Road; 3, Greasboro Road, Parkgate, near Rotherham.

Clayton, H., l/o Westleigh, Lancs.; 15, North Cray Road, Bexley, Kent.

Crossley, Dr. A. W., l/o St. Thomas' Hospital; Pharmaceutical Society, 17, Bloomsbury Square, W.C., Professor of Chemistry.

Dunn, Dr. J. T., l/o The Side; 10, Dean Street, Newcastle-on-Tyne.

Escher, Paul, l/o National Stock Yards; 733, West 64th Street, Chicago, Ill., U.S.A.

Fawsett, Dr. Chas. E., l/o Edinburgh; Chemical Department, The University, Glasgow.

REPORT OF COUNCIL.

The number of members on the register on July 31, 1904, was 4,134, as compared with 3,950 at the last annual meeting. During the year 400 new members have been elected, as compared with 380 last year; and the losses have been 216, as against 224.

There have been 29 deaths, as compared with 44 last year, *viz.*, Dr. A. P. Aitken, Mr. Alfred H. Allen, Capt. H. C. Aspinwall, Sir Frederick Bramwell, Baron W. de Bush, Messrs. Alexander Dick, E. E. Ewell, Harry Grimshaw, Jas. Hands, Dr. E. Hantke, Messrs. Jas. Heriot, Edwin Hunt, G. B. Jackson, H. C. Kohl, R. W. McKinlay, W. G. Macmillan, R. Preston, Geo. Rae, Julius Schad, C. Simeons, H. E. Slade, Major W. Staempfli, Jno. Stanning, W. Van Slooten, E. Robinson Walker, A. W. Walls, A. Weightman, Thos. Whiffen, and W. H. White.

The Journal for 1903 numbered 1,378 pages, equal to 57·5 pages per issue, as against 65·5 in 1902. During the past session 90 original papers, with discussions, have appeared in the Journal, as compared with 81 in the previous session. Of 20 papers returned to authors by the Publication Committee for amendment or condensation, 17 have been published after being recast, rewritten, or condensed, and three have been withdrawn.

The exchange list has been revised; journals which have ceased to be of value to the Society have been discontinued, and others, more useful, substituted. The decennial index for the years 1896—1905 is in a satisfactory state of advance, and it is hoped that it will be issued as contemplated in 1906. Pains have been taken to improve the illustrations in the Journal.

The Hon. Treasurer's financial statement, which was issued in the Journal for June 30th last, will be laid before the meeting.

Since the last annual meeting, the Sydney Section has been duly constituted, its by-laws approved, and papers from the Section published in the Journal.

From the Board of Trade the Council continues to receive for consideration important papers relating to the tariffs and trade regulations of other countries.

Allusion was made last year to the appointment of a committee to collect information from members as to the incidence of railway freights upon the chemical and allied industries. The replies received enabled that committee to report that the burden of freight was highest on the cheaper articles, and ranged from 15—30 per cent. of the value. Whether railways can carry at appreciably cheaper rates is regarded as doubtful; but, as proved by the experience of America, Belgium, France, and Germany, heavy freight can be carried much more cheaply by canals, if they be brought up to date and placed under independent management.

It has long been urged that Government, through a department, should be in closer touch with commerce and industries. In Germany the functions of the Minister of Commerce comprise the control of "all matters affecting handicrafts," and to it, as a consultative body, is attached the Technical Committee for Industry, which studies the scientific progress of industries, and keeps the minister in touch with them. America has recently established a Department of Commerce and Labour, and France has had a Minister of Commerce for some years. The Council two years ago appointed a committee to co-operate with Members of Parliament and others who were in favour of this reform.

The Society of Chemical Industry has during the past year been able to render effective assistance to the Royal Commission for the St. Louis Exhibition in respect of the British chemical exhibit. The chemical industries are represented at St. Louis by a collection which is described by the *Times* as "an excellent show on both the theoretical and practical sides," and it may fairly be said that the success which has attended the labours of the organising committee, all of whom are active members of the Society, would have been more difficult of achievement in the absence of the facilities which the Society was able to afford for making known the merits of the project. It is gratifying to record that the thanks of the Royal Commission have been conveyed to the Society for the services thus rendered. The important section of the Society represented by the American membership cannot fail to share the satisfaction which the Council feels in having contributed in this manner to the carrying out of the wishes expressed by the President of the United States.

The concessions made by the British Government in respect of the use of untaxed denatured alcohol for manufacturing purposes have not yet proved of general value in chemical manufactures. There have been some variations in the denaturants used in some instances, notably in the manufacture of fulminates and celluloid, both of which manufactures are under continuous supervision by revenue officials. The Council is of opinion that the range of denaturants should be greatly extended, and that no increase of drinking or "illicit distillation" is probable as a consequence of granting concessions to British manufacturers under guarantee. The Council regards with satisfaction the indications that the subject of reductions in the differential duty on British-made alcohol, and an alteration in the regulations for the sale of suitably denatured spirit, are receiving the sympathetic consideration of the authorities. The extension of the use of internal combustion engines, and the consequent increase in the demand for volatile fuel, have also directed attention to alcohol as a source of power; and the employment of methylated spirit for domestic use and lighting and heating purposes has been found economical and practicable. The Council has long co-operated with the Chemical Trade Sections of the London and Manchester Chambers of Commerce, and the Joint Committee of this Society and these Chambers has been further strengthened by the addition of representatives of the motor, lighting, distilling, agricultural, and engineering industries. At the instance of this Committee, supported by many Members of Parliament, the Chancellor of the Exchequer has consented to appoint a departmental committee, including recognised commercial and scientific representatives, to examine into and report upon the best method of providing untaxed alcohol, denatured or otherwise, for industrial purposes. The Council desires to express its appreciation of the persistent efforts of Mr. Thomas Tyrer in connection with this industrial need.

The Executive Committee of the National Physical Laboratory at Bushy Park, on the governing body of which the Society is represented, and to which the Council has made grants from time to time, has petitioned the Treasury for a larger annual grant and an increased equipment to fit it for its scientific work. At the same time a series of constructive proposals for the future working of the Institution have been presented. The Council has given its support to a petition asking the Treasury that the Laboratory may be placed in a position to do its important international work by means of a grant for capital expenditure and an increased annual subvention. Among the more important researches carried out by the Laboratory during the past year may be mentioned those on pure iron-carbon alloys, certain nickel-steel alloys, mercury standards of resistance, a comparison of thermometers up to 1,100° C., and measurements of the specific heat of superheated steam up to a pressure of 200 lb. to the square inch.

In response to a request from the Director of the Department of Commerce and Labour at Washington, the Council has granted a free copy of the Journal for the use of the new Bureau of Standards. The Director of the Department states that the purposes of this Bureau are similar to those of the Physikalisch-Technische Reichsanstalt at Charlottenburg, and that in the future it will issue bulletins containing much valuable matter on the scientific work of the Bureau.

The Association of Chambers of Commerce, at a recent meeting in London, passed a resolution welcoming the instalment of reform secured by the Patent Law Amendment Act of 1902, to which allusion was made last year. It also expressed the opinion that all foreign-owned patents for inventions and designs workable in the country, which were not so worked within a reasonable limit of time, should be forfeited. The Council has since been invited to appoint delegates to a deputation to bring this subject before the President of the Board of Trade, and has consented, subject to a reservation in regard to the words "foreign-owned."

In the opinion of the Council, if patents granted in Great Britain are worked elsewhere, they should also be worked here or lapse, whether they are "foreign-owned" or not.

The Society's medal, founded in 1896, and awarded by the Council once in every two years for conspicuous service rendered to Applied Chemistry by research, discovery, invention, or improvements in processes, has this year been awarded to Ira Remsen, President of the Johns Hopkins University of Baltimore. In 1896 the medal was awarded to John Glover, in 1898 to W. H. Perkin, in 1900 to Edward Schunck, in 1902 to Jos. Wilson Swan.

An invitation will be laid before this meeting from the Local Section of the Society to meet in London in 1905. It is hoped that this invitation will receive favourable consideration. American, Canadian, and Australian members will receive that cordial welcome which the Society has always experienced on these occasions. The Council trusts that American members will be present in force to support the President, who, as in 1900, will be a member of the New York Section of the Society.

The expenses of the Journal are necessarily heavy, and the Council trusts that members will make known to others the aims of the Society and the character of its Journal, so as to secure a constant addition to the membership, and thus permit of an equally constant extension of the Society's sphere of usefulness.

HONORARY TREASURER'S REPORT.

In the first place allow me, through Mr. Tyrer, who has kindly consented, with the Council's permission, to occupy my position as your honorary treasurer during this meeting, to express the very great disappointment which I feel in being unable personally to make the acquaintance of so many good and hospitable friends and brother industrials.

Last autumn I fully hoped and intended to be with you to-day, but have been forbidden; and after three-quarters of a century of life one is bound to attend to what one's doctor says.

To me it would have been an immense pleasure to have met again those of you whom I have the good fortune to know, to have enjoyed the magnificent programme you have set before us, and to have seen something of your vast country and works; but this is denied me, and I can only trust to your kind forbearance for any apparent dereliction of duty towards you.

Turning from myself to my duty as treasurer, it is with pleasure that I am able to place before you the accounts for last year, 1903; these have been published in the 30th June number of the Journal, and you will, I think, find them clear and explicit.

The first account, that on page 642, shows the Revenue and Expenditure for 1903. There was a net balance to the good of 840*l.*, and this, with the entrance fees (which are not reckoned as revenue, but are always invested), has been funded in good securities during this year.

It may be well to explain that this account is dated as made up to the 20th May 1904, and it will be seen that it includes all subscriptions for 1903, whether paid in former years or during 1904. On the other side of the account all liabilities for 1903 have been paid and are included, so that the statement shows accurately the year's working.

In connection with this, I should mention the rule, of which probably some of you are not aware, that the Journal is not forwarded after February in any year to those members whose subscriptions have not been received in London by that time, but on their subsequent receipt the back numbers are sent.

As treasurer it is right that I should explain to you that after this year it is probable that there may not be such a balance on the year's working. Publishing twice a month, and giving abstracts of American and French patents, has very materially increased the cost of editorial work, printing, and posting. Our present contract expires at the end of this year, and a considerable increase appears probable. The decennial index, combining the 10 years 1896 to 1905 inclusive, will be costly, both for editing and printing, although considerable sums have already been paid in preparing it to date, and debited to expenditure in each year. When finished it will be a complete index to all the available information to the end of 1905 in the 24 sections into which the chemical industries are divided in our Journal.

I am only expressing the unanimous feeling of your Council in saying that they desire to keep the Journal up to the highest standard for information and promptness of publication, and to publish, subject to the rules of the Society, papers which have been read before the Sections, containing new and useful matter; but it must be borne in mind that every page has to be paid for, that lengthy papers are apt to be merely glanced at, and not read, so that it is very desirable to condense as far as possible, to avoid redundancy of expression, and to make judicious use of references.

Like other journals, advertisements form an important item, though they do not appear in the present balance sheet, being included in the contract. Those who can advertise will be assisting the Society by so doing, and also by obtaining the addition of new members.

Referring again to the accounts, the second statement, on page 643, shows the actual position of cash and securities in your honorary treasurer's hands on the 31st Dec. 1903. The securities are in the names of three trustees, and are all first-class. You will see by the chartered accountants' certificate that they have all been verified by them, as have also all receipts and payments during the year. The interest on the funded property amounts to over 400*l.* a year.

Allow me to detain you for a few minutes longer with that side of our Society which not only benefits ourselves individually, but the world generally. I mean its cosmopolitan or international character. One can see its far-reaching usefulness from the fact that, whilst reckoning the British Isles, the United States, Australia, Canada, Germany, India, as only one country each, your fellow members live in 62 different countries; your New York Section, with its vast area, has just over one-quarter of the whole. Germany has over 50 members, "Far Cathay" 2, and Japan 30, whilst such places as Siam, Korea, Turkey, Syria, Borneo, and 50 others are represented.

Can anything more be wanted to show the value of the Society and the Journal? Is it too much to say that it is the best journal of the kind published? Judging by the care your Publication Committee give to the work, to which I can personally testify, and from the reports one hears from outside, it seems to me by no means too big a claim.

Believing as I do that the intercommunication of knowledge useful to all is for the general welfare of the world and the gradual reduction of jealousies, it has been much pleasure to me to serve the Society in the office in which it has done me the honour to place me. My only regret is not being with you to-day.

PRESIDENT'S ADDRESS.

On this occasion of the first visit of our Society to America, let me thank you for the hospitable reception which you have given us. We are proud of our New York Section; we are glad to be associated with your great nation; and although separated by an ocean, though we differ as regards methods of government, and as regards some of the items of policy which the Governments of both nations pursue, we admire your energy, your progress, and the inventive ability of your people.

Gratitude has been defined as a sense of favours to come, and we know that we have reason to be grateful, for you are about to give us, your guests, a token of your regard; you are going to show us your magnificent country, and to demonstrate to us the enormous developments in chemical industry which you have made. We look forward with pleasurable expectancy to the treat which you have in store for us; and we ask you to accept our heartfelt thanks.

It is customary in our Society for the President to give his address when he is on the eve of retiring, and I have looked for hints in those of my predecessors. I had thought that perhaps some suggestions dealing with the training of technical chemists—a subject of which I have now had over 30 years' experience—might have been favourably received, and I find that this has been a favourite subject with the Presidents of our Society, and that it has been discussed at length by Mr. Beilby in an address delivered in 1899 to the London Section. The history of our industries in London has been described by Sir Frederick Abel in 1882; Sir Frederick also discussed the early history of explosives in 1883; in 1884 Mr. Weldon gave an account of the development of the alkali and chlorine industry; he was followed in 1885 by Dr. Perkin, who, in a charming sketch, told the history of the foundation of the manufacture of colouring matters; Mr. Muspratt, in 1886, gave some interesting information regarding the early manufacture of alkali in Liverpool; in 1889 Dr. Mond described attempts which have been made to produce compounds of nitrogen from free nitrogen; in 1890 Sir Lowthian Bell discoursed on blast-furnaces; in the following year Mr. Rider Cook gave an account of the processes in use at that date for the disposal of sewage.

We find Prof. Emerson Reynolds lecturing on coal, peat, and oil as fuels; Sir John Evans, on the paper industry; Mr. Stanford, on the kelp industry; Dr. Thorpe, on the carburation of gas; Dr. Schunck, on his remarkable researches on the colouring matters of plants; Mr. Beilby, on smoke consumption; Dr. Swan, on electro-chemistry; while Prof. Chandler gave a sketch of the development of chemical industry on this side of the Atlantic.

In short, we have had specialists each discoursing on his own subject in a masterly way. The memory of many of these eminent men is all that remains to us; but we are glad to realise that many still remain among us, working enthusiastically for the progress of the science which they love so well.

For it is impossible to sever science from industry. Many of the addresses emphasise this point. Sir Henry Roscoe, in 1882, said: "My object has been to show that in certain branches of chemical industry, at least, it is only the highest and most complete scientific training that can command commercial success." Dr. Perkin, in 1885, in discussing technical education, emphasised the fact that "what is wanted is a thorough knowledge of chemical science, and knowledge how to use it by conducting research . . ." "The linking together of industrial and theoretical chemistry has undoubtedly been the cause of its wonderful development." Mr. Stanford, in the year of the foundation of the New York Section, said: "I think it could be easily proved that nothing ultimately pays better than original research." And in defining research he wittily divided the human race into two classes: "those who go ahead and do something, and those who sit still and inquire why it wasn't done the other way."

Much has been said about the right course of training for a technical chemist, and the example of our Continental friends has been freely cited. No doubt we have much to learn from them; yet there are some first principles which lie at the root of the whole matter, and which I will venture to lay before you, in the hope that they will commend themselves by being self-evident.

I am aware that all of them have often been laid down before; "there is nothing new under the sun," so far as first principles are concerned, at least. Yet that is no reason why they should not be stated again, for perchance constant attrition may soften the stony hearts of those whose decision is important in such matters.

The education of a chemist (and the word "chemist," of course, includes the qualification "technical chemist") must be conceived in the sense that it consists in an effort to produce an attitude of mind, rather than to instil definite knowledge. Of course the latter must not be neglected; the definite knowledge may be likened to the bricks which the architect has at his disposal in erecting a beautiful building; he knows their shapes, their capacity for resisting stresses, and, in short, what can be done with them. But the conception of the design is the result of many attempts to create; just as the poet has to utilise words, or the architect bricks, so the chemist has to know the materials with which he is dealing. The training of a bricklayer, however, will never make a man an architect; nor will the dry research of a grammarian train a poet. In short, it is the inventive faculty which must be cultivated.

Here I am met by the criticism—"The inventive faculty must exist; it cannot be implanted." "Poeta nascitur, non fit." I deny it. There are some persons whose dislike for the investigation of Nature is ingrained. I remember at Bristol advising a lad to abandon the study of chemistry for that of literature on learning his disgust for the former and partiality for the latter. He became the editor of a newspaper. But such persons are few. It is unlikely that they will ever begin the study of natural science, unless impelled by too expectant parents; as soon as the horse begins to trot, "they do not remain." My contention is that most of the lads who enter a chemical laboratory are able to receive some inspiration, or to have a latent inspiration developed, which will fit them to become inventive chemists.

Now how can this be brought about? The answer is perfectly simple: by offering them examples. Every teacher in the laboratory, from senior professor to junior assistant, must be engaged in research, and, most important of all, they must not be reticent, but willing to converse freely on their problems. It is that which creates a "chemical atmosphere." The objection may be raised that junior students are not ripe enough to make any use of such examples. True; and for that reason it is well for the juniors to spend the first year attending lectures and practical classes in rooms for the purpose, and not to let beginners enter the general laboratory. Moreover, they should be spending the major part of their time in attending courses on physics and mathematics, and in the drawing-office. But during the second year the initiation should begin. Even during the first year the seniors will talk occasionally about what occurs in the main laboratories; the publication of some discovery is sure to be discussed in the junior laboratory, just as the servants' hall discusses the doings of the drawing-room; and the criticism is sure to be somewhat keen, even though—perhaps the more so because it is—founded on insufficient information.

There are some simple ways of furthering this spirit of research. First, as regards the students. I regard it as a mistake to provide special laboratories for different classes of students. If students of organic chemistry are walled off from those who are working at analysis, then neither set knows what the other is doing. The best instruction that a student can get, he acquires in having to explain his operations to his neighbours. Now it is customary for the study of organic chemistry to follow on that of inorganic; the organic student is usually the senior; and it keeps up his knowledge of inorganic chemistry if he has frequently to place it at the disposal of his neighbours who are making routine analyses. They, on the other hand, cannot help seeing the very different processes employed by the organic man; and they insensibly learn a number of tips and dodges which prove of service to themselves at a later stage.

There is a further advantage. The junior, to whom everything is at first strange, meets at once with ancient mariners who have sailed seas unknown to him, and who are proud to be able to display a little erudition; to do so does not imply love of ostentation, or spiritual pride; it is simply human nature. A little care makes it possible to assort one's students, so that a shy boy is placed next a kindly senior, and a cocky youngster who thinks that he knows everything is placed next a man who will stand no nonsense, and whose chaff and banter soon dispel the inflated ideas of his own powers which the youngster has brought from his science school. Indeed, the lesson learnt is, that the chief question is not—"What does he know?" but "What has he done?"

Of course, for complicated researches, where much elaborate apparatus is erected, special rooms are necessary, but I have noticed frequently that the inhabitants of these rooms hold informal receptions, and have pleasure in exhibiting the result of their skill in manipulation and in glass-blowing.

In some laboratories a tame glass-blower is kept on the premises. There cannot be a greater mistake. If the members of the teaching staff are glass-blowers, "es geht von sich," as the Germans say. The whole laboratory becomes proficient. Each imitates the other. No doubt advice is often given which refers to the folly of paying sums for apparatus which it is possible to construct with little trouble, after knowing how; and the money is better spent. And glass-blowing is an all-important adjunct to research. I cannot imagine how anyone can stand the annoyance of having to wait for hours, possibly for days, for the repair of a piece of apparatus, which would probably take fewer minutes if the owner was able to manipulate a blow-pipe. Nearly the same may be said of the mechanic's place in the laboratory. Here, however, the work is slower, and in many cases the mechanic's services may be required; but for small repairs, such as soldering, repairing, contriving stirring apparatus, electrical apparatus, &c., much may be done by the student himself without any direct teaching. I confess, however, that a mechanic is necessary, if only to see that the tools are kept in order.

After the preliminary year I do not think it advisable for the student at once to commence research. There are the usual subjects of complex qualitative and simple quantitative analysis to be mastered, separations, gas analysis, and the preparation of typical organic and inorganic compounds, besides physico-chemical operations, such as vapour densities, determinations of molecular weights, conductivities, and electrical separations. But the time spent on these may easily be too much extended. A fairly good student should have done enough, in a year and a half or two years, to place him in such a position that, if necessary, he can help himself when he is face to face with an analysis which he has not made before. By mixing research students in the same laboratory with others at all stages of advance, the man who is working at analysis insensibly gets to regard his operations as partaking of the nature of a problem, and pursues his work with the greater interest. Moreover, it is not difficult to intensify this view of the question by contriving variations on ordinary routine: the determination of calcium and magnesium in a shell; the estimation of phosphoric acid in a bone; the Dumas method for nitrogen applied to a dried mouse; the analysis of the gases of respiration of a fly kept in air confined in a tube over mercury, and so on. When an analysis is regarded as a problem, it gains greatly in interest. And it can always be checked by a duplicate, and if necessary a triplicate. It often happens, moreover, that the research-work of a senior student is greatly helped by analytical work which can be safely entrusted to a junior. In this way double interest is gained—in the problem set, and in the research which the solving of the problem furthers.

Above all, not too much teaching. The essence of scientific progress is the well-worn method of trial and failure. It is simply horrible to think of the travesty of teaching in vogue in some of our colleges, where everything is provided, and where the students add one solution to another by word of command, and record their results in special notebooks constructed for the purpose. What do they learn? To obey? That should have been taught in the nursery. Manipulation? Manipulation consists in constructing what is required, not in using what is given. I had rather see a youth commit the Æneid to heart than carry out such time-wasting, soul-destroying routine operations. The first may result in a stronger memory; the second is fatal to all originality.

It may be said that by thus leaving the students very much to themselves, much time is lost. Yes; possibly at first. But the ultimate rate of progress is very much more rapid. Unless the pupil learns to be of use to himself, he cannot possibly be of any use to others. And the training consists in finding out how to do it: not in doing it; that is easy, if one knows how.

Let me consider the matter next from the point of view of the junior staff—the assistants, or whatever they may be called, "Privat-docenten," lecturers, instructors. It must never be forgotten that these young men have their way to make in the world; that it is unjust to treat them as teaching-machines; and that the only opportunity given them to make their mark is to afford them all possible encouragement to further the aims of their science, for in doing so they will further their own aims. They must become known; and without publication of their work they will remain unknown; and without reasonable leisure for research they will be unable to publish. Hence the duties of the members of the staff of a laboratory should be so arranged that at least half their time is available for research. Again, I am a firm believer in encouraging joint work done by assistants and students; the student gains much, and the assistant gains an assistant. Moreover, he learns the chief duty of a professor—the need of retaining in his mind problems for solution, and the art of getting the most out of his students in encouraging them to think for themselves. It is, indeed, an apprenticeship, where the young teacher learns his trade. He must have tools to work with; these tools are the students who act as his assistants. I regard it as essential, therefore, that the laboratory should have such a number of assistants that each one has half his time at his own disposal.

But, it may be urged, the number of assistants must necessarily be much greater than the possible vacancies in chairs, and it must therefore follow that many men will grow old in subordinate posts, and grow sick with hope deferred. Here the manufacturers should step in. A man who has had such an experience as I have sketched is invaluable, if he is not too old, as a works chemist. It is true that he may have had no special experience; but that matters little; in six months he will have grasped the principles of the manufacture, and if he is a man with the experience I have tried to sketch, he will be able to get the most out of men—perhaps the most valuable quality which a works manager can possess—and he will have a great deal of experience, experience perhaps not of a kind to be immediately useful in the particular work in which he is employed, but possibly of great value if the processes used in the work are to be altered. It must be remembered that the assistant must have proved his capacity for research and his ability to deal with other men before he is appointed; and he must have justified his choice. Here I may justify my own opinion by citing the practice of many German manufacturers; it is the rule, not the exception, to induce the assistants from university laboratories to enter their works.

I come next to a question which I have some delicacy in alluding to—the pay of an assistant. While it should be sufficient to enable him to live an unmarried life with comfort, it should not be sufficient to induce him to spend his life in a subordinate university post. He should have reason to wish to better his condition. It is impossible to lay down a hard and fast rule in such matters; but the point should be borne in mind.

If the assistants are to be given leisure for research, the number must be considerable; in fact, a double staff, in a sense, must be employed. This raises the question, How many students should be in the charge of each assistant? The question does not admit of a definite answer; yet an approximate one may be given. It necessarily depends on the class of work which the students are doing. If each assistant is told off to superintend the work of two or perhaps three students who are pursuing investigations—the junior assistants will necessarily have fewer, the seniors perhaps as many or more—each of these men may take much attention on some one day, and need not be looked at for perhaps a week or more, except in a general way. In that case perhaps ten or twelve systematic students might be allotted to each assistant; but it necessarily depends greatly on the nature of the work, and of the assistant himself. My experience is that assistants are disposed to be almost too conscientious, and to devote not only an unnecessary but almost an injudicious amount of attention to each student. I am not sure that the students look at it quite in the same light; it is so much easier to be taught than to learn. Very few of us care to think if we can possibly avoid it; I confess that I have frequently spent far more time in looking over papers in order to find a calculation which I had previously made than would have sufficed to make the calculation anew.

We come next to the senior teachers, or professors. The first point I would urge is that, while it is possible to lecture to as many students as the largest lecture-room will hold, it is not possible to supervise the practical work of more than, say, forty or fifty students. The professor should always know what every man is doing. It is not necessary that those who are engaged in routine-work should be visited every day; they are under the care of assistants; but it is necessary that the professor should be able to gauge the capacity of each of his laboratory students; for only thus can he tell whether they are profiting by their studies. The reason why the old laboratories of Liebig, of Wöhler, and of Bunsen are regarded with such loving memory by those who were the students of these great men is that the total number of students was small; they formed a family party, where the individual character of each was known, and where the father lived among his children, and was able to distribute correction, reproof, and instruction in righteousness. Hence the necessity for limiting numbers. Now, if there are forty students, and the professor spends ten minutes each day with each—no great allowance of time—simple calculation shows that more than six hours are gone. I think that two hours is ample for the professor to spend daily in teaching laboratory students. Of course at some critical moment he must spend a much longer time with one; it may be several hours; but that should absolve him from attendance on that individual for the best part of a week. It is better to mix example with precept, and unless a large part of every day is given to research, the professor loses the attitude of mind which it is his duty to cultivate in his students. It does not do to let a day pass without making some effort to continue research; the habit is only too easily lost; it is like all arts; the successful pianist or violinist spends many hours each day at his instrument, and if the acrobat were to take a month's holiday, he would require to begin to learn his trade again. Moreover, it is only by continually keeping his hand in, and his mind turned on his own research, that the professor can conceive new problems, some of which are simple enough to form the best introduction to research to be carried out by his students.

Again, in a large laboratory, the time occupied in the details of organising is so great as to make a heavy call on the energies of the professor, who is necessarily the director. There are parents to be seen; notebooks to be read; correspondence with old students in search of employment; apparatus to be ordered; servants to be directed; in short, the whole management of a business in addition to the work of teaching and research. The cares of management grow very rapidly with the increase in size of the laboratory, and many of the duties cannot be delegated. Moreover, there are the calls of public duty which often press very heavily on the successful scientific man. Add to these the share which it is always necessary to take in attending university councils, and it is manifest that the administrative duties should be simplified as much as possible.

If the reputation of the professor is such that students crowd to his laboratory, my counsel is, do not build larger laboratories, but appoint a new professor, with a separate chair, and a new laboratory; but do not make your man of talent a mere administrator.

This leads me to touch again on the technical side of my subject; I must refer to the question of remuneration. If the best men are to be attracted towards any career, an inducement must be offered, of such a nature that a young man, deciding on his future prospects, may be influenced to choose it. It is not necessary that all the members of the profession should be highly remunerated; but it is necessary that some should. Although I am not here to defend the particular case which I am going to mention, I wish to refer to it as specially applicable: the Archbishop of Canterbury has an income of 15,000*l.* a year; many bishops receive an annual income of 5,000*l.*, and the result is that young men take orders who will ultimately have to be contented with very small emoluments. Now in the payment of university professors, it must be kept in mind that the men who fill the chairs are withdrawn from the practice of medicine, law, engineering, and other professions, including that of technical chemistry; and if they are to teach others, it is greatly to be desired that they themselves should be of the best of their kind. Hence there should be prizes for the best, comparable in amount with what a successful lawyer, doctor, or manufacturer would earn. If this is not done, then one of two things will result: either the standard of teachers, and consequently of teaching, will be lowered, to the great disadvantage of the next generation of professional men; or the position of teacher may be accepted by enthusiasts, who could have made a much larger income had they entered professional or commercial life, and who will therefore be making a life-long sacrifice for their country. Probably both will happen; a few chairs will be filled by such enthusiasts, while the average professor will be much below par.

Of course other considerations must enter into the question of remuneration. The life is a regular and pleasant one; there are practically no risks; the standing is good; but I submit that, making due allowance for these, the prizes should exist. And they should reach the right men. How can this be achieved?

This brings me to consider the method of appointment to chairs, and that involves the government of the university. It is a large question; but as the reputatation of a university is entirely dependent on the standing of its professors and teachers, it must be considered.

There are as a rule three methods of appointing to chairs: one is selection by a council or committee—by the governing body of the university; and this, in fact, amounts to selection by the principal or president, for as a rule the principal or academic head of the university is regarded by the council of outsiders as the best judge of scholastic matters. The second method is selection by a committee of specialists appointed by the university; if, for example, a physical chair is vacant, it is filled by a committee consisting of four or five eminent physicists, themselves not connected with the university in which the vacancy occurs. The third method, and it is the one which commends itself to me, is selection by a committee of the faculty in which the vacancy occurs, after a reasoned report in which the relative merits of all the possible candidates are discussed.

The reason for my preference is a very simple one: it is because selection by persons belonging to the same faculty of the university unites two qualifications in the persons of the electors—competent knowledge on the one hand, and self-interest on the other. Choosing, as an instance, a vacant chair of physics, the committee of selection would consist of any other professors of physics in the university, provided there were more than one; the professors of chemistry, biology, mathematics, botany—of all sciences to which physics is a fitting introduction. These men of science either know, or can make written inquiries about possible candidates. They discuss all the *pros* and *cons.* of each one; and they finally resolve to ascertain whether two or three persons would accept the vacant chair, if offered to them. They then make their recommendation either to the governing body of the university, or to some state official; and the question is asked and the post accepted.

Now it is the interest of every one of the members of the committee to secure the best man; and as it is to be presumed that they are themselves all engaged in investigation, they will select an occupant of the chair who has already made his mark, and shown that he can be relied on to continue to carry out investigations. His reputation will reinforce theirs; his tenure of the chair will add lustre to the university. Moreover, as all sciences touch, they will have a colleague from whom they can get advice; who will aid in the development of their own sciences.

It is true that the academic head of the university—the principal or president—may be influenced by like motives, and that any selection which he may make may be made on very similar lines, after a similar inquiry. But the filling of a chair is not a single-handed job; if it is single-handed, it is likely to become a job; either the principal is not able to get the required information, or his judgment is not so sure as that of those colleagues more intimately connected with the subject of the vacant chair. Selection by the principal *may* succeed; selection by colleagues of the same faculty practically always succeeds.

As for selection by a committee of outsiders, they have no feeling of responsibility. From personal experience, I know that their aim is satisfied when they have elected a man who will not disgrace their choice; they do not necessarily select the best man. I know, having had to act as an elector by all three methods, that one is much more particular when one has to choose a fellow-teacher with whom one has to pass one's days. It is like choosing a wife. A lady chosen by the vote of the families may prove a success, and no doubt often does. If the wife were chosen in cool blood by the man who is to live with her, after careful inquiry into her antecedents, hereditary and otherwise, her temper, her suitability for the duties which a wife is supposed to perform, there would be fewer unsuccessful marriages. The analogy breaks down; for, unless it is a case of marrying a widow, previous experience should not be a possible consideration. But in selecting to a chair it must; and this leads me to ask, From what group of persons should a professor be chosen?

There are large universities, and there are small ones; and obviously the professors in the smaller institutions will be available for selection to the larger ones, with their greater field of usefulness and their higher emoluments. Should the professors in the smaller universities have justified their election, they will doubtless be the first to be considered in filling the more important chairs. And for the chairs in the smaller institutions, the assistants will be available. They will have published work of a nature to make their names known as promising investigators, and they will have commended themselves to their chiefs as capable men to whom the management of a department may well be entrusted.

The choice of the assistant from among the senior students may be left entirely to the professor with whom he has worked, and who is best able to judge of his powers. He will doubtless have filled the position of a student-demonstrator, in looking after junior classes; and his frequent appearances at the local scientific society will render it possible to estimate his ability as a lecturer.

And now let me discuss a question which has not given difficulty in America, I understand, but which has greatly retarded the advance of knowledge and research in England. I refer to examinations. It may well be introduced here, for it may be asked, Should only a graduate be recognised as worthy to occupy a junior teaching position? To this I would reply, Let the choice be free. I have often seen men whose circumstances, or whose character, or whose deliberate choice has led them to abstain from taking a degree, and who, nevertheless, are most successful investigators, well able to increase the knowledge of their subject, and who have proved most inspiriting teachers; and, on the other hand, I have perhaps more frequently come in contact with graduates whose only claim to recognition was a parrot-like ability to repeat what had been told them, and a knack in gauging the idiosyncrasies of an examiner. The older I get, the less I believe in university degrees as a test of capacity. Perhaps the reason is the manner in which degrees are awarded in England; the degree follows on one, or at most two examinations, often by men who know the candidate only as a number, and whose idea of examination often is to set questions to trip the candidate, and not to draw out what he can do. Indeed, it raises the question which I have mentioned earlier in this address: the examination is so contrived as to elicit what a man knows, rather than what he can do.

Now here, again, there are certain obvious truths which have often been stated, but too often ignored. The student, working under the eye of the professor and of his assistants, undergoes a daily examination. He may not earn marks; but, none the less, he impresses his teachers with some conception of his character; and the impression is made rather by what he can do, than by what he knows. The qualities tested by such examinations as have been customary for the past forty years in England are the last which one would wish to have in a student of science—readiness of memory to the exclusion of deliberate judgment; the faculty of spreading knowledge thin, and making a veneer of scientific facts instead of the power to correlate them and increase their value; and the skill to gauge the capacity of and hoodwink the examiner, instead of the power to incite enthusiasm in others. They are ideal qualities for a successful barrister, because they pay in his profession; but their reward has been the bane of science. A sound judgment, though it may be a slow one; persistence in struggling against obstacles; the knowledge where to get information when required, and to use it when found; and the inventive faculty—these are the qualities required, and they can be gauged only after long-continued observation. Moreover, the pernicious system of competitive scholarships and fellowships, instead of eleemosynary support given to the necessitous and deserving youth, has also contributed much to the debasement of the scientific spirit; for it has early implanted in the young mind the idea that to outrun his fellows, and to work solely for a money reward, are the ends to be aimed at, instead of the joy of the exercise of a divine gift, and the using that gift for the benefit of man. It is true that to earn money is a necessity; it is in no way a wrong aim; but it is not the chief aim; and money should be earned as a reward for useful labour, not for success in scholastic competitions. I am aware that these evils are much less noticeable in America than in England; and also, fortunately, public opinion is beginning to recognise, in England, that such inducements to work do not select the best men, so far as science is concerned. Under present circumstances, however, as scholarships exist, and must be awarded by examination, it requires considerable ingenuity to devise a method of examination which shall pick out men who will make a good use of them. I recently gave as a question for my own students, "Describe shortly the researches which have been going on in this laboratory during the past six months"; and I found the result very satisfactory. The question put a premium on the interest which a student should take in his friend's work, on the intelligence in following it, on his powers of description, and on his suggestiveness where invention had to stand for want of accurate knowledge. The after-effect of such a question, too, will be considerable. The students will endeavour in future to follow the researches of their neighbours with more understanding than they have done.

A question sometimes debated is whether the professor should lecture to junior or to senior students. Should he introduce the young student to the study of chemistry, or should he lecture to the most advanced students on recent developments of the subject? My reply would be, that students are much over-lectured. The object of lectures is more to open out a subject, and to direct a student what to read, than to give definite information. And for that reason I think the senior teacher is the best for junior students. Experience has generally taught the older man how to make his subject interesting to beginners; he has learned the art of repetition without showing that he repeats: he does not travel too fast on roads untravelled before by the young student; and he is more lenient to their often absurd efforts to form correct conceptions. On the other hand, the senior student is less exacting than the junior; to him the matter is more important than the manner of delivery; if the lectures prove useful to him he is ready to excuse any want of judgment on the part of the young teacher. For these reasons, therefore, I incline to think that the junior courses are better entrusted to the senior man, and the more advanced courses to the junior teachers. But we have found it advisable to ask individual advanced students to deliver short courses of lectures on special subjects of which they have made a study; no fee is charged for admission to these lectures; and they are much appreciated both by the deliverers of the lectures, as a field for practice, and by the students, as an easy way of becoming acquainted with special branches. We do not usually insist on the attendance on lectures beyond the third year; indeed, the formal lectures end in the second year. We find that more progress is made by the students through reading and conversation than in a more formal way. But here, again, the course followed must depend more on the individual cases than on any general rule; some learn more easily through the eye, others through the ear. On the whole it is better to appeal to both organs of sense, and utilise, as it were, a system of double entry.

It consequently appears to me futile to extend courses of lectures to more purely technical subjects. The ideal plan of education for technical chemists would be some system analogous to the apprenticeship of engineers, after they have been educated in the science; that is, after the correct habit of mind has been largely formed. But it is difficult see how this can be brought about. The obstacles in the ay appear to me to be insurmountable. The chemical anufacturer is not willing to throw open his work to udents, nor would he do so even if very considerable remiums were paid. Indeed, in England, it is not uncom-on for the "chemist," so-called, to be refused admission the works, and to be confined to the laboratory. In the rger German works, where many chemists are employed, is possible for a young man to gain the requisite experience. have been informed by the managing director of a emical work in Germany where 70 chemists are em-oyed, that nature has divided the young men into three rge classes, the members of which are fairly easily stinguished, and do not greatly overlap. There is first e routine chemist; the young man who declines responsi-lity, but who is hardworking and trustworthy; he finds s place as an analyst, testing raw materials and analysing e products at various stages, including the finished pro-icts. Second, there is the young man to whom the anagement of some department may be entrusted; one th a firm will, plenty of energy, and the quality of verning men. And third, there is the research chemist, 10 delights in new problems, whether suggested by others conceived by himself. All three classes are utilised; d after forming one of the analysts for some time, the ung men naturally range themselves in one or other partment, where their natural tendencies find scope. it even in Germany the number of works which iploy 70 chemists is not great; and with a small number is more difficult to effect the division of labour so tisfactorily.

I have wondered if it might not be possible to establish raining school for technical chemists somewhat on the lowing lines:—To start an association having for its ject the encouragement of invention, each member of iich would subscribe a certain sum for the erection of ildings and plant. There would need to be a number of lated buildings, and a considerable collection of stock ut of a small scale—stills, tanks, evaporating pans, er-presses, vacuum-filters, centrifugal machines, crystal-ing vats, and so on. The work should be furnished with am and electric current. Such a syndicate might let it known that they were willing to make arrangements th inventors, or with syndicates which had secured the tents of an invention, or secured an option on such tents. The superintendent or professor should be provided th a staff of assistants, who would be each in charge of e building—that is, of one operation. Students would be mitted for an appropriate premium, as in engineering rks. Supposing an idea to be brought to the notice of directors, they would consult as to whether it should accepted or not. If accepted, then the share of profits uld be arranged with the patentee, should it prove cessful. It would be committed to the charge of one of staff, who would first work it out in the laboratory with aid of a staff of students. If it then seemed feasible, would be tried on a comparatively small scale, dealing h hundredweights, in one of the special buildings, those dents who had investigated the process in the laboratory aring in the larger-scale operations. The surmounting difficulties in the transition, the perfecting of the process, making working drawings of the requisite plant, would afford the best of all training to students; and in case the process proved a commercial success, these students who had helped to elaborate the process would be naturally the first to obtain employment in works, should they be erected. At the same time, manufacturers would naturally be anxious to obtain the services of men trained in so good a school, so that many students would be drafted off to works. Indeed the scheme may be paralleled from the medical side; after receiving a medical education, for example, in preliminary scientific subjects, such as chemistry, physics, and biology, the medical student devotes himself to professional studies for three years. Then his technical education begins when he becomes house physician or house surgeon. After such experience, he is available for junior positions, for becoming "locum tenens," and so on.

The students in such an experimental works would, of course, have to do labourers' work; employees always respect a man who can "take his coat off." In this way he gets to know their difficulties, and to judge them fairly; to know what they can do, and what reasonably to expect.

I am by no means sanguine that such a scheme of technical education can be started. I acknowledge that it is an imperfect imitation of the magnificent schools of technical chemistry which form part of every large German chemical work. But such schools are unlikely to find a footing, so far as I can judge, in England. I cannot judge of America. Our system is, when trade is good, to let well alone; the manufacturer thinks, "I have done very well without a chemist so far; why have one now?" or, "the class of man who has served us as analyst has sufficed for our needs; he costs only 2*l.* a week; why burden ourselves with a more expensive, even if a more skilled man?" And when trade declines, he naturally shrinks from spending money. It is the policy of "penny-wise and pound-foolish."

In conclusion, let me make one more remark. It is that the scientific curiosity of to-day often becomes the trade necessity of to-morrow. A scientific friend of mine once drew my attention to the fact that most of the changes which have been introduced in industry have had their origin in the universities. Why? Because the investigator is unfettered. If a man sets himself to improve an existing process, he very likely may succeed, but he will not effect a revolution in manufacture. The purely scientific investigator who is free to follow indications of no apparent commercial import has not infrequently made discoveries of a radical nature, which have entirely changed some particular industry. I do not recommend the one to the exclusion of the other; both are best; and both are best attained by an intimate association between the universities and the chemical works. The investigator often learns much by the study of industrial processes. The chemical manufacturer who is keenly alive to his own interests will not fail to keep himself in touch with every discovery, however little it appears to be connected with his own industry.

To quote from the "Rules of Political Conduct," written for the people of Japan thirteen hundred years ago: "The imperative duty of man is to sacrifice his private interest to the public good. Selfishness forbids co-operation; and without co-operation there cannot be any great achievement."

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3^e).

I.—PLANT, APPARATUS AND MACHINERY.

English Patents.

Steam Meter. H. E. Newton, London. From the Farbenfabriken vormals F. Bayer and Co., Elberfeld. Eng. Pat. 21,471, Oct. 6, 1903.

The steam is passed through a closed vessel, over the outlet of which a hollow truncated cone is arranged. In the opening of the cone, a float is arranged to work; it is supported by a wire working through the cover over a pulley and balanced by a weight. Attached to this wire, and on the outside of the vessel, is a pen or pointer which operates in connection with a moving scale. From the indications of the pointer, the position of the float and consequently the area of the discharge opening can be deduced, and from the pressure, recorded on a registering gauge, the quantity of steam passing can be calculated. —W. H. C.

Condensing and Cooling of Gases, Vapours, and Liquids. A. F. Browne and D. Chandler, London. Eng. Pat. 5485, March 5, 1904.

The gases, &c., to be condensed and cooled are led through a chamber or series of chambers, the outer surfaces of which are exposed to the air, so that radiation and consequently cooling may take place. Within each chamber is a series of other chambers or pipes, through which a current of air is transmitted. The interior of the walls of these pipes is kept constantly wetted by a film of water, supplied in the form of spray by an atomiser, or drawn up by capillary attraction by cotton wicks or cloths attached to wire netting and dipping into water. A number of shallow trays filled with water are superposed one over the other in these pipes, so that the water overflows from each pipe to the next lower one. A partial vacuum may also be maintained in the pipes. In this way, the heat abstracted from the gases to be cooled, is rendered latent by the continuous evaporation of a film of water, in the air current.—W. H. C.

United States Patents.

Centrifugal Separator. H. McCornack, Westchester, Pa. U.S. Pat. 766,837, Aug. 9, 1904.

A suspended shaft, to which a tubular centrifugal vessel is coupled, is supported and enclosed by the upper portion of a frame, the lower part of which forms a fixed casing below the coupling and surrounding the depending centrifugal vessel. The casing supports the lower end of the centrifugal vessel and has diverging walls, so that the latter, when uncoupled, can be tilted sufficiently to enable it to be freely lifted out of the casing.—E. S.

Drying Apparatus. H. Baetz, St. Louis, Mo. U.S. Pat. 767,198, Aug. 9, 1904.

Within a suitable casing are contained a blower, one or more pairs of superposed and spaced air chambers, with steam heater, the adjacent faces of the chambers on either side of the open space separating them being provided with nozzles for discharge of the air; exhaust pipes leading from the casing back to the blower; also suitable feed mechanis for advancing the articles to be dried, through the spa separating the chambers in the path of the air curre issuing from the nozzles.—E. S.

Drying Apparatus. F. E. Allen, Boston, Mass. U.S. Pat. 767,727, Aug. 16, 1904.

A vertical series of horizontal conveyors, between each which are horizontal radiators, is arranged in a casin, The material to be dried, is fed into the top from a hopp and passes downwards over the conveyors, to the outlet the bottom. Means are provided: for supplying a suitab heating agent to the radiators; for agitating the materia for forcing a current of air across the conveyors; and f withdrawing the moisture-laden air from the apparatus. —W. H. C.

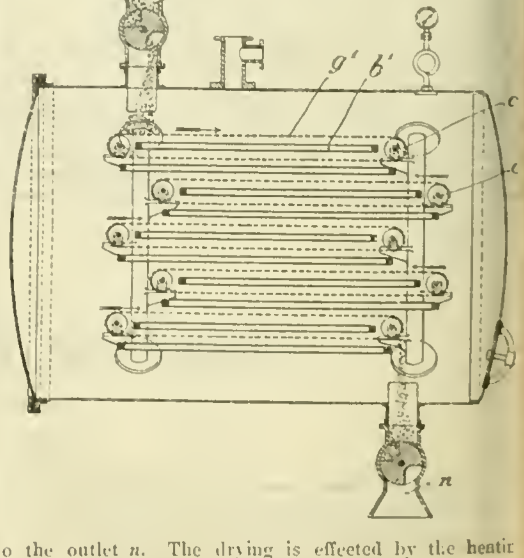
Exhausting Vapours or Gases; Apparatus for —— V. Schwaninger, Oggersheim, Germany. U.S. Pa 767,502, Aug. 16, 1904.

See Eng. Pat. 5119 of 1902: this J., 1903, 407.—T. F. B.

French Patents.

Vacuum Drier; Continuous ——. R. Haack and th Surther Maschinen-Fabr. vorm. H. Hammerschmi Fr. Pat. 341,672, March 26, 1904.

The material to be dried is introduced at O and carried, the endless band conveyor g^1 in the direction of the arrow



to the outlet *n*. The drying is effected by the heatir boxes b^1.—W. H. C.

apours of Volatile Solvents; Process and Apparatus for Collecting, Drying, and Recovering ——*from the Air.* E. Bouchaud - Praceiq. Fr. Pat. 311,690, March 26, 1904.

HE air is automatically aspirated through a filter, then rough a drying tower, and finally passes into an absorbing amber filled with porous material through which percolates suitable liquid for absorbing the volatile solvents. The ethod is particularly applicable to the vapours of alcohol id ether. The absorbed vapours are recovered as solvents suitable distillation of the absorbing liquid.—W. P. S.

II.—FUEL, GAS, AND LIGHT.

lame of Different Fuels; Calorific Value of the ——. P. Mahler. Rev. Univ. des Mines, 1904, 1. Proc. Inst. Civil Eng., 1904, **156**, 47—48.

the following table the flame temperature is that obtainble when the fuel is burnt with air at 0° C. and 760 mm.:—

The true measure of value of a fuel is not the flame mperature, however, but the calorific power; for example, e flame of peat is hotter than that of St. Étienne coal, but e body of flame is much larger in the case of the coal than that of the peat. 100 grms. of the peat yield 28 vols. gas at 2000° C., whilst the same weight of coal yields vols. of gas at the same temperature. From a thermoetric point of view, the use of hot blast for improving the ime would appear to be more efficacious in furnaces fired ith coal than in those using fuels of an inferior character. —A. S.

lagnetite Arc-Lamp. C. P. Steinmetz. Elect. World and Eng., 1904, **43**, 974; J. Gasbeleucht., 1904, **47**, 751—753.

HE lamp is provided with a copper positive electrode, hich does not require renewal, and a negative electrode onsisting substantially of magnetite (Fe_3O_4). The elecodes themselves take no part in the light emission, which due solely to the luminous arc, containing volatised agnetite. In the preliminary experiments, which led to e construction of the lamp, it was ascertained that, in minous-arc lamps, the substance which conducts the arc given off more rapidly from the negative than from the sitive electrode, and, impinging upon the latter, heats it highly. If the positive electrode be a good enough heat-conductor and of suitable dimensions, the heat developed is led away and the electrode is not consumed. If it has too great a heat conductivity, material from the negative electrode is deposited upon it. Thus, in the magnetite lamp, if the copper electrode is not thick enough to conduct away a sufficient proportion of the heat generated, it is destroyed; and, on the other hand, if too thick, drops of magnetic oxide condense upon it. The electrodes are therefore so chosen as to avoid both difficulties, and the positive electrode forms a permanent, fixed part of the lamp. The metals of the iron group give a brilliantly luminous arc, emitting white light; but electrodes made of the metals themselves have little durability, whereas the oxides, being incombustible, are suitable for use. Of these oxides, magnetite gives the best results, and it is found that a steadier arc and a higher efficiency result, if titanium and other compounds are mixed with the magnetic oxide. The electrodes are manufactured in compact form, and it is claimed that in use they are consumed at the rate of only 0·8 to 1 mm. per hour. An electrode 200 mm. long therefore lasts about 150—200 hours; but with a slight decrease in efficiency, the durability can be increased to 500—600 hours. The life of the electrodes is then about equal to that of an ordinary glow lamp. The most favourable length of arc is 20—30 mm., and this is maintained by means of a simple automatic regulating device. According to A. Holmes, a 320-watt magnetite lamp emits rather more light than an ordinary 340-watt lamp with open arc, or a 460-watt lamp with enclosed arc. The lamp is adapted for use with a direct current; if an alternating current be employed, there is a considerable diminution in efficiency. —H. B.

English Patents.

Gas and Air; Apparatus for the Production of Mixtures of ——. H. H. Lake, London. From Selas G. m. b. H., Berlin. Eng. Pat. 17,788, Aug. 17, 1903.

Apparatus for the production of gaseous mixtures, by the separate suction of gas and air, is provided with a regulating device for automatically varying the amount of the mixture produced in accordance with the consumption, the said device being interposed between the suction and forcing chambers and subjected to the pressure in the outlet service main of the apparatus in such a manner that when alterations in the pressure occur, a communication between the suction and forcing chambers is opened more or less. The effect is that the operation of the suction apparatus (piston pumps, blowers, or the like) never varies, the regulation being effected merely by repumping more or less of the already formed mixture back through the apparatus from the forcing side. The regulating valve between the suction and forcing chambers may be actuated by means of a float, diaphragm, or the like connected to a branch pipe from the forcing side of the apparatus.—H. B.

Gas Producers; Suction ——. E. Capitaine, Frankfort on-the-Maine, Germany. Eng. Pat. 2547, Feb. 2, 1904.

A vertical water-vaporiser is arranged concentrically above the combustion chamber inside the shell of the producer, the hot gases flowing up through the vaporiser. The annular space between the vaporiser and the shell is utilised as a storage chamber for the charging fuel, which serves as a heat insulator and falls into the combustion chamber as required.—H. B.

Gas Retorts; Inclined ——. E. Derval, Paris. Eng. Pat. 21,964, Oct. 12, 1903.

The bottom of the inclined retort is provided with one or more longitudinal ribs extending the whole of its length, in combination or not with a series of channels, hollows, or projections at the lower end of the retort, for the purpose of facilitating the disengagement of gas, preventing the coal from slipping down to the lower end during the distillation, and rendering the discharge of the coke easier. The effectiveness of the non-slipping devices may be increased by employing curved retorts, as described in U.S. Pat. 762,578 (this J., 1904, 745).—H. B.

Gas-Producing Plant for Heating Retort Furnaces. H. Poetter, Dortmund, Germany. Eng. Pat. 8993, April 19, 1904.

A plant for the production of coal-gas, having beneath the retorts a gas producer which generates water-gas and producer-gas, both for heating the retorts and for admixture with the retort gases, is so arranged that the outlet flue for the water gas and the outlet flue for the producer-gas open into a pipe leading to the retort space, and are also connected with the gasholder by a branch pipe, the pipe junctions being controlled by three-way valves in such manner that when the valves are in one position the producer-gas passes exclusively to the retort setting, and when in the other position the water-gas passes partly to the retort furnace and partly to the gasholder.—H. B.

Gas Producers. H. Poetter, Dortmund, Germany. Eng. Pat. 14,383, June 25, 1904.

In order to keep the fire grate cool and to provide for an automatic generation of steam, cooling tubes, having lateral perforations through which the cooling water may overflow into collecting troughs below, are arranged beneath the firebars, and may be adapted to support the fire-bars. The air-blast pipe is arranged below the cooling tubes. An auxiliary grate may be provided to support the fuel whilst the grate proper is removed for cleaning or repairs.—H. B.

Refuse-consuming and Gas-producing Furnaces. L. Tobiansky. Eng. Pat. 12,361, May 31, 1904. XVIII. B., page 878.

Gas Purifying Plants. J. D. L. Klein, Copenhagen. Eng. Pat. 14,465, June 27, 1904.

The purifiers are connected together by separately valved pipes in such a manner that the gas may be directed through any one or more of the purifiers, and in any desired order. The grids for supporting the purifying material are made of horizontal parallel bars, the cross section of which is diamond-shaped or which are roof-like on the top. The bars are spaced far apart, experience having shown that the purifying material, instead of falling through, forms arches from bar to bar, the inclined top surfaces of the bars serving as abutments. The lowest grid of each purifier is of the usual closely-set form, and is covered with a layer of bark.—H. B.

United States Patents.

Coke-Oven; Horizontal ——. H. Poetter, Dortmund, Germany. U.S. Pat. 766,898, Aug. 9, 1904.

See Eng. Pat. 16,807 of 1902; this J., 1903, 899.—T. F. B.

Gas and Coke; Process of Manufacturing ——. J. C. H. Stut, Oakland, Cal. U.S. Pat. 766,400, Aug. 2, 1904.

A body of coal, contained in one of a series of parallel contiguous ovens, is heated to incandescence by passing air over and up through the burning fuel; the air supply is shut off and crude oil is fed upon the surface of the fuel, whereby oil-gas is generated and oil residue is deposited; then steam is introduced from below, the water-gas produced mingling with the oil-gas at the surface of the fuel. Simultaneously a body of coking coal, contained in a contiguous oven, is carbonised by the heat transmitted through the dividing wall, and the coal-gas produced is led along with the water-gas and oil-gas through a fixing chamber. The operation is then reversed by filling the second oven with fresh coal and introducing steam below and oil above the fuel as already stated, whilst the heat transmitted through the dividing wall produces coke and coal-gas from the coal and oil residue in the first oven, the various gases being mingled and fixed as before. See following abstract.—H. B.

Gas and Coke; Apparatus for the Manufacture of ——. J. C. H. Stut, Oakland, Cal. U.S. Pat. 766,553, Aug. 2, 1904.

The apparatus consists of a series of parallel contiguous ovens, connected to carburetters and regenerators, suitable for carrying out the process described in the preceding abstract.—H. B.

Gas; Process of Manufacturing ——. J. C. H. Stut, Oakland, Cal. U.S. Pat. 766,554, Aug. 2, 1904.

An oven, having a layer of incombustible porous materia at the bottom, is heated to redness. Crude oil is injecte on to the incandescent porous material, forming oil-ga and a carbonaceous deposit, and, after the latter ha become coked, it is consumed in the production of water gas by passing steam up through it. The oil-gas an water-gas are mixed. The heat transmitted through th walls of the oven may be employed in producing coal-ga from a body of coking coal in a contiguous connected oven the several gases being mixed together. See the followin and the two preceding abstracts.—H. B.

Gas and Coke; Apparatus for Making ——. J. C. H Stut, Oakland, Cal. U.S. Pat. 766,555, Aug. 2, 1904.

The apparatus consists of contiguous ovens, having perforated hearths and connected to carburetters and regenerators, suitable for carrying out the process described in th preceding abstract.—H. B.

Gas [for Oil Engine]; Apparatus for Generation of —— W. A. Salisbury, Assignor to C. O. Goss, Winona, Minn U.S. Pat. 766,530, Aug. 2, 1904.

The generator consists of a number of retorts, each havin an independent oil-supply under pressure; a gas-mixin chamber, having independent valved communication wit each retort; burners beneath the retorts and gas-mixin chamber, communicating with the latter and with the air a main mixing chamber communicating with the gas chamber, and having an exit and hot-air supply controlled b valves carried by a common stem; and a governor mounte on the same stem and actuated by the engine fed with th gas produced.—H. B.

Gas Producer. J. R. George, Assignor to Morgan Construction Co., Worcester, Mass. U.S. Pat. 766,88 Aug. 9, 1904.

See Eng. Pat. 16,263 of 1903; this J., 1903, 1189.—T. F. B

French Patents.

Coke; Process and Apparatus for Extinguishing an Bleaching ——. E. A. Moore. Fr. Pat. 341,499, Marc 21, 1904.

See U.S. Pats. 755,154 and 755,155 of 1904; this J., 1904 436.—T. F. B.

Generator for Low-Grade Gas. Lerouge, Formas, & Ci First Addition, dated March 2, 1904, to Fr. Pat. 339,817 Jan. 22, 1904 (this J., 1904, 710).

This addition refers to an automatic rubbish grate that i mounted on an axis, and capable of oscillating to allow o the removal of portions of ash that are too large to pass th long-toothed wheel which regulates the discharge of ordinary-sized cinders into the ash-pit.—W. C. H.

Gas Generators; Arrangement for the Automatic Supply o Water and Steam in ——. F. L. A. Paguy. Fr. Pat 341,402, March 17, 1904.

Each aspiration of gas by the piston causes a certai amount of water, kept at constant level, to flow from a tank into a receptacle inside the upper part of the scrubber, fro which receptacle the water falls into the scrubber, whilst b the weight of the water drawn in, the receptacle works a lever and spring arrangement which controls the gas valve. —W. C. H.

Generators for Low-Grade Gas. Gay and Vivier. Fr. Pat 341,414, March 19, 1904.

In the type of gas-generator in which the steam required i derived from a vaporiser arranged in the upper part of th generator, it is found that a sediment from the water collect in the vaporiser. To allow of the easy removal of suc sediment, it is proposed to incline the bottom of the vaporiser, so that the sediment may collect in the lowest part and be removed through a plug-hole.—W. C. H.

hting and Heating Gas ; Apparatus for the Production f ——. W. Lord. Fr. Pat. 341,708, March 28, 1904.

HOT-AIR engine, driven by means of a Bunsen burner, nps air through a carburetter consisting of a chamber ntaining vertical partitions covered with flannel and satued with petrol or the like, between which partitions the pursues a tortuous course. An automatic device for ulating the air pressure is interposed between the engine l the carburetter. It consists of a cylindrical vessel into ich the air is pumped, a column of water, on which a ball its, being maintained within the cylinder at a height pending upon the air-pressure therein. The ball is linked by means of levers to the cock of the pipe which supplies to the Bunsen burner of the engine, so that a reduction air pressure at once causes an increase in the speed of engine, and *vice versâ*. The air, on leaving the cylinder, ses through the cooling-jacket of the hot-air engine ore passing through the carburetter.—H. B.

monia and Cyanogen Compounds ; Obtaining Simultaeously —— *by Treatment of [Coal] Gas, with Partial Regeneration of the Scrubbing Materials.* W. Feld. r. Pat. 341,614, Jan. 18, 1904.

HTING gas is scrubbed with a solution of 280 grms. of ous sulphate crystals, and from 1000 to 1300 grms. of ium chloride, for each 100 cb. m. The solution proed, containing calcium ferrocyanide and ammonium oride, with a deposit of calcium carbonate and sulphate, reated with lime and steam to obtain ammonia (free n sulphide) and calcium chloride, suitable for re-use. m the turbid solution the cyanogen may be precipitated Prussian blue, and the mud, separated by filtration, r addition of an iron salt, may be again used in the ubber. Several formulæ are given, showing the use proportions of various scrubbing agents, including ous hydroxide, or ferrous or manganous sulphate in bination with magnesium or calcium chloride or the , adapted to be used with gas of certain stated types. Pats. 41,030 and 112,159 are referred to. Compare . Pat. 10,876, 1902 ; this J., 1903, 691.—E. S.

from Water-Gas ; Process of Utilising the ——. Scholvien. Fr. Pat. 340,995, March 7, 1904. III., ext column.

rry Vapours ; Recovery of —— *in the Manufacture of arbon Electrodes.* Soc. Franc. des Electrodes. Fr. Pat. 41,698, March 29, 1904.

gas and vapours, issuing from the furnace in which the trodes are baked, are blown by means of a fan through ries of condensing pipes and thence to the chimney. tar is thus condensed and recovered, whilst the gas ses on.—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

English Patent.

oal Tar ; Distillation of ——. C. Weyl, Mannheim, Germany. Eng. Pat. 12,122, May 27, 1904.

tar is heated in a horizontal, cylindrical boiler or , furnished with several narrow tubes fixed in its ends ; furnace gases circulate through these tubes and heat tar, whilst a high vacuum is maintained in the still, hat the boiling point of the tar at the end of the distilla- is about 270°—280° C., thereby preventing coking, as l as accelerating the distillation.—T. F. B.

United States Patents.

e Wood ; Process of Distillation of Crude Oils from ——. J. C. Mallonee, Charlotte, N.C., Assignor to . J. Mallonee, Crichton, Ala. U.S. Pat. 766,717, Aug. 2, 1904.

E wood is heated in a retort by means of a perforated m coil, and also by external heating ; the distillate is collected in three fractions, the first consisting of oils of specific gravities of 0·855 to 0·92, the second from 0·92 to 0·96, and the last fraction of oils above 0·96 sp. gr., and having an average specific gravity of 1·015. These three fractions are further fractionated both by steam and external heating.—T. F. B.

Wood Distilling Apparatus. B. Viola, New York, Assignor to R. G. G. Moldenke, Watchung, N.J. U.S. Pat. 767,090, Aug. 9, 1904.

A CYLINDRICAL retort is mounted in a furnace, at a slight inclination to the horizontal, and in such a manner that it can be rotated. The lower end of the retort is connected by an air-tight joint with a fixed discharge chamber, which is provided with discharge pipes. The upper end of the retort is connected, also by an air-tight joint, with a curved elbow piece, which leads the products of distillation to a vertical receptacle, provided with a stirrer. The retort is also provided with a stirrer. The retort, elbow-piece, and "vertical receptacle" are all of approximately the same diameter.—T. F. B.

Wood Distilling Apparatus. B. Viola, New York, Assignor to R. G. G. Moldenke, Watchung, N.J. U.S. Pat. 767,091, Aug. 9, 1904.

THE apparatus is similar to that described in the preceding specification, with the addition of an arrangement for raking the non-volatile residue from the retort down a shoot into a water-tank.—T. F. B.

French Patents.

Tar from Water-Gas ; Process for Utilising the ——. L. Scholvien. Fr. Pat. 340,995, March 7, 1904.

THE tar obtained in the carburetting of water-gas is distilled till the residue consists only of pitch. The distillate is treated with acid and then with alkali, and distilled as long as the distillate remains clear ; any further distillates are treated in the same manner as the original tar, and the resulting products mixed with the clear distillate. The resulting liquid has a specific gravity of 0·82 to 0·9, flashing point 30° C., and consists principally of unknown hydrocarbons, with small quantities of toluene, xylene, mesitylene, and traces of naphthalene ; it contains no sulphur or phenols, and can be used as a solvent for gums, resins, fats, &c.—T. F. B.

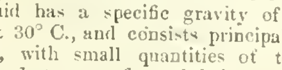
IV.—COLOURING MATTERS AND DYESTUFFS.

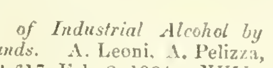
Galangin ; Synthesis of ——. St. v. Kostanecki, v. Lampe, and J. Tambor. Ber., 1904, **37**, 2803—2806.

2′-HYDROXY-4′.6′-DIMETHOXYCHALKONE, $(CH_3O)_2(OH)C_6H_2.CO.CH:CH.C_6H_5$, was converted, by boiling with alcoholic hydrochloric acid, into 1.3-dimethoxyflavanone—



$$(OCH_3)_2C_6H_2\left\langle\begin{array}{l}O\,.\,CH.C_6H_5\\ \qquad\;\;\cdot\\ CO.CH_2\end{array}\right.$$

This was treated with amyl nitrite and hydrochloric acid, yielding an isonitrosoderivative, which was converted in the usual manner into 1.3-dimethoxyflavonol—

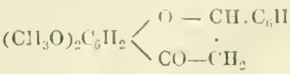


$$(CH_3O)_2C_6H_2\left\langle\begin{array}{l}O - C.C_6H_5\\ \qquad\;\;\cdot\cdot\\ CO - C - OH\end{array}\right.$$

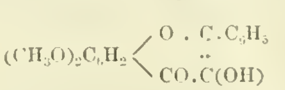
On demethylation with hydriodic acid, this forms Galangin, which is 1.3-dihydroxyflavonol. It was absolutely identical in properties with the product from the galanga-root. In strong sulphuric acid solution it shows blue fluorescence. On alumina mordant it dyes in fine yellow shades, though not very strongly.—E. F.

Galangin: An Isomeride of ——. F. Dobrzyński and St. v. Kostanecki. Ber., 1904, 37, 2806—2809.

By the action of benzaldehyde on gallacetophenonedimethylether, 2′-hydroxy-3′.4′-dimethoxychalkone, $(CH_3O)_2(OH)C_6H_2.CO.CH:CH.C_6H_5$, is obtained. By treatment with alcohol and dilute sulphuric acid, this is converted into 3.4-dimethoxyflavonone—



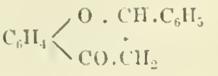
the isonitroso derivative of which, when boiled with dilute mineral acid, yields 3.4-dimethoxyflavonol—



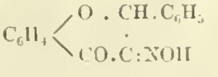
On demethylation with hydriodic acid, this yields 3.4-dihydroxyflavonol, an isomeride of Galangin. The product dyes strongly on mordanted fabrics. On alumina mordant it gives orange-yellow shades. It is readily soluble in aqueous alkalis, with a reddish-yellow colour. In concentrated sulphuric acid it dissolves to a yellow solution.
—E. F.

Flavonol; Synthesis of ——. St. v. Kostanecki and W. Szobrański. Ber., 1904, 37, 2819—2820.

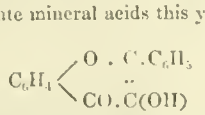
Flavanone—



(this J., 1904) is nitrosated in the usual manner to form isonitrosoflavanone—



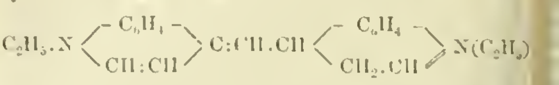
On boiling with dilute mineral acids this yields flavonol—



Flavonol forms colourless needles almost insoluble in cold sodium hydroxide solution, but soluble with a yellow colour on warming, forming a sodium salt which crystallises in yellow needles on cooling. It dyes in bright yellow shades on an alumina mordant.—E. F.

Cyanine Dyestuffs; Constitution of ——. A. Miethe and G. Book. Ber., 1904, 37, 2821—2824.

Diethylcyanine was obtained by acting on a mixture of 2 mols. of quinoline-ethyl iodide and 1 mol. of lepidine-ethyl iodide with 2 mols. of alkali hydroxide in alcoholic solution. The product forms dark-green needles, soluble with difficulty in alcohol, almost insoluble in water, and having the formula, $C_{23}N_{25}N_2I$. The dyestuff is quite similar in its reactions to Ethyl Red (this J., 1203, 712). The iodine atom can be replaced by other acid radicles through the medium of the corresponding silver salt. The nitrate produced in this way is also exceptionally soluble in water, and has a very powerful sensitising action on a silver-bromide-gelatin plate. Diethylcyanine resembles Ethyl Red further in forming a di-iodo addition product from which iodine is not set free by dilute hydrochloric acid or b solution in acetone. The authors therefore assign to Diethy cyanine the constitutional formula—



—E. F.

Dibenzalacetone and Triphenylmethane. V. A. v. Baey and V. Villiger. Ber., 1904, 37, 2848—2880. (Se this J., 1902, 607, 1326; 1903, 1124; 1904, 318.)

The authors have succeeded in preparing stable forms (the true colour bases (phenylated quinone-imines) of vario triphenylmethane dyestuffs, and their results show th Nietzki's quinone formula represents most correctly th constitution of the dyestuffs. Since, now the true quinono colour bases have been isolated, the old system of nome clature is not a rational one, the following new method proposed, 7.7-diphenylquinomethane, the root substance (aurin, discovered by Bistrzycki (this J., 1903, 901) bein taken as the basis. The name fuchsone is proposed f this substance, fuchsone-imine for the imide derived from i and fuchsone-imonium salts for the salts of the latter. Tl following are examples of the new system :—

Old Name.	New Name.
Aurin group:—	
Diphenylquinomethane...	Fuchsone.
Benzaurin................	Hydroxyfuchsone.
Aurin	Dihydroxyfuchsone.
Colour Bases of Carbinols not completely alkylated:—	
Imide of Diphenylquinomethane..............	Fuchsone-imine.
Colour Base of Dobner's Violet	Aminofuchsone-imine.
Homolka's Fuchsine base.	Diaminofuchsone-imine.
Colour base of triphenylpararosaniline	Diphenylaminofuchsonephenylimine.
Colour Salts or Dyestuffs:—	
Hydrochloric acid colour salt of aminotriphenylcarbinol	Fuchsone-imonium chloride.
Dobner's Violet...........	Aminofuchsone-imonium chlori
Malachite Green..........	Tetramethylaminofuchsone-imonium chloride.
Viridine	Phenylaminofuchsonephenylimonium chloride.
Parafuchsine	Diaminofuchsone-imonium chloride.
Hexamethyl Violet	Hexamethyldiaminofuchsone-imonium chloride.
Aniline Blue..............	Diphenylaminofuchsonephenylimonium chloride.
New Fuchsine............	Diaminotrimethylfuchsone-imonium chloride.

p-Dimethylaminotriphenylcarbinol was obtained by co densing benzophenone chloride with dimethylaniline presence of zinc chloride. After purification it crystallis in tufts of colourless needles melting at 92°—93° C., eas soluble in chloroform and benzene, somewhat less solul in alcohol and ether, and only slightly soluble in petrole spirit. It dissolves in acids with an orange-red colour a dyes tannin-mordanted cotton orange-red. *p-Monomethy triphenylcarbinol* was obtained by condensing diphen carbinol with methylaniline. It also dissolves in acids wi an orange-red colour.

Döbner's Violet.—Döbner prepared di-*p*-aminotriphen carbinol from aniline hydrochloride, nitrobenzene, ben trichloride and iron filings, but did not obtain a pure produ The authors' method consists in converting di-*p*-amino phenylmethane into its diacetyl derivative, treating t latter with sulphuric acid and manganese dioxide to obta the diacetyl-carbinol and separating the carbinol by hyd lysis with 30 per cent. sulphuric acid. Di-*p*-aminotriphen carbinol loses water below its melting point, which is 173 175 C., when the compound is heated fairly quickly, a 167°—168 C. when the heating is more gradual. It slightly soluble in ether and cold benzene, more readily alcohols and boiling benzene or xylene, and easily solul in pyridine. It is also somewhat soluble in hot water, t

nsiderably less so than pararosaniline. When warmed
th acids it is readily converted into the corresponding
ninofuchsone-imonium salts. These colour-salts crystallise
ll, and are only slightly soluble in cold water. When
aken with caustic soda solution and ether or benzene, they
ld the colour-base of Döbner's Violet (aminofuchsone-
ine), which resembles in properties Homolka's Fuchsine
se, but is yellower and much more unstable than the latter.
benzene solution the colour-base readily polymerises,
rming a violet powder.

*Colour-base of Viridine (p-Phenylaminofuchsone-
enylimine).*—This was prepared by heating on the water-
th a mixture of dianisylphenylcarbinol, aniline, and
nzoic acid and purifying the product by means of its
rate, from which the base is set free by dilute caustic
la solution. The base melts at 166°—168° C., dissolves
th difficulty in ether and cold benzene to a brownish-red
ution, and is more easily soluble in hot benzene. It has
nilar properties to the fuchsonephenylimine previously
scribed (this J., 1904, 318). On treatment with alcohols
aniline, decolorisation takes place, the alkyl ethers or
anilide of diphenylaminotriphenylcarbinol being pro-
ced; the colourless carbinol is also produced by treat-
nt with very dilute acids. Reducing agents convert it
o the leuco-base. The *p*-phenylaminofuchsonephenyl-
onium salts give green solutions.

*Fuchsone-imines of Parafuchsine and New Fuchsine
lomolka's Base).*—The authors confirm the statements of
molka and Hantzsch as to the behaviour of the bases.
ey can be dissolved unaltered in water and re-precipitated
caustic soda, if the experiment be carried out quickly,
t if the aqueous solution be allowed to stand, a precipitate
a faint violet colour is deposited, consisting mainly of the
rbinols. With sodium chloride and nitrate the phenyi-
ines give the corresponding dyestuffs; with ethyl alcohol,
d more readily, methyl alcohol, the alkyl ethers of the
binols; and with aniline, the anilides of the carbinols.

*Colour Base of Triphenylpararosaniline Blue (Di-
enylaminofuchsonephenylimine).*—This was prepared in a
nilar manner to the colour-base of Viridine, by heating
gether a mixture of *p*-trianisylcarbinol, benzoic acid, and
line, an approximately quantitative yield of the imonium
nzoate being obtained. The pure colour-base forms a
ck crystalline powder, easily soluble in pyridine and
stallising from boiling xylene in aggregates of plates
lting at 237°—238° C. It has similar properties to the
er phenylimines.—A. S.

*uorazones: a New Group of Dyestuffs formed by Melt-
ing Amino-azo Dyestuffs with Resorcinol.* L. Paul.
Chem.-Zeit., 1904, **28**, 765—772.

he author finds that the reaction which takes place when
ino-azo dyestuffs are melted with resorcinol is quite
ferent from that which occurs when they are heated with
enol. Two new groups of dyestuffs are formed, accord-
to whether the amino-azo dyestuff is heated with
orcinol alone or in presence of a second component,
ch as aniline or its derivatives. It is possible to so
ry out the reaction that only dyestuffs of the first
oup (Fluorazones) are formed, whilst these when heated
h aniline, &c., are converted into dyestuffs of the
ond group. The Fluorazones appear to be of no tech-
al value. The dyestuffs of the second group differ in
aracter, according to whether the benzene ring in the
xed amino-azo dyestuff contains a substitution group in the
ra position or not. For example, when the benzene ring
ntains a hydroxyl or an amino group in the para position,
Fluorazones obtained, give, when heated with amines
120°—150° C., red dyestuffs very similar to those of the
gdala Red group. When the benzene ring contains no
bstitution group in the para position, the reaction with
ines fails altogether at 120°—150° C., but at 180°—
0° C., a different reaction takes place, Rosinduline deri-
tives being produced. The dyestuffs similar to Magdala
d, mentioned above, are also converted into Rosinduline
rivatives when heated to 180°—190° C. For example,
rting with Meldola's base (*p*-aminobenzene-azo-α-naph-
lamine), Aminorosinduline, a red basic dyestuff, is
finally obtained, probably useful for printing cotton goods. On cotton mordanted with tannin and antimony, it gives a bluish-red shade, fast to soaping and light, distinctly superior to that obtained with Safranine or Magenta. The method of preparation is as follows:—10 grms. of resorcinol and 5 grms. of aniline are heated to 160° C., and 5 grms. of Meldola's base and 2·6 grms. of aniline hydrochloride rapidly added. The melt is extracted with dilute hydrochloric acid, and the bluish-red dyestuff, which separates on standing, is filtered off. In the filtrate the base is precipitated by ammonia, filtered off, redissolved in 10 per cent. acetic acid, again precipitated with ammonia, and so on, until the precipitate dissolves readily in hot water. The yield of Aminorosinduline obtained in this way was 10 grms.; the residue insoluble in hydrochloric acid, weighed 1·7 grms.
—A. S.

Sensitisers [Dyestuffs]; Supplementary ——. A. Miethe.
XXI., page 881.

English Patents.

Sulphurised [Sulphide] Dyestuffs; Manufacture of Yellow, Orange-Yellow to Orange ——. O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maire. Eng. Pat. 21,800, Oct. 9, 1903.

The reaction product of 1 mol. of *m*-phenylenediamine and 1 mol. of carbon bisulphide when heated with sulphur at 170°—195° C., or with sulphur and sodium sulphide to 120° C., gives dyestuffs dyeing unmordanted cotton clear yellow shades. If, previous to heating with sulphur, the parent compound be heated to about 235° C., evolution of gas occurs, and the product, when heated with sulphur to 220° or 250° C., gives yellow to orange dyestuffs according to the temperature employed. When these latter dyestuffs are heated with sodium sulphide to 130° C., the shade of the product is somewhat modified. (See U.S. Pat. 760,110 of 1904; this J., 1904, 712.)—T. F. B.

Sulphur Dyes [Sulphide Dyestuffs]. H. H. Lake, London. From K. Oehler, Offenbach-on-Maine, Germany. Eng. Pat. 12,270, May 30, 1904.

Seventy-five parts of 2.4-dinitrophenyl-3′-chloro-4-hydroxy-5′-tolylamine (obtained by condensing 1.3.4-dinitrochlorobenzene with *p*-amino-*o*-chloro-*o*-cresol) are heated with 300 parts of sodium sulphide, 120 parts of sulphur, and 200 parts of water, with reflux condenser, at about 100° C., for about 20 hours, and the product is evaporated to dryness at 105°—110° C.; the resulting dyestuff gives fast deep blue shades on cotton from its solution in sodium sulphide.—T. F. B.

United States Patents.

Indigo; [Electrolytic] Manufacture of Brominated ——. A. Schmidt and R. Müller, Assignors to Farbw. vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. U.S. Pat. 765,996, July 26, 1904.

See Fr. Pat. 322,348 of 1902; this J., 1903, 360.—E. B.

Wool Dye [Azo Dyestuff]; Dark Brown ——. A. L. Laska, Assignor to K. Oehler, Anilin- und Anilinfarben Fabr., Offenbach-on-the-Maine, Germany. U.S. Pat. 767,069, Aug. 9, 1904.

Azo dyestuffs, which give blackish-brown shades on wool after chroming, are obtained by combining diazotised naphthylamine sulphonic acids with *m*-hydroxydiphenylamine.
—T. F. B.

Mordant Dye [Azo Dyestuff]; Brown ——. A. L. Laska, Assignor to K. Oehler, Anilin- und Anilinfarben Fabr., Offenbach-on-the-Maine, Germany. U.S. Pat. 767,070, Aug. 9, 1904.

Diazotised aminonaphtholsulphonic acids (which have the amino- and hydroxy-groups in different benzene nuclei) are combined with *m*-hydroxydiphenylamine; the dyestuff obtained from heteronuclear-β-amino-α-naphtholsulphonic acid is specified. These dyestuffs dye wool from acid baths orange to violet shades, converted, on subsequent chroming, to reddish-brown to brownish-violet.—T. F. B.

French Patent.

French Patents.

Collodion-Silk; Apparatus for Spinning ——, *with Recovery of the Solvents Used.* M. Denis. Fr. Pat. 341,173, March 5, 1904.

Artificial cellulose fibres are produced from collodion, whilst the alcohol and ether present in the latter are recovered, by causing the collodion to flow from a system of spinnerets into a pipe through which water or an aqueous denitrating solution, maintained at a temperature above the boiling point of ether, is passed. The vaporised ether ascends into a receiving pipe whence it is drawn off into a condenser. The water or aqueous solution is circulated until it is sufficiently saturated with alcohol, when it is replaced, the alcohol being recovered from it by distillation. The nitrocellulose or cellulose fibres are drawn through a trap in the pipe and are spun together in the usual manner. —E. B.

Dyeing in Several Colours on the Same Thread of Cotton; Process of ——. Teinturerie Clément Marot. Second Addition, dated Feb. 25, 1904, to Fr. Pat. 337,027, Nov. 26, 1903. (See this J., 1904, 440 and 605.)

The thread wound on the bobbin is only dyed in parts, this result being brought about by mordanting a portion of the thread, or by a partial discharge, or by allowing only a portion of the bobbin to come in contact with the dye bath, or by other similar means.—T. F. B.

Dyeing Tissues [Mechanical Reserves]; Process for ——. L. Fanchamps-Philippe. Fr. Pat. 341,341, March 15, 1904.

Tissues are placed between perforated plates upon which pieces, of appropriate shape and size, of an elastic material are fixed. The plates are then immersed in a dye vat, o dye-liquor is drawn or forced through them, the tissue becoming dyed only in the less tightly compressed parts. —E. B.

Dyeing Fibres in the Loose State or in the Form of Slubbing, &c.; Apparatus for ——. Hartmann & Co. Fr Pat. 341,403, March 17, 1904.

The object of this invention is to facilitate the removal o textile fibres from portable receptacles in which they hav been bleached or dyed by the circulation of dye- or othe liquors through them. The apparatus devised to this en consists of a receptacle composed of a perforated drum o slightly conical shape, forming the body of the receptacl fitted to a detachable bottom open at its centre and extende upwards to form an inner tube, which is perforated fo the admission of liquors from a circulating pump. Th top of the inner tube is closed and is surmounted by a ring by means of which the whole apparatus can be lowere and raised. After dyeing, the inner tube and bottom along with the mass of fibres, are raised from the dye-vess in which the operation has been effected, the outer vesse adhering to the fibres and being simultaneously removed The receptacle is then placed upon a draining frame, upo which the outer cylinder is secured. The bottom and inne tube, with the fibres on or around them, are now raise and withdrawn from the outer vessel. The fibres bein thus freely exposed to the air quickly become cool and ar easily removed for further treatment.—E. B.

Dyeing and Printing Yarns and Printing Slubbing Apparatus for ——. G. Masurel-Leclercq. Fr. Pat 341,281, March 15, 1904.

Chiné-printed warp yarns are dried, either alone o together with dyed warp yarns, in a continuous manner i a vertical hot air chamber, provided with ventilators an radiators. Printing slubbing, alone or along with dye slubbing, may be similarly treated.—E. B.

Printing [Fabrics]; Process of ——. Soc. Anon. Pro F. Bayer et Cie. Fr. Pat. 341,007, March 7, 1904.

Acetyl derivatives of cellulose, soluble in alcohol (se Fr. Pat. 317,007 of 1901, and Addition thereto; this J 1902, 870; and 1903, 1015), may be substituted for th thickening agents usually employed in textile printing White designs on a red ground are obtained by printin cotton, dyed, for instance, with "Geranin G," with a past composed of zinc white, 10 grms.; glycerin, 20 grms. acetone, 10 grms.; a 5 per cent. alcoholic solution of acety cellulose, 60 grms. The fabric is finally dried and steame for 10 minutes.—T. F. B.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

Paper Dyeing. J. Nonnenmühlen. Färber-Zeit., 1904, **15**, 229—230.

Mottled Papers may be manufactured by mixing in th cylinder short lengths of dyed jute or cellulose fibres wit dyed and sized paper pulp.

Coloured Papers, which will not lose colour on immersion in water, are produced by "staining" with colour lakes. These are obtained by precipitating (i) basic, (ii acid, (iii) resorcinol (Eosine, &c.), and (iv) direct cotto dyestuffs, in the presence of kaolin, calcium sulphate starch, or barium sulphate, with (i) tannic acid and basi aluminium sulphate, (ii) basic aluminium sulphate an barium chloride, (iii) lead acetate, and (iv) barium chlorid respectively. The precipitates are filtered off, drie powdered, mixed with glue or gelatin solution, and applie to the paper, which is afterwards "satin" glazed.—E. B.

French Patent.

Dyeing Skins for Gloves and other Purposes. P. Sorel. Fr. Pat. 341,450, March 19, 1904.

The skins, after the usual preparation, are stained throug to a uniform shade in a bath of a chromium compound. —R. L. J.

VII.—ACIDS, ALKALIS, AND SALTS.

'itric and Sulphuric Acids; Properties of Mixtures of ——. A. Saposchnikoff. J. russ. phys.-chem. Ges., 1904, 35, 1098—1112; 36, 518—532. Chem. Centr., 1904, 1, 1322—1323; 2, 396—397.

ie author examined mixtures of nitric acid with increas- g amounts of sulphuric acid with regard to the partial essure of the nitric acid; the composition of the vapour rried over by air at 25° C.; the vapour densities of the ixtures; and their specific conductivity. The acids used ere sulphuric acid containing about 97 per cent. of the onohydrate, and the strongest nitric acid (containing, of urse, oxides of nitrogen). The curves expressing the sults obtained give no indication of the formation of com- unds, such as the nitrosulphuric acid of Markownikoff, t point to the production of nitric anhydride to a small tent in presence of a large proportion of sulphuric acid. periments were also made with pure sulphuric acid onohydrate and nitric acid of sp. gr. 1·478 at 15° C., ntaining 0·4 per cent. of oxides of nitrogen. The vapour essure of this nitric acid is only 16·64 mm., *i.e.*, much ver than that of acid of sp. gr. 1·52. With increasing ditions of sulphuric acid, the vapour pressure rises, aining a maximum in a mixture containing about 35 per nt. of sulphuric acid. Further addition of sulphuric acid uses a gradual diminution of the vapour pressure, almost accordance with Henry's law. Analysis of the vapours owed that from mixtures containing from 100 to 30 per nt. of nitric acid, they consisted of the pure monohydrate tric acid); from this point onwards, the nitrogen content the vapours increased (up to 24 per cent. of nitrogen), parently owing to a dehydration of the nitric acid, with mation of nitric anhydride. The results show distinctly t sulphuric acid dehydrates nitric acid containing water, l makes it thereby more active for the purpose of ration.—A. S.

mmonia-Soda Process from the Standpoint of the Phase Rule. P. P. Fedotieff. Z. physik. Chem., 1904, 49, 62—188.

e reaction: $NH_4HCO_3 + NaCl = NH_4Cl + NaHCO_3$, n which the ammonia-soda process is based, is reversible, l thus represents the phenomena of equilibrium of four stances, *i.e.*, one of the most complicated cases of the se rule. The author in attacking the problem makes cf the method proposed by Löwenherz (Z. physik. em., 1894, 13, 459), for representing graphically the erimental results. These results are set out in a series ables and curve-diagrams. It should be possible, prac- lly, to convert into sodium bicarbonate 75 per cent. of sodium chloride taken, as against the theoretical 79—80 cent. From the purely chemical standpoint the author siders that the later method of Schlösing, in which ium chloride in the solid form or in solution, is treated ectly with solid ammonium bicarbonate, is more rational n the so-called Solvay process, *viz.*, carbonation of an moniacal solution of sodium chloride.—A. S.

ali Chlorates and Zinc Chloride; Simultaneous Pre- aration of ——, by K. J. Bayer's Method. L. Friderich, C. Mallet and P. A. Guye. Chem.-Zeit., 1904, 28, 63—765.

authors have investigated Bayer's process (Eng. Pat. 978 of 1894; this J., 1895, 658), both in the laboratory on a semi-manufacturing scale. The method consists in sing chlorine into a solution of alkali chloride containing oxide in suspension, and subsequently heating the liquid ined, the final result being expressed by the equation: $3ZnO + NaCl + 3Cl_2 = 3ZnCl_2 + NaClO_3$. The best ds are obtained by working with an excess of alkali oride, and it is found that the following reactions occur, des the one given above: $2ZnO + 4Cl = Zn(OCl)_2 +$ l_2; $Zn(OCl)_2 + H_2O = ZnO + 2HClO$; $3HClO +$ $l = NaClO_3 + 3HCl$. The chlorination is best carried at 40°—50° C., and a yield of 100 per cent. of dissolved li chlorate is obtained under normal conditions. If the rination be stopped before the last traces of the zinc oxide are dissolved, any impurities (*e.g.*, iron) present in the latter do not pass into the solution. For the separation of the alkali chlorate, the solution must be evaporated under reduced pressure at a relatively low temperature (*e.g.*, that of the water-bath), as at higher temperatures, the reaction expressed by the equation (1) proceeds from right to left. The yield of chlorate is 96 per cent. of the total quantity in solution, and the crude product, if washed by the mother liquor from a previous crystallisation, yields, by one recrystallisation, crystals containing only a trace of zinc. The mother liquor contains zinc chloride contaminated with alkali chlorate. The latter is converted into sodium chloride by treatment with hydrochloric acid, metallic zinc, or ferrous hydroxide or carbonate. The only impurity contained in the zinc chloride finally obtained is a small quantity of sodium chloride. The authors conclude that the process would give good results technically, one great advantage being that practically the whole of the chlorine is obtained in the form of valuable products, which is not the case with the ordinary chemical methods for the preparation of chlorates.—A. S.

Calcium Sulphate; Solubility of —— in Aqueous Solutions of Sodium and Potassium Sulphates. F. K. Cameron and J. F. Breazeale. J. of Phys. Chem., 1904, 7, 335—340. Chem. Centr., 1904, 2, 501—502.

The determinations were made at 25° C. The results are set out in curve-diagrams and tables. The following are some of the figures obtained:—

Potassium Sulphate.	Calcium Sulphate.	Sodium Sulphate.	Calcium Sulphate.
Grms. per Litre.		Grms. per Litre.	
9·85	1·446	9·535	1·157
19·57	1·485	24·369	1·171
30·66	1·587	36·979	1·563
35·79	1·213	46·159	1·650
40·53	0·970	94·229	1·980
96·00	0·257	146·612	2·234

The potassium sulphate curve consists of two parts, of which the upper one represents the solubility of calcium sulphate in potassium sulphate solution, and the lower one the solubility of syngenite, $CaSO_4.K_2SO_4.H_2O$, in solutions containing more than 32 grms. of potassium sulphate per litre. The point of intersection is a triple point, corresponding to 32 grms. of potassium sulphate and 1·585 grms. of calcium sulphate per litre (32·47 grms. and 1·582 grms. respectively by direct determinations). The solid phases corresponding to this triple point are gypsum and syngenite. The sodium sulphate curve gives no indication of a stable double salt.—A. S.

Copper Oxide, Hydroxide, and Carbonate; Solubility of —— in Ammonia Solutions. E. Murmann. Oesterr. Chem.-Zeit., 1904, 7, 272. Chem. Centr., 1904, 2, 110

The author finds that in the preparation of ammoniacal solutions of cupric hydroxide or carbonate, solution takes place immediately if a quantity of commercial ammonium carbonate or some other ammonium salt equal to half the weight of the copper compound be added. Ignited pure copper oxide, which is very slightly soluble in ammonia, is considerably more soluble in presence of ammonium salts. —A. S.

Borax; An Abnormal ——. L. Spiegel. Chem.-Zeit., 1904, 28, 750—751.

A sample of refined borax was melted until its water of crystallisation was expelled. It was then dissolved in water, and titrated with sulphuric acid. The titration indicated the presence of the hitherto unknown sodium triborate, $Na_2O.3B_2O_3$. When the triborate is crystallised from water ordinary sodium biborate separates out first, and from the mother-liquor crystals of tetraborate can be obtained. The new compound is not easily prepared from sodium hydroxide and boric acid in aqueous solution, but experiments showed that it could be formed in, and crystallised from, a solution

containing biborate and an excess of boric acid. Its occurrence in commercial borax appears to be extremely rare.
—E. H. T.

Tungstates of Sodium; Action of Zinc on ——. L. A. Hallopeau. Comptes rend., 1904, **139**, 283—284.

Zinc has no appreciable action on normal sodium tungstate ($Na_2O.WO_3.2H_2O$) at the boiling point of zinc. With the paratungstate ($5Na_2O.12WO_3.28H_2O$) crystals of normal zinc tungstate, $ZnWO_4$, form the chief product; but golden-yellow scales, probably Wöhler's tungsto-sodium tungstate, $Na_2WO_4 + WO_2.WO_3$, are also obtained in small quantity and a little tungsten as a grey powder. The reaction therefore differs from that of tin on sodium paratungstate, and from that of zinc on ammonium tungstate or on tungstic anhydride (this J., 1900, 829 and 908).
—F. Sdn.

Manganese Solution: Self-purification of —— from Contained Iron. G. Kassner. Arch. Pharm., 1904, **242**, 407—409.

A manganous sulphate solution containing iron equivalent to 0·0162 per cent. of its manganous sulphate content, deposited, when left to itself, a blackish-brown sediment. It was found that this sediment contained the whole of the iron present, the supernatant solution being absolutely free from iron. The author supposes that the catalytic action of the manganese salt hastens the atmospheric oxidation of the ferrous salt, and that a basic ferric salt is deposited. To take advantage of this reaction for the purification of manganous salts from iron, the iron present must be reduced to the ferrous condition, and the solution must be carefully neutralised.—J. T. D.

Nitric Oxide and Oxygen; Reaction between —— at Low Temperatures. L. Francesconi and N. Sciacca. Gaz. chim. ital., 1904, **34**, 447—457. Chem. Centr., 1904, **2**, 397.

The authors' results were briefly as follows:—Nitric oxide and oxygen both in the liquid condition, or nitric oxide in the liquid or solid condition, and oxygen as gas, or nitric oxide as gas and oxygen in the liquid state, always yielded, in whatever proportions they were mixed, nitrous anhydride. Nitric oxide and oxygen (in excess), both in the gaseous condition, gave nitrous anhydride at temperatures below − 110° C. Nitrous anhydride was converted by oxygen into nitrogen peroxide only at temperatures above − 100° C. Reduction of nitrogen peroxide to nitrous anhydride by nitric oxide began at − 150° C. Nitrous anhydride under normal pressure was stable up to a temperature of − 21° C.—A. S.

Bichromates and Chlorates; [Electrolytic] Process o Manufacturing ——. A. E. Gibbs. Fr. Pat. 341,223 March 12, 1904.

A solution of a chromate is treated with chlorine, eithe by passing the gas into a concentrated solution or by electrolysing a solution of alkali chromate and alkali chloride the products are separated from one another and fron unchanged chloride by fractional crystallisation. If larger proportion of chromate be required, alkali can b added to the solution from time to time, to reconvert son of the bichromate into chromate.—T. F. B.

Filling Materials; Manufacture of ——, *for variou Applications.* Soc. Solvay et Cie. Fr. Pat. 341,35 Feb. 8, 1904.

Various substances, inert chemically, but used in the art for filling purposes and the like, are prepared, such a calcium carbonate or sulphate, barium sulphate, kaolin, &c and in illustration, the following processes, all starting wit lime obtained by calcining limestone, &c., are given:—(a A solution of lime in a saccharine liquid is treated with carbo dioxide to obtain precipitated calcium carbonate. (*b*) Mil of lime is passed through a sieve, the cleared portion is prec pitated by carbon dioxide, and the residue may be utilise to obtain an inferior product. (*c*) Sodium carbonate treated with milk of lime, the calcium carbonate formed filtered off, and the caustic solution is carbonated for re-us (*d*) Ammonium chloride is treated with lime, whereb calcium chloride is formed, with liberation of ammoni (*e*) The calcium chloride thus formed may be treated (i solution) with ammonia and carbon dioxide, to precipita calcium carbonate, and reproduce ammonium chlorid (*f*) Or, calcium chloride solution is treated with a liqu containing sodium carbonate or bicarbonate such as th produced in the ammonia-soda process, whereby calciu carbonate is precipitated, and sodium chloride remain Some of the calcium compounds indicated may be replac by corresponding magnesium compounds.—E. S.

Ammonia and Cyanogen Compounds; Obtaining Sim taneously —— by Treatment of [Coal] Gas. W. Fel Fr. Pat. 341,614, Jan. 18, 1904. II., page 861.

VIII.—GLASS, POTTERY, ENAMELS.

United States Patent.

Glass; Process of Manufacturing ——. S. O. Richards jun., Toledo, Ohio. U.S. Pat. 766,771, Aug. 2, 1904.

The process is continuous and consists in supplying batch and reducing it in a substantially closed chamb heated externally. The resulting product is conduct into a "plaining" chamber during the reducing process, a the resultant "metal" flows continuously into a direct heated receiving chamber, which is at a lower temperat than the "plaining" chamber. In this receiving chamber t "metal" undergoes a prolonged "plaining" process, a flows continuously from the lower portion of this tank chamber into a working tank, from which it is work See U.S. Pat. 756,409, April 5, 1904; this J., 1904, 489.
—W. C. H.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

English Patents.

Kilns; Continuous —— for Burning Blue and S Glazed and Vitrified Bricks, Tiles, Pipes, and Te Cotta and like Goods. F. Fidler, Wigan. Eng. I 12,201, May 30, 1904.

Inside flues are constructed down the sides and alo the front firing face of the kilns, to carry the heat fr burning and cooling chambers through those in wh "blueing," &c. is in progress to chambers ahead with t ffecting the proceedings named. The flues are provided ith perforated covered tops to serve as "fire-benches," e passage of gases through the flues and holes being ontrolled by fireclay slabs over the holes.—W. C. H.

iln; Improved Vertical ——, to which the Heat is Supplied by the Aid of Furnaces or Combustion Chambers and by Aid of a Blast. C. R. Gostling, Mitcheldean, Gloucester. Eng. Pat. 14,075, June 22, 1904.

HE heat from the furnaces, which are exterior, but ljacent to the vertical kiln, and which may be fed with lid, liquid or gaseous fuel, is forced into the kiln by eans of a fan or other blast. The material to be calcined fed in at the top and continuously withdrawn, when urnt, from a suitable cooling chamber below the kiln.
—W. H. C.

ilns for Burning Fireproofing Tile and other Clay Products: Continuous ——. D. F. Henry, jun., Port Murry, N.J., U.S.A. Eng. Pat. 14,374, June 25, 1904.

E Fr. Pat. 338,561 of 1903; this J., 1904, 663.—T. F. B.

ilns for Burning Cement, Lime, and the like. N. Perpignani, Tchoudowo, Russia, and E. Candlot, Paris. Eng. Pat. 22,769, Oct. 21, 1903.

E Fr. Pat. 335,377 of 1903; this J., 1904, 188.—W. C. H.

gglutinant or Cement, and Method of Manufacturing the same. F. J. M. M. Ducastel, Paris. Eng. Pat. 9944, April 30, 1904.

RIED and powdered lime or cement is mixed with a rtain quantity of silica, silicates, or carbonates, also in wder, in a furnace consisting of a rotary horizontal iron linder, lined with flint masonry, in which mixture is ected by the action of rounded flint rollers, whilst heating ses are passed through, derived from the combustion of s, from an independent generator, in a chamber concted to the rotary furnace. The gas thus introduced, ntaining much carbon dioxide, is stated to produce ctions in the materials treated, inducing formation of ither acid silicates or bicarbonates." The heated gases ss from the furnace to apparatus for drying the materials ed.—E. S.

United States Patents.

Fireproofing Wood; Process of ——. J. L. Ferrell, Philadelphia. U.S. Pat. 767,514, Aug. 16, 1904.

E Fr. Pat. 319,123 of 1902; this J., 1902, 1455.—T. F. B.

ment or Cementitious Products; Machine for Making ——. W. E. Jaques, Assignor to A. O. Crozier, Grand Rapids, Mich. U.S. Pat. 766,260, Aug. 2, 1904.

E apparatus consists of a horizontal chamber to which terial is supplied through a tapered mouth. One end the chamber develops into a comparatively long narrowing e. Longitudinally through the chamber is arranged a ew which extends into the die. The pitch of the threads this screw is greater in the narrow portion of the die n in the chamber, so that material is carried through re rapidly than it is fed in.—W. C. H.

French Patent.

rnace for Burning a Raw Mixture of Cement, and for other Purposes. G. Gröndal. Fr. Pat. 341,382, March 16, 1904.

E apparatus consists of a hollow rotary drum, slightly lined, at the upper and lower ends of which are vertical naces; an orifice for the gas to enter the drum, and one charging the material to be burned in the upper furce. The lower vertical furnace is constructed so that gas and air can pass through horizontal channels in it the burner, the gas thus becoming heated by contact h the burnt material passing down the furnace. The per furnace is similarly constructed, so that the products combustion and any material in the form of powder are ried off to the chimney and cooled by imparting sensible t to, and thus pre-heating, raw material fed in.
—W. C. H.

X.—METALLURGY.

Steel; Strength of —— at High Temperatures. C. Bach. Z. Ver deutsch. Ing., 1903, 762. Proc. Inst. Civil Eng., 1904, **156**, 56—57.

SPECIMENS of steel were tested at the ordinary temperature and at 200°, 300°, 400°, 500°, and 550° C. The tensile strength increased up to 300° C., and then decreased. For example, the tensile strength of one specimen was 4267 kilos. per sq. cm. (27 tons per sq. in.) at the ordinary temperature; about 4767 kilos. per sq. cm. (30·17 tons per sq. in.) at 300° C.; and 2070 kilos. per sq. cm. (13·1 tons per sq. in.) at 550° C. The ultimate extension decreased from 25·5 per cent. at ordinary temperatures to 7·7 per cent. at 200° C., from which point it rose again to 39·5 per cent. at 550° C. The contraction of area was also less at 200° C. than at ordinary temperatures, but did not commence to rise again until the temperature was above 300° C. Increased duration of the action of the load during the tests had no effect on the tensile strength at ordinary temperatures, but caused a slight decrease at 300° C., and a still greater decrease at 400° and 500° C. By prolonging the action of the load, extension and contraction of area were increased between 300° and 400° C., but then again decreased until, at 500° C., they were lower by 20—25 per cent. than with the ordinary duration of test. The results show that steel for steam boilers, piping, &c. should be tested at higher as well as at ordinary temperatures.
—A. S.

Chromium Steels; Properties and Constitution of ——. L. Guillet. Comptes rend., 1904, **139**, 426—428.

THE results of the micrographic study of two series of chromium steels, with 0·200 and 0·800 of carbon respectively, are summarised in the following table:—

Class.	Microstructure.	Chromium-content in Steels containing:	
		0·2 per Cent. of Carbon.	0·8 per Cent. of Carbon.
		Per Cent.	Per Cent.
1	Pearlite	0—7	0—5
2	Martensite or troostite	7—15	5—10
3	Martensite and carbide	15—20	10—18
4	Carbide	Above 20	Above 18

The term "carbide" is applied to a special constituent, appearing as white globules after attack by picric acid, which the author has not yet isolated. The table shows that the higher the carbon-content, the less the proportion of chromium needed to pass from one structure to another. Mechanically, the same classes are distinguishable, save that classes 2 and 3 tend to run into one another. In the pearlitic steels, with constant carbon, increase of chromium raises the breaking stress, the elastic limit, and the hardness; the elongation, the diminution of cross section, and the brittleness are not greater than in ordinary steels with the same carbon-content. The martensite and troostite steels have an exceedingly high breaking stress, elastic limit, and hardness; very low elongation and contraction of area; medium resistance to shock. The "carbide" steels have medium breaking stress, elastic limit, and hardness; high elongation; considerable contraction of area; but are very brittle. Re-heating softens all these chromium steels. Tempering modifies the pearlitic steels as it does ordinary steels, but acts with greater intensity; it slightly softens the martensite steels, producing some γ-iron; whilst with the "carbide" steels it produces no effect, mechanical or micrographic, between 850° and 1150° C.; but at 1200° C. sharply defined white regions are produced, apparently of γ-iron, and the carbide disappears more or less completely, according to the speed of cooling and the content of chromium. Only the pearlitic chrome steels possess industrial interest.—J. T. D.

Vanadium Steels. L. Guillet. Comptes rend., 1904, **139**, 407—408.

Continuing his researches (this J., 1904, 255), the author finds that the pearlitic vanadium steels are very sensitive to thermal and mechanical treatment, and that when reheated to 900° C. and slowly cooled, they are not more brittle than ordinary steels with the same carbon-content. High vanadium steels, the carbon of which is entirely as carbide, are completely heterogeneous, probably because the vanadium carbide existing in the melted metal tends to rise to the surface. The only vanadium steels of industrial interest are those containing less than 0·7 per cent. of vanadium. A table of the results of mechanical tests is given in the paper.—J. T. D.

Zinc and Magnesium: Alloys of ——. O. Boudouard. Comptes rend., 1904, **139**, 424—426.

The curve of melting-points of these alloys shows a maximum (570° C.) at a point corresponding with the alloy Zn_2Mg. 84 per cent. of zinc; and two minima (355° and 332° C.). The alloys are all more or less brilliantly white in colour. That with 10 per cent. of zinc can be filed or sawn, but as the proportion of zinc increases, the alloys become more and more brittle; their fracture is conchoidal, or in some cases very finely granular. Micrographically, the 90 per cent. zinc alloy shows alternate white and black regions, the black portions being themselves heterogeneous and exhibiting a sort of perlitic structure; the 50 per cent. zinc alloy shows fine arborescent crystals ($ZnMg_4$). Two definite compounds have been isolated from these alloys—Zn_2Mg from the 80 per cent. zinc alloy by treatment with 0·3 per cent. hydrochloric acid, and $ZnMg_4$ from the 30 per cent. zinc alloy by treatment with 5 per cent. ammonium chloride solution.—J. T. D.

Copper; Physical Properties of —— [Crusher Gauges for Recording Powder Pressures]. P. Galy-Aché. Ann. Chim. Phys., 1903, 326. Proc. Inst. Civil Eng., 1904, **156**, 59.

The experiments were made with a view of interpreting the deformations of copper crusher gauges which are used for recording powder pressures. It was found that the "breakdown point" for compression is always raised to the level of the stress applied previously, which can therefore readily be ascertained by testing a used crusher gauge and noting its breakdown point. The amount of compression was greater under the drop test than in the testing machine, owing to the lowering of the breakdown point due to the raising of the temperature by a blow. The breakdown point decreased from 10 tons per sq. in. at − 58° F. (− 50° C.) to 8·5 tons at 392° F. (200° C.). It was also considerably effected by annealing, being, for example, 9·3 tons per sq. in. for an unannealed specimen, but only "0·64 ton" for a sample annealed at 1832° F. (1000° C.). For equal elongations, the acquired breakdown point in tensile test pieces was greater with rapid (drop) testing than with slow testing. As the temperature of annealing was increased, the crystalline structure of the copper became coarser.
—A. S.

"Crystallitic" Forms; Permanence of —— in Crystals [Metals]. F. Osmond and G. Cartaud. Comptes rend., 1904, **139**, 404—406.

Charpy and others have noticed in the structure of the surfaces of bronze, cut, etched, and polished, crystallitic forms the axes of which have a constant direction in the same crystalline granule. These have usually been attributed to lack of homogeneity in the metal, the proportion of copper diminishing with the distance from the crystallitic axes, the points of first solidification. The authors find, however, that these appearances are largely due to mechanical causes—chiefly the different degrees of hardness of the eutectic and the crystalline granules and the varying extents to which the surface is removed by the etching and polishing operations; and it is possible to eliminate or considerably diminish them by lessening the thickness of material removed during these operations. This is best effected, with soft metals like copper (or even lead), by alternating several etching and polishing operations, using materials which shall act as gently as possible. The etching solutions for copper and its alloys should be picric acid and quinone in alcohol or acetone, or aqueous ferric chloride solution slightly acidified; and the polishing should be done by hand with a cloth dusted over with chromic oxide and wetted with weak ammonia.—J. T. D.

Metals; Evolution of Structure in ——. G. Cartaud Comptes rend., 1904, **139**, 428—430.

The author finds that the cellular structure described by him as existing on the cooled surface of metals poured ou in the melted state in a thin layer over a polished surface (this J., 1901, 811), also exists in the interior of an ingot The progress of micrographic art has rendered it possible to polish and etch the surfaces of sections of soft metals like zinc, tin, or lead; and microscopic examination of these surfaces shows the existence of a cellular structure the boundary lines of which are followed and cut by the boundary lines of the larger crystalline structure much as the delineation of the course of a river on a map would be followed and cut by a line indicating its average direction He suggests that the cellular structure forms a stage—a temporary state of equilibrium—in the evolution of the final stable crystallino state. Traces of this earlier stage still exist in the final state, but when the final state has been, so to speak, confirmed by treatment, such as deformation and subsequent reheating, the crystalline boundary lines alone remain, and no sign of the cellular structure is left.—J. T. D.

English Patents.

Furnaces for Baking Briquettes made of Ore, Concentrate or other Material. W. Simpkin, London. Eng. Pat 21,183, Oct. 2, 1903.

The furnace is of the tunnel type, with a central combustion chamber and rails entirely occupied by linked car loaded with the briquettes to be baked, both ends of th furnace being closed ordinarily by sliding doors. The wall are built with expansion pockets. A sand lute extends on both sides of the rails, into which sand an apron, carried by each car, projects, to prevent the passage of heating gase from the upper to the under side of the car. Air admitted by vertical ducts near the entrance end of the furnace passes beneath the cars, and at the opposite (exit) end rises through other ducts to the upper part of the furnace meeting a supply of air under forced draught, and passe over the tops of the cars, cooling them preparatory fo discharge, whilst the air on reaching the combustion chamber becomes heated, and heats the cars near to the entrance end, near to which is the escape for the gases of combustion to the stack. The combustion chamber is supplied with finely-powdered coal, or with gaseous fuel under pressure For each car drawn out, another loaded car is admitted a the entrance end.—E. S.

Cupola. T. Holland, Delphos, Ohio. Eng. Pat. 7694 March 31, 1904. Under Internat. Conv., April 3, 1903.

The object of the invention is to introduce into a cupola for melting metals, &c., hot-air blasts in such a manner as to raise quickly and maintain uniformly a very high temperature. For this purpose, an air receiver, having air-baffling partitions extending transversely one above another, and opening alternately at opposite ends, is arranged in the upper portion of the cupola, with a cold-air pipe leading into the receiver, around which latter a portion of the pipe is coiled. Pipes leading from the receiver and from an air jacket convey the highly-heated air to the lower portions of the cupola.—E. S.

Ferruginous Ore; Process of and Apparatus for Treating —— for the Manufacture of Iron and Steel therefrom. M. Moore, Melbourne, and T. J. Heskett, Brunswick, Victoria. Eng. Pat. 4975, Feb. 29, 1904.

See Fr. Pat. 341,169 of 1904; this J., 1904, 827.—T. F. B.

United States Patents.

oaration [of Metalliferous Ore from Gangue]; Process of ——. A. Schwarz, Assignor to C. N. Lindley, New York. U.S. Pat. 766,289, Aug. 2, 1904.

E materials to be separated, such as the metalliferous tions of ore from the gangue, are moistened, in the nular or pulverulent state, with water, and are then roduced, without agitation, into a bath containing two nids of different specific gravity, insoluble in each other, h as oil floating on water or on a solution of salt in ter.—E. S.

es; Recovering Values [Copper, &c.] from —— by Dissolving in Molten Baths. R. Baggaley, Pittsburg, Pa., and C. M. Allen, Lolo, Mont. U.S. Pat. 766,654, Aug. 2, 1904.

BATH of low-grade copper matte is formed in a converter ough which air is blown, and successive additions are de, first, of ore containing a high proportion of silicious tter, in order to flux the iron present, and lastly, of er molten matte, to replenish the bath as its volume is reased by enrichment. Compare U.S. Pat. 746,260 of 03, this J., 1904, 23.—E. S.

opper] Ore; Method of Smelting ——, and Cleaning Converter Slag. R. Baggaley, Pittsburg, Pa., and C. M. Allen, Lolo, Mont. U.S. Pat. 766,655, Aug. 2, 1904.

AG from a Bessemer converter is poured upon the charge "sulphide ore" which is being smelted in a copper-ore elting furnace, contributing heat thereto, and facilitating smelting process. Or, the smelted product of "sulide ore" is charged directly into a converter, into which cious ore is also charged, and the slag is withdrawn m time to time, while molten, and poured upon the ore ilst it is being smelted. See also the preceding abstract. —E. S.

atte [Copper]; Method of Producing ——. R. Baggaley, Pittsburg, Pa., and C. M. Allen, Lolo, Mont. U.S. Pat. 766,656, Aug. 2, 1904.

R is blown into a molten bath of copper matte, to which added successive small quantities of a highly silicious tal-bearing ore, whereby the iron present is fluxed. The th is then replenished with molten ore, and with "molten terial high in fuel value." See also the two preceding stracts.—E. S.

agnetic Materials [Alloys]; Method of Making ——. R. A. Hadfield, Sheffield, England. U.S. Pat. 767,110, Aug. 9, 1904.

produce a magnetic material of high permeability and hysteresis, a magnetic substance is alloyed with silicon, d the alloy, reduced to a "thin body," is heated to a mperature below its melting point, then quickly cooled, heated to a temperature higher than that first employed, d allowed to cool slowly. Compare U.S. Pat. 745,829 d Eng. Pat. 4981, both of 1903; this J., 1904, 23 and 0.—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

Diaphragm for Electrolytic Cells; New Form of ——. F. M. Perkin. Electro-Chemist and Met., 1904, **4**, 2—4.

THE diaphragm is constructed of two concentric perforated cells, the space between them being filled with some material which forms the diaphragm proper. This may be asbestos, parchment, or filter paper, or may be made *in situ* from a pulp of asbestos, or from powdered glass or sand, which is poured into the annular space between the cells. The perforations in the cells are about the diameter of an ordinary pin.—R. S. H.

Alkali Chlorides; Electrolysis of ——. *Theory of Diaphragm Electrolysis.* P. A. Guye. Arch. Sc. phys. nat., Genève, 1903, **15**, 612—622; **16**, 393—416, 652—668. Science Abstracts, 1904, **7**, A, 198—199.

IT is shown that the apparently complex character of the electrolysis of alkali chlorides under the ordinary conditions of working becomes very much simplified by accepting the fundamental principle of Hittorf, *viz.*, that the alkali chloride and alkali participate simultaneously in the electrolysis. At any particular temperature, the instantaneous current yield, r, is practically only a function of the alkali concentration, c, and may be expressed very approximately by the equation: $r = 1 - nx$, where n is the "transport number" of the hydroxyl ions, and x the amount of alkali taking part in the electrolysis. If the concentration of the alkali chloride in the cathode liquid be kept constant, the relation is: $r = 1/(1 + ac)^{\frac{1}{3}}$; whilst if the chloride in the cathode liquid is not replaced as it is gradually decomposed, the relation becomes: $r = 1/(1 + ac)$. In either case the value of a is influenced but slightly by variations in the concentration or temperature of the electrolyte. Two methods of working are in vogue in diaphragm electrolysis, *viz.*: (1) The electrolysis is continued until the alkalinity of the cathode solution reaches a certain value, when the liquid is replaced by fresh solution. (2) The concentration of the cathode solution is kept approximately constant by continuous feeding with chloride solution. The first of these methods is the more economical with regard to the consumption of electrical energy. When the second method of procedure is followed, two cases may arise: (*a*) When the added solution does not mix with the remainder; this is approximately so in practice when the cathode compartment is large and the current density small, and in such a case the yield is the same as with the first method of working. (*b*) When instantaneous and complete mixture takes place; this condition is closely realised when the cathode compartment is small, and the current density high. Experimental results obtained in tests on a large scale agreed well with those calculated by the author.—A. S.

Electrolysis of Alkali Chlorides; Physico-Chemical Studies on the ——. A. Tardy and P. A. Guye. J. de Chim. Phys., 1904, **2**, 79—123. Chem. Centr. 1904, **2**, 292—293.

Mode of Action of Diaphragms.—In a diaphragm apparatus for the electrolysis of alkali chlorides the following processes take place:—(1) Physical diffusion of the alkali from the cathode liquid into the anode compartment. (2) Migration of hydroxyl ions into the anode compartment. (3) Depression of the level of the anode liquid in consequence of electrical osmose towards the cathode compartment. (4) Diffusion of cathode liquid to the anode compartment induced by (3). It has been shown that the migration of ions mentioned under (2) is the chief cause of the transference of alkali to the anode compartment. The counteracting influences (3) and (4) produce after some time a condition of equilibrium, the depression of the level of the anode liquid finally established being proportional to the strength of the current and the thickness of the diaphragm, and inversely proportional to the superficial area of the diaphragm. The equation given previously (see preceding abstract) for the instantaneous current-yield must be modified by the introduction of two subtractive terms, and should read: $r = f(c) - k_1c - k_2c$. The coefficient k_1 depends upon the diffusion and electrical osmose, and k_2 upon the permeability of the diaphragm. In an examination of the efficacy of a diaphragm, diffusion, electrical endosmose and the "overflowing" of the anode liquid have alone to be considered. The authors examined a number of different diaphragms and found that it is possible to fix certain characteristic constants for each one, which are of value in judging its efficiency. (1) Ratio, r_1, of the hollow spaces of the diaphragm to its apparent volume. (2) Absolute coefficient of permeability k. This is determined by ascertaining the amount of water which is forced through 1 sq. dcm. of the diaphragm at a definite temperature in 1 hour by a pressure of 1 cm. of water, and referring the result to a liquid having a viscosity of 1. The viscosity of water at different temperatures was found to be as follows:—0° C., 0·01778; 5°, 0·015095; 10°, 0·013025; 15°, 0·011335; 20°, 0·010015; 25°, 0·00891; and 30° C., 0·007974. The coefficient of permeability k is also proportional to the loss of salt by electrical endosmose. (3) Specific coefficient of electrical resistance $= e/r_1$ (e = thickness of the diaphragm). (4) Coefficient of loss by diffusion. The actual diffusion is always less than the calculated, owing to the peculiar nature of the capillary channels forming the diaphragm. For the last constant (5) the virtual thickness of the diaphragm calculated from the diffusion is substituted for the actual thickness. The following conclusions are drawn with regard to the technical electrolysis of alkali chloride solutions with the aid of diaphragms:—The level of the anode liquid should always be kept as high as that of the cathode liquid. The current-density should be tolerably high in order that the endosmotic flow from anode to cathode may in some measure compensate diffusion in the opposite direction: the permeability of the diaphragm may also be somewhat diminished. Under these favourable conditions the yield attains the normal value fixed in the earlier investigation (see preceding abstract).—A. S.

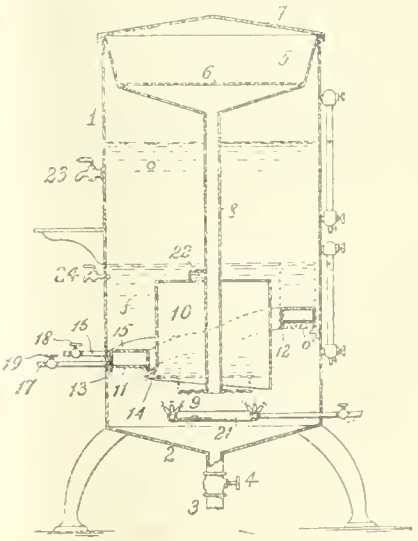
Oils; Apparatus for Purifying ——. D. H. McClelland and F. Risk. Fr. Pat. 341,400, March 17, 1904.

The apparatus consists of a cylindrical vessel 1, having a funnel-shaped bottom 2, in which the impurities and the



washing liquid collect, and from which they are drawn off by the valve 4. The oil to be treated is contained in the vessel 5, situated at the top of the cylinder. After passing through the strainer 6, and down the pipe 8, it escapes under the spreader plate 9, in a thin film, and rises through the washing liquid (the coarser impurities settling to the bottom) and collects in the bell 10. Any air escapes through the valve 22 and the pipe 8. The partly purified oil flows out of the bell 10, by the lip 14, to the under surface of the heating arrangement 11. This consists of a coiled tube of rectangular section, set obliquely as shown, and having the sides projecting downwards as at 12 and 13, in order to cause the particles of oil to follow the course of its under surface. The heating is effected by a current of steam or hot air which enters at 16, passes round the tube, and leaves at 17. The oil is thus heated and washed by the liquid *f*, and collects at *o′*, and then rises through the liquid, finally collecting in the upper part of the cylinder at *o*, from which the purified oil is drawn off by the tap 23. The warming and thorough mixing of oil and washing liquid, which enters thorongh the pipe 21, are said to effectually purify the oil.—W. H. C.

Fats; Apparatus for Extracting Glycerin from ——. G. Col. Fr. Pat. 340, 521, Feb. 17, 1904.

The material is introduced into the top of a closed conical vessel *a*, which is heated by means of the perforated steam coil *g*, *g*, *g*. Having passed through the holes in the diaphragm *d*, it falls in a finely divided state upon the plates *e*, *e*, *e*, *e*, and comes in contact with the steam. It next passes into the cylinder *h*, where it is beaten by the revolving paddles *k*, before passing through the tubes *m*, *m*, into the lower cylinder *l*. Here it is subjected to further beating in the presence of a regulated supply of distilled water from the tank *o*. Finally, the mixture passes into the separator *p*, which is provided with two outlet tubes, the upper *s*, for the residual fatty material and the lower *t*, for the aqueous solution of glycerin.—C. A. M.

Soap [Containing Benzene]; Manufacture of ——. J. F. G. de Roussy de Sales. Fr. Pat. 341,568, March 24, 1904.

Benzene or other hydrocarbon, is emulsified with the soap by means of a suitable mucilage, such as gum arabic, quince gum, fish glue, linseed meal, and the like.—W. P. S.

Bone dust, or other bone preparation, is mixed with solutions of ferric chloride, sulphate, or nitrate, for the production of a fertiliser and cattle food.—N. H. J. M.

XVI.—SUGAR, STARCH, GUM, Etc.

Press-Diffusion Process: The Hyros ——. K. Andrlik and V. Stanek. Z. Zuckerind. Böhmen, 1904, **28**, 573—577.

The authors give the results of the working of the Hyros diffusion process (Fr. Pat. 318,451 of 1902; this J., 1902, 1462) with a model apparatus which worked almost the whole season at a Bohemian sugar works. The beetroot chips were fed by hand into the first diffuser at the top, the juice flowed from it continuously, and the exhausted chips left the seventh diffuser automatically. The water pressure varied from 2·4 to 3·4 atmospheres, and the temperature in the battery was 77°—78° C. In six hours eight minutes, 960 kilos. of fresh chips were worked, the quantity of water used was 247·5 litres, and there were obtained 905·6 litres of diffusion juice at 80° C., and 295·6 kilos. of exhausted chips. In the ordinary diffusion the juice drawn off was 119·2 kilos. for 100 of beetroots, in the Hyros only 96·07, and 30·8 of exhausted chips. The density was 18·2° Balling against 15·0° by the ordinary process. The amount of dry solids in the exhausted chips was very high, being 21·94 against 6·79 per cent. by the ordinary diffusion. Although the chips were not exhausted so completely, they could be dried without further pressure and consequent loss of feeding value, whilst the sugar contained would be fully utilised and could not therefore be looked upon as loss. The amount of sugar remaining in the chips was 0·18 per cent. calculated on the beetroots, more than the total loss by the usual diffusion, but this is of no account compared to the economy of the process. The purity of the juice was 90·98 as compared to 90·0 by the diffusion in the 14 ordinary diffusers. The absence of all waste sweet waters and the smaller quantity of water used in working are both obvious advantages (see also this J., 1904, 831).—L. J. de W.

Juice in Raw Sugar Works; Purification of —— by the Lehmkuhl Process. F. Janák. Z. Zuckerind. Böhmen, 1904, **28**, 593—596.

Raw-sugar factories use from 2½ to 3½ per cent. of lime for the purification of the juice, not because such quantities are indispensable for purification, but because the filtration is difficult unless this amount of lime be used. The difficulty in filtration has been variously attributed to the presence of certain organic substances, to saccharates, to gelatinous mineral hydroxides, &c. Lehmkuhl came to the conclusion that it was due to albuminoids dissolved in the juice, and that if these were precipitated by chemical means, 1 per cent. of lime would suffice for purification and the filtration would proceed satisfactorily. Further, he found that it was necessary to heat the juice to 90°—95° C. in the presence of the chemical reagents. The juice is usually heated alone before the addition of lime, but as Classen and Herzfeld have shown, 9/10 of the albuminoids remain in solution under these circumstances. Although these are decomposed by lime into amino-acids, the salts thereby formed remain as molasses formers in the juice. The reagents employed are sulphuric acid and aluminium sulphate, and these are not found to produce any injurious effect at the temperature of 90° C. in the proportions employed during the time they are mixed with the juice, and the small quantity of salts remaining offers no disadvantage and does not appreciably affect the purity compared with the salts of amino acids. The process has been worked with advantage at the factories of Gross-Gerau, Melno, Amongies and Sokolnic. The coagulated albuminoids are not acted on by lime.—L. J. de W.

English Patent.

Sugar; Manufacture of ——. G. Harrison, London. From F. Hlavati and Co., Genoa. Eng. Pat. 16,750, July 30, 1903.

To the saccharine materials during the diffusion process there are added substances which precipitate or prevent the extraction of the organic non-sugar bodies. Suitable substances are: gypsum, sulphates of metals of the magnesium or aluminium group, permanganates of the alkaline earths, peroxides of the alkaline earths or their equivalents, sulphides of hydrogen, nitrous oxide, carbon dioxide, and sulphurous acid. After saturation and carbonation, the slightly alkaline juice is treated in the vacuum-pan with a silicate of the aluminium or magnesium group which has previously been converted by an acid into a poly-silicate, and which combines with the alkali salts of the juice. A final decolorisation may be effected with zinc dust and subsequent carbonation. The use of silicon lead fluoride, supersaturated with lead, is also claimed for the purification of sugar solutions.—J. F. B.

French Patents.

Starch; Rotatory Apparatus for Catching and Automatically Grading ——. L. A. Morel. Second Addition, dated March 17, 1904, to Fr. Pat. 300,237, May 11, 1900.

In this addition the application of a receiver for the preparatory grading of starches before centrifugalising is claimed, together with the arrangement of a circular trough round the basket of the centrifugal apparatus so as to collect the water and carry it into the succeeding centrifugal vessel.—T. H. P.

Tar from Water-Gas; Process for Utilising the ——. [*Solvent for Gums.*] L. Scholvien. Fr. Pat. 340,995. March 7, 1904. III., page 861.

Barley; The Tannin of ——. H. Seyffert. Woch. f. Brau., 1904, **21**, 483—485.

The tannin of barley has a far lower affinity for albuminoids than the tannin of hops. Barley-tannin is only precipitated in combination with the readily coagulable albumins, whereas the precipitating action of hop-tannin extends to albuminoids, such as glutin, &c., which are non-coagulable in the ordinary sense. This is illustrated when one portion of a malt-wort made by infusion is boiled for two hours with a small proportion of hops, whilst another portion is boiled for half an hour without hops, and then for 1½ hours with the same quantity of hops. The total quantity of coagulated albumin in the first case is considerably less than in the second case and the former wort has a harsh flavour. When hop-tannin and barley-tannin occur simultaneously, as in the first case, in presence of readily coagulable albumins, the whole of the more powerful hop-tannin is precipitated in combination chiefly with the latter, leaving the barley-tannin and most of the soluble albumins dissolved in the wort. In the second case, the barley-tannin is precipitated in combination with the coagulable albumins during the preliminary boiling, thereby permitting the whole of the hop-tannin to be utilised subsequently for the precipitation of the glutin and similar undesirable albuminoid constituents of the wort. Barley-tannin can be extracted from the grain by means of 75 per cent. methyl or ethyl alcohol, and is precipitated from its solutions by lead hydroxide. The author has isolated the tannin in a crude state, and has studied its relations towards certain constituents of wort. The alcoholic solution of barley-tannin when added to an aqueous solution of barley-albumin [leucosin] causes a heavy turbidity which coagulates on heating. In a saline solution of barley-globulin [edestin], the tannin solution causes a precipitate which dissolves on heating and re-appears on cooling. In an alcoholic solution of hordein it produces a turbidity which clears on heating to 60° C., but re-appears on cooling. Barley-tannin produces a precipitate in a solution of diastase, and the precipitate coagulates on heating. In a solution of Lintner's soluble starch the tannin solution produces a voluminous slimy precipitate, soluble on heating, but re-appearing when cold. When added in excess to unhopped wort, the tannin solution produces a turbidity which coagulates on boiling, but the wort becomes turbid when cold. In unhopped wort which has been coagulated by boiling, the tannin solution produces a heavy turbidity which clears on heating, but re-appears on cooling. Thus, apart from its astringent taste, it appears that the barley-tannin requires consideration as a possible cause of "beer-hazes;" it also probably has an injurious effect upon the yeast.—J. F. B.

Malt; Prior's Method of Determining the Degree of Friability of Cured ——. G. Bode. Woch. f. Brau., 1904, **21**, 495—497.

Prior recently proposed (Bayer. Brauer. J., 1903, **13**, 97—98) to determine the degree of friability in malt by sifting the grist and weighing the meal, a Seck mill and a Vogel sieve being used. The classification is as follows: very tender malt, containing at least 40 per cent. of meal: tender, with 35—40 per cent.; hard, with 30—35 per cent.; and very hard, with less than 30 per cent. of meal. These limits, however, are so narrow as to easily give rise to discordant results, more especially since the author's experiments with artificially moistened samples have shown that an alteration in the percentage of moisture is sufficient to displace one and the same malt from one category into another. In view of the results obtained he therefore proposes to adopt 5 per cent. of moisture as the standard, and where less than this quantity is present to deduct the difference from the percentage of meal found, the converse procedure being adopted when the moisture exceeds this mean. As an example of the effect of this precaution, one sample of malt yielded 38·8 per cent. of meal when the moisture content was 3·5 per cent., but only 29·6 per cent. when containing 11·4 per cent. of water. Under the Prior classification it would be considered in the former case as friable, but in the latter as very hard; whereas after the proposed adjustment, the percentages of meal become respectively 36·3 and 36·0 per cent. *i.e.*, the sample is properly classed as friable.—C. S.

Concentrated Malt Extract; Sugars of ——. A. R. Ling and T. Rendle. Analyst, 1904, **29**, 243—247.

From analyses of nine samples of malt extract, Korn (Ber. deut. Pharm. Ges., 1896, **6**, 319) found their mean carbohydrate composition to be: maltose, 41·43—60·43; dextrose, 0·47—6·21; cane sugar, 0·33—3·60; and dextrin, 11·70—22·70. In their analyses, the results of which are given in the following table, the authors have determined the dextrose as dextrosazone (Chem. Soc., 1904, **84**, 24), whilst the maltose was calculated from the reducing power

—	1.	2.	3.	4.	5.	6.	7.	8.	9.
Sp. gr. at 15·5/15·5 C.	1395·70	1395·12	..	..	..	..	1408·43	1377·82	..

less that due to dextrose and the dextrin from the rotatory power after deducting that of the dextrose and maltose: the small amount of cane-sugar, stated by Korn to be present, was neglected.

Of these samples the first two were not submitted to a higher temperature than 145° F. at any time during the mashing process, whilst Nos. 3—6 were mashed at a slightly lower temperature; these six were prepared from low-dried English malt.

As regards the presence of dextrose, it has been shown (this J., 1903, 1058, 1059, and 1204) that when any of the products of the incomplete hydrolysis of starch by diastase are isolated, and submitted to the further action of the enzyme, even at a temperature of 131° F., glucose is invariably formed. It is suggested that the dextrose of malt extracts may be due to the action, during the evaporation, of the diastase in the extract on the incompletely hydrolysed starch products formed during the mashing.
—T. H. P.

Starch; Note on the Hydrolysis of —— by Diastase. J. S. Ford. Chem. Soc. Trans., 1904, **85**, 980—983.

Ling (this J., 1902, 983) has stated that Kjeldahl's law of proportionality does not hold for the diastase of air-dried malt. The author found, on the other hand, that two different preparations of Lintner's soluble starch gave similar results as regards "proportionality" with extracts from various barleys and air-dried (at 17—40° C.) and kiln-dried malts. These results show that Kjeldahl's law is true for the diastase (amylase) in extracts of barley and air-dried malt as well as for that in kiln-dried malt. Having regard to the influence of slight traces of impurities on amylolytic action (see this J., 1904, 414), it is suggested that the discrepant results obtained by Ling and by the author are due to the use of starches of different degrees of purification.—A. S.

Starch; Final Degradation Products of —— by Hydrolysis with Oxalic Acid, with special Reference to Dierssen's (Lintner's) "Isomaltose." F. Grüters. Z. angew. Chem., 1904, **17**, 1169—1179.

The degradation products obtained consisted of achroodextrins I and II, maltodextrin γ, maltose, dextrose, and a small proportion of levulose. These are the same as the products furnished by diastatic action, except that in the latter case maltodextrin γ is replaced by maltodextrin β, which exhibits different constants and behaves differently towards diastase. The author, however, believes that both these dextrins occur simultaneously, but in varying proportions, this view being supported by the fact that the conversion into maltose is sometimes very imperfect, and at others almost complete. The divergent behaviour of various "isomaltose" preparations towards malt extract is also regarded as indicating that the more resistant maltodextrin γ occasionally preponderates as the lowest member of the dextrin series. Like Lintner and Dierssen he failed to isolate maltose in the pure, crystalline state from the syrups; but neither could this be accomplished from mixtures of maltose and dextrin, which, moreover, gave osazones resembling "isomaltosazone." Furthermore, the statement by Ost that he has finally succeeded in crystallising maltose from the syrups seems to have deprived the "isomaltose" theory of its last support.—C. S.

Brewing; Employment of Sugar in ——. C. Moreau. La Bière, 1904, **12**, 98—104.

Commercial glucose is of irregular composition, and contains undesirable ash constituents; its use in brewing gives unsatisfactory fermentations besides entailing extra fining. Saccharose, whilst free from these defects, is not directly fermentable, and if the necessary inversion be left to the action of the pitching yeast, the latter may be overtaxed and caused to degenerate. Again, this sugar increases the temperature of fermentation by about 2° C., the attenuation is greater by about 3 per cent., the wort does not break so well in the copper, nor is the beer so bright when fined, nor are the flavour and aroma so good as when invert sugar is used. Commercial invert sugar, however, lacks uniformity, but this difficulty can be overcome by inverting saccharose with yeast in the brewery, at a temperature (55° C.). The author made trial brews with this invert sugar added to the malt in proportions ranging between 12 and 55 per cent. The best result was obtained with 15—16 per cent., this quantity leaving the beer unchanged in flavour, and the yeast vigorous and free from degeneration; and the beer kept unusually well, showing good condition and a firm "head." With larger proportions of sugar the results were less favourable. No trace of yeasty flavour could be detected from this yeast-inverted sugar, the taste observed in the sugar itself entirely disappearing when the wort was boiled; and the quantity of proteids introduced in the same way is smaller than in the corresponding weight of malt. Over-attenuation can be prevented by mashing so as to produce a wort containing more dextrin and by the use of about 2 per cent. of high dried malt. For priming, this sugar is less suitable, owing to its yeasty taste, and the inversion is preferably effected by boiling the 20 per cent. solution of saccharose with 1 per cent. of tartaric acid for 20—30 minutes. No injury accrues to the beer from the introduction of this small quantity of acid, and even when 12 per cent. of the malt is replaced by sugar inverted in this way, it is stated, the degree of acidity does not rise above the normal limit. The author considers that the use of sugar would improve the cold flavour of North of France beers, which lack palate-fulness owing to the loss of dissolved carbon dioxide during fermentation and fining. At the same time a slight economy would be effected in the cost of production.—C. S.

Culture Yeasts; Studies on the Behaviour of Certain Races of —— at Various Temperatures. W. Henneberg. Woch f. Brau., 1904, **21**, 347—349; 374—376; 400—403; 432—434; 447—451; 457—460; 470—476.

The subjects dealt with in this series of investigations comprise:—*I. Death of the Yeast Cells:* Diagnosis by appearance and staining; appearance according to the manner of death; death with simultaneous liquefaction; death caused by high temperatures and storage. *II. Cell-wall:* Agglutination; racial variations; permanence; rupture. *III. Nucleus.* *IV. Glycogen:* Detection; appearance and disappearance at various temperatures; persistence after death from different causes and in presence of various substances. *V. Fat:* Its secretion in excess probably pathological; persistence after death; racial and hereditary tendencies of cells rich in fat; sparing solubility of the fat in ether. *VI. Peptase:* Detection; racial differences; conditions which influence auto-digestion; comparative resistance of dead cells to proteolysis; microscopic characters of cells during proteolysis; resistance of peptase to high temperatures and storage; distinction between auto-digestion and the gelatin-liquefying power of living yeast. *VII. Catalase:* Detection; occurrence; diffusibility; behaviour towards heat. *VIII. Zymase:* Its early disappearance from liquefied yeast. *IX. Invertase:* Its high powers of resistance; relative abundance in bottom fermentation yeasts. *X. Putrefaction:* Non-occurrence at temperatures above 38° C.; bottom yeasts putrefy more readily than top yeasts; various lactic acid bacteria probably play a part in starting putrefaction; presence of active enzymes in liquefied yeast is probably inimical to putrefaction.—J. F. B.

Wild Yeast Infection. A. C. Chapman. J. Inst. Brewing, 1904, **10**, 382—396.

The chief sources of wild yeast infection in English breweries are said to be direct aerial infection at the refrigerating stage, indirect aerial infection from dust in the refrigerator or fermenting room, and infection due to nests of micro-organisms in defective fermenting tuns or yeast backs. On the other hand, infection due to very impure pitching yeast or to dry hopping is rarely met with. Provided the wort is run off the cooler before the temperature falls below 140° F., there is little risk of infection at that stage; but it is advisable to screen the ventilation openings with fine linen, moistened with water or dilute salicylic acid, and the same method should be adopted in the refrigerator room, or the latter apparatus be itself enclosed in a casing of similar character. Dust infection may be prevented by cleanliness, and that from defective plant by shaving down the tuns to remove all soft places and spongy surfaces, and treating them for several days with a strong solution of calcium bisulphite. This method proved efficacious in two cases of infection by *S. pastorianus I.* The author also mentions an instance of infection by *S. apiculatus,* occurring in the winter months, whereas this yeast is seldom encountered except in summer and autumn. From the attendant circumstances it was concluded that the organism had found its way into the brewery earlier in the year, and lodged in accumulations of dust, being afterwards disturbed by wind.—C. S.

Fermenting Room [*Breweries*]; *Infection in the* ——. E. de Fine-Bunkeflod. Z. ges. Brauw., 1904, **27**, 573—576.

To prevent infection of the beer by micro-organisms it is essential that the vats should be well cleansed with hot water, followed by spraying or brushing over with an antiseptic, preferably one of the fluorine preparations (this J., 1904, 757). Sarcina germs are frequently found on dirty floors, and the latter should therefore be kept clean. The best material for fermenting room floors is asphalt with a little sand, or cement, crevices being thus avoided. The number of germs gaining access to the wort from the air is relatively small, and the authors failed to detect any injurious infection from this source. More importance attaches to the use of uncontaminated pitching yeast. A greater potential source of danger is water falling from the ceiling in drops. The ceiling should be frequently scraped and disinfected, hot lime wash or bleaching powder being cheapest. Sarcinæ have also been found on walls splashed with fermenting wort; and where contamination arises in this way the old plaster should be scraped off before disinfection.—C. S.

[*Beer*] *Sarcina Infection.* N. H. Claussen. Z. ges. Brauw., 1904, **27**, 528–529.

In reply to the criticisms of Will and Braun (this J., 1904, 757) the author states that he is unaware that sarcina grown in ammoniacal yeast-water has ever been found capable of growing in beer; on the other hand, he has isolated *Pediococcus damnosus* and *P. perniciosus* from beers of various origin, and found the cultures produce sarcina sickness in beer but refuse to grow in the above medium. Hence he feels justified in the conclusion that ammoniacal yeast-water is an entirely unsuitable reagent in brewery tests.—C. S.

Fermentation Processes; Review of Recent Improvements in ——. H. Wichmann. Woch. f. Brauw., 1904, **21**, 455—456.

In the use of pure yeast the best results are only obtained when the propagation of the pure yeast is worked as an integral part of the routine fermentations and under identical conditions. In Delbrück's "natural" pure cultivation the conditions are chosen so as to cause the culture yeast to suppress all foreign organisms. In this natural process of selection without the isolation of single cells, attention must be devoted to the choice of a nutrient material in accordance with the enzymatic power of the species of yeast; also to the demands of the yeast for oxygen, its sensibility towards its own excretion products, acids, and antiseptics, and towards unfavourable temperatures. The use of pitching-vats, which is on the increase, is of assistance in obtaining pure yeast. Purity may also be favoured by conducting the fermentations at higher temperatures, whereby wild yeasts are placed at a disadvantage. Octagonal vats constructed of glass plates with embedded wire have been introduced recently as substitutes for wooden fermentation tuns. For very large-sized fermentation vats only iron is available; these large vats are rendered indifferent towards beer by a special internal coating according to Lapp's process.—J. F. B.

Beer; Filtration of ——. Bauer, Jakob, and Riefenstuel. Z. ges. Brauw., 1904, **27**, 601—607.

The experiments made show that filtration makes the beer brighter and removes most of the yeast cells present, thus enabling the brewer to send out beer sooner and also to clarify beer that has been rendered quite turbid by yeast. Filtration improves the keeping properties of the beer, and delays the appearance of sediment or haze. To enable these advantages to be realised, the filtering material must be kept in a sterile condition and replaced at intervals. The used mass should be washed at once, a temperature of 70°—75° C. sufficing to destroy the micro-organisms. Boiling makes the mass lumpy, and is only required previous to the first time of using. The cleansed mass should be at once repacked in the frames and placed in the filter, to obviate risk of infection from exposure to the air. It is inadvisable to use the same mass several days in succession with merely a washing in the filter in the intervals. On no account should beer be left standing in the filter. The latter must be thoroughly cleaned before use, hot water being the most suitable agent to follow the usual methods of cleaning. Owing to the risk of causing metallic haze, it is inadvisable to treat the filter with antiseptics liable to loosen the incrustation.—C. S.

Amyl Alcohol; Origin of —— *in Fermented Liquids.* Windisch. Z. Spiritusind., 1904, **27**, 311.

The author gives an account of the experiments of Rayman and Kruis on the chemistry of fermentation. In 1892 they found that pure cultures of normal saccharomycetes form no other alcohol than ethyl alcohol at the ordinary brewery temperatures; later on, in 1896, they showed that the culture yeasts are capable, under certain conditions, which they could not clearly define, of yielding fusel oil without the help of bacterial action (see this J., 1896, 465). In continuation of this work, these authors inoculated a series of nutrient sugar solutions, both with yeasts rejuvenated by culture through numerous generations and with others which had finished their alcoholic fermentation years before. It was found that neither unfavourable composition of the nutrient medium nor the age and physiological condition of the yeast cells influence the formation of amyl alcohol. On the contrary, it was shown that amyl alcohol is a product of the culture yeast, that it is formed only in presence of certain carbohydrates, and that it is the nature of the nutrient medium on which the formation and yield of amyl alcohol mainly depend. None of the artificial nutrient solutions yields a trace of amyl alcohol with pure distillery yeast, but with a clear, sterile, barley-malt wort, prepared as in the distillery, amyl alcohol always appears. From this it is concluded that the source of this alcohol is not the hexoses, but fermentable sugars formed by the hydrolysis of other polysaccharides occurring in the raw materials used. On oxidising a mixture of sugars containing a large preponderance of one constituent, the course of oxidation of the mixture depends upon the course of oxidation of the sugar in excess. Thus, in presence of a sugar which readily oxidises, dextrose yields no saccharic acid but oxalic acid. Rayman and Kruis suggest that something similar possibly occurs in fermentation.—T. H. P.

Metals; Influence of —— *on Fermenting Liquids.* L. Nathan. Centrabl. f. Bact., 1904, **12**, 93. Biochem. Centrabl., 1904, **2**, 690.

Cider musts offer greater resistance to the action of metals than beer worts, notwithstanding the fact that they dissolve more of the metals. There is considerable difference in the influence of different metals on the fermentation. Thus copper, zinc, brass, bronze, and rough iron have a strong restrictive influence; tin and lead have less effect; whilst the following metals are only slightly injurious: Polished iron, silver, nickel, gold, polished tin, and aluminium.
—C. A. M.

Wine Making; Australian ——, *with some Notes on the Use of Pure Wine Yeasts.* F. Stoward. J. Inst. Brewing, 1904, **10**, 421—447.

Wine Making.—Fermentation is generally conducted in cement-lined brick tanks, holding about 1600 galls. For producing dry red wine, the bottom of the tank is covered with a layer of stalks, to facilitate drainage and impart tannin, a similar layer being placed on the top of the mash of skins and juice. The skins are kept from rising to the surface of the must by means of a false head of light battens, held down by screw jacks, which also serves to support the attemperators. Yeast from a tank in active fermentation is sometimes added, or occasionally pure cultures are used. No aeration of the must is necessary, but attempts are made to maintain uniformity of temperature by means of a circulating pump, better results being, however, now obtained by piercing the cap of skins with a number of short bamboo vents. When fermentation begins, the temperature in the cap is several degrees higher than that of the must above the false head, the difference being due to the low conductivity of the skins, and the difficulty experienced by the carbon dioxide in escaping through them to the surface. In about six days the must is racked into wooden vessels, and left for a couple of months to clarify, an operation that is repeated previous to blending. For dry white wines, the juice is left in contact with the skins for only 24—36 hours, and is then fermented by itself; whilst, for sweet wines, either red or white, the fermentation is arrested at a certain point by the addition of grape spirit.

Acid : Sugar Ratio.—Australian musts contain more sugar in proportion to acid than do those of French or German origin, the relative quantities of acid per 100 parts of sugar being as follow :—Victoria must, 2·80—3·14 ; South Australian, 2·82 ; French, 4·13 ; and German 5·65 parts. This is because the wines being of more robust type need a high sugar content for their manufacture.

Pure Yeast.—The author has experimented with pure cultures of Chateau Lafitte and Richbourg yeasts, the sub-cultures of which were employed to ferment batches of must, a third batch being left to ferment spontaneously. In addition to giving a more regular fermentation, and suppressing the development of *S. apiculatus* infection, the culture yeasts furnished a superior product, the Chateau Lafitte giving a specially fine bouquet after two years' storage, whilst the Richbourg proved better than the control batch, which lacked cleanness of taste. It was noticed in laboratory experiments that the use of pure yeasts lightened the colour of the wine.—C. S.

Alcohol ; Hydration of —— by Calcium and Barium Oxides. L. Crismer. Bull. Soc. Chim. Belg., 1904, **18**, 128—129.

The author tests the degree of hydration of alcohols by a very sensitive method, *viz.*, by determining the lowest temperature at which they mingle completely with a paraffin hydrocarbon ; this he calls the "critical temperature of solution." With a given solvent these temperatures show equal increments for an additional CH_2 group in the alcohol molecule ; thus in kerosene ("huile de paraffine") the temperature is 166° in the case of methyl alcohol, 89·7° with ethyl alcohol, and 13·5° C. with propyl alcohol, the differences being 76·3° and 76·2° respectively. Having prepared a really anhydrous methyl alcohol, which has a critical temperature of 37·5° C. in "gasoline," the author finds that distillation from quicklime freshly prepared from marble actually leads to hydration, raising the critical temperature to 39·6° (first distillate) and even 66° C. (last distillate), corresponding to 0·12 per cent. and 2 per cent. of water respectively. The reaction is presumably expressed by $CaO + 2CH_3OH = Ca(OCH_3)_2 + H_2O$. Hence the familiar process of dehydration with quicklime is illusory. Anhydrous ethyl alcohol is hydrated by barium oxide but not by quicklime.—W. A. C.

Grain for the Production of Malt ; Treatment of ——. J. Sleeman, Portishead, Somerset. Eng. Pat. 17,975, Aug. 19, 1903.

The apparatus described permits the whole process of malting to be carried out in a combination or series of appliances, the complete plant consisting of a washing and steeping drum or cylinder, two germinating drums, two withering cases, and two drying machines. The washing and steeping drum consists of a perforated cylinder mounted so as to revolve in a tank of water. It is fitted with internal paddles for raising the grain and allowing it to fall again. A perforated tube may be fitted centrally in the drum to supply air to the latter. The washed grain is then passed through a shoot into the germinating drum. A suitable form of this part of the plant is described in Eng. Pats. 18,412, 1898 (this J. 1899, 936), and 2109, 1899. The air used during the germination is previously passed through a moistening apparatus. Withering is carried out in a similar drum, but the grain space is much narrower. The malt then passes either to an ordinary drying kiln, or to drying and curing machines. For curing, the perforated case is preferably enclosed in an impervious casing, to enable the heated air contained therein to permeate the grain, instead of forcing large volumes of air through it. —W. P. S.

Grain for Malting, Distilling, &c. ; Apparatus for Aerating —— during the Steeping Process. C. F. Henry, Dublin. Eng. Pat. 19,472, Sept. 10, 1903.

The apparatus consists of a cylindrical perforated casing of circular or polygonal section, mounted horizontally on pivots projecting from the end walls. The cylinder is divided radially into compartments into which the grain is loaded through longitudinal doors. The casing is partially immersed in the steeping vat in such a manner that the grain in one compartment is aerated, while that in the other compartments is submerged.—J. F. B.

Malting and Drying Drums. T. McKenna, London. From Holst and Fleischer, Christiania. Eng. Pat. 11,752, May 21, 1904.

In malting grain between two concentric perforated drums, the inner drum being utilised for the admission of air, a perfect distribution of the moist air during germination is ensured by maintaining the whole of the perforations of the inner drum freely open. When, however, the malt is to be dried by the admission of dry heated air, which causes a considerable shrinkage of the grain, the upper portion of the inner drum is closed by deflecting plates or dampers, which swing round on pivots and cover the perforations. Thus the hot air is compelled to pass through the denser, lower layers of the grain. For kilning malt with roasted aroma, the deflecting plates are heated by means of steam pipes attached to their lower surfaces and constructed to swing with the dampers.—J. F. B.

Malting Drums. H. Schreier, Sheboygan, Wis., U.S.A. Eng. Pat. 14,517, June 28, 1904.

A rotary malting drum is provided with a discharge opening, covered by a slide, and also with internal spiral conveyors mounted on a shaft so as to move the contents of the drum towards the discharge opening. The discharge opening may be in the longitudinal centre of the drum, and the conveyors arranged so as to deliver the contents from opposite ends to the centre. The driving gear consists of a bevel wheel on the outer end of a conveyor shaft, engaging with a corresponding wheel, which is mounted on a transverse shaft and can be displaced on the same so as to clear the conveyor wheel while the drum is being rotated. —C. S.

Mersey and Irwell Joint Committee. Report by R. A. Tatton, Chief Inspector, July 5, 1904.

A review of the progress made towards the purification of the rivers of the watershed during the past 12 years is given. The area under the jurisdiction of the joint committee consists of seven county boroughs, Manchester being the principal one, 14 non-county boroughs, 63 urban districts, and 11 rural districts; with a total population of 2,502,103, and a rateable value of 2,390,446*l*. The watershed comprises five rivers—the Irwell and the Roach, with 286 manufacturers upon their banks; the Irk, with 45 manufacturers; the Medlock, with 15; and the Mersey, with 98—giving a total of 444. The tipping of cinders into the streams, which was a very common practice 12 years ago, has practically ceased. The sludge accumulating in mill lodges is now seldom discharged into the rivers, but pollution still occurs through the running off of lodges in which polluted water is used, the putrescent water carrying mud with it. Fewer complaints are now received of pollution from stone-polishing works. Tables and diagrams are given showing the gradual progress made in works for preventing pollution from liquid sewage. In May 1892 only 27 of the authorities in the watershed had sewage works in operation; in May 1904 there were 80 in operation in urban districts, and 10 in rural districts. In 1892 there were 26 urban authorities which had no scheme of sewage purification; now there are only two, and of those one—Ramsbottom—has its works nearly completed, and the other—Bollington—has received tenders. In the appendix to the report particulars are given of the methods of treatment adopted by each authority with works in operation. The adoption of bacteria beds, in place of land, is largely on the increase, creating a large demand for suitable material. Special attention is directed to the pollution caused by the discharge of untreated storm water through storm overflows, and it is recommended that if the storm water cannot be filtered, it should at least be allowed to pass through settling tanks to remove solid matter. Fairly satisfactory improvement is noted in the treatment of the dry weather flow of sewage. In the section dealing with liquid by-products of a polluting character, tables are given showing the number of manufacturers in each industry where purification works are necessary, and the progress made since 1893. Of the 444 on the rivers, there were, in October 1893, 45 which had efficient works of purification; in May last there were 306. In 1893, 77 works had plant constructed, but not efficient; now there were 133 works in a similar position. At the first date there were 191 manufactories at which no treatment was adopted; now there were only five. Out of 120 dyeworks, 88 had now efficient plants; out of 75 bleachworks 56; of 59 woollen trades, 44; of 48 printworks, 38; of 12 breweries only three were now efficient; and of five factories of fellmongers, only 1. In addition to these, effluents from a large number of factories drain into the sewers. No proceedings have been taken against manufacturers during the last six years, and it is seldom that the suggestions made by the joint committee are rejected. Considerable trouble is caused by the effluent from fellmongers and bleachworks, owing to the large area required for the necessary filtration. A hopeful direction in which progress has been made is in the recovery of waste products. Interesting facts are given to show the improvement which has taken place in the rivers during the last 12 years, but it is stated that much yet remains to be done, some of the rivers, especially the Irk and the Roach, being in a highly polluted condition.—G. J. F.

Chemical Disinfectants; Action of certain ——. Schumburg. Z. f. Hyg., 1903, **45**, 125. Proc. Inst. Civil Eng., 1904, **156**, 66—67.

Schüder has stated that bromine in a solution of 0·06 per 1000 is not invariably fatal to cholera vibrios in drinking-water. This statement is confirmed, but it was found that only in very rare cases are cholera vibrios capable of resisting the action of the disinfectant. The same is the case with a 1 per 1000 solution of mercuric chloride and a 5 per cent. solution of carbolic acid (phenol). The author considers that since the above disinfectants, which are the most powerful it is possible to use, are not certain to destroy all germs within a short time (say in three-quarters of an hour), no chemical mode of disinfection is to be absolutely depended upon, under all circumstances, to prove fatal to bacteria. Disinfection by means of heat is therefore to be preferred to the use of chemicals.—A. S.

Manganese in Drinking Water; Determination of ——. G. Baumert and P. Holdefleiss. XXIII., page 883.

English Patents.

Refuse-consuming and Gas-producing Furnaces. L. Tobiansky, Brussels. Eng. Pat. 12,361, May 31, 1904.

The refuse destructor consists essentially of a retort, in which the waste substances are dried and distilled; it is arranged above a combustion chamber which is fed with the coke produced in the retort. The apparatus is worked with the minimum admission of air, so that the steam, air, and vapours passing down from the retort, and up through the coke in the combustion chamber, give rise to a poor gas free from smoke, containing carbonic oxide and hydrogen. To render the gas suitable for use for motive purposes, it is enriched to a standard calorific value, the apparatus for automatically regulating the enrichment consisting of a small gas motor, burning the gas, and having its governor connected with the supply valve for the carburetting material, a reduction in the speed of the motor causing a corresponding increase in the supply of the carburetting material. The enrichment is effected by feeding tar into the fuel in the furnace, distilling oils in a special retort above the fire, passing the gas through a spray of light hydrocarbon, or mixing it with rich gas from any suitable source.—H. B.

Garbage and Offal; Apparatus for Cooking ——, and Removing the Oil therefrom. C. S. Wheelwright, Bristol, R.I., and J. T. Fiske, jun., Burrillville, R.I. Eng. Pat. 14,482, June 27, 1904.

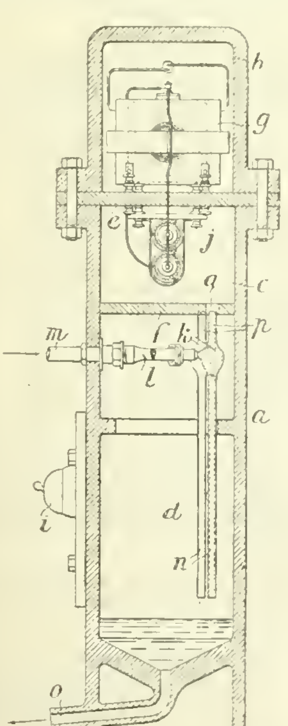
The apparatus consists of a digester in combination with a trapped water and oil receiver placed above the digester. The trap consists of the receiver itself and a stand-pipe opening directly from the digester and extending upwards in the receiver. Taps are provided for drawing off oil and water at different levels from the latter. A strainer is placed at the upper part of the digester. The steam enters through pipes at the lower end of the digester, deflectors being fitted over the end of each pipe. (See also U.S. Pat. 709,836, 1902; this J., 1902, 1285).—W. P. S.

Garbage or Offal; Apparatus for Cooking ——, and Removing the Oil therefrom. C. S. Wheelwright, Bristol, R.I., and J. T. Fiske, jun., Burrillville, R.I. Eng. Pat. 14,483, June 27, 1904.

The steam digester described in the preceding patent is provided with a second chamber apart from the oil and water receiver. The two are connected by a valved circulation pipe and a trapped chamber is placed above the second chamber to receive oil, steam, or water passing through the circulation pipe. A pipe leading from the bottom of the second chamber allows water to be drawn off and injected into the digester to replace the oil and water withdrawn from the latter.—W. P. S.

Sterilising Water by means of Ozone; Apparatus for ——. R. F. Wood-Smith, London. Eng. Pat. 18,193, Aug. 22, 1903.

The outer casing, *a*, of the apparatus is divided into three chambers, *b*, *c*, and *d*, by the horizontal partitions, *e* and *f*. The upper chamber, *b*, contains a step-up transformer, *g*, for raising a low tension alternating current to current of a tension suitable for the ozoniser, *j*, of the Andreoli type, in the middle compartment, *c*. The water to be sterilised is supplied through the pipe, *m*, to three branch pipes, *l*, forming the horizontal side tubes of the three filter pumps, *k*, the upper nozzles, *p*, of which, fit into orifices, *q*, in the partition, *f*. The transformer is controlled by the switch, *i*, and supplies the necessary current to the ozoniser, *j*, which ozonises the air passing into *c* through apertures in *e*. The water, supplied through *m*, draws the ozonised air through the nozzles, *p*, and the water and air being brought into intimate contact in the discharge pipes, *n*, the water leaves the apparatus at *o* in a completely sterilised condition.—B. N.



Removing Oil or Grease from Garbage or Offal; Apparatus for ——. C. S. Wheelwright, Bristol; and J. T. Fiske, jun., Burrillville, R.I., U.S.A. Eng. Pat. 14,709, June 30, 1904.

The garbage, &c. is cooked in the digester by the introduction of water and fresh steam. By mechanical means the solid parts of the garbage are held back, whilst the grease and water pass to an upper chamber, and are separated by gravity.—N. H. J. M.

(C.)—DISINFECTANTS.

English Patent.

Gaseous Germicide and Insecticide; [Electrical] Process and Apparatus for producing a ——. R. Marot, Paris. Eng. Pat. 14,372, June 25, 1904. Under Internat. Conv., Nov. 30, 1903.

A mixture of sulphur dioxide and air is subjected to the silent electric discharge, or is forced through a chamber containing electrodes between which sparks are caused to pass. The gaseous mixture, which now contains some sulphuric anhydride, and is therefore capable of acting as a germicide as well as an insecticide, is mixed with a further quantity of air, and driven by means of a fan into the space to be disinfected.—A. S.

French Patent.

Wines and Spirits; Improvement of ——, and Sterilisation of Liquids. W. Dorn. Fr. Pat. 341,671, March 26, 1904. XVII., page 878.

XIX.—PAPER, PASTEBOARD, Etc.

Kollergang and Pulping Machine. U. Wochenbl. f. Papierfabr., 1904, **35**, 2530—2531.

The author enumerates the relative points of merit of the Kollergang, as compared with the pulping machine of the Würster or Dietrich type.

Advantages of the Kollergang.—The Kollergang, in combination with a strainer, is almost indispensable for pulping up unsorted waste paper and trimmings containing string, binding thread, and other hard and elastic impurities; the stuff can be prepared either "free" or "wet," according to the density of the charge, moisture, and length of treatment; on this account a better felting and, consequently, a tougher paper and better retention of clay and fine fibres can be ensured. The Kollergang, moreover, is the only satisfactory means for pulping up hard papers, such as imitation parchment and strong glazed papers, since it has a kneading and rubbing action.

Disadvantages of the Kollergang.—The Kollergang necessitates a small and intermittent production; the period of treatment cannot be controlled; a certain amount of injury to the fibre cannot be avoided; the treatment is a lengthy one; the service is somewhat dangerous, and the up-keep is costly; any foreign bodies, such as wood or coal, are ground up with the pulp, which also becomes contaminated with sand from the stones.

Advantages of the Pulping Machine.—For "machine-broke" and clean-sorted waste paper, and for all sorts of dry wood-pulp, the pulping machine is vastly superior to the Kollergang. The work is continuous and the output is large; the operation is rapid and cheap; the machine having been adjusted, the condition of the prepared stuff is always constant; the fibre is improved; the service is perfectly safe; space is economised; foreign impurities are discharged intact.

Disadvantages of the Pulping Machine. — Unsorted waste papers may cause clogging and, ultimately, a breakdown of the machine: the treatment is not sufficiently drastic for certain kinds of hard paper; the machines cannot be used for the preparation of "wet" stuff.

Cellulose: Production of Amorphous ——. I. Kitsee, Philadelphia. U.S. Pat. 767,822, Aug. 16, 1904.

Amorphous cellulose is produced "by applying an oil or fatty substance to a portion of the surface of a fibrous material, and then subjecting the material to nitration, whereby only the parts which are not protected with the oily substance are nitrated."—T. F. B.

Nitrated Cellulose: Process of Dissolving ——. I. Kitsee, Philadelphia. U.S. Pats. 767,943 and 767,944, Aug. 16, 1904.

Moist nitrated cellulose is dissolved by treating with a suitable solvent, such as acetic acid fumes. According to the second specification, "cellulose in previous nitrated condition" is subjected to the fumes of a suitable solvent.

—T. F. B.

Celluloid [Utilising Waste ——]. I. Kitsee, Philadelphia. U.S. Pat. 767,646, Aug. 16, 1904.

Waste pieces of celluloid are subjected, in wire baskets enclosed in a suitable vessel, to the action of the vapour of a solvent until they are sufficiently plastic to be worked up again. The vapours of the solvent are then drawn off to a cooled condenser.—T. F. B.

Viscose; Apparatus for Extracting Air and Carbon Bisulphide contained in ——. L. Naudin, Assignor to La Soc. Franç. de la Viscose, Paris. U.S. Pat. 767,421, Aug. 16, 1904.

See Fr. Pat. 340,690 of 1904; this J., 1904, 834.—T. F. B.

French Patents.

Gypsum for Loading Paper; Manufacture of Crystallised ——. W. Brothers. Fr. Pat. 340,952, March 4, 1904.

Natural or artificial calcium sulphate is heated in water or in an aqueous solution to a temperature of from 80° to 130° C. under pressure, the mixture being agitated during cooling to allow of the formation of separate and complete crystals, which are afterwards taken out and dried.

—W. C. H.

Celluloid; Process for Making Products Resembling ——. Chem. Fabr. vorm. Weiler-ter Meer. Fr. Pat. 341,556, March 23, 1904.

Instead of using camphor in the manufacture of celluloid, the following classes of compounds may be employed:—Mono- or poly-halogen derivatives of primary aromatic amino compounds; acidyl derivatives of halogenised aromatic amines (*e.g.*, chloroacetanilide); acidyl (formyl-, acetyl-, benzoyl-) derivatives of secondary aromatic amines such as methylaniline or alkylnaphthylamines.—T. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Veronal [Diethylmalonylurea]. B. Molle and Kleist. Arch. Pharm., 1904, **242**, 401—406.

Veronal, prepared by the condensation of urea and diethylmalonic ester, forms a white crystalline powder of bitter taste, melting at 191° C., and dissolving in 145 parts of water at 20° C., in 12 parts at 100° C. It dissolves readily in ether, acetone, acetic ester, or warm alcohol, less readily in cold alcohol, chloroform, carbon tetrachloride, acetic acid, ligroïn, or amyl alcohol, still less in petroleum spirit or aniline, and very slightly in warm benzene. It also dissolves, apparently unaltered, in concentrated sulphuric acid, and in cold alkali hydroxide or carbonate solutions. When these alkaline solutions are heated for some time, or when the dry substance is fused with sodium hydroxide, ammonia, carbon dioxide, and di-ethylacetic acid are formed:—$(C_2H_5)_2C(CO.NH)_2CO + 5 NaOH = (C_2H_5)_2CH.COONa + 2Na_2CO_3 + 2NH_3$; no doubt sodium diethylmalonate is formed intermediately. A characteristic reaction of veronal was discovered, as follows:—To 1—2 c.c. of the solution, as nearly saturated as possible, add two drops of nitric acid, then Millon's reagent drop by drop; a white gelatinous precipitate falls. Excess of the reagent must be avoided, as it dissolves the precipitate. From the precipitate the veronal can be recovered in the pure state. This, together with Denigès' reaction with mercuric sulphate, with the determination of the melting-point, and with the appearance of the crystalline needles of the sublimate of the substance, afford satisfactory criteria for identifying veronal. Veronal, when taken into the system, is excreted unaltered in the urine.—J. T. D.

Euporphrine [Apomorphine Bromomethylate]. Bergell and Pschorr. Apoth. Zeit., 1904, 423. J. Pharm. Chim., 1904, **20**, 173—174.

Euporphrine, and other quaternary ammonium compounds derived from apomorphine, have, like apomorphine, powerful emetic action, showing that this is not due to the presence of a tertiary amino-group, but to the two phenolic hydroxyl groups, since the dialkyl ethers of apomorphine exhibit no such action.—T. F. B.

Alkaloid Content of Cultivated Cinchonas. O. Hesse. Apoth. Zeit., 1904, **19**, 315. J. Pharm. Chim., 1904, **20**, 160.

The subjoined table shows the mean results obtained by the analysis of certain specimens of cinchona.

Variety.	Total Alkaloids.	Quinine Sulphate.
	Per Cent.	Per Cent.
Cinchona paludiana	0·7	0·2
„ calisaya v. jap.	3·7	1·05
„ hasskarliana	3·4	1·45
„ lancifolia	3·9	0·9
„ coloptera	3·6	0·5
„ officinalis	4·8	4·7
„ succirubra	8·1	2·45
„ calisaya ledgeriana	8·0	8·8
Hybrid of succirubra and ledgeriana.	8·0	5·2

It appears that the most suitable for cultivation are *officinalis*, *succirubra*, and *calisaya ledgeriana*; in Java the latter is largely cultivated, as also are its hybrids with *succirubra*.—T. F. B.

Essential Oil of Rose [Otto of Rose]; Analytical Characters of ——. P. Jeancard and C. Satie. Bull. Soc. Chim., 1904, **31**, 934.

Essential Oil of the non-petaloid parts of Rose Flowers.—1000 kilos of the calices, stamens and pistils, or the rose flowers deprived of petals, gave 50 grms. of a green essential oil with the following characters:—Solidifying point, + 8° C.; stearoptene, 54·13 per cent.; sp. gr. at 15° C., 0·8704; αD at 15° C., − 41°; acid value 6·12; saponification alue, 22·4 ; total alcohols, 13·99 per cent. ; citronellol, 3·56 per cent. The bulk of the stearoptene is composed f a body having the m. pt. 14° C. The high lævo-rotation f the oil indicates that practically all the alcohol present s citronellol.

Essential Oil of Entire Rose Flowers grown at Cannes.—The oil obtained by cohobation and distillation of the entire oses of the Cannes district had the following characters :—olidifying point, 25·5° C. ; stearoptene, 33·20 per cent. he oil freed from stearoptene had the sp. gr. 0·8790 at 50° C. ; α_D — 3° at 15° C. ; solubility in 70 per cent. alcohol, :2 ; total alcohols, 88·55 per cent. ; citronellol, 22·40 per ent. By merely distilling, without cohobation, so as to btain a weight of distillate [rose-water] equal to that of he flowers, only a very small yield of essential oil was btained. This had the following characters :—Solidifying oint, 25·9° C. ; stearoptene, 58·88 per cent. ; acid value, ·2 ; saponification value, 14·7 ; total alcohols, 32 per ent.

Essential Oil of Tea Rose distilled at Cannes had a istinctive odour ; it contained 72—74 per cent. of stear-ptene, although it congealed as high as 23·5° C. This tearoptene consists of two bodies, one solidifying at 14° C. he other at 40° C. In this it resembles the stearoptene f the oil from the nonpetaloid portions of the flower. hese results indicate the fallacy of the application of the olidification test to the valuation of otto of rose. The mount of stearoptene should be determined gravimetrically nd the percentage of citronellol determined after its removal.

Determination of Stearoptene.—10 grms. of the oil are reated with 50 c.c. of acetone, and cooled, without tirring, to – 10° C. The separated stearoptene is collected n a tared filter surrounded by freezing mixture, washed ith cooled acetone, dried *in vacuo* over sulphuric acid and eighed. The acetone is distilled off from the filtrate *n vacuo* and the residue employed for the determination f the citronellol.

Bulgarian Rose Oil of good quality shows but little ariation from the following characters :—Solidifying point, 9—21° C. ; stearoptene, 18—23 per cent. The oil, de-rived of stearoptene, has the sp. gr. 0·886—0·888 at 5° C. ; α_D from – 1° to 3° C. ; solubility in 70 per cent. lcohol, 1 : 1·5 ; acid value, 1—2 ; saponification value, 10—2 ; total alcohols, 84—88 per cent. ; citronellol, 30—40 er cent.

Standards.—Provence rose oil should contain from 30 to 5 per cent. of stearoptene and from 20—23 per cent. of itronellol in the oil freed from stearoptene ; whilst for Bulgarian otto the figures should be 18—23 and 30—40 espectively.—J. O. B.

Lemon Oil ; Adulteration of ——. E. Bertè. Boll. Chim. Farm., 1904, **43**, 349—357. Chem. Centr., 1904, **2**, 358—359.

As an addition to an earlier paper on the analysis of lemon il (see Soldiani and Bertè, this J., 1897, 266), the author ives the results of analyses of oils of the years 1898—1902 inclusive). In 1898 and 1899, adulteration was limited to he addition of French turpentine, but since that time, dulteration with American turpentine, limonene, stear-ptene—easily recognised by the dark colour of the residue—nd, in one case, with turpentine resin has been detected. Contrary to the opinion of Child and Burgess (this J., 1901, 176) the author states that the nature of the adulterant an be ascertained by chemical examination of the frac-ionated distillate, and comparison of the refractive indices f the different fractions, and of the residue, with the refrac-ve index of the original oil. In presence of small uantities of American or French turpentine or limonene, he optical rotation of the residue and of the distillate was he same or somewhat lower than that of the original oil. —A. S.

English Patent.

obacco and its By-products : Process and Apparatus for Treating ——. E. Turpin, Pontoise, France. Eng. Pat. 16,613, July 28, 1903.

OBACCO is freed from nicotine by moistening it with nmonia or other alkali, and then extracting with a suitable solvent, *e.g.*, water, alcohols, ethers, carbon bisulphide, benzene, &c. The solvent is recovered by distillation, and the nicotine is precipitated from the extract by means of salicylic or phthalic acid or picric acid or other nitrophenols. The tobacco thus freed from nicotine may be treated with aromatic perfumes, &c., as substitutes for the nicotine. Several modifications of apparatus for carrying out the extraction of the nicotine are claimed, as also the use of nitrophenols (especially picric acid) and salicylic and phthalic acids as reagents for the detection of nicotine, for the purpose of controlling the process.—A. S.

United States Patents.

Odoriferous Compound ; Process of Making ——. E. Knoevenagel, Heidelberg. U.S. Pat. 767,291, Aug. 9, 1904.

See Fr. Pat. 335,380 of 1903 ; this J., 1904, 204.—T. F. B.

Xanthine Derivative [Theobromine Carboxylic Acid], and Process of Making same. M. C. Massie, Washington, Administrator of F. Ach, Assignor to C. F. Boehringer und Soehne, Mannheim-Waldhof, Germany. U.S. Pat. 767,352, Aug. 9, 1904.

8-Trichloromethyltheobromine is converted into theobromine-8-carboxylic ester by heating with alcohol. The ester is saponified by means of alkali, and the alkali salt precipitated by acidifying the solution. The salt is then filtered off, and its aqueous solution is decomposed by addition of acid. Theobromine 8-carboxylic acid is thus obtained in the form of small white needle-shaped crystals, of m. pt. 345° C., sparingly soluble in water, and almost insoluble in alcohol, chloroform, or acetic ester.—T. F. B.

Xanthine ; Art of Making ——. M. C. Massie, Washington, D.C., Administrator to F. Ach, Assignor to C. F. Boehringer und Soehne, Mannheim-Waldhof, Germany. U.S. Pats. 767,353, 767,354, and 767,355, Aug. 9, 1904.

See Fr. Pat. 326,267 of 1902 ; this J., 1903, 819.—T. F. B.

French Patent.

Camphor from Isoborneol ; Process for Preparing ——. Chem. Fabr. auf Actien, vorm. E. Schering. Fr. Pat. 341,513, March 21, 1904.

Isoborneol is converted into camphor to the extent of 95 to 100 per cent. by oxidation with a neutral solution of a permanganate. 1 kilo. of isoborneol, powdered, or dissolved in 1 kilo. of benzene, is agitated with a solution of 1 kilo. of potassium permanganate in 100 litres of water until the solution is colourless ; pure camphor is obtained by distilling the product in steam, and crystallising the crude camphor from any suitable solvent.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Sensitisers ; Supplementary ——. A. Miethe. Z. Wiss. Phot. Brit. J. Phot., 1904, **51**, 708—709.

The Eosines, Quinoline Red, and a few other dyestuffs, which do not by themselves increase the colour sensitiveness of emulsions, have considerable value as auxiliary sensitisers when used in conjunction with the cyanines or isocyanines. For instance, a plate stained with Methyl Red nitrate (nitrate of the isocyanine from quinoline methyl iodide and quinaldine methyl iodide) always exhibits a certain amount of fog, whereas, if Quinoline Red be added to the staining bath (*e.g.*, 1 part of Methyl Red nitrate and 4 parts of Quinoline Red) the plates obtained are of good colour and sensitiveness, free from fog, and keep well, whilst the curve of colour sensitiveness will be remarkably even, the separate maxima being much less pronounced. Ethyl Red nitrate may be substituted for Methyl Red nitrate with equally good results. The use of certain other cyanines which give great sensitiveness for red (*e.g.*, ethyl cyanine) is also rendered possible by addition of Quinoline Red, the plates obtained exhibiting perfect freedom from fog and good general sensitiveness.—T. F. B.

Cyanine Dyestuffs; Constitution of ——. A. Miethe and G. Book. IV., page 862.

English Patent.

Centrifugal Spreader [*Photographic Films*]; *Improved* ——. A. W. Penrose, London. From G. W. Hinton, St. Joseph, Mo., U.S.A. Eng. Pat. 14,498, June 27, 1904.

The spreader, which is used for spreading the sensitive film on metal plates for photo-etching processes, consists of an inverted cone in which the plate is placed. Means are provided for rotating the cone, for supplying air heated by a lamp held in position below the apparatus, and for preventing the access of actinic light, and dust to the interior of the cone. There is also a suitable brake and means for collecting the excess of emulsion.—W. H. C.

United States Patent.

Photographic Developer [*Glycocoll*]. B. Homolka, Frankfort, and N. Schwan, Soden, Assignor to Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine. U.S. Pat. 767,815, Aug. 15, 1904.

See Eng. Pat. 20,377 of 1902; this J., 1903, 380.—T. F. B.

French Patent.

Photographs having the Appearance of Engravings or Sepia Prints; Process for Producing ——. Van Meurs et Cie. Fr. Pat. 340,974, March 5, 1904.

Photographs resembling black or sepia engravings are obtained by toning the ordinary gelatino-chloride paper, with a bath containing platinum or gold, to the desired tone, fixing in the usual manner, and then again toning in a solution which tints the high lights yellowish or pale brown; this latter bath may consist of a solution of a platinum salt with sodium thiosulphate, and may be prepared by adding platinum sulphate to a solution of sodium thiosulphate, boiling, and filtering. Other methods of preparing the bath are also claimed.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

Copper; Physical Properties of ——. [*Crusher Gauges for Recording Powder Pressures.*] P. Galy-Aché. X., page 868.

English Patents.

Guncotton Blocks; Pressing of ——, *and Apparatus therefor.* G. W. Bell, Ipswich. Eng. Pat. 17,414, Aug. 11, 1903.

See Fr. Pat. 340,473 of 1904; this J., 1904, 837.—T. F. B.

Guncotton; Method of and Apparatus for the Formation of Blocks of ——. G. W. Bell, Ipswich. Eng. Pat. 17,415, Aug. 11, 1903.

Guncotton pulp, composed preferably of one part of nitrocellulose to 10 or 15 parts of water, is introduced into an exhausted chamber which is connected with a vacuum pump. When the block so formed is practically free from air, water is introduced into the chamber, and the block is compressed from each end by means of pistons. A suitable apparatus consists of a mould with perforated walls, fixed in a vertical airtight cylindrical chamber, the lower end of which is connected with a vacuum pump. Pistons are provided in each end of the chamber, working snugly in the mould, and the guncotton pulp is introduced into the upper end of the mould from a receptacle provided with stirrers and a gauge-glass. This receptacle is preferably adapted to be made airtight, if necessary, so as to enable pressure o be applied to force the pulp into the mould. A distributor, for distributing the pulp evenly in the mould, is also described.—T. F. B.

Nitroglycerin; Manufacture of ——. R. Möller, Hamburg. Eng. Pat. 13,562, June 15, 1904.

The separation of the crude nitroglycerin from the nitrated mass is facilitated by adding to the acid mixture or to the glycerin, before nitration, a small quantity of a fatty hydrocarbon or acid, or ester of the latter, or a compound of the aromatic series which is not decomposed by the acids present. For example, 0·5 to 2 parts of paraffin oil is mixed with the acid necessary for the nitration of 1000 parts of glycerin.—T. F. B.

French Patent.

Explosives of the Ammonium Nitrate Group; Process fo Manufacturing ——. J. Führer. Fr. Pat. 341,633. March 7, 1904. Under Internat. Conv., Feb. 19, 1904.

This process is applicable to all explosives containing ammonium nitrate mixed with other compounds, the points of fusion of which are lower than the decomposition point o ammonium nitrate. The materials are intimately mixe and compressed into cylinders by a pressure of 1000 t 5000 kilos. per sq. cm. The cylinders are then immerse in a bath of liquid at a temperature somewhat lower tha the melting point of the fusible constituents of the mixture until the temperature of the whole mass is uniform, whe they are transferred to a bath consisting of the same con stituents in a molten state. The cylinders are now drie and placed in a current of cold air. This treatment ha the effect of producing a more or less porous mixture o high detonating power and in a compressed state.—T. F. B

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

English Patent.

Butyrometers; Impts. in ——. E. E. O. Roewer, Stützer bach, Germany. Eng. Pat. 20,630, Sept. 25, 1903.

The instrument consists of an ordinary shaped (Gerber tube, having the graduated part of the neck flatten instead of round.—W. P. S.

INORGANIC—QUANTITATIVE.

Potassium; Determination of ——. N. Tarugi. Gaz. chim. ital., 1903, **34**, 324—341. Chem. Centr., 1904, **2**, 36

After destroying any organic matter present, the sa (about 1 grm.) is treated with concentrated sulphuric aci and then ignited in order to remove hydrochloric and su phuric acids and ammonium salts. It is then dissolved in definite volume of water, and 10 c.c. of the solution a treated with 10 c.c. of a 15 per cent. solution of sodiu persulphate of known purity. (The persulphate conte of the sodium salt is determined by titrating hot with N sodium hydroxide solution, and the acidity by titrating i the cold; see this J., 1903, 493.) The mixture is agitate for three hours, at 0° C. in the case of dilute solutions, an the separation of the potassium persulphate is induced b introducing a small crystal of the salt. The unused pe sulphate in a known volume of the solution is then dete mined by titration with N/10 sodium hydroxide solutio The author finds that the solubility of potassium persulpha in water at temperatures from 0° to 40° C. is not influence by the addition of sodium, calcium, and magnesium su phates, di- and tri-sodium phosphate and sodium persulpha The solubility of potassium persulphate expressed in pe centages is: From 0° to 9° C. (0·0376) t + 0·564; 9°—10° (0·00278) t + 0·8773; 10°—15° C. (0·0376) t + 0·52 and 15°—40° C. (0·094) t + 0·3164. That potassium pe sulphate gives four distinct solubility curves is consider to be due to the formation of hydrates. Test analys carried out by the above method gave at 21° C. instead 4·32 per cent., 4·34, 4·31, and 4·28 per cent. of potassi oxide; and at 0° C. instead of 1·35 per cent., 1·36, 1· and 1·36 per cent. of potassium oxide.—A. S.

Persulphates; Quantitative Determination of ——. E. Pa nain. Gaz. chim. ital., 1904, **34**, 500—504. Che Centr., 1904, **2**, 563.

Hydrazine set free from its salts by means of concentrat potassium hydroxide solution, reacts vigorously with pe sulphates, according to the equation—

$$2K_2S_2O_8 + N_2H_4.H_2SO_4 + 6KOH = 5K_2SO_4 + N_2 + 6H_2O.$$

he determination of persulphates by this method can be arried out in a Lunge's nitrometer, solutions of the per- ilphate and of a hydrazine salt being placed in the outer essel, and concentrated potassium hydroxide solution n ie inner one.—A. S.

ulphur, Commercial; Valuation of —— [by Means of Aniline]. J. Ceruti. Boll. chim. farm., 1904, 421; Rép. de Pharm., 1904, **16**, 364.

NILINE, b.pt. 180°—185° C., is used as the solvent to extract ilphur from the crude commercial product. From 1 to 2 rms. of the sample are extracted on a tared filter with 0 c.c. of aniline heated to 120°—130° C. The filter is then ashed with alcohol, dried, and weighed. The filtrate may e neutralised with hydrochloric acid and cooled, when the ure sulphur is precipitated; this may be collected, washed, ried over sulphuric acid, and weighed.—J. O. B.

Vater in Molasses; Determination of ——. G. Testoni. Staz. sperim. agrar. ital., **37**, 366—369. Chem. Centr., 1904, **2**, 562—563.

IFTY grms. of the molasses are distilled with 200 c.c. of irpentine, which has been previously saturated with water. istillation begins at 90°—95° C., and the temperature then radually rises to 155°—160° C. Towards the end of the stillation, the condenser should be gently warmed, to rive over any small quantity of water therein. The distil- te is collected in a graduated vessel, and the volume of ie layer of water read off. The author states that this ethod gives more accurate results than the usual one of ying for 7—8 hours at 105°—110° C.—A. S.

opper Sulphate; Method for Determining the Purity of —— for Use in the Vineyard. C. Montanari. Staz. sperim. agrar. ital., 1904, **37**, 227—230. Chem. Centr., 1904, **2**, 367.

HE author proposes the following modification of Zecchini's ethod (this J., 1899, 710), by which the use of an unstable lution of iodine is avoided. 50 c.c. of a solution contain- g 19·878 grms. of pure crystallised sodium thiosulphate, grms. of ammonium thiocyanate, and 0·5 grm. of potas- um iodide are treated with 5 c.c. of a freshly prepared arch solution (1 grm. per 100 c.c.), and a solution of the mple of copper sulphate under examination (20 grms. per re) is run in slowly from a burette, until a faint blue loration appears. The amount of copper contained in ie volume required to produce the blue colour is equivalent 1 grm. of crystallised copper sulphate ($CuSO_4.5H_2O$)

—A. S.

oric Acid; Determination of —— in Cider, Fruits, &c. A. H. Allen and A. R. Tankard. Brit. Pharm. Conf., 1904. Pharm. J., 1904, **73**, 242—244.

ORIC acid is, in traces, a normal constituent of apples, and therefore present also in cider. Apples were found to con- iin from 0·009 to 0·013 per cent., and cider from 0·004 0·017 grm. per 100 c.c., the lower amount being found the Devonshire variety, the higher in the Herefordshire roduct. Boric acid was also found in grapes—0·004 per nt.; in pomegranates, 0·005 per cent.; in quinces, 0·016 er cent.; and in pears, 0·007—0·016 per cent. The resence of phosphates in apples and apple juice renders the eneral processes for the determination of boric acid therein iapplicable. The following methods have been found both ccurate and expeditious for the purpose.

Extraction Method.—About 100 c.c. of cider or other quid are evaporated to dryness with a few c.c. of a 10 per ent. solution of calcium chloride. In the case of fruits bout 50 grms. are cut up into small pieces, and the solution f calcium chloride poured over the mass, which is then vaporated to dryness. The dry residue is well charred, oiled with about 150 c.c. of distilled water, and filtered. he carbonaceous residue is then thoroughly incinerated at moderate temperature, and the resulting ash boiled with nother 150 c.c. of water, and allowed to stand, when cold, or some hours, or, preferably, over-night. A third treat- nent with water, and subsequent standing, may be neces- ary to extract the whole of the borate. The collective queous extracts are filtered and evaporated to 25—30 c.c. After cooling, the concentrated liquid is neutralised with N/10 acid with Methyl Orange as indicator, care being taken that all the borate is in solution before the titration is begun. An equal volume of glycerol (rendered neutral to phenolphthalein just before use) is next added, and the mixture titrated with N/20 sodium hydroxide solution with phenolphthalein as indicator. At the end of the titration another 10 c.c. of glycerol should be added, when the red colour should be permanent. Each c.c. of the N/20 sodium hydroxide solution is equivalent to 0·00175 grm. of boric anhydride, B_2O_3, or 0·0031 grm. of boric acid, H_3BO_3.

Distillation Method.—A suitable quantity of the substance under examination is treated with calcium chloride as described above, well charred, and the main portion of the salts extracted with about 50 c.c. of water. This aqueous extract is transferred to a 100 c.c. distillation flask and evaporated nearly to dryness. Meanwhile the charred residue is incinerated, the ash moistened with 2 c.c. of strong sulphuric acid and warmed. When the evolution of gaseous hydrochloric acid is nearly complete, the acid liquid is transferred to the distilling flask, the last portion being washed in with 10 c.c. of methyl alcohol (ordinary wood spirit of good quality, distilled over caustic potash, is suitable for the purpose). The liquid is distilled nearly to dryness. Another 10 c.c. of methyl alcohol are then introduced, and distilled off. As many as six such treatments are usually requisite, the contents of the flask being allowed to cool between each addition of methyl alcohol. A portion of the residue in the flask should then be tested by the name test for boric acid. If a reaction be obtained, further distillations must be performed. The alcoholic vapours are passed into 25 c.c. of water, the end of the distillation tube dipping into the liquid in the receiver. The distillate is evaporated on the water-bath until free from alcohol, the methyl borate is then hydrolysed and boric acid liberated. The liquid is rendered neutral to Methyl Orange, then treated with glycerol and titrated with N/20 sodium hydroxide solution as described above.

—J. O. B.

Manganese in Drinking Water; Determination of ——. G. Baumert and P. Holdefleiss. Z. Untersuch. Nahr. Genussm., 1904, **8**, 177—181.

THE following method is given for the determination of the small quantities of manganese occurring in some well waters (this J., 1904, 556). From 250 c.c. to 1000 c.c. of the water are acidulated with 1 c.c. of hydrochloric acid and evaporated to a volume of 100 c.c. Towards the end, a little zinc oxide or barium carbonate may be added to precipitate the iron. The solution is filtered and the filtrate collected in a stoppered flask. 5 c.c. of a 10 per cent. sodium hydroxide solution are added and the contents of the flask well shaken for five minutes, the stopper being raised from time to time to admit air. After this, 5 c.c. of a 10 per cent. potassium iodide solution are added and then hydrochloric acid drop by drop until the brown precipitate dissolves. Starch solution is now added and the liberated iodine titrated with sodium thiosulphate solution (0·30 grm. per litre). The latter is standardised on a solution of pure manganous chloride (about 10 mgrms. per litre). The authors also employed Knorre's method (this J., 1903, 1104) in so far that they precipitated the manganese from some of the samples of water with persulphate, and then applied the above method to the precipitate. Evaporation of a large volume of water was thus avoided (see also this J., 1903, 926).—W. P. S.

ORGANIC—QUALITATIVE.

Hexoses; Reactions of ——. R. Ofner. Monatsh. f. Chem., 1904, **25**, 611—620.

THE author has made systematic investigations on the action of hydrochloric acid of various strengths on levulose, dextrose, cane sugar, mannose, maltose, galactose, lactose, isodulcite and arabinose. He finds that Seliwanoff's reaction for detecting levulose in presence of dextrose and other aldoses must be modified as follows: A small quantity of the sugar, and a little resorcinol are dissolved in 3 or 4 c.c. of hydrochloric acid of 12 per cent. strength, and boiled for not longer than 20 seconds. When levulose is present, a deep

red coloration and turbidity immediately appear. If a sugar solution or urine is to be examined, concentrated hydrochloric acid is added to it until the solution contains 12 per cent. of acid, the heating being then carried out as before. No general rule exists for the action of secondary hydrazines on ketoses and aldoses, and in order to detect levulose in presence of dextrose in this way, methylphenylhydrazine must be employed as originally recommended by Neuberg.
—T. H. P.

Abrastol in Wine; Detection of ——. E. Gabutti. Staz. sperim. agrar. ital., 1904, **37**, 234—236. Chem. Centr., 1904, **2**, 370.

100 c.c. of the sample rendered alkaline by the addition of a few drops of ammonia in order to prevent extraction of the natural colouring matter of the wine, are shaken for some minutes with 10—15 c.c. of amyl alcohol. The alcoholic extract is filtered, evaporated to dryness in a small porcelain dish on the water-bath, the residue dissolved in concentrated phosphoric acid (sp. gr. 1·7), heated, treated with 1 or 2 drops of a concentrated solution of formaldehyde, again heated, and filtered. If abrastol be present, even in so small a quantity as 0·1 grm. per litre, the filtrate shows a green fluorescence.—A. S.

ORGANIC—QUANTITATIVE.

Methoxyl; Determination of ——. W. Kropatschek. Monatsh. f. Chem., 1904, **25**, 583—592.

In the determination of alkoxyl groups it is advisable to employ hydriodic acid perfectly free from hydrogen phosphide. If this be done, it is immaterial whether Zeisel's process is used or any modification of it, such as that given by Gregor (this J., 1898, 609). The author recommends the following method, which avoids the use of phosphorus, for the preparation of hydriodic acid. Formic acid and iodine in the relation of I_2 to CH_2O are boiled together in a reflux apparatus, until the greater part of the iodine is used up. Between the boiling flask and the reflux condenser is placed an extraction apparatus provided with a cock (as in the figure), by which it is contrived that the iodine subliming away from the liquid shall be washed into the flask again by the condensed formic acid vapours. The hydriodic acid thus obtained, is distilled several times *in vacuo*.
—T. H. P.

Betaïne Periodide and the Determination of Betaïne. V. Staneк. Z. Zuckerind. Böhmen, 1904, **28**, 578—583.

On adding a solution of iodine in potassium iodide to an aqueous solution of a betaïne salt, a brownish-red precipitate is formed which quickly changes to green crystals with metallic lustre similar to Magenta. If precipitation take place in a hot solution a green oil separates, which on cooling sets as a crystalline mass with a metallic lustre. Free betaïne is not precipitated by a neutral solution of iodine in potassium iodide, but only when acid is added. The tri-iodide is easily soluble in alcohol, hydriodic acid, and in an aqueous solution of potassium iodide. It fuses at 58°—61° C. with disengagement of iodine. The compound is only slightly soluble in water, but on boiling in water it loses iodine, and betaïne hydriodide passes into solution. For the quantitative precipitation of betaïne the author uses a solution of potassium tri-iodide prepared by dissolving 100 grms. of potassium iodide and 153 grms. of iodine (free from iodine cyanide) in 200 c.c. of water. On dilution, iodine separates out from the solution. Sodium chloride or sulphuric acid lessen the solubility of betaïne tri-iodide. Acetic and lactic acids and the constituents of the ash of molasses are without influence on the precipitation, but urea and the substances contained in Liebig's extract of meat are partly precipitated also. An acidified solution of diluted molasses gave a black somewhat crystalline precipitate containing 1·64 per cent. of nitrogen, 65 per cent. of this being due to betaïne.—L. J. de W.

Malt Analysis. A. R. Ling. J. Inst. Brewing, 1904, **10**, 481—491. (See this J., 1902, 983; 1903, 677.)

In the determination of extract it is considered preferable to employ weighed quantities of water than to make up the wort to a definite volume, and to calculate the total volume by means of the formula: $V + v = \frac{100\,(500 + W - 1)}{G - S}$. In this formula, V represents the number of c.c. of solution from 10 grms. of wort; *v* the number of c.c. of water in the wort; W the number of grms. of moisture in 50 grms. of the malt; D the gravity of the wort; S the number of grms. of dissolved matter per 100 c.c. of wort; and G the weight of 100 c.c. of wort. The factor for multiplying the excess gravity of the wort, in order to obtain the yield of extract in lb. per barrel, may be calculated by the formula: $\frac{3\cdot36\,(V + v)}{500}$. The fineness of the grist influences the results obtained in malt analysis; and the author uses a coarse grist ground as uniformly as possible. For attaining this object, the Seck mill is considered advantageous. The mash temperature may vary slightly from the limit of 150° F., but should be kept constant owing to its influence on the character of the wort solids Little definite is yet known of these, but useful statistical data may be obtained from the specific rotatory power and cupric-reducing power of the wort, calculating from these the percentage of apparent maltose and dextrin present. The rotary power, however, varies with the nature of the malt, whilst the percentage of apparent maltose seems, in malts made on identical lines, to have a more definite ratio to the amount of extract present.—C. S.

Aldehydes in Wine, &c.; New Method for the Determination of ——. L. Mathieu. Rev. intern. falsific., 1904, **17**, 43—45. Chem. Centr., 1904, **2**, 180.

One grm. of tartaric acid and 20 c.c. of a solution containing sodium bisulphite equivalent to 30 mgrms. of sulphur dioxide are added to 100 c.c. of the wine, the mixture is shaken, and allowed to stand for four hours in the dark. A few c.c. of starch solution are added, followed by iodine solution till a distinct blue coloration is produced, and then immediately about 10 c.c. of sodium arsenite solution. The combined sulphur dioxide is finally determined by the Has-method. For wines containing more than 10 mgrms. of aldehydes per 100 c.c., relatively more sulphur dioxide is added, whilst of wines containing very small amounts of aldehydes, 200 c.c. are used for the determination. Some brandies contain more than 0·1 grm. of aldehydes per 100 c.c. In such cases, 100 c.c. of the sample are treated with 2 grms. of tartaric acid and about 400 mgrms. of sulphur dioxide in the form of a concentrated solution of sodium bisulphite, the flask containing the mixture is filled up with water, and the method described above followed.
—A. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Radio-active Lead, Radio-tellurium and Polonium. A. Debierne. Comptes rend., 1904, **139**, 281—283.

The author has re-investigated the radio-active substance obtained from pitchblende residues by precipitation with sulphuretted hydrogen in acid solution. A method is described by means of which a body 100,000 times more radio-active than uranium has been extracted. It agrees in properties with each of the three bodies already obtained from pitchblende by rather similar treatment, viz., polonium by the Curies, radio-lead by Hofmann and Strauss, and radio-tellurium by Marckwald (this J., 1903, 49, 657, and 1146). Like these it is sharply distinct from other radio-active substances in its radiation, which consists only of α-rays of feeble penetration and deviated with difficulty by a magnet. It gives no emanation and does not induce radio-activity. The fact that the radiations from these three bodies are identical, proves, in the author's opinion, that ere is only one radio-active substance precipitated from tchblende by sulphuretted hydrogen in acid solution, and is should be called polonium by right of priority.—F. Sdu.

Lead Acetate and Thiosulphate; Crystallised Compound ·——. P. Lemoult. Comptes rend., 1904, **139**, 422—124.

· to a solution of sodium thiosulphate there be added lution of lead acetate, followed by acetic acid, or if the iosulphate solution be added to lead acetate solution eviously acidified with acetic acid, there is deposited, ter a longer or shorter time, according to the concentra- ons of the solutions, a beautifully crystallised substance ıving the composition represented by $2PbS_2O_3.Pb(C_2H_3O_2)_2$. ıe substance is but slightly soluble in cold water, less so water acidified with acetic acid; it is much more soluble hot water, and is deposited again from the solution on oling. Barium acetate behaves similarly to lead acetate so far as in its presence acetic acid does not decompose dium thiosulphate with separation of sulphur, but the lution does not, like the lead solution, deposit crystals.

—J. T. D.

ydrogen Sulphide in Mineral Springs; Condition of——. F. Auerbach. Z. physik. Chem., 1904 **49**, 217—223.

ɪᴇ dissociation constant of hydrogen sulphide was found be $0.91.10^{-7}$. By means of the "avidity formula"—

$$\frac{[HS']}{[HCO_3']} = \frac{k_s}{k_c} \cdot \frac{[H_2S]}{[H_2CO_3]}$$

which k_s is the dissociation constant of hydrogen sulphide d k_c that of carbonic acid, the relative amounts of free and mbined hydrogen sulphide and carbonic acid in sulphur rings may be calculated. In mineral waters containing y considerable quantity of free carbonic acid, boric, silicic, d titanic acids will be present practically entirely in the e and undissociated condition, whilst the amount of rbonate ions (CO_3'') will be negligible.—A. S.

p-Phenylenediamine; Oxidation-Products of ——. E. Erdmann. Ber., 1904, **37**, 2776—2780.

ı oxidising *p*-phenylenediamine with potassium perman- nate in aqueous solution, the main products are carbon oxide and ammonia, but both hydrocyanic and oxalic ids are also formed. Under favourable conditions 2 per nt. of the theoretically possible amount of hydrocyanic d can be obtained. In the animal organism, *p*-pheny- ıediamine is also oxidised with plentiful formation of ımonia. It is therefore possible that in this case also drocyanic acid is formed by a by-reaction, and contributes the toxic effect.—E. F.

Dimethylpyroarsenic Acid. E. Baud. Comptes rend., 1904, **139**, 411—413.

ʜᴇɴ monomethylarsenic acid is heated in an oil-bath at 0°—140° C. in a stream of dry hydrogen, it loses water, d forms dimethylpyroarsenic acid, $2\ (OH)_2.AsO.CH_3 =$ O + $(OH)_2.As_2O_3(CH_3)_2$. Monosodiummonomethyl- ɪenate, when heated, and disodiummonomethylarsenate, ated at 140° C. in a stream of carbon dioxide, undergo rresponding transformations. In each case the product, ıen dissolved in water, regenerates the original substance. ıe new acid, when heated above 170°—180° C., decom- ses, forming arsenic trioxide and methyl alcohol.

—J. T. D.

French Patent.

hers, Alcohols, Benzols, Collodion, &c.; Process for Rendering —— Incombustible. J. P. Ducruet. Fr. Pat. 341,158, Feb. 23, 1904.

ʀʙᴏɴ tetrachloride is added to inflammable liquids to luce their combustibility; in the case of benzol, for tance, it is claimed that the addition of 25 to 30 per cent. carbon tetrachloride renders it absolutely incombustible. rbon tetrachloride is also claimed as a fire-extinguishing ent.—T. F. B.

New Book.

Carborundum (Monographien über angewandte Elektrochemie). Bd. XIII. Von Francis A. J. Fitz-Gerald, Chemiker der Internat. Graphite Co., Niagara-Falls, N.Y. Ins Deutsche übertragen von Dr. Max Huth. Wilhelm Knapp's Verlag, Halle a. S. 1904. Price M. 2.

8vo volume, in style of pamphlet, containing 42 pages of subject-matter with nine illustrations and three tables. There then follows a bibliography, and index of authors. The leading subjects treated of are as follows:—I. Historical chapter, with description of the researches of Despretz, Marsden, Cowles, Schützenberger, Moissan, and Acheson. II. Carborundum Furnace by Acheson. III. Purification, Properties, and Analysis of Carborundum. IV. Applications of Carborundum. V. Simultaneous Preparation of Zinc and Carborundum. VI. Production of Carborundum.

Trade Report.

I.—GENERAL.

Government Laboratory. Report of the Principal Chemist for the year ended 31st March, 1904, with Appendices.

[*Cd.* 2,144.] *Price* 3*d.*

The work of the Government Laboratory during the financial year 1903-4, involved 59,986 tests in the Customs Laboratory, as compared with 61,442 in the preceding year, of samples of goods in regard to their liability to spirit duty, the sugar and tobacco duties, &c., and 85,305 analyses (against 83,370) in the Excise Branch of the Laboratory for the Inland Revenue and other Government Departments. 918 samples of flavouring essences, essential oils, and perfumery were tested during the year for liability to spirit duty. In addition, a large number of samples were examined of preparations such as chloroform, acetic ether, and ethyl bromide, in the manufacture of which spirit is used. A quantity of pure alcohol, equivalent to 2,272 proof gallons, was issued duty-free, with the sanction of the Treasury, to schools and colleges for research purposes, whilst the quantity of duty-free spirit issued to manufacturers under the Finance Act, 1902, was equivalent to 206,451 proof gallons. The majority of applications for permission to take advantage of this concession are said to have been made in cases in which the use of ordinary methylated spirit could not be regarded as unsuitable or detrimental; and in several cases the applicants seemed to be quite unaware that it was possible to obtain permission to use duty-free spirit in the form of methylated spirit in their manufacturing operations. In connection with the same subject there have also been examined a number of samples of denaturing agents—camphor, toluene, benzene, petroleum ether, nitrotoluene, nitrobenzene, animal oil, pyridine bases, &c.—and also samples of the denatured spirit before use, and after recovery by distillation. 160 samples of spirit entered as methyl alcohol, or wood oil, were examined, and of these eleven were found to be pure methyl alcohol and fifteen denatured ethyl alcohol. These were accordingly charged with duty, being potable. A note is given that among the imports were many instances of goods described as "extract of malt." This liquid, in these cases, having the density, alcoholic strength, and general character of ordinary beer, was charged the usual beer duty.

The exportation of medicinal tinctures, flavouring essences, and perfumes on drawback shows a continuous increase. In the past year 13,371 samples, representing 121,137 galls., of proof spirit have been examined, as compared with 12,878 and 118,557 galls. in the previous year. "The regulations in connection with the export of these preparations work very satisfactorily, and inaccuracies found in the traders' declarations are less frequent than formerly." The quantity of wood naphtha approved in the year ending March 31, 1904, is slightly less than in the previous year; this does not, however, involve any real reduction in the use of spirit in manufacturing operations. During the last two years a number of manufacturers have erected apparatus for recovering the methylated spirit formerly wasted in their manufacturing operations, and in this way a large proportion of this spirit is used again instead of being allowed to escape into the air.

In regard to the sampling of saccharin-containing articles, Dr. Thorpe called the attention of the Board of Customs to the importation of chemicals related to saccharin, and requiring only very simple treatment for conversion into this compound, and it was decided that such substances are liable to saccharin duty. Goods suspected to be of this nature, as *o*-toluene-sulphonamide, are now sampled and sent for test to decide this point.

Arsenic was found in 34 out of 1,218 samples of beer in a sufficient quantity to render it necessary to notify the brewers that their materials were contaminated. Herb-beers were examined for alcohol in excess of 2 per cent. Of 852 samples, 269 contained excess of spirit, the amount ranging up 9·1 per cent.

There is a note on rosin size used at a paper mill, which, being discharged into a trout stream, killed a number of fish by blocking up the gills. A dilute solution of copper sulphate, used at Kew as a parasiticide for cucumbers and tomatoes, was found to answer well and not to affect the fruit injuriously. No trace of copper could be detected in either the cucumbers or tomatoes.

RUSSIA; FOREIGN TRADE OF —— IN 1903.

Foreign Office Annual Series, No. 3253.

The first of the subjoined tables shows the quantity and value of certain articles exported from Russia during the years 1902-3, whilst the second gives details of some of Russia's exports to the United Kingdom :—

Exports from European Russia during the Year 1903, *as compared with* 1902.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM PRODUCTS; COUNTERVAILING DUTY ON ——. U.S. CUSTOMS DECISION, AUG. 1904.

Bd. of Trade J., Aug. 25, 1904.

Petroleum is on the "free list" of the United States Tariff, but its free admission is subject to the proviso that the crude article itself and all petroleum products produced in a country which imposes a duty on like articles exported from the United States are to be subject to a duty equal to the duty imposed by such country. It has now been decided that, for the purposes of this proviso, petroleum products manufactured in one country from crude petroleum produced in another country are to be assessed with duty at the rate imposed by the country of origin of the crude petroleum upon *similar products* imported into that country from the United States, and not at the rate levied upon crude petroleum imported into such country from the United States.

X.—METALLURGY.

LEAD; BOUNTIES ON —— IN CANADA.

Bd. of Trade J., Aug. 25, 1904.

The present Act amends the previous Act (No. 31 of 1903) providing for the payment of bounties on lead contained in lead-bearing ores mined in Canada, in so far as it relates to section 5, which reads as follows :—

"5. The said bounties shall cease and determine on the thirtieth day of June, one thousand nine hundred and eight."

The following section is hereby substituted :—

"5. Payment of the said bounty may be made on all such lead-bearing ores mined in Canada, and delivered at smelter in Canada on or after the first day of July, one thousand nine hundred and three; and the said bounties shall cease and determine on the thirtieth day of June, one thousand nine hundred and eight."

BROKEN HILL MINING INDUSTRY IN 1903.

Eng. and Mining J., Aug. 11, 1904.

In the Broken Hill district in New South Wales there were 12 mines in operation during the year 1903, which raised 1,078,442 long tons of sulphide ore, removed 195,969 cub. yds. of material from open cuts, and filled 270,254 cub. yds. into depleted slopes. They used 13,364,399 superficial feet of timber, 330,385 lb. of explosives, 433,089 detonators, and 57,030 coils of fuse, the total value of explosives, including fuse and detonators, being 21,926*l.* The consumption of coal was 70,644 tons. The aggregate of engines was 10,456 h. p., and of boilers 9,300 h. p. The total value of plant on the mines was 620,487*l.* The consumption of explosives per ton of ore raised was about 0·3 lb.; of timber, about 12·5 ft.; of coal, about 0·07 ton. The total number of men employed at the end of the year was 5,626.

From 1,100,514 tons of ore raised there were obtained he following profitable products:—

Galena concentrates, 203,416 tons, containing 5,438,498 z. of silver, 2,135 oz. of gold, 117,078 tons of lead, and 7,063 tons of zinc. Average grade = 26·7 oz. of silver per on, 57·5 per cent. of lead, and 8·4 per cent. of zinc.

Oxidised ore, 22,072 tons, containing 895,681 oz. of ilver and 4,065 tons of lead.

Slimes, 61,498 tons, containing 1,103,350 oz. of silver, 1,654 tons of lead, and 10,035 tons of zinc.

Zinc concentrates, 21,634 tons, containing 295,416 oz. of ilver, 2,606 tons of lead, and 8,385 tons of zinc. Average: 3·7 oz. of silver per ton, 12 per cent. of lead, and 38·8 er cent. of zinc.

The total amount of the profitable products was 308,681 ons, while 826,497 tons of slimes, middlings, and tailings, ontaining 5,029,466 oz. of silver, 52,075 tons of lead, and 48,516 tons of zinc were either dumped on the surface, ith a view to possible future treatment, or were returned the mine as filling.

The 1,100,514 tons of ore raised comprised 22,072 tons f oxidised and 1,078,442 tons of sulphide. The latter ontained 11,867,157 oz. of silver, 183,416 tons of lead, and 84,011 tons of zinc. The average grade of the sulphide re was therefore about 11 oz. of silver, 17 per cent. of ead, and 17 per cent. of zinc.

BOHEMIA; MINING INDUSTRY IN ——.

Foreign Office Annual Series, No. 3255.

In Bohemia there are 21 undertakings for silver mining, f which three were being worked in 1903. The mines are orked by the Imperial Government, and in 1903 produced 1,958 tons of ore, giving 86,000 lb. of silver, worth 38,160*l.*

There are six copper mines in Bohemia, of which one as being worked on a small scale in 1903, and 10 tons of re were produced. In the whole of Austria there were nly 11 being worked, producing 12,688 tons of ore, which ielded 961 tons of copper worth 57,542. There were 10 tons of copper sulphate produced, an increase on 1902 f 62 tons.

Bohemia is particularly rich in iron ore deposits, and ey are to be met with in all parts of the Kingdom. The chest deposits are in the strata of silurian formation nning south-west to north-east from Bischofteinity rough Pilsen, Beraun, and Prague, as far as the River lbe at Celakowitz, for a distance of over 20 miles. It tains its greatest breadth (10 miles) in the neighbourhood Pilsen, whilst towards the Elbe it gradually narrows own to 4 miles. This silurian basin contains an almost exhaustible quantity of iron ore. The iron ore beds etween Prague and Beraun are now being worked, and oduce more than one-third of the total output in Austria. eside the underlying beds with fine-grained hæmatite, ontaining over 50 per cent. of iron, two hanging beds are eing worked, containing some reddish-brown oolitic ematite of great purity, yielding as high as 52 per cent. iron, but more frequently red clay iron ore with a yield from 30 to 40 per cent. of iron. This ore forms the chief chness of the silurian beds of Bohemia. In the year 1903, 3,435 tons of iron ore were produced from 20 mines, out of a total of 78 in Bohemia. In the whole of Austria 37 mines were being worked last year, producing 1,715,984 tons of iron ore, at an average price of 7*s.* 2*d.* per ton. The production was 28,312 tons less than in 1902. The amount of crude iron produced in Bohemia in 1903, in 10 works, was 286,593 tons. The total in Austria was 970,833 tons in 38 works.

NORWAY; MINING INDUSTRY OF ——.

Foreign Office Annual Series, No. 3252.

The copper and pyrites mines at Trondhjem have been worked with good results during 1903, and one mine, which had not been worked for 200 years, has been restarted, and is very rich. The existence is reported of iron veins of some importance at Larvik and Sandefjord. The molybdenite mines at Hekkefjord are reported as not being a success. About 30 tons, valued at from 150*l.* to 200*l.* per ton, were exported last year. These prices did not pay, so that the company are now turning their attention to ferromolybdenum, which it is anticipated will yield better results. A large quantity of copper, iron and copper pyrites, amounting in all to 63,446 tons, and valued at 139,500*l.*, were exported from Bodö in 1903.

The total number of mining works of all kinds in operation at the close of 1902 is stated to be 37, employing 3,550 workpeople, and yielding produce of the total value of about 310,000*l.*

GOLD AND PLATINUM INDUSTRY IN RUSSIA.

Foreign Office Annual Series, No. 3253.

Taking the production of gold for 1903 at 1,134,000 oz., the Russian Empire comes fourth on the list of gold producing regions, and produces 7 per cent. of the whole world's supply. A large tract in Northern Manchuria was being prospected and worked under Australian management when war broke out. In the Ural district great efforts are being made to develop the industry.

In the valley of the river Ivalo, at Kultana, about halfway between the Arctic Ocean and the Gulf of Bothnia, work has been carried on since 1870, but, though the ore is described as being rich (1·96 to 3·25 grms. per cb. m.), the yield from that date to 1899 is valued at only 55,000*l.* The Finnish gold-bearing district is a tableland about 30 miles long by 10 miles broad; the richest finds have been made near Haugasoja, on a southern affluent of the Ivalo: veins of quartz yielding 67·7, 78·7, 217·4, and even 289·6 grms. per ton, are alleged to have been crushed, but the financial results do not appear to have been great so far. The quantity of platinum mined in 1903 was a little under 6 tons (366 poods against 374 poods in 1902). Only a trifling quantity was worked up into articles in Russia, the rest being sent abroad in its natural or refined state, exactly one-half of it to the United Kingdom, against four-fifths in 1901. There is a continually increasing demand for platinum for the making of jewellery, chemical and assaying apparatus.

XII.—FATS, FATTY OILS, Etc.

COD FISHERIES IN NORWAY.

Foreign Office Annual Series, No. 3252.

The winter fisheries of cod yielded 44,600,000 fish against 41,000,000 in 1902 and 40,000,000 in 1901. The average for the preceding 35 years was 53,000,000. The fish were, however, very light in weight. The production of cod-liver oil was the smallest for many years, owing to the poor quality of the fish—amounting to only 3,000 barrels. Prices opened at 9*l.* per barrel, but later rose to 24*l.* per barrel. The total quantity exported was about 25,000 barrels against 34,500 barrels in 1902. For other sorts of fish oil 7,000 barrels of liver were obtained against 21,900 barrels in 1902.

XIII. C.—INDIA-RUBBER, Etc.

INDIARUBBER EXPORT FROM THE AMAZON.

Bd. of Trade J., Aug. 25, 1904.

The following table, showing the quantity of indiarubber exported from the river Amazon during the year 1903–04, including direct shipments from Iquitos (Peru) and Serpa (State of Amazonas) and rubber in transit from Bolivia, has been compiled from figures furnished by H.M. Consul at Pará:—

To Europe.

	Manaos.	Para.	Iquitos.	Serpa.
	Kilos.	Kilos.	Kilos.	Kilos.
Fine	3,636,085	4,012,093	621,703	3,790
Medium	556,158	434,520	160,769	..
Coarse	801,589	1,695,314	249,254	1,143
Caucho	1,665,521	638,869	1,033,283	..
Total	6,659,353	6,780,796	2,005,009	4,933

To United States of America.

	Manaos.	Pará.	Iquitos.	Serpa.
	Kilos.	Kilos.	Kilos.	Kilos.
Fine	5,262,373	2,114,249	2,999	..
Medium	1,131,216	389,200	179	..
Coarse	1,207,758	3,764,577	1,050	..
Caucho	1,137,003	65,410	7,386	..
Total	8,738,350	6,333,436	11,614	..

The total quantity of rubber exported to Europe during the year 1903–4 was 15,450,091 kilos., as compared with 15,260,651 kilos. during the previous year; 15,083,400 kilos. was exported to the United States of America, as compared with 14,565,816 during the previous year; while the total export figures are 30,533,491 kilos. for 1903–4, and 29,826,467 for 1902–3.

XVI.—SUGAR, STARCH, Etc.

SUGAR FACTORY IN TURKESTAN.

Foreign Office Annual Series, No. 3253.

A well-equipped sugar factory, worked by hydraulic power on the turbine system, has been built at Kauf mannskaya station, 30 versts (about 20 miles) from Tashkent, being the first establishment of the kind in Turkestan; it is to begin working in the autumn of 1904, when the first crop of beetroot is harvested; it cost 60,000*l*.. and is to turn out 5,000 tons of sugar annually. Over 3,000 acres of beetroot are being planted, and in 1905 the area is to be increased to 10,000 acres of irrigated land; the white beet yields 24 cwt. of sugar per acre, the red beet less.

XVII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOL FOR INDUSTRIAL PURPOSES; DUTY-FREE ——.

The Times, Sept 3, 1904.

The Chancellor of the Exchequer has appointed the following gentlemen to serve as members of a committee to inquire into the use of duty-free alcohol for industrial purposes:—Sir Henry Primrose, K.C.B., C.S.I., chairman; Prof. Sir William Crookes, F.R.S.; Sir W. H. Holland, M.P.; the Hon. J. Scott-Montagu, M.P.; Lothian D. Nicholson, Esq.; Dr. W. Somerville; Dr. T. E. Thorpe, C.B., F.R.S.; Thomas Tyrer, Esq.

The terms of reference are:—"To inquire into the existing facilities for the use, without payment of duty, of spirits in arts and manufactures, and, in particular, into the operation of section 8 of the Finance Act, 1902; and to report whether the powers conferred upon the Commissioners of Inland Revenue by this section permit of adequate facilities being given for the use of spirits in manufactures, and in the production of motive power, or whether further facilities are required; and, if it should appear to the committee that the present facilities are inadequate, to advise what further measures could be adopted without prejudice to the safety of the revenue derived from spirits and with due regard to the interests of the producers of spirits in the United Kingdom."

All communications should be directed to Sir Henry Primrose, K.C.B., at Somerset House, Strand, W.C.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

„ 18,512. Lake (Dessoliers and Regnier). Apparatus for treating solids with liquid, fluid, or gaseous agents.* Aug. 26.
„ 18,531. Zeal. Thermometers. Aug. 26.
„ 18,539. Helm. Cooling apparatus. Aug. 26.
[C.S.] 23,183 (1903). Sellenscheidt. Method of and apparatus for decanting fluids under pressure. Aug. 24.
„ 11,839 (1904). Cautley. Centrifugal hydro-extractors. Aug. 31.
„ 14,434 (1904). Reese. Whisking, agitating, and mixing machines. Aug. 24.
„ 15,713 (1904). Paradis. Funnels. Aug. 24.
„ 15,875 (1904). Waldbaur. Apparatus for heating liquids. Aug. 31.

II.—FUEL, GAS, AND LIGHT.

[A.] 17,712. Nash. Gas producers.* Aug. 15.
„ 17,795. Marshall. *See under* I.
„ 17,906. Zuiderhoek. Process for the manufacture of coke briquettes. Aug. 17.
„ 18,047. Haber. Process of and means for controlling the composition of gaseous mixtures. Aug. 20.
„ 18,214. Hatton. Operating gas producers. Aug. 23.
„ 18,262. Koppers. Coke ovens.* Aug. 23.
„ 18,364. Verdier and Teuton. Gas retorts. [Fr. Appl., Sept. 2, 1903.]* Aug. 24.
„ 18,456. Shiels. Production of combustible vapour or gas. Aug. 25.
„ 18,487. Junkers. Method of and apparatus for determining the heating value of fuel. [Ger. Appl., Sept. 1, 1903.]* Aug. 26.

[C.S.] 21,149 (1903). Crossley and Rigby. Gas producers. Aug. 24.

„ 2240 (1904). Capitaine. Method of and means for purifying the gas of gas producers. Aug. 31.

„ 5333 (1904). Dewey. Mantles for incandescent gas burners. Aug. 24.

„ 11,948 (1904). Guilbaud. Apparatus for generating gas. Aug. 24.

„ 12,221 (1904). Deschamps. Gas producers. Aug. 31.

„ 14,007 (1904). Diehl, Showalter, Grube, and Showalter. Apparatus for producing air-gas. Aug. 24.

„ 16,067 (1904). Grice. Gas producers. Aug. 31.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 18,301. Schnell. Means for rendering petroleum or petroleum spirit non-inflammable until heated or vapourised. Aug. 24.

IV.—COLOURING MATTERS AND DYESTUFFS.

[C.S.] 17,982 (1903). Johnson (Badische Anilin und Soda Fabrik). Oxidation of methyl groups of aromatic hydrocarbons. Aug. 24.

„ 22,289 (1903). Raosford (Cassella and Co.). Manufacture of *p*-acetylamino-*o*-aminopheuol and dyestuffs therefrom. Aug. 24.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 17,775. Hunter, Moser, and Burrows. Retting and preparing fibrous stems or straws, especially flax, preparatory to scutching. Aug. 16.

„ 17,822. Carstanjen. Mordanting and loading silk and other textile fabrics. Aug. 16.

„ 18,056. Rhodes. Apparatus for dyeing and otherwise treating with liquids wool, yarn, and other fibrous material. Aug. 20.

„ 18,069. Dawson. Wool washing and scouring machinery. Aug. 20.

„ 18,084. Sherman. Treatment of rhea, grass, wood fibre, and the like. Aug. 20.

„ 18,194. Brossard. Apparatus for dyeing, cleaning washing, and the like. Aug. 22.

„ 18,488. Lenuox. *See under* I.

[C.S.] 22,189 (1903). Thompson (Wyser). Apparatus for mercerising yarn. Aug. 24.

„ 22,869 (1903). Beutner. Dyeing apparatus. Aug. 24.

„ 6728 (1904). Knnp. Process for dyeing silk a blue-black colour after it is weighted. Aug. 24.

„ 13,090 (1904). Haddan (Elosegui). Fulling of woollen fabrics or other fibres or materials adapted to be felted. Aug. 24.

„ 15,978 (1904). Bauersachs and Brückner. Processes of dyeing cops. Aug. 31.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

[A.] 18,096. Abel (Act.-Ges. f. Anilinfabr.). Process of dyeing leather. Aug. 20.

„ 18,303. Dean and Co., Ltd., and Possnett. Method of and means for dyeing skins in the manufacture of leather. Aug. 24.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 17,794. Lake (Soc. Anon. Ing. L. Vogel per. la Fabr. di Concimi Chimici). The manufacture of sulphuric acid. Aug. 16.

„ 17,888. Wilton. Treatment of leucite or other alkali aluminium silicates for the obtainment of useful products. Aug. 17.

„ 17,985. Lake (Soc. Romana Solfati). Treatment of leucite and similar aluminious silicates. Aug. 18.

[A.] 18,049. Le Sueur. Liquefying air. Aug. 20.

„ 18,239. Brindley. Treatment of spent acid from galvanisers' liquors and the like, and the manufacture of the pigment oxide of iron. Aug. 23.

„ 18,283. Carter. Manufacture of sulphate of ammonia. Aug. 23.

[C.S.] 17,640 (1903). Ashcroft. Production of alkali metals. Aug. 24.

„ 14,966 (1904). Schilling and Kremer. Process for the extraction of ammonia from the sewage waters of towns and similar liquids. Aug. 31.

„ 15,308 (1904). Betts. Process of making lead dithionate. Aug. 24.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 18,609. Fitzmaurice. Method of treating molten or semi-molten glass. Aug. 27.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 17,692. Howden. Process of wood preserving and the apparatus to be used therein. Aug. 15.

„ 17,736. Powell. Vulcanising, preserving and treating timber. Aug. 16.

„ 17,870. Elmes. Manufacture of artificial stone, plaster, or plastic material. Aug. 17.

„ 18,437. Bottomley and Paget. The working of fused silica. Aug. 25

„ 18,584, Hnmblet. Brick kilns and other like kilns. Aug. 27.

X.—METALLURGY.

[A.] 17,676. Clinch-Jones. Heat treatment of metals to prevent decarbonisation and oxidation. Aug. 15.

„ 17,707. Heskett. Process of and apparatus for obtaining metallic lead and zinc and other metals from their sulphides. Aug. 15.

„ 18,027. Lett, and Metalia, Ltd Treatment of ores containing copper, silver, and gold. Aug. 19.

„ 18,357. Hunter and Herbert. Preparing aluminium plates, zinc plates, &c., for lithographic printing purposes. Aug. 24.

„ 18,363. Evans. Enrichment of ores. Aug. 24.

„ 18,415. MacIvor and Burnett. Treatment of crude silver and silver alloys. Aug. 25.

„ 18,537. Barton and McGhie. Processes for the extraction of copper, nickel, and cobalt. Aug. 26.

„ 18,568. Herzog. Composition for welding or soldering cast iron.* Aug. 27.

[C.S.] 19,984 (1903). Price. Furnaces especially adapted for separating gold or other precious metals from the sweepings of jewellers' warehouses, photographers' waste, &c. Aug. 24.

„ 22,073 (1903). Prescott and Green. Manufacture of metallic alloy. Aug. 24.

22,308 (1903). Higham. Cupola furnaces for melting iron. Aug. 24.

„ 22,767 (1903). Talbot. Manufacture of ingot iron and steel. Aug. 31.

„ 23,145 (1903). Gührs and Gührs. Treatment of zinc. Aug. 31.

„ 24,493 (1903). Savelsberg. Process for desulphurising lead ores. Aug. 24.

„ 25,986 (1903). Marks (Lamargese). Process for case hardening. Aug. 24.

„ 16,448 (1904). Harmet. Process and apparatus for refining cast iron. Aug 31.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 17,784. Ashcroft. Electrolytic cells. Aug. 16.

„ 18,042. Imray (Meister, Lucius, und Brüning). Processes of oxidation and reduction effected in an electrolytic bath. Aug. 19.

„ 18,356. Bartelt. Electrolysers. Aug. 24.

„ 18,403. Townsend. Electrolytic process, and apparatus therefor. Aug. 25.

[A.] 18,501. Wallace and Sandy. Primary batteries. Aug. 26.

„ 18,594. Fiedler and Gerard. Galvanic batteries. Aug. 27.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 17,965. Horn. Process for the preparation of soaps. Aug. 18.

„ 18,022. Daum. Machine for solidifying liquid soap in moulds. Aug. 12.

„ 18,152. Nusch (Chem. Werke. G. m. b. H. vorm. Dr. C. Zerbe). Process for making durable soap preparations for use in preventing poisoning by compounds of lead, copper, arsenic, mercury, and other metals.* Aug. 22.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(A.)—Pigments, Paints.

[A.] 18,239. Brindley. *See under* VII.

„ 18,391. Fischer. Preparation of printing inks for the immediate superimposition of colours in trichromatic printing or any other multicolour process. Aug. 25.

[C.S.] 17,895 (1903). Malzac. Preparations of zinc for use as a paint. Aug. 24.

(B.)—Resins, Varnishes.

[A.] 18,376. Walton. Manufacture of floor cloth, wall coverings, &c., and apparatus for use therewith. Aug. 24.

[C.S.] 17,971 (1903). Seeser. Manufacture of linoleum or the like. Aug. 24.

(C.)—India-Rubber.

[C.S.] 22,986 (1903). Seguin and Roussy de Sales. Method of manufacturing artificial caoutchouc. Aug. 31.

XIV.—TANNING, LEATHER, GLUE, SIZE, Etc.

[A.] 17,979. Müller. Manufacture of imitation leather.* Aug. 18.

„ 18,096. Abel (Act.-Ges. f. Anilinfabr.). *See under* VI.

„ 18,135. Flek. Method of treating leather.* Aug. 22.

„ 18,267. Baily. The treatment or preserving of skins. Aug. 22.

„ 18,303. Dean & Co., and Possnett. *See under* VI.

„ 18,514. Amend. Deliming, bating and tanning hides and skins [U.S Appl., Sept. 3, 1903]. Aug. 26.*

[C.S.] 19,017 (1903). Foelsing. Manufacture of albumen from fish. Aug. 24.

„ 15,629 (1904). Piesbergen. Artificial leather and its manufacture. Aug. 24.

XV.—MANURES, Etc.

[C.S.] 13,361 (1904). Mathesius. Process of manufacturing an artificial manure. Aug. 24.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 17,687. Bradin and Baines. Method of ageing or maturing spirits. Aug. 15.

„ 17,749. Richardson. Aërated waters, alcoholic and other drinks. Aug. 16.

„ 18,013. Deichmann and Deichmann. Malting processes [Ger. Appl., Aug. 26, 1903].* Aug. 19.

„ 18,488. Lennox. *See under* I.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(A.)—Foods.

[A.] 17,818. Bouma and Selhorst. Process for the production of milk free from sugar. Aug. 16.

„ 18,441. Lake (Belmont). Manufacture of coffee substitutes.* Aug. 25.

[C.S.] 14,010 (1904). Lehmann. Process for humanising cows' milk and condensing it to a dry state. Aug. 24.

„ 16,189 (1904). Barbier. Method of converting whey into vinegar. Aug. 31.

(B.)—Sanitation; Water Purification.

[A.] 17,920. Mather and Platt, Ltd., and Hepburn. Method of and means for softening water. Aug. 18.

„ 17,994. Mather and Platt, Ltd., and Hopkinson. Methods of and means for purifying, softening and treating water. Aug. 19.

„ 18,152. Nusch (Chem. Werke G. m. b. H. vorm. Dr. C. Zerbe). *See under* XII.

„ 18,484. Hawliczek. Purification of distillery or like refuse effluents. Aug. 26.

„ 18,488. Lennox. *See under* I.

[C.S.] 20,025 (1903). Cowie. Bacterial bed system of treating distillery or other impure effluents containing matter in suspension. Aug. 31.

„ 14,003 (1904). Schweitzer. Apparatus for treating sewage and other fluids. Aug. 31.

„ 14,966 (1904). Schilling and Kremer. *See under* VII.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 17,929. Morris and The Cornbrook Chemical Co., Ltd. Manufacture of paper. Aug. 18.

„ 18,117. Bradley. Paper-making machines. Aug. 22.

„ 18,371. Lake (Soc. Cartiera di Maslianico). Manufacture of waterproof paper. Aug. 24.

[C.S.] 22,299 (1903). Cave-Brown-Cave. Apparatus for the treatment of celluloid, &c. Aug. 24.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 18,147. Wetter (F. Hoffmann-Laroche and Co.). Pharmaceutical compound, and process for the manufacture of the same. Aug. 22.

„ 18,602. Askenasy and Mugdan. Process for producing acetylene tetrachloride.* Aug. 27.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 18,183. Gaedicke Process for the production of silver emulsions.* Aug. 22.

[C.S.] 23,722 (1903). Newton (Bayer and Co.). Sensitising photographic emulsions with the aid of dyestuffs. Aug. 24.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 17,880. Boyd. Manufacture of explosive compositions.* Aug. 17.

„ 18,188. Guthridge. Explosive compounds. Aug. 22.

„ 18,269. Le Brocquy. Manufacture of cordite and the like. Aug. 23.

[C.S.] 22,379 (1903). Clark (Badische Maschinenfabr. u. Eisengiesserei vorm. G. Sebold, und Sebold und Neff). Finishing machines for wood matches. Aug. 24.

„ 3253 (1904). Haddan (Führer). Explosives. Aug. 31.

Printed and Published by Eyre and Spottiswoode, East Harding Street, London, E.C., for the Society of Chemical Industry.—P 10477.

JOURNAL OF THE Society of Chemical Industry.

A RECORD

FOR ALL INTERESTED IN CHEMICAL AND ALLIED MANUFACTURES.

ISSUED TWICE A MONTH.

No. 18.—Vol. XXIII. SEPTEMBER 30, 1904. No. 18.—Vol. XXIII.

Subscription of Members 25/- per annum ;
Entrance Fee 21/- :
Election by the Council.

Price to Non-Members 36/- per annum :
To Members 25/- per Set of extra or back numbers.
Single copies (Members and Subscribers only),
1882—1901, 2/6 each ; 1902 *et seq.*, 1/9 each.

The Society of Chemical Industry.

Past Presidents:

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., F.R.S.	1891—1892.
Sir John Evans, K.C.B., D.C.L., LL.D., Sc.D., F.R.S.	1892—1893.
E. C. C. Stanford	1893—1894.
T. E. Thorpe, C.B., LL.D., Sc.D., Ph.D., F.R.S.	1894—1895.
Thomas Tyrer	1895—1896.
Edward Schunck, Ph.D., F.R.S.	1896—1897.
Frank Clowes, D.Sc.	1897—1898.
George Beilby	1898—1899.
C. F. Chandler, D.Sc., M.D., Ph.D., LL.D.	1899—1900.
Jos. W. Swan, D.Sc., M.A., F.R.S.	1900—1901.
Ivan Levinstein	1901—1903.
Sir W. Ramsay, K.C.B., D.Sc., LL.D., F.R.S.	1903—1904.

COUNCIL FOR YEAR ENDING JULY 1905.

President: Wm. H. Nichols.

Vice-Presidents:

Prof. P. Phillips Bedson.
Dr. Virgil Coblentz.
Dr. Edw. Divers, F.R.S.
Prof. W. R. E. Hodgkinson.
E. Grant Hooper.
David Howard.
Ivan Levinstein.
Max Muspratt.
T. J. Parker.
Dr. F. B. Power.
Sir Wm. Ramsay, K.C.B., F.R.S.
Thos. Tyrer.

Ordinary Members of Council:

Dr. J. Grossmann.
Oscar Guttmann.
H. Hemingway.
Prof. W. R. Lang.
Dr. J. Lewkowitsch.
N. H. Martin.
B. E. R. Newlands.
Prof. W. J. Pope, F.R.S.
Dr. Boverton Redwood.
Walter F. Reid.
Frank Scudder.
Dr. W. S. Squire.

Sectional Chairmen and Secretaries:

CANADIAN.	Dr. F. J. Smale.	Alfred Burton.
LIVERPOOL.	Eustace Carey.	W. R. Hardwick.
LONDON.	A. Gordon Salamon.	Julian L. Baker.
MANCHESTER.	J. Carter Bell.	Julius Hübner.
NEWCASTLE.	Dr. J. T. Dunn.	F. C. Garrett.
NEW YORK.	Prof. C. F. Chandler.	Dr. H. Schweitzer.
NOTTINGHAM.	J. T. Wood.	S. R. Trotman.
SCOTTISH.	R. T. Thomson.	Dr. Thos. Gray.
SYDNEY, N.S.W.	Prof. A. Liversidge, F.R.S.	T. U. Walton.
YORKSHIRE.	Prof. H. R. Procter.	Thos. Fairley.

Honorary Treasurer:
Samuel Hall, East London Soap Works, Bow, E.

Honorary Foreign Secretary:
Dr. Ludwig Mond, F.R.S.

General Secretary: Charles G. Cresswell.

Offices: Palace Chambers, 9, Bridge Street, Westminster, S.W.

Telegraphic Address: 59, Palatable, London.

THE JOURNAL.

Publication Committee:

The President.

Julian L. Baker.
G. Beilby.
J. Carter Bell.
Joseph Bernays, M.I.C.E.
H. Brunner.

Chairman: A. Liversidge.

Committee:

W. A. Dixon.
J. F. Elliott.
L. Meggitt.
J. Morison.
A. A. Ramsay.
J. A. Schofield.
R. Greig Smith.
H. G. Smith.
T. Steel.

Hon. Local Secretary:
T. U. Walton, Colonial Sugar Co., O'Connell Street, Sydney, N.S.W.

Yorkshire Section.

Chairman: H. R. Procter.

Vice-Chairman: G. W. Slatter.

Committee:

W. Ackroyd.
C. S. Bedford.
J. E. Bedford.
F. Branson.
B. A. Burrell.
John W. Cobb.
W. M. Gardner.
F. W. Richardson.
A. Smithells.
Geo. Ward.
Thorp Whitaker.

Hon. Local Secretary and Treasurer:
T. Fairley, 17, East Parade, Leeds.

List of Members Elected

8th SEPTEMBER 1904.

Alpers, William C., 4 & 6, White Street, New York City, U.S.A., Manufacturing Chemist.

Babb, Edward E., 41, Central Wharf, Boston, Mass., U.S.A., Food Analyst.

Carroll, Jno. L., 23, Division Place, Newark, N.J., U.S.A., Secretary (American Oil and Supply Co.).

Cohoe, Prof. W. P., McMaster University, Toronto, Canada, Professor of Chemistry.

Dickenson-Gair, C. J., 11, St. Luke's Road, Clapham, S.W., Analytical Chemist.

Dörr, Dr. Gustav, 3, Crumpsall Hall, Crumpsall, Manchester, Technical Chemist.

Frankl, A., Clotilde Chemical Works, Nagy Bocskó, Hungary, Chief Manager.

Fryer, Percival J., 27, Minster Road, West Hampstead, N.W., Analyst.

Giese, Otto E., 4, Cedar Street, Manhattan, New York City, U.S.A., Importer.

Ginsburg, Louis, 438, Main Street, New Britain, Conn., U.S.A., Architect.

Hurren, F. H., 43, Northumberland Road, Coventry, Analytical Chemist.

Johnston, J. H., 8, Leopold Road, Wimbledon, S.W., Chemist and Bacteriologist.

Knowles, W. R., The Hollies, Wood Green, Wednesbury, Chemical Works Manager.

Laury, N. Arthur, Capelton, Prov. Quebec, Canada, Chemist.

Mason, Dr. Edward D., c/o Messrs. Grimshaw Bros. and Co., Ltd., Clayton, Manchester, Chemist.

Miller, James, 178, Duane Street, New York City, U.S.A., Pharmacist.

Pickard, Glenn H., 1397, Euclid Avenue, Cleveland, Ohio, U.S.A., Chemist (Glidden Varnish Co.).

Stokes, J. A., 354, Castleford Road, Normanton, Yorkshire, Research Scholar in the Royal College of Science.

Valk, S. J., 158, Franklin Street, New York City, U.S.A., Manufacturer.

Wait, Walter S., 30, Kilby Street, Boston, Mass., U.S.A., Chemist.

Wigglesworth, Edwin, c/o General Chemical Co., 25, Broad Street, New York City, U.S.A., Manufacturing Chemist.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Adrot, Leon, l/o Jette St. Pierre; 15, Rue de Neuilly, Rosny sous bois (Seine), France.

Burkhardt, Dr. G. A.; Journals (temporarily) to c/o Ad. Burkhardt and Co., Pforzheim, Baden, Germany.

Butters, Chas.; Journals to Roselawn, Oakland, Cal., U.S.A.; subscriptions as before.

Dubois, Norman A.; Journals to Havemeyer Chemical Laboratory, New York University, N.Y., U.S.A.

Haigh, Frederic, l/o Passaic, N.J.; Matteawan, N.Y., U.S.A., Chemist.

Hobbs, A. F.; all communications to Rolfe Street, Lowell, Mass., U.S.A.

Huntoon, Louis D., l/o Paterson; c/o Sheffield Scientific School, New Haven, Conn., U.S.A.

Levy, Dr. Albert, l/o Clydach, Glam.; 15, Alfonsstr., Aix-la-Chappelle, Germany.

Macintosh, J. C., l/o Midland; Helen Mine, Michipicoten, Ont., Canada.

Meyer, Karl, l/o Osterbrogade; Sortedams Dossering 95A, Copenhagen O, Denmark.

O'Loughlin, C. C., l/o Shawinigan Falls; c/o Pittsburg Reduction Co., Niagara Falls, N.Y., U.S.A.

Payne, A. G. C., l/o West Ham; 15, Lauvanor Road, Queen's Road, Peckham, S.E.

Pollitt, Dr. Chas. P., l/o Rectory Road; Ivy Walls, Stanford-le-Hope, Essex.

Poole, Herman, l/o West 106th Street; 331, West 57th Street, New York City, U.S.A.

Pringsheim, Dr. H. H.; all communications to 13½, Hilliard Street, Cambridge, Mass., U.S.A.

Samuelson, Godfrey B., l/o Salford; Parliament Mansions, Victoria Street, London, S.W.

Southerden, F., l/o Dulwich; c/o Mrs. Beer, Summerlands, Topsham Road, Exeter.

Timmans, W. G., l/o Derby; c/o Basford Chemical Co., Nottingham.

Tripp, Dr. E. Howard, l/o Swansea; The Modern School, Bedford.

Watt, Francis L., l/o London; Russenden, Stanley Street, Epping, near Sydney, N.S.W., Australia.

CHANGE OF ADDRESS REQUIRED.

Connor, C. C., l/o 4, Queen's Elms, Belfast, Ireland.

PATENT SPECIFICATIONS may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3ᵉ).

I.—PLANT, APPARATUS, AND MACHINERY.

ENGLISH PATENTS.

Evaporating or Concentrating Apparatus. J. and C. McNeil, Govan, Scotland. Eng. Pat. 20,777, Sept. 28, 1903.

A HOLLOW shaft, divided internally into steam and water spaces, is provided with projecting radial pipes, also divided internally into steam and water spaces, which latter communicate with the steam and water spaces of the shaft. The whole is arranged in a vacuum pan. Means are provided for rotating the shaft, for introducing the steam, and for allowing the condensed water to escape.
—W. H. C.

Roasting Chemicals and the like; Apparatus for ——. T. P. Thomas, J. L. Richardson, and P. Davies, Swansea. Eng. Pat. 21,896, Oct. 12, 1903.

THE apparatus, which is specially suitable for the manufacture of oxalic acid, consists of a shallow circular pan which can be rotated above a furnace. Above the pan are girders from which depend suitable, adjustable, stationary stirrers. A cover luted in sand encloses the pan and stirrers in such a way as to prevent the escape of the gases except by the proper exit.—W. H. C.

Decanting Fluids under Pressure; Method of and Apparatus for ——. C. Sellenscheidt, and Filter u. Brautechn. Maschinen Fabr., A.-G., vorm. L. A. Enzinger, Berlin. Eng. Pat. 23,183, Oct. 26, 1903.

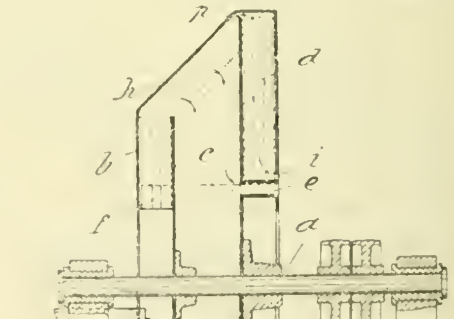
SEE Fr. Pat. 338,188 of 1903; this J., 1904, 600.—T. F. B.

Casks or Vessels from which Liquid is Discharged under Pressure; Impts. in ——. O. Imray, London. From Deutsche Steinzeugwaaren Fabrik für Canalisation und Chem. Ind., Friedrichsfeld, Germany. Eng. Pat. 14,752, June 30, 1904.

THE air inlet and discharge-valves are operated by separate floats, in such a manner that the air supply is cut off before the vessel is quite emptied of liquid. The expansion of the compressed air completes the emptying.—W. H. C.

Purifying Liquids by Centrifugal Force; Apparatus for ——. G. Sagasser, Zwickau, Germany. Eng. Pat. 8181, April 13, 1904.

THE conical drum *b* and the distributing plate *c* are keyed upon the horizontal shaft *a*, which is mounted above a trench, and can be rotated. From the edge of *c* a perforated metal sheet *h* is arranged parallel to the conical wall of the drum, and attached to one side of the mud-collecting chamber *d*. The liquid to be purified, *e.g.*, muddy water, enters by the pipe *g*, which projects into the drum *b* through a central circular opening. The mud, along with a little water, is thrown by centrifugal force against the conical wall of the drum, and passes into the mud collector *d* through the circular channel *p*, whilst the clear water, it is stated, passes through the perforated plate *h*, and flows away through *e*, *e*. At first a small stream of clear water also flows out of the opening *i* in the mud chamber, but when the latter is full, this becomes muddy, and the apparatus is stopped and cleaned out. The clear water and muddy liquid flow away by the two channels *m*



and *n*, either of which can be shut off by the trap *o*. When the apparatus is running, the clear-water channel is left open; when muddy liquid begins to come out of *i*, this is closed and the muddy-water channel is opened.—W. H. C.

Whisking, Agitating, and Mixing Machines. L. C. Reese, London. Eng. Pat. 14,434, June 27, 1904.

Two sets of beaters, revolving the one within the other and in opposite directions, are carried upon a frame. The whole fits into slots arranged in the vertical sides of the pan, and can be removed if required. Suitable means for driving the beaters are provided.—W. H. C.

United States Patents.

Drying Oven. M. M. Suppes and O. Phelps, Elyria, Ohio. U.S. Pat. 768,203, Aug. 23, 1904.

On a suitable perforated base is arranged a movable sheet metal cover, forming the top and side walls of the oven. Means are provided for heating and circulating the air, and for luting the cover with sand.—W. H. C.

Crystallising Apparatus. E. von Seemen and E. Rühle, Rheinfelden, and O. Faller, Basel, Switzerland. U.S. Pat. 768,314, Aug. 23, 1904.

See Eng. Pat. 19,034 of 1902; this J., 1902, 1386.—T. F. B.

French Patents.

Radioactive Substances; Apparatus for Utilising and Storing ——. E. Armet de Lisle. Fr. Pat. 341,833, April 1, 1904.

The radium salt is contained in a glass cup covered by a plate of ebonite which is screwed down to the top of the ebonite cup in which the glass cup stands. The ebonite cup is placed in a leaden vessel with a screw lid, india-rubber rings being used to make tight joints.—L. F. G.

Centrifugal Separator. Aktiebolaget Separator. Fr. Pat. 342,115, Feb. 9, 1904.

Inside the drum of the apparatus, which is provided with a screw cover, two short vertical shafts are placed midway between the centre and the circumference. Each shaft carries a set of curved blades, and a toothed wheel, which engages with another toothed wheel fixed to the central shaft, and is thus rotated in the reverse sense to the drum. The curved blades or rakes remove the solid material deposited on the pervious wall of the drum, and carry it towards the centre, where it falls through an aperture into an annular space below, from which it is expelled by the action of centrifugal force through suitable holes to the outside of the apparatus. The cover of the drum is provided with an inlet pipe and a suitable distributor, and with holes for the escape of the separated liquid.—L. F. G.

II.—FUEL, GAS, AND LIGHT.

Combustion; Retardation of —— by Oxygen. H. E. Armstrong. Proc. Roy. Soc., 1904, **74**, 85—89.

According to H. B. Dixon, carbon monoxide, rather than the dioxide, is the initial product of the combustion of carbon and its gaseous compounds; and the same author has shown that water plays a peculiar and all-important part in the combustion of the monoxide; and, further, that in a number of cases oxygen is by far the most effective diluent in retarding combustion. As an explanation of these results and also of later ones by Bone and Wheeler (Chem. Soc. Trans., 1902, **81**, 536; 1903, **83**, 1074) and Bone and Stockings (this J., 1904, 601), the author puts forward the following views as to the mechanism of combustion:—(1) In the combustion of hydrocarbons, the latter initially merely undergo hydroxylation. (2) At a certain stage in the hydroxylation, thermoschisms begin to take place. Thus dihydroxymethane breaks up as soon as it is formed, into water and formaldehyde, which latter is, in turn, easily resolved into hydrogen and carbon monoxide, $CH_2(OH)_2 \rightarrow CH_2O + OH_2 \rightarrow CO + H_2 + OH_2$. In like manner, dihydroxyethane gives rise to acetaldehyde, which, under some conditions, breaks up into methane and and carbon monoxide, $C_2H_4(OH)_2 \rightarrow CH_3.COH + OH_2 \rightarrow CH_4 + CO + OH_2$. (3) In the case of more complex hydrocarbons, these are to a large extent resolved into thermoschisms prior to oxidation, *e.g.*, $C_6H_{14} \rightarrow C_3H_8 + C_3H_6$; $C_2H_6 \rightarrow C_2H_4 + H_2$. The change may extend even to the formation of carbon when a relatively small proportion of oxygen is present. It is probable that such thermoschisms play an all-important part in high temperature changes (explosions). (4) The reaction by which the oxygen is introduced into the hydrocarbon molecule is regarded as being electrolytic in character, the electrolyte, *i.e.*, conducting water, being the immediate source of the oxygen, whilst the oxygen molecule plays the part of depolariser; it is probable that the water molecules contribute hydroxyl rather than oxygen. The process may be formulated as involving the conjugation of hydrocarbon with water (acting primarily as the catalyst or associating agent) and oxygen, thus:—

$$\begin{array}{c} H_3C \\ \dot{H} \end{array} + \begin{array}{c} OHH \\ OHH \end{array} + \begin{array}{c} O \\ \ddot{O} \end{array} \longleftrightarrow \begin{array}{c} CH_3.OH \\ HOH \end{array} + \begin{array}{c} HO \\ \dot{H}O \end{array}$$

(5) Carbon dioxide is the final product of the change, and in its formation from the monoxide the latter is first converted into formic acid. This affords an explanation of why the presence of so large a proportion of water is required in order that the explosive wave may attain to its greatest velocity, the affinity of water for carbon monoxide being relatively slight, and the reversible change one which takes place mainly in the direction $HCO(OH) \rightarrow CO + OH_2$. (6) Oxygen has a marked influence in retarding the combustion of electrolytic gas, whilst hydrogen has the opposite effect, and nitrogen retards the explosion less than does an excess of oxygen. In seeking for an explanation of these facts, the author points out that the stability of hydrogen peroxide is at a maximum at a high temperature, and that probably water is readily oxidised at temperatures such as prevail in explosions. Then, if the formation of water be regarded as involving the changes—

$$\begin{array}{c} H \\ \dot{H} \end{array} + \begin{array}{c} OHH \\ OHH \end{array} + \begin{array}{c} O \\ \ddot{O} \end{array} \longleftrightarrow \begin{array}{c} HOH \\ HOH \end{array} + \begin{array}{c} HO \\ \dot{H}O \end{array}$$

$$2H_2O_2 \longleftrightarrow 2H_2O + O_2,$$

it follows that water and oxygen will mutually hold each other in check, owing to formation of hydrogen peroxide, which may be looked upon as relatively, if not entirely, inoperative as an oxidising agent at high temperatures in presence of oxygen. The influence of hydrogen in accelerating the combustion is also explicable by the above view, the hydrogen serving to promote the dissociation of the hydrogen peroxide, by diminishing the proportion of active oxygen present.—A. S.

Pentane Lamp; Investigations on the ——. C. C. Paterson. Brit. Assoc., 1904. J. Gas Lighting, 1904, **87**, 606.

Investigations have been carried out at the National Physical Laboratory in order to determine the influence on the Harcourt 10-candle pentane lamp of variations in: (1) the barometric pressure, and (2) the amount of water-vapour present in the air. Photometric comparisons were made against two large-bulb Fleming-Ediswan electric standard glow lamps. The double-comparison method was employed, the electric lamps being used to standardise a comparison glow lamp anew for each experiment, so that it was only necessary to burn the standards for 5 or 10 minutes at a time. From the results of upwards of 60 observations under different conditions, such as are obtained in ordinary practice, the following formula has been deduced for correcting the candle-power of the lamp to the standard atmospheric conditions of 760 mm. of mercury and 10 litres of water vapour per cb. m. of pure dry air:—Candle-power $= 10 + 0{\cdot}066\ (10 - \epsilon) - 0{\cdot}008\ (760 - b)$, where ϵ is the humidity, and b the height of the barometer in mm. The humidity ϵ represents the number of litres of water vapour per cb. m. of pure dry air at the barometric pressure existing at the time so that if b = height of barometer in

mm., e = aqueous pressure, e_1 = vapour pressure of carbon dioxide present in the atmosphere, then $\epsilon = \frac{e}{b - e - e_1} \times 1000$. The standard humidity of 10 litres per 1000, is the mean value for three years found at the Kew Observatory. From the formula given above it follows that a variation of 1 litre per cb. m. in the moisture causes a variation in candle-power of about 0·7 per cent., and that a change of 10 mm. in barometric pressure brings about an alteration of 0·8 per cent. in the illuminating power of the lamp.
—A. S.

English Patents.

Briquets; Process for Producing Pit-Coal and Coke ——. C. Plate, Bonn, and J. Lieb, Cologne, Germany. Eng. Pat. 17,074, Aug. 5, 1903.

See Fr. Pat. 334,257 of 1903; this J., 1904, 15.—T. F. B.

Fuel; Agglomerant for Use in the Manufacture of Compressed ——, *and a Process of Preparing the same.* R. Middleton, Leeds. Eng. Pat. 17,471, Aug. 12, 1903.

See Fr. Pat. 339,370 of 1904; this J., 1904, 709.—T. F. B.

Coke Ovens. H. Koppers, Essen, Germany. Eng. Pat. 17,283, Aug. 8, 1903.

See U.S. Pat. 753,146 of 1904; this J., 1904, 365.—T. F. B.

Peat and Materials evolving Volatile Products; Apparatus for Treating ——. E. K. Carmichael. Eng. Pat. 17,096, Aug. 16, 1903. III., page 897.

Burning Liquid Fuel; Apparatus for ——. P. Davies, Southfields, Surrey, and The Hydroleum Co., Ltd., London. Eng. Pat. 20,059, Sept. 17, 1903.

The invention relates more particularly to the combustion chambers of apparatus of the type described in Eng. Pat. 14,791 of 1898 (this J., 1899, 745). The combustion chamber claimed comprises a casing, preferably of metal, lined or not with refractory material, into which the fuel-supply-pipe projects; and a laminated structure of refractory material constituting the firing plate; the two communicating with each other at adjacent ends, and being situated and supported respectively at the exterior and the interior of the heating chamber, furnace, fire-box, or the like. The laminated structure consists of angular members spaced apart, the outer members being rectangular or polygonal and the inner ones more or less L-shaped.—A. S.

Gas Producers. W. J. Crossley and T. Rigby, Manchester. Eng. Pat. 21,149, Oct. 2, 1903.

See Fr. Pat. 341,970 of 1904, following these.—T. F. B.

Gas-Plant, comprising Generator Base, Gas Washer, Gas Chamber, Cooling Water Reservoir, and Motor Cylinder Casing: One-Part Foundation Frame for a Complete Suction ——. J. Hillenbrand, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 11,853, May 24, 1904. Under Internat. Conv., Jan. 25, 1904.

A combined frame and base for a complete gas plant and motor is formed so as to receive the different parts, as indicated by the title, and combine them into a compact unit, the frame and base being cast in one piece, or consisting of several castings bolted together.—H. B.

Gas; Apparatus for Generating ——. F. E. Guilbaud, Levallois-Perret, France. Eng. Pat. 11,948, May 25, 1904.

A generator for the production of low-grade gas is charged continuously from below by means of Archimedean screws, which convey the fuel into the lower part of the combustion shaft of the generator. A water-sealed trough receives the cinders, which fall from an outlet arranged a short distance above the fire-grate. A superincumbent body of incandescent fuel prevents the escape of smoke in the gas produced. The Archimedean screws may be arranged horizontally, to feed the fuel through a conduit curving upwards into the vertical combustion shaft; or they may work in straight, inclined conduits, arranged almost tangentially to the inner circumference of the shaft, so that a slight rotary movement is imparted to the stack of fuel in the shaft.—H. B.

Air-Gas; Apparatus for Producing ——. G. C. Diehl, H. M. Showalter, W. H. Grube, and J. W. Showalter, Butler, Ind., U.S.A. Eng. Pat. 14,007, June 21, 1904.

Gasoline is fed under pressure from a closed reservoir into a vaporising retort, which is heated by means of a burner supplied with gas from the retort. The main body of gas produced is injected, along with air, into a pipe which rises through the reservoir itself and thence to the place of consumption, this pipe, from its lower end to the part which comes out of the top of the reservoir, being surrounded by a wider pipe, serving as a jacket through which a stream of warm air rises and prevents the condensation of the gas by the cold gasoline. The reservoir is provided at the top with a safety valve, consisting of an upright pipe leading to the outer air and having a diaphragm or valve adapted to give way if the internal pressure becomes excessive, a by-pass pipe permitting the escape of air while the reservoir is being refilled with gasoline.—H. B.

Gasification of Coal or other Materials in the Production of Illuminating or Heating Gas; Apparatus for Use in the ——. C. C. Carpenter, London. Eng. Pat. 14,718, June 30, 1904.

A vertical retort opens at its lower end into a horizontal chamber, in which coke or other residual material collects. In the horizontal chamber is a "pusher," for the removal of the coke. The pusher consists of a cutter, which cuts through the pile of coke at the intersection of the vertical retort and the horizontal chamber, and a shield behind the cutter, which prevents the contents of the vertical retort falling behind the head of the pusher.—W. C. H.

United States Patents.

Peat Blocks; Manufacture of ——. F. W. Gaertner, St. Petersburg. U.S. Pat. 768,445, Aug. 23, 1904.

A cold, dry mixture of peat, powdered rosin, and powdered sulphur is subjected to pressure and slight heating.
—W. H. C.

Hydrocarbon Burner. A. M. Hunt and T. Mirk, San Francisco. U.S. Pat. 768,367, Aug. 23, 1904.

The burner comprises a rectangular frame; a horizontal partition wall in the same, having a series of openings at the sides; air flues extending longitudinally below and communicating with the openings; a longitudinal vaporising flue upon the partition, between the openings, provided with slits alternately upon the sides and top, and with a feeding arrangement for the hydrocarbon, and a body of broken refractory material within the frame, covering the top and sides of the vaporising flue and partition wall.—H. B.

Hydrocarbon Burner [Furnace]. A. M. Hunt and T. Mirk, San Francisco. U.S. Pat. 768,368, Aug. 23, 1904.

The furnace consists, as shown in the diagram, of a closed outer wall, with an opening in the lower part of one end to admit air; the combustion chamber is formed by two horizontal partitions, extending nearly the entire length of the outer casing, the upper partition having an opening, 9, to admit the air; the side walls of the outer casing also form the side walls of the combustion chamber. The hydrocarbon is introduced through the nozzle 4, fixed at a point immediately below the opening 9.—T. F. B.

Gas-Generator. J. H. Eustace, Assignor to J. Williamson, Chicago. U.S. Pat. 767,217, Aug. 9, 1904.

The generator consists of a furnace for heating fuel and superheating steam. Above the furnace, and communicating with it, is a carburetter, by the side of which is a superheater, each of these being filled with chequer brickwork. At one end the carburetter and superheater communicate, and at the other end they are closed to each other. Communicating with the furnace is a chamber in which the superheated steam and "carbonaceous oil" mix, and pass into the carburetter, and thence into the superheater, where the fixed gas is formed.—W. C. H.

Waste Gases; Process of Utilising ——. A. Schütt, Charlottenburg, Germany. U.S. Pat. 768,404, Aug. 23, 1904.

Hot waste gases are brought into contact with water in a finely-divided condition travelling in an opposite direction, the water being thus heated to the boiling point. The amount of water supplied is greater than can be converted into steam; the portion remaining liquid absorbs impurities from the gases. The vapour and the purified gases are utilised in heating a liquid of low boiling point.—E. S.

Gas-washing Mechanism. A. M. Hunt and W. S. Dole, San Francisco. U.S. Pat. 768,369, Aug. 23, 1904.

Between the gas-producer and scrubber are arranged a number of washers, comprising a series of compartments containing the washing liquid, through which the gas has to bubble on its way to the scrubber, means being provided for closing the passage through any of the washers at will.—H. B.

Electrical Apparatus for Clearing Gas. C. G. Hardie. U.S. Pat. 768,450, Aug. 23, 1904. XI. A., page 904.

Incandescent Filaments and Mantles; Manufacture of ——. A. M. Plaissetty, Paris. U.S. Pat. 768,073, Aug. 23, 1904.

See Fr. Pat. 321,803 of 1902; this J., 1903, 291.—T. F. B.

French Patents.

Fuel Briquettes and their Manufacture. M. G. Larondie. Fr. Pat. 338,863, June 15, 1903.

The fuel consists of 91·8 parts of coal, 8 parts of cellulose, and 0·2 part of dry sodium nitrate. The cellulose, in the form of rags, is treated in an autoclave with a dilute soda-lye, and warmed till a clear pulp results. This pulp is then mixed with crushed coal treated with a solution of sodium nitrate, and the mixture thoroughly heated and stirred. The mass is then heated in an autoclave under a pressure of eight atmospheres, and, when dry, compressed into blocks by a hydraulic press.—L. F. G.

Agglomerating Finely-divided Materials [Fuel Briquettes, &c.]; Process for ——. Soc. Anon. des Mines de Houille de Montrelais, Mouzeil et Languin. Fr. Pat. 341,751, April 1, 1901.

Coal, anthracite, lignites, peat, sawdust, leather waste, or other similar material is treated with a solution of a colloid, such as gelatin, gum, or rosin, to which a suitable oxidising agent, such as formol, potassium permanganate, potassium bichromate, or iron perchloride has been added, and the mass formed into blocks and dried. For instance, 92 parts of sawdust are mixed with 8 parts of a solution containing 5 per cent. of gelatin and 2 per cent. of formol. The block, after drying, is stated to possess all the properties of wood, and can be worked and cut.—L. F. G.

Agglutinant for Agglomerating Finely-divided Materials, which becomes Insoluble after Drying, [Fuel Briquettes, &c.] Soc. Anon. des Mines de Houille de Montrelais, Mouzeil et Languin. Fr. Pat. 341,752, April 1, 1904.

The agglutinant is used for the materials specified in Fr. Pat. 341,751 (see preceding abstract), and consists of 1 part of gelatin, to which one-twentieth part of potassium bichromate has been added, dissolved in 4 parts of water. This is then mixed with 99 parts of anthracite powder, the mass formed into balls, and dried for four to five hours at a temperature of 100°—150° C.—L. F. G.

Fuel; Manufacture of Artificial ——. Graigola Merthyr Co., Ltd. Fr. Pat. 341,771, March 30, 1904. Under Internat. Conv., April 6, 1903.

See Eng. Pat. 7871 of 1903; this J., 1904, 539.—T. F. B.

Gas Producers; Apparatus for Regulating the Supply of Steam to ——. P. M. V. Guignard. Fr. Pat. 341,791, March 31, 1904.

In this apparatus the pressure in the exhaust of the motor, which is fed by the producer, is utilised for regulating automatically the supply of steam to the producer, in accordance with the gas consumption. A branch pipe from the exhaust enters the upper end of a closed box containing water, and, at each explosion of the motor, the pressure created temporarily within the box forces some of the water up a pipe into a tank above. This tank has an outlet so adjusted that, as the speed of the motor increases (the amount of water forced up into the tank increasing accordingly), the level of the water in the tank rises, and *vice versa.* The water flowing out of the tank passes down into the box again, through a non-return valve; there is thus an almost continuous circulation of the water in the box and tank. A float inside the tank is connected to the steam-supply valve of the producer, and hence, as the float rises or falls with the level of the water, the steam supply is regulated.—H. B.

Gas Producers. W. J. Crossley and T. Rigby. Fr. Pat. 341,970, April 7, 1904.

A gas producer, the lower end of which rests within a hydraulic seal, is provided with a rotary conical grate, mounted on ball bearings carried by a central cylinder into which the air, or air and steam, is led on its way through the grate. The mechanism for rotating the grate is protected from excessive heating by being situated in one of the conduits through which the air, or air and steam, is led to the central cylinder. The conical grate is of such size as to support only a part of the superincumbent fuel, so that the rotation may be effected easily.—H. B.

Barytic Ores; Preparation of —— *for the Production of a Double Carbide of Barium and Calcium.* J. Cartier. Fr. Pat. 342,036, April 11, 1904. VII., page 901.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

English Patents.

Peat and Materials Evolving Volatile Products; Apparatus for Treating ——. E. K. Carmichael, Edinburgh. Eng. Pat. 17,096, Aug. 6, 1903.

Peat powder, obtained by drying and separating the fibre from peat in an apparatus which forms a part of this patent, is fed through a hopper into a horizontal cylinder provided with a rotating rod, on which are fixed blades to convey the material along the cylinder to an outlet at the further end. There are several of such cylinders arranged one above the other in a furnace, the material being conveyed from one to the other by similar rotating rods. The furnace is so arranged that the lower tubes are more strongly heated. The volatile products are removed from each cylinder by means of outlet pipes, and the hot carbonised material from the lowest cylinder is led through a pipe which passes through a boiler containing water, the steam thus generated being led back to the lowest carbonising cylinder, thereby generating water-gas.—T. F. B.

Filtering and Washing [Lubricating] Oils; Apparatus for ——. C. W. Brown. From W. F. Warden. Eng. Pat. 14,216, June 23, 1904. XII., page 905.

French Patent.

Benzene, Alcohol, Oil of Turpentine, and Petroleum; Process for Rendering —— Uninflammable. G. H. Dilette and J. Talabot. Fr. Pat. 341,927, Feb. 10, 1904.

Carbon tetrachloride is added to the following substances in the proportions given to produce non-inflammable products: benzene or mineral oils, about 15 per cent.; alcohol or oil of turpentine, about 50 per cent. (See also Fr. Pat. 341,158 of 1904; this J., 1904, 885.)—T. F. B.

IV.—COLOURING MATTERS AND DYESTUFFS.

English Patents.

p-Acetylamido o-amidophenol, and [Azo] Dyestuffs therefrom; Manufacture of ——. R. B. Ransford, Upper Norwood. From L. Cassella and Co., Frankfort-on-Maine, Germany. Eng. Pat. 22,289, Oct. 15, 1903.

p-Acetylaminophenol is nitrated at a low temperature and the nitro compound reduced, *p*-acetamino-*o*-aminophenol being obtained. On coupling the diazo compound of this substance with amines, phenols, or their derivatives, azo dyestuffs dyeing various shades are produced. Thus, the dyestuff obtained by coupling with 1.8-aminonaphthol-5-sulphonic acid gives bluish-violet shades on wool, converted into blackish-blue on chroming; whilst that obtained from 2.5-aminonaphthol 7-sulphonic acid gives red shades, converted into blackish-violet on chroming. The dyestuffs obtained by coupling with the following compounds are also described: aminonaphtholmonosulphonic acids 2.3.6 and 2.6.8; aminonaphtholdisulphonic acids 1.8.3.6 and 1.8.2.4; dihydroxynaphthalenemonosulphonic acid 1.8.4; and dihydroxynaphthalenedisulphonic acid 1.8.3.6.
—T. F. B.

Sulphur Dyes [Sulphide Dyestuffs]; Manufacture of Colouring Matters of the Class known as ——, and of an Intermediate Product of the said Manufacture. H. C. Cosway and the United Alkali Co., Ltd., Liverpool. Eng. Pat. 22,966, Oct. 23, 1903.

Dinitrobenzene and sulphanilic acid are heated together in alkaline solution, and the solution acidified; the product obtained thus is salted out of the solution, and heated with an equal weight of *p*-aminophenol, six times its weight of sodium sulphide, and one half its weight of sulphur, until the melt becomes dry. The resulting product dyes green shades, fast to light, acids, and alkalis.—T. F. B.

Anthracene Series; Production of Colouring Matters of the ——, and of Intermediate Products relating thereto. [Anthracene Dyestuffs.] J. Y. Johnson, London. From Badische Anilin und Soda Fabrik, Ludwigshafen, Germany. Eng. Pat. 23,179, Oct. 26, 1903.

See Addition, of Oct. 26, 1903, to Fr. Pat. 319,618 of 1902; this J., 1904, 368.—T. F. B.

Sulphurised [Sulphide] Dyestuffs; Manufacture of ——. O. Imray, London. From Soc. Chem. Ind. in Basle. Eng. Pat. 23,188, Oct. 26, 1903.

See Fr. Pat. 337,316 of 1903; this J., 1904, 186.—T. F. B.

Glucosides possessing Colouring or Tanning Properties; Processes for Extracting from Vegetable Matters ——, and the Products resulting from such Processes. F. J. Oakes, New York. Eng. Pat. 9932, April 30, 1904.

See U.S. Pat. 759,008 of 1904; this J., 1904, 604.—T. F. B.

United States Patent.

Glycollic Acid Anilide Orthocarboxylic Acid and Process of Making Indigo. B. Homolka, Frankfort, and F. von Bolzano, Assignors to Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. U.S. Pat. 768,455, Aug. 23, 1904.

See Eng. Pat. 4538 of 1903; this J., 1904, 16.—T. F. B.

French Patents.

Basic Dyestuffs; Production of Soluble Salts of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,857, June 11, 1903.

See Eng. Pat. 12,681 of 1903; this J., 1904, 485.—T. F. B.

Anthracene Series; Production of Dyestuffs of the ——. Badische Anilin und Soda Fabrik. Second Addition, dated March 2, 1904, to Fr. Pat. 338,529, March 30, 1903. Under Internat. Conv., Feb. 12, 1904.

See U.S. Pat. 763,233 of 1904; this J., 1904, 747.—T. F. B.

Sulphide Dyestuffs; Process of Making Yellow ——. Act.-Ges. f. Anilinfabr. Fr. Pat. 341,798, March 31, 1904.

Sulphide dyestuffs, dyeing clear yellow shades from sodium sulphide solution, are obtained by heating equimolecular quantities of *m*-toluylenediamine and diformyl-*p*-phenylenediamine with sulphur to 220°–230° C. By raising the temperature of the reaction, or by reducing the quantity of diformyl-*p*-phenylenediamine, dyestuffs giving more orange shades are produced.—T. F. B.

Lakes [from Azo Dyestuffs]; Process for Preparing ——. Soc. Anon. Prod. F. Bayer et Cie. Fr. Pat. 341,867, April 2, 1904. XIII. A., page 906.

Anthraquinone Derivatives [Anthracene Dyestuffs]; Production of ——. Soc. Anon. Prod. F. Bayer et Cie. Fr. Pat. 342,195, April 11, 1904. Under Internat. Conv., Nov. 26, 1903.

On treating alizarin with fuming sulphuric acid or with a mixture of anhydrous sulphuric acid and boric acid, and saponifying the resulting sulphuric ether, the hitherto unknown 1.2.5-trihydroxyanthraquinone is obtained. It dyes cotton mordanted with alum pure bluish-red shades, and gives violet-blue shades on chrome-mordanted cotton.
—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Silk Mordanting. C. Knapstein. Färber-Zeit., 1904, **15**, 248–250.

The paper is a polemical one, and adduces sundry cases in which P. Heermann's work on the various theories of the mordanting process (see this J., 1904, 820) does not agree with facts observed in actual dyeing practice.—T. F. B.

Tannic and Gallic Acids; Determination of ——. W. P. Dreaper. XXIII., page 913.

English Patents.

Dressing Material; Method of Producing a Consistent Dust-free Surgical ——. E. M. Sello, London. Eng. Pat. 15,276, July 8, 1904.

The "fleecy" material is passed, directly it comes from the carding machine, between heated rollers, the stearic acid adhering to the material being thereby melted, and imparting a gloss to the material.—T. F. B.

Woollen Fabrics and other Fibres or Materials adapted to be Felted; Fulling of ——. H. J. Haddan, London. From A. Elosegui, Tolosa, Spain. Eng. Pat. 13,090, June 9, 1904.

Woollen fabrics or other materials suitable for felting are exposed to the mechanical action of compression, either by passing between cylinders or by stamping, the fabric being heated at the same time by hot water or steam. The usual treatment with alkali, acid, soap, &c., is omitted.—T. F. B.

Mercerising Yarn; Apparatus for ——. W. P. Thompson, London. From A. Wyser, Aarau, Switzerland. Eng. Pat. 22,189, Oct. 14, 1903.

A stand is fixed on the edge of the mercerising tank on which the reel is placed after mercerising, to allow it to

lrain. Two washing tanks are provided for each mercer-
ising tank; these have perforated tubes arranged inside
hem, which project a spray of washing liquid on to the
abric. The yarn reels are driven by an adjustable change-
gear, so that the reels may be rotated alternately in opposite
lirections, thus preventing tangling of the under threads of
he yarn.—T. F. B.

Dyeing Apparatus. E. W. Beutner, Neukirchen, Germany. Eng. Pat. 22,869, Oct. 22, 1903.

Two vertical cylindrical tanks, communicating with one
nother by means of a short pipe fixed near the top of
ach, are divided horizontally into compartments by means
of perforated plates or sieves, on which the goods to be
lyed rest. The dyeing liquid is introduced into the bottoms
of the tanks through branch pipes leading from a main pipe,
which latter is provided with a three-way cock and a rotary
ump, so that the liquid can be introduced into each of the
anks alternately. By this means, as the liquid comes in
ontact with the goods on the sieves alternately from above
nd below, more even dyeing results.—T. F. B.

Dyeing Silk a Blue-Black Colour after the same is Weighted; Process for ——. J. A. Knup, Paterson, N.J., U.S.A. Eng. Pat. 6728, March 19, 1904.

ilk is weighted by successive immersions in solutions of
tannic chloride, alkali phosphate, and alkali silicate; the
arious strengths of solution and methods of working for
weighting to definite degrees are specified. The silk is then
mmersed in a solution of "Iron liquor" (iron dissolved in
rude acetic acid) of 40° B. at 60° F. for one hour, and then
n a solution of 100 lb. of gambier, 20 lb. of logwood extract,
nd 10 lb. of fustic extract (for each 100 lb. of silk) at
60° F. for two hours. After washing, the silk is finally
reated with a solution containing 20 lb. of logwood extract
nd 50 lb. of soap per 100 lb. of silk, the temperature being
aised from 110° F. at the start to about 150° F., the treat-
ment being continued until the desired shade is produced,
fter which the material is finished as usual.—T. F. B.

Vaterproofing Fabrics; Apparatus for ——. T. F. Wiley, Harrogate, Yorks. Eng. Pat. 7172, March 25, 1904.

he apparatus is of the type in which the waterproofing
gent is applied to the fabric in the form of spray. In order
o ensure a uniform discharge of liquid, a hollow float is
ounted in a tank or vessel containing the waterproofing
quid, the tubes which convey the liquid to the fabric
assing diametrically through this float. Air outlets are
rovided behind or below the fabric, to prevent uneven air
urrents in the waterproofing chamber.—T. F. B.

UNITED STATES PATENTS.

mpregnating Fabrics with Fluid Substances; Machine for ——. H. A. Mann, Albany, N.Y. U.S. Pat. 768,059, Aug. 23, 1904.

Two cylinders, between which the fabric passes, are provided
ith rubber coatings which extend beyond the ends of the
ylinders, and are mounted on a suitable framework, the axis
f the upper cylinder being rearward of that of the lower
ne. Side walls of glass abut against the projecting rubber
acings without touching the ends of the cylinders. The
ylinders are rotated by suitable mechanism, the journal
nds of one of the shafts being supported in stationary
earings, and the journal ends of the other in adjustable
earings. The fluid substance is contained in a receptacle
bove the upper cylinder, and is delivered by a suitable
evice on to the surface of the upper cylinder.—B. N.

yeing and Washing; Machine for ——. C. Corron, Lyons, France. U.S. Pat. 768,425, Aug. 23, 1904.

ee Fr. Pat. 319,049 of 1902; this J., 1902, 1533.—T. F. B.

FRENCH PATENTS.

Fibre from Gelatin; Production of an Artificial ——. L. E. Jannin. Fr. Pat. 342,112, April 1, 1904.

concentrated solution of gelatin (1 kilo.) in water
1 kilo.) and glycerin (100 grms.), containing, if desired, a
mall proportion (1—2 grms. per litre) of formaldehyde and colouring matters, is forced, at a temperature of 80°—100° C., through spinnerets, as in the manufacture of artificial silk. The fibres thus produced are passed either into the air or into a solution of formaldehyde in alcohol or acetone, in order to harden them. They are then treated in a closed chamber with gaseous formaldehyde, to render the gelatin completely insoluble.—E. B.

Artificial Silk, Hair, and Straw; Manufacture of ——. L. Crespin. Fr. Pat. 342,077, April 11, 1904.

Nitrocellulose is dissolved in a mixture of methyl and ethyl alcohols and ether, to which is added some castor or palm oil or glycerin. The collodion is forced through a capillary tube, the threads issuing from which being passed into a tube containing water, which dissolves nearly all the solvent from the collodion; this bath is constantly renewed, so that it always contains about 10 per cent. of alcohol. On distilling the wash water, the alcohol and nearly all the ether are recovered and can be used again.—A. B. S.

Woollen Fabrics in General; Manufacture [Fulling] of ——. Soc. Reynes et Michel. Fr. Pat. 341,943, March 1, 1904.

In order to avoid the loss in weight of woollen fabrics during fulling, the operations of scouring and fulling are performed simultaneously by immersing the fabric in a solution containing alkali and ammonia, "of suitable concentration and temperature," and then rapidly passing it between rollers, to cause the liquid to thoroughly impregnate the fibres.—T. F. B.

Removing Fatty Matters from Tissues [Wool Scouring]; Application of Electrolysis in ——. J. M. J. Baudot. Fr. Pat. 342,108, April 1, 1904.

Woollen tissues are taken from a scouring machine without being washed, and are passed at full width through a tank in which positive and negative plates are fixed, a bath of sodium or potassium carbonate serving as electrolyte at starting. The fatty matters present in the tissues are, it is stated, readily saponified and removed. The soapy liquors obtained are run off into a separate tank and are electrolysed for the recovery of the fatty acids contained in them. The apparatus in which these operations are accomplished is especially intended for use in connection with the wool washing machine described in Fr. Pat. 331,956 (this J., 1903, 1192).—E. B.

Cop-tubes for Use in Dyeing, Bleaching, &c.; Improved ——. J. Brandwood. Fr. Pat. 342,109, April 1, 1904.

The cop-tubes in question are composed of woven or knitted materials.—E. B.

Blue and Blue-black Shades [on Wool] Fast to Light and Fulling; Production of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 342,026, April 8, 1904. Under Internat. Conv., March 11 and 18, 1904.

By dyeing chromed wool with substituted Acid Fuchsines mixed with certain azo dyestuffs susceptible to chroming, blue to blue-black shades are obtained, perfectly fast to light, fulling, washing, and acids. Suitable azo dyestuffs are those obtained by coupling diazotised di-o-diaminophenolsulphonic acid with 2 mols. of β-naphthol, or by coupling diazotised 1.2.4-naphthylaminedisulphonic acid with β-naphthol. (See Fr. Pat. 338,819 of 1903; this J., 1904, 820.)—T. F. B.

Dyeing Silk a Blue-Black Colour after the same is Weighted; Process for ——. J. A. Knup. Fr. Pat. 341,482, March 19, 1904.

See Eng. Pat. 6728 of 1904; preceding these.—T. F. B.

Stannic Oxide contained in the Wash Waters of Silk Dyeworks; Plant for the Automatic Recovery of the ——. R. Schmitz. Fr. Pat. 341,769, March 30, 1904. Under Internat. Conv., March 22, 1904.

The washings containing stannic oxide are collected in a tank placed below the silk-washing apparatus, and are then pumped up into the separator, the rate of flow being controlled by means of a perforated nozzle fixed on the end of the discharge tube. The separator consists of an upright cylindrical vessel with conical bottom: the upper part of this vessel is divided into two compartments by a plate extending about halfway down the vessel, whilst at the bottom of the cone (*i.e.*, at the apex) is provided a conical cap, resting on feet fixed to the vessel. The stannic oxide falls to the bottom of the vessel, and is prevented by the cap from rising again in the vessel. When a sufficient deposit has collected, it is drawn off, and filtered through a press. The water, freed from the stannic oxide, overflows from the separating vessel by means of a pipe provided in the compartment not containing the inlet pipe.—T. F. B.

Fabrics printed with Metallic Powders; Process of Compression for ——. O. Ostersetzer. Fr. Pat. 341,899, April 6, 1904.

To remove the metallic glitter, the materials are compressed with heated plates or cylinders the surfaces of which are finely engraved either with lines or dots.—A. B. S.

Printing of Fabrics. Soc. Anon. l'Art Industriel. Fr. Pat. 341,875, April 8, 1904.

The dry colouring matters are made into a thick paste with boiled linseed oil, and this is thinned, according to the material to be printed, with a mixture of equal parts of heavy petroleum and ammonia. To this mixture is added some silicate of potassium solution containing about 80 grms. of sugar per litre. The colouring matter is fixed by the silicate which also combines with the sugar; the latter prevents the colour from being too brittle. The ammonia counteracts the smell of the linseed oil and petroleum and accelerates the drying of the colours.
—A. B. S.

VII.—ACIDS, ALKALIS, AND SALTS.

Carbon Dioxide and Soluble Nitrites; Reaction between ——. R. B. Moore. J. Amer. Chem. Soc., 1904, **26**, 959—961.

In order to obtain conclusive evidence as to whether carbon dioxide does or does not liberate nitrous acid from a solution of potassium or sodium nitrite, the following experiments were made:—Three small bottles were filled with (*a*) distilled water, (*b*) and (*c*) concentrated potassium nitrite solution. Carbon dioxide was passed into (*a*) and (*b*), but not into (*c*) until the liquids were saturated, and a strip of iodised starch paper was suspended in each bottle $\frac{1}{4}$ in. above the liquid. After six minutes the paper in bottle (*b*) was quite blue, whilst the papers in the other two bottles remained unchanged, even after several hours. Similar experiments, using papers dipped in a solution of *m*-phenylenediamine hydrochloride and also others dipped in a solution of ferrous sulphate, gave confirmative results. On repeating the experiment with solutions of sodium nitrite and silver nitrite, instead of a solution of the potassium salt, similar results were obtained, proving that nitrous acid is also liberated from these nitrites by the action of carbon dioxide.—W. P. S.

Ferrous Salt Solutions; Oxidation of ——. E. Jordis and H. Vierling. Z. Elektrochem., 1904, **10**, 679—682.

The differences in behaviour of solutions of ferrous ammonium sulphate, according to the method used to purify the salt, are ascribed in large measure to the slight variations in constitution of the salts obtained. The small electrical conductivity of a solution of the salt precipitated with alcohol is, however, chiefly due to the presence of alcohol which has adhered to the crystals. The oxidation of dilute solutions (1/1000 mol.) by means of oxygen was chiefly studied. Platinum was found to accelerate the oxidation, as also did an elevation of temperature. The precipitates obtained with and without platinum differed considerably in constitution and appearance. In the former case the precipitate was fine grained, bright yellow and insoluble in dilute acids, whereas in the latter it was coarser, of a red colour, and easily soluble. These observations agree with and extend those of Graham (Phil. Trans., 1861, **151**, 208—210).—R. S. H.

English Patent.

Lead Dithionate; Making ——. A. G. Betts, Troy, N.Y., U.S.A., Eng. Pat. 15,308, July 8, 1904.

Sulphur dioxide gas is passed through water in which native manganese dioxide, in fine powder, is suspended. The necessary amount of lead dithionate is added to decompose any manganese sulphate which may have formed, and the solution of manganese dithionate is then treated with lead peroxide, to obtain lead dithionate in solution, and a precipitate of manganese dioxide.—E. S.

United States Patents.

Sulphuric Acid Plant. A. Zanner, Brussels, Belgium. U.S. Pat. 768,108, Aug. 23, 1904.

The plant includes a roasting furnace, Glover tower, and heating flue through which the gases pass to the tower within which flue removable concentrating pans are set These pans have an inlet supply pipe traversing the flue wall at the end near the tower, and are fed from without A discharge pipe also extends through the wall at the enc near the furnace. Vapour exit openings discharge into the flues. See also U.S. Pat. 693,635 of 1902; this J., 1902 476.—E. S.

Carbonic Acid Gas; Manufacture of ——. W. J. Knox Assignor to G. Westinghouse, both of Pittsburg, Pa U.S. Pat. 768,230, Aug. 23, 1904.

The process consists in heating carbon dioxide gas, anc passing it through carbonates or "carbonic-acid-containin substances," which then yield a further portion of the gas A portion about equivalent to the portion thus added i withdrawn, and the remainder is reheated, and is passe continuously through the carbonates, &c., the evolution o the gas being increased by circulation of steam through th system.—E. S.

French Patents.

Lead Chambers [Sulphuric Acid]; Pulverisation of Wate in ——, *by aid of the Gases of the Pyrites Furnac* R. Delplace. Fr. Pat. 342,117, Feb. 15, 1904.

The furnace gases, after being cooled, and before enterin the Glover tower, are passed through a column in whic they are washed with strong sulphuric acid, in order t absorb any sulphuric anhydride present. The gases a then compressed, and admitted to a reservoir, whence the are supplied to the injectors. The injectors consist J-shaped tubes into the long limbs of which the current water enters. The mouths of the shorter limbs are covere by circular plates of greater diameter than the tubes, th plates being surmounted by small cones against the apic of which the gases are directed, through small orifices i the ends of vertical tubes arranged above the cone Compare Fr. Pat. 333,285 of 1903; this J., 1903, 1292.
—E. S.

Gas; Apparatus for the Absorption of Liquids by —— *and especially for the Absorption of Hydrochloric Ac by Water.* Vereinigte Thonwaarenwerke Akt.-Ges. F Pat. 342,008, March 18, 1904.

The apparatus consists of a shallow rectangular clos box, the double bottom of which is separated as to t greater part of its length by a partition, which causes t water or liquid entering at one side aperture to traverse t length of the box before returning to emerge at a cor sponding outflow aperture. A thin layer of liquid is th presented to the gas which enters the top of the box by vertical pipe at one end, and leaves by a corresponding p at the opposite end. A number of such boxes are co nected in series, with arrangements for the circulation fr box to box of both the absorbing liquid and the gas. T apparatus may be provided with cooling tubes.—E. S.

Hydrosulphites; Production of —— *Dry and quite Stab* Soc. Badische Anilin und Soda Fabrik. Fr. Pat. 341,71 March 28, 1904.

A hydrosulphite, such as sodium or potassium hyd sulphite, or a hydrosulphite of zinc, or of zinc and sodiu or of potassium and ammonium, is heated in a reflux ap

tus with a volatile liquid capable of absorbing water, such
 ethyl or methyl alcohol. The receiver in which the
istillate collects is charged with lime or other desiccating
ibstance, which absorbs moisture from the distillate before
 returns to the retort. The final product is dried in a
acuum at about 60° C., and lastly over sulphuric acid.
e Eng. Pat. 2204, of 1903; this J., 1903, 1347.—E. S.

ithopone; Manufacture of —— by Electrolysis of Sodium Sulphate or Chloride, with Simultaneous Production of Sodium Hydroxide. J. B. and A. Caudau. Fr. Pat. 341,827, April 5, 1904. XI. A., page 904.

arytic Ores; Preparation of ——, for the Production of a Double Carbide of Barium and Calcium. J. Cartier. Fr. Pat. 342,036, April 11, 1904.

ITHERITE (barium carbonate) mixed with minerals con-
ining both barium carbonate and calcium carbonate, is
ated in a reverberatory furnace to expel carbon dioxide.
e oxides of barium and calcium obtained are then mixed
th carbon and strongly heated in an electric furnace.
—E. S.

rbon from Pulverised Carbonaceous Substances; Process for Separating ——. J. D. Darling. Fr. Pat. 341,736, March 29, 1904.

E U.S. Pat. 763,859 of 1904; this J., 1904, 780.—T. F. B.

VIII.—GLASS, POTTERY, ENAMELS.

ttery Clay; Influence of Magnesia on ——. A. E. Hottinger. Thonind. Zeit., 1904, **28**, 806; Chem.-Zeit., 1904, **28**, Rep. 240.

The last sherd was so hard as to resist scratching with
steel point. In further experiments with clay shale, the
lition of 10·5 per cent. of magnesite caused the body to
ter at cone 1.—C. S.

English Patent.

ment [for Porcelain, &c.]; Manufacture of a Material Designed for the Production of ——. P. Steenbock, Berlin. Eng. Pat. 15,181, July 7, 1904.

RYLLIUM compounds soluble with difficulty in water, but
cting with phosphoric acids, or their acid salts, are
xed with similar compounds of other light metals, includ-
 zinc, and a solution of phosphoric acid or an acid phos-
ate is added to the mixture. For example, a solution of
yllium nitrate may be precipitated with sodium silicate
ution, and eight parts of the beryllium silicate obtained,
er washing and slightly calcining, mixed with five parts
 a mixture obtained by melting together one part of lime,
 part of alumina, and two parts of silica. The whole
then mixed with a 50 per cent. solution of ortho-phos-
oric acid, which is almost saturated with aluminium
osphate, and also contains a small quantity of zinc
osphate. The mass hardens in a short time. Colouring matters may be added to it. The cement produced is adapted for filling teeth, cementing porcelain, &c.—A. G. L.

United States Patent.

Glass Furnace. J. E. Berry, Monongahela, Pa. U.S. Pat. 767,373, Aug. 16, 1904.

THE furnace consists of a melting chamber, from which a central channel passes to a gathering or drawing chamber, which, together with the central channel, is surrounded by double heating chambers provided with means for introducing gas, and a communicating flue formed near the furnace proper.—W. C. H.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

Lime in Cement; Rapid Method for the Determination of ——. B. Enright. XXIII., page 912.

United States Patent.

Brick; Process of Making ——. O. G. Diefendorf, Waterton, N.Y. U.S. Pat. 766,938, Aug. 9, 1904.

THE ingredients, including cement, a friable earth, and colouring matter, are first mixed with a small quantity of water, and formed into bricks in suitable moulds and subjected to a pressure of about 2,000 lb. per sq. inch, whereby the small quantity of moisture is brought to the surface of the moulds. The bricks are then removed from the moulds, exposed to the air till a thin crust forms on the surfaces, and then wetted and allowed to stand and harden.—W. C. H.

French Patents.

Marble; Process for Rendering —— Antiseptic and at the same time increasing its Insulating Power. Chem. Techn. Fabr. Dr. Alb. R. W. Brand and Co., G. m. b. H. Fr. Pat. 338,886, June 22, 1903.

THE marble is impregnated with substances such as asphalt, paraffin, caoutchouc, linseed oil, &c., to which disinfectants such as boric acid and thymol may be added, by placing it in a benzene or other solution of these bodies in a vessel from which the air is exhausted. On admitting air again, the solution is forced into the pores of the marble, the solvent being then removed by heating or other suitable means, leaving the dissolved non-volatile body in the marble.
—A. G. L.

Colouring Natural Stones, especially Marble; Process for ——. Chem. Techn. Fabr. Dr. Alb. R. W. Brand and Co., G. m. b. H. Fr. Pat. 338,887, June 22, 1903.

THE stone is first impregnated with a volatile liquid, *e.g.*, ether, benzene, or alcohol, and is then placed in the solution containing the colouring matter, which solution must have a much higher boiling point than the first liquid. The whole is then heated until the volatile liquid has been driven off.—A. G. L.

Peaty Packing and Coating Material; Manufacture of —— for Walls, Ceilings, &c. W. Klinger. Fr. Pat. 341,929, Feb. 13, 1904.

MOIST peat is well mixed with about 10 per cent. of cork waste and with a milk of mixed lime and magnesia (4 per cent. of lime to 1 per cent. of magnesia), and the plastic mass is moulded to any desired form. For coating such surfaces as ceilings, dry peat is mixed with about 20 per cent. of asphalt and tar, to which plaster is added, with sometimes, magnesia also. It is stated that the mixture may be rolled into thin plates, which can be used, for example, for covering ice-houses.—E. S.

Nickel; Utilisation of the Waste produced in the Manufacture of —— [Bricks, &c.]. M. Molon. Fr. Pat. 342,000, March 11, 1904.

THE nickel waste is ground, sifted, and sorted, to form a "sand," which is utilised alone or mixed with river sand, chalk or the like, in the manufacture of bricks, in masonry, and otherwise.—E. S.

Cement Composition containing Magnesia, and Process for Making Artificial Stone therefrom. E. Bidtel, G. J. Bidtel, and G. K. N. Nutz. Fr. 341,989, March 7, 1904.

See U.S. Pat. 757,252 of 1904; this J., 1904, 491.—T. F. B.

X.—METALLURGY.

Gold-Copper and Gold-Silver Alloys; Specific Gravity of ——. C. Hoitsema. Z. anorg. Chem., 1904, **41**, 63—67.

The author determined the specific gravity, at 15° C., of cast gold-copper and gold-silver alloys, in order to supplement the figures previously given by Matthiessen and Roberts-Austen. The results are given in the following tables:—

Gold-Silver Alloys.

Silver; Simple Method for the Preparation of Metallic ——. J. Thallwitz. Z. phys.-chem. Unterr., 1904, **17**, 224. Chem. Centr., 1904, **2**, 634.

For the rapid preparation of metallic silver from silver chloride, the author recommends the use of a mixture of powdered charcoal and sodium peroxide. A mixture of powdered wood charcoal and sodium peroxide is placed in an earthenware crucible, and is covered with a layer of the dry silver chloride. The whole is then carefully and intimately mixed. After a short time the mixture ignites spontaneously, and metallic silver separates in a reguline condition. The proportions of the substances taken are calculated from the equation:

$$2AgCl + Na_2O_2 + 2C = 2CO + 2NaCl + 2Ag.$$

ertical Furnace; Process and —— for the Direct and Continuous Extraction of Metals, and especially for the Direct Production of Iron. O. Simmersbach. Fr. Pat. 341,788, March 31, 1904.

he iron ore to be reduced is contained in a covered vertical rnace in the walls of which channels are cut from the bottom up to a certain height, these channels being connected annularly and heated by gas burners at their bases. An exit for the products of combustion is provided at the top of the channels. The furnace, while thus heated entirely from its walls, without access of air or of fuel to its body, is traversed by carbon dioxide admitted into the mass of the charge near the bottom by suitable tubes, and aspirated from a discharge opening at the top. The gases discharged from the body of the furnace may be led away to feed the burners within the furnace walls. The reduced ore is withdrawn from the water-cooled iron base of the furnace, and may be then treated to obtain iron or steel in, for instance, a Martin's furnace.—E. S.

Steel Articles; Protecting certain portions of —— during Cementation. A. De Dion and G. Bouton. Fr. Pat. 342,061, April 9, 1904.

The parts of the piece of steel to be guarded against cementation are coated with a metallic deposit or with a salt which is not attacked by carbon.—E. S.

Nickel; Utilisation of the Waste produced in the Manufacture of ——. M. Molon. Fr. Pat. 342,000, March 11, 1904. IX., page 901.

Metals; Process for the Extraction of ——, the Formation of Alloys and Metallic Oxides, and the Production of High Temperatures. P. and A. Weiller. Addition, dated April 7, 1904, to Fr. Pat. 336,989, Nov. 9, 1903. See this J. 1904, 145.

The powdered ore, freed as far as possible from gangue, is mixed with iron filings and saltpetre, with addition, in some cases, of a chlorate. The mixture is ignited in a small furnace, and the reduced and molten metal which sinks to the bottom is drawn off in the usual way.—E. S.

Metallic Alloy; Manufacture of a ——. A. Jacobsen. Fr. Pat. 342,054, April 9, 1904.

Two atomic proportions each of copper and of iron are fused with one atomic proportion each of aluminium and of nickel. The alloy is said to be suitable for the manufacture of cannon, of machines, ships, &c. A bronze is obtained by fusing together 6 parts by weight of the above-described alloy with 54 parts of copper and 40 parts of zinc. See Fr. Pat. 338,415 of 1903; this J., 1904, 610.—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

English Patents.

Batteries; Galvanic ——. L. Fiedler and F. J. Gerard, London. Eng. Pat. 18,010, Aug. 20, 1903.

The active portion of the cathode consists of an alloy of zinc and antimony, together with or without an amalgam of mercury and with or without other metals, such as manganese. The alloy may conveniently be in the form of a powder saturated with mercury, and contained in a tray, the electrolyte being in the form of a jelly.—B. N.

United States Patents.

Furnace; Electric ——. C. G. P. de Laval, Stockholm, Sweden. U.S. Pat. 768,054, Aug. 23, 1904.

The furnace is cubical in form with a flat hearth, and has a horizontal feed opening in one wall extending inwardly. The electrodes pass through opposite walls, terminating in front of the feed opening, and between the latter and the electrodes is an escape opening in the roof of the chamber. —B. N.

Connector for Electro-Chemical Apparatus. O. P. Fritchle, Denver, Colo. U.S. Pat. 768,175, Aug. 23, 1904.

This invention comprises a cup containing mercury, the cup being grooved externally, and furnished with a lower stem coated with tin and surrounded by a lug of cast lead, and a coupler of copper wire with a tinned body portion covered with a lead sheath cast on the copper. The end of the wire projects from the sheath, and is supported within, but out of contact with the cup, both cup and coupler end being coated with nickel. Near the end of the lead sheath is an annular groove, forming a bulb at the end, and an elastic sleeve of rubber encloses both cup and bulbed end, so that when the coupler end is withdrawn, the perforated diaphragm in the elastic sleeve closes.—B. N.

Electrical Apparatus for Cleaning Gas. C. G. Hardie, Hamburg, N.Y. U.S. Pat. 768,450, Aug. 23, 1904.

The gas is passed through an inclined casing, containing an electrode insulated throughout its length so as to prevent disruptive discharges between it and the casing. The electrode is connected to one of the secondary terminals of a high-potential transformer, the other terminal being connected to the bottom of the casing. Water is caused to flow uniformly over the bottom of the casing, to wash away the impurities deposited thereon under the influence of the electrical condenser.—H. B.

French Patents.

Removing Fatty Matters from Tissues; Application of Electrolysis in ——. J. M. J. Baudot. Fr. Pat. 312,108, April 1, 1904. V., page 899.

Lithopone; Manufacture of —— by Electrolysis of Sodium Sulphate or Chloride with Simultaneous Production of Sodium Hydroxide. J. B. and A. Candau. Fr. Pat. 341,827, April 5, 1904.

Sodium sulphate solution is electrolysed with zinc anodes in cells having porous partitions, the products in the anode and cathode compartments being respectively zinc sulphate and sodium hydroxide. The zinc sulphate solution is treated with solution of barium sulphide to obtain lithopone, a white precipitate composed of zinc sulphide and barium sulphate. If sodium sulphate be replaced by sodium chloride in the process, the zinc chloride obtained is mixed with a solution of sodium sulphate before precipitation by barium sulphide. Compare Fr. Pat. 338,322 of 1903; this J., 1904, 606.—E. S.

(B.)—ELECTRO-METALLURGY.

Iron and Iron Alloys; Electro-thermal Production of ——. B. Neumann. Stahl u. Eisen, 1904, **24**, 682—688; 761—769; 821—826; 883—888; 944—950. See also this J., 1904, 258.

The author reviews the different methods for the electrical production of iron and iron alloys. The subject-matter of the paper is given under the following headings and sub-headings:—*I. Processes and Apparatus.*—Processes of Ruthenberg, Stassano, Conley, Héroult, Keller, Harmet, Kjellin, and Gin; Girod's crucible furnace. *II. Nature of the Products.*—Examination of castings; examination of forged electro-steel. *III. Power Consumption and Thermal Efficiency.*—Production of pig-iron; conversion of pig-iron into steel. *IV. Costs. V. Comparison of the Electrical Production of Iron and Steel with the ordinary Metallurgical Processes.*—The author considers that in countries such as Germany, England, and the United States, which have large supplies of coal and have only impure iron ores to work with, electric processes cannot compete with the blast-furnace process in the production of pig-iron. In countries such as South America and New Zealand, however, which are deficient in mineral fuel, but in which pure iron ores and sufficient cheap water-power are obtainable, the production of iron in the electric furnace can be carried out economically. With cheap electric energy, the production of iron alloys containing high percentages of silicon, chromium, tungsten, &c., may be made remunerative. The electric process for the manufacture of steel from pig-iron can also compete with the costly crucible process for the production of the finer kinds of steel.—A. S.

Electro-plating; Baths for ——. A. Grésil. Monit. Scient., 1904, **18**, 675—676.

The nickel-plating bath recommended by Namias (this J., 1904, 754) is considered to contain too little nickel; a very suitable bath contains 60 grms. of "ammoniacal nickel sulphate" and 40 grms. of crystallised nickel sulphate per litre. In silver-plating, the baths corresponding to the simple formula AgCN, 2KCN are not invariably the best; thus experience shows that, for silver-plating copper and its alloys, the most suitable bath contains 20 grms. of silver cyanide and 30 grms. of potassium cyanide per litre; whilst for tin and its alloys, 50 grms. of silver cyanide and 150 grms. of potassium cyanide per litre constitutes the best bath. As regards copper-plating, the formula given (*loc. cit.*) is considered too complex; excellent results are obtained with a bath consisting of copper sulphite, 20 grms.; potassium cyanide, 30 grms.; water, 1 litre.—T. F. B.

English Patents.

Alkali Metals; Production of ——. E. A. Ashcroft, Runcorn, Cheshire. Eng. Pat. 17,640, Aug. 14, 1903.

A solution of an alkali chloride is electrolysed ove mercury, the latter forming an amalgam with the alkali metal. The amalgam is then used as the anode in a electrolytic cell containing an electrolyte capable of fusing and yielding alkali metal at a temperature below th volatilising point of mercury. A mixture of sodium an potassium hydroxides in about molecular proportions, whic fuses at about 200° C., may be used, or other mixtures o the alkalis or alkaline earths, or organic compounds of th alkali metals, such as sodium amide, may be used.—B. N.

Electro-deposition of Metals upon Aluminium. J. Creswic and H. Shaw, Sheffield. Eng. Pat. 21,609, Oct. 8, 1903.

Metallic tin is first deposited upon the article by im mersing it in a solution of stannous chloride and ammoniu alum, prepared by dissolving 2 oz. of the former and 5 lb of the latter in water. The plating is afterwards carried ou in the usual way.—B. N.

French Patent.

Electric Furnace intended for the Transformation of Ca Iron into Steel. G. H. Gin. Fr. Pat. 342,101, March 3 1904.

The furnace has a horizontal hearth of refractory materi and is supported on wheels running on rails within a thic casing of non-conducting and heat-resisting material. T hearth is indented by a gutter extending from near the fr to near the back, and repeatedly curved upon itself so as form a series of connected parallel depressions, the two en of which terminate opposite to one another at the front the furnace. Each of the two termini to the gutter formed within a massive block of steel, hollowed in i lower part and cooled by a current of water, and the bloc are constituted the poles to a source of electricity. funnel of refractory material is set in the roof of the casi of the furnace, immediately above each terminus, throu which molten cast iron is introduced so as to flow throu out the entire length of the gutter, giving the resistance the current necessary for obtaining the temperature requir for effecting the purification of the metal and its conversi into steel. Channels are provided at the exit end of t furnace converging from the end loops of the gutter towa a receptacle for receiving the outflow of metal. Scrap ir may be added to the charge, and means are described f making other additions, and for rabbling, &c. Compa Fr. Pat. 340,413 of 1904; this J., 1904, 792.—E. S.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

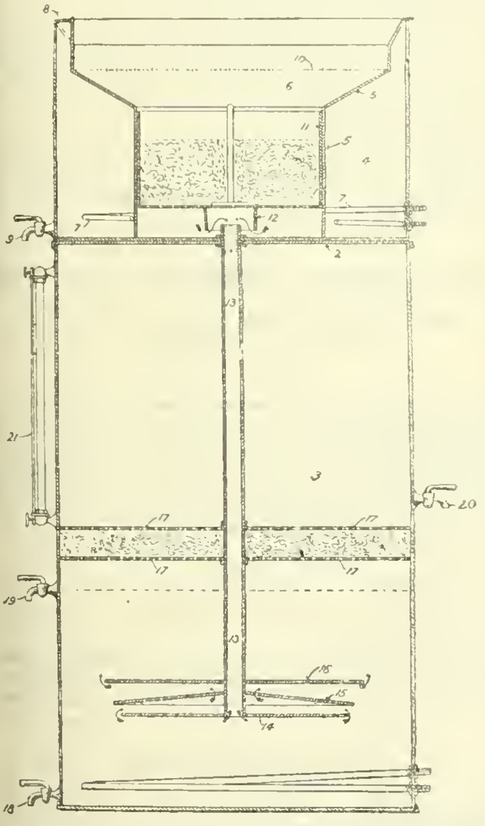
aponification Process; Theory of the ——. L. Balbiano. Gaz. chim. ital., 1901, **34**, 55—56. Chem. Centr., 1904, **2**, 674.

he facts that: (1) oleic acid when heated in the air is xidised and then gives an acetyl value; (2) the esters of e fatty acids of linseed oil readily oxidise and give acetyl alues; (3) the oxidised oils yield triglycerides of fatty cids; and (4) in the residue after the partial saponification f the triglyceride of benzoic acid, only the triglyceride is resent, lead the author to believe that the increased acetyl alue of the residue after the partial saponification of fatty cids observed by Lewkowitsch, is due to the formation of iglycerides of hydroxy acids and not, as the latter conders, to the formation of di- and mono-glycerides. (Compare Lewkowitsch, this J., 1898, 1107; 1899, 1031; 1900, , 254.)—A. S.

English Patents.

iltering and Washing [Lubricating] Oils; Apparatus for ——. C. W. Brown, London. From W. F. Warden, Akron, Ohio, U.S.A. Eng. Pat. 14,216, June 23, 1904.

tank (see figure) is divided by a partition, 2, into two mpartments, 3 and 4, the upper one containing an inner amber, 6, into which is fitted a vessel, 11, containing tton waste. Water is circulated through the compartent, 4, and heated by the coil, 7. The oil, which is pplied to the chamber, 6, passes first through the wire auze, 10, then through the cotton waste and perforated ottom of vessel, 11, and overflows through the pipe, 13, nto the lower compartment, 3. The deflecting plates, 14, 5, and 16, cause the oil to travel as indicated by the rrows, the conical plate, 15, being perforated near its entre, and every particle of oil is thus subjected to the ashing action of the water, which is contained in 3 up to the level of the tap, 19. Before being withdrawn through the tap, 20, the oil finally passes through more cotton waste between the perforated plates, 17.—B. N.



Garbage or Offal; Process of Cooking —— and Removing the Oil or Melted Grease therefrom. C. S. Wheelwright and J. T. Fiske, jun. Eng. Pat. 15,235, July 7, 1904. XVIII. B., page 909.

Detergent and other Preparations for Toilet Use [Soap with Lemon Juice]; Manufacture of ——. G. Giraudet, Paris, and A. Neuberger, London. Eng. Pat. 18,247, Aug. 24, 1903.

See Fr. Pat. 334,916 of 1903; this J., 1904, 121.—T. F. B.

French Patents.

Removing Fatty Matters from Tissues; Application of Electrolysis in ——. J. M. J. Baudot. Fr. Pat. 342,108, April 1, 1904. V., page 899.

Fatty Materials of any kind; Apparatus for the Deglycerination of ——. G. Col. First Addition, dated March 28, 1904, to Fr. Pat. 340,521, Feb. 17, 1904 (see this J., 1904, 872).

A form of apparatus is described which can be worked both continuously and intermittently. The fatty material is fed into a conical drum in which it traverses successively a series of plates and then runs through a series of superposed horizontal cylinders. In its passage over the plates in the conical vessel, it is mixed with steam under pressure, and steam is also supplied to the horizontal cylinders, which are furnished with rapidly moving stirring arms. This apparatus discharges the material to one of two cylindrical "saturating collectors," which are likewise provided with slowly moving stirring arms and steam under pressure. Whilst one collector is being filled, the other is being discharged, and the operation is thus made continuous.
—J. F. B.

Cellulose from Green Alfa [Esparto]; Preparation of —— [and Manufacture of Soap from By-Product]. P. Boutry and A. Deiss. Fr. Pat. 341,930, Feb. 16, 1904. XIX., page 909.

Soap; Apparatus for Rapidly Cooling Liquid ——. R. Roth. Fr. Pat. 341,731, March 29, 1904.

The hot liquid soap is filled into a closed reservoir or tank. Below the latter are a number of vertical tubes surrounded by cold water. The liquid soap fills the tubes, where it is cooled and solidified. The solid bars are removed from the tubes by forcing air into the closed tank, a fresh supply of liquid soap being caused to pass into the tubes. At the commencement of the operation the lower ends of the tubes are closed by a sliding plate.—W. P. S.

Rosin Soap for Sizing Paper and Millboard; Manufacture of ——. A. Sauvage. Fr. Pat. 341,844, April 6, 1904. XIX., page 910.

Soap [containing Benzene]; Manufacture of a Liquid Sanitary ——. L. Jodoche. Fr. Pat. 342,033, April 8, 1904.

19 kilos. of rosin are dissolved in 57 kilos. of warm benzene, 24 kilos. of potassium hydroxide solution (sp. gr. 1·10) are then added, and the mixture is stirred for 15 minutes. The quantities of rosin and potassium hydroxide may be varied, and the benzene may be replaced by another solvent, such as "essence."—W. P. S.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(A.)—PIGMENTS, PAINTS.

English Patents.

Paint; Preparation of Zinc for use as ——, and Apparatus therefor. M. Malzac, Paris. Eng. Pat. 17,895, Aug. 18, 1903.

See Addition, of June 29, 1903, to Fr. Pat. 329,079 of 1903; this J., 1903, 1357.—T. F. B.

Colour Lakes [from Azo Dyestuffs]; Manufacture of ——. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld, Germany. Eng. Pat. 22,856, Oct. 22, 1903.

SEE Fr. Pat. 336,433 of 1903; this J., 1904, 368.—T. F. B.

FRENCH PATENTS.

Lakes [from Azo Dyestuffs]; Process for Preparing ——. Soc. Anon. Prod. F. Bayer et Cie. Fr Pat. 341,867, April 2, 1904.

RED lakes, fast to light, are obtained by precipitating, on a suitable substratum, the dyestuff obtained by coupling the diazo compound of 1-naphthylamine-3.8-disulphonic acid with β-naphthol.—T. F. B.

White Lead; Non-poisonous ——. H. and L. Dodé. Fr. Pat. 341,870, April 2, 1904.

LEAD oxide is heated with about 25 per cent. of its weight of kaolin, sand, or other siliceous substance, to 700° or 800° C. When cold, the mass is pulverised and made into pigments in the same way as white lead. Such pigments are non-poisonous, and do not blacken on exposure to bad air.—T. F. B.

Lithopone Manufacture of ——, *by Electrolysis of Sodium Sulphate or Chloride, with Simultaneous Production of Sodium Hydroxide.* J. B. and A. Candau. Fr. Pat. 341,827, April 5, 1904. XI. A., page 904.

(B.)—RESINS, VARNISHES.

Turpentine: Technical Analysis of Spirits of ——, *with a New Method for the Detection of Petroleum Adulterations and Wood Spirits of Turpentine.* J. M. McCandless. XXIII., page 913.

ENGLISH PATENTS.

Linoleum of Multiple Layers; Manufacture of ——, *and Apparatus therefor.* W. P. Thompson, London. From Bremer Linoleumwerke Delmenhorst, Delmenhorst, Germany. Eng. Pat. 17,780, Aug. 17, 1903.

SEE Fr. Pat. 334,635 of 1903; this J., 1904, 69.—T. F. B.

Linoleum or the like; Manufacture of ——. L. W. Seeser, Raguhn, Germany. Eng. Pat. 17,971, Aug. 19, 1903.

THE linoleum mass is passed between rollers, together with two layers of fabric instead of only one. The stretching of the whole under the rollers, and the consequent irregularities due to shrinkage, are thus much diminished. The additional layer of fabric, the use of which forms the main feature of the patent, may be applied to the same side as the usual layer and afterwards stripped off, leaving the inner layer firmly imbedded, or to the opposite side in a subsequent operation, when by reversing the whole and removing the first layer, inlaid linoleum can be produced on the rolls themselves.—R. L. J.

(C.)—INDIA-RUBBER, &c.

Castilloa: its Description, Yield, and a Method of Preparing Rubber from its Latex. C. O. Weber. India-Rubber J., 1904, **28**, 228—230.

THERE are at least three varieties of Castilloa:—*C. alba*, the hardiest, which yields a large quantity of rubber and suffers little from the tapping operation; *C. negra*, yielding good rubber, but which easily bleeds to death; and *C. rubra*, which produces a good rubber, but in very small quantities. Cultivation of the Castilloa in Colombia should prove very remunerative, since land, at any rate in territories adjoining the isthmus, is to be had for practically nothing, and labour is cheap. In fact, the cost of clearing the land and attending to the plantation for seven years does not exceed 25*l.* per 1,000 trees. If the trees are tapped at the end of the seventh year and yield only ½ lb. per tree, then, after deducting all expenses, a return of about 100 per cent. would be made in the eighth year, and with careful management this would increase for some years. The trees should not be tapped until they are at least eight years old, as the rubber from young trees contains a large percentage of resin, as is shown by the following figures:—Two years old, 42·33; three years old, 35·02; four years old, 26·47; five years old, 18·18; seven years old, 11·59; eight years old, 7·21 per cent. By the following process it is stated that a purer and stronger product can be obtained from the Castilloa than the finest brands of commercial Para:—The crude latex is diluted with five times its volume of water (in some cases boiling water being preferable), strained through cotton gauze, and formaldehyde added in the proportion of about 8 oz. to a barrel of the diluted latex; the whole is then well stirred and allowed to stand for 24 hours. The formaldehyde prevents coagulation of the albumin, and the rubber collects on the surface of the liquid in the form of a snow-white cake, which can be lifted out in one mass. Every trace of albuminous matter can then be removed in an ordinary washing machine. The analysis of a sample sheet of rubber so prepared, gave the following figures:—Resinous matter, 2·61; ash, 0·44 per cent.; nitrogenous constituents, nil; insoluble matter, nil.
—J. K. B.

ENGLISH PATENT.

Rubber Solutions or Compounds. Isidor Frankenburg, Ltd., R. J. Frankenburg, and F. H. Betteridge, Salford, Lancs. Eng. Pat. 17,156, Aug. 7, 1903.

MORE or less uninflammable solutions are obtained by dissolving rubber in one or more of the following solvents:—Carbon tetrachloride, dichloromethane, trichloro-ethane, tetrachloro-ethane, or trichlorobenzene. The rubber may also be softened with coal-tar naphtha or other ordinary solvent, and then one of the above solvents added until the desired consistency is obtained.—T. F. B.

UNITED STATES PATENT.

Wurtzilite [Rubber Substitute]; Process of Treating and Dissolving ——. F. M. Whitall, Assignor to S. R. Whitall and J. R. Edson, Washington, D.C. U.S. Pat. 768,101, Aug. 23, 1904.

WURTZILITE (see this J., 1903, 1139) in a finely-divided or pulverised condition is dissolved in "dead-oil" by the aid of heat; the solvent is then removed until the mass becomes consistent.—J. F. B.

XIV.—TANNING; LEATHER, GLUE, SIZE.

Tannic and Gallic Acids; Determination of ——. W. P. Dreaper. XXIII., page 913.

ENGLISH PATENT.

Leather; Artificial —— *and its Method of Manufacture.* R. Piesbergen, Berlin. Eng. Pat. 15,629, July 13, 1904.

A PLASTIC compound which sets hard when cold, composed of tanned animal albumin, glycerin, fatty oils, india-rubber solution and filling material is enclosed in a collodion film and gently pressed or rolled to the desired shape.—R. L. J.

UNITED STATES PATENT.

Skins or Hides; Process of Treating Pickled or Tanned ——. O. P. Amend, New York. U.S. Pat. 768,259. Aug. 23, 1904.

PICKLED skins and leather are de-acidified and oxidised by treatment in a neutral or slightly alkaline solution of a nitrite of an alkali or alkaline earth, such as sodium nitrite.
—J. F. B.

XV.—MANURES, Etc.

Phosphates: Action of Water and Saline Solutions upon certain Slightly Soluble ——. F. K. Cameron and L. A. Hurst. J. Amer. Chem. Soc., 1904, **26**, 885—913.

THE phosphates of iron, aluminium, and calcium are all hydrolysed by water, and the solutions always contain free phosphoric acid. It is therefore more correct to speak of the resulting solutions as solutions of the decomposition products, the phosphates themselves being, in many cases, present in negligible quantities only. The reaction follows the law of mass to some extent, is a slow one, and is markedly affected by the temperature. The conclusions arrived at after a considerable number of experiments are as follows:—Whilst the free acid tends to increase the solubility of the phosphate, the base, though in solution in smaller amount, exerts a greater effect in decreasing it. Successive additions of water, therefore, cause relatively less solution and decomposition of the phosphate. Potassium chloride decreases the amount of phosphoric acid entering into solution from iron, aluminium, or calcium phosphate, but increases the amount of base. Potassium sulphate increases the amount of soluble acidity in the case of iron phosphate, but decreases the amount entering into solution from aluminium phosphate. The presence of sodium nitrite decreases the acidity obtained from iron or aluminium phosphate, but appears to slightly increase the amount yielded by calcium phosphate. No correlation of the acidity with the amounts of iron in the solution seems possible. A rise of temperature accelerates the decomposition of the solid phosphates in either water or saline solutions.—W. P. S.

English Patent.

Manure; New and Useful Process of Manufacturing an Artificial ——. W. Mathesius, Berlin. Eng. Pat. 13,361, June 13, 1904. Under Internat. Conv., June 13, 1903.

Mineral phosphates, such as phosphorites, &c., are mixed with lime to form a "tetrabasic phosphate of calcium," if sufficient lime is not already present, and are melted in, for instance, a cupola furnace. The molten slag is treated with steam under pressure, or, in case an adequate excess of lime is present, with exhaust steam, in a closed vessel, until the product crumbles to a dry powder.—E. S.

XVI.—SUGAR, STARCH, GUM, Etc.

United States Patent.

Syrup; Process for Purifying ——. H. Kowalski, Warsaw. U.S. Pat. 768,130, Aug. 23, 1904.

See Addition, of May 23, 1902, to Fr. Pat. 315,737 of 1901; this J., 1903, 221.—T. F. B.

French Patent.

Saccharine Juices; Process of Defecation of ——. Vve. H. Breyer (*née* Muterbacher) and A. J. de Wehrstedt. Fr. Pat. 342,159, April 2, 1904.

Pulverulent, inert materials, such as pounded brick, are mixed with lime and employed for the defecation of saccharine juices. It is stated that such materials permit of a considerable economy in the quantity of lime required and that they absorb colouring matters and impurities from the juice and assist filtration.—J. F. B.

XVII.—BREWING, WINES, SPIRITS, Etc.

Malt Analysis; Fermentation Experiments as an Aid to ——. A. Schifferer. Z. ges. Brauw., 1904, **27**, 585—587.

To obtain evidence of the behaviour of a malt in the brewery, the mixed wort which has been employed for extract determinations by mashing the coarse and fine grist is boiled for a short time in an Erlenmeyer flask, cooled to 17·5° C., and its specific gravity determined. Three clean, dry, white beer bottles, 340—360 c.c. capacity, are one-third filled with the wort, closed, and kept in the steriliser for half an hour at 55°—58° C. After cooling, two of the bottles are each pitched in the sterile chamber with 1 grm. of the freshly-washed, dry-pressed brewery yeast, and, after closing with a sterile cotton-wool plug, placed in a thermostat at 25° C. The third bottle, which is also kept in the thermostat until the fermentation in the other two bottles is at an end, serves as a control. In the author's experiments these blanks gave either zero or negligible results, so that no corrections were needful. Of the two bottles pitched with yeast, one is removed from the thermostat after 72 hours, and the specific gravity of the beer determined at 17·5° C., after removal of the carbon dioxide and filtration. The other fermented wort is treated in the same way after a further 24 hours, by which time the fermentation is complete. The relation between the results thus obtained and those of the tun beers are shown in the following table:—

	Apparent Final Attenuation.	
	Experimental Wort.	Tun Beer.
	Per Cent.	Per Cent.
Pilsen malt	82·0	78·4
Pale lager beer malt, No. I.	77·0	73·5
" " " No. II.	76·3	72·0
Dark " " No. I.	72·5	64·5
" " " No. II.	70·5	63·1

The higher percentage of matter fermented in the laboratory experiments as compared with the brewery mashes is explained by the more favourable conditions for starch degradation obtaining in the former case, the decoction process of mashing involving much destruction of diastase.
—T. H. P.

Yeast Oxydase. W. Issajew and S. Kalliski. Z. physiol. Chem., 1904, **42**, 132—140; Chem. Centr., 1904, **2**, 663.

The authors have detected an oxidising enzyme in extracts of yeast prepared with water and glycerin. The action of the enzyme is frequently masked by that of a reductase, but the latter can be rendered inactive by previous oxidation with atmospheric oxygen. The oxidising action of the enzyme can be proved both on the normal constituents of the yeast and on added polyphenols (quinol, pyrogallol). Top-fermentation yeast is appreciably richer in this oxidising enzyme than is bottom-fermentation yeast.—A. S.

Invertase of Yeast. B. Hafner. Z. physiol. Chem., 1904, **42**, 1—34. Chem. Centr., 1904, **2**, 603.

By dialysis of different specimens of invertase, the author found that the ash-content could be considerably reduced, but could never be brought quite to zero; this is especially the case with regard to the phosphorus, which, as Salkowski (Z. physiol. Chem., **31**, 321) has stated, is in organic combination. All attempts to obtain invertase free from carbohydrates failed. (Compare Wróblewski, this J., 1898, 682.) Invertase is not an albuminoid body, as it is not acted upon by proteolytic enzymes, and does not give the biuret reaction. It, however, contains nitrogen, and is possibly a complex phosphoric acid derivative, in which hydroxyl groups have been replaced by carbohydrates and nitrogenous substances. Invertase prepared from brewers' yeast is, in general, more active than that prepared from pressed yeast, but the latter preparations are of more constant composition.—A. S.

English Beer Types; Preparation of ——. H. Seyffert. Woch. f. Brau., 1904, **21**, 519—520.

With reference to the discovery by Claussen (this J., 1904, 721) of the so-called Brettanomyces, torulæ which produce the characteristic flavour of English beers, the author describes his own experience in a Russian brewery, preparing top-fermentation ales and porters with single-cell yeast. It was found that genuine English porter always contained a large proportion of wild yeasts and bacteria, whereas the Russian porter was free from infection, but lacked the typical "English" flavour. Experiments showed that when the Russian porter was infected with some of the cask-sediment from the English, the desired aroma was readily developed in it. The constituent organisms of this cask-sediment, some of them closely resembling Claussen's Brettanomyces, were isolated and cultivated in the pure state. Amongst them was a peculiar yeast which was capable of conducting the entire fermentation of the porter-wort, with the production of an "English" aroma. But difficulties were encountered in separating the yeast from the beer, and after a few fermentations the yeast had changed its character and had lost its property of developing the "English" aroma. None of the isolated organisms were capable of giving such a good flavour as the original mixed cask-sediment, but here again, when it was attempted to transfer the sediment from one brewing to the next, alteration or degeneration gradually took place, and the desired effect was lost. Similar results, successful at first, but failing after continued use, attended all attempts to obtain the "English" flavour by means of imported organisms, whether pure or mixed. The author suggests that the property claimed by Claussen for his Brettanomyces may also not be of a specific character, but merely a temporary property, which will disappear under different conditions of sub-cultivation, in the same manner as in the cases cited above.—J. F. B.

Beer; Sulphur Dioxide in ——. G. Graf. Z. ges. Brauw., 1904, **27**, 617—620.

The author's experiments confirm the assumption of Pfeifer (this J., 1889, 995) that the formation of sulphur dioxide in fermenting liquids is the result of a physiological process based on racial peculiarities of the yeast, and depending on the environment. The chief practical inference is that sulphur dioxide is a normal constituent of beer, and that its presence in excess of the usual limit (57 mgrms. per litre) should not be regarded as conclusive evidence of the use of sulphites or the like.—C. S.

Wine; Manufacture of —— by Sulphuring and Fermenting the Grapes. A. Lacassagne. J. d'Agric. Pract., 1903, 412—416; through Bied. Centralbl., 1904, **33**, 639—640.

Experiments were made on the large scale by exposing the grapes to the vapours of sulphurous acid in order to kill the foreign organisms whilst acclimatising the yeast to sulphurous acid. In addition to this treatment, "potassium persulphate" was added to the juice to the extent of 40 grms. per hectolitre. The fermenting must showed a preponderance of *S. ellipsoideus*, whilst *S. apiculatus* was absent. The above treatment, when applied to sound grapes, had a slight but distinct favourable influence on the course and the final result of fermentation; the last residues of sugar were fermented in a shorter time. The treatment had no appreciable effect upon the chemical composition of the wine, nor upon its colour, flavour, &c. The value of the wine was in no way impaired. The sulphured wine was decidedly more resistant towards the attacks of foreign micro-organisms, and kept better when exposed to the air than wine prepared in the ordinary way.—J. F. B.

Spirit from Dried Potatoes; Manufacture of ——. G. Heinzelmann. Z. Spiritusind., 1904, **27**, 358.

Owing to poor harvests, the use of potatoes preserved by drying as raw material for the manufacture of spirit has not made much progress in the last two years, since the cost of the potatoes has been too high. Dried potatoes require the same treatment during steaming as maize, *i.e.* the Henze steaming apparatus should be provided with stirrers; otherwise the potatoes clog together and form a mass impenetrable to the action of the steam, and gelatinisation is incomplete. If a stirrer be not available it is necessary to employ rather more water for the steaming, in order to ensure the necessary mobility. For the reason just mentioned, it has not been found practicable to steam a mixture of fresh and dried potatoes simultaneously, with the object of increasing the concentration of the mash. In thick-mash distilleries 100 kilos. of dried potatoes have yielded 33—35 litres of absolute alcohol, according to their richness in starch. Dried potatoes occur in the market in two forms: dried slices, which are prepared by drying slices of raw potatoes in a current of hot air; and flaked potatoes, which are made by passing boiled potatoes between hot rollers. The slices require steaming under pressure in the Henze apparatus. The flakes, manufactured originally for food purposes, are much dearer than the slices; they do not require steaming, but are mashed with water and malt at 60 C. If potatoes at harvest time show any signs of disease or any indications that they will not keep well over the winter, it is strongly recommended that, wherever practicable, they should be dried.—J. F. B.

French Patents.

"Lecithinated Beer": Incorporation of the Active Constituents of Lecithin with Acid, Alcoholic, and other Beverages. A. Fournier. Fr. Pat. 342,007, March 17, 1904.

The active constituents of lecithin, *viz.* choline and glycerophosphoric acid, may be isolated for the purpose of mixing with beverages in two ways: (1) by the hydrolysis of lecithin with hydrochloric acid and neutralisation of the solution with sodium bicarbonate, and (2) by boiling the alcoholic solution of lecithin with glycerophosphoric acid. In the first case the solution ultimately isolated for use contains choline hydrochloride and sodium glycerophosphate, and in the second case the product is a solution of choline glycerophosphate. In either case the final solution is brought to a standard concentration, and adjusted to the same degree of acidity and alcoholic strength as the beverage with which it is to be incorporated.

—J. F. B.

Distillery; System of —— adapted for Agricultural Use L. P. Bazin. Fr. Pat. 341,983, Feb. 25, 1904.

In order to continue the working of the distillery all th year round, a sufficient number of cylindrical silos ar constructed of masonry below the level of the ground The roots, &c. are washed and sliced, and the slices ar stored in the silo-pits, in regular horizontal layers, car being taken to pack them closely, with exclusion of ai spaces. When required for use, the slices are remove layer by layer, and extracted systematically by boilin water. The wort is acidified, and fermented by yeast.

—J. F. B.

Brandies and Liquors; Use of Roasted Wood for Improving and Ageing ——. J. L. Rouméguère. Fr. Pat 342,123, March 10, 1904.

The wood is first roasted in order to render the principles which play a part in the improvement and ageing of brandy immediately soluble in the liquor.—J. F. B.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(*A.*)—FOODS.

Flour; Preservation of —— by Cold. Balland. Compt rend., 1904, **139**, 473—475.

Samples of flour were stored for three years in a receptacl at the ordinary temperature, and in an apparatus kept a temperature between + 2° and − 2° C. The flo preserved at ordinary temperatures was slightly bleache after storing, and was bitter, and useless for food, whil the gluten obtainable from it was in clots, inelastic, an contained 64·5 per cent. of water; the amount obtained b extraction with ether was from 3 to 6 per cent. less tha that obtained from the original flour; the acidity had als increased. The sample preserved in the cold was rath damp and tasteless, but this was due to the presence moisture in the apparatus; the amount of gluten obtainab was slightly greater than that from the original sampl whilst, as regards quality, it was homogeneous, sweet, an contained 71 per cent. of water; the fatty matter and aci were present in the same quantities as in the original flou

—T. F. B.

English Patent.

Albumen from Fish; Manufacture of ——. A. Foelsin Offenbach a Main, Germany. Eng. Pat. 19,017, Sept. 1903.

The fish, after the removal of the head and bones, is fre from grease by a suitable solvent, such as acetone, and th repeatedly extracted with a 1½ per cent. solution of sodiu or potassium hydroxide, until all the albuminous matter dissolved. The liquors are filtered, deodorised by additi of hydrogen peroxide (2 per 1000), and precipitated b sulphurous acid solution. The flocculent matter is wash till neutral, dried, and pulverised.—R. L. J.

French Patent.

Milk Powder; Manufacture of a ——. J. Maggi. Fr. Pat. 341,840, April 1, 1904.

The milk is intimately mixed and rendered homogeneous under pressure, then dried by the hot-roller system, and powdered.—W. P. S.

(*B.*)—SANITATION; WATER PURIFICATION.

Nitrogen in Water; Determination of Ammoniacal and Proteid ——. J. Effront. XXIII., page 912.

Iron; Colorimetric Determination of Small Amounts of —— *by Acetylacetone* [*especially applicable to Water Analysis*]. H. B. Pulsifer. XXIII., page 913.

English Patents.

Wash and other Waste Waters or Residues; Treatment of ——. A. J. Boult, London. From A. E. Vasseux, Hal, Belgium. Eng. Pat. 17,661, Aug. 14, 1903.

See Fr. Pat. 330,423 of 1903; this J., 1903, 1099.—T. F. B.

Trade Effluents; Treatment of ——. J. Turner, Sowerby Bridge, Yorkshire. Eng. Pat. 20,021, Sept. 17, 1903.

Any common soap, such as rosin soap, or fats and alkali, are added, preferably in solution, to the trade effluent. After agitating the mixture, sulphuric acid, aluminium sulphate, or any suitable metallic salt, is added to "curd or crack the sud," after which the whole is allowed to stand for some time. The clear water may then be run off, the solid matters being precipitated. If necessary, the effluent may also be oxidised before or during the treatment by blowing air through it.—A. G. L.

Garbage; Apparatus for Removing Liquids from Solids, applicable for the Treatment of —— *and for other Purposes.* C. S. Wheelwright, Bristol, R.I., and J. T. Fiske, jun., Burrillville, R.I. Eng. Pat. 14,484, June 27, 1904.

The apparatus consists of a cylinder placed at the lower end, and in connection with, a digester in which the material is previously treated with water. The cylinder is provided with a revolving screw fitting its internal periphery. Perforated plates are placed in the sides of the cylinder with suction boxes below them, and a pump is arranged in connection with the latter to return the water to the cylinder. Fins or plates are let into the cylinder, which vibrate to and from the interstices between the threads of the screw. One end of the cylinder projects beyond the screw, and is provided with an outlet and a head fitted with a valve on the axis of the screw at various distances from the latter, to direct the material from the screw to the outlet. (See also U.S. Pat. 719,541 of 1903; this J., 1903, 288.)—W. P. S.

Garbage or Offal; Process of Cooking —— *and Removing the Oil or Melted Grease therefrom.* C. S. Wheelwright, Bristol, R.I., and J. T. Fiske, jun., Burrillville, R.I., U.S.A. Eng. Pat. 15,235, July 7, 1904.

Steam is introduced under pressure directly into the mass of garbage or offal, together with sufficient fresh water to float the oil or grease extracted from the garbage. The water and extracted oil or grease are continuously trapped, whilst the solid parts of the garbage or offal are held back, and the water is finally separated from the oil or grease extracted.—A. G. L.

French Patent.

Water Filter. N. A. Hélous, L. Mauclaire, and E. Meyer. Fr. Pat. 341,908, April 6, 1904.

The filter consists of a vertical cylindrical vessel having a tubulure at the top and bottom. A tube passes through the lower tubulure, the upper end of the tube being surrounded by a hollow block of compressed carbon which has previously been "stoved," soaked in a solution of ferric chloride containing 1 per cent. of vanadic chloride, and then in a solution of sodium hydroxide (4° B.) to which has been added 10 per cent. of hydrogen peroxide. This block of carbon has around and above it a layer of granulated wood-charcoal also previously treated with ferri-vanadic chloride and sodium hydroxide. A packing of oxycellulose is placed above this layer, and the remaining space in the filter is filled with a mixture of powdered iron, containing 1 per cent. of vanadium, and corundum. Above this mixture is a second packing of oxycellulose. The water to be filtered enters through the upper tubulure.—W. P. S.

(*C.*)—DISINFECTANTS.

United States Patents.

Antiseptic Compound. A. M. Clover, Ann Arbor, Mich. U.S. Pats. 768,561 and 768,563, Aug. 23, 1904.

See Eng. Pat. 8415 of 1904; this J., 1904, 834.—T. F. B.

Peroxide Acids; Process of Forming Organic ——. [*Disinfectants*] A. M. Clover, Ann Arbor, Mich. U.S. Pat. 768,562, Aug. 23, 1904.

See Eng. Pat. 8415 of 1904; this J., 1904, 834.—T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

English Patent.

Celluloid and like Substances; Apparatus for the Treatment [*Softening*] *of* ——. H. W. Cave-Browne-Cave, London. Eng. Pat. 22,299, Oct. 16, 1903.

An air-tight box is fitted with a loose perforated bottom, beneath which wool or other absorbent material, moistened with a volatile solvent of celluloid, *e.g.*, methylated spirit and camphor, amyl acetate, or methylated ether, is packed. The articles to be softened are placed in trays above the false bottom and exposed to the vapours for the necessary space of time.—R. L. J.

United States Patents.

Paper-making Machine. E. Waite, Franklin, Mass. U.S. Pat. 768,353, Aug. 23, 1904.

In a paper machine, the web of paper, after passing from the suction rolls on to the long felt, comes in contact with an upper apron travelling in unison with the long felt. The surface of the apron which is in contact with the web of paper is composed of a coarsely woven fabric, such as jute, which, passing through the press-rolls with the paper, imparts to the latter a roughened surface on the side with which it is in contact. The other side of the apron, which is reversible, may be employed when desired for giving a smoother surface.—J. F. B.

Paper; Process of Making ——. R. S. Case, Unionville, Conn. U.S. Pat. 768,422, Aug. 23, 1904.

A series of disconnected and bevel-edged webs of paper of uniform character are formed upon a single travelling apron by gathering pulp from the vat by a cylinder and forming it into a number of independent webs or plies, which are transferred to the blanket. The same operation is repeated a certain number of times in succession, each fresh ply being couched upon the previous one, and each successive ply being slightly wider than the last. The resulting bevel-edged webs are then pressed and trimmed, colour is applied to the edges if desired, and the whole series is dried simultaneously. (See also U.S. Pat. 759,862; this J., 1904, 677.)—J. F. B.

French Patents.

Cellulose from Green Alfa [*Esparto*]; *Preparation of* ——. P. Bouby and A. Deiss. Fr. Pat. 341,930, Feb. 16, 1904.

The esparto, in the perfectly fresh green state, is sorted and subjected to a preliminary mechanical breaking treatment; the plant is then treated in open vessels with five times its weight of an alkaline solution, either hot or cold. After sufficient steeping the cellulose is separated, washed, and bleached. The sediment deposited from the used alkaline baths serves for the manufacture of a green-coloured soap.—J. F. B.

Rosin Soap for Sizing Paper and Millboard; Manufacture of ——. A. Sauvage. Fr. Pat. 341,844, April 6, 1904.

The soap is prepared at high temperatures by introducing very hot, molten rosin gradually into a boiling solution of the alkali concentrated to its saturation point. Boiling water is added from time to time, to replace that lost by evaporation, and to prevent crystallisation of the alkali. —J. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Cerite Earths; Preparation of —— *in the Pure State by the Aid of their Alkali Double Carbonates.* R. J. Meyer. Z. anorg. Chem., 1904, **41**, 97—125.

The following alkali double carbonates were prepared and analysed:—*Potassium Salts*: Potassium lanthanum carbonate, $K_2La_2(CO_3)_4.12H_2O$; potassium cerium carbonate, $K_2Ce_2(CO_3)_4.12H_2O$; potassium praseodymium carbonate, $K_2Pr_2(CO_3)_4.12H_2O$; and potassium neodymium carbonate, $K_2Nd_2(CO_3)_4.12H_2O$. *Ammonium Salts*: Ammonium lanthanum carbonate, $(NH_4)_2La_2(CO_3)_4.4H_2O$; ammonium cerium carbonate, $(NH_4)_2Ce_2(CO_3)_4.6H_2O$; ammonium praseodymium carbonate, $(NH_4)_2Pr_2(CO_3)_4.4H_2O$; and ammonium neodymium carbonate, $(NH_4)_2Nd_2(CO_3)_4.4H_2O$. *Sodium Salts*: Sodium lanthanum carbonate, $Na_6La_4(CO_3)_9.20H_2O$; sodium cerium carbonate, $Na_6Ce_4(CO_3)_9.24H_2O$; sodium praseodymium carbonate, $Na_6Pr_4(CO_3)_9.22H_2O$; and sodium neodymium carbonate, $Na_6Nd_4(CO_3)_9.22H_2O$. The sodium salts were all amorphous unstable compounds, and were possibly contaminated with adherent sodium carbonate. The ammonium and sodium double salts are only very slightly soluble in the corresponding alkali carbonate solutions. The potassium salts, on the other hand, are easily soluble in a concentrated solution of potassium carbonate, but the degrees of solubility of the several salts examined differed considerably one from another. If the concentrated solutions be diluted with water, the potassium double carbonates separate in the following order: lanthanum, praseodymium, cerium, neodymium. A crude lanthanum salt can be almost completely freed from cerium and didymium by three precipitations as potassium double carbonate, whilst at the same time the didymium splits up to a considerable extent into praseodymium and neodymium. Praseodymium oxide contaminated with small quantities of cerium, neodymium and lanthanum can be completely freed from cerium and neodymium by three precipitations as potassium double carbonate. The lanthanum can be almost completely removed by systematic fractional crystallisation of the praseodymium oxalate from nitric acid solution. The praseodymium oxide obtained by ignition of the oxalate invariably has the composition Pr_6O_{11} or $4PrO_2.Pr_2O_3$; the formula Pr_4O_7 or $2PrO_2.Pr_2O_3$, accepted by Auer von Welsbach and by Jones, is incorrect.—A. S.

Mercuric Chloride in Corrosive Sublimate Pastilles; Volumetric Determination of ——. R. Corradi. XXIII., page 913.

English Patents.

Methyl Groups of Aromatic Hydrocarbons; Oxidation of ——. J. Y. Johnson, London. From The Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. Eng. Pat. 17,982, Aug. 19, 1903.

The methyl groups of aromatic hydrocarbons are oxidised in acid solution to aldehyde groups by means of the sulphate of manganese dioxide obtained by the action of electrolytic oxygen on a solution of manganous sulphate in sulphuric acid (see Eng. Pat. 17,981 of 1903; this J., 1904, 749). For example, a solution of the sulphate of manganese peroxide obtained from six parts of manganous sulphate is added slowly to five parts of *o*-nitrotoluene at a temperature of 50° to 60° C., with constant stirring; the mixture is heated to 100° or 110° C. until decolorised, and the product distilled with steam, the distillate consisting of *o*-nitrobenzaldehyde and unchanged *o*-nitrotoluene; the solution is oxidised electrolytically and used for a further operation. Toluene is oxidised to benzaldehyde similarly, and also to benzoic acid if sufficient oxidising agent and high enough temperature be employed.—T. F. B.

Roasting Chemicals and the like; Apparatus for ——. T. P. Thomas, J. L. Richardson, and P. Davies. Eng. Pat. 21,896, Oct. 12, 1903. I., page 894.

Suprarenal Glands; Manufacture of Compounds of the Active Substance of ——. O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. Eng. Pat. 24,723, Nov. 13, 1903.

Adrenalin, the active principle of the suprarenal gland, may be dissolved in a solution of boric acid or of one of its derivatives (*e.g.*, phenylboric acid). The resulting solutions are not precipitated by the addition of alkali. The compound of adrenalin and boric acid may be obtained in the dry state by evaporating the solution (preferably *in vacuo*) or by precipitation with absolute alcohol from a concentrated solution.—T. F. B.

Protocatechuic Aldehyde and its Derivatives [*Vanillin*]; *Manufacture of* ——. A. Verley, Paris-Neuilly. Eng. Pat. 25,546, Nov. 23, 1903. Under Internat. Conv., Nov. 27, 1902.

See Fr. Pat. 326,775 of 1902; this J., 1903, 819.—T. F. B.

United States Patents.

Cyclogeraniolidene Acetone and Process of Making same G. Merling, Frankfort, and H. Eichwede, Hoechst-on-the-Maine, Assignors to Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. U.S. Pat. 768,389, Aug. 23, 1904.

See Eng. Pat. 3173 of 1903; this J., 1904, 203.—T. F. B.

Pyrazolone Compound [*with Butylchloral Hydrate*], *an Process of Making same.* M. Overlach, Greiz, Assigno to Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. U.S. Pat. 768,398 Aug. 23, 1904.

See Eng. Pat. 15,782 of 1903; this J., 1904, 679.—T. F. B

Theophylline; Process of Making ——. M. C. Massie Washington, Administrator of F. Ach, Assignor to C. F Boehringer und Soehne, Mannheim-Waldhof, Germany U.S. Pat. 768,533, Aug. 23, 1904.

See Eng. Pat. 5901 of 1903; this J., 1903, 648.—T. F. B.

Extracting Essence; Apparatus for ——. E. E. Hand, New York. U.S. Pat. 768,575, Aug. 23, 1904.

The material to be extracted is placed in a horizontal perforated, cylindrical cage, mounted on a horizontal shaf projecting from each end, by means of which it is supporte in an outer, horizontal, cylindrical vessel or "still." Mean are provided for rotating and for withdrawing the inne cage, one end of the still being removable, and the end o the shaft passing through this removable head of the stil being connected with the rotating mechanism, which i mounted on a truck running on rails.—W. H. C.

French Patents.

Halohydrins of the Aromatic Series, and Amino Alcohol derived therefrom; Process for Obtaining —— Poulenc Frères and E. Fourneau. Fr. Pat. 338,38 June 23, 1903.

Epichlorhydrin reacts with phenyl (or other aromati derivative of) magnesium halides, forming two classes c products, *viz.*, substituted chloropropenes, and substituted chloropropanols, which can be separated by fractionation. Using phenyl magnesium bromide, for instance, phenylchloropropene and phenylchloropropanol are produced. On heating the arylchloropropanols with fatty amines, amino-alcohols derived from propane are obtained. Thus, from phenylchloropropanol and dimethylamine, dimethylaminophenylpropanol results. The following compounds are also described :—Phenylpropenol, phenylchlorobutanol, anisylchloropropanol, phenyldi- and trimethylaminopropanol. All these compounds have agreeable odours, and are applicable to perfumery.—T. F. B.

Alcohols and their Derivatives; Production of New Compounds, and General Method of Preparing Primary ——. L. Bouveault and G. Blanc. Fr. Pat. 338,895, June 27, 1903.

See Eng. Pat. 14,758 of 1903; this J., 1904, 798.—T. F. B.

Formic Acid from Formates; Production of Concentrated ——. M. Hamel. Fr. Pat. 341,764, March 30, 1904.

Concentrated formic acid is obtained by dissolving the formate in some solvent which, on subsequently distilling the solution, will not dilute the formic acid, and then decomposing the formate with concentrated sulphuric acid or an acid sulphate. Suitable solvents are formic or acetic acids, formic acid being preferable. The sodium formate may be dissolved in an equal weight of concentrated formic acid, and sulphuric acid and sodium formate added alternately, until the retort is sufficiently full, when the contents are distilled.—T. F. B.

Formates; Process for Making ——. R. Koepp and Co. Fr. Pat. 342,168, April 6, 1904.

Carbon monoxide reacts more rapidly on alkali hydroxides in presence of water than in the dry state, and the reaction is also more rapid with rise of temperature, owing to the increasing solubility of carbon monoxide. Sodium formate can be produced by running a solution of sodium hydroxide of 40° B. on to a mass of coke heated to 220° C. in a closed vessel, and blowing heated carbon monoxide through the liquid for three-quarters of an hour. In place of alkali hydroxides, the oxides or carbonates of the alkaline earth metals or alkali carbonates may be employed.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

English Patents.

Photographic Emulsions; Sensitising —— with the Aid of Dyestuffs. H. E. Newton, London. From Farbenfabr. vorm. F.Bayer and Co., Elberfeld, Germany. Eng. Pat. 23,722, Nov. 2, 1903.

See Fr. Pat. 336,298 of 1903; this J., 1904, 337.—T. F. B.

Furnaces especially adapted for the Separation of Godl and other Precious Metals from the Sweepings of Jewellers' Warehouses, Photographers' Waste, and the like. S. W. Price. Eng. Pat. 19,984, Sept. 16, 1903. X., page 902.

French Patent.

Photography of Colours. J. Hero. Fr. Pat. 342,037, April 12, 1904.

Photographs in natural colours are obtained by the following process :—An ordinary dry plate is immersed for about six minutes in a solution prepared by dissolving 50 grms. of gelatin in a litre of water, and then adding solutions containing alum, 5 grms.; ferrous sulphate, 15 grms.; Judea bitumen, 10 grms.; potassium ferricyanide, 7 grms.; potassium ferrocyanide, 6 grms.; uranium nitrate, 5 grms.; "paraffin," 5 grms.; white gum, 10 grms. The plate is dried, exposed in the usual way, developed by means of diaminophenol, and fixed as usual. A print is made on gelatino-chloride paper in the usual way, and toned and fixed in a bath containing gold chloride, lead acetate, alum, and sodium thiosulphate in stated proportions. The print is finally immersed for about one minute in a bath similar to that used for preparing the dry plate, with the exception that barium sulphate is used and the gelatin is omitted, the proportions being also slightly modified.

—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

United States Patent.

Explosive Compound. N. Ceipek, Vienna. U.S. Pat. 768,512, Aug. 23, 1904.

See Fr. Pat. 341,021 of 1904; this J., 1904, 837.—T. F. B.

French Patents.

Explosive Materials and Powders; Method of Manufacture of ——. A. Mikolajczek. Fr. Pat. 341,911, April 6, 1904.

Glycerol dinitrate is prepared by adding nitric acid of sp. gr. 1·5 (33 parts) to glycerin (10 parts) under continuous stirring and cooling. The mixture is allowed to stand for several hours at 10° C., diluted with 10 parts of water, and then neutralised with calcium carbonate. After a further period of standing, the greater part of the glycerol dinitrate rises to the surface, and can be separated, the remainder being extracted from the liquid by means of ether. Glycerol dinitrate is a colourless oil soluble in water and nitroglycerin (glycerol trinitrate), and dissolves and gelatinises collodion cotton, &c. It does not solidify at low temperatures, and its admixture with the trinitrate lowers the freezing point of the latter. The following are mentioned as examples of explosives containing this body :—glycerol dinitrate (61 per cent.), collodion cotton (1·8 per cent.), saltpetre (30 per cent.), and wood meal (7·2 per cent.), and also glycerol dinitrate (45 per cent.), glycerol trinitrate (30 per cent.), chalk (2 per cent.), kisselguhr (23 per cent.).—G. W. McD.

Matches; Method of Manufacture of Phosphorus-free Paste for ——. J. D. Riedel. Fr. Pat. 342,010, April 9, 1904.

Barium-copper poly(di-, tri-, tetra-, penta-)thionate (10 parts) is mixed with sulphur (3 parts). Under the action of pressure or heating a sulpho-polythionate is produced. The paste has the following composition :—Barium-copper sulpho-polythionate (20 per cent.), powdered pumice (27·2 per cent.), potassium chlorate (44·8 per cent.), and gum (8 per cent.).—G. W. McD.

XXIII.—ANALYTICAL CHEMISTRY.

INORGANIC—QUANTITATIVE.

Oxidising Substances; Use of Hydrazine Sulphate in the Determination of ——. U. Roberto and F. Roncali. L'Ind. Chimica, 1904, **6**, 178—179; Chem. Centr., 1904, **2**, 616.

Substances capable of evolving oxygen react with hydrazine sulphate according to the equation, $H_2SO_4.N_2H_4 + O_2 = H_2SO_4 + 2H_2O + N_2$. For example, if potassium permanganate be heated gently with hydrazine sulphate, the solution is decolorised and nitrogen is evolved: $4KMnO_4 + 6H_2SO_4 + 5H_2SO_4.N_2H_4 = 2K_2SO_4 + 4MnSO_4 + 5H_2SO_4 + 16H_2O + 5N_2$. Then, from the volume of nitrogen evolved, the amount of permanganate can be ascertained in a manner similar to that previously described for bleaching powder (this J., 1904, 623). Bichromates, peroxides, chlorates, and other compounds of a similar character can also be determined in this manner.—A. S.

Magnesium; Colorimetric Determination of ——. O. Schreiner and W. S. Ferris. J. Amer. Chem. Soc., 1904, **26**, 961—967.

The following solutions are required: (1) fifty grms. of ammonium molybdate in 1 litre of water; (2) nitric acid, sp. gr. 1·07; (3) 0·5045 grm. of crystallised sodium phosphate, $Na_2HPO_4.12H_2O$, and 100 c.c. of nitric acid of sp. gr.

1·07 in 1 litre; (4) a standard colorimetric solution prepared by diluting 10 c.c. of the sodium phosphate solution (3) to about 80 c.c., then adding 9 c.c. of nitric acid (2) and 8 c.c. of the ammonium molybdate solution (1) and making up to 100 c.c.; (5) phosphate reagent, prepared by dissolving 17·4 grms. of potassium hydrogen phosphate, K_2HPO_4, and 100 grms. of ammonium chloride in about 900 c.c. of water, adding 50 c.c. of ammonia (sp. gr. 0·9) and diluting to 1 litre. Fifty c.c. of the solution to be examined are evaporated in a basin to dryness after adding one drop of ammonia and two or three drops of saturated ammonium oxalate solution. The residue is treated with 1 c.c. of the phosphate reagent (5), well stirred and allowed to stand two hours, when 5 c.c. of dilute ammonia (1 : 9) are added, and the precipitate is collected on a filter. The precipitate is washed with the dilute ammonia five times by decantation, and then on the filter until the filtrate measures 50 c.c. The basin is washed once with 5 c.c. of water, which is poured on the filter. 5 c.c. of nitric acid (2) are added to the basin, poured on the filter, after removing the vessel containing the ammoniacal washings and substituting another, and both basin and filter are washed with hot water until about 45 c.c. of filtrate have been obtained. To the cooled liquid 4 c.c. of the ammonium molybdate solution (1) are added, and after 20 minutes, the coloration is compared with that produced by known quantities of the colorimetric phosphate solution (4). 1 c.c. of the latter is equivalent to 0·00001 grm. of phosphoric anhydride or 0·00000342 grm. of magnesium. Any silica present is completely removed during the washing process.—W. P. S.

Lime in Cement; Rapid Method for the Determination of ——. B. Enright. J. Amer. Chem. Soc., 1904, **26**, 1003—1005.

THE powdered cement is agitated with hot dilute hydrochloric acid, a few drops of bromine-water are added, and the solution is boiled, rendered alkaline with ammonia, and filtered. The residue is treated with hydrochloric acid, and the solution diluted. After once more adding ammonia in slight excess, boiling, filtering, and washing, the united filtrates are slightly acidified with hydrochloric acid and boiled. Ammonium oxalate solution and ammonia are added to the boiling solution, the precipitate is washed with hot water, and dissolved in sulphuric acid, and the solution immediately titrated with potassium permanganate solution.—W. P. S.

Gold Determination by means of the Purple of Cassius Test, for Cyanide Works. A. Prister. J. Chem., Met. and Min. Soc. of S. Africa, 1904, **4**, 455.

THE process is a modification of the one previously described (this J., 1904, 207). Potassium cyanide is added to the cyanide solution to be tested, until the proportion of free cyanide reaches about 1 per cent. 1 grm. of zinc dust is added to each 200 c.c. of the solution, and, after boiling, the solution is filtered, and the zinc dust remaining is dissolved by warming with dilute sulphuric acid. The zinc sulphate solution is passed through the same filter. The residual metals are dissolved in 10 c.c. of dilute *aqua regia*, and the boiling solution is passed repeatedly through the same filter. To the gold solution collected in a test tube, and cooled, a few drops of stannous chloride solution are added, and, if the proportion of gold is small, time is allowed for formation of the coloration.—E. S.

Lead, Iron, Lime, Sulphur, Cadmium, and Copper in Commercial Zinc Ores; Determination of ——. W. G. Waring. Eng. and Mining J., 1904, **78**, 298—299.

THE author from a long practical experience finds the following methods give accurate results with the least expenditure of time:—

Lead.—From 0·5 to 3 grms. of the ore are decomposed with nitric acid, 2 or 3 c.c. of strong sulphuric acid are added, the mixture is evaporated till white fumes appear, cooled, diluted, and then boiled until the soluble sulphates are dissolved. The insoluble residue containing the lead as sulphate is filtered off, washed with water containing 2 or 3 c.c. of sulphuric acid per litre, and digested with 15 or 20 c.c. of a hot solution of ammonium carbonate, the lead carbonate dissolved by means of 5 or 6 c.c. of glacial acetic acid or 15—20 c.c. of hot 30 per cent. acid, and the solution titrated with standardised potassium ferrocyanide solution, using uranium acetate or nitrate as indicator. The solution must not contain more than 0·2 grm. of lead per 100 c.c. If the amount of lead sulphate separated at first correspond to only 50 mgrms. or less of lead, more accurate results are obtained by dissolving the lead sulphate by repeated boiling with ammonium acetate solution, washing the residue with 15—25 c.c. of hydrochloric acid of sp. gr. 1·4, heating the solution with a pellet of pure zinc, and weighing the separated lead.

Iron.—For the determination of iron, the ferric hydroxide separated in the ordinary zinc assay is reduced by sulphuric acid and zinc, or by means of stannous chloride, and the solution titrated with permanganate solution.

Lime.—Iron and manganese are separated by precipitation with excess of ammonia in presence of ammonium chloride, and the calcium is precipitated as oxalate. If the ore contain a large proportion of lead, the calcium oxalate should be redissolved and again precipitated.

Sulphur.—0·25 grm. of a blende ore, or a larger amount in the case of an oxidised ore or roasted blende, is ground with 0·5 grm. of dry sodium carbonate, 0·25 grm. of potassium chlorate, and 1·2 grms. of pure manganese dioxide, and the mixture transferred to a platinum or porcelain crucible lined with magnesia. The mixture is covered with a little magnesia, and the crucible is then heated, gently at first, and finally to full redness for 15—20 minutes. After cooling, the contents of the crucible are emptied into water and the sulphur determined as in Eschka's method, except that no addition of bromine is required. For more exact results, the insoluble residue should be dissolved in hydrochloric acid, and any sulphur present determined. A blank test must always be made with the manganese dioxide.

Cadmium and Copper.—The ore is decomposed with hydrochloric acid or *aqua regia*, the excess of acid expelled, the solution diluted and filtered, and sufficient acid added to the filtrate to bring its acidity up to the equivalent of 10 c.c. of hydrochloric acid of sp. gr. 1·10 per 250 c.c. Hydrogen sulphide is then passed through the solution, the precipitated sulphides are treated with dilute sulphuric acid to dissolve the cadmium and zinc, and acid or alkali is added to the solution to make its acidity equivalent to about 6·5 per cent. by weight of sulphuric acid. The solution is then heated to 70° C. and the cadmium precipitated by hydrogen sulphide.

Other Elements.—Gold and silver, antimony, arsenic, selenium, tellurium, thallium, iridium, bismuth, manganese, cobalt, and nickel may also be present in zinc ores. For the determination of gold and silver by the crucible or scorification method, the ore must first be decomposed by hydrochloric acid and the zinc removed by treatment with water. Skinner and Hawley's method (this J., 1902, 1156) has been found to be the best for the determination of arsenic and antimony. Thallium, iridium, tin, and bismuth are precipitated together with silver, cadmium, copper, and part of the antimony, tellurium, &c., by means of aluminium from acid solution, as a preliminary step to the separation of zinc by hydrogen sulphide in the presence of formic acid. In the metallic residue, the elements named are determined by the usual methods.—A. S.

Nitrogen Determinations [Kjeldahl]; Influence of the Alkalinity of Glass on the Accuracy of ——. K. Barelt and R. Schönewald. Woch. f. Brau., 1904, **21**, 523.

PARALLEL blank distillations made in an apparatus which had been in use for a considerable time, and in a similar but perfectly new apparatus, showed that with the new apparatus the errors due to the glass were considerably greater than with the old one. It is therefore advisable to "age" a new apparatus before use by boiling water in it. (See also this J., 1904, 269.)—J. F. B.

Nitrogen in Water; Method for the Determination of Ammoniacal and Proteid ——. J. Elfront. Monit. Scient., 1904, **18**, 669—674.

THE method is based on the reduction of alkali hypochlorite to chloride by ammonia and albuminoid substances. 1 litre of the water is allowed to stand for two hours with 20 c.c. of N/1 sodium carbonate solution and 20 c.c. of a standardised hypochlorite solution (prepared by digesting 50 grms. of bleaching powder with 1 litre of water). Excess of a standard solution of arsenious acid (containing 4·586 grms. of arsenious acid and 15 grms. of sodium carbonate per litre) is then added, and the excess determined by titration with a solution of iodine in potassium iodide, corresponding to the arsenious acid solution. 1 c.c. of this iodine solution corresponds to 0·5 mgrm. of ammonia. Proteid nitrogen is determined by evaporating 1 litre of the water with 0·5 to 1 grm. of sodium carbonate to a volume of 150 c.c., diluting to 1 litre, and then treating as in the determination of ammonia, with the exception that the solution must stand for 14 to 16 hours instead of for 2 hours only. 1 c.c. of iodine solution corresponds to 0·215 mgrm. of proteid nitrogen. By this method it is stated that 0·5 mgrm. of nitrogen can be determined in 1 litre of water.—T. F. B.

Iron; Colorimetric Determination of Small Amounts of —— by Acetylacetone [especially applicable to Water Analysis]. H. B. Pulsifer. J. Amer. Chem. Soc., 1904, **26**, 967—975.

The method is based upon the fact that acetylacetone, $CH_3.CO.CH_2.CO.CH_3$, gives an intense red coloration with ferric salts. For the determination of iron in water, 100 c.c. or more of the latter are evaporated to dryness and all organic matter removed by treating with sulphuric and nitric acids. The residue is warmed with a few drops of dilute sulphuric acid and a drop of hydrochloric acid, filtered, and the filtrate oxidised by a trace of nitric acid. If the amount of iron present be very small, the solution must be evaporated almost to dryness to expel excess of acid. If larger amounts be present the solution may be diluted to 500 c.c. or 1000 c.c. without removing the acid. A definite portion of the solution is then transferred to a Nessler tube, 2 c.c. of a 0·5 per cent. aqueous solution of acetylacetone is added, and the tube filled up to the mark with water. The contents must be well mixed. The coloration produced is compared with that yielded by a known amount of iron. In no case should the colour be matched by pouring out one or other of the solutions until the tints are equal, but a number of standard tubes should be used. The colour is very permanent, and there are practically no substances which interfere with the reaction. The test is more sensitive than the potassium thiocyanate one, the limit being 0·000003 grm. of iron.—W. P. S.

Mercuric Chloride in Corrosive Sublimate Pastilles; Volumetric Determination of ——. R. Corradi. Boll. Chim. Farm., 1904, **43**, 424—427. Chem. Centr., 1904, **2**, 617.

The method is based upon the reaction: $HgCl_2 + 2KI = HgI_2 + 2KCl$. The mercuric iodide produced dissolves in the excess of potassium iodide, with formation of a double salt, $KI.HgI_2$. A 2 per cent. solution of potassium iodide is added, drop by drop, to 10 c.c. of a 1 per cent. solution of mercuric chloride, till the exact amount required to just re-dissolve the precipitate produced is determined. A corresponding determination is then made with, for example, an aqueous solution of five corrosive sublimate pastilles. Sodium chloride, vaseline oil, and colouring matters (Eosine, Erythrosin) are stated to have no influence on the results. —A. S.

ORGANIC—QUALITATIVE.

Turpentine; Technical Analysis of Spirits of ——, with a New Method for the Detection of Petroleum Adulterations and Wood Spirits of Turpentine. J. M. McCandless. J. Amer. Chem. Soc., 1904, **26**, 981—985.

For the detection of petroleum and wood turpentine in turpentine, determinations of the flashing point and specific gravity were found to be useless, the iodine value also giving no decisive evidence (see this J., 1904, 302) when only small quantities of the adulterants were present. Polymerisation with sulphuric acid, followed by steam distillation and a determination of the refractive index of the distillate, however, afforded a reliable means of detecting 5 per cent. or less of petroleum in turpentine. 100 c.c. of the turpentine were cautiously treated with 50 c.c. of concentrated sulphuric acid, with constant agitation and cooling. After adding 25 c.c. of water, the mixture was steam-distilled until 100 c.c. of distillate, consisting of oil and water, were collected. The oily layer was separated and treated with its own volume of fuming sulphuric acid. The resulting mixture was poured into water, the oil separated and steam-distilled. The distilled oil was again treated with fuming sulphuric acid and re-distilled. The refraction of the oil obtained was then determined at 25° C. by means of a Zeiss butyro-refractometer. In no case with a genuine sample of turpentine or wood turpentine, did the reading fall below 30 (scale degrees), but with adulterated oils, containing even as little as 1 per cent. of petroleum, the reading fell as low as 25, and could be reduced to 22 by further treatment with sulphuric acid. The final volume of the oil obtained roughly represented the quantity of petroleum present. Petroleum having been proved to be absent, the following method was employed for the detection of the wood turpentine:—100 c.c. of the sample are slowly distilled and the refraction of the first 0·5 c.c. of distillate determined. At 25° C., genuine turpentines gave readings from 60 to 63, and wood turpentine from 57 to 59. If no indication of adulteration was detected by this initial reading, the distillation was continued, and the refraction of the 97th and 98th c.c. observed. Genuine turpentine did not give a higher reading than 77, usually much less, whilst with wood turpentine, the reading exceeded 77, and even reached 90. A further distinction was noticed during the distillation. In the case of the genuine turpentines 95 c.c. distilled over below 165° C., but if admixed with any wood turpentine, when 95 per cent. had come over, the temperature would be found to be much higher than 165° C.—W. P. S.

ORGANIC—QUANTITATIVE.

Tannic and Gallic Acids; Determination of ——. W. P. Dreaper. Chem. News, 1904, **90**, 111—112.

The author considers that until further evidence is brought forward, the use of collin as a precipitant for tannin, as recommended by Parker and Payne (this J., 1904, 648), must be regarded with suspicion. In a test with a solution containing equal parts of tannic and gallic acids, it is stated that about 60 per cent. of the gallic acid was separated with the tannin-collin compound. The author recommends the following modification of his earlier process (this J., 1893, 412), and claims that it enables one to differentiate between tannic and gallic acids, and also between tannin acids soluble and insoluble respectively in ammonium carbonate solution. Three solutions are required: (1) Standard copper sulphate solution of a strength equivalent to 0·05 grm. of copper oxide per c.c.; (2) solution containing 50 grms. of ammonium carbonate and 50 grms. of sodium sulphite per litre; (3) solution containing 20 grms. of lead acetate and 60 c.c. of glacial acetic acid per litre.

Total Tannic and Gallic Acids.—50 c.c. of the tannin solution containing 10—15 grms. of tannin material per litre are heated with excess of calcium carbonate, cooled, and titrated with the copper solution, with ferrocyanide indicator, as previously described (*loc. cit.*). The result, expressed as copper oxide, represents the total tannic and gallic acids, and, from the dyers' point of view, the "mordant value" of the tannin extract.

Tannic Acid Insoluble in Ammonium Carbonate Solution.—50 c.c. of the tannin solution are treated with 25 c.c. of No. 2 solution, and titrated with the copper solution; the reaction proceeds slowly towards the end, and the final colour test with the ferrocyanide, which must be rendered strongly acid with acetic acid, should be made after the lapse of three minutes. The copper tannate produced is free from gallate. In the case of an unknown extract, the precipitate may be filtered off, and weighed at 105° C., and the amount of tannic acid present calculated, the weight of copper oxide being known.

Total Tannic Acid.—50 c.c. of the tannin solution are treated with 10 c.c. of No. 3 solution and some barium sulphate, and the mixture well shaken. The solution is filtered through a dry paper, lead is precipitated in the filtrate by adding a little anhydrous sodium sulphate, and after five minutes the solution is again filtered through a dry paper. 40 c.c. of the filtrate are heated with calcium carbonate, and titrated with the copper solution. The result obtained gives the amount of gallic acid, and, by difference, that of the total tannic acid.—A. S.

Methyl Alcohol; Determination of —— in Formaldehyde. H. Bamberger. Z. angew. Chem., 1904, **17**, 1246—1248.

It is alleged that the method of Gnehm and Kaufler (this J., 1904, 626) gives too low results owing to the presence of aldehyde in the distillate (caused by the partial decomposition of the aldehyde and sodium sulphanilate condensation product). More accurate results (3—4 per cent. higher) were obtained by "fixing" the aldehyde with sodium bisulphite. 50 c.c. of formaldehyde (about 38 per cent.) are treated with 140 c.c. of a bisulphite solution containing 1 grm.-mol. in 200 c.c. of water, and the liquid then neutralised with caustic soda. The neutrality of the liquid must be tested by transferring a drop on to Brilliant Yellow or phenolphthalein paper. If too much alkali has been taken, dilute sulphuric acid or bisulphite solution is added. The flask is then fitted with a fractionating column containing glass beads and joined to a long condenser and heated in an oil-bath at 135°—145° C. until about 75 c.c of distillate have been collected. After washing the condenser with water and making up the volume of the distillate to 100 c.c., the sp. gr. at 15° C. is determined to four places of decimals with a Mohr's balance. By this method the amount of aldehyde which gets into the distillate is negligible.

—E. H. T.

Quinine Sulphate; Testing of ——. B. H. Paul. Chem. and Druggist, 1904, **65**, 428—430.

The solubility of cinchonidine in ether has been variously given as 1 in 76, 1 in 143, and 1 in 188 parts by weight. The author finds that the normal solubility of cinchonidine in ether, determined by extracting the alkaloid with ether from an aqueous solution of one of its salts, after the addition of sufficient ammonia solution, is 0·004 grm. per c.c. Cinchonidine can, however, form supersaturated ethereal solutions, from which, on allowing to stand, the alkaloid gradually deposits in crystals. The solubility is also considerably influenced by the presence of quinine. The author criticises the B.P. ether-test for quinine sulphate, and states that a far greater degree of precision may be secured more conveniently, by proceeding in the following manner:—1 grm. of the quinine sulphate is dissolved in 100 c.c. of boiling distilled water, and the solution, after cooling, is filtered from the crystallised quinine salt. The filtrate is concentrated to 30 c.c., cooled, filtered through a loose plug of cotton-wool, and the volume made up to 30 c.c., if necessary, by washing the separated crystals with a little water. 5 c.c. of the solution are treated with five drops of ammonia solution and shaken with 1 c.c. of ether in a corked tube, and then allowed to stand in a cool place for one hour. If no crystals are formed at the end of this period, the 5 c.c. of solution contain less than 0·004 grm. of cinchonidine. If crystals are formed, different volumes of the solution, less than 5 c.c., are shaken each with 1 c.c. of ether, the operation being repeated until with two portions of the solution differing in volume by 0·5 c.c., after treating with ammonia solution and shaking with 1 c.c. of ether, and then allowing to stand for 12 hours, a slight formation of crystals takes place in one case, but not in the other. The mean volume of the two portions of solution contains 0·004 grm. of cinchonidine or 0·0054 (0·004 × 1·35) grm. of cinchonidine sulphate.—A. S.

Quinine Sulphate; Testing of ——. D. Howard. Chem. and Druggist, 1904, **65**, 475.

The varying statements as to the solubility of cinchonidine in ether mentioned by Paul (see preceding abstract) may probably be explained by differences in the purity of the ether used. A small proportion of alcohol greatly increases the solubility of cinchonidine; ether of the B.P. will dissolve nearly twice as much cinchonidine as *æther purificatus*. Paul's modification of the B.P. ether-test is considered to be in the wrong direction, since the whole of the cinchonidine will not be contained in the mother liquor of a single recrystallisation. If a solution of commercial quinine sulphate be concentrated and allowed to crystallise, then, specially below 50° C., the cinchonidine sulphate persistently crystallises with quinine sulphate in varying proportions far in excess of those which might be deduced from the relative solubilities of the two salts. For ascertaining the purity of quinine sulphate, the author recommends the test now adopted in the Codex Français:—2 grms. of the sample and 20 c.c. of water are maintained at 60° C., with frequent agitation, for half an hour. The mixture is then allowed to cool, and is kept at 15° C. for half an hour, with frequent agitation. 5 c.c. of the solution mixed with 7 c.c. of *liquor ammoniæ* must remain clear.—A. S.

Volatile Oil of Mustard; Determination of ——. Vuillemin. Apoth.-Zeit., **19**, 607. Pharm. J., 1904, **73**, 218.

Five grms. of the powdered seeds are treated in a closed flask with 100 c.c. of water at 25°—30° C., and the mixture is maintained at that temperature for one hour, during which period it is frequently shaken. 20 c.c. of alcohol are then added, and half of the liquid is distilled off, and collected in 30 c.c. of ammonia solution and 3—4 c.c. of 10 per cent. silver nitrate solution, the delivery tube of the condenser dipping below the surface of the liquid. The receiver is connected to a second vessel also containing ammoniacal silver solution. After the distillation, the ammoniacal solution is gently warmed, the silver sulphide filtered off, washed with water, alcohol, and ether, dried at 80° C., and weighed. The weight, multiplied by 8·602, gives the percentage of mustard oil in the powder. Seeds of *Brassica nigra* yielded from 0·815 to 1·19 per cent. of volatile oil. The volatile oil in mustard plasters and papers may also be determined in the above manner, but the maceration with water must be prolonged to 90 mins., whilst, to avoid troublesome foaming, it is advisable to add a further 20 c.c. of alcohol during the distillation and to use a larger distillation flask.—A. S.

Tobacco; Analysis of ——. R. Kissling. Chem.-Zeit., 1904, **28**, 775—776.

Determination of the Moisture.—The stripped tobacco is first dried over sulphuric acid in an exsiccator, and is then ground and sifted. The powder obtained, forms the raw material for the analysis. The moisture is determined by drying to constant weight 2—3 grms. of the powder in the exsiccator at the ordinary temperature. In 20 samples of different tobaccos, the amount of water determined in this manner varied only from 3·25 to 6·37 per cent.

Determinations of Ash and its Alkalinity are carried out with 2—3 grms. of the tobacco powder in the usual way, except that luteol is used as indicator.

Determination of Nicotine.—Ten grms. of the tobacco powder are mixed with 10 grms. of powdered pumice stone and 10 grms. of a solution of caustic soda containing about 50 grms. per litre. The moist mass is extracted with ether in a Soxhlet or other apparatus, the ether is distilled off from the extract, the residue dissolved in water containing some caustic potash, and the solution distilled in a current of steam. Each 100 c.c. of distillate are titrated with sulphuric acid in presence of luteol as indicator; the fifth fraction should be free from nicotine. 1 mol. of sulphuric acid corresponds to 2 mols. of nicotine.

Determination of Resins.—See this J., 1900, 696.

Determination of the Non-Volatile (Citric, Malic, and Oxalic) Acids.—See this J., 1902, 1104.—A. S.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Solubilities; Influences causing Alterations of ——. G. Geffcken. Z. physik. Chem., 1904, **49**, 257—302.

The author has studied the effect of the presence of dissolved electrolytes, chiefly acids and bases, upon the solubility of the gases, hydrogen, oxygen, nitrous oxide, and carbon dioxide, in water at 25° C. and at 15° C. In all the cases examined, the relative depression of the solubility was greater at the lower temperature than at the higher. The gree of relative depression of solubility depends very uch upon the nature of the gas, although the order is most the same for all gases; the alterations are especially fferent in the case of the otherwise very similar gases, rbon dioxide and nitrous oxide. The alteration of the lubility due to the electrolytes is probably connected with e alteration of the internal pressure caused by their lution in water. In other experiments, on the influence the presence of dissolved electrolytes upon the solubility other electrolytes, the observed divergences from the law mass-action are probably attributable to the same causes. olloids in solution have practically no influence on the lvent capacity of water; a notable exception to this rule as found in the case of the solubility of carbon dioxide in ferric hydroxide "sol," which absorbed about 12 per cent. ore of this gas than pure water—a result due probably the acid and basic nature of the two bodies. Nitrous ide in aqueous solution was found to be practically different; it cannot therefore be regarded as behaving as e anhydride of hyponitrous acid.—J. F. B.

mmonia; Decomposition of —— by Heat. E. P. Perman and G. A. S. Atkinson. Proc. Roy. Soc., 1904, **74**, 110–117.

HE authors examined the rate of decomposition of nmonia by heating in a vessel of porcelain at tempe- tures between 677° and 1111° C. The results are given two tables and two curve-diagrams. The rate of de- omposition was found to be much influenced by the state the porcelain globe; it invariably increased after the obe had been used once or twice, owing probably to the tion of ammonia or hydrogen upon the porcelain. The sults show that the reaction is essentially monomolecular, oceeding according to the equation $NH_3 = N + 3H$. he rate of decomposition is much quickened by the esence of traces of some of the metals, *e.g.*, mercury, on, platinum. No confirmation of Ostwald's view that e decomposition of ammonia by heat is a reversible action, equilibrium being established when 98 per cent. of e ammonia is decomposed, was afforded by the authors' sults.—A. S.

otassium Ferrocyanide; A Reaction of ——. A. Gutbier. Z. anorg. Chem., 1904, **41**, 61–62.

SOLUTION of potassium ferrocyanide, when warmed with a eshly prepared solution of phenylhydrazine hydrochloride, quired a brownish-red colour, changing to bright red d then to deep red, and finally became suddenly colour- ss, with separation of a yellowish-green precipitate and ith vigorous evolution of hydrocyanic acid and nitrogen. he mixture was now distilled with steam; a dark-coloured l, insoluble in caustic soda solution, distilled over, whilst greenish-blue residue was left, below a layer of a violet- loured liquid. The volatile oil, after purification, solidified, hen cooled by a freezing mixture, to a bright red mass, om which, on an earthenware plate, a yellow oil ran off, hilst a bright red mass, melting at about 45° C., remained hind. The yellow oil, when treated with strong sulphuric id, was coloured first green and then brown, with separation a solid, apparently crystalline mass.—A. S.

Trade Report.

I.—GENERAL.

MEXICO; CHEMICAL INDUSTRY AND TRADE OF ——.

Foreign Office Annual Series, No. 3262.

The following table shows the quantity and value of rtain Mexican exports during the last three years. The orld's production of silver in 1903 was, approximately, 65,800,000 troy oz. Of this Mexico, which now holds r the first time the leading position, mining more than e United States, produced 60,000,000 oz. as compared ith 58,000,000 oz. in 1902. In 1881 Mexico produced but 23,000,000 oz.; in 1891, 33,000,000 oz.; and in 1901, 57,500,000 oz.

	1900-01.		1901-02.		1902-03.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
	Tons.	£	Tons.	£	Tons.	£
Gold	..	1,800,000	..	1,900,000	..	2,800,000
Silver	..	7,000,000	..	5,500,000	..	6,800,000
Copper	33,000	800,000	61,000	1,500,000	62,000	1,600,000
Lead	85,000	450,000	98,000	520,000	99,000	550,000
Chicle	1,100	83,395	1,750	99,000	1,832	119,700
Dyewoods	41,500	130,218	38,600	107,397	31,895	80,331
Rubber	189	37,000	180	32,600	142	28,000
Vanilla	..	..	22	44,557	57	98,388

The average annual export of Mexican silver dollars is 15,000,000. 10 per cent. are melted down, and the balance reaches India, the Straits Settlements, China and the Philippines, where it circulates as currency. Those which reach India are also ultimately melted.

The imports of certain goods into Mexico from the United Kingdom were as follows:—

	1900-01.		1901-02.		1902-03.

There are over 1,200 sugar mills in Mexico, of which 300 may be considered as important producers, and cane growing and sugar refining are becoming of considerable consequence. The mills, equipped with British or American machinery, are general, and the number is increasing.

The sugar exported, about 20,000 tons annually, now goes almost entirely to the United Kingdom, and the reduction of the duty on imported sugar, which came into effect on May 1, 1904, aims solely at securing for Mexican exported sugar the privileges of the Brussels Convention. Common and refined sugar of all kinds, including the so-called sugar-candy, formerly paid per gross kilo. 15 c. Mexican currency, while the new rate is 2 dols. 50 c. per 100 kilos. gross. Molasses from sugar cane or fecula, as well as preparations for colouring wines, liquors, &c., and for grading up sugar, have hitherto paid duty per gross kilo. 5 c., while the new rate is 2 dols. 25 c. per 100 kilos. gross. The total product of molasses in 1903 was 77,000 tons. The total produce of sugar during the last few years was, during 1900, 78,000 tons; 1901, 95,000 tons; 1902, 103,000 tons; 1903, 112,000 tons; and the 1904 crop is estimated at 126,000 tons.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM; BOUNTIES ON CRUDE ——.

Bd. of Trade J., Sept. 8, 1904.

A supplement to the *Canada Gazette* contains the text of an Act, assented to on the 10th August, to provide for the payment of bounties on crude petroleum produced from Canadian wells. The Act is to take effect as from the 8th June 1904.

By this Act the Governor in Council may authorise the payment, out of the Consolidated Revenue Fund, of a bounty of one and one-half cent per imperial gallon on all crude petroleum produced from wells in Canada on and after the 8th June 1904, the said bounty to be paid to the producer of the petroleum.

The Governor in Council may further authorise the payment, out of the Consolidated Revenue Fund, of a bounty of one and one-half cent per imperial gallon on all crude petroleum produced from wells in Canada and held in storage tanks or other storage receptacles on the 8th June 1904, the said bounty to be paid to the actual owner of the petroleum on that day.

Asphalt Production in the United States.

Eng. and Mining J., Aug. 25, 1904.

The Geological Survey gives the production of asphalt and bituminous rock in the United States in 1903 as follows, in short tons:—

Bituminous sandstone	38,633
Bituminous limestone	2,520
Mastic	961
Refined asphalt and gilsonite	12,896
Liquid asphalt, or maltha	58
Asphalt from petroleum	44,849
Total	99,917

The largest increase shown last year was in manufactured asphalt—that is, the asphaltic material produced by the distillation of petroleum. Exports of asphalt from the United States in 1903 were valued at 104,586 dols.; imports were 181,579 long tons, of which about two-thirds came from the island of Trinidad. Considerable quantities were also imported from Cuba, Venezuela, and Italy, while some small lots came from Turkey, France, Mexico, and Colombia.

VII.—*ACIDS, ALKALIS, Etc.*

Phosphate Rock Output in the United States.

Eng. and Mining J., Sept. 1, 1904.

1,581,576 long tons of phosphate rock were mined in the United States in 1903. Of this quantity Florida contributed 860,336 tons; South Carolina, 258,540 tons; Tennessee, 460,530 tons; Arkansas, 2125 tons; and North Carolina, 45 tons. Florida showed a decrease in hard rock phosphates, but a large increase in pebble. The greatest gain last year was in the Tennessee district.

Lithium Minerals in the United States in 1903.

Eng. and Mining J., Sept. 1, 1904.

The output of lithium minerals in the United States in 1903 amounted to 1155 short tons, valued at 23,425 dols., as compared with 1245 short tons, valued at 25,750 dols. in 1902. The production includes lepidolite, spodumene and amblygonite, and was obtained entirely from the deposits at Pala, California, and in the Black Hills, South Dakota.

Fluorspar Output of the United States.

Eng. and Mining J., Sept. 1, 1904.

The output of fluorspar in 1903 amounted to 42,523 short tons, valued at 213,617 dols., against 48,018 short tons, valued at 271,832 dols., in the previous year. The falling off, as shown by these figures, was due partly to the depression in the iron and steel industries, and partly to the fact that considerable stocks of fluorspar were left over from the previous year. Kentucky was the largest producer, followed by Illinois, Tennessee, and Arizona.

IX.—*BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.*

Monazite Production of United States.

Eng. and Mining J., Aug. 25, 1904.

The Geological Survey reports that the total production of monazite in the United States in 1903 was 862,000 lb., an increase of 60,000 lb. over the preceding year. All of last year's output came from placer workings in North and South Carolina.

Asbestos Production.

Eng. and Mining J., Sept. 1, 1904.

The production of asbestos in the United States in 1903 was only 874 short tons, which compares with 1005 short tons in 1902. Most of the asbestos reported in 1903 came from Sall mountain in Georgia, but small quantities were mined at Dalton, Mass., and near New Hartford, Conn. Some deposits near Lowell, Vermont, are being explored.

Talc and Soapstone.

Eng. and Mining J., Aug. 25, 1904.

The production of talc and soapstone of all varieties in the United States last year was 58,901 short tons. This is a decrease of 39,053 tons from the preceding year. The falling off was chiefly due to the reduction in the quantity of fibrous talc in New York. The demand for this mineral decreased, owing to a diminution in a production of paper in which talc is used. In other States there was little change.

X.—*METALLURGY.*

Tasmania; Mineral Production of ——.

Bd. of Trade J., Sept. 8, 1904.

The following table, showing the quantity and value of the minerals produced in, and exported from, Tasmania during the year 1903, has been compiled from the quarterly statements issued by the Government geologist:—

——		Twelve months ended 31st Dec. 1903.		Three months ended 31st March 1904.	
		Quantity.	Value.	Quantity.	Value.
		Oz.	£	Oz.	£
Gold, won		59,887	254,403	14,235	341,29
		Tons.		Tons.	
Gold quartz and pyrites	Exported	410	11,304	41	
Silver ore	"	16,013	167,282	4,098	
Silver-lead bullion	"	7,020	255,776	1,694	
Copper, blister	"	5,812	383,187	1,705	
" ore	"	13	77	27	
" matte	"	3,727	83,624	..	
Tin ore	"	305	10,822	49	
" metallic	"	2,376	300,098	529	
Zinc ore	"	1,357	4,247	..	
Iron ore	"	5,323	4,646	3,150	
Other ores	"	373	4,871	..	
Coal	Raised	49,069	42,147	11,873	

Canada; Pig Iron Production of ——.

Eng. and Mining J., Sept. 1, 1904.

The American Iron and Steel Association has received direct from the manufacturers, the statistics of the production of pig iron in Canada in the first six months of 1904. The figures show a decrease as compared with either of the two halves of 1903, as will be seen by the following table which gives the production by fuels, in gross tons, in half yearly periods:—

——	1903.		1904.
	First Half.	Second Half.	First Half.
Coke	123,500	124,405	111,840
Charcoal	9,430	8,083	8,803
Totals	132,930	132,488	120,643

Of the total production in the first half of 1904, 35,29 tons were basic pig iron, against 69,325 tons in the fir f of 1903 and 57,567 tons in the second half of that r. A small quantity of Bessemer pig iron was produced the second half of 1903, but none was made in the t half of 1903 or in the first half of 1904. The unsold iron held by Canadian manufacturers on June 30, 4—none of which was intended for their own consump- ı—amounted to 36,868 gross tons, as compared with 168 tons on December 31, 1903, and 13,585 tons on e 30, 1903. Of the unsold stocks on June 30, 1904, a e less than 4,000 tons were made with charcoal, the ainder being coke iron. On June 30, 1904, Canada 15 completed blast furnaces, of which six were in blast nine were idle. Of this total, 11 were equipped to use e and four to use charcoal. In addition, one coke fur- e was being built on June 30, 1904, and one coke and charcoal furnace were partly erected, but work was pended. During the first half of 1904, the total number urnaces in Canada actually in blast for the whole or a t of the period was 10, of which seven used coke and e used charcoal. The number of furnaces idle during whole period was five, of which four used coke when in blast, and one used charcoal.

Tin Exports of the Federated Malay States.

Bd. of Trade J., Sept. 1, 1904.

he following statement, showing the weight of tin and ore (tin exported in the form of ore being taken at per cent. of the gross weight of the ore) exported from Federated Malay States during the first six months of 4, with corresponding figures for the corresponding od of the previous year, is taken from the *Selangor ernment Gazette* of 22nd July :—

——	First Half of 1903.		
	Tin.	Tin exported in the Form of Ore.	Total.
	Piculs.	Piculs.	Piculs.
k	80,060·25	128,282·54	208,342·79
ngor..............	60,576·00	75,279·26	135,855·26
i Sembilan.......	18,581·26	20,248·91	38,830·17
ng...............	3,103·15	8,723·46	11,826·61
Totals	162,320·66	232,534·17	394,854·83

——	First Half of 1904.		
	Tin.	Tin exported in the Form of Ore.	Total.
	Piculs.	Piculs.	Piculs.
k	72,182·58	136,718·24	208,900·82

i Sembilan.......	22,474·07	16,014·98	38,489·05
ng...............	2,556·12	8,358·78	10,914·90
Totals	154,679·99	243,798·59	398,478·58

NOTE.—Picul = 133⅓ lb.

Zinc Industry in Poland.

Eng. and Mining J., Aug. 25, 1904.

1903 there were in operation three mines in the asz district, in Poland, of which the Joseph and Ulyss es are owned by the Crown and are leased to the nce-Russian Company, and the Boleslaw mine is owned he Sosnowice Company, by which it is operated. Work carried on through 47 shafts and adits, the number of loyees being 1108, of whom 614 were engaged underund. The production of the mines was 4,570,000 poods alamine and 43,317 poods of lead ore. Each of the e mines has dressing works.

he ores are smelted at the Pauline works of the owice Company and the Konstantin and Bendin works, ed by the Crown and leased to the Franco-Russian pany. All of these works are situated in the vicinity of Bendin. They had in operation in 1903 an average of 47 gas-fired furnaces, with about 1818 muffles, and produced 604,031 poods of spelter, of which 248,747 came from the Pauline works, 150,747 from the Konstantin, and 204,528 from the Bendin. In addition to the spelter production, there were produced 31,037 poods of zinc dust. Of the spelter production, 36·26 per cent. was rolled into sheets at the works where smelted.

U.S. Iron Ore Production in 1903.

Bd. of Trade J., Sept. 1, 1904.

An advance abstract of the annual report of the United States Geological Survey upon the production of iron ore in 1903, states that in the year ending December 31st, 1903, the quantity of iron ore produced in the United States was 35,019,308 long tons. This is a decrease of 534,827 tons, or about 1½ per cent., from the maximum of 35,554,135 tons in 1902; but the quantity mined in 1903 is the second largest recorded.

The production of iron ore in the United States during each of the last three years was as follows:—1901, 28,887,479 tons; 1902, 34,554,135 tons; 1903, 35,019,308 tons.

In 1903 the quantity of red hematite mined in the United States was 30,328,654 tons, or 86·6 per cent. of the total for the country, a decrease of 203,495 tons, or about 1 per cent., from the 1902 production of 30,532,149 tons.

The total quantity of brown hematite mined decreased in 1903 to 3,080,399 tons, a loss of 225,085 tons, or 7 per cent.

The production of magnetite in 1903 was 1,575,422 tons, a decline of 113,438 tons, or 7 per cent., from the 1902 total of 1,688,860 tons.

The carbonate ores, the least important class, show an increase, the 1903 total of 34,833 tons being 7,191 tons, or 26 per cent., more than the quantity mined in 1902, 27,642 tons.

The output of concentrated ore in 1903 was 259,469 tons, most of which was magnetically separated, the remainder having been passed through jigs.

In 1903 there were also produced 73,264 tons of zinc residuum for use in the production of spiegeleisen and ferromanganese.

Zircon in the United States.

Eng. and Mining J., Aug. 25, 1904.

3000 lb. of zircon were produced and sold in the United States last year. The mineral is used for the same purposes as monazite. The production all came from two mines at Zirconia, in Henderson county, North Carolina. The zircon occurs in a pegmatite dike, which is about 100 ft. wide and can be traced for nearly 14 miles. This is worked at two places: the Freeman mine, near the south-west end, and the Jones mine, near the north-east end of this dike. Owing to the slight demand there is no systematic working, but the crystals are washed out of the soil largely by women and children.

Sweden; Mining Industry of ——.

Bd. of Trade J., Sept. 1, 1904.

The quantity and value of the minerals extracted during the past year were as follows, corresponding figures for the preceding year being added for comparison :—

——	Quantity.		Value.	
	1902.	1903.	1902.	1903.
	Met. Tons.	Met. Tons.	Kr.	Kr.
Iron ore...............	2,896,616	3,677,841	11,368,806	16,626,3
Silver and lead ore..	9,378	9,792	165,688	191,005
Copper ore...........	30,095	36,687	320,841	331,725
Zinc ore	48,783	62,927	1,712,869	2,233,681
Manganese ore......	2,850	2,244	51,959	36,550
Iron pyrites	..	7,793	..	46,000

The chief iron products show the following results for 1903:—

——	Quantity.	Value.
	Metric Tons.	Kr.
Castings	506,825	34,024,488
Unwelded blooms	192,342	20,718,316
Bessemer metal	84,229	8,012,100
"Martin" metal	232,878	24,966,268
Crucible ingot metal	1,105	354,875
Iron and steel bars	178,538	25,879,451
Iron and steel bands and rods	74,823	11,386,234
Wire rods	31,805	4,652,126
Steel tubes (unfinished)	21,959	4,542,381
Strong sheet iron	14,027	2,157,407

NOTE.—Krona = 1*s*. 1⅓*d*., or 18 to the 1*l*.

The output of coal in 1903 was 320,390 metric tons, as against 304,733 metric tons in the preceding year. The refractory clay deposits, which are worked in connection with the extraction of coal, produced in 1903, 172,718 metric tons of clay, or 11,106 metric tons more than in 1903.

SPAIN; MINERAL EXPORTS OF ——.

Eng. and Mining J., *Sept.* 1, 1904.

Exports of mineral for the half year ended June 30 are reported by the *Revista Minera*, as follows, in metric tons:—

——	1903.	1904.
Iron ore	3,953,909	3,642,594
Copper ore	542,713	538,794
Zinc ore	68,349	66,541
Lead ore	1,151	2,897
Pyrites	292,688	258,518
Salt	177,871	203,784

Exports of metals for the six months were 18,813 tons of pig iron, against 20,745 tons in 1903; 14,534 tons of copper, against 14,991 tons; 936 tons of spelter, against 1,038 tons; 87,943 tons of lead, against 76,935 tons last year.

XI.—ELECTRO-CHEMISTRY, Etc.

COPPER CONDUCTORS; BRITISH STANDARDS FOR ——.

Interim Report by the Engineering Standards Committee, August 1904.

The report, by the Sub-Committee on Cables of the Engineering Standards Committee, commences by defining the standards for copper conductors finally adopted, as follows:—

(1) A wire 1 metre long, weighing 1 grm., and having a resistance of 0·1539 standard ohm at 60° F., to be taken as the Engineering Standards Committee (E.S.C.) standard for hard-drawn, high conductivity commercial copper.

(2) Hard-drawn copper to be defined as that which will not elongate more than 1 per cent. without fracture.

(3) A wire, 1 metre long, weighing 1 grm., and having a resistance of 0·1508 standard ohm at 60° F., to be taken as the E.S.C. standard for annealed, high conductivity commercial copper.

(4) Copper to be taken as weighing 555 lb. per cb. ft. (8·89 grms. per c.c.) at 60° F., which gives a specific gravity of 8·90.

(5) The average temperature coefficient of 0·00238 per 1° F. (0·00428 per 1° C.) to be adopted for commercial purposes.

(6) Two per cent. variation from the adopted standard of resistance to be allowed in all conductors.

(7) Two per cent. variation from the adopted standard of weight to be allowed in all conductors.

(8) An allowance of 1 per cent. increased resistance, as calculated from the diameter, to be allowed on all tinned copper conductors between diameters 0·104 and 0·028 (Nos. 12 and 28 S.W.G.) inclusive.

(9) For the purpose of calculation of tables, a lay involving an increase of 2 per cent. in each wire, excep the centre wire, for the total length of the cable, to be take as the standard.

(10) The legal standard of wire gauge, as fixed by Orde in Council dated Aug. 23, 1883, to be adopted as th standard for all wires.

The remainder of the report is occupied by tables givin British standard sizes of stranded conductors for electri supply; British standard radial thicknesses for jute or pape dielectric, lead and armour, for underground cables, fo working pressures up to 11,000 volts; and British standar radial thicknesses for rubber dielectric, for lead sheathin and armouring.—T. F. B.

XII.—FATTY OILS, FATS, Etc.

ILANG-ILANG OIL IN THE PHILIPPINES.

Bd. of Trade J., *Sept.* 8, 1904.

The *Monthly Summary* of commerce of the Philippir Islands contains a review of the trade of those islan during the year 1903, from which the following extract taken:—

"Among the products of economic value in the Phili pines, ilang-ilung oil as an export amounted to 123,182 dol or about 50 per cent. increase over the trade in 1902, tl shipments to France advancing in about the same propo tion. Some consider the oil as equal in perfume to attar roses, and by the greater yield of essence furnishing a le expensive base, it becomes a strong competitor of the latte the perfumers of the United States (to whom exporti houses in Manila shipped nearly 10,000 dols. worth la year) making it the base of some of their most expensi extracts. The ilang-ilang tree grows best in the Philippin and it takes about 75 lb. of the flowers, worth from 8 15 cents gold per lb., to yield 1 lb. of oil. The cost manufacture is about 4 dols., and it sells readily for fro 40 to 55 dols. in open market, with the supply unequal the demand."

XVII.—BREWING, WINES, SPIRITS, Etc.

SPIRIT FOR TECHNICAL PURPOSES; USE OF —— IN FRANCE DURING 1903.

Z. Spiritusind., 1904, **27**, 359.

The following statistics show the use of spirits domestic and manufacturing purposes in France duri 1903:—Total consumption, 374,598 hectols. (1902, 326,66 divided as follows:—For heating and lighting, *i.e.*, de tured in the ordinary way, 262,036 (1902, 227,253); lacquer, varnish, and polish, 14,447 (1902, 14,188); dyeing, 532 (1902, 41); for collodion, celluloid, &c., 45 (1902, 3963); for drugs, 844 (1902, 742); for chemical a pharmaceutical products, 27,027 (1902, 6071); for et and explosives, 63,879 (1902, 69,996); and for scienti purposes, 519 (1902, 406).

The apparent decrease under the heading of "ether a explosives" is partly accounted for by the inclusion certain articles under the heading of "chemical and ph maceutical products.—J. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

EXPLOSIVES CONTAINING NITROGLYCERIN.

Bd. of Trade J., *Sept.* 8, 1904.

The following notice has been issued to mine-owner the United Kingdom with a view to the prevention of ac dents occurring in metalliferous mines from the use explosives containing nitroglycerin:—

"All cartridges made of dynamite, gelignite, blasti gelatin, and other explosives containing nitroglycer must always be thawed (in a properly-designed warmi pan) before use during the months of December, Janua February and March, and also at any other times if cartridges are not in a soft or pasty condition."

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and .S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an terisk is affixed. The dates given are (i) in the case of Applicaons for Patents, the dates of application, and (ii) in the case of omplete Specifications Accepted, those of the Official Journals which acceptances of the Complete Specifications are advertised. Complete Specifications thus advertised as accepted are open to spection at the Patent Office immediately, and to opposition ithin two months of the said dates.

frigerating machines. Sept. 14.

„ 24,332 (1903). Donnachie. Appliances for t
manufacture of nitric acid. Sept. 14.

„ 24,619 (1903). Schwab, and H. Greene and So
Ltd. Manufacture of vitriol. Sept. 14.

„ 2739 (1904). Bellot des Minieres. Apparatus f
the manufacture of cupro-ammonium soluti
Sept. 7.

„ 11,172 (1904). Cie. Franç. de l'Acetylene Disso
Manufacture of oxygen. Sept. 7.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 19,067. Baudoux. Glass-melting furnaces.* Sept.

[C.S.] 16,600 (1904). Good. Apparatus for the ma
facture of glassware. Sept. 21.

„ 17,235 (1904). Robin. Composition for the ma
facture of ceramic products. Sept. 12.

IX.—BUILDING MATERIALS, CLAYS, MORTAR AND CEMENTS.

[A.] 18,699. Pryor. Wood-preserving compositi
Aug. 30.

„ 18,804. Brunson. Composition of matter for a
ficial stone.* Aug. 31.

„ 18,837. Saunders. Manufacture of bricks and
like. Aug. 31.

„ 18,920. Lake (Matthey and Co.). Manufacture
electrical insulating and non-heat-conduct
compositions. Sept. 1.

„ 18,930. Sellars. Manufacture of cement or cementitious substances. Sept. 2.

„ 18,939. Müller. *See under* XI.

„ 19,737. Boult (Hülsberg and Co.). Impregnat
of wood and other porous materials. Sept. 13

„ 19,884. Morris and Chalmers. Manufacture
bricks and tiles. Sept. 15.

„ 19,912. Hamblet. Brick kilns and the l
Sept. 15.

„ 20,018. Ridley, Taite, and Williamson. Slag
scoriæ bricks or blocks, and method and apparatus for manufacturing the same.* Sept. 16.

[C.S.] 19,676 (1903). Magens. Treatment of conc
and the like, whereby the setting of the s
after mixture may be arrested. Sept. 7.

[A.] 20,028 (1903). Sadler. Brick kilns. Sept. 21.

„ 11,258 (1904). Stöffler. Fireproof quartz bricks or blocks. Sept. 14.

„ 15,979 (1904). Schmidtgen and König. Process for manufacturing a non-conductor of heat. Sept. 7.

„ 16,987 (1904). Ryser. Building stone. Sept. 14.

X.—METALLURGY.

[A.] 18,658. Bavay. Process for separating by flotation parts of the constituents of ores and other solid bodies from the remainder thereof. Aug. 29.

„ 18,652. Bavay. Apparatus for separating by flotation parts of the constituents of ores and other solid bodies from the remainder thereof. Aug. 29.

„ 18,660. Bavay. Process for separating by flotation zinc blende from ores, tailings, concentrates, and slimes, and for preparing such ores for such separation. Aug. 29.

„ 18,674. Annable, Steinhardt, Vogel, and Tungsten Rare Metals Co., Ltd. Treatment of nickel ores. Aug. 29.

„ 18,746. Goodsell. Method of and apparatus for treating sheet iron and steel.* Aug. 30.

„ 18,977. Vanderlip. Ore concentration. Sept. 2.

„ 19,053. Massenez. Manufacture of steel by the basic Bessemer process. Sept. 3.

„ 19,140. Swyny and Plucknett. Ore separators and classifiers.* Sept. 5.

„ 19,142. Swyny and Plucknett. Process for extracting normally buoyant mineral particles from slimes, tailings, and like metalliferous materials.* Sept. 5.

„ 19,233. Guye. Treatment of lead sulphide, or ores thereof, to obtain volatile products. Sept. 6.

„ 19,251. Thompson (Carlo, Tito, and Pollak and Rothschild). Alloy, and process for manufacturing the same. Sept. 6.

„ 19,269. Rawson and Elmore. Process for extracting gold from solutions. Sept. 7.

„ 19,394. Fyfe. Ore-roasting furnaces, and means for producing and depositing fumes from ores. Sept. 8.

„ 19,464. Reinke. Process for briquetting friable ores. Sept. 9.

„ 19,497. Turnbull. Apparatus for separating water-borne particles of varying density, such as finely divided ore, &c. Sept. 9.

„ 19,555. Abelspies. Ore concentrating and classifying apparatus. Sept. 10.

„ 19,653. Ellis and Highton. Apparatus for extracting gold from slimes, tailings, or the like. Sept. 12.

[C.S.] 12,727 (1903). Auchinachie. Manufacture of metallic vanadium from its ores or any other compounds of vanadium. Sept. 14.

„ 19,226 (1903). Deutsch. Plunger-jig for treating ores. Sept. 14.

„ 19,353 (1903). Lake (Sanfilippo). Ore-roasting and like furnaces. Sept. 21.

„ 18,989. Müller. Insulating substance, and method of making same. Sept. 2.

„ 19,266. Ziegenberg. Galvanic cell.* Sept. 6.

„ 19,571. Bloxam (Soc. Anon. d'Études Electro-Chimiques). *See under* VII.

„ 19,898. Blackburn. Primary batteries. Sept. 15.

„ 20,003. Birkeland and Eyde. Process and furnace for subjecting solid materials to the action of the electric arc. [Appl. in Norway, Sept. 19, 1903.]* Sept. 16.

[C.S.] 14,221 (1903). Dreibholz. Galvanic batteries. Sept. 7.

„ 23,712 (1903). Nehmer. Manufacturing of dry batteries. Sept. 7.

„ 8216 (1904). Gin. Electric furnace for converting pig iron into steel. Sept. 21.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 18,797. Nicholson and Shepherd. *See under* V.

„ 19,043. Le Brocquy. Oils for lubricating gun barrels. Sept. 3.

[C.S.] 25,010 (1903). Harvey. Manufacture of dry soap powders. Sept. 7.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*B.*)—Resins, Varnishes.

[A.] 19,282. Dunnett. Composition for preventing the incrustation and preserving the hulls of ships. Sept. 7.

„ 19,583. Pugh. and Rudge Whitworth, Ltd. Application of varnishes and the like. Sept. 10.

[C.S.] 17,135 (1903). Tixier and Rambaud. Process for the manufacture of varnishes by the direct solution of gums without previous fusion. Sept. 14.

„ 21,020 (1903). Johnson (Foelsing). Apparatus for the treatment of products containing gums and resins, for the separation and obtainment of the gums and resins therefrom. Sept. 21.

(*C.*)—India-Rubber.

[A.] 19,780. Owen and Threlfall. *See under* XIX.

XIV.—TANNING, LEATHER, GLUE, SIZE, Etc.

[A.] 18,691. Jerret, Graham, and Blair. Leather-dressing composition. Aug. 30.*

„ 19,244. Sonoff and Zwerkoff. Curing skins and hides. Sept. 6.

„ 19,323. Petersen. Cleansing and dyeing gloves, skins, leather, and the like. [Appl. in Denmark, Sept. 9, 1903.]* Sept. 7.

„ 19,779. Owen and Threlfall. Manufacture of leather. Sept. 14.

„ 19,780. Owen and Threlfall. Manufacture of leather for use as a substitute for india-rubber and for other purposes. Sept. 14.

[A.] 19,989. Nusch (Sorel). *See under* VI.

[C.S.] 18,677 (1903). Muir. Treatment of skins or hides anterior to and during the process of tanning. Sept. 7.

XVI.—SUGAR, STARCH, GUM, Etc.

[C.S.] 26,799 (1903). Lafeuille. Annular moulds for treating sugar by centrifugal action. Sept. 21.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 19,587. Hunt. Manufacture, purifying, and maturing or flavouring of spirit. Sept. 10.

[C.S.] 19,645 (1903). Monti. Treatment of wine, must, beer, beetroot juice, and the like, and apparatus therefor. Sept. 14.

„ 24,294 (1903). Jensen (Diessler). Process for freeing yeast extracts from bitter principles. Sept. 14.

„ 28,264 (1903). Plischke and Beschorner. Malting apparatus. Sept. 7.

„ 14,028 (1904). Schueible. Art of brewing. Sept. 21.

„ 15,370 (1904). Boult (Pabst Brewing Co.). Pasteurising apparatus. Sept. 7.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 18,906. Ross. Production of foods for animals.* Sept. 1.

„ 19,082. Cornthwaite. *See under* XXIII.

„ 19,676. Bell. Process for preserving flesh meat and other foodstuffs. Sept. 13.

[C.S.] 9684 (1904). Maggi. Manufacture of milk powder. Sept. 21.

(*B.*)—Sanitation; Water Purification.

[A.] 19,444. Adams. Filter beds for sewage or other purposes. Sept. 9.

„ 20,031. Gaskell and Day. *See under* I.

[C.S.] 19,599 (1903). Adams and Springborn. System for the purification of sewage and other fluids. Sept. 7.

„ 19,644 (1903). Talbot. Means for purifying air. Sept. 21.

„ 17,307 (1904). Walter. Water purifying apparatus. Sept. 14.

(*C.*)—Disinfectants.

[C.S.] 18,678 (1903). Muller. Insecticide. Sept. 7.

„ 19,837 (1903). Kösters. Process for forming solutions of antiseptics which are otherwise insoluble or not easily soluble. Sept. 21.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 18,742. Krais and The Bradford Dyers' Association, Ltd. Manufacture and application of nitrocellulose solutions. Aug. 30.

„ 19,178. Beadle and Stevens. Manufacture of blotting and other water-leaf papers. Sept. 6.

[A.] 19,310. Thiebaut. Manufacture of paper, cardboard, and the like. Sept. 7.

[C.S.] 11,253 (1904). Noyes and Krueger. Machines for coating paper and like materials. Sept. 7.

„ 16,403 (1904). Nebrich. Pulp strainers for paper manufacture. Sept. 7.

„ 17,232 (1904). Homberger. Method of imparting lustre to objects made of celluloid or the like. Sept. 14.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 18,825. Newton (Bayer and Co.). Manufacture of a pharmaceutical compound. Aug. 31.

„ 19,411. Zimmermann (Chem. Fabr. auf Actien, vorm. E. Schering). Manufacture of dialkylated barbituric acids. Sept. 8.

„ 20,071. Wetter (J. D. Riedel). Pharmaceutical compounds having the therapeutic properties of codeine, and processes for the manufacture of the same. Sept. 17.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 18,890. Von Garainow-Trauttenberg and Fabian Method of production of photographic paper an the like. Sept. 1.

„ 19,940. Smith. Photographic plates or films. [Ger Appl., Sept. 17, 1903.]* Sept. 16.

[C.S.] 25,144 (1903). Newton (Bayer and Co.). Manufacture of new sensitising dyestuffs and intermediate products for use therein. Sept. 7.

„ 17,009 (1904). Lake (Jacobsen). Photographi reproductions. Sept. 14.

„ 17,036 (1904). Lake (Jacobsen). Photographi reproductions. Sept. 14.

„ 17,610 (1904). Schmidt. Pigment photographi processes. Sept. 21.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 19,200. Hall. Manufacture of explosives. Sept.

„ 20,106. Evangelidi. Explosives.* Sept. 17.

[C.S.] 23,766 (1903). Unge. Slow-combustion compos tions for fuses, self-propelling explosive proje tiles, and the like. Sept. 7.

„ 11,000 (1904). Steel. Explosive. Sept. 21.

„ 12,627 (1904). Hough. Nitrated carbohydrate Sept. 7.

XXIII.—GENERAL ANALYTICAL CHEMISTRY.

[A.] 19,082. Cornthwaite. Soxhlet extractors f analysis of milk, cereals, cattle foods, &c. Sept.

„ 19,337. Decker. Goniometers or similar instr ments. Sept. 7.

[C.S.] 15,706 (1904). Thompson (Verein. Maschine fabr. Augsburg und Maschinenbauges. Nürnber A.-G.). Method for the continuous determin tion of the hydrogen contents of gaseous mixtur and apparatus therefor. Sept. 7.

Notice.

COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Aiden, Fredk., l/o 17th Street; 342, 22nd Avenue, Milwaukee, Wis., U.S.A.

Baxter, John G.: all communications to Nine Elms Cement Works, Cliffe, Kent.

PROCEEDINGS

OF THE

TWENTY-THIRD ANNUAL MEETING.

About 100 members and ladies from Europe, the bulk of whom travelled by the steamships "Baltic," "Campania," "Kaiser Wilhelm der Grosse," and "Majestic," arrived in New York for the Annual General Meeting, and were received on landing by Drs. H. Schweitzer, V. Coblentz, R. W. Moore, E. G. Love, and W. McMurtrie, Prof. E. Hart, Mr. N. J. Lane, and Mr. and Mrs. F. Hemingway, acting on behalf of the Reception Committee, and conveyed to the Society's head quarters, the Hotel Seville, Madison Avenue, in automobiles.

On Wednesday evening (Sept. 7th) a reception was held at the Chemists' Club, West 55th Street, which was attended by a large number of members and ladies

Thursday, September 8th, 1904.

The twenty-third annual meeting of the Society was held in the Gymnasium of Columbia University, New York City, on Thursday, September 8th, 1904. The President, Sir William Ramsay, K.C.B., F.R.S., occupied the chair.

Prof. Charles F. Chandler, in welcoming the Society on behalf of the faculty of Columbia University, said it was eminently proper that the Society of Chemical Industry should hold its first meeting on that side of the Atlantic Ocean in the halls of Columbia University, which was one of their oldest institutions of learning, having been founded by King George II. by Royal Charter in 1754, one hundred and fifty years ago, under the name of King's College. At the close of the War of Independence the college had been opened under its present name of Columbia. Columbia was in the forefront for the study of the sciences; she had been the very first in this country to establish a School of Mines and cognate School of Sciences, founded on a regular prescribed course of four years, with strict requirements of personal preparation, and graded courses specially designed and devised for the education of those men who wished to make the applied sciences their professions for life—mining engineers, metallurgical engineers, mechanical engineers, electrical engineers, chemists, and architects. It was indeed a great pleasure to welcome the distinguished President of the Society. The late Dr. Barnard, President of the University, had provided in his will that once in five years there should be awarded a gold medal to the person who during the previous five years had made the most important contribution to physical science, or who had conferred the greatest benefit upon mankind by the application of the sciences. That medal was to be awarded by the trustees of Columbia University on the nomination of the Nationa Academy of Sciences. At the end of the first period of five years, when the Academy met at Washington to consider who should be named as the first recipient of this medal, it had been decided that the most prominent contribution to physical science during the previous five years had been the discovery of the curious and inert element argon But this great discovery had been due to the joint labours o Lord Rayleigh and Sir William Ramsay. Although the wil of Dr. Barnard had provided but for a single gold medal President Low had risen to the occasion and had said ther should be two medals, and those two medals had been conferred, one upon Lord Rayleigh and the other upon Si William Ramsay. So they claimed Sir William Ramsay a belonging to Columbia. He expressed the hope that thei English guests would enjoy the three weeks' trip which ha been arranged for them.

The President, in the name of the Society, cordiall thanked the Trustees of the University for the use of th magnificent hall in which they then were, and Dr. Chandler for his extremely kind welcome. He said that it had been the greatest possible pleasure to come and visit their brethren of America. The recollection of the War of Independence was not an unpleasant one to most Englishmen, whose feelings had so changed that, if a poll of the country were taken, he doubted whether there would be found an Englishman who would not in that war have fought on the American side.

The General Secretary read the minutes of the last annual general meeting, which were passed, and signed by the President. He then read the list of new members of the Council (see this J., Sept. 15, 850), and stated that two Vice-Presidents had resigned, namely, Prof. Procter and Mr. Carey, who had been elected respectively chairmen of the Yorkshire and the Liverpool Sections, and did not wish to duplicate their offices. In their places Mr. David Howard and Dr. V. Coblentz had been elected.

The President, after announcing that Mr. William H. Nichols, President of the General Chemical Company of New York, had been elected President of the Society for the ensuing year, said, with regard to the Report of the Council (see this J., Sept. 15, 851), the number of members on the register was 4134; at the same time last year it had been 3959. Four hundred new members had been elected, as compared with 380 last year, and the losses had also been fewer—216 as against 224. There had been 29 deaths. The Journal numbered 1378 pages; and 90 original papers, with discussions, had been published, as compared with 81 in the previous year. Since the last meeting a new section had been added to the Society, in Sydney, Australia. Important papers relating to the tariffs and trade regulations with other nations had been furnished from the Board of Trade. These would no doubt prove interesting, not merely in the British Isles, but also in the United States, for the sake of the information contained in them.

Dr. Harvey W. Wiley, of Washington, D.C., U.S.A., moved, and Prof. A. C. Humphreys, of Stevens Institute of Technology, of Hoboken, N.J., U.S.A., seconded the adoption of the report, and the motion was carried.

The President, in answer to a question, said that there were 1250 members in the U.S.A., not including the Canadian members.

The President invited Mr. Thomas Tyrer to read the report of the Honorary Treasurer, Mr. Hall, who was, unfortunately, not able to be present.

Mr. Tyrer expressed his regret at the absence of their highly esteemed Honorary Treasurer, and pointed out the satisfactory character of his Report as regards the balance. In connection with that, however, he had to draw attention to the likelihood, in the near future, of some increase in the cost of printing the Society's Journal. Its bi-monthly issue had, he thought, been fully justified by the results, but it had proved to be more expensive than had been anticipated, and the printers were therefore terminating the present contract as unremunerative to themselves. An important source of income to meet the expenses of the Journal was that of advertisements, to which the Treasurer had called attention in his Report, at the same time pointing out that those who could advertise in the Journal would be assisting the Society's work by so doing. Mr. Tyrer concluded by reading the last three paragraphs of the Treasurer's Report (which has already appeared in full in the Journal for Sept. 15th, p. 852).

Dr. McMurtrie echoed Mr. Tyrer's expressions of regret at the absence of Mr. Hall, and at the cause of that absence. Mr. Hall's very valuable Report was gratifying as showing the real prosperity of the organisation, and he believed that they were all glad to join in congratulations to the Treasurer and those who had supported him. Therefore he moved the adoption of the Report, and expressed the thanks of the Society to the officers who had had it in charge.

Prof. Edward Hart seconded the motion, which was carried unanimously.

The President then read his address. (See J., Sept. 15, pp. 852—857.)

The President-Elect, Mr. W. H. Nichols, stated the appreciation which the members of the New York Section felt of the honour which had been brought to them by holding their meeting on that side of the Atlantic Ocean; the New York Section felt keenly the honour which for the second time had been conferred upon one of its members by electing him to its presidency. Personally, as the one chosen to fill that office, he felt his inadequacy. He knew he had not been selected for anything which he had done, or for anything which he could reasonably expect to do; but he had been selected because so many friends in the New York Section had felt disposed to name him as their candidate; he cordially thanked his friends for putting him forward as representative of what they hoped their President might be. It would be his desire, in carrying out the duties of the office, to do what he could in his humble way to follow in the steps of the gentlemen who had occupied the position. He then moved a vote of thanks to the gentleman who had just finished reading one of the ablest papers which it had been his pleasure to hear on that subject—the subject of the education of the technical chemist. In the New York Section it was a matter that had shown evidence of sharp divergence of opinion, but they had before them the word of the master, which it would be well to consider and to take to their hearts. In moving this vote of thanks he did so not only for the paper, but also for the man himself, who had permitted himself to be used in the office of President during the past year, to bring all that he had been able to bring to the advantage and glory of this Society.

Prof. Charles F. Chandler, in seconding the motion, said he had listened to this address with the greatest interest, and felt sure every teacher of chemistry in the English-speaking world would read it and consider carefully its recommendations. For his own part, he should certainly study it with the greatest care. He was apprehensive, however, how far it would be possible to adopt those radical suggestions in an institution like Columbia University, where there were over 700 students working in the chemical laboratory, where the appropriations were not half sufficient to provide the necessary apparatus and chemicals, where the laboratories were so very crowded that it was almost impossible to find standing room for the young men who were entitled to the required laboratory practice in chemistry, and where the number of instructors was not half sufficient for the number of students. And this condition at Columbia applied, to a greater or less extent, to most of the larger institutions in America; but the presentation of this ideal plan of chemical instruction, and the spreading of it upon the records, where it might be read, not only by the patrons of chemistry, but by the authorities of our institutions, and further, by the liberal citizens of this country, who were so ready to come forward, when the necessity could be brought home to them, to provide the facilities for proper study and instruction, would serve a useful purpose. He took great pleasure in seconding that motion for a vote of thanks.

The motion was put, and carried unanimously by a rising vote, amid much applause.

The President thanked the meeting very heartily for the cordial reception which they had given to his address. In regard to the phase which Prof. Chandler put forward, the only remedy he could suggest would be to erect more laboratories, to subdivide the offices, and give to each of a number of professors of chemistry complete charge over all his particular department. There should not be one department of chemistry in the University, but some eight or nine. It was now his extremely pleasant duty and greatest possible pleasure to give the medal of the Society, which was awarded every two years, to his very old friend Prof. Ira Remsen, President of the Johns Hopkins University. He was known throughout the whole of the United States, throughout the whole Continent, as well as in England, as one of the most eminent and resourceful of chemists: he it was whose work had led to the discovery of that curious substance, saccharin; not only had he promoted chemical industry in that particular way, but he had trained a very large number, perhaps the majority, of the technical chemists in America; he certainly was a focus, a centre of learning, from which learning had spread throughout the whole of the United States. His first acquaintance with Prof. Remsen had been in the year 1871, when he rang the front-door bell of a door which was never opened, he believed, except when the King of Württemberg entered the University of Tübingen. The door was finally opened, after several pulls at the bell, by a man wearing a blue apron, and with rather black hands. He (Sir Wm. Ramsay) put the following question to him:—"Können Sie mir sagen, wo ist das Vorlesungszimmer?" This man was Prof. Remsen, and he said, "You want to find the lecture room, don't you?" Ever since, they had known each other intimately, and had corresponded for upwards of thirty years. In acknowledgment of his conspicuous services to technical chemistry, the Council of the Society, with the concurrence of the whole Society, had directed him, as President, to offer Prof. Remsen this medal, with the hope that he would long live to wear it.

Prof. Ira Remsen said it was scarcely necessary for him to say that he was deeply gratified by that act of the Council of the Society. What more could he say? The subject which the circumstances suggested was not an inspiring one. He could not talk touching himself. Indeed, altogether too much had been said on that subject. He wished he could believe one-half of what Sir William had said; it would be a pleasure to him, as the receipt of that medal was a pleasure. The subject of teaching had been suggested by what had been said. Of course the subject in general was one that he might enlarge upon, but he thought they would hardly care to hear it, nor should he care to take up their time in discussing it. To the study of teaching he had given his life. He could, he thought, enlarge upon that, because his heart was full of it even now, when circumstances had made it necessary for him to give up most of the work in that line in which he had been engaged since the memorable day when he opened the front door for Sir William. It was of course a great pleasure to see so many members of the Society there, and especially to see his "very old friend" again.

[A portrait of Prof. Remsen is enclosed with this issue of the Journal.]

Mr. J. B. F. Herreshoff moved that Messrs. Miall, Wilkins, Randall, and Co. be elected auditors of the Society at a remuneration of 10*l.* 10*s.*

Mr. Maximilian Toch seconded, and the motion was carried.

The President read a letter from the Chairman of the London Section, Mr. Reid, officially and heartily inviting the Society to hold its next annual meeting in London.

Dr. R. Messel moved that the next annual meeting of the Society be held in London. He thanked the New York Section for its kind attention and hospitality, and assured them that the Society would be no less warmly and cordially welcomed by their London brethren.

Dr. J. Lewkowitsch seconded the motion, and assured the members that everything would be done to make their stay in London pleasant.

Mr. Thomas Tyrer supported the motion and endorsed Mr. Reid's letter of invitation.

The motion was unanimously adopted.

Mr. Wm. T. Matheson moved that the thanks of the Society be given to the President and Trustees of Columbia University for the hospitality shown the Society and facilities afforded it.

Mr. Thomas Tyrer seconded the motion, and it was passed by a standing vote. This concluded the business, and the proceedings terminated.

After the meeting, a photograph of the members in a group was taken on the steps of the library of Columbia University.

The Annual Dinner.

The Banquet was held at the Waldorf-Astoria Hotel, Prof. Charles F. Chandler acting as toastmaster.

The Toastmaster proposed the health of the President of the United States, which was drunk standing. He then proposed the health of his Majesty, King Edward, which was also drunk standing.

The Toastmaster in announcing that the next toast, the Society of Chemical Industry, called for a response from the late President of the Society, said he felt that the late President owed an apology to the Society for having brought into the world five of the laziest elements, and he asked if any one had ever heard any good word for argon, neon, krypton, xenon, or even helium. He certainly thought that the late President owed the Society an apology for bringing into the chemical elements a lot of tramps.

Sir William Ramsay, in responding, referred to his address in the morning at the annual meeting, saying it was his hope to bring into closer touch Science and Industry, and that he lived in the hope—and believed that the Society would share his hope—that the present President would look at the other side of the shield in his address at the next annual meeting, and that he would touch upon the relation of Industry to Science. He confessed to the justice of the charge of bringing into the world—although one was in the curious position of having two fathers—a set of lazy tramps, and stated that there was another body which had recently been born—only about two months ago. He went on to relate the circumstances that led to the discovery of that body, and stated that experiments were now in progress to try which of certain suppositions were correct, and it appeared to him that they were on the brink of a discovery of the synthesis of atoms which would themselves decompose, and possibly into the ordinary well-known elements, and in this way prove to be the ultimate sources of these elements. It was a mere hope, he said, but he gave it to the Society for what it was worth. Having effected the introduction of his very latest child, he would like to add just a few words on the subject of the toast, the Society of Chemical Industry. He foresaw that the New York Section of the Society was bound to grow very rapidly, but whatever they did they must not quarrel. They must devise some means of living together in peace and harmony, and it was for his successors to consider this question very carefully. That union had to be preserved; but difficulties would obviously arise when the child outgrew the parent and became much larger. He was not going to prophesy, but it would demand very careful consideration. He thought they might remain in perfect union as one body, with sections not merely in America and England, but also in the English colonies. Indeed, he hoped it would foreshadow a much larger union, for he did not see why the two nations, America and Greater Britain, should not work together in absolute peace and harmony; not, of course, under one government, but in thorough agreement to support each other through thick and thin. Sir William then thanked the Society for the very cordial way in which it had received the toast, the Society of Chemical Industry.

A toast to the Verein Deutscher Chemiker was then drunk amid cheers.

Dr. Erdmann replied in German.

The subject of the next toast was Industrial Corporations.

Prof. Wiley, in responding, quoted statistics in regard to the wealth, population, and voting strength of the United States, and then, referring to the prophecy of Sir William, said there was no danger of a dissolution of the unity of the Society of Chemical Industry. There was a little fact in history which they had possibly forgotten—that they parted from England because they were taxed without representation; but that did not occur in the Society of Chemical Industry. They were taxed, it was true, but they had a large representation. So there would be no Boston Tea Party in the Society of Chemical Industry. They had a perfect community of interests, and that community of interests was not confined to the science of chemistry; it was a community of interests that percolated every feature of their common international life. Further, he believed such meetings as those—meetings that were international in character—did more to draw together already strong ties than any amount of preaching in the public prints could do. They saw their fellow-man face to face; they saw the character of the man, and then began to appreciate that it was the man, for, after all, it was the man—the man as a man. In the great sphere of industry it was the man—the man was measured by his industry, but the man was the thing. Industry was incident to the man and his develop ueur, and it was because industries developed manhood, nd not because they brought dollars, that industries were seful to man.

The Toastmaster then called upon Dr. Wilhelm Ostwald, f Leipzig, to say a few words.

Prof. Ostwald, after expressing regret, as a man who ame from the land of theory to the land of practice, at not aving heard any speeches or discussions on chemical industry at the meeting, and having referred to the fact that there vas no quarter on the surface of the globe where no member f the Society was residing, said that the Society was therefore nternational, and if they would look through all things they vould find nothing more international, nothing more naturally nternational, than science; there existed nothing in the whole vorld that was quite the same thing, whether you considered ngland, Japan, Sweden, or the frontier land in South Africa. cience was indeed the only thing that formed a part of the quipment of every body of men which had reached some legree of civilisation. He then expressed the hope of seeing he day when all people would speak one language, and stated hat science was indeed the tie that held nations together. cience was spreading over all lands. International science vould be the means of uniting all peoples of the world. o this purpose he drank to the furtherance of the idea of nternational brotherhood, beginning with science and ending vith the union of hearts. Science was brotherhood. The oast was drunk by the assembly amid cheers.

The Toastmaster proposed the toast, "American Chemical ndustry," and called upon the new President of the Society o respond.

Mr. Nichols, in replying, stated that chemical industry in he United States was of comparatively recent growth, but vas not altogether without interest. He referred to the ffect of the American tariff on chemical industry, and the act that America had all kinds of raw materials. In eferring to the cost of labour, he stated that it was his xperience that it paid well to pay men well, and cited an nstance where by paying certain labourers double the wages hey received abroad for certain work it cost his firm rather ess to turn out a ton of ore with those identical men than t did their former employers at half the wages. That was he only way in the world that the American manufacturer with high-priced labour was able to compete with the foreign manufacturer at lower cost. In other words, it was perfectly possible in his judgment for the foreign labourer to produce wice his present result if he received twice the pay. In ecalling the names of the men who had been the pioneers n the domain of American chemical industry, Mr. Nichols eferred to Mr. Weightman, of Philadelphia, lately deceased, Martin Kalbfleisch, of Brooklyn, Major Knight, Eugene Kressley, Mr. Gridley, Hugh Cochran, ex-Mayor Tiemann, of New York, Mr. Chappell, and Mr. Bowers, who he said were the originators of what was known as American hemical industry to-day. The future was in the hands of the young men, many of whom were present. It was to them that they looked for the future of chemical industry; the young men had it in their power to make it worthy of the great country in which they lived.

The Toastmaster then called upon the British Vice-Consul, Mr. Clive Bayley, to give some impressions of New York.

After expressing regret at the absence from the city of the Consul-General, Mr. Bayley narrated his impressions and experience since coming to New York, and said, further, he hoped that was not the only time that they would be able to have impressions of New York, and that not only they, but every Englishman, would make it his duty and his object in life to come not only to New York, which was not the United States, but to the whole United States, becoming better acquainted with their own sons, their own relatives.

The Toastmaster then proposed a toast to the English committee which arranged the trip to the United States, and called upon one who had been familiar with the affairs of the Society since its inception—their past president, Mr Thomas Tyrer.

Mr. Tyrer, in calling attention to the American colours —red, white, and blue—which decorated the hall, noticed the fact that the same colours appeared in the British ensign and the tricolour, which were also among the decorations. He warmly advocated the cosmopolitan and international character of the Society. He stated that this meeting with the New York Section differed from meetings held 20 or 21 years ago only in two things: first, in locality, and second, in the peculiarity of the conditions under which hospitality had been extended. Mr. Tyrer then paid a glowing tribute to the ladies' committee of the New York Section, which had looked after the welfare of the wives and daughters of the visitors, and also warmly thanked the committee which had looked after the party from the time of their landing in New York up to that time.

The Toastmaster then said he could not bring that delightful function to a close without calling upon the man who was practically responsible for the Society of Chemical Industry in America—Dr. Hugo Schweitzer.

Dr. Schweitzer, admitting that he was godfather when the New York Section was founded, went into a history of the growth of the Section in New York. Ten years ago there existed the American Chemical Society in New York, which was strictly devoted to science; the industrial chemists had been hardly represented in it, and had no voice in the management of the Society. At that time some kindred spirits had started the Section with about 300 members; to-day they were 1250. He knew his Section, knew the members—knew fully 90 per cent. of the members belonging to it—and they were loyal to the parent Society, and would never depart from it. This was not sentiment, he said, but was absolute materialism. Dr. Schweitzer also referred to the value of the Journal as being the best paper published for chemists. As chairman of the general committee of arrangements for the entertainments and annual meeting, he desired to express his thanks to Drs. Coblentz and Moore, Mr. Zabriskie, and Messrs. Parker and Love, the last two of whom he called the "Gold Dust Twins," they having looked after the financial side of the matter.

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d*. each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s*. each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3°).

I.—PLANT, APPARATUS AND MACHINERY.

English Patents.

Furnaces; Mill and the like ——. D. G. Davies, Birmingham. Eng. Pat. 19,542, Sept. 10, 1903.

The furnace is constructed with double walls and a double roof, the spaces thus formed communicating with each other and opening into the ash-pit by means of holes formed within the inner walls under the grate bars. Suitable means of access are provided for clearing out the holes. The air-inlet, which opens directly into the double roof, is controlled by a damper.—L. F. G.

Grinding Mills for Gradual and Variable Pulverisation. J. Rakowski, Warsaw, Russia. Eng. Pat. 20,932, Sept. 29, 1903. Under Internat. Conv., Nov. 22, 1902.

The grinding stones, of which there are several and which act successively, have gradually diminishing diameters, and gradually increasing grinding surfaces. The weight of the grinding stones can be varied as desired. For this purpose certain parts of the stones, *e.g.*, the lateral walls or parts, are made of sufficiently heavy material, and are detachable.
—W. H. C.

Distilling and Condensing Apparatus. J. S. Forbes, Philadelphia, Pa. Eng. Pat. 10,157, May 3, 1904.

See U.S. Pat. 760,440 of 1904; this J., 1904, 652.—T. F. B.

Filter Elements. K. Kiefer, Cincinnati, U.S.A. Eng. Pat. 14,381, June 25, 1904.

See Fr. Pat. 325,255 of 1902; this J., 1903, 690.—T. F. B.

Heating Liquids; Apparatus for ——. A. Waldbaur, Stuttgart, Germany. Eng. Pat. 15,875, July 16, 1904.

Hot gases from a combustion chamber are drawn into a separate chamber by means of sprayed jets of liquid, with which they mix, and thus uniformly heat the liquid.
—L. F. G.

United States Patents.

Roasting Furnace. O. Hofmann, Argentine, Kans. U.S. Pat. 768,748. Aug. 30, 1904.

A roasting furnace of the Herreshoff type is constructed with a vertical hollow shaft, provided with adjustable hollow arms to which stirrers are attached. In the centre of the hollow shaft an air pipe is fixed, so as to rotate with it, having branch pipes projecting into the hollow arms. The cooling air is forced through the central pipe into the branch pipes, and returns between the latter and the hollow arms to the hollow vertical shaft.—W. H. C.

Drying Kiln. H. J. Morton, Chicago. U.S. Pat. 768,813, Aug. 30, 1904.

The kiln has a vertical series of air-inlet ports in one wall, so arranged that the air can be admitted at different levels. The air-outlet ports are similarly arranged in the opposite wall.—W. H. C.

Drying Apparatus. M. Bertrand, Grigny, France. U.S. Pat. 769,643, Sept. 6, 1904.

The apparatus consists of a main closed chamber, connected at each end with an auxiliary chamber. Hot air is admitted at one end, and a draught chimney is placed at the other end of the main chamber. One of the auxiliary chambers also contains a draught chimney. Lateral heating pipes are arranged in the main chamber, being separated by lateral partitions from a truck-track. Sliding doors are provided for closing the main and auxiliary chambers.
—L. F. G.

Crucible and Preheater; Combined ——. J. A. Aupperle, Indianapolis, Ind. U.S. Pat. 768,972, Aug. 30, 1904.

A crucible is provided with air inlet and outlet tubes, which are connected with a device for preheating, and a wash-bottle for purifying the air before it passes to the crucible. The crucible is surrounded by a water jacket.
—W. H. C.

Filter. E. Boellinghaus, Hamburg. U.S. Pat. 769,143, Sept. 6, 1903.

See Eng. Pat. 27,287 of 1903; this J., 1904, 708.—T. F. B.

Condenser. O. S. Still, Annette, Cal. U.S. Pat. 770,127, Sept. 13, 1904.

In a vertical casing having a conical bottom, provided with an outlet tap, a determined depth of water is maintained. A vertical pipe, forming the uncondensed-vapour outlet, extends from a slight distance above the surface of the water, through the centre of the casing, to above the top. The vapour inlet is situated near the top of the casing, and above it is a spraying device and means for supplying liquid to form the spray.—W. H. C.

Liquid-cooling Apparatus. A. Siebert, St. Louis, Mo. U.S. Pat. 770,190, Sept. 13, 1904.

A zigzag series of double sloping shelves, down which the liquid to be cooled flows, are held in a frame and so arranged that the liquid from the upper shelf of one set flows on to the lower shelf of the next, and *vice versa*. There is a cooling shelf between the shelves of the lowest set, and means are provided for feeding the liquid on to it.
—W. H. C.

French Patents.

Drying Apparatus for all kinds of Substances. H. Diedrich. Fr. Pat. 342,417, April 18, 1904.

See Eng. Pat. 4173 of 1903; this J., 1904, 315.—T. F. B.

Furnaces. White-Mylin Furnace Co. Fr. Pat. 342,434, April 19, 1904.

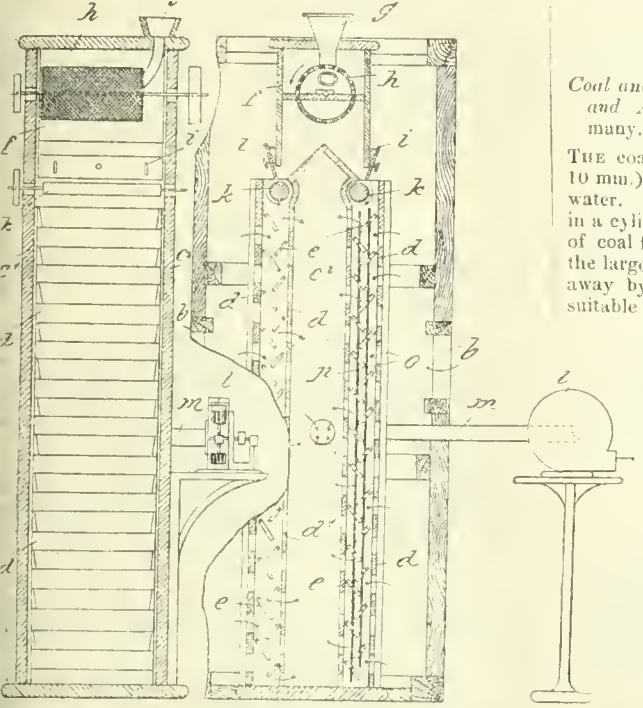
See Eng. Pat. 6855 of 1904; this J., 1904, 600.—T. F. B.

Extraction and Distillation Apparatus. C. Garnier. Fr. Pat. 312,534, April 22, 1904.

A horizontal cylindrical frame, carrying around its periphery a number of smaller cylindrical frames formed of rods, is mounted on an axis, capable of rotation, within an outer casing forming the still. The material to be extracted is contained in cylindrical, perforated, metal cages, which are placed in the frames around the inner cylinder. The apparatus is heated by a steam coil, and filled to about one-quarter of its height with the solvent, means for charging and drawing off which are provided. The outer casing is provided with a still head and condenser for dealing with the products of distillation.—W. H. C.

)esiccating and Cooling Granular Products, such as Crystallised Sugar, &c.; Apparatus for ——. F. Hall. Fr. Pat. 342,619, April 25, 1904.

'he material to be treated is fed through a hopper, g, and he rotary sieve, f, on to the series of sloping shelves, e, y means of the rollers, k. The whole is surrounded by ie casing, c. A current of air, produced by the suction f the fan, l, is drawn through h, and the openings, o and p, cross the shelves. Means are provided for heating the ielves and for adjusting the angle at which they are set.—W. H. C.



II.—FUEL, GAS, AND LIGHT.

'uels; Valuation of Mineral ——. E. Goutal. Ann. Chim. anal. appl., 1904, **9**, 242—246. Chem. Centr., 1904, **2**, 726.

ECENTLY several samples of coal from one and the same oring gave calculated values (this J., 1902, 1267) differing onsiderably from those determined calorimetrically. The ause of the discrepancies was found to be the contamination f the coal with adherent gangue, which latter, in this ase, contained considerable quantities of volatile matter. 'he author also draws attention to the necessity of the xygen used in calorimetric determinations being perfectly ee from hydrogen. Electrolytic oxygen seldom contains ss than 1 per cent., and frequently more than 2 per cent. f hydrogen, and the error caused in this way may amount several hundred calories.—A. S.

'ulphuretted Hydrogen; Bacterial Production of ——. [Pollution of Coal-Gas.] J. G. Taplay. J. Gas Lighting, 1904, **87**, 734.

T one of the testing-stations of a London gas company, was recently found that the gas, when submitted to the 'as Referees' test, gave stains indicating the presence of ydrogen sulphide, whilst in the laboratory immediately ver the testing-station, no such indication could be obtained. he source of the contamination was found to be a slightly ncave portion of the service-pipe, in which a small nount of water had lodged. From this water, bacteria ere isolated which were capable of generating hydrogen sulphide in amount sufficient to stain paper moistened with lead acetate solution. Gas free from hydrogen sulphide became contaminated by the latter by contact with this water.—A. S.

Flue Gases; Rapid Method for Testing ——. H. Le Chatelier. XXIII., page 951.

Phosphorus in Calcium Carbide; Determination of ——. H. Lidholm. XXIII., page 951.

English Patents.

Coal and the like; Apparatus for simultaneously Washing and Assorting ——. C. J. Kremer, Dortmund, Germany. Eng. Pat. 23,259, Oct. 27, 1903.

The coal is fed on to a sieve with large mesh (about 10 mm.) placed in the upper portion of a vessel containing water. The water is kept in motion by a piston working in a cylinder at one side of the vessel. The small pieces of coal fall through the meshes into the water, whilst of the larger pieces left behind, the heavier slate is carried away by the water beneath a horizontal plate fixed at a suitable height, into a channel, from which it is removed, whilst the lighter coal passes over the plate, and is collected separately. The small pieces that have dropped through, are washed in another apparatus with a sieve of finer mesh.—L. F. G.

Gases; Manufacturing and Mixing ——. B. Loomis and H. Pettibone, New York. Eng. Pat. 5911, March 10, 1904.

Two generators are connected together and operated reversibly in series for the making of producer-gas and water gas in succession. Whilst water-gas is being generated, it is drawn off by an exhauster and stored in a holder. During the next period the producer-gas is drawn off into a second holder by means of the same exhauster, and simultaneously a certain proportion of the water-gas is admitted from the first holder by means of an auxiliary exhauster. A mixed gas of definite calorific value, suitable for use in high-power gas engines, is thus obtained.—H. B.

Gas Producers [Down-Draught, Suction]. J. J. Deschamps, Paris. Eng. Pat. 12,221, May 30, 1904.

A down-draught producer, operated by suction, is provided at the top with one or more metal casings, having openings at the bottom, down through which tuyères may be passed, so as to penetrate into the mass of the fuel. The casings are connected to the air supply, and have removable covers to permit of replacing the tuyères; they may also be fitted so as to allow of feeding liquid fuel continuously into the tuyères. The casings may be prolonged downwards so as to form protecting sheaths for the tuyères.—H. B.

Gas Producers [Suction]. H. J. Grice, Acocks Green, Worcestershire. Eng. Pat. 16,067, July, 20, 1904.

An annular reservoir for water, at the upper part of the producer, is connected by means of a pipe with the exhaust pipe of the motor, and at each explosion in the latter, a quantity of water is forced from the reservoir into the steam generator, which consists of a series of horizontal tubes extending across the upper part of the producer. The steam generated is sucked by the motor into the producer, along with air. The fire-grate is formed of rotatable bars, provided with cog-like projections to facilitate the breaking up of clinker. The producer gas is led through a cooler and is then passed with water down through a scrubber packed with coke; at the base of the latter is a separating chamber, containing a series of short vertical pipes, through which the gas escapes, the upper open ends of the pipes being shielded from the falling water by means of conical shields. The under sides of the latter are fitted with fine gauze to arrest solid matter and prevent backfiring.—H. B.

Gas of Gas Producers; Method of and Means for Purifying the ——. E. Capitaine, Frankfort-on-the-Maine, Germany. Eng. Pat. 2240, Jan. 29, 1904.

To remove the mechanical impurities in the gas, a fine spray of water is injected into it by means of compressed air, the air being used in quantities insufficient to form an explosive mixture. The apparatus described consists of a vertical shaft, arranged alongside the producer, and divided internally into three vertical compartments. The gas passes down the first compartment, in which it is cooled by means of water; it then flows up the second, at the bottom of which is a diffuser, which throws up a jet of air and water spray; and finally it passes down the third compartment to the outlet. The compressed air is supplied by a pump actuated by the motor which is fed by the producer, so that the proportion of air is varied automatically according to the amount of gas produced.—H. B.

Hydrogen Contents of Gaseous Mixtures; Method for the Continuous Determination of ——, *and Apparatus therefor.* W. P. Thompson. From Verein Maschinenfabr. Augsburg u. Maschinenbau-Ges. Nürnberg. Eng. Pat. 15,706, July 14, 1904. XXIII., page 951.

UNITED STATES PATENTS.

Coking Coal; Process of ——. C. F. Spaulding, Chicago, Ill. U.S. Pat. 769,241, Sept. 6, 1904.

The coal is fired in an oven, and an upwardly directed blast of air and oxygen is forced into the part of the oven above the coal.—L. F. G.

Coke-Oven. J. H. Bowling, Ozone, Tenn. U.S. Pat. 769,246, Sept. 6, 1904.

In a battery of beehive coke-ovens, a flue leads from the coking chamber of each oven into a horizontal main flue running below the ovens, each oven flue being controlled by a valve. At the other side of the ovens is a similar main gas-flue connected to a chimney, the two main flues being connected across by a number of straight and parallel cross flues of rectangular cross-section.—L. F. G.

Peat; Oven for Coking ——, *with Recovery of By-Products.* E. Bremer, Mariupol, Russia. U.S. Pat. 769,531, Sept. 6, 1904.

A vertical retort with perforated sides carries at its upper end a preliminary drier adapted to discharge peat into the retort, and at its lower end a cooling or condensing box for receiving the coked peat, the discharge from the retort being regulated by a valve. A combustion chamber surrounding the retort receives the evolved gases, these being then mixed with air and burned, the hot products of combustion circulating round the drier, and then passing to the chimney. Several retorts are arranged side by side, and surrounded by a common collecting chamber for the combustible gases.—L. F. G.

Gas Producer. W. J. Crossley and T. Rigby, Manchester. U.S. Pat. 768,655, Aug. 30, 1904.

See Eng. Pats. 13,763 and 13,764 of 1903; this J., 1904, 779, 780.—H. B.

"Hydrogen Carbide"; Process of Producing ——. H. S. Blackmore, Mount Vernon, N.Y. U.S. Pat. 770,214, Sept. 13, 1904.

A metallic carbide (*e.g.*, iron carbide), containing at least 9 per cent. of combined carbon, is heated and exposed to the action of a gaseous or fluid sulphurous hydrocarbon (sulphurous petroleum or so-called Lima oil). The sulphur of the hydrocarbon must have a greater affinity for the metal of the carbide than for the hydrocarbon radical with which it is combined.—H. B.

Gas; Apparatus for Purifying ——. W. Everitt, Ilkley, and T. Redman, Bradford, Yorkshire. U.S. Pat. 768,792, Aug. 30, 1904.

The apparatus comprises "a chamber or conduit having screens, a gas inlet to and outlet from said conduit or chamber, and means independent of said inlet and outlet for abstracting portions of gas from and injecting same into said conduit in intermittent currents at high velocity against and through said screen in alternate directions."
—H. B.

Gas; Apparatus for Purifying ——. J. E. Prégardien, Kalk, Germany. U.S. Pat. 769,713, Sept. 13, 1904.

See Eng. Pat. 13,788 of 1901; this J., 1901, 1101.—T. F. B.

[Coal] Gas; Purifying ——. W. O. Felt, New York. U.S. Pat. 769,860, Sept. 13, 1904.

The gas is cooled out of contact with a liquid, scrubbed, and then "subjected to the action of glycerin and subsequently to the action of an oxide."—H. B.

Electrodes of Arc Lamps; Manufacture of ——. M. Lilienfeld, Berlin. U.S. Pat. 769,003, Aug. 30, 1904.

See Eng. Pat. 2698 of 1903; this J., 1903, 691.—T. F. B.

FRENCH PATENTS.

Generator for Poor Gas, free from Tar. L. Boutillier. Fourth Addition, of April 9, 1904, to Fr. Pat. 331,011, April 7, 1903.

The combustion chamber of the generator is constructed with an inclined bottom, and the fresh bituminous fuel is fed upwards from below, to the lowest part of the bottom, by means of a screw conveyor. The tarry matters are thus liberated beneath an incandescent body of fuel. To prevent the escape of any of the tarry matters with the gas, a vertical partition depends from the top of the producer down into the fuel, at a point between the gas outlet and the inlet for the air and steam. The gas is thus compelled to pass through the upper strata of the fuel, which has already been coked in passing up the inclined bottom.
—H. B.

Gas; Process for Manufacturing ——. J. Bueb and Deutsche Continental Gas-ges. Fr. Pat. 342,299, April 14, 1904.

See Eng. Pat. 15,147 of 1903; this J., 1904, 602.—T. F. B.

Gas; Apparatus for Producing ——, *having the Generator placed beneath the Retorts.* H. Poetter. Fr. Pat. 343,487, April 20, 1904.

See Eng. Pat. 8993 of 1904; this J., 1904, 860.—T. F. B.

Water-Gas; [Double] Generators for ——. F. Thuman. Fr. Pat. 342,578, April 23, 1904.

A "double" generating apparatus (consisting of two generators, connected together in parallel during the blast period, and in series during the make period, the direction of the gas through the fuel being reversed periodically) is provided with air-, steam-, and gas-valves so connected together as to prevent explosions through inadvertence. The air (or water-gas) remaining in the ash-pits and passages at the foot of the generators is expelled by means of steam at the end of each phase. If carburetted gas is being made, the inlet valve for the hydrocarbon is also connected to the air-valves as above.—H. B.

Gas Generators [Suction]. W. J. Crossley and T. Rigby. Fr. Pat. 342,627, April 25, 1904. Under Internat. Conv., June 20, 1903.

See Eng. Pat. 13,763 of 1903; this J., 1904, 779.—T. F. B.

"Mixed-Gas" Generator. A. Vizet. Fr. Pat. 342,820, May 3, 1904.

The generator consists of a vertical tubular boiler, having at its base a combustion chamber for solid fuel, the whole being enclosed in a cylindrical casing provided at the foot with an inlet for compressed air, and at the top with an inlet for water and a device for admitting the fuel. By the combustion of the fuel, steam is generated from the water surrounding the tubes; the hot combustion-gases, issuing from the upper ends of the tubes, impinge upon the incoming water supply, which falls in the form of rain from a distributing plate, thus generating more steam; and the mixed gas, consisting of steam and the gaseous products of combustion, is used for motive purposes in the same way as steam or compressed air.—H. B.

"*Mixed Gas*"; *Apparatus for Making* ——. F. R. Boivinet and Soc. Popineau, Vizet Fils et Cie. Fr. Pat. 342,821, May 3, 1904.

The apparatus, which is designed for generating a mixed gas composed of steam and gaseous products of combustion, consists of a vessel, fitted with suitable inlet and outlet valves, into which gas, air, and water are admitted under pressure, the combustion of the gas and air causing the vaporisation of the water. The water is heated beforehand by circulating in a jacket surrounding the combustion vessel. The gas produced may be used for motive or heating purposes.—H. B.

Candles; Rapid Lighting Wicks for ——. A. Haase. Fr. Pat. 342,527, April 22, 1904.

The wicks, freed from fat or wax, are impregnated with a solution of potassium chlorate or nitrate and dried. To increase their inflammability they are then dipped in a solution of sulphur in carbon bisulphide.—W. H. C.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

Benzene and its Homologues from Russian Petroleum; Preparation of ——. W. N. Ogloblin. Z. Farben- u. Textil-Chem., 1904, **3**, 293—294.

The method of preparation depends on the decomposition of the naphthenes by heat, into aromatic hydrocarbons. The petroleum is first heated to 525°—550° C. in iron retorts, which are furnished with iron channels through which the petroleum flows. The outlet of the retort is connected with a receiver which condenses all the substances that boil above 200° C. The lower-boiling portion is condensed in a water condenser, any gas being collected in a gasometer. The portion boiling above 200° C. can be used as fuel or be still further decomposed. The portion boiling below 200° C. is distilled again at a temperature of from 700° to 1200° C. under a pressure of two atmospheres. The distillate is fractionally distilled. The fraction boiling up to 120° C. is called "gray benzol." The fractions from 120° to 200° C. are further decomposed under a pressure of two atmospheres. The portion above 200° C. is used for the preparation of naphthalene, anthracene, &c. The "gray benzol," which amounts to about 12 per cent. of the petroleum, consists of benzene, toluene, and xylene, and can be used at once for nitration, &c.—A. B. S.

Petroleum; Determination of Impurities in Crude ——. R. Nettel. XXIII., page 952.

United States Patents.

Distilling [*under Reduced Pressure*]; *System and Apparatus for* ——. L. Gathmann, Washington, D.C. U.S. Pat. 768,795, Aug. 30, 1904.

This apparatus, which is designed for distilling or evaporating under reduced pressure, consists of a still connected with a rectifier and condenser, means being provided for heating the rectifier. Heated air is introduced into the contents of the still by means of a rotating "tubular rake," nd connections are provided for continuously circulating he air through the entire system; an air-heating device is placed in the tube connecting the condenser to the still, to eheat the air after each circuit.—T. F. B.

Hydrocarbon Oils and Spirits; Process of Distilling or Refining ——. L. Gathmann, Washington, D.C. U.S. Pat. 768,796, Aug. 30, 1904.

Petroleum or other hydrocarbon oils or spirits are distilled in an apparatus similar to that described in the preceding specification, a current of hot air under reduced pressure being passed through the contents of the still, and then through the condenser and air-heating apparatus, before being again passed into the still.—T. F. B.

Pyro-Acetic Spirit; Apparatus for Producing ——. A. Ippendorf, Düsseldorf, Germany. U.S. Pat. 769,164, Sept. 6, 1904.

The apparatus consists of a horizontal cylindrical vessel, "having a frusto-conical end"; a rotating shaft, passing diametrically through the vessel, carries blades in the cylindrical portion of the vessel, and a worm conveyor in the frusto-conical end. The vessel is provided with heating means, and communicates with a rotating retort, which is provided with a shaft on which are mounted inclined blades to agitate the contents of the retort.—T. F. B.

Wood; Apparatus for the Distillation of ——. J. A. Mathieu, Georgetown, S.C. U.S. Pat. 769,177, Sept. 6, 1904.

Each of a series of vertical cylindrical retorts is provided with a removable top, a liquid discharge opening in the bottom, and a discharge pipe for the volatile products. A cylindrical basket, with openwork sides and solid bottom, adapted to contain the wood to be distilled, fits loosely in the retorts; the bottom of the basket contains an opening which is in register with the liquid-discharge opening of the retort. A cover without a bottom is provided, which is lowered over the basket when it is desired to transfer the contents from one retort to another, means being also provided for fastening the cover to the basket, raising the whole, and carrying it along the series of retorts.—T. F. B.

Peat; Oven for Coking ——, *with Recovery of By-Products.* E. Bremer. U.S. Pat. 769,531, Sept. 6, 1904. II., page 930.

Lubricant for Oiling Guns; Alkaline ——. J. G. Wild, Assignor to Winchester Repeating Arms Co., New Haven, Conn. U.S. Pat. 768,835, Aug. 30, 1904.

This lubricant, intended for neutralising the acid residues left by smokeless powder on the surface of guns, consists of a fixed hydrocarbon lubricant mixed with an alcohol or glycerin saturated with ammonia gas.—C. A. M.

Oils; Process of Treating [*Bleaching*] ——. A. C. Calkins, Assignor to H. E. Brett, Los Angeles, Cal. U.S. Pat. 769,681, Sept. 6, 1904.

Oil is treated with sulphuric acid in a closed tank "to precipitate tarry matters within the oil." The air and sulphur dioxide are pumped from the top of the vessel and passed through a pipe which discharges into the tank containing the oil near the bottom; this circulation of gas is continued until the oil is sufficiently bleached.—T. F. B.

French Patent.

Soap; Transformation into ——, *of Mineral Oils in General, and principally Petroleum.* M. Kuess. Fr. Pat. 342,348, April 15, 1904. Under Internat. Conv., Nov. 3, 1903.

See Eng. Pat. 7481 of 1904; this J., 1904, 817.—T. F. B.

IV.—COLOURING MATTERS AND DYESTUFFS.

Aldehydes; Detection of ——, *and the Constitution of Nitrosodimethylaniline.* G. Velardi. XXIII., page 952.

English Patent.

Dyestuffs Derived from Anthracene; Manufacture of ——. [*Anthracene Dyestuffs.*] O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. Eng. Pat. 23,392, Oct. 28, 1903.

On condensing the halogen derivatives of 1.5- and 1.8-aminohydroxyanthraquinones with primary aromatic amines, and sulphonating the products, dyestuffs are obtained which give fast blue shades on unmordanted wool. (Compare Fr. Pat. 338,756 of 1903; this J., 1904, 783.)—T. F. B.

United States Patents.

Anthraquinone Dye [*Anthracene Dyestuff*]; *Blue* ——. W. Berchelmann, Elberfeld, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 764,837, July 12, 1904.

Dyestuffs having the general formula—

$$C_6H_4 < \substack{CO \\ CO} > C_6H_2(NH.CH_3)(CH_3)(NHR)[1.2.4],$$

R being an alphyl radical, are obtained by first brominating methylamino-β-methylanthraquinone (produced by treating mononitro-β-methylanthraquinone with methylamine), and condensing this compound with an aromatic amine; on sulphonating the resulting product, dyestuffs are obtained which give blue shades on unmordanted wool from acid baths.—T. F. B.

Orange Dye, and Process of Making same. [*Acridine Dyestuff.*] O. Sohst, Assignor to Farbwerke vorm. Meister, Lucius und Brüning, Höchst-on-the-Maine, Germany. U.S. Pat. 766,540, Aug. 2, 1904.

The leuco-acridineglycin, obtained by treating tetra-aminoditolylmethane with a mineral acid and monochloracetic acid, is alkylated and then oxidised. The resulting dyestuffs give orange shades on leather and cotton mordanted with tannin. By alkylating in presence of concentrated sulphuric acid, the dyestuff gives redder shades than when hydrochloric acid is used, and yellower shades are obtained by ethylation than by methylation.—T. F. B.

Azo-Dye, and Process of Making same. P. Julius, H. Reindel, and F. C. Günther, Assignors to Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany, U.S. Pat. 770,177, Sept. 13, 1904.

See Fr. Pat. 338,819 of 1903; this J., 1904, 820. The diazotised naphthylamine-*o*-sulphonic acid is converted into *o*-hydroxynaphthyldiazonium compounds by treatment with an alkali carbonate and hypochlorite. The dyestuff from 1.2.4-naphthylaminedisulphonic acid is specified.
—T. F. B.

French Patent.

Dyestuffs or Tannin from Dyewoods; Process for Extracting ——. F. J. Oakes. Fr. Pat. 342,748, April 30, 1904.

See U.S. Pat. 759,008 of 1904; this J., 1904, 604.—T. F. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING AND FINISHING TEXTILES, YARNS, AND FIBRES.

Indigo-dyed Tissues [*Calico Printing*]: *Discharging* —— *with Chromic Acid.* A. Bulard. Rev. Gén. Mat. Col., 1904, **8**, 257—261.

With the object of dispensing with the use of oxalic acid in the acid discharge-bath employed in discharging indigo-dyed tissues by the chromic acid method, it has been proposed (this J., 1903, 359) to add potassium oxalate to the alkali chromate printing-mixtures. The author finds that the oxalates of sodium, ammonium, and calcium are more effective in this connection. The last-named salt binds the printing-mixtures well together, and appears likely to be of special value in the production of well-defined, "white" discharges. By its use it may be possible to obtain, with sulphuric acid alone in the discharge bath, results equal to those produced with the mixed sulphuric-oxalic acid bath. Besides the economy, an advantage to be gained by the omission of oxalic acid from the discharging-bath is that the intensity of the indigo dyeings in the unprinted parts of the tissues remains unimpaired, whereas, when the mixed acid bath is employed, this is considerably reduced. Owing to the insolubility of calcium oxalate, it may be advisable, in the case of printing mixtures containing pigments, to use a mixture of this salt and a soluble oxalate, in order to keep as low as possible the proportion of insoluble matters present.—E. B.

English Patents.

Fabrics, Warps, Yarns, and the like; Apparatus for Subjecting —— *to the Action of Fluids or Chemical Solutions.* J. Gebauer, Charlottenburg, Germany. Eng. Pat. 21,949, Oct. 12, 1903.

A series of endless conveyors, composed of wire netting, are arranged one above the other in a closed tank; each one is adapted to rotate in the opposite direction to the one below it; the conveyors which rotate in the same direction are fixed vertically one above the other, with their ends projecting beyond the ends of the conveyors rotating in the opposite direction. The fabric is passed through a folder, hvaing been previously impregnated with the liquid, and deposited in folds on the uppermost conveyor; when it reaches the end of this, it falls on the projecting end of the second conveyor, and so on down the series. Above each conveyor is fixed a system of perforated pipes to spray the liquid on the fabric, and between the conveyors steam pipes are provided. Below the upper conveyors are fixed trays to collect the liquid with which the fabric has been treated. The liquid from the lower conveyors is collected in suitable tanks at the bottom of the main tank, and removed for further use.—T. F. B.

Straw, or Mixed Straw and Chip Plaits; Production of Two-coloured Effects upon ——. R. B. Ransford, Upper Norwood. From L. Cassella and Co., Frankfort-on-Maine, Germany. Eng. Pat. 20,324, Sept. 21, 1903.

Straw, or mixed straw and chip plaits, are treated with cold solutions of sulphide dyestuffs, rinsed, and then cleansed or bleached by means of acid, hydrogen peroxide, &c. This treatment gives dyeings fast to light and washing, the rough inner surface of the straw, and the chip, being coloured, whilst the outer surface of the straw remains colourless.—T. F. B.

Dyeing Cops; Process of ——. E. F. Bauersachs and G. A. H. Brückner, Scheibe, Germany. Eng. Pat. 15,978, July 19, 1904.

The cops, dyed in a single colour and wound on bobbins, are again dyed with another colour, for such a time as to allow the colour to only partially penetrate the material, thus producing variegated effects. This partial dyeing can be repeated with other dyestuffs of different colours to further vary the effects obtained.—T. F. B.

Figured Fabrics; Manufacture of ——. J. Morton, Carlisle. Eng. Pat. 18,897, Sept. 2, 1903.

Fabrics, resembling tapestry, &c., are produced by printing the desired pattern on a fabric made by weaving white, grey, or other light yarns with interspersed lines of warp or weft which have been previously treated with a resist for the printing mixture, and, if desired, dyed in some different colour.—T. F. B.

Patterns on Pile and other Fabrics or Goods; Method of and Means for Producing Ornamental ——. O. St. L. Davies and J. Booth, Castleton, Lancs. Eng. Pat. 21,427, Oct. 6, 1903.

The portions of the fabric which it is desired to produce in relief are printed with a solution of gum or other suitable mixture, and a portion of the unprotected pile are removed by burning with a singeing roller, or by some cutting appliance, the protected parts having been depressed by the printing, thereby producing a variety of effects.
—T. F. B.

Printing, Painting, or Marking Cloth [*Stencil-Printing*]; *Process and Apparatus for* ——. A. A. Scott, Bradford. Eng. Pat. 23,484, Oct. 29, 1903.

The tissue to be printed is drawn in a continuous manner over a table, and is printed, from a portion of a stencil plate or disc, by means of an apparatus travelling in the ame direction above it, whilst the printing is being accomplished, and then returning in the opposite direction, the iate or disc being simultaneously, though partially, turned ound to bring another portion of it, with the same or a lifferent design upon it, into position. The colour-mixtures mployed are applied from a valved receptacle which forms he subject of a special claim.—E. B.

rinting Sarees, Scarves, Shawls, and the like; Machines for ——. The Calico Printers' Association, Ltd., Manchester, and J. Whittaker, Bury. Eng. Pat. 25,088, Nov. 18, 1903.

'his invention relates to a special form of tappet-shaft riving-clutch, which has been devised for the purpose of voiding undue shocks or jars experienced in starting the appet shafts in the apparatus described in Eng. Pat. 22,678 f 1902.—E. B.

rinted Fabric, such as Calico; Production of ——. Hulse and Co., Ltd., Salford, and A. G. Shaw, Pendleton, Lancs. Eng. Pat. 16,594, July 27, 1904.

'issues are "back-filled," *i.e.*, coated on the reverse side to hat which it is desired to print, with filling materials, such s a mixture of starch paste and china clay. After being ried, they are printed with the usual printing mixtures by eans of surface rollers.—E. B.

ydro-Extractors [for Textiles]; Centrifugal ——. N. Cautley, Halifax, Yorks. Eng. Pat. 11,839, May 24, 1904.

'o prevent the tearing and stretching of clothes, yarn, or xtile fabrics in a centrifugal hydro-extractor, the drum is ivided into compartments by means of plain or perforated adial partitions fixed to a central cone fitted over the otating shaft.—L. F. G.

UNITED STATES PATENTS.

ordanting; Process of ——. A. Müller-Jacobs, Richmond Hill, N.Y., Assignor to Cosmos Chemical Co., New York. U.S. Pat. 769,954, Sept. 13, 1904.

'he process consists of mordanting the fabrics with a ixture containing stearamide. (See also U.S. Pat. 767,114 f 1904; this J., 1904, 864.)—T. F. B.

ormaldehyde Hydrosulphites [Discharges], and Process of Making same. L. Descamps, Lille, France. U.S. Pat. 769,593, Sept. 6, 1904.

ee Eng. Pat. 19,446 of 1903; this J., 1903, 1345.—T. F. B.

FRENCH PATENTS.

ollodion and Cellulose Solutions; Apparatus for Filtering and Spinning Filaments from ——. Soc. Desmarais et Morane and M. Denis. Fr. Pat. 342,655, April 26, 1904.

he solution is supplied to two closed reservoirs, one of hich is discharged whilst the other is being charged. The scharge is effected by means of air, compressed by a pump arranged that the pressure is accurately governed by eans of weights and regulating springs which move levers nnected with the electro-motor driving the pump. The lution is thus delivered under pressure to a special pump, ted with several pistons in order to avoid pulsations, and ecially constructed suction-valves which are under control. he pump passes the solution into a regulating cylinder ntaining a piston which acts as the governor for the inning system. This piston is worked by a motor conolled in a manner similar to that working the air pump, d the pressure-accumulator is capable of very delicate ljustment by means of reservoirs of water above the eights.—J. F. B.

aw Wool, Yarn, &c.; Dry Cleaning of ——. L. Bouillant. Fr. Pat. 341,492, March 21, 1904.

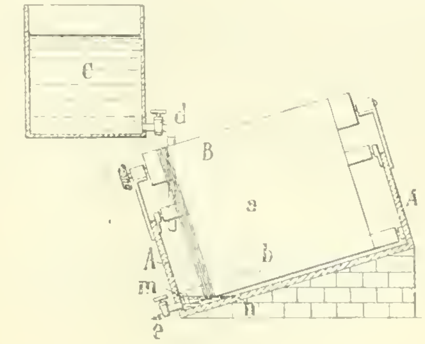
e material is treated in closed vessels with benzol, to ich has been added from ½ to 2 per cent. of the following xture. Oleic acid, 33 to 36 per cent.; methylated alcohol, to 22 per cent.; olive oil, 4 to 6 per cent.; ammonia, 22° B., 18 to 22 per cent.; "green soap," 4 to 6 per cent.; rain water, to make up 100. This mixture is stated to remove the moisture contained in the wool, which would interfere with the extraction of the fatty matters.—A. B. S.

Bleaching Apparatus; Continuous ——. M. Muntadasy Rovira. Second Addition, dated March 23, 1904, to Fr. Pat. 327,931, Nov. 10, 1902. (See this J., 1903, 948, and 1904, 251.)

In the present Addition, arrangements are added for controlling the level of the liquids in the various compartments. The number of compartments is reduced and a new arrangement is used for rolling and unrolling the cloth.—A. B. S.

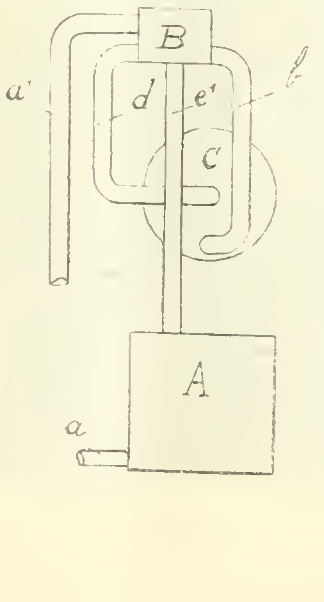
Shaded Dyeings of Textiles; Process for ——. Soc. Hannart Frères. Fr. Pat. 341,950, April 6, 1904.

This process depends on the use of a dye-bath with an inclined bottom (see figure). The material passes over the inclined rollers B and *b*. The dye liquor, at the beginning of the operation, only fills the lower part of the dye-bath, and only a portion of the material passes through the liquor. As the dyeing proceeds, water and the necessary mordants, &c., are allowed to flow in from a tank C, so that the level of the liquid in the dye-bath rises, the dye liquor being at the same time diluted. As the level rises, further portions of the material pass through the liquor and are dyed in gradually lighter shades. As water is introduced, dye liquor may be run out through the pipe *e*, whereby the dye liquor is diluted to a still greater extent. —A. B. S.



Dyeing of Piece Goods wound on Perforated Tubes; Process and Apparatus for the Automatic Treatment and ——, *as well as for all other Textiles.* G. A. Dantan and C. G. Pain. Fr. Pat. 342,340, April 16, 1904.

The material to be dyed is wound on perforated tubes fixed in closed cylindrical vessels, the end of one of which is shown in the diagram at C. Tubes *b* and *d* convey the dye-liquor or other liquid from the reservoir A to the material; *b* enters the cylinder near its outer wall, whilst *d* introduces the liquid into the interior of the perforated tube. A device is provided to cause the liquid to enter C alternately through *b* and *d*, thus giving even dyeings. The tubes *a* and *a'* are connected by a force pump, which causes the liquid to circulate through the apparatus. A replica of



the cylinder C and perforated tube in miniature is connected with the liquor pipes to enable the progress of the dyeing to be judged without interrupting the operation. In case hanks or narrow pieces have to be treated, small cylindrical boxes can be fitted on to the perforated tube at will.—T. F. B.

Dyeing Piece Goods; Machine for ——. C. Gruschwitz and C. Herminghaus. Fr. Pat. 342,345, April 15, 1904.

The vat containing the dye-bath is provided with two short vertical pipes, which project above the surface of the liquid, near the points where the material enters and leaves the liquid. At the top of these pipes are fixed air-blowers, which cause a spray of the liquor to play on the material, the size of the spray being regulated by taps in the blowers. The liquor in the vat is kept in motion by pumping it through a pipe, one end of which enters the side and the other end the bottom of the vat.—T. F. B.

Dyeing, Scouring, Bleaching, or Treatment with Liquids of Threads wound on Spindles or on Bobbins. R. Rawson and E. Lodge. Fr. Pat. 342,694, April 27, 1904. Under Internat. Conv., May 4, 1903.

See Eng. Pat. 10,035 of 1903; this J., 1904, 543.—T. F. B.

Dyeing Hanks; Apparatus for ——. G. Stöhr. Fr. Pat. 342,795, April 30, 1904. Under Internat. Conv., June 12, 1903.

See Eng. Pat. 9311 of 1904; this J., 1904, 820.—T. F. B.

VI.—COLOURING WOOD, PAPER, LEATHER, Etc.

English Patent.

Dyeing Leather. R. B. Ransford, Upper Norwood. From L. Cassella and Co., Frankfort-on-Maine, Germany. Eng. Pat. 23,563, Oct. 30, 1903.

See Addition, of Oct 24, 1903, to Fr. Pat. 322,605 of 1902; this J., 1904, 321.—T. F. B.

VII.—ACIDS, ALKALIS, AND SALTS.

Chamber Process; Theory of the ——. F. Raschig. Z. angew. Chem., 1904, **17**, 1398—1420.

The author stated his views on the reaction of nitrites with bisulphites, and of nitrous acid on sulphurous acid, 17 years ago (this J., 1887, 819; and 1888, 747). From those views he drew the conclusion that the reactions in the chamber were expressed by the equations—

$$ON.OH + H.SO_2.OH = ON.SO_2.OH + H_2O \quad (1)$$

$$ON.SO_2.OH + ON.OH = SO_2(OH)_2 + 2NO \quad (2)$$

$$2NO + O + OH_2 = 2(ON.OH) \quad (3)$$

It was not possible, however, to isolate either "nitrososulphonic acid," $ON.SO_2.OH$, or the dihydroxylamine-sulphonic acid, $(OH)_2.N.SO_2.OH$, from which it may be supposed to be derived by the loss of a molecule of water. Since that time Divers has closely investigated these reactions, and has found that nitrite and normal sulphite do not react; the author has confirmed this as far as cold solutions are concerned, but finds that at high temperatures reaction occurs, with formation of $N(SO_3Na)_3$, though the sodium hydroxide simultaneously produced, soon limits the reaction. Divers also contends that hydroxylamine-monosulphonic acid, though in acid solution it hydrolyses to sulphuric acid and hydroxylamine, does not do so, as Claus stated and the author believed, in alkaline solution. The author finds that though in presence of aldehydes or ketones the corresponding oximes are formed, yet that alone hydroxylamine is not produced, but, as Divers states, sulphurous acid and hyponitrous acid, which latter and water are products of decomposition of hydroxylamine. Thirdly, Divers states that nitrous acid and bisulphite at once give hydroxylaminedisulphonic acid, and that nitrososulphonic acid does not exist; and he has shown that Fremy's salts, potassium sulphazite and potassium sulphazate, regarded by the author as derivatives of dihydroxylamine-sulphonic acid, are mere double salts of potassium hydroxylamine-disulphonate and potassium nitrite, and can be formed directly by crystallisation from the mixed solutions. The author finds, however, that whilst nitrososulphonic acid cannot be isolated, yet it exists temporarily during the reaction of nitrite on bisulphite; for determination of the acidity and of the sulphur dioxide during the progress of the reaction in very dilute solutions show that they do not steadily diminish in the proportion of 3 mols. of bisulphite (acidity) to 2 mols. of SO_2, as required by the equation $NaNO_2 + 3NaHSO_3 = OH.N.(SO_3Na)_2 + Na_2SO_4 + H_2O$, but at first in the proportion of 1 mol. of bisulphite to 1 mol. of SO_2, and later in that of 2 mols. of bisulphite to 1 mol. of SO_2, as indicated by the successive equations $NaNO_2 + NaHSO_3 = ONa(OH)N.SO_3Na$, and $ONa(OH)N.SO_3Na + 2NaHSO_3 = OH.N.(SO_3Na)_2 + Na_2SO_3 + H_2O$. The extreme instability, in these solutions, of nitrososulphonic acid, is not so marked in acid solutions; and when N/100 nitrous acid is allowed to act on N/10 sulphurous acid, reaction occurs exactly in the proportion $HNO_2:SO_2$. When these proportions are used, however, immediately after mixture, sulphuric acid is found, in amount equivalent to the sulphurous acid taken, and no evidence of the first formation of nitroso-sulphuric acid is forthcoming. But that it is so formed is inferred from the fact that when a large excess of sulphurous acid solution is used, the amount of sulphuric acid formed is lessened, and there appears hydroxylamine disulphonic acid, and, with still greater excess of sulphurous acid, nitrilo-sulphonic acid, $N(SO_3H)_3$. That the second and third stages of the reaction, which occur so readily when nitrite and bisulphite react, should occur so much less readily when the acids themselves react, is of great importance for the chamber-process. Were there, for example, great quantities of $N(SO_3H)_3$ produced, then by its reaction on water much nitrogen would be lost to the process by conversion into ammonia. The hydrolysis of nitrososulphonic acid yields, then, sulphuric acid, and must also yield hyponitrous acid, $OH.N:N.OH$, or nitrous oxide and water, or the substance $O:N.H$, investigated by Angeli, and called by him nitroxyl. The author shows that neither hyponitrous acid nor nitrous oxide is present; but the solution contains a neutral substance, very unstable, readily decomposing into nitrous oxide and water, and oxidised by permanganate to nitric oxide and water—the properties of nitroxyl. The same substance is produced if nitrous acid be allowed to react on stannous chloride instead of sulphurous acid; and in this case sodium nitrite and neutral stannous chloride can be used in fairly concentrated solutions. There is then no evolution of nitrous oxide till the solution is heated. If to the nitroxyl solution nitrous acid be added, nitric oxide instead of nitrous oxide is evolved: $HNO + ON.OH = 2NO + H_2O$. If the liquid contain dissolved oxygen, the nitric oxide reacts to form nitrous acid, $2NO + O + H_2O = 2HNO_2$, which again reacts on any sulphurous acid (or stannous chloride), and the cycle of changes recurs as long as sulphurous acid (or stannous chloride) and oxygen are present. The reaction is slow; but whereas in the case of stannous chloride, addition of sulphuric acid accelerates it only slightly, in the case of sulphurous acid the acceleration is enormous, so that, when the reaction is carried out in sulphuric acid much weaker than chamber acid, a stream of sulphur dioxide can be led into the liquid and continuously converted into sulphuric acid, provided only that sufficient oxygen be supplied by vigorous agitation: we have, in fact, the chamber reaction. Acid of the concentration of chamber acid dissolves so little nitrous acid that the reaction is on this account checked; and with this strength of acid it can only be carried out by bringing the reagents together in the form of gas, "atomised" liquid, or cloud—under the chamber conditions, in fact. The difference in the behaviour of stannous chloride and sulphurous acid, in presence of nitrous acid and sulphuric acid, is attributed by the author to the direct formation, in the case of stannous chloride, of nitroxyl, which reacts but slowly on nitrous acid, whilst in the case o sulphurous acid, nitroso-sulphonic acid is formed, which react very rapidly on nitrous acid. If no sulphuric acid b present, the nitroso-sulphonic acid decomposes into sulphuric acid and nitroxyl; but in presence of sulphuric acid it is much more stable and remains present to react on the nitrous acid. Hydrochloric acid produces the same result as sulphuric acid. Finally, as the result of all these investigations, the author regards the three reactions, given above as those representing the chamber process, as confirmed. Only as to the second is there any uncertainty, not as to its final result, but as to its intermediate progress. Without question, nitrous acid is reduced to nitric oxide; but it is not certain whether the nitroso-sulphonic acid is directly oxidised to sulphuric acid and nitric oxide, or whether intermediately a higher state of oxidation is not produced. The author considers it possible that the reaction $ON.SO_3H + 6\,(OH.NO) = 6\,NO + H_2SO_4 + HNO_4 + 2H_2O$ may occur The evidence for the existence of pernitric acid, HNO_4, is as follows:—When nitrous acid acts in great excess on a little potassium iodide and starch, a blue substance is produced. If it acts on potassium iodide alone, and then starch be added, no blue colour is struck, but a drop or two of thiosulphate renders the solution blue. These two blue substances are identical, but are not iodide of starch; for a few drops of thiosulphate very slowly decolorise them, and then the blue colour, in spite of the presence of nitrous acid, only very slowly returns, whilst the decolorised liquid, if added to fresh potassium iodide and starch solution, at once turns it blue. Moreover, this "nitroso-iodide of starch" is at once decolorised by hydrogen peroxide, which has no action (in the dilute solutions used) on iodide of starch. This formation of "nitroso-iodide of starch" may be regarded as an indication of the presence of nitrous acid. Now if to N 100 nitrous acid solution be added varying quantities of hydrogen peroxide solution, the liquids containing less peroxide than the proportion $HNO_2:2H_2O_2$ still contain nitrous acid; those containing that proportion, or more peroxide, contain a substance which liberates iodine from potassium iodide—not hydrogen peroxide, and not nitric acid, therefore. Since, in the mixture $2HNO_2:3H_2O_2$, all the peroxide has disappeared and yet nitrous acid remains, it is clear that the substance formed contains more oxygen than nitric acid. Further experiments showed that the reaction occurs between one molecule of nitrous acid and two of hydrogen peroxide, and is therefore presumably $HNO_2 + 2H_2O_2 = HNO_4 + 2H_2O$. The substance is very unstable, and readily decomposes, with formation of nitric acid and hydrogen peroxide. No analysis has yet been possible: the only other reaction established is the ability of pernitric acid to decompose potassium bromide, with evolution of bromine, which, at these dilutions, neither nitrous acid nor hydrogen peroxide can accomplish. (Compare Inglis, this J., 1904, 643.)—J. T. D.

Lead Chambers; Effect of Blackening —— on their Radiation and Yield. Bakem. Z. angew. Chem., 1904, **17**, 1447.

The increase of yield per cubic foot of chamber space in the modern vigorous working of the chamber process, is limited by the difficulty of keeping down the temperature. The author filled two small "chambers" of 1 cb. m. capacity, one of plain lead and the other of lead coated with a black paint, with water of 85° C., and timed their rates of cooling. The curve of results shows that in 100 minutes the uncoated chamber cooled from 73° to 56·5°, the coated chamber from 73° to 49° C., ranges of 16·5° and 24° C. respectively.—J. T. D.

Nitric and Sulphuric Acids; Properties of Mixtures of ——. A. Saposchnikoff. J. russ. phys.-chem. Ges., 1904, **36**, 669—671. Chem. Centr., 1904, **2**, 685. (See also this J., 1904, 865.)

The specific gravity and electric conductivity of mixtures of nitric acid of sp. gr. 1·48 and concentrated sulphuric acid were determined. The results are given in curve-diagrams in the original. The specific gravity is at a maximum in a mixture containing about 90 per cent. of sulphuric acid. The increase in the specific gravity caused by additions of sulphuric acid up to 90 per cent. is due to the formation of nitric anhydride, whilst the decrease in specific gravity, when the amount of sulphuric acid added exceeds 90 per cent., may be attributed to reactions between the latter and the oxides of nitrogen present. The results of the determinations of electric conductivity were as follows:—

Percentage of Sulphuric Acid.	Specific Conductivity × 10^{-4}	Percentage of Sulphuric Acid.	Specific Conductivity × 10^{-4}
0	1283	50	899·7
1·25	1267	60·75	874·5
5·14	1201	79·93	911·8
10	1199	89·95	1016
20·32	1068	94·71	1023
30·19	964	100	1067
40·09	930·6		

—A. S.

Magnesium Hydroxide; Action of Carbon Dioxide on ——. M. Monhaupt. Chem.-Zeit., 1904, **28**, 868.

When magnesium hydroxide is suspended in water and carbon dioxide passed through to saturation, the clear solution has a variable composition. Alcohol precipitates from it a substance having approximately the composition $MgCO_3.3H_2O$. If excess of solid magnesium hydroxide be used, the residue not dissolved by the carbon dioxide will invariably consist, to the extent of 96·3 per cent., of minute crystals of $MgCO_3.3H_2O$, the remaining 3·7 per cent. being unchanged magnesium hydroxide.—J. T. D.

Hyposulphites (Hydrosulphites). H. Bucherer and A. Schwalbe. Z. angew. Chem., 1904, **17**, 1447—1451.

The authors consider that sodium hyposulphite, as usually obtained by salting out from its aqueous solution, contains at least one molecule of "constitutional water"; is, in fact, an acid salt, $Na_2H_2S_2O_5$—

$$(NaO).HS(:O).O.(O:)SH(ONa)$$

and that the corresponding normal salt is $Na_4S_2O_5$. The acid salt condenses with formaldehyde to an addition-product, analogous in constitution to the oxymethylenesulphonic acids produced from bisulphites and formaldehyde. This product, like the bisulphite derivative, condenses with aromatic amines to form ω-hydrosulphonic acids analogous to the ω-sulphonic acids, with which they share the property of reacting on potassium cyanide to form the nitriles of glycines. These properties are clearly indicated by the constitution, analogous to that of sodium bisulphite, ascribed to sodium hydrosulphite by the authors. Possibly the hydrosulphites of the metals like calcium and zinc are also acid salts ($MH_2S_2O_5$), though salts of the type $M_2S_2O_5$ may also be formed.—J. T. D.

Cuprammonium Sulphates; Composition and Constitution of ——. D. W. Horn and E. E. Taylor. Amer. Chem. J., 1904, **32**, 253—285.

The methods of analysis of these compounds are critically examined and details given of the authors' improvements. Whether prepared by precipitation of ammoniacal copper sulphate solution with alcohol (Berzelius) or by passing ammonia into copper sulphate solution (André, Comptes rend., **100**, 1138), a substance having the composition $CuSO_4 + 4NH_3 + H_2O$ is obtained. It must be dried over lime, after which it is quite odourless in dry air. It decomposes over sulphuric acid and most desiccating agents, and cannot be dried mechanically without loss of ammonia, which probably accounts for Bouzat's formula, $CuSO_4.4NH_3.\frac{2}{3}H_2O$ (this J., 1903, 1045). In the presence of solid potassium hydroxide and concentrated ammonia solution, H_2O is displaced by NH_3, and a substance approximating to the composition $CuSO_4 + 5NH_3$ is obtained, but it is probably a mixture. Heating at 100°, 125°, 149°, 203°, and 260° C. gives rise to no definite products. Water hydrolyses the salt, liberating some ammonia and precipitating basic salts, but it is long before equilibrium is established. The authors conclude that the formula $CuSO_4 + 4NH_3 + H_2O$ does not correctly represent the constitution of the salt, since four equivalents of acid do not neutralise one molecule of the salt, but produce a permanent precipitate.

Sulphuric Anhydride; Process of Making ——. H. S. Blackmore, Mount Vernon, N.Y. U.S. Pat. 769,585, Sept. 6, 1904.

During the reaction between sulphur dioxide and oxygen, in an "igniting or transforming chamber," a fresh portion of the gaseous mixture is supplied in such volume and at such a rate as to prevent the temperature of reaction rising to the dissociating point of sulphuric anhydride. The same result may be attained by supplying a sufficient volume of an inert gas to the reacting mixture, by refrigerating the mixture of sulphur dioxide and oxygen, or by mixing the residual gases after absorption of the sulphuric anhydride formed, with the reacting mixture, and again passing through the apparatus. The required refrigeration may also be effected by employing sulphur dioxide or oxygen in a compressed or liquid state. The oxidation of the sulphur dioxide in presence of oxygen is effected by supplying heat to the sphere within the reacting chamber with which the gases come into contact, the temperature being kept within proper limits by one or other of the means described. See U.S. Pat. 724,251 of 1903; this J., 1903, 554. —E. S.

Bricks; Drying Plant for ——. G. Pagel, Stettin, Germany. U.S. Pat. 770,186, Sept. 13, 1904.

The drying plant consists of a compartment combined with a kiln. A smoke conduit, opening into the kiln, extends lengthwise under the compartment and communicates with similar supplementary conduits parallel to the first. Air-conduits are arranged between the smoke and supplementary conduits, and the latter and the air conduits are provided with grated openings leading into the compartment.
—W. C. H.

Hydraulic Cement; Process of Making ——. F. W. Brown, Portland, Col. U.S. Pat. 769,467, Sept. 6, 1904.

Slag resulting from fusing argillaceous and calcareous materials together is subjected, together with sulphate of calcium, to a high degree of heat in an oxidising furnace. —A. G. L.

Cement Kiln. F. M. Haldeman, Alpena, Mich. U.S. Pat. 769,742, Sept. 13, 1904.

The kiln is of the rotary type, and comprises a drum or kiln portion proper, inclined to the horizontal, and a hood portion, capable of removal from the former, both portions being lined with firebrick materials, and having a gasket of asbestos or similar heat non-conducting material between the linings. Near the lower end of the kiln is a door, worked by gravity, and a channel which retains the cement material and supplies it to the door. At the lower end an annular wall of refractory material projects inwardly from the kiln lining, and separated from this annular wall by a small space is a second annular wall, which does not project inwardly quite as far as the first, these walls forming the channel, above referred to, which conducts the cement to the discharge door. The lower end of the kiln is completely closed, and finely pulverised fuel is fed in through a pipe passing through this closed end. Means are provided for supplying finely divided cement material to the upper end of the kiln, where there is a dead space for the material introduced. To protect the finely divided material from the draught caused by the process and products of combustion, a bridge wall is arranged to close the larger portion of the upper end of the kiln, where the products of combustion escape to the chimney, the finely divided cement material being introduced to the kiln through this bridge wall near ts base.—W. C. H.

French Patents.

Wood; New Treatment of —— with Silicate of Soda (Soluble Glass). A. Boissi. Fr. Pat. 312,321, March 26, 1904.

All the timber entering into the framework of a structure s painted over with a coat of sodium silicate. The planks forming the skirting are also painted in a similar manner, but only on the side nailed to the framework, so as not to destroy the paper or paint on the other side by the efflorescence which is formed after a time.—A. G. L.

Dehydrator or Calciner for Gypsum, Cement, or other similar Materials. V. Ragau and H. Cornette. Fr. Pat. 342,449, April 5, 1904.

Two circular hearths are set stepwise over a furnace, so hat the heat is first utilised under the lower hearth, and hen passes to the next, which is kept at a lower temperaure. The waste gases pass from the second hearth to conomisers formed of vertical chambers with a series of horizontal tubes through which the waste gases pass. The material fed into these economisers around the tubes is dehydrated by the waste heat. Means are provided for eeding, discharging, and for regulating the operations. —W. H. C.

Building Materials; Manufacture of ——. A. Lévy and V. Couti. Fr. Pat. 312,495, April 21, 1904.

Bricks, &c., are made from 10 parts of an agglomerating mixture, consisting of a metallic oxide, chlorine, sulphuric acid, or other materials capable of forming an oxychloride which may unite with magnesium, aluminium, barium, or ther isomorphous sulphates, and 90 parts of an inert ubstance, such as sand or calcareous or silicious waste. The mixture is moulded as usual, and then dried in the air. A suitable composition for the agglomerating mixture is s follows:—Magnesia, 10,000 parts; magnesium chloride n solution, 10,000 parts; magnesium sulphate in solution, 5 parts; aluminium sulphate in solution, 25 parts; "barium ulphate in solution," 25 parts; kieselguhr or other infusorial arth, 5 parts.—A. G. L.

Slate; Hardening of ——, Crude or Worked, by Heating and Enamelling. G. Rovere. Fr. Pat. 342,788, May 2, 1904.

Slate may be hardened by firing in the usual manner, or enamelled in the same way as earthenware or majolica ware.—A. G. L.

Calcium Sulphate and Carbonate occurring as Residues in the Manufacture of Caoutchouc Goods, Colours, Ceramic Ware, and Cement Blocks, and in other Chemical Industries; Utilisation of —— in the same Industries. A. Mouin. Fr. Pat. 342,797, May 2, 1904.

Precipitated calcium sulphate or carbonate, occurring as residues in various works, is heated to from 400° to 1500° C., then ground, sifted, and sorted according to tints, to replace talcs, kaolins, ochres, &c., used in the industries specified.—E. S.

X.—METALLURGY.

Boiler Plates; Effect of Heating on the Strength of —— Le Chatelier. Bull. Soc. d'Encourag., 1904, **106**, Rev. Metall., 467—470.

Test pieces of iron, very mild steel, and mild steel, were cut from various plates, and treated as follows:—One piece served as a check, another was heated and cooled under conditions approximating to those obtaining in boilers, and a third was rapidly annealed by heating it to cherry redness and then letting it cool in the air. The test pieces measured 10 × 10 × 70 mm., and were broken in a machine. The results show that when it is impracticable to temper the whole of a big piece of metal work, it suffices to quickly anneal those plates which have been submitted to a good deal of forging.—L. F. G.

Steel; Fracture of Structural —— under Alternating Stresses. J. O. Arnold. Brit. Assoc., 1904. Engineer, 1904, **98**, 227.

The ordinary methods of examining steel fail, to a considerable extent, to show the cause of its sudden rupture under vibration and alternating tensile and compressive stresses. For instance, the steel plates of the boiler of a cruiser split longitudinally from end to end under the hydraulic test, notwithstanding the fact that the chemical composition of the steel and the results of the ordinary mechanical tests were good. The author has devised a machine for the purpose of ascertaining the resistance of steel to rapidly alternating stresses. Results obtained with a good boiler-plate steel indicate that, in all probability, the resistance under rapidly alternating stresess is inversely proportional to the rate of alternation. The results obtained with test-pieces of the boiler-plate mentioned above were erratic, but this was found to be owing to one side of the plate being brittle and the other tough under alternating stresses. The results with test-pieces from both sides of the boiler-plate, as received, and after various heat treatments, show that once a steel has become distinctly brittle under alternating stresses, it cannot be restored by heat treatment of any kind short of remelting. In the case under notice, the injury to the steel was due to unskilful reheating of the ingot, and not to an improper casting temperature, since the latter would necessarily have affected every portion of the plate, and not one side only. The micro-structures of the test-pieces from the two sides of the boiler-plate were in all respects identical, though, of course, that of each pair varied with the heat treatment to which they had been subjected.—A. S.

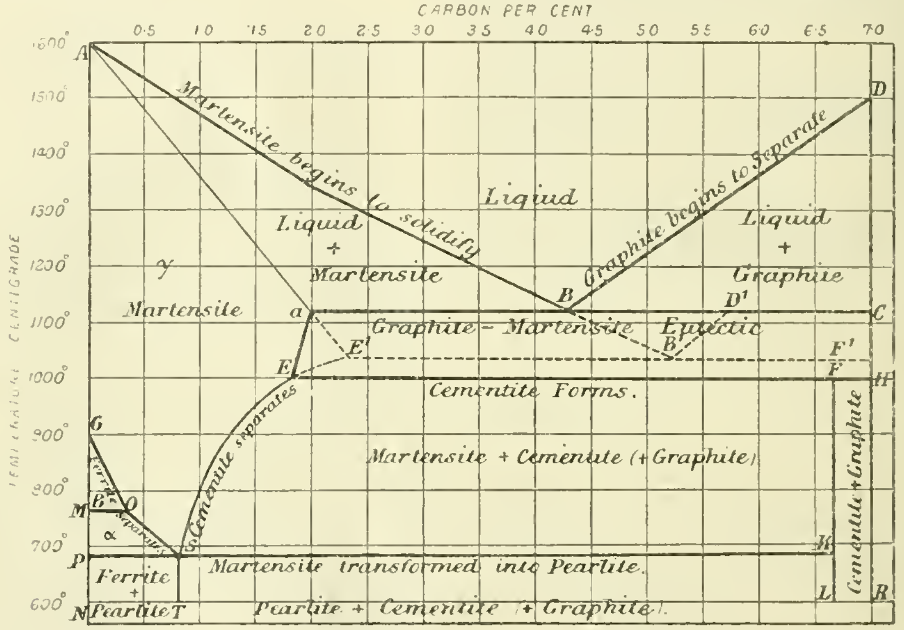
Solid State [Metals]; Change of Structure in the ——. W. Campbell. J. Franklin Inst., 1904, **158**, 161—184.

Changes of structure after a metal or alloy has passed completely from the liquid to the solid state are (1) those due to mechanical stress and to the growth of crystals on annealing the metal or alloy thus strained; (2) those due to changes in composition and to diffusion, such as cementation, decarburisation, diffusion of gold into lead, formation of alloys of copper and copper oxide, &c.; (3) those produced by change of temperature, like the conversion of α-, β-, or γ-iron into one of the other forms, or changes in structure during cooling of copper-aluminium, copper-tin, copper-antimony alloys, or of iron or steel. An account is given, with photo-micrographs, of the work of Le Chatelier on copper-aluminium alloys, and of Heycock and Neville on copper-tin alloys (this J., 1896, 810; 1901, 811). In the copper-aluminium alloys the general structure of the slowly-cooled alloys is that of grains and dendrites of the compounds Al_2Cu, AlCu, or $AlCu_3$, in a mass of eutectic, whilst the same alloys reheated to redness and quenched, become much more homogeneous and "martensite-like" in structure, regaining, however, their original structure when again reheated and slowly cooled. With regard to copper-tin alloys, the most remarkable point is that in some cases, during the cooling, crystals differing in composition from the mother-liquor, separate from the liquid, but afterwards react with the mother-liquor to produce a homogeneous solid, which on further cooling once more splits up into two constituents of different composition. The behaviour of the iron-carbon alloys is very clearly shown by the diagram, based on that of Roozeboom. Above A B D everything is liquid; below A a B C all is solid. The areas A B a and D B C represent mixtures of solid and liquid. Below 4·3 per cent. of carbon, martensite (about 2 per cent. of carbon) separates in the liquid; above 4·3 per cent. of carbon, graphite similarly separates. At 4·3 per cent. of carbon there is no separation till the whole solidifies as the martensite-graphite eutectic. When complete solidification has occurred, the structure is, up to 2 per cent. of carbon, dendrites of martensite, whilst above that point the martensite-graphite eutectic contains dendrites of martensite or free carbon, according as the carbon content was below or above 4·3 per cent. On cooling below a B C, graphite separates out in such a way that at 1000° C. all steels above 1·8 per cent. of carbon (E) contain graphite as well as the eutectic, with or without martensite; below this temperature martensite and graphite react, and form cementite, but so slowly that with ordinary cooling there may still be graphite below the line E F H. Between 1000° C. and 700° C. the martensite still loses carbon, which reacts with more martensite to form cementite, till, at the temperature of recalescence, all steels with more than 0·8 per cent. of carbon are transformed into the ferrite-cementite eutectoid (pearlite); from those with less than 0·8 per cent., ferrito begins to separate, as shown by the line G O S, and below the recalescence line pearlite forms. With the pearlite we have excess of ferrite or excess of cementite, according as the carbon is above or below 0·8 per cent. The diagram al shows the transformation of γ- into β- and β- into α-iro The effects of heat and mechanical treatment are illustrate by reference to a steel containing 0·50 per cent. of carbo and 0·98 of manganese, which showed two critical poin on heating: *Ac* about 700 C. (strong), and Ac_{2-3} abo 750° C. (slight), and on cooling, Ar_{2-3} about 700 C. (sligh and *Ar*, at 660° C. (strong).

Steel Cooled in Air.—Best elastic limit, when heated t 750° C.; greatest maximum load, 840° C.; best elongatio 750° C.; best reduction of area, 700° C. Photo-micrograph show that the whole steel has the finest structure at 733° C where the gradual coarsening of the martensite on heating t 700° C., and the gradual lessening in size of the ferrit result in a uniform texture for the whole steel.

Steel Quenched in Water.—Here the best results we given when the reheating was carried to 733° C.; and th micro-photographs show that the uniform fine structure the steel at that temperature was preserved on quenchin The results show that for *heat refining*, the steel which ha cooled down slowly from 1390° C., and is much overheate must be reheated to that temperature at which the chang due to *Ac* and Ac_{2-3} just balance, for then the whole ste has the finest structure. For *mechanical refining*, the ste should be allowed to cool, before rolling, to such a temper ture that, after rolling, the structure will be as close possible; and although general conclusions can hardly b drawn from a single set of experiments, it would appe that the best results are obtained when the bars leave th rolls as near Ar_{2-3} as possible. An allowance of 40° C. f cooling in the rolls is perhaps sufficient, so that the ba should be withdrawn from the furnace at, say, 740°—750

—J. T. D.



Passivity of Metals in relation to Time and Temperatur W. A. Hollis. Proc. Cambr. Phil. Soc., 1904, **12**, 462—46

The results of the author's experiments with iron, nick cobalt, and copper, lead him to the conclusion that th passivity of metals to fuming nitric acid represents relative condition, which is a function of the structure the metal, the time, and the temperature. There is critical temperature for each metal, above which passivit is no longer exhibited. The transition from the passi to the active condition is, in most cases, a sudden on The critical temperature is about 100° C. for iron, 10° for cobalt, about 80° C. for nickel (varying in differe samples), the change taking place slowly, and somewh above 10° C. for copper. A metal may be regarded being in the passive condition if, when brought into contact with fuming nitric acid, it has not been perceptibly acted upon after 10 seconds. Immediately below the critical point there is a zone of temperature, extending over about 10°, wherein a metal may behave as if it were in either the passive or active condition, according to external conditions. For example, iron plate can be heated with nitric acid to over 90° C. before its passivity is destroyed, yet if the plate and the acid be heated separately and then brought in contact, a vigorous evolution of gas occurs at 75° C. The critical temperature also varies with the purity of the metal.—A. S.

Ammonium Salts and Metals; Some Reactions between ——. W. R. Hodgkinson and A. H. Coote. Brit. Assoc., 1904. Chem. News, 1904, **90**, 142.

The action of ammonium nitrate, both in aqueous solution and in the fused condition, on some metals was examined. Except on cadmium, the rate of action of the aqueous solution and of the fused salt differed notably. Cadmium dissolves rapidly in an ice-cold saturated solution of ammonium nitrate, without evolution of gas. The solution gives off nitrogen only when heated to 100° C., when the cadmium ceases to dissolve. It contains a little free ammonia, and, apparently, the nitrite of cadmium and ammonium, since the cadmium can be completely precipitated by means of a current of carbon dioxide, leaving a solution containing mainly ammonium nitrite. Zinc and magnesium act in a similar manner, but more slowly and to a less extent, owing to the formation of somewhat insoluble double ammonium compounds. Aluminium, iron, mercury, and silver are not acted upon by an aqueous solution of ammonium nitrate. Nickel, copper, and lead are affected to a slight extent, lead becoming coated with a somewhat insoluble nitrite. Fused ammonium nitrate has no action on iron, mercury, or aluminium, but silver is acted upon slightly by the salt, when the latter is heated so strongly as to decompose, with formation of red fumes. When ammonium nitrate is just fused, it acts upon the following metals at rates about in the order given:—Cadmium, magnesium, zinc, copper, nickel, lead, bismuth. Weighed quantities of metals were allowed to act upon ammonium nitrate in a vacuum-tube maintained at the melting point of the salt. In the cases of cadmium and copper, the gas collected was pure nitrogen, the amounts corresponding to a little less than 4 atoms of nitrogen to 1 atom of cadmium, and nearly 3 atoms of nitrogen to 2 atoms of copper. The deficit of nitrogen may be due to the liberation of ammonia which takes place during the first phase of the reaction.

Powdered cadmium dissolves in a solution of aniline nitrate, and if the temperature be kept below 10° C., no appreciable evolution of gas occurs, and a considerable yield of diazoaminobenzene is obtained. The course of the reaction is very similar to that with the ammonium salt, a little aniline being liberated in the first instance.—A. S.

Gold and Silver in Zinc Ores; Crucible Charges for [Determination of] ——. E. J. Hall and E. Popper. XXIII., page 952.

Platinum-Gold-Silver Alloys; Analysis of ——. Hallard and Bertiaux. XXIII., page 952.

English Patents.

Ingot Iron and Steel; Manufacture of ——. B. Talbot, Leeds. Eng. Pat. 22,767, Oct. 21, 1903.

The pig iron and scrap employed are converted in a single furnace having two or more independent hearths, being first treated on a basic hearth, and finished on an acid-lined hearth. Briquettes of iron ore with carbon may be placed on the fore-hearth of the melting furnace, and, when heated, be pushed forward into the hearth proper, to be here treated with suitable additions of lime and iron oxide o eliminate phosphorus and silicon. The charge is preferably tapped from this to the refining hearth while it still contains about 2 per cent. of carbon. The finishing hearth may be worked, if desired, on the continuous system, with a permanent bath of metal.—E. S.

Cast-Iron; Process for Refining ——, *and Apparatus therefor.* H. Harmet, St. Etienne, France. Eng. Pat. 16,448, July 25, 1904. Under Internat. Conv., Aug. 28, 1903.

See Fr. Pat. 334,892 of 1903; this J., 1904, 119.—T. F. B.

Zinc; Treatment of ——. P. and A. Gührs, Berlin. Eng. Pat. 23,145, Oct. 26, 1903.

See Addition, of Aug. 31, 1903, to Fr. Pat. 332,657 of 1903; this J., 1904, 191.—T. F. B.

United States Patents.

Values [Precious Metals]; [Amalgamating] Apparatus for Recovering —— *from Sand or Dirt.* C. M. Poppenberg, Brainard, Minn., Administratrix of C. G. Poppenberg. U.S. Pat. 768,624, Aug. 30, 1904.

A casing is provided with upper and lower discharge spouts, the lower one communicating with a basin, above which is a series of mercury holders, suspended by lugs from ledges of the opposite casing walls. The holders are arranged set above set, and have depressions with sharp edges, the spaces between which permit downward passage of the sand, &c., into deflectors below each set of holders. Above the chamber containing the mercury-holders is another chamber the floor of which has numerous minute discharge apertures; a screen above rejects any particles which are too large, and "rocks" are rejected by a grating above the screen, both sets of coarse particles being passed into the upper spout under pressure from fluid admitted to the chamber.—E. S.

Precious Metals; Method of Extracting —— *from their Ores.* S. C. C. Currie, Assignor to W. Courtenay, New York. U.S. Pat. 769,254, Sept. 6, 1904.

Ores containing precious metals and sulphur are heated in hydrogen, then roasted, the roasted ore digested in a hot caustic alkali solution, after freeing from which it is chloriunated, and the solution of chlorides obtained precipitated by the hydrogen sulphide obtained in the first stage of the process. The residuum is treated with sodium thiosulphate. The alkaline solution resulting from washing the roasted ore with a caustic alkali solution is treated with hydrogen sulphide and then used again.—E. S.

Gold; Process of Extracting —— *from Ores, &c.* H. S. Stark, Johannesburg. U.S. Pat. 769,280, Sept. 6, 1904.

Crushed pyritic auriferous ores are treated with a solution of an alkali thiocyanate (sulphocyanide), in presence of an oxidising agent (including atmospheric oxygen), and the gold dissolved by the nascent cyanogen, and the hydrocyanic acid set free, are recovered. The residue of the treatment of such ores by the ordinary cyanide solution, are oxidised, to set gold free and to produce in the mass thiocyanate and thiosulphate of an alkali metal or metals, and by addition of a quantity of water in presence of air, a solution is formed by which the gold is dissolved. Or, pyritic residues of the cyanide treatment are oxidised, leached with water containing a thiocyanate, and re-leached repeatedly with the same liquor after successive extractions of the gold.—E. S.

Precious Metals; Process of Extracting —— *from Ores or Slimes.* H. R. Cassel, New York. U.S. Pat. 769,938, Sept. 13, 1904.

The process consists in adding solutions of a bromide and of a cyanide to the ore, and passing chlorine gas through the mixture to evolve bromine, and form solvents for the precious metals. Finally, the bromine is reconverted into bromide. See U.S. Pats. 732,708 and 732,709 of 1903; this J., 1903, 915.—E. S.

Tilting Metallurgical Furnace. J. A. Potter, Pittsburg, Pa. U.S. Pat. 769,712, Sept. 13, 1904.

At opposite ends of a furnace, which can be tilted endwise, are regenerators running on tracks in the line of the longitudinal axis of the furnace. Ports in the ends of the furnace communicate with ports in the regenerators. A receptacle is arranged below one end of the furnace and means are provided for tilting the furnace below the ports, so as to pour at least a part of the bath from the end port into the receptacle,—E. S.

French Patents.

Steel; Manufacture of ——. J. Vernon. Fr. Pat. 342,412, April 18, 1904.

See Eng. Pat. 1966 of 1903; this J., 1904, 609.—T. F. B.

Chrome-Nickel Steel; Manufacture of Cemented Pieces of ——. A. De Dion and G. Bouton. Fr. Pat. 342,591, April 23, 1904.

Pieces of chrome-nickel steel, containing, say, from 1 to 3 per cent. of chromium, and from 4 to 6 per cent. of nickel, with 0·12 per cent. of carbon, receive by simple cementation, without hardening, great superficial hardness. See Fr. Pat. 342,061 of 1904; this J., 1904, 903.—E. S.

Armour Plates and Projectiles; Manufacture of ——. F. C. Fairholme and J. E. Fletcher. Fr. Pat. 342,614, April 25, 1904.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(*A.*)—ELECTRO-CHEMISTRY.

Carbon Primary Cell. F. Haber and L. Bruner. Z. Elektrochem., 1904, **10**, 697—713.

The chemical and physical changes occurring in the carbon cell, carbon—fused caustic soda—iron, have never been fully explained, despite the great economic importance of the subject. The authors have carried out a long series of experiments, and show that this cell must no longer be considered as a primary cell with carbon as the source of E.M.F., but rather as an oxygen-hydrogen gas-cell. The iron electrode becomes passive in fused caustic soda, the presence of manganate assisting the change, and in this form is a well-defined oxygen electrode, the oxygen being supplied from the air. On the other hand, both carbon and carbon monoxide react rapidly with fused caustic soda, producing sodium carbonate and hydrogen, and it is this hydrogen alone which causes and conditions the E.M.F. at the carbon. Careful measurements were made of the potential at both the oxygen and hydrogen electrodes under varied conditions. The authors consider that their results will be sufficiently definite to show that there is no hope of the application of this cell.—R. S. H.

Films on Aluminium Anodes; Electrical Properties of ——. W. R. Mott. Electrochem. Ind., 1904, **2**, 352—355.

Taking the thickness of film previously calculated by the author (this J., 1901, 792), the specific resistance in phosphate and sulphate solutions is found to be 10·0 × 10^{10} ohms and 0·8 × 10^{10} ohms per c.c. respectively. The specific resistance of the solid film decreases as a logarithmic function of the temperature. The critical voltage and current for any aluminium anode is defined as the voltage and current at which the heating effect can just be balanced by the cooling effects; above the critical point the characteristic behaviour of the aluminium electrode disappears. The dielectric strength of films formed with phosphate solutions is calculated as one million volts per centimetre.—R. S. H.

Anodic Oxygen Evolution. F. Foerster and A. Piguet. Z. Elektrochem., 1904, **10**, 714—721.

In using polished platinum electrodes Foerster and Mueller found that, as the electrolysis continued, the potential of the anode rose slowly from that at which oxygen was first given off, until it attained a considerably higher value, although the current was kept constant (this J., 1902, 1235). The present authors have carried out a number of experiments to investigate this problem, and have used different metals as electrodes. The effect is observed in both alkaline and acid solutions, but varies considerably with the particular metal employed and with the conditions of experiment. With high current density and a low temperature the rise of potential is greatest. The only explanation which the authors consider satisfactory is that put forward by Haber, who assumes that during electrolysis some of the evolved gases become adsorbed by the electrodes and thus form a layer around them. The actual thickness of this layer will, of course, vary according to the experimental conditions, but the rise of potential and the properties of such a layer seem to be in agreement in all the cases considered.—R. S. H.

Copper Sulphate Solutions: Electrolysis of ——. F Foerster and G. Coffetti. Z. Elektrochem., 1904, **10** 736—741.

Recent observations have shown that a measurable curren can be passed between a platinum cathode and an anode i copper sulphate solutions at as much as 0·1 volt below th potential of metallic copper, *i.e.*, below the point at whic copper can first be deposited. The authors prove tha this is due to the reduction of cupric to cuprous ions $Cu^{\cdot\cdot} + \ominus \longrightarrow Cu^{\cdot}$. At ordinary temperatures, since th concentration of cuprous ions is limited to a low value, th experimental realisation is difficult, but at 90° and 70° C currents of 1·6·10^{-3} amp. per sq. cm. and 0·85·10^{-3} amp per sq. cm. respectively can be maintained without causin the deposition of metallic copper. In neutral solution cuprous oxide, produced by hydrolysis, is deposited at th cathode, and the oxidation of the cuprous salt by the air which also occurs in acid solutions, further tends to restor the equilibrium between the cuprous and cupric ions.
—R. S. H.

Potassium Acetate; Electrolysis of ——. F. Foerster an A. Piguet. Z. Elektrochem., 1904, **10**, 729—736.

In addition to the formation of carbon dioxide and ethan at the anode and hydrogen at the cathode, it has for lon been known that secondary reactions lead to the productio of ethylene, methyl acetate, and oxygen at the anode. Th authors have investigated the electrolysis, so far as it i influenced by different metallic anodes, by the potential the anode and by the use of alkaline solutions. The yie of ethane is also lowered by electrolytic oxidation of aceti acid to carbon dioxide and, to a small extent, to carbo monoxide. With iron and palladium anodes the evolutio of oxygen predominates, corresponding to the low potenti observed in these cases. With platinised electrodes th potential is found to be higher, and here, with increasin current density, the evolution of oxygen diminishes an the oxidation of acetic acid increases. Finally, with brig platinum and iridium anodes, both the potential and yie of ethane are greater. In alkaline solutions the yield always lower than in the corresponding neutral solutio this appears to be due to the prevention of the formation layers of acetic acid around the anode. The authors favo the view of Jahn that the production of ethane is due t the electrolytic oxidation of acetic acid, $2CH_3CO_2H + O =$ $C_2H_6 + 2CO_2 + H_2O$.—R. S. H.

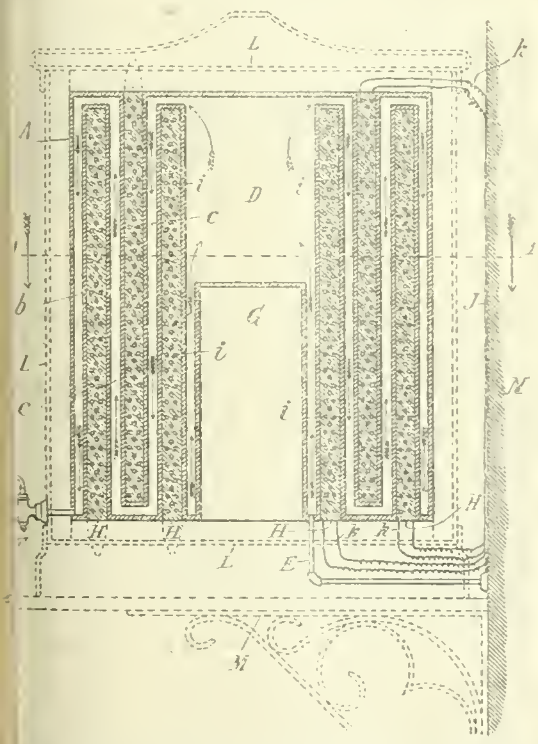
lectrically Heating Liquids; Apparatus for ——. E. R. Waterman. Fr. Pat. 342,896, May 3, 1904.

he liquid to be heated enters the apparatus by the pipe E, rculates, in the direction shown by the arrows, around the



ıting devices H H, and is drawn off at F. The heating effected by wire resistance coils, embedded in asbestos, l contained in the concentric cylinders H H. G is a sed air space, and D a liquid space to accumulate a body heat in order to maintain, in some degree, the temperae of the liquid after the current has been cut off. The ole is enclosed in the outer casing L, to shield it from currents and prevent too rapid radiation.—W. H. C.

one; Apparatus for the Production of ——. B. J. X. Gosselin. Fr. Pat. 342,295, April 14, 1904.

a horizontal tube, a metallic piece, annular in crosstion, and having numerous projecting arms or wings, is secured by tinfoil, or amalgamated metal, this short encircling, metallic piece embracing the longer horizontal tube at its middle. Within the tube a somewhat longer tube, the middle portion of which is enlarged, is sealed at both ends, so that the open ends of the enclosed tube project outwards. There are two apertures in the periphery of the enclosing tube to admit passage of a current of the air to be ozonised. The enclosed tube receives through it a flow of water, to which one of the electrodes of a source of electricity is connected, the other electrode being connected to the surrounding metal piece. A glass cap, with opening to admit of passage over the main tube, is connected airtight to each end, and is fitted to the extreme wing on either side of the metal piece. An aperture on the side of each cap admits air to maintain the circulation.—E. S.

(B.)—ELECTRO-METALLURGY.

Complex Sulphide Ores; Electrolytic Production of Zinc and Lead from ——. C. H. Burleigh. Electrochem. Ind., 1904, 2, 355—357.

The finely crushed ore is very carefully roasted, since the subsequent extraction depends upon having as much as possible of the ore in the form of oxide and the remaining sulphur as sulphide rather than sulphate. The extraction of the zinc and lead is effected with a hot solution of "soda" of 25 to 40 per cent. strength. In this way all the lead and 85—95 per cent. of the zinc is extracted. The residue, containing iron, copper, gold, silver, and gangue can be treated with cyanide or by some smelting process. The solution of zinc and lead is electrolysed at first with a low potential (1·5 to 1·7 volts) to deposit lead and then at 2·5 to 7 volts, when the zinc can be recovered in a coherent form with a 95 per cent. efficiency.—R. S. H.

English Patents.

Aluminium; Process for Hard-Soldering ——. C. and L. Michelis, C. Kruse, and O. Kuhn, Hanover. Eng. Pat. 26,375, Dec. 2, 1903.

Silver is first electro-deposited on those parts of the aluminium which are to be soldered, and a hard solder is then used. Such a solder, corresponding very nearly to the colour of aluminium, may be composed of equal parts by weight of brass, zinc, and aluminium; or, a tougher one could be formed of 10 parts each of silver and brass, 14 parts of aluminium, 2 parts of copper, and 4 parts of zinc. —E. S.

Cast Iron; Process for Hard-Soldering ——. C. and L. Michelis, C. Kruse, and O. Kuhn, Hanover. Eng. Pat. 26,376, Dec. 2, 1903.

After thoroughly cleaning the parts to be joined, they are electro-coated with copper in an alkaline copper bath. The subsequent soldering or brazing may be effected with the usual solders.—E. S.

United States Patents.

Electric Furnace. M. R. Conley, Assignor to Electric Furnace Co., New York. U.S. Pat. 769,250, Sept. 6, 1904.

The furnace consists of a receptacle of like cross-sectional area at top and bottom, composed of resisting material adapted to become incandescent on the passage of an electric current through it. The receptacle has "integral extensions" at each side, with which a series of arms, of greater electrical conductivity than the receptacle, can be connected in different planes, each arm being provided with a switch so that the distribution of the electricity through the furnace can be controlled.—E. S.

Electro-plating Machine. J. Bailey, Walsall. U.S. Pat. 770,148, Sept. 13, 1904.

See Eng. Pat. 15,735 of 1902; this J., 1903, 306.—T. F. B.

French Patent.

Metals [of the Rare Earths]; Process and Apparatus for Obtaining —— in a Pure State. Elektroden Ges. Fr. Pat. 342,581, April 23, 1904.

The process is for the preparation of metals fusible with difficulty, especially those of the rare oxides, such as thorium and zirconium. The oxide of the metal is intimately mixed with excess of magnesium, potassium, or other suitable metal, and the mixture heated in an atmosphere of hydrogen or nitrogen, the heat of the reaction being supplemented, not only externally, but by the electric current. The furnace consists of a horizontal cylinder of refractory material, with a central bore from end to end, each end being occupied by a closely fitting electrode. A vertically ascending tube near one end, and a vertically descending tube at the opposite end, both valved, permit passage of gases.—E. S.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Iso-erucic Acid. G. Ponzio. Gaz. chim. ital., 1904, **34**, 50—55. Chem. Centr., 1904, **2**, 623.

The author prepared erucic acid by saponifying colza oil, freeing it from arachidic acid by treatment with glacial acetic acid, in which the arachidic acid is insoluble. The erucic acid was converted into iodobehenic acid by treatment with phosphorus tri-iodide, and from this, iso-erucic acid (m. pt. 54° C.) was obtained by the action of alcoholic potassium hydroxide solution. When iso-erucic acid is oxidised by means of nitric acid, it yields nonylic acid, $C_8H_{17}CO_2H$, and brassylic acid, $CO_2H(CH_2)_{11}CO_2H$, whilst its dibromide when treated with alcoholic potassium hydroxide solution is converted into behenoleïc acid, $CH_3(CH_2)_7C : C(CH_2)_{11}CO_2H$. These reactions show that iso-erucic acid has the double linking not between the first and second carbon atoms from the carboxyl group as stated by Alexandroff and Saytzeff (J. russ. phys.-chem. Ges. **24**, 486), but between the thirteenth and fourteenth carbon atoms, and that it consequently has the same structural constitution as erucic acid, $CH_3(CH_2)_7CH:CH(CH_2)_{11}CO_2H$.—A. S.

Oleïc Acid Series; New Acids of the ——. G. Ponzio. Gaz. chim. ital., 1904, **34**, 77—85. Chem. Centr., 1904, **2**, 693—694.

The higher members of the $C_nH_{2n-2}O_2$ series of acids with the double linking in the 1.2-position can be prepared from the *a*-iodo derivatives of the corresponding saturated acids, *e.g.*, palmitic, stearic, arachidic, and behenic acids by treatment with alcoholic potassium hydroxide solution. The hitherto unknown 2.3-oleic acid, $CH_3(CH_2)_{14}CH:CH.CO_2H$, was obtained by converting stearic acid into its *a*-bromo-derivative by treatment with phosphorus and bromine, preparing the corresponding iodo-derivative by heating the bromine compound with alcoholic potassium iodide solution, and then boiling the iodine compound for six hours with alcoholic potassium hydroxide solution. A mixture of 2·3 oleic and *a*-hydroxystearic acids was obtained. The 2·3-oleïc acid melts at 59° C. and re-solidifies at 52° C.; it is easily soluble in ether and chloroform, slightly soluble in cold alcohol and soluble in light petroleum spirit. When fused with potassium hydroxide, it yields palmitic and acetic acids. The sodium, calcium, barium, and silver salts, the ethyl ester, the amide, and the dibromide (2·3-dibromostearic acid) of the acid were prepared. The author considers that in an analogous manner to iso erucic acid (see preceding abstract), the iso-oleïc acid described by Saytzeff (J. prakt. Chem., 1888, **37**, 269), has probably the same structural constitution as oleïc acid.—A. S.

Oil of Safflower (Carthamus tinctorius). G. Fendler. Chem.-Zeit., 1904, **28**, 867—868.

The seeds of this plant (from German East Africa) are pear-shaped, 6—8 mm. long, 4—5 mm. maximum breadth. Thin, hard, shining greyish or yellowish-white husks enclose a very soft, greenish-white seed. 100 seeds weigh 5·2 grms. of which the weight of the husks is 2·4 grms., and that o the kernels 2·8 grms. Ether extracts from the whole seed 25·8 per cent., from the kernels 59·37 per cent. of fat The oil, obtained by percolation with ether and evaporatio of the ether, is golden yellow and almost inodorous, bu quickly acquires a very disagreeable rancid flavour. Th following constants of the oil, and of the fatty acid obtained from it (5·84 per cent. reckoned as oleïc acid corresponding to an acid value of 11·63), were determined Oil:—sp. gr. at 15° C., 0·9266: m. pt., − 5 C.; solidifi cation point, begins at − 13° C., incomplete even a − 18° C.: saponification value, 191; iodine value (Hübl) 142·2; unsaponifiable matter, 0·708 per cent.; butyro refractometer reading at 40° C., 65°. Fatty acids:—sp. gr. a 15° C., 0·9135; m. pt., 17° C.; solidification point, 12° C. acid (saponification) value, 199; mean molecular weight 281·8; acetyl-acid value, 151·4; acetyl value, 52·9; acetyl saponification value, 207·4; iodine value (Hübl), 148·2 iodine value of liquid acids, 150·8; acid (saponification value of liquid acids, 191·4; mean molecular weight o liquid acids, 293·1. In a thin layer, the oil dried com pletely at the ordinary temperature within six days; mor rapidly at a higher temperature. The oxygen absorbed, b Livache's test, was after 18, 40, 64, 136 hours respectivel 0·6, 4·3, 6·4, 7·5 per cent. The oil is not suitable fo food, but will be useful for soap-making, and in th manufacture of varnishes.—J. T. D.

English Patent.

Soap Powders; Manufactures of Dry ——. C. Harve London. Eng. Pat. 25,010, Nov. 17, 1903.

Ordinary hard soap is automatically fed into a series c high speed disintegrators. The ground soap is then con veyed by means of spirals or worms to another disintegratio machine where it is mixed with automatically measure quantities of crystallised sodium carbonate, anhydrous bor acid, boron nitride and ammonium chloride. The followin proportions of ingredients are specified: desiccated har soap, 28 parts; sodium carbonate (crystals), 69 parts anhydrous boric acid, boron nitride, and ammoniu chloride, of each 1 part.—W. P. S.

French Patents.

Oils and Fats; Enzymic Saponification of —— witho introducing Appreciable Quantities of Impurities. M Nicloux. Addition, dated April 11, 1904, to Fr. Pa 335,902, Oct. 14, 1903 (see this J., 1904, 327).

Various methods of preparing the active agent from cast seeds are claimed in addition to those described in t main patent (*loc. cit.*). Thus the crushed seeds or se cake may be treated with cotton-seed oil, which is subs quently filtered through silk, yielding a very active filtrat Or, instead of filtration, centrifugal force may be employe and the supernatant oil will then require only the additi of acidified water for direct saponification. Or benzene other solvent may be added to the filtered oil before usi centrifugal force. Again, the castor-seed cake may treated with benzene, &c. and the supernatant liquid sep rated and evaporated. Or the crushed grain may be treat with hot castor oil, which is filtered through fabric a allowed to stand at 80 to 90° C., when aleurone is deposite whilst the active agent left in suspension may be separat by treatment with benzene and centrifugal force. Oth combinations of these different methods are also describe To prepare an active dry substance a large excess solvent is used, and the deposit separated from this in t centrifugal machine treated with a fresh portion of solve and again separated. This dry deposit requires to suspended in oil before use.—C. A. M.

Soap: Manufacture of ——. F. A. V. Klopper. Fr. Pat. 342,691, April 27, 1904.

A certain proportion of wheat gliadin and glutenin added to the soap during the manufacture, with the obj of combining with free alkalis and rendering them innocuo without introducing the drawbacks of superfatted soa (tendency to become rancid, &c.).—C. A. M.

Soap; Manufacture of a Floating ——. F. W. Zimmermann and A. A. Stöhr. Fr. Pat. 342,750, April 30, 1904.

SEE Eng. Pat. 13,451 of 1904; this J., 1904, 871.—T. F. B.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—PIGMENTS, PAINTS.

French Patents.

Vehicles for Colouring Matters in the Manufacture of Pigments; Production of ——. E. H. Strange and E. Graham. Fr. Pat. 342,327, April 2, 1904. Under Internat. Conv., April 11, 1903.

SEE Eng. Pat. 8335 of 1903; this J., 1904, 448.—T. F. B.

Calcium Sulphate and Carbonate occurring as Residues in the Manufacture of Caoutchouc Goods, Colours, Ceramic Ware, and Cement Blocks, and in other Chemical Industries; Utilisation of ——. A. Morin. Fr. Pat. 342,797, May 2, 1904. IX., page 937.

(*B.*)—RESINS, VARNISHES.

United States Patent.

Turpentine Still. J. F. Bailey, Valdosta, Ga. U.S. Pat. 770,149, Sept. 13, 1904.

A DISTILLATION apparatus is claimed which consists of a distillation tank and a condensing coil immersed in water. The still is heated by a series of steam pipes extending ransversely through it, and having their projecting ends onnected with "headers" on opposite sides of the tank. With one of these "headers" a boiler supplying steam is onnected, and with the other a steam pump for forcing water both into the cooling vat and the steam boiler, with he necessary valves for controlling the flow of steam and water.—M. J. S.

French Patent.

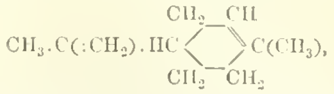
Resinous Products [Turpentine]; Apparatus for the Distillation of ——. G. Coi. Fr. Pat. 342,425, April 18, 1904.

THE apparatus consists of a cylinder of wrought iron nclined at a suitable angle to the horizontal. Its walls orm two concentric envelopes so arranged that there are o rivets or joints in the inner wall, and all chance of eakage is thus prevented. The inner chamber has an nlet tube for the introduction of material, and an outlet or the escape of vapours into the condenser, and is heated y means of a steam coil at the bottom. A door at the nd, kept closed by means of a screw, permits the introduction of an open vessel beneath the inlet tube. The material falls into this and leaves behind the ligneous impurities, &c., which are thus dried separately, obviating the anger of spontaneous combustion, which may take place when such impurities are carried over with turpentine apour into the condenser, as in the methods of dry istillation.—C. A. M.

(*C.*)—INDIA-RUBBER, &c.

Caoutchouc: Pyrogenic Decomposition of ——. R. Ditmar. Gummi-Zeit., 1904, **18**, 1013—1016, 1038—1041, 1058—1061.

THE author gives a detailed review of the investigations which ave been made with regard to the nature of the products f the destructive distillation of caoutchouc. He concludes hat the pyrogenic decomposition of caoutchouc may be egarded as proceeding in the following manner: The large aoutchouc molecule is in the form of an open chain. The olyprene decomposes primarily into a series of aliphatic erpenes with long open chains, which then split into ompounds with short chains, the lowest member of the eries being isoprene, $CH_3.C(:CH_2).CH:CH_2$. These open-hain compounds polymerise and form dipentene, and sesqui-, i-, and poly-terpenes of a cyclic nature. The formation f open-chain and of cyclic compounds almost certainly proceeds simultaneously, and one can scarcely hope to be able to arrest the decomposition of the caoutchouc at a point where only aliphatic terpenes have been produced. The author refers to numerous errors which occur in the literature of the subject with regard to caoutchine, $C_{10}H_{16}$, owing to confusion of the compound with the caoutchene discovered by Bouchardat, and also to the custom of calling it di-isopene. Caoutchine is really a cyclic terpene—



$$CH_3.C(:CH_2).HC\langle\begin{matrix}CH_2-CH\\CH_2-CH_2\end{matrix}\rangle C(CH_3),$$

and, to prevent further confusion, the author proposes the name dipentene for it. A bibliography is appended to the paper.—A. S.

India-Rubber; Presence of Oxygenated Compounds in ——. P. Alexander. Gummi-Zeit., 1904, **18**, 867—869.

CONTRARY to Weber's statements (Gummi-Zeit., **17**, 397 and 952, and **18**, 461) the oxygenated constituents of Pontianac rubber, *i.e.*, those soluble in acetone, have the composition $C_{25}H_{40}O$, whilst the portion insoluble in acetone is a hydrocarbon with a composition closely approximating to $C_{10}H_{16}$, and in general character resembles the hydrocarbon found in other rubbers. The dinitro method showed that the insoluble portion contains 77 per cent. of rubber substance. Guaryrule rubber also appears to consist chiefly of a true hydrocarbon, and the dinitro method indicated slightly above 60 per cent. of caoutchouc. The author considers it doubtful that oxygen compounds exist in rubbers, except in those portions which are soluble in acetone and usually recognised as resin.—R. L. J.

English Patent.

Caoutchouc; Method of Manufacturing Artificial ——. L. L. A. Seguin and J. F. G. de Roussy de Sales, Paris. Eng. Pat. 22,956, Oct. 23, 1903.

SEE Fr. Pat. 336,206 of 1903; this J., 1904, 329.—T. F. B.

French Patent.

Calcium Sulphate and Carbonate occurring as Residues in the Manufacture of Caoutchouc Goods, Colours, Ceramic Ware, and Cement Blocks, and in other Chemical Industries; Utilisation of ——. A. Morin. Fr. Pat. 342,797, May 2, 1904. IX., page 937.

XIV.—TANNING; LEATHER, GLUE, SIZE.

English Patent.

Hides and Skins; Treatment of —— *anterior to and during Tanning.* J. Muir, Beith, Scotland. Eng. Pat. 18,677, Aug. 29, 1903.

THE following claims are made: (1) For the use of a fleshing machine, more particularly in connection with fatty skins. The machine consists of a cylinder fitted with spiral knives, and provided with mechanism for regulating the pressure and presenting the hides to the knives. The cylinder is made to revolve at a high rate of speed. (2) For removal of hair from limed skins by drumming them in a cylinder, that is by attrition of one skin on another instead of by hand labour with a stone or knife. (3) In the above drum (*a*), apertures or slits in its walls to allow of escape of the loosened hair, and (*b*) a shelf fixed at an angle to the door, so that when the latter is removed the skins fall out automatically. (4) Piling the skins in the pits on a false bottom, so that the whole may be lifted and removed in one operation.—R. L. J.

French Patents.

Vegetable Tannage; Rapid ——. M. Berthon. Fr. Pat. 342,600, April 25, 1904.

To induce rapid absorption of tannin from strong liquors without injury, the limed skins are soaked for 2—4 days in the following liquor at 10°—15° C.: Water, 100 litres; hydrochloric acid, 3 litres; barium chloride, 2 kilos.; sea salt, 18 kilos. When transferred to a new liquor made from natural bark or wood (30 parts per 100 of water) for 6—24 hours at 20—25° C., the salt rapidly passes out, and the plumping agents (acid and barium chloride) resist the otherwise injurious action of the strong tannin. The after-liquors are old ones successively strengthened, resinate of manganese being added to the last. A fortnight in layer pits completes the tannage.—R. L. J.

Leather; Artificial ——. H. Karle. Fr. Pat. 342,622, April 25, 1904.

Cotton and similar fibres are formed into a felt, which is impregnated with a mixture of rubber, gutta-percha, and oils, capable of being vulcanised. After rolling into suitable forms or patterns, the whole is vulcanised, and then coloured and finished by various methods.—R. L. J.

Vegetable Tanning or other Substances and Mineral Matters on Hides and Skins; Fixing ——. F. R. Carmichael. Fr. Pat. 342,762, April 30, 1904.

A solution of casein (100 parts) in (1) neutral soap (20 parts), (2) glycerin (10 parts), or lactic acid is drummed into the skins, the presence of free alkali being carefully avoided, so that loosely held tannins, extractive matters, or mineral substances are fixed in the hide to give weight and substance. A similar solution is used as a substitute, together with oils, for egg-yolk in stuffing mixtures, *e.g.*, powdered casein, 13 parts; dry soap, 6 parts; wool grease, 4 parts; mineral oil, 9 parts; pale rosin oil, 9 parts; water, 58 parts.—R. L. J.

XVI.—SUGAR, STARCH, GUM, Etc.

Starch Syrups; Examination of ——. A. Rössing. XXIII., page 953.

Sugars; Enzymic Inversion of ——. N. P. Barendrecht. XVII., page 945.

Molasses; Destruction of Sulphurous Acid in Sulphited ——. M. E. Pozzi-Escot. XVII., page 946.

Molasses; Use of Oxidising Agents in the Fermentation of Sulphited ——. H. Alliot and G. Gimel. XVII., page 946.

Sugars and Starch; Determination of —— *in Vegetable Substances.* J. S. Ford. XXIII., page 953.

English Patent.

Drying Starch from Rice or other Amylaceous Products. W. F. Bate, Manchester. Eng. Pat. 23,703, Nov. 2, 1903.

Rice starch or other amylaceous products are dried in a vacuum apparatus, comprising an open-ended receptacle mounted in a casing connected with a suction or vacuum pump; the casing carries a false bottom for the said receptacle. There is also a filter bed interposed between the receptacle and the casing, and means are provided for clamping the former to the casing so as to form an air-tight connection.—T. H. P.

United States Patents.

Condenser for Vacuum-pans [Sugar Manufacture]. J. F. Utrilla, Jersey City, N.J. U.S. Pat. 769,574, Sept. 6, 1904.

The claim is for the combination of an injector pipe with a condenser cylinder, and a gas-discharge pipe connecting the upper portion of the cylinder with the discharge-pipe of the injector.—L. F. G.

Starch; Process of Making Soluble ——. J. David, Assignor to Otto Bredt and Co., Barmen, Germany. U.S. Pat. 769,061, Aug. 30, 1904.

See Eng. Pat. 23,370 of 1903; this J., 1904, 29.—T. F. B.

French Patents.

Saccharine Liquors and Molasses; Extraction of —— *from Plants and Refuse.* S. Meisels. Fr. Pat. 342,555, April 22, 1904.

Refuse vegetable matters, such as sawdust, wood-refuse, straw, maize-stalks, &c., are moistened and heated with a soda-lye of 3—5 per cent. strength for several hours under a pressure of about 10 atmospheres. The boiled mass is largely diluted with water and subjected to a pressure of 20—24 atmospheres, in order to "dissolve the cellulose." The mass is then aërated with sterilised or ozonised air and converted into sugar by means of mucedinæ.—J. F. B.

Beetroot Chips; Extraction of the Juice from —— *by Heating and Pressing.* A. Wagner and Soc. Selwig and Lange. Fr. Pat. 342,784, May 2, 1904.

The fresh beetroot chips are heated, without the addition of liquid, to a temperature sufficient to precipitate the albuminoid matters; the heating may be effected either indirectly or directly by means of steam or hot gases; the chips are then pressed in the hot state to extract the juice. —J. F. B.

[Saccharine] Liquids; Elimination of Coloured Impurities from ——. E. Koperski. Fr. Pat. 342,229, April 12, 1904.

Coloured liquids of any kind are decolorised by treatment at the boiling temperature with zinc dust and animal charcoal. In the case of very dark saccharine liquids, it is advantageous to acidify them with an organic acid, such as tartaric acid, before treatment.—J. F. B.

Massecuites; Malaxeur for Crystallising, Concentrating, and Cooling —— *with Circulation.* H. Roy. Fr. Pat. 342,786, May 2, 1904.

The system of crystallising massecuites by the aid of agitation is operated in a vertical, cylindrical malaxeur, provided with a conical bottom and stirring arms carried by a vertical shaft; the usual heating and cooling coils are also provided. Parallel with the axis of the malaxeur there is an external pipe, which can be put into communication with the interior at various levels. By means of this pipe, the thinner material, which accumulates near the top of the mass, can be decanted off and returned through a special circulating pump at the bottom of the malaxeur. If desirable, the decanted molasses can be re heated or concentrated in a vacuum pan before it is returned to the malaxeur.—J. F. B.

Desiccating and Cooling Granular Products, such as Crystallised Sugar, &c.; Apparatus for ——. F. Hall. Fr. Pat. 342,619, 1904. I., page 929.

XVII.—BREWING, WINES, SPIRITS, Etc.

Hops; The Bitter Constituents of ——. C. J. Lintner and J. Schnell. Z. ges. Brauw., 1904, **27**, 666—669.

The authors isolated the α-hop bitter acid in the form of a brown crystalline mass by decomposition of its lead compound by sulphuric acid and extraction with ether. The α-hop bitter acid was decomposed by hydrolysis with alcoholic caustic soda, and yielded, in addition to resinous bodies and valeric acid, about 30 per cent. of a very well crystallised derivative, occurring in the form of colourless, tabular, elongated crystals, melting at 92·5° C. This product does not resinify on exposure; it is sparingly soluble in water, but soluble in most organic solvents. A study of its properties showed it to be a hydroxy-ketonic acid having the formula $C_{15}H_{24}O_4$. Since the α-hop bitter acid yields only valeric acid on oxidation with permanganate, it is regarded as a combination of the above hydroxy-ketonic acid with a valeric acid residue, and its formula should be written $C_{20}H_{32}O_5$, instead of $C_{20}H_{30}O_5$ as found by analysis. The authors propose the following nomenclature for the crystalline bitter constituents of hops:—*Lupulinic acid* for the β-hop bitter acid, $C_{25}H_{36}O_4$; *Humulone* for the α-hop bitter acid, $C_{20}H_{32}O_5$, since it is probably a lactone; and *Humulinic acid* or *Humulin* for the above hydroxy-ketonic acid decomposition product of humulone.—J. F. B.

Sugars; Enzymic Inversion of ——. H. P. Barendrecht. Z. physik. Chem., 1904, 49, 456—482.

In the inversion of cane-sugar by acids the formation of invert-sugar is always proportional to the concentration of cane sugar, but this is not the case with invertase, except at very low initial concentrations (up to about 1 per cent.) of cane-sugar. To account for this, the hypothesis is set up that the catalytic action of invertase is due to a kind of radiation. The inversion of cane-sugar by invertase is retarded to an equal extent by invert-sugar, glucose, and levulose; hence the inversion is not a simple matter of chemical equilibrium, otherwise invert-sugar would show exceptional powers of retardation. Mannose and galactose retard inversion to twice the extent of glucose. Thus, the further hypothesis is suggested that the radiation emitted by invertase is of two different orders: either has the property of inverting cane-sugar, but the one s absorbed only by glucose, the other only by levulose, whilst foreign hexoses absorb either indifferently. Mannitol and dulcitol, which contain one asymmetric carbon atom less than the hexoses, retard somewhat less. Salicin, which contains a glucose differing from that produced from cane-sugar, retards, molecule for molecule, twice as much as glucose. There is no difference between the yeast-enzymes which invert cane-sugar and maltose. Since the maltose molecule is less easily broken down, weakened invertases fail of effect on the maltose though they may be still active towards cane-sugar. Equilibrium between maltose and its primary product of inversion (*i.e.*, bi-rotating glucose) is reached much sooner than in the case of cane-sugar. The inversion is retarded equally by levulose and by galactose.—W. A. C.

Top-Fermentation Yeast; Relations between the Quantity of Pitching Yeast and the Attenuation and Yeast Crop with ——. J. J. van Hest. Z. ges. Brauw., 1904, 27, 633—636 and 651—654.

When different proportions of yeast are sown in wort of he same concentration, the attenuations at the end of the first day are approximately proportional to the quantity of yeast sown. After that time the proportionality ceases and he attenuations tend towards equalisation; high fermentaion temperatures also tend to equalise the attenuations. n the series of experiments here recorded, wort of 10·7° Balling was pitched with proportions ranging between ·0001 and 20·0 litres of "normal pitching yeast" (see his J., 1904, 30) per hectolitre, and fermented for eight ays at 17·5° C. At the end of that time the final attenuaion was in all cases identical and perfectly independent of he quantity of pitching yeast. The yeast crop, naturally, was greater the greater the quantity of yeast sown, but fter deducting the original quantity of pitching yeast from he quantity of the crop, the absolute value of the yeast ncrease reached a maximum with a sowing of 1 per cent., nd then decreased. The point at which there was no ncrease at all lay between 10 and 20 per cent. of pitching east. The number of times the yeast cells had multiplied coefficient of reproduction) was inversely proportional to he quantity sown; this coefficient is also a measure of the atio of young cells to old cells. Similar experiments made t a temperature of 25° C. yielded results of the same nature, ut the yeast crops and coefficients of reproduction, especilly with the smaller sowings, were generally higher than t the lower temperature. Increase in the concentration of he wort, and aeration during fermentation, the quantity of itching yeast being constant, also caused an increase in he reproduction coefficients, but not in a degree proportional to the increased nutrition available. Increased eproduction by these methods soon reaches a limit, because he yeast requires a certain degree of dilution of its food nd a certain amount of dissolved oxygen in the wort in rder to perform its biological functions. The usual limits f practical brewery conditions, as regards proportion of pitching yeast and concentration of wort, correspond pproximately to the maximum degree of healthy reproduction. With the usual brewery sowing of 0·5 per cent. of "normal" pitching yeast, each cell has at the time of pitching an available free space of 500 times its own volume; at the end of the fermentation at 17·5° C. the yeast had multiplied six times, and each cell then had a free space of 83 times its volume. In the cases where, owing to heavier sowings, the free space at the end of fermentation was less than 83 times, the resultant yeast was generally debilitated to an extent proportional to the restriction of its free space. In top fermentation it is the younger generations of cells which rise to the surface and are used for pitching; it is therefore important that these young cells shall not have suffered from malnutrition and overcrowding during their growth. The cause which prevents the yeast from growing indefinitely, so long as there is excess of nutrition and air, is the accumulation of excreta, *i.e.*, products of metabolism other than alcohol and carbon dioxide, the two latter, in the author's opinion, having very little inhibitive influence. The considerations of the amount of free space available for each yeast cell, as determined by the amount of the original sowing, are also discussed from the point of view of fitness in the struggle for existence and the power of the yeast in suppressing infecting organisms.—J. F. B.

Beers; Comparison between the Composition and Properties of —— *prepared from Barleys rich and poor in Albumin.* R. Wahl. Amer. Brew. Rev., Aug. 1, 1904. Chem.-Zeit., 1904, 28, Rep. 255.

Beers were prepared in a perfectly parallel manner from Montana barley malt (albuminoid content of barley, 9·23 per cent.) on the one hand, and from Minnesota barley malt (albuminoid content of barley, 15·16 per cent.) on the other. Both beers were stored for a month at 3°—4° C. and then kept in bottle at 0·75° C. for another month. At this temperature both beers became turbid after a few days, but the turbidities subsided, in the Minnesota beer after two weeks, and in the Montana beer after four weeks. The clear beers were tested, both in the pasteurised and unpasteurised condition, for their susceptibility towards chill, with the result that the Montana beer was found to be the more susceptible. The analysis of the nitrogenous constituents of the two beers gave the following results:—

——	Montana Beer.	Minnesota Beer.
	Per Cent.	Per Cent.
Original wort solids	13·98	13·98
Albumin	0·018	0·027
Albumose	0·109	0·137
Peptone	0·201	0·302
Amides	0·36	0·504
Total albuminoids	0·68	0·97
Albumin deposited during cold storage	0·0024	0·0024

Thus the higher proportion of albuminoid constituents in the Minnesota beer had no evil effects in rendering the beer susceptible to chill, but, on the other hand, it had a favourable influence in increasing the palate fulness and the permanence of the "head." The author gives the preference to barleys rich in albumin for brewing purposes, so far as American barleys are concerned.—J. F. B.

Beer and Brewing; Surface Influences in ——. F. Emslander and H. Freundlich. Z. physik. Chem., 1904, 49, 317—328.

The authors discuss the various physical phenomena which are met with in the brewery as the results of surface influences of various kinds. Owing to the fact that beer consists partially of a pseudo-solution ("sol") of organic colloids, the particles of which possess surfaces of separation from the liquid in which they are suspended phenomena of the nature of "adsorption," *i.e.*, concentration and retention of certain of the dissolved matters on the outer surfaces of the colloid particles, are produced. Electrical experiments similar to those described by Biltz for other colloid "sols" (see this J., 1904, 459 and 619) proved that the organic colloids of beer are positive relatively to the liquid by which they are surrounded. The beer colloids migrate to the cathode under these conditions in the form of a thick, flocculent mass which carries with it most of the colouring matter. The foam surrounding the cathode is yellow, very glutinous and permanent, whereas, that near the anode is pure white and transient. Owing to the surface influence of "adsorption" these colloidal bodies attract to themselves the colouring matter, the flavouring and odorous bodies, and the carbon dioxide. To them the qualities known as "permanence of head," "fulness of body" and "condition" of the beer are, therefore, attributable. Geffcken has recorded (this J., 1904, 914) how, in the case of ferric hydroxide "sol," also a positive colloid, there is an analogous instance of the retention of carbon dioxide by "adsorption." Cases of "adsorption" occur in all the filtration operations in the brewery, for instance, in running off the wort from the mash the soluble extractive matters are retained with exceptional firmness by the insoluble colloids of the grains. Passing on to other influences exerted by surfaces upon the brewing operations, the authors discuss the different powers of different surfaces in discharging a state of supersaturation of the carbon dioxide during fermentation. Since a rough or greasy surface discharges the gas with greater facility than a clean smooth surface, and since a rapid removal of the carbon dioxide favours the rapidity of fermentation, the following values for the apparent attenuations reached by the same wort fermented in vessels of different internal structure for nine days at 7°—8° C. are explained:—Wood, dry, untreated, 72·8; paraffined wood, 71·3; wood boiled and saturated with wort, 69·9; wood with pitch coating, 68·4; wood, lacquered, 57·4; glass, 52·9 per cent. The rapidity of clarification also followed the same order.—J. F. B.

Brewery Refuse; Purification of ——. H. M. Wilson. Brewers' J., 1904, 40, 635—637.

Owing to the fact that brewery refuse rapidly undergoes acid fermentation, it is very refractory towards the action of the ordinary purifying organisms, and consequently the septic tank treatment is not one to be recommended for this purpose. The most satisfactory results were obtained by successively treating the refuse by chemical precipitation, filtration or percolation, and straining through sand. The refuse was first rendered alkaline by the addition of milk of lime, about 45 grains of lime per gallon of liquid being generally found sufficient. After allowing the mixture to settle, the liquid portion was then subjected to double contact filtration, the filters being constructed as follows:—The first was underdrained by channels formed of loose bricks laid on the concrete bottom of the bed. The latter was then made up of 6 ins. of clinker sized from 1 in. to $1\frac{1}{2}$ in., then 12 ins. from $\frac{3}{4}$ in. to 1 in., 12 ins. from $\frac{1}{2}$ in. to $\frac{3}{4}$ in., and the top 9 ins. from $\frac{1}{8}$ in. to $\frac{3}{8}$ in., 3 ft. 3 ins. in all. The second bed, underdrained in the same way, consisted of 12 ins. of sifted ashes of 1 in. size, 12 ins. of $\frac{3}{4}$ in., 9 ins. from $\frac{1}{8}$ to $\frac{3}{4}$ ins., 3 ins. of fine lime-stone chippings, and again 3 ins. of fine ashes free from dust; 3 ft. 3 ins. in all. The first bed was also covered at the inlet end with an extra layer of fine ashes 3 ins. in depth, to catch the fine suspended matter carried forward from the settling tank by the flushes of liquid. The effluent from these filters, not being sufficiently clean to run into a river, was then pumped up into a tank, and passed by means of a rotating sprinkler on to a coke filter, consisting of a bed, 6 ft. in diameter and 6 ft. deep, of coke breeze, about a quarter of which had been obtained from some first contact beds at sewage works, and the remainder direct from the gas works. The pieces were about the size of apples, and a layer of stones was placed at the bottom of the bed for drainage purposes. By supplying the effluent to this filter in intermittent doses every 5 minutes for 8 hours a day to the amount of 140 gallons per sq. yard per day, the resulting effluent was quite satisfactory and contained nitrates. A final straining through sand was found to be necessary as usual. The albuminoid ammonia was reduced to 0·15 part per 100,000, and the oxygen absorbed to 1·8 parts. An earth-filter was tried instead of the coke-bed, and yielded nearly the same results. The above experiments were to some extent determined by the nature of the existing works at the brewery, but in constructing new works, the best course would be to provide tanks for chemical treatment, a first percolation filter and another at a lower level, and finally a shallow sand strainer. To prevent acid fermentation of their contents, the tanks should not be too large, and the filters should be of sufficient area to allow of only a moderate quantity per yard being passed through them. The actual amount of purification effected during the experiments amounted to 96 per cent. as regards the albuminoid ammonia, and 93 per cent. reckoned on the oxygen absorbed.—W. P. S.

Molasses; Use of Oxidising Agents in the Fermentation of Sulphited ——. H. Alliot and G. Gimel. Bull. Assoc. Chim. Sucr. et Dist., 1904, 22, 88—92.

The method of Saillard for removing sulphurous acid, by boiling with sulphuric acid, is too costly owing to the large consumption of fuel. The authors find that calcium hypochlorite and manganese dioxide are among the chemical oxidising agents presenting most interest. Calcium hypochlorite, from its cheapness and more rapid action, is to be preferred, and its employment is more general, since there is no need for it to act in an acid medium as is the case with manganese dioxide. Moreover, the salts of manganese, although not injurious, retard fermentation. The advantages secured are the disappearance of sulphurous acid, either free or as potassium bisulphite, bactericidal action and consequent purity of fermentation, and an acceleration in the multiplication of yeast cells. The quantity of hypochlorite used is 50 grms. per hectolitre.—L. J. de W.

Molasses; Destruction of Sulphurous Acid in Sulphited ——. M. E. Pozzi-Escot. Bull. Assoc. Chim. Sucr. et Dist., 1904, 22, 92—101.

Although the use of sulphurous acid as an antiseptic is valuable in obtaining pure fermentations, large quantities give rise to the production of sulphuretted hydrogen by enzymic hydrogenation, with formation of metallic sulphides in the pipes, and the sulphurous acid also acts injuriously by retarding the development of the yeast. It has no sensible action on the activity of sucrase and zymase of yeast. In active fermentation with acclimatised yeast, part of the sulphurous acid is reduced, part oxidised, and part absorbed. It is not possible to destroy the acid by chemical reduction in distillery wort, and electrolytic reduction introduces substances injurious to yeast. By using a scrubber and working at 60°—70° C. it is possible to oxidise sulphurous acid practically with atmospheric air. This action may be assisted by manganese protoxide, which was found to have only a negligeable influence when present to the extent of 0·5 grm. per litre. Worts fermented in presence of a large quantity of sulphurous acid contain notable quantities of fatty acid, aldehyde, and higher alcohols. Calcium hypochlorite is useful if added in quantity to merely reduce the quantity of sulphurous acid, but electrolytic oxidation introduces a large quantity of accessory products in presence of which yeast develops with difficulty.—L. J. de W.

Sugars and Starch; Determination of —— *in Vegetable Substances* [*Malt*]. J. S. Ford. XXIII., page 953.

English Patents.

Malting Apparatus. R. Plischke and A. Beschorner, Vienna. Eng. Pat. 28,264, Dec. 23, 1903.

See Fr. Pat. 337,983 of 1903; this J., 1904, 556.—T. F. B.

Whey into Vinegar; Method of Converting ——. A. Barbier, Paris. Eng. Pat. 16,189, July 21, 1904.

Distillery or other Impure Effluents containing Matter in Suspension; Bacterial Bed System of Treating ——. A. M. Cowie. Eng. Pat. 20,025, Sept. 17, 1903. XVIII. B., page 947.

French Patent.

Albumin-Tannate; Soluble —— [*for Filtering and Clarifying Wine, &c.*]. Soc. Lasmolles and R. de la Faye. Fr. Pat. 342,682, April 27, 1904.

Powdered casein (46 parts), tannin (16 parts), and sodium bicarbonate (8 parts), are mixed together. This powder forms a clear solution in tepid water, and when added to acid liquors such as wine, the insoluble albumintannate precipitates out, carrying with it suspended matter. Infusorial earth may be used in conjunction. Filter cloths soaked in the solution are said to become much improved for the filtration of weakly acid, turbid liquors.—R. L. J.

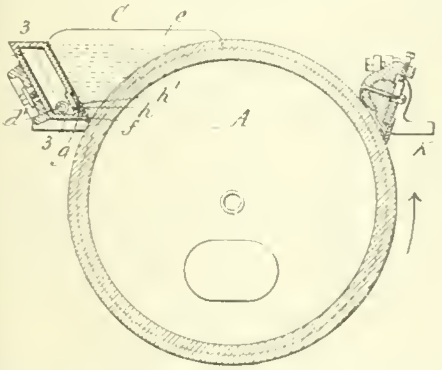
United States Patents.

Evaporating Liquids [*Milk*]; *Process for* ——. J. A. Just, Pulaski, N.Y. U.S. Pat. 765,343, July 19, 1904.

The liquid in the form of a film is evaporated by exposing it to the action of a heated surface on one side, and to a cooled surface on the opposite side. This method prevents the overheating of the material, and keeps the outer surface



f the film in a porous condition, so that evaporation easily akes place. A is a hollow cylinder, heated by passing team into the interior, and capable of being rotated in the irection of the arrow by suitable means. A flat waterooled box (3) is placed at an angle against the cylinder, nd so adjusted that only a thin film of liquid can escape s the cylinder rotates. The liquid to be evaporated is upplied at C, and the dried product is taken off by the craper K. The use of the cooled surface allows a sufficiently high temperature to be applied to ensure the terilisation as well as the complete desiccation of the aterial without damage from overheating.—W. H. C.

French Patent.

oods; Process of Sterilising ——. K. C. L. G. Budde. Fr. Pat. 342,769, April 30, 1904.

he food—green peas, for instance—is heated for 10 minutes ith a 0·005 per cent. solution of formaldehyde, and afterards for 10 minutes with a 0·025 per cent. solution of ydrogen peroxide, and then canned. Other foods, such as sh, milk, or meat, may be similarly sterilised, but without eating, if the treatment be more prolonged. The hydrogen eroxide may be replaced by sodium peroxide or perlphate.—W. P. S.

English Patents.

ewage and other Fluids; Purification of ——. A. A. Adams, London, and E. Springborn, Glasgow. Eng. Pat. 19,599, Sept. 11, 1903.

he sewage is conducted into a settling tank containing a rizontal grating covered with filtering material (coke). fter passing this grating the liquid flows from the lower part of the tank into a distributing main, and from the latter to a number of filter channels. These are fitted with box screens and a series of filters. The filters, consisting of any suitable filtering material, packed between perforated walls, are in pairs, so that while one is lowered into the channel, the other is suspended in the air. By this means the filters are alternately aerated. The channels discharge into a main effluent conduit. A space of 2 feet is left between the successive pairs of filters, a bed of gravel confined by low walls extending across the channel, being placed in this space. The second wall of each gravel bed is perforated by tubes sloping upwards.—W. P. S.

Distillery or other Impure Effluents containing Matter in Suspension; Bacterial Bed. System of Treating ——. A. M. Cowie, Dufftown, Scotland. Eng. Pat. 20,025, Sept. 17, 1903.

To the usual bacterial installations are added sludging compartments provided with sludging boards for the purpose of removing suspended matter, especially yeast. The compartments are preferably made deep and narrow.—A. G. L.

Sewage and other Fluids; Apparatus for Treating ——. W. J. Schweitzer, White Plains, N.Y., U.S.A. Eng Pat. 14,003, June 21, 1904.

See U.S. Pat. 763,026 of 1904; this J., 1904, 758.—T. F. B.

Ammonia; Process for the Extraction of —— *from the Sewage Waters of Towns, and similar Liquids.* R. Schilling and C. Kremer, Berlin. Eng. Pat. 14,966, July 14, 1904.

The clarified sewage-waters are led on to layers of coke, slag, or the like contained in closed receptacles, and after remaining some time are removed, and hot gases passed through the layers of coke, &c. After these are well heated, the entrance of gases is stopped, and the filters are again filled for renewal of the process. The gases are led away to be treated for recovery of the ammonia. The hot gases used are, preferably, produced by the combustion of the slime deposited during the preliminary purification.—E. S.

(*C.*)—DISINFECTANTS.

English Patent.

Insecticide. G. Muller, Mulhausen, Germany. Eng. Pat. 18,678, Aug. 29, 1903.

"Saccharic acid" is claimed as an insecticide. Owing to its hygroscopic nature, it is to be mixed with some "animal or mineral powder" (*e.g.* talc), and in the state of powder is blown into the air by distributing bellows.—T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

Sulphite Wood Pulp; Notes on the Boiling of ——. Montanus. Wochenbl. f. Papierfab., 1904, **35**, 2832—2833.

The improvements introduced in recent years in the manufacture of sulphite wood pulp have led to a considerable shortening of the boiling process, so that in the Mitscherlich apparatus the boiling is reduced to 28—30 hours, and in the Ritter-Kellner to 14—16 hours. The time of boiling is regulated by the nature of the wood, strength of liquor, &c.; it also depends on the kind of pulp it is desired to make. If easy bleaching be not a desideratum, and if a strong, tough cellulose be required, the process of "high" boiling is adopted, *i.e.*, the boiling is stopped whilst the liquor still contains a relatively high percentage of sulphur dioxide. But if an easy bleaching pulp be required, it is boiled "low" until little or no sulphur dioxide remains. Pulp boiled "low" is, however, proportionately weaker; it leaves the boiler with a pale to chocolate-brown colour. The browner the stuff as it leaves the boiler, the less the quantity of chlorine required for bleaching. Sometimes a "high"-boiled pulp will turn brown when not desired to do so, especially if the blowing-off of the gases be delayed. If, as a compromise, a pale, strong pulp, which does not present too great difficulties in bleaching, be desired, the temperature in the boiler should not be allowed to rise too rapidly, but the whole boiling should be conducted more slowly than for pulp which has not to be bleached. The "brown-boiled" pulp, above referred to, must not be confounded with the interior scorched pulp obtained when the wood is not fully covered with liquor. For the preparation of a fine "white-boiled" pulp, it is recommended to use perfectly fresh pine wood, in which all the sap is still present, and to boil it slowly with a strong sulphite solution. If properly prepared the resulting pulp will be nearly as white as if it had been bleached.—J. F. B.

Sulphite Cellulose; Bleaching of ——. Montanus. Wochenbl. f. Papierfab., 1904, **35**, 2761—2762.

In the author's experience the consumption of bleach, in bleaching sulphite wood-pulp to a "high white," works out at an average of 14 per cent. The author never uses acid, and does not beat the pulp to a higher temperature than 35°—40° C. If the stuff, for any reason, has to be kept for a long time in the bleaching engine, it is best to mix it cold. Thorough washing after bleaching causes a certain fall back in colour; the use of an antichlor also dulls the white slightly. In the case of a pulp which bleaches with difficulty, the author does not add an unnecessarily large quantity of bleach, but discharges the engine whilst the stuff is still yellowish and contains a residue of chlorine. After a few days the same stuff is loaded back into the engine with quite a small addition of bleach, which then brings about a far better white than if the whole quantity of bleach had been employed in a single operation; but if the cellulose is well boiled and not browned, this double bleaching is never necessary. The bleach solution is made up to a density of 3·5° or 4° B., but the active chlorine should always be determined chemically. The composition of the water has a great influence upon the bleaching process. The consumption of chlorine is relatively less in hollanders which take a heavy charge than in the smaller ones.—J. F. B.

Sulphite Cellulose; Manufacture of Tissue Paper from ——. C. Meyer. Papier-Zeit., 1904, **29**, 2685—2686.

For the manufacture of tissue paper from wood cellulose, a machine of the Fourdrinier type with several drying cylinders is the most satisfactory. Sulphite pulp is preferable to soda pulp, on account of its superior strength. The chief difficulties encountered are occasioned by the presence of resinous impurities in the raw material, which cause sticking and tearing. The whole secret of successful manufacture lies in a suitable boiling and bleaching of the pulp. The boiling liquor should be as rich as possible in sulphurous acid, and the duration of boiling must not be curtailed. The condition of the wood is also important; it must not be too fresh, and wood which has been floated down the rivers always gives the best results. The residual sticky impurities are removed by bleaching. This operation is not as a rule an easy one, since the resinous bodies in combination with gypsum form a hard scale on the fibres. Bleaching should be conducted at a lukewarm temperature with 18—20 per cent. of bleach, without the assistance of acid. A preliminary treatment with sodium carbonate is not necessary with a well-boiled pulp; the use of antichlor is desirable. With a suitable machine, a speed of 35 metres per minute is attainable, working on tissues at 17 grms. per square metre. The wire should not be coarser than 85—90 mesh (German measure), otherwise very inferior results are obtained. If the shaker does not work with perfect uniformity and horizontally, it will destroy the wire and had better be discarded; the dandy roll may also be omitted with advantage. The stuff should be sized very sparingly, but plenty of alum should be used. With steel knives in ordinary beaters it is usual to allow two hours for opening out the fibres, four hours for beating proper, with gradually increasing pressure, and two hours for brushing out and for making the stuff even. Beating must on no account be hurried, but the time can be shortened considerably by using broad bronze or basalt-stone beating surfaces, which rapidly impart the desirable "wetness" to the pulp without beating it "dead."—J. F. B.

Bank-Note Papers. Liber. Wochenbl. f. Papierfab., 1904, **35**, 2757—2761.

Details are given of comparative tests made with three papers made from pulps of the following composition: (*a*) 30 per cent. of flax and 70 per cent. of hemp, both in the partially crude, semi-white state; (*b*) 85 per cent. of pulp (*a*) with 15 per cent. of raw unbleached cotton; (*c*) pure ramie pulp. The pulps were beaten for a very long time, especially pulp (*a*), and the consequent "wetness" made the treatment on the hand-mould very difficult. The strength tests of the unsized papers showed that the paper (*a*) was the strongest, with an average breaking length of 8310 metres; the presence of the cotton in the paper from pulp (*b*) caused the lowering of the breaking length to 7096 m., a fall of 14·7 per cent.; the strength of the ramie paper was only 6112 m. The effect of animal sizing on the three papers was different; the strength of (*a*) was increased 43 per cent., that of (*b*) 30 per cent., and that of (*c*) only 18 per cent. The rosin sizing of the same pulps in the beater caused decreases of strength amounting to 6 per cent. in (*a*), 12·5 per cent. in (*b*), and 3 per cent. in (*c*). The ramie fibre responds less to the influence of the sizing, whether animal or rosin, than the other fibres, owing to its cruder nature. The presence of incrustations on the surface of the ramie fibres accounts for the unabsorbent nature of the paper, and also causes the marked deficiency of felting properties, as shown by the comparative weakness of the waterleaf paper, although the individual ramie fibre is stronger than either flax or hemp. In the case of pulp (*b*) the unbleached cotton is also less absorbent than the flax and hemp, and the paper is less strengthened by the animal size than paper (*a*). When the rosin-sized papers were subsequently sized with gelatin the paper containing the cotton increased 25 per cent. in strength, whereas the ramie paper increased only slightly. The author concludes that ramie is unsuitable for the manufacture of strong papers, and its great transparency is not favourable to the water-marking. Phormium (New Zealand flax) is a fibre which felts very well, and should prove an excellent constituent for water-marked bank papers; certain of the Russian notes contain a layer of phormium mixed with hemp. Since the strength requisite for bank notes can only be obtained by using semi-crude fibres beaten very "wet," the resultant transparency causes difficulties in fine engraving. In the author's opinion the desirable strength, combined with opacity, would be afforded by the use of the Japanese paper-mulberry fibre if it were obtainable in a regular supply. A very good substitute for this can, however, be got from several European species of mulberry trees of the genus *Morus*. The author has prepared pulps from these, and finds that they bleach well and give very strong papers, with an exceptionally high resistance to crumpling.—J. F. B.

Paper Machine; Cleaning the Wire of the ——. J. K. Wochenbl. f. Papierfab., 1904, **35**, 2837—2838.

The writer recommends the use of a steam jet for keeping the wire cloth of the paper machine free from impurities. A spraying pipe, connected with a ¾-in. steam pipe, is placed on the under side of the wire cloth, about 4 ins. in front of or behind the tension roll or near one of the other guide rolls. The spray should not be more than 2 ins. away from the surface of the wire. This spray can be applied at any convenient time, but preferably immediately after the machine stops work, the wire being run round several times for the purpose; a regular spraying every other day should suffice to keep the wire in good condition.—J. F. B.

English Patents.

Paper and like Material; Machine for Coating ——. L. W. Noyes, Mechanicsville, N.Y., and J. W. Krueger, New York, U.S.A. Eng. Pat. 11,253, May 16, 1904.

In order to increase the speed with which a web of paper may be passed through the coating machine, the web, as it emerges from the coating devices, is engaged by a suction box, from which it is transferred to a double or compound apron composed of a short endless apron of continuous material, and a long endless apron of perforated material. Both aprons travel in the same plane, and the brushes operate upon the paper, whilst the latter is supported by both aprons; after the short apron has returned, however, the web still passes on the long apron over a final suction box, immediately above which is another brush; the long apron then returns, and the paper passes on to the driers. —J. F. B.

Pulp Strainers for Paper Manufacture. P. Nebrich, Prag-Schmichow, Germany. Eng. Pat. 16,403, July 14, 1904.

A compartment is formed by two vertical slotted strainer plates situated in a vat; the top of this compartment is closed by a movable cover, and a valved opening at the bottom communicates with a waste-channel. The crude pulp is introduced into the compartment between the two strainer-plates, and is there subjected to the oscillating movement of a centrally pivoted plate swinging on a horizontal axis. The oscillating motion at each stroke forces the fibres through two diagonally opposite half-sections of the strainer-plates, at the same time creating a suction on the complementary half-sections, which washes the slots free from knots. The latter collect at the bottom, and are removed from time to time through the waste valve. —J. F. B.

United States Patent.

Binding Mediums for Colours [for Paper, &c.]; Production of ——. C. H. Voigt, Assignor to L. Voigt, Leipzig-Plagwitz, Germany. U.S. Pat. 770,202, Sept. 13, 1904.

As a substitute for animal glue to be used with colouring naterial for pasteboard, &c., 100 parts of starch, 4–6 parts f a mixture of an "alkaline sulphate and a superoxide compound," and 300—500 parts of water, are heated together under pressure at 100°—200° C.—M. J. S.

French Patents.

Printing Papers; Manufacture of ——. J. von Schmaedel. Fr. Pat. 342,206, April 11, 1904.

A solution of a suitable glucoside, such as esculin, saponin, &c., is added to the paper either by impregnation of the inished or partially finished paper, or by incorporation with he pulp. The saponin renders the paper very pliable, and nables it to take a surface which is eminently fitted for eceiving the colours and inks in printing.—J. F. B.

Paper Pulp; Filter for ——. F. G. Busbridge. Fr. Pat. 342,265, April 13, 1904. Under Internat. Conv., Nov. 17, 1903.

EE Eng. Pat. 25,073 of 1903; this J., 1904, 677.—T. F. B.

Celluloid Composition; New ——. R. Ortmann. Fr. Pat. 342,464, April 19, 1904.

Ordinary pyroxylin, 1 kilo., is mixed with 0·065 litre of urpentine, 0·25 litre of a ketone, and 0·25 litre of ether; ·5—0·75 litre of methyl alcohol is then added, and the ixture is allowed to remain for 12 hours before being illed between hot rolls. Venice turpentine and acetone ield the best results, but any turpentines or derived resins nd any ketones may be used.—J. F. B.

Collodion and Cellulose Solutions; Apparatus for Filtering and Spinning Filaments from ——. Soc. Desmarais et Morane and M. Denis. Fr. Pat. 342,655, April 26, 1904. V., page 933.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Cinchonine Iso-Bases. Z. H. Skraup and R. Zwerger. Monatsh. Chem., 1904, 25, 894—906.

URTHER experiments have been made with a view to conrming the authors' opinion that the relations between nchonine and the so-called iso-bases, *i.e.*, *α-i-* and *β-i-*nchonine, and allocinchonine may be most clearly shown by formulæ differing not so much structurally as stereochemically. The work comprised experiments on: the action of hydrochloric acid on *α-i*-cinchonine both at the ordinary and at higher pressures; decomposition of hydrochloro-*α-i*-cinchonine by alcoholic potash; heating trihydrochlorocinchonine with hydrochloric acid in a sealed tube; action of hydrochloric acid on *β-i*-cinchonine; allocinchonine and hydrochloric acid; *α-i*-cinchonine and hydrobromic acid; action of chlorine on the cinchonine bases.—A. S.

Clove Oil; Refractive Index of ——. W. H. Simmons. Chem. News, 1904, 90, 116.

The author points out the usefulness of the determination of the refractive index to distillers of clove oil. With pure oils the refractive index is approximately proportional to the percentage of eugenol. In the case of adulterated oils, however, the refractive index cannot be regarded as a measure of the amount of eugenol, as is shown by the figures for No. 9 in the following table:—

Sample.	Specific Gravity at 15°/15° C.	Rotation. $[\alpha]_D$	Refractive Index. $n_D^{20°}$	Phenols.
				Per Cent.
No. 1	1·0606	..	1·5382	93·0
,, 2	1·0509	− 0° 44′	1·5318	88·0

—A. S.

Acorus Calamus; Constituents of the Essential Oil of ——. H. Thoms and R. Beckstroem. Ber. Pharm. 38, 187. Pharm. J., 1904, 73, 428.

The following constituents have been recognised in the essential oil of sweet flag (*Acorus calamus*):—Free normal heptylic and palmitic acids, eugenol, asaryl aldehyde, esters of acetic and palmitic acids, the crystalline body, $C_{15}H_{26}O_2$, m. pt. 168° C., previously detected by Schimmel and by Soden and Rojahn, which the authors name *calameone*, and asarone, $C_{12}H_{16}O_3$. Asarone forms a solid compound with phosphoric or arsenic acid, in the same manner as cineol [eucalyptol]. During the reaction it becomes polymerised, forming *parasarone*, $(C_{12}H_{16}O_3)_3$, a product which becomes transparent and vitreous at 173° C., and melts at 203° C., and is readily soluble in most organic solvents.—A. S.

Cascara Bark; Chemical Examination of ——. H. A. D. Jowett. Amer. Pharm. Assoc., 1904. Chem. and Druggist, 1904, 65, 509.

The author finds that cascara sagrada contains emodin, glucose, and small amounts of (1) a substance apparently an isomeride of emodin, and possibly identical with the *iso*-emodin obtained from *Rhamnus frangula* bark; and (2) a substance which yields syringic acid when treated with acids. No evidence could be obtained of the existence of chrysophanic acid or chrysarobin, or of glucosides yielding, on hydrolysis, emodin, chrysophanic acid, or rhamnetin (compare this J., 1893, 513; 1898, 792; 1901, 66). Emodin, though insoluble in water, is soluble in the aqueous extract of cascara bark, and can be extracted only slowly and with difficulty by shaking with immiscible solvents. This behaviour probably accounts for the statements that cascara bark does not contain emodin. If the aqueous extract be treated with acids, the substances soluble in water are decomposed with formation of resins, and the emodin can then be readily extracted. Cascara sagrada also contains a hydrolytic enzyme capable of decomposing amygdalin, and about two per cent. of a fat consisting of arachidic acid, both free and combined with an alcohol, and substances, probably glycerides, yielding linolic and myristic acids on hydrolysis. The alcohol with which the arachidic acid is combined, has been named *rhamnol*. It has the composition $C_{20}H_{34}O$, melts at 135°—136° C., and is identical with the alcohol obtained from Kô-sam seeds by Power and Lees (this J., 1903, 1013). Physiological experiments showed that emodin is not the active constituent of cascara sagrada. The active principle or principles were not isolated, but are contained in that portion of the extract which is precipitated by lead subacetate. It is also soluble in water and in alcohol.—A. S.

Metatolylsemicarbazide. J. Callsen, Elberfeld, Germany, Assignor to Farbenfabr. of Elberfeld Co., New York. U.S. Pat. 765,164, July 19, 1904.

By treating *m*-tolylhydrazine with cyanic acid or its salts, metatolylsemicarbazide is obtained in the form of colourless crystals of m. pt. 183°—184° C., sparingly soluble in cold water, soluble in hot water and alcohol, and insoluble in ether. It is said to possess therapeutic (antipyretic) properties.—T. F. B.

Polychloral, and Process of Making same. S. Gærtner Halle-on-the-Saale, Germany. U.S. Pat. 768,744, Aug., 30, 1904.

Chloral is polymerised by gradually adding an amine (*e.g.*, pyridine) to cooled chloral, with constant stirring, until the mass solidifies, when it is shaken with dilute hydrochloric acid, and the residue washed and dried. Polychloral, as thus obtained, is a slightly volatile anæsthetic substance, capable of volatilisation without melting, converted by hot water or hot alcohol into chloral hydrate or chloral alcoholate, and decomposed by alkalis into chloroform and formic acid.—T. F. B.

Iron and Arsenic; Soluble Compound of ——, *and Process of Making same.* L. Spiegel, Charlottenburg, Germany. U.S. Pat. 768,886, Aug. 30, 1904.

Lubricant for Oiling Guns; Alkaline ——. J. G. Wild, Assignor to Winchester Repeating Arms Co. U.S. Pat. 768,835, Aug. 30, 1904. III., page 931.

French Patent.

[*Nitrocellulose*]; *Method for Nitrating* ——. J. Selwig Fr. Pat. 342,502, April 21, 1904.

While cellulose is being nitrated in a centrifugal nitrating apparatus it is proposed to make the acid circulate continuously through the material by means of a pump, for the purpose of producing a more uniform nitration and avoiding local centres of heating.—G. W. McD.

XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

United States Patent.

Pouring and Filtering; Apparatus for ——. E. Keller and A. Ferrell, Baltimore, Md. U.S. Pat. 768,605 Aug. 30, 1904.

The funnels are held in an adjustable rack above the row of beakers in which the filtrate is to be received. The beakers holding the liquids to be filtered are mounted in another rack, in which they are held by clamps, which also hold pouring rods against the lips of the beakers. By suitable mechanism, the beakers can be tilted to the desired extent and a continuous stream of liquid poured into the funnels. Means are provided for adjusting beakers of different sizes in the rack so that their lips are all in the same line.—W. H. C.

INORGANIC—QUALITATIVE.

Phosphide, Arsenide, and Antimonide of Hydrogen; Reagent for ——. P. Lemoult. Comptes rend., 1904, **139** 478—480.

Mercuric iodide dissolved in excess of potassium iodide solution, but not rendered alkaline as in preparing Nessler's reagent, forms a very sensitive reagent for the detection of phosphine, arsine, and stibine, with each of which i forms a crystalline precipitate, orange-yellow, light brown and dark brown respectively, of formula RHg_3I_3. The precipitates are readily decomposed by alkalis or by strong nitric acid or *aqua regia*.—J. T. D.

Precious Metals; Coloration of the Borax Bead by Colloidal Dissolved —— [Detection of]. J. Donau. Monatsh. Chem., 1904, **25**, 913—918.

The author finds that the colorations imparted to a fused borax bead by the precious metals afford an extremely sensitive test for their detection. The colour produced is, in general, the same as that of a colloidal solution of the metal. In the case of gold, the bead is first coloured red or purple; on heating for a longer time, the colour changes first to blue, then to greenish-blue, and finally disappears. The smallest weight of gold which can be detected is 0·025 μ grm. (0·000025 mgrm.). Alkali salts, silicic acid, and iron have practically no influence on the test; platinum, if the amount present be greater than 6 per cent. of that of the gold, obscures the reaction. The coloration is not produced if the gold solution contains free sulphuric acid or free halogens. Silver colours the borax bead yellow, the coloration appearing after 1—2 mins., but disappearing again on continued heating; the smallest amount which can be detected is 0·18 μ grm. In the case of platinum the borax bead appears fawn-coloured by transmitted light, and "milky" by reflected light. The smallest quantity which can be detected is 0·05 μ grm. The coloration disappears on continued heating of the borax bead, but it persists longer than in the case of gold. Iridium and osmium colour the bead in the same manner as platinum, but no turbidity is to be observed by reflected light. With rhodium the borax bead appears brown by transmitted light and a slate-gray by reflected light. Palladium and ruthenium colour the bead black. Figures are cited showing that the above colour reactions are much more sensitive than the usual methods for the detection of small quantities of the precious metals.—A. S.

INORGANIC—QUANTITATIVE.

Flue Gases; Rapid Method for Testing ——. H. Le Chatelier. Bull. Soc. d'Encourag., 1904, **106**, Rev. Metall., 471—472.

The author has devised the following apparatus:—Two wires of silver or platinum, 1 metre long, are fixed parallel to and electrically insulated from each other. The ends are 1 cm. apart, and are steeped in a semi-fluid mixture composed of equal weights of flax and kaolin or some pure clay, and the mass connecting the ends is then dried and calcined. This porous mass is next soaked in a 10 per cent. solution of copper nitrate, dried, and calcined till the mass blackens. It is then reduced in an illuminating-gas flame, and tested to see if it allows an electric current to pass. The open ends of the wires are then connected to the poles of a Leclanché battery, and put in circuit with a galvanometer or an electric bell. The covered ends of the wires are placed in the path of the hot flue gases, which should have a temperature of about 500° C. When there is an insufficiency of air to complete combustion, the copper oxide on the dry clay is reduced to copper, the electric current then passing, and actuating the bell or galvanometer. When there is sufficient air, no current passes, copper oxide being a bad conductor.—L. F. G.

Hydrogen Contents of Gaseous Mixtures; Method for the Continuous Determination of ——, and Apparatus therefor. W. P. Thompson, Liverpool. From Verein. Maschinenfabr. Augsburg und Maschinenbauges. Nürnberg, A.-G., Nuremberg, Germany. Eng. Pat. 15,706, July 14, 1904.

The method is based on the fact that the conductivity of hydrogen, both for heat and for electricity, is considerably greater than that of other gases, and therefore the conductivity of the gaseous mixture affords an indication of its hydrogen content. One form of apparatus consists of a wide tube, through which passes a current of the gas to be examined, and which contains a coiled tube heated by a current of some fluid (gas or liquid) which enters it at a constant temperature. From the temperature of the heated fluid as it emerges from the coiled tube the hydrogen content of the gas under examination can be calculated. In another form of apparatus, the variation in conductivity of the gaseous mixture is judged by the variation in length of a metal rod placed in the gas and heated to a constant temperature. In a third form, the hydrogen content is ascertained by the alteration in resistance of a helix placed in the gaseous mixture, and heated by a constant electric current; whilst a fourth form consists of two electrodes fixed a certain distance apart in a tube through which the gas circulates, the variation in potential difference between the electrodes affording a basis for calculating the hydrogen content of the mixture.—T. F. B.

Phosphorus in Calcium Carbide; Determination of ——. H. Lidholm. Z. angew. Chem., 1904, **17**, 1452—1453.

The author finds that in the determination of phosphorus in calcium carbide by evolving and burning acetylene from it, and determining the phosphoric acid in the collected products of combustion, if dilute alcohol be used instead of water alone, the rate of evolution and combustion can be made perfectly regular. Ten grms. of the powdered sample are placed in a crucible, which is put into a very wide necked 500 c.c. flask, the cork of which carries a stoppered dropping-funnel, a tube for the entry of hydrogen, and a reflux condenser, the upper end of the latter being connected with a burner. The burner is placed under a vertical wide glass tube, connected with a wash-bottle containing water; during the experiment a strong current of air is aspirated through the wide tube and wsh-bottle, in both of which are collected the products of combustion of the acetylene. The apparatus is filled with hydrogen, which is then lighted at the burner; 50 c.c. of alcohol are poured in through the funnel, and water is gradually added. When no more gas is evolved, hydrochloric acid is added till the lime is dissolved, the liquid boiled, and the flame allowed to burn 10 minutes after all luminosity has disappeared, and the absorbing apparatus is then washed out into a beaker, with water and ammonia, the liquid filtered from any separated silica, and the phosphoric acid determined by means of magnesia mixture. Closely concordant results are said to be obtained. The solution of the lime by hydrochloric acid is merely to render the boiling safer; all the phosphorus is evolved by water alone.—J. T. D.

Chloric Acid; Determination of ——. W. S. Hendrixson. Amer. Chem. J., 1904, **32**, 242—246.

The author has found that metallic iron readily reduces free chloric acid even in very dilute solutions. Chlorates or bromates may be estimated by adding excess of iron in the presence of sulphuric acid. The reduction is complete in about an hour, and no heating is necessary. The iron is then oxidised with nitric acid and the halogen hydracid titrated by Volhard's method. The advantages claimed are great simplicity, and absence of errors due to heating. Perchloric acid is not reduced, so does not interfere.
—F. Sdn.

Alkali Chromates; Action of Nitric and Acetic Acids on ——. [Determination of Chromium.] A. Leuba. Ann. Chim. anal. appl., 1904, **9**, 303—304. Chem. Centr., 1904, **2**, 849.

The author finds that in the analysis of minerals containing chromium, if the melt obtained by fusing with sodium carbonate be dissolved in nitric acid, the hydroxides of iron and aluminium subsequently precipitated by ammonia always contain chromium. This is owing to the reducing action of nitric acid on the alkali chromate. By repeatedly evaporating a quantity of potassium bichromate with nitric acid, 9 per cent. of it undergoes decomposition with formation of chromium sesquioxide. Acetic acid acts in a similar manner to nitric acid.—A. S.

Iodine; Determination of —— in presence of Bromine and Chlorine. E. Thilo. Chem.-Zeit., 1904, **28**, 866.

When silver nitrate solution is added to a solution containing chloride, bromide, and iodide, the whole of the iodine is precipitated first as silver iodide, followed by the bromine, no silver chloride being formed till the whole of the bromine has been precipitated. The point at which the precipitation of the iodine is complete is determined by placing drops on a strip of filter-paper freshly wetted with dilute palladium chloride solution. The method is applied to crude iodine or cuprous iodide as follows:—5 grms. of the substance are treated with 50 c.c. of water and 2 grms. of zinc dust, and when all the iodine is converted into zinc iodide the mixture is filtered into a 500 c.c. flask, the residue washed, transferred to a small beaker, dissolved in dilute nitric acid, excess of zinc dust added, and the mixture filtered into the flask. After making up, 50 c.c. are titrated with N/10 silver nitrate solution, till a drop gives no black spot on the palladium paper. Chlorine or bromine, if present, may now be determined in the liquid by adding a crystal of potassium chromate, titrating with the N/10 silver nitrate, adding nitric acid to dissolve the red silver chromate, filtering in a Gooch crucible, and weighing. The excess of silver in the filtrate is titrated with thiocyanate, after reducing the chromate by ferrous sulphate (and, if need be, concentrating the liquid). From the weight of the mixed precipitate, and the amount of silver it contains, the chlorine and bromine can be calculated. It is stated that relatively small amounts of iodine can be determined in presence of considerable quantities of chlorine and bromine by this method. In testing commercial potassium iodide, the silver iodide separates in a colloidal form, and the end-point cannot be determined; but the addition of 1—2 grms. of sodium chloride completely overcomes this difficulty.—J. T. D.

Gold and Silver in Zinc Ores; Crucible Charge for [Determination of] ——. E. J. Hall and E. Popper. School of Mines Quart., 1904, **25**, 355—358.

As the result of a large number of experiments, the authors conclude that, in the determination of gold and silver in zinc ores by the crucible method, the amount of litharge used should be just sufficient to give a lead button large enough to collect the gold and silver, since lead oxide in the slag seems to interfere with the complete decomposition of the ore, and prevent the formation of a slag which is free from lumps, and which can be readily poured. The amount of sodium carbonate should be from four to five times that of the ore. Borax glass should be added in amount sufficient to prevent the charge from being entirely basic, and to assist in fluxing the gangue minerals not acted on by sodium carbonate alone. If necessary, an amount of argol sufficient to reduce the whole of the litharge should be added, whilst if the ore contain more than 15 per cent. of pyrites, the addition of a couple of [iron] nails will prevent the formation of a brittle button. The following charge was found to be the most suitable one for a 20-grm. crucible, the quantities being given in A.T. (assay tons): Ore, $\frac{1}{3}$; sodium carbonate, $1\frac{1}{3}$; borax glass, $\frac{1}{2}$; litharge, $\frac{4}{5}$. The most suitable temperature is 750°—775 C., and the time required for the fusion is 30—35 minutes. The method gives good results with ores containing up to 7·5 per cent. of copper.—A. S.

Platinum-Gold-Silver Alloys; Analysis of ——. Hollard and Bertiaux. Ann. Chim. anal. appl., 1904, **9**, 287—292. Chem. Centr., 1904, **2**, 852.

The authors find that by the usual methods for the analysis of platinum-gold-silver alloys, the results are too low for the gold and too high for the platinum and silver, but are very accurate for the gold and platinum together. The following method is recommended for the determination of the silver: The alloy, cut into small pieces or rolled out to a leaf, is dissolved in *aqua regia* (1 vol. of nitric acid + 5 vols. of hydrochloric acid), the solution is evaporated to the consistence of a syrup, and then evaporated to dryness three times with addition of nitric acid, the residue boiled with a few c.c. of water, 2 c.c. of nitric acid, and 2 drops of hydrochloric acid, the liquid diluted to 100 c.c., the silver chloride filtered off, washed well, dissolved in 30 c.c. of a 20 per cent. solution of potassium cyanide, the solution diluted to 150 c.c. and electrolysed. The separated silver is dissolved in nitric acid, and determined by titration with thiocyanate solution.—A. S.

Electrolysis with Rotating Cathode. H. E. Medway. Amer. J. Science, Silliman, **18**, 56—58. Chem. Centr., 1904, **2**, 809.

By using the rotating platinum crucible cathode previously described (this J., 1903, 823), many metals can be separated in a short time, by the aid of a high current density, as is shown by the following results: 0·2 grm. of cadmium was separated in 10—15 minutes from a solution slightly acid with sulphuric acid; the current density was 5—6·6 and the cathode was rotated at the rate of 650—700 revolutions per minute. Towards the end of the process, ammonia was gradually added to prevent re-solution of the deposited cadmium. Tin was completely deposited in 15—20 minutes from 20 c.c. of a solution of stannous ammonium chloride to which had been added 100 c.c. of a cold saturated solution of ammonium oxalate; current density, 6·6—12. The whole of the zinc was deposited in 25—30 minutes from 50 c.c. of a solution of zinc sulphate containing 4 grms. of potassium oxalate; current density, 6·6—8·3. Gold was completely precipitated in 25—30 minutes from 25 c.c. of a solution of the chloride, to which had been added excess of potassium cyanide and 30 drops of ammonia solution.

—A. S.

ORGANIC—QUALITATIVE.

Aldehydes; Detection of ——, and the Constitution of Nitrosodimethylaniline. G. Velardi. Gaz. chim. ital., 1904, **34**, 66—74. Chem. Centr., 1904, **2**, 733—734.

The reaction of Rimini (Gaz. chim. ital., **31**, [1], 84), which depends upon the splitting up of Piloty's benzenesulphonehydroxamic acid, $C_6H_5SO_2NHOH$, in alkaline solution, into benzenesulphinic acid and nitroxyl, $:N.OH$, the latter then combining with any aldehyde present to form the corresponding hydroxamic acid, is of general applicability, and can be used for the detection of unsaturated aldehydes in complex mixtures, *e.g.*, in natural oils. The reaction is not, however, a quantitative one, as the liberated nitroxyl also acts on unsaturated compounds at their double linkings, with formation of the corresponding oximes:— $R.CH:CH.R \rightarrow R.C(:NOH)CH_2R$. For the detection of aldehydes in essential oils, a few drops of the latter are heated with a trace of Piloty's acid and alcoholic potassium hydroxide solution, the mixture is cooled, diluted with water, some ether added, and then, after neutralising with hydrochloric acid, also some ferric chloride. Petitgrain, cinnamon, orange-peel, lavender, bergamot, angelica, fennel, rosemary (French), and lemon oils, among others, gave a red coloration; coriander and sassafras oils, on the other hand, a yellow coloration. The reaction with nitroxyl can also be used to ascertain the constitution of nitroso compounds, which behave in this respect like aldehydes. For instance, nitrosodimethylaniline, when treated with nitrohydroxylaminic acid, yields, on addition of barium chloride, the barium salt of dimethylaminonitrosophenylhydroxylamine, $C_6H_4.N(CH_3)_2.N(NO)OH$. It is thus a true nitroso compound of the constitution, $C_6H_4(NO)N(CH_3)_2$.—A. S.

ORGANIC—QUANTITATIVE.

Organic Matter; New [Electrolytic] Method for the Destruction of —— in Toxicological Analysis. O. Gasparini. Atti. R. Accad. dei Lincei Roma, 1904, **13**, [2], 94—100. Chem. Centr., 1904, **2**, 852—853.

The substance to be analysed is covered with concentrated nitric acid, and after some time a current of 4—6 ampères is passed through. An E.M.F. of 8 volts is used.—A. S.

Petroleum; Determination of Impurities in Crude ——. R. Nettel. Chem.-Zeit., 1904, **28**, 867.

Mud from the borehole is determined by mixing a known quantity of the oil with petroleum spirit, filtering, and weighing.

Water is determined by mixing 100 c.c. of the oil with an equal volume of petroleum spirit in a stoppered separator adding 50 c.c. of N/10 hydrochloric acid, and shaking vigorously for five minutes. The mixture is then left at rest at 65° C. for half an hour, and 25 c.c. of the separated acid are titrated with alkali. From the loss of strength of the acid, due to dilution, the amount of water in the oil is calculated. The author has proved experimentally that—1. The water in crude petroleum has neither acid nor alkaline reaction. 2. The added acid mixes thoroughly with any water present (experiments with known quantities of added water showed exactly the quantities added).

3. The crude oil has itself no reaction on the hydrochloric acid.

Solidifying Point.—The oil is cooled in a test-tube fitted with a two-holed cork. Through one hole passes the hermometer. Through the other is dropped at each degree-nterval a small shot. At the solidifying point the shot emains on the surface. With dark-coloured oils the shot nay be painted with zinc-white. On gradually warming ne solidified oil, the melting point is indicated by the inking of the shot.—J. T. D.

Sugars and Starch; Determination of —— in Vegetable Substances. J. S. Ford. Analyst, 1904, **29**, 277—279.

N the determination of sugars in substances like malt, which contain starch, it has been suggested that the material e first boiled with alcohol to destroy the enzymes present, fter which the sugars can be extracted with water. The uthor points out that this destruction of the enzymes does ot take place with alcohol of any strength, the best result eing obtained with about 95 per cent. (volume) alcohol; he actual volume of alcohol taken does not appear important, provided there is sufficient to cover the substance nd to boil readily. In the case of vegetable substances of n acid nature, boiling with alcohol even for half an hour ives rise to some inversion of sucrose, if present, and even with malts, slight hydrolysis occurs. If the substance be istinctly acid, a very slight excess of ammonia may be dded to the alcoholic mixture before boiling.—T. H. P.

Starch Syrups; Examination of ——. A. Rössing. Z. öffentl. Chem., 1904, **10**, 277—279. Chem. Centr., 1904, **2**, 855.

HE author's method for the determination of dextrose this J., 1904, 386), failed in the case of three samples f starch syrup recently examined by him, the amount of extrose found exceeding considerably the amount calculated from the direct cupric-reducing power of the sample, lthough by the latter method, the reducing dextrins would e returned as dextrose. No other kinds of sugar were resent. The syrups in question had been prepared by means of dilute hydrochloric acid, and the inaccurate esults were found to be due to the fact that when starch s hydrolysed by means of very dilute hydrochloric acid nder certain conditions, the reducing power of the glucose roduced is diminished by the baryta treatment (*loc. cit.*) o a considerably greater extent than is that of a normal pecimen of glucose.—A. S.

Phenol; Volumetric Determination of ——. F. X. Moerk. Amer Druggist, **45**, 144. Pharm. J., 1904, **73**, 453.

s the ordinary method of determining phenol by treating with excess of bromine in presence of hydrochloric or lphuric acid, and determining the excess of bromine by lding potassium iodide and titrating with thiosulphate olution in presence of starch, the final reaction is obscured o some extent by the precipitated tribromophenol. If, owards the end of the titration, a small quantity of chloroorm be added, the tribromophenol is dissolved, and the nal point of the titration can be more readily observed.
—A. S.

Rhubarb; Colorimetric Valuation of ——. A. Tschirch. Pharm. Centralb., **45**, 496. Pharm. J., 1904, **73**, 428.

HE method is based upon the hydrolysis of the anthraucosides and the subsequent extraction of the oxymethylnthraquinones by ether. 0·5 grm. of the finely-powdered ubarb is heated for 15 minutes with 50 c.c. of 5 per cent. lphuric acid under a reflux condenser. After cooling, e mixture is extracted with successive quantities of ether, ntil that solvent remains colourless when treated with a ace of potassium hydroxide. The separated aqueous quid is then heated, to expel dissolved ether, boiled for a rther 15 minutes as before, and again extracted with successive quantities of ether. When no more soluble matter removed, the combined ethereal extracts are shaken with 0 c.c. of a 5 per cent. solution of potassium hydroxide, in ccessive portions, until the alkaline liquid is no longer loured red. The red solution is diluted to 500 c.c. with stilled water, 100 c.c. are withdrawn and diluted to 1 litre, en 350 c.c. of this solution are taken and diluted to 1 litre. The depth of colour of the solution should now be about the same as that of an alkaline aloe-emodin solution of the strength of 1 : 1,000,000. It is matched against the colour of a solution containing a known weight of aloe-emodin rendered slightly alkaline with potassium hydroxide. Rhubarb of good quality should yield from 2·8 to 4 per cent. of oxymethylanthraquinones by this method.—A. S.

Nitrocellulose; Determination of the Stability of ——. E. Bergmann and A. Junk. Z. angew. Chem., 1904, **17**, 982—985, 1018—1023, 1074—1077.

The apparatus and method described have been in use in the Prussian testing station for the past six years. The apparatus consists of a closed copper bath provided with a condenser and 10 countersunk tubes of 20 cm. length. By boiling amyl alcohol in the bath, the tubes can be kept at a constant temperature of 132° C. The explosive to be tested is placed in a glass tube 35 cm. long and 2 cm. wide, having a ground neck into which an absorption bulb is fitted. The whole apparatus is surrounded by a shield, in case of explosion. In carrying out the test, 2 grms. of the explosive are placed in the glass tube and well pressed down. The absorption bulb is half filled with water, and fitted into the ground neck of the glass tube, which is then placed in one of the tubes in the bath previously brought to the boiling point (132° C.). The evolved oxides of nitrogen are absorbed in the water in the bulb, and at the end of two hours the tubes are removed from the bath, and, on cooling, the water from the bulb flows back and wets the explosive. The contents of the tube are filtered and washed. The filtrate is oxidised with permanganate, and the nitrogen determined as nitric oxide by the Schulze-Tiemann method. The authors conclude that a stable gun-cotton does not evolve more than 2·5 c.c. of nitric oxide per grm. on being heated at 132° C. for two hours, and a stable collodion cotton not more that 2 c.c. under the same conditions. When, in the course of purification, the evolution of nitric oxide is once brought below the limits specified, further purification does not appreciably diminish the proportionate evolution of nitric oxide per grm. In the tables which follow, the figures represent c.c. of nitric oxide per grm. on heating at 132° C. or two hours.

Pulping and Washing.—The influence of these two processes is shown in the following table:—

	Collodion Cotton.		Guncotton.	
	1 Hour.	2 Hours.	1 Hour.	2 Hours.
	c.c.	c.c.	c.c.	c.c.
Half pulped	..	..	6·1	..
Fully pulped	0·8	1·7	1·5	2·8
5 changes hot water....	0·7	1·7	0·9	2·2
50 „ „	0·7	1·5	0·8	2·4

Moisture.—The percentage of moisture in the sample to be tested should be kept as low as possible. A nitrocellulose containing 1·97 per cent. of moisture gave an evolution of 2·6 c.c. per grm., while the same sample with 3·4 per cent. of moisture gave an evolution of over 50 c.c. per grm.

Sodium Carbonate.—Under the conditions of the experiment, the addition of dry sodium carbonate to an unstable nitrocellulose diminishes the rate of decomposition. If sodium carbonate be intimately mixed with a stable nitrocellulose, the rate of decomposition will be increased. The following table shows the effect of sodium carbonate under different conditions:—

Conditions.	Stable Nitrocellulose, 2 Hours.	Unstable Nitrocellulose. 2 Hours.
	c.c.	c.c.
Without addition..................	2·5	23·9
+ 5 % dry Na_2CO_3..................	2·5	13·3
+ 10 % „ „	2·5	7·1
+ 5 % $Na_2CO_3 10H_2O$	2·5	7·0
+ 10 % „ „	5·2	7·1
+ 5 % Na_2CO_3 dissolved in water	16·8	18·2

Calcium Carbonate and Mercuric Chloride.—These two bodies showed practically no influence on the rate of decomposition.

Alcohol.—When an unstable nitrocellulose is extracted for a short time with alcohol a stable compound is immediately produced.

Solubility in Ether-Alcohol.—The percentage solubility of a nitrocellulose rises on heating at 132° C. A sample which before heating had a solubility of 4·7 per cent., had its solubility increased to 82·5 after six hours' heating. See also this J., 1903, 511, 924 and 1208; 1902, 687—689, 819—825 and 1470-1; 1901, 8—13, 609—617 and 1555—6; 1899, 174 and 857-8; 1898, 1180; 1897, 283—290.

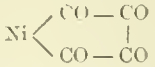
XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Nickel Carbonyl; Constitution of ——. H. O. Jones. Brit. Assoc., 1904. Chem. News, 1904, **90**, 144—145.

Nickel carbonyl reacts like a ketonic substance in that it forms compounds with hydroxylamine and hydrazine. It also reacts with Grignard's alkyl-magnesium iodides yielding products containing nickel, magnesium and iodine. With phenyl-magnesium iodide it yields a product, which when treated with acids gives rise to a mixture consisting chiefly of diphenyl and benzoin. All reactions of nickel carbonyl which have been described previously can be equally well explained by means of either of the two formulæ—

and



but benzoin should theoretically be formed in a much simpler way from a compound with the second formula.—A. S.

Titanium and Tin Compounds; Some ——. F. Emich. Monatsh. Chem., 1904, **25**, 907—912.

Barium-titanium fluoride, $2BaTiF_6.H_2O$, was prepared by treating a solution of potassium-titanium fluoride with the requisite quantity of barium chloride solution, in a platinum dish, and filtering off and washing the barium compound. On strongly heating the barium titanium fluoride in a platinum retort connected with a platinum U-tube cooled by a mixture of solid carbon dioxide and ether, there was found, in the neck of the retort after cooling, a white transparent substance, soluble in water and consisting of titanium fluoride.

The author found the solidifying point of titanium chloride to be −23° C., and the boiling point of tin tetraiodide, 341° C. (corr.).

A quantitative yield of potassium tin fluoride $K_2SnF_6.H_2O$ can be obtained by treating a solution of 27 grms. of tin tetrachloride in 270 c.c. of water with a warm solution of 57 grms. of crystallised potassium fluoride in 170 c.c. of water. The precipitated tin compound is recrystallised from boiling water and washed with cold water till free from chlorine. Barium-tin fluoride can be prepared in a similar manner.—A. S.

Acetylides; Double ——. A. E. Edwards and W. R. Hodgkinson. Brit. Assoc. 1904. Chem. News, 1904, **90**, 140.

The authors describe the action of acetylene on some silver salts. A number of organic salts such as silver acetate, benzoate and butyrate, yielded the same acetylide as that obtained from a neutral or faintly alkaline solution of silver nitrate. From a solution of silver nitrate in nitric acid of sp. gr. 1·3, an acetylide containing nitric acid as nitrate was obtained. Silver salts dissolved in potassium cyanide or in thiosulphate solution were not acted upon by acetylene. The product obtained by the action of acetylene on pure silver thiocyanate suspended in water, is explosive. It contains both sulphur and cyanogen, but it was not obtained in a pure state. From a boiling solution of silver bichromate, acetylene precipitates an orange-red salt of the composition ($Ag_2O.C_2H_2.Ag_2CrO_4$), whilst chromic acid liberated. When dry the salt is very sensitive to frictio and explodes violently at 157° C. The corresponding con pounds from silver sulphate, selenate, tungstate, an molybdate are all much less sensitive than that from th bichromate, and explode much more feebly. The con position of the products obtained from silver phosphate ar vanadate was not determined satisfactorily; the compoun explode in a very feeble but peculiar manner.—A. S.

Enzymes; Origin of ——. C. Beckenhaupt. Woch. f Brau., 1904, **21**, 548—551.

The author quotes the results of several recent investigatio which tend in his opinion to support the view that t activity of enzymes is a function connected in some mann with the mineral constituents of the medium. It is su gested that the enzymes are formed by the combinati of an albuminoid or nitrogenous molecule, such as aspar gin, with certain mineral constituents, the latter playi an important part, which part is determined by "molecul vibrations" under the influence of external forces, suc as moisture, heat, &c.—J. F. B.

New Books.

Anleitung zur Verarbeitung der Naphtha und ihr Produkte. Von N. A. Kwjatkowsky, Chem. u Ing. in Moskau. Autorisierte und Erweiterte deutsc Ausgabe. Von M. A. Rakusin. Julius Spring Monbijouplatz 3, Berlin, N. 1904. Price M. 4.

8vo volume containing subject matter filling 138 pag followed by a bibliographic index (5 pages) and two tabl The text is illustrated with 13 engravings. The treatme of the subject may be classified as follows:—I. Histori Statistical and Geographical; Petroleum industry in Bak &c. II. Origin and Occurrence of Petroleum. III. Chen cal Condition and Physical Properties of Petroleum. I Distillation of Petroleum and Petroleum Spirit, and App ratus required. V. Distillation of Petroleum Residu Apparatus, Increasing the Yield of Machine Oils, &c. V Decomposition of Crude Petroleum Naphtha in prepari Aromatic Hydrocarbons and Illuminating Oils. VII. R fining the Kerosine Distillate, &c. VIII. Refining t various Petroleum Fractions. IX. Purification of Lub cating Oil Distillates. X. Testing the Goods and th Properties, Apparatus required. XI. The different Co mercial grades of Petroleum Products. XII. Storage Petroleum oils, &c. XIII. (Appendix) Utilisation of t Spent Acids and Alkali Lyes.

The Industrial and Artistic Technology of Pai and Varnish. By Alvah H. Sabin, M.S., Lecturer New York University and the Massachusetts Institute Technology, &c. First Edition. John Wiley and So New York. Chapman and Hall, Ltd., 1904. Pri 12*s.* 6*d.*

Large 8vo volume, containing 364 pages of subject matt and the alphabetical index. The text contains numero illustrations, and may be classified as follows:—I. Intr duction. II. Early History. III. Varnish, Etymolog IV. and V. Linseed Oil. VI. Manufacture of Varni VII. Tung Oil. VIII. Japans and Driers. IX. Ros X. Spirit Varnishes. XI. Pyroxylin Varnishes. XII. O paints and Paints in Japan. XIII. Varnish or Enan Paints. XIV. Chinese and Japanese Lacquers. X Protection of Metals from Corrosion. XVI. Water-p Coating. XVII. Ships'-Bottom Paints. XVIII. Ship a Boat Painting. XIX. Carriage Painting. XX. Ho Painting. XXI. Furniture Varnishing.

FOOD INSPECTION AND ANALYSIS FOR THE USE OF PUBLIC ANALYSTS, HEALTH OFFICERS, SANITARY CHEMISTS, AND FOOD ECONOMISTS. By ALBERT E. LEACH, S.B., Analyst of the Massachusetts State Board of Health. First Edition. John Wiley and Sons, New York. Chapman and Hall, Ltd., London. 1904. Price 31*s.* 6*d.* nett.

LARGE 8vo volume containing 770 pages of subject matter with 119 illustrations, and at the close of the work and ollowing the alphabetical index, 40 plates giving microphotographs of cereals, legumes, miscellaneous starches, urmeric. sago, coffee, tea, chicory, cocoa, spices, and fats. The subjects treated may be generally gathered from the ollowing chapter headings :—I. Food Analysis and State Control. II. The Laboratory and its Equipment. III. Food, its Functions, Proximate Components and Nutritive Value. IV. General Analytical Methods. V. The Microscope in Food Analysis. VI. Milk and Milk Products. VII. Flesh Foods. VIII. Eggs. IX. Cereals and their Products, Legumes, Vegetables, and Fruits. X. Tea, Coffee, nd Cocoa. XI. Spices. XII. Edible Oils and Fats. XIII. Sugar and Saccharine Products. XIV. Alcoholic Beverages. XV. Vinegar. XVI. Artificial Food Colours. XVII Food Preservatives. XVIII. Artificial Sweeteners. XIX. Canned ud Bottled Vegetables, Relishes, and Fruit Products.

ABORATORY MANUAL OF ORGANIC CHEMISTRY FOR BEGINNERS. By Dr. A. F. HOLLEMAN. Appendix to Author's Text Book of Organic Chemistry. Translated from the Dutch by A. JAMIESON WALKER, Ph.D , B.A. With the co-operation of the Author. First Edition. John Wiley and Sons, New York. 1904. Price 4*s.* 6*d.* Chapman and Hall, Ltd., Henrietta Street, Covent Garden, London, W.C.

MALL 8vo volume containing 69 pages of subject matter ith two illustrations, and an alphabetical index. It is a oncise manual of qualitative reactions of organic comounds, and forms the companion volume of Holleman's ext Book of Organic Chemistry, also translated by A. J. Valker (see this J., 1903, 659).

Trade Report.

I.—GENERAL.

PATENTS ACT, 1902; OFFICIAL NOTICE RELATING TO THE ——.

Examination of Previous Specifications.

The following notice appeared in the *Illustrated Official urnal (Patents)* of 21st September :—

The Board of Trade, in pursuance of the provisions of tion 1, subsection 11, of the Patents Act, 1902, do hereby the 1st January, 1905, as the date for the coming into eration of section 1 of the above-mentioned Act, and do ler accordingly.

LGIUM; TRADE OF —— WITH THE UNITED KINGDOM IN 1903.

Foreign Office Annual Series, No. 3275.

The following figures give the quantities in tons of certain icles imported into Belgium from the United Kingdom ing 1903, the figures for 1902 being added in brackets:—Bitumen and resin, 129,857 (141,699); chemical pro-ts, 39,989 (38,159); dyestuffs, 10,849 (13,571); lard tallow, 5409 (5049); minerals, 114,409 (127,241); oil e, 9836 (7867); oil seeds, 4946 (5111); salt, 21,810 (,552); soap, 3075 (2482); vegetable oils, 10,233 (,464).

Among the exports from Belgium which came to the ted Kingdom were chemical products, 50,275 (57,692); stuffs, 7427 (7892); glass, 87,316 (92,187); lard and ow, 3628 (2723); minerals, 421,095 (includes cement, .159) (387,675); paper, 16,310 (15,161); resin and bitumen, 5201 (4809); starch, 7550 (7537); sugar, 43,387 (41,230); vegetable oils, 10,229 (11,455); zinc, 33,120 (42,294).

UNITED STATES; TRADE OF —— IN 1903-4.

Foreign Office Annual Series, No. 3279.

Subjoined is a list of certain articles imported into the United States during the fiscal year ended June 30, 1904, with the value in dollars, and the sources of supply in order of importance:—

Article.	Value.	Countries of Origin.
	Dols.	
Cement	1,993,303	Germany, Belgium, United Kingdom.
Chemicals, drugs, and dyes—		
Dyes	636,702	Germany, United Kingdom.
Wine lees	2,550,223	Italy, France, Portugal.
Quinine bark	501,375	Netherlands, United Kingdom.
Coal-tar colours and dyestuffs.	4,918,503	Germany, Switzerland, United Kingdom.
Dyewoods, logwood	663,572	British West Indies, France, United Kingdom, Switzerland.
Glycerin	2,583,270	France, United Kingdom.
Gums—		
Copal, cowrie, and dammar.	2,127,228	British Oceania, British East Indies, Dutch East Indies, United Kingdom.
Gambier	1,251,782	British East Indies, United Kingdom.
Shellac	3,505,229	British East Indies, United Kingdom.
Indigo	1,282,497	Germany, British East Indies, United Kingdom.
Bleaching powder	772,532	United Kingdom, Germany, France.
Potassium chloride	2,407,957	Germany, Belgium, United Kingdom.
Potassium nitrate	366,526	British East Indies.
Quinine sulphate	852,164	Germany, Dutch East Indies, United Kingdom.
Caustic soda	74,072	United Kingdom, Germany.
"Sal soda"	20,855	United Kingdom.
Soda ash	188,750	United Kingdom.
Sulphur	3,229,539	Italy, Japan, United Kingdom.
Sumac	276,891	Italy, United Kingdom.
Vanilla beans	1,424,647	Mexico, France, French Oceania, United Kingdom.
Earthenware and china	12,005,008	United Kingdom, Germany, France.
Leather	4,909,231	Germany, United Kingdom, France.
Oil—		
Animal—		
Whale or fish	638,591	Canada, Scandinavia, United Kingdom, Germany.
All other	34,830	United Kingdom, Canada, Germany.
Mineral	280,746	United Kingdom, Canada.
Vegetable—		
Olive, &c.	1,875,825	Italy, France, Spain, United Kingdom.
All other	5,952,702	United Kingdom, British East Indies, Germany, Spain, Italy, France.
Volatile or essential	2,396,745	France, Italy, Germany, United Kingdom, Turkey, British East Indies.
Paints	1,674,019	Germany, United Kingdom, France.
Paper stock, rags	1,511,835	Germany, United Kingdom, Belgium, France.
Paper and manufactures thereof.	5,319,086	Germany, United Kingdom, France, Belgium.
Plumbago	991,134	British East Indies, United Kingdom, Italy, Canada.
Salt	515,230	United Kingdom, British West Indies, Italy, Dutch West Indies.
Plate glass	979,819	Belgium, Germany, United Kingdom, France.
Other glass and glassware	5,603,349	Belgium, United Kingdom, Germany.
Glue	598,546	United Kingdom, France, Germany.
Indiarubber—		
Unmanufactured	42,214,219	Brazil, United Kingdom, Belgium, Germany, Portugal.
Manufactured	1,157,042	Germany, United Kingdom, France, Belgium.
Iron ore	1,593,279	Cuba, Canada, Spain.

Articles.	Value.	Countries of Origin.
Sugar, &c.—	Dols.	
Molasses	1,018,198	Cuba, British West Indies, San Domingo, Canada.
Sugar	71,409,639	Cuba, Dutch East Indies, British West Indies, British Guiana, San Domingo.
Tin	21,486,311	British East Indies, United Kingdom, Netherlands, Italy, Germany, British Australasia.
Soap	900,841	United Kingdom, France, Germany.

Among the exports during the same period were :—Chemicals, drugs, and dyes. 14,474,323 dols. (1903, 13,697,601) ; hides and skins, 6,414,638 dols. (1903, 5,290,948) ; paints, 2,756,581 dols. (1903, 2,350,937) ; glass and glassware, 1,978,481 dols. (1903, 2,150,699).

Belgium ; Chemical Industry in ——.

Foreign Office Annual Series, No. 3275.

The glass exports, which were so well maintained in 1902, showed a considerable decline in value during 1903, the actual loss on the comparison being 122,720*l*. This decrease was mainly due to the lessened demand from the United Kingdom, the United States, Germany, Australia, Canada, and Japan. The total volume of the exports of glass from Belgium in 1903 was 237,501 tons, with a value of 3,578,120*l*.

The cement industry, as far as the export trade was concerned, made good progress, the figures being 599,091 tons, with a value of 623,040*l*., increases of 10 per cent. on the volume and 2·5 per cent. on the value over 1902. The countries to which large quantities of this material were exported were the United Kingdom (208,159 tons valued at 216,484*l*.), Canada (29,717 tons), Cape Colony (22,906 tons), the United States (90,137 tons), and the Netherlands (51,308 tons).

The decline noted in the sugar exports of 1902 continued during 1903, and the total exports fell from 134,394 tons in 1902 to 116,655 tons in 1903, this latter quantity being exactly half the amount of the volume exported in 1901.

V.—PREPARING, BLEACHING, Etc., TEXTILES, YARNS, AND FIBRES.

Weighting of Silk ; Effect of Excessive —— on the present Position of the Silk Industry.

A. Bolis. Chem.-Zeit., 1904, **28**, 796—797.

The present depressed state of the silk-manufacturing industry is attributed to a variety of causes, namely, the high price of raw silk, competition of Tussah and "artificial" silks, and of mercerised cotton, and other causes, but especially to the loss of confidence in the durability of silk fabrics which has been brought about by the practice of excessive weighting. Weightings may be divided into three classes, according to the proportions employed, namely, those amounting to (1) not more than 50 per cent., (2) from 50 to 150 per cent., and (3) from 150 to 300 per cent. of the weight of the silk. Only the first of these, it is considered, should be used. To control the practice of weighting, the author advocates, with Pinchetti, the establishment, in all silk-manufacturing centres, of public laboratories, where the nature of the weighting agents used could be examined, and their amount determined. Moreover, it is believed that much useful work could be done by such laboratories in investigating the action of weighting agents on the tenacity, &c. of the fibre, and in fixing with some degree of precision, the proportion of charge which may be safely allowed.—E. B.

VII.—ACIDS, ALKALIS, Etc.

Gypsum Production of the United States.

Eng. and Mining J., Sept. 15, 1904.

According to the *Geological Survey*, the output of gypsum in the United States in 1903 was 1,041,704 short tons, valued at 3,792,943 dols., as against 816,478 shor toos, valued at 2,089,341 dols., in 1902. The production reported as crude gypsum, land plaster, plaster of Paris, an wall plaster, according to the condition in which the gypsu first reaches the market. The figure given as that of th total production is, therefore, an estimate arrived at by con puting the whole output as crude gypsum. The total valu given is that of the product in its different forms as reaches the market.

IX.—BUILDING MATERIALS, Etc.

Cement Industry in Canada.

Eng. and Mining J., Sept. 15, 1904.

The Portland cement industry is making rapid strides Canada, and the time is approaching when the requiremen of that country will be supplied entirely by domestic manu facturers. The chief centre of the industry is in Ontari which made 695,260 barrels in 1903, as compared with 31,9 barrels ten years ago. There were nine plants in operati and four under construction.

X.—METALLURGY.

Iron and Steel Production of France i first Six Months of 1904.

Bd. of Trade J., Sept. 29, 1904.

The French *Journal Officiel* of 25th September publis statistics relating to the production of iron and steel France during the first six months of 1904, with comparati figures for the corresponding period of the preceding ye on which the following table is based :—

	First Six Months.	
——	1903.	1904.
Cast iron—	Tons.	Tons.
Forge pig	1,095,120	1,193,21
Foundry pig	270,301	287,4
Total	1,365,421	1,480,6
Iron—		
Wrought iron (various)	295,554	261,91
Sheets	23,191	17,35
Total	318,745	279,2
Steel—		
Rails	118,541	137,61
Wrought steel (various)	394,740	464,1
Sheets	153,290	149,91
Total	666,571	751,6
Bessemer and Siemens-Martin ingots	942,658	1,042,6

Sardinia ; Mineral Production of ——.

Foreign Office Annual Series, No. 3268.

The following table gives the quantity and value minerals produced in Sardinia in 1903 :—

Minerals.	Quantity.	Value.
Zinc—	Tons.	£
Calamine	112,547	525,310
Blende	11,323	46,620
Lead	40,751	207,475
Silver	401	9,435
Arsenic	49	160
Manganese	742	930
Antimony	1,385	4,494
Lignite Anthracite	25,187	14,21
Copper	20	141
Ochre	742	1,21
Total	193,147	810,3

109,223 tons of zinc ore were exported, and also 32,580 ns of lead ore and 3154 tons of pig lead.

146,990 tons of salt were mined during the year; the port amounted to 5244 tons.

XII.—FATS, FATTY OILS, Etc.

OIL-SEED AND OIL-CAKE EXPORTS FROM ODESSA.

Foreign Office Annual Series, No. 3277.

Ravison is the most important oil-seed as regards the port trade, 53,000 quarters being exported from Odessa uring the period between August 1, 1903, and June 1904. he bulk of this was shipped to Hull. Very little business as done in rape seed or colza from this port, and ouly 000 quarters of colza were exported from Odessa (all to otterdam and Marseilles) during the same period, while e total amount of rape seed shipped from the port (to ull and Rotterdam) was 1100 quarters. The prospects r rape seed and colza this year, both as regards quantity ıd quality, are poor.

The following comparative table shows the quantities ported in 1901–3 inclusive :—

Articles.	Quantity.		
	1901.	1902.	1903.
	Tons.	Tons.	Tons.
nseed	935	4,022	2,902
emp seed	1,853	3,170	1,501
ıvison	1,548	..	14,150
ustard seed	..	100	31
lza	..	187	..
her oil seeds	1,144	3,773	536
Total	5,480	11,252	19,120

32,048 tons of oil cake were exported in 1903, compared ith 30,450 tons in 1902, and 29,518 tons in 1901; of these antities, the following came to the United Kingdom :— 03, 4900 tons; 1902, 5370 tons; 1901, 7560 tons.

OLIVE OIL PRODUCTION OF SARDINIA.

Foreign Office Annual Series, No. 3268.

The production of olive oil in the province of Cagliari, hich was very small in the preceding years owing to the vasion of the *Mosca olearia* (olive fly), has increased now is insect has disappeared, and it reached 606,345 galls. in 03; the province of Sassari produced 748,429 galls.—a tal of 1,354,774 galls., compared with 1,175,280 galls. in 02, and 1,120,258 galls. in 1901.

XV.—MANURES, Etc.

HEMICAL MANURES; CONSUMPTION OF —— IN ITALY.

Foreign Office Annual Series, No. 3265.

The amount of chemical manures consumed annually in aly is about 477,500 metric tons. Superphosphates are prered and consumed in large quantities. The annual consumpn of phosphates in Italy is at present about 400,000 metric ns, whereof 370,000 metric tons are mineral phosphates, e remainder being prepared with bone powder or with ne ashes. The greater part of the phosphates is prepared the 50 more or less important factories in Italy. The antities imported from France, the United Kingdom, and lgium are no longer very considerable. Thomas slag is imrted from Luxemburg, Belgium, and in smaller quantities om the United Kingdom. The consumption thereof has creased considerably during the last few years. Bone st is used to a certain extent in its natural state without y special preparation, but it is not of much importance. e consumption of sodium nitrate in Italy is not so imrtant as in other countries, but it is on the increase, and s already reached 20,000 metric tons, almost all from ili. Italian agriculture also consumes about 12,500 metric tons of ammonium sulphate annually. It comes mostly from the United Kingdom. Italy produces barely one-third of the consumption. The consumption of potassium sulphate and chloride is still limited as compared with the consumption of other manures. Owing to the high cost of transport they are used almost in a pure state. The importation amounts to about 3,000 metric tons, and is from Stassfurt. In addition to these, large quantities of nitrogenous organic manures, such as guano, blood, dried meat, horns, refuse from tanneries, &c., are used in Italy for agricultural purposes. It is difficult to give the exact quantity used, but there is no doubt that its value amounts to several millions of francs per annum.

XVI.—SUGAR, STARCH, Etc.

SUGAR PRODUCTION OF FRANCE.

Bd. of Trade J., Sept. 29, 1904.

The *Journal Officiel* of 13th September contains statistics of the production of sugar in France during the 1903-4 campaign (1st September, 1903, to 31st August, 1904). In 1903-4 the number of sugar factories working in France was 292, as compared with 319 during the previous campaign. The total quantity of sugar despatched from the factories (expressed in terms of refined sugar) amounted to 769,291 metric tons in 1903-4, as compared with 825,274 metric tons in 1902-3.

SUGAR PRODUCTION OF GERMANY.

Bd. of Trade J., Sept. 22, 1904.

The *Reichsanzeiger* for September 14th publishes statistics of the production of sugar in Germany during the campaign 1903-4. In 1903-4 the quantity of raw beet used in sugar manufacture was 12,706,527 metric tons, as compared with 11,255,958 metric tons during the 1902-3 campaign; the amount of raw sugar produced in 1903-4 was 1,662,814 metric tons, against 1,503,703 metric tons in 1902-3; whilst the production of refined sugar amounted to 1,411,129 metric tons in 1903-4, as compared with 1,367,086 metric tons in 1902-3. The total output of sugar (raw and refined) during the period from September, 1903, to August, 1904, expressed in terms of raw sugar, was 1,929,415 metric tons, as compared with 1,755,397 metric tons in the corresponding months of 1902-3.

XVII.—BREWING, WINES, SPIRITS, Etc.

ALCOHOL; DUTY-FREE ——.

Pharm. J., Sept. 24, 1904.

The following statement has lately been issued by the Treasury Department :—

Return for the Years 1902-3 *and* 1903-4, *respectively, showing the Applications for Exemption for* (1) *Trade Purposes;* (2) *Scientific or Educational Purposes.*

——	1902-3.	1903-4.
Applications for trade purposes :—		
Number received	54	30
„ granted	8	†4
Quantity of spirit on which exemption was granted	*341	*206,452
Applications for scientific or educational purposes :—		
Number received	65	53
„ granted	49	†27
Quantity of spirit on which exemption was granted	*358	*2,272

* These figures represent the total number of proof gallons of spirits used duty-free for the respective purposes in the year to which the figures relate.

† These numbers are in addition to the applications granted in the previous year, the privilege not being limited to one year, but continuing year by year until revoked.

SPIRIT (BRANNTWEIN), AND WASTE LIQUORS FROM ITS RECTIFICATION; UNTAXED DELIVERY OF —— FOR TECHNICAL PURPOSES IN RUSSIA.

Z. Spiritusind., 1904, **27**, 881.

By an order of the Imperial Council, confirmed by the Tsar, and dated May 12, 1903, the Russian Minister of Finance was authorised to allow, experimentally for three years, the untaxed delivery of spirit and of waste liquors from spirit rectification, in the denatured condition, for technical purposes, for lighting, heating, and power purposes, for the preparation of pharmaceutical products, for hygienic and medicinal purposes, and for disinfection, and to fix the conditions under which the delivery and the use of denatured untaxed spirit can be permitted. According to the regulations issued on June 18, 1903 by the Minister of Finance, spirit which is to be denatured for the above mentioned purposes must have an alcohol content not less than 85° Tralles. If, instead of ordinary raw spirit, a product containing more than 1 per cent of fusel oil is denatured, this fact must be stated upon the containing vessel when such denatured spirit is sold. Spirit for heating, lighting, and power purposes, &c., must be denatured as usual by the addition of a mixture of substances according to the prescription of the Technical Committee of the Department of Indirect Taxation; spirit for technical purposes, in which the ordinary denaturing process cannot be applied, can be denatured by other means, to be specially defined for each case. Mixtures for the ordinary denaturing process are to be bought at the bonded spirit warehouses; materials for special denaturing processes may be purchased privately, but, before being used, must be submitted to examination in the Central Chemical Laboratory of the Ministry of Finance or in the Laboratory of the Government Excise Department. The amount of spirit to be denatured must in each case be not less than 10 wedro (123 litres).—A. S.

XIX.—PAPER, PASTEBOARD, Etc.

PULP AND PULP WOOD; CANADIAN EXPORT OF ——.

U.S. Cons. Reps., No. 2058, *Sept.* 17, 1904.

The statistics for the fiscal year 1904 show that, while the export of wood pulp from Canada decreased, the export of the raw material (pulp-wood), all of which goes to the United States, increased The value of total export of pulp-wood in 1904 was 1,758,049 dols., an increase over 1903 of 229,489 dols. The total export of pulp decreased 23 per cent., the value being 2,409,074 dols., against 3,150,943 dols. during the previous year. The falling off was chiefly in the export to Great Britain, the value of which decreased 51 per cent., from 1,129,173 dols. to 548,720 dols., while the value of exports to other countries fell from 226,002 dols. to 52,912 dols. The value of Canada's total exports of paper, however, rose from 849,519 dols. to 1,097,212 dols., an increase of 247,693 dols., or 29 per cent. of the total value of the exports during 1903. Great Britain took 447,672 dols. worth; the United States, 163,000 dols. worth; and other countries, 486,531 dols. worth.

XXII.—EXPLOSIVES, MATCHES, Etc.

EXPLOSIVES IMPORTED INTO NATAL.

Bd. of Trade J., Sept. 29, 1904.

A Government notice (No. 554 of 1904) issued by the Natal Colonial Secretary, on Aug. 22, 1904, lays down the tariff fees payable for the examination by the Government chemist of dynamite and other explosives imported into Natal, as follows:—For the first 100 cases of dynamite or other explosive, 10*s.*; for every additional 100 cases or part of 100 cases, 5*s.* One sample from each 100 cases or part of 100 cases must be sent to the Government laboratory for examination, and cases of detonators will be regarded as separate shipments of explosives.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 20,154. Hecht and Rott. Safety containers for inflammable liquids.* Sept. 19.
„ 20,184. Thompson (Matricardi). Furnaces. Sept. 19.
„ 20,276. Aktiebolaget Separator. Centrifugal separators. [Appl. in Sweden, Oct. 3, 1903.]* Sept. 20.
„ 20,297. Campbell. Furnaces. Sept. 20.
„ 20,641. Parry. Machinery for separating pulverulent and granular substances from mixture containing same. Sept. 26.
„ 20,857. Kostalek. Filters.* Sept. 28.
„ 20,938. Shiels. Apparatus for heating, cooling evaporating, condensing, &c. Sept. 29.
„ 20,942. The Cotton Seed Co., Ltd., and Stanley Drying apparatus. Sept. 29.
„ 20,984. Pearson. *See under* XVIII. B.
„ 21,052. Oakley. Washing machine. Sept. 30.
„ 21,088. Wilkins and Overend. *See under* X.
[C.S.] 22,057 (1903). Doyle. Furnaces. Sept. 28.
„ 28,525 (1903). Mechwart. Filtering apparatus Oct. 5.
„ 642 (1904). Pidgeon. Rousers for mixing pur poses. Oct. 5.
„ 15,389 (1904). Czapikowski. Filters. Oct. 5.
„ 16,588 (1904). Matcham. Combined rotary kiln and dryers. Sept. 28.
„ 17,270 (1904). France. Sprinkler for liquids semi-liquids, and pulverulent materials. Sept. 28
„ 17,772 (1904). Forbes. Filtering apparatus. Oct. 5
„ 17,957 (1904). Tobler and Rheinische Webstul und Appretur Maschinenfabr. Drying apparatu Oct. 5.

II.—FUEL, GAS, AND LIGHT.

[A.] 20,125. Hawliczek. Recovery of by-product resulting from the destructive distillation of coa in "bee-hive" coking ovens. Sept. 19.
„ 20,277. Abel (Siemens und Halske A.-G.). Manu facture of incandescence bodies for electric g lamps. Sept. 20.
„ 20,326. Craig. *See under* VII.
„ 20,371. Rincker and Wolter. Production of o gas.* Sept. 21.
„ 20,784. Chalk Power Gas Synd., Ltd., and Pearso Process for the continuous and concurrent pr duction of fuel gas and lime. Sept. 27.
„ 20,845. Wilson. Gas producers. Sept. 28.
„ 20,870. Koppers. Process of and apparatus f obtaining by-products in the dry distillation gasification of fuel.* Sept. 28
[C.S.] 21,360 (1903). Shedlock. Artificial fuel and th manufacture thereof. Oct. 5.
„ 24,588 (1903). Settle and Padfield. Manufactu of coal gas. Oct. 5.
„ 18,262 (1904). Koppers. Coke ovens. Oct. 5.
„ 18,291 (1904). Cotton. Process and apparatus f generating a combustible gas from carbonaceo liquids. Oct. 5.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 20,697. Imray (Meister, Lucius und Brüning). Process for purifying orthonitrotoluene. Sept. 26.

„ 20,870. Koppers. *See under* II.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 20,527. Newton (Bayer and Co.). Manufacture of new anthracene dyestuffs suitable for dyeing and printing. Sept. 23.

„ 20,697. Imray (Meister, Lucius und Brüning). *See under* III.

[C.S.] 24,409 (1903). Ransford (Cassella and Co.). Manufacture of *o*-nitro-*o*-amido-*p*-acetamidophenol, and dyestuffs therefrom. Sept. 28.

„ 25,541 (1903). Newton (Bayer and Co.). Manufacture of oxyanthraquinones. Oct. 5.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 20,178. Johnson (Badische Anilin und Soda Fabrik). The discharge of dyed textile fabrics. Sept. 19.

„ 20,513. Sutherland. Method of cleansing or degumming stalk fibres. Sept. 23.

„ 20,637. Valette. Manufacture of artificial silk.* Sept. 26.

„ 20,664. Ward and Kenworthy. Apparatus for dyeing and treating textile fabrics and materials. Sept. 26.

„ 21,079. Calico Printers' Assoc., Ltd., Bryce-Smith and Hanson. Printing woven fabrics. Oct. 1.

[C.S.] 20,673 (1903). Müllers and Spindler. Manufacture of figured plush Sept. 28.

„ 20,942 (1903). Naeyer. Dyeing vats. Oct. 5.

„ 17,240 (1904). Destrée and Wiescher. Dyeing of hanks or yarns. Oct. 5.

„ 17,242 (1904). Krais and The Bradford Dyers' Association, Ltd. Finishing piece goods. Oct. 5.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 20,195. Imray (Meister, Lucius und Brüning). *See under* XX.

„ 20,241. Fryklind. Process for producing ammonia or ammonium salts from nitrogenous organic substances containing a high percentage of water. Sept. 20.

„ 20,326 Craig. Obtaining carbonic acid gas from the products of carbonaceous combustion, and apparatus therefor. Sept. 21.

„ 20,652. Hargreaves. Production of sulphate of baryta. Sept. 26.

„ 20,784. Chalk Power Gas Synd., Ltd., and Pearson. *See under* II.

„ 20,835. Hargreaves. Generation and application of chlorine. Sept. 28.

„ 20,952. Eschelmann, Harmuth, and Tov. Tentelevskago Ximichesk Zavoda. Apparatus for the manufacture of sulphuric anhydride.* Sept. 29.

[C.S.] 24,806 (1903). Hinz. *See under* XI.

„ 26,668 (1903). Meurer. Producing metal sulphates or other salts from metal sulphides and sulphide ores containing iron. Oct. 5.

„ 4487 (1904). Granier. *See under* XI.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 20,879. Bredel. Manufacture of quartz glass from quartz sand, silica, and the like.* Sept. 28.

„ 20 880. Bredel. Manufacture of articles from quartz glass.* Sept. 28.

[C.S.] 25,686 (1903). Stanley and Jeffcote. Process and apparatus for applying glazes, enamels, and bodying material to bricks, tiles, and like goods. Oct. 5.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 21,018. Bottomley and Paget. Attachment of metals to fused silica and analogous materials. Sept. 30.

[C.S.] 25,686 (1903). Stanley and Jeffcote. *See under* VIII.

„ 26,115 (1903). Hodgkinson. Impregnating wood and other porous materials to protect against damp, fungus, or insects, or for colouring. Oct. 5.

X.—METALLURGY.

[A.] 20,159. Gillies. Apparatus to be used in the separation and recovery of sulphides from their ores.* Sept. 19.

„ 20,160. Gillies. Apparatus for recovering zinc and other sulphides from their ores by the wet or chemical process.* Sept. 19.

„ 20,300. Ogle, Sulman, and Picard. Treatment of ores, slimes, and the like. Sept. 20.

„ 20,468. Duncan. Manufacture of steel.* Sept. 22.

„ 20,542. Thompson (Wickels Metallpapier Werke). Substitute for tin foil, and process for making the same.* Sept. 23.

„ 20,543. Armstrong. Furnaces or apparatus for obtaining zinc. Sept. 23.

„ 20,656. Auchinachie. *See under* XI.

„ 20,782. Bloxam (Soc. Anon. d'Études Electrochimiques). *See under* XI.

„ 20,797. Fink-Huguenot. Process for the preparation of metallic oxides by direct combustion of the metal, and apparatus therefor. [Fr. Appl., April 19, 1904.]* Sept. 27.

„ 20,842. Crosthwaite. Alloy. Sept. 28.

„ 20,877. Goodwin and Hollidge. Magnetic separators. Sept. 28.

„ 21,018. Bottomley and Paget. *See under* IX.

„ 21,081. Dawes. Magnetic separators for ores, &c. Oct. 1.

„ 21,088. Wilkins and Overend. Puddling and heating furnaces. Oct. 1.

[C.S.] 14,398 (1903). Worsey and Hoal. Extraction of gold from gold ores. Oct. 5.

„ 21,324 (1903). Dawes. Magnetic separators for ores, &c. Oct. 5.

„ 23,333 (1903). Moss. Magnetic separators for ores or like materials. Sept. 28.

„ 25,248 (1903). Rouse and Cohn. Method of converting powdered iron ore or iron waste or natural iron sands into briquettes or lumps. Sept. 28.

„ 25,794 (1903). Hadfield. Manufacture of manganese steel. Oct. 5.

„ 26,668 (1903). Meurer. *See under* VII.

„ 9584 (1904). Routin and Monraille. Metallic alloy. Sept. 28.

„ 16,205 (1904). Edelmann and Wallin. *See under* XI.

„ 17,038 (1904). Meadows. Preparing metallic mixtures. Sept. 28.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 20,285. Martin. Fireproofing electric cables. Sept. 20.

„ 20,656. Auchinachie. Continuous electric furnace for reducing metallic oxides and other compounds. Sept. 26.

„ 20,782. Bloxam (Soc. Anon. d'Études Electrochimiques). Electrolytic extraction of zinc from its ores, and apparatus therefor. Sept. 27.

[A.] 20,809. British Thomson-Houston Co., Ltd. (General Electric Co.). Electric furnaces. Sept. 27.

„ 20,810. British Thomson-Houston Co., Ltd. (General Electric Co.). Electric furnaces. Sept. 27.

[C.S.] 14,309 (1903). Dutertre and Nodet. Electric roasting oven. Sept. 28.

„ 24,806 (1903). Hinz. Process for the electrolytic manufacture of peroxides of magnesium and zinc. Oct. 5.

„ 25,853 (1903). British Thomson-Houston Co., Ltd. (General Electric Co.). Insulating material for electric conductors. Oct. 5.

„ 4487 (1904). Granier. Process and apparatus for the manufacture of sulphate of copper and caustic alkalies by the electrolysis of alkaline chlorides. Oct. 5.

„ 12,188 (1904). Tourneur. Producing electric energy by the utilisation of the chemical energy of any suitable combustible without the employment of thermal engines. Sept. 28.

„ 16,205 (1904). Edelmann and Wallin. Electric furnaces and the extraction of zinc by means of the same. Oct. 5.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 20,185. Ambleston. Apparatus for removing or extracting the oil or oily fibre from nuts, *e.g.*, palm nuts. Sept. 19.

„ 20,474. Boult (Burton). Process of manufacturing hydroxystearic acid from oleic acid. Sept. 22.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A.*)—Pigments, Paints.

[A.] 21,062. Bennett and Mastin. Manufacture of pigments. Oct. 1.

(*C.*)—India-Rubber.

[C.S.] 7795 (1904). Karavodine. Treatment and utilisation of waste vulcanised rubber and ebonite. Oct. 5.

„ 17,313 (1904). Price. Process for the devulcanisation or regeneration of rubber waste. Oct. 5.

XIV.—TANNING, LEATHER, GLUE, SIZE, Etc.

[C.S.] 17,979 (1904). Müller. Manufacture of imitation leather. Sept. 28.

„ 18,135 (1904). Flick. Process and composition for treating leather. Oct. 5.

XVI.—SUGAR, STARCH, GUM, Etc.

[A.] 20,166. Gouville and Jarvis. Caramelisation of carbohydrates. Sept. 19.

[C.S.] 15,297 (1904). Drewsen. Process of manufacturing products from cornstalks, sugar-cane, and analogous pithy stalks. Oct. 5.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 20,534. Nathan. Brewing beer. [German Appl., Oct. 7, 1903.]* Sept. 23.

[C.S.] 26,360 (1903). Tuckfield and Garland. Process of recovering alcohol and other volatile matters from waste or other products. Sept. 28.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(*A.*)—Foods.

[A.] 20,273. Bromhead (Chem. Fabr. Helfenberg). *See under* XX.

„ 20,291. Kennedy. Treatment of milk.* Sept. 20.

„ 20,292. Taylor. Cream substitute.* Sept. 20.

„ 20,339. Hatmaker. Milk food and method of manufacture. Sept. 21.

„ 20,340. Hatmaker. Milk food and method of manufacture. Sept. 21.

„ 20,658. Bernstein. Utilisation of the protein substances of milk. Sept. 26.

„ 20,885. Combret. Alimentary products constituting a phosphated vinegar. [Appl. in Belgium, Sept. 28, 1903.]* Sept. 28.

[C.S.] 17,431 (1904). Grenard. Preserving compound for the conservation of eggs and other alimentary substances. Oct. 5.

(*B.*)—Sanitation; Water Purification.

[A.] 20,889. Kremer and Schilling. Method of and apparatus for the bacterial purification of sewage and the like.* Sept. 28.

„ 20,984. Pearson. Apparatus for producing pure water by distillation, automatic and continuous in operation. Sept. 30.

„ 21,059. Noake. Method of aerating or oxygenating sewage. Oct. 1.

[C.S.] 28,137 (1903). Bonnotte. Manufacture of a compound for preventing scale in steam boilers. Sept. 28.

(*C.*)—Disinfectants.

[A.] 21,053. Morgan. Method and process of disinfecting.* Sept. 30.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 21,101. Birkbeck (Brooks). Process for making a substitute for cork. Oct. 1.

[C.S.] 18,117 (1904). Bradley. Paper-making machines. Sept. 28.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 20,195. Imray (Meister, Lucius und Brüning). Manufacture of iodine compounds. Sept. 19.

„ 20,273. Bromhead (Chem. Fabr. Helfenberg, Ltd., formerly Eugen Dieterich). Process for producing a stable non-alcoholic solution of iron-peptone or iron-manganese-peptone.* Sept. 20.

„ 21,047. Darzens. Manufacture of certain aldehydes and intermediate products. [Fr. Appl., Nov. 28, 1903.]* Sept. 30.

[C.S.] 22,163 (1903). Zimmermann (Chem. Fabr. auf Actien, vorm. E. Schering). Manufacture of acidyl derivatives of rufigallic acid alkyl ethers. Sept. 28.

„ 26,480 (1903). Imray (Meister, Lucius und Brüning). Manufacture of pyrocatechol derivatives. Oct. 5.

„ 15,784 (1904). Boult (F. Fritzsche und Co.). Manufacture of protocatechuic aldehyde. Oct. 5.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 20,157. Bonnaud. Paper and other surfaces for photographic printing. Sept. 19.

„ 20,272. Shepherd. Colour sensitometers. Sept. 20.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 20,251. Nicolay. Match.* Sept. 20.

„ 20,284. Hope. Explosives. Sept. 20.

[C.S.] 21,511 (1903). Yonck. Explosives. Oct 5.

J. White.

Hon. Treasurer: S. J. Pentecost.

Hon. Local Secretary:
S. R. Trotman, King's Walk Chambers, Parliament Street, Nottingham.

Scottish Section.

Chairman: R. T. Thomson.

Vice-Chairman: J. S. Macarthur.

Committee:

W. S. Curphey.
L. Dobbin.
D. B. Dott.
Thos. Ewan.
J. Arnold Fleming.
W. Frew.
G. H. Gemmell.
R. Hamilton.
Jas. Hendrick.
Jas. Hope.
H. Ingle.
W. G. Johnston.
J. Falconer King.
M. A. Parker.
T. L. Patterson.
D. J. Playfair.

Hon. Secretary and Treasurer:
Thomas Gray, c/o Gourlay and Deas, 180, Hope Street, Glasgow.

Sydney, N.S.W., Section.

Chairman: A. Liversidge.

Committee:

W. A. Dixon.
J. F. Elliott.
L. Meggitt.
J. Morison.
A. A. Ramsay.
J. A. Schofield.
R. Greig Smith.
H. G. Smith.
T. Steel.

Hon. Local Secretary:
T. U. Walton, Colonial Sugar Co., O'Connell Street, Sydney, N.S.

Yorkshire Section.

Chairman: H. R. Procter.

Vice-Chairman: G. W. Slatter.

Committee:

W. Ackroyd.
C. S. Bedford.
J. E. Bedford.
F. Branson.
B. A. Burrell.
John W. Cobb.
W. M. Gardner.
F. W. Richardson.
A. Smithells.
Geo. Ward.
Thorp Whitaker.

Hon. Local Secretary and Treasurer:
T. Fairley, 17, East Parade, Leeds.

Notices.

ANNUAL GENERAL MEETING, NEW YORK. PHOTOGRAPHS.

The Columbia University Groups may be obtained from Mr. Harry Coutant, 5, West 31st Street, New York, and 8, Alice Court, Brooklyn, N.Y.

The Mount Vernon Groups may be obtained from Mr. G. Prince, Pennsylvania Avenue and 11th Street, Vashington, D.C.

The Boston Groups may be obtained from Mr. E. hickering, 21, West Street, Boston, Mass.

The prices vary according to size and form of reproduc- on, but those exhibited cost from 3 dols. to 4 dols. apiece. emittances must accompany orders.

The Secretary is awaiting the receipt of particulars of ther photographs taken from time to time.

RARE MINERALS FOR RESEARCH.

Mr. A. B. Frenzel, of 1540, Sherman Avenue, Denver, olo., U.S.A., Commissioner of Rare Minerals for Colorado the St. Louis Exposition, and a member of this Society, ill give to any member of the Society, for research work, for demonstrating purposes in any institution of learning, y reasonable quantities of ores containing uranium, nadium, tungsten, or molybdenum, free on board, Denver, olorado. Members should communicate direct with Mr. renzel.

COMMUNICATIONS.

Authors of communications read before the Society, or y of its Local Sections, are requested to take notice that der Rule 43 of the Bye laws the Society has the right of iority of publication for three months of all such papers. fringement of this Bye-law renders papers liable to be jected by the Publication Committee, or ordered to be stracted for the Journal, in which case no reprints can furnished to the author.

List of Members Elected

24th OCTOBER 1904.

len, William R., c/o Watson, Jack, and Co., Montreal, Canada, Dyestuff and Chemical Manufacturer.

pleyard, Percy, Albany, West Australia, Chemist.

mpbell, J. H., 41, Summit Street, Brooklyn, N.Y., U.S.A., Chemist.

mpion, A., Coopers Hill, Englefield Green, Surrey, Chemist and Metallurgist.

whirst, J. A., 36, Southfield Square, Bradford, Yorks, Analyst.

glehard, Charles, 41, Cortlandt Street, New York City, U.S.A., Platinum Importer and Manufacturer.

dd. Henry Wippell, 100, Fore Street, Exeter, Analytical Chemist.

rnaas, John C., 69, Barclay Street, New York City, U.S.A., Dyestuff Merchant.

bbs, A. E., Wyandotte, Mich., U.S.A., Manufacturing Chemist.

ndlach, Walter, 153, E. 79 Street, New York City, U.S A., Superintendent of Colour Works.

rriman, Norman F., c/o Union Pacific Railroad Laboratory, Omaha, Neb., U.S.A., Engineering Chemist.

rrington, Dr. B. J., Macdonald Chemistry and Mining Building, McGill University, Montreal, Canada, Director of Chemistry and Mining Building.

rris, Norman B., 50, West Broadway, New York City, U.S.A., Manufacturing Pharmacist.

Harrison, H. E., 1688, Buckingham Place, Chicago, Ill., U.S.A., Chemist.

Heaton, Noel, 20, Baker Road, Harlesden, N.W., Colour Manufacturer.

Henley, F. R., 9, Beaufort Gardens, London, S.W., Brewer's Chemist.

Holdich, A. H., 55, Clarendon Road, Whalley Range, Manchester, Analytical Chemist.

Jewell, Wm. M., Park Ridge, Ill., U.S.A., Chemist and Engineer.

Jewson, F. T., Thornly Park Terrace, Paisley, N.B., Chemist.

Jones, Arthur B., c/o General Chemical Co., Station F, Box 12, Cleveland, Ohio, U.S.A., Superintendent.

Jones, Geo. F., c/o De Beers P.O. Explosive Works, Somerset West, Cape Colony, Technical Chemist.

Koerner, H. Theo., Beyerstrasse 28, Chemnitz, Germany Student of Chemistry.

Kübler, Alfred, 69, Barclay Street, New York City, U.S.A Vice-President, Geigy Aniline and Extract Co.

Le Maistre, F. J., 65, Bruce Avenue, Westmount, Montreal, Canada, Graduate (Inorganic Chemistry).

Le Sueur, E. A., 50, McLaren Street, Ottawa, Ont., Canada, Electrical and Chemical Engineer.

Marston, John P., 247, Atlantic Avenue, Boston, Mass., U.S.A., Merchant.

Mays, Edmund A., 100, N. Moore Street, New York City, U.S.A., Chemist.

Noake, Frank, S. S. Mond Gas Co., Trindle House, Dudley, Chief Engineering Assistant.

Patz, E. O., 215, Water Street, New York City, U.S.A., Manager, Berlin Aniline Works.

Pennington, Thomas, Platteville, Wis., U.S.A., Chemist.

Pfahler, H. W., 208, Linden Street, Holyoke, Mass., U.S.A., Chemist.

Ruef, Harry Herbert, 335, Marshall Street, Elizabeth, N.J., U.S.A., Chemist.

Sand, Dr. Henry J. S., University College, Nottingham, Lecturer and Demonstrator.

Slator, Dr. Arthur, University ollege, Nottingham, Lecturer and Demonstrator.

Sparre, Fin, Experimental Department of E. I. du Pont Co., Wilmington, Del., U.S.A., Chemist.

Teller, George L., The Columbus Laboratories, 103, State Street, Chicago, Ill., U.S.A., Chemist.

Vandenbergh, Dr. F. P., Pelham Manor, Westchester Co., N.Y., U.S.A., Consulting Chemist.

Weightman, Aubrey H., 1915, Walnut Street, Philadelphia, Pa., U.S.A., Chemical Manufacturer.

Wherry, H. P., c/o Boston and Montana Smelter, Great Falls, Mont., U.S.A., Chemical Engineer.

Wild, Irving L., 235, College Street, Middletown, Conn., U.S.A., Electrical Engineer.

Wright, Chas. L., Electric Illuminating Co., Cleveland, Ohio, U.S.A., Chemical Engineer.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Aykroyd, H. E., l/o Ilkley; Ashdown, Apperley Bridge, near Bradford, Yorks.

Baty, Ernest J., l/o Birkenhead; Nunclose, Prince's Avenue, West Kirby, Cheshire; and (Journals) c/o The Dee Oil Co., Saltney, near Chester.

Bennie, P. McN.: Journals to Fitzgerald and Bennie Laboratories, P.O. Box 118, Niagara Falls, N.Y., U.S.A.

Bolam, Dr. H. W., l/o Leith Technical College; 2, Summerfield, Leith, N.B.

Cameron, Alex., l/o Lexham Gardens: Whitcher Place, Rochester Road, Camden Road, N.W.

Caspari, Dr. W. A., l/o Langham Road; 28, Coleshill Road, Teddington.

Clayton, Dr. G. Christopher, l/o Maldon Lodge; Etonfield, Wavertree, Liverpool.

Cleveland Chemical Society; Journals to c/o Prof. C. F. Mabery, Case School of Applied Science, Cleveland, Ohio, U.S.A.

Connor, Chas. C.; all communications to 4, Queen's Elms, Belfast, Ireland.

Cronquist, G. W., l/o Sweden; Rhenania Chamotte und Dinas Firebrick Co. Ltd., Bendorf a/Rhein, Germany.

De Wilde, Prof. P.; Journals to Hotel d'Orient, Bône, Algeria.

Evershed, F.; all communications to Kenley, Surrey.

Fitzgerald, F. A. J.; Journals to Fitzgerald and Bennie Laboratories, P.O. Box 118, Niagara Falls, N.Y., U.S.A.

Hodgkins, D. H., l/o Newark; 82, Lafayette Avenue, Passaic, N.J., U.S.A.

Lessing, Dr. R., l/o Brunswick Square; c/o Gas Light and Coke Co., Tar Works, Beckton, E.

McCowan, Wm., l/o Neilston; Essex Wharf, Narrow Street, Limehouse, E.

Mond, Robt. L.; Journals (temporarily) to c/o Thos. Cook and Son, Cairo, Egypt.

Munroe, Prof. Charles E., l/o Columbian University; George Washington University, Washington, D.C., U.S.A.

Neilson, Thos., l/o Mexico; Highland Bay Smelter, Murray, Utah, U.S.A.

O'Brien, Claude H.; all communications to Tamunua, Navua, *viâ* Suva, Fiji.

Oglesby, W. R.; Journals to c/o Alma Cement Co., Wellston, Ohio, U.S.A.

Olshausen, B. A., l/o New York; 1505, St. Andrew's Place, Los Angeles, Cal., U.S.A.

Parker, Chas. E., l/o New Street; 151, College Avenue, New Brunswick, N.J., U.S.A.

Pizey, J. H., l/o Muswell Hill; Anchor Chemical Works, Provanmill, Glasgow.

Rawson, Christopher, l/o New York; 44, St. Augustine's Road, Bedford.

Roscow, J. F., l/o Norwich, Conn.; P.O. Box 417, Boonton, N.J., U.S.A.

Tilley, Jas. W., l/o Brixton Hill; 95A, Southwark Street, London, S.E.

Vernon, R. H., l/o Lausanne; Cornell University, Ithaca, N.Y., U.S.A.

Wingate, Hamilton M., l/o Wynell Road; 90, Queenswood Road, Forest Hill, S.E.

MEMBER OMITTED FROM LIST.

O.M. Kearns, H. W., Baxenden House, near Accrington, Dyer.

CHANGE OF STYLE.

His Majesty the King has been pleased to confer the honour of Knighthood on Mr. Thos. Stevenson, M.D., Guy's Hospital, S.E.

Deaths.

Chattaway, Wm., Apothecaries' Hall, London, E.C. Oct. 7.

Pattinson, Dr. H. S., Newcastle-on-Tyne. Oct. 26.

Storar, John, of Reckitt and Sons, Ltd., at Coniston Lodge, Hornsea. Oct. 6.

Annual General Meeting,

NEW YORK, 1904.

The following is an outline of the proceedings of th Annual General Meeting and the excursions connecte therewith. It is impossible to give adequate expressio here to the deep debt of gratitude which the visitors owe t those fellow members and ladies, not only in New York, b in all the other cities visited, who devoted themselves s unsparingly in order to uphold the traditions of America hospitality and make a record meeting.

It is hoped to publish detailed reports of visits to work and other places of interest as they come to hand. F this the Council will be to some extent dependent on th further courtesy of those manufacturers and others w have already laid the Society under so deep an obligation.

NEW YORK.

The following is a list of the committees charged with t various arrangements for the New York meeting and f providing the facilities of travel in connection with t visits to various other cities included in the programme entertainment:—

BRITISH COMMITTEE.

The President.

E. Divers.
R. W. Greeff.
Samuel Hall.
H. Hemingway.
B. E. R. Newlands.
F. B. Power.
Boverton Redwood.
W. S. Squire.
Thos. Tyrer.
T. J. Wrampelmeier.

NEW YORK COMMITTEES.

Executive Committee.

H. Schweitzer, Chairman.
T. J. Parker, Secretary.
R. C. Woodcock, Treasurer.

Virgil Coblentz.
E. G. Love.

Finance Committee.

W. H. Nichols, Chairman.

Chas. F. Chandler.
H. A. Metz.
T. J. Parker.
R. C. Woodcock.

Hotel and Transportation Committee.

C. B. Zabriskie, Chairman.

Leo Baekeland.
De Laguel Haigh.
Wm. F. Hoffmann.
Clifford Richardson.

Entertainment and Programme Committee.

E. G. Love, Chairman.

Leo Baekeland.
Marston T. Bogert.
Gustav Drobegg.
A. P. Hallock.
G. C. Stone.
Maximilian Toch.

Invitation and Press Committee.

E. J. Lederle, Chairman.

W. F. Fuerst.
R. W. Moore.
Wm. J. Schieffelin.
R. C. Schnepphaus.
H. W. Wiley.
D. Woodman.

Reception Committee.

Virgil Coblentz, Chairman.

A. C. Bedford.
F. J. Butterworth.
W. B. Cogswell.
Thomas A. Edison.
William H. Erhart.
H. C. Grant.
Edward Hart.
J. Hasslacher.
A. C. Humphreys.
E. J. Lederle.
William McMurtrie.
Wm. H. Nichols.
Chas. Pellew.
Wm. J. Schieffelin.
F. Schniewind.
F. M. Smith.
I. F. Stone.
F. G. Zinsser.

Ladies' Committee.

Mrs. Charles E. Pellew, Chairman.

Mrs. Leo Baekeland.
Mrs. Marston T. Bogert.
Mrs. Virgil Coblentz.
Mrs. Ernest J. Lederle.
Mrs. Herman A. Metz.
Mrs. William McMurtrie.
Mrs. Wm. H. Nichols.
Miss Parker.
Mrs. Thomas J. Parker.
Mrs. Clifford Richardson.
Mrs. Wm. J. Schieffelin.
Mrs. Hugo Schweitzer.
Mrs. Maximilian Toch.
Mrs. Fred. G. Zinsser.

The names given above by no means exhaust the list of hose who co-operated in receiving and entertaining the isitors. The Hotel and Transportation Committee made hemselves responsible for the whole of the railway trip, for otel accommodation in all cities visited, and for transport f baggage, while the work entailed upon the Executive and inance Committees still engages their attention. Sub-ommittees of the Reception Committee met the various teamers on arrival, and saw the visitors safely lodged in he Hotel Seville, Madison Avenue and 29th Street, the ociety's headquarters, where their comfort was looked after y Mr. L. Raegener, a member of the Society who is part wner of the hotel.

Wednesday, September 7th.

The programme began with a reception at the Chemists' lub, 108, West 55th Street, at 9 p.m., at which some 50 guests were present, including many of the foremost cientists of Europe, who were passing through New York n their way to the Congress of Arts and Sciences at t. Louis.

Thursday, September 8th.

After a council meeting at Havemeyer Hall, the general eeting of the Society was held in the Gymnasium of olumbia University, 116th Street, Amsterdam Avenue his J., Oct. 15, 1904, 924—926). Among those present ere the President and President-elect, Prof. C. F. Chandler Chairman of the New York Section), Dr. H Schweitzer hairman of the Executive Committee and Hon. Sec. of e New York Section), Mr. T. J. Parker (Secretary of the eception Committee), President Remsen (Johns Hopkins niversity), Prof. Hart (Lafayette College), Dr. Russell . Moore (U.S. Customs), Judge Waite, Dr. L. Baekeland, r. Charles Baskerville (College of the City of New York), rof. M. T. Bogert (Columbia University), Prof. W. H. handler, Prof. V. Coblentz (College of Pharmacy), Presi-ent Humphreys (Stevens Institute of Technology), Dr. E. G. ove, Dr. Wm. McMurtrie (American Chemical Society), r. W. J. Schieffelin (Chairman, New York Section of Ame-can Chemical Society), Dr. H. W. Wiley (U.S. Department Agriculture), Mr. R. C. Woodcock, Prof. T. M. Drown President, Lehigh University), Dr. Eames, President Finley College of the City of New York), Prof. Dr. H. Erdmann erlin), Prof. Dr. Oscar Liebreich (Berlin), Prof. Mohlau resden), Prof. Ostwald (Leipsic), Mr. Thos. Tyrer (past resident of the Society), Dr. F. B. Power, Dr. R. Messel, r. Max Muspratt (Vice-Presidents), Dr. J. Lewkowitsch ember of Council), and Mr. Eustace Carey (Chairman of verpool Section).

Photographs were taken of the Council and also of embers in front of the Library of Columbia University; pies of these may be obtained from Harry Coutant, 18, lice Court, Brooklyn, N.Y. (see notice, p. 963).

Luncheon was provided in the open piazzas of Claremont, old residence near the University and Grant's Tomb, erlooking the Hudson. Thence 24 automobiles took the rty for a drive through the upper part of the city, and Riverside Drive and through Central Park to the Hotel ville.

At 7.30 p.m. the visitors were entertained at dinner by e New York Section at the Waldorf-Astoria Hotel, Fifth venue and 34th Street (see J., Oct. 15, 1904, 926—927). overs were laid for 270. On the daïs, besides the esident and President-elect, were Prof. C. F. Chandler oastmaster), President Ira Remsen, Profs. Ostwald, iebreich, and Möhlau, Drs. Hallock, Wiley, and Schweitzer, r. Thos. Tyrer, President Finley, and Mr. Clive-Bayley, itish Vice-Consul.

The menu was executed by Tiffany. The cover, in romo-collotype, showed at the top a sketch of the port of ew York and the arrival of a steamer, in the middle were e two hemispheres united by the scroll of the Society of hemical Industry, and at the bottom the power station d Falls of Niagara. For each guest there was a gilt ree-handled loving-cup, a white chrysanthemum, and a f of laurel.

Meanwhile the Ladies' Committee entertained the ladies a theatre-party, which was followed by a supper at the aldorf-Astoria Hotel.

By the courtesy of various members of the New York Section, many visitors were made honorary members of the University Club and other important New York clubs.

Friday, September 9th.

Excursion 1.

Guide: Mr. T. J. Parker.

Nichols Chemical Co.'s Copper Refinery at Laurel Hill.

Through the courtesy of this Company the steamer *Quaker City* took the party to the works, after inspecting which they were entertained at luncheon by the officials of the Company. Both ladies and gentlemen took part in this excursion.

Mr. Wm. H. Nichols, in welcoming the visitors, gave a short account of the growth of the works. Years ago, he said, the enormous works over which they had been conducted consisted of a small plant worked by two men, of which he himself was one. Now the premises covered many acres of ground. The copper refinery was nearly twice as large as any other works of its kind in the world, and the amount of copper produced at Laurel Hill was over one-fifth of the total production of the world. He could not lay claim to the scientific knowledge possessed by many of those present, but he attributed his success and the success of the works to his knowledge of men, and hence to the men whom he had drawn around him to assist him. One of the first of these had been Mr. Herreshoff, and he would add that these works were the first in the State of New York in which a chemist had been employed. He then called upon Mr. Herreshoff to address the company.

Mr. Herreshoff said that in large works the usual plan was to cast the copper into plates, as had been shown. The impure copper contained gold and silver, for the complete removal and recovery of which the electrolytic method was employed. In addition to gold and silver, other metals that were never removed before by the ordinary firing methods—namely, arsenic, tellurium, selenium, and antimony, &c., which make copper very brittle—were also thus removed. The copper thus produced was of 99 per cent. purity. The success of the electrolytic process had caused a great many mines to be opened which could never have been worked otherwise. Their method was the well-known series system. True, the multiple system was more generally used, but it was curious that the largest works in the world employed a method that was generally condemned. In their method there were serious difficulties to be overcome, but certainly they had overcome them.

In regard to the other parts of the plant, the reverberatory furnaces were very simple. The Bessemer converter had been first introduced 18 to 20 years ago in France, and was now used largely in the West in large copper plants. The molten matte, as it came from the smelting furnaces, was run into bowls and air blown in to oxidise the sulphur. The matte consisted of 55 per cent. of copper, 20 per cent. of sulphur, and 25 per cent. of iron. The iron was very easily oxidised, but silica had to be supplied. In the application of silica many difficulties were encountered. They confined themselves to the use of a brick lining, consisting largely of silica, 85 per cent. or more. The thickness of the bricks was about 18 ins. The revolving liquid inside caused a rapid combination of the oxygen and iron. In 15 minutes the contents of a converter, fed with 4 tons of matte, was oxidised, the residue taken out, and the copper left. The point at which this was to be done was determined by the little scintillations thrown out—a phenomenon requiring a practised eye to observe. 90 per cent. copper was poured out. The process was an intermittent one, each operation taking one hour and a half or two hours. When the lining was reduced to about one-half of its original thickness, it was removed by what was known as a lapp machine, something like a rock drill, and made up with fresh material.

Excursion 2.

Guide: Mr. George C. Stone.

The members of the party visited the Spiegel Furnace of the New Jersey Zinc Co., the works of the Balbach Smelting and Refining Co., and of the Murphy Varnish Co. at Newark.

In the evening there was a Reception at the Majestic Hotel, in Central Park West, the weather proving too wet for the party to avail themselves of the Roof Garden, which is a feature of this hotel.

SATURDAY, SEPTEMBER 10TH.

Excursion 3.

Guide : Mr. GEORGE F. KUNZ.

Most of the ladies and many of the gentlemen visited the establishment of Messrs. Tiffany and Co., Union Square, where jewels, jewel cutting, and setting were shown. Statuary, bronzes, porcelain, and glass, in which the highest forms of art are exhibited, are also a feature of this establishment. Here too was seen "Kunzite," a new lilac-coloured spodumene from Pala, California, so called in honour of the Director, who, together with Dr. Chas. Baskerville, has devoted considerable study thereto. The mineral affords, when cut, a new gem of great beauty.

Others visited the Metropolitan Museum of Art, Fifth Avenue and 82nd Street. Among the principal modern pictures of a collection still further enriched by the loan collection of W. H. Vanderbilt, may be mentioned Turner's "Grand Canal at Venice," Meissonier's "Friedland," Millet's "Sowers," Rosa Bonheur's "Horse Fair" (that in the National Gallery is a small replica), Leighton's "Lachrimæ," and a "Holy Family," by Knauss—considered to be equal to the best work of Murillo.

The Cesnola Collection of Cyprian Antiquities, the Bishop Collection of Jade, and the Morgan Collection of Porcelain are the finest of their respective classes in the world.

After luncheon at the Casino, Central Park, the members drove to the American Museum of Natural History, Eighth Avenue and 77th Street, and inspected the paleontological collection, which includes the celebrated series of fossil horses collected by Prof. Marsh, and regarded as conclusive evidence of the truth of the theory of evolution; the paleontological collection of the late Prof. J. Hall; the gem room; and the Bement Collection of minerals.

Excursion 4.

Guides : Dr. A. H. ELLIOTT and Mr. M. TOCH.

The works of the New York Edison Co.; Westinghouse, Church, Kerr, and Co.'s power house for the Pennsylvania Railroad at Long Island City; and the Ravenswood works of the Consolidated Gas Co., were visited. Luncheon was served by invitation of the Consolidated Gas Co.

Excursion 5.

Section A.—Guide : Dr. M. WALLERSTEIN.

A party of gentlemen visited the brewery of George Ehret, lunching afterwards with Section C.

Section B.—Guide : Dr. WM. McMURTRIE.

Another party visited the works of the Tartar Chemical Co., Brooklyn, and later joined Section C. at lunch.

Section C.—Guide : Dr. A. P. HALLOCK.

A third party, consisting both of ladies and gentlemen, visited the mineral water factory of Carl H. Schultz, 440, First Avenue, and, with Sections A. and B., were entertained at a sumptuous lunch by invitation of the company.

It should here be mentioned that Mr. Carl H. Schultz also gave to the Society a very ample supply of mineral waters, wines, and spirits for the use of the special train in which the party afterwards travelled.

The paint works of the F. W. Devoe and C. T. Reynolds Co., and John W. Masury and Sons, Brooklyn, were also open to members.

Excursion 6.

Guides : Mr. GEORGE C. STONE and
Mr. E. L. RANSOM.

A party of gentlemen visited the works of the Pacific Coast Borax Co. and Tide Water Oil Co. at Bayonne, N.J.

By the courtesy of Mr. W. J. Matheson, who placed steam yacht *Lavrock* at their disposal, a small pa of members, including the President and President-el were enabled to wait upon the President of the Uni States at his marine villa at Sagamore Hill, Oyster President Roosevelt expressed his great regret at be unable to receive the Society at the White House, ow to his absence, for a much needed rest, from Washing at the time of the Society's visit to that city. He offe them a most cordial welcome to the United States.

On Saturday evening a smoking concert and Vaude entertainment was offered to the members at the "Lie kranz," a German Club, whose object is indicated by name. Members found on the tables copies of "A. No Vol. II.," of "The Journal of the Sassiety of Chom Industry," issued that day by an irresponsible Publicat Committee in New York. The "Table of Attempts" cluded "Council Notices," "Changes of Address," " Members Elected," "A Few New Elements" by " Hoonderville," and other original papers and songs. hoped to obtain some further copies for home memb After supper an illuminated address was presented Sir Wm. Ramsay to the New York Section on be of the European visiting members, in order to place record their feelings of gratitude and esteem for the ma ficent reception accorded to them. Credit is due Mr. David Perry for the expedition with which the add was prepared, in view of the very limited time that available for this purpose.

SUNDAY, SEPTEMBER 11TH.

The New York portion of the Annual Meeting conclu on Sunday with a steamer trip up the classic Hudson R as far as West Point. Near the city the river presents either hand, a varied scene of docks and shipping, w further to the north the Palisades, rising on the wes shore, form a beautiful contrast to the more gentle sl of the eastern. Scarcely a mile is passed that does remind the student of much of interest in American hist The Palisades attain their greatest height of 550 directly opposite Hastings. West Point, the highest p reached, is the home of the United States Mili Academy.

During the trip Mr. Thos. Tyrer, on behalf of the l visitors, presented a silver vase to Mrs. Charles E. Pel Chairman of the Ladies' Committee, wife of the Adj Professor of Chemistry at Columbia University, and dau ter of Prof. C. F. Chandler. Beautiful weather favo this trip, the haze of early morning soon giving wa bright sunshine, in which the scarlet tint of the ma those harbingers of autumn, only served to set off brilliant green of the foliage which clothed the banks either side.

MONDAY, SEPTEMBER 12TH.

At 8 a.m. the whole party left New York by the W 23rd Street Ferry for the special train by the Pennsylv Railroad to Philadelphia.

The following American and Canadian members acc panied the party:—Dr. L. Baekeland, New York; M. T. Bogert, New York; Mr. H. J. Case, New Y (special correspondent of the Central Press); Mr. W. Drey New York; Mr. M. L. Hersey, Montreal; Mr. W. H stetter, Cincinnati; Mr. Theo. Körner, New York; Mr. J. Krebs, Wilmington, Del.; Dr. E. G. Love, New Yo Mr. A. P. Van Gelder, Emporium, Pa.; and Mr. C. Zabriskie, New York.

The President-elect, Mr. Wm. H. Nichols, was preve from joining the party by the sudden illness of Mrs. Nich and Mr. T. J. Parker was also detained by illness. B however, joined later.

The following representatives of the Pennsylvania R road were also in attendance:—Mr. H. C. Bates, Tou Agent; Mr. T. S. Wilson, Special Baggage Master; Mr. N. W. Hower, Stenographer, with a full staff, includ some 30 car attendants, &c.

(*To be continued.*)

New York Section.

Meeting held at Chemists' Club, on March 25th, 1904.

DR. VIRGIL COBLENTZ IN THE CHAIR.

THE PREPARATION OF COTTON FIBRE FOR SURGICAL PURPOSES.

BY FRED B. KILMER.

The use of cotton fibre in surgery as an application to wounds is of comparatively recent origin. Cotton cloth in strips has long been employed as an outer or retaining bandage. Lint was, until quite recently, made, as its name implies, of flax. About 1837, loose cotton was suggested for the direct covering of wounds, but was not generally adopted. In 1864, Augustus Touraine, a surgeon-major in the army of Maximilian, published a formula and process for the preparation of "Hydrophile" cotton.

The real introduction of absorbent cotton into surgery is due to Lister, who propounded the doctrine that both wound treatment and dressing should prevent the access of micro-organisms, and that when micro-organisms have entered in spite of every care, they should be destroyed or rendered incapable of harm. The Lister system, as first practised, called for the use of cotton and gauze dressings impregnated with antiseptics. The first of these dressings used was non-absorbent, but very early cotton fibre and gauze were demanded which would absorb wound discharges and antiseptic solutions.

Absorbent cotton fibre, under the name of "Absorbent Cotton," became an article of commerce about 1877. Now wherever surgery is practised cotton fibre in some form is the basis of every form of dressing. The industry is noted for its rapid growth. Twenty years ago there was no maker who could produce as much as one hundred pounds at one time, and even the largest purveyors rarely handled more than that amount in a year. The wholesale price of absorbent cotton in 1881 was 1·12 dols. per pound for pound packages; in smaller packages, 2·25 dols. per pound. At the present time the wholesale price ranges from eighteen cents for the lower grades to thirty cents per pound for the higher types.

There are single retail dealers at the present time who handle 40,000 lb. of absorbent cotton in a year. One of the laboratories in the United States, where this article is produced, has in process upwards of 20,000 lb. at one time. The table which follows is an estimate made by one of the largest manufacturers :—

Cotton used in Surgery in the United States.

—	1878.	1886.	1898.
Raw cotton .... lb.	1,000	5,000	20,000
Absorbent cotton .. lb.	5,000	250,000	3,000,000
Bandages .... lb.	10,000	20,000	100,000
Gauze .... yds.	1,200	120,000	20,000,000
Lint................ lb.	50,000	15,000	40,000
Miscellaneous dressings .... lb.	500	2,000	20,000

The present output of cotton for surgical purposes is upwards of 6,000,000 lb. per year, and there is invested in this industry a capital aggregating five millions of dollars. There is also an increasing demand for this class of material in various industries. The increased demand has reduced the cost while the products have also greatly improved. As to surgical cotton, the best produced as recently as 15 years ago was yellow, dirty, and not absorbent. It was packed in wads and put up in all sorts of boxes and paper wrappings.

The improvement introduced about 1887 by an American maker, whereby the absorptive power and the whiteness was increased, and the cotton put up in continuous sheets with layers of tissue paper between, had a pronounced effect upon the consumption.

Absorbent cotton carefully made from clean straight fibre, of the type known as Texas Strict Middlings, is elastic and springy, and will absorb about fifteen times its weight of water. The moisture is quickly diffused through the whole of the fibre. It does not pack and lie hard on the flesh, but stands up, forming an absorbent cushion. Cotton made of a low grade fibre, or from mill waste or old rags lacks absorbing and diffusing power and when wet packs down like so much clay.

Selection of Fibre.—In the preparation of cotton for surgical uses, the selection of the raw cotton, the grade, and the staple are not the only factors to be considered. The high class fibres represented in the Sea Island and Egyptian types, which are long stapled and small in diameter are unsuitable, since they would produce a thread too fine for surgical gauze, and could be made absorbent only with difficulty. The Egyptian and Brazilian types are rough and woolly; the brown varieties of these types can scarcely be made white in the processes which are employed. The East Indian fibres are rarely used, for the reason that those which are low in price are short, harsh, brittle, weak in staple, and often very badly stained, and mixed with leaves and dirt. The most desirable kinds are those represented by the American types known as Orleans, Texas, Allenseed, Mobile, and Benders.

The grade known as strict middlings gives the best results.

To make a good product, the fibre must be free from seed, leaf, sand, and mud, which even under the most careful treatment will appear in the finished product, and cannot be made absorbent. Stained, tinged, or off-coloured fibre will never become white, and absolute whiteness is of prime importance.

In every pod of cotton, when the plant reaches maturity, there remains an under-growth of short hairs at the base of the seed. If the ginning process is run very closely, these hairs are removed, and mixed with the longer fibre. They are not perfect fibres, and never become fully absorbent or white, and have a great tendency to form what are known as nibs or nebs. Again, unripe or immature fibres have to be reckoned with. They are extremely thin and transparent, with little or no twist. When spun into yarn they contract and tie themselves into knots. These unripe fibres contain no cellular opening, do not form capillary tubes, and do not become absorbent. Under the action of chemical agents they have a tendency to become brittle. In the carding operations such fibres become entangled with the perfect fibres, and prevent the formation of a smooth web.

In spinning mills, where the better grades of woven cloths are produced, all nebs, unripe, immature, and short fibres are removed in the carding and combing processes. The carded, or combed-out product, known as "card waste," "combers' waste," "linters' waste," "fly waste," &c., is consumed in the manufacture of low-priced surgical cotton. The higher grades can only be produced from cotton fibres of a good grade and staple.

The process now generally followed for rendering cotton fibres absorbent is that originally devised by Slocum and modified by the writer. At a first glance, the chemical processes involved will appear quite like the familiar bleaching methods, but there are essential points of difference.

Cotton fibre can be bleached without being rendered absorbent, and it can also be made absorbent without being bleached. On the Continent, cotton fibre and woven gauze are made absorbent and prepared for surgical use by simple extraction of the fatty matters with solvents such as petroleum ether, carbon bisulphide, or by an alkaline treatment without bleaching. The resulting product is fairly absorbent, but is not white.

Bleached cotton cloth and fibres which are not absorbent are well-known products. No bleacher in the trade would dare subject his fibre to the very drastic treatment used in the processes here outlined.

The principal operations in the preparation of cotton fibre for surgical uses, in the form of absorbent cotton and surgical gauze, may be summarised as follows :—

I. *Mechanical Operations.*—(1) Sampling and inspection to establish grade. (2) Mixing. The blending of different varieties of raw cotton to ensure uniform quality and colour, and an even fleece or thread. (2) Opening. In this process the matted masses of cotton fibre are opened out and shell, sand, leaf, &c., are removed. (4) Beating, blowing, lapping, or "scutching" (a continuation of the process of opening). At the end of this the cotton is rolled in an even sheet or lap. (5) Carding. In this process the fibres are further opened out and individually separated; very fine impurities are removed, together with short and unripe fibres. As the cotton leaves the card, the fibres, if they are to be made into absorbent cotton, are gathered together in a web or fleece; if they are to be made into surgical gauze they are gathered into a rope a little less than an inch in diameter, called a "sliver."

II. *Chemical Processes.*—(1) The cotton fibre (mechanically cleaned) is packed in boilers and washed with water (2) Alkaline hydrolysis. In this process the non-cellulose constituents of the fibre, wax, fatty oils, pectose, &c., are hydrolysed. (3) Extraction of alkali and hydrolysed products. (4) Oxidation. The removal of colouring matter, residues, and by-products of the alkaline treatment (the first stage of bleaching). (5) Hydro-extraction of oxidising chemicals. (6) Acid oxidation. A continuation of the oxidation and bleaching action. (7) Hydro-extraction of acids and acid products. (8) Second alkaline hydrolysis. (9) Hydro-extraction of alkaline products. (10) Second acid oxidation (completion of bleaching). (11) Neutralisation of chemicals and removal of neutralisation salts. (12) Hydro-extraction.

III. *Mechanical Processes.*—(1) Opening. The fibre at this point is bleached and absorbent, but somewhat matted and tangled, and must be opened for subsequent operations. (2) Drying (at 220° F.). (3) Lapping. Gathering into sheets preparatory to carding. (4) Carding. The fibres are individually separated and formed into thin films and the films gathered into layers. (5) Rolling in layers with thin tissue paper between each layer. The rolls are cut into sizes, pound, half-pound, quarter-pound, ounce, &c., and packed into cartons or rolled into packages. (6) Sterilisation.

The mixing or blending process is important, whether the final product is to be absorbent cotton or surgical gauze. Short and defective fibres, if present, must have a proper proportion of perfect fibres to make a suitable web or thread. When cotton waste is employed, the mixing or blending operation becomes a fine art.

The operations of opening, beating, blowing, scutching, likewise require considerable skill.

In the final product no dyes nor fillers can be used to aid in covering up unsightly particles. Every speck, seed, leaf, &c., must, if possible, be removed. If these specks are light in gravity, their removal is practically impossible.

The fibres must be well opened out. There must be no tangled masses or the cotton will not be acted upon by the chemical agents used in the subsequent operations. Fibres to be used for absorbent cotton are best left in their natural curl or twist, in as even sheets as possible, lying crosswise on each other in such a way as best to be receptive of the hydrolysing solutions. On the contrary, fibres to be used in gauze are laid parallel to each other and then twisted together.

After the mechanical treatment outlined in the table the sheeted fibres (laps) are packed in vats or kiers for the chemical treatment. This is shown in the table as taking place in twelve stages. These are sometimes carried out in one vat by passing the fibre through; but more often, after the first alkaline treatment, the fibres are removed to an open vat, washed, and then passed through to subsequent processes in crates or in bunches moved by hand. Washing machines of the rake type, such as are used in wool scouring, are also utilised.

In packing into kiers, when a considerable percentage of short fibres is present, the fibres have a tendency to become so closely pressed that the solutions do not readily penetrate. With regular fibres, this packing is avoided by the natural elasticity of the hairs, and their tendency to spring up and allow a free movement of the extractin liquids.

The essential feature of rendering the fibres absorbent i embraced in the stage designated in the table as number : or alkaline hydrolysis. This consists of boiling the fibr in a solution of caustic soda of about 1 per cent. strengt This is varied with the condition of the fibre, its colou tenacity, &c., of which the operator must judge in eac individual case. The boiling is conducted under lo pressure, continuing from 12 to 48 hours. Extractio under a vacuum has been tried, but found to be of n advantage. In fact, in experiments noted by the write the fibre was not wholly absorbent when boiled in a vacuu

In the alkaline treatment a portion of the cellulose dissolved. Upon this point I have made the followin experiments:—Carded and cleaned cotton fibre were dri to constant weight, boiled in solutions of caustic soda varying strength for different periods, washed until fr from alkaline reaction, and again dried to constant weigh The losses are shown in the following table :—

Loss of Weight of Cotton Fibre by Boiling in Caustic Soda Solution.

Strength of Solution.	Loss on Boiling for	
	Half Hour.	One Hour.
Per Cent.	Per Cent.	Per Cent.
1	4·41	5·71
2½	5·08	7·33

The products of the alkaline treatment are not easi removed from the fibre, especially in the mass. In ordina bleaching processes the fibres become white in the proce which follows the first, or alkaline, treatment. The washi away of the saponified products is a long operation, and the end of it the fibre structure is not freed of its conten Their final removal takes place subsequently.

The first alkaline treatment is followed by the bleachi proper. Here the fibres are subjected to the prolong action of a solution of hypochlorite containing, approx mately, 0·1 per cent. of chlorine. The hypochlorites lime and soda have both been used. The former is employ almost exclusively in the cheaper grades of cotton a gauze. The soda bleach produces a softer, whiter, a more elastic product. The Thompson process, viz., utilisi the combined action of hypochlorite and carbon dioxi has been tried, but has been found too expensive and dif cult to manage with large masses of loose fibre. Sodiu peroxide has also been tried experimentally, but the prese price was found to be prohibitive.

In practice, the oxidation is carried to the utmost lim that the fibre will allow. The requirement is not only attack the colour, but to penetrate every molecule and break every existing combination, even those remaini from the alkaline hydrolysis. The way is thus prepare for the removal in the subsequent operations of everythin except the cellulose.

It can easily be imagined that in the process he described the cellulose itself is attacked and oxidise That the cellulose is oxidised is shown by the gre rapidity with which these fibres take up basic coal-t dyes. In fact, the affinity of the fibres for these colou is, in a rough way, a measure of their absorbency. Th fibre is always more or less tender and gives the usu reaction for oxy-cellulose.

The residues of hypochlorite solution are next wash away, as shown in the table under No. 6, and the fib subjected to acid oxidation, in a solution of either sulphur acid (2 per cent.) or hydrochloric acid (1 per cent.). Th oxidation and bleaching is carried one point further. I practice, the process is pushed to a partial solution of th inorganic constituents of the fibre. The acid being carefull washed out, there follows a second alkaline treatment, No. in the table of operations. The object of this process is attack any matter not reached in the first alkaline treat ment; to remove fatty matters decomposed in the chemica process, and to render soluble any residue still remaining in the fibre.

The strength of the alkali is generally about 0·25 per cent. of NaOH, and the time of boiling is short. After washing away the alkali, a second acid treatment follows. Any residue soluble in acids is removed, inorganic salts are dissolved, iron compounds and stains are cleared, and the cotton assumes a full white.

The next step is of considerable importance. It is difficult to remove all traces of acid, but if they are not removed the fibre becomes tender on drying. In practice, after very long washing with water, antichlor (or soap wash) is used. After treatment with antichlor the fibres are crisp and emit a crackling sound.

The soap treatment is preferred, but the soap must be thoroughly washed away, or the fibres will turn yellow. There is a temptation to leave in a considerable amount of soap, as the soap overcomes any difficulty in absorptive power. Calcium chloride is also added for a similar purpose. With some makers it is the custom to use sulphuric acid in the final acid treatment, and to allow a considerable portion of this to remain upon the fibre. This acid fibre is next treated with soap, and there is deposited with the fibre sulpholeate compounds which render the fibre soft and flexible and apparently increase its hygroscopic property. The inevitable decomposition and yellowing follow, to the ultimate detriment of the product.

The last treatment of the chemical process (No. 11) in the table should be a prolonged washing in water until no trace of soluble matter remains.

The character and quality of the water used in the preparation of cotton fibre for surgical uses is of great importance. Water acceptable for use in the ordinary processes of bleaching and dyeing will here be a source of trouble. The reason for this is easily explained. Each fibre of absorbent cotton is a capillary porous cell of absorbent cellulose. Each individual cell becomes a filter, and particles of water are taken in and passed through with great rapidity. There are about 150,000,000 fibres n a pound of absorbent cotton, and if 1,000 lb. are packed n a cylinder, and water passed through, we have a filter-bed of no mean capacity. To a certain extent these cellulose cells are capable not only of straining out sedimentary matter from the water, but also of dissociating salt and colouring matter. The fibres rapidly take up algæ and other organisms. In waters containing large numbers of organisms, naturally covered with gelatinous envelopes (such as diatoms), the upper layer of closely packed cotton becomes covered with a slime, like that found in filter beds. When impure water is passed through a considerable depth of cotton, the water is to a degree purified, and the cotton rendered unfit for use. Not only is very hard water objectionable for use in the preparation of absorbent cotton on account of the reactions with the chemicals used, but also the fibres, being absorbent, hold so much of the water, that, upon drying, a portion of the lime and alts remain.*

To produce the finest product the water must be soft, lear, free from suspended matter, and, as far as possible, ree also from dissolved organic matter.

Following the chemical processes come the mechanical operations noted in the table. The cotton fibres as they eave the drier are in tangled masses. So crisp are they hat when pressed they emit a sound. The first of the mechanical operations which follow are for the opening out f the fibres (opening and lapping). The fibres are then arded, and as they pass from the cards gathered into ayers. The fibres of absorbent cotton have a tendency to ontract and form themselves into tangled nebs; hence, in well-carded absorbent cotton, the amount of card-waste is arge.†

The layers, consisting of several films from the cards, laced on top of each other, are rolled up with tissue paper. This rolling in tissue is an American invention, and is of great utility, preventing the felting of the fibres, which would occur if the cotton were rolled upon itself. The cotton fibre unrolls like a sheet or blanket, and can be cut or torn with ease.

One manufacturer of absorbent cotton adds a final and most important process, viz., sterilisation. Sterilised or aseptic cotton fibre is a product of very recent times. While the methods of antisepsis have by no means been discarded, still in many conditions (as, for example, when an aseptic wound is made by the surgeon), and for many uses during the course of an operation, simple aseptic, absorbent cotton fibre is the only material required. Many hospitals sterilise the fibres at the time of use. Sterilised absorbent cotton fibre and sterilised surgical gauze and other dressings have, however, become permanent articles of commerce.

The sterilising agents used for absorbent cotton rolled in tissue is formaldehyde gas. For gauze and other dressings, steam is employed. In the laboratories in which these notes are made, the sterilising chambers are long steel cylinders similar to the chambers used in quarantine, and have a capacity of about 2,000 lb. of cotton each.

The cotton is run into the chambers, the doors are closed, the chamber is warmed, and a vacuum of about 20 ins. is drawn. Formaldehyde gas (or steam) is then admitted to the chambers, and the fibres are almost instantly penetrated. In practice, the gas or steam is removed by the vacuum pump and a fresh charge is admitted. The fibres are in contact with the formaldehyde gas for about two hours, with steam one hour.

The material is so packed that the sterilising agents can penetrate the fibres, but it is so enclosed that the cotton cannot be infected unless the packages are broken open.

Bacteriological tests, made by placing infected strips within the chambers, have demonstrated the efficiency of the process for ordinary forms of organisms.

Surgical Gauze.—Absorbent gauze cloth, made of cotton fibre, is at once a covering and protection. It may be used to bind together separated parts. Its threads act as compresses to severed blood vessels. The absorptive power of gauze is very great when properly prepared, its qualities make it the most useful wound-dressing material known.

The gauze of the cotton trade, known as "Cheese Cloth" or "Tobacco Cloth," is quite distinct from surgical gauze. In the United States, in England, and in some parts of the Continent, gauze is spun and woven solely for surgical uses.

Cotton fibre, after primary mechanical treatment as above, when it is to be made into surgical gauze, passes through a series of mechanical and chemical operations, the principal ones of which are here noted.

I. *Mechanical Processes.* — (1) "Combing," (2) "Drawing," (3) "Slubbing," (4) "Roving," (5) Spinning," (6) Weaving operations: (*a*) Winding, (*b*) Warping, (c) Sizing, (*d*) Drawing or twisting the warp, (*e*) Weaving.

II. *Chemical Operations.*—The woven gauze cloth is made of non-absorbent fibre, and must be made absorptive. This requires operations similar to those for rendering cotton absorbent. (1) "Grey washing," (2) "Bowking," decomposition of fatty, resinous, and waxy matters in the threads preparatory to removal by subsequent operations; (3) Washing, (4) Alkaline hydrolysis, (5) Extraction of alkali and hydrolysed products, (6) Oxidation (first stage of bleaching), (7) Extraction of oxidising agents, (8) Acid oxidation, (9) Second alkaline hydrolysis, (10) Extraction of alkaline products, (11) Second acid oxidation—completion of bleaching, (12) Neutralisation of chemicals and removal of salts produced thereby.

III. *Mechanical Processes.*—1. Opening. The gauze cloth at this point is white and absorbent, but folded and twisted, and must be opened to full width for the next operation. 2. Tentering (stretching, drying, calendering). 3. Rolling (folding automatically). If the material is intended for antiseptic gauze, it is impregnated with the antiseptic solution at this point. 4. Packing into containers. 5. Sterilisation.

In selecting and blending the fibres, great care must be taken to secure evenness in length, freedom from leaf,

---

* Instances have occurred where soap was used, as noted in the rocess marked No. 11 in the table, and the water used in the ubsequent washings contained an excessive amount of alum. In hese cases it was found that the soap became coagulated, rendering he fibres non-absorbent.

† In lower grades the nebs are allowed to pass through.

shells, dirt, and above all, to give exactly the right twist to the thread. In spinning, the object is not to secure a tight, strong, hard twisted thread, but rather an even smooth one, with the fibres so laid as to be readily rendered absorbent. A vital point is that the sizing must be one that is perfectly soluble and that can be quite removed in the main chemical processes. The process of rendering the gauze absorbent is very drastic. Considerable oxidation takes place, with an average loss of 11 per cent. in weight. The finished product is carried beyond the stage of bleaching before the desired absorbtive power is reached. In small laboratories this work is carried on in the piece, while the larger establishments have automatic apparatus for the chemical washing, &c. The finishing of surgical gauze is of considerable importance.

The use of fillers, such as gums, starches, dextrines, &c., or softeners, such as soaps and fats, is very undesirable. In some grades to be found in the market the amount of such dressings is such as to preclude the use of the material with iodoform, mercuric chloride, or other sensitive antiseptics.

It is comparatively easy in trade to obtain a price for gauze much above its actual value. For example, a gauze which in the grey is 36 ins. in width will, under the ordinary treatment, finish up only 35 ins. in width. A free use of starch, however, may aid in holding it out to width. By manipulating the tentering machine, the longitudinal threads may be stretched so as to give an increase in length of from 10 to 20 per cent.

In dealing with gauze, it is usual to take a piece one inch square as a standard. If we take such a square of a fairly high grade, such as is represented by one having 40 longitudinal and 44 cross threads per square inch we shall have 84 inches of thread.

Again, the size of the thread will make a difference in the weight of cotton in each square inch.

With surgical gauzes, as found in the market, there is a marked variation in the quality of the fibre, the number of threads to the inch, and the size and weight of the threads. The National Formulary (United States, unofficial) names as standard cloths, Lehigh E. and Stillwater brands. These have 32 threads per square inch each way, and weigh about 800 grains to the square yard. The gauze cloth now found in commerce exhibits a great variation.

The earlier surgical gauzes were made of Egyptian cotton, with equal number of threads each way, hand finished. The hand finish kept the threads straight. The final product was less white but more elastic. It came from the bleach unchanged in tensile strength.

Surgical gauze is to be used as a protective covering, a bandage, and a dressing. It must have strength and sufficient power and capacity to absorb, to hold, and to act upon all discharges. It must contain nothing inimical to wound tissue. It must be aseptic; in other words, its value depends upon its preparation rather than upon its textile composition. The gauze, within its final container, is sterilised by saturated steam in a vacuum.

Classes of Cotton Dressings.—The progressive evolution of surgery has demanded cotton dressing possessing certain characteristics which may be crudely defined as follows:—Non-absorbent dressings which resist absorption into the fibres themselves. These absorb by capillarity and act as filters and protectives. Absorbent dressings capable of absorbing into the fibres and interstices the serous discharges, and solutions applied to wound surfaces. Antiseptic fibres impregnated with antiseptics, or dressings which work antiseptically, dry sterile absorbent cotton fibre which absorb serous discharges and hold them in a dry condition. Aseptic dressings free from living organisms (sterilised).

Dressings impregnated with antiseptics may still contain organisms and be the means of carrying infection to a wound; hence all dressings applied to a wound must be antiseptic and surgically clean. Sterility, once attained, must be maintained until the dressing reaches the wound surface.

Lister first impregnated lint with very pure phenol, his object being to form a crust over the wound, and thus prevent putrefaction. This was followed by mixtures o oil and carbolic acid, carbolated pastes, and putty encased in muslin or lint, and, in 1871, gauze cloth was introduced by him. The Continental surgeons, who had been the first to adopt absorbent cotton, were also the first to impregnat the fibres with antiseptics. The list of antiseptic dressing made of cotton is to-day quite meagre. The most commonl used are mercuric chloride, iodoform, boracic acid, and Lister's gauze of mercury and zinc. The method o preparing these need not be detailed here.*

Antiseptic gauze is supplied in two forms, moist an dry. In dry gauze a volatile solvent is used, and, upo evaporation, the antiseptic is left upon the fibre. The usua standard for such a gauze would be the percentage b weight of the finished product.

In moist gauze a non-volatile solution or emulsion i made by the aid of glycerin and the gauze is impregnated the excess of solution is extracted, and the gauze lef undried. The standard adopted for such antiseptic gauz is that the gauze when dry shall contain the require percentage of antiseptic by weight.†

Mixtures of carbolic acid with oils, fats, and soap certainly neutralise the activity of the acid, from a chemica and bacteriological point of view. Mercuric chloride form an inert compound with serous fluids from the tissue Lister redissolved the precipitate formed by corrosiv sublimate and serum in an excess of blood serum. Thi preparation was quickly abandoned. The chemical activit and bacteriological power of mercuric chloride in solutio depends upon its free ions. Yet in surgery, sodiu chloride and ammonium chloride are used to increase th solubility of the mercuric salt. In the case of ammoniu chloride undoubtedly a double salt is formed (sal-Alem broth, Lister), and it is the free ions of the double salt tha are active. Lister also introduced a so-called double sal the cyanide of mercury and zinc. From the chemist' point of view there was in this salt no combination, and th soluble mercuric cyanide was nearly all washed away in th preparation of the mixture, leaving only zinc cyanide, a inert substance. Mercuric chloride, in contact with cotto fibre, is in the course of time reduced to oxide. Th change seems to take place more rapidly if the fibre is dr Mixtures of soap and mercuric chloride and iodoform f impregnating gauze are very common. Here there is decomposition of the mercuric salt and the iodoform, an in turn a combination of the mercury and free iodine. A these compounds, however, satisfy the surgeon, and th chemist must be suited.

With the development of surgical technique the use antiseptic cotton and gauze has markedly decreased. The has been a marked reduction in the proportion of ant septics used, and a gradual abandonment of antiseptic Plain aseptic sterilised dressings of cotton or gauze a now used in many instances, to the entire exclusion antiseptic preparations.

In addition to the already noted forms of surgic dressings made of cotton, still others may be enumerated.

Absorbent cotton fibres, compressed into small hul have found considerable favour in military practice. . preparation of cotton fibres partially felted so as to form cross between lint and loose fibres is known under the nam of lintine. Combinations of cotton fibre and other cell loses have also been manufactured, the advantage of t cellulose being that the fluids absorbed are soon diffus and spread over the entire area of the dressings.

There are a number of modifications of cotton fibre use. Carbonised cotton fibres have found a very limite use in surgery. Many other fibres and substances hav been suggested as substitutes for cotton or for mixing wi it, *e.g.*, peat, ramie, and flax, but all these lack one or mo essential features, while cotton fibre in various forms com more and more into use in surgery.

---

* Styptic cotton, *i.e.*, cotton fibre impregnated with a solution ferric chloride or subsulphate, belongs to the class of cott prepared with non-absorbent fibre, its use antedates antisepsis, a it is not used in modern surgery.

† In some instances the impregnation is adjusted so that ea square measure of the gauze contains a definite measure of t antiseptic.

Absorbent cotton fibre and gauze cloth, have found numerous uses in the industrial arts.

Water, watery solutions, oils, syrups, jellies, and varnishes can be strained or perfectly clarified as may be desired. Dairies consume large quantities of both cotton and gauze for the straining and clarification of milk. In chemical laboratories, in addition to use for filtering purposes, there is an increasing use of absorbents for absorption of fats, &c., as in milk analysis.

The use of prepared cellulose as an absorbent is undoubtedly capable of great extension. In this paper it has been noted that the prepared fibre has a marked power in removing certain coloured matters from solution, forming in certain instances lake-like compounds. From the basic salts of certain metals the fibres take up notable proportions of the basic oxides. This phenomenon is increased in well-prepared absorbent cotton fibre. A farther study along this line might prove of considerable value.

In the electrical industry considerable use is found for absorbent cotton fibre, as also in the preparation of films, cements, and varnishes. Absorbent cotton fibre is also utilised in the manufacture of incandescent mantles.

There is a constantly increasing demand for absorbent cotton fibres in the preparation of collodion compounds. In many of the industrial uses here noted it is required that the fibre shall be free from foreign matters and from chemicals. In certain of them the presence of immature fibres, nibs, &c., is objectionable. For other uses a low content of ash is very desirable. In bacteriological work and for filtering milk, &c., sterilised fibres are preferred.

Ash of Cotton Fibre.—A consideration of the ash in cotton fibre is important in view of the attempts of several Pharmacopœias to prescribe the amount which shall be present in absorbent cotton, and also in view of the fact that in the use of absorbent cotton for many purposes, the quantity and quality of the ash is a factor of considerable moment. The writer has often been asked for a process to produce a cotton entirely ash free. At other times trouble has arisen over the presence, in considerable quantities, of such constituents as lime, magnesium, and iron in the finished product. The table first given shows the amount of ash in samples of raw cotton fibre as found in the American market.

Ash of Raw Cotton Fibre (based on Uncleaned Fibre with Natural Moisture).—Orleans, 1·5; Texas, 1·8; Egyptian, 1·6; Sea Island, 1·8; Peruvian, 1·7; Strict Middlings, No. 300, 1·65; "East Indian," 2·72 per cent.

Davis, Dryfus, and Holland (quoted in Cotton by C. P. Brooks) gives the ash of several varieties of Indian cotton as follows:—Dhollerah, 6·22; Dharwar, 4·16; Bengal, 3·98; Broach, 3·14; Comrawuttee, 2·52 per cent.

The United States Department of Agriculture gives results of analysis of 10 samples of American staples as follows:—Minimum, 0·93; maximum, 1·80; Average, 1·37 per cent. ash.

The amount of ash in the fibre is small in comparison with the amount in other parts of the plant as shown below.

Ash of the Cotton Plant, American grown.

——	Maximum.	Minimum.	Average.
	Per Cent.	Per Cent.	Per Cent.

In cotton fibre, as it is delivered from the market to the gin, is found a varying proportion of impurities which increase the percentage of ash. Thus the percentage of ash in absorbent cotton varies somewhat in proportion to the thoroughness with which the cotton is cleaned by the mechanical processes before chemical treatment. How much of the ash the mechanical and chemical treatment removes is shown in the sample marked 300 (see below), where the proportion of ash in the ground fibre was 1·65 per cent., and after being made absorbent, 0·123 per cent.

As far as my researches have extended, I find the following standard for ash in absorbent cotton:—

United States Pharmacopœia, 1890.—Not more than 0·8 per cent of ash.

British Pharmacopœia, 1898. — Less than 1 per cent. of ash.

German Pharmacopœia, 4th Edition.—Not more than 0·3 per cent of ash.

The percentage of ash present in a sample of absorbent cotton sold in various markets is as follows:—American, 0·063, 0·120, 0·177, 0·180, 0·150, 0·177; American, N.P., 0·265; American, 390, 0·123; German, 0·073, 0·178; French, 0·216, 0·094; English, 0·200, 0·092.

Test for Purity.—A few of the Pharmacopœias have established standards for the purity of absorbent cotton. Among these are the following:—"Purified cotton should be perfectly free from all visible impurities and on combustion should not leave more than 0·8 per cent. of ash. When purified cotton previously compressed in the hand is thrown on the surface of cold water it should readily absorb the latter and sink, and the water should not acquire either an acid or an alkaline reaction." (Evidence of Proper Purification, U.S. Pharmacopœia, 1890.) "It should readily be wetted by *water*, to which it should not impart either an alkaline or an acid reaction. On incineration in air it burns leaving less than 1 per cent. of ash. It dissolves in concentrated solution of copper-ammonio-sulphate." (British Pharmacopœia, 1898.)*

"Purified cotton, moistened with water, should not change the color of litmus paper. Having been immersed in boiling water, the liquid should hardly produce an opalescence with solution of silver nitrate, barium nitrate, or ammonium oxalate. The red tint which is produced by the addition of a few drops of sulphuric acid and three drops of a solution of potassium permanganate should not disappear within a few minutes. If purified cotton is thrown on water it should become moist and sink at once. On burning it should not leave more than 0·3 per cent. of ash." (German Pharmacopœia, 4th Edition.)†

Purified cotton should readily become wet when brought into contact with warm water, and the washings should be neutral. 0·3 grm. of purified cotton when ignited and incinerated should leave no weighable amount of residue. (Pharmacopœia Svecia, 1901.)

All these standards are open to criticism; that of the U.S. P. is particularly faulty in that absorbent cotton heavily charged with impurities will, if previously pressed in the hand, sink when thrown on the surface of water. This authority is also indefinite as to the amount of water to be used. If a large amount of water is used with a small portion of cotton, alkaline or acid reaction easily escapes observation. The British Pharmacopœia is likewise open to criticism in this same respect; impure cotton may be immersed in water without imparting either an acid or an alkaline reaction.

The test of sinking in water is a test neither of purity nor of absorbent power. Soaps, glycerin compounds, and calcium chloride will increase the apparent absorbency enough to comply with this test.

A very simple test for the presence of substances added to give artificial absorbtive power is, to thoroughly wash the cotton in water, to dry it thoroughly, and then to drop it in water. If it has been made absorbent by added substances its power is diminished under this treatment.

In my laboratory the following tests have been found of service in rapid quantitative work:—A portion of cotton (generally 2 grms.) is percolated with alcohol. Another portion is percolated with ether, the solvents being slightly

---

* The word "copper-ammonio-sulphate" in the B.P., 1898, is an error: solution of cuprammonium oxide was evidently intended.

† The following Pharmacopœias contain no reference to absorbent cotton. Pharmacopœia Espanola, Pharmacopœia Danica (1893), Pharmacopœia Chilensis (1886), Pharmacopœia Portuguesa (1876), Pharmacopœia Helvetica (1893), Pharmacopœia Belgica (1885). The Pharmacopœia Venquela (1898) gives a process for preparing absorbent cotton, but has no requirement for purity.

warmed and passed through twice. If no residue then remains upon evaporation, the extraction has been thorough. Purified ether and purified alcohol are to be used, or else there will be a residue due to impurities in the solvent.

For the presence of bleaching materials due to faulty processes, left by design, or added to give absorbtive power, take 5 grms. of the absorbent cotton and wash it well with 100 c.c. of distilled water, either by letting it stand for some hours in the water or by boiling it for a few minutes. The water must be absolutely pure and the vessels perfectly clean. With pure absorbent cotton the water remains clear; bleaching chemicals and soaps show a cloudiness if present in notable quantities. If no cloudiness appears, or if it is only faintly cloudy upon concentration to half or one fourth its bulk, the water may be tested for the presence of chemicals such as chlorides (from the chlorine of the bleaching bath).

Calcium chloride (sometimes added to give hygroscopic power) and sulphuric acid may be detected by the usual tests. Salts of the fatty acids (soaps) are detected by their reaction with mercuric chloride or acetic acid. Soaps, when present in considerable amounts, are also manifest in the ether residues, and glycerin in the water residues, when the cotton is extracted with these solvents.

Tests for the purity of absorbent gauze present a much wider range than those for the purity of absorbent cotton. Here, in addition to the impurities mentioned in the foregoing, such as the natural fats, waxes, colouring matters, and bleaching chemicals, there are often present also many added substances.

The number of substances used for dressing and felting gauze to give a better finish, to make weight, or to increase the apparent size of the thread, is very large. Only those of more common occurrence are here noted. As staying or dressing materials: starch, flour, dextrine, glue, albumin, casein, gums, tragacanth, senegal, arabic, &c. Loading materials: gypsum, chalk, chlorides, and sulphates, sodium and zinc salts, china clay, barium chloride, sulphate, and carbonate. Substances added to make the fabric soft, pliable, and hygroscopic: glycerin, glucose, calcium, zinc, and magnesium chlorides, sodium, and ammonium salts. The number of substances is so large that no general method of examination can be given; specific methods for each would require too much space. The rough and simple method used in our practice is, first to examine the external or physical properties. Then a practised eye can detect filling at once. A heavily charged gauze will lose much of its filling by brisk rubbing between the fingers, and dust will fly off upon tearing.

Sydney, N.S.W., Section.

MR. HENRY G. SMITH IN THE CHAIR.

THE BACTERIAL ORIGIN OF THE VEGETABLE GUMS.—PART II.

BY R. GREIG SMITH, D.Sc.

It will be remembered that the arabin and metarabin gums were first obtained in the laboratory by growing *Bact. acaciæ* and *Bact. metarabinum* upon a medium containing saccharose, potato-juice, tannin, and agar. The medium as at first prepared was excellent for the purpose of producing slime, but unfortunately it subsequently became uncertain in its action, and this could only be accounted for by differences in the composition of the potato-juice, which was made at various times from different lots of potatoes. Further research, however, showed that one reason for the discrepancies lay in the fact that the bacteria rapidly lost the power of producing slime from saccharose. There seemed also to be a variable constituent of the potato-juice, possibly dextrose, that prohibited the formation of the typical by-product. As the potato-juice medium was so unsatisfactory, a number of experiments were made with the object of obtaining a medium better adapted to the slime-forming requirements of the bacterium. This entailed an investigation into the nutrition of the organism, and incidentally a number of other questions were considered.

In experimenting with the various nutrients, the effects were measured by the weights of slime that were produced. The slimes were grown upon the surface of 20 c.c. portions of agar media which had been allowed to solidify in ordinary 9-cm. Petri-dishes. The material used for infecting the plates was prepared by growing the bacteria upon saccharose-potato-agar (without tannin) at 30° C. for from 24 to 48 hours. At that temperature the bacteria grew exceedingly well, and were practically without slime. After a certain period of incubation, the slimes were removed from the experimental agar-plates as thoroughly as possible and weighed directly. Duplicate tests made at the same time and incubated under the same conditions generally agreed, but when made at different times and possibly under different conditions, they did not always agree. The yield of slime appeared to depend largely upon the vitality of the bacterium when infected. The largest yield of slime, *viz.*, 25 per cent. (5 grms. from 20 c.c. of medium), was obtained from the most favourable medium when the bacteria had been subcultivated for some weeks at close intervals, such as every two or three days. When the bacteria were allowed to rest for, say, a month, the amounts of slime were very much less, and after they had been subcultivated for a few months upon sugar-free media, the gum-forming faculty was temporarily lost.

A series of preliminary experiments, in which the balance was not used, indicated that a quantity of slime could be obtained upon an agar medium containing levulose, asparagine, potassium citrate, and tannin. Further experiments were made to discover the optimum quantity of each of these nutrients, &c., and the comparative effect of other nutrients.

The bacterium responded quickly to levulose, the maximum yield being obtained with 2 per cent. of sugar. The yield gradually fell until, with 10 per cent., only four-tenths of the maximum was produced. With regard to the other carbonaceous nutrients, saccharose was found to be as useful as levulose when the organism had been trained to utilise that particular sugar. Glycerin, mannite, and maltose were not quite so good, while dextrose, galactose, lactose, and raffinose were useless. A curious point was that while levulose produced the maximum quantity, invert sugar produced none. Experimental trials with mixtures of levulose and dextrose showed that as the proportion of dextrose was increased, the yield of slime decreased. Dextrose was thus not only useless for enabling the bacterium to form gum, but it also prevented the organism from utilising levulose. It was furthermore found that dextrose also prohibited the production of gum from maltose. Galactose behaved like dextrose in producing no slime and in preventing the utilisation of levulose and maltose.

These experiments with sugars have a direct bearing upon a certain hypothesis regarding the origin of gum from cellulose. Botanists seem to have agreed that gum is derived more or less directly from cellulose, probably because it had been found in certain trees in *lacunæ*, which had been produced by the swelling and ultimate deliquescence of the cell walls. It is probable that the destruction of the wood tissue had been caused by the activity of microscopic moulds, and that the gum had flowed into the cavity exactly as it flows into the cavities in the fruit of the almond and the peach. Fragments of cellular tissue are sometimes found embedded in gums, such as gum tragacanth, but rather than indicating a cellulose origin of the gum, I think this points to the presence of insect life, *e.g.*, tree-borers, in the wood in the neighbourhood of the puncture through which the gum had exuded. I have shown that the gum has a bacterial origin, so that its direct production from cellulose is out of the question. The results with the sugars show that dextrose, the hydrolytic product of cellulose, is useless for the production of gum. And if we use the name in its broadest sense and include the hemicelluloses, pectins, and other celluloses, we know that the dextrose or galactose, which generally accompanies the other saccharine products of hydrolysis, would prohibit the formation of gum. The experimental evidence goes to show that the gum is formed by the bacteria from levulose and maltose, the wandering sugars of Brown and Morris.

When varying quantities of asparagine were contained in the media upon which the slime was grown, it was found that the maximum yield was obtained with 0·1 per cent., and that larger amounts had no effect one way or the other in modifying the activity of the organism. Upon comparing peptone, asparagine, and urea with different sugars, &c., the asparagine clearly gave the best results. With the exception of levulose, from which the same weight of slime was obtained, the yields from the urea plates, in which the nitrogen was equivalent to that in the asparagine plates, varied from two-thirds in the case of saccharose to three-fifths with mannite. Peptone gave practically no slime.

It was found, upon testing various alkaline salts, that the acid radicles fell into four groups; they either (1) accelerated, (2) were indifferent, (3) depressed, or (4) prohibited the production of slime. The first group included succinates and citrates; the second contained tartrates and, possibly, chlorides; the third had sulphates, phosphates, and oxalates; while the fourth included acetates, lactates, and formates. When the quantity of salt was investigated, it was found that 0·1 per cent. of succinate or of citrate was the optimum. Of these two salts, the latter was, if anything, the better. As the bacterium produced among its acids succinic, acetic, formic, and lactic, it is interesting to note that the first of these accelerated and the others prohibited the production of gum. One is inclined to regard the by-products of bacteria and of yeasts either as depressants or prohibitants; but succinic acid does not appear to come under either of these groups. So far as yeasts are concerned, succinates undoubtedly hasten fermentation, but possibly not more so than do phosphates.

The investigation of the action of tannin was interesting. The best quantity was 0·1 per cent., but as much as 0·3 per cent. could be used; more than that destroyed the cohesiveness of the agar during sterilisation. All tannins did not seem to have the same slime-producing effect, as it was found that a fresh lot was not so active as the older sample. In order to test the action of different known tannins upon the medium, I obtained a number of specimens from Messrs. Harrington Bros. The baterium enabled these to be separated into two classes, one of which increased the yield of slime, and included the sumach tannins used by dyers; the other was either inactive or depressed the yield, and contained the gall-nut tannins, such as the pure forms, as well as those used by calico-printers. The addition of glycerin to the medium and a longer period of incubation checked the depression due to the second group of tannins. Since *Bact. acaciæ* can distinguish between certain of the tannins, it is possible that it might form the basis of a biological method for the recognition of these substances. With regard to the function of the tannin in the medium, I am of the opinion that by causing the agar-jelly to be somewhat contractile, it enables the bacteria to be slowly fed with nutrients in solution—that is to say, the bacteria can obtain the water necessary to form the slime (which contains 97 per cent. of water) much more easily when tannin is present than when it is absent.

The optimum temperature for slime formation lies about 17° C. As the temperature rises, the slime becomes less. At 22° it was two-thirds, and at 30° it was one-fourth the maximum.

From the experiments briefly treated in the foregoing, it appeared that an optimum medium for the formation of slime in the laboratory should contain levulose 2, glycerin 1, asparagine 0·1, tannin (preferably sumach) 0·1, potassium citrate 0·1, agar 2 grms., and tap-water to 100 c.c. This medium is not only an excellent substratum for enabling *Bact. acaciæ* to form its slime; but it is also a means of distinguishing between other gum bacteria, some of which do not produce slime upon it.

As there might be the possibility of checking the gum-flux of fruit trees by the application of saline manures, experiments were made with various salts which were added to the optimum medium. These, however, showed that there would be little hope of checking the gum-flux with any salt, excepting, perhaps, nitrate of potash. Upon a medium prepared according to the prescription detailed above, but without glycerin, 20 grms. of slime were obtained from 100 c.c. of agar. The addition of 0·2 per cent. of potassium nitrate reduced the yield to 8 grms., and larger percentages of salt had no further influence. The same reduction was obtained with 0·6 per cent. of sodium chloride, while double the quantity checked the growth of the bacterium.

In my work connected with the formation of gum in plants and the relationship between the gum and certain bacteria, I have always endeavoured to produce the typical bacterial product in the laboratory. This was not always capable of being done, but in the present instance the production of arabin and metarabin in the laboratory by *Bact. acaciæ* and *Bact. metarabinum*, both isolated from the tissues of trees, was a much more decided proof that the bacteria produced these gums in the plant than would have been their production in the plant after an infection with the bacteria. The proof was more decided, for the simple reason that we could not have been absolutely certain that the trees would not have developed gum-flux independently of the infection, possibly as the result of a previous or a subsequent accidental infection with the same or other organisms.

However, an infection experiment was made, but it was done with the idea of testing if the bacterium, isolated from a member of the *acaciæ*, could bring about a production of gum in one of the *Rosaceæ*. Peach trees, after having been infected with *Bact acaciæ*, developed gum-flux, but the gum which exuded was metarabin. This was rather a curious result. That the tree should have produced insoluble metarabin after an infection with the soluble arabin bacterium was unexpected. Some light was, however, thrown upon the matter by the bacteriological examination of the infected plant. In the tissues I found *Bact. acaciæ*, *Bact. metarabinum*, and forms intermediate between these two organisms. The peach tree had apparently altered, and was rapidly altering *Bact. acaciæ* into *Bact. metarabinum*, a process which, as I have already shown, could not be done in the laboratory. It is therefore evident that the host-plant is able to modify the gum-forming faculty of the bacterium, and that so profoundly that the acquired character is practically permanent. In the case of *Bact. metarabinum*, isolated from *Acacia penninervis*, the formation of metarabin had been maintained for two years, during which time the organism had been subcultivated in the laboratory. The influence of the host-plant upon the bacterium explains how the gums from certain species of trees are so constant in character, that from the fruit trees (*Rosaceæ*) being practically always the insoluble cerasin (metarabin), and that from certain *Acaciæ* being always the soluble arabin.

During the research I kept in view the possibility of gum being produced industrially, perhaps from the waste liquors in the manufacture of potato-starch or from molasses, but at present there seems to be little possibility of its being prepared from these substances. The gum is not readily formed in fluid media, and the agar medium appears to be a necessity for the production of the slime in quantity. Molasses acts as a complete food for the bacterium, and the addition of other nutrients is unnecessary. It does not, however, produce a maximum yield of slime, probably on account of its excess of saline matter. Speaking roughly, 20 parts of agar, with 20 parts of saccharose, 10 of glycerin, and 1 each of asparagine, tannin, and potassium citrate would yield 250 parts of slime, containing 7·5 parts of dry slime, or, say, 6 parts of gum. The cost of producing this small quantity of gum, in materials and labour, would be in excess of its value. We must therefore look at present to growing the gum in trees and augmenting the production by the infection of suitable kinds.

In this Journal (1902, 1381) appears a paper by Mr. Thos. Steel and myself upon gum levan, which is formed in solutions of saccharose, such as cane-juice, by the biochemical activity of *Bacillus levaniformans*. The organism is a comparatively large spore-forming bacterium, measuring 2 to 3 μ in length. I have found it frequently in plant tissues during the investigations connected with the vegetable gums, and it undoubtedly occurs widely distributed in the vegetable kingdom. It is not, however, the only organism that can form levan. In a sweet gummy exudate from a tree, *Eucalyptus Stuartiana*, I obtained *Bact eucalypti*, a small non-sporulating bacterium, 1 μ in length, which grew in solutions containing peptone, saccharose, and salts, producing the strong opalescence so characteristic of levan. It also degraded the saccharose to reducing sugars. Both gum and reducing sugars were produced in the same proportions and at the same rate as in the case of *Bac. levaniformans*, so that the table showing the composition of the nutrient saccharose medium during the cultivation of one bacterium would also apply to the other. Practically the same acids and subsidiary products were obtained. Butyric acid was the only exception, but it is probable that, had an older culture been examined, as was the case with *Bac. levaniformans*, that acid would have been found. One point noted in addition was that the acids in the nutrient media containing chalk were formed from the reducing sugars and not from the saccharose. The activity of the organism was tested upon saccharose, but the gum was formed naturally from raffinose, the manna of the eucalypt, with which the gum was mixed.

I have found a gum-forming bacterium frequently in vegetable tissues, and although I have not yet discovered a natural gum produced by it, yet there is every probability that such does exist. It was obtained first from the sugar cane, and then in the gum-resin of *Araucaria Cunninghamii*, the Moreton Bay pine. It probably has nothing to do with the production of the gum of the latter, which is undoubtedly arabin.

The organism produced slime readily upon the levulose-tannin medium already described, and the slime yielded a gum which became insoluble in water after it had been coagulated by alcohol. This property altered in time, for, when the bacterium had been subcultivated in the laboratory for two years, it was no longer converted into an insoluble form when dehydrated with alcohol. The gum mucilage made paper adhere firmly to glass, and when tested was found to react as follows: Basic and ammoniacal lead acetates gave curdy masses; ferric chloride produced a brownish clot; barium hydroxide thickened the mucilage; Schweitzer's reagent produced a gelatinous slime; dilute iodine gave a reddish tinge; while Fehling's solution gave no reaction; copper sulphate, followed by potassium hydroxide, produced a gelatinous blue precipitate, which coagulated to a curdy mass upon boiling. The other usual gum reagents gave no reactions.

The gum was easily hydrolysed to galactose by 5 per cent. sulphuric acid. It was, therefore, a galactan. In saccharose media the sugar was not inverted, and, besides the gum, there were produced ethyl alcohol, carbon dioxide, lauric, palmitic, succinic, acetic, and formic acids.

In the disease known as "gummosis," or gumming of the sugar-cane, the plants become sickly and eventually die as a result of the plugging of the large vessels of the vascular strings with a yellow gum or slime. With badly infected canes the gum exudes from the ends of the bundles when the canes are cut transversely. The gum has been named vasculin by Cobb, who saw bacteria in the fresh gum. His field experiments, in which the canes were infected with *gum*, were inconclusive.

From the gum that exuded from the cut ends of the vascular strings of a diseased cane, I separated a bacterium to which I have applied Cobb's name, *Bacterium vascularum*. It grew slowly upon ordinary glucose-gelatin, which it slowly liquefied, as hemispherical colonies of yellow slime. A quantity of the gum was grown upon cane-juice agar, and after purification portions were tested with the usual reagents. Precipitates were obtained with neutral, basic, and ammoniacal lead acetates, barium and calcium hydroxides, copper sulphate, and ferric chloride. A slimy voluminous precipitate or coagulum was given with alcohol. The natural gum, scraped from cut canes, was tested at the same time as the bacterial product, and the reactions were found to be identical. The bacterial gum as grown upon the artificial media was similar in appearance to the natural product. This is different from those gums that have been already recorded, but is explained by the fact that cane-gum, although it is popularly called a gum, is in reality a slime.

Mr. Thos. Steel had already done much work with the natural gum, and I have left to him the publication of its chemical nature.

A number of experiments were made with various nutrients to test their influence upon the production of slime. The product was not weighed like the arabin slimes, but the quantity was estimated visually as it appeared upon the surfaces of the agar slopes. This is not so good a method as by making use of the balance, but the yields were small in comparison with the arabin slime, and on this account the visual method seemed the better at the time. The bacterium grew well when peptone was present to the extent of from 0·1 to 0·5 per cent. Levulose, saccharose, and, to a less extent, dextrose were the only carbohydrates which favoured slime production. None was formed when glycerin, starch, dextrin, maltose, or lactose were the sources of carbon. With regard to salts, potassium phosphate was decidedly beneficial; all other salts were indecisive, with the exception of common salt, which prevented the growth of the bacterium. As sodium chloride is the only salt which acted as a poison, it is possible that it may be useful in checking the disease, the more especially as healthy crops of sugar-cane can be grown in soil containing anything under 1 per cent. But better than the use of preventives is the growth of varieties of cane insusceptible to the disease. With regard to the reaction of the medium, a faint acidity, equal to 0·01 per cent. of tartaric acid, was found to give the best result. This doubtless explains why the bacteria are to be found in the faintly acid juices of the large vessels of the vascular bundles, and not in the relatively highly acid cellular tissue, the juice of which has an acidity equal to 0·2 to 0·3 per cent. of tartaric acid. The optimum temperature was found to be 30° C.; no slime was formed at 37°. The production of the gum at the lower temperature, and not at the higher, explains why cold weather increases the prevalence of the disease. As no invertase is secreted by the bacterium, it cannot directly cause a degradation of the sugar in the cane.

Associated with a mould, a bacterium is found in the phenomenon which I have named the "red string of the sugar-cane." The bacterium produces a colourless slime from saccharose and levulose, but the mould when growing in the slime produces a red colour which becomes diffused throughout the bacterial product. The red slime fills up the large vessels of the vascular strings, producing a condition similar to that which is found in gummosis. It is, however, found only in some of the strings, and a general gummosis does not appear to be produced. The gum was obtained from the slime by the method employed in obtaining the bacterial arabin, and it was found to behave to reagents precisely like arabin. Upon hydrolysis it yielded galactose only, so that it may be called a pseudarabin. I have obtained the same gum from a yellow race of the bacterium isolated from the quince.

These instances of the formation of vegetable gums by bacteria are sufficient to indicate that *all* exuded gums have in all probability a bacterial origin. I would go further and say that until they can be shown to be otherwise, all vegetable gums and even mucilages are the products of bacteria.

ERRATUM.

In Part I. of this paper, this J., 1904, page 107, line 45, for *neutral* read *natural*.

DISCUSSION.

Mr. THOS. STEEL remarked that the different effects on the growth of the *Bact. Acaciæ* of tannins from various sources was most interesting and suggestive, particularly in the light of much that had recently appeared on the subject of tannins in the Society's journal. It was curious to find that succinic acid, contrary to what might be expected, acted as an accelerator in producing a growth of slime by the bacterium, while oxalic had an inhibitory effect. Were the acids experimented with in the free state or combined with a base? Another most interesting fact was the remarkable change produced in the character of the bac-rium by the host-plant, a bacterium which could not, so ar, be changed in artificial cultures, at once altering its form hen grown in the living tree. It was very curious to find ndoubtedly different species of bacteria producing a subance of the nature of gum levan; this was probably due the mode of attack on the sugar molecule being similar. e congratulated the author on having thrown so much ght on the origin of the vegetable gums.

Dr. G. Harker said that he was most struck perhaps by e fact that while levulose was easily converted into the m, dextrose was perfectly immune to the attacks of the cterium. It recalled the work of Emil Fischer on the eaking up of complex sugars by means of enzymes, in hich he showed how the polysaccharide, which could be nsidered as a chain of $C_6H_{10}O_5$ groups differing from one other in structure, might be broken up link by link only the right enzyme could be found to attack the last link. F. Armstrong (Trans. Chem. Soc., Dec. 1903) had also own how α-methyl glucoside could be converted under e influence of the enzyme maltase, into α-glucose, while methyl glucoside was converted by another enzyme, nulsin, into β-glucose. These forms were simply stereomeric. He asked Dr. Greig Smith how far the experients were of a quantitative nature. Had he established y relation between the amount of gum formed and the antity of sugar which disappeared? Also what tests had en made to prove that the gum obtained was the same in l cases?

The Chairman said that the marked differences shown by e action of dextrose and levulose seemed to point to a tarding influence of the aldehydic group over that of the tonic. The action of the tannins also indicated a difference structure. There were often several tannins in the same oup of plants, and no less than three distinct tannins were und in eucalyptus exudations alone. With regard to the tion of succinic acid, it seemed conclusive that nature did deavour to get rid of this acid when formed in plants, and this was shown by the deposition of large quantities of aluminium succinate in the trees of *Orites excelsa*. The acid in this tree was formed by the oxidation of the normal butyric acid occurring in the sap, and was perhaps brought about by bacterial agency. The economic results likely to eventuate from the author's researches were likely to be far-reaching.

Dr. Greig Smith said, in reply to Mr. Steel, that the acids were added as salts of potash generally, but as the cultures and the media were always faintly acid, some of the free acid would always be present. With regard to the question of Dr. Harker, the relation between the gum produced and the sugar that had disappeared was not determined, and no tests were made to see if the gum was the same in all cases. It was possible that the constitution of the complex gum molecule might vary according to the sugar employed, but as the cultural characters of the organism were constant with a particular sugar, it was probable that the gum was always the same when that sugar was used. A marked difference in the chemical constitution as evidenced by a difference in the solubility of the gum would alter the character of the bacterial colonies. This had been noted with a certain gum-forming organism, *Bact. Atherstonei*, which altered its cultural characters in the laboratory, showing the transition from an insoluble to a soluble gum. The point raised by the Chairman concerning succinic acid was interesting. Delbrück (this J., 1903, 813) said that small quantities of toxic substances stimulated yeast cells, but if this were the case why should not lactates and acetates have behaved like succinates in the case of *Bact. Acaciæ?* One could always infer the behaviour of substances upon the bacterial cell from the action upon the cell aggregates or higher plants, for it had been shown by Gabritschewsky (Centralbl. f. Bakt. Orig., 32, 256) that calcium was not required by bacteria, and that therefore oxalic acid had no injurious influence upon them. Its toxicity for the higher plants was admitted.

—PLANT, APPARATUS, AND MACHINERY.

English Patents.

frigerating Machines; Carbonic Anhydride ——. F. Windhausen and F. Windhausen, jun., Berlin. Eng. Pat. 17,040, Aug. 5, 1903.

e machine is of the counter-current type described in g. Pat. 9084 1901 (this J., 1902, 760), in which carbon dioxide liquefied in the condenser passes through a regulating valve into an intermediate receiver, &c. In the present machine, this receiver, containing spaces separated by temperature-exchanging surfaces, has two tubes or coils, one within the other, into one of which a part of the liquefied carbon dioxide passes to evaporate at a higher pressure and temperature than obtains in the evaporator, and lower than in the condenser, whereby the other portion of the liquefied carbon dioxide passing through the other tube or coil, is cooled on its way to the evaporator. (Compare also the two following abstracts.)—E. S.

Refrigerating Machines; Carbonic Anhydride ——. F. Windhausen and F. Windhausen, jun., Berlin. Eng. Pat. 17,040A, Aug. 5, 1903.

IN machines of the type described in the preceding abstract, having an intermediate receiver, there is, according to the present invention, a double-acting compressor, the end spaces of which are connected by a channel, to which a delivery tube is attached by means of a pressure or delivery valve; and there is a movable piston or plunger for altering the volume of vapour drawn in from the intermediate receiver.—E. S.

Refrigerating Machines; Carbonic Anhydride ——. F. Windhausen and F. Windhausen, jun., Berlin. Eng. Pat. 17,040B, Aug. 5, 1903.

IN a carbon dioxide refrigerating machine, of the type described in the two preceding abstracts, a combination is made of two compressors, so connected that one of them is double-acting for the vapours from the evaporator, whilst in the other, vapours drawn in from the evaporator are compressed at one end to about the pressure in the intermediate receiver, and are then passed to the other end, where they are compressed, together with the vapours from the intermediate receiver, to the pressure of the condenser into which they are passed.—E. S.

Distilling, Evaporating, or like Apparatus; Manufacture of ——. A. Jouve, Lyon, France. Eng. Pat. 21,765, Oct. 9, 1903.

SEE Fr. Pat. 330,666 of 1903; this J., 1903, 1086.—T. F. B.

Evaporating Liquors; Process of ——. H. H. Lake, London. From E. N. Trump, Syracuse, N.Y., U.S.A. Eng. Pat. 28,572, Dec. 29, 1903.

SEE U.S. Pat. 743,352 of 1903; this J., 1903, 1285.—T. F. B.

Vacuum Pans. H. H. Lake, London. From E. N. Trump, Syracuse, N.Y., U.S.A. Eng. Pat. 28,593, Dec. 29, 1903.

SEE U.S. Pat. 743,351 of 1903; this J., 1903, 1285.—T. F. B.

Safety Devices for Preventing Explosions in the Blast Pipes of Furnaces. P. Trapp, Falkirk, Scotland. Eng. Pat. 23,785, Nov. 3, 1903.

A FLAP valve is arranged against a seating in the upper part of the horizontal portion of the blast pipe in such a way that so long as the pressure of the blast is maintained, the valve is closed. Should, however, the blast fail, the flap drops, shutting off the blast pipe and allowing any back pressure of gas from the furnace to escape into the air.—W. H. C.

Mixers. J. F. Gandolfo, Du-Buque, Iowa, U.S.A. Eng. Pat. 3922, Feb. 16, 1904.

Two pairs of oppositely rotating, curved blades work in a bowl-shaped mixing pan, and are so arranged that they give somewhat in case of meeting any obstruction.
—W. H. C.

Furnaces; Heating ——. R. McAulay, Dumbarton, Scotland. Eng. Pat. 6786, March 21, 1904.

THE fuel- and air-ports are so arranged that the fuel gases from the producers are thoroughly mixed with the heated air from the regenerators, and are projected downwards towards the centre of the hearth.—W. H. C.

Grinding Mill; Improved ——. F. Stark, Ludwigshafen, Germany. Eng. Pat. 15,746, July 15, 1904.

A VERTICAL grinding disc rotates against a vertical grinding face, both having specially arranged cutting teeth. Means are provided for feeding the material to be ground, for renewing the grinding faces, and for regulating the feed.
—W. H. C.

Kilns and Driers; Combined Rotary ——. C. A. Matcham, Allentown, Pa., U.S.A. Eng. Pat. 16,588, July 27, 1904. Under Internat. Conv., Jan. 11, 1904.

SEE U.S. Pat. 755,513 of 1904; this J., 1904, 435.—T. F. B.

UNITED STATES PATENTS.

Separator; Centrifugal Liquid ——. J. A. Dahlquist and C. L. Holm, Assignors to Nya Aktiebolaget Radiator, Stockholm. U.S. Pat. 770,679, Sept. 20, 1904.

SEE Eng. Pat. 5716 of 1902; this J., 1902, 1464.—T. F. B.

Drying Apparatus; Tubular ——. M. Salzmann, Magdeburg-Buckau, Germany. U.S. Pat. 770,823, Sept. 27, 1904.

THE apparatus consists of a revolvable casing, inclined to the horizontal, containing two series of tubular passages, connected at the middle portion of the casing by an intermediate chamber with perforated sides. The tubes are surrounded by steam-jackets with an axial steam-supply pipe. Material supplied by suitable means to one series of tubular passages falls into the intermediate chamber, where it is pulverised by a roller, and then passes through the other series of passages into the discharge-trough.
—L. F. G.

Treatment [Drying] of Material; Apparatus for Continuous ——. W. H. Gesner, New York, Assignor to Caribbean Manufacturing Co., New York. U.S. Pat. 771,141, Sept. 27, 1904.

MATERIAL is delivered from a mixing chamber through a normally closed opening to an inclined casing surrounded by a steam-jacket, and containing a suitably rotated hollow shaft and hollow screw through which steam circulates.
—L. F. G.

Mixer. F. A. Hetherington, Indianapolis, Ind. U.S. Pat. 770,855, Sept. 27, 1904.

ONE of the end bearings in a horizontal mixer is removable. The mixer blades are attached to a hollow shaft which fits as a sleeve over the polygonal middle portion of the rotating shaft journalled in the above bearings, so that the removable bearing can be removed, the rotating shaft withdrawn axially, and the hollow shaft with the mixer blades withdrawn transversally from the casing of the mixer.
—L. F. G.

II.—FUEL, GAS, AND LIGHT.

Bunsen Flame; Water-Gas Equilibrium in the ——, *and the Chemical Determination of Flame Temperatures.* F. Haber and F. Richardt. J. f. Gasbeleucht., 1904, **47**, 809—815, 833—837, 861—869, and 877—880.

A CRITICAL review of past work on the subject of gas flames is first given, and then an account of the authors' experiments and results. The gases evolved from the inner cone of the Bunsen flame (compare this J., 1891, 992, 993) were quantitatively examined, and the relations between the concentrations of the four substances, carbon dioxide, hydrogen, carbon monoxide, and steam, were determined. It was found that in the green inner cone the water-gas equilibrium, $CO + H_2O \rightleftarrows CO_2 + H_2$, is produced very rapidly. The reaction-constant of the system was, within the limits of experimental error, the same as that calculated from Hahn's results (this J., 1903, 1038) for the temperature of this zone. After the withdrawal of the gaseous mixture from the combustion-zone and during the passage through the cooling zone, the equilibrium was not displaced to any notable extent. It is concluded from the experiments that the same result for the temperature of the inner combustion-zone is obtained by calculation from the composition of the products of combustion by the aid of the reaction-isochore of the water-gas equilibrium, as by thermo-electric measurements. The same numbers are also obtained by calculation from the heats of combustion and specific heats (Mallard and Le Chatelier) of the individual gases.—A. S.

Water-Gas Process ; Theory of the ——. v. Jüptner. Chem.-Zeit., 1904, **28**, 902—903.

An attempt is made to apply the principles of physical chemistry, especially Guldberg and Waage's equilibrium law, to the reactions concerned in the production of water-gas. The author's conclusions are that in order to obtain the best results : (1) The pressure must not be too high ; (2) the temperature must not fall below 800°—900° C. ; (3) with pressures up to four atmospheres the temperature should not exceed 900°—1000° C. These conditions hold for the ideal state, *viz.*, when there is equilibrium in the generator. If there be not equilibrium, the composition of the gas will alter on its way through the generator, and its final composition will depend on the height of the coke-column, the velocity of the current of steam, and the temperature. It is of great practical importance to introduce the steam at the coldest part of the generator, so as to avoid the reaction $2CO = C + CO_2$ in the cooler parts.—J. T. D.

Aerogen Gas. Stern. Chem.-Zeit., 1904, **28**, 902.

Aerogen gas is prepared by driving air, by means of clockwork or other power, through a meter, on the drum axis of which is a hydraulic arrangement for introducing nto the stream a regulated quantity of light petroleum spirit. The inflammable mixture so obtained is burned under a mantle, and gives a light of 50 candles for 100 hours at a cost of a shilling. As the mixture is made at the ordinary temperature there is no condensation ; there is also practically no danger of explosion ; and the gas is not poisonous. It can be used for heating and for driving small motors, as well as for lighting, and its cheapness and the implicity of its manufacture make it most suitable for mall private gas installations.—J. T. D.

Sulphur in Coal ; Photometric Determination of ——. S. W. Parr and C. H. McClure. XXIII., page 1000.

English Patents.

Coke ; Manufacture of ——. J. J. C. Allison, Butterknowle, Durham. Eng. Pat. 24,670, Nov. 13, 1903.

Non-coking coals are powdered, mixed with pitch, tar, or ther bituminous matter, formed into pellets by first melting nd then dropping them into water from a height. They re finally carbonised in coke-ovens.—L. F. G.

Coal ; Method of Treating —— *for Coking Purposes.* W. J. Patterson, Pittsburg, Penn. Eng. Pat. 17,580, Aug. 12, 1904.

he coals are stored in one entire mass, as they come from e washers. This mass is allowed to stand until the water as percolated downwards, carrying the sludge with it, and e coal is then removed from the top of the mass. —L. F. G.

Water- or like Gas from Small and Dust Coal ; Apparatus for Generating ——. L. Wesselsky, Dresden, Germany. Eng. Pat. 19,220, Sept. 7, 1903.

o prevent the crushing together, and consequent defective urning, of the fuel, which commonly occurs when coal dust nd "smalls" are used in the production of water-gas, means re provided for lessening the pressure of the fuel on the rate, so that the combustible as consumed may by its own eight fall freely on to the grate. A horizontal supporting oor or conical body, may be arranged above the grate, in e upper part of the generator, to support the main superincumbent mass of fuel, an annular space being left round e support to enable the fuel to descend as required : in his case the grate is of inverted conical form, and is built p of rings, suitably spaced apart, a series of converging eps being thus provided for the fuel to rest upon. ifferent forms of apparatus, embodying the same principle, e described and claimed.—H. B.

Gas Retorts. H. Gielis, Berlin. Eng. Pat. 24,068, Nov. 5, 1903.

E Fr. Pat. 338,684 of 1903 ; this J., 1904, 653.—T. F. B.

Gas Producers. L. Wilson, Glasgow. Eng. Pat. 27,823, Dec. 18, 1903.

See U.S. Pat. 762,568 of 1901 ; this J., 1904, 715.—T. F. B.

Combustion Chambers of Steam Boilers and the like for the Manufacture and Burning of Gas ; Process and Apparatus in connection with the ——. P. Stiens, Rotterdam. Eng. Pat. 14,971, July 4, 1904.

The gas generator is arranged within the combustion chamber (of the steam boiler or the like) in which the gas produced is to be burnt, so that the generator itself is maintained at the requisite temperature. The gas generator consists of a chamber divided by a horizontal grate, or perforated partition, into two compartments. Upon the grate rests an incandescent layer of reducing material, such as retort carbon, iron, or the like, and into the space above this a mixture of water, petroleum, and air is injected. The gas produced passes down through the reducing material and is discharged into a number of perforated pipes surrounding the generator ; it then burns on escaping through the perforations, heating both the boiler and the generator itself. In starting the apparatus, air and petroleum alone are admitted to the generator, until the reducing layer has become incandescent.—H. B.

Gas and Air ; Apparatus for the Production of Mixtures of ——. A.-G. für Selas-Beleuchtung, Berlin. Eng. Pat. 15,238, July 22, 1904. Under Internat. Conv., Oct. 21, 1903.

This specification relates to improvements, with regard to the arrangement of valves described in Eng. Pat. 17,788 of 1903 (this J., 1904, 859).—H. B.

Gas, Poor, Free from Tarry Matters ; Apparatus for Producing ——. L. Boutillier, Paris. Eng. Pat. 16,763, July 29, 1904. Under Internat. Conv., Aug. 25, 1903.

The producer described in Eng. Pat. 7979 of 1904 (this J., 1904, 653) is improved by providing the vertical distillation-retort, at its upper end, with a pipe for leading off the liberated hydrocarbons, the said pipe discharging the latter underneath the grate, to mingle with the air and steam supplies and pass up through the incandescent fuel.—H. B.

Illuminating Gas ; Method of Purifying —— [*from Carbon Bisulphide*]. A. J. Boult, London. From C. S. Lomax, Everett, Mass., U.S.A. Eng. Pat. 14,445, June 27, 1904.

The cooled gas, freed from tar and ammonia, but not necessarily from carbon dioxide, is passed through a purifier containing "chemically divided" sulphur (preferably spent oxide heavily charged with free sulphur), impregnated with an amine (preferably commercial aniline). The sulphur acts as a catalytic agent, in the presence of which the aniline reacts upon the carbon bisulphide in the gas, to form sulphocarbanilide and sulphuretted hydrogen, according to the equation $2C_6H_5NH_2 + CS_2 + S = CS(C_6H_5NH_2)_2 + H_2S + S$. The sulphuretted hydrogen is removed from the treated gas as usual. The aniline may, if desired, be mixed with a suitable neutral solvent to aid in disseminating it throughout the sulphur. When the purifying material becomes exhausted, it is re-impregnated with aniline, when it is ready for further use.—H. B.

Incandescent Gas Light ; Method of Increasing the Intensity of ——. H. H. Lake, London. From Ges. für Flüssige Gase Raoul Pictet and Co., Berlin. Eng. Pat. 20,556, Sept 24, 1903.

Various forms of burner are described in which separate concentric supplies of combustible gas, and of air or oxygen (giving, if burnt, a non-luminous flame), are admitted to the interior of a mantle, or are projected, the one along the interior surface of the mantle and the other along the exterior surface, in order to produce a very high temperature. In other modifications, one mantle is surrounded concentrically by another, and oxygen (or combustible gas) is admitted into the interior of the inner mantle, whilst combustible gas (or oxygen) or concentric streams of oxygen and combustible gas, are admitted into the annular space between the two mantles. (Compare Fr. Pat. 322,601; this J., 1903, 358.)—H. B.

United States Patents.

Coal Briquettes; Process of Forming ——. E. H. Larkin, St. Louis, Mo. U.S. Pat. 770,503, Sept. 20, 1904.

About 3 per cent. of crude petroleum is mixed with 97 per cent. of coal slack, and to this mixture starch paste is added in the proportion of about 2 lb. of the paste to each 100 lb. of the petroleum-treated slack, the whole mass being finally pressed into blocks.—W. C. H.

Coal; Method of Treating and Handling —— *for Coking Purposes.* W. J. Patterson, Pittsburg. U.S. Pat. 770,778, Sept. 27, 1904.

See Eng. Pat. 17,580 of 1904; preceding these.—T. F. B.

Gas Producers, Furnaces, &c.; Apparatus for the Continuous Feeding and Distributing of Material in ——. C. W. Bildt, Stockholm. U.S. Pat. 770,491, Sept. 20, 1904.

See Eng. Pat. 9376 of 1904; this J., 1904, 709.—T. F. B.

Gas; Process of Manufacturing ——. A. Bougault, Assignor to Soc. Franç. de Constructions Mecaniques (Ancien. Établ. Cail), Paris. U.S. Pat. 770,554, Sept. 20, 1904.

See Eng. Pat. 12,506 of 1903; this J., 1903, 1079.—T. F. B.

French Patents.

Heating Appliances, the Heat of which is Produced by a Chemical Reaction. Hunger and Uhlig. Fr. Pat. 342,915, May 6, 1904.

A cylindrical metal vessel with a conical bottom is filled with lime or caustic soda, and a metal funnel containing water or vinegar placed inside, resting on the rim joined to the vessel. The funnel is provided with a hole near its apex, and with a metal cover pierced by a hole, whilst a hole is also pierced in the top of the cylindrical vessel. A strip of steel passes over the various holes so as to close them, and projects through the cover. On winding the strip round a key, the holes can be opened and the chemicals allowed to react.—L. F. G.

Drying Oven, Continuous ——*; for Combustible Materials and the like.* P. H. Pute-Cotte de Renéville. Fr. Pat. 343,089, May 11, 1904.

The oven is especially designed for the drying of briquettes, and consists of an upright square tower containing a set of inclined shelves arranged zigzag fashion. The material is fed in at the top, and, whilst sliding down the shelves is dried by a current of hot gases passed in from a furnace. In order to keep the tower hermetically closed, the material is fed into a conical hopper divided into two vertical compartments, which rotates slowly round an axis, the material being discharged alternately from each compartment, as the latter passes over a hole situated in the cover of the tower. —L. F. G.

[*Gas Manufacture.*] *Method for Completely Distilling Coal, and Apparatus for Use therein.* H. W. Woodall and A. M. Duckham. Fr. Pat. 313,091, May 1, 1904. Under Internat. Conv., July 27, 1903.

See Eng. Pat. 16,497 of 1903; this J., 1904, 744.—T. F. B.

Tissue for Incandescent Gas Mantles. H. Loewenthal. Fr. Pat. 338,931, July 18, 1903.

Fabrics for the manufacture of mantles are made of threads of "compounds of cellulose soluble in water."—H. B.

Wicks of Artificial Silk for Candles. V. Plersdorff. Fr. Pat. 343,086, May 11, 1904.

Claim is made for the use of twisted or plaited wicks of artificial silk, and especially of the waste material. It is stated that such wicks absorb fat more readily than cotton wicks, and burn without carbonisation.—C. A. M.

Candles, Lamp Oils, Edible Fats, Unguents or Pomades, Soaps, &c.: Manufacture of ——. C. Dreymann. Fr. Pat. 343,158, May 14, 1904. XII., page 988.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

Petroleum; A Radio-active Gas from Crude ——. E. F. Burton. XXIV., page 1003.

English Patents.

Tar; Process for Treating —— *for the Elimination of Water and Recovery of Volatile Products therefrom* W. Oppenheimer and T. O. Kent, London. Eng. Pat. 12,696, June 5, 1903.

See Fr. Pat. 334,472 of 1903; this J., 1904, 55.—T. F. B.

Peat and Turf; Treating [*Distilling*] —— *to obtain valuable Products.* T. R. Hanmer, Manchester. Eng Pat. 24,326, Nov. 10, 1903.

Air-dried turf, peat, or bog is heated in a retort, and the products of distillation are separated and collected for the making of wood spirit, acetic acid, tar, and charcoal. The gas is to be utilised for heating the retorts, or for "burning purposes."—L. F. G.

United States Patent.

Ammonia-Water Apparatus. H. A. Abendroth, Berlin. U.S. Pat. 771,031, Sept. 27, 1904.

The apparatus is provided with superposed cells having covered openings or doors in the side, and near these openings, overflow pipes supported in the bottoms of the cells. These overflow pipes are made in sections, telescoping one in the other. Compare U.S. Pat. 712,891 of 1902; this J., 1902, 1526.—E. S.

French Patents.

Tar; Process of Solidifying ——. S. G. Coulson. Fr Pat. 343,691, June 4, 1904. Under Internat. Conv. Jan. 28, 1904.

See Eng. Pat. 2102 of 1904; this J., 1904, 780.—T. F. B.

Hydrocarbons, such as Crude Petroleum and Petroleum Oils of all Densities; Process for Refining Commercial ——. H. P. J. B. Goffart. Fr. Pat. 342,588, April 23 1904.

The hydrocarbon is treated with a metallic powder, such as zinc, which acts catalytically and at the same time as a reducing agent, decomposing the colouring matter and reducing the unsaturated hydrocarbons, which are stated to be generally more highly coloured than the saturated compounds. For example, petroleum of sp. gr. 0·835 to 0·840 is refined by keeping it in contact with powdered zinc placed on an asbestos filter contained in a jacketed funnel a temperature of about 70° C. being maintained for five hours. Correspondingly higher temperatures and longer treatment are required for heavier oils, and very viscous oils are advantageously treated under pressure.—T. F. B.

Petroleum or other Mineral Oils; Process for Solidifying —— *with a view to their Application for Heating* V. J. Kuess. Fr. Pat. 343,545, May 30, 1904. Under Internat. Conv., Nov. 6, 1903.

See Eng. Pat. 7481 of 1904; this J., 1904, 817.—T. F. B.

IV.—COLOURING MATTERS AND DYESTUFFS.

Rosanilines; Nomenclature of ——. J. Schmidlin. Comptes rend., 1904, **139**, 504—505.

HE author proposes to take as the basis of his nomencla-ure the real base of Parafuchsine, $(C_6H_4NH_2)_2:C:C_6H_4:NH$, hich he terms rosaniline. The corresponding carbinol is esignated rosanilinecarbinol, whilst Parafuchsine would be osaniline hydrochloride. The homologues of the base of arafuchsine are called rosamonotoluidine, rosaditoluidine, nd rosatritoluidine, containing one, two, and three toluidine uclei respectively. The leuco bases are called leucaniline, ucomono-, leucodi-, and leucotritoluidine. Thus the orresponding terms in the author's nomenclature and that f Baeyer (this J., 1904, 862) are:—

Baeyer.	Schmidlin.
Diaminofuchsonimine.	Rosaniline.
Diaminodimethylfuchsonimine.	Rosaditoluidine.
Diphenylaminofuchsonphenylimine.	Triphenylrosaniline.

—E. F.

etrahydroxycyclohexane - Rosanilines: a New Class of Colourless Derivatives. J. Schmidlin. Comptes rend., 1904, **139**, 506—507.

IE salts of rosaditoluidine and rosatritoluidine are very luble in strong hydrochloric acid. If the solution be lowed to stand for 24 to 48 hours, the liquid becomes colorised and transformed into a mass of perfectly white ystals. These are extremely soluble in water. They are ible at the ordinary temperature. At 50° C. they lose mols. of water, forming black trihydrochlorides, which solve in water to a red solution. On heating the colour-s compounds to 100° C. they form characteristic green agenta homologues.—E. F.

rbinol Salts and Cyclohexane-Rosanilines: Phenomena of Decolorisation. J. Schmidlin. Comptes rend., 1904, **139**, 521—524.

IE fact that the colourless salts of tetrahydroxycyclo-xane-rosaniline lose 4 mols. of water on heating, with rmation of black compounds (see preceding abstract) is garded as a direct proof of the quinonoid constitution of saniline salts, thus:—

$$H_4NH_3Cl)_2CH(OH)C<\begin{matrix}CH(OH).CH_2\\CH(OH).CH_2\end{matrix}>C(OH)NH_3Cl\rightleftarrows 4H_2O+$$

Colourless salt.

$$(C_6H_4NH_3Cl)_2C:C<\begin{matrix}CH:CH\\CH:CH\end{matrix}>C:NH_2Cl$$

Black salt.

t is found that when solutions of rosaniline salts are olorised by addition of mineral acid, heat is evolved; o, a solution of rosanilinecarbinol in acetic acid loses its our, but absorbs heat, approximately the same amount as volved in the former reaction. Hence it is concluded t these colourless compounds are salts of rosaniline-binol, $C(OH)(C_6H_4NH_2.HCl)_3$. The only salt of this ss which could be obtained in a fairly pure state was trihydrochloride of hexamethylrosanilinecarbinol; it is eedingly hygroscopic, turning black on exposure to ist air, and giving a highly coloured solution in cold er. When the carbinol salts are neutralised by acid, t is evolved, the benzene nuclei being converted into ahydrobenzene nuclei; these cyclohexane salts, on atment with acid, lose 4 mols. of water (heat being orbed), and are converted into the quinonoid rosaniline s.—T. F. B.

Sulphur Dyestuffs; Study of the ——. P. Friedlaender and F. Mauthner. Z. Farben- u. Textil-Ind., 1904, **3**, 333—337.

The method of study adopted by the authors consisted in the preparation of simple sulphur-containing dyestuffs synthetically, in order that from a study of their properties conclusions might be drawn as to the composition of the more complicated commericial products. As a starting point, use was made of aromatic compounds which contain amino or hydroxy groups. These compounds can, in many cases, be easily "sulphurised" either by boiling with sodium polysulphide solution or by other means. The number of sulphur atoms entering the molecule depends on the conditions. As a rule, in "alkaline sulphurising," the sulphur takes up the ortho position to the amino or hydroxy groups, and the o-aminomercaptans and o-hydroxymercaptans obtained, must be looked upon as the chief components of the dyestuff formation. If the reaction be carried further, these primary mercaptans change rapidly, and condensations of various kinds take place, by preference thiodiphenylamine derivatives being formed from simple benzene derivatives. The sulphur which enters into the rings of these compounds appears not to be affected by sodium sulphide; the solubility of the sulphide dyestuffs must therefore be due to the presence of sulphur in other forms of combination probably as –SH groups or bisulphides, which latter are easily changed by sodium sulphide into soluble mercaptans. A sulphide dyestuff should fulfil the following conditions:—(I.) It should have a molecule with one or more chromophor groups. (II.) It should have bisulphide groups in the molecule, which cause it to be soluble in sodium sulphide with formation of –SH groups, this reduced body being reconverted into the original substance during the dyeing process. (III.) It should have the property, not necessarily following from I. and II., of dyeing unmordanted cotton direct from sodium sulphide baths. The authors have prepared a large number of dyestuffs containing sulphur which answer the above conditions entirely or in part.

Azo Dyestuffs containing Sulphur.—o-Dihydroxydiphenylbisulphide was prepared by pouring a solution of potassium xanthate into diazotised o-aminophenol. The bisulphide combines with diazotised naphthionic acid in alkaline solution. The free colour-acid forms yellowish-brown needles very slightly soluble in water. The formula is $SO_3H.C_{10}H_6.N:N.C_6H_3(OH)S.S(OH)C_6H_3.N:N.C_{10}H_6.SO_3H$. Alkalis give easily soluble salts. Sodium sulphide colours it violet, slowly in the cold and quickly on heating, but the colour goes back on exposure to the air, the bisulphide group being split off and an azo derivative of thiopyrocatechol formed. In this case the attraction of the fibre for the sulphur compound is practically no greater, either in alkaline or in sodium sulphide solution, than it is for the combination of naphthionic acid and phenol, so the sulphur has here no influence on the dyeing properties. The compound from benzidine and 1 mol. of dihydroxydiphenylbisulphide is, on the contrary, a direct-dyeing cotton dyestuff. The compound from 1 mol. of benzidine, 1 mol. of α-naphthylamine, and 1 mol. of dihydroxydiphenylbisulphide is almost insoluble in alkalis, and is only dissolved very slightly by sodium sulphide, so that the presence of the bisulphide group here is not enough to make the large molecule soluble enough for use in dyeing.

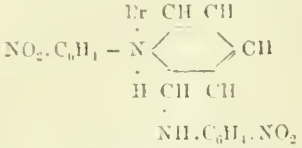
Quinone-imine Dyestuffs containing Sulphur.—The dyestuff produced by the action of diaminodiphenylbisulphide on gallocyanine has no affinity for the cotton fibre, but dissolves in sodium sulphide solution. Diaminodiphenylbisulphide reacts on quinizarin in the presence of acetic and boric acids. The leuco body formed at first oxidises rapidly to a dark blue insoluble dyestuff, which can be crystallised from ethyl benzoate and quinoline, and has apparently the formula—

$$C_6H_4<\begin{matrix}CO\\CO\end{matrix}>C_6H_2<\begin{matrix}NH.C_6H_4.S.S.C_6H_4.NH\\NH.C_6H_4.S.S.C_6H_4.NH\end{matrix}>C_6H_2<\begin{matrix}CO\\CO\end{matrix}>C_6H_4$$

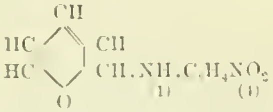
The dyestuff is not dissolved by alkaline sodium sulphide, but dissolves in alkaline hydrosulphite to form an indigo-like vat with a blue bloom, which dyes cotton a fast bluish grey. The sodium sulphide is not strong enough to make it soluble, and the hydrosulphite does so owing to the fact that it reduces the carbonyl groups as well.—A. B. S.

Pyridine Dyestuffs. W. König. J. prakt. Chem., 1904, 70, 19—56.

a-p-Nitrophenylamino-p-nitrophenyldihydropyridonium bromide—



a compound probably existing also in the tautomeric form $NO_2.C_6H_4.NH(HBr).CH:CH.CH:CH.CH:N.C_6H_4.NO_2$ is obtained by the action of cyanogen bromide on a mixture of pyridine and *p*-nitraniline dissolved in absolute alcohol. It forms bluish-red plates, m. pt. 149° C., or dark blue needles; is insoluble in water, ether, and benzene, moderately soluble in alcohol and acetic acid with a pink colour and yellowish-green fluorescence, and easily soluble in pyridine. It dyes silk from an alcoholic solution a pink colour which is very fugitive to light. Concentrated hydrochloric acid decomposes it, according to the conditions of reaction, into either *p*-nitrophenylpyridonium chloride or tetrachlorohydroquinone. Sodium carbonate, at the ordinary temperature, has no action upon it. Caustic soda, under the same conditions, precipitates a red compound, which, on the further addition of the reagent, becomes in turn brownish-red and dull purple. On heating with this reagent, the compound is decomposed into a substance which has not been identified, but which has the characteristic odour of, and appears, in fact, to be crotonaldehyde, anhydroglutaconic-aldehyde-*p*-nitraniline, or, as it is proposed to term it, *a-γ*-nitrophenylaminopenfurane—



being formed as an intermediate product. Bromine acts upon the dyestuff, forming dibromo-*p*-nitrophenylpyridonium perbromide, which, on boiling with acetic acid or acetone, is resolved into 2.6-dibromo-4-nitrophenylpyridonium bromide. The isomeride of the above dyestuff, prepared from *m*-nitraniline, of m. pt. 167° C., dyes silk in an orange colour with a faint yellowish-green fluorescence. The analogous dyestuffs, obtained from *o*- and *m*-toluidine and *o*- and *p*-anisidine, dye silk in orange, orange salmon-pink, and pink colours respectively. The compound (m. pt. 175° C.) derived from *p*-aminodimethylaniline dyes silk and wool in violet shades resembling those yielded by Crystal Violet. Ammonia and caustic soda change the colour of the aqueous and alcoholic solutions of this dyestuff to pale yellow, the original colour not being restored by the addition of acids.—E. B.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

Cotton from Trinidad. Bull. Imp. Inst. (Suppl. to Boar of Trade J.), 1904, 2, 173.

The cotton is known locally as "Creole," or native cotto and appears to be a short-stapled or "Upland" variet The sample examined was of a pale cream colour, well cleane rather rough to the touch, and fairly strong. The lengt of the staple was 1·2—1·4 ins., which is a little abo the average (1·1 in.) for American "Upland" cotto Commercially it would be worth 8½*d*.—9*d*. per lb. "U land" cotton is stated to be better suited to the Trinida climate than "Sea Island" cotton.—A. S.

Fibres from Southern Rhodesia. Bull. Imp. Inst. (Supp to Board of Trade J.), 1904, 2, 168—169.

Sisal Hemp.—The sample was stated to have been deriv from a species of *Agave*. It consisted of soft, fine fibre, good colour, well cleaned, and fairly strong; average lengt of staple, 33 ins. It is said to resemble Mauritius hen rather than Sisal hemp, and is worth 32*l*.—34*l*. per to (See also this J., 1903, 1192.)

Banana Fibre.—The specimen consisted of a somewh soft fibre, of a dull, pale brown colour, of fair strengt it was stronger and more even than is usually the case wi banana fibre; average length of staple, 27 ins. It is wor 25*l*.—26*l*. per ton. (See also this J., 1903, 737.)

Pineapple Fibre.—This consisted of very fine, whit well-cleaned fibre, strong but very short; average lengt of staple, 11 ins. If the fibre could be obtained of great ength it would be worth 30*l.*—40*l.* per ton. Pineapple ibre is stated to be used in India and China as a substitute or silk, for mixing with wool or cotton, and in the manu-acture of lines and thread. In the Philippines it is used or the preparation of the fabrics called "piña" and rengue."

Baobab Tree Fibre.—The sample consisted of the bark f the tree in an unprepared state. The soft inner bark vould probably be worth 4*l.*—5*l.* per ton. The fibre was sed some years ago for the manufacture of strong, light-oloured wrapping papers, and was then sold at 8*l.*—10*l.* er ton.—A. S.

Mercerising Industry; Studies on the ——.

F. J. G. Beltzer. Monit. Scient., 1904, **18**, 732—748.

his is a summarised account of the process of mercerising, nd treats the subject under the following headings:—Pre-minary treatments (gas-singeing, scouring, bleaching); ercerising liquids (alkaline, acid, and neutral); measure-ent of the degree of mercerising; mercerising apparatus, iving a general description of the various types of ma-hines in use; mercerising threads before being made into keins; dyeing mercerised cotton; examination of the rilliancy of mercerised cotton; mercerising fabrics; gas-ngeing mercerised dyed fabrics; examination of mercerised brics; mercerising ramie. The article concludes by giving general idea of the cost of the various stages of the process, cluding the cost of labour.—T. F. B.

otton; Weakening of —— by Acids under the Influence of Hot Air and Steaming.

A. Scheurer. Bull. Soc. Ind. Mulhouse, 1904, **74**, 211—219.

XPERIMENTS were made on the effect of oxalic, lactic, rtaric, citric, thiocyanic, *o*-, *m*-, and pyrophosphoric and osphorous acids on cotton under the influence of dry and oist heats. Solutions of oxalic acid containing 10 and grms. per litre were used, and solutions of the other acids equivalent strength. Thiocyanic acid had the greatest fect on the tensile strength of the cotton in a dry atmos-here at 40—50° C., the stronger solution causing the nsile strength to fall to less than half its original value ter 72 hours; the effect of thiocyanic acid and steam is so nall as to be negligible. Meta- and pyrophosphoric acids, the stronger solutions, caused a reduction of about one-ird of the tensile strength, both after three days hot-air eatment and after one hour's steaming. The action of osphorous and oxalic acids was somewhat less, the reduc-on being from 25 to 27 per cent. in either case. Lactic, thophosphoric, tartaric, and citric acids, in the order med, had still less effect on the tensile strength of the tton, the reduction lying between 10 and 20 per cent. he addition of glucose to the printing mixture containing alic acid diminished the destructive action of the acid der the influence of hot air or steam to a considerable tent, particularly in the former case.—T. F. B.

ordant Theories and the General Working of Mordanting with Primary Metallic Mordants.

P. Heermann. Färber-Zeit., 1904, **15**, 284.

heory of Dyeing; Contribution to the ——.

E. Knecht. Ber., 1904, **37**, 3479—3484.

OM a series of determinations of the amounts of dyestuff ken up by wool in dyeing with a number of acid dyestuffs homologous or analogous series with addition of sul-uric acid, it is shown that the amounts are proportional the molecular weights of the dyestuffs, if the same con-tions be observed. This result holds good if the amount dyestuff used be varied from 6¼ to 50 per cent. of the eight of the wool. The amount of water used can be ried between fairly large limits without affecting the antitative results; this is contrary to the "solution eory." The solubility of the dyestuff in water also pears to be without influence. The sulphuric acid used ust do more than simply liberate the free colour acid, r, if the dyeing be effected with 2 per cent. of the free colour acid of "Crystal Porceau," without addition of another acid, the bath will not be nearly exhausted, whilst, in presence of sulphuric acid, exhaustion is nearly complete. These facts are greatly in favour of a "chemical theory" of dyeing.—A. B. S.

Paranitraniline Red; Action of Amines on the "Mordant" of ——.

C. Favre. Bull. Soc. Ind. Mulhouse, 1904, **74**, 268—269.

THE addition of certain aromatic amino-compounds to the β-naphthol solution used for dyeing fabrics with Paranitraniline Red, has a considerable influence on the shade of the resulting dyeings. Thus, the addition of 20 per cent. of α-naphthylamine (on the weight of β-naphthol used) gives deep brown shades, fast to soaping, but not to light; the same quantity of β-naphthylamine changes the shade to brick-red, fast to soaping and light; whilst *m*-toluylenediamine produces chocolate shades, also fast to soaping and light.—T. F. B.

Half-Discharges on Tannin Mordants; Process for Producing ——.

C. Zundel. Bull. Soc. Ind. Mulhouse, 1904, **74**, 220—221.

ON printing fabrics, impregnated with tannin, with solutions of alkaline salts of potassium or sodium, such as silicates, sulphites, borates, carbonates, thiosulphates, &c., and subsequently steaming, a portion of the tannin is converted into gallic acid. After fixing, the portions of the fabric containing gallic acid are not dyed in such deep shades as the remainder of the fabric. The best results were obtained with a solution of normal potassium sulphite (39° B.) thickened with starch, the dyeing being performed with a basic dyestuff. O. F. Alliston, in a report to the Society, confirms these results, and finds also that all the above-mentioned salts, with the exception of the alkali thiosulphates, give similar half-discharges on fabrics mordanted with antimony tannate.—T. F. B.

ENGLISH PATENTS.

Cotton and Flax, Raw, and Cotton and Linen Goods; Treatment of ——, to Reduce the Inflammability thereof.

W. H. Perkin, jun., and Whipp Bros. and Todd, Ltd., Manchester. Eng. Pat. 24,222, Nov. 7, 1903.

RAW cotton or flax, and cotton and linen goods can be rendered fireproof by means of sodium stannate, without subsequent treatment with solutions of metallic salts or ammonium salts (see Eng. Pat. 8509 and Fr. Pat. 321,063 of 1902; this J., 1903, 623 and 142). The goods may be impregnated with a solution (30° Tw.) of sodium stannate, dried, and exposed to the air for some days, an insoluble fireproofing compound being thus formed in the fibre. See also this J., 1903, 92 and 294.—T. F. B.

Fabrics and Similar Materials; Means of Heating ——.

W. Mather and G. G. Hepburn, Manchester. Eng. Pat. 24,617, Nov. 12, 1903.

FABRICS "and similar materials" are heated by passing them, in a wet or dry state, through a bath of mercury, heated to the desired temperature. A suitable apparatus consists of a vat, the bottom of which is made with a number of semi-cylindrical troughs, adapted to contain the mercury; a rotating roller is fixed in each trough, and a roller is also supported between each pair of troughs, immediately over the partition between them, so that the fabric as it passes over the rollers, is alternately immersed in and removed from the mercury. These troughs are conveniently heated by gas-jets. The vat is provided with a cover, having a deep flange, which dips in a suitable liquid contained in a trough, which is provided round the upper edge of the vat; by this means a liquid seal is formed, loss of mercury vapour being thereby prevented.—T. F. B.

Yarn-dyeing Vat, with a Device for throwing in and out of Gear a Windlass for Lifting the Material out of the Colouring Liquor. E. J. Henser, Cottbus, Germany. Eng. Pat. 2062, Jan. 27, 1904.

The yarn is hung on horizontal rollers, which fit into a frame, which can be lifted bodily out of the dye-bath by means of a rope and pulley. These rollers each have a cog-wheel at one end, so that adjacent rollers revolve in opposite directions. The lifting arrangement is connected with a clockwork mechanism, so that after an arranged time the frame is automatically lifted out of the vat until it reaches a certain height, when it operates a lever, which throws the driving belt out of gear and stops the machine. —A. B. S.

Dyeing, and Apparatus therefor. J. O. O'Brien, Manchester. From H. l'Huillier, Paris. Eng. Pat. 13,302, June 13, 1904.

See Fr. Pat. 338,113 of 1903; this J., 1904, 605.—T. F. B.

Calico Printing. The Calico Printers' Association, Ltd., Manchester, and J. Garnett, Alexandria, N.B. Eng. Pat. 27,539, Dec. 16, 1903.

The cloth is first slop-padded or otherwise prepared or printed with a solution of β-naphthol, neutralised with caustic soda, and then treated by one of the two following processes. (1) The cloth is printed with a thickened, diazotised solution of *p*-nitraniline or other amine, and then printed by another roller with an organic acid (*e.g.*, tartaric acid or citric acid); the cloth is now mordanted, steamed, and dyed with a suitable dyestuff, *e.g.*, a basic dyestuff mixed with tannic acid. (2) The prepared cloth is printed with a mordant and then with a resist for the azo dyestuff (with another roller); it is now treated with a thickened diazotised solution of an amine, fixed, and finally dyed as in the first process.—T. F. B.

United States Patent.

Mercerising Yarn; Apparatus for ——. I. E. Palmer, Middletown, Conn. U.S. Pat. 770,920, Sept. 27, 1904.

A suitable framework, mounted in the mercerising tank, carries two yarn-supporting reels, one above the other; the lower one is fixed, whilst the upper one is vertically adjustable, and can be removed in order to place the yarn in position. The gearing is so arranged that both reels can be rotated, whatever the position of the upper reel. —T. F. B.

French Patents.

Fibres and Fibrous Substances; Process for Treating [Felting] ——. G. Goldman. Fr. Pat. 342,941, Feb. 15, 1904. Under Internat. Conv., Aug. 29, 1903.

See U.S. Pats. 758,243 to 758,247 of 1904; this J., 1904, 544.—T. F. B.

Retting and Degumming Vegetable Fibres; Process of ——. E. Poisson. Fr. Pat. 338,941, July 24, 1903.

The soluble soda or potash soaps which are formed by the decomposition of the fatty matter of vegetable fibres by treatment with alkali, are converted into insoluble soaps by treatment with solutions of aluminium or magnesium salts; after this treatment, the stalks, &c., can be much more easily removed from the fibre. The same treatment may also be applied to fibres which have been degummed by treatment with soap.—T. F. B.

Dyeing Furs, Hair, Feathers, and similar Materials by Means of p-Amino-p-hydroxydiphenylamine; Process of ——. Farbwerke vorm. Meister, Lucius und Brüning. Fr. Pat. 338,915, July 8, 1903.

Unmordanted skins are dyed bluish-grey to blue-black by treatment with an ammoniacal solution of *p*-amino-*p*-hydroxydiphenylamine in presence of oxidising agents. By similarly treating furs mordanted with chromium salts, good blacks are obtained. The following is an example of the process:—2 grms. of *p*-hydroxy-*p*-aminodiphenylamine are dissolved in 200 c.c. of water containing 2 c.c. of ammonia (sp. gr. 0·91), 50 c.c. of a 3 per cent. solution of hydrogen peroxide is added, and the solution made up t 1 litre. The skin is worked in this solution for an hou and allowed to remain for a further 12 hours.—T. F. B.

Dyeing Furs, Hair, Feathers, and similar Materials b Means of 2-Nitroso-1-naphthol and 1-Nitroso-2-naphthol Process of ——. Farbwerke vorm. Meister, Lucius un Brüning. Fr. Pat. 338,919, July 9, 1903.

The materials (furs, feathers, skins) are dyed with a solu tion of either 1-nitroso 2-naphthol or 2-nitroso-1-naphtho with or without the addition of oxidising agents. suitable bath for chrome-mordanted skins consists 2 grms. of 2-nitroso-1-naphthol and 20 c.c. of a 3 pe cent. solution of hydrogen peroxide, with or without 2 c. of ammonia (sp. gr. 0·91), the whole made up to 1 litr Reddish-brown shades are obtainable by this process. —T. F. B.

Dyeing Hair, Feathers, and Furs; Process of ——. Act Ges. f. Anilinfabrikation. Fr. Pat. 342,714, April 2 1904.

Hair, feathers, or furs are dyed yellow to clear brow shades by treatment with dilute alkaline solutions 1.2-naphthylenediamine or its sulphonic acids in presenc of an oxidising agent. For example, a 3 per cent. solutio of hydrogen peroxide is added to an equal volume of 4 per cent. aqueous solution of the sodium salt of 1. naphthylenediamine-4-sulphonic acid; this solution i applied with a brush or by any other suitable means. Th shades so obtained are said to be very fast to ligh washing, and friction.—T. F. B.

Woollen Fabrics Dyed with Indigo; Process for Increasin the Fastness to Friction of ——. Farbwerke vorm Meister, Lucius und Brüning. Fr. Pat. 338,907, July 1903.

According to the claim, the fastness to friction of indig dyed woollen fabrics is greatly increased by treating th fabric, before dyeing, with solutions of metallic salts. —T. F. B.

Printing by Pulverisation; Machine for ——. E. Marinic Fr. Pat. 342,484, April 20, 1904.

The fabric is passed over a hollow cylinder, on which th design to be printed on it is cut. Smaller cylinders, number equal to the number of colours to be used, a arranged within the main cylinder, in contact with i inner surface, and are provided inside with nozzles throug which the colour-mixture is discharged in the form spray. On the surface of each small cylinder is cut th portion of the design which is to be printed in any pa ticular colour. By causing these small cylinders to rota at the same circumferential velocity as the main cylinde having first fixed them so that the designs are in regist with the design on the main cylinder, the fabric is print in the various colours with one treatment.—T. F. B.

Embossed and Printed Tissues; Manufacture of ——. A. Lacombe. Fr. Pat. 343,050, May 10, 1904.

The material is pressed by a pressure plate against anoth plate engraved with the pattern to be embossed. Thes plates are suitably heated. If it be required to pri colours in relief, the requisite dye is placed in the engrave portions of the pattern plate and is fixed on the materi by the pressure and heat.—A. B. S.

Printing with Indigo by the Aid of Hydrosulphites; Pro cess for ——. Cie. Paris. Coul. d'Aniline. Additio dated June 22, 1903, to Fr. Pat. 338,831, May 30, 1903.

See Eng. Pat. 13,827 of 1903; this J., 1904, 605.—T. F.

VII.—ACIDS, ALKALIS, AND SALTS.

Sulphur Trioxide Catalysis. F. W. Küster. Ges. deutsc Naturforscher u. Ärzte, Sept. 1904. Z. angew. Chem 1904, 17, 1512.

In a patent by Lunge it was claimed that, by the us of iron oxide containing arsenic as contact substance, i the manufacture of sulphuric anhydride, more satisfactory results were obtained than with pure iron oxide. The author states, however, that the presence of arsenic in the iron oxide has a deleterious influence, both on the yield of sulphur trioxide and the velocity of the reaction; and these views have, in the meantime, been, he considers, practically confirmed by Lunge (this J., 1904, 821). Contrary to Lunge, however, it was found that thorough drying of the reacting gases by means of phosphorus pentoxide caused a considerable decrease in the velocity of the reaction.

With vanadium pentoxide as contact substance, the gases having been dried by concentrated sulphuric acid, 52 per cent. of the sulphur dioxide was converted into sulphuric anhydride in two hours, and 84 per cent. in eight hours.

In the discussion, it was pointed out that the method of preparation of the contact substance has a considerable influence on the velocity of the reaction. The best yields are stated to be obtained by using iron oxide prepared by heating ferrous sulphate at 650° C. for one day.—A. S.

Perchromic Acid. E. H. Riesenfeld. Ges. deutsch. Naturforscher u. Ärzte, Sept., 1904. Z. angew. Chem., 1904, **17**, 1514.

The author has prepared several salts of perchromic acid by the action of a 30 per cent. solution of hydrogen peroxide on chromic acid or its salts. The ammonium salt, $(NH_4)_3HCrO_8$, explodes when struck, but the sodium salt is more stable. In aqueous solution, the salts give off oxygen and are reduced to chromates. If the salts are shaken with ether and a little water, some oxygen is evolved, and free perchromic acid (recognised by its characteristic blue colour) is produced. The anhydride of perchromic acid has the composition CrO_6.—A. S.

Hydrated Alumina. F. Russ. Z. anorg. Chem., 1904, **41**, 216—230.

The author's experiments show that "crystalline" alumina hydrate represents the final stage of a transformation which the freshly-precipitated hydrated alumina invariably undergoes (see this J., 1893, 599; 1900, 1014; 1902, 877). This transformation, slow under ordinary conditions, is accelerated by the presence of hydroxyl ions. The rate of transformation is dependent upon the concentration of hydroxyl ions. The difference in the behaviour of the two modifications to acids and caustic soda solution is one of degree only. The so-called "crystalline" hydrated alumina, when examined under the microscope with a magnification of 500, gave no evidence of crystalline structure. The results of the experiments also give some indications as to the most favourable conditions for the technical manufacture of alumina by Bayer's process (Eng. Pats. 10,093 of 1887 and 5296 of 1892; this J., 1888, 625; 1893, 263; see also this J., 1888, 748; 1893, 925). With a liquor containing alumina and soda in the molecular proportions 1 of Al_2O_3 to 1·24 of Na_2O, the best results are obtainable with a concentration equivalent to about 1·24 sp. gr. measured at 21° C., a yield of 85 per cent. of the alumina present following. By using a highly concentrated solution of caustic soda, it is theoretically possible to obtain a solution of sodium aluminate containing alumina and soda in the molecular proportions 1:1. If such a solution were diluted to a concentration of 3·3 mols. of Na_2O to 100 mols. of water, it would be supersaturated to the extent of 2·9 mols. of Al_2O_3, which would consequently be gradually deposited on stirring. The yield of alumina in such a case would be the highest obtainable, *viz.*, 88 per cent.—A. S.

Alkali Bromides; Electrolysis of —— and Action of Bromine on Alkalis. H. Ketzschmar. Z. Elektrochem., 1904, **10**, 739—817.

By the action of bromine on alkalis, hypobromites are at first always formed, although if equivalent quantities of bromine and alkali are brought in contact, at first a considerable proportion remains uncombined. Free bromine or hypobromous acid reacts with hypobromites to form bromates, $2HBrO + MBrO = MBrO_3 + 2HBr$, the reaction being quite analogous to the formation of chlorates, but proceeding more rapidly. Solutions of hypobromites of a concentration above N/10 are about as stable as similar hypochlorite solutions. On electrolysis of neutral bromide solutions, free bromine separates at the anode, and from this hypobromite is formed by reaction with the alkali from the cathode. Hypobromite formation proceeds until a definite concentration is attained, after which only bromate is produced. In strong alkali solutions hypobromite is also first formed up to a definite concentration, but bromate production commences at an earlier stage than in neutral solutions. In acid and neutral solutions the electrolytic bromate formation is due to a secondary reaction between the hypobromite and bromine or hypobromous acid, as shown in the above equation. In strong alkaline solutions, on the other hand, hypobromite is electrolytically oxidised to bromate.—R. S. H.

English Patents.

Nitric Acid; Appliances for the Manufacture of ——. D. Donnachie, Stevenston, N.B. Eng. Pat. 24,332, Nov. 10, 1903.

The invention relates to the condensing apparatus for nitric acid vapour. The receiving tank for the vapours from the retort is connected to condensing pipes arranged in undulating series within cooling tanks. The pipes have trapped connections to small pipes which lead back the condensed acid to the tank, where, coming into contact with the hot vapours from the retort, impure vapours are given off, thus purifying the acid.—E. S.

Vitriol [Sulphuric Acid]; Manufacture of ——. M. Schwab and H. Greene and Sons, Ltd., London. Eng. Pat. 24,619, Nov. 12, 1903.

The ordinary lead chamber for the manufacture of sulphuric acid, is supplemented, on its inlet side, by a mixing tower having, preferably, two channels communicating with the chamber, one near the bottom and the other near the top. One of these channels is so disposed with regard to a steam jet or jets, and to the inlet of gases from a Glover tower or from a preceding vitriol chamber, that the pressure in the upper parts of the mixing tower is decreased, and the circulation of gases thus promoted. In long chambers, one or more vertical shafts are arranged, with a steam jet discharging horizontally at the lower end of the shaft towards the outlet end of the chamber.—E. S.

United States Patents.

Barytes; Process of Bleaching —— and Recovering Glauber Salt. W. D. Gilman, Sweetwater, Tenn. U.S. Pat. 770,963, Sept. 27, 1904.

Powdered barytes ore is heated with a solution of nitre-cake, and after separating the solution, the purified ore is washed with hot water. Impurities are precipitated from the solution and wash-waters by sodium carbonate or hydroxide solution, and the resulting solution of Glauber's salt is crystallised.—E. S.

Mineral Substances [Graphite]; Separation of —— by means of the Selective Action of Oil. C. Kendall, Upper Norwood, England. U.S. Pat. 771,075, Sept. 27, 1904.

See Eng. Pat. 1309 of 1903; this J., 1904, 115.—T. F. B.

French Patents.

Caustic Soda and Hydrochloric Acid; Manufacture of —— from Sodium Salts. C. Girard. Fr. Pat. 338,901, July 1, 1903.

Sodium sulphate (salt-cake) is prepared as usual, or by passing sulphuric anhydride vapours over damp salt, hydrochloric acid being recovered. The solution of sodium sulphate is then precipitated by barium hydroxide. The caustic lye produced may be evaporated, and the caustic soda fused, or it may be carbonated. Alternatively, crystals of sodium sulphate may be brought into contact with solid hydrated barium hydroxide, to give at once a strong lye, the water of crystallisation sufficing for the reaction. The barium sulphate resulting in either case is heated with carbon, and the sulphide is treated: (*a*) in saturated hot solution in an electrolytic cell with diaphragm, to obtain barium hydroxide, sulphur, and hydrogen; or (*b*) a mixture of barium sulphide, carbon, and a metallic oxide, is melted in an electric furnace to obtain a mixture containing barium carbide, which, decomposed by water, gives acetylene and barium hydroxide and an insoluble metallic sulphide. The latter is "calcined" to obtain sulphuric anhydride. Other alternatives in the cycle are given.—E. S.

Sulphuric Acid of High Purity; Process for Economically Producing —— in Lead Chambers. H. H. Niedenführ (Installationsbureau f. Chem. Ind.). Fr. Pat. 343,156, May 14, 1904.

See Eng. Pat. 1066 of 1904; this J., 1904, 714.—T. F. B.

Salt, Pure; Process for Making —— from Crude Rock Salt. H. Tee and H. H. Perkes. Fr. Pat. 342,920, May 6, 1904.

VIII.—GLASS, POTTERY, ENAMELS.

Glass; Action of certain Gases on —— in the neighbourhood of Heated Metals. G. T. Beilby. Brit. Assoc., 1904. Chem. News, 1904, **90**, 180–181.

The author has previously (Brit. Assoc. Report, 1903) described the formation of halos around pieces of metal foil on glass plates, when these are heated in the presence of the products of combustion of coal-gas and air, and also the formation of images of the heated metal on glass plates placed a short distance above the heated metal. Further experiments have shown that the halo and image are produced by decomposition of the glass brought about by the action of sulphuric anhydride, which has been formed by the oxidation of sulphur dioxide, under the catalytic influence of the heated metal. It is suggested that the localisation of the decomposition of the glass is due to ionisation produced by the heated metal, this having the effect of causing the particles of sulphur trioxide produced to be projected from the surface of the metal, some being carried up to the under surface of the covering glass, which they attack, producing the image, whilst the greater number do not reach thus far, but fall back on the surface of the lower glass plate, producing the halo around the metal.—A. S.

Clays; "Rotting" of ——. P. Rohland. Z. anorg. Chem., 1904, **41**, 325—326.

Clay-mixtures for the manufacture of porcelain are kept for at least three months in a moist atmosphere before being used, in order to increase their plasticity. The changes ("rotting") which the clay undergoes during this process have not yet been satisfactorily explained. Seger (this J., 1892, 162) found that small quantities of caustic soda, sodium carbonate, or sodium silicate diminished or destroyed the plasticity of the mixtures, whilst a slight addition of hydrochloric or acetic acid considerably increased it; he therefore recommended, instead of storage, the addition of a small quantity of acid. The author has repeated and extended Seger's experiments, and finds that, at first, the plasticity is increased by both hydroxyl and hydrogen ions, but whereas in presence of the latter the increase is permanent, in presence of hydroxyl ions the plasticity again diminishes after a short time, and is finally less than at first. The author considers that all substances which have the power of forming colloidal solutions with water exhibit the property of plasticity to a greater or lesser degree. Clay and porcelain masses contain such colloidal substances, partly of an inorganic and partly of an organic nature, and the combination of these substances in the dissolved condition with the peculiar clay substance, aluminium silicate, $Al_2O_3.2SiO_2.2H_2O$, may be regarded as the cause of the plasticity of such mixtures. The degree of plasticity may be expressed as $\frac{M}{N}$, or the ratio of the inactive substances M to the active (colloidal) substances N. The increase of plasticity of clay mixtures on storing ("rotting") is due to the formation of acid by the fermentation of the organic matter; the hydrogen ions produced first neutralise the hydroxyl ions present in the solution in contact with the clay, which have an injurious influence on the plasticity, and then the excess of hydrogen ions exercises an accelerating action on the coagulation of the colloidal substances, and consequently on the degree of plasticity of the mixture. The plasticity of clay mixtures can be increased by the addition of colloidal substances, *e.g.*, tannic acid, dextrin, aluminium hydroxide.—A. S.

English Patent.

Ceramic Products; Composition for the Manufacture of ——. C. Robin, Saint Genon, France. Eng. Pat. 17,235, Aug. 6, 1904. Under Internat. Conv., Aug. 7, 1903.

"Carborundociment" [Protective Facing for Masonry]: Powdered Product called ——. L. E. Muller. Fr. Pat. 338,914, July 8, 1903.

A coating used to harden furnace bricks is composed of carborundum, 90 to 60 parts; fireclay, 10 to 40; lime, 0 to 4; sodium or potassium silicate of 47° B., 20 to 50 parts. These materials are mixed intimately, dried, and re-powdered. The product is then mixed to a paste with water. In cases where it is meant to withstand chemical action the coating is composed of carborundum, 50 to 85 parts; calcined magnesia, 5 to 15; and fine sand, 10 to 25. In either case the carborundum may be replaced by other carbides or by metallic silicides and borides. Instead of with water, the mixture may be treated with other liquids, such, *e.g.*, as a solution of magnesium chloride.—A. G. L.

Cement; Manufacture of ——. B. Grau. Fr. Pat. 343,152, May 14, 1904.

Blast-furnace slag is treated in the fused state with steam, preferably superheated, and the resulting product is reduced to powder.—A. G. L.

X.—METALLURGY.

Temper-Carbon ("Temperkohle") in Iron; Influence of other Elements on Formation of ——. F. Wüst and P. Schlösser. Stahl u. Eisen, 1904, **24**, 1120—1123.

The authors show that temper-carbon can separate from pure carburised iron without requiring the influence of other elements. The amount produced is a function both of the temperature to which the iron is heated and of the total amount of carbon. The presence of silicon assists the formation of temper-carbon, which then occurs at a lower temperature and from iron with a lower total content of carbon. Manganese and, to a greater extent, sulphur oppose the formation, whereas phosphorus seems to have no influence.—R. S. H.

Molybdenum Carbide; New ——. H. Moissan and M. K. Hoffmann. Ber., 1904, **37**, 3324—3327.

A mixture of molybdenum, aluminium, and petroleum coke is heated in a closely covered carbon crucible in the electric furnace. The product is treated with sodium hydroxide solution to remove aluminium, and with dilute sulphuric acid. After removing from the residue any admixture of graphite, there remains a grey crystalline powder of sp. gr. 8·10 and hardness 6—7, oxidising when heated in air or with potassium chlorate or nitrate, readily attacked by nitric, slowly by other acids, burning spontaneously in fluorine, but attacked much less readily by chlorine or bromine at a red heat. Analysis assigns to it the formula MoC. It is analogous to Williams' tungsten carbide, and is probably present, as a double carbide, in molybdenum steel.—J. T. D.

Magnetic Alloys from Non-magnetic Metals; Production of ——. R. A. Hadfield. Brit. Assoc., 1904. Chem. News, 1904, **90**, 180.

The author describes a series of magnetic alloys prepared by F. Heusler. It was found that whilst the metals, copper, aluminium, and manganese, and alloys of copper and aluminium, are all non-magnetic, alloys containing the three metals in certain proportions, possess considerable magnetic properties. Although it would appear that the magnetic properties are due to the manganese, yet in alloys containing a fairly constant percentage of manganese, the magnetisability increases with the amount of aluminium up to a maximum, when the proportion of aluminium amounts to about one-half of that of the manganese. This is shown in the following table:—

Alloy containing		H = (Magnetising Force).				
Manganese.	Aluminium.	20.	40.	100.	150.	
Per Cent.	Per Cent.					
28	3·6	Unmagnetisable.				
28	5·7	Very slightly magnetisable.				
26	9·6	2220	2670	3200	3470	B = magnetic induction.
26	14·6	4500	4850	5380	5550	
25	13·8	3580	4075	4645	4900	

The author made some experiments with an alloy containing 60 per cent. of copper, 25—27 per cent. of manganese, and 12 per cent. of aluminium. It is very brittle, and cannot be forged either hot or cold. It is feebly magnetic immediately after casting, but becomes non-magnetic when heated to about 170° C. and quenched in cold water. By continued heating at about 80°—150° C., it regains its magnetic properties in an intensified degree. If lead be introduced into the alloy, it becomes more fusible, its transformation-point is lowered, and under suitable heat treatment, the magnetisability is even increased. Alloys of copper, manganese, and tin also possess magnetic properties; magnetisability is first shown when 10 per cent. of tin is present, whilst the most magnetic alloy is one containing 21—22 per cent. of tin to 30 per cent. of manganese. Alloys of antimony and manganese are also magnetic. —A. S.

Alloys of Copper and Antimony, and their Recalescence. A. A. Baikoff. J. Russ. Phys. Chem. Soc., 1904, **36**, 111—165. (See also this J., 1903, 744.)

THE author has prepared melting-point curves and tables for the alloys of copper and antimony, and also their cooling curves. The latter show that these alloys exhibit the phenomenon of recalescence. Copper and antimony form two compounds, $SbCu_2$ and $SbCu_3$. The violet alloy, $SbCu_2$, melts and decomposes at 516° C., and can be prepared by melting the alloy $SbCu_3$ and antimony together in such proportions that solidification begins at a temperature below 586° C.; mixtures of the two metals which commence to solidify at higher temperatures than 586° C., deposit only the alloy $SbCu_3$, which melts at 681° C. These results are in accord with those given by a study of the other physical properties of these alloys—hardness, expansion, and E.M.F. in galvanic elements. The alloy $SbCu_3$ exists in two modifications: (1) the α-form, stable at temperatures below 407° C., and (2) the β-form, stable only at higher temperatures. All mixtures of the two metals containing from 53·5 to 61 per cent. of copper, and consisting of mixed crystals of antimony and the compound $SbCu_3$, undergo, on cooling, two distinct changes: (1) polymorphic transformation of the β-form of the compound $SbCu_3$ into the α-modification, and (2) separation of the compound $SbCu_2$. The micro-structure of the different alloys confirms the above conclusions.—T. H. P.

Passivity of Metals. W. Muthmann and F. Fraunberger. Sitzungsber. Bayr. Akad. Wiss., 1904, 201—241. Chem. Centr., 1904, **2**, 972—974.

A LARGE number of experiments have been carried out with different metals, and it was found that, besides iron, chromium, nickel and cobalt, vanadium, molybdenum, tungsten, and ruthenium are capable of being rendered passive. The results are given of a large number of potential measurements made in N/1 potassium chloride solution against a normal electrode (mercury, mercurous chloride, N/1 potassium chloride solution) with the metals after treatment with various reagents and after filing, &c. The authors consider that the passive metals contain dissolved oxygen, and that the degree of passivity is dependent upon the amount and the pressure of the dissolved oxygen. The potential of a passive metal can thus be regarded as an alloy-potential, which in certain cases can approach very near that of pure oxygen. (Compare this J., 1903, 637.)—A. S.

Concrete in Smelting Works. F. I. Havard. Amer. Inst. Mining Eng., Sept. 1904. Eng. and Mining J., 1904, **78**, 460.

THE author describes the advantages and disadvantages which have been observed with the use of concrete (1 of cement to 7 of sand and "jig-tailings") flues and stack at a lead- and silver-smelting works. The cost of construction was about 0·11 dol. per sq. ft. *Effect of Heat:* Cracks were caused by temperatures above 100° C. Neutral furnace-gases at 120° C. caused so much damage by formation of cracks, that after two years, the stack, constructed of pipes 4 ins. thick, required repairing throughout. *Effect of Flue-Gases and Moisture:* In cases where the flue was protected on the outside by a wooden or tiled roof, and inside by an acid-proof paint, composed of water-glass and asbestos, the concrete was not appreciably damaged. Where the protective covering, both inside and outside, was of asphalt only, the concrete was badly corroded and cracked at the end of three years. Concrete unprotected from both atmospheric influences on the outside, and furnaces-gases on the inside, was quite destroyed at the end of three years. The presence of an excessive amount of moisture in the furnace-gases had a very injurious influence.—A. S.

ENGLISH PATENTS.

Incorrodible Material [Iron-Hydrogen Alloy], and Method of its Production. G. W. Gesner. Eng. Pat. 16,029, July 19, 1904. XIII. A., page 989.

Steel and Armour Plates; Process of Treating ——. E. Engels, Düsseldorf, Germany. Eng. Pat. 16,419, July 25, 1904. Under Internat. Conv., March 21, 1904.

THE steel is heated in presence of oxygen, or of substances that yield oxygen, such as manganese dioxide, and, whilst still red hot, is plunged into molten lead (or other cooling bath); when withdrawn it may be rolled or pressed, and be then cemented on the side to be hardened. It is then hardened in oil or the like, and is annealed at a temperature lower than that used in cementing. The process may be varied according to circumstances, and the indicated special treatment may be used with or without combination with a cementation process. See also Eng. Pats. 25,932 of 1903 and 1842 of 1904; this J., 1901, 118 and 374.—E. S.

Ore-roasting and like Furnaces. H. H. Lake, London. From I. Santilippo, Casteltermini, Sicily. Eng. Pat. 19,353, Sept. 8, 1903.

Vanadium; Manufacture of Metallic —— from its Ores or any other Compounds of Vanadium. P. Auchinachie, Wrexham, Wales. Eng. Pat. 12,727, June 6, 1904.

THE ore or other compound of vanadium is strongly heated for about two hours with, preferably, concentrated sulphuric acid, to which a small proportion of sodium nitrate is added. The cooled solution is diluted with water, and after settling the clear blue solution of vanadium sulphate is electrolysed using iron electrodes, vanadium oxide being deposited; or the vanadium oxide may be separated by chemical means and in either case it is mixed with carbon and heated t about 2000° C. in an electric furnace. The vanadium i obtained from the residual melted mass by grinding unde steel rollers and washing the carbon away by water.—E. S.

Solder for Aluminium or Aluminium Alloys. R. F. y Pelletier and E. S. y Semprun, Madrid. Eng. Pat. 13,3 June 13, 1904.

AN alloy of silver, aluminium, and tin, in stated proportions is melted in a covered crucible, and immediately before solidification, about 10 per cent. of its weight of phosphorus i added; this alloy is referred to as "metal F." "Metal S" is obtained by adding sulphur in small pieces to melted zinc and casting the mass in "rails." "Metal FS" is obtaine by fusing 85 parts of "metal F" with 15 parts of "metal S. The solder for aluminium or its alloys is obtained by meltin, and adding together, in the order named, 10 parts each o "metal FS" and aluminium, 80 parts of zinc, and 320 part of tin, all by weight. See also Eng. Pat. 7016 of 1903; thi J., 1903, 801.—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(A.)—ELECTRO-CHEMISTRY.

Nitrites and Nitrates; Production of —— by the Electrolytic Oxidation of Ammonia in presence of Cupric Hydroxide. W. Traube and A. Biltz. Ber., 1904, **37**, 3130—3138.

A MIXTURE of a 20 per cent. solution of sodium hydroxide and a 10 per cent. solution of ammonia containing dissolved cupric hydroxide equal in weight to about one-tenth of the ammonia present was used as the anode liquid of an electrolytic cell, and a 20 per cent. solution of sodium hydroxide solution, in an inner porous cell, as a cathode liquid. The currents used were 5, 10, and 15 ampères, and he electrodes thin sheet iron, the anode surface being from 15 to 25 sq. cm. per ampère. Sodium nitrite was produced during five to seven hours of electrolysis, up to quantities of 20—30 grms.; current yield, 75—90 per cent. The maximum strength of solution thus obtained was about 7 per cent.; but by starting with a solution already containing this amount of nitrite, the strength was increased to nearly 10 per cent. If the current be continued long enough, the amount of nitrite ceases to increase, and then diminishes, ill finally it entirely disappears. Examination of the liquid shows that the nitrite has been converted into nitrate. The yield of nitrate so obtained was about 75 per cent. of hat corresponding in theory with the current. Corresponding experiments have shown that the nitrites and nitrates of potassium and of barium are also obtainable in this way, hough in neither case have as good yields been yet obtained as with the sodium salts.—J. T. D.

Persulphates; Preparation of ——. E. Müller. Z. Elektrochem., 1904, **10**, 776—781.

THE production of potassium or sodium persulphate by the lectrolysis of acid sulphates is greatly aided by the presence of the fluorine ion. Thus, in 125 c.c. of a N/2·3 solution of potassium bisulphate, by substituting 20 c.c. of N/20 hydrofluoric acid for added free sulphuric acid, the yield of persulphate was raised from about 50 per cent. to about 5 per cent. Paraffined glass vessels were used. If a crust of persulphate be allowed to form on the anode, the beneficent effect of the hydrofluoric acid ceases.—W. A. C.

Potassium Cyanate; Electrolytic Preparation of ——. E. Paternò and E. Pannain. Gaz. chim. ital., 1904, **34**, [2], 152—155. Chem. Centr., 1904, **2**, 982.

THE authors find that the best yields of potassium cyanate re obtained by electrolysing a solution of potassium cyanide ontaining 4—6 grm.-mols. per litre, using a rotating anode, n E.M.F. of 4—6 volts, and an anodic current-density of —4 ampères per sq. dcm. Under these conditions nearly he whole of the cyanide can be converted into cyanate, which partly crystallises out during the electrolysis. For xample, from 72 grms. of potassium cyanide, with an E.M.F. of 4·5 volts and a current-density of 1·5—2·5 mpères per sq. dcm., 32 grms. of cyanate separated during lectrolysis, whilst a further 42 grms. were recovered from he solution by evaporation, thus giving a total yield of 0 per cent.—A. S.

Nitrotoluene; Electrolytic Reduction of ——. W. Löb and J. Schmitt. Z. Elektrochem., 1904, **10**, 756—764.

FOR the production of toluidine, the following cathode-materials were tried, and are arranged in ascending order f efficiency: nickel, zinc, copper, and copper with the ddition of powdered copper to the electrolyte. The reduc-on of *p*-nitrotoluene is decidedly easier than that of -nitrotoluene. The electrolytic preparation of *m*-azoxyoluene with nickel cathodes in a 2 per cent. solution of caustic soda is recommended as a laboratory method, also the preparation of toluidines with copper cathodes and powdered copper.—W. A. C.

(B.)—ELECTRO-METALLURGY.

Iron; Electrolytic ——. A. Skrabal. Z. Elektrochem., 1904, **10**, 749—752.

IRON may be deposited electrolytically in two modifications. The first, from ferrous solutions at low current densities with iron anodes, is white, very hard, and brittle, and resists the action of corrosive liquids to a striking extent. On igniting it, hydrogen is expelled, whilst the metal becomes quite malleable. On the other hand, it gives up hydrogen on heating to 70° C. without losing its brittleness, and can then be recharged with hydrogen electrolytically; whilst after ignition it can neither be charged with hydrogen nor brought into the hard, brittle condition again. The second variety of electrolytic iron is produced from complex ions of bivalent iron at high densities with platinum anodes, and is grey, amorphous, and not very compact. Though not free from oxide, it contains more hydrogen than the first variety. It is not only very readily soluble in acids, but is capable of decomposing water. The author regards both varieties as solutions of more or less hydrogen in γ-iron, changing on ignition into the stable α-iron.

—W. A. C.

Metals capable of Decomposing Water; Electrolytic Separation of —— from Solutions of their Salts. A. Siemens. Z. anorg. Chem., 1904, **41**, 249—275.

Magnesium can be separated in the metallic condition, together with nickel, from aqueous solutions containing salts of the two metals, provided the concentration of the magnesium salt be sufficiently high. The following were the most satisfactory results:—

Concentration.		Current Density.	Temperature.	Percentage of Magnesium in the deposited Metal.
Nickel Sulphate.	Magnesium Sulphate.			
		Amp. per sq. dcm.	° C.	
N 1	8N	5	90	2·12
4N	8N	1	20	2·63

The deposits containing magnesium differ from those of pure nickel in being compact and adherent, and showing no tendency to "strip" as the latter do. The nickel-magnesium alloy adheres firmly to iron, whereas in electroplating iron with nickel it is thought necessary to deposit an intermediate layer of copper, in order to obtain an adherent coating of nickel. Magnesium can also be deposited in a similar manner with cobalt, and to a lesser degree with iron, but only in traces with zinc. Aluminium and the alkaline-earth metals cannot be deposited simultaneously with heavy metals from aqueous solutions. The alkali metals can be deposited in very small amounts with nickel and tin, but not with iron and silver. In all cases the deposits are not definite compounds of the two metals, but are solid solutions of the light metal in the heavy one. Deposits of a heavy metal containing a dissolved light metal are characterised by having a distinctly higher potential than deposits of the heavy metal in a pure condition. Alkali and alkaline-earth metals can, under certain conditions, be deposited electrolytically from solutions of their salts in acetone; on the other hand, magnesium, aluminium, and beryllium cannot be deposited in this way.—A. S.

English Patent.

Electric Furnace for Converting Pig Iron into Steel. G. Gin, Paris. Eng. Pat. 8216, April 9, 1904. Under Internat. Conv., June 4, 1903.

See Fr. Pat. 342,101 of 1904; this J., 1904, 904.—T. F. B.

French Patents.

Electric Furnace; Arrangement of ——. A. Voelker. Fr. Pat. 343,004, May 13, 1904.

The crucible or object to be heated, placed centrally in the cavity of the furnace, is surrounded by a packing consisting of pieces of charcoal, varying in diameter from 1 to 7 mm., arranged in classified layers or groups, whereby on passage of the current the heating is regulated by the position of the strata, such heating being in part on the resistance, and in part on the arc system. The conductivity of the packing medium may be further modified by addition, in places, of graphite or of silicates. (See U.S. Pat. 770,991 of 1904, XI. A., page 987.)—E. S.

Zinc; Process for the Direct Extraction of [in Electric Furnace] —— from its Ores. A. Rodriguez Bruna. Fr. Pat. 343,114, April 20, 1904.

Zinc ores are mixed with carbon, and the mixture is heated, under pressure, in an electric furnace. It is stated that the zinc may be thus obtained in the melted state, instead of as vapour. When blende is thus treated, certain by-products are obtained, including carbon bisulphide, which may be burnt with the other gases to produce sulphur dioxide, &c. —E. S.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Fats; Effect of Exposure to Light on ——. M. Winckel. Ges. deutsch. Naturforscher u. Ärzte. Z. angew. Chem., 1904, **17**, 1524. Chem.-Zeit., 1904, **28**, 931—932.

H. Kreis found that fats which had been exposed to sunlight gave a red coloration with a mixture of phloroglucinol and hydrochloric acid. The author examined a number of fats and oils, and found that the fresh substances did not give the reaction, but that they did after being exposed to direct sunlight for one hour. On keeping samples of lard (1) In the air exposed to direct sunlight, (2) Exposed to sunlight *in vacuo*, (3) Exposed to the air in the dark, and (4) *In vacuo* in the dark; and subsequently testing them, it was found that samples (1) and (2) gave the phloroglucinol reaction after half an hour and several hours respectively, whilst samples (3) and (4) became rancid, but did not give the colour reaction. The colour reaction was found to be caused by free oleic acid.—A. S.

Saponification; Theory of ——. R. Fanto. Monatsh. Chem., 1904, **25**, 919—928.

The author opposes the theory of Geitel and of Lewkowitsch (this J., 1898, 1007; 1899, 1031; 1900, 254; 1903, 596) on the ground that he was unable to detect mono- or diglycerides in the products of the partial saponificatio of fats with aqueous solutions of potassium hydroxide In his experiments with olive oil, ox tallow, tristearin, and (impure) triolein, the fat was heated with the potassiu hydroxide in a cylindrical flask immersed in boilin water for three or six hours, whilst the contents were kep in continual motion by means of a stirring device worked by a turbine. The products of the reaction were the decomposed with acetic acid, extracted with ether, an analysed, the glycerol and the acid value being determined and from the increase on the acid value of the original fat the amount of potassium hydroxide that had entered int the reaction could be calculated. From the results obtaine the author considers himself justified in stating, with refer ence to the saponification of fat with potassium hydroxid in homogeneous solution, (1) That the presence of di- an mono-acyl hydrins cannot be detected; (2) That in homo geneous solution the saponification is practically quadrimol cular. (See also this J., 1898, 673; 1904, 550, 905.)

French Patent.

Candles, Lamp Oils, Edible Fats, Unguents or Pomade Soaps, &c.; Manufacture of ——. C. Dreyman Fr. Pat. 343,158, May 14, 1904.

The following derivatives of fatty acids are claimed f these purposes:—(1) Esters, (2) Condensation products esters with other organic compounds, (3) Amides, (4) Pr ducts of the limited oxidation of unsaturated fatty aci either alone or mixed with fatty acids of a higher series with other fatty bodies. Claim is also made for a proce of mixing sulpholeic acids prepared in the usual way wi an oxide, hydroxide, or other suitable substance (e. calcium or magnesium oxides) before the distillation. Th addition is stated to reduce the loss of solid material duri he distillation. Loss by decomposition may also be prevented by converting the fatty acids into esters, which are istilled and then saponified in an autoclave. A method claimed) of obtaining a larger yield of a harder soap onsists in raising the saponification value of an olein by neans of regulated oxidation, and saponifying the product. —C. A. M.

Lakes very Fast to Water ; Production of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 342,903, May 5, 1904. Under Internat. Conv., March 8, 1904.

Lakes very fast to water are produced by precipitating dyestuffs on a substratum of a basic aluminium salt. The basic chloride, nitrate, and thiocyanate are the most suitable for the purpose ; basic aluminium sulphates do not lend themselves very well to such treatment. The lakes may be prepared by adding a determined quantity of hydrochloric or nitric acid to a suspension of alumina in a solution of the dyestuff, or by adding sufficient alkali to precipitate the dyestuff on an aluminium salt which is not sufficiently basic. It is often advantageous to heat the mixture during the precipitation. The following example is given for preparing a fast yellow lake : 200 kilos. of a 4 per cent. alumina paste are incorporated with a solution of 1 kilo. of Naphthol Yellow S, and the lake is precipitated by the addition of a solution of 0·8 kilo. of aluminium chloride ($AlCl_3$, $6H_2O$).—T. F. B.

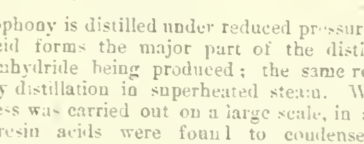
Colours [Pigments] : Manufacture of Oil ——. M. Hérisson. Fr. Pat. 342,550, April 22, 1904.

The basis of this pigment is barium silicate, to which are added hydrated silica, infusorial earth, kaolin, zinc oxide, and alumina in stated proportions.—T. F. B.

(*B.*)—RESINS, VARNISHES.

Resin Acids of the Coniferæ. I. Constitution of Abietic Acid. T. H. Easterfield and G. Bagley. Chem. Soc. Trans., 1904, **85**, 1238—1249.

When colophony is distilled under reduced pressure, abietic (sylvic) acid forms the major part of the distillate, no isosylvic anhydride being produced ; the same result was obtained by distillation in superheated steam. When the latter process was carried out on a large scale, in a stearin still, the resin acids were found to condense almost entirely in the first two coils, the abietene and other decomposition products being found mostly in the cooler coils. The decomposition of abietic acid to abietene occurs to a much greater extent when distillation is carried out in an iron still than in a glass retort ; thus abietic acid can be redistilled from a glass vessel under 100 mm. pressure, while from an iron still, considerable decomposition occurs even under 20 mm. pressure. By distillation under ordinary pressure, abietic acid is decomposed into abietene and oxides of carbon in such proportions as make it certain that abietic acid is abietene carboxylic acid. On distillation with small quantities of sulphur under ordinary pressure, or with large amounts under reduced pressure, retene is produced ; from this and from the empirical formulæ of the two compounds, it follows that abietene is decahydroretene. Kelbe (Ber., 1884, **17**, 1157) has shown that resin spirit is rich in *m*-cymene ; hence it is highly probable that abietic acid is decahydromethylisopropylphenanthrene-carboxylic acid of the constitution—



By analogy, pimaric acid is most probably a monomethyl derivative of abietic acid. Rimuic acid and podocarpic acid are considered also to be octohydrohydroxymethyl- and octohydrohydroxydimethylphenanthrene-carboxylic acid respectively.—T. F. B.

Nan-ta-Yok or Burmese Storax; Properties of ——. D. Hooper. Agric. Ledger, 1904, 115—122.

Source.—This balsam, which has long been used in Burma as incense and for medicinal purposes, is produced by *Altingia excelsa* (Noronha), a large tree (150 to 180 feet high) growing in the forests of the Indian Archipelago, Burma, Assam, and Bhután, and especially in the Tenasserim province of Burma. It is also found in China, Java, Cochin China, New Guinea, and the Sunda Archipelago. Three samples of resinous balsam from Java examined by Tschirch and van Itallie (this J., 1901, 1122) were said to be the products of two species of *Altingia*, but in Greshoff's opinion both trees were *Altingia excelsa*. The two aromatic exudations from South Tenasserim examined by the author had the following properties:—

Soft White Crystalline Balsam. — This resembled honey when fresh, but after two years crystallised, and became white, and had a fragrant odour of styrol. It melted at 41° C., and when heated on the water-bath lost 7·65 per cent. in weight, the volatile substances being chiefly essential oils. It gave the following values:—Acid value, 24·96; saponification value, 199·35; and iodine value, 57·3. About half the balsam consisted of an ester of cinnamic acid, the amount of the latter separated being 37 per cent. calculated on the original balsam.

Dark Brown Solid Balsam.—This consisted of resinous masses, which yielded a brown powder with an aromatic odour in which that of cinnamon predominated. After clarification with alcohol two samples gave the following results:—Resins, 53·72 and 54·70; organic impurities, 19·09 and 28·05; inorganic impurities, 22·24 and 10·67; and volatile oil and loss, 4·95 and 6·58 per cent. The purified resin (m. pt. 68° C.) was clear, of an amber colour, and had the fragrant odour of the crude balsam. It was soluble in chloroform, carbon bisulphide, and benzene, partially soluble in acetic ether, and slightly soluble in petroleum spirit.

——	Acid Value.	Saponification Value.	Iodine Value.
Crude resins	52·48	130·10	41·07
Pure resins	76·80	130·44	51·68

The brown balsam contained a trace of free cinnamic acid, and 9·7 per cent. of that acid in the form of an ester. The author's conclusion is that the white balsam is valuable as a perfume and as a source of cinnamic acid, whilst the brown balsam is of value as a perfume and as incense. Both possess a sweeter aroma than genuine storax, and when heated with sulphuric acid and potassium bichromate both evolve an odour of benzaldehyde. If examined by Dieterich's method (this J., 1898, 807) the brown resinous balsam cannot be regarded as true storax, whilst the white balsam only agrees with that resin in the saponification value. Hence the author's results confirm the statement of Tschirch and van Itallie (*loc. cit.*) that Nantayok resin differs in constitution from the genuine storax of Asia Minor.—C. A. M.

English Patents.

Gums and Resins; Impts. in and Apparatus for the Treatment of Products containing ——, *and for the Separation and Obtainment of the Gums and Resins therefrom.* J. Y. Johnson, London. From A. Foelsing, Offenbach-on-Maine, Germany. Eng. Pat. 21,020, Sept. 30, 1903.

The apparatus consists essentially of four parts: a closed extractor, in which the substance is exposed to the action of the hot solvent; a boiler, in which the solution so obtained is distilled for the recovery of the solvent and the extracted matter; a cooled coil, in which the vapour of the solvent is re-condensed; and a reservoir, intermediate between the condenser and the extractor, for the storage of the solvent. The special claim is for the use of selective solvents, by which resins can be extracted from substances containing rubber also, the substance to be treated being first rolled out into thin sheets and dried before placing it in the extractor.—M. J. S.

See Fr. Pat. 334,430 of 1903; this J., 1904, 69.—T. F. B.

United States Patent.

Wood; Method of Treating [Distilling] —— *for the Production of Paper Pulp, Turpentine, &c.* W. Hoskins, Lagrange, Ill. U.S. Pat. 770,463, Sept. 20, 1904.

Wood is subjected, in a digester, to the direct action of steam, at a temperature lower than that which would cause the decomposition of the resins; the "volatilisable condensable constituents" are then separated from the wood, the resinous constituents melted out, and the residual fibrous mass is treated with caustic soda-lye or other substance to reduce the fibre to pulp, which is suitable for paper-making. The alkaline liquor is evaporated and the residue distilled, to produce therefrom "oily and tarry products." The residue of this distillation is finally extracted with water to recover the alkali or other reagent employed.
—T. F. B.

(C.)—INDIA-RUBBER, &c.

Latex of Castilloa Elastica; Cause of Coagulation of ——. A. W. K. de Jong and W. R. Tromp de Haas. Ber, 1904, **37**, 3301—3305.

Three different latexes, containing respectively 3·5, 3·4, and 3·65 grms. of rubber per 10 c.c., were treated with increasing amounts of various coagulating agents, well shaken, allowed to stand, thrown into water, and the coagulum collected. Alcohol and acetone, employed as coagulating agents, were found to give yields increasing proportionally to the amount of coagulant used, up to a certain maximum, and then diminishing. (The maximum referred to is attained with $\frac{1}{2}$ vol. of alcohol and 1 vol. of acetone.) Glacial acetic acid coagulated the rubber in direct proportion with the amount added, 2 vols. coagulating the whole, and larger quantities causing no diminution. In the presence of water, however, the yields of rubber were smaller, but in the same general proportion with the different coagulants; in no case was the whole of the rubber coagulated. The latex was then purified by washing with water until 10 c.c. contained 0·65 grm. of rubber. Alcohol ($\frac{1}{2}$ vol.), acetone ($\frac{1}{2}$ vol.), and acetic acid, strong or dilute ($\frac{1}{3}$ vol.), now caused total coagulation, smaller quantities than those stated giving proportionally lower amounts, and excess having no adverse influence. The phenomenon of maximal point in the case of alcohol and acetone thus appeared to be due to constituents in the latex removable by washing. Pasteurisation of the latex almost destroyed the coagulating power of alcohol, much reduced that of acetone, but had no effect on that of glacial acetic acid. The filtrates from the fresh latex gave a precipitate with alcohol ($\frac{1}{2}$ vol.) or acetone ($\frac{1}{2}$ vol.), but little with glacial acetic acid. Addition of these filtrates to the washed latex restored the properties of the unwashed latex, *i.e.*, partial coagulation. It seemed, then, that alcohol and acetone precipitated soluble constituents that hinder coagulation. Again, fresh latex is not coagulated by heat, but washed latex is. Addition of these precipitates to washed latex also inhibited its coagulation by heat. Attempts were made to knead together mechanically, in a mass, finely divided solid rubber placed in various fluids. This was accomplished with alcohol, acetone, and glacial acetic acid, but failed with tannin, formaldehyde, alkalis, and hydrochloric acid. The first three liquids are known to be solvents for resin, and determinations of the amount of resin in the coagulum from washed latex, by Van Romburgh and Tromp de Haas' method (Bull. de l'Institut Bot. de Buitenzorg, **15**), showed amounts ranging from 9 to 12 per cent.—R. L. J.

Rubber ; Apparatus for [Coagulation of —— by] Smoking ——. J. R. Cardoso Danin. India-Rubber World, 1904, **30**, 413.

Rubber coagulated by "smoking" is stated to possess a pecial value, and in order to make the process less dependent ipon the skill of the native rubber collector, the author ecommends the adoption of the following simple apparatus. The latex is fed into a rotating cylinder mounted on friction ollers, and the smoke is introduced by a side tube.—A. S.

Rubbers and Rubber Vines from the East Africa Protectorate. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 153—156.

Rubber from Takaungu.—Three specimens of a rubber-ine which occurs in considerable quantities near Takaungu, nd two samples of the rubber obtained from it, labelled Sokoki" and "Mtoni" respectively, were examined. The ine was identified as *Landolphia Kirkii.* The "Sokoki" ubber was not sticky, and exhibited very good physical roperties. It contained: moisture, 11·7; caoutchouc, 8·9; resin, 6·8; dirt, 2·6; ash (included in dirt), 0·87 er cent. The "Mtoni" rubber was almost identical in ppearance and character with the "Sokoki" rubber. It ontained: moisture, 9·1; caoutchouc, 78·2; resin, 4·1; dirt, 8·6; ash (included in dirt), 8·5 per cent. Both rubbers were valued at 3*s.* 2*d.*—3*s.* 3*d.* per lb.

Rubber from Kamasia Hills, Naivasha Province.—The vine was identified as *L. Kirkii.* The sample of rubber gave the following results on analysis:—Moisture, 10·8; caoutchouc, 68·3; resin, 11·5; dirt, 9·4; ash (included in dirt), 1·05 per cent. The rubber was not sticky, and exhibited fair elasticity and great tenacity. If properly prepared, it would probably be equal in value to the rubber from Takaungu.

Rubber from Rabai.—The vine was a species of Landolphia. The sample of rubber contained: moisture, 4·3; caoutchouc, 84·1; resin, 4·5; dirt, 7·1; ash (included in dirt), 3·62 per cent. The rubber was not sticky, and exhibited very good physical qualities. It was valued at 3*s.* 3*d.* per lb. (See also this J., 1903, 918.)—A. S.

Rubber of Urceola Esculenta from Burma. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 156—159.

Five specimens were sent for examination, one of which contained three distinct kinds of rubber, which were analysed separately. The results of the analyses are given in the following table:—

No. of Sample.	Place of Origin of the Rubber.	Percentage Composition.					Value.	Remarks.
		Moisture.	Caoutchouc.	Resin.	Dirt.	Ash (included in Dirt).		
							Per lb.	
9,747	Bassein	1·9	54·0	42·6	1·5	0·64	..	.. ..
9,747 1	"	0·9	52·1	45·5	1·5	0·56	..	.. ..
9,762 A.	Pegu Division	11·6	70·7	12·1	5·6	1·86	About 3*s.* 2*d.*	Tonquin character.
" B.	"	5·9	76·4	10·9	6·8	1·32	" 3*s.* 6*d.*	Red Tonquin ball character; inclined to be heated, which would greatly affect its value.
" C.	"	9·7	73·7	8·3	8·3	2·03	" 3*s.*	Dark ball, slightly gummy and not well cured: might be difficult to sell at ordinary times.
9,865-1	"	2·6	75·7	18·0	3·7	1·02	3*s.* 6*d.*	Thick biscuit, strong: would command a ready sale.
0,583	Tenasserin Division.	4·0	89·5	9·8	5·7	1·16	4*s.*	Thin sheet, fairly strong; would fetch a good price if not heated.

The samples Nos. 19,747 and 19,747-1 were of much orer quality than the others, and from information ceived since the examination, it is stated that their tanical source is rather doubtful.—A. S.

ubber of Rhynchodia Wallichii and Chonemorpha Macrophylla from Burma. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 159—161.

he Rhynchodia rubber was quite free from stickiness, d exhibited good elasticity and tenacity. It contained: oisture, 2·8; caoutchouc, 86·5; resin, 6·5; dirt, 4·2; h (included in dirt), 0·48 per cent. It was valued at . 6*d.* per lb. The Chonemorpha rubber was rather sticky, t exhibited fairly good elasticity and tenacity. The ecimem was too small for commercial valuation, but the llowing analytical results indicate that it was of inferior ality:—Moisture, 8·0; caoutchouc, 55·2; resin, 34·6; rt, 2·2; ash (included in dirt), 0·97 per cent.—A. S.

Pontianac from the Patiala State. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 162—163.

he specimen examined, contained: moisture, 54·5: resin, ·6; caoutchouc, 7·6; dirt, 1·3; ash (included in dirt), 94 per cent. It closely resembled commercial Pontianac th in chemical composition and in appearance and general operties. It was valued at 20*l.* per ton.—A. S.

English Patent.

ums and Resins; Impts. in and Apparatus for the Treatment of Products containing ——, and for Separation and Obtainment of Gums and Resins therefrom. J. Y. Johnson. From A. Foelsing. Eng. Pat. 21,020, Sept. 30, 1903. XIII. B., page 990.

French Patent.

Vulcanised Caoutchouc and Ebonite; Regeneration of ——. V. de Karavodine. Fr. Pat. 338,945, July 25, 1903.

The material is pulverised and heated, with or without the addition of sulphur, in a metal mould at 150° to 200° C. under a pressure of 100 to 500 kilos. or more per sq. cm. The process may be used for obtaining vulcanite casts and for insulating cables. By adding mica or asbestos (which may previously be mixed with fused rosin, tar, drying oils, or caoutchouc solution with sufficient sulphur for vulcanisation) to the pulverised ebonite a very hard substance is produced.—C. A. M.

XIV.—TANNING; LEATHER, GLUE, SIZE.

Tanning Extracts; Manufacture of ——. F. A. Bühler. Chem. Ind., 1904, **27**, 478—487.

This is a general description of the plant and methods employed in the manufacture of extracts, with special reference to the handling of hard woods, such as quebracho. The numerous illustrations include plans and elevations for a model factory, arranged to produce 25,000 to 30,000 kilos. of extract daily.—R. L. J.

Tannin Content of Liquors from different Tannin Materials and Tannin Extracts; Variation of ——. J. Paessler. Collegium, 1904, 277—280, 284—290, 293—296.

It is well known that clear tannin extracts become turbid on standing, and deposit considerable quantities of a thick precipitate. Hence it is of interest to know whether this deposition is caused by the tannins or non-tannins separately or both together. Messrs. Youl and Griffith have already carried out experiments in this direction with strong liquors of valonia, myrobalans, and mimosa (this J., 1901, 428). The author has previously determined the variation of weak myrobalans liquor on keeping (this J., 1904, 71). He has now extended his investigations to liquors prepared from the undermentioned materials:—Oak bark, pine bark, mimosa bark, mangrove bark, valonia, trillo, myrobalans, divi-divi, knoppern, sumach, quebracho-wood extract, soluble quebracho extracts, oak-wood extracts, chestnut extract, and block gambier. Strong liquors of these materials were prepared in an extraction battery of the usual type, and, after being allowed to settle, were filtered and made up to 2° B. The liquors were then kept in open bottles at a constant temperature and subsequently analysed, according to the I.A.L.T.C. methods, after periods of 6, 18, 30, and 60 days. The bottles were weighed to commence with, and losses of weight due to evaporation made good with distilled water. The following are the tabulated results:—

—	Tannin Substances. Grms. contained in 100 c.c. of Liquor.			Non-Tannin Substances. Grms. contained in 100 c.c. of Liquor.			Total Soluble Matter. Grms. contained in 100 c.c. of Liquor.			Grms. of Non-Tannin Substance per 100 Grms. of Tannin Substance.	
	Freshly Prepared.	After 60 Days.	Loss.	Freshly Prepared.	After 60 Days.	Loss.	Freshly Prepared.	After 60 Days.	Loss.	Freshly Prepared.	After 60 Days.
Mangrove bark	3·37	3·37	0	0·56	0·55	2	3·93	3·92	0	16·5	16·5
Mimosa bark	2·85	2·79	2	0·63	0·41	35	3·48	3·20	8	22	14·5
Sumach	1·90	1·87	1·5	1·40	1·17	16	3·30	3·04	8	74	62·5
Quebracho wood	3·87	3·72	4	0·30	0·18	40	4·17	3·90	6·5	8	5
" extract	3·77	3·66	3	0·37	0·24	35	4·14	3·90	6	9	6·5
" " Soluble I.	3·22	3·09	4	0·68	0·51	25	3·90	3·60	8	21	16·5
" " " II.	2·53	2·53	0	0·97	0·87	10	3·50	3·40	3	38	34
Gambier	2·57	2·57	0	0·95	0·60	37	3·52	3·17	10	37	23·5
Oak	2·17	2·01	7·5	1·31	0·53	60	3·48	2·54	27	60	26
Pine bark	2·12	1·90	10	1·73	1·18	32	3·85	3·08	20	82	62
Oak-wood extract	2·28	1·99	12·5	1·38	1·31	5	3·66	3·30	10	61	66
Knoppern	2·55	2·15	16	0·77	0·50	35	3·32	2·65	20	30	23
Trillo	2·49	1·92	23	0·83	0·75	10	3·32	2·67	20	33	39
Myrobalans	2·29	1·74	24	0·98	0·57	42	3·27	2·31	29	43	33
Valonia	2·45	1·73	29	0·82	0·64	30	3·27	2·37	30	38	37
Divi-divi	2·15	1·53	29	1·12	0·87	22	3·27	2·40	27	52	57

The results show that the liquors prepared from tannin materials and tannin extracts can be divided into different groups according to their behaviour on keeping. (1) Liquors which even after standing for 60 days show no perceptible diminution in the percentage of tannins, such as those prepared from mimosa bark, mangrove bark, sumach, quebracho wood and extract, and gambier. (2) Those which show a moderate (8—16 per cent.) diminution, such as oak bark, pine bark, oak-wood extract, chestnut extract, and valonia liquors. (3) Those which show a larger diminution of from 23 to 29 per cent., such as trillo, myrobalans, valonia, and divi-divi liquors. The author concludes that the insoluble matters deposited from the tannin liquors on standing are valueless from a tanning point of view.

—F. D. T.

Mangrove Barks, and Leather Tanned with these Barks, from Pemba and Zanzibar. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 163—166.

Zanzibar mangrove bark is said to be obtained from two different trees, "msinzi" (*Rhizophora mucronata*) and "mwi." The results refer to the air-dried bark:—

—	"Msinzi" from Pemba, 1901 Specimen.	"Msinzi" from Zanzibar.	"Magomi" from Pemba.	"Mkomafi" from Pemba.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Moisture	16·2	16·4	18·0	16·0
Total ash	..	5·65	7·39	7·51
Ash soluble in water	1·55	1·5	1·9	Traces
Total matter soluble in water	49·4	50·2	49·8	29·8
Tannin	31·3	35·8	32·8	23·2

The "mkomafi" bark is stated to be of no commercial value, but the "magomi" and "msinzi" barks would probably be worth from 3*l.* 10*s.* to 4*l.* per ton, c.i.f., Glasgow. Specimens of leather from Pemba prepared with "mkomafi" and "magomi" barks were valued as low-grade boot leather, worth, in the form of sides or whole hides, about 9*d.* per lb.

—A. S.

Leather; Influence of Self-contained Moisture upon the Strength of ——. M. Rudeloff. Mitt. königl. Materialprüfungsamt Gross-Lichterfelde-West, 1904, **22**, 8—47.

This investigation deals with the moisture naturally present in leather, as regards amount change in amount when the amount of moisture in the surrounding atmosphere (hereafter called "atmospheric conditions") changes, and the influence of such change on the extensibility and tensile strength of the leather. The communication is freely illustrated with tables and curve-diagrams. The following conclusions are drawn from the results. The amount of moisture in leather rapidly changes when the atmospheric conditions change. The change is rapid at first, but some days are required for complete equilibrium to be established. Equilibrium is more rapidly established when leather is losing moisture to the air than when absorbing it; but in both events the time required is longer for thick leathers than thin ones. Under similar atmospheric conditions different leathers in equilibrium hold different amounts of moisture, chrome-leather holding more than other kinds. Leather left in the air till of constant weight (in equilibrium holds a proportionately lower amount when the atmospheric moisture itself is small, and the proportion increases as the outside moisture rises, especially with chrome-leather. With increasing moisture content leather expands, the expansion being greatest when the moisture content, to begin with, is low. Chrome-leather stretches about 2·3 per cent. when the moisture is between 10 and 30 per cent., ordinary leather only 0·8 per cent. Under similar tensile stresses, mois leather stretches in general less than dry leather. As regards chrome-leather the tensile strength increases unti the moisture reaches about 50 per cent., whilst the tota stretch appears to reach a maximum at 30 per cent. o moisture. Ordinary leather appears to follow similar rules The experiments were conducted on strips of Rheuisl chrome-leather, oiled leather, and harness leather.—R. L. J

Albuminoids: Oxidation of —— by Calcium Permanganat I. Oxidation of Glue. Fr. Kutscher and M. Schenck Ber., 1904, **37**, 2928—2931.

Best commercial German gelatin (60 grms.) was dissolve by heating with 1 litre of water, oxidised with calcium permanganate (300 grms.), the solution filtered, and the lime removed by ammonium carbonate. From the filtrat there separated on evaporation first a somewhat insolubl ıbstance agreeing closely in properties with oxaluramide, though the percentage of hydrogen found was unduly igh, and finally a substance identified as ammonium xamate. Glycocoll is known to yield oxamic acid on xidation, and tho authors claim that their results further pport Kutscher and Zickgraf's theory that the so-lled hydrolytic decomposition products of albumin are ally pre-existent in the albumin. (Sitzungsber. d. königl. reuss. Akad. d. Wissensch., 1903, May 28.)—R. L. J.

FRENCH PATENT.

ides and Skins ; Apparatus suitable for Treating ——. C. Amidon. Fr. Pat. 343,237, May 17, 1904. Under Internat. Conv., Jan. 28, 1904.

EE U.S. Pat. 759,814 of 1904 ; this J., 1904, 671.—T. F. B.

XV.--MANURES, Etc.

hosphatic Manures ; Influence of Lime on the Action of ——. M. Nagaoka. Bull. Coll. Agric. Tokio Imp. Univ., 1904, **6**, 195. Chem.-Zeit., 1904, **28**, Rep. 291.

HE presence of lime retards the useful action of the hosphoric acid of organic fertilisers, the injurious influence f the lime, which persists up to the second crop after the pplication of the fertiliser, being twice as great in the case animal manures as in that of vegetable ones. The ganic constituents of the fertilisers, such as humus, minish the injurious effect of the lime. The relative anuring value of animal phosphatic manures is about rice that of vegetable fertilisers in the first year. In the cond year the relative value of vegetable fertilisers creases, but is always less than that of animal manures. —A. S.

XVI.—SUGAR, STARCH, GUM, Etc.

ugar Industry ; Application of Electrolysis in the ——. L. Gurwitsch. Z. Ver. Deutsch. Zuckerind., 1904, 1013—1045.

FTER a theoretical discussion of the subject and a review the processes hitherto patented, the author concludes at only three processes have a possible future, *viz.*, anodic ectrolysis with addition of lead saccharate (this J., 1902, 545), electrolysis with two diaphragms, and removal of kali metals by the aid of mercury cathodes. He further olds that electrolytic purification is less well adapted to the iginal juice or syrup than to the molasses.—W. A. C.

ilk-Sugar ; Hydration of —— in Solution. C. S. Hudson. J. Amer. Chem. Soc., 1904, **26**, 1065—1082.

N evaporating a solution of milk-sugar above 95° C., rge crystals of the anhydrous sugar separate out, whilst low this temperature the ordinary hydrated sugar is tained. The multi-rotation of either of these varieties in lution at 0° C. is shown to be due to a change in the state hydration. When a large excess of the ordinary hydrate agitated with water, a saturated solution corresponding an "initial solubility" is formed in a few minutes ; on rther agitation, dehydration takes place, and more sugar es slowly into solution up to a limiting "final solubility." t 0°, 15°, and 25° C. respectively, the initial solubilities are ·8, 20·9, and 25·3, and the final solubilities 34·8, 49·7, d 63·4, expressed in "millimols." per 100 grms. of water. —W. A. C.

ixtures of Sugars ; Melting Points of ——. H. Gillot. Bull. Acad. Roy. Belgique, 1904, 834—854. Chem. Centr., 1904, **2**, 890—891.

E author determined the melting points of the following ary mixtures of sugars :—Mannitol-dulcitol, mannitol-xtrose, dulcitol-dextrose, dulcitol-saccharose, dulcitol-tose, mannitol-saccharose, mannitol-lactose, saccharose-xtrose, saccharose-lactose, and lactose-dextrose. In no e was a simple isomorphous mixture produced, the dition of a small quantity of one sugar to another always ısing a lowering of the melting point. The forms of the lting-point curves of all the mixtures, except that of saccharose-lactose, point to the existence of definite compounds. The curve of the saccharose-lactose mixture consists of only two branches, the point of intersection corresponding to the eutectic mixture. The curve for the mixture of saccharose and dulcitol (the melting points of which lie close together) consists of two end portions inclined upwards, connected by a horizontal portion, but whether, as in the case of similar conductivity-curves of alloys, this form of curve indicates that isomorphous mixtures are formed by the sugars in the proportions corresponding to the horizontal portion, remains doubtful.—A. S.

Carbohydrates ; Action of Hydrogen Peroxide on —— in presence of Ferrous Sulphate. R. S. Morrell and A. E. Bellars. Brit. Assoc., 1904. Chem. News, 1904, **90**, 158—159.

In continuation of previous work (this J., 1902, 506 ; 1903, 1371), the change in optical activity of carbohydrates during oxidation with hydrogen peroxide in presence of ferrous sulphate, has been examined. In the case of the hexoses (glucose, fructose, and galactose), the decrease in the rotatory power is fairly proportional to the amount of peroxide added, up to 1 grm.-mol. of the latter. The diminution of optical activity is practically the same with glucose and fructose, but in the case of galactose, the decrease is much greater, and it was found that galactose yields a keto-acid of the hexose group rather than an osone. In the case of the bioses (maltose, lactose, and cane-sugar) there seems to be some connection between the diminution in optical activity on oxidation and the tendency to be hydrolysed. The order maltose, lactose, cane-sugar, forms an ascending series with regard to the tendency to be hydrolysed and the diminution in optical activity. Of the pentoses examined, arabinose lies between glucose and galactose with regard to the decrease in optical activity, but in the case of rhamnose, the original dextro-rotation changes to a lævo-rotation, the latter being due partly to the osone, and partly to an acid which is not rhamnonic acid.

In examining the action of bases on osones, it was found that an alcoholic solution of an osone when treated with guanidine gives a white semi-crystalline mass of the composition $CN_3H_5.C_6H_{10}O_6(C_2H_5OH)$. The guanidine compounds of glucose, fructose, galactose, arabinose, rhamnose, and maltose were also prepared. The glucose and maltose compounds are addition products of 3 mols. of the sugar with 2 mols. of guanidine. They give strongly alkaline aqueous solutions, from which the guanidine is completely and quantitatively removed by dilute mineral acids and oxalic acid. They are apparently not hydrolysed immediately by water, since the optical activity of their solutions is much less than that of the parent sugar. In the case of glucose, the specific rotation $[\alpha]_D = +29{\cdot}8°$ had become $[\alpha]_D = -5{\cdot}7°$ after five days. An aqueous solution of the compound neutralised by hydrochloric acid gave the same rotation as free glucose.—A. S.

Sugars ; Action of Methylphenylhydrazine on ——. R. Ofner. Ber., 1904, **37**, 3362—3363.

THE author has previously shown that pure benzylphenylhydrazine reacts with neither levulose nor dextrose. He now finds that methylphenyldextrosazone, which has been prepared by Fischer from glucosone and by Neuberg from levulose, may be obtained directly from dextrose itself ; the details of the preparation are given. In some cases, where an old sample of methylphenylhydrazine reddened by partial decomposition was employed, it was found that the primary - secondary phenylmethylphenyldextrosazone was formed with the methylphenyldextrosazone. It is evident that phenylhydrazine is formed in the spontaneous decomposition of methylphenylhydrazine, just as it is in that of benzylphenylhydrazine.—T. H. P.

Molasses ; Electrolytic Purification of ——. L. Gurwitsch. Z. Ver. Deutsch. Zuckerind., 1904, 1045—1059.

THE following process has been worked out on the laboratory scale, and is regarded as hopeful. The molasses, diluted with twice its weight of water, is electrolysed with vertical iron-mercury cathodes (this J., 1903, 872) ;

the anodic part of the cell is divided off by a septum of parchment-paper and charged with a 5 per cent. solution of calcium chloride, the anode being of iron. To prevent the deposition of iron at the cathode, the anodic liquor is continuously precipitated with milk of lime. The molasses, after electrolysis, is freed from calcium saccharate by means of carbon dioxide. In the most favourable experiment, purification by one "degree of purity" per 100 grms. of sugar was effected at an outlay of 4·48 watt-hours. The by-products are (1) mixed caustic alkalis in 25—30 per cent. solution, (2) a mixture of organic acids, suggested as a substitute for tartaric and citric acids in dyeing, and (3) precipitated ferric oxide, suitable for paint.—W. A. C.

Cochlospermum Gossypium D.C.; Gum of ——. P. Lemeland. J. Pharm. Chim., 1904, **20**, 253—260.

An examination of the gum of *Cochlospermum gossypium* furnished the following results:—Moisture, 22·72 per cent.; ash, 4·61 per cent.; the ash contains iron, calcium, and potassium as oxide and carbonate. 2·04 per cent. of the gum is soluble in water, the solution possessing a rotatory power of + 77·15. Determination of the galactans by Tollens' method gave 34·99 per cent. (expressed as galactose). No arabinose or sugar other than *d*-galactose could be isolated from the products. 22·59 per cent. of pentosans, equivalent to 25·64 per cent. of pentoses, was found. The total quantity of sugar could not be determined, owing to the difficulty experienced in hydrolysing the gum, the highest result obtained being less than the sum of the pentose and galactose. On oxidation with nitric acid, 71·8 per cent. of mucic acid (on the weight of gum used) was obtained.—T. F. B.

Keto-Hexoses; Reaction for ——. H. J. H. Fenton. XXIII., page 1001.

Saponarin: a Glucoside coloured Blue by Iodine. G. Barger. XXIV., page 1004.

English Patent.

Sugar; Annular Moulds for Treating —— *by Centrifugal Action.* J. C. F. Lafeuille, Paris. Eng. Pat. 26,779, Dec. 7, 1903.

The annular moulds serving for moulding and centrifugalising sugar slabs or loaves are cooled by causing liquids of gradually falling temperatures to circulate successively through the annular mould and round the separate moulds for slabs or loaves, the annular moulds being provided with means both for connecting them consecutively with the supplies of liquid and for discharging such liquids.—T. H. P.

United States Patent.

Sugar from Beets: Process of Making ——. M. Roeseler, Berlin, and A. Schaer, Holland, Mich. U.S. Pat. 770,700, Sept. 20, 1904.

The overflow from the centrifugals is freed from alkali salts by osmosis, the resulting liquid is treated with phosphoric acid to separate the surplus "alkalis" and a part of the organic non-sugar, the surplus phosphoric acid is neutralised by the oxide of an alkaline-earth metal, and the compound thus formed is precipitated by means of carbon dioxide and sulphur dioxide. The syrup so prepared is mixed with the fresh beet juice or concentrated syrup at any convenient stage of manufacture.—J. F. B.

French Patent.

Wood Cellulose: Process for Converting —— *into Sugar.* M. F. Ewen and G. H. Tomlinson. Fr. Pat. 343,006. May 9, 1904.

See U.S. Pat. 763,472 of 1904; this J., 1904, 797.—T. F. B.

XVII.—BREWING, WINES, SPIRITS, Etc.

Malt with Short Grown Acrospire. E. Prior. Woch. f. Brau., 1904, **21**, 571—572.

On several sides recommendations have been made to employ malts with short acrospires, averaging two-thirds the length of the corn, when it is desired to improve the fulness of body and permanence of head of the beer. The author thinks, however, that such recommendations introduce a danger of obtaining an inferior modification of the endosperm, and consequently unstable beers. The real meaning of such recommendations is that the malt should not be over-modified, as is frequently the case when th maltster strives to attain an average length of acrospire o three-quarters the length of the corn. No definite rule fo malting can really be laid down on a basis of the lengt of the acrospire. The acrospire must be developed unti complete modification of the endosperm is attained, an no longer. Above all, a malt with a restricted acrospir should never be kilned according to the Bavarian method In order to avoid both extremes of modification, the barle should not be over-steeped, and should be grown ver slowly with low temperatures in the couches. For Bavaria malt a somewhat fuller steep is necessary, and the treatmen on the floor should be made in two stages; the malt shoul be germinated very cool until the acrospire attains a lengt of half the length of the corn, and then it should be allowe to felt at least once, preferably twice, in order to develo the rootlet and complete the modification. The author i in agreement with the advocates of a short-grown acrospir only so far as that is a means of avoiding over-modifica tion, but in no case must the desire for a short acrospire b permitted to govern the treatment if the nature of th barley be such as to demand a longer growth for complet modification.—J. F. B.

Culture Yeasts: Abnormal Cell Forms of ——. W Henneberg. Woch. f. Brau., 1904, **21**, 563—566 an 579—581.

The author's studies were made principally with the di tillery yeasts Races XII. and II. The abnormal for described are not to be confounded with the ordina "giant" cells, which are abnormal only in size, nor wi the "reserve" cells studied by Will, which have not be observed in these yeasts. Most of the abnormal ce here described were obtained in the course of experime on the longevity of the yeast on storage, and they form a certain proportion of the cells which survived the vario tests. The mass of yeast in which they occurred was da brown in colour, having a neutral or faintly alkali reaction and the odour and taste of yeast-extract. Hen these abnormal forms originated under conditions of au digestion, in a medium highly charged with albuminoi and poisonous excreta; they are therefore pathologic forms. The greater portion of the pasty mass consist of dead cells, almost emptied by digestion, with cell wa intact and containing globules of fat and residues plasma; the normal living cells were very rich in fat a sporogenous. The abnormal forms observed compri "medium sized round cells" rich in fat or in albu granules, sometimes in both, "large round cells" c taining vacuoles, and irregularly shaped "broad cell similar in size to the large round cells. Many small ce still living, had either no, or very thin, invisible cell wa In many cases normal budding chains were observ originating from the medium round cells. Very rare certain irregular-shaped amœba-like cells were prese When transferred to a hanging drop of wort many of round and broad cells died owing to the change in c centration; some shrivelled up, others burst and oth showed double cell-walls. Those which survived swel considerably owing to the formation of large vacuoles, surrounding layer of protoplasm being observed to be of rapidly moving granules. In many cases the la round cells budded, forming equally large vacuola daughter cells, and their descendants gradually beca normal. In contradistinction to the original pasty m the drop-culture contained a large number of amœba- forms, which constantly changed their shape, but did possess much power of changing their position, some these forms were observed to contain nuclei. By observ the transition stages it was found that the amœba- forms were the products of the round and broad for the cell walls of the latter became very thin in pla then ruptured, and the plasma, still living, emerged in form of amœba. Whilst the large round cells lived for several days the amœba forms died in less than two days. The formation and study of all these forms is closely dependent on the extent of dilution; when the pasty yeast mass is diluted with water these forms cannot be observed: even wort is not favourable to their development if much of it be used. When a large dilution is desired for accurate observation it is necessary to employ the albuminous liquid decanted off from yeast which has been liquefied by digestion at 48° C. for 24 hours.—J. F. B.

Yeast; Testing the Homogeneity of ——. P. Lindner. Woch. f. Brau., 1904, **21**, 621–622.

When a sample of yeast is thoroughly homogeneous, all the cells have approximately the same size and appearance, all belong to the same species and are in the same physiological condition. When a pure yeast is first started u the propagating apparatus, it very rarely presents a omogeneous appearance, the cells being in all the different tages of development; it is not surprising that such a yeast hould give different results in the fermentation tuns from . brewery stock yeast which has been in continuous use nd which is generally homogeneous. The process of ashing the pitching yeast eliminates the light, budding east, leaving the agglomerated heavy mother-yeast at the ottom. If the washing has not been thorough, the ppearance of the yeast will not be homogeneous. For sting whether the yeast is homogeneous, the author ecommends that it be suspended in beer and prepared in e form of droplet cultures ["Federstrich-Kultur"] each ontaining a definite small number of original cells. In ese droplets there should be observed how many of the lls are capable of further budding, the form of the budding hains, how many descendants are produced by each cell in efinite times, and whether the descendants of the various lls are alike or different. The droplet test also gives a quantative expression for the degree of infection by wild yeasts, d the form of the budding chains indicates whether a top rmentation yeast is contaminated with bottom yeast. In me cases the cultivation of the yeast in a thin layer of er-gelatin (Will's test) is more delicate. According to hether the colonies are mulberry-shaped or extend in treamers," it can be ascertained whether the original cells ere of the fermentative form or film-cells of the first or cond generation. A preponderance of these film-cells dicates an excessive exposure to air. All the above servations should be made in order to study the influence variations in the brewing conditions upon the homogeneity the yeast.—J. F. B.

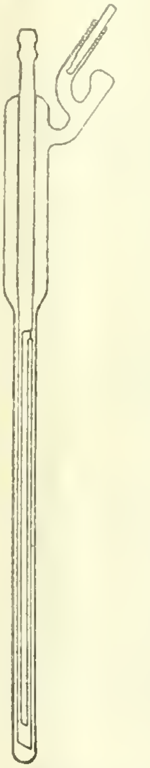
ymase and Endotryptase in Dead Yeast Cells; Activity of —— under various Conditions. T. Gromow and O. Grigoriew. Z. physiol. Chem., 1904, **42**, 299–329. Chem. Centr., 1904, **2**, 998.

e activity of the proteolytic enzyme (endotryptase) ntained in permanent yeast (zymase) prepared by means acetone (this J., 1902, 1033), is strongly diminished by no- and di-saccharides and polyhydric alcohols (glycerol, nnitol), the effect being greater, the stronger the concention of the added substances. Calcium chloride and tassium nitrate increase the activity of the endotryptase; ohol and quinine have an injurious effect. The amount of bon dioxide produced by zymase in the presence of fermentable substances (mannitol) is the same as that duced by autofermentation, therefore in both cases the mentation proceeds at the expense of the glycogen of the st. The cessation of the evolution of carbon dioxide is not to the exhaustion of the nutrient material, but to the haustion of the zymase. The concentration of the sugar tion and the percentage of oxygen in the surrounding osphere are without influence on the amount of carbon xide evolved. The amount of carbon dioxide is increased addition of quinine or alcohol, which injure the activity the tryptase and consequently allow of a longer life for zymase. Potassium nitrate and calcium chloride act in reverse manner, as they increase the activity of the teolytic enzyme. In almost all cases poisonous stances have directly opposite effects on zymase and tase. (See also this J., 1902, 60.)—A. S.

Brewery Wort; Simple Method for the Determination of the Degree of Infection of ——. F. Schönfeld. Woch. f. Brau., 1904, **21**, 622—623.

In order to control the sterility of the wort as it comes from the brewhouse or cooler, the author employs a glass plate, 15 cm. square, provided with 25 depressions, each capable of holding 0·4—0·5 c.c. of wort. This plate is sterilised and the hollows are filled with drops of wort delivered from a sterile pipette. Several of these plates are arranged in a wire cage, one above another, and the whole is covered with a sterilised bell jar in a moist atmosphere under aseptic conditions. Any germs present in the wort develop either in the form of concrete colonies or in the form of a turbidity. After a few days the plates are examined and the number of drops in which organisms have developed is counted. If the brewery conditions be good the number of infected drops will be very small. —J. F. B.

Beer Casks; Pressure Regulator for ——. F. Schönfeld. Woch. f. Brau., 1904, **21**, 623—624.



The author describes a new apparatus, invented at the Berlin Research Brewery, for maintaining a constant pressure in the beer-casks when bunged down for secondary fermentation. The apparatus, which is shown in the figure, consists of a narrow glass tube inserted in a wider tube, which is enlarged somewhat at the upper end. The narrow tube is connected by rubber tubing with the interior of the cask through the bung-hole, and carries inside it a still smaller vertical tube, which is fused on to an opening in the side of the inlet tube, and which serves for the discharge of the gases. The outermost tube carries a branch on its enlarged portion, which is provided with a trap of peculiar shape to prevent any loss of mercury by splashing, and this trap is connected with another branch, which carries the exit tube provided with a hole in its side. Mercury is placed in the apparatus in quantity sufficient to allow of the free discharge of the gases when a certain pressure is reached. The whole apparatus is enclosed in a wire cage and hung up above the cask.—J. F. B.

Denatured Spirits; Action of —— *upon Metals and upon Cement.* G. Heinzelmann. Z. Spiritusind., 1904, **27**, 399.

Strong spirit containing 95—96 per cent. of alcohol by volume both in the pure and in the denatured state is perfectly indifferent to any of the metals examined. But weaker spirit, such as that containing 90 per cent. by volume of alcohol has, when denatured, a considerable oxidising and solvent action upon many metals. In contact with cement, the spirit becomes yellow and the non-volatile residue increases to a very considerable extent, the lime salts of the lower members of the fatty acid series being found in solution. Cement linings for iron storage vessels containing spirits are therefore condemned. The 90 per cent. denatured spirit acts most powerfully upon zinc and lead, the liquid becoming opalescent and ultimately depositing white precipitates, and the non-volatile residue being increased owing to the solution of metallic salts. Its action upon iron is somewhat less, but a considerable formation of a brown deposit of oxide occurs a er some time; this deposit is, however, readily separated by filtration. The action upon copper and brass is not great, but the spirit acquires a greenish-blue colour, and copper salts are present in the non-volatile residue. Tin and tinned metals are absolutely unattacked by 90 per cent. denatured spirit, the tinned metals only being corroded in places where the layer of tin has been scratched. Vessels of tinned iron are the most satisfactory receptacles for denatured spirits. Whilst the presence of the water plays a certain part in the corrosion of metals by the spirit, the main cause is to be attributed to the crude methyl alcohol present in the denaturing agent; pyridine is without action upon metals. —J. F. B.

English Patents.

Yeast Extracts; Process for freeing —— from Bitter Principles. C. A. Jensen, London. From R. Deissler, Berlin. Eng. Pat. 24,294, Nov. 9, 1903.

The yeast extracts are treated, before or after the removal of the cell-residues and before or after concentration, with a suitable proportion of an oxidising agent, such as ozone or a peroxide. For instance, the extract may be concentrated to half its volume and treated with hydrogen peroxide in the proportion of 60—100 c.c. per kilo. of concentrated extract, then boiled and clarified.—J. F. B.

Brewing; Art of ——. J. Schneible, Weehawken, U.S.A. Eng. Pat. 14,028, June 21, 1904.

In this process, the peptonised malt mash is brought to a pre-determined converting temperature without permitting diastatic action at any other temperature. This is effected by thoroughly and immediately mixing the peptonised malt mash with either a heating medium or a cooked (unmalted cereal) mash at a higher temperature.—T. H. P.

Wine, Must, Beer, Beetroot Juice, and the like: Treatment [Concentration] of ——, and Apparatus therefor. E. Monti, Turin, Italy. Eng. Pat. 19,645, Sept. 11, 1903. Under Internat. Conv., Sept. 12, 1902.

See Fr. Pat. 324,474 of 1902; this J., 1903, 567.—T. F. B.

Antiseptic Compound, and Process of Making same. Endermann, New York. U. S. Pat. 770,275, Sept. 2 1904.

Rosin is treated with caustic alkali to convert it into ros size, and the latter is then subjected to the action of pe manganic acid. The oxidised product is soluble in h water and in alcohol, less soluble in ether and partia soluble in benzene and chloroform. It has a bitter tast and melts between 105° and 125° C.—J. F. B.

French Patent.

Vaporisation of various Substances [Disinfectants, &c. Apparatus for the ——. P. Castanet, Fr. Pat. 343,1 May 14, 1904.

The apparatus is intended for the vaporisation of substanc affecting the respiratory organs, and for disinfecting a scenting purposes. It consists of a hollow metal truncat cone or cylinder, perforated by a number of holes at the and bottom. Inside this metal vessel is placed a paraf burner, and on top of it a box containing a mixture magnesium carbonate, trioxymethylene, eucalyptus oil, a turpentine. The magnesium carbonate may be replac y talc, calcined magnesia, or some porous earth. Metal ubes are embedded in the mixture to assist the liberation of apours.—L. F. G.

XIX.—PAPER, PASTEBOARD, Etc.

English Patents.

aper Machines; Shower-pipes or Cleansing Apparatus for ——. F. W. Howarth, London. From The Sandusky Foundry and Machine Co., Ohio, U.S.A. Eng. Pat. 20,840, Sept. 28, 1903.

or cleaning the wire and rolls of the paper machine a hower pipe is provided having a line of discharge orifices. "longitudinal member" fits over the pipe and carries a ongitudinal plate projecting obliquely to the orifices. The prays of water issuing from the orifices impinge on the eflecting plate and are directed by the latter in the form of continuous sheet of water against the part of the machine o be cleansed. By duplicating the line of orifices, and aving a second deflecting plate on the "longitudinal ember," two sheets of water can be discharged in opposite irections from the same shower pipe.—J. F. B.

elluloid or the like; Method of Imparting Lustre to Objects made of ——. W. Homberger, Brugg, Switzerland. Eng. Pat. 17,232, Aug. 6, 1904.

he glacial acetic acid used for imparting lustre to celluloid bjects is replaced by acetic anhydride, alone or mixed ith acetic acid, and preferably mixed with benzene, toluene, hloroform, or similar organic solvent. A suitable mixture onsists of 2 parts of acetic anhydride, 2 parts of toluene, nd 1 part of glacial acetic acid.—T. F. B.

United States Patent.

ood; Method of Treating [Distilling], —— for the Production of Paper Pulp, Turpentine, &c. W. Hoskins. U.S. Pat. 770,463, Sept. 20, 1904. XIII. B., page 990.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Papaverine. M. Freund and H. Beck. Ber., 1904, **37**, 3321—3324.

y the electrolytic reduction of papaveraldine sulphate, mploying lead poles and a porous cell, the authors btained, with the elimination of the carbonyl oxygen, a econdary base having the formula $C_{20}H_{25}NO_4$. This ormula corresponds with that of tetrahydropapaverine, but e new compound is not identical with that body. The ew base has been termed provisionally *isotetrahydroapaverine*; it yields a crystalline nitroso-compound elting at 138° C., and its hydriodide crystallises in small hite columns, which begin to soften and turn yellow at 45° C. and melt at 255° C. The ethereal solution of the ase, when treated with methyl iodide, yields a yellowish-rown crystalline powder, which is apparently the hydriodide f the methylated base.—J. F. B.

erpenes and Essential Oils. O. Wallach. Annalen, 1904, **336**, 1—46. [68th and 69th Communications.]

he 68th communication deals with the behaviour of the itrites of some cyclic hydrocarbons (indene and methylindene). The 69th article treats of phellandrene, described s a hydrocarbon, $C_{10}H_{16}$, which in contact with nitrous nhydride, N_2O_3, in an indifferent anhydrous solvent ligroin) at a temperature below 0° C. yields immediately well characterised nitrate. The *d*-phellandrene prepared om elemi oil is chemically and physically identical with at from bitter fennel oil. The *l*-phellandrene present in ustralian eucalyptus oil is the optical antipode of the ove-mentioned *d*-phellandrene. The *d*-phellandrene of ater-fennel oil is chemically different from the *d*-phellandrene of elemi and bitter fennel oils. The name α-phellandrene is proposed for that modification present in elemi and itter fennel oils in the *d*-form, and in eucalyptus oil in the *l*-form; and β-phellandrene for the modification contained in water-fennel oil. The experimental work is described under the following headings:—I. α-Phellandrene: (1) its nitrite; (2) action of nitric acid on the nitrite; (3) action of hydrochloric acid on the nitrite; (4) action of sulphuric acid on the nitrite; (5) conversion of α-phellandrene into active carvotanacetone. II. β-Phellandrene.—A. S.

Lemon-grass Oil from Montserrat. Bull. Imp. Inst. (Suppl. to Bd. of Trade J.), 1904, **2**, 166—167.

The sample of oil examined, was obtained from *Andropogon nardus* L., var. *genuinus* Hack, which is commonly known as the true lemon grass. It was soluble to the extent of about 97 per cent. in 70 per cent. alcohol. On distillation it yielded about 25 per cent. between 180 and 220° C., and 50 per cent., consisting chiefly of citral, between 220 and 230° C. The results obtained on examination of the oil are given in the following table, together with the corresponding figures for commercial lemon-grass oil distilled in India from *Andropogon citratus*.

——	Montserrat Lemon-grass Oil.	East Indian Lemon-grass Oil.
Sp. gr. at 15° C.	0·906	0·899—0·903
Optical rotation in 100 mm. tube.	− 0° 10′	+ 1° 25′ to 3° 5′
Percentage of citral (by sodium bisulphite method).	74·6	70—75

The East Indian oil is completely soluble in 70 per cent. alcohol. The Montserrat oil is valued at 5*d*.—6*d*. per ounce.—A. S.

Gymnema Leaves: Chemical Examination of ——. F. B. Power and F. Tutin. Brit. Pharm. Conf., Aug. 1904. Pharm. J., 1904, **73**, 234—239.

From an alcoholic extract of the leaves of *Gymnema sylvestre* there was precipitated by the addition of water, a quantity of soft, dark-coloured resinous matter, of an acid nature. The greater part of the precipitate was soluble in petroleum spirit, and from the extract after treatment with an alcoholic solution of potassium hydroxide, hentriacontane, $C_{31}H_{64}$, m. pt. 68° C. was isolated by shaking out with ether (yield 0·05 per cent. on the weight of the leaves). The alkaline solution when acidified and distilled, yielded formic acid and a butyric acid. The filtrate from the precipitated resinous matter yielded, when acidified with sulphuric acid, a quantity of dark-coloured resinous matter, the "gymnemic acid" of Hooper (Chem. News, 1889, **59**, 159). The authors find, however, that this precipitate is an impure and complex mixture of substances. By treatment with ethyl acetate about 35 per cent. of it was extracted, and this portion possessed the property characteristic of gymnema leaves of destroying the sense of taste for sweet substances. The name "gymnemic acid" is retained for this portion soluble in ethyl acetate, which is also readily soluble in alcohol, but insoluble in ether, chloroform, benzene, and water. It is not a glucoside, but has very weak acidic properties. When fused with potassium hydroxide, it yielded acetic acid and a molecular compound of protocatechuic and *p*-hydroxybenzoic acids. The portion of the resinous matter insoluble in ethyl acetate was readily soluble in alcohol. It is of an acidic nature, but has no anti-saccharine property. When fused with potassium hydroxide it yielded formic acid, and apparently a small amount of acetic acid, together with the molecular compound of protocatechuic and *p*-hydroxybenzoic acids previously mentioned. The original aqueous solution from which the preceding substances had been separated contained a *l*-quercitol (see this J., 1904, 797) associated with optically inactive glucose. No evidence could be obtained of the presence in the leaves of *Gymnema sylvestre* of a cyanogenetic compound, such as was observed by Greshoff in the leaves of *G. latifolium* (this J., 1891, 268). Neither gymnemic acid nor the resin insoluble in ethyl acetate possess toxic properties. The fruits of *Gymnema sylvestre* appear to have the same constituents as the leaves, but no quercitol could be obtained from them.—A. S.

Nux Vomica Extract: Official Process for —— in the Forthcoming [French] Codex. E. Bourquelot. J. Pharm. Chim., 1904, **20**, 289—293.

In view of the decision of the Brussels Internat. Pharm. Conf. in 1902, the official extract of nux vomica of the Codex is to be standardised to contain 16 per cent. of total alkaloids. The drug is directed to be extracted by the macero-percolation method with 70 per cent. alcohol; the percolate, after distilling off the alcohol, is concentrated by evaporation to about 150 grms. for every 1,000 grms. of drug used, diluted with 50 c.c. of water, and fat removed by shaking out with three successive 50 c.c. of ether. The mixed ethereal extracts are distilled, and the oily residue is washed free from alkaloids with 15 c.c. of boiling water rendered acid with acetic acid. This acid solution is then added to the aqueous ether-washed extract, and the whole is evaporated to about 200 grms., or until all trace of ether has been driven off. The amount of dry extractive and of total alkaloids are then determined in aliquot portions of the liquid.

Determination of the Alkaloids.—Four grms. of the liquid are treated in a separator with 20 c.c. of a mixture of 95 per cent. alcohol, 2 vols.; solution of ammonia (sp. gr. 0·960) 1 vol.; distilled water, 1 vol. After thorough agitation, the mixture is shaken out first with 20 c.c. then with two successive 15 c.c. of chloroform. The combined chloroformic extracts are evaporated to dryness, and the dry alkaloidal residue is taken up with 20 c.c. of N/10 sulphuric acid and 50 c.c. of distilled water, the whole being heated for 15 minutes on the water-bath to effect solution. The acid liquid is filtered, the filter washed, and the final volume of filtrate adjusted to 200 c.c. 50 c.c. of this (equivalent to 1 grm. of the original extract) are then titrated back, in the presence of 20 c.c. of ether, with N/100 sodium hydroxide solution, using 5 drops of a 0·2 per cent. solution of Iodeosin as indicator. The number of c.c. of N/100 alkali used is divided by 10; 5 is subtracted from the result, the product multiplied by 0·0364 (the mean equivalent of brucine and strychnine) gives the percentage of total alkaloid in the original liquid. From these data, and the amount of dry extractive found, the quantity of milk sugar to be added to give a dry extract containing 16 per cent. of total alkaloids, is calculated. This amount having been added, the whole is evaporated to dryness, powdered, and preserved in well closed vessels.

French Patents.

Chlorostyrolene; Process of Making ——. M. Dinesmann. Fr. Pat. 338,904, July 4, 1903.

Phenyldichloro-acetaldehyde, obtained by condensing chloral with benzene in presence of aluminium chloride, is converted, by treatment with zinc dust and acids, into monochlorostyrolene. By replacing the benzene in the condensation with homologues of benzene, the corresponding homologues of chlorostyrolene are obtained. These latter, as well as chlorostyrolene itself, are applicable in perfumery.—T. F. B.

Hydroxybenzaldehydes and Hydroxybenzoic Acids; Production of Sulphonic Ethers of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,908, July 4, 1903.

See Eng. Pat. 17,347 of 1903; this J., 1904, 798.—T. F. B.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Photographs in Natural Colours by the Three-Colour Process; Use of Leuco-bases for the Preparation of ——. E. König. Ges. deutsch. Naturforscher u. Ärzte, Sept. 1904. Z. angew. Chem., 1904, **17**, 1513—1514.

Leuco-bases when exposed to light are oxidised to the corresponding dyestuffs in a more or less short time. In applying this property to the preparation of coloured photographs, a collodion-emulsion gives the best results, the oxidation of the leuco-bases in this medium, especially in presence of quinoline, proceeding very rapidly, probably by the action of the nitro groups of the nitrocellulose. In carrying out the process a suitable support is coated with a film of a collodion-emulsion containing a dissolved leuco-base of a blue dyestuff and some quinoline. This is covered with the negative of the photograph to be printed, exposed, and the image fixed by treatment with chloro-acetic acid. These operations are repeated after applying (1) an emulsion containing a leuco-base of a red dyestuff and (2) one containing a leuco-base of a yellow dyestuff.—A. S.

Wood: Action of —— on a Photographic Plate in the Dark. W. J. Russell. Proc. Roy. Soc., 1904, **74**, 131—134.

All woods are found to possess the property of producing images of themselves on a photographic plate in the dark. The wood has to be in contact with, or a short distance from, the plate for from half an hour to 18 hours, at a temperature not above 55° C. The wood of the conifers is very active, and this activity is thought to be largely due to the resinous substances present; in most cases the light rings of the wood are active, but in the case of the Scotch fir the effect is caused by the darker portions. Oak, beech, Spanish chestnut, and sycamore woods are also very active, whilst ash, elm, horse chestnut, and plane are but slightly so. The active constituents of the wood appear to be the resinous substances, and it was found to be extremely difficult to remove them so completely that the wood becomes inactive. If a portion of the wood be exposed to bright sunlight the activity was greatly increased: comparatively inactive woods, such as elm, showed considerable activity after such exposure. Exposure to red or green light gave little or no increase in activity, but the action of blue light was almost as great as that of white light in increasing the activity of the wood. Resin, guaiacum, copal, and turpentine showed a similar increase in activity under blue light. (See also von Aubel, this J., 1904, 560.)—T. F. B.

English Patent.

Pigment Photographic Process. H. Schmidt, Berlin. Eng. Pat. 17,610, Aug. 12, 1904.

Bichromated pigment paper is pressed while wet on a thin transparent sheet of mica, celluloid, or similar material, dried, and a print made on it through the transparent "carrier." Development is carried out as usual, the transparent sheet forming the temporary support, from which the picture is easily detachable. The degree of adhesion between the gelatin and the support can be modified by previously treating the support with wax, varnish, rubber, or other suitable substance.—T. F. B.

French Patent.

Cyanines [for Photographic Purposes]; Process for Making new ——. Act. Ges. f. Anilinfabrikation. Fr. Pat. 342,656. April 26, 1904.

Unlike the α-naphthoquinaldine derivatives, β-naphthoquinaldine alkyl halides react with the alkyl halides of quinoline or *m*- or *p*-toluquinoline in presence of alkali hydroxide in aqueous solution to form Cyanines. Naphthoquinaldines will not react in a similar way with naphthoquinolines, but the alkyl halides of both α- and β-naphthoquinolines form Cyanines with quinaldine or with *m*- or *p*-toluquinaldine in the usual manner. The Cyanines thus prepared, containing the naphthalene nucleus, are of great value for colour-sensitising photographic emulsions, giving greater sensitiveness for orange and red than other known Cyanines, and at the same time causing no diminution of sensitiveness for the colours at the other end of the spectrum.—T. F. B.

XXIII.—ANALYTICAL CHEMISTRY.

INORGANIC—QUALITATIVE.

Nickel Salts; Reaction of Potassium Nitrite with ——. C. Reichard. Chem.-Zeit., 1904, **28**, 885—886 and 912.

The triple nitrites of nickel, potassium, and alkaline earth metals (this J., 1904, 683) are readily distinguished from potassium cobalt nitrite by their greenish or dingy-yellow colour, and by their behaviour with boiling water, in which the cobalt salt dissolves with a red, the nickel salt with a green colour. Again, whilst the presence of acetic acid is necessary for the precipitation of the cobalt salt, it absolutely prevents that of the nickel compounds. This difference may perhaps be made use of in the technological separation of nickel, along with barium, strontium, or calcium, from cobalt. The after separation of nickel from he alkaline-earth metal is an easy matter. For the preparation of these nickel compounds pure potassium nitrite should be used; but if a commercial nitrite containing hydroxide be used, the triple salt can be freed from coprecipitated nickel hydroxide by dissolving in boiling water, iltering, and cooling; repetitions of this will also purify it rom excess of potassium nitrite or of alkaline-earth, though here is considerable loss from the solubility of the compound n cold water. All of these compounds are destroyed by acids, even by acetic acid. Alkalis act but slowly on them in the cold, more rapidly when heated; the precipitate ormed by sodium hydroxide is nickelous hydroxide, while that formed from potassium cobalt nitrite is obaltic hydroxide—so that the nickel compounds are ltogether different in constitution from the cobalt salt. Analysis shows that these compounds have the formula $Ni.(NO_2)_2.M(NO_2)_2.2KNO_2$, where M = Ba, Sr, or Ca. —J. T. D.

Arsenic; Reports and Recommendations with reference to the Tests for Detection of —— in the Drugs of the British Pharmacopœia. Presented to the Pharmacopœia Committee of the General Medical Council. May 1904. W. R. Dunstan and H. H. Robinson.

Proposed Tests.—The freedom of any drug from arsenium (As) is to be proved by comparing the stain yielded when it is submitted to one of the following tests, with that given by a known volume of *Liquor Arsenici Hydrochloricus* suitably diluted, submitted to the same test.

Test A.—An aqueous solution of 4 grms., or the prescribed quantity, of the drug to which 5 c.c. or more of hydrochloric acid have been added, is diluted to 25 c.c. with water, and introduced into a test-tube having a diameter of about 18 mm. and a length of 18 to 20 cm. Granulated zinc, sufficient to reach about two-thirds of the height of the liquid is then added. Immediately, a small plug of cotton wool, and then another plug of cotton wool which has been soaked in lead acetate solution and dried are inserted, so as to leave a short space between the two plugs; a closely fitting cap formed of two pieces of filter-paper which have been soaked in mercuric chloride solution and dried, is then fitted over the mouth of the test tube. The test must be allowed to continue for 2 hours at least; the test paper is then examined, in daylight, for a yellow stain. The test should be performed in a place protected from strong light. Ten c.c. of the *Liquor Arsenici Hydrochloricus* are diluted to 75 c.c. when 1 c.c. of the solution contains 0·001 grm. of arsenium. Four c.c. of this solution diluted to 1000 c.c. afford the standard solution, each c.c. of which contains 0·004 mgrm. of arsenium and is equivalent, for purposes of comparison with 4 grms. of the drug, to 1 part per 1,000,000. Therefore the yellow stain from 4 grms. of the drug should be paler than the yellow stain from 3 c.c. of this solution mixed with water and with 5 c.c. or a suitable quantity, of hydrochloric acid, diluted to 25 c.c. and tested in a similar manner and at the same time. The dilute arsenical standard solution should be freshly prepared.

When the drug cannot be conveniently dissolved in 25 c.c. of liquid or when frothing occurs, the test may be conducted in a small flask, the stain being compared with the standard stain obtained under similar conditions.

The yellow stain due to sulphur is soluble in less than 10 minutes in a few c.c. of hydrochloric acid, whereas that due to arsenium changes to an orange colour and persists for one or two hours. The zinc employed should first be washed for a few seconds with hydrochloric acid, and then with water, shortly before use, to remove any adherent sulphur compounds.

Test B.—Four grms. of the drug are introduced into a 60 c.c. distillation flask, with 2 grms. of potassium metasulphite, and 22 c.c. of a mixture of hydrochloric acid and water in such proportions that, after reaction, "there shall be hydrochloric acid solution approximately of the constant boiling strength, that is, 20 parts of free hydrochloric acid to 80 parts of water." The flask is then attached to a condenser the internal tube of which should not exceed 8 mm. and heated gently for one hour to reduce any arsenic compounds. It is then distilled until three-fourths have passed over; the distillate is partially neutralised with strong solution of ammonia, so as to leave unsaturated about 4 c.c. of the 20 per cent. hydrochloric acid (1 c.c. of strong solution of ammonia neutralises 2·8 c.c. of 20 per cent. hydrochloric acid). Some distillates, especially those from antimony and bismuth compounds, effervesce with zinc more violently than the solutions of other substances, so that in these less than 4 c.c. of acid should be left un-neutralised. The sulphur dioxide in the distillate is then removed by means of bromine solution until the red colour is permanent, on warming for a minute or two. Excess of bromine is then removed with solution of hydroxylamine hydrochloride until the liquid is colourless. The liquid is then diluted to 25 c.c. with water, and the process completed as described under Test A. When effervescence has ceased, a further addition of hydrochloric acid should be made to ensure that all the arsenium has been evolved. The stain obtained is compared with that from 3 c.c. of the dilute standard solution submitted to the same process.

Methods for particular Drugs.—Modifications of the above tests to meet the special requirements of the case are given in minute detail.

Proposed Limits.—Those drugs which are directed not to yield any characteristic reaction with the tests for arsenium should contain less than 3 of arsenium : 1,000,000, equivalent to 4 of arsenious anhydride : 1,000,000, except in the case of citric and tartaric acids, which should contain less than 1 of arsenium : 1,000,000; of hydrochloric, nitric, and sulphuric acids, which should contain less than 0·3 : 1,000,000; and of stronger solution of ammonia, which should contain less than 0·1 of arsenium : 1,000,000.

Suggested Additions to the List of Drugs which should give no characteristic Reaction for Arsenium :—

Acidum boricum ; Acidum citricum ; Acidum salicylicum ; Adeps lanæ (lanoline) ; Alumen ; Ammonii bromidum ; Ammonii carbonas ; Calcii carbonas præcipitatus ; Calcii chloridum ; Calcii hydras ; Calx ; Ferri sulphas ; Ferrum ; Ferrum redactum ; Gelatinum ; Glusidum (saccharin) Iodum ; Liquor hydrogenii peroxidum ; Magnesia levis ; Magnesia ponderosa ; Magnesii carbonas levis ; Magnesii carbonas ponderosus ; Magnesii sulphas ; Phenacetinum ; Phenazonum (antipyrine) ; Potassii carbonas ; Potassii chloras ; Potassii citras ; Potassii tartras ; Potassii tartras acidus ; Quininæ hydrochloridum ; Quininæ hydrochloridum acidum ; Quininæ sulphas ; Sapo animalis ; Sapo durus ; Soda tartarata ; Sodii bicarbonas ; Sodii carbonas ; Sodii hypophosphis ; Sodii phosphas ; Sodii sulphas ; Sulphonal ; Syrupus glucosi.

Test B. or a modification thereof is employed in the case of antimony, bismuth, copper, iron, and lead salts, gelatin, and quinine salts. The remaining drugs are to be tested by Test A. unless they contain iron, when Test B. must be substituted.—J. O. B.

INORGANIC—QUANTITATIVE.

Sulphur; Photometric Determination of —— in Coal. S. W. Parr and C. H. McClure. S. Amer. Chem. Soc., 1904, 26, 1139—1143.

The coal is burnt in a bomb with sodium peroxide, and after dissolving the residue, the sulphuric acid is precipitated as barium sulphate, and the amount of the latter determined "photometrically." To obtain concordant results, 100 c.c. of the slightly acid solution are treated with the requisite amount of the barium salt, *e.g.*, chloride, in crystals, and when these have dissolved, the whole is heated to 70° C., allowed to stand for half an hour, cooled, and then examined "photometrically." The apparatus consists of a tube, graduated in millimetres, with a carefully blown round bottom, ground on the outside. The tube stands in a flask containing water, which rests on a glass plate placed upon a carbon plate about $\frac{5}{8}$ in. thick, having a $\frac{1}{4}$-in. hole in the centre. An ordinary candle is arranged about 10 ins. vertically below the hole in the carbon plate. The liquid containing the precipitated barium sulphate is filled into the graduated tube until the light from the candle-flame, as observed through the column of liquid, is extinguished. A table is given showing the relation of sulphur content to height of column of liquid through which the light can no longer be seen; but operators are advised to check or replace it for themselves, using a standard solution of potassium sulphate.—W. A. C.

Sodium Water-Glass; Analysis of ——. P. Heermann. Chem.-Zeit., 1904, 28, 879—880 and 883—884.

The free alkali in water-glass may be determined after precipitation of the silicate by (1) salt solution and alcohol, or (2) barium chloride. (1) A mixture of 10 grms. of water-glass, 100 c.c. of water, and 20 c.c. of saturated salt solution is made up to 250 c.c. by the addition of neutralised alcohol. The solution is then filtered, and 100 c.c. of the filtrate are titrated with N/10 acid and phenolphthalein. (2) This very old method has fallen into disuse largely because the conditions necessary for accuracy were only imperfectly understood. The most important source of error lies in the solubility of freshly-formed hydrated barium silicate which is perceptibly soluble in cold, much more so in hot, water and very much less so in alcohol, sodium chloride solution, or barium chloride solution. By working in the cold with a minimum volume of liquid, and adding a considerable excess of barium chloride, satisfactory results are obtained, as follows : To 10 grms. of water-glass add 100 c.c. of water, then, in a slow stream and with constant agitation, 100 c.c. of barium chloride solution, containing at least 10 grms. of the anhydrous salt. Make up to 250 c.c., shake well, filter at once through a dry paper, throw away the first 20—30 c.c., and titrate 100 c.c. of the filtrate with N/10 acid and phenolphthalein. On the whole the author regards this method as preferable to that given under (1). A high alkalinity in water-glass has both advantages and disadvantages as regards its use in the treatment of silk. The more alkaline it is the more stable in presence of acid reagents; the more acid (*i.e.*, the higher in silica) the more readily is it decomposed, but the more silica does it deposit in the fibre. As the substance is very cheap, and the bath can be readily renewed, a high silica-content is most advantageous, but this must not be carried so far as to render the product viscous or unfilterable. In practice, the ratio $SiO_2 : Na_2O = 3·1—3·2 : 1$ is most usual, equivalent to a "basicity-number ($SiO_2 : Na$)" of at least 4. A *résumé* of the usual methods for determining total alkali, silica, and neutral salts concludes the paper.—J. T. D.

Ozone; Quantitative Precipitations and Separations by means of —— [Determination of Manganese]. P. Jannasch and W. Gottschalk. Ber., 1904, 37, 3111.

A preliminary communication. By leading ozonised oxygen through a solution of ammonium-manganese sulphate rendered acid with acetic acid, manganese peroxide was precipitated, yielding Mn_3O_4 equivalent to 19·28 per cent. of the substance taken, against 19·50 per cent. calculated. In the filtrate no manganese could be detected by any of the usual reagents.—J. T. D.

Phosphorus in Solutions; Quantitative Determination of ——. A. C. Christomanos. Z. anorg. Chem., 1904, 41, 305—314.

In determining phosphorus in ether or benzene solutions, the solution containing the phosphorus, it is proposed, shall be weighed in a tared glass flask, shaken for some minutes with excess of a 10 per cent. solution of copper nitrate, and the ether or benzene expelled by heating on a water-bath for 15—20 minutes. Bromine is then added gradually, with shaking, to the warm liquid, till the whole of the black copper phosphide is decomposed. The excess of bromine is now expelled and the phosphorus compounds oxidised to phosphoric acid by heating with excess of concentrated nitric acid. Ammonia is added till the light-blue copper hydroxide which separates is re-dissolved, and the phosphoric acid is determined in the usual way as magnesium pyrophosphate.—A. S.

Lead [in Brass, Bronze, &c.]; Determination of ——. E. J. Ericson. J. Amer. Chem. Soc., 1904, 26, 1135—1139.

The author modifies the method of Walters and Affelder (this J., 1903, 927) by leaving the iron, which must not be excessive, together with the lead, and by substituting a permanganate titration for the iodometric one. In a bronze analysis, 25 c.c. of strong ammonia are added to the filtrate from tin, then gradually 3—4 grms. of ammonium persulphate; the liquid is boiled for five minutes, the precipitate allowed to settle, and collected on a filter; it consists of lead peroxide and ferric hydroxide; this is then washed with dilute ammonia (1:5) until free from copper and then 4—5 times with hot water. The precipitate and filter are returned to the beaker and agitated with 25 c.c. of hydrogen peroxide reagent (900 c.c. of water, 50 c.c. of concentrated nitric acid, 15 c.c. of hydrogen peroxide U.S.P.). After reaction 20 c.c. of nitric acid (sp. gr. 1·28) and 150 c.c. of water are added, the liquid again agitated, and titrated with permanganate of such strength that 1 c.c. = 0·002 grm. of iron = 0·00381 grm. of lead.

—W. A. C.

Copper; Electrolytic Assay of ——. G. L. Heath. J. Amer. Chem. Soc., 1904, **26**, 1120—1124.

In carrying out the following processes for the exact determination of copper, the weighing out of large quantities of substance, up to 5 grms., is advocated. The figures given, however, refer to 1 grm. of substance. For metal containing arsenic and antimony, but less than 0·01 per cent. of nickel, cobalt, and zinc together, dissolve in 10 c.c. of nitric acid, evaporate with 10 c.c. of concentrated sulphuric acid until the residue is white, take up with 70 c.c. of water, add 1 c.c. of nitric acid and just enough ammonia to redissolve, and electrolyse. For metal containing much selenium and tellurium, but only traces of antimony, and less than 0·02 per cent. of arsenic, treat with nitric and sulphuric acids as above, dissolve in 60 c.c. of water, heat nearly to boiling, pass in pure sulphur dioxide for 10 minutes, settle overnight, filter, and boil off the sulphurous acid. Ignite the filter, dissolve the ash in 1·5 c.c. of nitric acid, add to bulk of liquid, and electrolyse. For metal containing over 0·01 per cent. of antimony and other elements, heat with nitric and sulphuric acids, dissolve in 70 c.c. of water, add 1 c.c. of ferric nitrate solution (1 c.c. = 0·01 grm. of iron), boil, precipitate with ammonia, filter, and wash. Dissolve in dilute sulphuric acid and re-precipitate, adding filtrate to bulk. Redissolve and pass sulphuretted hydrogen, extract the precipitate with a little hot dilute sodium sulphide, ignite, dissolve in 1·5 c.c. of concentrated nitric acid, and add to bulk. Acidify the collected liquors with sulphuric acid, concentrate to a suitable volume, and electrolyse. For metal containing much arsenic, but at most 0·01 per cent. of antimony, dissolve 5 grms. of the copper in nitric acid, dilute to 50 c.c. and add 3 c.c. of concentrated sulphuric acid. Add ammonia until a slight permanent precipitate forms, redissolve by 1 c.c. of sulphuric acid (sp. gr. 1·84), and stir in dry powdered ammonium nitrate to saturation, and electrolyse.

—W. A. C.

ORGANIC—QUALITATIVE.

Fatty Oils; Colour Reactions of —— [Lignin Reaction]. H. Kreis. Chem.-Zeit., 1904, **28**, 956—957.

An account is given of further experiments with the phenoloid substance, sesamol (this J., 1903, 575, 1210). Sesamé oil thoroughly shaken with successive portions of cold alcohol did not give the characteristic colour reaction with diazonaphthionic acid (termed by the author the "sesazo reaction") nor did it give the green coloration with nitric acid (sp. gr. 1·4), though it still reacted with resorcinol (after about one minute), and with stannous chloride, phosphomolybdic acid, and solution of vanadic acid in sulphuric acid. On distillation of the alcoholic extract a dark brown oily liquid consisting in the main of fatty acids was left. The fatty acids were converted into calcium salts and filtered off, and the filtrate shaken with ether. The ethereal extract on evaporation left about 0·5 c.c. of a viscous dark brown oil (from 1·5 kilos. of sesamé oil) which could not be distilled under reduced pressure. It gave the following reactions in addition to those already described (*loc. cit.*). (1) It was soluble in concentrated sulphuric acid, yielding a dark green solution. (2) An ethereal solution of sesamol shaken with seed oils and nitric acid (sp. gr. 1·4) gave a green coloration which speedily disappeared. (3) A pinewood chip impregnated with sesamol and then dipped into hydrochloric acid (sp. gr. 1·19) gave an intense green coloration. This new reaction of lignin could also be obtained directly with sesamé oil. There appears to be a close relationship between the lignin reaction and Kreis's reaction for fats that have been exposed to light. In both cases the reaction is to be attributed to the action of phenols on aldehydes in the presence of strong hydrochloric acid. The colorations given by different phenols in the two reactions show a close agreement, except in the case of naphthoresorcinol. The analogy between the two reactions even extends to aniline, for on shaking cottonseed oil (after exposure to light) with a drop of aniline and hydrochloric acid of sp. gr. 1·19, a perceptible yellow coloration was produced. (See this J., 1899, 1158; 1904, 194.)

—C. A. M.

——	Lignin Reaction.	Kreis's Reaction.

Wool-Fat Oleines [Detection of Mineral and Rosin Oils in ——]. J. Marcusson. Mitt. königl. Materialprüfungsamt, 1904, **22**, 96—110. Chem. Zeit., 1904, **28**, Rep. 283.

The insoluble residue left after boiling the unsaponifiable constituents of wool-fat oleines (see this J., 1903, 825) with acetic anhydride, gave the Hager-Salkowski and Liebermann's reactions, and would thus appear to contain higher alcohols or their derivatives (see Lewkowitsch, this J., 1892, 131). The residue resembles the cholesterilenes in that (1) it gives the two colour reactions mentioned, (2) it rotates the plane of polarisation from + 18° to + 28°, and (3) it absorbs considerable quantities of iodine (iodine value, 59—79). These properties clearly differentiate it from mineral oil; moreover, analysis showed that it contains 4·28 per cent. of oxygen.

Detection of Mineral Oil.—Mineral oil has seldom an iodine value higher than 14, and its rotatory power is at the most $[\alpha]_D = + 3\cdot1°$. If, therefore, the insoluble residue left after boiling the unsaponifiable matter with acetic anhydride has an iodine value much lower than 60, and a rotatory power less than + 18°, the presence of mineral oil is to be suspected.

Detection of Rosin Oil.—The presence of rosin oil in the residue insoluble in acetic anhydride can be recognised by: (1) its characteristic odour; (2) increased specific gravity (rosin oil, 0·97—0·98; wool-fat residue, 0·905—0·912); (3) increased solubility in alcohol; and (4) determination of the refractive index of the portion dissolved by an equal volume of 96 per cent. alcohol. With wool-fat residue, the refractive index would be from 1·5 to 1·53, but in presence of rosin oil, higher figures would be obtained.

—R. L. J.

Keto-Hexoses; Reaction for ——. H. J. H. Fenton. Brit. Assoc., 1904. Chem. News, 1904, **90**, 182.

The author finds that if levulose, cane-sugar, inulin, or sorbose be oxidised in presence of ferrous iron at 90—100° C., and the resulting solution be heated with phenylhydrazine-*p*-sulphonic acid, a compound is obtained which dyes silk a fast, brownish-pink colour. It is stated that the reaction appears to be characteristic of keto-hexoses or substances which yield them on hydrolysis, and is given only to a limited extent or not at all by dextrose, milk-sugar, maltose, or starch.—A. S.

Methylfurfural and its Derivatives; Colour Reaction for ——. H. J. H. Fenton and J. P. Millington. Brit. Assoc., 1904. Chem. News, 1904, **90**, 182.

Methylfurfural and its bromo-, chloro-, iodo-, or acetoxy-derivatives give an intensely blue-coloured compound when heated with dimethylaniline and a dehydrating agent, such as phosphorus oxychloride, zinc chloride, or anhydrous oxalic acid. The reaction is stated to be an extremely sensitive one.—A. S.

Picrates of Unsaturated Compounds. G. Bruni and E. Tornani. Atti R. Accad. dei Lincei Roma, 1904, **13**, [2], 184—187. Chem. Centr., 1904, **2**, 954—955.

Experiments with methyl- and isomethyleugenol, safrol and isosafrol, apiol and iso-apiol, and asarone, showed that the behaviour towards picric acid affords a simple means of determining whether an unsaturated aromatic compound contains an allyl or a propenyl group in the side chain. Unsaturated compounds containing an allyl ($.CH:CH_2$) group in the side chain (methyleugenol, safrol, apiol) do not combine with picric acid. Compounds containing a propenyl ($.CH:CHCH_3$) group in the side chain, on the other hand, react readily, a red to reddish-brown coloration being produced when their solutions are treated with picric acid. Compounds containing a dioxymethylene (.CH_2O_2.) group (isosafrol and iso-apiol) yield well-crystallised relatively stable picrates, which may be used for their isolation and identification. Isomethyleugenol and asarone give less stable and badly-crystallising picrates. The following compounds were isolated and examined:—Isomethyleugenol picrate, $C_{17}H_{17}O_9N_3$, reddish-brown needles, m. pt. 40°—45° C.; it rapidly decomposes. Asarone picrate, $C_{18}H_{19}O_{10}N_3$, dark-brown needles, m. pt. 81°—82° C. Isosafrol picrate, $C_{16}H_{13}O_9N_3$ glistening red needles, m. pt. 73° C. Iso-apiol picrate, $C_{18}H_{17}O_{11}N_3$, fine reddish-brown needles, m. pt. 89°—90° C. Anethiso-apiol, $C_{18}H_{17}O_{11}N_3$, red, needle-shaped prisms, m. pt. 81° C.—A. S.

ORGANIC—QUANTITATIVE.

Bacterioscopic Examination of Water; Standardisation of Methods for the ——. Report of the Committee appointed at the Congress of the Royal Inst. of Public Health, July, 1903. J. of State Medicine, Aug., 1904. Chem. News, 1904, **90**, 177—179.

The committee recommend that there should be undertaken in all cases:—(*a*) Enumeration of the bacteria present on a medium incubated at room temperature (18°—22° C.). (*b*) Search for *B. coli* and identification and enumeration of this organism if present. The majority of the committee recommend in addition:—(*c*) Enumeration of the bacteria present on a medium incubated at blood heat (36°—38° C.). (*d*) Search for and enumeration of streptococci. In special cases it may also be advisable to search for *B. enteritidis sporogenes.* *Collection of the Sample.*—The sample should be collected in the usual manner in sterile stoppered bottles having a minimal capacity of 60 c.c. If not examined within three hours of the time of collection, the bottles must be packed in ice.

Media to be Employed for Enumeration.—For enumeration at room temperature, distilled water gelatin, nutrient gelatin, distilled water agar, gelatin agar, or nutrient agar may be employed, but for enumeration at blood-heat an agar or gelatin agar must be used. When gelatin only is employed, this should be nutrient gelatin, but the use of distilled water gelatin also is to be preferred.

Preparation and Reaction of Media for Enumeration.—(*a*) *Distilled Water Gelatin.*—A 10 per cent. solution of gelatin in distilled water, brought to a reaction of + 10 (Eyre's scale). (*b*) *Nutrient Gelatin.*—A 10 per cent. solution of gelatin, containing meat (beef) infusion and Witte's peptone and brought to a reaction of + 10. (*c*) For enumeration at blood heat, the use of nutrient agar is recommended; it is prepared in the same manner as nutrient gelatin, except that 1·5 per cent. of powdered agar is substituted for the gelatin. (*d*) *Distilled Water Agar.*—A 1·5 per cent. solution of agar in distilled water, brought to a reaction of + 10.

Amounts to be Plated, Size of Dishes, &c., Gelatin.—For an ordinary water, amounts of 0·2, 0·3, and 0·5 c.c. may be "plated" in Petri dishes of not less than 10 cm. diameter. It is recommended to make duplicates in all cases. *Agar.*—Two plates may be made with 0·1 and 1·0 c.c. of the water respectively. The amount of the medium in a plate should be 10 c.c.

Counting.—Counting should be done with the naked eye, preferably in daylight, any doubtful colony being determined with the aid of a lens or low-power objective. Gelatin cultures should be counted at the end of 72 hours, or earlier if necessary on account of liquefaction; agar cultures incubated at blood-heat should be counted after 40—48 hours.

Search for Bacillus Coli.—Either the glucose formate broth method of Pakes or the bile salt broth method of McConkey is recommended, with anaerobic incubation at 42° C. Fifty c.c. should be the minimal quantity of water examined for the presence of *B. coli*, separate quantities from a minimum of 0·1 c.c. to a maximum of 25 c.c. being added directly to the tubes of culture media, without previous filtration through a porcelain filter. If indications of the presence of *B. coli* be obtained, the organism must be isolated by making surface cultures on litmus lactose agar of reaction + 10, bile salt agar, nutrient gelatin, or Conradi and Drigalski's nutrose agar, preferably the last-named: and then identified by making sub-cultures on surface agar at 37° C., in gelatin (stab and surface cultures), in litmus milk incubated at 37° C., in glucose litmus medium, in lactose litmus medium, and in peptone water (for indole reaction). The typical *B. colis* must conform to the following description and tests. It is a small, motile, non-sporing bacillus, growing at 37° C. as well as at room temperature. The motility is well observed in a young culture in a fluid glucose medium. It is decolorised by Gram's method of staining. It never liquefies gelatin; the gelatin cultures should be kept for at least 10 days in order to exclude liquefying bacilli. It forms smooth, thin surface growths and colonies on gelatin, not corrugated, and growing well to the bottom of the stab (facultative anaerobe). It produces permanent acidity in milk, which latter is curdled within seven days at 37° C. It ferments glucose and lactose, with the production both of acid and gas.

Streptococci.—It is advantageous to search for streptococci by making hanging-drop preparations of the fluid media employed for the preliminary cultivation of *B. coli.* Any streptococci detected should be isolated on nutrose agar plates and their characters determined.—A. S.

Nicotine; Determination of —— in presence of Pyridine [*in Sheep Dips, &c.*]. J. A. Emery. J. Amer. Chem. Soc., 1904, **26**, 1113—1119.

A weighed quantity (2·5 grms.) of the sheep-dip, tobacco-extract, tobacco powder, &c. is placed in a 300 c.c. flask with 50 c.c. of N/10 caustic soda and 150 c.c. of distilled water and distilled in a current of steam, in the usual way, until 10—20 c.c. of liquid remain. The distillate is made up to 500 c.c. and a portion examined in a 40 cm. tube and a polariscope reading taken. Each – 1° on the sugar scale represents 0·112 per cent. of nicotine in the distillate.

—W. A. C.

Nux Vomica Extract; Official Process for ——, in the forthcoming [*French*] *Codex.* E. Bourquelot. XX., page 998.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Zinc Sulphide; Phosphorescent ——. H. Grüne. Ber., 1904, **37**, 3076—3077.

To prepare Sidot's blende the author has tried the method of Henry (Comptes rend., **115**, 505:—A neutral solution of zinc chloride is precipitated with ammonia, the precipitate re-dissolved in excess, and exactly precipitated with hydrogen sulphide. The zinc sulphide is washed, dried, heated to whiteness in a fire-clay crucible inside a charcoal-lined graphite crucible.) Henry lays stress on the purity of the zinc chloride used, but the author obtained most variable results, and concluded that the brilliancy of the phosphorescence was probably due to minute traces of impurities. By purposely adding traces of other metals, he was able to prepare strongly phosphorescent sulphide with certainty. Copper, to the extent of 0·01 per cent., was the metal which gave best results, but good phosphorescence was obtained by adding silver, lead, bismuth, tin, uranium, or cadmium: none by adding iron, nickel, cobalt, or chromium. In the case of manganese, the sulphide produced gave a yellowish-red phosphorescence after illumination; but rubbing or scratching produced an extraordinarily brilliant light, visible even in daylight. Certain natural blendes have been found to phosphoresce on scratching, no doubt because of containing small proportions of manganese. The property of causing this phosphorescence in zinc sulphide is possessed by other metals, such as copper and uranium, but in much lower degree than by manganese.

—J. T. D.

Phosphorescent Substances. K. A. Hofmann and W. Ducca. Ber., 1904, **37**, 3407—3411.

In preparing Sidot's blende the authors found that, following Henry's method, they could obtain no phosphorescent product from pure materials, though the zinc chloride of commerce yielded very satisfactory products. As the result of their investigation into the influence of various impurities on the phosphorescence, they give the following method for preparing a blende with intense yellowish green phosphorescence. To the solution in 400 c.c. of water, slightly acidified with sulphuric acid, of 20 grms. of zinc ammonium sulphate, 5 grms. of sodium chloride, and 0·2—0·5 grm. of crystallised magnesium chloride, add 100 c.c. of 8 per cent. ammonia; allow to stand 24 hours, filter, saturate with hydrogen sulphide, filter, drain the filter, and precipitate (without washing) on porous tiles, and dry at 100° C. Powder finely and heat to whiteness in a covered porcelain crucible contained in an outer fire-clay crucible. The product is very sensitive both to light (though exposure to red light extinguishes its phosphorescence) and to *α*-radio-active substances. Neither magnesium compounds nor potassium compounds alone give a sensitive product. Of other impurities, iron, nickel, cobalt, bismuth, chromium, and copper were objectionable; but tin, selenium, manganese, and cadmium give sensitive products. In especial, the addition to the ammoniacal filtrate above obtained, before precipitation, of manganese chloride equal in weight to 1/1000 of the zinc ammonium sulphate gave a product with brilliant golden-yellow phosphorescence. None of the phosphorescent blendes prepared by the authors emitted any *α*- or *β*-Becquerel rays. (Compare preceding abstract.)—J. T. D.

Sidot's Blende; Phosphorescence of ——, under the influence of Ozone. R. Schenck and F. Mihr. Ber., 1904, **37**, 3464—3467.

Sidot's blende was found to be very weakly luminous, and to give feeble scintillations, in the dark. The passage over it of a stream of ozonised oxygen caused not only a great increase in the homogeneous luminosity, but also an increase in the intensity of the scintillations. Exposure to weak light, such as that of a lucifer match, also increases the intensity of scintillation. Other investigations have shown that the scintillation is influenced by other circumstances, and it would seem that any cause which increases the intensity of the homogeneous illumination also increases that of the scintillation. Increase of intensity of the scintillation of Sidot's blende is therefore not to be taken without caution as evidence of the presence of radio-active substances. Blende which has been often exposed to ozone ceases to show homogeneous luminosity, but still shows scintillation clearly. (Compare the two preceding abstracts.)—J. T. D.

Cinnabar; Radio-active ——. S. M. Losanitsch. Ber., 1904, **37**, 2904—2906.

Samples of Servian cinnabar (from Avala and Bare) were found to affect a photographic plate when placed upon it for three or four days in a lead box with a paper bottom. Some of the Idrian cinnabar, especially the variety known as "Ziegelerz," was found to exhibit similar activity, but all other specimens examined were inactive. The activity was much less marked than that of pitchblende; it was proved not to be due to metallic mercury contained in the cinnabar, nor to the barium compounds associated with it. From the latter circumstance the author concludes that it is not due to radium (which would have been with the barium compounds rather than with the cinnabar), and attributes it to "radiomercury" a hypothetical element of higher atomic weight than mercury in the zinc-cadmium-mercury homologous series. He considers that all of these homologous series of elements end in radio-active elements, but that the radio-activity of the upper elements diminishes in intensity as the series become less electro-positive.

—J. T. D.

Petroleum; Radio-active Gas from Crude ——. E. F. Burton. Phil. Mag., 1904, **8**, 498—508.

By drawing a current of air though heated crude petroleum (obtained from wells in Petrolia, Ontario), a strongly radio-active gas was obtained, very similar in its rate of decay, and also in the rate of decay of the induced radio-activity which it produces, to the emanations from radium, mercury, and from certain natural mineral waters. The radio-activity of this gas diminishes according to an exponential law, and falling to half value in 3·125 days, whilst the induced radio-activity which it produces falls to half value in about 35 minutes. Indications were also obtained of the existence in crude petroleum of traces of a radio-active substance more persistent than the radium emanations; it is thought that this substance may possibly be radium itself.

—T. F. B.

Rays of Short Wave-Length; Chemical Action of —— on Gaseous Bodies. E. Warburg and E. Regener. Sitzungsber. Kgl. pr. Akad. Wiss. Berlin, 1904, 1228—1231. Chem. Centr., 1904, **2**, 873.

It has been previously shown (Ann. der Physik, **13**, 464) that the formation of ozone by means of the silent electric discharge, is not an electrolytic but a photo- and cathodo-chemical action. The fact that rays of short wave-length can cause the formation of ozone, led the authors to examine their influence in other chemical processes. It was found that rays of short wave length can also exercise a de-ozonising action. The curves showing the ozonisation and de-ozonisation intersected at a point representing an ozonisation of 2·2 per cent., but this point of equilibrium varied with the permeability of the quartz-glass used, for the ozonising and de-ozonising rays. Rays of short wave-length can also effect the decomposition of ammonia, nitric oxide (into nitrous oxide and oxygen) and nitrous oxide (formation of nitrogen peroxide); in an experiment with ammonia, 10 per cent. was decomposed in 80 minutes.—A. S.

Platinic Sulphate; Analysis of Margules' ——. L. Staehlik. Ber., 1904, **37**, 2913—2915.

Margules, by the action of alternating currents, dissolved platinum in strong sulphuric acid (this J., 1899, 376), and has since succeeded in crystallising the substance formed, which he assumed to be platinic sulphate. The author has analysed Margules' recrystallised substance, reducing the platinum by passing hydrogen through the solution, filtering, and determining the sulphuric acid in the filtrate. The results showed a considerable excess of sulphuric acid: but by two or three recrystallisations crystals were obtained agreeing closely in composition with the formula $Pt(SO_4)_2.4H_2O$. These orange-yellow crystals readily lose water at the ordinary temperature *in vacuo* over sulphuric acid, darkening in colour, whilst the salt with excess of sulphuric acid loses but little even at 100° C. Both the hydrated and the anhydrous salts are very soluble in water; from the dark-coloured solution of the anhydrous salt sulphuric acid precipitates yellow crystals, probably of the hydrated salt.—J. T. D.

Light; Chemical Action of ——. F. Sachs and S. Hilpert. Ber., 1904, **37**, 3425—3431.

As a general rule, it is found that aromatic compounds which have a nitro-group in the ortho-position to a CH group are sensitive to light. It has already been shown (this J., 1904, 341, and Ber. 1902, 2704) that *o*-nitrobenzaldehyde and *o*-nitrobenzalaniline are converted, on exposure to light, into *o*-nitrosobenzoic acid and *o*-nitrosobenzanilide respectively. In the other reactions studied, the nitro-group was always reduced to a nitroso group. On exposing a benzene solution of *o*-nitrobenzyl alcohol to light, a green coloration soon appeared, and a yellow precipitate formed; this had the empirical composition $C_6H_4.CHNO_2$, but it had a high molecular weight, and has not been identified: that a nitroso compound was formed during the reaction was proved by the evolution of nitrogen when *o*-nitrobenzyl alcohol and phenylhydrazine were exposed to the action of light in acetic acid solution. Similarly, *o*-nitrobenzaldehyde cyanhydrin gave an unstable intermediate nitroso compound, which decomposed into hydrocyanic acid and *o*-nitrosobenzoic acid. *o*-Nitrophenyllactic acid ketone, *o*-nitrobenzylaniline derivatives, *o*-nitrobenzyl acetate, *o*-nitrobenzyl chloride, and even *o*-nitrotoluene to a small extent, decomposed under the influence of light, the green colour of the resulting solutions indicating the probable formation of nitroso compounds.—T. F. B.

Sugars; Acyl-Hydrazones of ——. R. Kahl. Z. Vereins deutsch. Zuckerind., 1904, 1091—1119.

The hydrazones obtained by acting on sugars with acylhydrazides have the advantage over osazones of permitting the sugar to be regenerated (by means of benzaldehyde or formaldehyde) and over the simpler hydrazones of being less soluble and therefore easily isolated. To the five examples prepared by Radenhausen and by Herzfeld, the author adds eleven new ones, applying *p*-bromobenzhydrazide, *p*-chlorobenzhydrazide, salicylhydrazide, and β-naphthylsulphonic-hydrazide. Ketoses do not form hydrazones of this kind and can thus be separated from aldoses. Only those hydrazides seem to react which have the CO.NH.NHR radical attached directly to the benzene ring. Several semicarbazones of sugars are also described, and it is shown that semicarbazide fails to react with ketoses.—W. A. C.

Saponarin: a Glucoside coloured Blue by Iodine. G. Barger. Brit. Assoc., 1904. Chem. News, 1904, **90**, 183—184.

The author isolated the glucoside *saponarin*, known to botanists as "soluble starch," from *Saponaria officinalis*. It was obtained in minute needles by crystallising from mixtures of pyridine and water. It is insoluble in water and in most organic solvents, but readily soluble in dilute alkalis and in pyridine: it melts at 231° C. with decomposition. When its yellow solution in alkali is acidified, the substance remains for a long time in a state of pseudo-solution, and in this condition it gives an intense blue or violet coloration with iodine dissolved in potassium iodide solution. Air-dried crystals of saponarin lose water when heated or when left *in vacuo* over sulphuric acid; the anhydrous substance is extremely hygroscopic. By hydrolysis with mineral acids, glucose is produced, together with a second substance, *saponaretin*, which separates from strong solutions as a thick yellow oil, and from dilute solutions either in the amorphous condition, or crystallised. Saponaretin appears to be closely allied to the flavones. When fused with caustic potash, it yields *p*-hydroxybenzoic acid, and a red solution which gives the phloroglucinol reaction with "pinewood."—A. S.

Lactase; Occurrence of —— in Plants. A. Brachin. J. Pharm. Chim., 1904, **20**, 300—308.

Lactase is found to be present in a large number of plants, those examined including members of the natural orders Rosaceæ, Cruciferæ, Cornaceæ, and Rutaceæ. It is not found in certain individuals, such as *Evonymus europæus, Capporis spinosa, Berberis vulgaris*, nor in the mould *Aspergillus niger*, nor in *B. coli communis*. The specific nature of the ferment, as recorded by Bourquelot and Hérissey, is confirmed. It is destroyed at 75° to 80° C., a temperature 10° C. lower than is fatal to emulsin. The presence of 0·24 per cent. of acetic acid is sufficient to arrest its action, whilst emulsin requires the presence of 1·25 per cent. of that acid to arrest its fermentative activity. Sulphuric acid in the proportion of 0·09 to 0·10 grm. per litre arrests the action of lactase, and oxalic acid is almost as energetic in this direction: it requires, however, about 7·5 grm. per litre of tartaric acid to arrest lactic fermentation. Lactase behaves differently from myrosin in that it has no action on potassium myronate.
—J. O. B.

New Books.

L'Ozone et ses Applications Industrielles. Par H. de la Coux, Inspecteur de l'Enseignement tech. au Ministère du Commerce, Expert près le Conseil de Préfecture de la Seine, &c. Vve. Ch. Dunod, 49, Quai des Grands-Augustins, 49, Paris. 1904. Price 15 fr.

Large 8vo volume, containing 515 pages of subject-matter, with 159 illustrations. The subject in this work is treated under the following heads:—I. The Physical and Physiological Properties of Ozone. (i) The Phenomena of Oxidation in Nature, and the Chemical Activity of Ozone in relation to the Industries. (ii) Nature of Ozone, and its Physical Properties. (iii) Ozone in the Air. (iv) Action of Ozone on the Organism. (v) Therapeutic Action of Ozone. II. Production of Ozone. (i) Preparation of Ozone by Gentle Oxidation, Heat, and Radio-active Salts. (ii) By Chemical Processes. (iii) By Electro-chemical Methods. (iv) By the Electric Discharge. III. Industrial Applications of Ozone: its Chemical and Microbiological Action. (i) Chemical Action of Ozone, and its Utilisation in the Manufacture of Chemical Products. (ii) Action of Ozone on the Air; Disinfection and Sterilisation. (iii) Sterilising and other Action of Ozone on Water. (iv) Action on Organic Products of Animal Origin, and their Preservation. (v) Action in Purifying and Maturing Alcoholic Products, Brandies and Spirits. (vi) Action in Improving and Maturing Wines. (vii to xi) Ozone in the Manufacture and Preservation of Vinegar, in Brewing, in Cider Making, in the Distillery, in Sugar Manufacture. (xii) Ozone in Bleaching. (xiii to xxii) In Starch and Dextrin Making; in the Manufacture of Oils and Fats, Soaps, Drying Oils, Varnishes, &c., Dyestuffs, Artificial Perfumes, Maturing Wood, Sericulture, Bleaching, Disinfection, Photography, &c. IV. Analysis. (i) Testing Ozone with Reagents and Test Papers. (ii) Determination of Ozone by Volumetric Methods. (iii) Determining Ozone by Physical Methods.

The Electric Furnace. By Henri Moissan. Translated by A. T. de Mouilpied, Ph.D. Edw. Arnold, 41 and 43, Maddox Street, Bond Street, London, W. 1904. Price 10*s.* 6*d.*

8vo volume, containing preface, translator's notes, introduction, 303 pages of subject-matter, with 42 illustrations, and the alphabetical index. The following are the leading themes, in the treatment of this subject:—I. The Different Types of Electric Furnace. Crystallisation of Metallic Oxides. Fusion and Volatilisation of some Refractory Substances. II. Researches on the Different Varieties of Carbon. III. Preparation of Various Elements in the Electric Furnace. IV. Study of Carbides, Silicides, Borides, Phosphides, and Arsenides. V. Recent Researches on Carbides, Silicides, and Borides: (*a*) Carbides of Neodymium and Praseodymium and Samarium. (*b*) Silicides of Vanadium and Cerium. (*c*) Borides of Silicon.

Laboratory Studies for Brewing Students. A Systematic Course of Practical Work in the Scientific Principles Underlying the Processes of Malting and Brewing. By Adrian J. Brown, M.Sc., Professor of the Biology and Chemistry of Fermentation in the University of Birmingham, &c. Longmans, Green, and Co., 39, Paternoster Row, London; New York and Bombay. 1904. Price 7*s.* 6*d.*

This volume, 8vo size, contains preface, 186 pages of subject-matter, 36 illustrations, and six tables. The whole subject is treated under the following sections:—I. Barley and Malting. II. Principles of the Mashing Process. III. Fermentation. IV. The Hop.

The Analysts' Laboratory Companion. A Collection of Tables and Data for the Use of Public and General Analysts, Agricultural, Brewers', and Works' Chemists and Students; together with numerous examples of Chemical Calculations and Concise Descriptions of several Analytical Processes. By Alfred E. Johnson, B.Sc. Third Edition. J. and A. Churchill, 7, Great Marlborough Street, London. 1904. Price 6*s.* 6*d.*

Small 8vo volume, with preface, 146 pages of data, tables, methods, formulæ, &c., interleaved with ruled, blank sheets for notes. At the end of the volume there is an alphabetical index. Among the tables, &c. are the following, as examples:—Atomic Weights and Logarithmic Tables. Multipliers and their Logarithms required in Gravimetric Analysis. Factors required in Volumetric Analysis. Nitrometer Analysis, &c. Notes on Indicators. Precipitating Powers of Common Reagents. Density Tables. Table of Freezing Mixtures. Percentage Conversion, into cwts., qrs., lb. per ton, &c., and the reverse. Barometric Tables. Specific Gravity and Hydrometer Tables. Water and Beer Analysis Tables. Alcohol, Phosphate, Ammonia. Albuminoid, Kjeldahl, and Electro-Chemical Equivalents

Tables. Tables of Constants of Oils, Fats, and Waxes. Calculation of Results of Milk Analysis. Variations in Reichert - Wollny Number, &c. of Butter and Margarine. Physical and Chemical Criteria in the Analysis of Butter-Fat. Table of Electro - chemical Equivalents, Thermometric Tables, and Scale Conversions, &c.

Tables for Qualitative Chemical Analysis, arranged for the Use of Students. By A. Liversidge, M.A., LL.D., F.R.S., Professor of Chemistry in the University of Sydney. Second Edition. Macmillan and Co., Ltd., London. 1904. Price 4*s.* 6*d.* net.

Large 8vo volume, containing introduction and 110 pages of tabulated analytical matter, an appendix of 13 pages, and an alphabetical index. It may be pointed out that qualitative methods in this work are extended to organic substances and compounds not usually included under ordinary qualitative analysis. Thus the alcohols, aldehydes, acetone, chloroform, and glycerol are included. Also the carbohydrates, glucosides, and certain aromatic compounds and volatile bases.

Trade Report.

I.—GENERAL.

Tunis; Export Trade of —— in 1903.

Foreign Office Annual Series, No. 3295.

The following figures give the quantity and value of the exports of certain articles from Tunis during 1902 and 1903; the figures for 1902 are given in brackets :—

Lead, 13,405 tons, 43,583*l.* (14,343 tons, 46,631*l.*); olive oil, 4872 tons, 113,708*l.* (4064 tons, 102,404*l.*); phosphates, 353,835 tons, 359,496*l.* (257,546 tons, 261,667*l.*); soap, 326 tons, 5304*l.* (917 tons, 11,913*l.*); tan, 4574 tons, 55,778*l.* (5620 tons, 68,526*l.*); raw wax, 67 tons, 4788*l.* (79 tons, 5626*l.*); zinc ore, 24,061 tons, 97,784*l.* (37,466 tons, 152,264*l.*).

Peru; Trade of ——.

Foreign Office Annual Series, No. 3231.

The subjoined table gives details of certain exports from Peru during the Years 1901—1903 :—

Articles.	Quantity.			Character of Trade.
	1901.	1902.	1903.	
	Tons.	Tons.	Tons.	
Calcium borate	4,094	4,975	2,282	Exnorted principally to United Kingdom.
Coca	601	919	1,026	Chiefly to Germany and United States.
	ton cwt.	ton cwt.	ton cwt.	
Cocaine.......	10 10	8 3	7 14	Exported almost entirely to Germany.
	Tons.	Tons.	Tons.	
Cotton seed ...	1,735	4,305	5,264	Exported to United Kingdom and Germany.
Cotton-seed oil cakes.	1,171	2,301	2,212	Chiefly to United Kingdom.
Guano........	29,920	52,994	21,356	The whole exported on British account and the bulk shipped to United Kingdom.
Hides and skins.	2,218	2,064	2,683	Chiefly to France, Germany, and United States.
Ores, sulphides, and matte.	46,192	40.702	37,086	Principally to United Kingdom.
Rubber.......	1,723	1,674	2,075	Exported chiefly to United Kingdom and France.
	ton cwt.	ton cwt.	ton cwt.	
Silver bars	77 0	35 16	106 10	Principally to United Kingdom and France.
	Galls.	Galls.	Galls.	
Spirits	149,157	293,146	368,380	Almost entirely to Bolivia and Chile.
	Tons.	Tons.	Tons.	
Sugar	112,942	115.513	125,662	Chiefly to United Kingdom, Chile, and United States.

The subjoined table shows the value of certain imports into Peru through Pacific Ports during the years 1902 and 1903 :—

Articles.	Value.		Character of Trade.
	1902.	1903.	
	£	£	
Bone, horn, and celluloid articles.	17,118	4,001	Chiefly from United Kingdom and Germany.
Candles, wax, and stearine	25,912	43,374	Chiefly from Belgium and United Kingdom.
Cardboard and its manufactures.	7.839	4,075	Principally from Germany.
Coal	92,961	122,712	From United Kingdom, Australia, and United States.
Cement................	14,195	21,603	From Germany, Belgium, United States, and Chile.
Drugs, chemical products, mineral waters, and surgical instruments.	105,065	126,888	The bulk comes from United Kingdom, France, Germany, and United States.
Dyeing and tanning stuffs.	23,813	28.741	From United Kingdom, Germany, Belgium, and Chile.
Earthen and stone wares, porcelain, glassware, fire - bricks, bottles, marble, alabaster, glass, and manufactures thereof.	76,360	81.760	Principally from United Kingdom, Germany, United States, and Belgium.
Explosives.............	39,119	27,936	Chiefly from Germany and United States.
Metals and manufactures thereof.	114,049	938,731	Principally from United Kingdom, Germany, France, and United States.
Oils of all kinds.........	44,960	56,846	United Kingdom, United States, and Italy.
Paint and varnishes	14,868	15,868	Chiefly from United Kingdom and Germany.
Perfumery.............	14,365	19,962	Comes principally from United Kingdom, France, Germany, and United States.
Soap....................	3,845	5,673	Chiefly from France, Germany, and United Kingdom.

Crete; Trade of —— during 1903.

Foreign Office Annual Series, No. 3282.

The subjoined table gives details of trade in Crete during 1902 and 1903 in certain articles :—

Articles.	Exports.		Imports.	
	1902.	1903.	1902.	1903.
	£	£	£	£
Olives and products of olives	106,685	*208,396	1,558	2,525

Orange River Colony; Trade of ——.

Chem. and Druggist, Oct. 1, 1904.

Among articles imported into the colony during the year ending June 30, 1904, were the following, the figures in parentheses referring to those of 1902–3 :—Acetic acid, 140*l.* (132*l.*); drugs and chemicals, 23,095*l.* (22,342*l.*); extracts and essences, 2,036*l.* (2,197*l.*); essential and perfumed oils, 170*l.* (91*l.*); all other descriptions of oils, 17,805*l.* (10,764*l.*); paints, colours, turpentine, and varnish, 14,879*l.* (8,467*l.*); common soap, 19,970*l.* (15,288*l.*): imported spirits, 38,212*l.* (48,517*l.*); and spirits manufactured in Cape Colony, 14,900*l.* (13,582*l.*).

BRAZIL; EXPORT TRADE OF ——.

Foreign Office Annual Series, No. 3283.

The subjoined table gives quantity and value of certain exports from Brazil during the years 1902—1903 :—

Articles.	Quantity.		Value.

CHINA; CHEMICAL EXPORTS OF —— IN 1902.

Foreign Office Annual Series, No. 3280.

The values of certain Chinese produce shipped abroad in 1903 were as follows :—

Hides, 621,704*l.*; paper, 460,716*l.*; oils (vegetable), 428,273*l.*; chinaware, 290,383*l.*; sesamum seed, 267,492*l.*; tallow, 213,040*l.*; sugar, 130,185*l.*; nutgalls, 100,131*l.*; musk, 67,668*l.*; glassware, 64,960*l.*; oils (essential), 41,435*l.*; white wax, 27,187*l.*

IV.—COLOURING MATTERS AND DYESTUFFS.

DYESTUFFS IN INDIA.

Chem. and Druggist, Oct. 1, 1904.

According to the *Indian Agriculturist*, the imports of aniline and alizarin dyes into India during 1903 were unusually heavy, and surpassed those of any previous year. The quantity of 12,182,600 lb. is one-third as much again as in 1902–3, but owing to a considerable fall in the average price of aniline dyes the value Rs. 82,67,610, was only 26 per cent. higher. The prices of the cheaper alizarin dyestuffs show a very slight decline, and with an increase of nearly 39 per cent. the quantity imported exceeded that of other dyestuffs by 1,216,000 lb. About four-fifths of the trade is with Bombay, and almost the same proportion is recorded as the joint share of Belgium and Holland; but most of this comes through those countries in transit from Germany, which exported to India, in 1902, 2,198,000 kilos. of alizarin, valued at 2,990,900 m., and 1,214,800 kilos. of other coal-tar dyestuffs, valued at 3,766,000 m. This accounts for practically the whole of the alizarin and about 60 per cent. of the remainder.

VII.—ACIDS, ALKALIS, Etc.

POTASH SYNDICATE (GERMANY).

Foreign Office Annual Series, No. 3287.

The Potash Syndicate was renewed on June 30 for a term of five years viz., from January 1, 1905, to December 31, 1909. The syndicate was originally formed in 1879, and renewed from time to time for periods of five years. From 1879 till the end of 1903, the sales amounted in all to 4,100,000 tons of potash (about 8 tons of kainite and 11¼ tons of carnallite being reckoned equal to 1 ton of potash); sales steadily increased, the five quinquennial periods participating with 9·4, 10·5, 16·6, 24·6, 38·9 per cent. of the total respectively. Of this quantity, 1,300,000 tons served for industrial and 2,800,000 tons for agricultural purposes.

The syndicate now embraces 27 works, the two largest being in the possession of the Prussian and the Anhalt Governments.

The scheme for providing a syndicate fund of 250,000*l.*, with the object of enabling the syndicate to meet outside competition effectively, was abandoned owing to the opposition of the younger works, but it is reported that the older works will raise this fund amongst themselves.

The new agreement of the syndicate divides the products into five groups :—Group I. includes chloritic products containing more than 42 per cent. of potassium, and the so-called 38 per cent. calcined potash manure. Group II.—Sulphate products containing more than 21·5 per cent. of potassium. Group III.—Products of 42—20 per cent. potassium, exclusive of 38 per cent. potash manure, and the sulphate products of Group II. Group IV.—Non-carnallite crude potassic salts containing 19·9 to 12·4 per cent. of potassium. Group V.—Potassic salts, including kieserite.

SALT PRODUCTION; THE WORLD'S ——.

Eng. and Mining J., Sept. 22, 1904.

The world produced 13,769,201 short tons of salt in 1902, of which the United States contributed 24·3 per cent.; Great Britain, 15·4 per cent.; Germany, 12·7 per cent.; and India, 8·5 per cent. The balance of 39·1 per cent. was credited to numerous other countries.

BORAX PRODUCTION OF THE UNITED STATES.

Eng. and Mining J., Sept. 22, 1904.

According to the report of the Geological Survey, the amount of crude borax produced in the United States in 1903 was 34,430 short tons, valued at 661,400 dols. The value given is much lower than the total reported for 1902, due to the fact that it is calculated for crude product, whereas last year the valuation was partly for refined borax.

FELSPAR PRODUCTION OF THE UNITED STATES.

Eng. and Mining J., Sept. 22, 1904.

The production in 1903, according to the United States Geological Survey, was 13,432 short tons of crude, valued at 51,036 dols., and 28,459 tons ground felspar, valued at 256,733 dols. In 1902 the output was 21,870 tons crude, valued at 55,501 dols., and 23,417 tons ground felspar, valued at 191,923 dols. Five States were producers—Connecticut, Maine, Maryland, New York, and Pennsylvania.

GRAPHITE PRODUCTION OF THE UNITED STATES.

Eng. and Mining J., Sept. 22, 1904.

In the report of the United States Geological Survey, the production of graphite in the United States during 1903 is given as 37,758 short tons, valued at 1,598,589 dols. Crystalline graphite, the most valuable of the natural varieties, was mined in Essex and Washington counties, N.Y., Chester county, Pa., and Coosa and Clay counties, Ala. The output was 4,538,155 lb., valued at 154,170 dols. The production of amorphous graphite, which amounted to 16,591 short tons, valued at 71,384 dols., came from Georgia, Wisconsin, Michigan, Rhode Island, South Carolina, California, Nevada, and North Carolina. Of artificial graphite there was manufactured a total of 2,620,000 lb., valued at 178,670 dols., all of it made by the International Acheson Graphite Company, of Niagara Falls, New York.

IX.—*BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.*

Cement Industry of Germany.

Foreign Office Annual Series, No. 3287.

After several years of ruinous competition the efforts aiming at a general understanding in the cement industry seem to have good prospects of ultimate success. Conventions between several local associations have already been effected or are nearing completion. However, there are still important interests outside the local syndicates which stand in the way of a comprehensive and universal organisation. The local syndicates embrace Silesia, Pomerania, South Germany, and a group of 15 works in Rhenish-Westphalia. The Hanoverian works are contemplating the formation of an association. Negotiations towards an understanding between the Rhenish-Westphalian group, the South German syndicate, the Hanoverian works and a Belgian syndicate are being carried on at present. The so-called Middle-German Works (in Thuringia and elsewhere) are ready to co-operate in a general organisation; it is in Hanover and in the Lower Elbe region that the idea of a general syndicate meets with opposition from some of the large works, which maintain that a fruitful organisation of the whole industry must be preceded by the stoppage of the small works.

Below are given the imports and exports of cement of all kinds during the half-year, January to June :—

—	1902.	1903.	1904.
	Tons.	Tons.	Tons.
Imports	26,588	25,950	28,090
Exports	244,603	374,381	282,592
Excess of exports	218,015	348,431	254,502

The decrease of the exports is principally due to reduced shipments to the United States of America.

X.—*METALLURGY.*

Victoria; Mineral Production of ——.

Bd. of Trade J., Oct. 6, 1904.

The annual report of the Secretary of Mines and Water Supply for Victoria contains statistics and reports on water supply, geological survey, and the inspection of mines, and dredging, and the progress of mining and boring operations, &c., in that State during the year 1903, from which the following particulars have been taken :—

Gold.—The yield for the year under review was 822,424 oz., as compared with 777,738 oz. for the previous year, thus showing the substantial increase of 44,686 oz. The value of the gold won during 1903 was 3,259,482*l.*, as compared with 3,062,028*l.* Dredging is making steady progress year by year, owing to the facility with which ground intended to be operated on by dredges can be thoroughly and inexpensively tested beforehand, enabling a near approximation of its value being arrived at before large sums of money are expended in machinery, &c., which might eventually not be required. The total quantity of material treated during 1903 by dredge mining and hydraulic sluicing by gravitation was 7,963,927 cubic yards as compared with 6,911,697 cubic yards for the previous year. The gold obtained showed an increase of 8,937 oz., being 42,066 oz., as compared with 33,109 oz. In all, 51 dredge-mining plants, comprising 15 bucket dredges, 23 pump hydraulic sluices, 10 jet elevators, and 3 rotary hydraulic plants, were in operation, as well as 14 hydraulic sluicing by gravitation plants, and at the end of the year 14 other plants were in course of construction.

Coal.—There was a great falling off in the year's output of coal, owing to the strike of miners, which lasted for practically the whole of the year. The amount obtained was 64,200 tons, or a little more than a quarter of that for the previous year, which was 225,164 tons. The total output of coal in Victoria to the end of 1903 now stands at 2,237,257 tons, valued at the pit's mouth at 1,239,026*l.*

Metals and Minerals, other than Gold and Coal.—The output of tin ore was 33 tons. Silver to the extent of 28,800 oz. was extracted from gold at the mint, and 5 tons of antimony ore were obtained at Heathcote for testing purposes, and 3,590 tons of gypsum from the Mallee, principally in the neighbourhood of Boort.

Pig-Iron Production of Germany.

Foreign Office Annual Series, No. 3287.

While the production of pig iron in the first half of 1903 showed an increase of upwards of 20 per cent. over the corresponding period of the previous year, in the period under review the output of pig iron increased only by 64,800 tons, or 1·3 per cent. The subjoined table gives the amounts of pig iron, in thousands of tons, produced by the various processes during the first half of the years 1902—1904 :—

Articles.	1902.	1903.	1904.
Puddle iron	596·5	451	411·4
Spiegel iron		376·7	293·8
Bessemer iron	191	209·7	220·9
Thomas pig iron	2,436·1	3,013·4	3,174·4
Foundry pig iron	790·2	883·8	898·9
Total	4,013·8	4,934·6	4,999·4

Manganese Ore; Output of Russian ——.

Gluckauf; through Eng. and Mining J., Sept. 29, 1904.

The output of manganese ore in Russia during 1903 amounted to 25,266,150 poods, or 413,860 metric tons. This shows a further decline in the industry, due to the continuance of the depression which began in 1901. The output is but little more than half of the total recorded in 1900, and falls considerably short of the production for the previous year, which was 28,648,635 poods. As usual, the Caucasus district contributed most of the supply, its output amounting to 22,974,603 poods. There were 251 mines under exploitation in this district, and the total number of employees was 2,004, as compared with 3,702 in 1902.

Open Hearth Steel Production of the United States.

Eng. and Mining J., Sept. 29, 1904.

The total production of open-hearth steel ingots and castings in the United States in 1903, was 5,837,789 gross tons, against 5,687,729 tons in 1902 (an increase of 2·6 per cent.), and 2,230,292 tons in 1898.

In 1902, 4,496,533 tons of open-hearth steel were made by the basic process, and 1,191,196 tons were made by the acid process, while in 1903 the production by the basic process amounted to 4,741,913 tons, and by the acid process to 1,095,876 tons.

There was a decrease in the production of acid steel in 1903, as compared with 1902, of 95,320 tons, or a little over 8 per cent., but an increase in the production of basic steel of 245,380 tons, or almost 5·5 per cent.

China; Mining in ——.

Foreign Office Annual Series, No. 3280.

Antimony continues to be mined in considerable quantities at Hunan: the production of metal in 1903 was 3435 tons, and of ore, 3234 tons (in 1902 the figures were 6740 tons and 3624 tons respectively). Japan took 1095 tons, and a large proportion was shipped to the United States. An installation, under German management, has been put up at Wuch'ang, to concentrate lead and zinc ores, capable of working 75 tons of ore daily. The iron mines at Ta-yeh shipped 50,000 tons of ore (2,000 tons more than in 1902) to Japan, and, as the ironworks at Hanyang increased their output of pig iron from 75 to 120 tons a day, they must have been supplied with 30,000 additional tons of ore and limestone. In return for a loan of 3,000,000 yen at 6 per cent., these mines have now been mortgaged to a Japanese syndicate for a period of 30 years. A Japanese engineer is to be engaged, and the Imperial Iron Foundry undertakes to purchase 70,000 to 100,000 tons of ore annually at a price which, from now till August 1915, shall be at the rate of 3 gold yen per ton for first-class ore and 2 yen 20 sen for second-class.

At the end of 1902 the Provincial Government granted exclusive mining rights in the north-west of Fukien to certain Chinese and French concessionnaires, and a French mining engineer of high repute, who has been prospecting there during 1903, has obtained a careful survey of the gold-fields in the Shao-wu Prefecture. These are described as very valuble and worth working, and it is proposed to form a company with a capital of 1,250,000 dols. to commence operations.

XIV.—TANNING; LEATHER; GLUE, Etc.

Lentisk Leaves in Tunis.

Foreign Office Annual Series, No. 3295.

The lentisk tree resembles a small shrub, grows wild, is very abundant in the whole Regency and produces a small, oval, thin, green leaf, which is gathered by the natives and brought to the market. Its prices in Tunis vary from 8 to 9 frs. per 100 kilos., or 80 to 90 frs. per metric ton. This includes the price of sacks in which the leaves are exported. The freight to the United Kingdom averages from 12*s.* to 15*s.* per ton. The lentisk leaves alone are not a powerful colouring agent, and this necessitates their mixture with sumac leaves, which are chiefly imported from Sicily. The lentisk leaves are said to contain about 10 to 12 per cent. of tannin, and the sumac from 40 per cent. upwards. British firms seem to prefer the leaves ground, so that most of the quantity intended for the United Kingdom is shipped to Italy and thence re-shipped in the ground state.

The exports of lentisk leaves were, during 1901, 3865 tons (value 7435*l.*); 1902, 4126 tons (value 7263*l.*); 1903, 7307 tons (value 16,421*l.*). The quantities coming to England are increasing, having been 251 tons in 1901, 364 tons in 1902, and 752 tons in 1903.

XVII.—BREWING, WINES, SPIRITS, Etc.

Spirit; Imports and Consumption of Foreign and Colonial —— in Great Britain.

47th Report of Commissioners of Inland Revenue.

The following table gives the imports and consumption of foreign and colonial spirits in Great Britain during the last three financial years:—

Year.	——	Consumption.	Total Imports.
		Proof Galls.	Proof Galls.
1901-2	Not for methylating ...	10,536,809	12,418,057
	For methylating.......	627,410	
1902-3	Not for methylating ...	10,723,837	13,130,182
	For methylating.......	1,212,001	
1903-4	Not for methylating ...	8,116,120	9,959,864
	For methylating.......	334,110	

XVIII. B.—SANITATION.

Gaseous Poisoning: Home Office Memorandum.

The following memorandum, "As to the Use of Water Gas and other Gases in Factories," was issued on Oct. 3 by the Chief Inspector of Factories:—

Carbonic Oxide Poisoning.—In recent years there has been great extension of the manufacture and use of water gas and other gases of a similar nature (Dowson gas, Mond gas, power gas, producer gas, blast furnace gas, &c.) for heating furnaces and boilers in factories, driving gas engines, welding, and many other industrial purposes. The particular danger associated with all these gases is that of poisoning by carbonic oxide (carbon monoxide, CO), which is also a constituent of ordinary coal gas. But whereas the proportion in coal gas varies from 4 to 12 per cent., in carburetted water gas it reaches 30 per cent., and in uncarburetted water gas 50 per cent. The other gases named above usually contain from 10 to 25 per cent.

The use of these gases was the subject of an enquiry in 1899 by a Departmental Committee,* who recommended in their report that the manufacture and distribution for heating and lighting purposes of any poisonous gas which does not contain a distinct and pungent smell should be prohibited, and that regulations should be made limiting the proportion of carbonic oxide. In recent Acts authorising companies and local authorities to manufacture and supply Mond or similar gas for motive or heating purposes, it is required that (1) the quantity of carbonic oxide in the gas shall be limited to 14 per cent.; and (2) the gas shall be strongly scented. It is made the duty of H.M. Inspectors of Factories to enforce these provisions as regards factories and workshops to which the gas is distributed.

The annual reports of the Factory Department during the five years 1899 to 1903 contain references to at least 51 cases, including 17 deaths, of poisoning by carbonic oxide on manufacturing premises: 43 were due to one or other of the gases named above. These casualties were traced to several causes, among which may be mentioned:—(1) leakage from joints or taps in pipes or flues conveying gas; (2) gradual escape of the gas into a confined atmosphere, as into a small engine-room or the siphon-pit of the Dowson apparatus; (3) cleaning of tanks or flues before a sufficient time has been allowed for the gas to escape; (4) underground situation of flues; (5) inodorous nature of the gas; (6) ignorance of the danger from the gas and of the earliest symptoms produced by it; (7) working alone; (8) lack of rescue appliances; (9) incomplete combustion of gas in defective gas ironing machines.

Carbonic oxide poisoning may occur in other ways without inhalation of the particular gases named. Thus danger of this kind may arise in laundries from the use of gas irons, and in workrooms from defective gas fittings and from gas stoves, especially when no provision is made for the products of combustion to be carried away by a flue or chimney. The absence of a chimney in a room greatly increases the risk. Carbonic oxide is found also in lime kilns, cement works, and where braziers and coke fires are used in confined spaces.

Symptoms of carbonic oxide poisoning begin with throbbing of the blood vessels of the head, giddiness, palpitation of the heart, and weakness of the limbs. These become greatly aggravated after any exertion. Owing to their insidious onset and the cumulative effect of the gas, the weakness of the limbs may come on without attracting notice, so that the person affected is unable to make good his escape from the poisonous atmosphere.

Headache, anæmia, and defective nutrition may result from the long continued breathing of the gas in amount too small to produce immediate effects, such as might occur from defective gas fittings in work rooms.

The appropriate remedies for poisoning by carbonic oxide are—fresh air, artificial respiration, administration of oxygen, and the application of warmth.

Preventive measures.—The precautionary measures to be considered must vary somewhat according to the different manner in which the gas is manufactured and used in one and another factory, but the following are of general application:—

(1) Notices should be posted up stating the deadly nature of the gas, the symptoms produced by its inhalation, and the best means of rendering aid to those who are "gassed."

(2) Persons in charge of any engine worked by the gas, or of any apparatus in which it is stored, or otherwise exposed to risk of inhaling carbonic oxide, should be free from any disease of the heart or lungs. Employers would do well to cause such persons to be examined and certified by a medical man.

(3) No engine in which the gas is used should be in a confined space.

---

* Report of Water Gas Committee, 1899, on the Manufacture and Use of Gases containing a large proportion of Carbonic Oxide. C. 9164. Eyre and Spottiswoode. Price 1*s.* 2*d.*, by post 1*s.* 5*d.*

(4) A competent and responsible person should, at stated short intervals, inspect all valves and connections, to see that there is no escape of gas; and a signed record with the dates of such inspections should be kept.

(5) The openings giving access to any part of the gas circuit should be few, and in positions as safe as possible, and opened only in cases of real need, and by responsible persons.

(6) No workman should enter, or approach when opened, the holder or other part of the gas circuit until the gas has been well flushed out by fresh air.

(7) A cylinder of compressed oxygen, fitted with a piece of rubber gas-tubing and a mouthpiece, should be kept in constant readiness. Such cylinders can be obtained fitted also with a reducing valve.

(8) Medical aid should be summoned immediately, but in view of the importance of losing no time in commencing treatment, the workmen employed should be instructed by a medical man in the manner of administering the oxygen and of performing artificial respiration. They should be especially warned of the danger of exposing the patient to cold.

Respirators are of no avail as a protection against carbonic oxide poisoning.

When, for purposes of rescue, it becomes necessary to enter an atmosphere charged with the gas, the rescuer must protect himself by tying a rope securely round his waist, the free end being held by persons outside, or, preferably, by the use of one or other of the special rescue appliances designed for such work. The principle underlying them is that the rescuer is made to breathe air, or a mixture of air and oxygen, which renders him independent of the poisonous atmosphere immediately surrounding him. Reference to such appliances, which are now kept in many chemical works, &c., will be found in the annual report of the Chief Inspector of Factories for the year 1895,* p. 47, and for the year 1896,† p. 31.

In towns where the public gas supply is largely charged with water-gas, attention to gas fittings in factories and workshops becomes a matter of increased moment.

The following notice, which has been drawn up by the Power Gas Corporation, Ltd., in consultation with the Medical Inspector of Factories, to be posted up near the place where danger arises, may serve as a model:—

Danger of Gassing.—Breathing of producer gas should be avoided. It is dangerous when breathed in quantity.

The first symptoms produced by breathing the gas are giddiness, weakness in the legs, and palpitation of the heart.

If a man feels these symptoms, he should at once move into fresh warm air, when, in slight cases, they will quickly disappear.

Exposure to cold should be avoided, as it aggravates the symptoms.

A man should not walk home too soon after recovery, as muscular exertion, when affected by the gas, is to be avoided.

If a man should be found insensible or seriously ill from the gas, he should at once be removed into fresh warm air, and immediate information be sent to the oxygen administrator, a medical man being sent for at the same time.

No man should work alone on any work which would be likely to involve exposure to the gas. Should the nature of the work cause the man to enter a culvert or hole, he should have a rope tied securely round his waist, held at the other end by his mate standing outside.

Use of the Oxygen Cylinder.—The cylinder should be provided with a lever key, nipple and union, together with a rubber tube at the end of which is a mouthpiece. It is also advisable to have a small pressure gauge attached to the cylinder, so that loss of oxygen may be observed and the cylinder kept in working order.

Open the valve gradually by tapping the lever key (fully extended) with the wrist until the oxygen flows in a gentle stream from the mouthpiece in the patient's mouth, and allow the oxygen to be breathed until relief is obtained. The lips should not be closed round the mouthpiece, as it is important to allow free egress for surplus oxygen. The nostrils should be closed during inspiration or inflation of the lungs, and opened during expiration or deflation of the lungs, so that the oxygen may be inhaled as pure as possible through the mouth.

If the teeth are set, close the lips and one nostril. Let the conical end of the mouthpiece slightly enter the other nostril during inspiration and remove it for expiration.

Artificial Respiration.—Artificial respiration is sometimes necessary, in addition to the oxygen inhalation, if the oxygen does not appear to act quickly.

Place the patient on his back, slightly raising the shoulders with a folded coat; remove everything tight about the chest and neck; draw the tongue forward and maintain it in that position. Grasp the arms just above the elbows, and draw them steadily above the head, keeping them on the stretch for two seconds and then folding them and pressing them against the chest for the same length of time. Repeat these movements about 15 times a minute for at least half an hour, or until natural breathing has been initiated, when the oxygen inhalation alone will suffice.

After recovery, oxygen inhalation at intervals should be continued as desired.

Further detail may be needed in connection with particular branches of industry. Thus, in consequence of the constant danger of carbonic oxide poisoning in cement works, the Associated Portland Cement Manufacturers (1900), Ltd., have adopted the following notice, in addition to somewhat similar instructions to those given above:—

"Regular inspection of kilns must be made on opening after being burnt off, to see that they are safe for men to work in.

"Under normal conditions the kiln is partly and sometimes entirely drawn before the chamber is cool enough to enter to clear for re-loading, and inspection must cover safety, not only as to heat, but as to gases. The eye in front of kiln and back eye of chamber must be opened when drawing is commenced, and entrance to a chamber must be made cautiously. Should there be the slightest indication of gas, a paper torch must be thrown into the kiln and seen to burn out properly before work therein is commenced. If after several attempts it is clearly shown that a paper torch will not burn freely, the men must not be allowed to enter, and the matter must be at once reported to the manager. This applies more particularly where there is a kiln burning next to one that is being drawn, but in any case the dampers of the kiln being drawn must be down tight, and precautions taken generally to see that fumes from a burning kiln on the same flue cannot get back into a kiln in which men are at work, and this applies not only to the work of clearing or drawing, but to repair or any kind of work done in or about kilns.

"In case of a kiln which has lain cold for a long period, all the above-named precautions must be observed, and, in addition, before men enter the pan or chamber, the drawing eye of the kiln must be opened, and thoroughly freed below so that the air may pass into the charge. Employees are especially warned against adopting the means employed by many persons ignorant of the first principles of resuscitation, *viz.*, placing men on their faces with mouth over a hole in the ground. All such means are strictly forbidden. The administration of stimulants in any form is most dangerous, and is also strictly forbidden."

XX.—FINE CHEMICALS, Etc.

Quinine, Italian.

Chem. and Druggist, *Oct.* 1, 1904.

The Italian Government are now making quinine dihydrochloride as well as hydrochloride, sulphate, and disulphate. The State sales of quinine amounted to 8,000 kilos. in 1903, with a net profit of 180,000 lire, against 3,000 kilos. in 1902.

Patent List.

N.B.—In these lists, [A.] means "Application for Patent," and [C.S.] "Complete Specification Accepted."

Where a Complete Specification accompanies an Application, an asterisk is affixed. The dates given are (i) in the case of Applications for Patents, the dates of application, and (ii) in the case of Complete Specifications Accepted, those of the Official Journals in which acceptances of the Complete Specifications are advertised.

Complete Specifications thus advertised as accepted are open to inspection at the Patent Office immediately, and to opposition within two months of the said dates.

I.—PLANT, APPARATUS, AND MACHINERY.

[A.] 21,394. Stark. Method and apparatus for varying the temperature of fluids. Oct. 5.
,, 21,418. Newton. Filters. Oct. 6.
,, 21,458. Mitchell. Centrifugal apparatus for separating liquids from steam or other vapours or gases. Oct. 6.
,, 21,469. Walker. Drying machines. Oct. 6.
,, 21,644. Howatson and Boby. Filters. Oct. 8.
,, 21,775. Marton. *See under* II.
,, 21,945. Black. Means for and method of filtering liquids. Oct. 12.
,, 22,267. Szek. *See under* II.
[C.S.] 24,931 (1993). Huillard. Apparatus for drying pasty and fluid substances. Oct. 12.
,, 26,575 (1903). Arnold. *See under* XXII.
,, 28,279 (1903). Samuelson and Hawdon. Blast furnaces. Oct. 19.
2291 (1904). Pfeiffer. Method of and apparatus for evacuating air. Oct. 19.
,, 12,541 (1904). Montlaur. *See under* XI.

II.—FUEL, GAS, AND LIGHT.

[A.] 21,317. Payens. Plants for making water-gas. [Ger. Appl., Oct. 6, 1903].* Oct. 4.
,, 21,318. Neuman. Combined double gas producers and steam generators for producing water-gas and producer gas, and generating steam by the heat of such gases. [Ger. Appl., Oct. 20, 1903.]* Oct. 4.
,, 21,408. Perrier. Production of a combustible gas obtained by the combination of compressed air with petroleum. Oct. 5.
,, 21,494. Lion. Means for utilising naphthalene vapours for producing heat and motive power. [Fr. Appl., Oct. 7, 1903].* Oct. 6.
,, 21,538. Sablin. Apparatus for cleaning blast furnace and like gases. Oct. 7.
,, 21,676. Carolan (Gen. Electric Co.). Electrodes specially applicable to electric arc lamps. Oct. 8.
,, 21,677. Carolan (Gen. Electric Co.). Electrodes specially applicable to electric arc lamps. Oct. 8.
,, 21,755. Márton. Manufacture of fuel and other briquettes. Oct. 10.
,, 21,790. Goode, Mitchell, and The Briquette Co., Ltd. Composition for briquetting. Oct. 10.
,, 22,002. Hennebutte. Manufacture of coke. Oct. 12.
,, 22,050. Ransford (Yacono). Treating smoke and apparatus therefor. Oct. 13.
,, 22,092. Robson. Gas producers.* Oct. 14.
,, 22,267. Szek. Manufacture of briquettes. Oct. 15.
[C.S.] 21,316 (1903). Goode, Mitchell, and Oakley. Binding material for coal dust or other finely-divided substances. Oct. 12.
,, 23,771 (1903). Lymn. Gas-testing apparatus. Oct. 12.
,, 17,712 (1904). Nash. Gas producers. Oct. 12.
[C.S.] 18,364 (1904). Verdier and Teulon. Gas retorts. Oct. 12.
,, 18,487 (1904). Junkers. Method of and apparatus for determining the heating value of gaseous and liquid fuels. Oct. 12.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM, AND MINERAL WAXES.

[A.] 21,494. Lion. *See under* II.
,, 22.238. Koellner. *See under* XII.

IV.—COLOURING MATTERS AND DYESTUFFS.

[A.] 21,638. Johnson (Badische Anilin und Soda Fabrik). Manufacture of azo colouring matters and intermediate products. Oct. 8.
,, 21 856. Cain. Manufacture of diazo compounds and of azo colouring matters therefrom. Oct. 11.
[C.S.] 26,700 (1903). Naef and Levinstein. Manufacture of new sulphurised dyestuffs. Oct. 19.
,, 28,563 (1903). Newton (Bayer and Co.). Manufacture of new azo colouring matters and of colour lakes therefrom. Oct. 12.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

[A.] 21,397. Cadgène. Dyeing materials in the piece.* Oct. 5.
,, 21,634. Könitzer. Production of oxidation black on animal fibres, mixtures of animal and vegetable fibres, and fabrics made from the same.* Oct. 8.
,, 21,793. Hofmann. Machines for printing yarn in several colours.* Oct. 10.
,, 21,822. Markus and The Barnwell Machine Co., Ltd. Machine for coating fabrics with finely comminuted materials. Oct. 11.
,, 21,934. Barnes. Warp sizing and drying machinery. Oct. 12.
,, 21.988. Imray (Meister, Lucius, und Brüning). Manufacture of silk-like threads and films. Oct. 12.
,, 22,098. Davies. Production of ornamental patterns or effects on velvets, velveteens, and other pile fabrics. Oct. 14.
[C.S.] 20,959 (1903). Naeyer. Apparatus for dyeing, bleaching, degreasing, and mercerising textile materials. Oct. 12.
,, 21.595 (1903). Mather. Fabric printing machinery. Oct. 19.
,, 25,460 (1903). Donisthorpe, White, and Ellis. Dyeing of yarns and fabrics produced therefrom. Oct. 19.
,, 25,611 (1903). Donisthorpe and White. Production of parti-coloured yarns. Oct. 19.
,, 26,521 (1903). Wakefield. Bleaching of textile fabrics and fibres. Oct. 12.
,, 27,202 (1903). Velvril Co., Ltd., and Howkins. Spreading machine for coating fabrics, &c. Oct. 19.
,, 13,178 (1904). Smith. Multiple-ply woven fabrics and process for treating the same. Oct. 19.

VII.—ACIDS, ALKALIS, AND SALTS.

[A.] 21,387. Jaubert. Preparation of substances containing easily liberated oxygen. [Fr. Appl., Oct. 14, 1903.]* Oct. 5.
,, 21,393. Souheur. Preparation of briquettes of arsenious acid. [Fr. Appl., Oct. 6, 1903.]* Oct. 5.
,, 22,004. Johnson (Deutsche Gold und Silber-Scheid-Anstalt vorm. Rössler). Manufacture of sodium perborate. Oct. 12.

[A.] 22,216. Hall and Anson. Separating oxygen from nitrogen. Oct. 15.

„ 22,228. Craig. Apparatus for manufacturing and extracting ozone from atmospheric air. Oct. 15.

[C.S.] 19,196 (1903). Parker. Production of sodium and potassium. Oct. 12.

„ 21,382 (1903). Brookes (Chem. Werke Hansa). *See under* XX.

„ 21,392 (1903). Schulze. Manufacture of porous barium oxide. Oct. 12.

„ 25,972 (1903). Atkins, and Oxychlorides, Ltd. Means of preserving the strength and keeping powers of solutions of alkaline chlorides and oxychlorides. Oct. 19.

„ 26,996 (1903). Davis. Constraction of ammonia stills. Oct. 19.

„ 6846 (1904). Lake (Soc. Anon. Ing. L. Vogel per la fabr. di concimi chimici). Manufacture of sulphuric acid. Oct. 19.

VIII.—GLASS, POTTERY, AND ENAMELS.

[A.] 21,395. Stark. Ceramic products. Oct. 5.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

[A.] 21,232. Reavell. Manufacture of artificial stone.* Oct. 4.

„ 22,023. Caddick and Oliver. Method of making building materials. Oct. 13.

„ 22,056. Castle. Manufacture of cement. Oct. 13.

„ 22,169. Perkin, and Whipp Bros. and Todd, Ltd. Treatment of wood for rendering it fireproof. Oct. 14.

[C.S.] 21,316 (1903). Goode, Mitchell, and Oakley. *See under* II.

„ 21,578 (1903). Reichel. Method of preserving wood. Oct. 19.

„ 22,042 (1903). Weaver. Paving blocks made from towns' refuse. Oct. 19.

„ 15,142 (1904). Muller. Manufacture of bricks and products with a facing of carborundum. Oct. 12.

„ 15,176 (1904). Steenbock. Manufacture of vitreous cement. Oct. 19.

X.—METALLURGICAL.

[A.] 21,238. Wild. Method for extracting precious metals from telluride and sulphotelluride ores, tailings, concentrates, and the like. Oct. 4.

„ 21,322. Strecker and Strecker. *See under* XI.

„ 21,566. Cowper-Coles, and The Metals Corporation, Ltd. *See under* XI.

„ 21,657. Cokayne (Zamora). Recovery of copper from its ores, and apparatus therefor. Oct. 8.

„ 21,661. Utehmann. Means for protecting copper from destruction by sea water. [Ger. Appl., Oct. 10, 1903.]* Oct. 8.

„ 21,669. Quennell (Miller). Treatment of refractory ores. Oct. 8.

„ 21,766. Siemens und Halske Act.-Ges. Process for purifying tantalum metal. [Ger. Appl., Oct. 15, 1903.]* Oct. 10.

„ 21,768. Sayer and Spiers. Extraction and recovery of gold. Oct. 10.

„ 22,133. Atkinson. Treating ores. Oct. 14.

„ 22,195. Beyer. Hardening or tempering iron or steel. Oct. 15.

[C.S.] 21,287 (1903). Dejey. Process for engraving and etching metal. Oct. 12.

„ 26,391 (1903). Ogle, and Rapid Cyanide Treatment, Ltd. Extraction of metals from their ores. Oct. 19.

[C.S.] 1767 (1904). Ganelin, and Accumulatoren Fabr., A.-G. Process for extracting metals, such as lead and silver, from ores. Oct. 19.

„ 16,396 (1904). Abel (Siemens und Halske A.-G.). *See under* XI.

„ 18,568 (1904). Herzog. Composition for uniting or soldering cast iron. Oct. 10.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

[A.] 21,211. Kieseritzky. Regenerating negative accumulator plates of diminished capacity and avoiding the diminution in capacity of new plates. Oct. 3.

„ 21,310. Moseley. Smelting furnaces and electric stoves. Oct. 4.

„ 21,322. Strecker and Strecker. Etching metal plates by the aid of electrolysis.* Oct. 4.

„ 21,402. Jungner. Electrodes for accumulators with invariable electrolyte. [Appl. in Sweden, Oct. 7, 1903.*] Oct. 5.

„ 21,403. Jungner. Method of increasing the activity in electrode masses of badly conductive metallic oxides or hydrates in accumulators with invariable electrolyte. [Appl. in Sweden, Oct. 31, 1903.*] Oct. 5.

„ 21,553. Strickland. Galvanic dry cells. Oct. 7.

„ 21,562. Koopman (Townsend). Electrolytic method of producing white lead. Oct. 7.

„ 21,566. Cowper-Coles, and The Metals Corporation, Ltd. Electro-deposition of copper and other metals. Oct. 7.

„ 21,672. Lake (Soc. Anon. la Carbone). Electric batteries. Oct. 8.

„ 21,894. Gregory. Regenerative dry batteries.* Oct. 11.

„ 21,911. Narino. Electric batteries, electrolytic apparatus, &c. Oct. 11.

„ 21,913. Ziegenberg. Manufacture of galvanic cells.* Oct. 11.

„ 22,210. Stead. Dry voltaic cells. Oct. 15.

[C.S.] 24,472 (1903). Ruhstrat and Grimmer. Electric furnaces. Oct. 12.

„ 8365 (1904). Fairweather (Vesta Storage Battery Co.). Storage batteries. Oct. 19.

„ 12,541 (1904). Montlaur. Production of chemical reactions in gases and vapours by electric discharges. Oct. 12.

„ 14,059 (1904). Potthoff. Apparatus for electro-galvanising. Oct. 12.

„ 16,396 (1904). Abel (Siemens and Halske Act.-Ges.). Method of producing zinc from sulphate solutions by electrolysis. Oct. 19.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

[A.] 21,514. Seidler and Paul. Process for deodorising fish oils, train oils, and products of similar origin. Oct. 7.

„ 21,596. Bedford, Bedford, and Crowther. Process and apparatus for the preparation of soap. Oct. 8.

„ 22,238. Koellner. Apparatus for purifying oil and the like.* Oct. 15.

[C.S.] 27,019 (1903). Powell. Manufacture of fancy soaps. Oct. 12.

„ 16,836 (1904). Riviere. Obtaining glycerine and other products from distillers' wash and other industrial liquids. Oct. 19.

„ 17,866 (1904). Lausen. Method of rendering plastic substances of fatty nature that are hard at ordinary temperatures. Oct. 19.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(A.)—Pigments, Paints.

[A.] 21,562. Koopman (Townsend). *See under* XI.

[C.S.] 26,951 (1903). Rosenhain. Ink. Oct. 12.

,, 28,563 (1903). Newton (Bayer and Co). *See under* IV.

(B.)—Resins, Varnishes.

[A.] 21,196. Kronstein. Process for treating varnishes, lacquers or the like to make them dry quickly. Oct. 3.

(C.)—India-Rubber.

[A.] 21,234. Betty. *See under* XIV.

,, 21,899. Frost. Vulcanising apparatus. Oct. 11.

XIV.—TANNING; LEATHER, GLUE, SIZE, Etc.

[A.] 21,234. Betty. Leather and rubber waterproof and preserver. Oct. 4.

,, 21,865. Hatmaker. *See under* XVIII. A.

[C.S.] 18,691 (1904). Jerrett, Graham, and Blair. Leather-dressing composition. Oct. 12.

XV.—MANURES, Etc.

[C.S.] 19,068 (1904). Jenkner, Jenkner, and Pleyl. *See under* XVIII. C.

XVI.—SUGAR, STARCH, GUM, Etc.

[A.] 21,636. Youles and Nightingale. Method of and apparatus for the production of caramel. Oct. 8.

,, 21,865. Hatmaker. *See under* XVIII. A.

XVII.—BREWING, WINES, SPIRITS, Etc.

[A.] 21,380. Friswell. The maturing of potable spirituous liquids. Oct. 5.

,, 21,389. Hewer. The process of brewing. Oct. 5.

[C.S.] 28,630 (1903). Brackenbury. Malt kilns. Oct. 12.

,, 16,836 (1904). Riviere. *See under* XII.

XVIII.—FOODS; SANITATION, WATER PURIFICATION; & DISINFECTANTS.

(A.)—Foods.

[A.] 21,549. Heritte. Preservation of organic substances. Oct. 7.

,, 21,865. Hatmaker. Process of obtaining milk sugar and casein from milk. Oct. 11.

,, 21,866. Hatmaker. Clotted milk, cheese, and cheese making. Oct. 11.

,, 22,030. Posternak. Production of soluble earthy-alkaline and metallic salts of the organic phosphorus compound contained in vegetable foodstuffs.* Oct. 13.

[C.S.] 12,113 (1904). Schröder. Sterilisation of food and other substances. Oct. 19.

,, 18,441 (1904). Lake (Belmont). Manufacture of coffee substitutes. Oct. 12.

(B.)—Sanitation; Water Purification.

[A.] 22,215. Fiddian. Apparatus for use in distributing liquid sewage or sewage effluent on a filter bed. Oct. 15.

,, 22,235. Wicks and Dodd. Distribution of sewage effluent or other liquids over bacteria or filter beds.* Oct. 15.

[C.S.] 22,042 (1903). Weaver. *See under* IX.

,, 23,837 (1903). Declercq. Apparatus for purifying water. Oct. 12.

,, 24,838 (1903). Alliott and Scott-Moncrieff. Apparatus for distributing sewage and other liquid. Oct. 12.

,, 25,480 (1903). Barwise. Filtering and purifying sewage. Oct. 19.

(C.)—Disinfectants.

[C.S.] 17,607 (1904). Endemann. Antiseptic preparations, and process for producing the same. Oct. 12.

,, 19,068 (1904). Jenkner, Jenkner, and Pleyl. Insect killer adapted for use as a manure. Oct. 19.

XIX.—PAPER, PASTEBOARD, Etc.

[A.] 22,179. Perkins. Manufacture of paper for decorative purposes.* Oct. 14.

,, 22,245. Didier. Manufacture and application of celluloid paste in imitation of horn, tortoiseshell, ivory, &c. [Fr. Appl., Nov. 3, 1903.]* Oct. 15.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

[A.] 22,064. Meister, Lucius und Brüning. Manufacture of phenylmethylamidochloropyrazole. [German Appl., Nov. 11, 1903.]* Oct. 13.

,, 22,126. Merck. Preparation of pyrimidines. [German Appl., Jan. 28, 1904].* Oct. 14.

,, 22,127. Merck. Preparation of pyrimidines. [German Appl., Jan. 28, 1904.]* Oct. 14.

,, 22,128. Merck. Preparation of pyrimidines. [German Appl., Nov. 14, 1903.]* Oct. 14.

,, 22,129. Merck. Preparation of pyrimidines. [German Appl., Nov. 12, 1903.]* Oct. 14.

[C.S.] 21,382 (1903). Brookes (Chem. Werke Hansa). Manufacture of soluble compounds containing iron and arsenic. Oct. 12.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

[A.] 21,208. Brasseur. Carbon transfer paper. Oct. 3.

,, 21,210. Brasseur. Polychrome photographs. Oct. 3.

[C.S.] 18,183 (1904). Gaedicke. Production of silver emulsions for use in photography. Oct. 12.

,, 18,890 (1904). Garainow-Trauttenberg and Fabian. Production of photographic paper and the like. Oct. 12.

XXII.—EXPLOSIVES, MATCHES, Etc.

[A.] 21,204. Soc. de la Poudre Peigne et des Brevets J. Luciani. Manufacture of gunpowder. [Fr. Appl., Feb. 17, 1904.]* Oct. 3.

[C.S.] 26,575 (1903). Arnold. Apparatus for weighing substances such as nitroglycerine. Oct. 12.

* * *

Printed and Published by Eyre and Spottiswoode, East Harding Street, London, E.C., for the Society of Chemical Industry.—P 472.

JOURNAL OF THE
Society of Chemical Industry.

A RECORD
FOR ALL INTERESTED IN CHEMICAL AND ALLIED MANUFACTURES.
ISSUED TWICE A MONTH.

No. 21.—Vol. XXIII. **NOVEMBER 15, 1904.** No. 21.—Vol. XXIII.

Subscription of Members 25/- per annum;
Entrance Fee 21/-;
Election by the Council.

Price to Non-Members 36/- per annum:
To Members 25/- per Set of extra or back numbers.
Single copies (Members and Subscribers only),
1882—1901, 2/6 each; 1902 *et seq.*, 1/9 each.

The Society of Chemical Industry.

Past Presidents:

Sir Henry E. Roscoe, B.A., D.C.L., LL.D., Ph.D., F.R.S.	1881—1882.
Sir Frederick A. Abel, Bart., K.C.B., G.C.V.O., D.C.L., D.Sc., F.R.S.	1882—1883.
Walter Weldon, F.R.S.	1883—1884.
W. H. Perkin, LL.D., Ph.D., F.R.S.	1884—1885.
E. K. Muspratt	1885—1886.
David Howard	1886—1887.
James Dewar, M.A., LL.D., F.R.S.	1887—1888.
Ludwig Mond, Ph.D., F.R.S.	1888—1889.
Sir Lowthian Bell, Bart., F.R.S.	1889—1890.
E. Rider Cook	1890—1891.
J. Emerson Reynolds, M.D., F.R.S.	1891—1892.
Sir John Evans, K.C.B., D.C.L., LL.D., Sc.D., F.R.S.	1892—1893.
E. C. C. Stanford	1893—1894.
T. E. Thorpe, C.B., LL.D., Sc.D., Ph.D., F.R.S.	1894—1895.
Thomas Tyrer	1895—1896.
Edward Schunck, Ph.D., F.R.S.	1896—1897.
Frank Clowes, D.Sc.	1897—1898.
George Beilby	1898—1899.
C. F. Chandler, D.Sc., M.D., Ph.D., LL.D.	1899—1900.
Jos. W. Swan, D.Sc., M.A., F.R.S.	1900—1901.
Ivan Levinstein	1901—1903.
Sir W. Ramsay, K.C.B., D.Sc., LL.D., F.R.S.	1903—1904.

COUNCIL FOR YEAR ENDING JULY 1905.

President: Wm. H. Nichols.

Vice-Presidents:

Prof. P. Phillips Bedson.
Dr. Virgil Coblentz.
Dr. Edw. Divers, F.R.S.
Prof. W. R. E. Hodgkinson.
E. Grant Hooper.
David Howard.
Ivan Levinstein.
Max Muspratt.
T. J. Parker.
Dr. F. B. Power.
Sir Wm. Ramsay, K.C.B., F.R.S.
Thos. Tyrer.

Ordinary Members of Council:

Dr. J. Grossmann.
Oscar Guttmann.
H. Hemingway.
Prof. W. R. Lang.
Dr. J. Lewkowitsch.
N. H. Martin.
B. E. R. Newlands.
Prof. W. J. Pope, F.R.S.
Dr. Boverton Redwood.
Walter F. Reid.
Frank Scudder.
Dr. W. S. Squire.

Sectional Chairmen and Secretaries:

CANADIAN.	Dr. F. J. Smale.	Alfred Burton.
LIVERPOOL.	Eustace Carey.	W. R. Hardwick.
LONDON.	A. Gordon Salamon.	Julian L. Baker.
MANCHESTER.	J. Carter Bell.	Julius Hübner.
NEWCASTLE.	Dr. J. T. Dunn.	F. C. Garrett.
NEW YORK.	Russell W. Moore.	Dr. H. Schweitzer.
NOTTINGHAM.	J. T. Wood.	S. R. Trotman.
SCOTTISH.	R. T. Thomson.	Dr. Thos. Gray.
SYDNEY, N.S.W.	Prof. A. Liversidge, F.R.S.	T. U. Walton.
YORKSHIRE.	Prof. H. R. Procter.	Thos. Fairley.

Honorary Treasurer:
Samuel Hall, East London Soap Works, Bow, E.

Honorary Foreign Secretary:
Dr. Ludwig Mond, F.R.S.

General Secretary: Charles G. Cresswell.

Offices: Palace Chambers, 9, Bridge Street, Westminster, S.W.
Telegraphic Address: 59, Palatable, London.

THE JOURNAL.

Publication Committee:

The President.

Julian L. Baker.
G. Beilby.
J. Carter Bell.
Joseph Bernays, M.I.C.E.
H. Brunner.
Edw. Divers, M.D., D.Sc., F.R.S.
Sir John Evans, K.C.B., F.R.S.
T. Fairley.
Prof. A. G. Green.
Samuel Hall.
John Heron.
D. B. Hewitt, M.D.
Prof. W. R. E. Hodgkinson, Ph.D.
E. Grant Hooper.
David Howard.
Julius Hübner.
Prof. A. K. Huntington.
Wm. Kellner, Ph.D.
Charles A. Kohn, M.Sc., Ph.D.
Ivan Levinstein.
J. Lewkowitsch, Ph.D.
A. R. Ling.
W. Macnab.
N. H. Martin.
B. E. R. Newlands.
John Pattinson.
Prof. W. J. Pope, F.R.S.
F. B. Power, Ph.D.
Prof. H. R. Procter.
Sir Wm. Ramsay, K.C.B., F.R.S.
Boverton Redwood, D.Sc.
Walter F. Reid.
John Spiller.
W. S. Squire, Ph.D.
L. T. Thorne, Ph.D.
Thomas Tyrer.

ST. LOUIS EXHIBITION AWARDS.

The following is a list of the awards at the St. Louis International Exhibition in Applied Chemistry, Electro-Chemistry, Metallurgy, and kindred industries. These effectively demonstrate the success of this country's participation in the enterprise, and are a proof of the general excellence of the British Exhibits.

The total number of Grand Prizes gained by Great Britain is 121, while 238 Gold Medals, 162 Silver Medals, and 132 Bronze Medals have been awarded to British Exhibitors, making 653 awards in all.

Group 20.—Medicine and Surgery.—Grand Prize : Wellecme Physiological Research Laboratories; Burroughs, Wellcome, and Co. *Bronze Medal :* Joseph W. Lovibond; John J. Griffin and Sons (Limited). *Awards to Collaborators.—Gold Medal :* Dr. Walter Dowson (Wellcome Physiological Research Laboratories). *Silver Medal :* A. G. Vernon Harcourt (John J. Griffin and Sons (Limited).

Group 23.—Chemical and Pharmaceutical Arts.—Grand Prize : Low Temperature Research Exhibit of the British Royal Commission; British Cyanides Company (Limited); Burroughs, Wellcome, and Co.; Edward Cook and Co. (Limited); Doulton and Co. (Limited); Joseph Crosfield and Sons (Limited); J. C. and J. Field (Limited); Evans, Sons, Lescher, and Webb (Limited); Gas Light and Coke Company; Hopkin and Williams (Limited), and Howards and Sons (Limited); Levinstein (Limited); Nobel's Explosives Company (Limited), and The Birmingham Metal and Munitions Company; Price's Patent Candle Company (Limited); Professor Sir William Ramsay, K.C.B., D.Sc., LL.D., F.R.S.; United Alkali Company (Limited); Peter Spence and Sons (Limited). *Gold Medal :* Allen and Hanburys (Limited); Stafford Allen and Sons (Limited); Anglo-Sicilian Sulphur Company (Limited); Baird and Tatlock (Limited) (London); Brooke, Simpson, and Spiller (Limited); Brunner, Mond, and Co. (Limited); Burmah Oil Company (Limited); the Cassel Gold Extracting Company (Limited); The Castner-Kellner Alkali Company (Limited); Chance and Hunt (Limited); Spencer Chapman and Messel (Limited); Corbyn, Stacey, and Co. (Limited); John J. Griffin and Sons (Limited); Hemingway and Co., and Hemingway's London Purple Company (Limited); McDougall Brothers; May and Baker (Limited); Dr. Ludwig Mond, F.R.S.; T. Morson and Son; The Owens College; James Pain and Sons; Royal College of Science, London; South Metropolitan Gas Company; Townson and Mercer; Thomas Tyrer and Co. (Limited); John and James White; Wood and Bedford. *Silver Medal :* Assam Oil Company (Limited); Lewis Berger and Sons (Limited); A. Boake, Roberts, and Co. (Limited); Walter Carson and Sons; J. M. Collett and Co.; R. and J. Garroway; The Glasgow and West of Scotland Technical College; Professor W. N. Hartley, D.Sc., F.R.S.; F. Kendall and Son (Limited); John Bennet Lawes and Co. (Limited); Joseph W. Lovibond; Dr. Allan Macfadyen; William Martindale: the Mond Nickel Company (Limited): Morris, Little, and Son (Limited); B. E. R. Newlands, F.I.C., F.C.S.; Newton, Chambers, and Co. (Limited); Parkin, Ness, and Co.; W. Pearce and Sons (Limited); Sharon Chemical Company (Limited); Sheppey Glue and Chemical Works (Limited); J. W. Swan, D.Sc., F.R.S., and J. A. Keudall; William Warren (Hooper and Co.). *Bronze Medal :* J. B. Aitken; P. and J. Arnold: John Austen; E. C. C. Baly; Battley and Watts; F. W. Berk and Co. (Limited); The Bone Phosphate and Chemical Company (Limited); Cerebos (1903) (Limited); George Clark and Son (Limited); Cornwall Arsenic Company; H. C. Fairlie and Co.; Daniel Davison; The Grove Chemical Company (Limited): W. H. Francis; W. J. Fraser and Co.; F. C. Hills and Co.; Kemball, Bishop, and Co. (Limited); The Society of Apothecaries of London; Stone and Tinson; John and E. Sturge; Alfred White and Sons. *Awards to Collaborators.—Gold Medal :* Professor Sir James Dewar, M.A., LL.D., D.Sc., F.R.S. (Low Temperature Research Exhibit); T. Wilton (the Gas Light and Coke Company); Dr. Andrew Ross Garrick (the United Alkali Company, Limited). *Silver Medal :* J. E Petavel (Low Temperature Research Exhibit); Dr. Radol Messel (Spencer Chapman and Messel, Limited); Julius Lewkowitsch, Ph.D. *Bronze Medal :* Dr. Carl Langer (th Mond Nickel Company, Limited); C. T. Tyrer (Thomas Tyrer and Co., Limited); Hugh Ramage (Professor W. N. Hartley).

Group 52.—Plant and Processes for Finishing Textiles —Gold Medal : Daniel Lee and Co.; William Liddell an Co. (Limited); John S. Browo and Sons.

Group 68.—Electro-Chemistry.—Gold Medal : Unite Alkali Company (Limited). *Silver Medal :* Sherar Cowper-Coles and Co. (Limited). *Awards to Collaborators.—Silver Medal :* Dr. Andrew Ross Garrick (Unite Alkali Company, Limited).

Group 80.—Fertilisers.—Gold Medal : The Aberdee Comb Works Company (Limited); Sheppey Glue an Chemical Works (Limited). *Silver Medal :* The Grov Chemical Company (Limited).

Group 86.—Equipment and Methods for Preparin Foods.—Grand Prize : Joseph Baker and Sons (Limited) *Gold Medal :* A. Boake, Roberts, and Co. (Limited). I Kendall and Son (Limited).

Group 87.—Farinaceous Products and their Derivative —Gold Medal : Burroughs, Wellcome, and Co. *Bronz Medal :* Joseph Edmunds.

Group 90.—Sugar and Confectionery.—Grand Prize J. A. Sharwood and Co. (Limited); A. Boake, Robert and Co. (Limited); Joseph Edmunds. *Gold Medal :* I P. Seton and Co.; Evans Sons, Lescher, and Web (Limited); F. Kendall and Son (Limited).

Group 95.—Inedible Agricultural Products.—Gran Prize : The Wellcome Chemical Research Laboratorie *Gold Medal :* A. S. Mackertich and Co.

Group 96.—Insects and their Products.—Gold Meda McDougall Brothers.

Group 114.—Appliances for Gathering Wild Crops.— Gold Medal : The Wellcome Chemical Research Laboratories.

Group 118.—Metallurgy.—Grand Prize : Birmingha Metal and Munitions Company. *Gold Medal :* Shera Cowper-Coles and Co. (Limited); the Lilleshall Com pany (Limited); the Monk Bridge Iron and Steel Compan (Limited); the Farnley Iron Company (Limited). *Sil Medal :* The Anglo-French Nickel Company (Limited Sheepbridge Coal and Iron Company (Limited); Unit Alkali Company (Limited). *Bronze Medal :* Joseph Lovibond.

THE JOURNAL.

From the beginning of next year the Society's Journ will be printed and published by Messrs. Vacher and So Great Smith Street, Westminster, S.W., to whom all com munications regarding subscribers' copies and advertiseme should be sent.

SUBSCRIPTIONS FOR 1905.

Foreign and Colonial Members are reminded that t subscription of 25s. for 1905, payable on January 1st ne should be sent in good time to the Hon. Treasurer (M Samuel Hall), in order to ensure continuity in the receipt the Society's Journal. Any changes of address to app in the new List of Members now in course of preparati should reach the General Secretary not later than Janua 15th, 1905.

ANNUAL GENERAL MEETING, NEW YORK. PHOTOGRAPHS.

The Columbia University Groups may be obtained fr Mr. Harry Contant, 5, West 31st Street, New York, a 18, Alice Court, Brooklyn, N.Y.

The Mount Vernon Groups may be obtained fr Mr. G. Prince, Pennsylvania Avenue and 11th Str Washington, D.C.

The Boston Groups may be obtained from Mr. E. Chickering, 21, West Street, Boston, Mass.

The prices vary according to size and form of reproduction, but those exhibited cost from 3 dols. to 4 dols. apiece. Remittances must accompany orders.

The Secretary is awaiting the receipt of particulars of other photographs taken from time to time.

RARE MINERALS FOR RESEARCH.

Mr. A. B. Frenzel, of 1540, Sherman Avenue, Denver, Colo., U.S.A., Commissioner of Rare Minerals for Colorado at the St. Louis Exposition, and a member of this Society, will give to any member of the Society, for research work, or for demonstrating purposes in any institution of learning, any reasonable quantities of ores containing uranium, vanadium, tungsten, or molybdenum, free on board, Denver, Colorado. Members should communicate direct with Mr. Frenzel.

COMMUNICATIONS.

Authors of communications read before the Society, or any of its Local Sections, are requested to take notice that under Rule 43 of the Bye-laws the Society has the right of priority of publication for three months of all such papers. Infringement of this Bye-law renders papers liable to be rejected by the Publication Committee, or ordered to be abstracted for the Journal, in which case no reprints can be furnished to the author.

Changes of Address.

When notifying new addresses, members are requested to write them distinctly, and state whether they are temporary or permanent. Multiplication of addresses is also to be avoided as tending to create confusion. When sending subscriptions, the use of the form attached to the application helps in the verification of addresses, on which the safe delivery of the Journal depends.

Anfilogoff, Nicholas A., l/o Thames Haven; 17, Windsor Road, Leyton, Essex.

Bell, Hugh P., l/o Egerton Crescent; 3, Mincing Lane, London, E.C.

Bloxam, W. Popplewell, l/o Bournemouth; 25, Upper Bedford Place, London, W.C.

Bowey, John, jun., l/o Coraopolis, Pa.; 567, Dufferin Avenue, London, Ont., Canada.

Byrnes, Dr. Eugene A.; Journals to c/o Byrnes and Townsend, 918, F. Street N.W., Washington, D.C., U.S.A., Patent Lawyer.

ayvan, L. L., l/o New York City; 4647, Indiana Avenue, Chicago, Ill., U.S.A.

lark, Edmund, l/o Board of Health; Room 1007, Appraisers' Stores, 641, Washington Street, New York City, U.S.A.

larke, Wm. B.; Journals to c/o Edison Swan U.E.L. Co., Ltd., Ponders End, Middlesex.

anziger, J. L., l/o Niagara Falls; 302, West 114th Street, New York City, U.S.A.

nequist, John, l/o Greene Avenue; 267, Rutland Road, Brooklyn, N.Y., U.S.A.

oodchild, Wm.; Journals to Bannie Mine, Sambas, Dutch West Borneo.

ray, Jas., l/o Fordsburg; c/o Langlaagte Estate and G.M. Co., P.O. Box 98, Johannesburg, South Africa.

aynes, D. O., l/o Spruce Street; 90, William Street, New York City, U.S.A.

oulder, B. E., l/o Portland Road; 50, Lady Margaret Road, Southall, Middlesex.

orte, Dr. R. F., l/o Köln; 146, Alexandra Road, London, N.W., and (Journals) University College, London, W.C.

Laurence, Jas.; communications to P.O. Box, Joplin, Mo., U.S.A.

Remington, J. Percy; all communications to 36, Doughty Street, Brooklyn, N.Y., U.S.A.

Sanderson, T. Crisp, l/o Port Richmond; Duboise Avenue, West New Brighton, N.Y., U.S.A.

Silberrad, Dr. O., l/o Shooter's Hill; 51, Shooter's Hill Road, Blackheath, S.E.

Smith, J. Cruickshank, l/o Bayswater; 5, The Elms, London Road, Wembley, Middlesex.

Ward, Wm. J., l/o Urmston; Journals to Bagillt, North Wales.

Warnes, A. R., l/o Calcutta; c/o T. W. Willson, 117, Boyson Road, Camberwell Gate, S.E.

Wigg, Chas. E., l/o Merstham; c/o The Hull and Liverpool Red Oxide Co., Peasley Cross, St. Helens, Lancashire. Delete "Electrical Engineer."

Young, Dr. Geo., l/o Sheffield; Lauraville, Bladda, Port Erin, Isle of Man.

Death.

Ekman, C. D., at 23, Pier Road, Gravesend, Kent. Nov. 3.

CHANGES OF STYLE.

His Majesty the King has been pleased to confer the honour of a Baronetcy of the United Kingdom on Michael B. Nairn, Esq., and the honour of Knighthood on Dr. Joseph Wilson Swan, F.R.S.

Annual General Meeting,

NEW YORK, 1901.

PHILADELPHIA, Monday, Sept. 12th.

Reception Committee.

Wm. Weightman, Hon. Chairman.
Samuel P. Sadtler, Chairman.

Theo. Armstrong.
H. R. Baltz.
Daniel Baugh.
Edward T. Beale.
Wm. H. Bower.
Chas. Heber Clark.
Walton Clark.
Pierre S. Du Pont.
Howard B. French.
Thos S. Harrison.
Jas. F. Hope.
Harry W. Jayne.
H. F. Keller.
M. N. Kline.
John B. Lennig.
Robt. W. Lesley.
J. Merritt Matthews.
R. V. Mattison.
Geo. McNeely.
Geo. D. Rosengarten.
Pedro G. Salom.
E. F. Smith.
D. K. Tuttle.
Joseph Wharton.

On reaching Philadelphia at 10.10 a.m. the party was met by a deputation of the committee, accompanied by several ladies, among whom may be mentioned Mrs. Matthews, Mrs. Clark, Miss Sadtler, and Mrs. Rosengarten, and driven to Independence Hall, where they were received by Mr. J. Weaver, the first English-born mayor of Philadelphia, in the famous room where the Declaration of Independence was signed. They were then driven to the University of Pennsylvania, and, after an inspection of the laboratories, &c., were entertained at luncheon by the University authorities in the Howard Houston Hall. This hall is a club-house for the use of the students of the University, and provides a place where all may meet on common ground and have every facility for passing their leisure hours in healthy recreation. The equipment of the hall includes a reading room, furnished with periodicals and newspapers, smoking rooms, billiard and pool tables, bowling alleys, a bath room and a swimming pool, athletic trophy rooms, a large auditorium with grand organ, rooms for the University papers, dark room for photographers, and many others

The University of Pennsylvania, founded in 1740 by the efforts of Benjamin Franklin, has to-day 2700 students, with 275 professors and instructors.

Visits were then paid to the Baldwin Locomotive Works, the Petroleum Refinery, the Varnish Works, and the United States Mint. The New Mint at Philadelphia is the finest building ever constructed for coining purposes. In the numismatic room are gathered for public inspection a valuable collection of the world's representative coins. From the corridors surrounding this department may be seen, from on high, through large plate-glass windows, the workrooms with the work of minting going on. First comes the room where the bullion is received, weighed, and deposited; next, the room of the refiner, where the pure metal is separated out; then the room where the metal is melted, alloyed, and cast into ingots; next, the room of the assayer; then, the room where the metal which has stood the test is rolled into long ribbons, from which the blanks or planchets are stamped; next, the room where the blanks are weighed and adjusted, and where those found to be of legal weight are raised round the edge and cleaned; then, the room where the blanks are stamped into coin; and, finally, the rooms where the coins are weighed counted, and packed into bags.

The party then drove through Fairmount Park, passing by the magnificent Washington statue and the site of the great exhibition, some of the pavilions of which still serve as boat clubs on the bank of the Schuylkill. Thence up the Wissahickon Drive and past the celebrated Fish House. The piece of marsh land on which the Fish House stands, some two acres in extent, is known as the "State in Schuylkill," and possesses a governor and legislature.

Dr. Samuel P. Sadtler, at a banquet—or second annual dinner—given at the Germantown Cricket Club, said, in proposing the health of the President, that Philadelphia chemists, whether manufacturers or professional men, felt a peculiar pleasure in welcoming their fellow members of the Society. They were glad to have that opportunity of showing that they appreciated the importance of the object for which their Society was founded, *viz.*, the exchange of information and views on the application of chemistry to the manufacturing arts by means of sectional meetings and the publication of a journal. They were also delighted to meet face to face the distinguished representatives of chemical science who had honoured them with their presence.

The Society was not one with which Philadelphia had but a recent acquaintance. In the first year of its existence, already, it enrolled several Philadelphians among its members, and when he himself joined it, early in 1884, there were already eight other Philadelphians on the register. Now there were in the city and its suburbs about 60 members of the Society. It was true that they were enrolled each year in the published list of members of the New York Section, but that was only an illustration of the methods of "benevolent assimilation" on the part of their friends in the borough of Manhattan, to which they had become quite accustomed, and did not resent in the least. On the contrary, they had availed themselves of this membership to attend the New York meetings, and the Chemists' Club had always given them a royal welcome.

Turning to the chemical industries of the city, Dr. Sadtler said that the exigencies of the War of the Revolution led to the erection, in 1770, of large saltpetre works in Market Street. The firm of Christopher and Charles Marshall, sons and successors of Charles Marshall, an early druggist and so-called "fighting Quaker of Philadelphia," in 1786 manufactured extensively "muriate of ammonia" and "Glauber's salt." The manufacture of white lead was commenced by Samuel Wetherill, another druggist, about 1789, and rapidly developed. This business is still continued by the Wetherills. John Harrison, a druggist, about 1793, was the first to produce sulphuric acid on a commercial scale, and may be called a leader in the establishment of chemical industries in America. The firm of Farr and Kunzi engaged in the manufacture of sulphuric acid about 1812 and general chemicals in 1818. In 1838 the firm became Farr, Powers, and Weightman, and in 1841 Powers and Weightman. George D. Rosengarten began the manufacture of chemicals under the name of Rosengarten and Zeither in 1822, and the name "Rosengarten and Sons" still continued with one of the sons and several grandsons of the founder still in control. Charles Lennig founded another important firm of chemical manufacturers about 1831. There were twenty-four works within the city engaged in chemical industry, while fifteen were engaged in the preparation of drugs.

In conclusion, Dr. Sadtler stated that Philadelphia was the leading city of the United States for the production of carpets and rugs, woollen goods, hosiery and knit goods, leather, chemicals, and dyeing and finishing textiles. It produced one-eighth of the chemical output of the country. He regretted that the shortness of the Society's stay in Philadelphia would not allow of their visiting many of the industrial establishments of the city. They would, however, receive a warm welcome at a future time when possibly they might have more leisure.

The party then left the club to rejoin the train for Washington.

WASHINGTON, TUESDAY, SEPT. 13TH.

RECEPTION COMMITTEE.

H. W. Wiley, Chairman.

Eugene A. Byrnes.
T. M. Chatard.
David T. Day.
Fred. P. Dewey.
A. W. Dow.
Edwin C. Eckel.
Wm. S. Ferris.
Max Georgii.
John J. Griffin.
W. H. Heileman.
Lyman F. Kebler.
Jas. B. Littlewood.
Chas. E. Munroe.
R. Outwater.
Harry J. Patterson.
E. Richards.
Henry N. Stokes.
Samuel S. Voorhees.

Marcus Benjamin, Secretary.

The Committee is subdivided as follows:—

Executive Committee.

H. W. Wiley, Chairman.

Marcus Benjamin.
Chas. E. Munroe.
Samuel S. Voorhees.

Finance Committee, Washington.

Chas. E. Munroe, Chairman.

T. M. Chatard.
A. W. Dow.

Finance Committee, Baltimore.

H. Burrough, jun.
A. R. L. Dohme.
Chas. Glaser.

Entertainment Committee, Washington.

Samuel S. Voorhees, Chairman.

Fred. P. Dewey.
Eugene A. Byrnes.

Entertainment Committee, Baltimore.

V. G. Bloede.

Press Committee.

Marcus Benjamin.

Ladies' Committee.

Mrs. Chas. E. Munroe.
Mrs. Marcus Benjamin.
Mrs. V. G. Bloede.
Mrs. T. M. Chatard.
Mrs. A. W. Dow.
Mrs. Samuel S. Voorhees.

Assisted by the wives of other members of the local committee.

On reaching Washington, the visiting members and ladi were met at the station by a committee of Washingt members led by Dr. H. W. Wiley, and, after breakfa proceeded to "see Washington" on electric cars, a gui on each describing the points of interest. Then they pr ceeded to Heurich's Brewery, where they were entertained luncheon. Mr. Christian Heurich led the members throu the large building and explained the working of the pla which is an unusually fine one.

The members were then taken to "Cabin John's Bridge seven miles from Georgetown, which forms part of t aqueduct system, and carries two 7-ft. pipes. The brid is 120 ft. in length, and the arch, with a span of 220 ft., w long reputed to be the largest stone arch in existence.

In the evening there was a reception and supper at "Rauscher's," where three couples of negroes, led by a master of the ceremonies, all amateurs, performed a cake-walk.

Wednesday, Sept. 14th.

Wednesday morning was spent in visiting the public buildings. At the Capitol were shown the Senate House and House of Representatives. These occupy wings right and left of the old Senate House, now the Supreme Court Room, and the old House of Representatives, now the National Statuary Hall. The Library of Congress, which may fairly be called the National Library, and contains about a million and a quarter of books, was shown by Dr. Herbert Putnam, the Chief Librarian, assisted by Mr. Bernard Green, C.E., superintendent of buildings and inventor of the bookstands and automatic transporting machinery used in the Library, Mr. Hutchinson, who is in charge of the Reading Room, and fourteen other guides specially detailed by the Chief for this purpose.

The White House, the Smithsonian Institution, the Navy Yard, and the Washington Monument were also visited, and on each occasion there was the same personal courtesy and guidance from the chiefs of Departments, while many things not ordinarily shown were freely placed before the members.

The Navy Yard, with its gun shops, where great lathes perform the turning, boring, and rifling of the steel breech-loading guns of the U.S. Navy, some of which weigh more than sixty tons, and its historic relics and trophies of former wars, was found to be of great interest to many.

The three publications of the Smithsonian Institute, "Contributions to Knowledge," "Miscellaneous Collections" and "Annual Reports" are known wherever science flourishes. Its famous Hodgkins medal and prize of 2000*l.* were bestowed in 1895 on Lord Rayleigh and Sir William Ramsay for their discovery of Argon.

The National Museum, which is under the care of the Secretary of the Smithsonian Institution, occupies a building adjacent to the parent institution, and contains precious relics of famous citizens, notably those of Washington, Lincoln, and Grant. This museum is also particularly rich in specimens illustrating the customs, arts, and industries of the North American Indians and the aborigines of North-western America.

The Bureau of Engraving and Printing is a branch of the Treasury Department, and there were shown the printing of the Government bonds, and the national currency or "greenbacks," as well as the postage and revenue stamps, military, naval, and diplomatic commissions, passports, &c. In this building there are fourteen departments and 1400 employees; each piece of work passes through the hands of thirty different persons.

The Bureau of Chemistry attached to the United States Department of Agriculture is divided into ten sections, according to the nature of the question to be investigated. The *Division of Foods* (chief, W. D. Bigelow) is charged with the inspection and examination of imported foodstuffs, and also the effect of preservatives on nutrition. In addition to these, the analytical methods necessary for the examination of food are studied. The *Division of Tests* (chief, L. W. Page) has for its object the testing of road materials, clays, cements, and concretes. The *Sugar Laboratory*, which is under the personal supervision of Dr. H. W. Wiley, chief of the bureau, is largely occupied with the study of sugar-beets grown in collaboration with the agricultural experiment stations under various conditions. The laboratory is also engaged in controlling the polarisation of imported sugars for dutiable purposes. In the *Dairy Laboratory* samples of dairy produce of every description are analysed. The *Insecticide and Agricultural Water Laboratory* studies the composition and effect of the various insecticides on the market, and examines the irrigation waters of the west and south-west; an examination of the leading mineral waters of the United States is also in progress. The examination of all kinds of medicinal remedies and crude drugs is undertaken in the *Drug Laboratory*, with especial reference to the analytical methods employed for such work. The *Contracts Laboratory* was organised for the purpose of examining all kinds of materials to be purchased by the United States Department of Agriculture. Fertilisers and their effects, and also the constitution of plants are investigated in the *Plant Laboratory*. The *Microchemical Laboratory* is charged with the microscopical and microchemical study of foods, drugs, cattle-food, paper and textiles, miscellaneous agricultural products, &c., especial attention being paid to the histological study of fruits, spices, cereals, starches, &c. Examinations are also made of the urine and blood in connection with the work on the effect of preservatives on nutrition. The *Leather and Paper Laboratory* conducts investigations on tannins, tanning materials, and leather production; also on papers, as regards their fitness for use in various Government departments, and on the raw materials used in paper manufacture. Among other work which has been taken up by the bureau may be mentioned a study on the influence of environment on the composition of certain agricultural products, and an investigation in œnological technology, with especial reference to alcoholic ferments and the composition of fruits and fruit juices and their fermented products.

In the afternoon a party, smaller than it would have been but for the inclemency of the weather, went by electric "trolley car" to visit Mount Vernon, the home of General Washington. This mansion overlooks the Potomac River, and is built of wood, cut and painted to resemble stone.

The visitors were shown the mansion, with its historic relics, by the Superintendent, Mr. Dodge, who explained in detail the significance of each object. With bowed and uncovered heads the visitors stood before the tomb of Washington, thus paying a silent tribute to the worth of this great man. They were much interested in the young tree planted by the British Ambassador by special order of his Majesty, King Edward, to take the place of the one planted by him when as Prince he visited the tomb of Washington in 1864. The tree planted by the young Prince unfortunately died. The domain is well cared for by the "Ladies' Mount Vernon Association."

The party then returned to Washington. In the evening, the visitors were entertained by Mr. and Mrs. V. G. Bloede, of Baltimore, at a vaudeville performance at Chase's theatre. The return to the hotel and the subsequent ride to the railway station were achieved under difficulties, owing to the flooding of the city by a violent thunderstorm.

The Cosmos Club, the science club of Washington, extended courtesies to the gentlemen, while the Washington Club, through the kindness of the Ladies' Committee, extended its privileges to the ladies.

(*To be continued.*)

New York Section.

Meeting held at the Chemists' Club, on Friday, October 21st, 1904.

MR. R. W. MOORE IN THE CHAIR.

CHAIRMAN'S ADDRESS.

CHEMISTRY IN CUSTOMS ADMINISTRATION.

BY RUSSELL W. MOORE.

The science of chemistry has so many ramifications in the industry of a country that many of the spheres in which its influence is felt receive occasional attention only. Thus at times the transportation of chemicals is discussed and valuable facts brought to light, showing that from want of knowledge of the character of various chemicals, many incongruities in freight rates occur. Chemicals as a class are popularly considered dangerous, hence insurance rates are often unnecessarily and sometimes arbitrarily high. Better knowledge will bring about better conditions, but since these matters are but a detail of chemical industry, they will probably never receive any united attention from manufacturers and consumers, but will have to depend largely on occasional effort for improvement. I have chosen as my subject a phase of chemistry which, as far as I can learn, has, in America, never been the subject of either book or pamphlet, and of but one paper. The files of chemical literature are silent; only occasionally, almost lost to chemists in legal reports, are to be found reports of Customs cases in which much chemical evidence is contained, and in which the judicial decision was largely based on the chemical facts established. Nevertheless, chemistry has an important influence on the administration of the United States Customs laws, and without its aid many irregularities and injustices would arise which would seriously be felt by chemical manufacturers and dealers. A few figures will show the great volume of merchandise which is handled in the customs houses of the United States.

The imports amounted, at the close of the fiscal year ending June 30, 1904, to 991,090,978 dols., of which 45·82 per cent. were free of duty. The duties collected amounted to 262,013,079 dols. The value of chemicals, drugs, and dyes imported during the same period was 65,272,176 dols., while oils of all kinds and paints, pigments, and colours amounted to 12,853,461 dols. Of these imports, merchandise of the value of 25,696,934 dols., of which 12,268,535 dols. is dutiable, was again exported to other countries. Of this volume of imports, about 70 per cent. is handled at the port of New York, while other ports constantly refer samples of merchandise to New York for information regarding the proper rate of duty and value.

The part that chemistry plays is to furnish all possible chemical data and facts to arrive at a correct tariff classification and value, and to aid in the collection of the proper amount of duty. A coal-tar dyestuff may be taken as an instance. The tariff assesses no duty on dyestuffs derived from alizarin or anthracene, but places a duty of 30 per cent. on all other coal-tar colours. The reason for this is apparent. Anthracene is not extensively produced in the United States, nor are alizarin dyestuffs, while other coal-tar colours are produced in considerable quantity. New dyestuffs are constantly being introduced, and must be examined chemically to determine their constitution. Often the question is a very narrow one, as in the case of condensation products from anthracene and toluidine. Simpler instances are argols (where the duty is levied according to certain limits of potassium bitartrate), borate of lime (where the percentage of anhydrous boric acid is the basis of the rate of duty), and still wines, which pay 40 cents per gallon if containing 14 per cent. of alcohol, and 50 cents per gallon if more. The function of the chemist is obvious. Of great importance is the assessment of duty on imported raw sugar, which, beginning with a polariscopic test of 75°, levies a duty of 0·035 cent. on each additional degree. This test was applied to sugar valued at 71,409,639 dols. in the year ending June 30, 1904. It must be remembered that the tariff is not a scientific paper, though it makes use of scientific terms, and that tariff distinctions are not necessarily scientific distinctions. Often a very simple examination suffices to determine the tariff description of a chemical, while to thoroughly identify it would be a great labour.

One of the most important cases under the present law hinged on the meaning of the term "derived from alizarin" or "from anthracene" as applied to dyes. The chemical view would include all the numerous derivatives. The position of the Government was, that the word was used in the ordinary sense of obtained or made from alizarin, and such was the final decision of the court.

The variety of samples analysed calls, in the first place, for a number of chemists with differing specialties. This is further required for the reason that in Custom matters one individual must be responsible for the report. No divided responsibility or work is possible, since the report may be used as evidence in a Customs suit, in which case the chemist may be called as a witness. Hence all chemists signing reports are on the same official basis; and a large Customs laboratory is in fact a collection of small laboratories, and not an organisation founded on the principle of division of labour. The most prominent requisite for Customs analyses is rapidity, combined, of course, with reasonable accuracy. Thus volumetric methods are followed whenever the amount of work renders them advantageous. The work bears the same relation to research analysis that journalism bears to literature. It must be clear, definite, and to the point. Problems do, however, arise in which not much aid can be derived from published methods, and research is necessary. Recently a case arose in which the quantitative analysis of a sample of a mixture of three fatty oils was required. These were identified as castor and olive oils and oleic acid. The chemist finally devised a method and reported a result, which the importer admitted was within 2 per cent. of his formula. I cannot refrain from saying that much difficult and laborious work is avoided by the readiness of the importers and manufacturers to furnish the Customs authorities with all necessary facts and data regarding their goods, so that a complicated research is often made a comparatively simple verification. While contests on the construction of the tariff are frequent, contests between Customs chemists and importers' chemists are almost unknown, as I am glad to say that both appear equally anxious to arrive at the truth.

Broadly speaking, a knowledge of chemical technology is of equal value to chemical knowledge in Customs matters; the origin, manufacture, and uses of various articles often determine their dutiable character quite as clearly as their chemical constitution. Here we are indebted to the Journal of the Society of Chemical Industry for a complete compendium of technical information, and all the more valuable for being recent.

When the importer is dissatisfied with the duty levied upon his goods, he can by protest or appeal obtain a new consideration of his case by the Board of General Appraisers. Here any chemical features that may arise are again carefully considered. Samples are again analysed if necessary, and any new chemical facts can be brought out. The Customs chemical report is subjected to scrutiny, and any error which may be detected duly allowed for. From this Board an appeal may be taken to the United States Courts, and frequently the United States district attorney avails himself of the services of the Customs chemist. It will be noted that at every step in this procedure the importer has ample opportunity to present both facts and arguments, and all chemical statements submitted are weighed and examined with care and skill.

Most of the Customs chemical work is performed in the laboratory attached to the office of the United States Appraiser at New York. The strictly chemical work is accomplished by two chemists occupied with metal ores and metallurgical products, one with merchandise containing alcohol, one with miscellaneous articles, including chemicals, fats, oils, paints, and drugs, one in estimating sugar in confectionery, preserved fruits, &c., and two with organic articles, together with a chemist in charge. During the last calendar year 38,751 samples of raw sugar were tested by the polariscope, and 7513 samples were chemically tested. In a note previously published in this Journal, April 30, 1900, I gave a rough classification of the samples received for analysis. The character, as well as the number of samples changes so much from year to year that a classification of this kind has only a temporary value. Nothing but actual experience will give a correct idea of the character of chemical work called for.

A similar rough classification of samples for the first six months of 1903 gives:—Asphalt, 4; chemicals, 174; Chinese wines, 62; coal-tar dyestuffs, 30; coal-tar preparations, 33; condensed milk, 17; confectionery, crackers, &c., 181; drugs, 14; dyewood extracts, 11; earths, stone, coal, and minerals, 52; fats, oils, waxes, and soap, 483; fertilisers, 21; fruit in sugar, 175; fruit in spirits, 23; fruit juice, 197; glycerin, 33; lead bullion and metallurgical products, 128; lead in cables, foil, and sheets, 106; metals and alloys, 193; medicinal preparations, 99; medicinal preparations, alcoholic, 131; miscellaneous, 278; paints and colours, 186; resins, 7; spirits, 27; vinegar, 167; wine, 346; wood-pulp, 332. Total, 3510.

It is not to be understood that samples from every importation of merchandise are tested chemically. The function of the Customs chemist is to supply the necessary knowledge to enable Customs officials to act correctly in cases of doubt or incomplete chemical evidence. The identity of a chemical once established, only occasional tests are required. I do not think that it is an over-statement to say that the Customs revenue is as much indebted to chemistry for the proper collection of duties on many articles as the manufacturer is indebted to his chemist for their production and quality.

While in no sense occupying a judicial position, the customs chemist is often called upon to furnish the facts which point irresistibly to a legal conclusion, and it is not saying too much to state that the chemical evidence in many cases requires to be as carefully weighed by the chemist as the legal evidence. Often judicial decisions are founded directly on the chemist's report. While this places a great responsibility on the chemist, it also furnishes him with a high ideal—to aid in administering the law of his country, not according to any policy, but with all the aid that a noble science can command in the interest of justice and ight.

CONSTANTS OF COCOANUT OIL.

BY N. J. LANE.

odine value, hot ethereal solution of lead soap.	14·50	15·10	14·04	20·68	21·16	19·52

In the "cold ether method" the lead soap was digested with cold ether, the solution diluted to 500 c.c. in a specially-made graduated tube, and an aliquot portion drawn off through a filter after the precipitate had settled. In the "hot ether method," the ethereal solution of the lead soaps was boiled before dilution.

Obituary.

HUGH SALVIN PATTINSON, Ph.D.

MEMBER OF THE SOCIETY OF CHEMICAL INDUSTRY, &c.

Hugh Salvin Pattinson, son of Mr. John Pattinson, public analyst for Newcastle-on-Tyne, received his early educational training at the Newcastle College of Physical Science, afterwards proceeding to Zürich, where, in 1877, he studied in the Polytechnikum, under Victor Meyer and G. Lunge, ultimately taking the Ph.D. degree. So enthusiastically did he enter into this course of study and research, that it is feared he overtaxed his strength, and thus, unfortunately, laid the foundation of much subsequent weakness and suffering. Returning to England about the year 1883, he worked for some time in his father's laboratory, afterwards becoming a partner with him. In this position he not only shared in the general work of the firm of J. and H. S. Pattinson, but also acted as joint public analyst with his father for the city of Newcastle and neighbouring towns. He was also, for some years, and so long as his other duties and health would allow, a most effective abstractor for the columns of this Journal. The following are amongst the more important of his scientific and analytical papers:—In conjunction with Dr. W. Michler, of Zürich, "*Zur Kenntniss der Diphenyl- und Ditolylverbindungen*," Ber., 1881, **14**, 2161 *b*; and "*Ueber Tetramethylbenzidin*," Ber., 1884, **17**, 115. Also, in conjunction with his father, "*Determination of Arsenic and Phosphorus in Iron Ores*," this J., 1893, 119; "*Preparation of Samples of Rich Argentiferous Lead for Assay*," this J., 1892, 321; *Determination of Manganese in its Ores and Alloys*," this J., 1891, 333; "*Determination of Phosphorus in Iron*," this J., 1895, 443; and "*Determination of Tin*," this J., 1898, 214. Though enthusiasm in all that he undertook carried him far, yet his work was greatly hampered by his very delicate health, which necessitated at times prolonged periods of total rest and retirement. Amongst friends and more intimate associates alike, his constant cheerfulness in the face of terribly adverse conditions, was not only a continual source of wonder, but also of inspiration. After a few days' illness, he died at his home in Tynemouth on October 26, at the early age of 47.

Patent Specifications may be obtained by post by remitting as follows:—

English.—8*d.* each, to the Comptroller of the Patent Office, C. N. Dalton, Esq., Southampton Buildings, Chancery Lane, London, W.C.

United States.—1*s.* each, to the Secretary of the Society.

French.—1 fr. 25 c. each, to Belin et Cie., 56, Rue des Francs-Bourgeois, Paris (3^e).

I.—PLANT, APPARATUS AND MACHINERY.

English Patents.

Filtering Apparatus. R. Mechwart, Milan. Eng. Pat. 28,525, Dec. 28, 1903. Under Internat. Conv., Jan. 16, 1903.

The filter—which is of the closed type with exchangeable filtering medium, and in which the filtering part is arranged without an outer chamber, and is almost directly impinged upon by the liquid to be filtered—has its filtering medium covered with a thin sheet of filtering paper, pressed close to the surface, in order to protect it from the jet or current of liquid to be filtered, which is under pressure.—W. H. C.

Filtering Apparatus. A. Forbes, Philadelphia. Eng. Pat. 17,772, Aug. 16, 1904.

A number of filtering chambers are arranged vertically around a standard which carries the supply and delivery pipes. Each filtering chamber consists of two hollow cones clamped together, carrying the filtering medium. Means for connecting and disconnecting the chambers with the supply and delivery pipes are provided.—W. H. C.

Drying Apparatus; New or Improved ——. E. Tobler and Rheinische Webstuhl und Appreturmaschinenfabrik G. m. b. H., Dülken, Germany. Eng. Pat. 17,957, Aug. 18, 1904.

The drying chambers, of which there are several, forming sectors of a vertical cylinder, are so arranged that the heated air passes through them successively. The order in which they receive the air current may be altered, either by rotating the body of the cylinder while the cover is fixed, or by rotating the cover and adjusting suitable slides, the general direction of the air current remaining unaltered. —W. H. C.

United States Patents.

Temperature; Means for Obtaining Liquid at a Desired ——. M. Treves, Turin, Italy. U.S. Pat. 771,512, Oct. 4, 1904.

A portion of the liquid is heated and is then mixed with another portion which has not been heated. Means are provided for maintaining the pressure on the liquid, for adjusting the proportions in which the two portions are mixed, for regulating the heat, and for indicating the temperature of the mixture by means of a scale and pointer. —W. H. C.

Condenser. F. J. Weiss, Basle, Switzerland. U.S. Pat. 771,515, Oct. 4, 1904.

Means are provided for exhausting the air of a vacuum condenser independently of the cold water supply which enters its upper part. A trough or series of troughs is arranged in the condenser to catch the water, which is conveyed by a pipe to a tank or series of tanks, and returned, by means of another pipe, to the condenser at a lower level. Thus the same water is used as spray several times.—W. H. C.

Crucible-Furnace and Crucible. G. L. Smith, Newport News, Va. U.S. Pat. 771,675, Oct. 4, 1904.

A crucible having a bottom lateral discharge pipe, clos by a plug at the end next the crucible, is arranged in furnace. The furnace has a spiral passage formed aroun the crucible, and a series of gas burners, disposed tange tially to the crucible. The air fed to the burners is pr heated, by the waste heat, in a heater-box situated in th flue.—W. H. C.

French Patents.

Re-heating of Liquids; Process for the ——. G. Tauc Fr. Pat. 338,972, Aug. 7, 1903.

The liquid to be heated is divided into two parts. On part flows into a vessel divided into two compartments b a plate, over which the liquid must flow to reach the oth compartment, from whence it is drawn off through a pip The other part of the liquid passes through a heatin jacket, and issues through perforations in a pipe lyin along the bottom of the above vessel, where it mingles wi the cold liquid flowing over the plate, heating it.—L. F. G

Heating Liquids; Apparatus for ——. G. Tauer. Fr. Pat. 338,973, Aug. 8, 1903.

The apparatus is built up of a number of units, consistin of two end chambers connected by a bundle of jackete tubes, through which the liquid to be heated flows. Th various units are either inclined to the horizontal, or vertica and are joined to each other in zig-zag fashion. Each un is provided with separate blow-off and draw-off cocks, an each heating jacket is connected by a separate tube to th main heat supply.—L. F. G.

Water-Bath for Heating Liquids, or Liquids Mixed wit Solids. P. P. A. Andrieu. Fr. Pat. 343,321, May 2 1904.

The apparatus serves either for heating grapes to a tem perature of 55° C., and also for heating must or oth sugared liquors, and for sterilising liquors containing veg table or animal matter. It consists of a hollow cylind jacketed by another cylinder, the space between being fille with hot water. Pipes traverse the inner cylinder, and th materials to be treated are passed through these, suitabl inlet and outlet pipes being provided.—L. F. G.

Drying Apparatus for all Kinds of Materials. H. Diedric First Addition, dated June 2, 1904, to Fr. Pat. 342,41 of April 18, 1904.

The material to be dried passes through a rotating hollo cylinder, and falls through holes situated at one end in another cylinder, concentric with the first. While traversin the cylinders the material is exposed to the action of current of hot gases, part of which passes through th cylinders, and part around the exterior of the outsid cylinder.—L. F. G.

Filtering Element. Filter- und Brautechn.-Maschinen Fabr. Act.-Ges. vorm. L. A. Enzinger. Fr. Pat. 313,37 May 21, 1904.

Each element consists of two cylindrical plates placed on inside the other, the plates being pierced by conical hole the bases of which are situated on the inner sides of the plates. The filtering material is pressed into the annular space between the two plates till of the consistency of cardboard. The liquid to be filtered is admitted into the inner cylinder, and the plates are suitably fixed at their upper and lower extremities.—L. F. G.

II.—FUEL, GAS, AND LIGHT.

English Patents.

Coke Ovens. H. Koppers, Essen-on-the-Ruhr, Germany. Eng. Pat. 18,262, Aug. 23, 1904.

In this coke oven the heating flues are constricted at the point where they pass into the upper horizontal passage, by projections of the bond courses or by similar means, so that the constrictions are narrow next to the chimney draught, and wider further away, the width of these openings being adjustable by means of slides. The heating flues contain an arrangement of nozzles for supplying air and gas so as to mix in a helical column, as is described in Eng. Pat. 17,283 of 1903. (See U.S. Pat. 753,146 of 1904; this J., 1904, 365.)—L. F. G.

Fuel; Artificial ——, and the Manufacture thereof. J. J. Shedlock, Colchester. Eng. Pat. 21,300, Oct. 3, 1904.

See Fr. Pat. 340,981 of 1904; this J., 1904, 816.—T. F. B.

Coal Gas; Manufacture of ——. T. Settle and W. A. Padfield, Exeter. Eng. Pat. 24,588, Nov. 12, 1903.

The tar produced on condensing the gas is pumped back continuously, in limited quantities, on to the coal in the retorts, where it forms coke and volatile hydrocarbons. The process is applicable to the vertical retorts described in Eng. Pat. 12,552 of 1902 (this J., 1903, 789).—H. B.

Combustible Gas from Carbonaceous Liquids; Process and Apparatus for Generating a ——. F. Cotton, Hornsby, N.S.W. Eng. Pat. 18,291, Aug. 23, 1904.

A carbonaceous liquid, such as the residuum of petroleum, is forced, along with steam, into a cylindrical vessel which acts as a mixing chamber, the steam used having been superheated to such a degree that the temperature within the chamber is about 300° F. The mixture passes through a pipe, closed at the ends but having lateral perforations, into a second cylindrical vessel, arranged coaxially with the first, but insulated from it by means of asbestos or the like. This vessel, which serves as a retort and is maintained at about 800° F., has an outlet nozzle for the combustible gas produced; it is kept at the required temperature preferably by arranging it to project more or less into the combustion chamber of the furnace in which the gas is burned. (See Eng. Pat. 20,234 of 1902; this J., 1903, 485.) —H. B.

United States Patents.

Gas; Apparatus for the Manufacture of ——. C. H. Claudel, Argenteuil, Assignor to Cie. du Carburateur Claudel, Paris. U.S. Pat. 772,131, Oct. 11, 1904.

See Fr. Pat. 331,372 of 1903; this J., 1903, 1122.—T. F. B.

Gas Purifier. R. B. Brown, Milwaukee, Wis. U.S. Pat. 771,414, Oct. 4, 1904.

The gas purifier, which contains the usual grid for supporting the purifying material, is provided with a removable vertical discharge-tube for the spent material, the tube consisting of a number of tube lengths telescoped one within the other and extending down through the purifying material to the covered discharge-opening at the bottom. —H. B.

Electric Heating; Apparatus for —— [Carbide Production]. W. S. Horry. U.S. Pats. 771,249 and 771,250, Oct. 4, 1904. XI. A., page 1034.

French Patents.

Briquettes and Agglomerated Combustibles; Manufacture of ——. A. A. Chevalier. Fr. Pat. 343,248, May 17, 1904.

A new agglutinant, "carbo-cellulose," to which may be added a little sodium nitrate and common salt, is used in the manufacture of briquettes. The "carbo-cellulose" is prepared by treating all sorts of vegetable refuse, such as fibres, wood-shavings, chiffons, straw, or dried herbs, in a lead-lined chamber through which a lead-covered mixing-screw passes, with sulphuric anhydride for 50 minutes, or with sulphuric acid of 60° B. The cellulose is thereby converted into a black mass, which on moistening becomes viscid and colloidal. A suitable mixture for the briquettes consists of 93·2 parts of anthracitic coal, 5 parts of "carbo-cellulose," 1 part of sodium chloride, and 0·8 part of sodium nitrate.—L. F. G.

Combustible; Manufacture of a —— for Heating the Contents of all kinds of Vessels. M. Bamberger and F. Böck. Fr. Pat. 343,724, June 6, 1904.

The combustible consists of finely-divided metals, such as iron, copper, or zinc, mixed with substances containing oxygen or sulphur, and some indifferent material, such as clay, to retard the combustion. Suitable proportions are: 3 parts of potassium permanganate, 4 parts of iron filings, and 2 parts of dried plaster. The mixture is formed into balls or plates, and can be hardened by first moistening with water, and then drying.—L. F. G.

Siemens Regenerative Furnaces; Process for Avoiding the Loss of Gas in ——. A. Kurzwernhart. Addition, dated April 13, 1904, to Fr. Pat. 340,332, Jan. 25, 1904.

See Eng. Pat. 8311 of 1904; this J., 1904, 816.—T. F. B.

Gas and Air; Process and Apparatus for Preparing Mixtures of ——. Selas Ges. m. b. H. Fr. Pat. 338,967, Aug. 19, 1903.

See Eng. Pat. 17,788 of 1903; this J., 1904, 859.—T. F. B.

Gas Generator [for Weak Gas]. L. Genty and Soc. Nouvelle des Établissements de l'Horme et de la Buire. Fr. Pat. 343,010, May 9, 1904.

The apparatus comprises a generator, a recuperator, a scrubber, purifiers, and a blower. Low-grade, bituminous fuel is fed into the generator, and descends first through a shoot or retort, and then over a conical deflector into the combustion chamber. Whilst in the retort, the tarry matters are distilled off and are driven, by means of a fan, down a pipe which discharges them into the incandescent zone of the fuel. The gas produced circulates round a steam generator arranged at the top of the apparatus, and then passes in succession through the recuperator, scrubber, and purifiers. The air-supply for the fuel is drawn in over the water in the steam generator, and the mixture of air and steam formed, after passing through the recuperator, enters the combustion chamber. The latter is provided with pokers and movable fire-bars for breaking up the clinker. —H. B.

Generator for Gas, Vapours, or for Supplying Liquids from Closed Vessels. R. Desouches. Fr. Pat. 343,390, May 24, 1904.

The apparatus is intended for distributing gas for driving motors or automobiles, hot liquids, or melted substances, and consists of a series of closed vessels connected to a common supply pipe. Each vessel is a separate unit and is provided with charging and discharging valves, and with an independent heating arrangement, which may be electric. —L. F. G.

Gas Retorts. E. Derval. Fr. Pat. 343,699, June 4, 1904.

A slight inward curvature is given to the bottom of the retort, for the purpose of sending the coal to the sides and diminishing the thickness of the charge along the middle line. A longitudinal vertical rib may also be provided, for the same purpose, along the interior side of the bottom.

Transverse ribs are fixed at intervals across the exterior of the bottom, to increase the heating surface of the latter; whilst the top of the retort is made thicker than usual, in order to prevent excessive heating of the gas evolved.
—H. B.

Mineralised Carbons for Arc Lamps. H. Mercier. Fr. Pat. 343,698, June 4, 1904.

In addition to the usual ingredients employed in the manufacture of mineralised carbon electrodes there is added zinc, or antimony, or a mixture of the two, either in the metallic state or in the form of compounds, such as zinc borate and tartar emetic. These are said to increase the luminosity and steadiness of the arc.—H. B.

III.—DESTRUCTIVE DISTILLATION, TAR PRODUCTS, PETROLEUM AND MINERAL WAXES.

Petroleum; The Hydrocarbons in Ohio Trenton Limestone ——, with Boiling Points above 213° *C.* C. F. Mabery and O. R. Palm. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 323—334. (See this J., 1897, 727.)

A large representative sample of Ohio crude oil, having the sp. gr. 0·8367 at 20° C., and the percentage composition C = 85·46 per cent., H = 13·91 per cent. S = 0·48 per cent., was distilled under ordinary pressure, to remove the fractions boiling below 200° C. The remainder was repeatedly fractionated under a pressure of 30 mm. and furnished the following hydrocarbons:—

Series.	Symbol.	Boiling Point.	Still Pressure.	Sp. Gr. at 20° C.
		° C.		
C_nH_{2n}	$C_{12}H_{24}$	211—213	Atmos. press.	0·7970
	$C_{13}H_{26}$	223—225	„	0·8055
	$C_{14}H_{28}$	138—140	30 mm.	0·8129
	$C_{15}H_{30}$	152—154	„	0·8204
	$C_{16}H_{32}$	164—168	„	0·8254
	$C_{17}H_{34}$	177—179	„	0·8335
C_nH_{2n-2}	$C_{19}H_{36}$	198—202	„	0·8364
	$C_{21}H_{40}$	213—217	„	0·8417
	$C_{22}H_{42}$	224—227	„	0·8614
	$C_{24}H_{46}$	237—240	„	0·8639
C_nH_{2n-4}	$C_{23}H_{42}$	253—255	„	0·8842
	$C_{24}H_{44}$	263—265	„	0·8864
	$C_{25}H_{46}$	275—278	„	0·8912

None of the fractions showed evidence of decomposition. The lower-boiling ones were liquid, but that distilling at 213°—217° C. was nearly solid at ordinary temperatures, and the higher distillates were quite solid owing to their high paraffin content (33—50 per cent.). In refining the heavy distillates, gasoline was used as a solvent, the oils otherwise forming a persistent emulsion under the acid treatment. The above composition of the fractions explains the high specific gravity of the crude oil and distillates. The C_nH_{2n} series is probably composed of the methylene hydrocarbons, perhaps with complex side chains; and the series still poorer in hydrogen may contain two or more methylene rings.—C. S.

Petroleum; The Hydrocarbons in Canadian ——, with High Boiling Points. C. F. Mabery and E. T. Numsen. Proc. Amer. Acad. Arts. and Sc., 1904, **40**, 334—340.

Hydrocarbons of the series C_nH_{2n}, from $C_{12}H_{24}$ to $C_{15}H_{30}$ were isolated from the fractions boiling above 216° C., a lower member of the series, *viz.*, $C_{11}H_{22}$, boiling at 196° C., having been obtained previously; whereas in Pennsylvania oil the series begins with $C_{17}H_{34}$, and in Ohio oil with $C_{12}H_{24}$ (see preceding abstract). The prevalence of this series, and of others still poorer in hydrogen, accounts for the higher sp. gr. of Canadian crude and refined oils.—C. S.

[*Petroleum*] *Crude Oil; Hydrocarbons in Santa Barbara ——.* C. F. Mabery and C. Y. Zoul. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 340—346.

The specimen of oil examined was from a submarine well. It was of the consistency of heavy tar, with the sp. gr. 0·9845 at 20° C., and contained 0·84 per cent. of sulphur, 1·25 per cent. of nitrogen, 86·32 per cent. of carbon, and 11·70 per cent. of hydrogen, a composition indicating the prevalence of hydrocarbons poor in hydrogen. When distilled under a pressure of 60 mm., only small quantities passed over below 175° C. A residue of 10 per cent. of the original quantity remained behind at 365° C. The following hydrocarbons were isolated:—

——	Boiling Point at 60 mm. Pressure.	Sp. gr. at 20° C.
	° C.	
$C_{13}H_{24}$	150—155	0·8621
$C_{16}H_{30}$	175—180	0·8808
$C_{17}H_{30}$	190—185	0·8919
$C_{18}H_{32}$	210—215	0·8996
$C_{24}H_{44}$	250—255	0·9299
$C_{27}H_{46}$	310—315	0·9451
$C_{29}H_{50}$	340—345	0·9778

The presence of these hydrocarbons explains the peculiar character of the oil, which is unlike any other examined by the authors, and affords an explanation of the conversion of petroleum, by slow evaporation, into natural tars and asphaltums.—C. S.

Paraffin Hydrocarbons; Separation of Solid —— from Petroleum without Distillation. C. F. Mabery and O. J. Siepleio. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 346—349.

By exposing 3 kilos. of Pennsylvania crude oil, in a shallow pan, to a powerful current of air for 30 days, 66·67 per cent. volatilised, the amount of residue being equal in quantity to that left on distillation up to 300° C. No further loss occurred on prolonging the exposure for a year. The crude oil contained 75·51 per cent. of carbon and 14·18 per cent. of hydrogen, whilst the residue contained 86·16 per cent. of carbon and 13·69 per cent. of hydrogen. The residue solidified when cooled by ice, and it furnished on distillation 28 per cent. of a fraction passing over below 300° C., 6 per cent. at 300°—360° C., and a residue of 66 per cent. at the latter temperature. The solid hydrocarbons were determined by the Zaloziecki method: extracting the residue with fusel oil, precipitating with alcohol, washing with a mixture of the two agents, extraction with benzene, and heating to 140° C. for an hour to expel the last traces of fusel oil. This treatment furnished 39·6 per cent. of a greenish-black solid melting at 32° C. Treatment with fusel oil and alcohol gave a light-brown solid melting at 57° C., which, after purification with ether and alcohol, yielded a white product melting at 61° C. and having the sp. gr. 0·7966 at 70° C. The percentage composition was: carbon, 85·37 per cent.; hydrogen, 14·69 per cent. These results show that solid paraffin hydrocarbons are present in Pennsylvania crude oil, as natural constituents and that they are not distillation products. Any decomposition during distillation results in an elimination of hydrogen and the conversion of the hydrocarbons into a lower series.
—C. S.

[*Petroleum*] *Paraffin Hydrocarbons; Solid —— that Collect in certain Oil Wells in Pennsylvania.* C. F. Mabery. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 349—355.

In certain of the Pennsylvania oil wells, especially those around Coreopolis, a light-yellow pasty mass is found in considerable quantities, and is utilised for the production of vaseline, &c. No solid matter can be separated from the mass by filtration or pressure; and it evidently consists of an emulsion and partial solution of heavy oil fractions and solid hydrocarbons, left by evaporation of the lighter constituents. The sample examined had the sp. gr. 0·8345 at 60° C., and furnished distillates passing over between 195° and 342° C. (50 mm.), leaving a residue of about 31 per cent. of the original mass. The separation of the solids in the cooled distillates was effected by solution in alcohol-ether, followed by re-cooling and filtration; and by this means the following solid hydrocarbons were identified :—

Hydrocarbon.	Symbol.	Melting Point.	Sp. Gr.
Tetracosane.......	$C_{24}H_{50}$	50°—51° C.	0·7900 at 60° C.
Hentricontane....	$C_{31}H_{64}$	68° C.	0·7997 at 70° C.
Dotricontane	$C_{32}H_{66}$	67°—68° C.	0·8005 at 75° C.
Tetratricontane...	$C_{34}H_{70}$	71°—72° C.	0·8009 at 80° C.
Pentatricontane ..	$C_{35}H_{72}$	76° C.	0·8952 at 80° C.

The oils separated by filtering the distillate seem to belong chiefly to the series C_nH_{2n-2}, with small amounts of hydrocarbons of a series still poorer in hydrogen. It is pointed out that the freezing point of benzene cannot be relied on for molecular weight determinations of solids much above $C_{20}H_{42}$, and even at its boiling point this solvent becomes uncertain with hydrocarbons in the vicinity of $C_{30}H_{62}$. Other solvents are equally uncertain, and naphthalene is unreliable for substances with melting points approximating to its own. —C. S.

Paraffin ; Composition of Commercial ——. C. F. Mabery and H. R. Payne. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 355—360 (see this J., 1902, 1271).

To determine whether the hydrocarbons of commercial paraffin are identical with the solid constituents of the oils yielding that substance, a sample of commercial paraffin was distilled under a pressure of 40 mm., care being taken to prevent decomposition by precluding the admission of air. The first fraction collected below 250° C.; and the final slightly brown residue, remaining at 350° C., weighed only 2 per cent. of the total substance (1,500 grms.). The distillates collected in larger quantities at temperatures corresponding to those of hydrocarbons separated from crude oil, *viz.*, 256°—258° C., 90 grms.; 272°—274° C., 45 grms.; 282°—284° C., 70 grms.; 292°—294° C., 30 grms.; 316°—318° C., 35 grms.; 332°—334° C., 20 grms.; 346°—348° C., 40 grms. In addition to the hydrocarbons previously identified in paraffin by one of the authors (*loc. cit.*) nonocosane was found; but the melting points exhibit certain differences, *viz.*, tricosane, 48° C. (instead of 45° C.); tetracosane, 50°—51° C. (48° C.): pentacosane, 53°—54° C. (no change); hexacosane, 55°—56° C. (58° C.); octacosane, 60° C. (no change); nonacosane, 62°—63° C. The solid hydrocarbons forming the bulk of commercial paraffin are evidently members of the series C_nH_{2n+2}, and none of them, capable of being distilled, contain oxygen; nor is it reasonable to assume that they have been formed by "cracking," this operation furnishing hydrocarbons of lower molecular weights.—C. S.

Vaseline, Cosmoline, and similar Products; Composition of Commercial ——. C. F. Mabery. Proc. Amer. Acad. Arts and Sc., 1904, **40**, 361—362.

One hundred grms. of vaseline distilled under a pressure of 15 mm. furnished 14 grms. of distillate up to 250° C., 22 grms. at 250°—275° C., 14 grms. at 275°—300° C., 18 grms. at 300°—325° C., 7 grms. at 325°—350° C., 20 grms. at 350°—360° C., and 6 grms. of residue. All the distillates were pale yellow, with a slight fluorescence when melted. The first fraction was a heavy viscous liquid, the others semi-solid, and the residue brown. By treating the second and final fractions with ether and alcohol, solid hydrocarbons, melting at 70° C. and 77°—78° C. respectively, were obtained, resembling the solid paraffin hydrocarbons. Vaseline therefore consists of heavy oils of the series C_nH_{2n}, C_nH_{2n-2}, and C_nH_{2n-4}, with solid paraffin hydrocarbons, the latter being sufficient in quantity to saturate the former and produce an emulsion. Refinery "scale" paraffin consists of solid hydrocarbons of the series C_nH_{2n+2}, and heavy oils of the above-named series, n which they are more soluble than in the lighter oils of heir own series.—C. S.

Indophenine Reaction. F. W. Bauer. XXIII., page 1047.

United States Patents.

Wood; Process of Destructive Distillation of Resinous ——. C. E. Broughton, Savannah, Ga. U.S. Pat. 771,706, Oct. 4, 1904.

Resinous wood is treated in a retort with superheated steam under pressure, at a temperature of about 300° F., whereby the light turpentine oils are removed "without being rendered empyreumatic"; the temperature is now raised to 450°—500° F. by application of external heat, steam being still injected, and the distillate is collected in suitable fractions. When no further distillation occurs, the heating is continued by external means alone, at a temperature of about 800° F.: the creosote and tar oils are collected, as before, in suitable fractions; and the tar is drawn off from time to time, thus leaving pure charcoal in the retort at the completion of the process.—T. F. B.

Ammonium Sulphate; Saturating Apparatus for Recovering ——. K. Zimpell, Stettin, Germany. U.S. Pat. 772,390, Oct. 18, 1904.

See Eng. Pat. 6891 of 1904; this J., 1904, 660.—T. F. B.

French Patent.

Tarring or Asphalting Roads; Product for ——, *and Process for its Manufacture.* L. Préaubert and G. A. Thubé. Fr. Pat. 342,898, May 5, 1904. IX., page 1029.

IV.—COLOURING MATTERS AND DYESTUFFS.

Trinitroxylenol; Symmetrical ——. E. Knecht and E. Hibbert. Ber., 1904, **37**, 3477—3479.

Five grms. of pure symmetrical xylenol were dissolved in 50 c.c. of equal parts of ordinary and of 20 per cent. fuming sulphuric acid, and warmed for 15 minutes on the water-bath. After cooling, 11·6 grms. of nitric acid of sp. gr. 1·415 were added, and the whole warmed on the water-bath after standing for some time. It was then poured into 300 c.c. of water. The precipitate was filtered, washed, and dissolved in boiling water, there being a slight insoluble residue. On adding potassium chloride in excess to the hot solution, the potassium salt of trinitroxylenol crystallised out in brownish-yellow crystals, from which the free acid was liberated by boiling dilute hydrochloric acid, and recrystallised from water. It is less soluble in water than picric acid, and dyes wool in redder shades in contrast to the corresponding trinitrocresol, which gives very greenish-yellow dyeings. It gives no reaction with potassium cyanide, whereas picric acid gives the isopurpuric acid reaction and trinitrocresol an orange-red coloration. —E. F.

Phenyldiazoaminobenzene; Substituted Derivatives of ——. L. Vignon and Simouet. Comptes rend., 1904, **139**, 569—571.

Substituted derivatives of phenyldiazoaminobenzene were easily obtained by combining substituted phenyldiazonium chlorides with diphenylamine in alcoholic solution in presence of sodium carbonate at 4°—5° C. Descriptions are given of the substances obtained from the diazo derivatives of the following amines :—*o*-, *m*-, and *p*-nitraniline; *o*-, *m*-, and *p*-chloraniline; 1.2.4-dichloraniline; 1.2.4.6-trichloraniline; *o*-, *m*-, and *p*-bromaniline; 1.2.6-dibromaniline; 1.2.4.6-tribromaniline; *p*-iodoaniline; 1.2.4-di-iodoaniline; *o*- and *p*-anisidine. All these compounds possess the general properties of diazo-amino compounds. In general, they are unstable, the stability apparently increasing with the number of substituent groups. —T. F. B.

p-Phenylenediamine; Oxidation Products of ——. E. Erdmann. Ber., 1904, **37**, 2906—2913. (See this J., 1904, 885.)

Hydrogen peroxide solution acts on a dilute aqueous solution of *p*-phenylenediamine to form a substance of the formula $(C_6H_6N_2)_x$, which was found to be identical with

Baudrowski's base. The reaction thus proceeds according to the equation: $3C_6H_4(NH_2)_2 + 3H_2O_2 = C_{18}H_{18}N_6 + 6H_2O$. The formula of Baudrowski's base is probably—

$$(NH_2)_2C_6H_3.N:C_6H_4:N.C_6H_3(NH_2)_2.$$

On oxidising *p*-phenylenediamine solution with hydrogen peroxide whilst boiling, ammonia is formed, and also a volatile substance, causing coughing, which was found to be quinone-di-imide. When very dilute solutions of *p*-phenylenediamine are treated with 1 molecule of lead peroxide paste below 12° C., quinone di-imide is formed. The solution is yellow, turns brown when spotted on paper, gives a green coloration with dilute acids, and gives the indamine reaction with aniline hydrochloride. After standing for some time, the indamine reaction can no longer be obtained, and on acidification and evaporation, a safranine-coloured liquid is obtained, from which, after evaporation almost to dryness, alcohol extracts a yellowish-red fluorescent dyestuff with the properties of phenosafranine. The solution of quinone-di-imide obtained from *p*-phenylenediamine solution and lead peroxide yields quinone on pouring into dilute sulphuric acid, and *p*-phenylenediaminesulphonic acid with sodium bisulphite solution. Quinone-di-imide irritates the respiratory organs strongly, and is also a strong poison. It therefore demands care in handling, especially as it is volatile.—E. F.

Hydroxyfuchsones. F. Sachs and R. Thonet. Ber., 1904, **37**, 3327—3334.

Benzophenone chloride was condensed with pyrocatechol in presence of concentrated sulphuric acid, 3.4-dihydroxytriphenylcarbinol $(C_6H_5)_2.C(OH)C_6H_3(OH)_2$ being thus formed. On heating, for two hours, to 80°—105° C., this substance loses 1 molecule of water, and forms the quin-2-hydroxyfuchsone $(C_6H_5)_2C:C_6H_3(OH):O$, a dark-orange powder. This compound dyes wool in yellowish-brown shades, intensified by subsequent treatment with copper sulphate or potassium bichromate. It dyes brown on alumina mordant, brownish-black on chrome, and violet-black on iron mordant; it also dyes on zinc, uranium, cerium, nickel, cobalt, zirconium, and yttrium mordants. Benzoylveratrol was condensed with pyrocatechol in presence of aluminium chloride, to form 3.4-dihydroxy-3′.4′-dimethoxytriphenylcarbinol $(C_6H_5)(OH)C[C_6H_3(OH)_2][C_6H_3(OCH_3)_2]$, which is very similar in properties to the nonmethoxylated carbinol. It dyes on mordants, and loses water at 80° C., forming the fuchsone. Michler's ketone was converted into the corresponding chloride, and condensed with pyrocatechol in presence of strong sulphuric acid. Liebermann's Proto-blue $[(CH_3)_2N.C_6H_4]_2C.[C_6H_3(OH)_2]OH$ was thus formed.—E. F.

Triphenylmethane Dyestuffs; Nature of the Bases of ——. A. Hantzsch. Ber., 1904, **37**, 3434—3440.

The author criticises Baeyer and Villiger's views as to the nature of the bases of triphenylmethane dyestuffs (this J., 1904, 862), and points out that the electrical conductivity of solutions of salts of these dyestuffs to which caustic soda solution has been added indicates the presence of true ammonium bases of the type $R_2:C:C_6H_4:NH_2OH$. These gradually split off water to form anhydrides $R_2:C:C_6H_4:NH$, the so-called "bases" of Baeyer and Villiger. According to the modern dissociation theory a true base must contain a hydroxyl group which is dissociated in aqueous solution to form a hydroxyl ion.—E. F.

Rosaniline Salts; Constitution of —— *and the Mechanism of their Formation.* J. Schmidlin. Comptes rend., 1904, **139**, 602—604.

In place of the quinonoid formula proposed by Fischer and Nietzki for rosaniline mono-acid salts, the author suggests the following:—

$$\begin{array}{l} H_3N.C_6H_4 \\ H_3N.C_6H_4 \end{array} > C:C_6H_4:NCl$$

where the three nitrogen atoms are united in a so-called "triazine chain." By the use of this formula, the mechanism of the transformation of these salts into the unstable tri-acid salts, and then to the stable, colourless salts of tetrahydroxycyclohexanerosaniline with excess of acid, and also the transformation of rosaniline carbinol in presence of acetic acid into the colourless salt and then into the coloured rosaniline salt, are easily explained (see this J., 1901, 979).
—T. F. B.

Naphthol Yellow S. E. Knecht and E. Hibbert. Ber., 1904, **37**, 3475—3477.

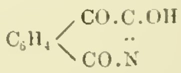
Dinitro-α-naphtholsulphonic acid was recrystallised repeatedly from concentrated hydrochloric acid. As so obtained the free acid contains 3 mols. of water of crystallisation. It is very soluble in water and in alcohol. The normal potassium salt has the formula $C_{10}H_4(OK)(SO_3K)(NO_2)_2 + 1\frac{1}{2}H_2O$, and is much more soluble in water than the technical product. It was not found possible to obtain a monopotassium salt. The sodium salt crystallises with 3 mols. of water, and is much more soluble than the potassium salt. The ammonium, calcium, magnesium, silver, aniline, and *p*-nitraniline salts were also prepared and are described.—E. F.

Immedial Pure Blue. R. Gnehm and F. Kaufler. Ber., 1904, **37**, 3032—3033.

In a previous communication (this J., 1904, 781) the authors described a substance obtained by brominating Immedial Pure Blue, which they concluded to be tetrabromodimethylaminothiazone. They have now obtained the same substance, with identical properties, by brominating Bernthsen's Methylene Violet, which is dimethylaminothiazone, obtained by treating Methylene Blue with silver oxide. This result confirms the authors' previous conclusions.—E. F.

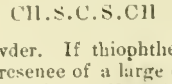
Indophenines; Some New ——. H. Oster. Ber., 1904, **37**, 3348—3352.

Nitro-indophenine $(C_8H_3[NO_2]NO)(C_4H_3S)$ was obtained in the usual manner from nitro-isatin and thiophen. It is a dark-blue powder, soluble in concentrated sulphuric acid with a pure blue colour, and almost insoluble in other media. Carbindophenine $(C_9H_4NO_2).(C_4H_3S)$ was made by condensing thiophen with phthalone-imide—



$$C_6H_4\begin{cases} CO.C.OH \\ \quad\;\;\, \ddot{} \\ CO.N \end{cases}$$

the oxidation-product of carbindigo. It is deep blue and has very similar properties to nitro-indophenine. Mono-isatin-indophthenine $(C_8H_4NO)(C_6H_3S_2)$ was obtained by condensing equimolecular amounts of isatin and thiophthen—

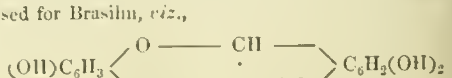


$$\begin{array}{c} CH - C - CH \\ \ddot{C}H.S.\ddot{C}.S.\ddot{C}H \end{array}$$

It forms a grey powder. If thiophthen is condensed with excess of isatin in presence of a large quantity of sulphuric acid, di-isatinindophthenine $(C_8H_4NO)_2(C_6H_3S_2)$ is formed; it is a dark-blue powder. Monobromo-indophthenine, from monobromo-isatin and thiophthen, and carbindophthenine, from phthalone-imide and thiophthen, were also prepared. Phenanthraquinone was also condensed with both thiophen and thiophthen. The products are green powders, soluble in concentrated sulphuric acid to a dirty-green solution, instead of the bright blue of the indophenines.—E. F.

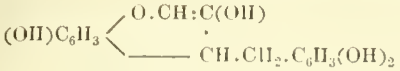
Brasilin and Hæmatoxylin. J. Herzig and J. Pollak. Monatsh. Chem., 1904, **25**, 871—893.

The authors discuss the different formulæ which have been proposed for Brasilin, *viz.*,

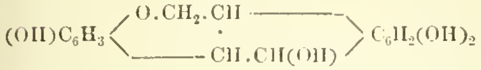


$$(OH)C_6H_3\begin{cases} O \text{———} CH \text{——} \\ \qquad\quad\;\; \cdot \\ CH(OH).CH.CH_2 \end{cases} C_6H_2(OH)_2$$

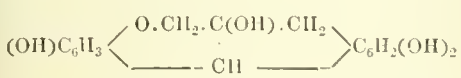
by Perkin (this J., 1902, 110),



or



by Kostanecki (this J., 1899, 677, and Ber., 1902, **35**, 1667), and



by Werner and Pfeiffer (Chem.-Zeits., 1904, **3**, 390, 420). None of these formulæ are considered by the authors to be satisfactory, but they think that there is a possibility of numerous tautomeric and also of stereoisomeric forms. They criticise Kostanecki and Lloyd's statement that the two isomers $C_{16}H_6O(OH)_4$ cannot be stereoisomers, because they behave differently on reduction and oxidation (see this J., 1903, 902). With cold concentrated sulphuric acid trimethylbrasilone yields an isomer which contains a very acid hydroxyl group, is partially precipitated from alkaline solution by carbon dioxide, and does not react with hydroxylamine hydrochloride to form an oxime. It is very readily alkylated. The monomethyl ether does not split off water with acetic anhydride and sodium acetate, and can be readily saponified by alkali, with formation of its mother-substance. The corresponding products from tetramethylhæmatoxylin are very similar in properties.—E. F.

Chromophors; Ionisation of ——. H. Decker.
Ber., 1904, **37**, 2938—2941.

Certain ammonium-, oxonium-, and thionium-iodides and bromides are coloured in the solid state, but are decolorised by solution in a large quantity of water, owing to dissociation into colourless ions. In these cases iodine and bromine form chromophoric groups with pentavalent nitrogen or quadrivalent sulphur or oxygen. A chromophoric group is only formed if the nitrogen itself forms part of an aromatic ring. Thus the aliphatic ammonium iodides and dimethyldiphenylammonium iodide are colourless, whereas pyridiniummethyl iodide is yellow. The iodo-alkylates of quinoline and isoquinoline are still more strongly coloured. The colour is intensified by the introduction of bromine- and nitro-groups into the aromatic nucleus, orange to garnet-red bodies being thus formed. 6.8-Dinitroquinolinemethyl iodide forms reddish-black needles which give a colourless solution in water. 5-Nitroquinolinemethyl iodide forms a red solution in alcohol or in a small amount of water. If portions of such a solution are diluted to an equal extent with alcohol and with water, it is found that the water causes decolorisation, whereas the alcohol only does so to a small extent, showing that its power of ionising the substance is very much smaller. A solution of the same compound in chloroform is raspberry-red in colour, and the colour is unchanged on addition of more chloroform, but is completely destroyed by shaking up with water, which dissolves and ionises the iodide. The corresponding compounds of the acridinium series are still more highly coloured, even the ion of methylacridinium possessing a yellow colour. The highly-coloured salts in this case show on dissociation the pale-yellow colour of the ion. The introduction of phenyl groups increases the intensity of the colour. Thus *ms*-phenylacridine is slightly coloured. Its tertiary and quaternary salts are strongly yellow in colour, and the latter dye animal fibres.—E. F.

Rosaniline and Pararosaniline; Method of Rapidly Distinguishing between ——. R. Lambrecht and H. Weil. XXIII., page 1047.

Magnesium Amalgam as a Reducing Agent. T. Evans and W. C. Fetsch. XX., page 1041.

English Patents.

o-Nitro-o-amido-p-acetamidophenol, and Dyestuffs [Azo-dyestuffs] therefrom; Manufacture of ——. R. B. Ransford, Upper Norwood. From L. Cassella and Co., Frankfort-on-Maine, Germany. Eng. Pat. 24,409, Nov. 10, 1903.

p-Acetaminophenol is energetically nitrated in strong sulphuric acid solution. Dinitroacetaminophenol ($OH:NO_2:NHCOCH_3:NO_2 = 1:2:4:6$) is thus formed. On reduction with suitable reagents, such as alkali sulphides, this compound yields o-nitro-o-amino-*p*-acetaminophenol. On diazotisation this latter compound is transformed into an orange-yellow diazo-compound, which combines with the sulphonic acids of aminonaphthols and dihydroxynaphthalenes to form dyestuffs which dye wool in even blue shades, changing to bluish-green on subsequent chroming, these latter shades being very fast to washing, milling, and light.—E. F.

Oxyanthraquinones [Erythrohydroxy-anthraquinone, Anthrarufin, and Chrysazin]; Manufacture of ——. H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld, Germany. Eng. Pat 25,541, Nov. 23, 1903.

See Fr. Pat. 336,867 of 1903; this J., 1904, 438.—T. F. B.

Azo Colouring Matters; Manufacture of New ——, *and of Colour Lakes therefrom.* H. E. Newton, London. From Farbenfabr. vorm. F. Bayer and Co., Elberfeld, Germany. Eng. Pat. 28,563, Dec. 29, 1903.

See Fr. Pat. 337,942 of 1903; this J., 1904, 543.—T. F. B.

Ink. W. Rosenhain, Birmingham. Eng. Pat. 26,951, Dec. 9, 1903.

An ink, suitable for writing upon very smooth surfaces, is prepared by adding the necessary colouring matter (preferably in the form of a metallic oxide) to a solution containing sodium aluminate and sodium silicate. This solution is best prepared by adding 40 grms. of a 2·5 per cent. solution of sodium aluminate to 150 grms. of strong commercial sodium silicate solution and 20 cc. of water.
—T. F. B.

United States Patent.

Anthracene Dyestuff. R. Bohn, Mannheim, Assignor to Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine. U.S. Pat. 767,259, Aug. 9, 1904.

By melting with alkali hydroxide, diaminoanthraquinones, or their sulphonic acids, dyestuffs are obtained very similar in properties to Indanthrene, which dye brown shades, turning grey on exposure to air, from hydrosulphite solutions in presence of alkali; the shades obtainable are very fast; the dyestuffs from 1.5- and 1.8-diamino-anthraquinones give reddish-grey shades, whilst those from the 1.3-, 2.6-, and 2.7-derivatives give greenish-grey shades.
—T. F. B.

French Patents.

Acetyldiaminophenolsulphonic Acid and a Bluish-Black [Azo] Dyestuff for Wool, susceptible to Chroming, derived therefrom; Process for Producing an ——. Manuf. Lyon. Mat. Col. First Addition, dated July 20, 1903, to Fr. Pat. 337,011, Feb. 4, 1903.

See Eng. Pat. 17,792 of 1903; this J., 1904, 782.—T. F. B.

Acetyldiaminophenolsulphonic Acid and a Bluish-Black [Azo] Dyestuff for Wool, susceptible to Chroming, derived therefrom; Process for Producing an ——. Manuf. Lyon. Mat. Col. Second Addition, dated July 24, 1903, to Fr. Pat. 337,011, Feb. 4, 1903.

See Eng. Pat. 3182 of 1903; this J., 1904, 56.—T. F. B.

Monoazo Dyestuffs susceptible to Chroming on the Fibre; Production of ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,960, July 30, 1903.

See Eng. Pat. 16,995 of 1903; this J., 1904, 712.—T. F. B.

o-Hydroxyazo Dyestuffs [*Azo Dyestuffs*] *capable of being Chromed on the Fibre; Production of* ——. Soc. Badische Anilin und Soda Fabrik. First Addition, dated Feb. 26, 1904, to Fr. Pat. 338.819, Dec. 17, 1903.

In the process described in the main patent (this J., 1904, 820) an α-naphthylaminedi- or trisulphonic acid is diazotised and the diazo compound converted into an *o*-hydroxydiazo compound by standing in neutral, weakly acid or weakly alkaline solution. In this process sulphurous acid is liberated which partially prevents the o-hydroxydiazo compound from combining to form azo dyestuffs. This is avoided, according to the present additional patent, by effecting the change in presence of chlorine or an alkali hypochlorite, or by acting on the diazosulphonic acid with these reagents. The resulting hydroxydiazo compound is then treated in the usual manner.—E. F.

Dyestuffs of the Anthracene Series [*Anthracene Dyestuffs*]; *Production of* ——. Soc. Anon. des Prods. F. Bayer et Cie. Fr. Pat. 343,608, March 29, 1904.

1-AMINO-2-HALOGENO-ANTHRAQUINONE, 2-amino-1-halogenoanthraquinone, or their derivatives, are treated with a metallic salts, such as cupric or zinc chloride, in presence of solvents or diluting agents. The presence of weakly basic compounds such as sodium acetate is advantageous. The products, which are the derived hydrazines of anthraquinone, are transformed by alkaline reducing agents into hydrogenated products, which are used for printing and dyeing cotton by the same methods as are used in the case of indigo. Bright and fast blue to green shades are so obtained.

Dyestuff obtained with—	Shade on Unmordanted Cotton.
1-Amino-2-bromoanthraquinone.	Blue.
1-Methylamino-2-bromoanthraquinone.	Pure blue.
1.4-Diamino-2-bromoanthraquinone.	Olive-green.
1.4-Diamino-2.3-dibromoanthraquinone.	Green.
1-Amino-2 bromo-5-nitroanthraquinone.	Bluish-grey.
1-Amino-2-bromo-4-*p*-toluidoanthraquinone.	Olive-green.
1.3-Dibromo-2-aminoanthraquinone.	Greenish-blue.

—E. F.

Black Dyestuff [*Sulphide Dyestuff*] *for Cotton; Production of* ——. M. K. Oehler. Fr. Pat. 343,282, May 18, 1904.

4-AMINO-3-CHLORO-2′.4′-DINITRODIPHENYLAMINE, obtained by condensing chloro-*p*-phenylenediamine with 1-chloro-2.4-dinitrobenzene, is melted with sulphur and sodium sulphide. The dyestuff so obtained dyes wool in very fast shades which become brighter and bluer by treatment with oxidising agents on the fibre.—E. F.

Green Sulphide Dyestuffs; Preparation of ——. Fabr. de Prods. Chim. ci-d. Sandoz. Fr. Pat. 343,377, May 21, 1904.

1 - ALPHYL - 4 - *p* - HYDROXYALPHYLNAPHTHYLENEDIAMINE sulphonic acids are heated with sulphur and sodium sulphide with or without the addition of copper or of copper salts. It is found that the most suitable compounds to use are the leuco-compounds of sulphonated indophenols formed by the simultaneous oxidation of *p*-aminophenol or chloro-*p*-aminophenol and phenylated or tolylated 1-naphthylamine-6, 7, or 8 monosulphonic acids. The employment of alphylated derivatives containing chlorine or methyl groups is not advantageous. The products dissolve in water forming bluish-green to yellowish-green solutions, from which they are precipitated both by acids and by excess of alkali hydroxide. They dissolve in concentrated sulphuric acid, to form steel-blue solutions. The products obtained from 1-*p*-hydroxyphenyl-4-naphthylenediamine-8-sulphonic acid dyes cotton in bright bluish-green, that from 1-*p*-hydroxyphenyl-4-naphthylenediamine-6 (or 7-) -sulphonic acid in yellowish-green shades.—E. F.

Lakes [*from Azo Dyestuffs*]; *Process for Preparing New* ——. Soc Anon. Prod. F. Bayer et Cie. Fr. Pat. 343,631, June 1, 1904. XIII. A., page 1036.

V.—PREPARING, BLEACHING, DYEING, PRINTING, AND FINISHING TEXTILES, YARNS, AND FIBRES.

ENGLISH PATENTS.

Dyeing Vats [*for Bobbins*]. T. de Naeyer, Alost, Belgium. Eng. Pat. 20,942, Sept. 29, 1903. Under Internat. Conv., Oct. 7, 1902.

THE principal feature of the vat is that the dye-bath is admitted to it on a surface considerably larger than the outer one, so that, by circulating the liquid by means of a force pump, pressure is produced. The bobbins are packed horizontally in the vat, which is preferably of conical form, and which is provided with a lid or cover, openings in which serve for the introduction of the dyeing liquid; this cover is also provided with a flat, perforated plate, so as to ensure even distribution of the liquid in the vat, the bottom of which is also in the form of a perforated plate. The liquid is contained in a jacketed boiler, over which the vat is mounted, the joints being made air tight. The force pump abstracts the hot liquid from a tube in the bottom of this boiler. This ensures that the dye-bath is not diluted by steam. The interstices between the bobbins in the vat are filled by means of "partial diaphragms" of special form, which are the subject of one of the claims of this specification. (Compare Fr. Pat. 334,828 of 1903; this J., 1904, 185.)

—T. F. B.

Dyeing, Bleaching, Degreasing, and Mercerising Textile Materials; Apparatus for ——. T. de Naeyer, Alost, Belgium. Eng. Pat. 20,959, Sept. 30, 1903. Under Internat. Conv., Dec. 31, 1902.

THE apparatus is similar in principle and form to that described in Eng. Pat. 20,942 of 1903 (see preceding abstract). In addition to the various features therein described, the discharge aperture of the vat is provided with an automatic valve or cock, which, by means of a lever and weight, maintains the aperture closed until the desired pressure is reached, when the valve is opened, and the pressure is reduced, in order to obtain normal circulation of the liquid, thus ensuring uniform treatment. Pressure gauges, water level, and thermometers are also provided for facilitating the control of the process.—T. F. B.

Bleaching Textile Fabrics and Fibres. J. Wakefield, Cockermouth, Cumberland. Eng. Pat. 26,521, Dec. 4, 1903.

VEGETABLE fibres or fabrics are bleached by treatment, first in a bath containing bleaching powder and alkali permanganate, and then in an acidified solution of sodium bisulphite.—T. F. B.

UNITED STATES PATENTS.

Dyeing Cops; Apparatus for ——. R. Rawson and E. Lodge, Huddersfield. U.S. Pat. 772,581, Oct. 18, 1904.

SEE Eng. Pat. 10,035 of 1903; this J., 1904, 543.—T. F. B.

Printing with Indanthrene. P. Jeanmaire, Mülhausen, and R. Bohn, Mannheim, Assignor to Badische Anilin und Soda Fabrik, Ludwigshafen-on-Rhine, Germany. U.S. Pat. 772,237, Oct. 11, 1904.

SEE Fr. Pat. 313,772 of 1901; this J., 1902, 342.—T. F. B.

Orthonitrophenyllactoketone; Printing Compounds of ——. S. Eichhart, St. Fons, Assignor to Soc. Chim. Usines du Rhône, Ancien. Gilliard, P. Monnet et Cartier, Lyons France. U.S. Pat. 772,560, Oct. 18, 1904.

SEE Eng. Pat. 9336 of 1902; this J., 1903, 362.—T. F. B.

Oxidising Sulphur Dye [*Sulphide Dyestuffs on the Fibre*] H. J. Cooke, New York, Assignor to A. Klipstein and Co., East Orange, N.J. U.S. Pat. 769,059, Aug. 30, 1904.

SULPHIDE dyestuffs are oxidised on the fibre by means of ozone, produced by the action of air on essential oils, such as turpentine oil, pine oil, cedar oil, &c. The dyed yarn or fabric is preferably supported in a closed chamber maintained at a temperature of about 60° C.; cotton wool saturated with the oil (*e.g.*, turpentine) is contained in a small adjoining chamber, and a current of steam or air is blown through it, towards the large chamber; the oil thus condenses on the fabric, and the dyestuff is oxidised by the ozone produced. The current of steam or air is preferably stopped when the fabric has received about 1 per cent. of its weight of the oil.—T. F. B.

Waterproofing Fabrics; Compound for ——. W. M. Mackintosh, Liverpool. U.S. Pat. 771,257, Oct. 4, 1904.

See Eng. Pat. 213 of 1903; this J., 1904, 184.—T. F. B.

French Patents.

Fulling Woollen Fabrics and other Substances adapted to be Felted. A. Elosegui. Fr. Pat. 343,819, June 9, 1904. Under Internat. Conv., April 11, 1904.

See Eng. Pat. 13,090 of 1904; this J., 1904, 898.—T. F. B.

Decolorising all Kinds of Fabric, Hair, and Skin. C. Ferry and S. Coguet. Fr. Pat. 343,642, June 2, 1904.

Imperfectly dyed fabrics, hair, skins, &c., are, it is stated, decolorised, restored to more perfect colours by immersing them in a boiling bath consisting of water, 100 litres; soap, 200 grms.; potassium carbonate, 500 grms.; carbon bisulphide, 500 grms.; hydrogen peroxide, 3 kilos.; sodium silicate, 2 kilos. The material is dried without washing, and is then ready for any subsequent treatment. Should the original material have been dyed with some "more or less fast" colour, it is treated in a solution of hydrogen peroxide and sodium silicate, or in a bath of soap, potassium carbonate, and carbon bisulphide.—T. F. B.

Blue and Blue-Black Shades [on Wool] Fast to Fulling and Light; Production of ——. Badische Anilin und Soda Fabrik. Addition, dated May 20, 1904, to Fr. Pat. 342,026, April 8, 1904. Under Internat. Conv., April 28, 1904.

Fast blue or blue-black shades are obtained on wool by dyeing with a mixture of Acid Alizarin R (diazotised *o*-nitro-*o*-aminophenol-*p*-sulphonic acid coupled with β-naphthol) and Acid or Alkaline Violet, and subsequently chroming, instead of using, with one of the latter dyestuffs, any of the *o*-hydroxyazo dyestuffs mentioned in the principal patent (see this J., 1904, 899).—T. F. B.

Waterproof Fabric for Wrapping, &c. Bourdu & Co. Fr. Pat. 343,240, May 17, 1904.

The fabric to be rendered waterproof is first coated with gum and passed between cylinders, and then immersed in a composition of rosin and rosin oil, 70 parts; "heavy oil," 15 parts; and gum benzoin, 15 parts; and dried in the open air.—T. F. B.

Sizing Apparatus for Warps, of Large Output. C. Vandamme. Fr. Pat. 343,801, June 8, 1904.

The essential feature of this apparatus is that it contains at least 30 heating tubes and eight ventilators or air distributors, these being found to be the smallest numbers necessary for an apparatus which can have a large output of material.—T. F. B.

VII.—ACIDS, ALKALIS, AND SALTS.

Sodium Hydroxide; Preparation of Pure —— for Laboratory Purposes. F. W. Küster. Z. anorg. Chem., 1904, **41**, 474—476.

A large glass or porcelain dish, (diameter, say 50 cm.,) with a flat bottom, is filled to a height of a few centimetres with water. In the middle of the dish is placed a shallow wide-necked bottle (crucible) of platinum, silver, or nickel of 500—1000 c.c. capacity, and above this a large funnel, closed below, formed of commercial nickel wire gauze. The funnel is mounted on a tripod, so that its point is a few centimetres above the mouth of the bottle or crucible. Pieces of bright metallic sodium (several hundred grms.) are placed in the wire funnel, and a large bell jar is placed over funnel and bottle. The bell jar is only slightly less in diameter than the outer dish, and it rests on pieces of glass rod, the water forming a seal. The sodium immediately begins to deliquesce, and the sodium hydroxide formed, drops as a concentrated (about 40 per cent.) oily solution into the bottle. The solution may be preserved in bottles made of pure nickel.—A. S.

Arsenious Acid; Action of —— on "freshly-precipitated" Ferric Hydroxide. W. Biltz. Ber., 1904, **37**, 3138—3150.

The fact that freshly-precipitated ferric hydroxide is capable of taking up arsenious acid from its solutions, was discovered in 1834 by Bunsen, who considered this due to the formation of a basic ferric arsenite, $4Fe_2O_3.As_2O_3.5H_2O$. The author prepared a hydrogel of ferric oxide, obtained by precipitating an oxidised boiling solution of ferrous sulphate with ammonia, and washing the precipitate for five days by decantation with hot water. 10 c.c. of this hydrogel (containing about 1·1 grm. of ferric oxide) were then mixed under different conditions with equal volumes (180 c.c.) of aqueous solutions of arsenious acid of different degrees of concentration, and after the action was complete, the amounts of arsenious acid remaining in solution were determined. The results, given in tables and curve-diagrams, can, according to the author, only be satisfactorily explained on the assumption that the fixing of the arsenious acid is an adsorption process. This view also affords an explanation of the great influence of the physical condition of the ferric hydroxide on the amount of arsenious acid taken up. Increase of temperature has little influence on the adsorptive power of the ferric hydroxide, but accelerates the rate at which the arsenious acid is taken up. The author, in conclusion, discusses some bearings of this adsorption process on the action of antitoxins on the toxins of blood serum.—A. S.

See Fr. Pat. 335,677 of 1903; this J., 1904, 253.—T. F. B.

Metal Sulphates or other Salts; Producing —— from Metal Sulphides and Sulphide Ores containing Iron. O. Meurer, Cologne, Germany. Eng. Pat. 26,668, Dec. 5, 1903.

See U.S. Pat. 733,590 of 1903; this J., 1903, 908.—T. F. B.

United States Patents.

[Lime-]Kiln. D. H. Gibson, Seattle, Wash. U.S. Pat. 771,623, Oct. 4, 1904.

A kiln for burning lime has an external annular gas chamber around its lower part, connected with a producer furnace and having adjustable openings or ports into the kiln. A distributor is arranged within the kiln so as to leave an annular space between it and the wall of the kiln. Air is led into the kiln through a central vertical channel in the distributor, having radial ports or openings into the annular space.—W. H. C.

Metals [and Caustic Soda]; [Electrolytic] Process of Obtaining ——. F von Kügelgen and H. Danneel. U.S. Pat 771,646, Oct. 4, 1904. XI. B., page 1035.

French Patents.

Barium and Strontium Hydroxides; Manufacturing —— by the aid of their Sulphides. C. M. Joseph, known as C. Limb. Fr. Pat. 338,958, July 30, 1903.

Barium or strontium sulphide solution is treated with the hydroxide of a heavy metal, preferably of zinc. On filtering the boiling solution from the precipitated zinc sulphide, crystals of barium or strontium hydroxide separate from the filtrate on cooling. The heavy metal hydroxide is prepared by adding milk of lime to solution of the chloride, and separating the precipitate. The zinc sulphide (or other metal sulphide) formed in decomposing barium sulphide as described, is dissolved in hydrochloric acid to reconstitute the chloride.—E. S.

Permanganic Sulphate derived from Manganese Dioxide; Production of a ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,961, July 30, 1903.

See Eng. Pat. 17,981 of 1903; this J., 1904, 749.—T. F. B.

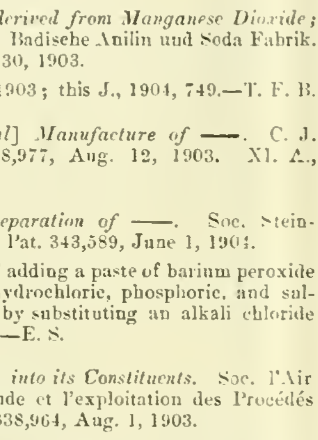
Zinc Oxide; [Electrical] Manufacture of ——. C. J. Barbier. Fr. Pat. 338,977, Aug. 12, 1903. XI. A., page 1034.

Oxygenated Water; Preparation of ——. Soc. Steinfelner and Co. Fr. Pat. 343,589, June 1, 1904.

The customary process of adding a paste of barium peroxide to a dilute mixture of hydrochloric, phosphoric, and sulphuric acids, is modified by substituting an alkali chloride for the hydrochloric acid.—E. S.

Air; Separation of —— into its Constituents. Soc. l'Air Liquide (Soc. p. l'étude et l'exploitation des Procédés G. Claude). Fr. Pat. 338,964, Aug. 1, 1903.

In the apparatus shown (see figure) the column Q is divided by the partition M into the two compartments I and II, which communicate by the overflow pipe L, the bottom of which reaches nearly to the bottom of the compartment H. Distillation and fractionation of the vapours from the liquid air are simultaneously effected in the compartment I, and the liquefied gas which collects at the bottom and overflows through the pipe L into the chamber H, consists of oxygen, more or less pure. In that chamber the oxygen volatilises and passes through the exit K, to a series of temperature-exchangers, and thence to apparatus for utilisation. The liquefying system is represented by the vessel B, into which previously cooled air enters through the inlet A, the adjuncts to which are the liquefying coil F, and the pipe C, D, E, terminating in a sprayer. The air ascending the coil becomes gradually liquefied as it ascends, the liquid formed becoming continuously poorer in oxygen. The liquefied portions trickle downwards into the vessel B, from which they pass through the tube and issue from the spreader, upon fragments of coke or the like, surrounding the coil, with which the chamber is packed, and which ensure even distribution. The nitrogen, in a more or less pure state, resulting from the fractionation of the gases volatilised from the liquid, escapes through the outlet to the coil O, on its way to the exchangers. Compare Fr. Pats. 296,211 (4th add.), 1904, and 338,842, 1903; this J., 1904, 816 and 823.—E. S.



VIII.—GLASS, POTTERY, ENAMELS.

English Patents.

Glazes, Enamels, or Bodying Material; Process and Apparatus for Applying —— to Bricks, Tiles, or other like Goods. R. Stanley and E. Jeffcote, Nuneaton. Eng. Pat. 25,686, Nov. 24, 1903.

The process consists in allowing a stream of the glaze, enamel, &c., to flow from an outlet, and spraying the same on to bricks, tiles, and other goods by means of jets of air, steam, or gas. The articles are placed on a travelling belt, and the glaze, &c., is contained in tanks, the outlets of which are near the articles on the belt; the spraying nozzles are arranged close to the outlets. A sloping roof is provided above the belt, and shields along each of its sides, whereby surplus material is collected and returned to troughs.—W. C. H.

French Patents.

Silica Glass; Manufacture of —— with Quartz Sand, Silicious Earth, &c. J. Bredel. Fr. Pat. 343,845, June 10, 1904.

Quartz sand, silicious earth, &c., is fused at a suitable temperature, and broken into small pieces, which are afterwards heated to 1,000° C., and rapidly plunged into cold water. By this means, it is claimed, the product acquires insensibility to variations of temperature, and the formation of air bubbles during the fusion is avoided.—W. C. H.

Enamels, Coloured Transparent; Process for obtaining in the Cold —— on a Metal Foundation. A. Westphal and H. Maillard. Fr. Pat. 343,602, June 1, 1904.

Substances which cannot be heated without injury, such as wood, iron, zinc, stone, &c., are first coated with thin metal foil, on which is then poured a mixture of a colouring matter with sodium silicate solution or varnish. After drying, the surface is polished. Two or more colours may be used to give different effects.—A. G. L.

IX.—BUILDING MATERIALS, CLAYS, MORTARS, AND CEMENTS.

Lime-Sand Bricks; Effect of Infiltrated Water on ——. Thoniud. Z., 1904, **28**, 1441.

A number of different kinds of lime-sand bricks were soaked with carbonated water for a month, by luting glass cylinders on to the bricks and filling the former with water saturated with carbon dioxide. To ensure comparable results the bricks were cut in two, one half of each being treated as above, the other left dry. The crushing-strength test gave the following results:—

Dry Bricks.	Soaked Bricks.
Kilos. per Sq. Cm.	Kilos. per Sq. Cm.
187	154
213	194
265	251
313	253

thus indicating the inadvisability of using lime-sand bricks in places where they are liable to infiltration of water charged with carbon dioxide.—C. S.

English Patents.

Impregnating Wood or other Porous Materials to Protect against Damp, Fungus, or Insects, or for Colouring. W. R. Hodgkinson, London. Eng. Pat. 26,115, Nov. 30, 1093.

The materials to be treated are placed in a vessel from which gases or liquids may be extracted by a suitable pump, and any desired vacuum maintained. Impregnating substances, dissolved in suitable volatile solvents, are then admitted into the vessel, and the solutions driven into the pores of the materials by atmospheric pressure, the volatile solvents being finally removed preferably by again exhausting the vessel. Impregnating substances suggested are dyes, waxes, resins or extracts, such as the acetone solution of the waxy and oily constituents of teak wood.—W. C. H.

Works of Art [Imitation Marble] and the like; Process for Manufacturing ——. H. J. P. Dumas, London. Eng. Pat. 26,568, Dec. 1, 1903.

The process consists in mixing lime, prepared from white marble, with finely-ground or larger pieces of white or coloured marble, with or without the addition of pigments such as graphite, or metallic oxides, and making the whole into a stiff mass with water, and casting it in moulds. As a binding agent a cement-like body may be used, in which the silica and alumina are replaced by scrap marble ground to fine powder.—W. C. H.

Bricks, Paving Flags, Artificial Stone; Manufacture of Various Articles, such as ——. S. F. Prest, London. Eng. Pat. 17,968, Aug. 18, 1904.

The slag from Bessemer converters or Siemens's furnaces is ground or crushed, and the magnetic particles are separated from the non-magnetic. Slaked lime is then added to the latter, the whole is moulded under pressure and then subjected in a closed chamber to the action of steam under pressure. A red colour may be imparted to the grey product by adding hæmatite iron ore.—A. G. L.

United States Patent.

Bricks; Coating ——, *and Apparatus therefor.* M. Perkiewicz, Ludwigsberg, Germany. U.S. Pat. 771,443, Oct. 4, 1904.

See Eng. Pat. 3760 of 1904; this J., 1904, 662.—T. F. B.

French Patents.

Marble and Stone, Artificial; Manufacture of ——. L. Torno. Fr. Pat. 343,479, March 8, 1904.

The artificial marble is made by mixing 100 kilos. of finely-ground porcelain waste, twice-burnt clay, lime burnt three imes, aluminium silicate, and powdered pebbles, 10 kilos. f marble dust, 1 kilo. of mica, 2 kilos. of gum arabic or ther gum, 100 grms. of glue, 300 grms. of agar-agar, 50 rms. of borax, 25 grms. of saponin, and 100 litres of vater. Colouring matter may also be added. The whole s allowed to remain in a mould for eight to ten hours, after vhich it is suspended by threads placed in the mixture for ight days in order to dry. When thoroughly dry, the nass is plunged into a liquid of the following composition, reviously heated to 100° C.: 1 kilo. of gum arabic, 100 rms. of glue, 300 grms. of agar-agar, 50 grms. of borax, 5 grms. of saponin, and 100 litres of water. After emoving from this solution the mass may be polished. —A. G. L.

Tarring or Asphalting Roads; Product for —— and Process for its Manufacture. L. Préaubert and G. A. Thubé. Fr. Pat. 342,898, May 5, 1904.

HE product for preventing the formation of dust on road-ays, &c., consists of a mixture of a solution of casein, nd of bitumen, asphalt, tar, or other bituminous body, reviously softened by heat, the mixture being diluted with suitable quantity of water, with or without the addition f fatty substances, antiseptics, and colouring or decoloring materials. See also Fr. Pat. 331,805 of 1903; this J., 003, 1200.—W. C. H.

Building Material; Artificial ——. L. E. Colomiès. Fr. Pat. 343,223, May 17, 1904.

PRODUCT called "calsibonarite massive" is obtained by ixing 45 parts of river sand or clay, 45 of limestone, 3 of on or copper sulphate, 3 of salt, 2 of alum, and 2 of borax, moulding and subjecting the mixture to a temperature of 1100° to 1200° C. After cooling, the mass presents a brilliant and polished surface. Another product called "calsibonarite vitrifiée" is made from 42·5 parts of river sand or clay, 42·5 of limestone, 4 of copper or iron sulphate, 5 of salt, 3 of alum, and 3 of borax. The mixture is fused at 1100° to 1200° C., and used for making paving-stones, facings, &c.—A. G. L.

Cement; Process for Making a Vitreous —— which can be used as a Mastic. P. Steenbock. Fr. Pat. 343,860, June 10, 1904.

See Eng. Pat. 15,181 of 1904; this J., 1904, 901.—T. F. B.

Substance [Cement] which Hardens under the Action of Phosphoric Acids or their Acid Salts; Process for Making a ——. P. Steenbock. Fr. Pat. 343,861, June 10, 1904.

See Eng. Pat. 15,181 of 1904; this J., 1904, 901.—T. F. B.

X.—METALLURGY.

Acid Open-Hearth Manipulation. A. McWilliam and W. H. Hadfield. Iron and Steel Inst., Oct. 1904.

The opinion is generally prevalent that to increase the silicon in the metal in the open-hearth furnace an abnormally high temperature is necessary. The authors still uphold their view that, though a high temperature may accelerate the reduction of silica by carbon, the main determinant of the amount of silicon in the steel is the composition of the slag, especially with regard to its acidity. They quote many instances in support of their view, but especially one experiment in which at a certain period they added to the charge 8 cwt. of old red bricks containing 79 per cent. of silica. Though the effect of this was obviously to lower the temperature, yet the silicon in the metal, which had been gradually going down, at once began to rise. Another experiment showed the effect of lime: the slag was allowed to thicken for nearly an hour, when $3\frac{1}{2}$ cwts. of limestone were added: the slag rapidly thinned, but though the percentage of silica in the slag was thus reduced from $55\frac{1}{2}$ to $53\frac{1}{2}$, and that of lime increased from 2 to 6, the silicon in the metal continued (though at a decreasing rate) to increase. Magnesia (3 cwts. of magnesite) in another experiment behaved very similarly; but 4 cwts. of peroxide of manganese, while it thinned the slag and made it less silicious, caused also a rapid drop in the silicon in the metal. The difference in behaviour between oxidising and non-oxidising "bases" is clearly shown by these experiments. In the last experiment the slag afterwards thickened and became much more silicious, at the cost, as was seen after the termination of the experiment, of the bottom of the furnace. Brinell has found (paper read by Wahlberg at May meeting of Iron and Steel Inst.) that, giving aluminium and silicon certain relative values in terms of manganese, calculating all out to manganese and taking the total, a number is obtained which is termed the "density-quotient," such that for the same "density-quotient" the same type of ingot is yielded, and the higher the "density-quotient" the fewer blowholes in the ingot. The authors' general experience agrees with that of Brinell; but they also find that the longer the time given for thickening of the slag, the lower is the "density-quotient" needed for the same type of ingot, or the fewer are the blowholes in ingots of the same "density-quotient"; ingots made (1) by ordinary treatment, (2) by giving $1\frac{1}{2}$ hours' and (3) $2\frac{1}{2}$ hours' thickening, and having "density-quotients" of 1·35, 1·00, and 0·814 respectively, were all three alike as to their freedom from blow-holes. —J. T. D.

Steel; Temperatures of Transformation of ——. G. Charpy and L. Grenet. Comptes rend., 1904, **139**, 567—568.

The temperatures of transformation of specimens of steel containing varying amounts of carbon were determined (*a*) by the electric resistance, (*b*) by the "thermo-electric" method, (*c*) by the expansion. The results were as follows:—

Temperature of Transformation.

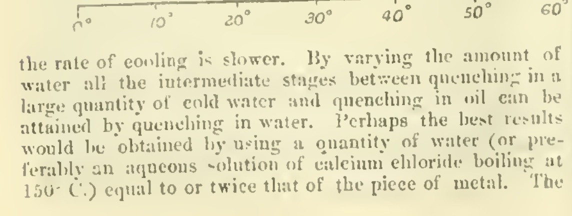
Carbon.	Resistance Method.		Expansion Method.	
	Start.	Finish.	Start.	Finish.
Per Cent.	°C.	°C.	°C.	°C.
0·82	730	760	735	745
1·06	730	760	740	750
1·15	739	739	735	740
1·38	750	750	735	755

Carbon.	Thermo-electric Method.		Expansion Method.	
	$\frac{dE}{dt}$	$\frac{dE}{dt}$	Start.	Finish.
Per Cent.	Max.	Min.	°C.	°C.
0·28	720	840	720	820
0·62	700	760	743	760
0·92	700	800	737	760
1·14	700	780	747	760
1·30	680	740	725	740

It thus appears that the resistance method and the expansion method give fairly concordant results, but the results obtained by the "thermo-electric" method do not agree well, except in the case of very low carbon steels.
—T. F. B.

Steel; Studies on the Quenching of ——. H. Le Chatelier. Bull. Soc. Encourag., 1904, **106**, Rev. Metall., 473—491.

The author determined the rate of cooling of test pieces of iron and steel in different liquids. The length of time occupied in cooling from 700° to 100° C. by a piece of iron or steel 18 mm. long and 18 mm. diam. quenched at 900° C. in a large volume of water, was found to be 6—8 seconds. The cooling proceeds at the same rate in different aqueous solutions, *e.g.*, solutions of sodium chloride, sulphuric acid, and sodium carbonate, as in pure water. Agitation of the cooling liquid has no notable influence on the rate of cooling, but is advantageous in that the metal is cooled uniformly. By raising the temperature of the water used for quenching, the rate of cooling is retarded, the retardation being greater the nearer the temperature of the water approaches 100° C. The rate of cooling is much slower when the quenching is effected in metal baths (mercury, molten lead, &c.), showing that the conductivity of the quenching liquid is of less importance than its specific heat. Quenching in fresh colza oil gives about the same results as quenching in boiling water, but with oil which has been used several times, and which has thickened, the rate of cooling is slower. By varying the amount of water all the intermediate stages between quenching in a large quantity of cold water and quenching in oil can be attained by quenching in water. Perhaps the best results would be obtained by using a quantity of water (or preferably an aqueous solution of calcium chloride boiling at 150° C.) equal to or twice that of the piece of metal. The curve given, shows the rate of cooling of a piece of metal from 700° C. when quenched respectively in a large quantity of cold water; in three times its weight of water (1) (see figure), twice its weight of water (2), 1½ times its weight of water (3), and in oil.—A. S.



Molybdenum Steels. L. Guillet. Comptes rend., 1904, **139**, 540—542.

Like the tungsten steels (this J., 1904, 663) these steels are divisible into two classes — those showing a perlitic structure (below 2 per cent. of molybdenum when the carbon is 0·2 per cent., below 1 per cent. of molybdenum when the carbon is 0·8 per cent.), and those containing a double carbide (with more molybdenum than 2 or 1 per cent. as the carbon is 0·2 or 0·8 per cent.). The latter constituent appears as extremely fine white filaments, left white by picric acid, but blackened by alkaline sodium picrate. The effect of molybdenum even in small quantity is greatly to increase the breaking stress without rendering the metal brittle. In the case of the perlitic steels, the breaking stress and elastic limit rise with increase of molybdenum; the elongation is fair, the reduction of area good, the resistance to shock high, and the hardness medium. The carbide steels have very high breaking stress and elastic limit, and are extremely hard, but they are very brittle. Their behaviour under tempering and annealing is similar to that of tungsten steels. Indeed, the effect of molybdenum is in general similar to that of tungsten, but a much smaller amount of molybdenum than of tungsten is needed to produce the same result. Bearing this in mind, molybdenum steels are probably not more expensive than tungsten steels, and may frequently, the author thinks, be substituted for them with advantage.—J. T. D.

Tin Steels. L. Guillet. Bull. Soc. d'Encourag., 1904, **106**, Rev. Metall., 499—505.

The author examined two series of tin steels with from 1·79 to 9·98 per cent. of tin containing:—(1) 0·100 to 0·204 per cent. of carbon; and (2) 0·665 to 0·767 per cent. of carbon. The results showed that tin makes the steel very hard and brittle. The tin dissolves in the iron and appears to form a compound with it. In tin steels containing not more than 10 per cent. of tin all the carbon is in the form of pearlite. Tin steels thus resemble titanium steels (see following abstract) more closely than they do silicon steels, in that the whole of the carbon contained in them occurs in the form of iron carbide.—A. S.

Titanium Steels. L. Guillet. Bull. Soc. d'Encourag., 1904, **106**, Rev. Metall., 506—510.

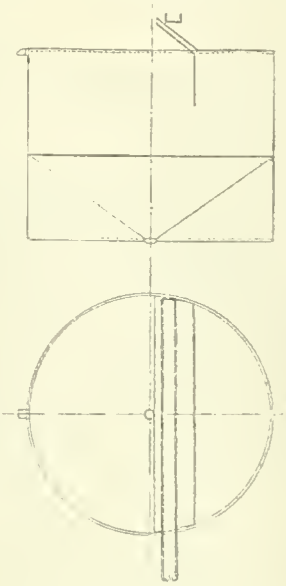
Two series of steels were examined, containing:—(1) from 0·112 to 0·137 per cent. of carbon and from 0·415 to 2·57 per cent. of titanium, and (2) from 0·611 to 0·760 per cent. of carbon and from 0·325 to 8·71 per cent. of titanium. The results of both the micrographic examination and of mechanical tests of the alloys shows that titanium has practically no influence on the properties of carbon steels.—A. S.

Gold Ore; Regrinding of —— for Cyaniding, &c. C. Butters and E. M. Hamilton. Inst. of Min. and Met., Oct. 20, 1904.

Many ores which have proved very refractory under other methods of treatment will yield excellent results by the cyanide process when reduced to a very fine state of division. The best method of effecting this seems to be to stamp through a screen of 30 to 35 mesh and then regrind the coarser particles in a tube-mill or some similar machine. The grade of sand to be reground should be all that will not pass a 200-mesh screen. When No. 35 screens were in use at the El Oro mill, Mexico, this amounted to 51 per cent. of the pulp issuing from the mortar boxes. The regrinding resulted in about 50 per cent. of the total ore in the battery bins being rendered capable of treatment by agitation, the remainder leaching freely; the extra recovery of gold and silver amounted to about 16*s.* 6*d.* per ton of sand reground and an extra profit of 14*s.* 4½*d.* With a view of recovering more of the silver, many tests were made on the slimes, such as mechanical agitation of the solution, addition of potassium permanganate, addition of mercuric chloride, roasting the dried slime, &c. On the whole, the use of mercuric chloride seems to give the best results at the least cost. The only drawback to its use is the possible effect it may have on the steel tanks and iron piping.—J. H. C.

Slimes [*Gold*] *Treatment; Impts. in* ——. M. Torrente. J. Chem., Metall. and Mining Soc., S. Africa, 1904, 5, 46—49.

The improvements relate to the settling and separation of the slime from the washing solutions, after extraction of the gold. The separator consists of a tank (see figure) with a conical bottom. A vertical partition extends downwards to about two-thirds of the depth of the cylindrical portion of the tank, whilst above the tank it is connected to an inclined plane. A number of these tanks are connected together. They are filled with water or cyanide solution, and the slime-pulp is delivered slowly on to the inclined plane above the first tank of the series. The solid matter passes down into the conical bottom, where it is run off, mixed with water or cyanide solution, and passed through the second separator, and so on. The clear solution containing the dissolved gold, runs off at the top of the tank and passes to the precipitating boxes. Figures are given showing the satisfactory results which are obtainable by this method of treatment.—A. S.



"*White Precipitate*" *of the Precipitating Boxes in Cyanide Works.* A. Prister. J. Chem., Metall. and Mining Soc., S. Africa, 1904, 5, 62—63.

The author gives the following analyses of "a medium solution" before and after passing through the zinc precipitating box, and claims that the results confirm his view that he "white precipitate" consists mainly of zinc ferroyanide and not of zinc oxide.

——	Before contact with Zinc.	After passing through the Zinc Box.
xygen	0·61	0·49 per cent. by volume.
itrogen	1·84	1·56 „ „
otassium ferrocyanide	0·147	0·0276 per cent.
hiocyanate	0·0232	0·0247 „
lkalinity	0·23	0·254 „
otassium cyanide	0·110	0·045 „

It appears therefore that over 81 per cent. of the ferroyanide present in the original solution remained in the zinc ox "in the form of white precipitate"; the reduction in the mount of potassium cyanide would also favour the precipiation of zinc ferrocyanide. The increase in the alkalinity f the solution would be unfavourable to the separation of inc oxide, which is soluble in alkalis.—A. S.

opper in Potassium Cyanide; Examination of Solutions of ——. F. Kunschert. XI., page 1034.

Iron Ore or Iron Wastes or Natural Iron Sands; Converting Powdered —— *into Briquettes or Lumps.* T. Rouse and H. Cohn, London. Eng. Pat. 25,248, Nov. 19, 1903.

Powdered iron ore, iron waste, or natural iron sand is wetted with a weak solution of alum, and moulded into briquettes or lumps, which, if intended for transport, may be hardened by heating them to about 700° C.—E. S.

Manganese Steel; Manufacture of ——. R. A. Hadfield, Sheffield. Eng. Pat. 25,794, Nov. 26, 1903.

An alloy of manganese and iron containing from 70 to 90 per cent. of manganese and less than 3 per cent. of carbon, such as is produced in the electric furnace, is added, preferably in a molten condition, to molten decarburised iron in lieu of the ferro manganese ordinarily used. In this way it is possible to produce a low-carbon manganese steel which is much less liable to fracture than that heretofore produced.—J. H. C.

Gold Ores; Extraction of Gold from ——. J. W. Worsey and E. Hoal, St. Helens, Lancs. Eng. Pat. 14,398, June 29, 1903.

To the powdered ore, freed as much as possible from aluminous silicates, chlorates and bromides of alkalis or alkaline earths are added together with acid, whereby nascent "bromide of chlorine" is produced, which, after the temperature of the mass has been raised to the boiling point, is stated to dissolve the gold. The gold solution is separated by decantation and leaching, a lead salt is added, then sulphuretted hydrogen, and finally air is blown through, thus precipitating the gold and lead as sulphides which may be reduced in any known way. Any gold remaining in the residues may be dissolved out with a weak solution of "double or single ferro-prussiate of ammonium and soda or potash."—J. H. C.

Magnetic Separators for Ores, &c. J. T. Dawes, Prestatyn, Wales. Eng. Pat. 21,324, Oct. 5, 1903.

The ore to be treated, is finely powdered and fed upon open-ended rotatable non-magnetic drums having surfaces sufficiently rough to carry the ore beneath rotating non-magnetic discs. By means of electro-magnets placed within the drums and above the discs, strong magnetic fields are produced passing through the discs and drums. By the rotation of the drums, the ore is carried forward through these fields, the magnetisable particles being attracted to the lower surfaces of the discs and carried out of the fields, when they fall into hoppers, the non-magnetisable particles remaining upon the drums until they too are carried through the fields and fall into hoppers.—J. H. C.

Magnetic Separators for Ores or like Materials. J. M. Moss, Heaton Chapel, Lancashire. Eng. Pat. 23,353, Oct. 28, 1903.

The powdered ore is fed from a hopper upon an endless travelling belt, which is supported on pulleys to pass below, and in contact with, a polygonal drum, provided with electro-magnets, and having projections or anti-friction rollers at the junctions of the faces, so arranged as to depress a portion of the belt as the drum revolves. There is also a movable roller to maintain the tension on the belt.—E. S.

Fused Metals and Alloys; Process and Apparatus for Granulating or Pulverising ——. L. Fink-Huguenot, Paris. Eng. Pat. 16,449, July 25, 1904. Under Internat. Conv., Jan. 7, 1904.

Metals or alloys which fuse below 1,472° F. are fed, in a molten condition, into the upper part of a vertical closed cylindrical vessel. The fused metal flows out through a horizontal side-passage near the bottom of the vessel and is ejected, by means of gas or steam under pressure, into a truncated cone in the form of spray. The spray passes through a central opening in the truncated cone, and is collected in a suitable receptacle in the form of a metallic

powder. The excess of gas or steam which does not escape through the discharge opening of the cone, returns through pipes to the top of the closed cylindrical vessel.
—A. S.

United States Patents.

Steel Alloy. C. E. Manby, Carnegie, Pa. U.S. Pat. 771,559, Oct. 4, 1904.

Claims are made for steel containing nickel and ferrovanadium; or ferrovanadium, nickel, and ferromanganese; and for a steel alloy composed of iron, carbon, nickel, manganese, and ferrovanadium.—E. S.

Metals or Alloys; Method of Decarbonising ——. F. von Kügelgen and G. O. Seward, Holcombe Rock, Va., Assignors to the Willson Aluminium Co., New York. U.S. Pat. 771,645, Oct. 4, 1904.

The ore is smelted under such conditions as to give a maximum yield of metal, independent of the proportion of carbon introduced or present, and the molten product is then decarburised by bringing it "into contact with calcium."—E. S.

Steel; Furnace for the Manufacture of ——. G. Gin, Paris. U.S. Pat. 771,872, Oct. 11, 1904.

See Fr. Pat. 342,101 of 1904; this J., 1904, 904.—T. F. B.

Iron; Process of Dechromising ——. O. Massenez, Wiesbaden, Germany. U.S. Pat. 772,164, Oct. 11, 1904.

See addition, dated July 1, 1903, to Fr. Pat. 329,132 of 1903; this J., 1903, 1353.—T. F. B.

Gold; Apparatus for Extracting —— from Auriferous Sand, &c. R. Blake, Assignor to Eliza Blake, Madison, N.J. U.S. Pat. 771,454, Oct. 4, 1904.

In an amalgamating tank a horizontal revolving cylinder is set transversely to the feed of ore, its lower part being immersed in mercury. Circular guards are secured to the inner sides of the tank, each having an annular horizontal flange overhanging, and closely embracing, the contiguous end portion of the cylinder. A revolving wiper is provided for dislodging the material carried upon the cylinder. A pivotally suspended arm depends within the upper portion of the tank, between the cylinder and the discharge aperture, and is provided with several alternating series of teeth extending transversely across the tank. Means are provided for oscillating the arm, so that the teeth move backward and forward in the path of an arc above the surface of the mercury.—E. S.

Ores; Process of Concentrating ——. Alice H. Schwarz, New York, Assignor to Schwarz Ore Treating Co., of Arizona. U.S. Pat. 771,277, Oct. 4, 1904.

Paraffin or some fatty substance which is solid at the ordinary temperature, is melted, and mixed with the powdered ore in a vessel provided with a mechanical agitator, and with means for introducing and discharging fluids. Cold water is introduced during agitation of the charge, and separation is effected between the valuable constituents entrained by the fatty matter and the gangue. The fatty matter is then liquefied to obtain the "values."
—E. S.

French Patents.

Cast-Iron; Process and Installation of Furnaces for the Production of —— by Reduction and Fusion of the Ores in Separate Furnaces. Georgs-Marien-Bergwerks and Hütten-Ver. Akt.-Ges. Fr. Pat. 343,548, May 30, 1904.

A blast furnace in which previously reduced iron ore is smelted with coke and lime, and is provided with an exit conduit for the gases (chiefly carbon monoxide) at about the upper limit of the zone of fusion. This conduit leads to near the bottom of one or more cupola furnaces in which the raw ore is reduced solely by the action of the reducing gases.—E. S.

Iron; Manufacture of ——. E. Fleischer. Fr. Pat. 343,701, June 4, 1904.

The finely-powdered iron ore, mixed with any required flux, is delivered into the upper end of an inclined rotating cylinder, the lower end of which is adapted to a second rotating cylinder, placed at a greater inclination than the first. The ore descending the first cylinder is met by a strongly reducing flame of relatively low temperature, issuing from the junction of the two cylinders, and the reduced and spongy iron produced, is fused in the second cylinder by encountering there a flame of high temperature, but of neutral or feeble reducing effect. In another form of the apparatus, a single rotating cylinder is used, having operating within it a specially devised burner for giving the reducing flame, whilst the hotter flame meets the ore at the end.—E. S.

Copper, Zinc, Cadmium, Silver, Nickel, Cobalt, and Tungsten; Obtaining Hydroxides of ——, in the Wet Way, by Direct Extraction. D. Lance. Fr. Pat. 342,865, May 4, 1904.

A "massive" filter press, in which the usual intermediate plates are replaced by a cylinder, is used in obtaining saturated solutions from finely-powdered ores of the metals named in the title, the solution being aided by the presence of ammonia or an amine, or a mixture of these. Simple or complex silicate ores are prepared for the specified treatment by a previous attack with a strong acid. From the solutions obtained, the hydroxides are fractionally precipitated by the aid of heat, assisted or not by a vacuum, the precipitation occurring in the following order:—zinc, cadmium, cobalt, nickel, copper, silver. The ammoniacal saline combinations of the dissolved metals are, when required, decomposed by the use of baryta or lime, in case it is required to fix sulphuric acid; or if it be required to retain carbon dioxide in combination, calcined dolomite may be used.—E. S.

Ores; Process and Apparatus for the Treatment of ——. J. E. Goldschmid. Fr. Pat. 343,313, May 19, 1904.

Powdered iron ore is charged from a hopper into one end of a horizontal revolving cylinder, into the opposite end of which a pipe passes conveying water-gas. Within the gas-pipe, and reaching beyond its end (at which the gas is ignited) is a tube conveying air to support combustion. The ore is successively dried, oxidised, and reduced, as it travels towards the flame at the exit end. A U-tube for passage of gaseous products is adapted to one end of the cylinder, in which tube condensation of vapours is effected by water spray. The apparatus is specially adapted for the preliminary treatment of pyrites cinders, &c., but is also available generally in treating matters which, owing to being pulverulent, are otherwise difficult to treat. Such matters are the residual products of the aniline manufacturer, or the residues of the treatment of copper ores.
—E. S.

XI.—ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

(A.)—ELECTRO-CHEMISTRY.

Zinc Salts: Study of Complex ——. F. Kunschert. Z. anorg. Chem., 1904, **41**, 337—358.

The author investigated the condition of zinc in solutions of its complex salts, by electro-chemical means and by solubility determinations.

Zinc in Alkali Oxalate Solutions.—In concentrated solutions of zinc oxalate in ammonium and potassium oxalates, the zinc is in the form of the complex ions $Zn(C_2O_4)_3''''$, but on dilution, the latter split up, in part, into $Zn(C_2O_4)_2''$ and free oxalate ions. A somewhat higher E.M F. is required to separate zinc from alkali oxalate solutions, then from solutions of its sulphate, but the deposit obtained from the oxalate solutions is more adherent. Further, in the electrolysis of sulphate solutions, sulphuric acid is set free, and thus the concentration of the hydrogen ions becomes greater and the discharge potential of the same less, so that the proportion of the current energy consumed in the evolution of hydrogen increases continuously. In the electrolysis of oxalate solutions, on the other hand, whilst the tendency to the evolution of hydrogen is greater at first than in the sulphate solutions, it remains nearly constant throughout the course of the electrolysis.

Zinc in Sodium Hydroxide Solutions.—The zinc exists chiefly in the form of ZnO_2'' ions, which, however, are hydrolysed, in part, to $HZnO_2'$ and hydroxyl ions. Both the compounds, Na_2ZnO_2 and $NaHZnO_2$, are stable only in the presence of excess of sodium hydroxide. In electrolysing with insoluble anodes, the E.M.F. required for the separation of zinc is 1·488 volts from N/1-alkali solution, and 1·528 volts from a neutral solution. In general, the employment of neutral solutions gives the more satisfactory results.

Zinc in Potassium Cyanide Solutions.—The zinc exists partly in the form of $Zn(CN)_4''$ ions and partly in the form of $Zn(CN)_3'$ ions. In a solution of zinc in potassium cyanide, according to the concentration, from 10 to 20 per cent. of the salt $K_2Zn(CN)_4$ is decomposed into potassium cyanide and the salt $KZn(CN)_3$. If the potassium cyanide produced be fixed, *e.g.*, by addition of silver nitrate, the decomposition proceeds further, until finally the whole of the double salt is decomposed, according to the equation: $K_2Zn(CN)_4 + 2AgNO_3 = 2KAg(CN)_2 + Zn(NO_3)_2$. The total cyanogen in the zinc double cyanide can thus be determined by titration with silver nitrate solution, and the statement of Bettel (Chem. News, 1895, **72**, 286 and 298) that in the titration of cyanide solutions containing zinc, only 7·9 per cent. of the cyanogen in the zinc double salt reacts with the silver nitrate, is incorrect. In the titration of strong solutions, indeed, a turbidity is produced before the whole of the theoretical quantity of silver nitrate solution has been added, but this turbidity consists not of silver cyanide, but of zinc cyanide, and its formation can be prevented by strongly diluting the cyanide solution before titrating. The formation of free potassium cyanide in solutions of the zinc double salt also accounts for the solvent action of such solutions on gold, and explains the possibility of regenerating the potassium cyanide by soluble sulphides. The potassium cyanide cannot, on the other hand, be regenerated by addition of alkali, since the ionic concentration of the zinc is greater in alkaline than in cyanide solutions; indeed, zinc in alkaline solution can be converted into the zinc double cyanide by addition of potassium cyanide. Zinc dissolves, with evolution of hydrogen, in potassium cyanide solutions of strengths such as are used in gold extraction. The rate of solution is accelerated by the presence of foreign metals such as platinum and gold, and by excess of oxygen.—A. S.

Nitrogen; Oxidation of —— by the Electric Flame. F. v. Lepel. Ber., 1904, **37**, 3470—3474. (See also this J., 1904, 376.)

In the course of some experiments in which currents of high potential were conducted by the aid of a rotating distributor simultaneously through several discharge-tubes, it was observed that, *e.g.*, with a current of about 6 ampères and 14 volts, the yield of acid (nitrogen oxide) from each of two discharge tubes arranged in parallel, with fixed electrodes, was approximately the same as from one tube by itself. With this arrangement, however, strong sparking was observed, indicating loss of energy, when the rotating distributor was passing over from one cathodic conducting wire to the other. Experiments were then made in which division of the electric flame was effected in a single discharge-tube by the use of a fork-shaped anode, the points of which could be made to rapidly rotate on the broad cathode plate. With a large apparatus of this form (capacity, 60 litres), and a current of air of 1800—2030 c.c. per minute, a yield of 2·419 grms. of acid was obtained in seven hours by using a current of 12 ampères and 70 volts. With two such apparatus, however, and using a rotating distributor, the yields were relatively much smaller; for example, with a current of 12 ampères and 65 volts the yield of acid was 2·4 grms. per hour from one tube alone, and 1·5 grms. from the other tube alone, whilst from the two tubes together the maximum yield was 1·5 grms. per hour. The cause of the relatively small yield in the large apparatus in comparison with the yield obtained in the preliminary experiments with a small apparatus with divided current is to be explained by the need of determining with each different size of apparatus, the most suitable values for (1) the amount of electric energy; (2) amount of air; (3) rate of rotation of anode. The experiments, however, show that rotation of the anode and division of the electric flame are advantageous.—A. S.

Carbonic Acid; Reduction of Combined Solid —— to Carbon, and Electro-Chemical Reactions with Solid Substances. F. Haber and St. Tolloczko. Z. anorg. Chem., 1904, **41**, 407—441.

The authors have investigated the electrolysis of solid substances at temperatures below their melting points.

Electrolysis of Solid Caustic Soda.—Metallic sodium was produced by the electrolysis of caustic soda below its melting point, with a current-yield of from 39 to 46 per cent., but this was not a true case of electrolysis of a solid compound, since it could be proved that in the electrolyte small pasty particles were present, which would of course act as conductors for the current.

Reduction of Combined Carbonic Acid to Carbon.—Experiments were made with mixtures of barium chloride and carbonate, the electrolyte being contained in a nickel crucible which served as anode; the cathode was of iron, platinum, or artificial graphite. The crucible was heated in a Hempel's gas furnace or in an electric furnace. The theoretical current-yield of carbon was obtained. The formation of the carbon is due to the action of the barium set free at the cathode on the barium carbonate.

Reactions between Chlorides and Flue Gases.—In an attempt to electrolyse pure solid barium chloride in a nickel crucible heated in a Hempel's gas furnace, the separation of carbon in amount equivalent to 34 per cent. of the theoretical current-yield was effected. This was found to be due to the formation of barium carbonate from the barium chloride by the action of the products of combustion of the gas, according to the equation: $BaCl_2 + CO_2 + O = BaCO_3 + Cl_2$. Experiments showed that calcium chloride and sodium chloride are acted upon in a similar manner. The following are some of the results obtained by heating the substances named in a Hempel's gas furnace:—

Substance.	Time.	Temperature.	Percentage of Chloride converted into Carbonate.
	Mins.	°C.	
6·935 grms. of calcium chloride.	55	780	8·22
10·2215 grms. of barium chloride	55	1000	3·06
12·283 grms. of sodium chloride.	40	900	0·184

In the attempt to electrolyse barium chloride, a small amount of barium sulphate was formed in a similar manner by the action of the sulphur dioxide or trioxide in the products of combustion of the gas.

Electrolysis of Pure Barium Chloride.—Quantitative current-yields of barium subchloride were obtained by electrolysing pure barium chloride at a temperature below its melting point, in a nickel crucible heated in an electric furnace. Metallic barium is first separated, and this reacts with the barium chloride, forming the subchloride.

Solid Daniel Cells.—Two solid Daniel cells were prepared. In the one, some lead chloride was fused in a U-tube of refractory glass and then allowed to solidify. In one limb of the tube a layer of molten lead was introduced above the lead chloride and a rod of lead inserted in the fused metal to serve as electrode. In the other limb was inserted a silver wire, which carried on its end a lump of silver chloride (prepared by repeatedly dipping the wire in fused silver chloride). This limb was then heated with a small flame until the silver chloride and lead chloride were in good contact. In the second cell, cuprous chloride and copper were substituted for the lead chloride and lead. The E.M.F. of each of these cells was quite measurable, and corresponded well with the value calculated according to Thomson's law.—A. S.

Graphite from Wood Charcoal; Preparation of ——. J. Weckbecker. Metallurgie, 1904, **1**, 137—142. Z. Elektrochem., 1904, **10**, 837.

Rods formed from a mixture of charcoal and alumina, in different proportions, were inserted as a resistance between massive carbon electrodes. By passage of the electric current they were brought to a sufficiently high temperature to dissociate the aluminium carbide, which is first formed, and to volatilise practically all the aluminium. The amount of graphite in the rod was determined by decomposing the amorphous carbon with fuming nitric acid. When the heating was carried out at 2000°—2490° C., a mixture containing 5 per cent. of alumina gave 68 per cent. of graphite, a mixture containing 30 per cent. of alumina, 97 per cent. of graphite. Furnaces are described for the continuous treatment of the mixture with production of graphite. The power required in these furnaces was 19 k.w. hours per kilo. of graphite.—R. S. H.

Potassium Acetate; Electrolysis of ——. H. Hofer and M. Moest. Z. Elektrochem., 1904, **10**, 833—834.

The authors offer some criticism of the recent paper by F. Foerster and A. Piquet (see this J., 1904, 940), and point out that methyl alcohol is a very important secondary product in the electrolysis of potassium acetate. The view that the various products of electrolysis are due to the mutual reaction of the separating anions is preferred to that ascribing them to anodic oxidation of acetic acid. —R. S. H.

English Patents.

Insulating Material for Electric Conductors. British Thomson-Houston Co., London. From General Electric Co., Schenectady, U.S.A. Eng. Pat. 25,853, Nov. 26, 1903.

The insulating material is formed by firing together a mixture of ground soapstone, a refractory substance such as clay, and cryolite or other fluxing agent which melts at a sufficiently low temperature to leave the soapstone in a soft condition, so that it may be drilled or machined.—R. S. H.

Peroxides of Magnesium and Zinc; Process for the Electrolytic Manufacture of ——. F. Hinz, Berlin. Eng. Pat. 24,806, Nov. 14, 1903.

See Fr. Pat. 337,285 of 1903; this J., 1904, 549.—T. F. B.

Copper Sulphate and Caustic Alkalies; Process and Apparatus for the Manufacture of —— by the Electrolysis of Alkaline Chlorides. H. M. Granier, Villemonble, France. Eng. Pat. 4187, Feb. 23, 1904. Under Internat. Conv., April 6, 1903.

See Fr. Pat. 330,963 of 1903; this J., 1903, 1086.—T. F. B.

Gases and Vapours; Production of Chemical Reactions in —— by Electric Discharges. A. de Montlaur, Paris. Eng. Pat. 12,541, June 2, 1904. Under Internat. Conv., June 3, 1903.

See Fr. Pat. 332,744 of 1903; this J., 1903, 1298.—T. F. B.

United States Patents.

Electric Heating; Apparatus for ——. [*Carbide Production.*] W. S. Horry, Assignor to Union Carbide Co., Niagara Falls, N.Y. U.S. Pat. 771,249, Oct. 4, 1904.

The electric furnace described is arranged so that terminals connected to a source of polyphase current are placed in contact with a conducting body. Different phases of the current are caused to flow along paths which converge to a common point within the body, which thus becomes heated up to any required temperature. The conducting material may consist of a mixture of "a compound and a reducing agent" or of carbide-forming materials. Means are provided for tapping off the product. (See this J., 1904, 548.) —R. S. H.

Electric Heating; Apparatus for ——. [*Carbide Production.*] W. S. Horry, Assignor to Union Carbide Co., Niagara Falls, N.Y. U.S. Pat. 771,250, Oct. 4, 1904.

As in the furnace described in the preceding abstract, polyphase currents are employed, but the connections are so arranged that the current flows along paths which cross each other through the material to be heated. (See this J., 1904, 548.)—R. S. H.

Peat; [Electrical] Apparatus for, and Process of Removing Water from ——. B. Kittler, Memel, Germany. U.S. Pats. 772,717 and 772,891, Oct. 18, 1904.

See Eng. Pat. 126 of 1904; this J., 1904, 326.—T. F. B.

French Patents.

Zinc Oxide; Manufacturing [Electrical] ——. C. J. Barbier. Fr. Pat. 338,977, Aug. 12, 1903.

Plates of carbon and of zinc are suspended alternately side by side in a bath of pure water. The plates are sufficiently apart to permit the free falling down of the zinc oxide which forms on the zinc plates when these are connected to the positive pole of a source of electricity, the carbon plates being connected to the negative pole. The oxide as it falls may be caught in a screen suitably supported for agitation; or the process may be made continuous by withdrawing the water charged with zinc oxide to a filter as fresh water flows into the bath.—E. S.

Electric Resistance Materials; Manufacture of ——. Chemisch-Elektrische Fabrik "Prometheus." Fr. Pat. 343,731, June 6, 1904.

The resistance bodies are formed from carbides of silicon or boron, or from other suitable material, by transforming the finely-divided material into a coherent mass by heating it to a temperature below its melting point. One method of carrying this out is to add boric acid to the finely-pulverised carbide, to strongly compress the mixture, and then to bake it at about 1200° C.—R. S. H.

(*B.*)—ELECTRO-METALLURGY.

Nickel Matte; Electrolytic Treatment of ——. E. Günther. Metallurgie, 1904, **1**, 77—81. Z. Elektrochem., 1904, **10**, 836—837.

The author has been successful in the direct electrolytic treatment of a nickel matte low in copper. The solution of the material at the anode was satisfactory. Using slightly-acid nickel sulphate as electrolyte, at first 92 per cent. of the current efficiency was attained, which, only much later, fell to 80 per cent. At the cathode, nickel of 99·27 per cent. purity was deposited in an excellent form.—R. S. H.

Copper in Potassium Cyanide; Examination of Solutions of ——. F. Kunschert. Z. anorg. Chem., 1904, **41**, 359—376.

The author finds by electro-chemical methods that in potassium cyanide solutions the copper exists in the form of $Cu(CN)_4'''$ ions, and to a lesser extent, of $Cu(CN)_3''$ ions. The results of the author's experiments afford an explanation of the necessity of using a somewhat high current-density in electrolytic brass-plating. With a very small current-density and a potassium cyanide solution of moderate strength, the copper, in consequence of its lower discharge potential, separates before the zinc. With a higher current-density the separation of brass takes place, the discharge potential of the zinc being so reduced that the metal becomes capable of forming compounds and solid solutions with the copper. The concentration of cuprous ions in a potassium cyanide solution is very small, and this accounts for the difficulty of precipitating cuprous sulphide from such solutions by hydrogen sulphide. Since if the concentration of the cyanogen ions were increased tenfold, the concentration of the cuprous ions would be diminished to $\frac{1}{10000}$ of its original value, the non-precipitation of cuprous sulphide by hydrogen sulphide in presence of a small excess of potassium cyanide is explicable, without assuming the formation of any particular complex ions (see Treadwell and Girsewald, this J., 1904, 61). The fact that precipitation may occur on diluting the cyanide solution can be explained by means of the law of mass action, since in the reaction $2Cu(CN)_4''' + H_2S = Cu_2S + 2HCN + 6(CN)'$, eight dissolved molecules or ions are formed from three, and a reaction by which the osmotic pressure is increased is always favoured by dilution.—A. S.

English Patents.

Sodium and Potassium; Production of ——. T. Parker, Wolverhampton. Eng. Pat. 19,196, Sept. 7, 1903.

Aluminate of soda or potash is mixed with carbon in suitable proportions, and calcined in an electric furnace, whereby the alkali metals are volatilised, and alumina remains behind. Similarly, the alkali silicates can be employed, and carbide of silicon (carborundum) obtained as a secondary product. The same processes can be employed, if nitrogen is introduced, for the production of cyanides.—R. S. H.

Electric Furnaces. E. Ruhstrat and W. E. Grimmer, Göttingen, Germany. Eng. Pat. 24,472, Nov. 18, 1903.

The furnaces described are of cylindrical or other shape, and are characterised by having a helix of carbon which serves as the heating resistance. The helix may be cut out from a solid carbon article, and the spirals of the helix may be separated by porous carbon having a very high resistance, which serves to strengthen them. Applications of the furnaces to the fusion of refractory materials are described. —R. S. H.

Electric Furnaces, and Extraction of Zinc by means of same. A. Edelmann and N. Wallin, Charlottenburg, Germany. Eng. Pat. 16,205, July 21, 1904. Under Internat. Conv., July 23, 1903.

The electric furnace comprises a vertical bell-shaped upper electrode and an annular lower electrode, with a central cavity in which is situated a condensing tube, connecting with condensing chambers. The shaft for the raw material surrounds the upper electrode. In the application to the extraction of zinc, the carbonic oxide and zinc vapours formed by the decomposition of the ore are prevented from escaping directly into the air by the charge filling the shaft. They consequently pass under and into the bell-shaped electrode, which serves as a heat interchanger and pressure equaliser, thence through the condensing tube to the chambers where the zinc is collected, and finally, through a shaft filled with coke, into the air.—R. S. H.

United States Patents.

Furnace; Electric ——. H. Harmet, St. Etienne, France. U.S. Pat. 772,354, Oct. 18, 1904.

See Fr. Pat. 318,283 of 1902; this J., 1902, 1459.—T. F. B.

Metals; [Electrolytic] Process of Obtaining ——. F. von Kügelgen, Holcombe Rock, Va., and H. Danneel, Breslau, Germany, Assignors to the Willson Aluminium Co., New York. U.S. Pat. 771,646, Oct. 4, 1904.

A metallic oxide is introduced into the cathode chamber of an electrolytic cell, in which the electrolyte is a solution of a haloid compound of an alkali metal. The oxide is reduced to metal, and alkali hydroxide is formed and is withdrawn from the cathode chamber. The strength of the electrolyte is maintained by additions of the haloid salt to the anode chamber. The process is applied to obtain metallic tin, sodium hydroxide and chlorine, from tin oxide and sodium chloride.—E. S.

French Patents.

Electric Induction Furnace with Air-Blast. A. Fauchon-Villeplée. Fr. Pat. 338,985, Aug. 14, 1903.

An induction furnace is combined with arrangements for blowing air into the charge which is being heated in the furnace.—R. S. H.

Copper Matte in the Electric Furnace; Process for Treating ——. A. Fauchon-Villeplée. Fr. Pat. 338,986, Aug. 14, 1903.

Copper matte is treated in a furnace of the type described in the above specification; by means of the air-blast the sulphur and iron are oxidised.—R. S. H.

Steel-making in the Electric Furnace; Process of ——. A. Fauchon-Villeplée. Fr. Pat. 338,987, Aug. 14, 1903.

Molten cast iron is run into a furnace of the type mentioned in specification 338,985 above. By means of the induced currents the metal is heated, whilst the air-blast oxidises the carbon and other impurities.—R. S. H.

XII.—FATTY OILS, FATS, WAXES, AND SOAP.

Olive-kernel Oil; Influence of —— *on Olive Oil.* N. Passerini. Staz. Sperim. Agrar. Ital., 1904, **37**, 600—610.

In order to test the accuracy of the widespread opinion that olive kernels contain oil that becomes rancid more readily than the pulp oil, virgin olive oil was mixed with varying proportions of the crushed stones or kernels and kept in flasks plugged with cotton wool for several months, after which the acidity was determined. It was found that in each case the kernels had caused a slight increase in the amount of free acid, which was greater in proportion to the quantity of kernels used. The author has arrived at the following conclusions:—(1) That olive oil becomes slightly acid when kept in prolonged contact with the kernels, the acidity increasing with the proportion of kernels. (2) That oil extracted from the kernels with ether has an acidity (1·84 per cent.) which at first differs but little from that of pulp oil (1·86 per cent.), but that in time the acidity increases considerably (*e.g.*, a sample kept for 18 months had an acidity of 10·18 per cent.). (3) That when the percentage of kernels does not exceed the normal amount in the fruit (12 per cent.) the pulp oil does not undergo any change in its organoleptic character, whilst the slight increase in the acidity is negligible. (4) That, in practice, no injurious effect need be feared from the short contact of the pulp oil with the crushed stones. (See also this J., 1898, 1055.) —C. A. M.

Carbon Dioxide in Seeds during Germination: Origin of ——. E. Urbain. XXIV., page 1047.

French Patents.

Liquids containing Glycerin; Treatment of ——. E. A. Barbet and L. Rivière. Fr. Pat. 338,962, July 31, 1903.

The liquid is treated with silicofluoric acid to precipitate the salts of potassium, sodium, &c., the precipitate is washed, and the glycerin separated from the filtrate and washings. The addition of alcohol before the filtration increases the insolubility of the silicofluorides. In the case of the products of alcoholic fermentation (Vinasses, &c.), the liquid is first concentrated to 10° or 12° B. in the presence of lime or calcium carbonate, and then filtered, and the filtrate treated with silicofluoric acid, the excess of which is neutralised with sodium or calcium carbonate. The liquid is next filtered, with or without the addition of alcohol (which is subsequently evaporated), the clear filtrate concentrated, and the residual crude glycerin purified, *e.g.*, by osmosis, as described in Fr. Pats. 323,373 and 330,939 (this J., 1903, 502, 1101).—C. A. M.

Soaps; Use of "Tangue" [Silicious Clay] in the Manufacture of ——. C. Sizaret. Fr. Pat. 343,398, May 24, 1904.

The soap is incorporated with about 25 per cent. of "tangue," an extremely fine silicious clay found principally on the sea coast.—C. A. M.

Soap; Manufacture of Hard Rosin —— [*for Paper Manufacture*]. E. Fischer. Fr. Pat. 343,617, May 11, 1904.

A HARD soap in solid form is prepared by mixing the required proportions of rosin and "soda" with the smallest possible amount of water which is continually renewed by condensation during the boiling, until the saponification is complete, after which the water is allowed to evaporate. Special apparatus claimed for this purpose consists of a boiler divided by means of a false bottom into two compartments, the upper of which is provided with means for condensing the evaporated water, and communicates by means of tubes, &c. with the lower compartment in which is the heating arrangement.—C. A. M.

XIII.—PIGMENTS, PAINTS; RESINS, VARNISHES; INDIA-RUBBER, Etc.

(*A*.)—PIGMENTS, PAINTS.

UNITED STATES PATENT.

Paint Composition. W. A. Hall, Bellows Falls, Vt. U.S. Pat. 771,241, Oct. 4, 1904.

SEE Eng. Pat. 26,903 of 1903; this J., 1904, 328.—T. F. B.

FRENCH PATENT.

Lakes [*from Azo Dyestuffs*]; *Process for Preparing New* ——. Soc. Anon. Prod. F. Bayer et Cie. Fr. Pat. 343,631, June 1, 1904.

LAKES of various shades of red, fast to light, are obtained by precipitating, on a suitable substratum, the azo dyestuffs formed by combining the diazo derivatives of 2-naphthylamine-1.6-disulphonic acid or of 2-naphthylamine-3.6-disulphonic acid with naphtholsulphonic acids. Bluish-red lakes are obtained, for example, by combining the diazo derivative of either acid with 2-naphthol-3.6-disulphonic acid; a yellowish-red lake is produced from the diazo derivative of the 3.6-acid with 2-naphthol-3.6.8-trisulphonic acid, whilst a brilliant red is obtained by combining the same diazo compound with 1-naphthol-3.6-disulphonic acid.—T. F. B.

(*B*.)—RESINS, VARNISHES.

UNITED STATES PATENT.

Wood; Process of Destructive Distillation of Resinous ——. C. E. Broughton. U.S. Pat. 771,706, Oct. 4, 1904. III., page 1023.

(*C*.)—INDIA-RUBBER, &c.

Castilloa Elastica; The Latex of ——. A. W. K. de Jong and W. R. Tromp de Haas. Ber., 1904, **37**, 3298—3301.

THE authors have examined a latex derived from 10-year-old rubber trees (*Castilloa Elastica*) grown in Java, but obtained originally from Kew. The results are much at variance with those described by C. O. Weber for a similar product (this J., 1903, 1200), and no support can be found by the author for Weber's theory of albumin-coagulation. The Java latex contained isolated particles and was of acid reaction. It was coagulable by methyl and ethyl alcohol, acetone, and glacial acetic acid, but not by albumin-coagulating agents, nor was an oxydase present. The latex was diluted with water, allowed to stand, and the cream collected. This was re-washed in a similar manner 12 times, but the cream still formed a white milky emulsion with water, like the original juice. After pasteurisation, the latex was coagulable by glacial acetic acid and acetone, but not by alcohol or by heating. By leaving *Castilloa* rubber in contact with ether, a thick syrup, unfilterable, except after addition of more ether, was obtained. After standing for 24 hours to settle, this liquid contained 8·7 to 9·3 per cent. of crude rubber. Also when the latex itself was extracted with ether, 7·9 to 8·2 per cent. of crude rubber was found in the filtered solution, so that the latex appears to contain rubber as such, and, moreover, rubber that is soluble in ether. As regards tannin, fresh latex was filtered, the liquid portion treated with lead acetate, and the precipitate decomposed with hydrogen sulphide. The resulting liquor when dried over sulphuric acid yielded a yellow brittle solid, which contained 30 per cent. of tannin by the hide-powder method (*cf.* Weber, *loc. cit.*).—R. L. J.

India-Rubber; Action of Radium Rays on ——. R. Ditmar. XXIV., page 1048.

ENGLISH PATENTS.

Rubber and Ebonite; Treatment and Utilisation of Waste Vulcanised ——. V. de Karavodine, Paris. Eng. Pat. 7795, April 2, 1904. Under Internat. Conv., July 25, 1903.

Rubber Waste; Process for Devulcanising or Regenerating ——. R. B. Price, Chicago. Eng. Pat. 17,313, Aug. 8, 1904. Under Internat. Conv., May 26, 1904.

SEE U.S. Pat. 762,843 of 1904; this J., 1904, 719.—T. F. B.

FRENCH PATENT.

Rubber; Regeneration of ——. M. Pontio. First Addition, dated April 18, 1904, to Fr. Pat. 338,048 of Oct. 16, 1903 (this J., 1904, 615).

IF petroleum be used alone as the solvent, it should be the fraction which boils between 125° and 140° C. If, however, the b. pt. be somewhat higher, it may be lowered to the required degree by the addition of benzene or toluene. When necessary, amyl alcohol may be substituted for acetone or alcoholic soda to free the rubber from sulphur and traces of solvent.—F. D. T.

XIV.—TANNING; LEATHER, GLUE, SIZE.

UNITED STATES PATENT.

Leather Substitute; Manufacture of an Artificial ——. G. Ebert, Rixdorf, Assignor to R. Piesbergen, Berlin. U.S. Pat. 772,646, Oct. 18, 1904.

SEE Eng. Pat. 15,629 of 1904; this J., 1904, 906.—T. F. B.

FRENCH PATENTS.

Tannin; Cold Extraction of —— *under Reduced Pressure*. L. Castets. Fr. Pat. 343,679, June 3, 1904.

MECHANICAL details are given of a plant for the cold extraction of tannin under reduced pressure. The main features are a series of five closed cylindrical extraction vats, mounted on trunnions and in connection with a pump and reservoir, so arranged that the liquors, as they increase in strength, come in contact with materials richest in tannin, also a sixth similar vessel supplied with refrigerating apparatus for the deposition of resins and colouring matters. —R. L. J.

Artificial Leather: Process for the Manufacture of the same. J. B. Granjon and J. F. L. Berchet. Fr. Pat. 343,704, June 4, 1904.

ONE or more sheets of cardboard are covered with a mixture of asphalt, bitumen of Judæa, tar, and resin. The sheets thus treated are heated by steam to about 100° C., and are then passed between steam-heated rollers. If the leather be required for straps, strips of linen or metal may be placed between the sheets before rolling.—F. D. T.

XV.—MANURES, Etc.

Phosphoric Acid of Manures; Effect of Liming on ——. B. Schulze. Bied. Centr., 1904, **33**, 653—654; from Fühling's Landw. Zeit., 1904, **53**, 186, 216, and 261.

THE effect of the phosphoric acid of bone meal on soil poor in lime, may very nearly approach that of phosphoric acid soluble in citric acid. Liming has very little effect as regards water-soluble phosphoric acid, but more on citric acid-soluble phosphoric acid, and most of all on the phosphoric acid of bone meal. In the case of spring manuring with phosphoric acid, a simultaneous application of burnt lime is the most injurious. Autumn manuring with lime is less injurious, whilst the least effect is produced when the lime is applied in the form of carbonate in the autumn. The injurious effect of lime on the activity of phosphoric acid in the soil, especially the phosphoric acid of bone meal, is due to the neutralisation of the acid constituents of the soil. The formation and decomposition of organic substances in soils is of no small importance in the nutrition of crops with phosphoric acid.—N. H. J. M.

Calcium Cyanamide; Agricultural Employment of ——. M. Gerlach. Bied. Centr., 1904, **33**, 649—651; from Mitt. d. deutsch. landw. Ges., 1904, [8]. (See this J., 1903, 809.)

The results of pot experiments showed that calcium cyanamide was equal to ammonium salts and nitrate of soda. In field experiments lower results were obtained, due perhaps to loss of nitrogen in the form of ammonia. Calcium cyanamide can be readily converted into ammonium sulphate.—N. H. J. M.

French Patents.

Manure in Powder; Process for making —— *by means of Phosphorites and other Natural Phosphates.* W. Mathesius. Fr. Pat. 343,820, June 9, 1904. Under Internat. Conv., June 13, 1903.

See Eng. Pat. 13,361 of 1904; this J., 1904, 907.—T. F. B.

Humous Manures; Manufacture of ——. J. J. Boutan. Fr. Pat. 338,981, Aug. 13, 1903.

Peat, the humous basis of these manures, is treated with a concentrated solution of potassium salts, rich in the carbonate, such as may be derived from the charred waste of the vinous or molasses distilleries; or by a mixture of potassium sulphate and chalk, to obtain a "humo-potassic" manure. Or, a "humo-phosphatic" manure is prepared by incorporating peat previously rendered alkaline, with insoluble phosphates in which the phosphoric acid, or part of it, has been rendered soluble by humous matter, together with such alkaline salts as those named, or by acids. Sodium or ammonium salts may in some cases replace the potassium salts in the preparation of the manures.—E. S.

Sewage and Water; Precipitant for use in Purification of ——. [*Manure.*] J. M. Lallemand and A. Soutièrre. Addition to Fr. Pat. 323,900 of Aug. 14, 1902. XVIII. B., page 1040.

XVI.—SUGAR, STARCH, GUM, Etc.

Sugar Factories; Micro-organisms in the Juices of ——. *II.* A. Schöne. Z. Ver. deutsch. Zuckerind., 1904, 1060—1090. (See this J., 1901, 733.)

The author has made a careful study of the nature, properties, and conditions of growth of the various micro-organisms which he has isolated from the juices of beet-sugar factories. The organisms are dealt with according to the following groups, the nature of the acids produced by them being also noted:—Group 1. *Leuconostoc mesenteroïdes* ("frog-spawn fungus"), forming chiefly lactic acid; mucus-forming *coccus* I., producing acetic and succinic acids and a little lactic acid; mucus-forming *coccus* II., producing acetic and *d*-lactic acids. Group 2. Coli-like bacteria: A, producing a little formic acid, much succinic acid, *l*-lactic acid; B, producing acetic and *l*-lactic acids; C, producing acetic acid, much succinic acid, *l*-lactic acid; D, producing acetic acid, a little valeric acid, much succinic acid, *d*-lactic acid. Group 3. *Clostridium gelatinosum* Laxa, producing acetic and lactic acids; *B. mesentericus fuscus*, producing acetic acid and a little valeric acid; *B. subtilis*, producing little acid (?). Group 4. Indifferent and accidental organisms: An acid-forming *coccus* producing *d*-lactic acid and traces of volatile acids; rodlet bacteria, similar to lactic bacteria; yeasts and mould fungi. The author discusses the occurrence of the above organisms in nature, and the manner in which they enter the juice. The harm which these organisms effect in the sugar factories is due principally to the production of gelatinous and mucous carbohydrates at the expense of the sugar. This property is a very general one, and accounts for a considerable proportion of the losses during manufacture. Sugar is also lost by the formation of acids, alcohol, and gases under microbic influences and by the activity of the inverting enzymes secreted by the organisms. Many of these organisms are remarkably resistant to the influence of high temperatures and of most antiseptics: and the inverting enzymes secreted by them are still more resistant than the organisms themselves.—J. F. B.

Sugars; Semicarbazones of Reducing ——. Maquenne and Goodwin. Bull. Soc. Chim., 1904, **31**, 1075—1078.

The semicarbazones of arabinose, rhamnose, xylose, dextrose, mannose, galactose, lactose, and cellose are described, their melting points, solubility, and rotatory power being given. The semicarbazones of maltose and levulose could not be obtained in a pure state. All the semicarbazones exhibited multi-rotation, the rotatory power only becoming constant after the solution had stood for some days. The rotatory power was, except in the case of rhamnose semicarbazone, considerably lower than that of the original sugar. The substances had no sharp melting points, the change of physical state being always accompanied by an evolution of gas. These derivatives are not considered to possess any value for the identification of the sugars, as their physical constants are not sufficiently well defined.

—T. F. B.

Sugar in Molasses and Cane Sugar Factory Products; Determination of Crystallisable and Reducing ——. H. Pellet. XXIII., page 1047.

Honey Substitute; Manufacture of a ——. A. Oetker, Bielefeld, Germany. Eng. Pat. 12,754, June 6, 1904.

500 grms. of cane sugar are mixed with 0·5 grm. of calcium formate and 0·5 grm. of tartaric acid, sufficient caramel to produce the desired colour being also added. 500 grms. of this mixture are heated to boiling with 125 grms. of water, then kept in a warm place for 30 minutes, and afterwards cooled.—W. P. S.

French Patents.

Diffusion [Sugar]; Continuous Process of ——. J. Galloo. Fr. Pat. 338,971, Aug. 7, 1903.

Rasped beetroot pulp is caused to travel through a diffusion vessel divided into several compartments. At the same time an extracting liquid is passed through the diffuser in the opposite direction. Each compartment of the vessel is provided with mixing rakes, which keep the pulp in suspension and facilitate the extraction of the sugar.—J. F. B.

Massecuite; Continuous Apparatus for Filtering and Washing ——. H. Roy. Fr. Pat. 343,194, May 16, 1904.

The apparatus consists essentially of a cylindrical vessel provided with a conical lower portion, around the walls of which a perforated filtering surface is arranged. The massecuite is forced in at the bottom of the vessel, and is agitated in contact with the filtering surface by means of stirring arms, whilst at the same time it is subjected to the action of compressed air introduced at the top of the apparatus. The syrup passes through the filtering surface, and drained sugar is discharged continuously from the upper portion of the vessel. By interposing one or more cylindrical sections provided with separate stirrers and filtering surfaces between the lower and upper portions of the vessel, the massecuite may be systematically washed in its upward course by means of "clairce" syrups introduced at various points.—J. F. B.

Starch Derivatives; Production of ——. J. Kantorowicz. Fr. Pat. 343,614, April 29, 1904.

Starch is treated in presence of water with liquids which are miscible with water, but which prevent the gelatinisation of the starch when caustic soda is subsequently added. For instance, 100 parts of potato starch are mixed with alcohol at a strength of 50—90 per cent., so as to produce a milky liquid in which the starch is held in suspension, and then 40 parts of a solution of caustic soda at 30° B. are added. The mass thickens, and is allowed to remain for one hour; it is then neutralised by acetic acid, and the resulting precipitate is filtered off and dried. The product yields a paste when mixed with 10 times its weight of water.—J. F. B.

Spirits, Cattle Food, and Glucose; Preparation of —— from Plants and Vegetable Refuse. Internat. Spiritus-Ind. Fr. Pat. 343,745, May 11, 1904. XVII., page 1039.

XVII.—BREWING, WINES, SPIRITS, Etc.

Malt; Relation between Moisture, Grist, and Yield in ——. K. Regensburger. Z. ges. Brauw., 1904, **27**, 649—651.

Four Bavarian malts were allowed to absorb moisture in a moderately damp place, and after definite periods of time, samples were crushed in a laboratory Seck mill set at 25°, and the moisture determined. The crushed malt was then classified on a Vogel sieve, the latter being shaken for 10 minutes, with the shaking apparatus working at 350 revolutions per minute. As the percentage of moisture in the malt increased, the proportion of grains also increased, mainly at the expense of the grist, but to a certain extent also at that of the fine meal. With an increase of 8—9 per cent. in the moisture, the proportion of grains increased to from four to five times the original amount. This is due to the toughness imparted to the corns by an increased moisture content, whereby not only do the grains resist crushing, but considerable amounts of the contents of the corns adhere to the husks, especially at the tips of the corns. With regard to the yield of extract, it was found that with imperfectly modified malts, an increased moisture content caused a distinct decrease (about 2·3 per cent.) in the yield calculated on the dry substance. With well-modified malts, the moisture content, so long as it was within the limits usually met in practice, viz., from 2 to 8 per cent., appeared to have little influence on the yield of extract, but with a very high content of moisture, *e.g.*, 9 per cent. and over, the decrease in yield of extract was as high as 1 per cent. In these experiments the extract was determined by an infusion method. Experiments with the decoction method showed that with the malts containing a low percentage of moisture, the yield of extract was increased by boiling the mash, but when the moisture content was high, boiling the mash had practically no influence on the yield of extract.—A. S.

Saccharomyces Saturnus Klöcker: A New Species of Saccharomyces with Characteristic Spores. A. Klöcker. Woch. f. Brau., 1904, **21**, 676—678.

The author describes a new species of *Saccharomyces* which belongs to the same group as *S. anomalus* (Hansen). It differs from the latter chiefly in the shape of its spores, and in its ability to invert and ferment cane sugar. It rapidly forms a white, wrinkled film on beer-wort and other saccharine media. The cells of the fresh films are spherical or oval in shape, with a diameter of 4—6 μ. In older films "giant" forms with thickened walls and chains containing elongated cells are observed. The cells of films grown on maltose-yeast-water media nearly always contain spores. The limits of temperature for budding lie between 2° and 37° C. The spores are lemon-shaped, more or less regular, and are surrounded at the centre by a protruding band (reminiscent of the planet Saturn). The dimensions of the spores from point to point are 3 μ; they contain a spherical, refractive corpuscule, probably of fat. Spores are produced on a gypsum block most readily at a temperature of about 25° C. This yeast ferments dextrose, fructose, raffinose, and cane sugar. Very little alcohol is formed during fermentation in beer wort, but an odour of fruity ethers, probably ethyl acetate, is developed. Maltose, lactose, and arabinose are not fermented. This species was first discovered in a sample of earth from the Himalayas; later the same or a very similar species has been found in samples of Danish and Italian earths.—J. F. B.

Schmitz Brewing Process; Remarks on the ——. C. Bleisch. Z. ges. Brauw., 1904, **27**, 681—683.

According to the Schmitz process, the malt, ground rather more finely than usual, is mashed and saccharified at any desired temperature in the mash-tun; the whole mash is then transferred to the mash-copper and boiled. The boiling mash is pumped into a special steam-jacketed clearing tun, the wort is run off, and the residue is sparged still at the boiling temperature. Since a further solution of the starch is effected by the boiling, the wort containing this residual starch is cooled by an arrangement in the bottom of the clearing tun, and subjected to a further saccharification by means of a diastatic extract reserved at the beginning of the mashing. The author has studied this process comparatively with the ordinary process. The advantages determined in favour of the Schmitz process included a considerable shortening of the time required for running off the wort and sparging, owing to the very high temperature employed, and a slight improvement in the yield. A question arises in connection with the possibility of the extraction of matters with an undesirable flavour from the grains by running off and sparging at the boiling temperature. Whether such a tendency is counteracted by the curtailment of the time of contact can only be determined by long practice. The increase of yield attributable to a better solution of the badly modified starch was surprisingly small, and the greater portion of the observed increase was due to the favourable conditions under which running off and sparging were effected. In comparison with a modern clearing tun of the best construction this increase of yield to the advantage of the Schmitz process would, however, tend to disappear.—J. F. B.

Beer; Causes and Prevention of Altered Flavour in —— with New Plant. H. Vogel. Ann. de la Brass., 1904, **7**, 368—372.

One cause of altered flavour in beer produced in new plant is the use of cheap shellac substitutes (impure pine resin, artificial turpentine, &c.) for varnishing the fermenting tuns and other vessels. To prevent this risk the varnish may be tested by pouring a little into a bottle, turning the latter upside down, and leaving the varnish to dry; the presence of any unpleasant smell will indicate that the varnish is not fit for use in the brewery. In coppers of more modern type the flues extend only about one-third up the sides, instead of half-way, and unless the mashing and boiling are modified accordingly, the beer will taste thin, as though from lower gravity wort. In steam coppers the lower initial temperature prolongs diastatic action, thus increasing the proportion of readily fermentable sugars, and consequently the attenuation. Unless coppers heated by steam coils be also provided with stirrers at the bottom, the beer will be liable to glutin haze and changed flavour. Excessive reduction of the individual area of the perforations in the false bottom may retard filtration, by the retention of air bubbles in the holes. This delay results in the extraction of flavouring matters from the grains, and affects the taste of the beer. It may be prevented by running in the sparging liquor from below, and thereby clearing out the holes. The vibration of a mashing machine will shake the grains into a compact mass and retard filtration. Dust produced by building operations is a fertile source of sarcina-sickness in beer, the altered flavour being then often erroneously attributed to the new plant. Wort may be boiled in an iron pan as well as in a copper vessel, any small quantity of iron dissolved in the former case being eliminated in cooling, or during fermentation; but an alteration in flavour will follow the introduction of iron into the finished beer. The water condensed in the dome of the copper should be discharged outside, for if the wort be boiled too briskly, hops and scum may adhere to the dome and scorch, and the materials extracted by the water of condensation will alter the flavour of the beer.
—C. S.

Beer; Behaviour of —— towards Metals. J. Brand.
Z. ges. Brauw., 1904, **27**, 713—716.

After commenting on the various notes which have appeared recently on this subject (see this J., 1904, 263, 332, 595, and 796), the author states that his experience does not confirm the conclusions as to the unsuitability of tin surfaces for contact with beer. He exposed iron plates, both black and polished, and tinned iron plates to the action of pale and dark beers. After 12 hours' exposure, the beers containing the unprotected iron plates had become very turbid and had completely changed in colour, whilst those containing the tinned plates were only slightly turbid and otherwise unchanged. After seven days the beers with the iron plates were no longer recognisable as beer, and contained 0·42 per cent. of dissolved iron per litre, whilst those in contact with the tinned plates were slightly turbid, but still drinkable. The author concludes that the evil effects of tin and tinned surfaces in contact with beer are quite inconsiderable in comparison with those brought about by plain iron, especially with regard to the injury to the flavour. It would be a mistake if tin and tin coating, which have done such good service hitherto in protecting iron vessels from the action of beer, were suddenly discarded.—J. F. B.

Fermentation Tuns: Effect of Chemicals employed for Removing Old Lacquer from —— upon the Wood and Subsequent Coat of Lacquer. F. Schönfeld. Woch. f. Brau., 1904, **21**, 667—668.

The experiments showed that solutions containing caustic alkalis, such as a 5 per cent. solution of caustic soda or a 10 per cent. solution of sodium carbonate mixed with 5 per cent. of lime, cannot be entirely eliminated even when the un is subsequently washed for two days with frequent changes of water. Consequently the new coat of lacquer does not adhere firmly to the wood, and in a very short time t begins to scale or to soften. In many cases also the outer ayers of the wood fibres are considerably damaged or destroyed. Milder alkalis, such as a 20 per cent. solution of sodium carbonate or a 5 per cent. solution of "antiformin" (see this J., 1904, 125), do not appear to affect he new coating of lacquer, provided the tun has been horoughly washed for two days. But if the washing be deficient, as may easily happen in practice, the new coat of acquer is certain to suffer. The author concludes that all chemical agents should be avoided, and that the old lacquer should be removed only by mechanical means. The experiments also indicate that "antiformin," which is a valuable antiseptic, should not be employed incautiously for the disinfection of lacquered fermentation tuns, owing to its powerful solvent action on the varnish.—J. F. B.

Fluorine in Wine and Beer; Determination of ——. F. P. Treadwell and A. A. Koch. XXIII., page 1046.

English Patents.

Malt-Kilns. J. Brackenbury, Burton-on-Trent.
Eng. Pat. 28,630, Dec. 30, 1903.

Kilns having a fire-shaft are constructed with an air-shaft urrounding the fire-shaft, both of which communicate with a mixing chamber situated below the drying-floor. The heat of the fire-gases induces an upward current of air hrough the air-shaft, the gases and air mixing in the hamber before reaching the drying-floor. Means for regulating the admission of air are provided.—W. H. C.

Alcohol and other Volatile Matters from Waste Products; Process for Recovering ——. C. Tuckfield and G. de F. Garland, East Molesey. Eng. Pat. 26,360, Dec. 2, 1903.

The wash or liquid to be treated is heated to a temperature few degrees higher than its atmospheric boiling point, g., under a pressure of 10—40 lb. per sq. in.; this may be ffected by providing a pressure valve on the worm before he point where the vapour passes into the condenser.
—J. F. B.

Rousers" for Mixing Purposes. A. Pidgeon, West Ham, Essex. Eng. Pat. 642, Jan. 11, 1904.

The invention relates especially to an improved form of rouser" or mixer for incorporating finings in ales and beers, or for blending wines or spirits. The "rouser" is constructed with a shoulder upon its length to prevent it touching the bottom of the vessel in which it is used. The top of the handle is made semi-spherical so that it can be "rolled around" in the palm of the operator's hand. The shoulder has a curved form, in order that every part of the the vessel may be reached, and the blade is made of a special section, two or three types of which are figured.
—W. H. C.

French Patents.

Yeast Extracts; Eliminating the Bitter Flavour from ——. M. Elb. Fr. Pat. 343,712, June 4, 1904.

Yeast-extracts are treated, after evaporation, with an oxidising agent, preferably hydrogen peroxide. The precipitated matters are removed either by filtration or clarification. (See also Eng. Pat. 24,294 of 1903; this J., 1904, 996.)—J. F. B.

Lees and other Residues of Wine; Drying and Extracting the Alcohol from ——. G. Grimard. Fr. Pat. 338,988, Aug. 17, 1903.

The lees and marcs are dried in a closed vessel under vacuum at any suitable temperature, and the alcoholic vapours which are evolved are condensed.—J. F. B.

Cream of Tartar; Extraction of White Refined —— from Marcs, before and after Distillation. G. Chiapetti. First Addition, dated April 22, 1904, to Fr. Pat. 330,951, April 6, 1903. (See this J., 1903, 1099.)

In the apparatus described in the original patent, refrigerators are interposed between each diffuser, in order to prevent the solution of tartaric and sulphurous acids, as it passes from one diffuser to the next, from being heated beyond a certain temperature by the hot marcs with which it comes in contact. In the distillation column, which is employed for the recovery of the alcohol from the marcs, the porcelain balls are replaced by plates having only one scrubbing-cap. The "head products" of distillation are collected separately from the "tailings" by means of two different receivers, above which is placed an inspection glass.—J. F. B.

Spirits; Apparatus for Continuous Rectification of ——. E. A. Barbet. Fr. Pat. 343,488, April 16, 1904.

Several improvements are described relative to apparatus for the continuous double rectification of alcohol, direct from the wines or from the phlegms. The new arrangements afford an accurate control of the analyser column and a certain auto-purification of the already purified phlegms; they do away with the passage of the vapour of the wine directly to the rectifying column, and supply this rectifier with a series of plates and a special condenser, in order to concentrate the "tail" products, the extraction of which facilitates rectification. An arrangement is interposed between the analyser and rectifier by which the phlegms may be purified by the admission of oxidising agents or other chemicals.—J. F. B.

Spirits, Cattle Food, and Dextrose; Preparation of —— from Plants and Vegetable Refuse. Internat. Spiritus-Ind. Fr. Pat. 343,745, May 11, 1904.

Wood, straw, or other vegetable matter is boiled under a pressure of 10 atmospheres with a dilute solution of caustic soda, the mass is diluted largely with water, and the cellulose is dissolved under a pressure of 20—24 atmospheres. The boiling mass is then treated under atmospheric pressure with ozonised oxygen or hydrogen peroxide. The saccharine solution so obtained may then be fermented with ordinary yeast or with "Koji," or may be evaporated to a syrup. (See also Fr. Pat. 342,555; this J., 1904, 944.)
—J. F. B.

Distillery Juices; Apparatus for Aerating and Decanting ——. A. Hochart. Fr. Pat. 343,627, June [illegible] 1904.

The saccharine juices coming hot from the presses or diffusers are delivered to the top of a cascade-refrigerator, consisting of tubes cooled internally by a current of water. As the juice traverses the refrigerator, air is blown across it by means of a ventilating fan. The cooled juice then passes through a series of decanting basins, arranged in the form of steps, in which the sediment and waste fine pulp are deposited. Arrangements are made for the inversion of the sugar by treatment with sulphuric acid. —J. F. B.

Liquids containing Glycerin; Treatment of ——. E. A. Barbet and L. Rivière. Fr. Pat. 338,962, July 31, 1903. XII., page 1035.

Water-Bath for Heating Liquids, or Liquids mixed with Solids. P. P. A. Andrieu. Fr. Pat. 343,321, May 21, 1904. I., page 1020.

XVIII.—FOODS; SANITATION; WATER PURIFICATION, & DISINFECTANTS.

(*A.*)—FOODS.

English Patent.

Eggs and other Alimentary Substances; Preserving Compound for ——. G. E. Greuard, Paris. Eng. Pat. 17,431, Aug. 10, 1904.

A mixture is made of sodium silicate (20 kilos.), sodium phosphate (0·2 kilo.), sugar (0·2 kilo.), and water (60 kilos.). To this mixture is added a 13 per cent. solution of hydrochloric acid (20 kilos.), and the whole is then poured over the eggs or other substances, so as to completely cover them. After a few minutes the mixture forms a firm gelatinous mass round the eggs, &c.—W. P. S.

French Patents.

Coffee Substitute [*Roasted Lupines*]; *Manufacture of a* ——. G. Doudieux and L. Jacotin. Fr. Pat. 343,485, April 8, 1904.

The substitute, which is said to possess the flavour of coffee, consists of roasted lupines which have been, either before or after roasting, treated with water, steam, and alcohol to remove substances objectionable to the taste.—W. P. S.

Food Product; Manufacture of a ——. R. Gross, Germany. Fr. Pat. 343,174, May 16, 1904.

White phosphorus is burnt and the products of combustion distilled, when it is stated that a yellow solid and an oily liquid are obtained. Reduced iron is then dissolved in the liquid portion and the mixture poured into boiling water. The product, a white powder, is mixed with other food substances, either alone or in combination with the "yellow solid" and "oily liquid."—W. P. S.

Flour, Corn, and other Cereals; Process and Apparatus for Bleaching and Improving ——. W. T. Mercier. Fr. Pat. 343,805, June 8, 1904.

The flour is subjected in a series of cylindrical chambers to the action of ozonised air mixed with a gas produced by the electrolysis of a solution of common salt or other suitable solution. The flour or other substance to be treated is previously air-dried.—W. P. S.

Spirits, Cattle Food, and Glucose; Preparation of —— *from Plants and Vegetable Refuse.* Internat. Spiritus-Ind. Fr. Pat. 343,745, May 11, 1904. XVII., page 1039.

Water-Bath for Heating Liquids, or Liquids mixed with Solids. P. P. A. Andrieu. Fr. Pat. 343,321, May 21, 1904. I., page 1020.

(*B.*)—SANITATION; WATER PURIFICATION.

English Patent.

Sprayer [*for Sewage Effluent*]; *Improved Construction of* ——. R. H. Reeves, London. Eng. Pat. 23,746, Nov. 2, 1903.

The sprayer, which is specially intended for spraying sewage effluent, is constructed with a socket and plug, having curved channels of irregular or spiral pitch, and is connected with the supply pipe by a straight reducing piece. The whole is arranged so as to revolve.—W. H. C.

French Patent.

Sewage and Water; Precipitant for Use in the Purification of ——. J. M. Lallemand and A. Goutièrre. Secon Addition, dated July 13, 1903, to Fr. Pat. 323,900, Aug 14, 1902 (this J., 1903, 563).

Aluminium phosphate "treated with hydrochloric or sulphuric acid" is added to the sewage. The sludge forme is rich in phosphoric acid and nitrogen, and is claimed as manure.—W. P. S.

(*C.*)—DISINFECTANTS.

Bacteria; Destroying —— *by Boiling under Reduce Pressure.* Schut. Z. Hyg.; through Brewers' J., 1904 40, 673.

The author finds that boiling the liquid in which bacteri or spores are suspended is more fatal to the micro-organism than merely heating the liquid to the boiling temperature By heating under diminished pressure, bacteria and spore may be killed without the physiological limits of temperature being exceeded. The use of saturated steam is more efficacious even than boiling. The powers of resistance possessed by micro-organisms vary considerably accordin to the temperature of cultivation and the medium in which the microbes are suspended; in the case of spores, th resistance decreases to a certain extent with the age of th culture. Heating at 60° C. for half an hour is sufficient t destroy the vegetative forms, especially of pathogenic germs —A. S.

English Patents.

Ozonising Air for Disinfecting Purposes; Apparatus fo ——. A. d'Arsonval, G. E. Gaiffe, and G. Gallot, Paris Eng. Pat. 27,358, Dec. 14, 1903.

See Fr. Pat. 337,531 of 1903; this J., 1904, 500.—T. F. B.

Antiseptic Preparations [*from Rosin*], *and Process fo Producing the same.* H. Endemann, Brooklyn, U.S.A Eng. Pat. 17,607, Aug. 12, 1904.

See U.S. Pat. 770,275 of 1904; this J., 1904, 996.—T. F. B

French Patent.

Insecticide. E. Maulouct. Fr. Pat. 343,829, June 9, 1904

This insecticide consists essentially of an emulsion o petroleum, fatty soap, potassium carbonate, and ethyl and amyl alcohols. It may be used for impregnating wood a well as for agricultural purposes.—T. F. B.

XIX.—PAPER, PASTEBOARD, Etc.

English Patents.

Beating or Triturating and Refining Pulp or like Fibrou Material; Apparatus for ——. J. H. Annandale, Polton Scotland. Eng. Pat. 26,012, Nov. 28, 1903,

A drum mounted on a rotating shaft has radially dispose cutter blades projecting from it. The drum is surrounded b a fixed casing, also having cutter blades, so fixed that the project into the spaces between the blades of the drum Means are provided for adjusting the spaces between th two sets of blades, for feeding and for withdrawing the pul continuously.—W. H. C.

Paper; Manufacture of Pressed or Gauffered ——. G Hennessen and P. Spix, München-Gladbach, Germany Eng. Pat. 14,149, June 27, 1904.

By heating the engraved rollers or moulds employed fo pressing patterns on paper or cardboard, the pressed portion of the product appear glossy, whilst the unpressed portion remain dull.—J. F. B.

Cornstalks, Sugar Cane, and Analogous Pithy Stalks Process of Manufacturing Products [*for Paper-making*] *from* ——. V. Drewsen, New York. Eng. Pat. 15,29 July 8, 1904.

See U.S. Pat. 731,290 of 1903; this J., 1903, 876.—T. F. I

Paper-making Machines; Impts. in ——. J. Bradley, Burnley. Eng. Pat. 18,117, Aug. 22, 1904.

n order to minimise the friction on the wire in passing ver the suction-box, the latter is divided longitudinally nto three compartments. The central compartment serves s the suction-box proper, whilst the two outer compartments each contain a roller capable of freely rotating herein, and of being adjusted slightly in a vertical direction. hese rollers revolve in troughs of water and project lightly above the level of the central suction-box. An ir-tight joint between the rollers and the edges of the entral compartment is made by means of compressible dia-rubber tubes. The end-plates of the suction-box roper are adjustable for any width of paper, and their tops re faced with plate-glass, over which the wire slides with he least possible friction.—J. F. B.

United States Patent.

Wood-Pulp or Cellulose; Means for Refining ——. A Wahlström, Honefos, Norway. U.S. Pat. 771,403, Oct. 4, 1904.

HE machine comprises a vertical rotary runner, having a lain peripheral grinding face, and a bedstone mounted eneath the runner and having a plain grinding surface ncompassing the greater portion of one-half of the grinding ace of the runner. Means are provided for adjusting the edstone vertically with regard to the runner.—J. F. B.

French Patents.

aper and Cardboard; Process of Sizing ——. F. Dobler. First Addition, dated April 29, 1903, to Fr. Pat. 328,178, Dec. 19, 1902. (See this J., 1904, 335.)

n the process for sizing paper described in the original pecification, the two separate sizing baths may be replaced y a single combined bath containing approximately: osin soap, 20—50 parts; gelatin, 20—50 parts; aluminium ulphate, 20—50 parts; water, 1,000 parts.—J. F. B.

oap; Manufacture of Hard Rosin —— [*for Paper Manufacture*]. E. Fischer. Fr. Pat. 343,617, May 11, 1904. XII., page 1036.

aper Coloured on One Side; Process and Apparatus for making ——. Leykam-Josefsthal Act.-Ges. f. Papier- und Druck-Ind. Fr. Pat. 343,186, May 16, 1904.

HE colour or other composition is applied to the web of he paper as it comes from the paper making machine, the urface of the paper is felted ("feutré") by pressure, and he colour is caused to adhere firmly to the paper by subequent drying. The apparatus consists of a tank with gitator for holding the colouring matter, which passes own a pipe provided with a cock and indicator, and disharges through a perforated tube into a small tank which verflows on to the surface of a cylinder; this cylinder is n contact with the paper, and revolves as the paper passes eneath it, thus applying the colour to the surface of the aper.—T. F. B.

apers with Designs of all kinds, Coloured Paper, &c.; Process for making Glossy ——. Soc. Hennessen et Jansen, and Soc. Spix et Lindermann. Fr. Pat. 343,856, June 10, 1904.

EE Eng. Pat. 14,449 of 1904, preceding these.—T. F. B.

apers of all kinds, Coloured Paper, &c., having at the same time a Glossy and Matte Effect; Process for making Pressed or Gauffered ——. Soc. Hennessen et Jansen and Soc. Spix et Lindermann. Fr. Pat. 343,857, June 10, 1904.

EE Eng. Pat. 14,449 of 1904, preceding these.—T. F. B.

honographic Records; Composition for ——. A. and L. Lumière. First Addition, dated June 16, 1903, to Fr Pat. 338,849, June 8, 1903.

A FLEXIBLE protective coating for phonographic records is omposed of nitrocellulose or acetylcellulose and a softeng agent, such as a salt of a fatty acid or paraffin wax, issolved in a common solvent.—J. F. B.

XX.—FINE CHEMICALS, ALKALOIDS, ESSENCES, AND EXTRACTS.

Magnesium Amalgam as a Reducing Agent. [*Preparation of Absolute Alcohol.*] T. Evans and W. C. Fetsch. J. Amer. Chem. Soc., 1904, **26**, 1158—1161.

Preparation of the Amalgam. — Magnesium amalgam affords a convenient and economical means of effecting reduction of organic compounds. It is found that generally magnesium powder will amalgamate with mercury at ordinary temperatures, amalgamation starts slowly, but evolves heat, which causes the process to become more rapid. Some specimens of magnesium, however, refuse to amalgamate unless the process be aided by the employment of a warmed mortar. Amalgams containing 5 and 10 per cent. of magnesium were thus prepared; the latter were thickly fluid when first prepared, but set to a hard crystalline mass when cold.

Action of Magnesium Amalgam on Ethyl Alcohol.—Magnesium amalgam is without apparent action, in the cold, upon absolute ethyl alcohol, but readily reacts with alcohol containing a trace of water. It affords, therefore, a convenient means for the preparation and preservation of alcohol in an absolutely anhydrous condition.

Action of Magnesium Amalgam on Nitrobenzene.—By reducing a strong solution of nitrobenzene in ethyl alcohol with excess of 10 per cent. magnesium amalgam, starting the reaction with heat, and moderating it subsequently by cooling, finally continuing the process just below the boiling point of alcohol, a yield of 95·66 per cent. of the theoretical amount of azobenzene was obtained. —J. O. B.

Primula Camphor. H. Brunner. Schweiz Woch. Chem. Pharm., 1904, **42**, 305. Pharm. Centralh., 1904, **45**, 688.

By distilling 300 kilos. of the roots of *Primula veris* (equivalent to about 20,000 plants), and extracting the distillate with ether, 170 grms. of crude primula camphor were obtained. When freshly distilled it forms a colourless liquid, becoming yellow on exposure to the air; sp. gr. 1·2155; b. pt. 255° C. It was identified as the methyl ester of *m* methoxysalicylic acid, $C_6H_3.(1)COOCH_3(2)OH.(5)OCH_3$.—J. O. B.

Quinine Salts: Neutral Hydrochloride of Quinine. H. Carette. J. Pharm. Chim., 1904, **20**, 347—355.

"NEUTRAL" quinine hydrochloride [*Quininæ Hydrochloricum Acidum* P.B.] is obtained by dissolving one mol. of quinia in two mols. of hydrochloric acid in dilute aqueous solution, concentrating, and slowly cooling. The salt $C_{20}H_{24}N_2O_2.2HCl + 2\frac{1}{2}H_2O$ crystallises in radiating and nodular groups. It is hygroscopic, but only liquefies in a very moist atmosphere. It parts with a small amount of its water of crystallisation at 20° C. in dry air, and with the whole at 102° C., acquiring a yellowish tint, which disappears on cooling. It loses no hydrochloric acid during this drying. It begins to melt at 80° C., and remains partially melted at 215° C., when it begins to decompose. When the salt is crystallised from solutions containing ethyl alcohol, bulkier crystals than the above are obtained, which have the formula $C_{20}H_{24}N_2O_2.2HCl + 1\frac{1}{2}C_2H_6O$. In 95 per cent. alcohol, a supersaturated solution is formed from which large crystals are obtainable by sowing, or by rapid evaporation *in vacuo*. These crystals are stable when kept in a sealed tube. They part with the whole of the alcohol at 100° C. and with almost all at normal temperatures *in vacuo*. The same salt is obtained from solutions in absolute alcohol, and from 55 per cent. and 30 per cent. alcohol. The weaker alcohol more readily forms supersaturated solutions. The crystals obtained therefrom by sowing are very large, but do not keep so well in the sealed tube as those obtained from 95 per cent. alcohol, becoming dull and gradually opaque, and forming a fluid which is at first colourless, ultimately acquiring a reddish tint on exposure to light. Exposed to the air, they lose all the alcohol of crystallisation, absorbing water and being converted into the salt containing $2\frac{1}{2}$ mols. of water. When heated in the dark to constant weight at 35°—50° C. a perfectly white, stable salt is obtained, which has the formula $C_{20}H_{24}N_2O_2.2HCl + \frac{1}{2}H_2O$: the whole of the 1½ mols. of alcohol are given off, and ½ mol. of water is combined. This salt is much less hygroscopic than the anhydrous hydrochloride obtained by heating the salt containing alcohol to 102° C. No appreciable loss of hydrochloric acid occurs when the salt $C_{20}H_{24}N_2O_2.2HCl + 1\frac{1}{2}C_2H_6O$ is heated to 35° C., but at higher temperature this loss becomes considerable. The salt has no definite melting point.

Anhydrous "Neutral" Quinine Hydrochloride.—The anhydrous salt, obtained by drying either of the above to 102° C. or *in vacuo*, rapidly re-absorbs 2½ mols. of water on exposure to the air. If the atmosphere be very moist, it combines with another ½ mol., forming the salt $C_{20}H_{24}N_2O_2.2HCl + 3H_2O$. It completely liquefies in an atmosphere saturated with moisture. It becomes yellow when heated to 165°—170° C., and melts to a brownish fluid at 180°—185° C. Its aqueous solutions are strongly lævo-rotatory; the $[\alpha]_D = -233°$.—J. O. B.

Aconitine. H. Schulze. Apoth.-Zeit., 1904, **19**, 782—783. Chem. Centr., 1904, **2**, 1238—1239.

The empirical formula of aconitine has been given as $C_{33}H_{45}O_{12}N$ by Dunstan (this J., 1891, 477; 1892, 366) and as $C_{34}H_{47}O_{11}N$ by Freund and Beck (this J., 1894, 539, 540). In the author's experiments several specimens of pure aconitine (m. pt. 197°—198° C.), prepared by recrystallising the pure commercial alkaloid from methyl alcohol, were analysed. The results obtained agree equally well with the formula of Freund and Beck, or with one differing from it by two atoms of hydrogen, *viz.*, $C_{34}H_{45}O_{11}N$, but differ materially from the figures corresponding to Dunstan's formula. Aconitine hydrobromide, $C_{34}H_{47}O_{11}N.HBr$, or $C_{34}H_{45}O_{11}N.HBr$, separates from water in crystals containing 2½ mols. of water, slowly expelled on heating to 115°—120° C. From a mixture of alcohol and ether, the compound crystallises with ½ mol. of water, which is expelled at 110° C. The anhydrous salt and the compound with ½ mol. of water melt at 206°—207° C., and the compound with 2½ mols. of water at 160°—200° C. Aconine hydrochloride, $C_{25}H_{41}O_9N.HCl$, or $C_{25}H_{39}O_9N.HCl$, was prepared by heating aconitine with 20 times its weight of water in an autoclave under 6—7 atmospheres pressure, and treating the product according to Dunstan and Passmore's method (this J., 1892, 366). It forms crystals containing 2 mols. of water, m. pt. 175°—176° C. The salt loses its water of crystallisation only incompletely at 120° C., but rapidly becomes anhydrous at 100° C. *in vacuo.*—A. S.

Ledum Palustre; The Stearoptene of the Essential Oil of ——. Lomedse. Chem.-Zeit. Rep., 1903, 284; Pharm. Centralh., 1904, **45**, 590.

Distillation with live steam of the inflorescences and young shoots of *Ledum palustre* afforded 1·5 per cent. of essential oil in 1901 and 0·5 per cent. with the 1902 crop. The oil was a viscous fluid which deposited crystals on standing. The stearoptene was found to be only partially separable by cooling the alcoholic solution of the oil; it was therefore obtained, as a residue, by distillation *in vacuo* under 20 mm. pressure at 80° C. Recrystallised from alcohol, this residue furnished long, colourless, acicular crystals, m. pt. 104° C.; b. pt. 281° C. in an atmosphere of carbonic anhydride at 770 mm. pressure. It had the formula $C_{15}H_{26}O$.—J. O. B.

Otto of Rose. W. H. Simmons. Chem. and Druggist, 1904, **65**, 703.

The author has applied the iodine absorption method (see this J., 1904, 686) to several samples of this season's otto of rose, and finds that the results confirm the value of this test in judging of the purity of the oils. Of the samples examined, those which, according to their other constants as well as their odour, appeared to be genuine, gave iodine values well within the limits proposed (187—194), whilst those which, according to their other characters, might be regarded as suspicious or adulterated, gave values ranging from 199 to 210. The determination of the refractive index has been proposed by Parry and others as a means of detecting adulteration of otto of rose. The author determined this constant for 36 samples, 23 of which wer genuine, whilst the remaining 13 were of doubtful qualit The satisfactory samples gave an average refractive inde of 1·4626, a maximum of 1·4654, and a minimum of 1·4592 whilst the doubtful specimens gave values ranging fro 1·4615 to 1·4770. It appears from these results that th determination of the refractive index is of little value, a the generally accepted limits, 1·4600 to 1·4650 or 1·4670 would cover many adulterated samples, whilst where th refractive index was beyond the limit, the other character of the oil would also be abnormal.—A. S.

Orchella Lichens; Some Substances present in ——. Ronceray. Bull. Soc. Chim., 1904, **31**, 1097—1103.

The lichens *Rocella Montagnei* and *Dendrographa leucophæa* were found to contain erythrin, and *Rocella Tinctori* lecanoric acid as the chromogen. Orcinol in a free stat was detected in all the above varieties. New methods ar given for the preparation of pure lecanoric acid and erythri from the respective lichens; the melting points were found to be: lecanoric acid, 201° C.; erythrin, 164° C.—T. F. B.

Siberian Fir; Essential Oil of ——. J. Schindelmeiser. Apoth.-Zeit., 1904, **19**, 815—816.

Characters of Pure Oil of Siberian Fir.—Sp. gr. no under 0·918 at 17° C.; $\alpha_D - 39° 40'$ at 17° C.; esters a bornyl acetate not under 35 per cent.

Characters of Commercial Specimens of Siberian Fir Oil —Sp. gr. at 17° C., 0·911—0·915; $\alpha_D - 29° 18'$ to $-34° 30'$ a 17° C.; esters as bornyl acetate in the fractions boiling abov 190° C., 19·5 to 30 per cent. From the fraction containing the *l*-pinene and *l*-camphene, and having an optical rotatio of $\alpha_D = -24° 13'$ to $-26° 15'$ at 17° C., it is possible t isolate a small amount of a hydrocarbon boiling at 174°—180° C., and having $\alpha_D = -18° 28'$ at 17° C.; this fraction probably contains inactive dipentene. The commercial oils are probably adulterated with the cheaper pine-needle oil or with turpentine oil. Since the value of Siberian fir oil depends on its high percentage of lævo-bornyl acetate, which renders it valuable for the synthetic preparation of camphor, these figures are significant.—J. O. B.

Copaiba Balsam; Surinam ——. L. van Italie and C. H. Nieuwland. Pharm. Weekblad, 1904, [40]; Apoth.-Zeit., 1904, **19**, 816.

From the examination of seven commercial samples of Surinam copaiba balsam, it was found that two varieties occur, one thick like Maracaibo copaiba balsam, the other thin like Para balsam. The colour ranges from light yellow to brown; some specimens have a feeble fluorescence. The specific gravity ranges from 0·9096 to 0·9611; acid value from 14·65 to 59·19; ester value from 9·7 to 18·21; percentage of essential oil, from 41·0 to 71·6. Surinam copaiba balsam is not soluble in 5 volumes of absolute alcohol, nor in 20 volumes of 90 per cent. alcohol. It gives a slightly turbid solution with carbon bisulphide. Towards other solvents it behaves like South American balsams. On shaking with one-third of its volume of 10 per cent. ammonia solution it forms an emulsion from which oily drops separate out on standing. When agitated with chloral hydrate solution, the essential oil separates on standing, but the lower solution of resin has no characteristic colour such as is the case with gurjun balsam.

Characteristic Reaction for Surinam Copaiba Balsam.—A mixture of equal volumes of Surinam copaiba balsam and acetic anhydride gives a fine blue colour with a trace of sulphuric acid. Maracaibo balsam does not give this reaction.

Essential Oil of Surinam Copaiba Balsam.—The essential oil contains a sesquiterpene alcohol, $C_{15}H_{25}OH$, forming colourless and odourless crystals, m. pt. 113·5°—115° C., which begin to sublime at 80° C.; also two sesquiterpenes, one lævo-, the other dextro-rotatory, and a small quantity of cadinene.—J. O. B.

Active Oxygen in Organic Persulphates; Quantitative Determination of ——. A. Wolff and R. Wolffenstein. XXIII., page 1046.

Dinitro-aminophenol (Picramic Acid); New Method of Preparation of —— [and Determination of Potassium]. A. Frébault and J. Aloy. XXIII., page 1046.

Arsenic in "Reduced Iron"; Determination of ——. C. A. Hill and J. C. Umney. XXIII., page 1046.

English Patents.

ron and Arsenic; Process of Manufacturing Soluble Compounds containing ——. A. G. Brookes, London. From Chem. Werke Hansa, G. m. b. H., Hemelingen, Germany. Eng. Pat. 21,382, Oct. 5, 1903.

EE Fr. Pat. 336,127 of 1903; this J., 1904, 383. The ompounds may also be prepared by heating spathic iron re, or other natural ferrous carbonate, with glycerino-rsenic acid (arsenic acid dissolved in glycerin) out of ontact with air, until evolution of gas ceases. The solution filtered, and the filtrate evaporated under reduced presure, a feeble current of carbon dioxide being passed rough it.—T. F. B.

rotocatechuic Aldehyde; Manufacture of ——. A. J. Boult, London. From F. Fritzsche & Co., Hamburg. Eng. Pat. 15,784, July 15, 1904.

ROTOCATECHUIC aldehyde is prepared by heating heliopin with acid and water without exceeding a pressure of 2 atmospheres, or a temperature of 130° C. The reaction facilitated by using certain acid salts, especially sodium isulphite, in place of the acid. The reaction can also take lace in the presence of a solvent for heliotropin, such as a ydrocarbon or alcohol. (Compare Fr. Pat. 326,775 of 902; this J., 1903, 819.)—F. S.

yrocatechol Derivatives; Manufacture of ——. O. Imray, London. From Farbwerke vorm. Meister, Lucius und Brüning, Hoechst-on-the-Maine, Germany. Eng. Pat. 26,480, Dec. 3, 1903.

ERIVATIVES of pyrocatechol, such as methylaminoacetorocatechol, $CH_3.NH.CH_2.CO.C_6H_3(OH)_2$, can be proiced by the interaction of a halogen-acetopyrocatechol d ammonia or a primary aliphatic amine. These keto rivatives can, if required, be reduced to the corresponding cohol bases.—F. S.

French Patent.

lcohols, Ethers, Acetic Acid, &c.; Process for making ——. Cie. Urbaine d'Eclairage par le Gaz Acétylène. Fr. Pat. 338,965, Aug. 3, 1903.

IE claims are for a continuous process for making ethyle, and converting it into ethyl hydrogen sulphate, which used as a starting point for making alcohol, ether, acetic id, &c. A suitable oxide, such as glucinum, lithium, or anganese oxide, is mixed with 50—60 per cent. of lime or ryta, and with coke, anthracite, pitch, or other suitable rbonaceous material, and the whole heated to form a rbide; this is decomposed with water in an ordinary etylene generator, and the ethylene formed, is absorbed by lphuric acid in an apparatus to which one of the claims lates.—T. F. B.

ethyl Groups of Aromatic Hydrocarbons; Oxidation of the ——. Badische Anilin und Soda Fabrik. Fr. Pat. 338,990, Aug. 17, 1903.

E Eng. Pat. 17,982 of 1903; this J., 1904, 910.—T. F. B.

rbituric Acid; Process for Transforming Iminobarbituric Acids into ——. Maison E. Merck. Fr. Pat. 343,673, June 3, 1904. Under Internat. Conv., July 11, 1903.

INOBARBITURIC acids are converted into barbituric acids heating with mineral acids. For example, iminodiethylbituric acid is boiled for some minutes with a solution of hydrochloric acid (1 : 3); diethylbarbituric acid results. The iminobarbituric acids result from the condensation of cyanoacetic esters with urea in presence of alkali alcoholates. —T. F. B.

Dialkylbarbituric Acids; Process for Preparing ——. Farbenfabr. vorm. F. Bayer & Co. Fr. Pat. 343,834, June 9, 1904. Under Internat. Conv., Sept. 25, 1903.

See Eng. Pat. 21,833 of 1903; this J., 1904, 76.—T. F. B.

Cream of Tartar; Extraction of White Refined —— from Marcs, before and after Distillation. G. Chiapetti. Addition to Fr. Pat. 330,951 of April 6, 1903. XVII., page 1039.

XXI.—PHOTOGRAPHIC MATERIALS AND PROCESSES.

Mercuric Iodide; Two Emulsifiable Double Compounds of ——. Lüppo-Cramer. Eder's Jahrbuch, 1904, **18**, 12. Chem.-Zeit., 1904, **28**, Rep. 295.

When glass plates, coated with a gelatin emulsion containing gum arabic, copper sulphate, potassium iodide and potassium metasulphite, are immersed in a 0·4 per cent. solution of mercuric chloride, the emulsion passes from red and orange to a yellow colour; by exposing such a plate under a negative for two minutes in diffused daylight, a black image on a red ground is produced, which changes, on fixation, to a brownish-black image on a yellowish-grey ground. The same emulsified double salt is obtained by mixing emulsified copper iodide with emulsified mercuric iodide. The compound has the composition CuI, HgI_2, and is a red substance, turning dark brown on heating, and becoming red again on cooling.—T. F. B.

Silver Oxide and Ammoniacal Mercury Compounds; Sensitiveness —— of to Light. Lüppo-Cramer. Eder's Jahrbuch, 1904, **18**, 10. Chem-Zeit., 1904, **28**, Rep. 296.

A silver oxide emulsion was prepared by emulsifying the precipitate obtained by adding the calculated quantity of ammonia to a cold solution of silver nitrate and gum arabic: the emulsion blackens on gentle warming, owing to reduction. An acid solution of metol blackens it strongly, whether it has been exposed to light or not. No practical application appears possible owing to the rapid reduction of the silver oxide by the gelatin. An emulsion prepared from ammonio-mercuric oxide was found to be very slightly sensitive to light; it also darkens slowly on exposure. The compound $Hg_2(NH_2)OI$, obtained by digesting mercuric iodide with ammonia, could not be obtained pure in the form of emulsion in gum arabic solution; the yellow emulsion obtained by adding ammonia to emulsified mercuric iodide is slightly sensitive to light, and gives, after 10 minutes' exposure under a negative, an image which can be developed with metol and sodium carbonate.—T. F. B.

Silver Bromide; Studies on Unemulsified ——. K. Schaum. Eder's Jahrbuch, 1904, **18**, 74. Chem.-Zeit., 1904, **28**, Rep. 295—296.

The action of light on layers of silver bromide, obtained by precipitating concentrated silver solutions with a soluble bromide, gives an image which can easily be developed. Most developers produce the image very quickly: good gradation and freedom from fog result from the use of dilute developers. An image which can be developed also results from the action of light on a plate coated with grains of silver bromide separated by an organic medium (*e.g.* gelatin). The sensitiveness to light of unemulsified silver bromide appears to depend on the nature of the soluble bromide used; unemulsified silver bromide can also be "ripened" in the usual manner, and also exhibits "solarisation," showing that this is due, in ordinary emulsions, to an actual change in the silver bromide. Solarisation is completely prevented by immersion for 22 hours in a 5 per cent. solution of ammonium persulphate. Unemulsified silver bromide is also sensitive to Röntgen rays, and exhibits solarisation under their influence after 80 minutes' exposure. —T. F. B.

Development for the Production of Images of Fine Grain; Process of ——. A. and L. Lumière and A. Seyewetz. Brit. J. Phot., 1904, **51**, 866—867.

Two conditions are found to be necessary for producing images of fine grain, viz., slow development (effected either by dilution of the developer or by addition of "restrainers") and the presence of some solvent of silver bromide in the developer: the addition of ammonium chloride (15—20 grms.) to the developer (100 cc.) is found to fulfil both these conditions. In this process, the dissolved silver bromide is reduced by the developer, and the silver is deposited on the image, thus causing physical as well as chemical development. Two developers—viz., *p*-phenylenediamine and *o*-aminophenol—do not require the addition of a substance such as ammonium chloride, since they themselves have a slight solvent action on silver bromide. A suitable developer may be made by dissolving one grm. of *p*-phenylenediamine and six grms. of anhydrous sodium sulphite in 100 cc. of water; this is especially suited for obtaining negatives intended for enlarging, since it gives images of fine grain and normal intensity, and free from fog, on "rapid" plates. With slow emulsions the deposits obtained are of a fine brownish-violet colour especially adapted to transparency work.—T. F. B.

Silver Grain in Photography; Influence of Concentration of the Developer, and Time of Development, on the Size and Character of the ——. R. J. Wallace. Astrophys. J.; through Brit. J. Phot., 1904, **51**, 865—866.

THREE equally exposed plates were treated with developers of varying concentration, and squares of equal opacity from each negative were examined microscopically. That developed slowly, with dilute "rodinal," exhibited an irregular appearance, the grains having grouped together and giving a "coarse" result. By more rapid development with quinol, the irregularity was quite apparent, but less marked than in the previous case. The most uniform result was obtained by rapid development with a mixture of quinol, "metol" and "adurol": the grains of silver in this case only exhibited very little grouping. The actual size of the particles was also found to be considerably increased by prolonged development. Similar experiments were carried out on unexposed plates, with the result that the grains of reduced silver became larger and more numerous as the development was continued. Lumière and Seyewetz obtained results in contradiction of the above (see this J., 1904, 799), but the chief reason is considered to be that they examined the actual particles of silver, abstracted from the emulsion, and not the groups of particles as present in the developed negative.—T. F. B.

ENGLISH PATENTS.

Silver Emulsions for use in Photography; Process for the Production of ——. J. Gaedicke, Berlin. Eng. Pat. 18,183, Aug. 22, 1904.

HIGHLY sensitive emulsions of very fine grain, and of which the sensitiveness does not diminish on keeping, are produced in the following manner: an unripened gelatin emulsion is well washed, and mixed with about 20 times its weight of water; it is then heated to 40° C. with, for each litre, 1—5 c.c. of ammonia, or other substance having a maturing effect. The heating is continued for one to four hours, according to the degree of sensitiveness desired, and the ammonia in the emulsion is neutralised by addition of the calculated quantity of acid (sulphuric and citric acids are suitable), when the emulsion is ready for use.—T. F. B.

Photographic Paper and the like; Method of Production of ——. P. von Gerainow-Trauttenberg and M. L. Fabian, Brünn, Austria. Eng. Pat. 18,890, Sept. 1, 1904.

ACCORDING to this invention, paper is sensitised by a suitable substance, without employing any emulsion. "Direct copying" paper is prepared by immersing paper in a 5—10 per cent. solution of silver nitrate, drying, and toughening in a solution of oxalic acid 25 grms., citric acid 5—50 grms. (according to the desired hardness) in water, 1 litre. "Contact" paper is produced by treating paper first in a 2·5—5 per cent. solution of silver nitrate, and then in a 2—10 per cent. solution of oxalic acid. Negative paper is prepared in the same way as "contact" paper, except that it is further saturated with castor oil, &c., to render it translucent.—T. F. B.

FRENCH PATENTS.

Casein Emulsion [for Photography]. Soc. Protalbin-Werke Aktienges. Fr. Pat. 343,263, May 18, 1904.

CASEIN (50 kilos.) is agitated with N/1 sodium carbonate solution (500 litres), to a homogeneous mixture, which is filtered, then treated with concentrated acetic acid and allowed to stand several hours. The solid is separated, washed with cold water till nearly neutral, and allowed to stand under water some days, until a test sample is found to be soluble in dilute alcoholic solution of citric acid, when it is placed in a centrifugal machine and dried. This prepared casein is soluble in alkalis, alcoholic solution of acids and hydrated acids, and when mixed with the sensitising salts forms an emulsion without precipitation. Alum or formaldehyde may be added to increase the strength; soap, glycerin, or castor oil to add suppleness, and gelatin or colouring matters if desired.—R. L. J.

Manganic Salts; Process for Preparing Stable Solutions of —— [for Photographic Purposes]. O. Gros. Fr. Pat. 343,547, May 30, 1904. Under Internat. Conv., Aug. 22, 1903.

THE higher oxides of manganese, or compounds which, during the reaction, give rise to these, are treated with polyvalent organic acids, which also contain hydroxyl groups (*e.g.*, tartaric acid), or their salts. The solutions thus obtained are rendered quite stable by making them alkaline. For example, excess of tartaric acid is added to a solution of potassium permanganate, and the resulting solution is rendered just alkaline with sodium hydroxide; or the maximum quantity of the precipitate obtained by adding potassium permanganate solution to a solution of manganous sulphate, is dissolved in a saturated solution of sodium tartrate. Such solutions are especially applicable as oxidising agents in preparing photographs by the "catatype" process (see this J., 1903, 380, 963, and 1015). —T. F. B.

Silver [Photographic] Pictures; Process for converting —— into more Stable Catalytic Pictures. O. Gros. Fr. Pat. 343,583, May 31, 1904. Under Internat. Conv., Aug. 22, 1903.

SINCE "silver prints," when used for the "catatype" process, are rendered more or less useless for the purpose after a time, owing to the action of the hydrogen peroxide, particularly in presence of traces of acid, it is desirable to use some more stable form of print. It is found that silver prints can be rendered stable for this process by treating them with a solution of a manganic salt (see preceding abstract) to which potassium ferricyanide has been added; the prints are finished by immersion in an alkaline solution of potassium ferricyanide and washing. If these prints should lose their catalytic properties after a time, they can easily be "regenerated" by subjecting them to the action of ammonia.—T. F. B.

XXII.—EXPLOSIVES, MATCHES, Etc.

Explosives in Coal Mines Order. A. Akers-Douglas, one of H.M. Principal Secretaries of State, Sept. 6, 1904.

THE following have been added to the list of "Permitted Explosives":—

Colliery Cheddite.—Potassium chlorate (76·5—79·5 parts), mononitronaphthalene (14·5—15·5 parts), dinitrotoluene (1·5—2·5 parts), castor oil (4·5—5·5 parts), and moisture (0—1 part).

Nobel Ammonia Powder No. 1.—Ammonium nitrate (82—86 parts), nitroglycerin (7—9 parts), wood meal (6—8 parts), and moisture (0·5—2 parts).

Nobel Ammonia Powder No. 2.—Ammonium nitrate (78—82 parts), nitroglycerin (9—11 parts), wood meal (8—10 parts), and moisture (0·5—2·5 parts).

Phœnix Powder.—Nitroglycerin (28—31 parts), nitrocotton (0—1 part), potassium nitrate (30—34 parts), wood meal (33—37 parts), and moisture (2—6 parts).

Ammonal B.— Ammonium nitrate (94—96 parts), metallic aluminium (2·5—3·5 parts), charcoal (2—3 parts), and moisture (0—1 part).

Celtite. — Nitroglycerin (56 — 59 parts), nitrocotton (2·0—3·5 parts), potassium nitrate (17—21 parts), wood meal (8—9 parts), ammonium oxalate (11—13 parts), and moisture (0·5—1·5 parts).—G. W. McD.

English Patent.

Explosives [*Perchlorate*]. M. E. A. C. Yonck, Namur, Belgium. Eng. Pat. 24,511, Nov. 11, 1903.

The explosives have the following composition :—

——	1.	2.	3.	4.	5.
Ammonium perchlorate	51·2	37·4	47·7	53·24	48·4
Sodium nitrate	37·3	27·17	..	..	..
Ammonium nitrate	..	8·34	..	..	..
Naphthalene.....................	11·5	..	..	..	..
Trinitronaphthalene	..	27·09	..	14·46	..
Sodium oxalate	..	..	27·3	..	..
Ammonium picrate	..	..	25·0	..	..
Ammonium oxalate	..	..	..	32·3	..
Calcium oxalate................	..	..	..	..	33·8
Trinitrotoluene	..	..	..	..	17·8

Neither free chlorine nor hydrochloric acid are produced upon explosion, and these explosives can be safely used in fiery mines.—G. W. McD.

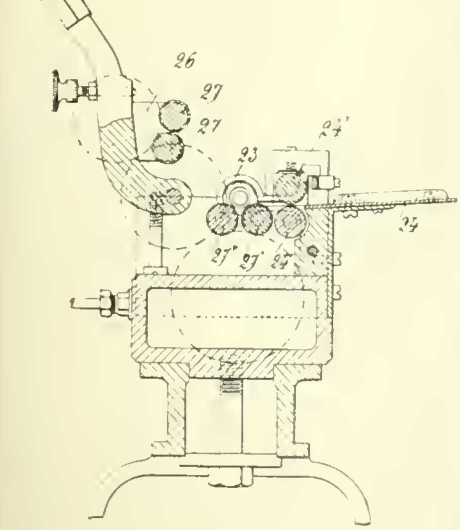
French Patents.

Nitroglycerin ; Process for Preparing ——. R. Möller. Fr. Pat. 343,760, June 6, 1904.

See Eng. Pat. 13,562 of 1904 ; this J., 1904, 882.—T. F. B.

Powder ; Automatic Machine to roll Charges of ——. Soc. de la Poudre Peigne et des Brevets. J. Luciani. Fr. Pat. 343,242, May 17, 1904.

By means of a system of six rollers geared together, sheets of powder are first rolled into cylinders of fairly large diameter. The distance between the rollers is then gradually reduced to produce cylinders of the desired diameter tightly compressed. The powder sheet passes through the guides (24) to the drawing rollers (24′), which carry it round the forming rings (23), thus producing the loose cylinder of large diameter. By bringing the rollers (27 and 27′) together by means of the handle, the compressed cylinder is produced. The rollers are recessed at a point opposite the forming rings.—G. W. McD.



XXIII.—ANALYTICAL CHEMISTRY.

APPARATUS, ETC.

Condenser and Distilling Column for Distillation in Vacuo, or under Normal Pressure ; New ——. H. Vigreux. Bull Soc. Chim., 1904, **31**, 1116—1119.

The inner tube of the condensers, which is about 22 mm. in diameter, is indented at a number of places, these indentations forming points in the interior of the tube (see Fig. 1) ; as these points are hollow, thus allowing water to fill them, very efficient condensation is obtained. The rectifying column is made on the same principle; the points are

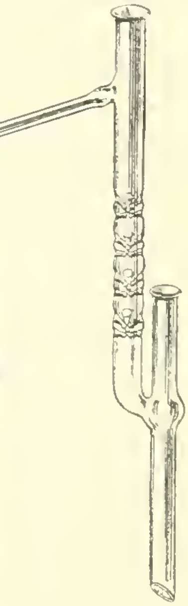


Fig. 3.

Fig. 1.

Fig. 2.

disposed in a number of horizontal planes round the interior of the tube, the sets of points being alternately horizontal and inclined downwards, thus forming a number of plates and inverted cones; as the drops of liquid fall from the cones, they are caught on the horizontal points before falling back into the liquid; the series of horizontal points thus play the same part as the platinum cones in the Le Bel columns (see Fig. 2). For distillation *in vacuo*, the column takes the form shown in Fig. 3, the projections not being so numerous as in the other forms. The side tube serves to hold a capillary tube for admitting air to the flask when necessary.—T. F. B.

INORGANIC—QUANTITATIVE.

Potassium as Picramate; Determination of ——; also Dinitro-aminophenol (Picramic Acid): New Method of Preparation. A Frébault and J. Aloy. J. Pharm. Chim., 1904, **20**, 245–247.

Preparation.—Zinc dust and solution of ammonia are added to a warm solution of picric acid in water or methyl alcohol, so as to obtain a distinct alkaline reaction. The mixture is boiled for an hour, with occasional addition of more ammonia. The boiling solution is filtered, excess of ammonia driven off by evaporation on the water-bath, and a slight excess of acetic acid added. Evaporation is then carried to dryness, the residue is redissolved in boiling water, filtered, and crystallised. Fine red crystals of picramic acid, m. pt. 165° C., are thus obtained.

Unrecorded Properties.—Picramic acid burns, but does not detonate, when suddenly heated. It does not precipitate albumin, albumoses, peptone, or alkaloids. Its alkali salts give solutions having a deep red colour, which becomes yellowish-green in the presence of acids. They are therefore available as indicators in alkalimetry.

Rapid Determination of Potassium as Picramate.—Potassium may be precipitated as picrate, converted into picramate, and its amount approximately determined colorimetrically as follows:—A few c.c. of the dilute solution containing potassium salts are treated with an equal volume of alcohol and precipitated with excess of sodium picrate. The potassium picrate is collected, washed with strong alcohol, dissolved in boiling water and converted into picramate by means of dextrose and ammonium carbonate. The colour is then matched with a standard solution of potassium picramate of known strength.
—J. O. B.

Selenium and Tellurium; Use of Phosphorous Acid in the Quantitative Determination of ——. A. Gutbier. Z. anorg. Chem., 1904, **41**, 448—451.

Compounds in which selenium and tellurium occur in the hexavalent condition, *e.g.*, selenic and telluric acids, are attacked with difficulty by phosphorous acid, and are not completely reduced. In the case of selenious and tellurous acids, however, reduction is effected rapidly and quantitatively by means of phosphorous acid. The best results are obtained by using a hydrochloric acid solution, and boiling after the addition of the phosphorous acid. In neutral and alkaline solutions, the reduced metal remains dissolved in the colloidal condition but a precipitate is produced on acidifying with hydrochloric acid.—A. S.

Active Oxygen in Organic Persulphates; Quantitative Determination of ——. A. Wolff and R. Wolffenstein. Ber., 1904, **37**, 3213—3214.

The organic persulphate is treated in an Erlenmeyer flask furnished with a Bunsen valve, with hydrochloric acid and a cold saturated solution of sulphurous acid, which has been previously treated with barium chloride solution, and filtered The reaction proceeds according to the equation:—$H_2S_2O_8 + SO_2 + 2H_2O = 3H_2SO_4$. The flask is heated till the excess of sulphur dioxide is expelled, the contents are then cooled and filtered, and the barium sulphate washed, dried, and weighed. Accurate results were obtained in test determinations with quinoline, quinaldine, acridine, and quinine persulphates.—A. S.

Chromium and Iron [in Ores and Alloys]; Volumetric Determination of ——. R. Glasmann. Z. anal. Chem., 1904, **43**, 506—508.

The solution containing a mixture of ferric and chromic salts (but not more than 0·05 grm. of chromic oxide on account of its colour) is treated in a flask, provided with a Bunsen's valve, with sulphurous acid, which reduces the ferric salt, leaving the chromic salt unaltered. The excess of sulphur dioxide is expelled by boiling, accompanied by the passage of a current of carbon dioxide, and the ferrous solution after cooling is titrated with permanganate. The oxidised solution is again reduced by heating with sulphuric acid and zinc according to Zimmermann's method, until it assumes an azure-blue colour. The ferrous and chromous salts are then again titrated with permanganate, the percentage of chromium being calculated from the difference between the two titrations.—J. F. B.

Fluorine in Wine and Beers; Determination of ——. F. P. Treadwell and A. A. Koch. Z. anal. Chem., 1904, **43**, 469—506.

The quantitative determination of fluorine, even in pure solution, in quantities of 5 mgrms. and less, is accompanied by serious errors; for larger quantities, a correction of 1·5 mgrms. of calcium fluoride may be added for every 100 c.c. of solution and washings to compensate for solubility. By Brand's qualitative etching test, a quantity of 0·5 mgrm. of fluorine in 100 c.c. of wine or beer can be detected with certainty.

Determination of Fluorine in Wine.—The authors advocate the following modification of Rose's method:—100 c.c. of wine are introduced into a 250 c.c. flask and made slightly alkaline with pure 2N-caustic soda solution; silver nitrate is added so long as a precipitate is formed and the liquid is shaken, made up to the mark and filtered. The first 5–10 c.c. of the filtrate having been discarded, 200 c.c. are measured into a 250 c.c. flask, sufficient sodium chloride is added, and the solution is diluted to 250 c.c. It is allowed to remain for 12—24 hours, the clear liquid is decanted off, filtered if necessary, and 175 c.c. (equal to 56 c.c. of wine) of the clear solution are boiled with 2—4 c.c. of 2N-sodium carbonate solution and precipitated with a large excess of calcium chloride, ebullition being subsequently continued for 5 minutes. The precipitate is filtered off, washed with hot water and dried. It is then incinerated and ignited at a dull-red heat for 10—20 minutes. The calcium salts are treated in the crucible with 2—4 c.c. of 1·5 N-acetic acid, and subsequently digested on the water-bath for 40 minutes. The liquid is then evaporated to dryness, the residue is moistened with two drops of acetic acid, extracted with water, and washed by decantation through a small filter After drying, the precipitate is returned to the crucible, the ash of the filter is added and the fluoride ignited for a few minutes. The extraction with acetic acid and subsequent operations are repeated until the further decrease in the weight of the calcium fluoride does not exceed 0·5 mgrm.

Determination of Fluorine in Beer.—The above method is not applicable in the case of beer, and the authors knew of no more exact method than is afforded by a modification of Penfield's process, which, however, only yields about 94 per cent. of the total fluorine present. 100 c.c. of beer are made alkaline with caustic potash, 2 c.c. of 2N-sodium carbonate are added, and the solution is precipitated with excess of calcium chloride at the boiling temperature. This precipitate always retains organic matter and must be ignited, and it is during this process that a large and somewhat variable loss of fluorine is liable to occur. The grey, calcined mass is mixed with 1·5 grm. of calcined quartz in an agate mortar, and is introduced together with 1·5 grm. of sea-sand into the Penfield apparatus, and there decomposed by sulphuric acid.—J. F. B.

Arsenic in "Reduced Iron"; Determination of ——. C. A. Hill and J. C. Umney. Pharm. J., 1904, **73**, 500—501.

Both the tests recommended by Dunstan (see this J., 1904, 899) and the German Pharmacopœia method are considered

quite accurate for determining arsenic in "reduced iron." The test of the U.S. Pharmacopœia is stated to be inaccurate, as the addition of the iron to hydrochloric acid in the absence of an oxidising agent causes evolution of hydrogen arsenide. The following test is recommended as the best to use: 0·1 grm. of potassium chlorate, and 1 c.c. of hydrochloric acid are added to 0·1 grm. of the reduced iron, and the mixture is warmed until the evolution of gas has ceased; 11 c.c. of hydrochloric acid, 7 c.c. of water, 2 grms. of potassium metasulphite, and 4 grms. of ferrous sulphate are now added and the mixture is heated on a water bath, under reflux condenser, for an hour, after which it is distilled; bromine is added to the first 17 c.c. of the distillate until a distinct coloration remains, and then the solution is decolorised with a solution of hydroxylamine hydrochloride. The arsenic, which is now present in the solution as arsenious acid, can be determined by any standard method. As to the limit of arsenic which should be allowed in "reduced iron," the suggestion of Dunstan (60 parts per million) is considered impracticable, and the matter is thought to call for further careful consideration.
—T. F. B.

Zinc Salts; Study of Complex ——. F. Kunschert.
XI., page 1032.

Sulphurous Acid in Molasses; Determination of ——. E. Pozzi-Escot. Bull. Assoc. Chim. Sucr. Dist., 1904, **22**, 231.

As the determination of sulphurous acid in molasses by direct oxidation with iodine in the presence of starch paste is not very exact, the author uses the following method which gives more accurate results: 500 c.c. of molasses rendered somewhat fluid with boiling water or 100 c.c. of wort, are introduced into a short-necked flask, a fragment (1 or 2 grms.) of chalk or marble added, and a few c.c. of hydrochloric acid. The flask is then connected to a condenser, and its contents boiled, the evolved sulphurous acid being received in an excess of iodine or bromine. When the distillation is finished, the distillate is heated to 90° C., acidified with hydrochloric acid, and precipitated with barium chloride.—L. J. de W.

ORGANIC—QUALITATIVE.

Indophenine Reaction. F. W. Bauer. Ber., 1904, **37**, 3128–3130.

In a former communication, the author stated that the indophenine reaction is not given by benzene containing thiophen, if chemically pure sulphuric acid be used (this J., 1901, 562) unless oxidising agents, such as ferric chloride or nitric acid be added. Storch (this J., 1901, 730) replied that the effect of the oxidising agents seemed to be entirely due to the heat evolved by them, and that the same effect could be produced by adding water, or by simply warming; whilst Liebermann and Pleus (this J., 1904, 768) deny the author's assertion. The author adheres to his first statements and does not find that warming, or adding water, promotes the reaction.—E. F.

Rosaniline and Pararosaniline; Method of rapidly Distinguishing between ——. R. Lambrecht and H. Weil. Ber. **37**, 1904, 3031.

Commercial rosaniline dissolves completely in 20 volumes of about 30 per cent. hydrochloric acid on warming. On cooling and standing, even for days, no precipitate is formed, whereas pararosaniline is almost completely precipitated under the same conditions in the form of a slightly soluble hydrochloride.—E. F.

ORGANIC—QUANTITATIVE.

Methylene Blue; Volumetric Determination of ——. L. Pelet and V. Garuti. Bull. Soc. Chem., 1904, **31**, 1094—1097.

This method depends on the formation of insoluble lakes by Methylene Blue with certain acid dyestuffs, an aqueous solution of which was run from a burette into an aqueous solution of Methylene Blue, until a drop of the solution, placed on unsized paper, showed that the dyestuff had been completely precipitated. It was necessary to use an acid dyestuff the aqueous solution of which was highly coloured, and which gave an insoluble lake: Ponceau, Carmine, Pyramine Orange, and Cotton Brown were all found to give good results; of these the authors recommend Ponceau as giving the most accurate results, as well as being very simple in use. One mol. of the Ponceau combines with 2 mols. of Methylene Blue. It was also found possible to determine the amount of Ponceau present by titration with a solution of Methylene Blue; in this case it was noticed that no lake formation commenced until one mol. of Methylene Blue had been added to the Ponceau solution.—T. F. B.

Sugar in Molasses and Cane Sugar Factory Products; Determination of Crystallisable and Reducing ——. H. Pellet. Bull. Assoc. Chim. Sucr. et Dist., 1904, **22**, 145—160.

The author states that normal lead acetate is the proper defecant for cane sugar products, but as it exerts only a slight decolorising action, sodium hypochlorite should be used with it to obtain solutions sufficiently decolorised for inversion and polarisation by the Clerget method. The polarisation is higher when basic lead acetate is used, except in some cases where molasses of light gravity (73°—78° apparent Brix) has been kept for some time, and the reducing sugars have become modified, and the sucrose transformed. It is essential to determine the water directly by desiccation in order to find the real purity, from which the apparent purity of molasses may differ by 7 to 13·5 per cent. In the determination of the reducing bodies of products of cane sugar factories, no defecating reagent should be used. In case the quantity of lime present is injurious, it may be precipitated by sodium carbonate, avoiding excess.

XXIV.—SCIENTIFIC & TECHNICAL NOTES.

Carbon Dioxide in Seeds during Germination; Origin of ——. E. Urbain. Comptes rend., 1904 **139**, 606—608.

Connstein, Hoyer, and Wartenberg (this J., 1902, 1541), noticed that when castor seeds were treated with a 1 per cent. solution of chloral hydrate, no hydrolysis of the fats occurred until after some days. That this saponification is not due to atmospheric carbon dioxide, or to that formed by oxidation by atmospheric oxygen, is shown by the fact that it occurs equally well in the absence of air.

The following experiments show that the carbon dioxide is the result of decomposition of the albuminoid matter by the proteolytic enzymes present in castor seeds. Castor oil treated with cytoplasma (prepared from the seeds by the method of Nicloux (this J., 1904, 687) and chloral hydrate solution, *in vacuo*, showed practically no acidity after eight days; whilst, when aleurone (prepared by the same method) was added to the other substances, almost complete saponification of the fatty acids occurred after eight days. It would thus seem that this proteolytic decomposition was the first phase of germination, preceding the lipolytic action. —T. F. B.

India-Rubber; Action of Radium Rays on ——. R. Ditmar. Gummi-Zeit., 1904, **19**, 3—4.

Experiments with a weak radium-barium bromide preparation (10,000 times as strong as uranium pitchblende) showed that the γ-rays pass through both raw and vulcanised rubber, but through the former more readily than through the latter. Rubber which has been made radio-active by induction behaves differently from other solid bodies in a similar condition. In general, the induced radio-activity is dissipated to the extent of one-half in 28 minutes, when the substance is exposed to the air. In the case of rubber, however, the radio-activity persists for from 15—20 days.—J. K. B.

New Books.

Monographs on Applied Electrochemistry. Elektrolytisches Verfahren zur Herstellung parabolischer Spiegel. Von Sherard Cowper-Coles. Ins Deutsche übertragen von Dr. Emil Abel. 1904. Price M. 1.

Pamphlet, 8vo size, containing 17 pages of subject-matter, with 13 illustrations. The leading themes are the following:—

The Process of Cowper-Coles.—Preparation of the Glass Mould. Silvering the Mould. Description of the Electrolytic Bath. Raising the Mirror from the Mould, &c.

Properties of the Metallic Mirror.—Reflective power of Palladium and other Metals. Weight of the Metallic Mirror, its Hardness, and Optical Tests. Improvement of the Surface of the Mirror.

Artificial Graphite. By Francis A. J. Fitz-Gerald. Ins Deutsche übertragen von Dr. Max Huth. Verlag von Wilhelm Knapp, Halle a. S. 1904. Price M. 3.

Pamphlet like the foregoing, and containing 58 pages of subject-matter, one page of bibliographic notes, and an alphabetical index of authors. The text is illustrated with 14 wood-engravings and five tables. I. Historic Survey. II. Methods of Preparation: A. Castner's Anode for Electrolytic Processes. B. Process of Girard and Street. C. Process of Acheson. D. Process of Rudolph and Härden.

Ueber Herkommen und Chemie des Kautschuks. Von Dr. Ed. Marckwald und Dr. Fritz Frank. Steinkopff und Springer, Dresden, A. 21. 1904. Price M. 1.50.

Pamphlet of 8vo size, containing 68 pages of subject-matter.

Smoke Prevention and Fuel Economy. (Based on the German Work of E. Schmatolla.) By Wm. H. Booth and John B. C. Kershaw. A. Constable and Co., Ltd., 16, James Street, Haymarket, London. 1904. Price 6s.

8vo volume, containing 188 pages of subject-matter, with 75 illustrations, and an alphabetical index. The subject is subdivided into and treated under the following heads:—I. The Chemistry of the Combustion Process. II. Present Methods of Burning Fuels, and their defects. III. Improved Methods of Burning Fuel. IV. The Examination of the Waste Gases, and Control of the Combustion Process. The Appendix is a considerable one, and is subdivided into: I. Patent Abstracts, English, German, and U.S.A. II. Fuel Analyses, Losses and Costs. III. Miscellaneous Extracts.

A Scheme for the Detection of the more Common Classes of Carbon Compounds. By Frank E. Weston, B.Sc. Longmans, Green, and Co., 39, Paternoster Row, London; New York and Bombay. 1904. Price 2s.

8vo volume, containing 56 pages of subject-matter and eight illustrations. The methods apply under the following conditions:—I. Carbon and Hydrogen only present. II. Carbon, Hydrogen, and Halogen present. III. Carbon, Hydrogen, Oxygen, and Halogen present. IV. Carbon, Hydrogen, and Oxygen present. V. Carbon, Hydrogen, and Nitrogen present. VI. Carbon, Hydrogen, Nitrogen, and Oxygen present. VII. Carbon, Hydrogen, and Sulphur present. VIII. Carbon, Hydrogen, Sulphur, and Oxygen present. IX. Carbon, Hydrogen, Sulphur, and Nitrogen present. X. Carbon, Hydrogen, Sulphur, Oxygen, and Nitrogen, or Halogen present. XI. Special Reactions. XII. Solubility of Carbon Compounds.

St. Louis Exhibition, 1904. German Educational Exhibition. Chemistry. W. Büxenstein, Berlin. 1904. A. Asher and Co., 13, Bedford Street, Covent Garden, London, W.C. Price 2s.

8vo volume, containing preface and 135 pages of subject-matter, followed by indexes of names and subjects. In this descriptive catalogue the contents or characters of the different rooms are found given as follows:—I. Reading-room. II. Alchemistic Laboratory. III. The Liebig Laboratory. IV. General and Inorganic Chemistry. V. Pyrochemistry. VI. Scales and Balances. VII. Electro-Chemistry. VIII. Organic Chemistry. IX. Dyeing Laboratory. X. Shaking Apparatus and Bomb-tube Experiments. XI. Physiological and Fermentation Chemistry.

Trade Report.

I.—GENERAL.

Australian Imports in 1903.

Pharm. J., Oct. 29, 1904.

Although the Commonwealth official statistics have not been issued, figures have been published which show that Great Britain still retains her lead as principal exporter to Australia. The imports into the Federal States for 1903 run out at 36,551,542*l.*, and the exports at 29,046,206*l.* Adding exports and imports of specie and bullion, the total comes out at 85,981,025*l.*, an increase of nearly one and a half millions over 1902. The figures (which are extracted from *Commercial Intelligence*) for certain articles are as follows:—

——	Great Britain.	France.	Germany.	U.S.A.
	£	£	£	£
Boric, salicylic, and other acids	5,363	14	565	12
Aërated and mineral waters	5,162	28	1,981	407
Alkalis	73,639	28	126	1,969
Alum	626	..	54	..
Ammonium carbonate	2,044	..	10	6
Drugs and chemicals	315,285	86,510	47,321	4,281
Dyes	18,175	7,106	2,078	5,261
Filters	2,341	94	15,000	252
Instruments, scientific	17,628	255	2,415	1,394
Medicines	133,613	562	2,682	51,868
Perfumery	32,263	2,881	3,749	10,363
Photographic goods	31,630	83	855	344
Varnishes	42,051	22	381	4,899

France heads the list for tartaric acid and cream of tartar, but these represent her only success. Germany, on the other hand, leads with several commodities, the only one of chemical interest being calcium carbide.

NATAL; TRADE OF —— WITH THE UNITED KINGDOM.

Bd. of Trade J., Oct. 27, 1904.

The following figures are given, as supplementing those given in this J., 1904, 630, showing the value of certain British goods imported into Natal during 1903:—Ale and beer, 43,700*l.*; apothecary ware, 74,400*l.*; candles, 46,000*l.*; cement, 26,100*l.*; earthenware, 59,100*l.*; glass and glassware, 68,500*l.*; malt, 24,300*l.*; milk, condensed, 105,900*l.*; oils, other than paraffin and linseed, 32 000*l.*; painters' colours, 53,600*l.*; paper, printing, 31,000*l.*; paper, wrapping and brown, 7000*l.*; perfumery, 12,000*l.*; soap, 73,500*l.*; spirits, 224,700*l.*

II.—FUEL, GAS, AND LIGHT.

COAL PRODUCTION OF THE WORLD.

Eng. and Mining J., Oct. 13, 1904.

The world's production of coal and lignite in 1903 amounted to 877,755,053 metric tons, compared with 804,405,293 tons in 1902 and 787,179,967 tons in 1901. This great increase in coal output shows, as no other one factor, how rapidly industrial activity advanced in the years named. The United States easily led the world in developing fuel resources, in spite of the reduced anthracite production of Pennsylvania in 1902, owing to the long strike of the miners. The long-developed fields of Great Britain made a substantial gain in 1902 and 1903, and in 1903, Germany, France, and Belgium increased their production. In fact, four of the five leading coal-producing countries in 1903 surpassed all previous records of output. The figures for the three years are as follows, in metric tons:—

——	1901.	1902.	1903.
	Met. Tons.	Met. Tons.	Met. Tons.
United States	266,078,668	273,600,961	326,064,592
United Kingdom	222,614,981	230,728,563	234,009,484
Germany	152,628,931	150,600,214	162,619,934
Austria-Hungary	40,746,704	39,386,884	39,600,000
France	32,325,302	29,997,470	35,002,992

The stationary position of Austria-Hungary has been caused by labour difficulties and industrial depression.

In the other European countries, in Canada, in South Africa and in Australia, production increased during 1903, and some of the smaller countries, not reporting outputs, such as Mexico, made substantial gains. In fact, the activity of coal mines was a feature of the world's work in 1903.

III.—TAR PRODUCTS, PETROLEUM, Etc.

PETROLEUM PRODUCTION OF THE UNITED STATES IN 1903.

Bd. of Trade J., Oct. 27, 1904.

The annual report of the United States Geological Survey on the production of petroleum in the United States in 1903, states that the output reached the large total of 100,461,337 barrels, being larger than that of any previous year, and greater than that of 1902 by 11,694,421 barrels, or 13·17 per cent. The greatest part of the increase during 1903 was from the State of California, which produced in that year nearly one-fourth of the entire production. The total value of the oil produced in 1903 was 94,694,050 dols., as compared with 71,178,910 dols. in 1902.

VARNISH; BLACK —— : U.S. CUSTOMS DECISION.

Aug. 19, 1904.

A mixture of light coal tar oils and coal-tar pitch, drying and forming a coating when exposed to the air, was held to be dutiable at 20 per cent. *ad valorem,* under paragraph 15 of the present tariff, as a "preparation of coal tar, not a colour or dye." The assessment of duty at 35 per cent. *ad valorem,* under paragraph 53, was overruled.—R. W. M.

PETROLEUM IN ROUMANIA; PRODUCTION OF ——.

Eng. and Mining J., Oct. 13, 1904.

According to official statistics recently published in the *Petroleum Review*, the output of petroleum in Roumania during the first half of the present year was 213,702 metric tons. The Prahova district, as usual, contributed the greater part of the output. The figures indicate that the industry is growing steadily, and the product for 1904 will probably exceed previous records.

VII.—ACIDS, ALKALIS, Etc.

ARSENIC PRODUCTION IN 1903.

Chem. Trade J., Oct. 29, 1904.

The annual report of the U.S. Geological Survey states that that the production of arsenious oxide in the United States during 1903 amounted to 611 short tons, valued at 36,691 dols., as compared with 1353 tons in 1902 and 300 tons in 1901, the last-named year being the date of the inception of the white arsenic industry in the United States. The entire domestic product has been made at the plant of the Puget Sound Reduction Co., Everett, Wash., and the large increase in the domestic production during 1902 promised success to the undertaking. Owing to various commercial reasons, however, the by-product plant was operated at its full capacity only during the first quarter of the year 1903. It was shut down from March until September 1903, when, at the latter time, the works came under the control of the American Smelting and Refining Co. During the last three months of the year, the by-product plant was used only for roasting small quantities of arsenical lead ores, and no white arsenic was shipped to the market.
