In the machines for cutting stone, &c., out of the living rock in the quarry itself, the principle is, I believe, new. The cutting tools, instead of being placed in a single row around the rim of a thin disc, are fixed in rows of twos and threes alternately across the margin of a wheel-like disc, so as to clear away a wider space. The outer portion of this wheel-like disc is a ring of fine malleable cast-iron armed on the outside with tools, and carrying a cog-wheel within. This cogged wheel is made to revolve on a broad metal plate as its axle. This broad plate is of great strength, and forms four-fifths of the diameter of the entire cutter, and can be firmly bolted to the machinery frame by any part of its surface nearest to the cogged wheel which carries the tools, and the latter so held is made to revolve by a pinion around it. This arrangement allows eccentrically-held cutters to penetrate the rock to a depth exceeding the semi-diameter of the disc. A machine of this kind, cutting horizontally, works with great freedom, and advances rapidly through slate rock upon which it is employed.

There are other applications of these movable cutters which I would gladly have introduced to the attention of the Society, especially the coal-cutter, but the time allotted is too short for my venturing upon them on the present occasion. There are some photographs, however, which display the formidable character of the tunnelling machines. One form includes a construction two parallel borers, cutting two tunnels each 5 ft. 4 in. in diameter, side by side, and freeing two cores weighing more than two tons each at every cut.

Another form of the tunneller, which is now being erected in a quarry of the Ffestiniog valley, will cut a single tunnel 6 ft. 9 in. in diameter, and penetrate 23 in. at each cut. This machine will excavate more than five tons at a cut.

A high authority in engineering has lately condemned the principle of "planning" out a round core as a mistake. I hope before the end of this month to prove, by a second successful success with a second machine, that practice is better than theory.

These machines were made expressly for slate rock tunnelling, and have not yet been tried on sandstone or limestone rock for tunnelling purposes.

THE MYSTERY OF AVERAGES.

At the recent dinner of the Royal Literary Fund it was announced that the grants made by the committee during the past year amounted to 1,605*l.* In the previous year they amounted to 1,682*l.*; in 1864 they were about 1,500*l.*, and in 1863, about 1,600*l.* Considering that these grants are uniformly made according to the special merits of each particular case that is brought before them, and without the slightest reference to what will be the aggregate amount at the end of the year, this agreement, or agreement of average, is certainly curious. Not merely here, however, but in every quarter, averages are puzzling. At the South Kensington Museum, for example, the number of visitors will run on week after week to about the same number, say 10,000, until something peculiar or fresh occur to produce a change.

Here are two returns that we happen to have before us. The number of visitors during the week ending 2nd of March was 11,614. The average of corresponding week in former years is 11,027. The visitors in the week ending 9th of March numbered 10,402; and the average of corresponding week in former years is 10,515. Again, during last Easter week (ending 27th April), the total number was 26,564; and the average of corresponding week in former years is 26,076. Now, why should this be, and why should just 10,000 persons come for six or eight weeks running, and not 15,000 one week and 5,000 the next? It seems hard to answer satisfactorily. Or take the case of a theatre during the run of a successful piece; such a run as we have seen several instances of in recent days, when 150,000 or 200,000 persons have visited the theatre during its continuance. Why should the theatre be steadily filled night after night by (say) 1,500 persons, some few going away occasionally for want of room? Why should not 10,000 persons, when every one is talking about the piece, go one night and not half sufficient to fill the house on the next representation?

We might follow the inquiry in many other directions; but we have probably said enough to justify our observation that there is a mystery in averages.

THE ROYAL ALBERT HALL OF ARTS AND SCIENCES.

The first stone of the structure proposed to be erected in the Kensington-road, on the plot of land adjoining the gardens of the Royal Horticultural Society, and opposite to the national memorial of the Prince Consort now in course of erection in Hyde Park, was laid on Monday last by her Gracious Majesty the Queen, in the presence of some thousands of her subjects. A more successful ceremony or a more brilliant scene has seldom witnessed. The incidents of the event have been well described by the daily press, and we shall give what space we have at disposal rather to official particulars of the undertaking (though of this our readers are not wholly unprovided) and of the proposed building, illustrations of which we are enabled to append.

The Prince of Wales, in the address read by His Royal Highness on Monday, said,—

"It is not necessary for me to remind your Majesty that the building of which you are graciously pleased to lay the first stone to-day is one of the results of the Exhibition of 1851, and that it forms a prominent feature in the success of that Exhibition by providing a common centre of union for the various departments of science and art."

And to this address, her Majesty replied,—

"I thank you for your affectionate and dutiful address. It has been with a struggle that I have nerved myself to a compliance with the wish that I should take part in this day's ceremony; but I have been sustained by the thought that I should assist by my presence in promoting the accomplishment of his great designs to whose memory the gratitude and affection of the country are now renewing a noble monument, which I trust may yet look down on such a centre of institutions for the promotion of art and science as it was his fond hope to establish here. It is my wish that this hall should bear his name to whom it will have owed its existence, and be called 'The Royal Albert Hall of Arts and Sciences.'"

In the prospectus issued in December, 1865, the Provisional Committee† stated that her

* See p. 355.

† The Prince of Wales, chairman; the Duke of Edinburgh, the Earl of Derby, the Earl Granville, Lieut.-General the Hon. C. Grey, the Right Hon. R. A. Bruce, M.P., the Right Hon. R. Lowe, M.P.; Mr. Thos. Baring, M.P.; Mr. Edgar A. Bowring, C.B.; Mr. Henry Cole, C.B.; Mr. John Fowler, and Mr. Henry Thring.

Majesty's Commissioners for the Exhibition of 1851, offered to grant a site for the hall, and to guarantee a sum, not exceeding 50,000*l.*, towards the preliminary expenses and the cost of its erection. The principal conditions of the grant and the guarantee were, that such an amount should be subscribed, before the 1st of May, 1867, as would be sufficient (inclusive of the commissioners' guarantee), to insure to the satisfaction of the commissioners' surveyors the completion of the building, and provide for the payment of every contingent expense.

Towards the fulfilment of the foregoing conditions, by the summer of last year, subscriptions to the amount of 112,000*l.* were obtained, but the monetary panic that took place about that time induced the committee to refrain from pursuing measures to obtain further subscriptions from the public. In the month of July, 1866, a proposal was made by Messrs. Lucas, which enabled the committee at once to take all the preliminary steps required for proceeding with the work, and Lieut.-Col. Scott, R.E., on behalf of the Provisional Committee, prepared plans of the hall, on the designs approved by a Committee of Advice,* and placed them in the hands of the surveyors. These gentlemen having certified that the building can be completed, externally and internally, including the fittings, and every expense connected with it, for the sum of 199,748*l.*, the Provisional Committee accepted the proposal of the Messrs. Lucas to subscribe for sittings to the amount of 35,000*l.*, and to contract for completing the hall at ordinary trade prices, on the estimate and valuation of Messrs. Hunt, Stephenson, & Jones, acting as surveyors to the commissioners, as well as on behalf of the Provisional Committee. It is understood that the sittings taken by Messrs. Lucas are to be disposed of to the public before the sale of further sittings on account of the Provisional Committee.

A royal charter has been obtained, which provides, amongst other things, that the purposes of the corporation shall be the building and maintaining of a hall and buildings connected therewith, on the estate of the commissioners at South Kensington, and the appropriation of the hall to the objects hereinafter mentioned, "that is to say, to—

- Congresses, both national and international, for purposes of science and art.
- Performances of music, including performances on the organ.
- The distribution of prizes by public bodies and societies, of science and art.
- Agricultural, horticultural, and the like exhibitions.
- National and international exhibitions of works of art and industry, including industrial exhibitions by the artisan classes.
- Exhibitions of pictures, sculpture, and other objects of artistic or scientific interest.
- Generally any other purposes connected with science and art;
- With power for the corporation to furnish the hall in such manner, and with such works and objects of scientific and artistic interest as they think fit, and generally to do all such acts and things, whether such acts and things are or are not of the same character or nature as the acts and things before enumerated, as they think conducive to the purposes of the corporation, or for the benefit of the members thereof, having regard to the purposes aforesaid."

The design for the building is by Lieut. Col. Scott, R.E., assisted by Mr. G. Townroe, architect. It is based on plans originated by the late Capt. Fowke, R.E. The plan of it is elliptical. The main walls are to be of brick, the exterior of red brick with terra cotta enrichments, chiefly of a buff tint. The roof is to be of wrought iron covered with lead, with a central skylight. The floors, stairs, and all partitions will be fire-proof.

Immediately over the upper tier of boxes is a corridor 20 ft. wide which can be used either for the exhibition of pictures, sculpture, or other objects, or it can be seated for an audience. An upper corridor, also 20 ft. wide, and top lighted, can be similarly used. The boxes are each provided with a separate room to which access is gained from corridors 9 ft. in width. Below the boxes is an amphitheatre, and an area 103 ft. long and 68 ft. wide, measured on the axes of the ellipse occupies the centre of the building. Small lecture and concert rooms, refreshment and retiring rooms, and offices for societies using the hall, are contained between the outer wall and that of the hall itself. The cost of the building is estimated at 200,000*l.*

The necessary funds for erecting the building are being raised by the sale of seats. The seats which are not sold will be at the disposal of the

* Messrs. James Ferguson, J. Fowler, J. Hawkshaw, R. Heigrove, H.A.; W. Tite, M.P.; and M. D. Wyatt.

MACHINERY AND CONSTRUCTION AT THE PARIS EXHIBITION.—It is a hard act of justice to mention, that all matters in the Paris Exhibition connected with machinery and engineering are being very fully treated of and illustrated in the *Builder*. Some of our readers may be glad of this information.

governing body, and the revenue arising from letting them will be applied to the maintenance of the hall, and to defraying the expense of carrying into effect the objects for which the hall is erected. Of the 6,000 sittings which it will contain it is proposed to sell 2,000. The portion of the hall set apart for the orchestra contains seats for 1,000 performers, not included in the above estimate, and these seats will also be available for the public when the orchestra is not required.

Each step or bench of the amphitheatre will be 3 ft. wide, and the whole will be seated with chairs. The freeholds of these sittings are to be sold to subscribers for 100*l.* each sitting. The sittings themselves will be transferable by sale or otherwise, or the right of occupying them may be sold either for a period or for any particular occasion. In all there will be about 1,720 of these amphitheatre sittings, and of these 360 can be converted if necessary into box sittings. The remaining part of the oval will be occupied by sittings for the orchestra and an organ. Above the amphitheatre again will rise two tiers of boxes. These in the lower tier are each to contain 10 persons, and are to be sold for 1,000*l.* each; those in the upper tier will contain 5 persons each, and are to be sold at 500*l.* the box. There will be 43 in the principal tier, and 86 in the upper. The portions of the building which are suitable for the amphitheatre and boxes. The Provisional Committee, in arranging this, have proceeded on the principle of retaining full powers for the shareholders over those portions which can be used for exhibitions or for other purposes connected with the objects of the undertaking. No seats will be sold which in any way may interfere with the various purposes for which the hall is intended. Above the boxes will be the corridor already mentioned, which is to be fitted with movable seating. It will give space for seating 2,700 persons. The wall of the corridor may be considered to bound the hall proper, and from wall to wall on the longer diameter of the oval it will measure 230 ft., and on the shorter 180 ft., which is all to be covered in with a roof in one span, resting on piers, between which the spectator in the hall will see the architectural features of a top-lighted picture gallery and promenade running completely round the hall. This gallery would also be available for a seated audience on great musical festivals. The total number that could be conveniently seated in the building is said to be 8,000, including the orchestra; and if of these the Provisional Committee have to sell 2,000, as the statement put forth by them implies, there will be 6,000 sittings for persons who take the hall or for societies and others using it. From the top of the piers which separate the upper galleries from the main body of the hall the ceiling will rise in an elliptical curve to the great central skylight, both ceiling and skylight being suspended from wrought-iron arched ribs or girders, similar to those of the Cannon-street and Charing-cross stations, only that they all converge on a central ring, instead of being all parallel, as in the roofs of those stations. The total height from the floor of the arena to the skylight will be 135 ft. Below the upper gallery there will be numerous offices, rooms for societies using the hall, and refreshment and promenade rooms, and extending from the general contour of the hall there are to be over the entrance on the one side a lecture theatre, and on the other a small concert room. Below this floor will be the crush rooms, which are to give admittance to the corridors surrounding the boxes, and also to the galleries. Behind the orchestra at the ground level, and also on a level with the lower tier of boxes, will be long refreshment and promenade rooms. The basement will be occupied with the kitchen, stores, &c., so arranged, it is stated, that the lifts from the kitchens will pass through all the refreshment rooms on the three floors above.

As to modes of ingress and egress: for the arena it is proposed that there shall be four staircases on the south-east and south-west side, and two on the north side. There will be six staircases to the box tiers, besides an entrance from the conservatory of the Royal Horticultural Society, where there will be two flights of steps. To the lower gallery, which will be occupied by persons admitted for comparatively small payment, the provision is not so lavish; but still there are six staircases, each 6 ft. 6 in. wide, for 2,700 persons. The upper gallery is to be provided only with two staircases, 6 ft. 6 in. wide; but space is to be left for additional staircases, in case of their being required. The

amphitheatre sittings will be entered from the level of the ground in Kensington-road. Counting two entrances to the corridor of the Horticultural Society, from the arena level there are to be twenty-nine exit-doors. For the refreshment department there will be provision made for dining, if necessary, 1,000 persons.

The executive committee are the Duke of Edinburgh, General Grey, the Right Hon. H. A. Bruce, Mr. Henry Cole, Mr. Bowring, and Mr. Thring.

Toucbing the proposed arrangement of the building, especially that of the arena and stalls around, we have opinions, but defer discussing them. One suggestion, however, we feel compelled to offer at once, and we do so with but one feeling, a sincere desire that the undertaking should be carried out in the most successful manner, and that the building should be eminently worthy of its purpose and of the age. What we desire, and what we urge most earnestly, is that a properly educated and qualified professional architect be at once associated with Lieut.-Colonel Scott in the erection of the building. We are not captious; we are not bigoted. Paxton and Fowke received at our hands a frank and hearty acceptance to the extent of their very remarkable capabilities. Colonel Scott may be a heaven-born genius: we know nothing to the contrary; but he has had no experience in the designing and carrying out of large edifices such as this will be—an edifice not only monumental but one calling for a perfect knowledge of detail and of all modern discoveries and aids. Even in the case of poor Fowke for a long time everything was necessarily experimental; and, even up to the close, difficulties were skipped and few things were finished: and so it will be with the Albert Hall if the course we suggest he not taken. It is no reply to point to the Committee of Advice. These gentlemen will have no responsibility in prospect,—no reward, we perhaps might add, no power. What we seek, and what we do most earnestly ask the Provisional Committee to appoint, is a properly qualified professional architect, duly paid and duly responsible.

THE LATE CLARKSON STANFIELD, R.A.

THERE are few, where animated canvas speaks to all emotions, who will not bear with regret that Mr. Clarkson Stanfield, our English Vanderwilde—and something more—is no longer with the living. The Charles Dibdin and Captain Maryatt, the William Falconer and Thomas Campbell of our painters died, sad to think, "after a lingering illness," at his house in Belsize Park, in his long-loved Hampstead, on the 18th of this month and year, a few months under the reverential age of seventy-five.*

When Stanfield quitted the "behind the scenes" of Sunderland and Edinburgh, he made or worked his way "by water" to London, and was charmed with Tibury, with Deptford, with Greenwich, with Wapping, Old Stairs, and *old* London-bridge. We have before us while we write a most admirable line-engraving by George Cooke, after "Clarkson Stanfield, R.A.," of what he calls "The Diving Bell used at the Thames Tunnel after the Irruption of the Water on the 18th of May, 1827. Rotherhithe Church in the distance." Very animated indeed is this engraving; quite up to the drawing.

Let us recal (our readers will not regret our so doing) a brief after-dinner speech made by Mr. Stanfield at Edinburgh, Wednesday, 29th September, 1858, at the noble entertainment given by "The Royal Scottish Academy" to Mr. Stanfield and Mr. Roberts. The president, the late Sir J. Watson Gordon, R.A., called on the meeting to dedicate a bumper to the health, fame, and prosperity of Mr. Stanfield, whose works, whether composed of scenes and incidents on the high seas or on the land, were universally admitted to possess the highest qualities of artistic and poetic beauty, and whose prolific genius had brought a large amount of reputation both to himself and the British school of which he was one of the most esteemed living masters. Sir John alluded with the eloquence of true feeling to the warm affection and regard, with which Mr. Stanfield was esteemed by the whole of his professional brethren, and by a very wide circle of the most eminent personages of the age.

We transcribe Mr. Stanfield's reply from a local

* On the 15th inst., at his residence, Belsize Park-road, Hampstead, after a lingering illness, Clarkson Stanfield, esq., R.A., in his 74th year.—The Times of Tuesday, May 21, 1867.

paper of the time, of which we had a copy sent to us by Mr. Roberts:—

Mr. Stanfield, who was received with great cheering, expressed his happiness in being so received by his brethren of the Royal Scottish Academy—the worthy daughter of the body to which he more particularly belonged, namely, the Royal Academy of London. Tasting from the high compliments which had been paid him by the distinguished president, his mind had great pleasure in reverting to his early days as an artist, which might be said to have begun in London, where he first made the acquaintance of his friend, Mr. Roberts, who at that time had commenced his career by painting scenes for the Theatre Royal, while he, Mr. Stanfield, was similarly employed in the rivers establishment at Corrie's Rooms. That acquaintance had ripened into a friendship, which had weathered the vicissitudes of a pretty long career, and had surmounted and survived the professional rivalries which had always accompanied them, first in Edinburgh, then in London, to which they were both at the same time summoned,—he, Mr. Stanfield, to paint for Covent Garden,—Roberts for Drury-lane.

Here Mr. Stanfield humorously described the rivalry as an earnest one, the respective managements ministering to the painters' professional enthusiasm: whole acres of canvas were covered by them with scenes and moving dioramas, until he believed both managements were ruined by their scenic ambition and rivalships. Then [said he] in a new field—the walls of the Royal Academy—our rivalries continued, and do continue; but the friendship begun in youth had also continued, and he believed these feelings of mutual affection and esteem would never cease. Mr. Stanfield alluded with satisfaction to his election as an honorary member of the Scottish Academy, and promised a close and constant alliance with it at its annual exhibitions.

The reporter remarks (truly enough, as we have heard) that "the natural grace, feeling, and humour of Mr. Stanfield's remarks were listened to with intense interest and pleasure." A very wise, appropriate, and honourable appointment (of little remunerative value) was given to Mr. Stanfield by the Governors of Greenwich Hospital—that of Curator or Keeper of the Painted Hall at Greenwich. Though "Stanny" knew little or nought about Blake or Van Tromp, or King James II.'s "Flagman," yet he attended to his work with a loving respect, and gave Sunderland and seaman-like a good white-hot dinner, once a year, at "The Trafalgar," or the Ship, to a select few. We had the good fortune to be a guest on one of those occasions, and have pleasant remembrances of our host there as elsewhere. There was a maritime savour in all the great painter said, and in all our liberal entertainer had cooked.

The selection of his pictures for the memorable Manchester Art Treasures Exhibition of 1857 was made under the written advice and assistance of Mr. Stanfield himself. We remember them well. The happy possessors will find an additional pleasure, and now an additional market money-value (when needed) in the following approved list—Clarkson Stanfield (*primaturus*):—343. Passage of the Myra, Earl of Ellesmere; 353. Dartmouth, J. M. Arthur, Esq.; 377. St. Michael's Mount, Cornwall, H. W. Eaton, Esq.; 387. The Wrack, T. Birchell, Esq.; 483. Battle of Roveredo, painted 1851, F. D. P. Astley, Esq.; 499. Dork on the Maas, painted 1850, J. P. Davis, Esq.; 504. The Abandoned, painted 1856, Thomas Baring, Esq.; 574. Bidassoa, painted 1863, Charles Morgan, Esq.

Nor was the public at the time, nor are we,—after ten years' lapse,—inclined to doubt the propriety of Mr. Stanfield's selection.

Mr. Stanfield commanded a large price for his pictures; the prices he received have been doubled, and more, when the same pictures passed under the hammer of Messrs. Christie & Manson, and others of the same inevitable fraternity.

"Castello d'Ischia" brought, at Knott's sale at Christie's, 680 guineas. This was again sold, in March, 1865, by Christie, at the sale of John Whitaker, esq., deceased, of Hurst, Ashton-under-Lyne; but for what we forget. An engraving from this was the seventh plate issued by the Art-Union of London.

"Wreckers off Calais" painted for Watson Taylor, bought at Taylor's sale, by the Duke of Buckingham, for 300 guineas, sold, 1848, at the Stowe sale, to John Naylor, esq., of the Manor House, Cheshire, for 430*l.* 10*s.*

But these quotations are as sought contrasted with the sums Mr. Bicknell's four Clarkson Stanfields brought at the memorable Herne Hill sale of 1863:—

1. "Shipping; French Coast near St. Malo;" 27*l.* in. by 43 in. Dated 1838. Printed for Mr. Bicknell (85 in catalogue) 1*l.* 2*s.* 6*d.* Volms. 1867.
2. "Lago di Garda, Lombardy;" 27*l.* in. by 43 in. Painted for Mr. Bicknell in 1839 (102 in catalogue)—36*l.* 10*s.* (ditto).
3. "Belaiton, on the Moselle; the Hansrath Mountains in the distance;" 45 in. by 63 in. Exhibited at the Royal Academy in 1837 (107 in catalogue)—1,574*l.* (Wells).
4. "Pic au Midi D'Ossau; in the Pyrenees; with Smugglers;" 63*l.* in. by 59 in. Exhibited at the Royal Academy. Painted for Mr. Bicknell (121 in catalogue)—2,677*l.* 10*s.* (Volms).

I. e., 6,405l. (six thousand four hundred and five pounds) for four pictures. What did Mr. Bicknell give for them?

Since Mr. Stanfield was elected a Royal Academician, in 1835, the following twelve Fellow Academicians, his juniors in membership, have died,—before him:—Sir William Allen, John Gibson, C. R. Cockerell, J. P. Deering, Thomas Uwins, William Wyon, David Roberts, Sir Charles Barry, Sir William Ross, William Dyce, Sir J. Watson Gordon, Augustus Egg.

This is a melancholy and suggestive list; nor do we see how the places of such men can be readily refilled.

The London residences of so great an artist deserve to be recorded. When he first came to London from his favourite Edinburgh, he went (1828), to "No. 14, Buckingham-street, Adelphi," where he lived in the same chambers (or under the same roof), with William Etty. In 1831 he moved his easel to 36, Mornington-crescent, Hampstead-road, near to Sol's-row, where Wilkie first took root in London; from thence he removed (1843), to No. 48, Mornington-place, and not long after to Sir Thomas Marjory Wilson's farm, Hampstead, dear to Leigh Hunt and the late London School of Poets.

His last exhibited picture is still to be seen on the walls of the Royal Academy, "Off the Coast of Heligoland." Some could see no failing off in his powers, though seventy-four, yet it certainly seemed to us, that like the mighty minstrel on his well-strung harp,—

"His hand had lost that sprightly ease,
Which marks security to please."

Stanfield did not possess much of that poetic enthusiasm which both "elevates and surprises." His picture (1853) of "The Victory, with the body of Nelson on board, towed into Gibraltar," wants the dignity such a subject would have inspired in Turner. Mr. Stanfield would have drawn "Stonehenge" more topographically than Turner, but he would not have thrown that Druidical combination of clouds over the ruins which Turner has shown in the drawing that Mr. Rogers, the poet, had and loved, and which Thomas Warton has made us see, or fancy we see, in his magnificent sonnet, written at Stonehenge. Stanfield's pictures are, nevertheless, full of truth and full of beauty.

covering a good deal of ground, and brings his estimate to 28,023l., and 1,550l. for walls.

It is to be hoped that the guardians will not attempt to decide between the designs without professional assistance. Their respective merits and demerits require to be discovered, and then carefully weighed and balanced. As we mentioned last week, each of the unsuccessful competitors is to receive fifty guineas. The building, if we rightly understand its purpose, ought to take the shape of a retreat, rather than that of a workhouse or hospital.

THE NEW AMPHITHEATRE, HOLBORN.

A new theatre, mainly for equestrian performances (and wrongly called, like others of similar form, an Amphitheatre), has been constructed on the north side of Holborn, where the Horse Bazaar stood, nearly opposite the luckless Inns of Court Hotel, under the architectural direction of Messrs. Thos. Smith & Son. The area covered is said to be 130 ft. by 76 ft., much too small for the purpose. The stage in consequence is only 20 ft. deep, and if the house hold a sufficient number of persons to pay, at reasonable prices, for first-rate performances, we are deceived by its appearance. At any rate, it could not possibly compete with a theatre of such a size as the purpose would conveniently admit of. In distribution the house consists of what may be called pit, boxes (one tier only), and gallery. The ceiling is flat, formed of a canvas strained, *veterinary* fashion, from all sides, but having in the centre a ring to admit a sunlight with many burners. The roof above is of iron. The box tier consists of a series of private, or family, boxes, with one row of stalls in front. The seats appear to be comfortable throughout, and no doubt the interior, when the decorations are finished, will look bright and pretty. It is a mistake, nevertheless, to cram a theatre into the midst of a parcel of houses on an area scarcely big enough for two good shops, and gives another proof of the want there is of a proper code of laws to regulate the erection of places of public amusement in the metropolis and large towns.

The exterior has at present nothing architectural to mark it.

to acquire mechanical knowledge is no longer bound, legally, to a stated period, but enters the handicraft he chooses, in most cases, of his free will and accord. He signs no parchment rolls, but his agreement is none the less binding or compulsory upon him on that account. Certain instances have occurred wherein young men have broken faith with their employers, and violated the confidence reposed in them; and these cases are the most flagrant because, in pursuing such a course, the apprentices damage their own characters for integrity and veracity. When a manufacturer takes a youth into his service, he does it at a considerable loss for the first two or three years, expecting to remunerate himself in the closing term of the novice's education, by the skill he may have acquired. When, therefore, the apprentice violates his verbal pledge, he is, in effect, dishonest, because he carries away with him a portion of experience for which he has rendered no equivalent. Extraordinary cases sometimes happen, no doubt, which admit much extenuation, such as those wherein the self-respect of the apprentice will not brook the indignities to which he is subjected; but these are of rare occurrence, and we mention them with hesitation, lest we furnish a specious excuse for some young man desiring to defraud his employer of his time. Our manufacturing mechanics and firms are, as a class, liberal in their provisions for the welfare of the young men under their care, as it is for their interest to be so; and it is desirable that young men who are dissatisfied with their condition and treatment should remonstrate, if necessary, quietly and respectfully, under the advice of those competent to decide for them, before taking hasty steps, which they may regret hereafter.

FIRE PROTECTION.

MR. M'LAGAN gives evidence, as chairman of the committee of the House of Commons he has been instrumental in appointing, that he desires to get at the root of the matters into which the committee inquires: the increase in the number of fires, the proportion of suspicious fires, the best means of extinguishing fires, and the legal measures that should be adopted to reduce fires and consequent loss of life and property to a minimum. But we fear that the committee will have considerable difficulty in agreeing to a report from the conflicting nature of the evidence which has been given to them; one witness giving evidence with reticence, another almost with rashness; one commending a certain expedient, another condemning it; one making a distinct allegation upon a certain point, and another denying its truthfulness. At a meeting of the committee, Mr. Swanton, superintendent of the London Salvage Corps, which is supported by the insurance companies, gave evidence, and expressed his belief that the number of fires had greatly increased for a number of years past in the metropolis. In a given district in the west of London, the fires had been, in 1852, 1 to 2,559 persons; in 1862, they were as 1 fire to 1,252 of the population. The number of fires compared with the number of houses had increased in a like ratio. The increase in the number of fires from unknown causes had been remarkable. In 1865, 700 fires out of 1,500 had been from unsatisfactory causes; 40 per cent. of them, he believed, of a suspicious character. The figures he quoted referred to a radius of say ten miles round London. In 1866 there were 589 fires not satisfactorily accounted for, of which 480, or about 5-6ths, were in insured property. The proportion of suspicious fires had increased in the last few years over 10 per cent. In 1852, the fires in proportion to houses was 1 in 354; and in 1865, the proportion was 1 in 269, being an increase of a fourth.

Of a large number of the unknown fires very many were doubtless wilful. De considered the water supply in London very unsatisfactory, both as regarded quantity and pressure. If the mains were continually charged there might be sufficient pressure, but the water was often off during the whole day. He recommended that watchmen should have keys of the fire-plugs, and that every water company should be bound to give notice to the fire-brigade authorities, in case of their cutting off the water supply. He also recommended an increase in the number of mains, and that certain regulations should be observed as to storage of petroleum and other inflammable materials. He decidedly approved of judicial investigation concerning fires of

WORKHOUSE COMPETITION, ST. MARTIN'S-IN-THE-FIELDS.

ACCORDING to the instructions given to the six architects selected to prepare designs for the proposed new workhouse at Wimbledon, for St. Martin's-in-the-Fields, the building is to form a home for 400 old men and women; 348 of them sleeping healthy and to have a separate bed, and 500 cubic feet of space each, in their dormitories, with day-rooms, work-rooms, &c.; 40 infirm to be provided with 850 cubic feet, in rooms on the ground-floor; there are to be also, separate sleeping-rooms for six married couples. The materials to be red or stock bricks, and Bath ground stone; the cost of the building to be about 25,000l.

The plan suggested to the Board by one of their officers, Mr. West, and laid by them before the architects, was a central circle, with dormitories, wards, and other buildings, radiating from it all round. To what extent this arrangement was made a condition of the competition we do not know; but only one of the architects, Mr. F. Maffable, can rightly be said to have carried it out, substituting for the circular form an octagon. The result is a building of very great compactness; and although many of the rooms are necessarily of awkward shape, it seems eminently worthy of consideration. The estimate is 28,332l., exclusive of boundary-wall. Mr. L. M. Burton sends as an alternative design a version of Mr. West's notion, but it is not fully brought out. His principal design has three stories, which are objected to, and is not over agreeable in appearance. The building, irrespective of boundary-walls, &c., is estimated at 30,820l. Mr. H. R. Cotton's plan, although it covers a large extent of ground, has merits; the elevation is pleasing. 29,400l. is the sum laid down for it, and 1,300l. for walls. Messrs. Kendall & Mew have sent a good plan, adopting the pavilion system, and they estimate the cost at 27,800l. Mr. William Lee has adopted the pointed style and seven towers, and adheres to the corridor system. His estimate is 28,000l. Mr. W. S. Cross confines himself to two stories,

APPRENTICES AND EMPLOYERS.

In days—happily for the credit of mankind—long since passed, an apprentice was regarded chiefly as a fit subject for the abuse and spleen of the hard-hearted master. No matter how trivial the offence, or how slight the shortcoming, the word and the blow, and often the latter without the admonition, followed closely on the transgression. The life of the apprentice was a constant scene of starvation, overwork, and personal indignity; and the press of remote periods had usually a column or so, in which an individual was depicted as fleeing from the wrath behind him, with a bundle and a stick—his sole earthly possessions. "Walked away—too lazy to run," was the common heading; and "one shilling reward" was offered for the apprehension of the fellow, as the most caustic satire that could be uttered respecting the value of the fugitive's services.

Hogarth thought it not beneath his eminent talent to illustrate the career of the idle apprentice; and he did it in such a powerful manner that it awakened universal attention. The regeneration of the apprentice system cannot, of course, be traced to the publication of these pictures; but it is very certain that in this country a much-needed and desirable reform has been gradually brought about, until it may be safely said that the artisan's assistant is more favoured here than elsewhere.

In former times, when the arts were as yet undeveloped, the idea prevailed that a trade which limited the number of its members enhanced its value in the community, so that by observing the law rigidly, the organisation could demand any compensation it chose. Were it possible to do this, if the laws of supply and demand were variable to suit circumstances, and if the seasons of the year were all equally busy, then some such arrangement might be feasible, but it is not, for the reasons set forth. When apprentices were bound for a certain period they almost invariably ran away before its expiration. The young man seeking of

suspicious origin, and believed that the coroners were competent, with the assistance of deputies, to conduct such investigations. He recommended that their remuneration should be by fees, paid from the same funds as those from which the fire-brigade was supported. In warehouse construction he recommended that the space between the flooring and ceiling should be filled with concrete. Being brought back by Mr. Tite to the question of water supply, Mr. Swanton repeated that he had known many cases in which the mains were found not changed, and recollected instances in which the engines did not get to work at all from want of water. He knew of forty-six cases in six months last year in which the engines were kept waiting for the arrival of the turncocks. The fire-plugs ought to be indicated by pillars, and made accessible to the men of the fire brigade. He would also recommend the provision of improved hydrants. Mr. Becker, metropolitan fire superintendent at Chelsea, was the

next witness examined, and concurred in the statements concerning the increase in the number and destructiveness of fires. The supply of water was for the most part efficient, but the brigade had difficulty in finding the plugs. The witness was understood to say that he considered the turncocks a useless set of functionaries. After being waited for, they were often drunk when they arrived, many of the calls being after ten o'clock at night. He considered the constitution of the fire brigade defective: the men were principally sailors, who were the worst class of men for the duties required. In Glasgow and other places the fire brigades were composed of masons, carpenters, warehousemen, and slaters, who were better qualified for the respective duties; and to avoid the destruction of property by water, which is often greater than that by fire. He considered that the steam fire-engines had caused loss to the companies by deluging property with water, as many fires being washed out as hurned out. A great deal

of water was wasted in the extinction of fires. Mr. Becker recommended the employment of hose-reels, the adoption of a number of central stations, and an improved mode of telegraphic signals to aid between the stations, under the direction of a telegraphic engineer. Plans, drawings, and models of Mr. Becker's system were exhibited, and will probably be gone into at the next meeting of the committee.

It may be mentioned that in 1866 the Metropolitan Fire Brigade had 1,338 calls to fires, exclusive of 102 chimneys and 103 false alarms. As regards the causes of these fires, 19 were from children playing with lucifers, 6 from children playing with fire, 11 from blocked-up flues, 28 from defective flues, 2 from timber in the flue, 9 from defective hot-air flues, 2 from fumigating bugs, 54 from escape of gas, 73 from sparks from fire, 17 from lucifers, 6 from spontaneous ignition, 4 from incendiarism, 639 unknown, and the remainder from a great variety of causes.

SANITARY MATTERS.

Dwellings unfit for habitation.—At the Newcastle Police Court recently, Mr. Ackrigg, inspector of nuisances, stated that several houses situated in Pandon Dene were in a very dilapidated condition. They had neither asphalt nor privy accommodation. The windows were not constructed so as to open, but were permanent fixtures. Dr. Dalgleish and Mr. Feitch, assistant inspector of nuisances, corroborated Mr. Ackrigg's statement, and the Bench gave instructions for the closing of the places complained of. Another statement was made by the inspector, with reference to the polluted condition of a stream which turns a mill belonging to the same person.

Remarkable Epidemic at Dublin.—Great interest amongst physicians and much public alarm have arisen in the Irish metropolis from the occurrence of several cases of a disease previously unknown there. The first case was on the 13th March, 1866, in the person of a most healthy student of medicine, and three others took place within the succeeding month, but during the present year over twenty cases have occurred in Dublin and the neighbouring suburb, Kingstown. Sudden prostration, almost black purpuric discoloration of the skin, and death within a very few hours, have marked all the cases. The duration of the disease from seizure to death (for all the cases have been fatal) has varied from seven to ninety hours. The symptoms indicate that the malady may be closely related to cerebro-spinal meningitis, which was epidemic in Ireland in 1848, and in West Prussia in 1865. No rank of life more than another attracted the disease, which numbers among its victims a young nobleman, two students of our profession, three soldiers, and some other persons living under the best hygienic circumstances. It preceded and immediately succeeded the outbreak of cholera in Dublin, Kingstown, and Tullamore. From Dr. Mapother's reports, it would appear that the disease is not at all communicable.

PROVINCIAL NEWS.

Horsham.—The Town-hall Restoration Committee have reported that the tender of Mr. Potter, for the restoration of the hall for the sessions, amounting to 371*l.*, had been accepted; and that the extra works would increase this sum to 396*l.*, besides the architect's charges, &c. The report was adopted at a meeting of the inhabitants, and money granted to proceed with the works.

Ashton-under-Lyne.—The corner-stone of a new building which Mr. Mason is about to erect for the use of his workpeople at the Oxford Mills, Ashton-under-Lyne, has been laid. The workpeople have enjoyed for some time past the advantages of reading, smoking, and lecture rooms, which Mr. Mason has provided for them free of charge; and the extensive use that has been made of those rooms has induced him to erect a large building, in which there will be spacious baths and other improvements upon the original design. The existing lecture-hall will seat 250 persons; and during the season of lectures and concerts it has been overcrowded. In the new room there will be accommodation for 400 persons; and the reading and smoking rooms will be proportionately larger. All the rooms will be spacious, well lighted, and lofty; and there will be large and well-arranged baths for both sexes. Messrs. Pannell & Robinson, of Manchester, are the architects of the new building, which will cost about 3,000*l.* The ceremony was attended by the whole of Mr. Mason's workpeople, with a band of music; and by a number of ladies and gentlemen who had been entertained at Groby Lodge.

Liverpool.—A "trade palace," described in the *Albion*, is in progress at Church-street, and will soon be completed. Compton House stands on a block of land nearly square, with its principal front to Church-street: its side fronts to Bassett-street and Tarlton-street, and its rear to Leigh-street. The front to Church-street is 156 ft. long; to Tarlton-street 173 ft.; and to Bassett-street, 169 ft. 8 in., the whole occupying an area of 2,980 square yards. An additional space is gained by vaults running under the pavements of 470 yards. The total area of floor-space is 17,322 square yards, or 3½ acres, of which nearly three acres are to be devoted to business purposes. The style of architecture adopted is Italian, with

certain modifications suited to street erections. The height of the building to the top of the main cornice is 60 ft.; but above this rises a curb roof, making the height to the leads 74 ft. At each corner of the Church-street front rises an imposing tower, 27 ft. square, to a height of 110 ft. The top of the roof is flat, 15 ft. square, and is surrounded by tall iron railings. The highest point of the building is 120 ft. The principal front is treated in the best manner for the display of merchandise, and the ornamentation of this front is rich and chaste in a high degree. The stone carvings are a notable feature. The basement, the ground-floor, and the first-floor are devoted exclusively to business purposes. Accommodation is besides provided for boarding 400 persons of both sexes. There are, therefore, extensive kitchens, numerous bed-rooms, a dining-hall, 68 ft. by 35 ft., lighted from the roof, and capable of dining 200 persons at once. There are also a library and writing rooms, billiard, smoking, and chess rooms, and a gymnasium, ladies' recreation-rooms, &c. On the fourth floor is an extensive range of work-shops, occupying 890 square yards, lighted by skylights, and affording accommodation for 300 workpeople. The ventilation throughout the whole building has received especial care; and an elaborate system of talking-tubes is ramified through all the departments. There will be bedroom accommodation for 300 gentlemen and 100 ladies. From the towers on either side access is obtained to promenades on the roof. Messrs. Haigh & Co. are the contractors. The sub-contractors are,—for brickwork, Messrs. Roberts & Robinson, Liverpool; for masonry, Messrs. Gabbott & Son, Liverpool; ironwork, Messrs. Weber & Co., Liverpool; plumbing, &c., Mr. Nicholson, Woolton and Liverpool; slating and plastering, Mr. T. Jones, Liverpool; stone carving, Messrs. Williams, Manchester and Liverpool; ironwork, Messrs. Smith & Son, Birmingham; brasswork, Messrs. Clarke, London; ventilating apparatus, Mr. E. Watson, Halifax; and hydraulic lifts, &c., Messrs. Armstrong & Co. The clerk of the works is Mr. John Kneale.

Hanley.—The contract of Mr. A. Barlow, of Stoke-on-Trent, for hotel for the Hanley Hotel Company, at Hanley, Staffordshire, has been accepted.—8,785*l.*

Frome, Somerset.—A building to contain a museum, library, news-rooms, and offices is being erected in this town at the cost of Mr. John Sinkins, J.P., of Wallbridge House. The design is of Italian character. The exterior will be constructed chiefly of Bath stone and red Mansfield. Mr. James Hine, of Plymouth, is the architect. The contract has been taken at 2,100*l.*

Plymouth.—Additional wards are being built at the Royal Eye Infirmary in this town, under the direction of Mr. James Hine, architect.

ROCK-BORING MACHINE FOR BLASTING.

A new rock-boring machine has just been completed at St. Peter's Foundry, Ipswich, for the Tarragower Gold Mining Company, Victoria, Australia, for boring holes in rocks, preparatory to blasting,—a process which, up to this time, has been performed almost entirely by hand. The machine, it is said, will bore a hole in the hardest granite, 20 in. deep, 2 in. diameter, in twelve minutes—a work that would take two men at least two hours and a half. The process is effected by air compressed into a large boiler-shaped receiver, of about 170 ft. cubic capacity, to a pressure of 90 pounds per square inch. This is done by a pair of powerful air-pumps, the air being forced through water, to deprive it of heat, which it evolves in the process of compression. The air-pumps are worked by a portable engine. From the receiver the compressed air is taken by flexible tubing, or any sort of piping capable of bearing the pressure (90 pounds per square inch), to the rock-boring apparatus, which may be placed at several hundred yards or a mile distant. The machine for boring consists of a carriage running upon rails, which carries a small (steam) engine, worked by compressed air, also the apparatus for boring. This looks rather a complicated piece of machinery. When placed, the tool, an instrument made of the best cast steel, about 3 ft. long, commences jolting into the rock, at the spot where the hole is required. The hardest rock very soon yields to the powerful blows, at the rate of from 300 to 400 per

minute. The blows are effected by the compressed air being let into the cylinder containing a piston, to the end of which the boring tool is fixed. The air, after having done its work, escapes into the atmosphere, and will serve to ventilate the mine in which the apparatus may be employed. After the machine has bored a series of holes it propels itself backwards, and when the blasting operations are over it advances again to a fresh series of holes. This machine is expected to work a great reform in tunnelling operations, both for railway and mining purposes. It was designed and patented by Mr. George Low. Experiments with it are said to have been very successful in boring a hard block of granite,—the hardest that could be got.

ACCIDENTS.

By the swerving of a cut-water caisson at New Blackfriars Bridge, while being lowered into the river, and the giving way of a beam and the timber supports of a large platform, one man has been killed and several others seriously injured.

Extensive carpenters' and joiners' workshops, with piles of timber, belonging to Mr. Rodda, builder, have been destroyed in Park-road, Stoke Newington. The origin of the fire is unknown. At the brickworks, Stubber's-green, a poor fellow, an engineer, has been literally ground to pieces in a mill for grinding clay. He must have stumbled in stepping over the cog-wheels and fallen in. Verdict: accidental death.

In the West Port, Edinburgh, a singular accident has happened. There are in McGillobou's land some miserable rickety and unwholesome tenements built over the ruins of old mill kilns. While a man with his wife and child were in a room, in one of these tenements, the hearthstone gave way and precipitated the man, who was reading a book at the fireside, into a cavernous pit filled with water, where he would have been drowned had not his wife nobly flung herself into it after him, and her clothes floated both till help arrived. The pit had several feet of soft mud at the bottom, with between 6 and 7 ft. of water above it, the surface of which was between 5 and 6 ft. from the flooring.

At Portobello, near Edinburgh, a railway embankment is said by the *Scotsman* to have been on fire for upwards of six months, and has defied all efforts for its extinction. A noxious smell arises from it; but of what the material consists, whether oily shale, or what, is not mentioned. Red-hot cinders from a locomotive set it on fire in October last.

A church at Lunense, in France, fell in during divine service on Sunday before last, and ten persons were killed and twelve others more or less seriously hurt.

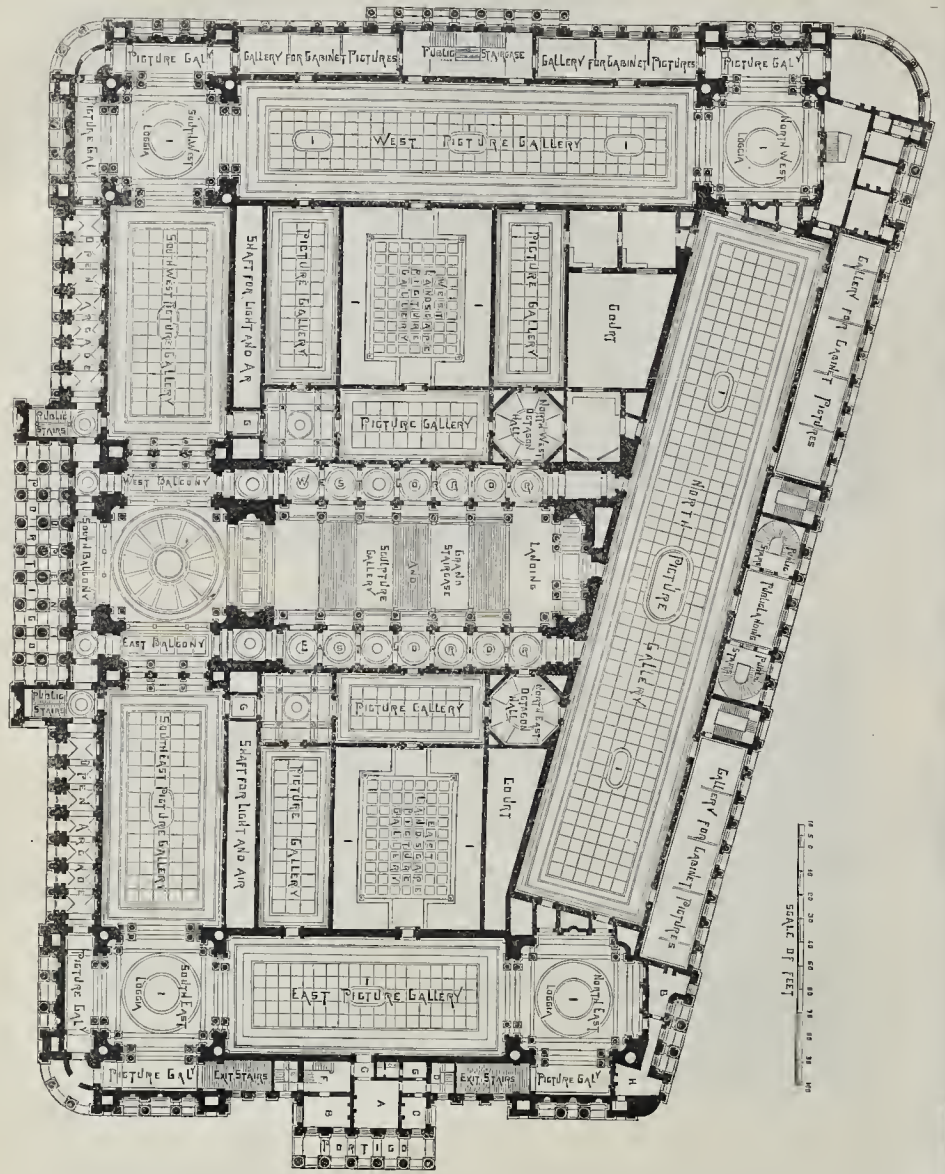

DESIGN FOR PROPOSED NATIONAL GALLERY.

ALTHOUGH the appointed judges did not select for execution any one of the designs submitted for the proposed National Gallery, they named Mr. E. M. Barry's design as best meeting the requirements. We have thought it desirable, therefore, to record in our pages a view of the Trafalgar-square front and the plan of the principal floor. We have before now reviewed this and the other designs at considerable length: we content ourselves, therefore, on the present occasion, with setting forth the architect's own intentions and views.

In designing the exterior, the architect considered it important to give to the building as much height and consequent importance as possible. A dome of large dimensions resting on a lofty centre building, with smaller domes at the angles, seemed to him a suitable mode of obtaining this result. The ground at the back of the building is about 13 ft. higher than in Trafalgar-square, which circumstance has led the architect to propose a ground story, the height of which would vary in the different fronts according to the levels of the ground, and which, while affording the opportunity of providing much useful accommodation, would enable such a height to be given to the mass of the building as is imperatively required, if it is worthily to occupy a site which has been justly extolled.

The instructions contain no reference to sculpture galleries, and the architect has not, therefore, felt at liberty to introduce them into his

DESIGN FOR THE PROPOSED NATIONAL GALLERY.—Plan of Principal Floor.

design. He has thought, however, that the building should afford suitable facilities for the display of sculpture historically treated, and he has, therefore, suggested its decoration by groups of sculpture, as well as by single figures. Under the dome he would place allegorical groups and statues of the great old masters. The staircase and corridors forming a grand sculpture-hall, he would reserve for statues of deceased British architects, sculptors, and painters. By such an arrangement the public would be led to form correct ideas as to the past history of art, and honours would thus be paid to British artists, similar in degree to those often accorded to their foreign brethren, although not hitherto customary to any great degree in this country. The picture galleries are shown of various

sizes and descriptions. The largest galleries have a width of 50 ft., and a few small galleries are provided with side-lights for cabinet pictures, as prescribed by the instructions. As a general rule, however, the author recommends top-lighting, and he has borne in mind the generally-admitted success of the picture galleries of the Exhibition of 1862. He has, in fact, made the section of his galleries correspond in all essentials with the section of the Exhibition galleries. The prescribed width of 50 ft. for the principal galleries has of course exercised an important influence on the plan and the extent of accommodation provided.

The architect has also provided for a landscape gallery of a construction such as we described some time since in writing of Munich. The centre

of the room is kept in half light by means of a low ceiling, over which light is conveyed to the pictures in such a way as to show them without inconveniencing the spectator. This plan is suggested as being suitable for landscape and subject pictures of moderate size.

The estimate, based on the price of 1s. per cubic foot, with an extra allowance for the architectural treatment of the exterior, brings the cost to about 480,000l.

DESIGN FOR THE PROPOSED NATIONAL GALLERY, TRAFALGAR SQUARE.—By MR. E. M. BARRY, A.R.A.

THE SIXTY-THIRD EXHIBITION OF THE SOCIETY IN WATER COLOURS.

TASTES vary, it is said. Nothing can be more true when the remark is accompanied by the reflection that there are certain limits of variation, and that, if these are over-past, the variation itself becomes that between good and bad taste. The variety of nature is infinite, but in every instance of startling contrast or of apparent anomaly, the accomplished student can detect the presence of fixed and unalterable law. The expression of that law may even be so subtle as to mock definition; but its presence is ever perceptible, so that nature is never at war with herself; and in her moods of most sombre gloom, or most wild and sportive exuberance, there is no such thing as bad taste in nature. Men and women would be happier beings, however, than they are, if there were no such thing as natural bad taste. To a certain, nay, to a great extent, such depravity is the result of ignorance, and will slowly disappear before enlightened culture. In this office of cultivating the artistic tastes of the masses our great annual exhibitions play no unimportant part. Nor can they be visited year after year,—still less can they be revisited after a lapse of five or ten years, without finding in them evidence of cheering and steady progress.

With all this, however, bad taste, far from being content to be quietly improved to death, makes spasmodic and persevering efforts to re-establish a positive power. It may be true that purchasers are in no slight measure to be blamed for this, for few artists will paint merely to enforce their own ideas on the world—because few, and in this case, happily few, can afford to do so. But still it is the painter who is the teacher of his art. The faults of a bad picture are best exposed by contrast with the merits of a good one. Criticism may do something to aid, but the true artist is the master of the situation.

The conventionalism of the thirteenth and fourteenth centuries seem out of place on the walls of London galleries of the nineteenth century, but they are to be found there nevertheless. Cupids that are neither charming nor dangerous, and Psyches that excite no emotion but a certain feeling of distaste, are better unpainted. We do not, for all that, fail to recognize the powers possessed by the author of them.

Since Sir E. Landseer and Rosa Bonheur did so much to call attention to the nobler features of animal life, we find cattle play no small part in any new collection. We have several very life-like cattle pieces in the present Exhibition. The picture which first attracts the attention of many a visitor is a remarkable desert scene, which excites at once our admiration and our perplexity—No. 117, by Carl Haag. The drawing is good, the colouring powerful, the rolling waste of sand and boulders that loses itself in the distant hills is impressive; but the idea of an Arab amusing himself on his pipe as he leads his camel across the desert, while his wife, mounted on the "ship of the sands," dances her infant to the tune, is a startling innovation on our experiences of travel. The light, too, though very effective, is not easy to understand. It would seem to be that of sunset while the moon is rising in the opposite horizon, but if this were the case the shadows would be longer, and, on any theory, the skeleton of the dead camel ought to throw some shadow at all events. It is a striking and a meritorious, but not a satisfying picture. "Spring in the Highlands," by Basil Bradley, No. 26, is a northern landscape with cattle, refreshing to gaze on after the glare of the desert. "Morning in the Highlands," No. 35, by H. Brittan Willis, is another that well repays attention. Another by the same artist, "A Fall Out by the Way," No. 69, is a very faithful and life-like representation of an encounter of two sturdy little bulls. The intent fury of the combatants, the scattered occupation of the herd, and the eager alarm with which the herdsmen rushes towards the field of battle with uplifted stick as all true and harmonious pastoral incidents are rendered. In "A Scene in Glen Nevis, Argyleshire," No. 68, by T. M. Richardson, the foam and tumble of the river, brown with the stain of peat, is very true to nature. And the deer are very good also; but several of them appear to be crouching before and turning from a storm which might well be rushing from the hills, but of which no sign is to be traced on the vegetation. No. 181, "Tilling the Ground, Sussex," by the artist of No. 26, is a very good study of the old English farm horse, a creature

quite distinct in his physiognomy from his noble cousins in Flanders, and again from those superb quadrupeds, the glory of some of our great brewers and contractors, that bear witness that naturalists are not in error in ranking the horse so near to the elephant. No. 201, and we see with surprise that we have again unconsciously noticed a work of Mr. Brady, is not a pleasant subject. And the litter, not an agreeable foreground, is not well reproduced. But for those who are content to look to the porcine family for the beau ideal of "a happy mother" there is a very good sketch of one. And the six little piglings might have run from the pigstye into the picture, where they stand alive and unabashed—one with his foot on another, according to invariable habit when so many are in company. The game cock, too, is the real bird, and no mistake. No. 136, "A Winter Morning," where a flock of sheep are in trouble in the snow, by E. Duncan, completes a note of the cattle on which we should turn a wistful eye if happily engaged in purchasing.

In landscape, while there is nothing to equal the "Mountain Road" of J. T. Linnell in this year's exhibition of the Royal Academy, there are not a few pleasing, and some very pleasing pictures. "Ulswater, from a point near Lylulph's tower," No. 142, by G. A. Fripp, is a grey evening scene of great truth and beauty. No. 180, "The Rising Mist," by A. P. Newton is a charming picture. These, and their neighbour No. 184, "Arning," by David Cox, jun., in the quiet truthful harmony of their English tints, form a very striking contrast, a contrast which is only the reflection of that which nature herself presents, with the deep blues of lake and sky in No. 185, the "Lago Maggiore," by Collingwood Smith. No. 5, "Llyn Idwal, North Wales," by J. P. Jackson, is another scene of mountain mist and glow on which it is pleasant for the eye to dwell. The rural scene "At Shiplake, on the Thames," No. 11, with sheep going over a bridge, is a very beautiful rainbow scene, a phenomenon, by the way, that is represented as if by photography, in "Latitude 53° 15' N., long 5° 10' W.," by Mr. Brett, in the neighbouring gallery. No. 17, "Early Moonlight," by C. Brawhite, gives a calm and graceful group of pines, the dark shadow mellowed by the moonlight. No. 59, "Evening in the Valley of the Ledr, North Wales," we find again to be from the pencil of Mr. S. P. Jackson. In 109, "Bridge of Badia, River Arno," by T. M. Richardson, the mountains are piled one on another as they often loom through gorges of the Apennines. No. 246, "A Dutch Fishing-boat in a Gale off St. Abb's Head," by E. Duncan, is a fine hit of dirty weather and angry sea. No. 165, "The Carnarvonshire Range of Mountains," by J. W. Whittaker, with the flecked clouds of a tint between rose-colour and orange, is another of those charming scenes of English mountain scenery in which the present collection must be considered as rich.

The figures, as a whole or as individual pictures, cannot be said to rival the landscapes. We must, however, make signal exception in favour of one which seemed to us the gem of the entire gallery. It may be called unfinished, but the want of finish is not slovenly but artistic, the chief attention of the painter having been riveted, as will be that of the spectator, on the lovely face. It is a peculiar feature of water-colour painting to allow of this very effective mode of treatment. The effect of portraits suffers to a greater extent than is readily conceivable from backgrounds. The old form of column and crimson curtain is abolished, but the difficulty remains. Even the photographers have discovered the ill-effect of the obligatory chair and desk with twisted legs, and have advanced to the more artistic form of vignette background. Hardly any faces look with such life from the canvas as do those which, like Sir T. Lawrence's "Wilberforce," have been painted by the artist, and left otherwise unfinished, the work of the assistant undone, the form a mere sketch, and the whole picture concentrated in the face. The picture to which we now refer is No. 157, "From Cairo," by E. Lundgren, and the face is charming, not only from its treatment, but from its great beauty and its thoroughly Egyptian character. It might have been that of a beauty of the court of Thebes during the reign of the eighteenth dynasty—the lips having the peculiarly chiselled fulness of the sculptured monarchs of that great period of ancient art, while the rich, warm colour gives a charm that is wanting in the granite colossal forms. Turn, as a contrast, to another very pleasing drawing-room scene—a quaint, richly-furnished room

with spider-legged harpsichord, deep relieve of the entry into Jerusalem immured over the chimney-piece, and portrait of a scarfed and Vandyke-collared cavalier, whose head, however, becomes a vanishing fraction of his person. Prettiest piece of the furniture is the young lady who is "demeaning" herself by offering to feed an odious little marmozet in a manner only permissible, in the case of pretty women, to birds—the brute stretches out five feeble little fingers in vain. 189, "Our little Pet," by the late O. Oakley, is a sweet face, and one treated in what we believe to be the true and, therefore, the best, water-colour style. In No. 203, "Exiles from the Cloister: Monastic Suppression in Italy," we recognise the well-known type of those holy men (taking holiness to be equivalent with idleness), the brown Franciscans. They are not of the southern type, the true *friarini* monk, but brethren of some more northern province. The puzzled, half-considering look of one of the more distant monks is very natural, and we seem to be intimately acquainted with the ex-superior. But Mr. Smallfield has surely invented his incident! To find such a stream as they are crossing is rare in Italy. Perhaps that may account for the inveterate antipathy entertained by all colours of the Franciscans to clean water,—of soap we can say nothing. *Omne ignotum pro mirifico*. One other figure we refer to as an instance of a likeness which does credit to the painter's ingenuity, if it is designed, and does more credit to his knowledge of physiognomy and power of expression, if it is accidental: it is No. 62, "Catherine," by Walter Goodall. The pretty shrew has the features of the famous Duchess Sarah of Marlborough.

Among architectural pieces the eye is at once arrested by the interior of the cathedral of Toledo, No. 111, by E. A. Goodall. No. 202, by William Callow, "A Street in Rouen," is a faithful and picturesque rendering of one of the fast-vanishing remnants of old French architecture. The procession sweeping into the porch of the cathedral is one more likely now to be met in the streets of Chent, than in this old fortress and battle-ground of "Hugonoterie." Mr. John Burgess's drawings of old French cathedrals possess both artistic worth and architectural value. In No. 160, "The Cathedral of Auxerre," he has well rendered the crumbling texture of the stone. This picture, however, is either not set exactly in its frame, or there is a want of perpendicularity in some of the main lines which, if existing in fact, threatens the stability of the edifice. 205, "The Cathedral of Dol, in Brittany," is another good example of an interesting series. But the pair of sketches which, simple and very likely rapid in their execution, appear to us to be the finest examples of the application to architectural lining of the true principles of water-colour drawing, are Nos. 219 and 227, the entrance to the Amphitheatre at Salona, and an arch of the Aqueduct at Spalatro by Carl Haag. "The Reigning Duke of Saxe-Coburg and Gotha," in these times of royal distress, has at least known how to select a master of this graceful style of painting.

On glancing again through the catalogue, we find that we have omitted to mention Mr. A. D. Fripp's "Commissariat Party," No. 294, hardly more than a sketch, but with subject, faces, and expression all alike cheerful and pleasing. "Judge Croke," No. 210, Margaret Gillies, is one that improves on acquaintance, and each visit to it raises it in our esteem. The face and figure of the judge are full of truthful physiognomical portraiture, and the scene is one eminently fitted to be treated by a woman.

Paul Nafel has given us, in No. 218, a stream running into the Wharf, a very truthful representation of one of those thickly wooded dingles, pierced by a brawling stream, that characterise this valley, so famous in legend and in song; and in 221 he shows us the winding track of the wharf itself, after passing by the well-selected locality of Bolton Abbey, looking all unconscious of its late fierce rush through the iron gate of the foaming Strid—the water grave of the "Boy of Egremont." The Italian skies again smile on us in No. 233, "San Remo," by W. Evans; and larger and fuller than any grapes of Mediterranean vintage are those presented to us by C. Rosenberg, No. 264, where grapes, and peaches, and wooden press, and, indeed, every detail of the picture, are perfect marvels of truthfulness in rendering texture, as well as in observing the difference between a down, a gloss, and a bloom.

We would not omit to mention a picture which can neither be considered pleasing nor picturesque in its subject, but which renders the brick houses and square windows of the Georgian era with the fidelity of a photograph, while Wren's steeple soars beyond—a picture which does for a bit of London what Canaletto did for Venice, and preserves so faithful a record that some centuries hence it would have historical value. We mean No. 208, "Where stood Bride-well Hospital and Prison, painted in June, 1866," by G. P. Boyce.

There are, of course, many pictures in the Exhibition of which the names of the painters will alone be sufficient to call the attention of every reader of the catalogue. Let such see and judge and admire for themselves. We think it a fairer mode of dealing with a collection of the kind to note those pictures that first strike or longest detain the eye, rather than to undertake a studied criticism of the works of each well-known artist.

THE WALTHAMSTOW PUBLIC HALL.

This building, situated in Orford-road, Walthamstow, has been erected by a company formed for that purpose, having a local direction, and of which Mr. Alfred Pittard is the secretary. It was opened a few months back, with a reading by Miss Glyn, and has since been in good demand for readings, lectures, and concerts. On the 17th inst. a reading by the Rev. J. M. Bellow took place; and on that occasion the reader offered spontaneous testimony to the capabilities and acoustic properties of the hall. It is 60 ft. long by 40 ft. wide; and will accommodate between 400 and 500 persons. It has a ceiling polygonal (almost segmental) in form, the extreme height being 24 ft. At the northern end are committee rooms, and other conveniences. The cost of the building, as it stands, has been about 1,500*l.*; and a somewhat similar amount will be required for the institute buildings. The architect, from whose designs and direction the building has been carried to its present stage, is Mr. Frederick Wallen.

FROM IRELAND.

Cork.—The contemplated additions to the Roman Catholic church of St. Vincent, Sundays Well, Cork, were commenced on last Sunday, by the laying of the foundation-stone. The mayor presided on the occasion. The additions consist of a large bay, on the western side of the nave, 20 ft. long; and on the north-west angle a tower is to be erected, 140 ft. high. Other additions besides those which go to the completion of the structure are intended. Among these is a presbytery, to be at right-angles to the western side; the presbytery, the eastern elevation, and the church itself, will form three sides of a square. The presbytery, where it joins the church at the eastern end, will be three stories in height; but on the south, in consequence of the incline of the ground, it will have an elevation of 4 ft. The basement story will comprise a cloister, 80 ft. by 22 ft., in which six windows, with geometrical tracery at the top, will be shown. The recess of the windows in the basement will be furnished with stone seats, and the ceiling vaulted. Leading from this will be the refectory, a room about 30 ft. square, exhibiting a carved ceiling of timber, resting on a cylindrical column in the centre, around which will be ranged the dining-tables. Immediately over this will be the library, 60 ft. by 22 ft., and a parlor, 22 ft. by 18 ft., on the same level, will be the community-room, which will be right over the refectory, and exactly of the same size. A corbela circular turret, crowned by a conical roof, will be over the south-western angle, showing a large bow-window for the community-room, and other chambers on top. Two stories of bed-chambers will be above the library. The kitchen and other offices will be situated in this wing. The entrance to the church will be at the north side, and the principal staircase, connecting the different parts of the building, will be near the entrance. Messrs. Goldie are the architects, and Mr. McMullen the builder.

Belfast.—The new Roman Catholic church of St. Mary Whitehouse, Belfast, which was dedicated on Sunday, the 12th inst., is of the Early Pointed style. In its interior, the church may be said to be finished, and is provided with stone

altars, pulpit, font, and open benches. The church presents, outside, a south-western tower, which, when completed, will be about 150 ft. high. The nave and chancel are of equal height. It has also a Lady chapel, aisles, two porches, and sacristies. The west doorway has arches deeply moulded and partly carved, resting on small columns. The chancel and nave have ceilings; and a chancel arch, springing from the "wall columns," resting on carved figures of angels, divide them. The ceilings are done in panelling, and the principal timbers of the roof are exposed. The chancel ceiling is arched; that of the nave is wagon-shaped. The appearance of the interior is agreeable, and the work is in harmony. The floors of the chancel and chapel are laid with encaustic tiles. The nave is lighted by a clearstory of folded windows, by a triplet of lofty lancets at the west end, and a couple of lancets, surmounted by a wheel window at the east end of the chancel. The walls are built of black stone, but light and stone dressings are introduced for relief. The altars and reredos, which are of Caen stone, were executed by Mr. Earp, of London. Mr. John O'Neil was the architect. The body of the building was executed by Mr. John Ross, and the fittings by Mr. John Murphy. Messrs. Davison, of Belfast, executed the ornamental painting in the interior. Ecclesiastical and street architecture, for the last fifteen years, has made rapid stride in Belfast, and no place in Ireland at present displays so much commercial activity as this northern capital of Ireland.

SUN DIALS.

In answer to "G. W. T."—First, it may be as well to have a concise idea of what a sun-dial really is.

The earth moves round the sun in one plane, and completes its revolution in one year, and round its own axis in one day.

Now, if its axis were perpendicular to the plane in which it moves when going round the sun, few would have any difficulty in understanding; but it is not perpendicular, but inclined at an angle of 23° 30' to the plane. Now, conceive, at an immeasurable distance, a star, and that one end of the earth's axis ever exactly points to that star, and that there is no parallax, or, in other words, that the earth's axis is at one time exactly parallel with every position it has occupied in travelling round the sun. Now, call the ends of the axis poles. If the earth were transparent, and a huge board were to travel round the sun with the earth, and opposite to the sun and parallel to the earth's axis; and if the earth had previously been strained from pole to pole, then once every hour the shadow of the axis would cross a line of section, and, at the same time, the shadow of the axis and line of section would coincide on the board, and thus we could tell the time. Now we may represent this on a small scale.

First by observation, with Hadley's sextant, or by referring to an atlas or geography, discover the latitude. Suppose it is 61° 35' north latitude: then find by observing the sun dip by the sextant, or by the compass, which is due south; mark it exactly on the ground, then fix the stile in the mark, and at 61° 35' to the ground, the upper end to be exactly above the line, so that suspending a plummet will touch the line (always fix the stile at the angle that is equal in degrees and minutes to the latitude). Supposing your ground is of wood, then from the upper end of the stile which reclines from the sun, and with a large set-square placed against the under part of the stile, cut the north and south line on the ground; then measure the exact distance from the end of the stile to the said mark; then on a wide board, and with the above-named distance as radius, describe a semicircle. Divide it into twelve equal segments; draw a line from the centre of the semicircle was described from and perpendicular to chord or diameter of semicircle, and passing through the division between the sixth and seventh sections, then temporarily fix the board to the end of stile and ground, making point of division between sixth and seventh sections coincide with mark already made on the end of the stile. Then run a straight-edge from division in the semicircle, till the lower end of corners into the ground (or wooden horizontal platform). Mark these points very carefully. Then remove semicircle, and with your straight-

edge draw lines through points to the lower end of stile, and they are your hour-lines. The stile must always be at the same inclination, but the index may be at any inclination, the points of division being got from a semicircle offered so that the stile already fixed is at right angles or perpendicular to face of board containing semicircle; and the points on the wall (or as the case may be) and the lines from points to fixed end of stile being got with a straight-edge as before. If the index be on a wall, the upper end of stile must be fixed, and the semicircle applied to lower end of stile, and so that the stile is perpendicular to the board containing the semicircle.

HENRY AMBROSE.

ANOTHER NOTE FROM THE CHAMP DE MARS.

In my description of the British Picture Gallery at the Paris Exhibition, I omitted to mention the admirable screens on which the water-colour drawings are hung, and which display them to perfection, bringing them on a suitable line of sight; but they detract greatly from the apparent size of the gallery; for, being placed across it, instead of longitudinally, they cut it up into a series of small compartments.

I suppose, however, this arrangement was unavoidable, from the necessity of gaining as much surface as possible. They are placed two and two all down the gallery, and have brown holland blinds skillfully affixed to them, which are drawn down before the gallery is shut up in the evening. These blinds are so arranged that on sunny days they can be pushed out from the top, like the sun-blinds to windows; thus allowing human eyes to rest on the pictures from below, but effectually screening them from the too ardent gaze of Phœbus's scorching glance.

The iron-doors at all the entrances of our gallery have been already mentioned in the *Builder*. They are of English manufacture, as are also those on a different principle at most of the portals of the Exhibition building.

The French people ought to feel much indebted to Messrs. Clark and Co. for showing them how to make good and slightly iron shutters for doors and windows; for it is impossible to conceive anything more frightful than those in use all over Paris, of two various designs, one of which I have named the prison-style, and the other, the iron-clad. The former is made of separate shutters, which are placed upright and have a handle on each side to lift them by; being tall they must needs be very heavy, and their appearance suggests that it must be a painful task to lift them in and out of their places. The "iron-clad" are frequently painted a dull red, and look exactly like the rusty old hull of a vessel; they are formed in five or six long strips which overlap from above, and are, I believe, wound up and down into position.

To return to the British Pictures.—Our Art-world is acknowledged to be not well represented; and yet almost every picture exhibited is a gem, as a perusal of the catalogue will show. True, that many of our most honoured names are absent from the list; and that, of exhibitors, the best pictures are, in many instances, not seen; but yet a goodly store remains. Look at the "Bay of Naples," by our now lost and lamented Stanfield! What a grand picture it is! And, following closely in his footsteps, what a fine thing E. W. Cooke shows, in his "Dead Lifeboat rescuing a Crew from the Goodwin Sands;" what a magnificent stormy sky, and what grandly surging billows. David Roberts's two views on the Thames, "Houses of Parliament" and Greenwich Hospital, show out admirably, as does also Millais' "Romans leaving Britain." This latter was placed two high when exhibited in the Royal Academy, and the desolation expressed by the expanse of distance was lost, but here it looks, and is, a fine thing. We English certainly do not indulge in the gigantic canvases in which foreign artists revel, but if the merit of a work of art is to be deduced from the delicacy of workmanship and the emotion produced in the beholder, our artists may boldly hold up their heads among all competitors. For the former of these attributes, delicacy of workmanship—if I may be allowed the expression—I may cite Wallis's "Death of Chatterton;" T. G. Linnell's "Gipsy's Haunt," such a gem, but being of small size, it may perhaps be passed over unobserved; and Arthur Hughes' "Woodcutter's Return Home." As a

Frenchman at my elbow remarked, "Tout est fait; le fond et le devant tout est fait." And for the second attribute, emotion produced in the beholder, I will mention from a host of others, O'Neil's "Eastward ho!" Elmore's "Tulleries, June 20th, 1792;" and "On the Brick;" Burgess's "Bravo Toro;" Phillip's "Spanish Wako;" Calderon's "English Embassy at Paris, the night of the Bartholomew Massacre;" and Yeames' "French Ambassadors at the Court of Elizabeth, after intelligence of the Massacre had reached England."

In various styles, but all admirable, the following pictures must not be passed over in silence:—Hook's well-known "Sea Urchins;" "From the Bottom of the Sea," the miner, with the extinguished candle still in front of his broad-brimmed hat, being welcomed by his wife and child; and "Fishermen;" the Misses Matric's charming flowers, with which no others save nature's can compare in the Paris Exhibition; J. Brett's "Capri at Sunset," so delicate, yet bright, peaceful, and true; Armitage's fine piece, "Esther's Feast;" Vicat Cole's "Summer's Golden Crown," which seems to have melted into richer beauty with its few years of existence; Egg's "Knighting Scene from Thackeray's 'Esmond,'" Fribb's "Claude Duval;" Leslie's "Clarissa," such a bit of days gone by; and Frost's "River Nymph."

Then in water-colour—in which walk of art, I presume, there is no question that the English are pre-eminent over all other nations—we find Corbould's richly-coloured "Mont d'Arthur;" Bayliss's almost equally rich "Sainte Chappelle;" Brett's "Gust of Wind in the Mediterranean;" Callow's "Falls of Schafhausen;" David Cox, Senior, "Snowdon," which is a fine thing; and from the hand of his son, "Eusebe of Llanberis;" Louis Haghe's "Church of St. Gomer;" Carl Haag, "Family of Wandering Arabs;" our dead Hunt's "Dead Peacock;" Jopling's "Frédigonda," a head and draped shoulders in rich deep colouring; Edmund Warren's "Cuckoo's first Chant," and a "Forest Scene," with some capital Foxglove in foreground; Harrison Weir's "Morning Hymn," lark rising from clover; two good interiors by Carl Worner; and a characteristic Britain, Willis, "Scene in the Highlands," with cattle.

Of the sculpture, I cannot speak in such high terms. The generality of it appeared to me very poor; and this remark does not apply solely to the British Gallery. Our own Munro sends two subjects, one of which, "Joan of Arc," a bust in plaster, has the true inspired look one would expect to see, and is, altogether, very satisfactory. A large work by Marshall Wood, a life-size seated figure, is a falsehood, and therefore a mistake in art. It is titled "The Song of the Shirt," and is dated "1867." The worn figure, the broken chair, and the old Church-hassock on which the feet rest, are doubtless cleverly portrayed; but at best the portrayal is a low type of art, and though the sad story was only too true when Hood wrote his touching poem, it is quite past away, and false as a representation of an episode in English life, in the present era of sewing-machines.

Before closing my somewhat lengthy "note," I must say a few words on the vexatious manner in which Frenchmen contrive to disguise our English names of men and places. It is difficult to recognize our own Princess Mary when printed in their catalogue as the Princess of Jock; and the "household words," Fæd, Frost, Frith, sound strangely unsmooth and unfamiliar when read Tæd, Frost, Trith; Edouard-Henry Corboud would be tempted to deny his own identity, but that his fine handiwork betrays him; travellers in Wales would be puzzled to find the Pass of Siamheris; Temysson never wrote of Finnovers; Mr. Home has changed his name a second time, and figures as Homo-Zion; a well-known suburb is Crap-hann; Redgrave changes to Redgrane and Redgrawe, Smallfield to Smallfield, Warren to Warrem, Landsæd to Landsser, Knight to Knight; and so on, and so on. This is an old grievance of ours against the French, and it is high time such a clever people as they are should not allow it to be said of them any longer, that they suffer themselves to be conquered by a few hard words.

In the foregoing remarks, I have made a patriotic, if feeble, endeavour to stem the tide of depreciation which English writers seem to delight in pouring over their own country and countrymen. Many of the notices that have appeared in the English papers with relation to our exhibits, and notably those on porcelain

and faience, seem to those persons who have carefully studied the display in the Champ de Mars, both unjust and untrue; and with regard to the British picture-galleries, it must be borne in mind that exhibitors had to brave the perils of four journeys by land and two by sea for their art-treasures; and, this considered, the great wonder is, that the English Commission contrived to produce so goodly a collection as is here presented. There are certainly no gigantic battle-pieces, nor frames containing yards of canvases, like those in other galleries; but if they were wanted in England they would soon be produced.

We English live in our own compact houses, and like to have our walls adorned with works of art; and therefore our artists paint such subjects as will most delight us—pleasant episodes in real or imaginary life; dear old cathedrals; lovely landscapes, cheering and refreshing the beholder. Where, in a French gallery, can be found the charming country scenes that year after year crowd the walls of our exhibitions? Perhaps our excellence in landscape-painting arises from the tender hues presented by the frequent atmospheric changes in our greatly-abused but, after all, better-than-any-other climate. Frenchmen get grand, sombre, truthful treatment in many of their *pagesages*, but the sweet loveliness, which is the peculiar characteristic of English landscape painting, we may seek for in vain in their sunless, gloomy landscapes.

R. F. H.

BUILDERS AND ARCHITECTS.

Sir,—The annual meeting of the General Builders' Association was held at the Volunteer Club in this city (Bristol) on the 9th instant, presided over by Mr. Alderman Neill, mayor of Manchester, who is president of the Association.

His worship, in a long speech anything but complimentary to architects generally, is reported to have said, "he believed when a good case arose, and it was taken into a court of law, the builders would be able to teach the architects a lesson,—to teach them for the future to be honest and do justice."

Now, Sir, this appears to me to be such an unwarrantable piece of impertinence on the part of his worship, and such a gross insult to the members of the architectural profession, that it ought to be exposed and properly dealt with by the Institute of Architects and all other architectural societies, as also by your own and other similar journals.

WM. BRUCE GINGELL, Architect.

PERIODICAL CHIMES.

Sir,—In the *Builder* of the 4th inst. I notice that Mr. Thomas Walsby refers to Boston respecting *carillons* that are to be erected in the Tower. The following extract from the statement issued to subscribers may be interesting:—This gentleman (M. Van Aerschoot, of Louvain) carefully examined not only the belfry of the church, but also the eight bells, which constitute the present peal; and he expressed his opinion that these bells could be made to form part of the contemplated set of chimes. He proposed to add to them thirty-six other smaller bells, giving a total number of forty-four bells. The price of these extra bells would be about 300*l.* Messrs. Gillott & Bland, the well known clockwork mechanics of Croydon, also sent a member of their firm to Belgium to examine the machinery of the chimes in that country, and they have since invented a new system of machinery which far surpasses any hitherto in use, and one special feature of which is its power of ringing the chimes loudly or softly as the passages of the music may require. The expense may be considered to stand thus:—

Cost of thirty-six new bells, say	£300
Mechanism for ringing the chimes, say	750
Recasting tower and other bells, and incidental expenses, say	250
	41,300

Above 1,100*l.* have already been subscribed, and contracts signed for supplying the thirty-six bells and machinery by the firms before named. It is expected that the chimes will be complete before November next. The tenor-bell being cracked, necessitated its being recast.

WM. GASK.

Sir,—Everybody must agree in condemning the un-musical chimes that proceed from many of our church steeples and towers; yet cannot this be remedied by other means than by the introduction of costly machinery similar to that in use on the Continent, which would be practicable but in few places?

I would call attention to the fact that tunes can be played by hand in a very pleasing manner, and without much trouble, it being necessary for only one of the chimes to possess an ordinary knowledge of music. It may be objected that the bells would have to be "clocked," but surely there is not a greater likelihood of cracking the bell by its being struck on the interior than if (as would be the case if machinery were used) it were struck on the exterior of the sound bow. Of course the chimes would not be recast, but they could be struck at stated hours and on any particular occasion, and there would be the

advantage of appropriate tunes being played, and an avoidance of monotonous repetitions.

It would require only four men for a peal of eight, or six men for twelve bells, and the number of tunes that could be played would be only limited by the number of the bells.

That the scheme is quite practicable is proved by the circumstance that it has been adopted by an amateur band of ringers at St. John's, Hackney, for the last twelve months, with perfect success, and has given great satisfaction.

G. H.

THE ARCHITECT OF THE HALL OF ARTS.

Sir,—In the published papers relating to the Prince Consort Memorial competition is contained the circular to the seven architects who were invited to send in designs in that competition. These gentlemen, Messrs. C. Barry, E. M. Barry, Donaldson, Hardwick, Pennethorne, Scott, and Digby Wyatt, were instructed to combine the design of the Hall of Arts and Sciences with that of the Memorial in Hyde Park, and with one or two exceptions they did so, the circular to them expressly stating that "the committee have decided not to invite other designs, except in the event of no one of those by the architects now selected being considered satisfactory." In her Majesty's answer to the report of the committee, "Her Majesty very fully participates in the regret expressed by the committee that it has been found necessary" (from want of funds) "to abandon, for the present, the idea of the Central Hall," but so far from there being any intimation that no one of the designs is satisfactory, the committee refer to "the ability, ingenuity, and taste displayed in all the designs as such as to prove the wisdom of the course" that had been adopted.

Such being the facts of the case, I should be glad to know why it is intended to ignore the competing architects, and entrust the great architectural work, for which they furnished designs, to an engineer officer.

VIGILANS.

THE FOLKESTONE COMPETITION.

As your columns have been open to competitors, perhaps I may be permitted to say that I will advise the Directors of the South Eastern Railway Company that the best design is that which was submitted by Mr. Ernest Turner, of No. 1, Vennian-buildings; and the second best that of Mr. T. C. Sorby, of Brunswick-square.

EDWARD RIDE.

PARIS EXHIBITION.

Sir,—In your paper of Saturday last, after a discriminating and valuable testimony to my escanatic tiles, as shown in the Paris Exhibition, it is said "the manufacture is limited, if we may judge by the small quantity exhibited." Permit me to say that the manufacture, so far from being limited, has been very largely increasing for many years past, and the smallness of my exhibit is explained by the simple fact that I was only able to obtain one-tenth of the space for which I applied. Thinking myself shabbily used, I had determined not to exhibit at all; but this intention was overruled by some influential gentlemen, and the result is that which has procured so favourable a notice in the columns of the *Builder*.

Logwoodine.

WILLIAM GODWIN.

THE TRADES MOVEMENT.

Oxford.—The labourers engaged in pulling down the old front of Balliol College, and those engaged at the new London and County Bank, have struck for an advance of 6*d.* per day, their pay being 1*5s.* per week. The men paraded the town, and were joined by labourers engaged at the Sisters' Home and other buildings now in course of erection in Oxford; the strike, however, is not a general one. The masters have announced their determination not to accede to the required advance.

Worcester.—A difference has for some time past existed in this city between the master builders and the men, which has at last unhappily resulted in a strike, the effect of which has been to temporarily throw out of employment between 600 and 700 men. The master builders resolved to form themselves into an association, and appoint a committee, composed of themselves, to draw up a code of rules, which was accordingly prepared and adopted, and issued to the men. These rules were similar to those framed under the arbitration of Mr. Lloyd, the banker, and adopted by masters and men in

Birmingham. They were submitted to the men as an ultimatum, but were rejected. A deputation of joiners waited upon Mr. Joseland, of the firm of Wood & Sons, to know whether their employers would consent to arbitration, and his reply to them was, that if the arbitration was made in general he was of opinion that the employers would consent. The bricklayers and joiners have unanimously consented to arbitration, and furnished Messrs. Wood with resolutions guaranteeing themselves to abide by the result of arbitration. The masters, however, repudiate arbitration altogether, and say they are strong enough to enforce their claims. The plasterers recommend a meeting of the masters and men to settle the matter, but the masters repudiate arbitration. The men in the employ of Messrs. Hughes & Collins, the contractors for the cathedral restoration, and also those of Messrs. Hemming & Son, are at work. A committee meeting of the masters was held, when it was decided to decline the question of arbitration, inasmuch as the proposal had only come from two of the parties engaged in the building trade, while three had rejected it.

Coercion of Masters.—In the Court of Queen's Bench, the conviction of a secretary of a trade union, for attempting, by threats, to force a master to dismiss a workman for not joining the union has been confirmed; Mr. Justice Blackburn observing that the enactment in question was evidently designed to protect masters from being compelled to employ union men. It was a very beneficial provision, for it was impossible to imagine a greater piece of tyranny than to insist that a master shall have his work stopped unless he consents to dismiss a workman for not belonging to a society, which he has a right, in the exercise of his liberty, as a free subject, to refuse to belong to.

Coercion of Workmen.—At the Marlborough-street Office, Thomas Gray, a journeyman tailor, has been committed for trial on the charge of conspiring, with others, to force Alexander Verbon, by threats and molestation, to depart from his hiring, and to leave working for his employer. Mr. Tyrwhitt, the magistrate, remarked, that defendant and others had tried their powers on an unfortunate man who wished to work for his bread. He must either join them or find himself a martyr, perhaps, for life. He could not see how it was, if passion did not interfere, that men could fail to perceive that such a course towards a fellow-workman was tyrannical and oppressive. It was a question of whether a man should be permitted to work and get bread for his family, and this, too, in a land of so-called liberty.

COMPENSATION FOR DAMAGE WHILE EXECUTING RAILWAY WORKS.

An appeal in the House of Lords (May 16), before the Lord Chancellor, Lord Cranworth, Lord Westbury, and Lord Colonsay, in the case of *Rahik v. the Metropolitan Railway Company* (in error), has been decided.

This was a proceeding brought to reverse the judgment of the Court of Exchequer Chamber, reversing a decision of the Court of Queen's Bench upon a special case stated for the opinion of that Court.

The Lord Chancellor said, the facts of the case were as follows:—The plaintiff was the lessee of a public-house, called the Pickled Egg, situated in Crawford-passage, in the parish of St. James, Clerkenwell. The company, in forming a tunnel under a public carriage-way, called Copping-row, and in the lawful exercise of their powers, caused a temporary obstruction of parts of the carriage-way in Copping-row, and placed a boarding on each side of it. The footway, border, and the carriage-way, the company constructed a bridge, by which foot-passengers could cross over Copping-row from one footpath to another. The obstruction was continued for such time only as was necessary to enable the company to construct the tunnel, being about twenty months, and at the end of that time all the streets and public highways in the neighbourhood state. During the time that the obstruction continued the number of foot-passengers coming towards the public-house was greatly diminished, and the custom to and from the public-house greatly fell off, and it did not again improve while the hoarding remained, nor after it was removed. The plaintiff claimed compensation under the Lands Clauses Act, 1845, on the ground of his public-house being injuriously affected by the execution of the work by the company. His opinion was that the damage which was the foundation of the claim to compensation was not obstructed, he might have been content to rest his judgment in favour of diversity of opinion which had prevailed among the judges as to the application of the clauses of the Acts in question to such a claim as was now under consideration rendered it almost imperative upon the House to pronounce an authoritative final decision upon the great number of cases bearing upon the question, and said that upon a review of all the authorities, and upon a consideration of the section of the statutes relating to this subject, he had satisfied himself that the temporary obstruction in this case would not have been the subject of an action at

common law, as an individual injury sustained by the plaintiff in error, as distinguished from the rest of the public, and that, therefore, the plaintiff had failed in claim to compensation under the Acts in question had been determined to depend; that upon the section of the Lands Clauses Act and the 8th section of the Railway Clauses Act and the 8th section of the Lands Clauses Act were both inapplicable, as his damage arose from the temporary operations of the company and not from their permanent works, and that upon the 16th section of the Railway Clauses Act, which did apply to his case, the damage was not of that nature as to entitle him to compensation, the interruption of persons who would have resorted to his house but for the obstruction of the highway being a consequential injury too remote to be within the provision of that section. He, therefore, advised their lordships to affirm the judgment of the Court below.

Lord Cranworth agreed with the judgment of the Lord Chancellor.

Lord Westbury differed.

The opinion of the Court below was affirmed, and the appeal dismissed.

ARBITRATION.

BADCOCK v. CLARR.

THIS case came on for hearing at the Court of Queen's Bench, on the 20th of December last, before the Lord Chief Justice Cockburn. It was an action brought to defendant in erecting some patent revolving shutters in plaintiff's house at Braintree, whereby they were rendered unserviceable. After the examination of the parties had been partly proceeded with, his Lordship expressed an opinion that the matter should be referred to a non-professional arbitrator, as he considered it was hardly possible for any jury to decide the question. The suggestion of his Lordship was accordingly adopted, and a verdict entered for the plaintiff for 100*l.*, subject to a reference.

Mr. Henry Stock, architect, was appointed arbitrator. The arbitrator has just now given his award. It was in the shutters in the declaration mentioned were properly made and fixed, and the said Robert Badcock had not at the time of the commencement of the action, nor at any time since, any cause of action against the said Alexander Clark in reference to the said shutters, nor any claim or demand against him in respect thereof; and that the said Robert Badcock is not entitled to recover anything in the said action.

We understand that the expenses of the trial and reference will amount to between 600*l.* and 700*l.* The original price paid for the shutters was 300*l.*

DISTRICT SURVEYORS

UNDER METROPOLITAN BUILDING ACT.

At the meeting of the Metropolitan Board of Works, on the 17th inst., the following motion was moved and carried:—"That the four vacancies amongst the district surveyors be filled up from amongst the district surveyors now in the employment of the Metropolitan Board, and that afterwards the candidates of the Metropolitan Board, and that afterwards the candidates applying for employment be considered by the Board as to whether it was in order, considering the Board was summoned to proceed to the election, had been decided by the chairman in the affirmative, Mr. Shaw said he considered it only right that those surveyors who had been in the employ of the Board for some time should have the benefit of any similar appointment which was in the gift of the Board, which was more lucrative than that which they held, and that their places should be filled up by the new applicants. It was a mere matter of common sense, and he thought he would move it without taking up any more of their time. Mr. Robert Taylor seconded the motion, and said the about 600*l.* a year each, whereas many of the present surveyors were only in receipt of from 200*l.* to 400*l.* The motion was put and negatived by a large majority. The Board then proceeded to the election of district surveyors for the districts of Newington and part of Battersea, Central Lambeth and part of Battersea, and Northern Battersea, and to accept the resignation of Mr. Hakewill, district surveyor of the northern division of St. George, Hanover-square, and to elect a successor. A large number of candidates attended, and the names were reduced by a show of hands, being taken for each, with the following result:—For Newington, Mr. Long; Central Lambeth and part of Battersea, Mr. Jennings; Northern Battersea, Mr. Hanson; and Northern Division of St. George, Hanover-square, Mr. Bell.

CHURCH-BUILDING NEWS.

London.—The chief stone of St. Matthew's, New Kent-road, has been laid, nearly opposite the Elephant and Castle Railway station. The edifice, from the design of Mr. Jarvis, architect, will be in the Gothic style, with stone frontage; and is to be erected by Messrs. G. Myers & Sons, of Lambeth, builders.

Horsmonden (Kent).—The restoration of the Parish Church has been completed. The architect employed was Mr. Wyatt. The cost, exclusive of the organ by Messrs. Hill, in a case, the gift of Mr. J. E. Austen, of Broadford House, amounted to 1,600*l.* The gallery has been removed, displaying the arch between tower and nave, and the western windows. The plaster has been scraped off from the walls, and the stone work shown and pointed. The whole of the paving has been raised and relaid upon a body of concrete, in the aisle in York stone, in the chancel in encaustic tiles. Open seats of oak have been substituted for the deal pews.

Aslyford.—The new church, which has just been completed for the South Aslyford and Beaver Districts, has been opened under licence of the Archbishop of Canterbury. The edifice is arranged to accommodate nearly 500 adults and 120 children, and all the sittings are free. It consists of a nave 7½ ft. by 20 ft.; north and south aisles, 75 ft. 4 in. by 11 ft. 8 in.; chancel, 27 ft. by 15 ft., and walls 20 ft. 3 in. high. The style is transition. The walling is of Kentish rag stone, with quoined angles of the same material; the exterior and interior dressings of Bath stone. The roofs are framed in Memel fir, and covered with local red tiles and ridge cresting. The church is fitted with deal open seats. The architect was Mr. Hubert J. Austin, of London.

Bedford.—St. Paul's Church tower and spire have been rebuilt, from plans by Mr. Palgrave, of London, architect. The old stones were as far as possible used, the deficiency being supplied with new Bath stone. The clustered columns of the arches supporting the tower and spire are of Portland stone, being 31 ft. in height from the ground-line of the church to the soffit of the arches, above which is the stone corbeling supporting the ringers' floor, and higher up are the clock and bell chambers, also supported by corbellings of Portland stone. The height of the tower from the floor-line is 81 ft. 6 in., internal dimensions being 25 ft. 8 in. square, or upwards of 102 ft. in circumference. The height of the new spire, from the top of the tower to the apex, is 78 ft. 11 in., the spindles, scroll-iron, and weathercock being 6 ft. more, making the total height of the new tower and spire, from the floor-line, 167 ft., or 30 ft. higher than the old structure. A lightning conductor has been fixed to the spire. Additional aisles to the church are included in the plan of improvement. The north and south transept five-light windows are large, and the north and south transept arches, as well as those of the north and south nave, together with that leading into the chancel, are all of stone, 3 ft. 6 in. thick, with clustered columns. The length of the interior of the transepts and tower is 96 ft., and the width 19 ft. 6 in., which will make room for 134 additional sittings. Messrs. Myers & Son were the contractors, who were represented by Mr. Horsman, as foreman of the works.

Gresford.—The parish church of Gresford has been reopened for divine service after the restoration of the interior. The church has been re-seated with benches to be free and unappropriated. The restoration also includes new flooring, with an encaustic tiled chancel pavement, and the paint and whitewash cleared from the panelled ceiling and walls. The architect was Mr. Edmund Street, of London, and the principal contractor Mr. Yates, of Shifnal. The cost, some 2,721*l.*, has nearly all been subscribed.

Blurton.—The church of St. Bartholomew, Blurton, has been re-opened after restoration, chiefly of the nave, and at a cost of about 400*l.* The work was carried out under the superintendence of Mr. Lynam, of Stoke-upon-Trent, architect; Mr. Barlow, of Stoke, being the contractor.

Meole.—The parish church of Meole Brace is being re-built, from plans by Mr. E. Haycock, junr., architect. The church will consist of a nave 68 ft. 6 in. long inside, by 26 ft. wide, having north and south aisles; a chancel the same width as the nave, and 35 ft. long, terminating in a three-sided apse, and north and south chancel aisles, one being provided for the organ. There will also be a south porch, and at the west end of the north aisle provision is being made for a tower. The accommodation will be for 500 people. The style will be Early Decorated. Red Hill stone is being used for the walling, Shellock for the dressings, and for the shafts to arcade and chancel arch. Bedford Wood stone. Messrs. Bowdler & Darlington, of Shrewsbury, are the contractors. The estimated cost is about 3,500*l.*

Chapmanslade.—The new church here has been consecrated by the Bishop of Salisbury. The style is Early English, and the edifice will seat 133 persons, in open seats. There is some stained glass in the windows, supplied by Messrs. Harwood, Brothers, of Frome, glass-stainers. The eastern window was supplied by Messrs. Clayton & Bell, of London. It represents the Annunciation, Nativity and Baptism, Last Supper, Crucifixion, and Resurrection. The organ was supplied by Mr. Willis.

Westhild (Herefordshire).—The parish church of Westhild has been reopened, after various

restorations have been effected during the last few months. The works have been done by Mr. C. Buffon, of Ocle Pitchard, under Mr. Blashill's superintendence. The tower foundations are in a bad state. The chancel has been rebuilt, together with the north wall of the nave. The south aisle has been re-roofed, and a new porch and vestry have been built. The altar, lectern, and altar rails are of oak, the pulpit of Bath stone, with columns of grey marble, similar to Purbeck, obtained from Messrs. Simpson & Maloué's quarries at Brough, in Yorkshire. The fittings generally are in pitch pine, lightly stained and not varnished. The church is heated by a Gurney stove. The nave is paved throughout in stone, with borders of tiles. The chancel floor is of tiles, by Godwin of Lugwardine. All the fittings are movable.

DISSENTING CHURCH-BUILDING NEWS.

Plymouth.—The Catholic Apostolic Church in Princess-street is now undergoing enlargement and alteration, under the direction of Mr. H. Elliot of this town. A new chancel is in course of erection and new vestries. The alterations will comprise a new roof and side windows to the nave, and a new front or street elevation of wrought limestone of the neighbourhood, with Portland stone dressings to the windows and doorways. The present low-pitched roof of nave, with its flat plastered ceiling, and also the present dilapidated street front, of common-place character, are in process of removal, to allow the new work to be proceeded with it. Various other works for the improvement of the building, including the re-arrangement of the seats and other internal fittings, are intended to be done. The style of the building, when completed, will be Early Decorated.

London.—The new Congregational church, Whitechapel-road, has been opened for divine service. The new edifice has been erected from designs by Mr. T. C. Clarke, of London. The outlay, including all expenses, is estimated at 5,200l. The debt remaining is 1,200l. It has been stated that had it not been for the rise of prices in the building trade, owing to which the tenders came out much higher than had been anticipated, the committee would have opened the new chapel free of debt.

Tunbridge Wells.—The memorial stone has been laid of the Countess of Huntingdon's Church, now in course of erection on Mount Ephraim. Messrs. Winble & Taylor, of London, are the architects, and Mr. J. S. Ancombe the builder. The works are being carried out under the superintendence of Mr. H. Stapley. The funds in hand for the edifice amount to 2,578l.

Arnold.—A new chapel, in connexion with the United Methodist Free Church, has been opened at Arnold. The building, which was erected from designs by Mr. Collyer, is of brickwork and stone, 51 ft. long, 28 ft. in width, 21 ft. high in the interior. The seats on the ground-floor are capable of accommodating 100 more. Underneath the gallery is a spacious room, which it is intended to use for school purposes; and by means of sliding-doors it can be thrown open to the body of the chapel. The material of which the pulpit, gallery, and furniture are composed is plain varnished pine. Mr. Jew, of Arnold, was the contractor; and the cost is estimated at 400l., of which 200l. still remain to be paid off.

Miscellaneous.

ROMAN VILLA NEAR ANDOVER.—Last week the Rev. E. Kell and Charles Lockhart examined a field at Andover Down Farm, called Castle Field, which tradition reported had once been occupied by a castle, and on which had frequently been found fragments of Roman pottery. By means of a long iron rod, they alighted on the wall of a Roman villa, which turned out to be of oblong form, sixty-five feet in length and forty-one in breadth, with a portico on its western side. The roof had been supported by six or eight massive pillars, the vestiges of six of which remained. Many roofing tiles, in good preservation, were found. Two fireplaces were discovered, one of which has been transferred to the museum at Andover; but there was no hypocaust or bath, nor a single piece of tessellated pavement. Various coins were found.

PRINCESS'S THEATRE.—All who heard Miss Glynn's remarkable reading of "Antony and Cleopatra" in St. James's Hall will doubtless renew their acquaintance with the play as produced under the direction of Mr. Vinig at the Princess's Theatre. It has been put upon the stage with great care, and Mr. T. Grieve and Mr. F. Lloyd have painted for it some very beautiful scenery, including a view of Rome, an Egyptian palace, and a view of the Sphinx at the foot of the Pyramid. But for great pressure on our space we should be led to comment on it at some length.

TESTIMONIAL TO A FOREMAN.—Last week a testimonial was presented to Mr. Slade (who for twenty years has been foreman of the brass-workers, at Messrs. Hart & Sons, of Wych-street), by the men lately engaged under him. It consisted of a silver tea-service, of good design, made by Tysal. It was subscribed for exclusively by the workmen of his own shop, in recognition of his good qualities, and on the occasion of his leaving the firm to commence business as art-metal-worker on his own account. Tea-services were previously presented to his colleagues, Messrs. Richardson & Ellison (by the men of their respective departments), who under the name of Richardson, Slade, & Ellison, have added one more firm to the art-metal-workers of London.

ARTISTS' GENERAL BENEVOLENT INSTITUTION. This institution celebrated the fifty-second anniversary festival on Saturday evening at the Freemasons' Hall, under the presidency of Mr. Anthony Trollope, supported by Sir Francis Grant, P.R.A., who has accepted the office of president of the institution, vacant by the death of Sir Charles Eastlake. The Chairman referred to the contemplated orphanage. A gentleman whose name he did not know had offered to build one for the reception of twenty-five children, on condition that its friends should raise a sufficient fund for its endowment. The list of subscriptions had already been commenced, and Mr. Agnew headed it with a guarantee of 2,000l. When established there was a gentleman who would build a second orphanage, with the intention that, as vacancies occurred in the senior one, they should be filled up from the junior one.

THE NATIONAL PORTRAIT GALLERY.—The tenth annual report, just issued, shows that the Board of Trustees of this gallery has undergone changes during the past year by the death of Mr. W. H. Carpenter and the nomination of Sir Compton Lindsay and Mr. Beresford Hope, in the place of Lord Elcho and Lord Dudley, and now consists of fifteen members. The gallery was enriched in 1866 by the presentation of nine portraits and busts, including likenesses of Colclen, Clarkson, and W. S. Landor. The most important donation is a full-length portrait of the late Prince Consort, painted by Winterhalter, and presented by the Queen, whose portrait will also be given at some future time. Fourteen additions have been made by purchase during the past year. The total number of donations received since the formation of the gallery is seventy-two, and of the purchases 163. The total number of visitors to the gallery in 1866 was 24,860, an increase of 8,024, or nearly 50 per cent. over the preceding year.

ARCHITECTURAL STUDENTS IN MANCHESTER.—The Manchester Architectural Association has approved of the formation of a students' class in connexion with its body, for the purpose of mutual intercourse, and advancement in the art and higher branches of their profession. The promoters of the class state that at present many young men leave the profession in disgust on the completion of their articles, and sometimes before, because they find the drudgery of office routine, and the perpetual square work and tracing to which they are kept, fall so very far short of their previously-formed ideal. The short of their previously-formed men an opportunity of culture in matters artistic and architectural, which, with some few exceptions, are neglected during office hours. All members must be associates of the Manchester Architectural Association; and if such a number of members shall join as will justify the rental of a room, the Association has promised to provide a room, which will be at the disposal of the class at least one evening in each week. There will be an out-door sketching-class for Saturday after-noon. The committee consist of Messrs. Batty, Langston, Bennett, Alley, Darbyshire, Oldham, and Ward; and of these Mr. Langston is appointed secretary *pro tem*.

THE WEST HAM SURVEYORSHIP.—On the 21st inst. the West Ham Local Board elected Mr. Lewis Angell, late of Portsmouth, to the office of Surveyor. There were seventy-nine candidates for the appointment.

SILCHESTER.—In our paper about Silchester, last week, for "Mardock Station" and "Strathfield Mardock," read *Mortimer* Station, and Strathfield *Mortimer*. Mardock is on the Great Eastern line; a slip of the pen confused them.

GLASS HOUSES.—A building, five stories high, to be used as a factory, is being erected in the Rue de Tardy, at Saint Etienne. The three sides consist of iron frames supported by stone columns, and filled in with sheets of thick glass.

THE SCANDAL AT GREAT GEORGE-STREET.—We have received several communications on this subject, but do not think it necessary for us to join in the cry against a man who is down. We shall be exceedingly glad if he succeed in setting himself right again.

NEW ENGLISH CHURCH IN PARIS.—At a meeting held at the Grand Hôtel two days back for the purpose of considering the desirability of building a church in Paris to fully represent the Anglican communion, it was agreed that such an erection was required, and a resolution to that effect was passed unanimously.

THE NEW DRILL-SHED AND ARMOURY AT NORTHWICH.—On Saturday last, a meeting of the Finance Committee of the Northwich corps was held for the purpose of receiving tenders for the new drill-shed and armoury; Captain Cheshire in the chair. Tenders were received from six builders in the neighbourhood, and it was resolved to accept that of Messrs. Drinkwater & Leicester. The building operations are to commence at once.

NEW CEMETERY FOR JARROW.—Plans of a new cemetery have been prepared for the local Burial Board by Mr. Thompson, surveyor, and approved by Mr. P. H. Holland, the medical inspector. The site is a piece of ground belonging to the Dean and Chapter of Durham, and situated east of the Springwell Paper Mills. The ground is 15 acres in extent, and this it is proposed to divide into two lots—one of 6 acres for the consecrated side, and 9 acres for the unconsecrated. The estimated cost of the whole, including ground and enfranchising, is 7,000l.

CRYSTAL PALACE RESTORATION FUND.—A great festival is intended to be held on Wednesday, 26th June, in aid of the Fund for the Restoration of the Palace. The long list of eminent artists whose services are placed at the disposal of the Directors for this occasion will render it one of unusual interest. It is anticipated that a notification will be made in the course of a few days of the issue of guinea stalls for this great musical festival, which will be under similar arrangements to the Great Handel Festivals held at the Crystal Palace.

ANOTHER "IRON" CHURCH BURNT.—Christ Church, Kensington, has been totally destroyed by fire. The iron collapsed, and the whole front fell across the carriage-road, nearly killing two men, and setting fire to the boarding of several newly-erected houses, as well as igniting about twenty houses in Wellington-terrace and Portobello-lane, and damaging cow-houses and a timber-yard at the rear of the church. The flames continued to rage for hours, notwithstanding an abundant supply of water, and could not be extinguished until the church was totally destroyed. These "iron" churches are, in fact, mostly built of wood, and their imagined ability to resist fire is a complete mistake, as we long since pointed out.

NEW CHURCH IN ST. JAMES'S, LONDON.—The Duke of Cleveland, the Earl of Derby, Earl Spencer, and Lord Egerton of Tatton, have each subscribed 500l. towards the erection of a new church in St. James's, Westminster, the district for which has been carved out of the northern part of the parish; and 3,000l. having been raised for its endowment in 1865, it was in the course of that year constituted a Peel district, and placed under the charge of the Rev. W. Edwards. The population exceeds 5,000, and by far the largest portion is of the poorest class. For the present the church services are held in the conservatory of the Pambeon, which Messrs. Gibbey, the recent purchasers of that property, have lent for the purpose. It is understood to be the wish of the rector of St. James's, who has set on foot this undertaking, to obtain a site for the new church in Great Marlborough-street.

MONUMENTAL.—A successful casting of a large statue of Mr. Ostler, well known for his labours to improve the condition of the youth employed in factories, has been made at the Phoenix foundry, Southwark. The statue is 10 ft. in height, the figure being in standing attitude. One arm, with the hand pointed downwards, is brought forward; the other rests on the back of a factory girl, against whose breast leans a factory girl. The artist is Mr. J. B. Phillips. The fund for the monument has been raised by subscription in three of the principal manufacturing counties, and the statue will be set up at Bradford.

A LAKE VILLAGE.—A small Pompeii of lake dwellings has been discovered near Daher, in Pomerania. Professor Virchow, to whom the discovery is mainly due, has succeeded in laying open on the western side of the Daher Lake more than twenty larger and as many smaller dwellings. Many remains of bones, horns, leather, combs, needles made of bone, wooden and clay vessels, &c., were found. Similar dwellings have also been discovered near Peranzig, in the New Suetin district, which seem to have been destroyed by fire. The wood used in them, where not burnt, is still in a remarkably good state of preservation.

TENDERS

- For Mr. Henderson's villa residence at Winchester. Mr. R. L. Roumen, architect. Quantities supplied by Welch & Atkinson:—
 - Bevis..... £3,332 0 0

Hoborn Valley Imvements: Kurrington road Bridge. The tender of Messrs. Hill & Keddell, for the foundations and granite pier, under Mr. William Laywood, C.E., has been accepted by the City of London Improvement Committee, £13,541.

TO CORRESPONDENTS.

Winchester Drainage Competition.—We have received several other letters on the proceedings of the Winchester Board, but they are too long for publication. The Forney surveyor (several correspondents desire it should be stated, that although a testimonial was given as noted, the surveyor was dismissed. We must decline going into the particulars).—B & B (as to see the design).—Mr. W. (paragraph has already appeared in—E. F.—Messrs C.—H. R. C.—S. A.—D.—W. H.—E.—C.—J. H.—R.—P.—Use of the Thousands.—J. R.—H.—E.—P.—G.—J. L.—E. R.—E. M. & Co.—L. A.—E. W.—Top and Half Exchange, Southwark.—The architect of this building, is 320 feet instead of 120 feet as stated. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

[ADVERTISEMENTS.]

CHURCH, TURRET, and STABLE CLOCKS.

J. W. BENSON, having erected steam-power and improved machinery for clock-making, at the manufactory, Ludgate-hill, will be glad to furnish to olgyermen, architects, and committees, Estimates and Specifications of every description of Horological Machine, especially cathedral and public clocks, chiming tunes on any number of bells. A descriptive pamphlet on Church Clocks post free for one stamp. Watch and Clock Maker by Warrant of Appointment to H.R.H. the Prince of Wales, and member of the great clock for the Exhibition, 1862. 25, Old Bond-street, and 33 & 34, Ludgate-hill, E.C. Established 1749.

PARIS EXHIBITION.—To Architects visiting the Continent.—Clark's Patent Shutters can be seen at Twenty different places in the Building.—CLARK & CO. by order of the Imperial Commissioners, have fixed their Patent Self-Coiling Steel Shutters to the entrances of the Building and Fine Art Galleries, where the Shutters can be seen in daily operation; also in Classes 14 and 58. Clark's Patent London Venetian Shutters and Steel Shutters are, by order of the British Commission, fixed in the windows and doors of the Testing House, where they can be seen in daily use.

ON the 18th instant, at Bayswater, MARIA, widow of the late GEORGE ALLEN, Esq. of St. Olave's, Southwark, Follow of the Hospital of St. Andrew's, Surveyor to the Gas-holders' Company, &c. in the 61st year of her age.

TO ENGINEERS, &c.

STANNAH'S TABLES.

Weights of Angles and T-ees in lbs. per lined foot.

Publishers: VIRTUE & CO. 25, Ivy-lane, London, E.C.

COMPLETION OF MR. FERGUSON'S WORK ON ARCHITECTURE. Now ready, with 1200 Illustrations and Index, a new, 8vo.

A HISTORY OF ARCHITECTURE in all COUNTRIES, from the Earliest Times to the Present Day.

By JAMES FERGUSON, Esq. Fellow Royal Instit. Brit. Arch. * * * Vols. I. & II.—ANCIENT ARCHITECTURE. 8vo. Vol. III.—MODERN ARCHITECTURE. 8vo.

Mr. Ferguson has chased the styles in historical order and has defined their genealogy step by step, of old and new, so that what has now come to be, and his work is in its present state is the most complete and original that has ever appeared on the subject.—Quarterly Review, Oct. 1862.

Mr. Ferguson's beautiful and most popular books have surpassed any other histories of Architecture. It is not only that the advantage over all his rivals or predecessors, but a special badge of a grasp of his subject, or one soon so well qualified to "The new edition of Mr. Ferguson's 'History of Architecture' is a monument of trifling, taste, and ingenious reasoning."—Edinburgh Review, April, 1857.

JOHN MURRAY, Albemarle-street.

GANOTS PHYSICS, BY PROFESSOR ATKINSON. In 10th Rev. with Coloured Plates and 630 Woodcuts, 15s. the Second Edition, revised and enlarged.

ELEMENTARY TREATISE ON PHYSICS.

PHYSICS, Experimental and Applied, for the use of Colleges and Schools. Translated and edited from GANOT'S "Revue de Physique" with the Author's sanction.

By R. ATKINSON, Ph.D. F.R.S. Prof. of Experimental Science, R.M. Coll. Sandhurst. London: LONGMANS, GREEN, & Co. Paternoster-row.

PERFECTION IN BOOK-KEEPING.

Builders desiring a really good system can have a set of Models for Builders' Books by Double-Kerry, to which was awarded the Prize offered by the Board of Trade, London, and which has been adopted by many large firms. Also a modified set of Single Entry, suitable for small Builders.—Address, E. A. G. St. George's-road, Regent's Park.

To Architects, Civil Engineers, Builders, &c.

THE NEWEST DESIGNS FOR LAMP POSTS.

DWARF GAS PILLARS, Brackets, LAMPS, Fountains, GATES, RAILINGS, Balcony Panels, Stable Fittings, Columns, &c. &c.

will, upon receipt of particular, be forwarded on application to

TURNER & ALLEN, Ironfounders, Engineers, &c. 201, Upper Thames-street, E.C.

Contractors for the supply of Lamp Columns, Lamps, &c. to Railway and Gas Companies; Local Boards, &c.

BURRY.—In the parishes of Wall-on-Thames and West Moulsey, Valuable Freehold and Tithe Free Property, consisting of 232 acres, presenting every desirable building feature, with considerable frontages to three half roads, and a tract contiguous to the river Thames.

MESSRS. COOKES & SONS are instructed to SELL by AUCTION, at the BART, Tokenhouse-yard, near the Bank of England, on the 12th of JUNE next, PROPERTY, known as THE FREEHOLD, the above valuable and extremely eligible Land for a profitable building-estate, having considerable frontage to three half roads, and by a judicious arrangement of new roads nearly thousand yards of valuable property well planted capital, a private cemetery or land or suitable location, affording an admirable opportunity for the erection of a large estate of one mile and a quarter (crossing the river) from Southwark, to the Thames Valley line. For further particulars and order to view, apply to Messrs. DONVILLE, Messrs. FISKE, CALMSLEY, & FORSTER, Solicitors, No. 22, Abchurch-lane, London, or to Messrs. COOKES & SONS, Land Agents and Surveyors, Ludgate-street.

FIMLICO IMPROVEMENTS.—The valuable and useful Building Materials of eleven Houses.

MR. S. B. COOK will SELL by AUCTION, on WEDNESDAY next, MAY 29th, 1867, at TWELVE for ONE o'clock, on the PREMISES, known as No. 2, 4, 6, 8, 10, 12, & 14, Bridge-row, and 5, 6, and 7 Avery Farm-row, comprising over 300,000 good articles, consisting of—SHEETS, GLASS, PAINT, &c.; window glass, sashes, doors, &c. They may be viewed the day prior to the sale. Catalogues on the premises, and at the Auctioneer's Office, 545, 2ndury Street, Eton-square, Fimlico, &c.

BROMLEY, ESSEX.—Very valuable and choice Freehold Residential Estate, known as Bromley House, being an exceedingly comfortable and well arranged family residence, with capital building and all other necessary offices, and a large garden, with a well stocked and a meadow land, containing pleasure grounds, tennis, and well watered. It is situated on the High Street, and is one of the best and most desirable neighbourhoods in the county, and is well adapted for being a most delightful part of the country, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DRIVER & CO. are instructed to SELL BY AUCTION, at the MART, in Tottenham-yard, on FRIDAY, MAY the 31st, at TWO O'CLOCK precisely, the following Estate, to-wit: A substantial, brick built, family residence, containing four bedrooms, a drawing-room, and bath room, on the first floor; a great staircase, and all other domestic offices; standing for eight years; lawn and pleasure grounds, beautifully laid out with ornamental kitchen garden, well stocked with wall and other fruit trees; also the choice residential site, forming the southern part of the estate, containing about 15 acres, forming the southern part of the estate, containing about 15 acres, forming the southern part of the estate.

LETONSTONE, ESSEX.—The Millbrook Estate, a valuable Freehold Estate, comprising about 100 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DRIVER & CO. will sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

ESHER, SURREY.—Freehold Building Land, containing about 77 acres, well timbered, most eligible for building, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DRIVER & CO. are instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

UPTON AND PLAINSTOW, ESSEX.—Valuable Freehold Building Land, containing about 45 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DRIVER & CO. have received Instructions from the Trustees of the late Sir John Perry, to SELL BY AUCTION, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

KENNEL NEW TOWNS, PADDOINGTON, MIDDLESEX.—Valuable Freehold Building Land, containing about 45 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DRIVER & CO. have received Instructions from the Trustees of the late Sir John Perry, to SELL BY AUCTION, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

TWICKENHAM AND WINDSOR, MIDDLESEX.—Valuable Freehold Building Land, containing about 45 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. ROLLS & LAWRENCE have received Instructions from Mr. A. Gillett to SELL BY AUCTION, at the MART, Tottenham-yard, on WEDNESDAY, MAY 29th, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

HOUSLOW.—Valuable Freehold Building Land, containing about 45 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

LONG, BROTH & SONS, will sell BY AUCTION, at the MART, Tottenham-yard, on WEDNESDAY, MAY 29th, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

DULWICH.—To Contractors, Builders, Paviors, Material Dealers,

MESSRS. BENNETT & COOPER are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

WINDMERE-HILL WOOD, NEAR SOUTHGATE.—Annual Auction, at the MART, Tottenham-yard, on THURSDAY, MAY 30th, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. A. RICHARDS will sell BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, MAY 30th, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. DANIEL SMITH, SON, & CO. are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. J. S. GOWER is instructed by MESSRS. J. WILSON & SONS, Contractors, to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. GREEN & SON are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. GREEN & SON are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MESSRS. GREEN & SON are instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

FULHAM.—The most productive and celebrated market garden in the district, and a capital Family Residence, with lawn and all other necessary offices, and a large garden, with a well stocked and a meadow land, containing pleasure grounds, tennis, and well watered.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

MR. PHILIP D. TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

TUCKETT is instructed to sell BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, JUNE 1st, at TWO O'CLOCK precisely, the following Estate, to-wit: A Freehold Residential Estate, containing about 10 acres, and is well adapted for being a most desirable part of the country, and is well adapted for being a most desirable part of the country.

The Builder.

VOL. XXV.—No. 1269.

A French Survey of English Theatres.

SOME months ago the Prefect of the Seine deputed M. G. Davioud, architect-in-chief of the service of walks and plantations of Paris and of the theatres of the Châtelet, to visit the different theatres of London, especially those to which the public are admitted at a low price, with a view to an inquiry into the possibility of introducing similar places of amusement in Paris. The fame of the Britannia Theatre, with its entrance-fee of sixpence, caused special instructions to be given that this establishment should form one of the centres of information. Accordingly, M. Davioud waited till the architect of that edifice was in town, and then commenced his task. We propose to give a condensation of the historical, architectural, and financial report he furnished to Monsieur le Préfet on his return, as it is not only interesting as a French architect's opinion of London theatres, but valuable for the classifications and contrasts made in it. He divides his subject into six sections, and commences the first by saying that the number of London theatres has increased very notably since the Bill passed in 1832 which suppressed theatrical privileges, and left any one free to open a *salle* for the performance of dramatical and lyrical works; although it would be difficult to state what the number is, for some of them are mixtures of concert-halls, theatres, and *cafés* impossible to be classed in a definite category; and others, constructed especially for the performance of music, are at the present time more frequently used for political and religious meetings. After describing the modern feature of the tables in the pit and galleries on which the frequenters can place their glasses, M. Davioud expatiates on the transformation capacities of the class of establishment in which refreshments are sold to the audience, describing how, when the bad season for spectacles sets in, they transform themselves into concert-halls by throwing a flooring over the pit, and building an orchestra in the centre of it, around which the company can circulate, one or more buffets attractively installed still forming a leading feature of the accommodations. But the two and three-fold purposes of these convertible *salles* are great perplexities in the consideration of the form of theatre he would recommend for selection; for, whereas in the best Italian theatres facilities for seeing are most thought of, and in those destined for the performance of the drama the acoustic perfection is first attended to, these, with their fairy-spectacles and promenade concerts, must have more requisites than both of them.

M. Davioud translates our music-halls as *cafés-concerts*, and gives parenthetically what he considers the English equivalent as "public-house-hall." He took count of the places of amusement in all quarters of the town and city, not ignoring "l'East-End," and arrived at the conclusion that not one of them presented any

novelty either in lighting or ventilation. He found that they generally take the form of the plot upon which they are erected, and are either rectangular, square, irregularly polygonal, or circular, according to the site; and for the reason that these sites are mostly in the centre of plots of houses their exterior appearance is little more than a door more or less grand and more or less ornate; and their fenestration opens into the rear grounds with which they are surrounded. In some *salles* the ventilation has no other provision than that which the windows afford, while those which are more complete provide for the escape of the products of combustion of gas by openings in the roof above the chandeliers.

The London theatres proper,—that is to say, theatres in which the audience do not *consume* as they sit in their places,—are divided into three categories. The first comprehends those reserved for the performance of operas; the second the national drama, and foreign plays. The price of seats in the *parterres* of these, we learn, with somewhat of astonishment, varies from three and four shillings to a sovereign. We have, indeed, heard of exceptionally high prices on very rare occasions, but should be scarcely disposed to quote a sovereign as one of the varieties of the usual prices of a seat in either of the houses mentioned as in this class: Her Majesty's Theatre (Le Théâtre-de-la-Reine), Covent Garden, Drury Lane, Haymarket, Saint James's. The first and three last constructed under the *régime* of privilege, present several interesting features to the French architect's eye, especially in their vestibules and staircases; but Covent Garden, rebuilt since the removal of the hamper in question, offers so many technical and economical novelties that he devotes a special chapter to it. Passing on to the second category, built, according to M. Davioud, for the interpretation of Shakespeare and performance of pieces adapted from the modern French theatre, we find the following selection: Sadler's Wells, Astley's Royal Amphitheatre, Adelphi, Lyceum, Princess's, Olympic, and Strand Theatre. With due deference to the author of this classification, we must record the remembrance of a charmed circle hushed in saw-dust, where the possessor of the loudest cracking whip and the brightest buttoned jacket in the world reigned over a tribe of spangled equestrian fairies, for whom he kept a stud of long-tailed earth-pawing steeds, with which they diverted themselves through the live-long night, riding them round and round at a pelting gallop, leaping, as they rode, through wreaths and over festoons of flowers, and performing all sorts of fantastic gambols, that were neither Shakesperian nor adapted from the French. Astley's should have enjoyed a place apart from the theatres with which it is grouped. Few of these possess constructional features of interest to the author of the survey, as they owe their origin to the period before the withdrawal of privilege; though fire has caused some of them to be reconstructed. The Adelphi is selected for a special examination. The third category comprehends the theatres supposed to be frequented exclusively by workmen and *les marins*, which are, for the most part, situated in that scarcely recognisable region l'East-End. In these he finds no boxes, but one vast amphitheatre, or place in common, in which the scale of price is regulated by the distance from the stage. They appear to him to be "*annexes de public-houses*," or the cause of which the public-house is the effect; as he has learnt that it is not rare to find, in London, *cabaretiers* building halls for the purpose of bringing business to their taverns. The City of London Theatre, the Surrey, the Victoria, Marylebone, Pavilion, Garrick, and Britannia are named in this group, and, as we might assume from his instructions, the last-mentioned is selected for a detailed report.

Before proceeding to the examination of the three edifices chosen to illustrate the three categories, the author of the survey reviews the precautions for public safety required by law, dwelling on the clauses in the Act relating to public buildings which render it illegal to erect corridors, passages, staircases, and their supports otherwise than in stone or equally nonflammable material, the discretion allowed to district surveyors, the neglect of art, and the rigorous economy with which private speculators comply with the letter of the law. The obligations of the English Act he nevertheless deems slight compared with the numerous requirements of the Préfet of the Parisian police. The particular mode of construction for the interior and the stage is left an open question, no apparatus in case of fire is fixed upon, heating and ventilating are not obligatory, workshops are not interdicted, neither are there any stringent regulations relating to the comfortable seating of the public, obligatory items which materially encumber the constructors of Parisian theatres, and upon which an ordinance of the Préfet, dated 1st July, 1864, insists more stringently than before. Private enterprise and personal responsibility are left to themselves, with us, to make arrangements that a paternal Préfet takes upon himself. Covent Garden is the theatre which has most closely approached the obligations of the Parisian ordinances; but even here there are short-comings, at which M. Davioud is aghast. He shrugs his shoulders as he views the quantity of wood used where the Préfet would object to it; and makes a special note to the effect that to such a degree of economy is the construction carried that the wall which separates the stage from the body of the house and which receives the curtain, is built of light masonry, and partly wood, and that it does not rise above the *voûte de la salle*; so that should fire break out in the upper part of the stage machinery or scenes, it would spread with the greatest rapidity over the whole edifice, as well above the heads of the spectators as over the stage; whereas, in Paris, the same wall would have been built of strong masonry and carried up to the roof of the house so as to effectually cut the building into two parts, and the opening on to the stage would be furnished with an iron blind which would descend every evening after the performance and close it.

M. Davioud commences his section on Covent Garden Theatre by remarking that it is assuredly the vastest and most remarkable of the aristocratic theatres of London, as well as the most recently constructed, and that it has been built from the designs of Sir John Barry, the son of the architect of Parliament! and he finishes it with the twin comment that it is the most complete expression of the *théâtre de luxe* in London, supplemented with the opinion that it presents the particular qualities of English construction, grandeur of material, and the employment of practical ingenuities, but in point of taste, architectural skill, and researches after comfort, it offers nothing remarkable nor worthy to be signalled. Between this beginning and end he mentions the leading features and novelties of the structure, with an accompaniment of criticism that may be called fair, and generally favourable; but, as we have placed all the particulars of this edifice before our readers, we will not follow him from point to point. He confesses to inability to speak of the acoustic properties of the house, as he did not assist at any representation, and the ventilation he considers voluntarily neglected. Of the Adelphi he cites a short history, telling how it was rebuilt in 1858 on the site of the theatre built in 1821, which succeeded the occupation on the same spot of a *salle de divertissement*. Favourably situated in one of the most frequented of thoroughfares, it advantageously rivals the best secondary theatres, and is, moreover, remarkable

for the production of English versions of French pieces. Built more recently than any other edifice in this category, M. Davioud looks to it specially as likely to afford him study of the most improved modes of theatrical construction. The exterior elevation consists only of a large doorway, the decorations of which compose all the external ornaments of the edifice. A long corridor conducts the company from this doorway to the *bureau de billet*, or pay-place, and divides it into two streams, though it by no means shelters the whole of those who would enter, who, meanwhile, station themselves in the public way till they can gain admission. The ground-floor of the house is level with the street, and two staircases give access to the tiers of boxes and gallery. The form of these is that of an elongated ellipse, of which the curve is graceful, and opens well as it approaches the side-scenes for the purpose of increasing the facilities of seeing. Behind them runs a narrow passage, following the same curve, from which the company can arrive at the part of the tier in which their seats are placed; and leading out of these narrow corridors are refreshment-rooms. The urinals are well installed on each floor at the extremity of a passage, and well sited from the spaces or courts that separate the theatre from neighbouring houses, divided from one another, and capable of receiving five or six persons at a time; but these our French surveyor is sure the French police would not tolerate. He appears to have introduced them at the theatres of the Place du Châtelet of equal spaciousness, and with not less provision for the maintenance of propriety, with the difference that they were only to be found by a descent of fifteen steps, when the use of them was interdicted by the police. The body of the house is lighted by an ordinary lustre, with an opening for ventilation above it; but no means are taken to cause a constant renewal of air, beyond that which is afforded through the doors of the boxes and galleries, which in their turn are refreshed from the corridors by the simple act of opening the windows. The space below the stage is not so considerable as it is in French theatres; nor is the machinery anything like so costly or so complicated, nor are the illusions made by it anything like so complete. The manoeuvres on the French stage are performed almost exclusively by machinery, ropes, and counter-weights, while that now under the scrutiny of the Parisian architect requires a large staff of manual labour. Finally, he perceives that the walls and floors are incombustible; the staircases are of stone and the roof of wood. As in every other enterprise, remuneration for capital invested is the chief aim of the constructor of theatres: art is scarcely taken into consideration, and imagination is more enchanted with the useful than with the beautiful: these are the characteristics which are to be seen still more fully developed in the last theatre to be dissected.

It is for the Britannia that our author reserves his strength.* In point of fact, it is the real cause of his survey, Paris being already stocked with first and second class theatres. This third-class place of theatrical entertainment is unknown there, the nearest approach to it being the *Cafés-Chantants*. He describes the site and appearance of this specimen of popular places of amusement—a public-house in High-street, Hoxton, having on either side of it doorways, which serve as entrances to the theatre in the rear of it; and dwells on the four-fold character of its proprietor, director, actor, and publican, as an indication of the reason why, though destined for the accommodation of as many as four thousand persons, the exterior preserves the character of a public-house, rather than suggests the representation of theatrical pieces within. The two doors divide the stream of persons desirous of entering; that to the left is reserved to those who intend to take seats in an upper circle; that to the right affords access to the pit: waiting the opening of them the company stand partly in the vestibules, extending the depth of the public-house, and partly in the street beyond. Wooden barriers and pay-places divide the crowd again, which ascends two staircases, one leading to the highest priced seats and the other to second-class seats, though both ascend to the full height, so as to facilitate the departure of the *secondaries* at the closing of the house. The pit is gained by three doors facing the stage, it contains twenty-six rows of forms, rising on an incline, of which

the first five rows are reserved places at a higher price than the rest. The house is of the form of a demi-ellipse, of which the great arc would be parallel with the *rideau*, and of which side scenes prolong the curb. It has but two complete tiers, for the third gallery only exists at the sides. Eight rows of benches face the stage on the first tier, and fifteen on the second. To enable spectators to take possession of these seats there is no passage-way behind them, as in other theatres, but simply a space where the public can circulate, or, on occasions of great crowding, stand and view the performances. On the floor above, the staircase opens directly into the gallery, in which people take their seats as they arrive. The absence of regulations concerning the exact amount of space that constitutes a seat augments very considerably the number of persons that can be accommodated. This licence strikes our surveyor forcibly. Where only three persons would be allowed to sit by the French police eight or nine people can find standing room in the Britannia Theatre. He contrasts the theatre of the Châtelet with this East End *salle*, and shows how impossible cheap theatres are in Paris as long as the existing regulations endure. The French house will hold but three thousand spectators on its *surface de places* of 965 mètres; while the Britannia, with a surface of 680 mètres, has held upon crowded nights as many as four thousand five hundred persons. In a word, though fitted with but 2,700 seats, 4,500 people can find room, and are permitted to do so. He next makes some useful remarks about the facilities for leaving the theatre in case of a panic. Though the two staircases are sufficient for an orderly entrance, he doubts whether they would be so, should the enormous number of spectators endeavour to get out simultaneously, as they would do in case of real or false alarm; and if the great crowd rushing out of the hall came in frightened contact with the streams from the staircases, a disastrous collision would take place, ending in a calamity frequent in the history of theatres. After describing the size of the site, the size and form of the house, and then detailing the construction of the different parts, he mentions with surprise the thinness of the brick walls and the strength and adhesiveness of the mortar which converts the slight barriers of bricks into veritable monoliths. The dressing-rooms of the actors also strike him as unlikely to be tolerated in Paris, being very few in number, and placed over a refreshment-room and part of the stage. The ventilation he considers very simple, and no attempt is made at heating. On the 29th of August he noted the result of the precautions taken for ensuring ventilation, namely, the insertion of windows in the *boies* abutting upon the space around the theatre, and observed that in the first gallery, two hours after the commencement of the play, there was an elevation of from 3 to 4 degrees, and a slight odour from the concentration of people; an hour afterwards, in the upper gallery the temperature was still more elevated, and the nauseous odour made a stay there very disagreeable.

In considering whether a similar kind of theatre is applicable to Paris, and whether it could be had there, he takes account of the cost. The Britannia cost 9,000*l.* sterling, 225,000 *fr.*, or about 200 *fr.* the imperial metre, without including the public-house in the main street, the magazines for the decorations, the refreshment saloons, and the urinals in the rectangular perimeter, which cost 50,000 *fr.* (2,000*l.*) more, all of which, however, are part and parcel of the same scheme, and indispensable to it. He concludes that it would not be possible to erect similar structures in Paris, with any chance of their proving a success. Three principal causes lead to this belief:—1st. the high price of sites in Paris compared with those of London; 2ndly, the regulations of the police which insist upon the apportionment of much more space to each spectator than that which the English obligations give; and, thirdly, the same police obligations which are binding as to the monumental nature of the fabric, the security of the public, and the safety of adjoining properties. The site in Paris most approximating to the populoness of that in Hoxton-road, M. Davioud thinks, is the neighbourhood of the Temple, and here instead of 25 *fr.* the superficial metre, as at Hoxton, land is already worth 200 *fr.* or 300 *fr.* per metre. As the French police would not allow 4,500 persons to crowd themselves into a place which was only furnished with half that number of seats, the full number must be provided, which would materially add to the size as well as the

cost of the theatre; and the building restrictions concerning the kinds of materials, the dispositions of all the parts, the exacting of well-lighted *colonnades* or passages, for each tier of galleries and boxes, exactings again for heating, ventilation, or for apparatus to extinguish fires for the furnishing of offices for the police and their commissaire, and the requirement that the urinals should be on the public way, and not in any portion of the theatre, which prevents the existence of any shops on the site, all combine to increase the cost very materially. The Britannia Theatre covers 1,830 mètres, and accommodation for the same number of spectators, arranged on a French basis, would call for a site of 2,745 mètres; and the 200 francs per superficial metre laid out on the Britannia edifice would become, under French police restrictions and obligations, 400 francs: and thus the cost would be swelled to 1,098,000 francs for the structure, and including the cost of the site, as well as of the constructions, it would become a total of 1,647,000 francs. Our architect can by no means recommend our cheap theatres to M. le Préfet. "Born," he says, "of a speculative idea," they satisfy the wants of cheap amusement, and the moralist alone can say whether they serve the popular cause. Before leaving us quietly in possession of our questionable property, he gives us his final opinion as to the value of our higher class of houses. "If from the popular theatres, where we ascend to the *théâtres de luxe*, where the bending should be in accordance with the literary and musical works which are interpreted there, one is forced to allow that England is far from being the country of the arts and of comfort applied to masses of individuals." Our railway stations, hotels, public places, theatres, and concert-halls are to a certain degree striking from the grandeur of their conceptions, just as we are great by our wealth and not niggardly in anything. But the speculators who undertake our theatres do not fatigue themselves with details or deign to satisfy wants which arise from without. The day, however, will come, he thinks, when this same speculator will find that the pleasures of the theatre will pall to those who have to partake of them under the disagreeable conditions such as no seat, no ventilation, and insufficient light; and then he will have to hestit himself. No progress has been made in this direction for the last three years. As though pondering over the remembrances of our hard seats and the desperate squeezes in our narrow entrances on crowded nights, he cries,—"I have shown of what fashion London possesses theatres truly popular and their conditions; and I must finish my task by recording that the *théâtre de luxe* does not exist there."

With reference to the reasons why he does not think popular theatres would pay in Paris, he says the expenses would be nearly as much as those of the ordinary theatres; and further, he thinks a *sentiment égalitaire* would prevent the working classes from frequenting a place especially built for their use. But more than these two reasons put together are the many precise, imperious, and costly requirements of the French police.

WHAT HAS BEEN DONE IN GLASGOW.*

It is unnecessary to dwell upon the mercantile glory and the engineering triumphs of the River Clyde: its noble bridges, extensive quays and wharfs, its ship-building yards, and its graving docks. We shall just mention that the widening and deepening operations on this river have cost from first to last upwards of two millions sterling. As Glasgow bridge fifty years ago there was only a depth of 5 ft. at high water; it is now at least 20 ft., therefore navigable by vessels of the very highest class.

Of course the Clyde is at this moment in the condition in which the Thames was previous to the high-level sewerage operations; and the purification of the river is one of the great tasks which must yet be accomplished. But we observe that it is now engaging the attention both of the trustees and the town council. The subject is freely ventilated; several of the local engineers are in arms, with various schemes for intercepting and utilising the sewage; and therefore, in the present aspect of the question, we abstain from discussing it. Even with all its pollution and noxious smells, the River Clyde is the centre of attraction in Glasgow, the place to which the

* The Britannia is very fully described in a previous volume of the *Builder*.

* See "A Run through Glasgow," p. 325, ante.

stranger will always gravitate. It is a most delightful change, for instance, to emerge from the "vends" and closes of the Brigette, and taking a stand on the fine granite bridge of Stockwell, look up or down at the broad expanse of the noble river, the splendid range of buildings on both sides and the forest of masts in the distance. The Clyde is certainly a beautiful river: let us hope that its purification will not be long postponed.

It is also unnecessary to recite the history and progress of the water supply of Glasgow—one of the most splendid triumphs of hydraulic engineering of our generation. This undertaking, indeed, in its conception and its execution—the magnitude of its operations, the simplicity of its principles, the difficulties which had to be overcome, and the highly successful results—places Glasgow with regard to its water supply in the very front rank of modern cities. The general result of the undertaking is that Glasgow is now furnished with a pure and plentiful supply of water from Loch Katrine—a Highland lake about 35 miles northward in the range of the Grampians—that the water is supplied on the system of constant service, and that the quantity given at present amounts to 26 millions of gallons per day. It may be added that enormous as this quantity is, the works connected with the source at Loch Katrine are so constructed as to be capable of furnishing at least 50 millions of gallons per day—and that, too, with a very small addition to the height of the embankments.*

Having been so successful in regard to the matter of water supply, the Glasgow Corporation has not neglected the important question of gas. About three years ago they applied to Glasgow the Act of Parliament under which the sale of gas may be regulated; and during the interval which has since elapsed arrangements have been in progress for the carrying out of that resolution. Suitable premises have been provided next to the police-office in South Albion-street, and an inspector under the Act has been appointed. One of the chief objects contemplated is the periodical testing of the gas produced by the two local companies; and we are glad to report that there is no difficulty found in keeping up the Glasgow gas to the legal minimum of ten candles; in fact, it is said that as a general rule the gas—which is entirely produced from canal coal—is equal in illuminating power to 27 candles! In addition to this testing of the value of the gas, experiments are also made by the inspector with regard to the best and most economical description of burners used in the consumption of it. Lastly, an important provision is made for testing the accuracy of the gas-meters which are used in measuring the consumption. It is said there are 70,000 or 80,000 gas-meters scattered throughout Glasgow; and, should any doubt exist as to the condition of one, for the moderate charge of sixpence, it may be sent to the test house and duly certified.

With regard to the lighting and paving of streets, construction of sewers, erection of public "stopping-places"—we do not know as to water-closets—public ash-pits, &c.—we have only to report generally that the Corporation has not been negligent of its duty. The underground sewerage of Glasgow, we understand, is very good, and deserves a better outlet than the basin of the Clyde at Bromielaw. There are upwards of 150 miles of paved streets. The pavement is unquestionably good, for Glasgow possesses great facilities for procuring granite cubes from the Argyleshire quarries. We cannot speak so favourably of the footpaths which even in the best quarters of the town are laid down with asphalt, and are of course cracked and broken in every direction. There is a very spacious cattle market erected so far back as 1818, but it is still the best in Scotland. There are also two or three magnificent cemeteries, the Necropolis and the Spring-hill Cemetery being the chief, and occupying sites of some picturesque and secluded. We may add here that the Corporation Buildings in Sanchiehall-street, the Sheriff Court Buildings in Nelson-street, and the new Police Buildings in Albion-street, as well as the whole of the public buildings under the control of the magistrates, are in every respect suitable for their respective purposes,

* Judging from a report of Town Council proceedings (March 5th, 1867), it would seem that the Glasgow Corporation are extending their system to the small towns in the neighbourhood—such as Rutherglen, Shettleston, and Calcutt.

and not unworthy of the city to which they belong.*

In speaking of the progress of Glasgow, we cannot omit to advert to its extraordinary increase of population. At the period of the union it was only 14,000. By the last census it was within the Parliamentary boundary, 395,503, including suburbs, 446,639. In the year 1864, the population was estimated at 467,114; and at this moment we may safely assume it to be 450,000. Within a period of fifty years the population has more than quadrupled, and it has been augmented tenfold since the period of the American war.

The number of dwelling-houses within the Parliamentary boundary amounted in July, 1864, to 92,480, of which 87,604 were occupied, and the remainder empty. These empty houses are now filled up, and rents are rising, therefore we may presume that building will again increase.

The gross rental of Glasgow for the same year, was 1,778,728*l.* Within the three preceding years it had advanced no less a sum than 110,575*l.* For the present year the rental, as furnished by Mr. Donaldson, the assessor of the city, is as follows:—

Houses, shops, warehouses, factories, gas, water, and other works within Parliamentary burgh.....	£1,769,212
Railways and canals.....	26,688
	£1,835,900
Royalty beyond Parliamentary burgh—Houses, shops, factories, &c.....	27,702
Railways and canals.....	9,422
	£1,863,094
Showing an increase on last year's rental of	64,594

A city which increases at the rate of 50,000*l.* and more of annual rent, is certainly in a very flourishing condition; and if we were sure the population made a corresponding increase in education and intelligence, there would be very little left to desire.

But in any proper estimate of real progress, we must always keep in view the relative values of the increments as contrasted with the aggregates of a population. The value of a London population, for example, as compared with Glasgow, will be found greater in the ratio that it absorbs a higher or, at least, a richer, class of people. It must always be remembered that a large city like Glasgow sucks up population from the adjacent country districts like a gigantic sponge; and it has no choice,—it cannot be particular in selecting. The fact is, that Glasgow has suffered more than any town in the kingdom from the character of its poor population. Liverpool has had its Irish indeed, but Glasgow has been overwhelmed with Highlanders and Islanders, as well as Irish; and among these foreigners, when they become resident, there is propagated a native population of the very lowest type!

Indeed, it does not require much consideration of our own previous remarks to detect the fact that the great blot on the general prosperity of Glasgow is the wretched condition of the poorest quarters of the city. This circumstance has been often pointed out. Mr. Chadwick, in one of his early and most vigorous reports, made the statement that the population of these wynds and closes was not only the worst he had seen, but the worst of whom he had been able to obtain any account! Subsequent investigators, ourselves among the number, only confirmed the truth of this sad statement; and even a superficial observer like Augustus Sala, in his visit to the Salt-market, speedily came to the conclusion that there were ample grounds for a charge of corporate neglect. At length the public outcry grew so great that the Glasgow people took in hand their own purification, and they went about the work with characteristic energy. It is just possible they may have been too energetic as a corporation, or, at least, too sweeping in their projected improvements. But there can be no doubt that they proceeded in the proper spirit and in the true direction. For what can be done with most of these hotbeds of disease and pauperism but to exterminate them? To try a piecemeal improvement is out of the question; not only would such a course have been unproductive of good result, but any result would have been inadequate to the cost. Accordingly, the Glasgow corporation resolved, in the most thorough-going and commendable manner, to pull down their slums and rookeries

* The fine range of galleries in Sanchiehall-street, were at the time of our visit occupied by the annual exhibition of pictures of the west of Scotland Academy of the Fine Arts: a very creditable collection, we may state.

and build new streets and improved dwelling-houses.

We believe that we are correct in awarding the principal praise for this bold and original conception to the former Lord Provost of Glasgow, Dr. W. G. Blackie, a member of the well-known publishing firm of Blackie & Sons. It is curious to observe that another publisher, who is also the Lord Provost of another celebrated Scottish city, has had the good fortune to be the recognized author of a similar Improvement Bill—we mean, of course, Mr. William Chambers, and we refer to Edinburgh. But the priority of publication, so to speak, of the rival Acts of Parliament undoubtedly rests with the Glasgow lord provost. May a worse rivalry than this occur between them? We ought to add, in connexion, that a large proportion of the labour, whatever we may say about the credit, of such measures falls on the shoulders of the city officials,—the town-clerk in particular, and the city architect; but as they are paid for their labour, and the lord provost is not (or at least, not more than nominally), it has grown into fashion that the chief magistrate gets the honour, whoever gets the profit. We will not stay to disturb the arrangement, if the parties are at peace.

The specific result of the Glasgow corporate action, was the passing of a Bill, entitled, "An Act for the Improvement of the City of Glasgow and the Construction of New, and Widening, Altering, and Diverting of existing, Streets in the said City; and for other purposes."*

The preamble sets forth, in the first place, that various portions of the city of Glasgow are so built, and the buildings thereon are so densely inhabited, as to be highly injurious to the moral and physical welfare of the inhabitants; that many of the thoroughfares are narrow, circuitous, and inconvenient; that it would be of public and local advantage if such houses and buildings were taken down, and such portions of the city reconstituted, and new streets constructed; and that in connexion with the reconstitution of those portions of the city, provision were made for dwelling-houses to the labouring classes who may be displaced in consequence.

Secondly, that provision should also be made for the establishment and maintenance of a public park in the north-east quarter of the city.

And, lastly, that the Lord Provost, magistrates, and council should be appointed trustees, for the purpose of carrying the said works and improvements into execution, and that they should be authorised to raise money for the purpose by means of rates, and on money borrowed on the credit of such rates, and on the credit of the property acquired in virtue of the Act.

Anything more simple and straightforward in the shape of sanitary legislation than this it would be very difficult to conceive. The simplicity of the measure, indeed, was never, as far as we are aware, called in question; it was its magnitude and the conflicting interests which were involved that excited the inveterate opposition which we are sorry to hear is now offered to the carrying out of the Act. It must be admitted indeed that this Glasgow improvement Bill gave the corporation prodigious powers. They have power to take, in the first instance, enormous quantities of land, within the whole Parliamentary boundaries of Glasgow, and to construct no less than *thirty-nine* new streets; powers to alter, widen, and divert at least twelve existing streets, "the whole being situated in the city of Glasgow and county of Lanark;" and powers to stop up some thirty or forty back streets, wynds, lanes, and closes, the very names of which we can understand are indicative either of their antiquity or their infamy. Such soil and ground, it is also provided, as may be derived from closes and streets so stopped up and inclosed, shall be vested in the corporation as trustees, who are also empowered to make lateral and vertical deviations, and to construct minor works, such as drains, sewers, and watercourses, on such void ground. One section (the 22nd) gives powers to pull down buildings and lay out the lands "of new;" and the section following provides that "the trustees may, on any lands so acquired by them under this Act, erect and maintain such dwelling-houses for mechanics, labourers, and other persons of the working and poorer classes as the trustees from time to time think expedient; and

* It received the royal assent on the 11th of June, 1866. The solicitors were Simpson & Wakeford, of Abingdon-street, and Alexander Munro, E.S.C., town-clerk of Glasgow.

let the same when so erected and fitted up to such mechanics, labourers, and other persons of the working and poorer classes, at such weekly and other rents, and upon such terms and conditions as they from time to time think fit; or the trustees may sell and dispose of the same." As a highly necessary corollary to this clause, provision is made further on that the trustees shall not eject nor displace, within any period of six months, any number of the labouring classes exceeding 500 without a certificate from the Sheriff of Lanarkshire that other and suitable accommodation has been provided for them or already exists within the city or in its immediate neighbourhood. Furthermore, the trustees are bound, when they mean to pull down fifteen or more houses belonging to the labouring classes, to make known their intention to the parties most concerned by means of placards or handbills, not less than eight weeks previously. The empowering powers authorised by the Bill amount to 1,250,000*l.*, a sum which will convey some idea of the magnitude of the contemplated operations. The final principle it contains is of course a power to defray the expenses by levying assessments; and this is done "upon the occupiers of all lands and heritages situate within the city." The assessment is annual, not exceeding sixpence per pound on the rental or annual value of such heritages for the first five years; and not exceeding threepence per pound for the next ten years after the expiring of the said five years. There are certain compounded or reduced assessments, such as land used as arable, meadow, or pasture ground; woodlands, market-gardens, and nursery-ground; canals, railways, gas and water pipes underground,—which are assessed in the proportion of one-fourth only of their net annual value. Finally, there is one most important exemption, and that is, property of a less rental or annual value than 4*l.*

Our readers will probably recognise in this Bill certain principles which we advocated years ago, when these were not so fashionable, and which we have never ceased to support. We are not so sure that we ever recognised the policy or propriety of loading a whole community for the space of ten or fifteen years only, with the cost of that condition of things, which had been the result of centuries of previous error and neglect; and of which the improvement will be felt as a benefit, not only by the present but by many succeeding generations. If, indeed, sanitary reform could be carried by a *coup de main*, or if poverty and crime could be struck down like an ox by one blow, then Lord Provost Blackie would appear to posterity among the ballies of Glasgow, something in the same light as that which Samson occupies among the Judges of Israel! But, alas! the history of human progress contains but few illustrations of such royal roads to improvement! Our most summary legislation will neither destroy pauperism nor prostitution, any more than disease or crime; and because society tacitly recognises this indubitable truth, or at least instinctively acts upon it, it is the fate of all such measures, however well intentioned and honestly constructed, to fall short of their original purpose. Such was the fate of the Central Board of Health Act in England; such seems to be the fate of the last General Police Bill for Scotland; and such, we are afraid, is the fate which at this moment hangs over the Improvement Bill for Glasgow. So long as the Lord Provost was engaged in promoting his measure, if not absolutely cheered on and applauded by the community over which he so worthily presided, he was at least openly encouraged and supported. But when speculative principles began to assume a practical form, in the shape of an assessment, the same community rose like one man, and ignominiously turned out the town council, not only the Lord Provost himself, but all his sanitary disciples! This occurred at the municipal elections in November last year. It was the old story, of course—another instance of the ignorant impatience of taxation.

Since an opportunity for improvement of such legal power and completeness has been provided in Glasgow, it would be a pity if the inhabitants did not avail themselves of it. For the truth is we are gradually getting alive to the fact that reforms of this character must be effected by the community itself if they are to be effected at all.

The removal of the University is a more satisfactory subject. We have already described the disgraceful condition of the locality in which it is at present situated, and the scanty accommodation afforded by the ancient buildings them-

selves. It happened fortunately that the Union Railway Company—a railway which will pass through the suburbs of the city, and which possesses the additional advantage, by crossing the Clyde, of connecting the different systems upon the north and south side of the river—sprang into being. It is highly probable, we think—but this is a mere conjecture—that the promoters of this Union Railway had been *alumni* of the Glasgow University. For they projected their line, in the first place, through the south-western angle of the far-famed College-green; and secondly, they projected an enormous goods-station on the very site of the ancient college itself! The result was that 100,000*l.* were offered to the trustees and the Crown in the shape of purchase-money; the bargain was struck; a clause was inserted in the Bill; the Bill passed, and the transaction was closed—we need scarcely add with great satisfaction to the subscribing parties and to the public.

By the sale we have mentioned, and from other sources, the University became possessed of 100,000*l.* The Glasgow merchants and manufacturers came forward and nobly subscribed 150,000*l.* by the end of the year 1865. Other contributions have since flowed in; and in the course of another year or so it is expected that the full sum required for the new University will be completed, that is, about 350,000*l.*

The University of Glasgow will be rebuilt on the eminence called Gilmore-hill, on the west bank of the river Kelvin, which forms the boundary between the College grounds and the West-end Park. Upon the opposite eminence, at the distance of half a mile, stands that stately range of crescents we have tried to describe. Mr. Gilbert Scott is the architect of the new buildings, and his plans, we believe, have been generally approved. The design is of course Gothic; and the plans indicate that the new College shall be in keeping with their scholastic character. In the centre of the pile of buildings there will be a tower 300 ft. high; and there will be a hall capable of containing 2,000 persons. A plot of ground hard by has been acquired for the site of a medical hospital; and, by the year 1870, it is expected that the professors and their students will remove to this new, more commodious, and certainly more respectable, seat of learning.

For some time, it is proper to mention, a cloud hung over even this enterprise. The Union Railway, it was discovered, might prove a bad speculation; the bargain might never be carried into effect. But we are glad to understand that the promoters are progressing steadily with their scheme; they are, in fact, in the active exercise of their powers of compulsory purchase; and we have been confidently assured that the improvements which will be effected by the operations of this railway alone will give a new and better character to many parts of the city. Dunlop-street, for example, is to be opened up in a line with Millar-street on the southern side of Argyle-street, thus forming a direct communication south and north from the river to George-square. But the total destruction of the old university, we predict, will be the greatest improvement which it will effect.

We had something more to say, but we must draw our cursory remarks to a conclusion. If we have not stated all the efforts the Glasgow people have made in the cause of progress and reform, we have at least indicated their direction and described their spirit. It would be easy to find faults; and on some future occasion, perhaps, we may return to the subject, more with the view of pointing out blemishes on their social organism than our present purpose comprehends. At the same time it is not our way to inquire too curiously when we find a community so alive to their true position, and so earnest in their endeavours to amend it, as the Glasgow people unquestionably are. Our readers will doubtless agree with us in the opinion that this is a great city which is yet destined to achieve still greater things. Its rapid growth, as we have said, is one of the most remarkable phenomena in our history. Nor do we see the least indication of this growth being checked; for if we only look at its present rapid extension eastward and westward along the banks of the Clyde, where the roads are dotted with villas as thick as those of Hampstead or Highgate, it is difficult to resist the conclusion that the boundaries of Glasgow will soon spread from Rutherglen to Renfrew on the one hand, and from Bothwell to Dumbarton on the other.

EXCURSIONS OF WORKING MEN TO PARIS.

At the end of the ensuing week, many hundreds, or perhaps thousands, of English excursionists will cross the Channel, some of them under the leading of speculators, and others under that of individuals actuated by the thoroughly commendable desire of securing for their countrymen some of the benefit which may be derived from observation of what is new and curious in mechanism or science, or tasteful in art, or the no less commendable aim of improving the relations between the one nation and the other. During Whitsuntide there will probably be more Englishmen in Paris than there have ever been before at one time; and week by week, to the close of the Exhibition, visitors will be going over singly, and in batches, to swell for a while the numbers of what M. John Lemoine has chosen to call *la colonie Anglaise*, and to contribute by their demeanour,—in default of other evidence, which perhaps might be taken as largely in their favour,—to future pictures of the English painted by the French.

The bulk of these visitors will not remain long enough for appreciation of what is great and exemplary in the French people, or for the getting rid of that besetting conviction of John Bullism, which now imperils the position of this country as to manufactures even, to wit that to the Briton is vouchsafed a monopoly of power in whatever he may choose to undertake. Nay, more, the majority may return, like the greater number of English visitors in ordinary years, bewildered by what they have seen, not instructed, and having gained new prejudices rather than lost the old, whilst having helped to increase that misconception of our nation which is common in France.

A serious duty, therefore, devolves upon, or is undertaken by, those organizers of excursions who have been actuated by views not of personal benefit, or of the provision of some amount of mere relaxation for others. That duty is to point out the way in which benefit may be derived, and the least amount of the misconception be left in the minds of the people visited. There are the nations, worse consequences from isolation and from difference of language, than those comprised in the withdrawal (which is but temporary) of a branch of trade or manufacture. There may be prejudices, as between England and France, dating from half a century back, and coming to expression sometimes of ridicule, and sometimes of contempt, which are attributable to nothing but the difference of language, the existence of two-and-twenty miles of separating water, and to certain defects on our own side; and these may be of the nature of causes from which enmities arise.

To the Englishman who has never been on the Continent, and who speaks only English-French, there can be no sensation more remarkable than that of his first landing at Dieppe. The coast looks so little different from that which you left, that you are passing into harbour before you detect by the great crucifixes that look down upon you from the quays on each side, that you are arriving in a country where much will be new. From that moment you alternate between bewilderment at the difference from what you had been accustomed to, of things that you expected would be the same, and a similar feeling at the similarity of what you had thought must be different because foreign. The language, as learnt, helps very little; it even contributes to the embarrassment; whilst the politeness, and quickness, of the people, together, prevent perception by the average Englishman that he is wrongly understood when he is so.

Should there be a serious misunderstanding presenting itself, as existent, to the mind of the Englishman, he, according to the united testimony of Frenchmen, drives his fist through it; which manner of proceeding, indeed, in his way through the world, is habitual with him, and which he is rather proud of. There is nothing that the French feel more certain of than this practice of pugilism, as national with us, unless it be what they equally ascribe to us, a taste for strong liquors, if not habitual drunkenness. We could multiply evidence in proof of the existence of these impressions. They are marked in the acted dramas, and in the romances of the *feuilletons*. Who that reads of special trains conveying some of the upper ten thousand to a fight, can wonder at one of the impressions? As regards the drinking-habit, this very week, in an exciting tale by M. Ponsou du Terrail, the

catastrophe of the story is made to turn on the fact that the driver of a four-in-hand coach, being an Englishman, was drunk. It is of no use to argue with ourselves that these notions are absurdities. We should look into the foundation for them in facts as they were, and of which the record or recollection exists with the French, if not also in facts as they are, that is, as presented by many English visitors to the Continent.

What is most common and offensive, however, to the French, irrespective of a want of courtesy generally, is the habit of pushing through crowds. The Frenchman is the real observer of the English vulgar maxim, "First come: first served,"—as witness the regulations for getting seats in the omnibuses, at the stopping-places, and the arrangements to prevent crowding at the doors of the theatres. But it is in the demeanour when walking the streets, that the greatest contrast is to be observed between the Frenchman and the Englishman. With the former, the slightest obstruction accidentally offered to a passenger is followed by a "Pardon, Monsieur!" A similar courtesy is observed in passing you as you are seated in the pit of a theatre, or on the top of an omnibus, or even in passing on the stairs. One French writer, having described the throng of Fleet-street, says of the Englishman that if the latter knocks down some poor old woman, it is of no matter to him; has he not to get to his appointment in the City? Again, in France, supposing you to be stopped in your route by some one asking his way, the question would be put with an apology for stopping you, and the information received with many thanks. Here, in London, you may be arrested in the Strand, at a moment when you have not a minute to spare, and as if the inquirer had had the right to stop you; and when you reply, directing to Waterloo Bridge, he who made use of you, and to your cost, will depart without a word of thanks. It is this sort of rudeness that the French cannot understand, and that justifies the observation, which we quote from the *Pall Mall Gazette*, that "we are the least well-bred of all the great European nations." There is no particular difference between classes, in England, in the matter referred to: the well-dressed man and the workman will be equally un courteous; whilst in France there are no individuals more polite than the working-men. Surely, the consideration for others is no more than observance of the Christian principle.

The French find us so strangely wanting in what seems to them essential; and they have met with so many rebuffs when attempting to show kindness, that they give up effort to understand us.

The Frenchman is supposed to take off, or at least to touch, his hat on entering a shop, a restaurant or *café*, or an omnibus. Some two or three years ago, it was noticed in the Paris papers that frequenters of some of the very crowded *cafés* of the Boulevard Montmartre were omitting the courtesy,—especially necessary to the lady of the *comptoir*. The observation, we recollect, was that English manners were being introduced. The Englishman in Paris will find himself none the less comfortable if he never omit taking off his hat to the presiding goddess, instead of merely touching the hat. Generally, a simple observance of deference to the feelings of others will help to make his stay in France more agreeable than otherwise it might be; and besides his avoidance of being disliked, or only tolerated, the compliment will be paid, usual in such cases with the French, of saying that he is not like an Englishman.

We would address these observations to no particular class. But we may mention that the writer of this, happening to be in Paris in 1861, when English working-men's excursions were commenced under the auspices of Mr. Layard, the late Sir Joseph Paxton, and others, saw enough to induce him to speak now as above. The march of a file of broad-shouldered working-men, perhaps hailing from the northern counties, or across the Tweed, along the boulevard or the Rue de Rivoli, is like to nothing but the passage of a sixty-pound shot through the crowd. If the young Englishman (and his sister) must walk at a quick pace, he must recollect that a Frenchman in the street does not expect to be even touched by another pedestrian, at least without apology.

It would be so very easy to convert the contemplated visits of working-men into a means of cementing the relations between the two countries, that we trust the effort will be made, com-

mencing with next week. There are several organizations, including that of the Society of Arts, and that of the Committee which has its present quarters in the Strand, at the offices of the Working Men's Club and Institute Union. Of this latter organization, which is presided over by Mr. Layard, Mr. Hodgson Pratt has been the chief instrument; and though the French Government have come forward nobly, promising the same lodging-accommodation as is afforded to French workmen, Mr. Pratt is to believe at this moment, or pending the formation of a guarantee-fund, personally responsible for the cost of the accommodation, or for a total sum that would amount, should the expected number of 150 excursionists per week not present themselves, to many hundreds of pounds. It is to be regretted that the organization was not put more prominently forward as that of the Working Men's Club and Institute Union, of which it is really one of many useful offshoots. The best arrangements, however, otherwise, have been made.

The chief inducement with many, for the visit to Paris, will be mere relaxation, obtained at a cheap rate; but we look forward to more important results. Far from the truth being, according to Pope, that—

"Not to go back is something to advance,"

the line should rather be,—

"Not to advance is something to go back."

The world is everywhere advancing; and when we reported some two years ago that the agents of the works at Creusot, in France, were offering to English firms foreign manufactured iron and machinery at less than English prices, and castings that, in consequence of strikes and of some want of appliances, could not be supplied by our founders, we were not prepared for the testimony that has been given lately to the continuance of such a state of affairs. A country that isolates itself, and that rejects such educational systems as are bearing fruit in science and manufactures in France, and in Austria, as well as other chief countries of Europe, must be left in the rear; and all the dinning of the jargon that we "hold our own" will not alter the sequence of effects. We say nothing now of what is to be learned in the matter of decoration.

It imports both the "heads" and the "hands" of English manufacturing establishments to take note of what there is in Paris just now, and to be prepared with programmes of inquiry, as after the manner of one adopted by a society at Versailles, in Belgium, and quoted by the *Engineer* in an article entitled, "How to Extract the full Value from the Paris Exhibition." Mr. Pratt's committee propose offering prizes for reports; and we trust that in this particular, as every other, the efforts may meet with success.

ARCHITECTURE: ROYAL ACADEMY EXHIBITION.

The place of honour, so to speak, is given to Mr. E. M. Barry's design for the National Gallery (897, 898), of which we published an engraving and particulars in our last. Other of the principal designs exhibited have also already appeared in our pages, and are known to our readers; such as the "Quadrangle of the New Exchange at Liverpool" (896), T. H. Wyatt; "Design for the Law Courts," W. Burgess (899); "Design for International College, Spring College," Norton & Masey (875); "The Royal Albert Hall of Arts and Sciences" (905), H. Y. D. Scott; and others. Mr. Penrose exhibits a "View of his Design for the National Gallery," which places his intention in a better light than some of the drawings he sent in competition.

873, "Shephalbury, near Stevenage," recently erected for Mr. Unwin Heathcote, from the designs of T. R. Smith, is a red brick and stone house in Hampton Court style, suggesting comfort and respectability. Mr. T. R. Smith exhibits two other very good country houses, "Stanchlife, near Matlock" (907), of which he has views in the Architectural Exhibition, Conduit-street, as mentioned by us recently; and "Blythwood, near Taplow," now in course of erection for Mr. George Hanbury. This, also, is of red brick and stone.

881 is a "View of Longmead, Bishopstoke, Hants," the seat of Mr. A. Barton, G. E. Street, a substantial-looking building of red brick and stone. It has for chief features one handsome bow, the stone window-heads displaying tracery,

and string-courses with inscriptions in them. Mr. Street also exhibits his "Design for North Porch of the proposed new Nave of Bristol Cathedral," and which seems in the drawing a little mixed up with the lattresses. It includes sculpture in a panel above the doorway, and a figure on each side of it.

883, "Interior of the new Church," now building at Sutton Veny, near Warminster, from Col. Everett, like all Mr. Pearson's designs, has a good serviceable common-sense look about it that satisfies the understanding. The interior stonework is shown as coloured.

886, "Interior of the Church of St. Andrew, Camberwell," B. Keeling; and 887, "Interior of St. Lawrence, Norwich," as proposed to be restored by F. Wallen, both show a large amount of polychromy.

Dromore Castle, Co. Limerick, 888, to be built for the Earl of Limerick, E. Godwin & Crisp, is Irish-castellated in style, and well suited to its position on the hill-side, out of which it seems naturally to grow.

893. Drawing of "Mansion" proposed to be erected at Sidney, for Sir Daniel Cooper, H. M. Barton, is much injured by an outrageous sky.

The Junior Carlton Club-house, now erecting in Pall-mall, from the designs of D. Brandon (895), will add another Anglo-Italian palace to Pall-mall. It has a second front in St. James's-square.

900. "The Original Design for Holy Cross Church, Liverpool," E. W. Pugin, shows a handsome west window. The effect of the church is injured by the connected buildings, which are awkwardly crowded on to it. Mr. Pugin also exhibits a view of his fine Church of Notre Dame de Dadizeole, near Courtrai, one of the best he has done.

"The Water Tower erected at Castle Ashby, Northamptonshire," for the Marquis of Northampton, from designs by M. D. Wyatt (901), has a parapet of letters, following the character of the well-known residence, and a circular panel filled in with a monogram. The tower exhibits a certain largeness of parts observable in other of Mr. M. D. Wyatt's designs.

903. "Warehouse proposed to be erected near Deptford," for Messrs. Wilkins, J. P. Jones, is an Italian-Gothic building of some pretensions, but scarcely suggests its purpose.

The design for the "Farrington-street Bridge," in the Holborn Valley, W. Haywood (906), includes iron arches on piers of vari-coloured granites. It promises to be a more successful structure of the kind than has yet been put up in London.

"The Grand Hotel, Scarborough" (913), C. Broderick, is nine stories in height on one side, and six on the other, where it adjoins the pier. The style is Italian; the roof-line somewhat confused.

OUR FUTURE ARCHITECTURE.

It is now some twenty-two years since our esteemed friend Professor Kerr amused and delighted the greater part of the architectural profession by the publication of the "New-leafs Discourses." You will observe that I confine myself to the greater part, for it must be confessed that one portion of the profession was neither amused nor delighted. The reason was very obvious. Professor, then Mr. Kerr, had the heresy to assert that Architecture was not mere construction, archaeology, or knowledge of Greek, Roman, or modern detail; but was emphatically a fine art, and a very fine art indeed. At the present day the learned professor would have been understood properly, but it was different in 1845. Then some people could by no means understand that a man might have all the modern construction of a house at his fingers' ends, and might take out quantities and do surveys and dilapidations, to say nothing of valuation, and with all this yet not be an architect. Accordingly, Mr. Kerr got some severe rups, evidently from the elder members of the profession. The papers having been collected and published in a separate form; the subject appears to have dropped.

Yet no subject can be more important to us students, who are now fighting the uphill battle of Fine Art Architecture. To clothe Professor Kerr's thoughts in other words, the various styles are to really beautiful architecture very nearly what languages are to a poem. How seldom do we find a man who can write equally well in two languages. How often in

* Originally published in the *Builder*.

such a case do we not find that one tongue goes to the wall, that some of the words are badly chosen, some of the sentences ungraceful, and some of the expressions sin against the idiom peculiar to the language; and yet an architect is expected to design equally well in the mediæval and pagan styles, which have just as many differences between them as the two languages have. But go a step further, and suppose that we had no fixed vernacular, and we were obliged to express ourselves in broken French or broken German, what sort of things would our poem turn out, in spite of any really poetic thoughts we might possess? Still the comparison holds good. We have no real vernacular in architecture. Neither of the two great styles belongs to our own days. We have to learn them painfully and imperfectly as we should learn languages. At the present time, indeed, we are seeking for an architectural language suited to our times, and we ought not to be disappointed that we do not get it in a single year. But almost every language can be traced back to a parent stock, and so with our new architecture. We have taken many points of departure, and thrown them away, one after another, until it must be confessed that we have got a little confused, and are by no means so advanced in our task as we have a right to expect, considering the pains we have taken.

The last century was consistently working in the traditions of Sir Christopher Wren; when, lo! people took to measuring the Parthenon, and we had accordingly to begin almost anew, only this time with Greek art. Unfortunately, after a few years, people discovered, very unwillingly it is true, that the climate of England was not precisely identical with that of Greece; that the broad surfaces and flat shallow sculpture, however well they might look beneath the sky of Athens, were different things when executed in cement and put up in London. Then we tried our national style, beginning with the latest and worst phase of it. I need scarcely tell you how from Perpendicular we went to Early English, and then to Decorated, always beginning backwards, until at last we came to what is called the Geometrical Decorated, and we were going on, to all appearance very well indeed, until one day Mr. Ruskin published his "Stones of Venice," and then a rush was made for Italian Gothic architecture, the details of which, never very fine, were nearly as unsuitable for our purpose as those of Greek architecture itself. I do not for one moment wish to deny the wonderful massiveness, heauty, and strength of the larger Italian works; on the contrary, I think them deserving of the most careful study, although they are precisely the features most difficult to introduce in these days of leasehold tenures and large fenestration; but the details of Italian-Gothic are worse than useless. For the most part, they are executed in marble, which requires just as different a treatment to stone as stone does to brick; for what do we see? In marble-work the work is generally shallow, and on the surface; for the material is hard. A system of rectangular panels obtained, for marble is generally supplied in thin pieces, and panels are the readiest way of showing off the peculiar colours and veining. In stone, on the contrary, the members rely on the mouldings, carvings are often deeply undercut, and the buttresses jut out like rocks. But in brick we found them very shallow, and iron tie-rods used to keep opposite walls in their places. The mouldings are also comparatively few, except we go to those countries where the clay, by the application of ornament and superior manipulation, becomes terra cotta. In speaking of brick construction, I have rather more in my mind the private houses in Belgium, than the wonderful churches at Milan.

But to return to my subject. Of late years we have actually taken to tamper with the old details of the styles we employ. We chamber things that ought never to be chamfered. We try to get an appearance of strength by using forms which were known to our ancestors, but rejected by them as being ugly. Such is the Saxon straight-sided arch—such the foliage where the leaves are square at the end instead of pointed; or we cover our buildings with notchings, an ornament most sparingly used in the thirteenth century, and even when employed generally placed at a height. We use marble in juxtaposition with stone, to the infinite injury of the latter. We ensp doorways which are exactly the features that ought not to be cusped and finally we cover our drawings with

such quantities of etchings that we finish by deceiving ourselves as well as our clients.

The last new invention is to use large sash windows, with of course the maximum of glass and the minimum of wood; then to put in a flat stone lintel, and over that a high pointed arch filled in with brickwork. Now a window opening demands some cutting up, if the scale of the building is to be preserved, and as far as I am enabled to judge, nothing is more destructive to the general effect of our modern buildings than these enormous sheets of plate-glass in the windows. A friend of mine once tried to deceive himself in this matter by saying that you have only to suppose all the lattices thrown back, but he was not sufficient of an artist to know that the sheen of the rain, or reflexions of the sky, which are sure more or less to appear in any large pane of glass were sufficient to dispel any illusion of this description.

Doubtless large sheets of glass are occasionally necessary, but why should we not try and diminish the artistic evil by putting the upper part of the window in smaller panes, either of wood, or iron, or of broadish lead.

If we go to Hampton Court, we cannot fail to be struck with the very noble appearance of the window sashes in that part of the palace built by Sir Christopher Wren.

It is, in fact, our modern windows which make our common houses so hideous. A house of Queen Anne's time, although it may not have a bit more ornament than one built twenty years ago, looks ten times more cheerful, for the window-boxings project nearly to the surface of the brickwork, and when painted white, as I said before, impart an air of comfort and cheerfulness to the whole building.

I know that this mode of construction is liable to communicate fire, and is therefore very properly forbidden. Still I think that we might attain a somewhat similar result by other means. What appears to me as most objectionable is the thin frame, surmounted by a segmental arch, and then another immense arch above it. This, in conjunction with a high-pitched roof, some of the gables entirely hipped, and others hipped at the point only, forms, I think, one of the most distressing specimens of modern art: it is both pretentious and ugly.

Now, the question arises, what form is our architecture of the future likely to take? I have, as far as I have been able, advocated two means for its advancement, viz.—a most careful study of early French art, and the study of the human figure.

As to early French art, I believe it to be more suited to the requirements of the present day than any other phase of Mediæval architecture. We live under different conditions to our ancestors. They delighted in small pretty buildings, with delicate details, which would be out of place in our smoky atmosphere. In French art everything is upon a larger scale, and it is naturally suited for our large warehouses and for high houses, such as are being sown broad-cast in old London. It is a curious thing, but there is little doubt of the London houses in the thirteenth century being very low as compared with those of Paris; for Matthew Paris, describing the visit of Henry III. to St. Louis, represents the English court being amazed at the loftiness of the houses of Paris as compared with those of the English capital.

It would be a work of supererogation for me at the present time to go deeply into the merits of the French architecture of the thirteenth century, and the various reasons for, to a certain degree, preferring it to that left us by our ancestors. I can only say that our whole habits of life and our external circumstances having altered from what they were in those ages, we should use our common sense, and adopt that style of architecture most suited to us, at the same time bringing into use all modern improvements which can actually be proved to be such, and decorating the building with sculpture and painting relating quite as much to our own times as to those gone by; for sculptured buildings are but stone books, and why should the last chapters be left out?

There is a window in Westminster Abbey which illustrates this; it is in the nave aisle, and to the memory of a civil engineer. I pass by its artistic merits or demerits, and come to the iconography; the series of stones begins with the Tower of Babel, and ends with the Menai Bridge. I should state that the latter was pointed out to me as a sort of practical joke on the part of the stained glass designer; but I confess I

see no joke at all in it, the designer only did what has been done in every age of the world, and who knows perhaps the fragile piece of glass may be destined to outlast the iron of the bridge? There are some people who view every application of Mediæval art to modern life as a joke, and, in nine cases out of ten, to be discouraged. They consider Mediæval art as eminently ecclesiastical, and therefore something profoundly serious and to be approached with caution, forgetting that mankind has been very much the same in every age, and that our ancestors joked and laughed just as much as we do. It is true that a very great part of our ancient domestic buildings have perished, and even of those which have been spared by time or man, none possess their original decorations. Consequently these people above mentioned almost refuse to believe in any scheme of secular painting and decoration of the thirteenth century, still less what they consider as the reprehensible interchange of secular and religious subjects; such as the series of Scripture history in the King's Chamber (probably answering to our drawing-room) at Westminster, or the secular series of the labours of the year, and the signs of the Zodiac in ecclesiastical buildings as at Salisbury, &c.

The fact is, that with our ancestors religion was not simply a mere matter of private devotion or of an attendance at church once in seven days: they said their prayers in their churches, and therefore had their churches made as beautiful as they could afford. A great cathedral must have been an encyclopædia of all the knowledge of his time: indeed M. Didron tries to prove that this was literally the case with regard to the sculptor's of the cathedral of Chartres. It is only by acting in a similar manner that we shall ever progress and have an art of our own, and I am the more disposed to reiterate this upon the present occasion when I have the honour of addressing my younger fellow-students; for, alas! we are all students now, and there are no masters in Israel. Whether there ever will be, must depend upon the zeal and earnestness of purpose with which you take up that banner which is about to fall into your hands. If you do not draw the figure better, if you do not study more deeply, and if you do not take due advantage of the art-discoveries and labours of those who have been a little longer in the profession, it will indeed be a bad thing for our future art.

Some men may do more and some may do less, but every one can do something. Of course a great deal depends upon the circumstances in which you may be placed and over which you may have no control; but I very much doubt whether any circumstances ever hindered the ultimate advance of any one who had a real and lasting love of art.

Various circumstances may hinder various men: thus one may have to work for his living immediately after finishing his apprenticeship; another may marry early, and may have to go to quantities for his livelihood; a third, seeing how very hard is the struggle for an art man, with no connexion, may go into dilapidations, and light and air cases; a fourth may get into practice too early, either through his connexion or through accident; but all may do something to advance our future art and architecture. Of course it cannot be expected that they can do so much as the man who thoroughly devotes himself to it, and who is neither married nor obliged to work for his bare living; but they can do something; they can afford employment to good artists in their buildings; they have their annual holiday, during which they can study more or less, and their more lucrative practice enables them to purchase art for their own houses.

Now during this time the art man, as your President very truly said upon a former occasion, finds that he gets comparatively nothing to do, and indeed he may think himself comparatively lucky if he does when he is tolerably past the middle of his life. But these fallow years are exactly those which are the most valuable to him; it is in them that he applies the knowledge gained by wandering to and fro over the surface of the earth. That knowledge may have but a small area to work upon; it may, perhaps, be a piece of goldsmith's work or ivory carving, for which he is almost ashamed to charge a fee at all, but which, with the design and the constant superintendence of the workman, takes him as much time as would suffice to enable his late fellow-student, who does the light and air, to make much gold; but then, on his side, he will have added another

new and beautiful thing to the world, and he will have done something towards solving the problem of our future art.

I hope you will not suppose for one moment that I wish to detract from the merits of the gentleman who goes in for quantities, light and air, and dilapidations; on the contrary, the world could not do without him; and there is no doubt but that he does the most useful as well as the most lucrative part of the profession; and if he has not the opportunity of becoming an artist, it is simply an application of the great law of compensation, which ordains that one man shall not have everything.

I confess that the most, by far the most, interesting series of drawings in this room are those of the sketching class. I should have liked them to have been more numerous, and to have come down to a later date. When one is a pupil, one often marches quickly, so that the drawing of 1865 may give a very different idea of a man's progress to what a drawing a year later might give. The only want in the sketching class appears to me that, when done, the sketches should be sent to some competent person to give a written opinion upon them, in the same way that a barrister might be asked to give an opinion; that that opinion should be paid for in the same manner that a barrister's opinion would be paid for, for this is the only way by which advice is ever attended to. Before leaving these sketches I must not omit one of a design for the polychromy of a chancel arch, where the figures are very well done indeed, and where the colour is exceedingly good.

In conclusion, let me ask you to devote some time to the drawings of Mr. Thompson, of Glasgow. They represent buildings in Greek architecture, but certainly the best modern Greek architecture it has ever been my lot to see. Whether some of the edifices are exactly suited to the climate of Edinburgh is another question; but the most curious thing is that many of them, by a very few touches, could be most easily translated into thirteenth century French art. There is one little drawing of a villa that might almost be taken for a copy of some little fortalice in the south of France; in fact, there are actually two rows of these features, called maehicolations, lately so rabidly prescribed by writers.

Gentlemen, I am sure that our art future will be safe in your hands; and although it is neither to be expected, or even desired, that all of you should devote yourselves exclusively to the fine art branch of the profession, as I said before, you can all do something towards our future architecture, and Mr. Thompson's excellent designs suggest to me a question which we might all ask ourselves whenever we turn out a design, viz., what would the Greeks have thought of it? If answered unsatisfactorily, or in the negative, would it not be better for us to try again?

W. BURGESS.

THE LATE EDWARD HODGES BAILY, R.A., SCULPTOR.

OUR English school of poetical sculpture has now lost one of its most distinguished Academicians (Royal Academicians, if you will). The distinguished pupil of the greatest of English sculptors (John Flaxman), Baily,—the sculptor of the twin half-recumbent figures of "Eve" (Milton's "Eve" at the fountain undefiled),—died on the 22nd ult., in his eightieth year.

Mr. Baily (Thomas Banks would have more than admired his "Eve") was born in the city of Bristol in the year 1788; worked under Messrs. Randall & Bridge as a modeller for soup-tureens and tea-pots and claret-jugs, and such like Benvenuto Cellini and Flaxman work; and from a designer, modeller, worker in hot metal, and chaser, rose to the very head of his profession. Watson and Joseph Durham worked under his tuition as he had worked (how much to be envied!) under Flaxman.

It was the lot of Mr. Baily to be outdone by his master, and his worse lot to find a rival and outrunner in the race of successful sculpture in Francis Chantrey, Messrs. Randall & Bridge wanted Cellini work for the white damask and bright mahogany and polished marble of George IV. Mr. Baily filled Flaxman's place with them,—not up by any means to his master's mark, but ably. Some of Mr. Baily's work is more than poetic; witness his "Eve at the Fountain," his "Eve listening to her own Voice," both marvellous inspirations softened into life.

We have before us while we write a slightly tinted fac-simile in plaster (very choice in its way) of Mr. Baily's first design for his "Eve at the Fountain," and very beautiful it is; to our thinking (and skilled judges in the art of Phidias and Flaxman are with us, less *lactescent* than the accepted "Eve" of Messrs. Randall & Bridge, the great Ludgate goldsmiths and silversmiths, and patrons of John Flaxman, Mr. Baily's master. The story of Mr. Baily's "Eve" forms a pleasing episode in the history of English sculpture. Oddly enough, it was made for the handle of the lid or cover of a City soup-tureen,—perhaps for the Licensed Victuallers. Eve, in all her beauty, surmounting a tureen redolent with real turtle,—fit food for lips and mind.

A bas-relief to the memory of Mr. Draper, in Bristol Cathedral (more beautiful in point of execution with the chisel than in its design), called his attention to the art of sculpture, and made him irrevocably a sculptor. He had modelled previously in wax, but now took to clay and plaster, and with such success and belief in his own powers, that he set off for London, and sought, like others before and after him, the approbation of Flaxman. The great sculptor liked what he saw, and gave more than a word of encouragement to the young enthusiast from Bristol, for he found employment for him in his studio, No. 7, Buckingham-street, Fitzroy-square, London; a classic spot, though we abstain to see over it, had to carry it to, in enthusiasm and associations, what the bricks and mortar on the ground could not, unassisted, awaken within us.

Mr. Baily was with Flaxman for seven years and a-half, and availed himself of many of the advantages of working with so great a man. Flaxman, it is said, foresaw his future excellence; and free, as he was, from the petty jealousies of genius, both aided and recommended the sculptor of "Eve."

Mr. Baily's admirers will like to know his London residences. In 1823 he was living at No. 75, Dean-street, Soho (Lawrence and Harlow had lived in the same street before him); thence he went to No. 8, Percy-street, Rathbone-place, Oxford-street (or rather Tottenham-court-road); from No. 8 he removed to No. 10 in the same street, where Dewint (the water-colour artist) and Hilton, his brother-in-law and historical painter, had lived before. Another London home,—or studio of Mr. Baily's,—was No. 11, York-place, Portman-square. Here, however, the world was not with him.

Mr. Baily exhibited at the Royal Academy, in 1839, a colossal statue of Thomas Telford, the engineer; and in 1840, a statue of that great encourager of art in England, the Earl of Egremont,—part of a monument to his lordship's memory in the church of Petworth, in Sussex.

His portrait-statues (luckily few in number) did not add to his reputation.

In 1811 his "Eve listening to her Voice" found him additional admirers; some, indeed,—and judges, too, from whom it was seldom safe to differ,—preferring it to his "Eve at the Fountain." This fine work, or a duplicate of it, was bought by the late Mr. Bicknell, of Hernehill, who always bought with taste and liberality. At Mr. Bicknell's sale, in 1863, it sold for 230 guineas—little enough.

Portrait-busts, such as Chantrey reigned unrivalled in, were little understood by Mr. Baily. We can call to mind but one of his really good, and that is very excellent,—the head of Douglas Jerrold. It is very fine in conception and execution, and true to the man and to the wit. The hair is excellently treated—in the antique manner—and true to the expressive character of Jerrold's head. Dr. Diamond has made some fine photographs from it.

In the year 1847 Mr. Baily exhibited at the Royal Academy of Arts a plaster statue of Chief Justice Tindal. The statue caused a great talk in the realms of art. It was an old patched-up model of the elder Bacon.—Sir William Blackstone's statue made to do new duty. Some of our readers may remember the circumstance, and the stir that the affair made in and out of sculptors' studios.

We may here catalogue, without classifying, some of Mr. Baily's other works. Lord Holland's large monument for the nave of Westminster Abbey—ambitious, with large, allegorical figures, and a lust of his lordship. The Nelson statue on the column in Trafalgar-square is by Mr. Baily; but who can say what it is like? Does distance lend enchantment to the view?

A statue (1843) of Dr. Wood, Master of St. John's College, Cambridge; a marble statue of Psyche; and a graceful little statue of Helena unveiling herself to Paris; the model (1844) of a colossal statue of Mr. Dawson, Dean of St. Patrick's, and the model of a small statue of Paris. The former work was executed in marble and erected in St. Patrick's, Dublin.

Mr. Baily was elected a Royal Academician on the 12th of February, 1820, in the room of Benjamin West, the President of the Academy.

In the *Art Journal* may be found a good likeness of Mr. Baily, "engraved by J. Smyth from a drawing by T. Bridgford."

ON ENGLISH PORCELAIN.

THE course of lectures on "Pottery and Porcelain," by Mr. W. Chaffers, at the Society of Arts, was brought to a close last week.

The subject of Mr. Chaffers's concluding lecture was "English Porcelain." He began by observing that the invention of the manufacture of porcelain in this country was much earlier than had been generally supposed; for a patent was taken out by John Dwight, of Fulham, in 1671, while that of Chieaguean, of St. Cloud, in France, was not granted until 1702, nearly thirty years afterwards. The first discovery in that country was accorded to Louis Paterat, of Ronen, who obtained letters patent in 1673, but the ware never succeeded, and only a very imperfect description of china was produced: Dwight's porcelain was therefore made two years previously, and the title of his patent is this:—"For the mystery of transparent earthenware commonly known by the name of porcelain or China." The fact is corroborated by Dr. Plot, in his "History of Oxfordshire," written in 1677, who says,—"*He* (Dwight) hath found ways to make an earth white and transparent as porcellane, and not distinguishable from it by the eye, or by experiments that have been purposely made to try wherein they disagree." The principal test of porcelain being its transparency, there can be no doubt about the nature of the ware here spoken of. A specimen of his porcelain, of about 1735, has recently been discovered; it is a bust of George II., of small life-size, in porcelain, which, from the peculiar modelling and the similarity to Dwight's busts in stoneware, leaves no doubt of its origin. It is in the possession of Mr. Reynolds. The manufactory at Stratford-le-Bow was established about 1730. Thomas Frye, an eminent painter, appears to have been instrumental in bringing the china to that perfection for which it was celebrated. In 1753 the works passed into the hands of Messrs. Crowther & Weatherby. In an interesting document, accompanying a Bow china bowl, which was presented to the British Museum, by the painter himself, we are told that they employed 300 persons,—about 90 painters, and 200 turners, &c., all under one roof. In 1775 the Bow works were sold to Mr. Duesbury, and all the moulds and implements transferred to Derby. The celebrated manufactory at Chelsea was established about the same time as Bow, and the early productions are frequently mistaken the one for the other; but, fortunately, the finer pieces are usually marked with an anchor in red or gold. The period of its greatest excellence was from 1750 to 1765. It has been thought that Venetian workmen were first engaged here, from the great similarity of the two wares, both in painting and gilding, added to which the mark upon both is an anchor. This manufactory was set on foot by Mons. Spremont, a Frenchman, and he acquired a great fortune. The beautiful vases in the French style of grosbleu and morne, with beautiful paintings, are well known, and are at the present day much appreciated, the prices they command being as high as are paid for the Sevres porcelain. These works were also bought by Mr. Duesbury, of Derby, in 1769, who continued them at Chelsea until 1781. The china made by him was called Derby Chelsea, and is known by the mark of a D, crossed by an anchor. Although the Derby works originated as early as 1750, it does not appear that any china of a high character was produced, but principally services and small chimney ornaments; and it was not until 1769, on the purchase of the Chelsea works, and a few years after of those at Bow, that they rose to any importance. In fact, with the best workmen and painters of those great establishments, and all the moulds and models from them, the

Derby manufactory may be considered as the Bow and Chelsea manufactories continued in another locality. Some beautiful examples of porcelain in the Chinese style were produced, and they seem also to have copied their marks, as well as their style of decoration; but their ordinary trade mark was at first a D crossed by an anchor, called Derby-Chelsea, and after royal patronage was accorded, in 1760, it was changed to a D surmounted by a crown. This was called Crown Derby, and was used by the successor, Mr. Bloor, down to 1830. The works ceased in 1848. The next porcelain manufactory of importance was Worcester, established chiefly through the exertions of Dr. Wall, who formed a company in 1751. The services made here were held in much estimation, and, although produced at a cheaper rate than Bow or Chelsea china, were better for use, and not so subject to crack with hot water. An important means of decorating porcelain was introduced here in 1759, by transferring impressions from engraved copper plates on to the surface of the ware. It was adopted almost simultaneously with Liverpool, the invention being claimed by both, and specimens of these productions are found bearing the names of Sadler & Green, of Liverpool, and Richard Holdship, of Worcester, dated in the same year. Bat-printing succeeded the printing from copper plates on paper; the impression being taken from a copper plate by a piece of gine (called a gine-bat), which received the pattern on its surface in oil, and being pressed on to the surface of the ware, the design was transferred. It was then dusted with colour and baked. The porcelain made from 1760 to 1780 was of a superior quality, and the colours used on decorative pieces approached very closely to those of Chelsea. In 1783 the manufactory was purchased by Mr. Flight, afterwards Flight & Barr, and many clever artists were engaged. It remained with them and their successors until 1840, when the two principal manufactories of Worcester, Messrs. Flight & Barr, and the Messrs. Chamberlain, were amalgamated, the concern taking the name of the latter. Chamberlain's works were established in 1786, and acquired a great reputation, being especially patronized by the Prince Regent, for whom they made a service which cost 4,000l. Another full service, for the East India Company at Madras, was supplied at a still higher price. The taste for gilding and bright colours caused this great increase of price, for it appears that nearly 1,000l. per annum were paid by the firm for gold alone. Caughley, near Broseley, Shropshire, was celebrated for porcelain. Mr. Turner, an engraver, from Worcester porcelain manufactory, made great advances, especially in services for the table. He invented a beautiful blue, which was printed on the ware in Chinese designs. The well-known "willow pattern" was produced here in 1789, which, even at the present day, is in great demand. This was the first blue printed table service made in England. The porcelain manufactory of Nantgarw was established by a Mr. Billingsley, in 1813. He had some time before produced his beautiful transparent ware at Pinxton; but its expensive character prevented it from becoming successful, and it was abandoned; he, however, revived it at Nantgarw, and it was so much admired that Mr. Dillwyn, of Swansea, made arrangements with Billingsley to superintend the production of it there also. Nearly all the ware made at Nantgarw was purchased in the white by Mortlock, a china-seller of London, and decorated in the metropolis. The favorite patterns at both the above-named places were pink roses heightened with gold. Mr. Rose, of Coalport, was a celebrated potter, and he established himself there about 1780. He was not, however, contented with such limited operations, but as the Caughley, the Swansea, and the Nantgarw works were successively relinquished by their owners, he became the purchaser, and incorporated them with his own, retaining Billingsley as director of his manufactory. The patterns known as the "worm sprig," the "Tommy sprig," the old "willow pattern," and the "blue dragon," remained staple articles. His decorative porcelain he marked "Coalportdale," which was another branch of his Coalport works. William Cookworthy, the inventor of hard porcelain, commenced his experiments as early as 1758, but it was not until 1768 that he considered it fully developed, and in that year, in conjunction with Lord Camelford, he took out a patent and commenced operations at Plymouth. The materials employed were called grown stone and grown clay,

which answered to the ingredients of the Chinese porcelain, *kaolin* and *petuntse*. The difficulties found in proportioning them properly, so as to give exactly the necessary degree of vitrification and no more, and other niceties with regard to the manipulation, discouraged them in their proceeding in the concern, and after expending on it between two and three thousand pounds, they sold their interest in the patent to Mr. Champion, of Bristol. The works were, however, carried on for nearly six years, and a considerable amount of ware was produced. Cookworthy engaged the services of a clever French artist, who produced the articles modelled in the form of shells and rock work, which became great favourites for the table. In 1774, the patent was sold and transferred to Mr. Richard Champion, of Bristol. He made some beautiful ware, but the great outlay prevented it being remunerative, and in three or four years he was compelled to give up the manufacture, and sold the patent to a company of Staffordshire potters. Various other porcelain manufactories were described; among these the New Hall China Works at Shelton, the first of the kind in Staffordshire. They had purchased Champion's patent, intending to make hard porcelain, but in a short time this was abandoned, and they made the usual English soft paste china, in which a great proportion of bone-dust was mixed. The important china works at Stoke-upon-Trent originated with Josiah Spode in 1780. Great improvements were made by him and his sons in the composition of porcelain, and they introduced a fine and durable material called iron stone china, which was largely exported to France, to the great injury of the French trade. The Prince of Wales visited the works in 1806, and he appointed Spode potter to his Royal Highness. About 1827, Messrs. Copeland & Garrett succeeded, the works being still carried on by Mr. Alderman Copeland, and the choice pieces which emanate from this establishment vie with the famed *pâte tendre* of old Sèvres, while the jewels which glitter upon it remind us of the lines in Shakespeare about gilding refined gold or painting the lily. On others the exquisite paintings are veritable works of art, and the beautiful bisque figures are unapproachable. Mr. Thomas Minton established works at Stoke-upon-Trent in 1790. He made porcelain in the Worcester style and realised a handsome fortune. He died in 1837, and was succeeded by his son, Mr. Herbert Minton, who attained great celebrity as a potter, and brought the ware generally to great perfection. He revived the manufacture of encaustic tiles, and by employing the most expert artists, the most skilful chemists, and sparing no expense in his numerous experiments to improve the colours, the body of the ware, and the decorations, he stood unrivalled in his art. His successors, Messrs. Michael Daintry Hollins and Colin Minton Campbell, have pursued the same course, and with untiring energy and zeal seconded all his efforts. Mr. Chaffers remarked that England has indeed reason to be proud of the rival potters, who have furnished forth their specimens of porcelain to the Paris Exhibition of 1867. Only two have exhibited, but the names of Minton & Copeland have added lustre to the English potters' art, and have borne away the palm of victory. Mr. Chaffers had on the table some fine specimens of the beautiful china produced at Rockingham by the Messrs. Bramford, from the year 1820, under the protection of Earl Fitzwilliam, the owner of the estate at Swinton. The china was of a superior description, and the painting and decoration were of the highest order. The manufactory was discontinued in 1840. The important manufactory of porcelain at Lowestoft was established about 1756, and is remarkable that the recollection of its existence, and the productions which emanated from it, should have been lost sight of and gradually died away, although it was in active work for nearly fifty years, and only ceased in 1802. But although this is the case at a distance from the locality, it is well remembered by the older inhabitants of Lowestoft, and the houses in the vicinity are teeming with its china. In fact, it is to be found all over England, but is usually, for want of a truer name, called Oriental, being a sort of hybrid ware, which nobody who knew what real Chinese porcelain is could for a moment mistake. The painting on the ware, too, is undoubtedly English, and the very touches of the artists can be identified. Its greatest prosperity was from 1770 to 1800. The question about hard paste being made at Lowestoft is

placed beyond dispute; it was probably introduced about 1775, after Champin's failure. There are several persons now living who can testify to the fact that no Oriental porcelain ever came into the factory to be decorated; yet this is the opinion of many who have not duly considered the matter, and who imagine that what is now called Lowestoft was actually Oriental china, painted only at that place. Mr. Chaffers referred those of his hearers who wished to judge for themselves to a large collection of Lowestoft china, which he had obtained from the gentry of the vicinity, and which was now exhibited in the South Kensington Museum.

FROM MELBOURNE, VICTORIA.

At a meeting of gentlemen of the Melbourne press, held on the 23rd of March, it was decided to appropriate the Press Broke Memorial Fund towards the purchase of a marble bust of the late tragedian, to be placed in the Public Library.

At a meeting of the Freemasons, held on the 15th, a committee was appointed to take immediate steps to erect the necessary buildings in connexion with the Freemasons' charitable institutions, on the site granted by the Government.

A tabulated return of the number of ratepayers in the city of Melbourne, the town of Geelong, and in all the boroughs, shires, and road districts in the colony of Victoria, together with the classification of electors for the provinces of the colony, has been laid on the table of the Assembly by the Chief Secretary. The number of ratepayers is 125,283, classified as follows:—Persons rated under 25l., 89,345; from 25l. and under 50l., 19,491; from 50l. and under 100l., 10,511; from 100l. and under 150l., 3,816; from 150l. and under 200l., 1,323; from 200l. and under 300l., 1,082; from 300l. and upwards, 1,327. The number of electors in the provinces are: Central, 3,276; South, 1,627; South-western, 2,064; Western, 842; North-western, 2,707; Eastern, 1,026; making a total of 11,602 electors.

ARCHITECTURAL MEDALS, PARIS EXHIBITION.

ALTHOUGH no official report has yet been made, it is currently stated that in architecture, a grand medal is awarded to Mr. Waterhouse; a medal of the first class to the late Captain Fowke; a second-class medal to Mr. Lynn; and one of the third class to Mr. Ed. Barry.

TOMB: MIDDLETON CHENEY, OXON.

THIS tomb, of which we give a plan and elevation, has recently been erected in the churchyard at Middleton Cheney, Oxon, by Miss Horton, the Lady of the Manor, in memory of her father (late Lord of the Manor) and her brothers and sisters. Beneath the tomb is the family vault, divided into five compartments, for the reception of coffins, and entered from the enclosure. The superstructure is of Portland stone, rising from a tooled-red granite plinth. The pillars and angle shafts are of red granite polished. Beneath the canopy is a cooped stone, the sides and ends of which are filled with the inscription; panels of white marble, having in the centre a marble shield, bearing the family arms. The roof of the tomb is groined, and divided by ribs springing from a string course above the capitals of shafts. The roof is terminated at each end externally, by a fluted cross, of which the sides only are seen in this elevation.

The length of the tomb at the base is 11 ft. 9 in.; the height to the top of ridge-cresting, 10 ft. The whole is surrounded by an ornamental wrought-iron railing upon a stone curb 3 ft. distant from the plinth, the space between this and the curb being laid with Portland slabs, slightly inclined outwards.

The work was carried out by Mr. Claridge, builder, of Banbury, with the assistance of Mr. Thomas Earpe, of Lambeth, who executed the ornamental stone and marble work, and Messrs. Thomason, of Birmingham, who supplied the wrought-iron railing, from the designs and under the direction of Mr. Wm. Wilkinson, architect.

TOMB, MIDDLETON CHENEY, OXON.—MR. W. WILKINSON, ARCHITECT.

THE TOOWOOMBA RAILWAY STATION, QUEENSLAND.—DESIGNED BY MESSRS. J. & R. FISHER

STATION BUILDINGS OF QUEENSLAND RAILWAYS.

THESE buildings have been designed to meet the requirements of a country where materials are difficult to be obtained, and where facility of erection is of importance. Our engraving illustrates the Toowoomba Station. The entire building has been planned in cubes of 15 ft., having the columns, standards, girders, &c., 15 ft. apart, with a principal over each. The external walls consist of cast-iron H standards, vertical and horizontal wrought-iron girders, with horizontal wood trusses, to which are attached the outside corrugated iron and the inside wood lining, leaving a space between for a current of air.

Over all the doors and windows, and in the ceilings, are placed ventilating panels of perforated zinc. Around the entire building over the ground-floor is a wide verandah, with ornamental balcony-railing, and supported by a lattice-girder, carried on light cast-iron columns. On the upper floor the roof overhangs and forms a verandah, similar to that below, with lattice-girders on columns. These verandahs effectually protect the iron side enclosure from the heat of the sun. There is also a balcony round the inside of the building, giving access to the office and other rooms.

The ground-floor is covered with asphalt. Against the longitudinal girders run the transverse girders, supported by H standards in the centre, and which carry rolled iron joists for the wood flooring and ceiling joists. The roofs are constructed of wrought-iron principals, with cast-iron standards, supporting the louvres, the blades of which are of galvanised iron. In the ceilings of the upper floor are ventilating panels to enable the cool air to pass through the louvres into the rooms without creating a draught.

The roofs are covered with Braby's Vieille Montagne zinc. The side enclosure is of galvanised iron. Sarmounting the building is an ornamental cast-iron cresting.

The inside partitions are framed of wood, lined both sides with matched and chamfered boarding. All the joiners' work, including doors, windows, "closets," counters, and fittings, is prepared in London, and similar to that of first-class stations in England. The woodwork is Bur-nettized and to be stained and varnished when finished. The building is to be decorated something after the manner of the Dublin Exhibition.

The whole is put together in England, so as to save trouble and expense in the colony. The total cost, including all fittings, was 6d. per cubic foot, equal to about 8d. when erected in the colony.

Three of these large terminal stations have been sent, besides second-class stations, work-shops, &c., and were designed for Sir C. Fox & Son, as agents of the Queensland Government, by Messrs. J. & R. Fisher, Westminster.

upon a raincloud, however small or large it may be, it is always a segment of a circle.

It is singular how constantly even the cleverest artists fail in reproducing this most beautiful of Nature's polychromy. It seems to be almost an impossibility to depict satisfactorily the definite yet impalpable "airy nothing" that glides from spot to spot as the gazer moves, but never obscuring the objects over which it casts its coloured rays.

Gifford's "Twilight on Mount Hunter" has a sweet, peaceful wooded valley for foreground, a calm and beautiful evening sky, a paling sunset, and delicate crescent with attendant planet. Kensett, in his "View of the Coast of Newport," has some admirably-painted water and cliffs; Durand, "In the Woods," capital beech trees, winding stream, and grey squirrel on a log in the foreground to the colour of which lively little quadruped some lookers-on objected, by the way, there showing their own ignorance, not the artist's). Richard's "Forest in June" is dull and cold; as is also the molten iron flowing from the seething caldron in Weir's "Cannon Foundry;" it looks pale and tamed, very different from the lively, crackling, impish substance I remember to have beheld at Stour-bridge and another such-like Pandemonium. W. Homer shows a group of capitolly-drawn figures in his "Confederate Prisoners," against a background of fog-enveloped morals, that reminds one of Landseer's charming "Children of the Mist," but without the same necessity.

Poor Abraham Lincoln looks out from a canvas of Hunt's, with the earnest, sad expression peculiar to his seamed and plain face, and which gave a charm to his homely features. G. Baker in his "Portrait of a Child," presents the sweet face and bust of a darling little lovable maiden most lovingly rendered; and C. Lambdin (if that be the correct name; I quote from the French authorized catalogue, and therefore am not responsible) has a charming little hit called "The Consecration," in which a pretty, fair girl is kissing the sword of her young officer-lover, who kneels before her.

Here end my remarks on the American pictures. Of the diminutive collections of Turkey and Crecece I have nothing to say, not having been attracted by a single work in either; but that of the Pontifical States shows, of course, some fine mosaics from the "Fabrique au Vatican," one large semi-circular picture, and three smaller ones on gold ground; and of the enamels, the "Children of Charles I.," after Van-Dyck, is good. Among the oil paintings I have marked "A Peasant holding a Bunch of Grapes in her Hand," by Guatave Muller (not an Italian name, by the way); Zuccolli's "First Christian Martyrs," where the poor creatures are seen in a crypt-like dungeon awaiting in despair or apathy, according to the temperament of each, the summons which calls them, one by one, up the cold stone stairs out into the colder resting-place of death; and Norfin's Victor-Emman-uel being welcomed in some town: rather a curious subject for an artist of the Papal States to indulge in.

Of the Sculptures, "An Episode of the Deluge," by Professor Vincenzo Lucardi, is a fine group, with his-reliefs on the sides of the pedestal; and Adams's bust of "Pharaoh's Daughter," is true to the Egyptian type and costume.

The gallery of the Kingdom of Italy comes next in succession, and several of the works here are very interesting. Alessandro Poesi has a large forcible picture of Catherine de Medicis and Charles IX., very rich in colouring, and in which the strong wicked will of the queen-mother has entirely cowed and conquered her weak vacillating son. Tuduino has two stories of the war, "A Letter from the Camp," and "The Caribaldian's Story;" Lelli, a charming view on the lake of Orta; Hayez, a cloaked and bonneted youth embracing a sweet fresh-faced maiden in a wonderful blue satin dress; Ciannetti, "The Meeting of Gaspard Stampa with Collatine de Collalto," large-sized figures, richly coloured, that have a dream of Paul Veronese about them; Molmenti, "Arrest of Philip Calendario," the frame of which also deserves mention, being black, with a delicate gilt pattern over it, that suggests a niello of gold on iron. Pasini has a large canvas with a long winding procession of small figures, that seem almost lost in the expanse of saudy desert over which they are progressing; camels, elephants, and men stirring up the dust of the arid plain in clouds as they move along, while snow-clad mountain peaks tower in the distance: "Le Schah de Perse parcourant les Provinces de

son Royaume" is the title. Rol sends a bust of a charming creature in thin white hodie, with dark blue trimmings; Devers, the bust of a male figure in red, painting a majolica plate, not marked in the catalogue; as also are not two charming interiors by Castiglioni—one, "The Doctor's First Visit to his Patient," a sweet pale girl in white satin, whose sunless, listless face contrasts so forcibly with the rosy cheeks of her young sister who sits beside her, and the eager, wistful look on all the other countenances in the room, down to that of the grey-haired old servant who is showing in the doctor. In the second picture, the illness has been endured and surmounted, and for the first time the convalescent is leaving her bedroom. The tender care of the father and mother, who support her on either side, and the happy love of the same old serving man, who draws aside the *portiere* to let her pass through into the fresh air, are all charmingly told.

A fine large-sized water-colour drawing, by Quadagnini, "The Betrothal of Gualdrati de' Donati with Buondelmonte," is excellent in every way, as are Palizzi's animals in oil colour.

Dupré sends a fine life-size "Cain" in bronze, and Sarocchi a pretty marble group, "La Pre-mière Lecture," which reminds one of our English Durham's capital children. R. F. H.

THE PURIFICATION OF WATER: AND SUPPLY.

INSTITUTION OF CIVIL ENGINEERS.

ON May 21, Mr. John Fowler, president, in the chair, the paper read, in abstract, was "Experiments on the Removal of Organic and Inorganic Substances in Water," by Edward Byrne. The object of these experiments was to try how far the statements generally made, with regard to the action of charcoal in purifying water, might be depended on.

It was stated that many substances were spoken of as having a purifying effect on water, but of all, charcoal (especially animal charcoal) had been considered the most efficacious. Though in works which treated on spring and river waters, the assertion was constantly made, that both vegetable and animal charcoal (particularly the latter) removed the organic and inorganic substances found in waters, yet no experiments were given by which to judge to what extent these statements were true. With a view to ascertain whether water, uncontaminated by either decomposing animal or sewage matter, but containing dissolved vegetable matter, would contain any nitrogenous bodies, some bog water was procured from a locality that precluded the possibility of its containing any animal or sewage matter, the experiments on which served to prove that, in bog water at least, vegetable nitrogenous matter was present.

The details of four sets of experiments were given, the first on animal charcoal, of which nearly 5 lb., new, and freshly burned, and of the degree of fineness used in sugar refineries, were packed in an ordinary stoneware filter. The water employed (of which a complete analysis was given) contained, in the gallon, organic matter, 10.50 grains; inorganic matter, 88.30 grains. The hardness of the water, before boiling, was found to be 50.50°, and after boiling, 39°, and the oxygen required to oxidize the organic matter contained in one gallon, amounted to 0.0116 grain. Several gallons of the water were allowed to percolate slowly through this charcoal, and upon examination, afterwards, it was found that, of the inorganic matter which had originally existed, 52.60 grains were removed from the first gallon; but from each succeeding gallon less and less; so that, from the twelfth gallon of water that passed through the charcoal, only 8.80 grains of inorganic matter were removed. Of the organic matter 4.80 grains were removed from the first gallon; but, with a gradual decrease, the charcoal ceased to remove any organic matter after the sixth gallon. In fact, immediately afterwards, it commenced to give back a portion of the organic matter removed in the first instance, the quantity returned to the twelfth gallon amounting to 1.55 grain. Thus, of the 13.54 grains of organic matter removed by the charcoal from the first six gallons of water, as much as 4.98 grains were given back to the next six gallons; from which the author concluded that, had this set of experiments been carried a little farther, all the organic matter removed at first by the charcoal would have been given back again.

NOTES FROM THE CHAMP DE MARS.*

THE United States' pictures occupy a small portion of space at one end of the Galerie Britannique. As if to show how little self-asserting we "Britishers" are, a large American eagle, with its concomitant of stars and stripes, lords it from above one of the principal portals of our gallery, just as if America were the proudest head and England the protected guest; and a modest dark-coloured hand, some six inches broad,—unnoticable save to those who especially seek it out,—is all the demarcation that attests where the few American pictures terminate, and the many British works commence.

Of these American pictures, some few call for especial notice. Church's "Niagara" from above the falls, is a work that well renders its grandiose subject. If I remember rightly, there were exhibited in London some few years since, three or four larger pictures by the same artist, on this and cognate subjects; and in one, a rainbow was very truthfully and beautifully represented. I cannot say the same for the rainbow in "La Saison Pluvieuse sous les Tropiques;" it is too opaque and too sharply defined, and the whole of the bow should not have been compressed into so small a portion of scenery; also, the form of it is shown as half of an ellipse, whereas whatever portion of a rainbow is seen

* See p. 374, ante.

The second and third series of experiments were with wood and peat charcoal, which, however, were still less satisfactory than those with animal charcoal. The fourth set of experiments was on animal charcoal, with water previously treated with permanganate of potash slightly in excess. After remarking that the water, in its passage through the charcoal, was found to contain organic matter, apparently in the same quantity as before treating it with the permanganate, attention was drawn to a comparison between the first and fourth sets of experiments, to show how closely they agreed to contradict the general statements made as to the removing power of charcoal, and to demonstrate how very little indeed could be done by this filtering material, even on a small scale, towards the purification of water.

The author then said that as the epidemic which had so recently left these shores might return again, before the adoption of any scheme to supply the metropolis with an abundance of pure water, he thought it would be well, if only to check its ravages in ever so slight a degree, to experiment on various materials which were believed to possess the power of removing organic matter; but, to obviate false conclusions, and to render such experiments practically useful, they must be systematic.

In conclusion, he gave it as his opinion that, as by chemical agency bad water could be purified to a very limited extent only, the public mind should more than ever be given to the great question of supply; and, as people valued their lives, they should above all things, in their choice of a source, not be too much influenced by distance, but be willing to undergo the necessary expense of securing the object of their search, not only in abundance, but in the greatest purity.

THE ARCHITECTURAL ASSOCIATION.

The usual meeting of members was held at the House, Conduit-street, on Friday evening, the 24th ult. Mr. R. W. Edis in the chair.

Mr. G. W. Herbert was elected a member of the Association.

A vote of thanks was passed to Mr. Gilbert Scott, R.A., for his kindness in permitting the members to inspect the new public offices in Downing-street.

After some preliminary business had been disposed of,

Mr. Burgess read a paper on "Our Architectural Future," which we print in full.

At the conclusion, Mr. B. said he was not disposed to take quite so desponding a view of British architecture as Mr. Burgess had done. On the contrary, he thought that we were making satisfactory progress in the direction of new designs; and this he was glad to perceive, because he did not think that the style of the thirteenth century ought to be practised or continued in the nineteenth. He regretted, however, to say that, so far as domestic architecture was concerned, the speculative builder was still in the ascendant; but he hoped that as the public taste continued to improve, its effect would be manifested in the whole tone of British architecture.

Mr. Seddon observed, that he also was at a loss to account for the desponding view which the lecturer had taken of the present state of architecture. Without attempting to follow the details of the paper, he might be allowed to observe that there were many difficulties in the way of the student who desired to make progress towards a new style of architecture, because it was the habit of people, when they saw new designs of that sort, to shrug their shoulders, and say it was not the Gothic of the Middle Ages. He did not see why this should be, because the style of the thirteenth century was now obsolete, and he thought there ought to be something peculiar to the age in which we lived, so that architects might not be copyists, but inventors. He had lately returned from the Continent, where he was surprised to find that many of the grand old buildings along the Rhine, which used to be almost household words among architects, were fast disappearing; he hoped, therefore, that those members of the Association who had time at their disposal for travelling would visit these places before it was too late, so as to bring back records of what remained of those buildings, and thus add to our store of knowledge on the subject.

Mr. Ridge agreed with the last speaker in the desirability of preserving records of the old Gothic buildings of the Continent; but he reminded the meeting that the Early French style of Gothic which Mr. Burgess recommended students of architecture to copy, was very nearly similar to our own Early English. He did not see why a desponding view should be taken of the future of Gothic art, as he thought its interests would be cared for in the hands of the many Gothic architects of our own day. He confessed that he desired to see, if possible, a distinctive art for the age in which we lived.

Mr. Spiers had expected to hear the expression of a hope that the young members of the society would study Greek works, but as Mr. Burgess had made some mention in his paper of Mr. Thompson, of Glasgow, whose drawings represented buildings of Greek architecture, and of whom he spoke very highly, that circumstance might, perhaps, be considered to make amends for the omission. He would have been glad also to have heard some expression of opinion as to what should be the predominant style of architecture in the future. The recent exhibition of designs for

the new National Gallery had, he thought, shown that Classic architecture had almost died in England. No wonder that it should, because there were no models from which the study of the art might be practised. In France the case was different. There they had models to go by, and the land of Classic Italy was close at hand. The French style of architecture was classical, and the Government Schools of Art incited the study of that style, and assisted by encouragements and very numerous importations of art objects from Italy. In England, however, he was sorry to say matters were very different, and one could almost count on his fingers the number of architects who had been to Italy to study classic art.

The Chairman could not agree with all the conclusions to which Mr. Burgess had arrived, when commenting upon our architectural future, so far as Gothic was concerned. The great opponent of Gothic architecture in the popular sense, was the speculative builder, who was always cropping up, and at whose command whole streets and suburban towns of the most fragile description sprang into existence. No one appreciated more than he (the chairman) did the grand and mighty style of thirteenth century art, but it was now obsolete, and could not with advantage be revived; and he was persuaded that if the architects of the thirteenth century could have lived in our own day, they would not design for the present generation such buildings as they had left behind them. With regard to our architectural future generally, he feared that until the public became really interested in the subject of architecture, and until its professors and students laboured to make it shine above all the arts, neither the art itself nor its professors would obtain the position they were entitled to assume. He hoped that towards attaining that end the members of the Association would direct themselves to do the work before them with enthusiasm, always bearing in mind that none could aspire to be the disciples of an art who did not prepare themselves by earnest and assiduous study.

FROM SCOTLAND.

Paisley.—The want of healthy dwellings for working men has long been a reproach to Paisley as well as to most other towns. A committee has just reported on the subject to a general meeting of those desirous of forming a co-operative building society. The report stated that ground for sites could be obtained in various parts of the town, at from 10l. to 15l. per acre.

As to the class of houses, the committee, after careful consideration, approved of a plan—which was submitted for the inspection of the meeting—for buildings of two stories as being the most likely to suit the wants of a large portion of the community. These houses were intended to be divided into two, each dwelling having a front entrance, and consisting of a half of the lower and upper stories. Each of these half-cottages was estimated to cost 160l.; the fronts being of stone, and the back walls and gables of brick. The ground-floor would contain a kitchen, a room, and a scullery; and the second floor would have three apartments. The committee did not mean that this plan should be uniformly adhered to, but only that it might afford an illustration of the most economical, and at the same time most complete style of dwelling which the society could adopt. The plan was approved, and ultimately it was unanimously agreed to form a local co-operative building society, and the committee were re-appointed with power to add to their number, to frame a code of rules, and to take all the necessary steps to promote the objects of the association. The Provost (or Mayor) will do all in his power to promote the success of the scheme, and the assistance of other influential townsmen will also be given.

Aberdeen.—The Aberdeen Town and County Bank has now been removed from its old premises to the new building recently erected as their new offices in Bridge-street. Mr. D. Miller was the builder of this edifice. The Aberdeen Bank are erecting new premises for their Thraso agency on a correspondingly suitable scale.

Aboyne.—The foundation-stone of a monument to be erected in memory of Charles, tenth Marquis of Huntly, who died in 1863, has been laid with some ceremony. The proposal to erect the monument originated with the tenantry on the Aboyne estates. Mr. G. H. Smith, of London, was chosen architect, and a site erected on the hill of Morlach, near Aboyne. It was felt by several of the mason lodges in the province that the laying the foundation-stone of a monument, commemorating one who held an honorable post in the Grand Lodge of Scotland, was a suitable occasion for showing respect for the memory of the late marquis. Arrangements were made accordingly. The procession, accompanied by a good many spectators, including several ladies, marched to the hill of Morlach, about three miles to the north-east of Aboyne. The hill is the highest for many miles around, and is seen from a great distance. On its summit the monument is to be erected, and there the ceremony took place. The design is a plain obelisk, 16 ft. square at the base and 6 ft. at the

top, with a pedestal of 19 ft. It is to be built of rough blocks of granite, taken from the bill, and on the top is to be placed an iron ornament, facing north and south, very much resembling the Dagnar Cross of Denmark. The extreme height of the monument will be 60 ft., and it is to be built by Mr. R. Dinnie, Aboyne. The site is on the boundary line between the property of the Earl of Aberdeen and the Huntly estates.

THE RECENT COLLIERY EXPLOSIONS.

The long-promised special reports on the explosions at the Oaks and Talks-of-the-Hill collieries have been published, but they do not justify the eulogies which were passed upon them by the Government in the House of Commons. With regard to the South Staffordshire catastrophe, Mr. Wynne, the Government inspector, thinks that he cannot perform his "melancholy duty in a better way than by using the reports of the local press." We are of a different opinion. "Our reporter" on the occasion was, no doubt, a man of ability, and having been "promptly on the spot" was enabled to "glean full particulars." But his version of the affair, even when helped by "a narrative by an eyewitness," and "another account," hardly fulfils all the conditions of an impartial and careful report. The inquiry before the coroner appears to have been conducted in a very unuseful way. The proceedings were frequently interrupted by laughter, especially when a collier was admitting that he had frequently endangered the lives of the whole of his fellow-workmen by smoking and removing the top of his lamp. The coroner, too, forgot himself when he spoke of a certain hand-bill emanating from the Miners' Association as being "false as hell." As regards the cause of the accident, Mr. Wynne believes it to be due to the—

"Want of power to ventilate the lower workings, which should not have been pushed forward until the pit was sunk, and, above all, not until there was some means of ventilating it, which does not appear to have been the case."

The verdict of the jury was in effect one of "accidental death."

Mr. Dickinson's report on the Oaks Colliery explosion is of more value, and is moreover accompanied by a sketch of the workings. The inspector's opinion is decidedly that the accident was due to the system upon which the colliery was worked. The seam is 8 ft. thick, and is notoriously fiery. At the time of the explosion the working faces open amounted to about one mile in length. It will easily be understood that the quantity of gas given off from such an enormous area must be very great, and one of the advantages of the plan suggested by Mr. Dickinson is, that the working faces open at one time will be very much lessened, and the ventilation simplified. Mr. Dickinson states that this answers well in his own district (Manchester), and is found to be economical in the long run.

The exact manner in which these explosive gases are evolved is not known, but it is certain that larger quantities are given off when the atmospheric pressure is low. To adopt a simple illustration we may suppose the gas to be contained in vessels closed by valves opening outwards. Under ordinary circumstances these valves are kept closed by the pressure of the air, but when the barometer falls the gas opens the valves and escapes. In the case of the Oaks explosion the barometer had fallen half an inch during the preceding 12 hours, and the temperature was rising. The explosion took place at 20 minutes past 1 in the afternoon—a time when the evolution of gas is greatest, owing to the number of fresh "faces" exposed. The decrease in the pressure would also favour the evolution of gas, and the rise in temperature would render the ventilating furnace less efficacious.* Mr. Dickinson enters into some calculations to show the additional amount of gas which would be evolved under the altered atmospheric conditions, but his figures do not seem to us correct.

Mr. Dickinson's views on Government inspection are sound and well worthy of attention. He considers that the State should not interfere to such an extent as to relieve the owners and managers of the responsibility which now de-

* A valuable report on certain accidents which have occurred in Belgian coal mines in consequence of the sudden evolution of gas may be found in the *Revue Universelle des Mines* for March, 1866, p. 231. The author was the late M. A. De Vaux, inspector of mines, whose efforts were continuously directed towards the amelioration of the condition of the workers in coal mines.

volves upon them. "If," he says, "the inspection becomes too frequent, the inspectors would be likely to become implicated in the management, and when an accident takes place their position would not be sufficiently disinterested to enable them to make an independent investigation, and it would require for that purpose some disinterested person to be called in to see that the provisions of the law were enforced, thereby tending to lower the standing of the inspector, and lessen his usefulness in his district. . . . The responsibility must rest somewhere. Hitherto it has been decided that it is best upon the owners and managers. But if it be intended that the Government should assume the responsibility, then the whole subject of the inspection will require reconsideration." He also suggests that all the statutes relating to mining should be consolidated, and some slight alterations made.

A good deal has been said about the danger of using gunpowder in firing mines. In the Oaks Colliery blasting was prohibited in getting the coal, although it was used for driving new levels. There is no doubt that the explosion took place when a shot was being fired, and that a much larger quantity of powder was used than usual for the purpose of blowing away the small portion of rock at the end of the drift. The shot, therefore, went into a part of the mine where none of the previous shots had been discharged, and whether the man, lighted any freampin in any of the old "slits" or "cut-throats," or whether the concussion disturbed the gas accumulated in the "goaves" or abandoned workings, and forced it on to the allowed open lights, will now never be decided. It appears, however, clear that the explosion was caused either directly or indirectly by the firing of a shot. It is generally admitted that the use of gunpowder is exceedingly dangerous, and on this point the evidence given by Mr. Coe, during the inquiry into the cause of the South Staffordshire accident, is worthy of notice. When asked whether powder should be used indiscriminately in a fiery mine, where gas is constantly being given off, he said,—

"That question involves a good deal. It is a matter of pounds, shillings, and pence. . . . I hold the opinion that in all fiery pits, giving off gas in considerable quantities, the use of gunpowder ought to be prohibited entirely and for ever. . . . I have fiery pits under my charge, and I use gunpowder simply because I am compelled to do so by the usages of the country. . . . If I said we must not use powder, the colliery proprietors in this and other counties would put me down for a complete noodle. They would not think me *compos mentis*. On the other hand the men, if I were to make such a proposition, would look upon me as their greatest enemy."

At the South Kensington Museum there is a very interesting case showing the constituents of the human body,—a large quantity of water, so much lime, so much charcoal, albumen, fibrine, &c., a few sheets of glue, some sticks of phosphorus in a bottle, and a few bits of iron wire. According to the "pounds, shillings, and pence" view of the question, this is a human being, and it is upon these data that his value is estimated.

THE TRADES MOVEMENT.

Stockport.—The joiners, numbering about eighty, are out on strike. They require an advance of wages, from 28s. to 30s. per week, and a hour's less work on the Saturday. The employers agreed that they would concede the advance on the 1st July next, but are determined to resist any interference with their working hours.

Derby.—A strike has taken place against Messrs. Wood, builders. Because they refuse to discharge their foreman, who is a non-union man, or compel him to join the union, all their reasons have left them. Messrs. Wood declare that they will rather give up this branch of their business altogether than yield to the dictation of the men.

Wolverhampton.—A strike among the joiners and builders is threatened. Some months ago the operatives petitioned their employers for a holiday on Saturday afternoon. There are a number of operatives from Chester, and other neighbouring towns where the half-holiday is granted, employed here, and the privileges which they enjoyed in those towns are extended to them in us; whereas, the great majority here have to work the full time, namely, till four o'clock, hitherto the employers have not given the application a favorable consideration.

Wolverhampton.—The builders here have exhibited outside their respective places of business

a code of "Rules to be observed between the master builders of Wolverhampton and the operative stonemasons, from May 1, 1867." The rules are prefaced by a statement, for the information of the public. The master builders have had various conferences with masons in their employment for the purpose of settling trade rules. As the operatives would not consent to leave such matters as could not be agreed upon to be settled by arbitration, these conferences have had no result, and the masons have struck work to enforce the acceptance of a code of rules which they had prepared by themselves.

Worcester.—The whole of the men who were on strike, except the masons, have gone in to work, pending the result of the arbitration which is to take place.

Birmingham.— "A decision given in the County Court," says *Aris's Gazette*, "shows the desirability, at all events in the building trade, of definite agreements between masters and men. A carpenter and joiner, who had been at work for a builder in the town, sued the latter for a quarter of a day's wages, on the ground that whilst by rule the claimant was entitled to a quarter of a day's notice of dismissal, the defendant had discharged him without any notice. The rule alluded to was one made by the trade society to which the workman belonged; and it was argued that in paying the price per hour fixed on by the society the defendant had practically agreed to the rules collectively, although he had expressly repudiated them. This extraordinary doctrine was not, however, adopted by the Court. The judge, having clearly ascertained that the man had been paid by the hour, that he had been paid for all the work he had done, and that no agreement or contract had been made, gave judgment for the defendant, with costs. Even the solicitor for the plaintiff could not help admitting that the proceeding was an attempt on the part of the trade society to 'make' laws, which, as his learned friend on the other side suggested, had better be left to Parliament—at least 'for the present.'"

RAILWAY MATTERS.

Liverpool.—The extension of the Lime-street railway station at Liverpool is in progress. The new platforms are now in course of formation, large numbers of workmen being engaged in their construction, and the first new arrival platform has been opened. The entrance to the new station will be nearly in the same position as the present one. The platform is 50 ft. wide, extending from the departure to the arrival side, with the proposed hotel on the right. This hotel, which has been designed by Mr. Waterhouse, of London, will have a frontage extending from Lord Nelson-street to New Gloucester-street, but on authority, the *Albion*, states, that it has been resolved to postpone its erection for some time to come, and for the present confine the Lime-street works to the extension of the station. The whole of the enlarged station will be covered in by an enormous iron and glass roof in one clear span. The present roof was the first application of iron on so large a scale. Favoured by the natural abutments of rock on either side to spring from, the new roof will be economically constructed. It has been designed by Mr. William Baker, C.E., chief engineer to the company, assisted by Mr. F. Stevenson, C.E. A scheme has been devised for working the whole of the signals, both in the station, and half a mile up the tunnel, from one central signal box, under the system of Messrs. Saxby & Farmer. The principle of this arrangement may be compared to a Chubb or a Bramah lock, in which the bolt cannot be moved unless a set of tumblers or discs is previously set to a certain relative position which allows the bolt to pass. In Messrs. Saxby's system, each lever working a point rod or signal, represents the bolt, and can be moved when free from the tumblers or stops connected with the other handles. The stops are so arranged that the moment a pair of points are set to enable a train to pass over a particular line, all the other levers which would give another train permission to run upon the same rails from an adjoining line, are locked. It is impossible, therefore, for the attendant to move these levers by mistake, or for a collision to occur between two trains if the signals are obeyed. The works are being carried out under the superintendence of Mr. Harry Footner, C.E., the company's resident engineer, Messrs. G. Thomson & Co. being the contractors.

Dartford.—The new station is rapidly approaching completion. The platforms will all be covered in; and there are waiting-rooms for those who are detained; while the dangerous practice of having to cross the railway will be avoided by an underground passage, which is well lighted.

Traffic Receipts.—The traffic returns of railways in the United Kingdom for the week ending May 11th amounted, on 12,792 miles, to 727,825 $\frac{1}{2}$, and for the corresponding week of 1866, on 12,512 miles, to 702,070 $\frac{1}{2}$, showing an increase of 250 miles and of 25,755 $\frac{1}{2}$.

Speed.—A comparison of a large number of examples has enabled the Railways Commission to make the following statement:—In England the express trains run generally, including stoppages, about 40 miles per hour; the average of all the examples of the quickest trains (omitting suburban) gives 36 $\frac{1}{2}$ miles per hour; the ordinary trains run generally from 18 to 30 miles per hour; the average of all the examples of the slowest trains gives 19 $\frac{1}{2}$ miles per hour. In France the express trains run, including stoppages, 25 to 35 miles per hour; the average of the quickest example is 31 miles; the ordinary trains run from 16 to 25 miles per hour; the average of all the examples of the slowest trains is 18 miles per hour. In Belgium the quickest trains run from 20 to 35 miles per hour; the slowest 18 to 23. In Prussia the quickest 29 miles; the slowest 17 to 21 miles. In Austria the quickest 20 to 29 miles; the slowest 14 to 21 miles. In Bavaria and along the Rhine the quickest 24 to 32 miles; the slowest 13 to 24 miles. In Italy the quickest 24 to 30 miles; the slowest 15 to 24 miles.

RESULTS OF SEWAGE IRRIGATION.

The Secretary of the Metropolitan Sewage and Essex Reclamation Company gives the following particulars as the results which have attended sewage irrigation upon the Lodge Farm, near Barking. He says,—Notwithstanding the previously severe weather, a crop of Italian rye-grass was cut in the early part of April, and weighed nine tons per acre. The same plot was cut a second time on the 15th of May, the crop weighing twelve tons per acre. On May 4th a crop was taken from an adjoining piece of land which weighed 18 tons per acre. There are some 70 acres of land under irrigation which it is expected will be cut six times during the year. Will it produce nothing but Italian rye-grass?

Some months ago a portion of land at Farnham was irrigated with the town sewage of Bury. A few days ago the crop raised from the land so manured was disposed of by action with the following results. Lot 1, 4a. 2r. 20p. sainfoin, Mr. Newall, 20 $\frac{1}{2}$; lot 2, 3a. 1r. rye-grass, Mr. Wing, 9 $\frac{1}{2}$ 10s.; lot 3, 6a. 1r. 10p. rye-grass, Mr. Newall, 14 $\frac{1}{2}$ 10s.; lot 4, 9a. 3r. rye-grass, Mr. Baker, 15 $\frac{1}{2}$. It will thus be seen that the first cutting of the crop on rather less than 24 acres of land realised 59 $\frac{1}{2}$, though sold under stringent conditions, requiring that it should be cut, made into hay, and stacked elsewhere within fourteen days. The results of the application of sewage to the lands in Essex lead to the supposition that at least four crops could be cut from the Farnham lands in the year.

BARRISTERS AND THEIR HABITATIONS.

In view of the probable alterations in the Temple and Lincoln's Inn, will you afford me space in the interests of the profession to which I belong to explain to the Benchers of the Inns and their architects what arrangement of chambers would be most adapted for barristers? When I have done so, any one conversant with the new buildings—viz., Dr. Johnson's, Goldsmith, and Crown Office-row, will see at once that the comfort and convenience of the inhabitants can never for a moment have entered the head of the builders or architects of those buildings. Two classes of chambers are required—one suitable for business purposes only, the other containing capacities for residence and business. In the former class there should be at least three fair sized rooms and a smaller one for a clerk. A barrister in good practice thus would have a room at the disposal of his pupils and another for a waiting-room. Barristers not in large

practice (how large a majority they are I need hardly say) would be able by letting off rooms to those circumstances as themselves to divide the expense, to too many of them a grievous burden. To residence-chambers these remarks do not exactly apply, though there is the same necessity for a larger number of rooms in each set than is usually at present accorded. The third floors are as a rule devoted to residence, but want of enporads, light, arrangement, in fact, want of common sense and a knowledge of the requirements of the inmate on the part of the designer, have made residence in the Temple certainly more uncomfortable and even more expensive to bachelor barristers than living elsewhere, and sharing a room and clerk. I suppose the fault is in the greed of the Benchers in the matter of rents. If they were to have the proper number of rooms in each set of chambers, the number of sets would, of course, be slightly diminished, and the facility for acquiring a room or rooms greatly increased; this might diminish the enormous incomes which the Inns derive at the expense of those members of the profession whom the authorities ought to protect, but it would take away from them one stigma. I will not do more than allude to the hopeless ugliness of all the buildings throughout the Temple, new or old; but I would ask, is it utopian to hope that though beauty may be totally disregarded, some slight attention may be devoted in any buildings that may be erected hereafter to the comfort and convenience of those persons, the necessities of whose business compel them to reside or rent chambers here?

AN UTTER BARRISTER.

THE BRICKWORK AT THE NEW FOREIGN OFFICES.

SIR,—In the evidence given before the Trades Union Commission a great deal has been said relative to the loose and inefficient manner in which the brickwork at the New Foreign Offices has been executed.

In carrying out the various works with which we have been entrusted at the above-named building, an opportunity has almost accidentally occurred of proving or disproving these statements. We had occasion last week to cut chases 26 ft. in height, 18 in. wide, and 9 in. deep, in two of the main walls. We found the bricks very hard, well set, and the work throughout perfectly sound.

As these chases will not be covered up for a few days, we have no doubt that the clerk of works, Mr. Sheffield, will be happy to allow any interested persons to inspect them.

W. S. ADAMS & SON, Engineers.

THE LAW COURTS COMPETITION.

SIR,—I believe you are too narrow-minded and prejudiced to admit this letter to your pages when you discover what I have got to say. You opened your columns some time ago to several paltry scribblers who wanted to get up a pother about this competition, impudently demanding "fair play" for it. But of course you won't listen to anything on our side of the question. Which side "our side" is you will know presently.

My object in writing to you is twofold. First, to ask this simple question.—What right have you to interfere in the matter? I think you will find it difficult to give me a satisfactory reply. Probably you will say you are the representative of the architectural profession, and in architectural matters the representative of the public also. Well, and what of that? The architectural profession and the public are equally ignorant of, and incapable of dealing with, the subject in hand. Only a lawyer knows the mind of a lawyer, or can know it; and I tell you plainly we are not going to be dictated to by a parcel of builders and people who, I firmly believe, don't know a chief justice's wig from a registrar's.

But I have heard lately,—and this brings me to the second point on which I wish to address you—that it is expected the competition will be decided upon questions of fact, and not upon mere whims and fancies. Now, I am not going to condescend to argue with you, but I am going to ask you to understand once for all that the expectation is as false as the mental capacity of those who indulge it is contemptible. Facts indeed! There is an inspired axiom of which

you have probably never heard, but in which I and all my noble profession find the very breath of life. It is this—"There is nothing so false as facts except figures;" and yet it is upon these emanations of the devil that you would have this great competition settled! Never while I live! I have made up my mind as to which of the designs is the best, and I am proud to say that my opinion is not hurried upon one single fact. It soars far above such miserable trammels; and I would advise you for your own peace and comfort to be guided by me, and take my choice without question. TWISTER FIBBS, Q.C.

BUILDERS AND ARCHITECTS.

SIR,—There appeared a letter in your last impression under the above heading, of which I should not have thought it necessary to take notice but for the opportunity it affords me of making a short statement on behalf of the builders of this country; and I trust you will allow me a small space in your valued pages for that purpose. For two or three years there has existed what is known as the "General Builders' Association," representing eighty towns and over two thousand employers in the building trade, and of which I have had the honour to be President. The attention of the members of this association has for some time been directed to the desirability of an amended form of contract-agreement, believing as they do that the form which now prevails is one-sided, and, as advised by eminent counsel and solicitors, such as no other trade is called upon to sign. Entertaining these views, we have been endeavouring to get the various architectural societies in the country to modify and render the present form more equitable, but I am sorry to say with very small success. The architects have by custom obtained exceptional power over builders, and as a body they seem loath to give it up. The present form of agreement usually contains such a proviso as this,—"that in case of dispute in respect to the manner of carrying out the work, or from any cause whatever, the decision of the architect shall be final, conclusive, and without appeal." The clause in respect to carrying out the work is sometimes made oppressive to the builder by a capricious or whimsical architect; but I conceive such a power to be inevitable if good work must continue to be done, and personally I take no objection to that; but in common with the two thousand employers in the Builders' Association, I do object to the words, "any cause whatever." The respectable architect should not require such a clause. He does what is right; and, speaking from my own experience, the agreement is practically a dead letter. The unprincipled architect (for unhappily there are such) ought not to be entrusted with such a power. I could give many reasons in proof of this, but I will ask space for one only, and will refer you to Mr. Holden, president of the Manchester Society of Architects, for the truth of my statement. An architect, after having a large contract finished by a member of our association, made out a bill, showing the balance about 5,400l. due to his contractor. The contractor demurred, and employed Mr. Holden and others on his behalf, who, after repeated measurements, made the balance due over 3,000l. additional. The original architect refused to listen to any remonstrance, and fell back on his agreement, which said, amongst other things, that no money should be paid without his written certificate, and he refused to give it. The case went into court, and by the judge, after much parleying, was referred to an eminent counsel, who, fortunately for the builder, waiving the points of law, ordered the payment of the money, but not till the contractor was worn out and nearly ruined by the proceedings. I could go on with cases where builders have been fined for non-completion of their contracts when strikes and other unavoidable circumstances have arisen; where architects have furnished quantities grossly deficient, received payment for them, and sheltered themselves under their powers in the agreement, alleging (although they had received the money for doing the work) that it was the duty of the contractor to have satisfied himself it was done right,—in other words, that he ought to pay for having the work done wrong, and do it right at his own cost, or take the consequences. I am not aware that any other commercial transaction connected with trade is based upon such morality.

A number of cases of the before-mentioned sort have from time to time been brought before the association; some of them, I have no doubt if they came to be investigated, would turn out differently to what they are represented; but we are satisfied that there is much ground for complaint. Many men suffer in silence and ha neither the means nor the spirit to put the selves right. It was about this I was talking and thinking when I made some such observations at the Bristol meeting as your correspondent quotes, and I believe I shall have the sympathy of the respectable architects of the country, when I repeat, that when a good cause occurs which the association can take up, they will read the architects a lesson, and teach them to be honest and just. This was all it was intended to imply. Any such observation applied to architects generally would be so posterior and unjust, that it would neither hurt your while nor that of your correspondents to take any notice of them; but still, I must be allowed to say our association has made it app that acts of oppression under powers of an arbitrary agreement are sadly too common, and we conceive it to be our duty, as well as of our interest, to find a remedy. ROBERT NEILL, Manchester.

CHRIST'S HOSPITAL,—ITS CHURCHES AND "WORTHIES."

THE interest of the noble "Blue Coat School foundation and its accessories being certainly more than metropolitan—national, if not almost European,—a few special remarks may not be unfit for the columns of the *Builder*."

Of the present Hospital "Buildings" the *Hall*, of such noble length, needs no remark except that its perfectly plain brick west termination, exposed, beyond calculation, by removal of the "Cover," would be much the better for a new "coat" of some kind or other; also the further extent of "covered" playground has been pronounced much to be wished. The new buildings (at least comparatively so) abutting on "Little Britain," may be termed very excellent. *In passant*, the gates there are still called the "Ditch" gates,—alluding to the "Town Ditch," round the Wall of London, which extended from this immediate quarter to the outworks of the "Tower."

Of the former church, might not some investigation of, or attempt to trace, the actual position and limits be quite sufficient to interest? It is styled by *Foelny* amongst foremost casualties of the "Fire," the "ancient fabric of Grey Friars" (having been formerly Conventual and Franciscan). No certain information appears to have descended; but it can hardly be doubted that it was, at the lowest, 300 ft. long,—about the same as that of the "Knights of Malta," whose chancel now forms "St. John's Church, Clerkenwell," but is said to have formerly reached quite to the western extremity of the present "Square." If the Grey Friars' Church extension was mainly westward, it probably reached to full the extremity of the present churchyard.

The present church, built by Sir Christopher Wren, is, without the tower, 114 ft. by 81 ft.;—largest of modern ones (except, no doubt in length, *St. Sepulchre's*) at *Spitalfields*, 111 ft. by 89. Gazing on the assembled "700" boys and youths, the mind speculates with interest on their varied future careers; some of which may be "famed in story," and happy for their country. Happy themselves if they never wholly lose sight of what "shall bring a man peace at the last." A very handsome testimonial, with very honourable eulogium by a Hebrew ex-Lord Mayor, was lately presented to the Rev. Mr. Gibbs, above a quarter of a century since. This gentleman, amongst other things, was an original secretary of the "Lancashire Relief Fund" has been of gratuitous service to the Church as Rural Dean and Proctor, being also an able "man of business," and it is perhaps regrettable that no emolument has yet reached him, beyond a moderate though very responsible living.

Of the famous "Spital" sermons at Easter, alone sufficient to render this one of the most noteworthy churches in England, the most celebrated on record was probably Dr. Parr's (an "old Whig"), against the principles, and horrible excesses, of the first French Revolution. The

* This is not the first occasion on which the subject has been handled, and at some length too, in our columns.—Ed.

mmense Organ has just been repaired by Messrs. Hill. It contains 68 stops; till lately the largest number in England (Spitalfields 44), and the name as in the renowned and lofty musical pile at Harlem; and, in justice, may be pronounced as good in the soft as powerful portion.

Of Christ's Hospital "worthies," one or two erroneous statements have lately appeared. Leigh Hunt certainly never took, nor was likely to take, "holy orders" "Christabel" dated, here, before 1800, did not appear till about 1818, and was then considered a great absurdity; needing now, with some other of his effusions, a veil of charity. To come, however, where there can be no mistake, Camden was one of the richest fruits of "Blue-coat" School nurture.

Bishop Myddelton, "first Protestant" one "of India," has a monument in the south nave aisle of St. Paul's, a fine figure, with two natives kneeling, in the act of confirmation, which may have been too much neglected. His "Life" was written, as Bishop Jeremy Taylor's before, by Archdeacon Boney, of Lincoln, formerly of Bedford, who well deserves a passing tribute, not least, perhaps, in the Builder. He was an able antiquary, also a draughtsman, having made some very good drawings for his "History of Notingham;" was about the first "visiting" Archdeacon in the present century; carefully inspecting every church, however inconvenient, giving an example to several others, and causing buildings to be better tended in general. Better still—he was not only a sincerely pious, whilst plain, but largely benevolent, man; leaving a name, not least at the living of King's-Chiffe, Northamptonshire, where he was much revered and lamented, as "Good Archdeacon Boney, who gave away all his money" to the poor and needy. "Go and do likewise."

Lamb has given several "Blue-coat" reminiscences. Only, doubtless, the custom was not so well attended to just then, as he speaks of "fresh" "fat" on "boiled-heef" days, as an abhorred, and certainly very insalubrious, edible.

Coleridge, son of a Devonshire clergyman, was, doubtless, the poet, at least in modern times, of the school; also one of the three "Lake" poets. He, it is said, was formerly an Unitarian, and speaks of the advancing influence of a loved wife:—

"My Sara! Meek daughter, of the family of Christ,"

who was, doubtless the heroine of the exquisitely beautiful ballad of "Genevieve," worthy of a funeral by all tender and romantic minds. There are some good lines at the end of his wild fancy of the "Ancient Mariner," as—

"He prayeth best who loveth best,
All things both great and small,"

which might be an suitable motto, amongst many more, for the excellent society against "Cruelty to Animals." His "Epitaph for himself," alluding to several years of severe bodily pain, is perhaps much less known than it deserves to be.

"A Poet lies, or that which once was he:
Oh! I'll a thought in prayer for 'S. T. C.;"
That, who for many a year, with anxious breath,
Fond Death in Life, may now find Life in Death!
Merry for praise—to be forgiven—For fame,
He asked and hoped through Christ: do thou the same!"

These well-intended, if "gossiping" remarks; not by a "Blue," though by one who has wandered on "Cam's smooth margin;" it is hoped may find favour with past and present members of a noble institution. D.

BEDFORD MIDDLE-CLASS SCHOOL COMPETITION.

Sir,—You will probably have heard that the directors of the above school have selected Mr. Peck's design. If they wished to employ Mr. Peck, neither I nor any one else would find the slightest fault with their doing so; but as they should persuade some thirty architects to compete, when they had already settled the matter, seems to me a course morally, if not legally, under the head of swindling.

I write you this, because I hear from Bedford, from a gentleman entirely unprejudiced in the matter, as follows:— "I was invited to employ Mr. Peck, which was composed verbally by the building committee, which was composed of Whitbread, Lord Cowper, and other county squalls. All the plans were before opened—yours amongst the number. More than a month ago, Sherman told Fisher, of this town, who was awarded the job, that he need not trouble himself about it, as Peck, of London, who built the Essex school, would be the builder of this. The plans at were examined were placed in the Assembly-room, on Tuesday, and were looked at only by the committee; but Peck's plans were placed in a side room by themselves." I need not quote further. I send you this as a current paper, which the directors would be reluctant if they could be thing is certain, viz, that fair consideration was not given to the plans, as they were returned in a little over a week.

A VICTIM.

PAYMENT OF GOVERNMENT ARCHITECTS.

Sir,—I am much surprised that the Government should seem to take away by a side wind a portion of the commission paid by them to their architects in the case of works carried out under a schedule of prices, while, in the case of works exactly similar, but carried on under a lump-sum contract, they pay the full commission of 5 per cent. without any deduction.

It is interesting, however, to note that this is not the first attempt of the Government in this direction; and architects may, perhaps, like to see how the question was met by Sir Jeffrey Wyattville as far back as 1826. I have extracted his letter from a book of parliamentary papers of that date.

I may add that my experience of many years agrees with that of Sir Jeffrey, and that apart from the special case of the New Palace at Westminster, I have never known an instance where the architect paid the expenses of measuring under a schedule of prices.

A SURVEYOR.

Sir Jeffrey Wyattville to S. R. Lambton, esq. Windsor Castle, July 4th, 1826.

Sir,—In answer to your letter, dated 6th of May last, by command of the Lords of the Treasury, I have to acknowledge the sum amount specified therein, for the works at Windsor Castle, has been regularly paid.

In regard to the observations respecting the charge for measuring, I conclude that it was made on the former part of the accounts by the Office of Works, and before your Lordships' minute was acted upon, by which the mesuror was appointed by and under the orders of that office, and that it is hereby answered.

But I feel it necessary to declare that I have never paid for measuring out of my commission in the various magnificent concerns that have been intrusted to my care; nor can I learn that any one in a superior rank of the profession has done so; at the same time, it is not, unthinkingly, nor improper, that a young man beginning business, or one who has employment for himself, or, perhaps, one clerk only, may engage in the measuring of works done under his direction; but it is much to be doubted whether or not it is advantageous to the employer.

Again, so far from charging anything not borne out by my practice in private business, I must repeat, for their Lordships' consideration, that I have omitted to charge a variety of extra matters, and all travelling expenses, and have rejected all the advantages that are to be obtained in private business; and I shall not have the least difficulty in proving, should it ever become necessary, that the extraordinary advantage of my employment at Windsor Castle is very trifling when compared with my previous private concerns.

Feeling that the eyes of the nation are on the works, I have considered the honour and glory of deserving the approbation of my King and country as my greatest reward. (Signed) JEFFREY WYATTVILLE.

A CITY OF THE SEVERN REVISITED.

PERHAPS few cities have made more rapid strides in architectural progress these last three or four years than the quaint old "city upon the Severn," so named for porcelain and pickles. A list of what has not been done would be very short indeed, whilst volumes almost could be written upon what has; and the city bids fair to become worthy its geographical and picturesque position, and which would be difficult to find a more pleasing sight than that which meets the prodigal's gaze after Ragobow-hill is scaled. There are some excavations to be performed, now in progress, but which are shortening; and wares are rising as fast as hours of labour are shattering. Equally fast are tradesmen retiring, and luxury becoming the order of the day. To the east lies a mansion for the aristocracy, and to the west another for Alderman B.; whilst to the north the sweet suburb of New Town crops out, where the cow is wont to chew, and to chow, her more advanced sister suburb of California outgrows her clothes in the south. In fine, the inhabitants appear to believe in nothing but bricks and mortar; in them all are dabbling, rich and poor alike—if, indeed, freeholders and shareholders can be so named, so much so that even the Arboretum itself is turned red by the ruthless bands of the bricklayer; no one who remembers that lordly spot can think calmly of her ravisher. Build by all means, but save us one little garden. Let us have, at least, one lung. Oh, massed! do not let Mammam have it all his own way, prithee!

A LOVER OF PROGRESS.

RIGHTS OF WAY AND GEOMETRY.

Sir,—I have an inkling of a suspicion (one has very high authority just at present for being the reverse of positive or decided), that the legal status of persons using rights of way across open spaces has been laid down thus, namely, that they may have the law on their side, while the path described by the action of their feet is on the whole a right line; the zig-zag produced by the alternate right and left footsteps not being accounted any error; while on the other hand they are in the wrong box, and guilty of trespass, should the aberrations of their steps extend to the dancing a hornpipe, or the playing at ball, or the hunting a butterfly, or the seeking the best point of view to sketch from.

So that an open common may be likened to the machine-ruled sky of an engraving, or the surface of a stone which a mason has took over with a succession of straight lines, and in respect to which the "line of beauty" is a mere deformity, and angularity little less awful than scroll-work. Turning from open spaces to inclosures, let us see how far the lawyers abide by their principles. Suppose that a dozen houses in a village stand along the base of a triangle, in respect to which the parish church occu-

pies the apex. A public road runs in front of the houses. The roadway used to be a hundred yards wide, ninety yards of green turf and ten yards of dusty gravel. Wayfarers used often to prefer the turf to the gravel, but this was an abuse and a trespass, for they had no right to swerve from the straight line, either to the right hand or to the left. So the lord of the manor (we will suppose), was pleased to "approve" the green turf, and to inclose some eighty yards of it out of the roadway, leaving in the next place the ten yards of gravel; and beyond this the remaining ten yards of space were given as a son to the householders for front gardens to their houses. Why the ten yards of gravel were not further reduced, like King Lear's attendants, till scarcely width for a single person to pass was left, is a mystery which I will leave for the lawyers to solve.

Now the dozen householders had each a right of way to the church; and they had been accustomed (so long as the weather was fine and the grass dry) to exercise it in a legal fashion, by proceeding in straight lines across the turf, swerving neither to the right nor to the left. Thus, a fan-shaped figure of twelve radiating lines was described by their footsteps. So, when the turf was enclosed, of course there ought to have been (on legal principles) twelve stiles set up, one in a straight line drawn from the door of each house to the church porch, so that the holder No. 1 might get over stile No. 1, holder No. 2 over stile No. 2, and so on. Yet, as a matter of practice, and in defiance of all principle, the church-way was confined to a single straight path, with a single stile at the end of it; so that only one householder, he who lived opposite the stile, could observe his legal straight line, and the other eleven were compelled to abandon their accustomed radiating lines, and to describe angles on their path to church, as they mount the one single stile.

Now I want to know why these angles are not as illegal as any angles, or curves, or circumvolutions, which they might have formerly described while dancing a hornpipe, or playing at cricket, in former days, on the grassy parts of the roadway from which they are now excluded? G. M.

SUN DIALS.

It would be found more convenient if on the wooden horizontal platform, at a few feet from and on each side of the stile, were temporarily fixed a perpendicular board due north and south, and the 1st, 2nd, 3rd, and 11th, 12th, and 12th points of division on the semicircle transferred to such boards by the straight edge, and a line inclined at the same angle that the stile is fixed at, brought down to the ground from each point, then the temporary boards removed and the four lines drawn from such points to the stile: if then equal angles, and similarly placed relatively east to each, be made on the other side of the line running due east and west, they will contain such other hour-lines as may be required.

If the dial be on a wall use perpendicular due north and south temporary boards, and transfer points of division to them as before described, but from these points draw lines upwards to wall, and at the angle of inclination of the stile: remove temporary boards, and through points of intersection draw hour-lines to the upper end of stile. In a high latitude a horizontal stile will indicate more hours than a vertical one. In the tropics a semi-cylindrical dial at the same angle as stile would best show the hour-lines, if great accuracy were required. The refraction of the atmosphere should be allowed for, but this will not affect the twelve o'clock line.

In my letter of last week the angle of the earth's axis, with her plane of revolution round the sun, should have been 66° 32' instead of 23° 32'. HENRY AMMONS.

THE NEGLECTED BOROUGH ROAD.

Sir,—Probably many of your readers may know and have noticed the wretched aspect of the Borough-road. On one side (north) there are a number of sheds, shanties, fried fish saloons, &c.; broken wheels and wrecks of vehicles have lain there many years, endangering shins and ribs. Wayfarers have many rips and downs if they do not fall for the pavement is dilapidated—holes, ruts, bridges, and stone terraces to tumble over; here and there a cart-load of rusty wares strewn on the pavement. This magnificent road is 120 ft. wide; the south side is respectable, and adorned with the structures. Why this eligible ground remains in this condition I know not; perhaps some of your readers may be able to assign a reason. St. James's was St. Giles's is very unsightly, and, I presume, unprofitable. The railway station has brought the City within five minutes' ride of this grand road, which approximates and leads to all the London bridges. B. T.

ELECTION OF ASSISTANT SURVEYOR, POPLAR, AND COMPETITION FOR NEW OFFICE DESIGNS.

Sir,—I beg to enclose you a report from a local newspaper touching this election, which will speak for itself:—

"The Board pleasantly occupied more than two hours in the examination of plans, testimonials, &c., of the various candidates. This was a proceeding scarcely worth the time, considering that it had been resolved by a majority of the members to elect Mr. Chatterton, who has been assisting the assistant surveyor for some time past."

Perhaps you will allow me to ask the members of the Poplar Board, through your columns, whether the competition is to be decided in the same manner, as I hear that the present assistant surveyor, assisted by the past assistant surveyor, is likely to be a competitor, and now, probably enough we shall find the future assistant surveyor has a finger in the pie. If the members have determined to uphold at all risks their association of past, present, and future assistant surveyors, why ask for other designs? B.

TENDERING ARCHITECTS.

At the usual meeting of the Board of Guardians of the Burnley Union last week, the question of the appointment of an architect to superintend the erection of the new workhouse was again taken up, it having been adjourned from the previous meeting. The Building Committee had recommended the appointment of Mr. Blessley, whose plans had received the 100l. premium. The tender in his case was stated to be 4l. per cent. on the outlay, deducting the 100l., which left it at 3½ per cent., and it was understood that this included the clerk of the works. Mr. W. Waddington, of Burnley, tendered at 3½ per cent. for all, and Mr. Watson at 2½ per cent. for the architect, and 2 per cent. for the clerk of the works. A long discussion ensued, which was terminated by the carrying of an amendment on the motion for the confirmation of the minutes, that they be confirmed with the exception of the part respecting the appointment of an architect to carry out the works, and that this be referred back to the committee.

There is a very decent bricklayer's labourer we know of, who is willing to undertake anything the guardians like for 2l. a week, and to include the architect in it. Perhaps this is the sort of thing would suit them.

PERIODICAL CHIMES.

HAVING some time ago suggested that it appeared to be very desirable to introduce a set of superior chimes in many of our large church towers, and in the noble canopies of some town-halls, &c., I think it should be made known that the expense of a machine to play appropriate melodies upon an ordinary pair of bells at certain intervals of time will be small in comparison with that of the undertaking for the tower of Boston Church, in which it is intended to place upwards of thirty new bells.

Allow me to add, that if any of our skillful countrymen construct mechanism for periodical chimes, the performance of which shall be equal in point of precision to that of the best *carillons* in Belgium, the effect will be very satisfactory, and, in my opinion, leave nothing to be desired. Nevertheless, if any man in Europe should be able to produce a machine which far surpasses any hitherto in use, one special feature of which is the passage of riging [sic] the chimes loudly or softly as the passage of the music may require, all I will say is, that when such a machine is in motion, may I be there to see and hear.

THOMAS WALSBY.

ARBITRATION.

BADCOCK v. CLARK.

MR. BADCOCK complains that only part of the award was furnished tons. The remainder is as follows:—

"And I further award, order, and adjudge that the said Alexander Clark has no claim and is not entitled to his expenses against the said Robert Badcock, set forth in his invoice of the 18th day of March, 1866, amounting to the sum of 3l. 8s.

And I award that each of the said parties shall bear and pay his own costs incurred by him in and about the said reference, and that the costs of this award be borne and paid by the said parties in equal moieties, and that if either of the said parties shall pay the whole thereof for the purpose of taking up this my award, then I direct that the other of them shall repay one moiety of the said costs to the party so taking up this my award, when and so soon as the costs of the said cause shall have been taxed.

And, lastly, I find that neither of the respective parties has any other demand, claim, or cause of action upon or against the other of them in respect of the matters referred to me, as aforesaid, than the matters aforesaid by me awarded upon, in witness whereof I have hereto set my hand, this seventh day of May, in the year of our Lord, 1867."

REPORT OF THE AMALGAMATED SOCIETY OF ENGINEERS, &c.

The sixteenth annual report to the members has been issued. It extends to no less than 430 pages octavo, and exceeds by sixty-four pages that of 1865. Fifteen branches have been added during the past year, three in the United States. The number of members was 33,007, an increase of 9,209. The society possesses an accumulated fund of 133,113l. 8s. 3d., which is equal to 4l. 3s. 8½d. per member; showing a clear gain to the society on the year's income and expenditure of 22,755l. 14s. 4½d. During the year 22,782l. 8s. 2d., or 13s. 0½d. per member, have been paid to members out of employment, which is 8,712l. 3s. 5d., or 4s. 8½d. per member in excess of the previous year. For sick benefit the amount paid has been 13,712l. 17s. 11d., or 8s. 3½d. per member; being 72l. 16s. 10d., or 7½d. per member less than in 1865. The expenditure for superannuation has amounted to 5,322l. 14s. 4d., or 3s. 2d. per

member; being 37l. 17s. less than the previous year. In cases of accident the amount paid has been 1,600l., or 200l. less than in 1865. The funeral benefit amounted to 5,319l., or 3s. 2½d. per member, being 432l. more than the previous year. For the principal benefits the total amount expended was 48,647l. 0s. 5d., or 1l. 9s. 5½d. per member during the year. The number of deaths of members was 376; and of members' wives, 236. Consumption is the chief cause of death in both sexes.

MONUMENTAL.

A GROUP of statuary, by Mr. W. Theed, placed in the principal corridor of Windsor Castle, has been uncovered. The group consists of figures of her Majesty and the Prince Consort, the size of life in the Saxon costume of the ninth century. The position of the two figures readily tells the tale of deep affection and present earthly separation. The heads and hands are portraits. The details and ornaments of the costumes are very elaborate. The figures are of Carrara marble, the pedestals of the marble called "Marmo Africano," wrought from an antique fragment found in Rome. On the pedestal is the line from Goldsmith's "Deserted Village":—

"Allured to brighter worlds and led the way."

The High-Sheriff of Cornwall, Mr. T. S. Bolitho, has offered, in case the Davy Monument Committee resolve to place a statue of the Cornish philosopher in front of the Penzance Public Buildings, to provide a suitable polished granite pedestal for the statue at his own cost.

A committee, consisting of the Duke of Leeds, the Bishop of Oxford, Colonel Howard, and other gentlemen, has been formed for the purpose of erecting in the church of Stoke Pogis, near Eton, a memorial of Thomas Gray, the poet, whose remains are interred in the "country churchyard" of Stoke, amid the scenes which he has made dear to all who read the English language. It is proposed that the memorial shall take the form of a window. The only record which at present indicates the spot of Gray's interment is a small stone inserted opposite to his grave, and beneath the east window of the Hastings Chapel.

ROMAN CATHOLIC CHURCH AND SCHOOL BUILDING NEWS.

Liverpool.—The new chapel in connexion with the convent of Notre Dame, Mount-pleasant, has been formally opened with the ceremonies customary on such occasions in the Roman Catholic Church. The sisters of the order of Notre Dame have, since their establishment in Liverpool, been engaged in the work of education, to which they exclusively devote themselves. The new chapel stands above the presiding school, and an exterior view of it may be obtained from Rodney-street. It is over 80 ft. in length, and terminates in an apse, the windows of which are filled with stained glass, the gifts of former pupils and other friends. The breadth is 30 ft., and the roof is high and vaulted. The black marble altar-steps were brought from Belgium, and the encaustic tiles from Shropshire. The design, which is a modification of the Early English, was furnished by Mr. Hadfield, of Sheffield.

Stourbridge.—A Gothic building has been erected here, in which a sisterhood of nuns have just taken up their residence; and connected with it are new schools, in which the education of the young will henceforth be conducted. The new buildings are from the designs of Mr. Pugin. The sisters who have taken up their home in the convent belong to the "Institute of the Blessed Virgin," a religious order which has five houses in England. In India there are some branches of the order. The convent at Stourbridge is not a new house proper, the inmates having been transferred from Kidderminster to this place. There are four school-rooms, each about 30 ft. by 17 ft. The separate rooms are designed for very young children, the children of a hatter station, and for the elder boys and girls. In the convent itself there is an ample amount of room. There are at present seven inmates in it, five religious and two lay sisters. The ground-floor consists of reception-room, parlour, refectory, and kitchen. On the next floor there is a novices' room, a community-room (where work, study, and recreation take place), an infirmary

for any who may fall sick, and a private chapel. This is about 30 ft. by 17 ft. There are cells or sleeping-rooms on this floor, and also on the one above. There is no fireplace in cells, except the post-panels. They are 8 rooms. Ventilation is effected by holes in upper part of the doors. The new buildings are not yet free from debt. The sum of about 2½ has still to be paid.

Windsor.—An excellent site is secured for church of St. Edward the Confessor, and works are to be commenced immediately. Designs have been prepared by Mr. Charles Buckler. Mr. E. W. Kelly is the contractor.

Wolverhampton.—The Roman Catholics of Wolverhampton have opened a third church in this town. The new edifice is situated in Little Lane, a street running out of Stafford-street, the east side, and has been erected for accommodation of a class of people number about 4,000 persons, chiefly Irish. The structure has been designed by Mr. E. W. Pugh and it has been put up by Mr. Geo. Heavenham, builder, Wolverhampton, at a cost of its fixtures, of 4,000l. The style is of Early Gothic period. It has a centre and side aisles, is 90 ft. by 45 ft., and will seat 6 persons. It has a clearstory and pillars of Gossal stone, intermixed with Bath stone. The apse for the altar and the reredos are also of Bath stone. There is a house attached to the church. About 2,000l. have been raised towards 4,000l.

Books Received.

Ure's Dictionary of Arts, Manufactures, and Mines, containing a clear Exposition of the Principles and Practice. Edited by ROBERT HUNT, F.R.S. London: Longmans, Green, Co. 1867.

The sixth edition is now completed of this valuable and standard work, chiefly re-written and greatly enlarged by its well-known editor, Mr. W. Hunt, the Keeper of Mining Records, and formerly Professor of Physics, Royal School of Mines, &c., assisted by numerous contributors eminent in science and familiar with manufactures. The work is in three portly volumes illustrated with nearly 2,000 engravings of wood.

The public are much indebted to Messrs. Longmans & Green for the excellent dictionary which they have published, and especially for the one now under notice.

In selecting, as we shall do, a passage for quotation by way of specimen of the way in which the multifarious subjects are treated of, it is really a perplexing task to choose from amongst a host. Almost haphazard, therefore, we pick upon Bronzing Powders, which have been much used of late in the decorative painting of houses as one of interest to our readers.

Of Bronzing Powders, after alluding to their use in house decoration, &c., the writer says:—

"They are prepared of every shade, from that of bright gold to orange, dark copper, emerald green, &c. Pale gold is produced from an alloy of 13½ of copper and 2½ of zinc; crimson metallic lustre—from copper; ditto, paler, copper and a very little zinc; green bronze with a proportion of verdigris; another fine orange by 14-4 copper and 1½ zinc; another ditto, 13½ copper and 2-4 zinc; a beautiful pale gold from an alloy of the two metals in atomic proportions.

The alloy is laminated into very fine leaves with careful annealing, and these are levigated into impalpable powders along with a film of fine oil to prevent oxidisation, and to favour the levigation.

Mr. Brandeis, in his account of his articles of manufacture furnished to the New York Exhibition, says:—

"Bronzes, or, more correctly, metallic powders resembling gold dust, were invented in 1643, by a monk, at Furth, in Bavaria, named Theophrastus Allis Bombbergeris. He took the scraps or cuttings of the metallic leaves then known as "Dutch leaf," and ground them with honey. This roughly-made bronze powder was used for ornamenting parchments, capital letters in Bibles, choral books, &c."

At Furth bronze powders are largely made for Europe, and with little change or improvement. There are four sorts of Dutch leaf.

Common leaf, soft, and of reddish cast, composed of 25 or 30 per cent. of zinc to 75 or 70 per cent. of copper.

French leaf contains more zinc, is harder, less brittle, and has a purer yellow colour.

Fluence leaf has a larger proportion of zinc, is of a greenish gold colour; and, lastly, White leaf, composed of tin.

The more zinc these alloys contain, the harder, more brittle, and more difficult are they working into perfect leaves. The manner of their being is similar to the mode for producing lead leaves.

The scraps, cuttings, and fragments of these leaves are the materials for the German bronze orders. First brushed through a sieve and ground with gum water on marble slabs for six days, the gum washed out, the powders sorted, and, and a coating of grease given to make them appear more brilliant, and to protect them from oxidation. Varieties of colour, such as orange, &c., are produced by a film of sub-oxide on the surface of the particles. The price of bronze powders depends upon the demand, and the supply of the waste material of the metal leaves, and prices change accordingly.

Messrs. Brandeis patent their process; and in case of being dependent upon uncertain supplies of metal and unknown composition, they take metals at once in a state of purity (they appear by voltaic precipitation) it is alloyed with zinc, cast into ingots, rolled into ribbands, annealed, and rolled until the metal is thin as leaf-like; then it is taken to a steam-mill, and ground. The bronze powder is washed out and dried, then introduced into an air-tight chamber, with an arrangement of boxes; the air of the chamber is set in violent motion by bellows, and the powder diffused throughout; the bronze powders are deposited, the finest in the upper boxes, and the coarser powders below. When tinned, mineral varnish is introduced; the boxes closed with tight lids are made to revolve, and the particles are thus rapidly coated, and the highest metallic brilliancy imparted. Different shades of colour, pink, crimson, &c., are produced by submitting the powder to heat and oxidation before the rapid revolutions of the finishing boxes.

The quantity thus produced by one firm, with three steam-engines at work, enables the finished bronze powders to be produced at a rate about equal to the price the German manufacturer has to pay for his materials—the cuttings and scraps of leaves. Hence, for the purposes of trade and export, a large exportation of bronze powders takes place from America to Europe, South America, and China.

The bronze powders are largely used in japanning, bronzing tin and iron goods, ornamental works of paper, wood, oil-cloth, leather, &c.; in sign-boards and the decoration of public buildings have effective metallic brilliant surfaces of beauty and durability. In fact, for ornamental decorations, the demand steadily increases.

In Holland and Germany the subject has been examined, with the view of ascertaining the effect of chemical composition.

De Heer E. R. König has lately given a table of the analyses of the best European samples of bronze powders and leaves (*Volkslistig*):—

	Copper.	Zinc.	Iron.	Tin.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Light yellow.....	82.38	16.69	0.16	0
Gold yellow.....	84.50	15.39	0.07	0
Messing yellow, or brass	90	9.61	0.20	0
Copper red, yellow colour	98.93	0.73	0.08	0
Copper red, high shade	99.90	0.00	trace.	0
of purple colour.....	98.22	0.5	0.30	trace.
Purple violet.....	84.32	15.02	0.03	trace.
Light green.....	84.32	15.02	0.03	trace.
Tin, white or leaden grey	0.90	2.39	0.56	97.46

Our importations, in 1864, of bronze powders, were valued at 5,637*l.*, according to the Custom House computation." The book cannot be too strongly recommended.

VARIORUM.

"On the Utilization of Sewage by Filtration and Irrigation." By C. E. Austin, Mem. Inst. C.E. Mr. Austin here gives practical details, with diagrams, of a process of irrigation similar to that practised at Croydon, under the superintendence of Mr. Baldwin Latham, surveyor to the local Board of Health. These details cannot but be useful at the present juncture, when the question, what is to be done with the sewage? is pressing so urgently on the local authorities of towns throughout the country.—The Telegraph

and its proposed Acquisition by the Government. By Robert W. Johnston, chief metropolitan post-office, W., late of the Telegraph service. Edinburgh: Nimmo. London: Simpkin, Marshall, & Co. 1867." The object of this paper is to point out some of the defects of the present system as they have occurred to the writer during a rather extensive experience of practical telegraphy, and to indicate the advantages which might be expected to result from a Government administration of the telegraphs in this country. The interest of the general public, and not hostility to existing companies, has been the chief object in view. Salaries ranging from 30*s.* downwards to 10*s.* for instrument clerks, we should think, are quite sufficient in themselves to account for defects in the telegraph service. Mr. Johnston does not think ladies very competent to apprehend readily the various commercial and other heterogeneous styles in which messages are sent to and fro, although they frequently make most expert manipulators of the telegraphic apparatus. The results achieved under the present system, as regards speed, are, he states, exceedingly variable, and on the whole not satisfactory. Telegrams and letters are so different in their nature, that the penny-postage system cannot well be the basis of calculation for a reduction of rates in telegraphy.

Miscellaneous.

ROYAL HORTICULTURAL SOCIETY.—The Royal Horticultural Society, following the example set by the International Horticultural exhibition of last year, announce that their great *fête*, commencing June 4, will remain open for five days, and we understand it is intended to admit the public on the Thursday and Friday for 1*s.*

NEW COURT HOUSE IN MANCHESTER.—We understand that the tender sent in by the executors of the late Mr. Samuel Bramall, contractor, Hulme, for erecting a magistrates' court-house adjoining the Manchester Assize Courts, in which to transact the magisterial and sessional business for the Manchester division of the Hundred of Salford, was on Wednesday accepted by the committee of magistrates appointed on the subject, the estimate being about 5,300*l.* Mr. Bramall, it will be remembered, was the contractor for the superstructure of the New Assize Courts, and has also had other large public contracts. Mr. A. Waterhouse is the architect.

THE CHELSEA VESTRY REPORT.—The tenth Report of the Chelsea Vestry has been printed. As usual, it is a voluminous record of vestry proceedings, containing no less than about 450 closely-printed octavo pages. It treats of every subject which has been before the vestry in course of the year (1865-6), such as lighting, gas, sewages, sewers, Thames embankment, sanitary matters, Sloane-square improvement, railway progression in the parish, Park-lane improvement, and a variety of others. Some attention has been paid to overcrowding, and the state of courts and alleys; and 109 private drains have been connected with the sewers upon the application of owners, 8 new gullies constructed, a new 12-in. pipe-sewer laid down in Regent-street, and numerous sewers finished and gullies cleaned. These seem to have been the chief sanitary measures adopted in course of the year.

RUST REMOVED FROM METALS.—Plunge the blade in a bath of diluted hydrochloric (muriatic) acid; say one pint for twenty-four hours; wash it out and rub well with a scrubbing-brush. The oxide will come off like dirt under the action of soap. Should any still remain, as is likely in the corroded parts, return the blade to the bath for a few hours more, and repeat the scrubbing. The blade will then present the appearance of dull lead. It must then be well washed in plain water several times, and thoroughly dried before a fire. Lastly, a little rubbing with oil and fine emery powder will restore the polish. Should oil or grease have mingled with the rust, as is usually the case, it will be necessary to remove it by a hot solution of soda before submitting the metal to the acid. This last attacks the rust alone, without injuring the steel; but the washing in plain water is all important, as, after the process, the metal will absorb oxygen from the atmosphere freely, if any trace of the acid be allowed to remain.

THE BRADFORD SURVEYOR'S SALARY.—The town council of Bradford have agreed, with a few dissentients, to raise Mr. Cot's salary from 400*l.* to 700*l.* a year.

THE INSTITUTION OF CIVIL ENGINEERS.—The annual *conversazione*, given by the president (Mr. John Fowler) of this institution, took place on Tuesday evening in Great George-street, Westminster. The rooms were, as usual, thronged with visitors.

AWFUL FEVER AT MAURITIUS.—Upwards of thirteen thousand persons have been carried off at the Mauritius by yellow fever. The official returns from the 10th of February to the 28th gave the deaths at 2,061; in March, 6,433, and from the 1st of April to the despatch of this notice, viz.—the 17th of April, 5,070; making a total number of 13,564. Since then there has been a decrease in the number of sick. Such a frightful mortality, it is to be hoped, will induce the Government and the public to unite in order to improve the sanitary condition of the island.

LIABILITY FOR NEGLIGENCE.—The case of *Thaermaur v. Dames* was where the plaintiff, a gasfitter, had sustained injuries by falling down an unfenced shaft in the defendant's sugar refinery, while, by permission of the defendant, he was inspecting some gasfittings which he had put up a few days before, in order to see that they were working properly. The Court of Exchequer Chamber held (affirming the judgment of the Common Pleas) that the plaintiff was not a mere volunteer or licensee, but that he was on the defendant's premises for a purpose incidental to the contract, and that it was therefore the duty of the defendant to have put up some safeguard, or to have given reasonable notice that there was a dangerous place on the premises.

THE ALBERT MEMORIAL.—To the number of sculptors selected by Her Majesty and Mr. G. G. Scott, R.A., to be entrusted with the execution of the several groups, bas-reliefs, and figures for the embellishment of the memorial, has lately been added the name of Mr. J. F. Redfern, who has been commissioned to model eight figures to represent the Virtues—the four Christian and the four moral virtues—which will be electrotyped and placed in the metal-work of the canopy, now being wrought by Mr. Skidmore, of Coventry. Mr. Redfern is also engaged in designing and executing for the restoration of Salisbury Cathedral a number of figures, which, when completed, will fill upwards of forty of the numerous niches of the west front.

OZONE.—Another advance has been made in the utilization of ozone, as demonstrated by the "ozone-generator" exhibited at the *conversazione* given by the President of the Royal Society. It is described in *Chambers's Journal* as consisting of a number of flat sheets of glass, coated with tin-foil, and piled one on the other, but slightly separated. Each plate represents a Leyden jar, and when the whole number are electrified, a stream of air forced through from one end to the other becomes so strongly ozonised that breathing it is painful and dangerous. The stream of ozonised air thus produced can be used for bleaching and other chemical purposes; and this is the form of it that is already turned to account in the decolorising of sugar on a large scale at one of the refineries in the east of London.

ASHFORD CHURCH TOWER.—The tower of Ashford church has fallen into a bad condition, and is about to be repaired. The church is cruciform, and the tower is at the junction. The pinnacles have no other support than the walls of the tower, which stands on four pillars in the centre of the church, and which are of course greatly strengthened by the four extensions of nave, chancel, and transepts; the walls of the tower commence about 5 ft. in thickness, and reduce to 3 ft. 6 in. from the chime loft; and as the pinnacles are octagonal with a width of 6 ft. 9 in., half the pinnacles necessarily rest on an arch springing from the side walls, the expansion of which is supposed to be partly the cause of the present defective state of this pinnacle, accelerated by the agitation caused by the ringing and firing of the bells. Sir John Fogge, who erected the tower about 1470, left estates, the revenues of which were to be applied solely to the reparation of the church; these, together with other estates left for the same purpose, now produce a revenue of about 250*l.* per annum. The north-eastern pinnacle was rebuilt in 1845, and the north-western in 1811.

WATER SUPPLY.—Mr. Whalley has obtained leave to introduce a Bill into Parliament to make better provision for facilitating the supply of water to the metropolis and other towns and districts.

INSECURE STATE OF THE LICHFIELD MUSEUM.—We have received a letter from Dr. Rawdon, of Lichfield, reiterating statements as to the very insecure state of the museum of that city and the inadequacy of the works that are being carried on to remedy it. It would seem desirable that professional opinion should be obtained from outside the town.

PICTURE GALLERIES.—A correspondent suggests, as if new, the arrangement of a picture gallery in steps or stages, so as to make the wall-space available to the top. In our volume for 1860 (xviii.), p. 345, he will find a similar suggestion from Dr. Horace Dobell, with a diagram.

ARCHITECTURAL EXHIBITION SOCIETY.—A lecture was given in the Gallery, Conduit-street, on Tuesday evening last, "On the Ancient Cities of the Eastern Shores of the Adriatic," by the Rev. W. Denton. The lecturer urged that here new sketching ground might be found. At a previous meeting, May 14th, Mr. E. W. Godwin read a paper "On the Architectural Exhibition of 1867."

HYDE PARK.—The piece of park from Albert-gate to Apsley House-gate has been rapidly transformed from a stretch of rough ground to a charming garden, and shows what may be done even with trees by skill and money. The level has been varied, a brilliant turf finish, and rhododendrons and other flowering shrubs are in full blossom. The spot can with difficulty be recognised. The poor man may here enjoy his pleasure-ground, without the inconvenience of having to pay gardeners.

DRAINAGE OF GEDDINGTON, NORTHANTS.—The southern and largest portion of this village is about to receive a complete system of sewerage, the mains being carried down to the lower part of the town, with a view to their extension and connexion with a filtering process at a future day. The plans have been prepared by Mr. R. W. Johnson, architect, of Melton and Leicester; and the contract for the first portion of the work has been taken by Mr. Patrick, builder, of Geddington. Glazed pipes are to be used for the new main sewers.

TOMB OF THE LATE BARONESS FERDINAND DE ROTHSCHILD.—For some time past the grave of the late Baroness Ferdinand de Rothschild, in the Jews' Cemetery, East Ham, has been tended by Messrs. Veitch, and plants and exotics of the rarest kind have been cultivated around it. Within the last few days workmen have been engaged in erecting scaffolding in the cemetery preparatory to building a mausoleum, which is also intended as the last resting-place of other members of the family. Mr. Digby Wyatt has prepared the designs, which have been approved, and the building is entrusted to Messrs. Myers, of Lambeth.

SOCIETY OF ARTS.—One of those *conversazioni* for which this society has become distinguished, took place last week, at the South Kensington Museum, under the most favorable circumstances. The company numbered upwards of 4,000. The duty of receiving the visitors was performed by Mr. William Hawes, Mr. Peter Le Neve Foster (the secretary), and other prominent members of the Society of Arts. The numerous halls and galleries were, as usual on these occasions, brilliantly illuminated, and the various objects of attraction were seen to the best possible advantage. As a promenade the building was found very satisfactory. The entertainment was enlivened by the music of two military bands.

ROYAL DRAMATIC COLLEGE.—The report read at the general meeting on Wednesday last showed that Mr. Argyle E. Slous's prize drama, "True to the Core," as performed at the Surrey Theatre, realized for the College 527l. 6s. 6d. Good fortune has also attended this drama at Liverpool. It is intended to produce it at Nottingham, and the council have reason to hope its further performance in other metropolitan theatres. The financial statement for the year ending April 30th, 1867, showed that the total receipts amounted to 3,456l. 6s. 11d., 1,085l. 18s. 10d. of which was realised by the Crystal Palace *&c.* The total expenditure amounted to 1,773l. 2s. 4d., leaving a balance in favour of the institution of 1,683l. 4s. 7d.

THE HOLBORN VALLEY VIADUCT.—The "chief stone" of the viaduct will be placed *in situ* at the south corner of the bridge over Ferringdon-street, by the chairman of the Improvement Committee, Mr. Thomas Henry Fry, on Monday afternoon next.

METROPOLITAN LOCAL GOVERNMENT.—The Local Government and Taxation Committee of the City of London, appointed in March, 1866, to watch the proceedings of the Select Committee of the House of Commons inquiring into the local government and local taxation of the metropolis, have recently sent in a report to the Court of Common Council, in which they express their opinion of the general scope and aim of the thirty-one resolutions of the Select Committee of the House of Commons on metropolitan local government, and conclude with some practical recommendations in relation thereto. With Metropolitan Municipal Association, referred to the City Committee, they report that the views and objects of that association generally commend themselves to their judgment as sound, and calculated to produce beneficial results, as it regards the local government of London; and they are informed by parties connected with the said association that a bill or bills will be immediately introduced into Parliament on their behalf, which will embody their views. The City Committee recommend that they should be empowered to oppose any attempts to subvert the free municipal government of the City, and to assist the other districts of the metropolis to the attainment of their rights of self-government.

WASTE OF INFANT LIFE.—Why is the rate of increase of population decreasing in many countries? An answer to this question, so far as America is concerned, has been given by Professor Storor, of Boston, in the *American Journal of Science and Arts* for March, 1867. The paper was prepared some time since, but it was thought best to confine its discussion, at first, to the medical profession, so that any error either in the statistics, or the reasoning, might be detected. To determine the increase of the English race, the emigrants must be taken into account. The rate of increase in the population of England was highest in the years following the peace, before emigration was developed; it reached its maximum, 1,533 per cent. per annum, in 1811-21, and fell successively to 1,141 per cent. per annum in 1851-61; but if the emigrants who have left our shores had remained in the country, the rate of increase of population would have been considerably augmented. Professor Storor states that the conclusions at which he has arrived do not rest alone on the statistics which he has collected, but that the experience of American courts of justice, and the body of physicians throughout the land, tend to corroborate the fact that the decrease in the rate of increase of population, is owing in a great measure to infanticide and feticide, which prevail to an alarming extent in many of the American states.

COMPENSATION: THE HOLBORN VIADUCT.—At the Lord Mayor's Court a compensation case, *Walton v. The Corporation of London*, was heard before the Common Serjeant and a special jury. The claim, as appeared from the precept, was just over 42,000l., and was made up of various items. The jury went to view the property, and on their return the case was opened by the Solicitor-General, who called witnesses in support of the claim, and afterwards summed up the evidence. Mr. Hawkins addressed the jury on behalf of the corporation, suggesting that about 21,000l. would satisfy the justice of the case. The Common Serjeant went through the evidence, and left the question of compensation to the jury. After an absence of half an hour, they gave a verdict for 28,060l. On a previous day was heard the case "The Governors of Bridewell and Bethlehem Hospital v. The Metropolitan Railway Company." The question was in respect to some freehold property in Liverpool-street and its adjacent parts, required by the railway for their Tower-hill extension line. Mr. Hawkins, Q.C., Mr. Garth, Q.C., and Mr. Pindar appeared for the hospital; Mr. Lloyd and Mr. Holloway for the Railway. The jury went to make a personal inspection of the property, and soon afterwards the counsel and other parties consulted together. A little time was craved in order to save a long inquiry, and eventually an arrangement was made. Mr. Hawkins informed the jury they had settled the matter, and they would only have to give a verdict for 40,000l.

DECORATION OF WALL-SURFACES.—In things the walls of Pompeii read us which we should be the better for to bear. The sight of any house which is allowed to go out of repair in an English pitiable enough. The crumbling mortar, everything, and the walls exhibit wreaths of paper with the colours faded and the spots blotted out. After centuries have passed on centuries, the walls of Pompeian houses scarcely less firm and beautiful than when owners lived and moved within them, signs of the mischief about to be done long-slumbering fires of Vesuvius. It would take many a year yet to convince the men that the pspheranger is not the person to make a home seemly or beautiful that a genuine artistic ornamentation may be within the reach of other than the wealthiest classes. The Pompeians, however, were not wealthy; and some examples of taste are found in the houses of whose means were manifestly not great. A beautiful effect produced by the treatment of wall-surfaces is disputed by none; that should still have but an imperfect knowledge of the means employed to obtain it is much regretted. The receipt for making the stucco used by the masons of Pompeii would be a thousand in this country, who long to escape from the dominance of fashions which are the less abhorred because they are old. All Dr. Dyer can say is that "it seems to have been made of calcined gypsum, or plaster of Paris mixed with pulverised, but not calcined, sand, in the more expensive sort, with powdered marble" (268). This stucco was spread, presently, with an instrument like that which is used by our plasterers; and Dr. Dyer adds "a difference in quality, and an economy in use of it, are observable, which make it probable that the expense varied greatly, according to the fineness of the material." Vitruvius, true, says that the stucco should be always thickly laid on; but he is probably mistaken for "on the columns of the oldest temple, Pompeii, the Greek temple, we see a stucco extreme beauty, harder than stone, and more than a line in thickness," while the temple of Paestum have received a coat still thinner. *The Chronicle.*

TENDERS

For alterations and additions to 4 and 5, Crown Place, for Sir Gouits Lindsay, bart. :—	
Wilson (accepted)	£2,105 0 0
For studio, conservatory, &c., for Mr. E. Duncanson, Upper Park-road, Hampstead. Mr. W. Wright, architect. Quantities applied:—	
Myers	£1,199 0 0
Beaves	1,144 0 0
Wardle & Baker	1,090 0 0
For two houses, at Leytonstone, Essex, for Mr. Payne. Mr. G. R. Noble, architect. :—	
Piper & Wheeler	£2,173 0 0
Perry	2,141 0 0
Hedges	1,893 0 0
Hill & Kedwell	1,885 0 0
Arber	1,800 0 0
Rivett (accepted)	1,867 0 0
For new chronic wards at St. Marylebone Workhouse. Mr. H. Saxon Snell, architect. Quantities applied:—	
Stephens & Watson	£6,450 0 0

The Builder.

VOL. XXV.—No. 1270.

Architectural Aspects at Genoa and Turin.

Three, or, with the greatest ease and the slightest possible fatigue, in four days, the traveller now finds himself in succession at London, Paris, Turin, Genoa. The aspects of the two first of these cities are not more strikingly in contrast than those of the two latter, which

are separated by still fewer hours. In both the Italian cities we find the same sun, and more or less of the same Alpine horizon gleaming with the snows of the wintry wilderness between Burgundy and Piedmont; but for the Po that burries by the side of Turin we have the harbour—nay, the very sea embraced by the curving shore of Genoa; for the city of the level plain we have a city built on the slopes of a circle of hills that descend with every variety of secondary hills and undulations towards the port. The Piedmontese capital is regularly itself in plan, so far as regularity consists in streets arranged at strict right-angles, and of even and constantly of most liberal amplitude, and not without widening centres and open squares and long continued uniform arcades. Genoa is not without open places, but they are come upon at all manner of angles with the streets that lead into them: the streets themselves are widening insensibly, even when they seem at their straightest; are on a level never, and usually steep; at their widest a footway on either side of moderate modern width would go far to obliterate any intermediate roadway, and usually there is none at all; carriages and omnibuses are scarcely available out of one leading artery through the city, and these can move but slowly over the passenger-obstructed pavement; elsewhere there are but few streets where conversation might not easily go on between opposite windows; and indeed the newly-arrived visitor can scarcely but be struck by the frequency and audibility of the human voice about a town where no rolling wheels and only rarely clattering hoofs and jingling bells of the mules come into competition. Narrow streets in Italy give shade without gloom, and it is only occasionally in some very unfavourable position that we see a daylight reflector—that in London is required in a street as broad as Lombard-street—in the simple form of a banner of white calico pendent in front of a window. Otherwise the ordinary streets are veritable defiles—olefts they seem between immense and lofty masses of building, where ten stories, including mezzanines, are as frequent as eight, and seven are exceptions. And still architecturally, as justly as in any other sense, is Genoa entitled *la Superba*.

The architects of the sixteenth century effected here a transformation as complete and of much the same nature as we have been witnessing in new Cannon-street and about the Bank of

England; and nobly succeeded in reconciling grandeur, amplitude, dignity, with the conditions of the narrowness of a lane. Leading streets and by-streets are occupied by successions of palaces, each of which afforded accommodation for a family in that larger continental sense that allowed of the grouping under a common roof of the head of the family, of married and unmarried children, of uncles and consins. There go many virtues to the possibility of such arrangements, and good faith, and so mutual confidence within the walls, made head against treachery and violence without.

It is with the aspect of the city and its special characteristics that we concern ourselves now,—with no detailed monography. The façades are frequently—are usually—immense square elevations; five or even more of the stories are of noble height; the windows, well-proportioned, and reaching within as near the top of the room as the cornice will admit, are of such liberal width, that sometimes the opened Venetian shutters exactly cover the intervals, that in other cases equal the width of a window with its dressings.

By wise delibateness or bappy instinct the architects have uniformly restrained their mouldings and window-dressings and balconies within limits of most moderated and but slightly varied projection. Hence a general air of repose and self-control, and, if it is not abusing metaphor to say it, of self-respect. There is none of that motiveless competition of story with story which is apt to be suggested by diversities under no apparent norm, and none of the insolent repudiation of conditions that, after all, will have their way in the adoption of a salient treatment, that challenges regard to a distant station point, such as is utterly out of the question. True dignity is shown to be not the less available, and it is obtained by substituting boldness in height and breadth of mouldings, and of distributions in place of exaggerated projection. One feature that is applied with masterly effect, is a deep flat band continued under the window-cills of the first story, and often repeated under those of every successive story, with gradually-diminished dimensions. The height of this band, sometimes 1 ft. or 1½ ft., is very great relatively to its projection, which is little more than that of a proportionate ogree-moulding beneath it. In many cases its profile exhibits the drip and corona of a Greek cornice, with the bed-moulding advanced to its lower edge.

The moderation of projection of these bands, and of the dressings and window pediments of the tiers of stories they divide, assists the emphasis of the projection of the general roof cornice, which is really bold, and yet does not in truth encroach on the interval of houses to an extent that would seem implied by its effect. The niting effect of it is assisted by its response to the special treatment of the other extremity,—the bold rustication of the base with very large masses of stone. These, no doubt, are often only mimetic; but they are so often, and to such an extent real, that the imitations pass unquestioned, or, if recognised, we are thankful for at least the conception of grandeur they imply. But it is in the treatment of entrance and entrance-halls and vistas from the open street that they who built for the Genoese noble citizens found opportunity and used it worthily. The sentiment of interest and importance on occasion of arrivals and departures has here its full expression. Through the free and columniated portal of grand opening we look into a vaulted hall to ascents of opal marble steps, single or meeting from either side on balustraded landing; beyond again we see the court of the house with vaulted peristyle and loggia above, and often the verdure of a garden in the centre or beyond. The slope of ground upon which so many of these palaces are built gives opportunity for some beautiful combinations of entrances from the two levels; as

where in one fine example a central flight of stairs from a lower pillared hall has its landing in the upper between the flights conducting to a balcony above.

As we look in or enter from the narrow streets of the cooped-up city, we are conscious of a magnificent generosity in the space afforded to these halls. We see the homes of citizen nobles at once wealthy, powerful, and popular. Luxury here is neither biding nor fortifying itself, nor parading itself. There is a largeness and a freedom combined with artistic effect that quite explain how the architecture of Genoa commended itself so far to the imagination of Rubens as to induce him to bring it before his wealthy countrymen in the architectural publication for which he obtained drawings and supplied a preface.

Here, as in other parts of Italy, we are pleased with the facile resort to vaulting for balls of any size, for chambers, for arcades, and loggias; and here, less often than elsewhere, are we offended by the humiliating metallic bow-string to the arch.

The remarkable flatness of these vaults save s our sensitiveness as to economy of space, and gives feeling of reality to interior construction that threatens many an hour of discontent at a flat ceiling. Much fancy is constantly displayed in combining the intersection of the groins even in the simplest plans, and thus deriving novel lines of distributed ornament.

The vertical opening of the windows, in place of the English guillotine sash, is an advantage in favour of grandeur for which climate has in the first place to be thanked; and the same may be said of the comparative rarity and nonchalance of chimneys—chimneys which it is impossible for a lover of architecture to speak of with patience. Treat them how we may they will still vomit smoke, and until invention shall contrive to divert the products of combustion towards the earth they should belong to, and not to the sky that they pollute, we must bear as we may exclusion from our purest air, and such a crowning with the chimney doctor's fool's cap of every triumph of design as we witness at Paris not less abundantly than in London.

From another difficulty, there is even in Italy, and even at Genoa, not so happy an escape. Palace fronts stand flush with the line of the confined streets, and ground-floor windows are, therefore, liable to inlook and overlook. This floor, therefore, becomes only ignobly available; and here, as at Rome, the lowest range of openings too conspicuously and inevitably betray how magnificence rises above cellars of dirt and darkness and evil ventilation. The area of an English club-house meets this difficulty; and the balustraded wall, as managed in the best examples, effectively supplies the requisite union of superstructure with proper base. Even so we do but mask our difficulty, but the difference is of great value still. Palladio's best designs are constantly marred by meanness in this important position; and the façade of Burlington House may be referred to as exemplifying an unfortunate incongruity between the importance of the rusticated basement, and the mean effect of the office-like openings with which it is pierced.

The architectural works now proceeding at Genoa are not very inviting of comment. Materials at hand favour the columnar design, but the sentiment of the column has yet to be recovered here, and, no doubt, will be. In this clear air and unstinted light we learn to appreciate the value, the necessity, of fluting in giving a sharp edge at the outline of the shaft, and precluding the indecision of varying shades and reflections on the smooth, if not polished, round.

But what now of the intimated contrast of the architecture of Turin. This is in every respect of subordinato interest, and we may very willingly comply with the nrgency of space to assign to it but a scanty paragraph.

It would be hard to complain of Gnarini and Invara in the seventeenth century on the same ground of taking liberties with an established style on which we are accustomed to eulogize the never-resting Mediaeval designers. But all the difference lies in success. It is hard to be displeased with an innovation in Gothic, when the novelty, though inferior to what it supplants, has still a merit of its own, and in itself is not only original, but good. But the propagation of monsters is not legitimate under any theory of the development of species. The general predilection of the architecture of Turin might have been a reaction from the monotony of the right-lined streets; for it is to substitute curved lines for right lines, to adopt elliptical in preference to circular, and even a wave line rather than an ellipse. Thus an important line of front follows the windings of the how of Apollo; entablatures follow of necessity, curving and recurring; pediments are curved both in plan and elevation, and are as frequently broken as complete; the plan of an apse or a cupola is often taken from the ellipse, and oove and vault are in sympathy. The vertical lines of the classic profiles are treated as unceremoniously; and when the distortion of old details reaches its limit, new are introduced which are fantastic, yet inelegant, wild, and yet clumsy after all.

A certain inventiveness in composition are not to be gainsaid; but the dignity appropriate to all structures of large size and usually challenged by magnitude, even apart from destination, is sadly sacrificed by changes of contour and direction, that favour infallibly of wriggle—he the word allowed—and of caprice.

It is the architecture of the age of warriors who went into the field in cuirasses shadowed by full flaxen wigs; it is treated in a style that at best would become interior decoration,—of a drawing-room rather than a hall, and of a boudoir than either. The moulded framings of windows in grand structures at Turin supply motives at least for the ornamentation of picture, or better of looking-glass frames; but even so would require enrichment and refinement. But, as we have said, the oppressive tameness of the city may persuade us to condone vagaries that seem like a caper indulged in for relief after the wearisome inaction of parade or the goose-step of drill.

The architectural lessons, then, that are to be learned at Turin will be for the benefit of chiefly those students who have the art commended by Shakespeare, and it is no slight one,—

"To gather honey from the weed,
And make a moral of the devil himself."

The lover of architecture wanders from city to city, and prepared for many a disappointment, has often to welcome a pleasing surprise; is rewarded for contentions *returini* and maritime nausea, the worries of the most accomplished of travellers that are compiled in that expressive first paragraph of the *Odyssey*. When a work of consummate beauty and perfected purpose is denied him he may still have his eyes unsealed to a danger of ugliness unsuspected; sometimes he recognizes a happy germ only half developed, and sometimes where all is either decadence or erudition he finds a welcome link in the parted chain of history; finds, perchance, how ignorance at least broke through obstinate tradition at the same time that it defied instruction, and so set free at once and stimulated invention to original contrivances in reparation of the lapse.

RECLAMATION OF LAND AT NORTH WOOTTON. The Norfolk Estuary Company have just completed another embankment of two miles in length at North Wootton, adjoining the lands of the Prince of Wales and the Hon. Mrs. Mary Greville Howard. It was commenced in February last, and has added about 700 acres to that already reclaimed by this Company in the Wash. This now makes a total of about 4,000 acres of the 32,000 to be recovered from the sea for which the necessary funds were raised by the authority of an amended Act of Parliament in 1849. The cost of enclosure is about 10*l.* per acre, and the estimated value of the lands enclosed was, at a late arbitration between the owners of the adjoining land and the Company, considered to be 50*l.* per acre; when it was also stated "that the land would make bricks; there was a good site for millings, good water, gravel to make roads, and houses might be built on the high land, and corn would grow there."

ROYAL COMMISSION ON RAILWAYS.

The Report of the Commissioners appointed in March, 1865, "for inquiry into the charges now and heretofore made for conveyance on the several railways of Great Britain and Ireland, and whether it would be practicable to effect any considerable reduction in such charges with a due regard to safety, punctuality, and expedition," has just been presented to both Houses of Parliament by command of her Majesty. It would be difficult to characterize this confused and bulky document otherwise than as a signal disappointment to those who have expected valuable assistance in dealing with one of the most pressing questions of the day from the tardy utterance of the commissioners. The disappointment is tacitly admitted by the whole public press. Even scientific and special journals find nothing better to do than to reproduce, without comment, some of the many feeble and uncertain recommendations which the Royal commissioners have printed in large letters here and there in the body of what they call a Report, and have repeated *verbatim en suite*, as part 7, in thirty-two paragraphs. The writers of the report appear to have fallen into the error common to the authors of ponderous volumes that are doomed to the dust of the bookshelf,—they have ceased to write when they should have begun to write for publication. In all literary labour worth the name the pen plays a conspicuous part. The investigator of any important subject must read, listen, look, with pen and paper in hand. Down goes at once every impression, and down with it, very often, an indication of the inference that it suggests, of the train of thought or line of argument that it originates. Very often such impressions are modified, explained, or altogether removed by subsequent information. The note-book should contain all this, and when the whole case is exhausted comes the time to review the voluminous materials, to reduce to clear and logical sequence the crude inferences and partial arguments, and to place before the world a clear, brief, intelligible result of much labour undertaken in the cause of truth. But people are too apt, and we have had signal proof of the fact, to shirk this last and most important part of their duty. A very large hook almost always has this upshot—"Judge for yourself—here is what we have collected." This is far easier than to say—"This is my opinion on the case referred to me, and annexed are the reasons for forming that opinion." But in a time of pressure like the present there can be no doubt as to which mode of dealing with a subject is the true one.

It must, however, in justice to the commissioners, be borne in mind, that for much of the inaptitude of their report to the wants of the day the express terms of the commission are to blame. It is singular to reflect that when, in a debate in the House of Commons on the subject of Railway Finance, not long since, the general assent of the members was expressed in favour of waiting for the report of the Railway Commission, there was not one of those gentlemen who were responsible for the restricted limits within which the labours of the commissioners had been hedged, who had the practical good sense to rise and say that the report would not deal with the question then before the House. The stability of a great national property, of a magnitude approaching that of the national debt itself, the definition of principles of legislation for its protection and development, the discouragement of wanton conflict and ruinous waste, the establishment of a searching and upright system of audit,—these are the points on which the public require both information and protection; but none of these points are included in the instructions given to the commissioners. If the commission had been expressly designed not to enlighten the public, but merely to collect a mass of statistics on which some measures for dealing with railway property at large might be, if not based, at least supported, while at the same time neither the commissioners themselves nor witnesses called before them were informed as to the use intended to be made of their labours, it could not have been more cunningly framed for the purpose. That two years should have been consumed in the inquiry as to the means of securing economy in the working of railways by legislation, the sole apparent aim of the commission, is incredible. About and around this subject, indeed, the report wanders, commencing with the very history of railways, and generally throwing everything on

the never-failing wisdom of Parliament; but of practical, definite, statesman-like dealing with so vast an economical question we see little trace.

The report proper of the commissioners, taking the commission itself as a guide, is contained in the following words:—"We do not consider that any direct legislative enactments would cause greater economy in the working of railways." That is the discharge of the commission. All the rest of the ninety-two pages is beside the mark. It is of course possible to present in a report much that is of real practical value, although not within the strict limits of the instructions. In such a case, however, a reporter fit for his post will know how to distinguish between the opinion for which he was called on, and the extra information which he volunteers. Nothing of the kind is even hinted at in the present report. The thirty-two twice-printed clauses in which the opinions, considerations, and views of the commissioners culminate, are all "humbly submitted" together to her "Majesty's gracious consideration," without any reference to the expression of "our will and pleasure," which called forth the inquiry. Had not the commission itself, dated 11th March, 1865, and the second commission which superseded it, dated 19th December, 1865, been printed with the report, it would have been impossible for any one to guess from that document itself what were the "various matters connected with the railways of Great Britain and Ireland," for the purpose of inquiring into which the commissioners were appointed. Alongside of this brief report,—perhaps lest it should seem too bald if offered to the Crown in its true and proper form,—we find such profound suggestions as the following:—"We consider it desirable that railway companies should avail themselves of every opportunity for obtaining possession of the railway plant used on their lines." "We are of opinion that a sound principle to act on in the matter of working and traffic agreements between railway companies, is to allow any companies to enter into them without reference to any tribunal." "We are unable to see any method of ensuring punctuality in passenger trains by means of legislative enactments."

The report, such as it is, does not even carry with it the weight of the unanimous opinion of the commissioners. Of the sixteen names to which the commission of December, 1865, was directed, only eleven are appended to the report. Next follows a special report from the Right Hon. W. Monsell, M.P., who ventures humbly to dissent from the opinions of the majority of his brother commissioners. Mr. Monsell's report, of thirteen pages, refers to Irish railways alone; and we cannot now afford the space to enter into this distinct branch of the subject. Mr. Monsell urges that the Irish railways should be purchased by the Government. The commission considered, "that when Parliament thinks fit to make advances to Irish railway companies, the money should be lent for a fixed period of considerable length." We have nothing for the moment to remark upon the subject, except that the former proposal appears to be far the most thrifty as regards the expenditure of the public money. But of this, again, as of the greater part of their suggestions, the commissioners carefully shift the onus on Parliament.

A second appendix, however, presents a very different claim on the attention of the public. We cannot, indeed, admit that, in point of style, the author has been more successful than his colleagues, and the idea of commencing a state paper with the words, "when the railway system is observed as a whole every one must be struck—" is more novel than admirable. But apart from the absence of clear incisive diction and lucidity of arrangement there is very much to read with serious attention in the report of Sir Rowland Hill. The signature alone is evidence that such must be the case. If there be one institution in England to which we can look with almost unmingled pride and satisfaction it is the one which owes its present form mainly to the exertions of this distinguished man. Comparisons are sometimes made with foreign arrangements to the disadvantage of this country. If we except the causes of certain want of punctuality and safety which are directly traceable to railway legislation, as in the tangle of lines at London Bridge, we think experience of foreign railways shows that any greater regularity which they may claim as to working, results altogether from the fact that they have less traffic to conduct. Under any

pressure the continental lines show far less elasticity than our own. But if we refer to postal service we may safely challenge competition in any quarter. Nothing in England, and nothing out of England, as a means of affording convenience to the public, and at the same time of sifting a sensible contribution to the public expenditure, is to be compared to the post-office. To call it perfect would, of course, be absurd, but its errors and short-comings seem to be within the limit of the average of even the best class of individual action. A letter, duly directed, stamped, and deposited in the post-office, will go to its destination with a far greater amount of certainty than that with which it can be asserted that a person who posts a money-letter shall have taken the necessary precaution of directing it at all!

When, therefore, a man of the justly acquired weight and authority of Sir Rowland Hill, expresses a deliberate opinion that railways should belong to Government, it is entitled to the most respectful attention. Sir Rowland has alluded to the fact that the monopoly of traffic enjoyed by the railway companies, and which the action of Parliament has tended to aggravate rather than to check by encouraging reckless and unprincipled competition, has taken the Legislature by surprise. The powers first conceded to the projectors of railways were given on the understanding that the iron roads should be as free for private traffic as was the king's highway. Very soon, indeed, it became obvious that the regard to public safety which the increase of speed rendered necessary practically repealed all those provisions; and it is to this circumstance that Sir Rowland Hill, with a great stretch of Christian charity, ascribes the subsequent freedom given to speculative competition. That the public must ultimately pay the penalty of the wasteful construction of duplicate lines needs hardly the experience of Sir Rowland Hill to point out; but it is a main and important element in the consideration of the whole question.

Sir Rowland Hill's recommendation is to the effect that a Government department should be created or adapted for the supervision of railways, and "should act as lessor, not only in granting leases, but also in fixing suitable terms and enforcing the observance of contract." The plan contemplates the creation of a new industry, the origination of an entirely new class of men, namely, the lessees of railways. It is contemplated that bodies of contractors should be formed, who shall work the several lines, paying a fixed rate of dividend to the Government, which, from time to time, is supposed to buy up the whole existing railway property. The current payments on account are to be made so frequently,—monthly or even weekly,—as to avoid the necessity of the heavy caution which it would be otherwise necessary for the lessees to pay, and thus to place competition within the reach of a comparatively large number of individuals. The interests of the public are to be protected by making the reduction of fares proposed by the competitors for taking leases as essential an element in the comparison of tenders as the actual amount of rent. The idea, in fact, is a reproduction of that most ancient and, in some countries, still existing scheme, the farming of sources of public revenue. But in a case as novel as the transformation of the entire system of internal communication, the proposal must be viewed on its own merits alone. We are not prepared to offer a definite opinion without further consideration, but there seems almost as much in the form of the suggestion as in the name of the author to pre-dispose practical men in its favour. It certainly seems as if Sir R. Hill had been the only commissioner who at all appreciated the gravity of the situation, and the propriety of recommending something more than a helpless reference to the wisdom of the Legislature.

Sir Rowland Hill has further dwelt, at some length, on a subject to which we have lately called the attention of our readers, that of the extension of railways and of what he calls railroad by-ways. The importance of this completion of our internal communication, and the proof of the economy with which it can be effected furnished by the Indian, Norwegian, and Queensland lines, are regarded in this supplementary report precisely as they were in our own pages. The only point raised by Sir Rowland, which is one that we have perhaps hardly brought into sufficient relief, is that a narrow 3 ft. 6 in. gauge is by no means a *sine qua non* of economy. Light and cheap railways can be

constructed on our national gauge, so as to allow the unimpeded circulation of the same trucks, an indispensable requisite for a cheap and thorough system of internal communication. On this point, indeed, the Royal Commission have found breath to offer a distinct and unqualified opinion: "We are of opinion," they say, "that the continued existence of the double gauge is a national evil." In that opinion most practical men will concur. It must not be lost sight of with reference to those branches which will be the occupation of our engineers and contractors so soon as the return of public confidence allows industrial expenditure to resume its natural channels. Uniformity of gauge is as requisite for the branch lines of the future as for the trunk lines of the day.

THE LATE JAMES WATT, LINE ENGRAVER.

ENGLAND has lost since our last publication a very eminent man in the noble art of line engraving on copper—remember, reader, not on steel, for on that material and surface he did not care to work, feeling that all the skill and cunning of preparation and laying of grounds,—all the dexterity of man's hand,—could not incise on steel in lines with like results to what Sir Robert Strange, Abraham Rainbach, the father of the Landseers, John Burnet, and others have produced on copper. Mezzotint is much to be admired; so is stipple when in the hands of a Bartolozzi; but a great line-engraver is a very great man.

Mr. "J. H. Watt" (he is best known to collectors and dealers by his initials) is dead. Charles Heath was his master,—and a worthy one. Many connoisseurs prefer Mr. Heath's little line keepsake *Lady Peel*, after Sir Thomas Lawrence, to the large mezzotint (excellent as it is) of the same picture by our happily still living master in mezzotint, Mr. Samuel Cousins.

Much, indeed, has Mr. James H. Watt done for art, and for the extended reputations of Stothard and Leslie, of Sir Charles Eastlake and Sir Edwin Landseer. Print publishers and collectors delight to dilate on the rare, unsurpassed qualities of his exquisite engraving, of Stothard's "Procession of the Fitch of Bacon" (the Dunmow and Harrison Ainsworth Fitch); while others, with equal enthusiasm, dwell with well-considered gusto and well-placed technical phraseology, over the careful, and feeling, spider-like lines of his translation from Sir Charles Eastlake's "Christ Blessing Little Children," and his large felicitous rendering of Sir Edwin Landseer's "Highland Drovers"—the Sheepshanks picture. The skilled translator translated with the same feeling and dexterity with which the skilled painter painted.

It is only of late years that engravers have been admitted to the full ranks of the Royal Academy of Arts in England. That Mr. Watt might have had—had he chosen—his full Trafalgar-square honours there cannot be a doubt; but he was content, like John Burnet and others, with the gilded fame of an educated man, a place in the portfolio of the taught collector, and the lingering admiration of the thousands who pass the well-lighted windows of the Boydells and Sir Francis Moors, of Pall-mall and Cornhill.

Mr. Watt's works are rather large in point of size than large in number. Let us recall public attention to some of the best of them.

Who does not admire "The Procession of the Fitch of Bacon," after Stothard? In size—12 in. high by 30 in. long—it ranks with the Schiavonetti and Heath engraving, after Stothard, of the famous "Canterbury Pilgrimage." As a whole, we have heard the engraving of the Dunmow Procession preferred by skilled judges to the engraving of the Canterbury Pilgrimage; while the unfinished Schiavonetti (unfinished at his death*) exhibits greater dexterity in the laying of the lines than Watt, with all his consultations with friends and unwearying labours, succeeded in producing.†

When Mr. Watt published this fine engraving, after Stothard, he was living at "No. 26, George-street, New-road, London," near to clever copper-plate printers like Hawkins, M^{rs} Queen, and

* June 14th, 1810, aged 45.
† James Heath, the engraver, was the apprentice of Joseph Collyer; John Henry Robinson (happily still alive) was the pupil of James Heath; Charles Heath was the pupil of his father; and George T. Doo (still alive) and James H. Watt were pupils of Charles Heath. The names of the masters of great men deserve to be remembered.

others. Proofs on India-paper were supplied to subscribers at 5s. a piece, and proofs on India-paper before letters at 7s. 7s. A signed artist's proof of "The Fitch" will, now that the skilled hand is "torpid,"* bring a far higher price under the hammer of Messrs. Christie, Manson, & Woods, or of Messrs. Sotheby, Wilkinson, & Hodge, or of Messrs. Puttick & Simpson.

Fine impressions from Mr. Watt's now "destroyed" plate" (as advertisements assure us) of "Christ Blessing Little Children," after Sir Charles Eastlake, will be sought for still more eagerly than ever. What is cold and chalky under Eastlake's lifeless eye for colour, rendered by James Watt's steel pencil, turns animated, though black and white alone, into flesh such as Sir Robert Strange has alone excelled; but then Sirange's opportunities in translating "Thy loved Guido's air,"† were infinitely greater than fell to the lot of the able engraver of Sir Edwin Landseer's "Highland Drovers."

An art memorandum will not be out of place here. "Artist's proofs—India," of the Eastlake and Watt engravings, were priced by its publisher, Alderman Sir Francis Graham Moon, bart., at 15s. 15s. "Prints, plain," at 4s. 4s. It was by these high charges that our modern Alderman Boydell was enabled not to "chaffer" about prices with skilled engravers.

This too imperfect note of the engravings Mr. Watt gave to art and the world must here conclude with a word about his great work, dated some thirty years back, when his eyes were young, and the hand that held the graver was dexterous and unerring. Sir Edwin Landseer (though he missed an Abraham Rainbach) has been most fortunate in obtaining the best services of real masters over copper and steel. In no case, however, has he been more favoured or better represented than by J. H. Watt, who has handed to posterity in black and white, and many impressions, the far-famed "Highland Drovers," the Sheepshanks gift to the National Gallery of Great Britain.

Of this masterpiece on steel (lines not gaping as in some popular prints possessing many merits), there is an etching by Mr. Watt himself, before the "descriptive key" to the engraving, published in the season of 1838 by Messrs. Hodgson & Graves, of Pall-mall, and written at Sir Edwin's and the publishers' request by Allan Cunningham. The opening sentence is picturesque and appropriate to the picture:—

"This fine picture will to many realize scenes which live but in memory, for it is as true to northern character and manners as heather is to a Highland hill. It is of a national as much as of a rural kind; nor have the romantic or the domestic refused to lend it the hues of poetry, and the truth of actual life."

The final sentence is equally to the point, and was liked both by Landseer and by Watt. It is short:—

"The beauty and sentiment of this fine national picture cannot be exhibited in a mere description; the writer feels that true Painting can no more be reached by words than true Poetry can be reached by shape and colour; forms, not words, must bring, like this picture, the Highland to London."

What is here said of Landseer's art deserves to be said as well of the late Mr. James Watt's spirited and faithful rendering of it in simple black and white. The name of James Watt, "line engraver," deserves a niche in that still needed work, a Biographia Britannica.

PIERRE DE MONTEREAU, THE ARCHITECT OF THE SAINTE CHAPELLE, AND HIS WORKS.

It is only a select few among the crowd of tourists who visit the beautifully restored Sainte Chapelle as one of the most exquisite monuments of ancient Paris, who ever dream of asking whether the name of the original contriver of so fair a work has been preserved to the annals of art. But one need not regret this indifference of ordinary spectators to the authorship of that work of marvellous beauty, since the name of Peter of Montereau has been sought out and preserved by the pious care of more earnest appreciators of artistic genius. Not only has the artist's name been disinterred from long neglected records, but fragmental glimpses of his artistic career have been gleaned, and his claim to the creation of many other works ascertained, all of which present special features, arising out of his peculiar and well marked architectural treatment. The works of his over

* Dr. Johnson's fine epitaph on Hogarth. † Pope.

graceful genius have been sought for in every likely, and, it might be added, in every unlikely place; and the search has not been vain, for several monuments of Gothic art of the finest and most interesting epoch of its development are now securely attributed to the great artist-mason of the thirteenth century, in addition to those with which his name was already associated. Peter the Mason was born at Montreaur towards the close of the twelfth or the beginning of the thirteenth century, and took his distinctive name of Montreaur from that of his native place. The precise date of his birth is unknown, but his tomb affords evidence that he died in the year 1266; so that most of his works belong to the first half of the thirteenth century. The monuments generally cited as the production of Peter of Montreaur are,—the Sainte Chapelle of Paris, the Chapel of the Castle of Vincennes, and the Refectory Chapel of Our Lady in the monastery of St. Germain-des-Prés; in the church of which he was buried, and where a monument was erected to his memory, which is still in existence, though no longer *in situ*. It was one of those fortunately preserved from the fury of the destructive epoch of the revolution, and is now in the collection known as the *Musée des Monuments Français*. A recumbent figure, holding a rule and a compass, forms the principal feature of this interesting sepulchral monument; the figure being, doubtless, a portrait—a positive portrait of one of the artistic worthies of the thirteenth century, which seems to have been an epoch when art was more genuinely honoured than in modern times; at all events, till quite recently.

The architectural student visiting Paris during the Great Exhibition should on no account omit to make a pilgrimage to the tomb of Peter of Montreaur, nor fail to pay a visit to a recently-restored work of the elegant Medieval architect, which is not generally mentioned among those commonly attributed to him. The work alluded to is the refectory of the ancient Priory of Saint Martin des Champs, now transformed into the library of the Conservatoire des Arts et Métiers. This most elegant structure having been restored much more recently than La Sainte Chapelle, is consequently, in many respects, more satisfactory, though much less has been attempted than in that most gorgeous of modern restorations. The truly elegant and somewhat lofty proportions of the refectory of the Monks of St. Martin at once impress the spectator, whether he be an artist or merely an ordinary sight-seer, with an instinctive feeling of admiration; and the chaste elegance of the original work has not been surcharged with that profusion of gaudy colours and gilding which often, under the pretence of accurate restoration, proves very injurious to the severely chaste beauty of the works of the thirteenth century. That epoch was indeed the "Classico" era, so to speak, of Gothic art, in which the slender elegance of the lofty column and the corresponding form of the graceful lancet window, combined with the sharply pointed vaulting of the interior of the roof, created a general style of architectural composition which was above all things characterized by exceeding elegance. The central row of columns supporting the roof of the structure under description are of black marble, with white bases and capitals, and serve to divide the apartment into two equal spaces. This disposition is common in refectories in our own country, and may have been adopted in order to secure space for two distinct ranges of tables, a condition that the arrangement of the central line of columns provides for in the happiest manner, as gracefully meeting the requirements of the occasion, and with, if possible, still better results in the direction of the artistic effect, which is strikingly agreeable, and, as regards the ordinary effect of Gothic interiors, novel. The springing of the arches and vaultings from the side walls is from responds of similar character and material to the great central columns: they are three quarters detached, and based on corbels placed about half way up the wall. This arrangement produces a most satisfactory effect of completeness of design, which at once satisfies the most critical observer. The spaces between these lateral colonettes are necessarily occupied by the windows, which are formed of a pair of graceful lancet-shaped openings of great simplicity, while above each pair is a circular opening, enriched with very sober tracery, forming a series of upper lights that cast most beautiful effects of chiaroscuro upon the vaultings of the roof. Another charming

feature of this most graceful apartment is the usual refectory pulpit, from which the benediction, or grace before meat, was pronounced. This structure is formed by a recess in the thickness of the wall, in front of which is a projecting stage or balcony, surrounded by an exquisite balustrade, which rests upon a massive corbel-like support, the sculptured moldings of which display foliage patterns of three kinds. The spiral columns, arched moldings, and cusps which form the dressings of the niche itself, are of great beauty, and their complete and delicately studied restoration has been most successful. The painted decoration of the vaulted roof has also been completely restored, with the feeling for tender harmonies of colour which distinguishes works of the thirteenth century, and of which such delicately beautiful examples are found in the illuminated manuscripts of that period of Gothic art. The whole of the library fittings of this work are the result of careful study, even to the locks and hinges of the doors, and, as a whole, it is perhaps the most successful restoration of a Gothic interior of that period in France. The earlier French restorations, effected fifteen or twenty years ago, though most excellent efforts for the time, and which served to point the way to still better things, are most of them left far behind in their appreciation of the delicate beauties of Gothic art by this, and other later works,—even the celebrated restoration of the Sainte Chapelle failing now to satisfy the exigencies created by a still more full and appreciative study of Gothic art. Every architectural student who visits Paris during the brilliant period of the International Exhibition, should see and carefully examine this monument of Medieval art; and should not omit a pilgrimage to the tomb of Peter of Montreaur, the great artist-mason, to whose genius for architectural design we are indebted for the charming saloon which now forms the library of the Conservatoire des Arts et Métiers.

THE HOLBORN VIADUCT.

On Monday last, the chief stone of the viaduct over Farringdon-street, a main feature in the proposed filling up of the too-long permitted Holborn valley, was laid by Mr. Thomas Henry Fry, deputy-chairman of the City of London Improvements Committee. The pier to which the chief stone belongs is the southernmost of the row on the eastern side of Farringdon-street. It is of considerable size and weight. In the course of an able address, Mr. Fry referred to the length of time that had elapsed since the improvement was first mooted, and said it was now to be carried out by the reversion of the 4d. coal duty.

Mr. W. Haywood, the architect of the improvement, gave a concise account of the contemplated works which we may usefully record:—

"The Holborn Valley Improvement consists of a viaduct, supporting a roadway between Hatton Garden and the western end of Newgate-street, and two side streets connecting the upper with the lower of Farringdon-street level.

The line of roadway on the viaduct will be 89 ft. in width, and will commence at the western end of Newgate-street; from that point it will be carried in a straight line to the western side of Farringdon-street, occupying nearly the whole of the space which now or recently formed by Skinner-street, as well as a large portion of the sites of houses on that line of thoroughfare; it will include also a portion of the churchyard of St. Sepulchre. From Farringdon-street westward it will be carried by a gentle curve to the end of Hatton Garden, occupying the sites of the houses which formerly stood on the southern side of Holborn-hill, and the largest portion of the present roadway at that spot; it will also occupy part of the churchyard of St. Andrew's, Holborn.

From Newgate-street to the entrance to St. Sepulchre's church the gradient will be about 1 in 696, and at this point the eastern approach street from Farringdon-road will join the viaduct on its northern side; from St. Sepulchre's church to Farringdon-street the gradient will be 1 in 453, and from Farringdon-street to Hatton Garden 1 in 143; for all the purposes of traffic, therefore the viaduct may be said to be level.

The viaduct in its formation will include vaultage beneath each footway, for the accommodation of the future houses on either side of the roadway; outside these vaults will be a subway for the gas and water pipes, and between each subway, and forming the centre of the viaduct, the roadway will be carried on a series of arches.

The footway vaults at the point next to Farringdon-street will be three tiers in height on each side of the road, and they will gradually diminish, both eastwards and westwards, until at Hatton Garden and at Newgate-street they will be but one tier in height.

The general height of the subways will be about 11 ft. 6 in., and their width 7 ft.; they will be constructed of brickwork, excepting where they are carried over the London, Chatham, and Dover railway, and at that point they will be altered in form, and be constructed of iron; the tops of the subways will be but a small depth beneath the footway pavement, and at Farringdon-street and Shoe-lane vertical shafts will be formed, to enable connections

to be made between the pipes in the oneways and those in the streets named.

In each subway provision is made for water, gas, and telegraph pipes, any of which, should it be found that their joints can be inspected, and repairs made without difficulty; the oneways will be well ventilated, and tubes will be laid in the subways and the vaults of the houses for the introduction of the service-pipes to the various premises. At each of the subways, as well as beneath the bridges at Farringdon-street and Shoe-lane, there will be enframes for the purpose of admitting workpeople, and taking in any materials that may be needed.

Immediately beneath the subways are sewers. Drain from every alternate house vault will be constructed to these sewers at the time the viaduct is built; and the mode of construction of sewers, drains, and street-gullies is such that it is believed it will never be necessary to break up the surface of the viaduct when it is once formed to repair or cleanse them.

The central vaults beneath the carriage-ways will be formed by arches springing from east to west; they will be ventilated into the carriage-way; the level of their floor will be such as to enable carts and trucks to be easily drawn along them; they will be commodious, dry, and have a uniform temperature, and it is anticipated, will be valuable for many purposes of trade and commerce. The entrance to these vaults will be in the situations of the bridges over Shoe-lane and Farringdon-street.

On the top of the footway vaults and the oneways the footway pavements will be laid, and the carriage-way will be principally laid over the large central vaults.

Farringdon-street will be crossed by a cast-iron bridge of an ornamental character; it will be in three spans, supported by piers, which will be carried on the existing roadway; these piers, as well as the outer abutment piers, are to be formed of polished granite; the height of the bridge next to the curb stones will be 16 ft., and in the centre the minimum height will be 12 ft., which is considerably more than sufficient for the traffic.

At each corner of this bridge flights of steps will be provided, to enable pedestrians to pass between the upper and lower levels; these will be enclosed in stone structures, ample light and ventilation being given to them; these structures will be carried up some stories above the level of the street; beneath the steps the vaults will be appropriated as shops or warehouses, and above the steps, the floors will be eligible for offices, or for general commercial purposes.

Shoe-lane, which its northern end is now but 14 ft. wide at one spot, is to be made 30 ft. wide; the viaduct will be carried over it by a girder bridge. This lane is to be carried northwards with a 30 ft. width to its junction with the new street, which is to be formed from the corner of Hatton-garden to Farringdon-road, and which will presently be described.

The western approach street will start by a junction with the viaduct at Hatton-garden, and be carried in a north-easterly direction to Farringdon-road; opposite to it the new street leading to Smithfield-market will commence, the two streets will therefore together form one straight line of thoroughfare 60 ft. in width, giving direct access to the market and to the north-east of London.

The eastern approach street will begin at Farringdon-road, about the middle of the point where the thoroughfare will be crossed by the viaduct; it will be carried nearly parallel to the viaduct for some distance eastwards, and will join on to it with a gentle curve by the side of St. Sepulchre's Church; this street will form a junction with King-street, and will, therefore, give another line of access to the new market. The lower end of this street will take the place of the thoroughfare which is now known as Snow-hill, the whole of which will be absorbed by its formation, or by the buildings to be erected on either side of it.

Farringdon-street or road, at a short distance northwards of the bridge, will have its level altered, and will be carried with a gradient of 1 in 45 as far as to West-street, and from that point northwards with a very slight inclination, until it again falls into the present level of the road. This alteration in gradient will enable the side streets to be formed with gradients of about 1 in 45.

In the approach street sewers will run throughout their entire length, and also above the sewer in the western street a subway is to be constructed, which will connect with the subways on the viaduct.

In the year 1863 the Corporation of the City of London prepared and deposited in Parliament plans for the improvement, and in 1864 the Act was passed authorising the works which are the subject of this paper. They are now being carried out, and the Corporation of the City of London are the designers and under the superintendence of Mr. William Haywood, Messrs. Hill & Keddell are the contractors."

The foundations for the viaduct already put in reach from St. Andrew's, Holborn, on one side of Farringdon-street, to Angel-court, not far from St. Sepulchre's church on the other. We do not know of any reason now why the works should not be proceeded with rapidly.

SOME RELICS OF VERY OLD LONDON.

In connexion with the various accounts that have appeared in the *Builder* regarding the remains of ancient lake habitations in different parts of the globe, the following additional particulars of some very ancient remains found in London late last autumn have interest. During the excavation for the foundations of a wool warehouse on the south side of London-wall during last October and November, and 17 ft. below the surface of the earth, a number of charcoals of ancient bones were disinterred. They consisted principally of the bones of an extinct ox, wild boar, wild goat, red deer, dog, and roebuck. When the excavations were carried deeper—viz. 22 ft.—many other objects were found, and amongst them eighteen human skulls, some human jaws, and four other human bones, including a shoulder-bone; no other portions of the skeleton being present.

But the most remarkable part of the discovery consisted of more than a hundred very ancient decayed unshod piles, driven into what appeared to be part of the ancient hed or shore of the Thames, or the bottom of a marsh, which hed had never been disturbed; the piles were from 6 in. to 8 in. square, and connected with transverse pieces measuring 2 in. in thickness, rotten, and roughly cut. In the upper part of the *débris* were a number of iron and bronze pins, knives, &c., large quantities of Samian pottery, and coins of Nerva, Vespasian, Trajan, Adrian, and Antoninus Pius. In one part, at a slight distance above the gravel, a kitchen-midden, 18 in. thick and 14 ft. long, was found, consisting of the shells of the oyster, mussel, cockle, and periwinkle; on this there were 18 in. of peat, and then a similar kitchen-midden above.

The Roman remains were at the top, and the piles and kitchen-middens below. Many of the bones of the animals were split lengthwise, and nearly all the skulls were split longitudinally (including the human skulls, which were all broken except three), and the horns of the oxen were cut off. A number of roughly-pointed and squared bones were picked up, including the usual collection of singular objects of unknown use.

During November similar piles were discovered on the other side of the Thames, in New Southwark-street, as was stated in our pages at the time, and every where on the north side where the excavations were extended, these pile-structures were discovered consisting of oaken piles, driven about 3 ft. into the primitive gravel, and connected with transverse pieces. The builder's men said exactly similar piles were constantly brought to light in deep excavations, notably in the neighbourhood of the Bank, Mansion House, New Auction Mart, &c. Some think that these are the most ancient remains of London ever brought to light, and date anterior to the Roman invasion, when London was built upon a marsh as described by Cæsar. For our own part, we must confess to doubts.

TAMWORTH CASTLE.

TAMWORTH CASTLE stands at the confluence of the Anker with the Tame, on the right bank of either between the town and the latter river, and close above St. Mary's Bridge. It occupies a position near the east end of the south, or river front, of the old town, the outlines of which are still indicated by a bank and ditch, showing it to have been in plan a parallelogram, with one side resting upon the Tame, and the east end defended by the Anker. The low ground about the junction of the rivers, the broad meadows on the left bank of the Tame opposite to, and on both banks below, the town, in their natural condition a deep morass, must have rendered the place nearly inaccessible upon its east, south, and west fronts; and, no doubt, led to its conversion into a safe residence at a very early period.

As the ground rises from the river, the town and its grand old church occupy positions rather higher than the castle, and which must always have been dry and airy, and, in consequence, salubrious.

The line of the town defence upon the east side is known as the King's Ditch; in reference, it is supposed, to the Mercian Offa. Though without anything like sharpness of outline, and occupied as a nursery garden, the work is by no means obliterated, and may be traced nearly from the Anker below Bolebridge for about 300 yards northwards. It is composed of a raised bank, which formed a terrace behind the wall or palisade, a ditch more or less filled up, and beyond this a slope representing a glacis, or space outside the works, which it was the custom from a very early period to keep clear of cover. Bank and ditch are about 45 ft. broad. The Market-street intersects the line of defence, and, being old, probably was crossed by a gate-house. There are some slight and uncertain traces of masonry upon its north side. Further north, a modern road affords a good section of the bank.

This side joins the north front at a right angle, within which is a sort of tower, remembered as somewhat larger, and which looks as if it marked the site of a mural tower, or perhaps a cavalier or small mound.

The defences of the north front skirt the Lichfield and Polesworth roads, and are traceable nearly to the cross-road from Seckington. Beyond

this, the line, now built over or enclosed in walled gardens, was traced by Dugdale along a front altogether of 400 paces, to a mound marking the north-west corner, from which the line passed at right angles southwards to the river. This would give a space of about 300 yards by 400 yards as the enclosure of the town. Outside the west front the ground sinks rapidly into the meadows, among which, on the river-bank, and just outside the town, is the Moat House, an old seat of the Comberfords, still standing in all its dampness, although the moat has been filled up.

The principal bridge, that across the Tame, close below the castle, known as St. Mary's or Lady Bridge, is of modern construction. It succeeded a mediæval structure, shown in Shaw's plate of 1780, the precursor of which was probably a bridge, or perhaps a ford, of Saxon times. In Leiland's day, a stone upon it bore the arms of Lord Basset, of Drayton.

Bow, or Bolebridge, crosses the Anker, and leads to the hamlet of Bolehill and to Nunceaton.

The church is a large structure of considerable merit, containing some Norman work, apparently once connected with a central tower, and in which may be seen traces of herringbone masonry, East of it are some ruins, known as the Deanery, part of which seems also to be Norman. The Market-place, though much altered, represents an early space set aside for trading purposes.

Tamworth has no historical pretensions to either British or Roman origin. The Britons would have designated it from the smaller stream. The earliest mention of it is in the records of the people in whose tongue it is named. Offa, King of Mercia, in a charter of A.D. 781, announces himself as "Ego Offa rex, sedens in regali palatio in Tamworthige," an evidence of its distinction at that time, and one which renders it probable that it had an earlier history. Cenwulf dates a charter of A.D. 816, "In vico celebrimio qui vocatur Tomoworthig," and other royal charters are dated from it in 841 and 854. So that in the eighth and ninth centuries it was already a royal residence and a place of celebrity.

The Danes ravaged it in common with much of Mercia early in the tenth century, and in A.D. 913-14, it was restored by Æthelred,

"*Elleda potens! O terror virgo virorum!*"

daughter of Alfred, sister of Edward the Elder, and the founders of Tuthury, Warwick, and many other well-known Saxon places of strength. She is reputed to have cast up the mound and to have placed her residence on the summit. She died here A.D. 918-22.

The castle and half the town are in the shire of Warwick; the other half and the church in Stafford. There is no mention of the castle in "Domesday."

At the Conquest Tamworth became the property of Robert Marmion, who seems to have fortified it as such earthworks were fortified in Normandy, and to have made it strong enough to be obnoxious, some time later, to King John, who, in 1215-16, ordered it to be razed. Under Henry III. another Robert was its Lord, and Philip Marmion died seized of it in 1291-2. From Marmion it descended to Freville, thence to Ferrers, thence with Ann Ferrers at the end of the seventeenth century it came in marriage to the house of Shirley, from whom, through Compton, it passed to the Townshends, whose representative, Marquis Townshend, is 16th Baron Ferrers by writ of 1299, and owner of Tamworth Castle, while Earl Ferrers, the male heir of the Shirleys, is Viscount Tamworth, by creation in 1711.

From the Norman Conquest to 20 Edward I. the castle descended through five generations of Marmions; from thence to 7 Henry V. through six of the house of Freville, and from thence to 1680 through eleven descents of the name of Ferrers; being twenty-two lords from the Conquest to 1680. King James and Prince Charles lodged here in 1619.

THE CASTLE is composed of a mound, a platform, buildings upon the mound, a curtain-wall ascending it, and the remains of a gatehouse.

The mound is wholly artificial, about 50 ft. high, circular, and about 100 ft. diameter at its flat summit. Its sides stand at the natural slope of mixed dry earth and gravel, the *débris* of the new red sandstone of the district; and its base may be about 12 ft. above the river.

South-east of the mound is a triangular platform, also more or less artificial, and raised about 15 ft. above the river. One side is straight, and fronts the water. That to the east is at present a hollow curve, and has evi-

dently been retained by a wall against which it formed a terrace. This side extends northwards to the ruined gate-house, indications upon which seem to show that part of the platform has been removed, and that it originally extended a few yards eastwards into the present hewery; so that this front was, no doubt, straight, and not, as now, concave.

The third side, or hypotenuse of the platform, lies towards and partly encircles the mound; and is therefore concave; and between the two is a ditch. Excepting this "valley of elevation," there is no present trace of a ditch at the foot of the mound.

Below the south front, between it and the Tame, and close above St. Mary's Bridge, is the castle mill, rebuilt in modern times. It is worked by the Anker, which, sweeping round the south-east front of the castle, serves as a mill race.

Above the mill and between the leat and the line of wall, is a narrow strip of land, now a garden, and probably once a pasture beneath the castle wall.

North of the platform a curtain wall runs from the gatehouse up the mound, with the summit of which its top is level. This wall in plan is angular, or slightly convex, towards the exterior or town side. It is 10 ft. thick, and has a rampart wall of 7 ft., a parapet of 2 ft., and a rere wall of 1 ft.; and the rampart was the regular, and probably the only, way from the gatehouse to the top of the mound. It rises gently, but has no steps. It is about 20 ft. high at the central part, ending and commencing at nothing. It is of herringbone masonry, of flat stones laid obliquely on edge, each course being separated by a horizontal bed, sometimes single, sometimes double, of small stones, resembling flat pebbles. At the deepest there are twenty-one courses. Here and there the surface has been clouted, but on the whole the wall is in its original state, very rough, but perfect. The joints are very open. The exterior face is less perfect, and is, besides, concealed by clumsy buttresses, perhaps of Tudor or earlier date. The herringbone structure is not seen in the rere wall, which is probably a restoration, but it appears in the parapet, for a foot or two above the rampart walk. This is a very remarkable wall, and should be photographed in detail.

The wall from hence to the gatehouse is in part old, but of later date than the curtain. The gatehouse itself, called the upper lodge, is chiefly modern, but part is old; and connected with it are the remains of an arch jamb and portcullis groove, probably remains of the main entrance to the castle. This gate leads by a short lane into the market-place. The lower lodge, or entrance from the bridge side, was built in 1810, and with its adjacent wall, is wholly of that date.

The mound is crested by a many-sided shell of wall, about 7 ft. thick, and from 30 to 40 ft. high. This wall is in part very old. The base has been supported by a modern facing, which hatters considerably, and is about 2 ft. high; but above this for 6 ft. or 8 ft. the workmanship is open-jointed rubble, with stones of large but irregular size and shape. The quoins are, however, of ashlar, rude but sound. Above this to the rampart height, the wall seems to have been rebuilt in early times in a better manner, but as though the old work had been left where sound, so that the two run much into one another.

The upper 10 ft. of the wall, all parapet, seems of still later date. It is crenellated, and occasionally looped at the rampart level. At the S.W. quarter is a loop about 6 ft. from the ground, and two others higher up, all which are apparently of the age of the wall, and being near the well probably lighted the offices. This wall is much obscured by ivy. It has been materially altered at two points; on the south side entirely rebuilt for several yards to form the outer wall of the southern private apartments; and on the opposite side by the insertion at the same time of several large late Tudor windows, to light the northern apartments. Under these latter are three heavy masses of stone-work to support balconies. One is of somewhat earlier date and of better design.

In the circuit of the wall, to the south, and commanding the way up the curtain, is a tower 24 ft. square, and having 5 ft. projection from the wall. Its angles within are plain, but those without are flanked by two narrow plaster strips, leaving a free angle between them. These strips rise about 20 ft., and clumsily pass into a sort of octagon, which at the top of the tower becomes a cylinder, and is so seen on the battlements.

These, however, may be an alteration. The tower is about 40 ft. high, and the walls are 7 ft. thick. It is somewhat battered. On its exterior face are two Tudor windows; and about half-way up a string course, stopped by the pilasters, which in the centre rises as a half round drip, probably once heading a Norman window. This tower is of rubble, of the date of the wall, with ashlar pilasters.

A few feet south of the tower, and, therefore, close to the curtain ascent, is the doorway into the shell. This is of small size, with an equilateral arch, plain square jambs continued up through the arch moulding, which is very plain, the angle only being rounded off. The drip, if one there was, has moldered away. This doorway traverses the wall rather obliquely. The inner front has a ribbed head, and two faces carved upon it near the springing. There is neither portcullis groove nor large bar hole. The defence was a single door.

Between the door and the tower a sort of oriel has been corbelled out at an early period, possibly to defend the approach. At present it has a loop in its basement, and two Tudor windows above, and is surmounted by a small gable of the same date.

Round the base of the wall is a terrace, about 10 feet wide and 8 ft. high, above the slope of the mound. The retaining wall is in part old, and is supported by short stout buttresses, apparently of Decorated date. This wall has been patched, and in places rebuilt, in Tudor and later times, and its low circumscribing parapet is mostly modern. What it was, or when constructed, is uncertain. It may have carried a low parapet, a sort of chemise, defending the base of the wall, and intended to supply the place of a ditch, or other defence, at the foot of the mound. In the last century it was crossed on the south side by a wall, which a gate in it, but this probably was not original.

The buildings within the shell are next to be described. The entrance lies beneath a sort of gatehouse, of the date of the other buildings, having on the right the tower court, and in front a rather elaborate doorway, of the style of James I. This opens into a passage or lobby, having on the right the great hall, on the left a buttery, or modern housekeeper's room, and in front the way to the kitchen.

The hall lies north and south, and occupies nearly the centre of the enclosure. At each end of it are distinct suites of apartments, having no direct communication save through the hall. On its east side is the tower and the tower-court; on its west side the kitchen and kitchen-court.

The hall is 40 ft. by 20 ft., the end of honour being the north. The entrance-door is on the middle of the south end. The north end is blank. Of the east side, about the south half is occupied by a large oak frame, with square apertures, glazed, reaching from about 5 ft. high to the eaves of the roof, and looking into the tower-court. In the same side at the north end a door leads by a stair to the northern apartments and the tower. On the west side, in the centre, is a large fireplace; to its north a window similar to the other, but rather smaller; and to its south a door, opening on a stair, leading to the southern apartments.

The roof of the hall is of open-work, supported by two detached and two engaged principals, one against each gable. The stone floor has lately been replaced by boarding. The three doorways are round-headed, of the age of James I. The aspect of the hall is gloomy, the roof heavy and unskillful, the windows unpleasant, and the walls thin and of brick. There are here four good wrought-iron candlesticks, about 6 ft. high.

The southern apartments upon the basement are, with the exception mentioned, private. On the first floor are the library and drawing-room, and one or two private rooms. The library is panelled with oak to the cornice, and along the upper tier of panels are painted Ferrers and his matches. The fireplace is very handsome, and above it is a large achievement, carved in black oak, of Ferrers and his quarters, crest, supporters, and motto. The drawing-room, also panelled and larger, has a good fireplace. Each room has a large Tudor window to the south, and is exceedingly cheerful. The second floor is not shown.

The northern apartments lie between the hall and the north wall, in which the windows are pierced. The basement is composed of cellars, on the ground-level, opening from the tower and kitchen courts. The first-floor contains a large drawing-room and two smaller

lateral rooms. All are dismantled, stripped of the panelling, and in a state of decay. The second-floor contains bedrooms, also disused. From this floor a door opens upon the rampart of the *cincture* wall, where it is seen to be 7 ft. thick, and to have a parapet about 10 ft. high. Below is the kitchen court, and against the wall may be seen a sloping water table marking a roof, probably of an early kitchen. At the other end these rooms communicate with the tower, the floors of which are ruinous. The tower basement is entered from the court. The stairs throughout are in rectangular staircases, and each step is a heavy log of oak.

Between the hall and the west wall is the kitchen, fitted up with a modern roof and appliances, but, no doubt, on an old site. At one end of it is the well, about 5 ft. diameter, lined with ashlar, and descending to the level of the river. At the other end is the kitchen court, in which is seen a closed doorway leading into the basement of the northern apartments. It may be of Decorated or Early Perpendicular date.

Looking to the rectangular and oblong outline of the defences, the cross-roads, and the position with one open side upon a river, it is difficult not to regard Tamworth as of Roman origin, or as modelled by Roman occupation. The Icknield-street, in its course from Birmingham towards Lichfield, passes, it is true, no nearer to Tamworth than Wall, the ancient Eboracum, six miles distant, where it is crossed by the Waulking-street; but this latter, in its course to Atherstone or Mancetter, passes through Fazeley, only a mile south of Tamworth; and had it not been for its considerable angle at Wall, it would have passed directly through the town. Nevertheless, Roman towns are generally indicated by history or tradition, or the remains of Roman masonry, or articles of domestic use, and these evidences appear here to be entirely wanting.

But whatever may be the origin of the rectangular bank and ditch, there can be very little doubt but that the mound and platform of the castle were the works of Æthelred or her Saxon predecessors, the one to support the usual timber stronghold of the Saxon thames, the other for the huts and sheds of their retainers and their cattle. Probably a ditch included both mound and platform on the three landward sides, and both these and the river-front were strengthened by a palisade. As no mention is made of the town walls, no doubt a similar defence crested the bank all round. This is the arrangement well known to have been carried in Normandy and England, in the and much earlier local example of it was given by the Romans at Wall, where a few years since the palisades were discovered preserved in a morass which formed their defence in front.

The Normans seem to have begun here, as elsewhere, by building a strong place, perhaps a rectangular keep, on the level, that is the platform, where was for many centuries the castle-house, which thus stood near the foot of the mound, as at Cardiff and Warwick, and towards the Market-place. The entrance to this castle was evidently at the spot marked by the ruins of a somewhat later gatehouse, from the town, and upon the market-place.

The curtain-wall cannot be much later than the Conquest. It is clear that it never was prolonged across the top of the mound, as the slope of its rampart walk only points to the level of the top; probably, therefore, when it was built there was a structure of some sort upon the mound. It is also uncertain whether the curtain recommenced on the opposite slope of the mound, and was continued down by the present lodge towards the mill, in which case the area of the castle would have been about 100 yards square.

The present shell, upon the mound, cannot be much later than the curtain, though scarcely of the same date. The entrance door and the middle hand of the wall seem additions of one age, perhaps of the reign of John or Henry III. The terrace and the oldest parts of the interior are probably later, perhaps of the time of Edward I. or II.

Leland, writing in the reign of Henry VIII., says, "The castle of Tamworth standeth on a meety high ground, at the south part of the mouth of it. The base court and great ward of the castle is clean decayed, and the wall fallen down, and therein be now but houses of office of noe notable building. The Dungeon hill yet standeth, and a great round tower of stone, wherein Mr. Ferrers dwelleth and now repaireth

it. . . . The town of Tamworth is all builded of timber." [Itin. iv. 122.]

The haas court evidently was the platform, and the great ward no doubt included all the ground south of the present curtain, and between the mound and the mill.

In the east window of the church was a painting, of which a copy is preserved by Dugdale. It represents the Conqueror enfeoffing Robert Marmion with the castle. The king stands in front of a considerable building, fronted by two drum towers of two stories with conical roofs, and connected by a curtain. In one tower is a gateway, and behind the two are seen, in perspective, the stepped gable of a hall, and the chisel-pointed roof of a rectangular tower.

On the proper right of the king and of the building, in the distance, is the mound, crowned with a wall. This is no doubt a representation, rather exaggerated, of the castle, as it stood in the later Plantagenet times.

Dugdale, writing after the civil wars, says, "the Norman castle stood below, towards the mercate-place, where the stables now are." The mercate-house, rebuilt in Queen Anne's days, remains: the stables are removed to the other side, towards the bridge.

13 Ed. I. Philip Marmion had made a certain "pour presture," or encroachment, to the injury of the king's market, on either side of Tamworth Castle, containing a width of 8 ft. and a length of 40 ft.

The Mr. Ferrers whom Leland mentions was probably Sir John Ferrers (died 1576), who married Barbara Cockaigne; and the domestic buildings now standing were his work, and, perhaps, the work of his son and grandson.

What originally stood within the shell is unknown, probably some lean-to houses of Early English and Decorated date, which were removed, or nearly so, for the present structures. These latest works are mainly of brick, with freestone dressings and doorcasings. C.

NEWS FROM IRELAND.

NOTWITHSTANDING the disturbed state of the country, there are many works in progress through Ireland, and not a few projected which will no doubt be prosecuted after a short time. In the south considerable progress is made with the dockworks at Haulboline. A foot-bridge is at present erecting to connect the historical-political Spike with Haulboline. Convict labour is engaged to a large extent on these works. Free labour, however, to a greater extent than hitherto has been found necessary, as skilled artisans are indispensable to the proper and practical execution of the works. When the bridge is finished the basin will be commenced, but its prosecution will be dependent on an adequate grant from Parliament. A quarry which has been discovered in Haulboline by the superintendent of the works has been found to yield a good supply of stone, and has answered its purpose remarkably well. The working of the quarry will be solely done by convict labour, and this will naturally effect a great saving.

Gasworks are in progress in the town of Skibbereen. The design consists of a dwelling-house for the manager, with large buildings for the storage of coals and manufacture of gas. The works will have a frontage upon the river for the supply of coals. The architect is Mr. Richard Lee, of Skibbereen, and the contractor is Mr. Murphy.

In the town of Bantry a new pier has been commenced, from plans by Mr. William Foreyth, C.E. The pier will be 200 ft. long by 35 ft. wide at the top, inclusive of banquet and parapet on the weather side. Flights of steps will be provided for access from small boats and mooring requirements. The Government have given a grant of 3,000*l.* and a loan of 1,600*l.* towards these works on the condition of repayment within six years, without interest. The pier will be an important addition to the commercial character of the town, and it will be amply sufficient to meet all its requirements at present in the matter of shelter and loading and unloading of the variety of small vessels that frequent the harbour.

Many of the harbour boards in the south, as elsewhere, are at present crying out to Government for grants to prosecute improvements, but without success. Mr. J. A. Blake, M.P., of Waterford, made an appeal for aid towards deepening the bar of the harbour of Waterford, but was remanded by a letter from the Secretary

of the Treasury of the example in the case of the Carlingford Lough, where a similar appeal was made; the Government refusing to make a grant, and referring to the Act of 1861, 24 & 25 Vict., cap. 47. The Government thinks that the works necessary should be carried out by the means therein specified. The only aid given by the Government in the Carlingford case being a loan from the Public Works Loan Commissioners advanced on the credit of local tolls. The Waterford Commissioners are advised to adopt the same course as was pursued in the case of Carlingford Lough.

In Waterford city some fresh sanitary precautions are taken. The main sewer passing through King-street and George's-street, has been renewed, it having been in a very bad condition. Many of the lanes and bye-streets of the city, with the property, are in a ruinous state, and require immediate looking after. The park is assuming an attractive appearance, and will have a most beautiful influence on the sanitary aspect of the city. A number of new trees and laurels have been recently planted. During the Fenian panic, the Russian trophy guns were removed from here for fear of seizure to the Artillery Barrack. After a short time the Waterford Park will be one of the handsomest of its size in the south of Ireland. Flagging operations are also in progress, outside the railway in the manor, and in Mary-street. In 1870 a considerable amount of old property falls into the hands of the corporation. There is still a considerable amount of flagging required on the sidewalks of several streets and lanes, before the city of Waterford assumes an appearance commensurate with its old reputation as an important commercial seaport and manufacturing city. The steamships plying between Waterford and Milford Haven have proved very satisfactory; they have not yet had a single accident or delay to record. The route is apparently a safe one, though somewhat longer than the Holyhead one.

At Clonmel, in Limerick, a handsome altar has been erected in the Catholic Church of St. Mary. It was executed by Mr. Paul Ross, of London. It is of Caen stone, with Scottish granite columns. The figures are all of Caen stone. Derbyshire alabaster, inlaid with foreign, composes the altar-front. The tabernacle is also composed of Caen stone, in addition to Carrara, Belgian, and Irish marbles. The doors are of wood, carved and gilt. The height of the whole altar is 36 ft. by 28 ft. in width, and the entire weight about 170 tons. The door of the throne is also of wood, richly carved and gilt. The contract price was \$700; but it is said, in consequence of a strike among the sculptors, that the artist has lost considerably by it at that sum.

The Kilkenny Junction line has just been opened for passengers and goods, and between the Marble City and Maryborough it has afforded great facilities, and confers many advantages on the inhabitants. The Government inspector, who was ordered to report on the new branch between Maryborough and Abbeyleix, has spoken of it most favourably, and in a manner that redounds to the credit of the directors and the contractor. Through traffic arrangements are not wanting, and must be effected between the Great Southern and Western before these new lines can be thoroughly serviceable and useful.

At Callan, in Kilkenny, the first stone is laid for new schools of the Christian Brothers. Callan is a town of some antiquity and historical interest. In 1217, this town received privileges from the Earl Marshal. In 1650 Oliver Cromwell battered down its walls. The old parish church, dating from the twelfth century, is a fine old ruin, with nave and aisles complete. The designs of the new schools comprise two separate houses. The trustees of Lord Clifden have given the use of a quarry.

On Sunday last, at Talbotstown, in Carlow, the new church was dedicated. The church is oblong in shape, has no transepts, but is provided on either side of the altar with vestries, the painting and decoration of which are executed in the Medieval style. A life-size representation of the Crucifixion ornaments the altar, surrounded by a group of figures above a collection of stonework symbolical of Calvary. An organ gallery is at the lower end of the church. The building will accommodate about 600 persons. A school house is also in contemplation.

In Wexford a new free bridge is in contemplation over the River Barrow; in relation to which a bill is at present before Parliament. The old toll bridge, which was the property of the commissioners, was carried away in part last January. Memorials have been presented to

the Lord Lieutenant, and the grand juries of Wexford and Kilkenny have consented to the purchase of the property under the provisions of the new Act. The want of a proper bridge has resulted in great public inconvenience and loss. The river which it is to span is the boundary between the counties Wexford and Kilkenny.

For some considerable time works for the improvement of Wexford Harbour have been going on. Last week in Parliament Mr. Dunne moved for copies of Mr. Goode's report on the harbour previously to the commencement of these improvements, and for the reports of Mr. B. J. Farrell, C.E. to the Admiralty, on the state of the harbour previous to the time when advances of money were made for those works.

Propos of harbour, Lord Naas, Mr. Dodson, and Mr. Hunt have prepared and brought into Parliament a Bill authorising the Commissioners of Her Majesty's Treasury to compound the public debt and interest due by the Limerick Harbour Commissioners, and to make arrangements for the payment of the amount compounded; also for the transfer of Wollesley Bridge in the city to the Commissioners of Public Works.

In Galway, the new Convent of Ballina is nearly finished. The building is in the Gothic style. The ceiling is of stained oak; that of the apse looks very handsome. All the furniture and fixtures in the chapel will be of oak. The hall is spacious. The refectory is 40 ft. in length by 25 ft. in width. The ground floor has sitting-rooms, with marble and slate chimney-pieces. An oak stair, highly carved, leads to the second story, from the landing of which runs a corridor the entire length of the building; on either side of which are the dormitories. On both sides of the building are wings, in which are drawing- and sitting-rooms, bathrooms, hospital, closets, &c. Gas will be supplied to every portion of the building; and a plentiful supply of water will be provided for on the top of the building. Thorough ventilation is secured for all parts of the edifice. Earthen pipes have been widely used in the drainage attached, and are sunk to a considerable depth, and are made to communicate with an air-tight reservoir placed at some distance from the building, below the ground. The site is a beautiful one, in view of the wood of Bealek and Lough Con.

Anent Railways. The majority of the corporate Boards in the country are agitating and petitioning in favour of the Government taking the entire railway system, in view to its better management, into its hands. With the exception of two or three branches, the Irish lines do not pay. There is one lossing in connexion with them, accidents on them are not frequent, and this is something worth considering by those who wish to have a tour through Ireland.

THE HALIFAX AND HUDDERSFIELD UNION BANK.

The Directors of the Halifax and Huddersfield Banking Company have opened for business the new premises erected for them at the north side of Westgate and along Chancery-lane, Huddersfield, from the designs of the late firm of Messrs. Paul & Ayliffs, now Paul & Robinson, architects, Manchester.

The style of the building is called Venetian Gothic. The four elevations of the building are each of a different design. The principal front is in Westgate, and forms an oblique angle with each side elevation. There is also a front facing Chancery-lane. The other side faces Booth's passage; and the back elevation is in a line with the gateway called Lancashire-yard, opening direct into the Market-place and Chancery-lane. The Westgate front is five stories high, including basement. The frontage is in a line with the street. At the east corner of the façade is a large splay, or chamfer, out from the building. Here is erected the principal entrance to the bank. The line of entrance is several feet within the line of the street canopy. At the upper corner of the Westgate front is the entrance-door to the news-room and exchange-rooms. Three windows in the Westgate front light what is to be used as an exchange-room; and two windows in Chancery-lane light the staircase leading to the news-room above.

Between the ground and first-floor stories there is a moulded and carved string-course, 15 in. deep. This is succeeded by a dado course, capped by an upper moulded string, of less projection than that below.

The four windows opening to the main front and the two-light windows in Chancery-lane and Booth's passage, on the first-floor, light the news-room. They have square heads with angle mouldings.

The main building has a moulded cornice, supported by numerous moulded and shaped corbels, placed 18 in. apart. Above the cornice is a parapet, 3 ft. 6 in. high. In the centre of the parapet and above the cornice is a large two-light dormer window. The main building is covered with a mansard-shaped roof, 15 ft. high from the square, with a flat on the top, covered with strong lead, and having crenellated ornaments below the ridge-roll. This flat is crowned with a wrought-iron ornamental cresting.

The campanile, or tower is at the east side corner of the building, and stands back from the front about 12 ft. It is 29 ft. high to the top of the iron finials. The upper portion of the campanile contains a room which may be used as a smoking-room; and through an iron casement access may also be had to the lead flat of the roof.

The whole of the Westgate front, the tower portion in Booth's passage, and the portion constituting the main building in Chancery-lane, are built of fine-tooled white ashlar stone, from the Bobbiner Wood quarries. The remainder of the frontage to Chancery-lane, Booth's passage, and the south end of the building, is built of local brown ashlar stone, from the Nethermoor quarries. In Chancery-lane is placed the entrance to the cashier's residence.

The ground covered by the building proper is a parallelogram of 76 ft. by 43 ft. Entering the building by the bank door entrance, at the east corner of the Westgate front, we ascend three steps to the corridor, or vestibule. The vestibule doors open into the public area of the banking-room,—a space of flooring 26 ft. by 7 ft. The banking-room proper, which is semi-octagonal on plan, is 26 ft. by 26 ft., with a recess at the south end 11 ft. by 12 ft., and with ceiling and enriched cornice 13 ft. high. The plafond of the ceiling of the public area is supported upon enriched and sculptured corbels. The banking-room is wholly lighted from the top, by means of a lantern light, glazed with rough plate-glass, and prepared for ventilation. Within this is an inner coved domical light, springing from an octagonal curb 9 ft. diameter. In the centre is a femoral, which can be raised and lowered by means of cords and pulleys, and used as a means of ventilation. The glazing of the domical light is of ornamental coloured glass, from a design by the architects. The height from the floor to the springing of the inner light is 25 ft. The ceiling of the banking-room is octagonal and coved, with moulded ribs at each angle. Polished Dalbeattie granite columns are placed at each angle of the room. The walls have been floated and finished in Keen's cement.

The bank manager's room is on the west side, and is entered from a door in the public area, and also from the side-entrance passage. A small window, with casement-slide, communicates with the cashier in the banking-room. The bank directors' room is at the south-west corner of the building. Marble chimney-pieces are fixed in these rooms. Each room is lighted by a two-light window, looking into Chancery-lane, and fitted with Bannett's patent shutters. The strong-room is in the south-east corner, on the ground-floor. It is built of solid through ashlar stone, with a segmental arched top. It is fitted with perforated galvanised cast-iron shelving. The strong-room door is 3 in. thick, made by Harris, of Bristol.

The two principal rooms to the Westgate front are to be occupied by the Chamber of Commerce. That on the ground-floor will be used as an exchange-room. It measures 24 ft. by 20 ft., and is 14 ft. high. The upper room, intended for the news-room, measures 39 ft. by 23 ft.—including an ambulatory at the east end, which is divided from the large room by coupled iron columns, with plaster capitals, segmental arched heads, and beaded angles. The credling to the iron beams divides the news-room into a trabeated ceiling, having four panels. This and the other principal rooms in the building are furnished with geometrical centre-pieces, modelled to the architects' designs. The exchange-room has an ordinary plaster ceiling and cornice. The exchange and news-room walls have wainscoting, plinth, and capping fixed to the height of the window bottom. The windows have 8-in. architraves fixed to the sash-frames. Ventilation is provided through the external walls. The whole

of the gasfittings, hell-pulls, and other ornamental brasswork, have been made to the architect's designs, by Mr. John W. Dovey, of Manchester.

In July, 1864, the works were let to the following local contractors—Messrs. Abraham Graham and Sons, masons; Wm. Fawcett & Sons, joiners; Isaac Jowitz, plasterer; Lidster & Armitage, plumbers; George S. Scholefield, smith and bellhanger; Webster & Denidge, painters. The architect's surveyor was Mr. H. Breray, and Mr. John Gill was clerk of works. The wood carving in the bank and the whole of the stone carving throughout the building have been executed by Mr. John Green, of Manchester.

WALL PAINTINGS, PARIS.

VISITORS to Paris interested in artistic matters should go to the court-yard of the "Invalides," even if they know the building and Napoleon's tomb, and they will find on the wall of the eastern arcade a painting, say 170 ft. in length, illustrating the history of France, commencing A.D. 113,—the Druids: and passage of the Rhine by the Franks; and coming up to A.D. 1070,—Establishment of the communes. This work, which is unequal in merit, and can scarcely be regarded as other than a remarkable piece of scene painting, was finished by the artist, M. Benedict Masson, in 1865. Quite recently he has illustrated Peace and War over the central entrance, on a gold ground, and it may be that he proposes to continue the history on the wall beyond. The Crowning of Charlemagne makes an effective centre in the large portion already done.

Amongst the ecclesiastical decorations those of the church of St. Germain des Prés, one of the most ancient buildings in Paris, are especially noteworthy. The interior is painted and gilded from bottom to top, and includes numerous figure-subjects. Much of the work here was done by Hippolyte Flandrin, the painter, to whom a monument has been set up in the north aisle of nave. This is of white marble, and includes a bust of the artist between two columns and *antæ*, which carry a canopy, a not inelegant mixture of classic and Gothic forms. The canopy, or pediment, encloses a trifol arch, and has a sort of crocketing running up the two outside lines; but the mouldings are classical, and the whole is supported on four Roman candeliers. The monument is inscribed,—*À Hippolyte Flandrin, ses amis, ses élèves, ses admirateurs. Lyon, XIII. Mars, MDCCXXI. Rome, XXI. Mars, MDCCCLXIV.*

THE HOSIERY MANUFACTURE.*

THE stocking-frame, which was also the basis of the lace machinery, was invented in Queen Elizabeth's time. The name of the inventor seems to have been Lee, but very little is known about him. That he was a man of respectability in worldly position would appear from the varied accounts of him,—that he was at one time a student of Oxford; that he belonged to St. John's College, Cambridge; that he was made a B.A. in 1582-3, and became a clergyman in his native parish of Woodborough, Notts, or Calverton, or a curate in some obscure part of Sussex; that his name was Leigh, not Lee,—in short, as a Scotoman would say, there have been a good many "lees" told of him, and it is hard now to get at the truth. Lee is said to have originated his machine under the influence of love and marital pity; yet we are also led to believe that he never had either wife or child; that he invented it moved by hatred to a knitting-needle woman, who would not marry him. Nice romantic stories have been told of both the married Lee and the bachelor Lee: perhaps the bachelor of arts fell away from his bachelorhood and became a benedict, so that he retained a sort of title to be both a married man and a quasi bachelor.

Queen Elizabeth, when his invention was recommended to "her highness" by Lord Hunsdon, who wished her to give the Notts clergyman a patent for it, replied, she should be very sorry to grant a monopoly that would ruin many poor knitting-needle women; but that, if his invention had been one that would have knit silk stockings, which it could not do, she might

have granted the request. Whether this both sagacious and short-sighted reply led Lee to modify his worsted-stocking machine so as to form one for knitting silk stockings, may be uncertain, like all else; but it is probable, as indeed is the story altogether. Nevertheless, Lee had to take himself and his inventions to France, where he was well received by Sully and others; but, at the time of the assassination of the French king by Ravaillac, Lee's affairs fell into disorder, so that he died of a broken heart; on which his brother, James Lee, and seven out of nine workmen, returned to England with their stocking-frames, and established themselves in Old-street-square, where they founded the manufacture which still retains a place in the occupations of East Londoners.

Jedediah Strutt, the inventor of the rib-hosiery frame, which was just Lee's frame, so adapted to the formation of ribbed-stockings that the frame might be used either with or without the ribbing mechanism, was far more fortunate than the obscure and almost apocryphal original inventor. While poor Lee respected little else but poverty, premature death, and utter family extinction, Strutt became a wealthy man, and his grandson is Lord Belper—a peer of the realm. This sort of issue appears to be the stereotyped order of events amongst inventors: yet there are remarkable exceptions to the rule.

The lace-machine was an out-birth or offshoot from the stocking-frame; and we cannot here enter further into that interesting subject, and must restrict ourselves to a condensed extract on the subject of its ancient equivalents from Mr. Felkin's interesting but diffuse work on an intricate network of inventions, as a specimen of the style of the volume.

"Dr. Johnson defines network to be 'anything reticulated or deconstructed at equal distances, with interstices between the interstices.' The varieties of network are almost infinite; the methods of production must be equally diversified. For many ornamental purposes the simple method of making nets, such as were used in every-day life, would be employed in producing fringes and other large objects. The idea was so natural as to occur to any mind, above all a female one.

Making nets by the hand for fowling, hunting, and fishing, had been, without doubt, practised from the most ancient times. Such nets are represented on the monuments of Babylon, Nineveh, and Egypt. So universal was their use, that, literally or metaphorically, they are found as illustrations in the most ancient writings of every nation. The pages of the Old Testament furnish ample proof. Job says—"He is cast into a net by his own feet." "God hath compassed me with His net." There does not seem to have been any material alteration in the instrument used to produce these common articles, during the long intervening series of ages, or in the way in which the mesh was formed, knotted, and fastened.

The needle or shuttle, upon or in which the netmaker placed his supply of corded string or line, was passed just as it ever has been through the loop he had opened, and the thread was tied into a firm knot, incapable of slipping, at the exactly measured distance from the last formed one. Almost as soon as these nets are named by any of these old authors, lace is mentioned; not only as a cord, but also as an ornamental part of dress. Lace may be described as plain or ornamented network, consisting of a thread or threads of fax, cotton, silk, gold, or silver; interwoven, drawn, platted, looped, or twisted so as to form beautiful texture. Articles of female attire, depicted in paintings on the walls of Egyptian and Nubian temples, and tombs, are believed to represent such networks in looped or darned crochet, on patterned heads of garments. One of the Egyptian pictures in the great temple of Omkhos, the goddess Athos wears a head-dress resembling lace. Rosellini, in plate 41 of his great work on Egypt, shows two figures who appear to be twisting two threads, and forming what seems to be a reticulated open work. At p. 79, neck coverings are seen, but whether of twisted or drawn open network cannot be ascertained. But at p. 96 the ends of musical instruments are ornamented with netted tassels, each mesh having a knob or knot suspended from it. At pp. 98 and 99 are figured transparent dresses of females, ornamented seemingly with beads, but whether on needle-work lace is uncertain. At p. 133 is a female figure whose shoulders are covered by a worked tippet of handsome appearance, the pattern of which might have been of drawn needle-work. Fringed borders were certainly applied to Egyptian articles of dress.

A lace of blue is thrice mentioned in Exodus, and was probably a fringed narrow lace or braid. Fringes are expressly named in Numbers and Deuteronomy; and knotted fringes became amongst that people through many ages of significant religious import."

The author might have here adduced a curious example of this religious import amongst Christians. The hat of the Roman Catholic cardinal has cords ending in tassels of net-work radiating as it were from a single knot, first into two, then into four, then into sixteen, exactly on the principle of a symbol which is said to occur at the entrance into the "Sorcery Hall" of New Grange in Ireland, and which is referred to in a letter on "Geometrical and other Symbols" in the *Builder* of 11th July, 1863.

Mr. Felkin ranks in Nottingham as one of the best authorities on the subject of machine-wrought hosiery and lace manufactures. He is now in his seventy-second year, and the work under notice is a remarkable product at such

an age: it is only a pity it is so diffuse. The intricacy or complexity of the subject, however, in some measure necessitated such a style of treatment in any work not liable to be regarded as a mere sketch or abridged history of the inventions connected with machine-wrought hosiery and lace manufactures; whereas this book professes to be a full and authentic history, and for which it must be accepted. Of the prolixity which was deemed unavoidable he himself says, referring to his work:—

"It has been a laborious one from the necessity of giving an account of many inventions, patents for which, in some cases, and prolixity of specification probably unexampled in any other manufacture, have had to be investigated. The short notices of these in the patent list issued from the office in London since this work was written form a volume of 1,070 pages. The present author has accounts of 388 English patents in hosiery and 331 in lace—719 altogether—many of them of immense length. The study of these mechanical descriptions is not favourable to elegance of composition, which may account for some defects in the volume. Such an intricate mass of details must also, after expending the utmost care, produce errors in narration."

Nevertheless, Mr. Felkin has added an important and interesting volume to the history of inventions.

THE LATE MR. JOHN HARDMAN.

THE revival of the art of metal-working and glass-painting owes much to Mr. John Hardman, who died at his residence, Clifton-park, Bristol, on the 29th ult., at the early age of 55. An accidental interview, in the year 1837, with the late Mr. A. W. Pugin, at that time Professor of Architecture at Osout College, resulted in Mr. Hardman's taking up the views entertained by the architect, and a friendship began, which terminated only with the life of Mr. Pugin. Mr. Hardman entered thoroughly into the views of Pugin, and was the medium by which the conceptions of the latter were realised. He thus gave Birmingham a new industry. Mr. Hardman was a liberal supporter of the local institutions, and was known for a most charitable disposition.

DUCAL FÊTES AT ALNWICK.

A SERIES of magnificent entertainments was given at Alnwick Castle last week, in honour of the coming of age of the eldest grandson of the Duke of Northumberland, Lord Warkworth. Fête after fête succeeded each other for four days, commencing on the 29th ultimo. The stately repast at which two thousand guests were seated in one hall; the excellent regales, full of hopeful, earnest acknowledgements of the responsibilities of wealth and rank, and weighted with good words, that the young lord made to the numerous addresses of the tenantry of his grandfather; the grand banquet to the volunteers, of whom Lord Warkworth is colonel; the draping of the town with flags and banners; the dinner of dainty dishes in the greatest profusion and most startling forms, to which every child attending either of the schools in the town was invited; the fireworks, the salutes, the bell-ringing, in which the silver-toned old Norman and Early English bells of St. Michael's Church seemed actually to rejoice; the ball to which the Duke invited two thousand of his friends and neighbours; and the concluding feast to the army of workmen and helpers, have been ably and duly chronicled with Froissart-like minuteness by the local press. We are, ah! only, to notice the structural features of the accommodation provided for the reception of this very numerous company. The state apartments, we must premise, built by the late duke, and so sumptuously finished in the Cique-Cento style, as formerly described in these columns, were occupied by the Earl and Countess Percy and a circle of friends. Within, however, the circumvallation of the castle, there is a vast hall, 135 ft. long, built in the recent remodelling of the edifice, known as Hotspur's Hall, as well as by the name of the Guest-hall; but even this was not adequate for the well-ordered and stately entertainment of two thousand guests. It was cleverly enlarged by the following means:—A large portion of the façade looking upon one of the courtyards was removed, and the yard in question was used as the site of a temporary booth, which was built up to the permanent building, so as to form a very spacious T-shaped hall. The roof of the Guest-hall was supported at the gap formed by the removal of the frontage by four arches, upheld in their turn

* A History of the Machine-wrought Hosiery and Lace Manufactures." By William Felkin, F.L.S., F.S.S. London: Longmans, Green, & Co., 1867.

by four square pillars. The ingenuity of this contrivance is enhanced by the economical adaptation of a piece of construction that has already done service on the banks of the Tweed as well as on those of the Tyne. The booth in question is the property of Mr. J. Richardson, builder, Arnhem, to whom was confided the task of erecting it as an extension of the Guest-hall. It consists of a centre and two aisles. The central portion is 50 ft. wide, and has a row of pillars 20 ft. high and 10 ft. apart. Over this a high-pitched roof rises 16 ft. above the wall plates, formed of rafters 30 ft. long, though hut 4½ in. by 3 in., to which sufficient strength is given by the introduction of light iron ties and small struts. This light though strong framework is covered with canvas rendered waterproof by oil and other materials. The aisles have lean-to roofs stretching from the pillars upholding the central roof to the sides of the yard. It is 130 ft. long by 90 ft. in width. These dimensions, added to those of the guest-hall, gave a covered space of 225 ft. in length, and 135 ft. in width at one end, and 90 ft. at the other, in which, for four days, banquets and a ball succeeded each other till every tenant, and nearly every neighbour of the duke—man, woman, and child—was feasted and entertained in honour of the auspicious event. The Earl and Countess Percy most happily represented his Grace, whose advanced age rendered the journey from Torquay, where he is at present residing, inadvisable.

“IRISH ARCHITECTURE.”

UNDER a sketch showing the tenant of an Irish hut digging away the floor of it, *Punch* thus records a conversation,—“Angler (in Ireland). ‘Hallo, Pat, what are you about now?’—Pat. ‘Shure, I’m raisin’ me roof a bit, yer honour.’” Our merry and wise contemporary would scarcely suppose that this mode of raising the ceiling is not more Irish than English, and is constantly being pursued in basements in the metropolis, under circumstances much more dangerous than occur in the poor hog-trotter’s hut, where the weight of the cabin-walls is as nothing. Of course, when the district surveyor is informed, as the law requires, proper steps are insisted on to ensure stability; but the operation is constantly performed without the knowledge of that officer, and the walls are left standing on a bank of earth, to the great danger of the tenants on both sides. In shooting at what might be thought an Irish bull, our Mentor has hit a London danger.

THE NEW DISTRICT BANK, STAFFORD.

The principal street of Stafford has within the last few years undergone great improvements, but the new Manchester and Liverpool District Bank, which is now almost completed, is the most elaborate piece of street architecture in the town, according to the local *Advertiser*. This new building, says our authority, is of red brick with Hollington stone dressings, and the shafts which support the capitals in the windows and doorways are of red Mansfield stone. The style is Gothic, treated with considerable freedom, and an almost profuse employment of carving and other ornamentation. The front is divided into three gables, terminating with finials. The whole width is 44 ft. In each gable there is an ornamental opening, and a monied string-course crosses the front in a line with the corbels or gable knees. The first floor is lighted with three windows, the centre one containing two, and each of the others three lights. There are balconies with ornamental wrought-iron railings at the front of these windows, which are supported by brackets projecting from a deep string-course. Below there are two three-light windows on each side the entrance. All the door and window openings inside and outside have shafts of red Mansfield stone, supporting carved capitals. The upper portions of the windows are of solid stonework, pierced with circular openings of various sizes. The main entrance doorway in the centre is lofty, wide, and deeply recessed. Double shafts, surmounted by carved capitals, support the arch, which is moulded. An inner arch, forming half a quatrefoil, is filled with floriated ironwork. The bank itself is 40 ft. 6 in. long, by 23 ft. wide. It is entirely lighted from the top by a

large lantern with side lights all round it, and which is also partially roofed with glass, an intervening ceiling of ornamental glass in panels serving to soften the effect of the vertical light. The lantern is supported by stained principals springing from corbelled shafts, which terminate below a stone string-course. The glass ceiling is 29 ft. above the floor. The strong room is fireproof, and is fitted with one of Chubb’s patent fireproof doors. There also is a ballion safe opening out of it, enclosed with case-hardened steel, and also fitted with a Chubb’s door. The architect is Mr. Robert Griffiths, county surveyor; and the work has been carried out by Mr. H. Lovatt, of Wolverhampton.

SURVEYORSHIP, FISHMONGERS’ COMPANY.

This appointment was decided on Monday last. There were thirty-eight candidates, amongst whom were Mr. C. Barry and Mr. Gardner. Six were selected, namely, Messrs. Clark, Knightley, Marrable, Parkinson, Ritobie, and Sanders. The contest eventually lay between Mr. Clark and Mr. Knightley, and ended in the election of the former.

NOTES FROM THE CHAMP DE MARS.*

In commenting on the Russian pictures I must depend upon the French translation of the un-readable and unpronounceable Russian names of the artists; and, therefore, if I am guilty of any egregious solecisms, I take this method of deprecating you and their anger.

Jean Aivasovsky has a lovely “Vue prise sur la Côte Méridionale de Crimée,” and a delicious moonlight on the water,—somewhat yellow methinks for moonlight, but so peaceful and calm, and the ripple of the wavelets charmingly portrayed. The distant town on the rocky cliff to the left, with its spires and roofs bathed in the same quiet splendor, is admirable. This picture is outside, and to the left of the entrance to the gallery; while on the right is seen Swertchkoff’s “Czar Alexis Michaelowitch reviewing his Troops.” The field of the review is snow and ice, so well represented that it achieves one to look at it; and, contrasting with the blue whiteness, a large crimson banner, bearing a giant-sized head of Christ, floats languidly above the troops. The horses of the three principal figures wear strangely barbaric-looking anklets on their forelegs. Horawsky shows a wonderfully painted “Portrait d’une vieille Lithuanienne,” with Denner-esque skin, and veins in the hands; but, if there had been a shade less redness in the flesh, the old-age effect would have been more successful.

Here, as in most of the foreign galleries, distressing subjects predominate, and vex while they sadden an English spectator; but of all the painful pictures, I think the one that attains to the acme of horror is, “Mort légendaire de la Princesse Tarakanoff.” She is represented robed in faded crimson velvet and white satin, both most admirably painted; she is in a dungeon that lies partly below the level of the sea, which—excited by a now spent storm—has risen above its bounds, and is rushing in at the barred window, flooding and filling the dank, slimy dungeon. The princess is standing on her poor pallet, her feet resting on the fur coverlet, her back pressed against the damp green stones of her prison-wall, at which her thin white hands convulsively clutch; and the rats are creeping up, wet and dripping, out of the rising water, which has already attained to the level of the bed. The moonlight that streams over the Princess’s upturned face, swollen eyelids, and convulsed bosom, make of them a horrible nightmare, not soon to be forgotten. Of course, the picture is clever and forcible, or it could not affect the beholder so deeply; but it could not be an awful companion to have in a lone midnight watch, especially if that watch chanced to be held in a solitary country-house, on a stormy night, with the wind howling mournfully outside, and the rain beating furiously against the window-panes.

On a stand in the centre of the Russian gallery are several admirable bronze groups and small figures similar to those which deservedly attracted attention in the 1862 Exhibition.

Nicholas Lieberich is the principal contributor; while in the marble, jewelry, and precious stones department a statuette, with “Sokoloff” on the base—whether the name of artist or subject I know not—is very beautiful from its simplicity and quiet dignity. It is merely a young man standing in an easy attitude, with crossed arms, and wearing the Russian costume. The price is 200 roubles.

Being in this court, I must pay a just tribute of admiration to the fine mosaic, intended doubtless for church-decoration, executed after Professor Neff’s picture by Michel Chmieboski, although already mentioned in the *Builder*. There are twenty-two heads rather larger than life-size, the variety and expression of which are very remarkable; and the rich colouring upon the gold ground is extremely beautiful.

In the gallery of the kingdom of Norway and Sweden, the King, Charles XV., occupies an honourable position as a landscape-painter. Each division of his kingdom exhibits a large work taken from his own especial scenery; and each is an admirable production. The “Lake of Brunnevikken, near Stockholm,” is a charming bit of land and water; and the “Norwegian Landscape” very beautiful to look upon. Baade has a lovely “Night-scene on the Coast of Norway;” Bøe, “Norwegian Sea-birds—Gronso—lighted by the midnight sun;” some “Flowers;” among which the roses are very good; and “Shells and Jewels” on a red cloth, with a candle burning, in which, if the flame had been the least trifle brighter, the effect would have been magical. Hans Gude has a very fine water-piece on a large canvas, “Return of Whale-fishers: dead Calm;” and Madame Johanna Möller, “A Trio,” of which the good-natured old paterfamilias, sleeping in his arm-chair, evidently makes up with his snoring the “third” part. Mamma is trying to rouse him, unobscured by the musicians: verily human nature is the same in all countries.

Söderman, of Stockholm, has a very pretty small hunting-group, price 500 francs, with a capital likeness of our Prince of Wales, and—good, we may, therefore, suppose also—of King Christian, Prince Oscar, and another, with a dead stag lying before them.

E. Berg has a lovely evening effect in a Swedish landscape, and a capital “Waterfall” Boklund, “Un Savant,” Fegerlin, three clever pictures—the lace cap in one of which (“Jalousie”) is a marvel of stereoscopic effect; Hoekert, a noticeable large picture, “Inoentie dans le Palais Royal de Stockholm, le 1er Mai, 1697,” with many good points, but marred by the dwarfish woman carrying a dog, and the legs of the man descending the lower flight of stairs, which are perfect deformities. The same artist’s “Intérieur d’une Tenté Laponne” is much more satisfactory, with its good-looking young couple—the husband making a net, and the wife caressing her bundled-up baby, slung to the roof. Lindgren, in “Le Dîner,” shows a pleasant cottage interior, with a pretty English-looking barefooted youngster, seated on the floor feeding itself, basin and spoon in hand; Mita, C. de Post has a clever portrait of M. Frolich, which (to indulge in a German pun) must be a happy likeness; and Wirgin shows a pretty Dalmatian peasant, that reminds one of Miss Osborne’s pleasant pictures, and speaks well for their truthfulness.

Denmark seems to group in naturally with Russia, Norway and Sweden, and here we find a charming picture by Gertner, “Les deux Amis,” in which a darling child, half dressed, has its arm round the neck of a beautiful Landseer-like noble old dog, in a richly-furnished room that makes a fine background to the pleasant subject; and a portrait, by the same artist, of “Comte Fys de Frysensberg,” is admirably executed. Clever Madame E. Jerichan has eight excellent works, of which the most noticeable are “The Wounded Soldier,” remembered from the ‘62 Exhibition; “Un Matelot Danois,” forcible as Hook, and wonderfully like him in colouring; and “Le Racommodage des Filets,” where the net hangs across the picture, with a handsome dark-haired woman and a child standing before it, and a pretty little thing on the other side, its bright face showing through the meshes. Rasmussen has a delicious “Beech Wood in Early Spring,” Rump a beautiful hit of the Wood of Fredericksberg, with a broad river or lake showing through the holes of beech-trees, and a group of Danish *gamins* frisking on its pleasant bosom; and Soerensen has two fine pictures of large size, “Matiuée d’Été sur la Rade d’Elseneur,” and “Lever du Soleil à Skagen: Tempête,” which is a lovely

* See pp. 374, 383, ante.

thing, and grows more and more grand the longer it is studied.

Some outline drawings by Frölich, illustrating various poems, are extremely delicate yet clear and distinct, especially those for "Hero and Leander;" and a host of a man with a wonderful name, Bjørnskjærne Bjørnsen, the work of H. V. Bissen, speaks for itself as being an excellent likeness.

R. F. H.

NORMANHURST, BATTLE, SUSSEX.

THE name of "Normanhurst" has been given to this mansion now in course of erection on land of historic interest, in connexion with the Battle of Hastings, the Normans, and "Hurst," which is the Sussex name for a wood. It stands near to the town of Battle, on high land, at the entrance of the vale Ashburnham, and commands a magnificent view of the surrounding country, Battle Abbey, the town and castle of Hastings, and the whole of the Channel from the South Foreland to Beachey Head. The site thus overlooks every spot traversed by the army of William the Conqueror, from the landing in Pevensey Bay to the battle-field.

The buildings form a conspicuous group in the landscape, and are clearly visible from the sea. The plan will explain the general arrangements of the mansion, and it will be noticed that the principal rooms are formed en suite, and are very lofty. The mansion is constructed entirely upon fireproof principles, and in addition a water supply is carried around the building, with hydrants at frequent intervals, to command every portion. The approach to the conservatory has been contrived so as to render the whole extent of it visible from the hall.

An octagonal tower rises from the south-west angle, having a prospect balcony and a lofty stone spire. The buildings are constructed of local hard blue stone, with dressings of Portland stone, and are roofed with Broseley tiles, with bands and patterns; and are in the style of the age of Francis I. The offices and kitchen department are, of course, planned with all the modern appliances. Access is given to the kitchen-yard by two octagonal towers and a large entrance-gate, flanked by pinnacles.

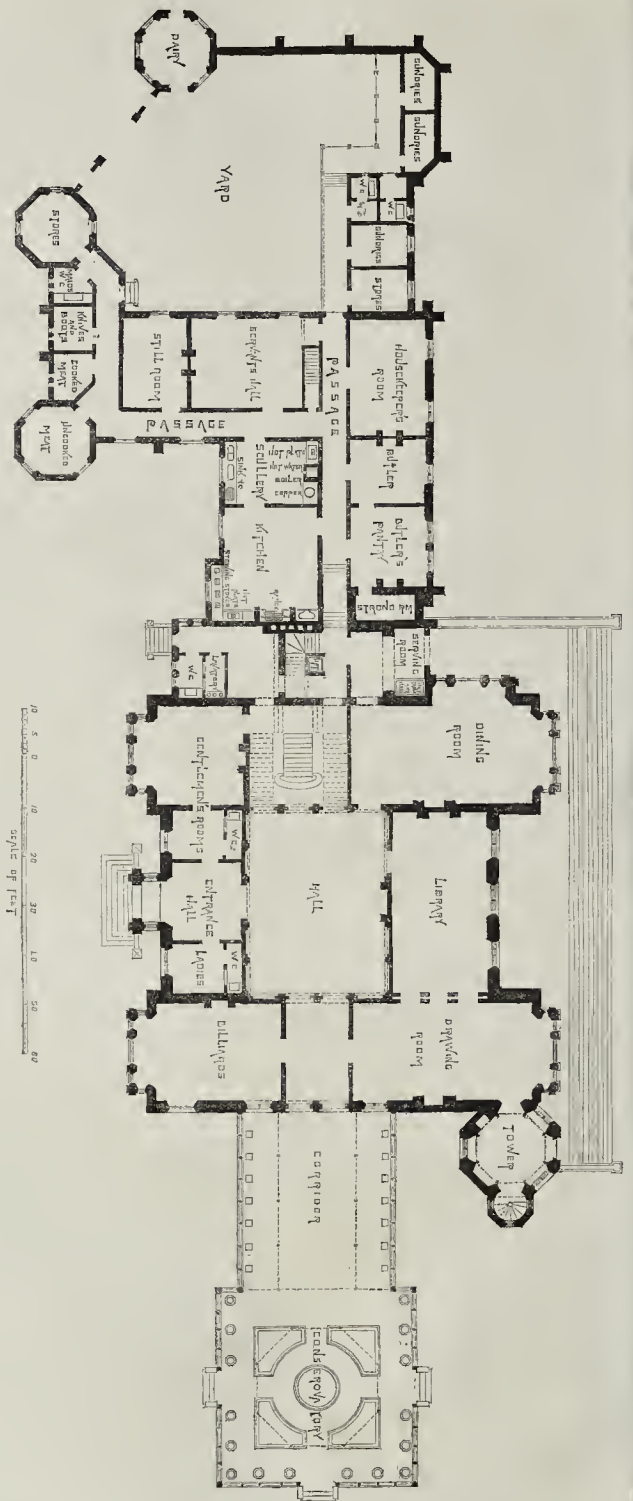

The water-tower, not shown in the view, is a conspicuous object in the landscape, being of great height. It will supply the whole of the house, offices, stables, and gardens with water, which is raised by a steam-engine from a deep artesian well. The laundry adjoins the water-tower, and is worked by the same steam-engine that raises the water.

The group of stable buildings stands at some distance from the mansion. These form three sides of a quadrangle, while the entrance gateway and a lofty spire occupy the fourth. The spire is prepared for a clock and musical bells to play the Oxford chime. A covered drive to exercise the horses during inclement weather extends around the quadrangle. A spacious kitchen-garden, with forcing houses of all kinds, and a gardener's cottage adjoin the stables.

The buildings are for Mr. Thomas Brassey. They have been designed and superintended by Messrs. E. Hahershon, Brock, & Webb, architects, and are being erected by Messrs. Lucas, Brothers. The outlay has, of course, been large.

INAUGURATION OF A NEW SYNAGOGUE. A new synagogue for German Jews resident in London has been inaugurated with great ceremony. The building was formerly known as New Broadstreet Chapel, City, and will contain about 700 persons.

GROUND PLAN NORMANHURST, BATTLE.

NORMANHURST; BATTLE, SUSSEX.—Messrs. HAMBROUN, PROCE, & WEBB ARCHITECTS.

THE SOCIETY OF ARTS' PRIZES.

The Prince Consort's prize of twenty-five guineas has been awarded to William Meadows, aged 19, of the City of London College, clerk, who, in this and the three preceding years, has obtained the following first-class certificates:—1864. Chemistry—first-class certificate; with first prize; animal physiology—first-class certificate, with first prize; geometry—first-class certificate, with first prize; 1865. Book-keeping—first-class certificate. 1866. Navigation and nautical astronomy—first-class certificate, with first prize; principles of mechanics—first-class certificate, with first prize; algebra—first-class certificate. 1867. Arithmetic—first-class certificate, with second prize; domestic economy—first-class certificate, with first prize; English literature—first-class certificate, with first prize; mensuration—first-class certificate, with first prize. Free hand drawing—Joseph Harris, 22, Royal Polytechnic Institution, draughtsman, first prize, 5*l.*; Henry Edward Gilbert, 22, Rugby Institute, solicitor's clerk, second prize, 3*l.* Geometrical drawing, John Conlson Nicol, 19, Alderdeen Mechanics' Institution, architect, first prize, 5*l.*; William Carter, 18, Manchester Mechanics' Institute, engineer, second prize, 3*l.* The Company of Coach and Coach-harness Makers' prize of 3*l.* is awarded to Henry Potter, 17, Chelmsford Literary and Mechanics' Institution, coach-painter; second class certificate in free-hand drawing, with the highest number of marks obtained, in that subject, by a candidate employed in the coach-making trade. The Company of Goldsmiths' prizes are awarded as follows:—First prize, 5*l.*, to James Rowan, 16, Belfast Academy, goldsmith and jeweller—first-class certificate in arithmetic, with highest number of marks obtained by a worker in the precious metals; second prize, 3*l.*, Thomas George Johnson, 17, Royal Polytechnic Institution, silversmith—third-class certificate in arithmetic, with the second highest number of marks obtained by a worker in the precious metals.

STOTTESDON CHURCH, SHROPSHIRE.

This church is now being restored and in part rebuilt. It is a large and ancient structure, having a curious early doorway with rudely sculptured lintel. The nave is Norman, with a large fourteenth-century south aisle or chancel, a north aisle, and a fourteenth-century chancel. The roof of the nave seems to have thrust the north arcade considerably out of the perpendicular soon after its erection, for in 1638 four stone arches or flying buttresses were constructed in the roof of the north aisle to support the piers and arches, and strong timber shoring was afterwards added. The works include new roofs, floors, and fittings throughout, and the restoration of the ancient piers and walling at a cost of 2,100*l.*, contributed by the patron, the Duke of Cleveland, and other subscribers. Messrs. Nevett, of Ironbridge, are executing the work under the direction of the architect, Mr. Blashill.

MEMORIAL OF "SIDNEY HERBERT."

The Memorial of the late admiral Lord Herbert of Lea has been set up in the Court-yard of the War Office, Pall Mall. It consists of a bronze statue 9 ft. in height, on a carved granite pedestal, the lower grey and the upper portion a beautiful specimen of red granite. Let us be *reliefs*, also in bronze, illustrative of subjects to which Lord Herbert chiefly devoted his attention whilst filling the office of Secretary of State for War. On the face of the pedestal, beneath the granite, are the armorial bearings of the "Unge serirat," and on the sides are the date of his birth and death—viz., "Born 16th Sept., 1810," on the east side, and "on the west," "Died August 2, 1861." On the southern side is a bronze tablet, inscribed, "Erected by public subscription, 1867." The tablet in front of the statue or northern side, facing Pall Mall, represents an incident in the "Herbert Hospital" at Woolwich, Miss Nightingale instructing nurses in their duties of tending wounded and sick soldiers—very good. On the east side is a *bas relief*, representing the volunteer movement, in which a battalion of volunteers are seen marching; whilst that on the west side

(the meaning of which is not very clear to the ordinary observer) exhibits the process of casting and testing the first Armstrong gun at Woolwich, which event occurred during the administration of Lord Herbert in the post of War Minister. With regard to the statue itself, it portrays Lord Herbert, robed as a peer, standing with his head bent rather too much downward in a position expressive of deep thought, and supported by the right hand, the elbow resting on the left, which holds a roll of papers. At the feet of the statue are some books. The likeness is satisfactory, the drapery well disposed, and the whole creditable to the sculptor, Mr. J. H. Foley, R.A. Messrs. H. Prince & Co. were the founders.

THE CLOISTERS.

SIR,—I confess I looked forward with some interest for Mr. Burges's promised lecture on the "Future of Architecture." I feel not a little disappointed, for Mr. Burges seems to me to have left out the very pith and marrow of what such a lecture on the future should, in my opinion, have contained, viz., a distinct statement of present *foundational* evils and shortcomings. Mr. Burges has forgotten them. What, then, are they?

It seems to me that there are two things here all others to be aimed at;—the preservation of the little that is left of past art in its integrity and truthfulness, i.e., the old handwriting as it is; and then, the distinct recognition of the actual art-handwriting of living and working artists, as distinguished most distinctly from the unproved claims of those who merely employ them. If thirteenth-century French Gothic is better than any other style of architecture, then is it the duty of all to study it, and certainly to preserve it; and more especially any specimen of it to be found in this country, or indeed anything that looks like it remaining to us from the past. If to draw the figure, whatever that may mean, be the one thing needful, and if the chief glory of the future of art is to be the capability in the artist or architect, whether young or old of drawing the human form, then the main thing in the whole business is, first and foremost, that we should single out and appreciate, and honestly own, the personality of the draughtsman himself, and not consent to take what he produces from the hands of another man who has merely bought such result. Sir, what are we now doing? I say, two things, directly antagonistic to those foundational principles,—destroying systematically and purposely the works of the old artists; and refusing, as systematically and purposely, to recognize the work of the living artists. No man can possibly deny the truth of these four primitive propositions, and how any one could come to read a lecture on the future of architecture without noticing either one of them, may be a fair matter of wonder, if not of regret. Mr. Burges has missed them, so perhaps you will allow me to add a few sentences to his otherwise capital paper.

First, then, one or two rough statements of art principles and facts. That the power and influence of capital in these days is all-absorbing this is so; but in fine-art matters things have now arrived at such a pass that art itself has existence by and is completely crushed out of all real art energy of the time, sells it again to the public, and at the same time appropriates to itself, unacknowledged, the whole of the credit properly and fairly due only to the executive and working artist himself, the real producer of the art. Art action is now nothing more than a sort of socially legalised system of pillage and wholesale robbery, rendered possible by the ignorance of the public mind as to the real reason of the nothingness of modern art. Art and architecture are both, as Mr. Scott said truly, starved; and for this one simple reason, the art capitalist eats up all the working artist does, and so leaves him simply minus and empty of everything. It has reduced him from an artist, with both mind and hand, into a simple labourer with hands only; but still, starved as is the work, the art capitalist appropriates the final results, and lives on them. This, sir, is the present of art; and how Mr. Burges could have brought himself to talk of the future, without first saying something of the present, I say I cannot imagine. If anybody doubts this, let

him look at the present year's Academy catalogue, and on the wall filled with what the public are given to believe to be architects' architectural drawings! The one or two exceptions are truly comforting to see, but they are rare exceptions, and it is to be feared hardly at all noticed; for when evil is at a climax, and the cup all poison, a drop or two of wholesome and clear fluid can hardly at first be expected to be even recognised. Strange that all this should have been missed. *The future of art is not to amend the present, but to reverse it.* Those who now, as art capitalists, pass with the world as artists, will in the future be no artists at all, but tradesmen and employers of labour merely; and any one in that future making the attempt to take so false a position, will most certainly earn the well-known name given to advertising medical charlatans, and treated by society as they sometimes so deservedly are. If any one he still incredulous, and feel inclined to say this is too hard a statement, then I would ask him to reflect for a moment on the results of the Paris Architectural Prize Show, and cogitate on the tremendous fact that it is now possible to exhibit the drawings of a set of architectural clerks, at the wages of common mechanics, to hand them in to a Royal Commission sitting round a table, and to have awarded to you Imperial medals and European fame, and, may he, Imperial smiles, for work which for all that is in it you may never have even seen, much less done anything to or touched, much less again drawn yourself. Is the reader, with these things in view, at all satisfied with Mr. Burges's lecture, or with this comment on it? No. It is, sir, with the utmost sorrow and heart-felt regret,—and truth compels me to make the confession as a matter of hopefulness,—that in Paris, at this moment, neither architectural models nor architectural photographs in the place of *bonâ fide* architectural drawings are of any avail. There would seem to be no magic mill in which out of plaster, or cardboard, or photographic fluid, gold in the form of medals can be ground. I know Mr. Burges is not convinced. Once more. To watch that wonderful movement now going on in the House of Commons, called the Reform Bill, it is necessary to walk over and on some encaustic tiles, and while waiting for a turn sometimes, it is interesting to pass from the frescoes to the floor, and it always strikes me as something wonderful how poor Pugin could at that time have designed and drawn this very pavement so well and cleverly as he did. It is Pugin's pavement, for he did it; but if, at all puzzled, you should happen to ask "Who did the pavement?" from the Chancellor of the Exchequer downwards to the boy who runs about with the telegrams, you will get the same answer,—"Minton's tiles." Sir Charles Barry himself, though his statue is close by, so his name is at least familiar, does not come in for this pavement any more than poor Pugin. "Minton" is triumphant here, and fairly a household word. Surely the future of architecture will comprehend the floor of a room as well as the roof. Before, therefore, we can possibly write on the future of architecture, the present must be looked at; for out of it, as a flower out of dung, the future must spring.

I fear I must not trespass on your space; but there are so many noteworthy sentences and omissions in this lecture that one feels at a loss which to take as most to the present purpose. Early French-Gothic architecture is for the future, we are told, and the best possible; be it so for the moment, at least. Mr. Burges is, then, in a position to appreciate the extreme heauty and surpassing value of the north cloister of Westminster Abbey. It is now unhappily in course of being sawn and hacked to pieces, or, according to architectural modernism, "restored." The whole of the tracery of one bay is already gone. Clerks, starved as they are, foremen, and labourers soon make short work of Early Gothic tracery; but to really and artistically reproduce, or even copy, the worthless rubbish, requires the hand of a master and an artist architect. Sir, of course I know what all this is being done for. It is just as easy to play a tin trumpet in the cloisters as in the Abbey: why not blow a note of real triumph over the preservation of this glorious hit of Early Gothic, instead of waiting three months for its worse than total destruction—a modern falsehood in its place? While we are about it, why not have put in the cusps without further destruction. Mr. Scott fancies Gothic to consist in ornament, cusps, finials, spikes, and so on. Of the real nature and foundation of Gothic, Mr. Scott has not the re-

mostest idea.* I have headed this short notice the "Cloisters" in the humble hope that Mr. Burgess's love of Gothic will lead him to help to induce Mr. Scott to spare one of these ways of real Gothic, not modern Puseyite cheap church-building called Gothic, but the real work. This is of the present of architecture. Up to the present hour the part of modern architecture has been simply restoration, i. e., destruction and falsehood, but the future will be preservation. Will Mr. Scott begin with the Cloisters, by the simple process of leaving them to tell their own art-story in their own antique language? Let Mr. Scott hear in mind that all is gone in London but this little, the Temple Church, the Smithfield Church, the Southwark Church; and the Abbey itself is disappearing fast day by day, its colour all scraped off, and the honest light of day shut out by forgeries. The little that was left of the Gothic writing has all disappeared from it and from them. Of your charity, then, spare the Cloister.

Mr. Burgess lectured before a very remarkable society, and said that what most interested him in this year's architectural display was the sketches by the clerks and students which compose it,—the art handwriting, however feeble it may be of those who are to succeed our present race of capitalist architects and employers of art talent and energy. All this is very significant, and seems to me to indicate a very great fact indeed, i. e. the utter inadequacy of all our present art societies, and academies, and institutes, and departments to meet the real want of the age artistically. What is really wanted now is an art society at once preservative and appreciative,—to preserve the remnants of the great artistic past, and to recognise the art power of the present—the *bona fide* artistic power of architect or student or workman, however great or however humble. Compared with this, style is nothing. Manufactured sham mosaic is as bad, though "Early Venetian Gothic" in style, as "Bernasconi plaster," Eighteenth Century Gothic, and to my mind far, far worse. Such needed society would see in style itself only a means towards an end, and that end the *bona fide* work of the workman, and its fair recognition as such by artists and the public. Burgess says let us get written criticisms on these art signatures. I say, Nonsense: every autograph best speaks for itself and tells its own tale; the further problem is not to criticise these specimens of artistic writing, but to demand them of every man who now moves about society as an artist. Well may we now say with the old prophet, "Woe unto you who despise the dwelling and inheritance of your fathers!" and "Woe unto you who build up palaces with the sweat of others!" C. BRUCE ALLEN.

GREY FRIARS' CHURCH.

We are informed in Stow's "History of London" that this church was 300 ft. in length, and consisted of fifteen bays, with a corresponding number of windows at each side and three large windows at each end, one of those windows being the gift of the Skinners' Company, and another of Queen Isabella, the church having been built in the time of that public-spirited and unjustly maligned queen. The church, probably, was almost a *fac-simile* of Anstin Friars, built a few years later. The bays of the present building, called Christ Church, are equal to those of Anstin Friars, and its external width exactly the same, as well as the heights of the nave and aisles. It is not known to whom Grey Friars' Church was dedicated. "Christ's Church" was its first title, to distinguish it from "Trinity Church," the first title of St. Paul's, that being the nearest church of equal importance. Its second title was most likely "Our Lady of Seven Dolours," Christ Church is most likely part of the old building, being built of rough coarse-jointed stone, with modern Portland stone dressings and a coating of cement; and it is also probable that, if the wooden pedestals supporting the gallery were removed, we should discover the remains of the old eight-shafted piers which formerly supported the nave roof. There were no transepts or central tower, but an octagonal turret at the north-west angle, similar to that at Anstin Friars. The internal width is equal to that of the cell of the Temple of Jupiter Olympius, at

* This is a hard saying, but what is Gothic? Natural material usefully employed and written on by the architect, artist, or workman, each one by himself with his own hand—the antipodes of art manufacture.—C. B. A.

Athens, and had a west tower been added equal in width to the nave, its length would have corresponded with the extreme length of that temple. The depth of the cloister equals that of the peristyle, and the whole extent of the cloister court from north to south equals that of either side of inclosure around the above temple. It was by no means uncommon for Medieval architects to copy Greek temples as far as written descriptions, without drawings, would enable them to do so. Bath Abbey, St. Mary Redcliff, and many others are Gothic Parthenons, to say nothing of innumerable village temples of Thesusus, with steeples and bells added to them. WALTER SCARBILL.

THE LAW COURTS COMPETITION.

SIR,—It is generally reported that the decision in this most important matter has at last been virtually given. The boasted minute examination of the designs is said to have been set aside, and the question narrowed to the single point of hall or no hall; or, according to another report, narrowed still further to the point of position of hall. It is confidently asserted that the Law Courts Commission has determined that a great hall is indispensable; and further, that the legal business of the country cannot be carried on unless the hall is placed one story lower than the floor of the courts. I am only repeating that which is currently reported; but supposing the statement to be accurate, I presume this so narrows the question that the thing is settled, and that I shall not be prevented in congratulating the fortunate winner on his splendid victory. LEX.

PREVENTION OF FIRES.

ALLOW me to point out to you a reason which I firmly believe to be the cause of many of the fires which take place in the metropolis. And this may be done by comparing them with those of Paris.

Now, may be asked, does that city, which has nearly all its houses six or seven stories high, suffer less from fire than London, with its small buildings? This may be very easily answered in considering that, although London possesses the finest of engines and a most choice and well-trained fire brigade, yet people shrink from incurring the expense through calling them in, and very naturally try at the beginning to extinguish fires themselves until it is too late; and then the men are called, but, alas! only to see the building reduced to ashes.

Now, in Paris this is quite different; for as the pompiers will extinguish any fire for nothing, therefore at the least signs they are called, and, of course, they very soon succeed in extinguishing it while it is in its infancy.

I do not pretend to say the London brigades should render their services for nothing, but only introduce the question, so that wiser men than I may take the matter into consideration. C. T. JUN.

RESPONSIBILITY OF BUILDERS.

SERVANTS OR SUB-CONTRACTORS.

THE case, Normill v. Brady, was an action recently decided in the Vice-Chancellor's Court. It was brought by the legal representative of a workman who had been killed by the fall of a hoist, as alleged, through the negligence of the defendant's servants. The accident occurred at the new railway-station at Cannon-street, City. The defendants, Messrs. Brady, had contracted to roof the station with zinc, and the ' had underlet the contract to one Musgrove, who was to do the work, they supplying the zinc. Their foreman measured the work weekly, with a view to weekly payments to the sub-contractor; but the workmen were not under his direction or management. On the day in question there was a very strong wind, and one of the men employed by the sub-contractor, Musgrove, let a board slip, which fell upon the deceased, and killed him. The case was tried at the last Summer Assizes at Guildford, before Mr. Justice Wille, who was of opinion that there was no case against the defendants, as the man who caused the accident was not in their employ, and he therefore directed a nonsuit, reserving the point whether there was any evidence of liability.

The Lord Chief Justice, at an early period of the argument, observed that, no doubt, if it could be made out that Musgrove was Brady's servant, then the man who caused the accident would be no too. But the difficulty the Court felt was in finding any evidence that Musgrove was Brady's servant. It appeared, rather, that he was in the position of a sub-contractor, and, if so, then the man was his servant, and not Brady's. At the close of the argument his lordship briefly conferred with his learned brethren, and pronounced judgment, in accordance with this view, in favour of the defendants.

MONOLITHIC COLUMNS, LIVERPOOL.

SIR,—In the old Liverpool Exchange news room, now being taken down, are twenty pillars, each about 24 ft. high and 2 ft. diameter; the shaft of each being a single block of the finest white freestone, without speck or flaw. Eight similar pillars stood on the exterior centre of the building; these, after being carefully lowered, have been cut in two to be re-used. The quarry from which these fine pillars were taken was long since closed and built over; and such fine and perfect pieces of stone are seldom now obtained. It is a pity that no use can be found for them in some other building, if they be not required for the New Exchange, without destroying or mutilating them. Unless some plan be devised to save them they may be treated like those already spoiled. E. W. C.

"CLOCKING" CHURCH BELLS.

WITH reference to the letter of "G. H.," printed in the *Builder* of the 25th ult., will you permit me to say that although certain tances are sometimes put on the bells at two or three metropolitan churches by respected chimers (which may be called an achievement), such misuse is a miserable apology for that of the improved periodical chimes. Moreover, in the cases alluded to, the bells are "clocked," or clappered; and that this is a dangerous practice, Mr. Walsely showed in a communication published in the *Builder* of the 12th December last, in which he intimated that both Mr. E. B. Denison and the Rev. H. T. Ellacombe had censured it in the most unequivocal manner.

Early then, when it is stated that more bells have been cracked by hitting a rope 'r the flight of the clapper, i. e. by "clocking," than by all other means together, such a practice ought to be discontinued. A CAMPANOLOGIST.

BEFORED MIDDLE-CLASS SCHOOL COMPETITION.

SIR,—My attention has been directed to a letter signed "A Victim," published in your paper of the 1st inst. At the next meeting of the Directors this letter will be brought before them.

Being personally alluded to in the statement, "that more than a month ago, Sherman told Usher, of this town, who was awarded the 50l., that he need not trouble himself about it, as Peck, of London, who built the Essex School, would be the author of this;" I beg to say this statement is utterly untrue, as never said to Mr. Usher the words attributed to me, nor any words of similar meaning.

It is untrue that Mr. Peck's plans were placed in a side room by themselves. I superintended the unpacking and hanging of the plans; all were placed in the same room, and all examined by the directors present at the meeting, and on a subsequent day by a committee of selection. Mr. Peck's plans were unknown to me, and were hung indifferently with the others, and in so far as I am capable of judging, by no means the best place in the room.

I did not know the author of any design, except one, whose name was written on his design. I do not know this gentleman.

Some designs were reserved for the decision of the directors at their next meeting, which, however, was not then, and has not yet been, given. Those reserved were removed into another room. MARK SHERRMAN.

* * We have also received a letter from Mr. Usher, denying the correctness of the latter in question. We should call upon the writer of that letter to justify his statement.

BUILDERS' BENEVOLENT INSTITUTION.

A GENERAL MEETING of the friends and subscribers to this charitable institution was held on the 30th ult. at Willis's Rooms, King-street, St. James's. The object of the meeting was for the election of three pensioners on the funds, two males and one female. Mr. Benjamin Hammen, president, took the chair.

The Chairman, in opening the proceedings, said it would be unnecessary for him to detain the meeting long, as he had but little to communicate. He found that the list contains the names of nine candidates, four men and five women, and he thought it a matter of congratulation that the state of the funds and present circumstances permitted them to elect one-third of the number who had put themselves forward for election, instead of having a very long list from which only a few could be successful. It was always a matter of regret to have to send any away, but of course it was far greater when the number was large. They were anxious on all occasions to elect as many as possible; and at the present time he could say that, if the funds continued in the same position of prosperity, there would be another election in November next, when those who were unsuccessful that day might have the gratification of obtaining a successful result.

The poll was then proceeded with, and at its close Mr. Thorn, Mr. Cozens, and Mr. Stirling officiated as scrutineers. On their return with the respective numbers, they announced the successful candidates.

Mr. Bird said that, in looking over the lists, he believed that 300 of their supporters had not been canvassed or asked for their votes, and im-

pressed upon the unsuccessful candidates the necessity for increased exertions. He concluded by proposing a vote of thanks to the scrutineers for the performance of their arduous tasks.

The motion, having been seconded, was duly carried, and

Mr. Thorn acknowledged the compliment. After some few observations by other speakers,

The usual voto of thanks to the Chairman concluded the proceedings.

PROPOSED COURT-HOUSE, MANCHESTER.

At the last meeting of the Manchester General Purposes Committee, the principal business related to the new Court-house for the city which it has been determined to erect. The building in Bridge-street is very inconvenient; and for the courts of record and quarter sessions the Corporation use the Assize Courts, and pay 900*l.* a year for the accommodation. Two sites for the new building had been selected, in Lower King-street and in Minshull-street, Portland street. The latter was preferred, and the names of six architects were chosen from whom the final choice was to be made. A majority of the Committee was in favour of Messrs. Mangall & Littlewood, who will therefore prepare the designs, and under their superintendence the Court-house will be erected. The cost is not to exceed 25,000*l.*, and the building will contain four court-rooms, besides other necessary offices.

PAYMENT FOR A MODEL OF A FLOWER STAND.

In the case Whittaker v. Wright, judgment has been given at the Rotherham County Court. Refusal to pay for the model in question was supported on the ground that it had been too late in being sent, that it was too heavy, and too expensive. Defendants, therefore, insisted on their right to have the contract rescinded. The judge, after hearing, said that, whether the defendants had a right to do this was the first question he had to try. The defendants said they had the right on the ground that the contract was a special one, containing three conditions, which had been broken by the plaintiff. These conditions, which the plaintiff denied, were that the model was to be delivered by the end of January; that it was to be "inexpensive," and that it was to be only one-third the weight of another stand then in defendants' possession; whereas, the defendants contended that the model was not delivered until March 8th, the price was "enormous," and the weight of the stand was two-thirds greater than that of the old stand. As to the condition referring to the time of delivery, the judge thought that the defendants had been too late in insisting upon it, and he considered the word "inexpensive," was too vague a term for him to decide upon, and that a maximum sum should have been fixed. In reference to the weight, he thought there had been no definite agreement on that point; but even if there was, the defendants would not, on the account, rescind the contract, but would only be entitled to a reduction in the price as was clearly laid down in "Chitty on Contracts." He therefore came to the conclusion that, on March 13th, the defendants were entitled to rescind the contract, nor to claim any reduction from the price. After a few other observations, his honour gave judgment for the plaintiff for the full amount claimed.

RECOVERY OF CHARGE FOR DESIGNS SENT IN COMPETITION.

HOPKINS v. THOMPSON: SUPERIOR COURT, MONTREAL.
This action, tried before the Hon. Justice Monk, was brought by plaintiff against the defendant for the recovery of 1*l.* per cent. on the estimated cost of a certain church, being a bond for the price and compensation and value of his services in making certain drawings and designs for the same. The judgment was given in May last, after being in court two years. It appears that in the month of April, 1864, the defendant, on behalf of a certain congregation, to which he belonged, and in which the Rev. Dr. Taylor was the spiritual director, addressed a letter to the plaintiff, requesting him to furnish plans and drawings for the erection of a church for the congregation. At the same time, the letter stated in a very minute and precise manner the kind of plans and drawings required; the designation and dimensions of the building; the material to be used; and the cost of the work. It was also mentioned in this letter, that the architect's estimate of the building would be awarded, should receive 5 per cent. on the estimated cost of the work; and the architect whose plans would not suit the congregation, and have his plans returned. It did not appear that the plaintiff accepted in any express manner this letter and its conditions; and, in answer, he did so in an implied way, inasmuch as he prepared plans in accordance with the letter, and sent them to the defendant. Other architects were at the same time requested to compete. Among them was Mr. Thomas. This gentleman furnished plans and designs; and these plans the building would cost 38,000 dollars, which exceeded the price laid down by 4,000 dollars. Mr. Thomas's plans varied in many respects from the conditions of the defendant's letter. In consequence of this the defendant's plans were returned to him. The latter then changed the plans, to have them correspond with the views of the defendant, as contained in the letter

above mentioned; however, even after changing them, they did not correspond in all points. Nevertheless, Mr. Thomas's plans were accepted. The plaintiff's plans were rejected and returned, together with 50 dollars, which sum the plaintiff refused to accept. He now sued upon a *quantum meruit* for his services in drawing up the plans and designs submitted to the defendant.

The Court said that the question at issue was whether the plaintiff should have accepted the 50 dollars, or whether he is entitled to remuneration upon a *quantum meruit*. After having carefully examined the whole of the *meruit*, the Court had no hesitation in saying that he had to restrict his design within a certain estimated figure, and this was a matter which entailed a great deal of calculation and thought. The Court gave as a reason of its judgment, that plans had been required to be made in conformity with certain precise conditions; that the plaintiff had complied with these conditions; that, however, the defendant derogated from these conditions by accepting Mr. Thomas's plans, which were not in conformity with them, and their acceptance by the defendant and others was a clear violation of the conditions proposed. All honest competition was thus set aside, and without competition there was no contract. The plaintiff's *quantum meruit* is therefore good, and the action is maintained with costs.

ARCHITECTS' ACTIONS.

REES v. POTTER AND ANOTHER.

This was an action (Bail Court, June 3) to recover the amount of an architect's bill. The plaintiff was an architect at Dover. The defendants were desirous of erecting a music-hall and four residences at Dover, and they consulted the plaintiff, and according to his case he was to have a per centage of 5 per cent. upon the *minimum* tender, and that was 3,000*l.* for the residences and a surplus for the music-hall, or 8,000*l.* for the whole. He had prepared plans, &c., in accordance with the directions of the defendants, and some tenders having been sent in, the defendants offered him 20*l.* for his remuneration.

The defence was that there was a special contract between the parties, and that the plaintiff was only to have 1*l.* per cent. if the scheme went.

The real question was this, whether the plaintiff was restricted to the preparation of plans for buildings which would amount to 3,000*l.*. The lowest tender was 8,000*l.* upon the plaintiff's plans.

The evidence was contradictory in every respect. The jury returned a verdict for the plaintiff for 200*l.*

CHURCH-BUILDING NEWS.

York.—The church of All Saints, North-street, has recently been restored and altered. The south aisle wall has been taken down and rebuilt, a new vestry and porch erected on the south side, about one-half of the roof re-erected, the entire church supplied with open seats, the pillars and walls scraped and cleaned, a new organ provided, and the old fittings replaced by new ones. The restoration has been carried out under the superintendence of Messrs. Atkinson of this city, architects, and as far as possible the new works have been a restoration only of the old work. The masonry, &c., has been executed by Mr. Brunby, the carpenter's work by Mr. Dennison, the plumbing and glazing by Messrs. Hodgson, the painting by Mr. Lee, and the re-decoration of the chancel ceiling by Mr. Knowles, by whom also the reredos has been decorated. The hot-water apparatus for heating the church has been supplied by Mr. Fryer. Accommodation is now provided for 456, being an addition of 142. The cost of the restoration and a new organ amounted to about 1,500*l.*

Clifton (near York).—The new church here has been opened for divine service. The architect was Mr. George Fowler Jones, of York. The church is Early English, of a very plain and simple character. The nave is 71 ft. long by 28 ft. 6 in. wide, and 35 ft. high, including the roof. The transepts are each 27 ft. wide by 13 ft. deep, and the chancel is 34 ft. by 21 ft. wide, and 25 ft. high. The tower is 16 ft. 6 in. square, and 94 ft. to the apex of the pyramidal roof, which is terminated by an iron vase 9 ft. high. The church is built of brick, faced with Bradford stone, and Ancaster stone dressings. The tower arch, the transept arches, and that of the chancel, and the organ-chamber are of the same stone. The walls are plastered, and the windows glazed with cathedral glass and coloured margins, and in the west window of the tower there is coloured glass in grisaille, presented by Mr. Jones, the architect. The contractors were Messrs. Biscombe & Heddon for the brick and stone work; Mr. Bellerly, carpenter and joiner; Mr. Croft, the plasterer; Mr. Hartley, the plumber and glazier; Mr. Ellis, the painter; Mr. Worthington, the painter; Messrs. Fryer & Ayres, the smiths; Mr. Cole, the stone carver; and Mr. Jones, the wood carver. Mr. George Harrison was the clerk of the works. The names given to the church are those of St. Philip and St. James, and its total cost has been about 3,800*l.*

Godalming.—The chancel of the parish church is to be entirely restored, at an expense of about 300*l.*, to come from the Ecclesiastical Commissioners. There will be a new encaustic tile pavement, a new communion-rail and open stalls, an open timber roof, the arcade arches restored, as well as the Westbrook Chapel and there will be erected a new south window. Mr. Ewan Christian is the architect, and the restoration will be executed by Messrs. Moon & Son, of Godalming.

Croydon.—The Archbishop of Canterbury has appointed Tuesday, June 18, for the consecration of St. Saviour's Church. Since the opening of the building for divine worship, about three months since, the church has been enriched by the completion of the east window in stained glass, from the design of a townsman, Mr. Barraud, of Lavers & Barraud, Bloomsbury; and workmen are now engaged in erecting the lateral screens of marble and stone, presented by Mrs. Newman Smith. These will separate the chancel from the organ chamber and the children's chapel, and with the reredos, which with the exception of the altar-piece, also the gift of Mrs. Newman Smith, is still in the hands of Mr. Theed, the sculptor, will, it is hoped, be finished prior to the consecration. The whole of the stained glass, marble, and carving, are special gifts from persons who had previously contributed liberally to the building fund.

Newport.—St. Andrew's Church, Chertown, has been rebuilt and re-opened. The design was by Mr. G. E. Street, of London, and the contract was carried out by Mr. Treasure, of Shrewsbury. The building is Gothic of the Decorated period. It is rectangular in form, and consists of a nave, north aisle, a chancel, and a chancel aisle. It is constructed of red stone, from the quarry of Mr. R. M. Leeke, with Grinshill dressings. The nave is 60 ft. long and 29 ft. wide, and the chancel 25 ft. long and 20 ft. wide. The height of the building to the ridge is 36 ft. The floor is paved with tiles, those in the chancel being glazed. The ceiling of the body of the church is plastered between the rafters, that of the chancel being entirely of wood, in the form of an arch; and it is said, that at the west end of the church each work of the minister is as audible as in the chancel, while the improvement to the singing is still more evident. The glazing was done by Messrs. Done & Davies, of Shrewsbury. The glass is semi-transparent, and of two colours, a sort of pale green and cream-colour. The panes are square and diamond-shaped, and are arranged in various shaped figures, so as to suit the windows. The church is estimated to seat about 350 persons.

Liverpool.—The memorial stone of the North Shore Church has been laid. It is dedicated to St. Paul. As the locality indicates, the church will be essentially a working man's church, and will be built on land given by the Earl of Derby, lying to the left of Bankhall-street, Derby-road. The plan consists of a nave about 70 ft. by 50 ft. having side galleries, with a wide open chancel 20 ft. deep, separated by the chancel arch, supported upon detached stone shafts, having enriched caps. The total cost, with the exception of boundary walls and land, will not exceed 4,500*l.* The organ and gallery for the choir will be at the west end. The nave will seat about 600, and the galleries about 250. The architects are Messrs. Culshaw & Sumners, and the builder Mr. George Rome. The Earl of Derby, besides having given 2,300 square yards of land, has promised 1,000*l.* for the endowment. The contract for the building is 4,500*l.*, and it is to contain 850 sittings, half of them free.

Croston (Manchester).—The ancient parish church of Croston, which has been in a sad state for some time past, has just been restored, and re-opened for Divine service. The work has been carried out under the direction of Mr. Gordon M. Hill, of London, architect, and nearly the whole of the cost of the restoration has been defrayed by private contributions and gifts.

Shoteshbrook.—For some years past the weather-vane of the spire of Shoteshbrook Church has been observed to be far from perpendicular, and some twelve months ago it was thought desirable to put up a new one. This led to the examination of the spire by Mr. Street, architect, who condemned it as unsafe to stand. It was, therefore, decided to pull it down and rebuild it. This work has been carried out by Messrs. Silver, builders, Maidenhead, and was brought to a conclusion by Mr. Richard Silver laying the top stone on the 17th ult., after which a special service was held in the church, at which the

builders and workmen returned thanks for their preservation from accident during their perilous work. Other works connected with this church will have to be abandoned or delayed, for want of funds. It is to be hoped that the delay will be but of short duration. This is the second spire in this neighbourhood which has been recently constructed by the same firm.

Lynmouth (North Devon).—A new church is to be built here. The design consists of nave, chancel, organ-chamber and vestry, and one aisle. There will be a stone hell-gable at the west end to contain two bells. The chancel will be terminated by a circular apse, and will be vaulted with red brick, having stone ribs, moulded corbels, and stone hands. The benches are to be of English oak, and movable. The walls are to be of local stone, having Bath (Box ground) stone dressings. The funds are being raised by subscription. The design was selected in a limited competition, and the author of it is Mr. Edwin Dolby, of Abingdon, Berks.

Standon.—The parish church, recently restored, has been re-opened, although the works have not been entirely completed, owing to unforeseen delays. This church, founded by Archbishop Anselm, dates back to the twelfth century. Fortunately, enough has survived the effects of time to enable the architect (Mr. T. Graham Jackson, of London), to restore it to nearly its original design. The north transept contains a chapel, dedicated to Thomas à Becket; and the bones of St. Ledger are interred here. The north and south aisles were added about two centuries later. These were covered with fresco paintings, similar to those that adorned the original structure. Many of them were discovered during the restoration; the effect of the air caused them soon to fade, so that only a few—outside the chancel arch and in the south aisle—were preserved. The contractor for the works of restoration was Mr. Robert Dnshby, of Littlebampton. The total cost of the building has been 2,170l.; but the funds raised amounted only to 1,750l.

STAINED GLASS.

St. Mary's, Edling.—Two new windows, designed by Mr. Boddington, and executed by Messrs. Heaton & Co., have been added to his series in the chancel of this church. The subjects already executed now run as follows:—John baptizing Jesus, Angels ministering to Jesus after the Temptation, the Call of Peter and Andrew, Jesus at the Well of Samaria, the Entry into Jerusalem, the Last Supper;—the Agony in the Garden, the Betrayal by Judas, the Foot of the Cross, the Descent from the Cross, the Three Marys going to the Sepulchre, the Three Marys at the Sepulchre;—the Angel sitting at the Entrance, Jesus appearing to the Magdalen, Jesus with the Disciples going to Emmaus, Jesus appearing to the Holy Women, Jesus showing his Wounds to St. Thomas, Jesus saying to St. Peter, "Lovest thou me?" The other remaining windows, it is said, will be shortly added.

DISSENTING CHURCH-BUILDING NEWS.

Malmesbury (Wilts).—On Thursday, the 16th ult., the memorial stone of a new Congregational church and schools was laid by Mr. H. O. Wills, of Bristol. The design is in the Early English style, by Mr. Stent, of Warminster, and the contractors are Messrs. Light & Smith, Chippenham.

Sheffield.—Montgomery Wesleyan Chapel, at Cherry-hill, has been opened. It is in the Decorated Gothic style of architecture, and is capable of accommodating about 450 persons. Over the entrance there is a small gallery, which is intended for the use of the school children and as free sittings. The seats in the body of the chapel are approached by two side aisles, the pulpit being at the extreme right, and the communion-table in the centre. The pews, pulpit, communion-table, and hassocks are of stained pitch pine, and are all in keeping with the general style of the building. The communion-rails are also Gothic. The roof of the chapel is an open one with tracery, hammer-beams, and carried purlins, and from it are suspended two large galleys. The windows are of ground-glass, with stained edges. Underneath the building there is a large school-room, which is capable of accommodating between 400 and 500 children. The entire cost of the erection is about 3,200l.,

towards which, at the time of the opening service, only 1,600l. had been raised. The architects were Messrs. Wilson & Crossland, of Sheffield.

Bristol.—The chief stone of Clifton-down new Congregational Church has been laid. It is to occupy the site of Down House, and will consist of nave, chancel, north and south transepts, with vestries and lecture-room beyond. The principal front will face the Down. The centre portion will be occupied by the tower, 22 ft. square, and 180 ft. high, finished by a light turret, supported on niches springing from the four corner pinnacles. At the west end will be an open porch of three arches, moulded and carved, which will be of stone, and groined and laid with encaustic tiles. On the right side of the tower will be a house for the minister; and on the left-hand corner there will be placed an octagonal staircase, finished by a high conical roof. The sides of the building will be ornamented with a parapet and pinnacles surmounting a range of traceried windows; and at each end of the transept will be a rose window. The designs for the building are by Mr. Hanson.

Newcastle-on-Tyne.—The foundation-stone of a Methodist New Connexion chapel has been laid here. The building will be 55 ft. 8 in. by 26 ft. 3 in., and 23 ft. in height internally, and will accommodate about 350 persons. Mr. S. Oswald is the architect, and the contracts for the erection have been undertaken by Mr. Robert Ridley (mason) and Mr. Robert Mattison (carpenter). The cost of the erection of the chapel, with vestry and keeper's room attached, will be about 700l. The walls are to be of stone. The roof timbers are intended to be partly visible, and, with the seats, stained and varnished. The style is Early English.

Great Totham.—A new Wesleyan chapel has been opened at Great Totham, near Witham. The new edifice has been erected by Mr. Gardiner, of Coggeshall, from designs prepared by Messrs. Pocock, Corfe, & Parker, of London, at a cost of about 1,000l. The style is Gothic, and the material red bricks and ornamental stonework. There will be a gallery across the end, and instead of a pulpit, a platform with desk. The seats consist of open benches. The chapel will seat 350, and there is a school-room attached, with small vestry or class-room.

SCHOOL-BUILDING NEWS.

Liverpool.—The foundation-stone of the new Holy Trinity schools, Wilton-street, has been laid by Miss Catherine Wright, at whose sole cost the building is being erected. The schools are intended for three classes of pupils, an infant school on the ground-floor, a girls' school on the first-floor, and a boys' school on the second-floor, and will accommodate altogether about 500 children. The materials used are local grey stock bricks, faced with pressed red bricks from St. Helens, and bands of Bolton bricks, and with Stourton stone sills and dressings. The steps and staircases are of York stone and Baltic pine. The building is being erected by Mr. John Westmoreland, contractor; from the design, and under the superintendence, of Mr. J. F. Doyle, architect; and the trustees are Messrs. James Denton and William Emery.

Boroughbridge.—The new national school at Kirby Hill has been completed and opened. The building is in the Gothic style, and consists of a large room and a class-room, together with a master's house. The architects were Messrs. Healey, of Bradford; and the several works have been executed under the superintendence of Mr. Alexander Wallace, clerk of the works. The contractors for the building were Mr. W. Leaf, for joiner's work; Mr. Taylor, for mason's work; Mr. Swift, for plumber's work; and Mr. Bramley, for painter's work; all of Boroughbridge. Cost of the whole, 750l.

Leeds.—The foundation-stone of a Wesleyan College has been laid at Headingley, near Leeds, by Mr. I. Holden, M.P. The institution is to accommodate forty students at first, but will be ultimately enlarged so as to receive sixty. The style of the design is Gothic of the twelfth century. The building is to cost 12,000l., and the fittings and furnishing 3,000l. more. It is to be called the "Wesleyan Theological Institute."

Brecon.—The condition of the building in which the Brecon Independent College is now held, with the increased number of students, has led to the providing of a new and more suitable

building. Plans prepared by the Rev. T. Thomas, of Landore, have been finally adopted by the committee, and tenders having been sought for, that of Messrs. Thomas, Watkins, & Jenkins, of this town, builders, has been accepted. The committee have obtained from the Marquis of Camden a site, consisting of about six acres of ground, immediately under Slooth Tump, and just behind the Brecon station, and within half a mile of the centre of the town. The building will accommodate about thirty resident students, and two or three times that number of non-residents, and contains class-rooms, halls, library, separate dormitories, and studies for thirty students, &c., with two professors' residences, and will cost, when completed, about 10,000l.—the contract of the Messrs. Watkins & Co. being 8,200l. Mr. Samuel Morley contributes 1,000l.

Books Received.

Treatise on Architecture; including the Arts of Construction, Building, Stonemasonry, Arch, Carpentry, Roof, Joinery, and Strength of Materials. Edited by Mr. ARTHUR ASHPITEL, F.S.A. Edinburgh: Adam & Charles Black, 1867.

UNDER this title we find, and are glad to find, a reprint of various treatises originally published as part of the "Encyclopædia Britannica," and already more or less well known and esteemed. First amongst them are the essays on Architecture, Building, and Construction, written by the late Professor Hosking, and which he himself published separately in 1846. Joinery and Stone-Masonry, which follow, were written by Thos. Tredgold; and to these are added Carpentry, the work of the great master of Egyptian hieroglyphics, Thos. Young (a man of universal knowledge), and treatises on Roof, Arch, and Strength of Materials, contributed by the late Professor John Robison. The volume, a portly quarto of 311 pages and 55 sheets of plates, is edited by Mr. Arthur Ashpitel, F.S.A., who has supplemented the articles on Egyptian, Jewish, and Assyrian architecture, and added a chapter on Indian and Chinese architecture. He has also introduced some illustrations of modern French architecture, scarcely sufficient, however, to give a complete idea of the costly buildings now ordinarily put up in Paris; and has added, amongst other things, some observations on that very little understood subject, Acoustics, and supplementary observations on Stone-masonry. Mr. Ashpitel is a little behind-hand in his information where in this chapter, speaking of artificial stone, he describes the objects made by Ransome's process as being submitted to a strong heat in a kiln like that of a potter: this system has been long given up. Nor can we go with him in expecting extraordinary results from Mr. Szerelmeij's process for the preservation of the surface of stone used in buildings. The evidence taken by the Government Committee appointed to inquire as to the condition and best mode of preserving the exterior of the Houses of Parliament, gave no such promise.

A quotation from the accomplished editor's observations on French architecture will serve to show his style and proclivities:—

"The modern French, as employed at the Tuileries and other important public buildings is purely Classic. The character of the detail is rather that of Viollet than of Palladio or Scamozzi. The mouldings are in general carefully studied and pure, and, as a general rule, the whole arrangement is remarkable for lightness and grace. Proportion seems to have been carefully studied. To those whose eyes have been accustomed to the cumbersome, ponderous style of some of our later works, that of the modern French appears to be too light. But it should be remembered that weight and lightness are qualities to be employed as the use, requirement, or sentiment of the building may dictate. Our earlier churches are all massive, and more dignified. A large window filled with slight tracery would have been easily dashed in, and the place taken, while the little narrow Norman arrow-slit was a formidable means of defence. We admire the massiveness of Newgate, which seems to suggest the means of safety, securing the malefactor inside, and of aving the world-be-malefactor outside. Surely a nineteenth-century house ought to have an air of lightness and cheerfulness.

We must take leave here to say a few words as to what is called sentiment in design—a feeling which depends much on the history or antecedents of similar structures. Thus it was in consonance with the existence of the Westminster Hall, that the New Houses of Parliament were designed in the same style. Under its roof our laws, based on those of our Anglo-Saxon ancestors, had grown to their present state, and had been administered by Littleton, Gascoyne, More, Hale, Somers, and a crowd of other great names. In chambers of similar architecture the feudal system had gradually given way to free society, and the petition of right and Act of Habeas Corpus had

passed. But however excellent in other respects, it seems very incongruous to design the palace where English law stands in majesty in the Venetian style. What is there in common between the recollections of the cold cruel tyranny of the ten, their spies, their secret accusations, their mock trials, their tortures, the secret death of the victim, his grave in the sea with a sack for his shroud, and the open, round-tide, even-handed justice of our British courts? Let us always study congruity. And in this way we should consider our dwellings; and we think the French have chosen rightly. Whatever faults they may have had, the Greeks and Romans were a highly intellectual, polished, and literary people. Everything they touched in the way of art, whether oratory, poetry, music, painting, sculpture, or architecture, had that refinement and elevation of thought and finish of execution that we call classicality. And classic architecture seems a necessary adjunct to refined manners and customs."

The most valuable addition, however, made by the editor is a Glossary of the terms in Medieval architecture, and sixteen new plates illustrating nearly 300 subjects, many of them never published before. This glossary fills thirty-nine pages, and shows much care, research, and learning.

The volume will make an excellent prize-book for architectural societies and colleges.

Miscellaneous.

ADOPTION OF THE FREE LIBRARIES ACT AT NOTTINGHAM.—At a meeting of ratepayers, to consider the proposed extension of the Free Libraries Act to the borough of Nottingham, there was a large attendance, and the Act was adopted with the greatest enthusiasm, and with only one dissentient vote.

FALL OF TWO HOUSES IN CLEMENT'S-LANE, STRAND.—In this somewhat ancient locality on Wednesday afternoon, two houses suddenly gave way and fell across the street. Partly owing to the shock, and partly to the fall of materials, the interior of two of the houses in Clement's-passage, Clare Market, gave way. No lives were lost.

A TESTIMONIAL.—The men in the employ of the Messrs. Poole, builders, Westminster, assembled on the 29th of last month, for the purpose of presenting Mr. Greenham (late foreman of that firm) with a case of mathematical instruments, a token of their respect for his integrity, and gratitude for his amiable bearing towards those who have worked under him.

THE DATE OF FLOWING WIGS.—A correspondent inquires at what time the flowing wigs common during the reign of King Charles II. were introduced at court. It happens that we are able, on the authority of Pepys, to give the exact date. The Duke of York, afterwards James II., first put on a perriwig, February 15, 1663-4, and King Charles II. on the 18th of April following. The fashion was introduced on the court of Versailles.

WATER FOR PESTH.—A correspondent states that Pesth is at last to be supplied with water. An Englishman, Mr. G. E. Peters, has come to terms with the municipality for the construction of waterworks. The new works will be erected on a piece of ground shuting on the Danube, near New Pesth, about a mile and a half from the city. Here the water will be pumped up on the river, filtered, and conveyed to a rising round behind the largest suburb, whence it will supply the whole town, a pressure of 100 ft. being obtained for that purpose. The scheme, when carried into effect, will cost about 250,000*l.* Mr. G. E. Peters's concession extends over a period of nearly ninety years, at the expiration of which the works will become the absolute property of the municipality.

BRISTOL ARCHITECTURAL AND ARCHAEOLOGICAL SOCIETY.—At a meeting of this society, held the Fine Arts Academy last week, Mr. C. F. Anson, vice-president, in the chair, the report of the council was read, from which it appeared that the close of the year the society consisted seventy-four subscribing members, six honorary members, and the artist members of the Academy of Fine Arts. The following officers were elected for the present year:—The Earl of Arnerick, president; Mr. Hanson and Mr. Anson, vice-presidents; Mr. C. J. Phipps, honorary secretary and treasurer; Messrs. Underwood, E. Godwin, Fripp, Masters, W. H. Willis, and the Rev. W. Barclay, council. Mr. R. P. Peters then read a paper on "Egyptian Architecture," illustrated by the series of sketches made during his tour in the East, to which we refer before now referred.

WHITLEY ABBEY, NEAR COVENTRY.—At the Auction Mart, on Friday, 31st ult., this interesting old place, the family seat of Viscount Hood, was knocked down to Mr. Edward Peire for 30,000*l.*

THE BISHOP OF LONDON'S CHURCH-BUILDING FUND.—Since the formation of the Bishop of London's Fund 500,000*l.* have been subscribed by the Ecclesiastical Commissioners and 850,000*l.* by private benevolence for church work in the diocese of London.

CONDITION OF THE LICHFIELD MUSEUM.—With reference to a letter referred to in our list, we are requested by one of the city authorities to say, that Dr. Rawson's letter, and the reply of the architect, having been read, the town council at their last meeting passed a resolution "that the works had been carried on in a satisfactory manner."

FIRE NEAR PICCADILLY.—Early on Saturday morning last a fire was discovered on the premises of Mr. Falkner, builder, in Duke-street, Piccadilly. The inmates succeeded in effecting their escape on the first alarm, and a strong force of fire-engines quickly arrived and set to work; but, in spite of the exertions of the brigade, the flames continued to spread, and eventually seized upon the next door, occupied by a bookseller and news-vendor.

THE PROPOSED MEMORIAL OF THE LATE DEAN OF HEREFORD.—At a public meeting of the subscribers to the fund for the erection of some lasting and suitable memorial of the Very Rev. Richard Dawes, to consider whether a memorial tomb in the cathedral, or a gateway into the cathedral close, should be decided on, it was resolved, "That a gateway leading from Broad-street into the cathedral close is the most suitable form of memorial to the late dean, providing sufficient funds be forthcoming to carry out such design." The meeting then adjourned for a month, when it is expected, estimates and designs having been received from Mr. Scott, the matter will be finally settled.

A WINDFALL FOR THE VICEROY OF EGYPT.—A search in the garden of an ancient Coptic convent is said to have brought to light a treasure consisting partly of ingots and partly of very ancient gold pieces rather larger than Napoleons, of a total value represented as about 50 millions of francs. The discovery having been telegraphed to Ras-el-Tin, the Viceroy left to investigate the matter in person. Can it be the cash-box of Amenopolis XXXVII., which that monarch is said to have lost on a journey, according to inscriptions on the obelisk of Luxor? As curious and unlikely a discovery of a lost and advertised valuable of ancient times, as our readers know, occurred in England not long ago.

ILLUSTRATIONS OF "THE IDYLLS."—Editions of "Vivien" and "Guinevere," with illustrations by M. Gustave Doré, uniform with "Elaine," published last year, are announced. We mention this merely to express a hope that Mr. Doré will be allowed time to read what he has to illustrate before making his drawings. This he could scarcely have done in the case of "Elaine." In more than one of the illustrations the author's meaning is wholly misrepresented;—as, for example, in the drawing supposed to illustrate that passage which says that Arthur, who "labouring up the pass" had trodden on the crowned skeleton, and sent the skull rolling, plunged down the shingly scour, "And set it on his head,"—Arthur is shown on horseback!

OXFORD ARCHITECTURAL AND HISTORICAL SOCIETY.—At the second meeting of this term, the committee submitted to the Society suggestions with regard to some important changes in the rules which were to be voted for at the next meeting. The junior secretary gave a lecture upon the Antiquarian and Historical Questions connected with St. Valery-sur-Somme. He concluded by asserting St. Valery-sur-Somme the port from which William the Conqueror sailed, there being no evidence whatever that St. Valery-en-Caux could claim the honor, though this has been sometimes maintained. The walls of the Medieval city, which are very perfect, date only from the thirteenth century, and the church was rebuilt at that time, but probably on the same spot where the church stood in which it is distinctly recorded William offered up prayers for the success of his enterprise.

ENGLISH CHURCH IN LYONS.—A new church is about to be erected at Lyons. The first stone was to be laid by Mr. W. L. Leaf, of London, on the 5th instant.

NEW METROPOLITAN MEAT MARKET, SMITH-FIELD.—The chief stone was formally laid on Wednesday last. Illustrations of the proposed building will be found in our pages.

FATAL FIGHT.—At a place near Normanton where some new houses are being built, a brick-layer, named Whiston, objected to an Irish labourer, named Sladen, using a trowel. The result was a fight, in which Whiston was killed.

RELICS OF A LINCOLN.—A case has been placed in the Patent-office at Washington containing relics of the late President, the most interesting of which is a little model of his own invention, whittled from the wood of a cigar-box, for floating steam-boats over the bars and snags of western rivers.

IRON FROM NEW ZEALAND.—The company formed last year for the utilisation of the iron-sand of New Zealand has delayed its operations for the report of Dr. Noad on the success of the process of smelting patented by the company: the report being highly satisfactory, operations are to be at once commenced.

OPENING OF NEW WING OF LOCK HOSPITAL.—The new wing of the London Female Lock Hospital, in the Harrow-road, has been formally opened in the presence of the Duke of Cambridge. The total number of beds in the old building was 76, and in the new wing 76, making a total of 152. The new wing has been erected from the designs of Mr. Porter, architect.

DEATH OF MR. ALEX. BRODIE, SCULPTOR.—Mr. Alex. Brodie, sculptor, Aberdeen, has died very suddenly. Although not so widely known as his brother in Edinburgh, Mr. Brodie was fast rising into celebrity as an artist. His Queen's statue in Aberdeen; the late Duke of Richmond on the square of Huntly; the Motherless Lassie; Highland Mary; Cupid and Mask; and a figure in the Aberdeen churchyard representing Grief strewn flowers on a grave, are evidence of a degree of attainment in the profession which have called forth more than local notice. Mr. Brodie, who began life as a brass-finisher, was only in his thirty-seventh year.

THE THAMES EMBANKMENT.—On Friday in last week the question as to the further extension of the approaches of the Thames Embankment, on the north side of the river (to the east of Westminster Bridge), and also the embankment which extends along Chelsea Reach, came before the Referees on Private Bills for consideration, as to the interests of a very large number of holders of property (real, copy, and leasehold), in the districts through which they would ultimately pass. The different parties appeared, and statements were made to the effect that arrangements had been entered into which would completely satisfy the interests of all concerned. It was ultimately arranged that all opposition to the Bill should be withdrawn.

PARTIAL FALL OF A NEW CHURCH AT WELLINGBOROUGH.—The new church now in course of erection in the Midland-road, Wellingborough, has fallen down. The whole of the completed arches on the south side, together with the clear-story windows and wall, and part of the roof, which had begun to be laid, has come to the ground and other parts have been taken down. The builder, Mr. John Burkill, had taken steps to remove the framework of the arches, and scarcely had the wedges been eased when the whole, four in number, and the clear-story, fell down with a noise like thunder, alarming the whole neighborhood. A telegram was at once despatched to Oxford to Mr. Backeridge, the architect, who arrived during the day. Mr. Scott, the architect, was also telegraphed to in London, and at once sent down a gentleman from his establishment with a view to report on the cause of the accident. In the meantime it was deemed advisable to remove the corresponding arches and clear-story on the north side, and this work is now in progress, together with the removal of the debris of the fallen arches. Opinion is at present divided as to where the blame rests. The piers were constructed of the soft red sandstone of the neighborhood, the material specified in the contract. The estimated damage, together with the cost of the removal of the arches on the north side, is about 8000*l.*

A NEW THEATRE FOR LONGTON.—Mr. Ward-lough, the proprietor of the Alma Theatre, Longton, has commenced the erection of a new brick and stone building to supersede the present wood erection. The new building is situated at the rear of the Flint Tavern, in Stafford-street. Mr. Spicer is the contractor.

VICTORIA PARK.—In reply to a question put in the Commons by Viscount Enfield as to a portion of the 290 acres which formed the area of Victoria Park having been devoted to building purposes, Lord J. Manners replied that the area of the park was only 265 acres, and of that one-sixth was reserved by Act of Parliament for building purposes. That plan of recouping the public to some extent for the expense of forming the park had always been intended.

CITY OF LONDON HOSPITAL.—Sermons by the Lord Bishop of Worcester, and the Rural Dean and Vicar of West Ham, Essex (the Rev. A. Ram), were preached on Sunday last to large congregations assembled within the walls of the chapel, and on behalf of the City of London Hospital for diseases of the chest, on the occasion of the seventh anniversary of the opening of the chapel, which has been recently much improved by various additions in the shape of corone, choir stalls, convenient sittings, and the like.

LEICESTER ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.—A bi-monthly meeting of this Society was held at Leicester on Monday, 27th ult. After the transaction of business in Committee, Mr. North (honorary secretary) announced that the general summer meeting of the members of the Society would be held (in conjunction with the Northamptonshire and Bedfordshire Societies) at Kettering, on the 4th and 5th of June. Various antiquities were exhibited. The Rev. John Fisher communicated some notes upon the destruction of Herald's College in the Great Fire of London, and the preservation of its contents.

NATIONAL MONUMENT TO LORD BYRON.—A meeting of influential persons has been held in the Mayor's Parlour, Nottingham, to take steps for the purpose of erecting a monument to Lord Byron. The meeting being rather small, no chairman was appointed. A letter was submitted from Mr. T. A. Murray, president of the Legislative Council of Sydney, who wrote:—"The movement ought to hear an Imperial character. The whole empire should contribute. The Austrian colonies, I am sure, will do so, and I shall be happy to act for you in forming a sub-committee, and collecting subscriptions in New South Wales, as well as to give my mite." The meeting was adjourned.

NOVELTIES IN MARINE CONSTRUCTION.—A steel steamer, as thin as card-board, has been built at Chatham, to be used by the exploring party in search of Dr. Livingstone. The boat is 30 ft. in length, and from gunwale to gunwale 8 ft. in breadth, the weight being rather more than one ton. The boat can be taken to pieces in a very short time, and taken across country by negroes. The plates, being of steel, possess a maximum amount of strength with a minimum of weight; they are 1-14th of an inch thick, and may be bent to almost any shape, without injury. Steel plates for ships and boats have been largely used by other Governments, but this is said to be the first instance in which our Admiralty have constructed a boat of steel.—The Atlantic, according to the *Scientific American*, is about to be crossed on one of Perry's rafts, now on exhibition in New York. This raft is constructed of three air-tight cylinders encased in heavy Russian duck cloth, each over 25 ft. in length by 12 ft. wide. When blown up these bags are connected by a light framework, which also forms the deck. The raft is schooner-rigged, with a lug-sail forward, main-sail aft, and jib. There is no cabin, the only protection for the passengers being a small waterproof tent rigged amidships. Captain Mikes and two companions constitute the complement of men, and the expedition is to start about the middle of the present month, bound for Paris and the Exposition. The raft draws but 7 in. of water, and with a fair wind the inventor states that its speed will be from twenty to thirty knots an hour. Its buoyant capacity is estimated at 14,000lb., or it will float 585 people on deck and clinging to its sides. The raft can be stored, wrapped in a tarpaulin, in a space 13 ft. by 20 in., and can be inflated and launched ready for use in six minutes.

DIAMOND.—In the *Comptes Rendus*, M. Dumas has recently described some very remarkable forms of diamond anthracite of the following composition:—Carbon, 87.6; hydrogen, 0.7; oxygen, 1.7; density, 1.66. The anthracite was in extremely hard polished concreted nodules capable of scratching glass and other remarkably hard and polished substances, after the manner of the diamond. The nodules were sold by a dealer to Count Donhet, who transferred them to M. Dumas for scientific examination.

MARKET HALL FOR NANTWICH.—The sanction of the Secretary of State to borrow the money requisite for carrying out the new set of plans adopted by the Local Board of Health for a market-hall, has been received, as also his approval of the plan of proposed increased water supply. The first-named work is estimated to cost 2,500*l.*, and the last 1,500*l.* A proposition is also on foot for substituting blue brick foot-paths for the existing stone pavements which formed so marked a peculiarity of this and many other ancient towns.

THE JUDGES' NEW LODGINGS AT LIVERPOOL.—The mansion on the Newsham Park estate, which until recently was occupied by Mr. Alderman Gardener, has within the last few months been undergoing very extensive alterations and additions under the superintendence of Mr. Robson, the borough architect, with the view of adapting it to the purposes of a residence for her Majesty's judges during the assizes. These alterations and extensions have now been fully completed. In addition to the apartments, including drawing and dining rooms, &c., especially for the use of judges, there are also several marshals' and clerks' rooms, besides reception-rooms for attorneys, and other apartments for similar requirements. The whole of the interior has been decorated. The cabinet and upholstery work is being executed by Mr. Dutton, of Liverpool. The grounds in front of the house, which are extensive, are being ornamentally laid out.

THE LEA VALLEY DRAINAGE.—“Minutes of the committee, formed in pursuance of a circular issued by the Tottenham Board of Health, representing the parishes of Tottenham, Hornsey, East Barnet, and the Colney Hatch Lunatic Asylum, upon the drainage of the Lea Valley, and the purification of the river Lea, with a report by J. W. Bazalgette, C.E.,” have been printed by Smith & Co., of Longacre, for the Tottenham Board of Health. They are accompanied with a plan by Mr. Bazalgette, who recommends the formation of a main sewer from Hertford to Barking by St. Margaret's, Broxbourne, Wormley, Waltham, Tottenham, &c., with branches from Barnet and Hornsey, and a reservoir at Barking; that Parliamentary powers be obtained to form this area into a sewerage district, with a commission or Board representing the whole, and also the East London Waterworks Company, the river Lea trustees, and the New River Water Company, for the execution of the said drainage works, with power to levy a sewerage rate over the district. The list of places to be drained comprises Hertford, Ware, Amwell, Hoddesdon, Broxbourne, Wormley, Cheshunt, Waltham, Enfield, Edmonton, Tottenham, Hornsey, East Barnet, Colney Hatch, Walthamstow, including Woodford, Leytonstone, Low Leyton, Wanstead, West Ham, East Ham, and Little Ilford, to all of which the Lea forms the natural outfall.

TENDERS

For a lifeboat-house, about to be erected on the beach at Brighton, for the National Life Boat Institution. Mr. Cook, of London, honorary architect:—	
Amcombe & Newbham.....	£880 0 0
Lockyer.....	657 0 0
Cheeman & Co.....	617 0 0
Kirk (accepted).....	455 0 0
For the erection of stables, in Duke-street, Portland-place. Mr. W. A. Baker, architect. Quantities supplied by Messrs. Richardson & Waghorn:—	
Amcombe & Newbham.....	£880 0 0

Important to Contractors, Builders, &c.—Large Sale of Railway Plant, to be sold by AUCTION, at the MART, near the Bank, on THURSDAY, JUNE 13th, at TWELVE for ONE, a valuable lot of land, situated in the County of Essex, and in the Parish of St. Andrew's, containing about 100 acres of land, with a large house, and other buildings...

MR W. DEW, of ABBEVAY, on TUESDAY and WEDNESDAY, at 18, ENFIELD, on the 19th and 20th of JUNE, 1867, commencing each day at ELEVEN o'clock, and ending at 5 o'clock, will sell by AUCTION, at the MART, near the Bank, a valuable lot of land, situated in the County of Essex, and in the Parish of St. Andrew's, containing about 100 acres of land, with a large house, and other buildings...

Freehold Building Land for country villas, with paddocks and garden at Bessing, Watford, Herts, and close to Paddington Park.

MESSRS. HUMBERT & COX are instructed by the Proprietor to submit FOR SALE by AUCTION, at the ESSEX ARMS HOTEL, Watford, on THURSDAY, the 13th day of JUNE, at FIVE for THREE, a valuable lot of land, situated in the County of Essex, and in the Parish of St. Andrew's, containing about 100 acres of land, with a large house, and other buildings...

Lot 1. The piece of Freehold Building Land surrounded on two sides by a park, pale fence, and the handsome house and grounds of adjoining proprietors, well adapted for the erection of one or more cottages, having a frontage to the Langley-road of 324 feet, a depth of 45 feet, and containing about 24, 2, 2p.

Lot 2. The piece of Freehold Building Land, nearly opposite to St. Andrew's Parsonage, and commanding extensive and picturesque views, well adapted for the erection of one or more villas, having a frontage of 232 feet, an average depth of 235 feet, and containing about 24, 2, 2p.

Lot 3. The piece of Freehold Building Land adjoining the last lot, having a frontage to the Church-road of 303 feet, an average depth of 41 feet, and containing about 24, 2, 2p.

Lot 4. The piece of Freehold Building Land near the Parsonage, well adapted for the erection of a handsome villa, having a frontage to the Church-road of 131 feet, an average depth of 41 feet, and containing about 3p.

Lot 5. The piece of Freehold Building Land adjoining the last lot, having a frontage to the Langley-road of 239 feet, an average depth of 109 feet, and containing about 6s. 3p.

The Builder.

VOL. XXV.—No. 1271.

Architectural Drawings in the Paris Exhibition.

AMONG all the ten groups and ninety-five classes into which the contents of the Paris Exhibition are divided, perhaps that which will be of the greatest interest to the bulk of our

readers is "Class 4. Group 1. Architectural Designs and Models." And not to professional readers alone, for in the revival of art that has been witnessed in England during the last quarter of a century there is hardly an educated man or woman who has not taken some little part, either in the general question of taste, the parent art of archaeology and architecture, or in one of the many subdivisions and details into which the subject may be arranged. The majority of us are either Goths or Greeks, consciously or unconsciously; and if knowledge and education do not lead to so general a survey of the whole question of architecture, we yet have our favourite periods of art or varieties of style in that Gothic or Classic school which has our sympathies; and when even these do not keenly interest us, we agree to hold different opinions as to the comparative beauty of the square or round tower, split ourselves into parties about vestments or mural decoration, or disagree in our views concerning the method in which the "five orders," or any portion of them, may be employed in designing the façade of a building. This, if it show nothing else, proves that the progress and development of architecture and its subordinate arts is becoming, however slowly, a question of some interest among educated people in England.

Apart from the historical interest and value architectural remains, which make their study attractive to the scholar or antiquary, there is so great an amount of information on subjects correlative to be obtained by archaeological inquiries, that we cannot become well informed in the past history of our country without absorbing in the process enough knowledge of architecture to make us latent if not active archaeologists. It has fallen to the lot also of this century to have both the task of restoring a large number of the architectural monuments of the past, and of supplementing them by new erections required for the present and the future. A large proportion of the great cathedrals and parish churches of England have been and are being restored in this century, and all those important public and civil buildings required under the national administration in the metropolis, or by municipal bodies in the large provincial cities, will also be the work of the nineteenth century in which we live. The only all-around period to this in this respect in English history is the fifteenth century, as the union of perpendicular with Norman architecture displays in so many of our cathedrals; but not in the fifteenth century, nor any other epoch in our history can we vie with the present age in number or extent of the public buildings erected, nor exhibit so rapid an elevation of art. At no previous era to that which

has been aptly called the Georgian, had architecture sunk to so low an ebb, or public taste so nearly approached extinction; and this makes our own period appear all the more satisfactory in contrast with the gloomiest phase of our art-history. But, without comparing the present with the more immediate past, and grieving for many opportunities missed, we may regard our own days as peculiarly the age of the Renaissance of art generally, and of architecture especially.

This alone would confer upon an international exhibition of architectural designs an absorbing amount of interest; for it is only by such opportunities for comparison as are thus given to us that we can as readily compare ourselves with other nations, as we can annually contrast the works of individuals with each other among ourselves at home. There are, however, limits to the opportunity now given in Paris, since it is no easy task to place side by side in competition works which have been designed for dissimilar purposes, and required to comply with very varying conditions. The only features in which, as it appears to us it is both possible and may be profitable to institute a comparison of the architectural designs of different nations, are the essentially fine-art elements of design and composition, the use of enrichments to develop the arrangement of masses and of effect, and the manner in which the designs themselves have been placed before us by the instrumentality of drawing.

Of the English drawings it is hardly necessary to speak in detail, so many of them being works already criticised by us, and already known by many of our readers. Nor is the collection itself of so inviting a character, that with the charm of novelty gone, we should be tempted to go very fully into a consideration of its excellence. It might have been hoped that even if private picture collectors retained possession of the greatest masterpieces of painting produced by our artists, preventing thereby a full and fair representation of the British school in the exhibition, we should retrieve our position to some extent by the display it was in our power to make in the department of architecture. Though it is only by permission of the purchasers of a painter's works, that he can hope to be efficiently represented in an international competition, the architect is under no such difficulty. By his own wish he can either display the evidences of skill in design, or withhold them; and considering the paucity in the collection of really good architectural designs which have been produced by living men comparatively recently, and are known to be now in existence, it would seem to be undeniable that our English architects have not cared to be represented in the exhibition, either as a school or as individuals. This is the more to be regretted, because we are accustomed to suppose we have the best grounds for believing that in architecture we hold no secondary position in Europe. The work of restoration has been an archaeological school for our architects, and the numerous competitions for important public buildings have tested their powers of design and drawing. The condition of architectural design in England is a sufficient proof that both of these influences have been felt and have borne fruit. Our display of works in the Paris Exhibition, as we said before the collection was sent off, gives but a very indifferent impression of the actual practice of architecture, and conveys a very false one of its study as a fine art. Of large works either completed or in process of erection our architects have had a scant show, the principal of these being Mr. Waterhouse's "Assize Courts at Manchester," Mr. Scott's "Albert Memorial," "Designs for the Houses of Parliament at Sydney," by Mr. Lynn, Mr. E. M. Barry's "Restoration of St. Stephen's Crypt," and Mr. C. Brodric's "Town-hall at Leeds." Of designs not carried out, there are the "Albert Memorial" drawings of Messrs. Donaldson,

Fergusson, Pennethorne, and C. Barry; "The Manchester Assize Courts," by Banks & Barry; and a "National Institute of Art and Science," by J. B. Waring. There are also many works of minor importance, both executed and designed, such as churches and private houses, but that we have named the most important drawings exhibited is equivalent to saying that English architectural design is rather indicated than represented. The architects named display, for the most part, only one design each; other architects of note exhibit but their lesser works; and many do not exhibit at all. It is true that in the exhibition of photographs of architectural works, this poverty of representation is in some degree apologised for; but this is only an indifferent apology.

It is comforting, however, that Mr. Scott should have so far remembered his status as an Architectural Academician, as to send his "Albert Memorial," and that one of the best modern adaptations of Gothic, the "Manchester Assize Courts," is exhibited. Both are good drawings, and the same may be said of the excellent design, well and artistically displayed by Mr. Lynn, of the "Sydney Houses of Parliament." Mr. Brodric's "Leeds Town-hall" says as much for classic study of architecture as we could well say, so long as Mr. Tite withholds his "Royal Exchange," Mr. Scott his Whitehall Government Offices, and the Liverpool Hall of St. George by Mr. Elmes, is out of the competition. There is not, however, one of the architects named, whose works appear in this collection, who could not if he chose have sent half a dozen of his own designs far superior to the one he has sent; and if the architects who have sent nothing except small photographs perhaps, had a mind to form an exhibition of their own designs in London, there would be displayed a better collection of works than is at present exhibited in the Champs Elysées.

Turning from the English to the French drawings, we cannot help being impressed with the same difference in scale as is to be seen in the oil paintings of the two nations. After the French paintings the English seem miniatures; and when we have examined the pretty-looking drawings of our own countrymen, the immense and powerful works in the French Architectural Gallery are the more striking. We cannot be prevented from admiring the pleasant water-colour drawings with their bright foliage and clear skies, rustic figures or prancing horsewomen in the foreground, with which our countrymen appeal to us when they bring forward perspectives of their designs; but as a style of conveying to us the actual architecture and composition of a building, the geometric drawings on a large scale adopted by the French architects seem to us preferable. The English, however, were not allowed space for such a display. It is somewhat instructive, also, to see how the disposition to draw the figure, and indulge in pleasant bits of colour which our architects exhibit in the landscape accessories of their designs, the French architects, who evidently have the same desire, apply to the enrichment of their composition by sculpture and its decoration polychromatically. The thought rather forces itself upon us that in the interpretation of a design and in its composition, the figure-drawing should be the architect's own work, and not that of the colourist, who undertakes to present the perspective in a charming manner to the public eye; and that it would be somewhat the better for architecture as a fine art if the figures formed a permanent part of the composition, designed, therefore, with becoming seriousness, and not be representations of passing spectators on the road in front of the building, or groups of picturesque figures surveying the interior.

Let us take, as an example of French composition, the design for "une salle des fêtes;"—

No. 880, by M. H. P. Picq, which is a longitudinal section of Renaissance interior, showing the composition in form and colour. As a picture, it is not to be compared to many drawings in the English department; but then examine it as an architectural composition, and see how the artist who designed the buildings revels in the decoration of it by his powerful figure-drawing and his love of chaste and harmonious colouring. Such a building as this is a design for, does not exist in England at the present time, the only approach to it being the interior of St. George's Hall, Liverpool, which, however, is far beneath it in general composition, in richness of effect, and in sculptured and coloured decoration. Here all the artist's love for colour and the enrichment obtained by introducing the human figure, finds vent in his elaboration of this design, and is not thrown away, architecturally speaking, upon purple skies or charming equestrians. The drawings under the number 870, by Lamarie, of the Church of St. John, are also examples of a thoroughly conscientious study of architects, betraying a mastery of all elements of art, arrangement of masses, contrast of form, grouping in pleasing harmony of the various modes of enrichment; and, taken together, they form a perfect example of design, in which the architect assumes and maintains his true position of the master-mind, equal to the task of not only providing the framework of a building, but of clothing it with its ministering subordinate arts. Especially among the numerous drawings exhibited by this architect are the two large perspectives and one large section, to illustrate this design for the Church of St. John. They are worthy to be made standards to convey to students an idea of what design is capable, and to show to what perfection architectural drawing may be brought, by a thorough mastery of its elements.

M. Héard exhibits three designs, two of which, Nos. 863 and 864, appear to us as remarkable for purity of taste as they are excellent in draughtsmanship. The latter, a monument to commemorate the friendship of all nations, is particularly worthy of the student's careful examination, on account of its quiet power in design and its masterly qualities of drawing. It is to be regretted that so apocryphal a subject should be identified with this excellent design; and we do hope that before the lion and the lamb lie down together, this monument may be adopted to commemorate a less abstract idea, in a concrete form. The former of these drawings, No. 863, is a large detail, some 12 ft. high, of a single bay in the façade of a Parisian house, and the large scale upon which it is drawn enables us to obtain a very accurate idea of the effect of the design. It is both refined and bold, well composed, and, remembering the limitations, very original. How few of the designs which appear good and characteristic in the pretty perspectives of our English school would bear the severe anatomisation of their features to which this large geometric drawing would subject them! And yet how valuable is the test thus applied, both to the architect and the public. From such a detail as this, drawn and coloured like it, we can see the effect of every detail in the whole building, and many an error which becomes evident for the first time in the completed building would be detected in the large-scaled drawing before it became irrevocable.

Another French architect, of whose works the nation may well be proud, is M. Quostel. His designs for the library and the mansion-house (as we should say), at Grenoble, seem to unite those usually divorced characteristics of skilful planning and pleasing *tout ensemble*, whilst the same universality of powers in artistic design and enrichment of parts, noticed of other architects, is eminently noticeable in his works. We confess to liking his interiors better than his exteriors, and his large geometric drawings show his great skill in composition better than the somewhat hastily executed perspective views which accompany them.

The collection of French architectural designs includes also, among others worthy of study, the complete drawings for Prince Napoleon's Pompadour House, by M. Normand; the Château of Liancourt, by the same; a design for a school of art, by M. Hunt (and what the French do in the way of art schools may be worthy of inquiry in England), and many extensive essays in the restoration of ancient works, apparently studies, or diploma drawings by students. Among the latter the restoration of the Temple Hercules, at Tivoli, by M. Thierry, seems a

carefully thought-out production, showing the actual condition of the temple, and its restoration, in an excellent series of drawings. As a monument of labour, the immense pen-and-ink drawing, by M. Fruchy, of the Abbaye Royale of St. John Desbiques, at Soissons, is worthy of a passing glance; and if the English architectural student wishes to leave the French Court with a little less keen sense of his own deficiency than he otherwise ought to, he should wind up by examining the Engineers' Cathedral of M. Boileau. This triangular iron house of cards will bring back to his memory some of the ecclesiastical architecture of his own country, and his final conviction will be that, however weak and powerless his art-education may have been, and how proved it is to be so may be seen by these French drawings, there is one thing which his countrymen can do now, as they did in the thirteenth and fourteenth centuries, and that is to build a Christian church, or cathedral, better than the Frenchmen, or whose other works he has lost his patriotism in admiration.

It is a curious phase in the architecture of two nations that, although for many centuries the French were as great believers in Gothic art as the English, yet, from a certain time, which we cannot exactly fix, the one drifted as steadily in a classic direction as the other did Gothically. How far asunder this drifting has taken them may be indicated by the two collections of architectural designs in this exhibition. There is scarcely a design in the English department worthy of long scrutiny where its author has attempted Italian or Renaissance treatment; on the other hand, we may say exactly the same of pointed architecture in the French department. Moreover, just as we seem in England to have settled the question of the adaptability of Gothic to large public buildings, the French appear to have given up thinking of it, except as a defunct style. Even where they attempt it, the composition is essentially Italian in general effect, and the details very Moorish in treatment.

Next to the French drawings, the architectural designs of the little kingdom of Belgium stand foremost in merit. Curiously enough, also, the classic spirit is not so observable here as in her French neighbour's works. There appears to be about an equal devotion to both styles in the Belgian drawings, with a preference as in England, for Gothic in ecclesiastical buildings. The drawings are neither upon so large a scale as the French, nor are they so excellent as compositions, and, in addition, there are very few of them. But the designs for the churches of SS. John and SS. Nicholas at Brussels, and SS. Peter and Paul at Chatelet, by M. E. Carpentier, are very creditable productions. The former, in a style of Gothic which, had it been the work of an Englishman, would have been developed into geometric Gothic, and the latter would have become in like manner First Pointed. There is, however, something about modern Continental Gothic which refuses to be classified in our own terms, and is as unlike also the Medieval style of France or Belgium. The Chatelet church is the more refined and effective of these two designs, the tracery of the other being scant and not graceful,—too much like windows cut from pasteboard. Something about both of these works suggests practice in a foreign style, to which the architect has not yet become accustomed. We saw the same kind of feeling in our own Gothic, thirty years ago, only that with us our designs were the productions of men learning to become artists, whilst M. Carpentier starts on his revivalism with finished power as an artist. The design for a cathedral or church, by M. Leon Sieyes, is another effort in Pointed architecture, which has many excellent features also. The new Bourse, for Brussels, which is simply a Classic temple, portico and all, better represents the powers of M. Sieyes, and his drawings of the national monument to King Leopold I. afford illustrations of a powerful mastery of drawing and colouring, as well as skill in composition.

"The Châteaun," by Vanhoneyben, a coloured perspective drawing, is perhaps the most picturesque of the Belgian buildings, and may be well compared with similar drawings in the English department, such as "Orchard Leigh, Somersetshire," by Mr. T. H. Wyatt, with "Hensted House," "Chilham Castle," and "Taverham Hall," by Mr. D. Brandon. In domestic architecture of castles and halls we might have shown greater felicity than we have done, though, as we have before remarked,

England could have placed herself in the first position in architectural design generally, had she been so minded, however painfully inferior she must have been in the mere technical practice of architectural drawing, as compared with the French.

How comes it that these Belgian architectural drawings are ignored in all the catalogues? Of the drawings exhibited by other nations, perhaps the most important are those which illustrate the design for the Hôtel de Ville at Berlin, by M. H. Waseeman. The design itself is a comparatively plain and meagre composition, having semicircular and segmental windows and doors, its good points being the skilful use of constructional ornament, especially in the cornice. Eight very large drawings and a model also, do perhaps more than justice to the composition, which can be thoroughly well understood from them, and in this respect the group of both drawings and model are deserving of attention. The very elaborate "Zion's Church, at Berlin," by M. Orth, a sort of Romanesque design, having semicircular windows, enriched with tracery, the latter feature showing very comically, is also well illustrated by four large drawings and a model. The grouping of this church is both skilful in construction, and very tasteful in ornamentation, though the purely architectural or sculptured ornament in other parts of the construction is scanty and poor.

The Netherlands are not badly represented by M. Cuyppers, who exhibits designs for three churches, as well as one for the King William Museum at Amsterdam; the latter profusely illustrated by many large drawings. One design for a church, by a Netherland architect, M. Van Sooden, is interesting as showing the use of coloured brick internally, instead of polychromatic decoration,—a custom much affected by one class of architects of the English school.

Of the many other architectural works scattered about in various parts of the building it is not our intention more fully to speak, than to say that those from Spain and Portugal are interesting, as displaying a peculiarly distinct national type.

Many other countries besides England have shown an apathy on the subject of architecture, design in this department of their display though whether they have as little cause for it as we have, it is impossible for us to say.

We cannot say much for the elliptical plan of the building for the Exhibition, so far as the arrangement of the architectural drawings is concerned. The English drawings are in a miserable little place, away from the great gallery, whilst of other nations, some have to be content with the vestibules and passages between one gallery and another; and many drawings are in the open air, under cover of the piazza round the central garden. In contrast with this the majority of the French works have the same sort of accommodation as is given to their paintings and sculpture, in the same broad well-lighted gallery range.

The verdict on the art display of our country is already being given against us, and with some show of reason. However much the Exhibition, as far as we are concerned, is a success as a trade advertisement, and in displaying the several branches of industrial manufacture we have before noticed, it is not a complete representation of the position of the fine arts architecture, painting, and sculpture amongst us, and for all this, either the management or the several professions are responsible, jointly or separately. Whichever it may be, the position we achieved in 1862 as a nation not wholly of shopkeepers, but with a taste for art as well, is sadly jeopardised. What have the painters, sculptors, and architects of England to say to the position of the English artistic name now? Is there no explanation for our deficiency? and, if not, have we no cause for regret?

Be this as it may, knowing what we do know of English art, we are as little disposed to be discouraged by our want of success in the competitions as we should be warranted in describing the Exhibition, in the painting, architectural, and sculpture department of the British section, as a fair representation of English art, admirable as many of the individual specimens are.

NEW DRINKING FOUNTAIN.—A fountain has been erected in Broad-street, St. Giles's, by the Drinking Fountain Association. It is composed of red granite, and has a dog-trough attached.

ARCHAEOLOGIC ITEMS FROM ROME.

THE excavations begun some three years ago by an enterprising proprietor in a garden to the south of the Antonine Thermae have lately claimed special attention, thanks to the most interesting of the discoveries here realised. It soon became evident that the ruins here brought to light, at considerable depth below the cultivated soil, must be those of an extensive and splendid palace, no doubt more ancient than Caracalla's Thermae, and apparently sacrificed so as to form a mere substraction to those later buildings of such vast extent. Reference to history soon established the fact that this patrician residence belonged to a well-known personage, of whom both poets and historians speak, namely, Asinius Pollio, an orator and author, the friend of Augustus, of Virgil and Horace, Proconsul in Spain, and in the year of Rome, 714, raised to the Consulate, not the least of whose merits, certainly, was this, that he founded near the Atrium of Liberty, restored also by his means, the first Greek and Latin library open to the public in Rome. The first treasure brought to light among the ruins of this palace was a Mosaic pavement, that covers a spacious arca, representing, in black and white, figures of Tritons, Nereids, and other mythologic creatures of the deep, the adornment, it seems, of an hypæthral court, for there is no trace of roofing above. Of this open different chambers, all found filled with soil or debris; and above extends another story more ruinous, with other mosaic pavements in a fragmentary state, geometric in designs, northward of that open court, and immediately under the stupendous Antonine buildings. But all previously discovered was surpassed in interest by the chamber, scarce ruinous, opened near one angle of the mosaic-paved area, and recognised as the chapel of the domestic Lares, still covered by its high-hung vault, and still retaining its altar in the midst, with a kind of semi-circular predella, no doubt for supporting the little images of those household gods. Around the walls we here see a series of paintings, figures of various size, that apparently belong to different periods, in part effaced, but, in what remains, are so beautiful, so distinguished by grace and vivacity, as to deserve place among the very best among known examples of antique Roman art in this walk,—superior, indeed, to all others yet included in this range as known to us moderns, with sole exception of the exquisite mythologic paintings combined with stucco reliefs, in the subterranean tomb-chambers on the Latin Way. Beside the doorway we recognise Harpocrates, laying one finger on his lips, and the dog-headed Amphis—proof of the fashionable prevalence of which these pictures belong; on one side, an impressive scene that seems intended for Ceres in the throne of Pluto in search of her lost Proserpine; the majestic goddess, with a torch, or, rather, candelabrum in her hand, approaching the throne, on which is seated a female, in commanding attitude, probably deprived of the companion-figure, Pluto, once by her side; opposite, three figures, the central evidently Mercury, the others not easily to be recognised, but all graceful in so far as time has spared them to our gaze. On the side facing the entrance is a more important group of several figures, unfortunately still less complete, among which we perceive one in Phrygian cap, and tunic (perhaps Paris); one pouring from a vase into a goblet held by a female; two youthful riders on steeds that seem ascending at a gallop up steep declivities, at the opposite sides, and whom we may suppose to be Castor and Pollux; also, near one of those riders, a head, evidently severed from its body, no doubt intended for that of Orpheus, borne along the stream of the Hebrus, after the poet's hapless fate at the hands of the Thracian Bacchantes. On a frieze below these are animals,—two stags, and the wolf giving suck to Romulus and Remus, alone remaining of a series perhaps more varied than we now see. Other graceful figures in separate panels,—females carrying patera, caskets, or other sacred objects; above this, on another pile, fruits and flowers, and a pretty design, more than once repeated, of a flute wreathed with flowers, &c. It is evidently of earlier date than the rest, being painted on a stucco surface, over which is laid the stucco on which we see those larger groups, and which seems to have been peeled away from a lower compartment adorned with the single figures, &c. On the pavement, which is of plain black and white mosaic, without designs, lie

strewn fragments of the vaulted roof, that has apparently been broken in by violence, in order to fill this interior, when the buildings of the Thermae were erected above; and these debris show us that the vault also was entirely painted over, a few figures of animals being still seen on its stuccoed surface. A roofless vestibule, leading into the Lararium, has its walls also painted, with figures on panels, Bacchantes, sacrificial ministers, animals, &c., so inferior to those in the chapel that we must refer them to a much later period, and need not give much time to consider their claims. The unique importance attaching to this discovery is, that it shows us, and for the first time, the Roman domestic chapel for the genial worship of those guardian deities, retaining all its art-decoration and its altar, scarcely ruinous, for the bloodless sacrifice offered to them.

But as to the altar, we observe that it is obviously a later adjunct, not entering into the original plan of this interior; and therefore are we led to conclude that the dedication as a Lararium was subsequent to some other use for which the same site once served.

The manner in which the possessions of Pollio were made to yield to the purposes of Caracalla, appears from the fact that the celebrated "Toro Farnese" (the group of Dirce tied to the horns of the bull), removed from the Thermae to Naples, is among the many sculptures mentioned by Pliny as seen in the villa of that patrician before its transfer to the imperial buildings.

The vast adjacent Thermae have been, for many years, left an unexplored field, save by the tourists who are daily wandering about in the endeavour to distinguish Tepidarium, Frigidarium, and Sudatorium among these greatest of Roman ruins. But of late we have heard, not without surprise, of works initiated by Government to excavate near one end of the immense central hall (the Tepidarium); and the other day was reported a treasure-trove here also, namely, a torso, in Greek marble, of a male figure, conjectured by some to be a Hercules; by others, a Diacolobus: the anatomic development, but characterised by manly grace, and giving the idea of youth; and as yet this precious fragment is left standing near the spot where it was dug up, awaiting the decision of authorities as to its future place. For the rest, these works in the Thermae have only brought to light some pavement of large tiles laid along two levels, and which, being bounded by a brick wall not correspondent to that of the Tepidarium itself, that rises above, we might suppose belonged to the area of a bath for several persons, into which would have been descent by steps.

Among items of news in this walk, we have to report the continuance of the diggings at the Station of the Vigiles in Trastevere, and henceforth at the charge of Government, which has taken them from the private hands first engaged, and ordered the demolishing of some paltry houses, in order to extend them over a wider area. The works, also carried on by Government, on the Palatine (beyond the estate purchased by the French Emperor for the well-known undertaking in French interest) had been long suspended, but are now, though not very vigorously, again in progress. We are glad to find that Mr. J. H. Parker has, at last, obtained the permission, first half-granted, then refused outright, to have photographs taken in the Catacombs from the more curious Christian paintings and other details for the work he is preparing on Roman antiquities; his assistant-artist, Mr. Smeaton, a Canadian, having already begun, and very well, to execute this series.

The monument to Mr. Gibson has been just erected in the Protestant cemetery, consisting of a plain erect slab, with a classic frieze and antefixes at the summit (a detail taken from a sketch left by the great sculptor), and the relief bust in a circlet, as to which we must correct our former report, having since learnt that, though the late Mr. Spence did indeed begin a likeness he had intended to present to the executors for this monument, he destroyed his first attempt, because dissatisfied, and unfortunately did not live to complete another; and that the portrait actually in its place, which is at once recognisable, was made by an Italian named Minghini. The epitaph, obligingly supplied by Lord Bulwer Lytton at the request of Mr. Penry Williams, is as follows:—"To the memory of John Gibson, sculptor, R.A., born at Conway, 17th June, 1778, died at Rome, where he had resided forty-eight years, 27th January, 1836. His native genius

strengthened by careful study, he infused the spirit of Greek art into masterpieces all his own. His character as a man was in unison with his attributes as an artist,—beautiful in its simplicity and truthfulness, noble in its dignity and elevation."

PUBLIC MORTUARY HOUSES.

SOMETHING is again being said as to the urgent necessity that exists for the establishment of places for the reception of the dead previously to burial—a want you have long urged and illustrated in the *Builder*. You have shown in your admirable papers on the subject the miserable condition in which many thousands are living around us,—families confined to a single room, and, in many cases, but one room for several families, amidst squalor and every other evil condition. This sad state of things culminates when death takes place, more especially death from infectious disease, the dead bodies lying for days in immediate contact with the living; a battle of life with death distressing to the last degree.* Here certainly is something which requires amendment. With respect, also, to the bodies of suicides, or persons meeting accidental or violent deaths. If in respectable houses, keeping the body and holding the inquest there, is a distressing nuisance; in the dwellings of the poor, besides the before-mentioned objection, it is often no small trial for coroner and jury to penetrate the filthy stums they are required to visit, whilst the deposit of the body at a tavern is unseemly, and open to many grave objections; this is a thing, too, requiring attention and alteration. In the Sanitary Act something is intended to amend this state of things, but it is not sufficiently comprehensive. Clause 27 states,—

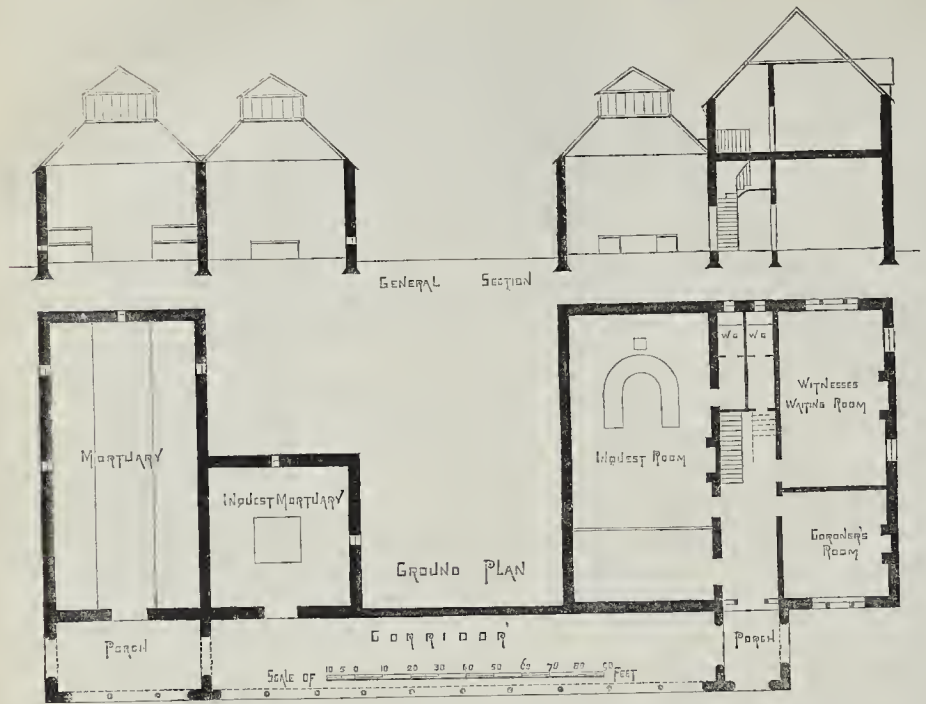

"Any nuisance authority may provide a proper place for the reception of dead bodies, and where any such place has been provided, and any dead body of one who has died of any infectious disease is retained in a room in which persons live or sleep, or any dead body, which is in such a state as to endanger the health of the inmates of the said house or room, is retained in such house or room, any justice may, on a certificate signed by a qualified medical practitioner, order the body to be removed to such proper place of reception at the cost of the nuisance authority, and direct the same to be buried within a time to be limited by such order; and unless the friends or relations of the deceased undertake to bury the body within the time so limited, and do bury the same, it shall be the duty of the relieving officer to bury such body at the expense of the poor-rate, but any expense so incurred may be recovered by the relieving officer in a summary manner from any person legally liable to pay the expense of such burial."

Clause 28 says,—"Any nuisance authority may provide a proper place (otherwise than at a workhouse or at a mortuary house as lastly hereinbefore provided for) for the reception of dead bodies for and during the time required to conduct any post-mortem examination ordered by the coroner of the district or other constituted authority, and may make such regulations as they may deem fit for the maintenance, support, and management of such place; and where any such place has been provided, any coroner or other constituted authority may order the removal of the body for carrying out such post-mortem examination and the removal of such body, such costs of removal to be paid in the same manner and out of the same fund as the cost and fees for post-mortem examinations when ordered by the coroner." It appears to me that it should be made compulsory on the parish officers to provide mortuary houses not only (as appears to be contemplated in the Act) for the bodies of those dying from infectious disease, but upon a doctor's certificate, of all bodies which otherwise would lie in crowded rooms amongst the living. The removal, of course, to be conducted with decent solemnity. In conjunction with the before-mentioned mortuary house there should be another for bodies awaiting post-mortem examination and inquiry, and a fitting building annexed for holding the coroner's court and for the residence of attendants.

There can be no doubt but that the removal of the dead from the stifling atmosphere of the dens, where so many of our poor reside would in its tendency to stay disease be a great public benefit.

The necessity, too, of fitting places for holding post-mortem examinations, and the requisite accommodation in connexion with the mortuary building for holding the inquest, is very plain; but from the supineness of many, and the direct opposition to alteration and improvement in

* See sketch, &c., "The Dead and the Living," vol. xliii., p. 825, and others previously.

DESIGN FOR PARISH MORTUARY HOUSE AND INQUEST HOUSE.—Ground Plan.

others holding parish authority, unless there is higher and more direct influence exercised than that of a "annuance board," no improvement is likely to take place: the law will remain a dead letter.

One hopeful sign is at least visible. At Liverpool the subject of the mortuary chamber has attracted attention, and Mr. Robert Hutchinson has generously offered to defray the expense of such a building.

I beg to submit to you a plan and section of what I think is required. I propose that the mortuaries and inquest-room be lighted and ventilated from above. Over the rooms for witnesses and coroner would be apartments for the attendants. The now disused churchyards might profitably and properly be turned to account as the site of such buildings.

By bringing together such bodies as require inquest, the coroner's duties will be much lightened. He will not have to go to different parts of the parish for individual cases, summoning so many different juries. One jury will be able to dispose of a number of cases.

PHILIP E. MASEY.

AN ARCHITECTURAL NOTICE OF ST. JOHN'S PRIORY, CLERKENWELL.*

THE story of the religious knights of St. John of Jerusalem (as well as that of the Knights Templars) has been so often told, and is so well known, as to render a repetition unnecessary. Some authors have entered so enthusiastically into the exploits of the knights as to lose sight of the buildings belonging to the Priory, and allude to them in a very cursory manner. Beyond the mention of the church by old John Stow, the tailor, in 1598, who naturally raises curiosity by his statement that "the great bell-tower was a most curious piece of work-

* By Mr. W. Pettit Griffith, F.S.A., read at the Charterhouse, before the London and Middlesex Archaeological Society.

manship, graven, gilt, and enamelled, to the great beautifying of the city," there is not much reliable information on the subject. The object of the present paper is to place on record certain facts and data connected with the Priory buildings, the result of discoveries and observations made during a residence of many years on the site of the Priory.

The Priory was founded about A.D. 1100 by Jordan Bristel and Muriel his wife, near "unto Clarke's Well" (now Clerkenwell), in the reign of Henry I. Ten acres of land were purchased for the above purpose, of the adjoining Priory of St. Mary; and for those ten acres twenty acres were given in his lordship of Willinghale, in the county of Kent.

The two principal objects of interest connected with this once important religious military institution are the southern entrance, known as St. John's Gate, and the church: these are both situated in St. John's-square, which latter, in old maps, is called St. John's Priory. St. John's-square was the Priory-court, and bounded by the ancient buildings. In Robert Seymour's Survey, 1735, it is named "St. John's-court, vulg. St. Jones's, St. John's-square." The enclosure walls can still be traced on the north, south, east, and west sides; and the modern dwellings in St. John's-square are mostly built upon the old rubble walls of the hospital: fragments of the ancient buildings are frequently discovered.

The north boundary comprised the north postern and the Priory buildings and walls, extending from the north postern westward towards Red Lion-street; and from the north postern eastward towards St. John's-street. The foundations of the Priory buildings and walls form the foundations of the cellars under No. 19, and the basements of Nos. 21 and 22 on the north side of St. John's-square. An opening was made in the basement-wall between Nos. 19 and 20, St. John's-square, on September 12th, 1851, and the wall was found to be 7 ft. thick, and formed of squared stone on the outer or north side, and chalk rubble within. Some of the stones had

been used for windows, &c. One stone was exactly similar in nature to the mantel stone found in the cellar by St. John's Gate, and was covered with black shining flinty particles, as if it had been subjected to fire. This wall was close by the northern postern. There are still in existence beneath the houses on the east side of the above postern, walls 7 ft. in thickness, and containing splayed openings.

In tunnelling beneath No. 46, St. John's-square, for the main drainage, in August, 1863, solid concrete foundations of priory buildings had to be cut through. The distance from the surface of St. John's-square to the bottom of the concrete was 26 ft.

We are informed from the minute-book of the Commissioners for Paving, &c., the parish of St. John, Clerkenwell, that permission was granted on May 19th, 1780, to Mr. Gabriel Gregory, the proprietor of the house adjoining (then about to be rebuilt), at the south-west corner of Jerusalem-passage, to take down the north postern and thereby leave the south entrance to the above passage "open from the ground to the sky." The north postern was therefore covered, and by the plan in the commissioners' book, it appears to have been 17 ft. 10 in. long (inside measure), and 10 ft. 1 in. wide at the south end, and 10 ft. 9 in. at the north end, and enclosed next St. John's-square by a light enclosure with a gate 10 ft. 7 in. high, and at the other (north) end by a gate 5 ft. 5 in. wide and 8 ft. high. This was an outer gate in the north boundary-wall, which latter was 3 ft. 6 in. in thickness at this part.

The Priory was enclosed on the south side from St. John's-street (eastward) towards Red Lion-street (westward), with St. John's-gate in the centre. Of the southern boundary there are St. John's-gate and 67 ft. of wall extending westward from the gate remaining.

Of the eastern boundary, Hollar has given a view as it appeared in 1661. It portrays the

* The first meeting of this Commission was held on May 13th, 1771. Sir George Booth, bart., in the chair.

east end of St. John's Church, with the Hospital-gardens and boundary wall; all of which faced St. John's-street.

Regarding the westward boundary, there are remains of the old Priory-wall in Ledbury-place, being also the west garden-wall of Bishop Burnett's house, and in the west-garden-wall of Dr. Adam Clarke's house, which adjoins Burnett's house southward, and in Red Lion Mews or Yard; all these portions remaining formed a continuous wall, and was the western boundary.

Cromwell mentions a circumstance which occurred in November, 1826, which seems to establish the probability that, previously to 1381, when the hospital was destroyed by Wat Tyler, its buildings extended southward beyond the present gate.

In excavating the ground on the east side of John's-lane, for the purpose of making a new opening into the sewer beneath, the workmen came to a wall between 4 ft. and 5 ft. thick, which crossed the lane from east to west, and, there can be little doubt, both from its situation and strength, formed part of the original erection of the Hospital. This idea receives confirmation also from the discovery of a similar wall in digging out the ground for the foundation of the houses in Albion-place (formerly George-court), the direction of which appeared to be north and south.

Of the early buildings which were of the semi-Norman and Early English style, there are, besides the crypt, a few remains in the south wall of the present church next Jerusalem-court, and fragments have been found built in the basement walls of St. John's Gate. The latter is exhibited to the Society of Antiquaries in 1856.

St. John's Gate.

St. John's Gate was originally built at the foundation of the Priory, about the year 1100, and was rebuilt by Prior Docwra in 1504. This prior was the immediate predecessor of the last superior of the house, Sir William Weston, and retained his office from 1502 to 1523.

In Hollar's view of the gate, the effect produced by the battlements, then complete, is shown to advantage. In some respects Hollar is not correct: the windows on each side of the large central arch and window in both fronts are in one light, while in the view they are shown in two lights. In alluding to the great multitude of prints of St. John's Gate which have been issued on the exterior of the *Gentleman's Magazine* during the last 115 years, the editor of that publication remarked in 1845, that they probably in all exceeded ten millions of copies, and presented in succession a considerable variety, arising from the respective taste or talent of the draughtsmen employed, whenever a fresh engraving became requisite. Hollar's view of the gate is the earliest extant, and is the most picturesque, but not the most accurate. It gives an undue altitude of proportions to the whole structure, and to its parts. In 1856 a view of the gate as restored superseded the old one.

I must now concisely allude to a few well-known events which have rendered St. John's Gate immortal, and will then return to the more immediate subject of the paper. In the reign of James I., 1604, the gate was inhabited by Sir Roger Wilbraham, and afterwards it was the residence of Edward Cave, the printer, who, in January, 1731, first published one of the oldest and most respectable of our monthly periodicals, the *Gentleman's Magazine*. Among the numerous visitors at that time were Goldsmith and Dr. Samuel Johnson (Cave being his friend and early patron). Dr. Johnson's pen was continually at work; and his pamphlets, sermons, epitaphs, essays, and biographical memoirs were continually published in the old style, either by themselves or in the *Gentleman's Magazine*. In 1740, and for more than two years afterwards, he wrote the parliamentary speeches in the same magazine; and these were followed by his "Life of Savage," "English Dictionary," "The Vanity of Human Wishes," "The Rambler," and many other literary productions.

The debates penned by Johnson were distinguished from the reports which had preceded them by a greater energy of language, a more finished style of expression, and a closer attention to the relative hearing of the arguments advanced by the speakers on either side. They were written with great rapidity, and at times when he was able to raise his imagination to such a pitch of fervour as hordered upon enthusiasm; to indulge which without interrup-

tion his practice was to shut himself up in a room assigned to him at St. John's Gate. Here, no one was suffered to approach, except a compositor or Cave's boy for the manuscript copy, which, as fast as he wrote it, he put forth at the door.

Boswell says that, "when Dr. Johnson first saw St. John's Gate he beheld it with reverence," no doubt referring to the edifice itself, with its chivalrous memories, and not, as has been supposed, in allusion to the magazine. Johnson himself was often to be found at St. John's Gate, where the *Gentleman's Magazine* was published, than in his own lodgings.

Cave died in 1754. The *Gentleman's Magazine* was continued by David Henry,* his brother-in-law, and Richard Cave, his nephew. The latter died in 1766, when Henry relinquished his business of a printer; and employed, as his agent at St. John's Gate, David Bond, who was so continued until the end of 1778. At that date a considerable share of the proprietorship of the magazine having been purchased by Mr. Nichols, it was for the next two years printed partly at St. John's Gate and partly in Red Lion-passage, Fleet-street. In 1781 (just fifty years from its commencement), the magazine entirely left its native spot. It was printed for nearly forty years in Red Lion-passage, and afterwards for thirty-six years in Parliament-street. In 1856, the magazine was published by John Henry and James Parker; and now Bradbury & Evans have undertaken the care of it.

The walls of the present St. John's Gate are about 3 ft. thick, of brick, faced with stone 9 in. thick, brought from Ryegate. This stone was also used in building Henry VII.'s Chapel in 1502.

Rickman considers the style of architecture of the gate to be Perpendicular work of pretty good character. On the ground-floor is a central arched entrance, with rooms on the east and west sides. On the north front, next St. John's square, is a projecting tower on each side, and on the south front is also a projecting tower on each side, and as the rooms above mentioned project beyond the centre, they form, in appearance, double towers, which give an imposing aspect to the south front, and constitute the front by which the hospital was approached from the city.

In Hollar's view of the gate is shown an inner wooden erection, for carriages and foot-passengers, which was succeeded by a hilliard-room, which filled all the upper part of the gateway from the springing of the arch.

This was purchased by St. John's Paving Commissioners for £21, and cleared away in 1771, and the arch repaired and restored to its original dimensions. Sir William Staines restored the masonry for 25*l*.

In 1856, Mr. B. Foster, the occupant of the gate at that time, discovered one of the original stone chimney-pieces, and a singular secret communication from the groined archway to the large room above. The chimney-piece is neatly moulded with spandrels, containing cruciform gilt ornaments; the opening of the fireplace is 4 ft. 6 in. by 4 ft. 2 in., and the stone is the same as that of which the gate is constructed. Over the chimney-piece is a relieving arch. The chimney-piece is restored and preserved, and also the chamber. The secret chamber or communication, occurs in the inner side wall, the latter is 3 ft. 4 in. thick, and the former is 1 ft. 11 in. wide, and 2 ft. 9 in. in length. At the base of the chamber or shaft, is an arched opening (now filled up), communicating with the open archway beneath the gate, and the top of the shaft is immediately under the floor of the hall. This communication may have been formed for the purpose of entering the hilliard-room, although its appearance is not modern.

In the room over the bar of the tavern, on the east side of the gate, another original chimney-piece similar to the one above described, has been laid open.

In the interior of the gatehouse remain several stone arched doorways, recesses, &c., with ancient hook-and-eye hinges. The ceilings are mostly divided into compartments, by large and boldly carved oak rib mouldings.

On the south front of St. John's Gate are sculptured five shields in foliated panels; the central panel contains the arms of France and England surmounted by a crown. The panels on each side of the above have the cross, the ensign of the Priory. On the next adjoining

* He possessed the freehold of St. John's Gate at his death, in 1792; he married Carr's (the architect's) sister, in 1793.

panels are a chevron engrailed, between three roundels, and the cross in chief (Docwra's arms). And the next or outer panels have the chevron and three roundels; cross in chief, impaling a single-horn stringed between three goats' heads erased. Beneath the above panels was the following inscription:—"Tomas x Docwra x Prior. Anno Dni 1504. Sans x oro."

The north front has three shields in cinquefoiled headed panels. The central one has the cross; on the left-hand side are the chevron, roundels, and cross-in-chief; and on the right-hand side the same, but with the cross moline as an impalement. Beneath the shield was "Anno Dni 1504." In the groining beneath the gateway are sculptured bosses (and moulded ribs) ornamented with shields. On two are the Priory cross, and on two are the chevron, roundels, and cross. Upon the central boss or key-stone is the Paschal Lamb.

The arms of the Priory were gules, a cross argent. The arms of Docwra were sahle, a chevron, engrailed argent between three plates, each charged with a pallet or. In each angle of the gateway is a slender attached column, with moulded capital and base, from which the groined ribs spring.

In the spandrels of the doorhead to the north-west tower are the Priory cross, with a cock and a hawk; and Docwra's arms, with a hen and a lion.

Shields with the arms of the Priory and of Docwra are also very sharply carved in an oak doorhead formerly on the south side of the north-west tower, in the ground-story of the gate. It was discovered in 1813, when this part was converted into a watchhouse, and then used in a partition, which was taken down in 1866, and the room restored to its original proportion. The doorhead is preserved in the gate.

The staircases were constructed in the towers on the north side next St. John's-square. They were spiral, of solid stone from the ground story up to the first story, and of solid oak from thence to the top. The stone staircase in the north-west tower was removed in 1814. The solid oak steps still remain; also the inner stone Tudor-headed doorways leading to the floors.

Numerous discoveries have been brought to light during the last thirty years, through excavating for drains, foundations to new houses, &c.; among these may be cited the original pavement beneath the gate, which was 3 ft. 1 in. below the present level.

St. John's Gate had a narrow escape in 1845; the new Metropolitan Building Act then came into operation, and the old gate was condemned as being dangerous, and it was proposed to demolish it; and had I not formed a committee to restore it to its present condition, the gate would have been destroyed. In 1846-7 the stonework was reinstated, the embattlements were added to the north front and partly to the south front, and the angular turrets partly rebuilt, with new windows, &c., under my superintendence, by public subscription.

St. John's Gate has been at various periods spoiled and modernised to serve the requirements of a tavern. The projecting tower in St. John's-lane, on the east side, was cut through and supported by a cast-iron column, which has disfigured the south front. The original stone mullions of the windows in the large room over the gateway have been removed, and miserable deal mullions substituted. All these alterations were effected many years prior to the restorations of 1846. In 1865 the freehold was purchased by Mr. Wickens, the present occupier, in whom the old gate has found another friend anxious to retain the fabric as far as possible in all its integrity. With this view, in 1866, 350*l*. were expended upon its further restoration; the modern staircase on the west side was cleared away, and the oak staircase in the north-west tower (this staircase winds from top to bottom with solid oak steps, and an oak newel) was restored; also the old stone doorway, formerly the entrance to Cave's printing-office, in the same tower, was raised 3 ft. in height; the continued raising of the street paving having shorn this doorway of its fair proportions.

Although not one of the City gates, the Court of Common Council responded to the public appeals made for its restoration, and more recently in a stained-glass window in Guildhall, portraying Edward IV. making four citizens of London Knights of the Bath, is a representation of St. John's Gate. At the base is a label, bearing the following inscription:—"Presented, 1866, by Samuel Wilson, Esq., Alderman of the Ward of Bridge Without, Alderman of the

Ward of Castle Baynard from 1831 to 1853. Sheriff of London and Middlesex, 1833, Lord Mayor of London, 1839." The tracery surmounting the whole contains, in two separate compartments, the arms of the City of London and those of the donor.

St. John's Priory Church.

The dedication of the original church, by Heraclius, Patriarch of Jerusalem, is recorded to have been in the year in which the Temple Church was also dedicated, and by the same Patriarch. "In ye year of Christ 1185, ye vj. Ides of Merche, ye domical lettre heing F, ye Chyrche of ye Hospital of St. John's, Jersusalem, was dedicatyd to ye honor of S. John Baptiste, by ye worshipfull fader Anaclys, Patriarke of ye resurreccion of Christe; ye same day was dedicatyd ye high Altare, and ye Altare of S. John Evangelist by ye same Patriarke."*

The Norman or circular portion of the present Temple Church formed the building alluded to above, and there is no doubt that the masons engaged in sculpturing the arcade in the aisle of the circular portion of the Temple Church were also employed on the ornamental capitals, &c., of St. John's Priory Church.

The erection of the first buildings of the Priory occupied some years. It has been stated that between the years 1274 and 1280, Joseph de Channey, prior, built a chapel, and that William de Henley, prior, erected a cloister between 1280 and 1284. In 1338 it appears that some repairs were effected.

The original church, of which part of the crypt remains, was semi-Norman and Early English. Some of the bases remain *in situ* beneath the present modern floor, and part of the south wall remains, in which can be traced narrow window openings, and a doorway also beneath floor, formerly facing Jerusalem-court. In one of the houses in the court built against this wall can be seen a Norman capital in the wall.

With the exception of the crypt, all the Priory (including St. John's Gate) was destroyed in 1381 by the rebels of Essex and Kent, who set fire to the buildings, causing them to burn seven days.

After this calamity the Priory was rebuilt, Prior Doewra completing it in 1504. Doewra's church was in the Perpendicular style, and grafted upon the Early English crypt, and consisted of nave, aisles, a great bell-tower, graven, gilt, and enamelled; a choir, with side chapels, &c., and the remains of the Early English crypt. The present church is a part only of the ancient choir, and beneath it is the crypt.

The crypt comprises a central avenue, 16 ft. 3 in. in width and 12 ft. in height, with an aisle on each side extending from east to west, and is, with the aisles, of the same extent and length as the present church above. The west end of the crypt is bricked up. It originally extended westward, which has been proved from time to time when excavating for drains, &c.

The most interesting remaining portions of the crypt comprise the central avenue and a small compartment on each side of it by the entrance at the east end. The compartment on the south side is bricked up, and forms a private vault, in which are deposited the remains of Simon Michell. It is 13 ft. by 10 ft., and was inclosed in 1793.

This system of allotting portions of the crypt to other families as well as Michell's, injured its fair proportions and lessened its original size.

The entrance to the crypt is at the east end by a flight of stone steps beneath a modern vestry. The crypt appears to have been originally above ground, and not subterranean. An entrance to it may be seen in Hollar's view of the east end as it appeared in 1661 from St. John-street, with the hospital gardens and boundary wall.

The central portion of the crypt consists of four severe or bays; two are simple and plain, being semi-Norman, and two (towards the east) are Early English, and very perfect, the details and mouldings being worthy of a careful examination. The voussoirs of the arch ribs are wrought in a similar manner to the voussoirs of the former nave, chancel, and aisle; these are often dug up in the vicinity of the priory. The voussoirs are worked with great precision about 5 in. long, are not arched, their shortness enabled them to be set to the proper curvature with apparent exactness; while the frequent occurrence of the mortar joints between them

has preserved them from fracture by settlement.

The ribs of the Early English bays spring from triple-clustered columns, 3 ft. 9½ in. high, in each angle of the bays, with moulded capitals and bases. An excavation was made in 1854, exposing the bases to view: the upper moulding is horizontally fluted, similar to some Grecian Ionic bases.

The central shafts of the clustered columns are pointed, and the diagonal ribs have three mouldings: the centre one is pointed, and the outer are rolls. This pointed howell occurs frequently in semi-Norman and Early English work, and is coeval with the introduction of the pointed arch. Suspended from the keystone of each arch is an iron ring.

On each side of the two western bays of the central aisle is a deeply-recessed pointed window: the opening was long and narrow, 3 ft. 9 in. high, and 9 in. wide, and the inner splay is 7 ft. 7 in. by 4 ft. 2 in. wide; the wall is 4 ft. thick. The trefoil-headed doorway, on the west side of the north compartment, has the large iron eyes of the door-hinges still remaining. The original pavement of the crypt is 1 ft. 5½ in. below the present level. Clay, introduced in modern times to prevent the damp from rising, lies over the original pavement, and conceals the bases and part of the shafts of the columns.

On January 23, 1860, an Order in Council was made relating to the coffins in the crypt, viz. —

"That the coffins contained in the public vaults be laid down on the floor, and covered with powdered charcoal and fresh earth." Instead of the coffins being laid on the floor (in March, 1862), they were piled up from the floor to the ceiling or arch in the aisles of the crypt, and the doorways bricked up. In this manner the Early English trefoil-headed doorway, engraved in the *Builder*, vol. xiii. p. 619, was obliterated. The crypt has been thus shorn of its proportions and almost reduced to a central avenue, which might have been avoided if the coffins had been laid on the floor as directed by the Order in Council.

This crypt in 1762 was rendered notorious by the detection of the imposture known as the Cock-lane Ghost. This was discovered in the crypt upon removing the coffins; her remains were turned quite black, and have been placed in the north aisle and bricked up with the rest of the coffins.

The vaults existing beneath the house No. 19, St. John's-square, abutted on the crypt (bricked under the nave) on the north-side next Jerusalem-passage. The walls are of considerable thickness, composed of brick and stone, and stand upon rubble-work, and were no doubt appendages to the ancient Priory. In a division-wall in these vaults was a doorway of the Perpendicular period, in a perfect state in January, 1861; and at that time the walls were converted into "Turkish baths," the floors paved with tiles, and the whole of the vaults rendered with cement, including the old doorway, and thus ignorantly destroyed. The baths were open only for a few months, and then abandoned.

A bird's-eye view of St. John's Priory, Clerkenwell, restored with its boundary-walls, St. John's-gate, and the Church, having its nave, aisles, transepts, tower, chancel, and chapels complete, may be seen in W. Newton's "London in the Olden Time, with a Pictorial Map of London, temp. Henry VIII.," folio. 1855.

In the 3rd of King Edward VI., in 1549, the church for the most part, the holy and side aisles, with the great bell-tower (a most curious piece of workmanship), were undermined and destroyed with gunpowder, and the stone was employed for the building the Lord Protector's (Somerset) House in the Strand, and the porch of Allhallows Church, Gracechurch-street. That part of the choir which remained with some side chapels, was closed up at the west end (next St. John's-square), and otherwise repaired by Cardinal Pole, in the reign of Queen Mary; and Sir Thomas Tresham, knight, was made prior, with restitution of some lands; but it was again suppressed in the first year of Queen Elizabeth. Five years subsequently to the Dissolution, Henry granted to John Dudley, Lord Viscount Lisle, and Lord High Admiral of England, "as well in consideration of his services, as for the sum of 1,000*l.* sterling, the site, circuit, and precinct of this Hospital or Priory of St. John of Jerusalem: only the lead, bells, timber, stone, glass, iron, and other things of the church were specially reserved to the king's majesty." James I. granted by letters patent, dated the 9th of May, 1607, "the scite, or house, of the

late Hospital of St. John of Jerusalem in England, in the county of Middlesex, and all the scite, circuit, and precinct of the same house, having thereon one great mansion-house and one great chapel, and containing by estimation five acres, to Ralph Freeman and his heirs in free and common socage."

The choir passed by various deeds to as many persons: — 10th James I., to Sir William Cecil, Lord Burleigh, son and heir apparent to Thomas, Earl of Exeter, by marriage with whose daughter, Lady Diana, it became (6th Charles I.) the property of Robert Bruce, afterwards Earl of Aylesbury, whose son Robert was created Earl of Aylesbury, and for many years was called Aylesbury Chapel. In this noble family the estate continued till 1706, when it was sold by them, and being finally bought by Simon Michell, in 1721, the chapel was by his instrumentality converted into a church for the intended parish of St. John.

When Michell converted the remains of the ancient building into the present church, the north aisle was used for part of a dwelling-house, and the upper part of the south aisle as a library.

In a newspaper of March 26th, 1716, the following advertisement appeared:—

"The remains of the once famous *Abbey* of Clerkenwell, called *St. John's* Chapel, in the parish of St. John, where (besides the adjoining house, furnished with all conveniences for a Boarding School), is a gallery, as fit as any whatsoever for a *School Room*, that will hold above two hundred Scholars."

In 1721 Simon Michell purchased the ancient structure of the Aylesbury family, and converted the remains into the present church (St. John's Church), and in 1723, having enlarged and repaired it, built the present west front of brick, with stone quoins, which has been since composed, and re-roofed the whole, he, and a Mr. Hutton, his trustee, disposed of the church, vault, vestry-room, and adjoining grounds, together with two messuages fronting St. John-street, for 2,950*l.*, to the commissioners for building fifty new churches. Friday, December 27th, being St. John's Day, the consecration of the church took place, being performed by Edmund (Gibson), Lord Bishop of London, when the edifice was formally styled "The Church of St. John, Clerkenwell, in the county of Middlesex," and was the second of the churches usually called Queen Anne's, in order of the time of consecration.

The turret was added in 1813, and the clock originally belonged to St. James's Old Church. The head of the headle's staff also belonged to that establishment, and was used in James I.'s time. It has the following inscription,—"Ann^o Dom. 1685. Ann^o d' Regni Kegis Jacobi." It is silver-headed, and was made at "ye charge of ye inhabitants of ye east liberty of St. John of Jerusalem." A portable baptismal bowl formerly supplied the place of the font now in use: it has a Scriptural quotation round its rim, with the name of the parish and "*Deo et Sacris*."

The font is a white marble pedestal, with hason (not capacious enough for total immersion), its date being probably coeval with Michell's alterations and additions in 1723.

On April 29th, 1724, Michell sold to Queen Anne's Commissioners a dwelling-house in Red Lion-street (now No. 59), 20 ft. wide and 96 ft. (including the garden) in length, for 650*l.*, as a rectory-house for the incumbent.

The church, thus altered, was repaired in 1500, principally at the expense of Philip Booth, of Red Lion-street, who contributed about 145*l.* towards the painting, &c.; and in 1812-13 further repairs were effected, and again 1825. The external porches to aisles, next St. John's-square, were added in 1825, and the central porch was built in 1845.

In 1838 the badly-constructed wall, erected about 130 years ago, partly enclosing the north side of the church, was rebuilt. Several fragments of the priory were found in the wall used as rubble.

In 1845 this church was repaired under my direction, and I took care to note the following:—

Upon removing the plaster from the inside of the east wall and central window, it was discovered that (Doewra's) masonry still existed from the ground to the middle of the said window-arch, in altitude 27 ft., all of the wall above that having been rebuilt in brickwork (by Michell). This window remains in the same state as shown in Hollar's view next St. John's-street. It has still its stone mullions, but the foils are gone. In the south aisle the pews

* Cotton MS.

against the south wall were removed; and it was found that Simon Michell, when he partly rebuilt the church, used portions of the former church to support the pews,—these consisted of ribbed mouldings, parts of shafts, portions of the groining, capitals of clustered columns, coloured and gilt, and other remains of the former church. The pew front, No. 82, opposite window recess in south wall by west end, stands upon eight large clustered capitals; upon these capitals was marked the geometrical system employed by the Medieval architects in designing their edifices, and which has been propounded by myself during the last thirty years. The bulk of the shafts, the capitals, the centres for producing the large and small columns, are all accurately defined. There is no guess-work, the diameter of the pier being determined; the whole of the parts proportion bear a proportion to each other, and to the original unit.

The floor of the original church was 1 ft. 2½ in. below the present floor. The south wall I found to have been built by Docwra on the remains of the Early English wall, which latter now remains some few feet above the floor, and contains the narrow splayed openings of the original windows, and a doorway that opened into Jerusalem-court. These are not visible without removing the pews. Docwra's wall contains large Perpendicular windows. The upper part of the south wall was rebuilt by Michell. The north wall has been partly rebuilt, but still contains some of Docwra's windows. Upon taking down this wall, built by Docwra on the wall of the crypt, an angular capital was discovered built in the wall.

This capital belonged to the original church, and by referring to the plates of ornamental capitals in Billings's account of the Temple Church, it will be observed that the resemblance is striking. As the Priory and Temple Church are of the same date, 1185, the same masons may have been employed on both buildings. A small gilt capital was also found in the wall.

In the central east window is a coat of arms (a chevron between three combs), in painted glass, stated to be the coat armour of Tunstall, of Tunstall, in Lancashire. They are, however, the arms of Prior Botlyer. The east windows of north and south aisles have lost their stone mullions. In 1812, in enlarging the east window of the south wall, the skeleton of a child was found in the masonry. It was left undisturbed.

The church was considerably injured and interfered with by the erection of houses on the south side, next Jerusalem-court, between 1600 and 1700. These contain the oak wainscoting of the period. The south entrance and windows of the church were unfortunately blocked up by these buildings, and many of our cathedrals and churches were formerly wantonly disfigured in this manner.

In conclusion, any further comments upon St. John's Church, as spoliated by Simon Michell, will be misapplied, as all real interest to the architect and antiquary ceased the moment Michell put his Classic extinguisher upon the Gothic edifice. The day may arrive when this Classic fungus will be removed, and Docwra's Perpendicular church reinstated upon the ancient crypt.

In 1677 the principal inhabitants of Clerkenwell were, Sir James Edwards, Lady Percy, Sir William Bowles, knight, Sir Richard Chiverton, Lady Wright, Sir John North, Sir William Palmer, the Earl of Aylesbury, and others. Bishop Burnet's residence is still to be seen on the west side of St. John's square; it adjoins the late Dr. Adam Clarke's house. John Weaver, the celebrated antiquary, also resided in Clerkenwell; and John Britton, the author of the "Cathedral Antiquities of Great Britain."

The residence of James Carr, architect of St. James's church, was on the north side of Albenarle-street (No. 12), set back from the houses contiguous. It was here that two noted architects, Samuel Ware, author of "Tracts on Vaults and Bridges;" and Edmund Aikin, author of several works, passed their articulated clerkships. During which, moreover, as regards Ware, he began, I have no doubt, to study "Arches and Abutment Piers," subsequently published.

It was natural for the nobility to reside in Clerkenwell at an early period, when, according to Fitz Stephen, in A.D. 1190, the monk of Canterbury (but native of London), the fields and open meadows were very pleasant, and among which the river waters did flow, and the whole of the mills were turned about "with a delightful noise." But Clerkenwell has been rendered more deeply interesting and remarkable by the

numerous celebrated literary characters, either resident in, or connected with, the locality; men not born great, but who have by their own indefatigable industry, created their own greatness.

NOTES FROM THE CHAMP DE MARS.*

PORTUGAL exhibits but a small collection of pictures and drawings, and of these only a very few possess interest for the general spectator. Miguel-Angelo Lupá, professor at the Royal Academy of Fine Arts at Lisbon, has four pictures: three of them are portraits, but the fourth—of large size—is an attractive though mournful subject,—"Tintoretto, while painting the portrait of his dead daughter, interrupts his work to contemplate her corpse."

A miniature, by whom I know not, of a pretty little child in black frock, with a large blue sash, who, with the help of "doggie" is watching baby in the cradle, is a charming thing, both as to colouring and manipulation; while amongst the sculpture, Antonio Conceiro's "Study of a Head," in plaster, an old man with monstache and beard nearly covering the face, is forcibly and cleverly rendered. The bust of "Luiz de Camões" is interesting to see, for it looks like a good portrait, carefully studied from a faithful likeness. The right eyelid is shrunk down, and the eye is missing, owing to the misfortune which happened to the warrior-poet in Gibraltar Straits, where he was the first to board a Moorish vessel, and, in the conflict, lost his right eye. The date of Camões's birth is given in Portuguese, on the foot of the bust, as 1524—some make it 1517, and also of his death, "Morren em 1580." About this latter date there is likewise a difference of opinion, some writers putting it a year earlier, namely, in 1579; but, unfortunately, no one can dispute the fact that Portugal allowed her finest poet to die on a poor hospital pallet, worn out with penury and neglect.

On entering that portion of the Champ de Mars Picture-gallery appropriated to Spain, a feeling of rest and satisfaction pervades the visitor who has been journeying through the other ugly galleries, all hideously "got up" after the frightful French pattern, of brick-dust-coloured walls, and ragged heggary ceiling. But here, though the tint of the walls is not much better, being of a dusty-blue lilac, that reminds one of the alicampagne of one's childhood, there is an evident striving after better things, which is consoling, and the result also is tolerably satisfactory. The entrance to the apartment is exceedingly good, being decorated with delicate raised ornamental work in plaster; and the high black dado to the alicampagne walls is effective; while under the ceiling a broad fringe runs round the room, formed of short coupled columns, with between each pair a large oval of sage-green, on which the artists' names are painted in bold gilt letters. The ceiling is formed of white muslin stretched tightly across, and decorated by blue lines, that edge it on all sides, and are repeated about 2 ft. in; thus cutting off a wide frame, as it were, from the large centre portion, and being joined diagonally at the corners, these blue lines give exactly the appearance of a deeply coffered ceiling, which seems to add to the height of the room. On each side of the said blue lines a delicate ornament of red tracery winds along, and the effect of the whole is cool and pleasant, like ground glass or frosted window-panes.

When I went through the Spanish pictures no numbers nor titles had appeared on any of them; nor yet the artists' names, beyond their own hieroglyphical scratchings on some corner of the canvas, from which it was not always an easy matter to dig out the required information. Fortunately, the subject of each work is a safer guide; and with the help of this clue, and the perverse French catalogue—which seems to pride itself in omitting just the particular item of information one most desires to obtain—I proceed with my inspection. Alta has a life-sized fresh young face, lying turned half-downwards on a pillow; with red hair, and a sort of feminine blue blouse on the bust and arms, that in richness of colouring would delight our P. R. B.s. Antonio Gishert has five works, two of them portraits, and two others, with small-sized figures, most charmingly painted: in one, a youth is seated outside a window on the wide sill, playing a guitar. He is dressed in black velvet tunic, with red tight-fitting leggings and

red cap; and beside him is the green damask curtain of the window. And in the other is seen a flute-player, in slashed doublet and grey hose; both these are pictures to be coveted. Pablo Gonsalvo has an "Intérieur" of some council-chamber, very carefully painted, even to the dust that has lodged on the interlaced carving of the tall dark wooden shutters; Heraldez Acosta, "Daphnis and Chloë"—he a young peasant with a bird's nest in his hand,—very effective at a little distance, but indistinct and confused near; as is also a sleeping goat-girl, by Agrasot, which hangs next to it. Léon y Escasura has three *tableaux de genre*, one of which is a "Studio," and another, the interior of a cabaret—*posada* is, I believe, the proper word—in which a musician is seated on the end of the table, and is evidently excruciating his hearers, who are seen stopping their ears, and endeavouring, in vain, to become deaf to the torment inflicted on them. Maureta has a touching picture, "Le Tasse se retire au Convent de Saint-Onfroi, sur le Janicula;" Palmarioli, "Sermon à la Chapelle Sistine," where the red and puce dresses of the numerous audience (of clerics grouped around, some of them reclining on the pavement), and which are relieved by only one grey and a few white robes, have a singular, but rich, appearance. The Pope sits enthroned to the left; and he alone appears to take the slightest interest in the preacher's words, for all the others look dreadfully weary and sleepy. It is curious to see what pleasure the followers of St. Peter seem to take in "showing up" the follies and vices of their "pastors and masters," the while they bow so servilely to their spiritual sway.

Ruizperz sends two excellent pictures—small size. In one a man is seen sitting outside a cabaret playing on a guitar; and in the other—which was exhibited not long since in London—a priest, two women, and a man, are turning out, and throwing from the window, books from a bookcase, in the absence of the owner. In Domingo Valdivieso's "Première Communion" the girls are all so snugly that, aesthetically considered, it would be little to be regretted if it were their *last* instead of their *first* communion. The white cloth held across by the two acolytes, lest a sacred crumb should fall to the ground, and supported by one hand of the girl who is kneeling, has a novel appearance to Protestant eyes. Francisco Sans, in "La Mort de Thurrucá," shows a spirited sea-fight, in which the spectator seems to stand on the deck of the vessel where Thurrucá lies. The foreshortening of the sailor, in shirt-sleeves and turned-up brown trowsers, who is running up to him and away from the gazer, is very clever, and the colouring excellent.

"Kingly and Imperial" Austria indulges in the same ugly walls, frightful ceiling, and gritty, sloppy floor, as do almost all the other nationalities; but many of its pictures are extremely interesting. The late Fritz Allemand has two battle-scenes, one a combat at Oversee,—which is also *over snow*,—is very truthful; Dell'Acqua (called Dell'Acqua in the French catalogue) has a terrible "Episode de la Guerre civile de Bologne," in which Imelda de Lambertazzi finds her lover, husband, or brother, murdered outside her door. Eyll has an exceedingly clever picture of an old woman, with a singular masculine-looking fur cap on her head, praying, with the help of Bible and rosary. Friedlander "Les Stratégistes," that recalls Wilkie's "Village Politicians," and where some men are seated round a table, on which lies a map, in a small cabaret; or, perhaps, as we are in Austria, I ought to say "Gasthaus." Gauermann has some clever animals—small size, with a stormy sky; Hansch, four charming little landscapes, two, in particular, called "Site dans les Montagnes," price 800 fr.; Raab, "Une Vieille," the bust of a young girl, in a jewel-laden violet-coloured cloak, against a tender "daffodil-sky," which is charming; by the late Professor Raab, "Frais pour l'Université d'Athènes," on a gold ground, very bold and effective; Schön, "La Nuit et le Matin," price 4,000 fr., which reminds of Hogarth, and shows the clear, calm sunrise looking in through the just-opened windows of a richly-furnished room, on the *débris* of a night of drinking and rioting. Of Schrotzberg's portraits, the catalogue says No. 72 is "the Archduke Charles-Louis," and if that's true, he is a very pretty girl. Manrice Than has a winking, bewildering picture, "L'Amour de Fata Morgana," in which a lovely female figure floats beside and embraces a handsome rider on a winged horse; the price of this is 2,500 fr., and the size medium. Ocho Thoren has a life-size

* See pp. 349, 374, 393, 413, ante.

portrait of the Emperor Francis-Joseph (on a large canvas), in which he is pretty good, but his horse is a perfect bré-à-te, the like of which is never seen in a modern picture-gallery; and talking of large canvases, here is the *champion* of the whole Exhibition, "Victoire du Prince Eugène sur les Turcs à Zontha," which stretches over about 24 ft. by 18 ft., inside the huge frame. Some "Bœhémiens," by Raffalt, camping out in a dusty plain, are good; as is also a "Tête d'Etude," by Wertheimstein.

Several statuettes in bronze, of a light copper colour, by Fernknor, are extremely spirited. They seem to be sketches for large statues. The price put beside some of them in the catalogue is 1,750 fr.

In Wirttemberg's tiny collection, Banerle's two pictures, "Les Orphelins," and "Dans la Chambrée des Enfants"—the latter especially—are very satisfactory. Upon Haerberlin's extremely clever "Ejection of the Monks from the Cloister of Alpebach" the verdict pronounced cannot fail to be "Serve them right;" for a more sneaking-looking set of men (varied by the wicked determination to be avenged some day, on the visage of him who looks from under his brows at the gibing soldier) it would be difficult to find. Not even the women-folk, who usually side with the clergy, seem to have a regret or a kindly word to spare for the mean-spirited crew, who go forth, taking with them as much of their worldly goods as they can possibly carry in their arms and well-filled sacks.

Theodore Schütz's "Family of Snaiban Peasants preparing their Repast in the Harvest-field," suggests Millais's "Apple-blossom," though here a beautiful view is seen from under the shading trees; the corn and the figures are admirably done, down to the baby in his wooden cradle; but the gigantic cows in the foreground are out of all proportion, and are sad hits.

Hans Gude, in the Baden collection, has two beautiful landscapes, one "Montagnards Norwégiens se rendant au Printemps à leurs Chalets," in which the effect of the figures going up the winding footpath carrying their simple household requisites, half seen against, half blending with the slightly misty mountain atmosphere, is charming, and nature itself. In the other a fisherman and maidens are in a boat crossing a still piece of water; and this also is a lovely work. Mlle. Hermine de Rech has a clever picture on coarse twilled canvas, "Retour d'une Faucheuse," of which the price is 15,000 francs; and L. Kachel has a very P.R.B. landscape, in which are two figures, a youth and a girl, he putting a betrothal ring on her finger. The frame to this picture is exceedingly agreeable, being trellis-work and birds, in natural colours, on a flat gold band; and at the top sits a little Cupid playing a violin. Why don't we have some novelty in our frames in England? This is the second example of this style I have noticed in these foreign galleries, and the effect is very pleasing and a great relief after the redundancy of gilt and plaster ornamentation in which our frame-makers too often run riot.

"Ein Sturm," by F. Sturm (called, though, *Tempête sur Mer*), is good; and Werner's picture of "Conradin de Hohenstanfen et Frédéric de Bade en Prison à Naples, attendant leur Condamnation à Mort, Août 1268," in which the two poor young men are interrupted in a game of chess, showing how little they anticipated the event, makes one reflect "what pleasant times those must have been."

The picture of the Grand d'uchy of Hesse—and actually one of its two oil-paintings, but cleverly arranged and carefully painted—is Schloesser's "Fruit défendu," in which a school of peasant-boys are learning to smoke during the absence of the master. One boy, evidently the captain of the school, and an experienced hand at the "forbidden fruit," is seated on the table, with arms crossed, and puffing away leisurely. Several beginners are looking awfully pale and sick. One poor little fellow is leaning against the wall with head drooped on to his folded arms. Another stands screening himself in a corner from the sight of the happier few who are adepts; and, as a climax, the rough-and-ready schoolmaster, with a look that means mischief, is peeping round the door he has noiselessly opened, preparing, like a cat, for the spring on his prey. R. F. H.

SOUTH WEALD.—It has been resolved to restore the parish church, on plans by Mr. Teulon, of London, and at an estimated cost of 6,000l.

THE WATER SUPPLY FROM THE THAMES.

A PAPER "On the Water Supply of the Metropolis, in relation to the Conservancy of the Thames and its Tributaries, and the Demands of the Water Companies," by Mr. J. Bailey Denton, has been read by that gentleman at the Society of Arts. Mr. Denton entered at some length into various questions, such as the amount and variation of the rainfall, storage, pollution and purification, quality and quantity, the companies and the Thames conservators, application of sewage to the soil, &c.

As to the powers of the Board of Conservators, Mr. Denton said.—Though they have authority to prevent the continued abuse of the river by pollution, they cannot prevent a legitimate use of its waters as population and trades increase, and agriculture may require it; and though they would successfully resist the water companies taking out of the river more than they have parliamentary powers to take, the Conservators have no power to force compensation from storage, let the effect be what it may. With powers of so little practical advantage as respects water supply, it is difficult to understand for what purpose the water companies are paying the additional 5,000l. a year, which, by the Act of 1866, they are collectively bound to pay. The first contribution of 1,400l. a year may be taken as payments incident to, though not directly for, the abstractions at Hampton, which in some degree affected the navigation below; but with respect to the last payment of 5,000l. a year, there exists no similar reason, inasmuch as the companies have no additional powers given to them, either to take more water, or to abstract it higher up, where it would affect the navigation above Staines. The payment could be understood if, by any actual expenditure on the part of the Conservancy Board, the additional quantities of water the several companies have yet the power to take were positively secured to them, without raising any objection on the part of the public interested in the river. If, on the contrary, the 5,000l. a year is, as I have supposed, required to maintain the river banks and works for the upper navigation, it would only appear right that those interested in, and to benefit by, that navigation should find the money, particularly as the Act recites that "if the duties of the conservancy of the upper part of the Thames were efficiently performed, the traffic on the navigation, and the income derivable therefrom, would considerably increase." With this expectation, there could have been no difficulty in raising any required amount of money by a loan, repayable by instalments, extending over a sufficient length of time to realise the assumption. As it is, however, the interests of the public have been sacrificed, and a prejudicial compromise effected. The water companies doubtless consider that they are paying their 1,000l. each for the privilege of drawing their water from the Thames as it passes by Hampton in whatever condition it may be secured to them by the proceedings of the conservators of the river, and that they are compensated by the payments they make from compensating the river for any quantity they may in future take out of it, within the limits of twenty millions of gallons each, even though the flow of the Thames may from other causes be materially reduced. No doubt the companies are justified in so regarding the arrangement, but it remains with the public to say whether some modification must not take place.

The quantity of water yet to be taken from the Thames under existing Acts is forty millions of gallons daily, and this is likely to be increased by the ten millions required by the East London Water Company. This company, with the New River Company, have absorbed the entire dry weather volume of the Lea, after the navigation has taken its prescribed quantity, and the company is obliged to come to the Thames for its immediate wants, no effort having been made in the valley of the Lea to store its surplus waters.

So great is the increase of demand for water in the metropolis, that it may be but a very few years before the maximum quantity which the companies are empowered to take may be reached. In the meantime winters may succeed, like the last, in which the valleys of the Thames and its tributaries may be in a state of inundation, involving local losses of an immense aggregate amount; and it may be fairly asked whether a compact such as the Legislature has sanctioned shall continue to have effect without an

effort being made so to balance excesses that the evil of one season may be turned to the benefit of another.

It is only in this way that we may satisfy the question of quantity; and, having placed before you in earnest terms the difficulties resulting from the Parliamentary compact I have referred to, I leave it in your hands for consideration.

As to the question of quality, it may be found that the towns called upon by the conservators to discontinue the discharge of their sewage into the river, may evade purification by the adoption of imperfect works. Some may have recourse to irrigation on river-side meadows without drainage, whereby, as I have already stated, the effluent water may flow into the river clear to the eye, though almost as foul as before. Others will adopt different expedients, but all will abstain as long as they can from incurring the extra expense of lifting the sewage on to high grounds, or even of under-draining the irrigated lands (which, as I have said, should always be insisted upon where natural drainage does not exist), to secure the necessary absorption which is essential to that degree of purification required by water-drinkers.

We may view the application of sewage to land in three ways:—

1. That sewage run over a surface of land which has neither natural nor artificial drainage to assist vegetation in retaining the deleterious elements, altogether fails to secure that degree of purity which will allow of its being discharged into rivers, from whence may be taken water for drinking purposes, though the operation may serve to clarify and improve its character sufficiently to allow of its being utilized in rivers for navigation, and for many other riparian uses.

2. That land artificially drained to a depth of a few feet affords, if irrigated, only an imperfect means, in conjunction with vegetation, of separating from sewage its objectionable elements.

3. That where sewage can be lifted to high and fertile grounds with a free and porous subsoil, which will admit of its penetration to a considerable depth after it has fed vegetation on the surface, a perfect means of purification may be attained.

HOW TRADE LAWS ACT AGAINST THE POOR.

To help a poor boy up the ladder of life has been esteemed a worthy act. Many a man now an eminent citizen of London has swept out the shop as a boy, or run of errands. We may learn what assistance is given by union laws to a poor man's child, from the evidence of Mr. Manly before the Commission on Trades' Unions. There is a rule insisted on by the men at Manchester, "That no employer shall be permitted to have more than one apprentice at one time except in cases where an apprentice is in the last year of his servitude, then such an employer may have a second apprentice." Now, of course, in a town like Manchester, where many of the larger masters employ 70, 80, or 100 bricklayers, the operation of a rule which enables them to have only one apprentice at a time would be, he said, that in the course of ten or twenty years, when the present generation of bricklayers died out, there would not be a quarter of the number to take their place. In reply to an inquiry by the Earl of Lichfield, if he knew of any instance in which a dispute had arisen in consequence of the masters not abiding by the rule as to apprentices, the witness said,—

"Yes. Here is a case from Lancaster:—William Waterhouse, son of the late W. T. Waterhouse, who was a near relative to me, was taken from school at the age of twelve and a-half years, and was engaged as an office-boy at 5s. per week wages. His father was out of work two or three years, and died about eighteen months ago, leaving a widow and eight young children totally unprovided for. At the request of Mr. Alderman Brockbank, of Lancaster, I consented to take William Waterhouse as an apprentice to the trade of a plasterer. He came to me on the 10th of September, 1866, and I kept him in the office the first week. At the end of the week, on the 16th, I got the inclosed notice from the men who struck work on the 18th, and the question still remains as they left it. Some of the men have left the town, and the remainder are in the receipt of 10s. per week. For the first two months they received 15s. per week from

the club. This was the notice:—'Sir: This is to give you notice, that the boy Waterhouse will not be allowed to be bound apprentice to the trade of a plasterer by the rules of this society. If hoond contrary to the rules you hold, the men will be obliged to cease work on Tuesday morning, the 18th of September, 1866; and if kept to assist plasterers in their work, it will be contrary to rules also. By order.' And it is signed by a cross. I can only, of course, attribute that to the union, by the fact that the Union of Plasterers acted according to that notice."

ARCHITECTS AND DIOCESAN CHURCH ARCHITECTS.

THE plans for the proposed church at Tything having been objected to by the Diocesan Church Extension Society, have been withdrawn, and Mr. Gilbert Scott has been selected as the architect for the new building; Mr. Allsop, whose plans were not approved of by the above society, having declined to alter them or to send in new ones, on the ground that "to satisfy the architect who is assisted by the Diocesan Church Extension Society, and who then sits in judgment upon his own designs, is more than I feel disposed to do." It is stated in reply that Mr. Hopkins, the consulting architect of the society alluded to, declined to give any opinion as to Mr. Allsop's plans,—a duty which was accordingly performed by another professional gentleman. The building committee, we are told, have passed a resolution sympathizing with Mr. Allsop, and presenting him with 10l. for his loss of time. Whatever may be the merits of the present case, this "diocesan-architect" question is calling for discussion and plain speaking.

THE TRADES MOVEMENT.

Chester.—A strike is pending amongst the carpenters and joiners. The stonemasons employed at the new Town-hall a short time ago obtained an increase of 3s. a week in their wages, and the carpenters and joiners seeing that the masons had obtained extra payment for their labour, commenced a movement to obtain 2s. more wages, and half an hour less time on the Saturday. The carpenters and joiners resolved "that the men leave work on Friday next, if the masters do not comply with the demands made upon them. If the masters comply, the men to be paid an advanced rate of wages, viz., 5s. per day for Monday, 5s. 4d. for the four following days, and 3s. 8d. for Saturday" (30s. in all). They have abandoned the demand for half an hour less on Saturday, however, and only ask for the extra wages. Several employers have complied with the demands of their men. Mr. Hughes, the contractor for the new Town-hall, who has also several large jobs on hand in the town, has not conceded the extra money, and in consequence the men employed by him have left their work, with the exception of about half a dozen, who, to use the term of the fraternity, have "gone in black." There are four or five other firms who have not given way.

Nantwich.—The men connected with the building trade here struck work because, although their employers agreed to give them a half holiday on Saturday as they wished, they coupled it with a condition that they would come to work at six instead of seven on Monday mornings, as on other days. The condition, however, has since been withdrawn, and the men have resumed work.

Wrexham.—In reference to the Joiners' strike a meeting of the operatives has been held, when they were addressed by the union secretary (Mr. Last, Manchester), in a lengthy speech, in which he strongly condemned strikes, and contended it was the masters who had been the cause of the present one. He also advised the men, however, the thing having taken the turn it had, to remain firm in the course they had adopted.

New Zealand.—Bricklayers earn in New Zealand 1s. per hour; plasterers have as good wages; while masons earn from 10s. to 12s. per day of eight hours. House carpenters and joiners can earn with ease 6l. per week; while blacksmiths, coopers, wheelwrights, the tin-smiths, and printers earn proportionately high wages.

INAUGURATION OF THE BRIGHTON PAVILION - DOME ASSEMBLY AND CONCERT ROOM.

The royal stable is now a great concert-hall and assembly-room: the royal *meus* has been dedicated to the muses. The stables and riding-school, of which the dome forms a principal feature, were built at a cost of about 70,000l. The Alhambra, in Leicester-square, with which the dome has been frequently compared, is much smaller in nearly every respect, but has cost in erection and improvements 100,000l. The stables were inclosed by glazed fronts. These inclosures have been removed, the heavy wooden supports replaced by iron pillars, and the whole of the space once occupied by the stables is now available for the audience. An immense chandelier has been suspended from the roof, composed entirely of glass, whilst twelve smaller ones are suspended from brackets. The prevalent tones of the dome are of tertiary colours, warm browns, which bring down the altitude considerably, and act as a foil to the more brilliant colouring below. Below the dome comes a rich cornice, and then the Moorish arches above the gallery, of varied span, and very symmetrical in form. The spandrels of these arches are painted with black figures on a chocolate ground, and the arches are all edged with gold. The front of the gallery is of open ironwork. Below the decorations of the cornice the brackets of the chandeliers and the capitals of the pillars are very rich in gold and primary colours. The decorations are Saracenic. Mr. Tony Drury was the decorator. The area under the dome is 50 ft. in diameter in the clear of the columns supporting the gallery front, and the site of the stables is 22 ft. on each side, thus making the extreme diameter 124 ft. The height to the springing line is 30 ft., and the total height to the iron grille under the lantern is 61 ft. 6 in. The orchestra occupies the width of three large bays of the dome. Under the orchestra are retiring-rooms for the performers. The available floor-space is over 7,000 superficial feet. The tenders for the performance of the work were as under:—For the builder's work, Messrs. G. Cheesman & Co., Brighton, 3,710l.; for the decorator's work, Mr. T. Drury, of Warwick, 1,420l.; for the gasfitter's work, Mr. H. Greene, Pavilion-buildings, 426l.

HOUSE OF COMMONS.

The University of London.—In reply to Mr. Goldsmid, Lord J. Mansergh stated that he could not say when Mr. Penneothorne was likely to finish the new design. The view he took of the vote the House arrived at last Friday was that the House wished itself to decide on the design; and therefore he should ask Mr. Penneothorne to place it in the library. He did not think it would be any part of his duty to submit the design to the senate of the London University.

Gases from Sewers.—Sir G. Stucley asked the Vice-President of the Council whether his attention had been called to the present system of ventilating the sewers by shafts covered with open iron gratings placed in the centre of narrow and much-frequented thoroughfares; and whether the gases dispersed by means of such gratings could not be carried off in some other way.—Lord R. Montagu said his attention had been called to the matter. No smell, however, issued from sewers which had been well constructed, and were well kept. It was from a deposit that the noxious gases arose. If a sewer were smooth and well flushed, all deposits were swept away. If sewers were not ventilated into the streets, they must be ventilated into houses. If shafts were carried up houses for sewer ventilation, private property was interfered with. All this, however, was the business of the local authority, with which the central Government has nothing to do.

Metropolis Subways Bill.—It was ordered that the committee on the Metropolis Subways Bill consist of Messrs. Tite, Floyer, Jackson, McCullagh, Torrens, and Paull, and five members to be nominated by the Committee of Selection. The Bills allowed to be introduced were brought in and read a first time.

National Gallery Enlargement Bill.—This Bill was put through committee, read a third time, and passed.

The Building of Barracks Abroad.—Mr. Oliphant asked certain questions respecting the decision to erect barracks in Ceylon, the Straits Settlements, China, and Japan. Beginning with Point

de Galle, he said he had learnt with great surprise that barracks were to be erected there; for neither the health nor the discipline of the troops could be secured by it. He concluded by moving "That, in the opinion of this House, it is desirable to postpone the construction of barracks in those places until after the report of the select committee upon the distribution of troops in India and the colonies shall have been received."—Sir J. Pakington said it would be absolutely impossible for any arrangement to be concluded with reference to the construction of barracks at Point de Galle within a much longer period than would be required for the production of the report of the committee. With respect to the situation of any barracks which might be constructed at that place, the Government had not come to any decision whatever about the locality; and he could not suppose that the authorities would place the barracks in a low and unhealthy situation in preference to a high and healthy one, which he understood was easily accessible.—Sir H. Verney did not approve of leaving this matter in the hands of the colonial authorities. More men had been lost to this country from the construction of barracks in unhealthy situations than from any other cause. He hoped the right hon. gentleman would take care that the barracks were built in a healthy spot. The motion was withdrawn.

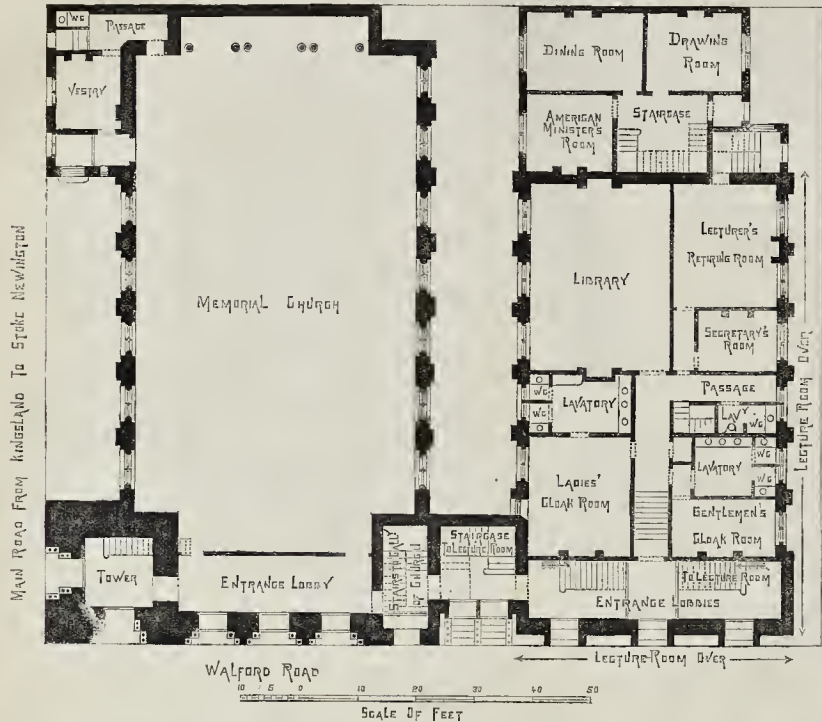

The "Black Death."—Mr. Verner asked the Chief Secretary for Ireland whether he had received any information from the Registrar-General, or other authority, with regard to the very fatal disease called in the newspapers "Black Death," which had of late been prevalent in the neighbourhood of Dublin.—Lord Naas said in reply,—"There have been in the neighbourhood of Dublin, since the 13th of May, 1866, about fifty deaths which are certified as having been caused by *fibris nigra*, or *puerpera maligna*; but I may state, on the highest medical authority, that those diseases bear no analogy to the "Black Death" of the Middle Ages.

TOWN DWELLINGS FOR THE POOR.

This urgent question is being actively dealt with in Liverpool, by the authorities. At a recent meeting of the town-council, the committee to whom the matter has been deputed recommended that the tender of Mr. James Callie, for the erection of labourers' dwellings, in Silvester-street and Ashfield-street, according to the amended plans submitted by the borough engineer, for 17,964l. 16s. 7d., be accepted, and that application be made to Government for a loan.

Mr. Alderman Dover, in moving the confirmation of the recommendation, said it would be remembered that some twelve months ago the committee were authorised to purchase land to the value of, in round numbers, 20,000l., and the land on which it was proposed to erect these dwellings was a portion of that land. Having obtained an estimate for the erection of the dwellings, he should say in candour that the committee were disappointed. They were under the impression that the estimate would show a profit, but it did not do so, though he was happy to say that, if the data were correct, it did not, at all events, show a loss. The Health Committee thought that, inasmuch as they had been the means of demolishing a large number of labourers' dwellings, which had not been replaced by parties out-of-doors, it was their duty to make an effort to replace them; and though the calculations did not in this case show a profit, he thought that the accomplishment of so desirable an object as that of providing healthy dwellings for the working classes would be a sufficient justification for the erection of the buildings. It was calculated that they would give a return of 4½ per cent. upon the cost, and the committee thought that, in the present state of the money-market, and with the disposition of the Government to lend money at 4 per cent., a small profit might be made. The cost of the land would be 3,290l., and the cost of the buildings, 18,192l., making a total of 21,482l. 12s. 11d. The accommodation afforded in the various dwellings would be as follows:—

Shops: First class consists of the shop, one living-room, two bedrooms, scullery, and closet. Second class consists of the shop, one living-room, one bedroom, scullery, and closet. Third class consists of the shop, one living-room, one bedroom, scullery, and closet—not so large as the second class. *Houses:* First class consists of one living-room, three bedrooms, scullery, &c. Second class consists of one living-room, two bedrooms, scullery, &c. Third class consists of one living-room, one bedroom, scullery, &c. Fourth class consists of one large room, 20 ft. by 11 ft. 6 in., with scullery, &c.

INTERNATIONAL MEMORIAL CHURCH AND LECTURE ROOM --- Plan.

Objection, he had no doubt, would be raised to this latter class of house; but there would be a keeper on the premises, and care would be taken that only one individual, or a man and his wife, should occupy these single-roomed dwellings. It was not a large amount which the council were asked to invest in this property, and he thought it was well to make the experiment. The rents proposed to be charged were as under:—

First class: Fourth floor, 5s.; third floor, 5s. 3d.; second floor, 5s. 6d.; first floor, 5s. 9d.; ground floor, shops, 6s. Second class: Fourth floor, in street, 3s. 9d., in court, 3s. 6d.; third floor, in street, 3s., in court, 3s. 9d.; second floor, in street, 3s. 6d., in court, 3s. 3d.; first floor, in street, 1s. 9d., in court, 1s. 6d.; ground floor, shops, 7s., in court, 4s. 9d. Third class: Fourth floor, 3s.; third floor, 3s. 3d.; second floor, 3s. 6d.; first floor, 3s. 9d.; ground floor, shops, 6s. Fourth class: Fourth floor, 2s. 6d.; third floor, 2s. 9d.; second floor, 3s.; first floor, 3s. 3d.; ground floor, 3s. 6d.

His impression was that the rents were low, and that there would be no difficulty in obtaining them, or even higher ones; but he thought it would not be desirable to ask more than would enable these buildings, so to speak, to pay their own way. He moved the confirmation of the recommendation.

A memorial from the Land and Houseowners' Association was read, asking that the proposed cottages be not built, and that the existing building and sanitary laws be relaxed, so as to enable builders to erect and maintain small separate cottages for the working classes.

Mr. Alderman Cooper opposed the recommendation. He said private builders had been driven out of the market entirely by persention. He moved, as an amendment, that the matter be referred back.

Mr. Robinson and Mr. Picton also opposed the recommendation.

After a lengthy discussion the council divided on the amendment, with which had been incorporated an instruction to the committee to offer a premium of 200l. for the best plan, which was carried by 25 votes to 15. The Health Committee have since referred the question to the sub-committee on Laborers' Dwellings.

INTERNATIONAL MEMORIAL CHURCH AND LECTURE ROOM.

This church is to be erected on a site purchased in the principal northern road out of London, viz., the Kingsland and Stoke Newington-road, and nearly opposite West Hackney Church. It is intended to be commemorative of the abolition of slavery in America, and a memorial also of the President who fell in the strife, and it will be devoted for one part of each Sunday to the use of the Americans.

It will be "International" in its uses, and memorial in its dedication.

It is remarkable that, notwithstanding our great intercourse as a nation with America, and the large number of persons from that country either resident in or passing through London, no place of worship exists in the metropolis the service in which is stately conducted by an American in the American manner, though the Parisians, with fewer ties of relationship, have provided such a church. It is now intended, therefore, to supply this lack, and it is believed that the closer intercourse so brought about between the clergy and others of both countries, and the better means of comparison afforded, will increase the liberality and wisdom of many on each side of the Atlantic. The other services will be those usual in the Independent body, by whom the erection is undertaken, and to this denomination the stated minister will belong. The building will be placed in trust for these purposes in the hands of Mr. Benjamin Scott, the City Chamberlain, Dr. F. Tomkins, of the Inner Temple, and others.

A small chapel, on a site closely adjoining, was erected two years since to serve first as an introductory chapel for this larger one, and afterwards as the school. This building will be named Lincoln School.

There will be accommodation for 639 sittings on the ground floor, and other seats for 218 in galleries at the end and two sides. The latter will be only one seat in width, and all the galleries will be below the level of the windowsills. The windows are placed high in the walls,

in order that they may not admit the noise of the great traffic on the road. The whole of the light will, therefore, be admitted over the galleries.

The interior will be 96 ft. by 48 ft., and have a flat coffered ceiling of wood. The height of the spire will be 180 ft., and with all weatherings to the buttresses, will be of Portland stone: the remainder of the dressings will be of Box ground stone, and the walling of Kentish rag.

The lecture-room at the side will occupy the area of all the apartments shown in the plan, and is for general educational purposes. It will seat 670, including those in the galleries.

The floor will be raised 10 ft. 6 in. above the pavement, and below it in a basement story will be a library and retiring and secretary's rooms. The erection of the structure is largely assisted by Mr. Samuel Morley, in the neighbourhood of whose residence the site is, and the lecture-room is in part to meet a wish of Mr. Morley's to provide such a building in the locality.

The lobbies at the northern end of the chapel and lecture-hall communicate with each other, so that the united length, with its numerous doors, can be made available for either part, and the two buildings can be used together with convenience upon special occasions. Two other entrances are provided at the side of the church, viz., one for the minister and one for the congregation; and the central entrance (that for the basement), in front of the lecture-hall, is so separated from the others by screens internally that the uses of the library, and other rooms in the basement, need not be interrupted when public meetings are held in the hall above.

In the rear of the lecture-room will be a minister's house, with two rooms for the use of the American minister for the time being.

The site is easily reached by the North London Railway or by omnibuses, and it is on the crown of a rise in the road, and visible from a great distance.

The estimated cost of the whole is 13,000l., exclusive of the land.

INTERNATIONAL MEMORIAL CHURCH, KINGSLAND-ROAD, LONDON.—MR. HENRY FULLER, ARCHITECT.

THE METROPOLITAN MUNICIPAL ASSOCIATION.

THE first annual meeting of this association has been held at the rooms of the Social Science Association, Adam-street, Adelphi, for the purpose of receiving the report of the committee, and transacting general business.

Lord Ebury, the president of the association, took the chair, and made some introductory remarks, in the course of which he said that the main object of the association was the attainment of a legislative enactment that would secure a more direct and thorough municipal representation of the ratepayers, and a more responsible, efficient, and economical form of government for the metropolis.

The report was adopted, and the following resolutions agreed to:—

1. That whilst the report of the committee of the House of Commons suggests most valuable improvements in the government of the metropolis, the Bill introduced by Mr. Mill to establish municipal corporations continuous with each Parliamentary borough embodies, as to the form of government, more fully the views of the association, and is similar to the scheme proposed by the Royal Commissioners (Lord Taunton, Sir G. C. Lewis, and Mr. Justice Pattison) in 1854; this association determines, therefore, to support such Bill.

2. That the co-operation of the City of London and the vestries of the metropolis be invited in support of the proposal to enlarge the administrative areas in the metropolis, and to extend the Municipal Reform Act, so as to make such districts municipalities; and that it is desirable that other Bills should forthwith be prepared providing for the establishment of a central "municipal council" for purposes common to all London, so as to extend the municipal system of the Corporation of the City of London to the entire metropolis."

The following gentlemen were elected to form the executive committee for the ensuing year:—Messrs. Z. D. Berry, Bonthron, Dr. Jabez Burns, F. Edwards, Jun., Dr. Hardwicke, G. Horton, Hastings Hughes, F. Kneustub, G. P. Miles, J. W. Probyn, J. Rables, E. D. Rogers, and James Beal.

ARCHITECTURAL PUBLICATION SOCIETY.

THE annual general meeting of this Society was held on Friday, the 31st ult., at the rooms of the Royal Institute of British Architects, Conduit-street.

The chair having been taken by Professor T. Hayter Lewis, the secretary read the report of the committee, which contained the following passages:—

"The audited balance-sheets annexed show that the receipts on account of the sixteenth year, 1863-65, has been £502, 19s. 3d., and the expenditure £503, 11s. 1d.; and that the receipts on the 17th on account of last year, 1866 (seventeenth year), has been 314s. 8s. 10d., and the expenditure 237l. 4s. 6d.

It is to be remarked, however, that of the amount actually expended in the production of the Part 17 of the Dictionary, only 171l. 3s. was provided by subscription on account of that year, a fact hardly creditable to the profession, if it be taken as evidence of their liberality or their respect for the rights of the extensions of the committee and officers to benefit the entire profession by the production of a publication which has no parallel.

This great undertaking has passed the half of the quantity originally estimated, and its completion at no distant date may be considered as secured; this is therefore the moment for all who have hitherto stood aloof, doubting the possibility of success, to come forward, and by siding themselves to those who have up to this time borne the burden of the struggle, to share with them the advantages secured by their expenditure of energy and capital, and hasten on the work to its successful end."

In moving the adoption of the report, the Chairman called attention to the favourable progress which had been made with the Dictionary, and compared it with that of other similar works. He showed that the peculiarities of the scope and range of subjects dealt with, and the necessity for giving exact and full information within a very limited space, tended to impede the progress of the text; and that even in a case like that of the dictionary of M. Villet le Duc, about fourteen years had elapsed from the commencement, and the work was still incomplete, although dealing with only a single branch of one subject. The completion of the letter K, and the progress made with L, were very encouraging; and if the subscribers would exert themselves in the spirit mentioned in the report, and make this valuable work more widely known, the progress to completion would be rapid. The Dictionary was so highly esteemed that all the early parts had been for some time out of print, until the committee incurred a heavy expenditure to reprint them; so that new subscribers might be supplied with new sets of the work. This stock was, however, limited, and, when once exhausted, could not again be reprinted; so that there was every inducement

for all to whose interest it might be to possess a work of reference of such authority, so copious and original, and of so extended a scope, to at once become subscribers and secure copies before they became as scarce as the earliest publications of the Society.

In the discussion which ensued, Messrs. C. C. Nelson, H. R. Newton, Robert Kerr, Wyatt Papworth, &c., took part, and in its course the committee were strongly urged to use all endeavors in their power to expedite the production of the text, and to devise some scheme by which the liberal donation of 100l. promised by Mr. T. H. Wyatt might be applied usefully to that end, and he made the commencement of a loan or subscription to place in the hands of the committee sufficient funds to justify them in proceeding to conclude arrangements by which the constant services of a responsible editor might be procured, and other steps taken to secure the completion of the text within a reasonable period.

In acknowledging a very cordial vote of thanks, Mr. Wyatt Papworth observed that no one more earnestly desired the completion of the work than he himself; that he had no desire to abridge the labour necessary to render the future pages as satisfactory as were the previous ones; and that his exertions in carrying on the Dictionary had not yet tired him; and he hoped to be able to afford at least the same amount of time as formerly during the ensuing year for what was to him such agreeable labour. A vote of thanks to the chairman terminated the proceedings, and the meeting then separated.

PICTURES IN THE HAYMARKET.

SOME of our readers will remember Mr. Bierstad's interesting picture of "The Rocky Mountains." The same artist is now exhibiting at Mr. McLean's gallery in the Haymarket a work even finer,—"*A Storm in the Rocky Mountains.*" The treatment of the masses of thunder-clouds surging with the wind, of the parts in sunshine, and the passing shadows, is admirable. It is, in short, a beautiful and pleasure-giving picture. At the same gallery are seen two clever works of an entirely different kind of merit, by Mr. Henry Barraud,—"*The London Season*," and "*Hyde Park*,"—which include a very large number of portraits. Two or three doors off, Mr. William Bradford, of New York, is exhibiting a striking piece of realistic painting, titled "*Crushed by Icebergs*," wherein the truthfulness of the bright emerald green of the ice will be less readily accepted by those who do not know the northern regions than by those who do. It is not the result of a painter's latitude, but of the latitude geographical. The drawing of the ice-boat ship in the foreground might be improved. Also, in the Haymarket, Mr. Frith's capital picture of "*The Marriage of the Prince and Princess of Wales*" is now on view.

CONDITION OF THE GAOLS IN INDIA.

THE Gaol Report of the Madras Presidency gives an annual death-rate of 129 in the 1,000! Is it necessary to state any other fact to prove the necessity for immediate change in the system and the buildings used? Many of these are enormously over-crowded, and are most unsuitable in construction and situation.

The separation of criminals at night is an essential element of sound prison discipline; yet throughout the gaols of India there are but few separate sleeping-cells, sometimes as many as forty or fifty prisoners being locked up together, generally for twelve hours, and that without light. Under such circumstances it is no wonder that the prison officers find it impossible to prevent grievous moral contamination, and even heinous crime. Hardly any provision exists for the instruction of the prisoners, either by the appointment of suitable schoolmasters, or in any other way.

The case of the female prisoners seems to be even more deplorable than that of the males; since they not only suffer the same evils, but have the additional disadvantage of being left without any warders of their own sex, and in a great measure without care or help in their wretchedness.

The principles of convict treatment which have been adopted in this kingdom do not seem to have found their way into India. At this moment several new gaols are contemplated, and central prisons for long-sentenced prisoners are in course of erection; yet even in these the provision of separate sleeping-cells for all the prisoners does not form part of the arrangements, nor are the gaols generally being constructed in a manner suited to the adoption of a sound system of discipline. Immediate action seems, therefore, to be urgently required in order to prevent the expenditure of public money in a way which may hereafter be deeply regretted.

The Social Science Association embodied these and other statements in a memorial, and, last week, laid it, by a deputation (including the Hon. A. Kinnaird, M.P., Miss Carpenter, Sir Walter Crofton, Mr. G. W. Hastings, Mr. P. Urquhart, Mr. Baker, Mr. Godwin, Mr. F. Hill, and many other gentlemen interested in social and sanitary reform), before Sir Stafford Northcote at the Indian Office. Mr. Hastings urged the various points set forth in the memorial, and asked for the appointment of some person or persons versed in the improved treatment of convicts to be sent out to India to co-operate with the Government there in the establishment of a proper system of prison discipline. Sir Walter Crofton followed in the same direction; and Mr. Godwin alluded to the want of proper structural arrangements in the prisons, the necessity for care in the selection of sites, and the desirability of proper architectural supervision.

Sir Stafford Northcote appeared to agree in all that was advanced; said that the steps that had been taken by the Association would tend to strengthen the hands of the Government, and promised the matter serious consideration.

With the frightful death-rate of 129 in the 1,000 per annum in view, no other reason for immediate steps on the part of the Government can be necessary, and yet there are many that could be given.

THE PRUDHOE CONVALESCENT HOME.

THE foundation-stone of the Prudhoe Convalescent Home was laid on Tuesday in last week, at Whiteley, on the Northumberland coast, by Lord Warkworth, grandson of the Duke of Northumberland. The building is dedicated to the memory of the late Duke of Northumberland, and will be connected with the Newcastle Infirmary. The building will accommodate fifty patients,—thirty men and twenty women; and it will be so arranged as to be capable of extension at any future time. The ground, containing six acres and three quarters, was bought for 1,500l., and the building will cost 12,746l., exclusive of the engineering work, which is estimated at 3,000l. more. It will be erected by public subscription, to which Sir W. J. Armstrong has contributed 1,000l., with a promise of another 1,000l., provided a certain number of subscribers add a like amount by increasing their subscriptions. The amount subscribed exceeds 12,000l. The building is intended as a memorial of the many benevolent and munificent deeds of the late Duke of Northumberland. The architect is Mr. Thomas Oliver; and the clerk of works Mr. John Adams, of Newcastle-upon-Tyne. The contractor is Mr. Joseph Kyle, of Newcastle; and the amount of his contract is 12,746l. The building will be on the pavilion principle. The length of the frontage is 230 ft.; and the various offices will extend to a depth of 190 ft. backwards. The style will be a plain form of Gothic, and the material stone. The building has a central tower, about the middle of which, on a projecting pedestal, and under a carved canopy, a statue of the late Duke may hereafter be placed.

GIGANTIC RAILWAY BRIDGE ACROSS THE MERSEY.

THE extraordinary and constant increase of traffic on the London and North-Western Railway, between Lancashire and the South, induced the directors some years back to take steps to provide a new outlet for the traffic from Liverpool. Of the various routes surveyed, one *à* Runcorn was finally selected, though it involved the construction of an expensive and gigantic bridge across the treacherous shallows of the river Mersey, at Runcorn Gap. When the subject was finally decided upon, energetic steps were at once taken to push on the works. The foundation-stone of the bridge was laid in 1864, and it is at last rapidly approaching completion. The total length of the structure, including the slopes on either side of the river (there being sixty-five arches on the Lancashire, and thirty-two on the Cheshire, side of the river), is a mile and a half. The river will be traversed by means of a huge iron bridge, consisting of three "stretches" of wrought-iron girders, resting on two stone piers rising from the bed of the river, and two on the margins at either side. Each of these "stretches" measures 305 ft.; the height

above the river at spring-tides being 75 ft. to the under edge of the girders, and 78 ft. 6 in. to the surface of the rails. The framework of the bridge proper consists of four iron beams, which extend the whole length of the span, the outer beams being strengthened on both sides by a trellis-work 40 ft. in depth, which, while helping to bind the structure, gives to the barge mass a comparatively light and airy appearance. Of the arches which form the remainder of the viaduct, eighty-eight have each a span of 40 ft., and nine of 61 ft. 6 in. The total cost of the viaduct and bridge will probably exceed 300,000*l.*, while the result will be a shortening of the distance between Liverpool and the metropolis by about a dozen miles.

BURSTING OF AN EMBANKMENT NEAR FLEETWOOD.

Mr. Bowie, of Limerick, who had undertaken the filling up of a large aperture in Kirk Scar Bay, near Fleetwood, commenced active operations a few weeks ago there. A number of navvies made their appearance, and earthworks were thrown up in a circular form, extending a considerable distance inland from the aperture to be enclosed. Openings were at first left to allow free ingress and egress for the tide, but one by one these openings were subsequently closed, until all except one was shut, that being at the point nearest the railway bank, along the base of which the tidal current was strongest. To meet the difficulty of this last inclosure a double row of piles had been driven, at about 12 ft. apart, and all the force of joiners which could be mustered was got together to nail fast to these piles planks of deal 3 in. thick to resist the action and pressure of the tide. A hase of earthwork had also been made several feet deep to bank up and support the wooden fencing thus made; and by the addition of about fifty navvies from Barrow, making about 200 in all, it was hoped the resistance would be made successful. The men all worked energetically, and before the reflux of the tide the boarding was finished, and the spectators, of whom there was a large number, believed that the victory was certain. But half an hour before the tide had reached its height the water began to percolate the bank at the rear of the boards, and in a very short time, in spite of the determined efforts made to stem the current, the piles were lifted from their places, the deals rent asunder, and the water rushed back to its old domain. Several of the men had very narrow escapes.

MANCHESTER POLICE COURTS COMPETITION.

The committee for general purposes had resolved,—

"That it is undesirable to incur any unnecessary expenditure in the external elevation of the intended new police-courts, and that it is suggested that the amount to be expended shall not exceed the sum of 25,000*l.*" "That in order to save trouble, and to prevent unnecessary delay in the erection of the courts, it be recommended to the committee for general purposes to select an architect to prepare plans for, and superintend the erection of, the courts, on any site which may be selected by the corporation." "That it be recommended to the committee to select one of the undermentioned architects to prepare plans and superintend the erection of the new police-courts:—Messrs. Clegg & Knowles, Messrs. Mangnall & Littlewood, Mr. Salomons, Messrs. Speakman & Charlesworth, Mr. Waterhouse, and Mr. Worthington."

And further, as we stated last week,—

"That Messrs. Mangnall & Littlewood be employed to prepare plans for, and to superintend the erection of, the new police-courts."

Six days later the same gentlemen, under the name of the Council, met at the same place and upset their previous resolution, passing an amendment throwing the selection of architect open to competition between the architects named, by a majority of 34 to 17. Councillor Woodward proposed that the competition be thrown open to the whole of the architects of the city of Manchester. The amendment was seconded by Councillor Townsend, but was negatived, and the proceedings of the committee, with the exceptions referred to, were approved.

It was resolved that the sum of 50*l.* be paid to each architect from whom complete plans might be received, such premium to form a portion of the commission to be ultimately paid to the successful competitor.

The reason given by the members of the com-

mittee who voted against their first recommendation is, that the votes on the first occasion were not correctly taken, although this is denied.

We should mention that the police-court was formerly held in the upper portion of the post-office premises in Brown-street. On the failure of the post-office authorities to satisfy the Manchester people as to a site for a new post-office, they determined to enlarge the old one by taking in the police courts, which were then removed into Bridge-street, a large shop or hazaar formerly occupied by Falkner, Brothers, drapers, being adapted for the purpose. The corporation has also had to rent rooms from the county magistrates, in the assize courts, for business connected with the "city sessions," and the new courts are for the purpose of concentrating the municipal business under one roof.

THE WHITE VEAL INFAMY.

Nor months, but years ago, we pointed out repeatedly the horrible cruelties practised towards calves, with the view of rendering the flesh white to meet an unsound popular taste and opinion. Our statements were copied far and wide, universal horror was expressed, and,—the poor calf was bled and beaten to death by lingering steps as before. Now the cry of shame has arisen again: again the daily papers echo it. Let us hope that this time public opinion may be expressed so unmistakably and so loudly as to lead to the abandonment of the scandalous practices. We can express an immense amount of virtuous indignation as to "vivisection" in a neighbouring county, and quietly insist on the pursuance of equally abominable and even less easily justifiable cruelties at home. Could not the Society for the Prevention of Cruelty to Animals effectually interfere?

ENCAUSTIC PAINTING.

Last week Mr. Cave Thomas gave the second lecture of a series on "The various Methods of Painting," at the Gallery of the Architectural Union, Conduit-street. A former lecture was on fresco, this on encaustic painting. The lecturer observed that paintings executed with vehicles in which wax is combined in certain proportions rank next to frescoes in architectural propriety of effect. They possess, in a great measure, the same freedom from gloss, and can be seen from any point of view; moreover, they powerfully resist the action of acids, atmospheric corrosion, and damp. The ancient marble sculptures were sometimes saturated with wax to preserve them. Pliny enumerates and distinguishes three methods of encaustic painting.

1st. That in which the ancients used a stylus, and painted on ivory or polished wood, previously coated with a wax preparation. The stylus or stigma, served to draw the outlines and its spatula or blade end, to clear off the filaments which it ploughed up in the prepared ground.

2ndly. That in which colours were mixed with wax, and spread over the pictures with a metal spatula. The various colours being previously prepared and formed into small cylinders for use. By the side of the painter stood a brazier, which was used to heat the spatula with which the colours were smoothly spread after the outlines were completed, and thus the picture was proceeded with and finished.

3rdly. That in which painting was performed by dipping a brush into wax liquefied by fire. By this method the colours attained considerable hardness, and could not be damaged by the heat of the sun, or the deleterious effects of sea water. It was thus that they painted their ships with emblems; which decorations were finally smoothed and polished. This kind of encaustic, therefore, was styled "ship painting." Some writers have been led to suppose that "encansto pingendi" must be enamelling, but a little consideration of the word *ensis* in connexion with "urere," will show that burnt *in*, inscribed on the pictures of Lysippos, ought not to be taken in the extreme sense as applied to enamels. If this had been the case, the ancient ships must have been either copper or iron-sided, at least, to have withstood the process of firing required by enamel painting; and it is difficult to imagine a Roman enamelled first-rate man-of-war. Other passages in Pliny were also examined, and the experiments instituted by Count Caylus

in the latter half of the last century detailed. Mr. Thomas also described the methods of Lorgna, Hooker, and others, and concluded by expressing a belief that, whatever be the process ultimately adopted, encaustic will probably be preferred to fresco in this country; promising as it does a somewhat richer range of effect, and to be the less encumbered process of the two.

THE WINCHESTER DRAINAGE PLANS.

We have received a communication from Mr. Newman, surveyor to the Winchester Local Board, giving reasons for adoption of the large scale, and the absence of a skeleton map, and denying the operation of any local influence, however the possession of "local knowledge" on the part of some of the competitors may have aided them. He does not find so much talent and judgment displayed in the schemes as he expected, and wonders that so many of the plans conveyed the sewage, either after passing through a filter or over a portion of meadow land, into the river Itchen, which a few miles below becomes the source of water supply to the important town of Southampton.

"Much has been said and written about the defilement of rivers of late; and as there is such an abundance of land in the neighbourhood of Winchester capable of absorbing the sewage for any imaginable time to come, it is singular that most, if not all, the schemes should allow it to find its way to the river in a greater or less degree.

Mr. J. H. Denton, practical engineer to the General Land, Drainage, and Improvement Company, says,— "There is no doubt that of all processes of filtration that by irrigation is the most effective. It is, however, far from a perfect process; though it has advantages which commend it to the country. All persons admit that, whatever ingredients are extracted from the sewage in its passage over or through the soil, they serve to increase the produce of the land and thereby enrich the country. Moreover, it is as generally allowed that towns so disposed of the sewage may fairly expect a return for this sacrificing refuse. But the desire to turn our sewage to profit should not lead us into the fallacy of believing that irrigation will render sewage pure enough to drink." This author cites other opinions on this subject. Sir Benjamin Brodie, Professor of Chemistry in the University of Oxford, says,— "I do not think that it could be asserted that all injurious matter was removed from [sewage] water by placing it on the land; but certainly it must be very much diminished."

Dr. Voelcker, the consulting chemist of the Royal Agricultural Society, says,— "Many people call water pure when it is clear and no smell perceptible, forgetting all the while that many of the properties of sewage (which he names) cannot be removed by filtration." That though the soil is the most efficacious of all practically available means of rendering offensive matters harmless, and converting them into the food of plants, yet it fails to make the water fit for drinking purposes. I could cite other opinions of great authority, but must forbear to trespass further on your space."

THE DESIGNER AND THE DRAUGHTSMAN.

STR,—It may be owing to my own stupidity, but I have some difficulty in seeing what Mr. Bruce Allen has been driving at in his recent communications to you. Had he confined his remarks to art-manufacture I could have had no such difficulty; for I quite agree with him that the designer is too frequently ignored and all the credit given to the manufacturer. But when he touches upon architectural design I cannot follow him. Does he mean to say that the architect must, with his own hand, draw out every detail of his designs, and not employ a draughtsman to copy them? As well might an author be denied an amanuensis. The handwriting (upon which Mr. Bruce Allen seems to lay great stress) I conceive to be of very small importance compared with the ideas intended to be conveyed. The draughtsman, when in his proper place, is merely the medium of placing the ideas of the designer on paper; if he is entrusted by his employer to design any part of a structure, then he is entitled to credit to that extent, but not otherwise. Perhaps Mr. Bruce Allen may say that the ideas undergo a transformation under the hands of the draughtsman. It may be so in some instances; but where the designer has a marked individuality of his own, it is sure to appear. Many of your readers will doubtless be able at first sight to identify particular works as the production of certain architects, without having had previous information on the subject. The impress of the designer is obvious; that of the draughtsman obscure, if not invisible.

It is needless for us to attempt to stem the stream of time. Modern civilization has placed art in a different position from what it occupied in the middle ages. The change is sometimes not favourable to the individuality of the artist;

but we must accept things as they are; we cannot retrace our steps, and "it is useless to cry over spilt milk." The man of true genius is sure, sooner or later, to show himself. A genius starving in a garret is now a *rara avis*; and upon the whole, the age in which we live is an improvement upon its predecessors. The labourer and the peasant enjoy luxuries unknown to the great of former ages; and if art is less concentrated, it is more diffused.

I, for one, look with hope to the future. We have been groping our way towards the light of day through devious passages,—each nook and cranny has been scanned by the aid of "the lamp of truth." The morn of a new day is dawning.

SCRIPTS.

BEDFORD MIDDLE-CLASS SCHOOL COMPETITION.

Sir,—I am glad to find Mr. Sbarman is able to give such an unqualified contradiction to the reports about this competition.

Though I am sorry to have been the means of spreading what is incorrect, you will remember that I quoted from a letter of a resident in Bedford, totally unopinioned in the matter, who told me what was current report, and as such I sent it to you, adding "That the Directors ought to rebut it if they can."

A VICTIM.

Sir,—I was not surprised to see the letter in your paper, signed "A Victim," alter the extraordinary and most incoherent conduct of the Committee of the Bedford Middle-Class Schools. For six weeks I devoted the greater portion of my time and attention to the subject, besides having four assistants under my eye almost constantly. In addition to this, I spent much money in paper-mounting, taking a journey to inspect the site, the instructions being so very scant and indefinite. Guess my surprise when my plans were returned within a week, the carriage unpaid, and not a single line to inform me who was the successful competitor. I was therefore in the consideration I had devoted to the subject. I was therefore in some degree prepared for the statements made by a "Victim."

VERITAS.

DORÉ AND TENNYSON.

Sir,—In a paragraph in your valuable journal of the 8th instant, reference is made to M. Gustave Doré's illustrations of the Laureate's "Idylls" as "more than five times the size of the original." As a supercilious misrepresentation of the poet's meaning, it is a ridiculous absurdity. To this we can only reply that, while your correspondent is evidently a stranger to the "pigskin," M. Doré is a most accomplished and daring horseman, and perfectly understood what he was about when designing this picture. If your non-equine critic would consult "Greenwood's Horsemanship," p. 73, he will be taught how to pick any object from the ground at the walk, canter, or gallop; and will at the same time, it is hoped, learn for the future to "kick his horse the length."

EDW. MOXON & CO.

* * Notwithstanding an erroneous assumption in Messrs. Moxon's note, we give it place, and at the same time reiterate our assertion that the engraving in question is not an illustration of the author's works.

THE PURIFICATION OF WATER AND SUPPLY.

Sir,—Under the above heading in your impression of the 1st inst., I see an extract from a paper read by Mr. R. Byrne on "Experiments on the Removal of Organic and Inorganic Substances in Water," to the following effect:—that had water could be purified by chemical agency to a "very limited extent only." I should be glad to know whether Mr. Byrne has made any experiments with Mr. Spencer's magnetic oxide filter agent, and if so, whether he would inform the public, through your columns, of the result of such experiments. Mr. Spencer's system of filtration is largely adopted by the Water Works Company of this borough (Wakefield); and in his evidence before the River Commissioners last year, Mr. Spencer asserted that organic substances were separated from the water supplied to the town by means of his filtering system, and that its filtering powers would increase every year. The filtered water, which is the domestic supply for the town is drawn from the River Calder below the main-sewer outfall, and therefore needs filtering so as to purify it of organic matter.

L. E.

"WAGES" AND "SALARY."

Sir,—In the *Builder* of last week are two advertisements which are placed (no doubt by chance) side by side. One is that of a Local Board of Health, who offer £2s. per week "wages" with house, coal, and gas, for a mechanic to attend to their steam-engines and pumps. The other is that of a Waterworks Company in Wales, who offer £24. per annum for a secretary and manager. Although I have sufficient knowledge of machinery to fit me for the mechanic's place, unfortunately for myself I have studied a good many other things as well,—such as mathematics and mechanics, pure and applied; surveying, levelling, and drawing; chemistry and metaphysics; the laws of fluids in motion, the strength of materials, and the many other branches of science which are required in the profession of the E. E., in which I have had twenty years' experience in England and abroad.

I have, also, unluckily, a knowledge of four modern languages, besides a fair amount of Latin, history, geography, literature, logic, and the usual branches of a

liberal education; and I therefore believe myself thoroughly competent for the double duties of secretary and manager to the Waterworks Company.

Supposing that I applied for, and obtained, that appointment, I reckon that it would cost me for "house, coal, and gas," as nearly as may be, 40*l.* a year, which would leave me 84*l.* per annum for those other expenses for which the filter will have 42*l.* per week, or very nearly 110*l.* per annum—that is, about 2*l.* more than I. He has also the advantage of being able to dress more economically than the secretary and manager," and the further advantage that, as a mechanic, instead of being his work, wages, or employers, he can at any moment stick his somewhat black and oily hands into the pockets of his fastidious unmentionables, decline to work any more, and be made his own *vicum cum dignitate* for a year or two by his "Union."

Are not these, Sir, very considerable odds in his favour, and against me? And really, so far as I can see, *only* because his hands are innocent of gloves, and his head of conic sections and Latin, whereas I plead guilty to all three. And if it be so, am I not somewhat too severely punished for the fault? And does it not rather tend to show that in these latter days the "Schoolmaster" is too much "abroad," and that it is high time to confine or restrain him a little, and to build hospitals and goals for these parents who are so wicked or so insane as to wilfully run their children's chances in life by sending them to profit (?) by his lessons?

CONTRAST.

THE WESTMINSTER CLOISTERS.

Sir,—Our attention having been called to a passage in your last number respecting a paper signed "C. Bruce Allen," in which the writer asserts that the north cloister of Westminster Abbey "is now unhappily in course of being sawn and harked to pieces, or, according to architectural nomenclature, 'restored' " by the masons, we beg a space in your columns to correct this statement, which is utterly untrue. The fact is, that the treasury of one of the northern bays, to the great grief of all interested in the Abbey, fell during one of the storms of the present spring. So alarmed have the Chapter naturally been at this accident that they have, without Mr. Scott's knowledge, ordered the clerk of the works to remove some of the tracery on the west side, which has long looked very threatening, and was supported by wooden props. This was done, not by our workmen, but by some other of the workmen employed in the Abbey; and no sooner was Mr. Scott aware of it, than he directed that all which was in any way threatening should be strengthened by wooden props, though we fear that partial restoration has become inevitable.

No one who has ever gone over the Abbey with Mr. Scott can fail to remember the special interest which he takes in these bays of the northern cloister, of which he has given a special notice in his paper known as "Gleanings from Westminster Abbey."

In another part of Mr. Allen's paper a somewhat obscure observation seems to imply that the colour is being scraped off from the Abbey. Permit us to declare that nothing of this sort has been done in our memory. The keen interest which Mr. Scott always shows for preserving every trace of colour, and for maintaining the ancient surface, though ever so much decayed, keeps alive all the same feeling in all those subordinate to him; and, happily, the adoption of recent appliances within the Abbey renders groundless the lamentation of the writer of the paper, at least as regards the interior, that "the Abbey itself is disappearing fast day by day."

HEXBY POOLE & SONS.

THE WATER THEY DRINK AT DONCASTER.

A CORRESPONDENT from Doncaster says,—Our source of supply is the Don, and during the past week the mouth of the culvert—a subterranean channel that conducts the water to the wheel to be pumped up into the town for the use of the inhabitants, has been cleaned out, when the following, amongst other "ingredients," were discovered in the water, namely, *twenty-eight dogs, eight cats, two pigs, one sheep, one goat, sundry rats, and divers other things* belonging to the animal and vegetable kingdoms. Many of the animals being in an advanced stage of decomposition, the stench they emitted was intolerable. The waters of the Don are not now fit for human consumption, "fouled," as they are, in their course; and it is abominable that the inhabitants should still have to obtain their supply from such a polluted source. The question of pure water is of paramount importance, and the matter ought to be dealt with at once.

Several correspondents want to know what the Water Supply Commissioners are doing.

ELECTION OF SURVEYOR, ST. GEORGE'S, HANOVER-SQUARE.

At the last meeting of the Vestry, held on Thursday, the 6th inst., the election of a surveyor took place. There were sixty-nine answers to the public advertisement, and forty-nine candidates appeared before the committee. With some difficulty nine were selected to stand the chance of election, viz.,—Mr. H. Cochrane, St. Andrew's-square, Edinburgh; Mr. C. H. Lowe, Elm Tree-road, St. John's-wood; Mr. H. G. Matthews, 1, Furnival's Inn, Holborn; Mr. C. Pincock, 1, Ebny-ridge-road; Mr. E.

Prichard, Bedford Leigh, Lancashire; Mr. H. Royle, Townhall, Hnlme; Mr. A. Scargill, Bower Spring, Sheffield; Mr. H. T. Tomkins, 39, Lancaster-road, Notting-hill; and Mr. W. H. Wheeler, Boston. The plan adopted at the Metropolitan Board in the election of district surveyors was followed on this occasion, and the contest was decided by Mr. Tomkins receiving 45 votes to Mr. Matthews's 31. The salary is 350*l.* per annum, with residence, rising gradually to 400*l.* An application for expenses was made by memorial from the unsuccessful candidates who had come from the country, but it was refused by the Vestry.

PATENTS CONNECTED WITH BUILDING.

FASTENINGS FOR WINDOWS AND OTHER PLACES. *J. H. Roberts.* Dated October 8, 1866.—This invention is performed as follows:—Upon one sash, say the outer, the patentee secures a plate formed with a slot, in which a button or stud is free to move backwards and forwards. Upon the other sash he secures another plate, which has a third plate hinged thereto, the hinged plate being capable of moving so as to come upon the first-named plate. This hinged plate is likewise formed with a slot corresponding to the first-named slot, and terminating at one end in a circular or enlarged aperture, corresponding to the button or stud. To secure the fastening it is necessary to bring the hinged plate on the inner sash upon the plate on the outer sash, so that the button enters the circular or enlarged aperture, and then to push the button along the slots. To release the fastening the reverse movements have to be made. The slots in the plates may be formed in any direction desired. Sometimes the patentee forms a thumb-piece or projection on the hinged plate for convenience of moving it.

HEATING AND WARMING ROOMS, &c. *W. Clark.* A Communication. Dated October 12, 1866.—This invention relates to the application of an air chamber in combination with an air stove or heating apparatus; this chamber contains a reservoir of water, over which the air heated in its passage through the metal or other flues is caused to pass, the water being heated by reason of its position. In this manner the air is supplied with fresh oxygen and nitrogen to compensate for that which has become absorbed in its passage through the flues of the air stove. This chamber also serves as a receiver of all impurities, and of the denser or noxious gases prejudicial to health.

CHURCH-BUILDING NEWS.

Elye.—The church here has been re-opened after having been closed for some time for repairs and alterations. The restorations just completed include the refacing the west end of the nave and buttresses with flint, removing a wooden window and replacing it by a four-light decorated window, which has been filled with stained-glass; a new stone cross has been fixed on the gable; a modern brick vestry pulled down from the south wall of the chancel, the door opening into which has been filled in with a new Early English lancet window. This also has been glazed with stained glass as a memorial to a parishioner. An old Norman window at the east of the south transept has been opened and filled in with stained glass. The nave roof, which, some forty years back, had been mutilated by cutting away carved bosses, ribs of principals, &c., and introducing a lath and plaster ceiling, covering up the entire oak roof, has been restored. Fortunately, two out of eight carved angels found at an old curiosity shop at Wood-bridge, were known by two or three old parishioners to have been removed from the church when the mutilations took place. On hearing of this, the rector procured them, and thus enabled the architect to restore the roof by filling the six vacant places with new carvings to correspond. Mr. E. C. Hakewill was the architect employed in the restorations. Mr. H. Luff, of Ipswich, has carried out the work; the stained glass being supplied by Messrs. Lavers & Barrand, of London.

Hartlepool.—The parish church of St. Hilda, Hartlepool, has been re-opened, after undergoing a restoration. The work has consisted of the raising of the roof of the nave to its ancient high pitch, as indicated by the stonework in the tower; and the replacing of the windows in keeping

with the original architecture, the tracery being in accordance with stones found; the lowering of the floor, and the disclosing of the basis of the piers; the removal of the gallery; refitting of the seats; chipping the interior walls, which were covered with thick coatings of whitewash; the repairing of the piers; replacing columns from the string-course of the clearstory to the heads of the piers; the introduction of carved corbels supporting the pillars, all in accordance with stones found. The church is fitted up with a heating apparatus by Messrs. Walker & Son, of Newcastle. The corbels, and carved work of the pulpit, seats, &c., were executed by Mr. Colley, of Durham. The contractor for the work was Mr. Graydon, of Durham; and who retold respectively to Mr. Thornton, stonemason, Mr. Laidler, plumber, and Messrs. Hodgson, painters, all of Durham. The total cost has been about 2,700l.

Slough.—The foundation-stone of the new chapel at the Eton Union Workhouse, Slough, a building to be erected by voluntary contributions, has been laid. The chapel will consist of nave and circular apse. The interior will be of red brick banded with black; the outside of ordinary stock brick banded with black. Mr. Wheeler, of Breckley, Kent, is the architect; and Mr. Holland, of Thame, the builder. The chapel will seat 100 adults, and its estimated cost, including all expenses, will be 530l.

Droitwich.—The foundation stone has been laid of a new church for the parish of St. Nicholas. Mr. Smith, of Droitwich, is the architect. The contract for the church is that of Messrs. Osborn & Inwood, of Malvern, for the sum of 1,650l. The church will be of the Decorated style of architecture, and consist of nave, chancel, north aisle, and tower. A spire is part of the design, but is not in the present contract. The church is designed to accommodate 258 persons, and all the seats are to be free and open. It will be built of Hadley sandstone, while the interior of the chancel will be of dressed Bath stone, the walls being plastered.

Swansey.—St. Andrew's Church has been reopened. The Lady of the Manor has had the church, at her own cost (upwards of 3,000l.), thoroughly restored and beautified. The architect engaged was Mr. Street, of London, and the contract was entered into by Mr. Cliphaw, of Newark. The whole fabric has been repewed, and internally all the material is new. The chancel has been rebuilt, and is approached by steps, with a carved screen and stalls. The pavement is of encaustic tiles, from the manufactory of Mr. Godwin. The chancel is elaborate, its principal decoration being a reredos, of which the central compartment contains a sculpture of the Crucifixion in alabaster. The pulpit is of white stone. The seats are in character with the old ones, a few of which remain on the north side; and the wood-work has been done by Messrs. Rattee & Kett, of Cambridge.

Wingfield.—The parish church has been restored. Several windows in the south aisle are of three lights; three of these at the chancel end have been renovated, and stone mullions supersede the old wooden ones. Former churchwardens must have been wonderfully fond of paint, for even the panels of the font, filled in with various subjects, were painted, and that in various colours. All this paint has, however, been scraped off. The roof of the nave is new. The entire chancel is a step higher than the rest of the church, and it is here that the greatest amount of attention has been displayed. The chief features are old carved screens and stalls, and the table monuments, on which are the effigies of Richard de la Pole, Earl of Suffolk, and Catherine, his wife; William de la Pole, Duke of Suffolk; and John de la Pole, Duke of Suffolk. The entire chancel has been repaired; the new roof is of oak, open; the floor has been relaid with Minton's tiles, the east end of it with Poole's. The chancel was restored by the Ecclesiastical Commissioners at an expense of about 1,200l.; and the roofs of the nave and north aisle have been renovated at an expense of a little over 500l. Mr. Christian was the architect; Mr. Botwright, of Bungay, the builder; Mr. Nursey, Bungay, doing the mason work. The south aisle demands immediate attention. Its roof has to be braced up, and the restoration cannot be called complete till this part of the building has been taken in hand.

Kintbury.—Christ Church has been consecrated. The style of this new edifice is of the Second Pointed period, but modified to circum-

stances, and all richness of details or mouldings has of necessity been avoided. The material is brick, as it is obtainable in the locality, but all the dressings are in Bath stone. The plan consists of a tower entrance, a nave, chancel, and vestry. The tower is at the south-west end of the nave. The spire is of tile in two stages, with perforated woodwork intervening. The nave is 26 ft. wide and 66 ft. long, and will hold 250 adults; the seats are of deal, stained, and varnished. The chancel is 29 ft. long, and 20 ft. wide, and has four rows of sittings. On the north side is the vestry, which is separated from the chancel by a perforated wooden screen, and between that and the back seats of the chancel there is a space left for an organ. At the east end of the church, under the window, is a carving of the Last Supper; the figures are in high relief, and carved by Mr. Farmer; this is sunk in an ornamental frame or panel, and on each side are panels in which are carved the passion-flower and the lily; these, as well as the figures, are relieved by gold grounds, which throw up the sculpture, and on either side of the panels the walls are painted in ornaments and monograms up to the north and south walls. The chancel is paved with Minton's tiles. One of the features of the church, and particularly of the chancel, is the introduction of stained glass; all the windows of the latter are filled with it. Messrs. Heaton & Butler were the artists. The west window of the church is of four lights with tracery in the head, and filled with stained glass. As the font is placed under it, the subject selected is the Baptism of our Lord. The architect was Mr. Talbot Bury, of London, from whose designs the Vicarage at Kintbury and other buildings in the vicinity have been erected. The church will cost altogether, without special gifts, the sum of 3,133l. 1s. 9d. The stone-work has been done by Mr. Keats, of Newbury; the brickwork, tiling, paving, and plastering by Mr. Cumner, of Kintbury; and the wood-work by Mr. Cruise, also of Kintbury.

Hungerford.—The chief stone of the Eddington Chapel of Ease has been laid. It is anticipated that the outlay will amount to about 2,300l. The site (given by Mr. W. Honeywood) is on the east side of the road leading to Hungerford-Newton. The architect is Mr. Blomfield, of London; and the contractor Mr. Woodridge, of Hungerford. The chapel will be 83 ft. in length, and built in the decorated style with brick and Bath stone dressings. It will accommodate 275 persons, and all the sittings will be free.

Bolton.—The chief stone of St. James's Church, Waterloo-street, has been laid. The foundations are already in, and some of the walls are several feet above the level of the ground line. The quicksands that prevail in Bolts have been taken down to a solid bottom; and concrete, and stones of great size have been used to prevent risk. The church comprises a nave of four bays, divided from the north and south-side aisles by four arches. These arches will spring from moulded and carved capitals of white stone; the cylindrical shafts which sustain the capitals being of a fine red stone, obtained from a quarry near Liverpool. Eastward of the nave a broad arch opens into the chancel, wherein are the choir seats and the prayer-desks. Six yards more to the east is another arch, beyond which the chancel ends polygonally, and is lighted by three traceried windows. The eastern part of the chancel is to be fitted up and furnished in the usual way. The tower and spire are placed over the western part of the chancel; north and south of which are transepts. The southern one will be appropriated chiefly for school children, who will enter by a separate door. Underneath the north transept is a cellar, where will be placed Haden's heating apparatus. There are no galleries; and the church will seat on the ground floor about 580 persons. The amount of the contract, which has been taken by Messrs. Warburton, is 4,600l., which includes tower, spire, and all the fittings complete. The style of the church is Early Decorated. It is to be built of stone throughout. The roofs are to be covered with Welsh slates. The floor under the seats is to be of wood, and the chancel, passages, porches, &c., are to be tiled. The nave is lighted by a large four-light traceried window at the west end, and by sixteen traceried clear-story windows above the aisle roof. The aisle windows are of one, two, and three lights, according to their position. The architect is Mr. J. M. Taylor, of Manchester.

Asfordby, Leicestershire.—The chancel and vestry of the church in this parish are now completely restored, and two of the windows are filled with stained glass. An effort is being made to raise funds for the restoration of the nave, aisles, transepts, and tower. Mr. G. G. Scott is the architect, and the works already completed have been carried out by Mr. John East, of Melton Mowbray.

DISSENTING CHURCH-BUILDING NEWS.

Watford.—It is proposed to erect a new Wesleyan Chapel at Watford, in the place of the present chapel, which is said to be inadequate to the requirements of the society, and to be plain and inconvenient, and situated in one of the most obscure parts of the town. Plans for the new building have been prepared by Mr. Pearson, of Rickmansworth. The chapel is to be in the Early English style, with a tower and spire.

Wolstanton.—The corner-stone of a Methodist New Connexion Chapel at Wolstanton has been laid. The style of the building will be Italian; the length within the walls 57 ft. 6 in., and width, 50 ft.; it will seat about 350. There will be two entrances from the front through porches 7 ft. wide, with a vestry between, and over which will be an organ-gallery and orchestra. The exterior front elevation will be faced with white pressed bricks and Hollington-stone dressings. The architect is Mr. Ralph Dain, of Burslem, and the builder Mr. Trevor, of Newcastle.

Over.—The new Independent Chapel at Over has been opened for divine service. The building cost 2,000l. Mr. John Douglas was the architect, the builder being Mr. Dutton, of Winstford. The edifice is in the Lombardic Italian style of architecture, and is built of white bricks with bands, &c., of red; the cornices, jambs, and arches of windows, and other ornamental features, are executed in moulded bricks; the three arches which form the entrance to the porch are supported on pillars of polished granite. Above these arches are three two-light windows, with semicircular heads and stone tracery, in accordance with the style of the building. These windows are filled with stained glass. In the side windows there are likewise circles filled with stained glass. The glass in the rose window over the pulpit is the gift of Mr. Thomas Rigby, and the subject is "The Good Shepherd." The organ was given by Mr. Haigh, of Darnhall Hall. The timbers of the roof are stained and varnished, and left visible. The floor of the church inclines slightly towards the pulpit. Accommodation is provided for 350 persons, including gallery across the end opposite to the pulpit. The masonry was done by Mr. Richard Price, and Mr. Henry Cross executed the decorative painting.

Launceston.—A small Congregational Church has been opened for public worship here. It is in the Gothic style, of red brick, with Bath-stone dressings, mullions, and bell-turret, the latter with pointed canopy. The building has been erected from the plans and specifications of Mr. Joseph Foster, of Bristol, who refuses to take any recompense for his services. The building will seat about 250 persons.

Books Received.

Holiday Excursions of a Naturalist. London: Robert Hardwicke. 1867.

This book, which is further described as a Guide to the Natural History of the Inland and Littoral, was written, the author says, by "one of a class of happy individuals who, through life, derive a chief source of enjoyment from intercourse with Nature in her works." Happy, indeed, are they who can thus find happiness; and sedulously should the inclination be cultivated in young and old. We well remember once, during a country ramble, hearing a man of great learning and eminent position lamenting want of knowledge of all around him. The trees, the flowers, the birds, the insects were all dumb to him, while to a much less man who was of the party they discoursed eloquently, and enabled him to do so too: not a weed, not a stone, not a passing cloud but had its story. It was this same enthusiastic lover of nature, by the way, who in early years caused a dear mother a severe attack of bronchitis by keeping

the sitting-room window open on a windy night to draw moths to the table-lamp. But the mother, like a wise mother, wanted her boy to have a hobby, and willingly humoured his bent.

The book before us is well calculated to make naturalists. It is pleasantly written, by one who evidently knows what he writes, is very suggestive, and very amusing.

A Descriptive Account of Houghmond Abbey, Salop. By HENRY PIDGEON, Leako & Evans, Shrewsbury.

Some Account of the Parish Churches of Abbey Dore, Kilspeck, Allensmore, and Holmer. By J. H. JAMES, Middle Temple. London: Limbird.

THE want of some particulars concerning the interesting ruins of Houghmond Abbey has been often felt by visitors, and we could have wished that the want had been met more completely than it is by this pamphlet, of which the architectural portion is but weak. Thus, alluding to the doorway in the cloister, of which we gave a view in a previous volume, Mr. Pidgeon writes,—"This, in common with the front of the Chapter House, shows a peculiar and elegant example of Anglo-Norman architecture, far between the columns of the semicircular arch, under crocketed ogee canopies, stand finely sculptured statues of St. Peter and St. Paul;" though he afterwards says (adopting our observations without telling where he got them from), these figures are the work of a later time. How, therefore, their presence shows the doorway to be "a peculiar and elegant example of Anglo-Norman architecture" is not obvious.

The point worth notice in the second pamphlet named is a set of observations showing the mortality represented in the burial-grounds of these churches. Mr. James is not sufficiently acquainted with architecture to give useful descriptions of old buildings.

Old London. London: John Murray. 1867.

UNDER this title, always attractive, have been published eight of the papers read at the London Congress last year of the Archaeological Institute, prefaced with Mr. Beresford Hope's opening address at Guildhall, and forming a handsome volume, and a not unimportant contribution to the history of our many-sided metropolis. It includes Dean Stanley's eloquent discourse in the Abbey pulpit on the text, "See what manner of stones and what buildings are here," Mark xiii. i.; Mr. G. T. Clark's paper on "The Military Architecture of the Tower of London," illustrated; Mr. Scott on the Chapter House; Professor Westmacott on the Sculpture in the Abbey; and, perhaps the most valuable of the number, Mr. George Scharf's account of the Royal Picture Galleries. In this the various inventories are brought together, and many of the pictures are commented on.

Miscellaneous.

A ROOM FOR BIDEFORD.—A Limited Liability Joint Stock Company has been formed for the purpose of erecting a large room at Bideford, to be used for balls, concerts, and other occasions, for which the present room at the Mansion-house is ill adapted, from its extreme smallness. The new buildings will occupy the sites of the Mansion-house and two adjoining houses, and will consist of a large supper-room, reading-room, green-room, and retiring-rooms with w.c., &c., on the ground floor. The first floor will be occupied by the large room, 70 ft. by 35 ft. in clear, with a wide stone staircase at each end, affording two easy exits in case of alarm. The stairs at the south end will lead into a large lobby, with a gallery over, capable of containing fifty persons. The north end will have a large orchestral platform to hold 150 performers, with separate staircase approach from the outside. The space in the roof, which will be of good pitch, is proposed to be used for billiard and smoking rooms, which will command beautiful views of the estuary of the rivers Taw and Torridge. The buildings will be of an early Gothic character, of brick or local stone, with freestone dressings; the roof will be covered with Broseley tiles, with hold red ridge tiles. The plans are being prepared by Messrs. Guild & Son, of Barnstaple, the architects to the company.

THE HYDRO-PNEUMATIC HOIST.—The action of the hoist patented by Mr. Wrightson, of the firm of Head, Wrightson, & Co., of Stockton-on-Tees, conjointly with Mr. Walter Crooke, of the same place, is as follows:—The balance-weight is made in the form of a bell, and allowed to work up and down in a tube filled with water. To raise the bell a valve is opened, which admits air to the under-side of the bell; this air bubbles up into the top of the bell, displacing a sufficient amount of water to give the required buoyancy. The bell then rises: when at the top the air is let out, on which the balance-weight sinks again. In the application of this hoist to blast furnaces a wrought-iron tube, 5 ft. to 6 ft. diameter, is erected, vertically, upon or near the air accumulator, a pipe from the tube passing down to within 3 in. or 4 in. of the bottom of the accumulator; the tube is carried up to 10 ft. or 12 ft. above the level of the top platform, and another tank, of similar capacity to the accumulator, is placed on the top of this tube. The tube is filled with water, and in the tube is a balance-weight formed like a bell, and of such a weight, when weighed in water, as to exceed the heaviest load the hoist is required to raise, and the hollow within it is of such a capacity that, when filled with air, it will attain the same power of buoyancy upwards that it possessed of sinking when full of water.

ACCIDENTS.—A fatal accident has happened at Eastbampstead Park, the seat of the Marquis of Downshire. For some time past considerable improvements have been in progress on Lord Downshire's extensive estate, and some old farm buildings in the park were being pulled down. The brickwork of a barn had been undermined, and one of the labourers went to the back of the building to attach a rope to some portion of it, when he observed that the brickwork was giving way, and called out to a fellow-workman, who was standing on the other side of the barn, to get clear of the old structure, but unfortunately the brickwork fell upon him, and killed him.—At the works of a builder named Jackman, at Bury, the machinery moving a circular-saw was at work, when a man attempted to seat himself on a couple of iron rollers fixed in a hench. The rollers slid round with the weight of his body, and he put out his right arm to sustain himself. Unconsciously he put his arm against the circular-saw behind him, and the limb was instantly severed from the body. The poor fellow consequently fell against the saw, which in a moment buried itself in his right side, and almost out his body in two, causing instant death. At the inquest a verdict of accidental death was returned.—The terribly dangerous nature of lucifer matches has just been once more shown by the death of the young Archduchess Matilda of Austria, who is believed to have trodden on a match which must have set fire to her dress in a room where no fire was otherwise lighted.

ARTISANS' VISIT TO PARIS.—The Birmingham Chamber of Commerce have passed the following resolution:—

"That the proposition of the Society of Arts, of sending skilled workmen to the Paris Exhibition, to report upon the productions exhibited, is approved of; and that an application be made to the members of the Chamber, and the manufacturers of the town generally, asking them to subscribe to a fund for the purpose, and also to recommend qualified men for selection by the Society of Arts."

Mr. W. C. Aitken, in a letter to the Vice-president of the Chamber, suggests, as to the number of those who should be sent:—

"Two artisans engaged in button-making;—one to report on the tool-making; one to report on the ornament, style, and varieties of buttons exhibited.

Two artisans engaged in brassfounding, to report on brass and bronze casting generally; cabinet, and general brassfounding; on bells, and plumbers' brassfounding; on rolled brass, wire, sheathing, tube-making; on lamps, gas-fittings, and naval brass founding; one to report on style and ornament; the other on quality and construction.

One artisan engaged in the manufacture of electro-plated goods; to report particularly as to Russian products in silver work, and in reference to niello and enamels associated with works on the precious metals generally.

One jeweller, to report also on gift toys, chains, &c.

One artisan engaged in the production of tools generally, who also has a knowledge of engineering connected with the construction of machines used in manufactures.

Two gunmakers.

One Japanese, acquainted with the processes of japanning, has artistic taste, and is also acquainted with the manufacture of *papier mâché*; also to report if there are any substitutes for that material, and ascertain what they are.

One stamper of metal, to examine as to the various processes employed in raising up thin sheet-metal, as cornices and other stampings, &c.

One steel-toy or edge-tool maker.

One tin-plate worker, to report also on copper goods."

GAS.—The Harwich Gas Company have declared a dividend of 9 per cent. for the last year.—At Dursley the consumption of gas has so largely increased that the directors are now fixing a new gasometer at the works. The contractors are the Midland Ironworks Co., Donnington, and Mr. E. Bloodworth.—At Kingswinford a movement is in progress for the reduction of the price of gas from 5s. 6d. to 3s. 6d. The gas consumers have deputed a committee to act for them in the matter.

LAND AT MUSWELL HILL.—A case, "Fuller v. the Highgate and London Railway," has been just heard and decided under a writ from the Sheriff's Court. The value on one side was about 2,600*l.*, and on the other side about 1,100*l.* One side said the damage by the severance would be about 700*l.*, and the other said *nil*. Property near London had increased in value, and this was worth 1,500*l.* an acre. The property was at Muswell-hill, which locality had greatly increased in value. The jury gave a verdict of 1,600*l.* for the land, and 400*l.* for damage by the severance. A verdict was entered for 2,000*l.*

CHURCH HOUSE FOR CHURCH SOCIETIES; AND HOARE MEMORIAL.—A deputation from the joint committee of the two Houses of Convocation, consisting of the Bishops of Oxford and Lichfield, the Prolocutor of the Lower House, the Vice-Chancellor of Oxford, and the Rev. Canon Hawkins, had an interview with the Chancellor of the Exchequer on Friday, with the object of obtaining the consent of the Lords of the Treasury to securing the site now occupied by the National Society's buildings for a church house for the use of all the great church societies, and to erect thereon a chapel which shall be a memorial of the late Henry Hoare. The Chancellor of the Exchequer expressed himself as favourable to the scheme, and did not anticipate any difficulties.

DUDLOW-LANE WATER-TOWER, LIVERPOOL.—The chief stone of the tower to be erected at the Dudlow-lane Waterworks, near Woolton, has been laid. The works will, in architectural features, be somewhat similar in character to the Audley-street high tower. The engine will be 56 in. in diameter, and the cylinder 10*ft.*, and they will be from the establishment of Messrs. Rothwell & Co., of Bolton. The well is to be sunk to a depth of 247 ft. below the surface, or to a depth of 40 ft. below the old dock-sill, and the water engineer proposes to sink a bore-hole 200*ft.*, commencing at a 2*ft.* diameter, carrying it down to 150*ft.* and possibly then diminishing it to 18 in.; but this latter will entirely depend upon circumstances. Already there is a yield of 500,000 gallons per day, and it is still required to go down with the well, independent of the boring, 45 ft. The intention is to supply the whole of the district lying to the south-east of Liverpool, including Garston, Aigburgh, Woolton, Wavertree, and the intermediate districts. The Dudlow-lane works are being carried on under Mr. Dnnnan's personal direction. Considerable progress has already been made.

THE EARL OF DUDLEY'S FOUNTAIN.—The works for the Earl of Dudley's gift to the town of Dudley have been commenced, the space in the centre of the market-place having been barricaded. The site chosen is on the spot where the old town-hall stood. The fountain is the work of Mr. Forsyth, of London, sculptor. The height of the work will be 27 ft., and the width at the base 24 ft. The general appearance is described as being that of a triumphal arch. The ornamental enrichments consist of two figures representing Mining and Agriculture, and these are placed in niches under the dome. There are two basins on the top, into which two river-horses discharge jets of water, and the whole is surmounted by two figures representing Industry and Commerce, architecturally arranged. On the top will be placed four panels of coloured glass, and these under the influence of the sun's rays will produce a prismatic effect on the water and basins under the dome. There are two large drinking-basins, one on each side, supplied by jets from the mouths of lions' heads. The fountain is flanked by two large basins for the waste water from the upper basin, forming a fan-like discharge from the mouths of dolphins. The base will be executed in granite, together with the steps. The drinking-basins and basins under the dome will be executed in Sicilian marble, and all the other portions in Portland stone. The cost of the work is estimated at from 2,000*l.* to 3,000*l.*

GATESHEAD TOWN-HALL COMPETITION.—Designs by Mr. Johnstone, Messrs. Austin & Johnson, Mr. J. E. Watson (to whom a premium was awarded about four years ago for a design for the building on a larger scale), and Mr. Thomas Oliver are now being exhibited at the Mechanics' Institute, Gateshead; the sum named is 12,000l.

SOUTHAMPTON SCHOOL OF ART.—The total number of papers taken by the candidates for the prizes offered by the Department of Art, at the examination held here in March last, in the second or higher grade, was 116, and 42 of these papers were successfully worked, although the candidates were nearly all under 15 years of age.

MR. C. AUSTIN'S BOOK ON SEWAGE.—Mr. Austin thinks that our brief mention of the object of his work on the "Utilization of Sewage" does not convey a right idea of it. We depart from our practice, and let Mr. Austin speak for himself:—"It is true," he writes, "that I gave therein some details of a process of irrigation similar to that practised at Croydon, but I also stated that the process of irrigation there carried on is not perfect, for want of a proper system of filtration; and my object was to show that, in whatever manner sewage is disposed of, filtration is a *sine quâ non*; that it should be promptly performed whilst the decomposable matter is fresh; and that it should be effected by such mechanical means as would dispense with the formation of large stagnant deposits, which can only be got rid of by disgusting manual labour, at an inadequate cost. The drawings accompanying that paper refer to the construction of such mechanical means in the shape of portable filters, which, I hold, are indispensable in any system of town drainage."

INTERESTING DISCOVERY IN HORTICULTURE.—There is no telling where horticultural ingenuity will stop, says *Galignani*. "A gardener of Gand, France, has, after many trials, succeeded in giving any kind of fruit the flavour he pleases, while it is still on the tree. Let us take an apple, for instance. He pricks it rather deeply in four or five places with a large needle, and then lets it dip for a while in a bowl containing a liquid possessing the taste he wishes to communicate. After a few seconds this liquid will have penetrated into the pulp; and, this operation being repeated two or three times, at intervals of eight or ten days, the apple is left to ripen on the tree, and will subsequently be found to have acquired the taste either of strawberry, raspberry, cloves, &c., according to the liquid employed." We have long had an idea that by sinking a hole with an anger in the trunk of an apple-tree to the pith, while it is bearing its fruit, and filling the hole with chloroform or bromoform, either of which has a delicious fruity odour, or by some other means should these fail, the flavour of the whole crop of apples might be greatly improved.

THE POST-OFFICE AND LONDON LETTERS.—We learn from a letter addressed by Sir Cusack Ronoy to the newspapers, complaining of the Duke of Montrose, the postmaster-general, curtailing the time of posting letters for the eleven daily deliveries in London without notice to the public, some interesting particulars respecting this important branch of the General Post-office department. In 1835 the local letters rose to about 11,200,000. In 1839, the year before the introduction of the penny-postage, they were 12,450,000. In 1840 they bounded suddenly to 20,372,000, and in 1844 they reached 27,000,000. In nine years afterwards (1853), they were 43,000,000. In 1855 London was divided for postal purposes into ten districts, by which very much more rapid delivery was obtained for local letters. The consequence was that in 1855, the third complete year after the alteration, local letters had risen to 58,404,000, and in 1862 to 71,961,000. In 1865 they were about 90,000,000, of which upwards of 16,000,000 were delivered in the districts in which they were posted. At the present time the average daily delivery of letters in London is about 560,000, of which about half are local and half from the provinces and abroad. The daily number of newspapers and hook packets delivered is about 55,000. Sir Cusack asserts that, if London correspondence continues to increase as it has in recent years, it will soon be necessary to have half-hourly collections and deliveries during certain parts of the day. He also alleges that London local letters are the most profitable that the Post-office handles, and that a very considerable portion of the total net revenue of the department is derived from them.

RAILWAY MATTERS.—The new iron girder viaduct, at Hutton, for the down line to Scarborough, has been completed, and opened for the Scarborough and Whitby summer traffic. The viaduct carries the York and Scarborough railway from the North to the East Ridings obliquely across the river Derwent, three miles below Malton. It has stone and brick piers, and reversed iron girders, on the top of which the permanent way is laid. The various spans range from 90 ft. to 100 ft. The new viaduct is built by the side of the old wooden one, and from the necessities of the navigation is of the same height. The props and timbers of the old bridge will be at once struck, and a twin erection to the new one be got ready for the up-line as soon as possible.

TENDERS

For alterations to the Viarage, Hampton, S.W. Mr. W. Wigginton, architect:—
 Hearle..... £1,150 0 0
 Johnson..... 1,025 0 0
 Tims..... 854 0 0
 Harrison & Edwards (too late)..... 812 17 0
 Warne..... 779 16 0

For works, Grass Farm, Finchley, for Mr. J. H. Heel. Mr. Edward Roberts, architect. Quantities supplied:—
 Holland..... £3,986 0 0
 P. Anson..... 3,984 0 0
 Lawrence & Son..... 3,733 0 0
 Higgs..... 3,673 0 0

For the erection of workshops at rear of, and alterations to, No. 47, Elizabeth-street, Hackney-road, for Mr. J. D. Link. Mr. William Mundy, architect:—
 Larke..... £1,482 0 0
 Read & Son..... 1,198 0 0
 Peters..... 1,143 0 0
 F. & F. J. Wood..... 1,010 0 0
 Forrest (accepted)..... 887 0 0

For villa residence, Hawthorn-road, Bootle, for Mr. David Carruthers. Messrs. William & Robert Duckworth, architects:—
 Tomkinson..... £1,227 0 0
 Calle..... 1,226 17 6
 Umson..... 1,220 0 0
 Sinclair..... 1,155 0 0
 Riley..... 1,150 0 0
 Hardy..... 1,148 10 0
 Nickolson & Ayre (accepted)..... 1,127 0 0

For the erection of a lavatory and covered way, and paving the Infirmary of Schools at Southall, Mr. H. Saxon Snell, architect:—
 Brown..... £273 0 0
 Hanson..... 238 15 0
 Nightingale..... 238 0 0
 Gibson, Brothers..... 238 0 0
 Brown..... 235 0 0

For construction and erection of a steam-engine, boiler, and necessary gearing for working a pair of pumps at Southall School. Mr. H. Saxon Snell, architect:—
 Shaud & Mason..... £298 10 0
 Jennings..... 187 0 0
 Pimbeck..... 153 18 8
 Gimson & Co..... 152 10 0
 Lovelock, Bateman & Co..... 139 0 0
 Potter & Son..... 116 0 0
 Bevington, Topham, & Cortauld..... 110 0 0

For the erection of Bedford Chapel, Enley, for the Methodist New Connexion. Messrs. Scrivener & Son, architects. Quantities supplied:—
 Stuck..... £1,998 0 0
 Matthews..... 1,976 0 0
 Bailey..... 1,919 0 0
 Woodridge (accepted)..... 1,675 0 0

For alterations and additions to Corn and Hop Exchange, Canterbury. Quantities supplied by Messrs. Fain & Clarke:—
 Wilson..... £2,092 0 0
 Perry..... 2,000 0 0
 Naylor & Son..... 2,097 0 0
 Cozens, Brothers..... 2,026 0 0
 Lancedfield..... 2,065 0 0
 Gaskin & Co..... 2,090 0 0

For alterations and new front to the "Tipping Philosopher," for Mr. Wm. Owston. Mr. S. Brookes, architect:—
 Chnter..... £418 0 0
 Langmaid & Way (accepted)..... 345 0 0

For new house at Hillingdon. Mr. Robert W. Edis, architect:—
 Fassnidge & Son (accepted)..... £2,550 0 0

For new houses at Houghton, near Huntingdon. Mr. Robert W. Edis, architect:—
 Mallo & Richardson (with Hunt. (Gims), accepted)..... £4,200 0 0
 Conder..... 3,678 0 0

For alterations and additions at No. 79, Gloucester-place, Portman-square, for Mr. George J. Leon. Mr. N. S. Joseph, architect:—
 King & Sons..... £1,500 0 0
 Tye & Andrew..... 1,502 0 0
 Newman & Mann..... 1,463 0 0
 Clarke & Mannooch (accepted)..... 1,453 15 0

For the restoration, enlargement, and resetting of the Church of St. Thomas-a-Becket, Newton Tracey, county of Devon, diocese of Exeter. Messrs. Gould & Son, architects:—
 Pilsford..... £2,818 10 6
 Dendie..... 499 2 0
 Hookway..... 498 0 0
 Bale..... 368 0 0

For new house at Bournemouth. Mr. Robert W. Edis, architect:—
 Hapgood..... £3,574 8 6
 Danford..... 3,510 0 0
 Dyke (accepted)..... 3,460 0 0

For a house at Tuffell Park, for Mr. J. Robinson. Mr. George Truefit, architect:—
 Carter..... £3,140 0 0
 Simpson..... 2,992 0 0
 Sanderson..... 2,873 0 0
 Warne..... 2,400 0 0
 Masley & Rogers (accepted)..... 2,590 0 0

For a pair of houses, Tuffell Park. Mr. George Truefit, architect:—
 Warne (accepted)..... £2,051 14 0

For the erection of the Chapel of St. Thomas the Apostle, in the parish of Swimbridge, county of Devon, diocese of Exeter. Messrs. Gould & Son, architects:—
 Gannon..... £990 0 0
 Hartnoll..... 988 10 0
 Oliver & Son..... 900 0 0
 Cook..... 898 15 0

For the erection of a vicarage-house at Yarncombe, North Devon. Messrs. Gould & Son, architects:—
 Oliver & Son..... £1,220 0 0
 Bowden, Son, & Cook..... 1,189 0 0
 Cook..... 1,150 0 0
 Howard..... 1,068 15 0
 Dendie..... 1,055 0 0

For the erection of a parochial school and residence at Challocombe, North Devon. Messrs. Gould & Son, architects:—
 Pilsford..... £378 7 6
 Fife..... 377 0 0
 Dolve..... 318 0 0

For the erection of a detached residence at Riddlesdown Park, St. J. Vender, Mr. J. J. Vender, Mr. Thos. Denby, architect. Quantities supplied by Mr. Sirr:—

Barnes..... £3,294 0 0
 Richards..... 2,774 0 0
 Garrad..... 2,612 0 0
 Warne..... 2,600 0 0
 Nightingale..... 2,437 0 0
 Howell..... 2,365 0 0
 Wilcox..... 2,311 0 0
 Poxon & Smith..... 2,270 0 0
 Neale..... 2,263 0 0

For Police-station, East India-road, Poplar. Mr. Thos. Charles Sorby, architect:—
 Nixon..... £1,447 0 0
 Howard..... 1,400 0 0
 Patman & Co..... 1,398 0 0
 Crossweller..... 1,330 0 0
 Higgs..... 1,298 0 0
 Hill & Kiddle..... 1,219 0 0
 Lathy, Brothers..... 1,193 0 0

For police stables, Battersea:—
 Gould & Son..... £586 0 0
 Lathy, Brothers..... 573 0 0
 Ehoral..... 568 0 0
 Nixon..... 548 0 0
 Adamson..... 539 0 0
 Higgs..... 463 0 0

For house in Bridge-road, Battersea, for Mr. Trow. Mr. Thornton, architect:—
 Thornton..... £460 0 0
 Baker..... 443 0 0
 Lathy, Brothers..... 437 0 0
 Godbold..... 439 0 0
 Harris..... 379 10 0

For three houses in Surrey-lane, Battersea, for Mr. Bridge. Mr. Charles Bones, architect:—
 Harris..... £1,668 0 0
 Baker..... 965 10 0
 Thornton..... 943 0 0
 Lathy, Brothers..... 867 0 0
 Godbold..... 897 0 0

For five pairs of villas at Norwood, for the London and Suburban Building Society. Messrs. Hammack & Lambert, architects. Quantities supplied:—
 Nixon..... £9,289 0 0
 Newman & Mann..... 8,674 0 0
 Hazle..... 7,557 0 0
 Gibson, Brothers..... 7,477 0 0
 Mann..... 7,045 0 0
 Ennor..... 6,898 0 0
 Hedges..... 6,537 0 0
 Darby..... 6,745 0 0

For works at Blackstock Park, Holloway. Mr. Thomas J. Hill, architect:—
 Sabej..... £2,405 0 0
 Corbeldick..... 400 0 0

For works at Norman's Buildings, St. Luke's. Mr. Thomas J. Hill, architect:—
 Gadsby..... £2,653 0 0
 Moreland & Burton..... 2,947 0 0
 Patman, Brothers..... 2,807 0 0
 Sabej..... 2,453 0 0
 Killy..... 2,781 0 0
 Webb & Sons..... 2,777 0 0
 Henshaw..... 2,658 0 0
 Freedy & Son..... 2,600 0 0
 Anley..... 2,439 0 0
 Perry..... 2,338 0 0

For building the King's Arms Hotel, Morlake, for Messrs. Phillips & Wigan. Mr. R. P. Pope, architect:—
 Lovatt..... £3,645 3 0
 Goodall..... 3,390 0 0
 Searle..... 3,216 15 0
 Brown..... 3,319 0 0
 Bouling..... 3,309 0 0
 Adamson & Son..... 3,268 0 0
 Wigmore..... 3,198 10 0
 Sharpington & Cole..... 3,030 0 0

The Builder.

VOL. XXV.—No. 1272.

Architectural Aspects in Florence.

WE pass from Genoa to Florence, and architecture again changes its aspect, not without certain reference to change of situation, from confined delicacies to spreading plain, though it by no means brings us back to the type that we willingly quitted

at Turin. The most characteristic palatial architecture here is of earlier date than in either of those cities; and even the later declares a native affiliation by ease of transition, and persistency of well-marked features. Every change again bears at Florence a certain impress of originality, and we become insensibly habituated to expecting not merely novelty, but the enlivening reality that clings to handiwork replete with all instruction, and yet too self-reliant to merely or chiefly copy. The crudity of experimental advance there may be, but very rarely indeed a dechisement of what is perfect elsewhere.

It would be difficult to find in Florence, perhaps, any remains so instructive for the history of early architecture as the side doors, especially the northern, of the Cathedral of San Lorenzo, at Genoa, or even its nave and aisles; and the banded black and white masonry of both exterior and interior has a value that will not be readily conceded to the panelled casing of the cathedral at Florence. But the tower of Giotto is unimitated and unrivalled. Some 273 ft. high, it is as elaborated in marble mosaic as a toy of Tunbridge ware, yet solid in its joinings after 500 years as if it were of a single piece; and owing whatever reparation it has had to the weathering of even best materials and not to flaws of workmanship. The white marble of the original has now assumed an orange tone, under influences that have not left other colours unaffected; but the clean, newly-inserted slabs, from point to point, enable us to see that when the primitive sheen of all was unimpaired, the effect of mingled tints and shades, while more brilliant, was quite as harmonious as that which now delights us.

Florentine mosaic is now best known, as shrunk to the dimensions of a brooch, or at most a letter-weight; but we may still see halls newly paved, with a happy sense that modest variety of colour is not of necessity tame, and that bold vivacity may defy the fatal risks of the patchy and the piebald.

This art is probably hereditary from later Roman times; a bolder characteristic—the architectural affection for massive, bossed rustication, might seem to have gained its hold from familiarity of the Florentines with the huge masses that form the prehistoric wall of their mother settlement on the heights of Fiesole. However this may be, the signs of the predilection itself in-

dulged most unsparingly, meet us in all directions, and give to Florentine palatial architecture its peculiar character. The application of it is not confined to the ground story; and the solidity it imparts is supported by the structure it is applied to, being for the most part a solid rectangular block. The windows are few, and small in contrast to those of Genoa, where the necessity to moderate the common Italian sun is partly counterbalanced by the narrower streets and shade of the loftier houses, and ever-welcome refreshment from breezes that come in from the sea. The somewhat fortress-like aspect of the Tuscan palaces is increased by the less liberal admission of inlook from the street, and by the absence of the balconies about windows, that express an interest in what may be going on there. Such palaces, more or less altered, are met with at every turn in the streets about the original city; more or less altered, but still retaining the appearance of having had all possible strength of passive resistance to violence, though, from whatever motive, dissembling any facilities for repulsing attacks by main force.

The Strozzi Palace, so well known to visitors to Florence from its central position and imposing effect, is at once the most remarkable of its class, and has the highest claims, simple as it appears, to be regarded as a work of well-considered art. The commencement of it is dated in 1459—a period familiar enough from the relations of Geronimo Savonarola to a Borgia on the Papal throne. How this date is to be reconciled with the tradition on the same authority,—that Pitti began his palace in rivalry in 1466,—the editors must be left to explain. Art, and not archaeology, is our immediate interest, and this topic alone will fill our space.

The windows for admission of some light, and even air, to the basement, are masked by a massive stone bench, raised a step, and projecting in front of the building. Above there are only three stories, including ground floor, all of extraordinary height,—the two uppermost containing the noble apartments. The oblong block is met by lower houses at one end; high central portals give entrance on all the other three sides,—to a vaulted peristyle intermediate between offices and an impluvium, and bearing corridors and loggias above. Coach-houses and even stables are accommodated on the ground level, and we are reminded of the self-contained arrangement of a Roman house.

In the two upper stories on the longer fronts there are nine windows, and the central place below, intermediate between two sets of four, is occupied by the majestic portal. Upon the importance of this, and its break of the basement line, depends, and not in vain, the expression of a central line of symmetrical division. Other help is there none beyond the projection of the celebrated iron cressets from each angle of the lower story, and the attachment of coronets and scutcheons, now demolished, at the angles of the story above. The stories are marked and divided by string-courses or cornices, we might call them, from their mouldings, but for their very slight projection. The mouldings of the windows are all kept flat and within the lines of rusticated projections, and the plain mouldings of the doors are also taken out of the thickness of the wall.

The effect of solidity and repose which belongs to the building seems at first fully accounted for by the manifest strength of its construction out of huge blocks, some of them 20 ft. long, rudely though regularly hosed, but plainly channelled along the faces of vertical and horizontal joints, and showing most accurate fitting; then by the gradations in degree of bossed projection, which is reduced in the second story; the bossing moderates as it rises, even in a single story, towards the milder details of the string-course, and to the still more marked

change above it. This is greatest in the upper story, where the still boldly-expressed masonry is surmounted by a plain broad band, in the place of a frieze, but kept unornamented to relieve the general cornice.

The doorways, and the windows likewise, are arched with immense voussoirs, of less thickness, however, than the horizontal courses. The intrados is in all semicircular, and the extrados rises to the ogive by a simple curve,—the key-stone being the highest of a sequence of extending voussoirs,—the proper Florentine arch. The horizontal courses, therefore, finish against the voussoirs with a corresponding curve, and it may be doubted whether any transformations that were given to this junction had a better effect. The development may be traced at ease in Florence. When the voussoirs were stepped to meet the courses with a horizontal and vertical joint, their number was of necessity limited and character entirely changed. By degrees there ensued a conflict for predominance in expression between the true arcuation and the orbelement of the courses; and, after many more ingenious vagaries than we wait to notice here, a last disgrace was incurred of an unnatural union of voussoir and ashlar in a single elbowed stone.

Even the portal of the Pandolfini Palace, ascribed to Raffaele, contributes illustrations to this particular chapter of mishaps and failures.

But there are more refinements in the masonry of the Strozzi Palace, which only declare themselves when we have come back to it more than once with a conviction that its attraction is not to be divined so readily as it is felt. The forms and proportions of the superposed stories form happy gradation with that of the general front. The heights and breadths of openings develop the sequence in one direction, and it finds its base in the low long parallelograms of the enormous channelled rustication. But how, we ask ourselves, is the introduction of arcuation in such a structure, with such materials, harmonized—not to say justified? As regards the latter point, the wide span of the large doorway is motive sufficient. A lintel-stone, which should have been large in proportion to the door-opening, would have been a mountainous mass indeed; and then the treatment of the larger windows follows fairly by sympathy, although not of necessity. In the Sun Fire Office, in Threadneedle-street, very large stones are employed, but so applied that their size is not sufficiently seen nor value recognized, while arcuation is resorted to for bridging spans, for which as architraves they would have been more than competent. In the Strozzi Palace, while the office of spanning the doorway is appropriately delegated, the self-assertion of the gigantic masonry is not utterly renounced; for the course above the arch has one symmetrical stone, of unmatched scantling, that more than reaches across the breadth of the opening below, and thus seems to accept co-operation with dignity,—as free from presumption as from parade. The same principle is contained in other openings. The small square windows of the ground-story, having no claim whatever to be arched, are spanned by a horizontal stone both at sill and lintel. Again, in the noble stories, the course immediately over the Florentine arch of the windows has the symmetrical long stone of full span, their sills being on a level with the intermediate string-course. These stones, so critical in effect, are not made conspicuous by marked contrast with the adjacent, and only the architectural eye in search for the cause of a perceived effect would be likely to pick them out and credit them for contributing as they do to the accentuation of the mighty masonry. The stones, all large, very very widely in largeness; and though always within a certain limit, if it were not for the element of symmetrical regularity thus introduced, the whole would scarcely escape a certain barbarous rudeness.

The Palazzo Riccardi, the original palace of Cosmo de Medici, if dated correctly in 1430, was well studied and well improved upon by the architect of the Strozzi. There is much more irregularity both in heights of courses and lengths of stones; the value of long stones as harmonizing, when of such magnitude, with a long front, seems not to have been recognized; and where such do occur they are introduced at discordant variance with the numerous others adjacent, that in length measure little more, not more, or even less, than their height.

A certain gradation of masonry in the ascending stories is applied, but much less grandly.

There are fine large doorways in front, or provisions for doorways, of which several are now filled up with windows,—not very effective,—ascribed to Michelangelo. The doors come in very disorderly relation to the seventeen windows of the front.

In the fragment of the Palazzo Gondi, by San Gallo (1481), behind the Palazzo Vecchio, there is more uniformity in size of stones than in the Medici and less than in the Strozzi, but the incongruity of the massive style with frequent openings is apparent; in small intervals the division of alternate courses by joints enforces employment of stones disproportionately small. The general distribution of joints in this example is at once obviously systematic yet confusing, not as in the Strozzi could yet harmonizing.

The Palazzo Rucellai, by Leon. B. Alberti, is worthy of remark for many beauties: it is its misfortune and our own that the present theme leads only to treat of its defects. In the contrast of channelled masonry with plain pilasters, and in the correspondence of the courses of both, we seem to have the suggestion of treatment applied with such success by Wren at St. Paul's; but in respect of variation of height of courses, Wren more wisely restricted himself to two. The varieties of height here run through from end to end of the front, but succeed with an irregularity that sadly impairs repose. This is particularly offensive on the ground story, where the breadths of the stones are as perplexingly capricious. In the upper stories the courses above the key-stone seem studiously perverse in their divisions, and a fine design is marred throughout by either disregard or mismanagement of its detail,—but an important detail,—or trifling with it.

In the Pitti Palace dignity and magnificence are debased, if anything Florentine can be, to clumsiness and frailty. The three stories are here again graduated in roughness of rustication, and the basement of the rustication below and its wings are still more huge in proportion, and unshaped in surface and breakage. But the long building has itself but the proportions of a basement; and when the more concentrated euhoid form is renounced, half the motive for massiveness seems to go with it; but

"Talk we not of it,—glance and pass along."

We would linger more willingly over the charming Casa Pandolfini, but that the design involves some enigmas that would carry us wide away from our immediate subject, and here not without some exertion of self-control, we speak of it no further.

There is a Doric temperance in the architectural resources made available in the Strozzi Palace that is somewhat contradicted by the enrichment of the Corinthian cornice that crowns it, and that was no part of the original design. In detail it is far superior to that of the Medici Palace, and its magnitude in some degree reduces the sense of over-enrichment; still we may be well content that only the bed-mouldings were completed on the side most seen at present. Its completion on the other side shows that the proper front was considered to face the more open space of the onion-market, where onions are still to be bought.

So permanently did the old Florentines build, on such a scale and with such massiveness. Even at the present day a lavish thickness of walls is adopted that does not allow a new house to be speedily habitable, and gives current illustration of an Italian proverb—the first year of a new house for my enemy, the second for my friend, the third for myself. With respect to earlier times, this solidity has permitted such an excellent restoration as that of the Municipal Palace—the Bargello to be completely carried through. Within its noble hall, during the years that it was transformed into a prison, no less than five stories of cells for prisoners were built up. This inner structure has been simply

demolished, and the hall reappears in its original proportions. In an adjacent quarter of the city, wall after wall bears scutcheons charged with pears; so we recognize that we are among the properties and places of business of firms and families—the Ferruzzi—whose prosperity came to an end in a crisis invited by ill-advised advances to our Edward III. for the expenses of his French wars. The record of this financial catastrophe in Villani reads sorrowfully like some that have interfered with building contracts nearer to our own day. The connexion of finance with architecture brings us back to the Strozzi Palace; for, unless history misreports, the fortune of which it is a monument chiefly grew from an exclusive dispensation granted by a Pope in return for a subsidy, for the exercise of serious pawnbroking in Tuscany. Happy, say the Italians again, are the sons whose fathers are in hell. When we look at such monument of a noble family as the Strozzi Palace, the crimes of commerce may seem, indeed, to have been buried with their authors, and the successors to have entered blameless into the happy exercise of the patronage of art. But it is something more than a proverb that avouches the visitation of paternal misdeeds on the progeny; and the destroyers of the liberties of Florence who came out from the old banking-house of the Medici found pathways, no doubt, to the highest places of the world, but have left their tracks along them in miseries, and murders, and disgrace.

THE PROFESSIONAL PRACTICE OF ARCHITECTS.

MANCHESTER.

DURING the last two years there has been in existence in Manchester, a very active and useful society—"The Manchester Society of Architects." Its objects have comprised the discussion, and, so far as might be, the regulation, of all matters of professional charges and practice, important to the interests of the building-owner or the public, as also to those of its members and of the profession generally. Considering that attention is now being given, throughout the country, to questions of the relations between architects and committees, and between architects and builders; estimating the probability of future Acts of Parliament and local regulations having intimate connexion with our calling; and viewing the importance of all these things to the future condition of the art and science of architecture and the practice of building, some account of the proceedings of the Manchester society may be interesting and important.

There are in the town two societies connected with architecture and the profession. One of them, "The Manchester Architectural Society," is occupied chiefly with the reading of papers and the discussions upon them; whilst the other, the society first named, confines itself exclusively to such objects as the establishment and maintenance of acknowledged charges for professional services; the obtaining information respecting competitions, and whatever else may affect the profession, together with the advising committees, and endeavouring to ensure equitable awards; and the affording mutual assistance, by advice or mediation, in cases of misunderstanding, either between members themselves, or between them and their employers, or those employed under them; besides the promoting personal acquaintance and good feeling between those belonging to the Society. In these objects, the success so far, of this association, seems to have been considerable; and we have now before us copies of several documents that have been prepared and issued, and which deserve to be widely known, to the end of adoption of such of their clauses as may be found applicable in a generally accepted code of practice.

The Manchester Society of Architects, as its name implies, is composed exclusively of architects, principals; and an indispensable qualification for membership is the having been in practice for not less than three years. The Society was established in 1865; and by its original constitution certain gentlemen, in number twenty, were to have the option of immediately becoming members. One of these, whose name is intimately associated with the architectural improvement that has been manifested in the last quarter of a century, in the town, however, preferred to stand aloof. As to members other than the twenty referred to, the election rests with the council. The subscrip-

tion is one guinea per annum. Honorary members, architects, but non-resident in Manchester, are also eligible. The council consists of five members, besides the president, vice-president, and the honorary secretary, Mr. J. Murgatroyd. The general ordinary meetings take place every four months, one of those meetings being for reception of the annual report and the election of a new council; but special meetings of the members are called when necessary.

The Society, on its establishment, at once adopted the scale of professional charges of the Institute of British Architects, but with three additions, the first, to the effect that duplicates of drawings, no less than the originals, were to remain the architect's property; the second, that the "day" to be charged for, at the minimum rate of three guineas, was to be of six hours; and the third, as follows,—"When an architect supplies builders with quantities, on which to form tenders for executing his designs, he should do so with the concurrence of his employer; and it is desirable that the architect should be paid by him rather than by the builder." This statement of duties and terms is printed along with the Rules of the Society; and reference to it has frequently proved the means of avoiding the difficulty and misunderstanding apt to arise in a locality where obligations and claims of the profession are not so well understood as even they are in London.

The association soon found work for itself. A report on the management of competitions was speedily drawn up; which is sent to promoters of competitions wherever desirable.

We may here mention that the original Manchester Architectural Society, which was founded about the year 1836, did good service in its day, in the matter of competitions; for, it got up an exhibition which, we believe, was the first after that of the designs for the Houses of Parliament; and it moved, in some manner or other, with a view to the amendment of terms that were put forth by different committees, including those of the Liverpool St. George's Hall, and the London Royal Exchange. Indeed, the individuals now living who formed part of that society, may claim to have been pioneers of the exhibition-system; which is almost the only check that there is upon unfairness of committees,—slight, however, though that check be.

In August, 1866, the present society put forth the report of a committee "on the question of Builders' Agreements," and in October of the same year a "General Statement of the Methods recommended by the Society to be used in taking Quantities and measuring up Works." More recently the Society has interfered for the amendment of proposed by-laws in connexion with streets and buildings in the town. The regulations, as revised, have been accepted by the Corporation of Manchester. The Society has also moved in the matter of the forthcoming Town-hall Competition; as to which matter we have reported from time to time.

In their original "Suggestions on the Management of Competitions," wherein the "great care" requisite to avoid causing injustice to competitors, and disappointment to promoters, is rightly dwelt upon, it is said;—

"Presuming that in no case will a competition be determined except where a satisfactory selection of one architect has been found impracticable, and that it is not arranged for the purpose of covering a selection already mentally if not actually made by some or a majority of the promoters, it would seem that the chief desiderata in every competition must be,—

- I. Proper instructions to Competitors.
- II. Strict adherence to the instructions by both Promoters and Competitors.
- III. The offer of sufficient remuneration to induce those qualified to compete.
- IV. The selection (in limited competitions) of architects generally recognised as of equal standing in the profession.
- V. Provision for competent and impartial examination and adjudication."

As to the "instructions," we are inclined to think that the Manchester Society would agree with us that the more definite they are, excepting as to the drawings and what is necessary for comprehension and comparison of designs, the more will they fetter the suggestions that it was the object to call forth. This must be a result even from one of the Society's recommendations, which relates to decorative character of the design, namely, the one worded,—"When possible, the style of the intended buildings should be mentioned, e.g., whether Gothic Italian, or otherwise;" though we scarcely expect every one who is in the habit of competing, to assent to our view, at present. Should the

promoters have a decided prepossession, fairness of course should dictate announcement of the fact: but the Manchester Society urge something different to this: they urge what would tend to protract the prevalence of distinct systems in taste, and the subordination of art to mere style, in place of leaving the rapprochement in progress to go on, and the influence of art in architecture to be dominant once more, as in the past. If a committee were to complain that it held itself wholly untrammelled, and that any information given must be taken only for what it might be worth prior to receipt of the independent suggestions of competitors, architects would not be worse off than they are now, and architecture might gain something. The Society say:—"Either the exact accommodation should be set forth with or without the *approximate* contemplated outline—or, the *maximum outlay* with general statement of accommodation, leaving the extent and nature of it to the skill and experience of the competitors." The latter are theirs. Either course advised would be an improvement on the present system: yet we have always held that, even, the mention of the sum of money in hand might involve the result of defeating the objects, or an alternative of injustice; since a good design might be means of inducing contributions of money. It is added.—"It would also be desirable that as regards hospitals, asylums, public schools, &c., the promoters should state the minimum number of cubic or superficial feet of space they expect to be allotted to each inmate," but surely, here, architects being supposed able to judge as to the space required, the recommendation should have been to the effect that intending competitors be asked to meet the committee, pursuant to an arrival at the conclusion with the benefit of advice,—payment for the attendance being made, if necessary. We are not certain that we should agree with the Society as to reduction of number of the drawings; but we are somewhat in favour of a limitation of the scale to something smaller than is now usual. Anything tending to increase the space that drawings cover in an exhibition, is a positive impediment to a right decision; but the architect's intention must be made more clear than it is usually. We quite agree with the Society that the majority of the drawings are never looked at by a committee, as ordinarily constituted,—"the judgment," such as it is, "dwelling on the main plan and perspective-view,"—and that "constructional drawings for the guidance of the builder," and the "specifications" that are "frequently required," are indeed not wanted: but construction, we say, as well as ultimate effect of details, must have been taken into account by the competitor; and a qualified judge will require evidence of the fact, and will attach far less importance to the perspective-view than to the other drawings, whilst however using it for saving of time in the mental operation of putting those drawings together. The "best general arrangement of plan and elevation," as shown in drawings, may be utterly spoiled by the conditions of execution. But, actually, the drawings that the Society mention as sufficient, would include nearly everything necessary, or what in the previous paragraph of the "Suggestions" had been referred to as useless. The uniformity of method of representation, and even of size of drawings, is litigiously dwelt upon. On the head of remuneration, it is very properly observed that the whole amount for the successful man should be more in the case of a competition, than in that of professional work where there is no competition; and it is clearly shown that the premium should not "merge" in the usual commission. Where competitors are of the unlimited kind, the "Suggestions" say that sufficient sums should be allotted to, and equally divided between, the authors of other designs than the first premiated, found worthy of consideration (the number depending on the magnitude of the competition), in lieu of the usual second and third premiums only; and that in competitions of the other kind, each competitor should be remunerated,—drawings remaining the property of the competitor in either case. The question whether absence of the limitation is not calculated, always or generally, to defeat the object, does not seem to have been considered sufficiently by the Manchester Society. As to selection of men as competitors, it is urged that it is only fair that each one should know whom he is expected to compete against. As to that which is rightly regarded by the Society as "the most difficult question," the adjudication, we are unable to receive the sug-

gestions "as a solution:" though they may be "worthy of consideration." Truly it is difficult to see how the best designs can generally be selected, unless by enlisting aid of the particular architects who have been "considering how to carry out the requirements,"—"that is the competitors themselves:" but the framers of these "Suggestions" do not seem to be aware,—or they have not attached sufficient importance to the facts,—that the proposal of a competitor's giving one vote in favour of his own design, as best, and another vote to a design as second-best, has been tried, with the result that it is now not so repeatedly suggested as it used to be. Whether the proposed statement of the competitor's opinion in writing, would prevent unfairness, may deserve consideration: but, ordinarily, we should prefer adjudication by a committee composed partly of architects, but these not in a minority, and with proceedings in open court,—giving opportunity to each individual to explain his design in presence of the other competitors. This course would involve limited competitions, without other argument for them. Public exhibitions of the drawings may advantageously be allowed to continue: but the judges must not defer too much to the public expression of opinion; which, in the present state of qualifications for judging of ultimate effects from drawings, and with the utter carelessness, indeed, or want of conscientiousness, in expressions of opinions on drawings, is proved to be deserving of little consideration. Referring to professional judges, the "Suggestions" say that the individuals appointed must be "not too much engrossed with their own business to spare the proper amount of time for the consideration of the designs." This point we have often insisted on; and it is really the most important to be dwelt on at this juncture, or that is connected with adjudication.

The question of building-agreements was considered in 1866, by a committee of the Society, keeping in view a form of agreement proposed by the Master Builders' Association, the discussions thereon in the Society, and several forms in use with members. The committee were unable to offer any stereotyped form, but recommended certain main features as to be included in all agreements. They dwelt upon the importance of the building-proprietor's not being in doubt as to nature or extent of his liability, or as to the thing to be received in return, and upon the desirability of the builder's having sufficient opportunity, before signing the contract, of examining the quantities before accepting them as correct. This done, the agreement should, according to the report, contain, beyond the usual preliminary statement of its objects and the parties to it, clauses of certain kinds, which have been grouped under three heads, namely,—1. On the part of the contractor; 2. On the part of the architect; and 3. On the part of the proprietor. When read, however, these are not found, throughout, to be obligations on the part of the contractor, or architect, or proprietor: thus, it might be urged, there is no liability of any kind admitted as incurred by the architect. Generally, they are to the effect following.

The work shown, or described, is to be done in the manner set forth, proper means being adopted, by signatures, of identifying documents and constituting them part of the agreement. No deviation from the contract is to be made without the architect's authority in writing. Deviation that has been ordered, as referred to, is to be carried into effect without nullification of the agreement, and is to be paid for, or deducted, by the proprietor in a manner to be agreed upon. For instance, the manner may be,—

- (a) According to a schedule of prices agreed on between the contractor and the architect;
- (b) By reference to the original estimate,—or, in place of either,
- (c) At the architect's determination,—with such a percentage allowed to the contractor upon the value of works actually omitted (not substituted by others) as shall be stated; and
- (d) A proviso for deducting the value of materials found by the proprietor, or of contingencies to which prices are affixed in the specification, either at the net amount or with such a trade-discount as is set forth in the agreement.

No payment is to become due, or be made, except on production of the architect's certificate; and the works are to be handed over complete by a fixed date, subject, on the one hand, to a stated deduction for delay, as well as, on the other, to the following,—

Provision for an extension of time for completion of the works (to such an extent as the architect may on the occasion of such extension determine) on account of extraordinary stress of weather, or on account of a strike of workmen, if not originated by the contractor.

The architect is to have power to reject materials, or work, not, in his opinion, accordant with the agreement, and to cause removal and replacement, after notice agreed on, at the contractor's risk and expense; also to employ other workmen, and procure other materials, at the contractor's expense, if due diligence is not used, or in event of the contractor's bankruptcy; and power to remove workmen. All sub-contractors are to be first approved of by the architect. The next clause, which has, just now, peculiar importance, is thus worded:—

Decision of the architect in all cases provided for by the agreement, to be binding on all parties. In the event of any other circumstances arising, in which he and the contractor or proprietor may not agree, the decision of a referee, named in the agreement, to be final.

The obligations on the part of the proprietor, as stated, are to involve engagement to pay the amount contracted for, subject to the increase or diminution, on production of the certificate; whilst a following clause involves,—

Statement of time beyond which the architect shall not withhold such certificate of completion, provided the work has been carried out in accordance with the terms of the agreement.

The payments are to be made as agreed upon, for example, either in certain sums at stated periods of progress, or by instalments not exceeding, say, 85 per cent. of the value of the work, and, also, if agreed upon, the value of materials delivered and approved of.

The Statement of Methods recommended in taking Quantities, and in Measuring-up works, was very carefully considered. Its main features appear to be the taking out of the hands of the measurer the optional allowances, which are often excessive, for waste, for trade-usages, and so forth, and the measuring the actual amount of work done,—careful descriptions and particulars being given of all matters requiring special labour, as mitres, ramps, trimmings, and hips and eaves. The document, as printed, extends to 148 clauses, divided under the heads of the trades, and besides a page of general clauses and prefatory suggestions.

A desideratum in taking quantities is, as stated, the giving to parties estimating, the clearest idea, and in the simplest manner, of the cost and character; so that in measuring up works executed, no more is required than the ascertaining the principle of measurement on which the prices have been determined, and then the proceeding accordingly. It would occupy too much space here to mention the purport of the several suggestions or instructions; but we may say that they deserve to be studied by all estimators and measurers, as also by all architects, since they are suggestive of some improvements in the language of specifications. In the measurement of brickwork, the work is reduced to one-brick thick, and called "brick-length walling," and is taken in yards superficial; and there has, we believe, been a local system of charging for "hollows," or "cutting hollows." As to these items, or to prevent any misunderstanding with regard to other materials built-in, it is proposed to measure the net-quantity of brickwork, deducting entirely all labour and materials in openings having more than 100 square feet face-measure, and deducting materials only (leaving "hollows," for labour) on all other openings, the shape they are actually executed (provided they are openings in the walls and built above with the same materials), and on all sills, strings, cornices, and generally the masonry and dressings built-in and being more than 6 in. in height; whilst, further, fireplace openings, from underside hearth, and all flues, are to be deducted as "hollows," and the lineal dimensions of flues (with size, if various), to be given for extra-labour of forming and pointing. Such things as ends of joists, wall-plates, and door-frames, are not to be deducted, if built-in with the work. To indicate how much has been thought of, we may mention that one clause is to this effect:—"Covering walls to protect them during inclement weather or strikes, and manner of doing it, to be added to the brick-setter's contract." As regards mason's work, the minute subdivision in measuring, and the taking into account each necessary operation of the workman,—even to what may appear the measuring the same surface (as in panelled or enriched work) more than once for different descriptions of work,—are prominently set forth. Generally, in the trades, the system appears to be characterized by perfect fairness; though it is capable of revision for use in London and in the country generally.

The action taken as to the local Bye-laws

resulted from an intention on the part of the corporation to make particular regulations applicable to streets and buildings in Manchester. On the discovery of the intention, and of the nature of the proposed laws, these were seen by the Society to have a somewhat arbitrary character. The Local Act for Improvements allows the town-council to make such laws subject to approval of the Secretary of State. As the Council did not very favourably receive advances made on the part of the Society, the architects memorialized the Secretary against adoption of the bye-laws. Although they were too late to prevent the coming into force of the regulations, legally,—since the time given by the Act, to the Secretary of State, for disallowance, had elapsed,—the Secretary sent Mr. Rawlinson to inquire into the subject, and the result has been the adoption by the Town Council of a new or revised set of Bye-laws, which have been approved of by the Secretary, and have superseded the others. The circumstances show that if public and corporate bodies would avail themselves of assistance within their reach, absurd stipulations might be prevented, such as now get into Acts of Parliament, or are embodied in local bye-laws, and that the eye of the Secretary of State may be in danger of passing over. Some regulations that have been proposed in like cases, whilst professing improvement, as that of a sanitary character, would offer impediments in each direction of progress. This seems to be the case in Manchester with reference to prevention of the system of depositing small quantities of ashes in the streets, to be removed by the dust-cart, a system prevailing where from want of space there are no ash-pits, as in the case of the offices in the centre of the town. The truth is, the system of depositing refuse in a street, within prescribed hours, combined with such perfect street-cleaning as there is in Paris, and the rejection of all hoarding of refuse in a house, is the best system, sanitariously speaking; though, on the one hand, from the defective scavenging of our towns, and on the other from the unavoidable unsightliness where heaps of refuse are temporarily left, the common idea about it is very different.

Besides the business-meetings of the Manchester Society, the members meet together every year; and, generally, the Society has conducted that friendly feeling which is not less important to the influence of the profession in the direction of the public interest, than to that of each architect in furthering his own claims.

The success that has attended the Manchester Society of Architects, has induced several of the leading architects of Liverpool to associate themselves for the formation of a similar professional body; of which Mr. Hornblower is the honorary secretary.

Judging from the activity of the secretary of the Manchester Society, Mr. Murgatroyd, we may attribute much of this success that we have referred to, to his individual exertions.

THE KENSINGTON NATIONAL PORTRAIT EXHIBITION, 1858—1860.

"THE SIR JOSHUA."

In the *Builder*, of the 25th of last month, we promised "something" with reference to the one hundred and fifty-four examples of Sir Joshua, now so pleasantly accessible at South Kensington. This promise we shall endeavour to make good.

Judges of the present or last generation who have reached a little beyond the middle period of the scriptural imitation of three-score-and-ten, who love art, and have frequented the British Institution in Pall-mall in its Aberdeen and Beaumont days, must have seen many choice examples of England's Sir Joshua, but never till this year have they had the opportunity of seeing our great painter in all his force of portraiture, in his full strength of fertility of conception, adaptation, and treatment of position, as he is to be seen and studied through the labours of the Committee of Council on Education. We cordially recommend all who love art to make a visit to "The Sir Joshua." If those who study good English writing are to give their "days and nights" to Addison, why should not portrait painters and portrait sculptors dedicate a long summer morning to the Sir Joshua here properly collected for their instruction and delight at accessible and fashionable west-end London? Reynolds is the preserver on canvas of the ineaneats, and red-and-white-rose complexions

of two generations of English beauty. He lived to paint the mother in her prime, the daughter in her youth. How many revolutions in dress has he been the means of perpetuating. He did not foresee crinolines, but he loved and painted full and richly embroidered trailing silks with the skill of a mercer or a milliner, and all the fidelity of an accomplished painter.

There are several "wants" in the present collection, rich as it is beyond precedent, in examples of Sir Joshua. We will instance some of the portraits which might have been usefully added. We miss, for instance, Reynolds's own portrait of himself, in his own hair—one of the treasures of the Dilettanti Society, at Willis's Rooms, in St. James's-street; we miss the two admirable Dilettanti pictures—twin conversational and toasting portraits—in the rich colours of Paul Veronese, in the same room. The members of the Graphic Society know them well. Charles Turner engraved them. Did the Kensington committee ask for them? The Manchester Art Treasures Committee asked for the loan of them exactly ten years ago, and were refused; yet we remember to have seen them, or we say greatly deceived, at the British Institution in Pall-mall.

Where is the Thrale, Watson Taylor, and Sir Robert Peel noble head of Dr. Johnson? Was Sir Robert Peel asked for it? Would he not spare it from its central situation at White-hall? Sir Joshua's George IV., too, when Prince of Wales, now at Sir Robert Peel's, at Whitehall, the portrait (head only) before which we remember the Duke of Wellington to have exclaimed aloud, in Sir Robert Peel's house, before the great ministers and a room full of the learned in art, "Ah! my old master. And very like him!" Nay, more, we miss the portrait of James Boswell, the prince of biographers, in the conversational way, painted by Sir Joshua, at Boswell's request, and on Boswell's own terms for payment. Witness the copy of Boswell's letter which Mr. Wilson Croker was the first to publish, and Sir Joshua's memorandum of acceptance at the foot of it. Sir Joshua's characteristic portrait of Horace Walpole (the Grosvenor-Bedford portrait), engraved by McArdell in mezzotint, and in line by Bromley, is also absent. Our reference to Johnson reminds us that a little forethought on the part of the committee might have carried to Kensington the portrait of Frank Barbery, Dr. Johnson's black servant. The careful reader of Boswell—and who is not?—would surely have exclaimed, when standing before it, "Frank, a clean shirt!"

At Kensington is not seen Sir Robert Peel's Commodore Keppel? or the National Gallery's Gibraltar Lord Heathfield? The Committee has borrowed, we observe, from the Trustees of the National Gallery the portraits of three English worthies—Hogarth, and Woollett and John Hall, the engravers. The Bedford or Russell Family is still at Middleton, in Oxfordshire, the seat of the Jerseys.

Where are Elizabeth Keppel, the Woburn Marchioness of Tavistock (that lovely full-length) in her wedding dress, so charmingly engraved by E. Fisher, living "at the Golden Head, the south side of Leicester-square, price 15s.?" and Mr. Thrale's Hester Lynch, Salisbury born, afterwards, sad to think, Hester Lynch Piozzi?

Where is the famous "Marlborough Family," that rival to Holbein's More Family and Vanduyck's Pembroke Family? Sir Joshua is seen in all his strength in this picture.

Where is the half-length of Lord Temple, which Horace Walpole noted in his Catalogue of the Royal Academy Exhibition as the finest portrait Reynolds ever painted? This was written in 1776.

But we have done replying to the cry of our old London apprentices, "What d'ye lack? what d'ye lack?" preserved to all time in "The Fortunes of Nigel." There is quite enough to be thankful for.

Three portraits here exhibited of a great English historian will delight other students of history besides the very reverend and learned Dean Milman, the editor of Gibbon. We allude to 684—a miniature to waist of the historian of "The Decline and Fall,"—"looking to right, grey coat and flowered white waistcoat," the property of Mr. G. E. Wilbraham; to 657, Sir Joshua's portrait of the same great man; and to 668, Romney's almost unknown portrait of him. So little known, indeed, is Romney's head of Gibbon that we (curious in such matters) have never heard of a person who had seen it. Sir Joshua's Gibbon is grand; we have a photograph of it before us while we write, and have found no engraving worthy of it, or indeed very

much like it. What superiority of intellect is written on that lofty forehead and that lowering Walter Scott-like head! There is a haughty insolence in the great historian's look which commands respect. One feels little when standing before the Sheffield Gibbon. By the way, we should like to have seen here Sir Joshua's companion head of Lord Sheffield. It was at Manchester in 1857, and was much looked at by artists. What does Malone say of Sir Joshua's Gibbon?—and he had seen Gibbon—"The picture of Gibbon painted by Sir Joshua is as like the original as it is possible to be." This commendation would have enriched the Catalogue.

We shall conclude this brief reference to Sir Joshua with a correction on the subject of No. 656, the portrait of "Richard Stonehever." The Catalogue tells us that he was the friend of the poet Gray and his executor. This was something new to us. Why the poet Mason and James Brown, the President of Pembroke Hall, Cambridge, were left the "joint executors" of the poet. "I give," says the poet in his will, "to Richard Stonehever, esq., one of his Majesty's Commissioners of Excise, the sum of 500*l*. Reduced Bank Annuities, and I beg his acceptance of one of my diamond rings." And what does Mason leave to Stonehever? "I also return," he writes, "to Richard Stonehever, the portrait of himself, painted by Sir Joshua Reynolds." Where is it now? The portrait here exhibited is the property of the Duke of Grafton,—and, to our thinking, is the very portrait of Stonehever that Mason bequeathed to the friend of Gray.

THE LAW COURTS COMPETITION.

The Judges of Designs have not yet commenced their work, but will, no doubt, do so now without delay; the various persons and committees to whom special inquiries were deputed having made their reports. The most important of these, the result of a very elaborate inquiry, is that from Mr. Shaw and Mr. Pownall, who preface it thus:—

"We have now the honour to present the report of our investigation of the competitive designs for the Courts of Justice on the several points contained in the instructions furnished to the competing architects.

We should have been glad to feel that this report, made, as we believe, in conformity with the instructions contained in your minute of the 23rd day of March, would have enabled the Commissioners to determine 'which of the designs upon the whole afforded the greatest advantages.'

We fear, however, that this is not the case; and that, although we have expressed a definite opinion on all the most important requisitions, the number of those requisitions is so considerable, and they vary so much in their relative importance, as to make it extremely difficult, if not impossible, for the Commissioners upon the report alone to arrive at a satisfactory conclusion as to which of the designs does offer the greatest advantages, having reference as well to the relative compliance of the several competitors with the instructions in detail, as to the most important points of the general arrangement and combination of the design as a whole.

We beg to submit the following observations for the consideration of the Commissioners:—

We have been deeply impressed with the great talent exhibited in the designs, and with the unwearied application which must have been devoted to their preparation, as to the difficult task of compressing into the allotted space the large extent of accommodation called for by the instructions.

We are, however, decidedly of opinion that it is impossible properly to provide this extent of accommodation on the proposed site, and that in order to obtain sufficient light and air to the numerous courts and offices, it is essential that the area of ground should be enlarged.

This enlargement, we consider to us, is further desirable as facilitating the placing the courts and some of the more frequented and important offices on a lower level than has been found practicable in any of the present designs.

We consider this change in the level important both as regards the convenience of the judges, as well as of the numerous persons attending the courts and offices in question.

On the subject of warming and ventilation we beg to suggest, that while as regards the courts, halls, and corridors some general system of hot-air or hot-water should be adopted, it would be desirable to warm and ventilate all the rooms by means of ordinary fire-places and sub-windows opening, not into covered courts, but directly to the external air.

The Commissioners will be fully aware that the opinions we have expressed in the Report have been formed entirely without reference to the relative merit of the designs as architectural compositions, that part of the subject not having been referred to us.

JOHN SHAW,

Geo. POWNALL.

The result of their report is decidedly in favour of Mr. E. M. Barry's plans, thus confirming the good opinion we arrived at as the result of our necessarily much briefer and more superficial examination. Out of seventy-nine heads of comparison, they are of opinion that that gentleman's design "offers the greatest advantages" in thirty-two cases; and these for the most part under the most important heads. Mr. Scott's design, we elicit, offers "the greatest

advantages" in the next greatest number of cases, namely seventeen. Mr. Lockwood's design comes up as the superior under eight heads. This statement is of course influenced by the opinion Messrs. Shaw and Pownall arrive at under the head "Accommodation" where they say:—

"As to No. 6, Area of Courts and Rooms.—The designs of Mr. Street and Mr. Waterhouse as regards the courts are not in accordance with the instructions, being deficient in the prescribed area on the floor level. It appears to us that neither of the designs is deficient in the prescribed area within the four walls of the courts, but that Messrs. Street and Waterhouse, for securing greater quiet in the courts, have suggested that, instead of leaving the courts open, a portion of them should be partitioned off with glazed panels to allow of counsel and solicitors ascertaining the state of progress of the business in court without actually entering the court."

The Committee of Bar and Solicitors in their report dissent from this opinion, and say:—

"We consider it incumbent on us to notice that regard to the reports of Messrs. Shaw and Pownall which states that the designs of Mr. Street and Mr. Waterhouse as regards the courts are not in accordance with the instructions, being deficient in the prescribed area on the floor level. It appears to us that neither of the designs is deficient in the prescribed area within the four walls of the courts, but that Messrs. Street and Waterhouse, for securing greater quiet in the courts, have suggested that, instead of leaving the courts open, a portion of them should be partitioned off with glazed panels to allow of counsel and solicitors ascertaining the state of progress of the business in court without actually entering the court."

This Committee consider that the solution of the question whether any central hall is needed, and, if so, its position, and the uses to which it would more especially be devoted, has more than any other important bearings on the general scheme of each architect, and on the comparative advantage each scheme presents, and have passed the following resolutions:—

"1. That there should be a central hall. That one large hall is preferable to several smaller ones, and that it should be on the floor next below the courts. Mr. Waterhouse's design is of ample size, and is the only one placed on the floor next below the courts; but the designs of Mr. Barry, Mr. Brandon, Mr. Lockwood, and Mr. Scott, could apparently be amended in this respect by removing the rooms and offices underneath, and depressing the halls proposed by them to the level of the floor below, and their halls are of sufficient size.

The form of the hall should be as simple as possible, and so arranged as to be easily accessible to all the witnesses and suitors in it when they are wanted. The halls designed by Mr. Barry, Mr. Brandon, Mr. Scott, and Mr. Street, appear to be objectionable in this respect. Those of Mr. Deane, Mr. Seddon, and Mr. Waterhouse are in this respect the best, but Mr. Deane's is much too small."

The Metropolitan and Provincial Law Association also arrive at the conclusion that there should be a central hall, in which opinion we know, as from the first, fully concur.

The report of Capt. Shaw, chief officer of the Metropolitan Fire Brigade, consists of two statements only; one that "Mr. Deane's designs come nearer than those of any other competitor to the true principles of safety from fire;" and the second a somewhat vigorous denunciation of "the mode in which Mr. Scott has attempted to deal with this part of the question." He says, in conclusion:—

"Even as a financial question, there can be little doubt that it will be a sounder policy to make the building reasonably safe in construction and material in the first instance, and to reduce the annual expenses for watching to a small amount, than to neglect the subject of fire altogether at first, and then incur a heavy annual expenditure in guarding against it; but I most respectfully submit to the consideration of the Commission that this is something more than a mere financial matter; that, in short, it is a most important question of public progress."

In a second short communication, Capt. Shaw writes:—

"I gave my opinion simply as to the best and worst designs, judging them solely from my special point of view, and I omitted all reference to those which seemed to me to be of intermediate merit.

I am, of course, still of the same opinion as when I wrote on the 27th ultimo, and I have nothing to add to or retract from what I have said.

"My object in writing now is merely to ascertain whether the Commission would wish me to offer opinions concerning any of the other designs.

"In conclusion, I should wish to take this opportunity of expressing my attention to the fact that a careful inspection of these drawings cannot fail to convince any one who understands the principles of construction and the nature of the moulding materials, that the great majority of the designs are not only deficient in mechanical advance on anything which has been done in this way of late years; and that even if the subject of safety from fire be now dropped for the present, the Commission have already achieved a most important result, and laid the foundation of a permanent reduction of the eventual expense of watching the building and securing its safety."

The Royal Commissioners have received these and many other reports, proceeded to consider them, and with reference to the Bar and Solicitors' report, resolved,—

1. (Nominis contradictorie). "That the Commissioners do concur with the report of the Committee that there should be a hall."

2. (With one dissentient). "That the hall should be on the floor next below the courts."

3. (With two dissentients). "That such hall should be placed on the floor next below the courts."

4. (Nominis contradictorie). "That the recommendation of the Committee as to the form of the courts by skirting the walls, striking off the words 'where practicable.'"

5. And 6. "That the Commission, being unable at present,

to enter into a detailed examination of the remainder of the report, the same is to be transmitted to the Judges of Designs as the opinion of those Commissioners whose names are appended thereto."

We have only to add that the Judges of Designs, having assented to the proposal that two professional architects should be added to their number, have appointed Messrs. Shaw & Pownall to act in that capacity; and our readers now know exactly the present position of affairs.

EGYPTIAN AND CAMPANIAN DISCOVERY.

THE time when an important discovery was communicated to the world as if by an electric shock has gone by, perhaps never to return. In the age of steam-locomotion and of electric telegraphs, men are too busy to care for the discoveries of their neighbors. Anything that may affect the price of funds, of corn, or of cotton, monopolises the wires, and is communicated by Mr. Reuter's agency in the largest capitals. A shot goes off in Paris, and the echo is heard in Pall-mall almost as soon as in the *pages Latine*. But a new form of life is discovered—some strange bird, or beast, or giant tree, and who knows anything about it? The discoverer, proud, and justly proud, of the results of enterprise, or of happy observation, finds, on reaching our shores, that all that he can do is, after much pain and expense, to submit a paper to some special society occupying itself with the subject. If the season of the year be suitable, and the society sitting, and not too hazy, and the results of the new discovery are not too inconsistent with the opinions to which the leading members of the body are committed, the paper may be read, and subjected to the sceptical comments of the tarry-at-home travellers who so far honour it as to listen. And possibly a brief notice, in the very smallest type, may creep into some obscure corner of the daily newspapers. Such is the public meed of the discoverer now-a-days, unless he have time, and ability, and sufficient means of holding his own with a publisher, to give the results of his labours in his own name and in his own words to the world. And there are men who would find it easier to rival the heroic perseverance of Baker or of Livingstone than to give in plain English a readable story of their labours. How one of our most enterprising African travellers failed to take, in the first instance, his proper place in public esteem for want of some small share of literary skill, will be fresh in the remembrance of our readers.

To a great extent this indifference of the public to important discovery is a consequence of the march of science, of the immense amount of fact already collected, and of the necessity of referring separate branches of inquiry, as it were, to separate committees of the scientific world. But there is one point to which we more particularly refer, as coming within our own peculiar province. In Egypt, in Italy, in Central America discoveries are being almost daily made of the highest importance to the history of architecture, no less than to political history, and to our knowledge of the habits and manners of the past. While these discoveries may in each instance have their special interest for some small circle of philologists, of astronomers, of chronologists, of classical students, of ethnologists, and the like; they have a great and general interest for all lovers of art, and for all students of architectural and of engineering science. The opening of an Oscean tomb at Cumæ, or of a sepulchre of the time of the Hyksos in Lower Egypt, has a special interest for all who value our pages, no less than for the special Italian archaeologist or for the student of hieroglyphics.

It is therefore alike in the interest of our readers and of the general march of human intelligence to call attention to the work now silently pursuing in recovering the buried records of the past, and that not without the hope of attracting from time to time fresh intelligence to our own columns. It is strange not only that so little should be known generally in this country as to the progress of Egyptian and of Campanian discovery, but that it should be so difficult for those interested in the subject to arrive at the latest intelligence. No research in Egypt has had more important results than the discovery, by Mariette, of the Serapeum, of the sacred mausoleum in which the mummies of sacred bulls have been deposited from the very time of the exodus, and of the detailed inscriptions, which in some instances form the epitaphs of these incongruous sepulchres—inscriptions stating the year of the king

and the day of the month in which each Apis was born, was canonised, died, and was buried, and the number of years, months, and days which he lived, thus forming an absolute chronological check whenever the inscriptions are perfect. And yet it will be hard for the English student to satisfy his curiosity as to these invaluable discoveries. The *Bulletin de l'Athenæum Français*, in which M. Mariette was in the course of publishing them, ceased to appear in October, 1856. The *Revue Contemporaine*, in which it merged, seems to afford no means of printing hieroglyphic texts, and the abstract given by Mr. Birch of the Apis dates in the new edition of Bunsen's "Egypt" does not come lower than the date of the last Bulletin. At this moment, we learn from private sources, that excavations are being made in Lower Egypt, where monuments are being brought to light that promise information on the most perplexed time of the Egyptian annals, the reign of those shepherd kings who were an abomination to their native subjects. But whatever may be known at Paris or at Berlin as to these proceedings, we ask in vain in our own metropolis for news on the subject. There is evidence, some of us think conclusive evidence, to show that the colossal portrait of the very Pharaoh of the Exodus himself, as well as of his terrible predecessor who ordered the delivery of the Jewish boys to the crocodiles, are now reposing in the halls of the British Museum; and yet the public pass by the speaking faces with as little appreciation of the message they have to utter as of the hieroglyphics themselves.

Nearer home than Egypt, readily accessible in a six weeks' tour, steady progress is being made in uncovering the relics of Pompeii. From the first discovery of that buried city, 120 years ago, during the whole reign of the Bourbon dynasty, the excavations on the spot were not capriciously carried on, and for the most part rather with the object of extracting precious articles to enrich the Museo Borbonico, than with a view of laying open to the gaze of modern Europe a Campanian city of the date of the Christian era. When the power of the Bourbons, on the death of the formidable and little-understood Ferdinand II., collapsed from intrinsic corruption before the bay-troops of Garibaldi, a famous ruler in the literary world was made ruler of Pompeii. No Roman prefect was ever better disposed to make the best of his power and influence than was Alexandre Dumas. Ensnared in one of the regal palaces at Naples, a gem of an abode, looking out over the blue bay, which he held for some time, in spite of the efforts of the incoming government of Victor Emmanuel, Dumas had too much to do with his history of the Revolution, and his *Independence* journal, and his never-ceasing flow of novel publication, to have much time to devote to the *Sacri*. His successor in the direction of the works at Pompeii was a man of another order—a scholar and a gentleman, who had found shelter from political persecution by his attachment to the household of his late Royal Highness Leopold, Count of Syracuse, himself a sculptor and a virtuoso, an antiquary, and a man of taste. Under the direction of the Commendatore Fiorelli the works at Pompeii have assumed a new character: systematic preservation of all relics as much as possible *in situ* has been the rule. The frescoes, instead of having their colours refreshed for the inspection of every visitor by the usual Neapolitan practice,—we hardly like to describe it in its naked simplicity,—of being spit upon by the guide, and then rubbed with the cuff of his coat, if he had one, and with the skirts of its substitute if he had not, are now tenderly coated with a wax varnish as soon as they are exhumed, and thus promise to preserve their natural hues. An excellent map of the city has been prepared, and a superb delineation of the architecture, painting, and sculpture is in course of publication by the Brothers Niccolini, a work which, in purity of design and beauty of execution, is almost without a rival among the numerous editions *de luce* of the Continental press.

The excavations of Pompeii have not the peculiar characteristic of those at Cumæ, where archaeology assumes almost the character of geology; and where three distinct strata of tombs, each containing relics of a race different in date, in habit, in mode of sepulture, and in the orientation of their tombs, are superposed. But their special interest consists in the vivid reality with which they enable the visitor to present to his mind the actual daily life of Rome, or rather of the Roman country villa, or provincial capital, at the time when Julius

Cæsar was making his hasty and abortive inroad upon our coasts, and at the time when a voice, which has never ceased to echo in the ears of each succeeding generation, bade the subjects of Roman conquest to render unto Cæsar the things that are Cæsar's. The ruins that mark the carriage-ways of Pompeii were being formed by the rude, springless cars of the masters of the world, while the divine footsteps yet lingered in the dust of Palestine. The long-silent volcano awoke, and covered town and inhabitants with that thick veil of impalpable ash which remained inviolate for more than sixteen centuries, only nine years after the no less fearful desolation of Jerusalem by the arms of Titus. And among the latest discoveries of Signor Fiorelli, of which we have any English intelligence, is that of the remains of a Roman soldier, who seems to have calmly set himself to die at his post, and of whose person and attire so faithful a cast has been preserved by the volcanic snow that overwhelmed him, that antiquarian difficulties as to the mode in which the Roman soldiers were sandalled, have been dispelled by the evidence thus grimly brought to light.

The effect of Roman civilization on our domestic habits has been a most important element in our national life. Our earliest monuments,—not of human habitation, or indeed of worship or of sepulture, but of fortification, or of building properly so called,—are Roman. The influence of a people cultivated to a state of corruption on a nation of the simplicity of habit that characterized the Gauls and the Britons of the Imperial age, can only be compared to the effect produced by our own colonists and missionaries on the Sandwich Islanders. The natural growth of an architecture adapted to our climate and to our habits has constantly been interfered with by the importation of some Roman form of basilica, or of portico, unsuitable to both. It is by studying the foreign element in its purity that we can best learn how to eliminate it where incompatible with our own requisites.

PAINTED DECORATIONS IN CONNEXION WITH ECCLESIASTICAL ARCHITECTURE.

THE ARCHITECTURAL ASSOCIATION.

At the ordinary meeting of members held on the 7th instant, at the House in Conduit-street, the Rev. Mr. Cutts proceeded to make some observations on painted decorations in connexion with ecclesiastical architecture. He remarked that when an amateur was asked to speak on a professional subject, he did so with some diffidence, and could only take the view of an amateur or perhaps of a critic. In ancient times the use of coloured decorations was much in vogue. In Egypt it was extensively used, while in Greece it was applied not only to architecture, but to the most magnificent works of the sculptor's art. In Rome, too, it was made to contribute to architectural effects; while in Gothic architecture, also, it was largely introduced. In the opinion of ancient architects, colour was essential to heighten the effects of building, and, in their opinion, no building could be perfect without it. Indeed, in the matter of decorations, the sister arts went hand-in-hand, and no building could be said to be perfect which did not contain the accessories of sculpture and painting. It might also be conceded that colour gave effects which nothing else could do. A chalk drawing, for instance, or an engraving, although careful and elaborate, still could not impart the idea of colour. So, too, it was with a building. Let them take, for instance, a modern church. It might be a beautiful example of architecture; but contrast it with a church built four hundred years ago, where colour had been judiciously introduced, and how very different would the appearance be. With stained glass, appropriate hangings, and rich furniture, how much more glorious was the interior of a church than when it was denuded of those appurtenances. Let them imagine, if they could, the Church of St. Mark, at Venice, churchwardensised. That church depended for its magnificent effects very much upon colour. While advocating the introduction of colour generally, he did not, however, recommend the practice of copying old colouring. On the contrary, he believed that any servile imitation would have an injurious effect, and would seriously retard the application of colour to architecture in our own day. If they were to put bits of green

where they found green, and bits of red where they found red, and so on, the effects would be clumsy, hard, and bizarre. What was wanted really was to get at the general system upon which old churches were coloured. Colour might be applied in various ways; first, in mere lines and tints, so as to bring out the architectural effects; or, again, it might be applied to the ornamental features of the buildings, especially in cases where sculptured work had not been introduced, such as in the bell of a capital, or on a string-course. In this way colour might be used to help the proportions of a building. If a building were too low, it might be made to look higher by the introduction of vertical lines. On the other hand, a building might be spoiled by injudicious colouring, and made to look high where it ought to be low, or low where it ought to look high. For walls a tinted slate colour might be used, or a pale claret colour with diaper, or powdered with some other pattern. There was, he thought, much to be done in this to a church after the mason had performed his part of the work. It was, he ventured to assume, the duty of the architect to study the application of colour to architecture.

The study of old buildings showed that the great architects and painters on glass and vellum in past ages were able to produce a harmonious effect over the whole of the interior of their buildings. The usual foundations for wall paintings appeared to have been, as far as he could judge, a thin coat of fine plaster of the colour of the vellum or parchment of which old manuscripts were composed. He presumed that the same artists who painted on glass and who illuminated manuscripts were also the persons who executed wall decorations, because he had found in the British Museum fac-similes in manuscripts of wall decorations which he had found in country churches,—proving, he thought, that the same artist had executed both. The colouring was almost always in distemper, and the tints were flat and not vivid. It was only in small architectural features that brilliant colours were used. There might be said to have been two styles of colouring used in former days, namely, the Norman and the Tudor; and these were succeeded by the churchwarden style, which, however, he was glad to say was rapidly dying out. In the Tudor style there was the same ground colour, with the open spaces provided with *flours-de-lis*, or some other pattern; dined in dark red lines, boldly drawn, with a few flat tints for the drapery. Some excellent illustrations of this kind of decoration were to be found in a little detached chapel standing within the churchyard of a church in Jersey. The paintings were subjects chosen from the life of Our Lord. So, too, at an Early English chapel of thirteenth-century work with which he was acquainted, the walls were covered with masonry-pattern, done in double lines. In this case the floor of the church was paved with coloured tiles, which had a very good effect. The usual ornamental portions of church architecture were of course the work of the architect; but if really high art was to be appealed to, it would be necessary, as in ancient times, to have accomplished artists. So long, for instance, as stained glass was paid for by the yard, it would be impossible to expect any high development in that particular development of art. He might, he was aware, be asked whether they would be allowed to carry out all that the cultivated taste desired to see accomplished in reference to coloured decorations and cognate subjects; and his answer was, that he believed the architects of our own day would insist upon directing the public taste and feeling in those matters, and that eventually the public themselves would demand what the architect would now vainly accomplish, if allowed. He ventured, therefore, to recommend young architects to take up painted decoration as a special subject of study, always remembering that if they were commissioned to adorn a church, they could never make it too beautiful for the holy uses to which it was to be dedicated.

Mr. T. H. Watson observed that the subject to which Mr. Cutts had called attention was one of great interest to architects. There was much more to be done in the way of colouring than to put on crude masses of colour, as it seemed to him that much of the colour now used was to be coloured.

Mr. R. P. Spiers thought we were very backward in the present age in the matter of colour, as it was seldom used for designs. There was much more to be done in the architect's office without any colour at all. Although agreeing with much that had fallen from Mr. Cutts, he could not think it inadvisable to copy old work, because it would be necessary for the student to have something

to guide him. In dealing with coloured decorations also, it would be necessary to bear in mind that we lived in peculiar atmosphere unfavourable to bright colours. In Eastern countries (in Egypt, for instance), where the atmosphere was clear and dry, the ancient architects appeared to have used three simple colours, and yet with these they produced effects which we could not hope to realize. There were, he thought, two notable works at present in the metropolis in which glaring colours were being used, and which, he feared, when completed, would have anything but a pleasing effect. There were in Paris two or three modern chambers in which coloured decorations had been introduced with the best results, and there was also at Rouen the Church of Notre Dame de bon Secour, which was a fine illustration of the judicious application of colour to church architecture.

A member observed that the tardy decoration of St. Paul's Cathedral was a step in the right direction, although two or three hundred years had been taken to think over it. In painting walls, however, he recommended that two or three years should be allowed to pass before any colour was used, as if applied too early an effect might be produced similar to that on the fresco at St. Alban's the Martyr, in Gray's Inn-lane.

Mr. Birch stated that the effect to which the last speaker referred was not to be traced to the newness of the wall, or to any process of disintegration, but to dust, and that all the painting required was to be kept clean.

NOTES FROM THE CHAMP DE MARS.*

Of the pictures *within* the Exhibition building, those of Prussia remain alone to be commented on by me. Before commencing my survey, I may note, that in this gallery, also, the same ugly French ceiling prevails; but the floor is covered with cocoanut matting, which, though not so neatly laid as that in the English gallery, and consequently not so agreeable to the eye, is an immense comfort to the feet.

André Achenbach, of Dusseldorf, has two fine pictures, "The Port of Ostend," and "View of Amsterdam." The latter, a large canvas, is a magnificent work, very rich in colouring, the sails of the ships grouping in singularly with the trees and houses, and all seen against a stormy sky; the little red steamer from the tall mast contrasting admirably with its leaden hue. Becker's "Jouiller et Sénateur," the latter buying jewels for his two pretty daughters, is pleasing; but his "Scène de Carnaval de Venise" is his great picture here. Brendel has some capital "Motionless quittance l'Étable;" Frédéric Karbach, five fine portraits, of which that of the Comte de W. is especially admirable; Knaus, seven pictures, among them "Un Invalide," and "Une petite Paysanne cueillant des Fleurs dans une Prairie." In the latter, a pretty little child is coming down a narrow pathway in some most charmingly-painted high grass, and plucking the flowers that grow up amongst it. Lasch has two pictures, "La Fête du vieux Maître d'École," in which his pupils are bringing him birthday gifts of fruit, vegetables, poultry, and even small animals; and "A Village Festival,"—not noticed in the catalogue,—or perhaps "A Return from the Fair." E. Pape, of Berlin, has a lovely landscape, called "Le Rhin," so peaceful and holy, with just one large bird floating high above the placid water. Richter has two portraits, one "D'un Garçon," especially happy; and Schlesinger has "Les Cinq Sens," not a new idea, but treated in such a novel manner that the five large squares, with two pretty girls in each, are particularly charming.

On the exterior wall of the Prussian gallery, Pfannenschmidt exhibits a "Cycle de sept Cartons coloriés pour les Vitraux de l'Eglise Saint-Nicolas, à Berlin." They illustrate the life of Christ, and are admirable productions; but if they could be used as wall-decorations, instead of for windows, they would be better. It is not only their gold ground which suggests this idea, but the large picture that each design forms, seems so much more adapted to that style of treatment than for the transparent substance of glass.

We now go forth into the Parc to visit some of the various "annexes" that have been built by different nationalities for the reception of their pictures, insufficient space having been allotted to them *within* the "great granary."

Bavaria has not attempted any decoration of her annex, but has adopted the French brick-dust-coloured walls and ugly ceiling; she has boarded the floor, however; but this, as a matter of course, is very gritty and unpleasant.

Immediately on entering, the eye is attracted by the four immense pictures destined for the Maximilianeum at Munich; the subjects of these are, "Frédéric Barberousse et Henri le Lion," by Folingsby, in which the twisted mailed arms look particularly thin and small; "Noces d'Alex-

* See pp. 349, 374, 393, 409, 427, ante.

andre le Grand," by André Müller, very classic in treatment, and poetic in feeling; "Godefroi de Bouillon" by Piloty; and "La Cour de l'Empereur Frédéric II. à Palerme," by Professor Ramberg, wherein the emperor is represented fair and good-looking: much like our early English kings.

Ramberg has also some drawings *en grisaille*, most charming things, which of course were all *vendus*, and which set one breaking the tenth commandment awfully. Four of these "cartons" are illustrations for Göthe's poem of "Herman and Dorothea," and are delicious. Kaulbach, director of the Académie des Beaux-Arts de Munich, has a very large cartoon, chalk apparently, of all the noted persons all over the world, who lived during the Reformation era. Baumgartner indulges in pleasantry, to wit:—"Les sept Sonahes chassant le Monstre," a poor little hare, which sits still, to have a look at them (taken from a German popular tale); and "Procession surprise par la Pluie," in which the grotesque distress of the ecclesiastical banner-bearer is most ludicrous, and the gusty wind that so roughly handles the painted and gilt silk trumpany, is very cleverly shown.

A painful contrast to the above, and the more painful because felt to be only too true, is François Adam's "Route entre Solferino et Valeggio, le 24 Juin, 1859," wherein the poor wounded soldiers are seen "falling out" of the line of procession, to rest their wounded limbs awhile, and dress their shattered hands or feet. A car of sadly contorted and agonized wretches comes jolting over the rickety ratty track which serves for a road. The face of the poor creature in bloodstained, torn shirtsleeves, with an awful wound in his neck, who is trying to spare himself some of the shocks and collisions by leaning backwards on his hands, and thus raising himself slightly from the floor of the cart, is so terrible and yet so truthful as to make the tears start into one's eyes to look upon it. In the midst of this hellish misery and confusion, one man, apparently very little injured, has been pushed down, and is beginning to get up again, when straight over him comes galloping an enormous gun, the horses urged on madly by the lashes and shouts of their drivers and of the officer in command; the poor doomed wretch gesticulates and implores, but all in vain, for the spectator sees and feels nothing can save him from being crushed beneath the wheels of this modern Juggernaut. Such are the glories of war!

After contemplating this, it is a wonderful relief to turn to Schrandolph's two exquisite little pictures, "Groupes d'Angees faisant de la Musique." In each there are two floating angels, in richly-colored robes, seen against a gold background; and in one group an angel bears a scroll inscribed "Gloria in excelsis Deo!" The calm, solemn beauty of these two little pictures is very touching, and makes one feel soothed and bettered.

A Schuetz's "Matinée de Pâques" is pleasing and purifying to the mind; a procession of fresh-faced children singing their Easter hymn, as they walk along the skirt of a wood, just waking up into the consciousness that "Spring's delights were now returning." Buerkel's "Paysage d'Hiver en Tyrol," with its train of little boys in tiny sleds, coming full pelt down the steep road of a mountain village, is brisk and agreeable; "Die Messe du Minuit dans l'ancienne Abbaye de Petroschansen" is effective, with its grim and mailed stone effigies on the walls below, lighted by the blue-white moonbeams; while in the gallery above is seen a group of monks gathered round a redly-flaring candle. Folingshy's "Première Entrevue du Roi Jacques et d'Angleterre et de Anne de Danemark," will be remembered as having been exhibited in London last year. Kappis has a charming little bit, "La Moisson;" Adolphe Lier a lovely "Paysage du Mecklenbourg," with setting sun and rising mist, a still pond, with a boat vividly reflected on its calm bosom; and there is something witching in Martini's "Lorley," she playing her Irish-looking harp, seated on the summit of the Lorlei-berg, overhanging the Rhine, with a smile full of mischief on her pretty face, and a beautiful unearthly light surrounding her head. Liezenmayer's "Marie-Thérèse nonnaisant l'Enfant d'une Pauvre Malade," her own baby being brought in from the back by its pompous attendant, is interesting as matter of history, and commendable as recording a gracious and humane act; but the rich trail of the brocaded silk on the ground seems to have rather too much of ostentatious display in it. Gabriel Max's "Uno

Martyre" is a dreadfully painful picture. A sweet-faced black-haired girl is seen crucified and dead; the rough cross to which she is attached by nails through her delicate hands, still erect, and her head drooped backwards against it. Her white robes and Greek-sandalled feet are bound to it by cords; and a handsome young man in Roman dress,—who would seem to be returning from some Bacchanalian feast, from the vine-bough twined across his shoulder and around his waist,—is kneeling before her, looking up pitiingly and lovingly into her face, and laying a garland of roses at her feet. Is he her lover?

A "Madonna," by Müller, of small size, with four attendant angels, is very good; as are also "Le Refus" by Neustatter; Piloty's "Episode avant la Bataille du Weissenberg: un Pre Dominicain exhortant les Soldats," in which the admiral kneeling soldier in the right front recalls Louis Haghe's best manner; Seitz's "Tableau de Genre," where a Charles I. looking cavalier is playing a violin; Augusta Vischer's characteristic "Danse Nationale de Paysans de la Haute-Bavière," with the light streaming in from large opening in roof; and which picture, if I do not mistake, was shown in London at our International Exhibition; Zimmermann's "Cortège Nuptial," with its half-shy, half-proud bride, and the fussy bundle arranging the procession of gaily-dressed children; and Zwegener's charming "Crépuscule," with its clear sunset.

Spitzweg has some delicious pictures; among them, "Enfants dans la Montagne," and a small "Paysage" in the latter of which a steep wooden bridge is seen in the foreground, with some figures crossing it, all cutting sharply against a grand thundercloud, that covers and almost conceals the hills, and envelops the village and church in lurid obscurity. "Is he celebrated, Spitzweg?" inquired a Yankee—bent on picture-buying, but evidently mistrusting his own judgment—of the extremely polite and obliging attendant who was kindly showing him round the gallery.

Some few of the Bavarian pictures, I remember, are within the building; and of these I must particularize two or three: to wit, "Dégustation secrète du Vin," by Hohach, where a fat old monk is drawing the wine out of a cask by aid of a small pipe applied to the bung-hole, and is discovered by another, who is coming up behind him; Koekert's "Cortège de Noce sur un Lac dans les Montagnes de la Bavière," in which the wedding party are seen in a very strangely-shaped boat, which is decked with flowers and garlands; and "Le Peintre de Portraits embarrassé" by F. Meyer, of Wismar, wherein the child, brought to have its portrait painted, is roaring and writhing about, and the nurse is shaking a bunch of keys before him, in the vain hope of quieting him; while the poor artist looks on in hopeless perplexity. The plants in the studio, especially a bignonia, and the ivy climbing up and around the doorcase, are charmingly put in, and call to remembrance a well-known delightful studio in Munich.

R. F. H.

THE RECONCILIATION OF CLASSES.

THE WORKING MEN'S CLUB AND INSTITUTE UNION.

THE annual meeting of the "Working Men's Club and Institute Union," held on Tuesday (Lord Lytton in the chair), was a very interesting one from the speeches delivered; and it is to be regretted, especially when taking into account the immediate need of better understanding between classes, some of whom will shortly acquire political rights, and between employers and employed, that the importance of the society's operations did not secure a larger attendance.

During the past year the Union has been subject to some misapprehension of its objects. These are related to the chief questions of the day, but only inasmuch as they can be pursued by men of all parties, and alike by the representatives of the interests of capital or labour. The aim of the Union is to secure for working-men places of resort analogous to the clubs of the upper classes, where refreshment for mind and body may be obtained without obligation to defray the cost of the accommodation through the medium of drink, and where, in addition, different agencies for educational improvement, and meetings for discussion of questions of social interest, may be provided for, and quarters afforded for friendly and trades' societies apart from the public

house, as well as opportunity given for occasional intercourse and interchange of ideas between persons of different classes. It is to be hoped that the misapprehension to which we have alluded, and which is perhaps the unavoidable result of the present state of political and social questions, will not continue. It would not exist after general acquaintance with the scope and operations of the Union, as set forth in its publications.

Very inadequate reports of the meeting on Tuesday last have hitherto appeared. In moving the adoption of the report, the Rev. Main Walrod pointed out (what indeed is felt by the Council of the Union) that working-men had yet in great measure to be induced to take, themselves, interest in the club, and generally to withdraw their business-meetings from the public-house. He thought that too great an attempt should not be made to persuade them that they would do so much wiser and better from reading certain books. The Rev. Harry Jones, M.A., dwelt on the necessity of men rising by their own exertions, and upon the importance of its being felt by the working-classes that they were treated in the manner of patronage. The second resolution, which was moved by Mr. R. Fyke, M.P., and seconded by the Hon. Abernethy Herbert in an able speech, was "that in view of the present differences between employers and employed, such institutions as working men's clubs are of the highest value, as tending to bring about a better understanding between those classes." The third resolution was moved by Sir John Bowring, seconded by the Rev. T. W. Fowle, M.A., and supported by Mr. Hodgson Pratt. It was to the effect that the objects of the Society were such as to deserve the "active and cordial support of all persons desirous of improving the social condition of the working-classes." Sir John Bowring said, most impressively, that there never was a time when this movement was of the importance that it was at present, when our whole social position was about to undergo a thorough change. If any duty was pre-emptory, it was that of improving the social condition of the working-classes; and the working-men's clubs afforded an excellent opportunity for gathering all classes together. What was wanted to be done was to raise the many to the level of the few, not to bring down the few to the level of the many; and he believed the clubs would be fit instruments in accomplishing the noble object.

Mr. Hodgson Pratt, in supporting the resolution, observed that the Working Men's Club Movement, like many others of the same kind, arose out of a deep sense of dissatisfaction with the present condition of society. They all felt that it could never have been intended by the Author of the World that there should be so terrible a contrast in the condition of the "upper ten thousand" of the toiling millions around them. This contrast between immense wealth and hopeless misery distinguished this country, he believed, from all other countries. He thought that all persons who had lived much on the Continent would agree with him in thinking that working classes there had a far greater share of happiness and enjoyment than in England. The fact appeared even in the countenances of the people whom one saw in the streets. The English workmen whom he had recently met in Paris seemed at once to feel the influence of the works of beauty around them, and of the lighter atmosphere. The fact was, that in our climate there was a special cause why our people could not have the enjoyments which were accessible to those who lived abroad; and a special evil like this required special remedies. He dwelt much upon this question of enjoyment, because he believed that God had constituted us for enjoyment, and that unless man had a certain share of it, the moral and spiritual, as well as the intellectual nature, was dwarfed and crippled. The absence of the innocent enjoyment afforded by the glorious forests and mountains of the country or the splendid works of architecture and painting in the great towns of the Continent, was a real evil to the English workman. Our great cities had shut him out from the influences of nature without giving him anything else. As in this climate, and in such towns as ours, he could not have much out-door recreation, it was necessary to consider what access he had to means of enjoyment within doors. Where was it? If he had, on the one hand, a crowded, ill-ventilated, and often pestiferous dwelling, perhaps consisting of a single room, or he had the "public-house." The public-house, at present, was too often the working man's only resource. His whole life was bound up with the public-house. If he were a careful man, he must go there for his trade or benefit-society; if an industrious man, he must go there for his home of call; if a politician, he must go there for discussion; if he wanted recreation or society, he must go there for it. The temperance advocates and teetotalers did not sufficiently take this in mind. Until some substitute was provided for the public-house it was an absolute necessity to the working-man's daily life in all its aspects. The temperance movement would have made far more progress had it consisted in the positive work of substituting hills or clubs for tap-rooms, instead of merely in the negative work of denouncing the latter. The members of the "Working Men's Club and Institute Union" were doing more for the temperance cause than the teetotalers, and the best thing for the progress of the great cause of temperance was to rally round this movement. Intemperance was the greatest blot on the English character, which made them a by-word abroad, and which, more than anything else, impeded the progress of the

country. The public-houses were societies, not of "mutual instruction," but of "mutual degradation." Every man, therefore, who cared for the progress of this country, should be heartily for the establishment of clubs or halls. Every man who possessed leisure, wealth, or culture, was under a solemn obligation to make these possessions minister to the welfare of his poorer countrymen. "Property has its duties as well as its rights," and this was applicable not only to wealth but to all possessions, of whatever kind, by which we may help those around us who want these things. It was not necessary to give money to these clubs or halls. Let the upper classes of society offer to those institutions their services, their co-operation, their help in discussion or entertainments; occasionally lend them their works of art, or their books; give their members the opportunity of meeting them on a common ground of goodwill and mutual benefit. These institutions would then become so popular, so crowded, that they might everywhere be established on a large basis, and become self-supporting. Every man should seek to aid in the establishment and successful working of such institutions within his own vicinity; and if this aid were given in a right spirit, it would be gladly accepted. A greater spirit of goodwill would be the result. A better knowledge one of the other—was the great necessity of the time. The mutual ignorance of each other's feelings, habits, and opinions, which prevailed between the upper and working classes was a source of the greatest danger. Wherever he went he found the most extraordinary misapprehension of the motives and character of one class on the part of the other. Recent political changes in the distribution of power made this ignorance more dangerous. Such institutions as they were met to-day to advocate would enable these classes to meet and know each other better, and to derive a mutual benefit on each other by co-operation and association. With more true brotherhood we should learn better to understand the true Fatherhood of God, who is above us all.

In moving a subsequent resolution, the Rev. R. Allen spoke of the advantage that might be derived on both sides by visits of persons of the upper classes to the clubs; and a resolution expressive of the sense of the meeting of the valuable services of Lord Brougham, was moved by Mr. Fry. A well-deserved vote of thanks to Lord Lytton (now by Mr. Edward Hall), terminated the proceedings.

The "Working Men's Club and Institute Union" deserves all the support claimed for it at this meeting. It owes by far the larger portion of its success hitherto to the Rev. Henry Solly, who has now resigned the secretaryship. Well-considered arrangements on the part of the Council will be needed to prevent his resignation involving a check to what has hitherto been the progress of the Union.

TRADES' UNION COMMISSION.

In the further evidence of Mr. Manly, of the Master Builders' Association, given before the Royal Commission at Westminster, he went into the question of the restraint of trade exercised by the building trades' unions in preventing the introduction and use of machinery. That is done, he witness said, more particularly by the masons, the bricklayers, and the brickmakers. In connexion with the masons I may mention the case of this firm of Messrs. Coulter & Harpin, who have invented stone-working machinery which is admirably adapted for the purpose of dressing all manner of hard stone. This machinery they have endeavoured to introduce into various parts of the country, but they have been met everywhere by the fact that the masons forbid the use of machinery for the purpose of dressing stone, and, consequently, though they have had the patent out for some years now, I think they have only sold twenty-six of these machines. Six of them they have sold to Mr. Archibald Neill, a large contractor at Bradford. He employs them at a quarry which he possesses in the neighbourhood of Bradford, but although he keeps these machines going in that quarry, and it is close by Bradford, and the cost of dressing stone by that machinery is very much less than that of dressing it by hand, yet he is not allowed to use any of that worked stone in his own business at Bradford. His stone trade consists altogether, I believe, or very nearly altogether, in the supply of the London market and other markets where the unions have not been able to forbid the use of machine-worked stone. The cost of machine-worked stone is at least 35 per cent. less than the cost of hand-worked stone, and in many cases it is very much superior to hand-worked stone, especially in the case of large stones. The price of the machines varies according to their size. I think Mr. Neill told me that machines of the size that he uses cost him about 120*l.* each. I know another case of a gentleman at Manchester, named —, who many years ago invented a stone-working machine on a totally different principle from that of Messrs. Coulter & Harpin. I should explain that Messrs. Coulter & Harpin's machine is really a stone-grinding machine. It places stones face to face with other blocks of stone, and fixes the two different faces in two different frames which revolve in different ways and at different rates, and the two surfaces coming together grind each other to a true face. The machine of Mr. —, however, is a chisel-working machine; a lot of chisels are fixed in a frame and they hit the stone and make tracks very similar to the stroke that is made by a mason using a chisel, and the stone which is dressed by this machinery looks very like hand-worked stone, only that it is a little more regular. This machine of his he cannot introduce at all; and, in fact, when he took me to see it, he had to take me as if we were a couple of conspirators into a back street of Manchester and locked me in before he could show it to me. It was lying there completely idle, just because the masons in his employment threatened to strike all his work if he used it. To take another branch of the trade, the bricklayers of Manchester refuse to allow machine-made bricks to be used on any work that they have anything to do with; they insist upon having hand-made bricks. At Sheffield they do the same. On the other hand, I can say that the carpenters and joiners, as a rule, never make any trouble whatever about it, but are quite content to allow machinery to be used, and they

never raise any opposition whatever to it. It is simply in connexion with the masons, the bricklayers, and the brickmakers that any trouble is experienced on that point, so far as I know.

In reply to the Earl of Lichfield, the witness said that there was a way of preventing stone from being used in the area, and he had known masons to refuse to work by the buildings where this stone "axed" in the quarry had been introduced upon the premises.

The Earl of Lichfield asked,—"Would you be surprised if you were told that the cost to the employer of putting stone into a building in a particular case had been 5*s.* 6*d.* instead of 3*s.* 3*d.*, a yard, in consequence of his being unable, owing to the rules of the society, to introduce into the building stone which had been prepared by the axe in the quarry?" The witness replied, "I should not be at all surprised at that, because I know many instances very similar. I know a contractor at Manchester at the present time who is engaged in a large contract for the Midland Railway Company. His name is Mr. Edward Johnson. In that contract he requires upon walls. Now, the masons of Manchester have a rule allowing Yorkshire stone which is worked upon one side to be brought into their district; but if it is worked on two sides it cannot be brought in, or if it is worked upon the edge it cannot be brought in; they simply allow the stone to be worked on one side, and then it is brought into Manchester, and the Manchester masons are to joint it and work the edge, if the edge requires working, and work the other side if it requires working. Because, under the circumstance, Mr. Johnson cannot get this stone which he requires for coping his walls here another case from Messrs. Grindrod & Hargreaves, who are contractors at Liverpool, they are at present building a new Catholic church at Barrow-in-Furness, in Lancashire. In the course of the erection they required some moulded circular limestone bases or pilasters, to the number of six or seven. The stone was ordered direct from the quarries to the works to be worked there. On the foreman learning this he interceded and expressed a wish that the bases should be worked at the contractor's yard in Liverpool, giving the following reasons:—That the workmen not having the kind of tools required to work the peculiar kind of limestone, would object to the outlay of 1*l.* or 1*s.* about a week or ten days' work, and it was probable that they would not do it for them again, as the limestone referred to is rarely employed in that district. The foreman's recommendation was taken, and the order was issued for the stone to be sent to Liverpool, and there worked by members of the operative masons' society, who are paid a higher rate than the members at Barrow are. The bases were sent to Barrow and they lay on works two or three weeks before they were fixed upon the walls, and at that moment they had been fixed the masons found out that one of their local rules had been infringed upon; a general meeting of the masons in the town was called on the subject, and the enclosed resolution was agreed upon. This is the actual letter that the masons sent:—"Rowing Green Inn, Greengate, Barrow-in-Furness, November 26th, 1866. Sir,—I require to inform you that the Barrow Lodge of Operative Stonemasons to inform you that sending worked stone into Barrow is a direct violation of their local code of rules. According to a resolution passed here to-night, you are requested to work the stone sent to the chapel here over again (viz., the pilasters). They have allowed you till Monday next, December 3rd, to commence the same. On behalf of the members of the Barrow Lodge, I remain, yours respectfully, William Gaudie." On the receipt of the resolution Barrow, one of the firm immediately proceeded to Liverpool, and there met a deputation of the workmen. They were told that working them over again was an impossibility; that by so doing they would interfere with the architect's designs, which would not be within the province of the contractors; and some reasoning was done they agreed to waive the point, but insisted on being time to look to work them being occupied again in that to that proposition, as it involved a considerable outlay of time and money. The deputation were then withdrawing, saying that they had no further instructions in the matter, and intimating that a strike would be called in consequence. The contractors, in view of what had been proposed to allow them to be relied on the walls. The deputation promised to lay it before a meeting of the members, when it was ultimately decided that the matter rest, on the consideration that the bases were already on their heads and refixed, and that the contractors would promise not to introduce any worked or dressed stone into Barrow again. That statement is signed by Messrs. Grindrod & Hargreaves.

RATTENING AND RIBBANDING IN SHEFFIELD.

The disclosures made under the Sheffield Trades Union Commission are just what we expected. Of the complexity of the union officials there remains not a shadow of a doubt, notwithstanding their indignant protests against the implication that they must know more and do more in the matter than appeared in the villainous transactions which have made Sheffield a disgrace and a reproach to the whole country. And as if in defiance of commission, Parliament, and public, rattening is going on, at the very time that these exposures are being made, and that one of those who refused to give information regarding a murderous outrage in which he admitted he was engaged, has been sent to the House of Correction for six weeks, and where his employers ought to be sent for a much longer period, with the cat-o'-nine-tails to make acquaintance with.

Strange to say, it is not directly against the masters, nor for the purpose of raising wages, or lowering time, that the rascally practices of the Sheffield unionists are mainly concocted, but for

the purpose of compelling unionists themselves as well as non-unionists, to pay subscriptions to the worthies who instigate the whole of this devil's work; although it is true that the masters are thus compelled in turn to pay union subscriptions and arrears, in order to be allowed to carry on their business; and masters are also obliged to pay black-mail, in order to protect the unionists from "the tyranny of their employers!" From the infamous tyranny of the unions, it is full time the Legislature set to work to free Sheffield. They are a disgrace to unionists of all classes; and we feel certain, that whatever faults other unions may have, they will be glad to learn that the Sheffield reproach against them as a class no longer exists.

ARCHAEOLOGICAL MEETINGS AND EXCURSIONS.

The societies of the Archæology of Northampton and the counties of Bedford and Leicester, assembled on Tuesday in the week before last, in union, at Kettering. The attendance of members was large, but the uncomfortable state of the weather at the beginning of the week kept great numbers away. However, the congress altogether was regarded as a success.

After the transaction of some official business, and a visit to Kettering church, where divine service was held, a description of the church was given by the Rev. G. A. Poole, vicar of Welford. A public meeting was afterwards held at the Corn Exchange, where the Rev. G. A. Poole, in the chair, when a paper titled "Some Notices of an antiquarian Bishop of Peterborough," namely, Dr. Kennett, was read by the Rev. W. L. Collins, vicar of Kilsby. The meeting then broke up, and proceeded to examine a temporary museum, collected for the occasion. The company then started on an excursion to Rushton Hall and the Triangular Lodge, Geddington and its cross church; and in the evening partook of dinner at Kettering, and held a crowded evening meeting at the Corn Exchange, Archæology Trollope in the chair, when the Rev. H. Lindsay read a paper "On the History of Kettering," and the Rev. G. A. Poole one "On Aesthetics." Archæology Trollope described some of the chief objects of interest exhibited in the room.

On Wednesday another excursion was made to Barton Seagrave, Burton Latimer, Finedon, Irthingborough, Higham Ferrers, Stanwick, Raunds, Kingstead, Woodford, and Crauford.

In course of the excursions through the district noted for "spires and agnives," various of the churches and other places visited were described by the Rev. G. A. Poole and Archæology Trollope; and the Rev. H. Ward read a paper at Rushton "On the well-known Triangular Lodge."

"This building," said Mr. Ward, "was evidently designed to symbolise the Trinity. Almost every feature bears on the number three. The form is triangular, as denoting the three Persons, and in reference to the equality of the Godhead in the Trinity all the triangles are equilateral; next, each side of the building measures 33 ft. 3 in.; then the height of the parapet (25 ft. 7 in.) is exactly that which the apex of a triangle would reach with equal sides of 33 ft. 3 in. I have little doubt, also, if I could have ascertained the height of the centre pinnacle, that it would just be comprised within a triangle of exactly the same size, if lines were drawn from the corners of the building to it. Again, the building is of three stories, and there are three windows in each story on each of the three sides, and each of these windows has divisions of compartments of three. The shields of arms are arranged on each side in twice three complements in three lines. Another point I stumbled on is, that each of the long inscriptions consists of thirty-three letters, and the single words below them are three sets of two letters on each face of the building. The very name of *Fresham* (or, as I believe it should be pronounced, *Tresham*) has a sound of three about it. The arms are made up of trifolds, arranged in threes. It is very probable that his name and arms may have given to such a strange mind as that of Sir Thomas's, his in favour of this doctrine; but that his purpose in the building was that which we have ascribed to him may be proved, I think, by his adoption of the motto, 'text over the door,' 'There are three that bear witness.'"

Mr. Jardine, the author of "The History of the Gunpowder Plot," says, in a letter as to this building,—

"It may be interesting to the believers in modern miracles to learn that, at all events, 'rapping' is no new thing. I now send you an account of an incident in the sixteenth century which bears a strong resemblance to some of those veracious narrations which have enlightened mankind in the nineteenth century. Rushton Hall, near Kettering, in Northamptonshire, was long the residence of the ancient and distinguished family of the Freshams. In the reign of Queen Elizabeth the mansion was occupied by Sir Thomas Fresham, who was a pedant and a fanatical; but who was an important character in his time by reason of his great wealth and powerful connections. There is a lodge at Rushton, situate about half a mile from the Old Hall, now in ruins,

but covered all over, within and without, with emblems of the Trinity. This lodge is known to have been built by Sir Thomas Tresham, but his precise motive for selecting this mode of illustrating his favourite doctrine was not known until it appeared from a letter written by himself, about the year 1651, and discovered in a bundle of books and papers, enclosed since 1698 in a well in the old manor, and brought to light about twenty years ago. The following relation of a 'rapping' or 'knocking' is extracted from this letter.—"If it be demanded why I labour so much in the Trinity and Passion of Christ to depict this chamber, this is the principal instance thereof; that, at my last being lither committed [this refers to his commitments to prison for recusancy, which had been frequent], and I usually having my servants here allowed me, to read rightly an hour to me after supper, it fortuned that Fulis, my then servant, reading in "The Christian Revolution" in the treatise of "Proof that there is a God, &c.," there was upon a wainscot table, at that instant, three loud knocks (as it had been with an iron hammer) given to the great amazing of me, and my two servants, Fulis and Nilkton."

LIVERPOOL.

THE valuable collection of antiquities presented to the town of Liverpool by Mr. Joseph Mayer has been formally opened at the Free Public Library and Museum, William Brown-street. The collection has been arranged by Mr. H. Eroryd Smith and assistants, under the personal supervision of Mr. Mayer. The Gallery of Science and Invention is set apart for the collection, which appears of a far larger character than when it was housed in the Egyptian Museum, Colquitt-street. Nearly 16,000 Whitson holiday folk passed through the rooms during the day of opening, being the greatest number ever registered.

We may mention that the learned societies of the town have resolved to mark their sense of the importance of the gift by requesting the donor to sit for his portrait, which when completed shall be deposited with those of other worthies of the town in the Royal Institution. Mr. Mayer has acceded to the request.

The town council have resolved,—“That in commemoration of the eminent services to the nation of the Right Hon. the Earl of Derby, during a long and distinguished public career, and also as a memorial of the presentation of the Derby Museum to the town of Liverpool, a portrait statue of the earl be erected in St. George's Hall.”

The recorder has suggested the erection of a cathedral in Liverpool, and the suggestion has elicited offers of money.

FROM SCOTLAND.

Fall of a Railway Bridge at Dalkeith.—The Victoria Bridge, on the Ormiston and Monkton-hill branch of the North British Railway, has come down, killing one man, and seriously injuring three others. Four labourers were prodding the wagon laden with stones across the bridge, when the woodwork suddenly gave way. Men, wagon, and stones were precipitated to the ground, a distance of 30 ft. The wood-work of the bridge is said to be in a very decayed and insufficient state, having been in use for about twenty-eight years.

The Pinnelburgh Monument, Roxburghshire.—In the Vale of Teviot, and commanding an extensive view of the district, stands the monument erected by the late Marquis of Lothian and his tenantry, “to the Duke of Wellington and the British Army.” It is situated on a hill named Pinnelburgh, about 774 ft. above the level of the sea. The monument itself is cylindrical in form, and 150 ft. in height. It was intended by the late marquis to be a commemoration of the valour and endurance of the British army in its crowning victory of Waterloo. Either through faulty design or faulty construction the first erection proved a failure: it was built a solid column, and fell when nearly finished. The second erection was on another plan, and built with a spiral staircase running up the inside. Up till this time the monument has not been finished. The present marquis has resolved to have this carried out; and, according to a plan supplied by Mr. Pollon, architect, London, Messrs. Herbertson & Sons, builders, Galashiels, have got instructions to proceed with the work. The monument is to be surmounted by a gallery, protected by balustrades, all of wood, a lead roof, and a spire and vane. The gallery and spire are 37 ft. in height, making the monument, when completed, 187 ft. in all. The entire fabric is being made and temporarily put up in the contractors' yard at Galashiels.

Memorial of the late Miss Catherine Sinclair.—A monument to the memory of the late Miss Catherine Sinclair, who, by her many philanthropic deeds, won a high place in the affection of a large section of the citizens of Edinburgh, is being erected on a vacant plot of ground at the junction of North Charlotte-street, with St. Colme-street. The monument is in the form of a carved gothic cross, in freestone, somewhat similar in character to the Eleanor crosses. On a broad platform of stone, 2½ ft. in height, rests the base proper of the cross, consisting of a series of three steps, each 2 ft. in height. The plan of the monument is hexagonal, with buttresses at the angles, and the total height will be 60 ft. Above the base the structure is divided into three stages, in the two lower of which the sides are finished with arched recesses, surmounted by pediments, and otherwise ornamented. The upper stage consists of a crocketed pyramidal spire. The memorial is being built from designs by Mr. David Bryce, R.S.A. The cost is to be defrayed by a public subscription, which has already been raised. Mr. Rhind, sculptor, is the contractor for the erection of the memorial.

ART-DINNER AT THE MANSION HOUSE.

THE Lord Mayor, Gabriel, distinguished his mayoralty by a dinner on Wednesday evening last, in honour of the arts of the country, given to the members of the Royal Academy, and to meet whom a large number of men, for the most part distinguished, were invited and were present. The Duke of Cambridge was kept away at the last moment by an attack of gout. The Lord Mayor spoke fluently and to the point, touching admirably each toast. Lord Staunley, the Archbishop of York, Lord Elcho, Sir Francis Grant, P.R.A., Sir Rodrick Murchison, and Mr. Tom Taylor also spoke; as did M. Gallait, the eminent Belgian painter, as representing foreign art. The Corporation should play their part in the memories of the day by commissioning some of our best artists to remove the stigma of the fact that the Mansion House does not contain a single picture. The Egyptian Hall itself greatly needs colour.

THE BIRMINGHAM ART GALLERIES.

THE Birmingham Art Galleries Association has been completely formed. A committee and officers have been appointed, and their names, it is believed, will be a sufficient guarantee that the important interests which it is the object of the Association to advance have been entrusted to able and impartial hands. It rests with the local public to support this institution, in proportion to its local and national importance; and it is to be hoped that the corporation will act with it, so as to render its operations effective and successful on a large scale. The formation of art-galleries throughout the country is a highly important desideratum, which may either be advanced or hindered to a great extent by the result of the present attempt to establish one at Birmingham. The acquisition of pictures for the art-gallery is of course one important object of the society, but it is to be hoped it will be distinctly understood from the first that it is not the only important one. Articles of art-manufacture ought to be obtained, with a view to improving the taste of the artisans and manufacturers, and to advance the cause of art generally among the many.

BOROUGH SURVEYORS AND PRIVATE PRACTICE.

NORTHERN ARCHITECTURAL ASSOCIATION.

A SPECIAL meeting of the members of this Association was held at the Old Castle, Newcastle-on-Tyne, on the 12th inst., under the presidency of Mr. John Johnstone, vice-president, “to consider the propriety of sending a deputation to confer with the committee of the town council respecting borough surveyors accepting private practice.” It had been thought desirable that the attention of the committee should be called to the fact of the corporation surveyor and assistants preparing plans, with detriment to the public service.

Mr. Thompson said he would move that a small committee of the members of the Association should be formed to wait upon the com-

mittee appointed by the corporation, to state their views. He thought that it was certainly not desirable that any official—no matter how low his status—should have any private practice.

Mr. Oliver remarked that that was, he believed, the unanimous opinion of the members of the Association.

Mr. Thompson said that Mr. Bryson was looking after a house at Riding Mill some time ago, and told him that he was forced to take such work. He (Mr. Bryson) said to him (Mr. Thompson), “Do you know what salary I have?” and he guessed 200l. Mr. Bryson said, “Only 100l.” Shortly after that, he believed, Mr. Bryson had his remuneration increased to 150l., and it was understood that all private practice should be put on one side. He (Mr. Thompson) was, however, astonished to find that he had been employed to check the plans in competition at Gateshead, and considered that the position which he had taken would lay him open to remark.

After discussion it was resolved, “That a memorial should be drawn up and presented by a small committee, that committee consisting of Mr. John Johnstone, Mr. A. M. Dunn, Mr. Matthew Thompson, Mr. Septimus Oswald, and Mr. Oliver, the secretary, to wait upon the committee appointed by the town council of Newcastle, to inquire into the salaries and duties of the corporate officials, for the purpose of presenting a memorial respecting the custom and propriety of borough surveyors undertaking private practice.”

PROVINCIAL NEWS.

Leeds.—Messrs. Beckett & Co.'s new banking premises in Park-row the foundation-stone of which was laid on the 19th of August 1863, and which, therefore, has been upwards of three years erecting, is now completed, and opened for business purposes. The new building forms the junction of Park-row and Bond-street, opposite the Philosophical Hall. The style of architecture adopted is Early English. The building is constructed of red brick, and the outside facing bricks have been procured from Mr. Robert Bond, of Thirsk, who made them expressly to the dimensions decided upon by the architects. These bricks are very thin, of a peculiar and pleasant red colour, and smooth-faced. They have the appearance of being polished, and are laid in dark-coloured mortar, carefully jointed. To relieve the brickwork a proportion of stone has been introduced, the string-mouldings, base-course, capitals to the shafts of the windows and doors, a portion of the parapet, and other portions of the building have been executed in this material, the major part of which has been procured from Mr. Walker's quarry, Mount St. Michael, about ten miles beyond Halifax, and is said to be most durable and hard of its kind. The front of the building in Park-row is broken into three parts, the ends projecting as wings, and the centre receding therefrom. This front contains the public entrance to the bank, which consists of a projecting porch, with brick-vaunted roof. The Bond-street front is one unbroken line. The front to Basinghall-street is formed of two wings, with a screen wall between, enclosing a courtyard, which gives the private access to the bank. The north side of the building contains a dwelling-house for the resident cashier, and one for the porter. The building has been designed and erected under the superintendence of Mr. G. G. Scott, and Messrs. Perkin & Son, architects. Mr. John Kaberry was the clerk of the works, and under his direction the works have been carried out by the following contractors, viz.:—Mason, bricklayer, carpenter, and joiner's work, Mr. T. Whiteley; plastering, Mr. Proctor Mountain; plumber and glazier's work, Mr. John Hall; slater's work, Mr. Samuel Croft; painter's work, Mr. F. Jackson; foundry work and hot-water apparatus, Messrs. Nelson & Sons; carver's work, Messrs. Farmer & Brindley, of London; gasfittings, Messrs. Skidmore, Coventry; caustic tile work, Messrs. Minton & Co.; granite and marble work, Messrs. Dennis Lee & Welsh.

Ringwood.—The foundation-stone of a new building, intended to be used as a corn exchange and town-hall, has been laid in Ringwood by Mrs. Morant, of Brockenhurst Park. The site selected for the building is on the left-hand side of the High-street, a short distance beyond the old town-hall. The entire depth of the new building will be 108 ft. 6 in., and of this, at the

ST. GEORGE'S CHURCH, WORTHING, SUSSEX.—MR. GEORGE TRUFFITT, ARCHITECT.

rear, the room to be devoted to the purposes of a corn exchange will be 72 ft. long and 37 ft. 6 in. wide. The corn exchange will be on the front floor, and will be lighted on either side. The front to the High-street will be three stories high, and will probably be let off as business offices.

WORTHING.

ST. GEORGE'S CHURCH.

SINCE our last account of this pleasant watering place much has been done. A new esplanade has been formed, at least 50 ft. wide, extending along the whole frontage from east to west. In order to form this, new groynes have been constructed. The natives say these are not carried out sufficiently far into the sea, but are too steep, and will have to be altered, or, at least, some of them; also that the planking ought not to have been fixed except by degrees as beach is collected: but we leave these points to be settled by the storms, and congratulate the town for their fine new promenade. There is one thing, however, which can easily be altered, and should at once be attended to. The esplanade is covered with a thickness of about an inch of small stones, which no rolling can drive into the gravel and marl below. The greater part of these should be taken off, and only sufficient left to bind in with the gravel, as

at West Worthing. The members of the Board of Health at present walk on the pavement on the other side of the road. If they at once make this alteration, they and the visitors who are fast going to Worthing will be able properly to use this new walk.

In South-street large houses are being erected for shops, and in all parts building is going on.

At East Worthing the land has been selling well, and villas of a good class are being erected, and sold or let before finished. Here the new church of St. George, of which we give an engraving, is being built by Mr. Longhurst, from the designs of Mr. George Truffitt. The first stone was laid by the Lord Bishop of Chichester a short time since. The walls are now up 6 ft. all round. The materials are brick-faced with Bargate rag and Bath stone windows and dressings. The walls are double, having a 9-in. space between the outer and inner shell. The roof will be open hoarded and tiled, the span being 40 ft. The present contract includes nave and chancel, with paving, &c. The cost of the building, when finished, including tower and spire, is not to exceed 5,000*l*.

At West Worthing the directors have laid down groynes, and continued their esplanade so far that it is now called the "Ladies' Mile." They have also formed a fine road by the side of the esplanade. Here they are also forming good roads inland, to open up their property. At the east end of Worthing is a large house with a

high wall round it, belonging to Lady Rose. Cannot this lady be prevailed upon to allow the town to carry their esplanade and road in front of her property? and East Worthing would then continue on. There would then be a fine promenade and carriage-drive two miles in length, without a break or interruption of any kind. It is to be hoped this suggestion will be carried out, and one of these days will be seen the Worthing and Brighton Esplanade joining at Shoreham.

REREDOS, BOXGROVE CHURCH, NEAR CHICHESTER.

THE reredos, represented by our engraving, Early English in style, has lately been added to the church at Boxgrove, near Chichester, at the cost of the Duke of Richmond. The work is in Caen stone, the columns or shafts being of Purbeck marble. It is 10 ft. wide, by 8 ft. 6 in. in height, that is to say, from the top of the altar table. The width is divided into three bays, richly canopied and finialled. At the springing of each of these canopies is an angel bearing a shield. The wings are slightly opened or spread. Under the canopies appear three subjects: *in alto relievo* viz., the centre, the Crucifixion; the left, the Ascension; and the right, the Resurrection. Mr. W. Farmer has executed the work. Mr. G. G. Scott was the architect.

REDOS, BOXGROVE CHURCH, NEAR CHICHESTER, SUSSEX.—Mr. G. G. SCOTT, ARCHITECT.—Mr. FARNER, SCULPTOR.

EASTBOURNE SEWERAGE.

WE mentioned recently the completion of this work from the designs of Mr. McClean, C.E., and under the superintendence of Mr. G. A. Wallis, C.E., resident engineer. Eastbourne lies in a bay formed by Beachy Head and Langley Point, on the west shore of Pevensey Bay. Beachy Head is of chalk, but Langley Point consists of shingle of an unknown depth. Some time since the people of Eastbourne determined to get rid of their sewage effectually. To this end about 10,000l. were raised, but the Duke of Devonshire, on whose property Eastbourne is built, on consultation with Mr. McClean, found that the sum was not sufficient to really secure the object in view, and he added from his own purse a further sum of 25,000l. Mr. McClean, satisfied that so long as the outfall was situated anywhere near the bottom of the bay, the sewage must return to the town in a more or less diluted form, determined to place it at Langley Point, where the run of tide would effectually dispose of all objectionable matters; and the necessary works were commenced about two years ago and completed about three weeks since. Three miles intervene between Eastbourne and Langley Point, almost the entire distance being shingle beds of enormous depth. Through this material an excavation was made, in many places 25 ft. deep. Into the bottom of the excavation oak piles were driven, and on these rests a cast-iron main, 3 ft. in diameter, and over three miles long. The outfall is 160 ft. lower than Eastbourne, so that no difficulty will be experienced in flushing the main and keeping it clear. It is a sad waste to throw into the sea valuable manure the land is in want of, but the authorities feared to try experiments. They might have felt strengthened by the example of Worthing, also a watering-place depending on its reputation for salubrity.

OPERA AND STAGE.

Royal Italian Opera.—"Don Carlos" is produced with all the care and completeness that are ordinarily bestowed by the management of this theatre, and its merits as a musical work have been admitted more unreservedly in London than they were in Paris. The story is interesting, but its unqualified sadness is an objection, and has probably prevented the display of the light and sparkling writing to be found in other of Verdi's works. It includes, nevertheless, some as fine music as the composer has ever produced; and, set forth as it is by Mlle. Lucca, Mlle. Frizzi, Signor Graziani, and Signor Nandin, the result must be pronounced a great success. There is less local colour given by the scenery than might have been the case, considering how well known now Spanish buildings are. Nevertheless, the principal scene, "a large square in front of Notre Donna d'Atocá," is a fine piece of colour, and the procession and grouping enforce the greatest admiration. Gounod's last work, founded on our "Romeo and Juliet," is in continuous rehearsal, and will shortly be produced.

Princess's Theatre.—Mr. Slons, the committee of the Dramatic College, and Mr. Viuing must all be satisfied with the warm reception that is given here to the prize play, "True to the Core." His success is even greater than was the case at the Surrey, where it was first produced, though the principal parts are played by the same performers, Mr. Creswick, Mr. Henry Marston, and Miss Panceforer. The pedlar is now personated by Mr. Forrester, instead of Mr. Shepherd, and with advantage, and Miss Nellie Moore acts *Truogold's* wife with great taste and feeling. The spectacle, too, is improved, and Mr. F. Lloyd has been able to show his now well-known skill in a new scene, representing the Eddystone with the remnant of the wrecked crew, of remarkable beauty. A gorgeous sunset, the rising of the tide, and the approach of the boat to save them, are capably managed, and, added to the strength of the dramatic situation, and the good acting of the performers, who are nearer to the audience and better heard than they were at the Surrey, brought down the curtain on the first night with a perfect hurricane of applause. The College has good reason to be thankful to Mr. Angiolio Slons.

Re-opening of the Swansea Theatre.—Considerable alterations and improvements have been made in this theatre, under the direction of Mr. Phipps, architect, by Messrs. Thomas, Watkins, & Jenkins. The whole floor of the

stage and pit has been lowered 5 ft., the latter taken under the boxes, the proscenium removed 6 ft. further back, thus adding considerably to the size of the houses. The pit, which only held about 100 persons, now accommodates 350, and is approached from a separate entrance; while the gallery-entrances is removed to Gost-street. In the lines of the box front also the character of a new theatre has been given; there is one sweep with a curve to the curtain-line, the plan being very much that of an egg with one-third cut off, which forms the proscenium-opening. In the sides formed by the extension are commodious private boxes, each holding eight persons. The dimensions are as follows:—From curtain-line to front of boxes, 30 ft.; ditto to the back-wall of pit, 36 ft. 6 in.; width between boxes, 22 ft. 6 in.; ditto enclosing walls of pit, 32 ft.; height of pit-floor to ceiling, 27 ft. in centre; width of proscenium-opening, 18 ft.; height to top of arch, 22 ft. 9 in. Under the whole extent of the pit, approached from the floor under stage, are dressing-rooms. A new stage has been laid down, and new grooves erected, the scenery being now 17 ft. high, instead of 13 ft., as heretofore. The decorations have been executed at Bristol by Mr. George Gordon, the artist at the theatre in that city.

THE DERBY BOROUGH SURVEYOR AND THE LOCAL ARCHITECTS.

THE local architects and surveyors have been unpleasantly excited by the announcement of a resolution of the corporation to allow their surveyor to combine private practice with the public duties; and a deputation of these gentlemen, consisting of Mr. H. I. Stevens, Mr. Giles, Mr. Brookhouse, Mr. B. Wilson, Mr. Sheffield, and Mr. R. Elliott, has waited upon the mayor at the town-hall, for the purpose of presenting him with a memorial on the subject, in which they protest against the resolution of the corporation, in the interest both of the architects and surveyors, and of the ratepayers, and the public at large. They point out that the surveyor (Mr. Thompson) has already a subsidy from the ratepayers equal to 400l. per annum, viz., 330l. for himself and his assistant, and 76l. for office expenses, enabling him to compete with them at a great advantage, and that every plan made for new buildings or alterations, either great or small, must necessarily pass under the supervision of the borough surveyor, and that it is not unreasonable to suppose that many persons, if at liberty to do so, might and would avail themselves of the surveyor's services, so saving trouble and uncertainty. It was also held to be next to impossible for the surveyor to have divided duties without injury to either the public or his own clients, and delegation of his work to an office clerk would be the rule instead of the exception. The works in the town, it was urged, are far from being numerous, and cannot partially be diverted from the resident profession without serious consequences. Further, that it is most essential that the borough surveyor should be on friendly terms with the resident profession.

The memorial is signed by Messrs. Stevens & Robinson, Giles & Brookhouse, Benjamin Wilson, and G. H. Sheffield.

In the conversation which took place on presentation of the memorial, Mr. Giles said he considered that it would be a great disadvantage to the ratepayers if the surveyor were permitted to have a private office, and be continually absent from the offices of the Board. It was also manifestly unfair to the memorialists as architects that they should be compelled to submit their drawings for inspection in the office of one who was competing with them.

The Mayor said Mr. Tarbotton had several times asked the Nottingham Corporation to be allowed private practice. They did not grant it, but raised his salary until it got to 400l., when he came forward again, and said he must have another advance, which they declined to give, but allowed him private practice. Now, the Derby Corporation did not want to fall into the same error as the Nottingham Corporation. Mr. H. I. Stevens was at the meeting when the resolution was passed, and ably represented the architects. He was also ably replied to by Mr. Alderman Barber, and so satisfied were the Board that they carried the resolution unanimously. Mr. H. I. Stevens said he did not vote, and it seemed to him to be a foregone conclusion. He had been informed that Mr. Thompson would be glad to accept an addition to his salary, as he feels that by the resolution of the Board he

has been placed in a peculiar position. After some further remarks, the Town Clerk said it would be invidious on the part of the Mayor to summon a meeting of the Board; but if his worship received a requisition signed by five members, he could then summon a special meeting.

The deputation said they would get the necessary requisition signed.

TABLET TO THE LATE GEORGE LORIMER, THE LORD DEAN OF GUILD OF THE CITY OF EDINBURGH.

A TABLET of Sicilian marble has just been erected in the vestibule of St. Giles's Cathedral, in memory of this deeply regretted Lord Dean of Guild of Edinburgh, who it will be remembered at the destruction of the Theatre Royal was killed by the falling of a portion of the wall while attempting to rescue some of the workmen from death.

The monument is in the Italian style, and is supported by a winged angel springing from a background of Binny stone, the outline of which enhances the effect of the carved marbles. Above the angel is the monogram G. L., surrounded by a laurel wreath, and surmounted by a cornice and circular pediment; the pediment enriched with a clam shell, and broken up with scroll ornaments.

The following is the inscription on the tablet:—

"In memory of George Lorimer, the Lord Dean of Guild of the City of Edinburgh, who lost his life seeking to save the lives of others during the destruction by fire of the Theatre Royal, 13th January, 1865. Erected by a number of his fellow-citizens."

The work was designed by Mr. David Bryce, jun., architect, and the marble sculptured by Mr. J. T. Amstey, successor to the late John Thomas, of London.

RESTORATION: ARCHITECTS' ASSISTANTS.

SIR,—It appears evident to those who believe the testimony of the past that he who would successfully advocate reform and amendments must have a clear perception of the evils he attacks, and also see how they may be practically remedied.

Your correspondent "C. B. A.," in his article headed "The Cloisters," seems deficient in this respect, though in his remarks on destroying old work he is right enough. Yet, in speaking of restorations, it is necessary to distinguish between what is for use and what not; in the latter, the best thing is to leave them alone, but when (as in the case of churches) they are in use, safety and comfort must be secured, and want of increased accommodation renders considerable alteration necessary. It would be well in many instances if the ancient edifices could stand and new ones be erected, but economy argues against this means of keeping our fast lessening examples of the past.

The idea many have of restoration is absurd: a few weeks ago at Winchester Cathedral, while looking at the remains of an ancient wall painting, a gentleman said it wanted "restoring and touching up,"—truly, an obliteration that the whole wash-pail and mop of the last century fail to effect.

The references to assistants in the articles mentioned appears very vague. It is certain that an architect with any amount of practice must have assistants; it is also certain that a man of skill can direct, arrange, and diffuse his ideas into designs which time would prevent his drawing.

We must not expect more than our need of practice; the assistant may have a local and temporary fame, the architect may be known in his day and generation; but the country where they dwell, and the age in which they lived, shall reap the honour of all that is splendid in art and sound in construction when their names shall have passed away for ever.

The inference that many will draw is that all who display skill should attempt to practise for themselves. This is impossible; many who can act successfully as assistants would be unfit for the responsibility (too little thought of) incurred by those who undertake to carry out that which requires great judgment and experience, and who would swell the number, perhaps two-thirds, of those who bear the name of architects, that barely exist, though agents for coal, land insurance, &c., into the bargain, and whose amount of

practice any one may guess who has had to call at the third-floor office and disturb the drowsy pupil, sole representative and embryo of a future nondescript.

The comparison between wages is indefinite, as "mere mechanics" often deservedly earn large amounts. It is invitations, as many are men of great skill, perhaps the plentiful supply of assistants may account for the fact that their wages are low.

The term "art-architect" is objectionable; if a man can only design an artistic group without understanding the means of construction, he is merely an artist; if, with the skill of a "mere mechanic" he can also foresee the details, he is surely worthy the name of architect. If "C.B.A." has had the misery of using a set of drawings supplied by an art-architect, and seen the perplexity that the simple question of an intelligent workman concerning some very "foggy" point has occasioned, he would not perpetuate such a misnomer. T. H.

BEDFORD MIDDLE-CLASS SCHOOL COMPETITION.

Sir,—I should be much obliged if you would insert this, with the enclosed correspondence, in your next issue. You will see from the letter of Messrs. Medland & Baker that I had reason to believe that this correspondence would have been inserted by them last week.*

As this was not done, and as I feel that some explanation ought to be made to the directors which the directors of the Beds Middle-class School have preserved up to this time, and that the real facts of the case referred to ought to be made known, I trouble you with this request.

In order to complete my statement of facts, I may perhaps add that, since my letter to Messrs. Medland & Baker, the directors have come to a final decision in favour of Mr. Peck. W. COOPER, 4, St. James's-square, London, June 17, 1867.

June 3rd, 1867.
My Lord,—We beg to call your attention to the enclosed letter which appeared in the *Builder* of June 2nd, which contains serious charges of unfair dealing in the decision which your lordship and your colleagues arrived at in selecting Mr. Peck's design from among the thirty which were sent in competition for the Bedford Middle-class School.

We feel that such statements as those contained in the enclosed letter should not remain ununserved, either in justice to ourselves as competing architects or to yourself and the other members of the Sailing Committee, and we therefore ask the favour of a letter from your lordship answering these statements, and also permission to publish your letter with our own in the next issue of the *Builder*. MEDLAND & BAKER, To the Right Hon. the Earl Cowper.

Panahanger, Hertford, June 8th.
GENTLEMEN,—I beg to acknowledge the receipt of your letter of the 3rd, enclosing an extract from the *Builder*.

The plans of the different competing architects, thirty-three in number, were all placed without distinction in the same room. The Directors, finding that it would be inconvenient for so large a number of men to go through the work of selection, appointed a committee of five persons for that purpose.

The Committee of Selection, after careful consideration, chose four plans for recommendation to the Directors.

The sealed papers of these four being opened, and the names made known, the Directors ultimately decided that those of Mr. Peck and Mr. Usher were the best, and have since been occupied in making further investigation in order to come to a final decision on the subject.

I have, at your request, laid before you the conduct of the Directors as far as it bears upon the subject of your letter; but I shall altogether refrain from making any comment whatever upon the unfounded reports which have been circulated against us.

I regret that my only having returned from Paris last night prevented me from answering your letter in time for our correspondence to appear in the *Builder* of this week. W. COOPER.

To Messrs. Medland & Baker.

ARTESIAN WELLS FOR LONDON.

Sir,—The accident occurring at the source of the Vartry Water-works causing great damage and expense, as well as a cessation of the water-supply to the inhabitants of Dublin, proves the necessity of not being dependent upon one supply of water alone for a vast of such magnitude.

Instead of tapping a Scottish, Cumberland or Westmoreland, or Welsh lake, and carrying its contents to London, a distance of a great many miles, through a diversity of hill and dale, and a numerous amount of proprietorships, all claiming large remuneration for wayleave and damaged property, I propose, as a method of greater economy and utility, to sink a number of artesian wells, in suitable situations, in the immediate vicinity of the several railways communicating with London, and on their level road convey the water-pipes from these several artesian wells, paying way-leave to the railway company over whose lines the aqueduct-pipes are laid. It would be a more simple and cheaper plan to enter into an agreement for right-of-way leave for water-pipes with these railway companies than with the innumerable legion of landowners between the great lakes and London. It would be

* The correspondence reached us last week, but too late for insertion in the current number.

profitable to the shareholders in these companies in proportionate payment for way-leave. As the demand for water increased more artesian-wells could be sunk.

Any person who has acquired any information on the subject of sinking or boring for coal must be aware that when the borers taps the different strata containing springs an enormous amount of water is liberated and rushes to the surface in vast continuous quantity, creating in the endeavor to control it the greatest difficulty and expense in mining operations. It is from this immense supply of subterranean water in diverse localities that I propose to carry, on railway level, water to London.

In Essex, artesian wells have been bored with the greatest facility, at small expense, at Brintree, Wallasea, Mersea, and in the district of Bullhamphen, seven miles from Brentwood, these wells yield a large supply of water, and have proved of the greatest utility; formerly, in some seasons, the ditches became dry, the cattle suffered and died, but by the aid of artesian wells the ditches are now kept full all the year of fresh, sweet water. An artesian well is a well that is always overflowing, either from its natural source or from an artificial tube, and when the overflowing ceases it is no longer an artesian well. Near Shiffnal, in Shropshire, an artesian well, diminishing from 12 in. to 7 in. in diameter, and at a total depth of 260 ft., yields a continuous supply of 210,000 gallons daily; at Greenelle (Paris), an artesian well has for many years given out a jet of 3,000 cubic metres of water every hour, being sufficient supply for that district of Paris; but at Kissengen, an artesian well yields 100 cubic ft. of water per minute, with a jet of 76 ft. high and 15 in. in circumference.

I do not think that the chalk or green sand strata will either of them yield sufficient water-supply to repay the expense of boring and leading, but our great lines of railways from London must pass through several limestone districts, and these, particularly in the vicinity of rivers, would fill artesian wells with an abundant supply of water to be conveyed on the level route of these railways to the capital, with profit to the railway companies, and economy, comfort, and health to its inhabitants.

CHARLES F. PARKINSON, Colonel.

INQUESTS.

Sir,—To the suggestion contained in the closing paragraph of the article on Mortuary-houses in your last number, I must decidedly demur. "One day will be able to dispose of a number of cases." I was recently on a jury at St. George's Hospital on three cases,—one, a cabman let from his cab another, a man fell from a pleasure van; and the third, a labourer killed by some bricks falling upon him from a scaffold. Apart from the time occupied, the sickening details of the witnesses in such cases lead me to the conclusion that one case at a time was quite sufficient. JERMAN.

WORSE AND WORSE.

The following list of tenders made for the works required in draining at Mold, Flintshire, has been sent to us by one of the parties. Will somebody explain it?—

HINTS.

I KNOW we have architects brave enough "to throw a bridge" of iron and stone, allowing a graceful way to supplant disgraceful delay just at one place, at least, in Hyde Park, where the high public and low public seem to undergo an ordeal of gazing and counter-gazing. This is considerably qualified by seeing the beauty of goodness, still, thank God, left in the land; and I have yet to learn where these two admirable qualities are to be found so extensively combined, and some of us conjecture why. A pretty and strong and good bridge would be valued as an adjunct to the officially mounted and unmounted, as well as to the comfort of non-officials. Another want in London. It seems various brass edges on the stairs of railway termini are so worn as to help a possible fall, and one of the servants told me my slip, though alone, quite sober, and walking deliberately, was not the first, probably not the worst. Many of the pavings near shops are so smooth, as to endanger one's standing, though it were for a passing look at one where elegantly carved crosses in ivory attract notice. The non-shan regulators of work and reward could easily organise groups of those who need employment to groove these stones where needed, in some diagonal form, so as to save us from falling. In winter the feeble and drunken will be very likely to get injury if the rich and responsible neglect timely duty. QUETS.

CHURCH-BUILDING NEWS.

Braywood.—The Bishop of Oxford has consecrated All Saints' Church, Braywood, an edifice erected by the Belgian minister and Madame Van de Weyer, as a memorial of the late Mr. Bates, the father of Madame Van de Weyer. The church, which, with its parsonage, cost nearly 15,000l., stands within the parish of Bray, on the border of Windsor Forest, and about a quarter of a mile from the residence of the Belgian minister. The style of architecture is Gothic, of the transition period between the Early English and the Decorated. The structure is in the form of a cross, having chancel, nave, and transepts, and adjoining the south transept is a lofty tower, which at one angle is surmounted by a turret, containing the termination of a winding staircase. At the junction of the chancel and the transepts with the nave are three pointed arches, which spring from granite pillars. The base of the tower forms a memorial chapel, with light open carved stonework between it and the south side of the choir, which it adjoins; and in the east window of this chapel there is a memorial window to the late Mrs. Brand, the eldest daughter of the Belgian minister, who died at Windsor Castle some months ago. The large east window is a three-light one, representing Faith, Hope, and Charity; the subject is, however, treated differently from the conventional representation of these attributes. The nave and transepts have open timber roofs, and the chancel has an oak wainscot ceiling. The floor is paved with Milton's tiles. The pulpit is of white marble, carved. It is intended that there shall be a peal of five bells in the tower; at present only one of them, cast by Messrs. Mears, has been hung. The parsonage house is at a convenient distance in the rear of the eastern end of the church. The architect was Mr. T. Talbot Bury, of London, who was the architect of New Lodge, the palatial residence built for M. Van de Weyer some nine years ago. The builders were Messrs. Dove, Brothers.

Gloucester.—The gradual restoration of the exterior of the south transept of the cathedral is now being carried out, the clearstory on the south side of the nave having just been completed. Decayed stones only are removed, and as much as possible of the ancient work is retained. The workmen have found a number of shot-holes in the stonework of the western tower of the transept, and have also removed some hattered bullets from the mortar between the stones. These are curious relics of the siege.

Winterbourne Dawntsey.—A discovery of mural paintings has been made beneath the plaster on the walls of the parish church, which edifice was built in the thirteenth century, and is now in course of demolition. The paintings are probably of nearly the same date as the church, as they appear to have been executed shortly after the erection of the walls. From the style of ornamentation their origin is assigned to the middle or latter part of the thirteenth century. The series commences at the west end of the north wall, and was, no doubt, carried completely round the church, representing, in order, the principal events of our Lord's life, and ending at the north end of the west wall, with His resurrection. The colours used are red and yellow, in distemper; and, considering that it is 600 years since these paintings were executed, the colours are wonderfully fresh.

Attercliffe.—Christ Church has been closed for the last three months for extensive alterations and repairs, and has now been reopened. The galleries have been removed, the partition which shut off the west end from the body of the church has been taken down, and the high pews, several of them square ones, have given way to open seats of a simple design. The ground-floor at the east end has been raised and enclosed by light screens on the north and south, so as to give the effect of a chancel. The work has been executed from the designs and under the superintendence of Mr. J. Fawcett, architect. The stonework and cleaning have been done by Mr. White, of Neepsund; the woodwork by Messrs. Hardy & Duke; the painting and staining by Mr. Hague, of Attercliffe; and the gas standards and brackets have been supplied by the Sheffield Gas Company. All the seats in the church are free and unappropriated.

Hoston.—St. Leonard's Church, Hoston, Middlesex, has been re-consecrated. St. Leonard's Church, an old Medieval building, had, from lapse of time, become so decayed, with the exception of a Norman tower, which was found

comparatively sound, that restoration was deemed necessary. This has been effected, and additions have been made which afford increased accommodation sufficient for 200 persons. Mr. Brinley Richard's father-in-law, the celebrated Mr. Banting, has presented to the church a fine new organ, built by Messrs. Gray & Davison; and his eldest daughter has given a memorial window (by Bailey) in memory of her late husband, Mr. Westbrook, who was, during many years, one of the churchwardens. Mrs. Westbrook, having resolved to found and erect, also in memory of her husband, a workmen's club in the village, he called the "New Workmen's Home," requested the Bishop of London to do her the favor of laying the foundation-stone of the building after the church consecration; and his Grace, having known her husband personally, and always held him in high esteem, did so. The building alone, it is said, will cost upwards of 3,000*l.*; and it is hoped by its establishment to induce the workmen to abstain from beer-shops and improve their minds by innocent recreations. Mrs. Westbrook has also devoted a large sum towards the new church fund. At the conclusion of the ceremony, Mr. Banting presented, as contributions from his own children and grand-children, twenty five-pound notes towards the expenses of the new church.

Gipsy-hill, Upper Norwood.—Christ Church has been consecrated by the Bishop of Winchester. The building accommodates 1,200 persons without galleries. It is of Kentish rag with Bath stone dressings. The internal columns throughout are of red and grey polished granite, and the five windows of the chancel, which is apsidal in form, are already filled with stained-glass memorial windows. The builder's contract was under 7,500*l.*, including 40 ft. of the tower. The remainder and the spire have yet to be completed. The architect is Mr. John Giles, of London.

Clitheroe.—The chief stone of the projected Church of St. Paul, Low Moor, Clitheroe, was laid on Whit-Monday by Miss Henrietta Garnett, of Roe Field. The architects are Messrs. Stevens & Robinson, of Derby.

Birmingham.—Obstacles to the erection of the proposed church in the Hagley-road, Edgbaston, have been removed; and, at a recent meeting of the committee, instructions were given to the architect, Mr. Chatwin, to re-arrange the plans, so as to allow the erection of nave and chancel, leaving the tower and spire to be added at some future period. The cost of the proposed church, we understand, will be about 5,000*l.*, of which 3,500*l.* are promised, and arrangements have been made to raise the rest by an active canvass of the parish.

DISSEYING CHURCH-BUILDING NEWS.

Ross.—The foundation-stone of a new Congregational Chapel has been laid at Ross. The site having been purchased, and the plan of Mr. B. Lawrence, architect, of Newport, having been accepted, building operations were commenced a short time since; the contract being given to Mr. T. Durke, of Cardiff. The style is Geometrical, with open porch and entrance lobby on the south side of the chapel, which is to be divided into nave and aisles by iron columns, carrying open timber roof, with carved braces and hoarded ceiling. The chapel will be built of the local red sandstone, with Bath-stone dressings; Forest stone being employed in the arches. There will be tracery windows, four on each side of the chapel; octagon staircases, minister's vestry, and a large school-room, which will accommodate about 250 scholars; two classrooms, ladies' vestry, and all other necessary offices. The dimensions of the chapel will be 53 ft. long by 37 ft. wide, the height being about 33 ft., and it will be heated by the patent hot-air apparatus of Mr. T. Bright, of Carmarthen. The slates will be in colours of green and copper. The vestry, class-rooms, and ladies' vestry, will be situated in the basement. The chapel will accommodate about 400 persons, and the contract for its erection has been taken at 1,450*l.*, but the building will cost altogether about 1,570*l.*, exclusive of the price of the land.

Hereford.—The new Wesleyan chapel has been opened. This new edifice has superseded the one in Over-ross-street. It is in the Gothic style; the walls are built in rubble stonework, with Bath-stone dressings. The window-frames are of the same material, and glazed in lead lights, with cathedral glass of two tints, green

and yellow. The principal doorway is of the Norman period, with carved capitals, and there is a lobby, paved with encaustic tiles. Inside, the flooring is of board, and open benches supply the place of pews. The building is 43 ft. long by 30 ft. wide, and the height is 31 ft. At the east end there is a small room, about 10 ft. 6 in. by 8 ft. 6 in., which is intended to be used as a vestry. There is also a warming apparatus for heating the body of the chapel in winter. There are side galleries, which, however, do not run the whole length of the building, extending only about halfway. These galleries will accommodate about 100 persons, 50 in each, and the body of the chapel will seat some 170 persons. The building was erected from the design of Messrs. Pearson & Son, of Ross, and the work has been carried out by Messrs. Smith & Son, of Weston. The entire cost, including the purchase of the land, is calculated to be somewhat about 1,100*l.*

STAINED GLASS.

Hanover Chapel, London.—A stained-glass window has been put up in this chapel by Mr. John Hunter, to the memory of his late wife. The subject is Mary Magdalene anointing the feet of our Saviour, illustrating the text "Thy faith hath made thee whole." The window was executed by Messrs. R. B. Edmondson & Son, of Manchester, being the second placed in this chapel by that firm.

Denton Church.—The chancel window of the parish church of Denton, near Manchester, has recently been filled with painted glass, in memory of Edward, son of Mr. John Bradbury, of Broom-stair House, Houghton. The church, designed by Mr. Scott, is in the Decorated style, and the window in question is divided into four lights, surmounted by geometrical tracery. The window contains two subjects, viz., "The wise Men's Offerings," and "Christ blessing little Children." These are framed by foliated canopies, the upper parts of which contain angels bearing scrolls, inscribed with the texts which the subjects below are intended to illustrate. The tracery contains our Lord sitting in his sovereignty, angels with musical instruments, the *agnus Dei*, wine and chalice, &c. This window is from the works of Messrs. R. B. Edmondson & Son, of Manchester, who have also decorated the reredos by the introduction of the Decalogue, Lord's Prayer, &c., illuminated in gold and colours.

Cummock Parish Church, Ayrshire.—A new church, from the designs of Messrs. Brown & Wardrop, Edinburgh, has been recently erected in Cummock. The structure is in the Decorated style, and the principal windows have been filled with stained glass, at the expense of the Marquis of Bute, the principal heiritor. There are eight figures in the two principal windows, and these are intended to form an epitome of the founding of Christianity, and its introduction into Scotland. The figures of our Saviour, the Virgin Mary, St. John, and St. Andrew are connected with the first; those of Queen Margaret, King David, St. Kentigern, and St. Ninian with the latter event. The upright compartments are surrounded with decorated borderings, and the tracery is filled with lilies, roses, and other ecclesiastical emblems. There is also a wheel-window between the two twin-light windows, where similar emblems are introduced. Messrs. Ballantine & Son, of Edinburgh, were the artists employed.

Wigton Parish Church.—A large triplet window in this church has been filled with stained glass. The central light, which is above 15 ft. by 3 ft., is a memorial of the late Peter Young, who was sixty-five years minister of the parish. An illustration is given of King Solomon, in presence of his fellow-worshippers, dedicating his temple to God. The two side-lights are presented by the Earl of Galloway. In one is a figure of Moses, with the Tables of the Law; in the other, a figure of Paul preaching at Athens. The borderings, medallions, and bases are mosaic, and the groundwork is grizaille. The work was executed by Messrs. Ballantine & Son, Edinburgh.

Morton Church.—A stained-glass window has been erected at the east end of the south aisle in the village church of Morton by Mr. Alfred Harris, jun., of Ashfeld, Bingley. The window is in the Gothic one-mullion style; and the stained-glass illustrations have come from the works of Messrs. Heaton, Butler, & Bayne, of London. In one compartment of the window is

the representation of Christ as the Good Shepherd. In the other compartment is the design of Christ leading one of the faithful through the valley of the shadow of death.

Bromsgrove Church.—A memorial window has been erected in this church, in memory of the late Mr. Day, at a cost of upwards of 130*l.* This window was designed and executed by Messrs. Lavers & Barrand, the artists who also designed and executed the east window of the chancel. The new window is in the south aisle. The subjects chosen are the works of mercy mentioned by our Lord in St. Matthew xi. 5,— "The blind receive their sight, the lame walk, the lepers are cleansed, the deaf hear, the dead are raised up, and the poor have the gospel preached unto them." All the three east windows are now filled with stained glass.

Ringwood.—A stained glass window has just been placed in one of the southern lights of the chancel of the parish church, in memory of the late Mr. and Mrs. Davy. It consists of three groups of figures, representing the Visit of the Shepherds, the Crucifixion, and the Ascension, and was executed by Messrs. Ward & Hughes, of London.

Books Received.

The Electric Telegraph. By Dr. LARDNER. A new edition by E. B. BRIGHT, F.R.A.S. London: James Walton, Gower-street. 1867.

Mr. BRIGHT assisted Dr. Lardner in the preparation of the first edition of this work, and it has been revised and rewritten by him. He is the Secretary of the British and Irish Magnetic Telegraph Company, and therefore versed in telegraphic subjects as they now exist. The volume is illustrated by 140 cuts; and it gives a general view of the present state of telegraphy throughout the world, in which Great Britain certainly holds a distinguished place, even by comparison with the United States, considering that over and above its network of laid lines, it has already entered into electric union with Canada on the one hand and India on the other, and is preparing to unite Australia, New Zealand, and other of her distant colonies with the mother country in a similar way. The present volume is a record of astonishing progress and of wonders in natural magic.

VARIORUM.

THE "Charles Dickens" edition of Dickens's works, compact, clear, and cheap (in course of issue by Chapman & Hall), will reach a fresh public, and doubtless command a large sale. No one will wish it otherwise. No line has our admirable novelist written that the sternist moralist would wish to blot: scarcely a passage, indeed, could he blotted that would not be a loss to the public, for whose delight, and more than delight, he has so long and successfully laboured. "The Posthumous Papers of the Pickwick Club," wise as witty, is the first volume issued, with all its well-known illustrations, first by Seymour and then by "Phiz." The edition is dedicated to "John Forster, biographer of Goldsmith, in grateful remembrance of the many patient hours he devoted to the correction of the proof-sheets of the original editions, and in affectionate acknowledgment of his counsel, sympathy, and faithful friendship, during my whole literary life,"—words honourable to both.—The June number of *Nature and Art* completes the second volume, and with it ends the connexion of Day & Son with the work, excepting as regards the parts already published. The June number includes a sketching lesson, from Mr. Aaron Penley; Notes on the Early History of Engraving; and a short but instructive chapter on the Buddhist Architecture of India. It is capably printed and got up.—"The Laws and Bye-laws of Good Society" (Simpkin & Marshall), contains in a small compass much good advice, which will be useful to many who have worked their way up and are not "to the manner born." It is easy to laugh at such guides; but with many there is no advice to be looked for in any other direction.—Stevens & Hole's School Series: "The Standard Grammatical Spelling-book, in Four Parts, by H. Combes & E. Hines." "Arithmetic, Step by Step," by the same Authors. London: Longmans, Green, & Co. The speciality of the spelling-book is that on a combination principle, it presents all the more usual words

in the language, arranged in a systematic manner, in lessons of convenient length without entirely superseding learning by rote. The arithmetical book is intended, with a companion exercise-book, to supply the demands of those who require full explanation of the methods employed and additional examples for practice after they have gone through the arithmetical copybooks by the same authors.

—“Fox on Light Railways: Institution of Civil Engineers.” This is a reprint of a paper read at the Institution of Civil Engineers on 27th November last. By the term “Light Railways” the author means such lines as, “either being branches from existing trunk-lines, or being intended for districts requiring the development of their traffic, should be constructed in a thoroughly substantial and durable manner, equal in their details as to quality to the best trunk lines, but with every part made only of such strength as to carry loads represented by the rule that no pair of wheels should be allowed to have more than six tons upon it. This would enable these lines to carry the rolling stock of all other railways of similar gauge, with the exception only of the locomotives. The first railways constructed upon this principle, which have come under the author’s notice, are those of the Norwegian Government; the designs for which were prepared, and the works carried out, under the guidance of Mr. Carl Pihl, the State engineer. The author visited these lines in 1864, and was struck with their efficiency and economy.”—“Some Remarks on the Educational Uses of the Proverbs of Solomon. By Robert Skeen. London: Norman, Covent Garden.” As the title shows, this tractate is intended to advocate the inculcation of the Proverbs of Solomon in the schools and seminaries of learning throughout the country.—“The Sewerage of Much Woolton.” A report has been made to the local board on the sewerage of the district and the disposal of the sewage, by Mr. G. W. Goodison, C.E., of the firm of Reade & Goodison, of Liverpool. Mr. Goodison proposes a plan of sewerage whereby the sewage will be disposed of by falling into the Mersey through two brooks forming the natural drainage of the district. The total cost of the sewerage is estimated at 11,628*l.* Mr. James Newlands, the Liverpool borough engineer, has been consulted as to the merits of this plan, and has reported favourably of it. The report of Mr. Goodison has therefore been approved of and adopted by the local board, and the works, we understand, will be gone on with immediately; application being made to the Home Secretary for borrowing powers to carry the scheme into effect.—“Report of the City Surveyor of Montreal for 1866, presented to the Council” (Starke & Co., Montreal). Mr. Macquisten’s report shows that in Montreal sewerage and water supply, widening streets, and paving are all in active progress, and a map of the city has been contracted for on a scale of 20 ft. to an inch.—Readwin’s “Index to Mineralogy” (Spob, Charing cross). Mineralogical students and collectors will find this list or index useful, although it is admittedly very defective, but it is put forward in the hope that ultimately a list of minerals worthy of the name may be produced.—“Telegraphic Reform: the Post-office and the Electric Telegraph. Reprinted from the *British Quarterly Review*. Jackson, Walford, & Hodder, Paternoster-row. The author of this paper supports the proposal to transfer the telegraphs to the post-office department for their farther extension and more efficient management. He gives many interesting details of the contemplated measure, and urges that no more time should be lost in bringing the subject before the Legislature.—Mr. Scratchley’s Life Assurance Bill for enabling Policies to be secured to the widow and children of the assured, and for rendering policies assignable, at law, in favour of creditors: with an introduction. Extracted from the new edition of the “Treatise on Life Assurance Societies and Building Societies” (Layton), Fleet-street. As a bill for effecting one of the objects suggested by Mr. Scratchley, namely, that of legalising assignments of policies, has at last been brought before Parliament, and a further measure is also pending for enabling policies to be secured for the family of the assured; the author has here re-issued from the new edition, in a separate form, those sheets of his treatise which relate to these suggestions.—“Our Constitution,” an epitome of our chief laws and system of Government, with an introductory essay. By A. C. Ewald, F.S.A., of H.M.’s Record Office. London: Warne

& Co. This volume is intended to occupy an intermediate position between technical works on English law and the various kinds of students’ manuals on the same subject; and to form a useful book of reference, not only for county magistrates, members of Parliament, &c., but also for the general public.

Miscellaneous.

A REAL START IN AERONAUTICS.—A little model of an aerial machine has been exhibited in France, which, by purely mechanical force, it is said, carries a mouse through the air. A sanguine and patriotic critic declares that France has thus solved the difficulty of aerial navigation, and that a machine proportionately large will raise an elephant much more easily than the model bears its tiny traveller.

IMPORTANT DISCOVERY OF IRON.—For some months past the search for ironstone has been prosecuted on both sides of the Derwent, and these efforts have at last been rewarded. For nine years past the adventure has proved of varying success. The company, however, fortified by the opinions of Professor Phillips and other geologists and mineralogists, have steadily prosecuted their investigations. The result is that a royalty of 800 acres at Kirkham, in the East Riding, and 1,800 acres at Welburn, in the North Riding, the two being separated only by the navigable river Derwent and the York and Malton Railway, have been leased on favourable terms for a period of sixty-three years, as from the date of the first adventure in 1858.

COMPENSATION CASE: MIDDLE-ROW, HOLBORN. Last week a compensation case connected with the removal of Middle-row, Holborn.—“Edwards v. The Metropolitan Board of Works,”—occupied Mr. Under-Sheriff Burchell, and a special jury, the whole day. The claim was for 9,000*l.* Mr. Hawkins, Q.C., and Mr. E. James, were for Mr. Edwards, a mantle-maker and silk mercer, at the corner of Middle-row, facing the west. Mr. Lloyd and Mr. Phillbrick were for the Metropolitan Board. The premises were said to be in the best part, and large incomes had been made by members of the same family. They were worth 500*l.* a year. The stock was worth between 3,000*l.* and 4,000*l.*, and the loss by tender would be “50 per cent.” One of the witnesses said the mantle business was very deceptive. There was “more deception in it than in any other trade.” Mr. Lloyd called no witness, but contented himself with cutting down the claim. The Under-Sheriff placed the several items before the jury who had only been assisted by evidence on the one side. The alterations were for the benefit of the public, but Mr. Edwards was entitled to full compensation. The jury retired, and on their return assessed the compensation at 6,743*l.*

EGYPTIAN SCULPTURE.—Professor Piazza Smyth made the acquaintance of M. Mariette, otherwise Mariette Bey, a Frenchman, who has been appointed by the Viceroy as the officer in charge of the antiquities of Egypt. M. Mariette has recently discovered what he thinks the oldest extant piece of sculpture in the world, and he has placed it in the museum of which he is the custodian. The following is a description of this exceedingly interesting statue.—“When Mariette Bey shows you the chief piece of it, you stand almost appalled before the presence it conveys. It is the life-sized portrait of a King who built one of the Pyramids, seated in the calmness of majesty and the isolation of rank, gazing honestly straight forward, and on high thoughts intent, into space. There is neither the total nudity of Greek sculpture, nor the encumbering frippery of modern royalty; but the man is there, slightly more muscular in the arms than the Apollo Belvidere, though not less justly proportioned or exquisitely rendered; yet still, his *forte* is thought and administration rather than manual labour, and his manner that of one who can afford to bide his time, and expects with solid reason to see all things eventually combine for good. The eye is large and peaceful, the lips are rather fine as well as precise, the nose straight and thin, but not so much in the Grecian as the Anglo-Saxon manner; and almost the only decoration is the quasi-heraldic supporter of a hawk developed out of, rather than exactly standing on, the summit of the rocky seat, and folding its wings with benign protective influence towards the monarch’s respected head.”

EXCAVATING APPARATUS.—Milroy’s patent excavating apparatus was invented and first successfully employed for sinking the cylinders of the Clyde bridge, on the Glasgow (City) Union Railway. It is considered that the machine will be found useful in making any kind of perpendicular excavation, but more particularly in sinking coal-pits and wells through watery strata, and in sinking cylinders for the foundations of bridges, breakwaters, lighthouses, forts, &c., its suitability for such purposes consisting in its being perfectly independent of the water, which is allowed to remain in the pit or cylinder until the excavation is completed; and in the fact that it may be used with equal ease in any working, without sensibly increasing the cost of working; and that its rate both of sinking cylinders and of excavating is higher than has yet been attained by any other method. On the Clyde Bridge, cylinders 8 ft. 4 in. in diameter were sunk by means of it, at the rate of 4 ft. per hour, till the hard foundation was reached at a depth of 80 ft. below low-water level. The expense attending its working is said to be comparatively trifling, as skilled workmen are not required.

WATER SUPPLY FOR VALPARAISO.—A new company, called the Valparaiso Waterworks Company (Limited) has been formed, and appeals for capital to the extent of 200,000*l.* The shares are of 20*l.*, and the dates on which the different instalments must be paid up are specified. The object of the company is to supply the city of Valparaiso, in Chili, with water. It seems that Mr. Waddington, an Englishman, had obtained a concession as far back as 1856 from the municipality, which was approved of by the Government in 1862, to bring water from the range of the Andes. Mr. Waddington had begun to build a canal coming to the city by a circuitous route for the double purpose of supplying a reservoir and of irrigating the country. A length of 72 miles of the canal has already been finished. The company now formed has purchased that portion, with the concession, from a son of the concessionaire, and with whom also they have made a contract to complete the works. The contractor agrees to pay 6 per cent. on the capital during construction in consideration of receiving any income derived from the works during that period. The price to be given to the concessionaire for his concession, and the portion of canal already completed, is 100,000*l.* in fully-paid-up shares after the whole undertaking has been completed. This amount of fully-paid-up shares is to be a fresh issue in addition to the capital of 200,000*l.* The total net revenue derivable from the city and the irrigation is estimated at 76,366*l.*

THE POLITICAL ECONOMY OF MR. RUSKIN.—Two lectures on this subject have been delivered in the Town-hall, Manchester, by Dr. W. B. Hodgson, Examiner in Political Economy, London University. In the second, the lecturer proceeded to deal with Mr. Ruskin’s problem, “How to maintain constant numbers of workmen employed, whatever may be the demand for the article which they produce.” He agreed with him that wages should not be based upon charity, but justice; but he differed with Mr. Ruskin as to his ideas of justice, for the latter laid it down that if a man did an hour’s work for you, and you only did half an hour’s work for him,—no matter what the quality of the work was,—an injustice was done to the man. Mr. Ruskin, however, would not estimate half an hour’s work with his pen as only of the same value as half an hour’s work by a blacksmith; therefore such an idea of the equality of labour was an absurdity and a fallacy. The lecturer then went on to show what constituted the real value of a man’s labour, and how Mr. Ruskin failed in endeavouring to show that an hour’s labour of a blacksmith was worth an hour’s labour of another man who perhaps had devoted a lifetime to the study of a profession. The theory, however, was not new, as it was only the revival of a plan laid down by two other authors some years ago, whose object had been to abolish specie payment for hour labour. Indeed, Mr. Ruskin seemed to have stated his opinion on political economy without having duly considered them. He was sometimes right, but what he said was generally made worthless, as some previous statement of his would turn up to contradict it. His opinions on war as the great promoter of the arts and paternal government, the lecturer said, were all fallacies, which, when fairly judged by the science of economics, would not bear to be investigated.

HOUSE PROPERTY IN BRIGHTON.—At the Estate Mart, North-street, last week, Mr. Atreou omitted a large quantity of property in Brighton public auction, and of which the enbjoined—all freehold—were sold at the following prices:—No. 3, Lower Rock-gardens (let at 105*l.* year), 1,670*l.*; No. 44, Park-crescent, 690*l.*; houses in Prince's-street, 485*l.*; Nos. 11 to Francis-street (let at 30*l.* a year each), 1*l.* each; No. 60, Old-stone, was bought in at 30*l.*

PROJECTED IMPROVEMENT IN CABS.—Some enterprising capitalists at the West-end are about to originate a new cab company, for the purpose of supplying light and open elegant vehicles in place of the heavy, dismal, and, in nine cases of ten, dirty ones, at present used as hack-rickshaws. The company intend to let both cabs and horses to their drivers at the smallest possible amount of hire, and upon the good old principle of "live and let live." The men employed are to wear a livery of plain black or blue cloth, with a narrow gold band round the hat. The carriages are to resemble private broughams, the men will be those of sober and tried character only. So says *The Whip*,—a professional paper.

NITRO-GLYCERINE IN SLATE AND TUNNEL CUTTING.—Experimental blasting has been made at various near Slatington, in the United States. The blasting was considered entirely successful in hard to rock. Experiments in the use of the "sculpting" (the technical term for getting the blocks from which slates are made) have been concluded, but interested parties expect themselves confident of its ultimate success in this branch of the business. The oil, it is said, requires one-fifth less drilling for than gunpowder, and is more economical in many other respects. Nitro-cerine is cutting the Pacific Railroad tunnel through the summit of the Sierra Nevada at the rate, it is said, of 50 ft. per week, and by December fifty miles of road will be added to ninety-four already in operation at the California end.

ARTESIAN WELLS IN ALGERIA.—At the end of 1864, seventy-five wells, sunk by the French, were flowing and delivering 4,200,000 litres of water every hour, or 100,000 cubic metres a day. The water is limpid and drinkable, but generally little brackish. A village and date plantations were laid up around every well, and the natives, having nothing to lose, prefer peace to predatory expeditions. Thirty-five of the wells are in the Oued Rir district, which stretches far to the south. The deepest well is 175 metres, the shallowest 29 metres, and the total of all the borings amounts to 5,628 metres. The entire cost, defrayed by a loan from the natives, was 400,000 francs. Among the material results, we are informed that 4,000 date-trees have been planted in the Oued Rir district alone, besides fruit-trees of every kind, and more than 2,000 new gardens have been formed. Four boring brigades have been established for systematic explorations.

HOME FOR LITTLE BOYS.—At Horton Kirby, in Farningham, Kent, the opening has now taken place of the "Home for Little Boys," the foundation-stone of which was laid by the Prince of Wales on the 7th of July last. It is designed for children from all parts of the county, the only limit being that it shall be for the boys who are homeless and destitute. The buildings consist of five spacious houses, which are furnished in the plainest manner by Mr. E. Seaton, of the Hampstead-road. House No. 1, by permission of Her Royal Highness the Princess of Wales, is named "The Alexandra House." No. 2 the committee have named "The Hanbury House," Mr. Hanbury having obtained from his family the donation of 500*l.*, which, with his own contributions, completed the cost of the house. No. 3 has been erected at the request of the congregation of the Rev. Dr. Raleigh, of the Bare-court Chapel, Canonbury. No. 4 is named "The Children's Cottage," having been erected entirely by the subscriptions of children of friends and supporters of the institution; and No. 5 had been erected at the cost of Lady Morrison. Each house is surrounded with its allotment of land and garden-ground, in which the children are employed in agricultural pursuits during a portion of the hours not devoted to education, and there are workshops in which various trades are taught. The school is a Gothic structure, built of Kentish stone, and at its south-eastern corner contains the foundation-stone, with its inscription.

PRIZES FOR ART-WORKMEN.—The Society of Arts again offer a large number of prizes, in various departments, for art-workmen, whose attention to the list published we invite. It may be obtained at the House of the Society, in John-street, Adelphi.

THE INTERNATIONAL SOCIETY OF FINE ARTS, LIMITED.—The rooms of this company (Bond-street) contain this year a number of pictures by foreign artists, none very great, but some very pleasing. The mixed purposes of the company scarcely seem to us to promise a very successful issue.

THE POPULARITY OF THE PEEL PARK MUSEUM, MANCHESTER.—The plan of conducting the visitors during Whit-week has been now continued for the last ten years, and the total decennial return of visitors in Whit-week is nearly a million: the actual number is 898,780, being an average of 14,979 each day!

CONVALESCENT HOSPITAL, WITLEY, SURREY.—In connexion with this hospital, the laying of the foundation-stone of which was mentioned in May last, a chapel for the use of the convalescent patients, the children, and the establishment, is now about to be erected on the grounds, and this, so far as their presence will not interfere with the primary object of the building, the neighbours will be invited to attend. Mr. Sydney Smirke, R.A., is the architect, and Messrs. Mansfield & Co. are the builders. King Edward's Schools, mentioned by us when speaking of the hospital (p. 318, ante), have been erected by the same builders, also under Mr. Smirke, and not as then stated.

MONUMENTAL.—About two years ago a proposal was entered into for the erection of a monument to William, late Duke of Hamilton and Brandon. The subscriptions were chiefly confined to the tenantry and the personal friends of the duke, and a good sum was thus raised. The site has finally been fixed on the bank of the Avon, about 100 yards above the entrance to Cadzow Forest, by the Barncliff-road, amid a piece of the finest river scenery in Scotland. This position was specially approved of by the duchess, Princess Marie of Baden, as also the plans of the monument, which are by Messrs. Heath, Wilson, & Thomson, architects, Glasgow. The structure is to be circular, in the Italian style of architecture, 26 ft. high and 22 ft. in diameter, of polished freestone, from Dalpatrick quarry, in the parish of Dalsferr, where the columns of the front of the palace at Hamilton were taken from. There are to be nine openings in the circumference, which will be divided by as many granite pillars. The roof is to be of wood, covered over with lead. In the centre of the monument a column is to be placed, surmounted by a bronze bust of the duke. A monument has been erected at Chlum, in memory of the Austrians who fell at the battle of Königgratz. It is of iron, and consists of a colossal cross on a Gothic pedestal.

CRYSTAL PALACE.—The preparations for the great musical festival on Wednesday next, June 26th, in aid of the restoration of the Palace, have proceeded with much vigour, and may now be said to have been completed with a remarkable amount of success. The orchestra will comprise an extraordinary array of musical talent. Besides the entire Royal Italian Opera orchestra, and many of Her Majesty's Theatre, the band of the Sacred Harmonic Society, that of the Crystal Palace Company, the leading amateurs of the Wandering Minstrel Society, headed by their conductor, the Hon. Seymour Egerton, as violin, with Lord Gerald Fitzgerald, as violoncello, many other well-known instrumentalists will lend their aid, making up above 350 stringed, and nearly 100 wind, instrument performers, or in all, between 400 and 500 carefully-selected instrumentalists. The orchestral arrangements, as at the Triennial Handel Festivals, are organised by the Committee of the Sacred Harmonic Society. The chorus comprises the London Festival Chorus, that of the Royal Italian Opera, and many other professors and amateurs, solo singers, and members of choirs and choral societies and others, who have offered their services, thus forming an aggregate of 2,500 carefully-selected performers. The principal solo artists include Grisi and Adolina Patti and Titiens, with Lemmens-Sherrington, Rudersdorf, Vida, Sainton-Dolly, Sims Reeves, Mario, Naudin, Graziani, Santley, Arabella Godard, &c., an unprecedented combination of talent.

GLYCERINE GLUE.—A German chemist, M. C. Pascher, has discovered that, if glue or gelatine be mixed with about one-fourth of its own weight of glycerine, it loses its brittleness, and becomes applicable for many purposes for which it is otherwise unfit. A cement composed of starch, glycerine, and sulphate of lime is said to remain plastic and adhesive, and is recommended for lining chemical and philosophical apparatus, and other similar purposes.

THE PALACE FOR THE NEW BISHOP OF CHESTER.—The alterations and additions now being made to the residence of the late Chancellor Raikes, and which is destined to be the palace for the newly-appointed bishop of this diocese, Dr. Jacobson, are rapidly progressing. Two wings have been added to the old mansion, and the work is being specially superintended by Mr. Bramwell, of Oxford, architect. The builder is Mr. Hughes, of Aldford, who is also erecting the Town-hall.

AGRICULTURAL RETURNS.—The Board of Trade are soliciting returns from all occupiers of land in Great Britain, to obtain, for the information of the public, reliable facts as to the home supply of corn and cattle. The occupiers of land in Great Britain are so numerous, that a large staff of persons must be employed throughout the country to collect the necessary particulars. The successful collection of agricultural returns must, however, greatly depend upon the willing help of the landed proprietors and the tenant farmers; and we would earnestly urge upon them the importance of assisting, as far as they are able, to make the returns a source of correct and valuable information.

THE NATIONAL PORTRAIT GALLERY, GEORGE-STREET, WESTMINSTER.—Several new portraits have lately been added, we may mention for the sake of those who have already visited the collection. But how few, comparatively, these are, considering the numbers who would derive pleasure and instruction from a visit to the rooms in a proper spirit! The collection is open free on Mondays, Wednesdays, and Saturdays; and an interesting catalogue, compiled by Mr. Scharf, is obtainable. The collection is at present augmented much too slowly. When better housed, as will by-and-by be the case, larger funds should be made available, and more determined measures adopted to carry on the idea to a worthy extent. Our readers, however, need not wait till then: they will already find plenty to interest them.

THE TRAFFIC AT LONDON BRIDGE.—At a recent Court of Common Council, Mr. E. D. Rogers brought forward a motion to the effect that, in consequence of the constantly increasing traffic over London Bridge, it be referred to the Bridge House Estates Committee to consider as to providing additional accommodation for foot-passengers on the bridge, and that they obtain plans and estimates, and report as early as possible to the court. The motion gave rise to lengthened discussion, and Mr. Paterson moved as an amendment that the committee should confer with the South-Eastern Railway Company, with a view to ascertain upon what terms they would be willing to open their bridge at Cannon-street for public traffic. Ultimately the question was referred to the Bridge House Estates Committee.

FRATERNISATION OF WORKMEN AT THE EXHIBITION OF 1867.—A letter has been sent by M. Chabaud, president of the Paris Working Men's Committee and ex-president of the Paris working delegates to the Exhibition of 1862, to Mr. Blanchard Jerrold, acting director of the Foreign Workmen's Reception Committee at the Universal Exhibition of 1862, who is requested to obtain what publicity he can for it in England. In this letter the writer says:—"We have resolved that, in the Exhibition itself, there shall be a place where the working delegates of Paris, of the provinces, and of the foreign countries, may meet to promote, in a fraternal spirit, the complete enfranchisement of labour. With this idea, which will be sympathetically received by every generous nation, we have devoted the model house, constructed by us in the Exhibition Park, and known as the Paris Workmen's House, to the reception of delegates. We wish it to be their meeting-house. They will find in it every description of statistical and descriptive document necessary to the fulfilment of their mission, together with the French and foreign papers. Foreign editors are requested to forward copies of their newspapers for the use of the workmen of their respective nationalities."

EXPLORATION OF PALESTINE.—Oxford University has made a grant of 500*l.* to the Palestine Exploration Fund by a majority of 1 only; *placet*, 32; *non placet*, 31.

ENGLISH GAOLS.—It is not alone in India that the gaols want revision. A public meeting has been held in Carnarvon relative to the erection of a new gaol there, and in the course of it a surgeon stated that the existing gaol is "scarcely ever free from fever: it is a huge nuisance: a hotbed of disease."

THE DRAINAGE OF FARNHAM.—The gentlemen who are competing for the drainage of Farnham want to know what has become of the plans sent in, and when the decision of the authorities is to be made. The plans and reports were delivered to the clerk of the Board of Health of Farnham on the 1st of March last.

GREAT FIRE NEAR LEEDS.—A destructive fire has destroyed the Airedale Mills, at Rodley, five miles from Leeds, the property of the Airedale Mill Company, and used by them for cloth and wool scribbling and milling. The mill was a stone building, 60 yards long by 60 yards wide, and was five stories in height. It had been built about seven years, and was fitted up with new and costly machinery, at a large expense. Damage was done to the estimated amount of 25,000*l.*; and, in addition to this, nearly 1,000 people will be thrown out of work.

A NEW MATERIAL FOR PORCELAIN OR STATUETTES?—M. LEROUX has made a horate of magnesia with an equivalent of calcined oxide of magnesium and another of boric acid, which melts at a strong white heat, and yields a very fluid liquid. This liquid, on being poured on a cast-iron plate, is transformed into a slightly greenish sort of glass, remarkable for its lightness and strength. But, strange to say, if poured into platinum moulds, it will come out quite opaque, partaking of the appearance partly of porcelain and partly of white marble.

SANITARY REFORM IN THE METROPOLIS.—The report of the special committee on the Sanitary Act of 1866 appointed by the Marylebone Vestry has been presented to the vestry. The report recommended the adoption of numerous clauses of the Act, involving a revolution of the present sanitary arrangements of the parish. At an adjournment of the vestry the first recommendation had been adopted, by which it was resolved to devote a separate building to the special purpose of disinfecting the clothing, bedding, &c., used by persons suffering from infectious diseases. Mr. Hallam, Professor Marks, Dr. Whitmore (medical officer of health), Mr. Galsworthy, and other gentlemen pointed out the great aid this would prove in the endeavour to prevent the spread of infectious diseases. The remaining paragraphs of the report were left over to be considered at next sitting.

THE COPPER TRADE.—Messrs. Vivian, Yongner, & Bond (June 7) write.—Business has been on a most limited scale. Prices have altered but little, and no feature of interest has presented itself. We note sales of Urmeneta ingots at 80*l.* per ton. A cargo of regulus brought 1*l.* 4*d.* per unit, and about 250 tons Chili bars have changed hands at 71*l.* per ton. The available stock of Chili bars, ores, and regulus in Liverpool, Swansea, and Havre, and English and foreign copper in London, is thus estimated in fine copper:—June 1, 1867, 21,436 tons; June 1, 1866, 18,538 tons; and June 1, 1865, 17,866 tons.—An annual Parliamentary return shows that, in the year 1866, 129,547 tons of copper ore and regulus, from Chili and other parts, were imported into the United Kingdom,—11,346 tons of copper unwrought, &c.; 10,063 tons partly wrought; 270 tons of plates and sheets; and copper manufactures and copper plates engraved of the value of 9,475*l.*; this last item showing a great decrease from the previous year, when it amounted to 30,054*l.* The British copper exported in the year, chiefly sheets, nails, &c., amounted to 28,424 tons, as against 31,609 tons in the preceding year. India is the largest customer.

TENDERS

For shops, Starch-green, Hammersmith, for Mr. Foley. Mr. G. Saunders, architect:—
 Webster 2716 0 0
 Eyles 665 0 0
 Keys 695 0 0

WANTED, by a thoroughly practical Man, carpenter and joiner by trade, a RE-ENGAGEMENT as GENERAL FOREMAN, or the charge of a Job, or to take carpenter's work (piece work). Good references.—Address, Mr. N. 20, Job's place, Pomeroystreet, Peckham, S.E.

TO BUILDERS AND CONTRACTORS. WANTED, a SITUATION as MANAGER, Agent, General or Working Foreman, by a practical Man, aged 35. Sister by trade.—Address, W. P. 35, King William-street, City, E.C.

TO ARCHITECTS AND SURVEYORS. WANTED, by a Gentleman, an ENGAGEMENT in an Office of the above, with an ultimate view of purchasing a partnership.—Address, W. W. No. 27, Vauxhall Bridge-road, S.W.

TO ARCHITECTS AND LAND SURVEYORS. WANTED, a RE-ENGAGEMENT. Accommodated to working, detail, and competition drawings, and thoroughly up in the general management of the above offices. Salary moderate.—Address, N. 84, Office of "The Builder."

TO BUILDERS, DECORATORS, &c. WANTED, a SITUATION as PAPER-HANGER, and to help up time at the other branches, being also an experienced general hand in town or country. Constant or otherwise. Or as Working Foreman of Painters at a good country job.—Address, R. 355, Euston-road, N.W.

TO ARCHITECTS AND CONTRACTORS. WANTED, by a RE-ENGAGEMENT, as CLERK of WORKS, just completed his engagement—extensive London job. Twenty years' experience as General Foreman and Clerk on Government and other Works, extensive Docks, Yards, Reservoirs, from 1846, a large Church, Town and Boat Works. Good testimonials.—A. M. 103, Walworth-road.

WANTED, by the Advertiser, a SITUATION as FOREMAN, CLERK, or GENERAL ASSISTANT in a Builder, or other country. Constant or otherwise. Practical Man. Good references.—Address, H. care of Mr. Wood, Builder, Tottenham, N.

TO BUILDERS AND CONTRACTORS. WANTED, by a Practical Man, a RE-ENGAGEMENT as SHOP or GENERAL FOREMAN, as Carpenter and Joiner. Town or country. Good references to former employers.—Address, R. L. care of Mr. Jones, Stationer, Woodford, Essex.

WANTED, by a Young Man, a SITUATION as IMPROVER in a JOINER'S SHOP. Has been five years in the trade. Wages not so much as object as a constancy.—Address, C. care of Mr. Hall, 44, Church-street, Clapton-road.

TO ARCHITECTS. WANTED, a SITUATION as DRAUGHTSMAN.—Can prepare a set of Drawings from rough sketch. Good Colourist. Aged 25. Salary 27s.—Address, "GOTHAM" Post-office, Grays-road, Edmonton.

WANTED, by a Young Man, aged 25, who has had seven years' experience in a Surveying office, and is well acquainted with surveying, levelling, and general office, and is an ASSISTANT in a similar capacity, at home or abroad.—Address, C. care of Mr. Frothingham, 10, Cannon-street, London.

THE Advertiser wants a SITUATION as JUNIOR ASSISTANT.—Address, L. 76, Fore-street, Brompton, Cornwall.

THE Advertiser, a thoroughly practical Man of extensive experience and a total abject of the trade, is desirous of a RE-ENGAGEMENT as GENERAL FOREMAN, Clerk of Works, or to take charge of a Gentleman's Estate. First-class references.—Address, A. G. W. 9, Park-street, Cannon-street, London.

TO AGENTS, SURVEYORS, AND ESTATE AGENTS. THE Advertiser desires an ENGAGEMENT with the above. Can survey and plot land, trace plans, and find areas, &c. Excellent references. No objection to the country.—Address, C. care of J. Johnson, No. 33, Abchurch-lane, City.

THE Advertiser, who has had a varied and practical experience in his profession, is desirous of an ENGAGEMENT as CLERK of WORKS, or to take work by the Free. Used to large and difficult jobs.—Address, 555, Office of "The Builder."

THE Advertiser, who has been employed in the Office of a Waterworks, is desirous of an ENGAGEMENT in town or country. Salary 4s. 6d. per week as object as an immediate introduction to permanent employment.—Address, W. E. 22, Goldsmith-square, Copper-road, South Hammersmith, E.

THE Advertiser, who has been seven years in the Office of an Architect and Surveyor, wishes an ENGAGEMENT, in town. Would have no objection to a Building Office. First-class testimonials.—Address, 69, Office of "The Builder."

TO BUILDERS AND CONTRACTORS. WANTED, by the Advertiser, a RE-ENGAGEMENT as ESTIMATOR, Measurer, and Draughtsman of twenty years' experience in town and country. Referring from present employers.—Address, V. A. Mr. Smith, News Agent, Church-street, Hackney.

TO BUILDERS AND CONTRACTORS. WANTED, by a middle-aged Man, of practical experience, a SITUATION as MANAGER, or GENERAL FOREMAN of WORKS, having been engaged in very extensive railway, water, dock, and sewerage works, for the last twenty years with a thorough knowledge of plans, measurement, setting out, masonry, iron, and timber work, in all its branches, with first-class reference for character and abilities. Is open for an engagement either at home or abroad.—Address, A. W. Post-office, Edinborough, Leith.

TO BUILDERS AND CONTRACTORS. WANTED, by a first-class DRAUGHTSMAN an ENGAGEMENT. Well up in perspective and competitions, working and detail drawings. Colouring, &c.—Address, 552, Office of "The Builder."

TO BUILDERS. WANTED, by a Young Man, with good references, a RE-ENGAGEMENT as FOREMAN of a JOB.—Address, W. A. care of Mr. ROBE, Builder, Chesham, Bucks.

TO BUILDERS, CONTRACTORS, AND OTHERS. WANTED, by the Advertiser, a SITUATION as YARD FOREMAN, Wharf Clerk, or any place of trust, where a thorough knowledge of the various trades are required. Can have several years' undoubted reference as to character and ability from last employer.—Address, 814, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, Carpenter by trade, Town or country. Good references.—Address, G. H. Cadogan street, Chelsea.

WANTED, an ENGAGEMENT, by a thoroughly qualified ESTIMATOR, Measurer, and Draughtsman of twenty years' experience in town and country. Referring from present employers.—Address, V. A. Mr. Smith, News Agent, Church-street, Hackney.

TO BUILDERS AND CONTRACTORS. WANTED, a RE-ENGAGEMENT, as SHOP or OUT-DOOR FOREMAN, in town or country. Reference from London firms.—Address, A. E. S. 20, Shaftsbury place, Ading-street, City.

TO BUILDERS AND CONTRACTORS. WANTED, by a PERSON of much experience, a SITUATION as OUT-DOOR FOREMAN, or to take charge of a country job.—Address, 555, Office of "The Builder."

WANTED, by a Young Man, a SITUATION as BUILDER'S CLERK, for a few years' experience. Good references.—Address, C. B. 10, Devonshire-place, Ading-street, W.

WANTED, GRAINING and MARBLING, by Free-work.—Address, X. Y. 91, Charington-street, Oakley-square, N.W.

TO CONTRACTORS AND BUILDERS. WANTED, by a respectable Young Man, aged 24, a SITUATION as TIMEKEEPER, CLERK, or MESSENGER. First-rate references.—Address, W. B. Clark's Library, Dorling, Surrey.

TO ARCHITECTS, SURVEYORS, &c. WANTED, by a DRAUGHTSMAN, an EMPLOYMENT. Can manage an estate, act as an agent for a fire insurance office, or as assistant to a district surveyor, &c.—Address, DRAUGHTSMAN, 55, Finchbrough-road, Lorraine-square, Waltham, S.

TO BUILDERS AND OTHERS. WANTED, by a Young Man, aged 27, a prima cost and accounts, salary 30s. per week. Good references.—Address, F. C. 37, Green-street, Highbury.

WANTED, by the Advertiser, a Carpenter by trade, a SITUATION as CLERK of WORKS, or to the Charge of a Job. Town or country. First-class references.—Address, 555, Office of "The Builder."

TO CARPENTERS, BUILDERS, HOUSE AGENTS, &c. WANTED, by a steady Young Man, a permanent SITUATION as CARPENTER and JOINER. Undertakes repainting and decorating; also a good paperhanger. Good reference given.—Apply to J. HANLEY, 11, Broadway-terrace, Blandford-square, W.

WANTED, a RE-ENGAGEMENT as GENERAL FOREMAN or as CLERK of WORKS by a thoroughly qualified Man, of several years' experience. Satisfactory reference and testimonials from previous employers.—Address, A. B. 34, Chichester-road, Kilburn-gate, N.W.

TO BUILDERS AND CONTRACTORS. WANTED, an ENGAGEMENT, as CLERK, TIME-KEEPER, &c. Is a good book keeper and penman, and thoroughly up in all the duties of the above. Aged 24. Undeniable reference.—Address, 610, Office of "The Builder."

TO ARCHITECTS. WANTED, by an ASSISTANT, who is an efficient draughtsman, &c. a RE-ENGAGEMENT in a London Office. Good references.—Address, C. H. 42, Eleanor-road North, Hackney, N.E.

TO BUILDERS AND OTHERS. WANTED, by a good PLASTERER, who has completed extensive jobs in London and elsewhere. Good reference as to character and ability.—Address, 385, Office of "The Builder."

TO BUILDERS. WANTED, by a steady Young Man, a permanent JOB in a good Joiner's shop. Has a good knowledge of the trade, and can prepare working drawings. Good reference. Country preferred.—Address, W. S. 204, Macey-road, Finsbury, S.E.

TO ARCHITECTS. WANTED, an ENGAGEMENT, by a fully qualified and ARTISTIC ASSISTANT, of many years' experience in all branches of the profession. Could take the management of an office. London preferred.—Address, No. 134, Office of "The Builder."

WANTED, by an energetic and practical BRICKLAYER, a SITUATION as FOREMAN, or to take work by the Free. Used to large and difficult jobs.—Address, 555, Office of "The Builder."

WANTED, by the Advertiser, an ENGAGEMENT as WORKING FOREMAN of MASONRY. Good references, &c.—Address, E. F. No. 6, Magdalen-street, Cambridge.

TO BUILDERS AND CONTRACTORS. WANTED, by the Advertiser, a RE-ENGAGEMENT as ESTIMATOR, Measurer, and Draughtsman of twenty years' experience in town and country. Referring from present employers.—Address, V. A. Mr. Smith, News Agent, Church-street, Hackney.

TO BUILDERS AND CONTRACTORS. WANTED, by a middle-aged Man, of practical experience, a SITUATION as MANAGER, or GENERAL FOREMAN of WORKS, having been engaged in very extensive railway, water, dock, and sewerage works, for the last twenty years with a thorough knowledge of plans, measurement, setting out, masonry, iron, and timber work, in all its branches, with first-class reference for character and abilities. Is open for an engagement either at home or abroad.—Address, A. W. Post-office, Edinborough, Leith.

TO BUILDERS. WANTED, by a Young Man, with good references, a RE-ENGAGEMENT as FOREMAN of a JOB.—Address, W. A. care of Mr. ROBE, Builder, Chesham, Bucks.

TO BUILDERS, CONTRACTORS, AND OTHERS. WANTED, by the Advertiser, a SITUATION as YARD FOREMAN, Wharf Clerk, or any place of trust, where a thorough knowledge of the various trades are required. Can have several years' undoubted reference as to character and ability from last employer.—Address, 814, Office of "The Builder."

WANTED, a RE-ENGAGEMENT, as GENERAL FOREMAN, Carpenter by trade, Town or country. Good references.—Address, G. H. Cadogan street, Chelsea.

The Builder.

VOL. XXV.—No. 1273.

French Views of English Designs.

THE *Journal des Travaux Publics*, under the signature—not altogether unknown in this country—of Hector Horeau, expresses surprise that it is in the midst of objects manufactured in iron, in wood, and in artificial stone, that the works of the English architects are to be sought. However limited the space allotted to the English section, where food and deadly weapons occupy so prominent a position, it is inconceivable that architecture should have allowed itself to be so entangled, strangled, garotted in the midst of artificial stone-work, which would have been better placed out

of doors, than in spaces so narrow that two persons cannot look at the drawings together. This is the more striking from the fact that the designs are for the most part only represented by little photographs, occupying but very little room.

This complaint is all the more reasonable, continues our contemporary, from the observation of the empty spaces outside the principal building. Austria, Belgium, Switzerland, have erected special annexes at their own expense; but the architectural questions which agitate London at this moment are of a higher importance with reference to art and civilization than any that are under discussion in these continental kingdoms. In extending to foreign art that hospitality which has here been understood to be limited to roof and to floor, to an extent calculated to include a further space to be roofed as well as furnished by exhibitors at their own expense, M. Horeau omits to mention whether it is expected that the English architects should build a special annexe for the exhibition of their detail drawings; whether this duty should be performed by our patentees of artificial stone, or whether Parliament is to be asked to vote an expenditure supplemental to that provided for by the French budget.

The New Palace of Justice, the *Journal des Travaux Publics* goes on to say, will be as large as the old and the new Louvre united, and will cost some 1,200,000. Eleven English architects have competed for the design. Well, this competition, too exclusively English as it is, is only visible at the Exposition as represented by little photographic views, without any geometric plans such as are requisite in order to arrive at the relative value of the designs. The subject can, therefore, only be spoken of with reserve,—and that the more so since three of the competitors, Messrs. Abraham, Garling, and Street, have exhibited nothing, or rather had not allowed

their designs to be exhibited in consequence of the small space allotted to the works of English architects.

The eight other designs, represented only by photographic fragments, are as follows:—That of Messrs. Banks & Barry, whose plan is too much cut up, and wanting in simplicity.

Mr. Brandon has five drawings, which, both as to exteriors and interiors, too much resemble churches and cathedrals.

Messrs. Burges & Dean only show some picturesque views, which do not enable us to speak of their compositions.

Mr. Lockwood has a right-angled plan, which appears to offer scope for improvement. The elevations of this architect show much taste and draughtsmanship.

Mr. Scott has sixteen views, without a single geometric design. It is not possible, from these picturesque elevations, to form an opinion as to the architectural value of the work.

Mr. Seddon, with his exterior views, presents a not agreeable group of gabled houses; and in his interiors a transverse gallery in two stories, with the upper part heavier than the lower.

Lastly, Mr. Waterhouse exhibits nine picturesque views, which do not enable us to appreciate his architectural work.

In this great rivalry of little photographs is chiefly remarkable, continues the *Journal*, an undue richness of ornament unfitting a temple of justice, and a lamentable spirit of reproduction of forgotten architecture, incompatible with that use of iron, of glass, and of earthenware, which has been introduced into our modern buildings, and which architects who seek only to reproduce the past cannot employ.

We do not know whether a choice has been made among these eleven competing designs, concludes the *Journal des Travaux Publics*, or who has been able to make the choice.

The example of the *Journal des Travaux Publics* has not convinced us of the superiority of the French method of signing every contribution to a journal, since a signature does not seem to be an absolute guarantee as to the quality of the article. It does not prevent attack taking the place of criticism, and the productions of laborious artists from being blamed for matters regarding neither the artists themselves nor the art which they practise. Enough has been said as to the manner in which English exhibitors have been dealt with at Paris to make it quite unnecessary to call attention to the fact of deficiency of accommodation. But to blame the competitors for a work like the Courts of Law, because there is not room to exhibit their detailed plans to Parisian visitors, is a most curious and novel illustration of the fable of the wolf and the lamb. The accusation, once made, should surely be enough. But it is reiterated with almost every name, and not a single word of kindly and merited admiration is found for designs which certainly contain much to call forth such a welcome.

Originality, so that it be not the originality of negligence, is one of the rarest gifts of the architect; and from the very nature of his art, it is far rarer with him than with the painter, the sculptor, or the engineer. For the painter and the sculptor the portals of fancy are open. Limited only by the nature of his materials, or the size of his canvas or his block, the artist who relies on his brush or his chisel has the means of presenting to the world the embodiment of the highest flights of imagination, or the most faithful photographs of daily life. Witness that most wonderful creation of Paton in the Royal Academy Exhibition, the "Fairy Changeling," a picture that is a study, a marvel, and a delight—luminous with the most poetic fancy, and crowded in every niche with graceful forms of elfin life, while the solemn, wondering look of the babe borne by the elfin queen brings humanity itself into fairy-land. Look, on the other hand,

at the pigeons in Holman Hunt's "St. Swithun's Day;" are they not actual birds—are you not tempted to shout to make them take wing? For the engineer, again, constant demands are made on originality by the occurrence of new conditions. To bridge the Menai Straits, to carry locomotives over the Thames, to tunnel under the City-road,—all these are such novel demands on his skill that great originality must characterize an adequate execution of the task. But for the architect, for the most part, only recurs the repetition of the solution of the same old problem. The church, the hall, the castle, the palace will, in the same climate, have pretty much the same characteristics century after century, varying only with the changing habits produced by the changing forms of social life.

But the English architecture of the day, with all the room that yet remains for its improvement, has not proved wholly inadequate to the demands made by modern life on the genius of the architect. Gradually our street architecture is becoming at once more convenient and more picturesque.

M. Charles Garnier, the architect of the new Opera House, in the course of an interesting series of papers he is now contributing to the *Moniteur*, on Architecture and the Arts connected with it, takes a more generous tone, but nevertheless thinks it desirable to mention by name only one exhibitor. What Great Britain has sent, he correctly enough says, are for the most part water-colour drawings and perspective views of buildings proposed or executed, and not architects' drawings. But this admitted, the great talent shown in these water-colours cannot be too much admired, and whatever may be the ability of our French architects to produce, it would be difficult for them to compete in the mode of setting forth with our colleagues beyond sea. All designs being remarkable, M. Garnier continues, it is nearly impossible to class them: the weakest are nevertheless beautiful. As to the style employed, it does not vary much, and, little as English architects are wanting in imagination, they still live, to some extent, on a passed architecture where the Gothic type rules, but it is a type peculiar to England. To sum up, he continues, much as we may regret the absence of plans and geometrical drawings, and that the architecture of Great Britain is represented only by water-colour sketches and perspectives, one is forced to acknowledge that this collection does the greatest honour to the artists who have contributed to it.

ON THE INFLUENCE OF SOME CONTEMPORARY WRITERS ON ARCHITECTURE OF THE DAY.*

THE revival of Art, and especially Ecclesiastical Art, in England, is no doubt due, in great measure, to the Christian feeling of the country. I mean by this the deep religious feeling of the various religious bodies in this land, especially of the English Church. The Church, perhaps, in a higher measure than any other body, can take advantage of that earnest sympathy for Christian union, which, in spite of many discouragements, must be looked upon as one of the most cheering signs of the times.

It is the fact, however, that not merely in Christian but in Heathen lands the influence of philosophical and other writings in moulding the forms of external art has been fully recognised, while the converse—I mean, the effect of external beauty upon the moral nature of man—has been equally acknowledged in all ages.

The susceptible disposition of the Greeks exemplifies both these currents of human thought and human art. We have their actual imagination endowing wood and stream and flower with divine attributes and human form. We have their philosophy in its turn influencing human

* By Sir Walter C. James, Bart. Read at the Architectural Exhibition Society.

affairs and poetical sculpture springing up, as it were, the natural product of divine poetry.

We think too little of these things, too little of the indirect impetus which philosophy gives to the tendencies of an age, too little of the indirect modes in which all we see and hear affects us. The object of the present lecture is twofold: to exhibit, in the first place, the influence of mind upon matter; and in the second, to give a few examples of the effect of matter upon mind; to show how fine writing is connected with fine art, especially with fine architecture; and, again, to trace the influence of a noble style of building, in creating noble thoughts, and making a really noble man.

The great wars, which followed the French revolution, produced an injurious effect upon the arts in Europe, specially, perhaps, in England. What really happened was the more intense envelopment of an insular character. The reign of George III. was decidedly unfruitful in great architects. The name of Chambers alone is handed down to posterity as worthy of remembrance. In the other arts I am inclined to think scant justice is done to the conclusion of the last and beginning of the present century. Sir Joshua Reynolds is sufficient to immortalize the era in which he lived; but with Reynolds were associated other great names, notably those of Gainsborough and Wilson, who almost founded (we may say) the British School of Painting. In sculpture and the ficile arts, the name of Wedgwood can never be forgotten; while, associated with his, we have the still greater and nobler genius of Flaxman, whose works, more, perhaps, than those of any other Englishman, have attained a continental—a world-wide reputation. Such artists could not have been produced in a country (this is my theory) wholly destitute, as it is sometimes represented to have been, of taste for the fine arts. At the period to which I allude, the author of "Anastasis" was furnishing his house, and writing his learned works on the costume of the ancients; Beckford was building Fonthill; the poet Rogers was gathering about him that select collection of pictures for which all who knew the author of the "Pleasures of Memory" have the tenderest regard. Here stood furniture made by the hand of Chantry, while he was yet a journeyman carpenter. Here the young artist, whatever his speciality, was sure of a kindly and gentle welcome from one whose refined and gentle nature made him not only the kindest but best of judges.

When the revolutionary wars ended, the artists of England were hardly known; not at all appreciated upon the continent. And this to a very great degree is still the case.

In France, or Italy, or Germany, the names of Reynolds, of Gainsborough, of Wilson, are certainly not household words, and it has been reserved for the genius of Ruskin to draw out into full daylight the merits of that great landscape-painter, who, at the period to which I allude, was beginning to give proofs of his transcendent genius, and, as it were, to remodel the art of the landscape-painter.

With regard to architecture our efforts were futile. In this day of small things, however, Rickman and Britton, and the elder Pugin, were studying and collecting materials of rare value, the full importance of which could hardly become known till after their deaths. The weight of taxation, which accumulated debt never fails to produce, was a serious hindrance to building, and the first decade of the present century hardly boasts a single edifice of any importance. The proprietary chapel was the fashionable "place of worship;" and, I think, there is a letter in Gisborne's correspondence with Wilberforce in which the former says that, "having been solicited to aid in the formation of a parochial district, and the erection of a new church, the subject was one entirely new to him, and he could not tax his memory with any demand of a like nature." I wonder whether there is in this day any churchman who has come to years of discretion, and of religious character, who could with truth venture upon such an avowal.

It is a striking, though quite to be expected fact, that with peace the arts of peace began to revive. A taste for archeological pursuits has always been congenial to so aristocratic a nation as the English; and from the days of Selden and Camden the "painful antiquary" has always been a character much respected among us. The wide popularity, however, of the architecture of the Middle Ages, and of "Mediævalism" in general, which accompanied the peace, must be

ascribed to the works of one appropriately called the "Great Wizard of the North." With every detail of castellated work Sir Walter Scott had a most intimate acquaintance, and probably neither Hudson Turner nor Hartsorn could better give the details of a Mediæval fortress than our Scottish novelist. Sir Walter Scott, however, was not a warm churchman, and in ecclesiastical subjects probably less at home than in Border history or romance. Yet, what can be more eloquent than many of his descriptions of Gothic minster or moonlit ruin. Take, for instance, the celebrated lines on Melrose Abbey:—

"If thou wouldst view fair Melrose aight,
Go visit it by the pale moonlight,
For the gay beams of lightsome day
Gild but to flout the ruins grey;
When the broken arches are black in night
And each shafted o'ertop glimmers white;
When the cold light's succorless shower
Streams on the ruin'd central tower;
When buttress and buttress alternately
Seem framed of ebon and ivory;
When silver eaves the imagery,
And the scrolls that teach thee live to lie die;
When distant Tweed is heard to rave,
And the owlet to hoot o'er the dead man's grave;
Then go,—but go alone the while
To view St. David's ruin'd pile,
And home returning, soothingly swear
Never was scene so sad and fair."

Even Natro presented herself to the poet in the garb of castle and spire, as is well shown in these beautiful verses on the Trossachs, which we all remember:—

"Each purple peak, each flinty spire
Was bathed in floods of firing fire;
But not a setting sun could glow
Within the dark ravines below;
Where twined the path in shadow hid
Round many a rocky pyramid,
Shooting abruptly from the side
Its thunder-splitter'd pinnacle
Round many an insulated mass,
The native bulwarks of the pass,
Huge as the tower which builders vain
Presumptuously piled on Shinar's plain,
The rocky summits, split and rent,
Form'd turret, dome, or bastlement,
Or seem'd fantastically set
With cupola or minaret,
Wild crests as Pagod ever deck'd,
Or maque of Eastern architect,
Nor were those earthborn castles bare,
Nor lack'd they many a banner fair;
For from their shiver'd brows display'd
Far o'er the unfathomable glades,
All twinkling with the dew drops' sheen,
The brier-rose in streamers green,
And creeping shrubs of thousand dyes,
Waved in the west wind's summer skies."

These lines, I think, show with what pleasure Scott must have noted that remarkable feature of Mediæval building, the sky-outline, admirably adapted as it is to contrast with the fleecy character and rounded forms of our clouds, and of which we have such splendid examples in the towers and keep of many a castellated castle, and in the lofty spires of many a noble minster. Any young man, however, who wishes to see the difference between the man of imagination and the man of practical knowledge, need only visit Abbotsoford; for, notwithstanding the considerable sums spent upon it from time to time, it must be pronounced a failure,—built twenty years before its due time, and characterized by the miserable insignificance of what is called "villa Gothic." Whatever is worth doing at all, is worth doing well,—a maxim sadly forgotten by those who attempt to combine the bulk and grandeur of the old castle with the conveniences and prettinesses of a modern house. I do not mean to say the combination is impossible. Those who possess such lordly castles as Alnwick or Raby do right, unquestionably, in living in them and turning them as best they may to the uses of social life. It is a difficult thing to rear such buildings anew, when the warlike purposes to which they were turned are to be numbered among things of the past. Nothing can be more noble or elevating than a real relic of antiquity—nothing meaner or more contemptible than an artificial ruin.

There is, then, a preliminary fitness in the English mind to create for itself a style of architecture at least founded upon the Mediæval styles. The glorious traditions of our history and the literature at the beginning of the century matured that fitness. These, however, were but indirect encouragements. It remained for men of architectural talent to put, as it were, the torch to the pile, and to develop buildings worthy of the age and country. Before, however, I can enter all at large upon the merits of those who have directed the architectural movement of the day, I must say a few words,—and they shall only be few,—upon the state of religious thought, which powerfully contributed to bring about the taste for building, the origin of which it is my duty to investigate.

I need not say I allude to the great religious movement which, beginning thirty years ago, has, as it were, popularised Church teaching. I venture to remark that, while "preaching" alone was much appreciated among us, there was little need of splendour in our ritual or in our churches. Self-glorification might well be attributed to the clergyman who wished to raise a tabernacle, the chief object of which was to display his own powers of oratory; but when, in addition to the idea of preaching, the still greater idea of a common and catholic worship was superadded, it then became obvious that not the glory of the preacher, still less the comfort of the auditory, was to take the first place, but rather those rites which, "*in honorem Dei*," have always held the first place in the church of God, and which require, indeed, decency and order for their fitting celebration, and of which the effect is ever augmented by glory and beauty.

As the air is full of seeds, which do not prosper or germinate till they find an appropriate resting-place,—a nest, as it were, in which to place their habitation,—so with "art-ideas" it is not till the public mind has nursed them that they expand into maturity. The splendour of Leo X. produced a Raffaele and a Michelangelo. Each age, unlike its predecessor, produces its own work; each work, as the case may be, is but the child of the parental and first idea.

The England, then, of the present century, has all the elements which go to make a country great in art;—an enterprising and intelligent people, a prosperous commerce, a taste for antiquity, and perhaps more than all, strong religious sentiment. Among the individuals, however, who have brought this feeling into active energy no two can be named more remarkable, and yet more different, than Pugin and Ruskin. The publication of two lectures delivered at St. Mary Oscott, defining the true principles of the Pointed style, may be considered an era of some importance in the revival. With scientific precision Pugin proceeds, laying down the rule,—

1st. That there should be no features about a building which are not necessary for convenience, construction, or propriety.

2nd. That the ornament should consist of the enrichment of the essential construction of the building.

To the neglect of one or other of these rules, he adds, is due all the bad architecture of the present time.

The scientific precision and clear language of these definitions naturally astonished the public, brought up, as they at that time were in the belief, that "Gothic" was only another term for barbarous architecture,—a term of reproach for one or more kinds of architecture which prevailed during the Middle Ages. Mr. Evelyn, quoted by our great architect Sir Christopher Wren, writes in his *Parentalia*,—"Gothic architecture is a congestion of heavy, dark, melancholy, monkish piles; and again, "The Goths and Vandals have demolished the Greek and Roman architecture, introduced in its stead a certain fantastical and licentious manner of building, which we have since called *Moderu Gothicu*, of the greatest industry and expensive carving, full of fret and lamentable imagery, sparing neither pains nor cost." And to these opinions Sir Christopher Wren assented; indeed, he himself, speaking generally of Gothic architecture, calls it "mountains of stone; vast gigantic buildings not deserving of the name of architecture;" and Horace Walpole, with a supercilious admiration akin to contempt, says, "The pointed arch, that peculiarity of Gothic architecture, was certainly intended as an improvement on the circular; and the men who had not the happiness of lighting on the simplicity and proportion of the Greek orders were, however, so lucky as to strike out a thousand graces and effects, which rendered their buildings magnificent yet genteel, vast yet light, venerable, and picturesque." We certainly in this day should think it a very strange phrase to speak of a "genteel" cathedral.

When men inquire who invented Gothic buildings, they might as well ask who invented bad Latin? The former was a corruption of the Roman architecture as the latter was of the Roman language. Both were debased in barbarous ages, both were refined as the age polished itself, but neither was restored to the original standard. Beautiful Gothic architecture was engrained on Saxon deformity, and pure Italian succeeded to vitiated Latin." Again, "one must have taste to be sensible of the beauties of Grecian architecture; one only wants passions to feel Gothic." Strange as these sentiments

appear now, they are hardly so strange as the sad disfigurements by which many of our noblest temples and edifices were debased. Many were altered, and, unhappily, not a few entirely destroyed. I question much whether the zeal of the Reformer, or the Puritan, actuated by a good honest faith, has been so fatal to the arts as the ignorance of our immediate forefathers. The fanatic has done much evil: perhaps the churchwarden may have done more.

Towards the close of the last century the ingenious Bishop Warburton revived or perhaps originated what we may call the "Avenue theory" of Gothic architecture. Two systems prevailed in his day,—one deriving Gothic architecture from the Northern Goths, the other from the Eastern Saracens. Attempting to combine the two systems, he says,—“When the Goths had conquered Spain, and the religion of the old Christian inhabitants had inflamed their piety, they struck out a new species of architecture, unknown to Greece and Rome; for this Northern people having been accustomed, during the gloom of Paganism, to worship the deity in groves, when their new religion required covered edifices, they ingeniously projected to make them resemble groves, at once intruding their own prejudices and providing for their present conveniences, by a cool receptacle in a sultry climate, with the assistance of Saracen architects, whose exotic style of building suited their purpose.

When we see the crude and ignorant ideas thus prevalent, little more than half a century ago on the subject, we cease to wonder that the Pointed style of architecture has amongst so many enemies, that it has had to contend against the prejudices of many in high places, including such great names as Peel and Palmerston.

It was, I repeat, a matter of no slight importance that a man like Pugin should have been raised up, at the period to which I allude, to show as clearly as he has done that the Mediæval architects are guided not merely by monkish fancies, but by strong sense, and a knowledge of mechanical principles; his exposition of the suitability of high-pitched-roofs to the northern climate, in which we live, has always struck me as peculiarly happy.

“The pitch of roof in Pointed architecture,” he writes, “is another subject on which some useful observations may be made. It will be found, on examination, that the most beautiful pitch of a roof or eave-end is an inclination sufficiently steep to throw off snow without giving the slate or lead covering too perpendicular a strain, which is formed by two sides of an equilateral triangle. If the pitch be increased, the gable appears either painfully acute or too widely spread. All really beautiful forms in architecture are based on the soundest principles of utility.

“Practical men know that flat-pitched roofs, which are exceedingly ugly in appearance, are also but ill-calculated to resist the action of weather. In slated roofs especially, gales of wind actually blow under and uplift the covering. When the pitch is increased to its proper elevation, the whole pressure of the wind is lateral, and forces the covering closer to the roof.”

The elevation gained by a high-pitched roof forms one of the most remarkable features of the Pointed style. It is, however, worthy of passing remark that Mr. Ruskin, in his studied comparisons between Northern and Italian Gothic, giving, as he does, the undoubted preference to the latter, never once alludes to the great glory and beauty of the northern roofs, which are, *par excellence*, the most remarkable characteristic of the style, and that, too, whether we look at them externally or internally—externally as improving and heightening the sky-line, internally as a mere covering to the groined vault, with its manifold interlacings, the very triumph of the architect's skill.

The theory of the roof is applied by Pugin with much ingenuity to the spire and the pinnacle. It may be well, before concluding this passing notice of his work, to quote it:—

“In the third place, we will proceed to the use of pinnacles and spiral terminations. I have little doubt that pinnacles are considered by the majority of persons as mere ornamental excrescences, introduced solely for picturesque effect. The very reverse of this is the case, and I shall be able to show you that their introduction is based on the soundest principles of construction and design. They should be regarded as answering a double intention, both mystical and natural. Their mystical intention is like other vertical lines and terminations in Christian architecture to represent an emblem of the Resurrection. Their natural intention is that of an upper weathering to throw off rain. The most useful covering for this purpose is of the spiral form: only let such a form be decorated with a finial and crockets, and we have attained a perfect pinnacle. Now the spires, pinnacles, and which these floriated tops form the terminations, are all erected to answer a useful purpose when they arise from the tops of wall-buttresses.”

They serve as piers to strengthen the parapet, which would be exceedingly weak without some such support.

Their utility on the great piers which resist the flying buttresses is obvious. At the bases of great spires the clusters of pinnacles are also placed to increase strength and resistance; in short, wherever pinnacles are placed in pure Pointed architecture, they will be found, on examination, to fulfil a useful end.

The same remarks apply to the crocketed or floriated terminations of floriated and other turrets, which are in fact ornamented roofs; and I need hardly remark, that turrets were not carried up without legitimate reason.

Every tower built during the pure style of Pointed architecture, either was, or was intended to be, surmounted with a spire, which is the natural covering for a tower. A flat roof is both contrary to the spirit of the style, and it is also practically bad. There is no instance before the year 1400, of a church tower being erected without the intention at least of being covered or surmounted by a spire; and those towers antecedent to that period which we find without such terminations, have either been left incomplete for want of funds, weakness in the substructure, or some casual impediment; or the spires, which were often of timber, covered with lead, have been pulled down for the sake of their material. In fine, when towers were erected with flat embattled tops, Christian architecture was on the decline, and the omission of the ancient and appropriate termination was strong evidence of that fact.

Thus Pugin runs through the various features of the Pointed style in rapid succession, dilating upon each with consummate knowledge and the highest feeling for art.

From Pugin I pass by an abrupt transition to a writer of more than ordinary genius, but of a very different stamp. I allude to John Ruskin. Yet are there points of similarity. Both have been endowed with that sensitive and enthusiastic temperament which, as it were, drinks in the beautiful with the utmost avidity. Both had intellect to fathom the principles from which beauty is derived. In addition to this remarkable sensibility for the beautiful, both had a cultivated eye, for they were trained and finished architectural draughtsmen. The admirable illustrations which adorn Ruskin's great work, “The Stones of Venice,” are familiar to the art-world; yet I may add that it was my lot, as a young man, to see at Christ Church, Oxford, many of his earliest works. Young as he then was, nothing can exceed their elaborate care and artistic finish. Pugin's son has done good service to the memory of his father in photographing many hundreds of his beautiful sketches. I can pass no higher eulogium on them than that, while they never lose sight of his own great object,—the revival of the Pointed or Middle Pointed style in its true grandeur and proportions,—they show the deepest love for art as art. It is quite clear from such efforts that the man who became so eminent an architect world, under other circumstances, have become a painter equally eminent. There is hardly a sketch among them which does not of itself form a picture.

This gifted alike by nature with rare gifts, and a sense of the beautiful so fine as almost to touch upon the borders of the morbid (gifts which, in combination, amount nearly to a true definition of artistic genius), these two men arrived at theories with regard to art very opposite to, if not contradictory of, each other.

Pugin fixed his faith, strong and ardent, upon that phase of Christian art which is called Decorated or Middle Pointed. He looked upon it as not a question of relative excellence, but of absolute perfection. He says, “if we view Pointed architecture in its true light as Christian art, as the faith itself is in perfect so are the principles on which it is founded. We may, indeed, improve in mechanical contrivances to expedite its execution, we may even increase its scale and grandeur, but we can never successfully deviate one tittle from the spirit and principles of Pointed architecture. We must rest content to follow, not to lead. We may, indeed, widen the road which our Catholic forefathers formed, but we can never depart from their track without the certainty of failure being the result of our presumption.”

It would not, I think, be difficult to show that this is very serious exaggeration. The vanishing of a fourteenth-century church poised high in air, with its wonderful tracery, its hexapartite groining, can hardly be defamed as consistent with true principles of taste. It is rather a magnificent, not to say exaggerated, “*tour de force*,” than a legitimate exercise of skill, in

which not only ought the means to be nicely adapted to the end, but the end is beautiful because it is adapted to its purpose. Now, Gothic groining is by no means, in this respect, praiseworthy. It is in no sense a true roof. “At St. Peter's,” observes Pugin himself, “the dome is the actual covering of the building; at St. Paul's, London, the dome that is seen is not the dome of the church, but a mere construction for effect.” The same reasoning applies to the vaults of our Gothic cathedrals. They are structures for effect, and never the actual coverings of the building, which are mostly timber roofs covered with lead, forming an efficient protection to what without such cover would soon turn to decay. Again, we find frequently in the Decorated period shafts and pillars so scantily and ill-built, so far too narrow, that the architects have been compelled to abandon their original designs on account of the weakness of their supports. Hence it is, no doubt, that many of our cathedrals want to this day their central spire; while others are disfigured by the bulging of buttresses and artificial supports from pillar to pillar, enabling them thus to sustain the superincumbent weight.

But, if we disagree with Pugin in thinking the Middle Pointed style the acme, as it were, of true perfection, still less can we agree with Ruskin in that expression of the general inferiority of Northern to Southern work, in which his celebrated book on Venice abounds.

It is worth notice, that while Pugin considers “ornament or beauty to be attached with propriety only to such parts of a building as are truly useful,—bones, as it were, of a skeleton to be clothed with muscle, flesh, and bright skin,—Ruskin looks upon beauty essentially as an adjunct,—as a super-addition, in which we may revel, as it were, “*ad libitum*.”

“The first thing we have to ask of the decorator,” says Ruskin, “is that it should indicate strong liking, and that honestly. It matters not so much what the thing is, as that the builder should really love it and enjoy it, and say so plainly. The architect of Bourges Cathedral liked Hawthorns, so he has covered his porch with Hawthorn. It is a perfect Niche of May. Never was such Hawthorn. You would try to gather forthwith but for fear of being pricked. The old Lombard architects liked hunting, so they covered their work with horses and hounds, or men blowing trumpets two yards long. The base Renaissance architects of Venice liked masquerade and fiddling, so they covered their work with comic masks and musical instruments. Even that was better than our English way of liking nothing, and professing to like triglyphs.”

“The second requirement in decoration is the sign of our liking the right thing; and the right thing to be liked is God's work, which He made for our delight and contentment in this world; and all noble ornamentation is an expression of our delight in God's work.”

Between these two theories it may be asked, “Is there no true resting-place?” To say that we must ornament only the constructive parts of a building, seems open to some objection. I hardly know whether it would be thought correct to say that the angle is a constructive “member” of a building in the sense in which Pugin speaks of construction, or the ridge of a roof, or the wall-space generally; yet all these are very appropriate places for ornament,—quite as much so, one may say, as the jambs of a window, or the finials of a pinnacle. Still less do we like the theory of “revelling” in ornament. Appropriate ornament seems to be that which selects some point, or points, for special glory and beauty, leaving other parts comparatively plain. This is nature's plan. She selects her point—the flower; or in the human form, the face; and then moulds, as it were, secondary objects into her general design, subordinating them to some few, and often to one single grand object, upon which she lavishes all her concentrated treasures. Thus, in a Christian Church the chancel is and ever must be the “flower” upon which most skill is to be spent. Here we have the altar, its attendant priests, its reredos, its rich and traceried windows. In a castle there probably would be one single apartment, the banquet-hall, or saloon, to which the chief attention is directed, where all else is rude and almost barbarous. In a modern dwelling-house, the drawing-room, or chief sitting-room, is the most costly, as being devoted to the most costly purposes. In every work of art there is a central object—a jewel, as it were, the central stone of a diadem or ring, to which other parts contribute. Here it is that most pains should be spent; just as the petals of the rose are more delicate and more highly coloured than the leaf of the rose-tree. I venture to throw out this theory as taking a *via media* between Pugin's view of ornamenting only those parts of a building which are constructive, and Ruskin's more licentious view of scattering beauty with a liberal hand wherever fancy dictates.

What can be stranger, or, indeed, more unreasonable, than the following passage:—

"Then as regards decoration, I want you only to consult your own natural choice and liking; but you will assuredly like the right thing if you suffer your natural instincts to lead you. Half the evil in this world comes from people not knowing what they do like, not deliberately setting themselves to find out what they really enjoy. All people enjoy giving away money, for instance; they don't know that. They rather think they like keeping it,—and they do keep it, under this false impression, often to their great discomfort. Everybody likes to do good, but not one in a hundred finds this out. Multitudes think they like to do evil; yet no man ever really enjoyed doing evil since God made the world."

It is a pity that moral reflections, of so crude and questionable a character, should disfigure the works of so admirable a critic; but the fault of John Ruskin as a writer unquestionably is an overweening self-esteem.

Nallus additctus furure in verba magistri. He trusts implicitly in his own powers, not unlike a writer who, in a very different province of thought, has made himself a reputation second to none.—I allude to "Carlyle." Ruskin in his own way is, like Carlyle, an intense hero-worshipper; "Turner, among the landscape painters; "Fra Angelico, and Giotto," among the religious; Titian, and to a still greater degree, "Tintoret," among the colourists; Rembrandt among the Dutch; Italian Gothic among the architectural styles. These are his gods, and very worthy divinities they are; grand and solemn figures which from age to age we gaze upon with reverential awe. But woe to those who question their entire supremacy; woe to that man who is not content to sit at the feet of our modern Gamaliel and listen to his rhapsodies,—whether a rhapsody in applause of a Madonna by Fra Angelico or a "Phryne" by Turner.

Tennyson has, I think, with his universal and glowing sympathies, influenced us too much in this direction. The hurry in which we live does so much more: I mean in the direction of an abundant applause to art in every phase; to literature of all kinds, without a decided and masculine preference for any. It leads to a flimsy earnestness; to a small but not lasting enthusiasm. It leads men instead of doing one thing well to attempt to do twenty things; the result of which is that they are ill-done. It is a warning to all young men, and not least to professional men. If we look back to the days of Queen Anne, we find Sir Christopher Wren, Vanbrugh, and others despising Gothic or Pointed architecture; but then they were enthusiastic in their own line. Now-a-days we have artists equally ready to turn their hands to anything,—to Greek or Gothic, or Italian, the beauties of the Parthenon, or the beauties of the Alhambra. In this activity of thought it is surely very desirable to aim at something definitely to limit our designs, and to frame our purposes, so adapted to the spirit of the age as not to be without a true reverential feeling for the past.*

THE LATE SAMUEL CUNDY, MASON.

ALL who remember Pimlico when "the Queen's House" (alias Buckingham House) was standing, must well remember some of the leading families in that George IV.,—1820-1830,—outlying "off the stones" district, when the nearest letter-box for the reception of letters, franked or unfranked, was at a grocer's in St. James's-street, over against the Thatched House. Many a letter has the writer carried from Eccleston-street and Lower Belgrave-place, through Buckingham-gate, and by the stable-yard, through St. James's Palace, to the grocer's post-box in St. James's-street, some three or four doors above Mr. Sam's library and box and stall ticket office. Why, we remember the overflow of the Thames in 1821, when "the cuts" inundated "The Willow-walk," and Jerry Abershaw the highwayman's cottage (he adorned Wimbledon-common in chains), and Pimliconians were seen to carry pigs with them on horseback, to escape being "swept away with the flood." In the days we refer to Pimlico was without a hackney-coach stand; a bellman with a bag collected general-post letters, for which he had his perquisite of a penny himself per letter.

We have been led into these old-day remembrances by hearing the somewhat unexpected news of the death of one who belonged to a family of some note in Pimlico, when Pimlico was an isolated environ or suburb of West-end

London; bound on the north by the Fire Fields, where robbers were wont to lie in wait; on the south by a morass, with "cuts" belonging to the Chelsea Waterworks; on the east by unlighted Buckingham Gate and St. James's Park; and on the west by the far-famed Chelsea Broom-house. We allude to the family of the Cundys, who were largely connected with the Earls of Grosvenor, to whom Pimlico belonged when it was of little comparative value.

We have many pleasant recollections of the place. There Chantry used to play at quoits with his men,—foreman, modellers, sculptors, and masons,—and being a good shot (in spite of his left-shouldered gun and the want of his right eye, though the loss was in no way apparent), he could "ring" and "cut out" with a craft and certainty which many envied.

Death has just taken away Mr. Samuel Cundy, mason, known by his portly person, his always smiling lips, and rosy cheeks, beyond Pimlico and Millbank, "The Mason's Arms" and "The Rmle and Compasses." He was the son of that Mr. Cundy who was of note in Pimlico, and who was killed in Waterloo-place while on horseback by the pole of a butcher's cart.

Samuel Cundy (whose death we mention) was born in Pimlico about the year 1816. His education was uncertain. He early took to the mason's mallet and apron, and was an expert when very young with his chisel.*

His restoration—in stone, with mosaic and gilding—of the Westminster Abbey tomb of Philippa, Queen of Edward III., will be in the memory of all who remember the Hyde-park Exhibition of 1851. It was done with taste and the true antiquarian feeling of an heraldic mason.

Mr. Cundy's skill with his line and rule attracted the attention of a judge not readily mistaken, Mr. G. G. Scott (now R.A.), who secured his services. He wrought as foreman for him at the church of St. Stephen in St. Alban's; and afterwards at the noble Abbey, St. Alban's, until the subscriptions were exhausted, and the work was at a full stop. The thorough restoration of the church of St. Michael, the church in which Lord Bacon is buried, he had much at heart. We have heard him discourse "about it—and about it" most pleasantly on the spot. He understood his subject, and had the art to make his listeners understand what he said.

RANSOME'S CONCRETE STONE.

THE Patent Concrete Stone Company have removed their works from Ipswich to a commodious factory at East Greenwich, including two workshops, respectively 145 ft. long by 100 ft. in width, and 108 ft. long by the same width, with furnaces, boilers, steam-engine, hot baths and shower baths,—the first to saturate the blocks with chloride of calcium, the second to wash out the salt crystals left by the recombination. To see the new works and the processes going on in them, about 100 gentlemen interested in such matters, including a number of architects and engineers, assembled there on Friday, the 21st, when Mr. Fredk. Ransome explained the system to them. We have before now done this, but we may repeat in brief that the material is made, by preference, of finely-sifted dry sand. A small proportion of pulverized lime is added to the sand, to give the silicate of stone produced in the manufacture the necessary closeness of surface for its cementing action. To every hushel of the mixture about one gallon of prepared silicate of soda (melted flint) is added, and the whole mass is then thoroughly mixed and incorporated in a simple mill, from which it is taken—a putty-like plastic substance—in a fit condition for the moulds. The mixture of each charge of the mill occupies only from three to four minutes, and is remarkably complete.

The moulding is, for the greater part, done in wooden moulds, but in some cases metal, and in others plaster of Paris, is employed. The prepared mixture is pressed into the mould by means of suitable tools provided for that purpose. A peculiarity of this material is, that mouldings retain the precise form in which they emerge from the mould, without enlargement, contraction, cracking, or warping, which is not the case with materials that are burnt.

The men, when they have taken their work from the moulds, place it upon a bench, where, by means of a flexible hose, it is drenched

with a solution of chloride of calcium, in a cold state. The chloride of calcium acts rapidly upon the silicate of soda, and solidifies the mass. The castings are next conveyed upon trucks to the adjoining room, where they are immersed in cisterns containing a solution of chloride of calcium, having a specific gravity of about 1.400, and a temperature of about 212°. The chemical action between the silicate of soda and the chloride of calcium is consummated in this stage, and results in the formation of what is thought to be an insoluble silicate of lime, which envelopes and joins all the particles of sand, gravel, chalk, detritus of stone, or other mineral base, of which the block or casting is composed. After the work has been thoroughly saturated by the boiling calcium, all that remains to complete the process is to wash away the chloride of sodium, or common salt, which has been evolved by the combination of the sodium with the chloride. This is done by means of troughs with perforated bottoms, that discharge a copious shower-bath upon the castings.

Some experiments were made to show the strength of the concrete stone, as to its power to resist both pressure and pulling. A 4-in. cube, made fourteen days previously, remained intact under 35 tons, and was crushed by 40 tons. A second cube, of the same size and age, was damaged at the edges by 35 tons, and was crushed by 44 tons. Of its strength, however, there is no doubt. The question, of course, is what effect long exposure to atmospheric changes and the weather may have. Very satisfactory opinions were expressed by several of the visitors who had looked into the process and had had some experience of the result. The manufacture is in full activity, and a large amount of work under the direction of various architects is being produced.

MOSAICS.*

I HAVE been asked to say a few words on the use of mosaics. Recent inventions have so far reduced the price of them as to place them within our reach, in many instances in which, only a few years since, they would have been quite beyond it; and the splendid effects which they assist us in producing tend, naturally, to their employment to a large extent. But, as in all cases of vivid colouring, there arises the fear that so useful an aid in decoration may be made the means of overstrained effect, and thus produce a gorgeous deformity in place of beauty.

It happens, too, that there is now been for many centuries so rare, that there is really very little opportunity of studying the actual work itself in any place north of Italy.

A short half-hour or so will, therefore, scarcely be wasted in considering the subject of the various kinds of mosaics—how they were used, and how combined with each other, and with other kinds of decoration, so as to produce an agreeable and effective whole. We may consider them as being divided into those used for pavements; walls; and ceilings, or other roof coverings.

I shall say little by way of description of the several kinds. They are so well known to most, that the detail would have little of interest; and I shall, therefore, say only just enough to recall to memory the precise kind to which I shall refer.

I begin with the pavements.

The earliest kind of these whereof remains of any great size exist is the Roman, and we have large examples of it both in Britain and France. In scarcely any case, however, do the walls there exist of sufficient height to show the kind of decoration used in combination with these pavements. But in many parts of Southern Italy, Rome, and Pompeii, especially, we get it exactly.

The Roman pavements were of several kinds. That of which we have, perhaps, the finest specimens was the simplest (*opus sectile*), and was of geometrical pattern, formed of pieces of marble of different sizes and colour. One of the most noted specimens of this is at the church of St. Pietro ad Vincula, at Rome. It was found at the Baths of Titus, and is quite different from the kind that we ordinarily see in Medieval work. There is none of the large circular pattern, and very little of the rich filling in with

* To be continued.

* He restored the tower of Fulham Church, in Middlesex, under the direction, in early days, of the conductor of this Journal.

* By Professor Hayter Lewis, Read at the Architecture Association.

small pieces, as in the Alexandrine; but it is made of geometrical figures, formed of pieces of light marble, usually nine inches square or so, with filling-in pieces of a darker kind, and of smaller size, forming centres or borders. The whole is of a more even and less prominent pattern than the Alexandrine.

The other kind, best known out of Italy at least, is that made of small cubes of differently coloured materials (*tesselatum*), of which we have very many good examples in our Museum. These cubes were, generally, arranged also in geometrical patterns, in scrolls, frets, squares, circles, &c. Often, too, there are representations of animal life, human faces and figures, fruit, fish, &c. (*vermiculatum*). But these representations are roughly done, and are evidently mere bold studies for giving a good effect. These pavements were, in fact, generally rather coarse in execution, and not intended to do more than give a pleasing effect of colour. To make these pictures was certainly not the object. They were admirable things to walk on, so far as their structure was concerned, being somewhat rough and not at all slippery.

As to the question of the propriety of representing the human face, fruit, and so on in positions, wherein they must have constantly been trodden on, I say nothing here: that is another part of the subject. I am speaking now simply of decoration. But there are some examples in which the workmanship was of a much higher kind; one of the most noted being, perhaps, the famous battle mosaic found in the House of the Faun at Pompeii. This is executed in very small pieces with great care, and the result is a really beautiful picture, with such outlines and colouring as one could, at first, scarcely believe could be produced by the natural materials employed. A somewhat rude example of Medieval date, and so far rather uncommon, exists in the mosaic of the knights in S. Lorenzo at Rome. These are made of little cubes, varying from $\frac{1}{4}$ in. to $\frac{1}{2}$ in. square according to the delicacy required in the several parts. The whole are of marble, the red being of porphyry, the green verd antique, &c. But this luxury of materials is to a considerable extent exceptional. The more usual substances were of a much more ordinary kind. Take one case in England,—Cirencester, *p. 6.*, as described by Mr. Wright. The white was of chalk, but very little of this was used on account of its softness, and the ground was put in with a cream colour; the material being a fine-grained freestone. The grey was of the same stone, slightly altered by heat. The yellow was from an oolite of the neighbourhood, chocolate from a variety of the old red sandstone; slate from the lower lias stones; and the light and dark, red and black, were obtained by burning different kinds of clays at different heats.

Now, you will see from this description that a pavement so composed could have had as its general tone of colour little more than a series of half tints, with, every now and then, emphasis given to a particular part by a few cubes of glass being introduced. The general tone of colour was, in fact, even lower than what we might expect from my description, as the pieces of which the pavement was composed were very small and put together with tolerably thick cement joints, and the cement used in them was not coloured in my way; so that, probably, about one-eighth of the whole surface was made up of the light brown cement, assisting very materially to subdue the effect of even the very moderate colouring used.

It is supposed that the pavements were, to a certain extent, polished. If so, this must have been very slightly done, as the materials which I have named are too soft to have allowed of much gloss being given to them. We may take it, then, that as a rule, the floors used by the ancients presented a general mass of pleasing ornamentation, with just so much colouring as would serve as a sort of base for any decoration on the walls, but without being at all intrusive in itself.

With the architects of the early Christian times, those to whom are due the great basilican churches of Rome, Ravenna, &c., we get an altogether different class of paving,—I mean the Alexandrine. This seems to derive its name both from the emperor (Alexander) who introduced it into Rome, in the third century, and from the place whence he derived it, viz., Alexandria. It had been, no doubt, used in the East long before, and by the Pagans; but is so commonly found in the Christian churches, that it is almost identified with them. We have a

very early example of this in the famous Byzantine church of S. Vitale at Ravenna, and several others, though in fragments, in the various churches in Constantinople. One of the most characteristic specimens is from the S. Lorenzo frieze. This seems to be formed of circular slabs of marble, porphyry, and other coloured marbles or granites, taken as centres, with patterns in small mosaics, taken round these in geometrical forms, and imbedded in slabs of marble. The large centre circles are very irregular in outline—for what reason I am at a loss to account; but the sweeping lines of the small mosaics round them are truly struck, so that the borders are of very irregular width.

In this case, and in that of all (or nearly so) the Alexandrine mosaics, the whole of the materials are of a kind to bear a fine polish. The green is of verd antique, the red of porphyry, and the ground of white marble,—the whole undoubtedly of a much more gorgeous character than that of the ancient Roman pavement. But you must remember that the whole colouring was that of the actual materials used. There was nothing but Nature's own decoration, and you know well that this is never gaudy.

Examine a piece of verd antique or deep red porphyry, and you will find that it is little more than of a rich neutral tint,—nothing, for example, of the light green, blue, and red, of an artificially made tile. Then the marble ground, white enough when first laid down, became toned down to a rich stone-colour by the damp which rose to it from the earth on which it lay; and the whole series of patterns was lowered in brilliancy in the same way as the ancient Roman were, though not to the same extent, by each of the pieces which composed it being hedged in a brown cement, with joints which were often very wide and carelessly made; so that, when these pavements had the gloss slightly taken off them by time and wear, they must have formed a very beautiful pavement, of rich but subdued colouring, without a single piece of positive colour about them.

In their present state nothing can be more effective; and we see their effect as well now, probably, as when they were new, because the colouring to the walls and ceilings, then fresh, is now subdued as the pavements are. It is scarcely necessary to mention that there are a few specimens of this work in England, viz., at Westminster Abbey and at Canterbury; but they are on too small a scale to give a good idea of their general effect when used throughout the area of a large church. If we come down to later times amongst the works of the Medieval architects here and abroad, we get the same succession of subdued half-tints, however deep in tone they may be.

The actual mosaics, such as those used anciently, were little enough employed, either here or in France, in large masses. We have a kind of mosaic in the incised stones so often found, in France especially; but in general these were laid down in detached slabs, without any particular reference to the general effect. One of the most noted of these is that to the memory of the architect of Rheims Cathedral, which remains there perfect.

But there is another specimen at S. Remi, in the same town, filling up the whole of one chapel, or the general floor of it, showing its use in a more comprehensive way. This flooring is of stone, inlaid with lead, in various geometrical patterns, filled in with Christian symbols, &c., so that the general tone of colouring was very sombre indeed. Of somewhat of the same kind of effect were the very elegant pavements used in Italy, though at a later date.

These are simply composed of black and white marbles, inlaid in the most elegant patterns,—sometimes of figures, sometimes of scrollwork, a little sparkle being given to them by a few spots of red here and there: at the Baptistery and other edifices in Florence, also at Siena and many other noted churches, are very admirable specimens found.

This work has, of course, none of the richness of the Alexandrine paving, and its beauty depends upon the elegance of the outlines only.

It is altogether different with the paving used more particularly by the English Medieval architects. Their deep red and white glazed tiles are too well known to need description.

But you all know that, however bright these pavements would seem to be, judging from the description only of their colours, they really were only of a rich neutral tone; there was no bright artificial colouring beyond the richness which the deep yellow glaze gave, and the whole sur-

face of the pavement was simply of a dull red, contrasting with any stonework about it much as the deep red brickwork of Tudor mansions contrasts with the stonework of them.

The artificial bright reds, blues, and greens, were used only in exceptional parts to pick out and brighten some place as a chancel or a chapel, more vividly coloured than the rest; and, as a rule, the pavements in Medieval times, though deeper in general colour than the ancient, were less richly variegated in tints, and were, altogether, as little intrusive as a ground-work for the whole. Amongst the work abroad of this class I must beg you to note the paving of the cloisters of the Certosa at Pavia. The tiles are not figured, but merely inlaid in geometrical patterns.

We may, then, lay it down as a general rule, that, whether in ancient or Medieval times, the principle has been to make the paving so far ornamental as to be pleasing both in outline and tint, but not to use in it any such bright, artificial colours as to render it gaudy or overpowering in effect.

The next point is, how was the decoration of the walls arranged, so as to carry off the amount of colouring, which we find actually on the flooring? Now, it must be remembered, that the sides of a building, of whatever class, are sure to have in them a series of breaks and shadows, and effects of sunlight, such as are given by the doors, windows, pilasters, and so on; and if even stone be employed, it gets deeply tinted by time, so as, in itself, to oppose a varied effect to the plain unbroken surface of the paving.

But the ancients seem seldom to have trusted to that in their buildings of importance. From the nature of their climate, porticoes and columns were of more common use than with us; and when these were of marble, as they very often were, the richest paving was at once subdued by the large masses of marble starting from it. Very often this was carried still farther, and the whole walls lined with these marble slabs of costly kind and vivid colours.

Few of these remain, but enough to show the practice, if we even did not know it from descriptions. But any such course as this, beautiful though it might be, would be quite out of our ordinary means; and, however telling it might be, could scarcely satisfy the mind of a true artist, who must always rank the beauty produced by an effort of the mind before any which owes its fascination to the mere barbaric splendour of the material, however beautiful or costly.

That this feeling weighed with the ancients is most certain; and in the majority of cases preserved to us, the remains of their palaces or mansions have been found precious, not because of the costliness, but of the artistic beauty of their adornments. In England we have few vestiges left, only a part or so, in general, of decorated wall-surfaces above the pavements. But in Italy, in Pompeii, and Rome especially, there are vastly many which, year by year, are increasing in number.

From these we know that the houses of the Romans or Thesian Greeks (as those of Pompeii were) had the natural colour of the pavements altogether carried off and subdued by the most vivid artificial colouring that can be imagined.

The walls and columns alike were covered with the beautifully delicate white crystalline plaster, which surpassed the very marble itself in absolute purity of whiteness. And this plaster was then marked and divided into panels, and covered with delicate ornament in the most brilliant and powerful colours that have been ever used.

Colours were used not as mere auxiliaries to heighten the general effect of a more quiet general tint, but in large broad masses, edged round with borders of tints deeper but just as hold; and, where the mansion or the room was of a more ornate class, set off with a border or a centre piece which embodied the dreams of their elegant but licentious theology, and in forms of very loveliness. But all this was very superficial and fading. A damp wall, a piece of imperfect plaster, could wreck the finest fresco; and the ancients then brought to bear upon their wall decoration the same kind of work which they used more coarsely, though effectively, in their pavements.

Thus we arrive at the use of wall mosaics, of which we have many remains of exceeding beauty. They have been found *in situ*, as for example, in the walls of Cicero's villa, at mansions at Pozzerode, &c. The beautiful execution of these may be imagined by comparing them

with those of the modern brooches and other small pictures in mosaic. The ancient decorations of the walls were scarcely so delicate as these, yet yielded but little to those at Adrian's villa at Tivoli, where the heads of the figures were not more than two inches high, and beautifully clear; and in several specimens in the Vatican Museum, the mosaic of Masks, for example, the work is, perhaps, as beautiful as is to be found in any other, ancient or modern. One well-known mosaic, that of Pliny's doves, which has a world-wide fame and has been copied thousands of times, though of very small pieces, is not equal to the modern; but it is, nevertheless, a fine work of art. The precise position in which these mosaics was placed is not known. We may imagine, with great degree of probability, that they were used much as our pictures formerly were, when they were painted to fill up particular panels in a room, so as to form part of its general architectural effect, before the altogether modern fashion appeared of hanging them, *happazard*, on the mere surface of the walls, unconnected in design with them and with each other. In the descriptions left to us it is clear that they were considered (as they themselves would be sufficient to prove) as pictures or other such works of art were with us.

We may guess their effect from that of the mosaic pictures of more modern times, which now decorate S. Peter's, at Rome. These are so admirably copied in oil paintings (the Confession of S. Jerome being one of the most noted), that it is only when a bright reflection is thrown upon them that their mosaic workmanship is, unless quite close, detected. Yet the little bits of tesserae are, in the drapery, seldom less than $\frac{1}{2}$ in. square, and in the more delicate parts seldom more than $\frac{1}{4}$ in.; and I am not quite sure that some of the most delicate of the Medæval mosaics are not equal to them. There are some in S. Cosmo e Damiano, and in S. Giovanni Laterano, which approach very nearly to it, at least. The surface is rubbed to a perfectly even face, the joints made as close as possible, and the whole resolved into a surprising imitation of an oil-painting. It certainly has, too, a depth which only natural materials, polished, can give; quite different from that given by a mere superficial varnish. But, giving this work the utmost credit possible, it has little more effect than that of a painted panel, utterly inferior in splendour of elevation to what we know as the gold mosaics, and is easily brought into unison with the rest of the building, by gilding, gold shadows, or other accessories of an ordinary kind. The ceilings of St. Peter's, which harmonize admirably with these mosaics, are deeply coffered, the ground is gilt, the ornaments raised in white, and there is no colour whatever. Of course, such expensive work as this was not likely to be very common, and in most of the Basilican churches decoration of a much more simple kind was resorted to. Fresco, or distemper colouring, was that most used; and when we take into account the shadows, &c., of the walls, to which I have before alluded, it will easily be seen that pavement of the subdued tints employed could well harmonise with it; and so, in fact, it is found. But as my subject is the more expensive kind of mosaics, I resume the consideration of them only.

With the Byzantines we get some splendid examples of mosaic decoration. In no instance are they better shown than in the splendid work of our friends, Mr. Pullan and M. Texier. The pavements and wall linings were much as I have before described, and I need not dwell upon them. But they introduced, likewise, some kinds of inlaid work, not used, seemingly, before. It is found at S. Sofia, S. Vitale, S. Marco, and other Byzantine works, and consists in slightly relieving a pattern in marble, and filling up the ground with coloured cement,—the inlaid work, in fact, of our times. But the class of work with which the Byzantines were the most identified was the glass mosaic.

This was certainly used by the Romans, but it could have been so only partially, as the fragments are rare. It was of two kinds. That most commonly used, and to which I shall allude more particularly directly is composed of fragments of glass of various and irregular size, usually on a glass ground, and another made up likewise of small pieces of glass of the most vivid colour, arranged always in geometrical patterns (such as are used in Indian decorative mosaic work (such as are used in India), put together with the greatest care, the edges being very true and the joints close. Of this I speak first.

Now it is clear that such vivid colouring requires the greatest care in its use, and as it is very tempting for its intrinsic beauty, it will be necessary to study a little how it really was used by those the most accustomed to it.

So far as my recollection extends (for this paper has been a hurried one), it was used, with very few exceptions, for walls and columns in situations close to the eye, and these very sparingly indeed,—merely to heighten up some general mass of colour with lines of exceeding brilliancy, much as we see now the strongest or brightest colours for picking out a cornice or for a contrast with the general light tinting of a wall.

Two of the best examples which I had handy I give you, viz., the famous Ambro of S. Lorenzo at Rome, and the interior of the Castello di Zisa at Palermo. The first is formed of richly-coloured marbles as a ground-work, surrounded and set off with a framework, as it were, of the glass mosaics, which are twisted likewise, in the most graceful way, round the marble stand for the Paschal candle.

The Castello di Zisa was built by the Saracens, and is one of the most exquisite examples of colouring known. It is built in the form of a cross, the centre part having been originally open, and the arms arched over with the well-known honeycomb ornament. Opposite the entrance a little stream of water burst out from the side and floor in an ornamental channel through the paving, which is of marble.

In this paving occurs the only use, so far as I call to mind, of the glass mosaics in such a position. They form a slight edging to the little channel, and, by contrast with the changing tints of the water as it reflects the sky, this has a charming effect. But its brilliancy in such a position makes it very difficult to harmonize it with the walls or to prevent their effect being sacrificed to it. I look upon this pretty summer-house (for it was so on a large scale) as being as much worth study as almost any piece of work I know. We have not, of course, the same precious materials to work with, but we may produce the same sort of contrast in other ways. The walls are lined with marble, and at each angle is inserted a small shaft with a beautifully carved capital. This gave a bold effect above of light and shade. Then the walls were divided into panels by narrow borders of the glass mosaic, and, in one part, more marked than the rest, over the fountain this mosaic was increased to a much greater width, so as to give dignity to that part.

Then we have the delicate border, or the flat, even floor, kept down in point of decoration by the deeply-shadowed recesses and the angle columns, and sustained by the beautiful mosaics in the panels. The Saracens, we may assume, had decorated the honeycomb in their usual gorgeous way; and if this decoration remained (as no doubt it did) when the mosaics and the columns were added (in the eleventh century), it is impossible to imagine a more exquisite piece of colouring, or one more useful as a study in cases where richness of effect is required.

Before I come to the mosaic of all, the gold mosaic commonly used in the Medæval basilicas, I must just allude to a class seldom much noticed, but of a very gorgeous kind, viz., the Renaissance mosaics of Palermo, used exclusively for walls.

These are one mass of scroll-work, flowers, fruit, figures, &c., all in colours, and so far like what is now known as the Florentine inlaid mosaics, but the Palermo ones are not flat. Their more prominent parts are raised up strongly in relief, and the effect of light on the bright polished and coloured marble gives a wonderful richness and brilliancy. So rich, in fact, is the effect, that the most vivid colouring and utmost amount of gilding to the roofs are quite unable to harmonize with it.

This class of work is, so far as I am aware, quite peculiar to Sicily. The most noted examples are in Palermo, in the churches of the Jesuits and S. Caterina.

Now I come to the use of the glass mosaics, generally known now with us as the *gold* mosaics from their ordinary ground of gold. But this is not at all invariable. That at S. Corstanza, *p. e.*, is white; one at S. Prassede, dark blue; S. Pudenziana, a neutral tint; but these are supposed to be by Italian, not Byzantine artists. This beautiful kind of decoration has now been fairly revived, and a good deal of work done in it. I wish, therefore, to consider the question of its ordinary position in Medæval times, and the way in which it was worked and contrasted with the decorations of the walls.

As to its position, we may take it as the ordinary rule not to put it so upon the walls as to have a direct light in contrast with it, and not to bring it near to the eye at all.

The glass mosaic of Medæval times was essentially a decoration, and not a series of pictures.

It made no attempt to assume the place of a delicate representation of any object, animate or inanimate. There was no effort to conceal the roughness and irregularity of the bits of glass, nor of their joints; but they were placed so far beyond the reach of the eye that these peculiarities should not be offensive, and then the mosaics were worked in a broad, unmassive, conventional style, producing masses of brilliant colour, toned down by the absence of any glaring light.

There were some exceptions to this latter. At Monreale, S. Maria Maggiore at Rome, the two churches of S. Apollinare at Ravenna, S. Marco's at Venice, &c., we find the mosaics put directly upon the walls, exposed to a strong glaring light.

They are beautiful in themselves, and worthy of all possible admiration. But I never could see them without being struck with the dazzling and unpleasant effect produced by the direct contrast of the bright external light with them. No colouring of any kind could stand against this; and at Palermo, Monreale, and S. Marco's especially, a subduing of the light, such as a neutral grisaille-glass would give, seemed indispensable. We have one grand instance of wall mosaic in S. Sofia, at Constantinople. It covered there the whole surface of the wall, between and around the windows over the upper colonnade on the north and south sides. But then it is shown, almost for certain, that the ordinary clear glass was not used for these windows, but that the light through them was, in various ways, toned down, and must have been, when complete, about the finest instance in existence.

There is also another objection to the general use of the gold mosaics on walls, when exposed to the direct action of light.

Their brilliancy is then so great that it is almost impossible (as I before pointed out in the case of the Renaissance mosaics of Palermo) to carry off their effect by any ceiling decoration short of such mosaics themselves; while the expense of such a finish would be, in most cases, out of the question.

At S. Maria Maggiore at Rome, and S. Apollinare in Classe, Ravenna, the figures on the wall-mosaics are very small (in S. Maria Maggiore, not I think, 2 ft. high), and the whole of the mosaics up to a great height, and under the clerestory windows. The roof of S. Maria Maggiore is deeply coffered, carved, coloured, and profusely gilt, and thus carries off very fairly the mosaics on the wall.

But at Monreale, and the Chapel Royal, Palermo, they cover the whole surface under, above, and between the windows, both to the nave and aisles. They are beautifully designed and arranged. Those to the aisles are only used, as I have remarked was the usual plan, far above the line of the eye, the walls beneath being decorated in the most artistic way, with marble panels, laid out with delicate geometrical mosaics.

The columns to the aisles were also of marble, so that the eye was skilfully led up by a series of extremely rich decorations of various kinds, from the pavement to the roof. There the mosaics stopped, and the result is that the roofs, though decorated in the richest manner, quite fail to continue, satisfactorily, the richness of the walls. But when the mosaics are used on the places where they are most usually found, viz., the soffites of arches and filling in the semi-domes of the apsidal ends so common in Italy, we recognize at once their fitness and their beauty.

The subdued light under which they are seen gives to them a depth and richness of tone unknown to them in any other, whilst the gradual curving from the wall to the ceiling leads the eye pleasantly on to the very summit of the building.

In such a position as this the glass mosaics, as architectural decorations, are supreme. In some few cases the apsidal ends are pierced with windows, and thus the same objection applies as to the walls.

Apart, however, from the position, there are some special considerations connected with the treatment of these mosaics, which are of the greatest consequence in designing them.

They are all of one kind of workmanship—some more rude or more delicate than others;

but all, nevertheless, worked in a similar way.

But their artistic treatment is very different. In some cases, as the apse mosaics at S. Cecilia at Rome, which have the figures all round and the row of lambs, as usual beneath, there is no shading to the figures, and the folds of the dress are indicated by lines only. In this instance the whole work is coarse, the eyes of the figures large and staring, and the whole seems done by careless or inferior workmen. The same is the case in S. Prassède at Rome.

But it does not follow that such work need be badly done, and in some cases where bold effects are wanted probably the use of the single lines would be the most effective. In the Italian work, however, this plan was seldom adopted.

Take some of the most noted, as S. Pudenziana. The apse mosaics there are equal in freedom of outline, clearness, and shading to any of the Renaissance ones in the dome of St. Peter's. The same with those of S. Maria, in Trastevere; so, too, with those of S. Chrisogono, where there is a mosaic almost equal in beauty to the ancient Roman, the pieces of glass being only one-eighth or so square. But then they were almost always designed strictly as decorative works. But with regard to pictorial effect, there was no violent action with the figures. Each one was designed in a staturesque position, and stood freely and unencumbered out from the background of gold, around which there was also commonly taken a rich border of gold and colour. As exceptional cases in point of treatment may, perhaps, be mentioned the above-named S. Pudenziana, and S. Vitale. There the figures are arranged in a more artistic way than usual; but there is an archaic formality about the whole which prevents its being pictorial. The whole effect was, in fact, in admirable keeping with the formal geometrical patterns of the floors, and designed on very much the same general idea as the mosaic glass of our best windows.

Then, again, the colours were always of the vivid tints which one usually thinks to be an absolute characteristic of these glass mosaics.

In many cases it was quite the opposite. At S. John Lateran, S. Clemente (thirteenth century), S. Cosmo o Damiano, and others, the colours were either faint or in quite half tints. In fact, with mosaics, as with every other kind of decorative colouring, one can lay down no absolute general rule.

A depth of colour that would be quite suitable to the richness of one edifice would look altogether glaring and out of place in another; and with mosaics, as with everything else, special study is required in order to make sure of their proper use.

Now all these works were of the earlier times of art. The latest that I have quoted was, I think, of the thirteenth century.

It was revived and continued by the Renaissance architect, and we have some very grand works indeed left by them. The comparison of their mode of treatment with that of their predecessors is a most valuable one.

You will bear in mind that the early works did not affect to be in any way more than artistic decorations. There was little action in the figures, and the whole arrangement was, if I may so say, geometrical. The Renaissance architects worked in an entirely different way. They designed their mosaics much as they did their pictures.

The figures, instead of being isolated, were often massed together in groups, the draperies contrasting thus with each other in place of with the gold ground. It is so in many of the mosaics of S. Marc's, at Venice. They date from the sixteenth century, and are admirable in point of execution, the outlines and the work as good as in any other instance of the same kind, ancient or modern. As pictures they are excellent; but in contrast with the old works, simply viewed as giving a decorative effect to the grand old church, they fail utterly.

It was not the case with all the work of this date. At S. Marc's, the ceiling of the sacristy, which is arranged in geometrical patterns on a gold ground, is singularly effective; so, too, are the gold mosaics in the spandrel of S. Peter's. These are treated in quite a different way from that now being tried at S. Paul's, the centre being filled up in each case with a circle, in which is one large head. The rest is of gold, and the whole effect very much like that of the early mosaics.

With this latest, perhaps, of the grand series of decoration, which furnishes the subject of this

sketch, it may well end. Nothing as a decoration can be grander. Nothing in able hands and with careful study more effective. But it requires study to understand its use and talent to apply it. Like all instances of the use of vivid colours, the least mistake in its application will produce discordance. But when its use is thoroughly understood, I believe that no such aid to the beauty of our buildings was ever invented, short, of course, of the absolute handicraft of the sculptor and the painter, before whose work all other appliances in the artistic working of our art must give way.

CONVERSAZIONE: INSTITUTE OF ARCHITECTS.

The Conversazione of the Royal Institute of British Architects on Monday evening last was well managed, and passed off agreeably and successfully. Mr. William Tite, M.P., the president, received the guests, and there was a very large attendance, including many ladies. Pictures, carvings, photographs, and glass, afforded matter for conversation up-stairs, and the band of the Coldstream Guards down-stairs very pleasantly stopped it at intervals. Decoration and industrial art were represented by some specimens of Salvati's mural mosaics and Venetian table-glass, as well as by examples of furniture and cabinet-work, some designed by Mr. Seddon, and other specimens by Mr. Charles L. Eastlake.

Amongst those present, we recall the names of Sir Henry Holland, Sir F. Grant, P.R.A., Mr. Beresford Hope, M.P., Brigadier-General Lefroy, R.A., Lieutenant-Colonel Lane Fox, Commander Evans, R.N.; the Hon. Ashley Ponsonby, Colonel W. Pinney, Admiral Sir George Back, Professor Adams, Dr. Hatfield, Professor Wheatstone, Professor Pistrucchi, Professor Kerr, Professor Willis, Mr. Cave Thomas, Mr. Sydney Smirke, R.A., the Rev. Canon Jelf, Rev. B. Whitelocke, Dr. Denist, Rev. B. Webb, Rev. C. B. Scott, Rev. B. F. James, Rev. C. Jackson, Mr. E. W. Cooke, R.A., Mr. C. F. Hayward, Mr. Joseph Bonomi, Mr. J. G. Crace, Mr. C. Knight Watson, Mr. Frost, A.R.A., Mr. T. Landseer, Mr. Digby Wyatt, Mr. A. Waterhouse, Mr. Barges, Mr. W. White, secretary Royal Society, Mr. Godwin, Mr. Henry Baker, Mr. W. J. Thoms, Mr. F. Marrable, Mr. Garling, Mr. Hemaas, Mr. E. Christian, Mr. Tarring, Mr. L. Collmann, Mr. Truefitt, Mr. W. Hawes, Mr. Sidney Godwin, Mr. F. R. Conder, Mr. Hansard, Mr. Roger Smith, Mr. G. Gambier Parry, Mr. Bury, Mr. Poynter, Mr. W. Papworth, Mr. Massey, Mr. J. W. Porter, Mr. J. Fahy, Mr. F. Wyburd, Mr. John Gibson, Mr. C. Fowler, jun., Mr. Bateman, Mr. W. L. Donaldson, Mr. E. Salomon, Mr. Teulon, Mr. L. Pocock, Mr. E. W. Tarr, Mr. Charles Martin, Mr. W. H. Black, Mr. Frost, Mr. R. K. Penson, Mr. D. Brandon, Mr. H. Jarvis, Dr. Barlow, Mr. Spiers, the Bishop of Dunedin, Archdeacon Hale, Mr. Harry Oliver, Mr. G. Mair, Mr. E. B. Lamb, Mr. N. Gould, Professor Donaldson, &c., &c.

MATTERS PROFESSIONAL IN SCOTLAND.

At the closing meeting of the Edinburgh Architectural Association, on the 19th inst., Mr. Beattie, the president, delivered an address. After reverting to the rapidity with which events now succeed each other, he said,—When everything else is driving forward at such a high-pressure rate, it is not to be wondered at that our own department should share in the general acceleration of speed. Accordingly, we find that to a large extent the good old paths are deserted, and that novelties, acrobatisms, and short cuts to fortune are very much in vogue. We find the spirit pervading the building trades to a very great extent.

Take the lowest department first, the hewers of wood,—what do we find? We find that apprenticeships have become a mere farce and byword. We find the youthful aspirant, instead of faithfully and laboriously serving out his six or seven years, hardly disposed to serve as many months, and then deserting his master and seeking employment in some other place as an experienced workman. Like a well-known living engineer, who stated that it had cost a certain railway company 50,000*l.* sterling to teach him his business, the runaway apprentice acquires a knowledge of his trade, very imperfect at the best, at the expense of his future employers.

Hence I believe arise to a great degree all that agitation about shorter hours and higher payment, about less work and greater remuneration. Hence the determined efforts of the trades' unions to put the good and bad workman upon the same footing. The good workman is independent of trades' unions; he can secure constant employment and the best wages without any assistance from them. Trades' unionism is too often the instrument by which the inferior and half-qualified workman strives to put himself upon an equal footing with his more highly qualified neighbour, and, as a general rule, I believe trades' unions discourage superior excellence, and strive to retain all in a state of unhealthy mediocrity.

I suspect, however, that it will be a more beneficial employment to examine into our own failings rather than to occupy ourselves longer with those of our neighbours. Are there no imperfectly educated architects? Are we all animated by the same high motives, and aiming at the same worthy ends? Do architects dwell together in charity and brotherly love, and are we all prepared frankly to say, "Palman qui meruit ferat?" I am afraid it is not so. With us, as with other classes, there is the same hating to be rich, the same confidence that the race will be to the swift and the battle to the strong, the same sacrifice of much that is worthy and noble to mere temporary convenience or expediency. We often forget that to secure the golden harvest the ice and snows of winter are quite as essential as either the showers of spring or the heats of summer, and that slow and steady progress is more to be depended upon than those brilliant bursts which may for a moment dazzle the eyes of men, but disappear again with equal rapidity. An important point for all young architects to keep in view is the large extent to which their professional education is dependent upon themselves. It has been well remarked that self-culture is always the most permanent and the best, and it is peculiarly so in our profession. In an office the young architect can never acquire much more than the requisite technical skill. All else must be acquired by his own exertions; and I suspect he will find, before he has finished, however different the vulgar idea upon the subject may be, that mere technical skill in drawing is the least part of his professional knowledge. I consider this association a most valuable adjunct and assistance to our architectural education. Here, meeting after meeting, we have the most varied subjects brought under our notice, and opportunity afforded for discussing them. I would urge strongly upon the younger members the importance of their favouring us with papers. I can assure them that the party most benefited by a paper is always the individual writing it. Do not always choose the subject you are most familiar with; rather sometimes take a subject that you are ignorant of, but are desirous of acquiring a thorough acquaintance with. Take this for your subject, set systematically about acquiring all information you can in regard to it, and I will guarantee that, before your paper is finished, the knowledge you have acquired will be fixed in your memory and impressed upon your mind in a way that nothing else will do. Writing a paper systematizes, and, as it were, focusses our information.

I would also strongly urge the younger members to take part in the discussions. I am sure that they will afterwards find the benefit of it. In the course of business an architect is often called upon to explain a design or some other matter to a body of gentlemen,—it may be a church committee, it may be a town council, it may be a public meeting; but on any such occasion the young architect will find the facility of expressing himself clearly and to the point which he has acquired at our meetings will be of great value. It is, to a great extent, a mere matter of practice, and nothing looks more absurd than to see an educated man, who can talk well and even eloquently to a single hearer, stammering and stammering when he has to address either half a dozen or half a hundred auditors.

There is a subject which, during the past year, has been brought formally under the notice of the Architectural Institute of Scotland, and also of our own Association, by the Edinburgh Master Builders' Society, namely, the subject of measuring the quantities of work, whether from plans or otherwise. I believe that it is high time that attention was turned to this point. The present state of affairs is a most anomalous one, and should not be allowed to continue. The present condition of the measurers is much like that of

the Israelites in the days of the Judges, when every man did that which seemed right in his own eyes. Every town,—and, indeed, I may say, every measurer, has his own peculiar system, and in some point or other is sure to differ from all his brethren. This is most unfair, both to the builder and to the employers. Measurers vary so much in their way of measuring and reporting, that unless the contractor is familiar with the particular measurer's system, he is not safe, and may make most egregious blunders in the pricing of the works. I consider that there ought to be some fixed system from which no measurer could depart.

As the subject of measuring has not, I believe, been before brought under your notice, I will describe briefly a few of the discrepancies in measuring which occur to me. I may mention that in England measurements are generally much more detailed and dissected than in Scotland. In mason work, for example, English surveyors measure the work upon the beds and joints of hewn stones. In measuring mason work in Edinburgh, the whole stone work is first taken as rubble, and then the hewn work is measured in detail, the taking it as rubble being understood to be for the building of it. The surface work upon one side of all external rubble-walls is generally given as a separate quantity, but sometimes not. In some primitive parts of the country I believe they sometimes even do not separate the hewn work, but give a slump measurement of so many rods or yards, as the case may be, of ashlar-faced rubble stone wall, at a certain thickness.

Even in the measurement of rubble work there are many discrepancies. Some reduce all rubble work to 2 ft. thick, while others state the actual quantity at each thickness. Some deduct only through-going openings, and make no deduction for presses, fire-places, or recesses. Some give no sconces or rough corners for the inside of windows, doors, presses, &c., while others carefully take all these. Some measure scotonia lineal and some superficial. Some measure safety-arches in rubble walls by the lineal foot, some superficial, the soffit, while others superficial the extreme of the arch.

In measuring hewn work there are many variations. In Scotland all hewn stones, 12 in. thick and under are superficialled, and all above that thickness are cubed. In England all stones over 3 in. thick are cubed. In measuring ashlar some measurers merely superficial the surface, while others add in all the ingoings of the window and doors, and allow at all internal angles for the bond of the ashlar into the wall. Some include sills, lintels, corners, &c., in the ashlar, while others state these separately by the lineal foot. Beds and joints are not measured here, while in England the labour upon them is superficialled.

Some Scottish surveyors give the stone in cornices, strings, &c., separately either in cube or lineal measure, and then in a separate quantity the labour on the face. Others slump the whole together, and state so many feet of cornice, stone a certain size, and labour a certain girth. The first is obviously the more accurate way, as, in the second case, the dimensions being taken along the extreme projection of the cornice, a false idea is given of the quantity of stone, all stones at angles being measured both ways. Some surveyors in measuring steps take them on the clear, while others add in for the wall-hold; but there appears to be no fixed allowance for this, which ought properly to vary with the length of the step. In England, when work is more than 40 ft. from the ground, I believe an extra charge is made per cubic foot for hoisting.

In measuring brickwork in Scotland, it is generally superficialled at the various thicknesses, and stated by the yard. In England, on the other hand, it is reduced to a standard thickness of a brick and a half, and stated in statute rods of 5 1/2 yards square. Facings and dressings are taken by the superficial foot.

In carpenters' work there are also variations in the modes of measurement. Some surveyors in the case of framed timber roofs take the extreme length of the timbers over the tenons, while others measure the apparent length. Some in the case of wall-plates and door standards measure the billets, and add them into the quantity, while others do not.

In measuring roofs some make an allowance in the superficial quantity of 18 in. broad, at all cuttings for valleys, while others superficial the actual surface, and state the cuttings lineal. In Scotland superficial measurements in carpenters' work are given by the yard;

but in England flooring, roofing, &c., is given by the square of 100 ft. superficial. In measuring doors with special mouldings or ornamental work, some measurers merely superficial the door, and say see drawing; while others first superficial the door as plain square framed, and give the mouldings or ornamental works separately, carefully girthing them.

In measuring slaters' work in Scotland, surveyors give an allowance of 9 in. for all cuttings, both sides of centre gutters, valleys, and pendants being taken, while in England the allowance is 6 in.

In the measurement of plaster-work Scottish surveyors take the ceilings from wall to wall, while in England they deduct one projection of the cornice. Scottish surveyors take the plaster on walls from the top of grounds to the ceiling, while in England they take from top of grounds to foot of cornice, or a little above. In Scotland all mitres of cornices above four in a room are considered extra, while in England a mitre is allowed for every 10 ft. of cornice.

I have only mentioned a few of the more obvious differences in the way of measuring which occur to me. There are many other variations in minor matters. I believe the cause is that measuring is in a sort of transition state just now. The old measurers formerly used to have all sorts of absurd allowances, but at length a strong reaction took place against these, and I believe just now things are in a somewhat confused state, not having got settled down again. There is, therefore, great reason why architects should interest themselves in the matter, and get a system of measurement based upon equitable principles brought into general use. They will not have such an opportunity again, and this is my reason for calling your attention to a matter which is of general importance to the profession.

In the last paper read before this Society the Paris Exhibition was alluded to, and the paucity of prizes awarded to English exhibitors noticed with regret. The question was also asked, did not this go to prove that we are not an artistic people? I very much fear that this is the truth. I have read carefully the evidence of several Englishmen of eminence who were connected with our former Exhibitions, and who have visited the Paris Exhibition, either in an official capacity or otherwise, and they are almost unanimous in expressing the conviction that in many departments we are far behind our continental rivals, and that we have not made nearly such rapid advances as they have done within the last few years. Dr. Lyon Playfair, who was one of the principal jurors at the Paris Exhibition, expresses among others these opinions, and ascribes our want of progress to several causes. He says that our workmen have not the same facilities as they have on the Continent for acquiring an artistic education. He considers that this want of proper training is a great drawback to our onward progress. He also states that we have been much kept back by the constant strikes and disputes between employers and employed, and denounces the disgraceful regulations of the trades' unions, preventing good tradesmen working to the full extent of their powers, and appointing a maximum quantity of work beyond which they may not go.

I believe myself that the early training has most to do with the matter; and that if our young art workmen were properly trained, and were surrounded afterwards by as many objects of artistic skill as they have on the Continent, the result would be a very different one. In Scotland we are peculiarly ill off in these respects. Not only are we very deficient in the means of training, but also, in consequence of the Presbyterian mode of church government and worship general throughout the land, that highest and noblest development of art—namely, ecclesiastical art—has, until a very recent date, been not only neglected, but intentionally and of purpose discouraged. Presbyterianism has much to answer for in this respect.

In commenting upon the recent revival of art in the sister country, I think Mr. Henderson omitted to notice one of the most powerful agents which has been at work, not only in causing a shaking among the dry bones of art generally, but peculiarly in reviving the practice of Gothic architecture. Whatever its opponents may have to say of it in a religious point of view, there is no doubt that so far as the artistic development of the nation is concerned, what is generally known as the ritualistic movement in the Church of England, has been of inestimable benefit. It has given an impulse to ecclesiastical

architecture, and along with it to all the cognate ornamental arts—such as metal work, painted decoration, encaustic tiles, wood carving, mosaics, organ building, &c., which can hardly be overrated. It would be well, I consider, if both our clergy and our laity had a little more of that spirit which has animated the supporters of this movement in England. There nothing is considered too good or too precious for the house of God. There is still to be seen the same spirit of love and sacrifice which eighteen centuries ago inspired the repentant sinner to anoint her Master's feet with precious ointment, and wash them with her tears. Cavillers still say now as then, Why this waste? Can ye not pray as well in plainer edifices? Is our worship not to be in spirit and in truth? Are there no poor to be relieved? no heathens to be converted? Such arguments are better replied to by deeds than words; and when we find that those who are most zealous in the matter of church architecture and church decoration are also those who do most to relieve the miserable, to feed the poor, to convert the ignorant, we consider their conduct needs no further defence. The savour of that precious ointment has, as our Lord foretold, during the long ages which have since elapsed spread over the whole world, enshrining in the hearts of all the memory of that loving deed; and we doubt not that those whose zeal and affection for their Master have led them to do many things which may appear extravagant or even superstitious, in the eyes of a Sadducean age, will yet compare favourably with others, whose colder love and fainter zeal never lead them to step astray from the orthodox path, and that these deeds of love and reverence may hereafter find gentler judgment than on earth is given.

NOTES FROM THE CHAMP DE MARS.*

THE Swiss annexe is a spacious erection, entered by a handsome flight of steps, and is arranged in five compartments, appropriated severally to oil-paintings, water-colours, engravings, and so on. In the frieze of the centre portico appear the names,—M. Herian, S. Gessner, J. Pradier, L. Robert, H. Holbein, C. Maderno, D. Fontana, and F. Borromini, serving to show how much more the arts are indebted to Switzerland than is sometimes supposed. Amongst the architectural drawings within the main building is seen the design of this annexe, from which is learnt that the architect was M. F. Jaeger, who also designed the screen of the Swiss section. The central, and most important, compartment in the annexe contains the oil-paintings; it is lofty, and decorated in the deep-toned richly-coloured style peculiar to Swiss interiors. In a hasty walk through this gallery, a beautiful landscape by Meuron irresistibly arrested my progress,—a "Vue prise de Mirron, canton de Berne," a grand mountain-gorge, with a large bird poised high above the rocky bottom.

Belgium has created a charming gallery for her pictures, in a spacious annexe. Wide steps lead up to an open vestibule paved with coloured cements in various patterns; the inner doorways are draped with crimson cloth; and stationary and coloured glass adorn the three sides; the fourth being the open entrance-way. The interior of the building is divided longitudinally, by a wall, into two compartments; and these are subdivided into three bays by Corinthian pilasters and columns of imitation green marble; the walls are light crimson, with an imitation marble dado of a deeper hue; and the floor is well hoarded and cleanly swept. An iron rail protects the pictures from too close contact of eager gazers; the centre only of the ceiling is glass, mullioned over; and handsome benches, covered with green velvet, and fringed round, invite the wearied sight-seer to rest, while he feeds his eyes and soul with the pleasant subjects before him.

Baugniot has three pictures, all charming: 1. "Visite à la Vierge," in which two darling comforters—one in blue silk, with black and gold bermons, straw hat and white feather; the other wearing a brown silk filled pelisse, with scarlet hooded-cloak over—have come to console the poor widow and her three little children. The colouring in this, though so brilliant and vividly contrasted, is yet full of harmony and beauty. 2. "La Seconde Année," a young mamma watching her sleeping baby. 3. "Un

* See pp. 349, 374, 393, 409, 427, 446, ante.

Réve après le Bal," where a charming young creature has passed from her waking dream to her sleeping one, and is seen still in her ball-dress, with morning dawning and candles burnt out.

Bouffant, in his "Corps de Saint Étienne Martyr," forgot that the process of stoning to death must needs make wounds and bruises, even on a saint; besides which fact, stones around show evidence, in the patches of blood upon them, of the tragedy that has been enacted. Bossuet has some landscapes, which, for a wonder, are bright and sunny: continental landscape painters usually ignore Phœbus altogether. "Vue générale de Malaga," besides its pleasant sunshine, has some nice ripply water; and the old "Église Mozarabe près de Saragosse," and "Aquadoo Romain, Cordone," are especially interesting relics of the past. Campotosto's "Un Coin heureux" is nice, but somewhat indistinct when viewed close; and Clay's "Calme plat," translated "dull weather," in *English* in the catalogue, is very pleasing; but Marie Collart's "Un Verser," with cow-grazing, is sadly dull and dingy. Damsert's "Bon Serveur" is natural: a family group, where the father, a footman in a gorgeous livery, has come to visit his wife and children, and is seen nursing his little baby. De Gronckel has "Doux Portraits," both admirable: one with black hair and monstache, and grey shortish heard, the other, an old gentlemanly head with close-cut hair and monstache.

De Groux sends five pictures: "Les Bourgeois de Calais devant Edouard III.," in which the kneeling queen is monstrously long from the waist downwards. "L'Hospitalité," a cottage scene, wherein some beggars are being fed with brown bread. "L'Année," a sadly depressing picture, in which soup is being distributed to some most miserable-looking objects. "La Visite du Médecin" and "Mort de Charles-Quint," he who introduced the Inquisition into the Low Countries: pity he didn't die beforehand.

De Knyff's "Le Barrage du Moulin de Champigny" is natural, but gloomy; but Delfosse's "Conversation défendue" is admirable. A pretty young girl and her lover hold the forbidden conversation at the foot of the well-hole of a fine old carved oak staircase. She has a pensive—*pensive*—in her left hand, while her right is clasped between both those of her lover, who kneels on one knee at her feet: a hent grandam has come out from a room, and is peering over the handrail of the landing above, and her attendant cat is descending the stairs: *tableau complet!* De Schampfleer has some good stormy water in his landscapes; and "Gibonko de Juin, Environs de Gouda," is effective.

De Vriendt shows rich colouring in his "Saint Luc peignant la Madonne," in which, however, the P. R. B. mother and child are just like a wooden group from an altar; the emblematic lily is seen in bud and blossom. Dillens' three pictures are characteristic, to wit, "Une Noce au Zuid, Beveland" (Zelande), in which the old grand'mère is the only sad and weeping guest among a joyous party; "Le Cordonneur Barbier, Zelande," where a bright-faced country girl stands outside the shop wherein the shoemaker sits, and sticks up her foot on the shemacher window, through which he takes her measure for her new pair; and "Ordre et Désordre," among skaters. Fournois' small-sized "Moulin à Eau" has, of course, the proverbial gloomy sky; Alexandre Francais, besides his good name, has a good picture borrowed from our Scotland,—"Loch Etive;" Hamman sends three pictures, "Les Dames de Sienne pendant le Siège de cette Ville en 1553," wherein richly-dressed ladies are seen working at defences, and one poor thing in white satin robe looks sadly worn-out and tired to death, but will not give up; "La Pête du Bœufanture;" and "L'Éducation de Charles-Quint: une Lecture d'Érasme," where the queen-mother sits on a sort of throne, and he in a state-chair on her right.

Jacob Jacobs has a large and singular picture, "Chato de Sarp sur le fleuve Glommen, Norwège," where the clear brown water is seen swirling and eddying amongst piles and tangled heaps of wood, and wooden huts of the workers or watchers, and over and around all a magnificent storm-sky. Kindermans has a "Pêcheur au Ruines, sur la Semoy," the scenery of which recalls that of Cliefden-on-the-Thames; and Pierre Kremer has chosen a charming subject in his "Daniel Seghers, célèbre peintre de fleurs, présentant une grilande qui doit lui servir de modèle."

Lamorinière has three pleasant "paysages;" but in the one taken at Edgheem, the sun, which

shines so brilliantly at the extremity of the avenue, should not have forgotten to peep and glint amongst the trees a little, for they do not stand so closely together as to exclude his rays, by any means. "Interior of Burdham Wood, England," is capital, with its wondrously twisted old heeches; and "Vue prise en Angleterre; effet de Neige en Crépousole," with beech trees also, and hunter and dog screening themselves behind a tree from the distant deer, is very English and truthful.

Baron Henri Leys sends twelve of his remarkable pictures, several of them well known in England. "Le Bourgmestre Lancelot Van Ursel haranguant la Carde hourgeoise pour la Défense de la Ville, 1542," is a large canvas, crowded with figures. "L'Archiduc Charles, âgé de 15 ans, prêtant Serment à Anvers, 1615," reproduced in fresco in the large hall of the Antwerp hôtel de ville, is an interesting work; as is the "Publication dans les Rues d'Anvers des Édits de Charles-Quint, introduisant l'Inquisition dans les Pays-Bas," but which always seems to me a helpless and hopeless scene, too sad-looking to look upon. In "Luther chez son Ami Lucas Cranach," the head and dark beard of the latter are very fine; and "Conciliabule du Temps de la Réforme," painted 1857, is very admirable, especially the girl seated in the front, which is like nature, rather than paint and canvas.

Musin has one picture, and a very fine one,— "Napoleon Ier. . . . visitant l'Escadre dans le Port d'Anvers, le 1er Mai, 1810:" the wind in the flying sails, and the manner in which the vessels sit on the humming water, are admirably represented. Pauwels' "La Veuve de Van Artevelde" will be remembered with pleasure from the Exhibition of 1862. After the massacre of Van Artevelde by the people of Ghent, the town being surrounded by enemies and reduced to the greatest straits, the magistrats appealed for assistance to the patriotism of the citizens; and this noble lady, still in "widow's weeds" for her murdered husband, was among the first to answer the appeal, by bringing out all the treasures she possessed, gold and silver, and even the most precious of all, her husband's sword. In "Le Retour des Proscrits du Duc d'Albe," also by Pauwels, the poor exiles are affectionately met and greeted on landing by their relatives and friends. Quinaux has a pleasant "Vue prise dans le Dauphiné," a sunny middle-distance with foreground, and mountainous background, in shade. Robbe's "Fleurs et Fruits" is good; but in his second picture, "Fleurs," he has not done justice to the honeysuckle, or else his specimen was a very different thing to what we could show him in English hedges and around rustic porches; and Robie, in "L'Antonne," has some capital fruits and sparrows.

Roffidens' "Lac Lomonde, Écosse," is very good, with the steamer in the distance; but his "Chambrère dans la Campine" bears the almost universal stamp of gloominess. Eugène Smits' "La Bague Nouvelle, Costume de Fête de Nettuno, États Romains," the bust of a handsome Italian woman in a red jacket, contemplating her new ring, is charming; as are Stallaert's classic-looking pictures, "La Balance," in which Cupid floats above the swinging girl, and helps to propel her; and "Lesbie," a Pompeian-looking girl, crying over a dead bird, with her attendant.

Sombri's "Victor Pisani," the Venetian admiral, receiving back his sword, and swearing to forget the injustice of which he had been the victim—his imprisonment, that is to say, for some slight reverse, after manifold successes against the Genoese, when his country is once more imperilled,—sets one thinking, "What villains the nobles were in those days!" Some of Alfred Stevens's little pictures are too like "Le Petit Corrier des Dames" to have any special interest; but "Pensive" is pretty, as also is "Une Duchesse," in her blue velvet high dress, her cloak slipping off, and holding a letter in her hand. Joseph Stevens, who would seem to be related to the above, giving the same address, indulges in the comic vein,—apes dressed as men, smoking and drinking. Doubtless these pictures are cleverly painted, but I hold the comic in art to be usually a mistake; when a thing of this kind has been once looked at and laughed at, no one cares to see it a second time. The same remark applies to grotesques in bronze, monstrosities and deformities, of which there are several specimens in the Champ de Mars and elsewhere. In "Anciennes Maisons, Bruxelles," Stroobant gives a clear bright atmosphere, pleasant to look upon; and his "Ancien

Palais des Princes-Évêques à Liège," with its well-known singular columns, like giant balustrades, ornamented in parts with a sort of Greek honey-suckle, is interesting. Thomas, in his "Vierge au Calvaire," has given a strange and unaccountable light around her, but her blue robe is fine. Still, is not her presence there apocryphal? Christ had his beloved disciple take her home ere the death-agony approached: moreover, the crown of thorns is too thick and strong-looking.

Tschaggeny, in his "Sourcil d'Afrique," shows the shepherd in scarlet cloak and white head-gear in front of his flock of sheep, goats, and camels, leading and piping; and his "Madonna entourée de Fleurs," representing an alto-relievo on gold diapered ground, is very charming. Van Kiersbick, in "Le Chevalier de Saint-Géry, Echevin de la Ville de Bruxelles, haranguant le Peuple du haut du perron de l'Hôtel de Ville, 1407," has painted his principal sollettered figures too short and thick; but "le peuple" is excellent. Van Knyck has a capital "Intérieur d'Écurie, avec Chevaux," and dogs and fowls, and a dear little stable-boy, all excellent. Van Lerins's "Portrait," a fair little child in white, holding flowers, is very charming. Van Moers' "L'île Saint-Georges à Venise; Crépousole," is good; and in "Intérieur de l'Église Saint-Marc à Venise; étude," the sun seems to shine out as one gazes.

Vrclat has a good "Vierge et l'Enfant Jésus," qui appartient à S. M. l'Impératrice des Français," and his "An Loup," belonging to the King of the Belgians, is very vigorous. A wolf has killed a lamb, apparently the property of a peasant family: on the alarm being given by his wife, the man has seized a pitchfork, and has rushed upon the wolf, while the two brave dogs assist, and, with the terrified girl, complete the group. Willoms has thirteen pictures, mostly of small size, but all more or less worthy of note. The "Visito de Marie de Médicis à Rubens à Anvers en 1663," is the largest canvas, and is placed first on the list. The Queen has arrived on a white horse; Rubens is seen leading her across the court-yard of his house, over a scarlet cloth strewn with flowers. His wife stands waiting to receive her under the arcade, just advancing from the shadow into the light, and a fine peacock and hen add beauty and colour on one side, to balance the brilliant hues of the gay dresses of the attendants on the other. In "L'Anceur des Fiançailles," a girl, in a wonderful white satin robe, receives the ring from a gallant in red cloak and hat with blue feather. "La Veuve" sits sadly and pensively, with an open letter in her hands, lying upon which rests the expressive *pensive*, as folded up in it by him whose pictured resemblance looks down upon her; and at her feet lies a capially-painted "love" of a dog. "La Visite" shows the visitor dressed in pink satin, with drab cardinal cape over, and a man's stand-up hat of drab felt. In "Les Intimes," the profile, black-haired and coral-eared, is charming. "La Confidence," shows a girl in white, seated at a table, reading a letter; messenger standing apart before the door. "J'y étais!" with its simple and touching title, and treatment equally simple and touching, is another of his. A girl, in yellow satin and lace ruffles, is showing the pictures in a gallery to an oldish man, in grey snit, whose hack is turned to the spectator. When they arrive before a certain hattle-piece—a sea-fight—the calmed and subdued veteran says simply, "J'y étais!" and then comes "Les Adieux," between a lady in white satin dress, and a cavalier in yellow;—and with this I also make my *adieu* to the very interesting collection of pictures in the Champ de Mars.

In the Exhibition building, Léopold Harzé has several extremely clever "Gronpes en Terre cuite," the figures small in size, but most carefully and minutely manipulated, the subjects taken from Molière, Shakespeare, Béranger, &c. One of these, "La Mère Aveugle," with three figures in it, was alone unsold, the attendant said, and the price was 3,000 or 4,000 francs, he did not know which!

Near to the Belgian annex, in the Parc, stands a fine heroic-sized figure, by Jules Martin, "Modèle du Monument d'Ambiorix, Roi des Eburons, qui se trouve placé sur la Grand' Place de la Ville de Tongres." The hero stands proudly erect, trampling under-foot the Roman eagle, a laurel crown, and weapons. He looks like an early Dane, or Saxon, or English eyes; the more so as the pedestal on which he stands is a reproduction, in small, of our Kit's Coty House, in Kent. The railing is composed of

crossed lances, with stone corner-posts; in his hand Amhiorix brandishes a battle-axe. This statue is extremely bold and grand, and for power and feeling it is, to my thinking, one of the finest things of the Exhibition.

R. F. H.

BELL TOWER, ROTHENBURG, BAVARIA.

In a recent article on Bell and Clock Towers, with illustrations of the Clock Tower of the Rathhaus, Pégne, we mentioned, as a quaint and original example, that of the Rathhaus of Rothenburg, in Bavaria, and promised a sketch of it.* This we now supply. The tower, it will be seen, grows out of the gable of the Rathhaus. It is square in plan for two stories, and is then broadened into an octagon, with four statues standing on the "brackets." At the top a projecting cornice supports an iron parapet railing; the whole being capped with a hulvous spire of two orders.

ANCIENT ALTARS IN GERMANY.

It must have often struck those who have been in the habit of seeing Continental churches as a very remarkable circumstance, that although the remains of ecclesiastical furniture in some of them are plentiful enough, ancient altars are very rarely to be met with. The magnificent cathedrals of France, which in ancient times must have been rich in this important feature, at present exhibit scarcely one single example. Why, when, and how were all these old altars swept away, are questions which it is difficult to answer. In England, of course, the spirit of the Reformation caused the removal of all ancient altars, no longer recognized as altars; but how is it that so few examples exist in Roman Catholic countries? In France the revolution doubtlessly destroyed a few, but probably by far the greater proportion had disappeared before that date, and it is to be feared that the vile taste of Louis XIV.'s days did far more injury in this respect than sacrilege and violence. To gain some idea of the splendour of the altars in the French churches during the Middle Ages, we refer our readers to M. Viollet-le-Duc's work, under the head "Autel." The churches in Belgium are nearly as badly off for old altars as the French; one or two examples exist at Leau, and there are one or two in South Brabant. None of them, however, are remarkable either for age or beauty. In fact, the only countries in Europe which offer us valuable examples of ancient altars are Spain, Italy, and Germany. In Spain and Italy they are very rare, though often very remarkable and singularly beautiful; but in Germany nearly every cathedral and many parish churches contain valuable examples. The cathedral at Cologne is rich in this respect. It contains a high altar of the earlier part of the fourteenth century, one fine tryptich altar of wood of the same date, and four wood tryptich altars of the fifteenth century. The high altar is a very beautiful work. It is composed of black and white marble. The frontal consists of a series of niches, occupied with statues and ornamented with delicate carving.

The earliest altar known to exist in Germany is one in a Romanesque chapel adjoining the cloisters of the cathedral at Ratisbon. This chapel goes by the name of the "Alte Dom," and is said to have been the original cathedral: the altar, which is still *in situ*, dates from the ninth century; it is a simple oblong mass of stonework, about 6 ft. by 3 ft. 6 in., and about 3 ft. high: the lower portion of the stone frontal is pierced with circles containing crosses. In another Romanesque chapel, attached to the same cloisters, is also an ancient altar, probably as early as the eleventh century. This altar is very singular in form, being exactly square on plan, and about 4 ft. each way; the *mensa*, or altar slab, is very solid, and is supported upon four short columns with cushion capitals at the corners, and a solid mass of stonework in the centre.

In the church of St. Emeran, in the same town, is a small Romanesque altar, with the *mensa* supported upon two triangular-headed openings and dwarf columns. In the cathedral at Brunswick is a fine high altar of late Romanesque work; the *mensa* is very large, and is composed of one slab of marble,—the pillars supporting it are of bronze, with capitals orna-

* See pp. 113, 115, ante.

BELL TOWER OF RATHHAUS, ROTHENBURG, BAVARIA.

mented with the heads of birds and beasts. In the chapel of Castle Transnichts, at Landshut, in Bavaria, is a fine specimen of a thirteenth-century altar, with a "ciborium" or "haldachino" over it, against each pier of which is a tall statue in small crimped drapery, similar to those in the western portal of the Cathedral of Chartres; over these statues are fine "Jerusalem canopies."

In the cathedral at Ratisbon are several early fourteenth-century altars. They have all choria above them, which are richly ornamented with canopies, statues, and foliage-carving. The frontals of these altars are plain, and were evidently intended for moveable "antependia."

The "Ohermünster" church at Ratisbon contains three fine fourteenth-century altars of the same description as those in the cathedral, with the exception that the frontals are pierced with an arcade, which shows through it a full-length recumbent effigy. Probably these altars served also for monuments.

Our lower illustrations represent two very pretty stone altars of late fourteenth-century work at Erfurth.

Fifteenth-century altars are very frequently to be met with in Germany. They are generally of wood,—at least the reredos; and the altar itself is perfectly plain: the reredos is generally formed of a large tryptich, either filled with carving in deep relief or pictures. One of the earliest altars of this description is the high altar in our Lady's

Church at Oberwesel. This is fourteenth-century work, and consists of a series of Gothic niches filled with statues. It is said to have been the work of an Englishman.

Perhaps the finest altars of this description are those in the church of Lorsch, on the Rhine, and Alt Breisach, near Freiburg, in Breisgau. The former altar is nearly 50 ft. high to the highest pinnaclo of its reredos, and when the valves are thrown open exhibits a wonderful combination of carving and painting. The date is 1120. The altar at Alt Breisach is equally beautiful, but not quite so large. Our principal illustration, represents an altar of this description in the Carmelito Church in Erfurth. This altar is in a very perfect state of preservation, and is beautifully decorated with paintings. Fine tryptich altars of the fifteenth and earlier part of the sixteenth century exist at Nuremberg, Rothenburg, Ulm, Freiburg in Breisgau, Landshut, Nordlingen, Dettingen, Craglingen, Erfurth, and many other places. Fine stone altars of a late date exist at Paderborn and Landshut, Marburg, Soest, and Blanhoven. In the Phyne Church at Praguo is a late altar with a haldachino over it of very elaborate and singular design, the vaulting of which is pierced with tracery. Altars of the mixed style which existed in the middle of the sixteenth century are to be found at Mayence Cathedral, in the crypt of St. Gerson, at Cologne, and in St. Lawrence, Nuremberg.

ARCHITECTURE, UNIVERSITY COLLEGE.

The prizes of this college were presented to the successful students by Sir John Lubbock, in the lecture theatre, who, at the conclusion of his task, made an apposite speech on the liberal character of the college. The following is a list of the prizemen in architecture.—

Architecture.—Professor T. Hayter Lewis.
Fine Art, senior class.—Donaldson silver medal and certificate, Josiah Rose, of London. Second prize and certificate, Alfred Henry Paget, of Leicester. Third certificate, R. Lockyer Cox, of London.

Construction, senior class.—Donaldson silver medal and certificate, Thomas Batherbury, of Hampstead. Second prize and certificate, Josiah Rose, of London. Third certificate, R. Lockyer Cox, of London. Fourth certificate, R. Carno.

Fine Art, junior class.—Prize and certificate, Josiah Rose, of London. Second certificate, R. Lockyer Cox, of London.

Construction, junior class.—Prize and certificate, Josiah Rose, of London. Second certificate, R. Lockyer Cox, of London. Third certificate, Edward Haslehurst.

ASSOCIATION FOR IMPROVING THE DWELLINGS OF THE POOR.

The twenty-third annual meeting of the shareholders of this company has been held at the offices of the Association, Coleman-street, City. Mr. Julian Goldsmid, M.P., presided.

The annual report was read, in which the directors stated that the Gatliff-buildings, in Commercial-road, Pimlico, were complete, and in full occupation. They consisted of 27 single rooms, 104 sets of two rooms, and 18 sets of three rooms, erected under the arrangement with the Marquis of Westminster referred to in previous reports. The Marquis, by arrangement, having advanced the necessary funds at 3 per cent. interest, had reserved to himself the right of fixing the rents at a low rate, varying from 2s. 6d. for a single room, with every convenience, to 5s. 6d. for three rooms, and has thus enabled the Association to accommodate a poorer class of tenants. Since the last report ten more pairs of cottages at Penge had been completed, making a total of thirty-six cottages there, which were all occupied by London workmen; and arrangements had been made with the London, Chatham, and Dover Railway Company to convey them at the rate of 2s. per week each. To enable the directors to proceed with the erection of similar cottages, they had, in conformity with the resolutions of the meeting held on the 12th April last, applied to the Public Works Loan Commissioners for an advance of 18,000*l.*, which had been accorded to them. They had also obtained a Treasury order to relieve from house tax all the dwellings of this association. The net profits of the year amounted altogether to 3,51*l.* 5s. 11d., sufficient to pay a dividend of 3 per cent.

The report was unanimously adopted, and a dividend of 3 per cent. declared.

EXCURSION OF THE LIVERPOOL ARCHITECTURAL SOCIETY.

The annual excursion of the Liverpool Architectural Society took place on the 22nd inst., when, in conjunction with some members of the Manchester Architectural Society, they visited Hooton Hall and Church, which latter was erected a few years ago, at the cost of Mr. Naylor, from designs by Mr. J. K. Colling, of London. The church stands just inside the park gates. It is a transept church with cupola in the centre, somewhat in the Byzantine style. It is built of white Stourton stone, relieved by bands of red stone from the Runcorn quarries. The new conservatory and the entertaining and dining rooms at the hall, also by Mr. Colling, were next visited in turn, and last of all the new picture and sculpture gallery. The picture-gallery, which is 100 ft. long, was first built, and subsequently a corridor 200 ft. long was added, forming a vista 300 ft. in length.

The society and their friends afterwards dined together at Eastham, Mr. T. J. Kilpin, the president, in the chair. Mr. Boulton proposed the death of Mr. Colling, who in reply acknowledged himself a heretic in architecture, and disposed for innovation. Mr. Picton, in the course of a

reply for the Liverpool Society, said the Liverpool corporation had been doing something for the encouragement of art, and he rejoiced to see that a member of that society had obtained the first prize offered by the corporation for plans for the laying out of a magnificent park, and had been engaged to carry out the scheme at a cost altogether of about half a million of money. Another matter engaging the attention of the corporation was the provision of dwellings for the working classes, and there was no problem, as it appeared to him, more difficult of solution than that of providing convenient and comfortable dwellings for the working classes without pauperizing them,—erecting them so that they would pay a fair rate of interest, and not become almshouses. He, as a member of the corporation, had strongly held the doctrine that it was the duty of that body to solve the problem if they could by offering such a premium as would induce architects to come forward and devise a scheme by which money could be so applied in providing dwellings, comfortable, cheerful, and cheap, for the working classes, as to yield a fair return of interest. He was glad to say that a premium of 200*l.* was, or would shortly be, offered by the corporation for the solution of the problem, and most delighted should he be to find that it had been solved by a member of the Liverpool Architectural Society.

The Chairman, after reply to his "Health," extemporised a song, in which he related and lamented the circumstances that had prevented him from joining the excursion earlier.

To the toast "The Contractors and Builders of Liverpool and its Neighbourhood," Mr. Nicol, of the firm of Holme & Nicol, the contractors for the work at Hooton Hall, responded; after which "The Town and Trade of Liverpool" was proposed by Mr. Vale and responded to by Mr. Gibbs.

Mr. Statham, the honorary secretary, proposed "The Manchester Architectural Society;" and a toast to his own health closed the pleasant proceedings.

THE COVENTRY AND MIDLAND EXHIBITION.

The Manufacturing, Industrial, and Art Exhibition, at Coventry, has been formally opened by Earl Granville. In the course of his address his lordship, in allusion to foreign competition, said—My opinion respecting our competition with foreign countries is, that there is no real danger whatever, if we meet it in a proper manner. But, in order to induce us to meet it in a proper manner, I am not at all sure that it is not wholesome for us to fear a little, but not with undignified fear. I believe there is something in the persevering—something in the combative—character of an Englishman that prevents him doing his best until some strong stimulus or some successful rival puts him to the test. I am not quite sure, he also remarked, that I agree with Dr. Lyon Playfair as to the importance of establishing large schools for the application of science to manufactures and art, but I believe what is really wanted is great diffusion of scientific knowledge; and if you only get that diffused, the practical application of it is perhaps better taught and better learnt in the workshop and manufactory than in any other possible way.

In the afternoon, a large and brilliant company dined together in the New Market Hall. Lord Leigh (the lord lieutenant of the county) presided, supported by Earl Granville, Lord Hyde, and many of the gentry of the county and city.

THE SHEFFIELD TRADES' UNION HORRORS.

SURELY "the reign of terror" which has so long, and with such impunity, prevailed at Sheffield, is now drawing towards a close. The method adopted by the Legislature and the Commission whom they have appointed, has been singularly effectual in unmasking the remorseless villains who have been so long a curse to Sheffield. The craven scoundrel to whom we alluded in our last issue has since, under the terror of the power of the Commission, made a full and terrible confession of murder and maiming, explosion and rattening, or wicked destruction and theft, for years practised by him and others, at the instigation, and with the pay, of a master villain, who has long occupied an official

and influential position amongst the Sheffield trades' unions; and even he has been compelled to lay bare his black soul, to the horror and detestation of the nation, and especially of those who have covered with fear of his anonymous and malignant power, and who would have torn him to pieces could they have laid hold of him after his self-condemnatory "evidence" was given. Broadhead, the master villain—Mr. Broadhead, as the Commission and the press have been naming him till now,—in addition to being secretary, treasurer, and factotum of the said trade union, was a principal official of the Sheffield Association of Organized Trades, and had only recently been appointed the treasurer of the United Kingdom Alliance of Organized Trades. The whole of his examination was a confession of crimes of the deepest dye in which he had been concerned. "Rattening," he said, had been practised in Sheffield long before any one in the room was born; and he appeared to justify it on this ground. He also seemed to think that, as regarded the outrages committed, the end justified the means. He confessed that, after Linley's murder, for committing which he had paid his two unscrupulous instruments, Crookes and Hallam, he had written letters to the newspapers exhibiting great abhorrence of the crime! After Wheatman's place had been blown up, he wrote a letter in which he truly described the deed as a *hellish* one, and endeavoured to throw the blame on the Messrs. Wheatman themselves! He did similar things after Pearnough's place was blown up, and he offered a reward out of his own pocket for the discovery of the perpetrator of that outrage!!

And are these scoundrels,—these disgraces to humanity, to escapio scot-free? It was unfortunately, and yet unavoidably, a condition laid down by the Commission that, if they confessed fully and truthfully, they would obtain each a certificate, securing them against molestation or punishment by the law; but it is to be hoped it will be proved that they have not quite fully or truthfully confessed, so that the law may yet lay hold of them. And, at all events, their career at Sheffield is at an end, and they will have no Government aid, at least, to depend upon elsewhere. Perhaps, however, before they can get away from Sheffield, the townspeople may give them a testimonial of some kind which they shall have reason to remember. It would indeed be a pity to "put them under the pump," for the pump would be defiled by such a process; but we should not be sorry to learn that some of their bones were accidentally, or even unlawfully, broken.

PROPOSED ASSOCIATION OF BOROUGH SURVEYORS.

SINCE the passing of the Board of Health Act in 1848, and the adoption of the Local Government Act by all the principal towns in the kingdom, a large staff of officers has been required to carry out the provisions of these Acts. The most important officer of this staff is the surveyor, who has the practical management of all those works in a town which are essential to the health, the comfort, and the convenience of the inhabitants.

It is scarcely necessary to say that the duties of the surveyor are exceedingly varied in their nature, requiring not only much practical and scientific knowledge, but a special aptitude of character to enable him successfully to deal with the various and intricate matters that are constantly referred to him, and to discharge efficiently his duties to the Board, on the one hand, and the public on the other. Only those who have held the office can fully realise the trying nature of the position of a borough surveyor, always liable to be attacked by a small clique, who are averse to every improvement, and jealous of the expenditure of public money collected by rates; and never properly supported by a Board, who have no fixed principles of action, owing to the fact of their chairman and many of the members changing every year.

The importance of the office cannot be denied, when it is considered that the whole of the works connected with the paving, lighting, and sewerage of the town; the superintendence of new buildings; the highways, pleasure-grounds, and baths; the management of the fire brigade; the scavenging; and in many cases also of the water and gas supply, are included in the duties; and, occasionally, the surveyor is expected to design and carry out large and important works

of construction; and even, if not primarily responsible, yet to him must always pertain the duty of procuring the necessary local information for, and providing the consulting engineer with, the data necessary to enable him to advise as to the best course to be pursued.

The number of towns that have adopted the Act is over 400; and, as many boroughs have two surveyors, and the metropolis adds about fifty more, the number is sufficient to form a very important body.

My object in thus calling attention to the position of the borough surveyors is to point out the fact that they are as a class unrepresented. While engineers, architects, lawyers, doctors, and all other professions have their common meeting-ground in their representative association or institution, the surveyors are an isolated and scattered body. It seems, therefore, exceedingly desirable that they should unite and form an association, the objects of which should be:—

1st. To confer a recognised position on the class of engineering surveyors who have been called into existence by the sanitary demands of the day.

2nd. The collection of statistical and other information for the use of its members.

3rd. By conferring degrees by voluntary examinations, similar to those granted to the "District Surveyors" of the metropolis, or as proposed by the Institute of British Architects.

4th. To confer all those advantages of membership which appertain to a central representative institution.

With regard to the first object, it must have often been felt by a borough surveyor that he holds an anomalous position. The title "surveyor" conveys no idea of his standing, the word having so many meanings; there are land surveyors, highway surveyors, mining, measuring, building, and numerous other surveyors. It is true, some borough surveyors are members of the Institution of Civil Engineers, and others of the Institute of Architects, but the great body of them are not qualified by their antecedents or attainments for membership of either, while fully qualified to hold a middle position. An Institution of Engineering Surveyors, with the initials M.E.S., would meet the want, and give at once a recognised position to its members. It might even be a branch of the Institution of Civil Engineers if the Council would take them under their wing.

The importance of the second object must be felt by all who have held the position of borough surveyor, from the numerous papers of queries that are constantly sent out by different officers for inquiry on particular subjects, and the necessity felt for obtaining the latest information on the various sanitary appliances that are constantly being brought forward.

The third object is one, the necessity for which will be recognised by all who have either been candidates for vacant offices, or who have had the difficult task of selecting from the numerous applicants.

An advertisement for a borough surveyor to a town of any size, will call forth a response from seventy to eighty candidates,—some eminently qualified, others totally unfit. The only means a committee of selection has of judging of the merits of the several candidates is from their testimonials, and the indiscriminate way in which written testimonials are given, renders them eminently unsatisfactory as a means of judging of the fitness and qualifications of a candidate. The fact of having passed an examination before a properly recognised authority, would give a qualified man an advantage over all others, that would amply repay the time and trouble it might take.

I hope this letter may be the means of tending to some joint action on the part of my brother surveyors.

W. H. WHEELER,
Borough Surveyor, Boston.

A FEW HINTS ON BATHING.

As your columns are always open to suggestions which have a sanitary purpose, I feel sure you will allow me space for a few observations on bathing. Considering the great ignorance that prevails on the subject, and the risk incurred by numbers of persons during the bathing season, I wish to propose that notices be conspicuously placed near all bathing-places and baths, cautioning persons not to go into the water within two hours after a meal. Bath attendants should be well instructed upon the

rules of hygienic bathing, and see them attended to.

I throw out these hints, as cases are not rare in which apoplexy and other seizures are induced through an ignorant and imprudent method of bathing. There is no reason why such an agreeable recreation during the summer season should not be indulged in with benefit instead of harm, if proper precaution be exercised in the use of the bath.

SANTAS.

HAUGHMOND ABBEY.

SIR,—My attention has been called to a review of Mr. Pidgeon's "Guide to Haughmond Abbey," in your number for June 15th, and being away from references, I am unable to do more than point out that in the seventeenth volume of the *Journal of the British Archaeological Association* (pp. 216—218), appears a tolerably exhaustive account of this abbey, both architecturally and historically. Judging from your review, it appears that Mr. Pidgeon has erred in the usual way of local writers, by disregarding your own valuable remarks, as well as those of others who endeavour to treat, critically, subjects such as this, on true and broad principles, for the use of students.

Paris.

E. ROBERTS.

BUILDING PRICES.

SIR,—It frequently happens, in the event of a builder's account being disputed, that the evidence before an arbitrator is very wide as to the percentage of profits on labour and the various descriptions of materials. Would it not be well if the various local associations of architects would define these points, and fix a standard for future valuations? This, together with the mode of admeasurement, is a matter requiring immediate attention, as those can testify who have had to support a case before a legal arbitrator, with unscrupulous witnesses on the other side. I think it a great pity that so much false evidence should be given where it is possible to prevent it by means of some recognised authority.

Z.

ST. GEORGE'S, HANOVER SQUARE.—THE RECENT ELECTION OF SURVEYOR.

At the last meeting of the Vestry, held on the 20th inst., a further application was read from the unsuccessful candidates for the office of Surveyor, requesting to be allowed their travelling expenses, amounting together to 23*l*. 10*s*. The memorial was signed by Mr. H. Cochrane, St. Andrew's-square, Edinburgh (who made two journeys to London); Mr. M. Pritchard, Bedford Leigh, Lancashire; Mr. H. Boyle, Cow-hall, Hulme; Mr. A. Sargill, Bower Spring, Sheffield; and Mr. W. H. Wheeler, Boston. Mr. Joseph Bennett said it was perfectly certain that in the first instance it was stated no expenses would be allowed, but when the nine gentlemen were requested to come to stand the chance of election nothing was said as to expenses. In his opinion, it was a clear case for the consideration of the Vestry, and he would ask as a matter of principle whether it was worthy of them to refuse what was asked. Admiral Duncombe, M.P., said the previous resolution arrived at by the Vestry must be rescinded, and a special Vestry called for the purpose before the request could be acceded to. Mr. Joseph Bennett gave notice to that effect. A motion by Mr. Westerton, that "the letter lie on the table," was lost, 11 voting for it and 16 against. The general feeling of the Vestry seemed to be in favour of granting the application.

At the same Vestry an application was read from Mr. H. G. Matthews, 1, Farnival's-inn, Houlborn, who stood second on the list at the election for surveyor, asking for a testimonial to that effect. Dr. Appleton moved the request be granted, and that the seal of the Vestry be attached to the testimonial. It was resolved the matter should be postponed till the next meeting.

FLINT STONES ON LONDON STREETS.

At the usual meeting of the Committee of Works of St. George's, Hanover-square, on Wednesday, Sir William Codrington, of Eaton-square, made a reiterated complaint against the enormous size of the flints placed on the thoroughfares in the parish, especially in Belgrave-square and Eccleston-street. The contractor is bound not to place stones larger than five ounces on the streets, but the complainant assured the committee that he saw plenty of stones, three or four times that size, lying about, and that men were actually breaking them whilst the traffic was going on. In conclusion, Sir William observed, "I submit that it is the duty of some person to see that the contractor does his duty, and that the Board do pay some person out of the rates to do so. At present the contractor is favoured at the expense of the horses and carriages of all descriptions which have to break these stones every day of the contractor being kept to the terms of his contract." The new surveyor said he had only been a few days in office, but, from what he had already observed in the different thoroughfares, there were just grounds for the complaint which had been made as to the size of the flints. It was resolved unanimously to call the attention of the contractor to the complaints which had been made to the committee on the subject.

THE ACCIDENT AT WELLINGBOROUGH NEW CHURCH.

SIR,—At the time of the accident at Wellingborough new church, a statement appeared in your paper to the effect that the cause of the fall of the south arcade was the failure of the stone of the neighbourhood of which the piers were built; but this was not true,* it was owing to the fact that, instead of building the foundations under the piers of large flat-bedded walling stones, well grouted with gravel mortar as specified, the cores were filled in with small stones, and no gravel grouting used at all. Moreover, cracks appeared in them a fortnight or so before the fall of the south arcade, and neither the clerk of the works nor the builder informed me of them; but, seeing them get worse, they consulted together, and in their wisdom came to the conclusion that the best course to pursue was to loosen the centres, when down the whole thing came, fortunately without injuring any one: they then sent me a telegram informing me of the catastrophe. The north arcade I found to be also in a very bad condition, but fortunately the centres had not been loosened, and we have just completed the reconstruction of the foundations under the superintendence of I need hardly say, a new clerk of works, keeping the arcade up by proper cradles and shores; and the fallen arcade is being reconstructed on thoroughly good foundations.

The stone of the neighbourhood is used in the piers of the fine old parish church of Wellingborough, Pinner, and others, carrying far greater weights than we are putting on to the piers of the new church, which are built of Box-ground stone and local red stone, in alternate courses, and were, previously to the accident, uninjured.

C. BUCKERIDGE.

THE LAW-COURTS COMPETITION.

SIR,—I read the article in last week's *Builder*, and felt some surprise at the joint committee of the bar and solicitors should differ from Messrs. Shaw and Fownall on a question of fact.

I therefore determined to go to Lincoln's-inn with diversiders and ascertain for myself whether or not in Mr. Waterhouse's design the courts are of the specified size. Taking the common-law side, where the courts are specified to be 1,376 square feet in area, they are shown by Mr. Waterhouse exactly 22 ft. by 36 ft., giving an area of 1,024 ft. or 352 ft. less than the area prescribed by the conditions; and the diminished area includes the inclosures on the sides of the courts.

The deficiency is caused by the architect holly taking his bar-corridor out of the back of the courts, and this corridor is the only means of public communication between the courts on the first floor; so that if it did not exist, and the courts were made the prescribed size, there would be no means for counsel and others to pass from court to court on the same floor, except through the intervening courts.

As to the statement of the Bar Committee, that because the portion cut off from the court has been so cut off for the sake of quiet, and because it is partially glazed, therefore the courts which is only 1,024 ft. is in accordance with the conditions which prescribe an area of 1,376 ft. I will only say I cannot understand it, and should be sorry to see an answer before an arbitrator to any of the eminent lawyers who have signed the Report. It seems to me that they may succeed in proving their statement when 2 and 2 are shown to be 8; but not before.

A SURVEYOR.

CERTIFIED FOREMEN AND CLERKS OF WORKS.

SIR,—Has it ever occurred to you in this competitive age of examinations as to qualification, to see the necessity of a council, composed of architects and builders, empowered to grant certificates of ability to builders' foremen and clerks of works? I have often thought that a council, composed as above, would be productive of a great amount of good; both as a guarantee to the public that they had fit and proper persons to see that their works were carried out in a proper manner; also to architects, as it would be great satisfaction to them to know that there were efficient foremen and clerks of works employed; and that the general public would soon find it very much to their benefit to employ men so certified; and, lastly, the clerks of works and foremen themselves would be proud to have the grain separated from the chaff: the thoroughly competent man would have no difficulty in getting employment and a proper remuneration for his services; it would tend to elevate them as a class, and give them a position they never before occupied. As a rough outline of the plan, I would suggest six architects and six builders (practical men) to sit as a council, two leaving office every year, but eligible to re-election; to be elected by the present foremen of all our large towns, or by the employers, and nominated by the Architectural Society. Each candidate for examination to pay 5*s*. personally to be examined, and 5*s*. upon receipt of his certificate. As there must be some expenses incurred, it is only fair that the certificates should be paid for; and I

* No such statement was made in the *Builder*. Mr. Buckeridge should be more precise. What the paragraph said was,—"Opinion at present divided as to whether the blame rests. The piers were constructed of the soft red sandstone of the neighbourhood, the material specified in the contract."—See page 417, ante.

think no man would find fault with the expense. The council to meet once in every three months. Of course, each large town could make its own arrangements.

We certify captains and mates of vessels, and also subject candidates for the civil service to a competitive examination; and why not also the "of work and foremen?" The lives of her Majesty's subjects are of equal value on sea or on land.

F. W. B.

THE DERBY SURVEYOR'S DUTIES.

A SPECIAL meeting of the Derby Local Board of Health was held last week.

"To take into further consideration two important matters brought forward without due notice at a late special meeting held on the 5th of June, viz., the increase of salary to the clerk of the Local Board, and permission to private practice by the surveyor to this Board."

After a good deal of discussion, with a noisy accompaniment amongst the ratepayers present in the hall, which required the intervention of the police, the following resolution was carried by a majority of 20 to 18, (one vote in the majority being objected to), as an amendment on one confirmative of the previous one,—

"That, in the opinion of this Board, this resolution passed at the last meeting, held on the 5th instant, with respect to a re-engagement of the borough surveyor, is irregular, if not absolutely illegal, and it is therefore resolved that such resolution be expunged from the minutes of the Board."

It was also resolved,—

"That, in the opinion of this Board, the resolution passed at the last meeting, held on the 5th instant, with respect to an increase of the salary of the clerk of the Board, is also irregular, if not absolutely illegal, and it is therefore resolved that such resolution be expunged from the minutes of the Board."

Finally it was resolved, by a majority of 21 against 16, that—

"This Council resolve itself into a committee of the whole house to meet at 11 a.m., July 10th, to consider the application of the borough surveyor and clerk to the Board."

CHURCH-BUILDING NEWS.

Nuthurst.—The chancel of the church, which has been closed for several weeks past, while undergoing renovation, has again been opened. At the time the church was restored, the chancel was left incomplete; but now the whole is finished. The carpenter's work was done by Mr. John Fuller, of Nuthurst, and the fresh laying of roof and stone work executed by Mr. Hoadley. The reredos of encaustic tiles from Messrs. Minton's was laid by Mr. England, of London. The decorations of the walls and roof were by Mr. Fisher, also of London. The texts round the windows and arches were painted in oil on zinc by Mrs. McCaragher. Gurney's patent radiating stove has been placed in the chancel.

Burton-on-Trent.—The foundation-stone of Christ Church Mission-room, Fleet-street, has been laid. After the opening, the congregation adjourned to the spacious malt-offices belonging to Messrs. Allsopp & Sons, where tea had been provided. The building will be 70 ft. long by 20 ft., and is to be in the Gothic style. The design is by Messrs. Gilce & Brookhouse, of Derby; and Mr. Joseph Lakin, of Stapenhill, is the builder.

Ingatstone.—The old church of St. Mary has been re-opened, after being restored and beautified. The work of restoration, which was commenced about a year ago, has been carried out by Mr. Jas. Brown, of Braintree and Chelmsford, from the designs of Mr. F. Chancellor, architect, Chelmsford. Nearly 1,600l. have been expended in the restoration. When the work was commenced, the building was in a sad state of dilapidation; but an entirely new roof has now been placed on the south aisle, the chancel new roofed, and the roof of the nave restored. The old bell-fry over the doorway has been removed; new windows have been placed throughout the church; and the old pews have been removed, and the church re-seated throughout with open benches of stained deal, with carved traceries at the ends of the benches, the traceries of the chancel-benches being carved poppy-heads. The flooring is also new, and there is a new stone octagonal pulpit with carved panels. The restoration of the chancel has been carried out at the sole expense of the rector, the Rev. L. Parkin.

Boulge (Woodbridge).—Boulge Church, after having been closed for some time, during the progress of restorations, which have been carried out entirely at the expense of Mr. J. P. Fitzgerald, of Boulge Hall, has been re-opened for divine service. Boulge is a small parish, lying to the north of Woodbridge, from which town it is about three miles distant; and the church, which is dedicated to St. Michael, stands just within the park of Boulge Hall. In order to complete the restoration of the body of the church, Mr. Fitzgerald has added a south transept. The walls of the nave, &c., are rubble, with Caen stone dressings, angles, &c., and the

roof of plain tiles with a ridge. The new chancel-walls are faced with riven flints, with Caen stone angles and quoins, the roof resembling that of the other parts of the building. In the gable of the new transept is a stone window, in the Decorated style, to which the building belongs, of three lights, filled with cathedral glass. The only other alteration which has been made, whilst the church has been closed, has been the insertion of a lancet window on the west side of the north porch. The brick tower remains unaltered, all that has been done to it being to underpin it, and put down some new brickwork last year, signs that it might give way having been observed. The work, as well as the former restoration, has been carried out by Mr. B. Dove, builder, Woodbridge; Messrs. Habershon & Pite, being the architects. The cost of the work just completed is between 300l. and 400l.

Nottingham.—The ceremonial stone of a new church at Smeinton Elements has been laid by the Earl of Manvers. The new church is dedicated to St. Matthias. The church is situated on a declivity almost opposite the hock of buildings known as the "Elements," about fifty yards from the Carlton-road. It is shaded by a number of poplar and elm trees; and when the building is completed the appearance of the whole will be pleasantly quiet and comparatively rural and secluded. The church, which is in the Gothic style, is nearly ready for the roof. It consists of a nave 67 ft. long and 48 ft. wide, with open-timbered roof, the ridge of which will be nearly 50 ft. from the floor; a chancel, with circular apse, of equal height, 32 ft. long and 20 ft. wide; and chancel-aisles on either side, out of which a vestry and organ-chamber are partitioned off with open screens. The division between the nave and the chancel and chancel-aisles will be by a triple arcade, with two stone columns, in one of which the ceremonial stone will form the base. A fourth arch, rising to a height of 35 ft., will divide the chancel from the apse. The walls throughout are built of Balwell stone, and lined with red brick, interspersed with black brick hands and panellings. The building will provide for upwards of 700 on the floor of the church, and the cost, including fittings and internal decorations, will be about 2,600l. Messrs. Hine & Evans are the architects, and Mr. J. E. Hall the builder.

DISSENTING CHURCH-BUILDING NEWS.

Burley.—A new Wesleyan chapel having become necessary, it was decided to build one, and to use the old place of worship as a schoolroom. A subscription was therefore entered into, architects were engaged, and plans were prepared, and the works have been completed. The new chapel stands near to the old one. The edifice is of Geometric Decorated character, and consists, on the ground-floor, of an inclosed vestibule, from which both the body of the chapel and the gallery staircase are reached. The internal dimensions on the ground-floor are 50 ft. by 45 ft. within, with central recess for the Communion, opening into the chapel by an archway, enriched with corbels, shafts, and carved capitals. On one side of this recess is the organ chapel, and on the other is the minister's vestry. A gallery runs round three sides of the chapel, supported by light iron pillars, which are continued to carry an open timber roof, divided into a central span and two side aisles, of dressed timber-work, and stained and varnished. The front elevation presents a central double doorway, surmounted by a rose window of plate tracery, inclosed by a pointed arch, and the gable terminated by a foliated metal finial. This elevation is flanked by the inclosures to the gallery stairs, forming turrets with conical roofs and gilded finials. The side elevations have two light canted-headed windows. The accommodation is for 500 adults and 150 children. The building will be of stone throughout. Lighting, warming, and ventilation have been attended to, and the estimated cost of land and building is 3,500l. The architects are Messrs. Lockwood & Mawson, of London and Bradford.

Bristol.—The foundation stone has been laid of a new chapel at the top of Lawrence-hill, one of the poorer quarters of Bristol, where a new colony, which has been named Russell Town, has sprung up. This new Congregational Church is to be erected at the sole expense (3,000l.) of Mr. William Sommerville. The site has been presented by Mr. Charles Topler Godwin, and this is considered equivalent to 400l. The

NAMES OF PLACES IN LONDON.

In the *Builder* for April last, page 285, I referred to "Blow Bladder-street" as marked in some old maps of London to be situated between Newgate-street and Chapside, and as one of the names of which has disappeared in modern maps.

It is perhaps hardly worth troubling your readers upon so trifling a matter, but in the event of your regard for antiquity inducing you to feel otherwise, I beg to say the name is, I find, mentioned in Pennant's "London," octavo edition of 1813, vol. i., page 358, and as situated in London to have got up a sort of trade-union for the same purpose, of which I have seen it in some old map, though I cannot now say what map.

Perhaps some of your readers may be more fortunate. Pennant also refers to several other places, the names of which have gone to the tomb of all the Capulets, such as Past-house Fields, now Carnaby Market; Gelding-square, now Golden-square. Folio 175, &c. A. Z.

NOTTINGHAM MECHANICS' HALL COMPETITION.

Srs.—The first premium is awarded to an "Architect and Builder" of the town, and a member of the committee!

"CAUGHY NAPPING."

LOCAL SURVEYORS AND PRIVATE PRACTICE.

Srs.—I see by your last number that an organized system of prosecutions has been set on foot by what is called the "Northern Architectural Association" against architects and surveyors holding public appointments; and that also in Derby the architects and surveyors of the town have got up a sort of trade-union for the same purpose. The object they have in view, apparently, is to exclude any unhappy member of their profession who should have had the ill luck to be selected for a public appointment from over after practicing his profession. They are, however, only actuated by a sincere desire to protect the interests of the ratepayers and the public at large; and one member of this "Northern Trades' Union," Mr. Thompson, is of opinion, in his own mind, however low his status" (or high, either, we may suppose), "should have any private practice." Now if this opinion is of any value, it should apply to all officials, and not to local surveyors only. How is it that we do not find the Law Society, or any other legally constituted body, interfering with the right of private practice, which almost every town, borough, or local board clerk in England enjoys? Why do the local solicitors not get up a requisition that the clerk to the local board be debarred from the practice of his profession as a solicitor because he has been appointed clerk to the board? It is unfortunate for the profession that any person who chooses can call himself an architect, or dub himself a surveyor; and if he happens to know nothing of these professions, or anything akin to them, he is not only imposing a title of civil engineer, Solicitors and attorneys on the other hand, are the title of gentleman granted them by law, and are bound to have some education to support it.

But I fancy one who has a university or eighty candidates who apply for every local surveyorship, knows how few can show the slightest qualification for the office they would have. Few towns can afford to pay a salary to a clerk to a service of a competent person; nor do they, indeed, require them. It is most desirable that every local surveyor should be the best man that can be obtained, and it is monstrous to suppose that he should be debarred from practicing the profession he has spent his life in studying further than the sanitary or public works of one small town may afford him opportunities.

It would be as reasonable as appointing a parish doctor and prohibiting him from practicing in the neighbourhood. In the contrary, it is most desirable that if the surveyor is a clever man, he should practise in the neighbourhood, and the district be benefited by having at least one who aims to professional skill have stood the test of competition and examination.

Should the machinations of these architectural trades' unions be successful, the result must be that no man of proved ability will be able to hold any of the smaller class town surveyorships. In London all the district surveyors have their private practices; in Edinburgh the city architect has a large one also in the city; and in London, and in many other places. What would be said in London if any society of literary men in the metropolis should petition the Home-office authorities that Froloper and Yates should be compelled to confine their pen to their official clerkships, or have the subsidy they receive the shape of salary withdrawn, and their places declared vacant?

For my own part, I must own that I am what Mr. Thompson would call an official. Among my clients are the authorities of the place, in which I have the happiness to reside. The other architects and surveyors also, but they have not formed an association to deprive the clients of my services or of me of my subsidy, as the surveyors of Derby are pleased to call the annual sum for which I contract to do the town work. I trust, Sir, that with your well-known fairness you will not allow the local surveyors of your borough of surveyors of England to be the victims of a narrow-minded jealousy on the part of the other members of the profession. The tenure that these gentlemen hold of office is sufficiently precarious, and it is of the highest importance for the proper discharge of their respective duties that they should, by means of their private practice, obtain more independence than is compatible with placing them entirely at the mercy of their respective Boards.

"A LOCAL SURVEYOR."

designs of the chapel are by Mr. W. J. Green, architect, of London. The general building contract has been taken by Messrs. Harding & Vowles, of Bristol. The style of the chapel is to be the English Perpendicular. The edifice is designed to afford sitting accommodation for 800 persons.

Chipping-Norton.—Some months since a site for the erection of a new chapel and school-rooms in the West-street, Chipping-Norton, was purchased by the Wesleyan Methodists of this town. Since then the old buildings have been cleared off, the foundations laid, and the building commenced. The corner stones have also been laid. The architect is Mr. William Peachey, Darlington, and the builder is Mr. Charles Young, of Chipping-Norton.

Books Received.

The Engineer's, Mining Surveyor's, and Contractor's Field-Book. By W. DAVIS HASKOLL, C.E. Second edition. London: Lockwood & Co. 1866.

In this second edition the author has entered more into detail than before as to the application of the tables. He has therefore given, in the Introduction, an explanation of the system of levelling with the theodolite, and also of the system of traverse surveying and plotting, more especially as applicable to the working surveys required through thickly populated districts, where great accuracy in the plans is necessary. For those who object to the theodolite a set of tables has been given for setting out curves by numerous offsets from one tangent. The author has, besides, added earthwork-tables for every 6 in. up to 80 ft. deep, and a table of gradients intended to reduce the labour of preparing working sections.

The Sewage Question: being a general Review of all Systems and Methods hitherto employed in various Countries for Draining Cities and Utilising Sewage, &c. Also a Description of Capt. Liernur's System, &c. By F. C. KREPP. London: Longmans & Co. 1867.

THIS is scarcely an honest title. It tends to the belief that in the book it prefaces will be found a full and fair examination of all the systems of drainage employed, whereas the volume is simply and merely the trade hook of "Captain Liernur's Engineering Agency." It is all fair and right for an inventor to set forth the merits of his scheme; let him do so by all means. But it is better to do it in a straightforward way, and not to publish the description and panegyric under cover of something else.

We have before now briefly described the system in question. We will repeat the outline, however, by one quotation from Mr. Krepp's book:—

"Small iron reservoirs are placed under the pavement of all principal street-crossings, each reservoir being connected by means of small iron pipes with the privies of the houses next to it, in such a manner that no offensive gases can escape; in other words, from every single privy a continuous airtight passage leads into the next subterranean street reservoir, without the intervention of any cesspool.

The pipes are provided, each one, with a valve, to be worked from the side-walks of the street, so that the communication between each privy and a street reservoir can be established or cut off at will. These valves remain always hermetically closed, except during a short moment, when the privy contents are to be discharged into the street reservoir connected with it, which occurs during the night, in the following manner:—

A locomobile steam-engine working an air-pump is driven near the small subterranean street reservoir, to exhaust the air out of it, and out of the entire system of main and branch pipes up to the hermetically-closed bonse-valves, which are then, one after the other, opened and shut again, thus discharging the privy contents, including all gases, into the street reservoir.

After all the house-valves have thus been successively opened and shut, an operation which practice has shown can hardly be done quick enough, the small reservoir itself is emptied by pneumatic pressure into a hermetically closed wagon-reservoir, attached as a sort of tender to the air-pump carriage. This done, the connecting hoses, by which the movable apparatus communicates with the stationary one

under the pavement, are uncoiled, and the locomobile with its tender proceeds to the next reservoir, and then to another and another, until the tender is filled.

The filled tenders are drawn away by the horses to a temporary depot, where they are decanted by direct hydraulic pressure into air- and water-tight barrels, which are then at once sent like any other goods, by rail or steamboat, to the lands requiring the excellent fertiliser thus collected."

Very ingenious, but certainly not what we are disposed to recommend; and our readers will not want to be told why.

The Manual of Dates. By G. H. TOWNSEND. Second edition. Warne & Co., Bedford-street, Covent-garden. 1867.

THIS edition of a very useful book has, it is stated, been much enlarged, and also revised and verified, as far as possible, by renewed reference to authorities. The number of articles in it, alphabetically arranged, is said to be 11,045, the first edition containing 7,383. It consists of upwards of a thousand pages, broad octavo.

A work such as this can never be made quite correct, nor in all cases satisfactory; but some trouble in examination induces us to think that it is amongst the best of its kind. We have failed in some cases to obtain from it what we required; but in a great majority of instances it contained all that was wanted, or that could be expected in such a work; and where, at first, it seemed to be defective, a little further research enabled us to find the required information under another head than that first referred to.

Miscellaneous.

SOCIETY OF ARTS MEDAL.—The Society of Arts have this year awarded the Albert Gold Medal to W. Fothergill Cooke and Professor Charles Wheatstone, F.R.S., "for their joint labours in the introduction of the electric telegraph." The medal has been struck in duplicate, and a copy will be presented to each.

THE LEEDS EXHIBITION.—The arrangements for the National Exhibition of Works of Art, to be held in Leeds next year, appear to be progressing very favourably: a large number of influential persons have already promised contributions of pictures and objects of ornamental art.

EXTENT OF THE RAILWAY SYSTEM.—In the reply of the directors of the Brighton Railway to the Committee of Investigation, it is stated, that at the end of 1855, the total number of miles of railway sanctioned in England and Wales amounted to 9,486 miles, and the share and borrowing powers to 272,817,639*l.*; whilst at the end of 1866, the total number of miles authorized was 16,292, and the total share and borrowing powers, 516,801,356*l.*

NEWSPAPER PRESS FUND.—The expected dinner will take place this (Saturday) evening, the 29th, at Willis's Rooms, St. James's, and the Right Honble. W. E. Gladstone, M.P., will preside. The object of this Association, we may repeat, is to raise by subscriptions and donations a fund for the relief in want or distress of the whole paid class of literary contributors to the press of the United Kingdom, being members; as well as to afford assistance to their widows, families, parents, or other near relatives, in the hour of need. A remarkable list of stewards has been published, and there is every reason to expect a large assemblage of men connected with politics, art, literature, science, and the drama.

ISLINGTON VESTRY-HALL.—At a general meeting of this vestry, last week, the subject of the mass of scaffolding with which the new hall is disfigured was discussed, and it was explained by the clerk that a quantity of the compo facing of the building (13 or 14 cwt.) had fallen down; and it was found, on Mr. Dennis, the builder, examining it, that the facing had not been put on till the first coat was too dry, and that there was risk of more and more of it coming down, so that the whole work ought to be done over again at a cost of upwards of 250*l.* The vestry finally resolved that no further steps be taken in the repairing of the building till Mr. Higgins, their surveyor, had examined it, and reported to the vestry on the probable cost of the repairs.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—On Thursday evening last, an interesting lecture "On the Archaic Influences affecting Ionian Art," was given by Dr. Hyde Clarke.

RESTORATION OF ST. LAWRENCE'S CHURCH, READING.—The Finance Committee have decided upon at once entering upon the work, the contract having been taken by Mr. Lovett, of Wolverhampton, builder. Further subscriptions to a great extent are needed. The tenders for the work received by the committee were as follow:—Mr. Barnicoat, 4,457*l.*, being 3,220*l.* for general repairs, and 1,237*l.* for tower. Mr. Sheppard, 4,050*l.*: 3,574*l.* for general repairs, and 476*l.* for tower. Mr. Matthews, 3,980*l.*: 3,530*l.* for general repairs, and 450*l.* for tower; and Mr. Lovett, Wolverhampton, 3,784*l.*: 2,700*l.* for general repairs, and 1,084*l.* for tower. Mr. Lovett's tender for general repairs was accepted, with slight alteration, the amount being 2,628*l.*, exclusive of tower. Mr. Joseph Morris is the architect. Mr. Lovett is the contractor for the new local station on the Great Western Railway.

MEMORIAL OF MR. LE STRANGE.—The east window of Hunstanton Church has been recently filled with stained glass. The subjects in the centre light are the Crucifixion, Resurrection, and Ascension of the Saviour. In the two lights on either side of the centre are represented Old Testament types of each of these great events, and in the two outer lights are depicted the Last Supper, the Agony, the Betrayal, and Burial of our Lord, with His appearance to St. Mary Magdalene and to the two disciples at Emmaus, making fifteen subjects in all. The head of the window is filled with paintings of the Heavenly Host, corresponding with the corbels in the chancel roof, and with the figures painted on the reredos. The inscription runs across the window immediately below the medallions, and is as follows:—"In memoriam Henrici Ffestrance Styleman le Strange, conjux et liberi ejus posuerunt, MDCCCLVII." The window is the work of Mr. F. Preedy, architect.

THE HERTFORD NEW UNION WORKHOUSE.—For the new Union Workhouse seventeen plans were sent in, and inspected by the Board. A Committee of the whole Board was appointed to make a selection. The selected designs are those of Messrs. Thomas Smith & Son, of Hertford; Mr. Hooker; Mr. Peck, the architect of the workhouse at East Grinstead, a view of which is exhibited with the plans; Messrs. Messenger & Co.; Mr. J. T. Bressey; and Mr. Blessey. In most of the plans the corridors are closed at the ends. In all of them, the infirmary and fever-wards are detached from the main building, and at a considerable distance from it; and the tramp wards are placed at a corner of the ground accessible from the road. In most of them the front of the building has a western aspect, looking towards Hertford; in others it has a northern aspect abutting on the road. In some cases the competitors have omitted to give sections showing the natural fall of the ground, and the buildings placed on it clearly marked.

RESULTS OF SONOROUS VIBRATIONS.—This interesting and curious subject has again been brought before the Royal Institution by Professor Tyndall, who extended the consideration of it to the influence of vibrations on light, on streams of water, and on jets of smoke. Some of the experiments exhibited in previous lectures were repeated with variations. A long gas flame, just on the point of becoming sonorous, or roaring, was put in agitation by sounds resembling the chirruping of birds; and Professor Tyndall, having called on his audience to take part in the experiment, they commenced imitating the sound, and the general chirruping of the members of the Royal Institution was accompanied by violent movements of the flame. A jet of smoke was influenced by sonorous vibrations in a similar manner, a continuous jet of smoke about 2 ft. high being broken down and divided into two jets by the sound of an organ-pipe. A stream of water was similarly affected, a continuous stream having been broken into drops by the sound of a tuning-fork. [Moral: Keep quiet while fire-engines are at work in extinguishing flames, whether they be "singing flames" or roaring ones.] This experiment was varied by directing the jet of water upwards so as to form an arch; and when a tuning-fork of a certain pitch was sounded, the continuous arch of fluid was broken into drops. Several other interesting experiments were exhibited to illustrate the remarkable effects of sonorous vibrations.

A CEMETERY FOR SOUTH STOCKTON.—A site the Mandale-road has been purchased for a cemetery for South Stockton (on Tee). The committee have selected Mr. G. G. Hoskins, of Arlington, as their architect for the chapels and lodges.

BRISTOL ASSIZE COURTS COMPETITIONS.—The signs sent in for the second competition have not been received, and have been referred by the committee to Mr. Street. It is urged that they ought to be exhibited and publicly canvassed for a decision is arrived at.

APPOINTMENT OF MEDICAL OFFICER OF HEALTH FOR PADDINGTON.—At the last meeting of the vestry of Paddington, Dr. William Hard-cke was elected medical officer of health for his parish, in the room of Dr. J. B. Sanderson, resigned. He received 29 votes. There were numerous other candidates, but the only other gentlemen who received any support were Dr. Evenson and Mr. Bird; the former obtaining votes, and the latter 4.

THE TRADES' MOVEMENT.—The carpenters in the employment of one of the leading employers in Nairn struck work in order to compel their employer to dismiss a non-union workman, and the employes were on day's wages, it was a demand for them to leave or be discharged at a moment's notice, so that the employer was completely in the power of the men; and being engaged in finishing a contract in connexion with the Marine Hotel, the non-fulfilment of which would involve a serious loss, Mr. Mackintosh was obliged to comply with the terms of the men, by dismissing the non-unionist.

A NEW BREAKWATER AT THE ISLE OF MAN.—There is every prospect, it appears, of an efficient breakwater being constructed at the mouth of Douglas Bay, Isle of Man. The Government has sanctioned the appropriation of a balance of increased customs duties to this and other works of improvement around the island; and this balance will amount to about 13,000l. per annum. The Douglas breakwater, if carried out according to the plans submitted to the Tynwald Court, will form an island 1,200 ft. long, and will enclose an area of 42 acres at low water. Its entire cost will be 179,000l., but the plans may be so modified as to reduce the expenditure to 130,000l. The construction will occupy seven years.

OPENING OF A FREEMASONS' NEW LODGE AT DOCKERMOUTH.—At the annual St. John's meeting of the Skiddaw Lodge (1002) their new lodge room was opened for the first time. The dimensions of the room are 27 ft. by 16 ft., and it occupies a prominent position in the Market-place. The ceiling is a light blue, whilst the pilasters and cornices are a somewhat darker brilliant tint, the quoins being adorned with tasteful busts. The walls are panelled in imitation of Scottish granite. At the top of a recess which forms the background to the canopy of the chair or throne of the W.M., appears "The All-seeing Eye" in a blaze of illumination; and the cornice, which is mosaic, is in red and gold. The canopy is crimson damask, with a heavy gold fringe, and lined with yellow satin, and the chair is cushioned with crimson velvet and gold fringes. Nothing can be smarter.

CHOLERA AND EPIDEMIC DISEASES IN THE METROPOLIS.—At the last weekly meeting of the sanitary vestry, the subject of sanitary precautions was introduced, and the medical officer of health, Dr. Whitmore, thought it highly important that the vestry should take such precautions at the earliest possible date, as there had been already two or three cases of undoubted cholera at the East-end of London, and a very fatal and formidable disease, closely resembling black fever, had appeared in Liverpool, and was very prevalent in Ireland, especially near Dublin. These diseases were promoted and aggravated by overcrowding and defective ventilation; and if they found their way into the metropolis, the overcrowding was so great, and the ventilation so imperfect, that very fatal and serious results would follow. With respect to the erection of mortuary houses, his opinion was that there was no other sanitary arrangement so much needed. In his experience he could state that there were many houses where a dead body was kept in a room occupied by six or seven persons, and where every domestic office was performed. He hoped the Board would no longer defer the consideration of sanitary matters. It was resolved to go fully into the subject.

A NEW CONCERT-HALL FOR BRIGHTON.—A concert-hall is in course of erection, on ground situated between West-street and Middle-street, under the superintendence and from the designs of Mr. Horatio N. Gouly, architect. The hall is 200 ft. by 46 ft., with galleries on three sides, capable of accommodating 3,000 persons, in addition to which the orchestra will accommodate 400 performers and an organ. The building is fire-proof. The basement, which is let off as wine-cellars, is arched over with concrete on iron girders. At either end will be restaurants and private billiard-rooms. The hall is being erected by a private gentleman, an old inhabitant of Brighton.

HERTFORD VILLA RESIDENCE COMPANY.—The second ordinary general meeting of this company has been held. The chairman, in moving the adoption of the report, said the company had now fairly and satisfactorily entered on its career. The estate at Bengoe, purchased last year, and which they have named the "Warren Park Estate," has been laid out according to the plans of the architect, good roads had been made, and arrangements had been made with the Corporation for the supply of water. The company had given the public 10 ft. of roadway—5 ft. of pathway and 5 ft. of roadway—at the narrowest part of the road at the top of Port-hill, which greatly improved the entrance to the town from the village of Bengoe. The company was about to commence building; and were now in a position to offer plots for sale; and he hoped the ground would soon be studded with pretty and commodious villas, which would be an ornament to the neighbourhood and a benefit to the town. The report was adopted.

JAPANESE ART.—The Japanese is a very developed form of art, possessed of strong individuality, no small amount of versatility, acute and various observation, wonderful executive skill within the range of attainment which it contemplates and lays itself out for, and the most admirable consent between its aspirations and its performances. It has a certain directness of idea, conception, invention, perception, and aim and result in realisation, an adjustment and adaptation of each of these artistic elements to all the others, and withal a definiteness of standard, method, and traditional style, such as render Japanese art, from one point of view, the most living and efficient school now extant in the world. . . . The Japanese delineation is distinctly art, not bungling or make-believe; and it constitutes a school of art in the fullest sense of the word,—as fully as does the school of Giotto, or that of Van Eyck, Mantegna, Titian, Rubens, or whatsoever other illustrious European of the past; more fully, one might say, than any of the present. It has its traditions and generic conceptions, its fully-developed schemes of execution, its varying and duly related divisions of subject and treatment: it has both soul and body, and the complex of the two.—*Chronicle.*

LIME IN WATER PURIFICATION.—A patent has been taken out by Mr. James Davis, of Southsea, Civil Engineer, for "an improved method of treating limestone and applying the products for purifying and rendering water palatable, and for imparting a briskness to other beverages; as also for utilising the substances to the various purposes of the builder." He submits limestones to heat in retorts, with or without the alkalies, potash, and soda, sustaining the heat until the expulsion of both the free and latent water, together with the carbonic-oxide gases present in the materials, be fully consummated, collecting in receivers for use the gases set free. He purifies water by first destroying infusoria, fungi, &c., and decomposing vegetable and animal matter with caustic alkali, separating the substances by subsidence, filtration, or otherwise; and afterwards forces the liberated gases through the caustic fluid in order to free it from the alkali, which it does by converting the soluble lime into an insoluble carbonate. He then runs the bright water from off the deposition into another receptacle, and again gives it a further supply of the carbonic-acid gas to impart briskness, and hold in suspension such mineral constituents as may give the characteristics of good refreshing spring water. Further, he applies the caustic alkalies in combination with aluminous, silicious, and ferruginous earths, or one or more of them, for all purposes to which ordinary lime is used, whether it be in the manufacture of mortar, plaster, or cement, or castings of any kind in which lime forms a component part.

RAILWAY TRAFFIC RECEIPTS.—The traffic receipts of railways in the United Kingdom amounted for the week ending June 8, on 12,792 miles, to 783,531l.; and for the corresponding week of last year, on 12,516 miles, to 719,892l.; showing an increase of 276 miles, and of 63,639l.

ACCIDENT IN A ROMAN CATHOLIC CHAPEL.—During the celebration of mass in St. Patrick's Roman Catholic Chapel, Donegal-street, Belfast, a portion of the ground flooring immediately in front of the altar, about 16 ft. in length by 6 ft. in width, gave way, precipitating a large number of persons, who were kneeling on it at the time, into the open space below the flooring, which is about 5 ft. or 6 ft. in depth. A panic ensued, and many of the congregation rushed to the doors, while others fainted. The front door very soon became blocked up, and a great number of persons were trampled on, injured, and had their clothing almost destroyed.

UTILISING SCRAP IRON.—An improved method of utilising Bessemer and other steel and iron scrap has been provisionally specified by Messrs. Clay & Bowater, of Liverpool. They heat it in any convenient manner, and whilst it is still warm pour liquid Bessemer steel around it; or after heating it, they place it in or amongst liquid Bessemer steel, in either case during the solidification of the mass, and so form a strong casting, be it in the form of an ingot or otherwise. The croppings of Bessemer steel rails and other heavy bars and rods, as well as scrap of Bessemer cast and other steel, and of malleable and other iron, of various shapes, can be thus utilised.

IRON SHELLS AND SHINING PLUMAGE.—Eggs with iron shells ought to be a fact for the Paris Exposition. A Berlin chemist, it is said, caused his hens to produce them by feeding them on a preparation in which iron was made to take the place of lime. "Seeing is believing," but we have not yet seen them. The fine aniline colours were got from a substance which abounds in the excreta of brilliant-feathered birds after they have moulted, but not while they are getting their new feathers. Basing on this fact, we some years since suggested, in the *Builder*, that if it were possible, without poisoning them, to give moulted birds or fowls this substance, it might give brilliancy to their new feathers. This is at least as likely an idea as that of the Berlin chemist; but no one ever wrote us to say he had tried it, or with what result. We again suggest it for trial.

EASTBOURNE PARISH CHURCH.—Mr. Ewan Christian, architect, has recently surveyed this church, and has found it in a state of considerable dilapidation. He reports that it requires substantial repair in every part, but especially the tower, which he considers to be hardly in a safe condition. According to an approximate estimate he has furnished, the probable cost of needful reparation and restoration will be for the tower, 474l.; nave, 613l.; south aisles, 655l.; north aisles, 550l. Total, 2,302l. An appeal is now being made by the vicar and churchwardens for the necessary funds. They suggest, according to the recommendation of the architect, that the work should be proceeded with divisionally, as funds may be forthcoming; excepting only that the reparation and restoration of the south aisles should not be delayed, a lady having offered to give stained glass for four of the windows upon the accomplishment of this part of the undertaking.

SALTAIRE.—Until recently, Saltaire, near Shipley, the well-known establishment of Mr. Salt, in addition to its extensive works, consisted of 470 dwellings, including a proportionate number of shops and other buildings. Great improvements, however, are now being made; two contracts, one for the erection of eighty-three dwelling-houses, and another for eighty-two, are nearly finished, and tenants are daily beginning to occupy the houses even before they are completed. Other contracts are now going on; one for the erection of fifty-nine dwelling-houses, also the building of forty-five almshouses, a dispensary, and a schoolroom upon a large scale, with a suitable number of class-rooms capable of accommodating 750 scholars. Messrs. John Ives & Sons are the principal contractors for these buildings. The erection of a Wesleyan Chapel is also progressing, and plans have been prepared for the erection of a Mechanics' Institute: there is also much talk about a people's park. The population of Saltaire will now be about 3,500.

ACCIDENT.—While a number of workmen were engaged in hoisting one of the large girders of the new Corn Exchange in course of erection at Dorchester, the scaffolding and gear fell to the ground, burying one poor fellow beneath the rubbish.

A CONVALESCENT HOSPITAL FOR LIVERPOOL.—It is resolved to devote the sum of 40,679*l.*, balance of the Liverpool Cotton Famine Relief Fund, to the building of a convalescent hospital in a healthy position near the town, to act as a supplement to the existing infirmaries and hospitals.

A METHODIST MONUMENTAL CHURCH AT WASHINGTON.—The Methodists intend to build a large monumental church in Washington, U.S., to cost 200,000 dolrs. Seats will be set apart for the President and his cabinet, the judges of the courts, generals of the army, and other distinguished persons. Seats also will be provided for the different States, so that strangers from every section of the extended republic may feel that they have a place of worship when visiting the metropolis.

THE BIRTHDAY OF ALEXANDER THE GREAT.—We have already spoken of the *graphiti* or scribblings of the *Vigiles*, lately discovered in Rome. At the last meeting of the Archaeological Institute, Mr. Shakespeare Wood, secretary of the Archaeological Society of Rome, showed two large sketches of them, and spoke highly of the value of such discoveries, and of the extreme interest shown by the Pope in encouraging them. Their expense was, however, considerable, and help would be most welcome. Mr. Parker said one of these "*graphiti*" established the date of the birth of Alexander the Great. Alexander Severus, we are told, was so called because born on the same day as Alexander the Great; but the historians do not say what that day was. The Roman "*Vigil*" scratches a note of the feast on the birthday of Alexander Severus, and so settles that of Alexander the Great.

CONCRETE FUEL.—Heretofore, in order to cause small coal, or coal-dust, to adhere so as to form solid blocks, it has been found necessary to introduce and incorporate with the coal-dust pitch, bitumen, tar, or some other adhesive substance. In order to mix these substances together and form the compound into blocks, expensive and cumbersome machinery has been required, and it has also been found necessary to heat and char, or partially burn the blocks. The object of the invention of Mr. J. Roberts, of Cranmer-road, Brixton, is to cause the several particles of small coal to adhere together, so as to admit of the mass being moulded into the desired form. To this end he makes the small coal or coal-dust into a concrete mass, by the addition of pulverised lime and water. The lime may be added in various proportions, but he finds that from one-tenth to one-twelfth the quantity by measure of lime, well slaked with water, will be amply sufficient to form the coal into a hard concrete, but somewhat porous mass. The materials, when mixed, may be placed in wooden, earthen, metal, or other moulds, until the concrete becomes firm enough to be turned out to dry, for which purpose it will only be necessary to expose it to the air or wind for a few hours. The blocks will thus, in a day or two (without the application of any artificial heat), become hard enough to admit of moderately rough handling, and will burn with clearness and steadiness in any common grate or fireplace. He finds common lime answer the purpose of making a concrete fuel as well as any of the stronger and more expensive cements, and, therefore, on account of its cheapness, he prefers to use it.

TENDERS

For sundry works at the Licensed Victuallers' Schools, Kennington-lane. Mr. Wm. Nunn, architect:—
 Waite 439 0 0
 Emery 385 0 0
 Langmead & Way 357 0 0
 Taylor 353 0 0
 Geddes 347 0 0
 Lambie (accepted) 327 0 0

For the erection of a lecture-hall, school, and classroom, at Clapham. Mr. John Tarring, architect. Quantities supplied:—
 Kilby 42,178 0 0
 Myers & Sons 2,659 0 0
 Eldon 2,600 0 0
 Richards 2,621 0 0
 Saunders (accepted) 1,976 0 0

For chance to proposed new church at Great Grimby, Lincolnshire. Mr. J. H. Hakewell, architect:—
 Simpson & Malone 23,147 15 0
 Dove, Brothers 1,735 0 0
 Huddleston 1,745 0 0
 Brown 1,489 0 0

For flour mills at Waltham Abbey, Essex, for Mr. James Carr. Mr. John Randall, engineer. Quantities supplied by Messrs. Church & Rickwood:—
 Postman 23,186 0 0
 Smith & Coy 11,633 4 0
 Mansfield, Price, & Coy 2,923 0 0
 Gardener 2,925 0 0
 Piper & Wisley 2,889 0 0
 Field, Brothers 2,872 0 0
 Browne & Robinson 2,847 0 0
 Kirk 2,750 0 0
 Wiggs (accepted) 2,659 0 0

For brewery, offices, and four shops, for Messrs. Hannay & Dickson, Cross-street, Manchester. Mr. Wm. Elsworth, architect. Quantities supplied:—
 Ellis & Hinchliffe 12,968 0 0
 Patenson 11,800 0 0
 Farrell 11,633 4 0
 Thomson 11,635 0 0
 Bates & Brothers 11,600 0 0
 Robinson & Son 11,033 0 0
 Neill & Sons 10,923 0 0
 Thompson 10,923 0 0
 Foggett 10,500 0 0
 Clay (accepted) 10,500 0 0
 Warnunton, Brothers (too late) 10,205 0 0

For boundary walls and conduit to new almshouses, Wantage, Berks. Mr. J. P. Spencer, architect:—
 G. & J. Kent (accepted) 4,138 17 0

For villa residence, Denmark-road, Gloucester, for Mr. J. P. Jenkins. Mr. H. James, architect. Quantities supplied:—
 Clutterbuck 21,170 0 0
 Meredith 11,633 0 0
 Sims 1,115 0 0

TO ARCHITECTS AND BUILDERS. A QUANTITY SURVEYOR, Estimator, and good practical Draughtsman is open to an ENGAGEMENT. Can prepare Plans, Specifications, estimates, and Measure Works, or take the management of works. Age 35 years.—Address, Mr. GEORGE SMITH, 105, Regent-street, Prince's-road, Lambeth.

TO BUILDERS AND JOINERS. A YOUNG MAN is in want of a SITUATION as IMPROVER to the above trade; has served four years and a half. Aged 18.—Address, W. L. 10, Moscow-road, Queens-road, W.

AN ASSISTANT seeks a permanent ENGAGEMENT in an Architect's Office, or that of a District Surveyor.—Address, Z. 7, South Hackney-way Post-office, N.E.

TO ENGINEERS AND LOCAL BODIES. AN ENGAGEMENT is required in taking Levels and preparing plans, sections, &c. for two sewerage and other public works by an experienced surveyor.—Address, C. E. 35, Argyle-square, Easton-road, W.C.

TO ARCHITECTS, SURVEYORS, AND BUILDERS. AN experienced QUANTITY CLERK wishes EMPLOYMENT at 2s. per diem. Good references.—Address, SURVEYOR, Post-office, Pentonville-road.

A BUILDER, who thoroughly understands his business, wishes for an ENGAGEMENT as FOREMAN or CLERK OF WORKS, in town or country. Is a good quantity surveyor and estimator. Salary moderate.—Address, 78b, Office of "The Builder."

TO ARCHITECTS, SURVEYORS, &c. AN immediate RE-ENGAGEMENT is required, by a thorough general ASSISTANT, in the preparation of working and detail drawings, specifications, quantities, measuring up and superintending works, surveying and setting out building ground, &c.—Address, R. G. 169, Queen's-road, Dalston, N.E.

A FIRST-RATE DRAUGHTSMAN and COLLECTOR, experienced in design and EMPLOYMENT in the preparation of elevations, perspectives, &c. Terms moderate.—Address, H. P. Gloucester Villa, Grosvenor-grove, Grosvenor, Surrey.

A RESPECTABLE Young Man is open to an ENGAGEMENT as ASSISTANT DRAUGHTSMAN, in a Civil Engineer's or Architect's Office. Willing to be generally useful.—Address, X. Y. 2, Park-lane-cottages, Westminster.

TO CIVIL ENGINEERS. A Z. having had experience in Surveying and Levelling, Setting out Works, and all other Work connected with the construction of a railway, wishes to meet with a RE-ENGAGEMENT on Works or in an Office.—Address, No. 43, Ebury-street, London, W.C.

A CARPENTER, a good Working hand, is in want of a SITUATION.—Address, W. HANKE, 35, Manchester-street, King's-cross, W.C.

TO MASTER BUILDERS. AS FOREMAN. Willing to work in several branches. Very useful to a small firm. Last situation seven years. Country preferred.—Address, C. H. 21, Union-road, Stone-end, Borough, S.E.

TO ARCHITECTS. A THOROUGHLY competent GEOMETRICAL and PERSPECTIVE DRAUGHTSMAN, able in connection with any office, to draw and execute in perspective an ENGAGEMENT of any nature, or as Clerk of Works. Aged 29.—Address, H. A. 10, Grove-square, Brompton, S.W.

TO BUILDERS, &c. A SITUATION as FOREMAN. Is a thoroughly practical plumber, painter, glazier, writer, and grainer.—Address, 75b, Office of "The Builder."

TO GLASS PAINTERS AND STAINERS. A GOOD FIGURE PAINTER will be discharged on July 1st, and desires an ENGAGEMENT in a Firm either in London or the country.—Address, 77a, Office of "The Builder."

TO DECORATORS, BUILDERS, and ESTATE AGENTS. RE-ENGAGEMENT Wanted by the Advertiser, as WORKING FOREMAN, or to take charge of a job in the Plumbing, or otherwise, in any branch of the Building trade. Has had experience in all the branches of the trade; used to town or country work. References.—Address, W. WALLACE, 39, Upper Clifton-street, Finsbury, E.C.

A GENTLEMAN wishes an ENGAGEMENT in a Professional Office, where sixteen years' experience of surveying and building, with an intimate knowledge of prices, and all matters of estimate, and would be able to serve.—Address, W. care of Mr. C. C. 25, Kenilworth-town-nd.

A GOOD, practical PLUMBER is in want of a JOB. Well experienced in all kinds of new and old work. Has been accustomed to fill up time with gas-fitting, hot-water, and cold-water, and all other work, as MANAGING MAN, Clerk of Works, PLUMBER, &c. Has 17 years' experience in all the branches of the Building trade. References.—Address, A. P. 47, Lockington-road, Battersea Park, S.W.

A GOOD GRAINER and PAPER-HANGER is in want of a SITUATION. Has a thorough knowledge of painting and taking charge of work. First-class references.—Address, A. B. 2, White-church-street, Fenchurch.

A PRACTICAL MAN, of considerable experience in Building, is open to an ENGAGEMENT, where trust and confidence are strictly required, as MANAGING MAN, Clerk of Works, or General Foreman to a Building Firm, or private gentleman. References.—Address, A. P. 47, Lockington-road, Battersea Park, S.W.

AN efficient BUILDER'S ESTIMATING and MANAGING CLERK, with an ENGLISH MANNER, well up in making out accounts, and the usual office work. First-class references.—Address, G. G. Messrs. Dawson & Sons, 131, Cannon-street, E.C.

A FELLOW of the Royal Institute of British Architects, who has had extensive practical experience, and is now living in a desirable seaside watering-place, has a VACANCY for a well-qualified YOUTH as an Artificer, Painter, or Carpenter. Arrangements can be made for residence, if desired.—Address, G. W. Office of "The Builder."

AS WORKING FOREMAN of MASONS. A thorough practical MASON desires a RE-ENGAGEMENT. Accustomed to every description of general business, is a good mason and wood carver, good letter cutter, nail draughtsman, &c. Very respectable references. Town or country.—Address, 36b, Office of "The Builder."

TO CONTRACTORS, BUILDERS, MASONS, SCULPTORS, and OTHERS.—Y. E. PAYNE, First of the County of Kent, desires a RE-ENGAGEMENT, to take the charge of the works on the new STEAM SAW-MILLS, at the Railway, at PARKEND, now in full operation; and that he can supply on short notice, and at any quantity of Book or converted Stone, Grey Forest of Dean Stone, of the very best quality, at low prices, even free for railings.

TO ARCHITECTS, CONTRACTORS, &c. MARBLE COLUMNS can be SUPPLIED to any dimensions, and in one piece (if required), of the following Marbles: Victoria Red, Black or Kilburny Marble. These Columns will be finished and polished in the best manner; or, if preferred, Blocks will be supplied direct from the different quarries. Apply to ALEXANDER COLVILLE, Marble Mills, Kilsenny, Ireland. Samples can be seen at J. B. PHILLIPS & CO'S, 6 and 7, Paddington Green, London, who will take orders.

SERPENTINE. ESTIMATES and EXAMPLES on APPLICATION to THE LIZARD SERPENTINE COMPANY (LIMITED), 21, ST. JAMES STREET, LONDON, S.W.

VICTORIA MARBLE WORKS, 38, LOWEY BELMORE PLACE, adjoining the Victoria Railway Station, and at Commercial-road, Finsbury, London.

JOHN WREN begs to inform Architects, Builders, &c. he has OPENED the above extensive Premises with commodious SHOW-ROOMS, well stocked with GILBERT'S PRICES of the most modern designs and superior workmanship, and at the lowest rates prior to the N.B.—Estimates given. Country and foreign orders executed with promptness and personal attention.

BELLMAN & IVEY, GENERAL AND ORNAMENTAL PLASTERERS, Manufacturers of SCAGLIONE MARBLE and SUPERIOR PLASTER OF PARIS.

The First-class experts for their own hand, and of excellent quality, and its extreme lightness in weight ensures a saving of 30 per cent. in gas, from its covering one-third more superficies than the common plaster.

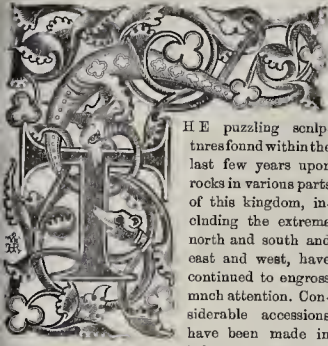

PREMIER PRIZES were awarded Messrs. Bellman & Ivey for their Works at the Exhibition of 1851, and again in 1852.

PLASTER WORKS, 10, VINE-STREET, LIQUOR-POND-STREET, SHOW ROOMS and OFFICE, 14, BUCKINGHAM-STREET, PORTLAND-ROAD, LONDON, W.

The Builder.

VOL. XXV.—No. 1274.

Our Pre-historic Sculptile Remains.

THE puzzling sculptures found within the last few years upon rocks in various parts of this kingdom, including the extreme north and south and east and west, have continued to engross much attention. Considerable accessions have been made in information concern-

ing them, although no certain solution of their meaning has been found. But as every new fact brings us nearer to the clue that will doubtless, at last, put us into possession of their meaning and age, we must examine its bearings with interest, although it may not be very definite in its suggestions. When first observed, the central cups within the circlets and concentric circles were passed over without any impression that they were of more meaning than the rest of the configuration of which they formed a part; but recent additions to our known examples have led to the recognition of these central semi-spherical hollows as leading features in the scheme of representation. As far as we are aware, the *Builder* was the first to point out that the stones having semi-spherical depressions upon them found in the neighbourhood of the Swiss lake dwellings, were most probably scattered links of this same system of rock-carving, and to urge that further search should be made on this score. We now learn that Dr. Keller, the Swiss historian of the lacustrine settlements, has ascertained that very numerous examples of the cup-markings are to be seen on rocks *in situ* in the western cantons of Switzerland, Vaud, Fribourg, and Berne, as well as on erratic blocks of gneiss and granite. Turning to our stock of English and Scottish examples, we perceive that the cup-like hollows, without inclosing rings, are also of frequent occurrence. There are numerous instances of these in Northumberland, and some in Scotland. A second fact of some importance is the certainty that these curious sculptile works are to be seen on several of the great monoliths forming the so-called Druidical circles or temples. In an amplified reprint of a communication made to the Society of Antiquaries of Scotland, Sir James Y. Simpson states that he has traced all the different types of figures, cup-marks, rings, and volutes upon the megalithic circle of stones near Liverpool, called the Calder Stones. The same indefatigable archaeologist has supplemented Sir Cardner Wilkinson's discovery of a fourfold concentric circle on Long Meg, the large monolith grouped with the sixty-seven "Dear Sisters" at Salkeld, Cumberland, by tracing on several others on the same stone. These all consist of the central hollow, with the ring proceeding from it through three or four encompassing circles. The sixty-seven Sisters were examined with a negative result, except as to

one, on whose western face a faded circle suggested itself, but which he doubted to accept as a certainty. Three sets of circles in Banffshire, Rothiemay, Thorax, and Bankhead; another in Inverness-shire, at Bruiach; four in Perthshire, at Culls, Glendevie, Moncrieff, and Craighall; one at Turin, in Forfarshire; two at Graystone and Holywood, in Dumfriesshire; besides those mentioned, and another example in the Isle of Man, at Oatlands, bring the number of instances in which these sculptiles are associated with megalithic remains in the north up to fifteen. In the parish of Llanidan, in Anglesey, there is a circular entrenchment, whose name, handed down to modern times, gives us some information as to the uses of at least this circle. It is called Bryn-Gwyn, *i.e.*, the supreme or royal tribunal; and, as the author of "*Mona Antiqua Restaurata*" points out, the early Welsh poets applied the same term to the Parliament House or Westminster Hall, thus identifying the uses of the two structures. The Bryn-Gwyn circle is, however, formed of earth and stones, not monoliths.

Several of the Scottish memorial stones have been recently observed to be linked with the subject in hand, by carvings of both cups and rings upon them. Hitherto unnoticed, these curious figures, indeed, seem to be found almost wherever they are looked for. We have before related that a few of the flat slabs of stone forming part of the rude cists, in which bodies have been interred at some unascertained remoteness of time, have been found to be marked with concentric circles and cups. And now we see the same mysterious impress on another sepulchral feature, the cromlech. Although this branch of the inquiry has as yet been scarcely handled, Welsh cromlechs have yielded sufficient evidence that we have only to seek for the symbols in question to find them. So far, then, these signs are equally associated with the dead and the living. Just as the cross is found on the tomb and on the church, so are these one-rayed circles and cups found in the grave and in places of meeting and memorial. That they were once very much more numerous than they are now is curiously shown by the discovery of similarly inscribed stones in "weems" or underground houses of Pictish antiquity, in positions more or less covered, which indicated that they had been carved before they had unceremoniously been taken by the Pict hilder, to assist in forming his dwelling. We should be sure, from this hint, that those few examples of inscribed stones found in graves have not been simply used up in this unconsidered manner. Those to whom the sign-writing that still obtains among us, by virtue of which almanac-makers indicate the sun by a dot with a circle round it, has suggested the possibility of a solar association of idea with these figures, will read with curiosity the following extract from the first known account of any cup and ring cutting. It has been brought to light by Sir James Y. Simpson, and printed in the "*Proceeding*" to which we have before alluded. In a description of the Antiquities and Scenery of the parish of North Knapdale, Argyleshire, Mr. Archibald Currie, the author, mentions a rock on which there are fifteen sets of concentric circles. He thus accounts for them:—

"These circles are similar to those used in astronomical plates for circulating the revolution of the planets round the sun. Of these circles, there are five in each of the concentric ones, probably to correspond with the number of the planets then known. The doctor is of opinion that this is one of those methods which were in use previously to the introduction of letters into this country, for commemorating extraordinary events; and, in the case in question, he thinks these circles represent the right of the proprietor to the estate where the rock lies on which they are engraved, and that they signify that his descendants were to enjoy it as long as the celestial luminaries which the circles represent should perform their unerring revolutions round the sun. This opinion is not at all improbable; for, of old, rights to inheritances were in many instances conveyed by hieroglyphic symbols, similar to those now described. I am informed, on unquestionable authority, that the right of Macmillan to the estate of Knap, in South Knapdale, was cut in rude characters in the Celtic language on a rock on the shore at the point of Knap, which are now obliterated by the action of the waves on its surface."

This speculative solution of the enigma will, perhaps, start in other minds a wonderment as to the fate or whereabouts of the King's Stones, whereon, according to the most ancient of Welsh writings, the ancient British princes ordered their will and pleasure upon important matters to be recorded. As the inscribed stones under notice have lain so long unheeded, perhaps these exceedingly interesting relics, which must have also been very numerous, may be some day recognised.

Danish and Swedish antiquaries have hitherto confined their investigations of early sculptiles to those of a less enigmatical character, such as the engraved stones of the cairn at Kivik, representing an immolation of prisoners of war by long-robed priests, and the rude sketches of ships with crews, and figures of animals found on some cromlechs and on rocks. But their antiquarian literature would seem to indicate that there are carvings more nearly approaching the character of our own that only require examination. The sketch of the Balder Stone, near Falköping, in Sweden, given by Professor Nilsson in his "*Skandinaviska Nordens Ur-Invanare*," shows only a large number of cups, as in the case of the Swiss stones illustrated by Dr. Keller. But, as the cups exist, it is more than probable that the circles so frequently seen associated with them in other countries, are also to be found. Nilsson gives an instance of a set of concentric circles occurring on a standing stone on Asige-moor, in Halland, Sweden; but these circles are formed by dots in close proximity, like some of the ornamentation on early Irish stones. It is somewhat singular that the marked difference that has been noticed between the rude carvings on Scandinavian stones and those of our country, is strikingly observable in the case of two sculptured stones found in a grave in Aspatria, Cumberland, a locality ever esteemed as more strongly impressed with traces of Scandinavian occupation than any other. This is, moreover, a case of mysterious disappearance, for when inquired after, recently, these stones were nowhere to be found. There were circles upon them having crosses for centres reaching from edge to edge, all being cut in slight relief instead of being deeply incised as in our other examples. There were also circles having central cups from which proceeded a long ray like a sunbeam, and in one instance this sunbeam terminated in three crooked prongs having a fork-like appearance. Two other arrangements of lines or prongs departing in each instance from another line at right angles with them are noticeable. This is, however, by no means an accession to our stores, as it was found in the last century: it is simply a classification of a known relic under a heading in which it is likely to be viewed with new lights.

Another class of sculptile antiquities which must be looked at in connexion with our rocks is the carving frequently found on pre-historic tools and weapons. The sepulchral tumuli of Britons have already yielded representations of axes and bows delineated upon the stones forming part of them; and a cromlech at Locmariaquer shows an axe with a fluted head and a looped handle. Hitherto, however, no weapons have appeared in connexion with the mysterious circles. The ancient Romans delineated upon their altars the implements with which the sacrifices were made. A Scandinavian stone possesses a combination of a double-horse chariot and some outlines of boats, as though to represent a victory by sea and land, with some cup-hollows; but the latter are clearly of an earlier age, as one of the boats runs into one of the hollows as a necessity, which was of no consequence. The idea that the cups were intended for the reception of the blood of the victims slain is nowhere borne out by the delineation of the weapon of sacrifice, as in the Roman examples.

We have seen a numismatic suggestion concerning these unknown figures in which the extraordinary departures from good models by rude mint-masters have been dwelt upon as producing configurations as startling as these and somewhat like them. The originator of this train of investigation will probably put his arguments and examples before the antiquarian world himself. It will not, however, detract from their interest then to state that a horse and rider on a coin, shown in fine bold circular and semi-circular lines, becomes in the transition from one degenerate die to another a chaotic group of single and concentric circles without apparent dependence upon one another. In proportion as the dies became debased from the original mould so did the various lines delineated become larger and coarser, till the coin which at first held horse and rider fully equipped was only of dimensions sufficient to show a fragment of the charger, whose noble proportions would not be recognizable in the scattered circular and crescent-like lines employed to represent them if the diligent numismatist had not traced the wonderful deviation to its source. The so-called elephants carved on the walls of the caves in life do not require a bolder flight of fancy to identify them.

The human figure has been found attempted in early carvings, but in very few instances. Wemys Cavo and Jonathan's Cavo, in Fife, have each an example. In the first the nude attempt is but 6 in. high, and possesses neither hands nor feet, though a club held at arm's length enables us to realize that the artist was not aiming at handing down an omission of such grave import on the part of nature. The second sculptured figure is of more elegant form. It is furnished with a good foot, though the arms are no longer visible. This is 25 in. high, a size which gives more scope to crude powers. Close to this figure are two examples of ringed cups, thus identifying it with whatever they express, be it a confession of faith or a sign manual, or accessories to worship, or the first manifestations of art, or a system of philosophy. Impressions of feet, or foot-prints, are, however, more frequent and more widely scattered. So far Norway carries off the palm as the possessor of most of these curiosities. Holmberg gives in his *Scandinavian Rock Sculptures* ("Skandinaviens Hällristningar") several instances of numerous foot-prints on rocks in that country. In one place, Bygdø, in Westerbotten, there are as many as thirty in a row hewn out of the rock, unaccompanied by any other carving; and in several others there are foot-prints, or foot-soles, mixed up with representations of ships and other figures. Ireland has a few examples, associated there in at least one instance with the ruins of the Early Celtic Church. The Stone of St. Columba has two sculptured foot-prints upon it. Sir James Y. Simpson, who has also been sweeping this field of investigation, has linked these foot-prints to the main types of rock carvings by the discovery of a grouping of the two classes of objects on one stone. In a small megalithic circle within the grounds of Monzie, Perthshire, he states there is a stone, called the Witch's Stone, on which are two foot-prints and several cup-markings, and on another stone just outside the circle there are more cup-hollows, and ten sets of concentric circles. Probably the removal of the central stone, as in this and the Salkeld instance, besides others, has been done with the view of overthrowing the temple or breaking some charm, just as we know all Roman remains were mutilated at a subsequent period.

The theory of the Phœnician origin of these sculptures is considered scarcely tenable, since the negative result of the search of Sir Gardner Wilkinson and Mr. Blight, in the counties of Devonshire and Cornwall, the district in which the particular object of the trade of the Phœnicians must have caused them to frequent more than any other part of the kingdom. It is, indeed, somewhat curious that it could have been started without a basis of probability rising out of the existence of similar figures in Phœnicia or her colonies—a fact which has not hitherto been discovered. Leading members of the Scandinavian school have, however, supported this opinion. Our Druidical temples in their eyes are sun temples; our cut and single circles are emblems of the same great liminary which, under the name of Baal, has been in all known time the sōndner of the worship of the unwary; and the additional circles present in so many examples are the records of the death of near relatives. Professor Nilsson pursues this idea

further: he gives the period when this solar worship obtained. It was, he deems, the bronze era. It was allowed in the old school of antiquaries that the Phœnicians largely influenced the philosophy of the Druids, that the Tyrian and Sidonian traders brought with them ideas as well as merchandise, and that the Druids under this influence taught their points of philosophy in obscure and enigmatical terms as the heathen philosophers did, dealing at the same time with such subjects as astronomy, geometry, medicine, and natural magic, besides the nature of things. Without the aid of hooks, which we know they scorned, diagrams on rocks may have made evident to their hearers the hold metaphysical flights of these early civilisers. The head-quarters of the Druids, the Isle of Anglesea, should yield the typical carvings that Devonshire and Cornwall have failed to do, if there be ought in this suggestion. We have Cæsar's warranty that the Gallic Druids resorted to Britain for instruction. "And now," he says in his Commentaries, "those persons here who would arrive at my excellence and perfection in that Druidical learning, frequently go over to Britain to complete and accomplish their studies."

There is one more subject which recent research has tackled on to our pre-historic sculpture remains. This is the present erection of megalithic structures in Upper India by the Khasias, a wild hill tribe. In Dr. Hooker's "Himalayan Journal" may be seen sketches of modern cromlechs, rivaling, as he remarks, those of Stonehenge in dimensions and importance. These are put up annually by the aid of the whole country-side, which the great man of the district summons for the purpose, and entertains during the process.

THE SOUTH KENSINGTON SECOND NATIONAL PORTRAIT EXHIBITION.

"THE SIR THOMAS LAWRENCE."

The portrait-painter who suffers most in reputation in the present South Kensington Collection of National Portraits is Sir Thomas Lawrence. This arises from the collection "ending (under authority, of course) with" the jubilee centenary of "the year 1800," at a time, when Lawrence's hand was not in its full dexterity, and his skill little more than academical and clever, and uncertain at the best. The sabler half of Lawrence's life, with his pencil, was from 1800 to his death, in the winter of 1829-30.

But Sir Thomas Lawrence was, when young, no common painter of men, and women, and children, singly or in groups, and the *fourteen* "Council on Education" examples we have had selected for us, foretell and foreshadow what his facile and prolific pencil (so early ripe), was to give in "advancing age" to an admiring public, nay, more, to admiring nations, for his name in his life-time was known further than the latitudes to which the name of any other English portrait-painter had ever reached, or has since reached. Sir Thomas, of Russell-square, was well known in continental cities, when the pleasant sound of Sir Joshua, of Leicester-fields, was, we fear, unknown, despite "The Infant Hercules," which Catherine, Empress of Russia, commissioned for St. Petersburg.

We shall not take the examples numerically, but shall group them in a way more convenient for our purpose. And, first, the *ladies*.

Observe Elizabeth Farren (the catalogue calls her "Eliza," the fascinating Countess of Derby. This is a full length (858 in catalogue), in Lawrence's sketchy, half Sir Joshua half Gainsborough manner. The Earl of Wilton is the fortunate owner. It was at the Manchester Exhibition of 1857 (No. 183), and was there, with all its dexterous lightness of treatment, much admired. What does the catalogue tell us? Here it is:—

"Eliza Farren, Countess of Derby (1769-1829).

Earl of Wilton. Sir T. Lawrence, P.R.A. Dau. of Mr. Geo. Farren, of Cork; b. 1769; successful comic actress, and succeeded Mrs. Abington in her principal characters; marr. (his and wife) Edward, 12th E. of Derby, 1797; d. 22 April, 1829.

Full-length, walking in landscape, with fir-lined white satin cloak, muff in l. hand. Canvas, 94 x 53."

Let us add to this that it is a capital engraving by Bartolozzi. Further, that Mrs. Darner made a host of her as "Thalia," that Zofany painted her at full length (engraved by Fisher) as "Hermione," and that there is a good colored print of her (A.D. 1795) at the theatre, in a box, with a large muff and an opera-glass, Lord

Derby is with her. This fascinating lady played *Niminy Pinney*, in General Burgoyne's "Heiress;" took final leave of the stage on the 8th of April, 1797; and married the Earl of Derby the 1st of May following.

We now turn to the Lawrence men, twelve in number. 1. The third Prime Minister Duke of Portland (780), lent by the Corporation of Bristol; 862, First Marquis of Salisbury, lent by the Marquis of Exeter,—full-length, and "half," such is our note on the spot; to 773, the First Marquis of Bath; to 673, the Thirteenth Earl of Derby, who died in 1831; to 856, the First Lord Crewe, lent by the poet-statesman, Lord Houghton; to 863, the First Lord Ancland, lent by Christ Church, Oxford,—it is very fine—the finest Lawrence in the exhibition, and is properly protected by glass; to 757, the First Earl Grey, and 860, the Prime Minister Earl Grey,—very fine, a companion in merit to the Ancland already mentioned. Four portraits yet remain to be specially pointed out:—850, Warren Hastings; 864, Dr. Johnson's Mr. Windham, the statesman and diarist. Compare with the Sir Joshua of Mr. Windham in the National Gallery, 761, John Philip Curran, lent by Earl Grey, and very fine,—admirably described by Allan Cunningham, in his "Life of Lawrence," p. 193; and 805, James Watt, the great engineer, lent by Mr. M. F. W. Boulton, and meriting close examination by all who delight in studying Chantrey's fine head in marble of the man. Allan Cunningham, who well remembered Watt sitting to Chantrey, and had many anecdotes of him, says of this portrait, "I believe painted after death."

An anecdote which the late anecdote-relating Mr. John Wilson Croker told the writer, during a pleasant visit to him at West Monsey, in April, 1853, relates to Sir Thomas Lawrence. "That fine full-length of the Duke of Wellington, 'the Peel portrait,'" (said Croker), "the one so finely engraved by Cousins, was first represented or painted holding his watch, as if waiting for Blucher to come up at Waterloo. 'I had no watch in my hand then,'" said the Duke to Lawrence, impatiently. "It was something else than time with me at Waterloo."

Years ago we were permitted by Mr. Pickersgill, the well-known portrait-painter, to take a copy of the following letter, addressed to him by Sir Thomas Lawrence, on, to artists and princelings, the all-important subject of a painter's copyright in an engraving from one of his pictures:—

(Private.) "Russell-square, January 4th, 1826.

My dear Sir.—In answer to your question, I beg you to understand, that where there is not a remuneration paid to me for the use of my pictures, it is when they are obtained without my consent; or when the mere legal power of the proprietor, from the purchase of the work, is considered by him as exempting him from the necessity, or rather propriety, of any reference to me upon the subject.

I should acknowledge and assert the right of every artist to remuneration for that use of his labours which is intended to be the source of profit to others, although the picture itself may have passed from his possession. The sum which will ever be made to him by any proprietor of enlightened mind or gentlemanly feeling.—Believe me to be, my dear sir, most truly yours,

THOMAS LAWRENCE.

I ought to have added, the right of choice of the engraver, and of direction of the work."

This letter is imperfectly printed in Allan Cunningham's "Life of Lawrence," p. 205; its reproduction here, as written and in full, will not therefore be out of place, especially at this time, when the copyright question again engages the attention of painters, engravers, and print publishers.

This letter, from Mrs. Forster to Allan Cunningham, contains interesting information:—

"Paris, May 2, 1831.

SIR.—I must apologise for having so long delayed complying with your request, but hope I may yet be in time for your work, if the little I have to communicate be of any interest; for I find, on referring to my letters from Sir Thomas Lawrence, that I have already quoted so much from them, when sending you materials for the sketch of my father's life, that but little remains beyond what relates to individual concerns.

My acquaintance with him dates from a very early period of my life, when I was in the habit of meeting him at the house of Mrs. Siddons, with whose daughters I was intimate, and his manners at that time appeared to me so frivolous, that I neither sought, nor supposed I obtained, his notice.

After I married I had but few opportunities of seeing him; but the high respect he entertained for my father, both as an artist and a man, was in a certain degree transferred to his family, and thus proved how strongly his whole nature was imbued with a sort of enthusiastic devotion to superior talents and abilities, which extended itself even beyond the immediate object of it.

When he visited Paris in 1825, happening to meet me at one of Baron Gerard's weekly conversations, he requested to be presented to me, and to renew an acquaintance which had long been neglected for so many years. Nothing could exceed his politeness at the time, and

when I went to England, the following winter, I called at his house to see his works.

On hearing my name immediately came out to me, invited me into his painting-room, and devoted nearly two hours of his valuable time to showing me his pictures and various drawings; and, as my stay in London was to be so long, he engaged me to pass the next evening at his house with some friends with whom I was staying, and the subsequent mornings also, which time was employed in looking over his magnificent collection of drawings by his own hand, and Michael Angelo, with him by my side, observing and pointing out the beauties of each.

I mention these particulars not from the idle vanity of having received such flattering attentions from so distinguished a man, but in illustration of his respect for departed genius, and in explanation of his motive for commencing a correspondence with me.

Knowing that my father's collection of drawings by the early masters was a valuable one, he wished to possess some of those by his favourite master; but as I knew no one in Paris likely to do justice to the originals, Mr. Forster consented to lend him some for his inspection; and at different times a considerable number were sent over, all of which were punctually returned.

His offer of making a drawing of my eldest daughter was equally attended to; he bestowed much time and pains on it, and, I think, his portraits are, as a most exquisite artist, Mr. Forster's, the most faithful resemblances of the original. I have reason to believe that it was nearly, if not the last small drawing he finished, unless that of Miss Fanny Kemble was done subsequently, in the month of August, 1829, which was in his own hand) June 1829; for he told her he should not attempt any more in that style, as it was become too trying to his eyes.

I have now in my possession a little drawing done by him when he was a child, with his name 'Thomas Lawrence, Davies,' written under it, and on one side 'Done when ten weeks old, I believe,' written at the time when he was ten.

After the death of my husband, in 1828, having accidentally heard that I was about to publish two volumes of his Sermons, he wrote to me how he could forward to me the sum of £10, the amount of the subscriptions which he had collected for me (see Letter VI.).

This act of liberality and friendship, so delicately conducted, did not wound my feelings, was immediately executed; and when I afterwards inquired for the names of the 'subscribers' for the publication, he gave me only two or three, stating that he had lost the list, and begging that I would excuse his carelessness.

On hearing of his death, which my friend Mr. Hardwick (Philip . . . 'R.A.')

communicated to me by the first post after it occurred, I sent to Baron Gerard to inform him of this melancholy event, on which he wrote me a letter expressive of his feelings on the occasion.

The friend who brought it mentioned that M. Gerard was desirous of sending some testimonial of the high regard which he bore to his deceased friend to England, if I could get it inserted in some of the public journals in that country; but he afterwards thought that it might bear too much the appearance of a studied panegyric, which would not be the case if it were written by a friend, and thereupon requested that I would send only a copy of the short notice which he had already addressed to me in the first effusion of his sorrow for so eminent a character; and this was inserted in the accounts published at the time of Sir Thomas's death.

If the mention of my name as connected with any of the foregoing particulars can give them authenticity, I have no objection to their being so. To have it combined in any way with that of so illustrious a character can only be productive of evitable distinction to me who obtained it, and which I highly merit, but from the respect heretofore which I have had for his name.

You estimate too highly my judgment or ability to criticise when requesting my opinion of his works. From my long residence in England, I have not seen many of his productions, on which, I believe, his fame was originally founded; and of his earlier ones I have not a sufficiently accurate recollection to venture any observations upon them. I am an indiscriminate admirer of all the pictures I have seen of his, for I think some of his portraits of females are affected and *monstrous*, and a sort of forced effect is sometimes attempted, which destroys the harmony of the picture.

Those which struck me as specimens of the highest kind of attainment in portrait-painting when I visited his studio in 1826, were the portraits of Mr. Canning and Lord Stobo. Of the latter, and some other heads of men whose names have now escaped my memory. The actual thoughts of the man before him were transferred to his canvas, and his mind breathed through every feature.

In the portrait of the Duc d'Angoulême he was peculiarly successful, and contrived to infuse a gentlemanly appearance throughout the whole countenance and figure, both the original certainly did not possess, and the general effect of the picture was excellent.

His portraits of children, of Mr. Lock's son, of young Lambert, of a girl with flowers in her frock or apron, are quiet, and an unfinished picture of Lady Nugent, painted some years since, is perhaps one of the most intellectual heads he ever painted.

The taste, the delicacy, the elegance of his drawings as unvaried and unique, and rendered them deservedly prized and admired.

I cannot, perhaps, close this letter better than by recalling Baron Gerard's opinion, which I heard him give by a few days after his death, however great and powerful he was, and distinguished even as a painter, he is, as even more eminent and remarkable for his drawings in his pictures; and that, since the time of Holbein, he had not attained such perfection in delicacy of execution as Sir Thomas Lawrence.

LAMINA FORSTER.

A passage about Lawrence in a letter from my mother to good Mrs. Ughes, the friend of so many poets and the mother of the author of 'Tom Brown's School Days,' will appropriately close what we have said:—

"When next I may be in town I am to fit to your friend T. Lawrence, for Mr. Peel. I am to be made by different artists to look like a Methodist preacher, like an ass, like a Jew, like a fool, like a prig, like a sensualist, like a Jew who sells oranges, and like a fellow on his trial uttering false notes. What will Sir Thomas make me look like?"

We must add a quotation relating to a love-episode or two in the life of our *Lady-billing* Lawrence. The letter from which the quotation

is now made was written, some thirty and odd years since, by Captain Henry Siddons, of the Bengal Engineers, to Lieutenant Joseph Davy Cunningham, of the same corps, the well-known author of "A History of the Sikhs;"—

"Do you remember a notice of the Misses Siddons in your father's 'Lives of the Painters,' Sir Thomas Lawrence, whose your father excused the president, and said the young lady probably died in the usual way, of *sickness and a doctor*?"

I have often wished to say to you that your father had not got the whole story in his wish to stand up for Sir Thomas. What the young lady died of I will not dispute; but Sir Thomas behaved very ill in first making love to the eldest, then shifting his affections and proposing for the youngest. Well, after this was settled, the uncle man again saw something more attractive in the eldest, and wavered again; but this brought on an explanation between the two sisters (who mutually consulted each other's happiness), and neither would have anything to say to him, and, in fact, he was forbid the house.

They both died very young (twenty-one and nineteen), and, I have heard, were very, very beautiful.

I have often met Sir Thomas at the Kembles' (for he never visited the Siddons afterwards), and he appeared to me then most devoted to Mrs. Butler, and every young lady, though a confirmed old bachelor by that time.

This page is *apropos* to nothing; but never mind that."

A final memorandum. Lawrence's charming portrait of Lady Blessington, was sold at the Gore Unse, Kensington, sale, to Lord Chesterfield for 420 guineas. Lord Byron's fine lines on seeing this picture render just homage to siter and to painter. At the same sale Lawrence's exquisite pencil drawing of the famous Mrs. Ingham (who is buried in old Kennington Churchyard—the grave unmarked) sold for 48l. 6s. to Mr. Birch, of Tipton.

ON THE INFLUENCE OF SOME CONTEMPORARY WRITERS ON ARCHITECTURE OF THE DAY.*

To revert to what I was urging on the subject of decoration: ornament in a building is analogous to finish in a picture. It should not be equally or thoughtlessly spread over the whole surface, but concentrated upon certain spots, specially upon one principal point, to which others should be kept subordinate. This is not only Nature's law, but also the law of states and civil governments. We confer dignified ornament mainly on the person of the sovereign, surrounding him with the paraphernalia of pomp; civil and military functionaries follow in due order, but so that each, as it were, should add to, not detract from, the dignity of the chief magistrate. Hence, it would seem a great fault in any style (as in the later Perpendicular and what is termed the Flamboyant) when decoration is equally spread over the whole surface and every minor part of a work. It is like a dinner all desert, or a gown covered with furbelows or furberelows. Who has not felt the repose, after wandering in a garden full of flower-heads, of coming out upon a velvet sward; and analogous exactly to this is the pleasure to the eye, after wandering through intricacies of ornament, of coming out upon a quiet wall space, an unbroken wall veil of stone or marble, like a flat bit of blue sky surrounded by the points and waving outlines of innumerable clouds.

I am inclined to think that Mr. Ruskin is quite correct in defining ornament to be, either directly or indirectly, the imitation of some natural object,—leaves, fruit, flowers, or animals. Even the somewhat stiff forms of Greek ornament can be traced to such common objects as the honeysuckle or the egg; and the same is the case with the earlier styles,—the Assyrian and the Egyptian. It is two-fold: either free, by which we mean the complete and accurate representation of any natural object, which is rare in architecture, all representations being more or less confined by the outlines of the structure; or, "in service," when it is strictly and closely so bound. The Lions of Sir Edwin Landseer, and the sculptures in the pediment of the Parthenon, are good examples of architectural ornament, free in their general effect, i.e., perfect representations of nature, yet kept subordinate in their general form to the architecture of which they form a part. This must be held to be a very high merit, on the one hand, to carry out perfectly the invitation of nature; on the other, to have sufficient modesty to place the ornament in the second rank and the general structure in the first. Had Sir Edwin's lions been standing up or in active movement they might have afforded a more signal opportunity for display of skill; but kept in repose, with

a consciousness of quiet power, they impress the mind not merely with the noble nature of the royal beast, but with a proper sense of the artist's good taste, who has not forgotten that the ornament at the base of the column should be secondary to the column itself.

I think, with regard to the remarkable names I have mentioned, as being upon the whole those of men who have most influenced us, it may be said that Pugin has most influenced us in structure; John Ruskin in ornament.

Pugin is quite right in selecting the Middle Pointed style as that which upon the whole combines most elements of hearty in Gothic art. Its forms are structurally as fine as anything which has been produced in any age. They are arranged according to the strict laws of geometry, and comprise every possible variation of the circle, the triangle, and the square.

The monkish architects who carried ecclesiastical art to such a pitch of perfection, not only loved fertile field and lovely flower, but must also have felt the great truth, that law reigns supreme over all the natural world. Perhaps very imperfectly instructed in science, they must have guessed by a kind of instinct that both plants and animals were formed according to a finite plan, and that the very rocks out of which they framed their lofty minsters crystallize, with angles, which can be clearly foretold. Nothing short of such ideas would have enabled them to design the decorated window,—that triumph of architectural skill,—to rear the slender shaft, and to frame those marvellous vaults, of which Sir Christopher Wren used to say that if he knew how to place the first stone aright he could do all the rest.

While, however, we do all homage to the Decorated or Middle Pointed style, Pugin's preference for it may be rather narrow in some respects. The Transitional styles, from the Norman to the Early English, of which we have a fine example in Canterbury, and the Transition from the Early English to the Decorated, of which Yorkminster presents in some parts a noble example, have elements of beauty which are not found in matured, or what an architect would call "perfect," styles. By a perfect style, I mean a style in which every conceivable case is met by a precedent, some important canon to which it would be treason to violate. My answer to this is, that precedent may be a fine thing, but that progress is still better. Now in what we call the Transitional styles, which I hold up, not as precedents, but as examples of true public spirit in the builders, we find less adherence to law, but a greater degree of ingenuity in adapting means to ends; less perfection, I admit, in the result, but more novelty and bolder design. I love that architectural courage which, securing regularity, would not hesitate to introduce (as in the case in the triforium at Canterbury) a pointed arch between two round arches, which would raise a clearstory of lancet windows over the ponderous columns of a Norman nave, or introduce a triple lancet under a rose window. The eastern transepts of Canterbury are fine examples of what I mean.

There remains another question. Supposing the Middle Pointed style to be all that it is represented. Shall we make a servile copy of it? Shall we adhere to our models closely? On this point I am aware that great differences prevail even among the best judges. Mr. Parker, of Oxford, than whom nobody has done more for the true interest of architecture, would say,— "Yes, walk ye in the old paths. At all events, stick to English examples, and don't spoil the true breed of English Gothic with a cross of any kind."

I confess I think the works of Mr. Ruskin are an excellent answer to this kind of reasoning; for no author has better explained, both in painting and architecture, that if a great deal has been well done, fortunately there yet remain a great deal more to do. Again, many I know regret the introduction of colour into our ecclesiastical buildings; others, the marbles and alabasters, the mosaics and the gilding, which are gradually finding their way into our churches. Up to a certain point, while we adhered to precedent, we did well; lately, it is said, to be perfectly frank, the young men have been running a little "wild," even "extravagant," and this wildness and extravagance is thought specially applicable to our decoration and colour. Mr. Scott, indeed, has happily combined prudence with considerable novelty; for his introduction of colour has always been sparing and judicious, and in any change of our Gothic forms he has usually confined himself to precedents, from the

* By Sir Walter C. James, bart. See p. 461, ante.

neighbouring country of France, and not gone so far afield as Italy or Spain, to seek for that infusion of novelty which must always be an element of importance in any architectural work, desirable at least, if not necessary. Mr. Scott has taken special pains in improving our architectural sculpture. The floriated capitals in many of the new churches erected by him are of exquisite workmanship.

Perhaps Mr. Ruskin can hardly be said to be in any respect a perfectly safe guide; but if in any, it is in colour and in his exquisite knowledge and judgment with regard to the effects of painted glass. No doubt, beauty of colour is entirely lost when it becomes garish or over-gaudy. Now this is the result of large masses of bright colour,—squares, oblongs, or what you will,—in large surfaces of nearly equal size. Variety in the surface itself, contrast in the material (as in the surfaces of stone or marble), and variety in the size of surface, as contrasting large round forms with those smaller and squarer, are essential to procure harmony. One of the brightest skies ever painted by Turner will be found upon examination hardly to contain in it any admixture of positive blue, but to acquire its extraordinary beauty and radiance by the skilful interweaving of every variety of tender grey. Hence he lays down the canon that we should have in our coloured decorations large masses of neutral tone, enlivened here and there by bright spots of colour, or intermingling with each other in delicate intermediate lines of orange, violet, and tender green. As a school of colourists, I fear it may be affirmed that our English school is rather gaudy.

With regard to glass the same principle holds good. Our modern glass is, as a rule, abominable, because it consists of a number of patches of the same size and the same materials. Our ancient glass, on the contrary, is composed of large masses of violet brown, of pale olive, of lustrous grey, with here and there a speck of bright crimson or ultramarine blue. Another point put in the clearest way by Ruskin is the nature of the material itself. Glass, says Ruskin, is transparent. It is therefore unfit for true pictorial representation, few objects in nature, if any, having that translucent effect which it is the object of the glass-painter to give. The principal aim, therefore, of painted glass is to produce, not a representation of a natural object, but a jewelled effect, intermingled, if you please, with quaint and grotesque imagery, with gorgeous heraldry, with interesting designs. The nature of the surface is in itself sufficient to forbid pictorial representation in its modern aspects.

This language is just; and, although it goes far to condemn a very interesting school of glass painting, that of Germany, and especially Munich, I have little doubt that posterity will pronounce the verdict correct. Oil painting and fresco painting represent the art of matter-of-fact imitation. In these you may come as near Nature as you are able. You may approach her, and the closer the better. In mosaic and glass-painting your object, from the very nature of your materials, is not to represent Nature as she is, but to see her, as it were, under a spangled veil, radiant with all the colours of the rainbow.

Before coming to the conclusion of this lecture, I venture to say that, so on the one hand it is intended by the Almighty that the reasonings of the philosopher should largely influence the course of the artist, so it is on the other that external objects should influence for good or evil the thoughts, words, and actions of each succeeding generation. Art is a creative power, most seductive in its charm to those who can use it well, but productive of good or ill accordingly as it is rightly or wrongly used. In the early times of the world ingenuity and skill were required to secure a fair supply of even the necessities of life; but, as civilization advances, the apprehension is, I think, in an opposite direction, namely, lest ingenuity and skill, having done all that can be required to satisfy our real wants, should turn their energies not to the promotion of what is great and good, noble and generous, amongst us, but to the cultivation of luxury and the indulgence of the eye. This, rely upon it, in our time, is a real danger. I mean a want of simplicity and a frittering of ornamental beauty through the whole domain and surface of society, rather than the reservation of it for those things which are truly great and noble.

I stated at the outset that, while I mainly

directed my attention to the influence of contemporary writers upon art, I should not hold myself shut out from offering a few remarks on the opposite or counterpart of the problem,—the effect of external art upon the mind; its elevating and useful influences; its dangers and excesses.

Architecture, indeed all art, may be classed under three heads, as exercised (1st) upon the temples of God; (2nd) upon public buildings; (3rd) upon private dwellings.

The ornament and splendour of magnificent temples set apart for the worship of the Deity has been an object of just pride even with heathen nations. With the advances of civilization, and the consequent multiplication of wants, this natural sentiment is, on the whole, perhaps rather enfeebled. The temples of the Assyrians and Egyptians were more magnificent, I apprehend, in their way, than those of the Greeks, though, of course, more barbaric. Heathendom, as a whole, probably expended as much as, if not more, in the organization of public worship than Christendom. I mean, of course, taking into account the disposable income of each. Modern society, in like manner, spends less than those ancestors of ours who resided smug glories piles, York and Durham, Lincoln and Canterbury.

But, though we fall short of the religious zeal of the Middle Ages, let us not on that account depreciate their noble efforts, nor deny the utility (I purposely use the word) of their aims. It argues a spirit of noble disinterestedness to perceive that ought dedicated to the use of the Supreme should be in every way worthy of Him, and better, both in material and workmanship, than things set apart for our own daily use. Some relation should be observed, I think, between the character of a church and the neighbourhood in which it is built. A wealthy congregation, for example, should have a splendid church; not merely from the suitability of such things, but as typifying the sacrifice of worldly things to God, as the very essence of a religion of sacrifice. "Shall I give to my God," says the pious man, "of that which costs me nothing?" The principal difference in church-building between this and former eras is, that whilst they were restoring and building cathedrals and monastic institutions, we are beautifying and erecting parish churches: there is, arising mainly from our social system and the dearth of labour, a smallness of size in all we do in this way. With some few noble exceptions, fresh in the memory of all, it may be said that we have no purely modern church of very large span or size.

Not a few of these, conceived in a purely English style, have developed a large liberty of action in a direction where even the greatest purist must allow liberty to be highly desirable, viz., in the introduction of new materials. London is a brick-built city, and we have therefore brick churches. Indeed, it may be questioned whether the assumed superiority of stone over brick is anything more than a mere prejudice. Some men think that whatever is most expensive must necessarily be best. Our country contains marbles, too, less known, perhaps, but quite as beautiful as those of Italy. Among these we may specially name the granites of Scotland and Cornwall. These are employed with great judgment in some of our latest metropolitan churches, and contribute much to enhance the beauty of colouring for which they are so remarkable.

But if, as I think is reasonable, we cannot but admit our noblest feelings of reverence and faith to be augmented in no common measure by the sight of a church; so must we admit, also, that patriotism and public spirit are increased by the sight of grand and noble public buildings—buildings for official and municipal purposes, and for the halls of the Legislature. To these we may add public museums and national galleries for the exhibition and due preservation of works of art. England has hitherto been very much behind-hand in these important matters; but we have recently had from the skilful plans of Sir C. Barry a noble pile erected—"the Houses of Parliament,"—as fine in execution and as dignified in sentiment as any building of the kind in any age or in any country. I am not here to deny or palliate its defects. Its most obvious faults, I may venture to indicate, are a want of bold and irregular projections in the river front, and a general overlaid ornamentation. The too great ornamentation may be fairly assigned to the style rather than to the architect. Perpendicular Gothic is remarkable for the sameness

and constant repetition of its ornaments, adding one more proof that uniformity is almost always connected with monotony and variety with a pleasing and picturesque effect in architecture. Indeed, I may mention, in corroboration of this, that a friend of some talent as an architect told me—"I was brought up in the Italian and Greek school, and always taught to believe that, if a doorway in the centre of a building had five windows on one side, it would be right that it should have five windows on the other. Experience," he added, "has confirmed me in this idea diametrically the reverse of this. I am now of opinion that the law of general symmetry should give way to a higher law,—that of a general adjustment and balancing of parts, such a balance as is produced by the two western towers of Lichfield Cathedral, counterpoising the central spire and the eastern end. The general balance of parts is the Gothic, the exact symmetry is the Roman or Greek principle.

The British Museum deserves a passing word of sincere respect for the memory of its architect, "Sir Robert Smirke." Practising at a time when true taste in architecture and love for Greek forms were supposed to be identical, it is not to be wondered at that this able man adopted the Greek style, and that, too, with an earnestness which might put to shame many of the Gothic professors of the present day. In addition to the pure taste which marks Sir Robert Smirke's buildings, I must specify his peculiar merit of really "constructing well." Of what avail, I would ask, the fairest elevations, and the most beautiful ornaments, if a building be not well constructed, if it do not answer the very ends for which it was designed?

Between buildings of a public and private nature we have a class which are a peculiar ornament to our city; I allude to the clubs. They have transformed Pall-Mall, which many of us recollect as the dingiest of streets, into a noble thoroughfare, which may not inaptly compare even with the Corso at Rome. I think that their moral effect, with some inevitable drawbacks, has been good. Those who can remember the times,—which few of us now can,—when a young officer turned loose upon the town was obliged to seek a dinner in a reeking tavern in Covent-garden or in Swallow-street (where Regent-street now exists), will think that we owe a large debt of gratitude to that spirit of combination which enables the young man to dine at his club, not only well, but with economy.

Passing on to private houses, both in town and country, I may observe that it is on private patronage that art in a free country must in the main rely. Not only has the taste for magnificent churches and public buildings become in a great degree obsolete, but it is to be observed that we are for the most part furnished with them. Here and there a great work arises,—Houses of Parliament and courts of law, which require a special exercise of talents; but these opportunities are few and far between. Comfort has taken the place of magnificence, and well-studied convenience and propriety are demanded of the architect. An aristocratic country must have aristocratic dwellings, and we may point, besides the most magnificent country palaces, whose name is legion, to dwellings like Sutherland House, Montagu House, and Dorchester House, as evidencing a great and notable step in domestic luxury and splendour. It remains a question whether this is a healthy state of things, and whether it develops the highest taste for art in the best way. Perhaps not altogether so; but if it does not in all respects do this, it develops enormously the taste for freedom and liberty. I have before alluded to the deadness and monotony of uniformity, and the picturesque beauties of variety. The *rationalized* of this seems to be, that uniformity is the product of centralization; variety of individual freedom. Every man's home is his castle, and he ought to be able to build it as suits his individual taste. This is the great charm of our old Mediaeval buildings, extending down to Elizabethan and even to Jacobean times. In many of these old houses you will not see two windows alike, and yet every window will tell its own story.

From the lattice in the lofty tower denoting the lady's retreat, to the broad arch, the glory of the banqueting-hall, each aperture has its own meaning,—one might say, its own features. The heraldry tells its own tale: the house is the house of a particular family, and for ages will indicate to whom it belonged. It is a thing endowed with certain moral attributes and

having a definite character. In our towns it used to be the same thing, for it is not till within the last century that the monotony of our large squares and long streets has offended the eye of accomplished taste; the sameness of the stucco terraces of Belgravia, and the heaviness of the brick houses of Harley-street. A friend of mine, who is both an artist and a judge of art, told me that some years ago he met Rauch, the celebrated German sculptor, who is well known for his works abroad, and especially his celebrated colossal statue of Frederick the Great. Rauch said to him: "Thirty years ago and upwards I visited your country, and was much impressed with the works of your countryman, Sir Joshua Reynolds. In him you truly have the foundation of a great school of national painting; for, while he conscientiously devoted himself to the study of the best masters, he preserved the individuality of a great and original mind."

If art be, as I believe it is, a unity, and that the partition walls set up between the various arts, between painting, sculpture, and architecture, are only partitions removable at will, Rauch's remark would apply, I think, with force to the architects and architecture of this day.

In the works of many noble minds we have abundant evidence, at the present day, that the study of ancient works has been combined with a successful appreciation of the real needs of modern society. The combination of the old with the new, of the spirit of reverence with the love for reform, is a remarkable characteristic of the Anglo-Saxon race. With many failures and shortcomings, we have much to be thankful for, and not the least in this, that in our free competition the same idea which governs one class pervades all, and is accepted as an axiom by the lord and by the peasant, by the man of property and by the artist. What is this great idea—this fertile source of England's power? It may be described, I think, almost in two words, which, though apparently inconsistent with each other, involve no real inconsistency,—reverence for the past, and for the future "progress;" or architecture, a respect for the great styles, whether Greek or Medieval, combined, however, with an ever-varying and ever original mode of applying them.

COMPETITION DRAWINGS FROM THE SCHOOLS OF DESIGN.

In what is known as the Competition Gallery, at the South Kensington Museum, the gallery upstairs, wherein was held the Exhibition of miniatures, the drawings submitted from the various Schools of Design throughout the country, in competition for the national medals, are now on view, and (what is more) deserve to be viewed? In the Architectural department the examples exhibited are mostly superior to those that have been sent before. The design for a cathedral, by H. C. Gribble (South Kensington), to which the gold medal is awarded, is a very creditable design, exceedingly well drawn. We should like to have seen the plan. The silver medal is awarded to a design for a small State Railway Station, by B. Samoiloff (South Kensington). The interior is well designed and drawn: it is suggestive rather of foreign than of English ecclesiastical architecture. A design for Cemetery Chapels, by A. Wade (Reading), to which the bronze medal has been given, is not so well set forth. Arthur Peter (Lincoln) receives the bronze medal for an unmeasured drawing of the Chapter House, Lincoln; and Ellen Miles one for a design for a bronze door for a library, containing reliefs illustrating the works of eight poets of different countries. The ornamentation in the spandrels is too large for the groups in the panels.

In reply to the premiums offered by the Plasterers' Company for the best designs for a decorated or ornamental diaper nine or ten competitors appear. The first premium has been properly awarded to W. E. Mackerness (South Kensington), and the second to T. Longere, Stoke. Other premiums offered by the company for modelled ornamental angles appear to have been gained, the first, by R. J. Morris, and the second by R. Luun, both of South Kensington.

The bronze medal has been awarded for a circular ornamental angle in plaster to G. Broomfield (Sheffield). W. Orr (Glasgow) has a gold medal for a clever design for surface decoration; Maria Brooks (South Kensington) the gold medal for some admirably painted porcelain. E. Mackerness (South Kensington) has the silver medal for a design for a ceiling; Thomas

Cox (Birmingham) one for a design for a metal screen, with Gothic outlines filled with natural forms; and Anne Baxter for a drawing of an Early English spandrel.

The gold medal is given to John F. Orr (Glasgow) for a design for a hall-floor. H. Hood (Nottingham) gets the bronze medal for some conventional borders, well designed; E. Fitch (Lambeth) a prize of hooks for a choir-screen of mosaics and metal; W. F. Randall (Stroud) hooks for designs for capitals; and Peter Kirkly (Nottingham) a similar prize for decorations. A design for a mosaic altar-piece, by H. Olden (Birmingham), though not rewarded, deserves mention; and we may add, that some of the pictures of fruit and still-life are excellent.

THE WEATHER AND THE PUBLIC HEALTH, TO THE 29th OF JUNE.

APRIL sustained its character this year. Rain fell on nearly every day in that month. The severe gales in the second and third week are unprecedented for April in these records. The first eleven days of May were remarkably hot:—May 6th, 82° in the shade; mean of week ending May 11th, 61½°, 11° above the average. As this month advanced we had a succession of strong north-easterly winds and cold nights, but no frost until the morning of the 22nd, when we went into mid-winter weather. That day was remarkable, frost and frequent snowstorms from morning till night. On the 22nd and 25th, 7° and 6° of frost respectively. There was nothing in previous years in the present century to equal it in severity in the fourth week of May. The range of temperature between the 8th and 23rd of May was upwards of 50°. It is a significant fact that hitherto all excessive heat in the early part of May was followed by cold weather in the same month, as in 1807, 1820, 1828, 1833, 1841, 1848, 1854, and 1867. The last six days of May were very hot. June opened with great heat and heavy rains. The weather was remarkably erratic in this month:—June 10th, 118° in sun; June 11th, 82° in shade; June 14th, 41°; June 11th, nine a.m., 73° in shade; June 17th, 9 a.m., 49° only! Polar winds prevailed from the 12th to the end of the month. 26th, 27th and 28th, barometer above 30½ in. The mean temperature in each of the three months, when compared with the average in eighty years was as follows:—April, 2° in excess; May, 0·9° in excess; and June, 0·3° in deficit. Rainfall in the three months, 6·19 in., being 0·19 in. in excess. In April and May the barometrical values were 0·23 in. and 0·09 in. below the average respectively, and in June, 0·12 in. above the average.

Spring Season, 1867.

TABLE from Nineteen Years' Observations, showing in parallel Columns the Earliest, the Latest, and the Average Dates on which the Foliage or Blossoms of each of the Trees therein named has commenced expanding, compared with the same Observations in 1867.—

	Earliest.	Latest.	Average.	1867.
Balsam Poplar (<i>Populus balsamifera</i>)	March 6	April 10	March 31	April 15
Larch (<i>Abies larz</i>)	March 21	April 14	April 21	April 14
Horse Chestnut (<i>Aesculus hippocastanum</i>)	March 17	April 19	April 8	April 19
Sycamore (<i>Acer pseudo-platanus</i>)	March 28	April 25	April 14	April 25
Damson (<i>Prunus domestica</i>) Blossom	March 28	May 13	April 12	April 17

Ash (<i>Fraxinus excelsior</i>)	May 13	June 14	May 30	May 16
Mulberry (<i>Morus nigra</i>)	May 12	June 23	June 1	May 16

In the beginning of April nature showed no signs of animation. Everything bore a wintry aspect. The severe weather in March, with the frequent heavy depositions of snow, partially melted in the day time, but unaged by the intense frost every night, pressed hard on the rose-trees and laurels, which had been prematurely brought forward by the fine warm weather in February. The check was so great many of these trees were killed.

There was not the slightest dawn of spring until the second week in April. The poplar and the larch did not come into leaf till the middle of the month. The damson was not in blossom before the third week; and it was the last week of April ere the sycamore expanded its leaves. This was later than ever before known.

But the progress of nature then made such rapid strides that everything hurst into life as if by magic. The oak was in full leaf early in May; and the ash and the mulberry expanded their foliage by the middle of the same month, or, at least, a fortnight earlier than their average dates. The short space of one month only sufficed to accomplish what usually takes from eight to ten weeks in the development of these beautiful

works of nature. The splendour of the pear, damson, and apple blossoms were, under the influence of bright sunny skies with alternate genial rains, so quickly followed by the formation of their fruits, firmly knitted and unchoked by frost, that we forgot for a time the usual precarious nature of our climate.

But in the latter portion of May we were once more assured of its vicissitudes. The north-easterly winds, which became the order of the day and night, brought intense frost. The progress of the spring was retarded by the long persistence of the harsh polar currents and low temperature. The wheat and barley and other cereals looked sickly, and withered. They were starved by the cold nights; but the great heat at the end of May and beginning of June, with plenty of rain, refreshed the pastures and roots. The cereals recovered from their unhealthy appearance, and there was every promise of excellent and abundant crops.

Still the weather was not favourable in June. Temperature varied considerably. There was great absence of sun. Rain was of two frequent occurrence. The crops of grass were heavy; but in the Midlands we had passed the middle of the month before hay-making commenced, and even then under the non-ambiguous circumstances of either rain or threatening skies. Dull cloudy weather kept the wheat-plant from coming into ear till the end of June.

The most productive harvests have been when hot weather of appreciable duration did not set in until after the summer solstice. In 1859, 1863, and 1864 there was no summer weather before July, and excellent harvests followed. If great heat prevails in June, as in 1826, 1846, and 1858, the grain does not arrive at its proper growth. The ripening is premature. The yield then becomes small.

What hot weather we had in May and June was of short duration, with twelve months unprecedented in these annals for excessive rainfall, there is abundance of moisture in the ground for the roots and pastures on most lands for some time to come. Wheat wants no more rain till harvest. This year the cereal plants are not close on the fields; but the ears are large, and promise to be well filled.

There is every reason to expect, in the event of a fine hot July and August, that we shall be blessed with a good and bountiful harvest of every description of grain, roots,—indeed, of the earth's produce generally.

Before commenting on the public health for the past three months, I wish to impress the fact that it is only when the mean temperature is below 40°, in the absence of cholera or fever, the death-rate is seriously affected. Hence it is

that the winter interferes with our vital statistics. The following table will demonstrate this fact:—

Annual Mortality per Thousand of Population Twelve Months ending June 30th, 1867 (London, Birmingham, Bristol, Manchester, Liverpool, Sheffield, Newcastle, Salford, Hull, and Leeds).

Year.	Mean Temperature.	Death Rate.
July	51°	25·5
August	52°	30·3*
September	54½	28·1*
October	51°	25·9
November	42½	29·6
December	41°	28·0†
1867.		
January	32½	32·4
February	35°	23·4‡
March	36½	23·1
April	41°	24·5
May	53°	23·9
June	53°	22·5

* Great mortality in Liverpool and London from cholera.

† Much fever in Newcastle-on-Tyne and other towns.

‡ Mean week ending January 5th, 25°; January 19th, 25°; hence the great mortality from intense cold.

§ Death-rate high first half of February, owing to severe weather in January.

|| High mortality in consequence of severity of the weather.

The high rate of mortality in January was owing to the intense frost. Even the cholera, which carried off so many thousands of human lives in Liverpool and London in July, August, and September last, was not so destructive as to bring up the general death-rate of the ten large towns to the January standard. The Polar currents in the spring months are always very trying. After the Tropical heat early in May, the severe weather in the third and fourth week, when the searching north-east winds blew with great force, did not however materially disturb the public health. At least fifteen per cent. of the mortality in February was in consequence of the cold in January. The moderate temperature in April had the effect of reducing the death-rate in that month, which was considerable in March from the inclemency of the weather; and notwithstanding the vicissitudes of temperature, in May the ranges were compatible with our endurance so far that the mortality was lower than any other period of the year, June excepted. Never was the death-rate so low since registration began as in June 1867. We had extreme heat at different periods of the month, at other times cold winds and low temperature ruled in our sea-girt island. Sometimes a range of 40° was recorded in two or three days. Whatever may be the atmospheric changes, the mortality is not affected so long as the temperature keeps within the limits above defined.

The public health for the quarter just ended has been very satisfactory. In the corresponding quarter of 1866, Liverpool returned an annual death-rate of 34 per 1,000 in one week, 35 per 1,000 each week in eight weeks, and 40 per 1,000 each week in four weeks. There was no cholera in Liverpool last year until July, excepting in isolated cases. In the quarter now terminated, the annual rate of mortality in Liverpool did not reach 30 per 1,000 in any week.

There is a decided improvement in the health of all the ten large towns, with the exception of the borough of Newcastle-on-Tyne, to which place I shall refer before I close this inquiry.

The average death-rate in Edinburgh is about 25 per cent. more than in London, Birmingham, Bristol, and Hull. The miserable abodes of the people in the old town are much to be deplored. The system of dividing the houses into flats, each tier being occupied by a separate family, precludes a proper mode of drainage and ventilation so essential to the promotion of health, and should be condemned and abolished.

VITAL STATISTICS.

Death-rate per Annum per 1,000 of Population.

	Quarter ending June 29, 1867.	Quarter ending June 30, 1866.
London	29.4	26.2
Liverpool	29.0	37.9
Manchester	27.6	30.2
Birmingham	19.8	24.5
Leeds	25.3	33.6
Sheffield	22.2	30.7
Bristol	21.0	25.3
Newcastle-on-Tyne	27.3	28.6
Salford	25.0	39.4
Hull	22.3	24.7

Death-rate per Annum of the Ten large Towns, irrespective of Classification.

1866, Quarter ending June 30	29.1
1867, Quarter ending June 29	23.7
Decrease in 1867	2.4

The mortality in Newcastle-on-Tyne is very large. No wonder at it. The deficiencies in ventilation, drainage, water-supply, and privy-accommodation in this dilapidated, over-crowded, and ill-constructed old town, compel the structural alteration, wherever practicable, of such places, and a large reduction in the number of inmates, so as to bring them within the contingencies needful for the maintenance of health. New thoroughfares should be opened, so as to admit light and ventilation, and proper and sufficient conveniences for the observance of sanitary law.

Of 55,366 people, or nearly one half of the population within the borough of Newcastle-on-Tyne, whose dwellings were inspected in the beginning of this year, one-eight of these houses had not, at the date of inspection, the means of good ventilation. One-eighth of the houses were without even water supply, either from the water company or other legitimate sources. One-fifth of the houses were without any privy accommodation. The drainage of two-thirds of the houses only was good; and of the remaining third, more than a third or an eighth of the whole number, were without any drainage. A

member of the town council of Newcastle-on-Tyne, in a letter to me on this vital question, says, "It is our intention to begin the experiment of building dwellings for the poor at once, as till we provide accommodation for this people we cannot turn them out of their miserable hovels."

In towns, as London, Birmingham and Liverpool (where there are active medical officers), manufacturers for non-consumption of smoke, also persons responsible for had drains, foul and neglected ashpits, or for offences against the Lodging-house Act, likewise purveyors of meat or fish for exposing such for sale in a decomposed state and unfit for human food, are summoned before public court. They are disgraced and fined. Their names and offences are published in the newspapers for the information and protection of the public, and in order to deter others besides themselves from offending in the same manner. By these precautions the health of places having efficient officers has been, and will continue to be, improved.

London, with its three millions of people, is one of the healthiest of our large towns. The drainage is good,—the water is excellent. Over-crowding is prevented as far as practicable. Nothing is permitted in any street within the limits of the metropolis, nor in any yard, court, or premises calculated to interfere with the public health in the metropolitan boundaries, but it is either removed immediately, or (if suffered to remain) under risk of exposure, fine, and disgrace to the responsible person. A fine sturgeon was caught near Westminster Bridge on the 11th of May. Thus far good for the waters of Old Father Thames. The prohibition of sewage passing through rivers in populous places cannot be too strongly enforced.

The sanitary supervision of Liverpool has so improved the health of that great seaport that instead of being the largest in mortality, as formerly, Liverpool now ranks among the healthy of the ten great towns. As one proof of the many important efforts made for the sanitary improvement of Liverpool, I may mention that the last great municipal project in this direction is the conversion of middens into waterclosets, with passage into the main street sewer; one half the cost of such conversion being at the expense of owners of the property, and the remainder borne by the corporation.

In an article on the "Town Death-rates in the first three months of 1867," the *Builder* says, "Birmingham is naturally one of the healthiest towns in England, and there is little doubt but that with some sanitary activity to which less favoured towns have been stimulated, the death-rate might be reduced nearly to the healthy district standard." The average mortality in Vienna is something like 50 per cent. more than in London.

THOMAS L. PLANT, F.M.S.

ARCHES.

"Ut pendet continuum flexile, sic stabit contiguum rigidum inversum."

I must premise that I make no pretension of treating didactically upon the intricate subject of the equilibration of arches. My object, in this communication upon that theory, is to elicit information, rather than to impart instruction.

Consulting a practical work, the other day, containing two or three articles upon arches, I was led to the consideration of working out mathematically, instead of finding experimentally, the weight required at each point of the catenary to make it coincide with any other curve equal to it in length; and, in thinking upon this, there occurred to me, also, a simple method of constructing an arch so as to support any weight, on any part of it, less than that which would actually crush the materials composing it. Having in earlier days worked a little, that I might not be quite ἀγέμετρος ἦτος,—

"Scilicet ut possem curvo dignoscere rectum."

I have been able to arrive at some results respecting the former of those propositions; and I give them here, because it may happen that, in the working, some consideration may have been omitted, or some error have crept in, which may render them of but little practical use; and, in this case, I hope that some scientific reader of this journal will—thinking his time not unworthily occupied in so doing—contribute an article upon the interesting subject which I have taken, by way of correcting or extending mine,

which will be at once strictly accurate and practically useful.

The investigation of the latter proposition is added on account of the simple and practical nature of the result obtained.

The equation to the catenary—that is, to the curve in which a heavy inextensible string, of a chain, of uniform density and thickness, hangs when suspended from two given points,—is

$$y + c = \frac{c}{2} \left(e^{\frac{x}{c}} + e^{-\frac{x}{c}} \right),$$

the origin being the lowest point of the curve. The law of the vertical forces or weights which must be applied to this curve that it may coincide exactly with another curve equal to it in length has to be determined. Let the other curve be the circle, and assume that the catenary and the circle coincide and have a common origin.

The equation to the circle, the origin being a point on the circumference, is

$$y^2 = 2ax - a^2,$$

and the length of the catenary is

$$s = \int \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx, \\ = \frac{c}{2} \left(e^{\frac{x}{c}} - e^{-\frac{x}{c}} \right) + C$$

where C = c when the arc is measured from the origin; therefore

$$s = \frac{c}{2} \left(e^{\frac{x}{c}} - e^{-\frac{x}{c}} \right),$$

or, expressing it intrinsically, $s = c \tan \phi$, $\tan \phi$ in this case being identical with $\frac{dy}{dx}$ of

$\frac{1}{2} \left(e^{\frac{x}{c}} - e^{-\frac{x}{c}} \right)$. Now, since the curves are assumed

coincident, the $\frac{dy}{dx}$ with respect to the catenary

corresponds to the $\frac{dx}{dy}$ with respect to the circle,

as the axis of y for the catenary corresponds to the axis of x for the circle.

$$\text{Therefore, } s = c \tan \phi = c \left(\frac{1}{d(2ax - a^2)^{\frac{1}{2}}} \right) = \frac{y}{c - a - x}.$$

But s also represents the force or weight acting vertically on the catenary, to make it coincide exactly with the assumed curve; therefore,

$s = c \frac{y}{a - x}$ is the pressure required at every point

x, y of the arch, that it may be in equilibrium. Now, suppose the values of s at a number of points on the curve to be proportionally represented by vertical lines, the locus of the equation

$s = c \frac{y}{a - x}$ will be a curve passing through the

origin, and extending to infinity on both sides of it; for y and s vanish with x , and if $x = a, s = \infty$. Thus each of the two lines s at the distance $a = c$ is an asymptote to the curve represented by these vertical lines at their extremities, as described.

From this result it is obtained that a circular arch must not be weighted at the crown; that the weight must increase continually towards the springing; and that when the arch is a semi-circle, the weight at the springing is infinite.

Suppose the curve of the arch to be equilibrated by the parabola; then

$$s = c \frac{x^2}{a^3}$$

the equation to a similar curve, a parabola whose latus rectum is $\frac{c^3}{a}$.

For this curve, then, the result gives the weight at the crown = 0, and the weight varies as x^2 .

By similar methods, the law of weights for other curves may be found.

$$\text{Since } s = \frac{1}{2} c \left(\frac{x}{c} - e^{-\frac{x}{c}} \right) = \frac{1}{2} c \left(\frac{e^{\frac{x}{c}} - 1}{e^{\frac{x}{c}}} \right), \\ \log_e s + \log_e \left(\frac{e^{\frac{x}{c}} - 1}{e^{\frac{x}{c}}} \right) - \frac{x}{c} = \log_e s + \log_e \frac{1}{2}$$

from which equation, s and x being known, the numerical value of the constant c may be approximately found. The value of y , however, in any case, can be found by actual experiment, and then the exact value of c determined from

$$\text{the equation } c = \frac{s^2 - y^2}{2y}.$$

In examining the result obtained for the law of the weights, it is seen that

$s = c \frac{dx}{dy}$; therefore, expressing $\frac{dx}{dy}$ or $\frac{1}{\phi'(x)}$ by F, there is obtained for the equation to the curve assumed for the arch

$$y = \int \frac{dx}{F} = \phi(x) + C.$$

This suggests the method of dealing with the proposition converse to that just considered,—that of finding the form of the curve of an arch for a given locus of vertical forces.

I come now to the construction of an arch having the property predicated in the latter of the two propositions enunciated at the commencement of this article.

Let ABCD be a circular arch; E, F, the middle points of AC, BD; then if the straight line EF, joining the points E, F, do not cut the arc AB, the arch ABCD will support any weight on any point of it less than that which would crush its voussoirs.

Let the straight line EF touch the arc AB. Now, suppose the figure inverted, and that a heavy string of the length of the arc EF be suspended at the points E and F, and weighted so that it would hang in any two straight lines; then, since the straight line EF does not cut the intrados AB, neither of these straight lines will cut it.

Again, neither of these straight lines will cut the extrados CGD. For it may be shown that the two straight lines EG, FG, drawn from the points E, F, to G, the middle point of the arc CD, are together greater than the arc EF, but less than any other two straight lines drawn from the same points E, F, to any other than the middle point of the arc CD; and that the two straight lines drawn from the points E, F, to either extremity of the arc CD, as the straight lines ED, FD, are together greater than any other two straight lines drawn from the same points E, F, to any point whatever in the arc between its extremities C, D. Hence no two straight lines in which the string can hang will cut the extrados CD; and it has been shown that they cannot cut the intrados: therefore the arch cannot be broken by any weight less than that which would crush the materials composing it.

From this theorem, then, the construction of a circular arch having the property predicated may be determined; and the same construction would most probably apply when the curve of the arch is any conic section whatever.

In deducing the results here given, the effect of friction has not been considered.

Cambridge.

A. J. TOMPKINS.

THE FRENCH EXHIBITION.

THE great ceremonial in honour of successful exhibitors has taken place in Paris, and has been recorded in one of those remarkable descriptive articles that have made the *Times*, and its special correspondent, famous in that direction. We have no disposition to go into any particulars as to the prizes just now. The undertaking commenced with a fraud on English artists (the appropriation of their design for an Exhibition building, and for the organization of the Exhibition), throughout its progress the English commissioners have been fleeced, and slighted at every opportunity, and it culminates in the greatest possible injustice to English exhibitors. It seems to us that the English jurors should be called upon, if not for a defence of their proceedings, at any rate for explanations,—but of this another time.

The contemporary we have already quoted, in an eloquent leading article accompanying the description referred to, says, and naturally,—

“The speech of the French Emperor is conceived in a spirit worthy of the occasion and the theme. He would be justified in claiming for France an eminent position in connection with this great work. It is true that the Exhibition, being universal and international, is the production of all nations. It is true that some of the most important contributions have been made by foreign exhibitors. If some nations have in certain departments not done themselves justice, while every variety of French art and industry is fully represented, it is no less true that in many particulars foreigners have shown incomparable originality and skill, and their labours are among the chief attractions of the Exhibition. But the impress of the French mind is on the whole. The disposition of the building, the arrangement, at once simple and scientific, of the departments or classes, the central court, the girde of restaurants, the surrounding park, with its wonderful buildings of all kinds, are undeniably French; and foreigners have paid a tribute to the excellence of the conception by the readiness with which they have fallen in with the conditions imposed, and the general acceptance of all things which they see. It is universally admitted that, though the building has no architectural pretensions, yet, arranged as it is without and tastefully arranged within, the effect is most pleasing, and that no building has it been easier to pass whether one wishes and to see what one wishes to see. Perhaps no other shape and disposition of building would have allowed such an immense number of objects to be seen to equal advantage. We must do the French, then, the justice to say that they have by their taste and power of organization made the Exhibition successful, and that the praises it receives from every visitor are principally due to themselves.”

In truth, however, all this for which the praise is being given is not due to themselves, and does not belong to them. We have on more than one occasion felt compelled to point out that the plan as carried out by the French Commissioners, with its central garden, radiating avenues, double classification, and so on, was published in our pages, February 18th, 1861, and that from that time to this, though no French architect has ventured to claim to be the designer of the building erected, the obligation to England has been resolutely denied. We republished the plans side by side in our volume for 1866,* and showed that even where departures had been made from the plan originally given in the *Builder*, the desirability of these departures had been pointed out in the letterpress accompanying it. From first to last, we do not hesitate to reiterate, injustice has been done to Englishmen.

LEICESTER CASTLE.

THE town of Leicester stands upon moderately high ground, and on its western side is divided by a narrow valley from the opposite elevations of Glenfield and Branstone. This valley gives passage to the Soar, the river of the county, which, flowing northwards, meanders through the meadows of the Abbey of St. Mary de Pratis, and thus before agriculture had drained these lands, securely covered the western and northern fronts of this very ancient and once well-fortified place.

Down the western valley, but outside the stream, and along the edge of the higher ground, was carried a branch of the Fosseway, or as some think, the Possway itself, which thus, on its passage from Bennoves or Higb-cross towards Lincoln, left the old Roman “Ratee Coritanorum,” known to us as Leicester, about a furlong to its east.

Leicester, a town of British origin, was taken possession of and fortified by the Romans. The line of the wall, on the usual rectangular plan, has been traced upon the north, south, and east sides, the western defence being formed by the river. There is, however, some doubt as to whether the wall actually reached the water at the south-west angle. If, as is supposed, the fragment of Roman masonry known as the Jewry wall was really a part of the town wall, it follows that the wall was present on the west side, and there was a space between that defence and the river, and that the castle, which occupies the south-west angle, was outside the town.

Leicester was also a town of great importance among the Saxons, and was nearly central in the kingdom of Mercia. It is mentioned in a Saxon charter of 819, and is said to have given the title of earl to Leofric, A.D. 716, to Algar in 838, and to other Algar and other Leofrics, and to Leofwin, the Saxon line ending with Earl Edwin, who was slain in 1071. The town, during the Danish interregnum, was one of the five burghs; and the castle, like those of Tamworth and Tutbury, is said to have been either

founded or restored by Ethelfreda in 913-14, though for this solid evidence is wanting. Nevertheless, that Saxon Leicester was the seat of a very important earldom is very certain, and the residence of the lords was most probably the castle.

The town and castle were placed by the Conqueror in charge of Hugh de Grenthamail, lord of the neighbouring honour and castle of Hinkley, and whose son Yvo was vice-count of the county under Henry I. The actual property of the Grenthamails in Leicester, was one-fourth of the town; but it does not appear how this and much of the other parts were acquired by Robert Earl of Mellent, who became Earl of Leicester, and died 1118, in possession of the castle and honour, “*justa et infra castellum*,” which may conveniently be rendered, “Outside, but just beneath the castle wall,” was a collegiate church, of Saxon foundation, dedicated to St. Mary. This Robert Bellomont rebuilt and enriched very considerably in 1103, and he is thought also to have completed the castle.

Robert Bossu, the second earl, took the part of Henry I. He also strengthened and enlarged the castle. He was the founder of St. Mary de Pratis, outside the town; and, to endow this, he diminished the ecclesiastical staff, and diverted some of the lands from his father’s foundation by the castle. He died 1167.

Robert Blanchmains, his son, the third earl, married Petronilla, the heiress of the Grenthamails, his predecessor at Leicester, and with her obtained Hinkley and other possessions. He also is reputed to have enlarged and strengthened the castle, and his constable, Anketel Mallory, held it against Henry, the second lord, in 1175, unsuccessfully. Both castle and town were taken, the town wall was demolished, and, it is said, between the north and east gates was never rebuilt.

Robert Fitzparnell, the fourth earl, died childless in 1201, when Leicester Castle, and in 1206 the earldom, came to Simon de Montfort, who had married Amicia, his sister and coheir. Upon the death at Evesham of their son Simon in 1264, and his attainder, the earldom and castle were granted to Edmond, second son of Henry III., Earl of Leicester and Lancaster, and the castle has since descended with the Lancaster property, and is still a part of the duchy of that name.

Henry, Earl of Lancaster and Leicester, founded the Hospital of the Newark contiguous to the castle in 1322, and the works were completed by Henry, his son, Duke of Lancaster, in 1354. The hospital contained four acres. It reached the river, and covered the castle on the south side, and at this time one approach to the castle is across the Newark, through its larger and smaller gates.

The earls and dukes of Lancaster must have restored the castle, as they resided here very frequently, and with their usual display. When John of Gaunt granted certain privileges to the city in 1376, he reserved the castle and its mill, and the rents and services of the castle court and its office of porter. In the castle he entertained Richard II. and his queen with great splendour in 1390.

In 1414, when Henry V. held a Parliament in the Hall of the Grey Friars, he resided at the castle, and it was in the great hall of the castle that was held the Parliament of 1425-6, the Commons meeting in an apartment below it, which, however, could scarcely be the case as regards the existing hall, which is on the ground level.

Henry VI. was here in 1426, and in 1441 the castle and honour were included in his marriage settlement. In 1450 a third Parliament was held at Leicester, but whether in the castle hall is not recorded. Edward IV. was here in 1463 and 1464, but from this period the castle seems to have been neglected, and to have fallen into great decay.

Leland, who visited Leicester about 1512, says,—“The castle standing here the worst bridge is at this time a thing of small estimation, and there is no appearance other [either] of high walles or dykes. So that I think that the lodgings that now be there were made since the tyme of the Barons’ war in Henry III. tyme, and great likelihood there is that the castle was much defaced in Henry II. tyme, when the walles of Leicester were defaced.” (Itin. i., p. 16.)

Speed gives a rough perspective view of the castle and town, which, however, is very indistinct as regards the former. In 1633 Mr. Herrick, of Beaumancr, was directed by the king to re-

* Vol. xxiii., p. 723.

move the ruinous parts and sell their material; to repair the castle house, which contained the records of the Honour of Lancaster, and to preserve the vault and stairs leading to it, for the use of the keep of the castle. Upon this an inquiry was taken in 1633-4, and the value recorded of the materials, "excepting the Sessions Hall and the vault under the old castle, and the stairs leading to it." This inquiry gives several details, chiefly of parts now removed; and mentions as to be repaired "John of Groat's kitchen, divers outhouses belonging to the Great Sessions Hall, and the ruinous pieces at the south end of the same hall; also the south gate, and the wall from this gate to the Soar, which divides the castle from the Newark; also a wall next the porch of the church."

In the civil wars the castle was held for the king. It then fell to the Parliament; was retaken by the king in 1645, and finally yielded to the Parliament after Naseby. In these struggles the south gate was destroyed. This is supposed to be a gate placed due south, and therefore outside the mound, or between it and the river.

In 1751, Mr. Rogers Ruding had a lease of the premises from the duchy, which specifies the south gate, probably that remaining towards the Newark, the castle house, several tenements, the moat, and the appendages to the castle, and stipulates for the holding of sessions in the great hall.

The castle stands at the south-western angle of the town, upon ground close to, and about 20 ft. above, the right bank of the Soar, the three chambers of which unite below the castle. The nearest of these streams is the least which supplied the castle mill, and does still supply its modern representative. From the line of the castle wall the ground slopes rapidly, and terminates in a strip of level land that forms the margin of the mill leat.

The castle seems to have been composed of a mound on its south-west quarter; a hall and other buildings on the west or river front; the church of St. Mary, opposite to the hall; and on the east side, a gatehouse between the church and the mound; and, rather east of both, another gatehouse close north of the church, and a wall which runs behind the church, and forms a part of the eastern boundary of its churchyard. There is also the mill which, though modern, covers the ancient site.

The area within which these remains are included is known as "The Castle View." This evidently represents the precinct of the Norman, and probably of the Saxon castle, and has been preserved as a distinct and, in part, extra-parochial district, vested in the duchy of Lancaster. The Castle View is nearly square, and may include four or possibly five acres. In 1861 it was returned as "The Liberty of the Castle View," and contained 29 houses and 131 persons. The boundaries are the line of the ancient wall, or nearly so. On the south they divide the castle from the Newark, just including the mound. On the east they take the line from the present gatehouse, by the old wall, and thence by the edge of the road down to the mill, including the house and garden attached to the Sessions House. The ditch is everywhere filled up.

This line includes St. Mary's, which was once the collegiate church or chapel of the castle. If it be that the castle was enlarged by Robert Bossu, it is probable that the older defence just excluded the church, and took the line of the present upper gatehouse, cutting off the churchyard and church, and placing the latter "*justa et infra*" the castle wall. St. Mary's was made parochial in 1400, the rest of the View remaining extra-parochial, and it is not impossible that this was a restoration to the church of its ecclesiastical position before it was included within the military precinct.

The mound, though broad, is less lofty than is usual in the more important Saxon castles. It is about 30 ft. high and 100 ft. diameter upon its circular top, which is quite flat, without a trace of old building upon it. It has no ditch, and is connected with no ancient wall; so that, though probably within the ancient *enceinte*, it may, as at Warwick and Tamworth, have formed only a part of it.

The hall formed a part of the castle building, or castle proper. It is an oblong structure, about 60 ft. north and south by 25 ft. east and west, with gables at either end, and an open high-pitched roof. Since 1633, and perhaps earlier, it has been used for judicial purposes, and divided into three parts—civil and criminal

court, and between them an entrance lobby, and above it a grand jury-room. To enlarge the courts, the east wall has been removed, and a building added on that side, so that the hall is much mutilated. Its clerestory parts also are concealed by panelling and partition walls. The original south gable remains. In it are two round-headed windows, resting upon a string-course, or set off in the wall, marked by a plain chamfered moulding. The windows are small and plain, and the recesses have but little splay. These are flanked by two slender detached octagonal shafts, possibly replacing cylindrical ones, and the heads of each recess is surrounded by a single bold band of chevron moulding. There is a third and small window above, near the apex of the gable, with a recess of about 2 ft. opening, all quite plain. Below is a small Norman door, but apparently a very recent insertion. It may, however, represent a way into the kitchen, which was at this end.

The opposite or north end wall, forming the side of the civil court, appears also to be old, but is so plastered and pointed as to be inscrutable. It contains a large round-headed window, probably a modern insertion.

On the west side of the hall, between it and the river, is a sort of aisle, the base of which is old, and the wall flanked at each end by a buttress, probably of Decorated date. In drawings of the last century this building is shown as an aisle or lean-to, but it has been raised, and now forms a judge's retiring-room behind each court, and a staircase between them. In the basement are offices. This building contains one original window near the south end, flat pointed, with plain jambs, and a head adorned by a single chevron band. The jambs have been renewed in brick.

The hall-floor is on the ground level, but it has been largely excavated, and now contains a number of cells and vaulted passages to them beneath the court. These excavations show nothing ancient.

Until recently there were some small inferior buildings at the south end of the court. These are now replaced by a barristers' room. The kitchen stood here till 1715, when it was removed.

A modern building, north of the hall, no doubt represents the principal apartments of the old castle. It is said that a vault is still to be seen in this direction, but the premises are private. Here was the Castle House of the seventeenth century, and if there was a Norman keep it must have been here. There is or was a vaulted cellar of considerable size on the side towards the moat. Possibly it may remain beneath some cottages there standing.

The Gate House towards the Newark, opens from the castle, its front being outwards. It is small, having a portal passage and two lodges, and on the upper floor, now a ruin, a portcullis chamber, and two other rooms. Its arches are four-centred. It has the broad hollow moulding of the Perpendicular period, and a square portcullis groove behind the outer entrance. The arch opening inwards was closed by a gate only. The central part of the portal was boarded over. The structure is good Perpendicular, the work, no doubt, of the Earl of Lancaster.

The upper or north gate-house is framed of timber, and probably of Tudor date. It stands close north of the west end of the church, with which it was, until recently, connected by certain timber houses, used by the prebendaries. These have been in part pulled down.

Parts of the church are Norman, and the north aisle seems of the date of the hall of the castle, and, therefore, a part of the work of Robert Bossu. There is a small door in the west wall of the aisle, that may very well have opened from the base court.

Should the courts of the county of Leicester ever be lodged in a more central or more convenient building, it is to be hoped that the castle ball will be divested of its unseemly additions, and restored to its original dimension and pattern, and, when, probably, some correct information would be discovered as to the vaults and foundations of the buildings of the eleventh century.

Leicester Castle, mutilated as are its remains, is yet a good example of the Norman practice of placing the castle proper on the level ground, and treating the mound as a part of the external defences. C.

THE NEW STANDARD THEATRE.—The first stone of the new theatre upon the site of the Standard Theatre, hurried in October last, was laid on the 3rd inst.

OLD MACHAR CATHEDRAL IN SCOTLAND: PROPOSED RESTORATION.

The proposal to restore the ancient cathedral of St. Machar, as far as is now possible, to something like its original grandeur, has called forth considerable interest in Aberdeen and the north of Scotland. For some time the proposed restoration was in danger of being allowed to go to sleep; but now, seeing that an arrangement has been arrived at between the heritors of the parish and the voluntary subscribers, there is every prospect of the scheme being proceeded with. Mr. Scott, of London, was selected to report on the subject; and, along with Mr. Matthews, he went over the buildings some weeks ago. After a careful and minute examination, Mr. Scott has just given in his report, which enters at great length into the history of the fabric, and gives suggestions for its restoration.

The first step, he suggests, is to clear the building, not only of its galleries and sittings, but of every portion of the internal casing of lath and plaster, by which its walls have been encrusted. Then, and not till then, can the interior be seen to be what it has really been, and can judge with accuracy how to deal with it.

At present, it can only be said that all the ancient stonework, whether pillars, arches, windows, or doorways, must be cleaned and repaired, but without the touch of an iron tool or chisel. The intermediate surfaces, which have been always plastered, must remain so. The Triforium must be restored to its original form, the deal frames and canvas filling-in being removed, and the whole, in fact, brought, as nearly as may be discovered, into its original state. There can be no doubt, he thinks, of the desirableness of the introduction of stained glass.

EDINBURGH.

All Saints', Brougham-street.—This church, which is erected as an auxiliary to the large and fashionable congregation of St. John's, for the purpose of accommodating the poorer classes of the district, was consecrated by the coadjutor bishop of the diocese, on Wednesday, the 19th inst. The design of the building was prepared by Mr. Robert Anderson, architect, and is of the thirteenth century Gothic style, and consists of nave, with aisles and clearstory, transepts, and apsidal choir. The west end is incomplete, for want of funds, but when finished, it will comprise a cloister, baptistery, and tower. The upper part of the west gable is pierced by a wheel window; the aisles are lighted by coupled lancets; the clearstory by single lancets; the transepts have windows of two lights, with a single multi-foil at the head; and the chancel has plain single lights, without tracery or mullions. The whole treatment of the exterior is simple and severe, being devoid of ornament, and the architect has sought his principal effect in the interior; the most notable features of which are red-coloured stone columns dividing the aisles (the caps of which are still in the rough), and the roof, which is of open timber, plastered between the rafters. Three of the windows in the chancel have been filled with stained glass, by Weale, of Newcastle. The building is very awkwardly placed at an angle with Brougham-street, and as this does not appear to be necessitated by the form of the ground, it may possibly arise from an ultra orthodox notion of Orientalism; be this as it may, the effect is very displeasing. Mr. Anderson has conscientiously sought after truthfulness, and has not aimed at too much where little was at his disposal. The masonry struck us as being defective, a fault not common in this city.

Hope Park United Presbyterian Church.—This church is in the Lombardic style, and exhibits at the west end a low-pitched gable, with a cross at the apex, a wheel-window, and a round arched door under a pediment, divided into two square-headed openings. At each side of the door are small coupled round-arched windows, and part of the gable to the south is marked off by a buttress and pinnacle into a quasi aisle. A tower is placed at the north-west angle, which rises up plain and unadorned for about 100 ft., where there is a cornice, and above this is a two-light window with circular piercing at top. The four sides of the tower are finished by gables, and a high-pitched slated roof with an iron flue. The side elevations consist of three gables, each with wheel-windows above, and coupled round

arched windows below them. There is a hall or schoolroom situated in a sunk basement. Why this arrangement was adopted we cannot conceive, as the foundation was quite sufficient without getting below the street level, and the edifice has a painfully depressed look, which might have been avoided by placing the whole structure above ground. The situation is a very fine one, and occupying a conspicuous position at the east end of the meadows, so that it is seen from a great distance; but we cannot say it holds its place worthily. It is one of the least successful efforts of the architects, Messrs. Peddie & Kinnear, and contrasts very unfavourably with the adjoining church of St. Peter, the spire of which dominates over it in a manner calling to mind Landseer's well-known picture of "Dignity and Impudence." The side elevations, too, are disagreeably suggestive of railway-sheds upon the ridge-and-furrow principles. The interior is fitted up with galleries in a plain and commonplace manner.

The same gentlemen are architects for new offices in George-street, for the Crown Insurance Company. The elevation is of three bays and four stories. The ground-floor has three similar arched openings, with piers between; one of these is to serve as the doorway, but has no distinctive feature to mark it as such. This floor is separated from that above it by a moulded cornice, with double consoles at the head of the piers. The windows of the first-floor are also round-headed, and a plain moulding runs, without break, from sill to key-stone. The third story has square-headed windows, with moulded architrave and cornice, and the fourth has square windows with panels between, the wall-end being finished with regulation cornice. The front is made to project considerably beyond the line of street front, which makes it conspicuous, and gives some additional accommodation; but the result is very detrimental to the general effect of this fine street, which depends greatly upon its breadth and continuity.

THE MUSEUM IN GOTHA.

In the beginning of the year 1864 it was determined to remove all the art collections from the ducal castle of Friedenstein at Gotha to a single building to be constructed especially for this purpose. Mr. Franz Nennmann, architect to the Duke of Coburg and to H.R.H. Prince Augustus of Saxe-Coburg Gotha, was commissioned to prepare plans for the building. Other architects also sent in designs, but those of Mr. Nennmann were adopted. The ducal Government trusted him with the entire superintendence of the building, and the work was to be carried out by his sole responsibility.

A site, near the kitchen-garden of the castle, as selected by the architect, with the Duke of Coburg's approval, and the building was commenced on the 1st of July, 1864.

It is necessary here to describe the site, as it considerably influenced the design, and the architect endeavoured to adapt the plan of the proposed building to the formation of the ground.

The Castle of Friedenstein stands on slightly rising ground, formed partly by Nature and partly by art, and thus commands an extensive view over the surrounding country. A terraced garden surrounds the castle. The road to Einhardtsbrunn lies on the first level about 40 ft. from the castle, and is bounded on one side by the park and on the other by the ancient and modern buildings of the castle. In the centre of the space before the castle, and 31 ft. below the level of the garden, was used as a plateau. The kitchen-garden was in a direct line with the centre of the castle, and 47 ft. below it. There was thus a difference of level between the garden and the kitchen-garden of about 16 ft.*

The architect has extended the plateau of the level towards the kitchen-garden, and on this new ground the museum was commenced, raised with and midway between the towers of the Castle of Friedenstein.

The difficult problem of the difference of level between the museum and the park was thus happily solved by means of terraces. By taking advantage of this difference of level, the architect was enabled to build rooms of different heights on a ground-floor, which greatly diminished the cost of the building.

Throughout this account, and in the illustrations, the foot is used. The Gotha foot is equal to 0.2831 of a metre.

The museum was to contain the following collections, and the plans were drawn up accordingly:—A picture gallery, a collection of plaster casts, a collection of engravings, a collection of Chinese objects, a general collection of objects of art, and many other collections illustrative of zoology, mineralogy, conchology, entomology, &c. It was also requisite to provide rooms for the officers of the museum, workshops for the repairs of the collections, store-rooms, &c.

In order to diminish the cost it was thought advisable to build the museum in three stories, so as to avoid an extensive ground-plan. This was the more difficult as some of the collections required a large surface of floor, and others a large surface of wall space; and in the latter case, as a matter of course, objects can only be exhibited at a certain height.

The superficial area required for each collection was fixed before hand, and the architect was, therefore, bound to provide it. The systematic arrangement of the collections, and their connexion with each other, also had his consideration.

The different floors were constructed to contain the following objects:—

The Basement Plan.

The basement of the left wing has a superficial area of 4,469 square feet, and contains the collection of plaster casts. The rooms on this floor are of different heights, owing, as mentioned, to the slope of the ground on which the museum is built; and this fact has been taken advantage of to exhibit on this floor the more or less lofty objects in the museum.

The system of separate recesses, formed by large circular openings, has also been adopted. By this arrangement it is possible to divide the different objects into their several classes, and yet to allow the collections to be viewed as a whole.

The windows at the back of the recesses for lighting the store-rooms have been placed close to the ceiling, so that there is an available wall-space of about 8 ft. below the windows.

The arrangement of the right wing has been carried out on the same principle. Here are located the collections of minerals and woods,—the former occupying a superficial area of 2,119 square feet, the latter 536 square feet.

Space has also been reserved for apartments for the attendants; two rooms right and left of the cabinets for the servants; two rooms for the restaurant; and four warming chambers, immediately below which space is reserved for fuel. Next to these are the stores of fuel and other necessaries required for the house.

The public gain access to all the collections by the principal entrance on the park side, which is connected with the next floor by a double staircase. There are also two stone winding staircases leading to the roof, at the opposite ends of the main wing; but these are only for the use of the staff of the museum. It should be noticed here that the whole of this floor is vaulted, the treads and risers of the stairs are of stone, and the rooms are warmed by means of stoves. All the rooms containing the collections are paved with stone: the store-rooms are paved with tiles.

The rooms on the two upper floors are warmed by means of hot water.

The Ground Floor.

The four central rooms, containing a superficial area of 4,976 square feet, are devoted to mammalia. This collection was placed here in order to protect it from the direct rays of the sun, and thus avoid, if possible, the destruction of the specimens by moth. There will be quite sufficient light, as all the windows are planned on a large scale, and the circular openings in the middle walls are of large size. The birds will be exhibited in the left wing round the mammalia. This collection will occupy a superficial area of 3,600 square feet. In the same manner the space round the mammalia in the right wing will be devoted to the collections of corals and skeletons, occupying 1,508 square feet; reptiles, 582 square feet; studies of horses, 361 square feet; and conchology, 1,148 square feet. The beetles and butterflies are placed right and left of the entrance-hall, occupying 513 square feet. Near the grand staircase there is one room for the director and another for the superintendent of the museum.

This floor is reached from the outside by a flight of steps, which lead through an open colonnade of columns to the portico, whence the

visitor can step into the rooms containing the collections.

There is another entrance to this floor through the vestibule, from which a view can be had of the whole of the main wing, glass doors being placed between all the rooms.

The principal staircase is of stone, and is situated on the park-side of the vestibule; it is so arranged that the visitor can pass into the basement floor, under the centre of this staircase, by a door corresponding to that on the double staircase; entrance to this floor is, therefore, always possible from the park side. With the exception of the central rooms, the vestibule and the staircase, all the rooms are vaulted. The ceilings of the central rooms and of the vestibule are constructed of wood and covered with stucco. The floor is throughout of marble mosaic.

Upper Floor.

The principal staircase terminates here in a noble landing, and a large doorway leads into the historical collection. This room is an octagon, and has a superficial area of 1,213 square feet. The roof is in the form of a dome, with a skylight in the centre. It is 47 ft. in height.

This room will be decorated with frescoes in the dome and on the walls, the leading idea being to commemorate, by means of pictures, the different Sovereigns of the country, and the principal events in its history.

The picture galleries are situated on the right and left of this historical room, and are lighted from above. They contain together a superficial area of about 5,000 square feet, and a wall space suitable for hanging pictures, of 10,836 square feet.

The general collection of objects of art is placed round the picture galleries in the left wing, and in the recesses of the main building; it occupies about 4,480 square feet.

The Chinese collection, occupying 2,323 square feet, and the collection of engravings with 1,015 square feet, are placed in the same manner in the right wing. On the right side of the principal staircase there is a room for the director; and on the left side there is a similar one for the attendant.

The recesses on this floor are vaulted. The ceilings are of wood, stuccoed. The floors are of oak parquetry.

Turning now to the exterior of the building, the front is, of course, opposite the castle. The steps leading to the museum rest on a perron five steps high, and two lions to be cast in bronze will decorate the pedestals. An allegorical figure of Germany will be placed in the centre of the steps, and two other figures, representing History and Architecture, will decorate the colonnade of this floor.

The top of the colonnade will be embellished with the Saxon arms in the centre, having two lions rampant for supporters. On each side of the arms there will be a vase and a group of figures; one of the groups representing Sculpture and Painting, and the other Mineralogy and Zoology.

Great care was taken to find a good foundation for the building, and every part has been carried out, we are told, in the most durable materials. The front is built of tooled stone and brick, and the roof is covered with blue-black slates with zinc fastenings.

The whole building is 265 ft. (Gotha) long, and 120 ft. wide in the centre, without the portico or colonnade; the ends are 85 ft. wide. The dome in the centre is 106 ft. in height to the commencement of the lightning conductor. The whole building covers a superficial area of about 24,000 square feet.

Both difficulty and delay have been experienced in getting the building materials. The collections cannot therefore be moved into the museum until the year 1868.

The final completion of the museum, however, depends on the internal decorations, which especially in some of the rooms must take years to finish.

The cost of the building, without taking into account any special internal decorations and fittings, will, it is thought, in consequence of the difficulty in obtaining the materials, amount to more than 200,000 thalers (about 30,000*l.*), the alteration of the surrounding ground and part of the park is included in the external completion of the building.

It is a cause of much satisfaction to us that we have been enabled to place before our readers illustrations and particulars of this interesting work, due to the liberality and wisdom of the Duke of Saxe-Coburg Gotha.

- SCALE OF GOTHA FEET -

MUSEUM OF H.R.H. THE DUKE OF SAXE-COBURG GOHA, IN GOTHA.—MR. FRANZ NEUMANN, ARCHITECT.

COMPETITIONS.

Bristol Assize Courts.—The committee advertised for designs for "altering the present Guildhall so as to afford more accommodation for the transaction of public business, with better light and ventilation; and also for the erection of a second court, for the purpose of civil business, on ground the property of the Corporation, adjacent to the Guildhall." Three premiums were offered: For the best plan, 100 guineas; for the second best, 50 guineas; for the third best, 25 guineas; and competitors were given to understand, that in selecting the plans for premiums, the cost of the proposed buildings and alterations would form an important consideration. In reply to this invitation, ten designs were sent in, and these having been referred to Mr. Street, he reported, as entitled to the first prize, the plan with the motto "*Usui civium decori urbium*" (the work of Messrs. Pope & Bindon); the second prize he awarded to the plan with the motto "*Quis*," sent in by Messrs. E. Godwin & Crisp; the third prize, to the design with the motto "*Dos à Dos*," by Mr. C. F. Hanson. In Messrs. Pope & Bindon's design, the style of architecture is intended to be that of the period in which Colston's House was originally erected. It shows the present Assize Court enlarged to 70 ft. in length, and 12 ft. higher than at present, and that the new civil court shall be 50 ft. long and 34 ft. wide. It is to be placed between the present court and Small-street, with ranges of large windows on both sides. The judges, by this plan, enter on the Broad-street side, passing along the present corridor and gaining access to their respective courts through their private rooms, which are so arranged that they can obtain interviews with each other perfectly free from any interruption. There is a distinct entrance for the barristers and attorneys, with a corridor on the Small-street side, and the consulting and robing rooms, &c., are conveniently arranged. The jurymen and witnesses have also a distinct entrance on the Small-street side into a corridor commanding both courts, immediately between their several rooms and the Courts. There are also separate rooms for male and female witnesses, with lavatories, &c. The design is so arranged as to preserve the remains of Colston's House (now used as the *Times* and *Mirror* printing offices), the large hall being made available as a vestibule.

The Nottingham Mechanics' Institution.—There were twenty-four sets of drawings sent in to the committee of this Institution. At first, five of these plans were selected; afterwards that number was reduced to three, viz., those of Mr. T. Simpson, Messrs. Clarke & Son, and Mr. R. C. Sutton. On further voting taking place, Mr. Simpson's plan, we understand, was selected as the best, and he will therefore be entitled to the 1000 premium. A local paper says,—"It is stated, though we cannot vouch for the accuracy of the report, that the three sets of plans will be merged into one." A note on this competition appeared in our last.

The Gateshead Town-hall.—Friends of some of the competitors are writing long notices in the local *Observer*, well calculated to perplex the committee. It is to be hoped they have called upon proper professional advice.

hered nearly 120, and included about a score of ladies. The excursion was more than usually popular, perhaps owing to the fact that it included a two hours' detention at Belvoir Castle. But it was also interesting for the fine array of beautiful churches which were visited, all of which were described by the venerable secretary, in what we might term a series of object lectures on ancient and modern architecture. The places visited were Harlaxton, Lenton, Belvoir Castle, Woolsthorpe, Muston, Sedgebrooke, and Barrowby; and the evening meeting was held in the Exchange-hall, Grantham, under the presidency of the Bishop of Lincoln. The proceedings commenced by an address from the town council to the members of the society being read by the town clerk, expressive of the gratification of the ladies at the visit of the society, and their desire to give them a hearty welcome and show them every attention in their power. The Ven. Archdeacon Trollope, the secretary of the society, read the reply of the members, which in very courteous terms reciprocated the good feeling which had been manifested to them, and alluded to the objects of interest in the ancient borough. Mr. Trollope next read a paper on "The proper Treatment of Stained Glass Windows" in churches, and the Rev. B. Street one "On the ancient Buildings of Grantham." On the following day an excursion was made to Manthorpe, Belton, Syston, Barkston, Honington, Carlton, Normanton, and other places.

Worcester.—The members of the Worcester-shire Architectural Society have had an excursion to Feckenham, Hanbury, and Hadzor, a district containing some interesting old mansions. The party went by train to Droitwich, and thence to Merehall, Stock and Brady, to Feckenham. By invitation they had luncheon with Mr. Vernon, M.P., at Hanbury Hall, and thence to Hadzor. Returning to Droitwich some of the party took tea at the Royal Hotel, and others at the residence of the Rev. W. Lea (St. Peter's), in the neighbourhood of which they inspected extraordinary cracks or crevices in the land, occasioned by the subsidence of the soil; and from nine to ten o'clock the party arrived at Worcester by coach and rail.

MANCHESTER SOCIETY OF ARCHITECTS.

The annual general meeting of this society was held on Monday, 24th ult., at the Council Chamber, Royal Institution, at which the report of the council on the business transacted during the past year was read, the most important points being the action of the society in regard to the principles to be observed in building contracts, the method of taking out quantities in such a manner as to ensure uniformity of practice, and the steps taken by the society in conjunction with the corporation in drawing up their new building bye-laws that have now come into force. The president (J. Holden) and vice-president (J. Charlesworth) retire from office, in accordance with the rules, and the meeting elected the following gentlemen to the council for the ensuing year:—Messrs. W. R. Corson (president), J. Stevens (vice-president), W. H. Brakspear, C. Clegg, J. Holden, P. Nunn, E. Salomons, and J. Murgatroyd (hon. sec.).

BUILDING PROGRESS IN MONTREAL.

The result of last year's architectural progress in Montreal is a goodly show of buildings of more or less importance, including a church, a bank, and a public hall, but more especially business premises. The style is, as usual, mostly Italian, except the church. The offices of the North British and Mercantile Insurance Company, at the corner of St. François Xavier-street and Hospital-street, now in course of completion, has a frontage of 45 ft. 6 in. on the former and 114 ft. 6 in. on the latter street. The site is wedge-shaped, but the apex has been cut off, making a splay forming the principal entrance. Upon a moulded and rusticated limestone base course of about 6 ft. in height, the superstructure is executed in the finest quality of Ohio sandstone. There are many carved enrichments. The roof is in the form of that of the Louvre, and covered with galvanized iron tiles. The total height of the building is 66 ft.

The whole of the works are being carried out from the designs, and under the superintendence, of Mr. J. W. Hopkins, architect. The contractor for the mason-work was Mr. Forsyth, at whose stone and marble mills all the stone was carved and prepared, Mr. P. Nicholson, builder, having erected the building; Mr. John Bulmer, brick-work; Mr. Brush, wrought-iron girders; Mr. Melville, carpenter's and joiner's work and roofing; Mr. Milen, painting and glazing; Mr. M'Kenna, plumbing; Messrs. R. Mitchell & Co., steam-heating; and Messrs. Aitkin & Morrison, plastering.

The Merchants' Bank, forming the corner of the Place d'Armes and Notre Dame-street, has been erected from designs by the same architect. It has a frontage on the Place d'Armes of 35 ft. 6 in., and on Notre Dame-street of 72 ft. 6 in. The building is of Ohio sandstone from the level of the plinth to the top of the enriched frieze of the main cornice. The height from the street to the top of the cornice is 67 ft. The main entrance is on the semicircular corner forming the angle of the two streets. The banking-room is 38 ft. by 32 ft., and 18 ft. high. The walls are panelled in scagliola, in imitation of various marbles, and the ceiling is frescoed.

St. Paul's Church, at the corner of Dorchester and St. Monique streets, is still in progress. The design (Early English) was selected in a limited competition, Messrs. Lawford & Nelson being the architects. Mr. Lawford is since dead, but the work is being carried out under the superintendence of Mr. J. W. Hopkins and Mr. James Nelson, his associates in the profession. The church will seat 1,000 persons, and there are no galleries. The plan is cruciform, and the nave is 102 ft. by 59 ft., transepts 45 ft. 7 in. wide, with projection from the nave 16 ft. 7 in. The side walls in the body of the building are 24 ft. 3 in. high, and from floor to apex of roof (an open-timbered one) 58 ft. The walls, to the level of the base, will be of Montreal limestone. The superstructure will be faced with similar material in their comess, having the natural surface of the stone exposed to view. The weatherings, quoins, pinnacles, and all the ornamental portions of the work will be of Ohio stone. The roof will be covered with slate from the Melbourne quarries. The windows will be filled with stained glass of a comparatively plain pattern. The walls are already up to the ground level. The total expenditure, exclusive of the cost of the ground, will be about 45,000 dollars. The contractors are:—for the masonry, Mr. P. Nicholson; carpentry, Messrs. Wright & Hutchinson; plastering, Messrs. Phillips & Wand; painting, Mr. Henry Milen; stained glass, Mr. J. C. Speuce; roofing, &c., Mr. G. W. Reed; ironwork, Messrs. Rogers & King; plumbing, Mr. Robt. Mitchell.

St. Patrick's Hall is also in progress. The building will have a frontage of 140 ft. on Victoria-square, and 100 ft. on Craig-street and Fortification-lane. It will be entirely isolated. The height from the street level to the cornice will be 72 ft., and to the apex of the roof 92 ft. The style of architecture is an adaptation of the Norman, suitable to the modern requirements of the present day as regards shops and show-rooms—library and reading-rooms, lecture and concert rooms, &c. The details are assimilated to those still to be found in certain portions of Ireland among the ruins of monasteries and chapels. On the ground-floor there will be eight first-class shops, six on Victoria-square and two on Craig-street. They will vary in depth from 40 ft. to 91 ft. On the third story will be the Grand Hall of St. Patrick, which will be 134 ft. long by 94 ft. wide, and 46 ft. high to the centre of the segmental-shaped ceiling. The stage, or platform, will be 52 ft. wide and 25 ft. deep. The building will be of Montreal limestone. A large number of wrought-iron girders will support the floor timbers where the bricks walls are not carried up to the third-floor level. The principal portions of the roof will also be of wrought iron. The entire works, with the exception of the iron girders, roof, &c., are being carried out by Messrs. Howley & Sheridan (Messrs. Payette & Perrault being sub-contractors for the stone-work) from the designs, and under the superintendence, of Mr. J. W. Hopkins, architect.

Among the various new business premises or stores, &c., are Muir's new block, corner of Place d'Armes and Notre Dame-street East, Mr. Alexander C. Hutchinson, architect; I. T. Caverhill's, St. Peter-street, Messrs. Thomas, Brothers, architects; and Notre Dame-street, Mr. H. M. Peralut, architect; Tiffin's, corner of

ARCHITECTURAL SOCIETIES.

Lincoln.—The annual meetings and excursions of this society have taken place, and attracted a numerous gathering, at Grantham, of workmen and laymen interested in archaeology. The weather was unfavourable nearly all the first day, and it was not until late in the afternoon when the last two churches were visited that the rain entirely ceased. At half-past nine the proceedings commenced with divine service; at the western end of the church, which is awarded off from the part where the restorations are being actively carried on. A sermon, appropriate to the occasion, was preached by the handsome lecturer, the Rev. C. Smith. Immediately afterwards the Ven. Archdeacon Trollope, the hon. secretary, commenced an elaborate description of the principal architectural features of the church of St. Wolstan, Grantham, for which purpose he stood about fifty yards before the western front, but it rained so heavily that he soon desisted, and gave the rest of his remarks within the building. The excursion started from the church in a cavalcade of twenty vehicles. The party num-

Notre Dame and St. Peter streets, Mr. M. Laurent, architect; and Great St. James's-street, Mr. William T. Thomas, architect; Gibb's, Notre Dame-street, Mr. J. W. Hopkins, architect; Merrill's, Notre Dame-street, East, Mr. T. Fahrland, architect; Alexander's, Notre Dame-street West, Mr. H. M. Perrault, architect.

Messrs. Caverhill's block in St. Peter-street, however, was built in 1865, but its extent and importance induce us to refer to it here. The building covers a large space of ground, is five stories high, divided into three first-class wholesale warehouses, extending from St. Peter-street, in front, to St. John's-street, in rear.

Muir's block has a frontage of 63 ft. on Notre Dame-street, and 45 ft. on Place D'Armes. The building is of four stories, with detached columns to its numerous windows, with carved capitals. The fourth story contains a lodge-room of the Freemasons, 52 ft. long by 34 ft. wide. The second story is occupied by a "Business College."

Gibb's stores in Notre Dame-street have a frontage of 47 ft., and the height above the street line to the top of the main cornice is 58 ft. There will be two shops on each side of a centre entrance leading to the upper floors. These are of the depths of 60 ft. in one case, and 100 ft. in the other. The centre entrance by means of a wide staircase, gives access to the three upper stories, which are divided into show-rooms on two, and a masonic lodge-room, with all the requisite preparing rooms, &c., attached, occupies a large portion of the top story. This lodge-room is 48 ft. long, 26 ft. wide, and 15 ft. high. The building externally, on the street, is of Montreal stone, but with ornamental iron pillars forming the divisions between the shop windows and doors. Those to the centre entrance are in limestone. The several contractors are Messrs. Perrault & Perrault, stone-work; A. Wand, brick-work; George Roberts, carpenter's and joiner's work; Phillips & Wand, plastering; Prowse, Brothers, roofing, &c.; Alex. Craig, painting and glazing. The iron-work was supplied by Messrs. Ives & Allen. The whole of the several works were executed under the superintendance of Mr. Hector Munro, from the drawings, &c., of the architect.

HOUSES FOR THE LABOURING CLASSES.

The Society for Improving the Condition of the Labouring Classes has held its twenty-third annual meeting at Willis's Rooms, St. James's, the Earl of Shaftesbury presiding.

The report stated that the house in George-street, Bloomsbury, for the accommodation of single men, had 100 inmates, producing a rent of 715*l.* 6*s.* 6*d.*, which, after deducting 455*l.* 1*s.* 1*d.* for expenses, left a balance of 260*l.* 5*s.* 5*d.*; the house in Streatlam-street had 54 families, consisting of 237 persons, producing 794*l.* 1*s.*, and leaving a balance of 432*l.* 13*s.* 4*d.*; the model buildings in Gray's-inn-road had 198 occupants, yielding a rent of 476*l.* 12*s.*, and having a balance of 288*l.* 15*s.* 4*d.*; the number of washings at the public washhouse was 3,633, producing 326*l.* 18*s.*; but in consequence of repairs, the washhouse was closed for several weeks, so that the return was less than it would have been. The Heston-garden house accommodated 54 single men, the rents amounted to 3*l.* 3*s.* 4*s.*, and after deducting expenses there was left a balance of 21*l.* 9*s.* 5*d.*, an exceptional outlay for painting having been necessary. The renovated lodging-house in Charles-street, Drury-lane, had an average of 89 single men lodgers; the rents were 498*l.* 4*s.* 1*d.*; and a balance was left of 136*l.* 6*s.* 5*d.* Clark's buildings, Broad-street, St. Giles's, had a population of 269; the rents being 576*l.* 3*s.*, and leaving a balance of 101*l.* 18*s.* 8*d.* The building in Wilda-court, Drury-lane, had 369 inmates; the rents amounted to 631*l.* 8*s.* 2*d.*, leaving a balance of 192*l.* 3*s.* 1*d.* At Tyndall's buildings, Gray's-inn-road, the occupants were 361, and the lodging-house had 28 inmates; the rents were 629*l.* 3*s.* 3*d.*, which, after deducting expenses, as in the former cases, left a balance of 136*l.* 1*s.*

The secretary then read an abstract of the cash account up to December, 1866, which showed the receipts to be 6,120*l.* 10*s.* 6*d.*, which, with the balance in hand, made a total of 6,421*l.* 13*s.* 1*d.* The expenses during the year amounted to 3,580*l.* 12*s.* 8*d.* Loans repaid and interest on other loans, 1,607*l.* 5*s.* 5*d.*; salaries, rent of offices, printing, &c., 759*l.* 11*s.* 11*d.*; leaving a balance in the hands of the treasurer of 474*l.* 3*s.* 1*d.* The value of the real property belonging to the society (at cost) was 4,524*l.* 14*s.* 9*d.*, and the general liabilities amounted to 20,446*l.* 12*s.* 4*d.*, leaving assets in the hands of the society to the amount of 24,078*l.* 2*s.* 5*d.* The report was received and adopted.

Lord Shaftesbury, while expressing his regret at the little progress which had been made in mitigating the evils which it was the object of the society to lessen, said, that bearing in mind that the main object of the society was to provide dwellings for the large masses of the

people who lived from hand to mouth by their daily labour, and who do not realize more than from 12*s.* to 14*s.* a week, it was perfectly clear that 1*s.* 3*d.* a week was as much as such people ought or could pay for their lodgings. The duty, therefore, as well as the principal object of the society was to do everything it could to facilitate the adaptation of existing buildings to the accommodation and means of that large portion of the community.

In respect to the Act of 1866, which insisted upon a certain number of cubic feet to each inhabitant, his lordship observed that if the working population were compelled to observe it, they could only do so by holding a perpetual feast of tabernacles, a state of things not very well suited to the climate of England. There was great difficulty as to the kind of houses to be built so as to let the tenements at a low rent for the poorer class of labourers. On the other hand, he had been recently in a court at the East-end, which was several hundred yards in length, and which he could touch at both sides by stretching out his hands. To live in such a court was like living in a tobacco-pipe. His lordship further detailed some of his experiences, showing the great improvements effected by rendering old buildings comfortable in different localities; and said that 7,000,000*l.* might be collected and expended in thus improving the metropolis without sensibly diminishing the comforts or even the luxuries of those who might contribute to such a fund.

LURKING PLACES FOR INFECTION IN DWELLINGS AND TOWNS.

In a paper under this heading, recently printed, Mr. Alfred Higginson says,—"Connected with a mine are, it may be, old workings, blocked off more or less imperfectly, and natural cavities or fissures in the strata, always giving off more or less of combustible gases. The atmospheric pressure being suddenly diminished, this ooze of gas is greatly promoted, and, if not counteracted by increased ventilation, an explosive atmosphere is produced in the mine, and waits only the contact of an open light to cause the dread result. Assuming, then, this principle, as clearly proved in the mine on a large scale, I think it admits of being carried safely into the consideration of other cases, particularly those of our sanitary arrangements in hospitals, private houses, ships, &c. What is true of the old workings of the mine is true of any cavity whatever, which is not closed hermetically from the air, be it a well or cesspool, a vault or coffin, a roof cavity, floor or ceiling, a cavity wall, lath and plaster partition, shut-up closet, cupboard, drawer or box, or even the sewers and drains in our towns and houses. In every one of these instances, a rise of the barometer will cause air from without to be condensed into the interior cavity through all the chinks and crannies; and on the fall of the mercury it will ooze out again, pure and simple, or fetid and poisonous, as the case may prove.

My object in this paper is to draw attention to the probable importance, possibly the great importance, of keeping this idea present to the mind of the architects of our houses and hospitals, and to all who are brought in contact with disease of an infectious nature. Let us for a moment picture to our minds a bad case of scarlet fever, in a house where there are many children: all but the sick child are sent away, and when the case is ended the room is fumigated, white-washed, and papered, ere the family return; but, alas! the disease attacks perhaps another, and another, and we dare not say the issue. Where did the infection lie hid? May it not have lurked in some shut-up cavity, from which a low state of barometric pressure caused it to come forth?

In attempted explanation of the spread of disease, we find terms used,—"atmospheric influence," "contagion," "infection," "epidemic," "zootic," "cholera cloud," "fever cloud," "typhus wave,"—all implying that morbid influence has been lurking somewhere, and has shown itself in localities ready to receive it. Whether, in such hiding-places as I have pointed out, morbid matters may gain a greater potency I know not. I am simply desirous that, in our future hospitals and dwelling-houses, these possibilities shall be banished as far as may be.

I have been led into these remarks, in consequence of my attention having been of late directed much to hospital construction, with a view to the building of the new Southern Hos-

pital in Liverpool. Two plans may be adopted to remedy the enposed evil: to have open ceilings and roofs, &c., or to make all such cavities communicate freely with the outer air,—at all events, let them not be shut up, which means, communicating by chance openings with the apartments adjoining."

These observations deserve consideration.

THE HOUSES OF PARLIAMENT.

SIR CHAS. BARRY being blamed for the insufficiency of the size of the House of Commons on special occasions when the attendance is large, the Rev. Alfred Barry properly writes to say the architect had really nothing to do with determining this, and merely followed orders:—

"The dimensions proposed for the House of Commons in Sir Charles's original design were enormously in excess of those eventually provided. The authorities of the House, who knew its practical working, and under whose direction everything was done, were inclined to contract more and more the accommodation proposed, both for the members and for the public, and so reduce the House to a size convenient for its average attendance of members (somewhere about 200) by whom the main bulk of public business is done. Of the two acknowledged evils it was thought that occasional hardship was preferable to constant inconvenience, and on this principle all was carried out under official authority."

Claims for merit as the designer of much of the Houses of Parliament have been again made for the late Mr. Pugin. Persons making this claim (a sort of claim always to be looked at with the greatest suspicion, especially when death has removed the chief person concerned) should refer to the statement made in our pages by Mr. Pugin himself on a similar occasion; to which we could add the recollection of an indignant personal denial by Sir Chas. Barry and Mr. Pugin both.

THE CAPITOL AT ALBANY, CANADA.

Out of three premiums of 1,000 dollars each, offered for the best architectural designs for the proposed State Capitol, at Albany, two have been awarded to Canadian architects,—Mr. Augustus Laver, the architect for the departmental buildings, and Mr. Thomas Fuller, the architect for the parliament buildings, Ottawa. If we remember correctly this last success of Mr. Laver, if he is to carry out his design, will make the third legislative building obtained by him in open competition, viz., Ottawa, Sydney (Australia), and Albany. The nominal cost estimated for the latter building is spoken of as 12,000,000 dollars to 15,000,000 of dollars! An appropriation was made during the last sitting of the State Legislature for the commencement of this large structure.

GREAT FIRES IN LONDON.

A FIRE, accompanied by a large destruction of valuable property, has taken place in a lofty and extensive pile of buildings in Guildford-street, York-road, Lambeth, in the joint occupation of Messrs. Nickells & Co., india-rubber manufacturers, and Messrs. Myers & Sons, the builders and contractors. The premises, which were five stories high, occupied almost the entire of the west side of Guildford-street, but were connected with the principal works of Messrs. Myers on the east side only by a bridge thrown across the street. The lower portion was used by Messrs. Myers as joiners' workshops, store-rooms for joinery work, and for the machine department of their business. In the rear and at the side of the building were extensive and numerous stacks of timber, some of rare and costly description. Before any engines arrived the whole building, owing to the inflammable nature of the contents, was on fire from basement to roof, and floor after floor kept falling in until nothing but the bare shell of the building was left standing. The origin of the fire is at present conjectured, but it is said to have broken out in the india-rubber works. The loss of property will amount to, it is said, from 50,000*l.* to 100,000*l.* Amongst Messrs. Myers's property was a large quantity of costly work just prepared for the fitting up of the Guildhall for the reception of the Belgian volunteers and the Sultan. About 100 of the joiners have also lost the whole of their tools, the total value of which was about 2,000*l.* The same factory was destroyed by fire just seventeen years since, and partially destroyed about five years back. The

association of two such combustible businesses in the same premises is unfortunate. Messrs. Myers state that their main works are uninjured, and that the business will be carried on as usual.

The most extensive conflagration that has happened on the Surrey side of the river for many years has taken place in the Old Kent-road. Amongst the premises involved were those of Mr. J. Mason, a cabinet-maker; Mr. Ell, a wheelwright; Mr. Smith, window-blind maker; Mr. Lewis, furniture dealer; the extensive stores of Messrs. Weston & Westall, and several others—the whole forming a block of buildings at least 100 ft. square. These premises were encircled by those of Mr. Carter, a hat factor, and were adjoined by large business premises in the Old Kent-road, and many small tenements in Castle-court, occupied by poor people. The origin of the fire, or whether the sufferers were insured or not, could not be learned.

CHURCH OF ST. LAWRENCE, READING.

The entire restoration of this beautiful old church is contemplated, and the works have been already commenced, under the guidance of Mr. Jos. Morris, of Reading, architect. The church is a fine specimen of Perpendicular architecture, with earlier portions, if we remember rightly. The tower is remarkably well proportioned, and, from its advantageous position at the end of Friar-street, and facing the Market-place, is the most attractive architectural feature in the town. The stonework of the tower is much decayed, and its restoration will cost about 1,000l. It is expected that at least 4,000l. will be needed properly to carry out the whole work of restoration; but as the committee have only a little more than half that amount already promised, the work to the tower has not yet been commenced. The restoration will probably occupy about a year. A curious piece of sculpture, representing "The Adoration of the Magi," has been found imbedded in the north wall. The contract, as we mentioned last week, is taken by Mr. H. Lovatt, of Wolverhampton, who is now engaged upon the railway works at Reading.

CASES UNDER METROPOLITAN BUILDING ACT.

OPEN AREAS.

On the 28th ult., the district surveyor of the hamlet of Mile-end Old Town summoned Mr. Dunk, the builder of four houses in the Burdett-road, before Mr. Partridge, the sitting magistrate, at the Thames Police Court, for erecting the said houses with open spaces in the rear of less than 100 ft. superficial to each (in one case less than 50 ft.), the said houses having rooms back and front, and not being all lighted and ventilated from the street.

The district surveyor contended that under the 29th section of the Building Act the buildings should have in the rear or on the side an open space exclusively belonging to each house, and that the said open spaces should be lighted and ventilated from a skylight above, could be brought into the same category.

The magistrate decided that the 29th section of the Act was not complied with in the erection of the said houses, and ordered the defendant to take down so much of each of the back additions as was necessary to give an open space to each house of at least 100 square feet, such a alteration to be made within a fortnight from the date of the order.

PLAN FOR CLEANSING RIVERS.

Sir,—As you are a great advocate and promulgator of sanitary measures, I venture to send you for publication in your columns, for the consideration of all river conservators, the following description of a plan by which the cleansing of our rivers, and, more especially, the amelioration of the waters of the upper Thames, may be effected by and at the expense of the river-side parishes, which, in greater part, cause their pollution.

I propose that a screen should be fixed along the top of every weir, so as to strain the descending water, and retain all floating matter above. The screen should be little deeper than the sheet of water flowing over, and should extend along the whole length of the weir, less an interval of about 20 ft. At this interval, on the lower side below the edge of the weir, a strainer or filter, in the form of one or more bag nets, or of one or

several perforated boxes, should be placed in such manner as to catch all matter falling over the edge of the weir.

The lock-keeper or a person specially charged with the service should be required to pass along the weir once a day and rake all the floating refuse caught by the screen along and over the edge of the weir into the net or boxes, which should be removed, emptied, and replaced daily. He should also be instructed to rake out the floating matter from the entrance to the lock and collect it with that from the weir, and the parishes on either bank above the lock should be bound proportionately to dispose of the matter extracted.

This daily operation will be found wonderfully efficacious in cleansing the water, and by this simple means all floating refuse would be precluded from descending to pollute the river below. Each river-side parish would collect and utilize the greater part of its own off-scourings, and would not then as now inflict the evil without the good of them on its neighbours.

The screens which it is proposed to erect along the weirs would be little or no impediment to the passage of fish in salmon rivers, as they travel only during freshes, when the screens would be far under water.

CHARLES E. AUSTIN.

CONCRETE BUILDING.

Sir,—I read in the *Builder*, some few weeks ago, of a concrete system of building houses. I have built a house with concrete lumps, which I think far beyond solid concrete walls, because I have a curtain of air passing between the walls, being in thickness 3½ in. for inside wall, and 3½ in. for outside wall, leaving a space of 5 in. for air-chase, and making my walls 1 ft. in thickness. My lumps are 1 ft. square, well bonded, as header and stretcher. I build all my woodwork in as I go on, as if brickwork. This system will supersede solid concrete walls,—so you would say, were you to see it,—because you can build up quicker, and there is not half the trouble in constructing the walls. This house may be seen already built, near the railway-station, Northfleet, and we are now about more, better than we have already built. They will perhaps look as well as any brickwork fronts, as we intend striking our joints as brickwork, making the blocks smaller, so as to imitate a first-class front of brick.

W. MAY, JUN.

* * A very good house may doubtless be built of concrete blocks; but it would not be a "concrete house" for all that. Moreover, we advise our correspondent not to give himself the trouble of trying to make the front look like anything but what it is.

TAR CONCRETE.

Sir,—I have been laying a quantity of tar-concrete paths lately, mixing boiling tar in certain proportions with gravel; but I find it takes some time to consolidate properly.

Will some of your correspondents be so good as to tell me if putting a quantity of Syssel or other asphalt with the tar would improve the hiding qualities of the concrete; and, if so, how much asphalt I ought to use say in a hogshead of tar? A STU.

THE TRAFFIC OVER LONDON BRIDGE.

HAVING seen in your valuable columns at various times accounts setting forth the necessity of further accommodation for the still fast increasing traffic over London Bridge, also suggestions for its accomplishment, and not being aware that the following plan has ever been made public, I ask the favour of its insertion in your Paper.

In the first place, the stone parapet to be removed, the stone pavement of footways on each side taken up, and paved to form part of the roadway, making space for six vehicles instead of four, leaving where the parapet stood to form part of new footway, which may be formed in the following way:—At each pier the masonry projects some feet to form the recesses on the bridge. On the outside of these piers place two cast-iron columns, the foundations being already carried up above high-water mark sufficient to receive them. On the top of the columns and piers place longitudinal wrought-iron girders for each footway, which may be hid from sight on the river by an ornamental cast-iron railing and open parapet running the whole length of the bridge. On the top of the two girders lay plates of iron, having a bearing also on the side of the bridge, the whole to be properly tied together, and the paving relaid, presenting the same finished surface as at present, with an open iron parapet in the place of the existing one.

The approaches at both ends may be made to the required width without any buildings being removed, which, in point of economy, is favourable to the widening of the present structure. EOWEN J. DEXHAM. * * The general proposition has been often made before. We insert the letter for its specific proposition of means.

WORKING MEN IN WREXHAM.

Sir,—I should like to make a few remarks with reference to a paragraph in a recent number of your paper. Wrexham, although a town of only about 8,000 inhabitants, is, on the whole, a thriving and a prosperous place, having in its immediate neighbourhood iron, coal, and lead mines, as well as valuable stone quarries; and to prove our past prosperity, I can vouch that upwards of 25,000l. were expended in the building trade within the town during the last twelve months; yet, although so much was done in time past, at the present time there is not a prospect of one-fourth the number of buildings to be erected this year as last year. There is not a contract of 500l. in the hand of any builder in the town. During our unusual prosperity, or rather at the close of it, the joiners, or somebody on their behalf, issued a printed notice, that on the 1st of June they would leave off at one o'clock on Saturdays, instead of four o'clock, the usual hour; it was signed "Carpenters and Joiners of Wrexham." As the masters knew that three-fourths of the carpenters and joiners of Wrexham were non-union men, they did not take any notice of the message sent them, treating the matter as others did. "The Three Tailors of Tooley-street,—We, the People of London," particularly as the non-union men declared that they neither would take, nor wanted, what was asked for. Up to the 1st of June not a word was said to the employers by the men as to what they would do; all believed that even the union men, under the present circumstances, would never be so unwise as to attempt a strike for what they wanted; however, it is now a fact, and Mr. East, of Manchester, who came here to harangue the men for their heroism and pluck, made them believe that they were all right, and the masters all wrong; and, from their actions since, we judge that he gave them private instructions to say all the things which they will go to work, are bought up at once at the regular price. It is true that those who are partly masters and jobbers or joiners, just as it happens, have consented to the men's requests; but the leading master-builders hold out, and are not much inconvenienced, for there are plenty of non-union men about; only just at present they are rather timid and afraid of having any disagreement with their fellow-workmen. What has been done will gain nothing for the men in the end, but will bring poverty and distress on their families. HUGH DAVIES.

THE ARCHITECTURAL ASSOCIATION.

The concluding meeting of members for the session 1866-67, was held on Friday evening (21st ult.), at the House, in Conduit-street; Mr. Bodis in the chair.

On the motion of the chairman, votes of thanks were passed to the Dean and Chapter of Rochester, for their kindness in allowing the members of the Association to inspect the cathedral; and to Mr. F. Cookerell, the architect, and Mr. Dudley, clerk of the works at Freemasons' Hall, Great Queen-street, for a similar privilege in respect of that building.

The report of the scrutineers in reference to the nomination of office-bearers for the session 1867-68, was brought up, and the following gentlemen were found to have been elected:—President, Mr. R. Phene Spiers; Vice-presidents, Mr. E. G. Tarver and Mr. Laoy W. Midge; Committee, Mr. R. W. Edis, Mr. G. H. Broth, Mr. E. C. Lee, Mr. J. Tarvernor, Mr. L. C. Riddett, Mr. Rowland Plumbe, Mr. Henry Jarvis, jun.; Mr. T. H. Watson, Mr. C. Honnam, and Mr. R. H. Carpenter, Hon. Treasurer, Mr. J. Douglas Mathews; Solicitor, Mr. F. Tracitt; Auditors, Messrs. Banker and C. W. Brooks; Carators and Librarians, Mr. L. C. Riddett and Mr. W. Frower; Hon. Secretaries, Messrs. J. D. Mathews and J. S. Quilter.

Professor T. Hayter Lewis then read a paper "On Mosaics," printed in our last number. At the conclusion,

Mr. Spiers observed, that the subject of the paper was of especial interest at the present moment, in consequence of the more general introduction of mosaic work into our ecclesiastical architecture. If the principles, too, which Mr. Lewis had laid down were followed, the rising generation of architects might learn to avoid the mistakes and extravagances which often disfigured the modern style of mosaics. The mosaics produced at Rome and at Florence were of a very superior description, and an immense amount of labour was thrown into them. A series of portraits of all the popes was now in course of execution for a church just outside the walls of Rome, but as they were shown at a height of 50 ft. from the ground much of the labour expended in the production of them was thrown away. In England, however, we appeared to go to the opposite extreme in economising labour and care, as some of the mosaic displayed in the recesses of new churches was so coarsely executed that the jointing could be seen at 250 ft. from the floor. He hoped the necessity of good drawing would be kept steadily in view, for all architects, whether they belonged to the Gothic or the Classic school, must be agreed that perfection in this respect was also-

intely essential if the art of mosaic decoration were to be revived in this country.

Mr. T. H. Watson observed that, although in very early mosaics the outlines of the drawings might be crude and formal, it should be recollected that in those days there were few if any capable artists. The motive and intention were, however, good, and in many instances the straight lines referred to by Mr. Lewis were very effective.

In reply to questions from Mr. Tarver and others, Professor Lewis explained the manner in which the early artists got the outlines of their figures, and observed that he had seen some modern mosaics in which the jointing was so rough that the cement appeared in lumps as big as the mosaic itself.

The Chairman considered it matter for congratulation that the subject of wall decoration, whether by means of frescoes or mosaics, was receiving so much attention, and that the members of the Association had been enabled, through the kindness of erudite persons, to bear so much that was useful, practical, and interesting on the subject. He feared it would be difficult to get as good drawing for our modern wall decorations as the ancients appeared to have had; but it was gratifying to think that in proportion as the arts of fresco and mosaics were encouraged, good draughtsmen would be induced to turn their attention to them, so that eventually something approaching to perfection might be reached. The public were indebted to Signor Salviati, and to Mr. Powell, for their exertions in the promotion of glass mosaics. Much had already been effected by their exertions in improving and elevating the public taste, and in eliminating the vulgar trading notion that mosaic and other wall decorations were to be obtained for so much per foot super.

PROVINCIAL NEWS.

Hartlepool.—A new temperance-hall and reading-room have been opened at Stanton Cross, near West Hartlepool. The building has been erected from the designs of Mr. G. G. Hoskins, architect, Darlington. The style of the building is Early English. The founder is Mr. Edward Backhouse, of Sunderland, who gave the site, and has subscribed nearly the whole of the cost.

Nottingham.—The memorial stone of a new Congregational Institute, on Nottingham Forest, intended for the use of the Independent denomination in the midland district, has been laid. The building will overlook the great valley leading to Annesley, Newstead, and Mansfield. The site is upon an eminence on the south side of Forest-road, not far distant from Mount Vernon. The building will accommodate from 80 to 100 students. The committee having invited architects to compete, selected the design of Mr. R. C. Sutton, of Bromley House, from which the building is now being erected. The frontage to the building will extend about 130 ft. Mr. Sutton has adopted the Gothic style of the fourteenth century. The materials are red bricks with stone dressings. On the ground floor the Institute will contain a large entrance-hall, staircase, reception-room, two large class-rooms, and library. On the second-floor will be the lecture-hall, a large room, 60 ft. by 30 ft., with open timbered roof. The houses for the principal and tutor will be situated at either end of the building. According to the plans the front will be well broken up, and the Gothic windows deeply recessed. Bands of black brick are carried at intervals along the brickwork. A porch stands out at the entrance to the main building; on either side are two Gothic traceried windows, and above a band of ornamental brickwork, surmounted by five upper windows. The centre one is a three-light traceried window running into a gable, which forms the central feature of the building. The high-pitched roof is surmounted by a bell-turret of ornamental design. The total cost, exclusive of land boundary walls, is about 3,000l. Messrs. Bell & Wood are doing the stone and brick work, and the woodwork is entrusted to Messrs. Stevenson & Weston, both Nottingham firms.

Nymehad.—The foundation stone of a new vicarage-house has been laid in this parish. Nymehad has hitherto been without a resident minister, and to remedy this disadvantage a new house is to be erected for the Rev. W. H. Waldron, vicar. It is to be built by Mr. Davis, of Tarnton, and plans prepared by Mr. Hayward, of Exeter.

CHURCH-BUILDING NEWS.

Redhill.—It has been resolved at a public meeting that the district church of St. John, Redhill, shall be enlarged. Subscriptions amounting to 1,164l. were given at the meeting. The total cost of the work will be 3,000l. There will be 536 additional sittings obtained by the alterations. Mr. Hesketh is the architect employed, but his services will be gratuitous, and he subscribed 100l. towards the work.

Blunsdon.—The parish church has been re-erected and opened for divine service. Mr. Kempton, of Hereford, was the architect; and Messrs. Collins & Collis, of Tewkesbury, the builders. The new church consists of a chancel, nave, north aisle, organ chamber, and vestry, and is 14 ft. longer than before, extending over several of the gravestones. The length of the nave is 42 ft. 6 in., that of the chancel 24 ft. Tiles, bearing the initials of those buried in the tombs included by the increased length, are to be placed in the chancel floor. The material of the building is red Forest stone, with Bath stone dressings, and there are buttresses of the same material. The roof is covered with grey Cornish slate. A spiral roof, surmounted by a weathercock, has been added to the tower. The porch has freestone seats, windows, and a double foliated iron gate. Inside, there are an open roof of stained deal and a floor paved with encaustic tiles. The chancel arch is moulded, and has carved terminations, executed by Mr. Purday, who has had this department throughout. On one side is the convolvulus leaf, on the other are birds and fern-leaves and other foliage. The screen dividing the chancel from the organ chamber consists of a column and two arches with carved capital and corbels. In the nave there is an arcade of four bays; the capitals of the columns are sculptured in ferns, ivy-leaves, and passion-flowers. The columns are of a hard lead-coloured stone. There are three windows on the south side of the nave, five in the north aisle, two side-lights for the chancel, and two for the organ chamber, on the north side of the chancel. The east window consists of three lights, with tracery; and it has pillars with carved capitals. The seats are oaken and open: those of the aisle are the old ones restored. The seats are free. The church is heated by hot-water pipes beneath the floor, provided by Mr. Magness, of Stoke Edith. The organ was given by Mr. Edmund Boughton, of Birmingham (formerly Mayor of Gloucester), whose family name appears upon many of the tablets. The floor of the belfry has been renewed and lowered, and all the old tablets have been removed to the walls beneath.

Ovenhall (Gloucestershire).—The body of the church has been rebuilt from a plan in keeping with the original structure. The parishioners, great part of them day labourers, agreed to a rate for the repair of the tower. The work has now been accomplished: the contract has been carried out by Messrs. Spring & Son, of Painswick. The amount spent has been 925l. The building consists of nave, chancel, and a vestry on the north side of the chancel. The style is the Decorated of the fourteenth century. Inside, the roof is of open timbers of varnished red deal. The deal pews are low and open, with double ledge, and hat-peggs beneath the sloped seats. The number is twenty-one, and each will accommodate six persons. Seats are also to be placed in the chancel. The seats for school-children are under the tower. The flooring of the nave is now common Forest stone—that of the chancel, tombstones: both will be covered with ornamental tiles when funds are provided. All the windows are Geometrical. There are three on one side the nave, two on the other, and also a baptistry window, filled with rolled cathedral glass, with green margin: each has two lights. There are also three windows in the chancel, besides the large east window: the minor arches are of Forest and Painswick stone alternately, and in the centre of each is a block for carving. The chancel arch springs from two caps carved with passion-flower and water-lily, supported by serpentine columns resting on carved corbels of Caen stone. The sculptor was Mr. Poulton, of Worcester. The walls are stained with a brown wash. Outside, the roof is of Broseley tiles, black and grey intermixed. All the dressings, except the weatherings of the buttresses, are of Painswick stone. The new building is several feet longer than the old one. The east window is a memorial of the late Mrs. Ouslow. The stained glass was supplied by Messrs. Hardman, of Birmingham. The stone-

work was carved by Roddis, of Birmingham. The church is dedicated to St. Anne, and the subjects of the three lights of the window illustrate her life.

Clapham.—St. Stephen's Church, Clapham Park, has been consecrated by the Bishop of Winchester. The church, which has cost 6,000l., will provide sittings for about 600 persons.

Bristol.—At an influential meeting held in Bristol, a resolution moved by the bishop of the diocese, adopting reports for the adding of a nave to the cathedral, has been passed, and subscriptions have been announced amounting to nearly 14,000l.

Clifton.—The chapel which has been erected within the grounds attached to the Clifton College has been opened for divine worship. This chapel has been built chiefly by the late Mrs. Guthrie, who was engaged in raising it as a memorial of her deceased husband, Canon Guthrie, when she herself died. The architect of the building was Mr. C. Hanson. The whole of the stained-glass windows are gifts. Mrs. Guthrie gave 4,500l. for the erection of the building; the college will spend about 1,000l. upon the tower; and the additions to the structure will bring the total cost to near 7,000l.

Brompton, near Northallerton.—The church here, one of the oldest in the neighbourhood, has long been in a dilapidated state, and it has been decided to restore and enlarge it, under the direction of Mr. Ewan Christian, of London, architect. The inhabitants are chiefly handloom weavers and unable to contribute much to the funds, but over 800l. have been already promised towards this object: it will require about 1,300l. if the alterations contemplated are fully carried out. The foundation-stone, having been displaced in carrying out the extension, has been relaid. After which the committee, the contractors (Messrs. Metcalf & Thompson, Northallerton), and the workmen partook of a dinner in the Mechanics' Institute.

Birmingham.—The foundation-stone of the new church, hereafter to be called St. Lawrence's, and to be erected in Dartmouth-street, St. Matthew's parish, has been laid by the Bishop of Worcester. This is the first church to which a grant has been made out of the Ryland Fund, and the amount voted by the trustees is 4,000l. The contract cost of the building is 3,199l., but the purchase-money for the site, architect's fees, and other expenses, will absorb the whole of the present available funds, and leave a deficiency of about 1,500l. The church will comprise a cleared nave, side aisles, a small chancel, and a saddle-back tower over the vestry at the north-east corner of the building. The length of the church will be 95 ft. 6 in., and 55 ft. 8 in. across the nave and aisles. There will be a small west gallery. The building will be of brick, with the tracery of the windows of Cornish Down Bath stone. Externally the bricks will be the ordinary red, with blue bricks, strings, &c., and internally faced with white bricks, with red bricks disposed in patterns. The church will accommodate 753 adults, 403 of the sittings being free. There are schools to be erected at the west end of the church. Mr. J. A. Chatwin is the architect, and the church is being erected by Mr. Charles Jones, of Birmingham.

Upton.—A new church, which is dedicated to St. James, has just been built in this parish, and consecrated. The church has been erected almost entirely at the expense of Colonel Ferguson Davie, of Bittescombe House, and the site was given by Sir Henry F. Davie, bart., of Creedy Park, near Crediton, who is the chief landowner. The building consists of a nave, chancel, and vestry, and is capable of accommodating about 180 persons. The style adopted is Early Decorated Gothic; there is a bell-turret over the chancel arch, and a deep wooden porch on the north side facing the road. The stone of the neighbourhood has been used for the walls, with Bath stone dressings. The floor is laid with Minton tiles; and the windows are filled with stained glass of various designs, supplied by Mr. Wailes, of Newcastle. The entire cost has been about 1,400l.

Dinedor.—The parish church had fallen into such decay that it was determined, on the suggestion of the rector, either to restore the building or thoroughly to rebuild it. The advice of an architect being taken upon the subject, the latter course was advised, and it was determined to rebuild on the old site a church similar in size and in character, retaining in its construction the old windows, arches, and other architectural features, as well as using, as far as possible, the old materials. Accordingly, the

building, excepting only the tower, has been entirely taken down, and the foundation-stones of the re-hulid edifice laid by Lady Saye and Sele. The floors will be entirely new; the seats will be of wood; the passages-between being paved with encaustic tiles from the manufactory of the Messrs. Godwin, Lulwardine. The seats in the nave, the pulpit stalls in the chancel, and the altar-table will all be new, as also will the roof. The latter will be open from within, and having plaster between the rafters; outside, it will be slated, and at the east end will be a gable, surmounted by a Greek cross. The wood-work in the interior of the church will all be of red deal. The walls will be finished with stone ashlar, from the quarry of Sir Edwin Stanhope, at Bullingham. New windows will be placed in the tower, and it is hoped that the funds will allow of the erection of a new arch dividing the tower and nave. There will be a new triple lancet window in the east end of the chancel, and an organ-chamber and vestry on the north side of the chancel. The church will be heated with Rimington's heating apparatus. The style of the architecture is Early English, or of the period of the thirteenth century, about which time, it is supposed, the old church was erected. The architect is Mr. F. R. Kempson, of Hereford, and the work is being carried out by Mr. J. Stone, of Fownhope.

Seal.—A new church has been erected in one of the most isolated parts of the parish, the hamlet of Underriver, by Mr. J. R. Davison, Q.C., of Underriver House. Mr. Davison engaged the services of Mr. Scott, architect, who prepared plans, and a site was chosen upon the estate in immediate proximity to the old school-room. The contract was taken by Mr. Coustable, of Peshurst, builder. The little church is Gothic in style, of Kent rag-stone with Bath dressings. The roof is open, with the rafters stained and varnished, and the chancel arch is of Bath stone. There are sittings for about 130 persons, the choir being placed in the chancel. The seats are open, of stained deal, and the total cost has been about 2,500l.

Droitwich.—The foundation stone of a new mortuary chapel has been laid on a site purchased for the enlargement of the burial ground. Mr. John Smith is the architect, and Mr. J. Priddey the builder.

Mayland (Essex).—A new church has been consecrated here. The edifice, which stands on an elevated site, is a small building in the Early English style, with accommodation for 200 persons, and has been erected at a cost of 1,500l., from designs by Mr. Hardwick, of London; the builders being Messrs. Hill & Son, also of London. The building consists of nave and chancel, with south porch and vestry attached to the north side of the chancel. The nave has an open timber roof, that of the chancel being boarded. The church is lighted by lancet windows with trefoil heads. The triplet at the east end of the chancel is shafted internally, in order to give a somewhat richer effect to this portion of the building. A bell-gable rises above the chancel arch, and forms the most prominent feature of the exterior of the church. A little memorial east window has been presented by Miss Tatham; the chancel windows by the churchwardens; and a window by Mr. Arthur Powell, almoner of St. Bartholomew's Hospital; while the gift of the west window has been defrayed by small contributions in the neighbourhood.

Fremington (North Devon).—The parish church has been restored. On removing the debris from under the seats portions of the ancient stone pulpit were discovered. These were collected and put together again, and the missing portions replaced. The east windows have been filled with stained glass by Messrs. Ward & Hughes, of Soho. The chancel window is the gift of the Rev. T. B. Robinson. The subject is the Ascension. The font is of Caen stone, the gift of the Vicar, the Rev. J. T. Pigot (by whose exertions the restoration has been effected); it is carved with the emblems of Baptism and lilies, by Pulsford, who also executed the pulpit and stone-work generally. The seats are of fir, stained and varnished; they are all open and unappropriated. The total cost is about 1,700l. The work has been carried into effect by Messrs. Dendle & Pulsford, of Barnstaple, from the designs of Mr. G. G. Scott; Mr. Thos. Leigh was the clerk of the works.

Moughtrey (near Newton).—The parish church being in a dilapidated condition, it was decided to shore up and prop the fifteenth-century roof during the process of rebuilding

the walls, which was satisfactorily accomplished. The roof has been restored where necessary, cleaned, and reslated. A red sandstone perpendicular three-light window on the south side of the chancel has also been repaired, a vestry and south porch have been added, and a stone bell-turret erected at the west end of the nave. The stone used for the new windows and dressings was from Cefn and Pecknall. The east and west windows are filled with stained glass, by Messrs. Clayton & Bell, and Wailes. The open seats, pulpit, and altar-rail are of oak; the chancel fittings are temporary. The floor of the chancel is paved with encaustic tiles. The accommodation is for about 140 persons. Mr. E. Haycock, jun., of Shrewsbury, was the architect, and the works have been carried out by Mr. Davies, of Newtown, and Messrs. Morgan, of Llandinaw, at a total cost of about 1,100l.

Eton.—St. John the Baptist's Church, Eton-wick, has been consecrated by the Bishop of Oxford. The site of the edifice is on the road leading from Eton to Dorney. The architect was Mr. Arthur Blomfield, of London; and the church has been erected by Mr. Giles Holland, of Thame. It has cost about 1,500l., and will seat 200 persons. The church, the architectural style of which is the Second Pointed, consists of a nave, choir, and chancel, with small south transept. The roof of the nave and choir is open timbered; the chancel is slated. The edifice is brick built; black bricks are used in ornamentation; and there are stone dressings to the windows, doorways, &c. The windows are filled with neutral tinted glass; the east and west windows are each of three lights. Beneath the east window and above the altar, there is a stone structure, carved in the form of an arch with pediment, enclosing a large golden Cross of Calvary, at the intersection of which there is a representation of the Lamb of God. This is the most prominent feature in the ornamentation of the church, and upon entering at first sight it appears as though the cross stands upon the altar.

ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Thirsk.—In this town a new Catholic chapel has been opened. It is in the Early English style, with nave and apsidal chancel; the former 64 ft. by 25 ft., and the latter 19 ft. by 17 ft. The roof is an open-timbered one, stained and varnished. The benches are of stained deal, and are uniform in design with the roof. In the centre of the west gable a bell-turret is carried up from the ground; iron finials surmount the turret, porch, and apsidal roof. The chancel ceiling displays panelings formed by moulded plaster ribs. On the south side of the chancel is the sacristy, between and connected with the presbytery and church. The altar is of Painswick stone, the front showing three panels, divided by columns of Devonshire marble; alabaster caps crown the columns. The gallery, which is on the west end, has a perforated panelled front; the canopy and pinnacle are also of Painswick stone. The tabernacle is of iron, highly gilt and ornamented. North of the altar stands a statue of the Virgin, of Painswick stone, with marble columns. Two stained-glass windows are in the west end of the church, and one on the east end, the gift of an inhabitant. Exclusive of the gallery, the church will accommodate 300 persons. The materials of the building are local brick, with stone facings, and hands of red brick and black brick, and a moulded brick cornice. The iron finials were supplied by McFarlane, of Glasgow. The entire cost of the structure, fittings included, will be about 1,600l. Mr. W. A. Bourne, of Thirsk, was the architect; and Messrs. Wright & Son, of the same town, were the builders.

Liverpool.—The New Catholic Chapel of St. Joseph has been opened. The building is of Gothic character, light in style. The materials is of brick, with stone dressings, and is flanked with buttresses alternated with narrow lights. The gable is lighted by an oriel window with eight quatrefoils around the circumference of the central light. The presbytery is in course of erection, and is square in form, and a small corridor will connect it with the sanctuary and vestry of the church. The principal entrance is from the west. The mean thickness of the wall is 18 in. A centre and side door open into the porch, which has two windows looking into the church. There are no aisles or screen to the sanctuary. The ceiling is lofty, and is sup-

ported by pentagonal beams. The walls are relieved by six windows on one side and five on the other, on which are represented the Stations of the Cross. A choir is provided for on the left of the entrance. The seats are of pitch pine, and are of light construction. Ventilation is secured by the usual appliances in the roof, and hot-air pipes are laid under the entire length of the nave. At the opening of the sanctuary on the left is placed a small pulpit platform; and on the opposite side are doors leading to the vestry and presbytery. The altar is simple, and is approached by three steps. It has pilasters, and the whole is done in imitation of marble. A tabernacle, large brass candelabra, and an altar-lamp, complete the altar ornaments. The western gable is surmounted by a bellfy-spire, containing a large bell, the gift of a former pastor of the district. The building was erected from the designs of Mr. E. W. Pugin, and is in close proximity to the Birkdale Park railway-station.

Gloucester.—The chapel in this city, designed by Mr. Gilbert B. Blount, of London, was opened about four years ago. It was then in an unfinished state. Since that time additions have been made, and the completion of the building, as originally designed, has now been commenced. It is intended to add two additional bays to the aisles and nave, and to erect a tower 70 ft. high, with a spire of 80 ft., at the street end of the south aisle. The nave will be lighted by a large wheel window, and the new works will extend in a line with the adjacent houses. The entrance will be under the tower, and the organ-gallery will be at the end of the nave facing the chancel. The work is being carried out by Messrs. Wingate & Sons, who built the church.

SCHOOL-BUILDING NEWS.

Irthingborough (Northamptonshire).—The new schools just completed have been opened by the Bishop of Peterborough. They are of a simple design, and consist of boys' and girls' schools, each 42 ft. by 20 ft., arranged to form one large room; an infant school-room, 30 ft. by 18 ft.; and two large class-rooms, with detached residence for teacher. They are situated in the centre of the village, the site, of large area, being about 6 ft. above the level of the road. They are built of the local stone, with Ancestor stone quoins and mouldings, the roofs being of open timbers, stained, and covered with grey tile made in the district, with a lofty bell spire. The cost of the whole was about 1,400l. The building has been erected by Mr. Allen, from the designs of Mr. Joseph Peacock, of London.

Hertford.—The new Green Coat School-house, adjoining the Cowper Testimonial School, is approaching completion. It is a simple Tudoresque structure. The building contains a school-room, class-room, &c.; and there is also a house for the master. The whole is enclosed by a wall. The cost of the building, including stoves and school furniture, will be about 800l. The architects are Messrs. T. Smith & Son, and the builders, Messrs. Ekins.

Nottingham.—A new school has been opened in the populous district of Sherwood-street, on a plot of ground which faces Colville-street. The school has been erected from plans by Messrs. Jackson & Heazell, architects, Nottingham, the builder being Mr. Daunt. The building consists of one good-sized room, 45 ft. by 20 ft., and a class-room, 21 ft. by 16 ft., the latter being connected with the principal room by a folding-door, so as to increase the space when required for meetings. It is a plain Gothic building, with high-pitched open roof, and will afford accommodation for about 120 children. The cost of the land was about 300l., and the total outlay, including that sum and the cost of the necessary fittings, is about 850l.

DISSENTING CHURCH-BUILDING NEWS.

Bally.—The memorial stones of a new Wesleyan chapel have been laid. The edifice will present an end elevation to both the Sheffield and Tickhill turnpike roads. The entrance to the school-room is 37 ft. by 30 ft. by 12 ft. high; also to two class-rooms, 13 ft. by 10 ft. each, will be from the low-level or Tickhill-road. The chapel will be entered from the high-level or Sheffield-road, and will be 42 ft. long by 37 ft. wide, and 25 ft. high to the collar. The edifice is of Classic

character, and built of red bricks, with white brick bands, arches, and other ornamental architectural features, and with stone dressings. All the constructive timbers in the interior of the building will appear to view, and will be stained and varnished. The pewing and fittings of the interior will be of red deal, also stained and varnished. There will be staircases to communicate from the chapel to the school-room and vestries or class-rooms. The chapel will accommodate 230 persons. The entire cost of the whole when completed will be about 775*l.*, and is being carried on by Mr. Harold Arnold, of Doncaster, builder, from the drawings and specifications, and under the superintendence of Mr. William Watson, of Wakefield, architect.

Wolverhampton.—The memorial stone of a Congregational chapel, with schools, class-rooms, and vestries, has been laid on the site of the old chapel. Mr. Street, of Warminster, is the architect; and Mr. W. Walden, builder, of Christchurch, the contractor. The design is Early English.

Cannock.—The Wesleyans of the district have erected a much more commodious place of worship than the one hitherto used by them, and it has just been opened for divine service. The building, which has been erected from plans of Mr. S. Johnson, of Wolverhampton, architect, is Gothic in design and a parallelogram in form, and is of red and white pressed brick, with buttresses, and Attleborough stone dressings. The central window is filled in with tracery and stained glass, and there are three double and two single lancet-headed windows on either side. The internal dimensions are, 63 ft. long, 36 ft. wide, and 30 ft. high, the main timber of roof, as also the fittings throughout, being of deal stained and varnished. The seating on the ground-floor (all open stalls) will accommodate 290, and a gallery at the back will seat 116 more. The vestry is underneath the gallery, with store-room and stairs to heating-vault. The chapel is lighted with gas by star-lights from the roof, and is heated with hot-water apparatus, provided by Mr. Jellyman. The builders were Messrs. Reynolds & Peake, of Cannock. The cost of the building and land amounted to nearly 1,500*l.* The old chapel, which is but a short distance from the new building, will be used for schools, &c.

Wombwell.—A new Congregational Chapel has been opened at Wombwell. The total cost of the building, including the site, was about 2,000*l.* The building comprises, besides the chapel, a large school-room, vestries, &c., underneath. There is sitting accommodation for about 500 persons.

Cardiff.—The foundation stone of a new Congregational chapel, in Hannah-street, has been laid. The building is to be in the Grecian style. It will cost about 8,000*l.*, and, besides giving accommodation to about 700 people, will contain two school-rooms beneath.

Chester.—The foundation-stone of the Catholic Apostolic Church in Upper Northgate-street was laid on the 17th ult. The building will comprise nave with baptistery, lower choir with organ-chamber, and chancel with upper choir and sanctuary. The vestries will be on the north side of chancel, and the tower at the south-east angle of nave and chancel. There will be a narthex to the entrance at the west, and space is left on the site for the future erection of the sacristan's house. The nave will be divided externally into five bays, the lower spaces between the buttresses being filled in with sloping brickwork, forming a base to the whole building. There will be tracery to the east and west windows, those to the nave being coupled lancets. The dimensions of the nave, internally, are 33 ft. wide by 72 ft. long. The roofs will be open timbered throughout, that to the nave in single span, with curved ribs to the trusses. The style of architecture is Early Gothic, and the material red brick and stone, with hands of blue bricks. The architect is Mr. Oliver Ayliffe, of Manchester; and the contractor Mr. Thomas Hughes. The present contract is for the nave and entrances only.

Nottingham.—A new chapel for the Swedenborgians has been opened for public worship in Blue-coat-street, Nottingham. It is a brick and stone structure, of Early Pointed character, with open timbered roof and stalls of stained deal, and will seat upwards of 200. Underneath is a school-room, of the same area as the chapel, both being heated by hot water. Mr. James Acton is the builder, and the works have been carried out from the designs of Mr. John Smith Norris, architect. A three-light stained-glass window at the chancel end of the building, to

the memory of deceased relatives of certain members of the church, has been carried out by Mr. B. Wheeler, a local tradesman, to whom, with the aid of his foreman, James Humphrey, the arrangement and execution are, we believe, due. The works have been carried out at a cost (exclusive of the site) of about 1,100*l.*

Driffield.—The new Congregational Church, erected on the site of the old Independent chapel built in 1803, has been opened. It is from the designs and plans of Mr. H. J. Paull, architect, Manchester. It is in the Italian Gothic style. The front elevation terminates in an acutely pitched gable, surmounted by a St. Andrew's cross. There are two entrances, with stone porches, and six windows, three and three. It is built of red brick, relieved with white brick string-course and stone dressings. The shafts of the stone columns are of red Mansfield stone, and have carved capitals. On the ground-floor are three rows of open stalls. A gallery extends the whole circumference of the chapel, and has circular ends with low fronts, and relieved by the insertion of open ornamental ironwork under the top rail. The seats in the gallery are all open, and at the end facing the pulpit ascend to a considerable height. At the opposite end is a recess for a new organ, which is in course of building. In consequence of the site of the church being blocked up on both sides by existing buildings a difficulty presented itself in obtaining the necessary lights. This has been overcome by the architect, who has introduced eight ornamental lights in the roof. Gas has been introduced, and the gallery is lighted by four gasolights. The church is capable of seating 600 persons, and has cost nearly 15,000*l.*, of which 900*l.* have already been subscribed.

Books Received.

Studies from the Antique, and Sketches from Nature. By CHARLES MACKAY. Second edition. London: Virtue. 1867.

THE power of the true poet over a people,—may, over all peoples in course of time,—is immense, for good or for evil. The cheering strains of Dr. Mackay rouse the backwoods-man of Canada like the Voice of inspiration, and in our own country have often created a *furor* of popular favour. The power of the Legislature—may even of the preacher—is, indeed, as nothing compared with this power when happily exercised for good as it has been by Dr. Mackay. The present volume is not quite of that stamp which is destined to so excite the popular mind, although it does contain amongst the songs appended one or two which may yet become popular, if not so much so as "Cheer Boys, Cheer," or "There's a Good Time coming, Boys, wait a little longer." The *Studies from the Antique* are not quite mythologically orthodox, but we dare say no one will look for the true meaning of ancient myths in the pages of the poet who modernises them. They have afforded Dr. Mackay themes for many happy thoughts, and increased the debt already due to him.

Miscellanea.

A MONSTER BLAST.—A few days ago Messrs. Briggs, of the Salt Lime Works, Clitheroe, fired an immense blast. Two tons of gunpowder were placed in the mine prepared by the men, and the explosion which followed the lighting of the train resulted in the displacement of about 20,000 tons of stone.

THE SIDINGTON STAINED GLASS IN CIRENCESTER CHURCH.—The Vestry of Cirencester have resolved to restore to the church of Sidington the Langley memorial stained glass, which was taken by licence from Sidington church, and has now been partly removed from the east window, where it was placed.

DEATH OF HORATIO McCULLOCH, R.S.A. OF SCOTLAND.—Mr. Horatio McCulloch, the chief of Scottish landscape-painters of our time, has died at his residence, St. Colm Villa, Trinity, near Edinburgh. All who knew his works will read this announcement with regret. Mr. McCulloch had, in course of the last fifteen years, four shocks of palsy, the last of which killed him. He was born in 1805, in Glasgow, of poor parents, and was named Horatio on account of his birth taking place on the day of illumination for Nelson's victory at Trafalgar.

THE METROPOLITAN DRAINAGE WORKS.—In the Commons, recently, the Marquis of Townshend moved for a select committee to inquire into the petition of Mr. J. J. Morewood with respect to the piracy of his plans for the main drainage of the metropolis by the engineers of the Board of Works, and praying for compensation. The Duke of Marlborough said that Mr. Morewood had not established a case for an inquiry. The matter had occupied attention for some years, and if a committee were granted, 137 other persons might bring forward similar complaints as unfounded as those of Mr. Morewood. The motion was rejected by a majority of 42 to 8.

ARCHITECTURAL EXHIBITION SOCIETY, CONDUI-STREET.—On Tuesday evening, the 25th ult., a lecture (in connexion with the Architectural Museum) was delivered at the galleries of the Society by Mr. Edmund A. Freeman, M.A., entitled "Notes in Normandy." After a few introductory remarks by the chairman, Mr. F. H. Dickinson, the lecturer commenced by noticing some striking points of resemblance between English and Norman buildings of early date. He then gave a rapid account of most of the important churches and other buildings in the country, and illustrated his remarks by a large number of sketches. In conclusion, he impressed upon his audience the necessity of understanding the political history of the country if they wished thoroughly to master the architecture.

GAS.—In his recent lectures on coal gas, Dr. Frankland said: "Representing the London gas by 12 that of Birmingham is 15, Manchester and Liverpool are 22, Inverness is 25, Edinburgh, Glasgow, and Greenock are 28, Paisley and Hawick are 30, and Aberdeen is 35. From this it appears that the illuminating power of London gas is the lowest of all, and that in some towns and cities in Scotland the gas gives twice as much, and in one instance nearly three times as much light as in London. Besides, the more the Londoner tries to increase his light the more does he contaminate his atmosphere. Dr. Frankland says that London gas was better sixteen years ago than at present: the new system of purification used by the companies leaves the gas weak and deleterious, and he warns them to amend their practice."

KNIGHTSBRIDGE BARRACKS.—An influential deputation of the inhabitants of Knightsbridge has had an interview with Sir John Pakington, to urge upon him the necessity of removing Knightsbridge Barracks, as an intolerable nuisance to the locality. Mr. Lowe described the head-quarters of the Household Brigade as an isthmus of barbarism. Lord Alfred Spencer Churchill followed, with two weighty memorials. Sir John, in his reply, said that the residents had come to the barracks, and not the barracks to the residents, and expressed his belief that, although now architecturally an eyesore, they were susceptible of improvement. He alluded to the Hyde Park affair as constituting a sufficient reason why cavalry should be within easy reach of the authorities. He professed himself struck with a suggestion made by Mr. Lowe that Chelsea Hospital should be converted into a barrack, and the pensioners sent into the country like their brethren at Greenwich. Finally, he said that, while the Government were disposed to retain Knightsbridge Barracks, they would reconsider the matter.

PHOTOGRAPHIC PROGRESS IN SAN FRANCISCO.—The San Francisco *Morning Call* says that Dr. Isaac Rowell and Francis E. Mills, of that city, have been granted a patent for a new mode of mounting photographs for exhibition. They have given the name of "anthroposcope" to their new invention. The nature of it consists in carefully divesting the likenesses of all those portions of the card, paper, or other opaque substances representing background, and not essential to the image which it is desired to preserve, and substituting therefor a background placed on another plane, diverging upward from the plane of the likeness, and intersecting the latter at the feet. The effect of this arrangement is that when viewed with both eyes through a magnifying lens, the receding landscape, the approaching foreground, and the double image, corresponding to the view of the natural objects, are obtained, consequently conveying a most vivid impression of life. By means of a little cogwheel, the pictures may be arranged into groups, and the scenery in the background may also be varied. The inventors say they can manufacture them at a cost of from 10 to 50 dollars.

A BALLAD CONCERT.—The Ballad Concert given by Mr. Sims Reeves at Exeter Hall, on the 1st inst., was a rich treat, at small cost, to a large assemblage. The experiment was entirely successful.

ST. NICHOLAS'S STEEPLE, NEWCASTLE.—We are told that the principal supports of the well-known tower of St. Nicholas's Church, Newcastle, have been found to be in a most dangerous state. Steps are being taken to remedy the evil.

TESTIMONIAL TO MR. MARK ANTONY LOWER.—With a view to assist the testimonial proposed to be given to Mr. Lower, for his antiquarian and literary labours, Mr. Charles Roach Smith, F.S.A., has been reading the tragedy of "Hamlet," and the Rev. R. H. Barham's Kentish legend, "The Smuggler's Leap," with great success.

FALL OF A PORTION OF A FACTORY.—At the extensive premises in Cirencester now in course of erection at Pitcares for Messrs. Cole & Lewis by Mr. Barrett, builder, of Swindon, a man was engaged in removing the centres of the large cellar arch, when a considerable portion of the brickwork gave way. He was completely buried; and four men, who were putting down the flooring in the room above the cellar, fell with the debris, each being more or less injured, and some of them severely so. This is the same arch that fell in a short time since. That accident entailed a considerable pecuniary loss, and this second disaster may prove a still more serious matter. Great blame evidently rests somewhere.

A FRIGHTFUL ACCIDENT.—At Conisborough Castle, Lieutenant Brown, a young officer of the Militia, ascended the walls of the keep by the frail, narrow, and always dangerous footway, so well known to all who have visited the castle, a stone ledge a few inches in breadth at the most, with no protection whatever on the outside, and simply a light iron handrailing on the inside, attached to the fast crumbling masonry of the tower. Mr. Brown slipped and fell down through the dungeon. The utmost consternation was created amongst his party, and the unfortunate and greatly-injured gentleman was removed to the inn at Conisborough. His back and one of his legs were broken, and he was otherwise greatly injured.

ARBITRATION IN THE BUILDING TRADE IN THE POTTERIES.—The carpenters and builders of the Potteries and Newcastle have, instead of striking or locking out, adopted the sensible plan of submitting their difficulties to arbitration—a single arbitrator chosen by each side, with Mr. Forhes, architect, as umpire. The result is a series of rules just issued. The working hours are to be 56½ hours per week, except in the winter months, when they will number 54½, at 6½d.; superior workmen to be rated; overtime to be reckoned 1½ hour per hour till eight, and 1½ hour per hour afterwards. Within a mile, the workman is to walk in his own time; beyond a mile, an hour or three miles, to be paid in going only; beyond three, a sum to be agreed. Disputes are to be settled by six masters, six men, and an umpire. Objections to a rule or rules are to be specified on the 31st of December, by requisition of six men to six masters, or vice versa, and a settlement thereof to be effected before March 1st.

THE CATACOMBS, ROME.—At the annual meeting of the Oxford Architectural and Historical Society when the president of Trinity College was elected president of the Society, Mr. J. H. Parker, who had just returned from Rome, gave a lecture upon the Catacombs. He had been able to employ the magnesium light with success in several of the chambers, and to represent, therefore, accurately, by means of photography, the varied forms and figures which appeared in the painting and decoration. He laid especial stress upon the late date to which some of the catacombs owed their decorations, because, after they had ceased to be used as burial-places, they were a constant resort of pilgrims down to the eighth and ninth centuries, and at these periods many of the paintings were renewed. In some of the earliest the construction of brickwork of the first century was visible, made in the sandpit roads, which were therefore of earlier date. Some were as late as the fifth century, and even in those which are of the earliest date, it often happens that later interments had taken place, from the fact of the vaults belonging to families, and so used from generation to generation. After the lecture there was some discussion on the question of the vestments as exhibited in the photographs.

THE CATHEDRAL ORGAN AT ELY.—On St. John Baptist's Day, the dedication of what might almost be called a new organ took place. The additions just executed by Messrs. Hill consist of a new swell of noble proportions and thirteen stops, five of which are reeds, also six additional stops to the pedal.

THE TRIANGULAR LODGE, RUSHTON.—A description recently given of this building at an archaeological meeting and mentioned in our columns having led to some inquiry concerning it, we may as well point out that a view of it, the windows at large, and some descriptive particulars will be found in Vol. III. of the *Builder* (1845), pp. 538, 539, 540, and 550.

A NEW HOSPITAL.—A morning paper says that Baron Ferdinand de Rothschild, whose young wife died in childbirth a few months ago, has determined to found a hospital to her memory. Direct action to this end has already been taken; and a site for the projected building has been purchased on the east side of Southwark Bridge-road. The establishment will be a lying-in-hospital. It is the baron's intention to spend 10,000l. on the building; the site costing probably as much more.

THE HOUSES OF EMINENT MEN.—The Society of Arts, continuing the work they have properly commenced, are about to affix a tablet at No. 32, King-street, St. James's, occupied by H.M. the Emperor of the French when in this country; one at 141, New Bond-street, on the house in which Nelson resided previously to his departure for Trafalgar; at 47, Leicester-square, the residence of Sir Joshua Reynolds; 7, Craven-street, Strand, where Franklin lived; and 36, Castle-street, Oxford-street, where James Barry had his abode.

RUSSIAN TIMBER.—It is computed that there are 400,000,000 acres of land in Russia producing valuable forest-grown timber, the right of felling which rests, for the major part, in the hands of the Government. Latterly the enormous wealth represented by these forests has attracted attention, and means have been taken to prevent the loss occurring partly from conflagrations and partly from the predatory habits of the population. Recently these vast resources have been opened up by the introduction of steam saw-mills, by the construction of small railways, tramways, and canals. There are abundance of firs in Southern Russia 400 years old, with a diameter of 2 ft.

BRISTOL FINE ARTS ACADEMY.—The annual meeting of the members and subscribers of this institution was held on Thursday. The Rev. J. Heyworth occupied the chair, and stated that he hoped the exhibition just closed would leave a balance in favour of the society. The report for the year 1866 was then read by Mr. Haythorne. It stated the exhibition of that year entailed a loss of 13l. 15s. 7d., and the graphic meeting of 12l. 2s. 6d.; a winter exhibition of sketches, which it was hoped would prove attractive, entailed a further loss of 18l. 18s. 3d. Alterations in the building to the amount of 16l. 16s. were made. The loss upon the year amounted to 78l. 3s. 3d. The report was adopted, and thanks were voted to the president, vice-presidents, and committee for their services during the past year.

PENZANCE (CORNWALL).—The Wesleyans of Penzance have determined for some time to complete the buildings connected with their chapel, by erecting new Wesleyan schools for the accommodation of upwards of 400 children. The school will consist of two principal rooms, with class-rooms attached. The school-room for boys and girls (mixed) will measure 62 ft. by 33 ft., height 20 ft.; and the infant-school will measure 40 ft. by 26 ft. There will be a large sewing-room for girls, 33 ft. by 16 ft., and three class-rooms. There will be a front and side elevation of the height of 30 ft., consisting of cut granite (two courses corresponding to one quoit), cut granite ashlar dressings to doors, windows, and main corners, and circular-headed windows, like those of the chapel, the whole to cost about 1,300l. Mr. Philip Thomas has undertaken the mason's work, and Messrs. Jenkin & Hill the carpenter's work. Mr. J. Tronson is the architect.—The tender of Messrs. Freeman & Co., of Penryn, of 500l. for the repairs of the pier, damaged during the winter gales, has been accepted, and the work will be done forthwith. A slaughter-house and shed are to be erected on the pier at this place, for the reception and slaughter of foreign cattle.

THE ANCIENT ART OF HARDENING COPPER.—A correspondent of the *Cincinnati Gazette* reports that a Mr. Disman, of Upper Sandusky, Ohio, has discovered a process of hardening copper, an art which has been lost for nearly three thousand years.

THE RESTORATION OF THE ELEANOR TOMB.—We are reminded, with reference to our notice of the late S. Cundy, that the figure-sculpture in the restored version of the Eleanor tomb, as exhibited in Hydo Park in 1851, and now shown at the South Kensington Museum, is the work of Mr. J. B. Philip, whose name we gladly add.

SUSSEX ARCHAEOLOGICAL SOCIETY.—The General Annual Meeting of this Society is appointed to take place on Thursday, August 8th, at Midhurst. The objects of interest to be visited are the ruins of Cowdray House, Eastbourne Priory, Midhurst Church, &c. The dinner will take place in the grounds of the ruined mansion of Cowdray.

ROMAN REMAINS AT ANDOVER.—A Roman villa has just been dug out at Andover, in Hants, by the Rev. E. Kell and other Hampshire archaeologists. It is 65 ft. long and 45 ft. broad. The roof had been supported by massive pillars. Two fireplaces have been discovered, also a quantity of fragments of Roman pottery, glass, and iron articles, and coins. The Roman station of Vinodunum is believed to have been in the neighbourhood.

NEWSPAPER PRESS FUND DINNER.—A dinner, with Mr. W. E. Gladstone in the chair, supported by forty-two members of Parliament and seventy other men more or less distinguished, is not an every-day meeting, and this was what the Committee of the Newspaper Press Fund succeeded in getting on the 29th ult. The Chairman made a great speech, the other speakers were wisely short and sharp, and the whole passed off most satisfactorily, producing a subscription-list of some 900l. Excellent as the singing was, a little less of it on another similar occasion may be desirable.

GIFT TO THE TOWN OF DERRY.—Mr. M. T. Bass, who for twenty years has been one of the members for Derby, has presented a public recreation ground to the inhabitants. It consists of six acres, and is situated on the banks of the Derwent, on the east side of Derby, being part of the Holmes, and is not distant more than 500 yards from the market-place. The subsoil is dry, and the surface of the greater portion of the land quite level, and admirably adapted for racing, cricket, and other sports. Mr. Bass purchased the land from the corporation at a cost of 3,000l., and has since defrayed the cost of fencing and levelling, which has been 850l. more, making the total value of the gift 3,850l.

THE LABOURERS' DWELLING QUESTION AT LIVERPOOL.—At a meeting of the Health Committee, Mr. Robinson moved that the council be asked to rescind its resolution with regard to offering a premium of 200 guineas for plans. The object was to replace those plans already prepared, and which were said by Mr. Whitty to violate the letter of the law while carrying out its spirit, and which did not seem well adapted to afford a fair prospect of returning a proper per-centage of profit. Mr. Robinson's motion was carried, only two members voting against it. It was also resolved by a similar majority that the proceedings of the Labourers' Dwellings Sub-Committee be referred back, with instructions to the sub-committee to prepare plans for dwellings in accordance with the Act of Parliament and the by-laws.

ALBERT ORPHAN ASYLUM.—On Saturday in last week the inauguration ceremony of laying the foundation-stone of a dining-hall and chapel for the Albert Orphan Asylum for Destitute Children, situated at Collingwood Court, near Bagshot, Surrey, was performed by her Majesty the Queen, in the presence of a large and fashionable assembly. On the southern side of the main building of the asylum, over the spot where the ceremony of the day was to take place, a dais, covered by a marquee capable of seating some 2,000 persons, and a second marquee affording accommodation to an equal number invited to the *déjeuner*, had been erected. The grand approach to the dais was from the main building, in which a suite of rooms had been fitted up in the Louis XIV. style, as refreshment, sitting, and retiring rooms. A carved and gilt chair, in which her Majesty sat during the ceremony of presenting the purses, was provided. There was no inscription on the stone.

RISE IN THE VALUE OF PROPERTY AT BAYSWATER.—A plot of land, &c., situated near Lancaster-gate, purchased by the late Mr. Edward Orme some years since for 1,600*l.*, has been recently sold by Messrs. Edwin Fox & Bousfield, by the direction of his trustees, in lots, realising altogether the sum of 21,950*l.*

ETCHINGS AND DRAWINGS BY REMBRANDT.—A fine collection of works by Rembrandt, brought together by the Burlington Fine Arts Club, of which Mr. R. N. Wornum is the honorary secretary, is now on view in the room of the Club, 177, Piccadilly. They include examples of his best etchings. An opportunity to see so many together may not occur again for some time. Wonderful works they are.

INAUGURATION OF THE SALFORD COBDEN MEMORIAL.—The ceremony of unveiling the statue of the late Mr. Cobden, erected in Peel Park, Salford, has been performed by the Right Hon. C. P. Villiers, M.P., in the presence of a large concourse of spectators. The statue is in the immediate vicinity of those of the Queen and the late Prince Consort. It is the result of public subscription. With the committee appointed to carry out the scheme, the workmen of the district united, and the total amount raised was about 1,450*l.* The Memorial Committee commissioned Mr. Matthew Noble, of London, to execute the statue. It is of large proportions, chiselled out of a block of white Sicilian marble, and stands on a pedestal of Aberdeen granite. The deceased is represented in an attitude of thought, with the fore finger of the left hand touching the corner of the mouth; the right arm hangs loosely by his side, and the hand holds a scroll of paper. Peel Park is one of Macbester's chief treasures.

THE SHEFFIELD ATROCITIES AND LONDON TRADES.—A meeting of the London Trades' Council has been held, to consider what course should be taken with respect to the Sheffield outrages by the trades of London. Mr. Barrow (Amalgamated Engineers) occupied the chair, and there were present representatives of the Operative Bookbinders, Amalgamated Engineers, Amalgamated Cordwainers, Iron-workers, Zinc-workers, and other societies. The delegates from the various trades expressed themselves in strong terms of condemnation of all those who were associated with the perpetration of the Sheffield outrages. Mr. Odger remarked that it was the duty of every operative tradesman in London to attend the great trades' meeting at Exeter-ball, and show by his presence that the Sheffield atrocities had none of his sympathy. That was a duty not owed solely to the trades with which the men were connected, but to each man's individual character, which to more or less extent was compromised by what had taken place in Sheffield.

TENDERS

For covering a portion of the Borough Market, Southwark, for the trustees. Quantities not supplied. Mr. Henry Jarvis, architect:—

Dixon	£3,500 0 0
Lloyd's Foster, & Co.	3,246 10 0
Thomas Ironworks Company	2,988 0 0
London Engineering Company	2,835 0 0
Henshaw	2,300 0 0

For the erection of a public-house, Little Titchfield-street, Mr. W. A. Baker, architect. Quantities supplied by Messrs. Richardson & Waghorn:—

Manley & Rogers	£1,577 0 0
Cooper	1,657 0 0
Kelly	1,492 0 0
Eaton & Chapman	1,490 0 0
Emor	1,459 0 0
Saunders	1,475 0 0

For ironwork of cattle stalls and pens, for the Southampton Cattle-market, according to plans prepared by the borough surveyor, Mr. James Lemon:—

Baylis, Jones, & Baylis	£237 15 0
Reading Ironworks	657 10 0
Norton	86 0 0
Hernulewicz & Co.	475 0 0
Cottam & Co.	462 0 0
Jukes, Coulson, & Co.	423 0 0
Fry	420 0 0
Cornell	400 0 0
Ford	389 17 6
Hill & Smith (accepted)	357 0 0
Godden	343 14 6

For alterations at No. 47, Charles-street, Berkeley-square, Mr. Philip B. Lee, architect:—

Morris	£1,094 0 0
For alterations to Burleigh, Cheshant Common, for Mr. J. Levick. Mr. F. G. Widdows, architect:—	
Hunt	£1,063 0 0
Rivet	1,490 0 0
Patman	898 0 0
Chessum	950 0 0

For erecting a house, on Lot 19, the Ellington estate, Ramsgate, for Mr. Pullen. Mr. John R. Collett, architect:—

Wade	£500 0 0
Elgar	470 0 0
Newby (accepted)	420 0 0

For erecting a shop, on the forecourt of 563, High-street, Ramsgate, for Mr. Hope. Iron shutters not included. Mr. John R. Collett, architect:—

Wade	£335 0 0
Duckett (accepted)	319 0 0

For alterations, No. 4, Dean-street, Park-lane, Mr. Philip B. Lee, architect:—

Potter and Bywaters	£354 0 0
For No. 110, Cannon-street, E.C. Mr. Philip B. Lee, architect:—	
Bywaters	£7,843 0 0

For alterations and additions to Spring Grove House, Isleworth. Mr. Philip B. Lee, architect:—

Bywaters	£2,330 0 0
For proposed Albert-buildings, Victoria-street, Westminster, for Mr. John Caseloduck. Mr. Philip B. Lee, architect:—	
Bywaters	£10,000 0 0

For proposed north aisle, Holy Trinity Church, Hove, Brighton:—

Sawyer	£1,372 0 0
Parsons	1,183 0 0
Cheesman & Co.	1,350 0 0
Nightingale	1,124 0 0

For erecting new house and carriage repository, for Mr. W. Richardson, at Hitchin. Mr. J. Shilcock, architect:—

<i>Bricklayer's Work, &c.</i>	
Jeeves	£212 10 0
Butterfield (accepted)	207 12 0
<i>Carpenter and Joiner's Work.</i>	
Allen	175 10 0

For erecting a new house, at Shillington, Bedfordshire, for Mr. M. Mason. Mr. J. Shilcock, architect:—

Lightfoot	£430 0 0
Harvey	369 0 0
Richardson (accepted)	257 10 0

For erecting a new lodge, for Mr. Alfred Ransom, at Bankow-hill House, Hitchin. Mr. J. Shilcock, architect:—

<i>Bricklayer's Work, &c.</i>	
Ansell	£320 0 0
Warren & Son	272 13 0
Jeeves (accepted)	369 0 0
<i>Carpenter's Work.</i>	
Allen (accepted)	147 12 0

Accepted for the Kent County Lunatic Asylum, for 100 inmates, Mr. Martin Palmer, architect. Quantities by Mr. G. Ruck and Mr. T. Lodd:—

<i>Contract No. 1.—Builder's Work.</i>	
Anscomb	£35,300 0 0
<i>Contract No. 2.—Smith and Founder's Work.</i>	
Butchard	1,544 0 0
<i>Contract No. 3.—Plumber and Glazier's Work.</i>	
Hyles	3,493 9 0

For new sewers, at Clapham, for the Wandsworth Board of Works. Mr. W. E. Lacey, surveyor:—

Pickering	£34,369 19 3
Suff	34,000 0 0
Pearson	31,400 0 0
King	29,725 0 0
Morion	28,478 10 0
Hill & Keddell	26,245 0 0
Vainwright	25,800 0 0
Morris	25,500 0 0
Miscox & Williams	25,500 0 0
Avis & Sons	24,950 0 0
Hubbard	24,350 0 0
Blackmore	23,344 0 0
Dickenson & Oliver	23,613 0 0
Trowsdale	23,000 0 0
Wignore	23,000 0 0
Bucknall	22,900 0 0
Harvey	22,757 0 0
Robinson	21,200 0 0

For building a public-house, in Battersea Park, for Mr. Mellish. Mr. J. Tanner, architect:—

Beale	£2,967 14 6
Wignore	836 0 0
Stuckford	600 0 0
Gates	590 0 0

For erecting a warehouse, at Clapham, for Messrs. Clarke & Co.:—

Easto	£636 10 0
Wignore	836 0 0
Stuckford	600 0 0
Gates	590 0 0

For new mains for the Aldeburgh Gas Company, Limited, and relaying old ones:—

Mason	£294 0 0
Child	349 0 0
Barker	344 10 0
Newly	335 0 0
Smyth & Walls (accepted)	330 0 0

For alterations and additions to workhouse school, Hornsey-road. Mr. C. Higgins, architect. Quantities by Pain & Clark:—

<i>Allow for Old Materials.</i>	
Wills & Son	£1,135 0 0
Bradley	1,109 0 0
Crockett	1,634 0 0
Lamble	1,005 0 0
Gill	985 0 0

For new Magdalen Hospital, at Streatham. Mr. Henry Carrey, architect:—

Holland & Hannon	£29,168 0 0
Lawrence & Sons	28,987 0 0
Lucas, Brothers	28,774 0 0
Stunns & Marten	28,733 0 0
Myers & Son	28,730 0 0
Gammon	28,375 0 0
Piper & Wheeler	28,227 0 0
King & Sons	28,147 0 0
Troilope & Sons	26,820 0 0
Henshaw	26,601 0 0
Hill & Keddell	26,481 0 0
Downs	26,393 0 0
Higgs	26,123 0 0
Hart	25,890 0 0
Ferry	24,667 0 0

For new receiving wards, at the North Surrey District Schools, Anerley. Mr. J. Berney, architect. Quantities supplied by Messrs. Franklin & Andrews:—

Bowles	£3,409 0 0
Monday & Hutchinson	2,031 0 0
Little	1,930 0 0
Simms & Marten	1,747 0 0
West	1,734 0 0
Hart	1,695 0 0
Godthorpe	1,680 0 0
Nightingale	1,647 0 0
Loe	1,618 0 0
Jarrett	1,590 0 0
Chappell	1,540 0 0
Poros & Smith	1,485 0 0
Holledge	1,465 0 0
Hazell	1,320 0 0

For new warehouse, at the corner of Essex-street and Southwark-street, S.E. Mr. John Wimbie, architect:—

Ramsey	£8,234 0 0
Adamson & Sons	7,993 0 0
Avallatt	7,793 0 0
Colls & Son	7,735 0 0
Wills	7,657 0 0
Fanor	7,640 0 0
Kilby	7,370 0 0
Piper & Wheeler	7,330 0 0
Browne & Robinson	7,287 0 0
Newman & Mann	7,165 0 0

For public-house, at Upper Holloway. Mr. M. C. W. Horne, architect:—

Marshall	£1,825 0 0
Harding	1,793 0 0
Taylor	1,748 11 11
Furnell	1,694 12 6
Shurman	1,666 0 0
Ravenscroft	1,639 0 0
Lamble	1,623 0 0
Langmead & Co.	1,588 0 0
Watts	1,552 0 0
Niblett & Sons	1,547 10 0
Robson	1,544 0 0
Blackmore & Morley	1,542 0 0
Nightingale	1,478 0 0
Cressall (accepted)	1,468 0 0
Steady	1,400 0 0

For restoring, reseating, and building new vestry-room, at the Wesleyan Methodist Chapel, Broad-street, Spalding, Lincolnshire. Mr. W. East, architect:—

Dawson	£227 0 0
Jepson	219 0 0
Goodhand	187 12 0
Stanger	138 0 0

For villa residence, at Corshamton, Surrey, for Mr. Charles Turner. Mr. A. J. Dyer, architect:—

Aitch	£638 0 0
Buck	635 0 0
Hayden	467 0 0

For Alexandra Orphanage for Infants, Horney Bise, Messrs. W. G. Habershon & Pite, architects:—

	Colleges.	Schools.	Central Buildings.	Earthwork, &c.
Williams & Son	£.	£.	£.	£.
	5,761	3,026	6,557	2,206

Patman & Fotheringham	5,742	3,043	6,359	2,206
Ham	5,198	2,953	6,272	2,620
Cowland	5,143	3,048	6,267	2,204
Forrest	5,149	2,850	6,250	2,200
Carter & Sons	5,093	2,770	6,140	2,210
Eider & Son	4,820	2,735	6,215	2,205
Manley & Rogers	4,420	2,488	5,500	2,300
Morland & Burton	4,327	2,436	5,369	2,208
Southcott & Wildgery				

For new roofs, reseating, and restoring the nave and aisles of the parish church of Edlesborough, Bucks. Mr. Withers, architect:—

Robinson	£1,943 16 4
Chappell	1,935 0 0

For the partial rebuilding and refitting of the parish church of North Reston, Lincolnshire. Mr. Withers, architect:—

Clark	£270 0 0
-------	----------

For the rebuilding, on same site, the parish church of Lampeter-Pont-Stephen, Cardiganshire. Mr. Withers, architect:—

Roberts	£3,357 5 8
James & Co.	3,073 0 0
E. & L. Thomas	2,950 0 9
J. & D. Jones	2,855 0 0
Davis & James	2,598 0 0

For alterations and additions to a house at Bideford, for the Rev. E. O. Vincent. Mr. Edwin Dolby, architect:—

<i>First Portion.</i>	
Ching & West	£225 0 0
Howard (accepted)	242 0 0

The Builder.

VOL. XXV.—No. 1275.

Art Education for Artizans in Paris.

There is one conclusion which is forced upon us in examining the purely artistic features of the manufactured articles in the French Section of the Paris Exhibition, it is that whether in surface or sculptured ornament there is a freedom of handling, a heaviness of outline, and delicacy of finish, such as is seldom, if ever, characteristic of similar works in our own English department. Perhaps the best workmanship of both countries may be nearly equal in technical execution, but there is a wide gulf between the second or third rate work of France and England, which is almost equivalent to dividing the good from the bad, and in this division

France certainly has the better part. In the most elaborate and costly objects, such as painted porcelain and cabinet-making, we can compete with credit with French manufacturers; but in the cheaper pottery, or common furniture for the million, they very far surpass us in taste and design. There is hardly an object exhibited by France which does not display some grace of constructional form, or delicacy of ornamentation, contrasting strangely with the rude and coarse shapes and vulgar ornament of our own productions, where a special effort has not been made to ensure an exceptional quality of design. Comparing the cheap furniture exhibited in the French Furniture Court, with what we may see in Tottenham-court-road, one thing strikes us very forcibly:—the former there is little ornament, either carved or painted; but when either is applied, it is simple, refined in form, or well drawn,—differing from the decoration of the costliest gony work, for which thousands of francs are demanded, only in the extent of the ornament applied, or the degree of richness of its design, but not in the quality, so far as it goes, of the art element in its execution. We see the same good drawing, the same graceful curves in the simple terminal of the post of a twenty-franc chestnut cut in pine or lime tree, as in the carving in mahogany or ebony of a masterpiece of Fourdinois or Lemoine. And this sort of artistic grace is not confined to furniture, but pervades all branches of industrial production, so which art may be introduced, whether it be in earthenware, glass, cutlery, iron work, or even in objects of personal costume or decoration. Now, in England, there is absolutely no common element in the best works of Jackson & Graham, Hill and Son, and the Messrs. Trollope, on the one hand, and the common furniture we have referred to as Tottenham-court-road work, on the other hand. Who has not been disgusted with

the lumpy, putty-like carving on cheap furniture in England, or with the atrocious drawing of vulgarly-painted green and yellow surface-ornament, when the chisel gives way to the paint-pot? Even where the forms used give evidence of having been related by distant ancestry to well-designed shapes, yet in the reproduction the good drawing becomes distorted and vulgarised, the relief coarse and heavy, and all grace of outline is utterly lost. That this is so, however disagreeable it may be to us to allow, needs for confirmation only an appeal to our eyesight. The general superiority of the French industrial art to the English is now too much recognised to be brought in question, and what is seen in the Exhibition in the Champs Elysées is but a reflex of that which is seen outside it, in Paris, and indeed in all France. There seems to us to be but one explanation of this superiority, and that is, that the French workman has received, as a necessary portion of his education, some instruction in drawing, and that when the workman becomes especially an art-workman, his instruction in secondary schools is both general and effectual. It is only upon this hypothesis that the all-pervading taste in French workmanship can be accounted for. Instances of a high order of design in any special manufacture, whether in France or England, may be traced to special causes, and we fear that in the latter it is not seldom due to the employment of foreign designers; but that every French workman should, as a general rule, produce graceful and refined work, whether the eye of the master be upon him or not, is due rather to systematic education of a general nature than to special instruction in particular cases. We know that success in art, a knowledge of the beautiful from the ugly, and power of facile execution, do not come by accident, nor are they, except in rare instances, the gifts of nature; for, if it were so, then all civilized nations would be nearly on a par with each other in art-manufactures. Our experience is that, where we sow education we reap intelligence, and if we plant art, we grow refinement; but if we permit ignorance, we encourage irrationality, and if we utterly ignore art-education, the fruits become visible in a general want of taste. There is a consistency of cause and effect in these matters, and it is a shallow and worthless hegging of the question to say that some races or nations are by nature more tasteful and artistic than others. Art-power is acquired power, the result of educational processes of one kind or another: it may be of instruction obtained in the class-room or workshop, or the influence of ever-visible taste in the streets, in public buildings, in art galleries and national collections, or monuments,—these acting as cultivators of taste which may lead to self-education. The French and English workmen differ artistically from each other precisely in the ratio of their opportunities and the demand which exists for art-workmanship in the two countries; and this demand is regulated by the amount of taste generated in the public mind according to the degree of art-instruction received by the public.

We cannot believe that there is any inferiority of race in the English to the French workman, though there is a material difference in the sort of education they receive, quite sufficient to explain why the former as a rule does not possess art power, and the latter as a rule does possess it. Much of the national tendency to art may, doubtless, be traced in France to the sensible influence of public collections of art, galleries of painting and sculpture, museums of antiquities, and of industrial masterpieces, and to the almost universal habit of adorning the façades of buildings with sculpture, all these together creating an artistic atmosphere in which the incipient art-workman draws in taste with his breath. But more direct is the explanation afforded by

the numerous Schools of Art abounding in Paris, as well as in the more important provincial towns of France. Something also may be attributed to the general instruction in drawing given in the Primary Schools, as well as to the efforts so long made by the Government to popularise art-education by the aid given to the production of good examples to be used for instruction, and their dissemination at a nominal cost to the schools. This prepares the way for the action of the schools in which art-instruction is alone given, and in which the young workman studies as a part of his necessary trade education, and the part he is taught to recognise as by far the most important.

It is worth while to examine for ourselves the nature of the instruction given in the municipal schools of Paris, in order that we may discover, if possible, the means by which so general an art-power is communicated to the Parisian artizan. As before remarked, these municipal schools of art are very numerous; but no two of them are exactly alike in range of study. This is accounted for by the fact that the masters or professors conducting them are professional artists, either painters, sculptors, or architects, and that no conditions whatever appear to be imposed upon them, either as to subjects or systems of education; each man therefore develops those branches of art in the school in which he himself is most successful or practices professionally. We will refer to this feature of management again; at present it is our intention to describe the method of study pursued in one school, where a large number of workmen were engaged in the study of drawing and modelling, at the time of a recent visit paid to this school, among others, for the special purpose of the present article.

The "École Municipale de Dessin et de Sculpture," of the 10th Arrondissement of Paris, situated in the Rue des Petits Hôtels, is conducted by M. Lequien, fils, whose father has long been engaged as master of a municipal school in another part of Paris. M. Lequien, fils, is professionally a sculptor, and his school has a high reputation for drawing and modelling. From information concerning the principal schools we are justified in regarding M. Lequien's as a good representative of its order, and especially so of the peculiarly characteristic method of teaching drawing, alike in all the schools, which was to be seen there in operation. The students varied in age from fifteen years to thirty, and seemed to be clad in the ordinary costume of the workman, no effort being made to appear in best clothes, as is usually the case in English schools of art. Beginning with a pupil who had been but a few days in the school, and had not previously studied in an art school, and going on through the various stages until we came to the work of young men who were drawing from the living model, and who were employed in the daytime as designers for the great French manufacturing firms, at large salaries, the whole of the students' drawings were carefully examined, in the presence and with the explanation of the professor. Afterwards, all the works produced during the past year, some of which are now in the *Exposition*, and many others still in the school, were displayed by M. Lequien, and information concerning the ages, occupations, and length of time occupied in study, and production of the drawings, was communicated by him also.

It seems, then, that in teaching drawing, but one medium is used,—carbon, chalk, or charcoal,—and from first to last the drawings are made upon a coarse, cheap paper, of a grey colour, very much like what English grocers wrap their moist sugar in, only that the drawing-paper is not of quite so good a quality. There are three stages of study:—

1. From lithographed shaded copies, or original drawings.

2. Shading from the cast, of figure and ornament.

3. Shading from the living model.

The examples used by beginners were simple bold details of ornament, drawn with thick lines, and having little more than half-tint shadows; perhaps there were as many as three degrees of shade, all being boldly expressed by lines. The point used was such as a boy of fifteen would be able or willing to keep on a stick of charcoal; and the means of erasure was a piece of wash-leather. The student is placed at a distance of perhaps a yard from his copy, which is hung on a screen or the wall in a glazed frame, and which he is not allowed to touch or measure from. Painful was the mess made by the first two or three boys, with their blunt points making such heavy black lines, and their still hunter eyesight, which betrayed them into such doleful errors. "But," said M. Lequien, "they soon tire of this black mess and these frivolous lines, and get to cleaner habits and more accurate observation of form. This boy, fifth up the line from the bottom of the school, has been here two months, and has done twenty drawings, and you see he is already using his charcoal in an economical manner, and putting shadow in only where he sees it in the copy." The pupils attend five nights in the week for two hours, and it is commonly in the indentures of the young apprentice that he attend a municipal school of art, for which his master pays the fee. At the first about two of these simple rough drawings are made in a week; imperfect many of them, but each showing some advance on the last. Thus the interest of the pupil is kept up by a change of examples, and he is never allowed to form a habit of slow or monotonous work. A little further on in the school the examples used are larger and more elaborate pieces of ornament, in which either the human or animal form is partially introduced. This takes the student as the more elementary examples took evenings to copy. But by this time his work has lost all traces of blackness and messiness, the shadows become delicate and transparent, the free outlines made by the soft and willing charcoal are firm and expressive, the white chalk begins to express light and direct reflection, and the workman appears to be getting master of his medium. The improvement appears to be startling, and M. Lequien says it is not exceptional. He objects to outline-drawing with lead pencil as a commencement, and thinks more power is got by regarding drawing as the imitation of masses of light and shade, from the first to the last. Judging from what we saw, there certainly appears to be a corrective influence in adding the shadow to the outline, which mere outlines cannot have by itself. By adding shadow to bad form, you intensify the errors, mistakes of proportion become evident, and bad lines become uglier still. The middle stage is drawing from the cast, the same medium being used. Good specimens of drawings made by previous pupils, are displayed for the student's guidance in his first efforts, and the casts are very simple in form, sometimes a section of the echinus moulding, one acanthus-leaf from an antique capital, a cast of the eye, mouth, or chin from heroic busts, or mask of a smooth face. By the time the student arrives at this stage, he has mastered his vehicle of expression partially, not so completely as he will when he gets to the living model, but it no longer gives him trouble and vexation of spirit by doing in his hands just what he wishes not done. The process of drawing from the cast may thus be stated. The large forms are, firstly, indicated by faint outlines, and the lines dividing masses of light from shadow are touched in. The shapes of shadows are drawn, but shade is not at first expressed.* When a sort of map of the form has been thus obtained, the cast shadows are rubbed in flatly with wash-leather and soft chalk, and deeper tints in these shadows drawn in, as it were, with the blunt point of a leather stump. In this condition the drawing looks exactly like a faintly-printed photograph, and it seems to us that is some recommendation of the system, which is natural, effective, and simple. Then the student, having obtained the general effect of his subject, proceeds to add the shades, whether faint or deep, of the half tints, blending them into the shadows, and afterwards taking out by means of a clean cor-

* Shade is the partial absence of direct light on an object; shadow, the total absence.

ner of his wash-leather, the reflected lights in the shadows, and by the use of white chalk, adding the high lights, used thickly or thinly according to the amount of brilliancy of the light. The grey paper stands for the natural colour of the cast; or sometimes much white chalk is used, and the colour of the paper then becomes a half tint to express the lighter shades. This mode of drawing from the cast is a rapid one in comparison with our own English method of stippling shadow with the chalk point, and it is very much more effective. A week or even a month may be spent on a subject from the cast by M. Lequien's pupils, seldom more, and the drawings made are varied in size according to the pupil's powers, from a foot square representation of a hand or a leaf to a cartoon on strained canvas some 5 ft. or 6 ft. square, of the Apollo Belvidere or the actual size of a section of the Panathenic frieze. Very lovely in feeling and truth of *chiaroscuro* were many of these large drawings from the cast—absolute imitation of natural effect being the aim of the student, and every detail of form was carefully rendered, either by the sharp hits of forcible shadows occurring where the light was strongest, or by delicate modulations in the broad shadows, or in the play of reflected light on the prominent portions of the nonilluminated parts of the cast. The subjects used for study are similar to those in use in our Royal Academy and schools of art, with the addition of a few good modern French busts and figures. The Greek and Roman antique and French renaissance are the styles of ornament which exclusively supply the ornamental casts, no example of Gothic being apparently used.

The final stage, after the practice of figure-drawing from the antique, is drawing from the living nude model. In this stage only the more advanced students study, and a very considerable power in drawing has been acquired previously to commencing from the living subject. A longer time is given to each model than we are prepared to expect, three hours each evening for five nights a week being allotted to each study. A very great amount of care is expended on the form of the figure, and the degree of finish is expected to be higher, though even in this the effect and truth of drawing are considered of more importance than finish. Stump and leather are used also in drawing from the life: they may, in fact, be considered as universal in teaching drawing in France. Besides drawing, modelling is practised in the school, in similar stages as already described for drawing, alto-relievo being the general method adopted for studying the antique and living figure. Ornament appears rarely to be copied, though original designs for special purposes of ornamental treatment were exhibited to us as the work of the students, and these were well designed and very spiritedly modelled. French art masters appear to believe that figure practice includes the study of all kinds of form, and that a good draughtsman of the human figure can draw ornament or design decoration in any style as a matter of course. The evidence is rather in favour of this view,—at any rate, so far as drawing goes. In another class a few students were drawing from examples architectural line drawings, and projections of geometric solids; but there was nothing in this portion of the school studies in any way remarkable.

It seems to us that in this system of teaching drawing in light and shade with charcoal and leather, and the effect it appears to have of giving facility of drawing and readiness to reproduce effects of light and shade, lies much of the secret of French skill in art. The medium is simple and easy to manage after the first few drawings have been made, and afterwards the student occupies himself solely in the study of form and its reproduction. Drawing is the first thought, drawing the second, and drawing all the remaining thoughts of the French professors in art schools. For the English systems of teaching drawing with outlines in pencil, and going on afterwards to the study of light and shade with the point, they profess to have the greatest contempt. The first, they say, cramps the hand instead of giving freedom and power, and the second only leads to the mechanical power of making fine dots, and neither has anything but a distant connexion with generating art power. There is a good deal of force in this opinion, and the very great superiority of French workmen to English in the matter of drawing, when both have been students in art schools, ought to lead to some further consideration of the two systems by the masters of our schools of

art. We trust that in the reports which may be written on the subject of art education by the teachers of schools of art who visit the Paris Exhibition, and for which prizes are offered by the Science and Art Department, this contrast of system may be referred to, and that we shall hear what can be said on both sides of the question. Nothing can be more directly opposed than the two methods by which the French and English Governments seek to develop the art power of working men. It is not a mere question of detail; it is one of principle, and if we are to judge of a tree by its fruits, the judgment is not a difficult matter. The real question is, are the twenty or thirty stages of art instruction doing for English industrial art what charcoal and wash-leather are doing for France? We must shut our eyes to the facts of the case, and look inwardly to the beauties of a perfect theory before we can answer this question in the affirmative.

Feeling interested in the pecuniary part of the matter as to how the schools in France are maintained, we learnt that the Government grants a subsidy of 3,000 francs per annum towards the support of the School of the Tenth Arrondissement. This pays the rent, and covers all expenses of maintenance. The master is paid by the fees of the students, and these are fixed at 4 francs a month. It is obviously the master's interest to fill his classes, and he is allowed free scope to do so, no limitations being placed upon him, no dictation as to methods or systems, and no tests are applied to his students. The State gives him nothing, but it provides a fit place for the working men of Paris to study in, and it takes nothing from him. It neither pays him for accidental cleverness in his pupils, nor stops payment if they are stupid and cannot pass examinations. It simply says to him,—Here is provided for the public good a studio for artisans, which you may take charge of. If you can teach soundly and well, and make it worth the money of working men to pay for your instruction, you will find yourself surrounded by pupils. If so, the better for you; if not, a more popular teacher, whose instruction will be sought for, will take your place. The greater your pecuniary success, the better for the public, for then the larger number of artisans will be instructed. If you cannot fill your classrooms, it will not pay you to carry it on, and it will not suit the public to be without instruction.

This seems to us by no means an unfair view of the question, for, whilst not ignoring the responsibility of the State, it does not waste the ratepayers' money. It places the art-education of working men on a somewhat similar basis as middle-class education in England, has been placed in our endowed grammar schools and universities, by either private or public generosity.

The educationist visiting the Paris Exhibition, at any rate if he is interested in art-education, should examine the French collections in group 10, class 90, the works of the French art-schools. Here we may see not only the productions of the school we have described, but of many others of equal, if not greater, reputation. These collections will well repay any time that may be spent on them; and we would warn him not to be content with looking only at the displays on the walls of the court,—for the wall-space is limited, but to open the portfolios of drawings, which are very numerous and highly interesting. They will show the same style of drawing as we have seen at M. Lequien's,—generally, with the addition of some branches of study added, here and there, according to the particular qualifications of the masters of the schools. The drawings do not look so well in an exhibition, as we may frequently see at a school of art exhibition in England; there are but few works in colour, or monochrome, or original designs. There are no pretty works at all, nothing to attract the public gaze amid all the glitter surrounding. All that can be seen, and that need be sought for, are sound and serviceable evidences of useful education, presented in a manner which shows that there has been no effort to make it appear better than it is. But there are proofs on all hands of good instruction and powerful drawing, and the visitor who chances to examine these works at an early period of his visit, will have no difficulty in understanding all the grace and good art in the French department, and of detecting its origin and primary cause.

Perhaps the best description that can be given of these cartoon drawings on sugar paper is, that they are evidently regarded as the means to an end, and not the end itself. We often feel in an

exhibition of the works produced in English Schools of Art, that the elaborate drawings which must have taken many months to produce, are treated as pictures, and are themselves the end of study. They point no further, and between them and the design and execution of art-workmanship in industrial manufactures, there is no connecting link. In our own schools there is certainly a greater breadth of subject taught, but we are justified in believing that what the art-education of our country gains by comparison in breadth of subject, it loses positively in depth of direct usefulness. We cannot conceal from ourselves the fact that French workmen possess great art-power, and are successful draughtsmen, and that it is not the case with English workmen. We see no more direct means of accounting for this than in the more rapid, simple, and effective method of teaching drawing in France than in England, as a primary, even if not the only explanation of their superiority. Let an unprejudiced person glance at the list of prizes awarded at the Paris Exhibition to the co-operators or workmen of English firms, who have been successful in obtaining the grand prizes or medals. How frequently the names are foreign, and what does this suggest, but that either we are unable to supply our own demands for art-power, or that we supply only the inferior branches of manufacture, whilst in pottery, the precious metals, and in cabinetwork of a high class, the better education of foreign workmen suits them for the highest positions of designers?

That this will not always be the case we fervently hope and believe; but that an improvement which will place our workmen on an equal footing with their foreign competitors will occur without a thorough remodelling of our system of art education, we as thoroughly disbelieve. The art progress of the age and our backwardness in many branches of industrial manufacture demand that this shall be done. We have all the means and appliances, and do actually spend the money every year, sufficient to supply good instruction in art to every town in the empire. Our artisan population is an intelligent one, and the demand for art-power in our manufactures is great: all that is wanted, therefore, is that some attention should be paid to our systems of instruction and national expenditure of grants for art. The results we now obtain are not commensurate either with our ability, our intelligence, or our demands; and this, we are disposed to believe, is the fault, not of the public, or the capabilities of our art students, but of our system.

From the Exhibition of 1851 we derived great impulses to art education. From that of 1862 we obtained less advantage, because a greater access in it made us more cautious and better satisfied with ourselves. The lesson we now have to learn is that it will not do to rest upon our oars, or be betrayed into a fool's paradise of self-satisfaction. We are far behind in 1867 as we were in 1851; and the disease we suffer from requires as prompt action to remedy it as those who were then compelled to adopt. Our art-schools were then placed on an entirely new basis, which had some good in it, and has lasted long enough, outliving in many points its own good qualities. Fifteen years of experience have taught us something, and we cannot do better than repeat our experiment of 1851, and with the additional light we now have, place the art education of the country on a new and improved basis.

A SORE IN THE BODY POLITIC.

The surgeon whose skill is appealed to in a serious case of accident, such, for instance, as a gunshot wound, knows the importance of ascertaining the worst at once. Before attempting any sanitary process he makes use of the probe. He finds up the wound may be useless, or evenchievements, until the cause of injury is discovered and removed.

It is not otherwise with the body politic. In the diseases of society that take the form of convulsions, and present the symptoms of extreme excitement, amounting to mania, dazed by collapse, little can be done to restore health to one without a severe application of the probe to discover the cause of disturbance. It is not, however, always necessary to probe deeply. The cause of disturbance may at times have been subtle and unperceived, or it may have been evident to the dispassionate observer; in the progress of the evil that cause fre-

quently comes to light. At least, a cause does; and it then not unfrequently happens that the patient, or the quack, points out a determining symptom as a primary mischief.

In the long and severe prostration of public confidence, from which recovery seems as slow and as doubtful as from the most serious disturbances of individual health known to surgery or to medicine, there has been of late no need to probe very deeply in order to detect sources of mischief. The evils have come to the surface with a vengeance. Unfortunately, they are neither few nor small; nor are they confined to one rank or section of society. We find them in the commercial world, we find them in the ranks of labour, in the man whose dealings are measured by so many shillings a week, and in those whose operations amount to so many millions a year. And, unfortunately, they are so widely different, at least in their first aspect, as to be liable to classification under the two main divisions of evil, force and fraud. The symptoms of the social evil from which we are yet suffering are apparent in that scientific form of swindling which is euphuistically termed finance, and in that simple form of terrorism which goes by the plainer name of murder.

In the higher circles of mercantile or speculative occupation the last month or two has been fruitful in scandals. Three great railway companies have been paraded before the public disrespect in unenviable rivalry. One has thrown away three times the amount of its original capital in supplementary works that have had the result of entirely absorbing the dividends of the primary proprietors. One has come to a dead lock from sheer indebtedness. Earning a large revenue it has managed as if unable to avoid the inconvenience of "a man being put in possession." A third has achieved the most insignificant case of disputed account that has yet been presented to the attention of students of arithmetic. The divergence of opinion between the parties in the case is as complete as was that recorded by Æsop as existing between the wolf and the lamb. The public will look with some interest for the solution of the question, "Which is the wolf?"

The contractors of a line of railway which, by the aggressive direction of its course and of its branches, no less than by the lavish magnificence of its works, had long occupied a prominent position in the country, were compelled some time ago to suspend payment. There was a good deal of sympathy felt for these contractors, as it was evident that a had or irrevocable debt of the amount of 380,000l., which sum it was stated that the company owed them, was sufficient to disturb the finances and even to affect the solvency of the most respectable firm. So amicable arrangements were made for the liquidation of the accounts, and perhaps the chief result of the suspension was the removal of anxiety from those whom such a danger no longer menaced.

Meantime the defaulting company wallowed in an ever-enlarging slough of financial and legal difficulties. Complication superadded upon complication; interest divided itself against interest; shareholders, preference shareholders, owners of stock distinguished by half the letters of the alphabet, debenture holders, Lloyd's-bondholders, judgment creditors, all rose fiercely one against another; and so dire and hopeless became the confusion that the injured creditor arose in his place in Parliament with the meek request that the House of Commons should bring its unrivalled power of discrimination to bear on the seething chaos.

At last, by methods inconceivable to the external world, the vast puzzle of account shook itself into definite form. How accurate and how truthful that form may have been is yet a question for the distant future. But in the provisional state, at all events, the liquidators of the contractors looked in vain for their 380,000l. No such item was there; nothing that in any way resembled it. The first impression must have been that there was an error of the press, an omission of this trifling item; perhaps a total forgetfulness of the existence of the injured contractors. A further inspection of the gigantic balance-sheet dispelled these delusions. Messrs. Peto, Betts, & Crompton had not been forgotten. But there was this difference of opinion between the two views of the case,—this illustration of the hazardous nature of reckoning without the host. Disclaiming a debt of 380,000l. towards the contractors, and the accountant of the London, Chatham, and Dover Railway, per contra, makes the demand of some six millions

seven hundred thousand pounds on the estate of the contractors. The effect of this counter-charge was as immediate as the amount was amazing. The liquidation instantly collapsed; the contractors surrendered as bankrupts.

We are no advocates of colossal contractors. On the contrary, we attribute to the formation of "contractors' lines" the destruction of the property of railway shareholders, and the ruin, for the time, of the profession of Civil Engineers. But there is such a thing as justice. The fortunes that sprang up in a night have for the most part perished in a night, and the fragments of the industrial Colossi, like the bronze limbs of the Colossus of Rhodes when overthrown by the earthquake, lie scattered "many a league." And if there is one culprit which more than another distinguishes the English gentleman, and manfully appeals to the good feeling of the Englishman of every class, it is that which leads one *parcere subjectis*, the meaning whereof is—not to hit a man when he is down. With this feeling we must remark that the report on the accounts between the London, Chatham, and Dover Railway Company and their contractors which has recently been issued "by order of the Board," has two sides. Dealing with this document alone, and excluding any extraneous information, we cannot but hold that the contractors are not the persons most seriously affected by the publication. Let us suppose, for the sake of argument, that Messrs. Peto, Betts, & Crompton are all that their worst enemies, if they have enemies, can assert; still, as regards the shareholders of the London, Chatham, and Dover Railway, their misdeeds are those not of principals, but of accessories. They were not the elected guardians of the interests of the shareholders. We use not a word to extenuate wrong, if wrong there be; but let the saddle be put on the right horse. Messrs. Peto & Co. entered into certain contracts with the representatives of the shareholders for the purpose of making profit. Fair profit, it may be,—more than fair profit, it may be urged,—miscalculated profit, at all events; but the relation as between contractor and company is one that is clearly understood. The object of the large expenditure incurred by every company for the staff of the engineer is to control and ensure the efficiency of the work of the contractor, who undertakes, for a fixed sum, or at an agreed scale of prices, to execute these works cheaper than the company could do if themselves the paymaster, but with a handsome margin of profit to himself. Now, if any directors so contract with a person in this position as to make him the virtual master of the undertaking, they betray their duty to their constituents. They expose the contractor to a series of temptations which it will require no ordinary virtue to resist. They give him the means, at every step, of taking advantage; and in all public works contingencies are so heavy, that the most straightforward tradesmen will be likely to take every opportunity in their power of "hedging" against them. So obvious is this fact, so small the knowledge of human nature that is requisite to enable a man to arrive at it, that it is difficult to see how it can be ignored by any persons of sufficient experience of life to be named as directors of a railway.

Now whether the finance arrangements of the London, Chatham, and Dover Railway were such as to make the contractors, who are the persons naturally interested in swelling the expenditure of the Company, the virtual disposers of that expenditure, the report before us does not enable us to say. But one thing is clear, whether this were the case or no, the directors are the persons primarily responsible to the shareholders for expenditure and for finance. How they have discharged this responsibility the report bears witness. The "state of the accounts" shows a total issue of stock and shares to the amount of 11,591,551l. It states the expenditure on works at 2,993,264l. It may be presumed that land is not included in this sum, but no mention is made of either land or working stock in that document. Two items in the account require explanation, as they appear to have been entered in their present form rather with a view of swelling the balance claimed from the contractors than for the sake of simplifying the balance-sheet. One of these is the fact that the sum of 4,171,150l. received by the company from the public is stated as a credit to the contractors; while the stock corresponding to this amount, and of a nominal par value only 36,550l. above it, is debited per contra. The other point is that the company state that they have paid to the contractors in cash nearly 232,000l. more than

the cash received from the public. But this difficulty is probably met by allowing for certain large counter payments from the contractors. If we balance the two cash payments stated between the parties, we come to the following stupendous result.

The London, Chatham, and Dover Railway Company, on their nominal capital of 11,826,543*l.*, admit receipts from the public to the amount of 4,171,450*l.* Out of this, or rather against this, they have to place an expenditure on works, as certified by the engineers, of 2,993,264*l.* Deducting the cash paid by the contractors to or on account of the company from the cash paid by the company to or on account of the contractors, we find that the latter have received in cash the sum of 2,232,105*l.*, leaving a balance due from the company on certified work, including profit, of 761,159*l.* To provide for this three-quarters of a million's worth of works, and for such further expenditure of the company as is not specified in the "state of the accounts," stock, and debentures, to the nominal value of 7,423,101*l.*, or just ten times the amount of the balance due for works, have been handed over to the contractors. This is financing with a witness, and, as we said before, whatever be the demerit of the contractors, we are utterly at a loss to imagine what defence the directors have to offer for such a mode of dealing with the property entrusted to their charge.

In each of the three great disasters to which we have referred the same features are apparent. Large power has been committed to persons who proved incompetent to exercise it. As far as directors are concerned, no charge of peculation or of corruption has been urged. But the inconceivable mismanagement, in each case, of the funds and of the powers of the companies, if not corrupt, is liable to the charge of profound incompetence, and of reckless waste. Nor can it for a moment be supposed that the mere blind fury of competition has been the sole, or even the main cause, of the waste of millions after millions. In every contest the rank and file, the officers and the contractors, had to be duly paid. Whence the money came they did not regard as their affair,—the point was to do the thing handsomely, to stick to the colours, to meet aggression by aggression, and to post millions against millions. So with the threefold division of labour—lawyers, engineers, and contractors to do the work and to pocket the profits,—directors and secretaries to sign the checks, to look big, and to enjoy constant "moral triumphs," and shareholders and bondholders to pay, the work went merrily on. Adam Smith would have been delighted at the result, for it would never have been attained except by such a division of labour. If directors had been expected to sign checks on their own bankers, or if lawyers had been paid in original shares at par, the total capital accounts of the Brighton, the South-Eastern, and the London, Chatham, and Dover railway would probably have been at least some 18,000,000*l.* sterling less than the present united amount.

While this method of dealing with the money of other people by millions has been sanctioned by men in the responsible position of chairmen and directors of such important public companies, we find the desire of living at the expense of others to be no less energetic among the operative classes. There, too, peculiar principles of political economy have been called into full play. The principle on which the action of the railway companies was conducted appears to have been this. Certain persons desire certain profits. To ensure these, certain lines, more or less unproductive, of railway must be made. Drive the scheme for these railways through an ever-subservient Legislature, and the public must find the money; and it has done so accordingly.

The principle of the operative unions has been this,—“We require a certain amount of wages. Unfortunately this involves the performance of a certain amount of work, but it shall be our care to make this work as little as possible. We shall, therefore, impose on the members of the trade a code which will so limit the work to be performed by each man as to make the day labour of the least efficient and industrious workman the normal maximum for all hands. We will force the masters to pay our own rate of wages for our own amount of work by the penalty of strikes, and we will force the body of workmen to obey our committee rules by picketing, by rattening, and by yet more vigorous steps.” That a small body of men should have been able, in so many instances, to impose so

fatal a burden on the industry of their respective crafts, is a social phenomenon of the most extraordinary kind. Eighteen pence, two shillings and sixpence, even as much as five shillings out of each pound earned by the workman have been exacted from him by the requisitions of the unions. That is to say, that a workman earning twenty shillings a week has been compelled to pay for the support of a system which is doing its utmost to limit the amount of work done, and which is actually driving work out of the country, more than three times the amount paid per head of the population for the support of the entire government and defence of the country. John Brown, saw-grinder, having paid in taxes direct or indirect an annual amount of not less than two guineas (supposing, which is not the case, that he pays the average taxation of the country) is called on to pay to the murderer Broadhead and his committee the further sum of six pounds ten shillings, which is liable to be doubled in case of need, for their mode of protecting his interests. When it is considered how large an amount of work is left undone in consequence of difficulties between masters and men, it is obvious that John Brown is not a political economist, and that his faith in the protectors of his trade is not justified by the result.

We shall extend our remarks to an undue length if we go on to show the moral from the above instances of social demoralisation; much will suggest itself to our readers. One thing is pretty clear, permanent prosperity is not attained by outrages on morals, however promising may be the original plan. Another thing is no less obvious, and that is, that unless we not only detect but extirpate the latent causes of these monstrous evils, these impositions on society for the exclusive benefit of designing individuals, who are not even competent to keep their ill-gotten gains, the New Zealander of Macanlay, who is to look over the ruins of what once was London, may not be a purely imaginary personage, nor even one in the very distant future.

TERRA-COTTA ARCHITECTURE OF NORTH ITALY.

THE revived manufacture of Terra-cotta in the shape of vases, fountains, friezes, and other ornamental works has been carried on in England for the last forty or fifty years, and to a considerable extent; indeed, we might go back to the time of Wedgwood, who established a factory for its production, and say nearly 100 years. The frieze of Her Majesty's Theatre, in the Haymarket, produced by Babb, the sculptor, and the external decorations of "New St. Pancras Church," London, are amongst the larger examples that occur to us. Little, however, had been done with it amongst us in architecturall work as an actual building material until recently. It was used, our readers know, in the Royal Horticultural Society's buildings at South Kensington. It is being largely used in the new building for the Museum there, and we have mentioned large specimens of the material exhibited by English manufacturers in the Palace of the Champ de Mars, for which more recently medals have been given to Blanchard, Blashfield, Pulham, and others. In some parts of Germany, Saxony, and Northern Italy this revived use of it as a building material has been going on longer. In England it is evident there is now a tendency to employ it to a greater extent. In several buildings in the City, some of them illustrated in our pages, and in the front of one, scarcely finished, at the corner of Surrey-street in the Strand, terra-cotta is extensively employed.

This movement will, doubtless, be much promoted by a fine hook that has been recently produced by Mr. Gruener on the "Terra Cotta Architecture of North Italy," dating from the twelfth to the fifteenth centuries, and which contains forty-eight illustrations, engraved, and printed in colours, from careful drawings and restorations by Frederigo Lose, with wood-cut sections, mouldings, &c., and descriptive text by V. Ottolini and F. Lose.*

In the introductory chapter Signor Ottolini rightly dwells upon the methods used in Italy at this time to produce terra-cotta, especially by Andrea Boni in Milan, and the necessity for the greatest care in the manufacture to obtain terra-

cotta that will last. That some of the terra-cotta lately produced in this country will not last there is already evidence.

Plasticity and homogeneity, says Signor Ottolini rightly, are the two conditions essential to the composition of any ceramic paste. Plasticity is the property of clays which contain only aluminum, silica, and a little oxide of iron; and depends mainly on the water contained in the clay, which cannot be evaporated evenly by the drying power of 100 degrees. But although plasticity be an all important condition of the manufacture, its excess entails grave inconvenience. Objects formed of over-plastic clays are dried unequally and with difficulty, which renders them liable to lose shape and crack. Such defects are developed at the stove, and in the furnace they increase further. Hence arises the necessity of introducing into the composition of the paste powdered quartz, calcareous earths, and sands, to diminish this excessive plasticity, increase porosity, and thus facilitate the expulsion of the water; which, although it serves merely to mix the materials and give them the needed softness, demands weighty consideration and precautions, because the wrought portions, however they may sometimes seem dry, never are absolutely free from water.

We have already observed that the liquid is strongly attracted by the clay, or, more strictly speaking, so combines with the clays as to require an intense heat for its total elimination. It has been stated that sandy substances make an easy channel for the water to pass from molecule to molecule, thus securing to all parts an equal density. Now, to the end that the desiccation of the largest pieces may be effected uniformly and without cracking, care must be taken to diminish the density at the centre; because, if the outside density did not exceed the inner, the evaporation of water must naturally proceed more slowly at the centre, the clays would from the first remain in an unavoidable state of dampness, and a separation of their molecules must ensue.

Rapid drying gives rise to another serious defect,—the work becomes coated superficially with a dry thick crust, impervious to internal moisture, and thus appears dry when only partially so; the result is, that the imprudently work, constrained in the furnace to evaporate by the high temperature, acquires an elastic force, sufficient not only to crack the piece that contains it, but even to split it to fragments. This is the reason Signor Ottolini points out why Boni, of Milan, adheres to the system of applying the paste in small pieces to the moulds, and leaving spaces at intervals; thus endeavouring to obtain an equal, slow, and thorough expulsion of the water from the modelled paste. For this reason, having studied the proportions of the disjunctive materials, he finds it needful to protect his works from the direct and too forcible action of the wind, and to watch that they be always accessible to the steady and beneficial influence of heat and light. As soon as the moulded objects have attained the proper degree of dryness, to obtain which various arrangements are made, they are polished by hand, and consigned to the furnace, where the burning is effected by means of combustibles calculated to emit flame.

"Yet all this care in drying and firing would fail to ensure solidity to the work if the conditions essential for obtaining perfect homogeneity and compactness of the earths were not first observed. In ceramic pastes two kinds of homogeneity must be aimed at,—one of parts, the other of masses. The first consists in equality of nature, uniformity of volume, invariableness of density, in each constituent of the paste, and is attained by working, by kneading, by sifting, finally by mixing the ingredients already finely pulverised. The second, and more important, results from a uniform blending of the dissolved earths, so that the inevitable modifications produced by desiccation and burning may affect alike every portion of the mass, which renders it highly advisable that, before moulding, the earths be subjected to much kneading with hands and feet."

If the paste be not thoroughly homogeneous, it fails to sustain equally in all parts the influence of heat. Hence neither judicious choice and just balance of ingredients, nor washings, grindings, mixings, slow desiccation, will suffice to render the paste homogeneous. Homogeneity is brought about by minute processes carried on through a lengthened period. Large depôts are formed, where the excavated materials, before being reduced to a paste, are submitted to atmospheric influences, and where large masses of the damp paste may remain for some years before undergoing moulding or modelling, and being exposed to the action of fire. These arrangements are indispensable for the production of a perfect material.

to the general correctness of the delineations. This tower has stood remarkably well, a result that may be ascribed to the excellence of material, and to great care in adjusting the bricks. Several writers have noticed the skill with which, in these days, bricks were arranged and fixed. The cement used for binding them together was of quick lime mixed with very fine sand, taken from the river bed. This lime was dissolved in plenty of water, so as to flow in a thin liquid upon the bricks, forming itself so slight a stratum that the seam between the bricks is now barely discernible. The bricks were of varying form and structure, according to the different parts of the edifice in which they were placed.

In rectilinear parts, the dimensions of each brick were about 1 ft. in length, 3 in. in depth, and 6 in. in breadth. When circular walls were in question, each brick presented a proportional part of an arch, more or less curved according to the expansion of the wall's circle. Figs. 7 and 8 show other parts of the campanile, fig. 8 being the arcade on the fourth story of the tower, the pillars of marble resting on projecting brackets.

A modern discovery gives the name of the architect: on a slab anciently inserted in the wall towards the base of the tower has been deciphered,—“Magister Franciscus de Pecoraris de Cremona fecit hoc opus.”

From the well-known and magnificent obituary and convent of the Certosa, near Pavia, several illustrations are obtained, including the apse of the Certosa and the arcade from the cloisters. We give a general view of the church (commenced 1396) cornices, figs. 9 and 10, and pilaster, fig. 11.

At the church of San Lanfranco, in the outskirts of Pavia, are found replicas in terra-cotta of some details in the cortile of the Certosa, and in the Church del Carmine, of Pavia, some of which are marked “Abbas Lucas F. F. 1464” (Abbot Luke caused to be made), from which our authors infer that the terra-cottas of the period all originated in one workshop. Another opinion arrived at is that the more recent terra-cotta is of a deeper shade of red than the ancient, and being more liable to atmospheric oxidation, allows of the encroachment of damp and wet, and so presents in many cases an aspect of greater age than its ancient predecessors.

We may not, however, pause longer over this hook. Suffice it to add to our previous encomium that it is a work of very great value and beauty, and is likely to have a considerable influence on the movement in favour of the employment of terra-cotta amongst us in architectural works now going on.

THE HEALTH OF NEWCASTLE-UPON-TYNE, WITH REFERENCE TO ITS CONDITION.

The condition of the town of Newcastle was referred to by a writer in our columns last week, and the subject is of so much importance that we revert to it. The weekly publication by the Registrar-General of the vital statistics of other large towns in addition to those of London, which was commenced in 1865, has already done good service in awakening local as well as general interest in the health of our urban populations. The inhabitants and local authorities of the different cities and boroughs are beginning to be stirred by a commendable emulation as to the position of their town in the list periodically published in the order of their rates of mortality, and to acknowledge that the apathy which acquiesces in a continually excessive death-rate will no longer be tolerated.

A few weeks ago we noticed the report of the Medical Officer of Liverpool for 1866, which not only entered fully into the causes which have so long contributed to make that town notable for its waste of life, but bore conclusive evidence that in Dr. Trench the town has the advantage of the services of an officer fully competent, if cordially supported with the weight of municipal authority, to materially raise the standard of health in that town. Indeed, the death-rate

ceeding to more elaborate forms, as examples for imitation, he says: we would rather put it, for study and suggestion. The illustrations commence with Santa Eufemia, Pavia, a work assigned to the eleventh century, and come up to the Certosa, near Pavia (commenced 1396), the sanctuary of Crema, 1500, and various charming residences round about Milan, belonging to the sixteenth century. The views are beautifully drawn and coloured, and form a storehouse of decorative detail. It must not be supposed that the artist found all these remarkable fronts as we now see them set forth by his drawings. We remember to have looked on several of them which presented indication of what they had been only to the practised eye. With care and knowledge, he has gathered hit after hit, and reproduced them in all their original completeness.

In addition to the views in colour, engravings are given of details, and some of these we are enabled to reproduce.* Figs. 1, 2, 3, 4, 5, and 6, are details of the Campanile of San Gottardo, in Milan, fourteenth century, and a personal study of it enables us to speak satisfactorily as

* See p. 510.

“The way in which terra-cottas were introduced into walls was not unlike that commonly used for inserting stone, marble corbels, and jambs of stone. It is evident that the general skeleton of the wall was first constructed, sweeping some bricks protruding; so that afterwards the casts, figures, heads, cornices, and such like, might be introduced into the interstices left between brick and brick out of the redundant material beyond the substance of the wall itself. Such pieces, if flat or slightly salient, were fixed in simply with lime and plaster; at the most, for greater strength, hooks of iron, or mere nails, were used. Large blocks were secured in the same way as corbels or stone cornices: they took, however, the precaution to hollow out by hand such figures as required to be fixed to the bricks that jutted beyond the wall level; sometimes also in order to lighten them, or to promote the uniform burning of large pieces such as large heads and statues. The utmost care to strengthen them was bestowed on the first row of cornices, and on such architectural members as had to sustain others; these appear portions, on the contrary, being borne by the lower and fixed to the wall as best might be without any extreme care, but never made salient by excessive or abrupt protrusion. They are always graduated and pitched, so that rain-water may never flow down behind, but invariably along their fronts. Here, in Italy, through the sudden changes of temperature, frost will soon split the hardest marbles; nevertheless, although these terra-cottas are not attached to the wall in a very elaborate fashion, yet, a consequence of the builder's precautions to prevent water standing on them, they appear little injured by frost.”

Mr. Gruner's work aims at supplying a series of specimens, commencing with simple and pro-

which has prevailed in Liverpool during the past half of this year shows a remarkable improvement upon recent years. Leeds, during last year, appointed a medical officer of health, and is at present enjoying a rate of mortality far below what has there prevailed for many years. Among the ten large towns of England furnishing weekly returns, and arranged in the order of their death-rates in 1866, Liverpool and Leeds showed worst with 41.9 and 32.5 per 1,000 respectively. Newcastle-upon-Tyne, however, stood next with 32.1.

It is satisfactory to find that this condition of the health of Newcastle so early as last October, engaged the earnest attention of the Local Public Health Committee; and that on the 4th of that month a sub-committee was appointed fully to inquire into the causes of this high rate of mortality, and to "report generally upon the sanitary state of the borough, and the means of improving it, but especially upon the advisability and practicability, under the direction of the Corporation, of opening up new streets in crowded districts; of sweeping away old, dilapidated, and unhealthy dwellings; and of erecting in their stead better and healthier houses, and lodging-houses for the labouring classes." We have now before us the report of this sub-committee, which is, perhaps, on the whole, one of the best publications on this subject which has ever been brought under our notice. We can not only congratulate the town upon possessing so much valuable information bearing upon its sanitary condition, but its treatment and arrangement are so essentially practical that we shall fully hope to see most of the suggestions embodied in the concluding chapter carried into effect without loss of time. It needs but a slight knowledge of sanitary science to feel entire confidence in a vastly beneficial effect from these reforms.

In the opening of the report, the loss of life in Newcastle from the excessive death-rate which there prevailed last year is dwelt upon at some length. This fact is now so generally known that we shall content ourselves with comparing it with the death-rates in one or two of the healthier towns. In Birmingham, for instance, the rate during last year was only 24.1, against 32.1 in Newcastle, showing an excess in the latter town of eight per 1,000, or equal to a loss of close upon 1,000 lives over the number that would have died had the death-rate not exceeded that in Birmingham. Calculated upon the death-rates of last year, the average lifetime in Birmingham would be 41 years, in Hull 40½, in Bristol 40, in London 37, and in Newcastle only 31. These few figures alone sufficiently prove the need of an inquiry, and of something being done after the inquiry. We may here remark that this difference between the health of Birmingham and Newcastle has been still more remarkable since the beginning of this year. In the first six months of 1867 the annual death-rate in Birmingham averaged only 22.6, while in Newcastle it was 32.4, or rather above the high rate in 1866, which gave rise to the report now before us.

The various diseases which contributed most largely to make up the excessive mortality last year in Newcastle are severally treated of in the report, which contains diagram maps of the town with coloured indications of the fatal cases of typhus and scarlatina in the different streets. The conclusion which appears to be drawn from a thorough investigation of the subject is that, although a considerable portion of the excess is to be ascribed to that class known as zymotic or epidemic, all the other diseases were also proportionately far more fatal than in most other towns, and in England generally. Diseases of the respiratory organs, including phthisis, convulsions, atrophy, and debility, and all infantile complaints, were far more fatal in Newcastle among a population enfeebled by so low a standard of health than in other towns; but of the 3,950 deaths returned during the year in Newcastle, 1,145, or 29 per cent., were attributed to diseases of the zymotic class. Scarlatina was epidemic in Newcastle last year, causing 500 deaths; typhus and typhoid fever were fatal in 22 cases, diarrhoea in 129, cholera and choleric diarrhoea in 51, measles in 105, and whooping-cough in 53. The All Saints sub-district, or eastern and lower portions of the town, where the want of sanitary reform is greatest, suffered most severely from these diseases, but a reference to the maps above alluded to will show that their fatality was very general throughout the borough.

Having most fully dealt with the statistics of the mortality from particular diseases in the

various portions of the town, the report proceeds to inquire into the general causes of this mortality, which has been excessive during a long series of years, but was strikingly so in 1866. The evidence collected proves the old story of bad drainage and sewerage, indifferent and insufficient water supply, and overcrowding in unhealthy houses from an insufficient supply of suitable dwellings for the working classes. A few of the facts, however, here set forth are new and instructive, and will be invaluable to other towns anxious to account for and to mitigate high rates of mortality. It is stated that in no other large town in the kingdom are there so many unpaved, unflagged, and unsewered streets as in Newcastle. In 1862 there were 219 of these unpaved streets, and the present rate at which their paving is being carried on scarcely more than keeps pace with the new streets built year by year, so that the arrears remain pretty nearly as great as in 1862. In unpaved streets effective scavenging is all but impossible, so that in summer "the accumulated filth sends forth poisonous exhalations." In Westgate and Elswick 155 of these streets are to be found, and it is shown that of 123 deaths from diarrhoea in the borough last year 65 were there recorded, or at the rate of 149 to 100,000 persons living; while in the other parts of the town, with far fewer unpaved streets, it varied from 41 in St. Nicholas and St. John, to 90 in All Saints, where the next highest number of these neglected streets are to be found.

The sewerage of the town has been much improved since 1857, 16 miles of new sewers having been constructed in those ten years; it is, however, still far from complete, and both the sub-soil and surface drainage is very defective. The effectual drainage of a town is almost as important as the satisfactory removal of its refuse by the system of sewerage. The registrars of Newcastle, more especially in the eastern portion of the town, continually have to report deaths from typhus, scarlatina, and other zymotic diseases, occurring in families living in houses, the basements of which contain several inches of liquid, black filth.

The overcrowding in dwellings, to which may be attributed so large a proportion of the excessive mortality in all our large towns, appears to be even greater in Newcastle than in other towns. At the census of 1861 there appear to have been 7.8 persons to a house in Newcastle, and although there is abundant evidence that the rate of increase of population since 1861 has been even greater than between 1851 and 1861, the supply of newly-built houses has not been maintained in anything like the same proportion. Only 1,300 houses have been built since 1861 to supply an increase of population estimated at over 13,000; and but a small proportion of these houses are suited to the wants of the labouring classes, who can only afford one, or, at most, two rooms to live in. In 1862, the number of houses built and building was 387; in 1863, 220; in 1864, 187; and in 1865, only 108. The report says, "various circumstances—differences between masters and workmen amongst others—have combined to limit building operations in the town during the past few years." This lull in house-building has not stopped the continual demolition of houses occupied by the labouring population, for railway purposes, town improvements, and conversion into warehouses and factories; so that house-room in Newcastle has declined below the insufficient supply of 1861. The result of this process is that by a recent estimate there are 9,639 families occupying single rooms, and 6,191 families occupying two rooms; about 47,490 persons, or more than a third of the entire population, are thus herded together at the present time.

The latter part of the report naturally contains suggestions for the improvement of the health of the town based upon the information derived from the thorough investigation into the causes of the high death-rate. By far the most important of these is contained in these words:—"The provision of more house-accommodation has become a matter of the first importance; and the case, not having been met by private enterprise, demands the prompt and energetic action of the corporation." The sub-committee strongly urge the erection by the corporation of model lodging-houses in different parts of the town, proving by most satisfactory evidence that such buildings have paid handsome dividends in other towns, and would probably result in no eventual loss to the municipal treasury in Newcastle. It is shown that the mortality is always lower in common lodging-houses, than in ordi-

nary tenements, which are not subject to the same inspections, and it is beyond doubt that in new dwellings, built with a due regard to the health and comfort of the inmates, the mortality, more especially of infants, among the labouring classes in Newcastle, would not only be reduced, but almost halved. The other suggestions include the vesting of more power in the hands of the Health Committee, the appointment of an efficient Medical Officer of Health, a more complete and frequent system of scavenging, which they believe would be more satisfactorily performed by contract, as in most other towns, the rapid paving of the 200 unpaved streets in various parts of the town, a better system of surface and sub-soil drainage, the creation of open spaces and playgrounds, the consumption of smoke, and many other improvements which are required in other towns besides Newcastle.

In conclusion, under the heading, "Encouragement to Proceed," the effect of a vigorous prosecution of sanitary reform in other towns is set forth. It is stated, that within the last thirty years the death-rate in London has been reduced from 50 to 24 per 1,000, and that whereas the annual mortality in English towns in 1840 was 44 in 1,000, it does not now average more than 24.25. We have good grounds for believing that the improvement in the health of our towns is here considerably over-stated; but at the same time it is beyond all doubt that the spread of general intelligence upon sanitary matters has already lowered the general death-rate in England, more particularly in towns, and the improvement may be taken as a proof of what may yet be done. Gloucester, Berwick, Cheltenham, Salisbury, and Worthing, are among the towns which have most benefited by sanitary reform. In a question which probably involves the saving or loss of nearly 1,200 lives per annum in Newcastle, it is scarcely to be imagined that the expense would prevent the suggestions embodied in the foregoing report from being carried out; but the sub-committee have done wisely in showing the intimate relations existing between a high rate of mortality and its inevitably attendant train of sickness and enfeebled health, with heavy poor-rates. It is to be hoped that this consideration will not be without effect, when the time comes for the corporation to grant the necessary means for carrying out the improvements. Money so spent should be looked upon as capital invested in a manner to produce a never-failing dividend, in the shape of improved health for the borough at large, without counting a more than probable reduction in the poor-rates. We shall look with much interest for sanitary intelligence from Newcastle, but more especially for the carrying out of that portion of the report which recommends the building of model lodging-houses by the corporation, for the labouring classes, to occupy the ground now covered with dwellings unfit for human habitation, and forming the principal haunts of fever and other zymotic diseases, whence the whole town becomes infected.

ARCHITECTURAL DRAWINGS IN THE PARIS EXHIBITION.

We have before us Professor Donaldson's report on the architectural designs and models. The circulation already given to it makes it unnecessary for us to reprint it. We cannot avoid, however, recording a portion of it. We take mainly the introductory passages, and the report on the drawings exhibited by Austria.

"In the review to be submitted of the architectural drawings of the great International French Exhibition, it is of course impossible to notice all the works exhibited. The remarks must necessarily be limited to those which may serve as types of the state of the architectural taste of the several peoples. Some of considerable merit may be omitted, or only generally alluded to. But susceptibilities must not be wounded, nor the position occupied by great names in the public estimation be interfered with. It is a mere general sketch of the subject, which may give an impartial idea of this important branch of the fine arts in Europe and other parts of the globe, as presented in the objects exposed in this magnificent collection of the natural products and intellectual creations of the whole world.

It is a remarkable circumstance that, in France and most of the Continental schools except the Austrian, Gothic architecture seems

to be ignored for modern buildings, unless for some churches. And (with the same reservation of Austria) the principles of that style are not thoroughly understood; and, consequently, the treatment of the parts evidences an absence of knowledge of the principles which directed the Mediæval artist. Very frequently, in Northern Germany and in France, there is in the modern architecture a vagueness of idea and an attempt to produce novelty; but then, in the former, it is the adoption of the Lombard or Byzantine as a basis; or, in France, the paring down of the leading features, as cornices, strings, and dressings, and the introduction of a profusion of florid decoration, or a conquetting with the past times of the country, still with gracefulness of composition. In England Gothic architecture has assumed, under clerical influences, the possession of the churches and of the ecclesiastical buildings connected therewith, such as the parsonage-house and the schools; and in provincial towns, from a certain reverence for tradition, frequently with the town-halls. But there is with us another class of pretensions art—if art it may be called—a wild idealism of Italian Gothic and assumption of Mediæval sentiment, grotesquely exaggerated—heavy masses and vegetable carvings, not idealised in treatment so as to become monumental nor adapted to the material; and in some instances there is a wildness for brick, unrelieved by stone dressings, producing hardness and heaviness. The commercial architecture of Paris and London is generally Italian, modified according to the taste of the people; rarely, if ever, Gothic. Still, it will be observed, that there are noble conceptions of noble-minded men in this collection, whose ideas cannot be fully appreciated by drawings alone; for it is only in the building itself, when carried out, that all the capacity of the architect for his work can be thoroughly realised. Hence the reluctance of many able men to imperil their hard-earned reputation by mere drawings, in which so much depends upon the technical skill of the draughtsman.

All these circumstances in modern architecture are evidenced in the French International Exhibition; and the result shows an unsettled state of thought and intent throughout Europe,—a transition; but to what end or purpose it is impossible to say. Whole nations and states have recently had their political transitions, and apparently must continue to have them. These may be ruled and decided by some determined self-will and resolute mind of a sovereign or his minister. But there is no such dominant physical power to direct the influences, and unfortunately, under capricious influences, the pure seems to yield to the fantastic; and the sound, well-informed, and well-directed frame of mind is thrown upon the wild waves of the rage for novelty."

"Austria deserves especial notice for its architectural designs and drawings, and it has its notabilities in the study and illustration of antiquities and architecture, as also some important buildings carrying out, which seem to indicate a great movement in the art, although probably we have before us only a limited number of the edifices actually in the course of erection or projected. The display is not confined to works at Vienna, but reaches to distant parts of the empire—Pesth, especially, contributing very important examples.

Vienna presents us, in the catalogue, with the names of three men among her architectural hierarchy, to whom may be assigned a European reputation; and, taken alphabetically, they are Ferstel, Hansen, and Schmidt; and Henschlmann also gives proof of deep archaeological research and careful design.

Ferstel's votive church at Vienna, which is much advanced in construction, may be cited as a happy adaptation of the elaborate Gothic of the later periods reflecting many of the beauties of the Cathedral of St. Stephen, and of Cologne Cathedral as in the towers. Its exterior is full of sparkling effect, with all possible varieties of chiaroscuro; but it would be better if there were more repose and breadth. His Akademie der Wissenschaften in Pesth is also a very fine design; and he shows that he can handle also Italian architecture with success in his palace for the Grand Duke Ludwig Victor, in Vienna, and in a design for the Commons House in the same city; and he exhibits a castle in Bohemia and a country-house, which are clever.

Professor Schmidt has an able Gothic church at der Vorstadt Weisgärther, Vienna. There is, also, a novel and fine design for a polygonal

Gothic church, having a central dome, well conceived and well adapted to the style. There is by him, also, a very fine hall for the Gymnasium Academy of Vienna, with the roof framed in the character of our wooden hammer-beam trusses, well proportioned in size, and appropriately coloured. The professor has a very quaint and original design for the Commons House (Herrenhaus) at Vienna, with a well-conceived plan of pentagonal form, having in the centre a vast decagonal hall, which rises out of the surrounding lines of halls and official chambers, under a lofty false dome, the chamber itself having its ceiling running up only half the height. In the adoption of such an important feature it should, as in the *Therma* of the ancient Romans, be brought to the outside, so as to be seen in its whole size. This style is that of many of the Rathhaus or Townhalls of Germany and Belgium, in brick; but it is deficient in nobility of aspect in the exterior, and the style is rather domestic than monumental. Nevertheless, it is the production of a man of striking ability,—of one who thinks for himself, and has the capacity to realise his conceptions with power.

Hansen embodies what may be considered the pure Classic style in his Commons House and Nenzen Kriehausen Algeordnetenhans in Vienna; but both are too dry in treatment, and we could desire more boldness and courage. They present, however, some graceful points of sentiment and detail.

Carl Fietz has many able designs in the Cinque-cento style also. They are beautifully drawn, and would be more satisfactory if they were less academic.

Rebner has a church of Lombard character, bearing more strongly the impress of German features, in the Cathedral of Diakovar, in Slavonia; and it may be regarded as the patriotic adoption, successfully treated, of a fine broad style of art peculiarly their own.

Hasebauer may be noticed for his very fine design for the restoration, or rather completion, of the facade of the Cathedral of Florence,—the stunning-block of so many centuries and the puzzle of so many architects, the subject of innumerable competitions, with some faint glimpse of a prospect of termination, if the spirit of the times be not counteracted by party jealousies. It carries out the style of the old cathedral and of the adjoining tower of Giotto. It combines much of the spirited outline of the Siena and Orvieto cathedral, picturesque and characteristic. The whole subject is, of course, a conventionalism. Hasebauer's projects for edifices are varied in character, effectively conceived, and principally in the Renaissance style.

Austria exhibits some fine drawings of Gothic buildings by draughtsmen of the very highest merit. Luntz has a hold, firm, and precise drawing of the Bridge Tower of Prague; and Banks, with Willmanns, have illustrations of the Mediæval monuments of Wiener-Neustadt,—the evidence of a like mastery of outline, with light and shade; and there is a wonderfully hold, large, elaborate drawing of the rich altar of the village of St. Wolfgang, about seven leagues from Vienna."

After noticing generally the drawings sent by England, the Reporter says:—

"This collection exhibits more completely than that of any other country, as a distinct individuality, the works either recently executed or in progress in the British empire; and it proves an active movement in individual or combined enterprise, and a very scanty attempt on the part of the Government to meet the wants of its administration, to promote the progress of art, or the embellishment of the capital or provinces by noble monuments. In an artistic point of view, this Exhibition also shows the unfettered liberty of the artist, unrestrained by any educational considerations or accepted canons of taste. Egypt, Greece, Rome, and the Middle Ages—May, India and China, present their national types. But with us there is no recognised principle of design, no impress of a fixed national thought. The fanciful and the picturesque too often supersede the positive and serious; the object with many being not to advance and improve upon the past, but to create a new sphere of invention by a spasmodic effort for originality. It may, however, be claimed that there is a noble spirit of independence in the English architect, a daring to meet his difficulties, and often a very successful realisation of fine design and elegant detail; a desire to do something noble and worthy.

Only two models of buildings are exhibited in the English section, and rarely any in the foreign.

One is Mr. G. G. Scott's model for the memorial now in course of erection to the memory of the late Prince Consort and the Kensington Hall of Science, both of like origin. The memorial is illustrated by a very fine drawing, by the model, and by a portion of one of the bronzes gables to the full size, with its inlay of precious stones.

The fate of all great works of art in the fantastic imitations to which they may be subjected, and the acceptance in public opinion of this memorial, are already realized in the cotton-stand of Messrs. Waters & Co., of Manchester, where the outlines and proportions of the original model are preserved, and in size exceeded, and its various polychromatic decorations are imitated with great success by reels of various coloured cottons, so as to deceive many a casual observer, and make them consider it the thing itself, instead of a pretensions rival and caricature."

Had the excellent Professor read his *Builder*, he would have avoided an error, and known that this clever model in cottons is a reproduction of the Manchester Memorial, not of Mr. Scott's.

Speaking of Italy, he says,—“The architects of Italy are not, in the designs here exhibited, apparently animated by the same energy and brilliant qualities as distinguish their colleagues in the other departments of the fine arts. In their best drawings they look back upon the past, and only scantily produce works now in course of erection.

Leopoldo Lombardi has two effective and large drawings of the Tabernacle of Oragni, in the Church of Or San Michele, at Florence, and of the northern doorway of the Cathedral of Santa Maria del Fiore, drawn with powerful effect.

Mengani, of Milan, displays a plan of the contemplated alterations at Milan carrying out by the Milan Improvement Company, which will do a vast benefit to the city; but the elevation of his gallery Vittorio Emanuele is too profusely ornamented.

The graceful screen inclosing the Italian Court shows that Italy has still its able and wise artists, men of capacity and imagination; for this inclosure of its courts is rich in effect, varied, and still well adapted for its purpose."

Of Prussia,—“How is it that the architects of ambitions Prussia have been so little careful to vindicate the prestige of their school? Have they quailed before the idea of meeting the able draughtsmen of the French capital? Why is there here an almost total absence of the names of their leading men in the art? And why are illustrations of the buildings recently executed or drawings for those contemplated so scanty? This is said in no unfriendly strain; for their men of renown deserve all honour: their Schinkel and their Stiller of the past; and one could wish to honour their able architects of the present day, and here they do not allow us hardly the opportunity to do so!

The Zion's Kirche at Berlin, by Orth, is a hold conception, with some novelty in the plan, which is that of a Greek cross. The exterior is of the Lombard character, and the interior is gracefully conceived, in taste similar to the uppermost church of S. Francesco at Assisi.

Walsenan's Hôtel de Ville at Berlin is a vast brick building, with three tiers of semicircular headed windows, machicolated cornice, and massive square tower. There is no relief of stone dressings to any part; and the whole forms a huge elephantine mass of red, imposing in fact on its scale, yet without grace and repulsive. What the Palazzo Pitti is to Florence, such is, apparently, the Hôtel de Ville to Berlin. *Informe, ingens!*

Schmitz, of Cologne, gives the project of a Gothic church, full of right feeling, masterly drawn, and equal in design to anything recently executed in England. His twelve sheets of views of architectural monuments of the Middle Ages are very fine."

SALISBURY CATHEDRAL.—The capstone of this cathedral's spire, immediately under the vane, having been discovered to be in a very decayed state, workmen are now engaged in its repair. It was necessary to enable them to do it effectually, it was necessary to surround that part of the spire near the weather-door with a strong platform, from which a series of five others have been erected at certain distances above one another, the last being at the summit. The ascent from the weather-door to the top is accomplished on the outside by means of about twenty iron handles firmly fixed in the spire.

DIGGINGS ON THE PALATINE.

The works that have been in progress for several months on the Palatine, on the grounds external to that part purchased by the Emperor of France, and which belong to the Papal Government, have been carried on by that Government with some vigour, and have obtained some valuable results, though not, indeed, as important as those that have rewarded French activity. These works extend along the southern and western heights, and also the grounds sloping towards the north-west, and therefore comprise all those ruins which present the most imposing aspect as we approach the Imperial Mount from the valley once occupied by the Circus Maximus; and we are glad to hear of the intent to include also the gardens of the convent, to be purchased from the Visitandine nuns who reside in that very ugly "Villa Mills," built by an English proprietor on the summit of this hill. In order to consider the undertaking now in progress under Papal authority, we may enter within its arena from the road that winds up the Mount, ascending near the Arch of Titus. Here we find a doorway that leads us into a valley laid out as a vineyard and orchard, bounded at the western end by lofty ruins, with arched openings, and on the southern side by different ruins, amidst which rises prominent a lofty and spacious hemicycle; here being recognised the site of the hippodrome, or stadium, of Domitian (550 by 170 feet), once surrounded by porticoes with double file of Corinthian columns, restored by Septimius Severus after the great fire under Commodus. Strikingly picturesque is the aspect of that valley, where vines and fruit-trees flourish under the shadow of majestic ruins; but before long a change must come over the pleasant scene, for it is intended to reduce the whole to its ancient level, of course with the sacrifice of all that culture has here effected. Along one side, under the boundary walls which divide this from the convent-garden, where that level is now laid open, we see several massive brick pilasters and some immense shafts of granite columns, now prostrate, referrible, no doubt, to the peristyle of Severus; two other similar shafts having been found deeply imbedded at a point near the centre of the valley. More noticeable is the discovery of a flight of marble steps, descending from the modern level into a large chamber, now roofless, but retaining colour on its walls, and a single figure painted in Pompeian style; at the foot of the stairs being seen the entrance into a corridor, now filled with soil. Not far from this spot, on a surface of ruined wall, we see three arched openings, one above another, perhaps conduits for water, brought hither from the Neronian Aqueduct. The lofty ruins bounding the stadium at the western end, and curving outwards, open at the centre in the form of a wide hemicycle, divided into two stories, the upper with coffered ceiling, supposed an Imperial loggia for enjoying the games of the Circus Maximus, hence fully seen; the lower, which has the peculiar arrangement of a platform in the midst, small compartments at each side, and a staircase in front (all recently examined), believed to be a bath, though called by the custode a temple. Not many days ago (in June) an enormous pile at one side of this hemicycle, fell in with a thundering crash that terrified all within hearing, but fortunately did no injury. From the stadium we enter, at the southern side, a vast labyrinth of chambers, for the most part vaulted, and ornamented in coffering in that style so much preferred by the ancient Romans, both for palace and temple. In some of these interiora the walls are covered with stucco, firm and compact, in part adorned with painting, though but few figures, one a Bacchante, of graceful and spirited design, remain perfect. The dim, receding perspective of halls, communicating by riotous entrances, lighted only by the custode's torch, is highly impressive, though at times we have to guide us the light of day, admitted by apertures in vaults, evidently formed to serve that purpose. Some of these interiors are lofty; but in others it is evident that we are not treading on the original pavement, but on a level formed by soil or debris. Here and there we reach the brink of some cavity, affording a glimpse into a lower story just opened, but not yet cleared out. A subterranean passage, deep under the floor of one chamber, is said to communicate with the arena of the Colosseum,—for what purpose it is difficult to understand, as we might, indeed, doubt the whole report of the custode respecting the

direction and extent of this hypogee. In those chambers first reached, and seen by daylight, has been formed a now continually increasing museum of fragmentary antiquities found on the premises. We need not detail all the wealth of marbles and alabasters, friezes and cornices, encrustations, stone and glass vessels, painted stucco and marble baths (one entirely of giallo antico) seen here as, more or less, in all similar Roman collections; but we may notice for especial beauty a headless female figure seated on a rock, probably a nymph or Naiad beside her fountain, and a torso of a young Cupid, most graceful and natural. The absence of windows and of every arrangement for illumination from without in most of these halls justifies the inference that such Roman interiors were intended to be lighted by the lamp or torch alone, and probably so defended from the sun in order to suit the purposes of summer residence. Alike do we find the evidence to other arrangements that seem incompatible with our notions of comfort, in the absence of fire-places and chimneys, and though windows are in a few examples seen, there is no trace of their having been provided with glass. Emerging from these buildings, we find ourselves among these loftier ruins so conspicuous from below, ascribed to Septimius Severus, and probably the last important addition to the imperial residence. Here have been laid open several chambers and baths, one entirely paved with purple-veined Phrygian marble, and still provided with its hypocaust, into which we may look through a low channel. On one lofty front of ruin we see the specus of an aqueduct with six conduits,—probably a part of the Neronian construction. The abundance of precious marbles, both in architectural fragments and on pavements, everywhere strikes the attention; and as to construction, we see much that is good, though hardly the best in antique Roman masonry, the usual compact brickwork and large tiles, but nowhere the *opus reticulatum*, which is known to have been abandoned before the decline of empire. A pleasant and picturesque garden, which extends along the western slopes, is traversed before we reach several roofless chambers, near the foot of the hill, supposed to have served as a guard-house, and the walls of which are in part covered with graffiti, names, and rudely-scratched figures; most extraordinary amongst which is that caricature of the Crucifixion, referred to the times of Septimius Severus, here found some years ago, and now in the museum of the Roman College. Near to this spot are some fine granite shafts, marble capitals, friezes, and cornices, set into a modern wall for better display. Passing hence to the north-western slopes we reach an extent of walls in enormous blocks of square-hewn lithoid tufa, unquestionably pertaining to the very oldest fortification on the Palatine, of which ought remains to the city—namely, of Romulus, or of whomsoever was actual founder of primeval Rome. A long winding passage, excavated in the living rock near this wall, has been identified by Mr. J. H. Parker as the conduit for supplying water to the Acropolis of that perhaps pre-historic city.

It would be suitable to class with other late discoveries the much more important remains of fortifying walls beyond yet known, among considerable and complete yet known, among similar local antiquities reached by works undertaken some years ago under St. Anastasia, a church at the foot of the Palatine near the north-western angle; where, after descending to some depth, and passing through several dark interiors, buildings both of Republican and Imperial periods, we see by torch-light those stupendous constructions from which at intervals advance, at right angles, walls that must have flanked quadrangular towers, a proof that such were known in the military architecture of old. We are glad to hear that Government is resolved on resuming the excavations, long left in suspense, below S. Anastasia. Near that church's front has lately been, not for the first time entered, but for the first time discussed by savans, an arched channel that passes, at the depth of 7-32 metres below the street, and along whose floor is carried, through brick channels, the stream of purest water that gushes forth, near the entrance of the Cloaca Maxima, and is by some writers identified with the classic *Fons Julurva*. One Roman antiquary of repute advances the theory that in this hypogee we behold the veritable cavern of the Tiberical, that primitive sanctuary of Pandean worship; but it seems impossible to make this accord with realities. Having descended through the narrow orifice that opens on the street pave-

ment, by a ladder placed perpendicularly, we may speak from experience as to the rude character of what is not in fact construction, but mere excavation of the rock, supported to some extent by buttress walls of brick, and with remains of cement on the roof, the ground we tread along being encumbered with moist clay, and the low vault obliging us to stoop as we advance. Nothing astoundingly is there here to remind of a scene sacred to religious observances.

Taking a general view of these recent discoveries on the Palatine, and assigning due importance to what is manifestly of highest antiquity, we may allow that the evidence they bear to the character and strength of the city first built, or at least to the oldest of which remains are extant, on this hill, affords to modify certain theories as to the credibility of ancient Roman history.

EDINBURGH.

Extension of the City.—A further extension of the city is projected in the attractive vicinity of the Meadows, at the west end, and the plans for the first three tenements are being prepared by Messrs. Brown & Wardrop, and by Mr. R. Thornton Shiels. The property on which the new houses are to be erected is part of the estate of Drumdryan, extending to about five acres, lying between Brougham-street and Chalmers-street. All Saints' (Episcopal) Church and Brougham-place are already built upon this property, and three new streets are now in course of formation. The three tenements already planned are expected to be ready for occupation on Whitsunday next. A tenement at Tollcross will give a finished and greatly-improved appearance to this locality. The building is harmonious in plan with the tenement already erected on the north side of Scott's Biding-School. The chief feature of it is the prominent and ornamental corner elevation, towards Earl Grey-street. This has been designed by Mr. Shiels in the Palladian style, freely treated. The building is to be of four stories, the three upper flats being dwelling-houses. The estimated value of the building is about 4,000l. The tradesmen for the works are,—Mr. John Wilson, mason; Messrs. W. & J. Brodie, joiners; Mr. Andrew Slater, slater; Messrs. Main & Gardner, plasterers; and Mr. Alex. Dixon, plumber.

* *The New City Poor-House at Craiglockhart.*—The chief stone of this edifice has been laid with Masonic ceremonial at Craiglockhart, about 2½ miles from the city, in a fine locality. The new buildings will cover, with their enclosed airing-courts, an area of about 16 acres. The parochial board propose to devote about 36 acres of the estate entirely to poor-house purposes; and such portion of this as is not required for the buildings and enclosed courts will be cultivated by inmates fitted for agricultural work. Two quarries have been opened upon the board's estate for the erection of the new buildings. One of these is the old quarry on the low ground at the side of the Colinton-road, and from this is procured a stone of a red colour similar to that of which the old keep was built. The other quarry is at the upper end of this site, and from this a superior stone, of a bluish tint, is got. This stone, which the *Scotsman* describes as being of a hard, compact, and homogeneous nature, and exceedingly durable, will be used for the external face of the walls of the various buildings; and the contractor has laid down a railway from the quarry to the spot. The new work for dressings is from Redhall Quarry; and its rich yellow colour contrasts pleasantly with the bluish hue of the Craiglockhart stone. Sand and clay have also been found in abundance upon the site. The new poor-house, which faces the south, has a frontage of 1,200 ft. It consists of three entirely distinct buildings, viz., the main poor-house in the centre, the infirmary to the east, and the lunatic asylum to the west. The style adopted is the Scottish, which, besides being national, harmonises well with the surrounding scenery. The whole is treated in a plain and simple way, without expensive or ornamental details; and the architectural effect such as it may be, is obtained by the arrangement of the plan and the breaking up of the building into blocks. At the centre of the main poor-house, a corbelled tower, octagonal in form, rises to the height of 105 ft.; and a picturesque and varied outline is given to the long fronts by numerous bold projections, finishing with crouched gables. The main poor-house is designed

upon the block-system, the building being subdivided into a number of separate blocks, connected only by a service corridor. The pavilions are all two stories in height. The porchouse will be supplied with water from a fine spring in the hillside. To make this available, a reservoir will be constructed to hold 500,000 gallons, and the water will be pumped up by a steam-engine to a large cistern in the upper part of the central tower, at a level considerably above the roofs of the buildings. From this point it will be distributed at high pressure to the various blocks. It is probable that a small gaswork will be erected. The total cost of the porchouse, infirmary, and governor's house at present contracted for is 35,000*l.*, in addition to which about 2,000*l.* are required for roads, &c. Messrs. George Beattie & Son are the architects. The contractors are Mr. Robert Hatchison, for the mason work; Messrs. Kemp, Murray, & Nicholson, for the joiner work; Mr. McCalman, for the plumber work; Mr. Anderson, for the slater work; Messrs. J. Young & Co., for the iron work; and Mr. John Mellon, for the roads, &c. The whole is to be completed for occupation by the 1st April, 1869.

The Calton Jail Lock.—The rock on which the Calton Jail stands is, it seems, in a dangerous state, and has been examined by two engineers, Mr. John Goddes and Mr. David Stevenson, appointed by the sheriff for the purpose. The overhanging and loose rock, it was found, though not dangerous to the jail, threatens a brewery and other property below, but a warning to the occupants that they ought to quit the premises appears to be all that the sheriff can order under the circumstances. It is hoped, however, that the magistrates will look to the safety of the buildings.

THE TRADES UNION MOVEMENT.

The Sheffield Trades Union inquiry, which had been slightly interrupted by the indisposition of the commissioner, has been resumed. A loom-grinder named Renshaw confessed that he committed the crime known as "the Acorn-treet murder." He said he confessed because he saw in court the individual who hired him, and he thought he was going to anticipate him. He was hired to do "the job" in the fashion with which the disclosures of Crookes, Broadhead, and others, have made us too familiar. A man named Thompson was tried for this crime, and narrowly escaped conviction. Renshaw completely exonerated Thompson, and declared that he was alone at the time he flung the grenade into the house. Some of the trade society agents said they paid for the defence of Thompson, but had been convicted,—and he had a very narrow escape,—they should have allowed him to be hanged rather than reveal who had committed the murder! They had promised secrecy, and would have kept their word though an innocent man were hanged. It was Thompson's misfortune to be charged with the crime, but they could not interfere. After blowing up the house, the villain Renshaw concealed himself for a few minutes in a chapel burying-ground, and when the police arrived,—they always come too late," he coolly said,—he returned and assisted some of the sufferers from the house!

It is stated that an inquiry will shortly be commenced into the operations of the trades unions in Manchester, Stockport, and the surrounding districts, and principally into the workings of the bricklayers' societies in this neighbourhood.

A correspondent of a contemporary says:—

"If Mr. Overend were to go to Manchester, he would soon find that the stigma is not confined to Sheffield, nor the precedents to thirty years ago. Outrages have been made recently against both property and person for trades union purposes, and such outrages have ceased in some places,—the brickmaking in Manchester and the neighbourhood,—simply because the outrages already committed have been persistent and effective enough to deter masters from recklessly risking property and life in carrying on their trade, if not in compliance with trade rules."

At a meeting of the Hull United Trades' Council, a letter was read from the Bricklayers' Society, stating that if Mr. Anderson, a delegate from that society to the council, continued longer to occupy his seat at the council, the Bricklayers' Society would withdraw. The reasons assigned for this withdrawal were, that Anderson had, as a plasterer, done piecework, which was contrary to the society's rules; that he had infringed other regulations; and that he had done all he could to injure the society. Upon this letter being read, Anderson expressed his

determination to quit the room, saying that he had done piecework, and that, as he considered it was his duty to do the best he could for himself and family, he should repeat the offence, if offence it was. It was also stated that Anderson was about to commence business on his own account, and that appeared to be displeasing to the delegate. Anderson confessed that such was his intention, and asked the complaining delegate what the society meant to do. The reply was, that they would prevent union men working for him. Anderson said he did not think they could; but, if they did, he could get non-union men to do his work.

Some masons in Bristol have struck work, but the matter in dispute has been referred to arbitration. It is, therefore, hoped that a general turn-out may be avoided.

The strippers and grinders at Messrs. Reyer's mill at Ashton-under-Lyne are on strike for wages, and it is expected that the strike will extend. Mr. Oldham Whittaker, a manufacturer, of the same town, has received an anonymous notice in which the following passage occurs:—

"You had better withdraw your foolish discussion, for so sure as you are a living man you will be put an end to in some way yet to be thought on. Don't expect to survive long after this warning; assassinated you must be as you have been whom you would expect had not been your (signed) ASSASSIN."

ST. PETER'S, BROMPTON.

The new church in Onslow-gardens, recently consecrated by the Bishop of London, has been built by Mr. C. J. Freake, of Cromwell House, from drawings prepared in his own office and at his own cost, with the exception, we believe, of the organ, for which a subscription was raised. It is a cross church (with an apse for chancel), nearly 140 ft. long and 115 ft. in width at the transept. The style is fourteenth-century Gothic. The width across nave and side aisles is about 70 ft., and the tower (containing a bell, by Mears) with spire is nearly 160 ft. in height. The walls are of Kentish rag, with freestone dressings. The interior is lined with cream-coloured brick, with some few bands of black and red brick. The roofs are open; the seating is of deal, varnished. The carving was executed by Mr. Sanson; that of the pulpit might be improved.

Mr. J. Brown acted as clerk of the works and general foreman. The church is so spacious, commodious, well built, and, in some respects, handsome, that it is impossible to avoid regretting just the dash of true art which is absent.

This is not the first good work performed by Mr. Freake, "founder and patron" for the neighbourhood he has so materially helped to create. An inscription at the west end of the church, north side, records that the first stone was laid on the 21st of July, 1866, by "Eliza Pudsey Freako," to whom also the neighbourhood has been long indebted for intellectual hospitalities of a not common kind.

MONUMENTAL.

Memorial of King Leopold at Windsor Castle.—Shortly after the death of the late King of the Belgians her Majesty gave instructions for the erection of a suitable monument in St. George's Chapel, Windsor Castle. The site adjoins that occupied by the cenotaph erected to the memory of the Princess Charlotte. The designing and modelling of the monument were entrusted to Miss Durant. It is of a whitish description of marble, the total length being upwards of 7 ft., and the height a little over 8 ft. The effigy is sculptured in a recumbent position upon the top of the tomb, and attired in a military uniform, with decorations. His head reposes on the Belgian lion. The various portions of the monument have been forwarded to Windsor.

Statue of the Earl of Derby.—Mr. Theed has been commissioned to prepare a statue of Lord Derby for the Liverpool council.

Pannure Monument, Brechin.—A meeting of the subscribers to the fund for the erection of a monument to the memory of the late Lord Pannure has been held in Brechin. It was reported that the subscriptions amounted to about 100*l.* A number of plans were submitted to the meeting, and it was resolved to erect a granite obelisk, to be combined from the various plans submitted, the height to be about 18 ft.

above the base; and it was submitted to the former committee to employ Mr. Baxter, mason, Brechin, to get a proper plan, and submit the same to Lord Dalhousie for his approval.

Great Statue of the Virgin Mary.—M. Lequesne, a French sculptor, has just received a commission to execute a statue of the Virgin Mary, nearly 30 ft. high, for the bell tower of the sanctuary of Notre Dame de la Garde, at Marseilles. There is to be a staircase within the statue leading to the head itself; and the eyes, which will serve as windows, through which to view the prospect around, will measure 10 in.

THE CHURCHES OF ANGERS.

FRANCE contains few more interesting towns than Angers; its ancient streets, churches, and frowning castle give the place quite a Mediæval character, and fortunately the rage for "boulevards" has not yet found its way to this quaint and historical city.

Angers is prettily situated on the Main, about 216 miles south-west of Paris. From a distance the town has a very picturesque appearance, owing to the number of church towers and spires which break the horizon. Three of these churches are most remarkable buildings. La Trinité is, in point of date, the earliest of these churches, and is probably not later than the middle of the twelfth century. The plan is very uncommon; the nave, which is large and lofty, is in one span, without either aisles or side chapels. There are transepts and a shallow apse, flanked by two smaller apses, opening into the eastern sides of the transepts. Over the junction of the nave and transepts is a tower, crowned by an octagonal lantern. As the square of the tower is much less than the width of the nave, the arch at the east end of the nave does not occupy the whole space, but is flanked by two smaller arches leading into the transept. The arrangement is very picturesque and equally uncommon. The whole church is vaulted. The vaulting may, perhaps, be fifty years later than the main walls of the building.

The next church in point of date is that of St. Serge. This church is quite as singular as the one we have just described, but is in every respect so different from it, that it is difficult to conceive their being in the same town. Here there is a very short nave, with very wide aisles, the shell of which is evidently of early work, but like the nave of Winchester Cathedral, it has been thoroughly re-cast during the latter part of the fifteenth century; so that were it not for the immense solidity of the piers, and the thickness of the walls, one would at once put it down as a Flamboyant building.

The transepts and the crux at the junction of the latter with the nave retain more of their original Romanesque character; but the most remarkable portion of the church is the choir, of which we give a view. The outer walls appear to be partly Romanesque, and are evidently of an earlier date than the internal portion of this part of the church. The choir is very long, and is separated from its aisles by columns, so tall and slender that at first sight they seem incapable of supporting the roof; when, however, one examines the construction of this roof the wonder ceases, as it is seen that there are no lateral arches, or any wall space resting upon these columns, and that all they have to do is to bear a most beautifully constructed groining, the ribs of which are in section a simple half-round, without any kind of moulding or ornament. The capitals are decorated with some very pure and beautiful sculpture, and the responds (fig. 2) have very rich abaci. The columns are 15 in. in diameter, and about 30 ft. high; the shafts are monolithic. This portion of the church bears a strong resemblance to the lady chapel of Salisbury Cathedral, and both buildings seem to offer suggestions which would be remarkably useful for modern churches, particularly as to the propriety of using very thin columns, and covering a large space without occupying room by heavy and solid supports.

The cathedral or church of St. Martin at Angers we may speak of in a future number.

We should mention that our illustrations are from sketches made upon the spot by Mr. G. Goldie, architect.

INTERIOR OF THE CHURCH OF ST SERGE, ANGERS, FRANCE

H BREWER.

T. HANCOCK

HEALTHFUL DWELLINGS CHARACTERISED BY CHEAPNESS.

We have before us Mr. Edwin Chadwick's report written for the English Commissioners on this subject, as illustrated by plans and models exhibited in the Champ de Mars. It is no reproach to the thoroughly well-informed writer to say that his report, being intended for persons who know comparatively little of the matter, contains much with which careful readers of the *Builder* are perfectly well acquainted. We print some portions of it, and may add that the whole of it, with illustrations, as well as that by Professor Donaldson on the Architectural Drawings exhibited, to which we have elsewhere referred, will be found in the *Illustrated London News*, where all the reports are to appear, by arrangement:—

"His Majesty the Emperor, in his continued interest in the question of the improvement of the dwellings of the wage classes, about two years ago directed some new dwellings to be built, as is stated, on a plan of his own. They are erected in the Avenue de la Bourdonnaye, in the Champ de Mars, not far from the Exhibition building.

His Majesty recently directed forty more new dwellings to be erected (in the Avenue Dumesnil, near the Bois de Vincennes) on this plan, and with a very important change in the principle of the wall construction, to be hereafter described.

I went over these buildings with some of the international jury, when I requested that the experience and feelings of the occupying housewives might be consulted as to the dwellings; and they were consulted separately, when they were found to be in unanimous and passionate disagreement with His Majesty's arrangement of the rooms. He had placed the living-room and the bedroom in the front; and they complained strongly of having always to go through the bedroom to the kitchen, where they have their principal occupation. Perhaps the mistake arose from following the common English arrangement, which is to place the scullery in the rear of the house, the cooking being done by the English housewife in the front living-room, at the common fire.*

The associated workmen of Paris, whilst they bowed reverently to his judgment in the great arrangement of the position of States, yet ventured to assert their own in the position of their *cuisine*, and of the rooms in which they were to live, and declared that they could themselves make improvements in them—as they would show if they only had the money. Whereupon the Emperor benignly said they should have the money to show what best suited them, and granted them an allowance of 20,000*fr.* to make their own trials, and the first result is the model dwelling of the workmen of Paris, which is constructed close by that of Malhous, within the Exhibition. In their building, which they conspicuously proclaim is designed and constructed by themselves—*sans architecte et sans entrepreneur*, they have reversed His Majesty's arrangement, and placed the *cuisine* in the front part.

On the whole, this house, on examination, it will be agreed, is, under the circumstances, a decided success. Some ventilation, though I deem it imperfect, is provided for the living and the sleeping rooms; but the window space is large.

They have preserved an open ornamental gateway for the front door, and the stair space is large; but with that front-door aperture it will serve for aération, and contribute to make the whole house one which will be of good, or comparatively superior, aération. The elevation is cheerful and in good taste, and the papering and internal decoration (without saying that Mr. Owen Jones or Mr. Craze could not improve it) are superior to any real workmen's effort that I have seen in their dwellings in England. Allowing that the occupants of model dwellings in Paris, as well as with us, are mostly of the foremost of the wage classes, it was observed, in visiting a new set of model dwellings erected by Madame Jouffroy Renault, at the Rue de Cailloux, and others, that the style of the decoration, the

large mirrors, and the taste of the pictures, as well as of much of the furniture, is greatly in advance of those in dwellings of the same class in England. Of its superior *batterie de cuisine* I shall make separate mention.

The workmen, in refusing to be, as they expressed it, 'caserné,' had been influenced by a feeling of repugnance to being dissociated from the middle or other classes of society. I have observed similar feelings manifested in England, and I must submit that they are right. A *cité ouvrière* exclusively—a dead level of society—is not good for them. Their wives prefer to have high instead of exclusively low neighbours, and to see, and have their children see, what is going on about and above them. It will be observed that the lower part of the dwelling of the *ouvriers* of Paris is laid out as shops. I gathered that this arrangement was of a policy entertained by the wage classes to associate themselves with the middle classes, or the shopkeepers; and to do this as associated owners or as landlords, and in that position to obtain in reduction of their own charges as rent somewhat of the shopkeepers' profits. This would be to reverse the conditions which prevail in some parts of London and other certain districts, where the smaller and poorer shopkeepers reduce their own charges by letting out (reserving to themselves only a back room as a living-room) the upper parts of their houses in lodgings to artisans.

The Cottage-wall Question.

Those who visit the common crowded dwellings of the wage class in our towns, even when they are unoccupied, are aware that the walls have a peculiarly depressing, musty, or fetid smell. On visits after severe epidemic visitation attacks, in some of these dwellings a peculiarly offensive smell has been perceived; and on inquiry what that could be, the answer has been that it was the 'dead man's smell;' the dead body had been too long kept near the wall, in a state of decomposition, before it could be removed for interment, and the fetor adhered to the wall. In the course of the service, under the Public Health Act, when the occupiers were nearly all struck with fever, we have, in some cases, ordered all to be removed and the walls and ceilings to be limewashed. But it has occurred that the performance of this service has been obstructed or neglected with respect to particular houses, and in those uncleaned houses, and those alone, and with fresh occupants, the fever has broken out again, thus demonstrating the condition of the "leprous house" and the efficiency of the work of purification. Walls lathed, plastered, and papered, are even worse for such tenements. The laths rot; the size of the paper decomposes, and the paper itself harbours vermin. The condition of some houses of this construction is horrible. To admit of the cleansing of the walls by limewashing in Miss Burdett Coutts's, in the Peabody, and in other model dwellings, the walls have not been plastered or papered. In some instances the sanitary orders are that the walls shall be limewashed twice, and in other instances as often as four washings a year are deemed necessary. The occupiers greatly dislike these bare brick walls. In new hospitals the evil is in a great measure prevented by facing the interior wall with some hard and smooth surface, generally of the best non-absorbent and washable cement. As a principle, all interior cottage walls should be made washable. Besides the evil arising from absorbency of the animalised gases by walls of the common construction, there is another great source of evil attaching to walls of the common brick and the common soft stone construction—the absorbency and retentiveness of water or damp. In England, the common bricks absorb as much as a pint or a pound of water. Supposing the external walls of an ordinary cottage to be one brick thick, and to consist of 12,000 bricks, they will be capable of holding 1,500 gallons, or 6½ tons of water. To evaporate this amount of water would require nearly a ton of coal, well applied. The softer and more workable stones are of various degrees of absorbency, and appear to be more retentive of moisture than common brick. Professor Ansted states that the facility with which sandstone absorbs water is illustrated by the quantity it contains both in its ordinary state and when saturated. He states that even granite always contains a certain per-centage of water, and in the dry state is rarely without a pint and a half in every cubic foot. Sandstone, however, even that deemed fit for building purposes, may

contain half a gallon per cubic foot, and loose sands at least two gallons. When water presents itself in any part of such material it readily diffuses itself by the power of capillary attraction, by which, it is observed on some walls in Paris, it ascends 32 ft. from the foundations. Walls of such absorbent constructions are subject to rising wet by capillary attraction, as well as to the driving wet of rain or storm. To guard against the driving wet on the coast expulsive external coverings of slate are used. But these do not stay the rising wet. This wet, having to be evaporated, lowers temperature. Damp walls or houses cause rheumatism, lower strength, and expose the system to other passing causes of disease. In London it is admitted that houses, even of the better class, cannot safely be inhabited in less than nine months. Indeed, registrars of deaths are aware that an extra death-rate is, after all, usually attendant on their first occupation. The majority of bent figures in our villages are due to the infliction of rheumatism from damp.

In Paris, notwithstanding its particularly dry subsoil and its drier climate, the sanitary, or insalubrious, evils of the common architect's constructions appear to be even greater than in London. I was assured by a Parisian builder of considerable experience, that it was unsafe to occupy any new house in Paris in less than a year after its construction, and that there were houses in Paris which would never be dry 'in their lives,' and would always afflict their occupants. In going over the new model dwellings constructed for the Emperor, we observed marks of damp upon some of the walls, though they had been erected nearly two years. The concierge who showed them to us was suffering from a grievous rheumatic affection; and I was informed that the occupants had had much illness amongst them, from having occupied the houses too soon.

Complaints, I found, were made in another set of the model dwellings, to which the jury had proposed to accord a medal, of the inferior quality of the tile pavement of the rooms. And certainly, the common tile or brick floorings—especially absorbent tiles and tiles which conduct heat rapidly, as some of them do—are detrimental to strength. A cook, who snited her master, an eminent manufacturer, gave him notice to quit, as she found that she could not work so well, or without detriment to health, on the brick or tile floor of his kitchen as she had done in a kitchen with a wooden floor. He found that a number of his female workers made the like complaints of the bad influence of common tile floors. He could not be persuaded of these different results; and, to try them, he had a wooden floor laid down in part over a tile floor, so as to enable him to walk up and down for a length of time, with one leg on the tile and the other on the wood, when he found that the leg on the tile floor sooner became cold and tired; and he was convinced. He had a wooden floor laid down in his manufactory, and his benevolence was rewarded, and his expenditure repaid, by more steady, longer, and better work from his people. If the tile, however, be of good quality, dense, and non-conducting, or if the floor be hollow and warmed, which would be practicable in large buildings, the conditions are altered in favour of tile floors.

In one set of model cottages, to which a prize had been awarded (for advances on other points), complaint was made to me by the housewife of another set of inconveniences to which the common absorbent and permeable wall-constructions are exposed; and that is, that, although they are comparatively thick, they are permeable to a high degree to sound, as well as to damp and the mephitic gases. The housewife stated that as they lay in their bed they could hear through the wall what was said in the bed-room of the next house. In consequence of this annoyance they paid an extra rent for an end house, in which the inconvenience would be confined to one side. These sorts of constructions generate angry passions and inflict much misery, as a person of feeble health and susceptible nerves of another condition of society might appreciate by taking up his abode in such a dwelling.

In view of the first class of evils of insanitary condition, those of absorbency of damp and miasma, it occurred to me some years ago that an improved brick would be the preventive, if it were made hard and non-absorbent. It appeared to me that the drain-tile making machine, which produced cylindrical forms so rapidly and cheaply, might turn out equally well rectangular forms or hollow bricks, which, having less clay in them,

* * * We are able to say that Mr. Newton is not responsible, either for the internal arrangement of the houses, as shown on the Emperor's plan, nor for the external architectural ornamentation. All these have been designed by the Emperor, and he would not allow any alterations to be made in them. Mr. Newton is responsible for laying out the land, and for the manner in which the works are carried on. All the floors are fire-proof, but are covered with parquet flooring. Each square block, comprising two houses, forming dwellings for six families, is to cost 500*fr.*—Ed. or "BUILDER."

would absorb less moisture, and might, indeed, be burnt hard and made impermeable. The first machine-made hollow brick ever made, as far as I am aware, was made, at my instance, by my friend, Lord Fortescue, with his tile-machine, and used in 1847 for the construction of some of his new cottages. Lord Shaftesbury also had some made and used, undoubtedly with the advantages contemplated of increased dryness and warmth. Subsequently I submitted the plans of cottages with hollow impermeable brick walls to his Royal Highness Prince Albert, who considered and approved the principle of the impermeable wall, and applied it for his model cottages in forms varied from those I had suggested, but with glazed, impermeable, and washable interior wall-faces.

It is this important and established sanitary principle of construction which appears to have been overlooked, and that there is a falling off displayed in all the model dwellings. None of them have a washable wall. All in due time will be infested with vermin, which, I am informed, is frightfully the case with the houses of the wage classes in Paris. It is the fact, however, that in several of the wall constructions in the Exhibition there is an advanced application of hollow brick. Instead of lath-and-plaster dividing-walls they have improved hollow-brick walls, which are economical, less sonorous than the old walling, and answer very well; but their facing is of porous plaster, papered. In the annex of class 65, of materials of architecture, will be found examples of hollow brick in common use for walling beyond any that have yet got into common use in England, though not in advance of scattered examples to be found there. The further improvement which the French bricks require is in the qualities of greater density, greater non-absorbency, which it is found may be imparted to them by an improved machinery at an inconsiderable extra expense. If the sanitary knowledge were wide, and the appreciation of the importance of the sanitary qualities and the demand were extensive, smooth and coloured brick or tile surfaces might be produced on large scales at rates that would render them available, at prices no greater than papered or coloured walling. The best specimen of a sanitary wall-surface, as I deem it, will be found in class 24 of the Prussian department of the Exhibition, in the white pottery,—large exterior surfaces of stones manufactured by T. C. F. Feilner, of Berlin. In them the joints are almost imperceptible. I am assured by Mr. Scrivenor, the engineer of the potteries, that by machinery, if there were a sufficient demand, ornamental terra-cotta or impermeable tile surfaces may be produced at a charge below that of unwhewn stone for architectural constructions."

We will look to this report again in our next.

CHICAGO WATER-WORKS.

THE Lake Tunnel for supplying the city of Chicago with pure Lake Michigan water, was, in March last, thrown open, and the undertaking, once ridiculed as an impracticable project, has already been pronounced a success, and has established the reputation of its projector, Mr. E. S. Chesbrough, the city Engineer. Chicago has been hitherto supplied with water drawn from a point about one mile north of where the Chicago River empties into Lake Michigan. The sewers of the city discharged themselves into the river, and consequently the refuse of the city found its way to the water-works, and was redistributed through the pipes, causing much inconvenience and ill-health.

In October, 1863, the contract was let to Messrs. Dull & Gowen, of Harrisburg, Pennsylvania, the price being \$15,137 dollars. The work was to be completed in two years, but the term was subsequently extended. Ground was broken on the 17th of March, 1864. A shaft was sunk, in the shape of a well, to the depth of 69 ft. The tunnel was then commenced. The tunnel, when bricked up, was 5 ft. in width, and 6 ft. 2 in. in height; the top and bottom arches being semi-circles. Two miners worked at the excavation, and the brick-work, 8 in. thick, followed. The tunnel was to have a slope from the lake terminus of 2 ft. to the mile.

In July, 1865, the "crib" destined for the lake terminus of the tunnel was launched and towed to its place. It is composed of huge timbers and iron, and is 40 ft. high and 93 ft. in diameter. It has three walls, making as many separate structures, one within the other. When

finished it had fifteen water-tight compartments. In the centre was the well through which the shaft was to be sunk. When the destination was reached, the gates were opened, and the huge structure settled upon the bottom of the lake, in a depth of 30 ft. of water. It was then firmly anchored and secured. It has since been covered, and a fog-bell and light mounted upon it.

An iron cylinder was then sunk for the lake shaft; it being forced to a depth of 27 ft. into the hard, blue clay. On the 1st of January, 1866, the work of tunnelling, from the crib, commenced. At that time the tunnel from the shore had been extended 4,515 ft. The work then progressed steadily from both ends, and on the 25th of November, 1866, there was but a thin wall of 2 ft. of clay separating the workmen. On December 6th the last stone was laid, with appropriate honours, by Mayor Rice.

A new pumping-engine, capable of pumping eighteen millions of gallons per day, has been purchased at a cost of 112,350 dollars.

Just before the water was let into the tunnel a final tour was made by Mr. Chesbrough and three newspaper reporters of Chicago.

VISIT TO THE LODGE FARM, BARKING.

On the 29th ult., Sir John Thwaites, accompanied by members of the Board, paid a visit of inspection to the model farm, which the directors of the Metropolis Sewage and Essex Reclamation Company have leased with the view of showing the value of sewage applied on the ordinary irrigation system. The members of the Board were conducted over the farm, and witnessed the mode in which the beds of Italian ryegrass were flooded, and the heavy crops of grass these beds produced. They saw flax, mangolds, and potatoes, all successfully treated, and, above all, an experimental patch of wheat. The newly-erected cowsheds, each capable of holding sixty cows, were also visited. There are at present upon this farm of about 210 acres (of which only fifty or sixty are under irrigation) over 250 cows in milk; and besides the daily consumption of grass by them, there remains a large surplus for the supply of horse-keepers in the metropolis.

After luncheon, Sir John Thwaites stated that he had viewed with the deepest interest the success of the application of the sewage. That he was glad that the operations were not confined to the production of grass, which established results proved could be obtained in large quantities, but that attention was directed to other crops, especially to wheat, where they had witnessed the manifest distinction between that which was under the influence of sewage and that which was manured in the ordinary manner in the same field. He had no doubt that success would follow the application of sewage to other crops, and he hoped that the present results might satisfy both the company and the public that the application of sewage was not only a proper thing, but a profitable application of that which had hitherto run to waste.

COMPETITIONS.

Nottingham Mechanics' Institution.—The design selected, that by Mr. Simpson, has a ball 117 ft. in length, its width in the gallery 94 ft. 6 in.; its clear height in the centre, 43 ft. The arena will seat about 920 persons, and the gallery 650. The old hall, with orchestra, contained an area of 4,850 ft., whilst this will contain 11,056 ft. 6 in. A smaller lecture-room, at the south-west corner (56 ft. long and 39 ft. 6 in. wide), is intended for various purposes. It will accommodate 520 persons (on the ground-floor, 325; gallery, 182). On the ground-floor it will be accessible by one front entrance, and two private ones at the back, the gallery being reached by three geometrical staircases. The reading-room is octagonal in shape, with an elliptical ceiling, and contains 1,266 superficial feet. It is lighted from the top and recess, is 24 ft. high at the apex, and the sides pierced alternately with triple arches, resting on columns, the two to the west being angular and fitted with seats and tables, whilst the main floor is furnished with tables running parallel with the walls. The library, elliptical in shape, will contain 1,347 superficial feet. The cost in stone is estimated at 8,000l., and in stone and brick at 7,600l.

Workhouse at Hertford.—From the six which had been previously chosen, the plans of Mr. Blesley and of Messrs. Messenger & Grundy were successively rejected; after which three other plans were balloted out. Mr. Bressley's plan was rejected by 10 votes to 7 against Messrs. Smith & Son's; and on a fresh ballot Messrs. Smith's plan was rejected by 12 votes to 6 against Mr. Hooker's. There then remained only two competitors—Mr. Peck and Mr. Hooker. The plan of Mr. Peck was finally accepted.

Gateshead Town Hall.—The Town Hall Committee of the Gateshead Council had decided on recommending Mr. Thomas Oliver's design to the Council as the most suitable; Messrs. Austin & Johnson's, and Mr. John Johnston's coming next in order of merit.

PREMIUMS AWARDED BY THE INSTITUTION OF CIVIL ENGINEERS.

The Council of the Institution of Civil Engineers have awarded the following premiums for papers read at their meetings during the past session:—

1. A Telford medal and a Telford premium, in books, to J. T. Chance, M.A., for paper on "Optical Apparatus used in Lighthouses."
2. A Telford medal and a Telford premium, in books, to E. Byrne, for paper "Experiments on the Removal of Organic and Inorganic Substances in Water."
3. A Telford medal to G. Biddell Airy, Astronomer Royal, for paper on "The Use of the Suspension Bridge with a Railroad Roadway for Railway and other Bridges of great Span."
4. A Watt medal to Colonel Sir W. T. Denison, K.C.B., R.E., for paper on "The Suez Canal."
5. A Watt medal and a Telford premium, in books, to John Bourne, for paper on "Ships of War."
6. A Telford premium, in books, to Captain Henry Wadley Tyler, for paper on "The Working of Steep Gradients and Sharp Curves on Railways."
7. A Telford premium, in books, to W. H. Preece, for paper on "The best Means of Communicating between the Passengers, Guards, and Drivers of Trains in Motion."
8. A Telford premium, in books, to W. A. Brooks, for paper on "The River Tyne."
9. The Manly premium, in books, to C. Douglas Fox, for paper on "Light Railways in Norway, India, and Queensland."

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

At the closing meeting of the session, Mr. Parker Neville, C.E., in the chair, a despatch service in silver, and an address, were presented to Mr. Jas. H. Owen, architect to H.M. Board of Public Works in Ireland, for his services as honorary secretary during the last five years. In the course of his reply Mr. Owen said:—

"Our Institute has certainly taken a wonderful stride forward in recent years. From being a very respectable but rather effete body, it has started up into new and vigorous life; without losing character—it has gained force and energy, and is already telling on the profession and the outer world. For this you have to thank, not your honorary secretary, but those which has brought the happy change that has taken place is, that I have not been an impediment to its progress. That I should endeavour for the future to be something more, you have heard me by the event of this day in a manner and to an extent which I never can fulfil, and I hope I may have many opportunities of proving in a more substantial manner than these few flattering words."

Mr. Owen, we are very glad to learn, has found more grateful constituents than are sometimes met with by honorary workers.

BOROUGH SURVEYORS.

The committee appointed at Newcastle to inquire into the working of certain departments find a state of things existing that calls for an instant remedy. There are three sets of officials to do the work of one, with no clear allotment of duties, and as a consequence discharging their functions with very little responsibility. There is, first, the department under the supervision of Mr. Bryson, the town surveyor, who has a staff of six subordinates, including his son; and which entails an annual charge of 653l. 12s. Then comes the engineering department, of which Mr. Larnh is chief, who, with his four subordinates, draws upon the borough revenue yearly to the extent of 920l. 8s. Lastly, there is the road

* Have previously received Telford Medals.

between Afton and High Downs, and intercepts the communication. The old road next the sea, and, indeed, a portion of the land sold, has been swept away by the encroachment of the sea during the last two years. And this leads one to make the inquiry, What was the object of the Government authorities in making a military road, at immense cost, from Chale to Freshwater without any means of communication with the forts at the west side of Freshwater Gate? At all events, it is quite clear that the communication cannot now be made, except by the purchase of a portion of this land which is about to be covered; or by the reconstruction of the old road, with a sea-wall to protect it.

Until something is done, the said military road affair is rather an expensive practical joke.

AN OBSERVER.

ANCIENT ALTARS.

SIR,—In your interesting article on "Ancient Altars" in a recent number, you remark on their scarcity in France and elsewhere, and say, owing to the Reformation, few are to be expected in England.

It may interest some of your numerous readers to know that, in the spacious chancel of St. Nicholas's Church, Arundel, all the altars remain, the east end of the south aisle being fitted up according to the ritual of the Church of England, an altar having stood there previously.

The altars in the chancel are quite plain. The top of the high altar, and that in the choir, formerly part of a convent on the north side, are covered with a wooden frame, the Dukes of Norfolk having always been careful to preserve them from desecration.

There are also several chantry altars, one, in a very small space behind the high altar, very much dilapidated.

J. ROOR.

CHURCH-BUILDING NEWS.

*Leire (Northampton).—*The foundation stone of a new church has been laid here. Mr. W. Smith, of London, is the architect; and Messrs. Laws, Luttreworth, the builders; Mr. James King, overseer of the works.

*Luttreworth.—*The restoration of Luttreworth church has been commenced. Mr. Scott is the architect employed, and Messrs. Laws are the builders; Mr. King, clerk of the works.

*Winterborne Danstsey.—*The foundation-stone of a new church, which it is proposed to substitute for the present small and dilapidated churches of Winterborne Danstsey and Winterborne Earls, has been laid by the Bishop of Salisbury. The site is a portion of what was formerly known as the allotment gardens, sufficient land being attached for a churchyard as well as for the erection of a parsonage-house and a school, which, it is hoped, may hereafter be built there. The new church, which is being dedicated to St. Michael, will be practically a combination of the two old ones, the building materials in both being as far as possible used in the rebuilding. The architect is Mr. T. H. Wyatt, of London, and the builder, Mr. Till, of Romsey; Mr. Harding, of Salisbury, acting as clerk of the works. Essentially it will be in the Perpendicular style, with an Early English chancel, the old windows being used again, as will also be the old roof from Winterborne Danstsey. There will be a tower at the south-west angle of the building, with an entrance underneath. It is intended to afford accommodation for 303 persons, of whom 193 will have sittings in the nave, 33 in the chancel, 30 in the south aisle, and this, with accommodation for 47 children, will give a total of 303 sittings. The contract, we understand, is a little below 2,000*l.*, the builder having permission to use the old materials.

*Fynone (Swansea).—*The church of St. James, at Fynone, near Swansea, has been consecrated and opened for divine worship by the Bishop of St. David's. The building has been erected from the designs, and under the superintendence, of Mr. Thomas Nicholson. The contractors for the work were Messrs. Thomas, Watkins, & Jenkins, builders, Swansea. The church is in the Decorated style. The plan comprises a nave, with north and south aisles, north and south transepts, chancel chapels, a vestry, and a porch. The aisles are separated from the nave

by four arches on each side, standing upon columns finished with carved capitals. An arch separates the nave from the chancel. The west front, the transepts, and the chancel are filled with large windows of geometrical tracery, that in the chancel being of five lights, and those in the transepts of four lights each. A series of three-light windows decorate the aisles. All the windows are glazed with thick cathedral tinted glass. The roofs are open-timbered, of an interlacing pattern: they are stained and varnished. Godwin's tiles are used throughout; plain in the body of the church, and ornamental in the chancel. A glazed tile reredos embellishes the wall behind the communion-table. The seats throughout are all open, stained, and varnished. The chancel is stilled, and is elevated above the nave. The materials used in the construction are native stone for the walling, and freestone, both inside and out, for all the dressed work.

*Enderby.—*The church of Enderby, which was built about five centuries ago, having fallen in some measure into decay, and having become completely inadequate to accommodate the increased population of the village, the owner of the Enderby estate, Mr. C. Brook, resolved to undertake the work of rebuilding and enlarging it, on a scale commensurate with the wants of the present day. The church, as it recently existed, consisted of a tower at the west end, a nave of four bays, and chancel. The last has been pulled down, and the remainder of the church is left standing for use during the progress of the new building. The tower is to be retained and incorporated with the new church, which is to be built outside the old one, and to consist of a nave of five bays, with side aisles, and a chancel of three bays. There is also to be a vestry on the south side of the chancel, and adjoining it an organ chamber. The style is to be as far as possible a reproduction of the original church, and the stone principally used is granite from a quarry on Mr. Brook's estate. The work, which was planned by Mr. E. Birchall, of Leeds, architect, and intrusted to Mr. J. Firth, builder, Leicester, for execution, having progressed sufficiently to show the extent of the alterations, the laying of the foundation or memorial stone, took place on the 24th ult., St. John the Baptist's day.

*Canterbury.—*St. Mary Bredin, Canterbury, built to supply the place of a very small and inconvenient structure formerly on the same site, has been consecrated by the Archbishop of Canterbury. The design, commenced by the late Mr. William Lightly, has been completed and carried out by Mr. Frederick Wallen. It is of Early Pointed character. The shape of the site, broader from north to south than from east to west, and so small that it required to be quite covered by the building, has caused the architects to design an unusually wide nave, and the necessary shortness of the chancel has been compensated for by equal width and height with the nave, and a bold chancel-arch. The only access to the ground was at the east side, the entrance is therefore at the east end of the aisles, the chief or south-east porch having an external door placed angularly, to meet the requirements of a head in the street, and the motif of an octagonal tower and spire thus given is adopted. The upper story of the tower opens into the church by an arch in continuation of the clearstory. The tower is carried up to the base of the timber spire, which is to be covered with shingles. Funds are lacking at present for this and for a small sum still unprovided for the church. The old reredos, reading-desk, and pulpit are at present retained. The total cost, including the spire, will be a little over 4,000*l.* The accommodation is for 520, in open benches. The builders were Messrs. Gasken & Godden, of Canterbury.

*Stour Provost.—*The foundation-stone of a chapel-of-ease in this parish, which is to accommodate a number of inhabitants belonging to the outlying districts, and is estimated to cost 1,200*l.*, has been laid. Mr. J. Hicks, of Dorchester, is the architect; and the building is to be erected by Mr. Miles, of Shaftesbury, builder. The work will be completed in December.

*Grimby.—*Several tenders for the building of the chancel of the new church have been opened, and that of Messrs. Brown & Son, of this town, builders, has been accepted. The work will be commenced forthwith.

*Gloucester.—*The dean and chapter have resolved that the general restoration of the cathedral shall be commenced almost immediately, the choir being the first part taken in hand. The chapter will shortly hold a special meeting to make final and definite arrangements. About

a third of the estimated cost of the entire restoration of the sacred fabric has been provided.

*Bournemouth.—*Arrangements are in progress for erecting a new district church at Bonnamouth. The church will be built by Mr. Ewau Christian, and will be designed to accommodate 1,000 persons, 350 seats being free, and 650 will be rented. A district will be assigned to the church. The site has been granted gratuitously, in perpetuity, by Mr. Robert Kerley, and is situated in Msdeira-vale, on the upper part of the old Christchurch-road. The cost of the building is estimated at between 5,000*l.* and 6,000*l.*

SCHOOL-BUILDING NEWS.

*Mere.—*According to the *Macclesfield Courier* the foundation-stone of a new school and house for the master has been laid at the village of Mere. The school is to be erected at the expense of Mrs. Langford Brooke, from designs of Mr. W. Owen, of Manchester, architect.

*Rhayader.—*The foundation-stone of the new Girls' School has been laid on the Maes. The school and class rooms, which will be 40 ft. by 20 ft., and 13 ft. by 10 ft. respectively, will accommodate 120 children, and the former, when arranged for meetings, &c., will contain upwards of 250 persons. The general style of the structure will of course be Gothic, the walls being brick on a stone base. Internally the timbers of the roof will be exposed to view, and externally they will be covered with Major's patent tiles. A hell cot will be added if the funds should permit. The contract has been taken by Mr. William Evans, and will be executed under the superintendence of the architect, Mr. E. H. Lingen Barker, of London and Hereford.

*Fleetwood.—*At the Rossall School new baths have been opened by the Marquis of Hartington, M.P. The building was designed by Messrs. Garlick, Park, & Sykes, of Preston, architects, and consists of a swimming-bath, 120 ft. long and 24 ft. wide. The east end of the building is fitted up with two-story dressing-rooms, water-closets, urinals, and a large raised platform. The west range comprises ten private baths, superintendent's house, committee-rooms, and bath-house. The building has a south frontage of 176 ft., an east frontage of 56 ft., and a west frontage of 55 ft. The swimming-bath contains 100,000 gallons, and is supplied with salt water pumped from the Irish Sea by an eight-horse engine and double-action pumps, constructed by Mr. John Stevenson, of Preston. The foundation-stone of the new buildings for convalescents was also laid by the Marquis of Hartington. The building, when completed, will comprise convalescent wards, porter's residence, board-room, additional class-rooms, studios, and dormitories, and is designed to harmonize with the main features of the buildings adjoining. It has a west frontage of 115 ft. to the court-yard, thereby completing the easterly side of the quadrangle, and on the east a frontage of 145 ft. The main entrance will be flanked by four octagonal towers, rising 60 ft. high, one at each angle, surmounted by slender turrets. Between each tower and over the pathway there will be an oriel window running two stories high, which forms the most prominent feature in the design. Messrs. Garlick, Park, & Sykes, of Preston, are the architects; and Mr. R. Sanl, of Preston, is the contractor.

DISSENTING CHURCH-BUILDING NEWS.

*Kettering.—*The new Wesleyan Church here has been opened. Its site is in Silver-street, about the centre of the town. It was erected from a design by Mr. G. Woodhouse, of Bolton-le-Moors, architect. Mr. J. Watkin, of Northampton, was the builder. The building is of brick, with ornamental facings of freestone, on which some carving has been bestowed. It is capable of seating 630 persons. The chapel is galleried all round in a circular, or rather oval manner, the segment in front and opposite to the pulpit swelling into tiers of seats eight pews deep, opposite to which, in the centre of the choir, an organ (from the manufactory of Messrs. Bevington & Son, London), is placed in a commanding position. The seats in the chapel are of deal, varnished, and are contrived so as to face the pulpit. The outside of the galleries is painted of a light green and white, with a polished mahogany ledging. The pillars which support the

galleries are light and slender, with Corinthian capitals. The pulpit is of carved work. An ornate frieze, wrought in plaster of Paris, surrounds the walls just under the ceiling, which is plain, and from which depend five stary gas pendants, by which at night the interior will be principally lighted. The original estimate of cost was 2,100*l*. The building is enclosed by a low wall mounted with palisades.

TAVENON.—Extensive alterations are about to be made at the Wesleyan chapel in Upper High-street. It is proposed to take down the whole of the buildings, except the chapel front—which was added but a few years since—and to enlarge both chapel and schools, so as to cover the whole ground belonging to the trustees. In the new chapel the upper end will be towards the west instead of the north, as now, and the size will be increased one-third, the area being about 70 ft. by 60 ft. Instead of a pulpit there will now be, within an apical arched recess, a rostrum over the Communion-table. On the right and left will be the vestry and the trustees' room. The organ is to be placed in the east gallery, at the opposite end of the chapel. Ten light iron pillars, with carved capitals, from which spring moulded wood arches, will support the galleries and roof. The fronts of the galleries around the sides of the chapel will be composed of uncarved wood framing and ornamental iron-work. The timbers of the roof, wrought, rounded, and slightly stained and varnished, will be open interiorly. The seats throughout are to be low, with moulded and chamfered solid bench-ends, and the backs sloped; they will form on the ground-floor what may be called a nave, 30 ft. wide, and two aisles. On the eastern turret, to the right of the entrance, will be added a light spire, the final stone of which will be about 70 ft. above the street level. The front elevation of the schools will be built out on a level with the chapel, parallel with the street, and correspond in style. The new school-room, on the same level as the chapel floor, will measure 61 ft. by 37 ft., and be 17 ft. high, with seven class-rooms, and a ladies' working-room over. The design and plans were prepared by Mr. S. Shewbrooks, of this town. The materials contained in the present buildings are to be saved, as far as practicable; and the whole works are to be carried out under the direction of Mr. S. Shewbrooks.

Books Received.

The Pyrenees: a Description of Summer Life at French Watering-places. By HENRY BLACKBURN. London: Sampson Low, Son, & Marston. 1867.

A VOLUME from the picturesque pen of the author of "Travelling in Spain in the present day," illustrated by more than 100 engravings from sketches by Gustave Doré, cannot be an every-day book, and that is what we have here. Some of the landscapes are charming; take, for example, the sketch illustrating the lines—

"The sultry summer day is done,
The western hills have hid the sun;
But mountain peaks, still rising higher,
Retain reflection of his fire."

Still, there is a want of variety in the subjects,—not the artist's fault,—and where we fall on his pigmies, little groups of people, or a German band, his change is agreeable.

Some of the towns on the way to the Pyrenees are dull, to use a mild term; Dax, for example, concerning which a friend wrote home,—“A funeral procession passed us in the street, and I think I envied the occupant of the bier. He, at least, was leaving Dax, whereas I had to wait over the seven o'clock train!” Our author has said all that can be properly said in favour of the Pyrenean towns, but he cannot disguise the fact, that in travelling in the Pyrenees there is a want of that sustained interest which in Switzerland never flags. Nevertheless, there are delightful spots, and his account of them will tempt many visitors that way. Eaux Bonnes he highly praises warmly. Concerning this fashionable little hotel village, we would make a protest against the frightful over-crowding that periodically occurs there. It consists of about fifty houses, and these in the season give accommodation to a thousand people!

Mr. Blackburn rightly denounces the wholesale encouragement given to begging in the Pyrenees generally, and the consequent woe everywhere for “*quelque chose; quelque chose pour l'amour de Dieu!*” The inhabitants are

everywhere demoralized. A girl of sixteen, well dressed, and evidently well to do, comes up with a bouquet of wild flowers: she asks 10 sous for it (about the wages of a day's work), and will not take less for it; but on receiving the money immediately asks for the bouquet back again, to sell to some one else! Indiscriminate almsgiving is a vice full of evil results. Anyhow, Mr. Blackburn's elegant book needs no “charity”; it can trust to “justice.”

VARIORUM.

“A HANDBOOK of Practical Telegraphy.” By R. R. S. CULLEY, Engineer to the Electric and International Telegraph Company. Second Edition, considerably enlarged. London: Longman, Roberts, & Green. 1867. This is a more elaborate and extensive volume on this subject than any of those recently noticed by us. It is intended to give information to members of the telegraph service and to those interested in telegraphy concerning the electrical laws upon which the system depends; the method of discovering faults; the practical management of apparatus; the construction of a line; and the leading principles of submarine telegraphy. The work is published with the sanction of the Board to whom Mr. Culley is engineer; and has been adopted by the Department of Telegraphs for India. — “Arithmetic Simplified.” By Neil ARNOTT, M.D., F.R.S. London: Longman, Green, Reader, & Dyer. 1867. This thin volume is intended for general use, and adapted to aid students engaged in any departments of science or art; also to serve as a supplement to the author's “Elements of Physics,” published in 1865, and other works on popular science.

Miscellaneous.

THE WALLACE MONUMENT.—At a meeting of some of the more prominent Scottish residents of New York City, held there on the 1st. ult., the feeling was unanimously in favour of zealous co-operation with those at “home” in completing the Wallace monument. A large and influential committee was formed to carry out this resolution, and twelve gentlemen put down their names for 100 dols. each. Up to the 15th ult., subscriptions continued to come in. The central committee in New York have made up their minds, it is said, to send over, if possible, a sum of 10,000 dols.

PROPOSED INTERNATIONAL ARCHAEOLOGICAL SOCIETY.—A Russian archaeologist, M. Filimonoff, who is now in Paris, on a visit to the Exhibition, is urging the establishment of an international archaeological society. The project has been favourably received by several other archaeologists, and M. Mandergreen, of Stockholm, has assisted M. Filimonoff in drawing up a set of regulations for the new society, which have been already submitted to the French Government. It is proposed to admit archaeologists of all nations to the society, and to hold congresses in the principal capitals of Europe.

WINDOW-GARDENING.—In past years window-gardening was pioneered by the *Builder*, and we are glad to see that it now no longer needs pioneering. Another flower-show has taken place in the garden of the Middlesex Hospital, kindly lent for the occasion by the authorities. The flowers exhibited had been grown in the rooms or on the window-sills of very poor persons living in the district of St. Andrew's, Wells-street, and Christ Church, St. George's. Prizes had been awarded to the most successful growers, and were distributed by the Lady Mildred Beresford-Hope and the Hon. Mrs. William Cowper. The flowers were quite remarkable for beauty when the circumstances under which they were cultivated are considered. They consisted principally of musk, geranium, and fuschias in full bloom, and they came from crowded courts, close alleys, or steaming mews. One chief prize was given to a deformed girl. In another instance the flower had been cultivated by the bedside of a little boy in one of the hospital wards. The Coalbrookdale Company, we observe, manufacture neat iron frames for window-gardens, which fit on to the usual window-sill, and have, if desired, a light wiring for creeping plants, which also affords protection for children while engaged in the window-gardening.

THE LONDON BRIDGE TRAFFIC.—At the last Court of Common Council in the City, a petition was presented by Mr. Medwin, praying the court to take some steps to relieve the foot traffic upon London Bridge, and suggesting that a footway might be erected at the side of the bridge. Mr. Medwin proposed that the petition should be referred to the Bridge-house Estates Committee for them to consider the statements made in it, and report thereon to the court; but an amendment was carried to the effect that the petition lie on the table.

BRICK BURNING.—The suit Evans v. Smith was to restrain the continuance of a nuisance arising from the burning of bricks within 112 yards of a dwelling-house. Vice-Chancellor Wood observed, in reference to an argument adduced on behalf of the defendants, that whatever might have been the case formerly, when there was considerable conflict of opinion as to whether the smoke and vapour arising from brick-burning were to be considered as prejudicial to health and comfort, it was now clearly settled that the fumes of a brick-kiln, if they reached dwelling-houses, were a nuisance to the inhabitants, which the Court of Chancery would restrain without requiring any scientific evidence upon the subject.

FALL OF A MOUNTAIN INTO A VALLEY.—At Feldkirch, Switzerland, according to a letter, part of a mountain has set itself in motion, and is sliding down into the valley. The inhabitants of a village at its foot are in great consternation at the occurrence. Every few minutes a new crack shows itself: at first as broad as a piece of thread, it becomes gradually broader and broader, and one piece of the mountain rapidly follows another. At present a very large surface is in motion to the depth of perhaps more than 1,000 ft. A river and all the brooks which flowed down the mountain have disappeared in the cracks. Paths which were formerly nearly level, have been separated into little pieces, of which some are 20 ft. higher than the next one; and large forests have been wrenched out of the earth and thrown away in all directions.

THE LARGEST BLAST FURNACE IN THE WORLD. The extraordinary development of the iron manufacture in the Cleveland district has led to the building of the largest smelting furnaces in the world. One of these, and the largest hitherto built, is at the Norton Ironworks. It was put in blast a few weeks ago, being previously charged with upwards of 500 tons of mineral. The inside diameter is 25 ft., the height 85 ft., and the capacity 26,000 cubic feet. It was expected that it would produce about 450 tons of pig-iron weekly, and this expectation seems to be in a fair way of being realised, as the furnace has hitherto proved a complete success, both as regards quantity and quality of metal produced, and quantity of coke used to the ton of pig-iron. The fourth week after the blast was put on the make of the best foundry pig was 395 tons, or equal to 50 tons per day; and during the sixth week the make had increased to upwards of 92 tons in 24 hours, or at the rate of 424 tons per week, and the furnace has neither its full “burden” nor full blast on yet, so that its producing powers have not been fully tested.

ALLEGED INFRINGEMENT OF A REGISTERED DESIGN.—At the Public Office, Messrs. H. & T. Kendrick, 158, Hockley-hill, and 129, Great Colmore-street, summoned Mr. James White, 62, Pershore-street, for fraudulently imitating the design of a registered stove-grate. Mr. Fitter appeared for the complainants, and Mr. Cntler for the defendant. The subject of the complaint was a small gas stove, standing on three ornamental legs. These legs, it was alleged by the complainants, had, until recently, been fastened to the main part of the stove by a screw, a hole being drilled in the body and in the leg to receive it. Their plan was to cast the leg with a rivet fastened to it, and cast the body with the holes ready-made, so that the rivet fitted in the hole, and only required hammering down. This, it was alleged, saves a great deal of time. Evidence to this effect was given on behalf of the complainants. The defence was, that the idea was known before it was registered by the plaintiffs; and, besides, the plaintiffs had themselves made and sold the article, which rendered the registration according to the Act null and void. Evidence was given to prove this, and Mr. Fitter said, of course he could not then go on with the case, as the complainants had thrown themselves out of Court. The case was therefore dismissed.

INTERNATIONAL COLLEGE, SPRING GROVE, MIDDLESEX.—This building, recently illustrated in our pages, was opened by H. R. II. the Prince of Wales on the 10th inst.

RATING OF LITERARY INSTITUTIONS.—The Lords of the Treasury have, on the recommendation of the Board of Inland Revenue, issued an authority for the limitation of the assessment of public buildings devoted to the culture of science, literature, and art, to such portion of the building beneficially occupied as a dwelling, when such portion is of the annual value of 20*l.* or more.

THE CLERKENWELL MORTUARY.—This building, which was erected recently at considerable expense, has been closed in consequence of certain representations made by parishioners in the locality to the legal advisers of the lord of the manor. A deputation of the inhabitants waited upon them, with a numerously signed memorial against the re-opening of the mortuary. The representative of the lord of the manor promised to bring the matter under his notice at the earliest opportunity.

A HINT TO GARDENERS.—If people planting orchards would give orders to mark the north side of trees with red chalk before they are taken up, and when set out to have the trees put in the ground with their north side to the north in their natural position, a larger proportion, it is said, would live, as ignoring this law of nature is the cause of many transplanted trees dying. If the north side be exposed to the south, the heat of the sun is too great for that side of the tree to bear, and therefore it dries up and decays.

STATE VISIT TO THE ROYAL ITALIAN OPERA HOUSE.—The visit of H. R. II. the Prince of Wales, his Majesty the Sultan, and numerous distinguished persons, with brilliant suites, to Covent Garden on Monday evening next, will be a remarkable event. The Floral Hall will be used as the reception-room; and Mr. Gye, it may be depended on, will decorate it superbly. The Royal Box will be placed in the centre of the house, as on the occasion when H. M. the Queen, the late Prince Consort, and the Emperor and the Empress of the French were present in 1855. A wonderful sight that was.

NEEDHAM MARKET FINE ARTS AND INDUSTRIAL EXHIBITION.—An exhibition of novelties, rarities, and curiosities, of things useful and things ornamental, is now open at Needham Market, and promises to prove a decided success. The collection includes much that is interesting, and which would do honour to a town of greater pretensions than Needham Market. The exhibition is held in the newly-erected town-hall, all the available space in which is occupied. The great majority of the articles are contributed by residents within a few miles of the town. The catalogue shows that there are 329 "articles" exhibited, but, in the majority of cases, each "article" consists of a collection in itself.

REPORTS BY ENGLISH ARTISANS ON THE PARIS EXHIBITION.—A laudable effort is being made by the Paris Excursion Committee of the Working Men's Clubs' Union, as already mentioned, to turn to useful account the visits to the French capital undertaken by large bodies of English artisans. Accordingly, by the exercise of the special influence of the president of the committee, institutions that were never previously opened to the people are freely opened to the excursionists. A prize fund is also inaugurated, for awards to the authors of the best reports on certain specified branches of industry; towards which, we are informed, the Science and Art Department at South Kensington have decided to grant 25*l.*

HOUSES IN ENGLAND AND WALES.—In the financial year ending the 5th April, 1866, 608,345 houses and shops were assessed to house duty in England and Wales, being worth 20*l.* a year or upwards. 232,344 were assessed under 30*l.*; 198,968 at 30*l.* and under 50*l.*; 123,885 at 50*l.* and under 100*l.*; 40,412 at 100*l.* and under 200*l.*; 11,051 at 200*l.* and under 500*l.*; 1,297 at 500*l.* and under 1,000*l.*; 293 at 1,000*l.* and under 2,000*l.*; 85 at 2,000*l.* and under 5,000*l.*; three at 5,000*l.* and under 5,050*l.*; one at 6,000*l.*, one at 6,500*l.*, one at 8,200*l.*, one at 8,350*l.*, one at 8,500*l.*, one at 9,000*l.*, and one at 20,000*l.* One in Lanoshoire was assessed at 3,000*l.* a year, one in East Sussex at 4,400*l.*, one in East Surrey at 4,550*l.*; but all the ten assessed at 5,000*l.* or above that value were in Middlesex.

RIVER TUNNELING.—The attempt to build a tunnel under the Chicago river has failed. The entire work lately in progress, including masonry, timber, &c., one morning fell in, involving heavy losses to the contractors.

PRECAUTIONS AGAINST CHOLERA.—The Government are rightly taking precautions against any outbreak of cholera. A supplement to the *Gazette* has been published, containing various Orders in Council as to quarantine, and the arrangements which are to be made by parochial authorities where any outbreak of cholera may take place.

GRINDSTONES.—A grindstone should not be exposed to the weather, as it not only injures the woodwork, but the sun's rays harden the stone so much as, in time, to render it useless. Neither should it stand in the water in which it runs, as the part remaining in water softens so much that it wears unequally, and this is a common cause of grindstones becoming "out of true."

MORTALITY BY FEVER IN MAURITIUS.—In reply to a question, Mr. Adderley stated that probably 30,000 might represent the total of the deaths up to the autumn of this year. The number actually dead up to 2nd of May was known to be 17,000, of which 10,000 were in Port Louis alone; and he was afraid that, by the last information, there was no abatement in the mortality. Measures had been taken by the Colonial Office to send out quinine and other fever medicines. He believed there was no precedent for a grant of money from the public funds, but this might be a proper object for a public subscription.

RESTORATION OF THE CHURCH OF ST. JOHN BAPTIST, FINDON.—This church is shortly to be re-opened, after a restoration under the supervision of Mr. Gilbert Scott. The old roof, with massive timbers, is substituted for stiffer white-washed ceilings, and the pillars and arches have been freed from the high pendent which locked them into a shapeless mass. The unsightly galleries and cumbersome and reading pews have been removed, and a new carved oak pulpit, reading-desk, and lectern, with an east window, are presented by Lady Bath. Two windows have been put up by the Rev. John Wyatt to the memory of his parents and sisters; and it is said that a stained window in the chancel is shortly to be added by a friend. There are remains of the frescoes with which the whole interior wall was once covered.

THE ALEXANDRIA ORPHANAGE FOR INFANTS.—On the 6th inst. the foundation-stone of new buildings to constitute the future Alexandria Orphanage for infants, was laid by the Duchess of Sutherland, on the site at Hornsey-rise. The arrangements to be carried out are somewhat different from those of any existing charity in England. It is intended to erect a central building, to comprise the schools, the dining-hall, the domestic offices, the laundry, &c. There will then be built, in pairs, separate houses, each to accommodate twenty-five infants, placed under the care of competent nurses, who will have the entire charge of them from their rising in the morning until they retire to rest, with the exception of the time they are under instruction. These separate houses will be connected by a covered way with the central building, so that the infants in every change of weather will be well protected. In winter it will be enclosed. To each house there will be a distinct playground for the twenty-five orphans. Messrs. Habershon & Pitt are honorary architects.

TENDERS

For alterations and repairs at the Wesleyan Chapel, Richmond-road, Hackney. Mr. John Tarring, architect. Quantities not supplied.—

GAIRDNER is instructed to SELL by AUCTION, on the PREMISES, near Hangerford-bridge, on MONDAY, JULY 15th, at TWELVE o'clock, 400 LOADS of several TIMBERS, to be hauled from 20 to 40 feet, short balk, and a large quantity of firewood.—On view, and catalogues had at Mr. GAIRDNER'S office, 49, University-street, Tottenham-court-road, N.E.—The entrance is from Cannon-row, Ecoland-yard, and Somerset Wharf, Strand.

To Builders, Farmers, Persons repairing, and Others. MR. STEWART has received instructions to SELL, adjoining the Red-faced Stag, Finchley Common, on THURSDAY, JULY 19th, at ONE for TWO, exact time, 200 lots of capital BUILDING MATERIALS, comprising many thousand feet of long joint, rafters, and plates, 20,000 feet of quartering, 10,000 feet of good floor boards, 50 pairs of sashes and frames, doors and frames, several capital frame partitions, and a large assortment of new cut oak, floor boards, in long lengths, &c.—Catalogue on the ground, and of the Auctioneer, High-street, Putney.

To Builders, Persons Repairing, Farmers, and Others.—300 lots of capital BUILDING MATERIALS, opposite the Anchor and Hope, Acton-lane, Bristol. MR. STEWART has received instructions to SELL, as above, on FRIDAY, JULY 19th, at ONE for TWO exact time, 500 lots of capital and nearly new BUILDING MATERIALS, comprising long sash, 10,000 feet rafters, long plates, and about quartering, 12,000 feet of floor, lining and other boards, sashes and frames, doors and frames, framed partitions, 50 pairs of capital framed principles, stone wall, fire wood, &c.—Catalogue on the ground, and of the Auctioneer, High-street, Putney.

SOUTH NORWOOD.—Freshhold Building Land.—The only portion of the Brompton Estate, opposite the Anchor and Hope, Acton-lane, Bristol. MESSRS. WINSTANLEY & HORWOOD are instructed to sell by AUCTION, at the MART, Tottenham-road, on WEDNESDAY, JULY 24th, in one lot, the REMAINING PORTION OF THE BROMPTON ESTATE, including retained and great title red-rose included, most eligible situated at Woodside-green and close to the Norwood Junction Station, and comprising a valuable plot of building land, possessing a frontage of 200 feet to Brompton-road by a depth of about 500 feet, also the Freshhold of the Brompton Estate, and known as Howard, Barchamer, and Kinnor roads, subject to the existing rights of way over them.—Detailed particulars with plans may be obtained from Messrs. BUCHANAN, HARRISON & MILLS, Solicitors, Crolyan; or at the office of Messrs. WINSTANLEY & HORWOOD, 10, Fitzroy-square, Pall-mall, E.C.

FOREST GATE.—Building Materials of the spacious Mansion, known as Forest House, Ranges of Stabling and Coach-houses, Two Cottages, a large quantity of valuable growing Timber, &c. to clear the ground for building purposes.

MESSRS. WINSTANLEY & HORWOOD have received instructions from the Conservative Land Society to SELL, by AUCTION, on the PREMISES, Forest House, Forest Gate, near the Eagle and Child, on MONDAY, JULY 29, at TWELVE o'clock, in lots, all the valuable BUILDING MATERIALS, fixtures, and fittings, of the MANSION and OFFICES, Two Cottages, Stabling, and Coach-houses; comprising about 20000 excellent stock bricks, 25 square sashes, 20 square prime oak and timber, in stout girders, rafters, joists, and quartering, French casements, glazed plate-glass, 60 pair sashes, 20 doors, iron and floor-boards, handsome cast-iron, brass, and steel stationary and vain marble chimney-pieces, iron and public paving, granite pitching, stone steps, coping and window-cills, several thousand feet of iron railing and gates, hurdle and wire fencing, and of wood flooring, coach-houses and entrance-steps, racks, managers, and stable fittings, erections of large greenhouses and viney with hot-water apparatus, several tons of lead, in flats, gutters, cisterns, pumps, and pipes, elegant ironwork and other stores, ranges, force-pumps, copper, brass, and a variety of useful fixtures and fittings; also the whole of the growing timber on the estate.—May be viewed two days prior to the Sale, and catalogues had of Messrs. WINSTANLEY & HORWOOD, 10, Paternoster-row, St. Paul's, E.C.

VICTORIA-STREET, WESTMINSTER.—First-class Freshhold Ground, fronted by the Westminstere Buildings, with possession.

MR. PHILIP D. TUCKETT is instructed by the Westminstere Building Commissioners to SELL, by AUCTION, at the MART, Tottenham-road, on TUESDAY, JULY 23, at ONE o'clock, in one lot, a First-class FRESHHOLD GROUND BENT of 72s. per annum, with Parliamentary title, amply secured upon the magnificent establishment known as Messrs. J. J. Vickers Distillery, forming the corner of Victoria-road, and Horse-ferry-road, the rental value of which may be estimated at 3000 to 4000 per annum, and three unfinished Freshhold houses, on the south side of Phillips-road, Victoria-road, erected in an excellent superior manner, with iron and brass roof, and admirably adapted for clubs or offices, or for some other manufacturing business. The last three lots will be sold with possession, and will most remunerative investments in the rapidly improving neighbourhood of Messrs. MAYHEW, SALMON, & WHITING, Solicitors, 30, Great George-street, Westminster; of Mr. W. M. ACQUERS, a Valuer, 10, St. James's-street, E.C.; and of Mr. PHILIP D. TUCKETT, Land Agent, Surveyor, &c. 78, Old Broad-street, E.C. and (late Mr. HAZARD), St. Martin's-place, Trafalgar-square, W.C.

In Chancery.—10 Acres of Freshhold Building Land close to Ashford Road on the South Western Railway, in 20 lots, with conveyance at a small fixed charge.

MR. PHILIP D. TUCKETT is instructed to SELL, by AUCTION, at the MART, Tottenham-road, on THURSDAY, JULY 26th, at ONE o'clock, an eligible FRESHHOLD ESTATE, fully ripe for building, most pleasantly situated close to the handsome new Church between the railway station and Village of Ashford, Middlesex, and richly contained 600 acres, and other lands having 40 feet frontages, with depths of 150 feet and 300 feet, included particulars of Mr. RICHARD H. WILSON, of F. W. DOLMAN, Esq. 80, Jersey-street, S.W.; or of Mr. PHILIP D. TUCKETT, Land Agent, Surveyor, &c. 78, Old Broad-street, E.C.; and of St. Martin's-place, Trafalgar-square, W.C.

BETHNAL-GREEN, adjacent to Shoreditch, three minutes' walk of the Great Eastern Terminal, and only about half a mile from the City.—A most important and very extensive Freshhold Estate, presented to a valuable good building site, either for philanthropic purposes or manufacturing purposes.

MESSRS. J. J. CLEMMANS & SON are directed by the trustees of the will of the late V. Phillips, Esq. to SELL, by AUCTION, at the new Auction Mart, Tottenham-road, on THURSDAY, JULY 26th, 1867, at ONE for TWO o'clock, in three or several lots, a most important FRESHHOLD ESTATE, covering the immense area of 82,000 feet. The estate is situated in Great Turrett-street, High-street, Westminster, and Trafalgar-street, all leading from Church-street, London. A good portion of the estate is now in the occupation of wealthy tenants, and the remainder is let on leases at second-rate rents, the present rental being about 6700 per annum. The estate comprises three independent sites, all fronting good light streets, and is totally unimpeded by the usual drawbacks of ancient titles invariably found in old established localities in its present state it offers a most secure and very profitable investment.—Particulars, with plans, will be published fortnight days prior to the Sale, and may be had of Messrs. ESCOFF & FINCKLEY, Solicitors, 15, King-street, Fenchurch-square; and of the Auctioneers, 15, Finsbury-square, E.C.

REPOSITORY, HARRISON.—Railway Horses. MR. J. S. GOWER will SELL by AUCTION, on FRIDAY, JULY 19th, the property of Messrs. J. WILSON & SONS, 15, Young Active CART and VAN HORSES, some Cover TIPPERS of the London and Cambridge line, nearly completed; also two NAGS, being used by the foreman.—On view two days prior.

SALE OF GRANITE POLISHING WORKS AND LEASE OF GRANITE QUARRIES.—There will be SOLD by AUCTION, at the FACILITY PLACE, Glasgow, on WEDNESDAY, the 31st day of JULY, 1867, at TWO o'clock in the afternoon, the POLISHING WORKS in St. James's-street, Glasgow, with the whole machinery and plant used by Messrs. Kingdon & the Scottish Granite Company, and the Lease of the Quarries at North Bay and Ferness, in the Parish of St. Andrew, Scotland, with the whole business, machinery, and plant at these Quarries. The Polishing Works are 300 feet long by 60 feet broad, and are fitted with the railway system of the country by a siding from the Glasgow Railway, which bounds them on the east and south. The Works are fitted with excellent machinery, complete, and at present in good condition. The Quarries are held on a lease of 99 years from Whitsunday, 1866, on excellent terms. These are trucks of all requisites plant for the working and transport of the material, and the Quarries are so situated as to admit every facility for shipping the produce. The granite obtained from these Quarries is of the first quality, incapable of being worked into any shape, and of taking the highest polish. The above subjects will be exposed at a low price.—Further information may be obtained from F. P. CHAPPEL, Esq. 25, Golden-square, London, W.; ROBERT CRAWFORD, Esq. 3, Pall-mall, London; A. CARLICK, Barrister-at-Law, Accountant, 80, Buchanan-street, Glasgow; or Mr. R. ADDISON SMITH, 13, St. Andrew's-square, Edinburgh.

TO BUILDERS, PLUMBERS, GLAZIERS, AND OTHERS. WANTED, by an experienced Plumber, Glazier, and Painter, a SITUATION as FOREMAN, Practically understands the trade, making out estimates, measurement, &c.—Address, H. W. B. care of Mr. Burroughs, 39, Temple-street, Brighton.

WANTED, by a Young Man, a SITUATION in a Builder's Office. Seven years' experience. Good reference.—Address, R. E. 29, West-street, Brighton.

TO ARCHITECTS AND CONTRACTORS. WANTED, by the Advertiser, a SITUATION as CLERK of WORKS, in town or country. Has had several years' experience in that capacity. He used to be given work, about work, and general works. Good reference will be given.—Address, I. M. N. Post-office, No. 37, Clifton-street, Fitzhugh-square, London.

TO ARCHITECTS. WANTED, by the Advertiser, who has been six years in the office of a civil engineer (three years as pupil and afterwards assistant), a SITUATION as IMPROVER in an Architects Office.—Address, E. 25, St. James-street, Brighton.

TO SURVEYORS AND BUILDERS. WANTED, a RE-ENGAGEMENT by the Advertiser. Is thoroughly experienced in measuring, abstracting, estimating accounts, and general office routine. Reference to eminent quantity surveyors and builders.—Address, J. A. Office of "The Builder."

TO BUILDERS AND CONTRACTORS. WANTED, by an experienced, energetic Man, of very sober habits, a SITUATION as MANAGER, or General Foreman. Aged 42. First-class testimonials.—Address, A. B. 28, Artillery-place West, Chiswell-street, E.C.

TO CONTRACTORS AND OTHERS. WANTED, a RE-ENGAGEMENT as MANAGER of extensive WORKS; has just completed a large drainage contract. In of great experience, steady, and energetic. Aged 40.—Address, A. B. 351, City-road.

TO ARCHITECTS AND CIVIL ENGINEERS. WANTED, a SITUATION, as CLERK of WORKS, by a person who has carried out extensive works abroad.—Address, ALFIA, 4, Richmond-place, W. Deiston, N.E.

WANTED, by the Advertiser, a SITUATION as JUNIOR CLERK, in a Builder's Office. Has some practical knowledge of the business.—Address, A. B. 35, Seymour-street, Knotten-square, N.W.

TO BUILDERS. WANTED, by an energetic, steady Man, or Painter, Grover, or Worker, Paperhanger, &c.—Address, S. W. 18, York-place, Beckington-street, Strand, London.

TO BUILDERS AND DECORATORS. WANTED, a RE-ENGAGEMENT, as FOREMAN of PAINTERS, by a respectable energetic Man, of great practical experience. No objection to country, or taking charge of a Job. First-class testimonials.—Address, DECORATOR, 85, Fences-road, Newington-hill.

TO CARPENTERS, BUILDERS, &c. WANTED, by a Young Man, who has been in the above trade five years, a SITUATION. Can work at the bench or fix. Wages not so much an object as a competency.—Address, CARPENTER, 35, Manor-church, Waltham-st. S.

TO ARCHITECTS. WANTED, by a really good DRAUGHTSMAN, an ENGAGEMENT at 30*l.* per week in an improving situation. Is well versed in construction and perspective. The hour not subject to.—Address, ALFIA, 4, Richmond-place, Brompton, S.W.

WATCHMAN, day or night, by a respectable Young Man—Address, J. B. 8, Washington-street, Bow Common-road.

TO MASTER BUILDERS, HOUSE AGENTS, AND OTHERS. WANTED, by a practical Man, a SITUATION as FOREMAN of PAINTERS, or to take the Management of a Brick-work. Has a general knowledge of the building trade, and is a good estimator. Good references.—Address, C. F. 25, Rusk-street, Regent's Park, N.W.

WANTED, in London, by a practical ARCHITECT'S ASSISTANT, in his 24th year, a RE-ENGAGEMENT. Used to prepare working and detail drawings from rough sketches, to assist builders' estimates of extra, and work in the superintendence of new buildings. Can take dilapidations and plans, and is acquainted with perspective and quantities.—Address, A. B. C. 2, Friar's-place, Commercial-road.

TO BUILDERS. WANTED, by a Young Man, a JOINER, with good reference, a RE-ENGAGEMENT as FOREMAN, or to take the entire charge of a Job.—Address, W. B. care of Mr. John Bullock, Chiswell-street, E.C.

TO BUILDERS AND OTHERS. THE Son of a Builder is desirous of an ENGAGEMENT as CLERK, Collector, Time or Store-keeper, or any position where trust is required. Aged 21. Unexceptionable references.—Address, D. 30, Upper Berkeley-street, Fortman-square, W.

TO DECORATORS AND OTHERS. THE Advertiser, a Young Man, desires an ENGAGEMENT as PRIME COST PAINTER, GLAZIER, and GRAINER. Town or country.—Good references.—Address, W. Z. 40, Upper Marylebone-street, Cavendish-square, London, W.

TO ARCHITECTS. THE Advertiser desires an ENGAGEMENT. In a most draughtsman, has a knowledge of perspective, &c. Town or country. Good references.—Address, F. H. Smith's Library, Duke-street, Adelphi.

TO BUILDERS. THE Advertiser, being only partly engaged, will be glad to serve a builder, who may require the services of a competent BUILDER'S CLERK, one or two days a week.—Address, X. Y. Z. 30, Palace New-road, Lambeth.

TO BUILDERS AND OTHERS. TWO good CARPENTERS and JOINERS, who do WORK either by the Piece or Job. Good references given if required.—Address, J. L. Mrs. Collins, 115, Hackney-road, N.E.

THE Advertiser, who has served his articles in an eminent London architect's office, and just completed an engagement as PRIME COST PAINTER, GLAZIER, and GRAINER. Town or country.—Good references.—Address, J. B. W. 167, Dora-ham-road, Lambeth, S.

TO BUILDERS AND CONTRACTORS. AN experienced SURVEYOR seeks EMPLOYMENT for TWO SPARE DAYS, WEEKLY, as QUANTITY TAKER, ESTIMATOR, or MEASURER.—Address, ALFIA, Post-office, 84, Old Kent-road.

OCASIONAL EMPLOYMENT required by a thorough SURVEYOR, whose time is not entirely occupied with present engagements.—Address, ALFIA, Post-office, 84, Old Kent-road, S.E.

TO SAWMILL PROPRIETORS. EMPLOYMENT WANTED, by a MILL SAWYER. Age 23. Can give either bench or frame. Shaping and fitting plan, and country. Ten years' experience. Good references.—Address, W. C. 14, Telling-street, Lambeth, E.

TO BUILDERS AND CONTRACTORS. A Young Man of steady habits, and extensive experience, requires a SITUATION. Unexceptionable testimonials, and references.—Address, N. W. 13, Bechem-road, Hornsey-road, Lond. e. N.

CLERK, TIME, and STOREKEEPER.—A Clerk of WORKS, who has had considerable experience in a Scotch house. Good accountant, and well acquainted with the usual routine. Undeniable reference.—Address, 885, Office of "The Builder."

TO BUILDERS AND CONTRACTORS. WANTED, by a thoroughly practical energetic FOREMAN, an ENGAGEMENT, at once. The Advertiser has a general first-class knowledge of his business, and is quite competent to manage one. Town or country. All letters to state terms.—Address, O. L. 29, King-street, Fortin-square, London, W.

TO ARCHITECTS AND CONTRACTORS. WANTED, by the Advertiser, a SITUATION as CLERK of WORKS, in town or country. Has had several years' experience in that capacity. He used to be given work, about work, and general works. Good reference will be given.—Address, I. M. N. Post-office, No. 37, Clifton-street, Fitzhugh-square, London.

TO ARCHITECTS AND CONTRACTORS. WANTED, by the Advertiser, a SITUATION as CLERK of WORKS, in town or country. Has had several years' experience in that capacity. He used to be given work, about work, and general works. Good reference will be given.—Address, I. M. N. Post-office, No. 37, Clifton-street, Fitzhugh-square, London.

TO BUILDERS AND CONTRACTORS. WANTED, by an experienced, energetic Man, of very sober habits, a SITUATION as MANAGER, or General Foreman. Aged 42. First-class testimonials.—Address, A. B. 28, Artillery-place West, Chiswell-street, E.C.

TO CONTRACTORS AND OTHERS. WANTED, a RE-ENGAGEMENT as MANAGER of extensive WORKS; has just completed a large drainage contract. In of great experience, steady, and energetic. Aged 40.—Address, A. B. 351, City-road.

TO ARCHITECTS AND CIVIL ENGINEERS. WANTED, a SITUATION, as CLERK of WORKS, by a person who has carried out extensive works abroad.—Address, ALFIA, 4, Richmond-place, W. Deiston, N.E.

WANTED, by the Advertiser, a SITUATION as JUNIOR CLERK, in a Builder's Office. Has some practical knowledge of the business.—Address, A. B. 35, Seymour-street, Knotten-square, N.W.

TO BUILDERS. WANTED, by an energetic, steady Man, or Painter, Grover, or Worker, Paperhanger, &c.—Address, S. W. 18, York-place, Beckington-street, Strand, London.

TO BUILDERS AND DECORATORS. WANTED, a RE-ENGAGEMENT, as FOREMAN of PAINTERS, by a respectable energetic Man, of great practical experience. No objection to country, or taking charge of a Job. First-class testimonials.—Address, DECORATOR, 85, Fences-road, Newington-hill.

TO CARPENTERS, BUILDERS, &c. WANTED, by a Young Man, who has been in the above trade five years, a SITUATION. Can work at the bench or fix. Wages not so much an object as a competency.—Address, CARPENTER, 35, Manor-church, Waltham-st. S.

The Builder.

VOL. XXV.—No. 1276.

What there is still to do in Glasgow.

We have tried, in two preceding papers, to tell, as far as we were able, the manner in which the progress of Glasgow has been aided by the citizens themselves, in the first place as individual members of that large community; and, secondly, in their collective capacity as a corporation. It must be admitted, we think, that those efforts have been most praiseworthy, and on the whole, they have been in the proper direction. But our readers will easily suppose, on considering the

and extension of such an important city as Glasgow—although many difficulties may have been surmounted, that many errors must have been committed, and that many evils remain to be encountered.

Accordingly we purpose to devote an article to these circumstances, in which we should not shrink from our tone can scarcely be that of our own eulogy or commendation. Nor should Glasgow readers regret our candid criticism for they will have seen that we do not write in a cynical or a depreciatory spirit. It is always to be acknowledged that it is the nation and the undoubted prerogative of the press in this country to criticise such measures as the improvement of great cities, particularly with respect to the principles and methods by which reform is ultimately obtained; and it is scarcely necessary to observe that this journal has some right to be heard on such questions. Indeed, the *Builder* has had its share of narrow to plough in this direction, or, to use the appropriate metaphor, its own crossing the deep; and it has been a dirty one.

The first fault we must find then is one about which there can be no dispute. We refer to the state of the Glasgow and South-Western railway, which is certainly in a most discreditable condition. The platforms extend several hundred yards outwards beyond the station roof; consequently the poor traveller and his traps are left into a miserable plight, after stepping off of the train on the platform, if he should be at the end of his journey in the midst of a heavy shower of rain. Then it turns out that the station is built like that of the Great Eastern Railway at Fenchurch-street, at an elevation of 40 or 50 ft. above the level of the street, and need not stay to demonstrate the evils of

The passengers make their exit by a steep flight of steps, very much worn, and dangerous-looking, which we are certain

must have been the scene of many severe accidents; and the luggage is conveyed by porters by a long, narrow tortuous inclined plane, to the regions beneath, under conditions of great risk, if not of positive danger. The somewhat imposing Doric portico which decorates the front of the station in Eglinton-street is no set-off to the gloomy hall and the dingy offices behind it; and there is no excuse at all for the prevailing dirt. Of course we shall be told that the traffic is very great; but then we reply that the profits are very good. Sir Andrew Orr, who is, we believe, chairman of the directors, told the shareholders at a recent meeting, that there is not better security for debentures on any railway in the kingdom. We hope Sir Andrew does not include the station in his estimate of the securities; for, if so, there might be grounds for differences of opinion.

The next fault we must find is with the general state of the streets. The most cursory inspection of the principal thoroughfares of Glasgow will convince any one in a moment that the surface cleansing is inadequate. It would be wrong to say that the streets of Glasgow are as bad as those of London. But they are very nearly as bad. The traffic in Argyle-street, for instance, is almost equal to that of Oxford-street; the omnibuses are larger, heavier, and frequently more crowded than those of the "General Omnibus Company;" and, since the principal thoroughfares alone, as it appeared to us, are paved with dressed cubes of granite, the cross streets of Glasgow, such as Stockwell-street and Maxwell-street, often present a shocking expanse of puddle—on wet weather especially. Glassford-street seemed, on one occasion, in the condition of a mews that had not been swept for a day or two; and the fact is, we discovered after careful inquiry, that the practice in Glasgow is to sweep the whole streets thoroughly, excepting, perhaps, the most crowded thoroughfares, *only once a week!* Now, this practice, we submit, is altogether insufficient to meet the sanitary requirements of a city like Glasgow, and is not at all in accordance with the spirit of the age. It is recorded in the Talmud that the streets of Jerusalem were swept every day. We do not see why modern Glasgow should yield in the matter of cleanliness (which is next to Godliness) to ancient Jerusalem! We must also point out that the footways along the lines of the principal warehouses are often impassable from the use private persons seem to make of the pavement when receiving or despatching goods. Miller-street, for example, is quite as much obstructed by drays and vans, with their huge horses, as Wood-street or Gresham-street, and very nearly as noisy. Yet here the authorities have thought fit to establish the library instituted by the late Mr. Stirling,—the only one in Glasgow, by the way, in which a stranger can consult any of the standard works. Of course the Glasgow streets suffer as much as those of any other large town in the matter of being cut up with gas-pipes and water-pipes at intervals more or less short; and this is an evil we predict which will grow in magnitude until it will become quite intolerable. Something towards a cure of this chronic disease has already been effected by the underground arrangements in the recent improvement of Southwark; and we see no reason why this or a similar plan should not be adopted in the projected streets to be made under the Glasgow Improvement Bill.* This, however, may or may not be a thing of easy accomplishment; but surely it would be an easy matter to keep the surface in better order. In connexion

* See illustrations in the *Builder*. Poor Tom Hoed used to call this intermittent process of excavation "the City grave-digging." Our readers will doubtless remember his humorous stanza:—

"'Grave-digger,' I said, 'what grave diggest thou
In the heart of London town?'
And the deep stern voice of the digger replied,
'We're a-laying a gas-pipe down!'"

with this subject, it is curious to note the tendency of the Glasgow authorities to copy the names of the principal London streets. Regent-street, Oxford-street, Cambridge-street, and such like, are perhaps common property; but Berkeley-street, Grosvenor-terrace, Windsor-terrace, &c., are evident plagiarisms. There is even a tendency visible on the part of the inhabitants to contract, and therefore destroy, the euphonious nominative of Sanchieball-street (*Anglicè, Willow-hall-street*) into something like Sahall-street or Soho-street! And what right has Glasgow, in the name of St. Eleanor, to set up a spurious Charing-cross! It is hardly worth mentioning the subject, for after all it merely involves a question of sentiment; yet we cannot help calling to memory the statute under the Mosaic law, and the penalty annexed to its infringement, concerning the removal of the ancient landmarks.

If we pass from the streets and examine into the method of removing the refuse and garbage from the private dwelling-houses, we are afraid we shall find equal grounds for censure. In this process of cleansing,—as contradistinguished, however, from surface-drainage,—Glasgow differs in one important respect from Edinburgh and other Scotch towns we have inspected, and we are sorry to say for the worse. Ash-pits are universal. Not in the older quarters of the town alone, but in the most fashionable modern streets, it is the custom of the inhabitants to empty the whole dust, ashes, kitchen garbage, and other refuse, into an ash-pit or dust-bin in the court or hack yard; and this accumulation is supposed to be removed by the authorities, at least once a week. We shall also suppose in all charity, that the duty is always faithfully fulfilled to this extent; and that no residuum of the filthy *débris* is left to contaminate and ferment the succeeding heap. But even then it will not suffice. We are too well aware in these days of the disastrous consequences which flow from the accumulation of any sort of vegetable matter—garden refuse, even—when freely exposed to the action of moisture, to expect that the contents of these ash-pits will not follow the natural law of decay and putrefaction.

There is obviously no excuse for this antiquated system; and the only reason which we can discover for it is an historical or traditional one. Glasgow has always been distinguished for its dung-heaps (*Scotticè, middens*). In the year 1751, for example, the street which is now called Argyle-street was the principal thoroughfare in the west end of the city; yet the roadway was a favourite place for the deposition of dung, huge heaps of which were accumulated until they obstructed the thoroughfare. The same evil prevailed to at least an equal extent within the quarters of the Gallowgate and Salt-market, notwithstanding numerous proclamations of the magistrates to the contrary.* We cannot help pointing out here that this continual *law-making* and *law-breaking* is one of the greatest curses of Scotland, and would seem to indicate some gross defect either in the constitution or the administration of its municipal codes.

We were glad to perceive that a vast number of Macfarlane's cast-iron "stopping-places" had been erected, some of them, as we have pointed out, in highly disconformable situations, throughout the streets of Glasgow. We are sorry to find a single fault with these useful sanitary appliances, but the fact is, many are not supplied with water in any form, consequently they act, in hot weather, as so many alembics for the distillation of those gases with which our railway stations are so peculiarly well perfumed. With such an abundant supply of water as Glasgow possesses, it would be

* Some of these curious municipal edicts are preserved in Mr. Pagan's admirable work, "Glasgow, Past and Present."

an easy task to abate this nuisance, at all events. We tried to find a corresponding number of public water-closets, but we failed.

We must now say a few words about the drainage. It is not our object to describe the entire system of the drainage of Glasgow, which, as we have already stated, is very good,—at all events, in its construction, so far as it goes; but we may try in a few words to describe its leading principles with respect to levels and outlets. Glasgow lies, of course, in the basin of the Clyde, on the slopes of a valley more or less distinctly formed by the action of the river on its circumjacent rocks. The natural drainage outlet is therefore the river and its confluent streams, such as the Molendinar Burn and the Kelvin. Confining our observation to the northern side, it is easy to see that there is a gradual elevation of level somewhat like that which occurs between Upper Thames-street and Islington. In fact, we may trace from the Clyde to the rising grounds above a parallel series of plateaux, the most important of which runs from the cathedral along by North Hanover-street, the top of Buchanan-street, at Grange-road, Garnet-hill, the Crescent-hill, and Gilmore-hill. Above this the highest level is reached at Port Dundas on the line of the Fifth and Clyde Canal. One of the most startling phenomena which the stranger in Glasgow can come across is to see for the first time from Glasgow-bridge, where he may be viewing the shipping, perisps, at the Bromielaw—his horizon bounded on the north by another forest of masts 200 or 300 ft. above the level of the river! It looks like an optical delusion until the explanation is made of a canal being there. It will be seen at a glance, therefore, that the drainage of Port Dundas must command the flow of the sewage which proceeds from the lower levels, and there is absolutely no separation of the systems. Let us observe the consequences. Port Dundas is a region of chemical works, distilleries, bone works, glue works, paraffin works, and patent manure manufactories. We know from sad experience the nature of the liquid refuse which these enterprising people pour into the drains. Supposing one manufacturer to send a waste product of sulphuric acid or ammonia; a distillery some decoctions of grain wort; a cotton manufacturer the oily liquid peculiar to his trade; and the others some crude paraffin, some hot glue, and some phosphogano,—there would be found in that sewage matter the elements of the most poisonous gases which it is possible to imagine. But if we add to this the ordure from water-closets, and the drainage from sinks, the entrails of putrid fish, and the hot water in which vegetables have been boiled, together with a proper and always necessary quantum of the liquid manure of the streets,—we should then get a combination the most horrible which a sewer could produce. That is, however, only the theory of combination in this case: let us inquire for a moment how stand the practical results. During hot or dry weather a bad smell proceeding from the sewers pervades the whole of Glasgow! There are gully-holes in the City-road from which is vomited a combination of smells so bad—so infernal, as they were on one occasion described to us—that a horse would shy at them! There are houses we saw in St. George's-road in which it is impossible to open the windows; some of which houses were, at the same time, damp from their faulty construction. The consequence was that in two days the carpets were covered with minute fungi, and the clothes in the wardrobe with green mould. But these are not solitary cases. At the head of Buchanan-street, at Blythswood-square, in Garnet-hill, even in the fashionable crescents, in short, wherever an elevation occurs such as we have already pointed out, the soil-pipes of the houses act as so many conductors or ventilators to the sewers; and during certain periods of the year some of the best houses become simply uninhabitable from bad smells, for which, moreover, no one seems able or willing to account, far less to cure! Here, then, we venture to say, is an evil of the first magnitude. Until Glasgow shall have been thoroughly sewered on two or three separate systems our firm conviction is that the best and highest class of property will be subject to constant deterioration in value; and the health of the inhabitants will suffer a corresponding lowering of the vital forces. It will be observed that it is not the mere house drainage alone they have to contend with; those horrible gases we have pointed out are actively interferred through the whole system of sewerage. Systematic flushing, in our opinion, would only

aggravate the evil; and no method of trapping with which we are acquainted could surmount this fatal influence. For, if repressed by water, the gas will in time saturate the water; if by valves it will in time burst the soil-pipes. It may, indeed, be possible for the speculative builder of fashionable tenements so to manage his drains that he sells the property; but in a year or two the evil will be as bad as ever. In point of fact, one has only to observe the marvellous falling off in a few years of the rental of certain streets, such as those on Garnet-hill, together with the constant per-centage of deaths from fever which occur in the same streets, to arrive at the just conclusion that some unseen but deadly enemy to life and property has been silently indeed, but actively and surely, doing his diabolical work! It has of late years almost grown into a postulate of sanitary economy that the higher a house is above the level of the river the healthier it is. And such is, no doubt, the case, all other things being the same. But one important principle must form a necessary condition to its general application, and that is, that the gully-holes of the street and the soil-pipes of the houses shall not serve as conductors to the sewer-gases which are generated at the lower levels. We are sorry to say that this notion does not exist at this moment in connection with the Glasgow drainage; and accordingly if we had the good fortune to pay soot and lot in that enterprising city, we should choose to dwell at a lower level, if not on the banks of the river itself.

Only we are afraid as to the Clyde that,—

“There's no path by the river o'ershadowed with trees”

that could be described, with truth, as being salubrious, nor no wood near which a poor valentinarian in quest of pure air would seek to build a cottage. For the difficulty we have to contend with here is, that the river is itself little else than a huge and abominable cesspool. We are sorry to be compelled to use such language respecting the Clyde, which is a river of great natural beauty, and has been the object of much careful and costly improvement. The Glasgow people are very proud—and justly so, in our opinion,—of their great achievements in dredging, deepening, embanking, and constructing quays to this noble river. Although we can hardly endorse the eloquent panegyrics of certain local authors—who compare the efforts of the ancient Egyptians in building the Pyramids of the Nile with those of the Glasgow merchants in making the Clyde navigable—we are still perfectly prepared to recognise all such efforts, and to appreciate their good results. To this end we must say that a great effort yet remains to be made. It is quite impossible that the present system of discharging into the river such conglomerate sewage matter as Glasgow continues to yield in annually increasing quantities can last much longer. We have not made the calculation per head of the population, and there is no data extant that we know of respecting the drainage products of manufactories. But it would be comparatively easy to form some approximate measurement of the quantity of liquid sewage poured into the channel of the river; and the result, we suspect, would be startling. It is, indeed, a sickening sight, particularly on a hot day, to observe the process of contamination. Let us take our stand on the Suspension-bridge. Every two or three hundred yards on both sides of the river, and about 6 ft. under the crest of the embankment, we may detect the mouth of a common sewer belching forth a small catarrh of fluid of the colour and consistency of diluted London porter. When the tide is out, and the filthy torrents discharge themselves in innumerable rills over the dark, slimy, bubbling sludge which covers the *alveus* like a stratum of coal tar, and when this occurs under the glare of a hot sun, the smells proceeding from the river are such as to baffie all description. Certainly they have nothing in common with “the spicy gales of Araby the blest.” The worst feature of the case is that the Clyde, being a purely tidal river, the sewage matter held in suspension is carried backwards and forwards with the flux and reflux of the tide; and, moreover, every increase of the volume of river water at the basin of the Bromielaw serves only to increase the diffusion of the ill-agglomerated and unhealthy particles.

The river itself being in this condition, we can hardly look for much improvement in its tributaries. The once beautiful Kelvin, after hiding farwell to its upland glens and their healthy atmosphere, is seized upon at Port Dundas, and

after being poisoned there and receiving all sewage of the adjacent streets and crescent steals away, foul and contaminated, through West-end Park, and finally disappears through the wheels of the flour-mills at Partick. It forms anything but an ornamental water to beautiful park, and its condition, we have reason to know, caused Sir Joseph Paxton much trouble and annoyance. On a hot day the easiest way to discover its aromatic qualities is to stand for few moments on the bridge which crosses little river and forms the junction between Great Western-road on the one hand, Drurwan-hill on the other. We need not be specific. All we can say is, that the sensate anything but refreshing or agreeable. The Kelvin, however, is totally eclipsed in depravity the state of the Molendinar Burn, which we only compare to the Fleet Ditch before it is covered in and converted into the Hollows of Nevertheless, it still sweeps round the base of ancient cathedral. For the purpose, we suppose of preserving a respectable-looking body of water at this point, a weir is erected under bridge which crosses from the cathedral churchyard to the necropolis—a structure which not inappropriately designated “The Bridge Sighs.” But, whatever may have been the intention of this provision, its principal effect has been to produce only a pool of filthy stagnant sewage, which must doubtless exercise its own influence on the atmosphere of the cathedral on a hot Sunday in July. This sewage stream next passes, without any cover, or even fence through the open spaces of Drygate, where the small boys amuse themselves with splashing bricks and broken bottles at the dead cats and such like objects of interest; it flows by a culvert underneath the foundation of the jail, doing some duty, we suspect, in the punishment of the Glasgow criminals; and again it emerges once more in open day, on the opposite side of Duke-street. Here it receives the waste steam and other superfluous products of a large cotton manufactory, passing at the same moment, we observe under the broad flanges of an undershot wheel. After this it finally loses itself somewhere underground beside the miserable quarters of South Pettigrew-street and Bridge-street. We would like to be thought guilty of an exaggeration; but we scarcely ever remember, unless it were on occasion, in a knacker's yard, to have had the evidences of a disgusting smell so strongly brought home to our senses as we had on overlooking the ditch for a moment, at the point of its contact with the cotton-mill in Duke-street. Nor was our disgust unmingled with regret; for this little streamlet, now so fearfully polluted, has a history as old as that of the Thames or the Sever. One of the earliest traditions with regard to the origin of Glasgow, is that the Druids had an altar on its banks in the surrounding forest. It had undoubtedly determined the site of the ancient cathedral; and it is equally certain that St. Mungo had consecrated the silver stream and had baptized his converts in its pellucid waters. These are not the days of primitive Christianity, we shall be told. This is the era of commerce and manufactures. Well; we do not see why the latter epoch should not imitate the former in preserving the purity of its rivers among other things!

If anything were wanting to complete the circle of polluted waters with which Glasgow is encircled it would be furnished by the canal at Port Dundas, which is in a worse condition than the Regent's Canal, and that is saying a great deal. But the canal is not the worst feature of Port Dundas. We have previously indicated the nature of the manufactures in this colony of chemical works, and described the influence they exercise over the lower-level sewage. That is also bad enough; but it is nothing in one sense, compared to the “foul and pestilent congregation of vapours,” which they pour into the atmosphere of the city. There is no least doubt but the most vital of them is—how questions in Glasgow at this moment is—how to purify its atmosphere. But this we are afraid is a wide question, and cannot be properly discussed unless in a separate article. We shall conclude our present remarks with a few observations on what we must regard as defective police arrangements.

There can be no doubt, we think, that a good many of the social evils under which Glasgow suffers is to a large extent due to the conflicting jurisdiction of its various municipal authorities. There are at least a dozen of separate and distinct local boards in Glasgow,—the town coun-

the police commission, the Clyde trust, water trust, the statute labour committee, local poor-law boards, and a multitude of subordinate committees, springing from their pet stocks, which all possess more or less of an administrative character within the same category of duties. For example, there are inspectors of nuisances under the Poor-law Act, inspectors of cleansing under the Glasgow Local Police Act, a medical officer of health under the general Police Act for Scotland, inspectors of sewers, an inspector of markets, and an inspector of gas-meters, &c., under the recently applied Companies Act. The Lord Provost, in his capacity of chief magistrate, is of course chairman of most of these local boards; but they are, nevertheless, separate members of the municipal body, under different Acts of Parliament, with a distinct constitution, and always provided with separate clerks. The clerks are also the law-agents for their own peculiar Boards. Can our readers derive, then, that these bodies carry on a state chronic intestine warfare with each other; that litigation or legislation in some shape constitutes the principal business of the statutory bodies; and that this is always carried on at the expense of a generous and discerning public? We who wish to study well the progress of large cities in Scotland must devote some time to the discipline by which the corporation clerks are appointed the law-agents of their constituents; and the study will, we are certain, shed much light on the heavy increase of public nuisances! The genius which these gentlemen exercise for levying assessments,—that is to say, upon the communities over which they exercise control,—was described to us on one occasion by an impoverished house-owner as being equal to the genius of Rob Roy for levying blackmail! Our chief fault to them, however, is of a professional character: they are the enemies of all systematic progress and improvement such as a town architect or engineer might effect without any litigation at all! How glad that we hear so much of the Lord Provosts of Glasgow and Edinburgh, and so little of Mr. Crick or Mr. Conist? How is it that sums of money are spent every year in promoting legislation,—abortive for the most part, and so little expended in positive requirements? The most ingenious town clerk, and the most virtuous Lord Provost, even supported by the comprehensive police Act under the sun, will, in our opinion, to make a city clean unless improvement be carried out and constantly supervised by a competent engineer. It is too high the fashion, we suspect, to postpone the services of this class of men to those of the town clerks and their legal concurrents; and the fact we have come to the conclusion, after long experience of the subject, that those towns which employ the greatest number of police bills, and are best provided with local Boards, are the most governed, the worst cleaned, and the most heavily taxed.*

And besides, if all this legislation were actually to accomplish its intended purpose, there would be nothing to regret, perhaps; but such is not the case. In the first place, we must point out that there is great need for a good Building Act in Glasgow. We will not stay to illustrate this by examples taken from contemporary construction, but we are glad to acknowledge that nature has done much for the builders in providing free use of splendid quality and in inexhaustible quantities. An 18 in. or 2 ft. rubble wall is certainly one of the very best securities against fire; nevertheless, fires are of far too frequent occurrence. We happened to observe an erection of shops in progress in Sanchichall-street, and did the whole range of six or seven fronts were divided from each other by ½-inch deal, and divided on cross standards at the floors and ceilings. It is quite clear that a fire in one would speedily reduce the whole to the ashes, and seriously endanger the houses behind. Again, we noticed a most conspicuous case of an enclosed area, 6 ft. deep, in Bothwell-street, along the whole basement, some 800 yards in length of that handsome range of buildings, where Messrs. Hutchison & Co. have their offices. There was not the slightest vestige of a railing. It is true there were steps from the pavement downwards; but it is scarcely necessary to say that a man might split his skull by falling down

6 ft. of steps on a dark night! It is also very grievous to behold the manner in which the foot pavement is cut up and interrupted by masons' sheds whenever a new building or an alteration is going on. It never seems to occur to the Lord Dean of Guild, or whoever is the presiding spirit of the building regulations, that in stepping from the footway to the roadway of a crowded thoroughfare in consequence of such obstructions, the passengers risk being run over and killed! But this is an excellent type of the general principles which characterise the whole of the Glasgow municipal government.

We have already spoken of the cleansing; let us give a few illustrations of another species of neglect. The magistrates, in virtue of their *nobile officium*, are, in addition to their other duties, the administrators of the Public Houses Act, or the Forbes-Mackenzie Act, as it is called in Scotland; and they delegate this disagreeable duty to the police. Accordingly, the chief part of a policeman's duty during the night consists of watching low public-houses and unlicensed shebeens. We will not speak of the bribery and drinking to which the constables are exposed; but the legitimate consequence is that their other duties are neglected, and hence garroting and robbery, we are told, have prevailed to a frightful extent in Glasgow since the operation of this attempt to make Scotsmen sober by Act of Parliament. Fires, too, are of more frequent occurrence, it is said; but we will do the Glasgow policemen the justice to say that they make plenty of noise, at all events, about a fire when it breaks out.

Tired with a long day's walk through crowded and noisy streets, his brain fired with a multitude of new and totally strange ideas, his heart sad and depressed at the sight of much misery and wretchedness, amidst so much wealth and opulence, we shall suppose the traveller through Glasgow has, at length, sought his weary pillow.

"Light thickens; and the crow
Makes wing to the rooky wood."

The noise of the lumbering omnibuses gives way to that of the cabs; and even this rattling noise is gradually hushed in the silence of the middle watches. A vision of gentle dreams, Highland lakes, herring-boats, mountain streams, waterfalls, heather hills, rocky passes, purple clouds, northern mist, gradually suffuses the slumbering yet curiously sentient intelligence; and the weary traveller sleeps in peace. Suddenly the stillness of night is invaded by the horrible concatenation of sounds which can be produced alone by the watchman's rattle; and a stentorian voice is heard shouting at its full pitch—repeated again at the intervals of about ten seconds—*Fire, at 329, Trongate!* Up starts our poor sleeper, as much alarmed as Isaac Shove was when Toby Tossopot performed the feat! He will reflect, in all probability, although this is an odd proceeding, that these Glasgow people are careful of their warehouses, and a fire is a dangerous thing. It may be as well, perhaps, to alarm the community: an ancient custom, doubtless.—Watching and Warding, Burgers, Border fends, Beacon fires; and he has hardly again succeeded in reaching the arms of Morpheus, under this new set of ideas, when his slumber is once more rudely broken by the same diabolical rattle, and the same stentorian lungs. This time (peal the second), the fire is in 615, *Buchanan-street!* No relapsing into slumber a second time, for in a quarter of an hour afterwards, perhaps, comes the peal the third,—128, *Virginia-street!* and so it may continue at stated periods during the night. After long and sleepless consideration, the stranger will probably come to the conclusion that he has fixed his quarters in the regions of the central fire-brigade of Glasgow, and that he will change his hotel next day. But alas! he will learn next day that the practice is universal and coincident with the boundaries of the city; and he will find his disgust not a little heightened by reading in the morning papers that there had been only two fires in Glasgow during the night (the others had obviously been false alarms), which had been got under, however, without the necessity of turning out the engines; and that Councillor Higginbotham and Ballie Muckleworth had distinguished themselves greatly by being early on the spot!

But in case it should be supposed that there are no similar annoyances during the day, we must ask leave to adduce one other example. Some parts of the New Town of Glasgow are built, as we have tried to explain, upon a series of eminences, at the base of which lie the parallel

thoroughfares. Branching from these main streets, at right angles, are numerous cross streets, such as Hill-street and Dalbois-street, which vary in their gradients from one to one in five. Some streets, indeed, such as Hanover-street, are almost too steep for even an empty cab. Nevertheless, every morning from six to eight o'clock the painful process may be observed of an old broken-down cart-horse vainly striving to mount those hills with a heavy load of coals. The attempt is painful to see; it is still more painful to hear; for the coal-carrier is usually most lavish of his whip and his lungs; and his language of objuraction—which the poor horse doubtless understands—proceeds from *forte to fortissimo* in a string of oaths and imprecations so horrid that we dare not venture to transcribe them in our columns! Need we add that the poor horses, overladen and overloaded, often fall under their burden; but not till then is the brutal operation suspended. We saw this dismal scene enacted at least twenty times during our short stay in Glasgow; and we never saw the police interfere once.

Nor is the inhumanity of the Glasgow police confined to the lower animals. Otherwise, how is it that the poor servant-girls are permitted to expose their lives so freely in cleaning the windows? We have seen a group stuck over the elevation of a house like hutterflies, with expanded hoops, of course, and streaming caps. One on the first floor of one house; another on the second floor of the next house; a third on the floor above; and, finally, a poor ignorant girl from Argyleshire or Bute, cleaning the outside of the attic windows at an altitude of 50 or 60 ft., with her feet resting on the gutter or on the course. We shall not be surprised if it be found in the social statistics of Glasgow that a constant percentage of these girls are killed with falling into the area or perhaps getting transfixed on the railing! Their very temerity, we were told, constitutes their safety. But that is surely a slender reed on which to trust. If the evil consequences stopped here the remedy might be easy; but the practice we suspect brings about a certain callousness and indifference to the risk of human life which must be demoralizing to the whole community. It is perfectly shocking to see the manner in which children are exposed at the open windows of the top flats; and no class of fatal accidents are more persistent in Glasgow than deaths arising from the fall over a window. How very narrow the margin is in which the balance may be destroyed is well known to those who have studied the laws of statical equilibrium; but it would be absurd to expect such knowledge at the hands of those poor people who fall victims to their ignorance or their temerity; or, if we must use more precise phraseology, whose instincts of self-preservation are not equal to the complicated circumstances in which they find their obligations of existence.

Commending these observations to the attention of the Glasgow authorities, we conclude for the present by expressing the hope, that while Glasgow flourishes in commerce and in manufactures, she will not neglect to cultivate the softer graces of social amelioration. The philosophy is rapidly gaining ground in these days, that the civilization of a country or of a city is to be estimated, not so much from its wealth or its magnitude in relation to other cities or other states, as from the position it has gained in the great commonwealth of Humanity. There are no surer tests of this position than the evidences which it can present of a sound constitution and a good heart,—that is to say, of its public health and its public morals.

HOW LONG WILL LONDON BE HABITABLE?

THE sun in his course through Cancer, in this the 2,620th year from the foundation of Rome, has shed light on strange and unwonted scenes in the ancient capitals of Europe. In the Seven-hilled city the chief of Latin Christianity has found in the assemblage of the unprecedented number of 500 bishops, who have paid no empty-handed visit to their superior, an encouragement for a fresh defiance of the evils of civilization and the infidelities of science. Almost at the very time that the reiteration of the loftiest claims of the Pontifex Maximus have been uttered to the hundred and fifty millions of the Romish church, the two other chief sacred personages of monotheistic worship, the head of the Greek church, and the Caliph of Islam, have thrown

* Take Glasgow, for example: the police-rates alone this year amount to 2s. 6d. per pound of annual rateable property situated within the reghality! This is exclusive of poor-rates, prison assessments, &c., and it is more, or, the highest rate ever levied within the city of Glasgow.

the weight of their authority into the opposite scale, and have admitted themselves to be disciples of the great intellectual revolution of the century, by their respective visits to its headquarters and parade-ground at Paris. The presence of the Sultan and of the Czar in France is a fact more significant than is the gathering of the Episcopate at Rome, even as the *claret* of troops on the march is more formidable than the most resolute determination to stand fast behind the intrenchments of the camp.

Of those princes who have so far broken through the habits of centuries as to visit the world's fair in the French capital, the two whose presence in that magnificent city was the most marvellous, have not been content to return to their Oriental seclusion without visiting our own island. Thus the flag which even within the last century has hovered around our Western coasts in a manner called piratical by our ancestors, has floated over Buckingham Palace, and the Sultan of Turkey, the Caliph of the Mahomedan religion, has partaken at Windsor of bread and salt with the Defender of the Faith. Which sovereign had the most distinct recollection of what was intended by the founders of the great knightly orders may be doubted by those who remember that the Sultan wore a Christian decoration.

London prepared itself to welcome his highness. Of courtly reception there was no lack. The heir to the throne and his Royal Highness the Commander-in-Chief paid graceful honours to the Padishah, whose arrival divided the attention of the town with that of the Belgian volunteers. But the Egyptian Viceroy, a prince no inferior to the Sultan himself in little more than name, has only narrowly escaped being sent to an inn owing to the public spirit of a private nobleman. Disinterested individuals, indeed, writing anonymously in the daily papers, were good enough to offer the use of more than one palace, without asking the consent of its master; but not even this futile attempt at a vicarious hospitality has been able to disguise the fact, to which we called attention some time since, of the disgraceful want of accommodation in London for the guests of the nation. If the sovereign invite a guest it is for the sovereign to entertain the visitor; but if the nation invite, or if the visitor be not that of one brother sovereign to another, but that of a prince to a great capital, and to the home of a mighty nation, it is not only a discredit to that nation to have no abode in which to offer hospitality, but, in relation to Oriental monarchs, it is a degradation of the national character which is likely to have had commercial results. The English influence in Egypt, the English prestige throughout the Musselman world, could hardly receive a more marked and mighty buffet than would have resulted from sending the Viceroy of Egypt to a *Khan*. That such a prince should be received in a manner worthy of his position, as the keeper of one of the keys of India, and that the English nation should have been able so to receive him, without being beholden to any individual of whatever station, every one must admit to be proper. It is more than proper—in the way in which some men look at matters;—to be unable to do so may involve a serious political blunder. The absence of any fit house of reception for foreign princes at the Court of London might, with men of a temper by no means extinct in the East, have closed our overland traffic with India, or caused an ugly want of continuity in the wires of the Indian telegraph.

The want of accommodation has led us to other thoughts. With the rapid growth of our enormous capital, it is not impossible that a comparatively short time may make a sensible difference in the comfort with which it may be inhabited. In the present year the prevalence for several days together of a south-east wind, charged with the atmospheric temperature due to the source whence it blows, has borne to the vicinity of the parks the dense canopy of the smoke and vitiated atmosphere of nine miles of buildings. As the circumference of the vast city extends, so do the dwellers near that circumference suffer more and more whenever the wind sets towards them across the metropolis. In that large district which lies near the course of the North Western, the Metropolitan, and the Kensington Railways, the difference in the facility of breathing during a south-east and a north-west wind is almost incredible. With each annual addition to the space built over, this evil is exaggerated. We are without experience to guide us as to its limits and future results. We have from two and a half to three *per mille* of

the whole human race crowded into a space of some 122 square miles. The means by which Nature restores the equilibrium of animal and vegetable respiration, and takes up by the latter process the poisonous gases thrown off from the lungs of animals, are almost entirely hushed from this area, and the slight remains of vegetation are daily diminishing. The actual cubic volume of air daily vitiated over this space is a matter of importance. More than six hundred millions of cubic feet of carbonic acid gas are expired in London in the course of twenty-four hours by human beings alone, irrespective of smoke and of the gaseous products of combustion, and irrespective of all other sources of vitiation of the atmosphere. This quantity of carbonic acid will render twenty times its weight of atmospheric air unfit for the support of life. Thus, if we respire a perfectly calm day, in which the respiration of London should hang within the limits of the thirty-six metropolitan districts, and if we then suppose that, for the purpose of removal by currents of wind, the air thus vitiated were poured into the streets, to the exclusion of the space covered with buildings, it would fill the whole roadway and footway of the metropolis to a depth of between 8 ft. and 9 ft. This is the amount of poisoned air which London must daily exchange for fresh; and, in the course of the necessary process, whether more or less rapidly performed, what is the state of the suburb over which the whole mighty column of vitiated air is steadily propelled?

In calling attention rather to the organic sources of atmospheric impurity, than to the effects of actual combustion, it must be remembered that the latter, if less subtle in their influence on human health, are of overpowering magnitude. An average quantity of upwards of 14,000 tons of coal is daily consumed in London, some 30 to 40 per cent. of which may remain in the form of ash, or may be thrown into the atmosphere, in the partially volatilised form of smoke, while the remainder, converted into carbonic acid by the process of combustion, joins with the actual human and animal expiration which is constantly accumulating in close and unventilated localities. But it would seem as if the absolute chemical quality of the air were not the sole, or perhaps not even the chief element of its effect on human health. Temperature, no doubt, has much to do with the summer effluvia of life in the metropolis, when the daily consumption of coal is at the minimum, are far more offensively appreciable than is the case in the winter. The carbonic acid expired from the lungs may be as yet indistinguishable by chemistry from the carbonic acid produced by actual combustion; but that there is in the expired air a noxious quality distinct from, and more pernicious than, that for which chemistry is responsible, we think few will be prepared to deny. The carbonic acid gas emitted from three million human lungs may be chemically indistinguishable from that disengaged from the fourteen thousand tons of coal consumed per diem in the metropolis; but with the produce of respiration we cannot doubt that there is mingled a miasma quite distinct from the effluvia of the furnace. Thus we find on the leeward side of London, in this summer weather, while the July sun is obscured by the canopy of unconsumed carbon, the current of polluted air that creeps through the streets is such as to affect even strong men with a sense of faintness. When a slow but steady draught sweeps the confined air gradually from the metropolis, those districts over which it last passes, in this summer heat, seem unfitted to allow the chest to expand with a healthy respiration.

If this be the case (and we can appeal to daily experience on whatever happens to be the leeward side of the metropolis), now, what will be the case at the close of the present century, by which time we may expect London to contain six million inhabitants? The actual experiment of how large a city can be made secure is in rapid course of solution.

It is not our wont to be alarmists, or even to point to menacing evils without the purpose of suggesting a remedy. The increasing difficulty of living in London in the summer, notwithstanding the immense improvement in the purity of the Thames, becomes every year more oppressive. One remedy, or rather palliative, must, sooner or later, be found in the appointment of some competent professional men as *Ediles*, or officers answering to that description. In the province of such officers would fall the provision for the

architectural wants of the metropolis, the preparation of a palace, in which the visits of our sovereigns might be properly received, in which our own sovereign might welcome subjects. With many noble buildings for assemblies, theatres, concert-rooms, commercial halls, we must not forget that only apartment in London fit for the site of a great court is traced to the son of the Roman Conqueror, and that even this is ordinarily made use of only as a corridor. A palace which the Queen can hold her court is as in a requisite in the present day as one in which the nation can welcome its guests. Neither nor the other exists among us. But while we require an edifice to build our palaces, we do we require the services of such an officer superintending the general outline of our rapidly increasing suburbs. In many instances where properties march, mutual inconvenience seems to be the law. Long lines of street, opening fair avenue not only for traffic but for the circulation of air, are often cut across by crescents, terraces, or even mews, placed at the whim of the landholder, to the immense detriment of the whole town. Instances of this kind are familiar to every inhabitant of the West-end, and the impediments thus caused both to ventilation and to traffic are daily becoming more serious. That London should be regarded as a whole, and that individual caprice on the part of the various landholders and speculators should be kept within the bounds demanded by public health no less than by public convenience, daily becoming more imperative.

That the time will come, sooner or later, when the work of the *edile* will be useless without the aid of the chemist, there are already pretty strong indications. Those very spots which, with the wind in twenty-four points of the compass, enjoy all the advantages of pure country air, are the most oppressive during the prevalence of breezes from the remaining eight points. You go to bed under a pure sky and in fresh air; you awake with a feeling of oppression, under a sky that looks like the mouth of an enormous chimney, and find that the only change is in the force of the wind, by which you have become leeward of London. Thus the most agreeable suburb for nine months out of twelve, become the most unendurable for the remaining three; nor can you tell even for a day when either condition will prevail. If chemistry can offer available assistance, if science come in aid, consuming smoke liberating oxygen or ozone within the limits of the metropolis itself, and fixing or neutralizing the gaseous products of respiration or of combustion, we may see a new chapter in the history of great cities. But unless something of the kind be effected the present century bids fair to witness a different solution of the problem. We have lived to see third-rate towns larger than Aristotle thought that independent states would ever become. We may live to see light thrown on the question how far the laws of health and the necessities of respiration will allow of the constantly increasing agglomeration of the centres of population.

ANOTHER NEW SCIENCE.

It is becoming more and more difficult every day to determine the pale of science. Once upon a time "the circle of the sciences" was a current expression that implied a certain and well-defined sequence of studies. Works of reference of the period of the foundation of the Royal Society speak of the "seven liberal sciences" as grammar, logic, rhetoric, arithmetic, geometry, astronomy, and music, or music, as it was then spelt: these stood within the pale; the other sciences stood without. But now-a-days this exclusiveness has been cast aside by the scientific world, or it has been in some way overthrown; and it is, as we have said, more and more difficult to say of anything that it is beneath the dignity of science. A remarkable example of this expansion, or this comprehensiveness, in the minds of savans, is presented in the creation of a new section in archaeology under the presidency of Sir John Lubbock, which is to treat of prehistoric matters only; but a still stronger illustration of the same fact is shown in the ready acceptance given to folk-lore as a subject likely to be developed into a new science. The genial, fanciful, German fairy tale-teller, misnamed Grimm, opened the way for this recognition in his startling suggestion that our household tales, with their giants and giant-killers, are probably

fragments of a mythology that has now nearly faded from human knowledge. This seedling of a hint, with a fecundity only second to that of the magic bean-stalk, threw its tendrils around several collateral subjects and drew them together in one entanglement. Charms, cures, credulities of various kinds, old sayings, curious customs, legends of wonderful creatures such as the "laidley worms" of Northumberland and Durham; the investiture with supernatural power of certain objects, such as wishing-wells, the ash-tree, and various herbs; the lip-lore, in fine, of the simple, are now looked at with a new interest as likely to be of an antiquity equal to that of our stories. To collect these several scholars have set to work; but their labours are shadowed with regrets that they are so late in commencing them, for the last two generations have lost much of this kind of lore. Our grandmothers could have furnished thrice the quantity. We say grandmothers advisedly, for charms, cures, interpretations of dreams, and portents, unaccountable customs generally, but especially those attendant upon births, deaths, and weddings, the supreme incidents in man's existence, were, till the present day, left unclaimed as a worthless possession in the hands of the aged ladies north-country people call "and wives." Though unclaimed they were not, however, unheeded; for we suspect there are few persons, even now, without a corner in their hearts in which early impressions have enshrined an illogical belief in omens, of good and bad luck; although there are, doubtless, still fewer who will own to such harborage of fancies planted in their minds in the nursery. We contend, nevertheless, that if a wedding-guest saw a solitary crow as he was setting out to assist in the ceremony, and it began to rain heavily as the procession came out of church, and from the unexpected absence of other guests thirteen sat down to breakfast, at which the salt was spilt, and the bride and bridegroom accidentally crossed knives in the progress of the feast, and then recollected it was Friday, he would find himself arrived at the conviction, despite any amount of common sense or well-regulated condition of his mind, that the prospect before the wedded pair was not so brilliantly alluring. The bridesmaids, however, would shrink from the wedding-cake, and no more think of putting a piece under their pillows than of eating it. A century ago, there were as few people who would deny a belief in such manifestations and portents as there are now who would own to it. Did not Horace Walpole, though his genius was of a discriminating order, call at Northumberland House, to make "my Lady Northumberland,—soon to be Duchess of Northumberland,—to Cock-lano?" Did not Gæthe gravely record that his grandfather saw the principal events of his life enacted in dreams before they actually took place? Or, going farther back, did not the possessor of one of the most eclectic of minds, Martin Luther, in all earnestness recommend the murder of a child, under the firm belief that it was a changeling?

The more we think of this unwritten lore, the more curious it seems that we have hitherto only regarded it as ignorance and superstition, instead of remnants of an obsolete learning. It is not of to-day, for it has already fallen out of general circulation, and is only met with occasionally. Our so-called roughs know it not. Much of it is doubtless of Mediaeval origin, but there is more that must be older still, and probably of Celtic antiquity. The Druids were remarkable for their learning, which, Latin writers agree, was all unwritten. We have remains of their altars and their ringed monolith temples, side by side with our railways and telegraphs, wherefore not of their lore? We labour to light the contents of ancient graves and ancient caves, sealed we know not how many hundreds or thousands of years ago; we delve into grass-grown entrenchments full of circular foundations of pre-historic dwellings; we pick out of the accumulations of soil upon them narrow-heads, Celt-heads, antlers, bones, querns, pieces of broken pottery,—sufficient relics, in a word, from which we can gather how men lived in those remote times, how they hunted with flint-headed arrows, hewed down timber with stone-headed axes, huilt huts of uncoloured stones gathered from the valleys and hill-sides, where mighty waters had deposited them in still more remote ages, grew cereals on terraces on hill-sides and ground them; and must we conclude that though this amount of knowledge of a pre-historic people has survived every word of their thoughts, hopes, and fears, their rude experience

and vague theology have perished? Surely here and there, disguised in modern phraseology, we may have preserved snatches of the talk and credence of these early times; and the "medicine men" of a semi-civilised people may be traced in the charmers, or wise men and women, of Mediaeval and modern life.

We have had occasional collectors in this field, we may say, for centuries. But they have collected with a different object in view, and have therefore disregarded items that were not available for their purpose, notwithstanding their curiosity or interest. Bourne, for instance, wrote his "Antiquitates Vulgares," in 1725, with the expressed object of showing which of the popular customs and opinions might be retained with propriety, and which should be rejected as either Popish or Pagan; and his commentator, Brand, in 1777, follows in his wake, led by a conviction that his predecessor had not done justice to his subject, rather than with a view of applying his stores to an illustration of a history of the culture of the mind of man. Both traced many of the popular notions and vulgar ceremonies, as they called them, to the times when Popery was the established religion, and thence from Christian to ancient and Heathen Rome, but they did so with an ecclesiastical rather than historical aim. In the hands of Bourne, the fancies of the multitude became only so many unrequished superstitions, which want of reflection had incorporated with Christian observances. Brand supplemented this by hinting that Christianity, first at its promulgation, and afterwards at the Reformation, had connived at the continuance of many ancient practices under new names, rather than run the risk of any violent alteration of the current of existing things. Sir Henry Ellis, in our own day, has largely added to the collections of both these worthies; but, as editor of their works, has naturally gathered together such curiosities as would best illustrate their stores, rather than add to the number. The collectors abroad now, however, are of a different order. Their object is to save from oblivion all knowledge of the floating traditions and opinions which one generation has handed down to another from lip to ear and from lip to ear again, without the agency of scribe or printing-press. Their task is a preliminary one: not a leisurely scanning of ancient literature for solutions as to the meaning or origin of a belief or of a custom; but a hasty gathering together of the remains of this unconsidered lip-lore, lest it should be altogether lost. Hereafter they may trace portions of it up the streams of ages, and across the face of the earth.

Let us consider the pretensions of our charmers, or wise men and women, as they are variously called. They can charm away long-standing and recurring complaints, such as rheumatism, ague, erysipelas, whooping-cough, epileptic fits, as well as minor matters, such as cramp or warts. They can interpret dreams, and they can dream where to look for stolen property, and thus aid in its recovery. They can decoct love-philtres, and advise young people how to proceed if they wish to see the individuals who are to be their future partners in life; and they can tell fortunes. In some of these matters a personal interview with the charmer is requisite, and special treatment is called for; but in the majority of cases the circumstances of a case are met by a selection from a sort of floating currency of charms and cures, that requires no departure from usual practice. Portents, especially, require no special interpretation, though there are some few that may be almost considered private property, such as the supernatural appearances that precede the death of members of particular families. Many cures, too, are of general application. Should a child have the whooping-cough, for instance, there is no need of a special consultation with any authority upon the subject. Every old lady knows that it only requires to be taken out walking every day, till it meets a man on a piebald horse; or to be taken to a married couple, whose names are Joseph and Mary; or to be placed, with its feet to the tail, on the cross that is always to be found on a donkey's back; or to have its breast fast of milk divided with a ferret; either of these cures will be efficacious. More serious complaints, of course, require sterner remedies. Epileptic fits call for a sacrifice: offended powers must be propitiated with the death of a cock, the spot on which the afflicted person fell when first seized being the altar indicated. The rite of sacrifice is, further, visibly interwoven with the ceremonial of many other charms. The im-

palement of snails on thorns for the charming away of warts is another case in point, as is the victimization of frogs by sticking them full of pins for magical purposes. In the north the "necanny" trick of piercing a pigeon's heart with a quantity of pins, and burning it thus curiously studded, is believed by inquisitive lasses to reveal wonders. There is a remarkable confusion of idea in the minds of those resorting to such practices as to whether they are enjoining to their aid good or had powers. The difference, too, between an invocation and a prayer is not clearly recognised by young and crude minds, as we may realise in the following familiar lines which, seventy years ago, as a septuagenarian assured us, were said by many a child at its mother's knee as a prayer, nightly:—

"Matthew, Mark, Luke, and John
Bless the bed that I lie on.
There are four corners to my bed,
There are four angels round me spread,
One to read and one to write,
And two to guard me all this night.
If I should sleep and never wake,
I pray to God my soul to take."

And, again, in the rhyme in which Coleridge tells us the Christchurch boys used to invoke the aid of the Evangelists to assist in untying the knot they believed the devil was trying in their legs when they had the cramp. The same confusion of idea is apparent in the key and the Bible test, in which two persons place a key between the leaves of a Bible and expect both objects to turn round as a sign that the questions to which they sought replies were answered affirmatively; and in the selection of holidays for the performance or accomplishment of some other ceremonies. Thus one girl whispers to another, and has done so, we may presume, for centuries, "if you pluck a rose on Midsummers-eve at midnight and put it away in a box till Christmas, and then wear it in your hand or hair, some one will take it out who will be your husband, or hear the same name as that of your future spouse." Fridays, supposed to be unlucky from the fact of the crucifixion having taken place on one, are picked out as the only days on which some rites can be performed with any prospect of a result. This mystification is intensified in some counties by the interweaving of the sign of the cross as part of the occult ceremonies. In the midland counties we have heard of a cross being made at the foot of their beds by maidens with their shoes, who, getting into bed backwards, repeat the following charm on three successive Fridays:—

"I have set my shoes in the shape of a T,
Hoping my true love for to see
In his apparel and his array,
In his clothes he wears every day."

After which they may not break the charm by speaking till the next morning. This process is to enable them to dream of their future husbands, and hearing in mind the physiological fact that our brains, in some conditions, continue to parse, in sleep, the objects that last occupied them when awake, it is probable that it was successful sufficiently often to create a confidence in its efficacy. In the southern counties we have heard of as much trouble taken, on three successive Friday evenings, to procure a visit from the unknown or tardy prospective partner. For this purpose the damsels throw a handful of salt into the fire at the same hour, week after week, with a form of incantation in verse, which sets forth that it is not the salt that the fire is to burn, but the heart of the young charmer's lover that it is to burn, so that he may be neither able to rest nor he happy till he pays her a visit. To procure a letter from a lover, it matters not on which day of the week, all the longing lady has to do is to turn her bed over nine times.

Some old people delight in this kind of lore. It is upon their lips all day long. Their quaint sayings and constant reminiscences of old times make their conversation like a cabinet of curiosities. They can meet every case with a cut-and-dried saying, cut and dried we know not when, we know not by whom. From the birth of an infant till it has "come the length of a man," as the north-country peasant says, circumstances over which no one has any control indicate its destiny to these worthies. To begin with, the day of the week upon which it is born settles the leading features of temperament or fortune.

"Monday's child is fair of face,
Tuesday's child is full of grace;
Wednesday's child is born to woo,
Thursday's child has far to go;
Friday's child is loving and giving,
Saturday's child must work for living."

In some parts of the kingdom the rhyme goes

on to say, that the child that is born on the Sabbath-day is blithe and bonny, good and gay; but in other parts these desirable characteristics are deemed the special property of those born on Christmas-day. If, in dressing, a garment should be accidentally put on wrong-side out, it is a sign of good luck; if his palm should itch it is a sign that he is about to receive money; if his nose should tingle, that he is going to be vexed or pleased, according to whether the titillation is most observable on the outside or inside of that organ; if his ears should hum, he may be sure some one is talking about him; if the sole of his foot should exhibit any irritation, he may make preparation for going to strange places; should he trip in running upstairs, a wedding may be expected; and should he shudder, some one is walking over the spot that is to be his grave. Should he forget anything, or have to turn back for it after leaving the house, he must sit down before starting afresh, or he will meet with bad luck. In some parts of the country it is deemed imperative that he should also eat and drink, to avert the evil his carelessness would otherwise draw upon him. If he should meet a squint-eyed person, he need not anticipate much profit from the undertaking in which he is engaged; for in this rude and illogical learning a squint-eye is an evil eye for others besides its unfortunate possessor. His own hands tell his own fortune, without any need of consultation with the palmist; for if there be specks upon his thumb-nails, he is going to receive a gift; if these marks appear upon his first finger-nail, he has a friend; if upon the second, a foe; if upon the third, a visit to pay; and upon the fourth, a journey to go.

The days of the week are arbitrarily lucky for the conduct of some business and unlucky for the prosecution of other. Nail-cutting on some days is a most hazardous proceeding; all sorts of misery culminate on the head of the rash mortal who presumes to cut them on the Sabbath-day,—“hetter for him he had never been born;” and to cut an infant's nails before it is a year old is a sure way to make it a thief. Sneezing indicates a great deal more than the development of a catarrh or cold in the head. In the matter of steruntation lip-love has shaped the experience into this:—

“Sneeze on Monday, sneeze for danger;
Sneeze on Tuesday, kiss a stranger;
Sneeze on Wednesday, get a letter;
Sneeze on Thursday, something better;
Sneeze on Friday, sneeze for sorrow;
Saturday, see your true love to-morrow.”

Another rhyme says,—

“Sneeze three times before you're up,
You'll see you're awesheart before you sleep.”

Some household duties are regulated by a regard for old-world rules that some people could not bring themselves to infringe for any convenience. Washing-day is settled with almost as much solemnity as attended the adjudication of the proper recurrence of Easter, in the days of rivalry between the Celtic and Roman churches.—

“Those who wash on Monday have all the week to dry;
Those who wash on Tuesday will have one day gone by;
Those who wash on Wednesday wash in the middle of the week;
Those who wash on Thursday have all their clothes to neck;
Those who wash on Friday must truly wash at need;
Those who wash on Saturday must be sluts indeed.”

It will be seen that it would be next to impossible for any rightly-disposed person to commence laundry operations later than Tuesday in the face of this statement. The working-classes of London have a hebdomadal nomenclature of their own: Black Monday, Miserable Tuesday, Dreadful Wednesday, Equal Thursday, Better Friday, Joyful Saturday, Glorious Sunday. Assistants in shops, especially, sympathise with these attributes and own their application. After their holiday on Sunday, a return to business on Monday morning may be felt as tedious. Tuesday and Wednesday drag on still shadowed by the contrast of past joys; but Thursday is midway between these and those in anticipation. Friday heralds the near approach of the Sunday holiday; and by Saturday anticipation has concreted into content. The Saturday half-holiday movement has, probably, dimmed the acuteness of this feeling, which, for all we know, may have been thus expressed by London 'prentices in the days of Queen Bess, or before. Portents do not disdain to indicate the approach of events in the homeliest forms. Our current lip-love assigns different meanings to the cinder that flies out of the fire on to the hearth-rug, according to its shape. If it be roundish, it is a purse, and sig-

nifies the prospective receipt of money; if it be oblong, it is a coffin, and announces death; if it be hooded, or thicker at one end than the other, it is a cradle, and intimates the probability of addition to the family circle. A film of soot, hanging to either of the bars of the fire-place, is called a stranger, and indicates the arrival of one; and, should the fire only burn on one side, the approach of a stranger is considered to account for the non-combustion of the rest of the fuel. Sparks are more definite: they point out that the strangers to be expected are enemies. A tallow-candle, every one knows, lets us know when we are about to receive a letter, and the expression of “a thief in the candle” applied to fiery excrescences on the wick, looks as though our forefathers relied upon the candle as a sort of burglar-detective, the transition from the security afforded by artificial light against midnight depredators to the object yielding that light being easy. Out of doors it is just the same: there is a meaning to many things where one might be expected; and nearly everything the eye rests upon is an omen of some sort. As is probably allowed, whether in jest or earnest, wherever the English tongue is spoken,—a crow, in the south, a magpie in the north,—means much more than a close inspection of those ornithological specimens would lead us to suspect: one crow is sorrow, two are mirth, three a wedding, and four a hirt. Here the indicative powers of crows cease; but magpies continue the tale, five are heaven, six are hell, and seven “the devil's own sell.” Crows are accredited with a determination to soil the garments of such persons who do not put on some new garments on Easter Sunday. Should a dog howl, it is because he knows of had news. Trees and herbs are both associated with this sort of domestic magic. The ash, for instance, has powers over witches and wizards; and lasses choose lovers by its aid:—

“An even ash I do confess,
But new pull'd from the tree;
The first young man that I shall meet
My own true love shall be.”

Herbs have offices beyond those of healing. Sage, unassociated with onions, has a property as attractive as its flavour associated with that herb is appetizing. A maiden can see her future husband if she likes to pull a leaf or two of it at midnight on Midsummer's-eve. Our rustic informant of this fact tried this charm some fifty years ago, and saw, as she left the garden for the house again, the young man she married walking across an adjoining field. Her curiosity brought none of the evil consequences that are supposed by some to accrue to charm-trying, for she and her husband are still living, and among their handsome progeny is to be counted one of the brave fellows who won the Victoria Cross and a commission, for chivalry in the field in the Crimea.

We have not touched upon the pagans still lingering in this century, nor upon curious local customs, nor related legends, nor described the ghosts, goblins, hobgoblins, fairies, brownies, elves, hgies, kelpies, and other supernatural beings that have sent so many little folks to bed trembling, and caused them to lie there shuddering with their faces covered with the helldeths in so many lands, through so many centuries. Different countries have their special customs, their special supernatural beings, and local legends, most of which have found their way into riches of local literature. Goblins and hobgoblins, however, are citizens of the world, for we expect that if Gbetho had described the beings he feared to see as he hurried out of bed in the old mansion at Frankfort to be frightened back into it again by his father, who waylaid him in the long dusky passages, with his dressing-gown turned inside out for the purpose, he would have painted them in similar outlines to those with which Sir Walter Scott would have depicted them at a similar age. We have simply shown our readers a few samples of the new curiosities antiquaries are now collecting, many of which have not been hitherto caught but lip-love, and from which their industry and intelligence are likely to fashion into form and linn with vivid colours most interesting additions to our knowledge of the manner of the growth of the human mind.

GLAPHAM.—The chief stone of new Sunday-schools and lecture-hall has been laid at Grafton-square, Clapham. The entire cost of the structure is to be 2,800*l.*, of which 2,114*l.* have been paid or promised. Mr. J. Tarring is the architect, and Mr. Saunders the builder of the new hall.

ECCLESIASTICAL CELEBRATIONS AT ROME.

The magnificent celebrations just brought to a close for the Genetuary of St. Peter and canonizing of twenty-five new saints, might be considered from various points of view. It is not our part or desire here to enter upon any theological question or to estimate any one of the interests affecting the Roman Catholic cause in these proceedings that are said to have attracted a greater number of prelates and priests to that Church's metropolis than ever had been seen there. We have to confine ourselves to the purely artistic aspects, and the question as to the phase in the story and progress of sacred art, the claim to rank as arbiters of taste or style in things admitted within the sanctuary asserted for herself by Rome in the aggregate of costly displays, in the gallery of paintings (as we might call it, though ephemeral indeed), and in lavish apparatus prepared expressly for these days of solemnity in the St. Peter's and St. Paul's basilicas. In one respect, superior to what was seen in the former church, on occasion of the previous canonization (the 8th of June, 1862), the decorating of the same interior, in this last instance, profuse and gorgeous as it was, had one good feature,—that it adapted itself to, instead of in any part concealing, the architectural whole; and, amidst the multiplicity of silken hangings, painted banners, garlands, and gold lace, all the principal lines and masses in the vast basilica were left distinctly marked out. In the choice of colour, the prevalence of warm crimson and gold was happy, and the grace of pendant draperies was pleasing. The illumination, also tastefully designed, and marvellously diffused over every “coin of vantage,” radiating from the colossal tiara and cross, suspended centrally above the nave, and from measureless heights where it might be supposed no human hand could reach, produced effect the finer inasmuch as it did not dispel the solemn twilight, but seemed, like countless gems, to shine amidst a rich gloom, that allowed to appear, but yielded not to, the lustre of lamps, tapers, chandeliers, and candelabra. The report that for this decoration alone had been spent 80,000 scudi, that each of the great candelabra of woodwork made to imitate marble had cost 500 scudi, and that the round sum of 100,000 scudi was the minimum required for the occasion within the walls of St. Peter's alone, need not have caused surprise to any spectator. But nothing better can we say of the gorgeous *ensemble* than that, seen by artificial light, with the almost total exclusion of that of day, it proved magical, mysterious in resplendence, harmonious in all its varieties of pomp. The details would not bear inspection; and, as seen by common light, the whole appeared theatrical, in many parts even tawdry and trivial. What could be more offensive, for instance, than *imitation sculpture*, namely, chiaro-scuro paintings on flat boards to represent colossal statues of saints in the upper file of arched niches, the lower of which (and the upper also to some extent), along naves and transepts, are occupied by the giant figures in marble of all founders and foundresses of religious orders? What could be more unsuitable than artificial flowers, in immense garlands and bouquets, which, with childish idea of bringing such details into accordance with the scale of architecture, were actually made *colossal* also, chalice and petals swelling into proportions ludicrously beyond nature! We might even forgive chiaro-scuro on flat surfaces, to imitate the inimitable, in comparison to the absurdity of painted cheruim, all blooming in fleshiness, and Valentinian in style, supporting similarly painted garlands, alike flimsy in material, along the summit of cornices, behind interminable rows of tapers! As to the attempts at higher art, the colossal groups, illustrating the lives of the new saints, hung over each entrance within the atrium, and pendant on banners from each arch along the naves, sufficed merely to tell their stories with some effect from a distance, though exception might be made in favour of one, by Signor Grandi, presenting a miracle wrought by S. Paolo della Croce, founder of the Passionist Order. And the other great banners carried in the procession, displaying more conspicuous or ecstatic scenes in the careers of the same individuals, could not be said, at most, to attain any worthier object than the supply of so many imposing accessories, highly conducive, indeed, to the effect of that stately pageant as it slowly defiled through the array of troops with

the gleam of tapers lighted in every hand, the hundreds of mitres, and superb varieties of ecclesiastical costume—episcopal, cardinalial, oriental. Graver objections than any we have made above might be urged against the introduction of the cross of St. Peter, instead of that by which a lost world was saved, as the grand luminous centre to all regards, pendant from the tiara and keys, that blazed like diamonds, all in glass, high above the arcades between vault and cornice. Nor could there, we thought, be a less dignified subject chosen to represent in picture the supremacy of St. Peter than the homage offered by the natives of all lands, in ideal grouping, through that ceremony of kissing the foot of the well-known bronze statue that stands in the same church, and was this day docketed out in Papal robes,—such being the scene indifferently painted over the chief portal on the inner side. And this intent to refer the glories of the occasion to St. Peter, in the true spirit of Rome, however inadmissible by Protestants, was manifest in another accessory not suitable as entering into the decorative whole, the inscribing on gold ground along the entire extent of cornices, and in enormous letters distinct at that height, the full narrative of the mysterious discourse held by the Saviour, after His Resurrection, with that Apostle, while around the copula was read in similar letters on gold the text in which such spiritual prerogatives are conferred on Peter by the Divine Master.

Turning to another art, we must report in the highest terms of praise the character and execution of the grand anthem "Tu es Petrus," &c. composed by Mustafa, the first soprano singer of the Sistine Chapel, and performed at the offertory by three choirs, each of 100 voices, answering from extremities of the church in strains that seemed to float through and pervade its entire atmosphere, and in their alternations of exultant jubilee and sublime mournfulness, answered to our imagining of the song of angels more than any vocal music we have ever heard. A grand passage also was the *Te Deum*, in that part where wind instruments accompanied the fine old chant in which it is invariably sung at Italian worship; and the clarion strains at the elevation had the thrilling effect never to be forgotten by those who have attended the Papal high mass.

The choral music at the grand Vespers, when was repeated the same resplendent illumination at St. Peter's on this evening, would alone have sufficed to signalize the day among the *fests* of Rome's religious observances. And with a "Girandola" on the Pincian Hill, more brilliant and varied even than the precedents of such fiery spectacles—the chief design intended to illustrate the triumph of the Church over the five regions of earth (Australia included)—were closed the pomps of the 29th of June, 1867, destined to perpetual record for the sixty-second act of canonization performed by the Roman Pontiff, perhaps in no preceding instance attended with circumstances more impressive.

The exposition of the chair of St. Peter, removed from its bronze case and colossal supporting statues, to be displayed for three days above a lateral altar, offered a study for the antiquary, and attracted crowds even amidst the ritual splendours of the 29th of June. Of dark stained wood, the seat made very deep, it has a high back terminating in a triangle, and adorned with round head open work; the front, below the seat, encrusted with ivory in eighteen small panels, on each of which is incised either an animal or some symbol not easily distinguished as at the distance in which the relic was now seen.

From such description, it is apparent that the Roman tradition of this being an antique senatorial, or curule, chair, applied to Christian purposes for the use of St. Peter as an episcopal throne, is quite untenable,—if anything, the evidence of its details seeming to imply Byzantine rather than other origin.

For the decoration of St. Paul's, scene of the grand ceremonies on the 30th, the Pope, with all the cardinals and prelates attending, a better principle was adopted than at St. Peter's: scarce any draperies or hangings were admitted, but a profuse, and, indeed, tasteful illumination was dispersed along frame-work that followed in general the lines of architecture. As to the various popular fêtes and spectacles extending over eight days, and directed by the magistracy in honour of the great religious occasion, it may suffice to report that they were, as invariably the case with such things in Rome, brilliant, ingenious, and shy

carried out; nor could anything have been finer in its kind than the displays of pyrotechny. The illumination of the Capitoline Museum claimed higher admiration in the sphere of calm and classic beauties. Though not introduced amid ritual celebrations, the great picture painted for this occasion by Fracassini, to be placed in a hall of the Vatican among other illustrations of hagiography, and representing the deaths of the nineteen friars, monks, and secular priests who were hanged in a garret where they had sought refuge from Calvinistic persecution at Gorkum, all being among the individuals now raised to the honours of the altar,—this powerful art-work may here be noticed as the great success of the day in Rome, and as indeed asserting for Signor Fracassini, who is still young, a primordial rank in the local school; his affecting treatment of a painful subject having this high merit,—to say the least,—that it renders the horrors of the scene subordinate to, and subdued before, those higher attributes in which is announced the triumph of the immortal over the mortal, the victory of faith at life's direst trial. For some fortnight before the removal of this picture, the studio of its artist was daily thronged by visitors of all classes, attracted by all that fame had made known with no exaggerating tongue. As to the many other artists employed for the pictures at St. Peter's, and remunerated according to their standing, it would be useless to record their names.

Rome.

HEALTHFUL DWELLINGS CHARACTERISED BY CHEAPNESS.*

I HAVE stated that the best sanitary construction of a house, apart from any question of cost, would be on the principle of the Crystal Palace, only with thick slabs of opaque glass, and with double walls, inclosing (like double windows) a still air, which would be the best means of meeting external variations of heat and cold and preventing the evils of the absorption of moisture or of miasma. The chief novelty in construction in the Exhibition is in the model dwelling of the Co-operative Society of Paris, made by M. S. Ferrand, the architect, to some extent on the principle I have stated.

He constructs his walls of hollow brick in this, and makes the wall double; thus:—The thickness of the double wall is 5 in., which, of course, would be insufficient for hearing purposes. But the wall is held together, and the bearing power is obtained, on what I have termed the Crystal Palace principle, by iron columns, beams, and cross-tees.

He claims for this construction the advantages of walls which are thin, and which, therefore, save space, and yet are warmer, resist changes of temperature better, and are better non-conductors of sound than the common brick or stone hearing walls, and that at a lower cost.

Of the hollow-brick cottage constructions, with hollow-brick flat roofs as well as walls, in England, it is reported that, as anticipated, they are warmer in winter and cooler in summer than the common constructions; whilst ancient hollow floors, that are warmed by hot air underneath them, it is declared that the warmth derived from their extended surface is more comfortable than that derived from any other mode of house-warming.

M. Ferrand has an extended application of these double walls as a means of equalizing temperature. He opens the space between the two hollow walls into the cave or cellar beneath the ground-floor, from which the air circulates between the walls. The air of the cave being cooler in summer and warmer in winter in extreme of temperature than the outer air, this inner structure of air serves to maintain an equal temperature in the interior hollow wall and in the wall surface of the room. The principle of construction has been applied in hospital huts in hot climates, as reported, successfully. The hollow of the double wall is also applied as a means of producing a current of air for interior ventilation, the success of which in M. Ferrand's construction I had no means of getting tested.†

Of the superior quality of the wall itself, or its advantage as a non-conductor of heat and of sound, of its economy of space, and of the general

* From Mr. Edwin Chadwick's Report. See p. 513, ante.

† Vide for plans, Army Sanitary Commissioners' Report on the Improvement of the Sanitary Condition of Barracks and Hospitals.

advantage of this iron-tied construction, there can be no doubt. If it were of our common brick construction, the expense of a dwelling of the same size, constructed in the cheapest manner, would not be less than 150*l*. I have an estimate from Mr. Samuel Sharp, the architect to whom I am indebted for assistance in the drawings and the technical points of this report, that, on a large scale, the improved iron-tied double-wall, detached dwelling might be constructed in England for 110*l*. Moreover, the substitution of the 5-in. wall for the common brick 14-in. cottage wall would ensure a gain of 710 cubic feet of space, which, as such spaces is now allotted in cottages, would serve as breathing space for two people.

Instead of facing the interior wall with soft plaster and paper, it might be faced with a light-coloured Scott's cement, in which case, at no great expense, the wall would be washable, and its sanitary quality would be nearly as perfect as if it were faced with an improved and smooth tile surface.

On the whole, this construction is eminently worthy of consideration as being an advance in the principle of construction, and as affording the best promise of any in the Exhibition in connexion with the sanitary improvement of the dwellings of the general population.

Besides the sanitary improvement of the impermeable and washable interior glazed brick-wall of the model cottage of 1851, there are other long-tried and proved improvements in construction in England, which, nevertheless, have not got into extended use. There are various practical reasons for this. In the first place, they are little known to individuals, and the common builders only attend to general demands; and any improvements requiring new forms which need care or study in alterations and adaptations for which there is no general demand can only be executed at increased expense to the first individual who adopts them. The common builder has rarely any interest in change, and is usually prejudiced against them, as requiring a change of habits in construction.

Besides these trade obstacles to amendment, there have been experienced serious obstacles from the trades unions to improved constructions of hollow brick. If the hollow brick be made of the usual size, the gain is chiefly in the quality of the brick, and there is little advantage in the price of the manufacture. But there is much gain if the cubic contents be enlarged; and a plan and estimate of a cottage, which I directed to be prepared for the Prince Consort, was submitted to the late Mr. Thomas Cubitt, the eminent builder and contractor, with walls of hollow brick, each of the size of twelve of the common bricks, and the 9-in. wall set in cement, costing 3*s*. the superficial yard, against 4*s*. 6*d*. and 5*s*. for the common brick wall set in mortar; the whole cottage, with improved qualities and washable walls, costing 25 per cent. less than the common brick construction. The contractor admitted the correctness of the estimate, but he declined to adopt the new construction, and gave to me his reasons, to this effect:—"If I adopt that new and large form of brick, which requires the use of both hands to set it, my men will strike, and I shall have all the labour of overreaching resistance; and when I have done it, and shown how much more cheaply the construction may be made, others will follow me, and I shall have no profit, and nothing but trouble and vexation for my labour. I will not, therefore, undertake it." In other instances of the introduction, not of hollow brick of new sizes, but of machine-made brick of the common size, but consolidated and improved by pressure, the trades unions, at the instance of the brick-makers, have combined to prevent them; and thus one section of the wages classes have been blindly led to oppose most important improvements in the dwellings and the health and comfort of the whole of the wage classes.

There is, however, one important material, of which extended adaptations from all parts of Europe are displayed in the Exhibition—namely, Portland cements, in various forms of concretes,—that appears to present great and earlier facility of individual use, with the least amount of skilled labour.

My attention was particularly directed by the late lamented Captain Powke to concretes, as a means of advance in quality as well as economy in labouring-class dwellings. He used much of it in constructions connected with the South Kensington Museum. An inferior specimen of it is presented in a small entrance-lodge there. It is proved that with a proportion of from one-

fifth to one-eighth of Portland cement to sand, gravel, or small stone a wall may be made one-third stronger than common brickwork; or with concrete a wall may be made of equal strength with one-third the thickness of common brickwork, and of equal thickness, about one half the price. The common brick absorbs about 20 per cent. of water. The concrete wall does not absorb one quarter that quantity, and takes about a quarter that time in drying, and when made of the harder stone, and properly set, it may be said to be impermeable to wet. In the French Exhibition of building materials there is a very interesting collection of specimens of concrete from Vicat's cement (which is nearly the same as Portland), with table tops for wine taverns, of polished stone, as well as stone for foot and road pavement, and blocks for walls. In the North German department, from the manufactory at Bonn, there are large tiles made of Portland cement, with coloured concrete facings, worth examining; as also some very good sculptured casts and objects of external decoration. But the chief development of the application of cement to concrete constructions is made by M. Coignet, who, by machinery, crushes stone into as fine a sand and powder as he can get it, and mixes the materials of lime and cement, and by pressure produces specimens of enormous strength; when powdered granite or porphyry is used, of strength approaching to that of the original stone. In the annex near the pond in the direction of the Pont de Jena, there is a school-house constructed by him, with statues of granite, porphyry, and other objects, specimens of the material. These various specimens go to prove that, if objects with the qualities of hard stone are required, it will be more economical to break the stone into pieces and recast it in moulds with cement than to carve it. One of the most important specimens is the flat concrete roof and its wide span, proving the possibility of making the ceilings and roofs of houses as with one large slab of stone. The principle of construction established by these concretes is that everything is made, as it were, a monolith. A church at Vesinet, near Paris, is made of the Béton Coignet, and the steeple may be said to be a monolith. In inferior constructions this is of importance, as cisterns and large water-tanks are made of it, as in one piece, without the insecurity of numerous mere common mortar-joints. The proportions of the common beton, or concrete, were—of river-sand of good quality, 5 cubic metres; hydraulic lime, slaked in powder, 1 cubic metre; heavy Paris cement (considered equal to Portland cement), 250 kilogrammes. In 1845 I got some trial works made for the use of concrete for public drainage and sewerage work. I do not know what cement was used; but, as cements were at that time less understood, probably the wrong sort was used, for the report was unfavourable. Subsequently large quantities of Portland cement have been used for the Thames Embankment; and Mr. John Grant, the engineer in charge of the works on the south side of the river, has made very extensive trials, stated in an interesting paper, to be found in the Transactions of the Institution of Engineers of London, which establish the great strength of the material. The chief engineers of the city of Paris informed me that they have used large quantities of the Béton Coignet for sewers, for which, on account of its monolithic principle and evenness of surface, it is very advantageous; and that they are using it in the construction of bridges, and are well satisfied with it. I did not ascertain the various costs of production, but the price charged for this more finely manipulated concrete is less than for stone, though I did not perceive that in the class of dwellings in question it would have any material advantage in price over common brick; in sanitary qualities, however, it would have very great advantage indeed. It was averred that houses constructed of it, instead of being unsafe to occupy within a year, would be very safe to occupy within little more than a month.

But the Emperor has, on the advice of Mr. W. E. Newton, the English engineer, adopted for the forty new dwellings of which I have already spoken concrete construction, which will remedy almost entirely the common defect of damp walls of the first set of buildings erected by him, and give him the advantage over all the model dwellings in the Exhibition in economy and quality of wall construction, except as to quality in the double hollow walls of the cooperative association.

The new wall construction is of Portland

cement, one-eighth of cement to the gravel, sand, and stones to be got from the stratum of the foundations, and may be made without bricklayers or masons, and with common labour. Various forms of concrete walls—the cob-walls and flims in Devonshire—are of old date; but there has been one inconvenience in their construction, that deep troughs, or inclosed cases of the height of one story, were necessary; but for the Emperor's new dwellings there was used a movable case, invented by Mr. Joseph Tall, with which the walls may be constructed very quickly to any height, with considerable gain in time. With one-eighth of Portland cement the cost of this construction in England is generally about one-half the price of brickwork; and as in small dwellings, with much division-walling, nearly two-thirds of the entire cost of construction is in brickwork, this economy of half upon two-thirds is a very important gain, constituting often a turning-point of commercial advantage. Where improved model dwellings now yield 5½ per cent. as the average of the later buildings in the metropolis do, there is a great convenience of the concrete walling for distant places, in this respect, that, inasmuch as the cement is only about one-eighth the weight of the mass of brickwork, there is only about one-eighth the cost of carriage, where brick is not to be had on the spot, and where there is loose stone, sand, and gravel, or clay that may be burnt, and where there is common unskilled labour available. By putting in cylinders of zinc, and lining them with cement as the walls are carried up, and when completed, taking them out, round and smooth chimneys, and water-spouts, and ventilation and warming flues may be formed readily, cheaply, and exactly. In respect to air-bricks and spouting, the concrete construction appears to have the advantage over any of the other constructions that I found in the Exhibition, and to be readily available for much sanitary improvement. The concrete renders skirting-boards—those great harbours for vermin—unnecessary, and it runs all round the door and the window-frames, and therefore no flitting round them is required. The ceilings and roofs are made with concrete, for which Colonel Scott, R.E., has invented a very economical iron framing. Of this concrete construction of ceilings and roofs, as well as of walls and stairs, there is little but the doors and window-frames to turn, and they may be said to be freeproof.

The colour of the concrete wall of Portland cement is that of the darker stucco colour of houses in London, or of brown paper; which, however passable it may be for exterior surfaces, leaves improvement necessary in lightness and cheerfulness, even if the inner surface of the concrete wall be smooth. Colonel Scott, who succeeded Captain Fowke at the South Kensington Museum, and who has conducted extensive experiments on cements (stated in the Transactions of the Royal Engineers), and is deemed a leading authority on the subject, has invented one cement, which appears to be the desideratum for cheap wall-facing. It is a species of artificial gypsum, of a light warm colour, or of a light lime colour. When properly laid on, it is even better than Parian facings. It is hard, impermeable to wet, and it is, above all, washable. It has already been introduced for the lining of hospital wards, as possessing the requisite qualities. The expense of a facing with this cement, if properly used, is about two-thirds the expense of the ordinary three-coat work.

On the question of comparative economy of the concrete walling and the brick walling, it is assumed that the two walls are of equal thickness; but in the plans of model dwellings originally presented to the Prince Consort a construction was proposed on the panel or buttress principle, to economise material as well as space, the hearing power being supplied by the buttresses; and this may be given by 9-in. walling, with concrete, or in appropriate forms of hollow brick; and 4-in. or 5-in. walling of the right materials may serve for the necessary protection against the weather. 4½-in. walls of properly-made hard hollow brick are proved to be better protection against weather in times of frost than 9-in. or 14-in. common brick or soft stone.

In the English exhibition of materials there is a new species of walling, invented by Mr. B. Nicoll, of London, which presents very great advantage in non-absorbency of moisture, in non-conduction of heat, in having a washable internal facing, in saving space as against common brickwork, and being lower in price. Over a framework of strong cross wires, of about an

eighth of an inch thick, there is woven by a powerful machine a mass of straw or fibrous matter, which is saturated with a solution which renders it fireproof. It is then subjected to very powerful pressure. A coating of light Scott's cement mixed with Parian cement is then put upon it for inside facing, and of Portland cement for the outside facing. The surfaces are impermeable to moisture, smooth and washable with water, so as to save the expense of repeated lime-washing. It is formed into slabs in iron frames, which are put together and closely and securely fastened with bolts. The slabs are from 1½ in. to 4 in. thick. These slabs serve as superior panelling for dividing walls and partitions. Where space is of importance it has the advantage, perhaps, over concrete walling, in enabling a wall to be made of not more than 1½ in. or 2 in. in thickness, and yet its quality deadens sound. It has also great advantages for weatherproof roofing superior to slate or tile, though not, as I conceive, superior to well-made hollow brick (when it can be got), tied together with iron ties and covered with layers of asphalt and cement. In the Prince Consort's model the principle of the flat roof was adopted, but none of the model dwellings in the Exhibition have attained to that principle.

Where ground-space is dear, as it is with dwellings of the labouring classes in town, there is good reason for utilising the roof-space. It serves as an additional drying-ground. In dry weather it may be used for the children to play on. One example has been set in London, where in a densely-crowded neighbourhood, there being no playground for a boys' school, they have made one for them on the flat roof. If any one will look over the city *ouvrières* of Mulhouse, it will be seen what a large amount of roof-space is lost; and yet the cost of the weather-tight flat roof of concrete or hollow brick is nearly a third less in England than the timber, slate, or tile roof. Its greatest convenience or use, however, would be for self-contained dwellings; on them the father of the family may sit in fine weather, and have better air and an extended prospect, and enjoy himself in the Oriental fashion.

In respect to the economy of these improved constructions, there can be no doubt that fully 24 per cent. of saving is attainable, either on the hollow-brick principle, on the simple concrete principle, or on the Nicoll wall principle of construction. Mr. Samuel Sharp has made a very close estimate of a four-tenemented dwelling, on the principle of construction of the Prince Consort's model dwelling. At the present prices in England such a dwelling could not be constructed of brick for less than 400l., or 100l. each separate dwelling. On the concrete principle of construction, with Nicoll dividing walls, it might be constructed for 300l., or 75l. each dwelling, minus the cost of land. Apart, however, from the superiority in quality, the improved dwellings would have a gain of cubic space. The cost of the chief dwellings and the space in them is as follows:—

	Total cubic space.....	Cost per cubic foot.....
The Mulhouse dwellings.....	8,252	3
The Workmen of Paris ditto.....	5,950	5½
The Co-operatives of Paris ditto.....	7,480	4
Model dwellings (concrete), with washable interior walls, on the Prince Consort's principle of flat roofs.....	4,800	3

THE NEW DISCOVERIES IN ACOUSTICS.*

THAT the acoustical force is closely correlated, and strictly analogous, to the other forces connected with material substructure, and especially to the electric, as has before been noted in the *Builder*, and to the elastic and cohesive forces, as well as probably to the diamagnetic and magnetic; and that the acoustical force is subject to laws strictly analogous to those even of light and heat, although its semi-mechanical nature shows it still closer affinity to the forces first referred to,—all this is now becoming more and more apparent. Professor Tyndall has of late been much engaged in this special field of scientific research, and his discoveries are likely to lead to important progress towards a clearing up of those perplexing mysteries in respect to acoustics in the design and construction of churches and halls which so often trouble and

* "Sound: A Course of Eight Lectures," delivered at the Royal Institution of Great Britain." By John Tyndall, LL.D., F.R.S. London: Longmans, Green, & Co. 1867

Disappoint the architect. Meantime, however, the science is in a very immature state in such respects as these, but the results already attained are both curious and instructive. We have more than one given particulars from Dr. Tyndall's lectures, while they were in course of delivery, and especially as to sensitive flames, or the influence of the sounds of articulate speech upon gas jets; and we propose here to give some further details, as to both singing and sensitive flames, and as to the laws and conclusions already deduced from these and other researches on acoustical vibrations.

Friction, remarks Dr. Tyndall, is always rhythmic. When we pass a resined bow across a string, the tension of the string secures the perfect rhythm of the friction. When we pass the wetted finger round the edge of a glass, the breaking up of the friction into rhythmic pulses expresses itself in music. Savary's experiments prove the friction of a liquid against the sides of an orifice through which it passes, to be independent of pressure, musical sounds. Let a tube be filled with water, its extremity being closed by a plate of brass, which is pierced by a circular orifice of a diameter equal to the thickness of the plate. Removing a little peg which stops the orifice, the water issues from it, and as it sinks in the tube a musical note of great sweetness issues from the liquid column. This note is due to the intermittent flow of the liquid through the orifice, by which the whole column above it is thrown into vibration. The tendency to this effect shows itself when tea is poured from a teapot, in the circular ripples that cover the falling liquid. The same intermittence is observed in the black dense smoke which rolls in rhythmic rings from the funnel of a steamer. The unpleasant noise of axled machinery is also a declaration of the fact that the friction is not uniform, but is due to the alternate "bite" and release of the rubbing surfaces.

Where gases are concerned friction is of the same intermittent character. A rifle bullet sings in its passage through the air, while to the rubbing of the wind against the boles and branches of the trees are to be ascribed the "waterfall notes" of an agitated pine-wood. Pass a steadily-burning candle rapidly through the air; an indented band of light, declaring intermittence, is the consequence, while the almost musical sound which accompanies the appearance of this band is the audible expression of the rhythm. On the other hand, if you blow gently against a candle flame, the fluttering noise announces a rhythmic action. When a gas flame is simply enclosed within a tube, the passage of the air over it is usually sufficient to produce the necessary rhythmic action, so as to cause the flame to burst spontaneously into song. Not all, however, are aware of the intensity to which this flame-music may rise.

In speaking of his researches as to singing flames, Dr. Tyndall says:—

"While executing these experiments I once noticed that, on raising my voice to the proper pitch, a flame which had been burning silently in its tube began to sing. The song was interrupted, and the proper note sounded several times in succession. In every case the flame responded by starting into song. The same observation held, without my knowledge, been made a short time previously by Count Schaffgotsch. Observe the conditions of the experiment. I place a tube 12 in. long over this flame, which occupies a position within the tube about 11 in. from its lower end. When the proper note is sounded the flame trembles, but it does not sing. I lower the tube so that the flame shall be 3 in. from its lower end; it bursts spontaneously into song. Now, between these two positions there is a third, at which, if the flame be displaced, it will sing, and if it be excited by the voice it will sing, and continue to sing.

In this position, then, it is able to sing, but it requires a start. It is, as it were, on the brink of a precipice, but it requires to be pushed over. I place the flame in this position; it is silent; but on the sounding of the proper note it stretches forth its little tongue, and begins its song. By displacing my finger for an instant on the end of the tube I stop the music; and now, standing as far from the flame as this room will allow me, I command the flame to sing. It obeys immediately. I turn my back towards it and repeat the experiment. My body does not shake; the flame, however, sings. The numerous pulses run round me, reach the tube, and call forth the song. A pitch-pipe, or any other instrument which yields a note of the proper height, produces the effect. When a silent flame capable of being excited is looked at in a moving mirror, it produces there a continuous band of light. Nothing can be more beautiful than the sudden breaking up of this band into a string of richly luminous pearls at the instant the voice is pitched to the proper note."

While treating of sensitive naked flames the doctor described some extraordinary phenomena.

"The most marvellous flame hitherto discovered," he remarks, "is now before you. It issues from the single orifice of a stearite burner, and reaches a height of 24 in. The slightest tap on a distant rind reduces its height to zero. When I shake this bunch of keys the flame is violently agitated, and emits a loud roar. The dropping of a sixpence into a hand already containing coin, at a distance

of 20 yards, knocks the flame down. I cannot walk across a floor without agitating the flame. The creaking of my boots sets it in violent commotion. The crumpling or tearing of a bit of paper, or the rustle of a silk dress, does the same. It is startled by the pattering of a raindrop. I hold a watch near the flame; nobody hears its ticks; but you all see their effect upon the flame. At every tick it falls. The winding up of a watch also produces tumult. The twister of a distant spool shakes the flame down; the note of a cricket would do the same. From a distance of 30 yards I have chirruped to this flame, and caused it to fall and roar. I repeat a passage from Spenser:—

'Her ivory forehead, full of bounty brave,
Like a broad table did itself dispread;
For Love, his lofty tumpet to engrave
And write the battles of his great godhead,
All truth and goodness might therein be read,
For there their dwelling was, and when she spake,
Sweet words, like dropping honey she did shed;
And through the pearls and rubies softly brake
A silver sound, which heavenly music seem'd to make.'

The flame picks out certain sounds from my intonation; it notices some by the slightest nod; to others it bows more distinctly; to some its obeisance is very profound, while to many sounds it turns an entirely deaf ear. I have heard it chirrup to it, or on shaking a bunch of keys within few yards of it, great part of the flame is immediately destroyed, a pale and almost non-luminous residue of it alone remaining.

We have called this the "vowel flame," because the different vowel sounds affect it differently. These sounds differ from each other through the admixture of higher tones with the fundamental. It is in the case of vowels, and not to the fundamental one, that our flame is sensitive. I utter a loud and sonorous *r*, the flame remains steady; I change the sound to *o*, the flame quivers; I sound *a*, and now the flame is strongly agitated; I utter the words *boat, boat, and boat* in succession. To the first there is no response; to the second the flame starts; but by the third it is thrown into greater commotion; the sound *ah* is still more powerful. Did we not know the constitution of vowel sounds, this department would be an insoluble enigma. As it is, however, the flame is a demonstrator of the theory of vowel sounds. The flame is sensitive to sounds of high pitch; hence we would infer that the sound *ah* contains higher notes than the sound *a*; that *x* contains higher notes than *o*; and *o* higher notes than *r*. I need not repeat this at length, perfectly with the analysis of Helmholtz.

This flame is peculiarly sensitive to the utterance of the letter *s*. If the most distant person in the room were to favour it with this letter, the flame would instantly sympathise with him. A hiss contains the elements that most forcibly affect this flame. The gas issues from its burner with a hiss, and an external sound of this character is therefore exceedingly effective. Finally, I place this musical box upon the table, and permit it to play. The flame behaves like a sentient creature; howing slightly to some tones, but courtesying deeply to others.

It is not to the flame, as such, that these effects are ascribed. Effects substantially similar are produced when jets of nitrified coal-gas, carbonic acid, hydrogen, or air are employed. These jets may be rendered visible by smoke, and the smoke jets show a sensitiveness to sonorous vibrations even greater than that of the flames.

When a brilliant sensitive flame illuminates an otherwise dark room, in which a suitable bell is caused to strike, a series of periodic quenches of the light by the sound occurs. Every stroke of the bell is accompanied by a momentary darkening of the room.

Savart's experiments on the influence of sonorous vibrations on jets of water belong to the same class of effects. This subject is treated of in the lectures.

In experimenting on the law of vibratory motions and the theory of beats, a curious experiment with a small brass table or mounted disc on which the hands are laid, reminding one of the spirit-knocking process, is thus described:—

"We are now prepared for a very instructive experiment which we owe to M. Lissajous. I divide this brass disc into six vibrating sectors, and bringing the palm of my hand near any one of the sectors, I intercept its vibrations. The sound is augmented. Placing my two hands over two adjacent sectors, you notice no increase of the sound. Placing them, however, over alternate sectors, a striking augmentation of the sound is the consequence. By simply lowering and raising my two hands, I produce these marked variations of intensity. By the approach of my hands I intercept the vibrations of the two sectors; their interference right and left being thus abolished, the remaining sectors sound more loudly. Passing my single hand to and fro along the surface, you also bear a rise and fall of the sound. If, when my hand is over a nodal-line, the remaining sectors are raised, you notice a nodal-line. Thus, by sacrificing a portion of the vibrations, we make the residue more effectual. Experiments similar to these may be made with light and radiant heat. If two beams of the former, which destroy each other by interference, one be removed, light takes the place of darkness; and if of two interfering beams of the latter one be intercepted, heat takes the place of cold."

The following summary of the lecture just referred to will show in what way light upon acoustical difficulties may be looked for hereafter, when the subject has been a little further investigated:—

"When several systems of waves proceeding from distinct centres of disturbance pass through water or air, the motion of every particle is the algebraic sum of the several motions impressed upon it."

In the case of water, when the crests of one system of waves coincide with the crests of another, the higher waves will be the result of the coalescence of the two systems. But when the crests of one system coincide with

the sinuses, or furrows, of the other systems, the two systems, in whole or in part, destroy each other. This mutual destruction of two systems of waves is called interference.

The same remarks apply to sonorous waves. If two systems of sonorous waves condensation coincides with condensation, and rarefaction with rarefaction, the sound produced by such coincidence is louder than that produced by either system taken singly. But if the condensations of the one system coincide with the rarefactions of the other, a destruction, total or partial, of both systems is the consequence.

Thus, when two organ-pipes of the same pitch are placed near each other on the same wind-chest and thrown into vibration, they so influence each other, that as the air enters the embouchure of the one it quits that of the other. At the moment, therefore, the one pipe produces a condensation the other produces a rarefaction. The sounds of two such pipes mutually destroy each other.

When two musical sounds of nearly the same pitch are sounded together the flow of the sound is disturbed by beats.

These beats are due to the alternate coincidence and interference of the two systems of sonorous waves. If the two sounds be of the same intensity their coincidence produces a sound of four times the intensity of either; while their interference produces absolute silence.

The effect, then, of two such sounds in combination, is a series of shocks, which we have called 'beats,' separated from each other by a series of 'pauses.' The rate at which the beats occur each other is equal to the difference between the two rates of vibration. When a bell or disc sounds, the vibrations on opposite sides of the same nodal line partially neutralise each other; when a tuning-fork sounds the vibrations of its two prongs in part neutralise each other. By cutting off a portion of the vibrations in these cases the sound may be intensified.

When a luminous beam, reflected on to a screen from two tuning-forks producing beats, is acted upon by the vibrations of both, the intermittence of the sound is announced by the alternate lengthening and shortening of the band of light upon the screen.

The law of the superposition of vibrations above enunciated is strictly true only when the amplitudes are exceedingly small. When the disturbance of the air by a sounding body is so violent that the law no longer holds good, secondary waves are formed which correspond to the harmonic tones of the sounding body.

When two tones are rendered so intense as to exceed the limits of the law of superposition, their secondary waves combine to produce resultant tones.

Resultant tones are of two kinds: the one class corresponding to rates of vibration equal to the difference of the rates of the two primaries; the other class corresponding to rates of vibration equal to the sum of the two primaries. The former are called difference tones, the latter summation tones."

We hope to hear more, shortly, of Dr. Tyndall's curious researches. The volume under notice is an exceedingly interesting one.

THE JUNIOR CARLTON CLUB-HOUSE, PALL-MALL.

In consequence of the large number of candidates waiting for admission to the Carlton and Conservative Clubs, it was thought desirable to establish a new club, and at a meeting held in the year 1864 at the Carlton Club-house a committee was appointed to carry out that object.

Several offers of properties in Pall-mall, St. James's-street, Regent-street, and Piccadilly were made in answer to advertisements, and eventually a site in Pall-mall was decided upon, on account of its eligibility with reference to the Houses of Parliament, and from the fact of its being entirely freehold.

Considerable difficulty and delay were experienced in purchasing the interests of the several tenants, but that was accomplished in the course of last year, when the new club-house, of which we illustrate the front in Pall-mall, was commenced by Messrs. Lucas, Brothers, who had obtained the contract in a limited competition.

It will be seen from the plans that there will be two frontages, one in Pall-mall, and the other in St. James's-square.

The rooms of the club-house are arranged as follows:—

On the ground-floor is an entrance-hall, 27 ft. by 23 ft. 6 in.; a reception-room, 29 ft. 6 in. by 20 ft. 6 in.; a morning-room, 89 ft. by 27 ft.; a smoking-room, 28 ft. by 29 ft. 6 in.; and a principal staircase, 30 ft. by 23 ft.

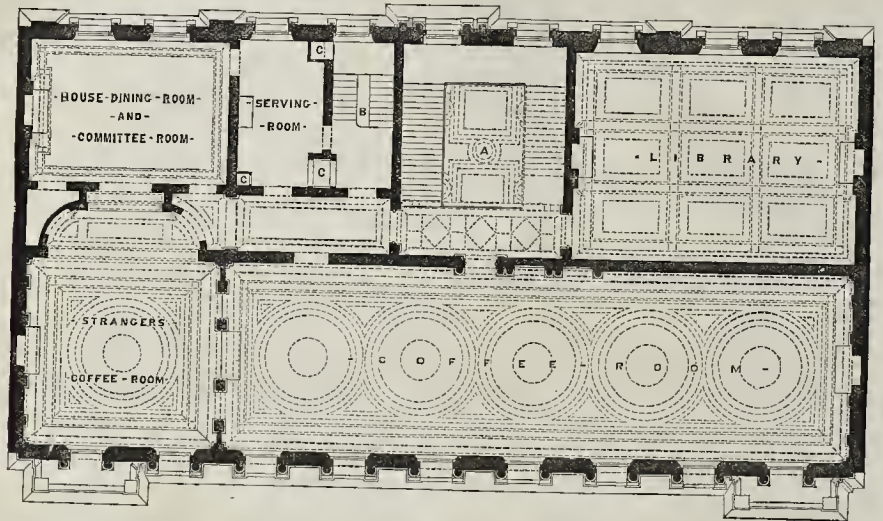

There is also a second staircase, and serving attendants' rooms, and an entrance in St. James's-square for members who have bed-rooms.

On the first-floor is a members' coffee-room, 90 ft. by 27 ft., divided by a plate-glass screen from a strangers' coffee-room, 27 ft. by 27 ft.; a house dining-room, 28 ft. by 20 ft. 6 in.; and a library, 40 ft. by 29 ft. 6 in. There is another serving-room on this floor.

The heights of these stories are respectively 20 ft., except where the mezzanine occurs on the north side, in which are lavatories, attendants' room, &c.

On the second floor are two billiard-rooms, one being 27 ft. 6 in. by 27 ft., the other 29 ft. by 21 ft., the secretary's offices and bed-room, and a second smoking-room for visitors. The

THE JUNIOR CARLTON CLUB-HOUSE, PALL MALL.—MR. DAVID BRANDON, ARCHITECT.

remainder of this floor and the floor above are occupied by eighteen bed-rooms, which will be let to the members of the club.

Attendants' rooms, water closets, &c., are provided on each of these floors.

The topmost story is intended to provide accommodation for about fifty male and female servants.

Under the ground-floor and above the basement a mezzanine story is formed, having six dressing and bath rooms, with separate corridor and staircase; also the steward's office, still-room, housekeeper's room, and stores.

In the basement are arranged the kitchen, 40 ft. by 29 ft., and the scullery, 25 ft. by 17 ft., which are continued up to the ground-floor, giving a height of 19 ft.; a servants' ball, butler's pantry, plate-closet, kitchen, clerk's office, cook's room, kitchen-maid's room, larders, steward's room, wine-cellar, and dispensing cellar. Outside, in the vaults under the pavement in St. James's-square, are beer and household cellars, fish and vegetable larders, and sand and charcoal stores.

On the Pall-mall front are coal, coke, and wood stores, an ice-well, and rooms for cleaning clothes, boots, and knives, also a washing place.

There will be three hydraulic lifts for dinners, wine, coals, and so on.

The club now consists of 1,500 members, exclusive of peers, members of Parliament, and members of the Carlton Club, who were entitled to be immediately balloted for, making together a total of 1,680, and they at present temporarily occupy the premises in Regent-street belonging to the late Parthenon Club.

The new club-house was designed by Mr. David Brandon, architect, under whose able direction the works are being done. The cost of the building will be about 40,000*l.*, exclusive of decoration and furniture.

RATS.

MR. MECCHI writes as follows on this subject, important to others besides farmers:—

Has any one ever estimated the number of rats that prey upon the farmer's property? Allowing one to each acre, we should then have about 60 millions in the United Kingdom. As animals consume according to their weight, a full-grown rat would consume much grain in a year. But, unfortunately, it is not only what they consume, but what they destroy, that concerns us. Said an old labourer's wife to me, "A rat has taken away in one night eight of my brood of young chicks, worth 8*l.* a piece. My neighbour, Mrs. —, a small farmer's widow, cannot raise any poultry, for under her house is a honeycomb of rats' runs. She took them in a hamper into her sleeping room last night, and even there they tried to get them out."

I can testify to their destructive powers from experience. When they have young they will carry away and store up scores of young chickens, ducks, or turkeys in a single night, catch the same as a cat having kittens. A friend of mine who had a little rabbit warren beside his windows, saw his cat catch a young rabbit. He followed her, and found that she had laid up thirty-six that morning near her kittens. I have known of a brace of foxes being thirty-seven turkeys in a single night, and burying many of them up in some dung-heaps which were upon an adjoining field ready for spreading.

When hard pressed for food for themselves or their young, rats are very daring, and will attack large chickens and good-sized rabbits. I saw a case where a youth was awake in the night by a rat beginning upon his ear. Where the stock are fed with meal or grain there the rats will surely come, to share, with the pigs especially, their barley-meal and pollard.

When dining at Vintners' Hall with the late excellent Mr. Green, the great shipowner, he said to me:—"Mr. Mecchi, I can beat you in this: I make a thousand a year by my pigs."

I expressed my surprise, and said if I got their share free of cost I thought myself a lucky fellow. "Well," said he, "I have only sixty pigs; before I kept these pigs the rats used to damage the sails of my ships to the extent of a thousand a year, eating every greasy portion of the now dine with or after the pigs, and never touch the sails." This hint may be useful to shipowners as well as to housekeepers, who find that the mice destroy the greased or stained portions of table-cloths.

Rats migrate, and travel a long way in a night, in search of food. A neighbour of mine told me that he one night met a small army of them, some hundreds together. The carelessness of some farmers or their false economy causes serious loss to their neighbours. They may be called rat-preservers or rat-breeders. I used to pass frequently by two wheat-stacks which were completely honey-combed by the rats, whose paths into and up the stacks were visible from the road. Having consumed nearly all the grain, they left the stacks for better quarters. When thrashed there was plenty of straw, but the corn was nearly "nil." Those who keep their corn in stacks for seven years (and I know of some who do so) had need have an eye to the rats. I have used a dozen iron stack-frames (Garrett's patent) for the last twenty years, without any rats. The fact is, they cannot do without water, so if one gets into the stack he must come down to drink, and cannot re-ascend. It is too common a practice to leave carts, ladders, or anything close to the stacks, thus affording access. As soon as these are removed, Mr. Rat must come down for water and cannot return. We always trim or shave our stacks (cost 1*s.* per stack) to cut off access from below, as well as for economy of corn and neatness.

Mice are more difficult to expel than rats, for they get into the sheaves at harvest time and are thus carried up to the stack. Unless poisoned by liquid immediately after putting up the stack they soon find out that they can exist by the 12 per cent. of water contained in straw and 11 per cent. in the grain. They also learn to avail themselves of dew and rain. In the spring and summer they will so multiply as to destroy or damage a large quantity of the grain, especially if left over-year. To show how animals can exist by the water contained in what is called dry grain and its straw, I will relate the case of a horse at Cressing Temple, a few miles from me, where a horse used for treading or consolidating the barley in the barn, being left there all night, slipped down between the closely packed barley and the boarded sides of the barn. In vain was search made for him in the morning, and it was concluded that he had been stolen. On Christmas Day, as the ploughmen came to attend to their horses, they heard the neighing of a horse in the barn, and after removing the barley, they found the lost horse as fat and as sleek as a mole. Thinking he must be very thirsty, they ignorantly allowed him to go to the pond and drink his fill, and in consequence he died. This is well known to many persons now living. The horse had gradually eaten his way into a comfortable space. But to return to our rats. They are most industrious and destructive burrowers: as they cannot destroy a solid brick wall they will burrow under it, unless the foundation is well concreted; where beams enter the wall they will gnaw the wood. It requires a watchful eye to keep them under. Every hole should be noted, and plugged at once with a piece of tile or brick fixed with cement or a piece of hard wood dipped in gas-tar. Their runs should be tarred, and thus they will soon get disgusted with their quarters. Wherever a small heap of earth is thrown up near a wall, the run should be traced and at once stopped: lime and stone as a concrete concerns them. Loose lime they cannot work in, it binds and disgests them. In every barn and shed door there should be a round hole, about 8 in. in diameter, so that the cats can have free access in search of the rats. It is at night they work, and they do so as much as possible under cover. They may be easily poisoned by strychnine, mixed with ground barley or oats; but before trying this it must be fed for several nights with the meal mixed with poison. Rats are very sagacious, and had I space I could relate many instances of their cunning. It is a most dangerous thing to spread poison on bread and butter, for they carry it away; and I know of too many instances where valuable dogs, fowls, &c., have perished. Another inconvenience is, that when poisoned they die in their burrows, which are too frequently under your drawing or dining room, or in the walls. Their decomposition causes a most detestable and too durable stench. There is nothing like plenty of cats. I find male cats, castrated when young, by far the best rat-catchers; and by blocking the holes you give the cats a better chance of catching them. Traps may also be set; but they are very wary of them. Hollow walls are objectionable, so is thatch on buildings.

Water rats undermined the banks of my pond until I turned in a few pike, which soon converted rats into fish. A pike of 3 lb. will take a rat and swallow him at once. Beware of pike where you have young ducks, for they enjoy them quite as much as they do rats. I had imagined that there was a chance of the rat biting the stomach of Mr. Pike; but, as an old angler, and examining the condition of the pike's stomach with a bait in it, I found that there is no fear of that, for instantly the stomach collapses like an elastic pitch-plaster, and not a single breath could the rat or any living thing draw. Pike always swallow their prey alive, and head foremost. They are very fond of eels, and swallow them alive and head foremost. They always seize their prey across the middle, and, unless very hungry, hold them so for some time.

Rats find abundant accommodation and concealment under the old-fashioned wooden barn floors and dilapidated or thatched farm buildings. The modern system of asphaltum upon concrete is an effectual barrier: they cannot gnaw it; their only chance is to burrow under between the ground and the concrete, and this, by a careful examination, may be easily prevented. A very destructive cunning old rat, that could never be trapped, was taken in the following manner:—Every hole except one was carefully stopped with gas-tar substances, and the trap set at the remaining hole. For two days and nights he declined coming out, but hunger and thirst at last compelled him to face the trap, and he was taken.

I very much commend asphalted floors to my agricultural brethren. It is so cheap and clean, and, above all, prevents any damage to corn, &c., by preventing damp arising from the earth beneath it. Cats such as I have will not only kill rats, but also weazels. The latter will destroy a brood of poultry in a night, if they have access to them. Of course every one knows the value of ferrets and a good rat-dog.

THE PACIFIC RAILWAY.

THE progress made by the construction parties who are laying down the track of the Union Pacific Railway appears to be something unprecedented. An explanation of the actual process of construction is furnished by a correspondent of the *Cincinnati Gazette*, who has recently been with the senatorial excursion party from Omaha to the western terminus of the road. He says:—

"There is little really known by the people of the character of the enterprise. Most think that a company of capitalists are busily putting down a road track, over which cars can be moved with ease, for the purpose of securing lands and money from the Government. The fact is, one of the most complete roads of which the country can boast, with equipments that surpass many, is being laid with a speed that fails to impress the nation, simply because it is not believed. But let the facts tell their plain yet wonderful story. General J. S. and J. C. Cassment, of Ohio, grade the road, lay the track, and put up the telegraph. The graders go first. There are 2,000 of them. Their advance is near the Beach Hills. They protect themselves, and are digging the fortification which makes the future sure for us, on through Indian battle-fields, while the daily light goes on. . . . Let the reader picture the scene. The rush of the loaded truck; the successive dropping of the rails in place; the rattles of the spiker's hammer, sounding like a hotly-contested skirmish; the roar of the distant supply trains moving up; the resounding of the frequent signals near at hand; the universal bustle; the rumble and grumble and roar of the wonderful advance. Let the elements of the savage warfare and the actual presence of hostile Sioux along the hills be woven into the picture, and together it forms one that the world has not seen before, and which the stories of magic can scarcely equal."

On the 9th of May, 1866, but forty miles of road were completed. In 182 working days thereafter 245 additional miles were laid and put in prime condition, every rail and tie and spike having been brought up from the rear. Seven saw-mills furnish the ties and lumber. All bridges are framed, the pieces numbered, and set up where wanted without the least delay. Unless driven off by Indians, which, the correspondent says, does not now seem probable, the road will touch the base of the Rocky Mountains in the coming autumn. The California end has already reached a point about a hundred miles east, and is descending the eastern slope of the Sierra Nevada into the Valley of the Humboldt. It is confidently expected that Salt Lake will be reached next year, and that 1870 will see the whole line completed. While the nation has scarcely heard of what has been done, the work has been nearly one-third accomplished. What about the Indians when the work is finished?

Water rats undermined the banks of my pond

THE PRODUCER, THE MIDDLEMAN, AND THE CONSUMER.

The great question whether the producers of wealth and its consumers cannot bargain with each other directly, for their mutual benefit, without the intervention of the overgrown middleman, who, for merely handing over goods from the producer to the consumer, takes enormous slices out of everything, and gets fat upon that which he neither produces nor consumes in this great "nation of shopkeepers," is likely to take a prominent place henceforth in the annals of England. A new foe to economical arrangements has started up in the self-interested objections of a by no means philanthropic "Howard" to deal with co-operative consumers without the intervention of the middleman drone, who is most certainly destined to be ultimately ejected from the busy hive of industry, but who in the meantime serves the purpose of the short-sighted producer, who depends on him for touting his goods to their mutual benefit, but at the great cost of the consumer; not perceiving, perhaps, that what such a trade combination must lead to is the rapid substitution of co-operative producers themselves, who will deal with the co-operative consumers without the intervention either of the middleman or the self-centred producer for whom he touts. The question has now been taken up by a limited co-operative agricultural and horticultural association, whose council comprises influential names such as those of the Right Hon. William Cowper, M.P., Thomas Hughes, M.P., and others also well known. In an attempt to deal with Messrs. James & Frederick Howard, agricultural implement manufacturers, for their implements, at cash prices, they find, to their surprise no doubt, that Messrs. Howard decline to deal with them, because retail customers are to be supplied with their implements on trade terms, as they "feel bound to protect the interest of those upon whose exertions their trade in great measure depends"—in the meantime. And they have largely advertised their resolution amongst the aforesaid "middlemen,—with what sort of motives may be readily conceived. We should not wonder to hear of a powerful co-operative agricultural implement manufacturing company or two being planted down in Messrs. Howard's neighbourhood some of these days, and circulars distributed by Messrs. Howard amongst an increasing number of co-operative agricultural implement-consuming farmers beseeching them for "custom."

THE SWANSEA WATER-WORKS.

This undertaking is now completed, and the final report of the chief engineer, Mr. Rawlinson, was shortly to be presented to the local Board of Health. The New Water-works Committee, accompanied by the surveyor, Mr. E. Cousins, the contractor, Mr. W. Williams, and other gentlemen, paid an official visit to the works, and inspected them prior to their being formally handed over to the town from the hands of the engineer and contractor. The work was carried out by the contractor, under the supervision of Mr. Unsworth, the resident engineer. The conduit and the conduit-pipes were first commenced in April, 1862, and the conduit and pipes were completed in the autumn of 1863, and the water began to be supplied from the new works at that time. The new reservoir works were commenced in April, 1862, and therefore but little apparent progress was made; and in May last the water for the first time was up to the finished overflow of the reservoir, and the whole of the embankments were found to be able to sustain the pressure thus thrown upon them without sign of weakness. The puddled wall of the embankment at its greatest depth is 98 ft. deep, and the main bank at its greatest depth is 80 ft. The top bank-line is a little over 600 feet long, and there are about 140,000 cubic yards of material in the bank. The bottom bank width is nearly 500 ft., and the top bank width is 12 ft., and is finished 6 ft. above the lip of the by-wash, having a 4 ft. bank water-wall on the top, so that there is a protection of about 10 ft. above the highest line to which the water rises. The greatest depth of water against the bank is 76 ft., and the available depth from which the water is drawn at the bottom of the culvert is 64 ft., so that the volume of water at command when the reservoir is full is 300 millions of gallons. The surface area of the new reservoir is 32½ statute

acres. The conduit from the reservoir to Morriston is 7½ miles long, and 2 ft. diameter earthenware pipes, having a uniform fall of 5 ft. per mile, excepting at the two valley crossings where the water is conveyed by cast-iron syphon-pipes. These conduit-pipes are capable of delivering no less than four million gallons of water within the 24 hours, equal to 30 gallons per head for 150,000 persons, so that should the reservoir be enlarged at any time, there would be no extra cost for conduit-pipes to supply the immense volume of water stated. The present daily consumption is about two millions of gallons to the town, and about one million for compensation water to the various mills, &c.

THE PALESTINE EXPLORATION FUND.

At the last meeting of the General Committee of the Palestine Exploration Fund, in the Jerusalem Chamber, Westminster, Mr. George Grove, the honorary secretary to the fund, read the report, from which we learn that at Jerusalem a discovery had been made outside the south wall of the sacred enclosure (Haram-esh-Sherief)—viz., that the live rock of the hill overlooking the Kedron was no less than 53 ft. below the present surface. The great south wall of the Haram had been traced down to that depth at the corner, making it in all 130 ft. high. In addition, the east wall of the Haram had been found to run on beyond the present south wall; and a second south wall had been discovered, 20 ft. distant from that already known. These discoveries were the most important that had been made in that part since the finding of the well-known arch by Dr. Robinson, and of the northern arch by Captain Wilson; and they were also interesting as showing what a great amount of unknown topography is probably hidden under the immense mass of debris which covers the hills and valleys of the Holy City. In the valley separating Moriah from the traditional Zion, opposite Dr. Robinson's arch, foundations of piers and other works had been found at a great depth. At the northern extremity of the town, close to the Damascus Gate, foundations of massive walls and of a tower had been uncovered. All these works are being prosecuted by Mr. Warren with energy. It had been the wish of the committee to procure a firman authorizing investigations inside the sacred enclosure; and Lord Stanley had been good enough to endeavour to obtain this; but on the arrival of the letter at Jerusalem it had been found to exclude all sanctuaries. The committee for forming a Biblical Museum reported that they had arranged to locate the museum at South Kensington, and to open it in the early part of next year. The committee will seek an interview with the Sultan during his visit to London. Their purpose is to engage the sympathy of the rulers of Syria in the object of the society, as being non-political and non-sectarian.

THE CRYSTAL PALACE.

The appearance of the "Palace" on Tuesday, when (lighted up for the second part of the concert, and filled with 27,000 listeners) the Sultan and H. R. H. the Prince of Wales made their appearance in the Royal box, was very grand indeed, and will not be forgotten for some time by those who were present. There were other "mental photographs" received that will not soon fade. The orchestra itself was a brilliant feature; and that graceful proscenium containing the boxes in which sat His Sultanic Majesty and suite (not a new creation) is one of the best pieces of *architecture de circonstance*, if we may use the phrase, employed in the building. Appealing to another sense, the characteristic Turkish Ode was striking, and the prayer "To thee, Great Lord," from "Moses in Egypt," was grand in the extreme. The fireworks, too, so far as we could see them, were effective; but with these mismanagement greatly interfered. Looking at the building in the daylight, it would seem to be a difficult task to prevent persons in it from seeing what was going on in the gardens, but this the managers, nevertheless, effected with remarkable success on the occasion in question. Persons who wished to obtain tickets for the galleries rushed to and fro unavailingly, while vexatious barriers threw difficulties in the way of egress to the grounds. The display of fireworks, for which alone many persons had come, was com-

menced before half the visitors had got into the gardens or found places within; and hundreds, we should probably not be wrong if we said thousands, were surging about inside seeking direction of some sort and finding it not, till all was over; while in the gardens matters were made worse by the stupidity and utter selfishness of many of the visitors themselves. In short, a magnificent *mélange* was mightily marred by miserable mismanagement.

THE SULTAN AT THE ITALIAN OPERA HOUSE.

The Floral Hall formed a charming vestibule to the Opera-house on the night of the Sultan and Prince's visit (the 15th), festooned with red and white roses, hung with muslin and cloth, well lighted with chandeliers and jets, carpeted in the centre, and lined on each side with lovely flowers and well-dressed people, who for a "brief happiness," as one little lady with three very large daughters expressed it, had paid a guinea a-piece to see the *cortège* pass into the house. And yet not so brief, either. The recollection of such incidents lasts. Many times will it afford a topic for conversation: often in after-life will it be referred to as a bright and remarkable moment. The group was a brilliant one when formed; our genial Prince of Wales all smiles and kindness; the Sultan, no longer apathetic, briskly saluting all the way down the hall; the Ulema, in green, and some of the other officers literally in gold.

The Royal Box was fitted up in the centre of the house (as it has been seen before), extending from above the pit-tier of boxes to the parapet of the amphitheatre. The house was crowded, with the exception of the "gallery," where the two topmost rows of seats remained untenanted all the evening.

The opera, *Massaniello*, was listened to with the greatest attention, and the duet at the commencement of the second act, capitolly sung by Nandin and Graziani, was vociferously redemanded, and was again given with increased effect. Many of the Sultan's suite divided their attention between the house and the stage; and no wonder,—such a flower-garden as was presented by the stalls, which on this occasion included even the three rows of seats that now ordinarily represent the "pit," has been seldom seen. Extravagance in dress, by the way, is greatly on the increase, and it is to be lamented. Mr. Frederick Gye may take the credit of having arranged one of the great successes of this remarkable week.

BARNS AND GATES IN LONDON.

The parochial authorities of St. Pancras and St. George, Hanover-square, have recently been discussing with much interest the subject of the increasing traffic of their streets, and the inadequacy of their present available thoroughfares. The Victoria railway station, disgorging daily some thousands of passengers in cabs and other conveyances, has greatly increased the traffic of the district; but owing to some thoroughfares being blocked up by "bars and gates" the traffic is sent all over the district by circuitous routes. In St. Pancras the case is still worse. That parish contains the termini of the London and North Western and the Great Northern railways, to which will shortly be added a third station by the Midland Railway Company. The number of these obstructive bars and gates in that parish alone are about thirty, and the traffic through the open streets, owing to that fact, is something astounding. Some portions of the district are perfect "quadrilaterals," defying the inroads of the traffic around them. In London the number of obstructions is close upon two hundred, but the quiet streets thus protected are cleaned, paved, and lighted at the general expense of the ratepayers of the district. It was expressed at the last meeting of the St. Pancras vestry that the inhabitants of these quiet thoroughfares ought to pave, cleanse, and light their own streets in return for the privileges they now enjoy at the expense of their neighbors. It was also stated at the vestry that Lord Belmore's Committee on London Traffic had declined to take evidence respecting bars and gates, though strongly urged to do so. With regard to Regent-street traffic, the vestry of St. James's, Westminster, intend to discuss, at their next meeting, the advisability of planting trees on "both sides" of the street.

THE GUARDS' INSTITUTE.

This building, as a place of occupation, resort, and recreation for soldiers when out of barracks, has been erected on a site in Francis-street, (auxiliary Bridge-road. It is in the Venetian-Italian style, and consists of a basement and three stories. A flight of steps leads to the entrance on the ground floor: on the right is a coffee-room for the privates, and on the left a billiard-room and coffee-room for non-commissioned officers. On the first floor is a reading-room and a billiard-room for privates, and a reading-room for the non-commissioned officers. The second floor is wholly devoted to the lecture and concert room, which is 100 ft. in length and 10 ft. in breadth, its height being from the floor to the open roof, which is constructed in an ornamental style in varnished deal, 28 ft. It was designed by Mr. H. A. Darbishire, and executed by Messrs. Smith & Co., of Piccadilly, under the immediate supervision of Mr. James Craddock. The Duke of Cambridge, when formally opening the building, the other day, said that the benefits of the Institution were not to be confined to the men of the Guards, but were open to every soldier in London. There are already less than 920 subscribers.

LEAKAGE OF RESERVOIRS AT TUNBRIDGE.

At a recent meeting of the local commissioners, a report by Mr. Bateman, C.E., was read, of which we give an abstract:—

On Wednesday last I examined, as requested, the two reservoirs recently constructed by you for the supply of water to the town and district of Tunbridge Wells. I was informed that they each lost water at the rate of 600 gallons per day, when filled to a depth of 10 ft. or more.

The whole of the bottom of each reservoir is covered with a coating of Seyssel asphalt, which is also carried to the side walls and round the base of the internal pier a height of about 1 ft. The asphalt is placed on a mering of bricks, resting on concrete; and I am informed that no leakage whatever occurs in this portion of the work. The whole work, so far as I had the opportunity of examining it, appears to have been most carefully executed, and all the materials, too, have been of the best quality; and I am of opinion that no blame can attach to the contractor. I am also of opinion that the sole cause of the loss of water arises from the insufficient thickness of the side walls and the absence of water-tight material at their base.

The simplest and most effective cure in this case will be to line the inside of the reservoirs with asphalt, in the same manner as has already been adopted for the bottom of the foot of the side walls, taking such measures as your experience of the Seyssel Asphalt Company may suggest for securely attaching the asphalt to the vertical walls. Should it hereafter shall off or exhibit weakness, I want of support, this will be easily remedied by building up an internal wall, about 1 1/2 in. thick, which will prevent the asphalt in its place, and prevent its cracking or falling off.

The Waterworks Committee reported, that in their opinion Mr. Bateman's proposal should be referred to, and after some discussion it was resolved by the commissioners to adopt the report and authorize the committee to carry out Mr. Bateman's recommendation.

ARCHES.

This branch of construction deserves the most careful investigation, though it has already received so much attention from the ablest men that it were impossible, perhaps, to offer any new matter entirely new concerning it.

In considering the very able article by Mr. Hopkins, let us make a number of voissours of building to construct a semicircular arch of say 10 ft. span and 4 in. thick and place sufficient weight on the crown to break the arch: it will probably fly up near the 45th degree on either side, the lower arises of the arch-joints being more pressed and crushed than any other part of the arch. In the arch constructed by Mr. Hopkins this could not occur; but for any span and considerable rise his work would have to be of a thickness incompatible with economy; and for arches of small span, except in the case of stone, perhaps, vaults, tunnels, and works of a like kind, the mode of construction is comparatively of little importance, as a few courses of bricks over the springing corbels the opening, and they carry no weight above that height.

If a construction were made to rise straightly from the abutments to the vertex, and sufficiently light to prevent bending, then the breaking weight at the vertex would be the weight sufficient to crush the transverse sectional area of such material when in that position; but a much less weight would break the material if

placed midway between an abutment and the vertex: we should, therefore, beighten that point, so that it would bear as great a weight as the vertex, and which would in consequence bear much less. The points equidistant between those last operated on would require similar treatment, these again weakening the previous points and reducing their greatest load; but we must also consider the load that will be placed on such arches, as that will materially alter the construction; and for a bridge we must also allow for the greatest weight that will be placed on any point, in addition to what we allow extra for safety and for the jarring of vehicles.

If an arch be elliptical, a breaking-weight placed on the crown will cause it to give way at its haunches. To prevent this, thicken the arch at the haunches, gradually diminishing towards the crown, two courses being worked to butt against one, and in doing so, endeavouring to approach in each successive course a circular curve for the following course, of as great a radius as possible; hearing in mind that the less the sagitta the greater the strength of each segment, and that, unless the arch be uniformly loaded, the crown will carry the greatest weight, because it has the shortest length of voissours to press on, and, if these formed a straight line, would then resist as the sectional area of their material when in that position and operated on in that manner. But if they form a curved line, so that a string stretched on their face and attached to the extrados at springing and to the extrados at the crown, were to be at the narrowest place 1 in., then excepting the weight of the arch and friction, the breaking-weight would be equal to the resistance offered by the 1 in. left by string multiplied by width of arch; and if the string were carried beyond the crown to a point, and a breaking weight placed there, that weight would be less, because we should find the width left by string less than it was, consequently the sectional area less and weaker in proportion; therefore the crown is the strongest part.

H. AMBROSE.

SIR CHARLES BARRY AND THE LATE MR. PUGIN.

Sir,—My absence abroad prevented my seeing your impression of the 6th until to-day, or I should have replied last week.

I now beg to state, that the offensive manner in which I, amongst others, am alluded to,* leaves me no alternative but to write and say, that we are fully prepared to state facts, which will doubtless remove "the suspicions" you mention, and explain even the personal denials of Sir Charles Barry and my father, to which you refer.

E. WELBY PUGIN.

THE LAW COURTS COMPETITION.

Sir,—Having read the letter signed "A Surveyor," in your number of June 29, I beg you will allow me to say that I also have carefully measured the Courts in Mr. Waterhouse's design. I find them, however, exactly of the size prescribed, viz., 43 ft. by 32 ft. on the Common Law side of the building, exclusive of the recessed side-galleries given to many of the Courts, which would add 2 1/2 ft. superficial more, making in all 1,700 ft., instead of 1,624 ft. as represented.

The mistake of your correspondent has doubtless arisen from his having excluded from the area of the Courts that portion which is assigned to the general spectator facing the Judge. Mr. Waterhouse appears to have raised this portion of the Court above the general floor level to isolate it and give a better view from it; but the fact of its being so raised can be no more reason for its being excluded from the area of the Court altogether, than the fact that the raising of the Judges' Bench allows the introduction of another important passage can effect the diminution of the Court area to the extent of the space occupied by the Bench.

Another Surveyor. The statement of "A Surveyor" agrees with that of Messrs. Shaw & Pownall. It is not "a mistake." The question seems to be, whether the corridor over which the Judges sit may or may not be measured into the area of the Court.

ARCHITECT AND BUILDER.

Sir,—The following is a list of the tenders sent in for new public-house at Chislehurst, Kent, for Messrs. Rigden & Delmar, Plaster, &c., prepared by Mr. H. B. Wilson:—

Smith & Co.	£779	0	0
Groombridge	689	10	0
Wilson, H. B. (accepted)	687	0	0
Coxens, Brothers	685	0	0
Adams	680	0	0

Query—Will the architect get a commission for superintending his own work? or will the employers be so much the gainers by combining the architect and builder in the same person?

A BUILDER.

* The observation was general, not particular.—Ed.

HOW THE THAMES EMBANKMENTS ARE GETTING ON.

Sir,—The insertion of the inclosed may do good.

Contract No. 1.—North side of river, from Westminster Bridge to Somerset House:—
 Total amount of contract £220,000 0 0
 Total done in labour, materials, and plant to end of June, 1867 133,811 0 0
 Total unfinished at end of June, 1867 86,189 0 0
 Total progress in June, 1867 7,555 0 0

Contract No. 2.—North side of river, from Somerset House to east end of Temple:—
 Total amount of contract £229,000 0 0
 Total done in labour, materials, and plant to end of June, 1867 214,284 0 0
 Total unfinished at end of June, 1867 14,716 0 0
 Total progress in June, 1867 1,037 0 0

Contract No. 3.—North side of river, from east side of Temple to Blackfriars Bridge (not yet commenced):—
 Total amount of lowest tender opened October 5, 1863 (dates of Acts, July 29, 1863, and July 29, 1865) £229,000 0 0

Contract for Sonthorn Embankment, Westminster Bridge to near Vauxhall Bridge:—
 Total amount of contract £309,000 0 0
 Total done in labour, materials, and plant to end of June, 1867 105,000 0 0
 Total unfinished at end of June, 1867 204,000 0 0
 Total progress in this contract during June, 1867 2,000 0 0
 JASPER.

CHURCH-BUILDING NEWS.

Witley.—The ancient church of Little Witley has been re-opened, after being entirely rebuilt at the sole expense of the Earl of Dudley. The chancel is built with a semicircular apse, in which there are five lancet windows, all filled with coloured glass, presented to the church by the rector's friends. The church is filled with eucastic tiles from Messrs. Godwin's works, Herefordshire. The pews are low and open, and the pulpit is of stone. Mr. Perkins was architect; Mr. Wall, of Hanley Castle, the builder.

Birmingham.—The parish of St. Thomas is to have a new church, which has been long talked of. Messrs. Abraham and George Dixon have promised a donation of 1,000l., and the rector is making an earnest appeal to his parishioners and townsmen. The new church will be called the Church of St. Asaph, and is proposed to be erected upon a triangular plot of land at the junction of Latimer-street with Great Colmore-street. The site being limited, the whole has been made use of, and consequently the plan varies from the usual arrangement. The church will comprise a nave (56 ft. long) of six bays, divided from the aisles by an arcade of lofty piers and arches. The piers will be of Bath stone with enriched capitals, and the arches of particularly coloured stone. Above the arcade will be a clearstory, pierced with windows filled in with geometrical tracery. Eastward of the nave a broad arch will open into the chancel, the east end will be polygonal in shape, and lighted with seven lofty windows. The aisles will follow the shape of the land, and will widen gradually from the east to the west. All the roofs will be open, and boarded underneath the slates. Galleries being a necessity, the church has been designed specially to receive them. They will be constructed in the aisles, and at the west end, the position being marked externally by a transom and tracery across the centre of the aisle windows. All the passages will be paved with tiles; those in the chancel with eucastic. The seats will be of pine, without doors, and stained and varnished. The vestry will be formed underneath the chancel, and approached by a stone staircase. Externally the structure will be of best bricks, with dressings of Bath stone, moulded, and blue bricks will be freely introduced. On the Colmore-street elevation will be placed the tower and spire, 160 ft. in height, the ground-floor of the tower forming the principal entrance. There will be seats for about 1,000 persons. The design, selected in a limited competition, was prepared by Mr. Yeoville Thomson. The contractors are Messrs. Wilson & Son, of Handsworth. The cost will be between 6,000l. and 7,000l.

Dickleburgh.—The church of All Saints, Dickleburgh, is one among the many in Norfolk and Suffolk which have recently undergone restoration and repairs. Mr. R. M. Phipson, of Norwich and Ipswich, architect, was engaged to prepare plans and specifications of the contemplated restoration. These being submitted for

competition, several tenders were sent in, the competition being, for the woodwork, Mr. Bishop, Diss; and for the stonework, Messrs. Wells & Son, Dickleburgh. The stonework of the south windows is entirely new, the design being copied from the original. They are filled with cathedral glass by Mr. W. Consens, of Norwich. The north wall has been pointed and repaired, and the old plaster taken off. A new hutchess of Bath stone now occupies the place of the three old ones taken down. The chancel doorway has been completely restored with Ancaster stone, and has carved bosses to receive hood-moulds, one representing the vine and the other the oak. The interior repairs include a reading-desk in carved oak. The pulpit has been cleaned and repaired, but is both ancient and ugly. The benches are new, of English oak, with carved ends of various designs. The old carved oak screen separating the nave from the chancel has been lowered, so as to show the carved heads of the chancel benches. The east window remains in a dilapidated and almost unsafe state, and requires complete repair to harmonise with the rest of the church.

Lowestoft.—The churchwardens called a public meeting in the Town-hall to appoint a committee to assist them in carrying out the necessary repairs of the parish church. The meeting resolved that immediate steps should be taken, by appointing a committee to assist the churchwardens in raising the necessary ways and means for carrying out the repairs of the church with as little delay as possible. They also appointed a committee to assist the churchwardens in carrying out the repairs of the south aisle of the church.

Books Received.

Studies for the Restoration of the Plans of the Sacred Edifices of the Bible. By C. JONES. Part I. London: Trübner & Co. 1867.

The author claims to have made important discoveries, and says this Part is issued with the view of determining whether or not he shall publish them. He further says it was written because it had been objected to his previous works that they told nothing and afforded nothing to criticize. We have looked through the present *brochure* with every desire to discover something useful in it, but have failed to do so, and are forced to admit that if the previous works told less, the objects were right. Six quarto plates and a number of pages of letter-press are devoted to setting forth the only point touched in the Part before us, namely, what might have been the form of the stones of Solomon's Temple if it were built with stones fitted or dove-tailed together; and as there is no foundation whatever for the belief that they were dove-tailed together, the inquiry seems to be altogether unnecessary and valueless, even from the writer's point of view, that things are made obscure in the Bible in order to teach its readers to think. Mr. Jones ends with the following:—"Note.—Lest any should puzzle themselves attempting to restore the plans of the temple by aid of the foregoing, I may as well caution my readers that they would probably fail." We have not the slightest doubt about it.

Illustrations of Medieval Antiquities in the County of Durham. From Sketches and Measured Drawings, by JOHN TAVENOR PERRY, and CHARLES HENMAN, JUNR. Oxford and London: James Parker & Co. 1867.

We have here fifty-one large folio plates, illustrating some of the architectural treasures possessed by the County of Durham: St. Andrew, Auckland; St. Cuthbert, Billingham; St. Paul, Jarow; SS. Mary and Cuthbert, Chester-le-Street; St. Lawrence, Pillington; Holy Cross, Ryton, and others, but more especially Finchale Priory, and St. Hilda, Hartlepool. Of the last there are twelve plates, and of Finchale fourteen. These are very carefully drawn, more so, indeed, than some of the remainder, and include a large number of valuable mouldings and other details.

In the brief sketch of the architectural history of Durham that precedes the plates, the authors say that one year after the death of Bishop Pudsey (which is fixed at 1195), "his son Henry commenced the building of the Priory Church at Finchale." Very little, however, of what is now seen can be the design of that early period. Bishop Pudsey, we may note, had been the

means of greatly helping forward the cause of art, for not only did he cover the diocese with important buildings, but by the decoration of shrines, and by the addition to the convent library of beautifully illuminated MSS., he made us his debtors.

The volume is exceedingly creditable to the industry, energy, and skill of Mr. Perry and Mr. Henman, and augurs well for the future of a professional career commenced so auspiciously. It is appropriately dedicated to the Duke of Cleveland, as president of the congress held in Durham by the British Archaeological Association in 1866.

The coloured paper cover,—cleverly arranged, by the way, by Mr. Perry,—is numbered as Plate 1; so that, unless it be bound up with the rest, the volume will seem imperfect.

History of the Anglo-Saxons. By FRAS. PALGRAVE, F.R.S. A new edition, illustrated. London: W. Tegg, 1867.

A CHEAP popular edition of the late Sir Fras. Palgrave's "History of the Anglo-Saxons" has been published. It is "illustrated," but would be all the better if two-thirds of the engravings had been left out. They are rude and inexact; and, moreover, including, without explanation, views of buildings belonging to periods long after that treated of, only serve to mislead. The reprint is, nevertheless, welcome.

Wages Table. By HENRY J. HALLETT, Assistant Surveyor, St. Marylebone. London: Harrison & Sons. 1867.

THIS table shows the amount for any number of hours from one to eighty, at per hour or day of ten hours, from 1d. to 1s. per hour. It is very clearly printed on a large card.

Inventors and Inventions. By HENRY DIRKX, C.E. London: Spon, Charing Cross.

THIS is a subject with which the author shows that he is familiar, and the result is an instructive volume, on,—first, the philosophy of invention considered strictly in relation to ingenious contrivances tending to facilitate scientific operations, to extend manufacturing skill, or to originate new sources of industry; second, on the rights and wrongs of inventors, particularly as affected by the influence of patent monopoly legally and politically examined; and third, on early inventors' inventories of secret inventions, employed from the thirteenth to the seventeenth century, in substitution of letters patent. The work is dedicated to Mr. Henry Bessemer.

VARIORUM.

SOME of our readers may be glad to know that the paper by Mr. Jas. Fergusson, F.R.S., "On the Study of Indian Architecture," read at the Society of Arts, with a report of the discussion that followed, has been published by Mr. Murray, in a separate form. A sketch map and a number of illustrations have been added.—In the current number of the *Fine Arts Quarterly Review*, Dr. Kinkel reviews Mr. Wornum's account of Hans Holbein in a manner not wholly complimentary. Mr. Ruland continues his "New History of Painting in Italy." Mr. Aschpitzel, in a paper on Gothic Architecture in Spain, says,—“People talk of 'honest brick-work,' just as if a brick, after all, was really nothing but factitious stone.” We apprehend the sentence was intended to read,—“People talk of 'honest brickwork'; just as if a brick, after all, was really anything but factitious stone.”—Messrs. Spon (Charing Cross) have published a catalogue of scientific books published or sold by them, which some of our readers would find useful.—“The Royal Guide to the London Charities, for 1867-8.” By Herbert Fry. London: Hardwicke. The mere list of titles of the London charities, here given in alphabetical order, occupies no less than 167 pages, and we feel assured that no more remarkable memento of London could be given to our numerous foreign visitors and sightseers than this volume of the titles of its host of charities.—“A Handy Book to the Collection and Preparation of Fresh-water and Marine Algae, Diatoms, Desmids, Fungi, Lichens, Mosses, &c.” By Johann Nave, translated and edited by the Rev. W. W. Spicer, M.A. London: Hardwicke. To all wishing to form a collection of algae, &c., this small volume will be useful: it also gives instructions for the

formation of an herbarium.—“Observations upon a New and Simple Process for the Preservation of Meat, Poultry, Fish, &c.” London: Simpkin, Marshall, & Co. The object of this pamphlet is to recommend the patented process of Messrs. Medlock & Bailey, for dipping or moistening fresh meat with a solution of bisulphite of lime and common salt in order to preserve it from taint. They say that the bisulphite gives no taint or disagreeable flavour itself.—“London Cabs: the Course System as applied to London or any large City.” By J. L. Haddan, C.E., of the Hackney Carriage Department of the Metropolitan Police. London: Stanford. Notwithstanding Mr. Haddan's experience, his proposal does not strike us as a satisfactory way to re-arrange the cab system of London. He quotes Sir Richard Mayne's remarks at the Society of Arts on the course system, although Sir Richard there admitted it to be inapplicable to London; and we are still of opinion that Sir Richard was right, and that Mr. Haddan has not completely obviated the objections to such a system as applied to London.

Miscellaneous.

THE CANTERBURY DRAINAGE.—The Home Secretary has given his consent to the carrying out of the plan of drainage submitted by Mr. Filbrow. The outfall has been visited by the Government Inspector, accompanied by the Local Board Committee, the engineer, and a committee from Fordwich. The outfall has been fixed at a spot below Fordwich, a few yards above the place originally fixed by Mr. Filbrow.

TRANSPARENCY OF IRON.—At a recent meeting of the Académie des Sciences, M. Sechi made the important announcement of the complete transparency of iron when at a red heat. His own experiments have proved the truth of the fact, provided the thickness of the piece of iron does not exceed one quarter of an inch. This property of the metal appears to explain some of the phenomena respecting analyses which have resulted from the employment of iron.

GOLD IN THE SCOTTISH HIGHLANDS.—A correspondent states that gold has been found in various parts of the Highlands by a gentleman who has had many years' experience at the gold-diggings in Australia and New Zealand. He states that the metal was found in fourteen or fifteen different parts of the country, and that he believes there is gold, more or less, to be found along the boundaries of Argyshire and Perthshire, and all the way from Glenfine to the head of Glenetive. He has also found lead, copper, silver, and other ores.

THE PNEUMATIC DESPATCH IN PARIS.—Some time ago experiments were made with a view to transmit letters from one post-office to another by means of subterranean pipes, the parcels being propelled by atmospheric pressure. Seven offices are now on the point of being connected by the new system; and it is highly probable, according to the Paris correspondent of the *Morning Post*, that the whole of the post-offices in Paris will eventually receive their letters by this process. The hags will travel at a rate of from 800 to 1,000 French yards a minute.

AN ARTESIAN WELL OF BITTER WATER AND FIRE.—A new artesian well has been sunk by M. Bellaud, of Salles d'Ande, in the centre of a large alluvial plain, on the left bank of the Ande, in Nerbonne. Not only water, but fire springs from this well, which has been sunk about 60 metres. The water is cold, limpid, and very bitter. It is purgative, and a carburetted hydrogen gas escapes from it. This latter, passing through a narrow tube, burns continuously, with a reddish flame, but it gives forth no odour, and consequently contains no trace of sulphuretted hydrogen or bituminous vapour.

METROPOLITAN WATER SUPPLY.—In the House of Lords, Lord de Mauley called attention to the expediency of supplying water to the metropolis from the superfluous water of the upper part of the Thames, and adduced a number of facts bearing upon the subject, urging their lordships to devise some means by which the superfluous water of the upper part of the Thames might be utilised. The Duke of Richmond said that the question had been carefully gone into by the commission, and he hoped that in the course of the autumn a report would be prepared, in which it would be found that the question had been thoroughly inquired into and considered.

LONDON ASSOCIATION OF FOREMEN ENGINEERS.—The thirty-second half-yearly meeting of members of this society has taken place at the London Coffee House, Ludgate-hill, Mr. Joseph Newton, president, in the chair: the large assembly-room was well filled. The report and balance-sheet were both of a satisfactory character. The present amount of money for all purposes, vested in the trustees, is 1,309l.; the number of ordinary members, 105; and of honorary members, 53. Mr. William Taylor read a paper on "Steam-Engine Boilers."

TRIAL OF SAFES AT THE PARIS EXHIBITION.—Mr. Samuel Chatwood, of Bolton, Lancashire, and Mr. Silas C. Herring, of New York, have formally entered into articles of agreement, whereby they stake 15,000 francs each on the issue of a trial of their respective safes by burglars' appliances, such as drilling instruments, gunpowder, crow-bars, &c. They have appointed a joint committee to decide the question between them, the winner to have his 15,000 francs returned, and the loser to have his distributed for charitable purposes in London, Paris, and Washington.

THE ANSTICE MEMORIAL, COALPORT, SHROPSHIRE.—Mr. W. O. Foster, M.P., has contributed 2000l. towards the fund for erecting an Anstice Institute at Madeley. The proposal is to erect an institute, to include reading-rooms, rooms where working men may sit down with their pipes, if they wish, and enjoy themselves on an evening; also baths, wash-houses, and recreation grounds, where amusements may be indulged in. The Ironbridge tradesmen and the tradesmen and professional men of Broseley, on the other hand, have set their minds upon a free bridge across the Severn. This proposal, however, has collapsed, and the subscriptions have been transferred to the Institution and Recreation Grounds, at Madeley. Mr. Fritchard, M.P., and Mrs. Fritchard have given 300l., making altogether about 1,450l.

PUBLIC HEALTH IN SALISBURY.—The city of Salisbury was formerly one of the unhealthiest small cities in the kingdom. The average annual rate of mortality in twelve winter quarters before the sanitary works were undertaken was 30 per 1,000; in the twelve winters subsequent to the establishment of the Local Board of Health, the average annual rate has been 23 per 1,000, which is the winter death-rate of the registrar-general's "country districts" of England. The mortality for the whole year, averaged for twelve years since drainage, is 20 per 1,000, exactly the rate observed during the last severe winter, when the mortality was generally raised all over the kingdom. The city was entirely unaffected by the cholera epidemic of last year, although in 1849 cholera and diarrhoea alone were fatal to 20 in every 1,000 of the inhabitants.

EXPORTS OF RAILWAY IRON.—Notwithstanding the prevalence of adverse influences in some quarters, the export of railway iron from the United Kingdom have attained a respectable importance this year, having amounted in April to 43,974 tons, as compared with 46,673 tons in April, 1866, and 28,667 tons in April, 1865, and for the four months ending April 30 to 133,875 tons, as compared with 135,803 tons in the corresponding period of 1866, and 92,018 tons in the corresponding period of 1865. The exports would not, however, have been sustained so well this year but for an exceptionally large demand from the United States. The exports of railway iron are also well maintained to British India. In the miscellaneous demands for British railway iron there appears, however, to have been a rather considerable falling off this year.

STRIKE AT SUNDERLAND.—In consequence of the excavators, 300 in number, employed at the new Hendon Dock having refused to work unless they received an advance upon their price equal to thirty per cent, they were paid off on Saturday, and the commissioners have decided to stop the night shifts, lay off one engine, and proceed with the cutting of the gulleys only, in order to get in the walls and warding. There only remain 40,000 cubic yards of mud to remove, 280,000 having already been removed, and of the 40,000 to remove 30,000 are required for backing up the walls when built, and levelling the ground. Only sixty men will therefore be required for the excavation necessary. There is no doubt that the strike arose in consequence of the excavators supposing the completion of the dock was imperative by a given time.

STRATFORD-UPON-AVON.—The foundation-stone of a bridge, to replace the old Mill Bridge, partially swept away by the floods of March, over the Avon, at Stratford, has been laid.—The partial re-erection of the church spire, damaged by lightning some years ago, has been completed.

THE VALUE OF LAND NEAR LONDON.—Eighty-seven acres of land at Edgeware, belonging to St. Bartholomew's Hospital, have been sold recently to the Midland Railway Company for the sum of 45,000l., as settled by arbitration. Up to this time the hospital has derived from it simply an agricultural rent. Time has made it building land.

THE NEW INDIA OFFICE.—The new building was last week inaugurated, so to speak, by "a competitive examination of candidates for appointments in the Engineer Establishment of the Department of Public Works in India." The examiners were Mr. George Preston White, C.E.; Professor Capp, F.R.S.; and Colonel Newmarch, R.A. The examination was conducted in rooms on the second floor.

ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The annual meeting, to be held this year at Hull, will commence on the 30th inst. The Archbishop of York will be the president, and the grand jury-room at the town-hall is to be the reception-room. The arrangements for the week include excursions to Beverley Minster, Hedon, Patrington, Flamborough Head, the Dane's Dykes, Driffield Church, Malton gravel-hedge, Howden, Wressell Castle, Selby Church, and Bridlington.

PRINCE CONSORT'S WINDSOR ASSOCIATION.—The annual meeting of this association, established in 1850 by the Prince Consort for improving the condition of the laboring classes of Windsor, Eton, and the surrounding neighbourhood, has taken place in the Windsor Home Park, under the most favourable auspices. The show of fruit and flowers from the royal gardens, the royal nurseries, and gardens of the nobility and gentry of the neighbourhood, was of a finer description than has been witnessed for several years past. Mr. T. Ingram's display from the Queen's Gardens included a very extensive and beautiful miscellaneous collection of plants, fruit, and cucumbers. Whilst the exhibitors were enjoying their dinner, and during the afternoon, the fine band of the Scots Fusilier Guards performed some pieces of music. The prizes were distributed by the Princesses Alice and Louise, and Prince Leopold.

REPORT ON CO-OPERATIVE SOCIETIES.—In a Blue-book lately issued is a report by Mr. Fane to Lord Stanley, on co-operative societies in France, in which the progress of these societies is reviewed. Of the three kinds of co-operative associations, societies of consumption, of credit, and of production, it is to the last Mr. Fane confines his attention. Amongst others he speaks of M. Leclair's Society, to which the attention of our readers has already been directed in the *Builder*. Mr. Fane states, that while many of the productive societies have collapsed, a few, such as the Society of Masons, are remarkably prosperous. There has been too much faith, he thinks, in the combination of skill and labour, and too little in the co-operation of capital. He is of opinion that societies enabling workmen to effect savings and to learn providence, should have preceded, in France, the formation of productive societies.

HEALTH IN MARYLEBONE.—In the last monthly report of Dr. Whitmore, the Medical Officer of Health for Marylebone, he states that on a very recent occasion great sickness and diarrhoea were produced by the offensive effluvia arising from large accumulations of manure. An outbreak of cattle plague occurred in Malthouse-mews, Lisson-grove, adjoining to which is Carlie-mews, and in these two places at the time of the outbreak there were sixty cows and from eighty to ninety horses. These places were promptly declared to be an infected district, and a *cordon sanitaire*, so to speak, was placed round it, so that in a very short time immense heaps of manure had accumulated. After the interval of a few days, sickness and diarrhoea broke out amongst the inhabitants, and out of 149 men, women, and children residing in these mews sixty-one were suffering from sickness and diarrhoea. It was not until after an interval of twelve days, and the expenditure of much time and trouble, that he was enabled to get the manure removed.

WORKING MEN'S COLLEGE.—The summer convocation of this excellent institution was held on the 12th inst.

THE WORCESTER MODEL DWELLINGS ASSOCIATION.—The annual meeting of this Association has been held in the Guildhall. Admiral Hastings occupied the chair. The report stated that the prospects of the Association "were cheering, owing to the general rise in the rentals of the buildings." The Gloucester Arms Inn and five tenements adjoining had been sold for 340l. and 410l. The whole square or block of buildings was now open on all sides. The buildings were in good repair, and the occupants numbered about 140. The arrears of rentals amounted to 1l. 13s. 9d., and a dividend of 2 per cent. was recommended. The report was unanimously adopted.

METROPOLITAN DRINKING FOUNTAIN AND CATTLE TROUGH ASSOCIATION.—The eighth annual meeting of this useful association has been held. The last year has been a successful one. An anonymous contribution of 1,000l., besides other subscriptions, enabled the Association to add many troughs for cattle and dogs to fountains in various parts of the metropolis and its suburbs, and more are in progress. There are 110 fountains in all under the care of the Association. The annual subscriptions for the year amounted to 546l. and the donations to 1,241l., besides the 1,000l. already referred to. A legacy of 1,000l. will shortly be available. Lord Grosvenor has consented to become the president. The New York people have consulted the Association and are supplying their city with fountains. The large fountain in Hyde Park, erected at the cost of the Maharajah of Vizianagram, is being rapidly proceeded with. The report was unanimously adopted.

WORKS IN BRONZED CAST IRON.—The American Department of the Paris Exposition contains a numerous collection of lamps of various kinds, clock-cases, and other works, all of them executed in bronzed iron. They are the productions of Tucker's Manufacturing Company, of Boston, and are the results of experiments carried on by Mr. Tucker during the last seventeen years. The material employed is American iron of several varieties compounded together, with a comparatively small admixture of the Scottish Cullinass iron. A combination of several important qualities is thus obtained. The desired colour is obtained through the union of the carbonized oil with the oxidized metal. This is a permanent bronzing, incorporated with the substance of the metal. The Tucker bronzing process is patented in England and France, as well as America, and may be applied to the decoration of stoves, iron bedsteads, and many other works in iron, which at present are usually coated with lacquer or varnish.

TIN WATER PIPES.—An invention of Messrs. Colwell, Sbau, & Willard, is being developed at New York, which is calculated to prove of great sanitary advantage, in providing a means of preventing the contamination of water by lead pipes. The *Scientific American* explains that the pipe differs from the ordinary lead pipe, in being, for its calibre, only about half the thickness of lead, and in being lined throughout with pure block tin, not merely washed or plated with it, but being really a pipe of tin enclosed by one of lead, the two being fused or welded together, forming one solid whole. It has been found that the new pipe is stronger than lead pipe, although weighing only half as much per foot. A powerful hydraulic press, worked by a steam-engine, stands by the side of a furnace, over which is a tank containing the melted lead. Directly under the press is a receiver, at the bottom of which a steel die is placed, the aperture in which corresponds with the external diameter of the pipe. The projecting portion of the press piston fits the receiver, and has a mandrel on its lower end corresponding with the inner diameter of the pipes to be formed. A cone-shaped block of pure tin, having a hole longitudinally through its centre, into which the mandrel fits, is placed in the centre of the receiver directly over the die, the apex of the cone downward. The piston of the press is then lowered until the mandrel engages with the hole in the tin, when melted lead is let in and the receiver is filled to the top of the tin cone. After a few minutes, to give time for the melted lead to form a junction with the outside of the tin, the pressure is applied, and the tin-lined pipe comes continuously through the die, and is coiled on a reel.

PATHS.—A correspondent writes:—"A Sub.' will get good paths by using less well-boiled tar to dry gravel, free from dirt, put on about 2 1/2 in. thick, with a good sprinkling of spar (Derbyshire), or small pieces of marble on the top. Roll the gravel and tar first a little, then sprinkle with the spar, and roll altogether well. It will improve the paths to put down a low edging of stone, tile, or wood, first; it keeps the edge of the path firm; no weed or damp will then lodge upon it.

ST. THOMAS'S HOSPITAL.—At the last weekly meeting of the Metropolitan Board of Works, the superintending architect, in answer to a resolution of the Board, reported that the sums paid, or agreed to be paid at Stangate, for the Southern Embankment, were 324,492l. The surplus lands were sold to the trustees of St. Thomas's Hospital for 108,000l., which was about one-third of the entire cost. The site of the new hospital extends from Westminster Bridge to Lambeth Palace, and is bounded on the river embankment by a new public road, 20 ft. wide, and by New Palace-road, on the eastern side, 60 ft. in width. The cost of clearing the ground will be 324,492l.; for 8 1/2 acres the governors of the hospital pay 95,000l.; for the triangular piece of ground adjoining, 13,000l.; making a total of 108,000l., which, deducted from the 324,492l., leaves 216,412l., or two-thirds of the total cost of the two new roads and embankments.

THE NEW MANCHESTER CEMETERY.—The low-lying portion of this cemetery has been submerged. It is defended from the river by an embankment some 7 or 8 ft. above the average water-mark. The rise of the river was so sudden, and the weir at the Messrs. Wood's print works offered so effectual a barrier to the flow of the water, that the flood speedily rose above the embankment and covered the burial-ground for a distance of 20 or 30 ft. The flood did not wash up the soil, or disturb any of the graves that had been closed; but it is usual to keep two or three graves unclosed, so that more interments than one may be made in the same graves, and the water, by overflowing these open graves, set five coffins afloat, one of which was carried into the stream. The city surveyor visited the ground, and in his opinion the only effectual mode of guarding against the repetition of such an occurrence will be to build a more solid embankment to about twice the height of the present one.

TENDERS

For extension of present shop, show-rooms, and warehouse, for Messrs. Brice & Sons, in the drapery, Northampton. Mr. George Low, architect. Quantities supplied by Mr. Frederick Johnston:— Smith, Brothers (accepted)..... £5,415 0 0

For alterations and repairs at Camden Church, Camberwell. Mr. F. W. Mearns, architect:— Harland & Fisher 997 0 0 Jones 839 0 0 Garland & Sons 804 0 0 Colls & Son 755 0 0

For parsonage-house for the incumbent of Holy Trinity Church, Kentish-town. Messrs. Beck & Lee, architects. Quantities by Messrs. Pain & Clark:— Ashby & Sons £3,333 0 0 Condit 3,215 0 0 Manley & Rogers 3,180 0 0 Colls & Son 3,154 0 0 Woodward 3,163 0 0 Foster 3,020 0 0 Webb & Sons 2,879 0 0

For building house and tavern, Seven Sisters'-road, Holloway, for Mr. J. Pigot. Messrs. Finch Hill & Paraire, architects. Quantities supplied by Mr. Doughney:— Warne £4,250 0 0 Hoare 4,057 0 0 Wiltshire & Rowell 3,968 18 0 Leaguard & Way 3,716 0 0 Newman & Mann 3,590 0 0 Eaton & Chapman 3,513 0 0

For residence, Tettenhall. Mr. G. Bidlake, architect:— Trov £3,800 0 0

For rebuilding Swan-hill Congregational Church, Shrewsbury. Mr. G. Bidlake, architect:— Nevitt £1,477 0 0

For double villa residence, Penn-road, Wolverhampton. Mr. G. Bidlake, architect:— Higham £1,187 0 0

For mission-room, Eroseley, Shropshire. Mr. G. Bidlake, architect:— Smithyman £236 0 0

For alterations and additions to Tor Lodge, Tettenhall. Mr. G. Bidlake, architect:— Heveningham £1,120 0 0

For alterations at the Three Cranes public-house, Brick-lane, Spitalfields, for Messrs. Truman, Hensbury, & Co. Mr. J. Fanner, architect:— Turner & Son £2,129 0 0 Brown 1,775 0 0 Eaton & Chapman 1,589 0 0 Marr 1,573 0 0

For residence for Mr. Harry Bridger, Old Shoreham, Sussex. Messrs. Gault & Gibbins, architects:— Cheeseman & Co. £2,765 0 0 Howell 2,643 0 0 Nightingale 2,470 0 0 Simms & Marton 2,456 0 0 Shearlung 2,490 0 0 Bland 2,352 0 0 Chappell (accepted) 2,346 0 0

For three houses, Queen's-road, Baywater, for Metropolitan Railway. Messrs. Withall & Evers, architects:— Bywater £1,880 0 0 Tongue 1,696 0 0 Ebb & Sons 1,680 0 0 Webb & Sons 1,385 0 0 Richardson 1,333 0 0 Foster 1,372 0 0

For erecting public-house, Gainsford-street, Kentish-town-road. Mr. J. F. Newman, architect:— Scribner & White £2,397 0 0 Webb & Sons 2,236 0 0 Manley & Rogers 2,200 0 0 White 2,168 0 0 Mann 2,133 0 0 Mathews 2,040 0 0

For rebuilding 45, Carter-lane, City. Mr. Whitehead, architect:— Ashby & Horner £1,325 0 0 Piper & Wheeler 1,233 0 0 Macey 1,223 0 0 Brass 1,157 0 0 Turner 1,171 0 0 Newman & Mann 1,159 0 0 Hill & Son 1,147 0 0 Webb & Sons 1,137 0 0

For rebuilding No. 43, Carter-lane, City. Messrs. J. Young & Son, architects:— Condit £2,629 0 0 Macey 2,613 0 0 Brass 2,542 0 0 Piper & Wheeler 2,472 0 0 Hill & Son 2,459 0 0 Webb & Sons 2,345 0 0 Ashby & Horner 2,325 0 0 Newman & Mann 2,296 0 0

For new wing to Hospital for Women, Soho-square. Mr. E. L. Bracebridge, architect:— Read & Sons £2,220 0 0 Patman & Co. 2,190 0 0 Wood & Co. 1,983 0 0 Myers & Sons 1,780 0 0 Piper & Wheeler 1,757 0 0 Hill & Son 1,660 0 0 Webb & Sons 1,717 0 0 Axford 1,707 0 0 Wagstaff & Sons 1,690 0 0

For alterations in Fishbury-place. Mr. H. J. Hammon, architect:— Foster £2,480 0 0 Honnor 2,480 0 0 Brass 2,450 0 0 Webb & Sons 2,345 0 0 Pritchard 2,327 0 0 Macey 2,283 0 0 Browne & Robinson 2,225 0 0

For redecorating St. Paul's Church, Islington. Mr. T. Mathews, architect:— Ramsay £265 0 0 Dovey, Rubens, & Co. 265 0 0 Webb & Sons 249 0 0 Smith & Sons 247 17 0 Sewell & Sons 215 0 0 Morland & Burke 207 0 0

For erecting parsonage-house, Haverstock-hill. Messrs. Beck & Lee, architects:— Ashby & Sons £3,333 0 0 Condit 3,215 0 0 Manley & Rogers 3,190 0 0 Colls & Son 3,184 0 0 Woodward 3,183 0 0 Foster 3,120 0 0 Webb & Sons 2,879 0 0

For Stockport Baptist Chapel. Messrs. Habershon & Pite, architects:— Brown £6,490 0 0 Weatherly & Bymer 5,947 0 0 Ramsay 5,623 0 0 Atkinson 5,600 0 0 Eapley 5,600 0 0 Robinson 5,600 0 0 Statham & Sons 5,185 0 0 Hughes 5,121 0 0 S. & W. Pattinson 4,993 0 0

For cottage, new club-room, and other works, at Prince Edward's Tavern, Park-road, Holloway. Mr. Thompson, architect. Quantities supplied:— Barker £567 0 0 Greenfield 534 0 0 Ramsay 483 0 0 Eaton & Chapman 475 0 0 Poxon & Smith 445 0 0 Shurman 417 0 0 Warne (accepted) 410 0 0 Bradbury & Brett 374 0 0

For building new parsonage-house for St. Peter's, Rochester. Mr. Ewan Christian, architect. Quantities supplied by Messrs. Goodman & Vinal:— Naylar (accepted) £1,470 0 0

For building house, Air-street, Regent-street, for Mr. Ralph Bodilly:— Nightingale (accepted) £755 0 0

For building new inn at Rochester, for Mr. George Beer, Canterbury. Mr. John Green Hall, architect:— Pettis £1,423 13 0 Solitt 1,370 0 0 Naylar (accepted) 1,370 0 0 * After deductions for old materials.

For residence for Mr. Henry Mills, on part of Beacott Estate, Welchesbury, near Walsall. Messrs. William & Samuel Horton, architects:— Taylor, Brothers £2,200 0 0

For repairs, alterations, and refitting the parish church of Hamerton, Lincolnshire. Mr. Withers, architect:— Huddleston £1,370 0 0 Binn & Co. 1,347 0 0 Locke 1,345 0 0 S. & W. Pattinson 1,300 0 0 Bellamy 1,168 0 0 Barker 1,028 0 0

For repairs and refitting to the parish church of West Parkwith, Lincolnshire. Mr. Withers, architect:— Bellamy & Barker £524 0 0

For alterations and additions to the Balmoral Castle, Caledonian-road, for Mr. Baines. Quantities not supplied:— Dalton & King £237 0 0 Brett & Bradbury 170 0 0 Bevington 155 0 0

For repairs and additions to six houses, Caledonian street, King's-cross. Mr. E. L. Blackburne, architect. Quantities not supplied:— Waters £950 0 0 Smith & Biggs 608 0 0 Ramsay 589 0 0 Blackmore & Morley 622 10 8 Bradbury & Co. 613 0 0 Taylor & Son 445 0 0 Laid 297 0 0 1

For laundry buildings to connect, Central Hill, Norwood. Mr. Goldie, architect. Quantities supplied by Mr. Scoble:— Myers & Sons £2,240 0 0 Longmire & Burge 2,110 0 0 Simpson 2,065 0 0 Lawrence & May 1,969 0 0 King & Sons 1,914 0 0 Gammon 1,903 0 0 Nightingale 1,891 0 0 Roberts 1,779 0 0

For the erection of additional buildings and alteration of the old buildings at the Red Coat School, Stepney-green. Mr. Henry Stock, architect. Quantities supplied by Messrs. Marsland & Widows:— Hill & Keddell (accepted) £2,177 0 0

For rebuilding the Old Field Bull public-house, Holloway-road, for Messrs. Taylor & Walker. Mr. Charles Duach, architect. Quantities supplied by Mr. G. P. Baggett:— Hill & Keddell (accepted) £2,493 0 0

For new parsonage, Holy Trinity, Wallington, near Croydon, for Mr. N. Bridges. Messrs. E. Habershon, Brock, & Webb, architects:— Simpson (accepted) £1,650 0 0

For part restoration of the offices of the London Society for the Propagation of the Gospel amongst the Jews. Messrs. E. Habershon, Brock, & Webb, architects:— Manley & Rogers £261 0 0 Warne & Co. 260 0 0 Cole 255 0 0 Morant 185 0 0

For alterations at 6, Russia-row, Milk-street, City. Mr. William Smith, architect:— Brisley £428 0 0 Chretien 407 0 0 Crabbe & Vaughan 394 0 0 Fanhall & Weeks 304 0 0 Sibley 295 0 0 Eaton 310 0 0

For six houses, Cross-street, Islington. Mr. William Smith, architect. Quantities by Messrs. Pain & Clark:— Webb & Sons £3,089 0 0 Eaton & Chapman 2,203 0 0 Nightingale 2,833 0 0 Sibley 2,816 0 0 Thompson 2,785 0 0 Eshop 2,695 0 0 Crabbe & Vaughan 2,549 0 0 Henshaw 2,521 0 0 Rodda 2,150 0 0

For villa in the Seven Sisters'-road, for Mr. Joseph Ramsay. Mr. William Smith, architect:— Flint £1,100 0 0 Crabbe & Vaughan 1,050 0 0 Brisley 1,000 0 0

TO CORRESPONDENTS.

"The Effemer Memorial"—An Inquirer wishes to know what is being done in this matter. Proposed Assistant Engineers' and Draughtsmen's Association.—Several letters received on this subject. S. M. H. (last week).—G. R. (has been posted).—W. H. (send particulars).—Poor Clerk (at any Artists' Coloursman's). F. J.—T. N.—W.—J. M.—A. O.—T. F.—J. T.—T. R. W. R.—C. S. H.—T. C.—W.—C. N.—A. Inauguration.—A. Well-wisher.—T. L. D.—A. R.—Mr. T. H.—R. W.—R. B.—W. P.—W. & S. H.—T. T.—M.—W. M.—C. R.—M.—Mr. W.—R. & B.—E. N. We are compelled to decline pointing out books and giving addresses. All statements of facts, lists of tenders, &c., must be accompanied by the names and addresses of the sender, not necessarily for publication. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the author.

Useful Properties. MESSRS. DRIVER & CO. beg to inform...

LEYTONSTONE. First—Several eligible Blocks on the Fuller brook Estate, a valuable Freehold Building Property...

ESSLER, SURREY.—Valuable Freehold Building Land, called Penners Park (see from last issue) containing about 60 acres...

MESSRS. DRIVER & CO. are instructed TO OFFER the above FREEHOLD BUILDING LAND FOR SALE BY AUCTION...

SEVENOAKS.—BRADPOUR ESTATE.—An exceedingly valuable and important Freehold Residential and Building Property...

MESSRS. DRIVER & CO. are instructed to offer for SALE BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, AUGUST 9th...

MESSRS. DRIVER & CO. are instructed to offer for SALE BY AUCTION, at the MART, Tottenham-yard, on FRIDAY, AUGUST 9th...

PECKHAM BYE.—On the bye-bill Estate.—For Sale, by order of Messrs. Debenham, Tewson, & Farmer...

NOBBURY-HILL, STREATHAM, SURREY.—7 miles by road from London, a about 1/2 mile from the present London Station...

MESSRS. DEBENHAM, TEWSON, & FARMER have been favoured with instructions to SELL, at the MART, near the Bank, on THURSDAY, JULY 26th...

MESSRS. DEBENHAM, TEWSON, & FARMER have been favoured with instructions to SELL, at the MART, near the Bank, on THURSDAY, JULY 26th...

MESSRS. DEBENHAM, TEWSON, & FARMER have been favoured with instructions to SELL, at the MART, near the Bank, on THURSDAY, JULY 26th...

MESSRS. DEBENHAM, TEWSON, & FARMER have been favoured with instructions to SELL, at the MART, near the Bank, on THURSDAY, JULY 26th...

LOUGHTON PARK ESTATE, ESSEX.—Choice Freshhold Building Estate, adjoining the station, and within forty minutes of the town of Fincham...

MR. V. BUCKLAND is instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, AUGUST 8th...

CITY OF LONDON.—Important to Railway Contractors. Colliery Proprietors, &c.—Brett Sale of valuable New Railway Materials nearly 6000 Tons of Ironwork.

GILLARD begs to announce that he has received positive instructions to SELL BY AUCTION, without reserve, on WEDNESDAY, the 24th of JULY, 1867...

WALWORTH.—To Packing case Makers, Steam sawyers, Manufactory of all kinds of Ironwork, and large variety of...

MESSRS. HARDS & VAUGHAN has SELL BY AUCTION, at the NEW AUCTION MART, Bank, on THURSDAY, AUGUST 8th...

MESSRS. BEADLE are instructed to offer for SALE BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

MESSRS. BEADLE are instructed to offer for SALE BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

RICHMOND HILL, SURREY.—One of the most charming Properties in the county, distinguished as Curdons House, situated on the crown of Richmond Hill...

MESSRS. BEADLE are instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

MESSRS. BEADLE are instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

VICTORIA STREET, WESTMINSTER.—First-class Freehold Building of 775 and Three Freehold Buildings, with possession...

MR. PHILIP D. TUCKETT is instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

In Chancery.—10 Acres of Freehold Building Land close to Ashford Station on the South Western Railway, in 29 lots, with conveyances...

MR. PHILIP D. TUCKETT is instructed to SELL BY AUCTION, at the MART, Tottenham-yard, on THURSDAY, JULY 26th...

TO ARCHITECTS AND OTHERS. ARCHITECTURAL DRAWINGS COLOURED for Competition or Exhibition; Perspectives, Designs, Sketches, or Finished and Working Drawings...

BRECON WATER-WORKS.—TO PLUMBERS.—WANTED THREE PLUMBERS for a few months.—Application, stating names required, to be made, by letter, to the SURVEYOR, Local Board of Health, Brecon.

TO ARCHITECTS, &c.—PARTNER-SHIP.—A gentleman of experience is desirous of joining an Architect and Surveyor of moderate practice.—Address, W. N. 271, Casualty Bridge road, S.W.

TO MASONS and WALLERS. GOOD WORKMEN may meet with EMPLOYMENT, at the New University Building, Giltspur Street, Glasgow, on application to WILLIAM BRADFORD, Foreman of Works. The works are expected to last from two to three years.

PUPIL.—An Architect of some position requires a well-educated gentleman YOUTH, with preliminary A. B. C. and French, and capable of assisting him in a respectable trustworthy way required in the same office.—Address, F. R. E. A. 128, Strand, W.C.

WANTED, a JUNIOR CLERK for a Builder's Office.—Address, stating age, salary, and where last employed, to G. C. Post-Office, Birmingham.

WANTED, for a Country Villa, an un-certificated SCHOOLMASTER, whose husband or son would be employed partly in the day, and partly as assistant clerk in the Education Office. Average school attendance 70. A liberal salary will be given. A man of mature age, capable of giving a good English, and of giving references with regard to education and character. Requirements.—Music, drill, needlework, reading, writing, and arithmetic.—Apply with fullest particulars, to H. U. H. Carlton Club, Pall Mall, London.

TO IRONMONGERS. WANTED, a steady Man, EMPLOYMENT as HOT or COLD WATER BAND, Gas filter, range filter, &c.—General Reference. Cut our hand to any of the above notices. Good reference if required.—Address, T. B. 13, Vesuvial-street, York-road, Battersea, Surrey.

WANTED, an OFFICE BOY, who can write a good plain hand and trace drawings.—Apply, HOBERTSETER, 58, Coleman-street, W.C.

WANTED, a JUNIOR ASSISTANT who writes a good hand, and is quick at figures.—One who has had some experience in a Builder's office preferred.—Address, X. V. Post-office, King-street, Westminster.

WANTED, in a DEAL-YARD and SAW-MILL, a First-class Man as GENERAL FOREMAN and SALESMAN; one that can take charge of the management of yard preferred.—Address, O. C. The Builder.

WANTED, a good GRAINER and HARBER (one who is a good writer as well preferred). One needed apply who cannot give good testimonials as to sobriety.—Address, stating lowest wages for a permanency, to T. C. care of Mr. Finlay, 147, Lamb-street, W.C.

WANTED, a DRAUGHTSMAN, for Water-works.—Address, Mr. BUCE, Maker, Edgeware-road, N.W.

WANTED, immediately, a CLERK of the WORKS, Salary Two Guineas a week.—Address, stating references and last employer, T. HERBERT WILLIAMS, Station, South Wales.

TO ARCHITECTS ASSISTANTS. WANTED, a thoroughly qualified ARCHITECT'S ASSISTANT. Must be a good Draughtsman.—Apply to Mr. R. J. GODDARD, Architect, 5, Princes Lane, Leicester.

WANTED, a good CARVER and LETTER-CUTTER, accustomed to Tombs and Memorials.—Apply to W. LANGDALE, Builder, Whiteby, Yorkshire.

TO HANDRAIL WORKERS and FIXERS. WANTED, a person fully competent to such Work, at some hours on the West-end.—Address, with references, to N. S. 57, Office of "The Builder."

TO BUILDERS' CLERKS. WANTED, one that is well up in every detail connected with the duties of a BUILDERS' OFFICE. He must be a quick and accurate accountant.—Apply, stating references, age, and salary required, to Mr. M. S. Filley, Royal Wigmore Park, N.W.

WANTED, in a Land and Estate Agent's OFFICE, a CLERK and ASSISTANT. One that can survey, act preferred.—Address, stating age, salary required, and last engagements, 925, Office of "The Builder."

WANTED, a good DRAWING BRICK-LAYER and CARPENTER.—Apply to Mr. GEA PICKERDEN, 29, Tottenham-street, Hackney-road, N.E.

WANTED, an active Man, as CLERK of the WORKS, for the erection of a Chemical Works.—Apply, stating salary, and references, to BOX 120, Post-office, Bristol.

TO ARCHITECTS AND LAND SURVEYORS. WANTED, a RE-ENGAGEMENT. Accustomed to working, drawing, and competition drawings, and thoroughly well up in the general routine of the above offices. Salary moderate.—Address, 120, Office of "The Builder."

WANTED, GRAINING and MARBLING by PICKER-WORTH.—Address, X. V. 81, Charlton-street, Oakley-square, N.W.

WANTED, by a respectable Young Man, a SITUATION as IMPROVER at the Plumbing.—No objection to fill up with painting.—Address, T. B. 34, Gauthier-street, Tottenham-road, Bow.

The Builder.

VOL. XXV.—No. 1277.

Technical Education.

IF the ultimate effects of international exhibitions on trade and manufactures be what they may, it is evident that they enable us periodically to compare the technical education of the various countries of Europe with great facility, and whatever advantage any individual country may derive from this comparison, will be through the improvement of its technical or secondary education reflected in its trades and manufactures. The present Paris Exhibition has afforded even greater than the usual opportunities for such a comparison, and the peculiar position in

which we are acknowledged to stand in several branches of manufacture depending for success on the intelligent co-operation of skilled workmen, has led many of the most far-seeing of our English jurors to consider seriously the subject of technical education in England. It may be, perhaps, cynically remarked that before we begin to meddle with the secondary education of our countrymen, it would be well to establish something like a decent system of primary education, so that every English child should receive as his birthright instruction in the simplest and most elementary knowledge;—that to offer instruction in science to people who cannot read or write is like offering jewelry to a naked man, or dainties to one who is perishing for want of bread. There is, we are prepared to allow, great force in this view of the case; but unhappily for us one great evil is not remedied, one important want is not provided for, by the omission from a sense of contrition of another obvious duty; or, in other words, upon the principle that two blacks do not make a white, bad primary education will not excuse bad secondary education; nor will the proved existence of a shameful neglect in the former relieve us from a responsibility to do something for the latter. We have been blundering long enough, Heaven knows, about sectarian and non-sectarian schools, denominational systems and national systems, frightening ourselves into religious panics concerning the precise theology which it is best to teach children of seven years and upwards, until, as a triumph of national foresight, there are more men and women unable to read and write in England, in proportion to the population, than in any other civilized coun-

try in Europe. This is a legacy bequeathed to us by our forefathers, for the existence of which we are not responsible, though we shall be for its continuance. It is a problem not approached in importance by any other question of the day, and one which of all duties it is our manifest business to attend to. There are signs of a recognition of the obvious necessity that exists for national action in the matter, for it is gradually resolving itself into a cry (and a cry which all political parties have used at different times), like the irrepressible Reform cry, and which all parties in the state will eventually have to agree about, to get it out of the way.

Meanwhile what is to be done in the matter of technical education? We have for many years advocated an extension of our present means of education in science and art, and the addition to them of new features on a much wider basis than exists at present. The opinions recently given by distinguished jurors of the Paris Exhibition, in reply to the inquiries of the Schools Inquiry Commission, betray to us what appears a practical unanimity of the best authorities in the opinion that we are losing ground fast and daily in our mechanical and manufacturing industries, and that this is to be attributed to the want of technical education in England,—education practical and theoretical in science and art. There is an almost singular similarity in the evidence on this point of such very different witnesses as Dr. Playfair, Mr. J. Fowler, and Mr. Huth. They all agree that what material advantages we have in England contributing to success in our manufactures, are more than counterbalanced by the great deficiency which exists in our manner of making use of them; and Mr. Huth, an extensive manufacturer at Huddersfield, a foreigner by birth, though an Englishman by everything else, boldly takes the bull by the horns, and says that we have the greatest difficulty even in maintaining our equality now, where we have for all past time ridiculed competition; and he attributes this change to the inferior education given to our “masters, foremen, and workmen,” to that which is now given to all those classes in almost every country on the Continent of Europe. It is no longer, therefore, a question of whether we should or should not teach chemistry or drawing in evening classes, in the few towns such classes exist in, but whether some degree of instruction in science and art cannot become a feature of every educational school or institution. If the inferiority of our position is as much to be attributed to the ignorance of masters as to the unskilfulness of men, the colleges and grammar-schools are as much to blame as the National schools, the universities are as deficient as Mechanics’ Institutes. We cannot much longer wilfully shut our eyes to the fact, that in consequence of the progress of invention, facilities of transmission, and rapidity of communication, a nation’s prosperity depends more upon the use it can make of its scientific powers than upon anything else. The natural productive powers of a country may have at one time been the test and measure of its resources or its wealth, but it is so no longer. The skilful application of scientific inventions has more to do with a nation’s prosperity at the present time than the possession of minerals under its share of the earth, or the quality of soil on its surface. How can we, therefore, ignore any longer the advantages and vital necessity of physics, as an integral part of all education? We do not cry out for the exclusion of Latin and Greek in our public schools, or the dead languages and the Scriptures at our grammar schools; but we do unhesitatingly say that other knowledge is now imperatively called for, besides these excellent subjects. Our eyes and our hands must be made intelligent and skilful, and our minds rendered capable of understanding common things in this scientific age, or we shall have to be content to

take a very insignificant position for the future among the nations of the world. If, on the other hand, we could give the first rudiments of scientific knowledge to every school-boy, gentle or simple, making the first a possible manufacturer or merchant of enlightened views and far-seeing action, and the second a possible foreman or workman with ability to execute intelligently the designs of his master; and could give also in comprehensive Technical institutes the means whereby these school-sown seeds might grow into a well-developed and comprehensive knowledge of science or of art; then no fear need ever haunt us of being behind in the race for existence or prosperity; nor need we be subject to periodical panics concerning the maintenance of our manufacturing supremacy.

It required only the electric shock of evidence just now given to make us realize how very natural it is, after all, that we should be deficient in technical knowledge. Let us consider for a moment what are the means we possess of obtaining it. In the first place, we ought to know what is meant by the term, and then we may see more clearly our real position. Broadly it is what is usually spoken of as secondary education, though all secondary education is not necessarily technical. Instruction in art or science, in manufacturing processes, in the highest branches of ordinary trades, in the theory and construction of machines; in the history, theory, and practice of design; the application of design to various materials; the adaptation of scientific knowledge and artistic practice to the selection of beautiful forms in manufactures; their ornamentation; the analysis of systems, orders, and common features in the various objects in the various kingdoms of natural history, and their classification; the theories, uses, and applications, in civilized countries, of all the sciences; the practice of all art above the level of common manual labour;—these may all be said to be a part of technical education; and, if time and space permitted, we might go very much further and, by giving the detailed description of their general heads, show how education in these subjects ought to be the natural sequence of primary or general elementary instruction. General education is merely giving a man the power to study a profession or learn a trade: technical education will enable him to learn all that has been or can be done in his profession or trade outside of and beyond the pale of his ordinary practice; and all that is not merely mechanical or manual labour in either will come under the head of technical skill. Technical education stands as a connecting link between learning and labour, and, by uniting the two, confers what is necessary to all success, theory and practice, in their true relations of learning saving labour, and practice testing and rectifying theories.

From this definition, imperfect as it is, we can at least see that with the exception of medical or surgical instruction in hospitals, or private tuition in engineers’ or architects’ workshops and offices, technical education does not exist in England. Our schools of science and art aim at giving general rather than technical education; and the distribution of government assistance depends upon successful elementary instruction in the two subjects in schools both of art and science. Our universities ignore such subjects as these, regarding them as modern and comparatively trivial matters; our public schools have too direct a connexion with and are too much occupied in preparing pupils for the universities to lead them in paths which must be abandoned directly university life begins. Our private schools, in individual cases, do aim at laying a foundation for future technical knowledge by touching upon such subjects as mechanics, chemistry, botany, or drawing; but in almost all instances such subjects are purely

voluntary, are charged for as extras, and consequently limited to a few pupils. The only institutions which even nominally aim at giving instruction in technical subjects are the Mechanics' Institutes, and their efforts in this direction are more nominal than real. Mr. Fowler says in his reply to the Schools' Commission that they (Mechanics' Institutes) are more reading-clubs than anything else; but in this he is somewhat mistaken. Where they are most successful—as at Huddersfield and Bradford—their principal work is in remedying the defects, or supplying the place, of primary schools. In other places they become clubs, or associations for lending books and giving lectures on trivial or popular subjects. Where science classes exist in connexion with such institutes; their operation tends toward technical instruction; but the number of these classes is too insignificant to affect the question in its national aspect.

Our experiment of establishing science classes, and, in a few instances, schools of science, is of comparatively recent origin, and their organization is of too complex a character to allow of their becoming general. The same changeable regulations which have made the direction of the Science and Art Department vexatious to the schools of art, have also afflicted schools of science and science classes in mechanics' institutes; so much so that at a recent educational conference at the Society of Arts, presided over by the Right Hon. Mr. Bruce, the senior officer of the Society, Mr. H. H. Sales represented in his report that the connexion with the Science and Art Department of evening classes in his district had been found detrimental to their best interests, from the frivolous changes so constantly being made in the regulations of the department. Even with this disadvantage, the demand for technical instruction in England is really great, and a very large number of students offer themselves for examination every year in the more general subjects of science, under the auspices of the Society of Arts, as well as in the more limited and less popular examination of the Science and Art Department.

The Society of Arts, from which so much benefit to technical education has already proceeded, through the offer of prizes, the establishment of examinations, and its services generally as an initiator of local action, must be regarded more as a testing agent than as an educational one, though its work in that direction has been of great value. The extent of its operations may be judged of by perusing a recent number of the Journal of the Society, in which the report of Mr. Sales before referred to, as well as others, will be found recorded among the proceedings of the meeting over which Mr. Bruce presided. This, as well as other indications, serves to show that there exists among us not only the capacity for scientific culture, but the demand for it also, sufficiently positive to make the establishing upon a permanent basis of technical instruction, warranted as a compliance with the national requirements, its importance being of too serious a nature to leave it liable to interruption from purely local causes.

The operations of the Society of Arts, and the few schools and classes of the Science and Art Department, are valuable as indicating the existence of a want, and demonstrating the possibility, of success in secondary education; and they also serve to show how comparatively trifling have been all our efforts in that direction. The field is great, and the harvest is ripe for action; and the need is great also. We want the means for the instruction of hundreds of our professional men and skilled artisans where we now have it only for a few individuals, and the organization which shall be equal to the task of offering it to all who now do not even understand the meaning of technical education.

Is it therefore to be wondered at that we should be rapidly going to the rear in subjects requiring technical knowledge, if, as we have shown, it is so nearly impossible to obtain such knowledge in England? The wonder rather is that we should so long have retained a moderately respectable place in Europe; and we take it to be an indication of our capacity nationally for a much higher position than we now occupy, that in spite of such imposing difficulties we are not much worse than we really are.

Whilst we have been ignoring this matter, Continental nations have been studying it to some effect, and not only thinking about it, but acting upon their thoughts. Technical schools, with their practising workshops, their courses of

lectures, their staffs of highly qualified professors, are general in the larger towns of France and Germany, and their influence is supplemented by public free libraries, museums, art galleries, technical collections, science laboratories, and art studios. There is not a town of half the population of Manchester, either in France or Germany, which has not better provision for adult education of all classes of the community in every branch of science and art, than London, or Edinburgh, or Dublin, or all of them put together. In France primary education invariably includes drawing, and technical instruction does also; so that you cannot find a Frenchman of decent position, or a tradesman of any kind, who is not able to draw to some extent. Ask a French or German artisan to describe a process he is working, or the intention of a work he is executing, and he will explain the whole matter in a clear manner, never stopping short in this direction or that for fear of getting out of his depth, but bringing knowledge of many outside or kindred subjects to illustrate his remarks. It is a common thing to see the man of science, and the workman in a blouse, sitting side by side, night after night, during the course of free lectures given in the Technical Schools of France. For as in our hospitals the very best and widest experience is employed, an Abernethy, a Cooper, or a Paget, to attend on the helpless patient who pays nothing for such brilliant services, so in the French Technical Schools, as at Lyons, Toulouse, and Paris, the best men are employed to deliver free lectures in the public service, with the well-founded belief that the good and profitable seed will be sown through their efforts, which eventually will bear fruit, and contribute to the national prosperity. Nor is this a new thing in those countries, though now more than ever cultivated and developed, for when we appeared to gain an advantage over our neighbours in the Exhibition of 1862, principally through our mechanical appliances, a definite movement was taken in this direction at once, and all that could be obtained from our experience in the sole subject in which technical practice was available for our artisans, mechanical engineering, was at once embodied more fully in their schools and free institutions.

How can we compete with people who act thus, unless we are prepared to very widely depart from our previous experience? Half measures will no longer suffice, and royal commissions issuing general suggestions addressed to the public which may never be acted on, will not provide the remedy so urgently required. Nor can we hope for much help from mechanics' institutes. Their very name implies the want of technical education, and this is precisely the only good thing that can be said in favour of their name. If we could get rid of so obviously a class name, and enlist all classes in their support by a general designation, such as Technical schools, then we might hope for the support of large numbers who now hold aloof from them, either from their charitable aspect, or from a feeling that they are only for one class of the community. Then, again, these institutes are generally managed by committees elected by members, who use the institutes for very dissimilar purposes, and when so elected they are not precisely the sort of men to manage great educational agencies. Voluntary management, and amateur direction, without any but purely accidental qualifications for the work, will not accomplish the establishment of a system of technical education; and for this we want no better proof than the present condition of the mechanics' institutes, which have attempted to do it and have failed. We require something more to be relied on as to qualification for the task of education, and providing more permanency than can be expected of purely voluntary efforts. It certainly might be attempted (if only the objectionable class-name could be got rid of) to make use of the organizations and buildings of the mechanics' institutes in the smaller towns as branches of more important centres in the larger towns, where complete and thoroughly organized systems of technical education could be carried out. Yet, it is quite possible that the institutes themselves may prefer to be the sole property of the class whose name they bear, rather than to become adapted to the requirements and new wants of society at large; and, if this be so, they must be left to their fate. If Dr. Birkbeck could cooperate in the movement which must sooner or later be made to remedy the deficiencies in education we have been describing, he would probably perceive the mistake made in giving the institutes he founded so narrow a name,

thereby very much limiting their influence, and leading them by this limitation to grow entirely out of the objects for which he established them. There is some probability that this mistake may be remedied,—for, if we mistake not, the London Mechanics' Institute, established by him, no longer exists under that name, but continues and is developing its usefulness under a more general designation.

The true remedy, however, can only be effectually provided by the matter being taken up by Government, and thoroughly well considered plans being adopted for national action. In our primary schools, endowed grammar schools, and public schools, much may be done as preparation, and these are regions which Government action can effectually reach. In our universities professors should be appointed, and their lectures form an integral portion of the academical course, examinations in the theory and practice of some branches of science and art being a necessary part of the final test for a degree. Still more important would be the establishment at every provincial town in which an important trade or manufacture is carried on, of good Technical schools, with museums of art and industrial productions, as adjuncts to their class and lecture rooms, for educational purposes; and these should be managed upon a general plan, which would leave the direction of the studies in the hands of highly qualified professors, appointed by the Government, the museums and collections of educational, scientific, and artistic examples being branches of the South Kensington Museum, and the property of the nation. The theory of local government may be perfect in its application to lighting, and draining, and scavenging, though it will not bear too close a scrutiny even in these features, in practical working; but to initiate and control a system of technical education it is utterly unequal. The industrial prosperity of the country cannot, with any degree of wisdom, be left endangered, as the English jurors say it is at present, through the ignorance of all classes of society, and to rely upon everybody to remedy this deficiency is equivalent to relying upon nobody. Local agency and voluntary efforts will do little or nothing for us in this pass, and we shall have to help ourselves by the combined action of the whole nation, or drift farther behind than we are now. But it is not too late for us to take example from those Continental countries where the remedy for the evil we suffer from is already in successful operation. They do very much what we have now suggested, establishing technical schools as a national investment, and supporting them for the national profit, relying only upon local patronage to supply pupils and upon manufacturers to assist in their own elevation. It may be a chimerical view of a nation's duties, but, we confess, to us it appears as much an imperial duty to come to the rescue when its trades and manufactures are endangered by fair, though unequal foreign competition, as it is to defend them from invasions of another kind. The establishing of schools and museums at such places as Manchester, Glasgow, Birmingham, Sheffield, Leeds, Nottingham, Coventry, the Potteries, Worcester, the three capitals, and perhaps one or two other places, and maintaining them in a high degree of efficiency for ten years, would cost a good deal less than half as much as one of those floundering ironclads which appear to be superseded on an average about every six months by the invention of new targets or new guns. From an art point of view there is material enough at South Kensington to furnish all these towns with examples of industrial art with advantage to the present overcrowded museum. A year's work would suffice to obtain the materials for technical collections enough to commence with, and there are architects and engineers in England competent at any moment to co-operate in the direction of technical instruction. If we have not designs, we must do as Hunt & Roskill or the Messrs. Crossley, of Halifax, do, import them; but for men of science we need not leave our own island. Not that we anticipate the slightest difficulty in inaugurating and perfecting a complete scheme, or in its practical outworking, provided the nation can be made to see the necessity for a movement, and entrust the organisation to the best men it can find,—responsible for its management and success, shielding them at the same time from the interference and meddling of incompetent committees.

Mr. Forster has suggested in the House of Commons that information concerning the

foreign technical schools could be obtained through our diplomatic representatives abroad, and doubtless much valuable information could be arrived at in this way. It will be a good discipline for us to know precisely how much has been done that we have left utterly undone, though we shall get very little more than tables of statistics or dry records of fact from the writers of despatches.

If a royal commission were appointed to inquire into the matter, or the powers of the Commission on Middle Class Schools extended for this purpose, we should probably arrive at better results than in any other way. The Commission which has elicited the very valuable opinions of the British Jurors to which we have referred, has employed the most experienced inspectors of schools to make personal investigations into the conduct and management of the middle-class schools of England, and much information of the most valuable character has been thus obtained. We would suggest a similar action in regard to the technical schools of France and Germany. The visits and personal examinations, with full reports of a few distinguished men of science and of art, to the best Continental schools, would give us information such as we want, differing as much from the sort of facts we shall get from our foreign diplomatic representatives, as a living man does from a dissected subject. We want not only the facts, but the life; not only the bare statements, but the full details of operation in practice; and to get this we must employ men capable of understanding the processes of education, and with experience enough to detect those features of it which are successful. Something also may be obtained from records of system, appliances, and methods of instruction which diplomatists will not be the best persons to note; and it will require something more than a faculty of annotating facts, or speaking in guarded language, to present this information to us in a way that will be serviceable to the cause of technical education in England. A knowledge of manufacturing processes, of much and varied technical knowledge, ought also to be possessed by those who examine for us the conduct and operation of technical education, including some experience of the trades which may be affected through the inquiry.

Nevertheless, whatever we do in this matter will be a step onwards, though much will depend upon the way we go about the task, whether it be the first of many steps, or result in a short-lived effort of no permanent benefit. We believe that if the attention of Parliament can be effectually drawn to the subject before the dissolution, which appears likely, takes place, so that an investigation can be commenced previously to the closing of the Paris Exhibition, our operations will be facilitated, and many opportunities now offering will be made use of. It is a subject of some importance nationally, and we shall not be maintaining the character of a practical people, of which we are so rightly proud, if we do not strain every nerve to obtain some practical advantage from its consideration.

A MEDICAL AND LEGAL OPINION OF THE NEW SANITARY ACT.*

AN Act of Parliament has disadvantages. One of these drawbacks consists in the fact that it is not placed in our hands on approbation, or on a month's trial, nor can its framers make any trial of its capacities themselves before issuing it to the world. It comes before us, drawn up, doubtless, with grave consideration by able men, but still untried: the first strain reveals flaws here and there that it is too late to remove, but which would have been carefully strengthened had it been foreseen that the particular pressure would have been applied to which they gave way. The new Sanitary Act is no exception to this disadvantage. The conventional carriage-and-four can be driven through it in various places; and the particular breaches through which the figurative vehicle can be dexterously guided have not been difficult to find. The principal cause of this weakness is, that the Act is not sufficiently imperative in its terms and binding in its obligations. Much that should be obligatory on all authorities is left a matter of choice.

* The Medical and Legal Aspects of Sanitary Reform. By Alexander P. Stewart, M.D., and Edward Jenkins, Barrister-at-law. London: Robert Hardwicke, Piccadilly, 1867.

We have before us a work of twin authorship, on sanitary reform, which points out the shortcomings of the Act. Dr. Stewart, looking at the question from a medical point of view, deploras, as others have done, the non-appointment of permanent officers of health in every town as a means of systematizing the enforcement of sanitary regulations; and Mr. Jenkins, looking at it from a legal point of view, puts his finger on the particular passages which stand most in need of revision to render the provisions of the Act effective. Out of fifty-nine towns, concerning which Dr. Stewart has been able to gather information from reliable sources, eighteen only can boast the delegation of the care of the public health to a responsible officer. Notwithstanding the great accumulations of proof that many diseases are preventible, only eighteen towns out of those fifty-nine have appointed an officer to see that the causes of needless loss of life are not in operation. Looking at Dr. Stewart's concern for this apathy or negligence, we see one great generous stride already made. The celebrated physician, Dr. Cheyne, wrote in his preface to his "Essay on Health and Long Life,"—"If it were possible any set of men could be offended at my performance, it might be my brethren of the profession, for endeavouring to lessen the *materia morbosica*." Now-a-days, many brethren of the profession are enthusiastic workers under the banner on which is inscribed "prevention is better than cure." It is re-assuring, too, to mark the certain steady progress made in the extended view of the conditions that maintain health. In Dr. Cheyne's day, when the Pretender, Sir George Byng, the South Sea Bubble, and Siege of Gibraltar occupied men's thoughts, regimen was considered to be the grand source both of health and disease. Nothing, if we except a recommendation to choose the side of a small eminence on a gravelly soil with a southern aspect, remote from any great concourse of waters or mines, for the site of a house, was deemed by him of much importance as the means of preserving health, but regimen. Sir Charles Scarborough's advice to the gay Duchess of Portsmouth was always in his mind as well as upon his page:—"You must eat less, or use more exercise, or take physic, or be sick." His theory was that the human frame was like a large vessel with only a small inlet and outlet, to cleanse which it was imperative to pour in a thin clear fluid and give it a good shaking. No leary person, according to him, was ever a long liver, unless he had an original constitution of brass; nor did a hearty eater ever see length of days. "The Grand Secret," he wrote over and over again, with a profusion of capital letters, "the Grand Secret and Sole Mean of Long Life, is To keep the Blood and Juices in a due State of Thinness and Fluidity, whereby they may be able to make those Rounds and Circulations through the animal Fibres, wherein Life and Health consist, with the fewest Rubs and least Resistance that may be. In spite of all we can do, Time and Age will fix and stiffen our solids." But he had a prescription with which to combat age. This was regimen again. Abstemiousness was his sovereign cure. He tells us Comaro lived to be a hundred years old by virtue of temperance all his life and great abstemiousness in his latter days, when the yolk of an egg was sufficient nourishment for him for three days. And Sir William Temple's measurement of wine was Dr. Cheyne's admiration. It is a hundred and forty-five years ago since he wrote, "It may be sufficient for those who are tender, studious, or contemplative, to drink three glasses of water with a spoonful of wine at the great meal. And, as Sir W. Temple has it, "One for yourself, another for your friends, a third for good humour, and a fourth for your enemies, are more than sufficient after it." He saw no sanitary reform needed except in the matters of eating and drinking. His monster nuisance was PUNCH, as he printed it. It was punch that made the fortune of Bath, for it was that "leathernish liquor" that sent the crowds of debilitated, tallow, Indian nabobs to drink its waters. In fine, in Dr. Cheyne's day, the public health was a matter of individual management and not suspected of being amenable to any general laws. Five-and-twenty years after his essay was penned a new light arose in the person of Dr. Lucas, an Irish physician, who was a prominent member of the Irish Parliament. He was an ardent politician, and frequently confused the political and physical health of the community. His energetic asperity overflows in his "Essay on Waters," where he hints that the

Bath doctors are strongly opposed to him. After belabouring his opponents and critics, and hoping the galled jades will wince, he unfolds his scheme of preserving the public health. This is also a personal and individual proposal, for it consists in bathing and drinking water. He took great pains to test the waters of the Thames, the New River, Hampstead, Rathbone-place, and the public pumps at Aldgate; in St. Paul's Church-yard; in Hare-court, in the Temple; in Swan-yard, in the Strand; in the Savoy; in Covent Garden Market; at the Banqueting House, Whitehall; St. Margaret's Church-yard, Westminster; as well as the springs of Lamb's Conduit, Crowder's Well, and Postern-row; and though he discovered the presence of foreign matters in various proportions, he gives no hint of the possibility of percolations having an injurious effect upon the persons habitually drinking them. So that they drank plenty of water, it mattered not, it seems, whence the source. Neither fever, consumption, nor gout could make any stand before water. Beginning with melancholy madness, indeed, he runs through a long list of chronic and acute diseases that are only so many sighs made by the constitution for copious draughts of water. Rain-water is to be preferred for the miserable mania just mentioned, but any kind of cold water answers for ordinary complaints. Should any perverse constitution receive no benefit from this prescription, there remains the alternative of warming the water. Not a thought about surrounding conditions,—not a suspicion that any disease-creating agent was at work that was not encased in the patient's frame. Twelve years after Dr. Lucas had dedicated the work in which he set forth his idea of the source of health, in pungent as well as fulsome terms, to "His Royal Highness the Prince," afterwards George III., Sir John Pringle published his admirable "Observations on the Diseases of the Army," in which he seems to have forestalled much of our experience. This eminent physician studied at Leyden, under Boerhave and Van Swieten, and was physician-general to the forces abroad till the peace of Aix-la-Chapelle, when he was appointed physician to the queen's household, and president of the Royal Society. Dr. Stewart aptly quotes, as a commencement to a retrospect of what has been done in sanitary reform, one of his most precious passages, which we also transcribe, as it shows a remarkable awakening to the serious consequences of external surrounding objects upon health, so completely unrecognized by fashionable physicians of the reigns of George I. and George II. :—

"From this view of the causes of malignant fevers and fluxes it is easy to conceive how incident they must be, not only to all marshy countries after hot seasons, but to all populous cities, low and ill-aired, unprovided with common sewers, or where the streets are narrow and foul, or the houses dirty; where fresh water is scarce; where streets and hospitals are crowded and not ventilated, or kept clean; where, in sickly times, the burials are within the walls, and the bodies not laid deep; where slaughter-houses are likewise within the walls, or where dead animals and carcases are left to rot in the kennels or on dung-hills; where drains are not provided to carry off any large body of stagnating or corrupted water in the neighbourhood; where flesh meats make the greatest part of the diet, without a proper mixture of bread, greens, wine, or other fermented liquors; where the grain is old and mouldy, or has been damaged by a wet season, or where the fibres are relaxed by immoderate warm bathing. I say, in proportion to the number of these or the like causes concurring, a city will be, more or less, subject to pestilential diseases, or to receive the heaven of a true plague when brought into it by merchandise."

Here, at the very commencement of the long reign of George III., we have several of the most vital sanitary requisites perceived, and the most deadly causes of disease exposed. Modern experience has added a few more items to the list, but not very many. For a hundred years the great family of mankind has been warned that certain conditions will cause the premature death of a great many members of it; and very little notice has been taken of the intimation till the occurrence of fearful epidemics draws temporary attention to the truth of the warning. This habit of indifference has led a continental philosopher, Hecker, to frame the theory "that great epidemics are epochs of development, wherein the mental energies of mankind are exerted in every direction." Would that it would also lead to the organization of competitive examinations of the management and conditions of our towns. We have seen merchandise from all corners of the earth coming to one common centre for examination, praise, and prizes: let us hope that the progress of a peripatetic jury from city to city, to examine and select for royal praise and prizes, and the concurrence of sovereigns, perfection in sanitary arrangements

made for the good of the community, is not beyond the limits of possibility.

Let us see what enactments have been made. Though sanitary legislation has been "timid and apologetic," it has been in advance of the national appreciation of the importance of the subject since the cholera epidemic in 1832, bearing upon the public health. In 1834, boys were prohibited from sweeping chimneys; in 1840 and 1841, the practice of vaccination was extended by law; and in 1842, the employment of women and children in mines and collieries was declared illegal; in 1846, the establishment of baths and washhouses was promoted; in 1847, the Towns Improvement Act was passed; in 1848, followed the Public Health, the Nuisances Removal, and the City of London Sewers Acts; in 1850, the Metropolitan Interment Act paved the way for another which applied to the whole of England in 1853; in 1851, there were the Acts to Encourage the Establishment of Lodging-houses for the Labouring Classes and the Common Lodging-houses Act; in 1852 the Metropolitan Water Act was passed; in 1853, the Smoke Nuisance Abatement (Metropolis) Act and the Act to Extend and Make Compulsory the Practice of Vaccination were added to our statutes; in 1854, the Merchant Shipping Act, protecting the health of the seamen, was passed; in 1855, the Diseases Prevention, the Metropolis Local Management, the Metropolitan Building, and the Nuisances Removal Amendment Acts were made; and in 1858 the Public Health Act abolished the powers of the General Board of Health, and vested them in the Privy Council. Since this transition was effected, 1858 and 1866 saw two new statutes for the purification of the Thames; 1860, the Nuisances Removal Amendment Act and the Act for preventing the adulteration of articles of food; 1860-61-64, Acts relating to the women and children employed in bleaching and dyeing works, in lace factories, potteries, and manufactories of lucifer matches, percussion caps and cartridges, in paper-staining and fustian cutting; 1861, a further amendment of the Vaccination Act; 1863, the Act for the Seizure of Diseased and Unwholesome Meat, and the Alkali Works Act; 1865, the Sewage Utilization Act; and, lastly, 1866, saw the Labouring Classes' Dwelling-houses Act and the Sanitary Act passed. All these Acts have had some influence for good, and most of them would have had more if they had been more stringently binding, and less full of loopholes through which the unwilling to comply with their terms have, facedly escape. An Act of Parliament should be more than a suggestion or a permission: in sanitary matters it should be an explicit explanation of what should be done in its various branches, an injunction to comply with these terms, besides a schedule of the penalties for evasion and other forms of non-compliance. As Dr. Cheyne would say, the grand secret of the weakness of the Sanitary Act is that it is content to suggest as frequently as it is to insist. Dr. Stewart has filed a string of instances in which refractory local authorities have adopted one Act so as to evade another, and have bearded the central authority Health Department of the Privy Council with decisions to take no sanative steps. He has, perhaps, been still more usefully employed in drawing up the following statement as to what is yet imperatively required, which we quote as a modern filling up of the sketch made by the Queen's physician, Sir John Pringle, in the beginning of the reign of her Majesty's grandfather.

1. We require a thoroughly efficient administrative department of government for the superintendence of all matters relating to the public health, and the enforcement of the law on recalcitrant local authorities.
2. The appointment of officers of health, not only in towns, but in the country, and for our ports and harbours, should be compulsory; they should be independent of the local authority, their appointment, the amount of their salary, and their dismissal being subject to the approval of the central department, and should exercise a general supervision of such districts as may be agreed upon.
3. The inspectors of nuisances should always be under the control of the officers of health, and should not be burdened with other and inconsistent duties. Their appointment should in every case be compulsory.
4. There should be an annual return to Parliament of all officers of health and inspectors of nuisances, of the population and areas of their respective districts, of the salaries paid to them, and of the duties they are required to discharge.
5. As a general rule the officers of health should be specially trained and set apart for that work alone, and be remunerated accordingly, out of the municipal funds or county rates, aided from the consolidated fund.
6. The isolation of those sick of infectious disorders should be enforced by their early removal to—
7. District hospitals or refuges to be provided by the local authorities.
8. The conveyance of such cases in hackney carriages

should be everywhere prohibited under a penalty, the same to be strictly enforced against offenders.

9. Carriages for the conveyance of such cases must be provided by the local authorities.

10. Disinfecting apparatus for clothes and bedding must likewise be provided by the local authorities.

11. We urgently need a well-considered Act, which shall facilitate the acquisition of low house property, and shall empower the Government to grant loans on easy terms, on the security of the new buildings, to those who shall undertake to provide wholesome dwellings for the labouring population.

12. The supply of gas and water should be taken out of the hands of private companies, and entrusted to public and responsible bodies in the interest of the consumer.

13. It should be made lawful for Boards of Guardians to apply a portion of the rates to the providing of convalescent accommodation for those who require but cannot procure it.

14. A strict Government inspector should be made during the progress of all works, for the execution of which the Government sanctions the borrowing of money, and before instalments are sanctioned, the inspector's reports and certificates being published.

Mr. Jenkins finds the most obvious deficiency in the new Act to be the absence of a central supervising power, which he would not confound with a central administration. Local authorities should be free to act, but still be under the supervision of a superior court: in other words, more coercion over local authorities is required. A district visitation of cholera, if unchecked, soon becomes a general one. It is, therefore, a matter of the first moment that the authorities of the place in which it first appears should be amenable to some central power should they fail to take remedial steps. We would here remark that a great deal has been said about the apathy and opposition of local authorities without the true source of the resistance being hinted at. The grand secret of the inactivity of the local authorities is, that they are formed of bodies of picked men, annually, or biennially, or triennially elected by the ratepayers out of the rest of their fellow-townsmen as men who are able and likely to resist any proposal that involves any addition to the rates. Until the ratepayers are brought to their senses, and have their eyes opened to the importance of leaving not a stone unturned to lessen every individual's chance of sickness and premature death, we fear this class of men will continue to be returned. In country unions the farming interest is largely represented in the board of guardians; and, as the rates fall heavily on the farmers, it is, perhaps, too much to expect that they should be so public-spirited and generous as to charge themselves with expenses from which they will derive personally but little benefit, as their own residences are not situated in towns. And where a local board of health is in existence, or a council charged with town improvements, it is often very much pervaded by the sentiments of its members, who are the real authors of the resistance met with. It is, then, the electors, or ratepayers, who are they, as well as their representative men, to whom the apostles of sanitary reform must preach.

Members of water and gas companies are often members of boards of health, and in that position are more likely to be the defenders of their company than their accusers, should complaints be made,—another instance that shows the desirability of an officer whose sympathies and property are locally unaffected. Such ratepayers as are in favour of reform in these matters should exert themselves to be more faithfully represented. Mr. Jenkins says, with compulsory enactments, and an efficient ministry or board of health, we might see some prospect of the sanitary regeneration of the country. We say more. There should be a college in which sanitary officers are trained, or a department should be made for them in some college, already existing, such as Sandhurst. Their appointments to towns should be for fixed periods, when they should be removed to another, the young officers beginning with small towns and graduating to large cities. A man permanently fixed in one locality gradually becomes bound hand and foot with sympathies with this or that inhabitant, fear of offending some, and wish to please others, just as a stone not belonging to the seashore gradually gets covered with seaweeds and limpets if left there long enough. The emolments should be sufficient to preclude the necessity of private practice, which should be prohibited.

In April last a deputation waited upon the Duke of Marlborough with a memorial from the Council of the National Association for the Promotion of Social Science, submitting for the

favourable consideration of the Government four statements:—

"1st. That the laws of public health require to be revised and consolidated with plain and specific enactments on sanitary matters.

"2nd. That permissive enactments are generally taken to be permissions not to act, and that therefore the most useful provisions should be made peremptory.

"3rd. That the constitution of sanitary authorities should be more uniform; their areas of administration more extensive; their powers and functions more comprehensive; and that some provision be made for the addition of members possessing other and higher qualifications than those now required.

"4th. That the inefficiency in the administration in the health laws by the local authorities is in part due to the absence of a central power, which could be appealed to without reference to the courts of law, and could by means of judicious advice, and, if necessary, by legal compulsion, cause the local authorities to do their duty."

The Duke expressed a wish to be furnished with a digest of the remarks made by some of the gentlemen forming the deputation, which has been drawn up. Mr. Jenkins gives this valuable pith. Mr. Rendle, secretary of the Health Department of the Association, alluded to the fragmentary and contradictory character of past sanitary legislation, and the need of a better organisation; an adjustment of the duties of magistrates, whose police duties be deemed little in harmony with sanitary legislation; an amended Building Act, in which there should be provisions under which healthy habitations for the poor might be rebuilt on sites where unfit dwellings were pulled down under any Artisan's Dwelling Bill; and an alteration in the administration of the Vaccination Act, which is now, paper-like, in the hands of the Poor-law authorities, whose appointed officer not only vaccinates, but certifies to the success of his own operation. Mr. Rumsey laid fresh eggs on this pile. He urged the consolidation of the duties now divided between the Privy Council, the Home Office, the Poor Law Board, and the Registrar-General; pointed out the anomalies which mark the administration of boards existing under Poor Law, Local Government, and Public Health Acts; the difference of area and population in the districts under these boards; recommended higher qualifications for their members, and the extension of areas of local government, with the appointment of a scientific officer to correct and verify the great facts of disease and mortality, and apply them to the suggestion of practical remedies. Dr. Lankester brought forward more fuel. What he found wanting was a unification of the laws relating to public health. In the present state of things it was a most difficult thing for an officer of health, in the parishes of London, to know to what authority to look when he wished to abate or prevent nuisances injurious to health; and that the present apportionment of control or power was not of avail he would instance in the fact of the failure of the Vaccination Act as at present administered, 2,000 persons having died of small-pox last year. Mr. James Beale heaped up the pile behind which it is to be hoped all obstructions and objections will ultimately disappear. He too, asked for unity: either of the present departments of government would answer with extended powers; but not all three, as they only made confusion. As an instance of this weakness be complained that the Sanitary Act of 1866 imposed upon vestries the duty of providing hospitals for infectious diseases, and that this year the Poor Law Board passed through the House a bill to impose this duty on boards of guardians, and that certain regulations approved by Mr. Walpole for Chelsea were disapproved by him for St. James's. His leading suggestion was that all the health bills and vaccination Acts should be banded over to a draughtsman to consolidate and unravel. Dr. Stewart put the apex to these legal and medical opinions of the short-comings of sanitary legislation in the same propositions we have mentioned as laid down in his work. All these testimonies go into the same scale. The medical men agree that a scientific officer should have the charge of the public health in every union, and that the inspector of nuisances should always be part of his staff or under his control; and the legal authorities urge that this large body of men, so appointed, should be all in communication with and under the supervision of a central board of health service; and that all the sanitary laws in existence should be compared, reconciled with one another, condensed, and all the most useful provisions made compulsory instead of optional.

Both Dr. Stewart and Mr. Jenkins have been well employed, and neither has ventured out of his depth. The practical or constructional engineering departments of sanitary reform they have

not touched upon. We have personally a quarrel with them: in their review of the efforts early made in the cause of sanitary reform they omit all reference to the continuous labours of the *Builder* in that direction at a time when many to whom they refer as workers had not learned the importance of the subject. This, however, gives us little concern. We are contented to see that what we have striven for during long years is being achieved bit by bit; and, having no selfish motive, we shall not be led to relax in our endeavours though others may be taking the credit of much of what we have done.

THE CONSTRUCTION OF GUNS.

If it were possible for the human ear to distinguish the varied sounds that combine in the constant roar of life ascending from the great centres of population, and to trace to its origin each order and species of sound, we should be startled with the strange and incessant activity of one special metallic note. Through all the din caused by the exercise of the arts of peace would be heard the sharp ring with which the armourers' hammers,

"Closing rivets up,
Give dreadful note of preparation."

In every arsenal, in every manufactory of small arms, men are working against time. Sixty thousand Chassepot rifles, we are told, are nearly ready for issue to the French army. Prussia is turning out a new needle-gun. Austria is converting her weapons into breech-loaders. Russia is preparing 600,000 of these new weapons. If the *vis pacem* follow as a matter of course on *para bellum*, never was Europe so busily employed in preparing for perpetual peace.

It will be but little purpose that we are made aware of the activity of the gunsmith among our neighbours, or that we shall be told that the ruler of a neighbouring country, who has never forgotten that the great soldier whose name he bears was an officer of artillery, has been preparing a surprise for the world in the perfection of that most serviceable of all weapons, the two-pounder gun, if we fail to cast a sharp glance on our own workshops. A conversation took place not long ago in the House of Commons, the great importance of which has been lost sight of amid the clash of party warfare, and the claims of the "compound voucher."

We trust that our readers will not have forgotten the name of Mr. Snider. Believers in ghosts may feel assured that the shade of that ill-used and meritorious inventor has been, to some small extent, avenged. It comes out that "the Department," hating itself with military promptitude to make the best of the prey secured for it by its legal advisers, has made more haste than good speed. Acting on the usual principle of offering change to the last moment, and then being driven into an inconsiderate hurry that deprives the change of much of its value, the War-office, or their officers, have managed so to convert or so to load the rifles dealt with on the Snider principle, as to cause wild firing, and to place our troops who were dependent on the new arm in a position to suffer affront, or worse disaster, if they had come into action. Of course, all is now set right, or will be so to-morrow or next day. It is always so when inconvenient questions are asked. But the point of the case is here. Great Britain spends annually a large sum for her defences; she does not grudge her millions for the purpose. She has more hesitation in finding men; her sons take to a red coat with less readiness than do those of some of her poorer neighbours. What the country has the right to demand is, that the army and navy estimates shall be so spent that our small and precious army shall have the best military instruction and the best arms and ammunition that practical science can supply. At present it is far from having either the one or the other, and public attention cannot be too loudly called to the fact.

It must be candidly admitted that the duty of a military administration, during a time of scientific revolution such as that of the last ten years, is neither simple nor easy. Time enters so intimately into all questions of safety,—the possible enemy may not choose to wait till we are ready to receive him. If the question of the best weapon cannot be solved *impromptu*, then to wait the proof, or the improvement, that can only be given by repeated experiment, we are none the less bound to be provided with

the best weapon known. There are, therefore, two requisites equally important to be borne in mind by a Minister of War and his advisers: One is to have readily and promptly under hand the best known and proved weapons; the other is, patiently and cautiously to take the advice of the most experienced and able mechanics, and steadily to prosecute experiment on the value of projected improvements. It can, perhaps, hardly be expected that a Secretary of State, or a Commander-in-Chief, in the present generation, should master the simple outlines of the scientific problem, see clearly what ordnance ought to be, and thus distinguish between that experiment which forms the pathway of practical science and that which is merely empirical. But the more fully a statesman is aware of the nature of the problem which involves the efficiency of the national defence, the more earnestly will he insist on the two points we have named—full supply of proved weapons, and careful inquiry as to the capacity of better ones.

The whole history of our recent improvements in small arms and in artillery, as well as the record of the military events of the last five years, bears out the above assertion. Precision has been introduced as an element of gunnery—precision so different from that attempted in the wars of the early part of the century, that it appears as a new feature of construction. To arrive at once at the best weapon was, of course, out of the question. To remain content with an inferior one, while other nations were re-arming, would have been treason. Hence we have had, and that wisely and properly, the Enfield rifle of 1853, the Lancaster gun of 1850, the Armstrong gun of 1859, and the Snider breech-loader of 1863. No less certain is it that the scientific problem, whether or no it be yet solved, is not taken for the main requisite of our theory of defence. We have fair rifles, fair cannon, filled on different systems, and formidable projectiles. But we have no system of artillery. Nor have we in the service either the best rifles or the best cannon known and proved to be in existence.

The progress of science, in any individual branch, is far from being always equable and maintained. There are periods of long stagnation, when some new principle awaits disclosure. There are periods when, like the planets themselves, Science seems to retrograde in her course, collecting, it may be, force for a new leap into the unknown. The discovery of some new truth may impel thought in a wrong direction, until the counterbalancing principles be also discovered. Thus, to confine ourselves to the subject of artillery, so late as the year 1863 we find a disposition evinced to return to the use of the old 68-pounder smooth-bore gun; and the frank admission of the First Lord of the Admiralty, after the enormous expenditure incurred for the improvement of our ordnance, that when asked what gun he approved for the navy, he was obliged to say that he "really did not know."

When, however, we find that the advance of scientific detail is in accordance with the historic progress of the question under investigation, we have a sure indication that the movement taking place is in the right direction. If we apply this principle to the case of artillery, we shall find that it gives valuable light. The history of offensive warfare is, scientifically regarded, the history of projectiles. The earliest instinct of self-defence among men is to make use of a missile. So completely is this the case, that it is acknowledged by the instinct of the animal creation. A dog fears, to a certain extent, a stick; but it is only when he sees it. Make believe to provide yourself with a stick, and the dog is not imposed on; but only stoop, pretend to pick up a stone, and the dog does not stop to reason on the probability of your finding one at hand,—he makes off before the first indication of recourse to the simple weapon from which he can least readily protect himself. Thus, especially in defence from siege, stones of all sizes were the ammunition of primitive warfare. And thus the first purely warlike weapon (whether for the chase, which is the war with brutes, or for the battle, which is war with men) was a means of propelling stones. The first means of distant offence was the sling. Great accuracy and power were attained by this simple weapon; it ranks high in military history; and its disuse, on the introduction of a more formidable weapon, was not because the bow was so much better than the sling or the catapult, but because arrows, to which a sustained flight would be imparted by attention to their feathering, were so much better projectiles than stones, or even than leaden bullets.

The invention of gunpowder drove arrows from the field. It was rather from the power of powder to project masses immovable by less forcible means, than from increased excellence of shooting, and also from the greater portability, and greater ease of manufacturing the new missiles, that the clumsy match-lock and the not very much more precise musket came to supersede the well-tried yew. The explosive system, as a whole, drove out the elastic system, as a whole, by the great superiority of the former as to the heavier artillery. As to the small arms, the question is more open. The bayonet may have had more to do with this than the bullet. The battle of Waterloo was the most terrible, as to the ravages of cannon, known in our history up to 1815; but, if we compare the results of the musketry in that critical encounter with those of the arrow flights at Crecy or at Agincourt, it is not so clear that the bullet, with all the advantage it derived from explosive propulsion, equalled as a projectile the cloth-yard shaft. In matter of precision, if not of range, the former seems to have been certainly the inferior.

Now, the increased precision of modern arms follows from the attempt to give to the bullet one main characteristic of the arrow. Instead of merely blowing a hall from the mouth of an intensified pea-shooter, such as the old smooth-bore musket, the rifle gave a spin to the projectile, which thus was enabled to sustain a more regular flight. To ensure the spin the bullet was, in the Minié and other early rifles, lengthened from a spherical to a conoidal form. But no actual investigation into the best proportions between diameter and length of bullet, or into the relation between the rapidity of spin to be given to the projectile, and the range through which it was to be propelled, appears to have been systematically attempted before the experiments of Mr. Whitworth. That eminent mechanician was certainly one of the first practically to grasp the truth that the first point in offensive science was to determine the best form of projectile, and that from this was to be deduced the best form of projecting weapon. Equally important, although a perfectly distinct subject of investigation from the question of form, is that of the nature of the best material to be employed, whether for bullet or for gun. The third element,—the nature of the projectile force,—does not at this time require investigation, from the fact that this question is not how to increase, but how to manage, the explosive power of gunpowder. So long as the powder is stronger than the gun, it is the weaker portion of the destructive machinery that demands the first attention of science.

Avoiding any minuteness of detail, it appears that the result of systematic and exhaustive experiments established the best form of projectile, a form which mathematical science might perhaps have predicted, but which positive knowledge owes to Mr. Whitworth. A bolt, some three times longer than its diameter, and with a twist around its axis four times more rapid than that which the Enfield rifle was calculated to impart to its leaden projectile, flat-headed, when destined to penetrate hard bodies, and tapered behind, to diminish the resistance of the atmosphere, such was the last step in the series of missiles that commenced with the smooth pebbles of the shepherd's scrip.

The barrel is the reciprocal of the bolt. The form arrived at as the result of Mr. Whitworth's experiments, in which the means of accurate mechanical manufacture were considered as thoroughly as the question of projection, was a twisted hexagonal tub. Shot and barrel are capable of being so turned out of hand that, if the former be sent home by the ramrod, the elasticity of the contracted air is sufficient to return the bullet towards the muzzle as the ramrod is withdrawn. Greater windage is allowed in practice; but the perfect freedom of the system from tendency to jam or to rack is shown very distinctly by so delicate an experiment.

With this form of bolt, and with this form of barrel, projectiles of every diameter, from the $\frac{1}{2}$ -in. of the small bore rifle to the 54-in. of the 70-pounders actually tried, or to the still larger calibres of our future guns, attain the widest range, and the greatest accuracy as yet known to be possible. In the experiments conducted at Shoehuryn in 1864 and 1865 between the breech-loading Armstrong 12-pounder, the muzzle-loading Armstrong 12-pounder, and the Whitworth 12-pounder, the committee report

that the range of the latter gun was 29 per cent. superior to that of the two former; the Whitworth projectile, fired at an elevation of 33°, attaining the distance (in the mean of nine shots) of 8,776 yards, against the respective distances of 6,788 and 6,774 gained by the competing bullets. For accuracy the superiority of the Whitworth ranges from 17 per cent. above the Armstrong muzzle-loader up to 900 yards, to 100 per cent. above it from 3,000 to 3,600 yards; the muzzle-loading Armstrong, in its turn, being from 25 to 48 per cent. superior to the breech-loading Armstrong. This result is derived from comparative trials with solid shot. As to shell and case, the question of the comparative projectile value of the different patterns brought forward for experiment is more complicated, and it is by the comparison of the same kind of projectile alone that accurate results can be obtained, no element of disturbance entering the case when solid shot are employed in each weapon.

In the trial of the 70-pounder guns, as reported by the same committee, the figures are no less eloquent as to the incontestable superiority of the Whitworth system. At elevations varying from 0° to 21°, the range of the 70-pounder Whitworth exceeds that of the muzzle-loader Armstrong by ratios increasing with the angle of from 5 to 26 per cent., reaching a mean distance, in eighteen rounds of 7,965 yards, against 6,380 yards covered by the muzzle-loader, and 5,821 by the breech-loading Armstrong. The mean radial error of the Whitworth, at this range of four miles and a half, was 65·8 yards, that of the Armstrong guns being respectively 116·2 and 123·8. Penetration, tested by firing against a solid mass of brickwork, 40 ft. thick, at a distance of 750 yards, was 7·25 ft. made by the Whitworth solid shot for 4·75 ft. made by the muzzle-loading Armstrong.

When it is remembered that these results are due to the employment of the same system which, in 1857, produced a rifle that best the Government arm more than three to one, planting the average of its shots, at a range of 800 yards, within a circle of 4½ in. mean radius, against an area of 27 in. mean radius in the other, it seems to us that there can be no room to hesitate as to the system on which the British army and navy ought to be armed. In availing themselves of the services of Sir W. Armstrong for the development of his own weapon, the Government of the day, no doubt, exercised a wise discretion. Whether after having so far departed from the time-honoured routine, as to take the advice of an eminent civilian, on a subject on which he was at home, and military men were inexperienced, the Government went rather too far, it is now scarcely necessary to inquire. In all cases of the kind the sage maxim "*Cautus in sua arte credendum*" cannot be neglected without misfortune. For the War-office end for the Navy to avail themselves of the best civil professional advice in such matters as the manufacture of firearms, is a duty so obvious that it seems useless to insist on it. The only danger lies in the exclusive reliance on one adviser and one system, when there is a fair question to be settled among competitive weapons. But when, on the one hand, are various systems, each more or less undergoing constant modification, for small arms, field guns, and heavy cannon, contrasted with, on the other hand, one comprehensive plan, slowly matured from exhaustive experiment, and resulting in an indistinguishable triumph against every competitor, though in many respects hardly fairly tested against rival weapons already bearing the prestige of "the Service," the minister who hesitates to take council of the engineer who has so far demonstrated the soundness of his views incurs a very heavy responsibility in the face of the country.

We have spoken hitherto of the forms of projectiles, and of the corresponding form of the projecting arm. Another question remains untouched—that of the material. The two are so far distinct that the best results might be attained in either case by different experimenters. There is no reason why the man who finds out the best form of gun should also be the discoverer of the best material from which to make it. The question before discussed may be considered as ground common to the mathematician and to the practical experimenter. The question of material is one for experiment alone. Chemistry, which here replaces geometric or algebraic investigation, is exclusively an experimental science. She knows, as yet, nothing whatever of "the high *a priori* road," or rather it is by her depart-

ture from that old-fashioned and devious track that she has entered so closely into the secrets of the great Architect of Nature. The state of this part of the case is, at present, that the force of gunpowder is so great that no known material enables us fully to utilise it. Any gun can be hurst by repeated efforts. The gun will not have attained its proper relation to the powder consumed in its barrel until it is made of a material which a full charge of powder can neither burst nor stretch.

The cohesive quality of iron, as at present manipulated, is below this requirement. Ordinary cast-iron, the readiest material for the construction of large guns, has to be altogether laid aside for the future. It cannot resist the heavy charges of powder, and the increased force of the explosive power due to the retention of the projectile by the rifling of the barrel. It has been attempted to meet this difficulty by several methods, the most successful of which have been respectively and interchangeably adopted by Sir W. Armstrong and by Mr. Whitworth. Sir William and Captain Blakely (for in this as in most instances of the independent discovery of nearly identical methods the honour is claimed by more than one inventor) have started from the mechanical fact that the chief strength of wrought-iron lies in the longitudinal direction of its fibres. Injury by excessive explosion, they consider, is inflicted on a wrought-iron gun by bulging its barrel, rending the fibres apart as if they were threads in a thread-paper. To counteract this tendency, and to make use of the utmost strength of the material, the bars of iron used to build the gun were therefore bent in a spiral, and welded together into a tube, three lengths of bar being required to form the barrel, which again was strengthened by other coils shrunk upon the primary ones, so as to thicken the breach. Mr. Whitworth preferred the forging of a single ingot or bar of steel, the solid centre of which was afterwards bored out, and the breech strengthened by hoops forced on cold by hydraulic pressure. It is enough to say that while by each of these laborious and costly processes guns may be produced far superior to any that were considered necessary a quarter of a century ago, yet neither the coil gun nor the hooped ingot gun is strong enough altogether to resist the explosive force of powder. Experiments were made by the Committee on the 12-pounder guns by firing with the service charges of powder, and one or more shot, with air spaces between the charges and the shot, the object being to ascertain which gun would have the greatest powers of endurance, and also the manner in which they would hurst. The breech-loader was fired with a charge of 1½ lb. of powder, and a shot of 11½ lb. weight. The Armstrong muzzle-loader, with a charge of 1½ lb. of powder and a shot of 11½ lb.; the Whitworth with a charge of 1½ lb. of powder and a shot of 12 lb. Under these graduated tests, the trunnion ring of the breech-loader was cracked at the 33rd round; and at the 42nd round it had opened to the extent of an inch. The muzzle-loading Armstrong was cracked at the 60th round, the coil in front of the trunnion being found open and near to the gun, as if it had simply fallen off. The Whitworth gun hurst violently into eleven pieces at the 92nd round. The strength thus evinced in each instance exceeds the ordinary requirements of the service; but the explosive force is still in excess of the resisting power of the gun when repeatedly and severely tested. In the case of the 70-pounders, after a practice of 3,000 rounds from each, the Committee endeavoured to burst them. The strength in each instance, however, was so great that the ammunition was exhausted without the hursting of either gun, 102 rounds of desruptive charges having been fired from each. The breech-loader was slightly cracked in the powder chamber, but uninjured in the body of the gun. The Armstrong muzzle-loader had fractured the steel barrel at the breech, but the superimposed coils were uninjured. In the Whitworth the bore was expanded 3·10ths of an inch, and the outer hoop shifted forward. In these experiments Sir W. Armstrong had adopted a steel barrel, with iron hoops; Mr. Whitworth a steel barrel with steel hoops. The result of the experiments appears to be that a trustworthy service gun can be constructed on either principle; but that the power of powder is still in excess of the resistance of the material of which the weapon is composed.

The projectiles invented by Mr. Whitworth are characterized by as great an advantage in penetrating power as they possess in range and in

accuracy. For the most serious service for which artillery is required, the attack of armour-plate vessels, the superiority of the punch-headed steel-bolt is incontestable, as it is found to cut clean hole through a target, even at an angle, which causes any other shot to glance. In the experiments with steel shell it was unexpectedly discovered that a fuse is unnecessary when firing against armour plates. The blow with which the missile punches out its path imparts such heat to the metal as to fire the bursting charge, and it has been found necessary to wrap the powder in flannel to prevent the explosion of the shell until its penetrative force is exhausted. To the invention of these two irresistible projectiles, Mr. Whitworth has added that of a form of case shot which the committee characterize as "an invention of very great value to be Majesty's service."

It seems unnecessary to add another word to the necessity of the adoption for the defence of the country of the Whitworth system of gun. Yet two most important features of the case remain unnoticed. The first is this. The capacity of a gun to consume powder, and therefore its requisite strength to resist disruption, is measured by its calibre; and therefore, supposing all the questions of construction to be satisfactorily solved, the weight of the gun should be in definite proportion to its bore. Now, in the trial of the so-called 70-pounders (leaving aside the breech-loader, as withdrawn from the competition), the two guns pitted against each other differed materially in calibre. The Whitworth gun, with bore of 21·33 in., area, burned 10 lb. of powder, and threw a projectile of 70 lb. weight to maximum distance of 8,075 yards, against a maximum range attained by the Armstrong gun of a similar charge, of 6,528 yards, an excess of 42 per cent. The weight of the gun was 78 cwt., being 3 cwt. 2 qrs. 17 lb. per section, 32·31 in. sectional area, which gave only the proportions of 2 cwt. 1 qr. 11 lb. of weight to the piece per sectional inch of bore. A difference more than 50 per cent. in a matter so important as ratio between weight and capacity was certain to tell its own story under experiment. The truth is that the Armstrong gun, with a capacity to burn 15·15 lb. of powder, was, in point of fact, a 106-pounder under-loaded and under-shot. This view of the case is supported by the fact that when each gun was fired with a large charge of powder, the increase of charge from 1 to 12 lb. in the Whitworth only increased the initial velocity 4 per cent., or by 57 ft. per second; while the same increase of charge in the Armstrong gun increased the initial velocity 124 per cent., or 164 ft. per second; and a further augmentation to 14 lb. (still less than the capacity of the calibre) increased the initial velocity by a further 24 per cent., or 37 ft. per second. The comparison of range is less precise as the 10 lb. charges were fired at 6° of elevation, and the 14 lb. charge at 5°. The Armstrong range at 6°, with 10 lb. of powder, was 2,665 yards, with a mean error of 25·5 yards. The Whitworth range, under the same conditions, was 2,948 yards, with a mean error of 25·7 yards. The range of the Armstrong gun at 5° of elevation, with 14 lb. of powder, was 2,311 yards. But the effect of the trials for duration plainly shows that a charge of 12 to 14 lb., while was less than that due to the bore of the gun and demanded by the diameter of the projectile, would have altogether exceeded the powers of endurance possessed by the piece. The inference is indubitable that the Whitworth 5·28-in. gun is one only proportioned for the discharge of a 70-pound shot, and that the Armstrong 6·4-in. gun is not so proportioned its power of propulsion being proportionate to the discharge of a 106-pound shot, and its powers of endurance being only those due to 70-pounder. The great superiority of the Whitworth gun is thus again brought to a definite test. Of the competing 5·28 in. and 6·4 in. diameter guns, the first is only considered as fairly proportioned as to diameter and weight, and the second is not. To produce a gun which must, if it is to endure, be always under-charged by 40 per cent., is not a triumph of construction; nor is such a weapon one that can with due regard to safety be issued for service.

The other question relates to the cost and durability for service of the projectiles. The former of these elements is of far more importance in the Army Estimates than the original cost of the guns themselves. We have just seen a comparison between two large cannon for 3,000 rounds, which were fired without injury to either

piece of ordnance. We have also seen that the Armstrong 70-pounder, with 14 lb. of powder, fell short of the Whitworth 70-pounder, with 10 lb. In this sole comparison, therefore, if we suppose the powder to cost 50l. per ton, the Armstrong gun would have cost, if fired according to its capacity, 600l. more than the Whitworth, a difference doubling the original price of either weapon. The report gives little information as to the actual cost of the projectiles themselves, and we are unwilling to supply the defect from any less impartial source of information. But if we regard, on the one hand, the rapidity with which the solid spiral bolt can be turned out of band by machinery, and, on the other hand, consider either the complex process of coating with lead, or the troublesome application of zinc or copper studs, there can be little doubt as to the superior cheapness of the hexagonal bolt. Again, the more complex projectiles are liable to such damage in the necessary service of the field as to interfere greatly with the exigencies of artillery practice. The only point in which the report of the Committee seems to us to have lost sight of mechanical truth, is where they mention that the studs provide the projectile with a certain power of self-adjustment. The action of the studs in the grooves of the obtuse gun would appear to a mechanic almost certain to impart irregularity to the motion of the projectile; while the action of the spiral bolt in the spiral barrel is such as to centre it on the least motion, a fact which no doubt tells for much in the steadiness of its flight. In cost, therefore, of working, in range, in accuracy, and in penetration, the experiments at Shoeburyness appear to establish the claims of the Whitworth guns and projectiles to rank, so far as experience goes, as the first in the world.

FLORENCE IN 1867.

WHATEVER the effect of the change that has raised her to a higher place in national life, Florence still remains the gayest as well as the fairest of Italian cities. It is impossible not to be struck by the visible expression on every side of the progressive and energetic spirit now awake here; and the joyousness of the scene makes itself more felt by one led to contrast it with the subdued solemnity of that capital where the church reigns supreme—should he happen, that is, to have passed immediately from one to the other. The Florentines may have something to complain of in respect to taxation, increased expenses of living, &c., but it is impossible not to recognize in the conditions of their city the prevailing evidences of things that tend to and proceed from the general well-being,—the proofs, in short, of progressive prosperity.

The works for the enlargement of this capital have been advancing, since the beginning of the year, with tolerable activity, though not yet very striking in their results. Most promising is the new quarter now rapidly springing up on the northern side between the Porta S. Gallo and Porta Croce, while the style of buildings and laying out of streets present altogether a cheerful and pleasant picture, and seem likely to attract the fashionable world. The best characterized houses are specimens of the modern Italian, without any attempt to imitate the palatial grandeur of Florence of the fifteenth century, but with general resemblance to the spacious and aristocratic residences that date from subsequent periods; the walls are brick, or irregular stonework, in every instance coated with stucco, coloured to imitate the dark grey or dark yellowish stone found in neighbouring quarries, and so much used in Florentine churches, uniformity being systematically avoided, and each house having its distinct features, however a certain type may predominate,—the ground-floor stories mostly of rustic masonry, so also the stone facings often introduced at angles; doors and windows sometimes arched, the latter, in almost all cases, surmounted by dressings, or, we might say, pediments, either curved or triangular, the two forms often alternating, many of the best residences having gardens at the rear or at one side; and at the level that forms a centre to this new quarter, already is opened to the public a much larger garden, planted and laid out in walks, that promises to become an attractive promenade when trees shall throw a deeper shade, and the air of novelty be worn off. That extent of fortifying walls which bounded this region is almost entirely demolished; but its

debris being not yet cleared away, the long line of ruins that rise like a steep embankment, still forming a barrier between town and country, present a somewhat dismal feature in this otherwise pleasant quarter, and give the idea of works lately overthrown by the artillery of besiegers. Beyond, however, we have the view of the hills of Fiesole and loftier Apennines, whilst we inhale the fresh air that breathes from mountain and plain, reminding of the advantages to health and enjoyment securable for the inmates of the city's new streets on this side. Southward, where the fortifications are more ancient and picturesque, they have been left untouched, and it is understood that in this extent they will be spared, seeing that the steep rising ground along which they are carried, between Porta Romana and Porta S. Nicolo, offers no inducement to the extending of street-lines, and is in great part occupied by the gardens of the Pitti Palace. The Medieval gateways, picturesque structures in their way, are also to be preserved, out of regard for historic antiquity, and for the art details, symbolic sculptures, animals and shields, frescoes of sacred figures, by which most of them are adorned.

The *Porta Croce* is destined to stand isolated in the midst of a spacious square, for creating which much of a populous suburb will have to be swept away. Between that gate and the river side has been re-opened the long-shut *Porta Ghibellina*, whose very name had disappeared from the Florence map, and whose archway had been built up to serve as a guard-house. Of this city's more ancient gateways eight were either built up or destroyed in the first years of Medician sovereignty; and that leading to the church whose name it bears, *S. Miniato*, had long been closed before its re-opening in 1834. Alike has been given back to public transit the *Porta S. Giorgio* on the height near the Belvidere fortress, a gate long reserved for military use, the river side of which has a good fresco by Bernardo Daddi, the outer a relief of Saint George and the Dragon. A fine fresco of the Crucifixion, life size, has been removed from its tabernacle, near the S. Gallo gate, to the museum in the Pretorio. Most important among works of demolition hitherto undertaken is that for destroying the "Fortezza da Basso," built by the Duke Alessandro de' Medici, 1534, with the architecture of Sangallo and two others, in the dungeon of which gloomy fortress the life of Filippo Strozzi had its tragic close. Condemned to perish as now utterly useless, and an obstacle to the city's development on the northern side, its low but extensive buildings and wide range of outworks will disappear to give place to a very spacious square, destined, it is said, to serve as a *Champs de Mars* for military parades. As yet indeed little has been accomplished towards this object, save the filling up of the moat and certain earthworks; the dark pile of that Medici castle, looking so like a den of tyranny, being still before us in horrid contrast to the beautiful scene amidst which it stands between the city and the cultured, mountain-girt plain.

Another project of importance, the works for which are now claiming notice, is the construction of the new "Lung' Arno," to extend along the river's left bank, commencing from a southeasterly point, and to be carried along the water-side so as to correspond with the magnificent promenade, so well known to all tourist-visitors, that presents the finest perspective in modern Florence on the Arno's left bank. In their present incabate stage, these works are aimed at throwing up a mole, that considerably narrows the river's bed by its encroachment, near the oldest of the bridges, *Ponte delle Grazie*; and numerous laborers are engaged all day behind palisades set in the gravelly ground through which the Arno flows, reduced, at this season, to a stream dwindling into insignificance at certain parts. For this improvement it will be necessary to knock down many picturesque old houses that rise, piled up in irregularities of good effect, immediately above the water. Public convenience has been well consulted in the other undertaking now in progress on the most frequented of the bridges, *Ponte Carraino* (originally of wood, first built in stone 1333, and restored by Ammannati, 1557); the bad condition of which was the more to be complained of as this bridge forms the principal approach to the chief marketplace in the "Olt' Arno" quarter. It is to be provided with canseways of iron-work, adding largely to its width, as well as new pavement for the central part; pending the labours for which, this busiest of Florentine bridges is now only

passable by pedestrians. We are glad to see the praise-worthy practice of distinguishing the houses of genius still kept up amidst the current of novelties and new activities in this city, alike since, as before, she became the Italian capital. On a house of modest dimensions in the Via S. Sebastiano, behind the *Annunziata* church, we read the following on a lately-placed tablet, that well honours the illustrious dead:—

"In questa casa abitò il pittore senza errore, Andrea Vannucci Fiorentino, detto Del Sarto, che reduce di Francia la edificò, e vi morì nell'anno MCCCCXXX, pieno di gloria e di domestici affanni." (In this house resided the painter without fault, Andrea Vannucci, of Florence, called Del Sarto, who built it after his return from France, and died here in the year 1530, full of glory and of domestic afflictions.)

Turning to the examples of entirely new architecture for public purposes, we do not find that Florence has received additions to be proud of. The ministerial palace on the Piazza S. Marco is not saved by greatness of scale from insignificance of character; that for the Minister of Public Works, Via della Scala, has better, but no very admirable, features. The facade of the Corsi Palace rebuilt as necessitated for the widening of the street, is the only architectural novelty of imposing or superior style; and this also is open to criticism for deficiency of projecting masses, and largeness in details; the occupying of the ample arched recesses that extend along its ground-floor by shops, whose windows fill the openings, detracting from the palatial in this great mansion's aspect.

Among realities of the day, the present conditions of the convents cannot be left unnoticed. The cloisters of S. Croce are in part let to families, in part used for a public office; at those of S. Maria Novella, the largest in Florence, no fewer than five Government offices are located. S. Marco, most interesting from art contents, and which was declared by edict, in this last year, to be "a national monument," is now destined to become a museum of sacred art, where several works of Fra Angelico, besides those painted on the walls of its cells and corridors, will be collected, some from the S. Maria Novella Church; and the largest of two deserted refectories will be the principal hall for this sacred exhibition. Ten of the Dominican community are still left in the S. Marco convent; though, according to the letter of the law, six is the extreme number allowed to remain for life, in order to guard the premises and officiate in the churches of those establishments that must eventually disappear; and repairs have been begun (but for some weeks suspended) in the above-named convent, for better adapting it to its new purposes. Under these circumstances, S. Marco is a mournful and silent place; the mason's work impedes one's advance through its interior; the frescoes of the "Beato" are mostly covered for protection, till this confusion shall be at an end. But in the chapter-house we still see the "Crucifixion," largest and noblest among the wall-paintings by that friar, in good light and with every convenience for spectators; a set of engravings of all the frescoes here by the same gifted hand being on sale in the same room.

In conclusion, we must testify to the general intelligence and taste, the religious respect for antiquity, for all that charms the eye by beauty, or the mind by association, in the principles that have presided over the complicated task of renovation at this centre; and we must rejoice in the tokens that promise for the capital of Italy such graceful distinctions as were ever owned by the "Etrurian Athens" in days gone by.

DIAMONDS.—At a recent meeting of the California Academy of Natural Science, Professor Whitney remarked that there are fifteen localities in California at which diamonds have been found in the course of washings for gold. In reply to a question if there was not some familiar test by which miners might prove them, he answered that the easiest way was to try their hardness on other gems, but miners have not always these convenient to do so. A knowledge of the crystalline form, twenty-four sided and the faces curved, was the surest test. He said that the popular notion that a diamond could be hammered on an anvil without breaking, was a mistake, resulting from confounding hardness and toughness. Also, that it would not pay in California to wash the gravel beds solely for diamonds. Diamond washings do not pay in any country, except with slave or convict labour.

THE CASTLE OF ARQUES.

THE Castle of Arques, one of the earliest, largest, strongest, most remarkable, and most celebrated of the pure Norman castles of Normandy, has had the advantage of being described by M. Deville in 1839, and illustrated, more recently, by the pen and pencil of M. Viollet-le-Duc.* To the work of the former of these authors the present writer is indebted for much of historical matter, and for the leading dimensions of the castle and its details; but, having recently visited Arques, he has formed his own opinion upon these details, and is responsible for them. M. Le Duc's account is very minute, and especially so upon the complicated arrangements for the entrance into and defence of the Norman keep. His statements probably rest upon plans and drawings of the building at some period when it was far more perfect than is at present the case. Indeed, at this time, the details do not differ materially from many Norman keeps of the same century in England, nor can I observe certain traces of some of the more complicated arrangements spoken of.

The castle and the county (*comté*), or, as we should say, the earldom of Arques, have played important parts in the local history both of France and Normandy. The town of Arques was the capital of Talou, the Roman *Talugiun*, a name well known as late as the eleventh century, when it passed gradually into disuse, being superseded by the equally old but more limited appellation, which, by the creation of the *Comté d'Arques* in favour of the Conqueror's uncle, became extended over the whole lordship.

Talou or Arques, in extent about 14,000 acres, lies open to the sea upon the old frontier of Normandy. To its north-east was the territory of the powerful counts of Eu, and to the west and south the divisions of Brui, Caen, and Rouen. It is a tract of high table-land of chalk, deeply scarred with valleys, some steep, short, and dry, others broad and level, giving passage to streams of some heauty, and the sources of much fertility. It was in request on account of its frontier situation, the strength of its positions, and its agricultural wealth.

For these reasons it was an early resort of its Norman rulers. Duke Robert, in 1031, designates it as "one of our residences," as does his renowned son in 1047. Duke Robert died in 1035, leaving William then eight years of age, and who was formally recognised as the heir in 1038, about which time his paternal uncles of the half-blood, William and Manger, sons of Duke Richard I. by his second wife, received from him the one the *Comté d'Arques*, the other the Archbishopric of Rouen.

The Norman nobles profited by the infancy and questionable title of their sovereign to strengthen their own positions, and William of Arques seems at once to have commenced and rapidly to have completed the present castle, which may therefore be attributed to between 1040 and 1045. Its completion tempted him into rebellion, upon which Duke William took possession of the fortress, which, however, his uncle speedily recovered by an understanding with the Duke's castellan. Then followed a second and more dangerous insurrection. The duke heard of this at Contances, in Lower Normandy. With instant speed, gathering force as he rode, he reached the town, and was in time to cut off a portion of the supplies on their way to the castle. He then attacked the advanced posts of the garrison, placed probably on the site of the present outer ward, drove them into the enclosure, and established a blockade. As the only gate of the place was at that time on the north, he threw up a fortified camp on that side, the ditch and palisade of which included the entrance to the castle, and a space in the direction of, but probably larger than, the later *Bel or Bailey*. It was strengthened—

"De fossez et de hericun
Et de pel fist un chasteillan;"

That is, "with ditch and palisade, and castlets he formed of piles." This he placed in charge of Walter Giffard, so well known afterwards on English ground. The garrison numbered 300, while with Giffard was a body of knights and men-at-arms. The duke then retired to settle his pressing affairs in Lower Normandy.

Archbishop Manger having stirred up Henry I.

* "Histoire du Château d'Arques," par A. Deville. Rouen, 1839. "Dictionnaire raisonné de l'Architecture," par Viollet-le-Duc, Paris, 1859. "Art. Château et Donjon."

of France, that monarch prepared to raise the siege, and was supported by the followers of Enguerrand of Ponthieu, brother-in-law to the count, and shut up with him in the castle. The French coming impetuously to the attack, neglected proper precautions, and were beaten back by Giffard, and Enguerrand was slain; but nevertheless supplies seem to have reached the castle. Upon this the duke returned from Valognes to the camp, and finally starved out the garrison. This was followed by the battle of Mortemar, in November, 1054, by which William secured his seat upon the ducal throne. After this event Arques was placed under the charge of a sheriff or vice-comes.

The revolt and blockade, the attempt of the King of France, the arrival of the duke, and the surrender of the castle, form the subjects of 160 very spirited lines in "Le Roman de Rou," which informs us that

"William d'Arches fu mult fier
E un e hardi chevalier,
Frere l'Arceveske Maugier
Ki mult l'amont e tenet chier."

And thus disposes of the result of the whole business:—

"Maiz pur viande ki falli
Terre e chasteil et tur guerpi;
Al Duc William tut rendi
Et al rei de France s'enfui."

William Rufus, having secured England, entered Normandy on the side of Arques, but the castle was held for Robert Curthose until the accession of Henry I., and the capture of Robert at Tinchebrai, in 1106. Arques, once in Henry's hands, was held by him, notwithstanding the attacks of Baldwin, count of Flanders, upon that frontier; and after his defeat of the French at Vexin, in 1119, he imprisoned Ormond, lord of Chaumont, in its dungeons. His sense of its value led him to strengthen it in 1123, and he held it until his death.

King Stephen, though he obtained possession of several Norman castles, seems only to have retained Arques. Geoffrey Plantagenet besieged it for a year, and at last, in 1145, obtained it by the accident of the death of Lemoin, the castellan who was shot by an arrow.

In 1150, before the accession of Henry II., son of Geoffrey, to the throne of England, Arques was attacked by Louis the Young of France. Henry marched to its relief with a powerful army, but it was not till long afterwards, in 1173, that the combination of the same Louis with Henry, son of Henry II., really menaced its security. Arnalde and Drincourt, two strong frontier castles, were at once surrendered, and Henry advanced upon Arques, with the Counts of Flanders and Boulogne. While actually beneath the castle the latter was slain by a Norman knight. This broke up the federation, and Prince Henry retired, leaving the castle still in the hands of its proper sovereign.

Under the treaty of Mantes, in 1193, between Longchamp, on behalf of Coeur-de-Lion, then in prison, and Philip Augustus, Arques and three other castles were to be placed, two in the hands of Philip, and two in the neutral hands of the Archbishop of Reims, to be held until France had received 20,000 marcs, one castle being restored at each payment of 5,000. Philip, upon this understanding was to obtain Richard's liberation.

Prince John, by secret and dishonest covenant with Philip, was substituted for the archbishop, and placed in possession of Arques, and the castle, thus virtually in the hands of France, was one of those which, under the truce of 1194, Philip was free to fortify or destroy. Richard, however, once in the field, bent himself to its recovery. He took post before it in 1195; but his adversary, with 600 knights and harons of France, came to its relief. Richard retired after a bloody struggle, in which the Earl of Leicester was made prisoner. Philip then burnt Dieppe, already a considerable post, the growth of the preceding century, but in his retreat suffered the loss of his rear guard at the hands of Richard.

Philip marked his possession of the lordship of Arques, and his sense of its value, by bestowing it, with his sister Alice, upon William, count of Ponthieu, retaining a power of redeeming it for 5,000 marcs of silver. Nevertheless, before a year, Coeur-de-Lion became lord both of the land and the castle, and this by virtue of a treaty. He entered early in 1196, and placed Geoffrey de Sny, whose name is preserved in Dover Castle, in charge of the fortress and of the lordship. His accounts, which are still to be seen in London, include, in 1198, a charge of 35l. 2s. 8d.

for repairs of the building of the castle of Arques. These accounts also show an expenditure of 496l. 13s. 8d. for the support of the king's nieces (Eleanor), daughter of the Countess of Briant, whom we thus learn to have been in residence here. She was the sister of the unhappy Arthur then at the court of France. The large sum more than half the receipts of the lordship placed annually to her credit, shows her treatment to have been on a very liberal scale. After Richard's death, and that of Arthur, John moved her to Corf. She is said to have lived 1241.

In 1200 King John ordered the usual inquisition into the state of the castle to be made, four true men of Arques, and 450 livres to be spent on the fortifications, if necessary. He visited there himself in that year, and there sign a grant of market at Sackville to Jordan Sackville, ancestor of the dukes of Dorset. It was also there 17th and 18th May, 1202, and a visit was followed by a hostile one from Philip Augustus, who appeared before the castle with proper siege apparatus very shortly afterwards. For fifteen days, according to Matthew Paris, catapults and ballists were directed against the walls; but the garrison, having greatly to its advantage of elevation, caused the besiegers to retire to a more respectful distance. Philip therefore, prepared for a blockade, and direct vessels from the Flemish ports to bring supplies by sea. A letter of John, in July, 1202, addressed to the Baron of the Cinque Ports, directed them to intercept these supplies. It was then that Philip learned that Arthur had fallen in the hands of his uncle. His fury was great. He broke up the siege to attack John in person while William Cumin, the castellan, acknowledged the bravery of his garrison, and made an order from John in January, 1203, paid 54l. 12s. 3d. as their arrears. This king, also, in February, showed his gratitude to the burgess by a grant of certain liberties to their town, witnessed by the well-known names of Gurne, Furnival, Fitzgerald, Mortimer, Sackville, Torberville, and Rivers. In 1203 Wm. Mortimer and Wm. Martel were placed in charge of the castle, which was provisioned afresh, and payments were ordered to the garrison through the chequer.

The cares of John were unavailing. Normandy was about to fall. Château Galliard after near year of siege, Rouen after a stout resistance, Falaise and Caen, and the other strongholds of the Norman dukes, were now in the hands of France, and the Arqueses received only the sad honour of being the last to surrender. In 1204 Arques became French territory, but the castle had never succumbed to an assault.

The change, however grateful to the inhabitants, who entered upon a career of many years of peace, was fatal to the fame and glories of the castle. The castellan became a mere collector of revenue, or was occasionally called upon to compose the disputes of the local clergy. Before ninety years had passed, the Norman garrison were reduced, and so many castles dismantled that one alone — that of Arques — was preserved in Upper Normandy. In the meantime it had been visited in 1273 by Philip the Hardy who there confirmed the privileges of Rouen accorded by Philip Augustus in 1207.

In 1348, under Philip of Valois, its garrison was hat four men-at-arms and twelve archers but in 1355, when the designs of Charles the Bad, of Navarre, drew the attention of King John to his Norman frontier, Arques was directed to be put in order. The keep was to be repaired one of its turrets leaved; and mention is made of the king's chamber within its walls. Timber was brought in from the forest, the drawbridge newly planned, the chains and ropes renewed, the working gear greased, the stables put in order, the well-ropes examined, the loops and windows repaired, and the tiled roofs mended. Nothing, however, followed this alarm. The dangers of France came on the side of Crecy and Poitiers, and King John was shortly afterwards a prisoner in an English keep at strong as Arques, and almost of the same age.

Under the treaty of 1359, for the liberation of King John, which, however, was not executed, Arques was one of the fortresses to have been delivered up to England.

In 1363 Charles V. confirmed the privileges granted to the people of Arques by John Lackland, in 1203. In 1375-80 the accounts witness to masons and carpenters having been employed at the castle. Buildings, destroyed by fire, were replaced. Caen stone was brought by sea for the repairs of the walls. Much was done to the

Keep or Great Tower and to the prisons, and a garrison was retained in the place.

The next event in the history of Arques, followed upon the English invasion of Normandy under Henry V., and the fall of Rouen in 1419. One month after this Arques opened its gates to the Duke of Clarence, and received the English Philip Leoblo as his captain, who in a short time was succeeded by John de Baskerville, and his lieutenant, Peter Lee, under whom the castle was once more put under strict military discipline. Ralph Boteler, of Sudeley, knight banneret, was their successor, and the garrison was reduced from ten to four men-at-arms, and from thirty to twenty-six archers, and the latter number was again reduced to twelve, in 1428-9. The prospect of an attack on Rouen caused these figures to be somewhat increased, and Gervase Clifton, Boteler's officer, raised them to fifteen and afterwards twenty men-at-arms, half horse and half foot, and sixty archers.

After the death of Henry V., when the time came for the expulsion of the English, the peasantry of the north rose in arms, but amidst the general fall of strong places, Arques held firm. Henry VI. was there in 1435, and there signed a charter in favour of the Archbishop of Rouen. Talbot came to Arques in 1442, when he besieged Dieppe, and trusted to that fortress to protect from the French army the vast siege preparations which he had made. John Norbury was then its captain, replaced by Sir Walter Devereux, in 1445.

The castle of Arques was one of the strong places agreed to be surrendered to Charles VII. upon the fall of Rouen in 1449. Meantime, however, the garrison of Dieppe had turned the tables, attacked Arques, taken the Bel by surprise, and laid siege to the castle, which, however, surrendered, not to their force, but in virtue of the capitulation of Rouen.

The castle now had rest until, in the reign of Louis XI., this side of France was invaded, in 1472, by Charles the Bold. The duke burned the suburbs of Dieppe, and made a demonstration before Arques, but could do nothing more. In 1485, Charles VIII. visited the castle, and the Sire de Lardinieres claimed the cup out of which he drank as a perquisite of his fee, held by the service of guarding the outer gate of the Bel of the Castle of Arques.

Francis I. visited Arques in 1544 and 1545, but does not appear to have signalled his visits. Under Francis II. Arques was employed as a means of putting down the Huguenots in Dieppe, and in consequence received Catherine de Medici's men in 1560. Two years later, Francis being dead, the men of Dieppe retaliated, and drove back the Duc de Bouillon into the castle of Arques; an act which was followed by a series of local skirmishes about the town and castle, with various success, the results of which were swallowed up in the events of the reigns of Henry III. and IV.

1584 found the castle held by Martin d'Epinau, a strong Catholic and member of the League, while Dieppe, still Huguenot, declared for the king. Aymar de Chaste, captain of the port, disguised a body of picked men as fishermen, and sent them laden with fish for sale to the governor. Thus equipped, they were allowed to enter the Bel and the outer ward of the castle. Once within, they killed the guard, rushed through the inner gate, and in a few minutes had secured the place for the king. Henry III. died in 1589.

Henry IV. took up his quarters at Dieppe, where he awaited the tardy and stunted aid of Elizabeth. Mayenne, in command of the army of the League, 30,000 men, hovered on the confines of the town, at about two miles' distance. Henry, holding Arques, established entrenched lines on the high ground, east of the castle, between the river and the forest, but within shot of the walls, which were armed with several pieces of cannon. His troops were placed within the lines, and there awaited the enemy.

It was long and without the aid of a map, tedious to tell how Henry fortified Le Polet, by Dieppe, and outmanoeuvred Mayenne, until, on the 21st of September, 1593, meeting him on the narrow space between the forest and the river, and under the guns of the castle, he succeeded with less than 8,000 troops in vanquishing the Leaguers with 30,000. The guns of the castle assisted in the battle, and, with the exception of a trifling affair three days later, this was the last and most glorious conflict in which that ancient fortress took part. From this time Henry's cause was, on the whole, successful, and it was from Arques that he wrote

to the Duc de Crillon those often-quoted words,—"Hang thyself, brave Crillon: we have fought at Arques, and thou wast not there!"

In 1596 the castle was the seat of a severe endemic, and was cleaned out at a considerable expense.

Louis XIV. visited the castle in 1647, then nine years old, from Dieppe; but it was no longer a military post of importance, and two archers, to open and shut its gates, formed the whole garrison.

As national property it was sold in 1793, and after various transfers, and a narrow escape of destruction for the value of its materials, it has come to be regarded as a relic of the past time worthy of our respect. It is, however, still in private hands.*

THE PARIS EXHIBITION.

We have before us a score of letters as to the recent award of medals, mostly complaining and protesting. Some of the complainants have made themselves heard through other channels; little public good will be done by repeating the protests. We have already said that the English jurors have not excited our admiration by results. The English sculptors as a body withdrew all their works from competition. Messrs. Powis, James, & Co. think themselves excessively ill-treated by the award of a bronze medal made to them for their wood-working machinery. "It is not in accordance with the comparative novelty in design, workmanship, and utility of the machines exhibited by us. We applied for and occupied our space with the full belief that we were going to compete fairly with the world in our particular tools; but the result of awards clearly shows that there has been most unfair partiality or want of ability to decide the respective merits on the part of the jurors. We cannot understand why no gold medal should have been given for wood-working machinery in the British section, whilst the Grand Prix and two gold medals were awarded for engineers' tools in the same class and group of that section. We consider that there have been greater recent improvements in wood-working machinery than in almost any other kind."
